**Drogheda** is 30 miles north of Dublin at the mouth of the river Boyne. It was the first garrison to be attacked by Oliver \*Cromwell when he invaded Ireland in 1649. Its royalist defenders included many English protestants as well as catholic Irish. They were no match for Cromwell's 12,000-strong army and heavy siege guns. When Sir Arthur Aston rebuffed the summons to surrender, Cromwell blasted two holes in the southern wall and on 10 September ordered his men into the breach. Only after the second assault, led by Cromwell himself on foot, did the parliamentarians overrun the town, at which point 'in the heat of action' he ordered 'any that were in arms' put to the sword. Dismayed, some of his soldiers let their prisoners escape. Much of the ensuing massacre, totalling 3,500 soldiers, clergy, and civilians, was carried out in cold blood the next day. Cromwell's intention was that the terrible example of Drogheda would bring Irish catholic resistance to a speedy end. Events proved him wrong.

IJG

**druids.** A priestly caste in British tribal society. The druids acquired a reputation from several Roman writers for inhuman practices perpetrated in the name of their religion. The Greek geographer Strabo accused them of mass human sacrifice, and Diodorus Sicula and Tacitus both claimed that the druids used human entrails cut from sacrificial victims to consult the gods and predict the future. Although they are not specifically identified as the instigators of the slaughter which accompanied the capture of Camulodunum (\*Colchester) by \*Boudicca's rebels, there can be little doubt that both Tacitus and Dio Cassius held them responsible for the atrocities they reported. These included hanging, burning, crucifixion, and impaling alive. Tacitus and Dio Cassius both emphasize the particular importance of sacred groves as places of worship for the druids. Dio mentions such a grove in the vicinity of Colchester, dedicated to Andate, the goddess of Victory, whilst Tacitus refers to many of them on the Isle of Mona (Anglesey), suggesting that both the druids and their groves were spread the breadth of Britain. Pliny confirms the important role of sacred groves in druidic religion, particularly those of oak trees. He was also responsible for linking the druids to mistletoe, white robes, golden sickles, and herbal medicines, all of which are part of the popular perception of druidism today. What is not clear from the ancient authors is the extent to which druids wielded political influence in Britain at the time of the invasion.

KB

**Drumclog, battle of,** 1679. John Graham (\*Dundee) of Claverhouse, attempting to disperse a rising of \*covenanters on 1 June, was sharply repulsed in a skirmish at Drumclog, near Strathaven. The insurgents went on to occupy Glasgow but were defeated at \*Bothwell Bridge by \*Monmouth. William \*Cleland fought with the covenanting forces and the engagement was described by \*Scott in *Old Mortality*. JAC

**Drummond, Thomas** (1797–1840). Civil servant. Drummond was born in Edinburgh and attended university there. He joined the Royal Engineers and began work on the \*Ordnance Survey, where his invention of the 'Drummond light' (a brilliant limelight) greatly facilitated progress. In 1831 he was recruited by \*Brougham to provide statistical data for the Great Reform Bill. In 1835 he moved to become under-secretary at Dublin, where he aimed at the impartial administration of law and order and began the establishment of an efficient police force. His supporters claimed a significant reduction in agrarian crime. Drummond gave great offence to ultra-protestants with his reminder to landlords that they had duties as well as rights. He was subsequently involved in planning a state railway system for Ireland which never materialized. Drummond wore himself out by work and died in harness. JAC

**Drury Lane** (London) takes its name from Sir Thomas Drury, who had a house there in Elizabeth I's reign. It was a fashionable street in the 17th cent. but rowdy by the 18th. The first theatre opened in 1663. Nell \*Gwyn made her début in 1665 and on May Day 1667 \*Pepys saw her outside her lodgings 'in her smock-sleeves and bodice, looking upon

one—she seemed a mighty pretty creature'. The theatre, burned down in 1672, was rebuilt by \*Wren. \*Garrick made his début there in 1742, became manager, and passed it on to \*Sheridan in 1776. His new theatre, built by Holland in 1794, was burned down in 1809 while Sheridan was at a debate in the Commons. The replacement was by Benjamin Wyatt and, much restored, is the present building. In the 1890s the theatre was famous for Dan \*Leno's pantomimes and in the 20th cent. for musicals. JAC

**Dryden, John** (1631–1700). English poet, playwright, and critic. Dryden's influence on contemporary political poetry was marked. Educated at Westminster School and Trinity College, Cambridge, Dryden came from a 'middling' landed family, but made a living from his writing. After commemorating Oliver \*Cromwell's death in *Heroic Stanzas* (1658), Dryden turned to celebration of the Restoration of Charles II and the early successes of his reign in a series of poems, *Astraea Redux* (1660), *To His Sacred Majesty* (1661), and *Annus Mirabilis* (1667), as well as writing numerous important and popular tragedies, comedies, and tragi-comedies, and seminal critical works such as *Of Dramatick Poesie* (1668). Appointed poet laureate in 1668 and historiographer-royal in 1670, Dryden continued to support the king, most notably at the height of the \*Exclusion crisis with *Absalom and Achitophel* (1681). Other significant poems of this period include the first English mock-heroic, *Mac Flecknoe* (1682), a witty and malicious demolition of his fellow-playwright Thomas Shadwell, and *Religio Laici* (1682), a defence of Anglicanism. However, Dryden converted to catholicism on the accession of James II, writing a religious allegory, *The Hind and the Panther* (1687), as a sort of justification. Stripped of his offices in 1688, he returned with success to the theatre, and began a brilliant series of translations from the classics, particularly Virgil's *Aeneid* and *The Georgics*. Scarcely surprisingly, given his political position, critics have discerned hidden Jacobite meanings in most of Dryden's later writings, including the magnificent *Fables Ancient and Modern*, published in the year of his death. JAD

**Dub** (d. 966), king of 'Scotland' (962–6). Son of \*Malcolm I. He succeeded on the death of \*Indulf at the hands of Norwegian raiders. He beat off a challenge for the throne by Indulf's son \*Cuilén in 965, at the battle of Duncrub (9 miles south-west of Perth). This may have marked the end of a period of dynastic solidarity which (with the possible exception of Malcolm I's accession in the early 940s) had seen no violent competition for the kingship for 75 years. Dub was not vanquished by dynastic rivalry, however, but by the men of Moray at Forbes, an event which apparently coincided with an eclipse of the sun on 20 July 966. It is likely that this defeat undid whatever his father had gained by his victory in Moray. DEB

**Dublin** takes its name from the Irish *Duibhlinn*, 'black pool', which may refer to a pool on the river Liffey's tributary, the Poddle. *Duibhlinn* was an ecclesiastical centre seized by the \*Vikings in 841. The city's alternative Irish name, *Áth Cliath*, 'the ford of the hurdles', explains its strategic significance, being one of the region's most important river crossing-

points. It quickly became the main Viking military base and trading centre in Ireland and its Hiberno-Norse rulers exercised power over its hinterland (which later developed into County Dublin), though its forces were famously defeated by the \*Munster king \*Brian Boru at \*Clontarf in 1014. Thereafter, Irish rulers established themselves as kings of Dublin and by the time Ireland was invaded by the Anglo-Normans in 1169 Dublin was effectively the country's capital. It fell to Anglo-Norman arms in 1170, was taken by King Henry II into his own hands, and remained the headquarters of the English colony in Ireland, enjoying a period of development and prosperity which continued until the early 14th cent. The subsequent decline lasted well into the 17th cent., considerable growth taking place following the \*Restoration in 1660. The 18th cent. was arguably the most colourful era of the city's history, the arts and architecture in particular finding encouragement from the wealthy society of what was now regarded as the second city of the empire. Under the Wide Streets Commissioners (established in 1758), Georgian Dublin flourished and the abolition of its parliament in 1800 did little to lessen the city's expansion. Opposition to the \*Union led to the \*Easter Rising in the city in 1916 and Dublin featured prominently in the war which led to the establishment of the \*Irish Free State in 1921, with Dublin as capital and the home again of an Irish parliament. SD

**Dublin** (*Áth Cliath*), **archiepiscopal diocese of**. Originally a Norse city-state, \*Dublin was one of the first regular episcopal sees in Ireland subject to \*Canterbury. When \*Lanfranc claimed primacy of all Britain, he included Ireland and consecrated Patrick, monk of Worcester, as bishop of Dublin (1074). There developed a strong link between Dublin and Canterbury, and 12th-cent. bishops were usually monks from the Canterbury province. Though Dublin was not listed by the Council of Raithbressail (1111), it was to be included in the Glendalough diocese under \*Armagh's primacy. Dublin, soon to be the centre of Henry II's colonial administration, became an archbishopric at the Council of Kells-Mellifont (1152), with five dioceses in the south-east of Ireland. Its link with Canterbury was broken. Anglicization came earliest to Dublin and took root there more deeply than elsewhere, so that all five sees of the Dublin province usually had Anglo-French bishops. The archbishopric itself became a reward for administrative service; absenteeism was the inevitable consequence. In 1238 Dublin unsuccessfully challenged the primatial claims of Armagh. It is still the see of both catholic and Anglican archbishops. In 1838 the Anglican province of Dublin absorbed Cashel and is now one of only two Anglican archbishoprics. Uniquely there are two Anglican cathedrals. St Patrick's, the largest in Ireland, is the national cathedral with an Early English interior and massive north-west tower. It holds Dean Jonathan \*Swift's tomb; the choir was the chapel of the Order of St Patrick (1783–1868). Christ Church is the cathedral for the Dublin diocese. WMM

**Dublin, kingdom of**. Established by the \*Vikings in 841, the kingdom of Dublin survived until the execution of its last Hiberno-Norse king, Asgall Mac Turcaill, by invading Anglo-Normans in 1171. Its earliest rulers may have come

## Dublin

from Rogaland in Norway, Olaf the White, famous in Norse tradition, being its first recorded king. In their early years the Dublin Norse faced competition from Vikings of Danish origin, and, although involved in raiding and military alliances in Ireland, much of their attention was devoted to Britain and during the first half of the 10th cent. members of its ruling family were also kings of \*York. After the defeat of King \*Olaf Cuarán (Sihtricsson) at the battle of Tara in 980 Dublin's kings, now largely integrated into Irish politics and society, came increasingly to feel the domination of the Irish provincial kings, most spectacularly in the defeat of Olaf's son, Sihtric Silkbeard, at the hands of \*Brian Boru at \*Clontarf in 1014. In 1052 the kingship of Dublin was seized by the \*Leinster king, Diarmait mac Máil na mBó, and from then until the Anglo-Norman invasion Dublin, effectively the country's capital, was largely an appanage claimed by the contenders for the \*high kingship of Ireland. SD

**Dublin, treaty of, 1646.** In the early months of 1646 Charles I's position, militarily and diplomatically, deteriorated sharply. On 28 March 1646 the \*Kilkenny Confederates reached an agreement in Dublin with \*Ormond, the lord-lieutenant. But when Ormond published the peace terms in July, they were repudiated by the Confederates as giving inadequate recognition to the catholic church. Ormond was accordingly forced to open negotiations with the English Parliament and in June 1647 a parliamentary army reached Dublin. Ormond left for England in July. JAC

**Dublin castle.** The \*Viking town of Dublin was, by the 10th cent., dominated by a fortress which was captured by Anglo-Norman invaders in 1170. In 1204 King John ordered the construction of a castle which was probably located on the site of the earlier fortress. Dublin castle became the administrative headquarters of the English colony in Ireland, housing the main organs of government. Re-edified by Sir Henry \*Sidney in 1566–70, and again after a serious fire in 1684, the castle remained a symbol of English power in Ireland until its surrender to the \*Irish Free State government on 16 January 1922. SD

**Dudley, Dud (1599–1684).** The natural son of Edward Sutton de Dudley, the 8th baron. Whilst studying at Balliol College, Oxford, he was appointed by his father to manage the ironworks at Pensnett near Dudley (Worcs.), where the family estates had large reserves of coal and iron ore. He experimented with coal in place of charcoal in the smelting of iron ore. His father secured for him a patent for his process in 1621, renewed in 1638. He demonstrated the quality of his iron for gun-making at the Tower of London. During the Civil War, in 1645, he became the general of ordnance to Prince Maurice, one of the royalist generals. Although sentenced to death in 1648, he survived, but his business had been destroyed in his absence by local ironmasters. In 1665 he published *Metallum Martis* but the commercial viability of a process using coal in place of charcoal for smelting had to await the endeavours of Abraham \*Darby in the next century. IJEK

**Dudley, Edmund (c.1470–1510).** Dudley came of Sussex gentry stock and studied law. His first wife was a sister of Andrews, later Lord Windsor, and his second the daughter of Lord Lisle. He was employed with Sir Richard \*Empson to raise revenue for Henry VII and was Speaker of the House of Commons in 1504. His work on the king's behalf made him many enemies and at the outset of Henry VIII's reign he was sent to the Tower. He spent his time in prison writing a treatise, *The Tree of Commonwealth*, intended as a handbook for the young king, which argued for a strong monarchy and deplored the deficiencies of aristocratic education. He was executed the following year on an implausible charge of high treason. Dudley's son John, created duke of \*Northumberland in 1551, held power during Edward VI's reign, and his grandson Robert was Elizabeth's favourite, the earl of \*Leicester. JAC

**duelling.** The duel, with its formal ritual, developed from trial by combat and its heyday coincided with the period of aristocratic supremacy from the 16th to the 19th cents. The amiable assumption was that the will of God would prevail. The concept of nobility demanded that a warrior would defend his honour, and that of his family, sword in hand. It should be distinguished from private warfare, clan feuds, bloody affrays, or assassinations, and it was a step forward when seconds were limited in numbers, forbidden to take part, but used as witnesses, organizers, and umpires. For obvious reasons, monarchs could not be challenged and had champions to represent them. In practice many monarchs tried to eliminate duelling, which was disruptive, particularly at court or in the armed forces. James I issued an edict forbidding duelling and in 1627 Richelieu in France had Montmorency-Bouteville executed as a grim warning. The change in the 18th cent. from swords to pistols helped to reduce the disadvantage of the novice confronted by an expert. Leading statesmen could expect to be called out. \*Pitt fought \*Tierney in 1798, \*Canning and \*Castlereagh exchanged fire in 1809 when both in the same cabinet, and \*Wellington and Winchelsea fought in 1829. A peculiarly bloody encounter in 1712 between Lord Mohun, whose aggression bordered on madness, and the duke of Hamilton left both dead. A ludicrous duel, averted in 1782 by the intervention of the Speaker, was between Lord \*North, notoriously short-sighted, and Colonel Barré, who had only one eye. It was important to know when to accept challenges as well as when to issue or decline them: the chevalier de Beauvoisis in Stendhal's *Le Rouge et le noir*, mortified to discover that he had fought Julien Sorel, a mere tutor, spread the rumour that his adversary was the natural son of a distinguished nobleman. The decline of the duel in the 19th cent. owed something to the growing concept of the equality of citizens but more to a sense of the duel's unfairness. In Britain duelling came to an end after 1843 when Colonel Fawcett was killed by his brother-in-law Lieutenant Munro, leading the prince consort to insist that the Articles of War be changed to prohibit meetings. Duelling lingered only in the militarized societies of Wilhelmine Germany and tsarist Russia, where a decree as late as 1894 required officers to accept challenges on pain of dismissal. JAC

**Duffy, Sir Charles Gavan** (1816–1903). Duffy had a strange career. The son of a shopkeeper from Monaghan, he moved to Dublin as a journalist in 1836 and in 1842 launched the *Nation* as the mouthpiece of \*Young Ireland. He broke with \*O’Connell in 1846 over the issue of moral force and in 1848 was implicated in the rising. Though put on trial, he was not convicted, and resumed his editorship of the *Nation*, but placing the emphasis on land reform. In 1852 he was elected to Parliament but, despairing of making progress, left for Australia in 1855. There he pursued his second career in Victoria, serving as legislator, minister, and 1871–2 as prime minister. He was knighted in 1873 and acted as Speaker 1876–80. Leaving Australia in that year, he spent most of the remainder of his life in southern Europe. JAC

**Dugdale, Sir William** (1605–86). Dugdale’s father was barrister at St John’s College, Oxford, before retiring to Warwickshire. Dugdale married at 18 and spent the rest of his life at Blythe Hall, Shustoke (Warks.), east of Birmingham, devoting himself to history and antiquities. Friends found him a place in the Herald’s Office and he became Garter king-at-arms in 1677, and was knighted. A royalist during the civil wars, his property was sequestered and his salary unpaid. In 1655, with Roger Dodsworth, he published the first volume of *Monasticon Anglicanum*, documents relating to the English monasteries. The second and third volumes appeared in 1661 and 1673, and the whole was repeatedly reissued and augmented. In 1656 Dugdale printed his *Antiquities of Warwickshire*, one of the first and greatest of county histories. After the Restoration, Dugdale devoted himself mainly to his heraldic duties, including strict visitations, though he continued to publish important work, particularly the *Baronage*, which came out in 1675 and 1676. In undertakings of this depth, Dugdale relied greatly upon the work of other scholars, not always acknowledged, but a later charge that he was ‘that grand plagiarist’ is ungenerous. He was a fine and dedicated scholar in an age of great scholarship. JAC

**duke.** The title of duke, derived from the latin ‘dux’, is the highest in the peerage and until 1448 was restricted to members of the royal family. In that year, Henry VI created William de la \*Pole, who had fought in France on many campaigns, duke of Suffolk: he enjoyed the title for less than two years, being murdered in a boat off Dover. Subsequent monarchs were sparing of the title and there were no English non-royal dukes in existence between 1572 and the grant by Charles I to his favourite the duke of \*Buckingham in 1623. After the Glorious Revolution, the Whig grandees were promoted to dukedoms in quick succession—Bolton, Shrewsbury, Leeds, Bedford, Devonshire, and Newcastle. George II and III resumed the policy of restraint. Notable 19th-cent. creations included Wellington (1814), Sutherland (1833), and Westminster (1874). The first non-royal Scottish dukedom was Montrose (1488) and the first Irish, Ormond (1661). Along with marquises and earls, dukes are entitled to strawberry leaves on their coronets. The eldest son usually takes the next title and younger sons and daughters are known as Lord Roger or Lady Jane, with the family surname. JAC

**Dumfries and Galloway** has since 1973 been a local authority region of Scotland comprising the counties of Dumfries, Kirkcudbright, and Wigtown. Till 1996 it shared local government activities with its districts of Annandale and Eskdale, Nithsdale, Stewartry, and Wigtown, but now has sole responsibility. A low-lying, mild, fertile area, agriculture still accounts directly for about 8 per cent of its employment (over five times the Scottish average). The provision and servicing of transport is also a significant industry because proximity to Northern Ireland generates traffic through the port of Stranraer. CML

**Dumnonia, kingdom of.** After the Roman withdrawal, Cornwall became part of the kingdom of Dumnonia, which also included Devon (the name derived from Dumnonia) and parts of west Somerset. Its domestic history is obscure, though its geographical position enabled it to survive for centuries. Its cultural and religious links were with Wales, Ireland, and Brittany. \*Gildas (early 6th cent.) denounced Constantine, ‘tyrant whelp of the filthy lioness of Dumnonia’, which is fierce but vague. The Britons in Dumnonia were cut off from their allies in south Wales by \*Ceawlin’s victory at \*Dyrham in 577, but since sea-travel was easier than land, the blow may not have been severe. Dumnonia was sufficiently part of the known world for \*Aldhelm, bishop of Sherborne, to address a letter, c.705, to its king Geraint, putting him right on the date of Easter, and though Geraint was defeated by \*Ine of Wessex c.710, the kingdom survived. \*Egbert of Wessex completed the conquest of the area in 814. Two rebellions, in 825 and 838, were crushed, the second, which had Danish assistance, at \*Hingston Down. JAC

**Dumnonii.** British tribe and *civitas*. The Dumnonii seem to have occupied the whole of the south-west peninsula, and parts of southern Somerset. They issued no coinage, they had no large nucleated settlements which acted as political focuses, and there is no evidence of a dynasty of Dumnonian kings. They were therefore probably a loose confederation of small tribal groups with a common ancestry. They appear to have accepted the Roman conquest without resistance and as a result few garrison forts were placed in their territory. The Romans granted them *civitas* status, and the town of \*Exeter (Isca Dumnoniorum) became their administrative centre. KB

**Dunbar, battle of,** 1296. In 1292 Edward I found in favour of the claim of John \*Balliol as king of Scotland. Three years later, relations between the two had broken down and Balliol formed an alliance with France. In the spring of 1296 Edward invaded and captured Berwick. Moving up the coast he laid siege to Dunbar. A relieving army was defeated on 27 April by John de \*Warene and the castle capitulated. Edward then proclaimed himself king of Scotland, called a Scottish Parliament at Berwick, and removed the stone of \*Scone to England. JAC

**Dunbar, battle of,** 1650. Dunbar was \*Cromwell’s greatest victory, won against severe odds. After the execution of his father, Charles II’s hopes rested with his supporters in Scotland, and he arrived there in July 1650. Cromwell followed

## Dunbar

him three weeks later, advancing up the east coast from Berwick. The royalist army was led by David \*Leslie, who had fought alongside Cromwell at \*Marston Moor. On 2 September Cromwell's army, weakened by sickness, was bottled up at Dunbar, Leslie, with twice his numbers, having cut off his retreat. Evacuation by sea appeared the wisest move. Cromwell chose to attack the following day and, with very light casualties, destroyed Leslie's force, taking 10,000 prisoners—almost the size of his own army. 'God made them as stubble to our swords,' Cromwell reported to Parliament. JAC

**Dunbar, William** (c.1460–c.1520). Widely regarded as the greatest of the late medieval Scottish makars (poets), Dunbar may have been a Franciscan novice and student at St Andrews early in life; but apart from the evidence of his poetry, little is known of the man outside the period 1500–13, when he received an annual pension from James IV, increasing from £10 in 1500 to a generous £80 by 1510.

Dunbar's work covers a vast range—formal court poetry like 'The Thirissell and the Rois' (1503), celebrating the marriage of James IV and \*Margaret Tudor; satire, as in his 'Remonstrance to the King' or the lampoons of Damian, alchemist and would-be aviator; and personal meditative poems, above all the grim 'Lament for the Makaris' (1508). Taken as a whole, Dunbar's poetry, embracing heady confidence, complaints about corruption, and bleak despondency, reflects the changing national mood in James IV's Scotland. NATM

**Dunblane, diocese of.** This see in Perthshire was named after Blane (d. c.590), a saint who studied in Ireland and later as bishop preached in Scotland. Dunblane became a bishopric (1162) under David I and the cathedral was built on the site of Blane's monastery. Still with its original 12th-cent. tower, it was largely rebuilt between 1238 and 1258. The roof collapsed at the Reformation and only the choir survives, much restored (1892–1914). Noted for its fine proportions, medieval woodwork, and stained glass, \*Ruskin remarked of its west window, 'nothing [is] so perfect in its simplicity and so beautiful'. Robert Leighton (1661–70), whose library of 1,500 volumes was bequeathed to the diocese, was the most celebrated of its bishops. Dunblane is also important for its influential ecumenical centre, Scottish Churches House (1960). The Anglican see was merged with Dunkeld (1776) and with St Andrews (1842). WMM

**Duncan I** (d. 1040), king of Strathclyde (possibly before 1034) and king of Scotland (1034–40). On the death of \*Malcolm II as an old man, the male line of the royal dynasty was extinguished. The vacuum was filled by Duncan, son of Crínán, abbot of Dunkeld (d. 1045), and Bethóc, daughter of Malcolm II. Duncan was possibly already king of \*Strathclyde, and may have been appointed by Malcolm II. Far from being Shakespeare's old man, he is likely to have been in his twenties when he died 'at an immature age' according to a contemporary account. He is recorded campaigning both north and south beyond the borders of his kingdom. His prime concern, however, was apparently Northumbria, where he found his wife and where he

mounted a disastrous campaign in 1039. This must have weakened him, and gave \*Macbeth an opportunity to challenge for the throne. It was Duncan, however, who went on the offensive and led an army into Moray. Battle was joined (probably) at Pitgavenny (2 miles north of Elgin), and Duncan fatally wounded. A debatable source claims he was buried on Iona. DEB

**Duncan II** (d. 1094), king of Scotland (1094), was the eldest son of \*Malcolm III and his first wife, Ingibiorg of Orkney. He was given as a hostage following Malcolm III's submission to William I at Abernethy in 1072, and remained a captive in England until freed and knighted by William II in 1087. William II gave him military backing in a bid to oust his uncle \*Donald III from the kingship in 1094. After initial success he was defeated and forced to dismiss his Anglo-Norman supporters. Gravely weakened, he was killed by Mael Petair, \*mormaer of the Mearns, at Mondynes (19 miles south of Aberdeen), and his uncle restored to the kingship. Duncan's son William was a key supporter of David I. DEB

**Duncan, Adam** (1731–1804). Born at Lundie (Dundee), Duncan was a Scot of prodigious strength and height. He entered the merchant service initially, only obtaining his lieutenant's commission when he was 24. A protégé of Keppel, in the Seven Years War Duncan took part in the Belle Île expedition and the successful attack on Havana. In the American War he served under \*Rodney at the first relief of Gibraltar 1779 and under \*Howe at the second in 1782, attaining the rank of admiral in 1787 when he was 56. Duncan's most celebrated command was in the North Sea in 1797 when, based at Yarmouth, he had to counter the effects upon that command of the \*Nore mutiny at a time when the hostile Dutch fleet might put to sea. At one moment he had only two ships with which to watch the Texel, the companies of both his flagship *Venerable* and the *Adamant* being restive. His subsequent defeat of the Dutch off \*Camperdown was testimony to the North Sea squadron's fundamental patriotism but, even more, to Duncan's resource and unsurpassed qualities of humane leadership. He was created Viscount Duncan of Camperdown; an earldom was conferred on his heir 30 years after his death. DDA

**Duncan Smith, (G.) Iain** (b. 1954). Politician. Heavy election defeats in 1997 and 2001 made for rapid promotion for some Conservative MPs. After seven years in the Scots Guards (1975–81), Duncan Smith moved into industry before election for Chingford as successor to Norman Tebbit in 1992. In 1997 he became opposition spokesman for social security and in 1999 for defence. On the right of the party, he was a strong opponent of further EEC integration. On the resignation of William \*Hague in 2001, he defeated Michael Ancram, Kenneth Clarke, David Davis, and Michael Portillo for the Conservative leadership. His rivals pointed to his lack of ministerial experience, but that did not seem to have harmed the performance of his political opponent Tony \*Blair. JAC

**Dundalk, battle of**, 1318. Edward \*Bruce's short-lived kingdom of Ireland came to an end in October 1318 when he was defeated and killed at Dundalk by an Anglo-Irish army under John de Bermingham. The victor was created earl of Louth by Edward II. JAC

**Dundas, Henry, 1st Viscount Melville** (1742–1811). Scottish politician, son of Robert, Lord Arniston, president of the Court of Session. Dundas followed his family tradition by taking up the law, and in 1766 was appointed solicitor-general for Scotland. He was MP for Midlothian 1774–90 and for Edinburgh 1790–1802 when he was created Viscount Melville. A burly figure and a vigorous and forthright speaker with a broad Scots accent, he was appointed to a series of legal and political offices. He became successively lord advocate [S] 1775, joint keeper of the signet [S] 1777, privy counsellor, treasurer of the navy 1782–3 and 1784–1800, home secretary 1791–4, president of the India Board of Control 1793–1801, secretary of state for war 1794–1801, keeper of the privy seal of Scotland 1800, and 1st lord of the Admiralty 1804–5. The list alone testifies to his indispensable value to \*Pitt, and Dundas became his right-hand man in the wartime administration as well as his friend and drinking companion. His influence extended far beyond his official duties, for after 1774 he acted as government manager of Scottish affairs and in particular of Scottish elections and MPs. A cynical politician who believed in the power of patronage, he knew almost everyone of importance in Scotland and how to appeal to their self-interest. He was nicknamed 'Henry the ninth of Scotland'. At the height of his influence he secured the return of at least 36 of the 45 Scottish representatives in the Commons and several in the Lords, though it was a moot point whether these men were attached to the administration or to Dundas personally. He kept his grip on Scottish elections even in opposition to the \*'Talents' ministry and after his retirement his nephew continued to exercise control of the majority of Scottish members until the Reform Act.

Dundas's success owed much to his command of Indian patronage as president of the Board of Control, which enabled him to bestow lucrative appointments on his Scottish clients. It was said that he sent younger sons 'by loads to the East Indies' and that there was scarcely a family of note in Scotland that was not under some obligation to him.

Dundas resigned with Pitt in 1801 but offered support to \*Addington and was given his peerage in 1802. On Pitt's return in 1804 he became 1st lord of the Admiralty but was forced to resign when an inquiry into financial irregularities in the navy pay office implicated him. He was impeached in 1806—the last occasion on which this process was used—and although acquitted was censured for laxity in his financial control. He attended the Lords only occasionally thereafter. EAS

**Dundee**. Situated on the Firth of Tay, east Scotland, and already a thriving centre with trading connections throughout northern Europe when granted burghal status c.1191, Dundee prospered through textiles, guns, and its role as an entrepôt port until the mid-17th cent., despite intermittent assaults by the English. Recovery after \*Monck's sack

was slow until it became the base for one of Scotland's largest whaling fleets and expanded its textile activities to become 'Juteopolis'. Past renown for shipbuilding, 'jute, jam, and journalism' has yielded to economic and social insecurity, from which it continues to endeavour to emerge. ASH

**Dundee, John Graham, 1st Viscount** [S] (1648–89). John Graham of Claverhouse was heir to a small estate 10 miles from Dundee. He was educated at the University of St Andrews, and in the 1670s served in the Dutch and French armies. He next accepted a commission in the Scots cavalry. A conservative royalist and episcopalian, he made a career in internal security duties against presbyterian radicals. Politically, he allied with the Drummond brothers and with James, duke of York (later James II). After 1685 the Drummonds ruled Scotland for James, and Claverhouse was made provost of Dundee and a viscount.

After the Glorious Revolution, he rebelled against the provisional government of Scotland in 1689. He could only raise a small army, mainly Highlanders, but his Williamite opponent, the Highlander General Hugh Mackay of Scourie, had few seasoned troops and was routed at \*Killiecrankie in Strathgath. Dundee died in the battle. His army failed to break into the Lowlands and disintegrated after defeat.

BPL

**Dunes, battle of the**, 1658. On 14 June Turenne, commanding the French forces with the help of an English contingent under Sir William Lockhart, attacked a Spanish army defending Dunkirk. The Spaniards, under Don John and Condé, were badly beaten, losing 4,000 prisoners. James, duke of York, the future James II, fought on the Spanish side. Dunkirk surrendered soon after and was handed over to the English. JAC

**Dunfermline abbey** (Fife). On the foundations of a pre-Conquest Celtic church and a small Roman church built by \*Malcolm III for Queen \*Margaret (c.1072), a Benedictine monastery church was erected by David I, dedicated to the Holy Trinity (1150). The burial place of royalty during the 11th–15th cents., its high connections and central position made it one of the richest and most influential abbeys in Scotland, used for meetings of the Scottish Parliament, election of bishops, and even, briefly, as an ecclesiastical prison. Lands and churches were given by royal charter, but although it had 'mitred' abbots as had Aberbrothock, Dunfermline was held increasingly in *commendam* after 1500. By the Reformation considerable land and revenue had already passed into private hands, much to \*Knox's anger. After 1587 all remaining properties and revenues were annexed to the crown, with James VI granting it to his bride, Anne of Denmark. The ample monastery guest-house was enlarged as an occasional residence for royalty, and was the birthplace of Charles I (1600). The nave survived despoliation to serve as the parish church until 1821, when a new one was erected over the foundations of the Benedictine choir. ASH

**Dungan Hill, battle of**, 1647. Michael Jones, sent back to Ireland by a victorious Parliament in 1646 to re-establish English rule, won his first success on 8 August 1647, when

## Dungeness

an attempt by Thomas Preston to reach Dublin was stopped at Dungan Hill, near Trim, with heavy loss. JAC

**Dungeness, battle of**, 1652. A sharp naval action during the first \*Anglo-Dutch War. Tromp, on convoy duty in the channel, attacked \*Blake off Dungeness on 30 November. Blake was obliged to break off the encounter with some losses and the Dutch convoys went through unscathed. JAC

**Dunkeld, battle of**, 1689. The death of their leader \*Dun-dee deprived the Jacobites of much of the advantage they had gained by the victory at \*Killiecrankie in July 1689. Mac-kay, leading the Williamite forces, was able to regroup. On 21 August, the Jacobites attacked a small force under \*Cleland at Dunkeld. Though Cleland was killed in action, his men repulsed the attack with such vigour that the Jacobite force was routed. JAC

**Dunkeld, diocese of**. The first monastery at Dunkeld ('fort of the Celts') may have been founded by St \*Columba. \*Kenneth I MacAlpin made it his capital jointly with Scone. The see was revived by \*Alexander I (1107–24), a devout son of the church, ruling jointly with his brother David I (1107–53), who may have founded the cathedral (1127) on the site of the monastery, but a new one was built between 1312 and 1464 in Norman and Gothic styles. It was drastically damaged at the Reformation and again after the battle of \*Killiecrankie (1689) when the \*Cameronians held out there against the Highlanders. Repairs were carried out in 1691, 1762, 1803, and a full restoration in 1908. The choir, now the Church of Scotland parish church, and ruined nave occupy an idyllic setting near the river Tay. The Anglican see was merged with St Andrews (1842). WMM

**Dunkirk**. North-eastern French port, whence, and from neighbouring beaches, 27 May to 4 June 1940, 200,000 British troops were brought back to England. On 10 May 1940 German troops attacked the Netherlands, Belgium, Luxembourg, and France. French and British troops moved north to join the Belgian army in resisting the main German attack which they expected to develop north of Namur; instead it came further south on the river Meuse below Sedan. By 20 May German units had reached the English Channel, splitting the allied forces. On 25 May Gort, commanding the British Expeditionary Force, deciding that Belgian retreats might expose his rear, gave up attempts to cut the German corridor to the sea, and began British retreat to the coast. On 26 May the British government ordered evacuation. French troops, hoping to maintain a bridgehead for counter-attack, played the main role in enabling the British to depart. Coincidentally, the British war cabinet discussed whether Britain could fight on alone. Churchill's view that Britain could and should continue the war against Germany, whatever happened to France, was reinforced by a promising start to the Dunkirk evacuation. Its success, in spite of German confidence that it was impossible, made more difficult any German invasion of England that summer, by increasing the size of the force the German army would need to land. The drama of the evacuation, including the part played by small civilian pleasure boats, raised British morale. But in his

speech to Parliament on 4 June 1940, Churchill, while commending the bravery and resolution of the troops, put the matter in perspective: 'We must be very careful not to assign to this deliverance the attributes of a victory. Wars are not won by evacuations.' RACP/JAC

**Dunlop, John Boyd** (1840–1921). Inventor. Dunlop was a vet from Ayrshire, who moved to Belfast and established a good practice. In 1887 he fixed air tubes to his son's tricycle and the production of tricycles with pneumatic tyres began in 1889. In 1892 he moved to Dublin but the development of his patent, which revolutionized cycling and greatly assisted motor transport, was left largely to others. The Dunlop Rubber Company became one of the industrial giants of the 20th cent. A patent similar to Dunlop's had been claimed in 1846: the key to Dunlop's extraordinary and rapid success was the use of rubber and the fact that cheap mass transport was urgently needed. JAC

**Dunnichen Moor, battle of**. See NECHTANSMERE.

**Dunning's motion**. On 6 April 1780 John Dunning carried by 233 votes to 215, in the face of Lord \*North's anxious protests, a motion that the influence of the crown had increased, was increasing, and ought to be diminished. This was the high spot of the opposition's campaign for \*economical reform. But the \*Gordon riots of June 1780 gave North's administration a reprieve. JAC

**Duns Scotus, John** (c.1265–1308). Little is known for certain of Duns Scotus' life. He is said to have been a Franciscan, born at Duns in Berwickshire, and to have studied at Oxford and Paris. His burial was at Cologne. He wrote extensively on grammar, logic, philosophy, and theology. He was concerned primarily with the nature and attributes of God, but distinguished between faith (theology) and reason (philosophy). If his concerns and parameters were still essentially medieval, his methodology was modern. Duns Scotus was greatly admired for the rigour of his thinking, yet, when medieval scholastic philosophy fell into disfavour in the 16th cent. as idle speculation, his name was borrowed to coin the word 'dunce'. JAC

**Dunstable, John** (c.1390–1453). Foremost English composer of the 15th cent., whose music circulated widely at a time when English music was extremely influential on the continent. The contemporary French poet Martin le Franc claimed that Dufay and Binchois had taken from him the new consonant English style (*contenance Angloise*). Very little is known about Dunstable's life and career, although there is evidence that he served John, duke of \*Bedford, regent in France and brother of Henry V, and \*Joan, dowager queen of Henry IV. By 1438 he seems to have returned to England to serve Humphrey, duke of \*Gloucester; two of his motets show links with the abbey of St Albans. Although the attribution of many pieces is uncertain, nearly half his output comprises movements for the ordinary of the mass, including two cyclic settings. The best known of his eleven surviving isorhythmic motets is the four-part *Veni sancte spiritus*, which is typical in its structural principle of progressive diminution in the ratio 3 : 2 : 1. ECr

**Dunstan, St** (c.909–88). Dunstan was born into an aristocratic family related to the royal house of Wessex. His early career owed much to family and royal patronage with special support from King \*Edmund, who appointed him abbot of Glastonbury c.943, from King \*Edred, to whom he became a close adviser, and from his uncle Ælfheah, bishop of Winchester (934–51). Exiled briefly by King \*Eadwig to Ghent and Fleury where he came into contact with advanced Cluniac ideas on monastic reform, he returned as Eadwig's half-brother \*Edgar took control and was quickly made bishop of Worcester (957), of London (959), and finally archbishop of Canterbury (959–88). Both at Glastonbury and as archbishop Dunstan played a dominant part in the affairs of the English church and state at a critical moment. From his Glastonbury base he was largely instrumental in the introduction of reformed \*Benedictine observance into England and for the training and support of prominent figures within the movement, notably \*Æthelwold, bishop of Winchester (963–84), and \*Oswald, bishop of Worcester (961–92), who was also archbishop of York from 972. As archbishop, Dunstan was immensely influential in secular and ecclesiastical affairs during the reign of Edgar (959–75), in a dominant position to ensure the success of the Benedictine reform and to see to the establishment of monk-bishops so that its influence was felt throughout the English church. At a council held at Winchester in 970 or shortly afterwards, a version of the Benedictine rule, the *Regularis concordia*, was drawn up for English usage, placing prominence on royal support for the monks. Æthelwold was responsible for the writing of the *Regularis*, but Dunstan was the inspiration behind it. In 973 he established the *Ordo* for Edgar's coronation at Bath, which remained the basis for English coronation ritual. After Edgar's death Dunstan (possibly because of his age) seemed to fade into the background, but his reputation remained high. Early 'lives' record many personal details, his skill at music and metalwork and miracles of healing (including cures for blindness). Popular opinion quickly accorded him sainthood with a commemorative day on 19 May. In medieval art, the tongs with which he was reputed to have tweaked the nose of the devil were taken as his symbol. HL

**Dunwich, diocese of.** Felix from Luxeuil in Burgundy converted the East Angles in the 630s and established his episcopal seat at Dunwich, then a thriving port on the Suffolk coast. He died in 647. In c.673 \*Theodore divided the see into two, placing Norfolk under the see of \*Elmham. After the Danish invasions in the 9th cent. Dunwich ceased to be active and was not revived. WMM

**Dupplin Moor, battle of,** 1332. Edward \*Balliol, supported by Edward III, claimed the throne of Scotland after the death of Robert I Bruce. On 11 August 1332 he was victorious at Dupplin Moor, on the river Earn outside Perth, over a much larger force led by Donald, earl of \*Mar, regent for the young David II. Mar was killed and Balliol was crowned at Scone the following month. JAC

**Durham** was one of the last shires to be fully incorporated into the English political and legal system, because for cen-

turies it was a \*palatinate under the jurisdiction of the bishop. It did not receive parliamentary representation until as late as the 17th cent. But \*Cromwell gave it representation in the 1650s and in this rare instance royalists after the Restoration were willing to build with Cromwell's bricks. The county sent two knights to Westminster in 1675 and the city of Durham two burgesses in 1678.

Geographically the county is of two halves and three rivers. The western half is hilly, running up into the Pennines, the eastern half flat with a harsh and somewhat unattractive coastline. It has always been mining country, with iron and lead in the hills and coal in the coastal plain. The northern boundary, dividing it from Northumberland, is the river Tyne and its tributary the Derwent; the southern is the Tees, flowing through Barnard Castle and separating the county from Westmorland and Yorkshire; through the middle flows the Wear, from Bishop Auckland to Durham, and on through Chester-le-Street to Sunderland.

In Roman times the area formed part of the territory of the \*Brigantes. After the Saxon occupation, it was part of \*Bernicia, the northern half of the great kingdom of \*Northumbria. The county owed its distinctiveness and pre-eminence largely to one man, St \*Cuthbert. \*Camden noted in the 16th cent. that the shire was often referred to as the Land of St Cuthbert or his patrimony. Cuthbert died in 687 on the Farne Islands and was first buried on Holy Island or \*Lindisfarne, of which he had been bishop. In 875 the monks were forced by Viking raids to abandon the place and, taking Cuthbert's coffin with them, established themselves at \*Chester-le-Street, which in turn became a bishopric. In 995, in the face of further raids, they fled once more, taking the remains first to Ripon, then to Durham, where it has remained. There it attracted the great wealth on which the power of the later bishops depended. The name—Dun-holm, the island on the hill—reflected the nature of the place, a rocky promontory, almost completely surrounded by a loop of the river Wear, and offering an ideal defensive position.

The region was not included in the \*Domesday survey and offered fierce resistance to the \*Norman Conquest. When finally it was subdued, the bishop was given palatinate powers, partly to deal with the local population, partly to resist Scottish incursions. The castle at Durham was begun by William in 1072, blocking the neck of the peninsula: the great cathedral, replacing an earlier 10th-cent. one, was started in 1093.

The palatinate powers exercised by the bishops were formidable. They included full ownership of land; the right to levy taxes; the power to raise troops; full jurisdiction, including capital offences, together with the power of pardon; the claim on property of traitors and outlaws. Such sweeping powers led to repeated clashes. Anthony \*Bek, one of the most powerful of the 'prince-bishops', was at odds with Edward I over military obligations against the Scots and with the archbishop of York over ecclesiastical jurisdiction. But by an Act of 1536 in the reign of Henry VIII, the legal powers were removed, and the remaining palatinate privileges were suppressed in 1836 during the episcopate of van Mildert.

Although the coal measures had been worked since the 13th cent., Durham remained thinly populated. Some of the

## Durham

market towns and ports had a local prosperity but none, with the exception of Durham, was given representation in Parliament. Defoe visited the county in the 1720s and was not greatly impressed: Darlington had 'nothing remarkable but dirt', and Chester-le-Street was 'an old dirty, thorough-fare town'. At the first census in 1801, the population was still only 149,000. But the industrial, mining, and shipbuilding developments of the 19th cent. acted as a magnet, and by 1891 the county had well over 1 million people. Though 21st county in size, it was 7th in population. Darlington had grown from a town of 5,000 to 36,000; Gateshead from 8,000 to 85,000; Hartlepool from 1,000 to 15,000; South Shields from 8,000 to 97,000; Stockton from 4,000 to 51,000; and Sunderland, which established itself as a major industrial centre of shipbuilding, pottery, and glass, from 12,000 to 156,000.

The need to find cheaper ways of carrying coal made Durham the birthplace of railways. Well before the 19th cent., the county was networked with rail tracks, usually using wooden rails and horses. The Causey Arch, near Stanley, built by the 'grand alliance' of coal-owners in 1727 to carry their plate-way over a deep ravine, has a claim to be the first railway viaduct. The Stockton and Darlington railway, laid out by George \*Stephenson, which opened in 1825 was the first to convey public freight, with passengers an afterthought. Timothy Hackworth's locomotive works at Shildon opened in 1833 and Stephenson's Locomotion No. 1 is preserved at Darlington. The Brandling Junction Railway between Sunderland and Gateshead opened in 1839 and the main NER line from Darlington to Gateshead via Penshaw and Washington was opened in 1844, with a branch to Durham.

Nineteenth-cent. prosperity was not maintained and the collapse of shipbuilding, mining, and the steel industry led to massive unemployment. The industrial base of the county has diversified, with chemicals at Billingham, car manufacture at Sunderland, and light industry in the Team valley south of Newcastle. In the 1990s the new universities of Northumbria and Sunderland joined the 19th-cent. establishments of Durham and Newcastle upon Tyne.

The county lost areas in the north to Tyne and Wear and in the south-east to Cleveland under the Local Government Act of 1972. In the local government reorganization after the Banham Commission report of 1994, Durham continued as a county, but with unitary authority status given to Darlington, Gateshead, Hartlepool, South Tyneside, Stockton, and Sunderland. JAC

**Durham, city of.** Though small, Durham is one of the great cities of Britain. It is best seen from the 1857 railway viaduct to the west of the town, which looks down on the great loop of the river Wear, which offered a fine defensive position, and across to the cathedral to the south and the castle to the north on the rocky promontory. The first settlement was probably at Elvet, east of the peninsula, where Pehtwine was consecrated bishop of Whithorn in c.762: the church is dedicated to St \*Oswald (d. 642), suggesting a 7th- or 8th-cent. foundation. But the arrival of the remains of St \*Cuthbert in 995 drew pilgrims to the spot and the diocese was transferred from \*Chester-le-Street. A new church was

begun at once and Durham seems to have been visited by \*Cnut in the early 11th cent. After the Norman Conquest, building of the castle was ordered by William I in 1072 and the foundation stone of the cathedral laid by \*William of St Carlelf in 1093. The congested peninsula may have prevented much expansion and \*Leland commented in the 1530s that 'the town itself within the peninsula is but a small thing'. But it developed into an important regional capital and administrative centre. Many of the houses in the north and south bailey were built or refaced in the 18th cent., and Prebends' bridge dates from the 1770s. The university, after several false starts, was founded in 1832, occupies the castle, and has its administrative headquarters at Old Shire Hall in Elvet. JAC

**Durham, diocese of.** The bishopric, conterminous with the old county of Durham, was created in 995, when \*Aldhelm moved the Northumbrian see there from \*Chester-le-Street. The consequent translation of St \*Cuthbert's bones to Durham benefited the new see spiritually and financially; no other northern bishopric could compete, so that even the principal see of \*Hexham fell into insignificance. Durham initially was not Benedictine, but \*William of St Carlelf (1081–96), himself a scholarly monk and former abbot of St Vincent, introduced monks on the lines of Canterbury. The Norman kings raised Durham to a palatine earldom as a protection against the Scots and Vikings, with the bishop as earl. \*Ranulf Flambard (1099–1128) was William II's adviser. Flambard's notorious reputation amongst contemporaries for rapaciousness led to the see being taken under Henry I's protection for a time. Nevertheless Flambard built the greater part of the cathedral. The prince-bishops of the Middle Ages were people of influence in both church and state, a fact symbolized by the juxtaposition of the massive features of the cathedral and castle. Bishops retained their civil jurisdiction until abolished by the Established Church Act of 1836. Today the bishops of Durham still hold seniority, with London and Winchester, second only to the archbishops of Canterbury and York. In recent centuries bishops have often been scholars of note, including Joseph \*Butler (1750–2), the philosopher and theologian, Joseph Lightfoot (1879–89), a leading exponent of New Testament scholarship, and B. F. Westcott (1890–1901). In the 20th cent. H. C. G. Moule (1901–20), Hensley Henson (1920–39), Michael \*Ramsey (1952–6), Ian Ramsey (1966–73), John Habgood (1973–84), and David Jenkins (1984–94) maintained this remarkable tradition of scholarship. The original Anglo-Saxon cathedral of 995 was replaced by the present magnificent Norman cathedral, 'the most impressively situated of the English cathedrals', begun in the Benedictine tradition by Bishop William in 1093 and completed in 1133. High on its rock alongside the castle, it was begun under William I. The cathedral's ribbed cross-vaulting (1104), previously common in Persia and Armenia, was the first seen in the West, probably due to the influence of returning crusaders. The tombs of Cuthbert and \*Bede are in the galilee chapel. The bishops live at the historic Bishop Auckland castle. WMM

**Durham, John Lambton, 1st earl of** (1792–1840). A wealthy Durham landowner and coal-owner, Lambton

became one of the county's MPs from 1813, advocating reforms and acquiring the nickname 'Radical Jack'. He was created Baron Durham in 1828. When his father-in-law \*Grey became premier in 1830, Durham joined the cabinet and the small committee which drafted the ministry's parliamentary reforms. He was promoted earl of Durham in 1834, when he resigned on grounds of ill-health. While out of office, he campaigned for further reforms, including vote by ballot, household suffrage, and triennial parliaments, embarrassing the Whig ministers. From 1835 to 1837 he was ambassador to Russia. After a rebellion in Canada in 1838, he was sent there on a special mission and produced the \*Durham Report, leading to the reorganization of British North America and contributing to the evolution of imperial constitutional conventions. His mission ended in controversy, partly because of his own high-handed conduct. Although talented, he was always a difficult colleague, proud, tactless, short-tempered, and easily offended. NMCC

**Durham, treaties of**, 1136, 1139. In the struggle between Stephen and Matilda for the throne of England, David I of Scotland supported the latter, his niece. He occupied Northumberland but reached a settlement at Durham with Stephen in 1136 whereby his son Henry did homage for the earldom of Huntingdon. The agreement soon broke down but, despite a sharp defeat in 1138 at the battle of the \*Standard, David negotiated similar terms in 1139, retaining Northumberland, save for Newcastle and Bamburgh. JAC

**Durham Report**. John Lambton, earl of \*Durham, was appointed governor-in-chief of Canada in January 1838 following rebellions in Canada. A dispute with \*Melbourne's government quickly ended the mission and Durham prepared an extensive *Report on the Affairs of British North America*, which was leaked to *The Times* in February 1839. He recommended the union of Upper and Lower Canada (now Ontario and Quebec) with local self-government. Durham's *Report* had limited influence at the time, but was hailed by late 19th-cent. enthusiasts as the Magna Carta of the empire. Durham's belief that French-Canadians should be encouraged to speak English remains controversial in Quebec.

GM

**Durotriges**. British tribe and *civitas*. Centred in Dorset but also occupying the southern parts of Wiltshire and Somerset, the Durotriges seem to have been a loosely knit confederation of small tribal groups or septa at the time of the Roman conquest. Their coinage carries the names of no kings, and there were many occupied hill-forts which were probably the strongholds of locally dominant chieftains. The best known of these is \*Maiden castle near Dorchester. In addition, on the south-eastern corner of their territory, they appear to have possessed a major trading centre at Hengistbury Head from which cross-channel trade with Gaul was controlled. This may be the settlement called Dunium by Ptolemy. At the time of the Roman invasion the Durotriges put up spirited if unsuccessful opposition and they were almost certainly one of the two tribes which Suetonius records fighting against \*Vespasian and the II<sup>nd</sup> legion. Archaeological evidence

from Maiden castle, Spettisbury Rings, and Hod Hill confirms the Roman assault on Durotrigan hill-forts. Ironically, it was the Emperor Vespasian who created the *civitas* of the Durotriges, with their capital at Durnovaria (Dorchester) in the mid-70s. Later a second Durotrigan *civitas* was created, administered from Lindinis (Ilchester). KB

**Dussindale, battle of**, 1549. \*Kett's rebellion in Norfolk in 1549 posed a formidable threat to the government of Protector Somerset, since it coincided with widespread disorders in the west country. One relief force under William \*Parr, Lord Northampton was driven out of Norwich and Lord Sheffield killed. In August Lord Warwick (\*Northumberland) was dispatched with a sizeable force, stiffened by German mercenaries. Warwick avoided being trapped in the alleyways of the city and attacked on 27 August just outside the walls. After heavy fighting and a successful cavalry charge against the rebels, Warwick offered pardon, which most of the peasants accepted. JAC

**Dyfed**. County of south-west Wales, extant between 1974 and 1996. The name given to the new county under the Local Government Act of 1972 was derived from that of the post-Roman kingdom which was derived from the tribal territory of the \*Demetae. Unlike other Welsh kingdoms there is evidence of a strong Irish influence, attested by a memorial stone at Castell Dwyrain to a possible early ruler Voteporix. The kingdom subsequently became part of the kingdom of \*Deheubarth. Norman occupation transformed the area into a series of lordships.

At the statute of \*Rhuddlan in 1284, the county of \*Cardiganshire was created, and by the Act of \*Union with England in 1536, \*Pembrokeshire and \*Carmarthenshire. It was not until 1972 that these were united as a new county and given the name Dyfed. The Local Government Commission argued that there was a common historical tradition and a 'unity of interest both social and economic, which rests on a geographical basis'. But though there was a tradition of unity, it had been greatly changed by the industrialization of the south-east, and intercommunication was poor. The county had little in the way of contemporary common interest and 400 years had created different loyalties. There was strong identification with the old counties, especially in Pembrokeshire, but little with Dyfed. In April 1996 authority reverted to the former three counties and Dyfed as a formal administrative area ceased to exist. HC

**Dyfed (Demetia), kingdom of**. The land of the \*Demetae people at the time of the Roman invasions. Throughout its history, this fertile region of south-west Wales has absorbed external influences—Irish, English, Norman, and Flemish—and changed its ethnic character. The kingdom may have been founded by Irish immigrants, the Deisi, in post-Roman times; its royal dynasty lasted until Llywarch ap Hyfaidd's death (904), when his daughter's husband \*Hywel Dda, son of the king of neighbouring \*Seisyllwg, succeeded; Dyfed then became part of the larger \*Deheubarth. Norman raiders arrived from the north-east in 1073–4, and ten years later Pembroke's fortress was built; thereafter, Dyfed was gradually replaced by several marcher lordships. The memory of

## Dyrham

Dyfed survived, not least in the Welsh prose tales, the *Mabinogi*, which were published in English translation in the 19th cent. RAG

**Dyrham, battle of, 577.** The *Anglo-Saxon Chronicle*, with remarkable detail, recorded that at Dyrham, east of Bristol,

\*Ceawlin, king of Wessex, defeated and killed three British kings, and went on to occupy Bath, Cirencester, and Gloucester. There is little doubt that this was a major victory in the Saxon advance, cutting off the Britons in Wales from those in the south-west, even if Ceawlin was unable to hold all the territory gained. JAC

**Eadgyth** (c.1022–75), queen of \*Edward the Confessor. Eadgyth was the eldest daughter of Earl \*Godwine, the most powerful nobleman of his day, and sister of \*Harold II. She married Edward in 1045 soon after his succession. There were rumours that the marriage was never consummated and certainly there were no children. She was disgraced with her family in 1051 but restored the following year. Eadgyth seems to have favoured her brother \*Tostig against Harold and, after his death at \*Stamford Bridge, transferred her support to William of Normandy. She spent the rest of her life in retirement at Winchester, which she held as part of her marriage settlement. JAC

**Eadgyth**, known as 'Swanneshals' ('Swan-neck'). Mistress of Harold II, Eadgyth probably bore all his children except his posthumous, legitimate son. After Harold was slain, she was given the task of finding his body and delivering it to William the Conqueror for burial. Eadgyth was the likely benefactress of St Benet's abbey, granted Thurgarten in her native Norfolk. AM

**Eadwig** (d. 959), king of England (955–9). The elder son of King \*Edmund, Eadwig succeeded at the age of about 15 on the death of his uncle \*Edred. A desire to move away from those who had been influential in the reigns of his father and uncle may explain the confiscation of his grandmother's property, the exile of Abbot \*Dunstan, and the retirement to a monastery of senior ealdorman Æthelstan 'Half-King', all in 956. Rivalry at court may also explain opposition to his marriage to Ælfgifu, his third cousin once removed, and their separation in 958 on the grounds of consanguinity. The succession in 957 of his younger brother as king of the Mercians and Northumbrians has been interpreted as revolt against Eadwig's rule, but contemporary sources suggest it was a peaceful, planned event with \*Edgar recognizing Eadwig's overriding authority. Ælfgifu's brother Æthelweard in his *Chronicon* says Eadwig was known as 'All-Fair' and that he 'deserved to be loved'. BAEY

**Ealdgyth**, wife of Harold II. She was daughter of the Mercian earl Ælfgar, and previously married to the Welsh king \*Gruffydd, defeated by Harold in 1063, slain by his own men. Harold probably married her to ensure the allegiance of her brothers, the earls of Mercia and Northumbria. Ealdgyth bore him a son after his death. AM

**ealdorman** in early usage could indicate a patriarch, prince, or ruler. This should nuance the impact of the term in the laws of King \*Ine, c.700, where the ealdorman appears as a functionary, in charge of a *scir* (shire) and subject to dismissal. In another context such men would probably appear as *subreguli* (under-kings). The shires concerned may already have been the historic shires of Wessex, which the \**Anglo-Saxon Chronicle's* account of the \*Vikings showed to have been in existence by the 9th cent., the forces of each led by an ealdorman. A grander usage of the term is its application to King \*Alfred's son-in-law, \*Æthelred, ealdorman of the Mercians. He was almost a king. In the 10th cent. shire ealdormen disappear. The term is then applied to such great men as Athelstan 'half-king', ealdorman of much of eastern England. From the early 11th cent. the Scandinavian term \*'earl' is used for such potentates. But the general sense of 'ealdorman' as indicative of authority gave the term lasting life, in particular in towns. JCa

**Ealdred** (d. 1069) was a political churchman. Starting as a monk at Winchester, he became successively abbot of Tavistock, bishop of Worcester, and, finally, in 1060 archbishop of York. As bishop of Worcester he took an active role in resisting Welsh encroachments. \*Edward the Confessor used him on diplomatic missions to Rome and to the emperor, and in 1058 he made a pilgrimage to Jerusalem. His wish to hold the bishopric of Worcester in *commendam* with the archbishopric of York led to difficulties with the papacy. Ealdred was an active church-builder and tried to improve clerical discipline. He may have crowned \*Harold Godwinson and certainly crowned William the Conqueror. He died at York in September 1069 just before the city was burned and devastated by a large Danish raid. JAC

**Eardwulf** (d. c.810), king of Northumbria (796–c.810). Before his accession Eardwulf was an \*ealdorman and it is not known whether he was of royal descent. He became king at a particularly disturbed period in Northumbrian politics and within four years of his accession had defeated an attempted coup and had two rivals murdered. He attacked \*Cenwulf of Mercia in 801 for harbouring his enemies. In 806 or 808 he was forced into exile, but soon returned with help provided by the Frankish king Charles the Great; however, not long afterwards he was succeeded by his son Eanred. Subsequently Eardwulf was venerated as St Hardulf and his remains housed at the Mercian monastery of

## earls

Breedon-on-the-Hill. His claim to sanctity apparently related to an event in 791 where he was left for dead outside the monastery of Ripon on the orders of King \*Æthelred, but made what was regarded as a miraculous recovery.

BAEY

**earls.** Though earl is the oldest peerage title, it has been overtaken by duke and marquis, to which it now ranks third. In early Saxon England it was merely the general name for noble. Administrative responsibility in shires belonged to \*ealdormen, particularly charged with leading the shire levies into battle. But the name earl gradually merged with the Danish jarl and, after the reign of \*Alfred, earls took over the responsibilities of ealdormen. But since they had responsibility for several shires or provinces, shire administration passed increasingly to the shire reeve. After the Conquest, earldoms tended to become hereditary and, as a consequence, their governmental responsibilities also fell to the sheriff. March earldoms, like Chester and Shrewsbury, retained considerable \*palatine powers. In the course of time the connection with a specific county, where the earl had his main estates, grew weaker: the earls of Derby were for centuries strong in Lancashire while the earls of Devonshire were strong in Derbyshire. In the reign of Henry I there were only eight earldoms, but Stephen and Matilda, in their rivalry, created many of their supporters earls. Since the titles of dukes and marquises were restricted, earldoms became, in practice, the senior title. The children of earls are in a curious intermediate position, however. The eldest son normally takes as his courtesy title the family viscountcy. Daughters are treated as duke's daughters and are known as Lady Susan —; but younger sons are merely known as the Hon. Anthony —.

JAC

**Earls Barton.** The tower of this Northamptonshire church is one of the best known examples of Late Saxon architecture. There are four pre-Norman stages, separated by string-courses. Each is elaborately decorated with strip-work and long-and-short quoining which all project boldly beyond the plastered face of the tower. There is currently a lively debate as to whether this type of strip-work is primarily decorative or structural in function; what cannot be denied is that the appearance of the tower reflects that of a timber-framed structure and that many of the components appear to have been prefabricated.

RNB

**Early English architecture.** See GOTHIC ARCHITECTURE.

**East Anglia, kingdom of.** Anglo-Saxon migrants, possibly with some Frisian elements, settled early in East Anglia in the late 5th and early 6th cents. Its difficult western boundary in the Fens ensured a degree of independence and the East Angles preserved in what became the two shires of \*Norfolk and \*Suffolk their own social and agrarian customs deep into the Middle Ages. Their ruling dynasty, the Wuffingas, appears to have had some affinity with Sweden. The greatest of their early rulers, \*Rædwald, who died c.625, was probably the king commemorated in the ship-burial at \*Sutton Hoo. He had been baptized a Christian, though he still followed pagan practices, and it was not until the generation after his death that the East Angles were

converted. Bishoprics were set up at \*Dunwich (until the Danish invasions, 870) and at North \*Elmham. In the 8th cent. the East Angles fell increasingly under Mercian control, and their young king Æthelbert was murdered on a visit to \*Offa's court, a particularly brutal and treacherous act which prompted Offa to penitence, payment to Rome, and the foundation of St Albans abbey. East Anglia played an important part in events that led to the emergence of Wessex against Mercia as the dominant power in England in 825 and 829, but bore the main brunt of the Danish invasions later in the century. Its last king, St \*Edmund, was martyred in November 870, and for a period East Anglia was governed by Scandinavian kings, notably by \*Guthrum (870–80). On its recovery by \*Edward the Elder and \*Athelstan, East Anglia was absorbed into the shire system of what was to become a united England, and governed by \*ealdormen.

HL

**Easter**—the uniquely English word is derived from the Teutonic goddess Eostre—is the primary Christian feast celebrating Christ's resurrection, an ever-present event to believing Christians. Originally however *pascha*, the Greek form of the Hebrew *pesach* (Jewish passover), signified the Christian equivalent, the redemption or delivery from bondage. Until the 2nd cent. it celebrated the whole redemption event, Christ's passion and resurrection, not just resurrection. Its dating has always presented a problem. While the gentile church, stressing the resurrection element, celebrated it on a Sunday (Resurrection Day), the province of Asia followed the Jewish Passover date in the lunar calendar (Nisan 14). They were tolerated until the Council of Nicaea (325) when Easter was settled as the Sunday following the first full moon after the vernal equinox. Another revision (6th cent.) caused divergence between the remote Celtic church and Rome, thus creating bitter animosity when the 6th/7th-cent. Roman missionaries arrived in Britain, until resolved at the Synod of \*Whitby (664). The eastern church, still following the Julian calendar, has Easter on a different Sunday. Attempts to have a fixed date for Easter in the 20th cent. failed.

WMM

**Eastern Association.** Consisting of Norfolk, Suffolk, Cambridgeshire, Hertfordshire, and Essex (Lincolnshire was added later), this was the only one of the parliamentary county associations to enjoy any permanence in the Civil War. Its purpose was to break down the reluctance of local levies to venture outside their own counties. Based in Norwich, the association was ordered to raise an army of 20,000 men with \*Manchester as commander-in-chief and Oliver \*Cromwell as lieutenant-general of the cavalry. While its chief function was to protect the rich and populous eastern counties, the army later ventured further afield, most notably at \*Marston Moor (July 1644). This stunning victory heralded the break-up of the association, since it fanned the flames of antagonism between Cromwell and Lawrence Crawford, the Scottish major-general of foot. The quarrel seems to have demoralized Manchester, who became increasingly reluctant to fight after Marston Moor. The public recriminations that erupted between him and Cromwell led to the absorption of the Eastern Association army into the

**\*New Model** in the spring of 1645, and the eventual demise of the association itself. JGG

**Eastern Question.** This was the problem created by the slow collapse of the Ottoman (Turkish) empire, which seemed likely to leave a power vacuum in the Balkans and lead to a general European war. Turkey's weakness became apparent in a series of wars with Russia in the late 18th cent. In 1783 Russia obtained the Crimea. Greece gained her independence, in an agreement brokered by Britain, France, and Russia, after an armed struggle (1821–30). European opinion was divided by anxiety for the balance of power, if Turkey ceased to be a great power, and sympathy for the Christian subjects of a Muslim and decayed empire, reinforced in the case of Greece by memories of her classical glories. The British feared that, if the Turkish empire broke up, Russian power would be enhanced and would become an increasing threat to the British empire in India. Russia gained some territory by the treaty of Adrianople at the end of the Russo-Turkish war of 1828–9 but Russian policy was thereafter governed by the conviction that an intact Turkish empire provided a buffer state which would be preferable to a partition. The \*Crimean War of 1854–6, in which Britain, France, and Turkey fought Russia, was the result of miscalculations, arising from France and Russia's over-vigorous championing of the rights of Turkey's catholic and orthodox Christians respectively, and Britain's misplaced fears that Russia wished to partition the empire and seize Constantinople (Istanbul). Nationalist feelings in the Balkans grew and the problem flared up again in the 1870s. The Bosnians rose in 1875, followed by the Bulgarians in 1876. The Bulgarians were repressed with particular brutality (the 'Bulgarian Horrors'). Russia declared war on Turkey but the other powers thought the peace treaty (treaty of San Stefano, 1877) too favourable to Russia and amended it at the Congress of \*Berlin (1878). European opinion wavered over the next 30 years between the comparative stability provided by the Ottoman empire and the volatility of the emerging Balkan states. The situation was complicated by the rival ambitions of the latter. Serbia and Bulgaria, for example, fought each other in 1885. It was also feared that the emergence of Slav states in the Balkans would destabilize the Austrian empire. It can plausibly be argued that the Eastern Question caused the \*First World War. Austria angered Serbia by annexing Bosnia in 1908. Russia helped to organize the Balkan League of Serbia, Bulgaria, Macedonia, and Greece, which went to war with Turkey in 1912. Militarily they were successful but they then fought between themselves over the spoils. The situation was still unstable when the heir to the Austrian throne was assassinated in the Bosnian capital, Sarajevo, in 1914. The Austrians blamed the Serbs. Russia, which had been unable to aid the Serbs in 1908, now backed them. Ultimatums, mobilizations, and war followed within weeks. MEC

**Easter Rising** (1916). The Easter Rising was planned by the \*Irish Republican Brotherhood's military council to take advantage of British participation in the world war by staging a nation-wide Irish rebellion. Sir Roger \*Casement was sent to Germany to raise a prisoner-of-war force and to win German

arms and ammunition. The plans collapsed due to British intelligence discovery of American links and confusion over time of arrival of arms from Germany. The German arms ship was scuttled off the Kerry coast and with it any chance of a successful rebellion in the provinces. Eoin MacNeill, chief of staff of Irish Volunteers, then countermanded the mobilization orders given by \*Pearse. The leaders of the IRB military council, including James \*Connolly and his citizen army, went ahead with the rebellion by taking over various buildings around the centre of Dublin. Outside the General Post Office, their GHQ, Pearse read out the provisional declaration of an Irish Republic; five days later, after British shelling of centres of resistance, the rebels surrendered. Leaders were executed in stages, and over 2,000 interned in Britain. While there was little overt support for the rising at the time, British actions gave it a retrospective significance. Traditional nationalists have depicted it as a decisive event in awakening Irish nationalist consciousness and have seen it as the realization of Pearse's concept of blood-sacrifice. Lately, historians have criticized the use of violence with only minority support and have questioned whether the rising was central to the achievement of independence. MAH

**East India Company.** The first English East India Company was formed in 1599 to compete with the Dutch for the trade of the spice islands. However, following the \*Amboyna massacre of 1623, it abandoned the East Indies to concentrate on the Indian subcontinent. The Stuarts regularly revoked and reawarded its charter, Charles II no fewer than five times. It was not until the so-called Godolphin Charter of 1709 that the company's institutional structure was consolidated. Thereafter, it prospered greatly from trade with China, over which it also had a monopoly. The company began to acquire a territorial empire in India after the battle of \*Plassey in 1757. The defeat of the Maratha empire in 1818 gave it undisputed supremacy. Territorial conquest, however, brought about more direct parliamentary control through the Regulation Act of 1773 and the India Act of 1784. The company was progressively converted from the activities of a merchant to those of a governor. In 1813 and 1833, it lost its monopolies over the India and China trades. It survived somewhat anomalously as a quasi-department of the British state until the \*Indian mutiny of 1857, whereafter it was abolished and its powers vested in a secretary of state for India. DAW

**Eastland Company.** One of the great trading companies, chartered in 1579, and trading with the Baltic. The foreign residence was first at Elbing, then at Danzig. The company imported timber and tar for shipbuilding, flax and linen, and corn, and exported mainly cloth. Dutch competition was fierce and there were the usual complaints of monopoly. The company was thrown open by an Act of 1673 and by the middle of the 18th cent. was moribund. JAC

**East Saxons, kingdom of.** See ESSEX.

**East Sussex.** See SUSSEX, EAST.

**Ecclesiastical Commission, 1686.** The Court of \*High Commission, to impose uniformity in the church, was

## ecclesiastical commissioners

abolished in 1641 by the Long Parliament. The abolition was reaffirmed in 1661 and 'the erection of some such like court by commission' expressly prohibited. Nevertheless, in 1686 James II named seven ecclesiastical commissioners with sweeping disciplinary powers. The commissioners immediately summoned Henry \*Compton, bishop of London, to explain why he had not suspended Dr Sharp for preaching what some took to be an anti-catholic sermon. Compton challenged the commission's authority but was himself suspended, and in 1688 was one of the 'seven' who appealed to William of Orange for help. Meanwhile the commission had deprived the vice-chancellor of the University of Cambridge and ordered the expulsion of the fellows of Magdalen College, Oxford, for refusing to elect as president a royal nominee. James's commission was declared 'illegal and pernicious' by the \*Bill of Rights in 1689. JFC

**ecclesiastical commissioners** were established in 1836 as a permanent body to supervise the financial management of the Church of England. In 1948 they were merged with the administrators of \*Queen Anne's Bounty and are now known as the church commissioners. They have responsibility for the considerable property of the church, which includes 140,000 acres of agricultural land, and have been under some criticism in recent years for imprudent investments. A large body of nearly 100, many of them honorary members, the commission disbursed £153 million in 1994, of which nearly half went on pensions, and a third on stipends. JFC

**ecclesiastical courts** have existed alongside secular courts from the Norman Conquest onwards, though their activities were much diminished after the Glorious Revolution of 1688. In addition to supervising clerical discipline and performance, the courts had important jurisdiction over matrimonial disputes, probate, and wills, and a general responsibility for the behaviour and religious observance of the laity. In the 12th cent. the boundaries between royal and ecclesiastical jurisdiction and the extent of \*benefit of clergy were hotly disputed and contributed much to the conflict between Henry II and \*Becket. Until the Reformation the hierarchy of courts, with appeals to the one above, was archdeacons' courts, bishops' (consistory) courts, archiepiscopal courts, and the papal court. Above the archiepiscopal court for Canterbury was the Court of \*Arches: above York, the Chancery Court. After the breach with Rome, a Court of Delegates heard appeals for the archbishops' courts, until in 1833 the duty was given to the Judicial Committee of the Privy Council. In addition, between 1559 and 1641 the Court of \*High Commission was very active, and James II established an ill-judged \*ecclesiastical commission 1686–8. Until the late 17th cent., the ecclesiastical courts had a high profile, prosecuting for fornication, witchcraft, and absence from church and, for lesser offences, punishing often by public penance. Much of the jurisdiction of the ecclesiastical courts was removed in the 19th cent., particularly over tithes, probate, and matrimonial causes, leaving their authority confined largely to the clergy. In Scotland, the Commissary Court of Edinburgh, set up in 1564, had jurisdiction over matrimony and wills, as well as an appellate role, but was abolished in 1876 by which

time many of its functions had been taken over by the \*Court of Session. JFC

**ecclesiastical history.** Traditional teaching of ecclesiastical history, in 19th-cent. seminaries and training colleges, was determined by the need to establish the historical roots of institutions. It began with the patristic foundations, dealt with the great heresies, councils, the papacy, the early reform movement, the great schism of the 16th cent., the Counter-Reformation, and 19th-cent. revival. The contents of the package were determined on confessional lines. In a catholic context the emphasis would be on the destruction of heresies and on the papacy and great councils; in protestant colleges, on the justification of reform and separation.

As a distinctive university discipline, ecclesiastical history developed alongside secular history and the recovery of patristic studies in the 19th cent. Owen Chadwick has described ecclesiastical history as the seed of general history, since historical consciousness first arose within the heritage of Christendom. Ecclesiastical history could be, and was, used by all sides for propaganda and was largely viewed in terms of division, reaction, and rationalization of ecclesiastical separatism. Christianity, being by its very nature historical, meant that some account of that history had to be given, but also had to be imbued with religious meaning.

In the 20th cent. a new context and role arose for ecclesiastical history. This role has been enhanced by the rise of serious and scholarly demand for a different kind of denominational history, the social history revolution which has taken church history out of the pulpit and into the pew, and the upsurge of local and family history, which has enabled a more subtle and intimate approach to religious questions. All these, accompanied by the decline in classical languages, have tended to move the focus of interest into the modern and early modern period, towards congregations, social and political interaction, and minority or sectarian interests.

Ecclesiastical history, or the history of Christianity, as it is often tellingly described, is now seen as a significant component in professional historical scholarship, filling a niche alongside other historical disciplines, illuminating our understanding of human society and culture. So much of human experience has been engaged with religion that any history which ignores it is impoverished. Religion, Christianity, and the churches have played a major role in shaping values, institutions, culture, and customs and are therefore worth serious investigation.

However, the religious historian faces a particular difficulty in dealing with religious choices and chances and with the religious impulses of people motivated by a relationship with God. How does the historian account for that relationship and its government of people's lives? The transcendent element, which cannot be ignored, inevitably complicates the ecclesiastical historian's task. JFC

**Ecclesiastical Titles Act, 1851.** In 1850, Pope Pius IX, encouraged by Nicholas \*Wiseman, announced the restoration of a Roman catholic hierarchy in England with English territorial titles, such as archbishop of Westminster. This provocative move, accompanied by comments on 'the Anglican

schism', was the consequence of the great numerical increase from Irish immigration of Roman Catholics in England in the 1840s and the church's more aggressive attitude to proselytization in England; it caused one of the final bouts of English anti-popery. Lord John Russell, the prime minister, further encouraged protests by his 'Durham letter' and by passing in 1851 the Ecclesiastical Titles Act, which forbade Roman Catholics from using English place-name titles. Opponents of the bill such as Gladstone pointed out that the episcopalian church in Scotland, which was not established, already did what the Roman Catholics proposed to do. The Act was a dead letter from the start and was repealed by Gladstone in 1871. HCGM

**Ecgrith** (d. 685), king of Northumbria (670–85). During the reign of Ecgrith the kingdom of Northumbria reached the peak of its political power and influence. He extended the range of lordship of his father Oswiu, even sending a strong military expedition to Ireland. In his attempts to stabilize his northern frontier he subdued the British kingdom of Strathclyde and the Irish in Argyll, but he overreached himself on campaign against the Picts and was defeated and killed at what proved a decisive battle at Nechtansmere, in 685. With that disaster all hope of Northumbrian predominance within England disappeared. Even so his achievements were not negligible. Modern scholars point to the secular wealth and dynamism that made possible the great period of the Northumbrian renaissance, the age of Bede (672–735) as it is sometimes called. The foundation of the monastery of Jarrow/Wearmouth and the activities of Bishop Wilfrid at York and Ripon were a product of the early, confident days of Ecgrith's reign. HL

**economical reform.** Demands for government economy have a long pedigree. Christopher Wyvill's Yorkshire Association was launched in 1779 when taxation was biting as a result of the American War. A programme of retrenchment, with the abolition of sinecures, was bound to have wide appeal and was taken up by the Rockingham opposition, partly to embarrass North's ministry, partly to weaken the influence of the crown. The triumph of the campaign was the carrying in April 1780 of Dunning's motion that the influence of the crown 'ought to be diminished'. The Rockinghams achieved a modest measure of reform when they came to power in 1782: Crewe's Act disfranchised revenue officers; Clerke's Act declared that government contractors could not serve as MPs; Burke's Civil List Act abolished 47 places tenable with a seat in Parliament. Though the campaign faltered after the end of the American War, economical reform was continued by Pitt, whose maiden speech had been on the subject, largely by administrative action. A further drive by Liverpool after the Napoleonic wars led some to argue that government had been fatally weakened. But the difficulties caused to ministers by persistent pruning of places was compensated, partly by patronage in other forms, partly by better party discipline. 'Cheap government' continued to be a most popular programme during the 19th and 20th cents. See also PLACE ACTS. JAC

**economic history.** As the name suggests, economic history is a hybrid discipline fusing together two areas of study with widely divergent interests and methods. The major source of difficulty and debate, according to C. H. Lee, has been the role of quantification in the judgements economic historians make about the past, for example, about the timing and nature of industrialization in Britain during the 18th and early 19th cents. While the problems tackled by economic historians generally require reliable statistics, there has also been a substantial input from other branches of history, like the history of science and technology, and from other disciplines, such as sociology, demography, geography, and politics. Social history has always been closely related and economic and social history, as distinct from political history, together form an important branch of the parent discipline.

R. M. Hartwell identified three phases in the historiography of economic history: the pre-1914 era, when the discipline had a close relationship with economics; an interim period to the 1960s, which was heavily history-orientated, with much study of particular sectors and industries; and the post-1960s, when there was greater recognition of the value of interdisciplinary approaches and, at the same time, a re-assertion of the value of economic theory. Of the early practitioners in Hartwell's first two phases, Toynbee, Tawney, Unwin, Seeley, and Clapham, among others, all made important contributions. Toynbee's study of the industrial revolution remained a classic for several generations and inspired many of his successors to explore in greater depth, locally and nationally, the impact of industrialization and economic development.

The relationship to theoretical and even to applied economics has always been ambiguous, though it has been greatly strengthened by 'cliometrics', which, introduced from the USA in the 1960s, applied economic modelling to historical problems. Perhaps the most successful instance by an American scholar, Mokyr, was a detailed analysis of the Irish Famine during the 1840s. An interesting spin-off, again imported from the USA, was the development of counterfactual history which derived its *raison d'être* from the concept of 'social savings' achieved in the economy had developments either been delayed or not taken place at all. Using this method, Hawke was able to show that railways had a more limited impact on the mid-19th-cent. economy than previously supposed, while Von Tunzelmann contradicted the view that the introduction of steam power greatly accelerated British industrialization much before the 1820s. Even the counter-factual horse, as conceived by F. M. L. Thompson, has featured in a debate about transport in the Victorian and Edwardian age.

Social history emerged powerfully in the 1960s with the work of E. J. Hobsbawm, E. P. Thompson, and G. Rudé, who, among others, articulated Marxist or quasi-Marxist views of both social and economic development. Thompson's *Making of the English Working Class* influenced a generation of social historians, not only of 18th- and 19th-cent. Britain, but also of the early modern period, and in much of this work the economic context of social change was closely addressed. There was also sustained interest in

the 20th cent., notably in the impact of war and peace on social change. In the related fields of historical demography and historical sociology, quantification has played a more critical role. P. Laslett in his study of *The World We Have Lost* was one of the most influential of those adopting a sociological approach, while E. A. Wrigley and M. Anderson were among several pioneering computer analysis to produce important studies on the historical demography of Britain during the 18th and 19th cents.

Economic historians have generated and sustained many major debates about the nature and impact of economic change in Britain, including such issues as the origins and timing of agricultural change and of industrialization, the role of various sectors in generating and sustaining economic growth during the era of early industrialization, the impact of industrialization, the standard of living during the industrial revolution, the role of overseas investment and trade on the 19th-cent. economy, the failure of entrepreneurship in later Victorian Britain, the effects of the two world wars on the British economy, and problems of adjustment in the international economy since 1945.

The Economic History Society, established in 1926, is the leading learned society in the field. It publishes the *Economic History Review*, while Scottish and Irish societies produce journals covering the economic and social history of their respective countries. ID

**Eden, Anthony, 1st earl of Avon** (1897–1977). Prime minister. Eden's career is indissolubly linked with the \*Suez crisis. But opinion is divided whether Suez was an aberration brought on by chronic ill-health or whether it confirmed weaknesses present throughout his career. Eden's early rise was distinguished, if conventional, and perhaps too effortless. Born into the gentry, Eden grew up under the shadow of a domineering and eccentric father. After Eton he fought with distinction on the western front. With a first at Oxford in oriental studies he entered Parliament in 1923 for the safe seat of Warwick and Leamington. At this stage Eden showed few signs of distinction or originality. His speeches showed a tendency towards cliché, which he never overcame. None the less, he rose rapidly and as parliamentary private secretary to Austen \*Chamberlain 1926–9 began a lifelong association with foreign affairs. He also won the patronage of Stanley \*Baldwin, whose brand of consensual Conservatism he much admired.

It was as junior Foreign Office minister after 1931 that Eden's career prospered. Almost miraculously, he managed to distance himself from the deeds of his seniors, whose reputations were damaged as they strove to grapple with the rise of the dictators. In particular, he was seen as the champion of collective security through the \*League of Nations, though Eden had a more circumscribed view of the league's potentialities than public opinion imagined. He developed an idealized image among the young and broadened his appeal beyond the Conservative Party. How far Eden differed from the foreign policy of the National Government as a whole remains arguable, but he seems to have kept any reservations as a matter of private dissent.

Eden became lord privy seal in January 1934 and minister for League of Nations affairs in June 1935. In December 1935, after Samuel \*Hoare's resignation in the wake of the Hoare–Laval Pact, Eden emerged as foreign secretary, aged 38. Yet many felt that his rise owed more to his charm and good looks than to any intrinsic brilliance. His tenure saw a further deterioration in the position of the democracies, particularly with their failure to resist Hitler's remilitarization of the Rhineland in 1936. Despite calling for accelerated rearmament, there is little evidence that he ruled out an accommodation with Hitler, though he was less ready to appease Mussolini, whom he actively disliked. It was ostensibly over relations with Italy that Eden resigned in February 1938, though the increasing interventions of the new prime minister, Neville \*Chamberlain, and the latter's handling of President Roosevelt's recent 'peace initiative' were contributory factors. Nevertheless, his resignation secured his reputation as an anti-appeaser.

With the outbreak of war Eden became dominions secretary and was promoted to the War Office in May 1940. That December Eden returned to the post of foreign secretary where he established an effective, if not always easy, partnership with \*Churchill. The latter regarded Anglo-American relations as his own preserve, but Eden was left more scope in relations with the Soviet Union. It was a difficult field for successful diplomacy, but Eden laboured prodigiously, revealing qualities of industry, patience, level-headedness, and attention to detail. He was often called upon to restrain Churchill's fertile but over-exuberant brain. From 1942 Eden was Churchill's designated successor, but his distaste for party politics made him consider seriously Churchill's offer of the Indian viceroyalty. By the end of hostilities Eden was exhausted, ill, and depressed by the loss of his elder son.

After the Conservatives' electoral defeat in 1945, Eden endured a further difficult—and increasingly exasperating—decade as heir apparent. Churchill was frequently absent from Parliament, effectively leaving Eden to act as leader of the opposition. It is often said that Eden neither understood nor interested himself in domestic politics. This is not strictly true, though his contributions were marred by platitudes and he did not go far to translate his vision into detailed reality. He was very much on the progressive left wing of the party and during the war had considered an alliance with congenial socialists such as Ernest \*Bevin.

In 1951 Eden returned again to the Foreign Office. By now his relationship with Churchill had markedly deteriorated. Continuing affection was balanced by a growing conviction that Churchill was no longer equal to the demands of the premiership. None the less his final period as foreign secretary was the most distinguished of Eden's career. Britain, through Eden, cut an impressive figure on the world stage which partly belied the decline in her intrinsic power even since 1945. Particular successes were achieved in arrangements for European defence, in ending the conflict in Indo-China, and, apparently, in placing Britain's relations with the emerging states of the Middle East on a new footing. It was once popular to complain that Eden failed in this period to put Britain at the forefront of moves towards

European union, but, as the European ideal begins to fade, Eden's reservations in this area appear less culpable. Eden's health collapsed in 1953 and despite—or perhaps because of—three major operations, many considered that he never quite recovered.

Churchill finally retired in April 1955 and Eden began his premiership on a wave of good will. Despite an impressive general election victory in May, the prime ministerial honeymoon was over by the end of the year. Colleagues became increasingly conscious of weaknesses which perhaps made him unsuited for the highest office of state—irritability, vanity, hyper-sensitivity to criticism, and an inability to place sufficient trust in subordinates. Problems with the domestic economy shook the confidence of the Conservative Party and press, while critics on the right felt him too willing to make concessions over Britain's imperial position. Into this unpromising scenario broke the crisis created by Nasser's nationalization of the Suez canal in July 1956. Eden was handicapped by Britain's inability to take immediate military action, and the longer such action was delayed the less likely it was to command domestic and international support. With the illegality of Egypt's actions at least open to debate, Nasser refused to provide Eden with the pretext for military intervention. Yet, ironically, it was when a negotiated solution seemed at last possible that Eden entered into a collusive—and many would say disreputable—pact with France and Israel to invade Egypt. After a secret agreement, which Eden tried desperately to erase from the historical record, Britain and France entered Egypt, ostensibly to separate the Israeli and Egyptian combatants and protect the canal. It was a paper-thin deception. Yet if a prime minister of failing health and judgement had been guilty of underhand collusion to capture the canal and, probably, to topple Nasser, it was a deceit in which several senior cabinet colleagues were active participants. Under the pressure of world opinion, Britain was compelled to accept a ceasefire on 6 November. Above all, Eden had grossly misjudged the response of the USA to Britain's actions.

Despite a period of recuperation, Eden was compelled by his doctors to resign the premiership and withdraw from public life in January 1957. Even without the intervention of renewed ill-health, it seems improbable that he could for long have survived. With the patient care of his second wife, Clarissa, Eden lived for a further 20 years—time to contemplate how a reputation built on integrity, internationalism, and a commitment to peace had ended in such ignominious catastrophe.

DJD

Carlton, D., *Anthony Eden* (1981); James, R. R., *Anthony Eden* (1986).

**Eden, William, Lord Auckland.** See AUCKLAND, 1ST BARON.

**Edgar** (943–75), king of England (959–75). The reign of Edgar as sole king of England marks an important stage in the development of the English monarchy. His coronation at Bath in 973, when the king was in his 30th year, has strong ecclesiastical as well as secular implications, and indeed the ceremony contained elements that formed the basis for all future coronations. Edgar's early years were not easy. He

and his elder brother Edwy were the sons of King \*Edmund (939–46), and on the death of their uncle \*Edred (946–55) Edwy succeeded to the throne. He proved licentious and incompetent, and a revolt in 957 on the part of the Mercians and the Northumbrians resulted in a partition which left Edwy ruling Wessex, but Edgar (still a boy of only 14) as king in the north. Civil war was averted by the death of Edwy in 959, and Edgar ruled thereafter, with the help of long-serving and competent \*ealdormen whom he confirmed in office, a reunited kingdom until his death on 8 July 975. In the secular field he was remembered for his good peace (there was a lull in Viking activity) and for his laws in which, while asserting the unity of all his Christian realm, he recognized the validity of Danish social and legal customs in those parts where they had settled. Late in his reign, c.973, he was responsible for inaugurating a massive reform of the coinage, exercising full royal control through the issue of dies, increasing the number of minting places, and initiating a system of recalling and reminting the silver pennies (the sole coins in regular routine mintage). In religious matters he worked closely with St \*Dunstan, whom he had appointed first as bishop of Worcester, then of London, and finally as archbishop of Canterbury. Helped by the powerful bishops \*Æthelwold of Winchester and \*Oswald of Worcester, Dunstan was the inspiration behind the Benedictine reformation which greatly enriched the cultural and educational life of England. King and church worked closely together. Immediately after his coronation, itself a symbol of such co-operation into which some read virtual imperial overtones, Edgar sailed with a naval force to Chester where he received formal pledges of loyalty from a number of rulers (the *Chronicle* says six but later authorities eight) drawn from the Welsh, Scottish, Cumbrian, and Scandinavian communities around Britain. Later historians seize on the importance of this event and tell of a ceremonial rowing on the river Dee from the royal palace to the church of St John and back, with the king at the helm and the other rulers at the oars, a symbolic picture of the political strength of the English king.

HL

**Edgar** (c.1074–1107), king of Scotland (1097–1107). Edgar inherited the throne in 1093 when both his father \*Malcolm Canmore and his elder brother Edward were killed at \*Alnwick. But he was at once driven out by Malcolm's half-brother \*Donald Bane. He was, in turn, dispossessed by \*Duncan, another of Malcolm's sons, but regained the throne. In 1097, with support from William Rufus, Edgar re-established himself. He relied considerably on his English allies and in 1100 his sister \*Matilda married Henry I. He also came to terms with Magnus, king of Norway, not disputing the Norse hold on the Western Isles. He was succeeded by his brothers Alexander I and David I.

JAC

**Edgar the Atheling** (c.1052–c.1125) was proclaimed king by the English gathered in London after the battle of \*Hastings. He was the son of \*Edward the Exile, and a great-grandson of \*Æthelred the Unready. Still young in 1066, Edgar's claims to the succession were ignored by \*Edward the Confessor's death-bed bequest in favour of \*Harold Godwinson and brushed aside by William the Conqueror.

## Edgecote

After 1066, Edgar intermittently played the role of pretender and was deeply involved in the English revolts of 1069–70. Reconciled with William in 1074, he thereafter lived as a courtier and played a small role in Anglo-Norman politics. He also participated in the First Crusade. Edgar cannot be regarded as anything other than a minor participant in great events. DB

**Edgecote, battle of, 1469.** In July 1469 Edward IV was in Nottingham to put down a rising in Yorkshire led by 'Robin of Redesdale'; this may have been instigated by the earl of \*Warwick. Warwick unmasked his intentions in a manifesto at Calais on 12 July, and then marched on London. Reinforcements for the king led by William Herbert, earl of Pembroke, and Humphrey Stafford, earl of Devon, reached Banbury on 25 July. Here the earls apparently quarrelled over billeting arrangements. Next day, Pembroke's Welsh force, having camped separately, was continuing its march when, 6 miles north-eastward, it was unexpectedly overwhelmed at Edgecote by a small force of Warwick's supporters. Pembroke was captured and beheaded by Warwick's order. On hearing the news, Edward's army deserted and he became Warwick's prisoner. RLS

**Edgehill, battle of, 1642.** Edgehill was the opening battle of the English Civil War. After raising his standard at Nottingham in August 1642, Charles I embarked on a recruiting march in the west midlands, while Parliament gathered an army under \*Essex to face him. Charles began an advance towards London from Shrewsbury, via Bridgnorth and Wolverhampton. Essex shadowed him across from Worcester to Warwick to intercept. The royalists slipped past him but on 23 October turned to fight on the steep slopes of Edgehill, outside Banbury. Each side had about 12,000 men. Prince \*Rupert's cavalry had much the better of the exchanges, but the parliamentary infantry stood firm, allowing both sides to claim victory. The road to London was left open for the king but his leisurely advance by way of Oxford gave his opponents time to regroup and look to their defences. JAC

**Edinburgh,** the capital of Scotland, is an ancient settlement, archaeological evidence pushing its history back over 4,000 years. A fine defensive site, the growth of the city stretched from the castle along glaciated ridges in medieval times to Canongate and the abbey of Holyrood and southwards by Cowgate to Kirk o' Field. The growth of Edinburgh involved the incorporation of districts outside the castle and the development of trade and industry.

The 'Old Town' by 1700 was teeming with people, its population huddled in great tenements. The building of a 'New Town' across the deep troughs, gouged by glaciers centuries before, was a consequence of further population growth. The wealthy were the first to move into a neo-classical grid-square suburb with wide streets and magnificent Georgian houses. By 1801 Edinburgh and Leith housed 83,000 people, but the vibrant 'Old Town' housed the university (1583) and remained the centre of religious, legal, and social activity. Linked by bridges (1772–1857), the 'New Town' became a major shopping area, and financial

services—banks and insurance companies—also took root in its spacious squares.

Edinburgh's development in the 19th and 20th cents. involved the absorption of previously isolated industrial and farming communities—for example, Burdiehouse, Craigmond, Corstorphine, Colinton, Dean Village, Gilmerton, Leith, Liberton, Portobello, Swanston—and the deliberate relocation of population to large corporation housing estates from the 1930s. In 2000 the city's population numbered 450,000.

From Leith to Sighthill a swathe of industries and factories gave the city considerable economic diversity during these two centuries. Industry was represented by mining, paper-making and printing, tanning and leatherware, rubber, flour- and saw-milling, sugar-refining, ropeworks, cement, brick, tile, soap, glass, and pottery production, brewing, distilling, shipbuilding, and engineering, all served by excellent transport and port facilities; the Union canal (1822), the railways (1836–50), and the improvement of Leith docks reinforced the changing industrial economy.

Employment in the 20th cent. was increasingly dominated by the service sector. The Scottish banks, investment trusts, building societies, and insurance companies provided jobs in financial services; the supreme courts of Scotland—the \*Court of Session (1532) and the High Court of \*Justiciary—are located in the Old Parliament House (1640), and together with city courts are an important component; the universities (including Heriot-Watt (1964) and Napier (1992)), the merchant company, private and public schools serve a wide constituency. Retailing and the distributive trades, hospitals, and other care institutions added to career opportunities for women. As the capital, Edinburgh was the administrative centre of Scotland, and from the 1930s the departments of the Scottish Office greatly added to service employment: since 1999 the revived Scottish Parliament has met in the city. Leisure and tourism have become major civic industries, the International Festival being a particular attraction. By 1981 about 80 per cent of Edinburgh's employment was in service industries.

From 1832 until 1885 the Liberals dominated parliamentary elections; with the split in the Liberals on religious issues and Irish Home Rule politics became more competitive and remained so, although Labour replaced the Liberals as a major force after 1920. At the general election of 2001, five of Edinburgh's seats at Westminster went to Labour, Edinburgh West to the Liberal Democrats. JB

**Edinburgh, Philip, duke of** (b. 1921). The duke of Edinburgh is the son of Prince Andrew of Greece and Denmark, and nephew of Earl \*Mountbatten, who was killed in 1979. His grandmother, Victoria of Hesse, was the daughter of Alice, Queen Victoria's second daughter, and married Louis of Battenberg. Prince Louis was first sea lord at the outbreak of the First World War but forced to resign by the clamour against Germans: in 1917, when the royal family adopted the name of Windsor, Prince Louis took the name of Mountbatten and was created marquis of Milford Haven. His daughter married Prince Andrew. After school at Gordonstoun, Prince Philip entered the navy in 1938, served

throughout the Second World War, and was mentioned in dispatches at Cape \*Matapan. His family connections, particularly through his uncle Louis Mountbatten, brought him into contact with the royal family, and his engagement to Princess Elizabeth was announced in June 1947. Before the marriage in November, he was given the Garter and a dukedom. Since 1952 Prince Philip has filled the difficult role of royal consort. Of the many societies and causes with which he is associated, the duke of Edinburgh's scheme for young people (1956) and his concern for the protection of wild life rank high. He retains much of the briskness and forthrightness of his early naval career. JAC

**Edinburgh, St Giles.** Founded 854, formally dedicated 1243, and rebuilt in stone after burning by Richard II (1385), St Giles was created a collegiate church in 1467, enlarged, and enriched. On \*Knox's return from Geneva, it became involved militantly in the new reformed church's activities. Although France and catholicism were surmounted, conflict with monarchs and episcopacy persisted throughout the 17th cent.: Charles I made Edinburgh a bishopric and St Giles a cathedral, before Cromwell's men cut it into four. Subsequently under presbyterian rule, the 'high kirk' was reconstructed in the 19th cent. and then enhanced by the Thistle chapel (1911). ASH

**Edinburgh, treaty of,** 1328. The treaty set the seal on the achievements of Robert I Bruce and ended the first War of \*Scottish Independence. Negotiations were concluded in March 1328 at Holyrood and ratified by the English Parliament at Northampton in May. Edward III recognized the full independence of Scotland, relinquished his claim to Berwick and the borders, and agreed to a marriage between Robert's young son David and \*Joan, daughter of Edward II. Though the treaty was intended as a 'final peace', it unravelled as soon as Robert died the following year. JAC

**Edinburgh, treaty of,** 1474. The first firm Anglo-Scottish alliance of the century was concluded by commissioners of Edward IV and James III. The Scottish king's infant son and heir James, duke of Rothesay, was formally betrothed to Edward IV's daughter Cecilia in the Edinburgh Blackfriars, with proxies taking the parts of the infant couple. The alliance has divided opinion amongst historians, some seeing it as a Scottish diplomatic success (which indeed produced five English dowry instalments), others viewing it simply as a device by which Edward neutralized Scotland before his invasion of France (1475). The proposed marriage was never solemnized and war was soon resumed. NATM

**Edinburgh, treaty of,** 1560. The treaty has been claimed as a turning-point in Anglo-Scottish relations. Elizabeth had succeeded in England in November 1558. \*Mary of Guise, regent for Mary, queen of Scots, faced great opposition in 1559 from the reform party, which begged Elizabeth to intervene on their behalf. By the treaty of \*Berwick in February 1560, \*Norfolk agreed to protect Scottish liberties, ships and troops were dispatched, and in June 1560 the regent died. At Edinburgh, French and English negotiators agreed on 6 July to withdraw all troops from Scotland. Though Mary, queen of Scots returned to Scotland in 1561 after the death of her

husband Francis I in December 1560, the French had no longer the same incentive to support her, and the outbreak of the French wars of religion greatly weakened their position. JAC

**Edinburgh castle** stands on Castle Rock overlooking the city of Edinburgh and is approached across the Esplanade, the site of the annual military tattoo and other ceremonies. Edinburgh castle has been sacked and rebuilt several times, one of its oldest surviving parts being the tiny St Margaret's chapel dating from the 12th cent. The focus of the layout is the Palace Yard, and on its south side lies the great hall (with its striking hammerbeam roof) built by James IV or James V in the early 16th cent. and subsequently altered in 1887–91 by Hippolyte J. Blanc. Neighbouring buildings in a variety of styles include the semi-circular Half-Moon Battery (1573–88) built by Regent \*Morton, the Scottish United Services Museum (1708), the Governor's House (1742), the New Barracks (1796), and the Scottish National War Memorial (1924–7) designed by Sir Robert Lorimer. Edinburgh castle houses the crown jewels (\*Honours) of Scotland, and occupies a special place in Scots history: in 1566 Mary, queen of Scots, gave birth there to Prince James, who became King James VI of Scotland in 1567 and James I of England in 1603. PW

**Edinburgh Review.** The review was founded in 1802 by Henry Erskine and Francis \*Jeffrey, the latter as editor for the first 26 years. \*Constable in Edinburgh and Longman's in London were the publishers. It followed a somewhat radical Whig line and its contributors included Henry \*Brougham, Francis \*Horner, Sydney \*Smith, \*Macaulay, and Thomas \*Carlyle. 'To be an *Edinburgh Reviewer*', wrote \*Hazlitt, 'is, I suspect, the highest rank in modern literary society.' Though its great days were in the 1830s and 1840s, it survived until 1929. JAC

**Edington, battle of,** 878. After the disaster at \*Chippenham in January 878, Alfred was reduced for some months to guerrilla warfare from the marshes around Athelney. By May he was ready to attack again and encountered \*Guthrum's Danes at Edington, near Westbury on the Wiltshire downs. The decisive victory of the Wessex levies forced Guthrum to sue for peace and give hostages. 'Never before', wrote \*Asser proudly, 'had they made peace with any one on such terms.' The site of the battle has been disputed and it is sometimes called Ethandun. JAC

**Edmund** (d. 870), king of East Anglia, known as 'the Martyr'. More famous in legend and because of the grotesque method of his martyrdom than in his life and works, Edmund, the last effective king of the East Angles of native stock, was killed by the Danes, probably under their leaders, Ingware and Ubba, on 20 November 870. Stories quickly grew concerning his sanctity, his refusal to forswear Christianity, and the nature of his death (tied to a tree and shot to death by Danish arrows). His burial place at Bury St Edmunds became a shrine of special veneration, and the great abbey founded there helped to perpetuate his memory. Even in Scandinavia his memory was later held in great esteem. HL

## Edmund I

**Edmund I** (c.922–46), king of England (939–46). Edmund succeeded his brother \*Aethelstan in 939. His prestige as a young warrior-prince who had fought victoriously by the side of his brother at \*Brunanburh (937), and the evidence of his law codes, suggests potential greatness as a ruler, but at the age of only 24 or 25 he was murdered by a private enemy at Pucklechurch (Glos.) on 26 May 946. Politically he had to face a revival of Scandinavian ambitions in the north. \*Olaf Guthfrithsson, king of Dublin (d. 941), invaded and forced Edmund, after arbitration which involved the archbishops, to yield control of much of northern England including the thriving Anglo-Danish community at York. Edmund found Olaf's cousin and successor \*Olaf Sihtricsson easier to deal with. He recovered the territory of the 'five boroughs' (Lincoln, Nottingham, Derby, Stamford, and Leicester) in 942 when the Anglo-Danish inhabitants of that area clearly preferred the rule of the Christian West Saxon king to the more backward rule of the Irish/Scandinavian overlords. By the end of his reign Edmund had regained (temporarily, it is true) York and Northumbria, and had even started to take direct interest in continental affairs on behalf of his nephew, the French king Louis d'Outremer. HL

**Edmund II** (d. 1016), king of England (1016), known as 'Ironside'. After the death of \*Æthelred in April 1016, his vigorous son Edmund, then in his early twenties, was recognized as his successor and took command of the forces resisting \*Cnut. A season of hard campaigning resulted in varying fortune. Cnut failed in his efforts to take London, but Edmund, after some successes, was defeated in the autumn at \*Ashingdon in Essex. Even so Cnut was content to come to terms and reached an agreement near Deerhurst to partition the kingdom, leaving Edmund in possession of Wessex. However, Edmund himself died on 30 November 1016, and Cnut then was received as king throughout England. Edmund's children went into exile in Hungary, and his grandson \*Edgar the Atheling was briefly acclaimed as king in London immediately after the battle of \*Hastings. HL

**Edmund**, son of \*Malcolm Canmore by \*Margaret, daughter of \*Edward the Atheling, is said to have shared the throne of Scotland with his uncle \*Donald III from 1094 to 1097, taking the southern part. They were then ousted by Edmund's brother \*Edgar, supported by William Rufus. Edmund is reported to have become a monk in England, where his sister \*Matilda was queen to Henry I, and to have died in the Cluniac priory at Montacute in Somerset. JAC

**Edred** (d. 955), king of England (946–55). The third of \*Edward the Elder's sons to succeed to the West Saxon kingship, Edred was confronted during the greater part of his reign by an independent Scandinavian kingdom of York, first under \*Olaf Sihtricsson and then under \*Erik Bloodaxe, son of Harold Fairhair, king of Norway. Only in the last year of his life after the defeat and subsequent death of Eric did Edred rule over a united kingdom of England. Unmarried, possibly deliberately celibate, he brought up his two young nephews, \*Eadwig and \*Edgar, as his heirs. His health was precarious, and his will, which has fortunately survived, shows him fearful for the depredations of the heathen

army. He was a devout Christian, a close friend of Abbot \*Dunstan of Glastonbury, to whom he entrusted some of his best treasures and land charters: and he left substantial sums of money to relieve poverty and suffering. He left money, too, to his household officers, and it seems likely, as modern investigation of 10th-cent. charters suggests, that Edred's influence on the developing efficiency of the royal secretariat, possibly under the direct tuition of Dunstan, was more considerable than used to be thought likely. The gloom of a seriously sick man can occasionally be glimpsed. In his will he made provision for the sustenance of alms from his estates with the ominous proviso that this was to continue 'as long as Christianity shall last'. HL

**education.** See EDUCATION ACTS; SCHOOLS; SCHOOLS ACT (SCOTLAND); IRELAND, BOARD OF NATIONAL EDUCATION.

**Education Acts.** Though Scotland had a system of parish schools as early as the 17th cent., the English and British Parliaments did not intervene until the 19th cent., leaving provision to private and voluntary enterprise. \*Dame schools and the surviving \*grammar schools were augmented from 1808 by schools supported by the \*British and Foreign School Society (undenominational) and the National Schools Society (Anglican). In 1833 Parliament made a grant of £20,000 towards the work of the societies, and in 1839 a Committee of the Privy Council was established by \*orders in council, with Sir James \*Kay-Shuttleworth as first secretary, to superintend education.

Direct state provision began in 1870, when the Liberal W. E. \*Forster steered through an Act intended to establish a system of efficient elementary schools in England and Wales. Locally elected school boards were to provide schools where there was a deficiency by the denominational bodies. This was the beginning of the so-called 'dual system' which still exists. The 1880 Act, introduced by the Liberal A. J. Mundella, imposed universal compulsory schooling under the age of 10.

The 1902 Act, the work of the Conservative A. J. \*Balfour, set up a co-ordinated national system of education, administered by a central Board of Education. School boards were abolished and replaced by local education authorities, consisting of elected councils of counties, county boroughs, boroughs, and urban districts, responsible for secular and voluntary schools: county and borough councils were also responsible for secondary and technical education. Grammar schools were established and free places provided for pupils from elementary schools.

The 1944 Act, introduced by Conservative R. A. \*Butler, stipulated that education should be organized in three stages—primary, secondary, and further, and that children were to be educated according to their age, ability, and aptitude, in grammar, technical, or modern schools. The Board of Education was replaced by a Ministry of Education and provision was made for raising the school-leaving age from 14 to 15: it was raised to 16 in 1972. The Act remained in force for the next four decades, but selection for the different schools caused difficulty. Labour governments from 1964 encouraged comprehensive schooling and many grammar schools were converted, closed, or became independent.

Concern in the 1990s about the quality of education in comprehensive schools provoked considerable discussion and a number of initiatives aimed at raising standards, but private education remained an attractive alternative to parents who could afford the fees.

PG/JAC

**Education Board (Ireland).** See IRELAND, BOARD OF NATIONAL EDUCATION.

**Edward** (d. 924), king of England (899–924), known as ‘the Elder’. The reign of Edward the Elder falls neatly into two parts. Up to 910 when he won a decisive victory against the Danes at \*Tettenhall in Staffordshire, Edward was involved first in suppressing a revolt led by his cousin Æthelwold, who drew support from the Danes settled in East Anglia, and then in efforts to keep the peace with Danish forces active from their bases in Northumbria and East Anglia. After Tettenhall narrative accounts chart a period of almost uninterrupted progress, which left Edward in effective command of all England south of the Humber. In the north of England he was not so successful. A Viking kingdom was set up at York which offered at most a vague recognition of overlordship to him, and a strong element of Irish/Norse colonization was intruded into Cumbria and modern Lancashire. His success was possible partly because of the readiness of Danes, settled into the countryside now for a generation or more, to submit to a strong legitimate king who could offer peace, and partly due to the active co-operation achieved between the West Saxons and the Mercians. Edward worked well first with his brother-in-law \*Æthelred, ealdorman of Mercia, and then after his death in 911 with his widow, Edward’s own sister \*Æthelfleda, the formidable ‘lady of the Mercians’. The co-operation had its uneasy moments. The *Anglo-Saxon Chronicle* implies that only after Æthelred’s death did Edward take direct control of London and Oxford. On Æthelfleda’s death in 918 some local Mercian attempt, quickly suppressed, was made to rally support behind her daughter Ælfwynn. Even at the end of his reign Edward was forced to campaign against the men of Chester who had formed an alliance with the Welsh. But by and large the success of Edward and Æthelfleda in reabsorbing much of the Danelaw did much to cement the Christian English into a common unity under the West Saxon ruling house. An outstanding feature of their campaigns was the implementation of what can best be termed a ‘burghal’ policy, that is to say the setting up of fortified defences at towns or rudimentary towns manned by forces drawn from surrounding estates according to a fixed system of assessment, each pole (5½ yards) of wall to be protected by four men. The origins of the system go back to \*Alfred’s day, and a document dating from Edward’s early years, the so-called ‘Burghal Hidage’, gives details of its implementation for some 30 or so \*‘burhs’, mostly in a great sweep of country defending greater Wessex. Extension now took place and burhs were built or repaired (where existing fortifications already existed) at places such as Hertford, Witham, Buckingham, Bedford, Maldon, Towcester (specially defended by a stone wall), Tempsford, and Colchester by Edward, and at Bridgnorth, Tamworth, Stafford, Warwick, and Runcorn by Æthelfleda, who also took the

Danish borough at Derby. The establishment of safe strongholds of this nature, keyed into the landed wealth of the community, were of vital importance to the creation of permanent effective royal administration, essential for the legal and financial as well as the military health of the kingdom. They represent an important stage in the setting up, on the West Saxon model, of the midland shires, based on shire towns such as Hertford, Buckingham, or Stafford.

At various points in his reign Edward also had his overlordship recognized by Welsh princes, Scottish rulers, by the Britons of Strathclyde, and by still independent Northumbrian noblemen exercising authority at Bamburgh, but his major contribution to the ultimate achievement of English unity rested on military and institutional success south of the Humber.

HL

**Edward** (d. 978), king of England (975–8), known as ‘the Martyr’. On the sudden death of \*Edgar, 8 July 975, succession to the throne was far from clear, and parties formed around his two young sons, Edward, then aged about 13, and Edward’s half-brother \*Æthelred, who was probably only 7 or 8. Edward was eventually accepted and the two or three years of his reign were marked by a check to the lavish endowments made to monasteries by his father (not necessarily an anti-monastic policy as such). Later authorities speak of the young king as unstable and violent, but all was overshadowed by the manner of his death. On a visit to his young brother and stepmother at Corfe in Dorset on 18 March 978 (just possibly 979) he was treacherously stabbed to death in cold blood by his brother’s retainers. It is possible that some of Æthelred’s weakness may be attributed to the moral blight thrown on him and his mother Queen Ælfthryth as a result of this murder. Edward was buried without due honour at Wareham, though his body was later translated to Shaftesbury. Popular opinion, encouraged no doubt by the nuns at Shaftesbury, postulated his sanctity and the anniversary of his death, 18 March, was set aside as his commemoration day in the legislation of Æthelred.

HL

**Edward** (c.1005–66), king of England (1042–66), known as ‘the Confessor’. Edward was born at Islip (Oxon.), the first recorded child of \*Æthelred’s second marriage. His mother was \*Emma (Ælfifu), the daughter of Richard I, count of Normandy (d. 996), and sister of the powerful Richard II (996–1026). During the Danish conquest of England, Edward took refuge in Normandy, initially in 1013, and then, together with his younger brother \*Alfred, on a more permanent basis from 1016. Emma married King \*Cnut in 1017, and seems to have been influential in Edward’s recall from the long Norman exile in 1041 in the reign of \*Harthacnut, her son by Cnut: and in the following year Edward succeeded his half-brother on the throne with general approval. He proved far from the weak and pious nincompoop portrayed by some historians, and should be given full credit for keeping his kingdom intact in troubled times for close on a quarter of a century, for reconciling the English and Danish elements in the aristocracy, and for accustoming England to regular cultural and political contact with continental Europe, especially with Normandy and with the papacy. He intruded some Norman favourites into the English Church and state,

but not to excess, apart possibly for a brief period, 1051–2, and generally succeeded in maintaining a balance at his court. It is true nevertheless that the politics of his reign was dominated by his relationship with one of the most extraordinary families in English history, that of Earl \*Godwine of Wessex, whose daughter \*Eadgyth married Edward in 1045. Godwine's five sons, \*Sweyn, \*Harold, \*Tostig, Leofwine, and Gyrth, all achieved the rank and office of earl, and Harold succeeded his brother-in-law as king in 1066. Much of the credit for the effective military defence of the realm and the pacification of the border with Wales must go to the Godwine family, especially Harold, but the king remained their superior, active in the creation and shuffling of the earldoms and in ecclesiastical matters, and by no means a passive symbol of royalty. Indeed in 1051 as a result of quarrels involving the exercise of both secular and ecclesiastical authority Edward was able to enforce the exile of the whole Godwine family, and although they returned under arms in the autumn of 1052 they did not do so unconditionally. In their absence Edward had indulged in a degree of Normanization. There is evidence, not utterly conclusive but strong, to suggest that Duke William of Normandy, his young kinsman (his mother's great-nephew), may have visited him in England in late 1051 when some loose accord may have been reached over the Norman duke's right to claim succession to the childless Edward. Godwine's return prompted reaction. \*Robert of Jumièges, whose promotion to the see of Canterbury in mid-Lent 1051 had caused disaffection, was in turn exiled and replaced by \*Stigand, a candidate favoured by the Godwines, but other appointments remained in being, notably that of the influential William, bishop of London, who remained in office until his death in 1075. Earl Godwine himself died in dramatic circumstances at Easter 1053, not long after his return. He is said to have declared on solemn oath that he was guiltless of the death of Edward's brother (murdered in an abortive attempt to lay claim to England in 1036), and then choked to death on the holy wafer taken to confirm his oath. After Godwine's death, Edward affirmed his overlordship in quite spectacular fashion, sending Harold on an embassy, and recalling from Hungary his own nephew and namesake \*Edward the Atheling, presumably again as a possible heir. Edward's skill in exploiting doubt over the succession must be ranked among his most formidable diplomatic achievements. Prince Edward died before he could even greet the king, but his children, \*Edgar Atheling (who lived on to the 1120s) and \*Margaret, queen of Scotland, proved potent pawns deep into the Norman age. The last decade or so of Edward's reign was a period of relative prosperity. The earls, those drawn from the Mercian house of \*Leofric and the Northumbrian house of \*Siward as well as the Godwines, remained powerful regional commanders but still subject to appointment and removal by king and council. Local government functioned effectively through a network of courts in shires, hundreds, and wapentakes, and urban life flourished, notably in London and Winchester. Tax systems and coinage were advanced, sophisticated, and efficient for the age. In church affairs the appointment of able clerics such as \*Wulfstan of Worcester (1062–95), and

the influence of \*Ealdred, bishop of Worcester (1044–62) and archbishop of York (1061–9), counterbalanced the dubious nature of Stigand at Canterbury. Edward himself remained active almost to the end of his life, planning hunting expeditions in the Bristol channel area in the summer of 1065, and hunting with Tostig in Wiltshire as late as the autumn. An outbreak of rebellion in Northumbria in October, resulting in the exile of Tostig, caused the king much grief and seems to have precipitated his final illness. He had spent much personal energy and treasure on the rebuilding of \*Westminster abbey, deeply influenced by similar ventures in characteristic new Romanesque style at Jumièges in Normandy, but was too sick to attend the dedication on 28 December. He died in the first week of 1066, on 4 or 5 January, and was buried in the abbey. His posthumous reputation was distorted by the nature and needs of the Norman Conquest. The Normans pointed back to his reign as a golden age in the recent past, while king Harold was dismissed as a usurper and oath-breaker. William himself claimed direct legitimate succession in kingly office from Edward, and \*Domesday Book used 'the time of King Edward' as its standard temporal test for legal rights and tenure. In the 12th cent. Edward became something of a symbol of reconciliation between Norman and English. His reputation as a lawgiver, largely unmerited, became great, and his personal piety (including an unlikely attribution of celibacy within marriage) exaggerated. Westminster abbey had a special interest in him which the monks exploited to the full. In 1161, after earlier attempts had failed, Edward was canonized by Pope Alexander III. The by-name 'the Confessor' persisted, that is to say one who suffered for his faith, though short of martyrdom, even though initially it was given merely to differentiate him from his half-uncle \*Edward the Martyr. Henry III fostered his cult, rebuilding Westminster abbey and naming his son and heir Edward. There was every likelihood that he would be adopted as the patron saint of England until more militant elements ousted him in favour of the soldier St \*George. HL

Barlow, F., *Edward the Confessor* (1970); Clarke, P. A., *The English Nobility under Edward the Confessor* (Oxford, 1994).

**Edward I** (1239–1307), king of England (1272–1307). When Edward came to the throne he was already an experienced general and politician. He had played the major role in the defeat of Simon de \*Montfort in 1265, the battle of \*Evesham being very much his own personal triumph; he was in control of the mopping-up operations that lasted into 1267; and he had taken a leading role in the deliberations of his father's council before departing on crusade in 1270. He returned with a considerable reputation, and for the rest of his life was widely considered as the expected saviour of the Holy Land. His experience of the traumas and the issues of the civil war of the 1260s informed his approach to English affairs when he became king. He appreciated that reform was needed and that Parliament was a necessary institution. The first 20 years of the reign were remarkably successful in this regard, the period marked especially by a great series of statutes which had an enduring significance, and which largely proceeded in response to the grievances of his

subjects. These same years also saw Edward's successful scotching of Welsh independence, following his two campaigns of 1277 and 1282–3, symbolically marked by the ten great castles, including \*Caernarfon, \*Conwy, and \*Beaumaris, that he constructed.

The early 1290s proved to be the turning-point in the reign and in Edward's fortunes. Increasing financial problems and domestic political tension, associated with the wars against the French and the Scots, replaced the more relaxed atmosphere of the 1270s and 1280s. It culminated in the crisis of 1297, but it is a measure of Edward's power and authority that although rebellion threatened, none actually rose in revolt—then, or at any other time—something that cannot be said of any of his predecessors since 1066, or of many of his successors.

On his tomb in Westminster abbey Edward is described famously as the 'hammer of the Scots'. But this is far from the truth. He acted as arbitrator between the claimants to the Scottish throne (the \*Great Cause of 1291–2), but on the understanding that he be accepted as feudal overlord of the kingdom. The throne was adjudged to John \*Balliol, rather than his chief rival, Robert Bruce, and Edward's attempts to secure Balliol and exercise his overlordship proved to be the beginning of the long-drawn-out \*Scottish War of Independence. The campaign of 1296 was intended to be as decisive as the conquest of Wales. Edward was victorious, symbolically removed the 'stone of destiny' from \*Scone to Westminster abbey, and established his own administration. But it was only a temporary settlement and Edward soon found himself in something of a medieval Vietnam from which he could not withdraw. He lived to see Robert Bruce crowned king in 1306, and it is highly indicative of his dogged determination that he should die leading yet another expedition to Scotland in 1307.

Edward 'Longshanks' was physically impressive and even in old age retained his physical presence. He stood head and shoulders above most men: when his tomb was opened in 1774, the body was measured at 6 feet 2 inches. He met most of the contemporary expectations of a king. He was a very able soldier and general, who possessed considerable courage. He was also a very competent organizer who, like his great-uncle Richard I, appreciated the importance of supply and transport. His military career was notable, although his victories against the Montfortians and the Welsh need to be balanced against defeats by the Scots and French. In most ways he lived up to the chivalric ideals of his age. As a young man, in particular, he was conspicuous for his enthusiasm for tournaments and other chivalric pursuits, and his devotion to the crusading cause is especially notable. (He took the cross again in 1287, but the matter of the Scottish succession and the outbreak of war with France unhinged all plans for departure.) But he could be cruel, as when he imprisoned Bruce's sister Mary, the countess of Buchan, in apparently inhuman conditions in 1306. He may well have sought to make a public example of them, and by then the Scottish war had become extremely savage. His violent temper, shared with his Angevin predecessors, may also have contributed. An account book records the cost of repairs to his daughter Elizabeth's coronet in 1297

after Edward had hurled it into the fire. And on one occasion he even assaulted his eldest son and heir, the future Edward II, tearing out his hair.

Yet, his eldest son apart—at least in Edward I's later years—he was devoted to his family. In particular, his love and fondness for his first queen, \*Eleanor of Castile, is legendary and the marriage was plainly both happy and fruitful. (There were probably fourteen children in all.) Indeed, it is possible that the marked change in character of the reign following her death in 1290 owed not a little to Edward's sense of personal loss. He grieved her deeply, and in the famous \*Eleanor crosses, twelve in all, one constructed at each stopping-point of the funeral cortège between Harby (Notts.), where she died, and Westminster abbey, where she lies buried, Edward constructed the most elaborate series of monuments ever created for an English queen (or king).

In his considerable achievements, especially in legislation and government, Edward was one of the most notable of English medieval kings, but those achievements have to be set against equally considerable failures, and the poisoned chalice of Anglo-Scottish relations, combined with chronic financial difficulties, which he bequeathed to his son. SL

Prestwich, M. C., *Edward I* (1988); — *The Three Edwards* (1980); Salzman, L. F., *Edward I* (1968).

**Edward II** (1284–1327), king of England (1307–27). Tall and good-looking, Edward II had the right physical attributes for kingship, but few other qualifications. Contemporaries ridiculed the pleasure he took in rowing and working with craftsmen; although he was a good horseman he lacked knightly military skills. His predilection for favourites, whether or not based on homosexual attraction, was politically disastrous.

It was not easy to succeed Edward I. Not only was his reputation almost impossible to live up to, but he left a legacy of debt and unfinished war. The political honeymoon at the start of the reign was brief; there were signs of trouble at the time of Edward's marriage to \*Isabella of France in January 1308, and at his coronation a new clause was added to the \*coronation oath which threatened to limit his authority. The main issue in his first years was the role of Edward's favourite Piers \*Gaveston. The scenes in the dispute were acted out against a backdrop of increasing difficulty in Scotland, and acute financial problems. Gaveston was exiled in 1308, to return in 1309. He was exiled once more by the \*Ordainers in 1311. When he returned, the king was unable to protect him from a baronial opposition increasingly dominated by \*Thomas of Lancaster. Gaveston was savagely executed in 1312. There was a real danger of civil war, but neither the king nor his opponents were in a sufficiently strong position to risk fighting. The next twist in the saga came when the government was discredited by the defeat by the Scots at \*Bannockburn in 1314. That placed the earl of Lancaster in a dominant position, but he proved no more capable of effective rule than the king. His policy was to try to adhere strictly to the Ordinances of 1311; his inclination was to take as little part in public affairs as he could, while pursuing private profit by questionable means.

## Edward III

Lancaster was formally made head of the council in 1316, but soon withdrew from active government, probably in protest at the methods being employed to raise troops for an increasingly hopeless Scottish war.

The earl of \*Gloucester had been a notable casualty at Bannockburn. He left three sisters, and the competition between their husbands for the lion's share of the inheritance was of major political significance from 1316. Above all, the ambitions of one of them, Hugh \*Despenser the Younger, husband of Eleanor, provided a new and divisive element. A political settlement of sorts was reached in the treaty of \*Leake of 1318, which imposed a council on the king, but by 1321 civil war had broken out in the Welsh marches as a result of the blatantly aggressive methods adopted by Despenser to gain yet more lands from his brothers-in-law Hugh Audley and Roger Damory. An alliance was struck between the marcher lords and the earl of Lancaster. Even Bartholomew Badlesmere, hitherto a staunch royalist, joined the coalition. The Despensers, father and son, were forced into a brief exile, but in the autumn of 1321 an astonishingly successful revival of royal and Despenser power took place. Badlesmere's castle of Leeds in Kent was taken, for Lancaster refused to allow assistance to a man he distrusted. A brief campaign shattered the power of the Welsh marcher lords, and Lancaster marched north from Pontefract, only to be defeated at \*Boroughbridge. By the time the battle was fought, most of Lancaster's retainers had abandoned him. The earl of Hereford (\*Bohun) was killed attempting to force a crossing of the bridge; Lancaster surrendered, to be executed at Pontefract. An unprecedented bloodbath of his supporters followed.

The royalist triumph at Boroughbridge marked the start of one of the most unpleasant and ultimately ineffectual regimes ever to rule in England. The king, the Despensers, the earl of Arundel, and Robert Baldock, an ambitious cleric, formed a narrowly based clique which controlled the country by means of semi-judicial terror and financial threats. The need for money was a motive force behind a highly successful programme of Exchequer reform, for which the treasurer, Walter Stapledon, was largely responsible. The war with Scotland went badly. An ineffective English march as far as Edinburgh in 1322 was followed by a Scottish raid into England, in which the king himself was nearly captured. Andrew Harclay, royalist hero of Boroughbridge, and newly created earl of Carlisle, was executed for treasonable dealings with the Scots in 1323. Conflict with France over Gascony in the War of Saint-Sardos of 1324–5 further discredited the English. The queen, Isabella, was alienated from Edward by the favour given to the Despensers, and by the way in which she was treated during the French war. She was sent to France to assist in negotiating peace, but went into exile in Paris, where a small but influential group of Englishmen gathered, and where she took as lover Roger \*Mortimer, one of the rebels of 1321, who had succeeded in escaping from the Tower.

In the autumn of 1326, Isabella invaded with a small force. She had the backing not of the French monarchy, but of the count of Hainault. The Despenser regime collapsed like a house of cards. London was in uproar, giving full support to

the queen. Bishop Stapledon was caught by the mob, and beheaded with a butcher's knife. Edward and his associates fled to Wales, where they were captured. The Despensers and the earl of Arundel were executed with barbaric ritual. Edward's removal from the throne was effected in Parliament in January 1327 by means of a mixture of deposition and abdication. He was murdered in Berkeley castle; a surprisingly circumstantial account that he escaped, to end his days as a hermit in Italy, is unlikely to have been true. MCP

Fryde, N., *The Tyranny and Fall of Edward II, 1321–1326* (Cambridge, 1979); Maddicott, J. R., *Thomas of Lancaster* (Oxford, 1970); Tout, T. F., *The Place of Edward II in English History* (Manchester, 1936).

**Edward III** (1312–77), king of England (1327–77), claimant to the French throne (1340–60 and 1369–77). Edward came to the throne in 1327 in unpropitious circumstances, with the government in the hands of his unscrupulous mother \*Isabella and her lover Roger \*Mortimer. His reign witnessed demographic disaster with the \*Black Death. It did not see major measures of legal reform, such as featured under Henry II or Edward I; concessions to Parliament on a range of issues weakened the theoretical position of the monarchy. Yet Edward must rank as one of the most successful English kings. His war with France saw the great victories of \*Crécy and \*Poitiers. The king of France and the king of Scots were both captured and held for huge ransoms. The Order of the \*Garter epitomized the glittering chivalric glamour of courtly and military circles. Political stability of a type unknown since the 1280s was achieved in the middle years of the reign.

Edward's first independent political action was in 1330, when he led the coup against his mother and Roger Mortimer at Nottingham. In 1333 he took a major gamble, supporting Edward \*Balliol's cause in Scotland, and reopening a war which had appeared concluded with the 'shameful peace' in 1328. No doubt Edward in part wished revenge after a disastrously unsuccessful campaign against the Scots in 1327. The battle of \*Halidon Hill in 1333 was a triumph, but succeeding campaigns achieved little, partly because of French support for the Scots. War with France began in 1337. In part this was similar to previous conflicts, with dispute over the English-held lands in Gascony and commercial rivalry in the Low Countries, but a new element was provided by Edward's claim, through his mother, to the French throne.

The French war dominated Edward's reign. It saw the great triumphs at Crécy in 1346 and Poitiers ten years later, but also the disappointment of the 1359 campaign, which Edward had hoped would culminate in his coronation at Rheims. Instead, it brought an unsatisfactory truce until 1369. The reopening of the war saw the advantage largely gained by the French. The gains may have been mixed with losses, but Edward showed himself to be a great commander. He took great care in the detailed planning of his campaigns, and clearly had the capacity of inspiring his men. He was also an opportunist; the war went through several phases of very different character as chance made new strategies possible. Realization that the initial policy of attacking from the north with the aid of a massive coalition

of allies was expensive and ineffective led to intervention in the 1340s in Brittany, followed by the unexpected invasion of Normandy in 1346. How far Edward carefully planned the strategy which led to the great success at Crécy is a matter for debate, but it is clear that arrangements were made for additional supplies to be brought from England, and that a march northwards was always intended.

The war was extremely expensive. By 1339 the king was effectively bankrupt, as were his main creditors, Italian bankers and English merchants. Heavy taxation at home was extremely unpopular, particularly at a time of severe bullion shortage. Political crisis came in Parliament in 1340–1, with the king's former chief councillor and chancellor, John \*Stratford, leading opposition to the crown, opposition in which the Commons, unlike the lay nobility, were very active. Edward rolled with the punches; he accepted the new statutes imposed on him in Parliament, only to repeal them once Parliament had been dissolved. He showed himself throughout more ready to compromise with his critics than any of his predecessors on the throne. He was even ready to concede on the question of military service in 1352, readily abandoning innovative concepts of military obligation in the knowledge that he would have little difficulty in recruiting troops by means of contracts with the main commanders. Parliament's demands were also accepted in 1352 over the question of treason. In an attempt to impose order on a lawless society justices had used charges of treason for offences which, though serious, hardly merited such a sledgehammer. Edward willingly accepted a considerable narrowing of the definition of treason in the interests of political peace. His reign saw the triumph of the Commons in Parliament in a wide range of areas; their power to grant taxes meant that it was impossible to deny them a major voice in public affairs. The king had to abandon useful techniques of raising money by negotiating with merchants' assemblies as a result of the claim that the Commons alone should grant taxes and customs duties. By 1376 the power of the Commons was dramatically displayed in the \*Good Parliament, with the impeachment of Lord Latimer, the chamberlain, Richard Lyons, a rich London government financier, many royal officials, and even the king's own mistress, Alice Perrers. Yet, as in 1340–1, Edward knew that once Parliament was dissolved, it would be possible to regain the lost ground. He can be accused of making concessions on a scale that seriously weakened the crown in the long run; at the same time, his concessions achieved many years of political stability and domestic peace, a remarkable achievement following the disastrous reign of Edward II.

Edward was extremely successful in his dealings with his own family, and with the magnates. He was able to provide adequately for his sons, while the war enabled him to provide them with sufficient independent scope, so that he never faced the internal family problems that had beset Henry II. The eldest, \*Edward the Black Prince, received the duchy of Cornwall in 1337, and was later given command in Aquitaine; \*John of Gaunt received the major duchy of Lancaster in 1362; Ireland was intended to serve as Lionel of Clarence's sphere of activity. The two youngest sons, Edmund (\*York) and \*Thomas, were less well treated.

but they were still young at the end of the reign, and did not present a political problem.

The creation of six new earldoms in 1337, four of them going to important members of the royal household, was a courageous move which could have aroused hostility from the established nobility. In practice, Edward's use of patronage was cleverly judged, and he was consistently able to rely on the support of the magnates in war and in politics. Edward skilfully manipulated the chivalrous feelings of his followers, patronizing tournaments and founding the Order of the \*Garter. He did not attempt to curb the authority of his nobles as Edward I had done, and though it can be argued that the crown's control over them was in theory diminished, in practice the results of royal policy prove the wisdom of the king's approach.

Ormrod, W. M., *The Reign of Edward III* (1990); Waugh, S. L., *England in the Reign of Edward III* (Cambridge, 1991).

**Edward IV** (1442–83), king of England (1461–70, 1471–83). The tall and handsome 'Rose of Rouen', so nicknamed because he was born in that city, the eldest son of Richard, duke of \*York, and Cecily Neville, gained the throne of England in March 1461 when he was only 18. Possession confirmed on the field of \*Towton a few weeks later, he was crowned in June. His reign, however, was interrupted in 1470 by his deposition and the temporary restoration of Henry VI.

During his first reign Edward was never fully secure. It took three years for him to eradicate Lancastrian opposition in England, concentrated in Northumberland, and sustained by Scottish and French help. In these early years he owed much to the earl of \*Warwick and his kinsmen. No sooner had Lancastrian resistance been brought to an end, however, than his secret marriage to \*Elizabeth Woodville, the promotion of her family, and a disagreement over foreign policy led to a rift between them. The Lancastrian exiles in France offered a convenient rallying-point for dissidents, the option Warwick finally took in the summer of 1470. When Warwick invaded England, Edward, caught on the wrong foot, fled precipitately to the Netherlands. Here he received the backing of the duke of Burgundy, his brother-in-law, who was also threatened by a Franco-Lancastrian declaration of war. In March 1471 a small fleet put Edward ashore at Ravenspur. Initially claiming only the restoration of his duchy (consciously imitating Henry IV), Edward successfully evaded the forces opposing him in Yorkshire, was reinforced in the midlands, most significantly by his fickle brother George (\*Clarence), and defeated Warwick at \*Barnet. He then rapidly marched west to intercept and overwhelm a Lancastrian army at \*Tewkesbury. With Warwick and \*Edward of Lancaster dead, and Henry VI promptly murdered on royal orders, he was now secure.

Edward began his second reign with a determination to secure reconciliation through war against the king of France, who had instigated his short-lived deposition. For four years he bent every sinew to achieve this end. Parliament, meeting in six sessions in 1472–5, voted generous taxation; a triple alliance with Brittany and Burgundy was forged and a truce with Scotland concluded. In 1475 the

## Edward V

largest army to invade France since the days of Edward III crossed the Channel. But at the eleventh hour, after his allies deserted him, Edward came to terms with Louis XI at \*Picquigny, accepting a generous pension. For the remainder of his reign Edward sought to enjoy the fruits of success. In 1477, however, he turned on and destroyed his brother Clarence, who was executed in 1478. Two years later, largely through the pressure of his younger brother Richard of Gloucester, he became embroiled in war with Scotland. Moreover, the treaty of Arras, concluded between France and Burgundy in 1483, left his foreign policy in tatters.

Edward died peacefully in his bed after a short illness on 9 April 1483, having apparently secured his dynasty and ended the Wars of the \*Roses. Yet immediately his body was buried, a fierce competition for power during the minority of Edward V ensued, leading to the seizure of the throne by his brother Richard, the renewal of civil war, and the ultimate destruction of the dynasty: a pattern of events in stark contrast to the minority of Henry VI. Thus historians have always found it hard to judge his achievement. The earliest admired the manner in which he restored peace and prosperity in his second reign, but admiration gave way to disapproval in the 19th cent. when his personal morals and political failures coloured interpretation. More recently his star has risen again. Impressed by innovations in government, the recovery of royal finances, and the determination with which he imposed his will after 1471, he has been seen as the progenitor of the revival of royal authority, developed further by Henry VII, and known as 'New Monarchy'; the disaster that followed his death has been placed firmly at the feet of Richard III.

But it is a misjudgement to see novelty in Edward's kingship. Indeed it was backward-looking. His reliance on a small circle of trusted intimates, most marked after 1471, has an Arthurian ring to it; and his knights were collectively as reliable and loyal as Arthur's fabled round-tables. Rule through a band of mighty subjects was no foundation upon which to lay a permanent recovery of the monarchy. The use of members of his household to manage finances and sustain the administration was factional in genesis, the easiest way to survive from day to day in a kingdom over which he did not at first exercise full control. Edward IV aimed low: like Charles II two centuries later, his principal objective after 1471 was never to go on his travels again. In this he succeeded. And had he lived but four years longer his son would have succeeded him without challenge.

Contemporaries attested to Edward's personal charm and ease of manner. He could, when resolved, be decisive, authoritative, even ruthless. He was a brilliant general, victorious in all his battles, who preferred to avoid war against France. In his youth he was callow and inexperienced. He was excessively generous to Warwick; his marriage to Elizabeth Woodville, its manner as much as its fact, was ill judged. Even when he was older, he was not capable of sustained attention to business. He maintained a magnificent court, influenced by the Burgundians. He was a notorious philanderer, whose last mistress, Jane Shore, was shamefully victimized by Richard III; his over-indulgence in food and drink made him in his later years, like his grandson Henry VIII, 'fat

in the loins'. It is probable that his excessive life-style contributed to his early death. He devoted himself to the completion of St George's chapel, Windsor, which he turned into his mausoleum and where he lies buried. AJP

Lander, J. R., *Government and Community: England 1450-1509* (1980); Ross, C. D., *Edward IV* (1974); Scofield, C. L., *The Life and Reign of Edward the Fourth* (2 vols., 1923).

**Edward V** (1470-c.1483), uncrowned king of England (1483). Eldest son of Edward IV and \*Elizabeth Woodville, Edward was brought up at Ludlow under his maternal uncle Earl \*Rivers. On the death of his father in April 1483, the 12-year-old prince of Wales left Ludlow to be proclaimed king in London, but at Stony Stratford his attendants were arrested by his paternal uncle Richard of Gloucester, claiming a conspiracy to deprive him of the protectorship. Initially lodged at the palace of the bishop of London, hence separated from his mother and siblings, Edward transferred in mid-May to the royal apartments at the Tower as part of the coronation preparations. He was joined by his younger brother Richard in mid-June, when they were seen playing in the garden, but after the execution of \*Hastings they were seen more rarely, until, at length, they ceased to appear altogether. The rumours and contested succession that ensued have been followed by continued controversy over the reliability of contemporary accounts, the manner of the presumed death of the princes in the Tower, and the degree of involvement of Richard of Gloucester, who had by then declared himself king as Richard III. The incomplete skeletons of two juveniles unearthed in 1674 in the Tower grounds have been presumed to be those of the princes, but the 1933 exhumation in Westminster abbey merely confirmed the bones to be of human origin, of approximately the correct ages.

ASH

**Edward VI** (1537-53), king of England (1547-53). Since Edward was 9 years old when he succeeded Henry VIII in 1547, he was in tutelage for the greater part of his reign, with \*Somerset as his governor until 1549 and \*Northumberland thereafter. His mother \*Jane Seymour died when he was born, his half-sister Mary was 21 years his senior, Elizabeth four years. Edward's chronicle or journal, which he kept from the age of 12, is largely factual and reveals little of character, save perhaps reserve and caution. His main interest was in the sham fights put on to entertain him, the poor state of the currency, and the obstinacy of his sister Mary in refusing to change her religion. From the age of 6 he had learned protestant tutors—Richard Cox, Sir John \*Cheke the distinguished humanist, and Sir Anthony Cooke. Contemporaries saw much in him to admire. The Venetian ambassador in 1551 thought him 'handsome, affable, of becoming stature', and in 1552 the imperial ambassador, after a difficult conversation about Mary's religion, reported him 'a likely lad, of quick, ready and well-developed mind'. Less sentimentally, G. R. Elton summed up: 'Edward was naturally haughty and arrogant . . . he had a marked intellectual ability, which an appalling schooling had turned into a precocious passion for protestant theology—a cold-hearted prig.'

The religious policy, the central theme of his reign, must have been that of his two chief ministers, though with Edward's growing approval. The position at Henry's death was an uneasy stalemate: the king's quarrel had been with papal authority rather than the rites and doctrines of the catholic church. But a series of measures during Edward's reign pushed England into the protestant camp. Catholic bishops were replaced by reformers. Persecution of protestants ceased and a number of continental reformers made their way across the Channel. The Act of \*Six Articles, which had represented a shift back towards catholicism, was repealed. The \*chantries followed the monasteries into dissolution, thus putting even more property into the hands of the gentry and aristocracy. The new \*prayer book of 1549, though not going far enough for many protestants, shocked Devon and Cornwall catholics into revolt. The revised prayer book of 1552 and \*Cranmer's Forty-Two Articles of 1553 moved the Church of England nearer to calvinism.

Another preoccupation of the reign was the future marriage of the young king. Most promising seemed the suggestion that he should marry Mary, queen of Scots, five years his junior, with the prospect of uniting the two kingdoms. In 1543 the treaty of \*Greenwich arranged for the marriage but the Scots were extremely reluctant to endorse it. Henry's savage reprisals in 1544 and 1545 ('the \*rough wooing') alienated what support the English had in Scotland and in 1548 Mary was betrothed to the dauphin and sent to France. In 1551 there were negotiations for the hand of Elizabeth, daughter of Henri II of France, but she was even younger than Mary and, in the end, became the third wife of Philip of Spain. In April 1553 the imperial ambassador reported rumours that Edward was to marry Joanna, a daughter of Ferdinand, king of the Romans and brother of the Emperor Charles V.

Further negotiations were not needed. In 1552 the young king had measles and smallpox, from which he seemed to have recovered, but by the beginning of 1553 signs of pulmonary tuberculosis were evident. Edward's last significant action was an attempt to head off any catholic revival by a 'devise of the crown', switching the succession from Mary. The plan to bring in Lady Jane \*Grey, of the blood royal, hastily married to Northumberland's son, was not as harebrained as the ultimate fiasco made it seem. But the puzzle is why Edward did not try to bring in Elizabeth, popular and protestant. She may have been far too prudent to involve herself in so risky a business or Northumberland might well have thought that she would not prove docile. The last weeks of Edward's life were grim as the illness took hold and diplomats speculated on his survival in terms of days, then hours. He died at Greenwich palace on 6 July. The settlement of the succession, which had meant so much to him, lasted barely a fortnight.

JAC  
Jordan, W. K. (ed.), *The Chronicle and Political Papers of King Edward VI* (1966); — *Edward VI: The Young King* (1968); — *Edward VI: The Threshold of Power* (1970).

**Edward VII** (1841–1910), king of Great Britain and Ireland, emperor of India (1901–10). The success of Edward VII's

reign would greatly have surprised his parents, who anticipated his accession with ill-concealed foreboding. His uncommon laziness, wrote \*Albert when the poor youth was only 18, 'grieves me when one considers that he might be called on at any moment to take over the reins of government'. Victoria doubted her son's discretion and not until 1892, when he was over 50, was he entrusted with the 'golden key' to Albert's dispatch boxes.

His disadvantages were considerable. He was not particularly intelligent, had a short attention span, and was easily bored. His temper was notoriously untrustworthy as a small boy and did not much improve. His mother was irritated by his weak chin and hang-dog appearance. His liaisons were numerous, his taste raffish, and his set fast. While prince of Wales, he was subpoenaed in one divorce case and, even worse, was involved in an unpleasant legal action about cheating at baccarat.

It has often been suggested that his parents were much to blame and could have handled him more tactfully. It is certainly true that Albert and Victoria were earnest, and the queen's manifest disappointment that her son was not more like his beloved father must have been a cross to bear. Yet earnest parents were not unusual in the 19th cent. and some of his problems may have been genetic. His Hanoverian great-uncles had been choleric and eccentric and his son Eddie, who died as duke of \*Clarence, was even more sluggish mentally.

Nevertheless, he had certain assets which came to the fore when he became king. He enjoyed company and had a gift for making graceful impromptu little speeches. He could be amusing and considerate when he wished and he looked good in uniform. He had a good memory for names and faces and an excellent command of both French and German. Not least of his assets was his Danish wife \*Alexandra, whom he married in 1863. Graceful and slender, with a natural dignity, she was an admirable foil to Edward's flamboyance.

Two incidents at the start of his reign in 1901 indicated that the new king would be his own man. The captain of the vessel bearing him and the queen's coffin from the Isle of Wight was sharply reprimanded for flying the royal standard at half-mast: his stammered explanation 'but the Queen is dead, sir' was met with 'But the King of England lives.' Secondly he announced that he wished to be known, not by his first name Albert, but as Edward—thus frustrating the deepest hopes of his fond parents—though, characteristically, he explained neatly that Albert had been so great that his name should stand alone.

Over the years, Edwardian England has acquired the image of an Indian summer, a golden age of tranquillity before the horrors of the Great War. It was in fact turbulent. There was a marked increase in industrial unrest and in working days lost by strikes. The militant phase of the women's suffrage movement began in 1905 when Sir Edward \*Grey was shouted down at Manchester. The rise of the \*Labour Party, returned in numbers for the first time at the general election of 1906, heralded a move towards class politics, which the king greatly deplored. The Liberals, after their great election victory, were pushed leftwards

## Edward VIII

by Labour and the Irish, and by the intransigence of their Conservative opponents. The rejection of \*Lloyd George's budget in 1909 by the House of Lords and the counter-threats to emasculate the Upper House drew the king into the political arena. Edward made it clear that he was unwilling to create 500 Liberal peers to carry the Parliament Bill, regarding it as a shabby manoeuvre, exploiting the royal prerogative of honour for party ends. Whether he could have sustained that position under pressure may be doubted, but he died in the middle of the crisis, leaving \*Asquith to wring a grudging promise from his inexperienced son George V.

Internationally, the reign was marked by the abandonment of isolation, splendid or otherwise, which had proved so uncomfortable during the \*Boer War. First, an alliance was reached with \*Japan in 1902; next, in 1904 the \*Entente was formed with France, and lastly an attempt was made to bury differences with France's ally, Russia. By the time of the king's death, Britain was firmly in the Entente camp, ranged against the Triple Alliance of Germany, Austria, and Italy.

The more extravagant claims for Edward's influence may be dismissed. He was credited, in some quarters, with skilful diplomacy and the Kaiser, who was his nephew, thought his uncle a monster of guile. But the encirclement of which the Kaiser complained so frequently was of his own making, and the *rapprochement* between Britain and France owed more to Tirpitz's naval programme than to Edward VII's evident relish for French cuisine and French music-halls.

In two respects, his influence was of some consequence. He took a keen interest in the armed forces, supported \*Fisher's naval reforms, and encouraged \*Haldane's overhaul of the army, which the humiliations of the Boer War had rendered so necessary. Since the Great War was a close-run thing, it is possible that Edward's interventions were decisive. Secondly, he raised the profile and the publicity of the monarchy. In this he had some luck. Any ruler who succeeded an 81-year-old widow was bound to have a residue of goodwill to draw on. His great successes on the turf did him no harm at all with the average citizen: he won the Derby three times with Persimmon (1896), Diamond Jubilee (1900), and Minoru (1909), and the Grand National with Ambush II (1900).

Edward was carried off in the middle of the House of Lords crisis by severe bronchial illness, exacerbated by a lifetime devoted to cigars and cigarettes. It is greatly to his credit that his son George V was infinitely better prepared for his royal duties than Edward had been, and mourned him as 'my best friend, the best of fathers'. He was fortunate to die when he did. His reign was brief and he did not overstay his welcome. The great crises of Ireland and the Lords were only beginning to unfold. Though, with the advantages of hindsight, one can see the roots of the Great War growing, the age was not yet in shadow. The crowned heads of Europe—kings, emperors, tsars, and kaisers—still entertained each other at regattas, manoeuvres, weddings, and funerals. The king was still head of society and there was society still to be head of. Great shooting parties assembled for long weekends at country houses and partridges by the thousand perished that gentlemen could demonstrate

their prowess before the ladies. The landed aristocracy, to which the king was devoted, had not yet gone down before the twin perils of the Great War and penal taxation. Behind the gun-carriage which conveyed Edward to his resting-place at Windsor marched nine kings.

Brook-Shepherd, G., *Uncle of Europe: The Social and Diplomatic Life of Edward VII* (1975); Hibbert, C., *Edward VII: A Portrait* (1976); St Aubyn, G., *Edward VII, Prince and King* (1979).

**Edward VIII** (1894–1972), king of Great Britain and Ireland, emperor of India (1936). Edward was the eldest son of George, duke of York, later King George V. His parents were strict disciplinarians, and his private tuition was seriously deficient. But an easy-going manner and outward-looking personality more than counterbalanced these disadvantages. A brief period at Oxford was followed by non-combatant but arduous service in the British Expeditionary Force in France. As heir to the throne he was not permitted to serve in the front line, but none the less courted danger—and achieved genuine popularity—in visiting the troops, sharing their cigarettes, and listening to their stories. Edward, much like his grandfather Edward VII, was 'one of the boys', able to communicate with ordinary people at their level—a refreshing antidote to the austere George V and the prudish Queen Mary. In 1919, at \*Lloyd George's suggestion, he undertook a tour of Canada and the USA; in 1920 he visited Australia and New Zealand, and toured India and the Far East in 1921–2; in 1925 and 1931 he journeyed to South America. All these voyages were resounding successes, demonstrating that the British monarchy took its imperial role seriously. But Edward had two weaknesses. Each, by itself, need not have been constitutionally fatal: together, they cost him his throne.

Edward was a notorious 'ladies' man', engaging in a succession of sexual liaisons with married women, one of whom, Lady Furness, introduced him to Mrs Wallis \*Simpson, with whom he became infatuated. He also revelled in his assumed role as the champion of the common man. He made it his business to visit the depressed areas, and his public statements, though they could be construed as nothing more than sympathy for the plight of the deprived, might also be interpreted as critical of current social and economic policy, and thus as political pronouncements. Most famous, or infamous, in this category was a donation of £10 he made to a relief fund set up for the miners after the collapse of the \*General Strike (1926) had left them at the mercy of the coal-owners. The donation was made (the covering letter explained), because 'it would be an unsatisfactory end to any dispute that one side should have to give in on account of the sufferings of their dependants'. Never before—or since—has the heir to the throne made such a blatant intervention in a matter of public controversy. The altruism and generosity of the donation may be applauded, but it made Edward many enemies within the Conservative Party (then in office), and marked him out as a future monarch whose judgement (as they saw it) could no more be trusted in matters of constitutional propriety than in matters pertaining to the sanctity of the marriage contract.

Edward's infatuation with Mrs Simpson was not reported in the British press, but within ruling circles was a matter of common knowledge. Wallis came from humble stock in Baltimore. Her first marriage, to an American naval officer, had ended in divorce; she married again, to an English businessman, Ernest Simpson, and lived in London. She lacked beauty, but compensated with sophistication, charm, and measured informality. Edward was not content to have her as a mistress. He determined to make her his wife. Mr Simpson acquiesced in a divorce, which was granted nisi, at Ipswich, at the end of October 1936.

By then Edward had been on the throne for nine months. His brief reign was dominated by 'the King's matter'. Stanley \*Baldwin, the prime minister, advised that a marriage to Mrs Simpson would not be popular. Whilst it is impossible to test the truth of this statement, and whilst the king could certainly have married his mistress and insisted on retaining his throne, had he wished, it is equally true that some of those who supported him, such as the \*British Union of Fascists, were peripheral elements in British public life, whilst others, such as Winston \*Churchill, were mavericks. It was not so much that Mrs Simpson was a commoner: rather, she was an American, twice-divorced commoner. Edward's suggestion that a morganatic marriage be contracted—she would be his wife but not his queen—was counter-productive, since it implied that she was unfit to be queen. Rank-and-file Conservatives regarded the king's morals as an affront to Christian values; but unlike his grandfather, he now proposed to compound sin by marrying the mistress whose bed he shared. They were reminded, too, of his embarrassing political interventions. During a visit to south Wales, in mid-November 1936, the king fuelled this prejudice by remarking, in relation to the unemployed, that 'something must be done to find them work'—a comment widely interpreted as an attack on Conservative economic policy.

Baldwin was not prepared to countenance a morganatic marriage; neither was \*Attlee, the Labour leader, nor were the dominion prime ministers. On 10 December Edward signed the instrument of abdication, and ceased to be king the following day, when he and Wallis travelled to France, where they were married by a Church of England parson acting without his bishop's authority.

The new king, Edward's younger brother George, agreed to confer on him the title duke of Windsor; but Wallis was not permitted officially to call herself HRH. Relations between Edward and the royal family were, and remained, bitter. It was said that he had brought the monarchy into disrepute, and it was also feared that he would be regarded as a king in exile, and a threat to his brother. Edward's much publicized visit to Hitler (October 1937) was not so much sinister as naïve. None the less, when Edward and Wallis fled to fascist Spain after the fall of France, Churchill, now prime minister, packed them off to the Bahamas, of which Edward became governor. His wartime meetings with American President F. D. Roosevelt caused further embarrassments. But when, following his death in Paris, he was buried in the royal mausoleum at Frogmore, Wallis was permitted to be present at the interment.

Edward was a weak and in some important respects a selfish man. His political judgement was unsound, but there is probably some truth in the view that during the inter-war period he gave the British monarchy the human face so lacking in his austere, class-prejudiced parents. GA

Bolitho, H. H., *King Edward VIII—Duke of Windsor* (1954); Sencourt, R., *The Reign of Edward VIII* (1962); Windsor, duchess of, *The Heart has its Reasons* (1956); Windsor, duke of, *A King's Story* (1951); Ziegler, P., *King Edward VIII: The Official Biography* (1990).

**Edward, duke of York.** See YORK, DUKE OF.

**Edward, prince of Wales** (1330–76), known as the 'Black Prince'. He was, both for contemporaries and later generations, one of the great chivalric heroes, though his reputation does not stand up to close inspection in all respects. The eldest son of Edward III, he was made earl of Chester in 1333, duke of Cornwall in 1337, and prince of Wales in 1343. In 1362 he became prince of Aquitaine, becoming a virtually independent ruler there. He was a great soldier. His career began at \*Crécy, where he fought bravely, and the notable victories of \*Poitiers in France (1356) and \*Nájera in Spain (1367) mark him out as one of the best medieval commanders, a man of ability and charisma. The brutal sack of Limoges in southern France (1370) is the one blemish on his military reputation, though it can be excused in strict legal terms. He was less skilled as politician and ruler than as a soldier; his venture into Spain was unwise, and his extravagant and harsh rule in Gascony alienated some of the most influential nobles there. His policies contributed to the reopening of the \*Hundred Years War in 1369. In England the administration of his lands was efficiently centralized, but overly harsh. In 1362 he married the celebrated beauty \*Joan of Kent in a love match; a more statesmanlike man would no doubt have used marriage as a diplomatic tool. Disease forced him to return to England in 1371, and ruined his last years. In 1376 he predeceased his father, leaving his young son Richard as heir to the throne. MCP

**Edward, prince of Wales** (1453–71). The heir of Henry VI, Edward spent most of his life in exile in France. In 1470 his prospects were transformed by the restoration of his father. Six months later, he returned to England only to find that Henry VI had been deposed once more by Edward IV. His army was intercepted and defeated at \*Tewkesbury on 4 May. He was probably killed in flight from the field. His death sealed the fate of his father. A description of him as eager to display his prowess in the field suggests that he was more like his famous grandfather than his unfortunate father. AJP

**Edward, prince of Wales** (1476–84), was the only child of Richard III by his marriage to \*Anne Neville. He was born at Middleham castle (Yorks.), made earl of Salisbury in 1478, and at Richard's second coronation at York in September 1483 was created prince of Wales. In January 1484 Parliament confirmed his place in the succession. Two months later, he died at Middleham, leaving his parents at Nottingham almost mad with grief, according to the Croyland chronicle. He was buried at Sheriff Hutton in Yorkshire. JAC

## Edward the Atheling

**Edward the Atheling** (d. 1057), known as 'the Exile'. Mystery surrounds the return of Edward the Atheling to England in 1057. The son of King \*Edmund Ironside (d. 1016), he was forced into exile as a young boy by \*Cnut's conquest of England. Later, not very reliable, sources suggest that Cnut intended that he should be harmed in exile, but in fact he was well treated in Hungary, and married a royal princess, Agatha, connected with the imperial ruling house of Henry II. Negotiations were set on foot for his return by an embassy sent out in 1054, but he died soon after his arrival and was buried at St Paul's in London. One version of the *Anglo-Saxon Chronicle* has the laconic and possibly sinister entry, 'we do not know for what reason it was brought about that he was not allowed to look on (the face?) of his kinsman, King Edward'. As Edward's nephew, but even more so as Edmund's son, he was next in line by blood to the succession. His children were well treated in England. \*Edgar Atheling, his son, was acclaimed king for a brief period at London immediately after the battle of \*Hastings, and lived on in a modest role in the Anglo-Norman world into the 1120s. His daughter \*Margaret, later St Margaret, was queen of Scotland. HL

**Edward Balliol.** See BALLIOL, EDWARD.

**Edward Bruce.** See BRUCE, EDWARD.

**Edwin** (d. 633), king of Northumbria (617–33). The son of Ælle, king of Deira, Edwin was driven into exile during the reign in Northumbria of \*Æthelfryth, head of a rival dynasty. With East Anglian aid he defeated and killed Æthelfryth in 617. His marriage to a Kentish princess in 625 had momentous consequences in a Christian mission to Northumbria led by \*Paulinus, who converted Edwin with many of his subjects and founded a church at York. According to \*Bede, Edwin gained authority over the whole of Britain, excluding Kent, but including Anglesey and Man. He successfully invaded Wessex in 626. In 633 he was defeated and killed by \*Penda, king of Mercia, and \*Cadwallon, king of Gwynedd, at \*Heathfield. His body was later (allegedly) taken to Whitby abbey, where he was venerated as a saint. JCa

**Egbert** (d. 839), king of Wessex. After a profitable three-year exile in the kingdom (and then the empire) of Charles the Great, Egbert succeeded to the West Saxon throne in 802. He belonged to the native dynasty, and was descended from Ingild, the brother of King \*Ine (688–726). There is little record of the early years of his reign apart from a powerful and successful campaign against Cornwall in 815. In the 820s, however, he took advantage of Mercian dynastic weakness, winning one of the decisive battles in Anglo-Saxon history at \*Ellendun (Wroughton to the south of Swindon) in 825, and inflicting further defeat on them in 829. His first victory marks the passing of control of the south-east (and temporarily of East Anglia) from Mercian to West Saxon hands. After his second in 829 the *Anglo-Saxon Chronicle* records that he conquered Mercia and was recognized as a \*bretwalda (overlord). The Northumbrians also submitted to him, and for a year (830–1) he was recognized as king throughout England. It is misleading, however, to regard

Egbert as the first king of a truly united England. A native prince was quickly restored to Mercia, even if not of the ruling dynasty, and only briefly did Egbert issue coins for Mercia. His own favoured title was 'king of the West Saxons' or 'king of the West Saxons and the Kentishmen'. He set up his son \*Æthelwulf as a subking in the south-east, and concentrated personally on the western heartlands of his kingdom, winning a substantial victory in 838 against the Danes and their Cornish allies at \*Hingston Down. His permanent memorial proved to be the achievement of West Saxon mastery over England south of the Thames, the making of a true greater Wessex, and with it an end to all hopes of a Mercian nucleus to a united kingdom of England. HL

**Egypt.** British interest in Egypt arose from concern to protect the route to India. Napoleon's occupation of Egypt in 1798 was terminated by the peace of \*Amiens three years later, when control of the country was restored to the Ottoman empire. The opening of the Suez canal in 1869 increased the strategic importance of Egypt to Britain, and British troops occupied the country in 1882 when Anglo-French attempts to sort out the government's debts had led to a revolt by the heavily taxed peasantry. A British protectorate was declared in 1914 when Germany's alliance with the Ottoman empire in the First World War posed a new threat to British interests. Nominal independence, under a constitutional monarch, was restored in 1922, but Britain maintained a military base to control the Suez canal until Gamal Abdel Nasser seized power in 1952 and nationalized the canal. KI

**Eikon basilike** or King's Book was one of the most successful books ever published and established Charles I's reputation as a martyr. It came out within hours of the king's execution in January 1649 and was a strange mixture of prayer and political commentary. Forty-six editions are said to have been called for within a year. Though purporting to be by the king, authorship was later claimed by John Gauden, appointed bishop of Exeter and then Worcester after the Restoration on the strength of it. Perhaps the greatest impact was made by a woodcut as frontispiece showing Charles at his devotions. JAC

**eisteddfod**, meaning a session or congress, was a competition of Welsh bards and minstrels under the patronage of the aristocracy. The institution was of great antiquity since the laws of \*Hywel Dda (d. 950) describe in some detail arrangements for churning the bard, the climax of the activities. \*Gruffydd ap Cynan, king of Gwynedd, is said to have held an eisteddfod at Caerwys about 1100 and \*Rhys ap Gruffydd, king of Deheubarth, at Cardigan in 1176. Another important gathering was at Carmarthen c.1450, presided over by Gruffydd ap Nicholas, which laid down the rules of poetic metre. A rather strange commission by Elizabeth in 1568 suggested that the principality was crawling with bards and minstrels and authorized an eisteddfod at Caerwys to restore order—competent bards were to be recognized by experts, 'the rest not worthy to return to some honest labour'. The institution declined in the 17th cent. but in the 18th cent. there was a marked increase of interest in

Welsh language and culture, with the Society of Cymmrodorion set up in 1751 and the Gwynnedigion Society in 1771. Revivals of local eisteddfodau soon followed, with meetings at Corwen and Bala in 1789. 'The first of the great modern eisteddfodau' was held at Carmarthen in 1819. The National Eisteddfod Association was formed in 1880 and holds an annual gathering, alternating between north and south Wales. There are also provincial and local eisteddfodau.

JAC

**El Alamein, battle of**, 1942. Fought in Egypt, close to Alexandria, El Alamein was the first decisive, irreversible British victory over German ground forces, which, together with their Italian allies, were forced to retreat 1,500 miles to Tunisia. Rommel, short of fuel and against British air superiority, could not fight a mobile battle to balance \*Montgomery's superiority in combat troops. The 8th Army had nearly 200,000 men, more than half from Britain, the rest from India, Australia, New Zealand, and South Africa, against about 100,000 Italians and Germans. Attrition dominated the battle and British inferiority to the Germans in manoeuvre and in co-operation between different ground arms was no handicap. Montgomery has been criticized for sluggish exploitation of his victory and failure to cut off the German retreat. However, the battle caused silenced church bells in Britain to be rung in celebration and made Montgomery a national hero. Together with the much larger-scale victory of the Red Army at Stalingrad, Alamein came to seem the turning-point in the war against Hitler. Cinematographic exploitation followed with *Desert Victory*, the British film which opened by using the dramatic effect of the intense artillery barrage at the start of the battle; a just tribute to the consistent excellence of British field artillery.

RACP

**Eldon, John Scott, 1st earl of** (1751–1838). Lord chancellor. The son of a Newcastle coal merchant, Scott rose rapidly as a lawyer. He entered Parliament in 1783, and became solicitor-general 1788 and attorney-general 1793. He led for the crown in the 'treason trials' of Thomas \*Hardy and other radicals in 1794. He was appointed lord chief justice of Common Pleas in 1799, becoming Baron Eldon, and lord chancellor in 1801. He was a favourite of George III, who called him 'My Lord Chancellor'. He served in the cabinets of \*Addington, \*Pitt, \*Perceval, and \*Liverpool until 1827. He was blamed by liberals for obstructing all reform and by others for the long delays in the Court of Chancery, though these were caused more by his conscientiousness in reaching judgments and the increase of litigation in this period. Eldon came to symbolize political obscurantism and right-wing extremism but was an exceptionally able lawyer and in private life good-natured, even-tempered, and affectionate, fond of a good story and good port.

EAS

**Eleanor of Aquitaine** (c.1122–1204), queen of Henry II. Heiress to the vast duchy of Aquitaine, Eleanor first married Louis VII of France in 1137, but they were divorced in 1152, partly because they were temperamentally incompatible, but largely because Eleanor had produced only daughters. Aquitaine accordingly reverted to Eleanor. In 1152 she mar-

ried Henry of Anjou, soon to be king of England, and over the next fifteen years bore him eight children. Their marital relations deteriorated, however, and this played a part in Eleanor's most significant decision in Henry's reign—to rebel against him in 1173 in support of her sons. Her plans misfired, she was captured by Henry, and until his death in 1189 was kept in close confinement, carefully watched, in England. On Richard I's accession, she was released and renewed her political life with relish, playing an important role during Richard's absence on crusade and then, on his death, crucially securing the loyalty of Aquitaine for John during the succession crisis of 1199–1200. She was very beautiful, very civilized, and a keen patron of the arts.

SL

**Eleanor of Castile** (c.1242–90), queen of Edward I. The daughter of Ferdinand III, Eleanor married Edward I in October 1254, when they were both children, bringing with her Gascony. The couple were unusually close and Eleanor accompanied him on several crusades. Much of her time was taken up with raising their fourteen children, including the future Edward II, born in 1284. Although intelligent and cultivated, both she and Edward were regarded as grasping: 'the King he wants to get our gold, the Queen would like our lands to hold,' ran a contemporary jingle. Edward was devoted to her and mourned her death deeply. He commissioned a series of twelve stone crosses, known as the \*Eleanor crosses, to mark the stopping-places of her funeral cortège from Lincoln to Westminster abbey. The effigy on her tomb in the abbey shows her beauty and is remarkable for its attention to detail.

SMC

**Eleanor of Provence** (1223–91), queen of Henry III. Daughter of Raymond Berenger IV, count of Provence, Eleanor came from a cultivated and well-connected family. Negotiations for her to marry Henry III began in 1235, the marriage taking place in Canterbury the following year. There were five children, Edward, Edmund, Margaret, Beatrice, and Catherine. The queen and her Provençal relatives were not popular: her uncle William, bishop-elect of Valence, was said to have returned to France with a vast fortune. She raised funds for her husband during the baronial wars and gathered troops on his behalf. Much of her wealth was used up and when she entered a convent after his death in 1272, she was heavily in debt. She died at Amesbury on 25 June 1291 and was given a full burial by Edward I, her son, who paid off her debts.

SMC

**Eleanor crosses** were monuments erected by Edward I at Lincoln, Grantham, Stamford, Geddington, Northampton (at Hardingstone), Stony Stratford, Woburn, Dunstable, St Albans, Waltham, West Cheap in the city of London, and the royal mews at Charing between 1291 and 1294 to commemorate the progress of the funeral cortège of his queen \*Eleanor of Castile from Harby where she died to her burial place in Westminster abbey. Those at Waltham, Geddington, and Hardingstone still survive. They represent a personal statement by Edward of grief and loss of a queen of whom 'living we dearly cherished, and whom dead we cannot cease to love'. They are almost certainly modelled on

## electricity industry

the 'montjoies', crosses erected to mark the progress of Louis IX of France's body from Aigues Mortes to Paris in 1270. The cross outside Charing Cross station in London is a replica erected in 1863. LR

**electricity industry.** As early as the 1830s the researches of Galvani, Volta, Daniell, Davy, Sturgeon, \*Faraday, and others had provided the scientific basis for the development of the electrical industry. The principles of electrolysis, the arc-lamp, the incandescent lamp, the electric motor, and the dynamo were understood, yet, partly due to the dominance of \*gas lighting, electricity was slow to reveal its potential. In the 1840s arc-lighting was used to light a few streets, and chemical batteries and copper wire were used in a rapidly expanding electric telegraph network, which had 3,700 miles of line by 1852.

Despite improvements to the dynamo, it was not until the development of a proven incandescent-filament lamp in 1878 by \*Swan in Britain and in 1879 by Edison in the USA that the rapid growth of public electricity supply was feasible. From the early 1880s efficient generators, mainly driven by steam power, and small lamps combined to provide the technical base for the expansion of the industry. A major improvement in generation was provided by \*Parsons's steam-turbine, which improved the output of power stations by greatly increasing the speed of rotation of the dynamo. In suitable locations small hydroelectric schemes were promoted, beginning in 1881 in Godalming (Surrey). Other such ventures, including a municipal scheme near Worcester, varied in size and were located as far apart as Greenock and Lynmouth.

During the 1890s the market for electricity widened and power stations were built in many cities and towns by private electricity companies or local authorities. Apart from providing light, they increasingly supplied power for street tramways, and later, in London and Glasgow, for underground railways. Bristol was the first local authority to operate an electricity supply service of any great size. Beginning in 1893 it provided both private and street lighting and soon began to compete effectively with gas. The electricity industry continued to make progress and by 1912 about 25 per cent of power used in British industry was electrical. However, foreign firms dominated, for electrical transport and factory power was mainly provided by American and German expertise.

Before the evolution of the national grid in the late 1920s, the electricity supply industry was in the hands of small stations and relatively small companies. The Electricity Supply Act of 1926 encouraged the regulation of current and greater standardization of the industry. Generating stations increased in capacity as electricity accounted for a growing proportion of power needs. Like coal-mining, the electrical industry was nationalized under the third Labour government.

Subsequently during the 1950s and 1960s, there was considerable expansion to meet industrial and domestic needs, as well as the electrification of the railways. Generation was mainly by coal or nuclear power, and there was also substantial investment in hydroelectric schemes in the Scottish

Highlands. Alternative energy sources, mainly wind and tidal power, were explored, but partly on economic grounds, and partly in line with decreasing demand in the wake of the energy crisis in the 1970s, investment was limited to experimental plant. In line with the policies of the Conservative government, denationalization and privatization of both generating and supply took place in the late 1980s. ID

**'Eleven Years Tyranny'** (1629–40). After the tumultuous end to the 1629 session of Parliament (see ELIOT, SIR JOHN) Charles I broke with convention—though not with law—by ruling without Parliament for eleven years. Financial needs were met through prerogative levies, the most notorious of which was \*ship money, and the prerogative court of \*Star Chamber supervised the maintenance of order in both state and church. This was hardly a tyranny, for Charles had no police force or standing army to compel obedience. Indeed, despite widespread resentment among the aristocracy and gentry, upon whom royal rule ultimately depended, they never refused to co-operate. In the end, it was Charles's own misjudgement in the 'Bishops' wars and not popular anger which brought the 'Eleven Years Tyranny' to an end. RL

**Elgar, Edward** (1857–1934). Though Elgar was not greatly interested in the revival of English folk-song which gathered pace in his lifetime, his music is soaked in the scenery of his native Worcestershire. He was born at Broadheath, just west of Worcester, where his father kept a music shop, in the shadow of the Malvern hills. Largely self-taught, his early life was spent as a local musician, conducting bands and choirs and teaching the violin. His breakthrough came with the *Enigma Variations* (1899), commemorating his friends in the area, and heralding a tremendous burst of creative energy until the Great War and the death of his wife Alice. *Sea Pictures* (1899) were followed by *The Dream of Gerontius* (1900), the *First Symphony* (1908), the *Violin Concerto* (1910), the *Second Symphony* (1911) and the darker *Cello Concerto* (1919). Honours were heaped upon him—a knighthood (1904), the Order of Merit (1911), mastership of the king's musick (1924), and a baronetcy (1931). Standing at the end of the great romantic tradition and on the eve of the Great War, his work is shot through with sunset gleams and his favourite marking was *nobilmente*. His palm-court pieces and the extraordinarily popular 'Pomp and Circumstance' marches gave him a reputation at variance with reality. With the appearance of a retired colonel and often accused of jingo patriotism, Elgar was, in fact, a deeply sensitive man, easily hurt, and haunted by 'the land where corals lie'. Even 'Enigma', to the listener a serene theme, Elgar thought expressed 'the loneliness of the artist'. He is buried in a small catholic cemetery at Little Malvern, overlooking the great plain of the Severn towards Bredon Hill. His statue at Worcester, near the cathedral, surveys a traffic roundabout. JAC

**Elgin marbles.** These were part of the frieze and pediment of the Parthenon of Athens and other carvings from c.440 BC, sent to England by the 7th earl of Elgin. While British ambassador in Constantinople, he obtained authority from the

Turks first to study, then to remove some of the antiquities, which were badly looked after. After an eventful journey during which some of the carvings were shipwrecked and the earl detained in France, the sculptures arrived in England to controversy about the wisdom and validity of their purchase by the government. Finally in 1816 Elgin received £35,000, much less than his expenses, and the marbles were placed in the British Museum. The Greek government has at times requested their return. JC

**Eliot, George** (1819–80). Novelist whose real name was Mary Anne (later Marian) Evans. Born in Warwickshire, she was the daughter of a land agent whose moral qualities are reflected in those of the upright *Adam Bede*. The landscapes and rhythms of daily life in the (fictionalized) towns of the English midlands are reflected in much of her best work, notably in her two novels set at the time of the first Reform Bill, *Felix Holt, the Radical* (1866) and the masterly *Middlemarch: A Tale of Provincial Life* (1871–2). In 1854 she established a lasting partnership with George Henry Lewes, the ‘scandal’ of her open liaison obliging her to publish her fiction under an assumed masculine name. Her reading of the works of Feuerbach, Hegel, Comte, and later, \*Darwin informs the arguments of her fiction with a decidedly ‘historical’ base, a \*positivist theme being especially noticeable in *Romola* (1863), a novel set in Savonarola’s Florence. ALS

**Eliot, Sir John** (1592–1632). Eliot, a parliamentarian, was initially a client of the royal favourite \*Buckingham, but turned against him. In 1626 he took part in the impeachment proceedings against Buckingham, comparing him to Sejanus, the notorious favourite of Tiberius. For this, Charles I imprisoned him in the Tower. Further imprisonment followed in 1627, when Eliot refused to pay the \*forced loan. In 1629 he led the Commons’ attack on \*Arminianism and prerogative taxation, and organized the coup on 2 May when the Speaker was held down in his chair to prevent him foreclosing debate, as the king had ordered. Eliot was again sent to the Tower, where he spent the rest of his life composing a treatise exalting royal authority. His commitment to parliamentary liberties was undoubted, but by preferring the role of demagogue to that of constructive statesman he blocked the way to compromise. RL

**Eliot, T. S.** (1888–1965). Poet and man of letters. Born in St Louis, after Harvard he studied in Europe, in 1927 becoming a British citizen. With the encouragement of Ezra Pound he produced *The Waste Land* (1922), usually seen as a commentary on the western civilization which collapsed in the Great War, though he preferred to think of it as ‘a piece of rhythmical grumbling’. Equally innovative literary criticism helped create the taste by which he was admired, though in 1927 his confirmation in the Anglican church to many seemed an anachronism. For others, the religious poetry of *Ash-Wednesday* (1930) and *Four Quartets* (1943) is his most profound response to the times. Attempts to restore poetic drama to the West End stage had more mixed success, though *Murder in the Cathedral* (1935) has endured. By

now very much an establishment figure, he found solace in a late second marriage happier than his first. JNRS

**Elizabeth I** (1533–1603), queen of England (1558–1603). ‘A very strange sort of woman,’ wrote the imperial ambassador three weeks after Elizabeth’s accession. Much of the pattern of Elizabeth’s life and reign was shaped by the circumstances of her birth. Her mother was \*Anne Boleyn, Henry VIII’s second wife. Elizabeth was born at Greenwich in September 1533 five months after her parents’ marriage had been announced. Her father was momentarily disappointed by the birth of a daughter but comforted himself that a son would no doubt follow. \*Cranmer’s declaration in May 1533 that Henry’s previous marriage to \*Catherine of Aragon had been invalid meant that Elizabeth took precedence over her half-sister Mary, seventeen years her senior.

Elizabeth’s early years were even more turbulent than those of Mary, but with different results. While Mary retreated into her religion, Elizabeth grew up wary and dexterous. Her position as heir was confirmed by the Act of \*Succession of 1534 but her favoured situation lasted less than three years. In May 1536 her mother was executed and a new Act of Succession declared Anne’s marriage void, Elizabeth illegitimate, and recognized Henry’s third marriage to \*Jane Seymour as ‘without spot, doubt or impediment’. The birth of her half-brother Edward in October 1537 made her chances of succeeding to the throne appear remote. After Henry’s three last marriages had failed to produce more children, a third Act of Succession in 1543 reinstated his daughters, declaring that if Edward died without heirs, the throne would pass to Mary and then Elizabeth. The king’s will in 1546 confirmed that arrangement and accordingly Edward succeeded in 1547. Elizabeth was then 13.

She had spent most of her girlhood at \*Hatfield. She received a high-powered classical education which left her in command of Latin and Greek and speaking French, Spanish, and Italian ‘most perfectly’. ‘My illustrious mistress shines like a star,’ wrote Roger \*Ascham, one of her tutors. She was on good terms with \*Catherine Parr, Henry’s last wife, and when, after his death, Catherine married Lord \*Seymour, Somerset’s younger brother, Elizabeth moved into the household. The arrangement ended when Seymour made playful advances to Elizabeth which were not totally unwelcome. After Catherine died in childbirth, Seymour suggested marriage to Elizabeth, who replied prudently that such a matter should be laid before the council. Seymour was arrested in 1549 on a charge of treason and Elizabeth closely questioned by Sir Robert Tyrwhitt, who confessed himself baffled that she would not ‘cough out’ anything: ‘she hath a very good wit and nothing is to be got from her but by great policy.’

During the rest of Edward’s reign she was in good standing at court and sympathetic towards the religious changes. But there are few mentions of Elizabeth in Edward’s journal and they do not seem to have been very close. Consequently, when he was dying in the spring of 1553 and could not bear the thought of a catholic succession, Edward bypassed Elizabeth and named Lady Jane \*Grey, \*Northumberland’s daughter-in-law, as his successor. During the ensuing crisis

which placed Mary on the throne, Elizabeth stayed at Hatfield on the plea of illness. She was not well rewarded for her acquiescence in Mary's triumph. Within a month Mary was urging her to attend mass and Elizabeth, in floods of tears, real or simulated, begged for time to study the question. The following month, Mary's first Parliament acknowledged the validity of Catherine of Aragon's marriage, by implication bastardizing Elizabeth once more. Yet Mary did not take the next step of removing her formally from the succession, presumably because, until six months before her death, she hoped for children of her own.

In February 1554 \*Wyatt's rising against Mary's Spanish marriage brought Elizabeth to the brink of disaster. Summoned urgently to court as the Kentish rebels advanced upon London, she pleaded more illness, then reluctantly obeyed. In March she was sent to the Tower while the conspirators were racked to provide evidence against her. 'She will have to be executed,' wrote the emperor's envoy Mendoza briskly, 'as while she lives it will be very difficult to make the Prince's [Philip] entry here safe.' But no evidence could be found and after two months she was sent off to Woodstock under house arrest. It was not an experience Elizabeth forgot: twelve years later she told her Parliament, 'I stood in danger of my life, my sister was so incensed against me.' While she was at Woodstock, Soranzo the Venetian ambassador sent a long description of her: 'her figure and face are very handsome, and such an air of dignified majesty pervades all her actions that no one can fail to suppose she is a queen . . . her manners are very modest and affable.' Ultimately she returned to Hatfield, kept her head down, attended mass regularly, and refused all offers of marriage. 'She is too clever to get herself caught,' Renard, the imperial ambassador, told the emperor. Elizabeth received some protection from an unexpected quarter—Philip, who, increasingly aware that his marriage to Mary would be neither fruitful nor lengthy, was thinking of long-term investments. Mary, queen of Scots, the next heir, though a catholic, was betrothed to the dauphin and would certainly carry England, Scotland, and Ireland into the camp of his French enemies.

In the event, Elizabeth's accession, on 17 November 1558, passed off without incident. Even Mary, in her last weeks, had conceded its inevitability. Elizabeth was faced at once with the same problems that had confronted Mary on her accession five years before—the religious question and her own marriage.

The outlines of her religious policy were signalled at an early stage when she pointedly absented herself from the elevation of the host, placed two of Mary's bishops under arrest for intemperate sermons, and in her first Parliament took back the governorship of the church. It would have been surprising had she done anything else. Her mother had sympathized with the reformers, and Elizabeth herself, educated with her brother Edward by protestant tutors, shared his views, though not his zeal. To adopt a catholic posture would have meant accepting her own bastardy and admitting that she had no right to the throne. It might, of course, have been possible in the intricate ecclesiastical politics of 1558 to come to some arrangement with the papacy,

but since the pope was at that time a staunch ally of the French, whose new queen, Mary, was a genuine catholic and had just claimed the English throne, it might seem a thin chance. The famous *via media* was to a great extent forced upon her. Catholicism certainly would have meant giving up the headship and possibly the throne as well: calvinism, as James VI of Scotland was to discover, meant being hectored by godly presbyters. By the end of 1559 the whole bench of catholic bishops had been replaced.

The second problem, marriage, had already caused trouble. There has been considerable speculation about the nature of Elizabeth's sexuality. But the romping with Seymour, the long attachment to \*Leicester, her sad coquetry with Anjou in the late 1570s, and her appreciation of 'proper men' like \*Raleigh and \*Essex suggest normal heterosexuality. Nor is there any reason to believe that she could not have borne children. The political objections to marriage were overwhelming and her council and Parliament urged in vain. Any husband would certainly interfere and possibly dominate, and opinion would support him. A foreign husband would drag the country into continental disputes and reawaken religious animosities: marriage to a subject would be an act of condescension and a formula for faction. Though her reasons for virginity were largely negative, she turned it to her own advantage, declaring that she was married to her people. Elizabeth's decision may have been wrong. But her sister's marriage had scarcely been a success and though Mary, queen of Scots, can hardly be accused of being against matrimony, the results were not encouraging. Elizabeth's cautious attitude extended to naming a successor. No doubt she postponed doing so for the reason that many people postpone making their wills, but essentially it was political—a named successor would create a rival centre of power and an invitation to intrigue. 'I know the inconstancy of the people of England,' she observed privately in 1561, 'how they ever mislike the present government and have their eyes fixed upon that person who is next to succeed.'

Two other decisions could not be delayed—her choice of advisers and her attitude towards the war with France which she had inherited from her sister. On the very first day of her reign she appointed as secretary William Cecil (\*Burghley), whom she had employed as her estates surveyor. He was yoked with \*Knollys as vice-chamberlain, Nicholas \*Bacon as lord keeper, Clinton as lord high admiral, and \*Howard as lord chamberlain. Despite internal rivalries and some very rough treatment from the queen, they stayed in service until they died and, joined in 1559 by Dudley (Leicester) and from 1573 by \*Walsingham, formed a remarkable team.

Elizabeth was anxious to wind up the war against France, but dared not risk alienating her ally Philip, lest the nightmare possibility of a grand catholic coalition of Spain, France, and Scotland should come into existence. Nor could she easily reconcile herself to losing \*Calais and in the end a face-saving formula had to be devised. No sooner had she escaped from one conflict than another emerged—in Scotland where she was persuaded to intervene in 1560 on behalf of the protestant lords against the French. Though the assault on the French-held Leith castle was a dismal failure,

the death of Mary of Guise took the heart out of the French resistance and by the treaty of \*Edinburgh they agreed to withdraw. Elizabeth's initial reluctance was due in part to natural caution, concern for the cost of the enterprise, but also to the thought that helping subjects to resist their lawful monarch was a bad example. She showed less reluctance in her next adventure, which was an unmitigated fiasco. Religious wars in France in 1562 held out the hope of strengthening the protestant cause there and of regaining Calais. An expedition to assist the Huguenots took possession of Le Havre, to be exchanged for Calais. The French factions then made peace to unite against the English, the English force was decimated by disease, and obliged to surrender.

The next developments in foreign affairs were on a totally different scale—no limited interventions, but the great crisis of her reign. Three problems ran together in the 1570s and 1580s—the international religious question, the problem of Mary, queen of Scots, and the developing rift with Philip over the revolt of the Low Countries. For some time, even after the readoption of the governorship of the church, the reaction of the papacy was restrained, since it was not clear that the breach would be permanent and there were suggestions that Elizabeth was sympathetic to catholicism. But immediately after the failure of the rising of the \*northern earls, Pius V, far less moderate than his predecessor Pius IV who had extended an invitation to Elizabeth to send representatives to the Council of Trent, issued in 1570 a bull deposing her and absolving her catholic subjects from allegiance. The result was a series of plots against Elizabeth's life—\*Ridolfi 1572, \*Throckmorton 1584, Parry 1585, and \*Babington 1586. The second element of the worsening storm was the decision of Mary, queen of Scots, after her disastrous marriages to \*Darnley and \*Bothwell, to flee her country in 1568 and place herself under Elizabeth's protection. She was soon under close arrest. Despair at ever being released led Mary to dabble in plots and each plot produced fresh demands from ardent protestants for her execution. For many years Elizabeth resisted but the Babington plot sealed Mary's fate and she was executed in 1587. Elizabeth, characteristically, blamed her secretary Davidson for a misunderstanding but the confusion was largely diplomatic. The third factor was that relations with her erstwhile ally Philip broke down and from 1585 Elizabeth sent help to the Dutch rebels. Philip's retort was to begin planning the invasion of England and in July 1588 the great \*Armada left Corunna. At Tilbury, Elizabeth delivered the most famous of all her speeches, 'not doubting that by your obedience to my general, by your concord in the camp, and your valour in the field, we shall shortly have a famous victory over those enemies of my God, of my Kingdom and of my People.'

The defeat of the Armada turned her into a living legend and the most famous of all English monarchs. It was a fame she nurtured carefully, devoting great attention to the presentation of her image. Inevitably the later years were something of an anticlimax. Philip launched more attacks, the plots against her life continued, and the centre of anxiety moved to Ireland, where \*Tyrone's rebellion had Spanish support. Many of her counter-measures were unsuccessful and Essex's foolish behaviour in Ireland, followed by his

abortive insurrection, darkened her last days. But she died still in charge, capable of putting on performances and, at the end, naming 'our cousin of Scotland', James VI, as her successor.

Though her character was that of her father—a tempestuous personality with sunshine and heavy showers—her policies were more akin to those of her grandfather Henry VII—an attention to money bordering on meanness, reluctance to summon Parliament, and a disinclination to foreign adventure which would not only be expensive but place her at the mercy of the military. After the usual dip immediately after her death, her reputation soared and as the Stuarts floundered, the great days of Good Queen Bess seemed more and more golden. Lord Cobham at Stowe in the 18th cent. placed her in his temple of British worthies, along with Alfred the Great, Shakespeare, and Newton. The late 20th cent. saw criticism from historians, to whom admiration does not come easily. 'The defeat of the Spanish Armada in 1588 solved nothing', we are told—a very odd verdict. The love she claimed to have for her people was shallow and insincere; she outstayed her welcome until the gap between image and reality became grotesque; the young men at her court in the 1590s were impatient and ribald; many of her policies were muddled and she made procrastination an art-form; she took little interest in the mechanics of government; her religious policy pleased nobody. In most of these criticisms there is a grain of truth, but collectively they suggest a determination not to be pleased. It is easier to attack her religious policy than to suggest how ardent catholic and zealous calvinist could be reconciled, nor were many of her contemporary rulers conspicuously successful. Images are always inflated—that is their purpose—but it is to her credit that she understood the importance of imagery. Like all sensible rulers she was, of course, interested primarily in her own survival: dead monarchs have no policy. But though her treatment of men was often bad, her judgement of them was usually good. Essex captivated her but Cecil and his son ran the country. Her religious settlement may have been a patchwork of compromises but the Church of England took root and earned respect and affection. It is, of course, perfectly permissible to prefer the wisdom of her predecessor Mary, or the political skills of her successors James and Charles, but it would be a little strange. JAC

Haigh, C., *Elizabeth I* (1988); Johnson, P., *Elizabeth: A Study in Power and Intellect* (1974); Ridley, J., *Elizabeth I* (1987); Strong, R., *The Cult of Elizabeth: Elizabethan Portraiture and Pageantry* (1977); Somerset, A., *Elizabeth I* (1997).

**Elizabeth II** (b. 1926), queen of Great Britain and Northern Ireland (1952– ). When Princess Elizabeth was born to the duke and duchess of York in 1926 there was little reason to expect that she would succeed to the throne. Her uncle, the prince of Wales, was only 31 and was being urged to marry: it was also quite possible that her parents would have a son who would take precedence. But the birth of her younger sister Margaret Rose in 1930 closed the family account and the abdication of her uncle in 1936 brought her father to the throne as George VI.

The Yorks were a close-knit and affectionate family and the princess had a secure and uncomplicated childhood. Since she was not sent to school, nurses and governesses bulked large—Clara Knight ('Alla'), Margaret MacDonald ('Bobo'), and Marion Crawford ('Crawfie'). The first two spent the rest of their lives in royal service: the third eventually resigned to marry, broke the convention of confidentiality by writing a book about the two princesses, and was cast into outer darkness. Princess Elizabeth grew up pretty, cheerful, and obedient, though less vivacious than her younger sister. Her strong sense of duty called to mind her grandfather George V and Queen Victoria. As she grew up, Crawfie's instruction was strengthened by teachers brought in for constitutional history and languages and by visits to museums and art galleries. Her education remained unstructured and was further disrupted by the war.

Most of the war was spent at Windsor castle, where the princesses learned the art of rolling out of bed and into air raid shelters when the sirens sounded. At the age of 18, and with the war coming to a close, Elizabeth was allowed to join the ATS as a subaltern and went each day to Aldershot to take a driving and vehicle maintenance course. She was already devoted to her cousin Philip Mountbatten, a naval officer and five years her senior. They regarded themselves as engaged from the summer of 1946 and were married in November 1947. Their first child, Prince Charles, was born a year later. In 1952 she succeeded her father on the throne at the age of 25.

The coronation of 1953, the first to be seen on television, was a great success, a splash of colour and ceremony in a still austere post-war Britain. Excitable journalists wrote fatuously of a New Elizabethan Age to come. In fact criticism developed rather quickly. Though not shy, the queen had reserve and, though nobody could accuse her of taking her duties lightly, she did not seem much to enjoy them, having neither the warmth nor easy manner of her mother. In 1957 when Lord Altrincham complained that she sounded like a 'priggish schoolgirl', he was predictably threatened with horsewhipping and the borough of Altrincham hastened to dissociate itself from so subversive an opinion. Political clouds also rolled in quickly. Britain found it extremely hard to shake off recurrent financial and economic crises and the \*Suez fiasco of 1956 was a reminder that the country had neither its former strength, nor perhaps its confidence.

The two themes which dominated the early years of her reign were the painful process of economic recovery and withdrawal from empire. By 1953 the crippled economies of Europe were beginning to recover and Germany, in particular, proved a formidable competitor, especially in car manufacture. This was followed by the rise of the Far Eastern economies, and Japan, Hong Kong, and Korea, which before the war had been synonymous with cheap toys, demonstrated quality and inventiveness in radios, televisions, refrigerators, computers, and shipbuilding. Many of Britain's basic industries—railways, mines, shipyards, cotton mills—were in dire need of re-equipment and investment, yet at the same time there was an urgent demand for houses, schools, and hospitals. Her third prime minister, Harold \*Macmillan, wrote rather simply in July 1960, 'the public want them all,

but they do not like the idea of paying for them.' Several of her governments ran onto the rocks of balance of payments difficulties, inflation, unemployment, and runs on the pound: traditional industries declined and their replacements were slow to emerge.

The Suez crisis was only one of the more dramatic episodes in the retreat from empire. The withdrawal from India had taken place in 1948 before Elizabeth came to the throne. It was followed into independence by Malaya (1957), Ghana (1957), Nigeria (1960), Sierra Leone (1961), Tanganyika (1961), Uganda (1962), Jamaica (1962), Trinidad (1962), Zambia (1964), and Aden (1967). The withdrawals were effected with relatively little rancour, though there was fighting in Malaya (1948–60), in Aden (1963–73), a protracted crisis over Southern Rhodesia (1965–80), and an unpleasant and tedious campaign in Kenya against \*Mau Mau from 1952 to 1955. The queen and the royal family played an active role in efforts to transform the empire into a commonwealth of equal states. But most of the newly independent countries opted to become republics and although the queen remained head of the Commonwealth, her role was largely social. The strength of Commonwealth bonds was weakened by Britain's increasing involvement with Europe. In addition, two of the most influential Commonwealth states seceded for long periods—South Africa between 1961 and 1994, and Pakistan from 1972 until 1989. Royal visits to the former dominions continued but even there difficulties emerged, with severe federal problems in Canada and moves towards republicanism in Australia.

The later years of her reign have seen considerable economic progress, though still subject to sudden mishaps. Macmillan's remark of 1957—'most of our people have never had it so good'—was premature, but despite a decline in Britain's comparative trading position, the gross national product continued to grow, albeit slowly, and her subjects acquired television sets, cars, telephones, washing machines, and spin-driers on a scale quite unknown in 1952. This was partly because the sharp rise in world oil prices which followed the Arab-Israeli war of 1973 and which threatened acute balance of payments problems was offset by the exploitation of North Sea oil from 1975 onwards.

As the empire shrank and economic performance faltered, Britain's relationship with Europe emerged as a major issue. It had implications for the monarchy since the more advanced schemes for a federal Europe would affect sovereignty. A British/European coinage which did not include the monarch's head would be a breach with tradition dating back to \*Offa and \*Alfred. Britain's first two applications to join the \*European Economic Community were vetoed by de Gaulle in 1963 and 1967, before Edward \*Heath's government gained acceptance in 1972. In the 1980s, as what was at first envisaged as a trading community moved towards political integration, the question of 'Europe' moved steadily to the front of the political agenda.

Of more immediate concern to the queen was probably the role of the monarchy itself and the vicissitudes of the royal family. The latter were a mixture of bad luck, compounded by the rapidly changing values of society, and the emergence of an intrusive and insistent press, which took

pride in its lack of respect. The days when an innocent party in a divorce action could not expect an invitation to royal functions were long past, and the restraint that had kept Edward VIII's infatuation with Mrs \*Simpson out of the news until the very last minute would have been unthinkable 40 years later. The first indications that the royal road might be bumpy came in 1953 when the queen's sister wished to marry a distinguished airman, Group Captain Peter Townsend, who was in the process of divorcing his wife. The issue came to a head at the very start of the new reign and the princess was persuaded not to marry him. When she did marry Anthony Armstrong Jones in 1960, it ended in divorce. These were no more than the drops of rain that preceded the deluge. The queen's cousin Lord Harewood was divorced for adultery in 1967. The marriages of three of the royal children also ended in divorce. The princess royal's marriage to Captain Mark Phillips was dissolved in 1992; the duke of York divorced Sarah Ferguson in 1995, and the protracted and much-publicized rift between the prince and princess of Wales ended in divorce in 1996. In November 1992 at the Guildhall, the queen referred ruefully to a year which had seen one divorce, two marital breakdowns, and a devastating fire at Windsor castle as 'not a year on which I shall look back with undiluted pleasure . . . an *annus horribilis*'. Many people must have wondered whether the victory of the 'modernizers' in the palace over the 'traditionalists' had been of benefit to the monarchy. The incessant publicity which surrounded the royal family as a result of the activities of the 'royal rat-pack' suggests that it is easier to start the process of reform than to control it, and that lifting the curtain to let in a little light might encourage people to burn the curtain itself.

It is too soon for any informed assessment of the queen's constitutional role. Though her prime ministers have enthusiastically published their memoirs, they have been bland in their references to the sovereign. There was some criticism of the procedure in 1957 when \*Eden was forced by ill-health to resign and was succeeded by Macmillan rather than \*Butler. But the lord chancellor and the lord president of the council (Kilmer and \*Salisbury) were asked to sound the cabinet, and its strong preference for Macmillan was confirmed by the chief whip, the chairman of the 1922 committee, the chairman of the Conservative Party, and Sir Winston \*Churchill. The queen certainly did not act against advice. Nor did she in 1963 when the choice of Lord \*Home to succeed Macmillan caused surprise. She acted on the advice of Macmillan himself, whom she visited in hospital. Changed arrangements in the Conservative Party in 1965 for electing its leader make it unlikely that this royal prerogative will cause awkwardness in future. Nor will many others. At every general election there is earnest discussion of the attitude the queen would take should there be a 'hung Parliament' but the contingency is remote, and the mechanics of consultation seem well established.

There is no doubt that, from the 1980s onwards, there has been increased criticism of the royal family, though not of Elizabeth herself. The urge by some of its members to seek publicity and unburden themselves to the press proved short-sighted and merely fed the monster. The decline in

respect is a general phenomenon and applies to many other institutions—to the church, the law, Parliament, and, not least, to the press itself. It is often said that the royal family has become a soap opera. But this element has always been present, centuries before the term 'soap opera' was coined, since spectacle and pageantry, spiced by gossip and anecdote, have always been part of the monarchy's appeal. Not for nothing is the longest running soap opera called *Coronation Street*. Yet a policy of openness, inaugurated by the film *Royal Family* (1966), has evident dangers. Satire, which in the 1960s was refreshing and witty, may become coarse and spiteful. Newspapers are not slow to understand that fervent admiration sells fewer papers than indignation and envy. 'The Palace' has often had to ponder the balance between over- and under-exposure. That the latter has its risks is demonstrated by the example of Queen Victoria's unpopularity during her seclusion after Albert's death. But the problems caused by under-exposure are more easily remedied.

Bradford, S., *Elizabeth* (1996); Bogdanor, V., *The Monarchy and the Constitution* (Oxford, 1995); Cannon, J. A., and Griffiths, R. A., *The Oxford Illustrated History of the British Monarchy* (Oxford, 1988); Longford, E., *Elizabeth R: A Biography* (1983); Pimlott, B., *The Queen* (1996).

**Elizabeth of Bohemia** (1596–1662). The lives of Elizabeth and her husband are part of the fabric of European history. The eldest daughter of James VI and I and sister of Charles I, she married in 1613 Frederick of the Palatinate. Five years later, the Bohemians elected Frederick as king in defiance of the Habsburgs. In the wars that followed, they were driven out of their new kingdom and the Palatinate overrun. She spent only October 1619–November 1620 at Prague and hence was known as the 'Winter Queen'. Elizabeth's husband died in 1632 and her son Charles Lewis was not restored to part of the Palatinate until the peace of Westphalia in 1648. By then her native land was in turmoil and she was forced to continue abroad: her small court was said to be overrun by rats, mice, and creditors. After the Restoration, she visited her nephew Charles II in England in 1661 but died shortly afterwards. She was the mother of Prince \*Rupert and through her daughter Sophia the Hanoverians came to the throne of Britain in 1714. \*Pepys, who saw her in 1660, thought her a 'plain lady', but in Sir Henry Wotton's poem 'Ye meaneer beauties of the night', written about 1619, she was portrayed as a vision of loveliness.

JAC

**Elizabeth Bowes-Lyon** (1900–2002), queen of George VI and queen mother. Perhaps the most remarkable member of the royal family in modern times, Elizabeth was born at St Paul's Waldenbury (Herts.), daughter of Claude Bowes-Lyon, 14th earl of Strathmore in the Scottish peerage. The earliest title in the family was Lord Glamis (1445). Her mother was a great-granddaughter of the 3rd duke of Portland, prime minister 1783 and 1807–9. She had six brothers, one of whom was killed in the Great War, and three sisters, one of whom died before Elizabeth was born. Her childhood was extremely happy, mainly because of the high spirits of her mother: 'fun, kindness, and a marvellous sense of security' was her own summary. When she was 19 she

## Elizabeth Woodville

met Prince Albert (duke of York and future George VI) and in 1923, after some hesitation, agreed to marry him. Their daughters Elizabeth and Margaret Rose were born in 1926 and 1930. The abdication of her brother-in-law Edward VIII in 1936 brought her husband to the throne and made her queen. During the Second World War the royal couple played a prominent role and their decision not to leave London was an important boost to national morale. George VI's death in 1952 at the age of 56 left her facing a long widowhood. She took the title Her Majesty Queen Elizabeth the Queen Mother. Into advanced age she carried out numerous public duties, which she fulfilled with a grace and warmth universally acknowledged, and her 90th birthday in August 2000 was celebrated with widespread admiration. In later years, much of her time was spent at her London home of Clarence House or at the small castle of Mey in Caithness-shire. She died peacefully at Windsor on 30 March 2002.

JAC

**Elizabeth Woodville** (c.1437–92), queen of Edward IV. Elizabeth was a widow with two children when she married Edward IV secretly at Grafton Regis (Northants) on 1 May 1464. She was the daughter of Earl \*Rivers and Jacquetta of Luxembourg. Almost certainly a love match, the unconventional and unwise marriage to a woman whom contemporaries considered beneath the king's dignity caused political tension, and later allowed Richard III to claim that their children were illegitimate. Her reputation has suffered from the hostile propaganda of her enemies, especially Richard III, who accused her of witchcraft. Yet the Croyland chronicler, the best-informed contemporary, described her as benevolent. In truth she was far more sinned against than sinning, by both her unfaithful husband and ambitious brother-in-law. After the disappearance of her son Edward V in 1483, she endeavoured, ineptly, to play one side against the other. After Bosworth, although her daughter \*Elizabeth became queen, she was excluded from court and induced to retire to Bermondsey abbey. In her prosperity she was the second founder of Queens' College, Cambridge, where her portrait hangs.

AJP

**Elizabeth of York** (1466–1503), queen of Henry VII. Henry set the seal on his great victory at \*Bosworth in August 1485 by his marriage in January 1486 to Elizabeth, daughter and heiress of Edward IV, thus uniting the houses of York and Lancaster. She had spent the first year of Richard III's reign in sanctuary at Westminster and there were rumours that Richard was to marry her after his wife's death in March 1485. She does not seem to have wished for a political role as queen and died soon after the birth of her last child in the Tower on 11 February 1503. She was said to be beautiful, with golden hair and a pleasant manner. She was buried in Henry VII's great new chapel at Westminster abbey.

JAC

**Ellendun, battle of**, 825. \*Egbert's victory over Beornwulf at the battle of Ellendun marks the transition of political overlordship within the Anglo-Saxon kingdoms from Mercia to Wessex. Fought just south of Swindon near the modern village of Wroughton, it gave Egbert mastery of the critical strategic area leading into the middle Thames valley and

prepared the way for assertion of effective West Saxon control of England south of the Thames and the south-west up to the borders of Cornwall. Beornwulf is a shadowy figure whose political authority rested on a shaky basis and whose connection with the old ruling Mercian dynasty was dubious. Within a twelvemonth of Ellendun he was killed on a campaign against the East Angles.

HL

**Elmet, kingdom of**. British kingdom based in the south-west of Yorkshire, including the area around Leeds; modern place-names with the suffix 'in-Elmet' delineate its eastern border. At the beginning of the 7th cent. its king Gwallog was allied with other British rulers against Hussa and Theodor of \*Bernicia. The last known British king Ceretic was driven out by \*Edwin of Deira c.616, perhaps in revenge for the death of his nephew Hereric who had been poisoned in the province. Elmet is listed in the Tribal Hidage, but probably before the end of the 7th cent. had been fully incorporated into Deira. The name is perpetuated in a parliamentary seat.

BAEY

**Elmham, diocese of**. The see of Elmham, conterminous with Norfolk, was created c.673 by \*Theodore's division of the East Anglian bishopric of \*Dunwich. The Danish invasions caused an interregnum, but Elmham revived to have oversight of both Norfolk and Suffolk. The see was moved to Thetford in 1072 and soon afterwards to \*Norwich. WMM

**Eltham palace** near Greenwich in Kent was acquired as a manor house by Edward II in 1311 and expanded by Edward III. It remained an important royal residence throughout the 15th cent., Edward IV adding a great hall. Tudor monarchs continued to make use of it but before the Civil War it had fallen into disrepair. The great hall was rescued in the 19th cent. after it had been used for decades as a barn. JAC

**Ely, diocese of**. The see, now roughly conterminous with Cambridgeshire, was created in 1109. King \*Edgar and \*Æthelwold founded a monastery here in 970 to replace the double monastery, established in 673, but destroyed by the Danes in 870. The new wealthy monastery was one of the last English strongholds against the Norman invaders (1070). When the see of \*Dorchester was transferred to \*Lincoln in 1072, the abbot's request for a bishopric was not granted until 1109, when Henry I and \*Anselm carved the Ely diocese out of the vast see of Lincoln. Based on a rich abbey, in Domesday second only to \*Glastonbury in wealth, Ely was in the first league. Together with the archbishops of Canterbury and York and the bishops of \*Winchester and \*Durham, bishops of Ely had an income equal to the wealthiest barons. The second bishop, Nigel Le Poer (1133–69), emulated his uncle, \*Roger of Salisbury, Henry I's justiciar, by becoming treasurer of England and was instrumental in reforming central government under Henry II. William \*Longchamp (1189–97) was chancellor and justiciar under Richard I. His successor Eustace (1198–1215), also chancellor from 1197, had to flee after becoming involved in John's dispute with Innocent III. The 13th-cent. arrival of the Franciscans in Cambridge accelerated the university's growth. The bishops of Ely kept a watchful eye on this new development. Hugh de Balsham founded the first college,

Peterhouse, in 1284 and subsequent bishops retained their right to confirm the chancellorship until 1401. In 1836 the bishops lost their ancient secular jurisdiction over the Isle of Ely, to compensate which, in 1837, the see was enlarged by the addition of Bedfordshire, Huntingdonshire, and parts of Suffolk. In 1914, nevertheless, the diocese lost Bedfordshire to St Albans and west Suffolk to Bury St Edmunds. The town for centuries had a reputation as a squalid and unhealthy place, but the cathedral, begun c.1083, rose majestically above the fens, a landmark for miles. It has a Norman nave and is noted for its 14th-cent. octagonal lantern tower and its unusual northerly Lady Chapel. WMM

**Elyot, Sir Thomas** (c.1490–1546). Humanist, administrator, and political theorist. Elyot, whose family were Wiltshire lawyer-landowners, was educated at Oxford and the Middle Temple. Clerk to the justices of assize (1511–26) and to Henry VIII's council (c.1523–30), he retired in 1530 to Carlton, near Cambridge, being knighted in the same year and made ambassador to Charles V in 1531–2. In the 1520s Elyot frequented the humanist circles of Richard Pace and Thomas \*More. Though remaining a suspect catholic, he benefited materially from the \*dissolution of the monasteries. A portrait drawing of him by Holbein (c.1532) is at Windsor castle. Elyot's *Book Named the Governor* (1531) advocated a monarchical 'public weal' for England and described the education, on Italian humanist lines, necessary to prepare Englishmen to help the king rule it. His use of English for his *Governor* and more than a dozen other works was intended to show how the vernacular, improved by Latin and Greek example, could encourage wise conduct. JBT

**emigration** is the departure of persons from their native country to settle permanently in another. This may be prompted by the 'push' of religious or political persecution or the 'pull' of work opportunities elsewhere. Governments have used emigration as a policy for keeping law and order at home and for populating new overseas colonies when empires expanded.

In the British Isles the first of the relatively large-scale emigrations occurred with the opening up of the New World in the late 16th and 17th cents. Many of those who looked for greater political and religious freedom chose to emigrate. The puritans who sailed to North America on the *Mayflower* in 1620 sought the opportunity to practise their religion without interference. Sometimes the emigrants had considerable influence. The quaker William \*Penn persuaded Charles II to grant a charter to the colony, later called Pennsylvania, to provide specifically for freedom of worship and expression. At this time the government also wished to populate and provide workers in the expanding overseas colonies in the West Indies. Initially, emigrants were convicted criminals who worked in the sugar, tobacco, and cotton plantations. Similarly during the 18th cent. the demand for cheap labour in Australia stimulated the government to transport convicts from the 1790s until the 1850s. Convicts, freed after completing their sentences, often preferred to remain and make their lives in the colonies.

Individuals also left Britain voluntarily to seek better opportunities overseas. During the 18th cent., Scottish emi-

grants took service in the Russian army and settlers from all over the British Isles moved to the American colonies (later the USA and Canada) to take up work in agriculture, commerce, and trade in natural resources such as furs and timber. Among the more prosperous manufactures was shipbuilding in New England for the European market.

During the 19th cent. emigration was on a scale hitherto unknown. The port of Liverpool became the most important departure place for all emigrants and 15 million persons (from the British Isles and northern Europe) were recorded as having left through that port between 1815 and 1914.

Two of the best-documented emigrations were those caused by hardship. In the early 19th cent. the clearances of the Scottish Highlands forced people off the land and large numbers of Highlanders emigrated to Canada and Australia in search of new lives. In the 1840s the Irish potato famine reduced the population by almost half when large numbers settled elsewhere including Britain, the USA, and Australia.

Emigration to all parts of the British empire was encouraged by the government. Commentators such as Gibbon \*Wakefield in his book *A Letter from Sydney* argued that emigration was the solution to the dangers of overpopulation identified by Thomas \*Malthus. In addition, colonial governments, such as that of New South Wales, offered free or assisted passages to emigrants and advertised widely in British local newspapers. Encouragement to emigrate was reinforced by those who had settled earlier in the colonies. Not all British emigrants settled in British colonies. Argentina also had a policy of encouraging settlers and descendants of Welsh emigrants to Patagonia continue to keep alive Welsh culture there to this day.

In the 20th cent. emigration continued to the Commonwealth and to the USA, but at a slower rate. Work opportunities declined as a consequence of the world-wide economic depression, as well as the changing links between Britain and her former empire. After 1945 emigration opportunities were increasingly under the control of overseas governments wishing to select only those migrants who had relevant skills. IJEK

**Emma of Normandy** (d. 1052), queen of \*Æthelred II and of \*Cnut. Emma played an important role in the confused succession to the English throne between 1016 and 1066. Early in life she became the second wife of Æthelred II (1002). Her first son, \*Edward, succeeded to the English throne in 1042: her great-nephew was William the Conqueror. After the death of Æthelred in 1016 she married Cnut. On his death in 1035, Emma tried to obtain the kingdom for their son \*Harthacnut, who was then about 16. In 1037 she was obliged to take refuge in Flanders but returned with Harthacnut in 1040. When he died two years later, her first son, from whom she was alienated, took the throne. Much of her property was seized and she lived in retirement at Winchester, where she was buried with her second husband, Cnut. Henry of Huntingdon called her 'the gem of the Normans'. JAC

**Emmet, Robert** (1778–1803). Irish patriot. Emmet, a middle-class protestant republican, came to prominence after the

failure of the 1798 rising. He was influential in reactivating the United Irish movement in 1799, and in 1801 journeyed to Paris in order to revive French support for the Irish republican cause. After March 1803 Emmet and other United Irish veterans of the 1798 rising began to prepare a second revolt. This occurred in a haphazard fashion on 23 July in Dublin, and although swiftly suppressed, caught Dublin castle ill prepared. Emmet escaped into the Dublin mountains, but was captured in August, and tried for treason. A lengthy state trial was held: Emmet, who readily accepted his guilt, was convicted and hanged. His youth and liaison with Sarah Philpot Curran have encouraged portrayals of the rebellion as a romantic, impulsive, and idealistic gesture. But Emmet had maintained a high standard of secrecy and professionalism in his preparations, and had an elitist conception of Irish independence far removed from that of the catholic democrats who later idealized his actions. AJ

**Empson, Sir Richard** (d. 1510). Empson and his colleague and neighbour Edmund \*Dudley were the first victims of Henry VIII's ruthlessness. Empson came from Towcester in Northamptonshire, took a legal training, represented his shire in the Parliament of 1491, and was elected Speaker. In 1504 he was knighted and appointed chancellor of the duchy of Lancaster. His zeal in collecting taxes and fines on behalf of Henry VII made him extremely unpopular and he was among those servants of the king denounced by Perkin \*Warbeck in 1495 as 'cattiffs and villains'. On the second day of Henry VIII's reign he was arrested and sent to the Tower on a trumped-up charge of treason. He was executed with Dudley on Tower Hill. JAC

**enclosures.** The process of 'enclosing' land into 'private' holdings goes back many centuries, and was a development from the system of open field farming which predominated in much of northern Europe during the medieval period, although in all periods enclosure was frequently of common and waste as well as cultivated land. Enclosure changed agricultural practices which had operated under systems of co-operation in communally administered landholdings, usually in large fields devoid of physically defined territorial boundaries. Instead, agricultural holdings were created which were non-communal, and within man-made boundaries which separated one farm from another. Communal obligations and rights were abolished.

In the 16th cent. landlords tried to enclose their land in order to keep more sheep. This process was condemned by the church and opposed by the government, which passed legislation designed to prevent enclosure. By the 1630s and beyond government opposition was breaking down, and a good deal of 'by agreement' enclosure took place in the period c.1630–c.1750, with large areas of land, particularly in the midlands, being converted from mixed arable farming to pasture. The extent of 'by agreement' enclosure is still debated, largely because it was not necessarily recorded.

From 1750, and in complete contrast to the 16th-cent. practice, Parliament began to pass bills to allow for the enclosure of the land under certain clearly defined conditions. As a result, between 1750 and 1830 in England more than 4,000 enclosure Acts were passed, and approximately 6.8

million acres across the country subjected to enclosure. In rough terms 21 per cent of the land area of Britain was enclosed by parliamentary Act in this period. The process varied regionally, the Welsh borders and south-eastern England experiencing very little enclosure, while more than half the land surface was enclosed by Act in Northamptonshire, Cambridgeshire, and Oxfordshire. The process continued through the 19th cent. with another 3 per cent of the land area enclosed by 1914, when there were hardly any open fields remaining. Only in the Nottinghamshire village of Laxton does a common field system continue to operate to this day.

Enclosure in Scotland occurred primarily in the 18th cent., in the Lowlands in the 1760s and 1770s and in the uplands at the end of the century. The extent of enclosure was rather less than in England, at least in terms of the acreage involved, but then again the area of land available in Scotland to enclosed farms was relatively small. It also seems likely that enclosure in Scotland was frequently the final deed in a long-drawn-out process of change. JVB

**Encyclopaedia Britannica.** A typical product of the Enlightenment, when there was a vast amount of new knowledge to be disseminated and a rapidly growing reading public. It was a riposte to the French *Encyclopédie* and was published in three volumes between 1768 and 1771 by a consortium of Edinburgh printers, Andrew Bell, Colin Macfarquhar, and William Smellie. The sequence was alphabetical and the articles lengthy. It is now in its 15th edition (1992). JAC

**Engagement, 1647.** Charles I gave himself up to the Scots in 1646 and began negotiations. In December 1647, while at Carisbrooke castle, he signed a secret treaty or engagement, buried in a lead casket, whereby \*presbyterianism should be established in Scotland, and in England for three years. In exchange, the Scots promised an army to enforce these terms. The result was the second civil war in 1648. But the Scottish army under \*Hamilton which invaded England was routed by \*Cromwell at \*Preston in August 1648. JAC

**Engels, Friedrich** (1820–95). Engels was the lifelong collaborator of Karl \*Marx and systematizer of Marxism. Son of a German textile manufacturer, Engels worked in a family-owned cotton mill in Manchester. He met Marx in 1842, forming a close working partnership with him, and together they wrote the *Communist Manifesto* during the revolutionary unrest of 1848. Engels, who gave Marx generous financial help, was closely involved with all of Marx's writings (their complete works are generally published together), and functioned as the authentic voice of Marxist views after Marx's death. In addition, Engels contributed a distinctive dimension to Marxist ideology—what has been termed 'dialectical materialism'. In his *Socialism, Utopian and Scientific* (1892) he applied the laws of dialectical materialism to history; in *Dialectics of Nature* (post-1927) he applied them to natural science. Whatever Marx himself would have thought of these crudities, they were incorporated into the official Marxist creed that flourished in the USSR and eastern Europe for most of the 20th cent. TSG

**engineering industry.** Engineering can take a variety of forms—civil, military, or mechanical—but the term ‘engineering industry’ is normally used in a more limited sense to describe the industry devoted to the manufacture of engines, machine-tools, and machinery. Up to the 18th cent. such products had traditionally been made by craftsmen such as blacksmiths and millwrights working in their own forges or workshops, but the rapid increase in the processes of industrialization in Britain encouraged the emergence of the modern engineering industry, with power-operated machine-tools brought together in factories, served by forges, foundries, and carpenters’ shops preparing metal and wood parts for processing and assembling. The first organized array of these facilities was probably the factory at Soho in Birmingham developed by Matthew \*Boulton to manufacture the steam-engines of his partner, James \*Watt.

Other manufacturers of steam-engines built up similar establishments, while some engineers entered the business to make textile machines or—like Henry Maudslay in Lambeth—better machine-tools. Maudslay responded to the need for greater precision in lathes, drills, planing machines, and other tools for cutting and shaping metal, and set new standards of excellence. He also trained a generation of engineers, including Richard Roberts, James Nasmyth, and Joseph Whitworth, who further improved reliability.

Whitworth, who became an outstanding figure in British engineering in the middle of the 19th cent. and won prizes at the \*Great Exhibition of 1851 for his superb machines, also achieved considerable success in standardizing screws and other basic machine parts. This made possible the development of mass production, whereby machines could be manufactured from sets of identical parts. Such practices had been established at the beginning of the 19th cent. by Marc Brunel and Henry Maudslay in order to create their famous block-manufacturing workshop in the royal dockyard at Portsmouth. But they were adopted with most enthusiasm by the new engineering industry of the USA, so that they became known as the ‘American system’ of engineering and were widely used in the manufacture of small arms, sewing-machines, and agricultural equipment.

The next stage in the development of the engineering industry was the introduction of systematic assembly techniques based on the moving assembly line, with all the processes linked together in a ‘flow’ pattern which enabled a complicated product like a motor car to be built quickly and economically. Once this had been achieved it became possible to introduce more and more automation in the performance of the functions of the assembly line. A modern automobile factory, for instance, uses electronically controlled ‘robot’ machines to perform most of the manufacturing processes, with the human participation reduced in numbers to a small team of controllers and maintenance staff. RAB

**England, kingdom of.** The kingdom of England was created by its monarchs. Successive rulers, sometimes from ambition, sometimes from fear, strengthened their armed forces, extended their boundaries, imposed law and order on their quarrelling subjects, introduced standardized coinage

and administration, and encouraged one religion. Once a nation had been created, the monarchy, its task done, became redundant, save as a symbol of unity and a constitutional device. The afternoon in 1649 when Charles I stood in Westminster Hall and was told that he was indicted by the English people was the moment when Frankenstein’s monster destroyed its creator. Though the monarchy was restored, the experience of the Commonwealth suggested that the nation could function without a king: far from falling into anarchy and confusion, Cromwell’s England became a powerful force in Europe and the world.

Such an exposition may sound teleological, purposive, and complacent. It is not. There was no predestined goal, no manifest destiny, save perhaps towards a kingdom of the British Isles, which was never quite achieved. It is not a story of steady progress, each ruler improving on the work of his forebears: some rulers were incapable of the task, others lacked interest or had different priorities. There were moments when the kingdom seemed in danger of being washed away or disintegrating—in the 9th cent. when the Vikings overran most of the country, in the 15th cent. when royal authority faltered in the Wars of the Roses, or during the great Civil War when the nation seemed about to destroy itself.

The evolution of the kingdom of England had, therefore, two aspects, its relations with other peoples—Britons, Vikings, French, Scots, Welsh, Irish—and its development as an effective political and military organism. One of the most useful weapons of the monarchy was ideology—respect for kingship, awe at its supernatural origins, belief in its identification with the nation, its past, its triumphs and tribulations. The relationship of monarch and people was symbiotic and changing. The monarch strove to create a nation out of different tribes and peoples: the nation often responded to the monarch, but also advanced claims and demands. If the monarch was, as often asserted, the father of his people, what should be done about a monarch who neglected them, was clearly incompetent, or did not appear to represent their interests?

Many of the characteristics of the English kingdom which emerged derived from the circumstances of the Anglo-Saxon settlements. The settlers came largely from Schleswig-Holstein, where there is a region still called Angeln today. Since the Angles settled mainly in the eastern part of their new land, the Celts were more likely to come into contact with the Saxons, from Holstein. Because of geographical distance, Britain had not been as Romanized as Gaul or Spain. Latin was not widely spoken and English did not have to come to terms with it. Though many Britons remained behind, the fact that much of the north and west of the mainland was mountainous and that the Saxons arrived from the south and east influenced the ultimate division between Saxon and Celt. The mountains of Wales and Scotland provided refuges: they were also less attractive to settlers and less worthwhile to conquer.

Bede’s account of an English nation in 731 was as much a programme as a description of the immediate reality. The English settlers were divided into a number of kingdoms, waging constant warfare, the borders vague, the fortunes

fluctuating. The enmities between them invited Celtic counter-attack if it could be organized. But the Celts were also divided and, though they were able to inflict sharp defeats on the Saxons, they were not able to drive them out. While the small kingdoms of East Anglia, Kent, Essex, Mercia, Northumbria, and Wessex struggled for supremacy, a kingdom of England remained a long way off. But in the title of 'bretwalda'—overlord of Britain—may be seen aspiration, even if the substance was shadowy and fleeting. Had Northumbria been able to consolidate its 7th-cent. superiority, a more northerly based English kingdom might have come into existence, perhaps centred on York, and with the border much further to the north along the line of the Forth. But with the decline of Northumbria, the struggle was between Mercia and Wessex and the probability was that any English kingdom would be southern. It retained that character throughout its history, despite the personal union with Scotland in 1603. In 1760, though George III gloried in the name of Britain, he not only failed to visit Ireland, Scotland, or Wales, but never penetrated north or midlands England.

From the incessant warfare of the first three centuries of Saxon settlement emerged the kingdom of Mercia. In the later 8th cent., \*Offa (d. 796) overran Kent and Essex, including London, pushed back the Welsh, and confined Wessex to south of the Thames. His great dyke remains the rough border between England and Wales. At one stage he took the title Rex Anglorum and Pope Hadrian I recognized him as that. Though Northumbria was not conquered, its king, \*Æthelred, married one of Offa's daughters. But Mercia's supremacy depended essentially on Offa's personal prestige and his country was in decline before the Viking raids commenced in the 9th cent. By 878, the north and midlands, including Mercia, had fallen to the Danes, and \*Alfred of Wessex was hanging on precariously in the Somerset marshes.

For some time it looked as if Viking raids and settlement would destroy the possibility of an English kingdom and that the British Isles might become part of a grand Scandinavian empire, based on the North Sea. But, in the event, the Vikings promoted the emergence of a kingdom of England. First, by destroying Northumbria and Mercia, they cleared the way for the supremacy of Wessex. Secondly, the effort required to throw back the invaders gave Wessex a new vitality, perhaps a rare instance of Toynbee's dictum of challenge and response. Alfred's counter-attack was so vigorous that he was able to divide the country between Wessex and the Danelaw, and his successors built upon his achievements. \*Edward, his son, and \*Æthelfleda, his daughter, began the reconquest as far as the Humber, and before his death in 924 Edward had received the submission of northern England. Edward's son \*Athelstan went further, receiving the submission of the princes of Wales, the king of the Scots, and the Cornish Britons. In 937 he confirmed his supremacy with a crushing victory at \*Brunanburh. Not only had a recognizable kingdom of England been reconstructed from the remnants of Wessex but a vision of a kingdom of Britain began to be entertained. \*Edgar was said to have been rowed on the Dee at Chester in 973 by British, Welsh, and Scottish

kings, though whether this was alliance or homage is not clear.

Compared with the early Saxon kingdoms of the 7th cent., Athelstan's England was capable of sustained military effort. Strong points or burhs were constructed; control of coinage established; a navy created, and the kingdom divided up into shires and hundreds. The taxation required to resist or buy off the Danes became a permanent feature of the royal finances. The church had gradually built up an ecclesiastical network, with the two archbishoprics of Canterbury (597) and York (625), and bishoprics at London (604), Rochester (604), Winchester (660), Lichfield (669), Hereford (676), Worcester (680), Wells (909), and Durham (995). The strength of the monarchy and the identity of the nation were so well established that the succession of a Danish king, \*Cnut, in 1016 no longer threatened disintegration, any more than did the succession of a Dutchman (William III, 1688) or a German (George I, 1714).

It follows therefore that when William and the Normans conquered in 1066 the existence of the kingdom of England was not in jeopardy, though the context in which it was to exist remained doubtful. Though there was an almost total change of top personnel, Norman nobles and bishops replacing Saxon ones, there was no mass settlement and the small number of Normans was bound to be absorbed before long. Some indication of the precariousness of a lone Norman in a largely hostile population can be gauged from William's institution of \*Englishry—that a murdered man would be presumed to be Norman, and the hundred fined accordingly, unless it could be proved otherwise. But the ruthless rule of the Norman kings meant that the kingdom was less likely to disintegrate than ever. The main effects were twofold. First, Englishmen and the English language were under a cloud for several generations. Secondly, the country found itself in the wider context of western Europe, as part of an empire which included, at times, most of France.

But soon the kingdom recovered its English character. The Conqueror's youngest son, Henry I, was born in England in 1068, possibly at Selby, brought up in the country, and spoke the language. Within three months of succeeding Rufus in 1100 he had married an English princess, the great-granddaughter of \*Edmund Ironside. In just over 100 years from the Conquest, Richard \*FitzNigel could write that 'nowadays when English and Norman live close together and marry . . . it can scarce be decided who is of English birth and who Norman'. The English language, which had given way in court circles and administration to Norman French or Latin, took longer to recover, partly because of the international utility of Latin. But in 1362 Parliament was opened with a speech in English and the law courts were instructed to hear cases in the English tongue. There were of course persistent complaints throughout the period of the influence of foreigners, particularly Provençals and Poitevins under Henry III, but they illustrate dominant Englishness and are paralleled at a much later period by complaints against Scottish, Dutch, and German favourites at court.

Meanwhile the power of the king's government increased. A network of royal castles pinned the country down mili-

tarily. One of the greatest of unifying forces was the development in the 13th cent. of Parliament, with representation, usually at Westminster, from most parts of the kingdom. Though in the long run Parliament was to challenge the monarchy, for the first four centuries it was an obedient servant and added greatly to royal power. In the 14th cent., and particularly during the reign of Edward III, came important developments in the legal system—the institution of regular assizes, bringing most of the country under royal justice, and the growing use of justices of the peace to maintain law and order in the localities. In the 16th cent. came further additions—new instruments of government like the prerogative courts and the use of lords-lieutenant for shire administration. Above all, the destruction of papal power by Henry VIII in the 1530s removed a rival source of authority and placed the monarch at the head of the church, with all its resources and powers of persuasion.

The connection with Normandy did not last long and John lost it to Philip Augustus of France in 1204. But the English kings retained Poitou and \*Aquitaine. The remaining territories were not lost until 1259 and even then the kings of England, from Edward III to Henry VIII, strove, with varying degrees of success, to regain their former territories. Not until the loss of \*Calais in Mary's reign in 1558 did the dream of a French empire finally vanish.

In succeeding to the Anglo-Saxon state, the Normans succeeded to its neighbours in the British Isles. The north of England had never been fully integrated into the Anglo-Saxon kingdom. William I's answer was the fearsome harrying of the north in 1069 and 1070, following the last great intervention of a Danish force in English affairs. Against Scotland, William achieved a temporary supremacy with a campaign in 1072 as far as the Tay, forcing \*Malcolm Canmore to do homage. Of more lasting consequence were the Norman advances against Wales and Ireland, which Saxon England had not been strong enough to attempt. The foundation for the eventual conquest of Wales was laid by the creation of the marcher earldoms and by the colonization and castling of Pembrokeshire and south Wales. The first Norman kings did not attempt anything against Ireland, though a Norman ecclesiastical organization was introduced under the primacy of Canterbury and an archbishopric founded at Armagh. In 1170 Strongbow took advantage of the feuds between the Irish to intervene and in 1171 Henry II landed at Waterford, received the submission of many of the Irish chiefs, and built a palace at Dublin. A foothold had been established.

The transformation of the small Wessex kingdom into a kingdom of Britain was built on these foundations. The conquest of Wales was completed by Edward I. After \*Glyndŵr's rising in the early 15th cent., the Welsh were subjected to savage penal laws, but the advent of a Welsh dynasty, the Tudors, in 1485 facilitated an accommodation. The principality was brought into the English political and administrative system in 1536 by the Act of \*Union, which gave the Welsh representation at Westminster and divided the country up into shires on the English pattern. The conquest of Ireland proceeded by fits and starts, according to English preoccupations elsewhere. The foothold was never

quite lost to counter-attacks. Richard II led two expeditions in 1394 and 1399 to secure the Pale and by \*Poynings's law of 1494 the English established control over the Irish Parliament. Henry VIII declared himself king of Ireland in 1541. Later, the Elizabethan settlements, the influx into Ulster from Scotland, and the Cromwellian land redistributions strengthened the English position.

Scotland was a different matter. For centuries the border in the north fluctuated and in 1092 Rufus seized and fortified Cumberland. There were repeated attempts by the English to unite the two countries, by diplomacy or conquest. Edward I's gains were cancelled by the disaster which overtook his son at \*Bannockburn in 1314. A plan to marry Edward VI to Mary, queen of Scots, came to nothing when she married the French dauphin instead—potentially a very damaging development for England. But there were already signs that the balance between the two countries was shifting. Between 1329 and 1625 only two of the eleven Scottish rulers succeeded as adults and the repeated minorities were bound to weaken the Scottish monarchy. Three hammer blows in succession—\*Flodden in 1513 when James IV was killed, \*Solway Moss in 1542 and \*Pinkie Cleugh in 1547—suggested that the English had gained the upper hand in warfare. Unification came as a consequence of Elizabeth's preference for virginity: the marriage of Henry VIII's sister \*Margaret in 1503 paid off 100 years later when her great-grandson, James VI, succeeded as James I of England.

A governmental union of his two kingdoms was top of the agenda for James. A combined flag was designed and the name of Great Britain put forward. To a glum Parliament, James outlined the advantages: 'do we not yet remember that this kingdom was divided into seven little kingdoms, besides Wales . . . And hath not the union of Wales to England added a greater strength thereto?' It was to no avail. 'We should lose the ancient name of England, so famous and victorious,' retorted his opponents: 'let us proceed with a leaden foot.' The project foundered.

Where James's arguments failed, Cromwell's sword succeeded. After his victories over the Scots at \*Dunbar and the Irish at \*Drogheda, the Scottish and Irish parliaments were wound up. The \*Instrument of Government in 1653 instituted one Commonwealth Parliament, with 30 MPs each from Scotland and Ireland. The arrangement lapsed at the Restoration, for while the case for union remained strong, Charles II was unwilling to build with Cromwell's bricks.

The issue was raised again in 1669–70 but broke down on the size of Scotland's representation. With the great war against Louis XIV from 1688 onwards and the risk of subversion from a Jacobite Scotland, the matter became urgent. William III pushed the question in 1689 and was still pushing it when he died. More negotiations followed in 1702 and when they broke down, relations between the two countries reached their lowest point since the 1540s, with war discussed as a serious possibility. The Union which came about in 1707 was essentially a Whig move to secure the Hanoverian succession. Scotland obtained access to English markets and to the empire, while preserving its own legal,

educational, and ecclesiastical system. England gained a greater measure of military security.

The new state was to be known as Great Britain and strenuous efforts were made to persuade all subjects to abandon old animosities and regard themselves as Britons. For many years such appeals fell upon deaf ears. Londoners, who had jeered at the Welsh in \*Pepys's day, jeered at the Scots in \*Wilkes's. Parliament was to meet at Westminster and Scotland was given 45 MPs and 16 representative peers. The Union is usually discussed from a Scottish point of view—'the end of an auld song'. But many of the English, including most of the Tories, looked at it sourly. They objected that Scotland was not paying its fair share and mistrusted its retention of a \*presbyterian form of church government. Lord Haversham doubted whether a union of 'so many mismatched pieces, such jarring, incongruous ingredients' could hold together and deplored the passing of 'the good old English constitution'.

The push towards British unification continued. True, there was no attempt to bring about a governmental union with \*Hanover after 1714: indeed, there were soon proposals to divide the two realms and they parted company in 1837. But the next great crisis, when the new British state faced the French Revolution, brought the Union with Ireland in 1801, and yet another change of name to the United Kingdom.

Wessex, having swallowed its neighbours in England, had now swallowed its neighbours in Britain. But Ireland proved hard to digest. Whereas the unions with Wales and Scotland undoubtedly contributed to British power, that with Ireland was a dubious asset. In 1916, when Britain was in the utmost peril, it was not possible to apply conscription to Ireland. It is a strange union which the government cannot call upon its people to defend. The breaking away of the \*Irish Free State suggested that the process of more than 1,000 years was in reverse. How far it would go remains unanswered.

But even should events push the kingdom of England back whence it came, or, to take the extreme case, Northumbria and Mercia should reappear as more than tourist boards or police authorities, two results of Wessex's supremacy will last for some time. The great imperial expansion of the 17th and 18th cents. produced America, Canada, Australia, and New Zealand and spread the practice of parliamentary government throughout the world. The second was that for centuries to come the language of international diplomacy and communication will remain that of \*Hengist and Horsa, \*Ælle and Cissa.

**Englefield, battle of**, 871. No more than a skirmish, the battle at Englefield to the west of Reading in early 871 marks the opening of the bitter struggle between the West Saxons and the Danes. An exploratory raiding party led by two earls, one of whom, Sidroc by name, was killed, was defeated by Æthelwulf, the ealdorman of Berkshire. Four days later, however, Æthelwulf himself was killed in the failure of

the West Saxons, commanded by King \*Æthelred and his brother \*Alfred, to dislodge the Danes from their campaign headquarters at Reading. The failure led directly into the so-called 'year of battles' in the course of which (in mid-April) the king died, to be succeeded by Alfred. HL

**English Heritage**, the Historic Buildings and Monuments Commission for England, was set up under the National Heritage Act, 1983. Responsible for the care and maintenance of many ancient monuments, historic buildings, and sites, this role includes making grants and giving assistance towards the conservation of privately owned properties, supporting archaeological excavation and research, and giving advice on the listing and scheduling of special sites. A wide variety of sites are in the care of English Heritage and, open to the public, are presented with informative displays, exhibitions, and occasional re-enactments of historic events.

AM

**English language**. This originated in the speech of small groups of Anglo-Saxon settlers in eastern Britain in the 5th and 6th cents. It is now not only the most widely spoken language in the world but also forms the basis for national and international communication between members of other speech communities.

The language of the Anglo-Saxon settlers and their pre-Norman successors is conventionally known as Old English. Closely related to Old Saxon and Old Frisian, it forms part of the Germanic grouping within the Indo-European language system. Little direct evidence of its nature survives from the 5th and 6th cents. but, as fuller records become available with the advent of Christian literacy, it emerges as a highly inflected language realized in four main dialectal varieties: Northumbrian, Mercian, West Saxon, and Kentish. Though Latin was inevitably the main language of learned communication, education, and the church, Old English was used as early as King \*Ine (d. 726) as a language of law; King \*Alfred's educational reforms of the late 9th cent. built on this precocious official usage and massively expanded its employment in literary and educational texts. As a result, by the 10th cent., the vernacular had acquired a literary prestige attained nowhere else in contemporary Europe.

The Anglo-Saxon period saw two major cultural revolutions: the conversion and the Scandinavian settlement. Both affected the development of the language. The linguistic impact of Christianity is probably exaggerated by the ecclesiastical nature of our sources but there is no doubt that it involved both borrowing from Latin and, more importantly, exploitation of the resources of English through compounding of, and semantic extension to, existing vocabulary to express the concepts of the new religion. The Scandinavian languages of the Viking settlers penetrated much more deeply into English vocabulary, syntax, morphology, and phonology. The influence of this cognate Germanic language clearly operated at the everyday level of communication and even included the transfer of the ancestral forms of the pronouns 'they', 'them', and 'their'—items of a type rarely borrowed from one language to another. More indirectly, the Scandinavian settlement seems to have accelerated the progressive loss of inflexional complexity in English, for

it is in the Viking-settled areas that these tendencies are most evident, encouraged no doubt by a desire to remove barriers to inter-intelligibility between the two related languages of Old English and Old Norse.

Paradoxically the extent of Scandinavian influence is not fully apparent until the post-Conquest period. The reason for this is that a standard written language had emerged in the late Anglo-Saxon period which was based upon the dialect of the politically dominant kingdom of Wessex, where also was the heartland of the \*Benedictine reform movement. This conservative, southern-based language registered little of the more radical linguistic changes spreading southwards from the Anglo-Scandinavian north. Only with the Norman Conquest, when the introduction of Norman French scribes resulted in the disruption of West Saxon literary conventions, did these changes become apparent. Untrammelled by convention scribes began to write what they heard. As a result the 'Early Middle English' language of their manuscripts differs greatly from that of 'Late Old English' texts, yet all that had happened was that written forms had caught up with spoken developments—which had included simplification of many inflectional distinctions and the absorption of Scandinavian vocabulary.

Under pressure from Latin and French in the post-Conquest period, English lost literary prestige; the 'Middle English' stage of the language between the 12th and 14th cents. is thus a record of geographically limited dialects. By the 14th cent., however, English had risen once more in status though it was only in the late 14th and early 15th that a new standard written language emerged, based upon the language of the capital, London. This standard was later reinforced and spread by the introduction of printing. Linguistic variation in spelling and vocabulary, however, long persisted.

The 14th-cent. language of \*Chaucer in the south and the Gawain poet in the north bears the marks of strong French influence in vocabulary and syntax. Detailed analysis of this French impact shows that it did not follow immediately upon the Norman Conquest but effectively began in the 13th cent. under the combined effects of the loss of Normandy in 1204 with a consequent identification of an Anglo-Norman nobility with England, and the European cultural ascendancy of French literary forms.

The flood of new ideas associated with the Renaissance and with Elizabethan and later exploration exposed the English speech community to languages and experience from most of the inhabited world. Terms to express the new concepts of religion, scholarship, and science invaded the language, not least from Latin and Greek; such 'inkhorn terms' were the subject of anguished debate and comedy among contemporary polemicists and satirists. The lack of fixed forms in English, particularly in contrast to the apparent stability of Latin, was also increasingly a matter of concern for those anxious to establish the vernacular as a language of learned discourse. This concern led to the eighteenth-century preoccupation with regularizing, fixing, and recording language of which \*Johnson's *Dictionary* and the appearance of prescriptive grammar books represent two complementary facets.

By the 18th cent., however, English was no longer the language of a small part of Britain. In the preceding century settlers had taken it to North America and the West Indies; it was now to spread to Australasia, South Africa, and India. In all of these areas it developed its own forms which proceeded to interact with British English, the more so as communications became easier. The language in its various varieties has continued to evolve, with conservative and innovative forces continually at war within it. One extreme example can illustrate this conflict: alongside the host of new coinages, based on Latin and Greek roots, which have been adopted to express the technology and science of the 19th and 20th cents. there coexisted an extraordinarily archaic, yet highly influential, form of language in the world of religion where the Anglican church continued to use prayer books and bibles published in the period of Elizabeth I, James I, and Charles II which themselves drew heavily upon the language of \*Tyndale (d. 1536), \*Cranmer (d. 1556), and \*Coverdale (d. 1569).

Barber, C., *The English Language: A Historical Introduction* (Cambridge, 1993); Freeborn, D., *From Old English to Standard English* (1992); Leith, R., *A Social History of English* (1983); Strang, B., *A History of English* (1970).

**Englshry.** To afford some protection to lone Normans in the tense period after the Conquest, William I declared that if a murdered man could not be proved to be English, he would be presumed to be Norman, and the hundred fined. By the time of Richard I, at the end of the 12th cent. it had fallen into disuse, as the nations merged, though it was not formally abolished until 1341. JAC

**entail.** The growth of landed estates in England from the mid-16th cent. until the 1880s was partly a product of the system of 'entailing' property. Until the mid-17th cent., the available forms of entail were quite restricted, but thereafter the courts agreed to permit an owner to tie up his estate to the second and third generation, through a process of 'contingent remainders'. The legal mechanisms were not dismantled until the 1880s and beyond. It was once held that as a result great estates were kept together, but modern research holds that the system of entailing property was introduced partly to protect the financial interests of younger children, that entailed estates could be partially or completely freed through either a common recovery or an Act of Parliament, and that the consolidation of estates was due to factors other than entail. As a result, more emphasis is now placed on the ability of landowners to borrow on the security of their property, and to service large mortgages over several generations, with entail seen as a vital element in family strategies. JVB

**Entente cordiale.** Friendly relations between England and France, stopping short of a formal alliance. The term was coined at Haddo House, the country home of the 4th earl of \*Aberdeen, by the French chargé d'affaires, the comte de Jarnac, in 1843. It is sometimes applied retrospectively to the 1830s, when Britain supported the government of Louis-Philippe in the face of the coldness of the conservative

## environment

powers Austria, Russia, and Prussia, but it applied more properly to 1843–6. It was revived to describe the relationship inaugurated by the agreements of 1904, settling outstanding questions between the two countries, which eventually brought Britain into the \*First World War on the side of France and Russia, although no formal obligation existed. MEC

**environment** briefly describes the surroundings in which we live. We can look at the environment historically in two ways. First, by identifying ways in which the environment has moulded or changed the course of human history. Towns have frequently developed where there were fords or bridges, and ports have grown or declined through the silting-up of themselves or their rivals. Wind and weather have frequently played a decisive role in battles or campaigns. William III in 1688 was assisted by the 'protestant wind' which kept James II's fleet in harbour while allowing the invaders to sail to Devon. The presence of bogs by the river Forth was a vital element in the victory of the Scots over the English at \*Bannockburn in 1314.

Secondly, we may consider the effects of human action on the environment itself. From the earliest prehistoric slash-and-burn agriculture to the development of genetically engineered crops, the natural environment of Britain has been modified by its inhabitants. Perhaps the most notable of changes has been the removal of the blanket of trees which once covered virtually all of the British Isles. Clearance for fields, firewood, and building materials had already reduced cover to 15 per cent of England's land by the time of \*Domesday Book. By the 16th cent. a timber shortage was developing that encouraged the use of coal, which itself changed the appearance of vast tracts of countryside.

The industrial revolution and the subsequent growth of large towns introduced extensive air pollution and caused acute problems of water supply and sanitation. It was only with legislation such as the Alkali Works Act of 1863 that substantial amelioration of bad conditions was effected. Even so, sooty buildings, smoky chimneys, dead rivers, and grimy canals soon became immortalized in literature set in the industrial north and gave impetus to the Romantic appreciation of 'natural' landscape, and to the development of national cultures, linked to an ideal of rural 'purity'. Conservation societies were founded from mid-19th cent. onwards.

Calls for conservation accelerated as first railways, then roads, and the inexorable spread of towns, changed the face of the land. Concern has increased about the pollution of rivers and oceans as a result of the indiscriminate dumping of waste. The industrialization of agriculture after the Second World War, with its attendant use of chemicals and uprooting of hedgerows, has destroyed the habitat of many familiar plants and animal species. Many historic town centres have been blighted by insensitive redevelopment, often to accommodate the ever-growing number of cars and lorries. The approaches to most towns now look the same, with the supermarket, the large car park, and the congested roundabout. Sometimes a spectacular disaster has awakened the public conscience. Up to 4,000 people died in

the London smog of December 1952: 116 small children were killed in October 1966 at \*Aberfan when a slag heap, created by coal waste, slipped down a hillside and buried their school. From the 1960s membership of older conservation groups mushroomed, and new and more radical groups, such as the Friends of the Earth, were founded. The \*Green Party, established to campaign specifically on environmental issues, had more success in persuading the other main parties to steal its clothes than in winning electoral support. In cleaning up rivers and reopening canals, much progress has been made: in creeping urbanization it is doubtful whether we have much improved on the 1930s which saw miles of ribbon-development along the new 'arterial' roads.

CNL

**Eochaid**, king of the Picts (877/8–885/889) The limited sources for royal succession in what became \*Alba ('Scotland') are very confused, possibly because this was a period of turmoil following the peak of Scandinavian devastation in 875–6. Eochaid, son of Rhun (king of Strathclyde) and a daughter of \*Kenneth I, is mentioned only once as king, and even there it is noted that 'others say that \*Giric . . . reigned at this time'. The same source claims that Giric may have been Eochaid's guardian, and that both were expelled following an eclipse of the sun on 16 June 885. This, however, contradicts the source's own chronology. Eochaid's ultimate fate is even more obscure than his reign (he perhaps led a warband to north Wales). DEB

**Episcopal Church of Scotland.** Scotland had no territorial episcopate before the 12th cent. and no archbishoprics before the late 15th cent. Although the church assumed an increasingly \*presbyterian accent after the Reformation, bishops remained a lively issue in the conflicts bedeviling church and crown between 1560 and 1690. Thereafter Scotland's remaining episcopalians formed links with English \*non-jurors, participating in 1711 in a joint consecration of bishops. An Act of Toleration (1712) gave them legal standing provided their ministers took the oath of allegiance to Queen Anne. Their continued adherence to the Stuarts hindered growth at first, but in 1720 the double election of John Fullarton, to fill the see vacated by the death of Scotland's last diocesan bishop, and as primus (presiding bishop), heralded a consolidation which John Skinner (1744–1816, primus 1788–1816) turned into revival. Skinner's negotiating skills led to the consecration of the United States episcopal church's first bishop (1784), repeal of the Penal Laws (1792), and adoption of the English church's Thirty-Nine Articles. They made possible the Anglican Communion; and reconciliation between non-jurors and the rest was effected at Laurencekirk (1804). This was the prelude to reconstruction: seven dioceses by 1837, a doubling of churches and clergy by 1857, a Church Council with lay congregational representation since 1876, and a Consultative Council on Church Legislation since 1905, the whole later enhanced by a General Synod and issuing in a theologically and socially alert church. CB

**episcopalianism** is the form of church polity in which the chief authority is exercised by bishops, as opposed to

\*presbyterianism, in which it is exercised collegially by ministers and elders, and \*congregationalism, in which it is exercised by gathered fellowships of believers. The bishop encapsulates in his diocese the collective powers of the church; he is the local expression of catholic unity, exercising a divinely bestowed authority. The system, normal among Christians by AD 200, became dominant in Christian Europe. Since the Reformation the term has usually been applied to episcopal churches not in communion with the Roman catholic church but, while it might be applied to the Lutheran churches of Scandinavia, the reformed churches in Hungary and Romania, and, by extension, to the methodist episcopal church in the USA and the churches of north and south India, it is particularly applied to the Anglican Communion. It describes the polity of the Churches of England and Ireland and the \*Church in Wales. In Scotland the \*Episcopal Church developed from the tension between kirk and crown which marked the period 1560–1690, in which bishops were an explosive issue. The Anglican Communion claims to have retained the apostolic succession, as did certain secessions such as the firmly protestant Free Church of England, which broke away in 1844, and the English episcopal churches, which left the Episcopal Church of Scotland in 1842–4, when it dropped the word 'protestant', but which had rejoined that church by 1987. CB

**Epstein, Sir Jacob** (1880–1959). Sculptor, painter, and draughtsman. Born in New York, he studied in Paris before settling in London in 1905 and becoming a British citizen two years later. From his first commission in 1907/8, eighteen figures for the BMA headquarters in the Strand, which were attacked as obscene, his work was surrounded by controversy. His Oscar Wilde memorial in Père Lachaise cemetery, Paris (1910–11), was at first banned as indecent. His later work was less controversial and his portrait busts of many of the leading figures of the day, for example, \*Vaughan Williams, T. S. \*Eliot, Einstein, were better appreciated. Examples of Epstein's work can be seen in London at the Tate gallery and Imperial War Museum and also in Walsall, where his widow's bequest is held. Two of the best-known monumental sculptures are *Christ in Majesty* (1954/5) in Llandaff cathedral and *St Michael and the Devil* (1955/8) at Coventry cathedral. He was knighted in 1954. JC

**Erik Bloodaxe** (d. 954), king of York (947–54). Erik was the last Scandinavian ruler of the short-lived kingdom of \*York. Son of Harold Fairhair of Norway, he was a typical battle-leader. Expelled from his native land, he made himself master of York in 947, and was welcomed for the protection he offered against the West Saxon advance, particularly by archbishop Wulfstan. He was soon dispossessed by \*Edred but returned in 952. Significantly his coinage for Jorvik (York) shows an unsheathed sword. In 954 he was killed at \*Stainmore, possibly making for the Norse kingdom of Dublin or for the Isles. York was then absorbed into the developing kingdom of England. 'Hot-headed, harsh, unfriendly and silent' was a saga description: 'he ruled from York . . . under the helmet of his terror.' JAC

**Ermengarde de Beaumont** (d. 1233), queen of William I of Scotland. Married to William the Lion at Woodstock, near Oxford, on 5 December 1186, she was chosen for him by Henry II, then overlord of Scotland. Her father was one of Henry's French vassals, Richard, vicomte of Beaumont-sur-Sarthe in Maine, and the marriage emphasized William's subordinate status as Henry's client, though Edinburgh castle, seized under the treaty of \*Falaise, was returned to William as a wedding gift. She enjoyed some prominence in public affairs, notably when William fell ill in 1212, and during her long widowhood from 1214 she founded the Cistercian abbey of Balmerino (Fife), where she was buried. KJS

**Ermine Street** was the Roman precursor of the Great North Road, running from London via Lincoln and the crossing of the Humber estuary to York. It was probably laid out in the late 1st cent. The current name is from the Anglo-Saxon *Earninga Stræt* meaning 'the street of the ?eagle's people'. The similarly named Ermin Street ran from Gloucester through Cirencester. ASEC

**Erskine, Thomas** (1750–1823). Erskine was the son of the earl of Buchan [S]. After serving in the navy and the army he entered Trinity College, Cambridge, and was called to the bar. After a slow start he became successful in commercial cases and then achieved fame as counsel for the defence in a memorable series of important 'political' trials, such as those of Baillie, Stockdale, Tom \*Paine's *The Rights of Man*, and Hardy and others who supported parliamentary reform. He twice served as MP for Portsmouth, was for a time attorney-general to the prince of Wales and, from 1806–7, lord chancellor. He enjoyed immense public popularity when opposing repressive legislation, and again when he defended Queen \*Caroline in 1820. Erskine has been described as the supreme advocate in English legal history. His political career was less distinguished than his career at the bar, but his advocacy in some of the great 18th-cent. trials caused him to be hailed as a champion of freedom. MM

**escheat** was the forfeiture of estates to the crown, or to the lord of the manor, when the owner or tenant died without heirs. It also applied to persons attainted, whose property passed to the crown. It was at times an important source of income, though estates were sometimes granted back to the attainted person's descendants. In Scotland escheat for debt was abolished in 1737. Escheat for felony was abolished in 1870. JAC

**espionage**. See SECRET SERVICE.

**Essex** is one of the larger counties and originated as a kingdom. Its southern boundary is the Thames, the Stour separates it from Suffolk, and the Stort and the Lea from Hertfordshire and Middlesex to the west. For many centuries the marshes along the Lea valley and dense forests around Epping and Waltham protected it from interference. \*Cunobelinus moved the capital of the \*Catuvellauni from Verulamium to Colchester, subduing the \*Trinovantes before Caesar's invasion. The Romans took over the site and made it the provincial capital, Camulodunum, sacked in

\*Boudicca's rebellion in AD 61. In the 5th cent. the area fell to the Saxons, moving up the coastal creeks, and a kingdom of the East Saxons was in existence by the early 7th cent. It maintained a somewhat precarious existence, sometimes trying to extend its influence into Middlesex, Kent, and Surrey, sometimes trying to hold at bay the superior forces of \*Mercia and \*Wessex. \*Mellitus was appointed bishop of London in 604 with the duty of converting the East Saxons and made some progress, but the area lapsed into paganism until mid-century. By the 9th cent. Essex had become a client state, first of Mercia, then of Wessex. In the late 9th cent. it was overrun by the Danes and allotted to them at the peace of \*Wedmore in 878. Danish settlement was not heavy, however, and the region was used mainly as a base, with camps at Maldon and at Mersea. It was reconquered by \*Edward the Elder. By the time \*Cnut took the whole kingdom, in the early 11th cent., Essex was emerging as a shire, with roughly its present dimensions. The county town was Chelmsford rather than Colchester, perhaps because it was more central.

For centuries Essex remained a rural county and something of a backwater. It had no mineral resources and its harbours were shallow. It was on no great national route, though the roads to Norwich and Ipswich brought some traffic. It could have been of strategic importance in relation to London but few invasion forces ventured up its muddy creeks. Colchester remained a sizeable town, the centre for a vigorous cloth trade, and with a reputation for oysters, but most of the other towns—Saffron Walden, Thaxted, Braintree, Romford, Waltham Abbey, Dunmow, Halstead, and Ongar—were of only local importance. Chelmsford, the shire town, was unusual in having no parliamentary representation, though Maldon, Harwich, and Colchester had two members apiece. Harwich profited from the Hanoverian connection in the 18th cent. to build up its position as a port for the continent. The shire provided London with fresh vegetables, particularly potatoes, but for many years the marshes remained a barrier to urban expansion. As late as 1907, the *Victoria County History* could write that Essex was 'one of the purely agricultural counties of England, depending almost entirely upon tillage for its economic prosperity'.

The chief characteristic of the shire was religious nonconformity. Proximity to the continent made for easy access to reforming ideas in the Tudor period and the Essex towns provided a number of protestant martyrs during Mary's reign. Its puritan sympathies made it come down heavily in the 1640s for Parliament against the king and it saw little fighting, save for the siege of Colchester during the second civil war in 1648, which ended with the two royalist commanders being shot after surrendering. In 1698 Celia Fiennes noted that Colchester was 'a town full of dissenters, besides Anabaptists and Quakers'.

Economic transformation came in the later 19th cent. with the overflowing of London into the old hundred of Becontree, first along the docks of the north bank of the Thames, then following the railway from Shoreditch to Romford in 1839, which built an important junction and repair works at Stratford. Dockers and railwaymen replaced

farmers in the streets of south-west Essex. In 1801, Dagenham, Barking, Ilford, Walthamstow, East and West Ham were still separate villages or small towns. But for a time the increase in population was the fastest in the whole country. West Ham had fewer than 5,000 inhabitants in 1801 but 267,000 in 1901, dwarfing the county town, which had 13,000. While the population of Becontree hundred in the south-west rose from 21,000 to 650,000 that of Dunmow hardly changed and Freshwell hundred in the north actually declined. The taste for sea-bathing gave prosperity to Southend, which became Londoners' favourite resort: from the 1820s paddle-steamers brought day trippers, the pier was opened in 1830, extended in 1889, and the rail link in 1856 brought more: by 1991 its population was 153,000. The arrival of the Ford Motor Company at Dagenham in 1929 created a great new borough. Though suburban growth declined after the Second World War, the new towns at Harlow and Basildon and the airport at Stansted kept numbers increasing, while Epping, Braintree, and Chelmsford became commuter towns, disgorging into Liverpool Street. By 1991, Essex, with a population of 1,400,000, was third only to Hampshire and Kent among counties. In the 1980s the concept of 'Essex man', upwardly mobile, fast-driving, Tory-minded, brought the shire back into national consciousness. The recommendations of the Banham commission report on local government (1994) were implemented, Essex retaining county status, and Southend constituting a unitary authority. JAC

**Essex, kingdom of.** Essex was formed in the 6th cent. by Saxon settlers established to the north of the Thames estuary and east of the river Lea and London. The ruling dynasty claimed descent from an obscure Saxon deity, Seaxneat, rather than from Woden, and there are puzzles about the intensity of settlement with many early place-names but comparatively few archaeological sites and pagan cemetery sites apart from the important settlement at Mucking. In the early 7th cent. London was regarded as part of the kingdom (though subject to Kentish overlordship), and \*Mellitus, bishop of London, was forced to flee to the continent during the pagan reaction which followed the death of the East Saxon king Saeberht in 616. Final conversion to Christianity took place in the 650s under Bishop Cedd from Northumbria; the nave of his church at Bradwell-on-sea still survives. After Cedd's death episcopal authority passed to the bishop of London though political control of the city rested in other hands. Indeed, while retaining its own kings until the 9th cent., Essex played a minor role, particularly during the reigns of the powerful Mercian kings in the 8th cent. When dominance passed to the West Saxons after their victories over the Mercians in 825 and 829, the subordinate role of Essex was further emphasized, and from that point onwards it was governed by \*ealdormen not by kings. The boundary drawn up by \*Alfred and the Danes after 878 left Essex in the Danelaw, though there is no evidence of Danish settlement in depth. Essex was reabsorbed into the English kingdom in the early 10th cent. (Colchester was reoccupied in 917), and played an important part in defence against later Viking attacks; the ealdorman Byrhtnoth was killed in the heroic battle at \*Maldon in 991. Ecclesiastical

links with London and St Paul's remained strong, and the religious life of Essex was further enriched by the foundation of Waltham abbey (initially served by secular canons) by \*Harold Godwineson, late in the Anglo-Saxon period. HL

**Essex, Arthur Capel, 1st earl of** (1631–83). Capel succeeded his father as baron when he was executed in 1649 as a royalist and at the Restoration was made earl of Essex. In 1670 he was sent to Denmark on a diplomatic mission and from 1672 to 1677 was lord-lieutenant of Ireland. Two years later, after the \*Popish plot, he was treasurer for six months, working uneasily with \*Shaftesbury. He resigned in November 1679, gave strong support to the \*Exclusion Bill and moved closer to \*Monmouth. In 1683 Essex was arrested in connection with the \*Rye House plot but was reported to have cut his throat in the Tower while awaiting trial, dying in the same room in which his father had been confined. The most recent scholarly inquiry suggests that he may well have been murdered. JAC

**Essex, Robert Devereux, 2nd earl of** (1566–1601). Courtier. Essex's father, raised to the earldom in 1572, died when his son was 10. Essex served under his stepfather \*Leicester at \*Zutphen in 1586 and was knighted for gallantry. From 1587 he was Elizabeth's master of horse and was given the Garter in 1588. After his capture of Cadiz in 1596 his success seemed assured. But a second expedition in 1597 was unproductive, his way of life at Essex House was extravagant, and his short spell as lord-lieutenant of Ireland in 1599 was disastrous. Instead of subduing \*Tyrone as he had vowed, Essex met him for private negotiations. 'Perilous and contemptible' was the queen's terse verdict on his behaviour, and when Essex returned to England in express defiance of her orders, he was disgraced. His half-hearted attempt at a palace coup in 1600 led to his execution. Though personally brave, he was petulant and totally lacking in judgement—a mere shooting star. JAC

**Essex, Robert Devereux, 3rd earl of** (1591–1646). Essex was the son of Elizabeth I's favourite, and was 10 when his father was executed. His sympathies being on the parliamentary side, he was appointed commander-in-chief as soon as war came. He fought prudent defensive campaigns at \*Edgehill and \*Turnham Green in 1642. In September 1643 he succeeded in relieving Gloucester and fought his way back to London at the first battle of \*Newbury. In September 1644 he led the ill-advised foray into Cornwall which ended in disaster at \*Lostwithiel. Essex resigned in accordance with the self-denying ordinance in 1645 and died the following year. Clarendon praised him for the good discipline of his troops and he seems to have been well liked. But he did not really gain one notable victory and his position depended mainly upon his name and rank. JAC

**Essex, William Parr, earl of.** See PARR, WILLIAM.

**Étaples, treaty of**, 1492. In October 1492 Henry VII led an expedition to France in support of the Bretons and to induce Charles VIII of France to repudiate Perkin \*Warbeck. He commenced a siege of Boulogne but the French offered terms which he accepted on 3 November. France was to

pay substantial financial indemnities and agreed not to assist Warbeck: trade was to be encouraged by moderate customs duties and action against pirates. Henry's campaign of one month proved highly profitable and he was accused of waging war for gain, but the treaty was confirmed by the English Parliament in 1495 and renewed in 1498. AC

**Eton College.** Founded by Henry VI with the title 'The College of the Blessed Mary of Eton beside Windsor' in 1440, it was modelled on \*Winchester and New College, Oxford, set up by \*William of Wykeham. In the original foundation provision was made for a schoolmaster, 25 'poor and indigent' scholars, as well as choristers, priests, and 25 infirm men. There are two types of scholars, the oppidans who live in houses of some assistant masters, and the collegers who are lodged in the college. Its pre-eminence among public schools dates from the headmastership of Edward Barnard (later Provost) 1754–65. PG

**Etty, William** (1787–1849). Painter. Son of a baker, born in York and educated at Pocklington, Etty was apprenticed to a printer, but moved to London in 1806 and worked under the guidance of \*Lawrence. His first success was *Cleopatra's Arrival*, a crowded canvas (1821). He was elected ARA in 1824 and full Academician in 1828, defeating \*Constable by 18 votes to 5. The large classical and historical themes on which he concentrated are not greatly to modern taste, but his nudes have always won admiration, and many of his portraits are outstanding, particularly *John Brook* (York City Art Gallery) and the *Hon. Caroline \*Norton* (private collection). Much of his work is in the Victoria and Albert Museum, London, and there is a special collection at York, with a somewhat insignificant statue of the artist (by J. W. Milburn, 1910–11) outside the gallery. Etty left a good (and romanticized) self-portrait, and an autobiography. JAC

**European Communities Act**, 1972. Act of the British Parliament giving legal effect to the treaties and legislation of the European Communities, effectively confirming Parliament's acceptance of British entry. The primacy of European over British law introduced by the Act was most vividly shown by the ability of the European Court of Justice, in 1991, to overturn provisions made by the British Parliament in the 1988 Merchant Shipping Act on restricting foreign ownership of British registered fishing trawlers, because they infringed article 52 of the treaty of \*Rome. CNL

**European Economic Community** was the full title of the EEC, which Britain joined on 1 January 1973, also known as the Common Market, later as the European Community; and, after the treaty of \*Maastricht, as the European Union.

Britain stayed out of the EEC's forerunner, the European Coal and Steel Community (ECSC), formed in 1952. This was a French initiative designed to ensure continuing influence over the German Ruhr's coal and steel production. It required a supranational high authority and Britain, with its attachment to sovereignty, its links with the Commonwealth, and a special relationship with the USA, could not have joined. The Labour government had just nationalized Britain's coal industry and faced trade union opposition to 'handing it over to foreign capitalists'. The French

## European Economic Community

had also discouraged Britain from entering the discussions so that they could shape the new entity to fit their interests.

The members of the ECSC agreed at the 1955 Messina conference to explore further economic and atomic co-operation. Britain declined to send a representative and therefore had no influence on the treaty of \*Rome that established the EEC. However, it soon became clear that the EEC countries were catching up or surpassing Britain both economically and politically, and this realization led to \*Macmillan's formal membership application in July 1961. This was vetoed by French President de Gaulle in 1963, after the Nassau agreement had increased British military dependence on US missile technology. Problems over Commonwealth and EFTA (\*European Free Trade Association) trade, and agricultural subsidies would have made agreement difficult, but the challenge posed by British membership to de Gaulle's aspirations as a leader of a 'Third Force Europe' probably condemned the negotiations to failure despite the support of other EEC members. The same factor led to de Gaulle's veto of Britain's second application, made by \*Wilson in 1967.

De Gaulle's downfall in 1969, coupled with French economic weakness and increasing German assertiveness under Brandt's leadership, cleared the way for the success of Britain's third application to join, under \*Heath in 1970-1. Unfortunately for Britain, the EEC had come to agreements in 1970, detrimental to Britain's future membership, on the Common Agricultural Policy (CAP), and budget contributions.

The application had major consequences for British domestic politics. Labour had opportunistically switched to an anti-EEC policy once in opposition in 1970, but a significant group of committed integrationists, headed by Roy \*Jenkins refused to follow, and supported the Heath government's European policy. The split in the Labour Party was contained only by Wilson's promises to renegotiate Britain's terms of membership and to hold a referendum on the results. This took place on 5 June 1975: the cross-party 'Britain in Europe' group managed to highlight the positive benefits of membership and secured 67 per cent of the vote.

Britain failed to use the EEC to her maximum advantage. The ill-will caused by the inept 'renegotiation' of 1974, the disdain shown towards Community institutions by some Labour anti-European ministers; the inability of British politicians and bureaucrats to adapt to the coalition-building necessary to influence EEC policy; and the distractions caused by domestic political problems over devolution and pay policy led to a loss of influence over collective decision-making.

The early \*Thatcher years from 1979 were dogged by arguments over Britain's EEC budget contribution. Opinion varies on how far Thatcher's aggressive behaviour was responsible for the favourable deal eventually reached at the Fontainebleau European Council in June 1984, but the whole row reinforced Britain's reputation for obstructiveness.

With the budget settled, Britain went on to play a positive role in the mid-Thatcher years. A more subtle approach to the Community enabled Britain to work with others to guide the eventual Single Market proposals towards the

British aim of trade liberalization with minimal institutional reform. The Single European Act, signed in Luxembourg on 17 February 1985, was the result, coming into force on 1 July 1987. Majority voting in the Council of Ministers was extended to ease the passage of European legislation (directives and regulations) needed to create the single market. British fears of the Greeks vetoing progress towards deregulation proved greater than fears of pooling sovereignty.

However, Thatcher was still regularly to be found in isolation. This was perhaps inevitable given her personal style and perhaps inflated view of the realities of Britain's sovereignty. These underlay her hostility to participation in the Exchange Rate Mechanism (ERM), or European Monetary Union (EMU), which led to the resignation of cabinet ministers Lawson and \*Howe. They feared that Britain was not only repeating the mistakes of the 1950s, staying outside institutions rather than influencing them from within, but also deluding itself in believing that national sovereignty was a meaningful concept in an interdependent world without capital or trade barriers. Others ridiculed the idea that national identities were threatened by European integration. Thatcher's opposition to these views was famously articulated in her Bruges speech of 20 September 1988: 'Europe will be stronger precisely because it has France as France, Spain as Spain, Britain as Britain, each with its own customs, traditions and identity . . . We have not successfully rolled back the frontiers of the State in Britain only to see them reimposed at a European level with a European superstate exercising a new dominance from Brussels.' The turmoil in eastern Europe as the Communist system and USSR collapsed encouraged France and Germany to seek reforms to bind the newly unified Germany tighter into European structures. John \*Major declared himself happy with the resulting treaty of Maastricht, but the 'no' vote in the Danish ratification referendum (2 June 1992), the ignominious devaluation of the pound and exit from the ERM on 'Black Wednesday' (28 September 1992), emboldened Conservative 'Eurosceptics', who forced Major into a Commons vote of confidence to achieve ratification.

The Labour government of 1997 began with warm intentions towards Europe, which became less enthusiastic as the euro, the new single currency introduced in January 1999, went into free-fall. Meanwhile, their policy of \*devolution within the British Isles sat oddly with the avowed intention of many European spokesmen to seek ever further integration, which would inevitably increase the power of Brussels.

The last few years suggest that the EEC has lost its way, more as a consequence of the over-enthusiasm of supporters like Jacques Delors and Romano Prodi than the work of its critics. Even in economic matters its achievements look less impressive as several economies, particularly the German, seem sluggish and over-regulated. A distinctly anti-American tone has revealed itself in both economic and military questions, with talk of a European 'super-power' to balance (and rival?) America. EEC interventions in Bosnia, Kosovo, and Macedonia have often looked hasty and ill thought out, which has not prevented demands for a Rapid Reaction Force to implement dubious decisions even more quickly. The scheme to expand membership from fifteen states to 30,

including most of the former Soviet bloc, seems bound to outrun the capacity of the EEC to reach and implement common policies. Worst of all, EEC spokesmen constantly reveal a most startling disregard for democratic processes, insisting that the Danes who voted 'the wrong way' in the 1992 referendum should hold another, and that the Irish, who voted against enlargement in 2001, should be made to think again. It is distressing if 'guided democracy', discredited by the collapse of the Soviet Union in 1989, should have returned in a new form, and if a noble concept of collaboration, respect, and understanding should have been ruined by imperialism, grandiosity, and bureaucracy.

CNL/JAC

Dinan, D., *Ever Closer Union?* (Basingstoke, 1994); George, S., *An Awkward Partner* (Oxford, 1994); Kitzinger, U., *Diplomacy and Persuasion: How Britain Joined the Common Market* (1973); Unwin, D. W., *The Community of Europe* (1991).

**European Free Trade Association (EFTA).** The idea of an intergovernmental organization to reduce tariffs on trade between the non-communist European countries was put forward by Britain in 1956. It hoped to prevent the formation of the EEC, and even after 'the Six' had signed the treaty of \*Rome, Britain persisted in attempting to draw the EEC into a wider free trade association. De Gaulle vetoed the idea in 1958. Following this veto, the Swiss government invited those countries who would not join the EEC (Iceland, Norway, Britain, Denmark) or, because of Soviet disapproval of the EEC and considerations of neutrality, could not (Finland, Sweden, Switzerland, Austria) to negotiations which resulted in the Stockholm convention setting up EFTA (3 May 1960). Finland became an associate member and Portugal joined the others as full members, who managed to eliminate mutual tariffs by the end of 1966. Yet Britain applied to join the EEC in 1961. In the 1990s EFTA reached agreements with the EEC, but by 2000 only Norway, Switzerland, Iceland and Liechtenstein remained members.

CNL

**European Union.** See EUROPEAN ECONOMIC COMMUNITY

**Eustace, Prince** (c.1127–53). Eustace was the second son of King Stephen, but the death of his elder brother Baudouin c.1135 made him heir apparent. In 1140 he was married to Constance, daughter of Louis VI of France. Stephen was anxious to have Eustace's claim recognized, but though a council at London acknowledged him as heir, the papacy refused approval. After Eustace's death on 10 August 1153, Stephen came to terms with his great rival \*Matilda, accepting her son Henry as his successor.

JAC

**evangelicalism.** A predominantly Anglican movement stemming from the mid-18th cent., originally with links to \*Whitefield and \*methodism, and led by John Fletcher, Henry Venn, and others, its characteristics have been Calvinistic with a literalist interpretation of the Bible, sabbatarianism, conversion-preaching, reform of the heart, human sinfulness, and personal salvation. The second generation was wealthy and close to political power; William \*Wilberforce, a Yorkshire county MP, his cousin Henry Thornton, John Venn, vicar of Clapham, and Charles \*Simeon formed

the \*Clapham sect, whose aims were the reformation of manners and the abolition of slavery (see ANTI-SLAVERY). The slave trade was abolished (1807) and slavery itself (1833). Fear of the French Revolution intensified the Clapham sect's attack (1797) on the moral laxity of the privileged as a poor example for the lower orders, and on the weakness of the church and its message. Hannah \*More, a great propagandist with her *Thoughts on the Manners of the Great* (1787), and Wilberforce's Proclamation Society called not only for a moral reformation, but respect for government, orderly society, and hard work as part of the moral law. Evangelicalism in achieving increased sobriety by the 1820s anticipated 'Victorianism' and also deflected political radicalism. Evangelicalism offered an anchor of stability in a world of turbulence. World-wide mission was another aim, for which the \*Church Missionary Society (1799) and the British and Foreign Bible Society (1804) were founded. With its best disciples leaving to evangelize overseas, evangelicalism's success in thus promoting 19th-cent. foreign mission, associated with Victorian imperialism, enfeebled it at home, so that by the 1920s, unlike \*Anglo-catholicism, it lacked its earlier vigour and became narrowly moralistic, conservative, and upper middle class. The Cambridge Christian Union (CICCU), founded 1876 as the watchdog of evangelical orthodoxy, was weak in the 1920s, but revived and spread throughout most universities in the 1930s. Further revival accompanied the visit of the American evangelist Billy Graham (1954). Under John Stott's leadership, its emphasis rather surprisingly changed at Keele (1967) and Nottingham (1977) to embrace ecumenism, increased social responsibility, and greater emphasis on sacramental life.

WMM

**Evelyn, John** (1620–1706). The second great diarist of his time, although his is less self-revelatory than that of Samuel \*Pepys. However, it covers a far longer time-span, 1641–1706. Evelyn was a less acute observer and more conventional in his interests and judgements but possessed a wider circle of acquaintances. A fervent royalist, he spent the Civil War years touring in Europe, but after 1660 he was commissioner for sick and wounded in the \*Anglo-Dutch War of 1665–7 and for the mint, and member of the Council for \*Plantations. Evelyn as a virtuoso or amateur scientist was a founding fellow of the \*Royal Society. His *Sylva* (1664) encouraged and educated landowners in forestry, and he wrote a pioneer tract on smoke-abatement for an already smog-enveloped London.

JRJ

**Evesham, battle of**, 1265. After his victory over the forces of Henry III at \*Lewes in May 1264, Simon de \*Montfort took possession of king and government. But Prince Edward, Henry's son, escaped from Hereford in May 1265 and raised an army in the west. De Montfort entered south Wales to ally with \*Llywelyn and then marched to Evesham, hoping to link up with his son \*Simon, advancing from Kenilworth. He was intercepted by an overwhelming royalist force and on 4 August, just north of Evesham, de Montfort and his supporters were butchered, 'for battle none it was'.

JAC

## examinations

**examinations.** The first school examinations were held in the 16th and 17th cents., when diocesan visitations were made. Teachers were questioned on their learning and pupils were tested for attainment. Examinations were required by statute in many schools, including Tonbridge (1564) and St Albans (1570).

From the second half of the 19th cent. the present examination system came into being. In 1853, the College of Preceptors initiated examinations in secondary school subjects. Three years later, the \*Royal Society of Arts held examinations for 15-year-old school-leavers. Technological examinations were added in 1873 and were transferred to the City and Guilds of London Institute in 1879. With the introduction of 'payment by results' in the 1860s, all children in elementary schools over the age of 6 were examined in the three Rs. A similar system was employed by the Science and Art Department, though here pupils could be awarded prizes. In both instances, examinations were abolished by the Education Department in 1895.

At secondary school level, Oxford undertook from 1858 the examination of schools through a body of delegates and Cambridge also held examinations in the same year. Only boys were allowed to enter. Universities took up this work, awarding certificates which exempted the holders from university entrance examinations. The Oxford and Cambridge Schools Examination Board was established for this purpose in 1873. The University of London had offered examinations from 1858. In the 20th cent., the School Certificate Examination for 16-year-olds and Higher School Certificate for 18-year-olds operated between 1917 and 1951. They were replaced by the General Certificate of Education (GCE), Ordinary Level, and Advanced Level examinations. Since 1988, the Ordinary Level has been superseded by the General Certificate of Secondary Education (GCSE). In the 1990s considerable concern was expressed at the number of examinations which schoolchildren faced, beginning with the Standard Assessment Tasks (SATs) at the age of 7. PG

**Exchequer.** Financial institution. The term is derived from the chequered cloth, similar to a chess board, which was placed over a table to assist in the counting of sums due to the crown. Its function and organization are first described in the \**Dialogus de Scaccario* (*Dialogue of the Exchequer*, c.1179): the Lower Exchequer received and issued money, the Upper Exchequer was essentially a court of account where royal revenue was managed, accounts audited, and disputes dealt with. The Exchequer thus exercised a judicial as well as financial competence. The origins of the Exchequer are not entirely certain, but it seems most likely that its institutional form dates from the reign of Henry I. The first surviving pipe roll for the financial year 1129–30 shows how the sheriffs and other royal officials were summoned to account at the Exchequer twice a year, at Easter and Michaelmas. By the later 12th cent., the Exchequer was no longer itinerant but permanently based at Westminster, the first of the crown's departments to acquire a separate existence, definite organization, and buildings of its own. Although there were reforms in procedures in the mid-13th cent., and other financial bodies, such as the \*wardrobe and \*chamber, were

developed in response to the crown's changing needs, the Exchequer remained the linchpin and apex of the crown's financial administration throughout the Middle Ages. In the 16th and 17th cents., the \*Treasury developed as a separate department, so that the administrative functions of the Exchequer declined. It ceased to be a financial department in 1833 but its judicial functions continued until 1873–80. The Treasury is now a ministerial department headed by the chancellor of the Exchequer, although the prime minister is technically its 1st lord. AC

**Excise crisis, 1733.** In 1733 Sir Robert \*Walpole, George II's first minister, was anxious to conciliate the country gentlemen before the forthcoming general election (1734) by reducing the land tax to 1 shilling in the pound. He had already reimposed a duty on salt (1732), but additional revenue was needed to make up the considerable shortfall. He therefore proposed the substitution of excise duties for customs duties on tobacco and wine, in order to maximize revenue and discourage smuggling. However, commercial anxieties about the scheme were exploited by opposition leaders in Parliament, who saw it as an attempt to expand government bureaucracy, and a full-scale outcry was raised in London and many provincial towns. In the Commons Walpole's majority almost collapsed, and when it seemed that he might lose the king's confidence, he withdrew the measure, immediately re-establishing his sway. AAH

**Exclusion crisis.** A period of intense political strife during 1679–81 generated by the attempt to bar Charles II's catholic brother James, duke of York, from succession to the throne. Widespread apprehension that James would inaugurate a catholic 'absolutist' monarchy was aroused in 1678 by Titus \*Oates's revelations of a \*Popish plot against king and government. In the three parliaments called between 1679 and 1681 discontented 'Whig' groups exploited their majority in the Commons to promote 'exclusion' measures, but were each time defeated when the king used his prerogative to close proceedings. The exclusionists' campaign against James represented a radical move by Parliament to dictate the succession in the face of conventional assumptions about the divine nature of monarchical authority, and highlighted the conflict between crown and Parliament which had germinated since the 1660s. Though initially the movement made much impact in the constituencies, it lost momentum as fears of renewed civil war increased, while the king's refusal to summon Parliament again after 1681 took away its main platform. AAH

**Exeter** (Roman), Isca Dumnoniorum, was successively fortress of *legio II Augusta* from the mid-50s to the mid-70s then *civitas*-capital of the \*Dumnonii. The fortress baths were excavated west of the cathedral in the 1970s; little else is known of the base. The civil basilica was constructed over the baths, and a civil bath-house is known. The 2nd-cent. earthen defences enclosed 93 acres and were refurbished in stone in the 3rd cent. Some houses have been excavated, but comfort and degree of Roman culture do not seem to have been high. ASEC

(post-Roman) Exeter was refounded as a fortified town (burh) by \*Alfred. It rose to be one of the leading English towns of the 10th–12th cents., apparently through the tin trade, acquired a bishop's see (1050) and, after a rebellion against the Normans, a castle (1068). It declined in the 13th and 14th cents., though this did not prevent a total rebuilding of the cathedral, 'the Decorated cathedral *par excellence*'. The Reformation was unpopular in Exeter, though the city resisted a siege by catholic rebels (1549). From the 15th to the 18th cents. Exeter thrived as a cloth-making and cloth-trading town; when the textile industry declined, it became a social and servicing centre instead. It never really industrialized, and has remained a modest-sized regional centre. Since 1942 it has suffered grievously from both air raids and insipid post-war redevelopment. DMP

**Exeter, diocese of.** The see, now conterminous with Devon, was created when Leofric, bishop of \*Crediton, moved his seat to Exeter in 1050, thus becoming one of the first in England to follow Pope Leo IX's injunction to move all sees to major towns. For 800 years it comprised Devon and Cornwall (formerly the sees of Crediton and \*St Germans), but in 1877 Cornwall was hived off to form the new diocese of \*Truro. Amongst notable bishops was Walter Stapledon (1308–26), who as lord treasurer (1320–1 and 1322–5) was notable in modernizing the royal Exchequer and chamber under Edward II. Miles \*Coverdale (1531–3) was important for his own translation of the Bible (1535) and the Great Bible (1539), from which the psalter was incorporated in the Book of Common Prayer. The cathedral, originally the abbey church of St Mary and St Peter, rebuilt between 1260 and 1307, is a fine example of the Decorated period, though with the original Norman towers remaining as transepts. WMM

**Exeter, Thomas Beaufort, 1st duke of** (c.1377–1426). The youngest legitimized son of \*John of Gaunt, Beaufort first served his half-brother Henry IV in the Welsh war and at sea. He was chancellor of England when Prince Henry (later Henry V) controlled the king's council, was created earl of Dorset in 1411 and admiral of England for life in 1412. He participated in \*Clarence's French expedition and was briefly lieutenant in Gascony. After the capture of \*Harfleur, he defended it against French attacks and was rewarded by promotion in 1416 to ducal rank. While visiting north country shrines in 1417, he organized the repulse of a Scottish invasion. From 1418 he had a prominent role in the conquest of Normandy; he was governor of Rouen and Paris. He attended the death-bed of Henry V. Back in England, he was a senior member of Henry VI's council in his own last years. RLS

**Exeter, Henry Holand, 2nd duke of** (1430–75). As a minor, Holand was the ward of Richard of \*York and married to his daughter. Thomas Percy, Lord Egremont, inveigled him into the feud against the Nevilles in 1454, when Holand claimed that he, not his father-in-law, should be protector during the king's insanity. From 1459, he fought against the Yorkists on land and sea. Attainted in 1461, he attended Queen \*Margaret in exile, returning with \*Warwick to

restore Henry VI. After the battle of \*Barnet, he was kept prisoner by Edward IV, his brother-in-law. His wife obtained a divorce and married her lover Thomas St Leger in 1472. Holand was taken to France in the king's expedition in 1475 and reportedly fell overboard on the return voyage. RLS

**Exeter, John Holand, 1st duke of** (1395–1447). Henry V, in his policy of reconciliation, restored Holand in 1416 to the earldom forfeited in 1400 by his father, the 1st duke. He earned restitution by service in the French war from 1415 to 1421, when he was captured at \*Baugé. Ransomed for 20,000 marks after five years, his compensation included the king's licence to marry the widow of Edmund \*Mortimer, earl of March. Holand was again fighting in France from 1429, a joint warden in the Scottish marches in 1435–6, and finally lieutenant of Gascony for six years from 1439. Henry VI created him duke in 1444 and granted that his son would succeed to his offices of admiral of England and constable of the Tower of London. RLS

**exploration.** The notion of Europeans discovering other peoples and telling them who they are and where they live is now suspect, especially as an explorer's discourse is said to be determined by his mind-set rather than any objective reality. Yet descriptions of the surface of the globe and its peoples have been put into a framework of knowledge which has affected historical development. In fact exploration has been linked with the exercise of political and economic power and sometimes religious evangelism. Britain's increasing domination of exploration broadly accompanied the rise of the English and then the British state to world power after 1500. From the late 18th cent., Britain not only organized the most important expeditions but also set the agenda by insisting that exploration be 'scientific'—which meant at the very least that latitudes and longitudes must be established.

More science did not lessen the connections between exploration and other aspects of British life. The state continued to be closely involved, partly for strategic reasons and partly because naval or military personnel so often led expeditions. The upper-class tradition of the \*grand tour with travel seen as heightening knowledge and experience had a powerful effect on the organization of exploration and the way it was written up. Another spur to expeditions from the 1790s was the desire of British protestant churches to evangelize overseas. \*Livingstone is the perfect example of the missionary becoming a great scientist and associating with aristocratic hunters and travellers before writing a best-selling travel work.

Exploration entered British consciousness in other ways: explorers became the pattern for heroes of boys' adventure stories and the subjects of numerous anthologizers and biographers. \*Hakluyt began the anthologies with his *Principall Navigations* . . . of 1589. The great 18th-cent. travel collections continued the tradition and in 1846 William Desborough Cooley founded the Hakluyt Society to publish historical accounts of voyages and travels, as it has done ever since. Biographies abound. We learn that Livingstone was a victim of cyclothymia, or that \*Speke had a mother fixation.

This sort of writing has had the unfortunate effect of grossly distorting the true significance of explorers in the history both of Britain and of the regions they explored.

Despite Hakluyt, the English contribution to primary exploration in the great age of maritime discovery was rather modest. John and Sebastian \*Cabot, English by adoption, contributed to the discovery of the Americas in 1497 and 1509, but most English maritime adventurers in the Tudor period merely followed the Portuguese and Spanish and attempted to steal some of their treasures. This was true of \*Drake although his circumnavigation of 1577–8 involved the discovery of California. But the English did try to open up new routes to the Orient—the North-East and North-West Passages with the voyages of \*Willoughby and \*Chancellor to Russia in 1558 and the contemporary landward travels in central Asia of \*Jenkinson matched by the voyages to the west of \*Frobisher in 1576 and \*Davis in 1585–7. The North-West Passage was to preoccupy Britain for 300 years, no doubt because of its comparative proximity to Canada. \*Hudson reached the bay bearing his name in 1607–11 and in the following century attempts on the passage were to be made from the Pacific as well as the Atlantic.

Partly for this reason, the Pacific attracted much British attention in the 18th cent. with \*Dampier's *New Voyage round the World* of 1697 and the circumnavigations of \*Anson in 1740–4 and Byron of 1764–6 adding interest. The prize would be the trade of the great southern continent believed to exist. \*Cook's first voyage of 1768–71 did reveal New Zealand and eastern Australia but the second voyage of 1772–5 effectively disproved the existence of a southern continent. Cook's third voyage was to the northern Pacific, so completing the greatest series of scientific expeditions ever undertaken. \*Banks had been on the first voyage and then came to dominate British exploratory activity, sending out more naturalist travellers and being instrumental in founding the African Association in 1788. This aimed to do for the interior of Africa what Cook had done for the Pacific. Mungo \*Park reached the upper Niger in 1795–6. Government took over the organization of expeditions by \*Clapperton and others and in 1830 \*Lander solved the vexed question of where the Niger debouched into the sea. The mantle of the African Association was taken on by the Royal Geographical Society, founded in 1830, which, often in association with government, sent explorers especially to eastern and central Africa and to the Polar regions. Livingstone, \*Burton, Speke—who reached the source of the Nile—Cameron, Stanley, and Thomson were the great African explorers, while the old obsession

with the North-West Passage led to the expeditions of Parry, and especially of \*Franklin whose disappearance after 1845 led to no fewer than 40 search expeditions. In the south polar region, \*Ross, Bruce, \*Shackleton, and \*Scott are the great names.

Scott's failure to be first to the South Pole in 1912 was perhaps a sign that the age of British dominance in exploration was coming to an end. Perhaps the era did end when a British expedition was the first to conquer Everest in 1953, albeit with a New Zealander and a Nepalese actually reaching the summit. RB

**extradition.** The first recorded instance of extradition procedures was in 1174 with a treaty between Henry II of England and William the Lion of Scotland to exchange criminals who had fled from one country to the other. In 1303 and 1497 similar agreements were made between England and the French and England and the Flemings. In 1794 the Jay treaty inaugurated a formal agreement between Britain and the USA, though it was limited to Canada. The \*Ashburton treaty in 1842 also included provision for extradition and was followed by agreements between Britain and France in 1843 and Britain and Denmark in 1862. They did not work well and in 1870 the Extradition Act attempted to improve the mechanisms. Between 1870 and 1904 35 treaties were implemented under the Act which remained in force for 119 years, enlarged by the Extradition Act of 1873, and finally superseded by the Extradition Act of 1989. Extradition does not apply to persons granted political asylum but the definition has often led to disputes. SMD

**Eyre.** The General Eyre, which probably dates from the reign of Henry I and is believed to derive its name from the Latin *iter*, was a commission issued by the king to officials of the \*curia regis, who travelled round the kingdom visiting the different regions every few years. The powers given to the travelling justices under the Commission of the General Eyre were extremely wide. During their visitation they took over the county court and summoned inhabitants to answer questions relating to local affairs and taxation, scrutinized the conduct of the sheriff and other local officials, and thus ensured that the king's interests were protected. The commission was 'Ad omnia placita'—to deal with all kinds of pleas—and in addition to a general local audit, the justices heard pleas of the crown (criminal cases) and common pleas (pleas between subjects). Although not at first oppressive, the General Eyre became feared and unpopular and in the 14th cent. it faded away. MM

**Fabian Society.** The Society took its name from the Roman dictator Fabius, nicknamed 'Cunctator', or delayer. It was founded in January 1884 by a group of middle-class intellectuals to further 'the reconstruction of Society in accordance with the highest moral principles', but *gradually*. Its first pamphlet, or 'Tract', *Why are the Many Poor?*, made it plain that the highest principles were socialist ones. Shortly afterwards Sidney \*Webb and Bernard \*Shaw, its most famous members, joined. The latter penned some of its most brilliant tracts. The society's main importance thereafter was as an amazingly fecund womb of ideas for the infant and maturing \*Labour parties, not all of which were predictable. In 1900, for example, it came out in support of the \*British empire, on the grounds that it could be made into a gigantic welfare state, which seemed perverse to other socialists. When Labour came to power, however, the Fabians' willingness to engage with the realities around them was a definite boon. It survives: the most senior of all Britain's socialist organizations. BJP

**Factory Acts** were introduced to protect working people from employers who permitted dangerous practices and environments in workplaces. The first Acts of 1809 and 1823 failed to include adequate enforcement clauses. In 1833 Lord Ashley (later earl of \*Shaftesbury) introduced the first effective law. It established an inspectorate with powers to enter premises and to require evidence of compliance with restrictions on the employment of women and children. This Act applied only to large textile factories. Acts of 1844, 1847, and 1863 extended the laws to other manufactures and included small workshops. Conditions in mines and quarries, brickfields, railways, shipping, alkali works, aircraft, and shops and warehouses were regulated separately. Concern about workers and the safeguarding of the general public were the subject of many pieces of legislation during the 19th and 20th cents. A coherent law relating to safety at work was not achieved until 1969 when the Health and Safety Executive was set up. IJEK

**factory system.** The 'factory system' has been an important element in the accelerating processes of industrialization which have become known as the \*industrial revolution. As British industrial enterprises expanded in the 18th cent., recruiting more workers and investing in expensive tools and equipment, it became important to develop a more tightly organized and disciplined form of production than the trad-

itional method of employing workers in small workshops or their own homes—as in the \*'domestic system' which had operated satisfactorily for several hundred years. The solution to the problem was the construction of large manufacturing establishments, in which the work-force could be closely controlled and strict conditions of discipline and time-keeping maintained. Employers were able to minimize the loss of raw materials and finished goods by theft, and to protect their capital equipment. They were able also to install powerful prime movers (water wheels or steam-engines) to drive all their machines.

From the employers' point of view, this factory system had such manifest advantages that it was widely adopted, especially in the textile industries, where the Lombe silk factory in Derby was a marvel of the age. It was also used by the heavy iron and steel industries, by manufacturers of pottery, glass, paper, and chemicals, and by processes in the food and drink industries, such as breweries. Indeed, the factory system became the dominant form of industrial organization throughout the 19th cent., and remained important in the 20th cent. However, the introduction of electricity and road haulage has made possible a significant dispersal of industry, and the 'information revolution' of modern electronics and telecommunications has enabled an increasing number of people to work at home, so that the general trend of recent decades has been for factories to become smaller.

Architecturally, the factory system developed through several phases. Early factories were solidly built to accommodate the necessary machines and sources of power, with the minimum of embellishment. But the hazard of fire in such confined environments compelled entrepreneurs to develop forms of fire-proof construction, using little wood and depending on a solid framework of cast-iron pillars and girders. The need for natural light in some of the processes, moreover, directed attention to improved glazing, and many factories became well-built structures with ample windows and decorative flourishes such as ornate chimneys to carry the furnace flues from the boiler room. Idealistic entrepreneurs, such as Robert \*Owen or Titus \*Salt, saw their factories as part of a human community, and provided good housing and public amenities for their workers. Modern 'industrial estates' are typically composed of a series of temporary boxes which, while providing good light and a comfortable working environment, have little architectural

distinction and can be easily scrapped when they become obsolete. The factory system has thus changed substantially over 200 years, in response to new industrial processes, changing sources of power and transport, and new social needs. But it provides, typically, the modern workplace, symbolizing life in industrial society. RAB

**Fairfax, Ferdinando Fairfax, 2nd Baron** [S] (1584–1648). Parliamentary commander in the Civil War. As soon as fighting began in 1642, Fairfax was put in command of Parliament's forces in Yorkshire, his home county. The early months of 1643 were spent jockeying for position, but in June 1643 he was badly beaten by \*Newcastle at \*Adwalton Moor and besieged in Hull. With his son Sir Thomas \*Fairfax he gained a significant victory at \*Selby in April 1644 and he fought at \*Marston Moor, where his son Charles was killed. He resigned in accordance with the self-denying ordinance of 1645. JAC

**Fairfax, Sir Thomas** (1612–71). With the exception of \*Cromwell, Fairfax was probably the best commander on the parliamentary side in the civil wars. His career started inauspiciously in March 1643 when he was beaten by \*Goring at Seacroft Moor in Yorkshire, but he turned the tables on Goring in May 1643, capturing him at Wakefield. He then gained an impressive string of victories at \*Wincheby, \*Nantwich, \*Selby, and \*Marston Moor. In the winter of 1644 he was busy training the \*New Model Army to unprecedented standards of drill and efficiency. In the spring of 1645 he replaced \*Essex as commander-in-chief and his two great victories at \*Naseby in June and \*Langport in July knocked the heart out of royalist resistance. In the second civil war he besieged and took Colchester. Out of sympathy with events during the Commonwealth and Protectorate, Fairfax helped \*Monck in 1660 to bring about the Restoration. \*Clarendon paid tribute to his outstanding courage and \*Aubrey recorded that his first action on taking Oxford in 1646 was to set a guard on the Bodleian library to prevent looting. JAC

**Fairford church** (Glos.), dedicated in honour of the Virgin Mary, is first mentioned in the 11th cent. The church was largely rebuilt at the end of the 15th cent. The fabric was completed around 1497 by John Tame, whose tomb stands in the usual position of a founder's tomb on the north side of the chancel. The wonder of the church is its medieval glass, which survives from all twenty-eight windows in the church. The windows are devoted to the life of Christ; the prophets, apostles, evangelists, and doctors; and the Last Judgement. Throughout the scheme the central importance of the Virgin is stressed, as is appropriate in a church dedicated to her. The glass early attracted antiquarian interest, which included speculations that it had been designed by Dürer. Modern study of the glass has confirmed that the designer was indeed a foreigner, probably Master Adrian van den Houde of Mechlin, who was also concerned with the early glass in \*King's College Chapel, Cambridge. Because of the affinities of the Fairford glass to other royal projects, and also because of the scale of the undertaking, with four designers and at least twelve glaziers, it is suggested that the glass was

actually made under royal patronage after the manor reverted to the crown in 1499, and was probably completed between 1500 and 1517. LR

**fairies** were thought of as supernatural beings, capable of being helpful and benevolent to humans, or hostile and dangerous, or simply mischievous. Fairy beliefs are of long standing, and over 170 types of fairy have been listed from British sources. Although evidence about fairy beliefs thickens from the 16th cent., most of them were already fixed in the Middle Ages. Fairies were diminutive and could make themselves invisible at will, while fairyland was seen as a timeless realm where the normal problems of human existence were absent. Changelings and fairy lovers were recurrent themes.

The fairies' intermediate position between the human and spirit world had always placed them close to devils. After the Reformation this connection was more readily made and the fairies figured in a number of witchcraft investigations. Belief in the fairies continued among the populace at large, as 19th-cent. folklorists discovered, but belief in them among the educated was long gone by then. Indeed, in that century the supernatural beings of an earlier era were regimented for the purposes of children's story-books. JAS

**fairs**, as periodic gatherings for the sale of goods and services including the hiring of labourers, developed in the Middle Ages. They brought together traders from much greater distances than the markets held weekly or more frequently in many towns and villages. Markets dealt in local and seasonal produce; fairs provided the opportunity to buy a wider range of products.

Fairs were held at regular intervals for a fixed number of days. They were licensed by charter, usually from the crown. In turn, they were highly profitable to magnates and corporations through stall rents. Some fairs became famous for their size and their specializations. These fairs drew traders and customers from many parts of the country and even from overseas. Examples include Stourbridge (Cambs.) for dried fish and cloth, St Ives (Cambs.) for wool, hides, and cloth, and Boston (Lincs.) for wine and wool.

Such large, temporary concentrations of strangers challenged the normal mechanisms for maintaining law and order. Special courts of \*piepowder (*pieds poudrés*: dusty feet) dispensed rapid justice to breakers of contracts, cheats, or those who behaved rowdily.

Most fairs provided entertainments but these remained only marginal until the major commercial changes of the 18th cent. These changes diminished the trade of fairs because of the expansion of shopping facilities and the regularity of deliveries of goods and services made possible by improved roads and the canal network.

Fairs continued for seasonal agricultural trade in grain, cattle, and sheep into the 19th cent.; and the custom of hiring workers also persisted. However, even these features declined as railways made deliveries of farm produce to major markets reliable and other forms of labour recruitment became the norm.

Only a limited number of fairs remained by the time the royal commission of 1888 examined the role of fairs and

markets. Its evidence indicated that fairs had become associated with entertainment and sometimes with disorder. Many fairs with ancient charters continue uninterrupted to the present time, often held in town centres. The Hoppings, which claim to be Europe's largest travelling fair, take place every June in Newcastle upon Tyne on the Town Moor. During the 20th cent. the Showmen's Guild collaborated with local government to control traffic and ensure public safety. IJEK

**Falaise, treaty of**, 1174. Earliest Anglo-Scottish treaty whose terms are known in full. It was imposed by Henry II on the captive William the Lion at Falaise in Normandy early in December 1174, and finally ratified at York on 10 August 1175. To secure his release from custody, William explicitly recognized Henry as feudal overlord of Scotland; Scottish nobles and churchmen followed suit; and the castles of Edinburgh, Roxburgh, and Berwick were surrendered and garrisoned by English troops. These terms were punitive and humiliating, and although Henry refrained from exercising his authority to the full, the treaty remained in force until 1189. KJS

**Falkirk, battle of**, 1298. \*Wallace's victory at \*Stirling Bridge in 1297 had shaken the English hold on Scotland. Edward I assembled a large army to restore the situation and on 22 July 1298 attacked William Wallace's men near the river Carron. The Scots had some protection from a marsh but superior archery and cavalry carried the day for Edward. Wallace remained a fugitive until captured in 1305. JAC

**Falkirk, battle of**, 1746. After the Jacobite retreat from Derby in December 1745, it was not Charles \*Stuart's intention to abandon the enterprise but to consolidate in Scotland. \*Cumberland handed over the pursuit to General Hawley, whose army of some 8,000 men included many Campbells. On 17 January at Falkirk the Highland charge once more carried the day, inflicting a sharp defeat on the Hanoverians. Cumberland returned from England to Edinburgh to take over. JAC

**Falkland, Lucius Cary, 2nd Viscount** [S] (1610–43). Falkland was educated in Ireland, where his father was vice-roy, but settled at Great Tew, his country house outside Oxford. This became, in the words of \*Clarendon, a regular visitor, 'a university bound in a lesser volume', where Falkland and his friends, turning their backs on religious fanaticism and political partisanship, pursued a dispassionate search for unifying truths. Elected to Parliament in 1640, Falkland condemned arbitrary rule in church and state, but opposed radical change. In January 1642 he accepted office as secretary of state, in the vain hope of closing the gap between the king and Parliament. His peace-loving and tolerant nature was revolted by the prospect of civil war, and made him careless of his own life. This 'incomparable young man', as Clarendon called him, found a welcome death in battle at Newbury in September 1643. RL

**Falkland palace**. Royal home and hunting lodge, Fife. After Falkland castle (home of the earls of Fife and dukes of Albany) came into the possession of James II, his 1450s

extension became the north range of the palace, with further chambers added by his widow \*Mary of Gueldres. James IV renovated the north range's great hall (1502) and added the east and south ranges, which were embellished by James V: his French craftsmen transformed them in the 1530s into the first Renaissance building in Scotland, now regarded as among the finest work of its period in Britain and marking the height of the 'Auld Alliance'. The ornamented gatehouse, garden, and royal tennis court further enhanced this favourite seat of the Scottish monarchs. The north range was burnt, possibly accidentally, when \*Cromwell's troops were quartered there (1654), and only its foundations now remain. No monarch has resided since Charles II, but much restoration has been undertaken by the Crichton Stuarts in their role as hereditary constable, captain, and keeper of Falkland; the king's bedroom and Chapel Royal are particularly fine. The National Trust for Scotland has acted as deputy keeper since 1952. ASH

**Falklands, battle of the**, 1914. After dispatching Craddock's squadron at the battle of \*Coronel, von Spee's ships rounded Cape Horn and on 8 December 1914 attacked the British installations at Port Stanley in the Falkland Islands. However, the Germans unexpectedly found themselves fighting a much stronger British squadron. As soon as news of Craddock's defeat had reached London, the Admiralty had dispatched two of its most powerful battle-cruisers to the south Atlantic under Vice-Admiral Sturdee, who now proceeded to sink all but one of von Spee's ships. The battle marked the end of any serious threat to British merchant shipping from German surface cruisers. DF

**Falklands War** (1982). The Falkland Islands had been under British control since 1833, but Argentina had become increasingly anxious to acquire them. On 19 March 1982 a group of Argentine scrap metal merchants landed on South Georgia without permission, and this was followed on 2 April by full invasion. The Foreign Office was caught largely unawares and Lord \*Carrington described the invasion as a 'great national humiliation'. The British government acted swiftly, assembling a task force consisting of 10,000 troops and 44 warships with auxiliary and aircraft support. It was dispatched 8,000 miles to the south Atlantic, using Ascension Island as a forward base.

The USA, anxious to retain good relations with both countries, tried to mediate through Secretary of State Alexander Haig but to no avail. On 25 April marines recaptured South Georgia. On 2 May the Argentine battleship *General Belgrano* was sunk by a British submarine with large loss of life and two days later the British destroyer HMS *Sheffield* was hit by an Exocet missile and sunk.

British troops, under aerial attack, landed on the Falklands at San Carlos on 21 May and established a bridgehead. After fierce fighting the settlements at Darwin and Goose Green were retaken and the capital, Stanley, came under fire. On 14 June the Argentine garrisons surrendered. The war cost the lives of 236 British and 750 Argentine soldiers. It was the turning-point in the fortunes of the Thatcher Conservative government, but in Argentina, General Galtieri's military junta fell from power a year later. RAS

## family history

**family history** refers to the records of those groups comprising parents and their children and all those connected to them by blood or marriage, claiming descent from a common ancestor. In Britain, where property and titles conferring status and privilege were and are inherited according to blood relationships, accurate documentation is of great importance.

From earliest times, tracing ancestors and establishing proof of relationship had practical importance for the wealthy and privileged and, in particular, for the sovereign. Throughout the 15th cent., before, during, and after the Wars of the \*Roses, evidence about family relationships formed an essential part of the case advanced by every claimant to the throne of England. Records of the aristocracy and royal families had always been maintained by the earl marshal and, in Scotland, by Lyon King-of-arms. However, in 1484, the \*College of Arms was incorporated as a permanent institution comprising heralds, who had the task of investigating descent and establishing incontestable rights to titles and property. At lower levels of society, amongst the gentry and smaller landowners, it was equally important to have knowledge of the family tree. Recognition of property rights guaranteed social status and acceptance. Thus, after the civil wars of the mid-17th cent. and the consequent upheaval and changes in land ownership, both aristocracy and gentry supported the publication of detailed histories of counties in England and Wales, which included family histories, often illustrating coats of arms, houses, and estates. In a formal sense the arrangement of these volumes was territorial, but information about rank, ownership of land, and powers to act as magistrates and to nominate clergy to benefices was given great prominence. These county histories focused on the wealthier residents of each county, giving little information about other levels of society. This pattern was followed by Scottish historians, except that they emphasized the role of the chiefs of Highland clans, particularly those who took peerages.

In the 20th cent. interest in family history became widespread, particularly after the 1950s with the expansion of popular education, greater resources including more leisure time, and easier access to documentary evidence. Tracing family history has become a popular activity, not as a means of establishing rights to title and property, but as a recognition of the importance of family and ancestry at all social levels. By 1960 county \*record offices had been established in all areas of England and Wales, providing readily available sources such as parish records, ancient wills, and, where they existed, family papers. An additional source has been the census enumerators' books, which may only be opened 100 years after their collection and give details about family composition and relationships.

In the 20th cent. social historians used studies of family histories to illuminate processes of social and geographical mobility in earlier times. This approach to history, combined with popular interest in family history, suggests that we may be moving towards a situation where the common people may be as well documented as the rich and privileged of previous eras. IJKE

**famine** may be defined as the occurrence of serious food shortages resulting in significant rises in the death rate. Mortality during famines was rarely caused solely by starvation but from related diseases like dysentery, typhoid, and typhus. Hence deaths from food shortages might occur some time after initial harvest failures. Increased migration out of famine-hit areas to towns and cities could also raise death rates since rural refugees often encountered diseases to which they had no immunity, or transmitted epidemics to urban dwellers.

Vulnerability to famine depended on more than the local harvest. Also important were the amount of food imported, the efficiency of distribution and relief systems, and the ability to purchase supplies in the market-place. Famines were more likely to occur when harvests failed successively, when population pressure on resources was extensive, and where populations were over-reliant on one particular crop. Pastoral areas of Britain, often located in more remote upland areas on poorer soils, where animal husbandry took precedence over grain production, were usually more vulnerable to famine than grain-producing regions.

What has been described as the worst famine in England in the last millennium occurred in 1315–18, after a century of rapid population growth, when a succession of disastrous harvests killed between 10 and 15 per cent of the population. Lesser famines had also occurred in 1293–5 and 1310–12. After the arrival of plague in 1348, however, England's agrarian economy was more than able to feed its much reduced population, and famine mortality disappeared until population growth accelerated again in the 16th cent.

When famine returned, the worst crisis took place in 1594–8 with another less serious in 1623–4. Even these were concentrated in England's more remote northern upland pastoral areas, notably Cumberland, and most of the country was unaffected. Famines disappeared from England after 1640. Their end was facilitated by improved agricultural productivity, a well-developed marketing network, and the introduction of England's \*Poor Law (1601) which alleviated distress when harvests failed.

England's Celtic neighbours experienced more severe famines for far longer. Scotland suffered spectacularly in 1623–4 when death rates in some areas increased eightfold. Increased specialization on pastoral agriculture in the 18th cent. seems to have increased vulnerability. Scotland suffered severe famine mortality in the 1690s which may have killed 15 per cent of its population, lowland areas were hit in 1740–1, and parts of the Highlands suffered famine late into that century. Famines were experienced in Ireland in the 1620s, 1640s, and 1650s. As its textile industry declined and the diet of its poor increasingly became dominated by the potato, Ireland became more rather than less famine-prone. Serious mortality occurred in 1727–9 and the 1740–1 scourge killed some quarter of a million people. Famines occurred again in 1744–6, 1800–1, and 1817–19 but these were dwarfed by the last Great \*Famine in Ireland, caused by potato blight which ravaged the staple potato crop for four successive years, 1845–8. Recent estimates put the number of deaths attributable to this disaster at 1 million. JPB

**Famine, Irish** (1845–51). The famine originated with the recurrent failure of the potato crop, devastating the Irish cottier and small farmer classes: around 1 million died in Ireland as a result either of starvation or—more commonly—disease. The origin of this demographic cataclysm lay with a fungus, *phytophthora infestans*, which destroyed half the Irish potato crop of 1845, and brought a near total crop failure in 1846. A partial recovery in 1847 was offset by a greatly reduced area under cultivation, so that although there was a good yield per acre sown, the total harvest was poor. The potato crop failed almost totally in 1848.

The social and economic consequences of the famine are disputed. But it is clear that excess mortality effectively doubled for the five years (1846–50). Mortality levels rose from 1846, reaching a peak in 1847–8, though there were social and regional variations. In addition the birth rate fell critically during the famine years. Emigration, a feature of Irish society since the early 18th cent., greatly expanded: between 1845 and 1870 there were at least 3 million Irish emigrants. Ireland emerged from the famine denuded of its cottiers and dominated by the farmer interest.

The political outfall from the famine offers few problems of interpretation. The Conservative administration of Sir Robert \*Peel initially tackled the blight with some success, importing Indian meal and establishing food depots. Peel's government fell in June 1846, to be replaced by a more doctrinaire Whig administration. The Whigs relied at first on an extensive scheme of public works, but this was abandoned in 1847, being replaced by soup-kitchens. The limited crop recovery in 1847 persuaded the government that the emergency had ended, and all special relief programmes were abolished. This apparent British complacency fired later 19th-cent. Irish nationalism.

The Great Famine affected all aspects of Irish life and remains one of the most emotive issues in modern Irish historiography. The dominant—'revisionist'—view of the famine, until recently, was that it accelerated existing trends in Irish society: this, in turn, has been challenged by those who, like Cormac O Grada, emphasize the uniqueness of the event, and place less stress on the continuities.

AJ

**Faraday, Michael** (1791–1867). Chemist and pioneer of electromagnetism. As a bookbinder's apprentice, he went to Humphry \*Davy's lectures at the \*Royal Institution and asked to be taken on as his assistant. Accompanying Davy to Paris and Rome in 1813–15, by 1820 he was himself a prominent chemist, famous for his experimental skill, thinking with his fingers. He isolated benzene in 1825, and when Davy died in 1829 he could escape from his shadow and work on the nature of electricity, magnetism, and light. After his death, this led to the \*electrical industry; and by the 1860s with J. C. \*Maxwell's work, it had transformed physics with field theory. Faraday was a keen member of the fundamentalist Sandemanian sect. He remained a very private man, refusing titles or (like Robert \*Boyle) public offices—a kind of scientific saint.

DK

**Farington, Joseph** (1747–1821). English landscape painter and draughtsman, Farington studied at the Royal Academy from its foundation in 1768, becoming an unofficial but influential part of its government. Until 1921, he was best known for two collections of engravings of the English Lakes, but in that year his copious diary was discovered and revealed Farington as an authority on matters artistic, literary, social, and political. A friend to many in Parliament and well informed on politics in France, Farington's work is rich in anecdote about almost every leading politician of his day. In 1793, with assistance from supporters of the war with France, Farington visited the front at Valenciennes and acting as an early war artist, recorded what he saw. Most of the original diary manuscript is in the Royal Collection at Windsor castle and examples of his drawings are in London at the British and Victoria and Albert museums.

JC

**farming and estate management.** Agriculture was the principal basis of wealth in Britain until its relative importance waned as a consequence of increasing financial returns from commerce and manufacturing industries. Surviving fragments of Anglo-Saxon accounts show that landowners controlled extensive properties but the earliest statements of the principles underlying practices of estate management only survive from the 13th cent. Manuscript treatises on farming and estate management were copied for many larger landowners. For example, *Walter of Henley's Husbandry* gave advice on estate management: appointing and supervising managers and workers, the necessity for surveys of property and assets, keeping accounts, guidelines for estimating likely yields per acre of seeds and of produce from livestock, and conducting audits.

During the 16th and 17th cents. new techniques of farming had implications for the management of estates. Conversion of common land to enclosures made possible new practices: creating water meadows and growing new crops such as sainfoin and lucerne to augment supplies of animal winter fodder. Enclosures for permanent pasture enabled sheep flocks to increase in size. In the 17th cent. Dutch techniques for land reclamation, as in the Fens, necessitated enclosures. Landowners protected their interests by studying land law at the Inns of Court and by appointing qualified stewards to manage estates effectively. Encouraging or coercing tenants to adopt new ways of farming challenged tradition, and changes were often achieved only after lengthy legal proceedings.

By the 18th cent. notable advances were made in improving returns to major landowners. Further enclosure in England was achieved by private Acts of Parliament which cost less money and time than the legal procedures of earlier centuries. These Acts became increasingly common after the middle of the century. Estate managers drew up leases specifying minimum standards of good agricultural practices, such as crop rotations, to be used by tenant farmers.

In the Scottish Lowlands landowners faced few legal problems during the 18th cent. and pioneered agricultural innovations. For example, the duke of Richmond brought his experienced estate steward to manage his English estates.

## Fascists

In the Scottish Highlands, clan chieftains encouraged their followers to adopt improved farming practices. In contrast, in the early 19th cent. the Highland clearances were undertaken to suit the convenience of landowners, whose priorities often ignored severe hardships imposed on dispossessed tenants.

During the 19th cent. many agricultural innovations were promoted by landowners who wanted to sustain or improve their incomes. This was the period of books and magazines about agriculture and of the agricultural show for disseminating new ideas. In 1839 formal agrarian education for landowners began in England at the Royal Agricultural College at Cirencester. Later in the century local colleges were opened for educating aspiring and working farmers.

In Ireland the history of landownership was characterized by many absentee landlords whose incomes came from the smallholdings of tenant farmers. Traditional farming methods continued into the 19th cent., dominated by the monoculture of the potato. The failure of the potato crop in the 1840s proved calamitous for the rural population. The mass migration precipitated by the famine altered farming practices, changed the social and political relationships of landowners and tenants, and resulted in legislation about tenants' rights.

During the 20th cent. farming was characterized by innovations: chemical fertilizers, labour-saving machinery for both arable and pastoral farming, hygiene legislation, and interventions in livestock breeding and care. As a consequence estate management has become increasingly like other business management, demanding high capital investment, financial expertise, skills in labour relations, and access to research and development. Sustained government intervention began in the Second World War and still continues. From 1940 subsidies provided much of the finance needed to increase food output and this support continued until Britain joined the Common Market in 1975, when farming began to operate within the framework of the Common Agricultural Policy. See also ENCLOSURES; FIELD SYSTEMS.

IJEK

**Fascists, British Union of.** See BRITISH UNION OF FASCISTS.

**Fashoda crisis,** 1898. In 1893 France, irritated by Britain's continued hold over Egypt, decided to go for Fashoda, on the White Nile to the south. An expedition was sent from the west under Colonel Marchand, to French Premier Delcassé's regrets later, because he feared it might provoke a conflict; but by then he could not call it back. Marchand arrived on 10 July 1898. On 18 September a British army under \*Kitchener met him there. Europe braced itself for war; but all that happened was that the two men sat down, cracked open a bottle of champagne Marchand had brought with him, swapped stories, and waited for the respective Foreign Offices to patch things up. In the end (3 November) the French gave in.

BJP

**Faulkner, Brian** (1921–77). One of the ablest and most articulate of Northern Irish Unionist prime ministers, Faulkner was from a commercial rather than a landed background. Progressive in economic policies as minister of

commerce (1963–9) yet a hard-liner against \*O'Neill's attempts to lessen entrenched sectarian divisions, he became the last Northern Irish premier in March 1971 and won British government support for a stiff security policy culminating in internment. The failure of that policy and his vulnerability within his own party led him to change stance abruptly and accept the power-sharing executive following the Sunningdale agreement of 1973. He became chief executive of the new administration, which collapsed after the loyalist strike of 1974. Thereafter Faulkner was left without a political constituency, and died in a hunting accident, a largely forgotten man. Regarded by his own side as too clever to be trusted, he was never forgiven by the catholic minority for his earlier sectarian intransigence. MAH

**Fawkes, Guy** (Guido) (1570–1606). Fawkes was born in York in a family of protestant ecclesiastical lawyers. His father died when he was 9 and his stepfather seems to have influenced him to become a catholic. At 23 he enlisted in the Spanish army in the Netherlands. In 1604 Catesby and his fellow-conspirators, despairing of obtaining relief for the catholics from James I, brought Fawkes into their plot to blow up the king and Parliament and proclaim the Princess \*Elizabeth. Fawkes was put in charge of the house next to Parliament from which a tunnel was to be made, and then of a cellar which they hired directly under the House of Lords. He passed under the name of John Johnson. Parliament was repeatedly adjourned until 5 November 1605. Fawkes's task was to light the slow fuse to ignite the barrels of gunpowder. After a warning letter to Lord Mounteagle, the cellar was searched and Fawkes taken. He faced torture in the Tower with great coolness but confessed after hearing that his fellow-plotters were taken, and was executed at Westminster on 31 January 1606. His dark lantern is in the Ashmolean Museum at Oxford. JAC

**fealty** derives from the French word *foi* meaning faith or trust. In the Middle Ages those in power demanded \*oaths of fealty from those subject to them—kings from their officials and their nobility (as William the Conqueror seems to have demanded at \*Salisbury in 1086), prelates from their clergy, manorial lords from their peasants—in order to confirm and strengthen their authority, perhaps at moments of crisis or challenge. Unlike \*homage, fealty was a unilateral process: those to whom oaths were given were not obliged to promise anything in return. AC

**Felix, St** (d. 648). A Burgundian bishop, Felix offered himself to \*Honorius, archbishop of Canterbury, for missionary work in England. He was sent to help King \*Sigeberht establish the church in East Anglia c.631, exemplifying the important partnership between kings and bishops in the evangelization of England. \*Bede tells us that he 'reaped a rich harvest of believers', delivering the province from 'its age-old wickedness and infelicity'. He also provided teachers and masters for Sigeberht's school, based on the Canterbury system. His see was established in Dommoc, thought to be \*Dunwich (Suffolk), where he remained until his death. AM

**feminist history.** 'Do women have a history, Professor?' said the French customs officer to a woman claiming to be attending a 1984 UNESCO conference on the history of women. As a question permitting a range of intonation from genuine puzzlement to withering sarcasm, it is richly suggestive of the suspicion and hostility with which the notion of feminist history may be viewed both inside and outside academic circles. Why should 'women's history' have become defined as a separate sphere? For feminist historians, one answer might be that there are two sides to any narrative and that we have heard only one for the last two and a half millennia. Precisely because women outside the ruling classes have been of little interest to historiographers, there has until recently been scant research into the lives and achievements of a wide social range of one half of the historical population.

Many of the protesters in 1960s newsreel footage of women's movement demonstrations were part of the influx of women into higher education in that decade. For those who perceived sexual discrimination as widespread, the male-dominated content of many educational syllabi seemed both part of the problem but also a potential solution. Beginning in the 1960s, a handful of college and university courses across the United States began to redress what was perceived to be a gender imbalance in the study of a range of humanities disciplines. Given that the majority of women in history had found their activities confined to the domestic sphere or a supporting role in politics, it is not surprising that women's history developed alongside social history. So successful have feminist historians been in recovering the history of those marginalized by traditional historiography, that few universities in the Anglo-American world now lack courses focusing on women from the medieval period to the present day.

The academic growth of feminist history has generated a vast critical literature, the authors of which are the heirs of early women writers who protested about the place allocated to them in society in virtue of their sex. Reading Mary Astell's *Serious Proposal To the Ladies* (1694), Mary Wollstonecraft's *A Vindication of the Rights of Woman* (1792), and John Stuart Mill's *Subjection of Women* (1869), we can see that feminist history has finally succeeded in legitimizing a field of enquiry that is at least as old as the history of early modern thought. GR

**Fenians.** See IRISH REPUBLICAN BROTHERHOOD.

**Fens, drainage of.** From the 13th cent. the commissioners of sewers in the 1,300 square miles of low-lying fenlands in eastern England were responsible for undertaking works designed to prevent inundation. With James I's declaration in 1621 that he was unwilling to allow waterlogged lands to lie waste and unprofitable, a firmer base was created for action, and this arrived in the form of the Dutch entrepreneur Sir Cornelius Vermuyden who in 1626 began the complex task of draining the fens of Hatfield Chase and the Isle of Axholme. Axholme was drained between 1626 and 1636, but at a price to the fenlanders, and during the civil wars they took the opportunity to undo much of his work. Drainage resumed after the Restoration, but it was the second half

of the 18th cent. before much enthusiasm could be generated. In the 1830s and 1840s the introduction of steam pumps ensured that by the later 19th cent. the risk of flooding had virtually disappeared. This, plus the agricultural benefits of cropping the fens, brought resistance to an end. The familiar dikes and drains of the fenland landscape are still a vivid reminder of how vulnerable this area has long been to inundation. See BEDFORD LEVEL. JVB

**Ferguson, Harry** (1884–1960). Engineer. Born in Co. Down, Ferguson opened a garage in Belfast and in 1909 was the first man in Ireland to fly. During the First World War he developed his interest in farm machinery and in the 1930s produced his ploughing tractor. Between 1939 and 1947 he was in partnership with Henry Ford to mass-produce tractors, and when Ford's successors repudiated the contract, set up on his own. Ford's were forced to settle in 1952 for \$9 million in compensation. Ferguson's constant advocacy of reducing prices and holding down incomes became fashionable after his death. JAC

**Fermanagh,** one of the six counties of Northern Ireland until the local government reorganization of 1973, borders on the Irish Republic. Enniskillen, the chief town, is in the centre of the county. In the north of the county is Lower Lough Erne, to the south Upper Lough Erne. Enniskillen was a protestant settlement in the early 17th cent. and sustained a siege in 1689 which took much of the pressure off the Jacobite attack on \*Londonderry. There is a Church of Ireland cathedral, dedicated to St Macartan, and dating from 1841. The area depends upon tourism, cattle, and fishing, with a little light industry. It has a mixed religious population. When Northern Ireland was set up in 1921 the Fermanagh County Council declared its allegiance to the Irish Free State and was dissolved. For parliamentary purposes, Fermanagh is joined with south Tyrone: at the 2001 election, a split within the Ulster Unionists, who held the seat, allowed Sinn Féin to take it with a majority of 53. JAC

**Ferrar, Robert** (c.1504–55). Protestant martyr. Ferrar was born in Yorkshire, took holy orders, and soon adhered to the reforming party. He became chaplain to \*Cranmer and took a wife. Under the patronage of \*Somerset, he was appointed bishop of St Davids (1548). His chapter brought a series of complaints against him and after the fall of Somerset he was tried and imprisoned. When Mary succeeded in 1553 his fate was sealed. Ferrar was deprived of his see in March 1554 and burned in the market-place of Carmarthen in March 1555. He died with great courage. JAC

**Fethanleag, battle of,** c.584. Fought possibly at Stoke Lyne, near Bicester (Oxon.), between the West Saxons and the Britons. The outcome is not recorded, but although the West Saxon king \*Ceawlin is reported to have taken towns and considerable booty, he returned home in anger. It seems likely that he was not wholly victorious and the West Saxons probably suffered a check to their westward expansion. AM

**feudal aids.** In the English feudal society which followed the Norman Conquest, custom permitted the king, at times

## feudalism

of exceptionally heavy expenditure, to take an 'aid' (*auxilium*) from his tenants-in-chief; a lord, similarly, could exact an aid from his free tenants. There was continual conflict about the occasions and amounts of such aids. \*Magna Carta (1215) listed three occasions when the king, or a lord, might demand a 'reasonable', but unspecified, amount. These were: the knighting of his eldest son; the marriage of his eldest daughter (once); and the ransom of his own person from captivity. In 1275 in the statute of \*Westminster, the king also set a limit on the amounts which could be claimed. MW

**feudalism.** An abstract term derived from the adjective 'feudal', and commonly used to highlight those features believed to be characteristic of western European society during the Middle Ages. The word was coined in the 19th cent. and is analogous to the earlier French term *feodalité*. It is based on the Latin noun *feudum* (or *feodum*) which is now usually translated as 'fief' and understood to mean property held by a tenant in return for service. This notion of feudal tenure was used by 16th-cent. French legal historians as a key to understanding the origins and development of aristocratic rights and powers in France in the centuries after the fall of Rome. In the 17th cent. Sir Henry Spelman argued that it was imported into England by the Normans. Hence \*Maitland's crack that it was Spelman who introduced the feudal system into England. In the 18th cent. historically minded intellectuals such as Montesquieu, Adam \*Smith, and David \*Hume believed that societies went through a 'feudal' stage—an idea subsequently taken over by Marxist historians who have, however, emphasized the labour services owed by peasants to manorial lords rather than the military or governmental service owed by high-status tenants, which was central to the older tradition. Particularly influential was Montesquieu's hypothesis that when aristocratic fiefs became hereditary in France (which he dated to the 9th cent.), royal government collapsed and 'feudal anarchy' resulted.

Most British historians have remained within the old tradition of thought, partly because if all that is required for a society to be labelled 'feudal' is that tenants of any kind owe service in return for their lands, the term is thought to embrace too wide a range of social structures to be useful, and partly because the whole notion of feudalism originating in France and spreading out from there has become thoroughly entrenched. The view that the Normans brought 'feudalism' to England, and that during the next two centuries French and English invaders and settlers took it to Scotland, Wales, and Ireland remains widely held—and also widely disputed. Since it is clear that, throughout the British Isles, rulers before 1066 expected political and military service from their landed élites, those historians who believe that William the Conqueror feudalized England have had to define feudalism in terms of precisely those features which they believe he introduced: castles, the 'feudal quota' (that is, the obligation of the king's tenants to provide a quota of knights to serve, usually without pay, for 40 days), and the 'feudal incidents' (that is, the king's right

to exploit the deaths, marriages, and wardships of his tenants both for profit and as an instrument of political control).

One problem with feudalism is that the 'facts' on which it is said to be based—e.g. that fiefs became hereditary in 9th-cent. France, or that William I introduced 'feudal incidents' and the quota—are themselves highly contentious. So many different definitions of feudalism have been offered—or, worse, simply assumed—that a degree of confusion has been the inevitable result. The adjective 'feudal' is commonly used to denote almost any social system regarded as being oppressive or backward. In these circumstances it is not surprising that some American and British medieval historians believe that both word and concept are past their sell-by date and should be abolished. French historians, more at ease with abstractions than their Anglo-Saxon colleagues, continue to use the term freely and much as Montesquieu did, though now with—thanks to the work of Georges Duby—a new orthodoxy dating the breakdown of public power and hence the 'feudal revolution' to c. AD 1000. JG

**fidei defensor** (Defender of the Faith). A title first given (1521) to Henry VIII by Pope Leo X for writing his *Assertio septem sacramentorum* against Luther. After the break with Rome, Parliament authorized it as a royal title (1544), which it has remained, though for modern multi-cultural Britain Prince Charles has suggested an improved translation, 'Defender of Faith' (i.e. all major religions). This proposal has been criticized for denying the superiority of \*Christianity, and for implying that it is possible to believe all religions at the same time—e.g. that Christ was the son of God and that he was not. WMM/JAC

**fief** (or fee). An estate held by feudal tenure from a lord—in the case of tenants-in-chief the obligation was knight service to the king. In the early Norman period, some 2,500 knights were required. The archbishop of Canterbury was to provide 60, the abbot of Peterborough 60, the abbot of Bury St Edmunds 40; Robert of Gloucester was to provide 100, the honour of Totnes some 75. A five-hide unit was usually regarded as sufficient to maintain a knight, though it varied according to the character of the estate. The tenant-in-chief usually subcontracted to his own vassals and any shortfall in the number of knights needed would be made up by a personal retinue, directly supported by the lord and acting as a bodyguard if necessary. There were also uncommitted knights and mercenaries whom William the Conqueror and his successors employed to augment numbers. As the cost of maintaining horse and armour rose, the complement of the feudal levy declined and the proportion of hired men increased. JAC

**Field, John** (1782–1837). Field was a piano virtuoso and composer, whose delicate and sentimental nocturnes had considerable influence on Chopin, Mendelssohn, and others. Born in Dublin of a musical family, he made his first public appearance at the age of 9. He was taken to St Petersburg by Clementi, to whom he was apprenticed, and spent most of his life in Russia, coming to England for a visit in 1832. Hamilton \*Harty's rather lush arrangement of four pieces as an

orchestral suite in 1939 contributed to a popular revival of interest. JAC

**Fielden, John** (1784–1849). Factory reformer, whose career illustrates the sometimes paradoxical nature of early Victorian radicalism. A wealthy cotton-spinner, whose mills dominated Todmorden (then in Lancs.), Fielden was a friend and admirer of \*Cobbett. He held that the welfare of labouring people should be the primary aim of all political endeavour, to be promoted by legislation in Parliament and by local action in the community. As MP for Oldham from 1832 he tirelessly sponsored bills to regulate minimum wages and hours of child labour in mills, and supported \*Oastler and the operatives' short time committees. In 1833–4 he collaborated with Robert \*Owen in the National Regeneration Society for an eight-hour day. His pamphlet *The Curse of the Factory System* was published in 1836, but it was not until 1847 that his \*Ten Hours Bill was finally passed. Fielden fought hard against the New Poor Law and by his encouragement of direct action delayed its introduction into Todmorden. He supported \*chartism, though withdrew from a position of leadership in 1839. JFCH

**Fielding, Henry** (1707–54). English writer and magistrate best known as the intrusive, ironic narrator of his novels. Educated at Eton and Leiden, Fielding wrote numerous plays, including swingeing political satires of \*Walpole's government, until the theatrical Licensing Act of 1737. Called to the bar in 1740, Fielding subsequently divided his time between literature and the law, developing his own idiosyncratic theory of fiction as 'comic epics in prose' in *Joseph Andrews* (1742) and his masterpiece, *Tom Jones* (1749), a political allegory set in the midst of the '45. Appointed JP at Bow Street in 1748, Fielding was an energetic advocate of effective measures to reduce crime, corruption, and public disorder in the capital, earning notoriety for insisting on the death penalty in the Bosavern Penlez case. His health undermined by overwork, Fielding travelled to Lisbon after the publication of *Amelia*, his final novel, dying there in 1754. His half-brother, Sir John Fielding (d. 1780), blind from the age of nineteen, was for many years also a magistrate at Bow Street. JAD

**Field of Cloth of Gold**, 1520. This was an extravagant diplomatic spectacle staged by Henry VIII of England and Francis I of France (1515–47) on 7–24 June 1520 at the Val d'Or, half-way between Guines, in the 'pale' round English Calais, and Ardres. An encampment of several hundred luxuriously decorated tents and pavilions was created for the occasion. The two kings and their entourages spent the time jousting, wrestling, and feasting, concluding with a mass and a banquet. Though the meeting was a great cultural spectacle, as a device to foster friendship between England and France following the treaty of \*London (1518) it failed dismally. Henry VIII negotiated with the Emperor Charles V both before and after the meeting, and in 1522 and 1523 English troops invaded France. EC

**Fields, Gracie** (1898–1979). Music-hall artiste and film star. A Lancashire lass, born Grace Stansfield, Fields joined a touring music-hall company (1913) before eight years with

Archie Pitt, gaining depth of experience in all aspects of revue work, to become a star overnight in the West End (1924). Talented, versatile, and dedicated, she could control her audience with merely a headscarf for a prop, switching easily from 'Ave Maria' to 'The Biggest Aspidistra in the World'. As music-halls declined, 'Our Gracie' moved successfully into film-making, but when she followed her future second husband into exile in America in 1940 (unjustifiably accused of deserting Britain), public adulation turned to condemnation, and it was many years before she regained British favour. She settled in Capri after the war, but returned periodically for concerts, command performances, media work, and to record, gave generously to charity, and was created Dame (1979). ASH

**field systems**. From the time that man began to practise agriculture, systems of husbandry were devised and adopted by individual communities which best suited the soil and climate. The precise circumstances in which the systems were adopted, and the external factors influencing particular communities, cannot now be reconstructed, and such were the variations that generalization is hazardous. Perhaps the best-known system was the common, or open field, system of farming in which the land of a particular parish was divided into two, three, four, or even more fields depending on local conditions. The system is usually dated to the Anglo-Saxon era, and emerged with the division of land and livestock among a mass of small occupiers. The need for common folding compelled common management of intermixed parcels of land. The fields were cropped usually on the basis of two crops and a fallow, although with considerable flexibility for individual initiative. Although the system was designed for a mixture of reasons including risk-sharing, plot-splitting (to accommodate sons for example), and the need to restore the fertility of the land, it is now believed that the need to maximize the number of animals may have been critical.

The common field system was found predominantly in midland England, and other systems were nearly as widespread. In upland regions, or on poor-quality soils, and particularly in Scotland, the system of infield-outfield cultivation was found. In Scotland the infield was an area of land under permanent cultivation which was regarded as a vital adjunct of the cattle-keeping sector of the agrarian economy. The 'outfield' land lay in irregular patches at varying distances from the settlement. They were broken up and cropped on a shifting system. Each parcel might be cropped for four or five years and then allowed to rest for five years. Cropping patterns on the infield and the outfield varied. See also ENCLOSURES. JVB

**Fife** lies on a peninsula between the Forth and Tay estuaries. Its name derives from a Pictish lordship, extending rather further west than the present boundary; the present region is still occasionally called the kingdom of Fife, particularly by those resisting attempts to divide its administration. In the 1973 local government reorganization of Scotland, Fife fought a successful campaign to be a region, and not to be divided between the neighbouring areas (Tayside and Lothian) to which it looks for significant employment, and in the 1996 changes it was Fife, rather than its erstwhile

## Fifteen rising

districts (Dunfermline, Kirkcaldy, North East Fife), which became the all-purpose authority. Though in recent times it has had an in-built Labour majority, Fife continues to display diversity in both political and economic life. It has good agricultural land, partly underlain by coal seams, which formerly provided much employment, and, particularly round its coastline, there is a remarkable concentration of small towns, formerly royal burghs, now mainly inhabited by commuters or retired people. The main population centres are Kirkcaldy (once a major site for linoleum manufacture) and Glenrothes new town (in which the microcomputer industry is an important employer). CML

**Fifteen rising.** See JACOBITE RISING.

**Fifth Monarchy men.** A movement of extreme \*millenarians, arising in 1649 and radiating from two centres: London, where Christopher Feake and John Simpson preached, and Wales, where its evangelists were Vavasor Powell and Morgan Llwyd. Fifth Monarchists interpreted the four beasts in Daniel's dream (Dan. 7) as the four great empires of the ancient world. The fourth, the Roman, had been usurped by the papacy, alias Antichrist, or the Beast in Revelation (Rev. 11–20). The fifth monarchy was to be that of Christ, exercised on his behalf by his saints for 1,000 years (Rev. 20: 3–5), until he returned in person to pronounce the Last Judgement. Such beliefs were held by many orthodox puritans; the Fifth Monarchists differed from them in relating the scriptural prophecies very literally to current events, especially the regicide; in setting an early, precise date for the destruction of Antichrist; and in confidently identifying themselves as the saints. Above all, they believed it was their mission to overturn all remnants of 'carnal' government and erect the promised kingdom by their own efforts, though they differed as to its precise form. One accused \*Cromwell to his face that he 'tooke the Crowne off from the heade of Christ, and put it upon his owne'. They disagreed over using force, but the militants attempted risings in London in 1657 and 1661. Thereafter they gradually declined. AHW

**Fiji.** The republic of Fiji is a group of small islands in the Pacific, 1,000 miles north of New Zealand. They were first explored by Tasman in the 17th cent. but there was little regular contact until the 19th cent. when traders and missionaries arrived. The islands were declared a British colony in 1874 but granted independence in 1970, within the Commonwealth and with a governor-general. In 1987, after coups, Fiji was declared a republic and withdrew from the Commonwealth, rejoining in 1997. Growing tension between the native Fijians and immigrant Indians led to another coup in 2000, during which its membership was suspended. The capital is Suva, and the principal exports are sugar, coconuts, ginger, and copra. JAC

**film industry.** Cinematography, on which many experiments were made in various countries, became feasible after the advent of celluloid film in 1889 and subsequent innovations in the motion film camera and the projector during the early 1890s. Following rapidly on the first public film show in Paris in 1895, the first commercial showing in Britain in 1896 caught public imagination to such an extent

that films were soon being shown in halls, music-halls, and theatres. Later many of these buildings were converted into cinemas and by the early 1900s cinematography was becoming widespread. The first major custom-built picture house, the Alpha, opened in St Albans in 1908. A tremendous boom in cinema building and conversion took place during the next few years and continued unabated until the First World War, by which time there were about 3,500. The Cinematograph Act, 1909, sought among other requirements the safety of the audience.

There was a corresponding growth in film-making and for the first decade British producers were very successful, establishing an important export market, particularly to the USA. Nevertheless only 15 per cent of films released in Britain were of British origin, with France and the USA accounting for 36 and 28 per cent respectively in 1910.

The main characteristic of the British film industry in the decade following the war was the dominance of American companies. This had reached such a degree of saturation that by 1926 British films occupied less than 5 per cent of British screen-time. The Cinematograph Films Act of 1927 attempted to counter this situation by setting quotas to combat the 'Hollywood invasion'. The Films Act became the cornerstone of Board of Trade film policy, recognizing the propaganda value of film and its increasing economic importance, and going some way to assisting British film production. A golden era for the film industry began with the arrival of the talkies in 1927–8, and, despite the depression, cinema building accelerated, no fewer than 715 new cinemas being built 1927–32. There was a boom in British production 1933–6, but in attempting to emulate Hollywood's lavish output, costs of film-making escalated dramatically. The international success of Alexander Korda's *The Private Life of Henry VIII* (1933) was exceptional.

The Moyne Committee, reporting in 1936, suggested major reforms, including a Films Commission and a quality test, but the Films Act of 1938, rather than addressing the financial and production problems of the industry, mainly reiterated the quotas of 1927. However, the Films Council was established in 1938. By 1939 the post-war structure of the industry was evolving and the aims and limitations of state intervention were clear. The propaganda value of the medium can readily be appreciated by viewing documentary and feature films of the war years.

After 1945 there were belated efforts to assist the British film industry, mainly through the National Film Finance Corporation, but such success as this brought in the 1950s and early 1960s was consistently overshadowed by American imports. As television became more widely available there was a steady decline in cinema attendances and British film production suffered. After a period of painful rationalization, when even more production and acting talent was lost to the USA, increased government support assisted revival. Despite the overwhelming American challenge many British productions achieved international acclaim and cinema-going recovered dramatically during the 1980s.

The development of film has been promoted by the British Film Institute, founded in 1933, and in Scotland by the Scottish Film Council. The National Film Archive has an

extensive international collection of books, periodicals, scripts, stills, posters, and over 200,000 films and television programmes, many of considerable historical interest. The Museum of the Moving Image at the South Bank traces the history of film and television. The Scottish Film Council, based in Glasgow, administers the Scottish Film Archive.

ID

**financial revolution.** This term refers to the extensive changes brought about in the British financial system between the Glorious Revolution of 1688 and the 1720s by the creation of a system whereby a national debt could be accumulated to provide government with spending power beyond the scope of taxation. This became necessary as a result of the extensive military commitments undertaken between 1688 and 1815. War expenditure grew from £49 million in 1688–97 to £1,658 million in 1793–1815 and the national debt soared from £44 million in 1739 to £820 million by 1815. At the same time business, in order to expand, required a secure and reliable means for making payments, as well as a stable system of credit. There were three main elements to this revolution, all of which relied on financial techniques developed in the Netherlands: the use of the bill of exchange for financial transactions, trade in shares of the capital stock of corporations, and perpetual annuities issued by the government and thus free from the risk of default.

In foreign trade, the bill of exchange acted both as a means of payment and as an instrument of credit. Its flexibility was increased by the introduction of serial endorsements in Antwerp in the 16th cent., and was institutionalized in the foundation of the Amsterdam Wisselbank in 1609. This allowed merchant bankers to transfer payments denominated in bank money between them quickly and without great risk. The bill of exchange became the main source of credit for merchants engaged in trade with the American colonies in the 18th cent. By the early years of that century facilities for short-term lending and clearing international payments had been established throughout much of western Europe. In the course of the century London became increasingly integrated with the Amsterdam market and attracted some investment from Holland, principally in government and bank stock.

The bill of exchange was used as follows: a purchaser in country A wishing to pay a debt to his supplier in country B obtained a bill from a merchant banker in the currency of country B which he dispatched to his supplier. This would be accepted by a merchant banker in B and paid in that country's currency, usually at a specific date, often three months after acceptance. Finally the bill was returned to the original drawer to show that payment had been made. A merchant could obtain a bill of exchange as a loan. Legislation at the beginning of the 18th cent. gave the inland bill of exchange the same status as its foreign equivalent, and it acted as a major form of money throughout the century. In 1726 the \*Bank of England created a 3 per cent annuity, paying out each year £3 for every £100 purchased, copying the scheme introduced three years earlier by the \*South Sea Company.

Another means by which the state raised capital was by the award of monopoly powers to corporations to raise funds on the understanding that they, in turn, would lend to the government. The Bank of England, founded in 1694, sold the £1.2 million of stock in twelve days. Subsequent flotations of the \*East India Company and the South Sea Company, together with a further round of subscriptions to the Bank, brought the total capital of the three institutions to £20 million by 1717. Similar monopoly status awarded to the London Assurance Company and Royal Exchange Assurance Company in 1720 was conditional on a government loan of £300,000, which was eventually written off as a bad debt.

The combined effects of these developments had profound economic results. They provided an institutional framework within which economic activity expanded, not only by creating a means by which provincial business could be transacted and linked to the main financial centre in London, but, perhaps more critically, by integrating London with the main European financial centre, Amsterdam, which by the end of the 18th cent. it had superseded. Secondly they provided a conduit through which investment on a hitherto unprecedented scale could be mobilized. Throughout the 18th cent. the principal customer remained the government. The state thus played a major role in stimulating and shaping the development of the financial system.

CHL

**Finn Barr, St** (d. c.623). Bishop of Cork. After a reported pilgrimage to Rome, Finn Barr lived as a hermit by Lake Gougane Barra. Attracting numerous followers, he established the monastery of Etargabail, renowned for its school and centre of his cult. More famous was his foundation around which the city of Cork developed and where he is buried. He is believed to have been the first bishop of Cork (c.600). According to legend, a vision of Christ prevented Pope Gregory from consecrating Finn Barr in Rome, since he was reserved for direct divine consecration with holy oil in Ireland. Another story alleges that the sun did not set for fifteen days after his death.

AM

**Finn mac Cumhaill** (McCool) is the hero of the 11th-cent. Fionn cycle of Irish tales, father of Oisín, and leader of the élite war-band, the Fianna. He has supernatural powers of prophecy and fighting. His great deeds include saving \*Tara from the goblin Aillen, who burns down the stronghold each year on the Feast of Samhain; and successfully challenging Nuadu, god of the Tuatha Dé Danann, for lordship of the sídh of Almu. Finn becomes an outcast after arranging the death of Diarmaid in his jealousy for the love of Gráinne. He dies attempting to leap the Boyne after breaking his 'geis' (bond of honour) by drinking from a horn.

SMD

**first fruits.** A tax, usually of the first year's income, paid to a feudal or ecclesiastical superior. Before the Reformation, first fruits for all clerical benefices went to the pope, together with an annual payment of one-tenth of the income. The Act of \*Annates (1532) declared this unlawful, payments were diverted to the crown, and a treasurer and court established to collect them. Mary did not restore the payments to the

## First World War

papacy. In 1649, after the abolition of the monarchy, the \*Long Parliament used the first fruits to support preachers and schoolmasters, but at the Restoration it became once more part of royal revenue. Charles II frequently used it for non-ecclesiastical purposes, such as the support of his bastards. In 1704 the revenue was diverted to found \*Queen Anne's Bounty, to augment the incomes of poor livings. Since the initial payment, and the accumulation of tenths during vacancies, could be a substantial burden, legislation exempted livings of less than £50 p.a. value. In 1838 the collection was removed from the First Fruits and Tenths Offices and handed over to the Bounty Office. Payment ceased altogether from 1926. JAC

**First World War.** In August 1914 Britain ostensibly went to war against Germany because of the latter's unprovoked invasion of Belgium. In reality Britain fought the First World War to prevent Germany dominating Europe and, with the help of her Austrian and Turkish allies, threatening the British empire in Asia and Africa. Though from the outset British policy-makers recognized that co-operation with their Russian and French allies would be essential if they were to win the war, they were determined to give that co-operation strictly on their own terms, rendering only enough assistance to their allies to prevent them from collapsing. The men who made British policy during the war had reached maturity and formed their vision of the world in the late 1870s and early 1880s. They had learned to see Russia and France as Britain's most bitter imperial competitors and they did not forget that fact even after the German threat emerged in the decade before 1914. Their misgivings concerning their allies' ambitions played a major role in determining British war aims. They wanted a peace settlement which would reduce Germany's power and also ensure that neither Russia nor France could tilt the European balance against Britain or menace Britain's imperial possessions.

In 1914 the \*Asquith government believed that the war would reach its climax in 1917. Britain could achieve her objectives at least cost by allowing her allies to carry the weight of the continental land war with only token British assistance. Meanwhile the Royal Navy would undermine the German economy by blockade and Britain would offer financial help to her allies. \*Kitchener formed the New Armies in the belief that by the end of 1916 the armies of the other belligerents would be exhausted. His troops would be unbloodied and in 1917 Britain could intervene decisively in land war, crush Germany and her allies, Turkey, Austria-Hungary, and (after September 1915) Bulgaria, and impose Britain's peace terms on everyone.

This policy collapsed because France and Russia were not willing to fight for three years without British military support. By late 1915 the government had reluctantly accepted that if they failed to give their allies large-scale support on the continent, France and Russia might prefer to make a negotiated peace. But it was equally obvious that the cost of increasing Britain's commitment to the continental land war might be self-defeating. Some argued that if the New Armies were committed to a major allied offensive in France in 1916, losses could only be made good by conscription. But

if more men were taken away from the civilian economy, Britain would be bankrupt before the enemy sued for peace. The British offensive on the \*Somme in 1916 was an enormous gamble. The government was wagering that the Entente could win the war before Britain went bankrupt.

The attack failed, for although both the British and German armies suffered enormously, the Germans had no intention of asking for peace terms. Instead they tried to starve Britain into submission by launching a campaign of unrestricted U-boat warfare against British shipping. This was the strategic situation which \*Lloyd George inherited when he became prime minister in December 1916. His aims were the same as Asquith's, but he was more aware than Asquith that he would have to work hard to sustain popular support for the war, for war-weariness was now rife in Britain. The armed forces were a serious drain on the economy, and nothing was more likely to undermine support for the war than shortages of food, fuel, and housing, especially if such shortages gave rise to the corrosive belief that 'profiteers' were making unfair gains from the war while the rest of the population suffered. But morale depended upon more than adequate supplies of food and fuel. Lloyd George knew that the people had to be convinced that their sacrifices were reaping tangible victories, and if they could not be won on the western front, they had to be gained elsewhere. One reason why he supported offensives at Salonika in Greece, in Palestine, and in northern Italy was his belief that a victory gained on one of those fronts would provide a much-needed stimulus to British morale.

The new government also knew that victory could only be achieved in co-operation with its allies. But in the spring of 1917 the pillars upon which British strategy rested began to crumble. In March 1917 the British greeted the first Russian Revolution with cautious enthusiasm, hoping that Russia would follow the same path as France in 1794; from the ruins of the tsarist regime would emerge a new military colossus. But news of the crumbling discipline of the Russian army meant that their hopes soon gave way to the fear that Russia would desert the alliance, and that the Germans would move large numbers of troops to the western front and break the allied economic blockade by gaining access to Russian food and fuel. In the mean time a large part of the French army mutinied, and although most French soldiers were ready to defend their trenches, they would not participate in further futile offensives. At sea German U-boats were sinking so many merchant ships that Britain was close to starvation. The only cause for optimism in the Entente camp was that in April 1917 the USA declared war on Germany. But any hope that the Americans would soon be able to throw their weight into the land war in Europe was quickly dashed. The USA had a tiny regular army and would not be able to deploy an appreciable force in France before 1918 or even 1919.

The debate about the future of British strategy in the summer of 1917 therefore concerned one question: what should be the new timetable for administering the knock-out blow against Germany? One option was to follow the French example. After the mutinies they had decided to remain on the defensive in the west for the remainder of

1917, and wait for 1918 and the Americans before trying to drive the Germans back across the Rhine. In the meantime the British might, as Lloyd George urged, divert troops to northern Italy. The Italians had entered the war on Britain's side in May 1915. If they could defeat the Austrians, and persuade them to make peace, they would destroy Germany's ambition of establishing an empire stretching from Hamburg, through Austria-Hungary, Bulgaria, and Turkey, to Baghdad. The alternative was to permit the commander-in-chief, Sir Douglas \*Haig, to have his way and mount an offensive in Flanders. If Haig drove the Germans from the Belgian coast he would remove the threat of invasion, inflict a major defeat upon the German army, and take German pressure off France and Russia. Haig believed that he could force the Germans to sue for peace by Christmas 1917. The politicians doubted, but allowed him to try. They expected little military help from the French, but they were afraid that if the British did nothing, France would go the way of the Russians and collapse.

The third battle of Ypres (\*Passchendaele) in July 1917 was a failure. Haig then launched a second offensive, using massed tanks, at Cambrai, but that also failed. In October Italy suffered a major defeat at Caporetto and in November the Bolsheviks seized power in Russia and soon signed an armistice. The arrival of the American army was even slower than the British had anticipated. Lloyd George still believed that the war could be won only after the German army had been defeated on the western front but he also believed that, if the British mounted another large-scale offensive in France in 1918, their army would be exhausted, America would dominate the Entente in 1919, and America, not Britain, would dictate the peace treaty. He therefore decided that Britain must preserve her army and economic staying-power in 1918. The knock-out blow against Germany would be delayed until 1919, when the arrival of the Americans would give the Entente a crushing superiority.

In January 1918, and despite the opposition of his own generals, Lloyd George persuaded Britain's partners to agree to his new timetable for victory in 1919. In 1918 each partner would increase production of artillery, aircraft, and tanks in order to multiply the fire-power of her dwindling military manpower, and Britain would safeguard her own imperial interests in Egypt and India by defeating the Turks in Palestine. The British were not fighting only to re-establish the balance of power in western Europe, for Turkey's entry into the war on the side of Germany in November 1914 had made the First World War an Asiatic as well as a European war. In 1915–16 the British had mounted expeditions against \*Mesopotamia, Palestine, and at the \*Dardanelles to protect their Asiatic possessions. The war was a contest for the division of world power. The Germans wanted to replace Britain as a world power by creating a middle European empire. It was a war in which the British assessed victory or defeat by their success or failure in frustrating Germany's ambitions and by their ability to maintain their own security in western Europe and in India and the Middle East.

Lloyd George's timetable for victory in 1919 collapsed because in the spring of 1918 the Germans made their

own final attempt to win the war before they became exhausted. Between March and July 1918 the survival of the Entente alliance was in doubt. At one moment the Germans threatened to divide the British army from its French ally. But by June the last German offensive had been stopped, and in July the Entente's armies began a counter-offensive, forcing the Germans back. The way in which the war ended surprised Britain and her allies. As late as August they were still preparing plans to continue fighting into 1919 and even 1920. As late as mid-October Haig did not think that the German army was so badly beaten that the German government would accept the armistice terms which the Entente wanted. When the armistice negotiations began in October the British had to consider several conflicting factors. Should they continue fighting into 1919, to invade Germany and inflict a Carthaginian peace upon the German people? Would such a settlement threaten the future peace of Europe by leaving the French too powerful and by making the Germans vengeful? Were the British people willing to fight for another year? Would the economic and political cost of doing so leave western Europe devastated and dominated by the USA? How could the allies devise armistice terms which would not be so harsh that the Germans would reject them but which would prevent Germany from gaining a breathing space after which it could start fighting again? It was only after weighing these factors they opted for an early peace and the guns fell silent on 11 November 1918, a year earlier than most British policy-makers had anticipated.

Bourne, J. M., *Britain and the Great War, 1914–1918* (1989); Turner, J. (ed.), *Britain and the First World War* (1988); Wilson, T., *The Myriad Faces of War: Britain and the Great War 1914–1918* (Oxford, 1986).

**Fishbourne** was an exceptionally early, large, and luxurious Roman villa or 'palace'. One mile west of \*Chichester, the site at the head of Chichester harbour was first occupied by a supply base of the invasion period. In the Neronian period the first stone civil buildings were constructed. The Flavian 'palace' covered 10 acres with dependencies. It consisted of four carefully planned ranges enclosing a central area with a formal Roman garden. The entrance-hall was in the centre of the east range and box-edged walkways led to the formal reception room in the centre of the raised west range. The north range and the northern part of the east range (now open to the public) were constructed round a series of internal courtyards, perhaps suites for guests or parts of the family. The south range, with a prospect over the sea, was probably the principal residence, though now inaccessible to archaeology. The Mediterranean-style complex and decoration (black-and-white mosaics, stucco-work) were unique in late 1st-cent. Britain. The complex declined through the 2nd and 3rd cents., though still a comfortable villa. It was destroyed by fire in the late 3rd cent. ASEC

**Fisher, Geoffrey** (1887–1972). Archbishop of Canterbury. Born in Leicestershire of a clerical family and educated at Exeter College, Oxford, Fisher taught at Marlborough. After succeeding William \*Temple as headmaster of Repton (1914–32), he was successively bishop of Chester (1932), bishop of London (1939), and archbishop after Temple's

sudden death (1945). His considerable administrative skills were evident in London especially during the blitz and at Canterbury where he accomplished the most substantial canon law reform since \*Bancroft. As archbishop, he was the first to travel world-wide in the Anglican Communion and the first since the Reformation to visit the pope. Headmasterly in manner, both as bishop and archbishop, he took a central position between Anglo-catholics and evangelicals, thus assuaging earlier antagonisms. On retirement to Trent village in Dorset (1961) he was active as parish curate.

WMM

**Fisher, John** (1469–1535). Bishop. Fisher was educated at Cambridge, became fellow of Michaelhouse, and took priestly orders in 1491. Through the patronage of Lady Margaret \*Beaufort, whom he served as confessor, he was made reader in divinity in 1502, and two years later bishop of Rochester. At Cambridge he promoted Renaissance humanist studies, especially at Christ's and St John's Colleges; he recruited teachers of Greek (including Erasmus between 1510 and 1514) and Hebrew. His Renaissance outlook was combined with a profound respect for the church's traditions. He wrote copiously against Martin Luther, his works including the *Assertionis Lutheranae confutatio* (1522/3), the *Defensio regiae assertionis* (1523), and the *Sacri sacerdotii defensio* (1525). When Henry VIII sought to repudiate his first wife, \*Catherine of Aragon, Fisher was one of the king's most public and prolific opponents. He led resistance to the attacks on the status of the clergy in the Reformation Parliament and in convocation, and was imprisoned in 1533. In 1534 he refused the oath of supremacy. In 1535, just after his elevation to the cardinalate by Paul III, he was put on trial for treasonably denying the king's supremacy over the church, and was executed on 22 June 1535. He was canonized in 1935.

EC

**Fisher, Sir John, 1st Baron Fisher** (1841–1920). Admiral. 'Jackie' Fisher was the main architect of the fleet with which Britain went to war in 1914. Between 1905 and 1910, when he served as 1st sea lord, he introduced two new classes of warship, the all-big-gun, turbine-propelled Dreadnought class of battleship and the more lightly armoured 'Invincible' class of battle-cruiser. They made all existing capital ships obsolete and gained for Britain a brief respite in the Anglo-German naval race. But when the Germans began to launch their own dreadnoughts in 1909, Fisher was determined to out-build them. He succeeded but only at the cost of further souring Anglo-German relations. Recalled to serve as 1st sea lord in October 1914, he resigned amidst great acrimony in May 1915 when he lost patience with his political chief, Winston \*Churchill, over the navy's growing commitment to the \*Dardanelles.

DF

**Fishguard invasion**, 1797. In one of the more bizarre episodes of the Revolutionary War, the French Directory collected 1,200 men, mainly from gaoles, and landed them from three frigates and a lugger near Fishguard on 23 February 1797. They surrendered two days later to the local militia under Lord Cawdor, their commander, an American named Tate, explaining that he thought it 'unnecessary to attempt

any military operations as they would tend only to bloodshed'. According to local legend, the invaders mistook the red coats of the Welsh women for cavalry. Though the military threat was negligible, the panic in London was enough to cause a run on the Bank and to drive Britain off the gold standard.

JAC

**fishing**. See ANGLING.

**fishing industry**. Historically, seafood was an important part of people's diet and fishing was a long-established activity round Britain's coasts, complementing subsistence farming or crofting, and providing livelihoods to sea-going communities. Britain was well favoured for the development of a large-scale fishing trade, located in one of the most prolific sectors of the European continental shelf, with seas of moderate depth readily fished for herring, haddock, pilchard, and cod by small vessels. It was also fortunate that the annual movement of herring round the coast worked greatly to the advantage of fisherfolk, giving opportunities for catches everywhere at some time of the year.

By the 17th cent. fish had become a growing item of trade, especially for the Scots and Irish, but the wealth of the offshore grounds also benefited the Dutch, who were active mainly in the North Sea. Indeed the competition of the Dutch caused much alarm and encouraged government policy to promote native fisheries still further, notably in Scotland under the Board of Trustees for Fisheries and Manufactures, established in 1727. Although bounties (or grants) were offered on vessels fitted out for herring fishing, other legislation on fishing practices and the high duty on salt needed for curing handicapped expansion. The establishment of the British Fisheries Society in 1786 coincided with a new attitude. Bounties were promised on herring catches and on fish exports and the Salt Laws were relaxed soon after in favour of the fisherman.

During the 19th cent. the fishing industry experienced dramatic expansion and by the 1850s the herring fishery on the east coast was the largest in Europe. The fishing population and communities grew accordingly, with Lowestoft, Hull, and Aberdeen the main fishing ports. As with agricultural produce the growth of the market for fresh fish coincided with the development of the railways and of refrigeration and these encouraged the introduction of steam trawling, initially in inshore waters, after 1880. Deep-sea fishing had meantime been pioneered by whalers working out of British ports, including Hull and Dundee.

By 1914 the industry was large scale, capital intensive, and, despite an important domestic market, much dependent on foreign exports. It experienced the same painful adjustment to changing circumstances as other industries during the depression. Falling prices and deteriorating equipment were the main problems, so that by 1939 the industry had shrunk from its peak at the turn of the century. Herring fishing never regained its previous significance, even when revitalization ultimately came after 1945, and white fishing became the mainstay of the industry.

As stocks were progressively exhausted through over-fishing, access to fishing grounds became a major source of conflict between Britain and other nations, especially with

Iceland to the north and Spain to the south. Relations between Britain and Iceland reached crisis point during a series of 'cod wars' in the 1960s and the fishing of southern waters by Spain was a continuing grievance of the Cornish industry. The European Community and its successor, the European Union, as well as national governments, attempted to regulate catches through quota systems and the Common Fisheries Policy, but not without sustained resistance from the fishing industry. Whaling was abandoned on environmental and conservation grounds. Rising prices made fish-farming in inshore waters more viable and since the 1970s this has become an increasingly important source of supply and export earnings, especially at the luxury end of the market.

ID

**Fitzgerald, Lord Edward** (1763–98). Irish patriot. Fitzgerald was born into one of the wealthiest and most esteemed families of the Irish aristocracy: his father was James, 1st duke of Leinster. He was MP for Athy in the Irish House of Commons (1783), transferring in 1790 to Co. Kildare. An enthusiastic Francophile and more radical than most of his parliamentary contemporaries, he came to regard Parliament as unreformable, and turned instead to the \*United Irish Society: after several years of close communication with its leaders, he was inducted into the society in 1796. He narrowly escaped capture when troops raided the meeting-place of the United Irish executive in March 1798. Although this venture enhanced his reputation within the movement and left him as its military leader, he proved to be highly indecisive. He was eventually arrested and mortally wounded on 19 May: his death on 4 June simultaneously freed Dublin castle from its most charismatic opponent, and the United Irish Society from the shackles of caution.

AJ

**Fitzgerald, Gerald, 8th earl of Kildare** [I] (c.1457–1513). Fitzgerald's father, the 7th earl, was a prominent Yorkist and deputy to the lord-lieutenant of Ireland on several occasions. Fitzgerald succeeded to the title in 1477 when he was about 20. He was continued as deputy by Edward IV, Richard III, and Henry VII, and since the lord-lieutenant was often a nominal appointment, was effectively ruler of Ireland. In 1487 he and his brother Thomas supported Lambert \*Simmel: the earl is said to have crowned him in Dublin and Thomas Fitzgerald was killed fighting for him at \*Stoke. Nevertheless, Fitzgerald gained a pardon. In 1494, suspected of conspiracy with \*Warbeck, he was attainted, but once more pardoned and reappointed deputy in 1496. In 1505 he was given the Garter, and Henry VIII continued him in his post. Fitzgerald was killed in a skirmish at Lemyvanna, King's County. A member of one of the great Norman/Irish families, much of his time was devoted to subduing the native Irish and the indulgence shown him by Henry VII suggests the strength of the Kildare position in the Pale.

JAC

**Fitzgerald, Gerald, 9th earl of Kildare** [I] (1487–1534). Fitzgerald's father built up a powerful position in Ireland, and served as deputy for many years, dying in 1513. Fitzgerald had been a hostage in England and was well known to Henry VIII, four years his junior. He was appointed to his

father's place as deputy and held the office until 1520. He accompanied Henry to the \*Field of Cloth of Gold. Reinstated as deputy in 1524 at the expense of his great rival Ormond, he was recalled in 1526 and sent to the Tower. He returned once more to Ireland in 1530 and was reappointed deputy in 1532. When he was recalled again in 1534 and imprisoned in the Tower, his son Thomas led a rising. Fitzgerald, who had been wounded in a skirmish the previous year, died in September 1534. He does not seem to have had the skill his father showed in navigating the turbulent currents of Irish politics and the precariousness of his position suggested that the English crown was growing in strength.

JAC

**Fitzgerald, Gerald, 14th earl of Desmond** [I] (c.1533–83). Fitzgerald succeeded his father in the earldom in 1558, in his mid-twenties. In 1565 he was wounded in private warfare with \*Ormond and sent to the Tower 1567–70. From 1574 he was in conspiracy against Elizabeth and from 1579 in open rebellion under papal encouragement. He was killed in 1583 and his head stuck on London bridge. 'Dim-witted, barely literate, more a captain than a courtier,' is a modern assessment.

JAC

**Fitzgerald, James Fitzmaurice** (d. 1579). Fitzgerald was nephew of James, 13th earl of Desmond [I], and cousin of Gerald, the 14th earl. In 1569 he claimed the Desmond earldom for himself and launched a catholic crusade. Forced to submit in 1573, he went to the continent, hoping that the king of France or of Spain would claim the throne of Ireland. Pope Gregory XIII encouraged him in an expedition to Ireland and he landed at Dingle in 1579, and began fortifying Smerwick. But he was killed in an affray and the garrison at Smerwick was butchered by Lord \*Grey.

JAC

**Fitzgerald, James, 15th earl of Desmond** [I] (c.1570–1601). Fitzgerald was about 13 when his father, the 14th earl, was killed in open rebellion. The boy was put into the Tower of London, where he seems to have been in indifferent health. Left there until 1600, he was brought out during the Tyrone rebellion, created earl, and sent to Ireland in the hope that he could bring his compatriots back to submission. But the Irish repudiated him as a protestant and a puppet, and he returned to England, dying shortly afterwards. His period of semi-freedom in adult life lasted just over a year.

JAC

**Fitzgerald, Thomas, 10th earl of Kildare** [I] (1513–37). In 1534 Fitzgerald's father, the 9th earl, was recalled as lord deputy to England and imprisoned in the Tower in disgrace. Fitzgerald, then Lord Offaly, had been appointed deputy by his father. He began with a show of defiance to Henry VIII which developed into open revolt, declaring that the king was a heretic and that all Englishmen were to leave Ireland at once. In the course of the rising the archbishop of Dublin was murdered, probably with Fitzgerald's participation. Had the revolt received foreign assistance, it could have been formidable. In September 1534 his father died and Fitzgerald succeeded to the earldom. William Skeffington's relief army arrived in October, took Fitzgerald's stronghold at Maynooth, killed the garrison, and shattered the revolt.

Fitzgerald surrendered, on promise of life, was sent to London, and there executed in 1537 with five of his uncles. The breach of surrender terms caused anger in Ireland, but the execution of a government official guilty of rebellion and atrocity hardly surprised many Tudor Englishmen. JAC

**FitzGibbon, John, 1st earl of Clare** [I] (1748–1802). FitzGibbon was the son of a lawyer and Irish MP from Co. Limerick, attended Trinity College, Dublin, and Christ Church, Oxford, and represented Trinity College Dublin 1778–83 and Killmallock 1783–9 in the Irish Parliament. In 1783–9 he was Irish attorney-general and from 1789 until his death he was lord chancellor [I]. Created Baron FitzGibbon [I] in 1789, he was advanced to a viscountcy in 1793 and made earl of Clare [I] in 1795. In 1799, just before the Act of \*Union, he was given a British barony. He was one of the leading advocates of the Union, arguing that Ireland would then play her full part in a larger political context. FitzGibbon was a ready speaker and tough politician, a rival to \*Grattan, and a most bitter opponent of the catholics. In 1795 he helped to defeat \*Fitzwilliam's proposed concessions. After the \*Irish rising of 1798 he defended repression in the House of Lords: 'happy would he be if he could go to his bedchamber at home without entering an armoury and could close his eyes without apprehensions of having his throat cut before morning.' JAC

**Fitzhamon, Robert** (d. 1107). Fitzhamon was one of the leading Norman colonizers of south Wales. He seems to have moved from his holdings in Gloucester to carve out a marcher lordship in Glamorgan, beginning the building of Cardiff castle in 1080. He was generous in his benefactions to Tewkesbury and Gloucester abbeys at the expense of his conquered territories. Fitzhamon was with Rufus in the New Forest when he was killed and gave strong support to Henry I in his struggle for the succession. Fighting in Normandy on his behalf against \*Robert of Gloucester, he was captured in 1105 but rescued by the king. At the siege of Falaise he was wounded and on his death in 1107 was buried at Tewkesbury. His daughter married an illegitimate son of Henry I, who created him Robert, earl of Gloucester. JAC

**FitzNigel, Richard** (d. 1198). Bishop of London (1189–98) and treasurer of England (c.1158–98). A member of the outstanding family who developed the sophisticated 12th-cent. English administrative system, he was son of Nigel, bishop of Ely, treasurer, and nephew of Henry II's justiciar, \*Roger of Salisbury. He was also successively archdeacon of Ely and dean of Lincoln (c.1184), mediated in the furious struggle between \*Longchamp and John, and was custodian for Richard's ransom. He is chiefly remembered for writing the \**Dialogus de Scaccario* (*Dialogue of the Exchequer*), 'a unique and precious document' on the English governmental system. Written especially for administrative apprentices, it was the first manual anywhere in Europe to explain the mysteries of bureaucratic practice and auditing. WMM

**Fitzosbern, William, earl of Hereford** (d. 1071). Fitzosbern, steward at the court of Normandy, was one of William the Conqueror's most trusted advisers and fought at

his side at Hastings. In reward he was given great estates in the west country, the rank of earl, and palatine powers. Much of his energy went into fighting the Welsh and establishing the Norman position in Glamorgan. He began the building of a number of castles, notably Chepstow, Monmouth, Berkeley, Hereford, and Wigmore. As viceroy in William's absence in 1067 he had to subdue a rising by Edric the Wild in Herefordshire. In 1070 Fitzosbern was sent to Normandy but he was killed in battle the following year, fighting on behalf of the countess of Flanders, whom he had just married. JAC

**FitzRoy, Henry, duke of Richmond** (1519–36). FitzRoy was Henry VIII's illegitimate son by Elizabeth Blount, a lady-in-waiting to \*Catherine of Aragon. Since Henry had no surviving male heir until 1537, and his marriage to Catherine was disputed, the future of FitzRoy produced much comment. In 1525 he was given the Garter and created duke of Richmond, a title held by Henry's father. His appointments as lord high admiral (1525) and lord-lieutenant of Ireland (1529), though nominal, were taken as favours to come. In 1533 he was married to a daughter of the duke of \*Norfolk. The second Act of \*Succession in 1536 bastardized both Mary and Elizabeth and gave Henry the power, should \*Jane Seymour not have children, to name his successor. It was presumed that he would use this on behalf of FitzRoy. Parliament dissolved on 18 July and five days later the young prince died aged 17, of consumption. 'Not a bad thing for the interests of the Princess [Mary]', wrote the imperial ambassador laconically. JAC

**Fitzwilliam, William Wentworth, 2nd Earl** (1748–1833). Fitzwilliam inherited the wealth and vast estates of his uncle Lord \*Rockingham in 1782 and became head of the Whig political interest in Yorkshire. He regularly returned five members to Parliament for his pocket boroughs and in 1807 spent £100,000 to win his son's election for Yorkshire. He was a lifelong friend of \*Fox and in 1782 he also succeeded Rockingham as patron of Edmund \*Burke. He reluctantly broke with Fox in 1794 and joined \*Pitt's cabinet, being sent to Ireland in January 1795 as lord-lieutenant. Under Burke's influence he attempted to establish Whig rule over Ireland and to persuade the cabinet to catholic emancipation, but he was dismissed in March. He rejoined Fox and \*Grenville after 1802 and was lord president of the council under Grenville in 1806. He had become lord-lieutenant of the West Riding in 1798 and was efficient and liberal-minded, but he was dismissed from this post in 1819 for chairing a protest meeting against the \*'Peterloo massacre'. A humane and genial character and a lifelong defender of aristocracy, he was widely popular and respected. EAS

**Five Knights' case**, 1627. After the 1626 Parliament had been dissolved without granting subsidies, Charles I raised money by various means, including \*forced loans. In 1627 five knights, imprisoned for refusal to contribute, appealed for \*habeas corpus. Lord Chief Justice Hyde denied bail: 'if no cause of the commitment be expressed, it is to be presumed to be for matters of state, which we cannot take

notice of.' As a means of alienating the propertied classes, Charles's policy was highly successful. JAC

**five members**, 1642. On 4 January 1642 Charles I, exasperated at the opposition of the House of Commons, which had passed the \*Grand Remonstrance, attempted in person to arrest five of its leaders—John \*Pym, John \*Hampden, Denzil \*Holles, Arthur \*Haselrig, and William Strode. Forewarned, they made their escape, leaving the king to mutter, 'I see that my birds have flown.' Within a week he had left London, never to return as a free man. JAC

**Five Mile Act**, 1665. 17 Car. II c. 2 was part of the \*'Clarendon code', which aimed at restoring Anglican supremacy. Clergymen and schoolmasters were forbidden to live within 5 miles of any city or parliamentary borough unless they took an oath not to endeavour to alter the government in church and state. Such a loosely framed statute was almost impossible to implement and few prosecutions were undertaken. JAC

**fives**. The game of fives, in a rough form, certainly dates back to Tudor times, though the derivation of the name is unclear. The essential ingredients are a hard ball, gloves to protect the hands, which are used instead of rackets, and a wall or court. Its modern form derives from versions played at Eton, Rugby, and Winchester, which spread to other schools in the later 19th cent. and then to universities. The first attempt to standardize the rules was in 1877. JAC

**Flambard, Ranulf**. See RANULF FLAMBARD.

**Flamsteed, John** (1646–1719). Flamsteed was the first astronomer-royal. He was born near Derby and educated there. Handicapped by ill-health, he began astronomical observations and in 1675 was placed on a panel to investigate claims to ascertain longitude at sea. The same year he took holy orders and was appointed by Charles II to supervise the new royal observatory at Greenwich. In 1677 he was elected to the Royal Society. He was in close touch with the scientists of the age, including \*Halley and \*Newton, but his health made him irritable and suspicious. In 1707, after many difficulties, Flamsteed's first catalogue of observations was published, but the rest had to wait until after his death. JAC

**Flaxman, John** (1755–1826). English sculptor, designer, and book illustrator. He studied at the Royal Academy Schools, before working as a designer for Josiah \*Wedgwood. In 1787 Flaxman travelled to Italy to study. During the seven years he spent there, he drew illustrations for the *Iliad*, the *Odyssey*, and works of Dante and Aeschylus, which earned him an international reputation. On his return to England he was immediately in demand as a sculptor of monuments and figures; among the best known are those to Lord \*Mansfield in Westminster abbey and Lord \*Nelson in St Paul's, although his work can be found in many churches, cathedrals, stately homes, and galleries throughout Britain. Appointed RA in 1800, he became the first professor of sculpture in 1812. He continued to draw book illustrations, some of which were engraved by his friend William \*Blake, and designs

for silverware. Much of his work is held at University College, London. JC

**Fleet prison** (London) was in use from the time of the Norman Conquest until the reign of Queen Victoria. It held those who owed money to the crown, with prisoners being committed by king's council and the Court of Chancery. A single family, the Levelands, retained control of the prison for 400 years. It closed in 1842. RAS

**Fleet Street** (London) was for centuries the home of the newspaper industry and the name is still used to describe the national press. It ran from the Fleet river, a noisome ditch, to the Strand—strategically between the city and the court. From Tudor times it was the haunt of booksellers, writers, and printers. The first daily newspaper, the *Daily Courant*, was established there in 1702, and *The Times*, in Printing House Square to the east, followed in 1785, under the name *Daily Universal Register*. In the 1980s there was a wholesale exodus of newspapers to less-congested sites elsewhere. JAC

**Fleming, Sir Alexander** (1881–1955). Discoverer of penicillin. A farmer's son from Ayrshire, Fleming moved to London at 13 to live with his doctor brother, and then went to St Mary's hospital for training in medicine. He spent his career there. He was assistant to Sir Almroth Wright, working on bacteria, seeking a magic bullet which would be harmless to our cells but fatal to bacteria. In 1928 he noticed that a culture of staphylococcus in his untidy laboratory was being attacked by a mould, which he isolated and grew. He had high hopes of it, but it attracted little attention, and it was not until the Second World War with the work in Oxford of H. W. Florey and E. B. Chain that penicillin was purified to be clinically effective. The three shared a Nobel Prize in 1945. DK

**Fletcher, Andrew** (1655–1716). Politician. Fletcher of Saltoun was taught by Gilbert \*Burnet, minister of his parish, who later described him as 'a most violent republican and extremely passionate'. He represented East Lothian at the convention of estates and in the Scottish Parliament and was in strong opposition to \*Lauderdale and James, duke of York (later James II). From 1682 he was in exile in Holland, a supporter of \*Monmouth. He accompanied Monmouth in 1685 but left the expedition after shooting one of his own side in a brawl. After the Glorious Revolution he returned to Scotland but was soon in opposition to William III, arguing for limitations on the crown. Returned to Parliament again in 1703, he became a prominent opposition speaker, advocating a Scottish national militia and annual meetings of the Scottish Parliament. He was violently opposed to the Act of \*Union, proposing a separation of the crowns instead. An effective speaker and vigorous pamphleteer, Fletcher was hot-headed and uncompromising. \*Macaulay wrote that he was 'distinguished by courage, disinterestedness and public spirit, but of an irritable and impracticable temper'. JAC

**Flight of the Earls**, 1607. \*Tyrone and Rory \*O'Donnell, who had been in open rebellion against Elizabeth, submitted in 1602. O'Donnell was created 1st earl of Tyrconnel. But

## Flinders

increasingly dissatisfied with their position, they fled on 4 September 1607 from Rathmullan on Lough Swilly with some 90 family and retainers and took refuge at Rome. Neither saw Ireland again. Tyrconnel died in 1608, Tyrone in 1616. The result was to deprive the native Irish of a focus for resistance, and colonization from England and Scotland proceeded rapidly until the great rising of 1641. Over the next three centuries, tens of thousands of Irish left their native land. JAC

**Flinders, Matthew** (1774–1814). Flinders accurately delineated the coasts of Australia and began the practice of using that name for it. After joining the Royal Navy in 1789, Flinders served with \*Bligh before surveying the New South Wales coast in detail in 1795. In 1798–9 he and Bass circumnavigated Tasmania, proving its separation from the mainland and impressing naval and scientific opinion in Britain with his qualities as an explorer. A new scientific expedition led by him 1801–3 mapped the coasts of nearly all Australia with great accuracy, completing the basic exploration of the Pacific Ocean section of the world. Flinders became a prisoner of war of the French on his way home but was released from Mauritius in 1809. RB

**Flintshire.** County of north-east Wales lying along the estuary of the river Dee. The shire was created at the statute of \*Rhuddlan in 1284 and was coincident with the Welsh cantref (hundred) of Tregeingl, the most easterly of the four cantrefs of Perfeddwlad. It was subject to Saxon invasion and was largely to the east of Offa's Dike, the 8th-cent. boundary between Welsh and Saxon. Under the Normans, it was soon overrun by the neighbouring earl of Chester, but after the wars of Edward I became crown land. Maelor Saesneg, or English Maelor, to the south was also in crown hands and was, although detached geographically, made part of the shire. The county, with the detached part, remained as such at the Act of \*Union in 1536. It was not modified until 1974 when Flintshire became part of \*Clwyd and was divided into three districts, Rhuddlan, Delyn, and Alyn and Deeside. The detached part was merged into Wrexham Maelor. In 1996 the county was reconstituted from the three districts.

Flintshire consists of a low coastal strip along the Dee estuary rising to the Halkyn Mountain to the west. The Alyn valley separates it from the Clwydian Range which forms the western border, although the mouth of the river Clwyd is in Flintshire. As in medieval times Flintshire straddles the gateway to north Wales, especially the Dee crossing, the basis of its economic significance. The economy is dominated by tourism, extensively developed on the north coast, and industry. The county includes the central and northern sections of the North Wales Coalfield; the last mine, at Point of Ayr, closed in 1996. Iron and steel production has also ceased, although a range of engineering and electronic industry has succeeded.

The population of the three districts which correspond with Flintshire was 191,706 in 1991. In such a border county, Welsh-speaking proportions are low, ranging from 9.6 per cent in Alyn and Deeside, to 17.8 in Delyn, and 16.2 per cent in Rhuddlan. HC

**Flodden, battle of, 1513.** While the young king Henry VIII was pursuing military glory against the French, his brother-in-law James IV of Scotland, an ally of France, declared war. He assembled one of the largest armies ever seen in Scotland, crossed the Tweed at Coldstream, and occupied the castles of Norham, Etal, Wark, and Ford. Lord Surrey (\*Norfolk), commanding the English forces, marched north from Newcastle to Wooler. His invitation, quaintly anachronistic, to do battle on 9 September was rejected by James, who replied that he would please himself. Nevertheless the armies met on the 9th, on Branxton Hill, near Flodden, having twisted round, the English facing south, the Scots north. Surrey's men fought with the Tweed at their backs. There was little tactical manoeuvring, but four hours of desperate hand-to-hand combat, the fortunes fluctuating. The turning-point was when James himself, in the thick of the battle, was cut down. The Scots sustained the heaviest defeat of their history, the flower of their nobility dying with the king. James's body was brought south and for many years the coffin was deposited at Sheen in Surrey in the Carthusian house. The battlefield of Flodden is heavy open land, sombre and desolate. JAC

**Foliot, Gilbert** (c.1108–87). A learned, austere, and ambitious prelate who became \*Becket's most outspoken opponent among English churchmen. He protested when Becket was made archbishop of Canterbury at the king's command and then opposed the archbishop at every turn. When Becket quarrelled with the king he became one of the king's principal advisers in church matters. He acted as administrator of the Canterbury estates while Becket was in exile and, not surprisingly, was several times excommunicated by the archbishop. Despite his own highly successful career—prior of Cluny, abbot of Gloucester (1139–48), bishop of Hereford (1148–63), and finally bishop of London (1163–87)—Becket's friends believed that Gilbert had wanted Canterbury for himself. Although many of his letters survive, including some fiercely attacking the archbishop, his character and motives remain enigmatic. JG

**folklore.** Despite the presence of what might be described as folklorists *avant le mot*, such as William \*Camden (1551–1623) and John \*Aubrey (1626–97), folklore as a discipline really became established early in the 19th cent. Its immediate origins are in German scholarship, with the works of the brothers Grimm being of central importance, the coining of the English term 'folklore' being attributed to W. J. Thoms (1803–85) in 1846. By the later 19th cent. folklore was an established, and in many ways scholarly, field of study. Its practitioners included enthusiastic amateurs, many of them country parsons and the daughters of the gentry, and such major figures as Andrew Lang (1844–1912), and Cecil Sharp (1859–1924), whose researches into folk-song and folk-dance were of lasting significance. The coming of age of folklore in England was symbolized by the founding of the Folk-Lore Society in 1878.

At its widest, folklore was an all embracing discipline, attempting to comprehend the totality of 'traditional' culture. Defining what traditional culture is in this context can be contentious, but, generally, folklorists have concentrated

on forms of culture transmitted orally or by imitation. So the folklorist will study such elements of the oral culture as songs, stories, proverbs, and riddles, the broader social phenomena of games, ceremonies, and rituals, and also the products of material culture, including buildings and all sorts of artefacts. The early work was on peasant culture, and folklore still seems to be a discipline which flourishes best when the rural world is being studied: Sharp's work, indeed, is to some extent distorted by an idealization of the English 'peasant'. Work on the folklore of industrial workers and their communities, notably of miners, does, however, indicate some of the broader possibilities of folklore studies.

In its search for the origins of human behaviour and its interest in the 'primitive', 19th-cent. folklore had much in common with the anthropology of the period, and some of the founding fathers of the latter discipline, notably Sir Edward Tylor (1832–1917) and Sir James \*Frazer (1854–1941), drew on 'folkloric' sources in their attempts to imagine primitive humans. Yet folklore in England did not become institutionalized as a university discipline in the way that anthropology was, and there are still few British (and more particularly English) universities which offer it as a degree subject.

Folklore's relationship with history remains problematic. Many historians, especially those working on mainstream political or economic history, seem to regard folklore as an ill-defined and unrigorous subject whose eclecticism denies its status as a serious discipline. Yet this seems unduly harsh on a field of study which, despite its appeal to the amateur, has at certain points created high standards of scholarship, for example in the analysis and classification of folk-songs and folk-tales. With the broadening of the subject-matter of history, there are now many historians, particularly cultural historians and those social historians interested in the history of *mentalité*, whose concerns are very similar to those of the folklorist. Both groups study 'culture' defined in a broad, anthropological sense, and concern themselves with customs, orally transmitted culture, the significance of folk-tales, and material culture.

Thus although the grand theory and the search for the origins of human culture in the 'primitive' of the late Victorian folklorists, and the eclecticism of later practitioners, may not be to the taste of modern historians, a dialogue with folklore, or at least the incorporation of elements of human behaviour studied by folklorists, can enter the historian's agenda. JAS

**folk-song.** The distinction between folk-song and 'art music' is a controversial one, but many writers agree with the main features identified by the international Folk Music Council in 1955: folk-song has evolved through the process of oral transmission, being shaped by (a) continuity which links the present with the past; (b) variation which springs from the creative impulse of the individual or the group; and (c) selection by the community which determines the form in which the music survives. Folk-song is passed down through generations, both words and music undergoing constant evolution in the process, so that it rarely exists in a single identifiable version. Traditionally it has been associated with

rural communities and lower socio-economic classes, but in the 20th cent. the pattern of dissemination changed, with greater emphasis on written transmission and especially on recordings. At the same time many of the original functions of folk-song have been taken over by popular music, another form of 'vernacular' music, although one often involving professional musicians and wide dissemination through the mass media.

Folk-songs are generally functional: examples include those linked to the cycle of the year (whether the rural year as in harvest songs or the church year as in carols), work songs such as sea shanties, children's songs, narrative ballads telling a story—often of a moralistic nature—and songs for dancing. Traditional British folk-songs have generally been performed unaccompanied. The most common verse comprises four-line stanzas, each set to the same basic melody, although the singer will often bend the rhythm or introduce vocal ornaments (this is particularly the case in Ireland). Older English folk-songs frequently have a different tune for each line (ABCD), while more recent ones favour a degree of repetition (ABBA, AABA, ABCA, etc.). Rhythms derive from verse patterns, so that up-beat openings are prevalent and quintuple metre not uncommon. Much English folk-song is modally based, although many Gaelic tunes are pentatonic. Scottish folk-song in fact clearly differentiates between the Gaelic tradition of the Highlands and Hebrides (including the bagpipe-influenced 'pibroch songs'), the Lowland songs and ballads, and the Scandinavian-based songs from Orkney and Shetland.

The boundaries between folk-song and art music are often very indistinct. In the 16th and 17th cents., for example, popular melodies like 'The Western Wynde' provided the framework for masses or motets (composers include Tye and Taverner) and keyboard variations (Bull and \*Byrd), while street cries appeared in consort songs (Weelkes and \*Gibbons). Eighteenth-cent. ballad operas like \*Gay's celebrated *Beggar's Opera* incorporated well-known songs, and the words of broadside ballads were printed and sold on street corners. Interest in collecting folk-songs stems largely from Bishop \*Percy's *Reliques of Ancient English Poetry* (1765); the following century saw an increasing number of publications, often of texts without music, especially in Scotland.

The real revival of English folk-song, however, came at the beginning of the 20th cent., primarily due to Cecil Sharp. He travelled around the country collecting over 3,000 tunes and over 200 folk-dances, often publishing them in regional anthologies such as the *Folk-Songs from Somerset*. In 1898 an English Folk Song Society was formed (incorporated in 1932 into the English Folk Dance and Song Society), and similar societies appeared in Wales, Scotland, and Ireland. Folk-songs were used in schools (with totally inauthentic piano accompaniments), while their modal language and undulating melodies became assimilated into a new compositional style. Foremost in this nationalistic movement was \*Vaughan Williams, himself a committed collector and arranger of folk-songs. The traditional use of folk-song for social and political protest was revived in the 1960s through the urban genre of folk rock epitomized by Bob Dylan. In

## Fontenoy

Britain this composite style was adopted by groups such as Fairport Convention and Steeleye Span. ECr

**Fontenoy, battle of**, 1745. In the War of the \*Austrian Succession, the French were besieging Tournai. The duke of \*Cumberland, in command of a large army, attacked a superior French force under Marshal Saxe on 11 May. After heavy fighting, the attack was repulsed, the Irish Jacobite brigade particularly distinguishing itself. The fall of Tournai soon after helped to persuade Prince Charles Edward \*Stuart to embark on his invasion of Britain. JAC

**food and drink** are substances and liquids, respectively, which are essential to maintain life and growth. For the most part, historians have been interested in studying the changing patterns of the availability of food and drink together with the social relationships involved in their production, distribution, and consumption. For many centuries difficulties of preserving and transporting food obliged most people to rely upon food and drink produced locally. There were marked inequalities in access to food. However, even the rich, who normally enjoyed better food than others, shared the experience of seasonal swings between plenty and want.

Until the 18th cent. food production depended on the opportunities afforded by agriculture, soil geology, and geographical location near freshwater or sea fisheries. Climate and the seasons imposed further restrictions on the output of food. In the Middle Ages most people had a diet based on grains with a few root crops: meat played a small role because of the costs of production. This pattern began to change in Britain with the growth of towns and industrialization and the associated expansion of trade and transport both within the British Isles and overseas. Improvements in the quantity and quality of food available at relatively low cost developed because of advantageous imperial trade connections. This was marked by caricatures of food habits, for example the images by \*Hogarth of 'the roast beef of Old England' in the 18th cent. and, more recently, the self-conscious romanticization of regional and local cuisine.

The changes which accelerated after industrialization had begun with the farming innovations of the 16th and 17th cents. Hops introduced from Europe in the 16th cent. gave longer life and greater variety of flavours to ales frequently known as beers. Some root crops, most notably turnips, once confined to gardens, became part of newly devised elaborate field crop rotations. The cultivation of potatoes spread in the 17th cent. from the gardens of the wealthy to smallholdings of the poor and eventually into the field rotations. In northern and western areas of the British Isles potatoes replaced or equalled grain in the diets of the poor. In southern Britain, potatoes only became part of the staple diet of the poor during the early 19th cent. when the rising cost of wheaten bread obliged people to change.

Until the 19th cent. ensuring a variety and an adequate supply of food throughout the year necessitated using the traditional preserving techniques of drying, salting, and pickling. During the 19th cent. increasing supplies of cheap imported sugar enabled preserves and conserves to move from the pantries of the well-off to a much wider

public. A further major innovation was the canning process, made possible by the introduction of safe and cheap thin sheet steel coated with tin. Chemical additives at the same time increased the availability of food and drink. After the mid-19th cent., railways and steamships with refrigerated or controlled atmospheres made possible cheap, regular, and reliable distribution of greater varieties and quantities of food and drink. Exotic fruits such as grapefruit and bananas had become common by the beginning of the 20th cent. These developments in trade and technology removed seasonal restrictions on food availability and choice.

Patterns of food consumption depend greatly on income as well as fashion and taste. Inequalities remained with inadequate diets for the poor. For those with adequate financial resources, the variety and quality of food and drink available became greater than ever previously recorded. Mass media promoted sales of food and drink by using brand names in establishing markets and, in the later 20th cent., freezers and microwave ovens in the home added to the choices of meals available to consumers. IJEK

**fools and jesters.** Laughter-makers were employed at court in the classical world and in many ancient monarchies. They had various functions—to entertain, to prick solemnity, to defuse awkward situations. They were often allowed considerable licence, though pertness had its dangers. Some were genuinely foolish (John Stultum = 'Stupid') but were tolerated on the principle that there are truths that only madmen know. The heyday of the court fool seems to have been late medieval and early modern, and the jester's costume—green and yellow patchwork garments, cap, bells, and stick—was introduced in the 15th cent. Most fools had their own specialities—singing, dancing, juggling, tumbling, or mimicry. Many of the royal fools are known to us. Martinet of Gascony served Edward I; John Scogan was at Edward IV's court and a jest-book attributed to him came out as late as 1570; Will Somers, said to be a good mimic, served Henry VIII, who also took over Wolsey's fool, Patch; Jeffrey Hudson, dwarf and fool to Charles I, turned cavalry leader during the civil wars. Great noblemen and ecclesiastics also had their fools. Patison, More's fool, was painted by Holbein with his master; the priory of Worcester kept a fool and the prior went in person to order his costume.

Few fools are to be found in the 18th cent. Court life became more dignified and ceremonious; taste changed and buffoonery went out of fashion; the great teeming households full of servants and retainers gave way to a more private existence; card-playing and conversation left little room for full-time jesters; 18th-cent. polite society no longer found dwarfs or little men funny in themselves. Shakespeare's fools—Touchstone and Lear's fool—have a more complex role, singing and diverting, but also acting as chorus on events. Their laughter is often shot through with melancholy and Olivia's clown brings down the curtain in *Twelfth Night* with 'the rain it raineth every day'. JAC

**Foot, Michael** (b. 1913). Deputy leader (1976–80) and leader (1980–3) of the \*Labour Party. A distinguished left-wing author and journalist, Foot, as editor and managing director of *Tribune*, was a leading \*Bevanite in the 1950s and after 1958

prominent in the \*Campaign for Nuclear Disarmament. An MP from 1945, he accepted office for the first time as employment secretary 1974–6. Between 1976 and 1979 he was lord president of the council and leader of the House of Commons, before succeeding James \*Callaghan as party leader. He led a divided party however, and went down to humiliating defeat at the hands of Mrs \*Thatcher in 1983 on a manifesto described as ‘the longest suicide note in history’. Foot, co-author of a famous polemic (*Guilty Men*, 1940), biographer of Nye Bevan, littérateur, brilliant orator, and devotee of the House of Commons, was a much admired and respected figure both inside and outside the Labour movement. AS

**football** (soccer). Medieval football was extremely violent, akin to modern hooliganism. Repeated attempts were made by the authorities to suppress it as dangerous, disruptive, and a diversion from archery practice. At Ashbourne (Derbys.) a variant of the old game is still played at Shrove-tide.

Modern football developed with the growth of large industrial towns. In the early 19th cent. the game declined in popularity in the face of overcrowded and cramped streets and considerable official disapproval. It survived among public schoolboys and at Cambridge University where, in 1848, a first attempt was made to compile a common set of rules. Previous rules were local and much disputed, with disagreements about charging and hacking, the number of players, the size and shape of the ball, and the duration of the game. The Cambridge rules were adopted by a number of clubs and the game made some progress in the 1850s. A further attempt to produce standard rules, at the Freemasons’ Tavern in London in 1863, led to the formation of a Football Association, from which some clubs soon seceded to follow a handling code.

At this stage football was an upper middle-class game and strictly amateur. The new Association launched a cup competition in 1872. Queen’s Park, the Glasgow team, entered, but scratched on finding travel costs beyond them. Wanderers beat Royal Engineers 1–0 at the Oval before 2,000 spectators and the following year beat Oxford University 2–0. Gradually the strength of the game moved towards the midlands and the north, where clubs were beginning to pay expenses and retaining fees. A watershed was the 1883 Cup Final, when Blackburn Olympics beat Old Etonians 2–1. In 1885, after protests, professionalism was accepted. Attendances began to edge up. The Cup Final at Manchester in 1893 between Wolves and Everton was watched by 45,000 people, and the attendance at Crystal Palace in 1901 to see Tottenham and Sheffield Wednesday was 111,000. With professional teams dominating the cup competition, an Amateur Cup was instituted in 1893, changed in 1974 to the Challenge Vase.

In 1888 twelve clubs from the midlands and north, including Preston North End, Accrington Stanley, and Blackburn Rovers, formed the Football League. The first two seasons were won by Preston. Over the next four years, sixteen more clubs joined, including Nottingham Forest, Sunderland, and Everton, and a second division was added in 1892. There was

considerable competition from the Southern League, but by 1914 the Football League had extended south to bring in Chelsea, Arsenal, Tottenham, Fulham, and Bristol City. The Scottish League began in 1890 and an Irish League the same year. Many clubs developed from works teams or from church or chapel. Stoke City and Manchester United both originated with railway workers, Aston Villa was an offshoot of a Wesleyan group. In most large towns in Britain, the Saturday afternoon match became part of the leisure pattern of working men.

After the First World War, a third division was added to the Football League, divided into north and south. Attendances remained high. When Wembley stadium was opened in 1923, well over 126,000 people crammed in to watch Bolton Wanderers beat West Ham 2–0.

During the Second World War, league competitions were suspended, though exhibition matches, with guest players, remained popular. In the 1948/9 season, more than 40 million people paid to watch football in England. Recognition of the game was accorded by knighthoods to Stanley Matthews, the Stoke and Blackpool winger, to Alf Ramsay, manager of the World Cup victors of 1966, and to Matt Busby, manager of Manchester United. But by the 1980s attendances were falling in the face of rival leisure activities, greater social mobility, and a growing distaste for the coarseness and hooliganism of the terraces. Many of the old grounds seemed vast iron hulks, echoing to depleted crowds, relics of a bygone age. From this parlous state, the game was rescued, largely by television. Fresh interest was injected into the third division by the introduction of promotion and relegation from the (Vauxhall) Conference League, which has produced cliff-hanging finales to several seasons.

The first international football match took place at Partick in 1872 between England and Scotland, ending in a 0–0 draw. One of the earliest international games between non-British teams was at Vienna in 1902, when Austria beat Hungary 5–0. FIFA was founded in 1904 but international competition did not make much headway until after the First World War, when the World Cup competition was started in 1930. England did not take part until after the Second World War, and was able to retain a comfortable sense of superiority. This was shattered in 1950 by a 1–0 defeat from the USA, followed three years later by a 6–3 defeat at Wembley from the Hungarians, and was not totally restored by victory in the World Cup at Wembley in 1966. In European competitions, British clubs like Manchester United and Liverpool, often with a good stiffening of foreign players, have done remarkably well, but apart from its triumph in 1966, the English national team has tested the patience of its supporters.

The modern professional game has been dogged by a number of disasters. In 1902, 25 people were killed at Ibrox, home of Glasgow Rangers, when a stand collapsed; 33 were killed at Burnden Park, Bolton Wanderers’ ground, when crush barriers gave way in 1946; the young and gifted Manchester United team was almost wiped out in an air crash at Munich in 1958. More recently, fire swept through Bradford City stand in 1985 killing 52 people; the Heysel

## forced loans

stadium disaster in Belgium the same year claimed 38 lives; and the death of 93 spectators at Hillsborough in 1989 led to the Taylor inquiry, which made urgent recommendations for improved safety. Recent developments towards premier leagues and super leagues have made life difficult for small and unfashionable clubs and a number of them have fallen by the wayside. At times the professional game seems in danger of being overwhelmed by television and press coverage, with as much attention given to managers as to football, and by heavy administration. Inflated wages, following the Bosman ruling (1995), plunged many clubs into debt. But underpinning the 90 or so professional clubs in the English league are the semi-professional leagues, and the vast number of amateurs, of all shapes, sizes, and talents, who play on windswept recreation grounds in Saturday or Sunday leagues, where attendances are measured in single figures, and it is not unknown for teams to turn up with nine men. See also WEMBLEY STADIUM. NJB/JAC

**forced loans** were non-parliamentary taxes which English monarchs demanded from their richer subjects. The forced loan of 1626 was exceptional in being levied on all taxpayers. This attempt to bypass Parliament provoked intense hostility, and in 1628 such levies were outlawed by the \*petition of right. RL

**Foreign Office.** The Foreign Office was created as a separate department in 1782. Until the present Foreign Office was built in the 1860s, the department was housed in decrepit buildings in \*Downing Street. It was headed by the secretary of state for foreign affairs, a senior cabinet minister, assisted by two under-secretaries. Eventually, the 'parliamentary' under-secretary sat in the Commons, if the foreign secretary was a peer (or in the Lords, if he was an MP), and acted as government spokesman on foreign affairs. The permanent under-secretary was a civil servant. In 1841 the rest of the establishment consisted of a chief clerk, six senior clerks, ten clerks, seven junior clerks, eight other clerks attached to particular duties, a librarian, a sub-librarian, a translator, a private secretary, a *précis*-writer, and a printer. Translation services were particularly weak. It was expected that communications would be in French and it once took the Office a week to find anyone to read a document in German. The first typist was appointed in 1889. Before that all dispatches were in manuscript and were copied by hand. Telegraphic dispatches began to be received in the 1850s but the first telephone was not installed until 1895. The volume of work increased enormously through the century. The Office handled 4,534 dispatches in 1821, 110,000 in 1905. Originally, the staff was recruited entirely by patronage and even qualifying examinations were not introduced until 1856. Employment in the Office was less prestigious than in the diplomatic service and the two services were quite separate. Only in the years before the First World War did the Office begin to modernize. Limited competition for entry was introduced in 1908 and a higher proportion of recruits, although still from a narrow social élite, now had university degrees. As the Office grew more professional, its influence on policy-making increased. Lord \*Palmerston, although he worked his subordinates hard,

had regarded them as mere clerks. Even at the end of the century, Lord \*Salisbury expected little in the way of 'advice' from the Office. The situation began to change between 1898 and 1914. Sir Edward \*Grey's dependence on his permanent officials should not be exaggerated but the fact that the Office, which had been predominantly pro-German in 1900, gradually shifted to being pro-French and suspicious of Germany must be taken into account in assessing the formulation of British foreign policy. MEC

**foreign policy.** No doubt \*Caratacus' resistance to the Roman invasion of AD 43 and his alliance with the \*Silures could be regarded as foreign policy, but it scarcely seems a helpful term. As long as monarchs wielded great personal power, it is hardly possible to divorce foreign policy from the individual circumstances and character of each king and treat it as a separate category. Nevertheless, at an early period, certain themes emerged. The connection with France that came about in 1066 was fortuitous in that William the Conqueror took advantage of the fact that Edward the Confessor had no sons in order to claim the throne of England, but it introduced a pattern that survived for 500 years. From the days of William Rufus to those of Henry VIII, English monarchs attempted to retain or extend their French possessions. Not until the loss of Calais in 1558 did this aspiration come to an end, and even then it was another 200 years before they relinquished the title of 'king of France'. This, in turn, had profound effects upon another object of English policy, which pre-dated the Conquest—the ambition to turn a southern English kingdom based upon \*Wessex into a kingdom of Britain, which should include the north, Wales, Scotland, and Ireland. So demanding a programme may have been beyond the resources of a small kingdom, yet it should be remembered that one object of these policies was to augment those resources. English possessions in France included some of the most fertile and prosperous regions, while it was a constant complaint of English monarchs that the \*Pale in Ireland, far from being a source of profit to the crown, drained men and money. Foreign affairs necessarily interlocked with domestic. Weak rulers like John, who lost Normandy, or Edward II, beaten at \*Bannockburn, were heading for disaster, but even successful rulers like Edward I and Edward III could expect opposition at home if their demands were too great.

Even within the limits of so general a context, other patterns may be discerned. The principle of supporting one's enemy's enemy is elementary, yet it had important consequences. The Scots, in their long struggle for independence, soon perceived the advantages of an understanding with France, and the 'Auld Alliance' survived from the treaty of \*Paris of 1295 until 1560. This also had domestic consequences. When Philip VI of France was at war with Edward III in 1346 he urged David II to cross the border by way of diversion, which led to his capture at \*Neville's Cross. During the \*Great Schism from 1378 to 1417 one reason for Scotland's recognition of the Avignon popes was that the English were supporting the rival popes at Rome. Likewise, the desire of James IV of Scotland to take advantage of Henry VIII's absence on campaign in France in 1513 led to

his death at \*Flodden. England pursued a similar policy, supporting Brittany and Burgundy against France. Balance of power also came into consideration centuries before the phrase was invented. In the 16th and 17th cents., when Spain and France disputed European hegemony, the choice was which side to take—unless England was prepared to run the risk that, by staying aloof, she would facilitate the establishment of a universal monarchy. It was left to the monumental incapacity of Charles I to contrive to be at war with both great powers at the same time.

Two other factors were also of increasing importance. The growth of England's trade, particularly in cloth, gave its rulers concern to protect it, which could not be divorced from foreign policy since embargoes and tariffs were easy diplomatic ploys. A special interest in Flanders and the Low Countries, reinforced by strategic considerations, lasted until the 20th cent. Linked with growing prosperity was the use of England's financial resources to eke out a small population by subsidizing continental allies, a policy operated by Edward III, who supported the small German states and Savoy on France's eastern border, and reaching its climax in the five coalitions needed to overcome Napoleon Bonaparte in the 19th cent.

The rift in Christendom in the 16th cent. introduced a new factor into foreign policy, but one which was rarely decisive. Monarchs certainly supported their co-religionists in other countries when it served their purposes, and some rulers like Philip II of Spain showed more than common zeal, but the co-religionists were well aware that the commitment was fragile and that they could find themselves abandoned. Catholic unity did not prevent the long struggle between France and Spain, nor protestant commitment three wars between England and the Dutch in the 17th cent. It is true that the Spaniards gave support to their fellow-catholics in Ireland in the 16th cent., but so did atheistical French revolutionaries in 1798, and *realpolitik* Germans in 1916. Nor, at a later stage, did ideology outweigh national interests. \*Burke maintained that the war in the 1790s against revolutionary France was an ideological crusade and quite unlike any previous conflict, but \*Pitt, who was in charge of affairs, was more low-keyed and would have made peace with the revolutionaries if they could demonstrate that their regime was stable and that they were sincere. \*Churchill, in 1941, reproached with commending the Bolsheviks, is said to have replied that he would speak well of the devil if he would take up arms against the Nazis.

The development of a modern context for foreign policy dates from the \*Glorious Revolution of 1688, when three factors combined to change the context of diplomacy. First was the steady spread of representation at foreign courts, which made policy more of a regular activity and less of a response to occasional crises or particular problems. The change had begun in Italy in the 15th cent. Henry VII had a permanent representative only at the Vatican, and though he added one at Madrid and Henry VIII added a third at Vienna, by 1568 there was only one permanent representative left, at Paris. William III, after 1688, had twelve resident ambassadors as well as envoys and agents. The existence of a network of representatives and the flow of information pro-

vided facilitated a more coherent foreign policy. The second factor was the changed importance of Parliament after 1688 which initiated a move away from a personal towards a national foreign policy. The Stuarts had often been at odds with their parliaments over foreign affairs but the annual meetings of Parliament after 1688 made it harder for subsequent monarchs to take an independent line. Monarchs and ministers certainly struggled to prevent Parliament from being informed, pleading that public disclosure could inhibit diplomacy, but in 1701 ministers were impeached for not placing the partition treaties before the council or Parliament. After 1688 ambassadors rarely reported directly to the monarchs and a highly personal policy like Charles II's secret treaty of \*Dover would have been difficult to sustain. The process was completed with the creation of the post of foreign secretary in 1782. The third factor was the growth of empire. In 1600 England had no overseas colonies: by 1700, in addition to the twelve American colonies, there were valuable possessions in India, the West Indies, and Africa to be protected.

The importance attached to foreign affairs in the 18th cent. may be gauged from the fact that, until the reorganization of 1782, the two secretaries of state were categorized according to the areas of Europe which they dealt with—north or south. The broad outlines of 18th-cent. foreign policy, for all its complexities and variations, are simple. After the swift collapse of Spanish power and rapid rise of France under Louis XIV, there was no question which was the dominant power in Europe, and the fact that France was also a major colonial competitor helped to bring about what has been called the second Hundred Years War. Between 1689 and 1815 Britain and France were at war for nearly half the time. France's much greater population and resources were a substantial handicap, but to build restraining alliances was far from easy. Spain was no longer an adequate counterweight and for much of the period was in the French camp in a Bourbon alliance. The Dutch, though they had an obvious interest in preventing French aggrandizement, were in rapid decline. The Habsburgs, whose possession of the southern Netherlands placed them in the front line, had very heavy commitments in eastern Europe to consider, and, after the reversal of alliances of 1756, moved temporarily into the French orbit. Russia and Prussia, two emerging powers, were purchasable, but their despotic regimes made them unpredictable. After 1714 there was a further complication that \*Hanover, virtually defenceless against a determined French onslaught, had either to be protected or taken out of pawn at the peace settlement. The rivalries and ambitions of the continental powers made the construction of grand coalitions difficult. Napoleon bought off Prussia in 1806 with the offer of Hanover, while at the peace settlement in 1814 Prussia and Russia were near to conflict over the fate of Saxony.

These factors dictated Britain's overall foreign policy. It was an accepted point that she must have a continental ally and, on the one occasion when she did not, she lost the American colonies. Indeed, the 1780s, at the end of the American War, were exceptionally difficult. Britain's gains at the end of the \*Seven Years War in 1763 had cast her in the

role of overmighty power and made the balance of power operate against her: Spain, France, and Holland, at war with Britain in 1780, were supported by Russia, Denmark, Sweden, Prussia, Portugal, and the empire in the \*League of Armed Neutrality. Continental alliances also demanded heavy subsidies and finance ministers from \*Newcastle to the Younger Pitt sweated to supply the sinews of war and diplomacy.

The peace which brought the Revolutionary and Napoleonic wars to a conclusion in 1815 was based essentially on balance of power considerations. France was made to disgorge the enormous gains she had made under Napoleon, but there was no attempt to reduce her to a second-rate power and she was speedily welcomed back into the comity of nations. Austria and Prussia both made substantial territorial gains but it was still considered essential that they should balance each other in Germany. Britain retained the Cape of Good Hope, taken from the Dutch, Mauritius, and a number of West Indian islands. In only one respect did the peace clearly fail. The new united kingdom of the Netherlands, intended, with international help, to bolt the door against any future French aggrandizement, lasted only fifteen years before collapsing in the face of Dutch and Belgian hostility. JAC

Where did Britain stand in the decades after Waterloo? Victorian foreign policy conjures up a vision of a John Bullish Lord \*Palmerston in the middle of the century; of Britain dominating world trade by her economic strength; a liberal, constitutional Britain, which supported national and liberal movements on the European continent against the declining forces of despotism; a Britain which, at the end of the century, was to rule the greatest empire in the world, with Queen Victoria reigning over a quarter of the world's population. The picture is not entirely false but it owes too much to the image which clever politicians like Palmerston and \*Disraeli wished to project to the British public. Historical study since the 1930s has revealed a more complex picture. Britain had only firmly established her right to be considered a European great power in the 18th cent. and had come close to forfeiting that status as a result of the American War of Independence. In the French Revolutionary and Napoleonic wars, Britain's naval strength had been of enormous importance but her lack of a large standing army had made the other European powers see her as a minor player on the continent. Even \*Wellington's victories in Spain, which dazzled British opinion, were regarded as a side-show until he brought his army over the Pyrenees in 1814. Britain's (justified) fears at that time were that the other powers, Austria, Russia, and Prussia, would conclude a 'continental' peace with France, ignoring British interests. It is a measure of \*Castlereagh's stature as a statesman that he not only played a major role in holding the coalition together but that he safeguarded all Britain's vital interests in the settlement at the end of the war.

All those responsible for British foreign policy between 1815 and 1865, Castlereagh, \*Canning, Wellington, \*Aberdeen, and Palmerston, looked back to William \*Pitt the Younger as their mentor. They interpreted the legacy somewhat differently according to temperament and changing

circumstances but the similarities were greater than the differences. The \*Vienna settlement of 1814–15 followed roughly the lines envisaged by Pitt in 1805 and the powers agreed to meet periodically to maintain the peace settlement, as Pitt had wished. Castlereagh felt obliged to withdraw from the resulting \*Congress system because he believed it was being perverted from its original purpose of maintaining international peace to the suppression of any subversion which might threaten authoritarian regimes. As late as 1863 Palmerston refused to join the revisionist Napoleon III in a congress because 'the Treaties of Vienna . . . are still the basis of the existing arrangements of Europe' and chaos would ensue if they were overturned. There was no clear division between Conservatives and Liberals among British foreign secretaries in this period. Where they did differ was in their attitude to Europe. All accepted without question that their first duty was to uphold British interests but whereas Castlereagh, Wellington, and Aberdeen believed that this could best be done by playing a full role in Europe, Canning and Palmerston took a more isolationist position.

The great issues of this period were the Eastern Question—the dangerous vacuum left by the decline of the Ottoman empire—and the rise of liberal and nationalist movements in western and central Europe. In the East, Britain reluctantly followed a policy, in the crises of 1840 and the \*Crimean War, of propping up the Ottoman empire to prevent Russian advances. The British public had some genuine sympathy with liberal and national movements, especially in Italy, but the government was always extremely cautious in its approach. In the great revolutionary year of 1848 Palmerston was long on rhetoric but short on action. His rhetoric convinced conservative Europe that he was a dangerous radical. It also won the plaudits of the British radicals, even though Palmerston was a strong Tory in facing the challenges in Britain and Ireland. Henceforth, Palmerston found that he could control the electorate (which in fact he feared) by this John Bull approach.

By the 1860s the balance of forces was changing. The British navy still commanded the seas but Britain's industrial lead was about to be challenged by other powers, especially the USA and Germany. Palmerston's last ministry saw Britain come close to what might have been a disastrous involvement in the American Civil War and Palmerston's bluff over Denmark was called by Bismarck. Britain stood aside from the Austro-Prussian War in 1866. Disraeli put a brave face on it. Britain's abstention, he said, was the result of increased strength, not decline. Britain was no longer 'a mere European Power'.

There was a more real clash of ideologies between Disraeli and \*Gladstone than between their predecessors. Gladstone, like Pitt and Castlereagh before him, had a clear vision of how international affairs should be conducted, with all submitting to the rule of law and disputes settled by arbitration, not war. He fought a losing battle for the old self-balancing Vienna system. In Europe he was defeated by Bismarck who created his tight, and dangerous, system of alliances to protect the newly united Germany. Disraeli turned to the empire and made it a Conservative cause.

Britain's acquisition of a new empire in the late 19th cent. is usually seen as defensive, a matter of weakness rather than strength. The old colonies of settlement, Canada, Australia, New Zealand, and South Africa, were becoming increasingly independent. Britain still had a great empire in India and its defence sometimes required further accretions of territory. Ironically, Britain acquired more of Africa, during the Scramble period, under Liberal than under Conservative administrations. The motive was almost always a challenge by another power, usually France or Germany. The rhetoric of Palmerston, Disraeli, and their successors convinced the public of Britain's greatness. Sober statesmen, Lord \*Salisbury, \*Balfour, or \*Grey, knew the dangers of the situation. 'Splendid isolation' was not glorious. It was an uncomfortable reality. In 1902 Britain, embarrassed by world reaction to the \*Boer War and feeling that even the Royal Navy was now overextended in view of the growth of other, particularly the German, fleets, concluded an alliance with Japan. Over the next twelve years she shifted from Salisbury's policy of 'leaning' on the Triple Alliance of Germany, Austria, and Italy (the first two, old allies) to close relations (although stopping short of a formal alliance) with her two traditional rivals, France and Russia. The simplest explanation may be correct. Britain could not afford to see Germany defeat France again. She fought Germany in 1914 in defence of a balance of power older than the 19th cent., as she had fought Philip II, Louis XIV, or Napoleon—to stop one power dominating Europe. MEC

After 1918 Britain was a sated and exhausted country. Though she took \*mandates under the League of Nations, they proved troublesome: \*Iraq became independent as early as 1932 and \*Palestine and \*Jordan soon after the Second World War. Britain's main concern was the search for security. The alliance which had defeated the central powers had begun to disintegrate even before the Great War ended, as Russia collapsed into revolution and civil war. The USA turned to isolationism, the Anglo-Japanese alliance was not continued after 1922, and France, Britain's main ally, was mistrusted in the 1920s as too belligerent and in the 1930s as too defeatist. The inability of the \*League of Nations to deal with the Manchurian crisis was an early warning that collective security might offer little protection and was followed in 1933 by the advent to power in Germany of the Nazis. The policy of \*appeasement, which had many facets, was accompanied by a new search for allies. Though Russia was admitted to the League of Nations in 1934, there was massive mistrust on both sides, and in 1939 Stalin preferred to do a deal with Hitler. Much effort was devoted to wooing Italy, whose strength was overrated, and appeasement of Mussolini brought down one foreign minister, \*Hoare, in 1935. Under these circumstances, British foreign policy lurched. Having abandoned Czechoslovakia in 1938, Britain gave a guarantee to Poland which could scarcely be honoured.

Many of the same themes re-emerged after the end of the Second World War. Churchill was not alone in wondering before 1939 whether victory, if obtained, would seem much different from defeat. Foreign policy was dogged by economic and financial weakness. In one respect policy was

simplified by the pace of de-colonization—Britain shed imperial responsibilities at such speed that protecting the empire soon ceased to be a major consideration. As the shape of the post-war world unfolded, two problems emerged—security in the face of Soviet power and Britain's attitude towards Europe. The first was achieved by the nuclear deterrent, participation in \*NATO (1949), and a close understanding with the USA, jeopardized only temporarily by the \*Suez crisis. The debate on Europe, which proved protracted, was governed by three factors. First was that Britain geographically and culturally was half-in and half-out of Europe, and her connections with her former colonies gave her a perspective Germany did not share, and France only partly. Though Churchill himself had spoken in favour of some United States of Europe as early as 1945, he did not envisage Britain as part of it: it was well-meaning advice *de haut en bas*. The second was that European unity, which began as the simple determination of European powers never to fight each other again, moved through economic collaboration towards political integration. The debate in Britain was often stultified by refusal to identify what 'Europe' meant at different stages: the phrase 'Common Market', which the British voted to join, masked the political aspirations of many of its continental supporters. The third factor was the timing of Britain's application to join. EFTA (the \*European Free Trade Association), Britain's immediate response to 'the six'—a free trade bloc of Sweden, Switzerland, Portugal, Denmark, Norway, Britain, and Austria—was scarcely a formidable economic force, and clearly a holding operation. Britain's application to join the EEC was vetoed by de Gaulle in 1963 and again in 1967 at a time when a federal Europe was hardly on the agenda and Gaullist France would have been very suspicious. But by the time Britain entered the EEC in 1973, the movement towards political integration was gathering pace. Britain acted as a somewhat ineffective brake, usually doing enough to exasperate the anti-Europeans while not satisfying the enthusiasts for European unity. It was also paradoxical that at a time when many Scots, Welsh, and others were protesting that decisions were always made in remote London, power should be leaking to remoter Brussels. All too often, the rhetoric of British foreign policy appeared to suggest that Britain should be at the very heart of Europe in order to lead it backwards. At the start of the 21st cent., Britain's relations with Europe were still deeply contentious. JAC

W., *Britain in Europe, 1789–1914* (Cambridge, 1945).

**forest laws.** Under the Norman kings, the royal forest grew steadily, probably reaching its greatest extent under Henry II when around 30 per cent of the country was set aside for royal sport. The object of the forest laws was the protection of 'the beasts of the forest' (red, roe, and fallow deer, and wild boar) and the trees and undergrowth which

## forma regiminis

afforded them shelter, known as the *vert*. Kings frequently granted their tenants the right to take smaller game, such as hares and pheasants, and more extensive hunting privileges were occasionally granted to especially favoured subjects, but generally none but the king and his foresters might hunt the deer or boar. The definitive form to forest law occurred during Henry II's reign, most notably in the *Assize of the Forest* (also known as the *Assize of \*Woodstock*) in 1184. Its clauses reveal the harsh restrictions which the forest officials enforced. None could carry bows and arrows in the royal forest, and dogs had to have their toes clipped to prevent them pursuing game. Savage penalties for any infringements were often imposed and in 1198 Richard I declared that those guilty of killing deer were to lose their eyes and testicles. But under Henry II and his sons imprisonment and the exaction of heavy fines were the norm. Discontent with the laws, and the extortions and petty tyranny of forest officials, ensured that the forest became a major political issue in John's reign. It culminated in the *Charter of the Forest* (1217) which sought to remedy many of the grievances. Its clauses provided the framework of forest law throughout the 13th cent., but only in the 14th cent., when large areas were disafforested, did the political issue subside. SL

**forma regiminis**, or form of government, June 1264, was arrangements after the victory of Simon de \*Montfort and his supporters at \*Lewes for a provisional government until a general settlement of the dispute with Henry III had been reached. The king was to be advised by a council of nine, three of them always present: the nine were to be nominated by three electors, 'prudent men', of whom de Montfort was one. At the subsequent peace of Canterbury in August, it was declared that the *forma regiminis* would operate for all of Henry III's reign and for a period of his son Edward's to be negotiated. But when Prince Edward, who had been a hostage, escaped in May 1265, negotiation was at an end, and de Montfort was killed at \*Evesham. JAC

**Formby, George** (1904–61). Comedian. Born in Wigan (Lancs.), Formby followed his father in the old music-hall tradition. His stage character was that of a gormless but good-natured Lancashire lad, with a squeaky voice, toothy grin, and a talent for playing the ukelele. He soon became an established success in provincial theatres and in 1929 began recording his cheerful, cheeky songs such as 'When I'm Cleaning Windows' and 'Chinese Laundry Blues'. He made his first film, *No Limit*, in 1935 and then made an average of two films a year until 1946. He retained the persona of his stage character who, with a mixture of luck and innocent guile, triumphed in the end with his catch-phrase: 'Turned out nice again!' These well-made pictures made Formby the highest-paid entertainer and the top box-office attraction in Britain. He was awarded the OBE in 1946 for entertaining the troops during the Second World War and his films were so popular in Russia he was awarded the Order of Lenin. RAS

**Formigny, battle of**, 1450. By 1450 Henry VI, beset by disaffection at home, was hard-pressed to defend his French territories. A relief expedition under Sir Thomas Kyriel and

Sir Matthew Gough was blocked by the comte de Clermont in Normandy on 15 April and badly defeated. The French use of artillery heralded the crushing victory at \*Castillon three years later and the collapse of England's empire in France. JAC

**Fornham St Genevieve, battle of**, 1173. \*Henry the Young King, eldest son of Henry II, rebelled in 1173, complaining of his inheritance. The support of Louis VII of France and William the Lion of Scotland made the revolt formidable. Henry II beat off an attack on Normandy, leaving Richard de \*Lucy, justiciar, to defend England. In September Robert, earl of Leicester, landed in Suffolk and joined forces with Hugh, earl of Norfolk. De Lucy abandoned the siege of Leicester castle and marched to intercept the rebels. On 17 October at Fornham St Genevieve, just north of Bury St Edmunds, though outnumbered, he defeated and captured the earl of Leicester. The lucky capture of William the Lion at \*Alnwick the following year broke the back of the revolt. JAC

**Forster, E. M.** (1879–1970). Novelist and man of letters, in *Two Cheers for Democracy* (1951) he described himself as belonging to 'the fog-end of Victorian liberalism'. If his spiritual home was in Cambridge and Bloomsbury, he maintained a certain distance. Emotionally vulnerable, he was critical of their intellectualism. The 'undeveloped heart' of the English, often most debilitating in the English abroad, is his theme. In the early *Where Angels Fear to Tread* (1905) he treats it with a light, dry irony recalling Jane \*Austen, digging deeper for his favourite book *The Longest Journey* (1907) and even anticipating D. H. \*Lawrence in his 'condition of England' novel *Howards End* (1910). Visits in 1912 and 1922 shaped his richest work, *A Passage to India* (1924), more 'philosophic and poetic' than before. Thereafter, ensconced at King's College as humanist sage, 'the fictional part of me dried up'. His one explicitly homosexual novel, *Maurice* (1914), was published posthumously. JNRS

**Forster, William Edward** (1818–86). Forster was a hard-working politician whose greatest achievement was the \*Education Act of 1870. He was the son of a quaker missionary and began his career in the Yorkshire woollen trade at Bradford. In 1861 he was returned for Bradford as a Liberal. He was given office under \*Russell in 1865 and in \*Gladstone's first ministry put in charge of education as vice-president of the council, being brought into the cabinet in 1870. His Education Bill proposed state schools where voluntary schools had not been established, to be administered by elected school boards. The religious difficulty was met by the Cowper-Temple clause, whereby the religious instruction was to be undenominational. Forster also guided through \*secret ballot in 1872. There was considerable support for him as party leader on the first of Gladstone's retirements in 1875, but many of Forster's fellow-dissenters were bitter at what they regarded as a religious betrayal in 1870, and he withdrew in favour of Hartington (\*Devonshire). In 1880 he was appointed chief secretary in Ireland. His Coercion Bill the following year was fiercely contested, with many threats against his life. In 1882 he resigned when

Gladstone negotiated the \*Kilmainham 'treaty' with \*Parnell. His successor, Lord Frederick \*Cavendish, was murdered within a few hours of his arrival in Dublin. Forster's offer to return to Ireland was not accepted and though he retained his seat, he did not again hold office.

JAC

**Fortescue, Sir John** (c.1394–c.1476). Lawyer. Fortescue studied law at Lincoln's Inn, became lord chief justice in 1442, and received his knighthood. A staunch supporter of the Lancastrian cause, he was at \*Towton in 1461 and subsequently attainted. In exile in Scotland and Flanders until 1470, he returned and fought on the losing side at \*Tewkesbury, being captured. He then made his terms with the triumphant Yorkists. His two most important writings were *De laudibus legum Angliae*, in praise of the laws of England, and *On the Governance of the Kingdom of England*, probably written after 1470. Fortescue was at pains to distinguish between absolute monarchy ('dominum regale' as in France) and limited or constitutional monarchy ('dominum politicum et regale' as in England). The essential difference is that in the first state the king makes the law, in the second the king rules his subjects only by laws 'such as they assent unto'. In his characteristically Lancastrian parliamentary interpretation, Fortescue divided the two types too sharply—the French also had representative institutions. But by doing so he helped to create pride in the liberal character of English government and was much quoted by the opposition to Charles I in the 17th cent. Like \*Bagehot, Fortescue helped to create the situation he was describing.

JAC

**Fortriu** was the Gaelic name of a Pictish region. The people of Fortriu first appear in a Latin guise as the Verturiones, a Pictish tribe first mentioned in the 4th cent. along with the more famous \*Caledonii. Fortriu, its people, and its kings are frequently mentioned in contemporary sources from the 7th cent. until 904, when they are last heard of led by \*Constantine II winning a battle in \*Strathearn (Perthshire) against the Danes. Its kings regularly appear in other sources as kings of the Picts, including Bridei son of Bile (d. 693), the victor of the battle of \*Nechtansmere (or Dunnichen, 11 miles north of Dundee) in 685 which liberated the Picts from Northumbrian overlordship. It would appear that 'king of Fortriu' was an alternative title for 'king of the Picts'. Fortriu was probably the core area of Pictish kingship and claimed overlordship over all Picts. There is some doubt about its extent. A late source identifies it with the Strathearn and Menteith; but it may have stretched from Menteith to Angus. The last kings of Fortriu mentioned belonged to a Gaelic dynasty which in the 830s, for the first time, retained the kingship without a break for more than a generation. They were, however, wiped out in battle against Scandinavian raiders in 839; and in the turmoil of the following decades Fortriu itself disappeared to be replaced c.900 by \*Alba, 'Scotland'.

DEB

**Forty-five rising.** See JACOBITE RISINGS.

**Fosse Way** was the Roman road from Exeter to Lincoln. Exceptional in (a) cutting across the grain of the main road-

system radiating from London, and (b) not deviating more than 6 miles either side of its direct line, it has been proposed as a lateral road along an early frontier line. This would be anachronistic, nor did the campaigns of conquest ever stop on this line. It may have been laid out to link the legions at Exeter and Lincoln after the \*Boudiccan revolt. The modern name derives from *fossa*, a Latin loan-word into Anglo-Saxon, perhaps used for a raised earthwork. The route is still in use for much of its 250 miles.

ASEC

**Foster, John, 1st Baron Oriel** (1740–1826). Politician. Foster, a lawyer, was returned to the Irish House of Commons when he was 21 and in 1784 became Irish chancellor of the Exchequer. The following year he was elected Speaker and strongly opposed the Act of \*Union, presiding over the last meeting of the Irish Parliament. Nevertheless, he was returned to the Westminster Parliament for Louth, and in 1804 resumed office as chancellor of the Exchequer (I), holding it until 1806 and again 1807–11. He was created a baron in 1821 when he was 80. Foster was bitterly opposed to concessions to the Roman Catholics and was one of the leading spokesmen for the \*Anglo-Irish ascendancy, predicting that Irish Catholics would soon tire of the Union and demand first repeal, then separation. Consequently he opposed the Union until it had passed and supported it thereafter.

JAC

**Fotheringhay, treaty of**, 1482. Anglo-Scottish relations deteriorated in 1480. Unruly Scottish lords raided northern England. Counter-raids followed, some by sea in the Firth of Forth. In Fotheringhay castle on 11 June 1482, the exiled brother of James III, Alexander, duke of \*Albany, undertook to recognize Edward IV as overlord of Scotland after an English army had set him on its throne. This army, led by Richard of Gloucester (later Richard III), reached Edinburgh, but Albany renounced the treaty after coming to terms with the lords who had imprisoned James. They agreed to surrender the castle of Berwick-on-Tweed, Gloucester's only gain.

RLS

**Fountains abbey** (Yorks.) was founded in Skelldale in 1132 by a group of dissident reforming monks of \*Benedictine St Mary's, York, under the direction of Archbishop \*Thurstan. In 1133 they adopted the \*Cistercian rule. After initial difficulties and in spite of the sack of the abbey, whose abbot, Henry Murdac, had been appointed archbishop of York in 1146, by supporters of William fitzHerbert, a rival claimant, the community flourished, attracting benefactions and recruits from many of the magnates and lords of northern England. It established several daughter houses, as well as Lysa in Norway. The mismanagement of its largely pastoral economy at the end of the 13th cent. brought Fountains close to ruin. Political unrest and Scottish raids contributed to the crisis, and a falling population led to declining monastic numbers and a switch to a *rentier* economy. Nevertheless, the late Middle Ages saw substantial building works, partly consequent on a relaxation of monastic discipline, and at the \*dissolution Fountains was still the wealthiest Cistercian abbey in England. Though much of the abbey was used to build Fountains Hall, the surviving ruins and precincts

## Fourth Party

(landscaped in the 18th cent.) are amongst the most impressive Cistercian remains in Europe. BJG

**Fourth Party** was the name given facetiously to a parliamentary ginger group in the Conservative Party in 1880 (the other three being Liberals, Conservatives, and Irish). It consisted of Lord Randolph \*Churchill, J. E. Gorst, Sir H. D. Wolff, and, at some distance, Arthur \*Balfour. The Conservatives had just lost the general election and the contempt of the Fourth Party was as much directed at their own front bench as at Gladstone's administration. Sir Stafford \*Northcote was considered particularly supine and nicknamed 'The Goat'. They began with opposition to allowing \*Bradlaugh as an atheist to take the oath or affirm and maintained harassing tactics towards the Liberals. When the Conservatives returned to office in 1885, all four were found employment. The main achievement of the group was to launch the spectacular career of Lord Randolph. JAC

**Fox, Charles James** (1749–1806). A brilliant orator and a man of dazzling charm, Fox never fulfilled his immense potential as a politician. The main reason for this was that his political judgement was erratic. At crucial times in his career he committed errors which proved decisive in denying him the office for which he craved.

Fox was educated at Eton and Oxford and entered the House of Commons while still under age in 1768. He held minor office under \*North but fell foul of the king and the prime minister over the \*Royal Marriages Act and the admission of reporters to debates in the Commons. Once in opposition Fox was drawn to alliance with the \*Rockinghamite Whigs. He became a critic of the influence of the crown, an opponent of British policy towards the American colonists, and the advocate of greater collective responsibility within the cabinet, arguing that cabinets should have a greater say in the choice of prime ministers. He favoured recognizing the independence of the American colonies and made no secret of his belief that the influence of the crown was the cause of British humiliation. He supported parliamentary reform, the repeal of the Test and Corporation Acts, and closer collaboration between parliamentarians and popular reform movements.

When North fell in 1782 Fox became foreign secretary under Rockingham. He wanted to recognize American independence in the hope of securing American goodwill during the peace negotiations but finding himself in disagreement with \*Shelburne and other colleagues he resigned office on Rockingham's death. This proved to be a grave misjudgement. He was driven to seek new political allies and entered into alliance with his old foe, North. There was nothing inherently disastrous about this. Coalition was an inescapable fact of political life, but working with North was bound to be risky: many MPs remembered the ferocity with which Fox had denounced North as an agent of corruption. By defeating Shelburne over the draft peace terms, Fox and North forced themselves upon the king. When they tried to reform the administration of the East India Company, George III procured the defeat of the \*India Bill in the Lords, dismissed the coalition, and after installing \*Pitt as prime minister in December 1783 saw him win a great

victory at the 1784 general election. Fox's gamble had failed and he faced the prospect of long years in opposition.

Even when Pitt was defeated over parliamentary reform and Irish free trade, there was little comfort for Fox. When George III became ill in the autumn of 1788 Fox expected that the prince of Wales would call him into office once he had become regent. Fox supported the prince's inherent right to be regent with full powers, but Pitt's advocacy of the need for Parliament to act proved more popular. The king recovered in February 1789 and Fox was blamed by many of his colleagues for mishandling the regency question. His fortunes were again at a low ebb.

When the French Revolution broke out in May 1789 Fox believed that the French were at long last imitating the English Revolution of 1688. But the Foxite party split over the French Revolution, and by 1794 Fox had only 60 supporters in the Commons. Though disgusted by the excesses of the Jacobins, he opposed war with France, arguing the case for a negotiated peace. He bitterly resented the desertion of so many old friends and for a time ceased to attend the Commons.

When \*Addington resigned in 1804 George III vetoed Pitt's proposal that Fox should be foreign secretary in a grand coalition. Only after Pitt's death in January 1806 was the king compelled to accept Fox as foreign secretary in Grenville's ministry. But he was now in poor health. Attempts to negotiate a peace with Napoleon collapsed ignominiously. The only consolation for Fox in his last days was the condemnation of the slave trade by the House of Commons. In September 1806 Fox died. He became the inspiration for Whig legend. His advocacy of peace, retrenchment, parliamentary reform, and civil and religious liberty inspired many later reformers. One irony was that the hero of Victorian liberals was so un-Victorian in his private life. In his youth Fox had been a compulsive gambler and womanizer. Though he found happiness with his mistress Elizabeth Armistead, whom he married in 1795, he could never manage his private finances. JWD

Ayling, S., *Fox* (1991).

**Fox, George** (1624–91). Founder of the Society of Friends (\*quakers). A Leicestershire man of puritan upbringing, Fox was an apprentice shoemaker who, after religious experiences, found no church spiritually satisfying. He began (1647) widespread itinerant preaching, rallying the many small groups of 'Seekers' of similar views. Rejecting organized ecclesiasticism, hierarchical authority, and contemporary social convention, even courtesy, and relying not on sacraments or Scriptures, but on mystical 'Inner Light', his followers were called 'Children of Light' then 'Friends of Truth' and popularly quakers (1654). They only became pacifist and non-political after 1660. Until 1689 they were much persecuted, Fox being imprisoned eight times. By 1660 there were about 30,000–40,000 quakers drawn mainly from rural and urban craftsmen. With the help of Margaret Fell, whom he married in 1669, he gave the movement cohesion. Fox himself travelled all over the British Isles, to the West Indies, and North America. A prolific pamphleteer, his *Journal* was published posthumously (1694). WMM

**Fox, Henry** (1705–74). Fox entered Parliament in 1735 and quickly found favour with \*Walpole. Walpole's successor Henry \*Pelham also regarded Fox highly and had him appointed secretary at war in 1746. Fox was a skilled and witty debater, a talented manager of men and money; many believed he would succeed Pelham when he died in 1754. But Pelham's brother the duke of \*Newcastle did not trust Fox and would not give him sufficient patronage to control the Commons. Fox was a secretary of state briefly, 1755–6, but his lack of expertise in foreign affairs as the \*Seven Years War began told against him. When his greatest rival William \*Pitt formed a coalition with Newcastle in 1757, Fox was 'bought off' with the lucrative but uninfluential office of paymaster-general. Fox's opportunity for revenge came in 1762–3 when \*Bute and George III employed him to push the peace of \*Paris through the Commons. To do so, Fox purged from office most supporters of Newcastle. He was created Lord Holland, but George III regarded his cynical methods with contempt and, politically isolated, his career was over.

One sees Henry Fox most favourably through his love of family. He eloped with a daughter of the duke of Richmond in 1744 and they were a devoted couple, dying within days of one another. He was highly indulgent to his children, particularly his third son, Charles James Fox. His children repaid this indulgence by gambling away most of his vast fortune and Fox's final years were not happy. AIL

**Foxe, John** (1516–87). Martyrologist. Born in Lincolnshire, educated at Oxford, he was fellow of Magdalen College (1539). Though, as an extreme protestant, he resigned in 1545, he was ordained deacon by Bishop \*Ridley of London (1550) and was tutor (1547–53) to the children of the recently executed catholic earl of Surrey. One of these, for whom as 4th duke of \*Norfolk he retained affection, he later attended on the scaffold (1572). After exile under Mary, he returned, was ordained priest in 1560, and, despite objecting to the surplice, became vicar of Shipton. Foxe's reputation rests principally on his *Actes and Monuments* (Latin 1554, English 1563) or *Book of Martyrs*, dedicated to Elizabeth, a best seller which reinforced the concept of England as God's elect nation. 'A database for the justification of the Elizabethan "godly" reformation', it was based on massive, but unashamedly biased and often inaccurate protestant scholarship. WMM

**Foxe, Richard** (c.1448–1528). Bishop and statesman. Foxe was born near Grantham and educated at Magdalen College, Oxford. On a visit to Paris he became acquainted with Henry of Richmond who, after gaining the throne as Henry VII, appointed Foxe bishop of Exeter, king's secretary, and lord privy seal. He was greatly employed in diplomatic and matrimonial negotiations. In 1491 he baptized Prince Henry. Foxe was translated to Bath and Wells in 1492, to Durham in 1494, and to Winchester in 1501. From 1507 to 1519 he was master of Pembroke College, Cambridge. His influence waned as that of \*Wolsey grew in the reign of Henry VIII and he gave up the privy seal in 1516. In his later years, while growing blind, he founded Corpus Christi College, Oxford, and encouraged the study of Greek. In view of

the trust both monarchs placed in him, he would presumably have gained Canterbury were it not for the long tenure of \*Warham (1503–32). JAC

**fox-hunting.** The medieval chase, so much loved by monarchs, was mainly of the deer, either in royal forests or in deer parks. Foxes, regarded as vermin, were killed by farmers and labourers, but without undue ceremony. But by the 17th cent., deer were becoming scarce, as guns took their toll and woodlands diminished. For some time hunters carried on with carted deer, but they were troublesome, expensive, and unsatisfactory. Hares made a good substitute and could be hunted on foot. Organized fox-hunting developed in the late 17th and early 18th cents. The Monsons were hunting foxes in the Burton in Lincolnshire in the 1670s, the Arundells in the 1690s in what became the South and West Wiltshire Hunt: the Puckeridge Hunt dated from 1720, the Belvoir from 1730. Hugo Meynell, who hunted with the Quorn, acquired a national reputation, breeding hounds and horses with great care. The lead was taken by local noblemen, since keeping a pack of hounds was expensive and prestige helped to obtain permission to hunt over other people's fields. Ritual, costume, and terminology developed—'pink', 'brush', 'mask'. By the 19th cent. fox-hunting was becoming a national tradition, with its own sporting writers like Charles Apperley and Surtees, and the walls of countless taverns adorned with paintings and comic prints. An Association of Masters of Foxhounds was set up in 1881. But the same century saw the beginning of serious criticism of hunting and the 20th cent. produced its hunt saboteurs and ugly clashes at meets. Despite the hostility of the \*Royal Society for the Prevention of Cruelty to Animals and the League against Cruel Sports, there were 190 packs of foxhounds in the 1970s, more than in Edwardian England. In Scotland, where fox-hunting had never been as popular, there were fewer than a dozen packs. JAC

**Fox's martyrs** was the satirical description of the 90 or so supporters of the Fox–North coalition who lost their seats in \*Pitt's landslide victory at the general election of 1784. It derived its name from John \*Foxe's famous book of 1563 of the sufferings of the faithful. JAC

**Fox-Talbot, W. H.** See TALBOT, W. H. FOX.

**Fragment on Government** (1776) was Jeremy Bentham's first book, written to refute Sir William \*Blackstone's *Commentaries on the Laws of England*. Bentham rejected Blackstone's celebrated treatise which set out the legal basis of the British constitution, because it perpetuated myths such as the doctrines of 'mixed' government and 'separation' and 'balance' of powers. Moreover, Blackstone confused fact with value, lending spurious legitimacy to whatever laws were in place. Bentham sought to flush out these errors, and 'break loose from the trammels of authority and ancestor-wisdom on the field of law', substituting the rational principle of utility for the irrational practice of tradition. TSG

**France, relations with.** From the Norman Conquest of 1066 England was involved in a series of French wars arising

out of the continental possessions (and claims) of the Norman and still more of the Angevin kings. The wine trade with Bordeaux was greatly valued. The \*Hundred Years War began in 1337, and in 1420 Henry V was recognized as the heir to the French throne. Disaster speedily followed, and by 1453 only \*Calais remained in English hands (it was finally lost in 1558). Meanwhile the French used the Auld Alliance with Scotland to add to English embarrassments.

A new era of Anglo-French conflict began in the later 17th cent. when under Louis XIV France emerged as the most formidable kingdom in Europe. In the War of the \*Spanish Succession (1701–13) Britain secured Gibraltar, Nova Scotia, and Newfoundland, and confirmed her position as a great power. The War of the \*Austrian Succession (1740–8) and the \*Seven Years War (1756–63) made Britain the leading European force in North America and India. The French obtained partial revenge when their intervention in the War of \*American Independence (1776–83) hastened the loss of the colonies. Despite the fears aroused in Britain by the radical political and social ideas of the French revolutionaries, the wars from 1793 to 1815 were essentially a continuation of those waged over the balance of power in Europe, colonies, and naval supremacy. France was finally defeated in 1814–15, although \*Castlereagh was careful to ensure that she remained strong enough to play a major role in the balance of power.

For the rest of the century the British continued to rank France (along with Russia) above all the states which posed a threat to their interests. The two fought on the same side in the \*Crimean War, but it needed the resolution of colonial rivalries to bring about the \*Entente of 1904, and it was solidly cemented only by the growing fear of Germany. France became the main battleground for the British army in the 1914–18 war. Yet relations soon deteriorated after 1919 in both Europe and the Middle East. Even the advent of Hitler failed to produce a close alliance until 1939. The dramatic fall of France followed in June 1940. At the end of the war Britain was the victorious power most interested in the revival of her neighbour, but the Soviet threat soon aligned Britain much more closely to the USA. The ill-conceived Anglo-French bid to overthrow the Nasser regime in Egypt in 1956 ended in tears, while President de Gaulle vetoed two belated British attempts to join the \*European Economic Community (in 1963 and 1967). Even after entry in 1973 Britain remained too semi-detached in her policies to satisfy the French. CJB

**franchise.** See SUFFRAGE.

**Franciscans** (or 'friars minor' or 'grey friars') were a mendicant order founded by St Francis of Assisi (1181/2–1226), the son of a wealthy merchant, in 1209, when he gave his disciples, like him devoted to poverty, care of the sick, and meditation, the 'Regula primitiva', the first rule, heavily influenced by apostolic models. In 1212 a wealthy woman, Clare, joined Francis: she became abbess of a community of Franciscan nuns ('Poor Clares'), like their male counterparts noted for their ascetic poverty. Francis was unwilling to regularize his rapidly growing band of itinerant preachers, and control soon passed from his hands. In 1223 Pope

Honorius III confirmed a more institutionalized rule which emphasized total poverty. The friars were to live by their own labour or by begging. Later, following \*Dominican example, the Franciscans were organized into provincial and general chapters under the ultimate authority of the minister-general.

Thereafter the order expanded rapidly, appealing particularly to urban benefactors, and the Franciscans settled and preached primarily in towns, though they were also active in missionary work in the East. Tension between those who wished to follow the apostolic ideals of the founder (later known as the 'Spirituals'), however impractical, and those who were prepared to compromise, particularly over the issues of property and corporate poverty (the 'Conventuals'), soon emerged, bringing disunity to the order, particularly in the mid-13th and early 14th cents., when many of the more radical 'Spirituals' were condemned as heretics, while in 1368 a new group, the 'Observants', emerged in Italy demanding a return to the rule of 1223.

The first Franciscans under Agnello of Pisa were sent to England by Francis in 1224 and communities founded at Canterbury, London, and Oxford. Thereafter the Franciscans grew rapidly and there were some 60 houses by 1300. At Oxford the Franciscans soon acquired a reputation for their scholarship, first under Alexander of Hales, and were in the forefront of intellectual activity during the 13th and 14th cents., their number including Roger \*Bacon, \*Duns Scotus, and \*William of Occam. There were also three successful houses of Franciscan nuns, of which the Minories, in London, was the most significant. At the end of the 15th cent. six houses of Observants were established, three being transfers from Conventual friaries. Observant friars were fierce opponents of Henry VIII's policies and many were executed or imprisoned during the 1530s. The English order was dissolved in 1538. BJG

**Franco-Scottish alliance.** Also known as the Auld Alliance. An offensive and defensive alliance, aimed at crippling England's attempts to conquer Scotland or France by threatening war on two fronts. First agreed at Paris in 1295, the Franco-Scottish alliance was renewed periodically until denounced by Scotland in 1560.

At its zenith in the 14th cent., after renewal by Robert I at \*Corbeil (1326), the alliance was an essential element in Scotland's success in the \*Wars of Independence, and was continued in 1371 and 1391. The \*Hundred Years War (1337–1453) emphasized the alliance's strengths as successive English kings found they could not conquer France without defeating Scotland.

The alliance remained an effective way of pressurizing England in the 15th cent., and was reaffirmed in 1428 and 1448. However, Louis XI of France's treaty with England, ignoring Scotland (1463), and James III's alliance with England (1474), illustrated changing Franco-Scottish relations. The alliance was renewed in 1484, 1492, and 1512, although neither nation intended to implement it actively. However, when Henry VIII attacked France (1513), James IV decided to abide by the alliance, resulting in disastrous defeat at \*Flodden.

The 16th cent. saw Scotland at the whim of swiftly changing European diplomacy. Alternately courted and abandoned by France, the Scots were reluctant to repeat Flodden on their ally's behalf. With the advent of the \*Reformation, many now favoured protestant England. The alliance was renewed by marriage arrangements for James V (1537) and Mary, queen of Scots (1548), but Scotland's refusal to be exploited by France was eventually reflected in the revolution of 1559–60 which saw England embraced, and the Franco-Scottish alliance finally renounced. RJT

**Franklin, Benjamin** (1706–90). Journalist, scientist, and diplomat. Born in Boston, Massachusetts, in a family from Northamptonshire, Franklin began in his father's tallow business before apprenticeship as a printer. In 1728 he opened his own printing-office in Philadelphia, and two years later purchased the *Pennsylvania Gazette*. In 1731 he began printing *Poor Richard's Almanack*, a mixture of information, forecasts, advice, and proverbs. The electrical experiments which made him famous—harnessing lightning through a kite—were conducted in the 1740s and resulted in his election to the Royal Society in 1756. His political interests developed from 1751 when he was elected to the Pennsylvania Assembly. From 1757 to 1762 he was in Britain as agent for the colony, and in 1766 returned, giving evidence before the House of Commons against the Stamp Act. In 1772 he passed on private letters of Governor Hutchinson, which resulted in the Massachusetts Assembly demanding the governor's recall. After the \*Boston Tea Party, Franklin was brought before the Privy Council, and denounced by \*Wedderburn, the solicitor-general, as a mischievous incendiary and a man no one could trust. Returning to America, Franklin took a prominent part in resistance, being one of five to sign the \*Declaration of Independence. He subsequently represented the new republic in France and obtained the alliance which won American independence. Franklin's *Autobiography* was published in French the year after his death. JAC

**Franklin, Sir John** (1786–1847). After a distinguished naval career in the wars against Napoleon, Franklin became the most famous British Arctic explorer of his day. Then, like \*Livingstone, at the end of his life, he became even more of a national figure by disappearing into the unknown. Although a naval officer trained in 1818 in using large ships to force a way through the ice of the Canadian north to find the North-West Passage and arguably a victim of that policy, Franklin made his greatest discoveries on two overland journeys of 1818–22 and 1825–7 when he explored vast areas of northern mainland Canada and traced the northern coast. After a spell as governor of Tasmania from 1834 to 1843, he was chosen to take the Antarctic ships *Erebus* and *Terror*, which \*Ross had used, to the Arctic to force the North-West Passage. It was later learned that, having got through sea passages to the west side of King William Island, the ships had frozen in. Franklin died, but his men survived to perish later of scurvy, starvation, and lead poisoning from their tinned foods. No fewer than 40 official and unofficial expeditions searched for Franklin (and in the process, ironically, showed there was a North-West Passage)

but not until 1859 was the nature of the disaster fully established. RB

**frankpledge** was a form of collective responsibility for good conduct, whereby every member of a tithing, or group of ten, was answerable for the good behaviour of the others, on pain of fine or amercement. Some elements were to be found in Anglo-Saxon and Danish England, but it developed after the Norman Conquest, perhaps to give some security to individual Normans in a hostile land. Sheriffs were instructed to hold twice-yearly meetings to ensure that all persons required to be in tithings had joined them. Individual lords bade for the right to supervise tithings in the view of frankpledge, which added to both their power and profit. There were parts of England where the system never operated, particularly in the north, and by the 15th cent. it was moribund. JAC

**Frazer, Sir James** (1854–1941). Anthropologist. Frazer was born in Glasgow, where he took his first degree, and was elected to a fellowship at Trinity College, Cambridge, in 1879, which he held for the rest of his life. In 1888 he contributed articles on taboo and totemism to the *Encyclopaedia Britannica*, which laid the foundation for his work on primitive religion. He followed them with *The Golden Bough* (1890), a pioneer work of comparative anthropology, which occupied him until the 1930s. The evolution of society was, Frazer suggested, from magic to religion and then to science. This led him to examine the role of god-kings, scapegoats and sacrifices, and fire festivals. Prodigiously dedicated and hard-working, he amassed a vast pile of evidence, much of it printed in *Anthologia anthropologica* (1938, 1939). He had no field experience and showed little interest in comment and criticisms of his work. His early presbyterian family religion gave way to a vague 'trembling hope' in some 'world of light eternal'. Frazer was knighted in 1914 and given the OM in 1925. JAC

**Frederick Lewis, prince of Wales** (1707–51). Eldest son of George II and Queen Caroline; father of George III. For most of his life Frederick was at odds with his parents, and by the mid-1730s he had become a willing tool of opposition politicians, hopeful of serving him when he became king. Brought up in Hanover, he came to England in 1728. After his marriage in 1736 to Augusta of Saxe-Coburg, the king's refusal to grant him a fixed income provoked a dramatic rift and he was banned from court. He soon established a rival court at \*Leicester House which became an important meeting-ground for \*Walpole's leading opponents. After Walpole's fall from power, a period of uneasy reconciliation between father and son lasted until 1747, when Frederick and his Whig followers forged an alliance with the Tories. The 'Leicester House group' made a limited impact in Parliament, and broke up on the prince's sudden death in 1751. AAH

**Free Church of Scotland.** This issued from the \*Disruption of 1843, when those unable to accept the infringements of the \*Church of Scotland's right of self-government which the Auchterarder case (1838–9) highlighted seceded under Thomas Chalmers (1780–1847). The

result can be regarded as a dramatic tribute to voluntarism (and Scottish middle-class affluence), or a wasteful duplication of resources: 500 ministers, 600 schools, 700 new churches by 1847; missionary work in India and central Africa; ministerial training renowned for its intellectual rigour. Under a powerful Edinburgh leadership, this church, claiming continuity from the Reformation's Church of Scotland, and retaining the Westminster confession and longer and shorter catechisms, steadily moderated its theological conservatism. It affirmed its political liberalism, developed a centralized financial system new to presbyterianism, and united with other presbyterian secessions: the original seceders (1852), the Reformed Presbyterian Church (1876), and the United Presbyterians (1900), thus forming the United Free Church which joined with the Church of Scotland in 1929. Inevitably each union bred its rump. The Free Presbyterians seceded in 1893, alarmed at the Declaratory Act of 1892, which modified the binding force of the Free Church's original formularies, and a remnant (the 'Wee Frees') has survived the union of 1900, confirmed in its property by the Free Church case (1904), conservative in theology, strong in the Highlands, and active in missions to India and southern Africa. CB

**freeholder.** Technically any outright owner of land is a freeholder, but the most regular use of the word historically has been in the context of voting rights. Freeholders were those people who owned property worth 40 shillings (£2) a year and were thus entitled to vote in county elections, at least until the franchise extensions of the 19th cent. The 'freeholder' was thought of as an independent voter exercising his legal rights unconstrained by the lure of political parties or threats.

The link with landownership has also led to the term being used in conjunction with social status. Gregory King referred in his social table of 1688 to greater and lesser freeholders, and in this he was followed by later commentators such as Joseph Massie (1760) and Patrick Colquhoun (1804). Unfortunately, King was not clear what he meant by a freeholder. In his published work he seems to have followed Thomas Wilson in regarding a freeholder as, in effect, a yeoman, but in some of his unpublished estimates he seems to have wavered between including only those who qualified on tenurial grounds, and all of those who were freeholders by virtue of having the right to vote in parliamentary elections. This latter group was rather wider than genuine landed freeholders.

The difficulty both for contemporaries and for historians has been to find a term suitable for describing landowners below the ranks of the \*gentry (see also PEASANTRY; YEOMEN). Freeholder has been used because it implies an individual who owned the land he worked, but as our knowledge of the complexity of tenure increases it is apparent that while the term had an effective currency in King's day, this was not so by the 19th cent. A 'freeholder' in the 19th cent. could be anyone who owned a small parcel of land, and the link with independent farming was increasingly detached, partly because so many freeholders were renting land to create a viable holding. JVB

**freemasons** were originally skilled workers in stone who, in the Middle Ages, travelled from site to site and developed a set of secret signs and passwords for private identification. With the decline in cathedral-building the guilds began to accept honorary members to bolster declining membership, these being similarly required to help all members as brothers. Soon they ceased to have much resemblance to craft guilds and became prosperous social clubs, which claimed to do much charitable and philanthropic work. Freemasonry revived after the expulsion of James II, influenced by Huguenot immigrants such as Desaguliers. Lodges were better organized, with regular meetings after 1691, and admitted broader social ranks; the first grand lodge was founded in 1717. The movement prospered, with many lodges owning their own premises, and in 1802 they established themselves as a national organization, identified with monarchy and protestantism, although freemasonry is not actually a Christian institution. Schemes were developed for mutual help in times of distress and aid for dependants—one of their best-known charitable endowments is the Royal Masonic Hospital. The framework of self-help, particularly to meet privations caused by illness, sudden death, and unemployment, led other organizations such as the Royal and Ancient Order of Buffaloes and the Free Foresters to emulate them. Largely because of their secrecy, freemasons have attracted much criticism, particularly from the Roman catholic church, which believed freemasonry to be a cover for free thinking; others suspected secret political influence or accused members of promoting each other's interest by stealth. IJEK

**free trade.** The basic tenet of the theory of international trade is that free trade, which is the absence of any artificial restrictions on the level or composition of trade or the price at which commodities are exchanged, represents the superior form of organization in international markets. Free trade assumes a state of perfect competition. Departure from free trade in the form of protection introduces distortions in the operation of markets which add to costs, fragment production, reduce competition, and allow excess profits.

There are, however, very few examples of any country following a free trade policy, Victorian Britain constituting a notable exception. The repeal of the \*Corn Laws in 1846 brought a shift in political perceptions, although not an immediate substantive reduction in tariffs, by removing the protection traditionally given to agriculture in favour of securing cheap imported food for the industrial areas. (See PROTECTIONISM.) This established the principle of free trade, the \*Navigation Acts were repealed in 1849, and all remaining protectionist regulations disappeared in 1860. The anomaly of the British adoption of free trade, by contemporary international standards, is a reflection of the unusual economic structure of the country. In the Victorian period the British economy was heavily dependent on international trade and finance, especially the latter, as massive overseas investment generated substantial 'invisible earnings' in returns on investment, insurance premiums, and earnings from transport services. No other country, before or since, has diverted such a large share of national income to overseas investment. Furthermore, British industry depended

heavily on export markets. It was thus in the interests of the British economy that international trade flourished. Substantial invisible earnings meant that Britain could sustain a trade deficit, the value of exports being less than imports, without experiencing a balance of payments deficit because invisibles added to exports exceeded imports. This free trade policy stimulated world growth by allowing many countries to run a balance of trade surplus with Britain, effectively dumping on the British market.

This structure of trade and the free trade policy could only be sustained as long as the value of invisible earnings was maintained. In time this advantage would doubtless have been eroded, as other countries provided investment and shipping services. In fact, the First World War severely undermined the British balance of payments as overseas investments were sold to pay for the war and shipping earnings were much reduced as peacetime trade activity went into abeyance. The depressed state of the world economy in the 1920s further eroded the balance of payments as export industries found their markets diminished. The 1929–32 depression marked the end of the fixed exchange rate regime which had, effectively, been based on sterling underpinned by the balance of payments surplus. It also marked the end of free trade. In 1932 a general tariff was introduced imposing a 10 per cent import tax, but allowing preferential treatment to Commonwealth countries in return for concessions on British exports. Thus Britain adjusted to a policy of imperial preference, hoping to create a trading regime with the colonial and imperial territories, exchanging their raw materials for British goods.

After the Second World War, the General Agreement on Tariffs and Trade (GATT) was signed in 1948 to reduce tariff barriers. In 1995 it was replaced by the World Trade Organization. It was a primary objective of the \*European Economic Community to reduce tariffs between member states. See also EUROPEAN FREE TRADE ASSOCIATION. CHL

**French, Sir John** (1852–1925). Soldier. After leading a cavalry division during the second \*Boer War and serving as chief of the imperial general staff, 'Johnnie' French served as the first commander of the British army in France 1914–15. He was ill suited to this role. French was a charismatic cavalryman but he had little understanding of staff work or diplomacy. His relations with his French allies were frosty and his only solution to the stalemate of trench warfare was to call for ever more shells. By May 1915 that recipe did not work, and he tried to find a scapegoat by secretly encouraging *The Times* and the *Daily Mail* to blame \*Kitchener for failing to provide the army with enough shells. French himself barely survived the subsequent scandal and was dismissed in December 1915 following another failure at Loos in September–October 1915. He served 1918–21 as Lord-Lieutenant of Ireland and was given a peerage in 1922 as 1st earl of Ypres. DF

**Frere, Sir Henry Bartle Edward** (1815–84). Frere was born in Brecknockshire, educated at Haileybury School, and joined the \*East India Company service in 1834. He was appointed to the Bombay presidency where, apart from a spell on the viceroy's Council in Calcutta (1859–

62), he spent his entire Indian career, finishing as governor (1862–7). He was known as an assiduous administrator and his most notable achievement was the development of the port of Karachi. In 1867–77 he served on the India Council in London but then was posted to South Africa as governor of Cape Colony. His governorship was turbulent and unsuccessful. He faced Sir Theophilus Shepstone's attempt to annex the Transvaal; deepening conflict with the Cape prime minister J. C. Moltene; and the outbreak of a disastrous war with the \*Zulus. In 1880, following the defeat of Lord Chelmsford by the Zulus at \*Isandhlwana, he was recalled. DAW

**friars** (from *fratres*, i.e. brothers) belonged to the so-called mendicant (i.e. begging) monastic orders. The four most important were the \*Franciscans, \*Dominicans, \*Carmelites, and \*Augustinians. In addition most orders had communities of associated nuns. The friars emerged in the early 13th cent., partly as a response to the spiritual needs of a changing society, particularly increasing urbanization, and the concomitant growth of a literate laity, partly to combat heresy (itself primarily an urban phenomenon) by teaching and example. Ecclesiastical institutions (including the great majority of the foundations of the 'new' monastic orders) were primarily directed to the needs of rural society. Into the vacuum had come evangelizing wandering preachers who represented a potential threat to ecclesiastical authority. Several such groups, e.g. the Waldensians, were condemned as heretical. A few, like the Dominicans and Franciscans, were fortunate enough to gain the conditional support of Pope Innocent III in his struggle against heresy and dissent.

The friars, though frequently following variants of older monastic rules, differed from monks in fundamental respects. Adopting a life of individual and corporate poverty, they refused endowments and property, relying instead on begging; unlike 'traditional' monks they lacked 'stability' but were licensed to travel, moving from place to place at the behest of the order to preach, study, or administer; their *raison d'être* was engagement with, rather than seclusion from, the secular world. The mendicant orders, particularly the Dominicans, developed a supranational organization directed by provincial and general chapters and ultimately subject to the papacy.

As orthodox evangelists they placed much emphasis on learning both within their own communities and in the universities, and it is no coincidence that almost all of the leading intellectuals of late medieval Europe, including Thomas Aquinas and \*Duns Scotus, were friars. Though the friars attracted much hostility and satirical comment in the late Middle Ages, there can be little doubt of their continuing appeal to the urban laity until the Reformation. BJG

**friendly societies** of working men can be traced back to the late 17th cent., but their rapid growth began about 1760. In return for a small weekly or monthly contribution paid into a common fund, they provided sickness and funeral benefits. The members met monthly in a local public house to transact business and have a convivial time. An annual feast was held, and the funerals of deceased members were usually followed by a supper. Ceremony and ritual were

## Friends of the People

essential parts of the societies' life. They held open-air processions with bands, banners, and uniforms. Indoors they conducted initiation rites, using mystical symbols, grandiloquent titles, and regalia, similar to the \*freemasons. Originally friendly societies were local institutions with seldom more than 100 members. But in the 1830s and 1840s these were eclipsed by the affiliated orders, with their organization into a unity (headquarters), districts, and lodges: the Odd-fellows, Foresters, Druids, Ancient Britons, Antediluvian Buffaloes, and Rechabites. From an estimated 925,000 members in 1815 they grew to about 4 million in 1872—more than any social organization except the churches. By 1892 probably 80 per cent of the 7 million male industrial workers were members of friendly societies. Governments had ambivalent views about friendly societies, on the one hand encouraging and regulating them as instruments of thrift and self-help, on the other suspecting them as independent working-class institutions similar to trade unions (with which in their early days they sometimes overlapped), and regretting the 'waste' of resources on festivities. After 1875 the insurance aspect of the societies became increasingly important; and under the 1911 National Insurance Act the societies were given a new role as agents in the state scheme of national health insurance. JFCH

**Friends of the People** was an association of radical Whig aristocrats and parliamentarians launched in 1792 by Lord John \*Russell, Charles \*Grey, and their friends. It advocated moderate parliamentary reform as a means of preserving the constitution. Welcomed at first by other reform bodies, the Friends quickly became distrusted by plebeian and middle-class radicals on the one hand, and by the government and conservative Whigs on the other, and ceased to operate after 1795. Their most important contribution to the reform cause was probably their report on the state of parliamentary representation, corruption, and influence. JFCH

**Frobisher, Sir Martin** (c.1535–94). Although notable as an early English sea trader in west Africa and the eastern Mediterranean in the 1550s and later associated with \*Drake in the West Indies expedition of 1585–6 and the defeat of the Spanish Armada in 1588, Frobisher is best remembered as an explorer who made three attempts in the period 1576–8 to find the North-West Passage. The first to penetrate so far, Frobisher discovered Baffin Island and sailed some way into the Hudson Strait, opening the way for later explorers. Frobisher was distracted by thinking he had found gold in the bay which bears his name in Baffin Land, but it was iron pyrites. After more encounters with the Spanish in the 1590s, Frobisher was killed at Brest. RB

**Frontinus, Sextus Iulius.** Governor of Britain (73/4–77). Of unknown origins, he was probably a legionary legate by 70 and must then have held the consulship before coming to Britain. \*Tacitus explicitly credits him with campaigning against the \*Silures of south Wales, but otherwise passes over Frontinus' governorship in a sentence. Archaeology strongly suggests that he campaigned well into northern Britain, laying the groundwork for Tacitus' hero \*Agricola

to build on. After leaving Britain he was consul twice more (98, 100) and *curator aquarum*, in charge of the water supply of Rome itself. His military experiences were memorialized in his book the *Stratagemata*, and his volume *De aquis* remains an invaluable work of reference on the practicalities of Roman water supply. ASEC

**Fry, Elizabeth** (1780–1845). Reformer. Elizabeth Fry was born into the quaker family of Gurney, bankers of Norwich, and brought up at Earlham Hall. At the age of 20 she married another quaker banker, Joseph Fry, and went on to raise a large family. In 1807 her sister Hannah married Thomas Fowell \*Buxton, also of quaker ancestry, and keenly interested in prison reform. Elizabeth Fry began visiting Newgate and in 1817 founded an association to help the female prisoners. In 1818 she gave evidence to a parliamentary committee, insisting on the importance of useful work for prisoners. She became greatly concerned for the plight of women convicts transported to Australia and between 1818 and 1843 is said to have visited more than 100 convict ships. By the 1820s she had acquired an international reputation and the patronage of royalty, though her husband's bankruptcy in 1828 forced her to curtail her activities. In 1842 she was visited by Frederick William IV of Prussia while he was in England. JAC

**Fuentes de Onoro, battle of**, 1811. On 3 May 1811 Wellington's Anglo-Portuguese army of 37,000 men tried to halt Marshal Masséna's 47,000-strong French army advancing to relieve Almeida. Masséna's attacks on the village of Fuentes de Onoro were repulsed but on 5 May French forces manoeuvred around the British flank. Craufurd's Light Division conducted a fighting retreat, buying vital time for \*Wellington to redeploy. Masséna wasted his forces in four massive but unsuccessful attacks on Fuentes village, and then broke off the battle. Along with \*Albuera, Fuentes de Onoro stalemated the situation along the Portuguese border. GDS

**Fulford, battle of**, 1066. Eight months after \*Harold Godwinson's succession in January 1066, \*Harold Hardrada, king of Norway, launched a major attack, in conjunction with \*Tostig, Harold's brother, recently deposed as earl of Northumbria. They brought 300 ships, and sailed up the Ouse to Riccall, south of York. On 20 September, Edwin and \*Morcar, Harold's brothers-in-law and earls of Mercia and Northumbria, gave battle at Fulford, but were heavily defeated. York fell to the invaders. But Harold led a forced march from London and on 25 September killed both Harold Hardrada and Tostig at \*Stamford Bridge. While he was celebrating his victory, Harold received news of William of Normandy's landing in the far south. JAC

**funerals** are rituals which enable relatives and friends of the dead person to express their feelings and enable mourners to show their grief. The forms of such ceremonies have varied according to the beliefs, religious or other, and the status of the deceased and the wishes of the principal mourners.

Most funerals in Britain before the 19th cent. followed rituals prescribed by Christian churches and varied according to the social standing of the deceased. Before the

Reformation, when Britain formed part of catholic Christendom, the funeral included a requiem mass. When a wealthy person died, the funeral ceremonies followed the terms of the will. Often money was left to pay for special clothes for mourners and for distributions of food, drink, clothing, and even money to the poor of the locality, so that the departed soul might benefit from the prayers of those who received charity. Wills often included arrangements for trustees to take income from property in order to build a \*chantry chapel and to make charitable gifts such as almshouses, schools, church buildings, and even bridges to the community. Priests received a fee to celebrate a memorial mass in the chantry and further alms were given to those who attended the service.

After the Reformation many wealthy protestants continued earlier traditions by making bequests to support good works such as almshouses and schools. Some left money to buy funeral clothes for mourners, especially servants, although some puritans regarded special clothing as inappropriate.

Before and after the Reformation the families of the deceased commemorated them by erecting tombs bearing brasses or sculptures or placed elaborate gravestones in churchyards. Large numbers of such memorials survive.

State funerals for sovereigns were arranged by the earl marshal. Outstanding statesmen and military commanders were sometimes honoured by a state funeral. For less exalted people funerals were arranged according to local and family traditions. Many people turned to an undertaker, or funeral director, although these terms were not commonly used until the later 19th cent. In most towns and villages a clergyman conducted the religious service including the burial of the body. The sexton had the task of digging the grave in the churchyard. From 1667 until 1814 the law required that bodies should be buried in a woollen shroud. However, fashion and greater affluence made coffins increasingly popular. In the case of pauper deaths, the Poor Law authority paid for a simple funeral.

The accuracy of the records of those buried in the churchyard depended on the diligence of the parish clerk in keeping the parish register and the burial of those with unorthodox religious or social views often went unrecorded. The registration of deaths became a legal obligation only in 1837.

During the 19th cent. many nonconformists held funerals in their own places of worship and, rather than pay fees to be buried in the parish churchyard, established their own burial grounds. Concurrently, many growing towns with overcrowded churchyards took advantage of the Act of 1853 which permitted ratepayers to elect a board with powers to buy land for a cemetery. Land in these burial grounds was divided according to denomination and plots could be purchased for a fixed period or in perpetuity. The costs of funerals were such that poorer people often took out special insurance to meet the bills and saved so that mourners could have an appropriate 'wake'. One of the original provisions of the \*'welfare state' established in the 1940s was a burial grant to help meet the cost of a funeral.

General interest in the practice of disposing of the dead by cremation, which was already established amongst groups

such as gypsies who believed that the dead and their worldly goods should be burned, grew in the 19th cent. Cremation became legal in 1885 and funerals took place in crematoria which were built by local authorities. Funerals involving cremation of the deceased became more frequent, increasingly without a religious service, during the 20th cent. Since the First World War, there has also been a decline in the elaborate rituals of mourning. With the exception of state funerals, most modern funerals do not involve special clothing or arrangements. Regardless of social standing, mourning has become much more private and the expression of grief more personal. IJEK

**furniture**, indicator of status, reflector of domestic habits, technological development, and personal taste, has constantly been influenced by architecture and socio-economic change. Until the 14th cent. furniture was scarce, since medieval kings and landowners were peripatetic, and it was customary to transport essential items (including door-locks and window-fittings) from estate to estate. Requirements were therefore basic and minimal, with design subservient to nomadism (folding stools, trestle tables with removable tops, collapsible bed-frames, portable chests); 'fixed' furniture was often built in (stone seating, cupboards recessed within a wall's thickness). Other than chests, medieval furniture was both functional and a reflector of precedence rather than just rank. When most folk used stools and benches, the outstanding symbol of authority was the chair, occasionally upholstered, often on a dais or beneath a canopy. Any bed with seigneurial pretensions (and a probable heirloom) required a canopy too, but other beds were also closed with curtains or set in alcoves for warmth and privacy. Display mattered, but money went on rich hangings, portable and adaptable, rather than on oak fashioned by semi-skilled woodworkers with crude tools.

As a more settled way of life developed, furniture acquired fixed location and function, and specialized items began to appear (lecterns/book-storage in monasteries); emphasis on textiles yielded only slowly to carved decoration influenced by Gothic arches and linenfold panelling. Houses were still sparsely furnished, but changes in furniture construction produced lighter items less inclined to split in damp northern climates, and joiners rather than turners or carpenters became the furniture specialists. Changing social custom affected form: late 16th-cent. tables broadened as host and hostess began to sit at each end rather than on one side with backs to the wall, and the use of upholstery increased. After Flemish immigrants reintroduced board construction in the late 16th cent., producing solid pieces that permitted veneers and elaborate marquetry, joined furniture became restricted to country craftsmen; differences began to appear between urban and rural furniture in both quality and technical approach.

In the 17th cent., increasing shortage of native timbers led to imports of walnut and exotic hardwoods like ebony, letting craftsmen refine their skills and leading to a healthy reciprocal export trade of finished items. The new enthusiasm for collecting boosted showpiece cabinets, while large mirrors increased light in a room and encouraged the

integration of furniture with interior decoration. As trade expanded, particularly post-Restoration, overseas influences on design abounded, such as lacquering and cane-seating from the East and \*baroque flamboyance from Italy which prompted sculptured/gilded pieces, while France held position as arbiter of fashionable taste. For those unable to afford elaborately carved items or high-quality cabinetry, there was nevertheless much practical, utilitarian furniture. Though convention still dictated sparse furnishing and rigid arrangements (chairs aligned against a wall), associated discomfort prompted 18th-cent. development of private quarters in large country houses, away from deliberately impressive 'state' rooms, subsequently dust-covered; as the middle classes burgeoned, more people owned good furniture, and those in unfurnished lodgings could buy on hire purchase. The introduction c.1720 of mahogany, which gradually displaced walnut, enabled pierced openwork carving, so obsession with fashion generated new styles and the emergence of designer-craftsmen (\*Chippendale, \*Hepplewhite, \*Sheraton); enthusiasm for chinoiserie was renewed, eventually inspiring the royal pavilion at \*Brighton. Architects such as William \*Kent and neo-classical Robert \*Adam produced fully integrated interiors, while Horace \*Walpole's neo-Gothic Strawberry Hill innovatively created an environment to express his own personality and taste.

After the Napoleonic wars the demand for expensive furniture fell, but a plethora of styles was still available—Gothic Revival for the dining-room or library, rococo for the drawing-room—though a general diffusion of furniture throughout the population shifted emphasis towards practicality and comfort, while still heavily ornamented. Technological changes led to cheap and partly mechanized furniture, but there was no real factory system in the 19th cent. Sprung upholstery, plywood, and bentwood appeared, metal was used structurally for bed-frames (eliminating bed-bugs) and cast-iron outdoor chairs, and arrangements became more informal. Early Victorian taste favoured opulence and eclecticism, so exhibition showpieces coexisted with simpler, compact items like Windsor chairs. A substantial improvement in the standard of living of ordinary people after 1850, coupled with the spread of mass production, led to the heavily furnished Victorian parlour, with carpet, rugs, fringed tablecloths and antimacassars, and decorated with stuffed birds under glass, Staffordshire figures, and reproductions of Holman Hunt's *Light of the World* (1854), Millais's *Bubbles* (1886), homilies, or portraits of the queen on the walls. A gradual move to studied simplicity, showing strong Japanese influences, contributed to the aesthetic movement, preceding the rise of art nouveau—Charles Rennie \*Mackintosh's black, elongated furniture in the early 20th cent. was both distinctive and scaled to his interiors. As formal living declined and living-spaces shrank after the First World War, the modern movement emphasized function and collaboration with industry, though metal furniture established itself more easily in offices than homes. Technical advances, putting much of the furniture industry on a fully industrial basis, were accompanied by marked stylistic uncertainty, though Scandi-

navian and Bauhaus influences flourished; the imposition of standardized Utility furniture (1942), to enable sufficient furniture for the bombed-out/newly married, was resented but did much to break down lingering resistance to modern design, and crossed class barriers. Post-war furniture, steered by designer imagination and machine capabilities, has seen technological experimentation (inflatable chairs, granule-filled sacks, expanded plastic foam in fitted covers) and promotion of a 'look'. With portable flat-pack, self-assembly furniture and increase in built-in storage space, the wheel has almost turned full circle. ASH

**Fursa, St** (d. c.649). Successfully establishing a monastery in Ireland, he left to escape the crowds he attracted, and, crossing to East Anglia c.633, built one near Yarmouth. When he withdrew again, he lived briefly as a hermit before going to Gaul. His monastery at Lagny, east of Paris, was built c.644. He was buried at Peronne, and a foundation developed there known as Perona Scottorum, because it attracted many Irishmen. Fursa's fame, however, rests upon his visions, which informed medieval accounts of the other world. Borne aloft by protecting angels Fursa saw the joys of the blessed, the struggles of evil spirits, the torments of sinners, and the flames destined to consume the world. Touched by a tortured soul, he bore a permanent scar as witness, and it was said that when relating his experience, he sweated profusely, despite bitter winter weather. AM

**fyrð.** In theory all freemen of Anglo-Saxon England were under an obligation to serve in the fyrð (army) when called upon. In practice communications were so difficult, crises so sudden, piratical or Viking raids so mobile, and the problems of supply so acute that the national militia was rarely summoned. A major invasion, like that of William of Normandy, was an unusual thing. Local raids were dealt with normally by the fyrð in the shires concerned, led by their \*ealdormen. \*Alfred in the Athelney marshes called upon the assistance of 'all the men of Somerset and Wiltshire and that part of Hampshire on this side of the sea', and Byrhtnoth 'with his levies' fought against the Danes at the battle of \*Maldon in 991. In 1066 Edwin and \*Morcar, the local earls, tried to deal with the Norse invasion, but were defeated at \*Fulford before Harold could come to their assistance. The local levies would be strengthened if possible by the king and his family, ealdormen, \*thegns, and in the 11th cent. \*housecarls, with whatever mercenaries were at hand. Hence it has been suggested that there was a great fyrð and a select fyrð, the latter based on the 5-hide unit, and better trained and armed. Though after the Conquest military provision was reorganized on the basis of knight service, the fyrð remained in existence and was called upon by William I and Rufus. In 1138 the local fyrð was a component in the army which defeated the Scottish invasion at the battle of the \*Standard. Henry II's Assize of Arms in 1181 gave instructions for its equipment. The growing sophistication of weapons made local forces increasingly ineffective and it is perhaps fortunate that the fyrð's later manifestations, the \*trained bands, \*militia, or \*Home Guard, did not have to face a major invasion. SMD

**Gabbard, battle of the, 1653.** An important naval battle towards the end of the first \*Anglo-Dutch War. \*Monck and \*Blake with a large fleet encountered Martin Tromp near the Gabbard shoal, east of Harwich. The fighting lasted 12 and 13 June with the Dutch losing seventeen ships. The English followed up their advantage with a blockade of the Dutch coast which did great damage. JAC

**Gaelic,** one of the Celtic dialects, is of the group known as the Goidelic, comprising Irish, Scottish Gaelic, and Manx. Scottish Gaelic and Manx developed through the migrations of Irish speakers in the late 4th cent. to the Isle of Man and western Scotland. Scottish Gaelic had its origins in the settlement of \*Dalriada in Argyll and Bute in the early 6th cent., but the language is not likely to have differed much from Irish Gaelic until the 10th cent. From the original settlement of Dalriada the Gaels spread rapidly northwards and eastwards through Scotland cutting through native Pictish resistance. Following the establishment of the Gaelic church on \*Iona by \*Columba in the 6th cent., the Gaels acquired the means of spreading both their authority and their language. In the 9th cent., Gaels and Picts were finally united under a Gaelic king, probably of mixed parentage. In the 11th cent., after a period of internal strife, \*Malcolm Canmore, son of \*Duncan, came to the throne with the aid of English forces and began to introduce Anglo-Norman customs and language into the court of Scotland. His descendants followed this policy and over the next few centuries the Gaelic language was gradually replaced by English in state and church administration, with the Gaeltachd (Gaelic-speaking area) beginning to shrink.

We can accurately chart the decline of Gaelic only from the late 19th cent. to the present. For 1755 it has been estimated that just under a quarter of Scotland's population were Gaelic speakers—i.e. some 290,000. The 1881 census noted that those who were 'habitually' speakers of Gaelic numbered 232,000 out of a total population of 3,735,000—in high contrast to the 1971 census when Gaelic-only speakers numbered no more than 477 out of 5,228,000. Bilingual speakers were first counted in 1891 when they represented 5.2 per cent of the population, which by 1981 had declined to only 1.6 per cent. There was a greater survival rate of Gaelic in North America, especially in Nova Scotia, where it was estimated that there were in 1880 some 80,000

Gaelic speakers out of 100,000 on Cape Breton Island, though these figures have since diminished sharply.

It is not easy to trace the development of the language from the Irish, as the literature of Scotland was consistently written in a standard Early Modern Irish from the 12th to the 17th cent. The 16th-cent. *Book of the Dean of Lismore* is the most important exception. Scottish Gaelic literature made its appearance in the 17th cent., but not until 1767 was the New Testament translated into Gaelic by the \*Society for Promoting Christian Knowledge. Support for and promotion of the Gaelic language began in the 19th cent., and in 1882 it became possible to study Gaelic as part of a university degree course. Today children can be educated in Gaelic at the primary level and it can be studied at secondary level. The government has allocated funds for Gaelic education and, along with An Comunn Gaidhealach (the Highland Association, founded 1891), has promoted the use of Gaelic in many areas, such as publishing, broadcasting, and in technological spheres. Since these efforts to save the language have been in place, the number of speakers has increased and the trend seems likely to continue. SMD

**Gaelic Athletic Association.** Founded in 1884 in Tipperary to encourage Irish sports, particularly Gaelic football and hurling, at the expense of English ones, like soccer, cricket, and tennis. Its first patron was Archbishop Croke of Cashel, and Croke Park, Dublin, became the headquarters of the association. Along with the \*Gaelic League it was a powerful stimulus to nationalism, and Douglas Hyde declared that it had done more for Ireland than all the speeches of politicians. JAC

**Gaelic League.** Founded in Ireland in 1893 with Douglas Hyde as first president. The intention was to revive the Irish language. Ostensibly non-political, the League inevitably attracted Irish nationalists. Patrick \*Pearse insisted in 1913 that membership of the League 'ought to have been a preparation for our complete living as Irish nationalists'. The work of the League ensured that Gaelic was declared the national language in 1922 and Douglas Hyde became first president of Éire in 1938. But the decline in the number of Gaelic speakers continued. JAC

**Gag Acts.** See SIX ACTS.

**Gainsborough, Thomas (1727–88).** Painter. Gainsborough was born in Sudbury (Suffolk), the youngest of nine

children. He showed early promise as a landscape artist and at 13 went to London to study etching and painting. While continuing throughout his life to paint landscapes, which were his first love, he set up as a portrait painter in 1752, first in Ipswich, then, in 1760, in Bath. In 1768 Gainsborough was elected a founder member of the Royal Academy, yet his relations with both the academy and his great rival, its first president, \*Reynolds, were always strained. In 1774 the artist settled in London, almost immediately becoming the preferred painter of the royal family. Royal patronage and that of artists, aristocrats, and politicians ensured his lasting prosperity. One of his best-known works is the portrait of Jonathan Buttall, known as *The Blue Boy*. His full-length painting of the Hon. Mrs Graham is in the Scottish National Gallery, that of Countess Howe at \*Kenwood. JC

**Gaitskell, Hugh** (1906–63). As Labour party leader, Gaitskell exercised a more enduring impact on British politics than might be supposed from his brief ministerial career. After Winchester and Oxford, Gaitskell spent eleven years as an academic before taking up a wartime civil service post at the Ministry of Economic Warfare. Enjoying the patronage of Hugh Dalton, he displayed intellectual penetration and transparent sincerity.

Elected to Parliament in 1945, Gaitskell was among the most impressive of Labour's new intake. Conspicuous success at the Ministry of Fuel and Power ensured rapid promotion and he became minister of state at the Treasury after the 1950 general election. The combined strain imposed by post-war reconstruction, the development of the welfare state, and the outbreak of the \*Korean War made this a difficult time to assume responsibility for the national finances. Yet Gaitskell was fortunate in the timing of his ministerial ascent. Many of the leading figures in the cabinet had been continuously in office for a decade. Some were now ageing, ill, or exhausted. Gaitskell, by contrast, seemed to be the coming man of Labour politics. When illness forced the resignation of Stafford \*Cripps in October 1950, the 44-year-old Gaitskell was an obvious successor as chancellor.

His only budget in 1951 proved to be controversial to a degree which its provisions scarcely justified. His decision to introduce limited Health Service charges prompted the resignations of Aneurin \*Bevan, Harold \*Wilson, and John Freeman. In Bevan's case thwarted ambition probably played its part. But the resignations gave notice that a right-left split would emerge once the constraints of office were removed. This happened after October 1951. But Gaitskell consolidated his power base when elected party treasurer in 1954, showing the strength of his following in the trade unions. \*Attlee finally retired from the leadership in December 1955 and, to the surprise of many, Gaitskell easily defeated Bevan and Herbert \*Morrison for the succession.

His first years as leader were relatively uneventful. He even succeeded in effecting a reconciliation with Bevan. Gaitskell performed effectively in Parliament over the \*Suez crisis and confirmed his hold over the party. With the Conservatives badly shaken by Suez, Labour approached the election of 1959 with confidence. If for no other reason,

pundits believed that the 'natural swing of the pendulum' would bring them back to power.

The result—a third successive Conservative victory and a substantially increased majority—was a considerable personal blow. With analysts wondering whether Labour was now doomed to permanent opposition, Gaitskell determined to modernize the party to accommodate the aspirations of middle-class voters. To traditionalists, however, this threatened the removal of all socialist content from the party's ideology. Such opposition led to Gaitskell's defeat in 1960 over his attempt to remove clause 4 from the party's constitution. But he restored his authority a year later, resisting the left's attempts to commit Labour to unilateral nuclear disarmament.

Gaitskell died suddenly in 1963, having done much to re-establish Labour as a credible party of government—an achievement which benefited Harold Wilson in October 1964. Whether he would have proved as adroit a party leader in power as Wilson remains an open question. His association with the right seemed to preclude anything like Wilson's capacity to paper over the fundamental divisions in the Labour movement. By the time of his death, Gaitskell could count on a band of devoted followers determined to modernize the party. Many of these had been disappointed by his decision in 1962 to oppose British membership of the Common Market. Even so, the Gaitskellites ensured that Gaitskell's influence survived his death. It is possible to see in this movement some of the origins of the \*Social Democratic Party of the 1980s. Many still regard Gaitskell as the lost leader of the Labour Party. DJD

Brivati, B., *Hugh Gaitskell* (1996).

**Gallipoli/Dardanelles campaign**, 1915–16. In February and March 1915, following a call for help from their Russian ally, the British and French navies mounted an attack against the Turkish defences on the Gallipoli peninsula. They hoped to break through the Dardanelles and capture the Turkish capital of Constantinople. This purely naval attack failed and was therefore followed by two amphibious assaults on the peninsula in April and August 1915. But despite bitter fighting, the British, French, Australian, and New Zealand forces only secured some small beachheads and the passage through the Dardanelles remained closed. Ironically the most successful part of the operation was the evacuation of the allied troops between December 1915 and January 1916. DF

**Galsworthy, John** (1867–1933). One of the most prolific of Edwardian men of letters, Galsworthy went to Harrow and New College, Oxford. He began as a lawyer but took up writing after meeting Joseph \*Conrad. In his plays *The Silver Box* (1906), *Strife* (1909), and *Justice* (1910) he showed how heavily the law could bear upon the poor and defenceless. The first novel of the Forsyte family appeared in 1906 as *The Man of Property*, followed by *In Chancery* (1920) and *To Let* (1921), brought together in 1922 as *The Forsyte Saga*. After that the Forsytes took over and appeared in a string of novels. Galsworthy declined a knighthood in 1918, was awarded the OM in 1929, and the Nobel prize for literature in 1932. His plays lost their topicality, but the novels remained popular

and the *Forsythe Saga* had a resounding success when transferred to television in the 1970s. In part this was nostalgia for a bygone age of clubs, cabs, grand hotels, and visits to spas, but it also reflected Galsworthy's gift for creating interesting and living characters. JAC

**Gambia.** Formerly a British west African protectorate. Britain became interested in the Gambia in the late 16th cent., concentrating upon the river which gave its name to the territory and provided access to trade. French activity nearby meant that British influence never penetrated far from the river and when Britain declared a protectorate in 1894 it was over a long, narrow strip of territory with few trading resources. Groundnuts became the main export crop and the chief source of the country's limited wealth. Though something of a geographical anomaly, Gambia became independent in 1965. KI

**game laws.** From the later 14th cent. the right to hunt game, and particularly the edible game of deer, pheasants, rabbits, and partridges, was legally restricted to those members of the social order with an income of £40 a year or more. The legal position was reformed and strengthened in 1671 in an effort to try to prevent anyone from hunting hares, partridges, and moor fowl, unless they had freeholds of at least £100 a year, or long leaseholds valued at £150. Wild duck, deer, and rabbits were not included in the legislation because they had a higher legal status as private property and their seizure could therefore be regarded as common theft. Sons and heirs of esquires and others 'of higher degree' were permitted by the 1671 Act to participate, while all lords of manors 'not under the degree of an esquire' were authorized to appoint gamekeepers with the right to seize guns and goods. The 1671 legislation also excluded non-landed wealth from the ranks of sportsmen, and turned the hunting of game into the exclusive pastime of a social minority. Not surprisingly the laws also produced considerable friction in the countryside during the 18th cent. Efforts to repeal the laws began in the 1770s, but came to a successful conclusion only in 1831. However, \*poaching remained an offence, and as a result an undeclared state of war persisted in the countryside through the 19th cent., although the position was modified by the Ground Game Act of 1881. JVB

**Gandhi, Mohandas Karamchand** (1869–1948), the 'Mahatma' or Great Soul. Born in an Indian princely state, he read for the bar in London. In 1893 he took up practice in Natal but rapidly turned to politics. He unified opposition among the disparate Indian community to the passing of racially discriminatory laws and pioneered the techniques of *satyagraha* (non-violent resistance), which later were to make him famous. In 1915, he returned to India and, following the 1919 \*Amritsar massacre, organized protest on a national scale. In 1920, he won the Indian National Congress over to policies rejecting the \*Montagu-Chelmsford constitutional reforms and offering 'non-cooperation' to the British Raj. From the 1920s to early 1940s, he led a series of passive resistance campaigns in pursuit of *Swaraj* (self-rule), which redefined the character of Indian nationalism. As much a religious teacher and social reformer as a politician,

he rejected western modernity and demanded a return to the simplicities of the self-sufficient village community. He sought tolerance between Hindus and Muslims and the eradication of caste untouchability. After his final release from gaol in 1944, he became disillusioned at the rise of Hindu-Muslim violence. He refused to celebrate independence in 1947 and rejected the Pakistan partition. In January 1948 he was assassinated by a Hindu fanatic for his pro-Muslim sympathies. DAW

**Gandon, James** (1742–1823). Best known for the embellishment of Georgian Dublin in the late 18th cent. Born in London of a Huguenot family, he studied architecture under Sir William \*Chambers and was awarded the first prize in architecture by the new Royal Academy in 1769. His career took off when he was invited to Dublin in 1781. His first work was the grand Custom House, not completed until 1791. The east and west porticoes of the Parliament House (now the Bank of Ireland) were finished by 1785 and he designed and built Carlisle bridge (now O'Connell bridge). His Four Courts building was opened in 1795. Gandon bought an estate at Lucan near Dublin and spent much of his later years planting and improving. He is buried at Drumcondra near Dublin. JAC

**gaol delivery.** Henry II, in the Assizes of \*Clarendon and \*Northampton, instituted the system of presentment by the men of each hundred to the travelling justices of the \*curia regis. The commission of gaol delivery issued to the royal justices instructed them to empty the gaols, which they would do by taking the presentments and then, before 1215, deciding whether the accused should be put to the ordeal and, if so, which ordeal. After 1215 they presided at the trial which became trial by jury. After the decline and eventually the end of the General \*Eyre in the 14th cent., the commissions of \*oyer and terminer and gaol delivery were the usual commissions, under which the justices of assize dealt with charges of serious crime. They were read out at the opening of the assizes until their abolition by the Courts Act 1971. MM

**garden cities.** Planned estates had been built by Robert \*Owen and Titus \*Salt in the earlier 19th cent., and by the Cadbury family at Bournville in the 1880s. Garden cities were conceived by Ebenezer \*Howard. Impressed by a visit to the 'garden city' of Chicago and influenced by Edward Bellamy's *Looking Backward* (1888), a futuristic look at Boston in the late 20th cent., Howard published *Tomorrow: A Peaceful Path to Real Reform* in 1898 (republished as *Garden Cities of Tomorrow*). Combining the ideologies of 19th-cent. social reformers and philanthropic industrialists, Howard sought to eradicate what he saw as the real cause of poverty, private landownership in the capitalist system. His plan was for limited-size cities built on municipally owned low-cost agricultural land. The centre of each city would be a garden, ringed by civil and cultural amenities, city hall, museum, library, and theatre. Shops and other facilities would be built under glass, with residential and industrial areas on the outer edges of the city. Howard envisaged clusters of garden cities, linked by railways, and powered by new

low-pollution electricity. In 1899 the Garden City Association was inaugurated. In 1941 it was renamed the Town and Country Planning Association, having adopted in 1919 the definition: 'a Garden City is a "New" town designed for healthy living and industry; of a size that makes possible a full measure of social life . . . the land being in public ownership or held in trust for the community.' Prototype garden cities were built at Letchworth from 1903 and Welwyn from 1919, greatly influencing the development of garden suburbs and the new towns built after the Second World War. JC

**Gardiner, Stephen** (c.1497–1555). Bishop. One of the most influential courtier-prelates of the early Tudor age, Gardiner sought to reconcile political advancement with principled defence of the rights of the church. He studied and taught at Cambridge until taken up by \*Wolsey as a secretary in 1524. Wolsey secured for him the mastership of Trinity Hall in 1525 and several diplomatic missions in 1527–9. On Wolsey's fall Gardiner became principal secretary to Henry VIII, and received the wealthy bishopric of Winchester in 1531. During the establishment of the royal supremacy in 1532–5 Gardiner opposed encroachments on church immunities until they became law, but accepted them once enacted. He acted on Henry VIII's behalf in his divorce suit and wrote *De vera obedientia* ('On True Obedience') in 1535 in defence of the king's actions. On returning from an embassy in France in 1535–8, Gardiner led resistance to Thomas \*Cromwell's surreptitiously Lutheran changes in English religion. He promoted the Act of \*Six Articles in 1539, and worked for Cromwell's fall the following year. From 1542 to 1547 he was one of Henry's leading ministers, inspiring some conservative religious measures and helping to administer the king's final wars. On Edward VI's accession Gardiner was outspoken in opposition to Protector \*Somerset's Reformation: from summer 1548 he was imprisoned in the Tower of London, losing his bishopric and other titles in February 1551. On the accession of Mary I he was at once restored to all his positions and made lord chancellor in August 1553. His last years were clouded by bitter political strife with the Hispanophile minister William, Lord \*Paget, who wrecked Gardiner's first attempt to restore papal authority in the Parliament of spring 1554. Gardiner nevertheless married Mary and Philip, welcomed Cardinal Pole to England, and played a minor role in the persecution of leading protestants until his death on 12 November 1555. EC

**Garrick, David** (1717–79). Actor and manager. Reared in Lichfield, Garrick accompanied \*Johnson to London (1737), but soon abandoned law studies for the wine trade; the appeal of acting and overnight success as Richard III (1741) led to further change, since his naturalistic style, expressive eyes, and versatility refreshed audiences weary of attitudinizing. Having purchased a share of Drury Lane's lease, he set about reforming plays, players, and audiences, with modifications to theatre layout, stage design, and eventual introduction of concealed lighting. Despite fluctuating fortunes and accusations of vanity and meanness, he raised his theatre from penury to prosperity. A devotion to Shakespeare motivated reclamation of his texts from Restoration adaptations, though not always creditably, and his cherished

Shakespeare Jubilee at Stratford-upon-Avon (1769) was washed out. Garrick's own farces and burlesques have faded into obscurity, but this contributor to the 'gaiety of nations' lies buried in Westminster abbey. ASH

**Garter, Order of the.** This, the oldest and highest order, was instituted in 1348 by Edward III in imitation of King \*Arthur and the great deeds of \*chivalry. Membership was limited to the sovereign, prince of Wales, and 24 knights. George III's fecundity created a problem since he had seven sons, and in 1786 a statute allowed them supernumerary status. After 1660, very few commoners were honoured, though exceptions were made for Sir Robert \*Walpole, Lord \*North, and Sir Edward \*Grey. The headquarters of the order is at Windsor, where St George's chapel was built by Edward IV. The motto—'honi soit qui mal y pense' (Shame unto those who think evil thoughts)—is said to derive from Edward restoring the countess of Salisbury's garter to her. The significant decorations are the Star, a garter to be worn below the left knee, and a diagonal blue ribbon. JAC

**Gascoigne, William** (c.1350–1419). Chief justice. A member of the Inner Temple, Gascoigne was in practice as an attorney by 1374, a justice of the peace in his native Yorkshire from 1382, and a regular judge in the eastern circuit from 1390. Now a serjeant at law, he was also employed by \*John of Gaunt and his son Henry who, when king (as Henry IV), appointed Gascoigne chief justice in 1400. He was probably the judge who secured the conviction of nine friars for treason in 1402. He was believed to have refused to participate in the trial of Archbishop \*Scrope. There is no contemporary evidence to this effect, nor for the 16th-cent. legend that an unnamed chief justice imprisoned Prince Henry (later Henry V) for contempt. Gascoigne's age was doubtless the reason for Henry V's decision in 1413 to instal a new chief justice. He remained a JP for the West Riding until his death. His effigy in Harewood church portrays him in judicial splendour. RLS

**Gascony.** French region lying between the river Garonne and the Pyrenees. In the 11th cent. it was acquired by the dukes of Aquitaine; the 1152 marriage of \*Eleanor of Aquitaine to Henry II meant that it passed into the hands of the kings of England. As a result of military defeats suffered in John's reign, from the early 13th cent. onwards the duchy of Aquitaine generally consisted of little but Gascony. Except in the 1290s and 1330s the English spent little time and money on Gascony—Edward I was the last reigning king to visit it—but Gascon appreciation of the value of the English market for the Bordeaux wine trade, and their sense that Paris represented a greater threat to their traditional independence and way of life than did Westminster, meant that the duchy long remained loyal to the English crown. However, the total disarray of Henry VI's government following the sudden collapse of English Normandy in 1450 allowed the triumphant Charles VI of France to walk into Gascony virtually unopposed. An expeditionary force under Talbot (\*Shrewsbury) briefly took advantage of Gascon resentment of French rule, but in 1453 his defeat and death at \*Castillon marked the end of English Gascony. JG

**gas industry.** Before the commercial development in the early 19th cent., many observations had been made on the illuminating power of natural gas occurring in coal seams, the first recorded being that of the Revd John Clayton of Wigan, whose discovery that an inflammable gas evolved when coal was heated was reported to the \*Royal Society in 1739. Later, George Dixon, a coal-master in Co. Durham, experimented c.1760 with an apparatus designed to produce gas from coal.

William \*Murdock, an engineer associated with James \*Watt, made a significant breakthrough in large-scale production with two important innovations, which allowed coal gas to pass directly into pipes rather than escape, and, by passing the gas through water, washed out suspended matter, such as tar particles, as well as water-soluble components like ammonia. While his research earned him the Rumford medal of the Royal Society, he did not patent his invention, and thus made little direct profit from the expansion of gas lighting. However, his firm, Boulton & Watt, provided a notable display of gas lighting for the national celebrations which accompanied the peace of Paris in 1814.

Meantime others had been less tardy in exploiting the potential of gas lighting. Samuel Clegg, a student of John \*Dalton's and an associate of Murdock, developed horizontal retorts, the lime purification process, the hydraulic main, the gasometer or gasholder, and other standard equipment found in 19th-cent. gasworks. Clegg installed gas-making plant and lighting in factories and mills and his son wrote a treatise on the manufacture and distribution of coal gas (1841). A German, F. A. Winsor, gave popular demonstrations of gas lighting in the Lyceum theatre, London, in 1804, and his company provided lighting for Pall Mall in 1807. His 'Gas Light and Coke Company' was formed 1810–12 and within a few years gas lighting was a feature of many London streets.

Despite problems of storing large volumes of gas, its distribution through pipes at high pressure, and the danger of explosions, gas manufacture and lighting spread rapidly to other towns and cities during the 1820s and 1830s. Lamp-lighters, or 'leeries', immortalized in a poem by Robert Louis \*Stevenson, became as familiar figures on the streets of Victorian Britain as constables or 'Peelers'.

The incandescent gas mantle, developed by the German von Welsbach in 1885, greatly increased illuminating power and for a time helped fight off competition from electric lighting. Although electric lighting and power began to make greater inroads into the market after the First World War, distribution problems prior to the development of the national grid meant that gas remained important for lighting and heating, and was only beginning to be seriously challenged in the inter-war period, and in some remoter areas much later.

Following successful exploration and discovery in the late 1960s, natural gas from the North Sea began to be tapped commercially and distribution was rapidly extended nationally, for both industrial and domestic purposes. The last town gasworks using the traditional technology closed in the 1970s. ID

**Gaskell, Elizabeth Cleghorn** (1810–65). Novelist. Born in Chelsea, daughter of William Stevenson, Mrs Gaskell was

brought up by an aunt in Knutsford, Cheshire. At the age of 22, she married William Gaskell, a unitarian minister. After the death of a young son from scarlet fever, she turned to writing as a distraction. Her first novel, *Mary Barton* (1848), based upon her life in Manchester and deploring the gulf between rich and poor, was an instant success. She was taken up by \*Dickens and wrote copiously for *Household Words*. *Cranford*, her best-known work (1851–3), was a gentle picture of life at Knutsford, and *North and South* (1854–5) returned to Victorian social problems. A life of Charlotte Brontë (1857) involved her in tedious controversy and threats of legal action. She died suddenly of heart failure while her last novel, *Wives and Daughters*, was being published by instalments. JAC

**gavelkind** was the practice of partible or equal inheritance, as opposed to \*primogeniture. It was predominant in Kent but found elsewhere, particularly in Wales and Ireland. The result was the creation of small estates with considerable political independence. It was extinguished in 1922 by 12 & 13 Geo. V c. 16. See also BOROUGH ENGLISH. JAC

**Gaveston, Piers** (1284–1312). The most notorious favourite of Edward II was the son of a Gascon knight who served in Edward I's household. Whether his relationship with Edward II was sexual is not clear, but it seems likely that it was. It was certainly formed early, in adolescence. Piers was exiled by Edward I in the course of a quarrel with his son; once Edward II came to the throne he showered his waspish 'brother' with many favours, starting with no less than the earldom of Cornwall. Foolish rather than malign, Piers irritated the English nobility by his rudeness, giving them coarse nicknames; he also annoyed them with his skill in tournaments. He controlled royal patronage to an unacceptable degree. He was forced into exile by the king's opponents in 1309, and again in 1311; he returned to surrender at Scarborough in Yorkshire, and died at the hands of his opponents at Blacklow Hill in Warwickshire in 1312. MCP

**Gay, John** (1685–1732). One of the leading members of the remarkable group of authors in the early 18th cent., Gay was on close terms with \*Pope, \*Swift, and Arbuthnot. Of Devon dissenting stock, he moved to London, soon abandoned the silk trade, and established himself as a minor poet. Though he had a succession of patrons, he chafed under the system: 'they wonder at each other', he wrote to Swift in 1727, 'for not providing for me, and I wonder at them all.' His enormous success, *The \*Beggars' Opera*, was produced at Lincoln's Inn Fields by John Rich in 1728 and was said to have 'made Gay rich and Rich gay'. He followed in 1729 with a sequel, *Polly*, which, though banned from the stage by the Lord Chamberlain, sold well. He wrote the libretto for \*Handel's opera *Acis and Galatea*, including the aria 'O rud-dier than the cherry'. Gay suffered poor health from asthma and died early. \*Johnson wrote of him in the *Lives of the Poets* that he was 'the general favourite of the whole association of wits, but they regarded him as a playfellow rather than a partner, and treated him with more fondness than respect'. JAC

## genealogy

**genealogy**, the study of ancestry and family descent, is an indispensable handmaiden of history. Its development reflects a gradual process of democratization as interest moved down the social scale. In post-Roman Britain, it was important for monarchs to claim impressive credentials, however unlikely. \*Bede insisted that \*Hengist and Horsa were descended from Woden: \*Nennius traced Britain back to Aeneas through Brutus. Neither claim was closely argued. In the Middle Ages, genealogy was related to heraldry and of concern largely to the monarchy and nobility, to whom the tracing of the succession, estates, and titles was of great importance. As the status of the gentry improved, their own interest in genealogy kindled. Richard III established the \*College of Arms in 1484 and from the 15th cent. to 1688 the heralds conducted visitations to confirm or deny claims. The 17th cent. produced in \*Camden, \*Dugdale, Ashmole, and Cotton distinguished genealogists and antiquarians. Authors of county histories devoted much space to pedigrees of families, since this would induce the gentry to subscribe to their volumes. Status, rank, and patronage opportunities had rarely been of greater importance and even remote family connections could be of real use. Genealogical investigation was also a powerful motive behind the foundation of many 19th-cent. local history societies, with their libraries and card indexes. The Society of Genealogists was founded in 1911. In the later 20th cent. there was a remarkable growth of interest in tracing \*family history among ordinary people, using record offices and reference libraries, and assisted by many books and manuals on the subject. As society grew increasingly incoherent and urban life became ever more impersonal, the desire to relate to the past and rediscover one's ancestry grew stronger. See also HERALDRY.

JAC

**General Assembly of the Church of Scotland.** Instituted in 1560 and meeting annually from the 18th cent., but with significant gaps before that, its constitution, statutorily confirmed in 1921, declares it to be the supreme court of a national church. Its national standing is symbolized by the attendance of the lord high commissioner (or the monarch), its freedom of action by that commissioner's place in a gallery outside assembly bounds. The 6 ministers and 35 others of 1560 have become 1,250 commissioners (elders and ministers in equal numbers since 1929) responsible, under an annually elected moderator, for their church's judicial, legislative, and administrative functions.

CB

**General Council of Estates** [S]. The General Council was a meeting of the three estates with smaller membership than that of a parliament and with no judicial powers. It was often an emergency session when circumstances did not permit summoning a full parliament, which required 40 days' notice. Consequently the General Council was frequently not much more than the Privy Council, augmented by commissioners who were available. Later the term \*Convention of Estates was more commonly used.

JAC

**general elections** have changed over the years. Until the 17th cent., there was no statutory requirement about their

frequency, and the \*Triennial Act of 1694, which laid down that a general election must be held every three years at most, was the first effective legal provision. In 1716 the \*Septennial Act lengthened the period to seven years, an interval which lasted until the \*Parliament Act of 1911 reduced it to five years. These periods were and are maxima and in practice the prime minister usually calls an election before the five years have expired. His right to decide when an election shall be held normally gives a considerable advantage to the party in power.

Many seats were uncontested right up until the end of the 19th cent. Even in 1900, 165 candidates in Great Britain were returned unopposed, and a further 69 in Ireland. Today it is normal for every seat to be contested. At the 2001 election, Conservative and Labour candidates stood in every constituency in Great Britain, save Glasgow Springburn (that of the Speaker); the Liberal Democrats did not oppose the Speaker, or the local independent in Wyre Forest, who won on a Health Service ticket.

In the 17th and 18th cents. general elections scarcely merited the term 'general'. They were essentially struggles between magnates and other interests for local paramountcy, and national factors played little part. Indeed, as late as 1830 it was not clear whether the Whigs or the Tories had won the general election, since many MPs sat loose to party. Elections in the 18th cent. did not choose governments, which, with heavy powers of patronage, could normally expect to carry any election in the country as a whole. The decline of patronage made this increasingly hard and also created a vacuum which was filled by organized parties. Nowadays, general elections are held to choose a government and the choice of MPs is usually incidental to that decision.

Today there are two general election campaigns—one at national level, run by the headquarters of the various parties, and one at local level, run by the constituency associations. Each constituency now returns one member. At the national level the parties publish their manifestos setting out the policies they will implement if they win the election. The larger parties are allotted time on television and radio for their election broadcasts, and locally, candidates and their activist supporters canvass, distribute party literature, and hold (usually poorly attended) public meetings. The campaign proper lasts for three weeks and election expenditure at constituency level is rigorously controlled by law. The ballot is secret. Voting is not, as in some countries, compulsory and the turn-out is usually about 75 per cent, though in 2001 it was substantially lower at 59 per cent.

Britain uses the first past the post formula and the candidate receiving the most votes is elected, regardless of whether or not he has a majority of votes cast. The absence of any element of proportional representation makes it difficult for smaller parties with evenly spread support to breach the two-party domination. Nationally, what is decisive is the number of members elected for each party, not the total number of votes won. Normally one party will win an overall majority in the Commons and the monarch will ask the leader of that party (unless he is already prime minister) to form a government.

HB

**General Strike, 1926.** The strike arose from the problems of the coal industry. Miners were locked out on 30 April; the TUC negotiated with the government, but Baldwin's administration precipitated the strike by breaking off negotiations when the printers at the *Daily Mail* refused to print a leading article. The strike began at midnight on 3 May, with workers in printing, transport, iron and steel, gas, electricity, and building being called out first. A second group of unions, including engineers and shipbuilders, joined the strike on 11 May; about 2,500,000 workers in total were involved. The strike failed because of government preparations which enabled essential supplies and services to be delivered; many, hostile to the unions, were prepared to assist in breaking the strike; the government won the propaganda battle. After nine days the strike was called off, although the miners remained out for many months in the winter of 1926–7. JB

**general warrants.** Eighteenth-cent. secretaries of state claimed a discretionary power in cases of seditious libel to issue general warrants for the arrest of persons unnamed. In 1763 Lord \*Halifax issued one for the apprehension of all connected with printing or publishing No. 45 of the *\*North Briton*. Forty-nine persons were arrested, including \*Wilkes, author of the offending piece. But in December 1763 Chief Justice Pratt (\*Camden) in Common Pleas declared general warrants illegal, and he repeated the finding in *Entinck v. Carrington* in 1765. The House of Commons confirmed the ruling in 1766, and in 1769 Wilkes won £4,000 damages from Halifax for wrongful arrest. JAC

**Gentleman's Magazine.** Issued monthly, the *Gentleman's Magazine* was the brainchild of Edward Cave and achieved a spectacular success. The first issue, printed at St John's Gate, Clerkenwell, came out in 1731 and included reviews, essays, songs, births, deaths, and marriages. At an early stage Cave discovered that there was a demand for parliamentary debates and he devoted an increasing share of the magazine to them. From 1741 to 1743 they were written up by Samuel \*Johnson. By the late 1730s Cave was claiming to sell 10,000 copies. His success spawned imitations, especially the *London Magazine* and the *Scots Magazine*. In modified form the magazine lasted until 1907 and Cave's premises in Clerkenwell survive. JAC

**gentry.** Technically the gentry consists of four separately defined groups, socially inferior only to the ranks of the peerage and—within a European definition—part of the nobility, although not entitled to the privileges of the nobility. The senior rank is that of \*baronet, a position founded in 1611 by James I, giving the possessor the hereditary right to be addressed as Sir. The second rank is that of \*knight, originally a military honour, but increasingly employed in a secular manner as a reward for service to the crown. Theoretically the number of baronets and knights can be established at different periods, but this is not the case with the third and fourth categories of gentry, esquires and gentlemen. The term 'esquire' originally had connotations with the battlefield. In the 14th cent. it was an honour which could be conferred by the crown, and by the 16th cent. it had a specific Office of Arms definition. Certain offices,

including that of \*justice of the peace, automatically carried the appellation. Heraldic visitations, which began in 1530, were designed to oblige anyone claiming gentry status to prove their right. Increasingly through the 16th and 17th cents. the heralds found it difficult to enforce their authority, and numbers proliferated, both of esquires and particularly of the fourth gentry rank, that of gentleman. 'Gentleman' emerged as a separate title in connection with the statute of Additions of 1413 and, like esquire, was originally closely defined.

The inability of the heralds to limit the use of 'esquire' and 'gentleman', particularly after the Restoration when visitations gradually declined, made counting numbers problematic. In 1688 Gregory King estimated the number of gentlemen variously at figures ranging from 12,000 to 39,000, and when in a parliamentary debate during the 1690s one MP suggested a round figure of 100,000 gentlemen, another promptly doubled the estimate. Over time the issue was complicated by the idea of the gentleman, a social construct which could incorporate all members of the peerage and gentry.

The concept of the gentlemanly way of life was current in the 16th cent.—even the king, it was argued, could not make a gentleman—and became increasingly important by the 19th cent. A gentleman was a man who held a social position not purely dependent on the suffix 'gent.', but implying a style of living, usually without manual labour, and with connotations for the defence of honour.

In terms of wealth, contemporary social commentators such as King and Joseph Massie placed the gentry immediately below the peerage, while Daniel \*Defoe argued that £100 a year was the minimum income required for a man to be a gentleman. Certainly this was the qualification figure required for JPs and \*land tax commissioners, suggesting that it was widely recognized to be the bottom end of the group. However, such were the vicissitudes of English fortunes that the link with wealth was far more complex than King and Defoe appeared to recognize. Since there were no automatic channels of admission to the peerage, some very wealthy men remained socially as gentry simply because they had no title. This anomaly is clearest by 1883 when John Bateman's survey of landownership revealed that 186 out of 331 landowners with 10,000 acres or more were gentry in this sense. This was the case despite a considerable expansion of the peerage from the late 18th cent. onwards.

Informed estimates suggest that the gentry owned about 50 per cent of the landed wealth of the United Kingdom from the 17th cent. onwards. This position was maintained by the queue of businessmen, merchants, bankers, and industrialists to invest part of their fortune in landed estate. Few of these men attempted to climb to the top of the landownership tree, and many were happy with a villa and a few acres close by a town. Despite some controversy in recent years it is apparent that their numbers were considerable and helped to maintain the overall landholdings of the gentry until land began to lose its social caché in the agricultural depression of the late 19th cent.

The link with landownership has to be treated with care since contemporaries were by no means clear in their

## Geoffrey

understanding. Increasingly a man was a gentleman depending on his style of life, his manners and bearing, and without reference to his ownership of landed acres. This has given rise among historians to the concept of the town or urban gentry, people who lived in towns but in a genteel manner, enjoying a reasonable income but lacking the landed acreage or the mansion associated with the country gentry. Many of these were members of \*professions—lawyers, doctors, and clergy—rising in status and in numbers during the 18th cent. As a result, the gentry as a social group has traditionally lacked cohesion, although today the term seems to apply colloquially to country dwellers with a substantial holding of land, as it did for Gregory King.

Quite separate from the gentry as a social group were a number of honours recognized and invented as carrying gentry titles. Men knighted for service to the state were dubbed 'knight bachelor', to distinguish them from the military service knighthoods. Originally the Order of the \*Bath was the most significant of these, exclusively limited to 35 members until the early 19th cent.

From 1814 the number of orders, and the membership of the orders, proliferated. In 1818 the Order of \*St Michael and St George was founded for natives of the Ionian Islands and Malta, and this began a wave of new orders, many of them connected with India. In 1843 there were 451 knights bachelor and 787 members of the orders, but these numbers swelled rapidly, and by 1915 there were over 4,000 members of orders. With the decline of the empire in the 20th cent. the position changed, but the number of orders—many of them of antiquated origin in Britain's role as an imperial nation—can still be read twice a year in the New Year and Queen's Birthday honours' lists. **Geoffrey** (c.1153–1212). Archbishop of York. A reluctant archbishop who preferred dogs and horses to books and priests. An illegitimate son of Henry II, his father secured his election as bishop of Lincoln in 1173; he had no wish to be a priest and in 1182 resigned rather than be consecrated. Henry then appointed him chancellor and Geoffrey served him faithfully, as he had during the rebellion of 1173–4, even when the king's other sons turned against him. 'This is my true son, the others are the bastards', the dying king is alleged to have said. Gossip suggested that Geoffrey hoped for the throne, so Richard I forced the reluctant canons of York to elect him archbishop in 1189 and later made him promise not to enter England while the king was on crusade. In 1191 he landed at Dover, taking sanctuary to avoid arrest, but was dragged from the altar. This enabled him to go to York in the heroic guise of a persecuted churchman. His archiepiscopate was filled with quarrels with his cathedral clergy and, from 1207, with King John. He spent his remaining years in exile in Normandy. JG

**Geoffrey of Brittany** (1158–86). The trouble-making third son of Henry II and Eleanor of Aquitaine. He became duke of Brittany (initially in name only) in 1166 when his father

invaded Brittany and forced Duke Conan to resign and agree to Geoffrey's betrothal to his daughter Constance. The wedding took place in 1181 and she was pregnant with \*Arthur when he died. In 1185 he issued an assize introducing primogeniture into Brittany. From 1173 onwards, when he joined his mother's revolt against his father, he was in the thick of every Plantagenet family quarrel. He was at Paris plotting with King Philip Augustus of France when he was trampled to death in a tournament accident. Contemporary historians disliked him. According to \*Gerald of Wales, he was 'overflowing with words, smooth as oil, a hypocrite in everything, capable by his syrupy eloquence of corrupting two kingdoms with his tongue'. JG

**Geoffrey de Mandeville** (d. 1144). An English baron whose stormy career caused controversy both in his own day and since. As keeper, like his father and grandfather, of the Tower of London and as possessor of large estates in Essex and East Anglia, he played a central role in the turbulent politics of Stephen's reign. Indeed his allegedly unscrupulous changes of allegiance during the civil war between Stephen and Matilda led to him being represented as 'the great champion of anarchy'. Despite being created earl of Essex by the king in 1140, he joined Matilda in 1141 and was made hereditary sheriff of Essex. Like many others, swiftly disenchanted by her rule, by the late summer of that year he was back in Stephen's camp. He was given a prominent role in the king's counsels, but serious doubts about his loyalty remained. In October 1143 he was arrested on charges of treason and freed only after he had handed over his castles including the Tower. In revenge he seized the abbeys of Ely and Ramsey and, using the fenland as a base, went on the rampage. Until mortally wounded while laying siege to Burwell, he did much of the damage which created the notion of Stephen's reign as 'the anarchy'. JG

**Geoffrey of Monmouth** (c.1100–55). Probably of Breton origin, Geoffrey was raised in Wales. As a young man, he went to Oxford and is thought to have been a canon of St George's church. His consecration as bishop of St Asaph, c.1152, may have been no more than a titular appointment. His principal work, earning him fame, was the *History of the Kings of Britain* (c.1136). Written in chronicle form, it proved very popular, particularly in Wales, for the portrayal of a long and glorious Welsh past, and for centuries was widely believed. Ultimately recognized as a work of fiction based on old legends, it was nevertheless a great literary work of its time. It also launched the romantic \*Arthurian legend in European literature. A separate *Life of Merlin*, based on Welsh traditions of the magician, appeared c.1148–50. AM

**Geoffrey 'Plantagenet'** (1113–51), count of Anjou (1129–51) and duke of Normandy (1144–51), became the husband of Henry I's designated heiress, the Empress \*Matilda, on 17 June 1128, in a political marriage which was intended to neutralize Anjou's participation in the wars which troubled Henry's rule in \*Normandy. His prospects in England may never have been defined by Henry I and his political ambitions seem always to have been restricted to the traditional aim of the counts of Anjou, the conquest of Normandy. He

never visited England during the civil war between his wife and King Stephen, which began in 1135, but his persistent attacks on the duchy between 1135 and 1142 and his eventual conquest of it in 1144 had a huge impact on Britain's history because they laid the foundations from which their son Henry II built the \*Angevine empire. DB

**George I** (1660–1727), king of Great Britain and Ireland (1714–27) and elector of Hanover. George was the eldest son of Ernest Augustus, elector of Hanover (1692–8), and of \*Sophia, granddaughter of James I of England, who herself became heir to the British throne by the 1701 Act of \*Settlement. She died on 8 June 1714, and George succeeded peacefully on 1 August upon the death of Queen Anne.

Having established links with the Whig Party before his succession, largely because of their mutual opposition to the Tory peace with France at \*Utrecht in 1713, George favoured a Whig administration, though he did employ a handful of senior Tories until the Jacobite Rebellion in 1715 led to the proscription of that party. The Whigs won the general election of 1715, and established their supremacy for the next four and a half decades. Though unpopular, George's position was never seriously threatened either by the rebellion of 1715 or by the Jacobite plots of 1719 and 1722. In fact these episodes served only to strengthen the Hanoverian succession.

George appears to have been diligent in politics, especially in his chosen fields of foreign affairs, diplomacy (he helped to negotiate the \*Quadruple Alliance of 1718), and the army, over which he insisted on keeping control. His court was private and he much preferred the company of his German ministers to his British advisers, as well as that of the duchess of Kendal and the countess of Darlington. These two were long thought to have been his mistresses, and indeed Kendal was from 1691, but she may also have later been his morganatic wife (he had divorced his wife \*Sophia Dorothea in 1694 for adultery and imprisoned her for life). Darlington, however, was his half-sister.

Contrary to long-established views, George did attend cabinet meetings throughout his reign. The language he commonly used with his ministers was French but he arrived with a smattering of English and knew sufficient to write and converse in it by the end of his reign. However, he rarely attended Parliament and never debates in the House of Lords 'incognito' as had some of his predecessors, such as Charles II and Anne.

Relations between George and his son, the prince of Wales (later George II), were often strained, and in 1717 a violent quarrel erupted. The prince and his wife were expelled from the court (their children were kept by the king) and set up a rival one in \*Leicester House. This quarrel coincided with the Whig schism in which \*Walpole and \*Townshend left the ministry of \*Sunderland and \*Stanhope. In April 1720 the royal quarrel was patched up as a cover for the reconciliation of the ministry with the schismatic Whigs.

George frequently returned to Hanover in the summer months. The king's attachment to his electorate and its presumed prominent influence on English foreign policy (as

well as the interference of the German ministers at the English court) created a good deal of friction. George, however, was close to some of his English ministers, particularly Stanhope, who looked after foreign policy, and Sunderland. It was the king's attachment to the latter which kept him in power after the bursting of the \*South Sea bubble in 1720 (the most serious crisis of the reign) and Stanhope's untimely death in 1721. Sunderland had arranged for fraudulent South Sea shares to be given to the king, and had overseen the distribution of *douceurs* in Parliament to help things along. George and his chief minister had to stick together in the ensuing crisis, and managed to weather the storm. Sunderland's unexpected death in April 1722 forced George to accept Walpole (whose acumen in salvaging the financial disaster had saved the dynasty) and Townshend as his chief ministers, though \*Carteret (a protégé of Sunderland) was to remain a serious contender for power for a further two years.

George's reign ended with domestic affairs entering a period of quiet, while abroad Britain was recognized as the major arbiter of the balance of power. He died of a stroke on 20 June 1727 at Osnabrück. CJ

Hatton, R., *George I: Elector and King* (1978).

**George II** (1683–1760), king of Great Britain and Ireland (1727–60) and elector of Hanover. He is best remembered for being the last British monarch to lead troops into battle (1743), which is appropriate, given his lifelong love of all things military. However, George was much more than a soldier, and made sensible use of the still considerable political powers accorded to him by the 18th-cent. constitution.

The king could choose his own ministers, but only those with Commons approval were able to do his business. Walpole had served George I for many years and George II soon formed an equally successful relationship with him. Walpole was masterful at holding the favour of both monarch and Parliament, sharing George's distrust of the Tories. He persuaded the king to keep Britain out of the War of Polish Succession and survived the turmoil of the \*Excise crisis. Though Walpole fell in 1742, the Whig oligarchy remained and the king gravitated towards \*Carteret, the German-speaking former diplomat, but his rivals, the \*Pelham brothers (assisted by William \*Pitt), forced him to resign in November 1744. The Pelhams reinforced their pre-eminence in February 1746 by threatening to resign unless the king took them into his full confidence. He was furious, but was unable to form a viable alternative government. Gradually George came to appreciate the prudence of Henry Pelham, 1st lord of the Treasury until his death in 1754. Thereafter, a period of great instability set in; Pelham's brother, the duke of Newcastle, hitherto foreign affairs minister, became 1st lord, but the Commons was restless, with Pitt and Henry \*Fox ridiculing the government (of which they were both members). The king detested Pitt and had long refused to admit him to the higher echelons of government, but there seemed no other option. War and expediency brought Newcastle and Pitt together in 1757, to form one of the greatest ministries in British history. George never came to like Pitt, but they worked effectively together; even in old age the

## George III

king remained at the heart of government and had, usually, the final word.

George II was the absolute ruler of a medium-sized German state, Hanover, as well as being the British sovereign. George's affection for and (understandable) desire to visit and protect Hanover was a frequent cause for concern among his British subjects and a significant factor in the development of foreign policy. It gave the king a German-centred view of foreign affairs, shared by Newcastle, but which came into conflict with the colonial vision of Pitt. In addition, his unfettered power to rule in Hanover contrasted with the limitations placed upon the monarch in Britain, which George could find frustrating.

George II's reputation for parsimony was not restricted to his private finances. He was an emotional miser too (he had been separated from his mother as a boy), having few, if any, close friends. This tendency extended to government. He admired Pelham's budget cuts (except when they affected the military) and was notoriously reluctant to 'dilute' the peerage with new creations, despite their political value. The one emotion he displayed liberally was a prodigiously bad temper. He was blunt, rude, and lacked social graces to a surprising degree. He had good health for most of his life, apart from severe piles, and into old age retained full command of his faculties. George had little interest in cultural or intellectual matters (with the exception of his patronage of \*Handel). His wife Queen \*Caroline, however, was renowned for her intellectual curiosity and quick wit. George loved her deeply, but resented any suggestion that she (and her alleged favourite, Walpole) dictated policy to him. His love did not prevent George from taking a number of mistresses before as well as after her death in 1737. Thereafter, Lady Yarmouth (a German) became the chief object of his not inconsiderable sexual appetite.

The king got along with his daughters fairly well, but towards his sons the difference in attitude was dramatic. His beloved younger son was the duke of \*Cumberland; he was very like his father in his devotion to the military with his finest hours coming during the War of \*Austrian Succession, including accompanying George at \*Dettingen (1743). His ruthless pursuit of the Jacobites after Culloden also met with paternal approval. Cumberland's errors of diplomatic judgement and consequent resignation in 1757 cast a shadow over George's otherwise triumphant final years. The king's pride in Cumberland contrasts with the loathing he (and Queen Caroline) had for their heir, \*Frederick, prince of Wales. That George I (whom George II also hated) had liked Frederick may have been the origin of the king's animosity, but it reached such intensity as to be beyond rational explanation. Frederick was often foolish, but he had received little encouragement to show responsibility; despite George II's own contacts with the opposition as prince of Wales, the king was enraged by Frederick's similar behaviour. Frederick's early death in 1751 provided the opportunity for reconciliation between the king and the princess of Wales and his grandson and heir. However, as the future George III grew older, a breach developed here too, so that when the new king acceded to the throne, he had already formulated theories of government notably different from his grandfather's.

During his reign George II demonstrated that his love of the military was not purely ceremonial. His courage in battle was obvious as early as 1708, when as Prince George Augustus of Hanover he fought as a British ally in the War of \*Spanish Succession. His courage was required again during the War of Austrian Succession, not just on the battlefield at Dettingen, but in the face of an invasion by Charles Edward \*Stuart in 1745. George was certain of victory, even when the Jacobites reached Derby; the minute levels of support the invaders received in England vindicated his instincts and the Jacobites were soon utterly vanquished. The \*Seven Years War brought momentous British successes in the colonies and in Europe. George supervised military operations and appointments carefully, though preferring elderly commanders to the more enterprising younger officers advocated by Pitt.

A flamboyant, charismatic, and forceful king may not have been the ideal way for Britain to preserve her balanced constitution in the mid-18th cent. But though George II had his flaws, he was essentially sensible and moderate, and his reign can be judged a success.

AIL  
Chevenix-Trench, C., *George II* (1973); Davies, G., *A King in Toils* (1938); Owen, J. B., 'George II Reconsidered', in Whiteman, A., Bromley, J. S., and Dickson, P. G. M. (eds.), *Statesmen, Scholars and Merchants* (Oxford, 1973).

**George III** (1738–1820), king of Great Britain and Ireland (1760–1820), and elector of Hanover. Popular misconceptions about George III are principally of three varieties: first, that he attempted systematically to subvert the traditional constitution; second, that he was personally responsible for the loss of the American colonies; third, that he became mad. None of these assertions has withstood detailed historical analysis. Consequently, the reputation of George III has been revised perhaps to a greater degree than any other British monarch.

He was born in England, the first of the Hanoverian monarchs to be a native of his own kingdom. Upon the death of his father Frederick in 1751, George succeeded as prince of Wales and heir to the throne. The young prince was not on good terms with his grandfather George II. He came to believe that the old king was the tool of a corrupt clique of politicians. A key influence on the formation of this naïve viewpoint was Lord \*Bute, tutor to the prince from 1755. Bute puffed up his protégé with unrealistic expectations of reforming the political system by royal initiative and assumed the character of essential partner in this putative reign of virtue. When George succeeded to the throne in 1760, Bute rapidly rose from courtier to cabinet minister and, in May 1762, became prime minister. Yet Bute proved a disappointment and resigned within a year. Ministries followed each other in swift succession: there were four different premiers between the fall of Bute and the appointment of \*North in 1770. Many contemporaries attributed these fluctuations to the influence, behind the scenes, of Bute. A more balanced assessment is that exaggerated suspicions of him poisoned the political atmosphere, though George III himself rapidly outgrew his youthful dependence. The accusation that the king aimed at increasing the royal

prerogative or deliberately connived at secret influence will not bear scrutiny. His view of the constitution accorded with the contemporary interpretation that the monarch possessed the undoubted right to choose his own ministers. One practical constraint, however, was the necessity of managing the House of Commons, the key to both public confidence and national finance.

The advent of the North ministry, led by an able parliamentarian possessing the confidence of the king, inaugurated a lengthy period of political stability. The king behaved with impeccable constitutional propriety throughout North's twelve-year premiership. Ministers, not the crown, were responsible for policy. This was particularly the case with regard to America. Colonial propaganda prior to the outbreak of war recognized the realities of political authority in Britain, focusing on the ministerial and parliamentary dimension to the burgeoning conflict. Yet, once war had broken out, it became necessary for the rebels to describe matters differently and the \*Declaration of Independence of 1776 enshrined the king as villain of the piece. This was a necessary fiction (justifying recourse to foreign aid) but fundamentally untrue.

George III took a keen interest in the military struggle and refused to accept that America was lost, even after the disastrous defeat at \*Yorktown in 1781. Bowing to Parliament's refusal to continue the war, the king reluctantly parted with North. The king tried to maintain some freedom of manoeuvre by playing upon the rivalry between \*Shelburne and \*Rockingham, the leading opposition politicians who now formed a ministry. When Rockingham died unexpectedly in July 1782, George III appointed Shelburne as his successor. But Shelburne was forced to resign following a concerted attack by the followers of Charles \*Fox and Lord North. The king viewed North's actions as personal betrayal, and, in the context of the unprecedented and recent humiliation of the war, remained implacably hostile to the Fox–North coalition. He withheld confidence from his new ministers, refused requests for peerages, and created difficulties over financial provisions for the prince of Wales. The king's obvious dissatisfaction persuaded the younger \*Pitt to negotiate secretly for the overthrow of the coalition, which was accomplished during the \*India Bill crisis of 1783. There was no constitutional justification for the king's interference in the House of Lords, nor was any public defence attempted. Pitt, at the head of a minority ministry, adroitly distanced himself from recent events and held out until it was safe to call a general election. Although the means had been underhand, the king's choice of Pitt proved excellent. Political stability was re-established and no serious threat arose until the king fell ill in the autumn of 1788. The ensuing \*Regency crisis was precipitated by the apparent madness of the king. According to modern diagnosis he was suffering from acute intermittent porphyria, a hereditary metabolic disorder. This condition, unknown to 18th-cent. medical science, gave rise to rival attempts at a cure, which shared ignorance and brutality in common. The king, in accordance with the pathogeny of the disease, recovered despite the treatment he suffered.

Pitt, having survived in office, continued to dominate parliamentary politics, but found it necessary, in the wake

of the French Revolution, to strengthen the ministry by incorporating \*Portland and the conservative Whigs. An English revolution did not materialize, and the king benefited from a groundswell of enthusiasm for monarchy, becoming a personal symbol of the durability of the traditional political system. But the danger of revolution was not negligible, nor was George III universally popular. Indeed, disaffection and rebellion in Ireland convinced ministers of the necessity of parliamentary union. Having achieved this objective, Pitt resigned in 1801 over George III's refusal to countenance the removal of residual penalties against Catholics. The king's views were never in doubt, nor had they changed substantially in the previous decade. He considered his coronation oath, with its pledge to uphold the Protestant religion, to be absolutely binding and resisted what he regarded as sophistical arguments to the contrary. The fall of Pitt led to a period of factional instability, akin to the early years of the reign, but further complicated by fears for the king's mental state. Some politicians vowed never again to raise the Catholic question; and a moderate proposal for relief, by the \*Talents ministry in 1807, precipitated a ministerial crisis, during which the king reaffirmed his intransigence.

In 1810 the king suffered a final decline into mental derangement, exacerbated by increasing deafness and blindness. The following year a regency was established under his eldest son, the future George IV. As a hard-working monarch, devoted husband, and sincere Christian, George III compares favourably with his dissolute successor. Although undeniably stubborn, he was prepared to admit some, though not all, of his errors. Three themes from his reign became benchmarks for opposition politicians: his involvement with Bute, his underhand conduct during the India Bill crisis, and his rejection of Catholic emancipation. George III was not blameless on any of these counts, but contemporary myth should not be mistaken for historical assessment.

Ayling, S., *George the Third* (1972); Brooke, J., *King George III* (1972); Hibbert, C., *George III* (1998).

**George IV** (1762–1830), king of the United Kingdom of Great Britain and Ireland (1820–30), and king of Hanover. Brought up under strict discipline by his parents George III and Queen Charlotte, he was a high-spirited boy and reacted against the regime they imposed in what Horace Walpole called 'the palace of piety'. He and his brother Frederick frequently escaped in their teens to sample the pleasures of the town and their pranks became notorious. In 1780 his father had to buy back the indiscreet letters he had written to the actress Mary 'Perdita' Robinson. Always susceptible to feminine charms, George then fell in love with Maria Fitzherbert, a widow six years his senior, and when she refused to be his mistress forced her to promise marriage by faking suicide. They married secretly in 1785 without his father's consent, so that the marriage was illegal under the \*Royal Marriage Act, and as she was a Roman Catholic it would have prevented his succession to the throne. It was nevertheless valid in the eyes of the Catholic and Anglican churches.

## George V

George was fascinated by the arts and had a lifelong mania for building and decorating his residences. In 1787 he applied to Parliament for additional funds to pay his debts, but to achieve success he had to authorize his friend Charles James \*Fox to deny in the House of Commons that he was married. His subsequent disclosure of the truth to Charles \*Grey resulted in a breach between him and his Whig political allies. They made up the quarrel in 1788 when his father suffered his first attack of mental illness, the Whigs proposing that George should be made regent with full use of all the royal prerogatives, hoping that he would change the government in their favour. \*Pitt defeated their scheme by proposing statutory limitations on the regent's powers, but the king recovered before the regency came into effect.

When the French Revolutionary War began George appealed to his father for a military command, but was refused. By this time he was again deeply in debt owing to the cost of building and furnishing Carlton House, his London residence, and the pavilion at \*Brighton where he disported himself in extravagant style with his cronies and Mrs Fitzherbert. In return for financial help the king insisted that he should marry a protestant princess, to secure the royal succession. The choice fell upon \*Caroline of Brunswick-Wolfenbüttel, who was brought over to be his bride in 1795. George, however, took an instant dislike to her lack of cleanliness, coarse language, and flighty manner. He had to be supported, in a state of intoxication, during the ceremony and spent the wedding night asleep on the floor. They separated permanently soon afterwards, though he had managed to father a child, Princess \*Charlotte, born nine months after the wedding. She was to provide a further source of contention between her parents over her upbringing, education, and marriage shortly before her premature death in 1817.

During the Napoleonic War of 1803–15 George was again unsuccessful in obtaining a military command and had to content himself with designing elaborate uniforms for himself and his forces. After Fox's death in 1806 he severed his political connection with the Whigs and in 1810, when his father's illness became permanent and he was appointed prince regent, he confirmed the existing Tory ministers in office. During the later war and post-war years he was very unpopular with his subjects, who contrasted his lavish lifestyle and expenditure with the distressed state of the country, and was caricatured and lampooned in the public prints, often in indecent and obscene circumstances. When he became king in 1820 his attempt to divorce his wife by a parliamentary Bill of Pains and Penalties on the grounds of her alleged immoralities aroused a public outcry against him and in favour of Caroline as an unjustly persecuted woman in view of his own infidelities. His popularity sank to its nadir during this period but Caroline's death in 1821 and recovery from the economic recession marked a turning-point. George's love of pageantry, given full rein in the magnificent coronation which he himself designed in 1821, helped to boost his popularity.

George IV attempted to exert authority over his ministers, but he lacked political skill and persistence and he could

always be outmanoeuvred or outfaced by determined ministers such as \*Liverpool and \*Wellington. He was compelled to accept the repeal of religious discrimination against dissenters and catholics in 1828–9 and his reign witnessed a further decline in the strength of the 'influence of the crown', which was eroded by financial and political reform.

George IV was a man of some dignity, was affectionate and generous towards his friends, and raised the royal patronage of the arts to greater heights than had been seen since the reign of Charles I. He could be selfish, but though *The Times* remarked, in a famous obituary, that 'there never was an individual less regretted by his fellow-creatures', Wellington more justly declared that he possessed 'a medley of opposite qualities with a great preponderance of good'.

EAS

Hibbert, C., *George IV* (1972–3); Smith, E. A., *George IV* (New Haven, 1999).

**George V** (1865–1936), king of the United Kingdom of Great Britain and Ireland and emperor of India (1910–36). The second son of Edward, prince of Wales (later Edward VII), George was not born to be king. His private education was followed by a naval career, but the death, at the beginning of 1892, of his elder brother, the duke of \*Clarence, meant that he was now in direct line of succession after his father. The following year he married Princess Mary of Teck (formerly his brother's fiancée); the couple remained devoted to each other; there were six children of the marriage. George's naval experience left him with a deep respect for habits of routine and obedience. Mary was a stern disciplinarian. Both Mary and George had what would now be called 'Victorian' moral values, especially in relation to the sanctity of marriage—a sharp contrast to those of George's father and of his son, the future Edward VIII.

When George's father succeeded as king on Victoria's death (22 January 1901), George undertook a strenuous round of international engagements as heir to the throne, visiting Australasia, South Africa, Canada, and Europe. But Edward VII's death in 1910 presented him, as king, with the first of a series of constitutional and political problems, which he handled with the utmost propriety.

The refusal of the House of Lords to approve the Liberal government's budget of 1909 had led to a general election (28 January 1910) at which the government had been returned with a reduced but still effective majority. George gave an undertaking that, should it become necessary (which it did not), he would agree to the creation of a large enough number of peers to ensure the budget's passage. In December 1910 he authorized a second general election in order to test opinion on reform of the powers of the House of Lords; the passage of the \*Parliament Act of 1911, destroying the Lords' power of veto over money bills, and severely restricting their ability to delay other bills, owed something to George's own common sense. This crisis was soon followed by another, over the government's intention to grant \*Home Rule to Ireland, and the determination of the Ulster protestants, supported by the Conservative opposition, to take up arms unless Ulster remained part of the United Kingdom. The king did not take sides in

this quarrel, but he did use his influence with the Conservative leadership in order to moderate the tone of public utterances, and on 21 July 1914 invited representatives of all sides to a round-table discussion at Buckingham palace.

During the Great War, George and Mary shouldered an unenviable burden of morale-raising visits and public appearances. Mindful of sensitivities over the German connections of the royal family, he ordered that German names be replaced by English ones: the house of Windsor was inaugurated. In the years 1918–24 the political topography of Great Britain underwent a fundamental change, the Liberal Party being replaced by Labour as the only credible alternative to the Conservatives. George had been deeply shocked by the overthrow of tsarism in Russia, and by the advent there of a Bolshevik government preaching world revolution. The demise of the old ruling dynasties, both in Russia and in Germany and Austria, and the rise to prominence of proletarian movements, might have made a British king suspicious of the Labour Party. In fact, when the first, minority, Labour government of Ramsay MacDonald took office in January 1924, the king did much to ensure a smooth transition, observing punctiliously the constitutional proprieties, and emerging as a truly national leader, neutral in politics. In 1929, on the occasion of the formation of the second Labour government, he played a similar role. During the crisis of August 1931, which resulted in MacDonald's 'betrayal' of that government and agreement to head a national, all-party administration, the king's role was more controversial. He urged MacDonald to form such an administration, and played a part in persuading the Liberal and Conservative leaders (Herbert Samuel and Stanley Baldwin) to serve in it, under MacDonald's leadership. But whether the downfall of the Labour government was a case of murder or simply death from natural causes, the king's hands were clean. He played a moderating and conciliating role; subsequently, as a personal gesture in a period of severe economic recession, he gave up £50,000 from the civil list—i.e. the budget of the royal household.

George was a shy, reserved man, not blessed with an overabundance of intellect, who did his duty in a selfless manner, displaying much common sense. Only once, in a reign lived during an era of international turmoil and great social change, did he ever lose his nerve, during the General Strike of 1926, when he favoured the use of the military, and was packed off to Sandringham by Prime Minister Baldwin.

George went out of his way to bring the monarchy closer to the common people. In 1924 he made the first of a series of radio broadcasts heard throughout the British empire; in 1932 he inaugurated the annual Christmas Day broadcasts by the sovereign. He attended rugby matches at Twickenham, cricket at Lord's, tennis at Wimbledon; but he also presented the trophy at the football Cup Final at Wembley, thereby giving a royal imprimatur to the sport most closely identified with the working man. The fact that Britain escaped revolution in the immediate aftermath of the Great War was due to a mosaic of factors, not least the existence of a rudimentary welfare state and of a parliamentary socialist movement. But some of the credit must go to George V,

who gave to the monarchy a quiet, statesmanlike dignity, and in the process made it genuinely national and genuinely popular.

GA  
Nicolson, H. G., *King George the Fifth* (1952); Rose, K., *King George V* (1983); Somervell, D. C., *The Reign of King George V* (1936).

**George VI** (1895–1952), king of the United Kingdom of Great Britain and Ireland (1936–52), and emperor of India. George was born at Sandringham on 14 December, the second son of the future George V and Queen Mary. It was the same day as the death of Prince Albert in 1861 and consequently he was christened Albert Frederick Arthur George, known as Bertie to the family. As a child Prince Albert lacked close emotional contact with his parents and was often overshadowed by his elder brother Edward. His subsequent insecurity meant he was intensely shy and developed a stammer.

In 1909–13 he studied at the Naval College at Osborne and then Dartmouth. He was not renowned for intellectual capability but worked hard. Prince Albert then spent time at sea on the battleship *Collingwood* but his active career was not a success. He suffered from chronic seasickness and spent long periods on sick leave for gastric troubles, culminating in an operation on a duodenal ulcer on 29 November 1917. However he was always eager to return to duty, both for his own sake and his father's, and served in the battle of Jutland on 31 May 1916.

In 1919 he spent a year at Trinity College, Cambridge, where he studied history, economics, and civics, and in 1920 he was granted the title of duke of York. In 1919 he became president of the Industrial Welfare Society touring industrial areas, showing genuine concern for problems and developing the 'human touch'. He also founded the Duke of York's camp in 1921 to promote better relations between boys of different class backgrounds.

At this time he fell in love with Lady Elizabeth Bowes-Lyon, young, spirited, and attractive. She finally agreed to marry him in 1923 and the wedding took place on 26 April at Westminster abbey. She was to be the stabilizing influence in his life and provide him with the love and support he had often been without. They had two daughters: Elizabeth Alexandra Mary born on 21 April 1926 and Margaret Rose born on 21 August 1930. They were devoted parents and formed a close family unit.

The duke and duchess toured the empire, visiting Ireland and East Africa in 1924, and New Zealand and Australia in 1925, opening the new parliament building in Canberra on 9 May. His stammer was still evident and made it difficult to make public speeches. In 1925 he was put in touch with Lionel Rogge, a speech therapist, who over the years helped him become a more assured speaker.

On 20 January 1936 George V died and by the end of the year Edward VIII had abdicated. The duke dreaded the prospect of becoming king, but resigned himself to the task. At the coronation on 12 May 1937 he was crowned George VI in an effort to restore a sense of continuity and stability.

George VI supported Chamberlain in his policy of appeasement before 1939 but with the outbreak of war was determined to retain the integrity of both nation and

## George

empire. Although initially sceptical of \*Churchill, they soon developed a close working partnership and the king remained well informed on most matters, including D-Day and the atomic bomb.

The king and queen refused to leave London during the Blitz, although Buckingham palace was bombed nine times. The royal family shared a sense of common danger with the nation, toured devastated areas, met civilian workers, and the king devised the \*George Cross medal for civilian gallantry. He also shared the grief of loss when his youngest brother George, duke of Kent, was killed in action. He visited troops abroad: in North Africa (1943), in Italy (1944), and on the Normandy beaches just ten days after D-Day. The actions of the king and queen during wartime were a great boost to national morale.

The post-war period was stressful for the king who fretted constantly. With Labour victory in 1945, he was worried at the scope and speed of the new legislative programme. Yet despite being a traditionalist, the king was not averse to social reform when necessary. He watched with great regret the dissolution of the Indian empire. In 1947 he toured South Africa in an attempt to strengthen ties to the Commonwealth, the future of which he was anxious to secure.

The strains of war and the post-war period took their toll on his health. On 12 March 1949 he had an operation to remove a thrombosis on his right leg and on 23 September 1951 he had the whole of his left lung removed. Both operations were a success but he fought a losing battle to regain his health, and died in his sleep at Sandringham on 6 February 1952.

He enjoyed hunting and gardening, was an accomplished sportsman, and a devoted family man. Like his father, he was scrupulous in his attention to detail and formality. George VI was a man of simple tastes and understanding, but displayed a passionate devotion to duty that earned him both the respect and affection of his people. RAS

Judd, D., *George VI* (1982); Wheeler-Bennett, J., *King George VI: His Life and Reign* (1958).

**George, St.** St George, patron saint of England and of several other countries, is said to have been martyred at Lydda in Palestine in the 4th cent. and began to attract reverence in the 6th cent. Ælfric included him in his homilies and saints' lives c.1000. The story of the dragon appears as late as the 12th cent. and is presumably a reminiscence of Perseus and Theseus. His adoption as patron saint of England is post-Conquest though a church in Doncaster was dedicated to him in 1061. Crusaders may have brought back accounts of the respect paid him in the Middle East and the red cross may have come from the same source. The Synod of Oxford in 1222 made St George's Day, 23 April, a lesser holy day. The cult probably gathered pace after the foundation of the Order of the \*Garter in 1348, with the emphasis on chivalry and St George as patron. \*Caxton printed the 13th-cent. *Golden Legend* in 1483 and in 1515 Alexander Barclay published a translation of Spagnuoli's *Georgius*. The saint was still holding his own in late Victorian England, when \*Elgar wrote *The Banner of St George* for Victoria's \*Diamond Jubilee

in 1897. He is often confused with George of Cappadocia, a 4th-cent. Aryan bishop of Alexandria. JAC

**George of Denmark, Prince** (1653–1708), consort of Queen Anne. The younger son of Frederick III of Denmark, George was affable but dull. 'I have tried him drunk,' Charles II once remarked, 'and I have tried him sober and there is nothing in him.' Trained in science and warfare, he saw action against the Swedes in the late 1670s. His marriage to Anne (his second cousin once removed) in 1683 sealed a diplomatic concord between their respective kingdoms against the Dutch. A highly devout Lutheran protestant, he was a most devoted husband. He deserted his father-in-law James II at the 1688 revolution, but was never on good terms with William III. At his wife's accession in 1702 he was made titular head of the Royal Navy as lord high admiral. Though dogged by ill-health, he was the queen's mainstay throughout her many personal and political tribulations. AAH

**George Cross and Medal.** The award was instituted by George VI in September 1940 for acts of outstanding heroism, particularly among the civilian population dealing with the \*Blitz—firemen, police, ambulance men, and civil defence personnel. The cross, which ranks second only to the \*Victoria Cross, replaced the Empire Gallantry Medal. The silver cross has a representation of St George slaying a dragon, with a dark blue ribbon. The George Medal has a red ribbon with blue stripes. JAC

**Gerald of Wales** (1146–1223). Gerald was born at Manorbier in Pembrokeshire with a Norman father and a Welsh mother—consequently, he reflected, he was not accepted by either side. After education at Gloucester and at Paris, a promising career in the church (he was archdeacon of Brecon by 1175) ran into difficulties and he consoled himself with his writing. He failed to become bishop of St Davids (a see which an uncle had held) because the strong support given to him by Welsh princes may have alarmed the English. His best-known works were his accounts of Ireland and Wales—*Topography of Ireland* (1188), *Conquest of Ireland* (1189), *Journey through Wales* (1191), and *Description of Wales* (1194). 'Incurably egotistic' is one comment, but he took trouble with his writing and was a keen observer. He was said to be tall, handsome, with bushy eyebrows and vast energy. JAC

**Geraldine League** is the name given to the political alliance formed in 1538 in Ireland to seek the reinstatement of Gerald \*Fitzgerald as earl of Kildare, resist the protestant Reformation, and secure the recall of the Lord Deputy \*Grey. The instigator was Manus O'Donnell, chief of Tyrconnel, who was joined by Con \*O'Neill, James FitzJohn earl of Desmond, O'Connor of Sligo, and O'Brien of Thomond. In August 1539 they raided the Pale but were defeated by Grey at Bellahoe. Grey's successor, Sir Anthony \*St Leger, worked out a deal with the league which amounted to an ambitious new policy. The Irish chiefs were to recognize Henry VIII as king of Ireland, to surrender their lands and have them regranted, to be accorded full constitutional rights, and to be granted peerages as appropriate. It would have been an important step towards the

Anglicization of Ireland, introducing English law and language. St Leger's scheme made some headway and he even succeeded in raising some troops for service abroad. But the death of Henry in 1547 and the decision of Edward VI's council to pursue a vigorous protestant policy produced fresh mistrust. JAC

**Gerard, John** (1564–1637). Jesuit. Gerard was from a Lancashire catholic gentry family and was sent to Douai. He was ordained priest at Rome in 1586 and joined the Jesuits in 1588. Captured on a mission to England, he made a daring escape from the Tower in 1597. He was on the fringes of the Gunpowder plot, aware that something was afoot, but ignorant of the details. He managed to make his escape in 1606 and spent the rest of his life in catholic teaching institutions on the continent. His autobiography throws much light on English catholicism under James I. JAC

**Germain, Lord George** (1716–85), formerly Sackville. After a promising early career, both as politician and army officer, Sackville was court-martialled for disobeying orders at \*Minden in 1759. Stripped of his rank and forbidden the court, he did not rehabilitate himself until the 1760s, eventually becoming American secretary in 1775. It was expected that Germain (as he was now called) would invigorate the war effort against the American colonies, but difficulties of slow communication militated against effective direction from Britain. Germain, moreover, never achieved complete control, since fellow cabinet members jealously guarded their own authority. A flawed strategist, he must share responsibility for the defeat at \*Saratoga (1777), having authorized two separate offensives, mistakenly hoping that each might succeed independently. He continued to hope, despite contrary evidence, that each fresh campaign would tap latent American loyalism, and was predisposed to favour the more ambitious \*Cornwallis over Commander-in-Chief \*Clinton. Germain's attitude exacerbated defects in the command structure during the prelude to \*Yorktown (1781). Despite this disastrous defeat, he opposed abandoning the war and resigned in 1782. He was created Viscount Sackville on his retirement. DW

**Germanus of Auxerre, St.** Soldier, bishop, and church emissary who visited Britain in AD 429 to counter heresy. In the early 5th cent. the teachings of \*Pelagius were proving popular in Britain. In 429 the Roman ecclesiastical authorities in Gaul dispatched Germanus to Britain to combat Pelagianism by preaching the true faith—Divine Grace—in British churches and the countryside. Although lacking in specific details, Constantius of Lyons's account of Germanus's visit is significant because of the incidental light it sheds on early 'post-Roman' Britain; Germanus apparently encountered organized town life, suggesting that Britain remained strongly 'Romanized' in character. Before becoming a bishop Germanus had been a soldier, and he defeated \*Picts and \*Saxons in a battle where he gave his troops the battle-cry 'Alleluia'. Germanus may have visited Britain for a second time in 435–7, and died c.448. ES

**Germany, relations with.** The German empire as established in 1871 was at first seen by Britain as a satiated power.

Such views changed rapidly from 1905, when an attempt to break the \*Entente with France excited fears that Germany was bidding for hegemony in Europe. By 1909 the bulk of the British navy was concentrated in home waters to meet the challenge from the new German fleet. Not surprisingly Britain speedily entered the war against Germany (4 August 1914), and soon became committed to the total defeat of German militarism. This did not preclude discussion of Germany's future role in the balance of power, and although victory was purchased at a bitter price, emphasis on revenge was soon qualified by doubts concerning the wisdom of what was widely considered to be the excessively punitive peace of \*Versailles.

Many saw Germany as a necessary economic partner in the 1920s, but efforts at conciliation had made little progress when Hitler came to power in 1933. Although the possibility of revisionist policies under the Nazis was recognized, and small increases in Britain's armed forces followed, the \*National Government regarded war as a last resort. Controversy over efforts to conciliate Hitler reached serious proportions only from the Sudeten crisis in the autumn of 1938. Neville \*Chamberlain himself until late in the day was persuaded that he could negotiate a satisfactory settlement with Hitler. Only when Germany persisted with the attack on Poland did Britain declare war on 3 September 1939.

Hitler, it seems, had some hopes of peace with Britain after the fall of France in June 1940, but soon turned to other objectives when no speedy victory proved possible. Britain, while not an immediate major threat to Germany, was well placed to help with the later provision of western aid to the USSR, just as it was the indispensable base for American operations against Germany. Victory left the British burdened with an expensive occupation zone in Germany, and unsure of what sort of Germany they wanted in the future. Fear of the USSR, however, soon persuaded them that there would be no stability in Europe if western Germany were to slip into the Soviet orbit. The British supported the USA in the Berlin Airlift (1948–9), and assisted in the creation of the German Federal Republic. Despite initial reservations, they also played a major part in devising a satisfactory structure within which West Germany could be rearmed, and included in \*NATO in 1955. From the formation of the \*European Economic Community Britain was often troubled by Franco-German co-operation, and Mrs Thatcher was not alone in her reservations when the two Germanies were reunited at the end of the Cold War in 1990. CJB

**Ghana.** Formerly the Gold Coast, British west African colony and protectorate. British traders became interested in the Gold Coast in the second half of the 17th cent., attracted by the trade in gold and, increasingly, in slaves for the Americas. As the campaign against the slave trade strengthened in the 19th cent., British policy towards the Gold Coast vacillated until, in the face of competition from other European countries, it was decided to establish a crown colony in 1874. Friction between the ethnic groups within the colony and those in the interior induced Britain to declare a protectorate over the hinterland in 1901. The development of cocoa as

## Ghent

an export crop brought prosperity to the country and made possible the expansion of European education there. The Gold Coast then became the leader in the nationalist movement in the British African dependencies and gained its independence, as Ghana, in 1957. KI

**Ghent, treaty of**, 1815. Peace talks to end the \*War of 1812 between Britain and the USA began at Ghent (modern Belgium) in August 1814. A treaty was signed on 24 December and ratified the following year. It resolved none of the proclaimed causes of the war. Neutral rights, an American grievance, ceased to be controversial as war had ended in Europe, while disputed boundaries were referred to arbitration. Because of slow communications, a major battle was fought after the conclusion of the treaty, at \*New Orleans in January 1815. GM

**gibbeting** was the exhibiting of the corpses of executed criminals in public. It was normally reserved for criminals convicted of unusually heinous crimes, or others of whom the authorities wished to make examples. The bodies were hung either in a much frequented location or at the place where the crime was committed. They were tarred, left to rot, suspended from a pole, and held together by iron hoops. The first definite case of gibbeting involved a Scot executed in London in 1306 in Edward I's reign. In 1752, after a crime wave, the practice was given statutory authority by 25 George III c. 37, which declared the need for 'some further terror'. In the 19th. cent. there was increasing distaste for the carnival atmosphere which accompanied some gibbeting, and the last occasion was of a murderer named James Cook in 1832, who had killed a merchant and cut up the body for burning. Gibbeted at Leicester, Cook's body was removed in a few days after local protests. A bill to abolish the practice, 4 & 5 William IV c. 26, was carried by William Ewart, MP. JAS

**Gibbon, Edward** (1737–94). Historian. After fourteen months at Magdalen College, Oxford, which the laziness of the dons made 'the most idle and unprofitable of my whole life', Gibbon converted to catholicism and had to leave. This was fortunate since it probably prevented him from becoming an obscure academic. His enraged father sent him to Lausanne (Switzerland), under a Calvinist tutor, where he learned French, reverted to protestantism, and determined to write some great work. He spent 1760–2 as a captain of the Hampshire militia—a strange inhabitant of the officers' mess. In 1773 he began serious work on *Decline and Fall of the Roman Empire*, the inspiration of which was a visit to Rome in 1764, described in his *Memoirs*. The following year he entered Parliament, was given minor office by Lord North, but never spoke: 'the great speakers', he wrote memorably, 'fill me with despair, the bad ones with terror'. The first volume came out in 1776 and established him at once: the work was completed in 1788. Gibbon was fortunate that his study touched on contemporary anxieties—the enervating effect of luxury, the fragility of civilization. But the intrinsic merits of his book, its scholarship, silky style, and philosophic detachment, made it an enduring classic. Gibbon spent his last ten years back in

Lausanne. Unmarried, very short, plump early in life, fat later, overdressed, vain, and watchful, Gibbon was easy to make fun of, and though he belonged to Johnson's Club, he was not a clubbable man. His 'cheerful temper' and urbane, balanced prose masked, but did not hide, strong and disturbing feelings. JAC

**Gibbons, Grinling** (1648–1721). Woodcarver and sculptor. Born in Rotterdam and probably trained in Holland, he was in England by 1668. Writing in 1671, the diarist John \*Evelyn refers to introducing Gibbons, 'whom I had lately found in an Obscure place', to Charles II and Christopher \*Wren. Gibbons's decoration appears in Windsor castle and Hampton Court and also in St Paul's cathedral on the choir-stalls and organ screen. One of the most skilful woodcarvers ever, his garlands of fruit, flowers, small animals, and cherubs led Horace Walpole to say, 'There is no instance of a man before Gibbons who gave to wood the loose and airy lightness of flowers.' He was less at home with bronze and marble. The bronze of James II outside the National Gallery in London, attributed to Gibbons and for which he was paid, was probably the work of his partner Artus Quellin. Other examples of woodcarving are in the Victoria and Albert Museum and many country houses throughout Britain. JC

**Gibbons, Orlando** (1583–1625). Jacobean composer and keyboard player who contributed to most musical genres of the time. A chorister at King's College, Cambridge, in 1596, by 1605 Gibbons was a gentleman of the Chapel Royal, later serving as joint organist. He was also organist at Westminster abbey from 1623. Gibbons's madrigals favoured the serious approach of the moralistic 'Silver Swan': 'More geese than swans now live, more fools than wise.' His Anglican church music includes full anthems such as the exuberant 'Hosanna to the Son of David', but his most significant contribution was to the verse anthem. These works, including the popular 'This is the Record of John', alternate sections for soloist/s and organ or instrumental consort with choral passages. Gibbons's instrumental fantasias display the same skilful counterpoint, and in his day he was chiefly famous as an organist and virginalist, being described by one listener as 'the best finger of that age'. ECr

**Gibbs, James** (1682–1754). As an architect Gibbs was unusual for his time, not because he was Scottish-born or even because he was Roman catholic, but because he spent six years in Rome and studied under Carlo Fontana (1703–9). Although Gibbs shared with the \*Palladians an admiration for Palladio, his thought was unblushingly \*baroque. He was predictably patronized by Tory magnates, but his own Toryism did not preclude him from a governorship of St Bartholomew's hospital (1723), for which he planned a rebuild; in 1728 the Whig duke of \*Argyll accepted Gibbs's dedication of his *Book of Architecture*. Appointed as surveyor for the '50 new churches' legislated for London in 1711, Gibbs built St Mary-le-Strand (1714), but he lost the 'political' surveyorship in 1715. It appears to have been through his sheer professional competence that he was appointed architect for the unbaroque St Martin-in-the-Fields (1722–6). Probably his best-known secular building is Oxford's Radcliffe library, the

'Camera', completed 1748; at Cambridge, he built the Senate House and Gibbs's Building at King's. DDA

**Gibraltar.** At the southern tip of Spain, with an area of 2½ square miles and 1,270 feet at its highest point, 'The Rock' commands the western entrance to the Mediterranean. The name derives from Djebel Tarik (Mountain of Tarik) after Tarik ibn Ziyad, the general leading the Moorish invasion of Spain in 711. Gibraltar was subject to numerous sieges as Christian rulers attempted to eject the Moors. Finally, in 1462 it was recaptured and became the evacuation point for Jews and Moors expelled from Spain. Queen Isabella of Spain in the 16th cent. laid it as a solemn charge in her will that her successors retain and hold the city. For almost 200 years few people, apart from privateers, showed much interest in Gibraltar until in 1704, during the War of the Spanish Succession, it was captured by an Anglo-Dutch fleet under Sir George \*Rooke and ceded to Britain by the treaty of Utrecht (1713). It has remained in British hands ever since. During the Great Siege of 1779–83, the garrison under General Elliott (Lord \*Heathfield) resisted all attempts to bombard or starve them out. During the Second World War, fighting in north Africa and Italy gave Gibraltar a crucial role. Spain resumed pressure after the war ended but in a referendum of 1967 the colony voted to retain its connection with Britain. Spain closed the border for sixteen years from 1969 and the Rock remains a bone of contention. JC

**Gibson, Edmund** (1669–1748). Bishop of London, scholar and prelate. Educated at Oxford, Gibson produced several translations of major historical works, including \*Camden's *Britannia*, before being ordained in 1697. In the convocation controversy he vigorously defended the archbishop's prerogatives, and in 1703 was made canon of Chichester and rector of Lambeth. His extensive researches in ecclesiastical law resulted in 1713 in the publication of his monumental *Codex juris*. A high-church Whig, he was appointed bishop of Lincoln in 1716, and in 1723 translated to the see of London. In the early years of his administration \*Walpole relied heavily on him in church affairs and patronage, and their partnership went far in replacing the old Tory hierarchy of Queen Anne's day with a Whiggish one firmly yoked to the Hanoverian dynasty. Nevertheless, Walpole resisted Gibson's calls for ecclesiastical reform, anxious to keep the church off the political agenda. Their association, long under strain, ended in 1736 over Walpole's support for the Quakers' Bill which Gibson had advised his fellow bishops to oppose. Gibson was passed over for Canterbury in 1737. AAH

**Gielgud, John** (1904–2000). Actor and director. Great-nephew of Ellen \*Terry, sharing her passion for \*Shakespeare and mellifluous voice ('a silver trumpet muffled in silk', according to Sir Alec Guinness), Gielgud devoted himself wholly to the theatre and maintenance of classical tradition, as one of his generation's greatest stage and screen actors. Joining the Old Vic, his portrayal of Hamlet (1929) quickly established his reputation, enhanced by subsequent performances as Prospero, Angelo, and Lear. Ambition to

direct was realized in the 1930s with wartime productions in Britain and abroad. In the 1950s Gielgud seemed happier in classical revivals than new drama—he was knighted in 1953—but his versatility led to acclaim in contemporary works later. Enjoyment of film-making (Academy award, 1982) and television continued, with cameo roles until his death. The Globe Theatre in Shaftesbury Avenue was renamed (1994) in his honour. ASH

**Giffard, Walter** (d. 1279). Archbishop of York and chancellor. A Wiltshire man, Giffard was successively archdeacon of Wells, bishop of Bath and Wells (1265–6), and archbishop. A royalist, he was consecrated bishop in Paris (1265) by the Savoyard bishop of Hereford, Peter Aquablanca, during Simon de \*Montfort's rule. After the battle of \*Evesham (1265) he became chancellor, actively engaging with the papal legate in restoring Henry III's authority and arbitrating the dictum of \*Kenilworth (1266). He subsequently became archbishop of York by papal provision, tutor to Prince Edward's sons, and, with \*Mortimer and \*Burnell, a strenuously active regent during Edward I's absences abroad (1272–4 and 1275). He was in dispute with Archbishop Boniface of Canterbury and his successor \*Kilwardby, over his rights in the south. WMM

**Gilbert, Sir Humphrey** (c.1537–83). A half-brother of \*Raleigh, Gilbert was able to get official support for his interests in overseas activities. In the 1560s, he began to argue against England's current interest in the North-East Passage, recommending in a treatise circulated then, although not published until 1576, the merits of the North-West route to Cathay. After service in Ireland, and as an MP, he was knighted and began practical expeditions with a patent from the queen to plant colonies in North America. A venture in concert with Raleigh in 1578–9 apparently failed, but in 1583 Gilbert annexed \*Newfoundland, though no settlers were left. He and his ship were lost on the return voyage. His treatise was an important influence on the long English obsession with the North-West Passage. RB

**Gilbert, Thomas** (1720–98). Poor Law reformer. The son of a Staffordshire gentleman, Gilbert was called to the bar in 1744 but worked as land agent for Lord Gower. He was MP for Newcastle under Lyme (1763–8) and Lichfield (1768–95). Among the reform measures he introduced into the Commons, the two which bear his name are the Act of 1782 which permitted two or more parishes to unite to administer the poor law, and the Act of 1793 which permitted the commissioners of \*Queen Anne's Bounty to lend money to build parsonages to facilitate a resident clergy. He also secured an Act in 1793 to encourage with parochial funds the formation of \*friendly societies. He unsuccessfully advocated a 25 per cent tax on government places and pensions during the American War (1776), restrictions on alehouses, and taxes on dogs. ER

**Gilbert, William Schwenck** (1836–1911). Gilbert is one of the rare examples where the librettist is as well known as the composer. His achievement in his partnership with \*Sullivan was threefold. Like all good librettists, he stimulated his composer and helped him to produce colourful and

## Gilbert and Ellis islands

sparkling music. Secondly, Gilbert spiced his plots with contemporary satire, which helped to sell tickets, had a cutting edge, and has lasted remarkably well. Finally, like all great writers, he created his own world, a world of gentle cynicism, honest simplicity, and legal quibbling, and he peopled it with memorable characters—the reluctant policemen; the decent, patriotic pirates; the philosophical sentry; the modern major-general; the skittish judge in *Trial by Jury*; the duke of Plaza-Toro, who led his regiment from behind; the three little maids who, all unwary, came from a ladies' seminary; Little Buttercup and Sir Joseph Porter, KCB. Though occasionally the humour degenerates into facetiousness, the verbal dexterity of the verse is superb.

Gilbert was born in London and educated at King's College. He spent his early years as an 'impecunious party' practising the law, before turning, with great success, to literature. He met Sullivan in 1871 and *Trial by Jury*, their first success, was produced in 1875. They worked together until 1896 when *The Grand Duke* was a comparative failure. Gilbert's many publications brought him considerable wealth, he was knighted in 1907, and he died after rescuing a woman from drowning in the lake at his home. JAC

**Gilbert and Ellis islands.** See KIRIBATI.

**Gilbert of Sempringham, St** (c.1083–1189). Founder of the \*Gilbertines, a purely English order. A wealthy Norman knight's son, Gilbert became incumbent at Sempringham (Lincs.), where (c.1131) he allowed a group of devout women to use a building next to the church. On the abbot of Rievaulx's advice he added lay sisters and brothers, in Cistercian fashion, to care for their physical needs. Failing to persuade the general chapter of Cîteaux to oversee the order, he was confirmed as administrator by Pope Eugenius III (1147), himself a Cistercian. Gilbert then added secular canons—like Augustinians—to act as chaplains. Growth was so rapid that by his death there were 1,500–2,000 members and, in addition to many leper-hospitals and orphanages, he had founded more than a dozen monasteries. His longevity appears well documented. He was canonized in 1202. WMM

**Gilbertines.** St \*Gilbert, parish priest of Sempringham (Lincs.), became spiritual adviser to a group of seven anchoresses c.1131. His following increased and in 1147, after his unsuccessful attempts to persuade the \*Cistercians to take over responsibility for his communities, they were organized as an order. It was intended for nuns (who followed the \*Benedictine rule), \*Augustinian canons, lay brothers, observing a version of the Cistercian rule, and lay sisters. They lived in double houses: however, following early scandal and dissension, they were rigidly segregated. Though these were ultimately virtually indistinguishable from other nunneries and while the canons gradually came to dominate, the order represented one of the best-articulated attempts to organize communities of religious men and women in medieval Europe. It enjoyed considerable success in eastern England, and by Gilbert's death in 1189 there were nine double houses and four for canons only. However, the order never successfully spread outside England and disap-

peared following the \*dissolution of its 24 communities in 1538–9. BJG

**Gildas** (fl. some time between c.475 and c.550). An important British cleric, Gildas is chiefly known for his tract *On the Ruin of Britain*. This work outlines some of the history of 4th- and 5th-cent. Britain as a study in divine judgement, which he expected to come to bear on the evil rulers of his own day. He is the only early author to provide an account of the first Saxon settlements in Britain. As such he has attracted much exegesis, often fruitless. The most certain thing his book shows is that he was a well-educated man with a sophisticated style. JCA

**Gillray, James** (1756–1815). Caricaturist. Abandoning the discipline of reproductive engraving for pungently witty etching, and stimulated by the political satires of James Sayers but concealing his own views, Gillray played a key role in the evolution of pictorial journalism by his development of recognizable caricature and rapid response to events. Using brightly coloured, almost grotesque distortion of an individual's salient features, to conjure amusement or contempt, Gillray targeted the royal family, politicians, society figures, exquisites, and charlatans. Fashionable London both approved and feared. From 1791 he settled down to etch almost exclusively for the printseller Hannah Humphrey, lodging over her West End shop, and briefly in receipt of a Tory pension, but generally retaining his independence. Failing eyesight (probably stemming from his meticulous craftsmanship) and increasing insanity from 1810 hastened his decline. ASH

**Gin Act**, 1751. Repeated attempts during George II's reign to curb the growing consumption of cheap gin proved fruitless. In January 1751 Henry \*Fielding in his *Inquiry into the Late Increase of Robbers* called for further legislation against this 'diabolical liquor' and his appeal was reinforced by \*Hogarth's print comparing the pleasures of Beer Street with the miseries of Gin Lane. The Act 24 Geo. II c. 40 curtailed the 'immoderate drinking of distilled spirituous liquor by persons of the meanest and lowest sort' by forbidding distillers to retail directly, restricting sales to taverns worth £10 p.a., and declaring debts of less than 20 shillings to be irrecoverable. JAC

**Giric**, king of Picts (877/8–885/9). The sources for the succession in what (c.900) became the kingship of the Scots are meagre and confused following the peak of Scandinavian devastation in 875–6. The descendants of \*Kenneth I in the male line lost the kingship between 878 and 889. Two names of possible kings in this period are \*Eochaid and Giric. Giric is very obscure; he may have been Eochaid's guardian; and he may have lost power following a solar eclipse on 16 June 885. By the 12th cent., however, he mysteriously acquired legendary status as liberator of the Scottish church from Pictish oppression and (fantastically) conqueror of Ireland and most of England. As a result, Giric was later known as 'Gregory the Great'. DEB

**Girl Guides.** Female branch of the Scouting movement founded in 1910. At the first big rally of the \*Boy Scouts

at Crystal Palace in September 1909 there appeared a large contingent of girls dressed in the Scout hat and scarf and parading with the boys. \*Baden-Powell was not in favour of incorporating girls into his organization as he believed it would discourage boys from joining. The following year his sister Agnes established the Girl Guides with £100 at her disposal and together they wrote the Guide Handbook *How Girls Can Help Build up the Empire*. The initial reaction was enthusiastic with around 8,000 girls joining. However the movement began to stagnate due to Agnes's poor organization and an uninspiring programme. The Girl Guides were also viewed with suspicion by some who thought it was a part of the women's suffrage movement, which was particularly active in this period.

In 1915 Baden-Powell made himself chairman of the Girl Guides and brought younger women into the organization, including his wife Olave. He also rewrote the Guide Handbook, *Girl Guiding*, in 1918. The Brownies were formed in 1914 for 8–11-year-olds. They were originally called Rosebuds, but the name Brownie was adopted in 1918. It derived from a book of 1870 by Juliana Ewing where Brownies were little elf-like creatures who, at night, finished the housework for humans. In 1988 the Rainbow Guides were introduced for 5–7-year-olds.

The first international Guide conference was held at Oxford in 1920. At the sixth conference, in 1930, Lady Baden-Powell became World Chief Guide, a post she held for 40 years. Today there are estimated to be around 8.5 million Guides in over 100 countries.

RAS

**Gissing, George** (1857–1903). Novelist. Gissing made a career out of his own misery. Born in Wakefield, he seemed destined for brilliant academic honours, winning prize after prize at school and at Owen's College, Manchester. His progress ended abruptly at 18, when he was sent to gaol for a month for stealing from friends at college to support a prostitute, Nell Harrison, whom he subsequently married. She did not reform and died of alcoholism in 1888. Meanwhile Gissing had moved to London to scrape a living from authorship, achieving some success with *Demos* (1886), a fierce attack upon the demeaning effect of poverty. The same theme was pursued in *New Grub Street* (1891), the autobiographical element in his early work giving it a persistently lugubrious character. Gissing compounded his difficulties in 1891 by a second marriage to a working-class girl, who became a shrew and died in an asylum. His third (and bigamous) marriage in France was more successful, but Gissing complained that his mother-in-law starved him. His novels received some comment and considerable praise and he was compared with Zola, but they did not sell well. His later work showed greater variety of subject-matter and a more cheerful attitude in *By the Ionian Sea* (1901) and *Private Papers of Henry Ryecroft* (1903). His finances were improving when he died of lung congestion at 46. The final twist of fate was when his novels began to attract much attention in the 1960s because of his interest in class relationships.

JAC

**Gladstone, William Ewart** (1809–98). Statesman and author. Gladstone was one of the longest serving of British

politicians and one of the most controversial. He was in office every decade from the 1830s to the 1890s, starting as a Tory, ending as a Liberal-radical prime minister. He was born in Liverpool on 29 December 1809, the son of Anne and John Gladstone, a merchant from Scotland who made his family's fortune in the Baltic and American corn trade. Gladstone was educated at Eton and Christ Church, Oxford, and from the start was marked out for success in public life. Intensely religious, initially in the evangelical tradition taught him by his mother, he at first felt drawn to ordination in the Church of England, but not sufficiently to go against his father's objections. While president of the Oxford Union, he strongly opposed the Whigs' proposals for parliamentary reform and was elected to the Commons as a Tory in December 1832. Influenced by both \*Coleridge and the \*Oxford movement, he published *The State in its Relations with the Church* (1838) and *Church Principles* (1840) arguing that the Church of England should be the moral conscience of the state; \*Macaulay, in a savage refutation of Gladstone's arguments, called him 'the rising hope of those stern and unbending Tories'. In \*Peel's government 1841–5 he was vice-president and then president of the Board of Trade. This experience made him a firm free trader. He resigned in 1845 over the \*Maynooth grant, returning in 1846 to be briefly colonial secretary and to support repeal of the Corn Laws (though he was not during that year in the Commons) and to become a leader of the Peelite group. In the 1840s Gladstone thus left the Tory Party and reorientated his political and religious position.

In 1839 he married Catherine Glynne, of an old north Wales family; between 1840 and 1854 they had eight children.

In 1852, as a member of the \*Aberdeen coalition, he began the first of his four terms as chancellor of the Exchequer (the others were 1859–66, 1873–4, and 1880–2); his greatest budgets were those of 1853 and 1860. Gladstonian finance emphasized a balanced budget (i.e. with no deficit), minimum central government spending, the abolition of all protective tariffs, and a fair balance between direct and indirect taxes (Gladstone hoped to abolish income tax, which he disliked, and to replace it with other direct taxes). In his 1853 budget he repealed about 140 duties; in 1860 he repealed duties on 371 articles, many of them as a consequence of the treaty with France which he planned and Richard \*Cobden negotiated. His plan for phased abolition of income tax was ruined by the costs of the \*Crimean War.

Gladstone saw the budget as the chief moment of the parliamentary year—a national commitment to sound finance. Finance was, he said, 'the stomach of the country, from which all other organs take their tone'. He deliberately made the presentation of the budget a dramatic and controversial political event. His budgetary strategy was accompanied by the imposition of Treasury control on a more professional civil service (deriving from the Northcote-Trevelyan Report which Gladstone commissioned) and financial accountability through the Public Accounts Committee which he set up. Gladstone had an explosive political character, which occasionally spilled over into outburst; but his reputation for sound finance gave him a firm political bedrock.

In the 1850s and 1860s Gladstone emerged as a politician of clear national standing with a reputation for oratory. Though MP for Oxford University from 1847 to 1866, and though initially supporting the South in the American Civil War, he began to take increasingly radical positions, especially on questions like parliamentary reform, and his statement in 1864, that 'any man who is not presumably incapacitated . . . is morally entitled to come within the pale of the constitution', seemed to mark him out as the future leader of the party of progress. However, the modest Reform Bill proposed by Gladstone and \*Russell in 1866 led to the temporary disintegration of the Liberal Party and the resignation of the government. Gladstone responded with increasingly radical demands on other questions, such as the abolition of compulsory church rates and disestablishment of the Irish church. Campaigning on these questions, he led the Liberals to win the 1868 election and became prime minister in December 1868: on receiving the queen's telegram of summons he remarked, 'My mission is to pacify Ireland'. In his first government, one of the greatest of British reforming administrations, he disestablished the Irish church (1869), passed an important Irish Land Bill (1870), but failed with his Irish University Bill (1873, when the government resigned, only for \*Disraeli to refuse to take office). This government also abolished purchase of commissions in the army and religious tests in the universities; it established the \*secret ballot and, for the first time, a national education system in England, Wales, and Scotland (1870–2). However, a series of scandals in 1873–4 damaged the government's standing. Gladstone called and lost a snap general election in January 1874 with a quixotic plan to abolish income tax; he then announced his retirement (often previously contemplated) from the party leadership.

Gladstone, 64 in 1874, expected a retirement of writing and scholarship. He was already an established if idiosyncratic authority on Homer with his *Studies on Homer and the Homeric Age* (1858) and a frequent book reviewer. In his lifetime he published over 30 books and pamphlets and about 200 articles, chiefly on classical, theological, literary, and contemporary political topics. His articles provided a useful source of income when out of office and enabled him to retain the centre of the political stage even when in opposition. Gladstone had that rare gift of being thought to be controversial even when at his most anodyne; no public figure has more easily kept a place in the limelight.

In his pamphlets of 1851–2 and a stream of subsequent works, Gladstone opposed the 'temporal power' of the papacy. He opposed the declaration of papal infallibility in 1870 and denounced 'Vaticanism' in 1874–5. He nurtured links between Orthodoxy and Anglicanism as an antidote to Roman catholicism's hegemonic claims. Not surprisingly, therefore, he was swiftly drawn into the Bulgarian atrocities campaign in 1876. A series of speeches and pamphlets broadened into a general attack on 'Beaconsfieldism' and having fought the \*Midlothian campaign 1879–80 he was elected MP for Midlothian. He thus had a Scottish constituency, a Welsh home (his wife Catherine's house, Hawarden castle), and widespread English connections. He had become that very rare phenomenon, a fully 'British' politician.

He again became prime minister in 1880. His second government passed an important Irish Land Act (1881) and, after initial rejection by the Lords, the Reform Act of 1884; but it failed to establish elected local government for Ireland or for Great Britain.

Since the 1860s, Gladstone had tried to pacify Ireland by accommodating Irish demands. He accompanied the concessionary \*Land Act (1881) with coercion, imprisoning C. S. \*Parnell, and breaking the power of the \*Irish Land League. From 1882, disregarding the set-back of the \*Phoenix Park murders, he sought to encourage the constitutional character of the \*Home Rule movement. His government resigned in 1885, unable to agree on local government for Ireland. Gladstone encouraged Parnell to bring forward a Home Rule proposal and fought the general election of November 1885 on a manifesto which carefully did not exclude it. In January 1886, his son Herbert having flown the \*'Hawarden Kite' and Lord \*Salisbury having turned down Gladstone's proposal that the Tory government introduce a Home Rule measure with bipartisan support, Gladstone formed his third cabinet with ministers pledged to inquire into Home Rule. He had come to see \*devolution as the best means of maintaining Ireland within the United Kingdom, as well as having substantial advantages for the United Kingdom as a whole. He drew up a Home Rule Bill, providing for a legislature with two Houses in Dublin and with a generous financial settlement for the Irish, and he proposed to accompany it with a substantial Land Purchase Bill (to buy out the Anglo-Irish landowners). This bold settlement was too bold for his party and the Government of Ireland Bill was defeated in the Commons in June 1886, many \*Liberal Unionists defecting and eventually forming their own party. The government did, however, pass the \*Crofters' Act for Scotland, one of the few significant land-tenure reforms ever passed for the mainland. Gladstone called a general election and resigned on losing it. The 1886 proposal was probably the best chance the British had for a constitutional settlement which retained Ireland within the Union.

In foreign policy, Gladstone stood for an international order governed by morality and based on an updated Concert of Europe. To achieve this he was, unlike many free traders, ready to intervene diplomatically or if necessary militarily. His first government submitted the \*Alabama dispute to international arbitration and paid the consequent hefty fine, thus clearing the way for good relations with the USA. In the Midlothian campaign, Gladstone laid out 'six principles' of foreign policy, which recognized the equal rights of nations and the blessings of peace—these principles were extremely influential in world-wide liberal thought, and especially on President Woodrow Wilson and the liberals planning the \*League of Nations. In office in the 1880s, however, Gladstone found himself intervening in unpalatable ways; to maintain order, as he came to see it, in \*Egypt, he bombarded Alexandria in 1882 and then invaded Egypt in what was intended as a brief occupation to remove 'extreme' nationalists. Egypt proved, however, to be the 'nest egg' of Britain's north and central African empire. In 1881, war against the Boers in South Africa included the public-relations disaster of \*Majuba Hill. Order had also

to be established in the \*Sudan and Gladstone, despite misgivings, failed to prevent Lord Hartington and others sending Charles \*Gordon to a Sudanese imbroglio partly of Gordon's own making; Gordon's death in 1885 was a further embarrassment to a beleaguered government. Gladstone always opposed imperial expansion and annexation, arguing—in a vein now common among economic historians—that expansion into tropical areas was a dangerous deflection from Britain's true economic and strategic interests (he was, however, a keen proponent of development of the 'white' empire). But he always lost the decision (if not the argument) and was an unwilling party to major imperial expansion in Africa and the Pacific.

Gladstone was aged 75 when his first Government of Ireland Bill was defeated. Now committed to campaigning for another attempt, he led the Liberal Party in opposition 1886–92 (his first period as formal opposition leader), winning the general election of 1892 despite the set-back of the split of the Home Rule party in 1890. In 1892 he formed his fourth and last government. In 1893 he successfully piloted his second Government of Ireland Bill through the Commons after 82 sittings; the Lords then brusquely rejected it, as they did many of the government's other proposals. Throughout his life Gladstone had battled to keep down defence expenditure. Already defeated in his attempt in 1892 to withdraw from \*Uganda, his final political struggle was an unsuccessful dispute with his own cabinet over naval expansion in 1893–4. His eyesight deteriorating, he finally resigned the premiership in March 1894, aged 84. He completed his edition of the works of Joseph \*Butler, the 18th-cent. theologian, and died on Ascension Day, 19 May 1898.

Gladstone stood 5 feet 10½ inches, with a large head and a powerful voice. He was always spry, his fitness maintained by long walks and his legendary tree-felling. Intense sexuality competed in his character with equally intense religious belief, and he had difficulty maintaining the two in balance when he undertook his 'rescue' work with prostitutes. These inner struggles combined with outward confidence to make him a very characteristic Victorian. His enduring governmental monument was the establishment of a tight code of financial principles, which remained influential long after the type of economy they were intended to serve had passed away. In British politics Gladstone was the most successful of non-Tory political leaders. Among executive politicians he has had few rivals in range and staying power, or in the capacity to meet new challenges with fresh policies. His use of speech-making and political meetings to bring great political questions before the people helped to integrate the mass electorate after 1867 and set a style which has influenced democratic countries ever since. **Glamorgan.** County of south Wales. It was part of the Welsh kingdom of Glywysing, but in the 10th cent., under Morgan Hen, became known as Gwlad Morgan, from which the later name is derived. Under the Normans it was con-

verted to the lordship of Glamorgan, and remained a lordship of the march until 1536, when it was made into a shire at the Act of \*Union with England, with the addition of the lordship of Gower (Gŵyr). In 1974 it was divided into three—South, Mid, and West \*Glamorgan.

The county consists of three main elements. Blaenau Morgannwg is the coalfield upland, deeply segmented by valleys, of which the Taff and its tributary, the Rhondda, are best known. In contrast, the southern section called Bro Morgannwg, or the vale of Glamorgan, is a low, level plateau of some 200 feet. The third element is the Gower peninsula.

The county was best known for the coalfield and the mining villages strung out along the valleys. The iron and steel industry of the late 18th and 19th cents. developed on the northern outcrop in places such as Merthyr Tydfil, but exhaustion of local iron ores led to a shift to the coast. The ailing British Steel (Corus) plant at Margam in West Glamorgan is the contemporary successor. Coal-mining has virtually ceased. There is only one deep mine operative, but there are extensive opencast operations. Modern industry has collected about the M4 motorway, which crosses the vale, and north of \*Cardiff, which grew as a port and is now the capital of Wales. The coalfield communities have suffered greatly from unemployment and contain some of the most deprived areas in the UK (e.g. the Cynon valley).

The total population in 1991 was 1,256,462, nearly half the population of Wales. Welsh speaking increased east to west—3.6 per cent in Trowbridge, a ward of South Glamorgan, to 79.1 in Gwaun-cae Gurwen in the west—and also up-valley, south to north—6.3 per cent at Llantwit Major on the coast to 19.3 in Rhigos, a ward on the northern boundary.

HC

**Glamorgan, Edward Somerset, 1st earl of, 2nd marquis of Worcester** (1603–67). Somerset, known until 1645 as Lord Herbert, was born at Raglan and in 1642–5 held south Wales for the king, though taking little part in the military skirmishes. After \*Naseby, when the king's position was quite desperate, Herbert was made earl of Glamorgan (though the patent was not subsequently recognized) and sent to Ireland to treat with his fellow-catholics in the \*Kilkenny Confederation. His private instructions were to obtain Irish troops at all costs. Once in Ireland, he floundered in a confused situation, victim of Charles I's tricky diplomacy. Glamorgan's secret treaty made such sweeping concessions to the catholics, in exchange for the promise of 10,000 men, that, when it became known, the king was obliged to repudiate it. After the wars, Glamorgan made his terms with the Commonwealth and recovered his estates at the Restoration. His private interest was engineering and in 1663 he published a celebrated book, *Century of Inventions*: the 'water-commanding engine' which he exhibited at Vauxhall seems to have been an irrigation-pump rather than any form of steam-engine. JAC

**Glamorgan, kingdom of.** A medieval Welsh kingdom which emerged from an earlier kingdom called \*Morgannwg that covered most of south-east Wales. It may be equated with the post-Roman kingdom of Glywysing, whose line of

## Glamorgan

kings from Meurig ap Tewdrig lasted until the late 11th cent.; these kings extended their power in the 8th cent. to \*Gwent and Eryng (Archenfield) to create Morgannwg, probably named after Morgan ab Arthrwys (died c.665) or Morgan ab Owain (Morgan Hen, d. 974). Prior to the Norman invasions, there were uneasy relations with \*Deheubarth and \*Gwynedd. From the 1090s Robert \*Fitzhamon and the Normans occupied the lowlands and established a marcher lordship between the rivers Neath and Rhymni called Glamorgan; manors, knights' fees, and feudal sublordships replaced earlier Welsh divisions. The conquest accentuated the division between upland and vale, for descendants of native Welsh dynasties continued in the hills until the early 14th cent., acknowledging the overlordship of Deheubarth and, then, of Gwynedd. RAG

**Glamorgan, Mid, South, and West.** These three counties were created by the Local Government Act of 1972 and came into operation in 1974. They were in being for only 22 years before being replaced by a new set of unitary authorities in 1996. The problem facing local government reorganization in Wales in the 1960s was the great imbalance in population. At the 1971 census, Glamorgan, including the county boroughs of Cardiff, Merthyr Tydfil, and Swansea, accounted for 46 per cent of the whole population of Wales. Any reform necessarily involved the subdivision of Glamorgan to ensure some parity, but the nature of that division was controversial. The first proposals simply eliminated the small county borough of Merthyr and transferred the Rhymni valley to Gwent. But that accomplished little and, in any case, the county borough was not to be retained. A Consultative Document in 1971 proposed a simple twofold division into East and West Glamorgan, but in 1972 the Local Government Act set up a threefold division into: West Glamorgan, the Afan, Neath, and Tawe valleys and centred in Swansea; South Glamorgan, or Cardiff and its immediate hinterland; Mid Glamorgan, the coalfield valleys but extending across the vale of Glamorgan, via the drainage of the river Ogmere, to the coast. This was an incoherent area, the administrative centre of which remained in Cardiff, which was not part of it. The populations in 1991 were West Glamorgan 361,428, South Glamorgan 392,780, and Mid Glamorgan 534,101 respectively.

The lowered and balanced populations are evident and more in line with those of the other counties, but the late separation of South Glamorgan was widely regarded as politically motivated, an attempt by a Conservative government to retain the possibility of control of one local authority in south Wales.

The counties were replaced in April 1996 by eight unitary authorities. They are, with approximate populations in brackets, Swansea (232,000), Neath and Port Talbot (140,000), Bridgend (130,000), Vale of Glamorgan (119,000), Rhondda, Cynon, Taff (238,000), Merthyr Tydfil (60,000), Caerphilly (171,000), Cardiff (302,000). There were minor boundary adjustments made in creating these authorities. HC

**Glanvill, Ranulf** (d. 1190). One of Henry II's most influential legal and administrative experts, though what was

once his greatest claim to fame has been stripped from him as he is no longer regarded as the author of *The Laws and Customs of the Kingdom of England*, the first systematic treatise on English common law and a work still commonly referred to as 'Glanvill'. Younger son of a Suffolk baron, he became sheriff of Yorkshire in 1164, made his name as a soldier when he captured King William of Scotland at \*Alnwick in 1174, and then rose rapidly in Henry II's service. From 1180 he was chief \*justiciar at a time of significant development for the English legal system. According to a well-informed contemporary, Roger of Howden, 'by his wisdom the laws which we call English were established'. But he was notorious for corruption and was dismissed by Richard I. He went on crusade and died in 1190 at the siege of Acre. JG

**Glasgow**, an ancient burgh (1175–8), first developed as an ecclesiastical centre on a hill near the cathedral. Having a grammar school from the early 14th cent., in 1451 the burgh acquired its university by papal bull and became an archbishopric in 1492. An attractive residential market town with its annual summer fair, Glasgow, little affected by the Reformation, was remarkable for its amenities.

From the mid-17th cent. Glasgow began to develop its overseas trade with Europe and the American colonies. By 1668 Port Glasgow had been established by Glasgow merchants. After the \*Union of 1707 Glasgow dominated the tobacco trade because of natural advantages reinforced by superior organization, and the city with about 12,000 inhabitants in 1700 began to grow as a manufacturing centre with its merchants controlling fine linen production over a wide area and developing other industries.

By 1776 Glasgow merchants imported more than half of Britain's tobacco and had lucrative re-export markets in Europe. The improvement of Glasgow harbour and the development of a diversified industrial economy had also progressed; the problems posed by the American War led to the formation of the Glasgow Chamber of Commerce (1783) and the growth of the West Indies trade. Cotton imports became significant, and Glasgow by 1850 had become a manufacturing city with a population of 345,000.

The importance of cotton diminished in the late 19th cent., but this was offset by the rise of heavy industry. Situated in a region rich in coal and iron, Glasgow became a major shipbuilding and engineering centre, the Clyde leading the world for tonnage launched and railway rolling stock and machinery produced. These industries were supplied by engineering firms which competed in world markets. By 1911 Glasgow had become the second city of the empire with a population of just over 1 million. A city with massive housing and other social problems, Glasgow was economically successful up to 1920.

The 20th cent. witnessed the decline of heavy industries. They were vulnerable to the vagaries of world markets, lacked adequate capital investment, and their record in labour relations was poor. Glasgow acquired the reputation of a politically radical city, Labour taking more and more political control, and the corporation embarking upon a public housing programme from the 1920s. Service indus-

tries gradually provided more employment, and consumer industries became more significant. Glasgow has gone full circle, important for its amenities—education, leisure, entertainment—and white-collar employment. JB

**Glasgow cathedral.** The earliest church, dedicated to the Holy Trinity, was part of a monastic foundation established by St Kentigern (more popularly, St Mungo, d. 603) on ground consecrated by St \*Ninian in the 5th cent., where Kentigern had buried the holy man Fergus. This site is now covered by the Blacader aisle. The diocese of Glasgow was re-established by David I and the first stone building consecrated in 1136 in his presence; despite later major rebuilding under Bishops Jocelin (after fire damage) and Bondington, there is a generally unified appearance. Its importance as a place of pilgrimage was underlined by a papal decree of 1451 declaring that journeys to Glasgow and Rome were of comparable merit; Edward I made three visits to the tomb of St Kentigern and his shrine in 1301.

Although furnishings were stripped or damaged, the cathedral survived the Scottish Reformation in 1560, before being adapted to house three separate congregations. By 1835, it became possible to open up the interior again, but the fabric escaped the proposed restoration 'improvements' by Kemp, although the western towers were demolished. It is now crown property, worshipped in by the \*Church of Scotland in the reformed tradition, under presbyterian government. ASH

**Glastonbury**, a Somerset market town c.30 miles south of Bristol, is distinguished by a conical hill, Glastonbury Tor, rising out of the Somerset levels. Noted for its Iron Age lake village settlements, its magnificent medieval Benedictine abbey was a centre of pilgrimage, inspired by a complex of legends about \*Arthur, Joseph of Arimathea, the young Jesus, and the Holy Grail. A monastery existed here at least from the 6th cent., and in the 10th cent. under \*Dunstan was the centre of vigorous monastic reform. In 1184 fire destroyed the abbey. The monks, by skilful use of the legends and newly discovered relics, raised funds to rebuild on a glorious scale. At the abbey's dissolution (1539), Abbot Whitting was hanged on the Tor. WMM

**glebe** was a portion of land allocated to support a priest. Though originally it was intended as the sole support, it soon required substantial augmentation, usually through tithes. At the Norman Conquest, the glebe was twice the holding of a villein: in the 18th cent. many glebes were enlarged, either in compensation for enclosures or in lieu of tithes. JAC

**Glencairn, William Cunningham, 9th earl of** [S] (c.1610–64). Glencairn succeeded his father as earl in 1631. In 1647 Parliament appointed him lord justice general [S] but he entered into the \*Engagement in 1648 and was deprived of his post. In 1653 he headed a Scottish rising against the Cromwellian regime but was forced to come to terms. After the Restoration he was appointed chancellor [S] but was on uneasy terms with \*Lauderdale. JAC

**Glencoe massacre.** The massacre, on 13 February 1692, has remained one of the most potent 'myths' in Scottish history. As part of the pacification of the Highlands after the collapse of the Jacobite rising of 1689–90 a royal order required all clan chieftains to take an oath of allegiance to William and Mary. The chief of the Macdonalds who lived in Glencoe, 10 miles from Fort William on the north-west coast of Scotland, did so, but only after the time limit of 1 January. The Scottish secretary, Sir John \*Dalrymple, and the administration in Edinburgh used his lateness as a pretext to send a force to Glencoe to exact the submission of a clan known to be Jacobite in its sympathies. The officers and men of this force were Campbells, hereditary enemies of the Macdonalds, who had raided Campbell land as recently as 1690. After being given traditional Highland hospitality the soldiers turned on and massacred some 40 of their hosts, and many of those who escaped soon died in winter storms. William had not authorized the action, but he did not punish those held to be responsible by a 1695 commission of inquiry. His failure was vociferously exploited by Jacobite propaganda. JRJ

**Glenfruin, battle of**, 1603. The clan Gregor in Scotland had long been lawless and troublesome. After their attack on the Colquhouns on 7 February 1603 at Glenfruin near Loch Lomond, they were subjected to draconian measures, designed to extirpate or subdue them. JAC

**Glenlivet, battle of**, 1594. Throughout the 1580s and 1590s, the catholic lords in Scotland were in touch with Philip II of Spain about an invasion to restore catholicism. In October 1594 \*Huntly and Erroll joined forces and on the 3rd defeated at Glenlivet, south of Elgin, a larger royalist force led by the inexperienced Argyll. But the rebels did not pursue their victory, Spanish troops were not forthcoming, and they were forced into temporary exile. JAC

**Glenshiel, battle of**, 1719. A small Spanish force landed at Loch Alsh in April 1719 to support the Jacobite cause. But the other part of the invasion was aborted, they received little local support, and Wightman advanced against them from Inverness. On 10 June the two groups, each about 1,000 strong, met at Glenshiel. After a short engagement, the Scottish Jacobites fled and the Spaniards surrendered. JAC

**gliding.** Repeated attempts to glide by fitting wings ended in failure. But Sir George Cayley in 1852 at Brompton Hall, North Riding, sent his coachman a distance of 500 yards and in 1891 Otto Liliethal successfully launched himself in a hang-glider. As a sport, gliding developed after the \*First World War and at an international meeting in Sussex in 1922 a flight of 3 hours 21 minutes was achieved. Thermal soaring enabled long flights to be made and by 1939 the world records were 465 miles and 22,500 feet in height. Considerable use was made of gliders during the invasion of Normandy in 1944. Hang-gliding, the pioneer of the sport, made a come-back in the 1970s. JAC

**Globe theatre.** Built 1598/9 on Bankside in Southwark, by Richard \*Burbage the actor and his brother Cuthbert, its sign showed Hercules carrying the globe on his shoulders.

## Glorious First of June

The company used it during the summer since it was not roofed. Burned down in 1613 during an over-ambitious performance of *Henry VIII*, it was rebuilt but closed by the puritans in 1642 and demolished. Admission was a penny for the pit, twopence for the gallery, and threepence for seats. \*Shakespeare was both a shareholder and an actor and several of his plays, including *Romeo and Juliet*, *Othello*, *Lear*, and *Macbeth*, were first performed there. A replica of the first theatre was opened in 1996. JAC

**Glorious First of June, 1794.** An Anglo-French naval battle fought some 400 miles out in the Atlantic from the Breton peninsula, which shelters the French naval base of Brest. Though the opposing fleets were of similar strength, the French under Villaret de Joyeuse were rather more concentrated than Lord \*Howe's better-found and manned ships: Howe's strategy was to watch Brest from Torbay, giving cover to Britain's Atlantic traffic, and to her West Indies possessions. The battle's immediate cause was Villaret de Joyeuse's evasion of Howe in order to cover a 117-strong convoy bound for Brest from America with 67,000 barrels of wheat flour for the critically under-provided French capital. Hence the French fleet putting to sea had been a political imperative. By a brilliant chase in foggy conditions, Howe intercepted the French, taking six ships prize and sinking another. As against 1,500 French killed there were only 300 British, with no ships lost. But the convoy from America reached Brest unscathed on 15 June. Though in some circles seen as a partial and overdue success for Howe, popularly his action was deemed a triumph over French republicanism. DDA

**Glorious Revolution.** Title given to the revolution of 1688–9, which resulted in the 'abdication' of James II and the succession of William III and Mary II. Participants had differing objectives. Tories and Anglican clergy wanted to stop James undermining the church. Whigs aimed to depose James and limit the powers of the crown. Ordinary people detested James for his catholicism. William needed to remove a potential ally of Louis XIV and lead England into the war against France that had just begun. Louis left James unassisted, calculating that William's army would be tied down in an English campaign.

William had earlier established clandestine connections with leading politicians and army and navy officers hostile to James's policies. In June 1688 he instigated an invitation from two Tories, four Whigs, and Bishop \*Compton to intervene in order to prevent James continuing to favour catholics, expand and purge the army, and manipulate elections for a parliament that was to sit in November. The birth that month of an infant prince to James had transformed the political future: he would succeed James in place of Mary (his eldest, protestant daughter, married to William). But most people were persuaded that the infant was 'suppositious', somebody else's baby smuggled in to give the appearance of a royal birth. William's intervention was necessitated by the size of James's professional army. However, William was promised that most of its officers would defect. When this happened soon after William landed at Torbay on 5 November James found that he could not fight a battle.

William moved on London unopposed while his adherents took over provincial centres. Demoralized, James tried to fly the country but was stopped. A second successful escape to France was the direct result of William's pressure. This left a vacuum. Tories wanted his return as a limited king, or for a regent to rule for him, or for Mary to reign as queen. Instead the \*Bill of Rights (1689) followed the Whig formula, construing James's flight as abdication, declaring the throne vacant, and William and Mary as joint sovereigns. But the limits it imposed on the crown were less than the Whigs desired. It made illegal royal claims to suspend laws and maintain an army without parliamentary approval. It barred catholics from succeeding. In Scotland the Revolution went further. James was deposed. Bishops were abolished, presbyterianism restored. Civil war resulted. JRJ

**Gloucester** (Roman) was successively a Roman legionary fortress and the *colonia* of *Glevum*. The earliest Roman military site, of c. AD 50, was at Kingsholm by an old channel of the Severn. The move to the present site took place in the mid-60s with the building of a legionary fortress (garrison uncertain). This was turned into a *colonia* for legionary veterans under Nerva (96–8). As at \*Colchester the military buildings were converted to civil use: the headquarters building became the forum, and barracks became housing. The *colonia* retained the legionary defences, fronted in stone as a mark of status. This gave a defended area about half that for towns of comparable rank, but there were extensive suburbs, in one of which has been found a tiler's workshop with products bearing stamps, some referring to the municipality and its magistrates. Another fronted a major Severn-side quay. As elsewhere, well-appointed houses became more common at Gloucester in the 3rd and 4th cents. Some were occupied into the early 5th cent., but there is no evidence that the town was still in being when it fell to the Anglo-Saxons after the battle of \*Dyrham in 577. ASEC

(post-Roman) Gloucester revived as a royal and ecclesiastical centre in the 7th cent., and as a fortified and planned town (*burh*) in the 9th. Situated at the lowest point bridgeable on the Severn (until 1966), it was long an important inland port. The medieval town was dominated by St Peter's abbey (created the cathedral in 1541) and the Norman castle: the Norman kings wore their crown at Gloucester annually and the town then ranked among the ten richest in England. It remained prosperous until the 15th cent., but in Tudor and Stuart times suffered an economic decline and developed a radical tradition. It held out for Parliament in a siege of 1643, perhaps the turning-point in the first civil war, and was punished for it after 1660. In 1780 Robert Raikes started the national Sunday school movement there. From the 1820s there was rapid industrial growth, lasting until the mid-20th cent. DMP

**Gloucester, diocese of.** The see, roughly coterminous with Gloucestershire, was founded in 1541 by Henry VIII from part of the \*Worcester diocese. From 1836 to 1897 it was united with Bristol in a combined new diocese to allow new sees for Ripon and Manchester without increasing the total episcopal bench. Its first bishop was John Wakeman, abbot of Tewkesbury. John \*Hooper (1551–5), notable for his

close association with extreme continental reform, in particular Zwingli and Laski, was a vigorous reformer within the diocese, but was burned at the stake for heresy in 1555 under Mary. Consequently there was within the diocese a strong tradition of puritanism, which became a target for both James I and \*Laud. James Monk (1830–56) was a vigorous bishop, who did much to improve the finances of livings. The Norman cathedral, previously St Peter's Benedictine abbey church, was partly transformed in perpendicular style, reputedly the earliest example, by the inflow of money from pilgrims to the shrine of Edward II. The tomb of \*Robert of Normandy, William I's eldest son, who died in Cardiff castle, is also there. The 14th-cent. fan-vaulted cloisters are among the finest in England. WMM

**Gloucester, Gilbert de Clare, 4th earl of** (d. 1230). Gloucester, who inherited the title in 1217, had been one of the barons in opposition to John and was among the 25 appointed in 1215 to see that \*Magna Carta was carried out. Consequently he was excommunicated by Innocent III when John did his deal with the papacy. After John's death, Gloucester supported the dauphin's attempt on the throne and was captured at the battle of \*Lincoln in 1217. In later years he campaigned against the Welsh. He is buried in Tewkesbury abbey, to which he had been a great benefactor. His widow married \*Richard of Cornwall, younger brother to Henry III. JAC

**Gloucester, Gilbert de Clare, 6th earl of** (1243–95). On his entrance into public life on succeeding his father in 1262, Gloucester joined de \*Montfort's party in opposition to Henry III and fought at \*Lewes in 1264 capturing the king. But he soon changed sides, joined Prince Edward, and was prominent in the defeat of de Montfort at \*Evesham in 1265. By 1267 he was once more at odds with the king, occupied London, and negotiated terms on behalf of the 'dispossessed', de Montfort's former supporters. Much of his time was devoted to holding back the Welsh under \*Llewelyn and he was responsible for the building of the great castle at \*Caerphilly. Next he saw service against the Scots and from 1292–3 was in Ireland. His second wife, married 1290, was Joan, a daughter of Edward I. He was buried at Tewkesbury. JAC

**Gloucester, Gilbert de Clare, 7th earl of** (1291–1314). Son of the 6th earl by his second wife, de Clare was therefore nephew to Edward II and was brought up with the young king, who was seven years older. He inherited the title at the age of 4. He seems to have tried to moderate the animosity caused by Edward's favourite, Piers \*Gaveston, who had married his sister. He acted as guardian or regent in 1311 and again in 1313. His political future seemed to be assured but he was much employed in warfare against the Scots and was killed in the thick of the fighting at \*Bannockburn. JAC

**Gloucester, Humphrey, 1st duke of** (1390–1447). The youngest son of Henry IV and brother of Henry V. Created duke of Gloucester in 1414, Humphrey played a prominent role, both in France and at home, during his brother's reign. He became protector of England following Henry's death in 1422, surrendering the office in 1429 when Henry VI was

crowned, but continued as president of the minority council until 1437. These years were dominated by his quarrel with Cardinal \*Beaufort, which caused disruption in 1425–6, 1432, and 1440. Fiercely loyal to the memory of his dead brother, Gloucester emerged in the 1430s as the principal opponent of moves towards peace. As a result, after the king came of age, he was edged from influence. The scandal of his duchess's trial for witchcraft finally discredited him in 1442. But still perceived as a threat to the court faction, in 1447 he was accused of treason, imprisoned at Bury St Edmunds, and died in suspicious circumstances before he came to trial. Posthumously he acquired the reputation of Good Duke Humphrey. He commissioned the first official history of Henry V, patronized John \*Lydgate, England's leading poet, and sponsored English humanist scholars. He bequeathed his substantial library to the University of Oxford, where it forms the nucleus of the Bodleian collection. He died childless. AJP

**Gloucester, Richard de Clare, 5th earl of** (1222–62). Succeeding his father in the earldom at the age of 8, he became a ward of Hubert de \*Burgh, whose daughter he married. His estates were on the Welsh border and in Ireland. His political course appears fluctuating. In 1258 he joined the barons trying to restrain the conduct of Henry III but he died before the civil war began and was buried at Tewkesbury. Matthew of Paris lamented that his great talents were ruined by avarice. JAC

**Gloucester, statute of**, 1278. This was an important attempt by Edward I to tighten up royal authority. Writs of \*quo warranto were to be issued to anyone claiming territorial franchises. The decision was much resented by the older nobility and the Earl \*Warene was said to have protested sword in hand. But, in practice, most franchises for which no warrant or charter could be produced were confirmed on payment of a fine. JAC

**Gloucester, Thomas, duke of** (1355–97). Also known as Thomas of Woodstock, from his birthplace. He was the youngest son of Edward III, brother of \*John of Gaunt, and uncle to Richard II. In 1376 he was declared constable of England and acted as such at his nephew's coronation. On that occasion he was created earl of Buckingham and in 1380 received the Garter. He added the earldom of Essex in 1380. After serving in France and against the Scots, he was created duke of Gloucester in 1385. He took a prominent part against the royal favourite Michael de la \*Pole. In 1387 he defeated de Vere (\*Oxford) at \*Radcot Bridge, occupied London, seized the king, and used the \*Merciless Parliament against his adversaries. For some years there was an uneasy *rapprochement* with Richard, but in 1397 Gloucester was seized, at the king's orders, and taken to Calais, where he died, having apparently been smothered under a feather bed. JAC

**Gloucestershire** falls naturally into three parts: the eastern hills of Cotswold limestone from Wincombe down to Bath, spilling towards Oxfordshire at Stowe and Fairford; the central heavy clay valley of the Severn from Tewkesbury down to Avonmouth; and the old red sandstone, wooded

Forest of Dean in the west, for centuries a community cut off from its neighbours. At Gloucester itself, until the opening of the Severn bridge in 1966, was the highest road bridge over the river, giving it a critical strategic position between south Wales and the west of England. Gloucestershire is one of the bigger counties, even after losing part of its southern fringe to \*Avon in the local government reorganization of 1972. From Chipping Campden in the north to Marshfield in the south is over 50 miles, and from Coleford to Lechlade, west to east, is nearly as far. The balance of the county has been much affected by two great towns. \*Bristol was a major city with a mint well before the Conquest and in 1373 was given status as a county in its own right, the first town to be granted such a privilege. Consequently it was outside county government, though remaining in the economic and cultural orbit. Cheltenham was a mushroom development of the late 18th and early 19th cent., after the celebrated visit by George III in 1789 had helped to spread the fame of its waters. In 1801 it had 3,000 inhabitants to Gloucester's 8,000. But within ten years it had overtaken its neighbour, and by 1901 was a town of 45,000.

Roman Gloucestershire was prosperous. A military base was soon established at \*Gloucester (Glevum); \*Cirencester (Corinium) became the second largest town in Roman Britain; great villas at \*Woodchester and at \*Chedworth testify to the wealth of some of the inhabitants; a network of roads, including Ermine Way, \*Fosse Way, and \*Akeman Street gave easy communication with the rest of the province, and another road ran to the Forest of Dean to enable the iron to be exploited. The local inhabitants were the \*Dobunni tribe. After the withdrawal of the legions, much of Gloucestershire fell to the Saxons in 577, when \*Ceawlin of Wessex defeated British chiefs near Cirencester. But Wessex did not long retain the area. In 628, \*Penda, pagan king of \*Mercia, defeated the Wessex levies, also at Cirencester, and took possession. The eastern part became the kingdom of the \*Hwicce under Mercian overlordship: the western fringes of the Forest of Dean formed part of the autonomous kingdom of the \*Magonsaetans. This division was reflected in the ecclesiastical organization. The Hwicce territories became part of the see of \*Worcester, while the Magonsaetans fell under the jurisdiction of \*Hereford, founded in 676. \*Æthelfleda, lady of the Mercians, fortified Winchcombe and Gloucester against Danish inroads in the early 10th cent., and was buried at Gloucester. The area then changed hands again, falling once more to Wessex: \*Athelstan pushed back the Welsh, with the boundary becoming the Wye rather than the Severn, and died at Gloucester in 940.

After the Norman Conquest, Gloucestershire, first named as a county in 1016, was still a frontier region, and the earl of Gloucester was given \*palatine powers. William of Malmesbury, in the early 12th cent., described the region in idyllic terms: the soil was so fertile that it bore fruit 'of its own accord'; the vineyards were prolific; 'the villages are thick, the churches handsome, the towns populous and many.' By \*Camden's time, in Elizabeth's reign, the vineyards had all gone, which he blamed on the sloth of the inhabitants, but the Cotswold pastures had proved ideal

for sheep, and a flourishing cloth industry had established itself around Stroud and Dursley. The establishment of a bishopric at Gloucester in 1541, after the \*dissolution of the monasteries, gave a shot in the arm to the county town. In the 17th cent. tobacco growing flourished for some years before the government closed it down to give protection to the new American colonies.

In the 18th cent. Gloucestershire was divided politically between the Beauforts and the Berkeleys, who, after an expensive election contest in 1776, reached agreement to share the county seats. Increasingly the county was knit together by improvements in transport. The Thames and Severn canal through Sapperton tunnel in 1789 never fulfilled the high hopes, and the Hereford and Gloucester canal linked two towns of only moderate importance. But the Gloucester and Berkeley canal in 1827 shortened the line of the Severn and enabled Gloucester to remain a busy port. Railways arrived in the 1840s—first the narrow gauge line from Birmingham to Gloucester, then broad gauge lines to Gloucester from Bristol and from Kemble. The change of gauge at Gloucester was for many years a major obstacle until the Great Western gave up the struggle in 1872. The Worcester to Oxford line, passing through the county via Moreton-in-Marsh, opened in the 1850s, but remained more picturesque than profitable, until in the late 20th cent. it found a new lease of life serving commuter traffic to Oxford. The western parts of the county were opened up by the railway bridge at Sharpness in 1879 and by the Severn tunnel in 1885.

As the cloth industry in the east and mining in the west went into decline, the county's industries diversified—wagon works at Gloucester, aeronautics at Bristol, piano-making, printing, furniture, chemicals, and tourism in the Cotswold valleys. In the 1960s the county was criss-crossed by the M4 running east-west and by the M5 running north-south: the interchange at Almondsbury was briefly a traffic sensation. Even more important was the Severn bridge in 1966 which brought to an end the old Beachley-Aust ferries: queueing for the ferry had once been a regular bank-holiday activity, and generations of Gloucestershire people had watched the last ferry disappear into the sunset before starting wearily on the 60-mile diversion via Gloucester.

JAC

**Glyndŵr** (Glendower), **Owain** (c.1359–c.1415), self-styled prince of Wales. A wealthy landowner in north-east Wales, his father was descended from princes of \*Powys and his mother from princes of \*Deheubarth. His rising (1400–10) was a serious and costly threat to the usurper Henry IV. Owain was a well-to-do gentleman, trained at the Inns of Court, serving in Richard II's armies against the Scots (1384–5), and becoming a retainer (by 1387) of the lord of Chirk, Richard Fitzalan, earl of Arundel. He married Margaret, daughter of Sir Edward Hanmer, a distinguished judge. By 1400 conditions in Wales were ripe for rebellion: there was racial tension between Welsh and English fanned by poets and propagandists; economic and social dislocation after the Black Death was made worse by the crown and English nobles exploiting their Welsh resources more harshly; and the Welsh church was dominated by an

English hierarchy at the expense of Welsh priests. French meddling and encouragement from Scotland and Irish lords fed the resentment, and risings before 1400 (especially by Owain Lawgoch in the 1370s) were a foretaste of widespread unrest.

Glyndŵr took the lead partly because of personal grievances against Lord Grey of Ruthin and Henry IV. He was proclaimed prince of Wales by friends and relatives at Glyndyfrdwy (Merioneth) on 16 September 1400, and attacked Grey's estates and towns close to the English border. He relied on his kinsmen, especially the Tudors of Anglesey who captured \*Conwy castle (April 1401). Owain advanced into central and south Wales following a victory in the Plynlimmon mountains (1401); his capture of Lord Grey (April) and the uncle of Edmund \*Mortimer, earl of March and claimant to the English throne (22 June), was a political coup, especially when the captive Mortimer married Owain's daughter. Expeditions led by Henry IV (1400–3) achieved little, and Parliament (1401–2) panicked into passing legislation to curb the rights of Welshmen. Owain sought allies among other rebels, especially the Percy family and the earl of March's supporters, though Henry IV's victory at \*Shrewsbury (21 July 1403) was a set-back. Owain focused on south Wales, capturing several castles, as well as Aberystwyth and Harlech (1404). He negotiated the treaty of Paris with Charles VI of France (14 July 1404), and he 'and his hill-men' held assemblies at Machynlleth, Harlech, and Pennal (1404–6) where ambitious plans were laid for an independent principality. These included support for the Avignon pope, a Welsh church, university, and civil service, and a principality extending into the English midlands. Although French troops landed in Milford Sound to assist him, 1405–6 saw significant reverses, and his French and Percy allies faded away. Aberystwyth and Harlech capitulated in 1408, and Owain's wife and two daughters were captured. Following a raid in Shropshire in 1410, Owain disappeared; he refused a pardon from Henry V in 1415 and may have died soon afterwards.

RAG

**Goderich, Frederick John Robinson, 1st Viscount** (1782–1859). Prime minister. Educated at Harrow and St John's College, Oxford, Goderich entered Lincoln's Inn in 1802 but was never called to the bar. In 1806 he sat as a moderate Tory for Carlow and a year later for Ripon, a seat he held for over twenty years. From 1813 to 1817 he acted as joint paymaster-general of the forces and accompanied \*Castlereagh to the continent for the Vienna peace negotiations. In 1815 he introduced 'with great reluctance' the notorious measure to prohibit the importation of wheat until the average price in England was 80 shillings per quarter. From 1823 to 1827 Goderich served as chancellor of the Exchequer. Along with \*Huskisson at the Board of Trade he introduced sweeping fiscal reforms to reduce customs duties and tax. The economic improvement led \*Cobbett to nickname him 'Prosperity Robinson'. He was created viscount in 1827 and became leader of the Lords. Despite being a popular man in the Commons, Goderich was less effective in the Lords. In August 1827 he became prime minister after \*Canning's death. Although able, Goderich was unsuited

to the task due to lack of resolution. He resigned in January of the following year and became secretary for war and the colonies in the \*Grey administration of 1830. In 1833 he was created earl of Ripon and made lord privy seal. 'A transient and embarrassed phantom', was Disraeli's description in *Endymion* of Goderich's premiership.

RAS

**Godfrey, Sir Edmund Berry** (1621–78). On 17 October 1678, in the middle of lurid allegations by Titus \*Oates of a \*popish plot to assassinate Charles II, the body of Godfrey, the magistrate who had taken Oates's evidence, was found on Primrose Hill (London). He had been missing for five days. Godfrey, a tall, stooping man, was a prosperous London wood merchant, educated at Christ Church, Oxford, and knighted for his exertions during the plague year. Money and jewellery had been left untouched and Godfrey had been run through with his own sword, though death appeared to have been by strangulation. It was readily assumed that he had been done to death by papists and a catholic silversmith, Miles Prance, was taken up and confessed. Three fellow-conspirators were then hanged. But in 1686, after the accession of James II, Prance was convicted of perjury and pilloried. Godfrey had predicted prior to his disappearance that he would be knocked on the head. Suicide seems improbable. Murder by Oates's friends to fan the flames of suspicion is possible. Pollock suggested that Godfrey had been murdered by catholics to suppress secrets that he knew, through his friendship with Edward Coleman, about the future king. A last possibility is that the murder was not political or connected with the plot at all. JAC

**Godiva** (Godgifu) (d. between 1057 and 1086). Wife of Earl \*Leofric of Mercia. To obtain her request that Coventry be relieved of a heavy toll, she is alleged to have ridden naked through the market. The legend obscures her reputation as founder and benefactress of religious establishments. A number of monasteries were recipients of her own and Leofric's generosity. Together they founded and richly endowed the Benedictine monastery and church at Coventry in 1043, where relics included an arm of St Augustine of Hippo bought by \*Æthelnoth, archbishop of Canterbury. The church was said to be resplendent with Godiva's gifts of gold and precious stones, and on her death she left a jewelled rosary to be placed on the image of the Virgin Mary, to whom she was especially devoted. She and Leofric were both buried in their Coventry church. Roger of Wendover in the 13th cent. first related her ride; 18th-cent. writers embellished it with picturesque detail like 'Peeping Tom'.

AM

**Gododdin, kingdom of the.** A British kingdom of the 6th cent. in south-east Scotland. Ptolemy recorded that the area was occupied in Roman times by the \*Votadini, whose capital was at Traprain Law, near Haddington. In the 5th cent. they seem to have moved their capital west to Edinburgh and re-emerge as the Gododdin. \*Aneurin's heroic poem in Welsh tells of a carefully planned raid by the Gododdin on the Anglo-Saxon kingdoms of \*Bernicia and \*Deira, and of the battle at \*Catterick (c.600). The Gododdin were utterly routed: 'of three hundred, save one man, none returned.'

## Godolphin

The Anglo-Saxons continued their advance into Lothian and after they had taken Edinburgh in 638, the kingdom of the Gododdin disappeared. JAC

**Godolphin, Sidney Godolphin, 1st earl of** (1645–1712). Prime minister. MP for Helston (1668–79) and St Mawes (1679–81), Godolphin was created baron (1684) and earl (1706). A Tory by inclination, he was the archetypal bureaucratic politician, described as ‘never in the way and never out of it’, who held the offices of a lord of the Treasury (1679), secretary of state for the northern department (1684), 1st lord of the Treasury (1684–5, 1690–6, 1700–1), chamberlain to Queen Mary of Modena, and a commissioner of the Treasury (1687). From the accession of Anne, he and \*Marlbrough (the ‘duumvirate’), and from 1704 to 1708 with Robert \*Harley (the ‘triumvirate’), as political managers, ran the government, Godolphin being lord treasurer and, effectively, prime minister (1702–10). His forte was in financial affairs, and he was responsible for raising the money which enabled England to fight 20 years of continental wars. He found himself increasingly unable to withstand political pressure from the Whig Junto and the duchess of Marlborough, and from 1706 the Whigs began to take over the ministry, leading to Harley’s resignation in 1708. Harley intrigued with the queen and took his revenge in 1710 when Godolphin was dismissed. CJ

**Godwin, William** (1756–1836). English writer and novelist. In 1793 Godwin published his anarchist masterpiece *Enquiry Concerning Political Justice*, which caught the public imagination and made his reputation. He argued against the use of coercion of any kind, whether political, ecclesiastical, or military, not because it violated natural rights, but because it was corrupting and counter-productive. Godwin was an extreme determinist, rejecting the idea of free will: indeed he asserted that the ‘assassin can no more help the murder he commits than the knife in his hand’. He claimed that the ills of society were due to the bad influences exerted on people, largely by governments, and that the path to improvement lay in the power of reason, not coercion. In the ideal society there would be no government and no punishment: individuals would live in harmony because of their mutual grasp of reason. In 1797 Godwin married Mary \*Wollstonecraft, who died two years later giving birth to their daughter Mary, who married \*Shelley. TSG

**Godwine, earl of Wessex** (d. 1053). Godwine rose to prominence in the reign of \*Cnut, as one of his chief advisers, and has traditionally been held responsible for the brutal death of Æthelred the Unready’s exiled son \*Alfred in 1036. When the Danish line ended (1042), Godwine supported the accession of Alfred’s brother Edward, who married Godwine’s daughter. When his sons were established in earldoms, his area of influence was vast. In 1051, he defied Edward’s order to harry Dover after an affray with men of Boulogne, and mustered a great force, bringing England to the brink of civil war. But the earls of Mercia and Northumbria supported the king, the matter was referred to the \*witan, and the Godwines were exiled. Resentment of an increasing foreign entourage around the king may account

for the support Godwine gathered when he returned the next year, obtaining reinstatement and the dismissal of many Normans. Within a few months Godwine died, his enemies said choking while protesting his innocence of Alfred’s murder. Wessex passed to his son \*Harold, who died at \*Hastings in 1066. AM

**Gold Coast.** see GHANA.

**Golden Jubilee, 1887.** The fiftieth anniversary of Victoria’s accession saw a well-orchestrated outburst of loyalty. Lord \*Rosebery assured the queen that the previous fifty years would be considered ‘the golden age of English history’. The Round Tower at Windsor was illuminated by electrical light, prisoners amnestied, medals struck, statues erected, the fleet reviewed at Spithead, and a thanksgiving service held at Westminster abbey with music by the late Prince Albert. ‘And all was the most perfect success,’ wrote Victoria afterwards. It set the pattern for the \*Diamond Jubilee of 1897 and subsequent royal celebrations. JAC

**Goldsmith, Oliver** (1728–74). Man of letters. Born in Ireland, the son of an Anglican clergyman, Goldsmith attended Trinity College, Dublin, before briefly studying medicine in Edinburgh and Leyden. On settling in London from 1756, he supported himself partly as a physician, partly as a hack-writer, and partly by borrowing from friends. But he gradually pulled himself out of Grub Street and began to acquire a reputation. His poem *The Traveller* (1764) was well received; a novel *The Vicar of Wakefield* (1766) has remained a minor classic; *The Good-Natured Man*, a comedy (1768), had a respectable stage run; *The Deserted Village* (1770) touched the chord of nostalgia and was much admired; the *History of England* (1771), though derivative, sold well; *She Stoops to Conquer* (1773), which Goldsmith claimed was based upon personal experience, was a great success. Goldsmith was a strange man, feckless, naïve, unworldly, generous. \*Boswell, a fellow-member of the Club, treated him as a butt and buffoon, but \*Johnson admired him as ‘a very great man’. He died heavily in debt, and Horace \*Walpole wrote of him, not unfairly, that ‘he had sometimes parts, though never common sense’. JC

**golf.** Though the Dutch game of *kolf* has been claimed as the origin, the first undoubted reference to golf was in 1457 when the Scottish Parliament deplored its popularity, along with that of football, since it took young men away from archery practice. James VI and I is said to have taken golf clubs with him when he moved south in 1603. But the great development of the game was in the later 19th cent. The handful of golf clubs in the early decades had risen to a dozen by 1870 and well over 1,000 by 1914. The first British open championship was held at Prestwick in 1860 and, since professionals dominated, an amateur championship at Hoylake in 1885. The main developments have been the standardization of the number of holes; the evolution of balls from the original wooden or feather-filled balls to cheaper gutta-percha balls in the 1840s and more aerodynamic rubber balls in the early 20th cent.; and the introduction of specialist clubs, up to a maximum of fourteen. The British

governing body is the Royal and Ancient Club at St Andrews, founded in 1754. JAC

**Good Parliament** (1376). This Parliament saw the first use of \*impeachment by the Commons, and the emergence of the office of Speaker. There was widespread discontent with an ineffective and apparently corrupt government. Charges were brought against the chamberlain, William Latimer; a London merchant much involved in government finance, Richard Lyons; the king's mistress Alice Perrers; the steward of the royal household, John Neville, and others. It appears to have been the knights of the shire who led the attack, though it may be relevant that Peter de la Mare, the Speaker, was the earl of March's steward. The Commons' triumph did not last long; the government, guided by \*John of Gaunt, undid most of their work in the following year. Those who had been found guilty received royal pardons, and Peter de la Mare was imprisoned. MCP

**Gordon, Charles George** (1833–85). British soldier and Christian mystic. After serving with distinction in the \*Crimean War (1853–6), Gordon gained public acclaim by his exploits in China (1860–5) where he showed his great talents as a military engineer and as commander of irregular troops in the defence of Shanghai during the Taiping rebellion. Seconded to the service of the khedive of Egypt as governor of Equatoria (1873–6) and then as governor-general of the Sudan until 1880, Gordon mapped the upper reaches of the White Nile, successfully combated the slave trade which used the river, and established firm administrative control over the whole region. He returned to the Sudan in 1884 to evacuate Egyptian troops threatened by the forces of the Mahdi, a Muslim revivalist who had declared a holy war against the Egyptian government. A relief force failed to arrive in time and Gordon was killed in Khartoum in January 1885. KI

**Gordon, Lord George** (1751–93). Soon after his election to Parliament in 1774 Lord George, third son of the 3rd duke of Gordon, began to exhibit signs of mental derangement and religious mania. His frequent lectures to the House of Commons were not much appreciated: 'the noble lord has got a twist in his head,' remarked one sympathetic member, 'a certain whirligig which runs away with him if anything relative to religion is mentioned'. Gordon's reply was that he and his supporters 'had not yet determined to murder the king and put him to death, they only considered that they were absolved from their allegiance'. On 2 June 1780, as president of the Protestant Association, he presented a monster petition denouncing concessions to the catholics. Six days of rioting and looting followed and Gordon was tried for treason. It was argued on his behalf that he had not intended violence and had tried to discourage it, and he was acquitted. He subsequently converted to Judaism and, convicted of libel, spent the last five years of his life in comfortable confinement in Newgate prison. See also GORDON RIOTS. JAC

**Gordon riots**, 1780. The greatest outburst of civil disorder in modern British history. They lasted for six days from 2 to 8 June and did enormous damage in London. They began

with the presentation by Lord George \*Gordon of a petition to Parliament against recent concessions to the catholics, but violent and criminal elements soon took over. Prisons were attacked and the inmates released, catholic chapels destroyed, breweries, taverns, and distilleries plundered, and the houses of catholics and magistrates set on fire. Order was with difficulty restored after troops had been called out. Many members of the mob lost their lives, shot by the military, engulfed by flames, or buried in rubble. In all, 135 were put on trial, 59 capitally convicted, and 26 hanged, including a Jew, a negress, a one-armed man, and 'a poor, drunken cobbler'. The riots were used by Dickens as the backcloth to *Barnaby Rudge*. JAC

**Gore, Charles** (1853–1932). Bishop of Worcester, Birmingham, and Oxford. Born at Wimbledon, educated at Balliol College, Oxford, Gore was an \*Anglo-catholic of liberal views and strong social conscience. As fellow of Trinity College (1875) and first principal of Pusey House (1884–93) he probably had more effect on Oxford University religious life than anyone save \*Newman. He founded the Community of the Resurrection (1892) for celibate priests, established at Mirfield 1898, of which he was superior until 1901. His controversial essay in *Lux mundi* on 'The Holy Spirit and Inspiration' (1889) and *The Incarnation of the Son of God* (1891) displayed his liberal theology. As bishop of Worcester (1902), he promoted the carving of a new Birmingham diocese out of Worcester. He made a powerful impact as Birmingham's first bishop (1905), and moved with reluctance to Oxford (1911), where he was involved in incessant controversy. He travelled widely, to India, America, the Near East, and the front during the war. Resigning his see to write, preach, and travel, he lived ascetically in London. WMM

**Gorham judgment**, 1850. George Gorham (1787–1857) was an Anglican minister with a taste for antiquarian and theological pursuits and a leaning towards calvinist views on baptism. In 1847 Lord Chancellor \*Cottenham wished to present him to the living of Brampford Speke in the diocese of Exeter, but the bishop, Henry Philpotts, refused. A protracted legal action then ensued, the Privy Council deciding in 1850 in favour of Gorham, whose supporters presented him with a silver tea service. JAC

**Goring, George** (1608–57). Royalist commander in the Civil War. Despite being universally disliked, George, Lord Goring, rose high in the king's service. He was first under \*Newcastle in Yorkshire and gained a notable victory over Sir Thomas \*Fairfax at Seacroft Moor in March 1643. At \*Marston Moor, in 1644, he commanded the left wing of the royalist army. After driving Fairfax's cavalry from the field, his men returned in disorder, and were routed by \*Cromwell's cavalry. Goring's ambition divided the royalists and the outrageous behaviour of his troops towards civilians discredited their cause. After \*Naseby, Goring was forced to give up the siege of Taunton by the approach of Sir Thomas Fairfax's victorious army. Despite the tactical brilliance with which Goring deployed his men at \*Langport, they were easily vanquished in July 1645. Goring then fled the country and joined the service of Spain, where he died. \*Clarendon,

no friend, recognized Goring's wit and courage, but declared that he could 'without hesitation, have broken any trust, or done any act of treachery'. JIG

**Goschen, George Joachim, 1st Viscount** (1831–1907). A front-rank and long-serving politician in his day, Goschen is now remembered chiefly in one phrase. He was the grandson of a Leipzig publisher: his father settled in London as a merchant in 1814. Goschen was sent to Rugby and Oxford to get an English education, took first-class honours in classics, and was president of the Union. By 1858 he was a director of the Bank of England, entered the Commons in 1863 as the Liberal member for London, and remained in Parliament all his life. Given junior office by \*Russell in 1865, he was brought into the cabinet the following year as chancellor of the duchy of Lancaster, and served as president of the Poor Law Board 1868–71, 1st lord of the Admiralty 1871–4 and 1895–1900, and chancellor of the Exchequer 1887–92. Given a viscountcy in 1900, he was chancellor of the University of Oxford from 1903. A financial expert, useful speaker, good administrator, Goschen was a safe pair of hands. 'A violent moderate' was his own description and he became increasingly uneasy at the Liberals' drift towards radicalism, refusing to serve in Gladstone's second ministry. After the Home Rule crisis of 1886, he joined \*Hartington in leading the \*Liberal Unionists. When Lord Randolph \*Churchill resigned dramatically from Salisbury's government in 1886, expecting to be recalled, his place was filled by Goschen, and not a dog barked. 'I forgot Goschen,' explained Lord Randolph ruefully. JAC

**Gothic architecture.** The main medieval style in western Europe, characterized by the pointed arch, slender columns and shafts, buttresses, pinnacles, and increasingly complex ceiling vaulting and window tracery. Courtly and sophisticated, often with chivalric connotations and redolent of theological symbolism, it found its fullest expression in the great cathedrals and churches of the Middle Ages; in Britain it flourished until the 16th cent., when many parts of Europe had adopted Renaissance forms.

Higher, lighter, and more delicate than the massive Romanesque or Norman style which it superseded, Gothic has been memorably described by Gombrich as *thé epitome of the 'church triumphant' rather than the earlier 'church militant'*. The origins of Gothic are obscure—the adoption of the pointed arch may well have stemmed from contact with the Saracens during the crusades—but probably lie in northern France during the late 12th and early 13th cents.

Before long, the English were making a major contribution, as in the nave of Wells cathedral or the western choir of Lincoln, both designed shortly before 1200. Another good example is Salisbury cathedral, unusual in being largely the product of a single building programme (c.1220–84), and where the usual emphasis on verticality occurs even more in the slightly later tower and spire than in the interior. Many English cathedrals combine Gothic with earlier Norman work and were built and rebuilt over several centuries, which accentuated their distinctive, even occasionally eccentric, character. For example, the early Gothic western façade of Peterborough cathedral (c.1193–1230) is far wider than the

(Norman) nave hidden behind, as is that at Wells (c.1230–60), where, above tiny entrance portals, the effect is one of a screen of sculptured figures. At Lincoln, the western towers and upper portions of the façade (13th and 14th cents.) are grafted onto an earlier Norman structure and, typically, but in complete contrast to the French prototype, the cathedral has double transepts and a squared-off east end. Of English examples, Canterbury cathedral, its choir (1175–8) designed by a Frenchman, William of Sens, and Westminster abbey (basically 13th cent.) are the most French in character.

In Britain, Gothic is traditionally classified into three main phases, although there were periods of overlap and transition between them and with earlier Norman architecture. These are, with approximate datings: 'Early English' (c.1180–1270); 'Decorated' (c.1270–1370); \*'Perpendicular' (c.1350–1550). The first of these has an austere purity, as in the examples of early Gothic mentioned above, and utilizes the simple, 'lancet' window type (e.g. the 'five sisters' window in the north transept of York minster, c.1250). The 'Decorated' is marked by intricate vaulting and window tracery (as in the nave of Exeter cathedral, 1328–42, and the early 14th-cent. east window at Carlisle); and the uniquely English 'Perpendicular' by even more elaborate vaulting, and ever-larger window apertures almost like a screen of glass. The great east window of Gloucester cathedral (c.1337–50) is a classic early example.

During the Civil War and after, systematic damage was inflicted upon the Gothic heritage by Cromwellian iconoclasts, but the \*Gothic Revival of the 18th and 19th cents. reasserted its significance. TEF

**Gothic Revival.** There is some truth in the suggestion that Gothic architecture in Britain never entirely died out, especially in the hands of local craftsmen in remote, rural areas. Certainly, even during the 17th and early 18th cents., a period dominated by classicism, the style had major patrons such as John Cosin, bishop of Durham between 1660 and 1672; and both \*Wren and \*Hawksmoor sometimes adopted it, although almost invariably for works intended to blend in with existing structures, as with the latter architect's additions to All Souls College, Oxford, begun 1715.

Thus, it is not until the mid-18th cent. that we have the first really self-conscious revival of Gothic, when, for example, Horace \*Walpole (1717–97) began to enlarge his villa, Strawberry Hill, Twickenham (near London), during the 1750s, and the amateur architect Sanderson Miller (1717–80) remodelled Lacock abbey (Wilts.) (1754–5). Arbury Hall (War.) (altered from about 1750 by Henry Keene) is another early example of the 'Gothic' taste. This architecture often seems whimsical, an intellectually fashionable alternative to \*Palladianism, although 'Gothick' buildings often retained Palladian proportions and soon many leading architects, such as James Wyatt (1748–1817), designed in both styles.

'Gothic' was at first an essentially literary movement, inspired by the new interest in medieval and Elizabethan poetry and the increasingly antiquarian spirit of the time. Later in the century, the Gothic Revival, always more English than British, became associated with Romantic ideas of the Sublime and Picturesque. For the eccentric millionaire

William Beckford, Wyatt built the gigantic, rambling Fonthill abbey (Wilts.), from 1796 (now demolished). The Picturesque movement encouraged this asymmetry in architecture and its greater integration with landscape. Gothic was often combined with castellated forms and merged into the 'Tudor-Gothic' of the early 19th cent.

By this time, however, the fanatical medievalist Augustus \*Pugin (1812–52) gave the revival a new moral and stylistic authority through his writings and designs. A Roman catholic, he argued that Gothic was truthful and Christian: a comprehensive English national style. His ideas coincided with the upsurge of church building after the \*Catholic Emancipation Act of 1829 and influenced many Anglicans associated with the \*Oxford movement. John \*Ruskin (1819–1900) was also a great champion of the Gothic Revival, and the 'high Victorian' period (c.1850–80) saw its widespread adoption for large public buildings and monuments in the growing cities and towns. Examples include Manchester town hall (by Alfred Waterhouse, 1869–77) and, in London, the Midland hotel, St Pancras station (by G. G. \*Scott, 1865–71), the Law Courts, Strand (by G. E. Street, 1874–82), and the \*Albert Memorial (again by Scott, begun 1863). In church architecture, the revival continued until at least the early 20th cent. TEF

**Gower, John** (c.1330–1408). Poet. A contemporary and friend of \*Chaucer, Gower was probably born in Kent and then lived in Southwark. He wrote in French, Latin, and English. His main work, *Confessio Amantis* (c.1386), contained 141 examples and stories of love in a conversation between a lover, Amans, and a priest of Venus, Genius. He drew on the classics and on medieval romances. By the time the lover had understood the nature of love, he was too old and tired to care. Of Gower's political works, *Vox clamantis* (c.1382) recorded the upheaval of the \*Peasants' Revolt and his hope that Richard II's reign would prove a blessing: when it did not, he transferred hope to Henry IV in *Cronica tripartita*. Highly thought of in the Tudor period, Gower's lack of humour led to Chaucer overshadowing him. JAC

**Gowrie, William Ruthven, 1st earl of** [S] (c.1541–84). The Ruthven estates were in Perthshire and the family, protestant by religion, formed part of the English interest. Gowrie's father, the 3rd Lord Ruthven, took a leading part in the murder of \*Rizzio in 1566, but died almost immediately after. Gowrie was also involved, and at Lochleven in 1568 helped to obtain Mary's abdication in favour of her young son. From 1571 he was treasurer of Scotland and in 1581 was created earl of Gowrie. He was the leader in 1582, with Mar and Angus, of the \*Ruthven raid and held the king prisoner for ten months, demanding the withdrawal of \*Lennox from the kingdom. An ill-judged reconciliation with \*Arran in 1584 led to his downfall and he was executed at Stirling. His sons were involved in the \*Gowrie conspiracy in 1600, both being killed. JAC

**Gowrie conspiracy**, 1600. James VI of Scotland mistrusted the Gowrie family. The 3rd Lord Ruthven had murdered \*Rizzio and the 1st earl of \*Gowrie had held James captive after the \*Ruthven raid in 1582. On 5 August 1600, while

hunting, James was urgently invited by Alexander Ruthven to Gowrie House in Perth, according to the king to investigate a mysterious stranger with a pot of gold. James dined at the house but no stranger materialized and after the meal James repaired to an upper turret with Ruthven. James's version was that Ruthven then reproached him with the execution of the 1st earl and told him to prepare to die: James wrestled free and cried 'Treason' from a window, whereupon his followers rescued him and killed both Ruthven and his elder brother, Lord Gowrie. It has never been clear who was plotting against whom. James owed the Ruthvens a good deal of money, but the suggestion that he deliberately acted as a decoy seems most unlikely, given the king's notorious cowardice. James's story of the pot of gold is so feeble that it might even be true, since it would not be hard to invent a better tale. Yet if the brothers were conspirators, looking for a repeat of the Ruthven raid, they are among the most incompetent in Scottish history. Since Alexander Ruthven was 20, and James's fondness for handsome young men is well established, it is not difficult to think of alternative explanations. JAC

**Grace, W. G.** (1848–1915). Grace was probably the greatest sporting hero of late Victorian and Edwardian Britain, his bulky form and black beard instantly recognizable. He was by profession a Bristol surgeon with four brothers. Before he was 17 he had appeared for the Gentlemen against the Players at the Oval and at Lord's. In 1866 he made 224 not out for England against Surrey and his volume of runs was unprecedented. In 1870 he launched the Gloucestershire side. In all he made 126 centuries and took 2,876 wickets, playing his last first-class game in 1908, at the age of 60. JAC

**Grafton, Augustus Henry Fitzroy, 3rd duke of** (1735–1811). Prime minister. Grafton came from an aristocratic Whig background and opposed Lord \*Bute in the early years of George III's reign. He became secretary of state in the first \*Rockingham administration, but his admiration for the elder \*Pitt caused a breach with his colleagues, and he resigned in April 1766 after the failure to negotiate Pitt's entry into the ministry. Grafton returned to office in July, when Pitt (now earl of Chatham) succeeded Rockingham as prime minister. Although Grafton became 1st lord of the Treasury, Chatham headed the ministry as lord privy seal. This unusual arrangement (devised to free Chatham from a heavy departmental work-load) did not achieve its object of preserving Chatham's precarious health. Grafton gradually emerged as *de facto* prime minister during 1767 and officially led the ministry after Chatham finally resigned in October 1768. The Grafton ministry was plagued with serious problems, such as the \*Wilkes case and the \*Townshend duties crisis; Grafton himself was ridiculed in the press by \*Junius. Unable to withstand the pressure (the final straw being a parliamentary attack by Chatham himself, who had recently recovered from illness), Grafton resigned in January 1770. He never returned to the front rank of politics, but served as lord privy seal in 1771–5 and 1782–3. Grafton is often accused of lacking political stamina and preferring the aristocratic good life to the burdens of office. Whilst partially true, it was a formidable assault by three former premiers (\*Grenville,

## Graham

Rockingham, and Chatham) which prompted his resignation. Furthermore, the emergence of \*North removed any necessity for the king to rely on Grafton. DW

**Graham, Sir James** (1792–1861). Heir to an important border landed estate in Cumberland, Graham was educated at Westminster School and Oxford. He succeeded his father in 1824, and implemented extensive estate improvement. Returned to Parliament in 1818 for Hull, he joined the Whig opposition, supporting \*catholic emancipation and parliamentary reform. In 1830 he became 1st lord of the Admiralty in \*Grey's cabinet, and was one of the four ministers who drafted the Great Reform Act. At the Admiralty he introduced administrative reform, before resigning in 1834 over proposals for reforming the established Irish church. He refused to join \*Peel's minority government of 1834–5 but moved into opposition to the succeeding Whig ministry. He became home secretary and Peel's right-hand man in the 1841–6 ministry, supporting him in Corn Law repeal and resigning with him in 1846. After Peel's death, Graham remained a prominent Peelite politician, returning to the Admiralty in \*Aberdeen's coalition ministry of 1853–5. Graham's frequent changes of constituency and of party led him to describe his own career as 'devious'. NMC

**grammar schools.** In Roman times schools of grammar taught language and literature. This type of school and its curriculum was adopted by early Christian educators, such as \*Alcuin. In 826 Pope Eugenius required bishops to ensure that grammar schools were founded in their dioceses.

The term was first used in England in the 14th cent. Grammar schools were under ecclesiastical supervision, but endowments were made by other institutions, such as guilds, charities, and hospitals. The grammar school was recognized as providing a training for future churchmen: Henry VI founded \*Eton College (1440), and Cardinal \*Wolsey Ipswich Grammar School (1528). From Tudor times, merchants, traders, and a number of women founded schools—Peter Blundell at Tiverton (1599) and Lady Alice Owen at Islington (1613).

After the Restoration, the grammar schools declined: they were described by Lord Chief Justice Kenyon in 1795 as 'empty walls without scholars, and everything neglected but the receipt of salaries and emoluments'. Attempts to widen the curriculum to allow mathematics and modern languages to be taught were rejected in the Eldon judgment 1805; but in 1840 a Grammar School Act allowed a wider range of subjects. Some of the schools had developed into non-local boarding schools: from these emerged the \*public school. The Endowed Schools Act 1869 helped to reform grammar schools, following the report of the Taunton Commission in 1868, including provision for girls. The 1902 Education Act established a system of municipal and county schools alongside the older grammar schools, which were popularly known as grammar schools. Because of the spread of comprehensive education from the mid-1960s, by 1990 only about 7 per cent of local authorities had retained grammar schools. Growing disenchantment with comprehensive education led to the grammar schools being regarded in the later 1990s with more favour. PG

**Grampian** (named because the eastern Grampian mountains lie within it) was from 1973 to 1996 a local authority region of Scotland. It was formed from the counties of Aberdeen, Kincardine, and Banff and most of Morayshire, and certain administrative functions were the responsibility of five districts. From April 1996 the new all-purpose local authorities for the former Grampian region are: Aberdeen; Aberdeenshire (comprising the former Banff/Buchan, Gordon, and Kincardine/Deeside districts); and Moray. Over 40 per cent of the region's population live in \*Aberdeen, Scotland's third largest city. Oil and gas deposits were first discovered in the northern North Sea in the early 1970s, with production starting in 1975; thanks to its location, Aberdeen has become the oil capital of Europe. Its prosperity since the mid-1970s engendered a diversification of much of the Grampian economy, to which agriculture and fishing are now much less important, with oil-related activity representing over 10 per cent of employment; the oil boom brought about increases in income, population, and employment well above all other parts of Scotland, with consequent boosts to services and to the tourist industry, already established by its castles and 'Royal' Deeside. CML

**Granby, John Manners, marquis of** (1721–70). Granby, heir to the dukedom of Rutland, became a national hero after brilliant cavalry actions at \*Minden (1759) and Warburg (1760), during the \*Seven Years War. He was elected to Parliament before he was 21 and remained in the Commons all his life. From 1763 to 1770 he was master of the ordnance, and commander-in-chief from 1766. He spent lavishly, drank heavily, gambled on the turf, and was always in debt. He was less at home in politics than on the field of battle. A newspaper attack upon Granby in \*Junius' first letter in 1769—'nature has been sparing of her gifts to this noble lord'—led to Sir William Draper defending him and provoked the Junius series. In January 1770 he resigned office, having changed his mind on the \*Wilkes issue: 'he recanted a vote he had not understood,' wrote Horace \*Walpole, 'for reasons he understood as little.' He died unexpectedly at the age of 49, leaving Chatham to declare, extravagantly, that his loss was 'irreparable'. \*Reynolds painted his florid, bald, ruddy countenance many times, and for decades less distinguished portraits swung outside countless taverns. JAC

**grand jury.** The Assize of \*Clarendon provided that twelve men of each hundred were to present on oath, to the travelling justices, often the justices in \*Eyre, those suspected of serious crimes. They acted from their own local knowledge. After the Eyres ceased, the grand jury consisted of 24 persons, summoned by the sheriff from the county generally, to make presentments to the justices of \*oyer and terminer and \*gaol delivery. From the late 14th cent. the grand jury had the task of scrutinizing indictments to examine whether or not the accused should be sent for trial. In 1933 the grand jury was abolished; its function as a preliminary 'sifter' of indictments was superfluous in the light of the preliminary hearings of all indictable offences by examining magistrates. MM

**Grandmontines.** This monastic order was founded by the hermit St Stephen (c.1054–1124) of Muret, near Limoges. It was an ascetic community of choir and lay brothers which, after Stephen's death, established itself at Grandmont and followed a strict version of the \*Benedictine rule. Its temporal affairs were almost entirely controlled by the lay brothers ('conversi'), an arrangement which gave rise to much internal dissension. Three small priories were founded in England where the order enjoyed the patronage of the Angevin kings. Only one of these (Grosmont, Yorks.) survived till the \*dissolution. In the later Middle Ages, the monks were often styled 'Bons Hommes'. BJG

**Grand National.** The most famous jumping race in the world. First run in 1839, it is a handicap for horses six years old and upwards, run near the end of March at Aintree, Liverpool. The course of 4 miles and 856 yards includes 30 jumps, such as the Canal Turn Fence, Valentine's Brook, and the notorious Becher's Brook, making it a severe test for both horse and jockey. Red Rum holds the record for the most wins, finishing first in 1967, 1973, and 1977. In 1993 the race had to be abandoned after a chaotic false start, and in 1997 it was disrupted by an \*IRA bomb hoax. RAS

**Grand National Consolidated Trade Union.** Founded in 1834 by delegates of societies nation-wide in response to calls of Derby artisans and labourers 'locked out' for belonging to 'combinations'. It was associated with Robert \*Owen, who became president only after the trial of the \*Tolpuddle martyrs in March. The GNCTU's attempt to co-ordinate unions on a general (rather than trade-specific) basis was innovative, aiming to provide financial support by imposing levies on affiliates and practical help by establishing co-operatives for strikers. Hitherto unorganized groups of workers, including agricultural labourers and some women, were amongst the 500,000 members. Handicapped from the outset by meagre funds (only a tiny fraction of fees were paid), the GNCTU's demise was precipitated when the treasurer absconded with its finances in December 1834. The collapse of this short-lived movement was symptomatic of the fate of trade unionism prior to the 1850s. SC

**Grand Remonstrance, 1641.** This lengthy petition was part of \*Pym's campaign to retain the initiative in his parliamentary struggle against Charles I. It was given added urgency by the news of the Irish catholic revolt. A long indictment of the misdeeds of the reign, attributing them largely to popish advisers, was carried on 18 November by 159 votes to 148. It demanded, on threat of withholding supply, that in future the king should employ such counsellors as Parliament 'may have cause to confide in'. Charles replied that in the 'choice of our counsellors . . . it is the undoubted right of the crown of England to call such persons . . . as we shall think fit'. JAC

**grand tour.** A standard part of the education of the English aristocracy between the Restoration and the outbreak of the Revolutionary and Napoleonic wars in 1789, though since it could take two or three years, it was extremely expensive and only a few could afford it. It therefore tended to be limited to elder sons. It had several objectives—to broaden

the mind, to introduce the tourist to classical civilization, to encourage social grace, to improve the command of languages, to establish useful personal and diplomatic links, and to enable wild oats to be sown at a discreet distance. It was usually undertaken between the ages of 17 and 22, under the supervision as 'bear-leader' of a prudent clergyman, if one could be found. The tourist was frequently required to write long letters home reporting progress, and often resorted to copying from guide books to eke out inspiration: a stream of advice, exhortation, and often reproach flowed in the opposite direction. The basic tour was to Paris and on to Rome, though many variations were possible, and Holland, Germany, and the Habsburg dominions were often included. Greece and Spain were much less popular and only a few intrepid souls penetrated to Stockholm, St Petersburg, and the Ottoman empire. Many commentators, such as \*Smollett, \*Johnson, and \*Gibbon, disapproved, arguing that the tour encouraged habits of dissipation and that the noblemen were too young to have much appreciation of what they saw. Others were concerned that tourists might come to admire Roman catholicism, but Anglican clergy were at hand to point out superstition, and bugs and brigandage were sufficiently common to impress most travellers with the delights of home. The English 'milord', tutor in tow, was a well-known sight on the continent and was not popular, save among innkeepers, since he was often arrogant and complaining. 'I find everything here so extremely inferior', wrote J. C. Villiers from France in 1778, 'that I glow with pride and rapture when I think that I am an Englishman.' Some tourists came to grief. George Damer's sexual proclivities got him into a scrape in Rome in which a coachman was killed and money had to be distributed to get him off: Viscount Morpeth caught venereal disease and died at the age of 22. The advent of railways in the early 19th cent. meant that the journeys could be made in a few weeks and the tour did not survive in its traditional form. JAC

**Grantham, Thomas Robinson, 1st Baron** (1695–1770). Robinson's father was baronet of Newby Hall, east of Ripon. His first parliamentary seat in 1727 was Thirsk. At Westminster School he formed a friendship with Henry \*Pelham and the duke of \*Newcastle, who looked after him for the rest of his life. Until the conclusion of the peace of \*Aix-la-Chapelle in 1748 his career was diplomatic, with seven years in Paris and eighteen at Vienna. From 1749 to 1754 he held minor government posts. He was thrust into prominence in 1754 when Henry Pelham died unexpectedly and Newcastle needed a spokesman in the House of Commons. But his months as secretary of state were a torment, assailed by \*Fox and \*Pitt, often in tandem: 'the Duke might as well send his jackboot to govern us,' remarked Pitt. In 1755 he was replaced by Fox and held only minor office subsequently. But his compensation as a discard was substantial—a handsome pension and a barony in 1761, when even his minor post was needed for someone else. Fox, while paying tribute to his honesty and good nature, called Robinson 'an instance of men to whom fortune has been constant . . . by mere chance made Secretary of State; by mere chance brought out

## Granville

of it with a pension . . . by mere chance made a peer . . . He needed all this luck, for he was a very dull man.' JAC

**Granville, Granville George Leveson-Gower, 2nd Earl** (1815–91). Politician. Son of the 1st Earl Granville and the grandson, on his mother's side, of the 5th duke of Devonshire, he was educated at Eton and Oxford. A lifelong Whig, he was MP for Morpeth (1836–41) and Lichfield (1841–6) before succeeding to the title. He was under-secretary for foreign affairs 1840–1 and, after holding various minor offices, succeeded Lord \*Palmerston as foreign secretary 1851–2. Granville was considered a possible prime minister in 1859 and 1865 but tended to hold honorific offices until he became colonial secretary (1868–70), foreign secretary (1870–4, 1880–5), and colonial secretary (1886) under \*Gladstone. An urbane and well-liked man, he was not an energetic politician. He was at the Colonial Office during the transfer of the Hudson Bay territories to Canada and the \*Red River rebellion of 1869. His greatest test in foreign affairs was the Franco-Prussian War of 1870–1, when he maintained British neutrality. He had little understanding of the new forces of imperialism during his third term at the Foreign Office, which saw the British occupation of Egypt and the death of General \*Gordon at Khartoum. MEC

**Grattan, Henry** (1746–1820). Statesman. Grattan was educated at Trinity College, Dublin, and called to the Irish bar in 1772. Returned to the Irish Parliament in 1775 for Charlemont, he rapidly gained a reputation as an orator and became a leader of the patriot group, pressing for Irish legislative independence, granted in 1782. He was later given £50,000 by the Irish Parliament for his services to the nation and the period 1782–99, the high-water mark of the protestant ascendancy, was known as Grattan's Parliament. In 1790 he founded the Irish Whig club and was elected for Dublin, denouncing parliamentary corruption and advocating concessions to the catholics. He was in England for the 1798 rebellion but was elected to the Dublin Parliament in 1800 in time to protest against the Act of \*Union: what the minister proposed to buy could not be sold—liberty. In 1805 he was persuaded to enter the Westminster Parliament for \*Fitzwilliam's borough of Malton and from 1806 to 1820 represented his old seat in Dublin. He declined office and strove continuously for \*catholic emancipation, his hopes remaining unrealized. A brilliant orator, a man of integrity and political consistency, Grattan died in London and was buried in Westminster abbey. 'What Irishman', wrote Sydney \*Smith, 'does not feel proud that he has lived in the days of Grattan . . . he thought only of Ireland, lived for no other object.' RAS

**Gravelines, battle of**, 1558. In August 1557 the Spaniards gained a major victory over the French at Saint-Quentin. A French counter-stroke in January 1558 gained them \*Calais at the expense of the English. In July 1558 the Spaniards gained another victory at Gravelines, assisted by an English naval force, sent by Mary to help her husband Philip of Spain. The French were obliged to make peace in 1559 at Cateau-Cambrésis. But they did not restore Calais. JAC

**Gray, Patrick Gray, 6th Baron** [S] (1558–1611). Known for most of his life as the master of Gray (he did not inherit the barony until he was 50), he was an adroit politician. The family estates were in Forfarshire and Gray's wife was from the house of Ruthven. He spent much of the early 1580s in France amid pro-Mary catholic groups. On his return to Scotland, personable and polished, he became a favourite of James VI, who appointed him gentleman of the bedchamber and master of the wardrobe in 1584. Sent to England as ambassador by \*Arran, he plotted to overthrow him. He betrayed Mary to Elizabeth and his protests against her execution were muted. From 1587 to 1589 he was in exile but remained a favourite with James on his return, though with diminished influence. \*Camden thought him 'a quaint young gentleman, and one that thought himself able for the weightiest business'. But he seems at times to have lost himself in meaningless treachery. JAC

**Gray, Thomas** (1716–71). Gray led a sheltered existence: 'a life so barren of events as mine', he wrote to a friend. Educated at Eton, he went to Peterhouse, Cambridge, and returned after a grand tour as a fellow-commoner. In 1756 he transferred across the road to Pembroke College, having found his Peterhouse neighbours boisterous and noisy. He did not greatly like Cambridge but remained there for the rest of his life. In 1768 he was made professor of history and, characteristically, did not lecture but worried about it. His poetic fame came in 1750 when, through Horace Walpole, his 'Elegy in a Country Churchyard' was published. It touched many of the themes that tormented the 18th cent., particularly the vanity of human wishes: 'the paths of Glory lead but to the grave.' Gray was offered the poet laureate-ship in 1757 in succession to Cibber, but declined. His poetic output was small but crafted. \*Johnson, whose assessment of Gray in the *Lives of the Poets* is very cool, admitted that 'in the character of his Elegy I rejoice to concur with the common reader'. JAC

**Great Britain.** The geographical term Great Britain was used to distinguish the largest of the British Isles from Brittany, or Little Britain. As early as the reign of Edward IV, when a marriage alliance with the future James IV was in negotiation, the advantages of a union of England and Scotland as Great Britain were pointed out. When James I succeeded Elizabeth in 1603 he hastened to propose that the union of the crowns should be followed by a governmental union and he suggested the name Great Britain. Though the English Parliament could not be brought to agree, James adopted the name by proclamation and used it on his coinage. It was given statutory authority by the Act of \*Union with Scotland in 1707, article 1 of which stated that henceforth the two countries were 'united into one kingdom by the name of Great Britain'. This usage lasted until the Act of Union with Ireland in 1801, which substituted the term 'United Kingdom of Great Britain and Ireland'. After southern Ireland established its independence, the name was again modified to the 'United Kingdom of Great Britain and Northern Ireland'. The Channel Islands and the Isle of Man are not part of the United Kingdom but direct crown dependencies. The constitutional evolution is reflected in

the cheerful complexity of the \*Union Jack, adopted in 1801 when the cross of St Patrick was superimposed on those of St Andrew and St George. JAC

**Great Britain** was the second of three highly innovative steamships designed by I. K. \*Brunel. It was intended by the Great Western Steamship Company as a sister ship to Brunel's *Great Western*, which had been launched in Bristol as a wooden-hulled paddle steamer in 1837 and became the first steamship to enter commercial trans-Atlantic service. But Brunel conceived a much bigger vessel, the first large iron ship and the first large screw-propelled ship. Launched in Bristol by the Prince Consort on 19 July 1843 (gross register 3,270 tons, compared with 1,340 for the previous ship), the *Great Britain* entered service between Liverpool and New York in 1845 and, despite a severe accident the following year when she went aground off Ireland at the start of her fifth voyage, she went on to have a long working life on the route to Australia. She was eventually abandoned in the Falkland Islands in 1886, but survived to be brought home to Bristol in 1970, where she is on show. RAB

**Great Cause.** The disputed Scottish succession which arose when Alexander III died in 1286 leaving only a young granddaughter, the Maid of Norway, who herself died in Orkney on her journey to Scotland in 1290. Edward I had already been consulted before the Maid's death and was called in again to adjudicate between the thirteen 'competitors', chief of whom were John Hastings, John \*Balliol, and Robert \*Bruce. The complex proceedings culminated in Edward claiming the throne of Scotland for himself. Though Bruce's grandson succeeded in resisting the English claim, the dispute poisoned relations between the two countries for generations. JAC

**Great Contract, 1610.** By the time James I ascended the throne of England the royal finances had been undermined by inflation. In 1610, therefore, Lord Treasurer Robert \*Cecil proposed that Parliament should vote the king a regular annual income. In return, the crown would abandon its deeply resented right to make wards of under-age heirs of landowners and sell control of their estates to the highest bidder. The Commons were allergic to the idea of permanent taxation, particularly for the benefit of the spendthrift James, but eventually accepted Cecil's proposal, though they offered far less than he had hoped for. The contract was duly formalized, but during the parliamentary recess members were made aware that their constituents were implacably opposed to it. Since James had become convinced that it would leave him no better off, the contract was abandoned, amid general recriminations. RL

**great council and king's council.** It can hardly be claimed that scholarship has yet entirely clarified the problem of medieval councils. The discussion is haunted by difficulties of nomenclature, the fluidity of the situation, and the fact that many developments were on an *ad hoc* basis. It is not even clear whether one can speak of more than one council, or whether they should be regarded as aspects of, or variants on, one body.

Elementary prudence dictated that medieval monarchs should seek the advice of their greatest subjects and should be seen to have their support. Anglo-Saxon monarchs had the \*witan. Norman and Plantagenet monarchs had their council, under various names. As business became more complex, councils tended to divide into specialized bodies, though with much overlapping of personnel. Two bodies have been suggested, the great council and the king's council (*curia regis*). The great council began as a meeting of the tenants-in-chief and barons and was largely advisory. The three traditional crown-wearings, at Christmas, Easter, and Whitsun, were good opportunities to consult the great men of the realm, but such infrequent meetings could not deal with day-to-day administration or requests for justice. Nor would great magnates necessarily wish, or be able, to devote much of their time to routine matters. Consequently a smaller and more specialized council developed, consisting of household officers, sometimes in attendance on the king in his progresses, sometimes at Westminster. This was the king's council, though it was not formally an institution with defined functions until the later 13th cent.

At times the great council attempted to take a more detailed role in government—against Henry III in 1258—but such arrangements were rarely successful for long. The growth of Parliament was bound to encroach upon its importance by offering another body which could claim to speak for the nation. By the early modern period, the great council was but an echo. In the desperate crisis of 1640, Charles I summoned a great council to York, after a lapse of centuries, but the peers who responded merely suggested calling a Parliament. In 1688, James II having fled, another assembly of peers advised William of Orange to summon a Convention or Parliament.

The king's council, on the other hand, survived and coped with an ever-increasing volume of business. In the 16th cent. it threw off the \*Star Chamber to take over more judicial work, and in Henry VIII's reign developed into the \*Privy Council, with a small membership of hard-pressed administrators, meeting most days. For a hundred years it was the main engine of executive government, but after the Civil War and Restoration, it began to lose ground to the cabinet council and the \*cabinet. JAC

**Great Eastern.** After the *Great Western* and the \**Great Britain*, I. K. \*Brunel went on to design his third and largest steamship, the *Great Eastern*. This was a huge vessel of 18,915 tons gross register, the largest ship built before the 20th cent., with a cellular double hull and two sets of steam-engines, one driving paddle wheels and the other a screw. The construction of the ship, which took place on the Isle of Dogs opposite Greenwich, caused novel and formidable problems for Brunel and his partner—with whom he quarrelled severely—the shipbuilder John Scott Russell. She was launched sideways into the Thames in January 1858 and set out on her first trial voyage in September 1859. The *Great Eastern* failed to establish herself as a successful passenger ship, but she performed a valuable service in laying the trans-oceanic cables across the Atlantic and Indian Oceans. She was broken up at Birkenhead in 1888. RAB

## Great Exhibition

**Great Exhibition, 1851.** Master-minded by \*Albert, consort to Queen Victoria, the Great Exhibition was the largest trade show the world had ever seen. Joseph Paxton's \*Crystal Palace, spanning 19 acres within Hyde Park (London), was accepted after 233 other plans had been rejected. Some 6 million people between 1 May and 11 October 1851, many of them on railway excursions, visited 100,000 exhibits (Raw Materials, Machinery and Invention, Manufacture, and Sculpture and Plastic Arts). Entrance fees ranged from 1 shilling to 3 guineas, with refreshments provided by the entrepreneurial Messrs Schweppes. Queen Victoria, always keen on her husband's achievements, visited 34 times. It was a paean to progress, though trade did not immediately pick up. But profits secured land in Kensington, future sites for the Victoria and Albert Museum, the Science Museum, and the Natural History Museum. Mayhew wrote that the crowds on the opening day were so dense that they formed a kind of road, paved with heads: 'on they went, fathers with their wives, and children skipping jauntily along, and youths with their sweethearts in lovely coloured shawls and ribbons.' On the last day Victoria wrote in her diary: 'To think that this great and bright time is past, like a dream, and all its success and triumph, and that all the labour and anxiety it caused for nearly 2 years should likewise now be only remembered as "a has been" seems incredible and melancholy.'

SMC

**Great Reform Act, 1832.** The first major reform of the representative system since the time of \*Cromwell. The demand for reform at the end of the 18th cent. had been tainted by association with the French Revolution and it was not until the Whigs came to power in 1830 that there was any prospect of successful legislation. Lord \*Grey saw reform as a means of satisfying the desire of the respectable middle classes for greater representation and the character of the Act was accordingly moderate. Only the mechanics of the system were changed. The principal changes were:

1. Redistribution of constituencies. Boroughs with a population of less than 4,000 were either disfranchised, or reduced to one member instead of two. Some seats were added to the rural counties and others to towns such as Birmingham and Manchester, where industries or trade had developed since the 16th cent.

2. Changes in the electoral qualifications: long leaseholders were added to the '40s. freeholders' in the counties and in the boroughs a uniform franchise, vested in householders occupying property valued at £10 or more for local rates, was established. All voters were to be resident adult males.

3. Rules were established for the conduct of elections.

The Act satisfied the middle classes in general but agitation for more radical reform continued among the working classes, though no further general changes were made until 1867.

EAS

**Great Schism, 1378–1417.** After the papacy's stay from 1309 at Avignon, an enclave in southern France, the Roman populace in 1378 demanded an Italian pope and the conclave, intimidated, elected Urban VI. Within three months, his conduct had alienated many supporters, who elected Clement VII. The rival pope established himself once more at

Avignon. The rift perpetuated itself and the Council of Pisa in 1409, summoned to restore church unity, merely succeeded in electing a third pope, Alexander V. Not until the Council of Constance in 1417 was unity restored with the election of Martin V. The response of governments to the schism was almost purely political. The king of France supported the Avignon popes, who were more likely to be under French influence. The English, bitterly opposed to France, recognized the Roman popes. The Scots, allied to France, joined in acknowledging Avignon. An Irish synod at Roscommon in 1383 also supported Avignon. The rival popes, greatly weakened, were obliged to make substantial concessions. Scotland received from the Avignon popes its first cardinal and its first university at \*St Andrews, granted by Benedict XIII in 1414. The Scots even stayed with Benedict after Martin V had been elected until the Faculty of Arts of the new university carried the day to abandon its benefactor. In 1406 Owain \*Glyndŵr, in rebellion against Henry IV, offered submission to Benedict if he would confer archiepiscopal status on St Davids, establish a university for Wales, and declare Henry IV a usurper.

JAC

**great seal.** The seal originated in the reign of Edward the Confessor as an imitation of the emperor's seal and was about 3 inches in diameter. The king is depicted in majesty, bearing sceptre and orb. The Norman rulers continued its use and the custody of the seal was given to the \*chancellor. William the Lion's seal in Scotland seems to have been based on the English one. The seal is broken at the start of a new reign and a fresh one made. Since the great seal was heavy, the practice developed of employing a privy seal and later a signet. In the Tudor period, the great seal was in the hands of the chancellor or the \*lord keeper but from the accession of George III the office of lord keeper has disappeared. The possession of the great seal was a matter of political importance. It was a charge against Cardinal \*Wolsey at his downfall that he had illegally taken the great seal out of the kingdom to Calais in 1521. When Charles I left for York in 1642 at the start of the Civil War, Parliament had its own great seal made, and another had to be produced for the Republic in 1649. James II flung the great seal into the Thames when he fled in 1688, hoping to bring government to a standstill, but it was retrieved by a fisherman. Burglars stole the great seal from the home of Lord Chancellor \*Thurlow in 1784. Since an election was imminent, craftsmen worked all night to make a new seal and jokes passed at the expense of the Foxite opposition. The great seal is used for proclamations, writs, letters patent, and treaties. A separate seal for Scotland, authorized by the Act of \*Union in 1707, is in the custody of the secretary of state for Scotland.

JAC

**great seal and great seal register [S].** A mark of sovereign authority, the great seal was appended to crown charters as a means of authentication. The appendage marked the final stage of a long bureaucratic process known as 'passing the seals'. The register of the great seal is a record of crown charters granted under the great seal, and is printed in eleven volumes dating from 1306 to 1668. Unfortunately, it is an incomplete record. Crown charters were

originally recorded on charter rolls, many of which have since been lost or destroyed. Many more charters were simply not recorded.

PER

**Great Yarmouth**, on the Yare estuary in Norfolk, developed in the 11th cent. as a fishing town, especially for North Sea herring. From then until the First World War it was a major port, one of the largest towns in England, with stone defences which largely survive, a huge medieval parish church, and a unique pattern of 'Rows' or parallel alleys, which were largely destroyed in the Second World War. In Victoria's reign the town more than doubled in size and turned round to face the sea, becoming a very popular holiday resort.

DMP

**Greece, relations with.** Although Greece was included in a number of \*grand tours, the extra distance and primitive conditions meant that it was less well known to British travellers than Italy. When the Greeks rose in revolt against their Turkish rulers in 1821, British opinion was divided. There was sympathy for struggling nations and for Greek culture, but the policy of supporting the Ottoman empire lest Russia become overmighty was already well established. For a while the British government solved its dilemma by urging the Turks, not for the first time, to institute reform. The revolt dragged on, with appalling atrocities on both sides, and in 1827 Britain, France, and Russia by the treaty of \*London offered mediation: the Greeks accepted, the Turks declined. At \*Navarino, \*Codrington with an allied naval force intended to separate the combatants destroyed the Turkish fleet. In 1830 the three powers guaranteed Greek independence. Codrington's action, though unintended and for which the British government apologized to the Turks, was important, though France and Russia played a greater role in establishing Greece.

Britain did not always find the new Greek regime easy to deal with, but the Don \*Pacífico affair in 1850, though it had important consequences for \*Palmerston, was not a serious rift. Greece made substantial territorial gains. In 1864 Britain ceded the Ionian Islands (including Corfu) which had been acquired in 1815. In 1881 Greece added Thessaly and, after the Balkan War of 1913, Macedonia and Crete. In 1914, under great pressure from both sides, Greece remained neutral, even after the Turks and Bulgarians had entered the war on the side of Germany (November 1914, October 1915). The country was badly split and on the verge of civil war, but joined the allies in 1917 when they landed troops to support Venizelos, the former prime minister. At the peace conference, Greece made large demands, including Thrace and Smyrna, which the Turks refused to hand over. Even with British support, Greece had to be content at \*Lausanne in 1923 with western Thrace.

In the Second World War Greece was invaded by the Germans in April 1941 and though the British sent troops, they were unable to stem the attack. But at the end of the war, \*Churchill succeeded at \*Yalta in keeping Greece out of the Soviet sphere of influence. It soon became clear that Britain had no longer the military or economic strength to offer protection, but the intervention of the USA by

the Truman doctrine of 1947 kept Greece outside the iron curtain.

JAC

**Green, Thomas Hill** (1836–82). Philosopher. Born in Yorkshire, educated at Rugby and Balliol College, Oxford, Green became Whyte's professor of moral philosophy at Oxford in 1878. He made a lasting contribution to moral and political philosophy by attacking the prevailing materialism and empiricism of utilitarian thinkers, arguing for a Hegelian sense of duty to promote the common good. His ideal was human self-perfection—a condition in which people voluntarily chose to develop their potential as active citizens in pursuit of the good life. In his essay 'Liberal Legislation and Freedom of Contract' (1881) Green claimed that the inequality of power between employer and worker vitiated freedom in the labour contract and prevented workers from achieving perfection. But Green was no ivory tower academic; he took an active interest in politics and social affairs, participating in the work of a royal commission on education in 1865–6, taking a leading part in the \*temperance movement, and becoming in 1876 a member of Oxford City Council.

TSG

**Greene, Graham** (1904–91). One of the most versatile, prolific, and popular writers of the mid-20th cent., Greene was born at Berkhamsted (Herts.), where his father was headmaster of the public school, and educated at Balliol College, Oxford. He converted to catholicism at the time of his marriage in 1927. Greene published a book of verse, *Babbling April*, in 1925, and followed with a historical novel, *The Man Within*, in 1929. Next he produced a series of thrillers ('entertainments') starting with *Stamboul Train* (1932) and continuing to *The Third Man* (1950), made into a remarkable film. Increasingly Greene explored the world of catholic guilt in *Brighton Rock* (1938), *The Power and the Glory* (1940), *The Heart of the Matter* (1948), and *The End of the Affair* (1951). He also wrote verse, travel books, short stories, children's stories, and plays. His autobiography is *A Sort of Life* (1971) and *Ways of Escape* (1980). His themes of ambiguity, moral confusion, betrayal, and seediness reflected and appealed to his own times.

JAC

**Green Party.** The British Green Party started life in 1973 as an environmental pressure group called 'People'. Two years later it became the Ecology Party dedicated to 'policies which preserve the planet and its people; decentralised decision-making in all areas of government, industry and commerce; a recognition that the human spirit is integral to a political system; and the realisation that all our policies are connected and none can be designed in isolation'. In the 1983 general election the party fielded 108 candidates but mustered barely 1 per cent of the vote. In 1985 it changed its name to the Green Party in line with similar international environmental movements. However it never managed to emulate the success of its continental counterparts. Its biggest success came in winning 15 per cent of the vote in the European elections in June 1989. Although putting up more than 140 candidates at the general election of 2001, mostly in southern England, it did not come close to winning any seats. The party is hampered by an unconventional decentralized organization and internal disputes, but has been

## Green Ribbon Club

instrumental in putting environmental issues on the political agenda. RAS

**Green Ribbon Club.** An important Whig venue in London, formed in the mid-1670s and so-called from the colours its members wore in their hats. Based at the King's Head in Chancery Lane, it played a major part in staging rowdy pope-burning processions and other demonstrations during the \*Exclusion crisis. AAH

**Greenwich, treaty of, 1543.** On 1 July 1543, after their defeat at \*Solway Moss the previous year, the Scots made peace and agreed to a marriage between the infant Queen Mary and Prince Edward, Henry VIII's heir, which would lead to a union of the kingdoms. The terms were repudiated by the Scottish Parliament in December and fighting resumed the following year. Meanwhile, Henry VIII's last campaign against the French faltered. JAC

**Greenwich palace** began life as Bella Court, built by Humphrey, duke of \*Gloucester, brother of Henry V, whose library housed the great collection which finished up in the Bodleian, Oxford. After passing to \*Margaret of Anjou, the palace came to Henry VII, who built extensively. Its position on the Thames made it convenient for receptions and it became a major Tudor palace: Henry VIII and his daughters Mary and Elizabeth were born there. James I gave it to his wife Anne of Denmark, who employed Inigo \*Jones to begin building the Queen's House. It passed next to \*Henrietta Maria, but during the civil wars fell into decay and at one time was a biscuit factory. Charles II began a major reconstruction, but did not complete it, though the observatory on the hill dates from 1676/7. William III decided in 1694 to employ \*Wren to build a great new hospital for seamen, which took many years to finish. George I stayed there in September 1714 on his way from Hanover. It subsequently became a naval college and home to the National Maritime Museum. The existing palace is probably the grandest of royal buildings and the Queen's House, colonnaded in the early 19th cent., and recently restored, is a jewel of cool classicism. JAC

**Gregory, Lady Augusta (1852–1932).** Though her plays and other writings fill many volumes, she is most often remembered in connection with W. B. \*Yeats. Her translations from the Gaelic influenced his work and in verse he celebrated Coole Park, her Co. Galway house, and the 'powerful character' which made her collaboration valuable. Her son, Major Robert Gregory, he elegized as embodiment of the artist as man of action. Though from the protestant ascendancy and sometimes at odds with nationalist opinion, she was committed to the Republic and Coole survived the civil war. Into her seventies she was active on the board of the Abbey theatre and her plays show a gift for comedy lacking in Yeats. Attempts to secure a Dublin home for her nephew Hugh Lane's picture collection were less successful, but her place as a moving spirit in the Irish renaissance is assured. JNRS

**Grenada,** the southernmost of the Windward Islands in the Caribbean, became independent in 1974. It is a constitutional

monarchy with the queen as head of state, within the Commonwealth. It was sighted by Columbus in 1498 and colonized by the French. In 1762 it was captured by \*Rodney and ceded to Britain in 1763. In October 1983, after a military coup, American troops intervened and returned power to the governor-general. Cocoa, bananas, and copra are exported, but tourism is important to the economy. JAC

**Grenville, George (1712–70).** Prime minister. After training as a lawyer, Grenville entered Parliament in 1741 and held a number of junior posts from 1744. Although he soon gained respect for his abilities as a parliamentarian, he was not offered high office until October 1761, when Lord \*Bute suggested him for a secretaryship of state. Grenville declined, partly out of fear of his brother-in-law \*Pitt, whose resignation had created the vacancy. He was, however, prepared to defy Pitt by accepting the leadership of the Commons. Soon afterwards he accepted cabinet office, becoming northern secretary in May 1762, but was moved to the Admiralty in October after clashing with Bute over patronage and policy. Grenville, therefore, was not a leading candidate for the premiership after Bute's resignation in April 1763, but when Henry \*Fox, the front-runner, declined he became 1st lord of the Treasury virtually by default. As prime minister he was responsible for the \*Stamp Act of 1765, which provoked serious rioting in America, marking a preliminary stage in the American Revolution. It would be wrong to see the Stamp Act as part of an ideologically driven programme of legislation. Grenville, in fact, inherited some key facets of colonial policy, such as the intention to curb western expansion and the decision to maintain a larger peacetime army in America. Moreover, the Currency Act (1764) forbidding paper currency in the southern colonies and the Mutiny Act (1765) permitting limited quartering of troops did not form part of a preconceived strategy: the first was hastily devised to block an independent proposal for even harsher restrictions, whereas the second responded to complaints from the commander-in-chief in America. Grenville was, however, responsible for the American Duties Act (sometimes called the Sugar Act) of 1764, which *inter alia* halved the prohibitive 100 per cent duty on foreign molasses and created a new Vice-Admiralty Court at Halifax (Nova Scotia). This signalled two clear intentions: to raise revenue via customs duties and to deny smugglers the benefit of lenient local juries. Grenville's colonial policy as evidenced by the Sugar Act and the Stamp Act reflected his adherence to financial and legal rectitude. In Britain there was no significant opposition to this legislation until after the Stamp Act crisis. Grenville understandably favoured enforcement of the Act, but was unable to prevent repeal because he had already been dismissed. American affairs played no part in Grenville's fall in July 1765. The atmosphere of suspicion left by Bute's resignation, exacerbated by Grenville's propensity to lecture the king, jeopardized political stability. Having avoided dismissal in the spring of 1765, Grenville determined to extort public proof of his mastery, insisting upon the removal of Bute's brother from the Scottish privy seal, thereby forcing the king to break his promise of granting the office for life. Unable immediately

to retaliate, the king rid himself of Grenville at the first opportunity. Grenville spent the remainder of his political career in opposition, consistently defending both his conduct as prime minister and his policy towards America.

DW

Lawson, P., *George Grenville: A Political Life* (Oxford, 1984).

**Grenville, Sir Richard** (1542–91). Of a landed family, Grenville was born at Buckland abbey, between Tavistock and Plymouth, which he sold to Francis \*Drake in 1581 (hence it became a Grenville–Drake shrine). Having campaigned against the Turks as a soldier, and in Ireland, in 1576 Grenville became sheriff of Cornwall and was knighted. A relative of \*Raleigh, Grenville was much involved, both as MP and man of action, in transatlantic settlement, especially during 1585–6 at Roanoke Island (North Carolina). In 1588 he fitted out ships against the Spanish Armada, and in 1591, under Lord Thomas \*Howard's command, Grenville sailed to the Azores to intercept the Spanish treasure fleet. Detained at Flores, with many sick, Grenville, in *Revenge*, a ship of proven fighting qualities, confronted alone a force of over 50 Spanish warships. Sinking one and damaging others before surrendering, Grenville died of his wounds; *Revenge* foundered in a gale shortly afterwards. Grenville's last fight became a legend.

DDA

**Grenville, William Wyndham, 1st Lord** (1759–1834). Prime minister. The third son of George \*Grenville, prime minister 1763–5, he was educated at Eton and Christ Church, Oxford, where he became a distinguished classical scholar. He entered Parliament in 1782 and cast in his lot with his cousin the young William \*Pitt. \*Shelburne appointed him chief secretary in Ireland in 1782 and under Pitt he was paymaster of the forces 1783–9, an office he held together with membership of the India Board of Control and of the Board of Trade after 1784. A diligent administrator, he contributed to the major financial and economic achievements of Pitt's peacetime ministry. In 1787 he was sent on diplomatic missions to The Hague and Versailles and sounded out the possibilities of an agreement with the French to end the African slave trade, a cause which remained close to his heart until he was able as prime minister in 1807 to accomplish it.

In January 1789 Grenville agreed to become Speaker of the House of Commons in order to help Pitt in the midst of the \*Regency crisis, but he craved a cabinet post and when the crisis was over was appointed home secretary. By this time he was recognized as Pitt's 'second in command' and in 1790 was elevated to the Lords to oversee the government's business there. He was translated to the foreign secretaryship in 1791 and for ten years was responsible for British policy in the French Revolutionary War. Grenville found the post uncongenial and his successes were few. In 1801 he resigned with Pitt over the king's refusal to grant catholic relief, but unlike Pitt he determined not to take office again unless the king withdrew his veto. Accordingly he did not return with Pitt in 1804 but formed an alliance with the Foxite Whigs, with whom he served in the 'Ministry of all the \*Talents' in 1806–7.

As prime minister, Grenville achieved little beyond the abolition of the slave trade. The government collapsed when George III thwarted their attempt to smuggle concessions to the Irish catholics past his protestant conscience. For the next ten years Grenville and \*Grey, Fox's successor, led the opposition to \*Portland, \*Perceval, and \*Liverpool but neither found the position agreeable. The alliance ended in 1817 when they disagreed over the government's suspension of \*habeas corpus to deal with radical agitation. Grenville then retired from political life, devoting his remaining years to classical scholarship.

Grenville was a diligent administrator and a conscientious politician but the glittering prizes eluded him. He lacked warmth, imagination, and leadership qualities. His forbidding manner earned him the nickname of 'Bogey' and he seemed remote and insensitive except to his circle of family and friends.

EAS

Jupp, P., *Lord Grenville* (1985).

**Gresham, Thomas** (1519–79). Second son of Sir Richard Gresham, he became a banker, merchant, and royal agent or king's factor. Born in London and educated at Gonville Hall, Cambridge, from 1551 to 1574 he was based in Antwerp, where he successfully negotiated royal loans with Flemish merchants to buy military supplies. As adviser to Queen Elizabeth I he was an advocate of sound monetary policy, seeking the restoration of base money, a reduction in debt, and prompt payment by the crown. He is credited with 'Gresham's Law', that 'bad money drives out good', arguing that if coins of different metal content but of equal legal tender are in circulation, those with lower value metal content will be used for exchange whilst the rest will be hoarded. He founded the \*Royal Exchange in London to function along the lines of the Bourse in Antwerp, gave Gresham College to London, as well as establishing paper mills at Osterley and a number of almshouses.

JRP

**Greville, Charles** (1794–1865). Greville's journal, kept from 1814 to 1860, is an invaluable source for the politics and society of his period. Originally published in part nine years after his death, his candid comments caused consternation and 'social outrage'. Greville, a grandson of the duke of \*Portland, prime minister 1807–9, and of the 1st earl of Warwick, went to Eton and to Christ Church, Oxford. Two sinecures given to him as a boy provided for him and his passion was horse-racing. His entrée into high society, where he was known as 'Punch', gave him the chance to hear political and social gossip, but he wrote well and with some impartiality. His memoirs were published in full in 1938. Greville finished as a deaf bachelor with a reputation for testiness. \*Disraeli thought him the vainest man he had ever met, not excluding Bulwer-\*Lytton.

JAC

**Grey, Charles, 2nd Earl Grey** (1764–1845). Prime minister. Son of General Sir Charles Grey of Fallodon, Northumberland, Grey entered Parliament in 1786 as a member for Northumberland through the efforts of his uncle Sir Henry Grey of Howick. Grey inherited Howick in 1808 and made it his beloved home from which he could rarely

be tempted to attend to his duties as leader of the Whig Party after \*Fox's death.

A headstrong young man, Grey was attracted to Fox and his circle of drinking and gambling cronies and joined the opposition to \*Pitt almost immediately on entering the Commons. He had a notorious affair with Georgiana, duchess of Devonshire, by whom he had a daughter in 1792. In 1794 he married Mary Ponsonby, by whom he had fifteen children.

Grey distinguished himself from the outset as a brilliant orator in the House of Commons, and quickly formed the ambition to be the next leader of the Whig Party after Fox, but in 1792 he committed himself to parliamentary reform, helping to found the Association of the \*Friends of the People. He hoped to use the reform movement to advance his career but the step split the Whigs, aristocratic grandees like the duke of \*Portland and Earl \*Fitzwilliam being frightened by the prospect of the spread of the French Revolution. They joined Pitt in 1794, while Fox and Grey led the rump of the party in opposition. In 1798 they seceded from the Commons in protest against Pitt's repressive measures.

After the peace of \*Amiens and the subsequent resumption of war against Napoleon the Whigs formed a coalition with the group led by Lord \*Grenville, but their conservatism meant that Grey had to give up active support of reform. In the 'Ministry of all the \*Talents' (1806-7) Grey served as 1st lord of the Admiralty and after Fox's death succeeded him as foreign secretary. He abandoned Fox's attempt to make peace with France, believing that the war was now a defensive one against Napoleonic aggression, but he was heavily criticized by some of Fox's followers as well as by the London radicals, who accused him of abandoning the cause of reform. After the fall of the 'Talents', Grey tried to steer a middle course between radicalism and conservatism but with little practical success.

In 1807 Grey inherited the peerage which, to his dismay, \*Addington had conferred on his father in 1802. For the remainder of his life he sat in the House of Lords, where his oratorical gifts were less effective. Though he never quite abandoned the position of leader of the Whig opposition, the party suffered from a lack of positive direction. He consistently advocated \*catholic emancipation and gave important assistance to \*Wellington in achieving it in 1829. He was widely expected to join Wellington's cabinet as foreign secretary, but George IV refused to allow an offer to be made. His dislike of Grey dated back to the time when Grey had refused to help him, when prince of Wales, in the affair of his illegal marriage to Mrs Fitzherbert, and Grey had also supported Queen \*Caroline against the king's attempt to divorce her in 1820.

In 1830 George IV's death removed the royal veto on Grey and at the same time the demand for parliamentary reform revived in the country. Wellington's refusal to consider it broke up his administration and William IV sent for Grey, at the age of 66, to form the ministry which was to pass the \*Great Reform Act.

The Reform Act was Grey's major achievement. He proposed it on the same principles which he had professed in 1792, the need to settle the disturbed state of the country by

satisfying the demand of the respectable classes for greater representation, while denying power to the mass of the people. He saw the Act as a means of preserving the essential elements of the existing constitution by removing abuses but perpetuating aristocratic leadership. He was able to persuade William IV to maintain a reluctant support for the measure and, finally, to promise to create enough new peers, if necessary, to force the bill through the House of Lords. The Reform Act bears the stamp of Grey's character—pragmatic, moderate, and fundamentally conservative—and its ultimate passage owes much to his ability to manage the king and his divided colleagues. His cabinet was a coalition of interests rather than a united party, and in 1834 when its divisions over the Irish church question became public Grey resigned, with relief at ending his burdensome duties. He spent the rest of his life in retirement at Howick.

Grey's early ambition was overt and headstrong, and gained him few friends, though Fox admired his talents. Later in life he became more circumspect, but his lack of personal warmth hindered his effectiveness as a party leader. His genuine belief in the necessity of political reform was tempered by his conservative instincts and aristocratic outlook. He was not a charismatic leader like Fox and he was never idolized by his followers or the public, but his achievement in piloting the Reform Bill through Parliament helped to preserve the traditional institutions of the country and to set the pattern for future peaceful development. EAS

Derry, J. W., *Charles Grey, Aristocratic Reformer* (Oxford, 1992); Smith, E. A., *Lord Grey, 1764-1845* (Oxford, 1990).

**Grey, Sir Edward** (1862-1933). Foreign secretary. Grey has been described as curiously 'suspended between the world of high politics and rural isolation', a man who sought refuge from the toils of office in fishing and ornithology. Behind the reserve lay a very determined and tough politician. He was among those Liberals who supported the \*Boer War, and was involved in the attempt to compel \*Campbell-Bannerman to move to the Lords on becoming prime minister in 1905. But it was as foreign secretary (December 1905-December 1916, the longest continuous tenure of that office) that he has attracted the interest of historians. He has been variously portrayed as unduly rigid in his dealings with Germany; as missing opportunities to convince Berlin that Britain would fight on the side of France in the event of war; as one who might have done more to act as a mediator in European affairs; or as one who at best had little opportunity to alter the course of events leading to war.

He gained his first experience in the Foreign Office under Lord \*Rosebery in the mid-1890s. As foreign secretary himself Grey quickly dispelled fears that a Liberal government might weaken Britain's role in the world. In the Moroccan crisis with Germany (1905-6), he went further than his predecessor by agreeing to precautionary military staff talks with France. He also overcame the doubts of some cabinet colleagues to push through the entente of 1907 with Russia. This led some contemporary radical critics to ask why, if he could negotiate with tsarist Russia, he could not do the same with the more progressive state of Germany. But Grey's

overtures on the question of the Anglo-German naval race always fell foul of Berlin's insistence on British neutrality in the event of a European war. Limited progress on other issues did not narrow the fundamental divide.

As Europe stumbled towards war in July 1914 cabinet divisions prevented Grey from unambiguously signalling that Britain would fight in defence of France. Berlin would have preferred British neutrality, but chose to risk war. Grey himself threatened to resign rather than abandon France, but it was German infringement of Belgian neutrality which ensured that most of the cabinet opted for war on 4 August. Grey did much in the first two years of the conflict to prevent serious differences with the USA, especially over American complaints arising from the British blockade of Germany. Horrified by the war, he became a supporter of the \*League of Nations, but failed in his bid for ongoing Anglo-American co-operation. CJB

Robbins, K., *Sir Edward Grey* (1971).

**Grey, Ford Grey, 3rd Baron** (1655–1701). Grey had a turbulent but dexterous political career. He inherited his barony at the age of 19 and was an ardent exclusionist, voting Lord \*Stafford guilty in 1680. In 1682 he was tried for abducting his wife's sister but the matter was compromised after he had been found guilty. In 1683 he was again on trial for a riot at the Guildhall and was later implicated in the \*Rye House plot. Sent to the Tower, he escaped and joined \*Monmouth. He commanded Monmouth's cavalry without much skill in the western rising, was captured, and saved his life by testifying against his companions. Though reinstated by James II in 1686, he adhered to William of Orange, was created earl of Tankerville in 1695 and held office as 1st lord of the Treasury and lord privy seal 1699–1701. 'A cowardly and incestuous traitor' was *Complete Peerage's* terse dismissal. JAC

**Grey, Lady Jane** (1537–54). Jane was the eldest daughter of Henry Grey, marquis of \*Dorset, later duke of Suffolk, and a cousin of Edward VI. An intelligent and well-educated girl, she joined the household of \*Catherine Parr. After Catherine's death in 1548 she became a ward of Catherine's fourth husband, Thomas \*Seymour of Sudeley, who hoped for a marriage between her and Edward VI. After Seymour's execution in 1549, Jane returned to live with her parents. The duke of \*Northumberland then planned to use her to seize the succession when Edward should die. Against her own wishes, she was married on 21 May 1553 to Guildford Dudley, fourth son of Northumberland. After Edward's death on 6 July 1553, she was proclaimed queen and Guildford declared himself king. Mary Tudor's supporters rallied and on 19 July Jane's father admitted defeat and recognized Mary's succession. Lady Jane's reign had lasted a mere nine days. She hoped to return to private life but was held in the Tower and executed on 12 February 1554. She was the innocent victim of her family's heartless ambitions. SMC

**Grey, Leonard, 1st Viscount Grane** [I] (1490–1541). Grey was one of many who perished in the mire of Tudor Ireland. He was a younger son of the 1st marquis of Dorset. His grandmother was \*Elizabeth, queen of Edward IV, and his nephew's daughter was Lady Jane \*Grey. A tough sol-

dier, he was sent to command in Ireland in 1535, where Thomas \*Fitzgerald, son of Gerald \*Fitzgerald, 9th earl of Kildare, was in rebellion. The rising was crushed and Fitzgerald and five of his uncles sent to England and executed. Grey was appointed lord deputy in 1536 and given an Irish peerage. He presided over the Dublin Parliament which effected the Reformation, including dissolution of the monasteries. But his rough manner made many enemies and the 9th earl of Kildare's young son, in flight, was his nephew. Despite considerable military success, Grey was accused of treason. In a long submission, the council charged him with not doing all he could to apprehend his nephew and of overbearing behaviour: 'when contradicted in the council, he falleth in fury with menacing words and great oaths, laying his hand on his dagger or sword.' Though he sounds brutish, the charges seem to fall far short of treason. Nevertheless, he was found guilty and executed in July 1541. JAC

**greyhound racing** as an organized sport developed in the USA, though greyhounds had been bred and raced for centuries. The sport owed its appeal to the oval course, which makes for tactical running, and to betting. In England the first track was opened at Belle Vue (Manchester) in 1926. The National Greyhound Racing Club was established in 1928. The major national event is the Greyhound Derby at the White City, London, which is usually televised. JAC

**Griffith, Arthur** (1871–1922). A printer from Dublin, Griffith was active in the Celtic Literary Society, the \*Gaelic League, and the \*Irish Republican Brotherhood. He spent 1896–9 in South Africa, returning to Ireland to commence vigorous journalism, urging that Ireland could emulate Hungary and acquire substantial autonomy. In 1906 he launched \*Sinn Féin, preaching abstention from British politics, and was involved in the Howth gun-running in 1914. Twice imprisoned during the First World War, Griffith did not take part in the \*Easter Rising, but was returned for East Cavan at a by-election in 1918. He was again imprisoned but emerged to lead the Irish delegation at the negotiations in 1921 which resulted in the \*Irish Free State. He succeeded \*de Valera as president of the Dáil in January 1922 but died from a stroke seven months later, just as the civil war between pro- and anti-treaty factions was beginning. JAC

**Grimond, Joseph** ('Jo') (1913–93). Liberal leader. Born in St Andrews, son of a Dundee jute manufacturer, Grimond went to Eton and Balliol, and was called to the bar in 1937. His marriage the following year to Laura Bonham-Carter, a granddaughter of H. H. \*Asquith, brought him into the centre of apostolic liberalism. Returned to Westminster in 1950 for Orkney and Shetland, he became an excellent speaker with a handsome presence. In 1956 he succeeded Clement \*Davies as leader, and served until 1967, when he made way for Jeremy \*Thorpe. Grimond began the process of liberal revival, from a low of six MPs in 1950 to nine in 1964 and twelve in 1966, even if the euphoria of the Orpington by-election victory in 1962 was never quite repeated. He welcomed an alliance with the \*Social Democratic Party in 1981 but retired in 1983, taking a life peerage.

## Grindal

His later years were troubled by deafness. His *Memoirs* were published in 1979. JAC

**Grindal, Edmund** (1519–83). Archbishop of Canterbury (1575–83). Born in Cumberland, Grindal was educated at Pembroke Hall, Cambridge, where he was later master (1559–61). As chaplain to Bishop \*Ridley of London, he supported the protestant changes under Edward VI. After exile in Germany under Mary, he was successively bishop of London (1559–70), despite reservations over vestments, and archbishop of York (1570) and Canterbury. Though prominent in framing the \*Thirty-Nine Articles, he was too calvinistic to help \*Parker re-establish Anglicanism. His ruthlessness towards catholics and reluctance to bring puritan London clergy into line persuaded Parker to recommend him for the less puritan see of York (1570) where dissidence was mainly catholic. Later \*Cecil suggested his translation to Canterbury (1575) where he was soon in conflict with Elizabeth for refusing to suppress puritan 'prophesyings' (1576), and was suspended from the temporalities of his see 1577–82. WMM

**Griqualand, East and West.** Griqualand West, an arid region occupied by the Griqua people, was annexed to Cape Colony in 1871 after diamonds had been found there. It is south of the Kalahari desert. The chief town is Kimberley. It now forms part of Cape Province (South Africa). Griqualand East was annexed to Cape Colony in 1880, but is now divided between the Transkei and Natal. JAC

**Grocyn, William** (c.1449–1519). Cleric and Greek scholar. Grocyn came up from Winchester to Oxford in 1465, and taught in the university in the 1470s–1480s. In March 1488 he went to Florence to improve his Latin and Greek, along with William Latimer and Thomas \*Linacre; he also got to know the great Venetian scholar and printer Aldus Manutius. From 1491 Grocyn taught Greek in Oxford. From 1496 he spent more time in his living of St Lawrence Jewry, London; and from 1506 in Maidstone as rector of the College of All Hallows, dying at Maidstone after having been incapacitated by a stroke in 1518. A letter to Aldus is Grocyn's only known publication, but his scholarship was much admired by contemporaries, including Erasmus, who lodged with him. His Oxford Greek lectures were the first given by an Englishman, and he collected a remarkable Latin and Greek library, which reflects forward-looking humanist tastes as well as knowledge of medieval authorities. It is known from Linacre's catalogue of it and from many volumes now in Corpus Christi College, Oxford. JBT

**Grosmont** (Gwent). Though no more than a pretty village today, Grosmont, just west of the Monnow, was an important part of the Anglo-Norman defences against Welsh incursions, protecting Hereford and the lush valley of the Severn. Glamorgan fell early to the Norman advance into north Wales, and Monmouth and Chepstow castles were begun immediately after the Conquest. White Castle, Skenfrith, and Grosmont, 15 miles west, formed a defensive triangle and belonged in the 1200s to the formidable justiciar Hubert de \*Burgh, who began converting them to stone castles and

improving the living accommodation. Grosmont was given borough status which it retained until 1857, when the last mayor was elected, and the church of St Nicholas was larger than the township required. The castle's last military activity was in March 1405 when a raid by \*Glyndŵr's son was beaten off by a relief force sent from Hereford by Prince Henry. By Tudor times it was in ruins but much survives, including a fine 14th-cent. octagonal chimney, crested by a coronet. Grosmont was briefly one of the Monmouth contributory boroughs when Wales was given parliamentary representation in the 16th cent. The three castles belonged to the crown, through the duchy of Lancaster, from 1267 to 1825, when they were sold to the Beauforts. They resold in 1902, giving the town hall, substantially rebuilt in 1832, to the community. JAC

**Grosseteste, Robert** (c.1170–1253). Scholar and bishop. Of a humble Suffolk family, Grosseteste went to Cambridge and later lectured at Oxford. He held archdeaconries for Wiltshire, Northampton, and Leicester before election in 1235 to the vast diocese of Lincoln. He plunged into reforming the discipline of the see and into the quarrels that preoccupied him for the rest of his life. From 1239 he was in collision with the chapter at Lincoln in a flurry of excommunications, until Innocent IV found in his favour in 1245. While this quarrel continued, he engaged in others, including several with Henry III. In 1253 he resisted the pope's attempt to place his nephew in a canonry at Lincoln. A man of great learning, Grosseteste wrote innumerable translations and commentaries. He was on close terms with Simon de \*Montfort and acted in his later years as tutor to his sons, which led Stubbs to identify him as a great constitutional statesman. Southern called him an 'enigma', adding that he was 'genial and courteous but a tyrant'. The combination of pugnacity and piety, more common in the 13th cent. than today, persuaded Powicke to classify him as the 'church militant'. JAC

**Grote, George** (1794–1871). Grote, whose family came from Exeter, was a banker, politician, and historian. After attending Charterhouse, he joined the family bank at 16. Greatly influenced by \*Bentham and James \*Mill, he took an active part in the foundation of the University of London, keenly supporting the admission of women. From 1832 until 1841 he was a radical MP for London and in April 1833 moved for the first time for \*secret ballot, a cause with which he is associated: he was defeated by 211 to 106. He did not stand for re-election in 1841 and gave up his banking interest to devote his time to finishing his *History of Greece*. Volumes i and ii came out in 1846 and the twelfth and final volume in 1856. He followed it with three volumes on Plato in 1865. From 1868 he was president of University College London, to which he left endowments and his brain. JAC

**Grove, Sir George** (1820–1900). Civil engineer and writer on music. After embarking on a career building lighthouses in the West Indies, Grove became secretary to the Society of Arts (1850) and the Crystal Palace (1852), for whose concerts he wrote numerous programme notes. Interested in biblical studies, he co-founded the Palestine Exploration Fund and co-edited Smith's *Dictionary of the Bible*; he also wrote on

many other subjects including geography and was editor of *Macmillan's Magazine*. He became the first director of the \*Royal College of Music in 1883. His *Dictionary of Music and Musicians* (1879–89), has remained the foremost English-language musical dictionary. Its most recent sixth edition, published in 20 volumes as *The New Grove Dictionary of Music and Musicians* (1980), was rewritten under the editorship of Stanley Sadie. Grove also published *Beethoven and his Nine Symphonies* (1896). ECr

**Grub Street** is a derogatory term for bad writing. Its figurative use was commonplace by the early 18th cent. and Jonathan \*Swift referred to a paper he was involved with as 'a little upon the Grub-Street'. In his *Dictionary* of 1755 Samuel \*Johnson commented: 'originally the name of a street in Moorfields in London [now under the Barbican development], much inhabited by writers of small histories, dictionaries, and temporary poems; whence any mean production is called grubstreet.' JAD

**Gruffydd ap Cynan** (c.1055–1137), king of Gwynedd (1081–1137). He was the son of Cynan ab Iago, a descendant of \*Rhodri Mawr but an exile in Ireland, and Ragnhildr, daughter of the Scandinavian ruler of Dublin. With skill and persistence, he turned himself from an adventurer into a ruler of \*Gwynedd, contending with Viking-Irish, Anglo-Normans, and volatile Welsh along the way. With Viking and Norman aid, he returned to re-establish Rhodri's line in Gwynedd (1075), but then attacked Rhuddlan and failed to overcome rivals. In his second foray (1081), again with Viking aid, he allied with \*Rhys ap Tewdwr in \*Deheubarth, but he was betrayed to the Normans and imprisoned at Chester. He took part in the major uprising of 1094, but by 1098 was again in Ireland. Only with Norman agreement did he return permanently (1099) and rule in Anglesey, whence he extended his dominion to the east and south, consolidated his control of Gwynedd, and created a stable, prosperous kingdom. His court poet, Meilyr Brydydd, and the *History of Gruffydd ap Cynan* commissioned by his son Owain (in Latin, later translated into Welsh), suggest a cultural vitality, perhaps under Irish influence, that extolled his achievements. RAG

**Gruffydd ap Llywelyn** (d. 1063), king of Gwynedd and Powys (1039–63). The son of Llywelyn ap Seisyll, king of \*Gwynedd, and Angharad, the king of Deheubarth's daughter, Gruffydd created a personal dominion over much of Wales in alliance with English and Scandinavians. He was later said to be slow and listless as a youth, but he grew into an ambitious warlord who won Gwynedd and \*Powys in battle (1039) and defeated the Mercians on the river Severn. His conquests in \*Deheubarth took longer (1040–55), during which he slew two of its kings. His alliance with Earl Ælfgar of Mercia, whose daughter he married, sustained a long struggle with \*Harold Godwineson (later Harold II), and Bishop Leofgar of Hereford also led an army against him (1056). To a Welsh chronicler he was 'the head and shield and defender of the Britons'. Harold's attack on Gruffydd's court at Rhuddlan (1062) caused him to flee, and soon afterwards

(5 August 1063) he was killed by his own men; his territorial dominion collapsed at the same time. RAG

**Gruffydd ap Rhys** (c.1090–1137), pretender to the kingdom of \*Deheubarth. Following the death of his father, \*Rhys ap Tewdwr, in 1093, Gruffydd was taken to Ireland for safety. In 1113 he returned with kinsmen and 'young hot-heads' to claim his inheritance, but others declined to support him. His rising against Norman settlers in 1116 was seen as 'repairing and renewing the Brittanian kingdom' in the spirit of the struggle between British and invader. Gruffydd ravaged south-west Wales but failed to capture the new castles or make permanent conquests. He had to be content with lands in the Tywi valley. He married Gwenllïan, daughter of \*Gruffydd ap Cynan, king of \*Gwynedd; in the general uprising after Henry I's death (1135), Gruffydd took part in the Welsh victory near Cardigan in 1136, while Gwenllïan led his army against Kidwelly castle and was killed there. He died soon afterwards and his four sons inherited his claims in Deheubarth. RAG

**Guardian.** Newspaper which has come to embody the ideology of liberal, middle-class, regional, and metropolitan England in popular perception. From its founding as the weekly *Manchester Guardian* by John Edward Taylor in 1821, it was a radical voice, demanding liberal economic and political reform. It became a daily from 1855, but did not drop its 'Manchester' prefix until 1959. It is notable today as the only national daily which has a strong regional input to supplement its London base, and which has escaped the ownership of any press magnate, preserving the democratic Scott Trust structure which has run the paper from 1936. DJA

**Guildford, diocese of.** The see, created in 1927, comprises most of Surrey. Because the area was poor agriculturally, economic development was weak and the population small, until road improvements in the 17th and 18th cents. and the advent of the railways knit Surrey closely to London. Because of this only half the parish churches date from before 1830, but Chertsey abbey, founded c.960, was significant enough to be Henry VI's original burial place before his final interment at Windsor (1484). John Wesley preached his last sermon at Leatherhead in 1791. The massive increase in population in the early 20th cent. necessitated the creation of a new bishopric which was carved out of the \*Winchester diocese. The cathedral, designed by Sir Edward Maufe and built between 1936 and 1961, is in a simplified Gothic style. WMM

**Guilford courthouse, battle of**, 1781. As late as the spring of 1781 British forces in America were capable of inflicting sharp defeats on the rebels. To follow up his victory at \*Camden in August 1780, \*Cornwallis moved northwards towards Virginia, impeded by Nathaniel Greene's forces. At Guilford courthouse on 15 March Greene gave battle. Cornwallis had scarcely 2,000 men and was heavily outnumbered, but carried the day, capturing the American guns. But his own losses were heavy and his army now tiny. JAC

## guilds

**guilds.** The guild was one of the most characteristic organizations of the later medieval period and an instrument of local urban monopoly control operated by a particular craft or by the market guild, which was the commercial guise of the local administration. Major towns had specialized guilds for different trades and London had a great variety of both mercantile guilds, such as grocers, goldsmiths, and vintners, and manufacturers like tailors and saddlers. The purpose of the guild was to regulate the local market. This took the form of control of the price and quality of goods. In Leicester, where the local wool trade was particularly important, guild restrictions were intended to retain as much of the business as possible in the hands of local merchants. Outsiders could not buy wool in the town and could only sell to members of the guild. Weavers were prevented from working at night since poor lighting would diminish the quality of workmanship. The guild also limited production and ensured that each individual member secured a fair share of the available business. Recruitment and employment were also limited through entry fines, a preference for the sons of existing members, or apprenticeships which could last for seven years. Membership conferred substantial advantages. Members of Southampton's guild were exempt from local tolls and customs and enjoyed the right of the first option to purchase goods brought to the town. Non-members were prevented from buying certain commodities including honey, herring, oil, or skins, from keeping a tavern, and could only sell cloth on market or fair days. Guilds were characteristic of an economic system, under threat from population decline and competition from unregulated rural industry, in which established interests sought to protect themselves through the maintenance of a monopoly.

CHL

**Guild Socialists** advocated workers' control of industry by transforming trade unions into monopolistic producers' guilds. These guilds would form one part of a pluralist power structure with the state, which would represent the individual as consumer on equal terms. These ideas, developed in the monthly *New Age* by A. R. Orage and S. G. Hobson, and later by G. D. H. Cole, had a degree of influence on the left until the mid-1920s.

Guild Socialism developed partly as a reaction to \*Fabian 'state socialism'. Hilaire Belloc feared that state intervention would make workers 'well fed instruments of production' whilst maintaining 'wage slavery'; as capitalist power lay in the economic field it was argued that parliamentary means would achieve little. Peaceful change was advocated by the gradual encroachment on the role of employers by union representatives. But the practical achievements of Guild Socialists were meagre. In 1915 an attempt to capture the Fabian Society for the idea failed. The Building Guilds established in 1920 by Hobson collapsed in 1923 due to the ending of government subsidies, the slump, building employer hostility, and Hobson's mismanagement. Guild Socialist ideas did, however, experience brief resurgences in the 1930s and 1960s.

LHM

**Guinness, Edward** (1847–1927). Born at Clontarf, Co. Dublin, son of the proprietor of Guinness brewery, he was

educated at Trinity College, Dublin. Eventually he became chairman of the company which, in 1886, became a public company, known as Arthur Guinness & Son. He retired in 1889 and devoted himself to various public services. His many benefactions began with housing schemes to replace slums in Dublin and London. He endowed the Lister Institute for Tropical Medicine in London and, during the Boer War, equipped a field hospital for Irish troops. He made various gifts to Dublin hospitals. Although a unionist, the nationalist majority of Dublin corporation offered him the lord mayoralty, which honour he declined. He became successively Baron Iveagh in 1891, viscount in 1905, and earl in 1919. Among his bequests to the British nation was his celebrated collection of paintings, now at \*Kenwood, which include \*Gainsboroughs and \*Romneys. IJEK

**Gulf War, 1990–1.** On 2 August 1990 Iraq invaded the tiny neighbouring state of Kuwait, giving the Iraqi dictator Saddam Hussein control of about 15 per cent of the world's oil, with a threat to a further 25 per cent. The almost defunct Soviet Union (which collapsed in December 1991) did not block a strong American response, which employed the United Nations Security Council to denounce Iraq's action and won Saudi Arabian agreement to receive large American forces. In response, on 8 August, Iraq announced the incorporation of Kuwait into Iraq, an act of direct conquest unprecedented among United Nations members.

President George Bush portrayed American military action as the start of a 'New World Order' following the end of the \*Cold War. Bush assembled a coalition of twenty-nine countries against Iraq, although with its immense armed forces and technological superiority the USA dominated the coalition in all respects. Britain's policy was to support the USA completely, to demonstrate both her reliability as an ally and her importance as a second-ranking power. By stripping her armed forces Britain contributed small but significant naval, air, and ground units to the war, all closely subordinated to American command.

The coalition forces took several months to assemble in Saudi Arabia. Iraqi strategy was to prevent a coalition forming by playing on pan-Arab sentiment, in particular over past American support for Israel. On 29 November the United Nations Security Council set a deadline of 15 January 1991 for Iraqi withdrawal from Kuwait, authorizing the use of force ('all necessary means') to support this.

Early on 17 January 1991, the coalition began with a massive air bombing attack against Iraq, which responded by attacking Israel (which was not a coalition member and had taken no military action) with long-range missiles. Critically for coalition solidarity, Israel refused to retaliate. The coalition launched its ground offensive to clear Kuwait on 24 February. This revealed that the Americans had greatly overestimated the Iraqi army, which virtually disintegrated, offering only token resistance. On 28 February, having achieved the objective of liberating Kuwait, Bush called a unilateral cease-fire, and a permanent cease-fire came into effect on 11 April.

With the liberation of Kuwait dissident groups within Iraq, notably the Kurds of the north, rose in rebellion.

Over the next year Saddam gradually reasserted his rule, and survived in power. Ironically, Prime Minister Margaret \*Thatcher, who had first committed Britain to the coalition, was forced from office in November 1990, and Bush failed to gain re-election in 1992. Although the Gulf War secured oil supplies for the West, effectively destroyed Saddam's ambitions for Iraq as a regional power, and upheld the rule of law through the United Nations, it failed to deliver the promised 'New World Order'.

SDB

**Gulliver's Travels**, Jonathan \*Swift's best seller, appeared on 28 October 1726. Purporting to be an autobiographical account of Gulliver's 'Travels into Several Remote Nations of the World', and read as a 'general' satire on political and social institutions, contemporaries also interpreted Swift's work as a 'particular' political allegory on the administration of Sir Robert \*Walpole. Attempts to identify a close allegory have been unconvincing, however. Although Swift's scathing portrait of the bestial Yahoos outraged Victorian sensibilities, *Gulliver's Travels* endured as a children's classic. It appeals to modern readers as a general political allegory and a savage indictment of human folly.

JAD

**Gundulf** (c.1024–1108). Bishop of Rochester. Born in Normandy, Gundulf became a monk at Bec, where he formed friendships with both \*Lanfranc and \*Anselm. Anselm called him 'first among my friends' and wrote that 'thy spirit and mine can never bear to be absent from each other'. In 1070 when Lanfranc became archbishop of Canterbury, he brought over Gundulf as an administrator and had him elected to the bishopric of Rochester in 1076. Gundulf changed it from a secular to a monastic church and began rebuilding the cathedral. William the Conqueror employed him to supervise the construction of the White Tower. In 1093 he wrote to the monks at Bec urging them not to oppose Anselm's appointment as archbishop of Canterbury. Gundulf remained on good terms with both Rufus and Henry I and had sufficient authority to beseech Rufus in 1093 to lead a better life, though he received a ribald answer. He was one of the most saintly and respected of post-Conquest bishops.

JAC

**Gunpowder plot**, 1605. Soon after becoming king of England in 1603, James I discreetly relaxed the penal laws which subjected catholics to fines, imprisonment, and even death. However, the ensuing uproar in Parliament persuaded him to backtrack, leaving the catholics feeling betrayed and hopeless, particularly since the conclusion of peace with Spain in 1604 had deprived them of help from that quarter. A band of young catholic hotheads decided to seize the initiative by destroying the entire English government. They smuggled barrels of gunpowder into the cellars of Parliament, and Guy \*Fawkes stood ready to ignite these on 5 November 1605, when the king, Lords, and Commons were assembled for the opening of the new session. The plot was betrayed, however, and the conspirators captured, tried, and executed. The plot etched itself upon the collective English memory, and bonfires and 'burning the guy' have remained traditional features of Bonfire Night celebrations.

RL

**Gurkhas** or Gorkhas were the ruling clan of the Kathmandu valley who, in the 18th cent., expanded their empire over much of Nepal and encroached into sub-Himalayan India. They were defeated in 1814–16 by Lord \*Hastings. However, their valour and fighting qualities—especially with the *kukri* knife—earned much respect. The king of Nepal was invited to supply Gurkha contingents to the British Indian army. Gurkha battalions served with distinction in many colonial engagements, including the \*Indian mutiny, and in the First and Second World Wars. They are still represented in both the British and the Indian armies.

DAW

**Guthlac, St** (c.674–715). Of Mercian royal stock, a native of Middle Anglia (around Leicestershire), Guthlac, baptized as a baby, for nine years led a war-band, before entering at 24 the monastery at \*Repton and at 26 occupying a (robbed) burial mound on the Lincolnshire island of Crowland (possibly territory of north Gyrwe), on the Middle-East Anglian border. His biography, by Felix, bears resemblances to the poem \**Beowulf*. Guthlac's life as a hermit, fighting demons, exemplifies the combination of Germanic heroism, Mediterranean influence, and genuine faith which characterized aristocratic Anglo-Saxon Christianity. Guthlac was politically influential, his visitors including Bishop Hedda, Ecburh, daughter of Aldwulf of East Anglia, and \*Æthelbald, future king of Mercia, whose accession Guthlac prophesied. Guthlac's support was exploited in Æthelbald's promotion of his cult. Crowland abbey developed from his hermitage. Vernacular lives were composed later and his cult flourished particularly in the 12th cent.

AER

**Guthrum** (d. 890). Viking leader, king in East Anglia, and major opponent of King \*Alfred. Guthrum probably first appeared in England as the leader of the 'great summer army' which joined the forces commanded by Halfdan at Reading in 871. When the army split up in 875, Guthrum returned with his contingent to Wessex. In 878 he was nearly successful in capturing Alfred when the latter was taken by surprise at \*Chippenham and received the submission of many West Saxons, but was defeated by Alfred at the battle of \*Edington later the same year. Guthrum was subsequently baptized with Alfred as his godfather and took the new name of Athelstan. He retired with his forces to rule East Anglia and issued coins there in his baptismal name. The text of a treaty survives which Guthrum made with Alfred at some point between 878 and his death in 890.

BAEY

**Guyana**, an independent republic within the Commonwealth since 1970, was the only British colony on the South American mainland. The population is about 800,000 and the chief exports are sugar, rice, and bauxite. The first European settlements were made by the Dutch. During the Revolutionary and Napoleonic wars they changed hands repeatedly, but in 1803 Essequiba, Berbice, and Demerara were finally taken by the British. In 1831 they were united as British Guiana and became a crown colony in 1928. The capital is Georgetown.

JAC

**Gwent**. County of the south-east Wales border, which has had a singularly complex administrative history. Its basis was

the Welsh kingdom of Gwent, which emerged on the lower Wye river in the 7th cent. It was quickly seized by the Anglo-Normans moving west after 1066 and a series of lordships created in both upper (Gwent Uwchcoed) and lower (Gwent Iscoed) Gwent. These were merged in 1536 to form the new county of Monmouthshire, which took its name from the royal lordship. The anomalous position of the county was evident when, after the Act of Great Sessions of 1542, it was not included in a Welsh judicial circuit. But after the Local Government Act of 1972, Wales was defined formally to include Monmouthshire, which, with some minor territorial adjustments, was renamed Gwent. The county town was moved from Monmouth to Cwmbran. In 1996, in yet another reorganization, Gwent was divided into four new unitary authorities, Blaenau Gwent, Torfaen, Monmouthshire (reviving the old name), and Newport. As might be expected from its location, Gwent was highly Anglicized and only 2.4 per cent of its population spoke Welsh. In 1991 the population was 442,212, and the estimated population of the new authorities is Blaenau Gwent 73,000, Torfaen 91,000, Monmouthshire 81,000, Newport 137,000. It will be interesting to see if this tug of war, which has lasted a mere 900 years, continues in the future. See also **MONMOUTHSHIRE**. HC

**Gwent, kingdom of.** A post-Roman kingdom situated between the rivers Wye and Usk that took its name from the Roman town of \*Caerwent, and lasted until Norman incursions in the late 11th cent., though it had been incorporated with Glywysing in the kingdom of \*Morgannwg from the 8th cent. From 1070 the Norman conquerors quickly created several marcher lordships in more accessible parts; native dynasties survived elsewhere, even acknowledging the overlordship of the lord \*Rhys of \*Deheubarth and, in the 13th cent., of the princes of \*Gwynedd. The new county of Monmouth (1536) was old Gwent together with the marcher lordship of Newport (formerly Gwynllwg); it took its name from one of the larger lordships and survived until 1974, when Gwent reappeared with only minor border adjustments. RAG

**Gwyn, Nell** (1650–87). Born in 1650 in Hereford, Nell first worked as a barmaid in her mother's drinking-house and then as an orange-seller outside the Theatre Royal, Drury Lane (London), before attracting the attention of Charles II, by which time she was a popular actress at the Theatre Royal itself. She became his mistress though sharing his affections with Louise de Kéroualle (duchess of \*Portsmouth) and others. Charles was infatuated not only by her physical appeal but also by her natural wit, boldness, and sparkle. The birth of two sons, Charles Beauclerk, later earl of Burford and duke of St Albans, on 8 May 1670 and James, on 25 December 1671, ensured that she remained in favour. But Charles's intention of creating her countess of Greenwich never materialized, emphasizing the social distinction made between the treatment of Nell and other royal mistresses. She remained, despite everything, 'the darling strumpet of the crowd'. Following Charles's death in 1685, she was given Bestwood Park near Nottingham, where she lived until her own death following a stroke on 16 November 1687. She was buried at St Martin-in-the-Fields, London. SMC

**Gwynedd.** A county of north-west Wales created by the Local Government Act of 1972 and extant in its initial form from 1974 to 1996, when it was modified by the removal of \*Anglesey (Ynys Môn), which became a separate unitary authority. It was based upon the post-Roman and medieval kingdom of Gwynedd which, after conquest by Edward I, had been divided by the statute of \*Rhuddlan in 1284 into the counties of Anglesey, Caernarfonshire, and Merionethshire. The name was revived in 1972 when new counties were created. Initially the proposal was to include all the counties of north Wales in a county to be called Gwynedd, a name acceptable because of its 'historical associations as well as . . . shortness and pronounceability'. But a Consultative Document in 1971 accepted a twofold division, defining Gwynedd as Anglesey, Caernarfonshire, and Merioneth, though there were minor changes by which the Conwy valley was included in Gwynedd and the Edeirnion rural district moved to Clwyd.

In 1996 further changes occurred with the establishment of unitary authorities. Ynys Môn was separated and reconstituted as the county of Anglesey and a new authority, Caernarfonshire and Merionethshire, proposed, again with some minor additions from the former Glyndŵr district. That new authority, however, opted to retain the name of Gwynedd. HC

**Gwynedd, kingdom of.** The name was derived from the district called in Latin, Venedotia, and the kingdom was based upon Snowdonia and Anglesey, extending at its height to include territory to the east of the Conwy. It was one of the immediate post-Roman kingdoms of the 6th cent., ruled by Maelgwn (Maelgwn Gwynedd), said to be a descendant of \*Cunedda, who, about AD 440, moved, or was moved, with the \*Votadini from Strathclyde to meet a threat from the Irish. From the outset Gwynedd was one of the most significant of the Welsh kingdoms, with claims to overlordship, and pursuing an expansionary policy. Under rulers such as \*Rhodri Mawr (d. 878), \*Gruffydd ap Llywelyn (d. 1063), \*Owain Gwynedd (d. 1170), \*Llywelyn the Great (d. 1240), and \*Llywelyn ap Gruffydd (d. 1282), much of Wales was brought under its hegemony, and titles such as 'king of the Britons' and 'prince of Wales' were employed. Under Gwynedd there was certainly a move towards statehood in Wales. Its downfall came from overambition on limited resources. Gwynedd took advantage of English divisions during the reign of Henry III to reassert itself and the treaty of \*Montgomery in 1267 gave it substantial territorial gains. But after the campaigns of Edward I in 1277 and 1282–3 it became part of the principality under the control of the English crown and was eliminated as a political entity, being divided by the statute of \*Rhuddlan in 1284 into the counties of Anglesey, Caernarfonshire, and Merionethshire. HC

**gypsies and tinkers** had different origins although the terms are sometimes interchangeable. Gypsies came from northern India and adopted a wandering life-style, keeping their Romany language and traditions. They arrived in the British Isles during the 15th cent. and their foreignness led to the presumption that they were Egyptians, corrupted to

'Gypsy'. They earned their livings by dealing in horses and making small household goods. Some of the women told fortunes and sold charms, which added to their air of mystery and magic, although it brought the dangers of being associated with witchcraft.

In Scotland and Ireland gypsies were often called tinkers because of their similar wandering life-style. A 'tinker' was an itinerant metalworker, who sharpened cutting tools and made or repaired items for household or farm use.

Despite the idyllic life described by George Borrow and other romantics of the 19th cent., tinkers and gypsies had a reputation for fecklessness and theft. They attracted hostility largely because of their refusal to accept a settled way of life. They were often treated harshly. Gypsies from Germany, expelled by laws forbidding their traditional life-style, were denied refuge in the British Isles early in the 20th cent. Recently local authorities have attempted to control travellers' movements by designating approved sites, and powers to move them on were enhanced during the 1980s. IJEK

**habeas corpus.** Before Magna Carta, the writ of habeas corpus constituted a command in the king's name to have a defendant brought physically before the court. It had then no libertarian function. In the 15th and 16th cents. it was used to remove a case from an inferior court to the central courts. By the mid-15th cent. it tested the legality of detention and the common law courts used it to release litigants who had been imprisoned by the Court of Chancery. In the 17th cent. it was employed to challenge arbitrary arrests by the royal government and, as such, played a crucial role in the constitutional disputes. In Darnel's case in 1627, which arose out of a forced loan, the judges refused to allow bail to a person detained 'at the special command of the king'. The \*petition of right (1628) protested at the practice, but opponents of the crown such as Sir John \*Eliot and John \*Selden (1629) continued to be committed for political purposes.

When the king lost control of the situation in 1640, his adversaries moved to defend habeas corpus. The Act of 1641 which abolished \*Star Chamber declared that the writ could ensure that a person imprisoned by king and council should be brought before the court without delay with the cause of imprisonment shown, the court should pronounce on the legality of the detention, and should bail, discharge, or remand the prisoner.

After the Restoration, the struggle was resumed, since many loopholes in the law remained. In Bushell's case (1670) habeas corpus was used to release a juryman who had been gaoled for returning what the court regarded as a perverse verdict. After several attempts, the Habeas Corpus Act of 1679 blocked up many of the loopholes and improved the mechanism of enforcement. Though habeas corpus was suspended at many times subsequently, the suspension had to be justified and aroused concern for civil liberty. In Scotland, the equivalent to habeas corpus was obtained by an Act for Preventing Wrongous Imprisonments in 1701. There was considerable agitation throughout the 18th cent. for the extension of habeas corpus to Ireland, but governments insisted that the situation was too volatile. It was one of the concessions gained in 1781 by the Irish \*Volunteer movement. JAC

**Habsburgs, relations with.** The addition of the Low Countries to the Habsburg empire in 1482 made the latter a force in northern Europe. Henry VIII was at times allied

with the Habsburgs against France, but the divorce of \*Catherine of Aragon turned her nephew, the Emperor Charles V, into an obdurate opponent. The central European parts of Charles's empire did not greatly interest the English until, with the accession of William III, the Habsburgs joined the Austro-Dutch alliance against Louis XIV. Notable successes were achieved in the War of the \*Spanish Succession, including the remarkable co-operation of \*Marlborough and Prince Eugene of Savoy at the battle of \*Blenheim (1704). The alliance of Austria and Britain in the War of the \*Austrian Succession (1740–8) was, however, marred by mutual recriminations. A renewed threat from France and a common interest in the exclusion of that power from the Low Countries brought the two together again from 1793. Years of frustration and fractiousness followed until 1814 when \*Castlereagh and Metternich began an eight-year partnership to preserve the balance of power in Europe against Russia as well as France. Britain's subsequent relations with Austria were frequently upset by the latter's determination to uphold autocracy, notably during the revolutions of 1848–9. Although \*Palmerston saw the Habsburg empire as an essential component of the European balance, he began to treat its presence in northern Italy as injurious to the Italians and itself. Both Britain and Austria were fearful of Russian ambitions in the Near East in 1854–6, 1878, and again in 1887–97 when the two powers were loosely bound by the Mediterranean agreements. The \*First World War ranged them on opposite sides, but even so the British, until late in the war, showed some interest in the survival of at least part of the Habsburg empire as a component of the balance of power. CJB

**Haddington, Thomas Hamilton, 1st earl of [S]** (1563–1637). Hamilton's father was a lord of Session as Lord Priestfield. Hamilton studied law at Paris and at 29 became a lord of Session himself as Lord Drumcain. He was appointed by James VI one of the \*Octavians to control royal finances and in 1596 became king's advocate. Knighted in 1603, he was created Lord Binning (1613), earl of Melrose (1619), and earl of Haddington (1627). He was secretary of state [S] 1612–26, president of the Court of Session from 1616 until 1626, and lord privy seal [S] 1627–37. For many years Haddington was one of James VI's chief administrators in Scotland, attempting to restrain the king's zeal for his episcopal policy. James's nickname for him—taken from the

Edinburgh street—was ‘Tam o’ the Cowgate’. The king found him an ideal servant—learned, reliable, and, above all, not terrifying.

JAC

**Haddington, treaty of**, 1548. The response of \*Mary of Guise and the pro-French party to intimidation by the English \*‘rough wooing’ of 1544–8 was the treaty of Haddington of 7 July 1548. Mary, queen of Scots, then aged 5, was to marry the dauphin, though Scottish independence was guaranteed. The following month Mary was sent to France to be brought up. The marriage took place in April 1558.

JAC

**Hadrian**. Roman emperor 117–38. Publius Aelius Hadrianus was born in 76, probably at Italica near Seville. Related by marriage to Trajan, he became a ward of the future emperor on the death of his father. During Trajan’s reign he progressed through a series of military and civil offices, succeeding Trajan in 117. In the early part of his reign he toured his empire, coming to Britain in 122. Here he commanded the building of the wall which bears his name. The forum at \*Wroxeter was dedicated in his reign and other public buildings are dated to this period, though it is far from certain that he consciously encouraged civil development in the province. An over-life-size bronze head of Hadrian from the Thames, now in the British Museum, suggests a colossal statue or a temple to him in London, perhaps after his deification by the Senate at the urging of his successor, Antoninus Pius.

ASEC

**Hadrian IV**. See ADRIAN IV.

**Hadrian’s Wall** was a Roman frontier work of the early 2nd cent. running 70 miles from the Tyne near Newcastle to the Solway west of Carlisle. Commenced at the behest of \*Hadrian on his visit to Britain in 122, the wall was originally to consist of a running barrier fronted by a ditch (except on the crags of the central sector), with a gateway defended by a fortlet every mile (milecastle) and two watchtowers (turrets) between each pair of milecastles. The troops remained based in forts along the Tyne–Solway road, the Stanegate. The eastern three-fifths of the wall were in stone, the western two-fifths in turf, later rebuilt in stone. With the construction of the wall well advanced, the decision was taken to place the garrison forts actually on the line of the wall and to extend the eastern terminal from Newcastle to Wallsend. The final addition was the ‘vallum’ to the rear of the wall, a ditch flanked by two mounds with causeways only at the forts. The western terminal of the wall was at Bowness-on-Solway, but fortlets (milefortlets) and watchtowers (towers) continued down the Cumberland coast. The entire complex was built by the three legions in Britain, though garrisoned by the more mobile auxiliary troops. Apparently a frontier, it was designed to be permeable, to supervise not to deny movement. The line could not have been held against a concerted attack; in the event of a crossing Roman forces would concentrate to the south to expel invaders. North of the wall were further forts monitoring Northumberland and the Lowlands. The psychological and propaganda effect of this enormous feat of construction and of the garrison along it must have been immense, not to mention the demo-

graphic and economic impact of the thousands of troops stationed along its line.

ASEC

**Hague, William** (b. 1961). Politician. Hague’s meteoric rise to the leadership of the Conservative Party was assisted by the shattering defeat of 1997, which removed from Parliament a number of potential rivals. President of the Oxford Union (1981), he was returned for Richmond (Yorks.) in 1989. He served as minister for social security 1994–5 and secretary of state for Wales 1995–7. From 1997 his political task was to restore morale and credibility to a battered and divided party. He became a redoubtable Commons performer, quite capable of inflicting bruises on Tony \*Blair at question time. But despite a very vigorous election campaign in 2001, his party failed to make any progress at the polls and Hague resigned at once from the leadership, though continuing to represent Richmond. Blamed for adopting too right-wing a stance, it is far from certain that any other leader would have done better, and the succession to John \*Major had all the appearance of a poisoned chalice.

JAC

**Haig, Sir Douglas, 1st Earl Haig** (1861–1928). Soldier. Before 1914 Haig was recognized as one of the outstanding soldiers of his generation. In December 1915 he replaced Sir John \*French as commander-in-chief of the British armies in France. He fought two of the most costly and controversial battles in British history, the \*Somme (1916) and third Ypres (\*Passchendaele, 1917), because he was convinced that the German army would run out of soldiers if he continued to attack. His reputation never recovered from the casualties his own army suffered and these battles have overshadowed the far more successful campaign he waged between August and November 1918 which finally broke the German army’s resistance. Haig remains a figure of great controversy. Despite attempts by some historians to portray him as an ‘educated soldier’, his popular image remains that of a callous butcher. In reality, he was a man of limited professional ability, sustained by a deep religious faith. DF

**Hailsham, Quintin Hogg, 2nd Baron** (b. 1907). Conservative politician and lawyer. Hogg entered Parliament at the Oxford by-election of 1938, a supporter of appeasement. He turned against \*Chamberlain before the latter’s fall in 1940. Hogg rose to prominence in the Tory Reform Group, seeking to commit the party to a vigorous policy of social reform. Elevated to the Lords in 1950 on his father’s death, he anticipated a career as a barrister. But Hailsham was recalled to government by \*Eden and enjoyed high office under \*Macmillan, including a successful period as party chairman. He renounced his peerage in 1963 to contest—unsuccessfully—the party leadership, returning to the Commons. He anticipated becoming home secretary under \*Heath in 1970 but, ennobled with a life peerage, served instead as lord chancellor, as his father had done. Hailsham showed his adaptability by retaining frontbench status under Margaret \*Thatcher, becoming lord chancellor again in 1979. By the time he retired in 1987, he was the longest-serving cabinet minister since the war.

DJD

**Hakluyt, Revd Richard** (c.1551–1616). In 1589, ‘for the honour and benefit of this commonwealth wherein I live and

## Haldane

breathe', Hakluyt published the *Principall Navigations, Voyages, Traffiques and Discoveries of the English Nation*. He wished to persuade the English to abandon the depressed trades to the continent and embark on enterprises in the wider world. Christ Church, Oxford, had introduced him to 'the sweet study of the history of cosmography' and then as chaplain to the English embassy in Paris from 1583 to 1588 he had come to realize how far behind France, Spain, and Portugal was England in the pursuit of wealth from non-European regions. Later a canon at Westminster, he became a publicist for the North-West Passage idea and other projects, and adviser to the new \*East India Company in 1600. The 1598–1600 three-volume extended edition of *Principall Voyages*, a 'prose epic' as well as a record of English explorations, is his chief memorial. RB

**Haldane, Richard Burdon, 1st Viscount Haldane** (1856–1928). Haldane was the son of a Perthshire landowner and was perhaps most famous for the report to which he gave his name when secretary for war. After a Scottish education, he became a successful Chancery barrister in London, though he had little skill in advocacy. In 1885 he was elected to Parliament for East Lothian and remained an MP until he left the Commons for the Lords in 1911. Haldane took office in \*Asquith's 1905 Liberal government as secretary for war. His reforms of the army earned him considerable respect. In 1911 he was created viscount and he became lord chancellor in 1912. In 1914 he returned to the War Office but his affinity with and affection for Germany and German philosophy caused public suspicion and criticism. He was dismissed by Asquith in 1915. He served briefly as lord chancellor in the first Labour government under Ramsay \*MacDonald. MM

**Hale, Sir Matthew** (1609–76). Hale was one of the great authorities on English law (particularly on the criminal law), and had a distinguished judicial career. He took office as chief justice of Common Pleas under the Commonwealth and after the Restoration became the chief baron of the Exchequer and in 1671 chief justice of Common Pleas. However his fame rests primarily on his writings, among them his *History of the Common Law*, *The Jurisdiction of the Lords' House*, *The Prerogatives of the King*, and above all his *History of the Pleas of the Crown*, which has continued to be an important source of the criminal law, and was quoted as recently as 1991 in the case of *R. v. R.* where Hale's statement that there could be no rape committed by a husband on his wife was finally overruled by the House of Lords. Hale was remarkable for his scholarship and for his personal qualities of integrity and humanity. MM

**Halidon Hill, battle of**, 1333. For years after the great victory of \*Bannockburn in 1314 Scotland was in a powerful position, confirmed by the treaty of \*Edinburgh–Northampton in 1328. But the death of Robert Bruce in 1329, leaving a young son David II, encouraged Edward III to intervene once more, supporting the claims of Edward \*Balliol. In the spring of 1333 Edward besieged Berwick in person. Sir Archibald \*Douglas led a large Scottish army to the rescue. At Halidon Hill, just north-west of Berwick, the

armies met on 19 July. The Scots had to attack up the hill and suffered severely from English arrows. Their heavy losses included Douglas. Balliol was reinstated as king of Scotland and Berwick passed into English possession permanently.

JAC

**Halifax, George Montagu Dunk, 2nd earl of** (1716–71).

Halifax was a hard-working and useful administrator. He inherited the title at the age of 23 and two years later made a lucrative marriage to the heiress of a London merchant, taking the name of Dunk. He began in opposition as a supporter of the prince of Wales and from 1742 to 1744 was a lord of the bedchamber to the prince. But in 1744 he joined the Pelhams and began his governmental career as master of the buckhounds 1744–6 and as 1st lord of Trade 1748–61. He worked hard on colonial questions and in 1749 the town of Halifax in Nova Scotia was named after him. In 1761–3 he was lord-lieutenant of Ireland, next served with Grenville as secretary of state for the north, and then the south, 1762–5. He was given the Garter in 1764. As secretary in 1763, he signed the \*general warrant under which John \*Wilkes was apprehended and seven years later, after general warrants had been declared illegal, had to pay £4,000 damages. Despite his marriage, he was usually short of money, building heavily at Horton in Northamptonshire, running an expensive mistress, and facing ruin after a costly election contest at Northampton in 1768. This may have persuaded him to accept office again under his nephew Lord \*North in 1770, though Horace \*Walpole commented that he was 'too old to learn'. In 1770–1 he was lord privy seal and for a few months before his death resumed his old office as secretary for the north. George III mourned him politely as 'an amiable man'. JAC

**Halifax, Charles Montagu, 1st earl of** (1661–1715).

Though of aristocratic background, Montagu achieved political recognition and advancement through matchless powers of oratory and a measure of machiavellian trickery rather than under a patron. Entering Parliament in 1689, he soon achieved prominence as a court spokesman and manager, becoming a Treasury commissioner in 1692, chancellor of the Exchequer in 1694, and 1st lord of the Treasury in 1697. Accusations of malversation forced his resignation in 1699, but in the year following he was created baron. An attempt to impeach him in 1701 failed. Throughout Anne's reign he was a \*Junto leader in the Lords, and at George I's accession (1714) was reappointed 1st lord and made an earl. He is chiefly remembered for the financial reforms he undertook in the 1690s, most notably the establishment of the national debt (1693) and the foundation of the \*Bank of England (1694), which greatly helped to rationalize the existing system of government finance. AAH

**Halifax, George Savile, 1st marquis of** (1633–95). Politician and essayist. Halifax both epitomized and advocated the 'middle path' in politics ('the Trimmer'), but in the shifting partisan atmosphere of the post-Restoration era he was regarded as an oddity, with whom few politicians could work easily. A wealthy Yorkshire baronet, and of royalist background, he entered politics in the 1660s and was made

a viscount in 1668. But successive administrations felt the edge of his finely tuned intellect. Initially hostile towards \*Clarendon, he was then critical of the pro-catholic policies of the \*cabal, and then of the Anglican reaction of \*Danby. He emerged by 1679 as a firm opponent of \*'exclusion', was reappointed to the Privy Council and in 1682 was created a marquis. As lord privy seal, however, he was increasingly unhappy in the enclaves of high Toryism. In 1685 James II dismissed him. Although in 1688 he threw aside his neutrality and supported William of Orange, he soon found himself out of favour with other power-politicians and retired in 1690. See TRIMMER.

AAH

**Halifax, Edward Wood, 1st earl of** (1881–1959). A Conservative politician, Halifax made some progress as viceroy of India (1926–31) towards constitutional change in talks with the nationalist leader Mahatma \*Gandhi. A devout high churchman, he was at first out of his depth in dealings with Nazi Germany. As foreign secretary (1938–41) he continued the search for an accommodation until September 1939, but he displayed mixed feelings during the Munich crisis (1938), and argued early in 1939 for tougher policies, including faster rearmament. In the leadership crisis of May 1940 he was favoured by some to succeed \*Chamberlain as prime minister. Briefly, while the Dunkirk evacuation hung in the balance, he showed interest in exploratory talks to end the war. Between 1941 and 1946 this tall, aloof aristocrat served with surprising success as ambassador in Washington.

CJB

**Hall, Edward** (c.1497–1547). Hall published posthumously in 1548 his *Union of the Two Noble and Illustre Famelies of Lancastre and Yorke*, tracing royal history from Henry IV to Henry VIII. He was a keen spokesman for the Tudors, whom he saw as restorers of order after decades of anarchy, greatly admired Henry VIII, disliked \*Wolsey and the clergy, and supported the Reformation. His book was consequently burned in Mary's reign for its anticlerical tone. Hall was born in London, educated at Eton and King's College, Cambridge, became a Gray's Inn lawyer, and served as a member of Parliament. He was made common serjeant of London in 1533 and under-sheriff from 1535. His early history owed much to Polydore Vergil but, as he approached his own times, he added eye-witness accounts, particularly of the London scene. \*Shakespeare's use of his works in his historical plays helped to popularize Hall's view of the past.

JAC

**Hall, Sir Edward Marshall** (1858–1929). Hall was one of the greatest English advocates and a legend in his own time and since. He enjoyed, at the height of his powers, the sort of reputation and glamour in the eyes of the public later enjoyed by actors and film stars. His most famous cases were criminal trials, such as the trial of Marie Hermann in 1894, where, as was frequently the case, he obtained an acquittal for his client by his eloquence, his striking presence and voice, and his magnetic personality. It has been suggested that his knowledge of law was poor and he was frequently criticized by judges, but his success, especially as counsel for the defence, was undeniable.

MM

**Hallé, Sir Charles** (1819–95). Conductor and pianist. Born in Hagen (Germany), Carl Hallé was a child prodigy, giving piano recitals and conducting operas at the age of 11. After a period in Paris, he settled in Manchester and in 1849 became conductor of the Gentlemen's Concerts. On 30 January 1858 the reconstituted Hallé Orchestra inaugurated a new series of concerts which soon became the centre-piece of Manchester's musical life. Hallé conducted the orchestra until his death; he also appeared frequently as soloist and gave regular London recitals, gaining special acclaim for his interpretations of Beethoven's sonatas. Although a conductor of determination, he was a man of charm and humour. In 1893 he was appointed principal of the new Royal Manchester College of Music. The Hallé Orchestra has continued to the present day, gaining particular renown under the conductorship of Sir John Barbirolli (1943–70).

ECr

**Halley, Edmond** (1656–1742). Astronomer, remembered because his name is attached to a comet. Leaving Queen's College, Oxford, without a degree in 1676, he went to St Helena to map the southern stars. After a famous meeting with \*Wren and \*Hooke, he visited \*Newton in Cambridge, and hearing about his work on gravitation, persuaded him to publish it; he was thus the catalyst making the *Principia* (1687) possible, seeing it through the press and providing a financial guarantee against failure. In 1703 he became professor of astronomy at Oxford, and in 1720 astronomer-royal. He computed the orbits of several comets, and deduced that those of 1456, 1531, 1607, and 1682 were periodic returns of the same body: some comets at least thus moved in vast elliptical orbits, their regularity proving how empty space must be.

DK

**Halsbury, Hardinge Gifford, 1st earl of** (1823–1921). Conservative lawyer. Son of the editor of the Conservative *Standard* newspaper, Gifford was trained up to both the law and party politics. With an early reputation for relentless determination and formidable memory as a barrister, he was solicitor-general under \*Disraeli in 1875 even before he had become an MP. He was prominent in the Conservative harassment of \*Bradlaugh. Lord chancellor in all Conservative or Unionist governments from 1885 to 1905—seventeen years in all—Halsbury made many political appointments to the judicial bench and intensified the sense of confrontation between the judiciary and trade unionism. Few holders of his office have been so partisan. A hard-liner in opposition, he was one of the 'die-hard' peers who fought to the end to prevent the 1911 \*Parliament Bill removing the Lords' absolute veto. A productive legal reformer, Halsbury oversaw the production of the digest of *The Laws of England* (1905–16) which bears his name.

BIC

**Hamilton, William Douglas, duke of** [S] (1634–94). A younger son of the 1st marquis of Douglas [S], he was created earl of Selkirk in 1646, at the age of 12, when his father was campaigning with \*Montrose. In 1656 he married the daughter of the 1st duke of \*Hamilton, who had been executed in 1649, and who was duchess in her own right. At the Restoration, he was created duke for life. Favourable to \*presbyterianism, Hamilton spent much of Charles II's reign in

## Hamilton

rivalry with \*Lauderdale. James II favoured him. He was given the Garter in 1682, made a commissioner of the Treasury [S] 1686–9, and appointed to the English Privy Council in 1687. But he joined the Williamite cause in 1688 and presided over the Convention which met at Edinburgh in 1689 and offered the throne to William and Mary. He was again commissioner to the Scottish Parliament in 1692. \*Burnet called him 'rough and sullen, with a boisterous temper'. JAC

**Hamilton, James Hamilton, 1st duke of** [S] (1606–49). Charles I's adviser on Scottish affairs during the civil wars. Educated at Exeter College, Oxford, Hamilton became a privy counsellor under Charles I and fought for the protestant cause in Germany during the 1630s. Successful neither as a general nor a politician, he was deficient in both intelligence and moral principle. He failed to pacify the Scottish religious disturbances of the late 1630s, or to wrest control of Aberdeen from the \*covenanters in 1639. His attempts in the early 1640s to find an accommodation with \*Argyll and the presbyterians brought royalist accusations of treachery, especially when he subverted \*Montrose's plan to attack Argyll's party. Fleeing Scotland in 1644 for the king's court in Oxford, he was arrested and imprisoned. Freed in 1646 he laboured to persuade the Scots to support a royalist-presbyterian uprising in England. When the rising did occur in the spring of 1648, Hamilton was unprepared and did not arrive with his promised army until July. Indecisive, and unable to prevent his cavalry from stringing out in a thin line more than 20 miles long, he was easy prey for Cromwell's hardy veterans, who dashed his army to pieces at \*Preston (August 1648). Hamilton surrendered at Uttoxeter, was condemned for treason by Parliament, and executed on 9 March 1649, five weeks after his king. IJG

**Hamilton, James Hamilton, 4th duke of** [S] (1658–1712). Hamilton played an important but equivocal part in the Union of Scotland and England in 1707. His grandfather had been executed in 1649 as a royalist and his great-uncle had been killed fighting for Charles II at \*Worcester. His mother, duchess in her own right, surrendered her title to him in 1698. Though his father supported William of Orange at the Glorious Revolution, Hamilton stayed with James II and was long suspected of Jacobitism. After taking his seat in the Scottish Parliament in 1700, he became leader of the party which brought about the confrontation with England caused by the Act of \*Security of 1703. But, to the indignation of his followers, he switched in 1705, moving that the queen should appoint the commissioners to treat for Union. He was not included in the commission and opposed the terms of Union vehemently. After the Union, he served as a representative peer 1708–12 and was given the dukedom of Brandon [GB] in 1711. The House of Lords refused to allow him to take his seat. In 1712 his fortunes seemed to have recovered: he was appointed master-general of the ordnance and given the Garter, but perished in a duel in Hyde Park (in which his opponent Lord Mohun was also killed). Hamilton was a good and persuasive speaker. \*Rosebery suggested that he was unduly influenced by honours, but irresolution seems to have been equally present. JAC

**Hamilton, William Hamilton, 2nd duke of** [S] (1616–51). Scottish royalist leader in civil wars. Hamilton was educated at the University of Glasgow, created earl of Lanark in 1639, and made secretary of state for Scotland the following year. He had little influence on policy and was regarded with suspicion by English royalists on account of his links with the \*covenanters. In 1646 he regained the king's confidence and worked throughout 1647 for a treaty with the Scots, the \*Engagement, to restore the king to his throne in exchange for establishing presbyterianism in England. He played a leading part in preparing the invasion of England in 1648, led by his brother, the 1st duke, though he did not take part himself. After inheriting his brother's title in 1649, he joined the second invasion of England in 1651. 'To go with a handful of men into England', he wrote, seems 'very desperate'. He was right. Wounded at \*Worcester, he died a few days later and was buried in the cathedral. \*Burnet said of him that he was franker, more passionate, more enterprising, and more religious than his brother. IJG

**Hamilton, Emma** (1765–1815). Born in the Wirral as Amy Lyon, Emma's earliest employers c.1778 had links with London artistic circles, and her sensational beauty became celebrated through the art of an early mentor, George \*Romney (1734–1802). Mistress of Sir Harry Fetherstonhaugh, and then in 1782 of the more worthy Charles Greville, Emma was much indebted to Greville and fell deeply in love with him. But his ultimate ambitions excluded her, and in 1786 he cynically passed Emma on to his widower uncle Sir William Hamilton (1730–1803), British representative at the court of Naples and Sicily. Hamilton delighted in Emma's ear for languages and music, and her theatrical flair, and in 1791 he contentedly married her. An intimate of Queen Maria Carolina, Emma was able to bring timely sustenance to Nelson's ships before the Nile battle in August 1798. From this time on Nelson's infatuation with her, reciprocated by Emma with boisterous panache, moulded her future and dramatized Nelson's. Defiant in self-induced adversity, after her mother's death in 1810 Emma Hamilton degenerated beyond redemption. She died in Calais. DDA

**Hamilton, Sir James, of Finnart** (c.1500–40). An illegitimate son of the 1st earl of Arran and brother of the archbishop of St Andrews, Hamilton became a successful architect. As a youth he was impetuous and aggressive, taking part in many affrays. He was a close companion of the young king James V, and was employed in the renovation of the palaces of \*Falkland and \*Linlithgow. In 1540 he was suddenly accused of plotting to murder the king and executed in haste. It has been suggested that the king may have been anxious to take possession of the great wealth which Hamilton had accumulated. JAC

**Hamilton, John** (c.1511–71). Archbishop of St Andrews. Hamilton was an illegitimate son of the 1st earl of Arran and brother of Sir James \*Hamilton of Finnart. He became a Benedictine monk as a boy. After study at Paris, he used his influence with his half-brother, the Regent \*Arran, on behalf of the old religion and was appointed lord privy seal in 1543. He was made bishop of Dunkeld in 1544 and three years

later, after the murder of Cardinal \*Beaton, was translated to the archbishopric of St Andrews and primacy. He was a strong persecutor of protestant heresy. After 1560 he lost much of his power though Mary, whose cause he supported, restored his consistorial authority in 1566. Captured in Dumbarton castle in 1571 after Mary's cause had collapsed, he was accused of complicity in the murders of \*Darnley and of \*Moray, and hanged at Stirling. JAC

**Hamilton, Sir Thomas.** See HADDINGTON, 1ST EARL OF.

**Hampden, John** (1594–1643). Hampden, a parliamentarian, sat in every Parliament from 1621 until his death. He was imprisoned in 1627 for refusing the \*forced loan and became a close friend of Sir John \*Eliot. He rose to national fame by providing the test case of the legality of \*ship money (1637–8), and in the Short and Long Parliaments his reputation was second only to \*Pym's. But he was more moderate than Pym—he would not vote for \*Strafford's attainder, and defused an explosive confrontation over the \*Grand Remonstrance—and his great influence stemmed partly from his conciliatory spirit. He had no doubts, however, over Parliament's cause in the Civil War. He raised his own foot regiment in his native Buckinghamshire, fought at \*Edgehill, and fell mortally wounded in a skirmish with \*Rupert's horse at \*Chalgrove Field. Compared with Pym, his great standing derived less from sheer oratory and managerial skill than from his human touch in debate and his evidently charismatic moral authority. AHW

**Hampden clubs** (1812–17), named after the 17th-cent. parliamentarian, marked a new era of agitation for parliamentary reform after the radicalism of the 1790s. Founded by Major \*Cartwright, the clubs were at first gentry-dominated, but spread rapidly in the provinces among the working classes. Each club was nominally a separate unit in order to circumvent the 1799 ban imposed on such organizations. They met for discussion, lectures, and adult education, as well as to further demands for reform. A national convention was held in 1817; whereupon the clubs were immediately suppressed by government legislation. JFCH

**Hampden Park** (Glasgow) is the home of the Scottish national football team and of Queen's Park FC. It was begun in 1903 under the supervision of Archibald Leitch, who also built Ibrox and Parkhead stadiums. The ground capacity was increased in 1910 to 125,000 and to 149,000 in 1937, but has since been reduced to 64,000. After years of post-war neglect, a programme of renovation has begun. JAC

**Hampshire** was essentially the hinterland of the great port of \*Southampton from which it took its name, plus the \*Isle of Wight. The central parts are drained by the rivers Test and Itchen, the western by the Avon, and the eastern by the Hamble and the Meon. The shire is bordered by Dorset, Wiltshire, Berkshire, Surrey, and Sussex.

At the time of the Roman occupation, the region was inhabited by the \*Regni in the south-east, the \*Belgae towards the south-west, and the \*Atrebates in the north. The Roman advance, undertaken by \*Vespasian, was early and occupation thorough. There were two major towns, each

probably of pre-Roman origins—Silchester (Calleva Atrebatum) in the north, \*Winchester (Venta Belgae) in the south. Of the many villas in the area, the best known is probably Brading on the Isle of Wight. Portchester, near Fareham, was a Roman fort, erected by \*Carausius in the 3rd cent.

Saxon settlement was relatively easy and Winchester became the capital of \*Wessex, though Silchester was abandoned. Birinus visited the region in 634 on a mission. His bishopric was established at \*Dorchester-on-Thames to the north and he was buried there, but the see was soon transferred to Winchester and the building of a cathedral started. The Isle of Wight and the eastern valley of the Meon were areas of Jutish settlement and for a while formed part of the kingdom of \*Sussex. By the 8th cent., a harbour of Hampton had developed near the site of the small Roman port of Bitterne Clausentum. Under 755, the *Anglo-Saxon Chronicle* referred to Hampton-shire, though we cannot be sure what area was intended. As Wessex flourished, Winchester became the capital of England: \*Edward the Confessor was crowned there and many kings, including \*Alfred and \*Cnut, buried there. The area suffered severely from Viking raids. In 860 a host stormed Winchester and during \*Æthelred's reign another army sacked Southampton in 981 and wintered there in 994, living off the countryside.

By the time of the Norman Conquest, Hampshire was an established shire. In the course of the 12th cent., the capital was removed from Winchester to Westminster, but Winchester retained importance as a bishopric: the new cathedral, the longest in Europe, was begun in 1079. The connection with Normandy and the continent enhanced Southampton's trade, particularly in wine from Gascony and Aquitaine. In the west of the county, the New Forest was appropriated by William I as a game reserve and it was while hunting there in 1100 that his son William Rufus met his death, and was taken to Winchester for burial.

In the \*Domesday survey of 1086, Winchester and Southampton were clearly important towns, and Basingstoke, Christchurch, and Stockbridge were of local significance. \*Portsmouth is not mentioned by Domesday but was granted a charter in 1194. Its prosperity rose with the establishment of the Royal Navy. The Tudors spent a good deal on fortifications and in Stuart times it became a major naval base. By 1801 it was the ninth largest town in England with more than four times the population of Southampton. Andover developed as a centre for the north-west of the shire and Basingstoke for the north-east: each was far enough from Southampton and Portsmouth to have its own sphere of influence. But, with the exception of the coastal fringe, Hampshire remained a predominantly rural county, growing corn and rearing cattle, providing timber for the navy, and supporting a domestic cloth industry.

During the Civil War, Hampshire was parliamentary territory, and attempts by the royalists to retain Southampton, Winchester, and Portsmouth were unsuccessful. But Basing House was held for the king by the marquis of Winchester throughout the whole war and surrendered only to Cromwell, who destroyed it. \*Hopton and \*Waller skirmished in the county in 1643 and the following year Hopton's men

## Hampton Court conference

were badly mauled at \*Cheriton, near Alresford. After Charles I's escape from Hampton Court, he spent a year at \*Carisbrooke castle on the Isle of Wight and three weeks at Hurst castle on the mainland before being taken to Windsor for his trial.

Gilbert \*White was born in 1720 at Selborne, south of Alton, where he wrote his *Natural History*. Edward \*Gibbon, the historian, had an estate at Buriton, near Petersfield, and served as a captain in the Hampshire militia. Jane \*Austen was born at Steventon, near Basingstoke, and spent the later years of her life at Southampton and at Chawton, near Alton. She died at Winchester and is buried in the cathedral. William \*Cobbett, the radical, had a farm at Botley, between Southampton and Portsmouth and in *Rural Rides* wrote with enthusiasm of the downland country of north Hampshire.

Though relatively little touched by the industrial revolution, the shire changed considerably in the 19th and 20th cents. The popularity of seaside holidays in the Victorian period produced the extraordinary growth of Bournemouth. The Isle of Wight also profited, partly no doubt because of the publicity given to \*Osborne House: Ryde, Ventnor, and Shanklin in turn waxed and Cowes achieved social cachet in the Edwardian period. An equally spectacular growth was in the north-east of the county. The army began building barracks at Aldershot in 1854, transforming a hamlet into a sizeable town, and Basingstoke, chosen for urban development in 1963, grew from 25,000 to nearly 150,000. The Isle of Wight was given its own county council in 1890. By the local government reorganization of 1972 Bournemouth and Christchurch in the west were transferred to Dorset. After the Banham commission report on local government in 1994, Hampshire survived as a county, with Portsmouth and Southampton becoming unitary authorities. JAC

**Hampton Court conference**, 1604. Although Elizabeth I established a protestant church in England in 1559, it offended \*puritan opinion by retaining many catholic practices. In 1603 the accession of James I provided the puritans with an opportunity to state their case by presenting him with the \*millenary petition. James, who relished theological debate, responded by summoning a conference of puritans and bishops to Hampton Court in January 1604. Discussions produced considerable convergence on minor matters, but the only major achievement was the authorization of a new translation of the Bible—the 'King James version'. Puritans were disappointed at the outcome, especially when a number of hard-line ministers were expelled from their parishes. But James was no persecutor and during his reign all but a tiny minority of puritans retained their commitment to the established church. RL

**Hampton Court palace** (Middx.). Royal residence, situated on the banks of the Thames, 15 miles south-west of London. Started by Cardinal \*Wolsey in 1514, Hampton Court was confiscated in 1529 by Henry VIII who subsequently added the great hall, and a new court where the present Fountain Court is, and remodelled the Chapel Royal and the Clock Court. The palace was used by Mary, Elizabeth, James I, and Charles I, but little further building was

done until William III appeared. From 1689 Sir Christopher \*Wren started work on the new Fountain Court, with its east and south frontages to the garden, and on a new range of the Clock Court. Wren's buildings are classical essays in brick and stone. William Talman completed interior apartments (1699–1702) and helped to lay out the gardens in Home Park and Bushey Park in which Hampton Court is set. Influenced by Le Nôtre in France, Charles II had made a *patte d'oie* (radiating avenues), and a long canal flanked by double avenues of limes, and King William (aided by Wise and \*Bridgeman) added the Great Fountain Garden, the Privy Garden, the Great Terrace, and the Chestnut Avenue. Much of this 17th- and 18th-cent. layout remains, together with the magnificent wrought-iron gates made by Jean Tijou in 1689–99 for the Fountain Garden. Externally, Hampton Court is the finest British parallel to a French palace set in a formal garden; internally, the state apartments, with their original decorations and art collections, offer an unrivalled perspective on English royalty from Tudor times to the present. PW

**Handel, George Frideric** (1685–1759). German-born composer who took English nationality. Initially cathedral organist in his native Halle, Handel played violin and harpsichord at the Hamburg opera-house, where his first two operas were produced in 1705. In 1706–10 he travelled around Italy, assimilating the latest musical styles, meeting leading composers, and writing some fine church music, including 'Dixit Dominus' (1707), over 100 Italian cantatas, two oratorios, and two operas.

In 1710 Handel was appointed Kapellmeister to the elector of Hanover (later George I of England), although within a few months he was in London. Here the colourful arias and magnificent stage effects of his opera *Rinaldo* (1711) created a sensation, and by 1712 he had settled permanently in England, acting 1717–19 as resident composer to the future duke of Chandos at Cannons (near Edgware). Handel's first love was the theatre, and the Royal Academy of Music (1720–8), formed to promote Italian opera, commissioned several masterpieces including *Giulio Cesare* and *Tamerlano* (1724).

Although Handel continued composing operas until 1741, increasing financial pressures and poor audiences encouraged him to turn to a new dramatic medium, the English oratorio. *Esther* (1732) initiated a series of oratorios, operatic in concept and performed in theatres but using English texts and singers and incorporating frequent choruses. The oratorio gradually displaced opera in the public's interest, forming the basis after Handel's death for a lasting English choral tradition centring especially on \**Messiah* (1742).

Handel wrote in every contemporary genre, also creating the organ concerto to display his own virtuosity in the intervals of oratorio performances and publishing two fine sets of concerti grossi. His music, drawing elements from various national styles, was enormously influential, both in England and abroad; 'Zadok the Priest', for example, has been sung at every English coronation since 1727. Nevertheless, some of his best music, especially for the stage, is still shamefully neglected. ECr

**Handley, Tommy** (1892–1949). Comedian. Handley's heyday was the Second World War when, with much entertainment suspended or curtailed, radio predominated. Born in Liverpool, Handley began as a commercial traveller and singer in variety shows, with modest success until the launch of the radio programme *ITMA* (*It's That Man Again*) in 1939. The weekly programme attracted vast audiences to the gallery of comic characters—Mrs Mopp, Colonel Chinstrap, Mona Lott, Funf—and repetitive catch-phrases. The show was still running when Handley died at 57. The *Spectator* called the end of *ITMA* 'something like a national calamity' and the *New Statesman* wrote that 'our little world, shared weekly by millions of ordinary people, has collapsed as completely as the Third Reich which indirectly brought it into being'. Though Handley received no honours in his lifetime, the king sent a message of condolence to his widow and there was a service in St Paul's. By later standards much of the humour was unsophisticated but it contained a satirical and surrealist element that was developed by later programmes: the *Goon Show* was first broadcast in 1951 and *Hancock's Half Hour* in 1954. JAC

**Hanover** was in personal union with Britain from 1714, when George I succeeded Queen Anne under the terms of the Act of \*Settlement, until 1837 when the Salic Law prevented Victoria from retaining Hanover and it passed to her uncle, Ernest Augustus, duke of \*Cumberland.

The line of Brunswick-Lüneburg or Hanover had been chosen in 1701 because Sophia, electress of Hanover, was a granddaughter of James I, through her mother \*Elizabeth, queen of Bohemia, and the nearest protestant heir. In 1692 Hanover had been granted electoral status within the Holy Roman empire and in 1705 it was reunited with the larger state of Celle, making it the leading second-line German power.

In 1714 it had a population of just over 500,000 and, with some 7,000 square miles, was rather bigger than Yorkshire. The chief town, Hanover, had about 10,000 inhabitants. In 1719, the acquisition of Bremen and Verden at the expense of Sweden gave the electorate access to the North Sea. George I had more authority as elector of Hanover than as king of England, but he did not rule Hanover autocratically. Most of the component territories had retained their assemblies, usually acting through committees, though executive power was firmly in the hands of the Privy Council, instructed by the *Regierungsreglement* promulgated by George before he left the country.

The connection with Hanover was regarded by most Britons with distaste or at best as a necessary evil. The Act of Settlement had indicated a marked distrust. The new monarch could not appoint Germans to any post in Britain, could not declare war to help Hanover without parliamentary consent, and could not even visit his native land without parliamentary approval. Though the last condition was soon dropped, as personally offensive to the sovereign, suspicion remained. Britons were afraid that the connection would mean continental entanglements and resented the evident pleasure their kings took in visiting their electorate. In December 1742, William \*Pitt gained great popularity by

declaring that 'this great, this powerful, this formidable kingdom is considered only as a province of a despicable electorate'.

But the main problem was strategic. Hanover was almost defenceless against French or Prussian attack and, if overrun, would have to be rescued at the end of the war by concessions elsewhere. In the War of the \*Austrian Succession, with France and Prussia in alliance, the situation was particularly tense. Britain put into the field the Pragmatic Army, under William, duke of \*Cumberland, the hero of \*Culloden. To avoid reproach, Hanoverian troops for the alliance were placed under Austrian command but paid for by British subsidies. With Prussia concerned mainly with Austria, and France bogged down in Holland, Hanover survived.

During the \*Seven Years War, Hanover's defence was easier, since Prussia had become a British ally. Indeed, the search for protection for Hanover had been an important factor in bringing about the reversal of alliances which preceded and precipitated the conflict. Cumberland, attacked in 1757 by superior French forces, was forced into the humiliating capitulation of \*Kloster-Zeven and Hanover occupied by the French. But the armistice was repudiated and the Army of Observation, under Ferdinand of Brunswick, succeeded in holding the French at bay, and even won a victory at \*Minden in 1759.

After 1760, British hostility to Hanover declined. The declaration by the new king, George III, that 'born and educated in this country, I glory in the name of Britain' played the nationalist card to some effect, and the swarms of Scots who clustered around \*Bute gave the English new people to hate. George III never visited Hanover, though at moments of crisis he mused on retiring there.

It was not possible for Hanover to escape the maelstrom of the Napoleonic wars. It gained Osnabrück in 1803 in one of the many reorganizations of Germany, but was occupied first by Prussia, then in 1806 by the French. Napoleon took the northern parts into his swollen French empire, giving the rest to a new kingdom of Westphalia, ruled by his younger brother Jerome. At the peace settlement in 1814, Hanover was given the status of a kingdom and gained important territories, including East Friesland, Hildesheim, and Lingen. The reign of Ernest Augustus from 1837 was turbulent. But his son, the blind George V, took the side of Austria in the war of 1866 and paid the penalty. Hanover was annexed to the new German empire.

The connection with Britain for well over a century left few traces. There was little attempt to develop trade between the two countries and little contact between the inhabitants, save for diplomats and soldiers. Though the University of Göttingen, founded by George II in 1737, soon acquired a fine reputation, few Britons went there. Though the British complained more fiercely, it is arguable that the Hanoverians suffered more. They were dragged into British struggles and had to put up with an absentee ruler and a diminished court at Herrenhausen. As a consequence, they welcomed Cumberland with joy in 1837, and his equestrian statue with an inscription 'Dem Landes Vater sein treues Volk' still stands outside the main railway station at Hanover. JAC

## Hansard

**Hansard, Thomas Curson** (1776–1833). Hansard's father Luke came from Norwich, set up as a printer in London, and from 1774 onwards published the *Journals of the House of Commons*. Hansard entered his father's business and in 1803 began printing the parliamentary debates for William \*Cobbett. In 1810 he was tried as the printer of Cobbett's *Political Register* for an article protesting at flogging in the army: Cobbett was sent to prison for two years, Hansard for three months. Cobbett's acute financial difficulties while in gaol forced him to sell the debates to Hansard and from 1813 the volumes appeared 'under the superintendence of T. C. Hansard'. The Hansard family retained the enterprise for most of the 19th cent. but had considerable trouble achieving an acceptable standard of reporting. In 1909 the House of Commons decided to issue an official report of proceedings prepared by the Stationery Office. The term 'Hansard' remains in general use and the name still appears in brackets on the cover. JAC

**Hanseatic League.** The league was a trading alliance which, at its height, included 200 towns, of which the most important were Lübeck, Hamburg, Bremen, Cologne, and Danzig. Founded in the 13th cent., it survived until the 17th and exercised great naval and diplomatic, as well as economic, power. The German word *hanse* meant a guild or company. Its London base, the Steelyard, was just west of London bridge, until closed by Elizabeth I in 1598. Other *kontore* were at Bergen, Novgorod, and Bruges. There was a vigorous trade with Scotland and the east coast ports: Boston imported furs and timber and exported cloth, and a Hanseatic warehouse survives at King's Lynn. The decline of the Hanse in the 16th cent. was caused partly by internal rivalries, by the growth in power of Prussia, Russia, Sweden, and Denmark, and by strong economic competition from the Dutch. JAC

**Hanway, Jonas** (1712–86). Philanthropist. Hanway was born at Portsmouth into a family with naval connections. He went into overseas trade, spent twelve years in Lisbon, joined the \*Russia Company, and from 1743 until 1750 was in Russia, travelling as far as Persia. He published an account of his journeys. In 1756 he became a supporter of the Foundling Hospital and was later elected a governor. His Marine Society, founded at the start of the Seven Years War in 1756, started boys on careers in the navy, and in 1758 he helped to establish the Magdalen hospital for penitent prostitutes. An indefatigable pamphleteer, Hanway campaigned on behalf of climbing-boys and parish children, in favour of Sunday schools, and against the 'pernicious' effects of drinking tea. The last crusade brought him into a literary conflict with Samuel \*Johnson. \*Carlyle, with some justice, called Hanway a 'dull, worthy man' and his writings, though well intended, are not sprightly. JAC

**Harcourt, Simon Harcourt, 1st Viscount** (1661–1727). Of an Oxfordshire gentry family at Stanton Harcourt, Simon Harcourt studied law and, returned for Abingdon in 1690, supported the Tories. His fortunes closely followed those of his schoolfriend Robert \*Harley. In 1702–8 he was solicitor-general and then attorney-general, resigning with Harley. In

1710 he defended \*Sacheverell at his impeachment, speaking to great acclaim. During the subsequent Tory ministry, he was lord keeper and then lord chancellor, obtaining a barony in 1711. On George I's arrival, he was dismissed. He then seems to have acted as political go-between, joining \*Walpole in 1720 and raised a step in the peerage in 1721. But he spoke in favour of Harley (Oxford) and took a part in persuading Walpole to allow \*Bolingbroke's return in 1723. He was on close terms with \*Pope, \*Swift, \*Gay, and Prior. Though his legal knowledge was said to be moderate, his oratorical ability was outstanding. JAC

**Harcourt, Sir William Vernon** (1827–1904). Liberal politician. Harcourt probably regarded himself as a failure. He was a brilliant lawyer, politician, and polemicist, who rose to be home secretary (1880–5) and chancellor of the Exchequer (1886, 1892–5), and expected to succeed \*Gladstone as premier, but was passed over when the latter retired (1894) in favour of \*Rosebery. He blamed the queen; but Harcourt also had enemies within his own party, among both the Whigs, who disliked the radicalism of his pronouncements, and the radicals, who distrusted their sincerity. His personal rift with Rosebery, not all his fault, did great damage to the Liberal Party in its wilderness years of 1895–1905. Harcourt's main contribution to British history was his introduction of death duties in the budget of 1894, and the claim 'We are all socialists now' that went with it. BJP

**Hardie, James Keir** (1856–1915). Socialist politician. Born in Lanarkshire, Hardie grew up in extreme poverty. While working as a journalist he was instrumental in organizing the Lanarkshire and Ayrshire miners, becoming secretary of the Scottish Miners' Federation in 1886 and, in 1887, chairman of the Scottish Labour Party. In 1892 he was elected as an independent Labour MP for South West Ham; the following year he established the Independent Labour Party. Hardie was a thoroughly class-conscious socialist (outraging Westminster opinion by wearing a cloth-cap and tweed jacket in the Commons), but was also acutely aware of the moderate nature of the British trade union movement, and he deliberately downplayed his socialist creed in order to persuade the Trades Union Congress of the need for the foundation (1900) of the Labour Representation Committee, forerunner of the Labour Party. Hardie believed that international working-class solidarity would prevent war in 1914, and never recovered from the realization of the strength of nationalism amongst the working classes. GA

**Hardknott** was the Roman fort of Mediobogdum on the road over the Hardknott and Wrynose passes from the Lake District to Maryport on the coast. It was built in the reign of \*Hadrian and garrisoned by *cohors IV Dalmatarum* until its abandonment at the end of the 2nd cent. Constructed in stone, the fort contained the usual complement of buildings (many now on display) and to the east was a levelled parade-ground. ASEC

**Hardwicke, Philip Yorke, 1st earl of** (1690–1764). As the longest-serving lord chancellor of the 18th cent., Hardwicke had significant legal achievements to his credit, particularly in clarifying the laws of equity, and great political import-

ance too. He was solicitor-general at the age of 29, chief justice and a peer at 42 and lord chancellor at 46 (1737); this rise being more extraordinary given (for a court Whig) his humble background. He was committed to maintaining order in society with stern sanctions for those who broke it. He presided at the trials of the Jacobite peers and designed the proscriptive measures against the Scottish Highlanders following the 1745 rebellion. An austere man, he had the lifelong friendship of the duke of \*Newcastle and was a steady hand on the governments of the 1740s and 1750s. Although resigning as lord chancellor in 1756, he remained a member of the 'effective cabinet' until 1762. AIL

**Hardwick Hall** (Derbys.), west of Mansfield, was the creation of the celebrated Bess of Hardwick, countess of \*Shrewsbury, four times married, who stamped her initials on walls and on parterres. It has a magnificent position on cliffs overlooking the valley of the river Doe Lee, through which snakes the busy M1. It is one of the grandest of Elizabethan houses, with a vast expanse of window glass. In front of the building is the Old Hall which, though in ruins, has surprisingly been allowed to remain. One of the most impressive rooms is the long gallery, used for recreation and for exhibiting family portraits and purchases, and a remarkable innovation was that the architect, Robert Smythson, turned the hall 90 degrees, so that it runs from front to back. JAC

**Hardy, Thomas** (1840–1928). Novelist and poet, Hardy initially trained as an architect. He left his native Dorset, the 'Wessex' of his books, for London where he lost his faith under the influence of \*Darwin and \*Huxley. His famous pessimism developed early and coloured everything to come. In the 1870s he caught the taste of an increasingly urbanized England for accounts of a vanishing world with *Under the Greenwood Tree* (1872) and *Far from the Madding Crowd* (1874). Yet he was no sentimentalist of rural life, and his interest in the past had little of the nostalgia of \*Tennyson or \*Arnold. An unrivalled observer of the countryside, he found no Wordsworthian solace there, nor in his own unhappy marriage. His major novels tackled the social issues of the day, the double standard in *Tess of the D'Urbervilles* (1891), the unfairness of the divorce laws in *Jude the Obscure* (1895), the hostile reception they encountered prompting a return to his first love, poetry. Some of the best came with his first wife's death in 1912, as buried emotion resurfaced, though he had already produced *The Dynasts* (1908), his epic drama on the Napoleonic wars, the most ambitious but probably least read of his works. JNRS

**Harfleur, siege of**, 1415. In August 1415 Henry V laid siege to Harfleur at the mouth of the Seine. After a heavy cannonade, the town surrendered on 22 September. But Henry's forces had suffered serious losses from dysentery and when he marched northwards towards the safety of \*Calais, he found his way blocked at \*Agincourt by a superior French force. Henry's intention was to encourage English settlement and turn Harfleur into a second Calais, but it was recaptured by the French during the reign of his son. JAC

**Hargreaves, James** (1720–78). Inventor. Hargreaves was a largely self-taught weaver from Lancashire, who invented the spinning jenny in 1764 and patented it in 1770. \*Kay's flying-shuttle had greatly speeded up the process of weaving and Hargreaves's jenny, using several spindles at once, enabled spinning to keep up. He experienced many of the difficulties that Kay had faced. In 1768 his house was attacked by a mob from Blackburn and he was involved in extensive litigation in an attempt to protect his patent. JAC

**Harington, Sir John** (1560–1612). Epigrammatist. Son of two of Elizabeth's loyal servitors, thereby her godson, 'Boye Jacke' was educated at Eton and Cambridge. Witty and well-read, he divided his time between the court and his estate at Kelston, near Bath, according to the queen's smiles or frowns. In 1599 he accompanied \*Essex to Ireland, where he was knighted, but weathered Elizabeth's displeasure on his return. Ever loyal to her, he nevertheless favoured James's accession to the English throne but failed to obtain his favour, despite preparing manuscripts for the young Prince \*Henry. Irrepressible, extravagant, and disarmingly candid, Harington has been dismissed as a Rabelaisian trifler, but his miscellaneous writings demonstrate keen observation and a more tolerant attitude towards the Irish than many of his contemporaries. His design for the first water-closet, installed at Kelston c.1595, may possibly have been used at Richmond palace. ASH

**Harland, Edward James** (1831–95). Co-founder of the Belfast shipyard Harland & Wolff. Harland, a Yorkshireman, was trained in the shipyards of Newcastle and Glasgow. In 1854 he moved to Belfast in order to manage Robert Hickson & Co. In 1858 he bought the firm with the assistance of the Liverpool capitalist G. C. Schwabe, and in 1861 went into partnership with Schwabe's nephew G. W. \*Wolff. A gifted and inventive engineer, Harland turned a small-time concern into an internationally successful business. He retired from active involvement in the yard in 1889, and devoted himself to Conservative and Unionist politics until his death. He was mayor of Belfast (1885–6), and Conservative MP for North Belfast (1889–95). He was granted a baronetcy in 1885. AJ

**Harlaw, battle of**, 1411. Donald, lord of the Isles, engaged in a dispute over the earldom of Ross, which he claimed by right of his wife, raised considerable forces, occupied Inverness, and advanced towards Aberdeen. On 24 July he was met near Inverurie, 20 miles north-west of Aberdeen, by the earl of Mar, supported by townsfolk from Aberdeen. The result of the encounter was variously reported, but Donald failed to obtain the earldom. JAC

**Harlech castle** was built for Edward I as one of a series of fortifications intended to secure his conquest of north Wales. Begun in May 1283, it was largely completed in seven years and is one of the greatest achievements of its architect, Master James of St George. It combines powerful defences, which enhance the natural strength of the site, with elaborate and well-planned accommodation for the king and his court. In the Welsh rising of 1400–13, Harlech fell to Owain \*Glyndŵr, became the residence of his court and his family,

## Harley

and may have been the place where he was formally crowned as prince of Wales. In the Wars of the \*Roses the castle was held for the Lancastrians, as a chronicler remarked: 'Kyng Edward was possessed of alle Englonde, excepte a castelle in Northe Wales called Harlake.' It was eventually surrendered in 1468; traditionally it is this defence which gave rise to the song 'Men of Harlech'. Harlech was the last castle to fall to Parliament in March 1647 and its loss marked the end of the war. Parliament ordered its destruction but this was not carried out, so, despite the passage of time, the walls still stand to virtually their full height, making it one of the most impressive ruins in Britain. LR

**Harley, Robert, 1st earl of Oxford and Earl Mortimer** (1661–1724). Prime minister and bibliophile. From a puritan Herefordshire family, Harley was MP for Tregony (1689–90) and New Radnor Boroughs (1690–1711), and in the 1690s a leader of the new country party (which attacked the royal prerogative and a standing army), as well as twice being chosen Speaker of the Commons. He was again Speaker (1702–5), and in 1704 was appointed secretary of state for the northern department in the \*Godolphin ministry. His growing Toryism and reputation for deviousness and (in the eyes of the Junto Whigs, \*Marlborough and Godolphin) untrustworthiness led to his resignation from the ministry in 1708. His revenge was to gain the confidence of Queen Anne and to engineer the fall of the ministry in 1710, becoming chief minister for the next four years, first as chancellor of the Exchequer and then in 1711 as lord treasurer (when he was raised to the peerage by a grateful queen after he had recovered from an assassination attempt).

Though the leader of an essentially Tory ministry, Harley wanted to establish a government above party. His failure was as a result of increased extremism in the Tory Party (which won decisively in the general elections of 1710 and 1713), the problems of the peace with France (which the Whigs strenuously opposed), and the rivalry with \*Bolingbroke. One week before she died, Anne dismissed Harley from office. He was impeached in 1715, largely for his part in the peace of \*Utrecht which George I had opposed, and remained in the Tower until 1717 when proceedings were dropped. His main political achievement was to develop a 'party of the crown' in Parliament, which was later taken up and refined by \*Walpole. His extensive collection of books and manuscripts later formed the basis of the British Museum library. CJ

**Harmsworth, Alfred, 1st Viscount Northcliffe** (1865–1922). Newspaper proprietor. The eldest son of a Dublin barrister who moved to London in 1867, Northcliffe was largely self-educated. Attracted to journalism, he discovered that he had a natural aptitude for the profession. In 1887 he formed his own publishing house, which he ran with his brother \*Harold. The business acquired first the *Evening News*, later the *Daily Mail*, the *Daily Mirror*, the *Observer*, and, in 1908, *The Times*. He was created baron (1905) and viscount (1918). If Northcliffe injected into *The Times* a refreshing element of commercialism, it was even truer that he used his newspaper empire as a political weapon, denouncing government ministers and their policies whenever the

fancy took him. Northcliffe was frequently accused of exercising power without responsibility; but the support of *The Times* was a factor in bringing about the Irish peace treaty of 1921, and his personal efforts as head of the British mission to the USA in 1917 were widely and rightly applauded. GA

**Harmsworth, Harold, 1st Viscount Rothermere** (1868–1940). Newspaper proprietor. Younger brother of Alfred \*Harmsworth, Viscount Northcliffe. Harold Harmsworth accepted Alfred's offer to provide financial management for the publishing venture which eventually became the Amalgamated Press. Neither a journalist by profession nor a politician by inclination, Harold eschewed the public limelight enjoyed by Alfred, but in 1917 accepted \*Lloyd George's invitation to take charge of the Air Ministry. Meanwhile he had increased the scope of his own newspaper proprietorship, producing the *Sunday Pictorial*, London's first Sunday picture newspaper, in 1915. Created baron (1914), he was advanced to viscount (1918). On his brother's death in 1922 Harold assumed control of Associated Newspapers, and used this opportunity to write forceful articles for the *Daily Mail* in praise of Hitler and Mussolini; he was initially sympathetic to the \*British Union of Fascists, and used the *Daily Mail* in an ill-judged and unsuccessful campaign (1930) against Stanley \*Baldwin on the issue of empire free trade. GA

**Harold I** (c.1016–40), king of England (c.1035–40), known as 'Harefoot', was a son of \*Cnut, by Ælfgifu of Northampton, his first wife. In 1035, on Cnut's death, he claimed the throne of England in opposition to his half-brother \*Harthacnut, whose mother was \*Emma, Cnut's second wife. Since the sons were young, the probability is that they were pawns in the hands of formidable mothers. They agreed to divide England, Harold taking the northern part and acting as regent for the rest, but by 1037 he had established himself as king of the whole realm. Harthacnut prepared to invade but Harold's death at Oxford in 1040 allowed a peaceful succession. When Harthacnut in turn died after a reign of only two years, Emma's other son, by \*Æthelred II, succeeded as \*Edward the Confessor. JAC

**Harold II** (Harold Godwinson) (c.1022–66), king of England (1066), the last Old English ruler before the \*Norman Conquest, was defeated and killed by William the Conqueror at the battle of \*Hastings. Along with the rest of his family, Harold rose to increasing prominence in England during the reign of \*Edward the Confessor, receiving the earldom of East Anglia in 1044 and succeeding his father \*Godwine as earl of Wessex in 1053. He was subsequently the most powerful man in the kingdom after the king. His role in the complex politics of the English kingdom in Edward the Confessor's reign, and, in particular, his attitude to the succession, can never be entirely clear. Despite his great power, there is nothing to suggest that Harold was being groomed for the succession or that he coveted it, until he was designated as his successor by the dying Edward. Harold's career passed through a number of periods of crisis. In 1051–2, for example, he was temporarily banished from England along with the rest of his family when they

quarrelled with the king. He was in some way involved in the mysterious return to England in 1057 of \*Edward the Exile, the father of \*Edgar the Atheling. In 1064 or 1065 (so Norman sources tell us), he visited Normandy to confirm Edward the Confessor's earlier promise of the succession to Duke William, swearing there the fateful oath which enabled William in 1066 to portray him as a perjurer. Late in 1065, he failed to assist his brother \*Tostig in the (probably) impossible task of crushing a rebellion against Tostig's authority in Northumbria; the embittered Tostig thereafter became his brother's enemy and fought and died with the army of King \*Harold Sigurdsson (Hardrada) at the battle of \*Stamford Bridge. The most probable explanation of Harold's career between 1053 and 1066 is that, while remaining essentially the loyal subject of Edward the Confessor, he was also a careful politician who did not take any risks. Edward's death-bed bequest of succession to the English kingdom was probably a recognition that Harold was the only successor likely to be accepted with anything resembling unanimity by the English. After his coronation on the day immediately following Edward's death, Harold's efforts to defend his kingship against his rivals were effective and courageous; he kept an army and navy in readiness for several months in southern England and the main institutions of government appear to have continued to function. The support he received during the great campaigns of 1066 must indicate that he was widely accepted as king, much preferred by the English to any of the alternatives. His march north to win the battle of Stamford Bridge was a remarkable military feat, as was the return to confront William the Conqueror. His generalship can, however, be criticized. He could have delayed confronting William in order to assemble a larger and fresher army and he concentrated his forces too close to William's, perhaps allowing the latter to attack him before the English army was ready. The length and hard-fought character of the battle of Hastings none the less suggests that the English were both well led and well organized. Harold's death occurred late in the battle. Its manner will always be controversial. Was he, or was he not, killed by an arrow through the eye? Interpretations of the crucial scene on the \*Bayeux Tapestry will always differ. DB

Walker, I., *Harold* (2000).

**Harold Sigurdsson** (d. 1066), king of Norway. Harold, the half-brother of St Olaf, was the last great Viking invader of England. Nicknamed 'Hardrada'—stern in council—and a man of great stature and strength, he joined forces in 1066 with \*Tostig, \*Harold II Godwinson's exiled brother. Harold Hardrada claimed the throne of England and Tostig was to be restored to his earldom of Northumbria. He may have been misled by Tostig into counting on more support in England than he found. His great fleet touched at the Orkneys, moved south to the Tyne to join with Tostig, and then entered the Humber, menacing York. The local earls, Edwin and \*Morcar, were defeated at \*Fulford, just outside York, but five days later the victorious Norsemen were attacked at \*Stamford Bridge by Harold, who had led a forced march from the south. After bloody fighting, Harold

Hardrada and Tostig were killed. Three days after the victory, William of Normandy landed near Hastings. JAC

**Harrington, James** (1611–77). Political philosopher. His *Commonwealth of Oceana* (1656), though dedicated to \*Cromwell, implicitly censured the \*Protectorate. Its central doctrine was that the distribution of property in a state determines its form of government. Where one ruler disposes of all the land, absolute monarchy results; where an aristocracy holds most of it, mixed monarchy is the natural form; but where property is widely distributed, only a republic can provide stable government. To maintain its stability, Harrington prescribed an upper limit to any individual's holding of land and an obligation on all property-owners to serve in arms, the wealthier as cavalry, the less affluent as infantry. A two-chamber legislature was to be elected by these local militias: a senate of 300 (all cavalry) to initiate laws, and an assembly of 1,050 (mixed horse and foot) to ballot silently for or against them. A third of their members were to retire each year. Officers of state and magistrates were to be similarly subject to election (by ballot) and rotation. AHW

**Harrington, William Stanhope, 1st earl of** (c.1683–1756). Stanhope was a younger son who, with moderate abilities but good connections, built an extremely distinguished career. Queen Anne complained of his 'insipid sloth', Lord \*Hervey of his 'infinite laziness', and Horace \*Walpole admitted that he had no talent for speaking in Parliament. But the earls of Chesterfield were distant cousins and James \*Stanhope, commander in Spain and briefly first minister, was another cousin. William Stanhope served in the army in Spain under his cousin, was soon given a regiment, and continued to hold rank, rising to full general. In 1715 he was returned to Parliament for Derby and began a diplomatic career as envoy and then ambassador to Spain. In 1730 he joined \*Walpole's cabinet as secretary of state, receiving a barony. His connections were with the duke of \*Newcastle and he survived Walpole's fall, gaining promotion to an earldom in 1742 and serving as lord president of the council 1742–5. In 1744 he resumed as secretary of state and finished his career as lord-lieutenant of Ireland between 1746 and 1750. There the agitation of Charles Lucas and the radicals made for a turbulent ending to his public life. JAC

**Harris, Sir Arthur Travers** (1892–1984). Marshal of the Royal Air Force, famous as commander-in-chief, RAF Bomber Command, 1942–5. This force absorbed much British productive capacity and high-quality manpower. Early in the war it showed itself incapable of daylight attacks on Germany and highly inaccurate at night. Under Harris, it became effective at 'area bombing', seeking to destroy civilian housing, injure morale, and reduce production. Harris repeatedly claimed that wrecking large German towns would win the war. British 'strategic bombing' killed and maimed civilians, destroyed beautiful buildings, and sacrificed many bomber crews (an RAF rear-gunner was unlikely to survive) but did not win the war. Harris resisted 'precision bombing' but his favoured methods failed to reduce war production as he planned. He was not engaged in 'genocide',

nor was he a 'war criminal'; he did not inflict casualties for reasons other than shortening the war. Nevertheless, he did not get a peerage and there were hostile demonstrations when a statue to him was erected in London in 1992. RACP

**Harris, Howell** (1714–73). A founder of Welsh calvinistic methodism. Born at Trefecca, Talgarth, near Brecon, and educated locally, Harris hoped for Anglican ordination, but started teaching (1730). Following a conversion experience, he began studies at Oxford (1735) but soon returned home. Though an Anglican until his death, he began itinerant open-air preaching (1737) several times a day so effectively that by 1739 he had aroused much of Wales. After parting from his colleague Daniel Rowlands (1751), he founded a protestant monastery at Trefecca (1752) which soon had 120 inhabitants. Fear of French catholicism encouraged him to join the militia and gave him a chance to preach in many parts of England. He had close contacts with Selina, countess of \*Huntingdon, and \*Whitefield. WMM

**Harrison, John** (1693–1776). Horologist. From the 15th cent. onwards, when mariners began to make long ocean voyages, the difficulty of estimating the exact longitude at sea had cost the lives of thousands of sailors, most notably of Sir Clowdesley \*Shovell and his crews off the Scillies in 1707. In 1714 Parliament, in the Longitude Act 12 Anne c. 15, offered a handsome first prize of £20,000 to anyone who could solve the problem. There were two approaches. First was by plotting moon, planets, and stars and observing them: this was difficult in boisterous or stormy weather, and impossible in heavy cloud. The second was to develop an extremely accurate timepiece, which would not be affected by salt water, damp, or violent motion on board, and use it to maintain the time of setting sail for comparison with the time as measured by the sun. Pendulum clocks would not serve since the metal was affected by heat and cold and the swing by the pitching of the vessel. John Harrison, a clock-maker from Foulby near Pontefract in Yorkshire, who later moved to Barrow-on-Humber, devoted his life to making four brilliant clocks, now preserved at Greenwich, and claimed the prize. For 40 years he was frustrated, partly by his own perfectionism, partly by obstruction by his rivals in the astronomic camp, particularly Nevil Maskelyne, appointed astronomer-royal in 1765. In the end the intervention of George III, who had an interest in astronomy, persuaded Parliament in 1773 to allow Harrison his full prize. He was then 80. His clocks were masterpieces of skill, precision, ingenuity, and determination. JAC

**Harrison, Thomas** (1606–60). Soldier and regicide. A butcher's son, born at Newcastle under Lyme, and trained as a lawyer, Harrison enlisted in \*Essex's bodyguard in 1642, fighting at \*Marston Moor as a major in Fleetwood's horse and subsequently at \*Naseby, \*Langport, and the sieges of Winchester and Basing. Thereafter his political and military lives were interwoven. Elected MP for Wendover (1646), he served in Ireland (1647), and escorted Charles I from Hurst castle to London, later signing his death-warrant. Intimate with \*Cromwell, he held the chief command in England during Cromwell's absence (1650–1). He helped expel the

\*Rump in 1653 and was prominent in \*Barebone's Parliament. Then his influence waned and his health failed. He had developed \*Fifth Monarchist views, lost his commission under the \*Instrument of Government, and was imprisoned in 1655–6 and again in 1658–9. One of the first to be arrested at the Restoration, Harrison was tried in October 1660 and defended himself stoutly: 'this thing [the king's execution] was not done in a corner.' He was hanged at Charing Cross looking, according to \*Pepys, 'as cheerfully as any man could do in that condition . . . the first blood shed in revenge for the blood of the king.' CB; JAC

**Harrowby, Dudley Ryder, 1st earl of** (1762–1847). Harrowby's grandfather was an eminent lawyer, who became attorney-general and died just before his peerage took effect. Harrowby was elected on the family interest at Tiverton in 1784 at the age of 21, supported \*Pitt, and worked his way up the ladder. He was made under-secretary at the Foreign Office in 1789, served as paymaster 1791–1800, was foreign secretary 1804–5, and chancellor of the duchy of Lancaster 1805–6. He succeeded his father as 2nd baron in 1803 and was raised to the earldom in 1809. From 1812 until 1827 he served under Liverpool as lord president of the council and in December 1827 was offered the premiership, which he declined on grounds of ill-health. He played an important role during the reform crisis of 1831–2 as a leader of the waverers, who ultimately voted for the bill. Harrowby was more respected than liked. \*Greville, while admitting his integrity, found him irritable and dismissed him as 'the top of the second-rate men'. His younger brother Richard held the family seat 1795–1830 and served as home secretary under \*Perceval. JAC

**Harrow School** was founded by John Lyon, a yeoman in the neighbouring village of Preston, in 1571 as a free grammar school for the education of 30 poor children. It was not opened until 1611. 'Foreigners', i.e. children from other parishes who paid for their education, were allowed in from 1660 and the school prospered. After a period of decline, the school's fortunes were restored largely by the effort of the eminent headmaster Dr Charles Vaughan (1816–97). Amongst its old boys are four 19th-cent. prime ministers—\*Peel, \*Palmerston, \*Aberdeen, and \*Goderich—and a 20th-cent. one, Winston \*Churchill. PG

**Harthacnut** (c.1019–42), king of England (1040–2), was a son of \*Cnut by his second wife \*Emma of Normandy, widow of \*Æthelred II. At his father's death in 1035 he was in Denmark, but his mother put forward his claim to the throne of England against his half-brother \*Harold Harefoot. On the latter's death in 1040 Harthacnut succeeded. He was said to have desecrated his brother's grave and the *Anglo-Saxon Chronicle* observed that 'he never did anything worthy of a king while he reigned'. In 1042, at the wedding-feast of his standard-bearer Tofig the Proud, he 'died as he stood at his drink and suddenly fell to the ground with a horrible convulsion'. He was succeeded by his half-brother \*Edward the Confessor. JAC

**Harty, Sir Hamilton** (1879–1941). Irish composer, conductor, and pianist. After holding organist's posts at Belfast

and Dublin, Harty moved to London in 1900, where his Comedy Overture was performed at the Promenade Concerts (1907) and his Violin Concerto premièred by Szigeti (1909). Having gained a reputation as a conductor through concerts with the London Symphony and Hallé Orchestras, he was appointed permanent conductor to the Hallé from 1920 to 1933. Under his leadership the orchestra became one of the finest in the country, performing many new works (including his own *Irish Symphony*) and giving memorable English premières of Mahler's ninth and Shostakovich's first Symphonies. A witty and sometimes controversial figure, he is probably best known today for his full orchestral arrangements of Handel's *Water Music* and *Fireworks Music*. ECr

**harvesting**—the gathering of crops at the end of growing seasons—was a crucial time for our ancestors because the size and quality of crops determined whether there was to follow a time of feast or famine: life itself was at stake. As late as the 1840s the failure of the Irish potato crop brought death to tens of thousands. Although the cycle of the seasons had its role, each season varied from year to year and over long periods of time climatic variations had resulted in the warm summers of the early 13th cent. and the little ice age of the 17th cent. Adapting to these longer-term shifts limited the cultivation of wheat in northern Britain since 90 frost-free days were required. Similarly, vineyards declined in the later Middle Ages and were revived for commercial farming only in the 20th cent.

Celebrations of harvests safely gathered in formed part of many rural traditions for centuries. The feast of Michaelmas (29 September) marked the end of the farming year when annual accounts were rendered. However, 'harvest festivals' in churches with special services and elaborate decorations only became formally part of many Christian church calendars during the 19th cent.

Yields of crops have increased since the Middle Ages arising from the selective breeding of plants and animals particularly since the early 18th cent. From the mid-19th cent. manufactured fertilizers and various technologies have enabled expansion of output. For example, yields of wheat from seed sown in the early 14th cent. were seldom more than eightfold whereas in the later 20th cent. yields reached fortyfold. In the 20th cent. mechanization reduced sharply the numbers of people needed to harvest most crops, and bringing in the harvest no longer concerns most city-dwellers. IJEK

**Harvey, William** (1578–1657). Physician. After Cambridge, Harvey went to the great medical school at Padua. His teacher Fabricius had identified valves in veins, and was interested in animal generation; these became Harvey's great concerns also. Back in England, he settled down to successful practice in London, becoming physician to Charles I and a staunch royalist. The structure of the heart and vein valves convinced him that, contrary to received physiological opinion, blood must circulate round the body (rather than ebb and flow), which he determined to confirm 'by sense and experience' (animal dissection, vivisection), but *De Motu Cordis* (1628) initially met with considerable contro-

versy. He then turned to embryology, inferring that all animals start from an egg. DK

**Haselrig, Sir Arthur** (c.1600–61). Haselrig, a Leicestershire baronet, was a leader of the parliamentary cause throughout the civil wars. A staunch puritan, educated at Cambridge and Gray's Inn, he was a close associate of \*Pym and brother-in-law of Lord Brooke. He served for his native county in the \*Short and \*Long Parliaments and his strong opposition to \*Strafford and \*Laud led to his being one of the \*five members 'named' by Charles I in January 1642. He was an active cavalry commander during the first civil war, at the head of his regiment of 'lobsters', and was made governor of Newcastle upon Tyne in 1647. He refused to serve on the High Court which tried the king and quarrelled with \*Cromwell when the \*Rump Parliament was dismissed. He declined to serve in Cromwell's 'other house', attacking it as a new House of Lords. In 1659 when the Rump was recalled, Haselrig was briefly influential, serving on the \*Council of State. But after quarrelling with \*Lambert, he threw in his lot with \*Monck. At the Restoration he was stranded and though Monck saved his life, he spent his last months in the Tower. An uncompromising and rigid republican, he was called by \*Clarendon 'an absurd bold man', and by \*Ludlow, who knew him well, 'a man of a disobliging carriage, sour and morose of temper'. JAC

**Hastenbeck, battle of**, 1757. \*Cumberland, the hero of \*Culloden, commanded the Army of Observation in the \*Seven Years War, charged with the protection of Hanover. Frederick the Great, Britain's ally, was too hard pressed himself to offer assistance. On 26 July, on the Weser near Hameln, Cumberland was attacked by a superior French force under Marshal d'Estrées, and though at one stage the French were preparing to retire, Cumberland was forced to retreat. Acting on private instructions from his father George II, he retired in good order to Stade, where he negotiated the convention of \*Kloster-Zeven, disbanding his forces. The British government repudiated the convention and Cumberland resigned in disgust. JAC

**Hastings, battle of**, 1066. Fought on 14 October at what is now Battle (Sussex), where William the Conqueror ordered the construction of an abbey to commemorate his decisive victory over King \*Harold Godwineson. Much is obscure about the course of the battle, although several crucial features can be deduced from the \*Bayeux Tapestry and other contemporary sources. The core of Harold's army had marched south in under three weeks after its victory at \*Stamford Bridge. It must have been tired and was undoubtedly surprised by the speed at which William advanced to force battle. The two armies were probably almost evenly matched numerically, but William's contained cavalry, whereas Harold's did not. An apparent lack of archers made the English excessively passive. A mixture of genuine and feigned retreats by William's army appears to have disrupted the packed English forces by drawing them down from their defensive position on the ridge where the town of Battle now stands. King Harold's death, late in the day as the Normans poured through the English ranks, ensured

## Hastings

that the battle would be decisive, despite attempts to organize English resistance around the young \*Edgar the Atheling. DB

**Hastings, William Hastings, 1st Lord** (c.1430–83). Hastings was the lifelong confidant of Edward IV, and, according to contemporary gossip, shared both the adversities and mistresses of his master. The son of a Yorkist retainer, he came into prominence at the beginning of the reign as chamberlain of the household. He recruited on Edward's behalf a well-documented body of indentured retainers in the north midlands. In the last years of the reign he was one of the half-dozen powerful men on whom the king relied. Unquestionably loyal to the dynasty, he gave his total support to the young Edward V in the early summer of 1483. Because of his antipathy towards the Woodvilles, he was prepared initially to support Richard of Gloucester in his bid for power. But he himself became a victim when he was suddenly seized and executed on 13 June. The manner of his death has secured for him a reputation for unimpeachable probity, but he too was a courtier in pursuit of his own ends. AJP

**Hastings, Francis Rawdon-Hastings, 1st Marquis, and 4th Baron Moira** (1754–1826). Hastings was born in Ireland and educated at Harrow and Oxford. In 1771 he joined the army and served in the American War of Independence 1776–81. Thereafter he held appointments mainly at home until he was made governor-general of India in 1813. His period in office was marked by major military conquests, which consolidated British power. In 1814–16 he successfully prosecuted the Gurkha and Pindari wars. In 1818, he inflicted a final defeat on the peshwa of Poona to dismantle the Maratha empire, which once had been the \*East India Company's principal rival for supremacy in India. His last years, however, were marred by financial scandals in Hyderabad involving Palmer & Company. He retired from India in 1823 and was appointed governor of Malta 1824–6. DAW

**Hastings, Warren** (1732–1818). Hastings joined the \*East India Company in 1750. He rose quickly in its service, being a member of the Bengal Council by 1757 when Robert \*Clive achieved his first military victories. He was at the heart of the subsequent intrigues surrounding the nawab of Bengal. In 1764 he retired to England with a large fortune which he rapidly lost. He returned to India in 1769 and, three years later, was appointed governor of Bengal. In 1773, he became the first governor-general of India. In office, he reformed the company's revenue and commercial systems and extended its influence across the Ganges valley. He retired with a second fortune after the establishment of a parliamentary Board of Control for east India affairs, which subsequently impeached him for murder and extortion. The prosecution was led by Edmund \*Burke and the proceedings lasted from 1788 until 1795, when Hastings was acquitted, but left impoverished and discredited. DAW

**Hatfield, Council of**, 680. The council arose out of concern over the Monothelite heresy, significant in the East, and finally condemned at the Council of Constantinople, 680–1. To test the soundness of the West, synods were held by

metropolitans in their provinces and the pope in Rome. Any possible fears that the Cilician \*Theodore, archbishop of Canterbury, might have introduced Greek customs to England would have been unfounded. At Hatfield, the bishops and teachers summoned by him united in their declaration of the orthodox catholic faith. AM

**Hatfield House**. Soon after his arrival in England, James I suggested to Sir Robert \*Cecil that they exchange Theobalds and Hatfield in Hertfordshire. At Hatfield there was a palace that had belonged to the bishops of Ely; Cecil began building a new house in 1607, using materials from the palace. It is therefore thirty years later than \*Longleat and fifteen years later than \*Hardwick Hall. It is a large house on the traditional E plan, with a remarkable grand staircase. The house remains in the Cecil family and was one of the first to be lighted by electricity, since Lord \*Salisbury, prime minister in the 1890s, was an amateur scientist and rigged up a power supply from the river Lea. He also introduced an early and erratic telephone system. JAC

**Hatton, Sir Christopher** (1540–91). Lord chancellor. Of Northamptonshire gentry stock, and not wholly studious at the Inner Temple, his good looks and graceful dancing brought him to Queen Elizabeth's attention. Despite total dedication and devotion to her, his governmental career was slow to develop, though he early on became her recognized spokesman in the House of Commons. Vice-chamberlain and a privy counsellor by 1577, member of the commissions which tried \*Babington and Mary, queen of Scots (1586), and regarded as most likely to know Elizabeth's real mind, he was appointed lord chancellor in 1587, when any shortfall in legal training was outweighed by impartiality, common sense and Star Chamber experience; his moderate attitude that 'neither fire nor steel' should be used in settling religious matters helped maintain internal quiet. A lover of literature, occasionally a patron, he died unmarried and was buried in St Paul's cathedral. ASH

**Havelock, Sir Henry** (1795–1857). Havelock was born in Sunderland and trained for the bar but took an army commission in 1815. He served with distinction in the first \*Burmese War (1824–6), the first \*Afghan War (1838–42), and the first \*Sikh War (1845–6). However, promotion was slow until he was appointed quartermaster of the Indian army in 1854 and adjutant to the queen's troops in India in 1855. He was a member of Sir James Outram's expedition to Persia in 1857 but returned to India after the outbreak of the \*Indian mutiny. He commanded the first attempts to reconquer the Ganges valley. However, although winning several victories, he failed to hold \*Cawnpore or lift the siege of \*Lucknow. He had to await the arrival of Sir Colin \*Campbell's army, brought back from China, before success could be achieved. He died of dysentery at Lucknow in November 1857, shortly after its relief. DAW

**'Hawarden Kite'**. After the general election of 1885 Gladstone's Liberals with 333 seats were balanced by 251 Tories who had an understanding with \*Parnell's 86 Irish MPs. Gladstone suggested that the Conservative government should sponsor a \*Home Rule measure, which it was not

keen to do. In December 1885 Gladstone's son Herbert leaked to the press that his father had a scheme for Home Rule. The Conservative government was defeated and resigned, and Gladstone formed his third administration, splitting his party on the Irish question. The satirical name given to Herbert Gladstone's initiative was taken from Hawarden in Flintshire, where Gladstone had made his home. There is no evidence that Gladstone knew of his son's intention, though few of his political opponents gave him the benefit of that doubt. JAC

**Hawke, Sir Edward** (1710–81). The son of a barrister. His early naval career was in time of peace but he was captain at 24 and rear-admiral at 37. His chance came towards the end of the War of the \*Austrian Succession when the commander of the Channel fleet, Sir Peter Warren, fell ill and Hawke took over. Off \*Cape Finisterre in October 1747 he won a decisive victory, taking seven out of nine enemy vessels. He was created KB and returned as MP for Portsmouth. Hawke was again employed in the \*Seven Years War. An expedition against Rochefort in 1757 was a dismal failure but in 1759 he blockaded Brest and in November his brilliant victory at \*Quiberon Bay ended all chance of a French invasion: \*Newcastle described it as 'the most glorious event at sea this century'. After the war, Hawke was promoted admiral of the fleet and served as 1st lord of the Admiralty 1766–71, though his health was giving way. His barony in 1776 was somewhat belated and not excessive compared with honours given to others. JAC

**Hawkins, Sir John** (1532–95). Hawkins began his career as an overseas navigator and trader as an ally of the Spanish, to whose West Indies and South American colonies he carried west African slaves in expeditions between 1562 and 1569. \*Drake was with him when relations with Spain became hostile on the last expedition. He was subsequently an MP and comptroller of the Navy, which he significantly developed. Further active commands followed—against the Armada, on an expedition to Portugal in the following year, and the disastrous association with Drake on the West Indies anti-Spanish expedition of 1595, when he died off Puerto Rico. Although as originator of England's long involvement in the slave trade his reputation must be to some degree dubious, Hawkins was one of the most important of the men who brought about the close involvement of the English state with overseas activity. RB

**Hawksmoor, Nicholas** (c.1661–1736). 250 years after his death some late 20th-century critical opinion hails Hawksmoor as the most interesting and daringly original architect England has produced, if not the greatest. The process resulting in this reappraisal has been one of informed deduction made the more complex because of the problems in distinguishing the collaborative work of Hawksmoor from that of his chief *partners*, rather than masters, \*Wren and \*Vanbrugh. Hawksmoor, self-schooled in the architecture of the classical world (though he never went abroad), ultimately, and above all in his seven London churches built during the twelve years 1712–24, revealed a profoundly original control of mass, if not of the play of light, over complemen-

tary broken surfaces. St Anne, Limehouse, St George-in-the-East, and Christ Church, Spitalfields, are all examples of a rare genius. For all Hawksmoor's indebtedness to contemporaries, a modernity stemming from primal forms seems to link him with the explosive, revolutionary imaginations of Ledoux and Boullée (active in France c.1760–1800). DDA

**Haydon, Benjamin Robert** (1786–1846). A historical painter, born in Plymouth, the son of a painter and publisher, Haydon was encouraged to sketch while at school. From an early age he showed great determination to succeed, yet his life ended in imprisonment for debt and suicide. For much of his life he painted large canvases of historical or religious subjects rather than more marketable works. A stubborn man, invariably in opposition to the establishment, he campaigned strenuously for patronage for the arts, the foundation of schools of design, decoration of public buildings, in particular the Houses of Parliament, and to save the \*Elgin marbles for the nation. He also became involved in radical politics. Despite his pugnacious character he had many admirers among the Romantic movement in literature, especially \*Wordsworth and \*Keats, whose portraits he painted. He is now chiefly remembered for his *Autobiography and Memoirs*, published in 1853. JC

**Hazlitt, William** (1778–1830). Hazlitt was the son of a unitarian minister and grew up in Wem (Shropshire), where he met \*Coleridge. Religious doubts preventing him following his father's profession, he started as a painter, and then began literary work for newspapers and periodicals. He was an idiosyncratic radical and had some success as a lecturer. But he was cantankerous—'I have quarrelled with almost all of my old friends'—his two marriages failed, and he was frequently in financial distress. Hazlitt is at his best as an occasional essayist—his piece on the bare-knuckle fight between Neate and the Gas-man is in many anthologies. To historians, his early biography of Thomas Holcroft is of value, as are the *Political Essays* of 1819: the late life of Napoleon (1828–30), intended as his *magnum opus*, was derivative if not plagiarized, and too hagiographical to win much approval when published. His best work is *The Spirit of the Age* (1825), with vivid and caustic sketches of contemporaries such as \*Godwin, \*Bentham, \*Southey, \*Scott, \*Byron, and \*Wordsworth. Of his love of history he wrote: 'I cannot solve the mystery of the past, nor exhaust my pleasure in it.' JAC

**Heads of the Proposals**, 1647. In June 1647 the army had taken custody of Charles I and, in the course of July, \*Lambert and \*Ireton worked out a basis for negotiation on behalf of the army council. The monarchy was to continue and to retain its veto; episcopacy was confirmed, though the bishops were to lose their coercive authority; there were to be guarantees of religious toleration; the militia was to be under the control of Parliament for ten years; parliaments were to be biennial and were to be elected on a reformed system that related representation to taxation; there was to be a council of state. Though these proposals were remarkably conciliatory in the aftermath of civil war, Charles rejected them out of hand. JAC

**health.** Efforts to attain and maintain good health have a long history. A plea for good health remained an important theme for prayers from ancient times until the present day, and was often the occasion for pilgrimages. The alleged curative powers of springs precipitated the establishment of \*spas where wealthy visitors came to take the waters and which may be considered the forerunners of modern health farms. Poorer people sought good health through folk medicine, using herbal remedies and techniques such as the laying-on of hands. Until the 19th cent. many believed the king's \*touch would cure scrofula. Caring for the sick had the blessing of the Christian churches, which urged their members both to be charitable and to care for those suffering. State intervention on a large scale in the 19th and 20th cents. aimed to promote good health amongst the population. This period also saw the development of professions and occupations, such as medicine, nursing, paramedical services, and environmental health.

The general health of people during the Middle Ages was discussed only obliquely in historical accounts and it was taken for granted that everyone suffered from the effects of seasonal food shortages. However, recent studies have suggested that larger towns were especially unhealthy because of poor sanitation and that their growth often depended on continuous migration from rural areas. Even the well-off in towns did not escape from health problems. Life expectation was relatively short. More has been recorded about the outbreak of spectacularly lethal diseases such as bubonic plague (known as the \*Black Death) during the mid-14th cent. and the Great Plague in 1665.

The first systematic attempt to devise indicators of the health of some groups of the population, particularly the upper and middle classes, was made by life assurance companies in the 18th cent. Measuring the size of these populations and their composition had commercial significance. Statistics about the entire population began with the establishment of the nation-wide decennial \*census in 1801. Censuses became increasingly sophisticated in the range of data collected. The compulsory registration of births, marriages, and deaths in 1837 made it possible to identify and analyse important overall trends in the population. For example, the government gained information about the total number of men available for national service and it was possible to start to analyse the increase in the total population.

The population of Great Britain rose from about 10 million in 1801 to over 56 million in 1991. Within these totals the distributions of age groups varied. During the 19th cent. children under the age of 15 years accounted for more than a third of the population whereas during the later 20th cent. they formed only a quarter of the total. Throughout the 19th cent. about a twentieth of the population was aged over 65 years whereas by the late 20th cent. they accounted for almost one-fifth of the total. These changes, particularly the greater life expectation, arose for several reasons: rising incomes, environmental improvements, and healthier diets.

One of the most sensitive indicators of a nation's health is that of infant mortality, the death rate of children under 1 year of age. Infant mortality rates remained well over 100 in

every 1,000 live births for almost the whole of the 19th cent. By the late 20th cent. the rate had declined to about 12 in 1,000 births. Within the British Isles there were geographical variations, with the highest mortality rates in the most densely populated areas. There were differences between social class with the highest rates amongst children whose fathers were in unskilled work and the lowest amongst the children of fathers in professional occupations. Relevant factors in explaining these rates appear to have been incomes, quality and quantity of food, heating, clothing, and housing.

Public health became a matter for government intervention during the 19th cent., partly precipitated by an outbreak of \*cholera in 1831 whose virulence paid no respect to social class. Interventions were based on theories about the link between health, clean water supplies, and adequate sanitation. The \*Public Health Act of 1848 required districts with above-average death rates to have a public health board with powers to raise loans and levy rates to pay for pure water supplies, drains, and sewers. These powers were extended subsequently to all parts of the country. Advances in the biological sciences with regard to the transmission of disease and the need for high standards of hygiene were incorporated into legislation after the middle of the 19th cent. Then, as now, such developments were controversial. Nineteenth-cent. debates about compulsory vaccination, immunization, and drug-taking can be compared with modern debates about fluoridation and smoking.

Efforts to improve the health of the school population began at the end of the 19th cent. They started with 'drill' and evolved later into physical education, emphasizing gymnastics, swimming, athletics, and games. From the end of the 19th cent., the curriculum for girls included cookery, later domestic science, and more recently home economics, whose purposes included imparting some basic knowledge of personal and household hygiene as well as dietary information. With the establishment of the national curriculum in the early 1990s, health studies became an optional subject for all.

During the 19th cent. there was an expansion in medical knowledge and in the variety and range of occupations devoted to the care of the sick. In the 20th cent. the care of the sick became increasingly likely to take place in hospital rather than at home. The establishment of the \*welfare state, in particular the \*National Health Service in 1948, indicated the political will to find resources for public health.

Evidence indicates that the health of the population has improved through the control of infectious diseases, public health provisions, such as clean water and sanitation, and effective legislation about the quality of food and drink. There has also been an expansion of medical services. A major controversy about the evidence of improved health of the general population is whether medical interventions, including public health measures, contributed as much as adequate nutrition, shelter, clothing, and heating. (eds.), *Population and Society in Britain 1850-1980* (1982); Porter, R., *Disease, Medicine and Society in England* (2nd edn. 1993); Smith, F. B., *The People's Health, 1830-1910* (1979).

**Healy, Timothy** (1855–1931). Healy was born in Bantry (Co. Cork) but moved to Newcastle upon Tyne in 1871 to work as a railway clerk. He was largely self-taught, assisted by a prodigious memory. He became a devoted disciple of \*Parnell, writing in his support in the *Nation*. He was elected to Parliament in 1880 for Wexford and at once established himself as a clever debater. In 1883 he served a six-month sentence for incitement to violence and in 1884 was called to the bar. In 1890, when the Parnell divorce scandal broke, Healy attacked him vehemently: his interjection in Committee Room 15, ‘who is to be the mistress of the party?’, still reverberates. He was in the anti-Parnell group until the Irish party reunited in 1900, but remained on uneasy terms with \*Redmond and the leadership, and moved towards \*Sinn Féin. Healy did not stand in the 1918 election which swept Sinn Féin to victory, but in 1922 became the first governor-general of the Irish Free State, serving until 1928. JAC

**Heath, Sir Edward** (b. 1916). Prime minister. Heath went to Balliol College, Oxford, where he secured an organ scholarship and became president of the Union. Music remained a lifelong passion. His first taste of national politics came in Oxford’s famous by-election in 1938, when he campaigned against the Conservative Quintin Hogg (Lord \*Hailsham).

The \*Second World War deepened Heath’s conviction that European reconstruction and unity represented the greatest challenge facing his generation. He was among the impressive new Conservative MPs elected in 1950, joining the ‘One Nation’ group of Tories who took a particular interest in social policy. It was a style of progressive Conservatism to which Heath clung tenaciously throughout his career, even though the group’s ideas revealed a more radical approach to welfare spending than Heath might now wish to concede. His maiden speech was on the subject of Europe—the most consistent theme in his career. Less than a year after entering Parliament, however, Heath was made a junior whip. This effectively silenced him as a parliamentarian. Appointed chief whip in 1955, Heath had to hold the party together during the Suez crisis in 1956. This he did with firmness and more charm than he tended to display in later years.

Heath enjoyed good relations with both \*Eden and \*Macmillan; under the latter his career prospered. After the 1959 general election he became minister of labour. In 1960, however, Macmillan decided to make Lord \*Home foreign secretary with a second cabinet minister (Heath) in the Commons. This proved a turning-point in Heath’s career. In 1961 the government determined to seek membership of the Common Market and Heath had the delicate task of negotiating the terms of entry. Though the mission was doomed, Heath won widespread applause for his handling of the discussions.

The choice of Home as a short-term leader in 1963 suited Heath since he was himself not yet ready to stake a claim. In the last year of Conservative government, Heath, as president of the Board of Trade, surprised many by introducing controversial legislation to abolish retail price maintenance. It served, however, to underline his credentials as the most

dynamic figure in the new generation of Conservative politicians.

As shadow chancellor in 1965 Heath further impressed. With his energy and commitment to the tasks of opposition he stood in marked contrast to his leading rival for the succession, Reginald Maudling. When Home suddenly resigned in July, Heath secured a narrow victory over Maudling—the first leader elected by a simple vote of Conservative MPs. Heath owed his election to the conviction that he was the man to take on Labour’s Harold \*Wilson on his own terms.

Such expectations proved wide of the mark. Heath never had the subtlety or political skills to compete effectively with Wilson. His popularity lagged behind that of the prime minister even when the Conservatives were running well ahead. None the less Heath prepared assiduously for government. His approach was based on intelligence rather than intellect, pragmatism rather than ideology. A major policy review emerged in the document ‘Putting Britain Right Ahead’. Its themes survived largely unchanged through the rest of the decade. It spoke of encouraging a competitive economy, moving from direct to indirect taxation, greater selectivity in the social services, and taking Britain into Europe. Such objectives inevitably encourage comparisons with the Thatcherism of later years. But for Heath the new policies represented a practical approach to the modernization of British society with little if any ideological underpinning.

Heath’s defeat in the 1966 election had been widely expected. But his comfortable victory in June 1970 surprised most commentators. Whatever Heath’s true intentions, his government seemed more right-wing than any since the war. In particular it espoused an industrial policy which would break the post-war consensus of planning and intervention. The government was certainly beset by bad luck. The chancellor, Iain Macleod, died within a month of the election; Northern Ireland provided unlooked-for difficulties; world economic problems, especially the quadrupling of Arab oil prices in 1973, distorted domestic politics and fuelled inflation. None the less, it is hard to escape the conclusion that Heath’s government was a failure. Its one lasting achievement was to take Britain into the EEC, though on terms which ensured that this would remain a contentious issue.

Rising unemployment initiated an abrupt change in policy by the end of 1971. Heath’s government now became one of the most interventionist since the war. By 1972 he had re-embraced the notion of an incomes policy. Industrial relations policy proved a disaster. The much heralded \*Industrial Relations Act, designed to introduce a framework of legislation into the workplace, proved inoperable. The government finally collapsed in the wake of the miners’ strike of 1973–4, to which Heath responded with a three-day week and finally a general election. The campaign was mishandled. Heath’s inability to convey his sincerity, which had long worried many Conservatives, proved decisive. A minority Labour government took office after Heath failed to negotiate a deal with the Liberals.

Further defeat followed in a second election in October. By now Heath had succeeded—through electoral failure and personal tactlessness—in alienating many of his own

## Heathfield

backbenchers. Senior Conservatives began to question the overall approach of his policies. Challenged by Margaret \*Thatcher, he withdrew from the leadership contest after failing to win the first ballot in February 1975.

Heath never reconciled himself to these events, his anguish intensified by being replaced by a colleague for whom he had never had much regard. Time failed to heal or even soothe his wounds. He found it difficult to find anything creditable in Mrs Thatcher's Conservatism, especially when it was claimed that she was implementing the policies upon which he had been elected in 1970. Heath remained an MP throughout her premiership, increasingly surly and devoid of his earlier charm. He greeted her fall in 1990 with undisguised glee and sought unconvincingly to find merit in the government of John \*Major, even though this owed far more to Mrs Thatcher's legacy than to his own. When he retired in 2001 from his seat at Old Bexley and Sidcup, Heath was Father of the House of Commons.

He remains an unqualified enthusiast for the European ideal. Overall, however, Heath's career leaves a feeling of disappointment. A man of great energy and considerable ability, his performance was marred by major character flaws. DJD

Campbell, J., *Edward Heath* (1993).

**Heathfield** (Haeth felth, Hatfield Chase), **battle of**, 633. Here on the Lindsey-Elmet border, north of the Idle on Hatfield Chase, or possibly near Cuckney (Notts.), died \*Edwin of \*Deira, king of Northumbria, in circumstances which enabled his promotion as a saint. He was defeated on 12 October by the allies \*Penda of Mercia (pagan) and \*Cadwallon of Gwynedd (Christian), both threatened by Northumbrian expansion, and perhaps supported by \*Bernician royal exiles. Union of Deira and Bernicia was broken, and the progress of Northumbrian Christianity temporarily halted (the next kings reverting to paganism and Bishop \*Paulinus fleeing), to be resumed, under \*Oswald, under Irish rather than, as formerly, Roman influence.

AER

**Heathfield, George Augustus Eliott, 1st Baron** (1717–90). Eliott, a younger son of a Scottish baronet of Roxburghshire, attended the University of Leiden and served in the Prussian army before joining the Horse Grenadiers, his uncle's regiment, in 1739. He fought at \*Dettingen and \*Fontenoy, and in the \*Seven Years War served in Germany, and was second in command at the capture of Havana in 1763. He was promoted lieutenant-general in 1765, served as commander-in-chief in Ireland 1774–5, and became general 1778. In 1776 he was appointed governor of \*Gibraltar, a post he held for the rest of his life. During the War of \*American Independence, Gibraltar resisted a four-year siege, 1779–83, against Spanish and French forces. Eliott inflicted enormous losses on the Spanish floating batteries in September 1782 with red-hot shot and the following month \*Howe raised the blockade. Eliott was knighted in 1783 and given his barony in 1787. \*Reynolds's magnificent portrait was painted in 1788. JAC

**Heavenfield, battle of**, 634. Fought near Hexham, \*Oswald of Northumbria defeated and killed \*Cadwallon of Gwynedd, who had been ravaging the province after slaying Osric of Deira and Eanfrith of Bernicia (brother of Oswald) the year before. Through this victory Oswald secured his own position as king of both Bernicia and Deira and ensured that Northumbria would return to Christianity after a year of apostasy. The battle takes its name from the place where Oswald erected a wooden cross and prayed for victory before the engagement; the monastery of Hexham subsequently erected a church on the site and splinters from the cross were famed for miracles of healing. BAEY

**Hebrides.** See WESTERN ISLANDS.

**Hedgeley Moor, battle of**, 1464. Despite her crushing defeat at \*Towton in 1461, Queen \*Margaret retained a following in the north of England and was given assistance by the Scots. In the spring of 1464 they raised a substantial force under the duke of Somerset and Sir Ralph Percy. Montagu, \*Warwick's younger brother, was sent to deal with it and on 25 April defeated it at Hedgeley Moor, between Alnwick and Wooler. Sir Ralph Percy was killed but the duke of Somerset survived to offer battle three weeks later at \*Hexham. JAC

**Heligoland.** A small island in the North Sea off the mouth of the Elbe. It was taken from Denmark by the British in 1807 and used by British commerce, during the Napoleonic wars, as a base from which to smuggle goods into continental ports closed by the Berlin and Milan decrees. Heligoland was formally ceded to the British in 1814, but in 1890 was given to Germany in exchange for territories in east Africa, and subsequently used as a naval base. After the First World War, article 115 of the treaty of Versailles declared that the island should be demilitarized but remain under German sovereignty. RAS

**Heligoland Bight, battle of**, 1914. In a confused naval encounter on 28 August 1914, \*Beatty's battle-cruisers sank three German light cruisers and one destroyer. The action, though fierce, was limited, but any victory when the Germans were still advancing on Paris was welcome. JAC

**Henderson, Arthur** (1863–1935). Labour politician. Brought up on Tyneside and apprenticed as an ironfounder, Henderson, then a fervent Gladstonian Liberal, moved slowly to the view that the political future of the manual working classes lay in separation from Liberalism. Elected as MP for Barnard Castle under the auspices of the Labour Representation Committee in 1903, Henderson succeeded to the secretaryship of its successor, the Labour Party, in 1911. Unlike Ramsay \*MacDonald, Henderson approved of the British war effort in 1914; he succeeded MacDonald as leader of the parliamentary Labour party, and in 1915 agreed to serve in Asquith's government, becoming a member of Lloyd George's war cabinet the following year. In 1917 he resigned from the government over his support for a negotiated peace, and while playing a major part in the constitutional restructuring of the Labour Party in 1918 he devoted himself increasingly to international reconciliation and

support for the \*League of Nations; he was foreign secretary in the second Labour government. GA

**Hengist and Horsa.** Reputed founders of the kingdom of \*Kent and its royal house. \*Bede was the first to identify the two brothers as the leaders of Germanic forces invited to Britain by \*Vortigern in 449; fuller accounts are provided in the 9th-cent. \**Anglo-Saxon Chronicle* and *Historia Brittonum*. The stories concerning them should be seen as part of Kentish foundation legends rather than as records of actual events. 'Stallion' and 'Horse' are more likely to have been horse-deities than genuine ancestors and with their alliterating names recall other legendary founding pairs of the Indo-European world such as Romulus and Remus. BAEY

**Henley Royal Regatta** was established in 1839 and from 1851, under the patronage of Prince Albert, took the prefix Royal. It is held on the Thames with races over 1 mile 550 yards. The two chief events are the Grand Challenge Cup (1839) and the Diamond Challenge Sculls (1844). The four-day event is held in the first week in July. JAC

**Henrietta Maria** (1609–69), queen of Charles I. Charles married Henrietta Maria, youngest daughter of Henri IV of France, in May 1625 after his Spanish marriage plans had come to naught. She was aged 15, small and vivacious, with dark curly hair, large brown eyes, and protruding teeth. She danced and sang well, surrounded herself with her French catholic servants, and found her first years in England trying. Her husband was rather solemn and there was a very sharp quarrel in 1626 when he sent all her servants packing. But her relations with her husband became close, particularly after the death of \*Buckingham in 1628. Their first child, the future Charles II, was born in May 1630. The 1630s she looked back on as halcyon days but increasingly Charles's political troubles darkened their lives. She fled to Holland in February 1642 with the crown jewels to raise men and money. Returning in July 1643 she joined Charles at Oxford, spending her time at Merton College. Heavily pregnant, she fled once more in 1644, giving birth to her youngest daughter at Exeter in June *en route* for France. She never saw her husband again. During the Cromwellian years she remained in France, returning to England at the Restoration in 1660, when Pepys noted her as 'a very little plain old woman'. She left England for good in 1665. \*Clarendon thought her meddlesome and historians have blamed her for many of Charles's misfortunes. She appears to have urged the disastrous attempt to arrest the \*five members, which she also inadvertently betrayed. But her influence has probably been exaggerated and Charles was quite capable of making his own mistakes. SMC

**Henry I** (1068–1135), king of England (1100–35) and duke of Normandy (1106–35), was the youngest son of William the Conqueror. In 1087, on his death-bed, William had given Henry a large sum of money, which he used to purchase land in Normandy. He played an intermittent role in the struggle between his elder brothers \*Robert Curthose and William Rufus for control of the Anglo-Norman realm and seized the opportunity provided by the latter's (probably) accidental death in 1100 to take over the English kingdom

while Robert was still on his return journey from the First Crusade. Henry moved quickly to consolidate his coup, issuing a coronation charter which promised to renounce the supposed abuses of William II's rule, recalling Archbishop \*Anselm from exile, and marrying \*Matilda, the niece of \*Edgar the Atheling and the daughter of \*Malcolm Canmore, to create a dynastic link with the Old English ruling house and an alliance with the kingdom of Scots. By 1101 he was sufficiently powerful to resist Robert's invasion of England and to agree terms with him which confirmed Henry's kingship in England. Thus established, Henry then proceeded to disinherit a number of powerful magnates known to be supporters of Robert's cause and to undermine his brother's already precarious authority in Normandy. In 1105–6 he invaded Normandy and completed his conquest of the duchy by defeating Robert in 1106 at the battle of \*Tinchebrai, thereby recreating William the Conqueror's Anglo-Norman realm. Henry ruled both England and Normandy for the rest of his life, but his control over Normandy was always threatened until the death of Robert's son William Clito in 1128 by alliances between William, the French king Louis VI, territorial princes such as the counts of Flanders and Anjou, and a group of Norman nobles with few landed interests in England. Henry suffered set-backs such as a military defeat at Alençon in 1119, but was successful in defeating invasions of Normandy in 1118–19 and 1123–4. Marriage alliances were used to secure useful allies, such as the one between his nephew, the future King Stephen, and \*Matilda, the heiress to the county of Boulogne. The death of his only legitimate son in the \**White Ship* disaster increased Henry's problems and his failure to obtain an heir through his second marriage to \*Adela of Louvain eventually forced him to the apparently desperate measure of marrying his daughter, the Empress \*Matilda, to Count \*Geoffrey Plantagenet of Anjou in 1128, thereby neutralizing one of his most powerful opponents at the cost of the prospect of an Angevin succession to England and Normandy after Henry's death.

The frequent warfare in northern France had an impact on England because Henry was obliged to raise money to finance the wars. His administration, supervised by Bishop \*Roger of Salisbury, had a reputation for efficiency and has on occasion been regarded by historians as being notably innovative. The developments should, however, be seen as taking place within the existing institutional framework. The most obvious, the \*Exchequer, involved a centralized audit of royal revenue and expenditure under Bishop Roger's supervision, for which there were precedents in the 11th cent. Other developments, such as the more frequent interventions of royal justices in the localities, can also be regarded as opportunist centralization because they relied fundamentally on the existing structure of shire courts and were not regular visitations after the pattern later established in Henry II's reign. Henry's regime is also notable for the advance of individuals of lower aristocratic status to positions of administrative prominence, but, with the important exception of Bishop Roger, their power came nowhere near rivalling that of the great magnates. The general character of Henry's rule was one of expedient

## Henry II

centralization within a socially conservative framework. The basis of his rule in both England and Normandy, like his father's, was a group of powerful cross-channel families into which Henry advanced a small number of his own relatives, most notably his nephew, the future King Stephen, and his illegitimate son, Earl \*Robert of Gloucester. Despite enduring problems, Henry was without doubt a very successful ruler. England was at peace after the early years of his reign and Normandy was kept secure. He dominated Wales as no predecessor had done and good relations were maintained with his nephew, David I of Scotland. He experienced problems with the church in his early years, most notably when Archbishop Anselm of Canterbury took a stand over the practice of lay investiture of bishops and went into exile in 1103. Henry and the papacy reached a settlement in 1107 and thereafter Henry's relations with the church were generally good. He was a great patron of monasteries, most notably of Reading abbey, in which he was buried. His last years were difficult because of the continuing insecurity of the succession, and because he was reluctant to provide his designated heir Matilda and her husband with lands and castles to assist their succession. At the time of his death at Lyons-la-Forêt on 1 December 1135, he was involved in another quarrel with Matilda, which facilitated the coup carried out by Stephen. Despite his many successes in war, diplomacy, and government, Henry I's legacy was a disputed succession and almost inevitable civil war.

W., *Monarchy, Magistrates and Institutions in the Anglo-Norman World* (1986); Southern, R. W., 'The Place of Henry I in English History', *Proceedings of the British Academy*, 47 (1962), 127–70.

**Henry II** (1133–89), king of England (1154–89). The first of the \*Plantagenet kings of England was also one of the most able of all this country's monarchs. His achievements are the more remarkable since his responsibilities encompassed not just England, but also two-thirds of France as well, for Henry was also duke of Normandy, count of Anjou, and, by right of his wife Eleanor, duke of \*Aquitaine. England was but part of the vast \*Angevin empire, each constituent dominion requiring Henry's attention. The consequence was that Henry was frequently absent from England, as he was from his other lordships. Twice, indeed, he was absent for more than four years at a time, and it has been calculated that in the entire course of the reign he was in France for some 21 years.

The problem of government, and the maintenance of peace and stability, were among the greatest challenges facing Henry when he succeeded in 1154. Nowhere was this more so than in England, since Henry inherited a realm severely affected by the disorder that had occurred in Stephen's reign. He proceeded to restore, and then further develop, the governmental structure inherited from his grandfather Henry I, one which assumed an absentee ruler, authority being delegated to one or more chief \*justiciars who acted as viceregal figures. But to restore the crown's overall position, including the recovery of lands, offices, and castles lost in Stephen's reign, Henry needed the co-

operation of the greater magnates. Equally, it was from this same group of men that Henry demanded the restoration of the crown's rights—a seemingly impossible task. But through a skilful mixture of policies, and using both carrot and stick, Henry attained his end. While bending the magnates to his will, he also succeeded in placating them and finding a place for them in his regime. Hence the remarkable general political stability of England during Henry's reign. Only in 1173–4 did serious unrest occur, in connection with the so-called Great Rebellion in England and France, and even then only a handful of English nobles were involved.

This political settlement helped provide the necessary stable context for a notable extension of the crown's activities, especially through the introduction of the famous assizes. A far greater positive role was being taken by the crown than hitherto, whereby the king's law was becoming truly national in scope, affecting the lives of royal subjects in a new way. Some concerned trade and commerce, such as the assizes of wine, ale, bread, and measures, whilst the \*Assize of Arms dealt with matters connected with the defence of the realm. But the most significant assizes were those which transformed both civil and criminal law. The grand jury, established by the Assize of \*Clarendon, would be fundamental in the prosecution of crime until the establishment of the director of public prosecutions in 1879, whilst the civil law reforms established essential procedures and principles that endured for centuries. National in scope, applicable to all freemen of the realm regardless of their feudal position, enshrining uniform rules and procedures, these various reforms marked the opening up of the royal courts as courts of first instance, to the inevitable detriment of the seigneurial courts. It is perhaps ironic that the 'grandfather of English common law' was a Frenchman.

It is fortunate that Henry's reign coincided with a great flowering in English historical writing and that men close to Henry penned descriptions of him. Stocky, of medium height, he was robust in his prime but was becoming fat in his later years, not through over-indulgence, because he was moderate in his eating and drinking. In the 1180s, it seems, he was aged beyond his actual years, worn out by the constant travelling and exertions needed to govern the Angevin empire. His remarkable energy and vitality struck everyone, a man who plainly demanded to be in the thick of the action all of the time. (Louis VII of France, indeed, was said to be so astonished by his movements that he was convinced that Henry could fly.) When not on the move around his dominions, he seldom sat still for long, except to eat or play chess. Even at mass, he scribbled memoranda or whispered on business to courtiers. And like all noblemen, he was addicted to hunting and hawking. Henry lived in the saddle.

He was a man of violent passions, easily moved to anger and outbursts of his famous temper, at times uncontrollable. He was also capable of hatred, most notoriously revealed in his struggle with Thomas \*Becket. But it seems that much of the threatening side of his nature was deliberately cultivated, stage-managed to get his own way. This was an aspect of his personal statecraft, and he knew how to bind men to

him, in respect tinged with fear if not in love. But there was another side to his character, simple, good-hearted fun. He was also quite well educated, applying his intellect to practical matters in the art of government, analysing a problem, and then formulating solutions in association with his advisers.

But one problem he never satisfactorily resolved—the partition of the Angevin empire between his sons. The issue blighted the last 20 years of his life, and poisoned relations within the family. Indeed, he died vanquished, defeated by his son Richard and Philip II of France over that very issue.

Gillingham, J. B., *The Angevin Empire* (1984); Warren, W. L., *Henry II* (1973); id., *The Governance of Norman and Angevin England 1086–1272* (1987).

**Henry III** (1207–72), king of England (1216–72). Henry was one of the most cultured monarchs ever to sit on the English throne. He seems to have been inspired by artistic beauty for its own sake, judging by his recorded payments for a wide range of objects—silver, gold, and enamel work, hangings and embroideries, and frescos for the royal palaces. Equally, it is plain that he chose to sink large sums into works of art to give visual expression to his heightened conception of monarchy and dynasty. Nowhere is this more apparent than \*Westminster abbey, which he established as the royal necropolis. Huge sums were spent on its rebuilding after 1245, despite an ever-worsening overall financial position. Henry also brought a new mystique and theatricality to English monarchy. He loved display and liturgical ceremony, as when he processed to Westminster abbey in 1247 personally bearing his newly acquired relic of the Holy Blood. He increased the number of occasions when the *Laudes regiae*, the liturgy in praise of the ruler, were to be chanted; and he deliberately promoted the cult of Edward the Confessor, his beloved patron saint, having his own tomb in Westminster abbey placed within the aura of sanctity of Edward's tomb.

Henry's conception of monarchy looked back to the period before \*Magna Carta when kingship was untrammelled and unlimited, in theory if not in practice, and he may well have sought to counter the dramatic growth in constitutional ideas by deliberately emphasizing the aura of kingship. The traumatic experiences of his early years—the bringing down of his father, king John, French invasion and civil war, tutelage by baronial regency council—probably propelled him in this direction as well. He certainly had consistently a definite set of views which held as axiomatic that a king is free in his sovereignty to do as he will, be it appointment or removal of ministers and officials, or conduct of foreign policy. In so doing, Henry was ignoring the new realities following Magna Carta and this contributed to that series of crises which characterize his reign after his personal rule began in 1232. It culminated in the demand for radical reform in 1258 and the imposition of the provisions of \*Oxford, the prelude to the so-called Barons' War that tore the country apart until the defeat of Simon de \*Montfort at the battle of \*Evesham (1265). But it was by no means only, even chiefly, constitutional issues that were

at stake, in 1258 or before. Recent research has shown how much friction was generated by very real political issues, of patronage, for example, and Henry's protection of his kinsmen and favourites from justice. Protest against his hated half-brothers, the Lusignans, who came to England after 1247, lay at the heart of the sworn baronial confederacy of 1258.

Henry was particularly vulnerable in 1258 because he faced imminent excommunication if he did not meet the gigantic debt he owed to the papacy, incurred when he accepted the grant of the kingdom of Sicily to his son Edmund in 1254. This was the culmination of a foreign policy that became ever more grandiose. At first, Henry's chief goal was the recovery of those parts of the \*Angevin empire lost under John. This was entirely reasonable. It was not inevitable that they would never be recovered, and as an Angevin Henry was dynastically impelled to seek to regain his inheritance and restore the honour of his lineage. But for a variety of reasons none of the expeditions dispatched to France succeeded, and the odds stacked against Henry steadily rose as the power of Louis IX of France and his brothers, installed in the former Angevin territories, increased. His failure led him into a wider European strategy that involved a network of foreign allies, including Emperor Frederick II, who married Henry's sister Isabella in 1236, and the Savoyards, the powerful kinsmen of \*Eleanor of Provence, whom Henry himself married in 1236. When Frederick was deposed by Pope Innocent IV in 1245, Henry was drawn into an attempt to secure the different parts of the imperial inheritance. He accepted the crown of Sicily for Edmund, he encouraged his brother \*Richard of Cornwall to accept the kingdom of Germany in 1257, and there are signs that he briefly toyed with the idea of extending his influence to the east Mediterranean through a marriage alliance involving Edmund and the Lusignan rulers of Cyprus, who also had claims to Jerusalem.

None of these schemes came to anything, and the huge costs incurred in the pursuit of Sicily, by stimulating the events of 1258, forced him to abandon them. In 1259, too, he finally accepted reality and agreed to the treaty of \*Paris, whereby he renounced his French claims as well. Henry's capacity to play for very high stakes, and yet lose, is truly remarkable.

**Henry IV** (1366–1413), king of England (1399–1413). The eldest son and heir of \*John of Gaunt, duke of Lancaster, he was born at Bolingbroke (Lincs.) in the same year as his cousin Richard II, whom he deposed in 1399. Returning from exile with the declared intent only to recover his inheritance seized by Richard, within three months he usurped the throne. It is not certain that he intended to do so when he landed; it is likely that he made the decision only after he had secured control of the person of the king. Although descended from Edward III, his claim to the throne was weak. He might have judged that only by taking

the crown did he have a chance of securing his long-term future; if so, he was successful.

The first seven years of Henry's reign were years of continuous crisis. He faced his first rebellion in January 1400 from a group of Richard II's excluded courtiers. Its principal victim was Richard himself, who died in custody at Pontefract shortly afterwards. Other baronial rebellions followed, especially those of the Percys who had been his principal supporters in 1399. In 1403 \*Hotspur, heir to the earl of \*Northumberland, was defeated and killed at \*Shrewsbury. In 1405 the earl himself fled to Scotland after a failed rising; he was finally killed in an abortive invasion in 1408. More serious to king and kingdom was the rebellion of the Welsh under Owain \*Glyndŵr in 1400, which, despite annual English campaigns, led to the complete liberation of Wales by 1405. In addition war with Scotland, a running war at sea, and constant threats to the remaining English possessions in France left Henry beleaguered. The cost of defending the throne and the realm (exacerbated by his own profligacy and indifference to financial management) led to frequent parliaments, frequent requests for taxation, and a hostile reaction from the Commons, especially in 1401, 1404, and 1406.

That Henry survived these torrid years was due to several factors; his own determination, decisiveness, and energy; the strength, commitment, and ability of his own supporters (whose loyalty he wisely sustained by lavish rewards); and his own pragmatism (he would have agreed with Harold Wilson that a week was a long time in politics). But he was also helped by the divisions in the ranks of his enemies, especially the development of civil war in France. As a result, by the end of 1406 the worst of his difficulties were over: the French were no longer a threat, the reconquest of Wales was under way (completed in 1409), and a reformed government began to bring order to royal finances.

But the strain ruined his health. In the spring of 1406 Henry had what was probably the first of a series of strokes, which by 1410 left him incapacitated and unable to play much more than a token part in public affairs. While the later years of the reign saw the return of domestic peace and greater security, they also saw the emergence of factions at court, one led by the prince of Wales, the future Henry V, the other led by the prince's younger brother (and father's favourite) Thomas of Lancaster (\*Clarence). Yet at no time was Henry's throne threatened, and when he died in 1413 there was no challenge to the succession of his charismatic son.

In the 19th cent. Henry was credited with an experiment in government by limited monarchy. His usurpation was justified on the grounds of Richard II's tyranny; he had been one of the \*appellants who had sought to impose conciliar government on Richard; and after 1399 he had himself willingly accepted rule through a council answerable to Parliament. In reality he sought to maintain the prerogatives of the crown, but was vulnerable and accepted the need to make concessions to a political nation unwilling to bear the open-ended cost of his usurpation. Moreover he was conciliatory by nature, a man who had been the head of a baronial council and knew the value of working with rather than against his leading subjects. To this extent he repre-

sented a different type of kingship from the 'absolutism' of Richard II, something akin to the participatory style of Edward III. It is indeed arguable that he had opposed Richard II out of principle as well as self-interest.

Henry was an able, accomplished, and much-admired man. As a youth he was renowned for his chivalry, the leading jousting of his generation, and a crusader. His piety was deep and sincere; he made a pilgrimage to Jerusalem in 1393. He was well fitted for kingship. But he was a usurper. A tradition grew up that he was later racked by guilt, for the execution of Archbishop \*Scrope of York in 1405 as well as his usurpation. It was early speculated that this guilt hastened the collapse of his health. Moreover, although he established his dynasty on the throne, he created a precedent which was subsequently used against his grandson Henry VI. No longer after 1399 was the crown of England sacrosanct.

Kirby, J. L., *Henry IV of England* (1970); McFarlane, K. B., *Lancastrian Kings and Lollard Knights* (Oxford, 1972); Wylie, J. H., *History of England under Henry the Fourth* (4 vols., 1884-98).

**Henry V** (1386/7-1422), king of England (1413-22). Eldest son of Henry IV and his first wife Mary Bohun, Henry was born at Monmouth. The exact date is unknown, but was most probably 9 August or 16 September 1386 or 1387. The young Henry was thrust into prominence by his father's successful usurpation of the throne in 1399. He carried the sword 'Curtana' at the coronation on 13 October and two days later was created earl of Chester, duke of Cornwall, and prince of Wales, and subsequently duke of Aquitaine and of Lancaster. From then on Henry took a prominent part in affairs as befitted the heir to the throne. Between 1400 and 1408 he was mostly in the west, concerned with the war against the Welsh, initially as a figurehead but increasingly as an effective leader. On 21 July 1403 he was with his father at the battle of \*Shrewsbury, where the English rebels under Henry \*Percy, 'Hotspur', and their Welsh allies were defeated. Henry took a prominent part in the battle, but the story that he killed Hotspur himself is without foundation. Between 1410 and 1413 there seems to have been tension between the king and the prince. Henry IV's health began to fail and at first Prince Henry took an increasingly prominent role in the king's council, supported by the chancellor, Thomas \*Beaufort. This led to factions in the council with divergent policies being pursued, especially with regard to France. In 1412 the prince's faction seems to have been defeated, because Beaufort resigned the chancellorship, and Prince Henry withdrew from the council. It is possible that the king was asked to abdicate in favour of the prince on the grounds of ill-health, but refused to do so and successfully reasserted his authority, supported by his son Thomas, who was made duke of \*Clarence. The story of the prince taking his father's crown from a cushion beside his bed as dramatized by \*Shakespeare may represent the actual disagreements between the prince and his father at this time. In the last fifteen months of the reign the prince seems to have taken little active part in government. Henry succeeded his father on 20 March 1413 and was crowned at Westminster on Passion Sunday, 9 April.

The start of Henry's reign was seen by contemporaries as a new beginning. Thomas Walsingham, a monk of St Albans, claiming that with the new king winter was past and the rain over and gone. Commentators were eager for the new reign and saw in Henry a man 'young in years but old in experience', who had dealt successfully with protracted Welsh rebellion and had been a prominent member of the king's council, well able to rule. The stories of Henry's wild youth and amazing 'conversion', as dramatized by Shakespeare, have some contemporary justification. The chronicler Elmham says that Henry 'was in his youth a diligent follower of idle practices, much given to instruments of music, and fired with the torches of Venus herself' and that on the night of his father's death, Henry visited a recluse at Westminster, made confession of his former life, and promised to amend. But the famous story of Henry's dispute with Lord Chief Justice Gascoigne, alluded to and embroidered by Shakespeare, is first recorded only in 1531 and has no foundation in fact. Perhaps it does not really matter whether these stories about Henry are true or not. They should be seen as symbolizing a break with the past, that is the failure of Richard II's and Henry IV's reigns, and a new beginning.

Henry lived up to these expectations and enjoyed considerable popularity during his reign. He provided good and dynamic leadership that fired widespread enthusiasm. He seems to have appealed to feelings of nationalism and nationhood; Christopher Allmand wrote that 'It was as a very English Englishman that Henry caught something of the mood of the day.' Henry encouraged the keeping of the festivals of English saints and promoted the use of English. He gave active encouragement to translators and began the use of English rather than French in government. From 1417 his signet letters to his English subjects were written in English. He used the war with France to promote the idea that England was a nation blessed by God and favoured because their king was also favoured. The general enthusiasm for the war is evidenced by the large number of the nobility who followed him to France, and by the generous grants of taxation made by Parliament before the first campaign. The contemporary \*Agincourt carol commemorated the battle as a famous English victory. The *Gesta Henrici Quinti* describes the reception of the king after he returned to England after Agincourt. The Londoners staged a triumphal entry with music and pageants attended by great masses of people, the civic dignitaries escorting the king from Blackheath.

A desire to create unity and nationalistic fervour were not the only reasons for Henry's aggressive policy towards France. He seems truly to have been persuaded of the justice of his claims. He did not at first claim the French throne but began by pressing for the implementation of the treaty of \*Calais of 1360 in which the French had ceded Aquitaine, and to which he added further claims to Normandy, Touraine, and Maine. It is not clear whether Henry really expected to gain his ends by diplomacy, for he had made extensive preparations for war before the negotiations broke down in June 1415. The subsequent campaigns for the conquest of France were thoroughly well organized. Henry's diplomacy secured the early neutrality of John, duke of Burgundy; and

after Agincourt the whole-hearted support of the Emperor Sigismund, with whom he signed the treaty of Canterbury in 1416. Militarily his main objective was the systematic reduction of the main centres of northern France. These, when provided with permanent garrisons, would become the centres from which the countryside could be subdued and governed. Henry's idea was that, once the initial conquests had been made, further warfare would pay for itself in the form of taxes from his new lands. The initial invasion was financed by borrowing and through generous parliamentary grants. The first campaign brought the capture of \*Harfleur in September 1415, and victory at Agincourt on 25 October 1415. Further campaigns were aimed at the effective conquest of Normandy, during which Rouen fell in January 1419. Henry's success forced the French to agree to the treaty of \*Troyes in May 1420, by which Henry was recognized as heir to the throne of France. The treaty was cemented by Henry's marriage to the Princess \*Catherine, which took place on 2 June. After this Henry continued his campaigns to reduce areas of the country still loyal to the deposed dauphin, Charles. During the sieges of Melun and Meaux his health began to fail and he died, probably of dysentery, at Bois de Vincennes on 31 August 1422, leaving, as his heir to both crowns, his son Henry, less than a year old.

Even before Henry's death the initial enthusiasm for the war was waning in England. There were complaints about the high levels of taxation needed, and in 1421 the Norfolk gentry refused to join Henry in France. There was widespread resistance to Henry in France and, even in Normandy, English rule was not as welcome as Henry had assumed that it would be. It has been argued that the treaty of Troyes, which appeared to have been such a triumph, was in fact a mistake and that Henry would have been better advised to restrict himself to securing Normandy. Henry's interest in Europe was not limited to the war with France, however, and he had notable success at the Council of Constance, where, in collaboration with the Emperor Sigismund, he helped to resolve the \*Great Schism. It is possible that all Henry's efforts with regard to France and the papacy were ultimately directed towards his plans for a crusade, which he never undertook. LR

Allmand, C., *Henry V* (1992); Seward, D., *Henry V as Warlord* (1987); Taylor, F., and Roskell, J. S. (eds.), *Gesta Henrici Quinti: The Deeds of Henry V* (Oxford, 1975); Wylie, J. H., and Waugh, W. T. (eds.), *The Reign of Henry V* (3 vols., Cambridge, 1914–29).

**Henry VI** (1421–71), king of England (1422–61 and 1470–1). Henry VI was the youngest king of England ever to ascend the throne; the only king never to know what it was like not to be king; the only one ever to be crowned king of France; and arguably the worst, who inherited two kingdoms and lost both. His reign is divided into three parts by modern historians as well as by Shakespeare. The first is his minority (1422–37); the second is his active majority (1437–53); and the third is the period of his mental incapacity (1453 until his death). Given the inherent dangers, Henry's minority was remarkably successful. Those who inherited power in 1422 in the name of the infant king were the same lords and

## Henry VII

retainers who had served the house of Lancaster from the time of \*John of Gaunt. They shared the overriding objective of preserving for the time he came of age the inheritances won by his grandfather and father in England and France. Fifteen years later not only was Henry still on the throne (he was crowned king of England in 1429, king of France in 1431), but his kingdom was not unduly lawless, the crown was solvent, and a substantial part of Henry V's conquests in France remained in Lancastrian hands. In 1437, when the king began to play a part in affairs, the old guard had discharged its duty as well as could be expected.

It was a cruel trick of fate to provide Henry V with a son who was the very antithesis of the martial and regal traditions of the house of Lancaster. Henry VI proved to be improvident, malleable, vacillating, partisan, uninterested in the arts of government, and, above all, antipathetic to the chivalric world his ancestors had adorned. As soon as he came of age he turned his back on the war in France. The defining moment came in 1440 when at 18 he had the opportunity to take the field in Normandy. Instead he sent his cousin the duke of \*York as his lieutenant, devoting himself to the foundation of \*Eton College. Within ten years the government of the kingdom had fallen into the hands of an unscrupulous court faction led by William de la \*Pole, duke of Suffolk, royal debts were mounting, and Normandy was lost. In 1450 the regime was shaken by \*Cade's revolt, the most widespread and sustained popular rising since 1381. It says much for the residual strength of the dynasty that it survived these shocks. Indeed when Henry suffered his devastating mental collapse in 1453, the reign appeared to be set on a more stable course.

Henry VI fell into a coma in August 1453. He recovered his senses just before Christmas 1454, but was permanently impaired. In some respects his recovery was politically more destabilizing than his collapse. While comatose Henry could be treated as a child again, a protectorate was established, and government entrusted to a council; after his partial recovery, he became a puppet tossed this way and that by faction. By 1459 royal government was almost totally powerless, the administration of the law had virtually collapsed, and the crown was bankrupt. In the civil war that erupted Henry was but a passive onlooker. In 1461 he became the victim when he was deposed by the victorious Edward IV. But his life was spared. There was no sentiment in this. Throughout the 1460s the hope of his cause was carried by his only son and heir \*Edward, in exile in France; killing Henry would only have promoted a more plausible Lancastrian claimant. In 1470 he was restored to the throne for six months. Coming out of the Tower for rare public appearances, he was a pitiful sight. But the death of the prince of Wales at \*Tewkesbury in 1471 sealed his own fate, and a few days later he was done to death.

Henry was a more effective force after his death than ever he was in his life. There soon developed a cult surrounding his saintliness, miracles were reported, and Edward IV was obliged to repress it. Richard III moved his body from Waltham, which had become a place of pilgrimage, to Windsor, the better to control the phenomenon. After 1485 Henry VII endeavoured, unsuccessfully, to secure his

canonization. It was at this time that John Blacman was commissioned to produce his *Recollections*, which have fixed the image of the saintly king. But Blacman's portrait of a prudish, unworldly man inhabiting a court more like a convent drew upon memories of Henry after 1453. Before then he had been a man of the world, maintaining a court as splendid as any in Europe. The sad truth is that between 1437 and 1453, between the ages of 16 and 32, Henry had been, as king in deed and as well as name, one of the most incompetent ever to rule England. In another age, and another society, a man who turned his back on vainglorious war, and whose greatest achievements were in the promotion of education (through the foundations of Eton and \*King's College, Cambridge), might have been more highly regarded. But in 15th-cent. England a king like Henry VI was a public disaster.

AJP

Griffiths, R. A., *The Reign of Henry VI* (1981); Storey, R. L., *The End of the House of Lancaster* (1966); Wolffe, B. P., *Henry VI* (1981).

**Henry VII** (1457–1509), king of England (1485–1509). Though the belief that Henry VII was a new kind of ruler at the head of a new kind of monarchy has long been abandoned, he was certainly an unusual ruler. Despite the fact that he was a competent soldier and personally brave, he did not hanker after military glory, even against the French, as many of his predecessors had. Secondly, he seemed to take positive pleasure in the detail of government and administration, while many monarchs left the hard work to ministers. Thirdly—and this may have distinguished him from most rulers, then and now—he seems to have wished to amass money rather than spend it. Consequently, he left his successor, if not a fortune, at least a healthy competence, and though Henry VIII reverted to type, disliking business and pining for glory, it took him some time to undo his father's good work.

The weakness of Henry's claim to the throne has been exaggerated: 'up to June 1483 Henry Tudor was hardly any more plausible as a king of England than Lambert \*Simmel or Perkin \*Warbeck were to be later.' That is absurd. Simmel and Warbeck were commoners pretending to be someone. Henry's father was a half-brother of King Henry VI; his grandmother had been queen to Henry V and a princess of France; his great-great-grandfather was John of Gaunt, son of Edward III. Once Edward IV's sons had been murdered, only \*Clarence's son \*Warwick had an obviously better claim to the throne, and across that lay the shadow of Clarence's attainder. Nevertheless, Henry's early life was inauspicious. His father Edmund Tudor, earl of Richmond, died three months before Henry was born at Pembroke castle. His young mother Lady Margaret \*Beaufort remarried. His grandfather Owen \*Tudor was beheaded at Hereford after the Lancastrian defeat at \*Mortimer's Cross in 1461, and his uncle Jasper \*Tudor, earl of Pembroke, was forced to flee. Custody of the boy was then given to the new Yorkist earl of Pembroke and he was brought up mainly at Raglan. On the brief restoration of Henry VI in 1470 he was reunited with his uncle, but after the crushing defeat at \*Tewkesbury, they both fled to Brittany. Not until Richard usurped the throne in 1483 did Henry's prospects brighten,

his cause sustained largely by his redoubtable mother. In secret negotiations with Edward IV's widow, it was agreed that Henry should marry her daughter \*Elizabeth, thus uniting the houses of Lancaster and York. But an attempt on the throne in 1483 proved premature. His ally \*Buckingham was captured and beheaded, and Henry's own expedition to the south coast was scattered by gales. In 1484 Richard put pressure on Brittany to hand over Henry, who escaped to France in the nick of time. Thence he sailed with 2,000 men to Milford Haven in 1485 on the journey that brought him to \*Bosworth and the throne.

It is sometimes said that Henry is a ruler of whom we know little. That is not quite true. We have excellent representations of him, a bust by Torrigiano, a portrait by Sittow, a remarkable death mask, coinage likenesses, and a realistic tomb effigy. There are descriptions by foreign diplomats and by Polydore Vergil, who knew him in later years. It is more that people do not always admire what is known about him. He was clearly reserved and rarely affable: he had little of Henry VIII's false heartiness nor of Elizabeth I's adroit condescensions. 'His appearance', wrote Vergil, 'was remarkably attractive and his face cheerful, especially when speaking; his eyes were small and blue, his teeth few, poor and blackish; his hair was thin and white; his complexion sallow.' His 'most cheerful countenance' was noted in 1498 by a Spanish envoy. He was more than commonly dutiful in his religious observance and, while aspiring neither to scholar nor saint, founded many religious houses and left as his main architectural memorial the chapel in Westminster abbey. His relations with his mother and wife were good, perhaps close. His application to business was proverbial, though his attention to accounts is often held against him as unworthy of a monarch. His reputation suffered from Francis \*Bacon's very readable *Life*, which exhibited him as close and mean—'a sad, serious prince, full of thoughts'. But it should be remembered that although Bacon is sometimes quoted as though a contemporary, he wrote 137 years after the battle of Bosworth, and his artistry often led him to caricature. 'For his pleasures,' wrote Bacon, 'there is no news of them.' In fact there is plenty of news had Bacon wished to find it. Henry enjoyed hunting and hawking, music and dancing, tennis, dice, archery, and cards—often, unlike many kings, losing and, characteristically, recording his debts.

He needed to learn very quickly since his nomadic existence before Bosworth had left him short of experience in government. He was undoubtedly circumspect, as anyone who hoped to survive at the top of Tudor politics needed to be. He learned early not to be too trusting. Lord \*Lincoln, who had fought against him at Bosworth, was at once forgiven, taken into employment, and attended the council to decide how to deal with Lambert Simnel—before riding off to join the rebels. But Henry became a good judge of men, and was well served by John \*Morton, archbishop of Canterbury from 1486, and by Richard \*Foxe, who finished as bishop of Winchester.

His main political objectives were to secure his own position, to found a dynasty, and to establish a stable government. Of his four predecessors as kings, two had been

murdered, one had died in battle, and the fourth (Edward IV) had been driven ignominiously from the kingdom in the middle of his reign. The foundation of Henry's success was the marriage to Elizabeth of York, and though not all Yorkists were reconciled, his political opponents were divided. Lincoln proved implacable, but Lord Surrey (\*Norfolk), who had fought alongside Richard at Bosworth and been attained, worked his way back into favour, was increasingly employed by Henry, and had a military career of great renown under Henry VIII. The first challenge from Yorkist irreconcilables came as soon as April 1486, was headed by Lord Lovel and the Hastings brothers, and was put down without difficulty. It was followed by the Simnel plot in 1487. Simnel claimed to be Edward, earl of Warwick, despite the fact that Warwick was in the Tower, and was crowned in Dublin as Edward VI. His supporters, strengthened by German mercenaries, were subdued at \*Stoke near Newark only after hard fighting. Simnel, a mere boy, was given a place in the royal kitchens and lived out a long life in safe obscurity. Perkin Warbeck, claiming to be Richard, duke of York, was received by James IV of Scotland as Richard IV, captured in 1498, but executed with Warwick the following year. Even then Henry had to face the claims of the de la Pole brothers and only for the last three years of his reign, with Edmund de la \*Pole in the Tower, was he totally secure. His dynasty by then hung on a single thread, since two of his sons, Arthur and Edmund, had died, leaving Henry as the sole surviving male heir. The marriage of Henry VII's daughter \*Margaret to James IV of Scotland reaped long-term dividends in 1603 when their great-grandson James VI united the two kingdoms.

Under these circumstances, Henry's foreign policy could hardly be very ambitious and he played a marginal role in the struggle between the French and the imperialists. He was unable to save Brittany from annexation to France but the task was impossible once the duchess of Brittany herself had married the French king, and Henry escaped creditably from his brief 1492 campaign. The short war with Scotland 1496–7 was not of Henry's making but arose from James IV's support for Warbeck. Henry stood on the defensive and used the large parliamentary subsidy to emerge with a handsome profit. By the end of his reign, England's standing in Europe had been greatly enhanced. At home the nobility was kept in check less by legislation against livery and maintenance than by large financial bonds hanging over them. Financial security, which had the advantage of allowing Henry to do without parliaments for much of his reign, was built up by the patient exploitation of the opportunities and dues open to the crown. Crown lands which brought in only £3,000 p.a. between 1487 and 1489 were worth £40,000 p.a. by 1502–5; wardships provided only £343 in 1491 but £1,588 three years later and had doubled again by 1504; bonds, bringing in £3,000 p.a. in 1493–4, had increased to £35,000 p.a. by 1504–5. Their zeal on Henry's behalf made his servants \*Empson and \*Dudley the most hated men in the kingdom and they were instant victims of Henry VIII's new reign in 1509.

The historical controversy about Henry's place in government derived in part from a desire to divide the past too

## Henry VIII

categorically into medieval and modern. But both sides shared a somewhat simple misunderstanding—that innovation in government is everything. The first group credited Henry with new policies and new expedients, to which the second group replied by tracing many of them to his predecessors, and particularly to Edward IV—action against maintenance, use of loyalty bonds, and the establishment of councils. But it was of more consequence that Henry pursued his policies, whether new or old, with rigour, system, and tenacity. Many rulers begin with economy drives, but are blown off course. Henry was not and, as Bacon put it, ‘what he minded, he compassed’—though, again, it sounds more grim than appealing. JAC

Chrimes, S. B., *Henry VII* (1972); Grant, A., *Henry VII* (1985); Lockyer, R., *Henry VII* (2nd edn. 1983); Storey, R. L., *The Reign of Henry VII* (1968).

**Henry VIII** (1491–1547), king of England (1509–47). Henry VIII was born on 23 June 1491 at Greenwich, the third child and second son of Henry VII and Elizabeth of York. On the death of his elder brother \*Arthur in April 1502 he became heir apparent; a few days after the death of his (by then) deeply unpopular father, he was proclaimed king on 23 April 1509.

**1. The early years to c.1514.** Despite being only 17, Henry acted as king in his own right at once. Shortly after his accession he solemnized his fateful marriage to \*Catherine, daughter of Ferdinand and Isabella of Spain and widow of his brother Arthur. In these first years Henry reversed many of his father's more obnoxious policies: he relaxed control over the aristocracy and allowed revenue to decline through neglect. However, apart from sacrificing Richard \*Empson and Edmund \*Dudley, his father's two most detested apparitors, he made few changes among his leading advisers. He began to play the European game of military alliances almost at once: a disastrous campaign in the Pyrenees in 1512 was followed in 1513 by the more successful seizure of Tournai and Théroutanne and the earl of Surrey's demolition of the Scottish aristocracy at \*Flodden. Peace was made in 1514.

**2. The ascendancy of Wolsey c.1514–c.1527.** The political scene was transformed by the arrival of a clergyman-academic turned administrator, Thomas \*Wolsey, who used his position as royal chaplain and almoner to build up a formidable collection of church and government posts, becoming lord chancellor in 1515 and papal cardinal-legate *a latere* in 1518. He and Henry communicated via their secretaries; Henry attended to business fitfully and occasionally intervened in details, but mostly left Wolsey to find the means to carry out the royal designs. With the accession of Francis I of France (1515–47) Henry found a rival whom he both disliked and imitated. For several years he manoeuvred in the diplomatic game, until in 1518 he and Wolsey stage-managed the great European peace treaty of \*London (1518). The next year another charismatic leader, Charles V of Austria, Burgundy, and Spain, became Holy Roman emperor, and Henry began meddling in the endless duel between Charles and Francis. He attacked France in 1522–3, but with-

drew from the alliance just too soon to profit from Francis's defeat and capture at Pavia (1525); in that year he renounced the imperial connection and began to court French support. Within England, the power-play plunged the crown deep into debt and forced highly unpopular increases in taxation, culminating in the taxpayers' strike against an illegal benevolence, the 'Amicable Grant', in 1525.

**3. The marriage question, 1527–1532.** During the 1520s Henry's marriage to Catherine had deteriorated for reasons both personal and diplomatic. After bearing a princess (the future Mary I) in 1516, the queen had suffered a series of miscarriages and still-births which reawakened Henry's early misgivings about the marriage and raised the spectre of his dying without a male heir. When Charles V dropped his plan to marry Mary in 1525, the Aragonese-cum-Habsburg alliance lost its political rationale. By early 1527 an annulment of the marriage was openly discussed. However, in that year Charles V's troops sacked Rome and forced Pope Clement VII to seek protection from Charles V. While in the emperor's hands, the pope would not shame his captor's aunt by annulling her marriage and thereby freeing Henry, it was supposed, to marry a French princess. Wolsey tried unsuccessfully to persuade the pope to allow him to resolve the issue in England. When the final failure of this effort became apparent, Wolsey was stripped of his offices; after negotiating unofficially with foreign powers he only escaped treason charges by his own death (1530).

Henry was now adrift among rival groups of advisers: some, like Thomas \*More, urged him to abandon the divorce and take back the queen; others carefully nurtured in him the belief that papal authority was, in any case, an illegitimate usurpation and might be rejected unilaterally. Henry subjected the English bishops and clergy to costly ritual humiliations, ostensibly because their support for Wolsey's legatine status had infringed English law; this tactic may have paved the way for forcing them to oppose papal authority. By May 1532 the king seems to have chosen an anti-papal solution to the marriage crisis, and several of his leading pro-Aragonese advisers resigned.

**4. The supremacy and the 'Henrician Reformation', 1533–1540.** The king's belief in his status as God's representative, supreme over all his subjects, now became a very potent political factor. It was exploited by a group of political theorists managed by the new rising minister, a former client of Wolsey, Thomas \*Cromwell (1485–1540). They devised an argument against papal authority which, unlike those advanced by the Lutherans in Germany, rested not on reformed theology but on a rewriting of the history of Anglo-papal relations. In the Act in Restraint of \*Appeals (24 Hen. VIII c. 12, 1533), the preamble enunciated Henry's claim to 'imperial' authority, without earthly superior, over clergy and laity alike; the text merely rejected appeals to Rome in matrimonial, testamentary, and other lawsuits. Henry secretly married \*Anne Boleyn in January 1533, and was formally separated from Catherine the following May. Having then been excommunicated by the pope, however, Henry's regime enacted further statutes up to 1536, which

cut all fiscal, legal, and spiritual ties to Rome and left the English church in schism.

The English church having now broken with the papacy, the question of its doctrine could not be evaded. Henry had a queen, Anne Boleyn, an archbishop of Canterbury, Thomas \*Cranmer, and a leading minister, Cromwell, all of whom were in varying degrees Lutheran sympathizers. Many others at court, however, were either zealous conservatives or, like one nobleman, boasted of never having read the Bible and never intending to. Henry's personal detestation of Luther, with whom he had exchanged polemics in the 1520s, and his horror of what he called 'sacramentarian' heresy made the two forms of emerging protestantism unacceptable, and left religious policy the plaything of factions. Nevertheless, enough innovations, both religious and fiscal, were introduced to enrage the population of the northern counties of England and bring about the complex of revolts known as the \*'Pilgrimage of Grace' in autumn 1536. The regime survived these by biding its time and retaining the loyalty of the nobility and the south. Up to 1537 Henry accepted and endorsed cautious moves, disguised as 'humanist' purifications of religion, to abolish parts of the old cult. An official English Bible was authorized in 1538 and issued in 1539. However, the Act of \*Six Articles of 1539 marked a reaffirmation of certain traditional shibboleths and a hunt for 'heretics'. Meanwhile, and without overt religious logic, the regime plundered the church, taxing the seculars heavily while abolishing the regular orders entirely and confiscating their wealth (1536–40).

Instability in official doctrine was matched by increasingly sanguinary feuds at court. In May 1536, after the birth of a daughter (the future Elizabeth I) and a miscarriage, the temperamental Anne Boleyn, with her brother and several of her attendants, were executed for alleged acts of treasonable adultery, which varied from the implausible to the impossible. By the end of the month the king had married \*Jane Seymour, who bore him his only son, the future Edward VI, on 12 October 1537 and died twelve days afterwards. Cromwell, having disposed of religious and political opponents of the supremacy, embarked on legal purges of those families he regarded as suspect or a threat, notably the Poles and Courtenays. Court rivalry and religious instability combined in the king's search for a fourth wife. Despite the reactionary strain then evident in religious policy, Henry was cajoled into a marriage-contract with \*Anne, sister of the duke of Cleves, a reforming sympathizer. Henry accepted her on the strength of a flattering portrait, and married her, with already too evident distaste, on 6 January 1540. Thomas Cromwell survived this disastrous marriage for a few months, but when he tried a pre-emptive strike against several conservatives, he was swiftly attainted of treason and executed.

**5. The years of faction and failing powers.** Henry seems to have regretted the execution of Cromwell soon afterwards, and thereafter no minister wielded the same sort of authority. Government became more 'conciliar': the Privy Council, adumbrated as early as 1536 and filled with opponents of Cromwell, began to work more effectively as an executive

cabinet from 1540. In his final years the king became more unpredictable and vulnerable. \*Catherine Howard, niece of the duke of Norfolk, whom Henry had married on the day of Cromwell's execution, proved unfaithful and indiscreet. Her fall and execution on 13 February 1542 left the king devastated. He threw himself once more into diplomacy and war. A successful campaign in 1542 by Lord Wharton in Scotland left Scotland's army broken and accelerated the death of its king; but Henry did not follow up the victory. Instead he made fresh overtures to Charles V and in June 1544 invaded France again, capturing Boulogne at huge cost shortly before Charles V made a separate peace with Francis I. A retaliatory attack by the French on the south coast in 1545 saw an embarrassing spectacle when the second largest ship in the fleet, the \**Mary Rose*, sank spontaneously before the king's eyes; but a reasonable peace was made in 1546. In these final years Henry wavered between a campaign against 'heresy', which reached peaks in 1543 (when it threatened Cranmer) and 1546 (when it briefly threatened Henry's last queen, \*Catherine Parr), and periods when Henry allowed Cranmer to embark on cautious, partial reform of the so far barely altered old liturgy. In the dying months of the reign the reformers, led by the earl of Hertford (\*Somerset) and the Seymour family, secured the near-total defeat of the conservative Howards; the duke of \*Norfolk was awaiting execution when the king himself died on 28 January 1547. The education of the young Edward VI had been committed to reforming humanist tutors, so the old king's conservative legacy would not last into the new reign.

**6. Assessment.** Few kings of England set so consciously to glorify the style and splendour of the monarchy. Henry was the first to be addressed as 'Majesty' and the first defender of the faith and supreme head of the church. He presided over a spectacular court and built \*Nonsuch palace in Surrey in 'the highest point of ostentation'. He had great athletic strength, a real talent for music, and an enthusiasm for theology (although his tendency to regard doctrines as unconnected building-blocks led to confusion and inconsistency). He enjoyed the windfall of the largely unchallenged plunder of the church and the service of talented and energetic ministers. In this light, the overwhelming impression is of advantages squandered. He came to the throne rich and bequeathed debts, a corrupt coinage, and roaring inflation; much of the newly acquired land was sold to the gentry and aristocracy by his death. Few monarchs before and none after were so ready to listen to, or to concoct, spurious charges of treason to get rid of unhelpful ministers or discarded wives. He showed little sign of that gift for managing the squabbles of courtier-politicians displayed by his daughter Elizabeth. His impact on the history of his time was colossal; yet nearly every part of his legacy was either disowned or significantly reinvented under his successors. EC  
Scarisbrick, J., *Henry VIII* (1968); Smith, L. B., *Henry VIII: The Mask of Royalty* (1971); Starkey, D., *The Reign of Henry VIII* (1985).

**Henry, prince of Wales** (1594–1612). Eldest son of James VI and I and Anne of Denmark, born at Stirling but immediately entrusted to the earl of Mar's guardianship. Following

## Henry

his father to England in June 1603, he impressed the crowds by his fine horsemanship and erect bearing. He had absorbed the precepts laid down in his father's *Basilikon doron*, which not only stressed the patriarchal nature of kingship but encouraged self-restraint and modesty, only to find himself critical of its author's own behaviour. His promise and popularity, despite an element of priggishness, occasioned jealousy in James; championship of \*Raleigh, dislike of the royal favourite \*Carr, and naval and military interests further increased tension. Marriage plans were overtaken by his sudden death from typhoid fever, leaving his less-gifted brother Charles as heir. Though he has been seen as the hope of England, this is mere speculation. ASH

**Henry, the Young King** (1155–83), was the eldest surviving son of Henry II and \*Eleanor of Aquitaine. At Montmirail (Maine) in January 1169 Henry II announced his intentions for the division of his vast dominions, the Young Henry, as eldest son, to receive England, Normandy, and Anjou, Henry II's own inheritance. In May 1170 the young king was duly crowned joint king of England, but like his brothers remained essentially powerless since Henry II had no intention of abdicating, and would not hand over territory or power until his sons had proved themselves worthy. Young Henry, though, was ever feckless and irresponsible, concerned to cut a fine chivalric figure but utterly uninterested in the serious business of government. This, combined with his father's very close monitoring of his activities and purse, led Young Henry into revolt in 1173. Relations between father and son never fully recovered thereafter and he rebelled again in 1183, shortly before his death. SL

**Henry of Blois** (d. 1171). Prince-bishop of the English church. Nephew of Henry I, he was made abbot of Glastonbury in 1126 and bishop of Winchester in 1129; by holding on to both he remained for over 40 years the richest prelate in England. Although brought up as a monk at Cluny, he became a great builder of castles and palaces (notably Wolvesey palace) and an art connoisseur who brought back pagan statues from Rome. Not surprisingly the ascetic St Bernard of Clairvaux branded him 'whore of Winchester' and 'old wizard'. In 1135 he helped his brother Stephen of Blois to obtain the throne and played a prominent political and military role throughout the reign. In 1139–43, when the conflict between Stephen and \*Matilda was at its height, he used his authority as papal legate to hold councils in unsuccessful but highly publicized attempts to settle the affairs of the realm. At Henry II's accession he withdrew for a while to Cluny, but returned as the elder statesman of the English church. JG

**Henry of Grosmont** (c.1300–61) was a cousin of Edward III and the king's right-hand man. His father was earl of Lancaster and Leicester. He was born in \*Grosmont, created earl of Derby in 1337, and succeeded his father as earl of Lancaster in 1345. In 1349 he was created earl of Lincoln and in 1351 duke of Lancaster. He was also created earl of Moray in Scotland in 1359. When the order of the \*Garter was instituted, he was next to the prince of Wales. Henry fought constantly against the French and the Scots and was

with the king at the naval victory of \*Sluys in 1340 and at the surrender of \*Calais in 1347. He was also much employed on diplomatic missions. His life was spent on campaigns, his reputation for chivalry widely recognized, and he was never tempted into treason or insurrection. His palace at the Savoy was sumptuous. He died at Leicester of the plague and was buried there in the presence of the king. His younger daughter and ultimate heir married \*John of Gaunt, for whom the dukedom of Lancaster was revived. JAC

**Henry Stewart.** See DARNLEY, LORD.

**Henryson, Robert** (d. ante 1505). Scottish poet. Very little is known of him, but he must have been born before 1450. He is usually said to have taught at the grammar school at Dunfermline abbey, and is probably the Robert Henryson recorded at Glasgow University in 1462. By 1478 he was a notary public at Dunfermline. His poetry was very popular with contemporaries, and by 1599 large quantities of his *Testament of Cresseid* had been printed in Scotland, and many manuscripts survive. In poems such as *Orpheus and Eurydice*, *The Fables*, and his finest poem, *Cresseid*, he blends medieval and humanist elements with great technical mastery. *The Lion and the Mouse* links a moral fable to a criticism of the kingship of James III—the lion a ruler who does not govern, the mice the 'commonty' who as a result rebel. He is now recognized as one of Scotland's finest poets. RJT

**Hepplewhite, George** (d. 1786). Cabinet-maker and furniture designer, Hepplewhite linked the ornate style of \*Chippendale and the severer lines of \*Sheraton. He was apprenticed to Robert Gillow of Lancaster, then opened a business in London about 1760. Little of his life is known and none of his furniture survives. No great innovator, more practical than novel, Hepplewhite adapted the designs of others, particularly Robert \*Adam, to suit both cabinet-maker and customer. His reputation rests with *The Cabinet-Maker and Upholsterer's Guide* published two years after his death. This catalogue, with 300 illustrations, which Sheraton said had 'already caught the decline', aimed to provide designs 'of every article of household furniture in the newest and most approved taste'. Hepplewhite is most associated with pierced and shield-back chairs often with wheels, lyres, or Prince of Wales feathers, and painted or japanned work of gold on black. JC

**heptarchy.** The description of 7th-cent. England as a 'heptarchy' probably derives, ultimately, from the historian Henry of Huntingdon, writing in the earlier 12th cent. It came into printed prominence in the works of historians of the late 16th and early 17th cents., beginning, probably, in Lambard's work on Kent (1576). The idea was that there were seven kingdoms, Northumbria, Mercia, East Anglia, Essex, Kent, Sussex, and Wessex. Reality was more complicated. But the formulation was a useful one and had a long life as a term of art. JCa

**heraldry.** The use of personal distinguishing marks on shields and banners seems to have developed in England and Scotland in the second half of the 12th cent. and in Wales in the 13th cent., initially as a way of telling men

apart in battle and tournament. Such devices rapidly became consistent and hereditary, and were used in a wide range of contexts, such as seals, surcoats, architectural features, and stained glass. The original purpose of identification was never lost, but the bearing of arms developed a further, social significance in denoting those of noble or gentle birth and status; by the later Middle Ages merchants and men who had never seen military service had coats of arms. By the mid-13th cent. armorial bearings had developed complex systems of description—preserving the (by then) rather archaic forms of Anglo-Norman French—and of differencing (i.e. modification in design to denote a family or feudal relationship), cadency (i.e. to distinguish younger sons), and marshalling (i.e. combining arms, often as a result of marriage). Such a complicated and socially sensitive subject required increasing scrutiny; this was provided by heralds, who make their first official appearance in English royal records under Edward I. Their duties expanded and became more fully defined over the course of the next two centuries. The office of Lord Lyon in Scotland appears in 1318, and that of Garter king-of-arms in 1417, with the full incorporation of the \*College of Arms by Richard III in 1484. Tudor and Stuart heralds embarked upon visitations of counties 'to remove all false arms', and 'to take note of descents'. Arms are still granted today by the College of Arms (for England, Wales, and Northern Ireland), and by Lord Lyon Court (for Scotland). See also GENEALOGY. AC

**Herbert, Arthur** (1647–1716). Created earl of Torrington by William III in June 1689, following an indecisive action with French transports in Bantry Bay, south-west Ireland, Herbert is a controversial if not disreputable figure in English naval history. A member of the Pembroke family, he early saw service in the third Dutch War and then the Mediterranean, where from 1680 he served as a flag officer, having lost an eye in action with Algerine corsairs. He was vigorously attacked for the extensiveness of his illicit trading at Tangier 1680–3, but back home in 1685 James II appointed him master of the robes. In March 1687 he refused to support James II's suspending of the Test Act, and so became ranked with the king's opponents, in June 1688 personally carrying to Holland the invitation to William to intervene in the nation's affairs. He commanded the Dutch invasion fleet, and became 1st lord of the Admiralty in February 1689. In June 1690 Torrington commanded an outnumbered Anglo-Dutch fleet off \*Beachy Head in an engagement with the French, which saw the Dutch badly mauled. His court-martial for a tactical withdrawal of his fleet to the Gunfleet Sand off Essex led to his acquittal, but he never served again. DDA

**Herbert, Edward, 1st Baron Herbert** (1583–1648). Herbert was of a younger branch of the earls of Pembroke which had settled in Montgomery castle. After attending University College, Oxford, he was knighted at the coronation of James I in 1603. From 1619 to 1624 he served as ambassador in Paris and was given an Irish barony, followed by an English one in 1629. He waited in vain for further employment and during the Civil War kept a low profile at Montgomery. He made no resistance when parliamentary troops occupied the castle

in 1644, being anxious to preserve his books. Herbert's many publications include *De veritate* (1624), an early deist exposition, and an admiring *Life of Henry VIII* (1649). But he is best known for his *Autobiography*, first published by Horace \*Walpole in 1764. Herbert was not inhibited by false modesty and pays warm tribute to his own valour, appearance ('I could tell how much my person was commended'), irresistible sex appeal, and good breath. George Saintsbury, a strong-minded critic, dismissed him as 'not a very bad poet, a very great coxcomb, and a hero chiefly by his own report'. He was the elder brother of George \*Herbert. JAC

**Herbert, George** (1593–1633). Poet. Younger brother of Edward \*Herbert, grounded in classics at Westminster School, then graduate of Trinity College, Cambridge, Herbert successfully sought the post of university orator (held 1620–7) as a preliminary to public service. But by 1625 his 'Court-hopes' had faded with his patrons' deaths, so, ill-health increasingly recurrent, he abandoned ambition and turned to the church, finally being ordained in 1630 and inducted at Bemerton, near Salisbury. Additionally chaplain to Lord Pembroke, he became friends with Nicholas Ferrar at Little Gidding and, with saint-like devotion, concentrated his remaining few years on the parish and church repair—'Holy Mr Herbert' was a contemporary assessment. Herbert is best known for his sacred poetry (*The Temple*, posthumously 1633), portraying his spiritual conflicts, but so well crafted and full of simple dignity that he not only influenced others like \*Crashaw and \*Vaughan but is now regarded as a major metaphysical poet. ASH

**Herbert, Sidney, 1st Baron Herbert of Lea** (1810–61). Politician. Herbert was educated at Harrow and Oxford. He entered the Commons as a Conservative in 1832, being in office in 1834–5 and 1841–6. In 1845–6 and 1852–5 he was secretary of war, being less blamed than others by the Roebuck Commission of 1855 for the poor organization of the army during the Crimean War, during which he supported Florence \*Nightingale's nursing reforms. He returned to the War Office in 1859 and began an energetic programme of reform; overwork and Bright's disease caused his early death. He was talked of as a future prime minister, Lord Houghton saying of him, 'He was just the man to rule England: birth, wealth, grace, tact and not too much principle.' HCGM

**Herbert, William, 3rd earl of Pembroke** (1580–1630). Herbert succeeded to the earldom at the age of 21 in 1601. He was under a cloud at Elizabeth's court for getting Mary Fitton, one of the maids of honour, pregnant. He fared better with James I, was awarded the Garter in 1603, and from 1615 served as lord chamberlain. In 1626 he became lord steward. He was often at odds with royal policy and on bad terms with \*Buckingham, favourite to both James I and Charles I. Nevertheless, his wealth and amiability gave him standing, he was chancellor of the University of Oxford, and Pembroke College was refounded in his honour. A patron of authors, including \*Donne, \*Jonson, and \*Shakespeare, the attempt to identify him with the W.H. of the

## Hereford

sonnets is implausible. \*Clarendon praised him as 'the most universally loved and esteemed of any man of that age', while admitting that Pembroke was 'immoderately given up to women'. JAC

**Hereford, diocese of.** Around 679 \*Theodore created the bishopric, conterminous with Herefordshire and south Shropshire, for the \*Magonsaetan tribe, out of the Mercian see. Despite the Danish invasions its westerly position enabled it to maintain continuity of bishops. Hereford was, by contrast, vulnerable to the Welsh, who sacked the cathedral in 1055 and killed the bishop, Leofgar. William I strengthened the region's defences by making it (until 1076) a Norman palatine earldom. Notable bishops include Thomas de Cantilupe (1275–82), canonized in 1320, chancellor of England during baronial rule in 1265 and adviser to Edward I; Herbert Croft (1662–91), stabilizer of the see after the Restoration; and James Beauclerk (1746–87), Charles II's aristocratic grandson, a conscientious 18th-cent. bishop. The cathedral, dedicated jointly to the Virgin Mary and Æthelbert, the martyred East Anglian king (753), is mostly Norman and its 15th-cent. College of Vicars is still intact. There are many fine Norman churches on the borders of Wales. The diocese was famed liturgically for 'the Hereford use' which rivalled Sarum before the Reformation. In 1716/17 Thomas Bisse, brother of Philip Bisse (bishop 1713–21), founded the \*Three Choirs Festival (with Worcester and Gloucester). WMM

**Hereford and Worcester.** This was a new county, formed under the Local Government Act of 1972. It included the county borough of Worcester, the old county of Hereford, and all of Worcestershire, save for Dudley, Halesowen, and Stourbridge, hived off to West Midlands. There was considerable opposition from Herefordshire, the smaller of the counties, complaining that it had little in common with the industrialized parts of north Worcestershire. A Hereford bull was paraded in Whitehall in protest. The debate turned largely on the extent to which the Malverns formed a natural barrier. But in accordance with the Banham commission recommendation of 1994 the two counties were separated once more in 1998. JAC

**Herefordshire** is a small border county, full of castles, running from the Black Mountains in the west to the Malverns in the east. Hereford itself was for centuries a stronghold against the Welsh, holding the crossing of the Wye, not far from its junction with the Frome and the Lugg. The name denotes an army-ford. Almost all the towns were on the east side, out of reach of the Welsh—Hereford, Leominster, Bromyard, Ross, Ledbury: in the western part is only Kington, 4 miles from the Radnorshire border, and with a population of no more than 2,000.

In the pre-Roman period, Herefordshire was part of the territory of the \*Silures, to whom \*Caratacus appealed in his fight against the Romans. In the mid-7th cent., it fell to \*Penda, pagan king of the Mercians. Soon after his death in battle, Hereford was founded as a diocese (676). A hundred years later Offa's Dike marked the limit of Mercian expan-

sion, running through the west of the county from Kington, through Hay, to White Castle.

In the reign of \*Athelstan Welsh princes did homage at Hereford, but the next 500 years were turbulent. Hereford itself was sacked by \*Gruffydd ap Llywelyn in 1055 and the new cathedral destroyed. The next bishop of Hereford was a fighting man, Leofgar, who, according to the *Anglo-Saxon Chronicle*, 'after his consecration, forsook his chrism and his cross, his spiritual weapons, and seized his spear and his sword, and thus armed joined the levies against Gruffydd, the Welsh king'. But Leofgar lasted a mere eleven weeks before he was slain. The Normans took the border in hand. William \*Fitzosbern was given palatine status as earl of Hereford and began the building of a formidable castle there—'one of the fairest, largest and strongest in all England', according to \*Leland. Even so, the county remained vulnerable. It was only just held against \*Llywelyn the Great in the early 13th cent. and threatened again by \*Glyndŵr in the early 15th.

Tudor rule brought peace to the county. \*Camden's *Britannia* in 1586 described Herefordshire as 'of an excellent soil, both for feeding cattle and produce of corn'. His account of the Golden Valley in the west was idyllic: 'the hills that encompass it on both sides are clothed with woods, under the woods lie corn-fields on each hand, and under those fields, lovely and gallant meadows. In the middle, between them, glides a clear and crystal river.' Edmund \*Gibson, editing Camden in 1695, drew attention to the 'vast quantities of cider, as not only serve their own families, for 'tis their general drink, but also to furnish London and other parts of England; their Red Streak, (from a sort of apple they call so), being extremely valued.'

The county saw yet more fighting during the Civil War. The line of communication was important since the king drew heavily upon Wales for recruitment. The shire was royalist in sympathy but harassed in the south by parliamentary troops from Gloucester, and in the north by forays from Bryan Brampton, the Harley estate. Hereford changed hands several times, stood a siege from the Scots in 1645, and was a centre of \*club-men activity.

The industrial revolution touched Herefordshire lightly and it remains a quiet rural county. In the local government reorganization of 1972, Herefordshire, the fourth smallest county in population, was merged, despite much protest, with its larger eastern neighbour, Worcestershire. But the forced union was abandoned on 1 April 1998 and Herefordshire reconstituted as a unitary authority. JAC

**heresy** is the holding of religious views regarded or defined as unacceptable by the church and, if persisted in, carried the punishment of burning. The first notable British heretics were \*Pelagius and Celestius, who taught in Rome in the early 5th cent., and argued, against Augustine, that man's own efforts could steer him towards salvation. Condemned by Pope Innocent I, pelagianism continued to find support in Britain and St \*Germanus was sent over in 429 specifically to deal with it. Accusations of heresy were rarely made against lay people, who neither preached nor published, and whose grasp of Christian doctrine was often, as their

pastors complained, distressingly approximate. The assumption was that they were ignorant of the truth and seldom persisted in error when it was pointed out to them. Heresy was hardly a problem in the Anglo-Saxon church or in the immediate post-Conquest period, and only a handful of cases can be identified. Nevertheless the church remained on its guard. A group of weavers, possibly Cathars, arrived in 1165 from Flanders or Germany and settled in Worcester: they were branded and not allowed to remain. Concern over heresy dates from \*Wyclif's challenge to the doctrine of transubstantiation and his attacks upon the wealth of the church, which, coming in the 1370s at a time of economic unrest, gained him considerable support. Though Henry IV's act *\*De heretico comburendo* passed in 1401 it was only after Oldcastle's \*lollard rebellion in 1414 that systematic persecution of heresy began. In Scotland, James Resby, a follower of Wyclif, was burned at Perth in 1407, and a Hussite at St Andrews in 1432. There was a marked revival of lollardy in the late 15th and early 16th cents., which merged with the Lutheran heresy. Henry VIII repealed *De heretico comburendo* in 1533 but retained the right to burn heretics. Edward VI then repealed all statutes against heresy, though it remained an offence at common law. Mary at once revived the previous statutes and Elizabeth abolished them again in 1558. \*Anabaptists continued to suffer since they were regarded as totally subversive of the social order, James ordering a burning in 1612. In Scotland the laws against heresy were repealed by the Reformation Parliament of 1560. In Charles II's reign, an Act of 1677 abolished the writ *De heretico comburendo*, but reiterated the right of ecclesiastical courts to punish heresy, short of death.

Though persecution of laymen for heresy ceased, the careers of clerics and academics (in holy orders) could still be jeopardized by charges of heresy, and the offence of \*blasphemy remained dangerous. James Nayler, a quaker, was whipped, branded, and had his tongue bored for blasphemy in 1656/7, and Thomas Aikenhead, a mere youth, was executed in Edinburgh in 1697. William Whiston, Newton's successor at Cambridge, was deprived of his chair in 1710 for arianism; John Simon, professor of divinity at Glasgow, was suspended in 1729 on the same charge; Thomas Woolston, a fellow of Sidney Sussex College, Cambridge, lost his fellowship in 1721, was prosecuted for blasphemy in 1729, and died in prison. Later prosecutions included the publishers of \*Paine's *The Age of Reason* (1797, 1812, 1819), the publisher of \*Shelley's *Queen Mab* (1821), and George \*Holyoake for a lecture (1842). In 1977 Mary Whitehouse brought a successful private action against *Gay News* for printing a poem portraying Christ as a homosexual. Existing legislation against blasphemy protects Christianity only and there has been pressure to extend it to cover Islam and other religions. JAC

**Hereward** (11th cent.), known as 'the Wake' ('the watchful one') was the leading figure in the fenland revolt against William the Conqueror. In 1070, the appearance of a Danish fleet in the waters of Ely raised hopes of resistance among Englishmen of that district, many of whom had Danish blood. Hereward, leading a band of outlaws and Danish

allies, sacked and plundered the monastery at Peterborough, but soon afterwards the Danes agreed terms with William and sailed away. Hereward was joined by other English leaders and their men in the defence of the Isle of Ely. In 1071 William attacked with ships, constructing a causeway for his main force. The outlaw's deeds are legendary. The alleged treachery of the abbot and monks of Ely after William seized monastic lands is blamed for the ultimate surrender. Hereward escaped by water, after which nothing certain is known of him, although there are legends of subsequent adventures. His fame is as a symbol of English resistance to Norman oppression. AM

**heriot** is derived from the Anglo-Saxon word for 'war-gear' (in Scotland, *hereyeld*). This was a feudal obligation due to a lord on the death of a tenant. Originally the tenant's heir returned armour and weapons lent to him, but it developed into a claim by the lord to the best beast or chattel, and even more. It was, in effect, a kind of death duty, though its incidence varied widely. By the 14th cent. it was becoming common for the heriot to be commuted to a money payment. JAC

**Heriot, George** (1563–1624). Heriot was a prosperous Edinburgh goldsmith who became jeweller to James VI and goldsmith to the queen. He moved down to London after the king and advanced large loans to the royal couple. Impressed by the success of Christ's Hospital in London, Heriot left the bulk of his fortune to establish a school in Edinburgh, to be administered by the town council. The school opened in 1659. As 'Jingling Geordie' he appears in Scott's *The Fortunes of Nigel* and he is also commemorated in Heriot-Watt University. JAC

**heritable jurisdictions.** In the Scottish legal system before 1747, many of the king's subjects were not under the jurisdiction of royal courts either at local or at central level. Instead, they were answerable to a complex of hereditary or franchise jurisdictions in the hands of the feudal nobility. The basic heritable jurisdiction was the barony, which was universal. Towns could be burghs of barony under a feudal superior. Though there was an appeal from the barony to the royal sheriff court, this was not true of baronies in the regalities. These units, some as small as a town, some like Argyll 500 square miles in extent, were autonomous jurisdictions with their own supreme courts. High treason alone justified royal intervention.

Though resented by the crown, the system provided cheap, quick local justice, as its extensive records show. It was abolished after the 1745 \*Jacobite rising by the Heritable Jurisdictions (Scotland) Act of 1747. Compensation was paid. Only baron courts survived though with curtailed powers. BPL

**Herrick, Robert** (1591–1674). Poet. Son of a Cheapside goldsmith, initially apprenticed to the trade but graduating at Cambridge (1617), Herrick was ordained in 1623. He returned to London and, in contact with other writers (especially Ben \*Jonson), musicians, and court wits, established himself as a poet. After accompanying the duke of \*Buckingham to La Rochelle (1627), he was admitted to the living of Dean Prior

## Herrings

(Devon), where he spent most of the rest of his life. As an Anglican with strong royalist sympathies, he was ejected from the living in 1647 (retiring happily to Westminster) but was restored in 1662. Herrick's poetry was widely appreciated, appeared in miscellanies, and was set to music. From epigrams to epithalamions, though influenced by English folklore and covering a wide range of subjects, it was carefully polished yet retained much charm. A collected edition of his poems was published as *Hesperides* (1648). ASH

**Herrings, battle of the**, 1429. In October 1428 the duke of \*Bedford invested Orléans. On 12 February 1429 Sir John Fastolf, bringing supplies of herrings and lentils to the besiegers, was attacked at Rouvray by a superior force under the comte de Clermont. The attackers were driven off with heavy loss and the supplies got through, but Orléans was relieved by Joan of Arc in April. JAC

**Herschel, John** (1792–1871). The most eminent physicist of early Victorian Britain. His father \*William was a famous astronomer, and John went to Cambridge where with Charles \*Babbage he reformed the mathematics course. After toying with law, he turned to physics, working on optics as the new wave theory was coming in, and to astronomy. In 1830, he just failed to be elected president of the \*Royal Society, and published his *Preliminary Discourse on the Study of Natural Philosophy*, an extremely influential account of scientific method. In 1833 he sailed to the Cape to observe the southern stars (results published 1847). He became a great pundit, widely consulted and involved in numerous scientific projects: he is remembered as a pioneer in \*photography, and also in geophysics; for editing the admiralty *Manual of Scientific Enquiry* (1850); and for his essays and poems. DK

**Herschel, William** (1738–1822). An astronomer, he added the planet Uranus to the list known since antiquity. He came to England from Hanover as a musician, and in 1766 became an organist in Bath. Taking to astronomy, he made his own reflecting telescope: with it in 1781 he saw the planet, which he had at first thought a comet. He named it *Georgium Sidus*, after George III who, as Galileo's patron had done in similar circumstances, duly appointed him court astronomer. He inferred that the sun was moving with respect to the fixed stars; found that some double stars were orbiting each other under gravity; and, helped by his sister Caroline, estimated the form of our galaxy, the Milky Way. DK

**Herstmonceux castle** (Sussex) was built mid-15th cent. by Sir Roger de Fiennes. Despite moat, battlements, and turrets, it was a defensible country home rather than a strong castle. One of the largest houses of its time, the stately, rose-hued Herstmonceux was an early and fine example of brickwork, a novel building material in England then. Neglected for some years, parts were dismantled in 1777. The castle remained a ruin until 1913 when some work was done, then extensive restoration undertaken by Sir Paul Latham in 1933, with the architect Walter Godfrey. The only radical change made was to have one large courtyard instead of four of differing sizes. The Royal Observatory in 1948 moved from Greenwich to Herstmonceux where it remained for some forty years. AM

**Hertford, Synod of**, 672. Convened by \*Theodore, archbishop of Canterbury, to reorganize the church following the Synod of \*Whitby (664), when Celtic Christianity gave way to Roman traditions, the synod was the first general assembly representing the whole English church. The Roman dating of Easter was affirmed. The precedence of one bishop over another was determined by seniority of consecration. Bishops' activities were confined to their own dioceses and monasteries exempted from episcopal interference. Monks and clergy were forbidden to travel without permission from their superiors. Pronouncements on marriage included the forbidding of incest and divorce, except for adultery. Theodore wanted to increase the number of bishops, dividing the larger dioceses, but as no decision was reached, he was doubtless opposed. It was agreed that annual meetings would take place at the unidentified Clofesho. AM

**Hertfordshire**, though a small county, has little geographical unity. The southern parts are within the orbit of London and discharge commuters into Euston, St Pancras, King's Cross, and Liverpool Street. The north retains quiet spots like Gaddesden in the west and Wyddial in the east. The magnetic attraction of London has meant that, since Roman times, communications have run north–south, with \*Akeman Street, \*Watling Street, and \*Ermine Street as the main thoroughfares. East–west communications have always been difficult. The \*Icknield Way, the great pre-Roman route, is too far north to unite the shire. Even today it is doubtful how often people from Tring find themselves in Bishop's Stortford, save to play football.

The divisions within the county run deep within its natural and political history. It consists of two river basins, with the natural watershed forming the northern boundary. The Lea rises just outside the county near Luton and leaves it in the south-east to join the Thames near Blackwall Tunnel: with its tributaries the Mimram, Beane, Rib, Ash, and Stort, it drains the eastern half. The western parts drain into the Ver, Colne, Chess, and Gade, which meet near Watford and join the Thames at Staines. The north-west of the county, adjoining the Chilterns, is gentle, wooded chalk country; the north-east is downland and bare wide fields; the south-east is flat clay, running down to desolate marshes at Cheshunt, bordering Essex.

In the immediate pre-Roman period, the area was part of the territory of the \*Catuvellauni, whose chief, \*Cassivellaunus, opposed Caesar's expeditions. His grandson \*Cunobelinus seems to have moved his capital from \*Verulamium, near St Albans, to Colchester, ruling over the \*Trinovantes. \*Caratacus, his son, led a protracted resistance to the Roman invasion of AD 43, was driven west, captured, and died a prisoner in Rome. The area was soon brought under Roman control, but Colchester, Verulamium, and London were all sacked during \*Boudicca's revolt of AD 61. Braughing is on the site of a Roman settlement of some importance.

The area was one of the earliest to be occupied by the Saxons and formed at first part of the diocese of London, established in the early 7th cent. to minister to the East Saxons. There was subsequently an ecclesiastical reorganiza-

tion since, until the foundation of the new diocese of St Albans in 1877, most of Hertfordshire was in the vast diocese of Lincoln, only the eastern part staying with London. In the 8th cent. the region formed part of the kingdom of Mercia, and \*Offa is said to have died in 796 while building the great abbey on the site of St Alban's martyrdom. In the 9th and 10th cents., Danes and Saxons fought for control. The boundary between the territories of \*Alfred of Wessex and \*Guthrum was settled by the treaty of \*Wedmore in 878 as the line of the river Lea. The truce was temporary, for in 896 the Danes are reported to have sailed up the Lea to near Ware and to have been stranded when Alfred ordered ditches to be dug to drain the stream. \*Edward the Elder, in his counter-attack in 913, fortified Hertford as a strong point and it became the nucleus of the emerging county. The first reference to Hertfordshire by name is in the *Anglo-Saxon Chronicle* for AD 1011 and by the time of the \*Domesday survey it had been divided up into 8½ hundreds. In the 13th cent. Hertford and St Albans established their right to parliamentary representation and were joined, on and off, by Bishop's Stortford and Berkhamsted. In 1586 Camden admired the county enormously: it was 'well furnished with corn-fields, pasture-ground, meadows, little woods and small, but very clear, streams'. Hertford, slightly off centre, never dominated the shire as some county towns did, and a considerable number of small market towns grew up, serving their immediate locality—Ashwell, Buntingford, Royston, Baldock, Hitchin, and Hoddesdon. St Albans was always bigger than Hertford and when the first county council was set up in 1889, it met alternately in the two towns.

The modern history of Hertfordshire is one of slow encroachment by London, \*Cobbett's 'Great Wen'. The pull of London had been felt from the earliest days, particularly in the south-east, where the river Lea gave easy access to east London. Efforts to improve the river began centuries before the river Lea navigation was completed. Competition was fierce. Neighbours, who depended on sending corn and malt to London by cart, smashed banks and destroyed locks on the river, as well as hinting that barge cargoes picked up moisture and weighed heavily. Hertford and Ware had a long-standing feud, with the Ware men stringing barges across the river to stop Hertford traffic. In the west of the county, the opening in 1800 of the Grand Junction canal, through Tring and Rickmansworth, assisted the growth of industry, especially paper-making and printing. Yet despite these developments, the county remained rural until late. There were plenty of open fields surviving well into Victoria's reign, estates in the county were much sought after by gentlemen with business in London, and tributes to the beauty of the shire continued to pour in. Charles Lamb, in a famous essay, sang the delights of 'Mackerye End in Hertfordshire'. In 1801 no town in the county had as many as 4,000 inhabitants. By 1851, though Hertford had scarcely grown at all, St Albans was over 8,000, Hitchin and Hemel Hempstead over 7,000, and Watford over 6,000.

But by 1901 the shape of the 20th cent. was becoming clear. Watford had increased to 32,000, twice the size of the next town, St Albans; and Cheshunt (12,000) and Barnet (7,000), on the fringes of London, had moved up. Two years

later, a development which cast a long shadow, took place. The first garden city was started on a 4,000-acre site at Letchworth, chosen in the main for its nearness to London. It was joined after the First World War by the second garden city at Welwyn. In the first half of the 20th cent. the county population increase was five times the national average. The success of the garden cities prompted governments to look to Hertfordshire for sites for the new towns. Stevenage was the first to be set up after the Second World War, followed by Hatfield and Hemel Hempstead, and Welwyn was taken over as a new town. Whatever the merits of new towns as such, the effect upon a small county of five in such close proximity was predictable. Increasingly it is reduced to quiet pockets and enclaves. Within the network of motorways and junctions, fragments of an old county survive. But few of the motorists using the M25 between junctions 24 and 25 have time to reflect that, beneath them, is the estate of Theobalds, where James I once nearly drowned in Sir Hugh Myddleton's \*New River. In the local government reorganization of the 1990s, Hertfordshire retained its county status. JAC

**Hervey, John, Lord** (1696–1743). The second son of the 1st earl of Bristol, Hervey was elected to represent Bury St Edmunds (1723), supported Walpole, and was rewarded with the posts of vice-chamberlain and privy counsellor. His quarrel with \*Pulteney, formerly a friend but prominent in opposition, led to a duel. A favoured companion of Queen \*Caroline, Hervey had considerable influence at the court of George II, where life and intrigue furnished ready material for his cynical and witty *Memoirs*, a superb and sustained piece of writing. His epicene beauty and use of cosmetics to cover hypochondriacal pallor prompted \*Pope's spiteful brilliance of 'Let Sporus tremble'. Hervey, a fluent writer, skilled pamphleteer, and more than useful debater, was elevated to the House of Lords in his father's barony in 1733 to strengthen Walpole's position after the Excise crisis. He was briefly lord privy seal 1740–2. ASH

**Heseltine, Michael** (b. 1933). Conservative politician. Heseltine entered politics after making his fortune in publishing. He believes in a combination of entrepreneurial enterprise and partnership between government and industry. As environment secretary (1979–83) he pioneered the sale of council houses, rate-capping of local authorities, and development corporations to regenerate inner cities. Popular with party grass roots and noted for his rousing conference speeches, Heseltine was never fully trusted by Mrs \*Thatcher. In January 1986 he walked out of cabinet, resigning as defence secretary (1983–6), over the fate of the Westland Helicopter Company. In November 1990 Heseltine precipitated Thatcher's retirement in a leadership challenge. His own ambition to be prime minister was thwarted by losing to John \*Major in the second ballot. For his loyalty to Major in the 1995 July leadership contest he was created deputy prime minister and 1st secretary of state. He gave up his seat for Henley in 2001 and became a life peer. RAS

**Hexham, battle of**, 1464. The duke of Somerset, campaigning on behalf of Henry VI, was defeated at \*Hedgeley

## Hexham

Moor in April 1464, but rallied his forces at Hexham the following month. They were trapped by Montagu, \*Warwick's younger brother, and cut to pieces on 15 May, 3 miles south of the town near West Dipton wood. Somerset was executed after the battle. JAC

**Hexham, diocese of.** The see was created in 678 for part of Northumbria. \*Theodore unsuccessfully tried to persuade \*Cuthbert to be bishop, who, though consecrated, refused. The most notable bishop was St John of Beverley (686–705; York 705–18). The bishopric collapsed under the Danish invasions (c.821) and was not revived. WMM

**Hexham abbey** was founded around 673 by St \*Wilfrid in Northumberland on land granted to him by Queen Æthelthryth. It was created a bishopric in 678 but after 821 the see was merged with \*Lindisfarne. In 875 the abbey was burned by the Danes and its inhabitants dispersed. In 1113 Archbishop Thomas II of York reconstituted the church as a priory of Augustinian canons. The abbey is noted for its Early English choir, the crypt and the night stair in the south transept, a broad flight of steps leading to the dormitory, used by monks attending night services. RAS

**hides.** The difficult study of the 'hide' is essential for understanding the history of the English state and, by connection and analogy, that of much of western Europe. In \*Domesday Book (1086), every village and estate in southern and western England is assessed in terms of hides. (In large areas of the north and east the corresponding unit was the 'carucate'.) The system of assessment was comprehensive, related to the levy of tax and military and naval service, and elaborately patterned. It was normal, in some shires, for almost every village to be assessed at 5 hides. In others, somewhat larger areas were assessed at, say, 20 hides. The system was remarkable in its completeness and complexity, and was very old. The very earliest land grants, late 7th cent., denote the estates concerned in Latin terms which must be intended to translate the vernacular *hid*. The etymology of this word indicates a connection with the idea of a household. This is echoed in \*Bede's description of a land such as that of the southern Mercians as 'of seven thousand families'. The extensive use of hidation for such wide areas is demonstrated by the 'Tribal Hidage', which may be a tribute list of the 7th or the 8th cent. and gives hidages for some entire kingdoms, also for lesser areas. The Burghal Hidage (c.900), shows how hidage assessments were used to allocate responsibility for fortress maintenance. Domesday and related evidence indicate that there could be extensive revision of hidages. Hidage assessment determined national taxation for a period after the Conquest. By the 13th cent. its use was residual and local. The hide was essentially a unit of assessment. Its relationship to real area and value varied, though commonly there was one. In much of England the hide was reckoned as of 120 acres, in Wessex generally as of 40 or 48. JCa

**high church.** Within the Church of England, the high-church party stresses continuity with the pre-Reformation church and holds a 'high' concept of the authority of the church, bishops, and sacraments. Originating in the resist-

ance of certain churchmen to the protestantizing determination of Elizabethan and early Stuart puritanism, the term was first coined in the later 17th cent. High churchmen flourished under the later Stuarts because of their insistence on the \*divine right of kings. Despite successful political campaigns into the early 18th cent., they were doomed to disappear along with the \*Jacobite cause. Their theological and ecclesiastical opinions survived, to be rediscovered by the \*Oxford movement of the 1830s. Separated from the politics of succession, 19th-cent. high churchmanship emphasized the spiritual nature of the Church of England and its role in society. High-church influence on the Church of England encouraged a recovery of its intellectual life, especially the study of patristic and medieval history, liturgy, and ecclesiology. By the end of the 19th cent. high churchmanship was the dominant orthodoxy, despite court battles over the ritualist movement, which represented one aspect of it. Its success also contributed to bitter divisions between the high church or catholic grouping and the \*low church or \*evangelicals. JFC

**High Commission, Court of.** Known as such from c.1570, it emanated from earlier ecclesiastical commissions (after 1547), was given statutory authority (1559), reconstructed (1583), and exercised the ecclesiastical appellate and original jurisdiction of the crown as supreme governor. Originally a visitatorial commission supervising clerical discipline, it became a full-blown court for various lay offences, often political. Extensively used by \*Whitgift, \*Bancroft, and \*Laud, its inquisitorial methods, swift and secret in action, demanding the oath *ex officio* rather than trial by indictment and jury, were more efficient than diocesan courts and likened by \*Burghley to the Romish inquisition. Savagely attacked by \*Coke and 17th-cent. common lawyers, its powers were enhanced (1611). Feared and detested universally, its abolition with \*Star Chamber (1641) was not revoked (1661), though James II revived it briefly in modified form (1686–8), when it suspended Bishop \*Compton of London and imposed a catholic president on Magdalen College, Oxford. WMM

**high kings of Ireland.** See IRELAND, HIGH KINGS OF.

**Highland.** An administrative region of Scotland, created in 1973 from the counties of Caithness, Nairn, Sutherland, Inverness (except the Outer Hebrides), Ross and Cromarty (except Lewis), and a northern part of Argyll. Between 1973 and 1996 it was a region, sharing local government activities with its eight districts, but now exercises all local government functions. It is a very large and very sparsely populated area, of which large tracts are mountainous. Many parts of the region lost population through the 19th-cent. clearances, when agricultural communities were shifted to make way for sheep-farming. Most of the present population is in the eastern part of the region around Inverness, where there is small-scale manufacturing and food-processing, established particularly with the support of the local economic development agency. Farming by crofting is still significant in the north and west and the islands, and tourism for the whole region. CML

**Highland clearances** were evictions which eliminated the bulk of the Gaelic-speaking population from the Highlands and Islands of Scotland. Between 1763 and 1775 thousands of Highlanders migrated to colonial British North America motivated by resentment at higher rents and consolidation of farms, and led by tacksmen, former clan gentry who were leasees of land, but were being eliminated as unnecessary middlemen.

Next, large-scale sheep-farming came to the Highlands, based on the replacement of the small indigenous sheep by commercial breeds such as the black-faced Linton. With Lowland sheep came Lowland farmer-capitalists and often Lowland shepherds, though some former tacksmen contrived to thrive. By the early 19th cent. this revolution had reached the vast Sutherland estates north of Inverness. Tenants were resettled on the coastal areas to combine fishing with farming and ancillary activity such as gathering kelp on the beaches to make commercial alkali.

The collapse of kelping due to cheaper imports after 1815 was followed by the decline of wool prices due to the arrival of cheap Australian and then New Zealand wool, and in 1848–9 by widespread famine conditions. After 1860, tenants were cleared to create deer forests, treeless shooting estates which, by 1914, covered 3½ million acres in the Highlands. By 1886 a residual crofting population clung to the margins of the region with legal security of tenure. BPL

**Highland games** were originally meetings of clans. They developed into more formal gatherings under the influence of the revival of interest in Scottish antiquity fostered by \*Scott and others in the 1810s. At Invergarry in the 1820s the games included not only piping, tossing the caber, hammer-throwing, wrestling, and running, but twisting the four legs off a cow. A sanitized version at Braemar in 1850 was attended by Queen Victoria, whose ghillie, Duncan, 'an active, good-looking young man', won the race up and down Craig Cheunnich, finished 'spitting blood', and was never the same man again. Modern gatherings are held in various places, usually in late summer. JAC

**Highland Land League.** Scottish crofters in the 1870s watched the success of the Irish in obtaining concessions, had 'a mind to turn rebels themselves', and concluded that the \*Irish Land League might be copied. The Highland Land League was formed in 1882 and returned four sympathetic MPs at the election of 1885. Results were gratifyingly swift. \*Gladstone's \*Crofters' Act of 1886 gave security of tenure and \*Salisbury, the same year, established a separate secretary of state for Scotland. These concessions dampened the agitation, though the Highland Land League stayed in existence, becoming the Scottish National League in 1921 and eventually merging with the \*Scottish National Party. JAC

**highwaymen** are more picturesque in fiction and retrospect than they were in reality. The heyday of the highwayman was from the Restoration, when coaches began to appear on the roads in large enough numbers to make the occupation profitable, to the end of the 18th cent., when stage-coaches travelled with armed guards and policing was better. There was usually a flurry of highway robbery

after each great war, with demobilized soldiers turning their hands to it. Because of the density of traffic, the outskirts of London were particularly frequented by robbers, and Finchley Common, Hounslow Heath, Bagshot Heath, and Blackheath all acquired a bad reputation. The Newmarket road was also hazardous, especially near Epping Forest. Highwaymen soon became popular heroes, accorded the sneaking admiration reserved in the 20th cent. for the great train robbers. The exploits of Claude Duval (a ladies' man), William Nevinston, James Whitney, Jack Sheppard (an escapologist), Dick \*Turpin, and 'Sixteen-string' Jack Rann, often turned into execrable verse, sold in broadsheets and ballads, usually accompanied by a woodcut of the final gallows scene. Highwaymen were expected to die game.

JAC

**Hilda, St** (614–80). Baptized in 627 with her kinsman, the Northumbrian king \*Edwin, at 33 Hilda became a nun, joining a community on the banks of the Wear. A year later she became abbess at Hartlepool, and in 657 founded the double monastery at Streanaeshalch (Whitby). Renowned for her high standards, no fewer than five bishops were trained under her rule. Hilda encouraged the poetic Whitby cowherd \*Cædmon, taking him into the monastery to ensure sound doctrine in his vernacular verses. Kings and princes sought her advice, and, representing Celtic traditions, she was an important figure at the Synod of \*Whitby. News of her death is said to have reached a neighbouring monastery through a vision of angels transporting her soul to heaven.

AM

**Hill, Octavia** (1838–1912). Social reformer. Early influence from her grandfather, the sanitary reformer Dr Southwood Smith, and work with the \*Christian socialists, led to conviction of the need for better housing for the poor. A loan from John \*Ruskin (1865) enabled purchase of squalid property in Paradise Place, Marylebone (London), for which, ever strict and businesslike, she encouraged both prompt rent payments and cleanliness, with profits directed to repairs and improvements. The experiment was so successful that the scheme spread, more houses were purchased or put under her charge, and other workers trained in her methods; her system of housing management was eventually introduced into Europe and America. Concerned with improving the quality of life generally, though not politically inclined despite appointment to a royal commission, she actively supported the Charity Organization and Kyrle societies, while her passionate belief in preserving open spaces for public use led to co-founding the \*National Trust (1895). ASH

**Hill, Rowland, 1st Viscount Hill** (1772–1842). Soldier. Hill was a younger son of Sir John Hill, baronet, of Shropshire and one of five brothers to join the army. He was wounded near \*Alexandria in 1801 while serving under Abercromby and was promoted major-general in 1805. Later he served in Portugal and was again wounded at \*Talavera (1809). In 1812 he was knighted. He was with \*Wellington in the advance into France 1813–14 and was given a barony. On Napoleon's return from Elba, Hill hastened to Brussels and was in action at \*Waterloo, where he had a horse killed under him. From

## Hill

1828 until 1842 he was general commanding-in-chief and was raised to a viscountcy just before his death. Melbourne confided to the young Queen Victoria that Hill was 'a very dull man'. There is a large monument to him at Shrewsbury.

JAC

**Hill, Sir Rowland** (1795–1879). Inventor of penny postage. Hill was born in Kidderminster, son of a schoolmaster and pioneer of shorthand. He took over his father's school and instituted a novel system of discipline, involving the boys as assessors. After 1828 he abandoned teaching, experimented with a number of inventions, and in 1835 became secretary to a commission to colonize south Australia. He then became interested in the postal service, which was so prohibitively expensive that the revenue of the Post Office was falling in a period of rapid population growth and commercial expansion. Hill suggested pre-payment, a standard delivery charge irrespective of distance, and the use of an adhesive stamp. A pamphlet of 1837 attracted attention and penny postage was adopted in 1839. Hill was put in charge but met with vast obstruction from within the Post Office and was dismissed in 1842. Reinstated by \*Russell in 1846, he held office until 1864. He was knighted in 1860 and \*Gladstone said of his reform that it had 'run like wildfire through the civilized world'. Anthony \*Trollope, who worked at the Post Office with Hill, was less flattering: 'a hard taskmaster who had little understanding of the ways of men . . . it was a pleasure for me to differ from him on all occasions.'

JAC

**Hillary, Sir Edmund** (1919–95). A New Zealander, Hillary's reputation as a mountaineer and, in particular, his experience of Himalayan climbing led to an invitation to join the Everest expedition of 1953. The leader, Sir John Hunt, selected him and Sherpa Tenzing to make the actual assault on the summit, and in May 1953 they became the first two men to reach the top of the world's highest mountain. News of the success became known as Queen Elizabeth was crowned, adding to the excitement of that occasion. Hillary also explored the Antarctic, reaching the South Pole in 1958. He made further Himalayan expeditions and was involved in development and welfare schemes for the Sherpas. RB

**Hilliard, Nicholas** (1547–1619). The greatest of English miniaturists. In 1570 he was appointed to the court, where his jeweller's skills suited Elizabeth I's desire for a painted image of splendour, handled with delicacy and elegance. About 1600, he wrote a treatise *The Arte of Limning* (published in 1912) in which he records that his method of painting without the use of shadow was in agreement with the queen's taste, 'for the lyne without shadowe sheweth all to a good Iugment'. Her patronage, and later that of James I, brought Hilliard other important sitters and a reputation in France, but did not prevent his financial problems, which, at one stage, resulted in his imprisonment for debt. In London there are examples of Hilliard's exquisitely detailed work in the Victoria and Albert Museum and National Portrait Gallery. A large-scale portrait of Elizabeth I hangs in Liverpool's Walker Gallery. The queen and the duke of Buccleuch have large collections of his work.

JC

**Hingston Down, battle of**, 838. For decades the Britons of Cornwall (\*Dumnonia) had been resisting the growing pressure of \*Wessex. In 838 they joined with a Viking force, possibly from Ireland, but were defeated at Hingston Down, between Callington and the Tamar, by \*Egbert. Cornwall was then incorporated into the Wessex empire.

JAC

**historical novels.** Most novels are set in the past, however recent. Fielding habitually described himself as a historian, and *Tom Jones* (1749) covers the same period as *Waverley* (1814), but \*Scott can claim to be the first historical novelist because his characters are caught up in history, defined as much by historical forces as by the whim of the author. The emerging nationalism of the Romantic period brought a new interest in history, seen first in the 18th-cent. taste for the Gothic and the Picturesque, but deepening to a more profound awareness of social change. The French historian Thierry praised *Ivanhoe* (1819) not for the romantic plot but for the study of 'two peoples, two languages; customs that contrasted and struggled against each other'. Socialist realism learnt from the genre, and the Marxist critic Georg Lukács saluted Scott's understanding of historical necessity.

The form has been seen as fundamentally unstable, the fiction detracting from the history and vice versa. This is what Manzoni came to feel, though his *I promessi sposi* (1825) is one of many 19th-cent. novels to acknowledge Scott's example. Bulwer-Lytton's painstakingly researched forays into the past are out of fashion now, but he brought a new seriousness to the problem of 'how to produce the greatest amount of dramatic effect at the least expense of historical truth'. \*Dickens was less punctilious, but *Barnaby Rudge* (1842) perhaps deepened the social concerns of the fiction; he wrote when he returned to his own century, and *A Tale of Two Cities* (1859) has given generations of readers their first picture of the French Revolution. The title of \*Thackeray's 'novel without a hero' suggests his basically moralistic approach, though *Vanity Fair* (1848) has a sharper and tarter flavour than Lytton manages, while the Victorian taste for religious polemic prompted Charles \*Kingsley's *Hypatia* (1853). George \*Eliot, Elizabeth \*Gaskell, and Thomas \*Hardy continued the tradition, and even a proto-modernist like Ford Madox Ford (1873–1939) based his trilogy *The Fifth Queen* (1908) on the Tudor period. In our own day the 'non-fiction novel' and 'drama-documentary' testify to an enduring appetite for the mingling of fact and fiction.

JNRS

**HMI** (Her Majesty's Inspectors). The first two inspectors, Seymour Tremenheere and the Revd John Allen, were appointed in 1839 to supervise the proper spending of £30,000 for the education of the poor. Dr J. P. \*Kay-Shuttleworth, the secretary of the Committee of the Privy Council for Education, determined that inspectors should be independent, ensured that they were appointed by order in council. Kay-Shuttleworth emphasized the inspecting rather than the examining role of HMI, stating that 'inspection is not intended as a means of exercising control, but of affording assistance'. However, with the introduction of the revised

code (or 'payment by results') in 1862, whereby teachers' salaries depended on pupils' attainment in the three Rs, the role of HMI was seriously distorted; from this time they became hated and feared in elementary schools. With the advent of Liberal governments in the later 19th cent., this rigid system was modified. By 1895, payment by results came to an end. After the 1902 Education Act, the inspectorate was restructured into elementary, secondary, and technological branches. The Education (Schools) Act 1992 established the Office for Standards in Education (OFSTED), which took over many of HMI's functions. PG

**Hoadly, Benjamin** (1676–1761). Bishop of Winchester. Born in Kent and educated at Catharine Hall, Cambridge, Hoadly held livings in London and successively the bishoprics of Bangor (1716), Hereford (1721), Salisbury (1723), and Winchester (1734). A Whig polemicist in conflict with \*Atterbury and his high-church colleagues after 1705, he was rewarded by becoming George I's chaplain, but his appointment to Bangor shocked even supporters. His sermon (1717) advocating private judgement and sincere conscience in preference to ecclesiastical authority challenged both high churchmen and the established church. It thus provoked the furiously bitter \*Bangorian controversy and consequent suspension of \*convocation. Later, writing as 'Britannicus' (1722), he tore Atterbury's defences to pieces. Traditionally cast as the archetypal Hanoverian absentee prelate, modern research shows that, though a cripple with inability to travel much, he nevertheless attended to his dioceses as best he could or made sure others covered his work. He was genuinely concerned with the spiritual issues of his day and used his 'razor-sharp, if acerbic, intellect' in support of his ideals. WMM

**Hoare, Samuel, 1st Viscount Templewood** (1880–1959). Hoare came from a Norfolk family and was educated at Harrow and New College, Oxford. He entered Parliament in 1910 as a Conservative and sat for Chelsea until given his peerage in 1944. He took office under Bonar \*Law in 1922 as secretary of state for air and held the same office under \*Baldwin. In 1931 he became secretary of state for India in the National Government and carried the Government of India Bill, advancing towards self-government. Baldwin, in 1935, moved him to the Foreign Office. 'Your stay at the Foreign Office will be memorable,' wrote \*Beaverbrook in congratulation. It was. Hoare was plunged straight into the crisis over Italy's designs on \*Abyssinia. In December 1935 he drew up with Pierre Laval, French foreign minister, a plan which would have dismembered Abyssinia. The public outcry forced his resignation, though Hoare defended his deal as the best he could do for Abyssinia unless governments were prepared to fight Mussolini. Though he was brought back as a minister in 1936, and served as 1st lord of the Admiralty, home secretary, lord privy seal, and secretary of state for air, his career limped. After resigning with \*Chamberlain in 1940, he served for four years as ambassador to Spain, at a very critical juncture. Hoare had held high public office almost continuously for more than twenty years. He was unlucky about the Hoare–Laval pact. He was ill at the time and much of the abuse he suffered for

'betraying the League of Nations' was from people who would never have supported war. But there is no reason to believe that the episode brought down a future prime minister. JAC

**Hobbes, Thomas** (1588–1679). Philosopher. Hobbes is without doubt the greatest political philosopher to have written in the English language. After graduating from Oxford, he devoted his very long life to private tutoring and study. He fled to France in 1640, fearful for his life under the Long Parliament because of his perceived endorsement of royal absolutism. In 1651 he published in English \**Leviathan*, his masterpiece of political philosophy, in which he set out systematically an ingenious social contractualist case for an authoritarian government. Hobbes argued that the state of nature (i.e. the pre-political condition) was a condition of 'war of all against all', since humans are by nature moved by competitiveness, fear, and pride to coerce others. They would contract together to establish an absolute ruler, since that was the only way in which their security could be guaranteed. Hobbes was thought by many to be an atheist, and there was an attempt in Parliament to investigate *Leviathan* as a possible cause of God's wrath in visiting London with the Great Plague in 1665 and the Great Fire in 1666. But the attempt failed, and Hobbes breathed a sigh of relief. He is remembered today for his brilliant defence of political absolutism from individualistic premisses. TSG

**Hobson, John Atkinson** (1858–1940). An economist with views that were unconventional for his time, and led him—he claimed—to be blackballed from academic posts. He earned his living therefore through part-time lecturing, journalism, and writing too many books. Two of those books however launched revolutions: *The Physiology of Industry* (1889), written in collaboration with the mountaineer A. F. Mummery, which undermined *laissez-faire* economics by arguing that its tendency was to over-produce; and *Imperialism: A Study* (1902), which attributed the militaristic colonial expansionism of that time to the resultant surpluses of goods and capital. In this way he can be said to have sown the seeds of two of the most powerful ideologies of the 20th cent.: Keynesian economics, and the Leninist interpretation of imperialism. He also contributed importantly to contemporary politics, especially the evolution of a 'New' kind of Liberalism around 1900 to replace the old. Later he dedicated himself to the cause of internationalism. BJP

**hockey** claims a very ancient pedigree since there are tomb-drawings and classical reliefs showing men hitting a ball with curved sticks. Variations were certainly played in the medieval period but, like most games, it was formalized and regulated in the 19th cent. Blackheath had a hockey club before 1861 and Teddington introduced the hard ball into the game in the 1870s. The National Association was formed in 1886, mainly by London clubs, and the first women's hockey club was founded at Wimbledon in 1889. Wales played Ireland in 1895 and men's hockey entered the Olympics in 1908. The game was introduced into India by British army officers and flourished exceedingly. The Federation of International Hockey was established in 1924. JAC

## Hogarth

**Hogarth, William** (1697–1764). Artist. London-born, disinclined to scholarship, but frustrated with armorial engraving, Hogarth set up as an illustrator, largely self-taught, before producing ‘conversation pieces’, engraved scenes of contemporary life, and history painting. Pugnacious, provocative, and a passionate believer that honest naturalism was preferable to the sterility of formal training, he suffered for his attempts to ridicule the deeply entrenched, Renaissance-based theories of good taste, and sought vainly to encourage a native English school of art. Underrated as a painter, he is best remembered for his moral and satirical engravings (*Rake’s Progress*, *Marriage à la Mode*, *Gin Lane*) which provide a forthright dissection of the times; promoting industriousness and respectability, the prints were deliberately cheap to facilitate wide distribution. A chauvinistic Englishman, Hogarth was actively interested in philanthropic projects, especially Thomas \*Coram’s Foundling hospital, was appointed sergeant-painter to the king (1757), quarrelled with \*Wilkes, and declined in acrimony. ASH

**Hogg, James** (1772–1835). Poet and novelist. ‘The Ettrick Shepherd’ had a long career as a minor poet and novelist before publishing anonymously an extraordinary masterpiece. *The Memoirs and Confessions of a Justified Sinner* (1824) dealt with psychological disorder and antinomian presbyterianism with a disturbing realism which has its roots in the psychology of the Scottish Enlightenment. Largely self-educated, Hogg acquired a taste for the vernacular culture of the borders and began to see himself as a new \*Burns. His early verse attracted \*Scott and gave rise to a complicated but enduring friendship which taxed them both. He made his way in Edinburgh as a literary journalist and as a historical poet, *The Queen’s Wake* (1813) being much admired. His historical novels ape Scott’s but are now attracting scholarly attention. A man with a highly developed taste for self-dramatization, he cultivated the role of the professional Scot in his popular contributions to the *Tory Blackwood’s Magazine*. NTP

**Hogue, La, battle of.** See LA HOGUE, BATTLE OF.

**Holbein, Hans** (c.1497–1543). Painter. It is hardly an exaggeration to suggest that our visual image of Henry VIII and his courtiers is derived from Holbein’s portraits. Born the son of an Augsburg artist of the same name, Holbein paid two visits to England, a short one 1526–7 and a longer one 1532–43. On the first occasion he brought with him introductions from Erasmus, whom he painted frequently, to Sir Thomas \*More, painted a celebrated More family portrait, and may have carried out decoration work at court. On his next visit his patron More was in disfavour, but Holbein received many commissions, and entered the service of the king, for whom he painted a family reconstruction, showing Henry, his parents, and \*Jane Seymour. Holbein was also employed to travel abroad and paint prospective brides for the king: his too-flattering portrait of \*Anne of Cleves caused considerable embarrassment. The largest group of Holbein’s work in Britain is in the Royal Collection. His magnificent portraits include More (1527), Arch-

bishop \*Warham (1527), Thomas \*Cromwell (1534), Henry VIII (1536), Jane Seymour (1536), the duke of \*Norfolk (1540), the duke of \*Suffolk (1541), and the young Edward, prince of Wales (1543). An early commentator wrote of Holbein: ‘he is not a poet but an historian.’ JC

**holidays** in their modern secular sense of days free from the demands of paid labour, but not necessarily channelled or confined by the demands of religious observance, are in many ways a product of industrial society, and the concomitant precise demarcation between work time and leisure time. Many older calendar customs survived into urban and industrial society, especially where craft industries persisted for a long time alongside the factories in the 19th cent. and migration flows were predominantly short-distance, as in the textile-manufacturing districts of Lancashire and the West Riding of Yorkshire. Thus the Lancashire Wakes and the Yorkshire Tides and Feasts, along with similar customary holidays in the Black Country and the Potteries, survived through into the second half of the 20th cent., although increasingly removed from their origins as celebrations of the saint’s day or anniversary of the foundation of the local parish church. National religious festivals, especially Christmas, Easter, and Whitsuntide, also survived erosion from the apostles of economic rationality, order, and propriety between the late 18th and mid-19th cents. Christmas was remade in more secular and commercial form, with an array of imported and invented traditions such as the Christmas tree, greeting cards, robins, and Father Christmas, while many northern towns introduced the Whit walks at which religious congregations paraded the streets in competitive finery. The more political festival of Bonfire Night (5 November), part of the politico-religious calendar since the 17th cent., also continued as a widely observed red-letter day, although aspects of its celebration were toned down by local authorities anxious to uphold public order in the mid-Victorian years. Meanwhile, the secular and unofficial holiday of ‘St Monday’, abstention from work on the day following the weekend, was particularly popular among the better-paid craft workers and miners, and although it was systematically attacked by employers and moral reformers, playing havoc as it did with work schedules and family budgets, it proved difficult to extirpate, especially among workers in heavy, hot industries who were paid well by the shift, and it survived strongly in coal-mining in the late 20th cent.

Holidays in the sense of extended periods away from home in pursuit of health and pleasure in enjoyably different surroundings were emerging as a regular practice among the better-off by the later 17th cent. \*Bath led the way among the spa towns, and the emergence of seaside resorts from the 1730s encouraged an opening-out of the market, as London shopkeepers flocked to Margate cheaply by sailing vessel and also found their way to Brighton. Fashions for cultural and scenic tourism emerged in the late 18th cent. and began to percolate down the social scale. But the holiday away from home as a popular and commercial phenomenon (as opposed to such activities as returning to one’s home village to help with the harvest) was mainly a product of the

railway age. At working-class level such holidays were almost always unpaid, and they emerged first as a genuinely popular phenomenon in northern England, where the customary Wakes holidays (especially in the Lancashire cotton towns) were adapted for extended seaside visits from the 1850s and especially the 1870s, and families saved through the year in special clubs to be able to afford them. The Bank Holiday Acts of 1871 and 1875, which came to guarantee four free Mondays in the year including the first Monday in August, were of no importance here, although they did help to open out summer holiday opportunities in parts of the country where the older holidays had not survived. Paid holidays for manual workers before the First World War were offered by only a few paternalistic or enlightened employers, and although they spread gradually through the inter-war years a compulsory Holidays with Pay Act was not passed until 1938, and did not become effective until after the Second World War, when English seaside resorts had a particularly prosperous couple of decades, before generally failing to meet the challenge of new opportunities and new destinations.

JKW

**Holinshed, Raphael** (c.1520–c.1581). Holinshed was the author and compiler of *Chronicles of England, Scotlande and Irelande*, published in 1577. A second and enlarged edition in 1587 was edited by John Vowell and took the story into recent times. Holinshed had little method or sceptical approach but his eclecticism made him a valuable quarry for historical playwrights. \*Shakespeare made use of the *Chronicles* in several plays, including *Lear*, *Macbeth*, and *Cymbeline* and the later historical plays. Though he made considerable changes to Holinshed's version of *Macbeth*, the episode of the witches is reproduced almost verbatim—'All haile, Makbeth, that hereafter shalt be king': the taking of the crown in 2 *Henry IV* comes straight from Holinshed. Of his life, very little is known for certain. He may have been from Cheshire, is said to have been at Cambridge, and could have been in holy orders. He worked for the printer Reyner Wolfe. His will was proved in April 1582, when he was described as steward to Thomas Burdet of Bramcote (War.).

JAC

**Holkham Hall** (Norfolk), 2 miles west of Wells-next-the-Sea, is a slightly forbidding house, built in a rather hard and unlovable local yellow brick. But the grand hall and staircase is majestic and the interior decoration sumptuous. It was built for Thomas Coke, earl of Leicester, in the mid-18th cent. and designed largely by William \*Kent and Lord \*Burlington, close friends of Coke. It passed to Thomas \*Coke, the agricultural improver, for whom the earldom of Leicester was revived in 1837. Lancelot \*Brown is believed to have worked on the gardens, but the park, flat and near the sea, offered modest capabilities, even to him.

JAC

**Holland, Henry Richard Vassall Fox, 3rd Baron** (1773–1840). The nephew of Charles James \*Fox, whom he idolized and who formed his literary tastes and political principles, Holland travelled extensively in Europe, spoke several languages, and cherished wide connections in European 'liberal' circles. He ran away with the formidable Elizabeth,

wife of Sir Godfrey Webster, and after her divorce they established at Holland House in Kensington a salon which became the centre of early 19th-cent. Whig society. He held office in 1806–7 as lord privy seal and 1830–4 as lord president of the council but was unfitted for a departmental post. He was a man of leisure, a noted *bon viveur*, and suffered badly from gout. Holland did much to smooth relationships in Whig society by his urbanity, and devoted himself to preserving the memory of his uncle, the defence of whose principles and reputation was the cornerstone of his life.

EAS

**Holland, relations with.** English interest in the revolt of the Dutch protestants against Philip II of Spain led to direct intervention (1585), but only after all else had failed. Both the Dutch and English profited from their alliance against Spain, yet at times in the next century the Dutch threatened to eclipse the English as the two peoples competed and fought for trade, colonies, and command of the seas. Lord \*Shaftesbury commented in 1663 that the Dutch were 'England's eternal enemy, both by interest and inclination'. Cromwell's navy had the better of the first \*Anglo-Dutch War (1652–4), but the Dutch were able to destroy much of the English fleet in the Medway in 1667. A third war (1672–4) was inconclusive. The political crisis in England of 1688 brought a Dutch prince, William of Orange, to the English throne, and the English and Dutch were allied in two wars against Louis XIV between 1689 and 1713. In due course the British emerged as much the stronger power. Holland was under French control for most of the Revolutionary and Napoleonic wars. Even \*Trafalgar failed to provide Britain with a lasting sense of security against the French presence in the Low Countries, and at Vienna in 1814–15 \*Castlereagh set out to create a strong north-eastern barrier against France, engineering what proved to be the short-lived union of Holland and Belgium. Of the Dutch colonies captured during war, only the \*Cape of Good Hope was retained. Britain tried in vain to assist the Dutch in their defence of the East Indies against Japan in 1942, but contributed to the short-lived restoration of their colonial rule after 1945.

CJB

**Holles, Denzil** (1599–1680). Holles, a parliamentarian, achieved notoriety on 2 May 1629 when, acting in concert with \*Eliot, he held down the Commons' Speaker. Punished by a brief spell in prison, he was re-elected to Parliament in 1640. Though included by Charles I among the five members threatened with impeachment in January 1642, Holles advocated a negotiated settlement. This brought him into collision with the army, and in December 1648 he fled to France. \*Cromwell permitted him to return to England in 1654, but he took no part in political life until the restoration of Charles II, who made him a baron. His increasing distrust of Charles's catholic tendencies drew him into opposition, but he rejected the call to exclude James, duke of York, from the succession. In 1680 as in 1640 what Holles wanted was a law-abiding, unequivocally protestant king, but he died before finding one.

RL

## Holst

**Holst, Gustav** (1874–1934). Of German/Swedish ancestry (Gustavus Theodore von Holst), he was one of the most original English composers of his day and an influential teacher, particularly of amateurs. Holst studied composition with \*Stanford at London's \*Royal College of Music alongside his lifelong friend \*Vaughan Williams, with whom he shared a passionate interest in folk-song. Other influences included plainsong and Hindu culture, the latter apparent in his own translations of Sanskrit texts for the *Choral Hymns from the Rig Veda* (four groups, 1908–12) and in his libretto for the much underrated chamber opera *Sāvitri* (1908–9, first performed 1916). The sparse economy of his later works, together with their adventurous harmonies and use of bitonality, was regarded by many contemporaries as unnecessarily cerebral. *The Planets* (1914–16, first performed 1919), however, was an immediate and lasting success, not least for its masterly orchestration, the pounding 5/4 rhythms of 'Mars', and the haunting female voices in the final movement 'Neptune'. ECR

**Holt, John** (1642–1710). Holt was the son of a serjeant at law, who enrolled him at Gray's Inn at the age of 10. After a riotous year at Oxford, he was called to the bar in 1663. He showed his independence and fearlessness in state trials by defending Pilkington and others in 1675 and the 'popish lords' in 1679. In 1686 he became recorder of London and was subsequently knighted and received the coif as king's serjeant, but resigned after refusing to condemn to death a soldier who deserted in peacetime. After the flight of James II he was returned to the 1689 Convention Parliament and in that year he was appointed chief justice of King's Bench, which office he filled for 21 years. His judgments were famous, especially in the case of the \*Aylesbury voters (1703–4). He also had an important influence on the development of commercial law. MM

'**Holy Alliance**' was the derisive name given to the declaration at Paris in September 1815 by Alexander I of Russia, Frederick William III of Prussia, and Francis I of Austria that they would govern and collaborate in accordance with Christian principles. The driving spirit was the tsar in the midst of a devout phase. Orthodox, protestants, and catholics should bury their differences and the other European monarchs (except the sultan) were invited to adhere. Britain, pleading her constitutional position, did not sign, though the prince regent expressed personal approval. \*Castlereagh, then foreign secretary, dismissed it privately as 'a piece of sublime mysticism and nonsense', but defended it publicly in the Commons in February 1816 against \*Brougham, who denounced it as a mask for autocracy and pointed out that the same three powers had preceded their partition of Poland in 1793 with a similar declaration of high principle. Castlereagh replied that 'it was certainly couched in language unusual in diplomatic documents but should be regarded solely as a pledge of peace'. No mechanism was included in the declaration and disagreements between the signatories soon appeared. JAC

**Holyoake, George Jacob** (1817–1906). Secularist, Liberal journalist, and co-operator. Born in Birmingham, the son of

an artisan, he entered radical politics as an \*Owenite socialist lecturer in 1840 and gained early notoriety when imprisoned for blasphemy in 1842–3. He edited a number of papers in support of socialism, atheism, and republicanism, notably the *Reasoner* (1846–61), and was last secretary of the chartist National Charter Association in 1852. In the 1850s he rallied the scattered forces of radical free thought under the name of \*secularism, but was a poor public speaker and lost the leadership to Charles \*Bradlaugh in the 1860s. His influence came as a writer, journalist, and political lobbyist. In later life he was closely associated with propaganda for the \*Co-operative movement, and advocated co-partnership schemes, supported Gladstonian Liberalism, and in 1899 was first chairman of the Rationalist Press Association. ER

**Holyrood** (Edinburgh). The palace of Holyroodhouse, with Holyrood abbey in its grounds, stands at the foot of the Canongate in the Old Town of Edinburgh, in the lee of Arthur's Seat. Holyrood abbey was built for \*Augustinian canons, and the ruins of its 12th- and 13th-cent. nave have inspired many travellers, including Felix Mendelssohn on his Scottish tour in 1829. The palace of Holyroodhouse, the official residence in Scotland of the reigning monarch, was started in the reign of James IV of Scotland and extended by James V. In 1671–9 it was enlarged and remodelled for Charles II to the designs of Sir William Bruce (c.1630–1710), assisted by Robert Mylne (1633–1711), the king's master mason. It is set around the four sides of a courtyard, and although the interiors are in an Anglo-Dutch style, the character of the exteriors is French. After a period of change and neglect, royalty came back to Holyroodhouse in 1745 in the person of Prince Charles Edward \*Stuart (Bonnie Prince Charlie), but it was not until after George IV's visit in 1822 that it was rejuvenated. Improvements were carried out 1824–35 by the architect Robert Reid (1774–1856), and subsequent alterations by Queen Victoria completed the transformation of Holyroodhouse from a Restoration to a Victorian palace. PW

**homage** was the formal and public acknowledgement by a vassal of his allegiance and obligations to a lord of whom he held land or whose overlordship he accepted. Thus English kings paid homage, albeit usually reluctantly, to the kings of France for their tenure of \*Aquitaine, and in turn claimed homage from Welsh princes and Scottish kings. Simple homage accepted that the land was held of a lord but did not oblige the vassal to pay the full range of feudal services. Liege homage involved the vassal admitting his obligation to pay all services, including the provision of military assistance. By making an act of homage, the vassal's own rights were deemed to be confirmed by his lord. The ceremony of homage involved the vassal kneeling before his lord, the clasp of hands, the uttering of certain key words which acknowledged lordship, and the kissing which symbolized accord. An oath of \*fealty might also be paid. In theory the reciprocal bond created by an act of homage lasted for the lifetime of both parties but was broken if either failed to maintain his side of the agreement. Homage by the peers of the realm remains part of the \*coronation service. AC

**Home, Sir Alec Douglas-Home, 14th earl of** [S] (1903–95). Prime minister. Douglas-Home succeeded to the earldom in 1951 but relinquished it in 1963 to re-enter the Commons as prime minister, in succession to Harold \*Macmillan. In 1974 he returned to the House of Lords as Lord Home of the Hirsell. He was first elected in 1931 and served as private secretary to Neville \*Chamberlain (1937–40), minister of state at the Scottish Office (1951–5), Commonwealth secretary (1955–60), and foreign secretary (1960–3). He also served as deputy leader (1956–7), then leader of the House of Lords and lord president of the council (1959–60). Between 1964 and 1965 he was leader of the opposition.

As foreign secretary Lord Home was a convinced anti-communist. He had spent the years 1940–2 flat on his back as a result of an injury and had read widely on current affairs. In particular, he had studied the theory and practice of communism and retained a deep suspicion and hostility towards the Soviets. Nor was he worried about nuclear weapons, telling an audience in April 1963: 'The great advantage of the nuclear bomb is that at last ordinary decent men have been given a weapon which can stop the wicked from achieving their ends by war.' On the other hand, he was deeply involved in the negotiations which led to the Test Ban treaty that same year.

An immensely sincere and straightforward figure, he appeared to be almost out of touch with political realities as prime minister. A poor public speaker and television performer (he confessed to 'counting with matchsticks' during a TV discussion on economics), he was unfortunate to encounter Harold \*Wilson's brilliance as leader of the opposition. His upper-class, 'grouse moor' image was another political drawback, while the refusal of both Iain Macleod and Enoch \*Powell to serve under him undermined his political credibility. They objected to the way in which Sir Alec had emerged as prime minister, believing that the cabinet favourite for the job, R. A. \*Butler, should have become premier. Both believed that Sir Alec had ruled himself out as a candidate. Yet, as Macleod was to write in a famous article in the *Spectator*, the 'magic circle' of Tory grandees had manoeuvred Sir Alec into the job. It was a charge which the new prime minister deeply resented. He also clearly resented the attacks on his upbringing. In a famous speech, he pointed out that if he was the 14th earl of Home, Mr Wilson was 'the fourteenth Mr Wilson'.

None the less, after a year of almost non-stop electioneering, Sir Alec, who concentrated on foreign and defence affairs, lost the 1964 election to Labour by the most slender of margins. Given the legacy of economic problems and scandals he had inherited from Macmillan, this was no small testament to his character. The British public clearly recognized him as a 'true gent', someone who could be trusted, but doubted his competence to modernize the economy or accept social change.

Given the controversy aroused by the way in which he had become prime minister, given that the queen could not choose a Tory leader while the party was in opposition, and given the need for a new leader after the party's defeat, Sir Alec arranged that his successor as party leader should be elected. This turned out to be Edward \*Heath under whom

he served as foreign secretary between 1970 and 1974. Relations between them were smooth, unlike those between Heath and his successor a decade later. As foreign secretary, Sir Alec was one of those who helped take Britain into the Common Market in 1973. All in all, he was a decent, if not a notably successful, political figure. AS

**Home, John** (1722–1808). Scottish dramatist and man of letters. Home was the author of *Douglas: A Tragedy* (1756), one of the most popular plays of the age with one of Sarah \*Siddons's favourite parts. It also encouraged a Scottish fan to yell, 'Whaur's yer Wullie Shakespeare noo?' at the first London performance. Born in Leith, educated for the kirk, Home fought for the government during the '45. A member of the moderate wing of the kirk, he was greatly distrusted by the orthodox. One of \*Bute's Scottish coterie of advisers and a royal pensioner, he was an active campaigner for a Scottish militia and a reasonably prolific playwright, who never managed to repeat the success of *Douglas*. His last work, a *History of the Rebellion of 1745*, lacks the panache and historical acumen one might have expected of a leading member of the Edinburgh literati. Home was a gregarious man who lived well and failed to live up to expectations. NTP

**Home Guard.** A volunteer organization founded by Anthony \*Eden, the secretary of state for war, in May 1940. Originally called the Local Defence Volunteers, its task was to assist in the defence of Britain against a possible German invasion. When this threat had diminished, it manned anti-aircraft guns and coastal defences. By 1943 over 2 million men served in the Home Guard in their spare time. It was composed of civilians exempt from military service because of their age or occupation. During their first year in operation they possessed few weapons, often parading with broom handles instead of rifles. Nevertheless they acted as a boost to British morale. The Home Guard was disbanded on 31 December 1944 but was immortalized in the television series *Dad's Army*. RAS

**Home Office.** Until 1782 the two secretaries of state divided their responsibilities into southern and northern Europe, dealing with the catholic and protestant powers. Domestic duties needed little attention: the justices of the peace looked after most problems of law and order and the secretary at war was at hand if troops needed to be called in. In 1782, when the Rockinghams took office, a new division was agreed: one secretary took domestic and colonial affairs, the other foreign affairs. In 1801 the secretary of state for war took on the colonies, leaving the home secretary free to concentrate on domestic matters. The first home secretary, Lord \*Shelburne, had two under-secretaries, a chief clerk, and ten other civil servants. But in the 19th cent. business increased dramatically as the office picked up responsibility for aliens, prisons, and police supervision. In 1833 the Home Secretary was empowered to appoint factory inspectors. The marked increase in the number of lobbies and protest movements meant difficult decisions about permitting or banning meetings and marches: Spencer Walpole was forced to resign in 1866 over his handling of the \*Hyde Park reform

## Home Rule

riots. Another area of delicacy was in advising the monarch on the prerogative of mercy, especially before the abolition of capital punishment. By the 20th cent. the post of home secretary had become one of the most senior and difficult in the government. Until 1885 the home secretary was responsible for Scotland; then a secretary for Scotland was appointed, whose office included a home department. JAC

**Home Rule.** See IRISH HOME RULE.

**Homildon Hill, battle of,** 1402. The clash at \*Otterburn in 1388 was followed by a ten-year truce on the Anglo-Scottish border. In June 1402 \*Hotspur and March got the better of a small skirmish at Nisbet Moor, in Berwickshire. \*Glyndŵr's rising in Wales gave the Scots a chance of revenge and in September 1402 a large force under \*Douglas pillaged Northumberland. Hotspur cut off their retreat near Wooler, and Douglas fought at Homildon Hill. The Scots were badly deployed, the English archers kept up a hail of fire, and Douglas was captured. JAC

**Hong Kong** island, which possesses the only safe deep-water anchorage between Shanghai and Haiphong, was used by the British as a staging-post for the opium trade and was taken by them as a free port during the \*Opium War (1839–42). Their occupancy was ratified by the treaty of \*Nanking. In 1860 the Kowloon peninsula was added to the port and in 1898 the New Territories were received from China on a 99-year lease. At its fullest extent, the colony reached 398 square miles. It developed as a commercial entrepôt and in 1917 was granted letters patent to be administered by a governor, and executive and legislative councils. Growth was particularly rapid during the 1930s when many Chinese fled the civil wars and Japanese invasion on the mainland and the population doubled to 1.6 million. Hong Kong itself surrendered to the Japanese on Christmas Day 1941 and was not liberated until 30 August 1945. During the 1960s, the colony became a major manufacturing centre and its population further expanded, reaching over 4 million in 1991. The lease for the New Territories ended in 1997, whereupon the whole colony reverted to the People's Republic of China. DAW

**Honorius** (d. 653). Archbishop of Canterbury. Honorius was the fifth and last of the archbishops to be appointed from the missionaries dispatched to convert the Anglo-Saxons by Pope Gregory the Great. Little is known of Honorius' activities, but \*Bede reproduced a letter sent to him by Pope Honorius after his appointment and recorded support he provided for the evangelization of the East Angles. Following his death in 653 there was an interregnum of eighteen months before the appointment of the West Saxon \*Deusdedit. Honorius was buried at Canterbury and subsequently revered as a saint. BAEY

**Honours of Scotland.** The Scottish crown jewels, consisting of a sceptre given to James IV (1488–1513) by Pope Alexander VI (1494), a sword from Pope Julius II (1507), and a crown made for James V (1513–42) in 1540. Representing royal authority, following the Union of the crowns (1603) they came strongly to symbolize Scotland's nationhood, because

of an absentee monarchy. Buried in Kinneff kirk (1652–60) to avoid Oliver \*Cromwell's attentions, the Honours were feared lost following the Union (1707). They were found hidden in Edinburgh castle by Sir Walter \*Scott (1818), and remain there today. RJT

**honours system.** Although the honours system is routinely denounced every January and June, when awards are published, there is, in fact, very little system. Like many things, it is a patchwork of accretions over the centuries. Consequently it reflects, to a considerable extent, the political evolution of the nation, from governing monarchy, through oligarchy and aristocracy, to parliamentary democracy. At each stage those who wield power award honours to themselves and their friends. The slow increase in the influence of ordinary people, as they have been brought into the political system, may be traced in the way in which, once totally excluded from honours, they are now accorded recognition as postmen, traffic wardens, and lollipop ladies. The declining power of the monarchy may also be traced as monarchs fought, with little success, to retain control of honours, sometimes refusing recommendations, sometimes creating new honours out of reach of the prime minister of the day.

In the early Middle Ages the highest honours were reserved for the royal family and their immediate favourites. The Order of the \*Garter, founded by Edward III in 1348, was jealously restricted: \*Pitt, \*Peel, and \*Gladstone were never included, and \*Disraeli only after he had become earl of Beaconsfield. The Scottish Order of the \*Thistle, refounded by James II, was restricted to peers until 1876 when Sir William Stirling-Maxwell, a mere baronet, was admitted. The knights of St Patrick, instituted by George III in 1783, were equally exclusive. Particular favourites might receive rapid advancement: Edward II made his friend \*Gaveston earl of Cornwall in 1307 to the indignation of the rest of the nobility; Richard II created Michael de la \*Pole earl of Suffolk in 1385. These were rare instances. The title of duke, highest in the land, was carefully restricted. Between 1572 and 1603 there were no English dukes at all, and between 1553 and 1660 the title was given to only one non-royal, Charles I's favourite \*Buckingham. Titles were, of course, augmented by other honours—lavish grants of estates (particularly at the expense of vanquished opponents), places of profit at court, functions at the coronation ceremony. Though there were always complaints that unworthy persons were being honoured, the circle remained very small indeed. At the end of Henry VII's reign, there were no more than 44 peers, and by 1603 it had increased only to 55.

The process of extending honours, which began in the 17th cent., had a number of causes. The penury of the Stuarts forced them to sell honours, and in addition to a sharp increase in titles, new orders of baronetcies—hereditary knights—were introduced. The victory of the nobility in 1688 opened the gates for Whig grandees to be promoted—no fewer than 23 were created dukes between 1688 and 1720. The parliamentary system meant that, more than ever, honours became an indispensable part of govern-

ment, particularly since the crown had far fewer estates to give away. Promotions in the peerage eked out creations. Superannuated politicians like Sir Thomas Robinson were pacified by peerages, borough patrons like Sir James Lowther bought over. It was a powerful blow to the Fox–North coalition in 1783 when George III made it clear that he would not grant peerages at its request, since it advertised that supporting the coalition was not the way to win royal favour. The award of honours for conspicuous gallantry came rather late, with the \*Victoria Cross during the Crimean War. The Order of \*Merit in 1902 was an attempt to create an order for men of letters that the politicians would not seize, but even then George V failed to carry a nomination against Lloyd George's disapproval. The great breakthrough for democracy came in 1917 with the establishment of the Order of the \*British Empire—significantly at the same time that the dynasty changed its name to \*Windsor to get closer to the people. Though the order was still ranked, it reached further into the people than ever before, and included substantial numbers of women. Even so, there was unease among some when the \*Beatles were given an MBE in 1965. Since, in an egalitarian society, there are few opportunities to wear crosses and ribands, the Order of the British Empire has begun to sell ties.

There is considerable debate about the nature and role of honours in a democratic society. The present confusion may be illustrated with reference to the peerage. By origin peerages were not necessarily hereditary and it was an early object of noble ambition to make them so. Eventually the principle was established and when in 1856 the crown attempted to create life peerages for judges, they were declared unlawful. By the time life peerages were brought in in 1958, governments had lost the confidence to recommend hereditary titles. None were created until William Whitelaw was made a viscount on Mrs \*Thatcher's advice in 1983. How long the royal prerogative to create hereditary peers can remain valid if not employed is an interesting question. JAC

**Hood, Alexander** (1726–1814). Admiral. The younger brother of Samuel \*Hood, Alexander had an active naval career of 54 years, first commissioned in 1746 and still commanding at the blockade of Brest in 1800. In 1755 he served under Saunders in North America, in 1759 was at \*Quiberon Bay with \*Hawke, and in 1761, off Belle Île, retook the *Warwick* from the French in a fierce contest. Made treasurer of Greenwich in 1766, he nurtured his relations with the Chatham family. He served under Keppel at Ushant in 1778, attained knighthood and admiral rank, and took part in the second relief of Gibraltar in 1782. In 1794, at the Glorious First of June action, he was second in command to \*Howe, and was subsequently created Lord Bridport in the Irish peerage. Made a British peer in 1796 and a viscount in 1800 he commanded the Channel fleet for the rest of his active service and was at Portsmouth during the Spithead mutiny. Hood was scorchingly critical of the Admiralty's mishandling of the mutiny and his part in the peaceful resolution may remain underestimated. Through the marriage of his daughter to \*Nelson's elder brother, the 1st

Earl Nelson, the Sicilian dukedom of Brontë passed to the Bridports. DDA

**Hood, Samuel** (1724–1816). Admiral. Born of Dorset clerical stock, Hood and his brother Alexander entered the navy at the same time and prospered under the patronage of the Lyttelton family and its relatives the Grenvilles and Pitts. Given a commission in 1746, Hood served throughout the Seven Years War and was present at \*Quiberon Bay in 1759. In 1767, still a captain, he was appointed commander-in-chief in North America; subsequently from 1771 to 1780 he was stationed at Portsmouth, where, in 1778, George III entrusted to him the naval grounding of the future William IV. A baronet (1778) and rear-admiral (1780), Hood was \*Rodney's second at the battle of the \*Saints (April 1782), and was severely critical of Rodney's failure to pursue the French. An Irish peer in 1782, he was returned to Parliament in 1784 for Westminster after a celebrated and fierce contest. Ten years later he conducted, with considerable address, the combined operations which led to the capture of Toulon. Raised to a British viscountcy in 1796, Samuel Hood stood high in the navy's esteem and was outspoken about the primitive conditions under which the lower deck served. DDA

**Hooke, Robert** (1635–1703). Hooke made the microscope well known as a scientific instrument, publishing his *Micrographia* in 1665. Its splendid engraving of the flea made a tremendous impression, and the book opened up a new world below the level of naked-eye observation. Previously, Hooke had worked with Robert \*Boyle on the air pump, and in 1662 had been appointed curator to the \*Royal Society, with the duty of performing experiments at the meetings. He was referee of Isaac \*Newton's first optical paper, and his critical comments made Newton his enemy. Hooke lectured on earthquakes, worked on pendulum clocks, toyed with something like a wave theory of light, and was a great, versatile, and controversial figure in the \*scientific revolution in England. DK

**Hooker, Richard** (1554–1600). Theologian and political theorist. Educated at Oxford, Hooker became a fellow of Corpus Christi College and master of the Temple before 'retiring' to a country living to write his masterly defence of the Elizabethan system of government *The \*Laws of Ecclesiastical Polity*. His intention was to show how in England there was an essential unity between church and state, which were different aspects of a single community, both subject to the authority of the monarch. However, Hooker insisted that the monarch's authority, though supreme, was not arbitrary. It was limited both by being founded on the consent of the people, and by being subject to the rule of law, a body of civil and ecclesiastical statutes originating in Parliament. In this work, Hooker supplied the most effective statement of the theoretical foundations of Anglicanism that has ever been written, and greatly influenced the ideas of later political theorists such as John \*Locke and Edmund \*Burke. TSG

**hooliganism** is public behaviour, usually by a group of young men, which the supporters of law and order find

threatening and disruptive. The term came into use at the end of the 19th cent. when a gang in south-east London, allegedly drawn from Irish immigrants, destroyed much property. Their conduct made no explicit political and social point, which was in some ways more disturbing.

Such rowdy, ruffianly, and apparently motiveless violence has a much longer history than the term hooligan. In \*Peppys's day, gangs of youths, known successively as Hectors, Scourers, and Mohawks, roamed the streets, leering at young ladies and pushing old gentlemen. In 1838 the younger members of the hunting fraternity at Melton Mowbray, a quiet provincial town, 'painted the town red'. Public concern at this behaviour spurts up at intervals. In the 1950s there was considerable anxiety about Teddy Boys, though they were in fact little inclined to violence, which would ruin their clothes and disturb their hair styles. They were replaced in the 1960s by Mods and Rockers, who 'beat up' seaside towns on their motor-cycles. Attention then moved to sporting events. Gangs of teenagers at soccer matches, or on their way to and from events, threw missiles, fought running battles with rival supporters, relieved themselves in front gardens, and became a source of considerable irritation to football clubs, the police, and owners of property near football grounds. The phenomenon became sufficiently disturbing during the 1970s to attract research into the causes of such behaviour and the means of effective control. It is not likely that the phenomenon will be totally eradicated in the 21st cent., and may perhaps be regarded as the price society pays for not sending its young men to be killed every thirty years. IJEK; JAC

**Hooper, John** (d. 1555). Bishop of Gloucester and Worcester. Born in Somerset and educated at Oxford, Hooper probably took Cistercian vows at Gloucester. After the \*dissolution he returned to Oxford to study reformed theology, but fled abroad in disguise and eventually settled in Zurich (1547–9), where he knew the reformer Bullinger. A radical extremist of 'blazing sincerity' and 'intolerable obstinacy', too militant for \*Cranmer, he returned to London as Protector \*Somerset's chaplain. When offered the see of Gloucester (1550), his disagreement with Cranmer over vestments led to brief imprisonment before he agreed to consecration fully robed (1551). A zealous reforming bishop, he set to work, but with the merger of Gloucester and Worcester (1552) he was retitled bishop of Worcester. In Mary's reign he was imprisoned, deprived (1554), and burned at Gloucester. His actions and writings were a potent force in spreading puritanism in England. WMM

**Hopton, Sir Ralph** (1596–1652). One of the most successful royalist commanders during the Civil War, Hopton was given a barony in 1643. Educated at Lincoln College, Oxford, he had fought in Bohemia for the protestants during the Thirty Years War. In the \*Long Parliament, he initially opposed the king, voting for \*Strafford's attainder in 1641. The following year he joined the royalist cause, having on his battle standard the motto 'I will strive to serve my sovereign king.' A west countryman by birth, he spent almost all his time campaigning in that region. He had a good record of success, winning at \*Braddock Down (January 1643),

\*Stratton (May 1643), \*Lansdowne (July 1643, where he was badly wounded), \*Roundway Down (July 1643), before being beaten by his old friend and opponent \*Waller at \*Cheriton in March 1644. Beaten again by \*Fairfax at \*Torrington (February 1646), he was forced to capitulate at Truro in March and went into exile. \*Clarendon called him 'the soldiers' darling . . . the soul of that army'. IJG

**Horner, Francis** (1778–1817). As \*Bagehot pointed out in 'The First Edinburgh Reviewers', Horner had an influence and standing out of all proportion to his career or achievements. It was not just a case of the Whigs buttering up each other: tributes at his death came from all sides of the House. Born and educated in Edinburgh, he was called to the bar in 1800. Two years later he joined \*Jeffrey and \*Smith in launching the \**Edinburgh Review* as a radical Whig journal. He was brought into Parliament in 1806 and made a reputation as a financial expert, chairing an important committee on bullion. After a diffident start, he became a useful and experienced member of the Whig opposition, speaking particularly against the Corn Laws and in favour of catholic relief. He left England at the end of 1816 in search of better health and died in Italy aged 38. Smith related how, during a previous illness, Horner was told to read amusing books: on searching his library it appeared he had no amusing books—the nearest being *The India Trader's Complete Guide*. JAC

**Horne Tooke, John** (1736–1812). A man of many parts (clergyman, philologist, conversationalist, and wit) who carried the radicalism of the 1760s into the early 19th cent. His legal and organizational talents were first apparent in his vigorous championing of \*Wilkes. His subsequent support for the American colonists led to a prison sentence. In 1781 he joined the \*Society for Constitutional Information, which he soon dominated; and in 1792 assisted in the formation of the London \*Corresponding Society. He was tried for high treason in 1794 and acquitted. Although twice unsuccessful, his contest of the Westminster elections helped to prepare the way for the radical triumphs of 1807. Tooke's radicalism, like that of \*Cartwright and others, was based on belief in an ancient constitution which had become corrupted, thus denying the traditional rights and freedoms of Englishmen. JFCH

**horse-racing** consists of flat racing or jumping, 'over the sticks'. Racing became popular during the 16th cent. and the first race-course with an annual fixture was established on the Roodee at Chester in 1540. Racing received support from successive monarchs. James I established a hunting stable at \*Newmarket where he bred horses, Charles I offered a gold cup as a prize for a race in 1634, and Charles II made it fashionable. Noblemen founded stables and became interested in breeding thoroughbred racehorses. Old Bald Meg (c.1659) is the oldest recorded mare in the *General Studbook* and it is argued that every thoroughbred has descended from her.

Racing expanded with courses springing up at Doncaster (1595), York (1709), Ascot (1711), Epsom (1730), Goodwood (1801), and Aintree (1827). In 1750 the Jockey Club was founded to regulate the sport. The first Racing Calendar

was introduced in 1773 and stud books and jockeys' colours followed. Lord George \*Bentinck (1802–48), an influential horse breeder-owner, devised the flag start, race card, paddock parade, and much of modern race-course practice. Highlights of the flat season include the \*Derby, Oaks, and St Leger.

Steeple-chasing derived from horses racing each other cross-country to the nearest church steeple. The concept of a course with artificial fences originated at the Newmarket Craven meeting in 1794. A Grand Annual Steeplechase began at Cheltenham around 1815. In 1866 the Grand National Hunt Steeplechase Committee was formed to establish rules and the first Calendar appeared in 1867. It became the National Hunt Committee in 1889 and merged with the Jockey Club eighty years later. Highlights include the \*Grand National and the \*Cheltenham Gold Cup.

Horse-racing has become synonymous with betting. The on-course Totalizator introduced in 1929 and the Horserace Betting Levy Board founded in 1961 both aimed to distribute betting revenue for the good of the sport. A Joint Racing Board was established in 1968 to facilitate policy discussion between the Turf Authorities and the Levy Board. RAS

**hosiery trade.** The trade had its origins in antiquity and remained a handicraft industry until the 16th cent. when William Lee, a Nottinghamshire clergyman, invented the framework-knitting machine. Many regions of the British Isles had maintained or developed the making of specialized hand-knitted wear, not just for family use but for sale elsewhere. The widespread use of frames had developed by the later 17th cent. making use of long staple wool yarns. The east midland counties of Leicestershire and Nottinghamshire became centres for framework-knitting during the 18th cent. The processes took place in the homes of the workers. Working with frames required light as well as space and so houses were built with large windows in the upper storey. Specialized products included stockings, gloves, caps, and many other types of garment. To a considerable extent, then as now, the prosperity of the industry was determined by the dictates of fashion.

Steam-powered frames were developed only in the second half of the 19th cent., accompanied by other inventions such as William Cotton's patents of 1864 which made possible the knitting of fully fashioned garments. The industry still plays a vital role in the economy of the east midlands, producing a great diversity of textiles. The sophistication of modern machines includes the use of computers to design and control production, superseding Jacquard controls. An important innovation of the 1970s was the lock-stitch, invented by Gordon Wray, which enabled new ways of processing and using textiles.

Until the 19th cent. wool fibres dominated knitting but other textile fibres came into use. In the later 20th cent. not only did man-made fibres for garments become common, but industrial uses of knitting processes utilized other materials such as fibre glass.

It was usual practice for the finishing trades of the bleachers and dyers to develop alongside hosiery. Similarly

suppliers of frames and needles became established in the same geographical areas. IJJK

**Hospitallers.** Originally established at the end of the 11th cent. to care for Jerusalem pilgrims, following the success of the First Crusade the Hospitallers' role expanded, with papal support, to include care of the sick and armed protection of pilgrims. They followed the \*Augustinian rule, and were divided into three groups, the knights, the infirmarians, and the chaplains. During the 12th cent. the order spread rapidly both in the crusading states and in western Europe. The first English priory was founded c.1144 at Clerkenwell and other smaller preceptories or commanderies followed, administering the order's estates, training its knights, and dispensing hospitality. Following the suppression of the \*Templars (1312) most of their possessions passed to the Hospitallers, whose headquarters had been transferred to Rhodes in 1309 following the fall of \*Acre (1291). After the Turkish capture of Rhodes (1522) the order moved to Malta until the island's capture by Napoleon. Its English properties were confiscated in 1540. BJG

**hospitals.** Since Christian tradition emphasized care for one's neighbours rather than their isolation because of disease, monastic infirmaries functioned alongside lay endowments founded on earth to buy grace in heaven; medieval hospices provided care and hospitality for the aged, infirm, and travellers, and were not necessarily devoted just to the sick. The \*dissolution of the monasteries (1538–40) not only ended hospital building in England for almost two centuries but transferred responsibility for much health care from the church to secular hands. St Bartholomew's, St Thomas's, and Bethlem were sold to the city of London, which claimed that the sick poor would suffer if the hospitals ceased to exist but also had regard to their endowments. Despite subsequent growth in London's population, however, it still had only two hospitals of significant size.

With the expansion of both population and the middle classes in the 18th cent. there came a surge of new establishments, initially in the older towns, then the manufacturing centres. The Westminster was established in 1719, to be followed by Guy's (1721) and St George's (1733); Edinburgh Royal Infirmary (1729) was deliberately planned to accommodate students. The mid-Georgian period saw a great proliferation of provincial hospitals and infirmaries—Bristol (1735), Bath (1737), Addenbrooke's, Cambridge (1740), York (1740), Exeter (1741), Northampton (1743), Liverpool (1745), Worcester (1746), Newcastle (1751), Manchester (1754), Gloucester (1755), Radcliffe, Oxford (1759), Salisbury (1767). Still set in the context of charity, social rather than medical criteria determined admission to these voluntary hospitals. Benefactors, whose names were published, were given rights to admit patients according to their contribution, and often sought to exclude the socially 'undeserving' (drunkards and prostitutes). Incurables, fever cases, and venereal patients were excluded from the general hospitals and sent to peripheral town sites such as lock hospitals. Treatment was free, but patients had to conform to strict rules and assist when convalescent. As towns grew, the number and size of hospitals increased, while less-established practitioners set up

## hotels

new institutions such as dispensaries. Entrepreneurs challenged traditional patterns with specialized establishments (Royal National Orthopaedic Hospital, Moorfields Eye Hospital), supported by new explanations of disease; the initial hostility of the general hospitals lessened as they themselves set up specialist departments.

The introduction of general anaesthesia in the 1840s increased the practice and scope of surgery, but high infection rates and deaths from 'hospital diseases' undermined confidence; the medical profession, unsurprisingly, opposed any ideas of hospital disbandment in order to reduce mortality. Florence \*Nightingale's advocacy of good ventilation led to pavilion-plan buildings on elevated sites, but \*Lister's antiseptic approach had more impact in transforming both surgery and hospitals. As medical science progressed, hospitals became increasingly complex because of newly developed diagnostic sciences and techniques such as bacteriology, pathology, and radiology. Hospitals themselves began to lose their charity status and became more attractive: patient demand came increasingly from the better off, workhouse infirmaries took away the poorest patients, whilst the image of nursing was being transformed. Cottage hospitals, established for rural patients, gave the general practitioner access to beds as well as retaining fees that would otherwise have been lost, insurance schemes increased entitlement to admission, while nursing-homes were essentially small private hospitals for the middle classes. Playing a central role in health care by the 1920s, hospitals were under the firm control of the medical staff, but developed financial crises as staffing and medical technology costs rose. The idea of scientific management, to increase institutional efficiency, had been introduced in the late 19th cent., but change was slow.

Despite reluctance at being taken into state service, hospitals formed an important arm of the newly formed \*National Health Service in 1948, emphasis on their role having continued as recent changes seek to move more treatment back into the community. Interventionist and invasive, but now perceived as essential centres for medical education and advances, and prestigious for ambitious staff, hospitals are now very costly, and increasingly regarded more warily through waiting-list times, league tables, and occasional scandals. They remain a popular subject for television programmes. ASH

**hotels** are largely a 19th-cent. development. Until the railway age, travellers stayed mainly at inns and those who visited seaside resorts rented rooms or houses. What hotels existed were small family businesses. But the advantages of a hotel attached to a railway station were obvious and the London and Birmingham railway built one at its Euston terminus in 1839. The Great Western hotel at Paddington in 1852 was on a much grander scale and the Midland railway's hotel at St Pancras in 1873 bigger still. Rail travel also opened up the seaside resorts: Scarborough's Grand hotel was built in 1867. The first large London hotel not owned by a railway was the Westminster Palace hotel in 1860. There followed a period of intense competition, hotels competing with distinguished chefs, palm courts, turkish

baths, and smart liveried staff. The Grand hotel in Northumberland Avenue in 1881 allowed non-residents to dine. The Savoy was built in 1903–4, the Ritz 1903–6, the Hotel Russell 1907–11, the Dorchester 1930. Post-Second World War hotels have clustered round airports and motorways, and the elaborate dining-rooms have given way to conference suites. Railway hotels are for connoisseurs of departed grandeur. JAC

**Hotspur.** See PERCY, HENRY.

**housecarls** were the immediate bodyguard of Danish and late Saxon kings, the nucleus of the army. They were introduced by \*Cnut and were similar to Saxon thegns. They were men of some rank, with a strong code of honour and service. Though by 1066 they did not necessarily reside at court, they were ready at short notice. \*Harold's housecarls at Hastings are said to have died in heaps around their fallen king. Modern scholarship has questioned the extent to which the housecarls formed an élite corps. JAC

**household.** Originally not merely the domestic residence of the monarch but the place from which the kingdom was governed. No very rigid distinction was made between its different functions. But as administration grew more complex and requests for justice more common, offices became more specialized and departments were hived off to undertake particular tasks. By the time of the *Constitutio domus regis* in 1135, there were many separate officers, with the chancellor at the head, followed by the \*treasurer, \*lord high steward, \*chamberlain, \*butler, and \*constable, down to the turnspits, carters, scullions, and watchmen. Early to develop was the \*chamber, which dealt with revenue, and out of which evolved the \*Exchequer and the courts of law. The \*Chancery also developed in England since the size of the kingdom meant more need for writs and instructions, which the scriptorium or secretariat provided. At first the whole household moved from place to place, with only a skeleton staff left behind: when the king was absent in Normandy officers left in England had to possess some discretionary authority. The peripatetic nature of the household became increasingly inconvenient and in clause 17 of \*Magna Carta in 1215 it was declared that \*common pleas would be heard in one place. At length the household and its offshoots settled at Westminster, with other royal palaces in reasonable proximity. A permanent headquarters allowed more comfort and more ceremonial and the household developed into the \*court. JAC

**households.** The study of British households from census-type listings was pioneered by Peter Laslett and his colleagues at the Cambridge Population Group in the 1960s, and was essentially designed to test widely held assumptions about the nature of family life in the past. It was supposed that most people in the past had lived in large households, with several generations under the same roof. In practice, mean household size was relatively small. The average size of household in England before 1750 was just 4.44 persons, rising to 4.81 in the following 70 years. It fell thereafter and by the end of the Second World War was just 3.67 persons. Households in the 1990s are historically the smallest they

have ever been, at only 2.4 persons. Laslett's analysis of household listings, dating from the 16th cent. to 1820, demonstrated that they were also relatively simple in their structure. The predominant form was *nuclear*, that is they consisted of one married couple, with or without children. Relatives other than unmarried children were found in only about 11 per cent of households, and only a handful, some 4 per cent, consisted of more than one married couple. Although some historians disagree and comparable data is lacking, most historians think that this form of household structure has predominated since at least the early medieval period.

The experience of living in households in the past differed from that of today in important respects. To begin with, they frequently contained servants and lodgers. Between 1650 and 1821 between 11 and 14 per cent of the total population were servants (either domestic or working as live-in labourers) and a further 5–6 per cent were lodgers. In 1970 just 1 per cent of the population could be so classified. Again, the proportion of households containing relatives was at its greatest in 1947 (when it was three times more common than in the 100 years before 1750), caused largely it seems by the temporary post-war housing shortage. Living alone has dramatically increased, particularly since 1960. In 1981 those in their 60s and early 70s were five times more likely to live alone than before 1790. There are also some striking similarities. Single parenthood today is only as common as it was in the 16th and 17th cents., although divorce, rather than death, is now the chief cause. JPB

**housing** refers both to shelter in houses and to the provision of houses. It is the latter which has attracted historians, who have been particularly interested in tracing the provision of accommodation in response to population increases in towns and, above all, in cities.

During the industrial revolution large increases in urban populations occurred because of migrations from the countryside and the reduction of the death rate. Housing was initially left to the open market. The provision of accommodation rested on a balance between the cost of building and what households could afford to spend on rents. Speculative builders often borrowed capital for construction from solicitors, who loaned them the money clients had deposited with them for returns which were said to be 'as safe as houses'. A limited number of houses were built by owner-occupiers who had borrowed money from the newly formed building societies. Not all housing was of good quality and some landlords built cheap and often badly constructed buildings, which rapidly became slums because of overcrowding. These slums attracted the attention of Parliament, municipalities, and social reformers. The sanitary laws of the second half of the 19th cent. stipulated minimum standards for new dwellings. Liverpool corporation erected the first council housing in 1867. However the provision of housing at public expense did not become government policy until the 20th cent. The slum clearance law of 1876 did not require local authorities to rehouse the homeless, although in towns where railways took powers to clear sites for stations and sidings they were compelled to provide

alternative new houses elsewhere. Some philanthropic attempts were made to provide good housing for the poor, one of the most active being the Peabody Trust which erected flats in London.

Some industrial developments, for example, coal-mining and some manufacturing using water power, occurred in places where there was no previous settlement. Entrepreneurs provided accommodation for their workers. The quality varied greatly. High standards were adopted by \*Arkwright at Belper (Derbys.) in the 1780s and by Peter Greg at Styal (Ches.). In the 19th cent. model housing was provided by several industrialists, for example Titus \*Salt at Saltaire, Cadbury at Bournville (Birmingham), and in the 20th cent. Lever Brothers at Port Sunlight on Merseyside.

During the 20th cent. successive governments intervened in housing by making loan funds available to local authorities, by subsidies to builders, and by giving tax concessions to owner-occupiers purchasing their homes through mortgages. Little house-building took place in the First World War and by 1918 there was a great unsatisfied demand. The election slogan of 1918 'Homes Fit for Heroes' proved difficult to translate into reality. Few houses were built under the terms of the Addison Act of 1919 because of high interest rates and shortages of materials. Subsidies for housing became available to local authorities by the Wheatley Act of 1924 and for private enterprise by the Chamberlain Act of 1925. The financial crisis of 1931 ended these forms of assistance. However, since the cost of borrowing money dropped, local authorities and building societies were able to advance mortgages to owner-occupiers during the 1930s.

After the Second World War the housing shortage remained acute for some years because no houses were built during the war and much accommodation had been destroyed by bombing. From 1945 to 1955 the greater part of house-building was undertaken by local authorities which built homes for rent. Between 1955 and 1980, largely because of a change in conditions which were more favourable to borrowing, there was a major shift from rent to owner-occupation. By 1980 owner-occupiers held about two-thirds of housing, most of the rest being in the hands of local authorities. During the 1980s legislation gave tenants of local authorities the option of buying their houses at very advantageous prices so that rented 'council housing' took a declining share of the market. By the late 1980s, owner-occupation, albeit with a rising level of repossession due to mortgage arrears, continued to be the most prevalent pattern of housing. In the rented sector, housing associations emerged as the main providers, their finance coming from the government and mortgage lenders. IJJEK

**Housman, A. E.** (1859–1939). Poet and classicist, whose failure at Oxford only delayed a career taking him to chairs of Latin at London and, in 1911, Cambridge. Labour expended on editions of Juvenal, Lucan, and Manilius made him the leading classical scholar of his generation and a formidable reviewer. His emotional life went into his poetry, *A Shropshire Lad* (1896) and *Last Poems* (1922). Shropshire, over the border from his native Worcestershire, became 'the land of

## Howard

lost content', where the beauty of nature is no defence against betrayal and death. He acknowledged affinities with \*Blake and Heine, and his relentless pessimism recalls \*Hardy, though expressed with more elegance and wit. His poems have inspired fine musical settings, and his stoic pastorals are some of the most sheerly beautiful in the late Romantic tradition. He is buried at Ludlow. JNRS

**Howard, Charles, 2nd Baron Howard of Effingham and 1st earl of Nottingham** (c.1536–1624). Howard took advantage of his high birth to sustain a long and distinguished career. \*Anne Boleyn was his first cousin. He was a grandson of the 2nd duke of \*Norfolk, the hero of \*Flodden, and son of Lord William \*Howard, created 1st Baron Howard of Effingham in 1554: he went on to serve Mary as lord high admiral and Elizabeth as lord chamberlain. In 1563 Charles Howard married a daughter of Lord \*Hunsdon, cousin and confidant to Queen Elizabeth: his wife was a lady of the bedchamber for many years. In 1569 he accompanied Hunsdon on the campaign which crushed the northern rebellion and in 1575 was given the Garter. In 1585 he was appointed lord high admiral for life, holding the position until he was 83: he held supreme command when the \*Armada was destroyed in 1588. In 1596, with \*Essex, he stormed Cadiz to forestall another Armada. The following year he was created earl of Nottingham and served as lord high steward until 1615. He remained in busy employment, acting as commissioner for peace with Spain in 1604 and commissioner to treat with the Scots for a union. Of the great naval action in 1588, he wrote to \*Walsingham that the Spaniards were very strong 'yet we pluck their feathers by little and little'. He was accused of being too circumspect, but \*Raleigh wrote that 'Howard was 'better advised than a great many malignant fools that found fault with his demeanour'. In the aftermath of victory he was greatly concerned for the care of his men. JAC

**Howard, Charles.** See CARLISLE, 1ST EARL OF.

**Howard, Ebenezer** (1850–1928). Howard, born in London, made a modest living as a shorthand writer and his importance was as a pioneer of the garden city movement. He believed that unrestricted private development of towns must lead to squalor and the communities which he advocated in his book *Garden Cities of Tomorrow* (1898, 1902) were to be owned by trustees, carefully planned, and surrounded by a green belt. He founded the Garden City Association in 1899 and the planning and development of Letchworth in Hertfordshire began in 1903. In 1919 he followed it with the purchase of an estate nearby at Welwyn. The examples had a vast influence on the planning of new towns in Britain and abroad, particularly after the Second World War. Howard spent the last years of his life on the Welwyn estate and was knighted in 1927. JAC

**Howard, Henry, 1st earl of Northampton** (1540–1614). Howard's father Lord Surrey was executed when he was 7. In Edward VI's reign, he was tutored by John \*Foxe, the protestant martyrologist, but at Mary's accession a catholic bishop took over. The indiscretions of his elder brother the 4th duke of \*Norfolk blighted his prospects in the 1570s.

Howard seems also to have entertained thoughts of a marriage to Mary, queen of Scots, and continued a correspondence with her. He was several times questioned and admitted to catholic sympathies. Not until 1600 did Elizabeth consent to receive him at court. By that time, he was cultivating James VI of Scotland and advising him by correspondence. It paid off handsomely. In 1604 he was created earl of Northampton, given the Garter in 1605, and became lord privy seal in 1608. He joined in the attack upon \*Raleigh and was believed to have been involved in the murder of Sir Thomas Overbury in the Tower. Northampton was reputed a man of much learning, but thought to be a flatterer and a schemer. JAC

**Howard, John** (1726–90). Prison reformer. Howard was born in London and owned a small property at Cardington (Beds.), where he spent the last 30 years of his life. He was an independent in religion, worshipping at the chapel \*Bunyan had served, a teetotaler, vegetarian, and a man of austere habits. In 1773 he was appointed sheriff of Bedfordshire and discovered that prisoners who had been acquitted were unable to leave gaol unless they could pay the gaoler's fee. His colleagues on the bench rejected his suggestion that the gaoler should be paid a salary, leading Howard to embark upon an extraordinary life of prison visits throughout the British Isles and ultimately most of Europe. His *State of the Prisons in England and Wales* (1777) exposed the squalor and brutality of many gaols. He died of typhus while on a visit to Russia and was buried there, though a statue was erected to him in St Paul's. Almost single-handedly, Howard placed the question of prison reform on the agenda. JAC

**Howard, Thomas, 1st Baron Howard de Walden and earl of Suffolk** (1561–1626). Howard's father, the 4th duke of Norfolk, was executed in 1572 when Thomas was 11 for conspiring to rescue Mary, queen of Scots. His mother was heiress to Baron \*Audley of Walden, Henry VIII's lord chancellor, and he inherited \*Audley End. In 1584 he was restored in blood and four years later was knighted for gallantry against the Armada. He served at sea in the 1590s and was given the Garter in 1597. The same year, when he was believed to be on his death-bed, he was summoned to Parliament as Baron Howard de Walden. He was in favour with James I, who made him earl of Suffolk and employed him as lord chamberlain 1603–14. From 1614 to 1618 he was lord high treasurer. His daughter Frances married the favourite \*Somerset and Howard was nearly brought down over the murder of Sir Thomas Overbury. His building programme at Audley End was on a lavish scale and pushed him heavily into debt. In 1619 he was imprisoned in the Tower and fined £30,000 for peculation. Though he was restored to favour in 1620 and the fine reduced, he never recaptured his former influence at court. JAC

**Howard, William, 1st Baron Howard of Effingham** (c.1510–73). Howard was a younger son of Thomas, 2nd duke of \*Norfolk, who died in 1524. He was great-uncle to princess Elizabeth. In the 1530s he served as ambassador to Scotland and to France but was in danger in 1542 when his niece \*Catherine Howard was executed. Howard was

convicted of misprision of treason but pardoned in 1544. In 1552–3 he was governor of Calais. For the last 20 years of his life he held high office continuously as lord high admiral 1553–8, lord chamberlain 1558–72, and lord privy seal 1572–3. He took an active part in repelling \*Wyatt from London in 1554, after his half-brother's forces had been badly beaten, and was rewarded by Mary with the Garter and a barony. He gained some displeasure by protecting the Princess Elizabeth, Froude writing that she owed her life to him. On her succession in 1558 he was in high favour. His son Charles commanded the fleet against the Spanish Armada. JAC

**Howe, Sir Geoffrey** (b. 1926). Howe served in \*Heath's government (1970–4) first as solicitor-general and then as minister for trade and consumer affairs. When the Tories lost the 1974 elections he became opposition spokesman first for social services and then for the economy. In 1979 he became chancellor of the Exchequer under Mrs \*Thatcher, before moving to the Foreign Office after the 1983 election. However, his growing antagonism towards the prime minister over the exchange rate mechanism led her to remove him from that post in 1989. He then became leader of the House of Commons before dramatically resigning in 1990. A grey personality whose rhetoric has been likened 'to being savaged by a dead sheep', he will be remembered chiefly for his part in Mrs Thatcher's downfall. As chancellor he succeeded in bringing inflation down from the high level of the Labour government but at the cost of eliminating a large part of the country's manufacturing base. AS

**Howe, Richard** (1726–99). Descended through his mother from a half-sister of George I, Howe was commissioned in the navy in 1745, seeing active service through to 1758, when he succeeded his elder brother as 4th viscount in the Irish peerage, becoming also MP for Dartmouth until 1782. He was already known as 'the Sailor's Friend'. Promoted admiral in 1770, Howe's professional standing, influence, and conciliatory disposition saw him given wide powers in 1776 to try to negotiate peace in America. After two indecisive years and lacking the ministerial support he expected, Howe gave up in disillusion. Raised to a British peerage in 1782, he relieved Gibraltar that October, and from 1783 to 1788, when he became an earl, was 1st lord of the Admiralty. Imperturbable in demeanour and high professionalism, Howe was notably lacking in lucidity of expression. But his standing as a leader was further enhanced by the \*'Glorious First of June' victory (1794), and his reputation proved important in quelling the \*Spithead mutiny in spring 1797, in which year he received the Garter. DDA

**Howe, William** (1729–1814). Younger brother of Richard \*Howe, William served in the army in Flanders 1747–8, and with distinction in Canada and Cuba 1759–62. Between 1758 and 1780 he was MP for Nottingham, where there was a family interest. Having previously refused to serve in America at the outbreak of rebellion, he arrived in Boston in May 1775, and after \*Bunker Hill was appointed KB. The following May, alongside his brother, William Howe was deputed to offer conciliation to the colonists; but after two years they

resigned this joint commission, and \*Clinton succeeded Major-General Howe. Promoted full general in 1793, Howe became governor of Berwick-on-Tweed and, in 1805, of Plymouth, where he died. In 1799 he had succeeded, on Richard's death, to the Irish barony first conferred on their great-grandfather by George I. Lord \*Melbourne, in his breezy way, told the young Victoria that Howe was 'as brave as a lion, but no more of a commander than a pig'.

DDA

**Hudibras**. Popular satire in mock-heroic style by Samuel \*Butler, in three parts (1662, 1663, 1677). Inspired by a west country knight (a parliamentary army colonel) and his clerk (an independent), with whom Butler had lodgings in Holborn, the two main protagonists are Hudibras, an Aristotelian knight whose intellectual accomplishments have no practical relevance, and Ralpho, his squire, proud of his ignorance and claiming to be divinely inspired. It delighted the royalists but was less an attack on the puritans than a criticism of antiquated thinking and contemporary morals, and a parody of old-fashioned literary form. ASH

**Hudson, George** (1800–71). Born near York and apprenticed to a linen draper, Hudson became a prominent York merchant. Inheriting £30,000 from a relative in 1828, he entered local politics and the developing world of railways. After several years on the city council, he became lord mayor in 1837. Hudson played a leading part from 1837 onwards in creating the railway network in the north. By 1844 he controlled 1,016 miles of railway and had been nicknamed 'the Railway King'. This facilitated his election as Conservative MP for Sunderland in 1845. He was deputy lieutenant of Durham and magistrate in three counties, acquiring estates and houses which became centres of high society. The financial basis of his empire was precarious and he was in trouble by late 1847. By 1849 he was stripped of his railway chairmanships and investigations disclosed much 'cooking' of railway accounts. He never recovered from this catastrophe. NMCC

**Hudson, Henry** (d. 1611). Though clearly a very accomplished navigator, Hudson's life is obscure. However, by 1607 he was employed by the \*Muscovy Company in whose service he reached Svalbad (Spitsbergen). After another northern expedition, he was recruited by the Dutch, for whom he explored Chesapeake and Delaware bays before entering New York harbour and following the Hudson river as far inland as Albany in a vain search for the North-West Passage. Hence the Dutch empire in North America until the 1660s. Meanwhile, Hudson returned to English service in 1610, again to search for the passage to India, entered the bay now bearing his name, and sailed to its southern end. But he and his son were cast adrift by a mutinous crew, who returned home without them. RB

**Hudson's Bay Company**. The company was founded on 2 May 1670 under the patronage of Prince \*Rupert after a voyage in 1668 had proved that access to the fur trade could be established through Hudson Bay. The company fought the French for control of the bay until 1713. Reliance on native peoples to supply furs (criticized as 'sleeping by a

## hue and cry

frozen sea') was challenged by long-distance competition from Montreal, forcing the company from 1774 to establish posts inland. In 1821, the company absorbed its Montreal rivals. Its territorial rights were sold to the dominion of Canada in 1869, but the company continued to trade. GM

**hue and cry.** Early English common law process of pursuing felons 'with horn and with voice' (*hutesium et clamor*), also a proclamation for capture of a criminal or recovery of stolen goods. The outcry could be raised by peace-officer or private citizen, whereupon everyone was duty bound to search and pursue on horse or foot, from town to town and county to county; both constables of the vill or hundred and citizens could make the arrest. Seizure while in possession of incriminating evidence boded ill. The main statutes and amendments (1285, 1585, 1735) were repealed in 1827, though the element of 'citizen's arrest' has persisted. ASH

**Hugh of Lincoln, St** (1140–1200). Bishop. Born in Burgundy and educated in a convent at Villard-Benoît, Hugh was ordained deacon at 19 and subsequently made prior of a small-holding at Saint-Maximin. He became a \*Carthusian in 1160 after visiting the Grand Chartreuse. Known for his holiness, in 1175 he was asked by King Henry II to become abbot of the first Carthusian monastery in England at Witham (Som.) (built as part of his penance for the murder of Thomas \*Becket). He reproached Henry for keeping sees vacant to enrich royal coffers and as a result, in 1186, Hugh was elected to the see of Lincoln, vacant for some time. In 1192 Hugh undertook the rebuilding of the cathedral at Lincoln, a project which continued long after his death. He is said to have had remarkable concern for lepers, tending them with his own hands and often sharing a meal from the same dish. Hugh condemned the persecution of the Jews which spread throughout England in 1190–1. He had a sharp clash with Henry over ecclesiastical patronage, and later refused to help Richard I fund his war with Philip Augustus in 1198 (the first time an English king had been refused a levy). Hugh died in 1200 after undertaking a diplomatic mission to France for King John, and his funeral was attended by the primate of all England, 14 bishops, 100 abbots, an archbishop from Ireland, and another from Dalmatia. \*Gruffydd ap Rhys from south Wales, King William the Lion of Scotland, and King John of England. Twenty years after his death he was canonized by Pope Honorius III, the first Carthusian saint. SMD

**Hugh de Puisset.** See PUISSET, HUGH DE.

**Huguenots**, a term of uncertain origin, were French-speaking (and some Walloon-speaking) protestants of \*calvinistic temper, who fled from two centuries of persecution to seek asylum and freedom of worship in countries more sympathetic to Reformation practices. After the St Bartholomew's Day massacre (1572), the first wave of refugees to Britain were received at already established French churches in London, Canterbury, and Norwich, but hopes that their exile would be short soon faded. Relative quiet in France lasted only until 1661, when there commenced a steady erosion of privileges, culminating in the Revocation of the Edict of Nantes (1685), after which the trickle of

émigrés became a flood, then a torrent. Some 40,000–50,000 Huguenots are estimated to have settled in England, the majority in London (those associated with the silk trade around Spitalfields, professional families in Leicester Fields/Soho) but other communities in East Anglia, the south/south-west, and at Edinburgh; 10,000 are estimated to have settled in Ireland.

A distinct minority element, but deriving much support from their close-knit communities and their faith, they proved highly-motivated, productive, and a considerable economic asset to their new host nation, though sympathetic acceptance was not universal, since their craft innovations and competition were sometimes resented. Involvement in clothing and textiles (especially silks), luxury trades like goldsmithing, watchmaking, glassware, and cabinetry, and the introduction of white paper were complemented by professional expertise in law, banking and insurance, education, and the armed forces, and contributions to the arts and sciences, and freemasonry. Integration and assimilation generally took several generations, though a few refugees migrated on to America. Today only one French church remains in London, but Huguenot names such as Courtauld and \*Olivier are familiar to all, and Huguenot descendants retain great respect for their forebears. ASH

**Hull, Kingston upon.** See KINGSTON UPON HULL.

'**humanism**' is the term conventionally used to describe a set of moral and literary values and techniques chiefly associated with the \*Renaissance of the 15th and 16th cents. It embraced enthusiasm for the Greek and Latin classics in their purest, most original forms; preference for rhetoric over logic as the means to persuade; the belief that good literary education would produce better people; and optimism about mankind's dignity and worth. However, this value-system was neither watertight nor exclusive: 'humanists' varied in their attachment to any of these elements, and often combined them with traditional learning.

Renaissance 'humanism' originated in Italy: even the word 'humanist' in this sense was derived from the Italian for a teacher of grammar. It was through literary and church contacts with Italy that humanism spread to England in the first half of the 15th cent. At first, some English patrons employed Italian secretaries and scribes to prepare for them manuscripts of ancient and more recent texts in the round, open, clear characters favoured by Renaissance book-collectors. Humphrey, duke of \*Gloucester (1390–1447), youngest brother of Henry V, employed such writers as Tito Livio Frulovisi, Antonio Beccaria, Lionardo Bruni, and Pier Candido Decembrio to prepare texts for him. John \*Tiptoft, earl of Worcester (d. 1470), collected books in Italy and patronized English scholars working there. The majority of the early English enthusiasts for humanism, however, were not noblemen but academics and churchmen, especially royal representatives at the papal curia such as George Nevill, bishop of Exeter, or James Goldwell, bishop of Norwich.

By c.1500 the teaching of rhetoric, poetry, and those classical writers neglected in the Middle Ages had become

appreciated at both Oxford and Cambridge universities. Humanist propaganda often depicted the campaign for 'good letters' as a gladiatorial struggle against the 'barbarism' of Gothic Latin and medieval school-logic. The reality, in England as elsewhere, was rather that humanistic studies developed alongside older styles of scholarship, within the traditional institutions. William \*Grocyn (c.1449–1519) introduced Greek studies to Oxford on his return from Italy in 1491. The royal physician and Oxford academic Thomas \*Linacre (c.1460–1524), pupil of Angelo Poliziano, wrote works on Latin composition and also encouraged good medical practice. In 1511–14 John \*Fisher recruited the famous Netherlands humanist Desiderius Erasmus (c.1466–1536) to teach Greek at Cambridge, and fostered the inclusion of humanist courses within the university curriculum.

The apogee of English humanism as a conscious movement was reached in the first four decades of the 16th cent. John \*Colet (1467–1519) learned Greek in Italy and taught at Oxford from c.1497; as dean of St Paul's from 1504 he refounded St Paul's School with a curriculum based on the new classical learning. His pessimism about human nature and emphasis on mordant criticism of failings among the clergy, however, were not typical of all humanists. Thomas \*More (1478–1535), unusually for humanists a lay lawyer rather than an ecclesiastic, cultivated the friendship of Erasmus and produced the most bewildering literary fantasy of the movement, *Utopia* (1516). Sir Thomas \*Elyot (c.1490–1546) in *The Boke Named the Governour* produced an English equivalent of the many treatises on education and politics current in Europe at the time.

As in France, Germany, and Italy, the advent of the Lutheran movement provoked a crisis in English humanism. The older generation of scholars, who had previously mocked or bemoaned the state of the church, rallied zealously to its defence when dogma was threatened. Both Thomas More and John Fisher deployed their rhetorical techniques to lambast reformers such as Luther, Oecolampadius, or \*Tyndale without mercy. Younger scholars such as Thomas Starkey (c.1495–1538) were pulled between two poles of attraction: the household of Thomas \*Cromwell, who encouraged humanist writers to produce work defending the royal divorce, the supremacy, and the changes to religious practice; and the group around the expatriate English Cardinal Reginald \*Pole in Italy, which wavered on the royal marriage before c.1535, was moderate in theological controversy, but stayed loyal to the papacy.

By the mid-16th cent. it becomes impossible to speak of 'humanism' as a distinct entity, because its influence was spread so widely. Renaissance techniques for learning classical languages and editing classical texts became generally accepted. Erasmus' *Colloquies* were repeatedly printed in England well into the 17th cent. Humanist opinions on such issues as structured poor relief, proper family relationships, even maternal breast-feeding became standard elements in the teaching of English protestants. The belief that exposure to vast quantities of Greek and Latin literature, combined with vigorous physical exercise, would produce healthy, moral young men survived in the public school system until about a generation ago. EC

**humanitarians.** The word 'humanitarian' was a 19th-cent. invention and usually had a contemptuous flavour, denoting a tedious, self-advertising busybody. But the roots of humanitarianism run deep. A feeling of concern for one's fellow-creatures is presumably as old as humanity itself, even if it has often been confined to one's own family, tribe, clan, or neighbours. The duty of giving alms and the need for good works was an integral part of the Christian message, though donations were often private in character or local in scale—almshouses, schools, bequests, and charities. In the 18th cent. this stream of philanthropy was reinforced and modified in two ways. First, many of the problems facing a rapidly changing and teeming society could only be attacked on a grander scale, calling for communal or national effort. The early Georgian period saw the establishment of a large number of hospitals, London and provincial, and although often associated with individuals like Thomas Guy or Captain \*Coram, they looked to a wider community for support and maintenance. They appointed management committees, elected trustees, issued appeals to the public, organized concerts to raise funds, sought patronage. This impulse was joined by a stream from the Enlightenment which, for all its occasional fatuities, had generous aspirations—to eradicate serfdom and slavery, to banish torture and barbaric punishments, to improve the lot of debtors in prison and lunatics in mad-houses, to protect women and children from exploitation. Indeed, the *philosophes* have been called 'the party of humanity' and, though they were thin on the ground in England (less so in Scotland), reformers were plentiful. Oglethorpe strove to help debtors, \*Howard campaigned for prison reform, \*Gilbert tried to improve poor relief, \*Wilberforce worked for the abolition of the slave trade, and Jonas \*Hanway—once memorably described as the greatest bore in British history—worked on behalf of orphans and chimney sweeps.

The French Revolution and the atrocities that accompanied it discredited enlightened thinking and for a time \*Canning's 'Friend of Humanity' in the *Anti-Jacobin* was a stock figure of ridicule, a self-important do-gooder. But the tide was too strong to be held back and, once the dark days had gone, humanitarianism reasserted itself. \*Romilly attempted to reduce the great number of capital offences, Elizabeth \*Fry campaigned for women in prison, \*Shaftesbury for children in mines and factories, \*Plimsoll for merchant seamen in peril on unseaworthy vessels. There were improvements in the treatment of the mentally ill, beating and confinement giving way to patience and understanding. \*Gibbeting, slavery, the press-gang, public executions vanished. Flogging in the armed forces disappeared, the stigma of illegitimacy was gradually removed. The advance of democracy meant that, in the 20th cent., humanitarianism became the creed of governments, expected to reform and protect. Crofters were assisted to purchase their plots, industrial workers were protected by safety legislation, the disabled helped and encouraged. The balance to be struck between mollicoddling and indifference has always been debated. The motives of humanitarians have always been mixed. In the 18th cent. the trustees of the

## Humberside

Foundling hospital pointed out that every abandoned infant saved was one more adversary against the French, and much of the public concern in the 1900s about the condition of the people was because of the poor quality of recruits for the \*Boer War. But as a force, particularly in its international role, humanitarianism is neither discredited, nor perhaps exhaustible. 'Do-gooder' is still a term of reproach, as humanitarian was in 1830, but there are worse things to be.

JAC

**Humberside** was a new county established by the Local Government Act of 1972. It was built around the county boroughs of Hull and Grimsby, with a substantial hinterland taken from the East Riding of Yorkshire, from parts of Lindsey in Lincolnshire, and Goole, previously part of the West Riding. There was much opposition to the change, particularly from people in north Lincolnshire, who voted by more than 2 : 1 against the proposal. The Humber bridge, intended to knit the two parts together, was opened in 1981. The administrative centre was Beverley. Humberside was abolished in 1996.

JAC

**Humble Petition and Advice.** The second written constitution of the \*Protectorate, formulated by its second Parliament early in 1657. Originally, its main purpose was to make \*Cromwell king, but it also proposed a new second chamber ('the other house'), to be nominated by him. Other innovations were that no member of either House could be excluded (as many MPs had been in 1656) except by that House's own decision, that the appointment and removal of privy counsellors were subject to Parliament's approval, and that the regular revenue was precisely stated (£1,900,000 was finally agreed). The established church was to have a confession of faith, and the bounds of toleration outside it were more strictly defined.

Cromwell was much drawn to a constitution bearing Parliament's authority, the \*Instrument of Government having only the army's, but he was asked to accept all of it or none, and he did not want the crown. Skilfully, he protracted negotiations for six weeks, until Parliament agreed to let him have the new constitution with the old title. The succession problem was settled by empowering him to name his own successor.

AHW

**Hume, David** (1711–76). Philosopher and historian, the younger son of a strict presbyterian laird, Hume lost whatever Christian belief he had at Edinburgh University in the 1720s. His *Treatise of Human Nature* (1739–40) provided a devastating critique of contemporary metaphysics, which cleared the ground for a genuinely empirical account of human understanding. He devoted the 1740s to clarifying the principles of his philosophy and applying them to contemporary political issues. His massive *History of England* (1754–63) is a neglected masterpiece, which remained a best seller for more than a century. His analysis of party is still one of the most acute investigations of that difficult subject. His account of the rise and fall of the feudal system is now attracting the attention it deserves. In general Hume wanted to reconstruct the political culture of his age and to recommend a 'sceptical Whiggery' to his contemporaries as

the best antidote to party zealotry and the best ally of commerce. In spite of long absences in England and France and in spite of constant friction with the kirk, Hume remained a loyal and much-loved member of the Scottish literati, whose influence on its thought can be traced in its historical, literary, and scientific thinking as well as in its philosophy. He died in 1776, probably of cancer of the bowel.

NTP

**Hume, Joseph** (1777–1855). The archetypal middle-class parliamentary radical. A confirmed \*Benthamite, Hume was an indefatigable speaker in Parliament and organizer of committees, pressure groups, and alliances designed to promote advanced liberal causes. Among these were repeal of the Combination Acts, catholic emancipation, Poor Law reform, disestablishment of the Church of England, repeal of the Corn Laws, free trade, extension of the suffrage, retrenchment in government spending, reform of municipal corporations, and the establishment of London University. He entered Parliament in 1812 as Tory MP for Weymouth after making a fortune as a surgeon in India. By 1818 he was a radical and represented a succession of Scottish boroughs. Hume was a friend and ally of Daniel \*O'Connell and such \*philosophic radicals as John Arthur \*Roebuck, George \*Grote, and Sir William Molesworth.

JFCH

**hundreds** were the principal subdivisions of most English shires from before the Conquest and for many centuries afterwards. Their approximate equivalents in Northumberland, Durham, and Cumberland were called 'wards', in six Danelaw shires 'wapentakes'. Hundreds are first mentioned by name in the laws of \*Edmund (c.940); it is likely that they derive from a somewhat earlier reorganization of local government. The adoption of the new term 'hundred' suggests recognition of the Carolingian *centena* as something of a model. The late Anglo-Saxon hundred was simultaneously a jurisdictional, a fiscal, and a military unit. Through most of the Middle Ages, the jurisdictional function was predominant. The hundred court usually met every three weeks, was attended by a variable number of freemen from the component villages, and exercised petty civil jurisdiction. On two of these occasions each year the sheriff attended to regulate the \*frankpledge system and then criminal justice was done. Hundred courts had a long decline until Victorian legislation (especially an Act of 1867) dismantled them. A few hundred courts were important through serving developing but unchartered industrial areas, e.g. Salford. Many more hundreds kept significance as recognized areas of authority, for \*petty sessional divisions or, ultimately, rural district councils.

JCA

**Hundred Years War.** This term for the Anglo-French hostilities of 1337–1453 was coined in the 1860s but has enjoyed universal acceptance ever since. When the last descendant of the main Capetian line died in 1328, Edward III had a claim to the French throne through his mother. The war which broke out in 1337 arose largely out of Edward's tenure of \*Aquitaine as a fief of the French crown, but was fuelled by dynastic ambition and by English annoyance at French involvement in Scottish affairs. Only in January 1340, however, did Edward adopt the title king of France, initially, it seems, to win Flemish rebels to his cause. He proved

militarily successful in France but the seriousness of his claim to the throne is thrown into doubt by his agreement to a territorial settlement in 1360. When war resumed in 1369, the French had the upper hand until Henry V's victories (1415–19) coincided with civil war and the insanity of the French king, Charles VI. Although Henry's main aim seems to have been to secure territory rather than the French crown, the murder of the duke of Burgundy by the Armagnac faction in September 1419 enabled him to negotiate the treaty of \*Troyes whereby he became both heir and regent to Charles VI. From 1420 to 1435 the English controlled much of northern France, and Henry VI was crowned king in Paris in 1431. The successes of Joan of Arc and the defection of the duke of Burgundy after the Congress of \*Arras weakened the English position, leading to their expulsion from Normandy in 1450 and Gascony in 1453. \*Calais remained English until 1558, but English kings continued to call themselves kings of France until 1802. The 'Hundred Years War' is a misleading term in that it disguises the different phases and variety of causes of the conflict, but it does remind us of the longevity and intensity of Anglo-French hostilities in the 14th and 15th cents.: neither warfare nor diplomacy could produce a permanent solution. AC

**Hunsdon, Henry Carey, 1st Baron** (1526–96). Hunsdon's mother was Mary Boleyn and he was therefore Elizabeth I's first cousin. Since Mary Boleyn was Henry VIII's mistress for a time, it was suggested that he was also Elizabeth's half-brother. He was MP for Buckingham 1547 and 1554. At Elizabeth's succession he was given a barony, followed by the Garter in 1561. Appointed governor of Berwick in 1568, he won an important victory the following year near Carlisle over Sir Leonard Dacres, one of the leaders of the rising of the \*northern earls. The queen acknowledged his services in her own hand in warm and affectionate terms. In 1581 he was made captain-general of the forces on the border, and lord chamberlain in 1585. Much of his time was spent on his duties in the north, which deprived him of some influence. At the crisis of the Armada in 1588 he commanded the troops at Tilbury. He was said to be unpolished and excitable and his capacity for swearing was awesome. JAC

**Hunt, Henry** (1773–1835). Radical reformer. 'Orator' Hunt was a Wiltshire gentleman farmer, whose radicalization followed his imprisonment in 1800 for challenging a colonel of yeomanry and the social ostracism following his adultery. He became convinced of the need for a thorough reform of the existing political system, based on universal suffrage, annual parliaments, and the ballot. In 1816–17 he headed three huge anti-government demonstrations in Spa Fields, London, which established his reputation as a great radical orator (or, as his critics alleged, demagogue). He was arrested for his part at \*Peterloo and imprisoned for 2½ years in Ilchester gaol. Hunt's tactics were those of the mass platform, i.e. extra-parliamentary pressure, legitimized through the constitutional right to meet, demonstrate, and petition. After several unsuccessful parliamentary contests, he was returned for Preston in 1830. He opposed the 1832 Reform Bill as a half-measure which did nothing for the working class. JFCH

**Hunt, William Holman** (1827–1910). Painter. The eldest son of a warehouseman, one of his early jobs was as a clerk in the London agency of Richard \*Cobden, the manufacturer and MP. He entered the Royal Academy Schools in 1844, where he met \*Millais and \*Rossetti, with whom he founded the \*Pre-Raphaelite Brotherhood. Hunt devised the technique of the brotherhood, using bright colours with no strong contrasts of light and shade. He travelled extensively in Egypt and the Holy Land to paint biblical and moral subjects in authentic settings. Among his best-known works were *The Light of the World* and *The Hireling Shepherd*, which were reproduced in great numbers in Victorian Britain. In 1905, the year he was awarded the OM, he published a memoir, *Pre-Raphaelitism and the Pre-Raphaelite Brotherhood*. JC

**Hunter, William** (1718–83) and **John** (1728–93). Scottish anatomists. Intended for the church, William turned to medicine, studying at Edinburgh and London before establishing a private anatomy school in Covent Garden (1746) with dissection on the Paris model. Abandoning surgery for obstetrics, he became physician to Queen Charlotte and delivered all her children. A hard worker, clear lecturer, cultured though frugal, William formed a notable anatomical and pathological collection, and published *On the Human Gravid Uterus* (1774). John, blunt and irascible, no book-lover but a passionate though disciplined enquirer, joined his elder brother in London (1748) before receiving surgical tuition from Cheselden and Pott. After army service in Portugal, he practised surgery with distinction while continuing investigations and experimentation into human and comparative anatomy; granted a royal appointment (1776), he has become regarded as 'the founder of scientific surgery'. The brothers' importance rests not only upon their anatomical discoveries but on their teaching methods which so influenced the early 19th-cent. teaching hospital entrepreneurs, linking structure with function and underpinning diagnostic accuracy by knowledge of physiology and pathology. Their personal estrangement is mirrored by William's collections now resting at Glasgow University, John's at the Royal College of Surgeons (London). ASH

**hunting.** See BEAGLING; FOX-HUNTING.

**Huntingdon, earldom of.** In the 12th and early 13th cents., an earldom acquired and held, though not continuously, by members of the Scottish royal house. Their association with it, which placed them in the front rank of the English nobility, stemmed from the marriage in 1113 between David (later David I) and the heiress Matilda, daughter of Earl Waltheof. Its lands, the 'honour of Huntingdon', sprawled across a dozen shires, but lay mainly in Bedfordshire, Huntingdonshire, and Northamptonshire, and a significant number of tenants—notably the Bruces, Lindsays, and Olifards (Oliphants)—were able to develop Scottish interests and careers. An important weapon in Anglo-Scottish diplomacy, it made Scots kings and princes vassals of the English crown; but it also enabled them to challenge English claims to the overlordship of Scotland itself, by insisting that homage was due for English lands alone. KJS

## Huntingdon

**Huntingdon, Henry Hastings, 3rd earl of** (1536–95). Huntingdon was of royal blood and briefly within reach of the throne. His great-grandmother, countess of \*Salisbury in her own right, was a daughter of the duke of \*Clarence and a niece of Edward IV. Huntingdon was summoned to Parliament in 1559 in his father's barony and succeeded him in 1560. Two years later, when the queen was believed to be dying of smallpox, Huntingdon, as a protestant, was discussed as a monarch to keep out Mary, queen of Scots. Elizabeth recovered and Huntingdon became a trusted servant, given the Garter in 1570 and acting as lord president of the north from 1572 until his death. JAC

**Huntingdon, Lady** (1707–91). Foundress of the countess of Huntingdon's Connexion, Selina Shirley, daughter of the 2nd Earl Ferrers, married the 9th earl of Huntingdon (d. 1746) in 1728. Despite her aristocratic background, her fortune was slender and her marriage a love match. Small in stature but characterful in the extreme, she was converted by her sister-in-law, Lady Margaret Hastings, and joined the methodist society in Fetter Lane in 1739. Coming to know the \*Wesleys, the Welsh evangelist Howell \*Harris, and George \*Whitefield, whose side she took in his dispute with the Wesleys in 1749, she built a number of chapels in such places as Brighton (1761), Bath (1765), Tunbridge Wells (1769), Worcester (1773), and Spa Fields, London (1779), served by ministers trained after 1768 at the college which she instituted at Trevecca, near Talgarth. Thwarted in 1770 by a ruling that her rank did not entitle her to appoint as many Anglican clergymen to be her chaplains as she wished, she registered her chapels as dissenting places of worship under the \*Toleration Act, forming them into an association in 1790. Many of her sixty chapels, like her college, long survived her. Opinion towards her among the nobility varied greatly. The duchess of Buckingham rebuked her sternly for sentiments 'so much at variance with high rank and good breeding', and Horace \*Walpole tried out a variety of jokes at her expense as 'Lady St Huntingdon' and 'Pope Joan of Methodism'. George Lyttelton thought her 'a gentle angel', and George III gave her an audience in 1772, wishing there were a Lady Huntingdon in every diocese. CB; JAC

**Huntingdonshire** was the third smallest of English counties in population until merged with Cambridgeshire by the Local Government Act of 1972: it is now a district council. In pre-Roman days it was on the borders between the \*Iceni of East Anglia and the \*Catuvellauni of Hertfordshire. The origins of the county almost certainly derive from the establishment of a Roman settlement at the point where two roads, from Cambridge and Sandy, joined Ermine Street, just before it crossed the river Ouse. Godmanchester, which arose on that site, was for centuries part mother, part rival to the town of Huntingdon, which developed just north of the bridge and no more than half a mile away. The area passed into the kingdom of the East Angles but was taken over by Mercia, forming part of the first Mercian diocese. In the later 9th cent. it was overrun by the Danes, who seem to have fortified Huntingdon as part of their defensive network of the five boroughs. Reconquered in 920 by

\*Edward the Elder, king of Wessex, it was fortified by him and had both a mint and a market by the mid-10th cent. The earliest mention of the shire is in the *Anglo-Saxon Chronicle* for 1011, when it was once more overrun by the Danes. By the time of the \*Domesday survey, Huntingdon was one of the largest towns in the kingdom. Many of the manors in the county belonged to the church, particularly to the great abbey of Ramsey, and to Thorney and Peterborough.

Huntingdon received a charter from John in 1206 and was granted parliamentary representation in the 13th cent., with two seats for the borough and two for the county. The main weight of property was in the estates at Hinchinbroke, just outside Huntingdon, and Kimbolton in the west. Since the two cousins, the earls of \*Manchester and of \*Sandwich, both supported Parliament, and \*Cromwell himself sat for the borough, the county was firmly in the Eastern Association during the Civil War. Charles I led a forlorn hope into Huntingdon after the battle of \*Naseby but was soon obliged to withdraw.

The county remained overwhelmingly rural. Drained by the Ouse, the western parts were good arable land, the eastern good grazing land. \*Cobbett in 1822 echoed \*Camden in the 1580s in admiring the meadows around Huntingdon—'the most beautiful that I ever saw in my life—it would be very difficult to find a more delightful spot in the world'. The main line from King's Cross to Edinburgh passes through the middle of the shire without causing much disturbance. Godmanchester and Kimbolton slowly stagnated, but the existence of several other flourishing market towns seems to have inhibited the growth of Huntingdon—St Ives and St Neots remain comparable in size, and Ramsey, in the north-east, is considerably bigger. Just before the merger in the 1970s, the population of the county was a little over 80,000. JAC

**Huntly, George Gordon, 4th earl of** [S] (1513–62). Gordon's mother was an illegitimate daughter of James IV of Scotland. His father died when he was an infant and Gordon inherited the earldom from his grandfather when he was 11. He won a success against the English at Hadden Rigg in 1542, was a regent after the death of James V, but was defeated and captured by \*Somerset at \*Pinkie Cleugh in 1547. In 1546–9 he was chancellor [S] and again in 1561, but lost favour with Mary after her return from France. When she gave the earldom of Moray, which he claimed, to her illegitimate brother Lord James \*Stewart, Huntly rose in rebellion. His troops were defeated at \*Corrichie and he died immediately after the battle, being 'gross, corpulent and of short breath'. His son was restored to favour, served as chancellor [S] 1565–7, and died 1576. JAC

**Huntly, George Gordon, 1st marquis of** [S] (1563–1636). Huntly played an important but erratic role in Scotland during the reign of James VI. He succeeded to the earldom at the age of 13 and in 1588 married the daughter of Esmé Stuart, duke of \*Lennox. In the same year he was involved in a rising with Spanish help but was soon restored to James's favour. In 1592 he was responsible for the murder of James Stewart, earl of \*Moray, and in 1594 was once more

in rebellion, defeating a royal force at \*Glenlivet. But he retained James's favour and in 1599 was created marquis. His influence declined sharply after the death of James. After a good deal of religious temporizing he died a catholic. JAC

**Huntly, George Gordon, 2nd marquis of** [S] (1592–1649). Huntly played a curiously ineffective role in Scotland during the Civil War. He spent much of his early life at the court of James I and then in France. In 1632 he was created Viscount Aboyne [S] and succeeded his father as 2nd marquis in 1636. His vast influence in the north-east made Charles I appoint him king's lieutenant in the north. But he was proud, moody, and irresolute. In the skirmishes of 1639 he was overwhelmed by \*Montrose, then acting for the \*covenanters. The hatred Huntly entertained for Montrose seriously weakened the royal cause in Scotland. Though his sons George and Lewis fought alongside Montrose when he waged his great campaign, and George was killed at \*Alford, Huntly remained aloof. He was arrested in 1647 and beheaded in March 1649. His son Lewis was restored to the family honours by Charles II in 1651 and his grandson was created duke of Gordon [S] in 1684. JAC

**Huntsman, Benjamin** (1704–76). Huntsman was born in Lincolnshire, a quaker in religion, and set up as a clock-maker in Doncaster. Dissatisfied with the quality of the steel for springs and pendulums, he began about 1740 a series of experiments near Sheffield to improve cast steel. He experienced great difficulties—technical problems, industrial espionage, and the hostility of the Sheffield manufacturers, who complained that his steel was too dear and hard to handle. For some years he was forced to export mainly to France. But in 1770 he established a successful foundry at Attercliffe, where he is buried. The business was continued by his son and helped to make Sheffield for decades the steel capital of the world. JAC

**Hurd, Douglas** (b. 1930). Former Conservative cabinet minister. After attending Eton and Trinity College, Cambridge, Hurd entered the diplomatic service. He served in Peking (1954–6), at the United Nations (1956–60), and in Rome (1963–6) before leaving to enter politics. In 1966 he joined the Conservative research department and later served as Edward \*Heath's private secretary (1968–74). In 1974 Hurd became MP for Mid-Oxon and managed to make a smooth transition from Heath to \*Thatcher. Considered a moderate, he held various cabinet appointments including Northern Ireland (1984–5) and the Home Office (1985–9) before becoming foreign secretary (1989–95). He is the first former official of the Foreign Office subsequently to become its head. Hurd stood in the leadership contest of November 1990 but came third behind John \*Major and Michael \*Heseltine. He retired in 1995 to take a position in the city. Hurd also has a sideline as a writer of thriller novels. RAS

**Huskinson, William** (1770–1830). Huskinson's father was a country gentleman from Staffordshire, in moderate circumstances, and Huskinson had a career to make. He was in France at the outbreak of the Revolution and became

acquainted with Lord Gower, the ambassador and a Staffordshire man. On their return to England in 1792, Huskinson was employed to help French refugees and became known to \*Canning, \*Pitt, and \*Dundas. In 1795 he was made under-secretary for war with Dundas as his chief and was brought into Parliament in 1796. Though not a ready speaker, he built a reputation as an administrator, particularly in financial matters. He went out of office with Canning in 1809 and returned in 1814 to the comparatively humble post of commissioner of woods and forests, which he held until 1823. Next he became president of the Board of Trade, and on Canning's death \*Goderich made him colonial secretary, with the leadership of the Commons. Huskinson was now a leader of the liberal Tories, with close links to \*Melbourne and \*Palmerston, and an advocate of retrenchment and of modification to the Corn Laws. He stayed in office under \*Wellington, but with increasing friction, especially over parliamentary reform, and his offer of resignation in May 1828 was eagerly accepted. He was in poor health for his last two years and though he could have expected office under \*Grey, he was no longer a rising sun. In September 1830, at the opening of the Liverpool to Manchester railway, he was run down and killed, 'seeming like a man bewildered', by the engine *Rocket*. A shy, awkward man, shambling and devoid of social graces, Huskinson was a strange fish in what was still an aristocratic pond—a man of business of more than common talent. JAC

**Hutcheson, Francis** (1694–1746). Scots-Irish philosopher. Educated for the kirk at Glasgow University, he returned to Ireland, taught at a dissenting academy in Dublin, and became the most prominent member of Viscount Molesworth's radical Whig circle. He made his reputation by publishing three metaphysical treatises between 1725 and 1728 attacking Mandeville's sceptical *The Fable of the Bees*, and attempting to prove that the roots of human sociability lay in a moral sense which would make men and women sociable and virtuous. Professor of moral philosophy at Glasgow from 1729 to 1746, he revolutionized the university's moral philosophy curriculum and attempted to justify toleration and a radical interpretation of the British constitution in terms of the principles of human nature. Distrusted by orthodox presbyterians, he was regarded by \*Hume and Adam \*Smith as an inspirational if misguided student of human nature. His political thought was much admired in colonial America. NTP

**Hutchinson, Lucy** (1620–post 1675). Writer. Studious daughter of Sir Allen Apsley, lieutenant of the Tower, Lucy married John Hutchinson (the regicide) in 1638. Apart from translating Lucretius and writing two religious treatises, she is best known for her *Memoirs of the Life of Colonel Hutchinson* (penned for her own consolation and their children's information, unpublished until 1806), which depicted the life of a puritan family, vividly narrated the progress of the Civil War in Nottinghamshire, and recorded her husband's career with a partisan attempt to justify his political activities. Probably the stronger in character but believing utterly in women's subservience, her devotion led to energetic campaigning to save his life in 1660—Lucy

## Hutton

wrote a letter to the Speaker pleading for pardon (later claiming that this was the only occasion she disobeyed her husband)—and tending him during his final months in the Tower and Sandown castle, Kent (1663–4). ASH

**Hutton, James** (1726–97). Geologist. The son of an Edinburgh merchant, Hutton went to his local university where he studied first chemistry, then medicine. From 1754 he took up farming but maintained his scientific interests, being on close terms with Joseph \*Black. A paper he printed in the transactions of the Royal Society of Edinburgh foreshadowed his major work, *The Theory of the Earth* (1795), which laid the foundations of the modern study of geology. Though overladen with quotations, it offered a coherent and plausible account of the evolution of the earth's crust and insisted that the present could be used to explain what had happened in the past. It explained the steady destruction and reformation of rocks, the origin of fossil deposits at the bottom of great oceans, the effect of volcanic action, and offered a new concept of evolutionary time, which 'is to nature endless'. Of the process of change, he could 'find no traces of a beginning, no prospect of an end'. JAC

**Huxley, T. H.** (1825–95). Biologist, \*Darwin's bulldog, essayist, public figure, and sage, Huxley was one of the most prominent Victorian scientists. After sketchy schooling, he studied medicine in London on a scholarship, and became a naval surgeon. Serving on HMS *Rattlesnake* surveying in Australian waters, he dredged, described, and classified marine invertebrates. Leaving the navy, he sought academic posts, and was appointed to the School of Mines, an ancestor of Imperial College, London. After 1859, he became famous defending Darwin's \**Origin of Species*. He coined the word *agnostic* to describe his attitude to science and to religion, and with John Tyndall and others formed the X-club, promoting professional science free from establishment interference. His lectures to working men were noteworthy, as was his introduction of German laboratory methods into Britain. DK

**Hwicce, kingdom of the.** An Anglo-Saxon kingdom continuous with the diocese of Worcester. Archaeology suggests both Anglian and Saxon settlement in the region and there seems to have been competition between Mercia and Wessex to control it in the early 7th cent., settled by \*Penda of Mercia's victory at the battle of Cirencester in 628. The royal house of the Hwicce, whose earliest recorded kings Eanhere and his brother Eanfrid belong to the second half of the 7th cent., may have been established with Mercian help. Five generations of rulers are known, with several instances of joint rule by brothers. The Hwicce seem to have come increasingly under Mercian domination and the last independent Hwiccan rulers appear as subordinates in the charters of \*Æthelbald and \*Offa of Mercia. By the end of the 8th cent. the province was controlled by Mercian ealdormen and seems to have been closely associated with the family of \*Cenwulf, who became king of Mercia in 796. BAEY

**Hyde, Anne** (1637–71). Though she did not survive to become queen herself, two of Anne Hyde's daughters, Mary (b. 1662) and Anne (b. 1665), became queen. The daughter of

Edward Hyde, earl of \*Clarendon, staunch royalist and lord chancellor to Charles II, Anne met James, duke of York, while she was maid of honour to Mary, princess royal and princess of Orange. Marriage did not take place until September 1660, when Anne was eight months pregnant with a son, who died an infant. After considerable hesitation, not least by her father who feared that his daughter's marriage to the heir presumptive would make him unpopular, the couple were accepted at court. Though Pepys thought the new duchess very plain and she rapidly grew fat, it was said from over-eating, by 1668 he remarked that 'the duke of York, in all things but in his codpiece, is led by the nose by his wife'. She converted to catholicism in 1670 though this did not become public until her death from cancer in March 1671. A patron of the arts and with some talent for sketching, she was repeatedly painted by \*Lely. SMC

**Hyde Park riots, 1866.** Soon after the death of \*Palmerston, Lord \*Russell's government introduced a second Reform Bill, extending the franchise. Opposition by discontented Liberals led to the fall of the government in June 1866 and a minority Conservative administration took office under Lord \*Derby. On 23 July a large \*Reform League meeting called for Hyde Park found it closed. The crowd broke down the railings and clashed with police in reserve inside the park. Lord Stanley, a member of the cabinet, commented that there was 'more mischief than malice, and more of mere larking than either', though a policeman was killed. Nevertheless, when there were further disturbances in 1867 the home secretary, Spencer Walpole, was forced to resign. Matthew \*Arnold awarded the riots a significance they scarcely possessed when in *Culture and Anarchy* he took them as a symbol of the collapse of civilized values in the face of mob rule: 'all over the country . . . [men] are beginning to assert and put in practice an Englishman's right to do what he likes, his right to march where he likes, threaten as he likes, smash as he likes. All this, I say, tends to anarchy.' JAC

**hydrogen bomb.** See NUCLEAR ENERGY.

**hymns.** In the sense in which most people understand the word, hymns are overwhelmingly a product of the 18th cent. They have been described as sacred poetry set to music, and have always been part of the Christian tradition, and the Jewish from which it derived. The psalms and specially composed sacred songs were certainly widespread in Christian worship by the 4th cent., and there is evidence to suggest that some passages in the New Testament, e.g. Ephesians 5, are actually quotations from hymns already in use within a generation or two of the lifetime of Christ.

Hymns in the early and medieval church were less expressions of personal or corporate devotion, than associated with the daily offices sung by members of monastic communities. In England the Reformation saw their virtual disappearance from public worship. There was a deep-seated prejudice against the use of non-scriptural language among many protestants, but the 16th and 17th cents. saw the composition of metrical versions of the psalms, notably by Sterhold and Hopkins (1557) and Tate and Brady (1696).

These attained widespread popularity and were bound in with many editions of the \*Book of Common Prayer.

The work of Isaac Watts and John and Charles \*Wesley revived the popularity of congregational hymn-singing, and Wesley's *Collection* of 1737 is widely regarded as the first hymnal as we understand it. Suspicion of hymnody remained among many Anglicans, who associated it with evangelical 'enthusiasm', and not until *Hymns Ancient and Modern*, a fruit of the \*tractarian movement and \*Anglo-catholic revival, appeared in 1861 was this finally overcome.

Since then the writing of hymns and the publishing of collections has gone on apace among Christians of all traditions, though the appearance of many repetitive 'choruses' alongside hymns expressive of doctrine or personal devotion in recent years, whilst embraced enthusiastically by some, has been viewed with distaste by others. JRG

**Hyndman, Henry Mayers** (1842–1921). Socialist. Born into riches—the West Indian fortune of his grandfather—Hyndman was converted to Marxism by reading *Das Kapital* on board an Atlantic steamer on a business trip. In 1881 he published a kind of précis of it under the title *England for All*, which he distributed to delegates at the first \*(Social) Democratic Federation conference in order to convert them to socialism. This irritated Marx, because Hyndman had not mentioned him by name. From 1884 he edited the leading British Marxist journal *Justice*. A committed anti-imperialist, he opposed the \*Boer War, but then supported the First World War, which estranged him from most of his fellow-

socialists. He also apparently alienated working people by his extremism, and his habit of quoting from Virgil in Latin in his speeches to them. He is probably the only western Marxist leader ever to have played county cricket for Sussex; but that was before he saw the light. BJP

**Hywel** (d. 949/50), king of much of Wales (c.904–49/50), known as Hywel Dda ('the Good'). The grandson of \*Rhodri Mawr, king of \*Gwynedd, he and his brother inherited \*Seisyllwg from their father Cadell. After his brother died (920), he became sole ruler. He extended his authority into \*Dyfed c.904, when he married Elen, probably the daughter of its last king; Gwynedd and \*Powys fell into his grasp when their king was killed by the English in 942. Faced with Viking threats, Hywel acknowledged the English kings \*Edward the Elder (918) and \*Athelstan (927) as his overlords; he visited their courts, witnessed their charters, and called his son Edwin. Like King \*Alfred he visited Rome (928), and Alfred's example may have inspired the codification of Welsh law which tradition attributes to Hywel. The earliest surviving texts of 'The Laws of Hywel Dda' date from the early 13th cent., but parts seem older and may have been codified by Hywel. A silver penny inscribed *Rex Houel* is said to have been minted by him; though if true, it would have been minted at Chester rather than in Wales. His dominion disintegrated after his death, but Hywel's reputation as 'the head and glory of all the Britons' flourished and in the early 12th cent. he was described as 'the Good'. RAG

**ice hockey** was pioneered by McGill University in 1880 and spread rapidly throughout Canada and the USA. A small English league was formed in 1903 and the first Scottish game was played in 1908. A British Ice Hockey Association was formed in 1914 and the sport was introduced into the Olympics in 1920. JAC

**Iceni.** British tribe and *civitas*. The tribal coinage, which carries the name ECEN or ECENI, suggests that the tribe were restricted to Norfolk and parts of Suffolk and Cambridgeshire. Their first appearance in written history is probably in Caesar's account of his British expeditions, where he refers to a tribe called the Cenimagni. They appear to have been a wealthy and powerful tribe in the 1st and 2nd cents. BC, for from their territory come the finest hoards of gold torcs found in Iron Age Britain. Other hoards of elaborately decorated bronze chariot fittings also point to a love of conspicuous display by the nobles of the Iceni. This wealth may well have continued through the period of the Roman occupation, for some of the finest hoards of Roman gold- and silverware have also been found in or close to Icenian territory. Initially their contacts with the Roman invaders were not unfriendly, and the Icenian king Prasutagus became a client-king of Rome. On his death, however, his kingdom was incorporated into the Roman province and this, and other alleged abuses, led to the Icenian revolt, led by Prasutagus' widow \*Boudicca. No doubt this set back plans for the Iceni to be given self-governing status as a *civitas*, but eventually that was accorded the tribe and their capital was established at \*Caistor St Edmund (Venta Icenorum). Despite the tribe's apparent wealth, the town remained unusually small (under 35 acres) and poorly developed for a *civitas*-capital. KB

**ice-skating** in its simplest form dates back many centuries, with skates made out of animal bones. It became fashionable in the 18th cent. and a London Skating Club was founded in 1842. Speed skating held its first international competition at Hamburg in 1885 and was admitted to the Olympics in 1924. Ice rinks were built in large numbers after one was opened in Manchester in 1877. Figure skating had its first world championship at St Petersburg in 1896 and pair skating in 1908. The popularity of the sport was much increased by Sonja Henie of Norway, who won ten consecutive world championships for figure skating between 1927 and 1936 and appeared in a number of films. In the 1980s Jayne Torvill and

Christopher Dean achieved vast popularity, winning world, Olympic, and European ice-dance titles in 1984 before turning professional. JAC

**Icknield Way.** A trackway which runs from the central Thames, through the Chilterns, and northwards to the Wash near Hunstanton. Though claims are made for a prehistoric origin, it is doubtful that such long-distance trackways existed, at least as a single entity, until the Iron Age at the earliest. At Baldock, the Icknield Way was certainly being formalized in the early 1st cent. AD by the digging of side ditches, but an earlier Iron Age date may be claimed from the dikes which cut across its line in the Chilterns. JRC

**iconoclasm.** Image-destruction has been a constant possibility in Christian history, for while for some artistic expression in sculpture, painting, or stained glass expresses the soaring upthrust of the soul to the divine, for others it is a distraction, 'obnoxious lumber' to be abhorred and discarded. For John of Damascus, what the written word was to the lettered 'the icon is to the unlettered'. The Byzantine iconoclastic controversy (7th–9th cents.), driven by the astrigent impact of Monophysitism, Manicheism, and Islam, created widespread devastation and led many to retreat, for instance, to the caves of Cappadocia. Medieval Cistercians, preferring their own stark abbeys, abhorred contemporary Cluniac embellishment. The 16th-cent. Reformation unleashed another iconoclastic trail of destruction, approved by Zwingli, though himself a lover of art and music, but shocking to Luther. Though Calvin was no extreme iconoclast, his followers wreaked havoc in 16th-cent. France and Scotland and 17th-cent. England, where in the Cromwellian period much of her heritage of medieval stained glass and statues was destroyed and wall-paintings whitewashed. Bible and sermon replaced imagery. WMM

**Ida** (d. c.559), king of Bernicia (c.547–c.559). Founder of the \*Bernician royal house from whom all subsequent Bernician and, after the reign of \*Oswui, Northumbrian kings with genealogies surviving claimed descent. One written tradition records that his grandfather Oesa was the first of the family to come to Britain. \*Bede believed that Ida came to the throne in 547 and ruled twelve years. His calculation appears to have been made by working backwards through a regnal list, but it is not certain that all the early

Bernician kings ruled concurrently or have had their regnal years recorded accurately. In Northumbrian tradition Ida is associated with the conquest of the area around \*Bamburgh. BAEY

**Idle, River, battle of the.** See RIVER IDLE, BATTLE OF THE.

**immigration** refers to settlement in a country not one's own. It has been a characteristic of the British Isles from earliest times, often through invasion and subsequent colonization, as well as through peaceful movements of individuals and groups. Historians can trace patterns of immigration from archaeological remains, and from the persistence of languages and place-names, as well as from historical records.

Celtic peoples came to the British Isles from the European mainland centuries before the Roman invasion of the 1st cent. AD. Celtic languages, Erse, \*Gaelic, Manx, and Welsh, continue to be spoken in Ireland, Scotland, Isle of Man, and Wales. In Cornwall, the Celtic language was spoken until the 18th cent. and even now is preserved in Celtic literature. Within the areas where these languages were spoken there were often separate legal traditions, particularly concerning landownership.

In those areas of the British Isles which formed part of the Roman empire immigrants settled alongside the indigenous people. After the Roman empire collapsed in the 5th cent., Angles, Saxons, and Jutes from continental Europe moved into most of what had been the Roman provinces. They were followed between the 9th and 11th cents. by Scandinavian immigrants, many of whom settled in the \*Danelaw, those parts which became Derbyshire, Leicestershire, Lincolnshire, and Nottinghamshire as well as further north, particularly Yorkshire.

The Norman Conquest of 1066 brought settlers from various parts of northern continental Europe. Many continued to use the French language and maintained cultural and dynastic ties with their former homelands. Initially their prestige and military power set them apart. However, by the 14th cent. they had mingled with the indigenous population to such an extent that Anglo-Saxon and French had blended to form the English language and, in various arts, including architecture, distinctive English styles had emerged.

Some groups of immigrants remained identifiable. For example the \*Jews, who arrived in Britain after the Normans, kept their religious and ethnic differences, but were dependent on royal protection to keep them from persecution. In addition Jews were forbidden to hold land and undertake a variety of trades and often they made their living by money-lending, an activity nominally forbidden for Christians. In 1297 Edward I expelled the Jews, after he had exploited their financial resources. Although it is not known whether all Jews left the country, there are records of Jews active as doctors in England during the reign of Elizabeth I. However, they did not receive religious toleration until the Protectorate of Oliver \*Cromwell in the mid-17th cent. After that time there were further immigrations as a result of persecutions, particularly in the Russian empire during the 19th cent., and the Nazi regime in Germany dur-

ing the 1930s. Other minorities have also settled in the British Isles. \*Gypsies first came to Britain in the 15th cent., and in the 16th and 17th cents. numbers of protestant Christians came to England fleeing from persecution by Roman Catholics in Europe. Amongst these the largest identifiable group was the \*Huguenots, who left France because of the hostility of Louis XIV. They brought with them economically important craft skills relating to silk textiles and created for themselves positions of wealth and prestige in their adopted country. Starting in the 17th and continuing into the 18th cent. black slaves were brought to Britain. Their number is unknown and their history has only recently attracted any attention.

To a considerable extent immigration during the later 19th and 20th cents. was characterized by the recruitment of workers with skills which were in demand. For example, a shortage of clerical labour in London gave rise to the recruitment of German clerks, as well as well-educated Germans who could develop applications of science and technology in industrial chemicals. Similarly in the 20th cent. after the Second World War labour shortages at all levels prompted the recruitment of workers from the Commonwealth and former empire, such as the West Indies, the Indian subcontinent, and western Africa. These workers were recruited to vacancies in a range of occupations in the health service, in public transport, in local government, as well as in textiles and heavy engineering.

Since the 1960s the right of immigrants to settle in Britain has been subject to ever stricter political control focused on the definition of citizenship. The period after the Second World War was also marked by the immigration of refugees and others from communist-dominated societies in eastern and central Europe. See also ASYLUM. IJEK

**impeachment** was a trial by the House of Lords at the instigation of the House of Commons, which presented articles and arranged the management. The first clear example was the presentation in 1386 of Michael de la \*Pole, earl of Suffolk, but the practice became common in the 17th cent. with the struggle between crown and Parliament, when a number of royal ministers—\*Bacon, Middlesex (\*Cranfield), \*Strafford, and \*Danby—were impeached. In 1710 the Whig government attempted to use impeachment against its critics by prosecuting Dr \*Sacheverell, but it misfired badly. The impeachment of Warren \*Hastings, which went on for seven years and ended in acquittal, helped to discredit the process and the impeachment of Henry \*Dundas, Viscount Melville, in 1806 for peculation was the last. Impeachments were normally held in Westminster Hall with the lord high steward or the lord chancellor presiding JAC

**imperial conferences.** The development of the white dominions from Canada onwards (1867) implied some structure for liaison and consultation within the empire. In 1884 the Imperial Federation League was set up to lobby for closer union, and the first conference met in 1887 when the leaders were in London for Victoria's \*Golden Jubilee, the main discussion being imperial defence. A second conference at Ottawa in 1894 discussed cable laying in the Pacific, and a third met in London in 1897 to coincide with

## imperialism

the \*Diamond Jubilee, when it was agreed to hold regular meetings. The autonomous character of the dominions was reaffirmed by the statute of \*Westminster in 1931. After the Second World War, the name was changed to Commonwealth conferences and the number of participants increased considerably. In 1949 the conference accepted that India could be a republic yet remain in the Commonwealth and in 1961 the conference insisted on a declaration against apartheid, which drove out South Africa. After 1969 it was agreed that London would not necessarily be the venue and that conferences should be held every other year. In 1996 there were 51 countries entitled to send their heads of government to the meetings. JAC

**imperialism** was not used in its modern sense until the later 19th cent. Before then it usually referred to the aggression of Napoleon Bonaparte. That does not mean of course that it cannot be used retrospectively, to describe the origins and growth of the \*British empire in Stuart and Hanoverian times, for example; but the convention is to call these 'colonization', and to restrict the word 'imperialism' to the later period. It has also taken on a wider meaning. It usually refers to territorial acquisitions, but can also cover extensions of power or influence which fell short of that. 'Economic imperialism', for example, means the process by which an economy extends its financial control over others. \*Missionary endeavours have been labelled 'cultural imperialism'. Sometimes all these different kinds of British expansion in the world are lumped together as 'informal imperialism'.

It has been explained in various ways. Missionaries used to attribute Britain's imperial successes to the will of God. 'Social Darwinists' thought they proved the British race was 'fittest' to survive. An Austrian sociologist called Joseph Schumpeter saw imperialists as a throwback to feudal times. Dr Ronald Hyam argued that the male sex drive had a lot to do with it (*Empire and Sexuality*, 1991). The favourite theories, however, are economic. At the root of imperialism lay Britain's phenomenal commercial expansion following her industrial revolution. That gave her worldwide material interests, which needed to be secured. Later, according to J. A. \*Hobson, the Marxists, and some capitalists (like \*Rhodes), that need grew desperate, as capitalism began 'over-producing', and the industrialized countries began competing with each other for outlets. That, however, is controversial.

At its height, around 1900, imperialism also took on a domestic character. Britons forgot the old Napoleonic connotations, and took pride in their imperialism. At its crudest, this pride manifested itself in \*jingoism; but it also had a more responsible side. All the main political parties—even Labour—sprouted imperialist wings. Keeping up the empire, they insisted, had implications nearer home. It could not be done with a weak, stunted, fickle population, especially in the competitive world of that time. That led some of them to advocate state intervention in order to strengthen people's bodies and loyalties, known as 'social imperialism'. That had an impact on the Liberal government's reforms of 1906–14. Later it created an unlikely bond between Tory

imperialists and more conventional kinds of socialists, which kept free marketism at bay in Britain for many years.

By 1902 it was clear that the empire was stretched about as tight as it could be without bursting, and imperialists turned away from expansion to consolidation. An imperialist became someone who wished to federate the empire: economically (through \*imperial preference), militarily, and even politically. Many of these imperialists were highly idealistic, and even liberal in their vision of a great multiracial empire, which would bring peace and civilization to the world. Some of them hoped that the post-Second World War \*Commonwealth might achieve all this, only to be disappointed in the longer run.

\*Decolonization did not bring an end to imperialism, especially in the more 'informal' sense of the word. British capitalism still lords it over other economies. Conversely, Britain could be said to be an economic colony of her own creditors. The 1982 \*Falklands War was widely taken to represent a reversion to an imperialism of a more traditional kind. For many foreigners, especially, it proved that Britain was still infected by the virus. That may have been unfair. BJP

**imperial preference.** This was a favourite nostrum of late 19th- and early 20th-cent. imperialists to bind the empire together by levying lower tariffs on colonial imports than on others. The colonies were supposed to reciprocate. Joseph \*Chamberlain championed it from 1903. But there was a snag. Britain still adhered to \*free trade. You cannot grant more preferential tariffs than none at all. Chamberlain wanted a tax on imported corn, to make this possible, but that was rejected at the election of 1906 because it would mean dearer bread. So the imperialists had to wait until 1932, when food import tariffs were introduced generally again, and a series of bilateral agreements negotiated with the dominions and colonies to favour them. Imperial trade increased thereafter, though that may not have been wholly due to this. After the Second World War the policy slowly declined, as a result of American pressure, the General Agreement on Tariffs and Trade (1947), and Britain's adhesion to a rival trading unit—the \*European Economic Community—in 1973. BJP

**Imphal, battle of**, 1944. In March 1944 the Japanese 15th Army under Mutaguchi advanced over the river Chindwin into India towards Imphal and Kohima. \*Slim's 14th Army was taken by surprise, but three divisions were able to take up defensive positions around the town of Imphal on 4 April. The Japanese besieged Imphal on the following day, the British garrison being sustained by an airlift of men and materials. Imphal was relieved on 22 June after bitter close-quarter fighting. Japanese offensive power was severely damaged at Imphal and Kohima, and they were forced to fall back to Burma. GDS

**impositions.** Tudor sovereigns received lifetime parliamentary grants of customs duties called \*tonnage and poundage, but as inflation reduced the royal revenue they had recourse to impositions—additional prerogative levies on imports, first collected under Mary I. Impositions were the subject

of a legal challenge in 1606, but the court upheld the crown's right, thereby enabling James I's treasurer, Robert \*Cecil, greatly to expand their range and yield. The Commons never accepted the validity of these non-parliamentary levies, and they were a cause of constant friction with both James I and Charles I. They were finally declared illegal by the Tonnage and Poundage Act of 1641. RL

**impropriations.** Impropriation was the assignment of a benefice to a lay proprietor, as distinct from appropriation to a monastery. In either case medieval benefices were served by poorly paid vicars or curates, while the rectors, who received the income, were often licensed, privileged absentee pluralists, yet valuable members of the community as royal civil servants. When the monasteries were dissolved, many appropriated monastic benefices were impropriated, causing Matthew \*Parker, for instance, great difficulty as primate in curbing Elizabeth's rapacious courtiers. Lay impropriators, as \*Tenison noted (1713), were known for seeking cheap and often indifferent curates. An effective Whig 1830s reform insisted on incumbents being resident. WMM

**Inchiquin, Murrough O'Brien, 1st earl of [I] (c.1614–74).** Inchiquin, a protestant, was one of several commanders who played a semi-independent role in the confused situation that followed the Irish rising of 1641. He had succeeded to the barony of Inchiquin in 1624 when he was about 10. He took up arms against the catholic Confederation and inflicted several defeats upon it in Munster. Passed over by Charles I for the presidency of Munster, which he expected, he joined the parliamentary side in July 1644 and working with \*Monck won an important victory over the Confederation troops at Knockmanus near Mallow in 1647. But the following year he rejoined the royalists. Driven into exile when \*Cromwell landed, he was raised to the earldom by Charles II in 1654, converted to catholicism, and fought for the French. At the Restoration he was given back his Irish estates with substantial compensation. Though the complex situation does much to explain his tergiversations and he could never be entirely sure of his army, his political and religious shifts do not suggest steadiness of purpose. JAC

**income tax** was introduced in 1799 by William \*Pitt's government to fund the war against the French. Proposing the legislation Pitt pointed to evasion of existing assessed taxes and claimed that the levies on income were equitable if not 'perfectly free from the objection of inequality'. The final form of the income tax system was embodied in the Act of 1803, the creation of \*Addington, prime minister and chancellor of the Exchequer.

The need for a new tax arose from unprecedentedly high expenditure on the British armed forces and on subsidies to the allies. Simultaneously, interest payments on the national debt had increased because the government continued to finance some expenditure by raising further loans. Many supposed that income tax would be a temporary expedient of war and in fact Parliament repealed the tax in 1816 and ordered the commissioners for the affairs of taxes to destroy their records. Although this was done, duplicates remained with the king's remembrancer.

Raising revenues continued to present problems to chancellors of the Exchequer. Moves towards \*free trade had led to the abolition of many indirect taxes on goods and services, and in addition the introduction of the penny post in 1840 reduced revenues from the postal services. In 1842 Sir Robert \*Peel proposed that 'for a time to be limited, the income of the country shall be called upon to contribute to remedying this growing evil [the deficit]'. No chancellor since 1842 has removed income tax.

The 1842 income tax followed closely the administrative mechanisms established in the Act of 1806. There were only two differences: the minimum income taxed was £150 instead of £50, and the assessment of taxes on incomes from commercial activity was subject to the scrutiny of special commissioners to prevent fraud and evasion. Incomes were taxed under five Schedules: A, income from land and buildings; B, farming profits; C, funds and annuities from public revenues; D, profits and interest; E, income from employments, annuities, and pensions. These schedules remain until the present time with the exception of A, which was abolished in 1963.

Although \*Disraeli proposed, in 1853, the abolition of income tax by 1860, the expense of the \*Crimean War encouraged \*Gladstone to keep it. Government expenditures on defence continued to rise and after 1906 the cost of defence and social welfare increased rapidly. David \*Lloyd George's 'People's Budget' of 1909 imposed, for the first time, income tax with rates varying according to the ability to pay. Thus income tax became more than a device for raising revenue and was a step towards redistribution of income. During the First World War alterations in the rates of tax on incomes offset some costs of warfare. The highest personal rate was known popularly as 'supertax' and the prosperity of firms involved in wartime activities incurred Excess Profits Duty. Higher personal taxes remained after the war ended, a Corporation Profits Tax replacing the Excess Profits Duty.

Although changes in the rates of income tax occurred between the two world wars, the \*Second World War required both more revenue and limits on demand inflation. This latter threat arose from higher wages seeking inadequate quantities of goods and services. The year 1941 saw the introduction of a new type of levy, reimbursable post-war credits, at the rate of 10s. (50p) in the pound, to enforce savings. Repayment was slow; many taxpayers waited as long as 20 years for their money. Simultaneously the surtax rate increased to 19s. 6d. in the pound.

Since 1945 reductions in the standard rate have occurred, although rates have always remained above those of peacetime in earlier periods. IJEK

**Indemnity and Oblivion, Act of, 1660.** Restorations after long exiles usually disappoint the loyalists since there are so many claims to be rewarded. In the declaration of \*Breda, Charles II had promised a general amnesty and the Act of 12 Car. II c. 11 put it into effect, 'to bury all seeds of future discords'. Fifty persons who had signed the death warrant of Charles I and those who had been involved in the Irish rising of 1641 were expressly excluded. But the many changes in

## Independent Irish Party

landownership which had taken place during the Commonwealth were ignored, leading royalists who had suffered severely to jeer that it was indemnity for enemies, oblivion for friends. JAC

**Independent Irish Party.** The forerunner of the \*Irish National Party put together by Isaac \*Butt and \*Parnell. It was formed by about 40 Irish MPs in 1852 to assist the \*Tenant League campaign and to obtain the repeal of the \*Ecclesiastical Titles Act. But it split badly between Catholics and Protestants, sympathizers of the Liberals and of the Conservatives, and those who gave priority to land reform over the religious question. The latter were known to their admirers as 'the Irish brigade', to their detractors as 'the Pope's brass band'. It collapsed within a few years, one of its founders, Charles Gavan \*Duffy, emigrating to Australia. JAC

**Independent Labour Party (ILP).** The party was established in 1893 at a conference in Bradford, composed of 120 delegates largely drawn from the industrial north and Scotland and chaired by Keir \*Hardie. By 1910 it had a membership of 28,000. Although the word 'Socialist' was deliberately excluded from its title, the ILP was still attacked by Liberal trade unionists. Chronic lack of union funding and modest successes at local and parliamentary elections led the ILP to take the initiative in forming the Labour Representation Committee in 1900. With the outbreak of war, a significant number of ILP members including Ramsay \*Macdonald adopted a pacifist stance. Some became involved in the \*Union of Democratic Control, thereby strengthening contact between Labour and left-wing Liberals.

The end of the war saw the ILP lose its seat on the NEC and much of its influence, as individuals could now join a Labour Party constituency association. However, under the skilful Clifford Allen, the ILP developed into a significant socialist pressure group. Its most important document was *Socialism in our Time*, which anticipated many of the later \*Atlee government reforms.

Disappointment over the second Labour government (1929–31) accelerated the leftward drift of the ILP and made many of its members rebellious in Parliament. As a result the party, under the Clydeside firebrand Jimmy \*Maxton, disaffiliated from Labour in 1932. The consequences of disaffiliation were far reaching. By 1935 the ILP, which assumed a neo-Marxist character, had fewer than 5,000 members, only a quarter of the previous figure. However, the party still played an important role in the Unity Campaign, hunger marches, and anti-fascist activities. In 1939 the party opposed an 'imperialist war' and its decline continued after 1945. Yet the ILP continued to exist and rejoined the Labour Party in 1975. LHM

**India,** or Hindustan, was named by the Greeks after the Indus valley. Its dominant civilization was Hindu and Buddhist but, from the 11th cent., it was subject to successive waves of conquest from the Islamic north. The most famous of its conquerors were the Mughals, who established their empire in 1526. In the age of exploration, the first Europeans to arrive were the Portuguese who developed a sea-borne

empire centred on Goa. In the early 17th cent., the Dutch displaced the Portuguese, but India was peripheral to their principal interests in Java. The English \*East India Company established its presence from the 1610s and concentrated on the textile trade. The French arrived in the 1660s. From the 1720s, the power of the Mughal empire started to decline. A series of regional successor states replaced it, in all but name, and extended war-frontiers against each other. In Europe, France and England also found themselves at war in this period and their respective companies carried on the conflict by constructing alliances with the successor states. Both were also drawn deeper into Indian politics by the prospects of wealth made from banking, monopolies, and trade with China. At first, the French under Dupleix had the upper hand. But, from the late 1740s, the English company's fortunes began to turn as Robert \*Clive won a series of military victories. The major threat posed by the French was eliminated after the battle of \*Wandewash in 1760. However, even before that, Clive had begun to lay the foundations for empire at the battle of Panipat in 1757, which made him the 'kingmaker' in Bengal, India's richest province. For the next thirty years, there was some hesitancy in British circles at building on these foundations. But, during the Revolutionary and Napoleonic wars, the opportunity was seized and by 1818, with the defeat of the Maratha empire, the East India Company had gained supremacy. After the \*Indian mutiny of 1857, however, the company was abolished and sovereignty passed to the British crown. In the 19th cent., India was undoubtedly Britain's most important colony. It provided a free army, a field for capital investment and a captive market for British goods. After the First World War, both its military and economic status began to decline and a mass nationalist movement emerged under the leadership of Mahatma \*Gandhi. As early as 1920, the British began to clear the way for 'responsible self-government' and, by 1935, had drawn up plans for India's eventual conversion into a dominion. However, the Second World War cut short this programme of devolution and promoted an extremely hasty retreat. 'Communal' problems also arose between Hindus and Muslims to complicate withdrawal. British India was partitioned into the separate states of Pakistan and India, which became independent on 15 August 1947. DAW

**India Bill, 1783.** An abortive reform of the \*East India Company, drafted largely by Edmund \*Burke and introduced by the Fox–North coalition. Opponents expressed exaggerated fears that the patronage thus created would give the coalition a stranglehold on power. The actual cause of the bill's defeat in the Lords in December 1783 was the resentment of George III against his ministers and the underhand pressure he brought to bear by letting it be known, via Lord Temple, that anyone voting for the bill would henceforth be treated as a personal enemy. Secret and prior negotiations with \*Pitt allowed the king summarily to dismiss the coalition. DW

**Indian mutiny.** On 10 May 1857, sepoys of the Bengal army shot their British officers and marched on Delhi to restore the aged Mughal emperor, Bahadur Shah, to power. The

mutiny spread down the Ganges valley—to Agra, \*Cawnpore, and \*Lucknow—and into central India. It encouraged a widespread civil revolt against the institutions of British rule. Existing 'loyalist' forces were unable to quell the rebellion and reinforcements had to be called from China. It took until December 1857 for Sir Colin \*Campbell's army to reoccupy the key strategic points along the Ganges valley and the last vestiges of armed resistance were not stamped out before the spring of 1859. The causes of the mutiny (by no means the first in British Indian military history) lay in attempts to impose British-style army discipline onto Indian warrior traditions—the celebrated issue of cartridges greased with animal fat being symptomatic of wider problems. The vehemence of the civil rebellion reflected the anxieties of aristocracies and peasant communities at threats posed to them by aggressive policies of westernization, especially under Lord \*Dalhousie. The events of 1857 marked a watershed in Indo-British relations. Afterwards, the British came to doubt the possibilities of a rapid social transformation and treated their Indian subjects with increasing suspicion. The army was reorganized to improve British surveillance. State policy became more conservative and politically defensive. DAW

**Indulf** (d. 962), king of 'Scotland' (954–62). His father was Constantine II and his mother was (probably) Danish, which would account for his Danish name. He succeeded Malcolm I, and extended the kingdom's territory south across the Firth of Forth to include Edinburgh. His reign witnessed a resurgence of Scandinavian incursions. A fleet of Vikings was defeated in Buchan, and Indulf himself perished in battle against a Norwegian force at 'Invercullen' (either Cullen, 55 miles north-west of Aberdeen, or Cowie, 15 miles south of Aberdeen). A 17th-cent. collection of annals records that he expelled Bishop Fothad of St Andrews (d. 963), but the circumstances are unknown. DEB

**indulgences.** Arising in crusading times—first in 1063—from Roman law concepts, they became an integral part of every late medieval crusader's—and pilgrim's—commitment. After sacramental confession, absolution, and penance, the church, on God's behalf also, from the treasury of merit built up by Christ and the saints, granted the sinner remission of 'temporal penalties' still inevitable after sin. Later, widespread abuse, often financial, made religious commitment mechanistic, and indulgences vulnerable to attack from 16th-cent. reformers. The Thirty-Nine Articles condemned 'the Romish doctrine concerning Purgatory, Pardons' as unscriptural. The Council of Trent (1545–63) and second Vatican Council (1961–5), while condemning their abuse, commended their continued use as 'beneficial to Christians'. WMM

**industrial archaeology**, a term invented by Professor Donald Dudley and used in print for the first time by Michael Rix, is the study and recording of the industrial heritage. Conservation in a few cases may be justified, but generally, the purpose of practitioners is to illuminate industrial and social history by using physical evidence. Field surveys have occasionally been used by historians; for the

industrial archaeologist they are essential. An interdisciplinary study, industrial archaeology has attracted a popular audience in Britain since 1960; there are many local societies, groups, and periodicals and a national society, the Association for Industrial Archaeology, which publishes *Industrial Archaeology Review*.

Industrial archaeologists employ techniques used by other historians, including evaluating the evidence provided by documents, maps, and plans and the critical use of printed sources. Oral evidence may also be important. To these are added others: measuring, surveying, and photographing a site so that an accurate record can be produced. In a few situations excavation is essential. These latter techniques reveal affinity with archaeology.

Apart from involving more people in the local study of industrial and social history as a recreational activity, industrial archaeology has a number of other purposes. Economic change has been so rapid that there is a grave risk that industries and crafts as well as machinery and plant will disappear before any adequate record is made, thereby reducing the prospects for future historians. The scale of local operations can only be appreciated by fieldwork, and a wider comparison be made only if similar work is undertaken in other places. An enlightened preservation policy can only be produced from knowledge of what survives and which is the best of the survivors. Churches and castles have long had this recognition; industrial artefacts such as mills, pumping stations, mines, and railway stations, require similar treatment. Industrial remains are simply part of that evidence to be used in complementing other sources. The disappearance of some processes may be offset by an adequate technical record taken on site from those who worked in obsolescent industries. The record and analysis of human endeavour demands an open outlook to new perspectives; the use of industrial archaeology can elucidate forgotten elements of human experience. JB

**Industrial Relations Act**, 1917. The Act, designed by a newly elected Conservative government (which abandoned incomes policy) to weaken the bargaining powers of trade unions, had its origins in the problems encountered by earlier administrations, such as excessive wage demands, unofficial strikes, and inter-union disputes. Unions had to register to keep their legal privileges; before a strike, they had to hold secret ballots of their members, effectively a cooling-off period; a National Industrial Relations Court was to ensure that these provisions were kept, and the Commission for Industrial Relations, established by Labour (1969), was to iron out inter-union conflicts. JB

**industrial revolution.** In 1837 Louis-Auguste Blanqui used the phrase to describe the changes Britain had undergone during the previous half-century in its social and economic life. Widespread use of the term followed from Arnold Toynbee's *Lectures on the Industrial Revolution of the Eighteenth Century in England* published in 1884. Debates about the precise period and its meaning reflected efforts to identify what brought about the transformation from a predominantly rural society, whose major source of livelihoods derived

from the land, to a rapidly urbanizing country whose wealth came from commerce and manufacturing.

Symbolic of the industrial revolution was the use of coal as a source of energy. The conversion of coal to coke made cheaper iron ore smelting possible and simultaneously produced town gas, used from the early 19th cent. for lighting. Coal-fuelled boilers provided steam-power for mines drainage, factory machinery, and locomotives, making speed and repetitive activities less arduous and greatly augmenting output. Particularly associated with such changes were cotton textiles, made cheaply in large quantities. Inventions of processes and discoveries of new materials increased the sophistication of products available. Examples of these occurred in metallurgy in the uses of iron and in chemicals. Organizational developments as well as large-scale capital investments gave impetus to the construction of well-built roads run by turnpike trusts and to the making of a nation-wide canal network. The better distribution of raw materials and finished products expanded the domestic economy and made exporting easier.

Social changes occurred simultaneously. Many new jobs were created between the later 18th and the mid-19th cent. from the ever widening applications of technical innovations such as in gas-making, in the chemical industry, in canal and railway transport, and in textiles. In the case of textiles, increased output depended on water- or steam-powered machinery installed in purpose-built factories. Although the total number of jobs in textiles rose, much unemployment was experienced in areas where factory products undercut the prices of the old domestic system of production. New methods of industrial production also required many people to move to urban locations. Some existing towns such as \*Manchester expanded very rapidly, whilst new towns emerged, such as St Helens (Merseyside). Rapid urban growth posed many unforeseen problems of overcrowded houses, inadequate sanitation, and law and order.

Marx's ideas about the making of capitalist society had their origins in his observation of British industrialization, particularly in Manchester during the 1830s. Marxists went on to argue that the triumph of capitalist organization of production and trade was exemplified most completely in the history of Britain between the accession of George III and the accession of William IV. This process was accomplished by the emergence of the middle class and the creation of an industrial working class from the landless labourers and smaller peasant farmers.

In 1958 W. W. Rostow in his *Stages of Economic Growth* proposed a model of economic and social change to challenge the Marxist analysis. This 'non-communist' manifesto identified five stages in the growth of economies. The crucial third stage was 'take-off' which, in the case of Britain, corresponded to the onset of rapid industrialization in the late 18th cent. and lasted until the early years of Victoria's reign when the economy became 'mature'. The fourth stage involved having a variety of heavy industries and commercial institutions and imperial ambitions. Rostow claimed for his model predictive capabilities which could be applied world-wide.

Many historians, geographers, and political economists have sought to explain the origins of the changes during the second half of the 18th cent. and why they should have occurred in Britain. The search for one main underlying cause has led to elaborate and careful studies of both economic activities and social developments, including geographical determination, religious discrimination against nonconformists, technological innovations in sources of power, and the rise of literacy.

In contrast other historians have challenged the very concept of an industrial revolution. For example, econometric techniques applied by N. F. R. Crafts and others indicate slow rates of change in British economic life. Innovations in technology and in organization occurred piecemeal in different parts of the economy, suggesting that the image of revolution seems inappropriate. Others have pointed to important economic changes both earlier and later than the period usually identified. For example, E. M. Carus-Wilson identified an industrial revolution in the 13th cent. associated with using water-powered fulling mills in woollen cloth-making. J. U. Nef used the term to describe developments between 1540 and 1640 when the greater use made of coal and metallic ores was accompanied by innovations in agriculture and the growth of overseas trade. Clarkson, L. A., *Proto-industrialization: The First Phase of Industrialization?* (1985); Crafts, N. F. R., *British Economic Growth during the Industrial Revolution* (Oxford, 1985); Hudson, P., *Britain's Industrial Revolution* (1992).

**Ine** (d. 726), king of Wessex (688–726). The reputation of Ine rests on two foundations, legal and ecclesiastical. He reigned from 688 for a very long period, 37 years, and was confident enough to resign his throne to younger men, making his way as a pilgrim to Rome where he died. His laws were impressive. Alfred (871–99), who was descended from Ine's brother, used Ine's decrees when he drew up his own statement of just law, and added Ine's code (drafted between 688 and 694, and much concerned with theft and the agrarian routine) as a supplement to his own pronouncements. In the ecclesiastical field Ine himself presided over the first synods known to have been held among the West Saxons, and founded the bishopric at \*Sherborne to serve his people west of Selwood. Internal evidence within the law code betrays a deep concern with ecclesiastical law. Heavy penalties were imposed on failure to see that a child was baptized or to pay proper dues to the church. In this sense his reign marks the legal consolidation of the total conversion of the West Saxon peoples to Christianity. His laws also show a significant concern with the status of Welshmen assimilated to the kingdom. A Welshman was accorded the substantial blood-price (\*wergeld) of 120 shillings if he possessed one hide of land, 80 shillings if half a hide, and 60 shillings if none at all. He also had rights in basic legal procedures of accusing by oath in cases concerning stolen cattle. There was discrimination: a penally enslaved Welshman was to be flogged if oaths assessed at 12 hides were sworn against him, an Englishman in such a plight needed an oath of 34 hides (probably a misprint for 24). There was still an independent British king, Geraint by name, operating

in Devon as late as 710. The Welshmen of the code of laws clearly referred to the British inhabitants of the west country taken over and governed according to Germanic law by the West Saxon king. Ine was also from time to time busy in the south-east. In 694 he compelled the Kentishmen to pay an immense compensation for the murder of the West Saxon prince Mul, the brother of Ine's own predecessor. He was regarded at times as king in both Surrey and Sussex though both communities were acting independently at the end of his reign. But his main efforts and achievement lay in the heartlands of Wessex and the south-west. Scholarship flourished under the inspiration of \*Aldhelm, abbot of Malmesbury, and then first bishop of Sherborne (705–9). Exeter, where St \*Boniface received his early training, possessed a monastery ruled by an English abbot in the 680s. Ine's master achievement was the completion of the political conquest of Devon, following on a generation or so of steady Saxon migration and agrarian settlement under arms in the fertile valleys of the south-west. HL

**infangthief** (in-caught-thief) and **outfangthief** were early medieval jurisdictions. The first gave the right to deal with a thief (including hanging) caught red-handed on the lord's manor or estate, provided he was the lord's own man. Such jurisdiction was prestigious and occasionally profitable, since the thief's chattels were forfeit. Outfangthief was much rarer and more complex. It seems to have started as the right to bring one's own man back for sentencing in one's own court for a theft committed elsewhere. But \*Bracton interpreted it as the right to try someone else's man, caught red-handed, in one's own court. That seems unlikely since it would conflict with another lord's outfangthief rights and be bound to cause dissension. Whether the custom had changed or whether there was legal confusion is not clear. These private jurisdictions were whittled away by the growth of royal justice in the 13th cent. JAC

**Inkerman, battle of**, 1854. In November 1854 an Anglo-French force was besieging Sebastopol in the Crimea. On 5 November a Russian army under Menshikov attacked at Inkerman, hoping to drive from the field forces supporting the besiegers. Despite having superior numbers, perhaps 50,000 to 15,000 allies, the Russian attacks were badly co-ordinated. The appalling nature of the terrain, and thick fog, ensured that Inkerman was a 'soldier's battle', with attacks and counter-attacks launched in an *ad hoc* and haphazard fashion. The arrival of allied reinforcements eventually forced the Russians to withdraw, having lost about 12,000 men to the allies' 3,400. GDS

**inns**. The most prosperous period for inns was the 200 years from the middle of the 17th cent., when the first regular stage coaches began, to the 1840s when the railways began to put them out of business. During those years they were a vital part of the network of communication—as important for the changing and care of horses as for the welfare of passengers. In the Victorian period, they gave way to railway dining-rooms and hotels, and in the late 20th cent. to motels and service stations.

In the later Middle Ages there were numerous inns, but monasteries also provided accommodation for travellers. Inns were to be found mainly in London, at busy ports, bridges, and ferries, in county towns where there was business to transact, and along the great pilgrim routes to \*Canterbury and \*Walsingham. \*Chaucer's pilgrims set out from the Tabard at Southwark. Few genuinely medieval inns survive, though there are cellars, staircases, windows, and bays. One of the oldest is the Angel at Grantham, where in 1483 Richard III signed the death warrant for \*Buckingham: it had originally belonged to the \*Hospitalers and was probably a much earlier hostelry. Another is the George at Glastonbury, built by the abbot in 1475 and previously known as the Pilgrim's Inn. More of the great Tudor and Stuart inns are still in business: the Feathers at Ledbury (c.1560), the Feathers at Ludlow (1603), the George at Southwark (rebuilt 1676), and the Bell at Tewkesbury (1696). The basic pattern was a courtyard, with galleries on the first floor, and extensive stabling. The many fine classical inns include the George at Stamford, in existence by 1568 and given its frontage in 1724; that most aristocratic of inns, the Duke's Head, at King's Lynn, built by Henry Bell c.1680 as a private house, and converted; and the George, Penrith, where Prince Charles Edward lodged in 1745.

By the 1840s many of the old inns were losing their struggle against the growing railway network, and in the 1960s and 1970s most of the remainder were bypassed by the \*motorways, leaving them to varying fates. JAC

**Inns of Court**. Legal institutions of medieval origin situated in London and responsible for the education of barristers. By the 14th cent. the bar was organized, like the guilds, as an association of the members of the Inns of Court. They were first used as accommodation and were a cross between the college, the club, and the trade union. Originally around twenty Inns were known to have existed of which only four survive: Inner Temple, Middle Temple, Gray's Inn, and Lincoln's Inn. The Temple was the London residence of the knights \*Templar until their dissolution and was let to lawyers in the mid-14th cent. Gray's Inn was formerly the town house of the Lords Gray of Wilton and Lincoln's Inn is thought to have belonged to Henry de Lacy, earl of Lincoln. In the 15th cent. the Inns gradually assumed responsibility for the education of students and today anyone wishing to become a barrister must first join one of the Inns. They are unincorporated bodies controlled by their senior members known as masters of the bench or benchers. When students are considered qualified for the profession they are 'called' to the bar by their Inn and entitled to practise in the higher courts of law. RAS

**inoculation**. See VACCINATION.

**Instrument of Government**. The written constitution under which Oliver \*Cromwell became lord \*protector on 16 December 1653. Its author was Major-General \*Lambert, who had never approved of \*Barebone's Parliament and helped to engineer its abdication on 12 December. Like the army's earlier \*Heads of the Proposals, which he had helped to draft, the Instrument was a prescription for

limited monarchy, and it originally named Cromwell as king. Cromwell declined the crown, but eventually accepted authority as protector under the instrument's terms.

These were that he should govern by the advice of a council, whose members it named and who were not dismissible at pleasure. On his death the council was to elect his successor. Legislative power was vested in a single-chamber parliament representing England, Wales, Scotland, and Ireland and elected at least every three years on a property franchise. Bills must be submitted to the protector for his consent, but could become law without it if they did not contravene the instrument itself. He was to have sufficient revenue for the navy, an army of 30,000, and £200,000 a year for civil government, but for any more he must come to Parliament. A national church was to be maintained, but with freedom of worship for protestant dissenters. AHW

**insurance** means securing payment of a sum of money in the event of loss or damage to property or life (in the latter case sometimes referred to as assurance) by payment of a premium. An embryonic form of life assurance existed during the Middle Ages in monastic institutions as a way of raising money. A wealthy person could purchase a corrody, which provided for either care in the monastic community or cash at agreed intervals. The sums paid depended on the donor and were not a calculated life risk.

Property insurance developed in response to the hazards faced by medieval exporters, for example losses from shipwreck, piracy, or theft. The rules of the Lombards, Italian merchants, formed the basis for spreading risks. They devised a system of partnerships which sent their produce in several ships with all partners undertaking to bear a portion of any loss but sharing in the profits of the venture.

Such insurance provided for particular combinations for specific ventures. More general cover emerged in the late 17th cent. when the expansion of overseas trade encouraged the development of a market in insurance. At this time Edward \*Lloyd's coffee-house became a meeting-place for marine insurers, although they accepted other risks. As other insurers of the time, members of Lloyd's offered insurance on terms of the unlimited liability of 'naries', each name meeting the full cost of any loss personally. Most insurers moved towards limited liability by forming companies under the companies Acts of the mid-19th cent. However, Lloyd's names continued with unlimited liability until 1993 when, because of unprecedented losses, their council admitted limited liability companies into syndicates to underwrite risks. Insurers invested premiums in loans and mortgages, for example, to landowners enclosing land in the 18th cent. and, more recently, in stocks and shares and in property developments.

Calculating risks required the systematic collection and analysis of appropriate data. Early in this field were life assurance companies selling annuities. Particularly successful was the Equitable Company, founded in 1762, which drew upon an analysis of mortality rates for Northampton. Profitability depended on accurate data and life assurance companies were active supporters of population censuses initiated by the government. In contrast with the commer-

cial insurance companies, many assurance companies were organized as mutual societies, distributing all profits to members after administrative costs had been met. Commercial insurance against fire and other risks also came to be based on systematic knowledge of the incidence of loss. In towns and cities largely built of wood the risks of fire were high. The Great Fire of \*London (1666) hastened the development of insurance against fire. The first company to offer fire insurance was that of Nicholas Barbon's Insurance Office for Houses in London, established in 1681. By the early 18th cent. other companies insured housing and business premises. These companies encouraged positive precautions to prevent fires by the design and construction of buildings, and to deal rapidly with conflagrations. Companies such as the Sun Insurance Office, founded in 1710, had private fire brigades in the largest towns, and its badges can still be seen on some old buildings.

During the 19th cent. insurance cover became available to a larger proportion of the population. Friendly societies and industrial assurance companies collected premiums weekly from mainly artisan subscribers. They paid out sums to meet losses of earnings and health care expenses arising from sickness or injury at work. It was also possible to insure against the cost of funerals and to provide for the subscriber's family.

Insurance increased during the 20th cent. to meet an ever widening range of risk. Two major areas of insurance are outstanding. First is insurance associated with travel and vehicles. Their importance is demonstrated by the fact that insurance against third party risk became a legal requirement in 1930. Second is the growth of a competitive market in pension provision and a shift from occupational to personal pensions.

IJEK

**intercursum magnus and intercursum malus** were treaties between Henry VII and the Archduke Philip of Burgundy, primarily for the encouragement of trade between England and the Low Countries. By the first (1496) Philip agreed not to support Perkin \*Warbeck, pretender to the English throne, to limit tolls, and to provide for speedy redress for merchants. Difficulties continued and the second treaty in 1506 allowed English cloth exports without duty. It was not ratified and a third treaty, in 1507, returned to the terms of the 1496 agreement. The names are those which, according to Bacon, the Flemings attached to the treaties.

JAC

**interdict** is a papal prohibition which operated at various levels. A general interdict could be imposed only by the pope. Pope Alexander III placed Scotland under an interdict when William 'the Lion' rejected the papal nominee to the see of St Andrews in 1178, and Innocent III issued an interdict against England when John in 1206 refused to accept Stephen \*Langton as archbishop of Canterbury. The Scottish interdict ended in compromise after ten years, when the royal nominee died and the pope's candidate accepted the see of Dunkeld instead. Innocent's interdict forbade all ceremonies save baptism of infants and confessions for the dying: it operated from 1208 and John was excommunicated in 1209. John resisted strongly but in 1213, beset by baronial

opposition, he surrendered completely, agreeing to hold his kingdom as the pope's vassal. The interdict was lifted in 1214. JAC

**Interregnum** is the name sometimes used for the period between the abolition of the monarchy in February 1649 and the Restoration of Charles II in May 1660. Royalists insisted that Charles II had become king as soon as his father was executed and his statutes were dated from 1649. The republican period is divided into the \*Commonwealth from 1649 to 1653, when power was exercised by the \*Rump Parliament and its \*Council of State, and the \*Protectorate from 1653 until 1659, when Oliver \*Cromwell and his son Richard were lords protector.

In Scotland, two interregna followed the death of Queen \*Margaret, the Maid of Norway, in September 1290. The first lasted until the nomination of John \*Balliol in November 1292. The second followed his deposition by Edward I in July 1296 and lasted until the coronation of Robert I, the Bruce, in March 1306. The disputed succession gave Edward I the chance to intervene and from 1296 to 1306 he governed Scotland himself. JAC

**'Intolerable Acts'**, 1774. These Acts were the British government's response to the \*Boston Tea Party and an attempt to isolate and suppress the allegedly contagious radicalism of Massachusetts. The Boston Port Act, the Massachusetts Government Act, and the Massachusetts Justice Act temporarily closed the port of Boston, replaced an elective council by a crown-nominated one, and allowed capital trials of soldiers and officials to be transferred outside Massachusetts. These Acts received overwhelming parliamentary support. In America, together with the \*Quebec Act and a new Quartering Act, they were seen as proof of Britain's wish to destroy American freedoms. RCS

**inventories.** Detailed lists of household and personal effects possessed by those recently deceased or attainted, insisted upon by probate courts (to be attached to will or letters of administration) from c.1526 but rarely after 1782 unless on request of an interested party. With valuations carried out by local men under oath, including leases and debts owed, inventories covered cottages and farms to mansions; their itemization (despite some limitations) has enriched social and economic history, particularly of the early modern period, through reflection of living patterns and standards, old crafts and industries, regional farming practices, wealth distribution, and economic growth. ASH

**Invergordon mutiny.** Severe pay cuts imposed by the National Government in 1931 led sailors of the British Atlantic fleet at the naval port of Cromarty Firth, Scotland, to refuse to go on duty. The cuts were revised slightly, but this led to financial difficulties for the government. The mutiny ringleaders were discharged from the navy. RAS

**Inverlochy, battle of,** 1645. \*Montrose's victory at \*Aberdeen in September 1644 was but a raid and he was soon on the move again, pursued by superior forces under \*Argyll himself. When the covenanters retired for the winter, Mon-

trose was persuaded to an insolent incursion into the heart of Campbell country around Inverary. On 2 February 1645, under the shadow of Ben Nevis, Argyll's forces were cut to pieces at Inverlochy, while their hapless chief watched from the safety of a galley on the loch. To the king, Montrose wrote jubilantly that he would soon lead his army south to the rescue. JAC

**Inverness, treaty of,** 1312. By the treaty of \*Perth of 1266, Magnus VI of Norway ceded the Hebrides and the Isle of Man to the Scots in exchange for a permanent annual payment of 100 marks. But the Norwegian presence in Orkney and Shetland led to continued friction.

Robert I Bruce, whose sister Isabella had married Eric II of Norway, was anxious to improve relations. On 29 October 1312 at Inverness, he and Haakon V adjudicated the disputes and repeated the terms of the Perth treaty. JAC

**Inverurie, battle of,** 1308. A decisive victory of Robert I, king of Scots, over John \*Comyn, earl of Buchan, probably on 23 May. After his escape at \*Slioch, Robert was able to capture strong points on the coastal plain of Moray and in the Black Isle before returning to Buchan, where, near Inverurie, he routed the earl's forces. He then ravaged the whole of Buchan. Comyn fled to England, leaving Robert to exploit his victory by forcing the earl of Ross to make peace and submit on 31 October 1308. The battle thus gave Robert control of the north. BW

**Investiture contest.** Name given by historians to the conflicts which ensued when 11th-cent. church reformers, popes like Gregory VII (1073–85) at their head, tried to free the church from its customary subordination to the secular world. To reformers that subordination was symbolized by the investiture ceremony in which a new bishop or abbot received the staff or ring of office from the hands of the lay ruler, who had in practice appointed him. On the other side, rulers wanted to be sure of the loyalty of churchmen who controlled rich estates. In Germany and Italy the quarrels took on the dimensions of a great 50-year struggle between empire and papacy. In England the contest between kings and church reformers such as \*Anselm was a relatively brief one and was ended in 1107 by a compromise. Henry I renounced his right of investiture but, as before, prelates continued to be chosen in accordance with royal wishes and swore homage to the king. By focusing attention on a ceremony it proved possible to find a formal solution to a dispute which—as \*Becket was to show—was probably insoluble when raised to the level of high principle. JG

**Invincibles.** A terror gang in Ireland in the 19th cent. After failing to assassinate W. E. \*Forster, chief secretary, they murdered his successor, Lord Frederick \*Cavendish, and T. H. Burke in Phoenix Park in 1882. James Carey turned queen's evidence at his trial, was pursued on board a ship bound for South Africa, and shot. The murders were a severe embarrassment to \*Gladstone and \*Parnell who had just reached the \*Kilmainham agreement. JAC

**Iona.** The monastery founded by St \*Columba in 563 soon became the centre for Celtic Christianity, sending out

missionaries to Scotland and Northumbria. Although the ravages of Viking raids before and after 800 made Iona a more dangerous place to live, its prestige continued well into the 9th cent. Following a massacre of its monks in 806, work began apace on the Irish midland monastery of Kells, which was gradually to become the focus of the Columban communities in Ireland. Kells was finished in 814, and not long after (c.818), a new Columban monastery in central Scotland was founded, \*Dunkeld. It is generally held that in 849 the relics of St Columba were split between the two new monasteries, confirming shifts in patronage and power centres which had been under way for some time. From the end of the 9th cent., we find the head of the Columban communities, the *comarba Choluim Chille*, based in Kells, and the headship remained there until the 12th cent.

None the less, Iona's importance as a religious centre continued, and began to attract the newly converted Norse settlers of the Hebrides. Two Norse cross slabs are now housed in the Iona museum, one bearing an inscription in Norse runes, another bearing a scene from Norse legend. In 980, the powerful king of Viking Dublin, Olaf Cuarán, died on pilgrimage to the island. This was an up-and-down relationship, however, as six years later, a raiding party from the Northern Isles slaughtered the elders of the monastery and the abbot.

The wider influence of Iona monks can be seen as far afield as Carolingian Europe. Dicuil, a cosmographer who wrote a description of the world c.825 in the court of Charles the Bald, probably came from Iona, and he describes other Iona monks ranging as far north as the Faroes and as far south as Egypt. The martyrdom of Blathmac, son of Flann, defending the relics of Columba from Viking raiders in 825 caught the imagination of Walafrid Strabo, based in the monastery of Reichenau on Lake Constance. One of the 10th-cent. heads of the Columban communities, Múgrón (965–81), who appears to have been partially based in Scotland, was a devotional writer of some skill.

The 11th cent. was marred by such incidents as the loss of some of Columba's relics on a journey back to Ireland from Iona (in 1034), and slaying of the abbot by a rival, the son of a former abbot of Kells in 1070. None the less, Scottish kings, according to tradition, continued to be buried there, and \*Margaret, wife of Malcolm III, king of the Scots, held the monastery in favour.

In the next century, it again became the religious hub of a new island-centred power-base. \*Somerled mac Gille-Brigde, the powerful Argyll sea-lord whose descendants became the Lords of the \*Isles, attempted in 1164 to lure the head of the Columban communities back to Iona. He failed, but the building of a new Benedictine monastery in 1204, followed by an Augustinian nunnery, spelled the return of Iona's fortunes. Closely linked to the Lords of the Isles from the 14th cent. onwards, and the seat intermittently of the bishop of the Isles, Iona in the later Middle Ages was a great centre of sculpture. The present church on the island dates substantially to the 15th-cent. renewal programme, and displays the skills and patronage then available. Only with the forfeiture of the lordship in 1493 and the Reformation did Iona's decline set in earnest. TOC

**Ipswich.** Suffolk town, on the Orwell estuary. It was one of the earliest post-Roman towns in Britain, originating in the 7th cent. as a trading port (*wic*) and industrial town. Large and wealthy from c.650 to 850, it was less important in the high and later Middle Ages. Thomas \*Wolsey, a major benefactor, was born there in 1471. Under the Tudors and Stuarts it enjoyed a second heyday as a port and cloth town, and was one of the half-dozen largest and wealthiest English provincial towns. Since the 18th cent. it has been of regional rather than national importance. DMP

**Iraq**, which formed part of the Turkish empire, was the scene of heavy fighting in the First World War, the British capturing Baghdad in 1917. At the end of the war the territory became a \*mandate under the \*League of Nations, though there was a substantial nationalist rising in 1920. From 1921 until 1958, when Faisal II was assassinated, the country was a monarchy. The second Labour government gave notice in 1929 that it would relinquish the mandate in 1932 and in that year Iraq entered the League of Nations as an independent country. The mandate was replaced by an Anglo-Iraq treaty which gave Britain military bases, held until after the Second World War. The attack on Kuwait in 1990 by Saddam Hussein, who had come to power in 1979, led to the \*Gulf War, in which Britain sent troops under United Nations auspices. A second war in 2003, undertaken by America and Britain, overthrew the Saddam regime in three weeks. JAC

**Ireland, Board of National Education.** By the end of the Napoleonic wars, there was an urgent need in Ireland to provide national education for the children of the poor. Large grants to separate denominational bodies, such as the \*Kildare Place Society, had proved unsuccessful. In September 1831 Thomas Wyse, an Irish MP, introduced a bill to educate catholics and protestants in the same school. Although the bill never became law, at the end of 1831 a Board of Education was established to institute an elementary school system. Members of the board, consisting of moderate catholics and protestants, administered an annual grant to local schools, supervised their work, supplied textbooks, and trained teachers. Although secular instruction was given in common, denominational religious teaching was conducted separately. Whilst the question of religious instruction caused many difficulties, by the 1840s the board had made much headway, providing over 3,500 schools attended by 400,000 children. PG

**Ireland, Government of, Act, 1920–1.** The first major constitutional reform since the Act of \*Union 1800–1 resulted from the need for an alternative to the third Home Rule Bill, suspended 1914, which no longer had the backing of Southern Irish nationalist opinion. It aimed to establish two devolved governments for the six counties of the north-east and the 26 counties of south and west. Essential powers were to be retained at Westminster, proportional representation was to be used at elections, and a Council of Ireland was to be established for the administration of agreed all-Ireland matters. It was intended to meet demands for self-determination and to hold out hope for eventual Irish

unity. The Dáil rejected the Act, which was supplanted by the \*Anglo-Irish treaty of 1921. Any prospect of a Council of Ireland collapsed in 1925. For 80 years the Act has provided the legal basis for Northern Ireland's existence. Following the Downing Street declaration of 1993, debate has concerned possible changes to the Act in response to the Irish Republic government's flexibility on its claim to Northern Ireland.

MAH

**Ireland, high kings of.** Despite the popular perception of the importance of the 'high kingship' of Ireland, it is clear that early medieval Ireland did not possess a monarch whose rule was effective over the entire island, since the early law tracts (7th–8th cent.) specify only three grades of kingship, the most senior of which is a province king. Nevertheless, the most powerful dynasty in the country, the Uí Néill, who dominated the northern half of the island, were often able to compel most, if not all, of the other province kings to submit to them, so that by the mid-9th cent. at the latest the concept of the high kingship had taken root. \*Brian Boru, however, destroyed the Uí Néill monopoly of the title and the 11th and 12th cents. were ones in which Ireland generally only had a high king 'with opposition', the last of whom was Rory \*O'Connor, high king at the time of the Anglo-Norman invasion in 1169.

SD

**Ireland, lordship of.** Ireland first emerges into the light of history with the introduction of Christianity in the 5th cent. in documents ascribed to the British missionary St \*Patrick. Thereafter it developed a highly literate society, which has left us a substantial corpus of Latin and vernacular literature, allowing us to form a mental picture of Dark Age Ireland that is clearer and far more detailed than that available for almost any other European country. The 7th–8th cent. law tracts, heavily influenced by the Scriptures, portray a society that was intensely hierarchical, where status and honour meant much, and where sharp distinctions were made between the various grades of society, principally between those regarded as 'sacred' (including kings, clerics, and poets) and those who were not, and between the free and the unfree.

At the highest rung of the ladder stood the kings, around whom society revolved. Ireland was a land of many kings, the law tracts defining three grades: kings of petty local kingdoms, overkings ruling several of these, and 'kings of overkings' who effectively ruled a whole province. Although the laws rarely refer to a \*high king of all Ireland, it is clear that for several centuries until the early 11th cent. the leading dynasty, the Uí Néill (based in the northern half of the country, having their capital at \*Tara), did claim, and were occasionally able to enforce, supremacy throughout the island. Their primacy was smashed by the upstart \*Munster king \*Brian Boru (d. 1014) and throughout the 11th and 12th cents. power revolved around a half-dozen or so leading province kings, each seeking to force his rivals into submission and assert himself as high king.

It is difficult to assess the extent to which these changes were the result of the \*Viking incursions which began in the late 8th cent., and which for a time in the 9th cent. seemed likely to overwhelm the country. Certainly, the Vikings in-

creased the intensity of warfare in an already violent society, and by developing towns at \*Dublin, Waterford, Limerick, Wexford, and Cork, and trading networks overseas, they added to the wealth of what was otherwise a largely pastoral economy. In time, the Viking enclaves were assimilated into the Irish political superstructure, and those Irish kings who succeeded in asserting dominance over them, in some cases establishing the Viking town as their capital, gained an advantage over their rivals in the race for the high kingship. This was especially true in the case of Dublin, overlordship of which was, by the late 10th cent., generally asserted by successful claimants to the high kingship and which, by the mid-11th cent., was directly ruled by Irish kings, in effect replacing Tara as the country's symbolic capital.

What might have been the evolution of a national monarchy was cut short in the mid-12th cent. by the Anglo-Norman invasion, spearheaded by men from the Welsh borderlands, at the instigation of the \*Leinster king, \*Dermot MacMurrough, who had been expelled by the reigning high king, \*Rory O'Connor. The invaders were led by Richard de Clare, earl of \*Pembroke, better known as Strongbow, who married MacMurrough's daughter and succeeded to Leinster himself. At this point, late in 1171, Henry II (who had received a papal licence to invade Ireland in order, it was claimed, to aid in the process of reform then under way in the Irish church) came to Ireland himself, the first English king ever to do so, and established the English lordship. A widespread process of colonization then began, which involved the introduction to Ireland of English common law and institutions. Early attempts to reach an accommodation with Rory O'Connor were soon abandoned in favour of a policy of all-out conquest which at first proved remarkably successful, to the extent that, by the end of the 13th cent., English rule was effective over perhaps two-thirds of the island.

At this point a gradual decline began to take place in the fortunes of the English colony, exacerbated by a Scottish invasion led by Robert Bruce's brother \*Edward in 1315–18, and worsening economic conditions throughout much of the 14th cent. This was accompanied by a dramatic revival in the power of the native Irish lords, whose culture many of the settlers had begun to adopt, in spite of frequent attempts by the Irish \*Parliament to legislate against it. Costly military campaigns in the second half of the 14th cent., two led by Richard II, the first English king to visit his lordship since King John's expedition in 1210, failed to turn the tide. A preoccupation with the war with France and a series of cash-starved Lancastrian administrations meant a curtailment in the English commitment to the government of Ireland in the 15th cent., resources being channelled into the preservation of peace in a cordoned enclave surrounding Dublin known as the \*Pale, with responsibility for the government of the rest of the lordship being devolved on the resident Anglo-Irish magnates, principally the earls of Ormond, Desmond, and Kildare.

A growing separatist tendency among the Anglo-Irish community, culminating in a declaration of parliamentary independence in 1460 (though checked by the passage of \*Poynings's Law in 1494, forbidding the holding of

## Ireland Act

parliaments without the king's licence), led to the emergence of the earls of Kildare as effective masters of the Pale and of much of the country, though nominally the king's deputy. The Kildare ascendancy continued until the rebellion by Thomas \*FitzGerald, son of the 9th earl, in 1534, which was used by Henry VIII as a pretext for destroying Kildare power, the males of the family being put to death and their lands confiscated. The fall of the Geraldines left much of Ireland ungoverned and served to reinforce the view that a reconquest of the country was needed. The Irish 'Reformation Parliament' convened in 1536 declared Henry supreme head of the church, while that of 1541 gave the English monarch for the first time the title of king (as opposed to lord) of Ireland, in the process bringing the medieval lordship to an end.

Duffy, S., *Ireland in the Middle Ages* (1996); Frame, R., *Colonial Ireland, 1169–1369* (Dublin, 1981); Ó Corráin, D., *Ireland before the Normans* (Dublin, 1972); Ó Cróinín, D., *Early Medieval Ireland, 400–1200* (1995).

**Ireland Act, 1949.** Following the Irish Free State government's declaration of a republic in September 1948, the Act regulated relations with Ireland in clause 1(1)B, and gave guarantees that the constitutional status of Northern Ireland would not be changed without the consent of the Parliament of Northern Ireland. That assurance has been reiterated at frequent intervals during the Ulster crisis since 1969 although rephrased as: no change without the consent of a majority of the electorate—in the Sunningdale agreement 1973, Anglo-Irish agreement 1985, and Downing Street declaration 1993. It has, however, never completely managed to reassure Unionist opinion, constantly fearful of a British sell-out. Opinion on all sides is now aware that there will probably be a catholic majority in the six counties early in the 21st cent.

MAH

**Ireton, Henry** (1611–51). Ireton was plunged into the Civil War, since he was appointed by Parliament to command the horse at Nottingham two months before Charles I raised his standard in the same town. He fought at \*Edgehill and in the first battle of \*Newbury, where he was wounded and temporarily captured, and rapidly became one of \*Cromwell's most trusted lieutenants. In 1646 he married Cromwell's daughter Bridget. \*Whitelocke described him as an excellent man of business with a great influence over Cromwell. In 1647 he was mainly responsible for the Representation of the Army and the \*Heads of the Proposals, which set forth a constitutional settlement, including reform of Parliament. At this stage Ireton was a moderate and had not despaired of coming to terms with the king. He took a prominent part in the \*Putney army debates of November 1647, ardently defending the rights of property against radical and egalitarian proposals. The second civil war, in which he served at the siege of \*Colchester, persuaded him that no deal with Charles was possible and in January 1649 he signed the king's death warrant. He accompanied Cromwell to Ireland and remained in charge when Cromwell returned to England in May 1650. The following year he died of fever and was buried with an elaborate funeral in Westminster abbey. At the Restoration he was one of the regicides whose

body was exhumed and hanged. A strong, determined, and capable man, Ireton might have been a possible successor to Cromwell had he not died at the age of 40.

JAC

**Irish Citizen Army.** Ulster responded to the introduction of the third Home Rule Bill in 1912 with the \*'Ulster covenant' and prepared for armed resistance. A section of the nationalists retorted with a Citizen Army in November 1913, which began drilling. Led by James \*Connolly, it was one of a number of nationalist paramilitary groups, not always on good terms with each other. But it took part in the occupation of the General Post Office during the \*Easter week rising of 1916 and made a raid on Dublin castle.

JAC

**Irish Constabulary/Royal Irish Constabulary** (after 1867). The Irish Constabulary was created in 1836 with an initial strength of around 7,500: this figure rose to 12,358 in 1850, before settling at around 10,000. The force was distinct from its English counterparts: it conformed more closely to continental models, being armed and centrally controlled. The prefix 'Royal' was granted in 1867 in recognition of the constabulary's conduct during the \*Fenian rising. However, pay remained low, while the administrative burden and unpopularity of the force grew: morale was therefore vulnerable, as evidenced by the police strike of August 1882, and by police disaffection during the Belfast dockers' strike of 1907. The RIC bore the burden of the \*Irish Republican Army onslaught of 1919–21, sustaining around 416 killed and just under 700 wounded. The force was disbanded in 1922 after the ratification of the \*Anglo-Irish treaty in London and Dublin.

AJ

**Irish famine.** See FAMINE, IRISH.

**Irish Free State, 1922–48.** The state was formed by the \*Anglo-Irish treaty of December 1921, which granted dominion status, with defence safeguards, to twenty-six counties of the south and west of Ireland. Its first months, December 1922–April 1923, saw the completion of a bitter civil war; that conflict established political authority over the military challenge, but the tactics used by the Free State government, especially executions, ensured long-term acrimony. Thereafter the Free State proved remarkably stable, thanks to an overwhelmingly catholic agrarian population and the exclusion of the north-eastern counties. Once stability was established, the fundamental conservatism in social and economic affairs asserted itself. Both Cumann na nGaedheal (1922–32) and Fianna Fáil (from 1932) governments adopted protectionist economic policies and catholic hierarchy-approved social policies. British forms ironically were major models for the governmental institutions. Heavy emphasis was put on Gaelic revivalism. Issues unresolved from the revolutionary period—partition and relations with Britain—dominated party politics. \*De Valera's government of the 1930s successfully widened the treaty settlement by abolishing the oath to the crown and removing the governor-general. The constitution of 1937 established a virtual republic and independence in international affairs was confirmed by neutrality during the \*Second World War; those achievements at the cost of becoming isolated. A republic was finally declared by the coalition government at a

press conference in Ottawa in September 1948. Recently historians have emphasized the poor performance of the Free State economy, resulting in appalling levels of emigration and a sluggish, parochial character. The pro-treaty leader Kevin O'Higgins had been correct to observe: 'we were probably the most conservative-minded revolutionaries that ever put through a successful revolution.' MAH

**Irish Free State/Republic, relations with.** Given the background of bitterness and the controversial circumstances behind the \*Anglo-Irish treaty of December 1921, relations were bound to be tense. The treaty left many issues unresolved: the precise definition of the South's constitutional connection with Britain; its autonomy in foreign affairs; potential changes in the border with Northern Ireland. The British government during the civil war doubted the integrity of Irish support for the treaty and frequently showed old colonial arrogance towards the Free State government. A majority in the South accepted the treaty without enthusiasm, but a minority supported the republican side in the civil war and did not agree to compromise at the end of the conflict. Partition and the constitutional status dominated Irish politics in the 1920s and 1930s: the agreement between the British and Irish governments not to change the border in 1925 hardened anti-British resentment. The two main parties in the South, Cumann na nGaedheal/Fine Gael and Fianna Fail, are best distinguished by their relative position over Britain. \*De Valera consolidated his electoral popularity by abolishing the oath to the crown and by refusing to pay land annuities; the British response resulted in a trade war, only settled in 1938 with an agreement favourable for Ireland, in which Britain agreed to vacate the so-called Treaty Ports. Relations soon deteriorated over Irish neutrality during the Second World War and refusal to bow to pressure to hand back the ports.

The coalition government's declaration of a republic in 1948 was made without consultation with Britain and caused the constitutional position of Northern Ireland to be reinforced by the \*Ireland Act a year later. Not until the 1970s, which saw Ireland and Britain in the \*European Economic Community and revision of the traditional nationalist ideology in the South did communications improve. In the early years of the Northern Ireland crisis, relations were put back on a footing reminiscent of the early 1920s: the Irish government talked of establishing field hospitals on the border and elements in it helped to finance the Provisional IRA in its early stages; the British embassy in Dublin was burnt down after Derry's Bloody Sunday, February 1972. As the northern conflict wore on, southern attitudes became increasingly pragmatic, particularly when Garret FitzGerald was Taoiseach (June 1981–March 1982, December 1982–March 1987). Increasing criticism within the South of the old irredentist outlook and appreciation of the need to change a conservative social framework were both part of a *rapprochement* with Britain. The British government came to recognize that Dublin must play an important part in any settlement of the northern question. Such developments culminated in the \*Anglo-Irish agreement 1985, which had disappointing results in the North, but dramatically im-

proved Anglo-Irish communications, and was belatedly accepted by Charles Haughey, Fianna Fail Taoiseach (1987–92). With the worsening northern security situation, increasing concern in Ireland and Britain about the level of expenditure, and agreement between leaders of Sinn Féin and the IRA, British and Irish prime ministers John \*Major and Albert Reynolds redefined their countries' aims in December 1993 in the Downing Street declaration. Never as cold as they superficially appeared, Anglo-Irish relations since the 1960s have become progressively warmer, but many fundamental differences have yet to be settled over Northern Ireland before the past can be buried. MAH

**Irish Home Rule.** From the formation of the Home Government Association, led by Isaac \*Butt in 1870, Home Rule became the ill-defined term representing the demands of the constitutional nationalists. Its origins lay in Daniel \*O'Connell's Repeal Movement of the 1840s: like O'Connell, Home Rulers between 1870 and 1918 never made clear precisely what form amendment of the Act of \*Union 1800–1 should take, whether it would mean a reversion to the legislative independence of 1782, whether some Irish representation would be retained at Westminster, or whether the desired aim should be a truly independent Irish state. There was agreement that the movement's tactics should be based on winning concessions from the British Parliament by influencing British MPs and by building up effective Irish representation in the Commons. Butt's embryonic party and his leadership, however, proved ineffective during the 1870s. From 1881 the movement entered upon its most successful period under the charismatic and autocratic leadership of Charles Stewart \*Parnell. Through his leadership of the \*Irish Land League, Parnell was able to provide mass popular backing for Irish MPs, organizing a disciplined parliamentary party with Home Rule as its priority demand. Parnell took advantage of \*Gladstone's dependence on the Irish Party for the survival of his government to influence him to introduce the first Home Rule Bill 1886. The bill allowed for only limited devolution: the British government was to retain control over security, foreign policy, and financial institutions. Though the bill divided the Liberal Party and failed to pass the Commons, it represented a triumph for Irish nationalism and an acknowledgement that Ireland could govern itself. Neither Parnell nor Gladstone allowed for resistance from Ulster protestants. From 1886 and with the advent of a new Conservative government, Parnell's party lost much influence and unity collapsed over Parnell's involvement in the O'Shea divorce case in 1890. In 1893 Gladstone introduced a second Home Rule Bill, which was soundly defeated in the House of Lords. The Home Rule Movement did not recover the appeal it had possessed in the 1880s for most elements of the Irish population. Between 1893 and 1910 more limited forms of self-government were considered by Tory and Liberal governments and the growth of cultural nationalism in Ireland challenged the hegemony of the parliamentary party, particularly amongst the young. A constitutional crisis, caused by reform of the House of Lords 1910–11, resulted again in a minority Liberal government, dependent on the Irish

## Irish Land League

Parliamentary Party, and led to the introduction of a third Home Rule Bill, with the expectation that it would become law within two years. The years 1912–14 produced a great test for the Home Rule cause in British politics, with fierce Ulster resistance, backed up by the Tory Party and by large elements of the British establishment. By 1914 and the final stages of the bill, civil war threatened in Britain and Ireland with the option of partition, temporary or permanent, as the only alternative. When the First World War intervened, the Home Rule Bill was on the statute book, but was suspended for the duration of the war, with temporary exclusion for Ulster. Following the \*Easter Rising, \*Lloyd George made another attempt to achieve a Home Rule settlement, which again foundered on the partition question. By the end of 1918 the situation was transformed by the collapse of the Irish Parliamentary Party and Sinn Féin's demand for a settlement considerably in advance of Home Rule. The Government of \*Ireland Act 1920–1 attempted a Home Rule settlement, with separate north-east and southern parliaments: ironically it was the loyalist Northerners who accepted the offer. Home Rule's demise was a failure for Liberal moderation in Britain and for constitutional nationalism in Ireland. British methods of conciliation and compromise had not worked in the Irish context. The consequences of Home Rule's failure are still felt on both sides of the Irish Sea. See also DEVOLUTION. MAH

**Irish Land League, 1879–82.** The league was formed during the agrarian depression to demand tenant rights, including fair rents and security of tenure. It spread through much of the south and west of Ireland, unifying the interests of large and small farmers, provincial town and countryside. Aided by developments in communications and literacy, it became the most popular organization in 19th-cent. Ireland. Its adoption of the boycott tactic towards rack-renting landlords and other forms of exploitation pressurized \*Gladstone to introduce his \*Land Act in 1881, granting many of its demands. Following this Act, divisions occurred between large and small farmers/labourers and between militants and moderates. \*Parnell, president of the league, in accepting a revised Land Act and rejecting further agitation by the \*Kilmainham treaty 1882 effectively terminated the movement. MAH

**Irish National Party** (Irish Parliamentary Party). Beginning from 1870 under Isaac \*Butt's Home Government Association, it only became a disciplined successful party under \*Parnell 1880–90. In the 1880s Parnell took advantage of the extension of the franchise, improved literacy and communications, and favourable circumstances at Westminster to build up a highly organized modern party which pressed the issue of Home Rule on British politicians. It increased popular support by its association with the land reform agitation. It split into contending factions over Parnell's fall 1890–1 and unity was only restored in 1900 under John \*Redmond. But the party never recovered the wide popularity enjoyed under Parnell and was overtaken by the appeal of new nationalism to the young. Appearing close to success when the third Home Rule Bill was introduced in 1912, it suffered from the effective opposition in Ulster and in the Conservative

Party to that bill. By supporting the British government in the First World War, it was blamed for the war's increasing unpopularity. It declined rapidly in the two years after the \*Easter Rising following the final failure of Home Rule settlement in 1916 and its apparent weakening over partition, and was obliterated by Sinn Féin in the 1918 general election. It suffered from being a single issue party for so long, and for being so dependent on British politicians. MAH

**Irish rebellions, 1641, 1798, 1848, 1867, 1916.** See KILKENNY, CONFEDERATION OF; IRISH REBELLION; O'BRIEN, WILLIAM SMITH; IRISH REPUBLICAN BROTHERHOOD; EASTER RISING.

**Irish rebellion, 1798.** The 1798 rising occurred in the summer, and involved between 30,000 and 50,000 insurgents and around 76,000 government troops. The intellectual leadership came from the Francophile \*United Irish movement (1791), originally middle class and urban and in favour of constitutional reform; but after 1795–6 there was an overlap between the United Irishmen and a rural protest organization, the catholic \*Defenders. As the possibility of non-violent reform diminished in the 1790s, the militancy of the United Irish movement and of popular protest developed: the prospect of French military aid after an abortive invasion at Bantry Bay (1796) also encouraged rebel preparations. The revolt was precipitated by the government's brutal efforts, especially in April–May 1798, to suppress sedition and conspiracy. There were two main centres of rebellion: in eastern Ulster, where the insurgents were decisively defeated at Antrim and at Ballynahinch; and in south Leinster, where the critical rebel defeat occurred at \*Vinegar Hill (Co. Wexford) on 21 June. A French landing, at Killala (Co. Mayo) in August, came too late to assist the Irish insurgents, and was defeated at Ballinamuck (Co. Longford) within a week of arriving. The rising cost perhaps 30,000 lives. It further discredited the Irish government with William \*Pitt, and reinforced his sympathy for a constitutional union between Britain and Ireland. As the first expression of popular militant republicanism, the rising, though a failure, had a lasting symbolic significance for physical-force nationalists. AJ

**Irish Republican Army (IRA).** The Irish Volunteers, formed in 1913/14 and reorganized along conventional military command lines after the \*Easter Rising, became known as the IRA from 1919. During the Anglo-Irish War, 1919–21, it became the dominant military arm of the Dáil government, and fought a limited successful guerrilla war until stalemate was acknowledged by the truce of July 1921. Divided over the \*Anglo-Irish treaty of December 1921, the minority formed the Provisional Government/Free State Army, while the majority armed against the new state in the civil war 1922–3. Guerrilla warfare tactics were then less successful, and defeat was implicit in the cease-fire of April 1923. The *raison d'être* of the organization remained because of partition and the allegiance to the British crown. For four decades, the IRA was undecided whether to concentrate on a campaign against the border, or against British and Free State/Republic government, or to focus on social and economic issues. It waged an unsuccessful border campaign

1956–61, and shifted into being a Marxist pressure group. The outbreak of violence in Derry and Belfast from 1969 found the movement wanting in its traditional protective role for the catholic minority: graffiti claimed IRA stood for 'I ran away'. A split occurred between the Belfast-based traditional nationalist Provisional IRA and the Marxist Official IRA, with the latter shrinking and splintering into smaller republican organizations. The Provisional IRA waged a high-profile \*terror campaign, which was instrumental in the collapse of \*Stormont in 1972 and in power-sharing initiatives, but it lost support and momentum as a result of an unsuccessful truce 1974/5, though continuing operations in the province and in Britain. Gaining considerable support from the hunger strike crisis of 1981, the movement adopted a more political strategy with \*Sinn Fein's Armalite and ballot policy. The decision of the IRA to agree to a ceasefire in the 1990s led to the 'Real' IRA taking over the mantle of violence. A Northern Ireland Assembly was established and Sinn Fein ministers appointed, but the reluctance of the IRA to begin serious decommissioning of arms led to the dissolution of the Assembly in 2003. MAH

**Irish Republican Brotherhood.** Better known as the \*Fenian movement. A secret society, organized along cell lines, it became the long-term agency for the planning of Irish insurrections. It was behind the abortive uprising in Ireland in 1867 and the equally unsuccessful 'invasions' of Canada between 1867 and 1870. From the 1870s, its supreme council—consisting of Irish, British, and American-based representatives—claimed to be the existing government of the Irish Republic. Revived after 1910, it infiltrated the Volunteer movement and regarded the British involvement in the First World War as its great opportunity. Its military council planned the \*Easter Rising; many advanced nationalists blamed the IRB for the rising's failure and argued that its usefulness was over. Others, however, notably Michael \*Collins, continued to regard it as a crucial élite and the means by which to defeat British intelligence and secure arms contacts. Like all other nationalist institutions, the IRB divided over the \*Anglo-Irish treaty and did not survive the effects of the civil war. MAH

**Irish Volunteers.** See VOLUNTEER MOVEMENT.

**Ironbridge** (Shropshire). The valley of the Severn below the Cistercian abbey of Buildwas developed in the early 18th cent. as a great iron manufacturing area under the \*Coalbrookdale Company, run by the \*Darby family. The bridge itself was designed and built by Abraham Darby the third and opened in 1779. Much of the ironwork was made by John \*Wilkinson, who followed up the success with an iron barge, launched in 1787. The intricate iron tracery gives the bridge a delicate, almost fragile appearance. It was one of the wonders of its age and is now the focal point of a superb museum complex. JAC

**iron industry.** Iron has been used in the British Isles since the prehistoric Iron Age. Its importance has continued until the present day. Archaeological evidence of iron production has been found on many sites over most of Britain, wherever

iron ores could be extracted with comparative ease and there was adequate fuel for smelting. Most villages employed a smith and it became the most common surname in England.

Iron production depended on the availability of smeltable ores and refining and casting techniques. For many centuries the highest-quality ore was haematite and the heat source for smelting was charcoal. Thus, for example, the weald of Sussex and the Cumbrian area, which both possessed the necessary resources, remained important centres of high-quality British production from the Middle Ages until the early 19th cent. However, mining of lower-quality ores supported the industry elsewhere.

When many areas became denuded of trees, efforts were made to find other fuels, notably coal, for smelting ores. Coal had only been used in fashioning iron previously. Experiments were undertaken by many ironmasters, including Dud \*Dudley in the 17th cent., but it was not until the early 18th cent. that Abraham \*Darby succeeded. The technique took many years to become economically worthwhile and only towards the end of the 18th cent. was coal usually used to smelt iron ores. The consequent quantity production at lower prices encouraged many developments in the uses of both wrought and cast iron.

The most famous centre of ironworking using coal was founded by Darby at \*Coalbrookdale (Shropshire). The adjacent iron bridge across the river Severn, designed and built by John \*Wilkinson, stands to this day. Wilkinson's pioneering efforts encouraged many innovators so that by the 1780s mills were erected with stressed iron members allowing height and scale in buildings, utilizing the principles of what came to be skyscraper engineering. One of the most spectacular buildings of iron was the \*Crystal Palace for the \*Great Exhibition of 1851.

Although unusual uses of iron for building purposes in the early 19th cent. impressed the public (iron-framed churches and wrought-iron Regency balconies), the more significant demands on the industry were supplying households with kitchen ranges, firebacks, and cooking utensils. During the 1830s and 1840s significant demand came from railways. These required iron for their tracks, locomotives, and as components for many kinds of equipment. The relationship of railways with the iron industry was close and continuous. However, such was the variety of demand for iron that the industry was never dominated by railway demands even at the heights of the mania in the 1840s.

Before 1850 manufacturers of many kinds of engineering products demonstrated the versatility of iron, either wrought or cast. During the 1820s, steam-engines made of iron and driving paddles gave an impetus to shipbuilding. In the middle of the century the Royal Navy received HMS *Warrior*, its first iron-clad warship. This was soon superseded by all-iron vessels of much greater size and mobility. From the mid-19th cent. the merchant navy ordered many iron ships, with greater speed and larger cargo capacity.

In the 1840s sheet iron plated with tin was invented. This gave rise to an industry, concentrated in south Wales and the west midlands, providing the basic material for many utensils for the kitchen, food-processing, and storage. The

## Ironsides

cutlery trade used iron for many products, reserving steel, a semi-precious metal, for cutting edges. The \*Bessemer process, patented in 1855, made mild steel a cheap and superior rival for wrought and cast iron in some products.

Iron continued to be in demand as the basic raw material for steel-making. However, steel had structural advantages and durability which iron lacked, and the railways adopted steel for their tracks. Research in steel manufacture produced metals for special purposes. Amongst these was stainless steel and, from the late 19th cent., a succession of armour plates evolved for warships, armoured cars, and tanks.

Iron continues to have a role in its own right for many engineering uses, ranging from building supplies to the structural beds for many machines, where its weight and strength make it ideal. Its cheapness keeps it in use. In the early 21st cent., challenges come not from other metals but from plastics. IJEK

**Ironsides** was a nickname given to Oliver \*Cromwell by Prince \*Rupert after the battle of \*Marston Moor (July 1644). The title was derived, according to a contemporary writer, 'from the impenetrable strength of his troops, which could by no means be broken or divided'. Later the term was extended to the soldiers themselves—the double regiment of cavalry which Cromwell had raised and trained in East Anglia at the outbreak of the Civil War, and known both for its rigid discipline and its religious radicalism. At the founding of the \*New Model Army in 1645 the regiment was divided, half being assigned to General Thomas \*Fairfax and the other half to Colonel Edward Whalley. IJG

**Irvine agreement**, 1297. In 1296 Edward I led a large army into Scotland, deposed John \*Balliol, and removed the stone of \*Scone. At Irvine in July 1297 a number of Scottish barons, including possibly Robert Bruce (later Robert I), submitted. But Scottish resistance flared and in September \*Wallace's great victory at \*Stirling put English supremacy in doubt once more. JAC

**Irving, Edward** (1792–1834). Religious leader. Born in Annan, educated at Edinburgh University, Irving was successively master of Kirkcaldy Academy, assistant at St John's, Glasgow, and minister at Hatton Garden chapel, London (1822), where his extravagant preaching moved many, but made him pretentious. He published his naïve *Argument for Judgement to Come* (1823) and moved to a large new church in Regent Square (1827) where his congregation grew to 1,000. Convinced of Christ's imminent second coming, he encouraged 'speaking with tongues' and translated a Spanish Jesuit's *The Coming of the Messiah in Glory and Majesty* (1827). After returning to Scotland (1828) where he was greeted with crowded churches, he was charged with heresy for his tract *The Orthodox and Catholic Doctrine of our Lord's Human Nature* (1830) and removed from Regent Square (1832). His congregation mostly followed him to found the \*Catholic Apostolic Church (or Irvingites). The Church of Scotland deprived him of his orders (1833). WMM

**Irving, Henry** (1838–1905). Actor and theatre manager. Born John Henry Brodribb, but abandoning a merchant's clerkship for ten years' apprenticeship with theatrical stock

companies in the provinces, Irving emerged as a leading actor, with a gift for the macabre, in 1871. On becoming lessee and manager of the Lyceum theatre (London), he mounted elaborate, sumptuous productions, paying much attention to detail and hiring leading designers and composers; the company made several successful American tours, and he became the first actor to be knighted (1895). Though a charismatic 'intellectual' rather than 'emotional' actor, described by Ellen \*Terry (his professional partner for 24 years) as 'an egotist of the great type', but criticized for mannerisms in delivery and gait, Irving ignored new drama from \*Shaw and Ibsen. After heavy losses in a fire and serious illness (1898), the struggle to maintain the Lyceum company ended in 1902. ASH

**Isabella of Angoulême** (c.1188–1246), queen of King John. Isabella was the second wife of King John and was about 12 at the time of their marriage in August 1200. The alliance seems to have been a mixture of passion and diplomacy on John's part, since Angoulême lay in the heart of \*Aquitaine, which John was seeking to retain. She was crowned in Westminster abbey in October 1200 and appeared with John at Canterbury for a crown-wearing at Easter 1201. The spite and malice of the chroniclers make it difficult to be sure of her personality. \*Matthew Paris insisted that she and her husband were vicious and adulterous and that John threatened to hang her gallants over her bed. But their fifth child, Eleanor, was born in 1215, the year before John's death, which suggests that their relations were normal, if not close. Their first child, the future Henry III, was born in 1207. After John's death, Isabella returned to France and in 1220 married Hugh de Lusignan, comte de la Marche, son of the man to whom she had previously been betrothed. From then on she was engaged in the dynastic politics of that region. Her son Henry erected a tomb over her grave at Fontevraud. SMC

**Isabella of France** (1289–1358), queen of Edward II. The daughter of Philip IV of France, Isabella married Edward II at Boulogne in January 1308, soon after his accession. Infatuated by Piers \*Gaveston, Edward neglected her. Nevertheless, they produced four children. The future Edward III was born in 1312 and their last child, a daughter, in June 1321. The influence of the \*Despensers estranged her from her husband and in 1325 she took refuge in France, supported by her brother Charles IV. In 1326 she joined her lover, Roger \*Mortimer, in an invasion which easily swept away Edward's power. London rose in her favour, the Despensers were executed, Edward deposed in January 1327 and murdered at Berkeley castle in September 1327. For three years she and Mortimer ruled the country on behalf of the young Edward III. But in 1330 they were overthrown by a coup at Nottingham which had the king's support. Mortimer was at once executed, Isabella lived in comfortable retirement before entering a convent for her last years. She died at Hertford. As an adulterous queen, Isabella achieved a notoriety she scarcely deserved and remained for centuries material for saucy lampoons or parallels directed at later royal couples. SMC

**Isabella of France** (1389–1409), queen of Richard II. The second daughter of Charles VI of France, Isabella became second wife of Richard II in November 1396 as the basis for a *rapprochement* between England and France. She was only 7 at the time but commented: 'they tell me that I shall be a great lady.' Richard showered his child-bride with gifts and seemed to be genuinely fond of her, making some effort to learn French. But in May 1399 he left for Ireland and on his return was deposed by Henry of Bolingbroke. Richard's successor, as Henry IV, had some idea of marrying Isabella to Henry, prince of Wales, partly to avoid paying back her dowry, but she was returned to France in 1401. She married her cousin Charles, count of Angoulême, in 1406 but died in childbirth in September 1409 and was buried at Blois. SMC

**Isabella of Gloucester** (d. 1217), queen of King John. Isabella, also known as Avice or Hawisa, was the youngest daughter and co-heiress of William, 2nd earl of Gloucester. She was betrothed to John, son of Henry II, in 1176 when he was only 9, presumably to provide him with estates. The marriage did not take place until 1189, when John's brother Richard had succeeded. It is doubtful whether they ever lived together. There were no children by the marriage and John's natural children date from this period. Isabella was not crowned when John became king in 1199 and the following year they were divorced on the grounds that, as cousins, they were within the prohibited relationships. John married his second wife, \*Isabella of Angoulême, almost at once. Isabella of Gloucester remained a wealthy heiress and seems to have lived in honourable confinement. But in 1214 she was given as a bride to \*Geoffrey de Mandeville, presumably as a favour, and on his death in a tournament in 1216 she married, very shortly before her death, Hubert de \*Burgh. SMC

**Isandhlwana.** Hill, located 75 miles north of Pietermaritzburg (South Africa), site of an important battle in the \*Zulu War. Part of the centre column of a three-pronged British invasion of Zululand, having underestimated its opponents, was surprised by a Zulu army on 22 January 1879. Disciplined rifle fire enabled the column to hold its own until it ran short of ammunition. Then it was overrun and almost completely wiped out. The Zulus did not follow up their victory because their ruler, Cetshwayo, anxious not to appear to be acting provocatively, had given orders that his forces should not cross into British territory. KI

**Isle of Man.** The Isle of Man in the Irish Sea is 48 miles from Anglesey, 38 miles from the Irish coast, and only 20 miles from Scotland. It is some 30 miles from north to south and 10 east to west—i.e. rather smaller than Anglesey but larger than the Isle of Wight. The population in 1991 was 70,000, many of them retired people. There is no evidence of Roman settlement, though they must have known it since Ravenglass, an important Roman port, was less than 40 miles away. A handful of Roman coins, probably from traders, have been found. From AD 800 it formed part of the Norse empire, though the control of the king of Norway was fitful. The representative institutions reflect the Norse influence. In 1266 it was ceded to Scotland after the battle of

\*Largs, but did not stay long in Scottish possession. The island was disputed between Scots and English until 1333, when Edward III annexed and retained it. The bishopric of \*Sodor and Man, founded in 1134, continued under the supervision of the archbishopric of Trondhjem but was placed in the archdiocese of York in the 15th cent. From 1406 the island belonged to the Stanleys, earls of Derby, who ruled it as lords of Man, and held it until 1736. It then passed to the dukes of Atholl, but in order to curtail smuggling the British government purchased it in 1765 and took full control in 1828.

The island is a crown possession with wide independent powers under a lieutenant governor. There is a two-chamber assembly, the \*Tynwald, the lower house of which is the House of \*Keys. The emblem of the island—the three legs of Man—is an ancient design, possibly going back to the Norse period. The Manx language, basically Celtic, was widely spoken until the 19th cent., but is now an acquired tongue. With the decline of fishing and mining, tourism provides the main income, with regular sailings in the season to Douglas from Heysham, Fleetwood, Liverpool, Stranraer, Belfast, and Dublin. The largest town and capital is Douglas (22,000), followed by Ramsey (6,500), Peel (3,800) and Castletown, the old capital (3,000). JAC

**Isle of Wight.** Known to the Romans as Vectis, the Isle of Wight is largely chalk, some 22 miles across by 13 north–south, and almost bisected north–south by the river Medina. At the end of the Roman period it was settled by the \*Jutes and for a time had its own kings. But it was difficult to stand against the kingdoms of Sussex, Mercia, and Wessex. \*Cædwalla of Wessex took it c.687 and gave a quarter of the land to St \*Wilfrid for the church. It was used as a base by the Danes in 998, and in 1371 Newport was sacked by the French. In the 1840s the building of \*Osborne House for the queen and the establishment of the Royal Yacht Squadron at Cowes nearby in 1856 did much to popularize the island. The population grew from just over 20,000 in 1801 to over 80,000 by Victoria's death in 1901, and to 125,000 by 1992. From Saxon times the island formed part of the county of \*Hampshire and fell under the authority of the bishop of \*Winchester. The island was given a county council in 1890. In accordance with the Banham commission recommendation of 1993, the county was made a unitary authority, though retaining county status for ceremonial purposes with its own lord-lieutenant. JAC

**Isles, kingdom of the.** The origins of the kingdom of the Isles can be sought as far back as the 840s. It was apparently the successor kingdom in western Scotland to \*Dalriada (last mentioned in the Irish annals in 839). It developed in the power vacuum left by the departure of \*Kenneth MacAlpin, king of Dalriada and 'conqueror' of the Picts, to \*Fortriu in 842. Kenneth may have had a hand in its inception, because its first king appears to have been his ally, and possible father-in-law, Gofraid mac Fherghusa, described on his death in 851 as *Toisech* or *Rí Innse Gall*, 'king of the Isles'. The extent of the kingdom is unclear, but by the late 10th cent. it included the \*Isle of Man.

## Islip

The inhabitants of this new kingdom were of mixed Gaelic and Norse origin, there having been heavy Norse settlement between c.795 and c.825, a 30-year period of unparalleled turmoil in western Scotland, which saw the Isle of Skye overwhelmed and \*Iona attacked at least five times. In the 850s the mixed population of the Isles made an appearance in Ireland. They were called *Gall-Gaidheil*, 'Scandinavian Gaels', and were led by Caittil Find, presumably Gofraid's successor as *Ri Innse Gall*. Like early gallowglasses, they were supporting Mael Sechnaill, king of Tara, against the Scandinavians of Dublin and his Irish rivals. They may have joined forces with Ireland's most powerful king because they felt threatened by the formidable Norwegian warrior-king Olaf, who had become king of \*Dublin in 853.

After a period of complete obscurity, from the 930s a close relationship developed between the Isles and Dublin. In 937, a *Ri Innse Gall* called Gébennach was slain at the battle of \*Brunanburh, fighting against \*Athelstan, the Anglo-Saxon king, apparently as a subordinate of \*Olaf Godfreyson (or Guthfrithsson), king of Dublin, described by Florence of Worcester as 'king of the Irish and the many islands'.

Under Maccus and Godfrey, the sons of Harald and members of a side branch of the Ui Imar, the Dublin royal family, the kingdom of the Isles began to impinge violently upon its neighbours. Maccus ravaged Penmon in Wales in 971 and attended a meeting of kings at Chester in 973, where he was called 'king of the very many islands', whilst Godfrey raided Wales in 972, 980, 982, and 987, when he took 2,000 captives from Anglesey. Both these kings appear to have made Man their base. With the death of Godfrey's son Ragnall in 1005, this lineage seems to have come to an end.

In addition to a continuing close relationship between the Isles and Dublin, the kingship of both being held on occasion by the same figure, the 11th cent. apparently saw a conquest of the Isles by \*Thorfinn the Mighty, jarl of Orkney, from the 1040s until his death c.1065. However, the most important event for the future history of the Isles was the reign of Godfrey Crovan, probably from Islay. Godfrey was a capable warrior who had taken part in the battle of \*Stamford Bridge as a mercenary. He conquered Man with a force of Hebrideans and took the kingship c.1079. In 1091 he also seized control of Dublin. However, in 1094 his Irish venture was brought to an end, when he was driven from Dublin by Muirchertach Ua Briain, king of Ireland. He died in Islay in 1095. His descendants were the kings of Man and the Isles for the next 200 years. By the treaty of \*Perth (1266) Man and the Isles, which had fallen under a shaky Norwegian overlordship, became part of the kingdom of Scotland. The lordship of the Isles was vested in the Scottish crown in James IV's reign in the 15th cent. AJe

**Islip, Simon** (d. 1366). Archbishop of Canterbury. Born near Oxford and a fellow of Merton, Islip was an ecclesiastical lawyer who became the bishop of Lincoln's vicar-general, archdeacon of Canterbury (1343), and dean of Arches. As Edward III's keeper of the privy seal, he was sent on embassies abroad or acted as adviser to regents in the king's absence. Elected archbishop (1349) at the king's request and

consecrated at St Paul's, he was at odds with the monks of Canterbury for not being consecrated there. During his primacy he agreed to the archbishop of York carrying his cross in the southern province and the statutes of \*Provisors and \*Praemunire were passed. To improve the standards of clergy after the \*Black Death, he founded (1361) at Oxford a mixed college for monks and seculars, a bold experiment, which \*Wolsey absorbed into Cardinal College (later Christ Church). WMM

**Italy, relations with.** Medieval English kings were several times involved in fierce disputes with the \*papacy concerning church-state relations. The papal refusal to grant a divorce to Henry VIII precipitated the English Reformation. Rome supported the Jacobite cause from 1688, and continued to excite the hostility of British liberals as well as protestants far into the 19th cent. The Italian Renaissance, in contrast, attracted growing admiration, and until the mid-19th cent. the Italian language was second only to French in popularity in Britain. Italy became one of the highlights of the \*grand tour for the sons of wealthy families. Trade was also important, with Italian merchants proving influential in London in the Middle Ages.

In the 18th cent. Savoy-Piedmont attracted interest politically and strategically, as a possible barrier against France and a restraint on Austrian influence. By 1814–15 \*Castlereagh, however, was so impressed by the success of French arms since the 1790s in the politically divided and relatively backward peninsula that he looked primarily to the Habsburgs to police and protect Italy. \*Palmerston, in contrast, as early as 1848–9, was considering alternatives to Austrian rule. Only ten years later, he led a government which gained significant credit during the unification of much of Italy (1859–60)—although British policy had been by no means consistent. Approval of unification was assured only once it became evident that the new Italy would not become a dependency of France. Anglo-Italian relations continued to be much influenced by relations with that power. For ten years from 1887 the two states subscribed to the Mediterranean agreements in order to maintain the status quo in that region.

In 1915 Italy finally opted to fight beside Britain and her allies in the \*First World War, but Italian patriots were disappointed when their country's services were not more amply rewarded in 1919. In the 1930s the fascist regime of Mussolini was tempted to manoeuvre between Nazi Germany on the one side and Britain and France on the other in search of territorial gains. The British responded ambivalently to Mussolini's war against Abyssinia in 1935–6, and only succeeded in driving *Il Duce* closer to Hitler. Italian involvement on the side of Franco in the Spanish Civil War led to further difficulties. Mussolini, however, did not enter the \*Second World War until France was on the verge of defeat. The Mediterranean became a major war theatre to which Churchill enthusiastically assigned forces in the belief that southern Europe was the 'soft underbelly of the axis'. But Italy's surrender in 1943 left the allies confronted by strong German opposition, and they became increasingly conscious of the difficulties of the terrain rather than of

an easy route into the heart of Europe. Italy's *volte-face* in 1943 did not prevent losses at the peace treaty of 1947. It was deprived of all its colonies except Somalia, kept as a trusteeship, made small territorial concessions in the Alps to France, and surrendered Istria and Dalmatia to Yugo-Slavia. But Trieste was returned to it in 1954.

CJB

**Ithamar** (d. 655/64). Bishop of Rochester. Ithamar was a Kentishman and the first native bishop of the English church from c.644. Nothing else is known of him. It is remarkable that for 47 years after the coming of Augustine every bishop in England had been either Italian or Irish. His name may sound vaguely Germanic but is in fact biblical. JCa

**Jacobins** were originally a faction or group in Paris who met in the old Dominican convent at the church of St Jacques, and opposed the more moderate Girondin group. The name was soon borrowed in England and applied, not merely to admirers of the French Revolution, but indiscriminately to radicals and reformers. It was exploited by \*Canning and his friends in their *jeu d'esprit* the \**Anti-Jacobin*, which came out in 1798/9. JAC

**Jacobite risings** were attempts after 1689 to reverse the expulsion of the senior branch of the Stuart family from its thrones. Supporters of the exiled dynasty were known as Jacobites from the Latin form of the name James which is *Jacobus*. James VII and II fled from England in December 1688. He landed in Ireland in March 1689, with French troops, but left when defeated at the \*Boyne in 1690. Military emigration after the last Jacobite army surrendered at Limerick in October 1691 ensured that future Irish Jacobitism was exilic.

The first Jacobite rising was in Scotland in 1689 led by Viscount \*Dundee and Lord Balcarres. They withdrew from the Scots Estates or Parliament, and launched a military assault on its provisional government. A coalition of conservative episcopalians and the smaller clans of the central and western Highlands, the rising had as little active support as the Williamites. Large clans and great magnates were inactive, apart from the Campbells, whose chief, \*Argyll, was restored by the events of 1688–9. Dundee died in victory at the battle of \*Killiecrankie in July 1689, and the Jacobite army was finally routed at the Haughs of Cromdale in May 1690.

Until the French lost control of the sea at \*La Hogue in 1692 James was more interested in returning with a French army than in promoting risings. However, the exclusively presbyterian settlement in the kirk in 1690 alienated many Scots, as did such tyrannical misgovernment as the massacre of \*Glencoe in 1692. Nevertheless, despite the stresses of war, it was not until the passage of the \*Union of 1707 that outraged Scottish national sentiment made another rising thinkable. Louis XIV planned a Jacobite seizure of Scotland. In March 1708 James Francis Edward \*Stuart, after his father's death in 1701 the Jacobite claimant, was off the coast of Fife with a French expedition, but the French fled north at the sight of Royal Navy ships. Designed to recover only Scotland, the plan aborted.

Queen Anne's death in 1714 was followed by the smooth accession of the protestant Hanoverian dynasty. The outbreak of the 1715 rising surprised the exiled Stuarts. It was the only rising entirely explicable in domestic terms. The Whig coup at the accession of George I drove many Tories to despair, some to rebellion. After failing to get a job from George I, the earl of \*Mar started a Scottish national rising. There was also a small English rising in Northumberland, supported mostly by catholic and high Anglican squires who were bankrupt. The Scottish rising failed due to the action of \*Argyll, who blocked the path south at Stirling, and Mar's incompetence. An attempt by an Anglo-Scottish Jacobite force to raise the Lancashire catholics was foiled at \*Preston on the same day (14 November) that Mar failed to sweep Argyll aside at \*Sheriffmuir. The late arrival of James Stuart, and surreptitious Spanish aid, failed to avert the collapse of the rising in early 1716.

Forfeitures, plus measures such as the \*Septennial and \*Riot Acts, seemed to entrench Whig power permanently. The next Jacobite rebellion was a fiasco cynically sponsored by a Spanish government which was quarrelling with the British over Mediterranean issues. The main invasion force was intended to strike at the west of England, but was scattered by storms. A purely diversionary force, including the exiled Scots Jacobite Lords Tullibardine and Seaforth, did invade the north-west Highlands, only to be crushed by General Wightman at \*Glenshiel in June 1719.

The rise of an Anglo-French entente, the strength of \*Walpole's regime, and the disrepute which the failure of the Jacobite claimant's marriage brought ruled out another rising. By 1744, however, war had broken out between France and Britain, and the French brought Prince Charles \*Stuart, elder son of James Stuart, to France to front an invasion. Then they dropped the idea. The arrival of Charles in the west Highlands in the late summer of 1745 was designed to reverse the French decision by seizing a poorly defended Scotland and then invading England to provoke French intervention. With the help of the Camerons and smaller central Highland clans, Charles occupied Edinburgh before shattering government forces under Cope at \*Prestonpans. The invasion of England in late 1745 was agreed to reluctantly by many Jacobite Scots. Even the field commander, Lord George \*Murray, regarded it as a reconnaissance to test English willingness to restore the Stuarts. By Derby, it was clear there was none, and retreat

in the face of superior armies was brilliantly executed. A final victory over the pursuing Hanoverian army under General Hawley at \*Falkirk in January 1746 merely postponed the day of reckoning which came on 16 April at \*Culloden east of Inverness, where the Jacobites were totally routed by the duke of \*Cumberland, a younger son of George II. Devastation, confiscation, and disillusionment with both Charles and France effectively destroyed all danger of another rising. The risings underlined the unpopularity of governments which were seen as corrupt and betraying their own principles, but also showed the unacceptability of the Stuart alternative, and their failures reinforced the Hanoverian regime.

Lenman, B., *The Jacobite Risings* (1980).

**Jacobitism** was a series of political movements which supported the restoration of the exiled house of Stuart after James II had been ousted from the throne at the Glorious Revolution in 1688 and had fled to France. Jacobites continued to support the claims to the throne of James's son James Francis Edward \*Stuart (the Old Pretender or 'James III') and his two grandsons Charles Edward \*Stuart (the Young Pretender or 'Charles III') and Henry \*Stuart (the cardinal duke of York or 'Henry IX').

There has been much recent controversy over Jacobitism, particularly who were or were not Jacobite MPs. One school of thought claims that as many as a third or more of Tory MPs were Jacobites, along with the major party leaders; while another believes that the bulk of the party were Hanoverian Tories who supported the new dynasty after 1714, despite the proscription of the party after the 1715 Rebellion. The problem lies with the definition of a Jacobite, with the sparseness of the evidence (engaged in treasonable activity Jacobites took care not to leave too much evidence behind), with the often ambiguous or even downright misleading evidence that has survived, with the use of the term Jacobite as rhetoric and as a smearword to damn one's political opponents, and with the emotional advocacy with which the topic has become charged. Some historians believe that once a Jacobite always a Jacobite, whereas it seems clear that, though there was a hard core of lifelong Jacobites, most drifted in and out of Jacobitism as circumstances or mood dictated. Some politicians thought by contemporaries and later historians to favour Jacobitism only worked with Jacobites in opposition because they were one of the few groups to hand (such as Earl \*Cowper in the new opposition grouping of dissident Whigs, Hanoverian Tories, and Jacobites in 1721–3); while others used Jacobites for their own (largely) political ends and discarded them when their objective had been achieved (such as the earl of \*Sunderland in 1721–2 when he negotiated with Jacobite MPs and peers to stave off impeachment proceedings over his involvement in the South Sea scandal).

Jacobitism had a religious, as well as a political, dimension. James II and his son and grandsons were Catholics, whose refusal to convert to Protestantism made their restoration virtually impossible other than by armed invasion. However, most of their supporters were Protestants, and many were non-jurors, who had refused the oaths of loyalty

to William and Mary (who had replaced James on the throne), and consequently had lost their secular or religious offices. Some who were prepared to take the oaths in 1689, and later to Anne, refused to recognize the Hanoverian succession and turned to Jacobitism. In Scotland, where Jacobitism was strongest, the episcopalian church had been disestablished at the Glorious Revolution, and subsequently many episcopalians became Jacobites. Jacobitism in Scotland became a refuge for many who opposed the Union with England in 1707. It also appealed to the lower, even the criminal, elements of society, as a form of social protest.

That Scotland was central to Jacobitism is shown by the two main risings which took place in 1715 and 1745. Many Highland chiefs and clansmen, who did battle for the Stuart cause, paid for their loyalty with life and property. Few English Jacobites came out in support of either rebellion. Jacobitism was crushed as a political force after the retreat from Derby by the forces of the Young Pretender and the defeat at \*Culloden in 1746. Thereafter the romantic and cultural aspect of the movements, which had always been a potent factor in attracting supporters, became dominant. CJ

**Jamaica**, immediately to the south of Cuba, is the third largest of the Caribbean islands. It was sighted by Columbus in 1494 but the name is of Amerindian origin. Becoming independent in 1962, it is a constitutional monarchy with the queen as head of state, and a member of the Commonwealth. Under Spanish occupation, the Arawak population was decimated. During \*Cromwell's regime, it was seized by the English under William \*Penn in 1655. In the 18th cent. the sugar plantations were extremely lucrative and the \*Beckfords were only one of many families which owed their fortunes to Jamaican slave labour. Coffee and bananas were introduced as alternative crops. A serious rising in 1865 led to the recall of Governor Eyre and a vigorous debate on colonial policy. The modern progress of Jamaica's economy has been much retarded by periodic hurricanes. JAC

**James I** (1394–1437), king of Scots (1406–37). Contemporary views of the style and kingship of James I were sharply divided. Abbot Bower described James as 'our lawgiver king'; Sir Robert Graham saw him as 'a tyrant, the greatest enemy the Scots or Scotland might have'; and the pope's emissary, the bishop of Urbino, claimed that the murdered king had died a martyr.

James was the third son of Robert III (1390–1406) and was born in July 1394. By the age of 8, he was the sole surviving male and heir to the throne. An elder brother Robert was dead; another brother, David, duke of Rothesay, who had run the kingdom as lieutenant-general for the ailing Robert III between 1399 and 1402, was arrested in the latter year and incarcerated in Falkland castle at the instance of his uncle and greatest rival, the chamberlain, Robert Stewart, duke of \*Albany. Rothesay's death in a matter of weeks provoked fears as to Albany's ambitions; and by the winter of 1405–6 the country was racked by civil war, with the rump of Robert III loyalists supporting the young Prince James against a formidable Albany/Douglas faction. Early in 1406 events came to a head when James fled for safety to the Bass Rock, took ship for France, only to be captured at

## James II

sea (22 March) and delivered to Henry IV of England. Less than a fortnight later Robert III died (4 April), and James became king at the age of 12, uncrowned and in English hands for the next 18 years.

These were the formative years of James I's life, instilling in him an admiration for English royal government, the most centralized in western Europe, and in particular for the aggressive Henry V, in whose armies James served in the French campaigns of 1420–1. Already suspicious of the Albany Stewarts, James had his fears of Albany ambitions further fuelled by the release of Duke Robert's son and heir Murdac (\*Albany) from English captivity in 1416. The king had to wait a further eight years for his own release, and then it was to return to a Scotland in which Duke Murdac had succeeded his father as governor.

James re-entered Scotland in April 1424, in his 30th year, bringing with him an English wife, \*Joan Beaufort, and a desire to emulate Henry V of England in a country which had no tradition of the masterful rule he sought to introduce. Having taken part in English wars in France, on occasion against his Scottish subjects, he can hardly have been popular; and he was saddled with a ransom (euphemistically described as 'expenses') of £40,000 sterling, which necessitated the raising of taxation in Parliament and the sending south of noble hostages as security.

Despite this inauspicious start, James possessed virtues which earned him praise in his own day. Abbot Bower describes his many accomplishments, including prowess in sports, music, and literary pursuits: the king was the author of the autobiographical love poem 'The \*Kingis Quair'. He was, untypically for the Stewarts, a faithful husband, and Queen Joan responded loyally by producing twin sons and a string of daughters, whose marriages abroad greatly enhanced the prestige of the dynasty in the next reign. James's zeal for law and order was real enough, even if it had an obvious fiscal motive and despite the fact that he was very selective in its application—for example, James \*Douglas of Balvenie, a blatant extortioner of burgh customs before 1424, was not punished but employed as a trusted counsellor of the king.

In his efforts to increase the authority, resources, and security of the crown, James launched pre-emptive strikes against members of his nobility. The Albany Stewarts were all but annihilated in 1425, though the charges brought against them are obscure, and contemporaries muttered about the king's acquisitiveness. At Inverness in 1428 the story was the same; Highlanders arriving for a 'parliament' were arrested while the king composed Latin poetry. The earl of \*Douglas was suddenly arrested in 1431, the earl of March in 1434. Furthermore, the king had abandoned efforts to redeem the hostages in England, instead investing the ransom money collected in building projects like his unfortified palace at \*Linlithgow and the Charterhouse at Perth, and in artillery and luxuries for the court.

James's failure at the siege of Roxburgh (August 1436) was followed by Sir Robert Graham's abortive attempt to arrest him during a general council, and his murder at Perth (20–1 February 1437) as part of a coup (which ultimately failed) by Walter Stewart, earl of \*Atholl, using Graham and former

Albany Stewart retainers to do the deed. Ultimately the king was the victim of his own methods; Atholl, seeing his influence in Strathearn threatened by the king, responded with his own pre-emptive strike. If James I was a mixture of Bower's lawgiver and Graham's tyrant, perhaps his martyrdom can be understood in terms of his efforts to impose strong monarchical government on a country which initially rejected it. But he had set the agenda for his successor.

**James II** (1430–60), king of Scots (1437–60). James II is the first Scottish king of whose appearance we can be fairly certain. An Austrian visitor to the Scottish court in 1458, Jörg von Ehingen, had a portrait made of the king, presumably for the edification of James's sister Eleanor of Austria. King James is portrayed as a confident young man, his hands on a dagger at his belt, with the whole of the left side of his face from forehead to chin disfigured by a livid vermilion birthmark described by the French poet François Villon and the contemporary Scottish 'Auchinleck chronicler'. The confidence and ruthlessness suggested by this face are an accurate reflection of the king's character and policies. In a short life—he died at 29—and extremely short period of personal rule, he followed the path taken by his father, broke the power of the greatest magnate house, the Black Douglases, secured a sizeable increase in royal power at home and a formidable reputation abroad.

James was the younger of twin sons born to James I and \*Joan Beaufort at Holyrood in October 1430. (The elder twin, Alexander, died in infancy.) His father's assassination at Perth in 1437 thrust James into the kingship aged only 6 and necessitated a long minority (1437–49), in the first part of which he was controlled by the rump of his father's supporters, headed by the queen. He was crowned (March 1437) by Michael Ochiltree, bishop of Dunblane, a close associate of James I but hardly the premier ecclesiastic in Scotland. The disappearance of many major noble families, either through forfeiture and execution or failure of heirs in the male line, meant that by 1437 there were very few earls left in Scotland; and the political imbalance which resulted from this caused an enormous concentration of power in the hands of the Black Douglas family, with its head, the young William, 8th earl of \*Douglas, becoming lieutenant-general for James II (probably in 1444) and—together with the Livingston of Callander—using the office to acquire earldoms and other honours for his brothers and allies.

In July 1449 James II married \*Mary of Gueldres, only daughter of Duke Arnold of Gueldres and niece of Philip the Good of Burgundy (who paid his niece's dowry in instalments). Four of James's sisters had already made prestigious European marriages—Margaret to the Dauphin Louis in 1436, Isabella to Francis of Brittany in 1442, Mary to the Lord of Veere in 1444, and Eleanor to Sigismund of Austria in 1449. Thus the Scottish king threw off the frustration of being under tutelage with confidence and ruthlessness. He arrested and forfeited the Livingstons in

1449–50, driving the young earl of Ross (who was James Livingston's son-in-law) into rebellion in 1451.

However, James II's real target was the Black Douglases. Various motives have been suggested for his attack on the family—royal financial difficulties, linked to the king's determination, from 1451, to secure the Douglas earldom of Wigtown; James II's perception of Douglas weakness in Galloway as a result of the \*'Black Dinner' of 1440; the bond (probably of friendship) between Douglas, Crawford, and the rebel Ross of 1451–2, bringing together former rivals in a potentially dangerous combination; or simply the issue of authority, with Douglas's predominance at court (in spite of his having relinquished the lieutenant-generalship by 1450) unacceptable to an adult Stewart king. The outcome was an attack on Douglas estates by James II, a policy apparently urged by Chancellor Crichton, Admiral Crichton, and Bishop Turnbull of Glasgow during Earl William's absence in Rome in Jubilee Year 1450. There followed a temporary reconciliation (indicating royal weakness), and the great crime of the reign, James's murder of Douglas at Stirling castle on 22 February 1452, following a two-day conference which Douglas attended under a royal safe conduct.

Civil war followed, with the 9th earl of \*Douglas pitted against a determined James II. The king was lucky to escape from Stirling with his life when the Douglases arrived to confront him a month after the murder. Thereafter the situation improved. A male heir was born to Mary of Gueldres at St Andrews (May 1452); a royalist Parliament justified the Douglas murder; and the king walked the political tightrope of satisfying his own supporters and negotiating with the Douglases until he was strong enough to deliver the killer punch. Events in England—the outbreak of the Wars of the Roses—assisted James by depriving the Douglases of the possibility of armed support. In 1455 the king's sieges of Abercorn and Threave, and a skirmish at \*Arkinholm on the river Esk, completed the ruin of the Black Douglases.

James II's five remaining years reveal no let-up in the king's energy and aggressiveness—organizing an abortive attack on the Isle of Man; leading border raids; playing off Lancaster against York; restocking the Scottish peerage with earls, including royal Stewarts; adopting an astonishingly high-handed attitude towards the Danes in his demand for a marriage alliance for his son ceding Orkney and Shetland to Scotland; and receiving from Philip of Burgundy the gift of the huge cannon 'Mons Meg' in 1457. James II died as he had lived, the eternal warrior, mortally wounded by the explosion of one of his own guns at the siege of Roxburgh castle in August 1460.

**James III** (1452–88), king of Scots (1460–88). Perhaps because he inherited fewer problems than his two immediate predecessors, James III presented to the world a different face of Stewart kingship. There can be little doubt that he had a dangerously exalted view of his kingly role, an attitude which was reflected in his adoption of concepts of

imperialism in the first Parliament of his personal rule (1469), and in the minting of the earliest Renaissance coin portrait outside Italy, showing James III wearing an imperial crown, in the very last silver coinage of the reign (1488).

The eldest of the three sons of James II and \*Mary of Gueldres, James was born at St Andrews late in May 1452. His father's death at the siege of Roxburgh (August 1460) was swiftly followed by the coronation of the 8-year-old James III at nearby Kelso abbey. The ensuing minority (1460–9) had its difficulties, but under the wise guidance of Mary of Gueldres (d. 1463) the Scots secured the cession of Berwick from the refugee Lancastrians (1461), and then swiftly changed horses to back the victorious Yorkists. The late king's marital and territorial schemes finally came to fruition in the 1468 treaty of Copenhagen, by which James III was to marry \*Margaret, daughter of Christian I of Denmark-Norway. Christian's inability to afford his daughter's dowry resulted in his pawning the earldom of \*Orkney and the lordship of \*Shetland; both were annexed to the Scottish crown by 1472. Thus, by the early years of James III's personal rule, the Scottish kingdom had reached its widest territorial extent.

The view of James III which has come down to us is largely that of late 16th-cent. writers. These portray the king as a recluse who ignored or despised the counsel of his nobility in favour of that of low-born familiars; he disliked war (to prove the point, the chronicler Pitscottie has him fall off his horse at the fatal battle of \*Sauchie Burn); and he was a committed patron of the arts.

This legend is broadly unconvincing. The unwarlike king is difficult to discern in a ruler who proposed annexations or invasions of Brittany, Gueldres, and Saintonge between 1471 and 1473, and this view may derive only from James's alternative policy of peace and alliance with Yorkist England, which he pursued obsessively—excepting one disastrous interlude (1480–2)—from 1474 to the end of the reign. Again, complaints of neglect of his magnates may reflect James's failure to reward support, as in the classic case of the earl of Huntly in 1476, whose invasion of Ross and capture of Dingwall castle for the king merited only a gift of 100 marks' worth of land. This breathtaking royal meanness no doubt weighed heavily with Huntly twelve years later, when his role as a committed neutral may have cost James III his life.

The king's patronage of the arts—excepting the Trinity College, Edinburgh altarpiece, which he may or may not have commissioned—is rather elusive, as is the contribution of his English musician familiar William Roger; and although James III's most exotic friend, Anselm Adornes of Bruges, spread the king's name and fame as far afield as Tunis, James as a Scottish Renaissance patron remains an enigmatic figure. Perhaps significantly, his most despised familiars, William Scheves, archbishop of St Andrews, and Thomas Cochrane, were respectively a powerful court 'fixer' and a royal troubleshooter in the north-east. And the elusive royal whore 'Daesie' is surely the figment of a later imagination.

In fact, James III's failure may be explained without reference to the later legend. He was a static king, rarely moving out of Edinburgh during his adulthood, and thereby

## James IV

neglecting to travel on justice ayres, visiting far-flung areas of the country to settle feuds and make the royal presence felt. Successive parliaments criticized him repeatedly for this failing, as they did also for his attempts to tax and granting of remissions for serious crimes. Furthermore, James may have been unfortunate to have adult brothers as potential rivals, though his treatment of them was appalling. Alexander, duke of \*Albany, fled to France in 1479—and significantly an assize of Parliament would not forfeit him—while John, earl of Mar, was arrested later that year and died mysteriously in custody shortly afterwards. The return of Albany in 1482, backed by an English army sent by Edward IV, prompted a great Stewart family crisis, with the seizure of James III at Lauder, the permanent loss of Berwick to the English, Albany's temporary acquisition of the office of lieutenant-general, the king's incarceration in Edinburgh castle, and his subsequent release and recovery of power through the timely intervention of loyal north-eastern nobility.

However, crown-magnate mistrust persisted, and the king's wide-ranging Treasons Act (1484) showed that he had learned nothing from the warning of 1482. When his eldest son James, duke of Rothesay, a youth of 15, moved against him in the spring of 1488, with extensive support from a huge array of disaffected magnates, no armed assistance was forthcoming from the former loyalists of the north; and on 11 June James III, bearing Robert Bruce's sword and a black box full of money and jewels, succumbed to his son's army on the 'field of Stirling' (\*Sauchie Burn). NATM Donaldson, G., *Scottish Kings* (1967); Macdougall, N., *James III: A Political Study* (Edinburgh, 1982); —, *James IV* (Edinburgh, 1989); Nicholson, R., *Scotland: The Later Middle Ages* (Edinburgh, 1974).

**James IV** (1473–1513), king of Scots (1488–1513). James IV was the most successful of all the Stewart rulers of Scotland. Two decades after James's death, Sir David Lindsay of the Mount, who had known the king well, described him as 'the glory of all princely governing', a view which is largely substantiated by contemporary witnesses, most strikingly by the Spanish ambassador, Don Pedro de Ayala, in 1498. A combination of luck, military prowess, skilful use of royal patronage, and shrewd diplomatic manoeuvring explains King James's success.

The eldest son of James III and \*Margaret of Denmark, James IV was born at \*Stirling castle on 17 March 1473. The successful rising against his father in 1488 associated his name with an act of regicide and patricide, and he undertook elaborate penances to atone for his role in James III's death for the remainder of his life—the iron belt worn round his waist was no invention of later chroniclers. Yet the young king benefited greatly from the manner of his accession, for he was assisted by a very wide spectrum of magnates who had found his father's rule unacceptable. By the end of James IV's reign, the royal council displayed a much broader territorial representation than had ever been known under the king's three predecessors, embracing the crown's greatest subjects, including Hepburn, Hume, Angus, Argyll, Lennox, Arran, and Huntly. And at the outset of James IV's personal rule, in the spring of 1495, there was no violent political

upheaval, but a smooth transition—the king, a late developer, was already 22.

In almost every respect, King James's government affords a sharp contrast with that of his father. The king was a tireless traveller, driving the justice ayres in the south and north-east, intervening in major feuds, for example those in Cunningham and Strathearn; and he placed himself at the centre of a glittering court. His expenditure on building, especially on \*Holyrood palace and the King's House and great hall at Stirling castle, was large, his lavishing of money on a royal navy (probably more than £100,000 Scots) spectacular. An insight into James's court is provided not only by the treasurer's accounts (which survive in some quantity from this reign), but also by the poetry of William \*Dunbar and Robert Carver's astonishing nineteen-part motet 'O bone Jesu'.

An ambitious programme of Renaissance patronage in the manner of his more powerful European neighbours cost James vast sums of money. Yet his father's methods of attempting to acquire funds (with some success) through forfeitures, taxation, and debasement of the coinage carried grave political dangers. Recognizing that parliaments were often a focus for criticism (or worse) of the crown, James IV called only three in the seventeen years of his adult rule. The money he needed for his navy, his building programmes, above all for his wars, was acquired through rigorous exploitation of feudal casualties, by income from profits of justice, by taxation of a loyal clergy, by the imposition of two Acts of revocation (1498 and 1504), and perhaps above all by setting royal lands in feu-farm in the later years of the reign. These devices raised annual royal revenue from around £13,000 in the 1490s to a total in excess of £40,000 Scots by 1513.

In foreign affairs, James IV adopted a high-risk policy which proved broadly successful. His invasions of Northumberland (1496–7), ostensibly in support of the Yorkist pretender Perkin \*Warbeck but in fact to utilize the military talents of the Scottish nobility and put pressure on Henry VII, provoked the English king into furious retaliation. But the Cornish rising of 1497, born partly out of resentment at the imposition of heavy taxation to support the Scottish war, put an end to Henry's efforts to chastise the Scots; and the eventual alternative was the treaty of \*Perpetual Peace of 1502, as a result of which James IV married Henry's daughter \*Margaret Tudor (August 1503).

This union of the Thistle and the Rose, celebrated in Dunbar's poetry and much lauded by later historians, did little to improve Anglo-Scottish relations. The real Scottish understanding was with Louis XII of France, who from 1502 to 1513 provided James IV with shipwrights, soldiers, ships, money, and munitions. Significantly James's fleet started taking shape late in 1502, the year of the English treaty; and in the war of 1513, it was to be paid for by the king of France. A naval race with the English resulted in the construction of the Scottish *Margaret* followed by the English \**Mary Rose*; and in October 1511 James attended the launch at Newhaven of the *Michael*, briefly the largest warship in northern Europe. When the young Henry VIII sought to renew the \*Hundred Years War in 1512–13, James made a

formal treaty with Louis XII, employed crusading language to justify his cause, accepted excommunication with equanimity, invaded England, and took Norham castle by storm (while the Scottish fleet attacked Carrickfergus in Ulster *en route* to France). However, on 9 September 1513 James rashly committed himself to battle against the earl of \*Surrey at \*Flodden and was killed, together with no fewer than nine of his earls, a striking if tragic reflection of his popularity in Scotland.

NATM

Donaldson, G., *Scottish Kings* (1967); Macdougall, N., *James IV* (Edinburgh, 1989); Nicholson, R., *Scotland: The Later Middle Ages* (Edinburgh, 1974).

**James V** (1512–42), king of Scots (1513–42). A fine exponent of Renaissance kingship, James V's death aged only 30 cut short a reign characterized by the pursuit of royal aggrandizement both at home and abroad.

Born on 10 April 1512, James inherited the throne when barely 18 months old on the death of his father James IV at \*Flodden on 9 September 1513. The protracted regency which ensued witnessed the kind of magnatial power struggle which had dominated the minorities of successive Stewart monarchs. In this case, however, the conflict between James Hamilton, 1st earl of \*Arran, and Archibald Douglas, 6th earl of \*Angus, was aggravated by the latter's marriage in 1514 to the queen mother, \*Margaret Tudor, sister of Henry VIII, and the involvement of the king's French-born kinsman John Stewart, duke of \*Albany. While Albany was regent from 1515 to 1524, it was Angus who came to dominate the regime and from whose clutches the 16-year-old king engineered his own escape in May 1528.

The vindictive pursuit of his former Douglas captors is often seen as the leitmotif of James's personal rule. However, while Angus was forced into English exile in 1529, and his sister Lady Glamis was executed for treason in 1537, the king's justifiable suspicion of the Douglasses hardly amounted to a relentless vendetta. Likewise, the charge that a paranoid fear of his nobility led to the ruthless expropriation of their lands is exaggerated. Certainly, James wished to assert the crown's authority and his punitive expeditions to the borders in 1530 and to the Western Isles in 1540 vividly demonstrate his concern that the royal writ should run even in the outlying reaches of his kingdom. His attitude to the nobility was informed by a similar desire to assert royal authority, and James exploited the full repertoire of legal devices in order to recover and augment crown lands and revenues. Some noblemen undoubtedly suffered as a result. Yet the aggressive pursuit of crown interests was nothing new and, if it was particularly effective in James V's reign, the reason probably lies less in the king's alleged paranoia than in the expertise of a cadre of lay lawyers (such as his influential secretary, the Pavia-trained Sir Thomas Erskine) who played an increasingly prominent role in the royal bureaucracy.

Lawyers like Erskine may well have lent juridical weight to the authoritarian style of kingship suggested by James's fascination with the most potent contemporary symbol of royal power: the closed 'imperial' crown. If so, the clergy had as much—probably more—reason to fear the king as the nobility. Although James's former tutor, Gavin Dunbar,

archbishop of Glasgow, remained chancellor throughout the reign, the clergy's monopoly of legal and administrative expertise was being steadily eroded, while the spread of reforming opinion in the 1530s threw them further on the defensive. James exploited both the weakness of his own ecclesiastical hierarchy and the papacy's fear that he might follow his uncle Henry VIII in repudiating Rome altogether. Thus, with papal blessing, he was able to consolidate royal control over appointments to major benefices, milk the revenues of the religious houses, and levy the heaviest tax on clerical income which the *ecclesia Scoticana* had ever experienced. James may well have been personally pious and was certainly aware of the growing pressure for ecclesiastical reform; but neither factor was allowed to stand in the way of replenishing the royal coffers from the church's vast resources. Determined to establish a court-life befitting a Renaissance prince, the king spent lavishly on maintaining a large royal household and on creating the architectural settings at \*Falkland, \*Linlithgow, and \*Stirling in which the full majesty of his kingship could best be displayed.

Even with greatly augmented revenues, however, James was hardly in a position to compete with contemporary princes like Henry VIII, Charles V, or Francis I. Nevertheless, the intense rivalry between France, England, and the empire, compounded by heightened religious tensions and the nervousness of Rome, lent the Scottish king unwonted diplomatic weight. His shrewd exploitation of the marriage market led to his securing first the hand of Francis I's eldest surviving daughter \*Madeleine, and then on her death that of \*Mary of Guise. Despite Henry VIII's attempts to sever them, Scotland's traditional ties with France and Rome remained intact, the bargain sweetened by two generous dowries and lucrative papal concessions. Yet the alliance with France came at the price of war with England—and a military reversal from which the king's reputation never recovered. Although a Scottish army was beaten at \*Solway Moss on 24 November 1542, it was neither a personal humiliation for the king (who was not there) nor the result of noble disaffection. In fact, James had substantial support for his war policy and, when he died on 14 December 1542, preparations were already in train for a further English campaign.

As this suggests, the king's death was hardly the result of shame or despair at military defeat. Nor, despite the sudden death of his two male heirs in April 1541, is it likely to have been caused by disappointment at the birth of a daughter on 8 December 1542. More probably, and prosaically, it was the plague or cholera which brought his vigorous rule to a premature end.

Cameron, J., *James V: The Personal Rule*, ed. N. Macdougall (1998); Donaldson, G., *Scottish Kings* (1967); Macdougall, N., *James V* (East Linton, 1998); Marshall, R. K., *Mary of Guise* (1977); Wormald, J., *Court, Kirk and Community: Scotland 1470–1625* (1981).

**James VI** (1566–1625), king of Scotland (1567–1625) and, as **James I**, king of England (1603–25), was the son of Mary, queen of Scots, whose enforced abdication brought him to the throne when he was not 2 years of age. A lonely but intelligent child, James was educated by a succession of formidable tutors, including George \*Buchanan, whose

insistence that kings were servants of their people provoked his pupil into believing the opposite. Royal authority had been brought to a low ebb by Mary, and during James's minority the factious nobility lived in a state of civil war. James's assumption of power in 1585 marked a turning-point, for he brought the nobles to heel at the same time as he involved them in government. His main adversary was the presbyterian church, or kirk, which claimed that its authority, deriving directly from God, was superior to his own. James skilfully outflanked the kirk's leaders by encouraging the moderates and reviving the office of bishop. He also used his learning to buttress his position. *The Trew Law* and the *\*Basilikon doron*, both written in the 1590s, proclaimed that kings were the images of God upon earth and should be venerated as such.

James, deprived of female company during his formative years, found an outlet for his emotional needs in male favourites, of whom Esmé Stuart, created duke of \*Lennox by the boy king in 1581, was the first of a long line. But James was also capable of relations with the opposite sex, as he showed in 1589 when he crossed the seas to Norway to bring back \*Anne of Denmark as his wife. The marriage began well and produced a number of children, of whom two sons, \*Henry and Charles (later Charles I), and a daughter, \*Elizabeth, survived into adult life.

In 1586 James concluded a treaty with Elizabeth I which provided him with a substantial pension and acknowledged his right to succeed to the English throne. This enticing prospect may have kept James from protesting when his mother was executed by Elizabeth's government in 1587, but Mary was virtually a stranger to him, and her steadfast commitment to catholicism was at odds with his deeply held protestant convictions. When, in early 1603, news came of Elizabeth's death, James was impatient to quit his impoverished kingdom, but he was not ashamed of his Scottishness. On the contrary, his major objective once he was established in England was to complete the union of crowns by a union of states. This could only be done with the support of the two parliaments, but while he could ensure the co-operation of the Scottish assembly, the English one proved recalcitrant. Debates on the union, the principal business of the Parliament which James summoned in 1604, revealed the depth of English prejudice against the Scots. They also revealed that James's subjects were acutely suspicious of his intentions. In his writings and speeches, he used the language of absolutism, and he was not familiar with the very different English political tradition based on \*Magna Carta and the common law. James, who had worked harmoniously with the Scottish Parliament, found the larger and more formal English institution alien and intractable.

James's open-handed generosity, particularly towards his Scottish companions, won him few friends among the English. Nor did the spread of corruption in public life, including the sale of titles and offices, much of which was generated by royal favourites such as \*Carr and \*Buckingham. Conviction that James would squander any money grants, plus fear that without dependence upon parliamentary supply he would develop into an absolute monarch on the European pattern, brought about the collapse of the \*Great Contract.

James's resort to non-parliamentary taxes like \*impositions made matters worse and led to the failure of the \*'Addled' Parliament. It took time before James realized that, while he was much richer than he had been in Scotland, he still needed to exercise restraint. Matters improved considerably after 1620, when he appointed a merchant-financier, Lionel \*Cranfield, to the Treasury, but by then the damage was done.

In the sphere of religion James was more successful, not least because his protestantism was unquestionable. After the \*Hampton Court conference he came to realize that English \*puritans were far less dangerous than Scottish presbyterians, and in 1610 he pleased them by appointing the low-church George \*Abbot as archbishop. James also remained tolerant towards his catholic subjects, even after the \*Gunpowder plot, and drew up an oath of allegiance which enabled them to express their loyalty without offending their conscience. The problem for James was that religion and politics were inextricably intertwined. In hopes of acting as a European peacemaker, he married his daughter to a leading protestant prince and planned a match between his son and the daughter of the king of Spain, the archetypal catholic ruler. This ecumenical approach to international politics baffled and outraged his subjects, who believed that England's place was at the head of a protestant crusade. When, in 1621, James forbade the Commons to discuss the Spanish marriage on the grounds that such matters were his concern, they drew up a protestation asserting their right to debate all 'urgent affairs'. James responded by sending for the Commons' journal and ripping out the offending protestation. The next Parliament, the last of the reign, which met in 1624, was more harmonious, but only because James was no longer in full control. A powerful alliance between his son and heir Charles, his favourite Buckingham, and the parliamentary leaders forced him to acknowledge, however reluctantly, the possibility not merely of breaking off relations with Spain but even of fighting her.

Fortunately for James, he died in March 1625, before war broke out. He was not deeply mourned in either England or Scotland; undignified and conceited, long-winded and short-tempered, he caused offence without realizing it. But he kept his kingdoms in peace at home and abroad, he preserved the powers of the crown, and he held the church firmly to a middle course. It was no accident that while James's mother and son both met violent ends, he died peacefully in his bed.

Akrigg, G. P. V. (ed.), *Letters of James VI & I* (1984); Lee, M., *Great Britain's Solomon: James VI & I in his Three Kingdoms* (Urbana, Ill., 1990); Peck, L. L. (ed.), *The Mental World of the Jacobean Court* (1991).

**James VII** (1633–1701), king of Scotland and, as **James II**, of England (1685–8). James's formative years before 1660 were spent in the French and Spanish armies. His experiences in exile permanently distanced him in sympathies from most Englishmen. As duke of York under his brother Charles II he developed a career as lord admiral, defeating the Dutch off \*Lowestoft (1665) and commanding at Sole Bay (\*Southwold) (1672). He showed himself honest, straightforward,

and brave, but not a good strategist. James advocated wars against the Dutch with the objective of strengthening royal power, particularly by reducing its dependence on Parliament and the militia. His association with the ministers who formed the \*cabal represented a reversal of his earlier connection with the constitutional royalism of \*Clarendon, whose daughter Anne \*Hyde he married: she produced two future sovereigns, Mary and Anne.

After 1667 James constantly worked for an alliance with France. Around 1672 he became a catholic, refusing in 1673 to take the Anglican sacrament as required by the \*Test Act and resigning as lord admiral. He had urged Charles to veto the Test, to dissolve Parliament, and continue the third Dutch War in alliance with France. When in 1673 he remarried to a catholic Italian, \*Mary of Modena, suggested by the French, opposition politicians began to exploit a growing impression that James was unfit to succeed Charles. In 1678 'revelations' of a \*popish plot to murder Charles and place James on the throne led \*Shaftesbury and the Whigs to lead a parliamentary and popular movement to exclude James from the succession. This issue dominated three parliaments in 1679, 1680, and 1681. James feared that Charles would abandon his right, especially when he was exiled in 1679 and 1680, but the king resisted all Whig pressure and after concluding a subsidy treaty with France ruled for his last four years without Parliament. James succeeded without opposition in February 1685.

A Tory Parliament voted revenues which, with foreign trade expanding, freed James from his predecessors' dependence on parliamentary grants. The Whigs were discredited. \*Monmouth's rebellion was easily crushed. Anglicans generally acquiesced in non-enforcement of the penal laws against catholics. But James aimed to free the crown from any dependence on its subjects. He ended the parliamentary session when votes of money were linked to representations about the illegal commissioning of catholics in the army. The \*Ecclesiastical Commission, set up to discipline Anglican clergy who attacked catholicism, suspended the bishop of London. James used his \*dispensing power to put catholics in offices. The militia was run down, the professional army expanded. James ineffectively canvassed peers and MPs to pass legislation granting catholics equality of civil and religious rights. Their refusal led him to suspend discriminatory statutes by the \*Declaration of Indulgence (April 1687), provoking fears that this dubious royal power could be used to terminate any law that restricted the actions of the crown. Sweeping changes in Ireland, where catholics replaced protestants in government, army, law, professions, and corporations, seemed to indicate such an intention. In England James initiated a political campaign to manipulate elections to a future parliament. This involved purging the justices and deputies in the counties and the urban corporations. Several thousand persons were displaced for refusing to promise that if elected they would legislate as James directed, or would vote for such pre-engaged candidates. James also encouraged a catholic mission to convert the nation which had limited success. Open opposition to his policies was impossible: the army, camped outside London, prevented disturbances.

Some Whig and Tory notables established clandestine contacts with William of Orange, but most people believed that James could not live long. His protestant daughter Mary, married to William, would then reverse James's policies. The queen's pregnancy and the birth of a prince (June 1688) dashed these hopes, while James demonstrated his intention to persist with his policies by reissuing the Declaration of Indulgence and (unsuccessfully) prosecuting the \*seven bishops who contested its legality. These developments led to the invitation sent to William by Whig and Tory leaders to intervene (30 June). Although James uncharacteristically abandoned all his unpopular policies in October he could not persuade his subjects to help him resist William. Army and navy officers defected, the provinces declared for William, and even the Anglican clergy stood neutral. Broken psychologically, James fled to France. Louis XIV sent him to Ireland under French supervision. Defeated at the \*Boyne (July 1690) he lived as Louis's client at Saint-Germain praying for another restoration. JRJ

Miller, J., *James II: A Study in Kingship* (1978).

**Jameson Raid**, 1895. At the time (29 December 1895) this was presented as a brave attempt by a troop of part-time cavalry led by Dr Leander Starr Jameson, the British South Africa Company's representative in \*Rhodesia, to rescue English women and children persecuted by a wicked Boer government in the \*Transvaal. It turned out, however, to be a sordid conspiracy by Cecil \*Rhodes, almost certainly with the British colonial secretary Joseph \*Chamberlain's prior knowledge, to seize the Transvaal for the \*British empire. It failed ignominiously, and sullied Rhodes's, Chamberlain's, and the empire's reputations. BJP

**Jane Seymour** (c.1509–37), 3rd queen of Henry VIII. Jane Seymour was a lady-in-waiting to \*Anne Boleyn in 1534 when she began to attract Henry's attention. From a Wiltshire gentry family at Wolf Hall, which the king visited in September 1535, she was said to be quiet and amiable, while Anne was growing more highly strung and imperious. By May 1536 Anne was under arrest and Jane's marriage took place soon after her execution and before the month was out. Honours were showered upon her family. Her elder brother Edward (the future Protector \*Somerset) was created Viscount Beauchamp in June and earl of Hertford in October 1537: another brother, Thomas, became a gentleman of the privy chamber. A new Act of \*Succession disinherited the Princesses Mary and Elizabeth in favour of Jane's offspring. In October 1537 she gave birth to the future Edward VI but died twelve days later. Henry seems to have felt genuine grief and ten years later was buried at Windsor at her side. JAC

**Japan, relations with.** Britain was among the powers to follow up the American initiative which opened Japan to the West from the 1850s, and to provide models upon which the Japanese based their modernization from 1868 (especially the development of their navy). The British were pioneers in the renegotiation of the unequal treaties which governed Japan's relations with the West, an agreement being reached in 1894. In January 1902 Britain and Japan became allies, the

Admiralty being especially anxious for assistance in offsetting Russian and French naval power in the Far East. Japan's victory in the war against Russia in 1904–5 added temporarily to British security at sea and on the north-west frontier of India, but increasing Anglo-Japanese trade competition soon developed in China. The alliance from 1911 was largely designed by Britain to restrain Japan and to facilitate the navy's concentration in home waters against Germany. Japan's assistance to Britain in 1914–18 was balanced by her advancing influence in China. Yet the alliance was given up in 1921–2 only in response to American pressure and in the context of efforts to regulate competition in the Far East. British interests, however, were dangerously exposed when Japan embarked upon an increasingly aggressive policy from 1931. German successes in Europe made the British empire ever more vulnerable as Japan advanced into south-east Asia. War broke out in December 1941. The loss of Malaya and Singapore soon followed, defeats often seen as a turning-point in the history of the empire. Commonwealth forces later took the offensive, but it was the USA which was primarily responsible for Japan's defeat in 1945. By the 1980s and 1990s it seemed as if the wheel was coming full circle with Japanese industry and investment helping to revitalize the British economy. CJB

**Jarrow**, on the south bank of the Tyne, was founded in 682 by \*Benedict Biscop and thereafter formed a single monastery with \*Monkwearmouth. Largely through the work of \*Bede this foundation had an enormous impact on medieval European learning. One of Biscop's churches still survives as the present chancel; the larger basilica, dedicated in 685, lay to its west and was destroyed in the 18th cent. As at Wearmouth, these churches and the surrounding excavated monastic structures reflect Gaulish tastes. The present standing buildings lying to the south of the church are of post-Conquest date, some associated with Aldwine's attempt to revive monasticism on the site in the 1070s. RNB

**Jeffrey, Francis, Lord Jeffrey** (1773–1850). Scottish law lord and literary critic, Jeffrey was called to the Scottish bar in 1794, but unable to attract work because of his switch of allegiance from his father's high Toryism to Whiggism, turned to literature and edited the newly founded *\*Edinburgh Review* for 27 years. He was an outstanding editor, and the *Edinburgh Review* became the most influential medium of critical opinion in Britain. Jeffrey's appointment as lord advocate in 1830 on his resignation from the *Edinburgh Review* was both a reward for his political services to the Whig Party, and a recognition of his legal qualities. He entered Parliament in 1831, but in 1834 became a judge of the Court of Session. However, it is as a literary critic that Jeffrey's fame rests: \*Carlyle even compared him to Voltaire. TSG

**Jeffreys, George** (1648–89). Notorious as the judge who presided at the \*Bloody Assizes, Jeffreys was a career lawyer who became conspicuous as an aggressive prosecutor and partisan judge. At political trials his success in harassing defendants and intimidating juries earned him royal approval for upholding the interests of the crown. In 1684

he ordered the execution of Sir Thomas Armstrong without trial, as an outlaw. Attached to James II since 1677, he became lord chancellor in 1685 and as Baron Wem acted as Speaker of the Lords. In dealing with his peers his bullying manner proved counter-productive. The other judges involved in the Bloody Assizes allowed Jeffreys to incur responsibility for the brutal treatment of Monmouth's rebels. Consequently Jeffreys was cast as scapegoat after the \*Glorious Revolution, but died soon after being arrested. Whig historians subsequently created the legendary figure of a unique judicial monster. JRJ

**Jehovah's witnesses.** An exclusive millennialist sect developed out of Charles Russell's International Bible Students Association (founded in Pittsburgh, 1872), now world-wide. Russell's successor, Judge Rutherford, sought to affirm Jehovah as the true God and developed the concept of a 'theocratic Kingdom' which will emerge after Armageddon. Date setting and prophecy have lessened, but they refuse any association with other denominations and regard civil authorities and secular governments as allies of Satan. Baptized by immersion, witnesses insist on high moral probity, oppose blood transfusions on scriptural grounds, write and publish prolifically (chief periodicals: *The Watchtower* and *Awake!*), and, after training, preach enthusiastically on doorsteps. The British headquarters functions as The Watch Tower Bible and Tract Society. ASH

**Jellicoe, Sir John** (1859–1935). Admiral. As commander-in-chief of the Grand Fleet until December 1916, Jellicoe knew that a single wrong decision could cost Britain the war by losing command of the seas. Confronted by a growing threat to his battleships from German mines and submarines, he was determined not to risk his ships unless he was certain of destroying the German high seas fleet. His handling of the Grand Fleet at \*Jutland was marked by excessive caution and he forfeited any chance of decisively defeating the Germans. He was a tired man in December 1916 when he was transferred to the Admiralty as 1st sea lord. Jellicoe lacked the political skills necessary to prosper in Whitehall. His natural pessimism, coupled with a reluctance to employ convoys to counter the German U-boat offensive against allied merchant shipping, cost him \*Lloyd George's confidence. He was dismissed in December 1917, and received his earldom, rather belatedly, in 1925. DF

**Jenkins, Roy** (1920–2003). Chancellor of the University of Oxford; previously deputy leader (1970–2) of the Labour Party and leader (1982–3) of the \*Social Democratic Party. Author, bon viveur, and quintessential establishment figure, he became Lord Jenkins of Hillhead in 1987. His political appointments included minister of aviation (1964–5), home secretary (1965–7, 1974–6), chancellor of the Exchequer (1967–70), and he was easily the most successful of \*Wilson's cabinet ministers. From 1977 to 1981 he was president of the European Commission. One of the 'Gang of Four' who broke with the Labour Party in 1981 to form the \*SDP, he was replaced as leader after 1983 by David \*Owen. His main political achievements were to facilitate the 'moral revolution of the 1960s' as home secretary (defending the

'permissive society' as 'the civilized society'), to give strong support to the move into Europe, and to help keep the Labour Party out of power in the 1980s and 1990s. AS

**Jenkins's Ear, War of.** Although Captain Jenkins's ear was cut off by the Spanish in a skirmish in 1731, the war between Spain and Britain that bears his name did not begin until October 1739. American colonial trade was at the heart of the conflict and, initially, Britain made gains. Defeats followed, which had virtually destroyed her Caribbean army by spring 1741, though the navy remained potent. Domestic pressure for war with Spain marked the beginning of the end for \*Walpole's premiership. From December 1740 the War of Jenkins's Ear was subsumed into the War of the \*Austrian Succession. AIL

**Jenkinson, Anthony** (d. 1611). Jenkinson, a member of the Mercers' Company, made a series of remarkable voyages to Russia and the Near East in the reign of Ivan the Terrible. His first, via Norway (1557–60), took him to Moscow, where he met the tsar, and on to Bokhara. The second (1561–3) was to Persia to negotiate with the shah. A third (1566–7) and a last (1571–2) were to Moscow. He then settled down to trade at home. His voyages were related in \*Hakluyt's *Principal Navigations*, first published in 1589. JAC

**Jenner, Edward** (1749–1823). Vaccination pioneer. As John \*Hunter's first house-pupil and dresser at St George's hospital (London), Jenner shared Hunter's disciplined observation and belief in experimentation, but chose to practise at home at Berkeley (Glos.), where he joined local medical groups and continued his interests in heart disease and natural history. He became obsessed with the idea that inoculation of cowpox matter (a mild contagious disease) was a better protection against the scourge of smallpox than using exudate from smallpox lesions. An initial paper having been rejected, he published privately *An Inquiry into Cow-pox* (1798), and very slowly the idea of 'vaccination' was popularized. World-wide recognition and honours ensued, but Jenner lost rather than gained financially, as he spent the remainder of his life in an ever-widening campaign to eradicate smallpox from the world. This was finally achieved in 1978. ASH

**Jervis, John, 1st earl of St Vincent** (1735–1823). Promoted earl following his triumph over the Spanish fleet in February 1797, Jervis, son of a crooked Staffordshire lawyer, had an inauspicious start in life. But these circumstances formed an unflinching character of firmness and integrity; and as a hard yet humane disciplinarian Jervis attained a standing in the navy which was all his own. A symbol of professionalism, he was commanding in the Western Approaches in his 71st year. Jervis served with \*Wolfe at Quebec in 1759, and subsequent service in the North Sea and Mediterranean endorsed his talents as a seaman. In the 1770s he spent a year in France, familiarized himself with France's Biscay bases, and visited all the ports of the Baltic. He was present at \*Keppel's indecisive action off \*Ushant in July 1778, while at home he became MP for Launceston, Yarmouth (Walpole interest), and Wycombe 1783–94. Promoted admiral in 1787 he combined well with the army in the West Indies in 1793,

but it was his command in the Mediterranean 1795–9 which established his fame, together with his affectionate tutelage of his subordinate \*Nelson. In 1801, as 1st lord of the Admiralty, St Vincent prosecuted an inquiry into theft in the dockyards which contributed to Lord \*Melville's impeachment in 1806 for malversation of funds. In 1810 \*Sheridan saluted St Vincent's 'triple laurels over the enemy, the mutineer, and the corrupt'. DDA

**Jesuits.** The Society of Jesus was founded by Ignatius Loyola and approved by Pope Paul III in 1540. It offered total obedience to the papacy and was prominent in the effort to recover ground lost to the church by the Reformation. Mary Tudor, though a devoted catholic, mistrusted the order and did not invite it to England, though a number of Englishmen went abroad to join it. But the deterioration of relations between Elizabeth and the papacy, culminating in the bull of excommunication of 1570, changed the situation. William \*Allen had already founded a seminary at Douai and about 100 catholic priests had made their way back to England by 1580, living an undercover existence, hiding in priest holes, and protected by the old catholic gentry. In that year, two Jesuit priests landed—\*Campion and \*Parsons—accompanied by a lay brother. Their mission lasted only a few months but gave an important boost to the morale of English catholics. Campion was soon apprehended and executed in December 1581: Parsons left for the continent and never returned. Elizabeth's ministers were at pains to convict the Jesuits of duplicity and indeed their interpretation of the papal bull—that catholics were not bound by it 'things being as they are'—was disingenuous. The events of the rest of the decade—powerful French and catholic influence in Scotland, plots against the queen's life, the threat of the Armada—combined to strengthen anti-catholic feeling in England, much of it concentrated on the Jesuits. But the culminating disaster for English catholics was the \*Gunpowder plot of 1605, which resulted in the capture of Henry Garnett, Jesuit superior in England for nearly twenty years. Though he claimed that he knew of the plot only through the confessional, others doubted, and he was executed as a traitor. For decades, 'Jesuitical' became a term of abuse, signifying mental reservation, prevarication, and casuistry. The prominence of Jesuits throughout Europe as teachers and confessors encouraged the belief that they practised relentless and insidious indoctrination. The fires of fear and hatred were stoked again by suspicions that Charles I (with a catholic wife) and Archbishop \*Laud were cryptopapists, and in 1679 by the lurid allegations of the \*Popish plot. Titus \*Oates purported to be a repentant Jesuit and his revelations of a Jesuit scheme to murder Charles II and place James, duke of York, on the throne brought nine Jesuits to the scaffold. But, in the long run, the Enlightenment proved more damaging to the order than downright persecution. The Jesuits were accused of accommodation and undue pliability in their zeal to proselytize and the order was wound up by Pope Clement XIV in 1773 after France, Spain, and Portugal had all moved against it. Surprisingly, it continued in Russia and Prussia, where there were many Jesuit teachers, and where Catherine the Great and Frederick

## Jevons

the Great paid little attention to papal bulls. Though reconstituted in 1814 by Pope Pius VII, the circumstances which had made Jesuits so hated were no longer in existence. The French Revolution, in which the catholic church had been persecuted, first by de-Christianizers and then by Napoleon, had brought about a realignment, and French refugee clergy had been welcomed and given assistance in Britain. The English province of the order was re-established in 1829, with the Jesuits in Scotland, who had never been strong, tucked into that organization. Although fierce bursts of anti-catholic feeling were still possible, particularly at the time of 'papal aggression' in 1850, the role of the Society of Jesus was no longer a national bugbear. JAC

**Jevons, W. S.** (1835–82). Distinguished neo-classical economist. Jevons was born in Liverpool, and educated in Liverpool and London. After studying chemistry at University College, London, and working as an assayer in Australia, he returned to University College in 1859 to study political economy, philosophy, and mathematics. From 1863 he was tutor, lecturer, and then professor at Owens College, Manchester, moving, in 1876, to a chair at University College, London (until 1880). He married the daughter of the founder of the *Manchester Guardian*, and drowned in the sea near Hastings. Jevons had wide interests in political economy, from currency and finance to the relation of sunspots to business cycles. His principal contribution, however, is his work on the marginal utility theory of value (*Theory of Political Economy*, 1872), the introduction of marginal analysis marking 'the true dividing line between classical theory and modern economics'. MW

**Jewel, John** (1522–71). Bishop. Born in Devonshire and educated at Merton College, Oxford, Jewel became a fellow of Corpus Christi College, Oxford, but was deprived at the accession of Mary and fled to the continent. He returned in 1559 after Elizabeth's accession and was made bishop of Salisbury. In 1562 his *Apologia pro Ecclesia Anglicana* defended the Church of England from the charge of heresy. At the same time, Jewel resisted \*calvinist demands for further changes. One of his disciples was Richard \*Hooker, who produced the most famous justification of Elizabeth's church settlement as a *via media*. JAC

**Jews.** Though there must have been individual Jews in Anglo-Saxon England, there is no evidence of settled communities. But after the Norman Conquest, some hundreds of Jews entered the country, mainly from Normandy where there had been settlements. Since Christians were not allowed to practise usury, Jews quickly established themselves as financiers and money-lenders. Their position was extremely precarious, exploited ruthlessly by monarchs in constant need of funds and hated by the native population. As their numbers increased and they moved outside London into provincial towns, tensions rose. As early as 1144 the accusation of ritual murder was made against them, with the charge that they had killed a small boy in Norwich, 'St William'. Severe restrictions were placed upon them. They were confined to Jewries, from 1218 were obliged to wear badges steadily increased in size, and in 1232 a *domus*

*conversorum* was opened in London for proselytizing. Fresh hostility came with the crusading movement. At the accession of Richard I in 1189—a notable crusader—there were attacks on Jews in London, which spread to the provinces, and culminated in the slaughter of 150 Jews in the castle at York. Religious zeal was reinforced by greed and envy. Some of the Jews were already very wealthy—Aaron of Lincoln in the 1170s dealt with kings, archbishops, municipalities, and monasteries.

The difficulties of the Jews continued in the 13th cent. John's financial worries made him severe and the baronial opposition to Henry III disliked Jews who could assist the crown. The story of William of Norwich was repeated in 1255 with the account of Hugh of Lincoln—another boy said to have been butchered, and again given saintly status. In 1275 Edward I in a statute forbade Jews to practise usury, allowing them to trade and own property. But if this was meant as an attempt at integration, it was followed in 1278 by a savage attack in which hundreds of Jews were hanged. In 1290, in exchange for a large subsidy from Parliament, all Jews were expelled from the kingdom and allowed three months to leave. They were given safe conducts though inevitably numbers were set upon and robbed.

Between 1290 and the 1650s there were no Jewish communities of any size, though individuals slipped through, sometimes professing conversion. In Elizabeth's reign, there were Spanish and Portuguese Jews in the country though they practised their religion with circumspection. When approached in the 1650s, \*Cromwell was more sympathetic than his council, perhaps because he had made use of some Jews in espionage and diplomacy. There was no dramatic reversal of policy but Jews were allowed in once more. Their numbers and status built up and the financial and commercial revolutions of the early 18th cent. gave them enhanced possibilities. Sir Samuel Gideon was prominent in assisting the government with loans in the crisis of 1745, and his son was given an Irish peerage in 1789, though he had to change both name and religion. But old hatreds died hard and when the Pelhams brought in a modest measure to facilitate naturalization in 1753, the public outcry was so great that they were forced to repeal it.

Catholic emancipation in 1829 left the Jews as the only religious group suffering under severe disabilities. Repeated attempts at concessions were thwarted in the House of Lords but the progress of Jews in society was unmistakable. David Salomons was made sheriff of London in 1835 and lord mayor in 1855; Francis Goldsmid was the first practising Jew to be given a baronetcy in 1841. When first Lionel \*Rothschild (1847) and then Salomons (1851) were elected to Parliament, only to be kept out by their inability to take the oath as a Christian, the plight of the Jews was dramatized, and the law was changed in 1858. The first government minister of Jewish faith was appointed in 1871, the first judge in 1873. Powerful prejudices remained and were strengthened by an influx of poorer Jews from eastern Europe in the later 19th cent. The obstacles facing Jews remained substantial, but they were personal and social rather than legal. JAC

**Jex-Blake, Sophia** (1840–1912). Pioneer of women in medicine. Ever concerned with women's education, Sophia Jex-Blake was mathematics tutor at Queen's College, London (1859), but an American friendship drew her to medical studies, initially in New York but then in Edinburgh, until increasing hostility prevented clinical training. The cause of women's medical education now publicly aired, she responded by founding the London School of Medicine for Women (1874), negotiating clinical work at the Royal Free Hospital. Gaining an MD at Berne, then the Dublin licentiate (registrable in Britain), but too stormy for the LSMW (who appointed Elizabeth Garrett \*Anderson as dean), she returned hurt to Edinburgh, where she founded her own medical school for women (1886). Like many of her schemes, this did excellent work but foundered through her domineering personality and intransigence. Impetuous trail-blazer, concerned with tuition and legal qualification but difficult to work with, Jex-Blake finally admitted defeat (1899) and retired to Sussex. ASH

**jingoism.** The word comes from a music-hall song popular at the time of the 1876–8 Eastern crisis: 'We don't want to fight, but by jingo if we do . . .'. Later it was used to describe other manifestations of popular bellicosity during foreign wars. The most famous example was on \*Mafeking night, 18 May 1900, when crowds took to the streets to celebrate the relief of a British garrison during the second \*Boer War, although there is controversy over how widespread the feeling was. It also erupted later, notably during the \*Falklands War of 1982, stoked up—as it generally is—by the gutter press. BJP

**Jinnah, Mohammed Ali** (1876–1948). Jinnah, 'the father of Pakistan', was born in Karachi and trained as a barrister. Initially, he was sympathetic to the Indian National Congress and did not join the Muslim League until 1913, when it became more critical of colonialism. He helped to organize the Lucknow pact (1916) and the Khilafat movement (1919–22), by which the Muslim League ran campaigns of anti-British resistance parallel to those of the Congress. However, he became suspicious that, especially under \*Gandhi's leadership, the Congress was being taken over by a narrow Hindu nationalism. His concern was heightened by the Nehru Report (1928) in which Congress proposals for Indian self-government denied Muslim claims for protected minority rights. In 1934 he became president of the Muslim League and chaired its 1940 conference at Lahore where the demand for a separate Pakistan state was first made. In the 1946–7 negotiations, he stubbornly resisted proposals, favoured by both the British and the Congress, that India should be granted independence as a unitary nation state. Eventually, both the other parties came to accept partition as the price of a rapid British withdrawal. Pakistan proclaimed its independence on 15 August 1947 with Jinnah as its first governor-general. DAW

**Joan** (Joanna) (1210–38), queen of Alexander II of Scotland. Eldest daughter of King John and sister of Henry III, her marriage to Alexander at York on 19 June 1221 helped to reinforce the Anglo-Scottish peace which lasted from 1217

to 1296. Said to have been 'of comely beauty', she was overshadowed in Scotland by her mother-in-law, the queen-dowager \*Ermengarde, and she disappointed her husband's dynastic hopes by failing to have children. She died in London during a visit to Henry III's court, and was buried in the Cistercian nunnery of Tarrant Keynes (Dorset). KJS

**Joan, Princess** (d. 1237). An illegitimate daughter of King John, Joan was married 1205/6 to \*Llywelyn ab Iorwerth of Gwynedd, prince of North Wales. Thereafter, she was a wise counsellor to her husband and a peacemaker in the fluid and often belligerent relations between England and Wales. In 1211, when John attacked Wales, Joan pleaded her husband's cause. The following year she warned her father of the hostile plans of his barons. She continued to act as a mediator during the reign of John and of his successor Henry III. In 1226 Pope Honorius III removed the stigma of her illegitimacy. Llywelyn remained indebted to his wife for her support, forgiving her an affair in 1228. He founded a Franciscan monastery to her memory at Llanfaes (Anglesey), where she is buried. JC

**Joan Beaufort** (c.1400–45), queen of James I of Scotland. Daughter of John Beaufort, earl of Somerset, Joan was married to James I of Scotland at Southwark in February 1424, a match celebrated in James's poem 'The \*Kingis Quair'. She was by James I the mother of twin sons, Alexander and James (later James II), and six daughters, and took some part in the business of government. A target for King James's assassins in 1437, the wounded queen escaped to head her infant son's administration. Following her second marriage (1439), to Sir James Stewart of Lorne, Joan lost support, and died at Dunbar castle in July 1445. NATM

**Joan of Kent, princess of Wales** (c.1328–85). Joan was a daughter of Edmund, earl of Kent (d. 1330), and succeeded as countess in 1353. While considerably under age, she secretly married Thomas Holand. In his absence in Prussia, she soon contracted a second marriage with the earl of Salisbury; this was annulled nine years later, in 1349. Within a year of Holand's death, this reputed beauty married \*Edward the Black Prince and accompanied him to Gascony, where their sons Edward (d. 1370) and Richard (II) were born. Widowed again in 1376, Joan had charge of Richard's upbringing until his accession, and is believed to have remained a restraining influence upon him. A popular figure, she was well received by turbulent Londoners and humble rebels, while \*John of Gaunt and John \*Wyclif benefited from her kindly intervention. RLS

**Joan of Navarre** (c.1370–1437), queen of Henry IV. A daughter of Charles the Bad, king of Navarre, Joan married John IV, duke of Brittany, in 1386; they had eight children. After his death in 1399, she acted as regent for Duke John V until his inauguration in 1401. Henry (IV) had visited the Breton court during his exile, which may partially account for his suit. Joan came to England and was crowned in 1403; the marriage was childless. She chose to remain in England after Henry's death. Relations with her stepson Henry V were amicable until 1419, when she was accused of plotting his death by witchcraft. She was confined without trial until

## Joanna of the Tower

1422, and her revenues seized but restored by Henry's death-bed wish. She was buried with Henry IV, under their effigies in Canterbury cathedral. RLS

**Joanna of the Tower** (1321–62), queen of David II of Scotland, was the youngest daughter of Edward II and born in the Tower of London. In 1328 when she was 7 she was married to David Bruce, son and heir of Robert I of Scotland, who succeeded in 1329. In 1334 when Edward \*Balliol invaded, the young couple were sent to France and did not return until 1341. Five years later, David was captured by the English at \*Neville's Cross and taken to London. Joanna visited him and for a while resided at Hertford castle. Soon after his release in 1357 she left him, and spent the rest of her life in refuge at the court of her brother Edward III. JAC

**John** (1167–1216), king of England (1199–1216). As every schoolboy knows, John was a monster and a tyrant. It is a reputation with deep historical roots, culminating in the judgements of Victorian historians such as J. R. Green, whose hugely influential popular history of England decisively shaped attitudes. His image of John is grisly: 'Foul as it is, hell itself is defiled by the fouler presence of John.' The terrible view of his contemporaries has passed into the sober judgment of history . . . in his inner soul John was the worst outcome of the Angevins. He united into one mass of wickedness, their insolence, their selfishness, their unbridled lust, their cruelty and tyranny, their shamelessness, their superstition, their cynical indifference to honour or truth.' Because of these characteristics, it was no wonder that John lost the support of his subjects, that he lost the \*Angevin empire in France, and that he was brought to book at Runnymede in 1215.

The Victorian view of John stemmed from a perspective on history from the high moral ground, and it drew its support almost entirely from contemporary chroniclers. At the time of John's death, there was already plenty of material that might be used to condemn him, but his legend was by no means complete and not even agreed by all. That process only occurred in the next 40 years, as a result of the deliberate fabrication of an image of John by Roger of Wendover and \*Matthew Paris, successive historians of St Albans. (It is Paris whom Green cites in the quotation above.) It is to them that so many of the notorious anecdotes concerning John are due, anecdotes that acted as a vehicle for savage denunciation of the inner being as well as the policies of the king, the better to justify the stance made against him in 1215, and to emphasize the need for \*Magna Carta. By c.1250, the elements of the legend had crystallized.

In the 20th cent., the unreliability of many of these chronicle sources was exposed, serving partly to rehabilitate John. More importantly, through close analysis of the record evidence for the reign, John has come to appear in a new light as a capable administrator with great powers of organization and application. No one would now doubt that John was an intelligent and able man. The system of continental alliances that he built up against Philip II of France prior to the disaster at \*Bouvines (1214) reveals diplomatic skill and a grasp

of strategy. His surrender of England as a papal fief in 1213 was a brilliant piece of manoeuvring, at a stroke dividing the pope from the conspiracy developing against John in France and England. Again, his actions in 1215–16 show both considerable ingenuity and a sure tactical sense, both political and military.

Another approach has stressed the continuity between the regimes of Henry II and his sons, placing John firmly in his dynastic context. Many of John's alleged acts of tyranny appear as continuations of the policies of his predecessors, although it is agreed that he bore down ever more heavily upon his subjects. And he did this, it is argued, not out of any innate wickedness, but because he had no option. His English subjects would have to be exploited, because only with English resources could he regain his lost French lands, his overriding policy goal after 1204 when the Angevin empire collapsed.

From these perspectives, John has been rescued from the excessive moralizings of Victorian historians and their predecessors. Yet modern scholarship has also strengthened some of the traditional charges against him. Perhaps the most infamous charge, that he murdered—or caused to be murdered—his own nephew, \*Arthur of Brittany, now seems virtually certain. Other acts of cruelty are also proven, his hanging of 28 hostages, sons of rebel Welsh chieftains, in 1212, or the starving to death of William de \*Braose's wife and son in a royal prison. The consensus has grown that although men of his age, and of others, could be excessively cruel, John overstepped the mark.

In a similar vein, he did not live up to contemporary expectations of a king. In contrast to his brother Richard I, he seemed incompetent in warfare. Particularly damaging was the epithet 'Softsword' applied to him as early as 1200. Yet he could be capable of decisive military action. Again, he took the business of dispensing justice seriously, but often his subjects could complain that the judgment rendered was unjust and partial. And in pressing ever harder upon his subjects out of financial necessity, if nothing else, he laid himself open to the charge of introducing evil customs and unlawful innovations.

Had John succeeded in regaining his lost lands, Magna Carta would almost certainly not have occurred and the legend about him would never have developed. But he lost, and paid a posthumous penalty as well. And one of the chief reasons that he lost lay in his appalling handling of his greater subjects. Whatever John's technical competence as a ruler, it was constantly compromised by his secretive and suspicious nature towards them, his jealousy, unpredictability, and caprice. None could live easily with such a ruler, his conviction that they were untrustworthy serving only to alienate them. Rule by fear might keep them in check, but in the long run, John's regime was dangerously unstable. He and his greater subjects confronted each other in a closed system of self-fulfilling preconceptions. John remains baffling and enigmatic. As Lewis Warren put it succinctly, 'He had the mental abilities of a great king but the inclinations of a petty tyrant.'

SL  
Painter, S., *The Reign of King John* (Baltimore, 1949); Turner, R. V., *King John* (1994); Warren, W. L., *King John* (2nd edn. 1978).

**John, Augustus Edwin** (1878–1961). British painter. John was born in Tenby (Wales), the son of a solicitor. A brilliant student, he trained at the Slade School, then went to Liverpool as an art instructor. In the first decade of the 20th cent. he was at the height of his powers, expressing in art and life an independent and rebellious nature. Although he had been rejected for military service, he served in Paris as an official war artist for a few months. Between the two world wars, he became the leading society portraitist. He was elected ARA in 1921 and a full academician seven years later. Following an argument over the rejection of another artist's work, he resigned from the academy in 1938 but was re-elected in 1940 and awarded the OM in 1942. The National Gallery at Cardiff has a number of John's paintings. JC

**John, lord of the Isles.** See MACDONALD, JOHN.

**John Balliol.** See BALLIOL, JOHN.

**John Bull.** The character of John Bull was invented by John Arbuthnot in a series of pamphlets, *Law is a Bottomless Pit*, published in 1712. Bull's sturdy honesty contrasted with the wily Frenchman Lewis Baboon. He became popular with cartoonists in the early 19th cent. and acquired the Pickwickian squat top hat and the Union Jack waistcoat. His heyday was the later Victorian period, when he appeared in countless *\*Punch* cartoons. A popular magazine, taking the name, was founded in 1906 by Horatio Bottomley. JAC

**John of Gaunt, 1st duke of Lancaster** (1340–99). The third surviving son of Edward III, born in Ghent, and England's greatest territorial magnate following the death of his father-in-law *\*Henry of Grosmont*. As earl of Richmond (1342–72), he was engaged in the French war from 1355, eventually leading major operations, the most notable the *chevauchée* from Calais to Bordeaux in 1373. He also had commands on the Scottish border. His wealth enabled him to form the largest baronial retinue of knights and esquires; their badge was his collar of linked SS. Gaunt's contingent was a quarter of the army raised by contract for Richard II's Scottish campaign in 1385. From 1372 he assumed the title of king of Castile in right of his second wife, which he renounced—profitably—after campaigning there in 1386–7. In Edward's dotage, Gaunt was virtually regent, incurring widespread odium for military failures and government corruption and for opposing criticism in the *\*Good Parliament*. His patronage of *\*Wyclif* and hostility to the bishop of London roused riots; his Savoy palace was sacked in 1381. Lords feared his wisdom as well as his might; they resented his 'poaching' their retainers. In response to *\*Northumberland's* opposition in the north, he advanced his Neville followers; Ralph Neville was made earl of *\*Westmorland* and married Gaunt's daughter Anne Beaufort, who with her brothers was legitimized in 1397. Despite allegations of treason by hostile courtiers, Gaunt's backing was invaluable to Richard; while Richard was childless, it is doubtful if this loyalty was disinterested. His son seized the throne in 1399 and reigned as Henry IV. RLS

**John of Salisbury** (c.1120–80). Scholar and clerical author. His letters and books drew on his own experience in church

politics and reflected the immense range of his classical and Christian scholarship. Born at Salisbury, a student at Paris (1136–46) in the days of Abelard, in his *Metalogicon* he defended the value of logic as an intellectual discipline. As political secretary to Archbishop *\*Theobald* (1147–61) of Canterbury he used his friendship with *\*Adrian IV* to promote Canterbury's interests at the papal curia and then used his insider knowledge to discuss both the theory of church-state relations and contemporary history in his *Policraticus* and the *Memoirs of the Papal Court*. He acted as adviser to *\*Becket* during his quarrel with Henry II and then became an active hagiographer, promoting the cult of the murdered archbishop. In 1176 he was elected bishop of Chartres. JG

**Johnson, Samuel** (1709–84). Johnson was the son of a bookseller in Lichfield (Staffs.). He attended local schools before spending just one year at Pembroke College, Oxford, 1728–9. His early attempts at teaching failed, but he married the widow Elizabeth Porter at this time (1735). The hard life of Grub Street in London beckoned him next, but it was some years before he was regularly commissioned by Edward Cave, proprietor of the *\*Gentleman's Magazine*, to report parliamentary debates and undertake book translations. Johnson wrote his fine poem *London* at this time (1738), containing the line, 'Slow rises worth, by poverty depressed.' In 1746–55 Johnson worked on his *Dictionary*, the first full colation of the English language and a masterpiece of prose. He composed *The Vanity of Human Wishes* in 1749 and lost his wife three years later. To pay for his mother's funeral, Johnson wrote *Rasselas* (1759) in one week; it is possibly his finest work, a profound novel upon 'the choice of life'. Between the larger works Johnson composed periodical moral essays under the title of the *Rambler*, the *Idler*, and the *Adventurer*. In 1762, Lord *\*Bute* bestowed upon Johnson a pension of £300 a year, ending his financial difficulties. He met *\*Boswell* in the following year, received a doctorate from Dublin in 1765, and met George III in 1767. After receiving his pension Johnson's literary output was smaller, but he produced his masterly edition of Shakespeare (1765), *Journey to the Western Islands of Scotland* (1775), undertaken with Boswell, and *Lives of the Poets* (1779–81). In addition, he wrote a number of political pamphlets in defence of the government, most notably its policy towards the American revolutionaries. Johnson's religious writings were published posthumously as *Prayers and Meditations* (1785), underlining his reputation as a devout Christian.

Much of Johnson's fame comes from his personality and conversation. To list his friends is to list many of the leading cultural figures of the 18th cent., painter Sir Joshua *\*Reynolds*, novelist Oliver *\*Goldsmith*, politician Edmund *\*Burke*, and actor David *\*Garrick*. All of these were members of the celebrated Literary Club, of which Johnson was a founder; many of the splendid discussions that took place there were recorded by Boswell in his incomparable *Life of Johnson* (1791). Johnson was a ferocious opponent in debate, but kind and understanding in daily life, loyal to friends, and sympathetic to their shortcomings. His house in London was filled with the needy and upon his death he bequeathed it to his black servant Frank Barber. Johnson was plagued by

depression, loneliness, and ill-health, but fought valiantly against them, aided by Hester Thrale, perhaps his closest friend. Politically, he was a Tory, but despite declaring, 'the first Whig was the Devil,' he had many Whig friends. To many Samuel Johnson has become the personification of the 18th cent. AIL

**Jones, Inigo** (1573–1652). Masque designer, architect, and courtier, Jones's architectural legacy only fructified in the early 18th cent. through the neo-Palladian movement. So infectious did his derivations from the functional architecture of Andrea Palladio (1508–80) then become that until the early 19th cent. English townscapes were arguably Jonesian in their lineaments. Yet Jones personally remains frustratingly elusive, for all his arrogance and engrossing power as surveyor of the king's works (1615–44). Palladio's *Four Books of Architecture* were not exclusively influential, for two visits to Italy, the second with the greatest Italophile of the age, Thomas Howard, earl of \*Arundel, brought other influences to bear, such as Serlio and Scamozzi (architectural) and Peruzzi and Parmigianino (painters and draughtsmen). Apart from entrancing scenic and costume designs, only seven of Jones's 45 architectural works survive: the most notable are the Whitehall \*Banqueting House, Queen's chapel at St James's, Queen's House at \*Greenwich, and, by no means least because of its Carolean town-planning context, St Paul's church, \*Covent Garden. DDA

**Jones, Sir William** (1746–94). Oriental scholar. Educated at Harrow and University College, Oxford, Jones was a gifted linguist, eventually mastering 13 languages and knowing 28 others. His opposition to the American War and the slave trade probably cost him the chair of Arabic at Oxford in 1781. Called to the bar in 1774, he was knighted and appointed a judge in the High Court of Calcutta in 1783. He remained in India until his premature death, founding the Bengal Asiatic Society (1784) and developing an appreciation of Indian law and culture unusual in a European. Having mastered Sanskrit, he translated parts of Indian classics including the scriptures (the Veda) and laid the foundations for comparative philology. His writings were a useful counter in Britain to the developing forces of Christian cultural imperialism. He was elected fellow of the \*Royal Society in 1772. ER

**Jonson, Ben** (1572–1637). English Renaissance poet and playwright, the most forthright and politically conservative of his contemporaries. His writing—poetry, drama, and opinions—is a curious blend of disciplined classicism and carnival grotesque. He was imprisoned twice, once for his part in the scurrilous play *Isle of Dogs* and once for killing an actor in a duel. He converted to Roman catholicism whilst in jail. Along with John Marston (with whom he exchanged dramatic fire in the 'war of the theatres', 1599–1600) and Thomas Middleton, he created 'Jacobean city comedy'. His best-known plays are *Volpone* (1605), *The Alchemist* (1610), and *Bartholomew Fair* (1614). Socially and culturally aspirant, Jonson attracted royal patronage, creating a series of court masques (in collaboration with Inigo \*Jones) and receiving a life pension from James I. Unlike most of his fellow-playwrights, he carefully supervised the publication of his

plays for his grandiosely named *Workes* in 1616. The latter part of his career was less successful, though he continued to be lionized, notably by a group of young royalist writers known as the 'tribe of Ben', who later formed the nucleus of the 'Cavalier poets'. He died in 1637 and was buried in Westminster abbey. GAM

**Jordan**, previously known as Trans-Jordan, was part of the Turkish empire in 1914 but after the First World War became a British \*mandate under the \*League of Nations. In 1946 the independence of Jordan was declared and a kingdom established under the Amir Abdullah. After Abdullah's assassination in 1951, his son Talal was briefly king, before giving way in 1953 to his son Hussein. In 1967 Israel occupied the territory west of the Jordan and annexed east Jerusalem, sending a million Palestine refugees into Jordan. In 1988 the Jordanians conceded their west bank rights to the Palestine Liberation Organization. During the \*Gulf War of 1990 Jordan maintained a precarious neutrality. JAC

**Jowett, Benjamin** (1817–93). Scholar. Jowett held the regius chair of Greek at Oxford for nearly 40 years and was master of Balliol College for more than 20 years. He was born in London, went to St Paul's school, and won a scholarship in 1836 to Balliol—a little puny, boyish, chubby-faced youth'. Two years later he was elected a fellow while still an undergraduate and the following year, presumably to everyone's relief, gained a first. He became professor of Greek in 1855 and began a successful series of lectures in Greek philosophy, while devoting much time to individual students. Elected to the mastership in 1870, his four-volume translation of Plato appeared in 1871, followed by Thucydides (1881) and Aristotle's *Politics* (1885). Waterhouse's rebuilding of the Broad Street front of Balliol was finished during Jowett's mastership and under his influence the college became pre-eminent in the university. It was said that in the late 1890s more than 40 MPs were Balliol men. Among his many *bons mots* one has certainly not lost point with the passing of years: to a young lady he remarked, 'You must believe in God, my dear, despite what the clergymen say.' JAC

**Joyce, James** (1882–1941). High priest of modernism and most uncompromising of novelists. The short stories of *Dubliners* (1914) chapter the moral history of his country 'in a style of scrupulous meanness'. In *A Portrait of the Artist as a Young Man* (1916) he set an ironical distance between himself and the catholicism and aestheticism of his youth before escaping to a life of cunning and exile on the continent. The major work, *Ulysses* (1922), chronicles a single day in June 1904 but was eight years in the writing and passed the censors only in 1933. An encyclopedic obsession with language in all its aspects does not exclude comedy, warmth, and humanity, but in the still more experimental *Finnegans Wake* he goes where few readers follow. Though he died in Zurich, in his writing he had never really left his native Dublin. JNRS

**Judicature Acts**, 1873–5. These Acts brought about a much needed reorganization of the courts in England and Wales. Before the Acts there were a number of common law courts, all with overlapping jurisdiction—Common Pleas, \*King's

Bench, and \*Exchequer. There was also the Court of \*Chancery, which administered the rules and remedies of equity, separately from the rules of common law, and which had become a scandal through its delays and expense. Finally there were courts administering family and probate matters, which had inherited their jurisdiction from the \*ecclesiastical courts, and the Court of \*Admiralty. The Judicature Acts abolished these separate courts and instead set up the Supreme Court of Judicature, consisting of a Court of Appeal, to hear appeals on civil matters, and a single High Court, having several divisions corresponding to the previous separate courts; there were now the King's Bench, Common Pleas, Exchequer, and Chancery divisions of the High Court, and the remaining jurisdictions were combined in a Division for Probate, Divorce, and Admiralty. MM

**Julian of Norwich** (1342–c.1416). anchoress and mystic. Probably educated by Benedictine nuns, her claim that she was 'unlettered' probably means that she knew no Latin. After nearly dying (1373) she had a series of sixteen religious experiences, 'shewings', and decided to become a recluse and spiritual counsellor in an anchorage attached to St Julian's church, from which she took her name. Twenty years later, she wrote *The Revelations of Divine Love*, meditations on her 'shewings', the first book known to have been written by a woman in English. She describes God as all-loving, despite contemporary suffering. Her saying 'All shall be well', and her vision of all creation in 'a little thing, the size of a hazelnut, lying in the palm of my hand . . . for God loves it' are well known. A positive thinker in an age of suffering, uncertainty, and change, her meditations are attractive in the early 21st cent. WMM

**Junius** was the pseudonym adopted by the unknown author of 69 letters to the *Public Advertiser* between 1769 and 1772. After an unspectacular start, they became a political sensation, boosting the sales of the paper and being widely reproduced. Junius moved from an exchange with Sir William Draper to repeated attacks upon the first minister, the duke of \*Grafton, and at length to a celebrated and offensive letter to the king himself. Junius' staple diet was political and legal commentary, but the letters were enjoyed for their scandalous insolence, for the secrecy surrounding the author, and for the inside knowledge he appeared to possess. They are a remarkable example of the growing importance of the newspaper press. Dozens of people have been suggested as possible authors and many volumes devoted to unravelling the mystery, but the evidence points strongly to Philip Francis, then a senior clerk in the War Office. JAC

**Junto** was the name given to the Whig allies in the later part of William III's reign and that of Anne. They were particularly strong in the Lords, where the leaders included \*Somers, \*Halifax, \*Orford, \*Sunderland, and Wharton. Their luck improved when George I succeeded in August 1714. JAC

**jury system.** The origins of the jury system are disputed. The name means a body of persons sworn to make a statement on a matter. Although it has been suggested that the

jury has Germanic-Anglo-Saxon origins, it is more likely that the institution of a body of men giving an answer, under oath, to a specific question put to them by the ruler originated in the Frankish inquest. The first juries in the common law were juries instituted by Henry II to make presentment of serious crimes to the travelling justices, and the juries under the Grand Assize and the petty or possessory assizes, who replied under oath to inquiries by the sheriff or the justices on questions relating to right to land or questions of disseisin of land.

The 'trial jury' originated when, in 1215, the Lateran Council of the church forbade clergy to participate in ordeals, which were, at that time, the means of deciding guilt. Deprived of the ordeal, the justices resorted to the use of sworn bodies of neighbours to decide whether the accused person was guilty. Gradually the 'trial jury' of twelve developed after a number of experiments. This jury became common in both civil and criminal law through the action of trespass and became one of the most marked features of the common law. Gradually juries ceased to speak from their own knowledge and instead were supposed to have an open mind and to decide questions by listening to evidence.

The jury was one of the attractive features, for litigants, of the common law, though there were periods of unrest (e.g. the 15th cent.) when it was discredited because of interference with its verdicts by the rich and powerful. In 1670 it was decided in Bushell's case that a jury could no longer be attainted for reaching a verdict contrary to the evidence or the wish of the court. This, coupled with the decisions in the period of constitutional strife in the 17th cent., led to the jury's being regarded as the 'bulwark of liberty' and trial by jury as a protection for the rights of the subject against tyrannical prosecution. Majority voting was introduced in the 20th cent. and the complexity and length of some trials, particularly in matters of fraud, led to suggestions that the use of juries should be reviewed. MM

**justice Eyre.** See EYRE.

**justices of the peace.** The forerunners of the justices of the peace were the conservators of the peace, first appointed in the reign of Richard I. In the 13th cent. conservators of the peace, consisting of knights and gentry of the county, served on the commissions of \*assize, \*oyer and terminer, and \*gaol delivery and were also given other peacekeeping duties, extended from time to time by legislation until, in the reign of Edward III, they were given powers to punish offenders and in 1344 to hear and determine criminal cases. A new function was entrusted to the conservators when, after the \*Black Death had decimated the population, the statutes of \*Labourers provided for the fixing of wages by the justices. In 1361 it was provided by statute that in every English county there should be 'one lord and with him three or four of the most worthy in the county with some learned in the law' to 'keep the peace, to arrest and imprison offenders, to imprison or take surety of suspected persons and to hear and determine felonies and trespasses done in the county', and in 1363 a further statute provided for the holding of sessions four times a year (the \*quarter sessions). They were now the

## justiciar

'justices of the peace' and were and still are appointed by the crown to the commission of peace for the county.

From that time onwards, the legislature increasingly extended the role of the justices of the peace. Their judicial function remained a vital part of the administration of criminal justice, though the calibre of the justices was variable—they were at first noblemen or country gentry, later prosperous burgesses or clergy, and until 1906 were subject to a property qualification. Literature provides us with numerous examples of justices, many of whom were scarcely admirable in performing their duties, especially when dealing with the poor and indigent.

The justices of the peace have been called the maids of all work of the English legal system. In addition to their judicial and peace-keeping duties, they were used to administer the \*Poor Laws and, through the quarter sessions, to oversee the whole of local government. These duties are no longer performed by the justices, but they retain a role in the keeping of the peace—they issue warrants in certain circumstances—and although quarter sessions were abolished in 1971, the magistrates' courts remain a vital part of the administration of criminal justice in England and Wales, trying most criminal cases. They also hear and decide applications for the licensing of premises for the sale of alcohol or for gambling. MM

**justiciar.** The frequent absences of Norman kings on the continent necessitated a competent viceroy or regent in England. This function became associated with the justiciar, who acted as chief minister, performing a great variety of duties, including campaigning, as well as presiding over the \*curia regis. \*Ranulf Flambard and \*Roger of Salisbury acted in this capacity under William Rufus and Henry I, without having the title: later the office was held by men of the calibre of Richard de \*Lucy, Ranulf \*Glanvill, Hubert \*Walter, Peter des \*Roches, and Hubert de \*Burgh. After de Burgh's overthrow by Henry III in 1232, the office lapsed, though the baronial opposition in the 1250s attempted to revive it. The legal duties were taken over by the chancellor or the lord chief justice. In Ireland the justiciar was the king's chief representative in the 13th cent. until superseded by the king's lieutenant, the lord deputy, and the lord-lieutenant. In Scotland the justiciar was the supreme law officer until replaced in the 15th cent. by the lord justice general. JAC

**Justiciary Court** (Scotland). The High Court of Justiciary is the supreme criminal court in Scotland. It was established in 1672, and consisted of the lord justice general, the lord justice clerk, and five of the lords of Session. From 1887 all lords of Session have been lords commissioners of Justiciary. The court has jurisdiction over serious crimes in Scotland and also acts as a court of appeal. Since 1836 the lord president of the Court of Session has also held the office of lord justice general and presides. JAC

**Justus, St** (d. c.627). Sent, according to Bede, by Pope Gregory I with \*Mellitus to Kent in 601, and consecrated bishop in Rochester by \*Augustine in 604. Justus was associated with Archbishop \*Laurentius' exhortations to bishops and abbots in Ireland, and to British priests, to follow Roman

practices. The accession of pagan kings in Kent and over the East Saxons prompted all three to decide to return to Rome, but after a year awaiting developments in Gaul, Justus and Mellitus, whom Justus succeeded as fourth archbishop of Canterbury in 624, were recalled. Justus consecrated Romanus to replace him at Rochester, and died on 10 November in, probably, 627, certainly no later than 631. As bishop he played some part in the conversion of Eadbald of Kent, he consecrated \*Paulinus to carry the torch to Northumbria, probably in 625, and maintained links with the papacy. AER

**Jutes.** Bede's account of the Jutes is highly specific—that they were a Germanic people who inhabited a region north of the Angles and that their settlements in England had been in Kent, the Isle of Wight, and on the mainland just north of the Solent. Their leaders had been \*Hengist and Horsa. Modern research has modified these suggestions, holding that the differences between Angles, Saxons, and Jutes was smaller than assumed and that the Jutes are less likely to have come from south Schleswig than from Frisia or even the mouth of the Rhine. The pattern of settlement has also been queried. There is evidence from burial practices and place-names of a variety of cultures in Kent, including strong Romano-British survival, and the settlements in the west are seen as secondary migrations rather than direct from the continent. The Jutish territories around the present city of Southampton were seized by \*Cædwalla, king of Wessex, c.686, presumably to acquire excellent harbours and access to the sea. Nevertheless, as late as 1100 Florence of Worcester could write that the New Forest was known in the English tongue as 'Ytene' (Jutes). Kent retained many distinctive characteristics, including the practice of partible inheritance or \*gavelkind, which made for a more equal society. The kingdom of Kent, prominent in the early 7th cent., found it hard to cope with powerful neighbours and during the 8th cent. was taken over by Mercia and in the 9th by Wessex. JAC

**Jutland, battle of**, 1916. The war in the North Sea was a frustrating experience for the Royal Navy. The Grand Fleet never gained the overwhelming victory over the German High Seas Fleet for which it yearned. The Germans, aware of their numerical inferiority, usually preferred to remain in port. The best opportunity the British had to fight a second Trafalgar was on 31 May 1916 when \*Beatty succeeded in luring the High Seas Fleet under the guns of the Grand Fleet. But the outcome only served to demonstrate the weakness of the British fleet. The Grand Fleet's range-finders were deficient, its target-plotting machinery prone to error, and its gunnery computers, staff work, and armoured protection defective. The British suffered greater losses of both ships and men, proof of the excellence of German gunnery and ship construction.

But although Jutland was a tactical victory for the Germans, it was a strategic victory for the British. The British were able to repair their damaged ships faster than the Germans, so after the battle \*Jellicoe still had more capital ships than his enemy. And crucially, the allied naval blockade of Germany, which was doing so much to strangle its

economy, remained unbroken. Although the High Seas Fleet ventured out of harbour on several occasions after June 1916, it never again sought a fleet action with the British, and when it was ordered to make a final attack in October 1918, its crews mutinied.

DF

**Juxon, William** (1582–1663). Juxon, a bishop and statesman, came to prominence through the favour of \*Laud, who persuaded Charles I to make him bishop of London in 1633 and, three years later, lord treasurer. As the first ecclesiastic to hold this key government post for 170 years,

Juxon's appointment intensified fears of a return to clerical rule, but although a conscientious administrator, he preferred persuasion to compulsion. Juxon's unwavering commitment to Anglican values brought him close to the king, and he acted as Charles's spiritual adviser until the very end, standing beside him on the scaffold. Thereafter he lived quietly in the countryside until the restoration of Charles II in 1660, when he was appointed archbishop of Canterbury, but old age and infirmity made him little more than a figurehead. He had the rare distinction, in an age of bitter passions, of being widely loved and respected.

RL

**Kames, Henry Home, Lord** (1696–1782). Judge and man of letters. Son of a petty laird, educated for the Scottish bar, Kames became a lord of Session in 1752. He was a prominent member of the Edinburgh literati and an important patron whose protégés included Adam \*Smith and John \*Millar. A prolific and often acute essayist, Kames's interests ranged from metaphysics to manners, morals, jurisprudence, *belles-lettres*, and agricultural improvement. A friend and relative of David \*Hume, he provided an early and intelligent reply to his kinsman's sceptical metaphysics. A jurist, Kames was one of the first Scots to have been interested in 'conjectural history' of the Scottish Enlightenment. His *Elements of Criticism* (1762) was an early and influential textbook, widely acclaimed in the Anglo-Saxon world. He was a gregarious if overbearing man. NTP

**Kay, John** (1704–c.1780). Engineer and inventor. Born in 1704 near Bury (Lancs.), Kay patented his flying-shuttle for a loom in 1733. It produced a great speeding-up in the process of weaving. Kay experienced considerable difficulty in exploiting his invention. His house was destroyed in 1753 by a mob, concerned about unemployment in the industry, while the Leeds manufacturers banded together to indemnify each other against legal proceedings to enforce Kay's patent. Kay took refuge in France, where he tried to carry on, but died in obscurity. JAC

**Kay-Shuttleworth, Sir James Phillips** (1804–77). Administrator and founder of the English education system. Educated at Edinburgh University, he studied medicine and graduated as a doctor in 1827. Working in Manchester, Kay (Shuttleworth was added after his marriage) quickly became aware of the suffering of the poor and interested himself in sanitary and educational reform. He was appointed assistant Poor Law commissioner in 1835 in the eastern counties and London area, writing valuable reports on the training of pauper children. Kay-Shuttleworth's opportunity to develop national education came in 1839 when he was appointed secretary to the Committee of the Privy Council. For the next ten years, until his health broke down, he worked with great zeal to establish a public system of elementary education, supervised by a national body of inspectors. He was responsible for the first training college for teachers at Battersea in 1840, with students from Norwood Pauper School. PG

**Kean, Edmund** (1787–1833). Actor. Son of an itinerant actress, Kean was exploited as an infant prodigy in London before being forced onto various provincial circuits, undergoing years of hardship but eventually playing most of the major parts. The impassioned delivery of his reappearance at Drury Lane (1814) as Shylock was so remarkable that the theatre's coffers were rapidly replenished. Barely average height, his flashing, sometimes demoniac approach, which so contrasted with the measured Kemble school, made him one of the most controversial of the early 19th-cent. actors, generating as much abuse as admiration. Described by Talma as 'a magnificent uncut gem', and famous for his tragic roles of Richard III, Shylock, and Othello, he briefly visited France and America. Youthful irresponsibility quickly evolved into recklessness, vanity, intolerance of rivals, and drunken debauch, so, by 1827, loss of respectability was accompanied by visible physical disintegration. ASH

**Keats, John** (1795–1821). Poet and sometime surgeon's apprentice, his early work suffered by association with Leigh Hunt and the 'Cockney School', though he was never, as \*Byron giped, 'snuffed out by an article'. Most richly sensuous of Romantic poets, with a Schubertian sensitivity to love and death, the 'indescribable gusto' which \*Arnold found in his writing continues to attract. 'O for a life of sensations rather than thoughts!' he exclaimed, but a keen intelligence is inseparable from the rapid development of his brief career. A severe self-critic, he introduced *Endymion* (1818) with apologies and abandoned the over-Miltonic *Hyperion* the following year. Nursing his dying brother he was torn between the 'realms of gold' he encountered in literature and the world 'where men sit and hear each other groan'. His best work, the *Odes* of 1819, dramatizes this conflict. By now ill himself with tuberculosis, a visit to Italy came too late to save him. JNRS

**Keble, John** (1792–1866). Credited with launching the \*Oxford movement with his Assize Sermon of 1833, Keble spent most of his life as a country parson. The sermon was provoked by the moderate reform of the Irish Church Temporalities Act, which to Keble represented a sacrilegious interference with church order by the secular power. He was heeded as a man of deep spirituality and the author of the much-loved volume of religious verse, *The Christian Year* (1827), and struck a chord with the growing \*high-church party seeking a more spiritual view of the Church

of England. Keble was brought up in a clerical family near Fairford in Gloucestershire in the high-church tradition of the Caroline divines. At Oxford he was regarded as a brilliant intellect and was professor of poetry (1831–5) until he married and left Oxford for the parish of Hursley in Hampshire, where he spent the rest of his life. JFC

**Keith, James** (1696–1758). Keith was the younger brother of the 9th Earl \*Marischal. They took part together in the '15 and fought at \*Sheriffmuir. Keith next joined the Spanish expedition which ended at \*Glenshiel in 1719, whence he escaped with difficulty. The rest of his life was spent as a highly successful soldier of fortune. For nine years he served the Spaniards, taking part in the siege of Gibraltar in 1727. He next joined the Russian service and distinguished himself in the war against Sweden 1741–3. In 1747, weary of Russian court politics, he transferred to the service of Frederick II of Prussia, who made him a field marshal. He was killed in October 1758 at Hochkirk, the most outstanding of Scottish mercenaries. JAC

**Kells, Book of.** A Latin copy of the four Gospels and some preliminaries, possibly late 8th cent., but first recorded at the monastery at Kells (Co. Meath) in 1007 after its theft and loss of covers. The unrestrained decoration and unusually large size suggest that it was an altar-book, for liturgical reading and ceremonial pomp; full-page illuminations and lavish embellishment render distinction amongst similar 'insular' manuscripts. In 1654 the town governor sent it to Dublin for safety from Cromwellian iconoclasm, following which it was presented to Trinity College by Henry Jones, post-Restoration bishop of Meath. ASH

**Kelvin, William Thomson, 1st Baron** (1824–1907). Pioneer of thermodynamics and one of the greatest of classical physicists. Educated in Belfast, Glasgow, and Cambridge, he was in 1846 chosen professor of natural philosophy at Glasgow. He remained there for 50 years, and on retirement signed on as a research student. He said that one word characterized his work, 'failure'. He was not serious: in fact, he had done fundamental research on electromagnetism and light, on telegraphy, and on heat, where he had come up with the idea of an absolute zero of temperature—the scale based on this is named after him. He was happy to turn his talents to practical use, over telegraph cables, liquefaction of gases, and the construction of instruments. The leading physical scientist in Britain, he was made a peer in 1892. DK

**Kemble, Charles** (1775–1854). Actor and manager. Youngest son of actor-manager Roger Kemble, Charles abandoned the post office for the stage, first appearing in the provinces (1792), then Drury Lane, London (1794). Often performing with his brother John Philip and sister Sarah (Mrs \*Siddons), he had an extensive repertoire but excelled in comedy (Doricourt, Mercutio) and was noted for secondary Shakespeare roles (Malcolm, Cassio). His management of Covent Garden commenced 1822/3, but it was saved from bankruptcy only by the début in 1829 of his daughter Fanny; their teamwork proved as successful in America as in Britain. Increasing deafness led to nominal retirement from the stage but appointment as examiner of plays (1836), until

he resigned this post to his philological son John Mitchell (1840) and ceased his Shakespeare readings. Though perpetuating the family's declamatory and stilted style and favouring melodrama, Kemble introduced the use of historically 'authentic' costumes and stage-sets. ASH

**Kemp, John** (d. 1454). Archbishop of York and Canterbury. Like \*Chichele, Kemp was an Oxford DCL who began his career in church courts, becoming dean of Arches in 1414. After an embassy to Aragon, he was a member of Henry V's council in France, as chancellor of Normandy and keeper of the privy seal. He was one of Henry \*Beaufort's supporters in the council of Henry VI's minority and appointed chancellor of England in 1426. By now he had risen through the episcopate as bishop of Rochester (1419), Chichester (1421), and London (1421), to the archbishopric of York (1426). Duke Humphrey of \*Gloucester removed Kemp from Chancery in 1432, but he remained a councillor. When the regime of William de la \*Pole, duke of Suffolk collapsed in 1450, this veteran was recalled to be chancellor. From 1452 he was archbishop of Canterbury. An uncompromising champion of royal authority, he was sympathetic to victims of its abuse by corrupt courtiers. His death, while Henry was insane, was a loss from which the Lancastrian government never recovered. Kemp was created a titular cardinal in 1439, recognition of his political stature; he rarely visited York diocese. He founded a collegiate church and grammar school at Wye (Kent), his birthplace. RLS

**Kempe, Margery** (c.1373–c.1440). The manuscript of her memories, which she had dictated in the later years of her life, was discovered in 1934, first published in 1947, and is now considered to be the earliest English autobiography. After the birth of her first child, Kempe, daughter of a prosperous burgess of King's Lynn (Norfolk), suffered a spiritual crisis and was subsequently redeemed by a vision of Christ. In later life she became deeply religious and undertook many pilgrimages to the Holy Land, Rome, and Santiago de Compostella, amongst others. Her devotion manifested itself in excessive lamentation, for which she was ridiculed and imprisoned, and even denounced as a heretic, 'for some said that she had a devil within her'. A mystic of remarkable courage, she is often likened to \*Julian of Norwich, whom she knew. Her story inspired admiration and pity for all she suffered in her search for God. SMD

**Ken, Thomas** (1637–1711). Bishop of Bath and Wells. Educated at Winchester and New College, Oxford, Ken was chaplain to Morley, bishop of Winchester (1665), and to Princess Mary (later Mary II) at The Hague (1679–80). He became bishop of Bath and Wells (1684) and attended \*Monmouth on the scaffold (1685). As one of the seven bishops petitioning James II to withdraw the \*Declaration of Indulgence he was imprisoned in the Tower (1688), but acquitted. Nevertheless, a man of conscience, he refused to recognize James's abdication or William's accession, was deprived of his see (April 1691), and lived at Longleat until his death. Refusing to acknowledge Richard Kidder as his successor, he retained his episcopal signature until his friend George Hooper succeeded (1703). A man of great sanctity,

## Kenilworth

caring for the poor in his diocese, he was a notable poet and hymn-writer. WMM

**Kenilworth, dictum of**, 1266. Simon de \*Montfort's death at \*Evesham in August 1265 brought to an end the protracted civil war of Henry III's reign, though young Simon de \*Montfort escaped to France, and Kenilworth castle held out for another year. The dictum of Kenilworth of 31 October 1266 was an attempt at a reconciliation, offering a general amnesty, but reasserting in full the king's rights. JAC

**Kenilworth castle** (War.) combined strong fortifications with palatial residential accommodation. From the first the castle seems to have included extensive water defences and these were enlarged during John's reign when it was in royal hands. The effectiveness of the defences was demonstrated when supporters of Simon de \*Montfort held the castle for a year against Henry III after the battle of \*Evesham and were able to surrender on terms in December 1266. The future Edward I was present at the siege and it has been suggested that the importance of water defences in his later castles was taken from Kenilworth. In the later Middle Ages the castle belonged to the duchy of Lancaster and was developed as a palace by \*John of Gaunt and later by Henry V, who had a pleasure garden with a small harbour created across the mere. Robert Dudley, earl of \*Leicester, also undertook major building work at the castle, to which Elizabeth was a visitor; one such visit is vividly described in \*Scott's *Kenilworth*. L.R.

**Kennedy, Charles** (b. 1959). Liberal Democrat leader. Kennedy was the youngest member of the House of Commons when he was returned in 1983 as a Social Democrat for Ross, Cromarty, and Skye. He was educated at Lochaber High School, Fort William, and at Glasgow University, where he was president of the Union. Plump and cheerful, he was thought by some to lack *gravitas* when he succeeded 'Paddy' \*Ashdown as leader in 1999, but his election campaign in 2001 was vigorous and his party gained four seats. JAC

**Kennedy, James** (d. 1465). Provided to the bishopric of Dunkeld by his uncle, James I (1437). Support of Queen \*Joan in James II's minority, and opposition to the Basle conciliarists, enabled his promotion to bishop of St Andrews (1440). His foundation of St Salvator's College at St Andrews (1450) is his most enduring legacy. His political career was less successful than many historians have believed. He supported the wrong faction in the 1440s, and in the 1450s, despite receiving considerable patronage, particularly the 'Golden Charter' (1452), he held no governmental office. Abroad on James II's death (1460), Kennedy was overlooked in \*Mary of Gueldres's distribution of minority government offices. He was upset, and managed to undermine the queen's policies by a campaign of black propaganda and misogyny, based on his parliamentary popularity. He finally gained possession of James III on her death (December 1463), and acted as royal guardian until his death in May 1465. RJT

**Kenneth II** (d. 995), king of 'Scotland' (971–95). His father was \*Malcolm I and his brother King \*Dub. He succeeded \*Cuilén to the kingship, but faced competition from Cuilén's brother Olaf, whom he killed in 977. His reign was untypically long and, like his father's, characterized by aggression beyond the kingdom's borders. He repeatedly raided northern England and attacked the Britons of \*Strathclyde, who defeated him at 'Moin Uacornar' (unidentified). His rule over \*Lothian was recognized c.975 by \*Edgar, king of England. It is likely, however, that Lothian was lost to the earls of Northumbria in the last year of his reign. He met his end at Fettercairn (30 miles south of Aberdeen), assassinated by the daughter of the earl of Angus in revenge for killing her only son. It is possible that his wife was a daughter of one of the Uí Dúnlainge kings of \*Leinster. He founded (or refounded) a monastery at Brechin, probably the community of \**céli Dé* ('clients of God') attested in later record. In some accounts Kenneth is included among the British kings who submitted to King Edgar at Chester in 973, but this is not corroborated by other sources which are more contemporary. DEB

**Kenneth III** (d. 1005), king of 'Scotland' (997–1005). He was son of King \*Dub and became king by killing \*Constantine III in battle at 'Rathinveramon' (probably a couple of miles north of Perth). This engagement represented the final victory of Kenneth's branch of the royal dynasty over its rivals, the descendants of \*Æd (d. 878). Kenneth faced competition for the kingship from his own branch of the dynasty, however, and was killed in battle at Monzievairst (15 miles west of Perth) by \*Malcolm II, his first cousin. Later king-lists credit Kenneth's reign to a son called \*Giric, but this conflicts with contemporary evidence. DEB

**Kenneth I MacAlpin** (d. 858), king of Dal Riata (c.840/1–58) and 'king of the Picts' (842/3–58). Kenneth is anachronistically regarded as first king of Scotland because he is deemed to have unified the \*Picts (north of the Firth of Forth) with the Gaels (in Latin, *Scoti*) of \*Dalriada (Argyll). 'Scotland' (\*Alba in Gaelic) did not emerge until 900, however, and is likely to have begun as a much smaller area than the united territories of the Picts and Dalriada.

It is typical of the 'Dark Ages' of documentary history that so little information survives to illuminate Kenneth's career. There are no contemporary sources which can confirm or explain his alleged unification of Picts and *Scoti*. From as early as the late 10th cent. it was commonly thought that Kenneth founded the kingship of the Scots by conquering the Picts. It is possible, however, that Kenneth's role as founding father was devised by the dynasty descended from him who monopolized the kingship from 889 to 1034 and who, in 900, presided over the abandoning of Pictish identity and the creation of the new kingdom of Alba.

Kenneth's ancestors were probably kings of Dalriada and his father Alpin may have been king before him. Both Dalriada and the Picts were suffering from the first large-scale Scandinavian incursions which, in 839, wiped out the Gaelic dynasty which had ruled the key Pictish region of \*Fortriu since 789. The confusion in Fortriu which followed is reflected in two king-lists which espouse different successions

in the 840s. By 849, however, all are agreed that Kenneth had secured his grasp on the kingship. Whatever his attitude to the Picts may have been, he clearly looked to Gaeldom for support, and in 849 erected a church in \*Dunkeld which housed relics of St \*Columba, implying that Kenneth sought to cultivate the enormous influence of the Columban network of monasteries as a power base. Such a policy was not new, however, and had probably been anticipated by the Gaelic king of Fortriu, \*Constantin son of Fergus (789–820).

Kenneth raided Northumbria repeatedly, but his kingdom suffered assaults from the Britons of \*Strathclyde as well as Scandinavians. He died of a tumour on 13 February 858, at Forteviot (5 miles south-west of Perth), and was succeeded by his brother \*Donald I. DEB

**Kensington palace** is architecturally one of the more modest royal residences, but historically it is full of interest. It began life as a private residence of the Finch family and was purchased by William III in 1689 since it provided fresh air but was near to London. \*Wren, surveyor of the works, was employed to rebuild extensively, but the scale was moderate, partly because speed was essential, partly because there was lavish building at \*Hampton Court. The delightful orangery by \*Vanbrugh was added during Anne's reign. Much of the later internal decoration, including the king's staircase, was by William \*Kent, and the gardens were laid out and redeveloped by George London, Henry Wise, and Charles \*Bridgeman. The Round Pond and the Serpentine were finished during the reign of George I. The palace was popular with the royal family until George III began developing Buckingham House. William and Mary died at Kensington; Anne had her celebrated quarrel with the duchess of \*Marlborough in a small ante-room, and later died in the palace. George II and Caroline were fond of the place and there are two admirable terracotta busts by Michael \*Rysbrack. George III made over apartments to his royal brothers, and the young Victoria, daughter of the duke of Kent, was brought up there. At Kensington she held her first Privy Council on the day of her accession in 1837. It is still used as a royal residence. The palace is open to the public and includes a permanent exhibition of court dress. JAC

**Kent** is one of the oldest counties, having been a kingdom in Saxon times. (See KENT, KINGDOM OF.) It has always been of great importance because of its strategic position as gateway to the continent. It is comparatively little known, since the millions who pass through it hurl themselves towards the ferries or the tunnel.

The shire was defined by the Thames and its estuary to the north and by the coast to the south and east. The border with Sussex followed the rivers Teise and Rother, and the western border with Surrey was largely the watersheds of the rivers Ravensbourne, Darent, and Medway. The north downs running from west to east end in the chalk cliffs of Dover. There has been considerable silting of the coast: the Isles of Grain, Sheppey, and Thanet are now united to the mainland, while many once flourishing ports and harbours such as Lydd in the south-west are now miles from the sea.

In pre-Roman times, the inhabitants were the \*Cantiaci, a group of tribes who offered serious resistance to \*Caesar's

two expeditions. The name Cantium goes back at least to the 4th cent. BC and seems to be of Celtic origin, meaning border or coastal land. The main Roman port was Richborough (Rutupiae), where the AD 43 expedition landed, and where there remains a remarkable Roman lighthouse. A major road ran from the port to \*Canterbury (Durovernum) and crossed the Medway at Rochester (Durobrivae), before reaching London. It was later known as \*Watling Street.

In the middle of the 5th cent., the area was overrun by \*Jutish settlers and a kingdom established. \*Æthelbert pushed Kentish power to its height, occupying London and taking control of the East Saxons. He converted to Christianity and founded the sees of Canterbury (597) and \*Rochester (604). Later kings of Kent found it difficult to sustain their independence against powerful neighbours and fell under the domination, first of \*Mercia, then of \*Wessex. Kent became a subkingdom or province and, at length, a county. In the 9th cent. the region suffered severely from Viking raids but there was little Scandinavian settlement.

Kentish society had a number of unusual features. The shire was divided into five large divisions or lathes and then into more than 60 small hundreds. The local custom of \*gavelkind supported equal inheritance and Kentish men had a reputation for independence. How dangerous this could be to governments was demonstrated in the \*Peasants' Revolt (1381), \*Cade's rising (1450), and \*Wyatt's rebellion (1554). As late as the 1720s, \*Defoe commended the sturdy Kentish yeomen, 'the graycoats', who could turn any election and were treated by the gentlemen with great respect. The east-west division of the shire, hinted at by the establishment of two bishoprics, continued strongly. There was a convention that representation in Parliament should be shared between east and west and JPs normally exercised their authority only in their own half. Quarter sessions were at Canterbury for east Kent, Maidstone for west Kent.

By \*Domesday in 1086, Dover had developed as an important borough, along with Canterbury and Rochester. Also of significance were Romney, Hythe, and Sandwich, subsequently recognized among the \*Cinque ports, and given special privileges in exchange for heavy defence responsibilities. The close association with the continent after the \*Norman Conquest brought the shire considerable prosperity, and more came with the development of the royal dockyards. By 1801 the largest towns in the shire were Deptford (17,000), Greenwich (14,000), and Chatham (10,000). Production for the ever-growing London market encouraged orchards, market gardens, hop-fields, and the rearing of sheep and cattle. Whitstable was renowned for its oysters. But as the remorseless growth of London continued, the balance of population in the county shifted to the north-west. Lewisham with 4,000 people in 1801 had 174,000 in 1921; Deptford had risen to 119,000, Plumstead to 76,000, Bromley to 68,000. Another rapid development was Gillingham with 95,000. In 1888 Kent lost a slice of London suburbia to the new London County Council, and in 1965 Erith, Bromley, Bexley, Chislehurst, and Orpington were moved out into the Greater London Council. Neither the Local Government Act of 1972 nor the Banham commission report

## Kent

of 1994 proposed any changes in the county, but Medway (Chatham, Gillingham, Rochester) has been made a unitary authority. JAC

**Kent, kingdom of.** Kent was founded, according to tradition, in the middle of the 5th cent. by two brothers of Jutish origin, \*Hengist and Horsa, who came to Britain to protect the native inhabitants against the Picts and Scots, turned against their paymasters, and won a kingdom for themselves. Archaeology and evidence from place-names (the name Kent itself, Dover, and the first element of Canterbury) and from later institutions tell a more complicated story involving some Romano-British survival and considerable variety of Germanic invaders from high-status leaders with splendid jewellery among their grave goods to poor and backward Germanic peoples. Kingship was not always unitary, and there were two clear-cut divisions within Kent along the Medway, the men of Kent and the Kentishmen. There are also vestiges of survival of Roman administrative divisions. Contact with the continent was never lost, and was intensified in the later 6th cent., especially after the marriage of \*Æthelbert (before 589) to a Frankish princess, \*Bertha. Under Æthelbert (d. 616), who was recognized as overlord by all the Germanic settlers south of the Humber, Kent reached the height of its political power, falling back later in the 7th cent. as overlordship passed briefly to East Anglia, and then to Northumbria. Æthelbert's chief claim to fame is his acceptance of Christianity, and with the help of the mission led by St \*Augustine he framed laws to accommodate the new church and also to lay down rules of social behaviour. Later Kentish kings followed this lawgiving precedent, especially Wihtred (c.690–725), whose laws had a very high social content, showing deep concern over marriage law, and rules concerning Christian oaths, an indication of the completeness of the conversion of Kent to the new faith. But politically Kent had no high aspirations, and was overshadowed in the 8th cent. by Mercia, and after 825 by Wessex. The West Saxon kings used Kent (and Surrey and Sussex) as a sort of appanage to be ruled as subkingdoms by West Saxon princes. There were no independent kings in Kent after 825, though Canterbury preserved its special prestige as the see of an archbishop. HL

**Kent, William** (1685–1748). Architect, painter, furniture designer, and landscape architect. In 1719 Kent was brought back to London from Rome by Lord \*Burlington, and together they became the leading proponents of \*Palladianism in England. In 1727, with Burlington's support, Kent published *The Designs of Inigo Jones* (though most of the designs were by Webb). Although Kent, as a member of the Board of Works, designed the Horse Guards, the Royal Mews, and the Treasury buildings, most of his architecture was for private clients. A notable instance of this was his collaboration with Burlington at \*Holkham Hall, Norfolk (1734 onwards, executed by Brettingham), with its 'staccato' elevations with Venetian windows, and its dramatic apsidal entrance hall with columns, coffered ceiling, and grand staircase. Here, as in other places, Kent's elegant furniture and rich decoration anticipated the interiors of Robert \*Adam. Significant too are Kent's illustrations for Gay's *Fables* (1727), Thomson's

*The Seasons* (1730), and Spenser's *Faerie Queene* (1751), and his garden buildings and progressive landscaping at Chiswick, Rousham, Stowe, and Claremont. In Horace \*Walpole's words, as \*Bridgeman's successor, Kent 'leapt the fence, and saw that all nature was a garden'. PW

**Kentish Knock, battle of**, 1652. Naval encounter on 28 September during the first \*Anglo-Dutch War between Robert \*Blake and a Dutch fleet under de Ruyter and de With. The Dutch suffered considerable losses and were forced to retire. JAC

**Kenwood**, a superb house beautifully situated on Hampstead Heath, was substantially rebuilt in the 1770s by Robert \*Adam for Lord \*Mansfield, the lawyer. Mansfield's town house was gutted in the \*Gordon riots of 1780 but distance saved Kenwood. It was saved a second time in 1922 by the Kenwood Preservation Council when threatened with urban development. It contains a remarkable bequest of paintings given by Edward \*Guinness, Lord Iveagh, which includes works by \*Gainsborough, \*Reynolds, \*Romney, Joseph \*Wright, and a Rembrandt self-portrait. The grounds, later improved by \*Repton, contain a large lake with a sham bridge. The chief feature of the house is a splendid library, with apsidal ends and Corinthian columns. JAC

**Kenya.** Former British protectorate and colony in eastern Africa. British interest in the region in the 19th cent.—missionary, anti-slave trade, then legitimate trade—saw Kenya only as a route to the more remote interior. A British protectorate was declared in 1895. The development of its agricultural resources by white settlers was made possible by the administration's need to generate income and by the construction of the Uganda railway from 1897. So influential did the settlers become that the country was declared a colony in 1920. Although African resentment of the advantages enjoyed by the whites became more vocal, and despite Britain's having declared a policy of trusteeship for Africans in 1923, the economy remained under settler control. The change in Britain's attitude towards colonial dependencies in the 1950s led to Kenyan independence under African rule in 1963. KI

**Kenyatta, Jomo** (c.1894–1978). Kenyan nationalist statesman. Kenyatta's involvement in politics began in 1922 when he campaigned for the restoration of land lost by his Kikuyu tribe to white settlers. In 1929 he went to London to plead the case of the Kikuyu and stayed in Europe, studying, writing, and lecturing. Returning to Kenya in 1946 he was elected president of the Kenya African Union in 1947. In 1952 he was found guilty of master-minding the \*Mau Mau rebellion although the evidence was far from conclusive. When the government gave the vote to Africans he was elected president of the newly founded Kenya African National Union. He was released in 1961 and became prime minister in 1963 when the country achieved independence, then president in 1964 when Kenya became a republic. His sympathies inclined towards the western powers and he displayed remarkable magnanimity towards his former white opponents. KI

**Keppel, Arnold Joost van, 1st earl of Albemarle** (c.1670–1718). Dutch confidant of William III. Born in Holland, Keppel attended William of Orange to England in 1688 as a page of honour. He rose quickly in the king's favour, and was appointed groom of the bedchamber in 1691 and master of the robes in 1695. He spent much time with the king on state business, and also accompanied him on campaign. With Keppel's youthful, slightly effeminate good looks and charm, gossips inevitably spoke of an improper relationship, while in parliamentary opinion he (together with \*Portland) was regarded as a sinister Dutch influence on the king. Notwithstanding, William lavished handsome gifts upon him including, in 1697, an earldom and the rank of major-general. After the king's death in 1702 he returned to Holland and was a commander of the Dutch forces in the allied campaigns against Louis XIV. AAH

**Kett, Robert** (d. 1549). Kett showed more organizational skill than is usually found in the leaders of peasant risings. He was a tanner and small landowner, holding the manor of Wymondham (Norfolk). Residual resentment over the \*dissolution of the monasteries, local feuds, and anger over enclosures sparked a riot in the town in the summer of 1549 which developed into a major rising. The insurgents set up camp for six weeks on Mousehold Heath, notable for the discipline which Kett imposed, electing a governing council and maintaining law and order. After he had occupied Norwich, the second town in the kingdom, the royal government gathered a force under Lord Northampton, which the rebels routed. Three weeks later, a second force, stiffened by mercenaries, cut the insurgents to pieces at \*Dussindale. Kett was hanged at Norwich, his brother William at Wymondham. The coincidence of Kett's rebellion with the \*Prayer Book rising in Devon and Cornwall caused Protector \*Somerset's government great anxiety. JAC

**Kew Gardens** (Surrey). Location of the Royal Botanical Gardens, which contain a vast collection of herbs, trees, and shrubs gathered from all over the world. Kew Gardens evolved from two adjoining 18th-cent. royal estates: Richmond Gardens, belonging to George II and Queen Caroline, and Kew House, the residence of their son Frederick, prince of Wales, and his consort Princess Augusta. Charles \*Bridgeman assisted in the laying out of Richmond Gardens, where William \*Kent designed the Hermitage (1730) and Merlin's Cave (1735). After George III inherited Richmond in 1760, he had the parkland re-landscaped by Capability \*Brown (1764–73). At adjacent Kew, following the death of Frederick in 1751, the Dowager Princess Augusta employed Sir William \*Chambers to lay out the grounds and to embellish them with a variety of temples and garden buildings, some classical and others oriental in style, including the orangery (1757–61), the Alhambra (1758), the Temple of the Sun (1761), and the pagoda (1761–2). These were publicized in Chambers's book *Plans, Elevations, Sections and Perspective Views of the Gardens and Buildings at Kew in Surrey* (1763). Two other major buildings at Kew—both pioneering structures largely in glass and cast iron—are the Palm House (1845–8) by Decimus Burton and Richard Turner, and

Burton's Temperate House (1859–62, wings added 1895–7, restored 1977–82). In 1844–8 the area around the Royal Botanic Gardens was landscaped by William Andrews Nesfield (1793–1881), with the Palm House the pivot of his layout. PW

**Keynes, John Maynard** (1883–1946). Arguably the foremost economist of the 20th cent., Keynes was born in Cambridge and combined a successful academic career with that of civil servant and government adviser. His early work in economics evolved out of the \*Marshall tradition in Cambridge, but through the 1920s and 1930s he increasingly broke new ground. His *Treatise on Money* (1930) and *The General Theory of Employment, Interest and Money* (1936) heralded the Keynesian revolution, which regarded government control of spending as the key to providing full employment. But his influence stretched beyond macro-economic policy. He was critical of the 1919 treaty with Germany and a main architect of the international monetary system created at Bretton Woods in 1944. As a prolific writer in newspapers and popular journals, occasional broadcaster, and speaker, he had a major impact upon the cultural and intellectual life of his time. JRP

**Keys, House of.** The elected chamber of the \*Tynwald, parliament of the \*Isle of Man. Dating back to Nordic times, when the island was the centre of a western sea empire including the Hebrides and the inner islands, it claims to be the oldest parliament in continuous existence. From early times there have been 24 members, self-chosen until 1866. Propertied women were given the vote in 1881, nearly 40 years before the rest of Britain. The House sits with the Council to form the Tynwald. The name is probably an English imitation of the Manx Yn Kiare-as-feed, the *four and twenty*. JAC

**Khartoum.** Capital city of the \*Sudan. Khartoum became Egypt's foremost military base in the Sudan in the mid-19th cent., but when Britain occupied Egypt in 1882 the British government was reluctant to become involved in the area, where the mahdi had proclaimed a religious war against Egypt a year earlier. It did, reluctantly, allow General Charles \*Gordon to take charge of the evacuation of the city but was slow to respond to his request for reinforcements. The city fell in January 1885 when Gordon was killed but was reoccupied by \*Kitchener in 1898 and became the seat of the Anglo-Egyptian government of the Sudan until 1956. KI

**Kildare Place Society.** The society for promoting the education of the poor in Ireland (commonly known as the Kildare Place Society) was founded in 1811, pledged to avoid sectarian distinctions. It was given a substantial parliamentary grant. Harmony did not last long. By 1820 \*O'Connell and the catholics, complaining that the society proselytized for protestants, withdrew from membership. It was replaced in 1831 by a national education system, also devised to be non-sectarian, and also denounced by both sides. JAC

## Kilkenny

**Kilkenny, Confederation of**, 1642. The Irish rebellion of 1641 was not a spontaneous peasant rising but a planned insurrection, though the attempt to seize Dublin failed. The rebels, while protesting their loyalty to Charles I, took steps to organize the large areas under their control. An assembly or parliament summoned at Kilkenny in October 1642 adopted a provisional constitution, with a general assembly choosing a supreme council. The new Confederation raised armies for the four provinces, imposed taxes, confirmed the privileges of the catholic church, and appointed a number of envoys to foreign powers. The situation was extremely complex. \*Ormond represented the king at Dublin, the Scots had sent an army into Ulster under Monro, and other leaders had declared for the English Parliament. Charles I's policy was to offer terms to the Confederation that would enable an army to be sent over to England to turn the scales in the Civil War, and as his position worsened, the terms improved. Ormond negotiated a truce or cessation in September 1643, which was repeatedly extended. But the negotiations proved difficult and protracted. Many of the confederates were prepared to wait until Charles was forced to offer not merely relaxation of the penal laws against catholics but their total removal, and they were strengthened when the papal nuncio, Rinuccini, who arrived in November 1645, took an intransigent line. Charles's diplomacy was characteristically convoluted. He dispatched the earl of \*Glamorgan on a special mission with powers to offer concessions far greater than Ormond could suggest—the next lord-lieutenant should be a catholic, and catholic bishops should sit in the Irish House of Lords. For good measure, \*Henrietta Maria conducted her own diplomacy in exile. When details of Glamorgan's proposals became known, Ormond's position was undermined and Charles had to repudiate the mission. It was, in any case, of no avail, for though Glamorgan succeeded in collecting a force together, Chester surrendered in February 1646 and there was nowhere left for them to land. The confederates now found the English Parliament a much more formidable opponent than Charles had been. The agreement they reached with Ormond in 1649, which marked the end of the Confederation, was too late to be of consequence, and their joint forces were routed at \*Rathmines by Michael Jones. \*Cromwell's campaigns of 1649 and 1650 restored English supremacy. JAC

**Kilkenny, convention of**, 1341. The English crown was too preoccupied with Wales and Scotland in the reign of Edward I, and too insecure in the reign of Edward II, to give much attention to the government of the English Pale in Ireland. Edward III was forced to pay attention in 1341 by a Parliament which began in Dublin and adjourned to Kilkenny when the royal ministers lost control. The Anglo-Irish protested vigorously against the decision to revoke and reconsider all grants since 1307, demanded action against English ministers who knew nothing of the country and thought only of making money, and warned that much territory had been lost to the native Irish. Edward returned a conciliatory answer and dismissed most of the ministers. The condition of the Pale continued to give concern. In 1361 the

king's second son, Lionel, duke of Clarence, was sent as lieutenant and in 1394 Richard II himself visited Ireland to restore English authority. JAC

**Kilkenny, statutes of**, 1366. Lionel, duke of Clarence, second son of Edward III, was appointed the king's lieutenant in Ireland in 1361. In 1366 he summoned a parliament at Kilkenny, which passed a number of statutes intended to buttress the position of the English. They were not to use the Irish language, or intermarry with the Irish; they were not to sell horses or armour to the Irish; they were forbidden to play hurling but told to practise archery; the Irish were excluded from cathedrals, abbeyes, or benefices in the English sector. The preamble referred significantly to the king's 'Irish enemies'. The statutes, though frequently repeated, did not prevent the Anglo-Irish from becoming Irish-speaking. Draconian though they appear, the provisions were for the most part not new; they applied only to the one-third of the country under Anglo-Irish control; and they were subsequently widely disregarded, either by default or by licence. JAC

**Killiecrankie, battle of**, 1689. \*Dundee's campaign for James VII in Scotland in the spring of 1689 led to a chase through the glens between his small force and a slightly larger Williamite army under Hugh Mackay. On 27 July Mackay's men were caught in the pass of Killiecrankie, near Pitlochry, and badly beaten. But Dundee was shot in the side and killed. The Jacobite campaign lost impetus and disintegrated after the check at \*Dunkeld in August. JAC

**Kilmainham 'treaty'**, 1882. In October 1881, Charles Stewart \*Parnell was arrested and imprisoned in Kilmainham gaol (Dublin) under the government's emergency measures 'on reasonable suspicion' of encouraging violence. In April 1882 Gladstone opened negotiations with him. In exchange for his release and a government promise to help with tenants' arrears of rent, Parnell agreed to denounce violence and appeal for law and order. The Irish chief secretary, W. E. \*Forster, resigned in protest. His replacement, Lord Frederick \*Cavendish, was murdered in Phoenix Park the day he arrived. JAC

**Kilmore** (Cell Mór), **diocese of**. This Irish see, in \*Armagh province, was first named Ardagh and then Kells at the Council of Kells-Mellifont (1152). The northern part of Co. Meath was absorbed into the Meath diocese (1152) and later, when the bishop of Kells was expelled (c.1185) by the bishop of Meath, the see of Kells was abolished. The territorial struggles between lordships confused loyalties so that in c.1453 the pope agreed to the obscure parish church of Kilmore on the borders being raised to cathedral status. Later the see was merged with Elphin and Ardagh (1841). It is still a diocese in both catholic and Anglican churches. The Anglican cathedral is 19th cent. with a fine Romanesque doorway. William Bedell (Anglican bishop 1629–42) reputedly made the first translation of the Bible into Irish. WMM

**Kilsyth, battle of**, 1645. Six days after Baillie had been beaten by \*Montrose at \*Alford, outside Aberdeen, in July

1645, a covenanting parliament assembled at Stirling. Montrose moved southwards to harass it, with a force of 5,000 men. Baillie was confirmed in his command and faced him at Kilsyth, south of Stirling on 15 August, with an army of 7,000. The covenanters were caught while still deploying and suffered very heavy casualties. But it was the last of Montrose's victories. JAC

**Kilvert, Robert Francis** (1840–79). Kilvert, a young Victorian curate, kept a diary in the 1870s when he served at Clyro, near Hay-on-Wye, and assisted his father at Langley Burrell, near Chippenham. He was born at Hardenhuish (Wilts.), where his father was vicar, and educated at Wadham College, Oxford, taking an undistinguished fourth in law and history. His simple and direct style and his keen interest in the country people he met on his walks and visits make his diary a vivid and moving account of the period—the mysterious family at Mouse castle, the dissenting ministers boating on Llangorse Lake, the curate of Cusop's extraordinary misfortune. Kilvert died of peritonitis four weeks after his marriage, and is buried at Bredwardine, his last living. The diary was first published in 1938. JAC

**Kilwardby, Robert** (c.1210–79). Dominican scholar, archbishop of Canterbury, and cardinal. Educated at Paris, Kilwardby taught grammar and logic before becoming a Dominican friar (c.1240). Later by upholding traditional scholasticism against the new Aristotelianism he was Aquinas's foremost opponent, though a fellow-Dominican. As occupant of the Oxford Dominican chair (1248–61) and provincial prior of the English Dominicans, he was energetic, establishing eleven new priories. Appointed archbishop by the pope in 1272, he was the first English friar to hold high office, but, little involved politically, he was on good terms with Edward I. Of moderate temper, his primacy was overshadowed by clerical grievances over crusading taxation. He made regular provincial visitations and held frequent synods. He 'visited' Oxford (1277) and, like \*Peckham, denounced its Thomism. To move him from Canterbury, the pope elevated him to the curia as cardinal-bishop of Porto (1278). He died at Viterbo. WMM

**Kimberley, John Wodehouse, 1st earl of** (1826–1902). A Whig politician, Kimberley served in all of Gladstone's ministries. A distinguished scholar at both Eton and Oxford, he never quite fulfilled his early promise. At the Colonial and India Offices he acquired the reputation of an 'imperial handyman'. Some thought him irresolute during the first \*Boer War in 1880–1, but he finally concluded that a military victory would not give Britain real control of the Transvaal. Self-government under British suzerainty followed. He also accepted the need for \*Irish Home Rule. As foreign secretary in 1894–5 he recognized that Britain could not respond to popular demands for intervention against the savage Turkish repression of an Armenian uprising. Inaction, however, during the Sino-Japanese War of 1894–5 meant that Britain did not share the odium incurred in Tokyo by Russia and other powers when they deprived Japan of some of her gains. CJB

**Kimberley, siege of.** Episode during the second \*Boer War (1899–1902). Kimberley was a diamond town of 50,000 inhabitants on the westernmost railway line in South Africa. From November 1899 it was defended by about 1,000 troops under Colonel R. G. Kekewitch with 3,800 irregulars (largely De Beers's employees), and besieged in a haphazard fashion by about 7,500 Boers. The presence of Cecil \*Rhodes in the town made British attempts to relieve the siege urgent, resulting in disasters at Modder River on 28 November and \*Magersfontein on 11 December (part of 'Black Week'). The relief of Kimberley was finally accomplished in spectacular fashion by the cavalry division under Major-General John \*French on 15 February 1900. In 124 days Kimberley had lost 35 soldiers and 5 civilians killed, 99 soldiers and 24 civilians wounded, with many more dead of disease. Rhodes, who had fallen out with Kekewitch, obtained his dismissal. SDB

**'Kingis Quair'.** A poem now generally accepted to have been written by James I of Scotland following his return from imprisonment in England (1424), perhaps in the mid-1430s. Written in Scots, with English influences, it is an autobiographical account of the king's incarceration, his love for his future queen, and their eventual marriage. This is linked to an allegorical account of the king's journey from ignorance to reason, through meetings with Minerva, Venus, and Fortune. Skilfully written, and influenced by \*Chaucer, \*Gower, and Boethius, the poem gives a fascinating insight into a different side of an often ruthless king. RJT

**King's Bench, Court of.** One of the three courts of common law. The Court of King's Bench evolved from the \*curia regis, the itinerant royal court which dealt with the administration of the realm. The court was held 'before the lord king wheresoever he should be in England'. Its origins have been traced back to 1178 when Abbot Benedict of Peterborough recorded that Henry II ordered five judges of the Curia Regis to sit permanently to hear complaints from his subjects. However, it was another century before a distinct court emerged. In 1268 King's Bench was appointed its first chief justice and the court also kept its own records, the *coram rege* rolls. Gradually it separated from the king and the royal council. Under Edward III the court became free of the obligation to follow the king and during 1305–18 settled at Westminster Hall. It had unlimited criminal jurisdiction throughout the realm and was similar, though superior in dignity, to the other common law courts from which it heard appeals. During the Interregnum, the court was renamed Upper Bench due to the absence of the monarch. The Judicature Act of 1873 unified the courts system and transferred jurisdiction to a single High Court of Justice. The Queen's Bench Division became the sole representative of the old courts of common law. RAS

**King's Bench prison** (London) took its name from the court it originally served from the 14th cent. In the 16th cent. it was one of the prisons used to hold political and religious prisoners during the swings of persecution. It later became a flourishing debtors' prison infamous for the privilege it offered the wealthy. The better-off could

## King's College chapel

pay the warders for comfortable rooms, to entertain and often be joined by their families: a celebrated inmate in 1769 was John \*Wilkes. The poor remained in squalid and overcrowded conditions, a prey to disease. In 1842 the name changed to Queen's Bench and began receiving prisoners from \*Marshalsea and the \*Fleet after changes in law virtually abolished imprisonment for debt. The prison was finally demolished in 1880. RAS

**King's College chapel** (Cambridge). Eton and King's College, Cambridge, were founded by Henry VI to celebrate his majority (aged 15) in 1437, before his reign had disintegrated into defeat in France and civil war at home. King's began in 1441 as the College of Our Lady and St Nicholas and the name was changed in 1443. Henry laid the foundation stone of the chapel on 25 July 1446. His personal interest is demonstrated by his 'will' or testament in 1448, which included a detailed plan. As early as 1451 Parliament was complaining that the king's endowments were 'over-chargefull'. The chapel was not completed until 1515 and for many years afterwards totally dominated the site, since Gibbs's building, which helps to balance it, was not started until 1723 and the King's Parade neo-Gothic façade by Wilkins was only begun in 1824. The chapel was started with magnesium limestone from Thevesdale and Huddleston, west of Tadcaster (Yorks.), and finished with stone from the Northamptonshire limestone belt. Though Henry had expressed a distaste for elaborate ornamentation, much embellishment was added over the years. The fan-vaulting (the most striking feature of the interior), the stained glass, and the screen all date from the reign of Henry VIII. Henry VI's original establishment of a choir to sing daily services has been internationalized by the broadcasting of the service of Nine Lessons and Carols at Christmas, introduced at King's in 1918 by Milner-White, then dean. JAC

**king's counsel.** See QUEEN'S COUNSEL.

**king's evil, touching for.** See TOUCHING FOR THE KING'S EVIL.

**king's friends.** The term gained credence with \*Burke's *Thoughts on the Present Discontents* (1770), which explained the lack of success of the Rockingham party by the machinations of royalists, manipulating policy through a 'double cabinet'. No such organized, sinister, and servile corps existed. But George III's desire for a non-party administration appealed to many, the advent of a young monarch with long expectations could hardly fail to strengthen royal influence, and the abandonment by the Tories of fruitless opposition meant a corresponding stiffening of governmental resolve. The growth of militant and radical movements at home and abroad, with \*Wilkes and \*America, helped to promote a countermove towards authority. JAC

**King's Inns.** The Society of King's Inns in Dublin was the Irish equivalent of the English \*Inns of Court. Its site on the north bank of the Liffey was taken in 1786 for the new Four Courts and the Society moved to Henrietta Street. Its new premises were designed by James \*Gandon. JAC

**Kingsley, Charles** (1819–75). Vicar of Eversley (Hants), social reformer, novelist, and 'muscular Christian'. Influenced by F. D. \*Maurice and Thomas \*Carlyle, Kingsley became a leading spirit in the \*Christian socialist movement of 1848–54, and under the pseudonym 'Parson Lot' contributed to *Politics for the People* (1848) and *The Christian Socialist* (1850–1). His novels *Yeast* (1848) and *Alton Locke* (1850) were sympathetic middle-class descriptions of working-class life. Kingsley looked to co-operation, education, and sanitary reform rather than radical politics for amelioration of the working classes. He was paternalistic and averse to monasticism, clerical celibacy, and all forms of asceticism, emphasizing instead the virtues of manliness, sport, and a 'muscular' type of Christianity. Kingsley was not an intellectual (despite his ludicrous appointment as professor of modern history at Cambridge, 1860–9) and was no match for John Henry \*Newman, whom he rashly accused of lying and whose reply led to the publication of the latter's *Apologia* (1864). JFCH

**King's Lynn,** on the estuary of the Great Ouse (Norfolk), was for centuries one of England's major ports. It was developed by the first bishop of Norwich in the 1090s, and enlarged by the third bishop, each sector with its own church and market. It was Bishop's Lynn from the 11th cent. to 1536, when Henry VIII acquired it and renamed it. Its trade was international in the Middle Ages, but mainly domestic from the 16th cent. Since the 1950s it has expanded, fortunately without much damaging its historic core, which is still grouped around its medieval guildhall, churches, and market-places. DMP

**Kingston, treaty of,** 1217. Immediately after the defeat of his supporters at \*Lincoln in May 1217, Louis, dauphin of France, began peace negotiations. They broke down in the summer but a further naval defeat at \*Sandwich persuaded him to agree terms. In exchange for a large indemnity, he renounced his claim to the crown of England against the young Henry III. Supporters on each side were to be restored to their estates and \*Magna Carta was confirmed. In September 1217 Louis returned to France. (See also LAMBETH, TREATY OF.) JAC

**Kingston upon Hull.** Yorkshire port at the junction of the river Hull with the Humber, usually called just 'Hull'. It originated as a monastic wool-exporting port, but was acquired and renamed by Edward I (1293). Its huge Holy Trinity church, and its Trinity House for mariners, testify to its late medieval importance. Henry VIII made it a fortified base, crucial enough for its control to become the flashpoint for civil war in 1642. Hull's MPs included Andrew \*Marvell in the 17th cent. and William \*Wilberforce in the 18th. By 1800 it was the third British port (measured by volume of trade) after London and Liverpool. The city (as it became in 1897) was hard hit by Second World War bombing, and by the collapse of its fishing industry in the 1970s. DMP

**Kinnock, Neil G.** (b. 1943). Formerly leader of the Labour Party (1983–92), European commissioner from 1995. Having lost two general elections in a row to the Conservatives (1987, 1992), Kinnock disarmingly confessed to being a failure.

His left-wing views (particularly support for the \*Campaign for Nuclear Disarmament) alienated many voters, while his rhetorical style was considered verbose even by many of his own supporters. His opponents labelled him 'the Welsh windbag'. His poor record at university, his lack of much professional experience before entering Parliament, and his lack of experience in government were all factors which handicapped him. Though he demonstrated courage in facing up to left-wing extremists in his party, dropped unpopular policies, and began the process of modernizing Labour, the impression remained that he lacked the *gravitas* required of a prime minister. AS

**Kinsale, battle of**, 1601. Around 4,000 Spanish troops sent to assist Hugh \*O'Neill, earl of Tyrone, against Elizabeth I landed in September 1601 on the south coast of Ireland at Kinsale, where they were besieged by Lord \*Mountjoy, who had taken over from \*Essex. On 24 December an attempt to relieve the town failed and the Spaniards surrendered on terms. Tyrone's power was broken and the Tudor conquest of Ireland completed. JAC

**Kipling, Rudyard** (1865–1936). Kipling is often thought of primarily as the trumpet of empire, but his writings were more varied than that suggests and he was far from triumphalist in tone. His parents were methodists. Kipling was born in Bombay, where his father had a chair in architecture. His first name is derived from Rudyard Lake, near Leek (Staffs.), where his parents had met. Stanley \*Baldwin was his first cousin. Kipling hurt his eyes reading as a boy and wore spectacles from his schooldays. After United Services College in Devon, he returned to India as a journalist and rapidly acquired a reputation. At 24 he settled in London, though continuing to travel widely, particularly in America and South Africa. *Life's Handicap* (1891) launched him as a London figure and he followed with *The Jungle Book* (1894/5). His poem 'Recessional' for the \*Diamond Jubilee of 1897—'lest we forget'—made him a national figure. *Stalky and Co.* (1899) drew on his schooldays and *Kim* (1901) on India. He published the *Just-So Stories*, one of the few children's books that children enjoy, in 1902 when he moved into Bateman's in Sussex, and *Puck of Pook's Hill*, set in the post-Roman period, in 1906. His poem 'The Way through the Woods'—a lovely example of controlled nostalgia—was in *Rewards and Fairies* (1910). Kipling declined national honours but was awarded the Nobel prize for literature in 1907. His only son was killed in the Great War in 1915. Kipling's reputation after his death sank even more quickly than that of most authors: the new generation did not respond to calls to shoulder 'the white man's burden', and whimsy was out of fashion. It is true that Kipling published too much and his work is uneven, but at his best he coined haunting phrases—'the Captains and the Kings depart'; 'and there's no discharge in the war'; 'and the dawn comes up like thunder out of China 'cross the bay'. JAC

**Kiribati**, formerly the Gilbert Islands, is an independent republic within the Commonwealth. It lies to the north-east of Fiji, and became independent in 1979. The islands were visited by various navigators in the later 18th cent.,

including Captain Thomas Gilbert in 1788. The inhabitants were then cannibals. The Gilbert Islands became a British protectorate in 1892 and were occupied by the Japanese during the Second World War. They rely upon fishing and agriculture and export coconuts, copra, and bananas. JAC

**Kirkcaldy, Sir William** (c.1520–73). Kirkcaldy had a tempestuous life in turbulent times. His father Sir James had been lord high treasurer to James V of Scotland, an opponent of Cardinal \*Beaton and privy to his murder. William was present and took an active part. He adhered first to the pro-English party, escaped from captivity in France in 1550, and served Edward VI. In Mary I's reign he transferred his allegiance to the king of France. Returning to Scotland in 1557, he resumed his English policy, taking up arms against the French troops there. But when Mary, queen of Scots, arrived back in her kingdom in 1561, Kirkcaldy entered her service until she married \*Darnley. He then changed sides again, leading the opposition at \*Carberry Hill. When she escaped from Lochleven, he led the forces against her at \*Langside. He then changed sides for the last time and attempted to hold Edinburgh castle for her in 1572–3 against the Regent \*Morton. When the castle was forced to surrender, Morton hanged him. Kirkcaldy was brave and capable but the verdict of *DNB* that he won for himself 'a place of honour in Scottish history' seems over-enthusiastic. JAC

**Kitchener, Horatio Herbert, 1st Earl** (1850–1916). Soldier and imperial statesman. Kitchener saw extensive service as a soldier and imperial administrator in Egypt, South Africa, and India. Amongst his achievements were the reconquest of the Sudan (1898) and the imposition of British peace terms on the Boer republics (1902). He was given a viscountcy in 1902 and promoted earl in 1914. But his greatest service to the British empire was between 1914 and 1916, when he served as secretary of state for war. Far from being merely a great poster, as \*Lloyd George claimed, he was a prescient strategist. He recognized that a conflict between the European great powers would not end quickly but would degenerate into a long war of attrition. To ensure that Britain emerged victorious he expanded the small regular army by raising a huge new army of volunteers. He was drowned when HMS *Hampshire*, the cruiser carrying him to a conference in Russia, was sunk off Orkney by a German mine. DF

**Kit Kat Club**. An early 18th-cent. London dining club which took its name from Christopher Cat, who kept the tavern in which it first met. Although not a political club, its members were prominent in the Whig Party and as well as the writers \*Congreve, \*Addison, and \*Pope, and artists \*Vanbrugh and \*Kneller, included Robert \*Walpole, \*Newcastle, and John Churchill (\*Marlborough). Kneller was commissioned to paint portraits of the members. All but one of the 42 pictures, now in the National Portrait Gallery, measure 36 inches by 28 inches and the term kit-cat came to refer to a canvas or portrait of this size. JC

**Kloster-Zeven, convention of**, 1757. After \*Cumberland's defeat at \*Hastenbeck in July, he withdrew to Stade and opened negotiations with the French. He interpreted his

orders from his father, George II, as authority to preserve his army at all costs and on 8 September signed the convention of Kloster-Seven, arranging for it to be disbanded. Though George II had been thinking of Hanoverian neutrality in the \*Seven Years War, he repudiated the convention. Cumberland, hastening to Kensington palace, was greeted with 'Here is my son who has ruined me and disgraced himself.' He resigned all his military offices in protest and never held command again. JAC

**Kneller, Sir Godfrey** (c.1646–1723). A native of Lübeck who had studied under Rembrandt, Kneller came to England c.1676. He became court portraitist to William and Mary, Anne, and George I, enjoying a reputation which evidently eclipsed \*Van Dyck's. In fact, like all portraitists he was at his best with sitters to whom he warmed; otherwise a stereotyped baroque grandiloquence and a thronged studio obscured his real talents as a designer and handler of paint. In high favour with William III, Kneller was knighted in 1692 (created a baronet by George I), and was integrally of the 'protestant establishment'. Kneller's more notable works include the eight 'Hampton Court Beauties' commissioned by Mary II, and his \*'Kit Kat Club' portraits, executed between 1697 and 1721. There are at least 40 of these, all painted to a standard size and often revelatory of the versatile men who comprised this Whig dining club. DDA

**knights.** In continental Europe from the 10th cent. onwards, the term *miles* (knight) was applied to a mounted warrior usually dependent on a greater lord. \*Domesday evidence suggests that this definition is appropriate for the knights of Norman England. Few held much land, and many were maintained within their lords' households. Their importance was thus derived from their military function, as had been that of the *cnichts* of Anglo-Saxon England. Over the next two centuries, knights were enfeoffed with land, becoming more fully involved in landed society and royal administration in the localities. Although the term never lost its military connotation, it had become by the late 14th cent. a social rank below the nobility, but above the squirearchy. It has been estimated that there were 4,000–5,000 knights in mid-12th-cent. England, but that the number declined to about 2,000 by 1250. The escalation of warfare from the reign of Edward I onwards may have helped to keep numbers up and even to revivify the military significance of the knight (680 English knights, for instance, served in the French campaign of 1359), but a major decline is evidenced after the end of the reign of Edward III. By the mid-15th cent., knights numbered only a few hundred. The decline has usually been explained in terms of personal preference: men of the requisite wealth and social standing resisted the crown's attempts to force them, by \*distrainment of knighthood, to take up the rank because they feared the additional expense and burden of responsibility. It seems that the rank of esquire became socially acceptable as an alternative indicator of gentility: it too had developed within a military context from the late 13th cent. onwards, and had adopted many of the trappings of knighthood, such as armorial bearings, military effigies, chivalric concepts, and administrative functions. Most knights were knights bach-

elor; the title was personal, not hereditary, nor did it give noble status, so that knights were represented in Parliament in the Commons not the Lords. The knight \*banneret emerged in the early 13th cent. as a senior rank, probably relating, in its initial stages, to special military significance. Some bannerets were summoned to attend the Lords, and their titles were passed on to their sons, so that they became, by the early 15th cent., indistinguishable from barons. The creation of baronetcies, which were hereditary, in the early 17th cent. brought about a further decline in the status of knighthood. Though the link with military service did not totally disappear and successful admirals were often knighted, 18th-cent. knights were just as likely to be diplomats, lord mayors of London, or wealthy merchants. AC

**Knollys, Sir Francis** (1512–96). Knollys was a prominent courtier and parliamentarian during Elizabeth I's reign. His father was a minor courtier, usher of the Privy Chamber. A zealous protestant, Knollys became gentleman pensioner to Henry VIII and escorted \*Anne of Cleves to her marriage. Knollys's career took off after he married the daughter of Mary Boleyn, first cousin to Princess Elizabeth. Most of Queen Mary's reign he spent abroad, but on Elizabeth's accession he was made a privy counsellor and vice-chamberlain. His accumulation of estates and a large family gave him a powerful electoral interest: six of his seven sons sat in Parliament and Knollys was a leading government spokesman in all the Elizabethan parliaments. In 1567 he became treasurer of the chamber, in 1570 treasurer of the household, and in 1593 was given the Garter. His daughter Lettice married the 1st earl of Essex and then \*Leicester, and his grandson, the 2nd earl of \*Essex, was a rising sun at court in the 1590s. His second, but surviving son, was created Baron Knollys (1603), Viscount Wallingford (1616), and earl of Banbury (1626). Though Elizabeth was sparing with peerages, it is surprising that Knollys did not receive one: perhaps he was too useful in the Commons. His religious views, shading into puritanism, may have alienated the queen and his rebukes may have grown tedious. JAC

**Knox, John** (c.1514–72). Scottish protestant preacher. Born at Haddington (East Lothian) and educated at St Andrews University, Knox was ordained a catholic priest before being called to the protestant ministry in 1547. In 1549, following two years' imprisonment on a French galley, he settled in England, where his powerful preaching and extreme reliance on biblical authority (typified by his opposition to kneeling at communion) established his radical credentials. Driven into continental exile by Mary Tudor's accession in 1553, his radicalism developed a powerful political edge, culminating in his infamous diatribe against female rule, *The First Blast of the Trumpet against the Monstrous Regiment of Women* (1558). On Elizabeth's accession later that year, Knox was barred from England and returned instead to Scotland where in 1559 his iconoclastic preaching triggered a protestant rebellion against the regent, \*Mary of Guise. The reformed settlement of 1560, however, was jeopardized by the return to Scotland in 1561 of the catholic Mary Stuart. While Knox denounced her idolatry from his Edinburgh pulpit, politically he was marginalized and played no significant

role in Mary's subsequent downfall. Dogged by failing health, he devoted his later years to compiling his biased but invaluable *History of the Reformation in Scotland*. RAM

**Korean War, 1950–3.** On 25 June 1950 the communist North Korean army, supplied with Russian equipment, attacked the Republic of South Korea, crossing the 38th Parallel, which acted as the artificial boundary. The army of the South was caught by surprise and forced to retreat. On 27 June the United Nations voted to provide military aid and the USA led a fifteen-nation task force to the peninsula. The South fell back on the key south-east port of Pusan and dug in, halting the communist advance. On 15 September the UN gained the initiative by launching an amphibious assault on Inchon and breaking out of Pusan. They pushed north capturing Pyongyang, the North Korean capital, on 20 October. However, by January 1951 the communists, massively reinforced by China, were marching south again. The UN secured a line 75 miles below the 38th Parallel and on 25 January counter-attacked. Communist counter-offensives on 22–3 April and 15–16 May were checked and by 15 June the UN held a line 20 miles north of the 38th Parallel. A cease-fire came into effect on 10 July.

After protracted negotiations and the repatriation of prisoners on 20 and 26 April 1953, an armistice was signed on 27 July. The UN listed 1 million men killed, injured, or missing. Communist casualties were estimated at 520,000 for North Korea and 900,000 for China. The two Koreas remained implacably opposed until the 21st cent. RAS

**Kruger, Paul** (1825–1904). Boer (Afrikaner) statesman and devout calvinist. Kruger spent most of his life trying to escape British rule. As a boy he accompanied his parents on the Great Trek of Boers away from Britain's Cape Colony. He was present at the signing of the \*Sand River convention in 1852 and was a founder of the South African Republic (Transvaal) in 1856. When Britain annexed the republic in 1877, he led the resistance to British administration which culminated in the first Anglo-Boer War (1880–1). His diplomacy resulted in two Conventions (\*Pretoria 1881 and London 1884) which recognized the internal autonomy of the Transvaal and in 1883 he became president of the republic, though regarding himself as essentially God's vicegerent rather than as head of state. Renewed British designs on the Transvaal, instigated by Alfred \*Milner, led to the second Anglo-Boer War (1899–1902). The elderly Kruger sought help in Europe and died there in 1904. KI

**labour aristocracy.** Top 10–15 per cent of manual wage earners in the 19th cent., characterized by relatively high and regular earnings, membership of a trade union, and respectable life-style. This élite of skilled artisans—engineers, cabinet-makers, printers, and cotton-spinners—set the tone of working-class leadership between the 1840s and the 1890s. The gulf between the labour aristocracy and the mass of unskilled or semi-skilled workers was virtually unbridgeable; but at the upper end of the social stratum the labour aristocracy merged with the lower middle class. The strength of the labour aristocracy rested partly on its control of entry to a trade (usually through apprenticeship) and the custom of subcontracting. Some historians have suggested that a labour aristocracy with a conservative ideology and a stake in the status quo helps to account for the social stability of mid-Victorian Britain; and Marxists have used the concept of a labour aristocracy as a partial explanation of the non-revolutionary character of the British working class. However, the labour aristocracy maintained a distinctive working-class ideology through its unions, and also provided the leadership in some radical reform movements. JFCH

**Labourers, statute of, 1351.** The statute was an early attempt at a wage freeze, rarely a popular policy. The scourge of the \*Black Death led to an acute shortage of labour and in June 1349 the council issued an emergency ordinance (23 Edw. III s. 1) imposing restraint. When Parliament met in 1351 there were complaints that 'out of singular covetise' wages had risen, and the statute (25 Edw. III s. 1) was passed. Men were to work at pre-1349 wage levels, which were laid down, and masters were forbidden to offer more. Persons below the age of 60 not in employment were not to refuse offers of work. Prices were merely to be 'reasonable'. Despite determined efforts to impose the policy and the appointment of special justices of labourers, it proved difficult to enforce. Even the carpenter at Knightsbridge who made the stocks to hold offenders had to be paid over the odds. But resentment played a part in the grievances leading to the \*Peasants' Revolt in 1381. JAC

**labour history** is an important specialism which has greatly extended its scope in the last 50 years. Scholars' perspectives, apart from exceptions such as J. L. and B. Hammond, concentrated on institutions and activists within them or the very poor. Moreover, it was widely believed that sentiment clouded scholarly judgement when in other

branches of history researchers were attempting to adopt and adapt techniques pioneered in the social sciences. Labour history has come to terms with these techniques and recognized the importance of work undertaken by social anthropologists, labour economists, historical demographers, and business historians. Consequently, subjects for investigation have changed, and methods of analysis have become more rigorous and less open to the charge of subjectivity and political bias.

There has also been a marriage between the 'old' labour history and the 'new'. Union histories often tend to follow the narrative style set by the \*Webbs in their *History of Trade Unionism* (1894) but are more analytical in their treatment of issues such as wage movements, labour productivity, and labour markets (which were either ignored in earlier work or passed over quickly). The past is not interpreted by sole reference to the trade union officials or activists at local level as it would have been earlier; rather, labour history has become concerned with the whole experience of workers.

Treatment is uneven and patchy; urban workers and their experience have received more attention than workers in factory villages and small towns. However, it might be reasonably argued that the big battalions are more representative and more important. Some subjects have prompted massive debate and swamped the periodical literature, notably the standard of living between 1790 and 1850; more work needs to be done on other periods. In most periods the majority of the labour force has not been unionized; good work has been done on female, seasonal, and casual labour for some areas of Britain, but geographical and occupational unevenness is a problem. For instance, the very important category (up to 1914) of domestic servants has increasingly attracted scholarly attention, but female clerical workers in the 20th cent. have been neglected.

On the positive side, excellent new work has been done on working-class agitations and movements. \*Chartism, for example, which in the 1950s seemed to demonstrate only two characteristics—moral and physical force and a national homogeneity—has been exposed as essentially a diverse local and regional movement. Structural changes in the demand for labour have been clearly analysed, taking account of labour productivity, and the history of groups such as hand-loom weavers has been much improved. Machine-breaking was simply seen as a blind reaction to industrial capitalism; recent work emphasizes its role in the process of

industrial relations. Employers' strategies were commonly discussed when newly-won trade union rights were challenged in the courts. The latest work emphasizes workplace experience of workers and employers' responses at the factory or industrial level.

Excellent new work is available on workers' consumption. This discusses the physique, diets, and health of workers and their families. Child labour and its regulation has always attracted the attention of historians, but only recently has it been understood how old and how widespread this was. More energy has been expended on female labour, often analysing census data, parliamentary papers, and business records in a more systematic fashion than was possible earlier. The family and housing have received more attention. Migration, immigration, and emigration have been studied in greater depth, and the incidence of poverty, which \*Booth, \*Rowntree, and their imitators examined locally over 100 years ago, has been examined over a wider area. Labour history prospers and has a healthy specialist periodical literature. JB

**Labour Party.** Labour has been the principal progressive alternative to the Conservative Party since the 1920s, forming governments in 1924, 1929–31, 1945–51, 1964–70, 1974–9, and from 1997. The Labour Representation Committee was established in 1900 by a conference of trade unionists and socialists orchestrated by Keir \*Hardie. Although it won only two seats in the 1900 'khaki' election, the secret electoral pact with the Liberal Party negotiated by Ramsay \*MacDonald in 1903 helped the rechristened Labour Party enjoy a tally of 30 MPs after the 1906 election.

The First World War (despite the divisions it caused) proved to be Labour's turning-point. Arthur \*Henderson (parliamentary chairman after MacDonald's resignation on the outbreak of war) entered the cabinet on the formation of the wartime coalition in 1915 and from August 1917 worked with Sidney \*Webb in devising a new constitution. In 1918 Labour became formally committed to the socialist objective of 'public ownership of the means of production' (clause 4); although this served to underline Labour's independence from the Liberals, it strengthened the trade union domination of the party's organization.

Under conditions of manhood suffrage, the 1918 'Coupon' election awarded Labour 63 seats for 2.4 million votes. In 1922 Labour gained 4.2 million votes and 142 seats to become the official opposition. Following the inconclusive 1923 election, Labour briefly formed the government with 191 MPs between January and October 1924, which demonstrated Labour's competence. However the second MacDonald government exposed the financial orthodoxy of ministers in the face of mounting unemployment and the financial crisis of 1931. The resignation of the Labour cabinet in August and the subsequent formation of the \*National (coalition) Government by MacDonald (with the support of only a handful of Labour figures such as \*Snowden and \*Thomas) caused lasting bitterness within the Labour Party. After the disastrous 1931 election (which reduced Labour from 288 to 52 seats) and the disaffiliation of the \*ILP the following year, Labour began a gradual recovery and won 154 seats in 1935

on 38 per cent of the vote. The unassuming Clement \*Attlee was elected leader before this election. The participation of Labour in \*Churchill's coalition government from May 1940 rebuilt its image with voters and \*Bevin, \*Morrison, and \*Cripps played highly visible and constructive roles on the 'home front', while Attlee's administrative talents found expression as deputy prime minister. The year 1945 heralded an unexpected landslide victory for Labour, which won 393 seats with 48 per cent of the vote. This strong administration, with Bevin at the Foreign Office, Dalton and then Cripps as chancellor, and 'Nye' \*Bevan at Health, was Labour's 'finest hour'. Despite economic headaches, notably the 1949 devaluation of sterling, by 1950 the 'Attlee consensus' of a mixed economy with a welfare state was firmly established.

Despite achieving its highest ever poll (fractionally under 14 million votes) in 1951, Labour began thirteen years of opposition. The period witnessed faction fighting between left-wing 'Bevanites' and right-wing followers of Hugh \*Gaitskell, elected leader in 1955. In response to three successive (and widening) election defeats, Gaitskell unsuccessfully attempted to persuade the conference to abandon 'clause 4' in 1959. The following year, Labour's anti-war tradition resurfaced in conference support for unilateral nuclear disarmament (reversed in 1961).

However, a tottering economy together with Harold \*Wilson's invigorating leadership allowed Labour to squeeze back into office in October 1964 by a four-seat majority. An easy victory in the 1966 'follow-up' election gave Labour a majority of 97. Despite positive achievements in the field of education and liberalizing social legislation in particular, Wilson's government struggled to cope with the legacy of Britain's relative economic decline and was humbled by the 1967 devaluation of sterling and consequent policy U-turns. Relations with the wider Labour movement deteriorated as a result of Barbara Castle's bold attempt at industrial relations reform, 'In Place of Strife'.

In opposition again after 1970, Labour divided over Britain's entry into the EEC and the left's call for more extensive public ownership. Wilson's two further narrow election victories in 1974 obscured a weakening of Labour's appeal since the 1960s. Left-wing alienation from the government's (under \*Callaghan from 1976) deflationary response to mounting unemployment and inflation came to a head after Labour began a further lengthy spell in opposition after 1979.

In 1980 and 1981 Tony Benn's supporters won constitutional changes which precipitated the defection of right-wingers to form the \*Social Democratic Party. Subsequently, Michael \*Foot led Labour to heavy defeat in the 1983 election. Under Neil \*Kinnock (1983–92) and John \*Smith (1992–4) a slow revival of Labour's fortunes occurred as the party shifted back towards the 'centre' and purged itself of militant infiltration. Tony \*Blair's 'New Labour' strategy from 1994 accelerated this trend, and, with John \*Major's Conservative government in disarray, secured a massive win at the 1997 general election. A second triumph at the general election of 2001, when the Conservatives were unable to make any inroads on the huge Labour majority,

## labour services

had Labour enthusiasts declaring that, at last, their party had become 'the natural party of government'. SC

Hinton, J., *Labour and Socialism* (1983); Morgan, K. O., *Labour People: Leaders and Lieutenants* (1987); Pelling, H., *Short History of the Labour Party* (10th edn. 1993).

**labour services** were tasks undertaken by tenants as part of their obligations to landowners for the right to farm or use land. These duties came to be seen as part of the rent paid by tenants under the \*'manorial system' during the Middle Ages. One of the definitions of villein status was performing labour services at the will of the lord because, in theory, the obligations were unrestricted. In practice, the levying of labour services depended on the farming regime of the lord of the manor. When cash crops were especially profitable, as during the 13th cent., lords of the manor increased their directly farmed demesne land and used labour services to take advantage of good weather conditions: for spreading manure, ploughing the arable, repairing and maintaining boundaries and ditches, gathering crops of hay and grain, and carrying them to barns or markets.

Precise statements of labour services owed by landholders to the lord of the manor were set out in 'customals', documents produced in manorial courts under oath. Villeins, tenants of the lord of the manor, resisted attempts to extend labour services. During the 14th cent. landowners found it profitable to commute labour services for fixed cash payments. Declining demesne farming by landowners after the middle of the 14th cent. reduced labour services and they ceased to be a determinant of social status by the 16th cent. A few labour services survived in economically underdeveloped areas until the early 18th cent., as in parts of rural west Lancashire. IJEK

**Ladysmith.** Town in northern Natal, scene of a siege by Afrikaner forces during the second Anglo-Boer War. Ladysmith became the main British military supply base in Natal in 1897 and when the Boers advanced into the colony at the outbreak of war in 1899 the British commander in Natal, Sir George White, expected an easy victory. Instead, his army was heavily defeated and White found himself surrounded in Ladysmith, a strategically unsuitable site for a beleaguered force to occupy. Fortunately for White, the Boer commander, Joubert, did not exploit his success and the town was relieved at the end of February 1900. KI

**Lagos, battle of, 1693.** On 17 June 1693 off Lagos in southern Portugal, Sir George \*Rooke, escorting a convoy of 400 vessels to the Mediterranean, was attacked by the French admiral de Tourville with a vastly superior force. One hundred English and Dutch merchantmen were lost. The defeat was attributed to poor intelligence. JAC

**Lagos, battle of, 1759.** In the summer of 1759 the nucleus of a French invasion fleet under de la Clue left Toulon and slipped past Edward \*Boscawen's squadron at Gibraltar. A running fight developed and on 18 August four French vessels sought refuge in Lagos Bay in southern Portugal. They were attacked, two captured and two burned, and de la Clue killed. The Portuguese protested at the violation of their neutrality. JAC

**La Hogue, battle of, 1692.** Control of the Channel, lost by the defeat off \*Beachy Head in 1690, was restored in May 1692 by the victory of La Hogue, or La Hougue, near Barfleur. De Tourville, the French admiral, had orders to engage while still awaiting reinforcements from the Mediterranean. This gave Edward Russell (\*Orford), who had replaced Torrington (\*Byng) as commander-in-chief of the Channel fleet, an advantage of nearly two to one. The French were badly beaten and when they sought shelter were assailed by fireships and boarding parties. James II, on shore with a French invasion force, watched the destruction of his hopes. The *Soleil Royal*, flagship and pride of the French navy, was among the vessels burned. Russell was raised to the peerage as earl of Orford. JAC

**lairds.** The Scots word 'laird' is a shortened form of 'laverd', an older Scots word deriving from an Anglo-Saxon term meaning lord. It implied ownership of landed property in the form of an estate. By the 15th cent. it was widely used of lesser landowners holding directly of the crown and therefore entitled to go to Parliament, but lairds were clearly distinguished from the higher aristocracy or lords of Parliament. In the 16th and 17th cents. it was commonly applied to the chief of a Highland clan with no other title, as in 'the laird of McGregor'.

The feuing movement which peaked at the time of the 16th-cent. Reformation enabled tenants to buy for a steep price feu charters which apart from a small ongoing feu duty bestowed virtual ownership. Some of these tenants, really small proprietors, were known as 'bonnet lairds', but the term is jocular, and it is best to equate the rank of laird with the possession of a barony held either of the crown or of a great lord of regality such as \*Argyll, who had the right to create his own baronage.

Lairds were therefore a numerous class in rural Scotland, though decreasing relative to the higher nobility over time. Baronial jurisdiction was extensive, though subject to appeal to the royal sheriff court or the regality court. The lairdly particle was the word 'of', as in 'Irvine of Drum' or 'Ferguson of Kilkerran'. The number of lairds is difficult to state before the 18th cent., but allowing for the large number of baronies directly in crown or noble hands, equating the laird class with all others, and remembering that in a Fife parish such as Creich there were at one stage three baronies, a figure in the lowish thousands seems the maximum. They were not a homogeneous class: Orkney and Shetland produced merchant-lairds. When great landlords, defined as those with a rental over £2,000 Scots (£166 13s. 4d. sterling), already held by 1770 half the agrarian wealth of Scotland and were consolidating their ascendancy, businessmen were buying into the laird class around the larger cities. As baronies survived after 1747, it is still possible to buy laird status with an estate which is a barony. BPL

**laissez-faire.** The transition from the medieval to the modern economy was characterized by the progressive removal of restrictions on individuals and groups in favour of the operation of market forces. The balance between complete unrestriction based on the assumption that the best social organization is that which allows the individual maximum

freedom, *laissez-faire*, and some control is still strenuously debated. In reality the state of complete *laissez-faire* has never existed. The classical economists believed that natural law required that the influence of government should be limited in favour of individual liberty. Strong supporters of this notion argue either that the actions of individuals pursuing their own ends are complementary, best reflected through the operation of a free market where individuals negotiate as equal partners, or that society is no more than the artificial aggregation of individuals so that no reference to a greater good is permissible. Beyond this extreme the main issue is to find a balance between complete *laissez-faire* and too great a degree of control. John Stuart \*Mill defined what has become accepted as the minimum level of state intervention. Amongst such interventions for the greater good, he included the power to enforce contracts and secure property rights, the administration of justice, the right to tax in order to provide public goods such as transport systems, sanitation and public health, and state-supported education. Typical *laissez-faire* constraints on 19th-cent. government were the fixed exchange rate and a minimalist attitude towards taxation. Ideas of social justice combined with individual freedom found a compromise in 19th-cent. \*Poor Law legislation, designed to provide help for the truly needy, while ensuring that the idle should be excluded.

While the notion of *laissez-faire* is usually associated with the decline of the medieval and mercantilist economic regimes, it has an enduring modern counterpart, or legacy, in the views of the neo-classical and new classical economists, who may use different terminology, but whose essential view is that individual freedom to function within untrammelled markets, with little involvement from government, represents the best type of economic organization. Variations of this position are found in monetarism, public choice theory, and the belief of some new classical economists that involuntary unemployment does not exist. All these strands of thought assert the right of the individual and depict state involvement in the economy as ineffectual or malign. See also FREE TRADE. CHL

**Lamb, Charles** (1775–1834). The mild and gentle character of Lamb is fresh air among the abrasive and arrogant men of letters of the early 19th cent. He was born in London, spent his 'joyful schooldays' at Christ's Hospital, and earned his living as a clerk in the East India House. Much of his life was devoted to caring for his sister Mary, who killed their mother in a fit of madness. Lamb himself, with his stammer and desperate punning, ran close to the edge at times. His most successful works were the *Tales from Shakespeare* (1807) for young readers, and the *Essays of Elia* (1823, 1833). Less interested in politics than many of his friends, much of his work was frankly nostalgic—'The Old Familiar Faces', 'Dream Children'—and shot through with love of Hertfordshire, where he spent much of his boyhood. JAC

**Lambert, John** (1619–83). Lambert had a strange life, missing his footing on the steps of power. He was a good cavalry commander under the \*Fairfaxes in the first civil war, and a leading general in the second, serving with \*Cromwell at \*Preston. He added to his military reputation at \*Dunbar in

1650 and at \*Worcester in 1651, becoming, in \*Clarendon's phrase, 'first in the affection of the army'. He was largely responsible for the \*Instrument of Government setting up the Protectorate in 1653, became a major-general for the northern counties, and was widely tipped as Cromwell's successor. In 1657 however he went too far in opposing the \*Humble Petition and Advice and was stripped of his military and civil appointments. Triumphantly reinstated when the army overturned Richard Cromwell in 1659, he helped to restore the \*Rump Parliament. But he soon quarrelled with the Rump and defied its attempt to cashier him by leading a military coup in October. At this stage he looked like a \*Monck in the making and there were rumours that Charles II would marry his daughter. But his position collapsed speedily. When Monck in Scotland threatened to intervene on the Rump's behalf, Lambert marched north to face him, but his troops melted away. He was captured and put in the Tower. He escaped in April 1660 to lead a last desperate rising for the Commonwealth, but few supporters came in to his rendezvous at Edgehill. Lambert spent the remaining 23 years of his life in captivity, mainly in the Channel Islands, watched by the government as a dangerous man. As late as the \*Popish plot in 1678, Charles's ministers were worried what Lambert might do, though his mind had long been clouded over. AHW; JAC

**Lambeth, treaty of**, 1217. After John's death in 1216, the supporters of his young son Henry III defeated Louis of France's men at \*Lincoln. On 20 September 1217 the treaty of Lambeth ratified terms agreed at \*Kingston upon Thames. Louis abandoned all claims to the English throne and retired to France but was given 10,000 marks in compensation. The king's supporters, chief of whom was William \*Marshal, earl of Pembroke, agreed to maintain the liberties of the subject as defined in \*Magna Carta. JAC

**Lambeth palace**. Originally approached by boat, Lambeth and its manor house was bought by \*Baldwin (c.1185). Known as Lambeth House until 1658, it is conveniently near the administrative centres of Westminster and Whitehall for archbishops as 'Primates of all England'. The Old Palace, Canterbury, is their diocesan residence. The chapel was the venue of \*Parker's historic consecration, the only archbishop to be buried there. The first Lambeth conference (1867) was held in the 14th-cent. guard room; later conferences (1878–1958) were held in the hall. The chapel undercroft dates from \*Langton, the chapel itself originally from c.1230. The great hall, with its hammer-beam roof, has an exterior rebuilt, possibly by \*Wren (c.1660–3), after destruction during the Commonwealth. From c.1830 it has housed the library, now of c.200,000 books and 4,000 manuscripts, a collection founded by \*Bancroft (1610). The residential section was rebuilt in Tudor style (c.1830). The entrance is by \*Morton's tower (c.1495). Second World War bombing destroyed the chapel and severely devastated the hall and residence, but all was restored (1955). The chapel and its undercroft were refurbished with murals and stalls for each primate world-wide (1988). The historic private garden, London's oldest and second largest, was restored and revitalized (1988). WMM

## Lancashire

**Lancashire.** Isolated by dense forests and scarcely marked by the Romans, this north-western area of England remained remote and desolate even at \*Domesday; the coastline of dunes, marshes, and mosses had discouraged intensive settlement from across the Irish Sea, although combined Norse/Anglian place-names still persist. Fully recognized as one of the English shires by 1194 and a county \*palatine since 1351, the palatine rights were subsequently vested in the sovereign as duke of Lancaster. Its relative remoteness later sheltered recusancy and Jacobitism.

Cloth-manufacturing was initially a subsidiary employment in the upland farms, encouraged by the soft water and mild, moist climate, since the Pennine hills entrap east-moving clouds; linen (west) and wool (east) had become increasingly important by the 17th cent. The invention of machines for spinning (\*Hargreaves's spinning jenny, \*Arkwright's water frame, \*Crompton's mule) and development of steam-power in the later 18th cent. encouraged exploitation of the coalfield and a move from a domestic to a factory system, with increasing concentration on the more easily worked cotton. Aided by improved communications and transport (canals, then railways), and growth of \*Manchester as a business centre and \*Liverpool as an Atlantic port, the expansion in cotton enabled Lancashire to dominate the British textile industry. Commerce, cotton, chemicals, and engineering generated industrial development, massive growth in population, and local wealth but at the expense of scarring of the valleys, the health of the work-force, and child labour, despite growing trade unionism. Church-building was matched by equally rapid growth of nonconformist chapels.

The gradual loss of vitality of Lancashire since 1880 has been attributed less to 'entrepreneurial failure', aggravated by economic depression between the world wars, than to a reduction in export demand as rival overseas industries developed. Glass, soap, and shipping prospered, but as textiles and mining declined, unemployment, urban decay, and out-migration accelerated. Museums have replaced mills. However, arable farming with some reversal of enclosures has made a significant return in the north and west, since the drained mosses yielded rich soils, while market gardens flourish; coastal towns such as Blackpool have become tourist resorts. Cricket and association and rugby league football retain passionate support, but, despite its regional distinctiveness, the county (shorn in 1972 of Merseyside, Greater Manchester, and its southern Lakeland fringe) barely withstands a drift back to its former position on the periphery. In the local government reorganization of the 1990s the county retained its status, but no fewer than sixteen areas were made unitary authorities—Blackburn, Blackpool, Bolton, Bury, Halton, Knowsley, Liverpool, Manchester, Oldham, Rochdale, St Helens, Salford, Sefton, Trafford, Warrington, and Wigan. ASH

**Lancaster, duchy of.** The duchy of Lancaster originated in the desire of Henry III to provide for his youngest son Edmund Crouchback, after the failure of a scheme to make him king of Sicily. He was granted many of the estates of Simon de \*Montfort, killed at \*Evesham, and in 1267 was

given all the royal estates in Lancashire, assuming the title of earl. Edmund's grandson, \*Henry of Grosmont, was created duke by Edward III in 1351, with considerable \*palatine powers, including the right to hold his own chancery with his own justices, and to appoint his own sheriff. Henry left a daughter who married \*John of Gaunt, Edward III's younger son. When John's son Henry seized the throne as Henry IV in 1399, the dukedom of Lancaster was merged with the crown. But a separate administration was maintained, possibly in case the new regime did not prosper, but more probably to give the king an independent source of income. The chancellorship of the duchy of Lancaster has been used in recent centuries as a supernumerary post, often in the cabinet, for an elder statesman. Queen Victoria used the title countess of Lancaster when she wished to travel semi-privately on the continent. JAC

**Lancaster, Joseph** (1778–1838). Founder of the Lancasterian system of education. The son of a nonconformist, Lancaster opened a school at Borough Road, south London, in 1798, offering free education to those unable to pay. He divided it into small classes each under a monitor; a group of these classes was supervised by a head monitor. In this way, and by using mechanical methods of learning, he could accommodate 1,000 boys. Recognition came in 1805 when George III met Lancaster and promised his support. However, Lancaster opposed the notion that education should be Anglican and encountered rivalry from a Church of England clergyman, Andrew \*Bell. A Royal Lancasterian Society, later the \*British and Foreign School Society, was set up in 1808, but Lancaster quarrelled with the trustees and emigrated to America. He died in a street accident in New York in 1838. PG

**Lancastrians.** The three kings of England between 1399 and 1461 (Henry IV, Henry V, and Henry VI) were so named because they were descended from \*John of Gaunt, duke of Lancaster. The term is also applied to their retainers, identifiable in many effigies by the wearing of the Lancasterian collar of SS, and to those who supported Henry VI in the Wars of the \*Roses. It would be wrong to liken them to a political party, although in its heyday the Lancasterian affinity was a powerful force, which played a crucial role in sustaining the dynasty on the throne during the first quarter of the 15th cent. AJP

**Land Acts** is a collective term applied to a series of Irish land reforms enacted between the end of the 19th and early 20th cents. This legislation was partly an attempt to defuse the increasingly assertive peasant nationalism which, fuelled by rural grievance, was threatening the stability of British rule in Ireland. Though often very different in detail, the legislation generally had two aspects: first, the immediate improvement of the tenant's contractual position, and, second, the gradual encouragement of a peasant proprietorship. \*Gladstone's Land Act of 1870 sought to give legal force to the \*Ulster custom, and to give tenants enhanced security of tenure; his more comprehensive measure of 1881 offered more decisive relief in the same areas, establishing in effect the principle of joint-proprietorship: rents might be

fixed by judicial arbitration, and the tenant was given both the right to free sale, and enhanced protection against unjust eviction. Conservative legislation developed these Gladstonian precedents, although the principle of land purchase (a secondary feature of the Act of 1870) was much more prominent: the 'Ashbourne' Land Purchase Act (1885) provided £5 million in order to fund sales of property to occupying tenants. This measure, even when boosted by subsequent funding, had a restricted impact, but it provided a precedent for the much more lavishly funded and successful Wyndham Land Act (1903): this built upon an earlier political agreement between landlords and tenants (the land conference of December 1902), and offered a range of inducements to both classes. Although watered down by the Birrell Land Act (1909), Wyndham's measure facilitated a massive transfer of land from the old Anglo-Irish proprietors to their tenants. This legislation, together with its predecessors, effected a social revolution in Ireland long before the Anglo-Irish War of 1919–21. AJ

**Landen, battle of.** See NEERWINDEN.

**Lander, Richard Lemon** (1804–34). Originally from Cornwall, Lander was a servant of \*Clapperton to whom he showed great loyalty on the expedition to what is now northern Nigeria. After Clapperton's death in 1827, he returned to London and was soon commissioned by the government to return to west Africa in 1830, this time penetrating from the Guinea Coast to Bussa on the Niger. Lander then followed the river down to its outlet on the coast, solving the age-old problem of the great river's course and termination. He died on a later expedition to west Africa. RB

**landscape gardening.** The 18th-cent. English landscape garden or park was a major, and highly influential, contribution to European art. It replaced the earlier fashion for highly formal gardens (most of which were destroyed during this period) as adjuncts to country houses and ultimately presented an effect of natural, rolling grassland coming right up to the house, with distant clumps of trees; so much so, in fact, that the architect Sir William \*Chambers found the landscapes of the celebrated Lancelot 'Capability' \*Brown (1716–83) to 'differ very little from common fields, so closely is common nature copied in most of them'.

Among Brown's numerous works were the landscapes at \*Alnwick castle, Northumberland (c.1760), \*Blenheim palace, Oxfordshire (1763), Bowood, Wiltshire (c.1761–6), \*Holkhams Hall, Norfolk (1762), \*Kew Gardens and Richmond Park, London (from 1764), and Prior Park, near Bath (c.1764). The naturalness and expansiveness of such landscapes undoubtedly encouraged a sense of surveillance and possession in the minds of their aristocratic owners, although they were also held to demonstrate the spirit of British libertarianism. Certainly they were associated with the general trend towards enlarging estates through the enclosure of common land; sometimes whole villages were moved to create the desired effect, as at Kedleston (Derbys.) or Milton Abbas (Dorset).

Pioneers of the new taste in gardening, favoured by the poet Alexander \*Pope, were Stephen Switzer (1682–1745), Charles \*Bridgeman (fl. 1709–38), the latter credited with the invention of the 'ha-ha', a hidden ditch which halted the movement of animals without interrupting the view, and William \*Kent (1685–1748). Their landscape gardens were more intricate and contrived, with wooded areas, glades, temples, and monuments. At Rousham in Oxfordshire, William Kent, from 1738, modified the original garden plan by Bridgeman of c.1715–20, adding cascades, ponds, walks, statues, and a pyramid. (Brown emphasized aquatic features but made little use of architectural elements.) Kent also designed the gardens at Chiswick House, Middlesex (c.1727–36). Such schemes often had complex, symbolic 'programmes' based on literary or political allusion, as at Stowe (Bucks.). The extensive gardens there were laid out mainly from 1713 by Viscount Cobham and his successor Earl Temple. Again, the scheme was initiated by Bridgeman and developed by Kent (mainly 1730s); a process of simplification and enlargement was begun by Brown, c.1749.

The final phase of the English landscape garden began late in the century, Picturesque theorists having rejected what they saw as the repetitive, over-formulaic approach of Brown. Thus Humphry \*Repton (1752–1818) adopted a more complex and varied approach, involving the effect of 'accidents' of nature and a more organic relationship between buildings and landscape. TEF

**Landseer, Sir Edwin** (1802–73). English painter, sculptor, and engraver of animal subjects, Landseer was the son and pupil of an engraver. Of precocious talent, he first exhibited at the Royal Academy when he was 13, became ARA at 24, and an academician five years later. In 1865 he declined the presidency of the academy. Engravings of his paintings were made by his brother Thomas and prints from these were widely available, making Landseer the most popular artist of his day. Capitalizing on an upsurge of Scottish Romanticism and a demand for sporting pictures, Landseer painted many Highland subjects, notably *The Stag at Bay* and *The Monarch of the Glen*. He also sculpted the lions at the foot of Nelson's Column in London. He was the favourite painter of Queen Victoria, from whom he received a knighthood in 1850, having refused the honour eight years earlier. In 1869 he began to suffer bouts of madness and by his death had become quite insane. JC

**land tax** is an indirect tax levied on the value of land and often forms part of wider property taxation. In Roman times the provinces relied upon land taxes for a considerable part of their revenue and their importance continued into medieval times. Local government relied upon land taxes (in the form of rates) for much of their revenue from the mid-17th cent. until the 1980s. Throughout the whole of the 18th cent. the land tax was the main source of government revenue. Introduced in 1693 to pay for the French wars of William III's reign, it sufficed until 1799 when the cost of the Revolutionary War forced \*Pitt to the even more drastic expedient of income tax. It was an object of \*Walpole's government in particular to avoid involvement in war so that the land tax could be kept down and the gentry content.

## land tenure

Land tax may be on the capital value of land or on an imputed rental value. Its physical fixity and productive potential, together with the difficulties of avoidance, means land has been seen to form a good tax base. Philosophical arguments have also been advanced since feudal times that landholding is a privilege conferred by the state and that holders are liable to tax in perpetuity. Economic thinkers such as John \*Locke and Adam \*Smith have favoured shifting much of the burden of taxation to land for these reasons. There are practical difficulties however in assessing the value of land to be taxed and in ensuring that there are no disincentive impacts on its productive use. Land taxes are *in rem* and unlinked to the circumstances of owners, which can lead to undesirable distributional consequences. KJB

**land tenure.** Land could be held in a number of ways. Theoretically all land was owned ultimately by the crown, but most of it has been 'sold' to private individuals or public bodies. Since the disappearance of feudal tenure in the Middle Ages, most land has been 'let' to tenants, in a variety of different forms. Of these the best known is 'rack rent', in which land and buildings are let by the owner to a tenant for what is agreed by both parties to be a fair economic rent, reflecting its real value. However, this has been universal in England only since the abolition of copyhold in 1926, and prior to that time various other forms of tenure existed, usually based on time (three lives, 99 years, lifeleasehold)—or type of holding (copyhold, customaryhold). Under both systems the tenant paid a nominal rent but ensured the continuance of the holding through fines and other dues, enjoying virtual security of tenure as a result. These tenancies were particularly suited to non-inflationary periods and to estates over which the landlord wished to exercise little or no supervision. By the 18th and 19th cents. they were gradually being abolished, usually by the landlord refusing to insert new lives in a lease, or to accept payment of the traditional renewal fine. However, they remained in place through much of northern and western England well into the 19th cent., and on the estates of institutions such as Oxbridge colleges.

In Scotland, two forms of land-leasing were common: co-joint tenancy in which all the tenants on a farm were responsible for its cultivation and rent payment; and an alternative system in which several cultivators of a single farm each had a separate lease (or 'standing') for which they were responsible. The latter was the multiple tenancy farm. The early 18th cent. saw a decisive move, particularly in the Lowlands, towards the single tenancy which made enclosure and related innovations easier to obtain. JVB

**Lanfranc** (c.1010–89), archbishop of Canterbury (1070–89), was an Italian from Pavia, who moved to northern France in the 1030s, and rose in \*Normandy before 1066 to be William the Conqueror's chief ecclesiastical adviser. A theologian and teacher of European renown, Lanfranc's presence gave the church in Normandy a prestige which it otherwise lacked; a fact which contributed considerably to the support given by the papacy to the \*Norman Conquest. Lanfranc originally came to northern France to seek pupils and, around the year 1040, he passed through a spiritual crisis and sought

seclusion in the then impoverished abbey of Le Bec. He emerged in the late 1040s and was thereafter always close to the centre of affairs. After 1070 his influence was widely pervasive throughout the Normanized church in England. Among other things, he controversially asserted Canterbury's primacy over York and, as a result, was able to preside over synods of the entire English church which gave a central direction to the efforts of the new Norman bishops. He circulated an abridged, but authoritative, collection of canon law throughout the English church and, through his *Monastic Constitutions*, he helped several English monasteries to adopt more up-to-date continental customs. His letters reveal a quiet disciplinarian who was also a pragmatist. His close and harmonious co-operation with William the Conqueror assisted the Norman settlement of England and contrasted with the attitudes of his pupil and successor St \*Anselm, who placed a much greater emphasis on obedience to the papacy and to the rigorist policies of the \*Investiture contest popes. DB

**Lang, Cosmo Gordon** (1864–1945). Archbishop of Canterbury. Lang was a native of Scotland. After a short ministry at the university church in Oxford, he became (1896) vicar of Portsea, an important and populous parish, where he trained and deployed a large team of assistant curates. At the age of only 37 he was nominated as suffragan bishop of Stepney, in London's East End, and then promoted (1908) to be archbishop of York. Here he proved a marked contrast to the more conservative, cautious, and diplomatic Randall \*Davidson, his fellow-Scot who was archbishop of Canterbury. The contrast is well illustrated by their attitudes to the Prayer Book reform of 1928. Davidson did not want it, and Lang wanted a return to the more catholic Prayer Book of 1549. Lang succeeded Davidson at Canterbury in 1928, but his work as primate was overshadowed by criticism for his part in the \*abdication crisis of 1936, and the outbreak of war in 1939. He resigned in 1942 and died three years later. JRG

**Langham, Simon** (d. 1376). Archbishop of Canterbury, chancellor, and curial cardinal. Born in Rutland, Langham entered the Benedictine monastery at Westminster (c.1335), and was successively prior and then abbot (1349), then treasurer of England (1360), bishop of Ely (1362), chancellor (1363), and archbishop (1366–8). As chancellor, his speeches at the opening of parliaments were the first in English. After a brief spell as archbishop, Edward III forced him to resign, whereupon he accepted a cardinalate without royal permission, thus becoming a valued diplomat in the papal curia at Avignon (1368). Regaining Edward's favour, he held various English dignities in plurality. When the Canterbury monks re-elected him archbishop (1374), the pope would not spare him, though, when the papacy was to move to Rome (1376), he was given permission to return to England, only to die in Avignon before setting out. Langham was a skilful administrator and a great benefactor of Westminster. WMM

**Langland, William** (1330s–90s). Author of \**Piers Plowman*. Almost nothing is known about Langland beyond what can be surmised from his great allegorical poem: that he was a cleric in minor orders, married to one Kit, that he originated

in the south-west, had connections with Malvern, and lived for a period in London. DCW

**Langport, battle of**, 1645. After his defeat at \*Naseby in June 1645, Charles had few resources left in England. He managed to raise another army, largely of Welsh recruits, and \*Goring was still pursuing a rather desultory siege of Taunton. \*Fairfax moved against him and at Langport, on 10 July, inflicted a severe defeat. Goring lost 2,000 prisoners, and was forced back to Bridgwater and then to Barnstaple. News of the surrender of Carlisle and of \*Montrose's defeat at \*Philiphaugh completed a disastrous summer for the royalists. JAC

**Langside, battle of**, 1568. On 2 May 1568 Mary, queen of Scots, imprisoned for nearly a year in Lochleven castle, made her escape and raised support. Marching west to join forces with the Hamiltons, her troops, under the earl of \*Argyll, confronted a smaller force under the regent, \*Moray, on 13 May near Glasgow. The issue was decided by a cavalry charge and Mary's supporters broke. She fled to the south-west and made her way to Carlisle, where she appealed for help to Elizabeth I of England. She never saw Scotland again. JAC

**Langton, Stephen** (c.1156–1228). Biblical scholar and ecclesiastical politician who helped in the making of \*Magna Carta. Educated at Paris, Langton stayed on to teach theology there. As a theologian he is most famous for his practical work in revising the order of the books of the Bible and arranging them into chapters. Pope Innocent III made him a cardinal in 1206 and next year consecrated him as archbishop of Canterbury against the wishes of King John. John's refusal to allow Langton into England led to a quarrel between king and pope that lasted until John submitted in 1213. Once in England, Langton's concern for lawful government made him an important mediator between the king and his baronial enemies, and he played a key role in the negotiations which led up to Magna Carta. Once this had been sealed, he remained fully committed to its principles. But this brought him into conflict with Innocent III since the pope thoroughly approved of a king who had submitted to him and, at John's request, declared Magna Carta null and void. Langton was suspended from office in September 1215 and went to Rome. He returned to England in 1218 but it was not until he had paid another visit to Rome in 1220–1 to secure the recall of an all too influential papal legate that he was free to play an active role in English affairs. During the minority of Henry III his moderating presence and co-operation with Hubert de \*Burgh did much to keep the peace, until he withdrew from politics in the year before his death. JG

**Lansbury, George** (1859–1940). Christian socialist and pacifist. Lansbury came from working-class stock, and after flirting with Liberalism in London's East End in the 1880s identified himself with socialist politics, more especially in the context of local government. In 1921 he and other members of Poplar Borough Council suffered imprisonment rather than authorize the payment, to the London County Council, of monies which they claimed impoverished Lon-

don boroughs could not afford. Perhaps for this reason, Lansbury was excluded from the 1924 Labour government, but in 1929 he became first commissioner of works. In 1931 he managed to retain his parliamentary seat at Bow and Bromley, and was elected Labour leader in the Commons. His obsession with pacifism in the early 1930s led him to oppose sanctions against Italy following Mussolini's invasion of Abyssinia, and in a dramatic but empty gesture he resigned the leadership at the 1935 Labour conference, striding defiantly out of the conference hall after being denied access to the microphone. GA

**Lansdowne, battle of**, 1643. This Civil War encounter was part of the early manoeuvring for control of the west country, and fought between two old friends, Sir William \*Waller and Sir Ralph \*Hopton, who exchanged letters before the fight, lamenting 'this war without an enemy'. Hopton's royalists attacked Waller on 5 July, trying to drive him from the Lansdowne ridge, 5 miles north of Bath. In hand-to-hand fighting, Hopton's men pushed their way up the wooded slopes and, during the night, Waller made an orderly retreat. A week later his forces were badly beaten at \*Roundway Down, just outside Devizes. There is a memorial on the field of battle to Sir Bevil Grenville, the Cornish leader killed in the attack. JAC

**Lansdowne, William Petty, marquis of**. See SHELBURNE, 2ND EARL OF.

**Lansdowne, Henry Petty-Fitzmaurice, 3rd marquis of** (1780–1863). Statesman. Lansdowne was a Whig grandee and for decades Bowood in Wiltshire and Lansdowne House in London were headquarters of Whiggism. His father, better known as \*Shelburne, was prime minister 1782–3. Lansdowne succeeded his half-brother as marquis in 1809, having been chancellor of the Exchequer in the Ministry of All the \*Talents at the age of 26. He supported \*Canning's brief ministry in 1827, which caused a temporary breach with his less flexible Whig friends, and was home secretary in \*Goderich's administration 1827–8. He served as lord president of the council in Whig ministries 1830–4, 1835–41, and 1846–52, and remained in the cabinet without portfolio 1852–8, as guardian of the Foxite tradition. He was given the Garter in 1836 and refused a dukedom in 1857. Lansdowne was several times within reach of the premiership but lacked ambition and was perhaps disinclined to ministerial toil. By 1857 he was, according to Greville, the first of the cabinet to fall asleep. JAC

**Lansdowne, Henry Petty-Fitzmaurice, 5th marquis of** (1845–1927). A Liberal politician, Lansdowne resigned from \*Gladstone's government over Irish land reform in 1880. After serving as governor-general of Canada and viceroy of India, he joined \*Salisbury's 1895 cabinet. As foreign secretary from 1900, he did much to satisfy those who believed that Britain could no longer afford the so-called policy of \*'splendid isolation'. In 1901 he resolved Britain's outstanding disputes with the USA. An alliance with Japan followed in 1902. His effort to negotiate with Germany in 1903 over the Berlin-Baghdad railway was thwarted by Joseph \*Chamberlain, but an entente with France in 1904 resolved

## Largs

various imperial differences—notably over Morocco and Egypt. Although he stood firmly with the French in the Moroccan crisis of 1905, he hoped that this was no more than a temporary rift with Germany. As leader of the Unionist peers from 1903 to 1916, he was much criticized for his conduct in opposition to \*Asquith's Liberal government. Initially a strong supporter of the war against Germany, he wrote a highly controversial letter to the *Daily Telegraph* in November 1917 putting the case for a compromise peace.

CJB

**Largs, battle of**, 1263. Though the fighting was little more than skirmishing, the consequences were significant. Throughout the reign of Alexander III of Scotland there were disputes about the Western Isles, under the sovereignty of Norway. In the autumn of 1263 Haakon IV of Norway assembled a large fleet, raiding and raising revenue. Early in October, some of his ships were driven ashore near Largs and others sent to protect them were attacked by the Scots. It was not clear who had the better of the fighting, but after Haakon had returned to Kirkwall, where he died, negotiations began for the Isles to be ceded to Scotland. Orkney and Shetland did not, however, become Scottish until 200 years later.

JAC

**Larkin, James** (1876–1947). Larkin was the nearest thing to a revolutionary leader that the modern trade union movement has thrown up. He wished, on \*syndicalist lines, to use trade union power not merely to obtain concessions but as a battering ram to destroy capitalism. Born in Liverpool of Irish parents, he became involved in union activity and went to Ireland to organize the dock workers. His first task was to persuade protestants and catholics to work together. In 1908 he founded the Irish Transport and General Workers' Union, supporting it from 1911 in the *Irish Worker*. In the autumn of 1913 a strike on the Dublin trams led to a long confrontation with the employers and gave Larkin his finest hour. Threatened with arrest, he whipped off a false beard on the balcony of the Imperial hotel, O'Connell Street, to encourage his men. But he alienated British trade union support and the rest was anticlimax. The strike dribbled away with little gained and there were other matters to preoccupy Ireland. Larkin spent the war years in America, where he was gaoled and then deported, and returned a convinced Marxist with an admiration for Bolshevik Russia. His militancy led to expulsion from the union he had founded. Elected to the Dáil in 1927 he was unseated as a bankrupt, but elected again in 1937. A large man, with a powerful voice and powerful emotions, Larkin has been called 'lion-hearted and erratic'. *The Times*' obituary remarked that 'of late he had not been much in the public eye'.

JAC

**Larkin, Philip** (1922–85). Poet, librarian, novelist, and, it has been said, 'unofficial laureate of post-1945 England'. War-time Oxford prompted his first novel, *Jill* (1946), but the early poetry was strongly influenced by \*Yeats and \*Auden. The discovery of \*Hardy's poems helped him find his own distinctive voice, first heard in *The Less Deceived* (1956). Though an admirer of \*Lawrence, he had little time

for modernism, 'whether perpetrated by Parker, Pound or Picasso', and his taste in jazz drew the line at 1945. With the responsibility for a large university library at Hull, writing was pushed to the margins and only two more collections followed: *The Whitsun Weddings* (1964) and *High Windows* (1974). A reclusive figure, he alternated between self-deprecation and self-dislike. Since his death, the letters and biography have perhaps damaged his reputation; if often very funny, he was seldom politically correct. Even so, it is not clear that anyone since the war has written better poems.

JNRS

**Latimer, Hugh** (c.1485–1555). Bishop. One of the 'Oxford martyrs', Latimer was also one of the most celebrated and effective preachers of the Tudor church in the early years of the Reformation. The son of a Leicestershire yeoman, he was educated at Cambridge, ordained priest, and in 1522 licensed as one of the university's preachers. Some time between then and 1525 he came under the influence of reforming ideas, reputedly through contact with Thomas Bilney. Inhibited from preaching by the bishop of Ely, Latimer regained his licence on appeal to Cardinal \*Wolsey. He briefly preached at court around 1530, then moved to a Wiltshire living, where his preaching was once again censured in 1532. In 1535, after the break with Rome, he was appointed bishop of Worcester. As bishop he demonstrated the concern for the poor and the skill in humorous invective for which he was later well known. He resigned his see in 1539 in protest against the Act of \*Six Articles and was twice imprisoned in the 1540s. On Edward VI's accession he was released, resuming his career of energetic and fashionable preaching. His sermon 'Of the Plough', preached at Paul's Cross in 1548, contains a classic combination of practical theology with social insights and concerns. On Mary I's accession he was summoned to London, declining opportunities to escape into exile. He confronted catholic spokesmen in the Oxford disputation of April 1554; after two examinations for heresy in 1555, in which he refused to submit to catholic teachings on the real presence and the sacrifice of the mass, he was burned at Oxford on 16 October 1555, alongside the former bishop of London, Nicholas \*Ridley. Less a theologian than a preacher and communicator, he did more than most to instil practical protestantism in the minds of those lay people who stood by it in the reign of Mary Tudor and thereafter.

EC

**Latin America, relations with.** English activities in Latin America began in 1562–8 when Sir John \*Hawkins carried three cargoes of slaves from Africa to Spanish possessions in the New World. The third of these voyages precipitated a series of clashes with Spanish forces, sometimes authorized by London and sometimes not, as the English battled for trade and gold. Charles II's commercial treaty with Spain in 1667 finally placed English trade with the colonies on a better footing—although English merchants remained far from satisfied. The treaty of \*Utrecht (1713) officially opened the colonies to British slave traders, but further incidents led to the so-called 'War of \*Jenkins's Ear' in 1739. Spain's alliance with Napoleon tempted the British to try to seize Buenos Aires in 1806–7. They failed, but Napoleon's

intervention in Spain in 1808 was followed by growing unrest in Spain's American colonies. The British tried to strike a balance between the colonists and those Spanish elements which were allied with them against Napoleon in the Peninsula. Later, as Spain's hold on its American colonies weakened, the British, eager to build up their trade and to ensure that the USA did not acquire too much influence and esteem, moved towards *de facto* and finally *de jure* recognition in the 1820s. The new states themselves recognized that the British navy was their best defence (rather than the Monroe doctrine) whenever there were suggestions that other European powers might be disposed to assist Spain to recover her colonies.

Britain retained her leading role in trade and investment in much of Latin America until the First World War. Meanwhile \*Canning in the early 1820s had assisted in the peaceful separation of Brazil from Portuguese colonial rule. Anglo-American rivalry persisted mostly in central America, partly because of British interest in the Mosquito Shore, and partly because both were interested in any project to build a trans-isthmian canal. Their relations were eased in part by the Clayton-Bulwer treaty of 1850 and further negotiations in 1856-60. Later in the century the British were forced to recognize that the balance of power was shifting decisively in favour of the USA. They were rudely reminded of this by US intervention in 1895 in a British frontier dispute with Venezuela. The Hay-Pauncefote treaty of 1901 yielded control of any canal to the USA. But later British retreats and concessions to the Americans did not prevent friction between London and Washington as, for instance, on policy towards Fidel Castro's Cuba in the 1960s. On the other hand, the USA, after some hesitation, supported the British in the war to recover the \*Falkland Islands after their seizure by Argentina in 1982. Sovereignty over the islands had been in dispute with Argentina since 1833. CJB

**latitudinarianism** was a reaction against the theological controversies and civil wars of the 17th cent. It drew upon the ideas of Cudworth and the Cambridge Platonists, placing little emphasis on precise points of doctrine and arguing for toleration. The spirit was evident soon after the Restoration, with \*Pepys noting in 1669 that Dr \*Wilkins, bishop of Chester, was 'a mighty, rising man, as being a Latitudinarian'. \*Tillotson, archbishop of Canterbury after the Glorious Revolution, preached a celebrated sermon on 'His commandments are not grievous.' Their high-church opponents retorted that tolerance could slide into deism, as it did with \*Locke, or into downright indifference, their charge against \*Hoadly. Latitudinarianism has often been seen as the prevailing characteristic of the Hanoverian church. But there were powerful counter-currents, and \*methodism and \*evangelicalism, while agreeing to avoid doctrinal disputes, laid great emphasis on Christianity as a profound spiritual experience. JAC

**Laud, William** (1573-1645). Archbishop of Canterbury. Laud has always been a controversial character. Born at Reading, a graduate of St John's College, Oxford (1594), he was successively chaplain to the earl of Devonshire (1603), president of St John's (1611-21), dean of Gloucester (1616),

bishop of St Davids (1621-6), Bath and Wells (1626-8), and London (1628-33), and archbishop (1633-45). Historians have regarded his use of the Court of \*High Commission and especially his supposed attempt to enforce the English Prayer Book on Scotland (1637) as the watershed of the reign. Impeached by the \*Long Parliament (December 1640), committed to the Tower (1641), and tried (1644), Laud was beheaded on 10 January 1645. Past historians evaluated him either as a secret papist who corrupted the church or as the martyr of true Anglicanism. One recent historian described him as 'the greatest calamity ever visited upon the Church of England', and another as 'an ayatollah of rigid theological views and liturgical preferences', who intensified suspicions that Arminianism was popish so powerfully that civil war was inevitable. Modern research, however, reveals a different picture; Laud aimed not to provoke, but to heal, controversy. Not a theologian, he was unconcerned by doctrinal minutiae; far from encouraging popery his one known theological work was a stout defence of the church against catholicism. His diary (17 August 1633) records that he 'would not suffer [reconciliation] till Rome were other than it is'. The church was the community of the 'commonweal', within whose compromises Calvinism and Arminianism could coexist without schism. Thus he aimed to promote unity and uniformity of worship, as enshrined in the Elizabethan settlement (1559), requesting decency of worship and restoration of decayed churches. This required reactivation of episcopal authority, a return to the 1559 situation which seemed so novel in 1630 that it was vilified by puritans. Charles's use of the royal prerogative to impose new canons and the Prayer Book on Scotland was unwise and probably unconstitutional; Laud saw the dangers. The Scottish Prayer Book, revised without ambiguities, was not the work of Laud, but of the Scottish bishops, backed by Charles. Laud enforced Arminianism neither through the High Commission nor through influencing Oxford to create an Arminian clergy. He stoutly supported the Anglican church as the purified form of traditional catholicism. If the altar controversy bulked large to Charles, to Laud it was a matter of 'indifference'. Though tolerant himself over doctrine, his rigorous drive for liturgical uniformity was his undoing. At Oxford he is gratefully remembered for establishing chairs of Hebrew and Arabic, for university reform, and for his large MS donation to the Bodleian library. WMM

**Laudabiliter**, c.1155-60. The authenticity of this papal bull, granted by Adrian IV and recognizing Henry II as lord of Ireland, has been much debated. 'Laudably and profitably does your magnificence contemplate extending your glorious name on earth . . .' The balance of scholarly opinion finds in its favour, but there is, in any case, little doubt that the papacy supported Henry's pretensions. Alexander III, Adrian's successor, praised Henry's attempt to subjugate 'this barbarous and uncouth race which is ignorant of divine law'. JAC

**Lauder, Sir Harry** (1870-1950). Entertainer. A genial if thrifty Lowland Scot, initially a miner, Lauder progressed from amateur concerts to travelling concert parties and

## Lauderdale

small music-halls before appearing at Birkenhead (near Liverpool) as an Irish comedian. Risking Scottish songs in London (1900), he soon became one of vaudeville's greatest box-office attractions, toured successfully in America and the empire, and tirelessly entertained the troops in both world wars (earning a knighthood, 1919). 'The Laird of the Halls' interspersed songs with patter, drawing on traditional airs to produce simple attractive liets ('I love a lassie'), and could carry his audience easily from trifles to more serious ballads. Lauderdale's exploitation of 'quaint old Caledonia' which prompted a nostalgic glow in expatriates was resented by young nationalists in later years, but in the Second World War he was president of the Scottish Regional Committee of ENSA. ASH

**Lauderdale, John Maitland, 2nd earl of** [S] (1616–82). Born to a Lowland territorial base, Lauderdale subscribed to the Scottish National \*Covenant in 1638 and usually adhered to the nationalist and monarchic persuasions which underlay it. His record through the Civil War—he was prominent in negotiating the \*'Engagement' with Charles I in December 1647 and in persuading Charles II to go to Scotland in 1650—demonstrated Lauderdale's Scottish royalism; and he suffered imprisonment in England and severe material loss during the Republic. His strangely enduring hold upon Charles II ensured a dominant role in Scottish government throughout the 1660s and 1670s, earning him the fear and detestation of compatriots. But he could never bring the king round to an absolutist-structured government in Scotland through which England might be coerced. Elevated to a dukedom and the Garter in 1672, Lauderdale's second marriage to his paramour the countess of Dysart saw his insolence, avariciousness, and brutality freed from all inhibition. Yet this unattractive couple were discerning patrons of the arts, and Lauderdale's formidable learning was never contested. DDA

**Lauffeld, battle of**, 1747. After subduing the Jacobites in 1746, William, duke of \*Cumberland, was placed in charge of an allied army in the Low Countries, commanding English, Hanoverian, Dutch, and Austrian troops. On 2 July 1747 he was attacked at Lauffeld, just west of Maastricht, by a large French army under Marshal de Saxe. After heavy fighting, Cumberland was forced to retreat but a brilliant cavalry charge by Sir John Ligonier enabled him to do so in good order, and the French losses were heavier. Peace negotiations to conclude the War of the \*Austrian Succession began soon afterwards. JAC

**Laurentius** (Lawrence) (d. 619). Second archbishop of Canterbury. Named Lawrence 'the priest', he landed in Kent with \*Augustine in 597. At Augustine's request he returned to Rome (601) with 'Peter the monk' to fetch a new body of missionaries and the pallium, the archiepiscopal insignia, for Augustine. Before his death Augustine consecrated him as his successor (c.604). Presumably he was not recognized at Rome, for he never received the pallium, but he worked closely with his fellow-bishops \*Mellitus and \*Justus. Little is known of his episcopate, but he tried unsuccessfully to bring the Celtic church into conformity, the Irish bishop,

Dagan, being especially hostile. Lawrence completed and consecrated the monastery of SS Peter and Paul (613), founded by Augustine. When \*Æthelbert of Kent died (616), there was likelihood of reversion to paganism under Eadbald, but, unlike Mellitus and Justus, Laurentius stayed and converted him. WMM

**Lausanne conference**, November 1922–July 1923. The conference was held to negotiate a treaty with Turkey to replace the unratified and disputed treaty of Sèvres (1920) imposed following the First World War. Turkey renounced all claims to territories of the former Ottoman empire occupied by non-Turks but recovered eastern Thrace in Europe. Freedom of navigation in the Straits was assured and the demilitarized zones of the Dardanelles confirmed. The question of minorities was resolved by an exchange of populations. Over 1 million Christian Greeks were expelled from Turkey and 350,000 Muslim Turks returned from Greece. The Lausanne treaty was signed on 24 July 1923. RAS

**Law, Andrew Bonar** (1858–1923). Prime minister. Described on his death as the 'Unknown Prime Minister', Bonar Law was a modest and melancholy figure, who appeared content to remain as second in command to \*Lloyd George from 1916 to 1921. The first Tory leader to be bourgeois and provincial, he made no attempt to play the usual role of a party leader; he had no country house, avoided entertaining, and took no pleasure in food and drink. Even \*Asquith professed disdain for the 'gilded tradesman' who 'has the mind of a Glasgow Baillie'. Law in fact represented a half-way stage in the evolution of the modern Conservative Party. Politically, his identification with the cause of Ulster and the Union with Ireland made him a Victorian survival, but in social terms he proved to be the harbinger of the middle-class men who dominated the 20th-cent. leadership.

Law's Ulster-Scottish parentage and stern presbyterian upbringing reinforced his rather dour personality. He joined the family ironmasters' business in Glasgow and worked for the Clydesdale Bank. This meant that as an MP from 1900 onwards he possessed—unusually—a personal understanding of business. His excellent memory and aggressive style made him a useful orator at a time when tariff reform was becoming central to the party's policy.

But Law did not appear to be heading for the top until, after \*Balfour's enforced resignation in 1911, the Tory Party split evenly between Walter \*Long and Austen \*Chamberlain. Energetically promoted by Max Aitken (\*Beaverbrook), Law emerged as a compromise candidate. 'The fools have stumbled on the right man by accident,' commented Lloyd George. Certainly Law's sharp House of Commons style seemed an improvement on Balfour's ambiguities, and the party's morale rose. However, he was a weak leader because he had almost no experience of government, enjoyed few powers of patronage, and led a party subject to bitter divisions over tariffs. As a result he encouraged his own extremists to pursue their attack on \*Irish Home Rule in the belief that this was best calculated to restore party unity. In this he lent respectability to violent resistance to the government's Home Rule Bill.

While the outbreak of war in August 1914 resolved one dilemma, it created another. Law found himself under pressure both to maintain the party truce and to follow his backbenchers and the press in attacking the Liberals' conduct of the war. In May 1915 he partly resolved the problem by a private agreement with Asquith to join a coalition. Remarkably Law failed to insist on a major position for himself and accepted the Colonial Office. Before long the ubiquitous Aitken (\*Beaverbrook) had involved him in collaboration with Lloyd George, and in December 1916 they presented Asquith with proposals for the reorganization of the machinery of war. When this led to Asquith's resignation, Law had an opportunity to seize the premiership. But he felt that he would have neither a parliamentary majority nor sufficient support in the country. Instead he served under Lloyd George as chancellor and member of the war cabinet. A remarkable period of co-operation ensued. The two men shared a modest social background, but very different temperaments; the dour, industrious Law was the perfect foil for the prime minister's brilliant, mercurial personality. As leader of the House he played a vital role in keeping the coalition majority intact.

In 1918 Law judged that the Conservatives' best interests lay in keeping the coalition in being and fighting the election under Lloyd George's leadership. Eventually ill-health forced him to retire in March 1921. However, by this time many Conservatives were restless, and at a meeting in October 1922 they voted to sever relations with Lloyd George. Law played a crucial role in this simply by indicating his willingness to return as party leader. As a result he succeeded at last to the premiership and won an immediate general election. Though obliged by poor health to withdraw after a few months, he had the satisfaction of having guided his party through a dangerous period and detached it from Lloyd George before it suffered serious damage. MDP

Adams, R. J. Q., *Bonar Law* (1999).

**law, development of.** Every society develops rules of law which govern it. Legal rules are different from purely moral rules or rules of etiquette in that they carry within them the authority of the community. The distinction may be made between criminal laws, which deal with the prevention of conduct contrary to and unacceptable to the community—transgression of which will lead to retribution—and civil law, which is concerned with the solving of disputes between individuals. In some societies there may be little distinction between criminal and civil law (e.g. in Anglo-Saxon England where murder, rape, or robbery would result in a payment being made to the injured person or their kin).

The way in which law develops and the meaning of the very term 'law' have been the subject of philosophical discussion and historical analysis for many centuries and the science or subject of jurisprudence is devoted to such discussions. Customary law develops in most societies and may be written down in codes or superseded by them.

The great legal codes of the world, dating back to the laws of Hammurabi, the ruler of Babylonia in 2000 BC, have been an important source of law. Other famous lawmakers have been Draco, Lycurgas, Manu, Moses, Muhammad, and Solon

of Athens. One of the most famous and far-reaching systems of law was Roman law, one of the most admirable and important features of the Roman state, and also one precious legacy which Rome the colonizer gave to the peoples whom it conquered. Roman law, contained especially in the *Institutes* of Gaius and Justinian, modified and interpreted by the medieval scholars of Europe, has provided the basis for the laws of most European countries.

In England, however, despite the Roman conquest, little Roman influence remained after they left Britain, and during the period known as 'the Dark Ages' such law as existed in England was apparently customary. The invasions of Germanic peoples brought strong traditions of customary law to these shores. Under the Anglo-Saxon and Danish kings of England these customs were recognized, declared, and enforced in local assemblies such as the shire court. The unification of the several Anglo-Saxon kingdoms into a unitary state brought about a synthesis of many of these legal customs, often confirmed by 'Dooms' or codes of law declared by the kings, usually with the advice of the leaders of the Christian church in England. After the Danish conquest of parts of England, especially of the east and north-east, separate laws of Danish origin were recognized in these regions—known by the collective name of 'the \*Danelaw'.

In 1066 William the Conqueror promised the English people that he would preserve 'the laws of Edward the Confessor' and apart from the introduction of a new and strict system of feudal landholding he did not change the laws of the English. However the combination of this new brand of 'military feudalism', the centralization of power and government, and the development of the king's \*curia regis led to the development of royal justice and hence of the common law, which gradually, through the decisions of the courts, built up a body of laws common to all the kingdom, including Wales, after its conquest by Edward I.

English law continued to develop, primarily through the decisions of the courts, modified or altered by Parliament, which is ultimately sovereign and can change or repeal any rule of common law. Increasingly, in the 19th, 20th, and 21st cents., the law is made by Parliament in the form of Acts of Parliament or subordinate legislation. MM

**Law, Edward, 1st Baron Ellenborough** (1750–1818). Lawyer. Law was called to the bar in 1780 and practised successfully on the northern circuit. He was leading defence counsel in the impeachment of Warren \*Hastings and through his success acquired a lucrative London practice. In 1793–4 he acted as counsel for the crown in the 'treason trials' of prominent radicals. He accepted office as attorney-general under \*Addington and entered Parliament in 1801, becoming lord chief justice of Common Pleas a year later. He spoke forcefully in the Lords and in 1806 he was brought into the cabinet to strengthen Addington's numbers, but the appointment was objected to on the grounds that it violated the independence of the judiciary. He presided over several important political trials and led the opposition in the Lords to criminal law reform. The collapse of his health obliged him to resign from the bench in November 1818 and he died a month later. He was 'a remorseless cross-examiner', too

severe and intolerant to be popular, but in private an entertaining table companion. EAS

**Law, Edward, 1st earl of Ellenborough** (1790–1871). Law succeeded his father, a distinguished lord chief justice and 1st baron, in 1818. Elected to Parliament in 1813 as a Tory, he had a long and varied political career. He held the privy seal in \*Wellington's government 1828–9; was president of the Board of Control for India 1828–30, and on three later occasions for short periods; governor-general of India 1841–4; and 1st lord of the Admiralty in 1846. He was raised to the earldom in 1844 when he returned from India. His term of office as governor-general was dominated by the first \*China War, the winding-up of the ill-fated \*Afghan campaign, and the annexation of Sind. A forceful and effective speaker, Ellenborough was thought to be extravagant, theatrical, and overbearing, and his career in office ended in 1858 during \*Derby's ministry when, as president of the Board of Control, he dispatched an indiscreet letter censuring the governor-general, Lord \*Canning, and was forced to resign. JAC

**Law, John** (1671–1729). Law, a Scottish financial genius, banker, and gambler, believed that an increase in the quantity of money would stimulate production. In 1716 the French regent gave him permission to set up his own bank in France, which was suffering from Louis XIV's wars and deeply in debt. Law issued paper money, lent both to the state and to private entrepreneurs, business revived, and industry expanded. In 1719 his Mississippi Company absorbed other trading companies and gained the monopoly of all French overseas trade. Its stock was placed on the market, demand was high, speculators made fortunes. In the mean time Law had become director-general of the Banque Royale (previously his Banque Générale) and issued paper notes to match the share issues of the company. The proceeds of the sales of stock, however, went not to develop the company, but as loans to the government, which spent them. Recipients of this money bought more stocks, the government received more money, paid it out, and so on. Holders of paper money began exchanging it for coin, of which there was insufficient to redeem all paper; a decree to halve the notes' value led to loss of confidence, panic, and crash (1720). Law fled and spent the remaining years of his life in England and Italy. Galbraith called him 'perhaps the most innovative financial scoundrel of all time'. MW

**Law, William** (1686–1761). Law, one of the most influential religious writers of his age, came from a modest family at King's Cliffe, near Stamford, and was elected to a fellowship at Emmanuel College, Cambridge. But in 1714 he refused to take the oaths of loyalty to George I and was deprived of his fellowship. He then became tutor to \*Gibbon's father. His most famous work, *A Serious Call to a Devout and Holy Life* (1728), preached a quiet and meditative Christianity, restrained, humble, and charitable. \*Johnson spoke of the great effect it had upon him as a student and \*Wesley and \*Whitefield were also much influenced. In 1732 he published *The Case of Reason*, arguing faith against deistical scepticism. From 1740 he established at King's Cliffe a devout

household, including the widow of Archibald Hutcheson, MP, and Gibbon's aunt Hester. Most of their income went on schools, almshouses, and the poor, and their charity attracted so many beggars that there was bad feeling in the village. When Miss Gibbon died in 1790 at the age of 84, her nephew wrote, disrespectfully: 'aunt Hester is gone to sing Hallelujahs, a glory she did not seem very impatient to possess. I received the news of this dire event with much philosophic composure.' JAC

**lawn tennis** evolved from real (royal) tennis in the 1870s. Among the pioneers was Major Walter Wingfield who introduced Christmas guests in 1873 to Sphairistike, which contained the ingredients of tennis, though with a narrow net. The MCC tried to draw up standard rules in 1875 and championships were first staged at Wimbledon in 1877, the crowd at the final numbering 200. The scoring system, which is of crucial importance, probably derived from clock quarters. The game's remarkable popularity was partly due to the fact that it could be played by women, and mixed doubles were soon established. The Lawn Tennis Association was formed in 1888 and the sport was included in the Olympics as early as 1896. It has since been played on a variety of surfaces, including clay, sand, and asphalt. JAC

**Lawrence, D. H.** (1885–1930). Nottinghamshire miner's son destined for notoriety as the author of *Lady Chatterley's Lover* (1928). His autobiographical *Sons and Lovers* (1913) sketches the background and the Oedipal tensions from which he escaped, a scholarship boy, first to London and then the continent. With him went Frieda von Richthofen, their early struggles recorded in his poem sequence *Look! We Have Come Through!* (1917). He had found his true subject, the relationship between men and women, and he wrote 'to make English folk alter and have more sense'. The frankness of his approach led to prosecution of *The Rainbow* (1915), and the war years were a time of trial, though he was unfit for military service. Even so, *Women in Love* (1920) rivals Joyce's *Ulysses* as the greatest novel of the century. His subsequent wanderings took him as far as Australia and New Mexico in search of better health and the ideal society, but he found neither. JNRS

**Lawrence, Sir Henry** (1806–57). Soldier. Henry Lawrence was the elder brother of John \*Lawrence, later viceroy of India, and younger brother of General Sir George Lawrence. All three made their careers in India. Henry was commissioned in 1822 as a lieutenant in the Bengal artillery, took part in the expedition to Kabul in 1842 after the disastrous retreat, and fought in the \*Sikh War of 1846. He was knighted in 1848. From 1849 he administered the Punjab but resigned in 1853 after a disagreement with his brother John. He was moved to Oudh and was in \*Lucknow when the Indian mutiny broke out in May 1857. In June Lucknow fell to the mutineers and Lawrence was forced back to the residency. There he was struck by shell-fire and died after two days. His eldest son was given a baronetcy in his honour. The residency was relieved by \*Havelock in September 1857. Henry Lawrence, prematurely aged and with a hot temper, was respected as a man of honesty. JAC

**Lawrence, John Laird Mair, 1st Baron** (1811–79). Lawrence was born in Yorkshire, educated at Haileybury School, and joined the East India Company service in 1830. He achieved celebrity during and after the \*Sikh wars (1845–6 and 1848–9) which brought the company possession of the Punjab. As the first commissioner of Jullundur district, he laid the foundations of 'the Punjab school' of administration which identified closely with the interests of the peasantry and sought to preserve traditional forms of society and law. In this, he clashed fiercely both with his brother and fellow Punjab commissioner, Henry, who favoured the Indian aristocracy, and with prevailing government policies which, under Lord \*Dalhousie, strongly promoted westernization. However, he proved his point during the 1857 \*Indian mutiny when he kept the Punjab 'loyal' and was able to send troops to relieve Delhi. Subsequently, the Punjab became the principal recruiting base for the Indian army and the influence of his 'school' was established. He was viceroy of India from 1864 to 1869, and was given his barony on leaving office. DAW

**Lawrence, Sir Thomas** (1769–1830). Painter. Lawrence was born in Bristol, the son of an innkeeper, and almost completely self-taught. In 1791 he was elected ARA, made a full academician three years later, and president in 1820. A portrait of Queen Charlotte, painted in 1790, led to enormous success and his appointment as painter to the king on the death of \*Reynolds in 1792. Knighted in 1815, three years later he was commissioned by the prince regent to paint the portraits of all the principals involved in the struggle against Napoleon. This group hangs in the Waterloo chamber in Windsor castle. Lawrence made probably the finest collection of old master drawings in England, which he offered to the nation in his will. This was refused and the collection dispersed on his death. Fellow-artist Benjamin \*Haydon, less successful, said of him, 'Lawrence . . . was suited to the age, and the age to him. He flattered its vanities, pampered its weaknesses, and met its meretricious taste.' JC

**Lawrence, T. E.** (1888–1935), generally known as 'Lawrence of Arabia'. Born in north Wales of Anglo-Irish stock, educated at Oxford High School and Jesus College, Oxford, Lawrence's interest in medieval military architecture led to a travelling fellowship to excavate in the Middle East, enabling familiarization with its language and people. In 1914 his rare expertise in Arab affairs resulted in intelligence work in Egypt, where he sought to undermine Germany's ally Turkey, and met Faisal (later ruler of \*Iraq). He was not the only British officer involved in the Arab rebellion, but his guerrilla attacks, particularly on communications (bridges, railways), distracted and contained Turkish troops remarkably effectively. Demobilized as a colonel, he was appointed adviser on Arab affairs to \*Churchill in the Colonial Office (1921), and worked on his war memoir *Seven Pillars of Wisdom*. An extremely complex individual, Lawrence then enlisted as an RAF aircraftsman, changing his name to Ross, then Shaw by deed-poll (1927), and spent several years developing high-speed watercraft. Soon after discharge in 1935, he was killed near his cottage at Clouds Hill, Dorset in a motor-cycling accident. Such was the awe in which he was

held that popular rumour insisted that he had once more gone into hiding in preparation for a new war. ASH

**Laws of Ecclesiastical Polity, The** (1594, 1597, 1648, 1662). Richard \*Hooker set out to expound the Anglican philosophy of government, in both civil and spiritual matters. The essence of Anglicanism lay in the state establishment of the Church of England under the supreme authority of the monarch. Hooker's book, the most outstanding work of 16th-cent. political thought written in English—not least because of its beautiful prose—is a classic expression of conservatism, defending the Elizabethan polity as a middle way both between puritanism and papism, and between traditionalism and rationalism. TSG

**lead-mining** took place in Britain before the Roman invasion and archaeological remains of mining occur in the Mendip Hills in Somerset, Devon, Cornwall, the Pennines, and Wales. Demand for lead grew during the Roman occupation when the metal was used for various purposes including making water-pipes. Lead-mining continued after the Romans left and lead's value was recognized during the Middle Ages when it was used for many purposes such as roofing churches and castles, fixing decorative glass in windows, and in the manufacture of pewterware and paint.

Most lead-mines were located in relatively remote areas which lacked high-value agricultural land. In consequence the value of lead and the skills needed to mine the ores enabled miners to sustain their social independence from the attempts of feudal magnates to control them. Miners secured separate special jurisdictions and regulated their mining activities and social life. These legal privileges remained in being until most of them were superseded by the formation of commercial mining companies during the 16th cent. or later. These organizations became necessary to pay for the equipment needed for extracting ores at greater depths and to meet the costs of installing furnaces making use of water-powered bellows in smelting processes. Capital from outside the lead-mining areas came first during the 16th cent. when lead prices rose as the metal was used more extensively, including for making weapons. Lead-mining intensified during the late 18th cent. as a consequence of increased demand. But mining in Britain became less worthwhile once cheaper supplies of lead from overseas became available and British mining dwindled rapidly in importance after 1850. IJEK

**League of Armed Neutrality.** The league was founded in 1780 during the American War of Independence to resist Britain's blockade of the rebels. The founding members, Sweden, Denmark, and Russia, were joined by the Dutch, the Holy Roman empire, Prussia, and Portugal. At issue was the right to search neutral vessels and the league retorted by arming convoys. One consequence was war between Holland and the British. A second league was formed in 1800 during the Napoleonic War and included Denmark, Sweden, Russia, and Prussia. The British response was the attack upon the Danish fleet at Copenhagen by Lord \*Nelson, and the Russians withdrew after the assassination of Paul I. In January 1801 a maritime convention in St Petersburg

## League of Nations

attempted to resolve the problems but the right of search continued to cause difficulties for many years. JAC

**League of Nations.** The League of Nations was formally established on 10 January 1920 with a permanent headquarters at Geneva. It was very much the brainchild of President Woodrow Wilson, who insisted that it should be included in the peace treaties at the end of the First World War, and supported by the other allied statesmen, notably \*Lloyd George, with rather less enthusiasm. There was an assembly, at which all members were represented, and a council which included four permanent members (Britain, France, Italy, and Japan, joined by Germany in 1926) and a number of other members elected by the assembly. It supervised the transfer of German and Turkish colonies to the victorious allies under the \*mandate system. As a peace-keeping body, the League suffered from two handicaps which proved insuperable. First, some of the most important world powers were not members: Germany was excluded until 1926, the Bolshevik government in Russia denounced it as a capitalist club and did not join until 1934; worst of all, Wilson failed to persuade the US Senate to ratify the treaty and the most powerful nation of the world was therefore absent. Secondly, the League had no armed force of its own and member states were reluctant to provide troops: it was therefore obliged to rely upon economic sanctions, which were difficult to enforce and slow to take effect.

The League had some modest successes in its early days. Its specialized agencies did much to encourage international co-operation against slavery, drugs, and disease, and the Permanent Court of International Justice, set up by the League in 1920, resolved a number of minor disputes. In December 1925 at \*Locarno, Britain, France, Germany, Belgium, and Italy reaffirmed their commitment to peace and accepted their western boundaries, a prelude to Germany's entry into the League in 1926. In 1928 the Kellogg-Briand pact, signed by most powers, announced their aim to repudiate war and settle all disputes peacefully. No more than a declaration, at least the USA was involved. Cynics pointed out that it merely repeated matters to which League members were already fully pledged.

The League's first major test came in 1931 when the Japanese invaded Manchuria. The League retorted with an investigation followed by a condemnation of Japan's violation of the covenant, and the Japanese promptly withdrew from the League in March 1933. A second challenge came in October 1935, when Mussolini's Italy invaded Ethiopia. This time the League did attempt to enforce economic sanctions, though there were vast gaps, particularly oil, and the invasion was completed before sanctions could bite. But, in any case, the rise of Nazi Germany presented a challenge on a far larger scale. Hitler had always made clear his contempt for the League of Nations as a talking shop and a tool for the Versailles victors. He lost no time in withdrawing Germany. The re-militarization of the Rhineland, the Anschluss with Austria, the dismemberment of Czechoslovakia, and the invasion of Poland followed in quick succession, with the League helpless. The council met only once after the outbreak of the Second World War, on 8 April 1946

when it handed over its powers to the new \*United Nations. JAC

**Leake, treaty of,** 1318. The negotiation at Leake, south of Nottingham, on 9 August was yet another round in the struggle to control Edward II. The king and his leading adversary, his cousin \*Thomas of Lancaster, agreed to a council and to unite their forces against the Scots. The disastrous campaign of 1319, with its abortive attack upon Berwick, reopened the wounds and led to renewed conflict. Lancaster was executed after his defeat at \*Boroughbridge in 1322.

JAC

**Lear, Edward** (1812–88). Artist. Commencing his career as an illustrator for others, particularly of birds, he depicted the earl of Derby's private menagerie at Knowsley in 1832–7, when he entertained his patron's grandchildren with humorous verses, tales, and sketches. These subsequently developed into the engaging books of nonsense for which he is today chiefly remembered, though their word colour and quirkiness are pervaded by melancholy. Despite an affinity with children, he remained unmarried, and, owing to his poor health, spent most of his life abroad. Travelling widely in Mediterranean countries, productive yet remaining careful and accurate, Lear earned a living as a topographical landscape painter in both water-colour and oils, and published illustrated travel journals. On one visit to England, he gave lessons in drawing to Queen Victoria. He died quietly at San Remo (Italy), where he is buried. ASH

**Leeds.** The earliest mention of Leeds is in Bede's *Ecclesiastical History* as the region of Loidis in the 7th cent. The derivation of the name is unclear. It is mentioned in \*Domesday but not as a place of particular importance. But by 1207 it had been granted a charter by the lord of the manor and it developed with the cloth trade from the 14th cent. onwards, less as a manufacturing centre than as a market for the surrounding villages. A bridge across the Aire is first mentioned in 1384 but may have existed much earlier. Charles I gave Leeds a charter in 1626 and its assessment for ship money in the 1630s suggests a town of importance—£200 as against £520 for York and £140 for Hull. \*Cromwell gave the town parliamentary representation but Leeds lost it again at the Restoration and until 1832 had to be content with the influence it exerted in the elections for the county. In 1698 Celia Fiennes found Leeds 'esteemed an excellent town of its bigness in the count(ry), its manufactures in the woollen cloth, the Yorkshire cloth in which they are all employed, and are esteemed very rich and very proud'. Before \*Defoe visited the town in the 1720s, improvements to the rivers Aire and Calder had encouraged export through Hull of cloth and coal: 'large, wealthy and populous' was his comment; 'the cloth market not to be equalled in the world.' Communications were further improved by the opening of the Leeds and Liverpool canal, in stages, between 1770 and 1816. The first railway, in a complex network, was the Leeds to Selby line in 1834, followed by lines to Derby (1840), Manchester (1841), and Thirsk (1849). By 1801 Leeds was the fifth largest provincial town with a population of 53,000 and its prodigious expansion in the 19th cent. took it into fourth place by

1861, having overtaken Bristol. The Kirkgate covered market, opened in 1857, housed Marks's Penny Bazaar in the 1880s—the forerunner of Marks & Spencer's. In the 20th cent., as the cloth trade moved to \*Bradford, Leeds diversified, with engineering, chemicals, banking, and services becoming important. The construction of the M1 and M62 motorways in the 1970s, when canals and railways had faded, preserved its importance as a great commercial centre, the crossroads of the north–south and east–west highways. JAC

**Leeds, Francis Godolphin Osborne, 5th duke of** (1751–99). Leeds was known as Lord Carmarthen till 1790, but sat in the Lords as Baron Osborne from 1776. A supporter of Lord \*North, he shifted to opposition and was punished, in 1780, with dismissal from his lord-lieutenancy (Yorkshire, East Riding). Although reinstated in 1782, he was never a Rockinghamite and supported \*Shelburne after Charles \*Fox's resignation. Shortage of available talent led to his appointment as foreign secretary under William \*Pitt in December 1783. An active, but never illustrious, foreign secretary, Leeds resigned in April 1791, when Pitt refused to back his aggressive policy towards Russia. Thereafter he had little political influence, but suffered occasional delusions of grandeur, as in the summer of 1792, when convinced that he could unite Pitt and Fox by acting as a neutral 1st lord of the Treasury. An embarrassing interview with George III disabused him. This episode confirms contemporary characterizations of him as a vain man, puffed up by an immediate circle of sycophants. DW

**Leeds castle**, east of Maidstone in Kent, is one of the most spectacular of later medieval fortresses, with three islands in a lake formed by damming the river Len. The castle passed into royal possession in 1272 and Edward I strengthened it considerably in the 1280s. From then until Tudor times it formed part of the queens' dower. It has been heavily restored. Maiden's Tower is Tudor and the main building part of an extensive early 19th-cent. reconstruction. The castle is much used for conferences. JAC

**Leeward Islands.** The Leeward Islands in the Caribbean form part of the Lesser Antilles, lying to the east of the Dominican republic. They include the \*Virgin Islands, \*St Kitts and Nevis, \*Antigua and Barbuda, \*Montserrat, and Guadeloupe. The largest of the islands, Guadeloupe, is a *département* of France. JAC

**Legh, Rowland** (d. 1543). Bishop. Legh came from Northumberland and was educated at Cambridge. After he had taken holy orders he was fortunate to come under the patronage of two powerful men, \*Wolsey and Thomas \*Cromwell. He was much employed in the early visitations of monasteries and priories and in negotiations about Henry VIII's divorce. In 1534 he was made bishop of Coventry and Lichfield and a little later was appointed president of the Council in the Marches of Wales. It was a task which he approached with vigour and which preoccupied him for the rest of his life. He survived the fall of Thomas Cromwell in 1540 and died in harness at Shrewsbury. JAC

**legions, Roman.** See ROMAN LEGIONS.

**Le Goulet, peace of**, 1200. On Richard I's death in 1199 a struggle over the succession broke out between King John and his nephew \*Arthur of Brittany. Philip II 'Augustus' of France lent Arthur support and invaded Normandy and Maine, but following defections he was obliged to consider peace. John needed breathing space to establish himself securely. The two met at Le Goulet (near Vernon, southern Normandy) and sealed a treaty (22 May 1200). Philip recognized John as Richard's successor, receiving his homage, and abandoned Arthur. But John had to pay a heavy price, consenting to pay the enormous sum of 20,000 marks as relief (succession duty) to Philip as his overlord. SL

**Leicester** (Roman) was the Romano-British *civitas*-capital of Ratae Corieltavorum (formerly Coritanorum). Possibly succeeding a major late Iron Age settlement, there was a brief period of military occupation before the new town started to develop in the late 1st cent. In the reign of \*Hadrian a forum/basilica complex was constructed, and slightly later a set of public baths in the *insula* (block) to the east of the forum. Part of the wall dividing the baths from their exercise hall survives today as the Jewry Wall. In the *insula* north of the baths was a *macellum* or covered market. Leicester does not appear to have had the later 2nd-cent. earthwork defences common at other towns of its status; in the 3rd cent. stone walls were built enclosing a roughly square area of about 105 acres. Relatively little is known of the development of private buildings in the town, but in the *insula* north of the forum was a major 2nd-cent. private house with exceptional wall-paintings. There were also shops of this date in the town; 3rd- and 4th-cent. residences and commercial premises have been identified. ASEC

(post-Roman) Next a Mercian town, Leicester became one of the Danish five boroughs until captured by the English in 918. Under the Normans it was a seigneurial town, its lords the earls of Leicester based in the castle (Simon de \*Montfort was a benefactor still remembered there). Lordship then passed to the earls and dukes of Lancaster, and in 1399 to the crown: the end of the castle as a ducal residence was a blow to Leicester's prosperity. The town revived through hosiery from the 17th cent. and later through footwear; by 1901 it was the fifteenth largest English town, a city from 1919 and a diocesan see from 1926. More than most industrial cities, it has a very visible past: 'the castle, St Mary and the Newarke, St Nicholas and the Roman baths, and St Martin and the Guildhall are monuments the patriotic citizen of Leicester might proudly take any visitor to' (Pevsner). DMP

**Leicester, diocese of.** The modern see, created out of the \*Peterborough diocese in 1926, comprises Leicestershire without Rutland. The ancient bishopric's origins are obscure. \*Theodore intended to establish a Mercian see at Leicester and a bishop, Cuthwine, may have been consecrated in 679. \*Wilfrid in his third exile administered the area from 692 to 703 at \*Æthelred of Mercia's request. Certainty of the see's existence begins in 737, when it was one of six, planned by \*Offa for his projected archbishopric of \*Lichfield. But when the 9th-cent. Danish invasions made Leicester untenable, the diocese was moved to \*Dorchester (c.870), while

## Leicester

Leicester became one of the Danish five boroughs. The cathedral is the mainly 15th-cent. parish church of St Martin.

WMM

**Leicester, Robert Dudley, 1st earl of** (c.1532–88). Son of John Dudley, duke of \*Northumberland, Dudley became one of Elizabeth I's most prominent courtiers. Until his death in 1588, he was master of the queen's horse and a privy counsellor (from or just before 1563); he was created earl in 1564 in part to make him a more acceptable match for Mary, queen of Scots. Following the example of his brother Ambrose, he was appointed general of the English forces in the Netherlands in 1585.

Leicester was a controversial figure. He was involved in his father's plan to crown Lady Jane \*Grey and was sentenced to death in January 1554, but pardoned in October of that year. His reputation as Elizabeth's favourite—an aristocratic and arrogant courtier—has been endorsed by historians but contemporaries were also gripped by rumours that the suspicious death of his first wife Amy Robsart was linked with his marriage designs on Elizabeth. In the 'factional' model of Elizabethan politics he has been seen as the rival of \*Burghley. Burghley certainly produced in 1566–7 a rather damning list of Leicester's qualities (or lack of them), questioning his knowledge ('meet for a courtier') and reputation ('hated of many'). Leicester's career was probably less conspiratorial. He was certainly part of Elizabeth's new court in November 1558 and was appointed to organize the stables the day after her accession. But Burghley and he collaborated in Privy Council business and, judging from their correspondence, had a fairly easy relationship. Like many of the early Elizabethan councillors, courtiers, and diplomats, who made their names at Cambridge in the 1530s and under Edward VI, Leicester had his own Edwardian connections. As master of the horse he emulated his brother Ambrose, earl of Warwick, who had held the office in 1553. He seems also to have used his religious patronage to benefit Edwin Sandys, bishop of Worcester, and John Aylmer, later bishop of London. His parliamentary influence was considerable and he promoted men to the Commons, as a privy counsellor keen on having 'discreet and wise men' in the House.

SA

**Leicester House opposition.** Leicester House, built in the 1630s, was leased in 1718 by George, prince of Wales, and became a focus of opposition to his father's ministers. Twenty-five years later, his own son \*Frederick, prince of Wales, set up in opposition there and, after his death, the tradition was continued by his widow Princess Augusta, and his son, the future George III. Though Leicester House politics was often factious, it was free from the taint of Jacobitism and helped make the concept of opposition acceptable. George III sold Leicester House in 1764 and, after serving as a private museum, it was demolished in 1791. Thomas Pennant described it neatly as 'the pouting place of princes'.

JAC

**Leicestershire** was one of the most regularly shaped shires, with Leicester itself almost exactly in the middle, on the river Soar. The western boundary with Warwickshire

ran along the line of \*Watling Street, the north-west between Derbyshire and Nottinghamshire was the angle formed by the Soar joining the Trent, and the southern border with Northamptonshire followed the rivers Avon and Welland.

Leicester was not far from the intersection of two great Roman roads, Watling Street and the \*Fosse Way. It became an important town of some 2,000–3,000 people, *Ratae Corieltauvorum*, the tribal capital of the \*Coritani. In the course of the 6th cent. the area was occupied by Anglo-Saxon settlers and became part of the kingdom of Mercia in the 7th cent., under the episcopal jurisdiction of Lichfield. \*Breedon-on-the-hill, where there are magnificent Saxon carvings, was founded as a monastery about the year 675. For a while there were bishops of Leicester, but the see did not survive the Danish occupation, and when it was recovered was placed under the diocese of Lincoln. Leicester became one of the five boroughs when the Danes overran the region in the late 9th cent., and though it was reconquered by \*Æthelfleda on behalf of Mercia in 918, Danish influence remained substantial. The shire was divided into wapentakes rather than hundreds, and many of the place-names—Ingarsby, Scraftoft, and Barkby Thorpe—are of Scandinavian origin. The name Leicester made its appearance in the *Anglo-Saxon Chronicle* for 917 as *Ligera ceastre*: this has been variously explained, but seems to be the fort of the people of the river Legra—possibly a tributary of the Soar.

Throughout the medieval period, Leicester remained an important town, granted a charter during John's reign. The de \*Montfort family in the 13th cent. took its earldom from the shire. \*Wyclif, the morning star of the Reformation, was vicar of Lutterworth in the later 14th cent.: in 1428, many years after his death, his bones were dug up as those of a heretic and thrown into the river Swift. Parliament met at Leicester in 1414 and 1426 and it was to Leicester that Richard III summoned his troops in August 1485 before marching out to fight his last battle at Bosworth.

The north-west of the shire around Charnwood Forest was still heavily wooded, but the open country to the east of the Soar was ideal for rearing sheep. Local wool became the basis of a flourishing textile industry, and though the county was rather thinly populated, Loughborough, Melton Mowbray, Market Harborough, Hinckley, and Ashby de la Zouch developed as small market towns. \*Camden, in Elizabeth's reign, described Leicestershire as 'champaign country, rich in corn and grain', though he had no great opinion of the inhabitants of Market Harborough, complaining of their 'harsh and ungrateful manner of speech'.

The shire was hotly disputed during the Civil War. Leicester itself was held for Parliament, Ashby and Belvoir for the king, which made for harassing sorties. The royalists achieved almost their last success in May 1645 when \*Rupert stormed Leicester and sacked it, but the victory was cancelled by the shattering defeat at \*Naseby the following month. The war damaged the Hastings family, which had been predominant, and marked the rise of the Manners at Belvoir, though their county interest was always shared with the country gentlemen.

\*Defoe visited the shire in the 1720s and thought the sheep the best in England for wool, and commented that 'the whole county seems to be taken up in country business'. It was still isolated. In Market Bosworth, where Samuel \*Johnson spent a few miserable months as a schoolteacher, the inhabitants were said to set their dogs on strangers. But the character of parts of the county began to change in the later 18th cent. Attempts to overcome the liability that the main river, the Soar, was not navigable had been made since the early 17th cent. But improvements in turnpike roads, canals, and then railways fastened the shire into a national network of communications. The Soar navigation, or Loughborough canal, linked Leicester with the Trent and Mersey canal in the 1790s, and was followed by the Oakham canal (1802), the Ashby canal (1804), and the Grand Union (1814) which, with a branch to Market Harborough, linked the county to the Grand Junction near Rugby, and thence to London, Birmingham, and the north. The dramatic reduction in the cost of conveying coal led to the opening of a number of pits in the north-west. The first steam railway was the Leicester to Swannington, largely a mineral line but carrying passengers. At the opening, in May 1832, George \*Stephenson drove his *Comet*, whose chimney hit the roof of Glenfield tunnel. The first major link was the Midland Counties railway, which joined the London to Birmingham at Rugby in 1840.

The growth of industry and population in this period was extraordinary. The domestic system of textiles production gave way rapidly to a factory system. Leicester itself, some 17,000 in 1801, was 60,000 by 1861, and 211,000 by 1901: it continues to dominate the shire, with nearly half the population in 1951. Coalville was an almost overnight growth. In 1801 it was not in existence. The opening of the Whitwick colliery in 1824 led to 1,200 people by 1846, 15,000 by 1901, and 25,000 by 1951. Hinckley and Loughborough also grew rapidly. By the local government reorganization of 1972 Leicestershire took over the neighbouring county of Rutland, but it was restored in 1995. Leicestershire retained its county status, but Leicester itself was made a unitary authority. JAC

**Leighton, Frederic** (1830–96). Painter. Born in Scarborough, the son of a doctor, Leighton studied art in Frankfurt, Rome, and Paris. Talented and personable, he soon had several wealthy patrons. In 1854 Thackeray warned \*Millais: 'look to your laurels: there is a young fellow in Rome called Leighton, who will one day be President of the Royal Academy.' The following year he exhibited at the academy *Cimabue's Madonna Carried in Procession through the Streets of Florence*. It was purchased by Queen Victoria: 'Albert was enchanted with it and made me buy it.' Leighton was elected ARA in 1864 and duly made president in 1878. Among his best paintings are a portrait of Sir Richard \*Burton (1875) and *The Garden of the Hesperides* (1892). He suffered increasingly from poor health and was given a barony on his death-bed: this unique peerage lasted only one day. Sir Walter Armstrong, writing in the *DNB*, admitted Leighton's technical skill, but observed disparagingly that, as a painter, 'he had nothing particular to say'.

His house in Holland Park Road, London, built in 1865, is now a museum. JC

**Leinster**, which takes its name from a people known as the Laigin, was, in the early medieval period, dominated by two dynasties, the Uí Dúnlainge, in the plains of Kildare, and the Uí Chennselaig, whose capital was at Ferns, Co. Wexford. By the time of the Anglo-Norman invasion the latter, who had come to exercise overlordship of the Viking town of \*Dublin, were dominant, and were led by \*Dermot MacMurrough, who initiated the invasion in an effort to recover his kingship. Dermot's daughter married the leader of the invaders, Strongbow (\*Pembroke), who succeeded to Leinster after him, making it the heartland of the new Anglo-Norman colony in Ireland, with Dublin as its capital. Leinster became the most heavily Anglicized part of Ireland, but by the late 13th cent. even the Dublin hinterland was under threat from the resurgent Irish of the Wicklow mountains. In the late medieval period it was dominated by the Anglo-Irish earls of Ormond and Kildare, the latter being masters of the English \*Pale. The 16th cent. saw renewed English plantation, notably of Laois and Offaly in the 1550s, though a more widespread transference in landownership to English protestants only followed from \*Cromwell's response to the \*1641 rebellion. The province, particularly Co. Wexford, was the focus of the failed \*1798 rebellion which led to the Act of \*Union. SD

**leisure** may be defined as the amusements, entertainments, and creative pursuits enjoyed by people in their non-working hours. Our modern understanding of leisure is different from the classical ideal of the worthwhile pursuit of the arts by a leisured class freed from the necessity of work. Contrary to its innocuous image, leisure is in fact one of the most controversial and contested areas of British social and cultural history, with a tradition of class-related disputes over how leisure time should be spent and how far it should be controlled.

An underlying ruling-class fear has often been that the boisterous leisure activities of the people might spill over into political riot; witness the frequent banning of early town ball games and similar sports. At the same time, a policy of 'bread and circuses' was a familiar and much-used weapon in the ruling-class armoury for winning the consent of an unruly populace. Organizations sponsored by paternalistic employers, such as \*brass bands in north of England towns and workplaces, can be seen as part of this hegemonic strategy; while works outings, holidays, and sports events were often more than just the disinterested acts of generous employers. In reply, the working class would either accept the opportunities on offer—sometimes renegotiated to gain some level of control—or carve out their own areas of leisure, free from ruling-class respectability, such as dog-fighting and badger-baiting.

There is, however, little evidence of a nation-wide 'social control conspiracy' within the ruling class to use leisure as a pressure valve to defuse class tensions. Indeed there were more often conflicts within the ruling class over how to approach the issue. Some held to the classical ideal that leisure should be used for self-improvement,

## Leland

allowing the working class to educate themselves into their role in society. From this ideology came the Victorian 'rational recreation' movement, encouraging public libraries, \*museums, \*mechanics' institutes, and 'pleasant Sunday afternoons'.

An alternative element in the ruling class was the entrepreneurs, who saw leisure as a commodity, and the working class as a new mass of consumers to be exploited. Thus much leisure activity in late Victorian times moved from participation to spectator status, with the boom in \*music-halls, variety theatres, \*pubs, holiday resorts, spectator sports, and the \*mass media of press, magazines, and eventually \*cinema.

These splits in the ruling class were echoed within the working class. Some adopted the aim of respectability, advocating self-improving leisure, sabbatarianism, teetotalism, and the like—a puritanical streak which became a pillar of the trade union and labour movement. The vast majority of the working class preferred a hedonistic approach, using the increasing leisure time of the 20th cent. (with the spread of paid holidays from work) for the simple, commodified, 'packaged' enjoyments of sport, gambling, holidays, music, dancing, hobbies, and mass media. By the end of the 20th cent. the leisure 'industry' had become one of Britain's economic mainstays. DJA

**Leland, John** (c.1506–52). Leland, a distinguished antiquarian, was born in London, and educated at St Paul's and at Christ's College, Cambridge. He took holy orders, served the duke of Norfolk, and was appointed royal librarian by Henry VIII, composing elegant and complimentary Latin verses. In 1533 he was made king's antiquary and spent much of the next ten years on a remarkable tour of cathedrals and churches. He was particularly concerned at the dispersal of many archives and books by the \*dissolution of the monasteries. He was given considerable encouragement and preferment, but became insane before his collections could appear in print. His notes were scattered but were used by John \*Stow in his work on London and by William \*Camden in his *Britannia* (1586). The *Itinerary* was not published until 1710, when Thomas Hearne produced an edition at Oxford. An ardent patriot, Leland was hostile to papal pretensions and his zeal led him to insist that King \*Arthur was far from a legendary figure. The *Itinerary* is in note form and a mine of information rather than a polished work, but Leland made a significant contribution to Tudor scholarship. JAC

**Lely, Peter** (1618–80). Portrait painter. Born Pieter van der Faes, 'Lely' was a nickname borrowed from his family home at The Hague. He seems to have come to England in the early 1640s as an aspiring landscape artist. His natural enterprise procured him patronage from the Commonwealth government, and by the time of Charles II's restoration Lely enjoyed high repute as a portraitist. Within two years he had become naturalized and in receipt of a royal pension. A wonderfully fluent technician, who moved in virtuosi circles, Lely recorded the worlds of politics and fashion alike, and sometimes revealed undoubted powers of character penetration. Above all he revelled in a sensuous

treatment of the human form and of costume, and his popularity obliged him to employ numerous studio assistants to the detriment of his overall output. Lely was knighted in January 1680. DDA

**Lennox, Esmé Stewart, 1st duke of** [S] (1542–83). Lennox was a comet who blazed across the Scottish sky and was gone. His father was a brother of Matthew Stewart, earl of \*Lennox and regent 1570–1. He held the seigniorship of Aubigny in France, to which his son succeeded in 1567. In 1579 Lennox arrived in Scotland, an exotic visitor from the court of France, and captivated the 13-year-old James VI with his worldliness and sophistication. He was created earl of Lennox, his uncle resigning the title for him, and in 1581 was promoted to duke. Meanwhile he had announced his conversion to protestantism and brought down the regent, \*Morton. It has been presumed that his ulterior motive was the restoration of Mary, queen of Scots, but others have seen him as purely self-seeking. In 1582 James was seized by \*Gowrie and other lords in the \*Ruthven raid and forced to order Lennox to leave the kingdom. He died shortly afterwards. His young son was brought up in Scotland, given an English peerage as earl of Richmond in 1613, and raised to the dukedom in 1623. JAC

**Lennox, Margaret Stewart, countess of** (1515–78). The daughter of Lady \*Margaret Tudor by her second husband Archibald, earl of \*Angus, Lady Margaret was niece to Henry VIII. If Elizabeth was bastardized, the countess was near the throne. In 1544, at St James's, Westminster, she married Matthew, earl of \*Lennox, a great-grandson of James II of Scotland. During Mary's reign, as a catholic, the countess was in high favour and given precedence over Elizabeth, who subsequently bore her 'little love and affection': she was chief mourner at Mary's funeral. By 1562 Elizabeth was concerned at her plan to marry her son, Lord \*Darnley, to Mary, queen of Scots, and when it was accomplished in 1565, the countess was sent to the Tower. She managed to effect a partial reconciliation but was in trouble again in 1574 when her second son Charles married a daughter of Bess of Hardwick: the queen's suspicions were aroused by the fact that Bess's husband, the earl of \*Shrewsbury, was custodian of Mary, queen of Scots. Lady Lennox played for high stakes. According to \*Cecil's reports, prophecies at the death of her first infant son declared that a future son would unite the thrones of England and Scotland. In the shape of her grandson James VI and I, Lady Lennox gained a posthumous victory. JAC

**Lennox, Matthew Stewart, 13th earl of** [S] (1516–71). Lennox succeeded to the earldom at the age of 10 when his father was murdered: his great-grandmother was a daughter of James II of Scotland and his grandfather had been killed at Flodden. Lennox spent some years in France and was hostile to the English interest until Henry VIII gave him his niece Lady Margaret Douglas in marriage in 1544. The double royal connection made him a person of some consequence and he was handsome and personable, but largely under the influence of his wife. After the marriage he was forfeited in Scotland and spent much of his life in

England. During Mary's reign, he and his wife, both catholics, were in high favour, but Elizabeth regarded them with suspicion. He was confined to the Tower in 1562 and was again in disgrace after 1565 when his son Lord \*Darnley married Mary, queen of Scots. Elizabeth allowed him to return to Scotland but he lost influence after his son was murdered in 1567. In 1570 Elizabeth had him elected regent for his grandson, but took the precaution of keeping the countess in England. Civil war in Scotland ensued and in 1571 he was stabbed in Edinburgh by a partisan of Mary.

JAC

**Leno, Dan** (1860–1904). Entertainer. Born George Galvin, and son of an Irish music-hall performer living in London, Leno made his first appearance at 4 as an 'Infant Wonder', singing, dancing, and tumbling. He developed his own act, though his clog-dancing was better received in the north than in London. Small and chirpy, with a streak of wistfulness, Leno's fame arrived in 1886–7 as the mother in *Jack and the Beanstalk*. Henceforth his forte was pantomime and he appeared at Drury Lane for fifteen successive seasons. The mainstay of his career was rambling character sketches. In 1901 he was asked to entertain Edward VII at Sandringham and was thereafter billed as 'The King's Jester'. The strain of continuous performing took a heavy toll and he died of a brain haemorrhage at the age of 44.

JAC

**Leofric, earl of Mercia** (d. 1057). Leofric rose to power in the reign of \*Cnut, as one of three great earls involved in governing England. Loyal and temperate, with \*Siward, earl of Northumbria, he appears to counterbalance the powerful and ambitious Earl \*Godwine of Wessex. In the division over the succession after Cnut's death in 1035, Leofric's proposal of the first son \*Harold's regency on behalf of the absent heir \*Harthacnut, in Denmark, was a compromise accepted by the \*witan, despite Godwine's opposition. In 1051, when Godwine defied Edward the Confessor and raised an army against him, Leofric and Siward supported the king with matching strength, civil war was avoided, and the dispute referred to the witan. Credited with wisdom in secular and religious matters, a number of foundations were enriched by his gifts, not least the monastery and church he built with his famous wife Godgiftu (\*Godiva). AM

**Leslie, Alexander** (c.1580–1661). Leslie was a good professional soldier, who served for many years with great distinction in the Swedish army and fought alongside Gustav Adolf at Lützen in 1632. When the Scottish presbyterians began armed resistance in 1639, Leslie was placed in command of the covenanting army. In 1640 he brushed aside royalist resistance at \*Newburn and occupied Newcastle. During the armed truce before the outbreak of the Civil War, he was created earl of Leven [S] in 1641. He remained at the head of the Scottish forces in alliance with the English Parliament and fought at \*Marston Moor. When Charles II, after the execution of his father, reached an understanding with the Scottish presbyterians, Leslie once more commanded their forces, but was badly beaten by \*Cromwell at \*Dunbar in 1650. Captured in 1651, he spent some time in the Tower of

London. Leslie was a competent experienced man with unusual gifts of conciliation and tact. JAC

**Leslie, David** (c.1600–82). Like his namesake Alexander \*Leslie, David Leslie also fought alongside Gustav Adolf of Sweden. He returned to Scotland in 1640 to help the covenanters and commanded the Scottish cavalry at \*Marston Moor in 1644. He was then recalled to Scotland to deal with \*Montrose, whom he defeated at \*Philphaugh in September 1645. When Charles II accepted the covenant in 1650, David Leslie had effective control, under Alexander Leslie, of the Scottish forces resisting \*Cromwell, but they were heavily defeated at \*Dunbar. Outmanoeuvred in the subsequent campaign, he commanded the royalist advance into England, was beaten at \*Worcester, and subsequently captured. He remained a prisoner until the Restoration, when he was created Lord Newark [S]. As a commander he was careful and patient rather than inspired. JAC

**Lesotho, kingdom of.** Former British crown colony of Basutoland. Threatened by the Boers of the \*Orange Free State, Mshweshwe, the ruler of the Basuto, sought British protection in 1843 and in 1869 agreed to the annexation of his country. Britain handed the administration of Basutoland to Cape Colony in 1871, but so badly did the colony's government fulfil its obligations that the Basuto rebelled. At the request of Cape Colony, and with the agreement of the Basuto, Britain reluctantly declared the territory to be a crown colony in 1885. Basutoland was administered by its traditional rulers under British supervision until it became independent in 1965. KI

**Levant Company.** The company, granted a charter by Elizabeth in 1581, had the sole right to trade with the Ottoman empire. A new charter in 1592 increased the number of traders and added Venice to its sphere. It was commonly known as the Turkey Company. The main imports were spices, perfumes, and currants: it exported mainly cloth. Entry into the company was made easier by an Act of 1754 and its charter was finally surrendered in 1825. JAC

**Levellers.** A popular democratic movement which emerged fully in 1647, though its leading pamphleteers, John \*Lilburne, Richard Overton, and William Walwyn, had campaigned earlier for specific rights and reforms. The Levellers' basic principle was that all men and women are born equal, and are rightfully subject to no authority except by agreement and consent. Their so-called 'Large Petition' of March 1647 confronted Parliament with a wide range of grievances, but was burned by the common hangman in May. By then the \*New Model Army was defying Parliament's threat to disband it, so the Levellers set about indoctrinating its newly elected agitators. They made some converts, notably Edward Sexby, but most soldiers remained loyal to their commanders. They therefore persuaded six cavalry regiments to adopt new agents or agitators, and through them brought a revolutionary \*'Agreement of the People' before the army's general council in the famous \*Putney debates. Implying the abolition of monarchy and the House of Lords, the agreement proposed that biennial, popularly elected parliaments should wield

supreme authority, subject only to certain 'native rights' such as liberty of conscience and equality before the law, which the sovereign people reserved to themselves. Unwisely, they accompanied their agitation among the soldiery with incitements to mutiny. They suspended their opposition during the second civil war, but when the \*Commonwealth was established their leaders (Walwyn excepted) denounced it virulently in *Englands New Chains Discovered* and other tracts. They also raised a new and more serious mutiny in the army. After its suppression they lost coherence as an organized movement, and some of them later intrigued with the royalists against Cromwell's \*Protectorate.

The Levellers' claim to be true democrats has been challenged, because they later qualified their demands for manhood suffrage by excluding those who subsisted by alms or worked as servants in a master's household; but this modification was tactical rather than principled. It was their principle, however, to preserve property, and not 'level men's estates'; here they differed from the self-styled True Levellers, or \*Diggers. AHW

**Lever, William Hesketh, 1st Viscount Leverhulme of the Western Isles** (1851–1925). Lever was born in Bolton (Lancs.). A congregationalist, he believed in self-help and free trade. He began work as a grocer. He later established a soap factory and expanded by purchasing firms in the same trade. His marketing strategies included the use of brand names, such as Sunlight, which was packaged and promoted by skilful advertising. In 1890 he founded Port Sunlight, situated on the Cheshire side of the Mersey, to provide well-designed works, housing, and facilities for his employees. His company acquired plantations for supplying raw materials in west Africa, the Belgian Congo, and the Solomon Islands. Efforts to form a soap monopoly were thwarted. In the 20th cent. the firm diversified to produce margarine, broadening its range by taking over Wall's, producers of ice cream and other foods, and establishing Macfisheries to sell the catch of the Western Isles of Scotland. In 1929, after his death, the company merged with the Dutch firm Jurgens to form Unilever. IJEK

**Leviathan** (1651) was the masterpiece on political philosophy written by Thomas \*Hobbes to justify absolute sovereignty. Hobbes held that the greatest threat to human security was the anarchy of the 'State of Nature', and that to avoid that horrific condition, where life was 'solitary, poor, nasty, brutish, and short', men must contract to establish a sovereign power with sufficient authority to enforce laws and maintain order. Hobbes claimed that the recent civil wars in England would never have occurred if men had followed the path of reason and worked out the necessary truths of political obligation. TSG

**Lewes, battle of, 1264.** In the early hours of 14 May 1264, before sunrise, the army of Simon de \*Montfort advanced on Lewes (Sussex), where Henry III's forces lay. Battle was joined between the town walls and some point on the slope, leading up to the ridge of the south downs, beginning half a mile west of the castle. Although outnumbered, Montfort

won a complete victory, able through his surprise advance to attack his enemies at a place and time of his choosing. The cause of the provisions of \*Oxford was saved and Montfort's protectorate, which lasted until his death at Evesham (1265), established. SL

**Lewes, mise of.** The mise of Lewes was drawn up between Henry III and Simon de \*Montfort following the battle of \*Lewes (14 May 1264). No text survives, but it plainly dealt with the surrender of hostages against Henry's good behaviour, the release of prisoners taken by both sides and the establishment of arbitrators. SL

**Lewis, C. S.** (1898–1963). Lewis was a fellow of Magdalen College, Oxford, from 1925 to 1954, and then took the chair of medieval and Renaissance English at Cambridge until a few months before his death. He was attached to Magdalene College, but his spiritual and literal home remained Oxford and he went there most weekends. Lewis was born in Belfast, the son of a solicitor, was wounded in the First World War, attended University College, Oxford, as a classicist, but made his career in English literature. His most significant scholarly book was *English Literature in the Sixteenth Century* (1954). His influence with the wider public came from broadcasts during the war, from his Christian apologetics *The Problem of Pain* (1940) and *The Screwtape Letters* (1942), and from his heavily allegorical and highly successful Narnia books for children, beginning with *The Lion, the Witch and the Wardrobe* (1950). JAC

**Lexington, battle of, 1775.** The first serious encounter in the American conflict occurred when General Gage, surveying the drift towards war, dispatched on 18 April a force of 700 men from Boston to Concord, some 20 miles, to recover arms and ammunition. To effect surprise, the troops set off on a night march. Just over half-way, at Lexington, they clashed with a small force of rebel militia. By the time they reached Concord to conduct a search, the Americans were in arms and heavier fighting took place. On the retreat back to Lexington, the British forces were harassed by snipers, but were met in the town by a sizeable relief party under Lord Algernon Percy. They had suffered well over 200 casualties and tasted a new kind of warfare. JAC

**Lhuyd, Edward** (1660–1709). Scholar. After attending Oswestry Grammar School and Jesus College, Oxford, Lhuyd became under-keeper, and in 1690 keeper, of the newly opened Ashmolean Museum at Oxford. At first his interest was mainly in fossils. But in 1695 he helped Edmund \*Gibson with the revised edition of Camden's *Britannia*, contributing 'the whole business of Wales'. A student of Celtic civilization, he learned Cornish and visited Brittany, and in 1707 published by subscription the first volume of a study of the Celtic language. No second volume was called for. His notes on Celtic antiquity were dispersed at his death, though the Irish portions found their way to Trinity College, Dublin. JAC

**Libel Act, 1792.** Prior to 1792 the jury in a libel case only had power to determine the facts of publication and was not permitted to decide whether the matter in question was

libellous—that decision being reserved to the judge. In May 1791 Charles \*Fox argued that civil liberty and freedom of debate would be safeguarded by extending the jury's competence to the whole question of libel, whilst reserving to the judge a discretionary right to direct the jury in points of law. The measure was not opposed by the prime minister, William \*Pitt, and duly became law the following year.

DW

**Liberal Democrats.** British political party founded in 1988 from the merging of the \*Social Democratic Party (SDP) and \*Liberal Party, following the disappointing performance of the two parties' alliance at the 1987 general election. The tortuous and mismanaged negotiations, the failure to agree on a party name, and the existence of a rump 'continuing SDP' led by David \*Owen ensured that the early years of the party were dogged by low opinion poll ratings and bad local, European, and by-election results. The 6.4 per cent vote achieved at the 1989 European election was worse than any Liberal showing since 1959.

The increasing popularity of party leader Paddy \*Ashdown (especially following television performances during the \*Gulf War) enabled the Liberal Democrats to recoup much of the support that had been lost. At the general election of 1997 the party fought on a promise to raise income tax by a penny to be spent on education, and did well, returning 46 MPs. They obtained an element of proportional representation in the system for the Scottish Parliament and the Welsh Assembly, where they joined Labour in a governing pact. In 2001, led by Charles \*Kennedy, they increased their Westminster numbers to 52.

CNL

**Liberal Imperialists** were a faction of the Liberal Party around 1900, who disagreed with their leaders' lukewarm line over the \*Boer War. Their leaders were \*Rosebery, \*Grey, and \*Haldane. At one time they threatened to secede formally, but did not, partly because of Rosebery's dithering. That was probably fortunate, because once the war was ended they found they had more in common with other Liberals than they thought. All wanted the empire run more benevolently than under the Conservatives. It also meant that they were able to benefit from the Liberals' election landslide victory of 1906, and play their full part in the government that followed. Opponents sometimes shortened their title to 'Limps'.

BJP

**Liberal League.** A political organization within the Liberal Party, founded in February 1902 with Lord \*Rosebery as president and including H. H. \*Asquith and Sir Edward \*Grey among its vice-presidents. Membership included Liberal Imperialist MPs, a number of Fabians, Liberal landowners, imperialistically minded journalists, and nonconformist ministers. Its aims were vague but 'moderate'. It succeeded in retaining within the Liberal Party some who considered leaving it over the party's cautious attitude to the Boer War. The league supported the 'national efficiency' campaign and a 'step-by-step' progression towards Irish Home Rule. It was well represented in the Liberal government of 1905 (though not by its president). Rosebery tried with little success to use the league to oppose that

government's policies, including the 1909 budget, and it was dissolved in acrimony in May 1910.

HCGM

**Liberal Party.** Before 1868 the Liberal Party had been an uneasy coalition of Whigs and radicals. The Whigs, led by some of the richest aristocratic magnates in the land, dominated Liberal cabinets and imposed a veto on radical legislation. The broadening of the suffrage in the boroughs in the \*Reform Act of 1867 strengthened the radicals and the \*Gladstone government of 1868–74 ranks as one of the great reforming administrations of modern times. Whig disquiet grew, especially during the second Gladstone government of 1880–5. There was a slow drift of Whigs to the Conservatives but Gladstone's \*Home Rule Bill of 1886 was the catalyst for the realignment of parties which had long been prophesied. The bill saw a mass defection of Whigs, or moderate Liberals, to the Conservatives. Ninety-three Liberal MPs voted against its second reading in June 1886. Many of these rebels were Whigs for whom Home Rule afforded not only an incentive to leave the Liberal Party, but an excuse. The rebels, however, also included a contingent of radicals, led by Joseph \*Chamberlain, until then the most prominent and articulate of the radical leaders. Despite the loss of Chamberlain and his closest colleagues, the effect of the schism was to radicalize the Liberal Party.

More important than the Whig secession was the change in the character of radicalism. Until 1868 radicalism was an individualist creed. The mid-century Liberal slogan—'Peace, Retrenchment and Reform'—summed up radical aspirations. Most radicals opposed armaments, belligerence in foreign affairs, and imperial expansion: the reforms they did espouse were political not social—the extension of the franchise, curtailment of the powers of the House of Lords, the equalization of constituency electorates, not factory legislation or the development of social services. The mid-century radicals were conspicuous champions of \**laissez-faire*. The radical programme was negative in character. It called for the disestablishment of the Church of England and for the redress of other nonconformist grievances. It sought to limit the power of government and demanded that government should not intervene in economic and social affairs. As late as 1888, Labouchère and \*Bradlaugh, two of the most advanced radicals, voted against a measure to provide one half-day holiday for shop assistants. Such legislation, they averred, 'would strike a blow at the self-reliance of the individual'.

After 1868 there was a gradual but major change in the nature of radicalism. Increasingly it was defined in collectivist terms. Radicals, perhaps seeking support from the now partly enfranchised working class, began to address the problems of industrial society. Thus, Joseph Chamberlain, while pressing the cause of disestablishment, as mayor of Birmingham embarked on a major programme of social reform in that city. Nationally, he declared for free and compulsory education and even, at one stage, urged redistributive taxation.

The exodus of the Whigs from the party has tended to obscure the significance of the transformation that was

## Liberal Party

taking place. By the 1890s it was largely complete. Radicalism was now collectivist radicalism. It stopped a long way short of socialism but, even if it had no blueprint for a new society, was prepared to use the power of the state in a positive way to help the poorest sections of the nation.

The loss of the stabilizing power of the Whigs, however, meant that the way was open for every minor section of the party—the 'faddists' and 'crotcheteers' as they were called—to invoke their own demands. All parties are institutionalized log-rolls, but the Liberal Party after 1886 set a new standard for factionalism. The Welsh insisted on the disestablishment of the Church of England in Wales; the \*temperance lobby on the strictest control of the liquor trade; the coal-miners wanted the eight-hour day; rural Liberals agitated for parish councils and smallholdings.

In the 1890s a new cleavage developed. Individual radicals had been Little Englanders, hostile to the growth of empire and fervent for a pacific foreign policy. The Unionist Party, as the conservatives were now called, became the party of imperialism, of strong defence, and of *realpolitik* abroad. Many Liberals still clung to the anti-imperial prejudices of the past. But after Gladstone gave up the leadership, some of the most prominent Liberals, such as \*Rosebery, his successor as prime minister, demanded a reorientation of party attitudes. The Liberal Party must show that it could be trusted with the administration of a great empire. \*Liberal Imperialism ranged itself against Little Englandism. \*Asquith, \*Grey, and \*Haldane, all to hold high office in Liberal governments after 1906, were among the leaders of the new organization, the \*Liberal League. The onset of the \*Boer War dramatized and made more acute the division of the party. Liberal critics of the war were called pro-Boers, and for a time the party seemed irrevocably split. \*Campbell-Bannerman, chosen in 1899 because there was no one else, strove to hold Liberals together.

In the end, the mistakes of the Unionists restored the unity of the Liberal Party. The \*Education Act of 1902 upset the religious balance achieved by the Liberal Education Act of 1870. Nonconformists were outraged and many of those who had deserted the party in 1886 came back. More important, in 1903, Chamberlain, now one of the leading figures in the Unionist government, repudiated free trade, an article of faith to both parties for over 50 years. A minority of Unionists still believed in free trade: \*Balfour, the prime minister, tried to trim by adhering to a qualified \*protectionism, but the bulk of the party followed Chamberlain and the tariff reformers, as the protectionists were called. The Education Act and tariff reform healed the rift in the Liberal Party which, in 1906, won a landslide victory.

Liberal hegemony lasted until 1915. During those nine years the party largely completed the unfinished agenda of Victorian radicalism, restricting the powers of the Lords, introducing \*Irish Home Rule, and disestablishing the Church of England in Wales. At the same time it looked forward, with the introduction of old-age pensions in 1908, the Trade Boards Act of 1909, and the National Insurance Act of 1911, to the collectivist agenda of the 20th cent.

There were two general elections in 1910, both bound up with the problem of the House of Lords. The Liberals, now

led by Asquith, lost their overall majority and their continuance in office depended on the recently founded \*Labour Party and on the Irish nationalists. The next few years were a period of bitter political conflict over Irish Home Rule and a dangerous division between the two main parties was averted only by the outbreak of the First World War in 1914. A coalition government under Asquith was formed in 1915; dissatisfaction with Asquith's leadership led to the formation of a new coalition with Asquith's rival, \*Lloyd George, as premier. Asquith, still party leader, went into opposition, with the Conservatives and a section of the Liberals following Lloyd George. This alignment was a paradox: Lloyd George had been one of the leaders of the radical wing of the party before the war, while Asquith had been a prominent Liberal Imperialist. At the general election at the end of the war in 1918, Lloyd George and his Liberals allied with the Conservatives against Asquith's independent Liberals and Labour. The election saw a huge increase in the suffrage, with the right to vote given to women over 30 and many more male voters on the register. Many of these new voters may have had no firm party allegiance. The result was a triumph for Lloyd George and a disaster for the Liberals. Even the two wings added together could muster only 170 MPs.

The early post-war years provided the most encouraging backdrop that Labour could have had. Heavy unemployment contributed to the unpopularity of the governing coalition which Labour, with more MPs than the Asquithians, could exploit. In 1922 the Conservatives broke with Lloyd George: a purely Conservative government was formed and called an early general election. The Liberals fought as rival sections, sometimes standing against each other. Their combined total fell to 115 while Labour more than doubled its representation to 142. This was a decisive victory, for Labour now became the official opposition in Parliament and henceforth the alternative to the Conservatives. Two years and two elections later, the reshaping of the party system was confirmed. In 1924 the Liberals, though reunited, were reduced to 40 MPs.

The Liberal Party split again in 1930 over the question of supporting the minority Labour government, a split made permanent in 1932 when more than half the party's MPs decided to support the \*National Government, under the title of National Liberal. The independent Liberals soldiered on but elected only nineteen MPs at the general election of 1935; after the Second World War the decline continued, in a seemingly inexorable way, until the party was reduced to five MPs in 1957.

There then began the first of the post-war Liberal revivals. Those of 1958 and 1962 soon petered out; but another revival in the early 1970s was followed by a remarkable Liberal performance in the two elections of 1974, when in October, for example, the party polled one-fifth of the votes and elected 13 members. The schism in the Labour Party in 1981 led to the formation of the Liberal-SDP alliance: in 1983 it won 25 per cent of the votes (2 per cent behind Labour) and elected 23 MPs, the best showing for the Liberals since 1929. Strains within the alliance led to a merger of the two parties in 1987 under the name \*Liberal Democrats. In policy the party's

collectivist borrowings are more evident than its individualist roots: it shares, however, the commitment of 19th-cent. Liberals to constitutional reform and the devolution of power. It, and its predecessor the Liberal Party, has been the most consistently pro-European of all three parties.

The Liberal party continued to do well in the 1990s. It maintained a strong showing in local government and, after \*devolution, it shared government in Scotland and Wales with Labour. At the 1997 general election, 46 Westminster seats went to the Liberals and in 2001, under the new leadership of Charles \*Kennedy, it increased its total to 52. This was a remarkable achievement for a party still handicapped by the 'first past the post' electoral system, and suggests that hopes of, at least, holding the balance of power may not be excessive. But the party remains very dependent on the 'Celtic fringe', with more than half of its seats held in Scotland (10), Wales (2), and the West Country (18). HB

Cook, C., *A Short History of the Liberal Party, 1900–1988* (3rd edn. Basingstoke, 1989); Douglas, R., *The History of the Liberal Party, 1895–1970* (1971); Searle, G. R., *The Liberal Party: Triumph and Disintegration, 1886–1929* (1992); Vincent, J. R., *The Formation of the British Liberal Party, 1857–68* (Harmondsworth, 1972).

**Liberal Unionists** The Liberal government's proposal for Irish Home Rule and land reform in 1886 caused substantial opposition within the party and the fall of the government in June 1886. The opponents of Gladstone's Irish settlement, known to themselves as Liberal Unionists, and to other Liberals as Dissident Liberals, believed Home Rule would lead to separation. They were of three chief sorts: (a) Lord Hartington and other Whigs who were important numerically and because of the loss of their money and their numbers in the House of Lords; (b) many Liberals in Lowland Scotland and Ulster (those in Ulster forming their own organization) who had become Unionists; (c) Joseph \*Chamberlain and his group of Birmingham MPs. After the 1886 election, when about 55 Liberal Unionists were elected, and the failure of talks in 1887, several returned to the Liberal Party.

In the 1890s the Liberal Unionists became more closely linked with the Unionists, Chamberlain and \*Devonshire (as Hartington had become) entering \*Salisbury's government in 1895. They split over tariff reform in the 1900s, some following Chamberlain into protection, others forming, with some Tories, the Unionist Free Food League. The Chamberlain family maintained control of the Liberal Unionist Council. The Liberal Unionists fused with the Conservative Party in 1912 and their members were admitted to the \*Carlton Club. HCGM

**Lib-Labs** were working-class MPs who, whilst prepared to speak out on 'labour' issues, accepted the Liberal whip. In 1874, Thomas Burt (Morpeth) and Alexander Macdonald (Stafford) became the first two such MPs. In constituencies where union members (chiefly miners) predominated, Liberal associations were often coaxed into nominating them, although William Abraham ('Mabon') at Rhondda in 1885 had first to defeat a Liberal employer. That election produced 11 Lib-Labs, but their numbers stagnated thereafter, except at the 1906 'Liberal landslide' when 24 were elected.

The appointment of Henry Broadhurst to the 1886 government reflected Gladstone's appreciation of the Lib-Labs' loyalty; however the leadership during the 1890s was frustrated by the reluctance of impoverished local associations to adopt Lib-Lab candidates. The decision of the miners to join the \*Labour Party in 1908 dealt a fatal blow to the Lib-Lab creed, notwithstanding the handful of Liberal working-class MPs who persisted until 1918. SC

**libraries.** Before printing, collections of MS volumes were held in some monasteries and cathedrals, notably at Canterbury, Wearmouth, and Jarrow: the Benedictine rule prescribed reading as one of the duties of a monk. They were largely commentaries on the church fathers and philosophical and legal works and in the later Middle Ages were usually kept in the cloister. Though occasionally loaned to scholars, they could not be generally available. With the foundation of Oxford and Cambridge colleges from the 13th cent. onwards, more collections were started. Thomas Cobham, bishop of Worcester, built a small library at Oxford c.1320; Archbishop \*Chichele gave 49 books to his new college of All Souls in 1438, and Duke Humphrey of \*Gloucester, a great patron of learning, made handsome bequests to the university in the same period. The libraries were small and the books often kept in chests or chained to avoid the need for a librarian: chained libraries are extant at Merton College, Oxford, and in Hereford cathedral. In addition, a few noblemen or ecclesiastics had their own collections—\*Richard de Bury, bishop of Durham (d. 1345), and John \*Tiptoft, earl of Worcester (d. 1470).

The invention of printing in the 15th cent. allowed the development of modern libraries. A great many MS volumes and books were dispersed at the dissolution of the monasteries (c.1540) and, though Archbishop \*Parker, Sir Robert Cotton, and Sir Thomas \*Bodley recovered some, many perished. The Duke Humphrey library at Oxford was devoid of books and given over to other uses. But the number of scholarly libraries was increasing. Cambridge University library began in a modest fashion, the books kept in chests, but in the 1470s Archbishop \*Rotherham endowed a new library building in Old Schools. Edinburgh began collecting a library in the 1580s before the university was established. The Bodleian at Oxford, incorporating the Duke Humphrey, dates from about 1610, and the library of Trinity College, Dublin, is from the same period. The libraries of the Inns of Court date from the mid-16th cent. to the 17th cent. Over the next 200 years, some of the college libraries were rebuilt on a magnificent scale. \*Wren's library at Trinity College, Cambridge, by the banks of the Cam, was built between 1676 and 1695; Queen's at Oxford between 1692 and 1695. \*Hawksmoor's great Codrington library at All Souls was started in 1715 but not completed until 1751; the Radcliffe library by James \*Gibbs opened in 1749; Christ Church's library took even longer to finish than the Codrington, being begun in 1717 and completed in 1772. The first move towards a national library was the foundation of the \*British Museum in 1753, housing the Harleian, Cotton, and Sloane collections and augmented by gifts from George II and George III: Smirke's great classical building

## Licensing Act

was opened in 1847. \*Playfair's library for the University of Edinburgh, another splendid piece of cool classicism, was finished in 1837. The Faculty of Advocates library in Edinburgh, dating from the 1680s, had acted as a Scottish national library and was entitled to the privilege of one copy of every book published, under the Copyright Act of 1709. It was not officially transformed into the National Library of Scotland until 1925, and opened its new building in 1956.

These were libraries for scholars and a high proportion of books were still in Latin. There was little provision for ordinary people unless their parish church had a small collection, though many homes had a few prized books. Grantham had a library as early as 1598 and Humphry Chetham left money in 1653 for libraries in Manchester and Bolton. In the course of the 18th cent. the situation began to change. The literacy rate started to rise. Circulating libraries were established in a number of towns, catering for the new novel reader—often a woman. By the end of the century, literary and philosophical societies and \*mechanics' institutes were being formed, most of which had libraries attached. Subscription libraries appeared in the 19th cent., the best known being perhaps the London library, founded by Thomas \*Carlyle in 1841, exasperated at the service in the British Museum. In 1849 a parliamentary select committee on library provision deplored the low standard, and a cautious Act of 1850 allowed towns of more than 10,000 people to spend a halfpenny rate (raised in 1855 to a penny) on library provisions (though not on books). Winchester, Manchester, Liverpool, Birmingham, and Leeds had all established libraries by 1870. Municipal undertakings were assisted by donations in the late 19th cent. from Andrew \*Carnegie, Passmore Edwards, John Rylands, and others. In 1919 a further Act lifted the rate restriction and a county library service, to cope with the rural areas, was begun. The proliferation of universities and colleges from 1860 onwards saw dozens of new libraries established. By the late 20th cent. libraries were focal points in most towns, with particular emphasis on children's sections, and a diversification of activities into lectures, evening classes, and music and video provision. JAC

**Licensing Act, 1662.** A feature of the Commonwealth period was the unprecedented proliferation of pamphlets and broadsheets. In 1662 Charles II's government moved to curb them, 13 & 14 Car. II c. 33 condemning 'the general licentiousness of the late times', and the 'heretical, schismatical, blasphemous, seditious and treasonable books, pamphlets and papers' which had appeared. Henceforth, publications were to carry the name of printer and author and were to be submitted for approval to a licenser. From 1663 until the Glorious Revolution, the office was held by Sir Roger L'Estrange, who used his powers in favour of the Tory/royalist cause. After 1688 the matter became even more contentious. A Whig licenser, Fraser, was forced to resign: a Tory licenser, Bohun, was dismissed. In 1693 the Act was continued for two years only and in 1695 it was not renewed at all. Macaulay remarked that while the decision owed more to practical objections than to high principle it did 'more for liberty and civilization than the Great Charter

or the Bill of Rights'. That is excessive, since many controls continued and Parliament refused to allow the publication of its debates until the 1770s. Nevertheless, within a decade of the Act lapsing, the London and provincial newspaper press had established itself. JAC

**Lichfield, diocese of.** There were Celtic bishops from 656, but no formal see until c.669, owing allegiance to \*Lindisfarne, not Canterbury. Though the modern diocese comprises only Staffordshire and north Shropshire, the Mercian see also included Derbyshire and most of Warwickshire. \*Theodore of Canterbury nominated \*Chad as first bishop (d. 672). Lichfield became briefly (788–803) an archiepiscopal see, while \*Offa, as \*bretwalda, was in conflict with Canterbury. After the Norman Conquest, the see was nominally moved to \*Chester c.1075, only to be moved again in 1102 to Coventry abbey. The bishopric had the title 'Coventry and Lichfield', reflecting the continuance of administration in Lichfield despite the see's peregrinations. Serious disputes over episcopal elections ensued between the monastic chapter of Coventry and the secular canons of Lichfield. The creation of the separate Chester diocese in 1541 reduced Lichfield's significance, though the dissolution of Coventry abbey enabled the Lichfield chapter's sole right to elect to be recognized in the reversed title 'Lichfield and Coventry'. In 1836 Coventry came under the \*Worcester diocese, further reducing Lichfield's significance. The 12th–13th-cent. cathedral of red sandstone with three spires was badly damaged in the Civil War, restored in the 1660s, and again in the 19th cent. WMM

**Lichfield House compact.** This was an agreement in the London house of Lord Lichfield on 18 February 1835 between the Whigs, radicals, and Irish to work together in the forthcoming parliamentary session. \*Peel's Conservative government, which had been in office only three months, was defeated the following day, and in April Lord \*Melbourne formed his second administration. JAC

**Lilburne, John** (1615–57). Leveller leader. Of minor Durham gentry stock, he was apprenticed to a London clothier. In 1638 he was hauled before \*Star Chamber, flogged, pilloried, and imprisoned for distributing illegal anti-episcopal literature. \*Cromwell secured his release in 1640, and he rose to lieutenant-colonel in Cromwell's Eastern Association cavalry, but left the service in 1645. Thenceforth he was in and out of prison, offending both Lords and Commons with his voluminous, unlicensed pamphlets and his claims for the rights of free-born Englishmen. Combative, indomitable, and self-dramatizing, he was the leading spirit of the \*Leveller movement from 1647 onward, and broke with Cromwell. In 1649 he denounced the newly established \*Commonwealth in *Englands New Chains Discovered*, fostered a serious army mutiny, and publicly demanded Cromwell's impeachment. A London jury acquitted him of treason, but the \*Rump banished him in December 1651. He returned without leave in 1653 to a life of captivity, which was eased latterly. He died a quaker. AHW

**'Lillibullero',** which 'sang a prince out of three kingdoms', was a doggerel ballad, attributed to Lord Wharton, with

a tune by \*Purcell. It purported to be the native Irish welcoming James II's lord-lieutenant \*Tyrconnel in 1687 to 'cut the Englishmen's throats'. The refrain 'Lillibullero' is probably a nonsense-jingle. According to \*Burnet, this 'foolish ballad' swept Britain 'the whole army and at last the people, both in the city and country, singing it perpetually'. JAC

**Limerick** (Luimnech), **diocese of**. The Irish see of Limerick was first named as such at the Council of Raithbressail (1111), though its first bishop Gilli was elected in 1106. As Limerick was originally a Norse settlement and thus important for Anglo-Norman colonization, Gilli had strong contact with \*Canterbury, was papal legate for 28 years, and presided over the Council of Raithbressail (1111). Though situated in western Ireland, Limerick's association with Canterbury enabled it to have Anglo-French bishops from the early 13th cent. It is now the seat of both Catholic and Anglican bishops. There are two cathedrals. St Mary's (Anglican) has much 15th-cent. work and a 12th-cent. west doorway. Its oak choir-stalls with misericords are unusual in Ireland. St John's catholic cathedral is 19th cent. WMM

**Limerick, treaty of**, 1691. The treaty concluded the siege of Limerick and the Jacobite war and was signed on 3 October. The military articles were generous, allowing the besieged army to migrate in French and English ships to join the forces of Louis XIV, thereby securing a French career for \*Sarsfield. The civil articles were confirmed by William III. Their intention was to protect former Jacobite officers from confiscation if they remained, and to give catholics the freedom to practise their religion which they had had under Charles II. The first aim was honoured, but did not protect many other catholic landowners. The Irish Parliament, which reluctantly ratified the treaty only in 1697 in a maimed form, later wholly defied its spirit of toleration by passing penal laws. BPL

**Limited Liability Act**. This legislation was introduced in the United Kingdom in the 1850s and consolidated in an Act of 1862. Prior to this anyone owning a share in a commercial activity was responsible for any debts incurred in the case of bankruptcy without limit and this was an obvious deterrent to potential investors. The legislation limited the extent of this liability to the amount initially invested. But as a restraint on uncontrolled expansion, companies claiming limited liability were required to have 15 per cent of their nominal capital paid up, to have at least 25 shareholders, and to have 25 per cent of the capital fully subscribed. CHL

**Linacre, Thomas** (c.1460–1524). Linacre is believed to have come from Canterbury and was educated at Oxford, where he was elected a fellow of All Souls in 1484. He then went to Italy, graduating as MD from Padua. He returned to Oxford, where his contemporaries included \*Grocyn and \*Colet, with a fine reputation as a Greek scholar. In 1509 he was appointed physician to Henry VIII. Linacre was largely instrumental in founding the College of Physicians in 1518 and served as its first president. He left funds for the establishment of lectureships in medicine at both Oxford and Cam-

bridge. His last years were spent in holy orders. Linacre College, Oxford, was founded in 1962 as a postgraduate institute. JAC

**Lincoln** (Roman) was a legionary fortress, then the *colonia* of Lindum, where the river Witham flows east through the ridge of the Lincoln Edge. The earliest known fortress, under the later town, was constructed by *legio IX Hispana* c.60, but there may have been earlier military occupation south of the river. In the early 70s *IX Hispana* was replaced by *legio II Adiutrix* which left the fortress in the late 70s, and the *colonia* was probably founded in the 80s. As at Gloucester, the legionary defences, on the hilltop, were maintained and fronted in stone, but at Lincoln the defensive circuit was extended down to the river as earthwork in the later 2nd cent., later fronted in stone. This brought the defended area to c.100 acres. The gates, including the surviving Newport Arch, were impressive. The principal public buildings were in the 'upper' *colonia*, including a forum/basilica incorporating the extant Mint Wall, baths supplied by an aqueduct which crossed the Roaring Meg stream on arches, and a sewer system. The evidence of houses, mosaics, sculpture, and burials suggests a considerable degree of prosperity and Mediterranean-style culture. In the 4th cent. Lincoln may have become a provincial capital; a bishop may have attended the Council of Arles in 314. ASEC

(post-Roman) After five centuries of near-desertion Lincoln was revived by the Vikings as a river port. The Normans planted a castle and cathedral in the upper city (the Roman site); the commercial centre spread downhill, where it still is. Lincoln's heyday was the 12th and 13th cents., when it was one of the six largest English towns, with 47 parish churches and a thriving textile industry. Its importance and strategic position made it the scene of decisive civil war battles (1141, 1217) and a second coronation of Henry II (1157). It declined spectacularly in the 14th and 15th cents., a decline which grants of privileges from the crown (culminating in county status in 1409) could not avert. Lincoln revived only modestly as a social centre in the 18th cent. and as an industrial town in the 19th; it has thus been able to preserve much of its historic fabric. Jewels in Lincoln's crown include the cathedral (called by Ruskin 'the most precious piece of architecture in the British Isles'), the only Roman gateway in Britain still used by traffic, and the only medieval bridge in Britain still lined by shops and houses. DMP

**Lincoln, battle of**, 1141. Stephen, besieging Lincoln castle, held by supporters of \*Matilda, the rival claimant to the throne, was himself attacked by a relief force under \*Robert, earl of Gloucester, Matilda's half-brother, and Ranulf, earl of Chester, Gloucester's son-in-law. After heavy fighting in the streets on 2 February, Stephen was captured and taken to Bristol for imprisonment. JAC

**Lincoln, battle of**, 1217. The opponents of King John called in Louis, dauphin of France, to assist them. He continued his campaign in 1217 after John's death. On 20 May 1217 his supporters besieging Lincoln castle were themselves attacked by a relief force under William \*Marshal, earl of

## Lincoln

Pembroke and regent for John's young son Henry III. The comte de la Perche, commanding the French troops, was killed and resistance melted away. The ironic nickname 'The Fair of Lincoln' suggested that the rebels did not fight with undue tenacity. JAC

**Lincoln, diocese of.** Now merely conterminous with Lincolnshire, this was one of the largest medieval sees, founded c.1072. Lincoln itself, originally in the short-lived Anglo-Saxon see of \*Lindsey, came under the episcopal oversight successively of \*Lichfield, \*Leicester, \*Dorchester (and for a short while, \*Winchester), as pressure from the Danes increased. After the reconquest of the Danelaw (10th cent.) the see of Dorchester extended from the Thames to the Humber. In 1072 it was moved to Lincoln. Though princely secular bishops became the norm, two major exceptions were the saintly \*Hugh of Lincoln (1186–1200), canonized in 1220, and Robert \*Grosseteste (1235–53), a scholar, ardent reformer, patron of the Franciscans, and friend of Simon de \*Montfort. The vast diocese was reduced in size by the creation of the sees of \*Ely (1109), \*Peterborough (1541), and \*Oxford (1542). Nevertheless it continued to have notable incumbents, like Thomas \*Tenison (1692–5) and William \*Wake (1705–16), future archbishops of Canterbury, and Edmund \*Gibson (1716–23), later Walpole's ecclesiastical lieutenant. The saintly Anglo-catholic Edward King (1885–1910) was prosecuted for his 'Romanizing' practices in 1890. The cathedral, begun in 1192 by St Hugh, stands magnificently on its hill, a superb example, the epitome perhaps, of 13th-cent. cathedral-building. WMM

**Lincoln, John de la Pole, 1st earl of** (c.1462–87). Pole's mother was Edward IV's sister Elizabeth: his father, John de la \*Pole, 2nd duke of Suffolk. He was given a peerage in his own right at the age of 5 and married a niece of the king. Under Richard III he was in high favour. Though there is no evidence that Richard recognized him as heir after the death of the prince of Wales in 1484, he was next in line if his young cousin \*Warwick's claim was disregarded on the grounds that his father \*Clarence had been attainted. He served Richard as president of the Council of the North and fought for him at \*Bosworth. Lincoln and his father submitted to Henry VII but, with Warwick in the Tower and a boy of 10, he was the strongest Yorkist claimant. In 1487 he suddenly fled the country and returned with an invading force supporting Lambert \*Simmel's claim to be Warwick. Lincoln's motives can only be conjectured, but presumably, had the rising succeeded, Simmel would have been pushed aside and Lincoln enthroned. As it was, he was killed at the battle of \*Stoke. JAC

**Lincoln judgment,** 1890. Edward King, bishop of Lincoln, was prosecuted by the Church Association for alleged illegal practices during worship, such as mixing water with sacramental wine and using lighted candles on the holy table. In his judgment, delivered on 21 November, the archbishop of Canterbury supported the bishop and decided not to take the matter further. RAS

**Lincolnshire** is the second largest English county but one of the most thinly populated. From the Humber in the

north, which formed the border with Yorkshire, to the Welland in the south, running through \*Stamford, is more than 70 miles. The greater part of the county is flat but there are three parallel north–south ridges. \*Lincoln stands at the gap in the western ridge, the Lincolnshire edge, Louth at the gap of the eastern. The northern parts drain into the Humber via the Trent and the Ancholme, the southern into the Wash via the Witham, Glen, and Welland.

At the time of the Roman invasion, the region formed part of the territory of the \*Coritani. The Romans established a legionary base and then a *colonia* at Lincoln (Lindum) where the Fosse Way and Ermine Street intersected. The name derives from the Celtic *Linn*, a pool—presumably the Brayford pool—with the suffix *coln*, derived from *colonia*. The Roman north gate survives and is still used by traffic. Caistor was another Roman town of significance, possibly a spa. The Foss dike, a Roman canal, joined the Trent with the Witham.

There were few obstacles to early Saxon settlement except in the south where salt marshes rendered the land impenetrable. \*Lindsey, in the northern part, may have formed a subkingdom, disputed between Mercia to the west and Northumbria to the north. \*Bede records the evangelizing visit to Lincoln of \*Paulinus in the 620s and a diocese of Lindsey was established from 678, though it fell victim to Danish raids in the 9th cent.

From the 870s onwards, the area formed part of the \*Danelaw, Lincoln and Stamford being two of the five boroughs. The Danes left a great impression on the area. Many of the place-names are of Danish origin—Grimsby, Saxby, Beckby, Swinthorp. The area was divided into three trithings—Lindsey, Kesteven, and Holland—and the largest, Lindsey, was further divided into three ridings. The smaller divisions known elsewhere as hundreds were in Lincolnshire called wapentakes, the brandishing of arms by assemblies of warriors. The shire itself seems to have been formed after 1016, when the southern divisions of Kesteven and Holland, previously orientated towards the east midlands and East Anglia, were united with Lindsey. The \*Domesday survey treated it as one unit.

In 1066 Lincoln was one of the leading towns in the country, with a population of about 5,000. Torksey, at the junction of the Trent and the Foss Dike, Stamford, Grantham, Barton, and Grimsby were also important. Castles were built at Lincoln and Stamford and in 1072 the diocese was transferred from Dorchester to Lincoln. The building of the cathedral began almost at once. The new diocese was enormous and in the 13th cent. Lincoln itself was said to have more than 40 churches. Barton did not long retain its importance, partly because the Great North Road diverted to the west from Ermine Street, bypassing the shire completely, partly because \*Hull took much of its river traffic. Boston, however, not mentioned in Domesday, developed rapidly and by 1204 was second only to London in subsidy payment. Lincoln soon complained of the competition, particularly after the wool staple was transferred in 1369. Louth and Sleaford, under the jurisdiction of the bishop, were just outside Lincoln's pull at 26 and 17 miles, and developed as local centres. The main activity of the shire was sheep-rearing

on the wolds, cattle on the flatlands, and fishing: reclamation of fenland went on steadily.

In the later Middle Ages a slow decline began. Stamford and Lincoln suffered much from the \*Black Death in 1349. Other areas in the west, such as Wiltshire and the Cotswolds, developed their own cloth industries. A number of small harbours suffered from silting up of the coast. The Foss Dike was out of action frequently and Grimsby and Boston each found silting hard to deal with. With the growth of colonies in the New World the whole axis of trade shifted towards western ports. \*Camden in 1586 wrote of the county largely in terms of past glories. Torksey was 'now a little mean town, but heretofore very noted': of Lincoln itself 'Tis incredible how much it hath sunk and decayed, under the weight of time and antiquity.'

Tudor and Stuart Lincolnshire was little known or visited—a quiet county of small market towns, left to its own devices. Its participation in the \*Pilgrimage of Grace in 1536 provoked Henry VIII to denounce its inhabitants as 'the most brute and beastly of the whole realm'. Celia Fiennes in the 1690s noted that Lincoln's waterways were choked up, and 20 years later \*Defoe, while admiring the minster and the countryside, dismissed the town as 'an ancient, ragged, decay'd and still decaying city'—if, indeed, it could be called a city. His crossing of the Humber from Barton, which he shared with fifteen horses and twelve cows, took four hours and made him very sick. Isolation encouraged insularity. Mary Yorke, wife of a dean, remarked in 1769 that 'the people in general of Lincoln have the least curiosity for anything out of their own circle that ever I met with'.

The industrial developments of the 19th cent., while leaving the character of the shire basically unchanged, helped to diversify it. The improvements in transport—turnpikes, canals, railways—helped to knit the shire together but did comparatively little to integrate it with the rest of the nation. The bridge at Gainsborough opened in 1790—the only one north of Newark—improved communications with the north-west. Schemes for a main railway line north through Lincoln came to nothing and in the end the main line followed the Great North Road, almost bypassing the county. But the growth of an agricultural industry brought employment to Lincoln, Gainsborough, and Grantham. Grimsby opened its new dock in 1800 but its spectacular expansion followed the arrival of the railway in 1848, which benefited the fish trade. By 1901 it had overtaken Lincoln as the largest town in the shire. The discovery of iron in the north-west of the county led to the development of a steel industry and the town of Scunthorpe came into existence from a group of small villages: by 1961 it was the third largest town with 67,000 people. Rail transport and the cult of seaside holidays produced Cleethorpes, Skegness, and Mablethorpe with holiday camps and caravan sites. The balance of town and country shifted steadily. In 1801 only 21 per cent of the shire lived in the twelve largest towns; by 1901 it was 34 per cent, by 1931 50 per cent, and by 1961 53 per cent.

The ancient divisions of the shire were acknowledged in 1888 when separate county councils were established for Lindsey (Lincoln), Kesteven (Sleaford), and Holland

(Boston). The Local Government Act of 1972 brought them together again but hived off Grimsby, Cleethorpes, Brigg, and their surrounding villages to form the new county of Humberside, which was to be welded together by the Humber bridge, opened to traffic in 1981. Though Humberside was abolished in 1996, the towns were not returned to Lincolnshire, but made into the unitary authorities of North Lincolnshire and North-East Lincolnshire. Otherwise Lincolnshire retained its county status. JAC

**Lindemann, Frederick, 1st Viscount Cherwell** (1886–1957). Lindemann is one of the comparatively small band who have combined science and politics. His father came from Alsace but settled in Britain and prospered. Lindemann was educated in Germany, took his doctorate in 1910, and stayed on to do research in low-temperature physics. In 1919 he was elected to a chair at Oxford, reorganized the Clarendon laboratory, and was attached to Wadham College, though living in Christ Church. A strange creature in the aristocratic world which his wealth allowed him to frequent, he was known as 'the Prof.' His experience of flying during the First World War and his friendship with Winston \*Churchill led him to an interest in air defence in the 1930s but he was an awkward colleague. When war broke out, Churchill leaned upon his scientific knowledge, got him a barony in 1941, and made him paymaster-general. His report of March 1942 that German morale would collapse if housing in 58 German towns could be destroyed was impeccably argued, coolly scientific, and based on a report of bombing in Hull which had reached totally opposite conclusions. In 1951, when Churchill formed his second administration, the Prof. was promoted viscount and resumed as paymaster until 1953. Confident and overbearing, as a war-time adviser he was a doubtful asset. JAC

**Lindisfarne** (Holy Island) is a small island off the coast of Northumbria south of Berwick-on-Tweed. It is connected to the mainland by a causeway which is inaccessible at high tide. The island is home to several species of birds, who find the bleak landscape ideal for breeding. It was the seat of sixteen bishops from 635 to 883, the most famous of them being St \*Aidan, who was brought from \*Iona by \*Oswald to Christianize the north, and later St \*Cuthbert, who took charge of the Romanized see after the Synod of \*Whitby. After the island had been ravaged in the 8th and 9th cents. by Vikings, the religious community removed to seek a new sanctuary, eventually settling at Durham. The priory was rebuilt c.1070 but was abandoned c.1541 and some of the stones used on the construction of the fort, rebuilt by \*Lutyens as a small castle in the 1900s. The island has retained its religious significance and has been the site of many pilgrimages through the centuries. SMD

**Lindisfarne, diocese of.** The bishopric, originally based on the island monastery founded by \*Aidan (c.635), became the spiritual springboard of Celtic Christian mission in England. \*Cuthbert became bishop in 685, but died in 687. After the island had been sacked twice by the Danes in 793 and 875, the monks fled with Cuthbert's relics and the \*Lindisfarne

## Lindisfarne Gospels

Gospels to \*Chester-le-Street and then to \*Durham. The see and monastery were not revived. WMM

**Lindisfarne Gospels**, now British Library, Cotton MS Nero D.iv. A Latin text of the Gospels, with a later Anglo-Saxon translation or gloss, which was made at the monastery of Lindisfarne, in the north-east of England, by Eadfrith, who was bishop of Lindisfarne 698–721. It is an elaborately decorated book. Each Gospel is preceded by three fully decorated pages: an author portrait, a carpet page, and an initial. Matthew's Gospel has a second initial page (1: 18), to mark the beginning of the story of the Incarnation. It is likely that the manuscript was made for the elevation of the relics of St \*Cuthbert in 698. The Gospels remained closely associated with the saint during the Middle Ages, travelling with the body to Chester-le-Street and then to Durham. When Cuthbert's shrine was pillaged at the Reformation, the Gospels were taken to London. They became part of Sir Robert Cotton's library and subsequently part of the national collections in the British library. LR

**Lindsay of the Mount, Sir David** (c.1486–1555). The most important Scottish Renaissance poet, Lindsay was extremely popular in the 16th cent. A Fife laird, from 1508 he was a courtier closely associated with the future James V (1513–42), a herald from 1530, and Lyon king-of-arms from 1542. His numerous works deal extensively with the need for good government and religious reform. In *The Testament of the Papyngo* (1530) Lindsay provides moral advice to James V and his court, and attacks clerical abuses. *Ane Satyre of the Thrie Estatis* (1552) calls for the estates to serve the commonweal during the minority of Mary, queen of Scots (1542–67). *The Monarchie* (1554) develops earlier calls for religious reform into strong anti-papalism through a description of corruption at the papal court. Such themes make Lindsay an important source for the political, religious, and cultural issues of Renaissance and Reformation Scotland. RJT

**Lindsey, diocese of.** \*Theodore carved this bishopric out of the Northumbrian diocese of \*York c.677 to serve part of modern Lincolnshire, then an area disputed between Mercia and Northumbria. It collapsed under the Danish invasions c.873 and was not revived. The region later came under \*Dorchester-on-Thames and then \*Lincoln. WMM

**Lindsey, kingdom of.** Lindsey was one of the smaller kingdoms of early Anglo-Saxon England and its existence must always have been rather precarious. Bordered in the north by the Humber and the east by the North Sea, it followed the Trent in the west, taking in the Isle of Axholme, and the Witham in the south, including Lincoln itself. The name—the island of Lincoln—reflects its character, surrounded by sea, marshes, and fens. A list of the kings of Lindsey has survived, though Stenton called it 'the obscurest of English dynasties'. It starts, conventionally, with Woden and ends with Aldfrith, probably in the 8th cent. In the 7th cent. Lindsey was disputed between Mercia and Northumbria, changed hands repeatedly, and seems to have been more of a subkingdom than an independent state. Converted by Paulinus c.630, Lindsey had its own bishopric

from 678 which did not survive the Danish invasions of the 9th cent. An area of heavy Scandinavian settlement, it became one of the ridings of the later county of Lincolnshire and was itself divided up into ridings. These divisions lasted and Lindsey was given its own county council in 1888, the county town being Lincoln. JAC

**linen.** Historically, the linen industry was widespread throughout much of Britain, though the major areas of production were in the north of England, the Scottish Lowlands, and Ireland. Flax cultivation and linen production were of considerable economic importance by the end of the 17th cent., thanks to parliamentary encouragement and to skills and techniques introduced by immigrants from the Low Countries. The industry expanded dramatically during the 18th cent. In Ulster, bounties contributed to the growth of the export trade to the colonies, while in Scotland the Board of Trustees, using capital derived from the Equivalent (union compensation fund), encouraged the industry by giving grants for flax cultivation and processing, as well as enhancing skills in spinning, weaving, and bleaching.

A proto-industrial phase saw the introduction of limited mechanization. Scutching mills, using water-power and operating on the same principle as the threshing-machine, greatly raised productivity in the preparatory stages. The poet Robert \*Burns worked in such a mill at Irvine in Ayrshire. Later stages of production, spinning and weaving, were highly labour-intensive domestic activities, coordinated by entrepreneurs, whose networks, in many instances, radiated throughout the surrounding countryside from centres like Nottingham, Leeds, Manchester, \*Belfast, Glasgow, and \*Dundee.

With the adoption of machinery, initially developed for the \*cotton industry, spinning became increasingly factory-based and, with greater use of steam-power, more concentrated in urban centres. Technological lags retarded the mechanization of weaving, but when it caught up in the early 19th cent., it led to the demise of hand-loom weaving. Reorganization led to even greater localization around Belfast, Paisley, and Dundee and to increased specialization, with fine linen being produced mainly in Ulster and the west of Scotland, and coarser linen in the east of Scotland. Bleaching, which had become a specialized trade, was also mechanized and became more efficient following the development of chemical bleaching. Belfast became the major centre of production with a large proportion destined for overseas markets. Paisley specialized in fine linen and linen thread, its famous 'Paisley pattern' prints derived from imported Indian designs. A significant spin-off in Dundee was the development of the jute industry, which expanded rapidly during the 19th cent. to create 'Juteopolis', as the city became known.

During the 20th cent. linen, like other textile industries, contracted in the face of foreign competition. Having experienced painful rationalization and modernization following the depression and the Second World War, it continued production on a reduced scale in its long-established locations, most notably in Ulster. ID

**Linlithgow, Victor Alexander John Hope, 2nd Marquis** (1887–1952). Linlithgow was born in Scotland and educated at Eton. He was a member of the Conservative Party who served at the Admiralty under \*Baldwin. His connection with India developed through his chairmanship of the Royal Commission on Agriculture in India (1926–8) and the Select Committee on Indian Constitutional Reform (1930–2). He was appointed viceroy of India in 1936. His period in office witnessed the growth of mass support for the Indian National Congress, the withdrawal of Congress co-operation for the Second World War, and the Quit India movement of 1942. An unbending imperialist without sympathy for the Indian national cause, he exacerbated rather than eased political tensions and showed a strong preference for repression over negotiation. His harsh response to the Quit India movement helped to spread guerrilla resistance to British rule, which harmed the war effort against Japan. He resigned in 1943. DAW

**Linlithgow palace** (Lothian). Initially a royal manor house beside the loch, and lodging for Edward I who strengthened it (1301–3), it was rebuilt in stone by James I of Scotland after the 1424 fire; the great hall and royal apartments were augmented by his successors to close off the open west side and transform it into a fashionable residence. Birthplace of James V (1512), it remained empty after the death of James IV at Flodden (1513) until the 1530s, when work was resumed reflecting James V's tastes, as at Falkland. Birthplace also of Mary, queen of Scots (1542), and set aside for the queen mother, \*Mary of Guise, the palace fell into disrepair after the accession of the infant James VI (1567). The ruinous north range was rebuilt 1618–24 with one of the finest Renaissance façades in Scotland, but was never used by James after his accession to the English throne. Charles I was the last monarch to sleep there (1633), \*Cromwell wintered there (1650), while the earl of Linlithgow forfeited his titles and hereditary keepership by supporting the 'Old Pretender'. Roofless since a bad fire in 1746, it is currently cared for by the Scottish Development Department. ASH

**Lister, Joseph** (1827–1912). Surgeon and pioneer of antiseptics. Qualifying at London, then teaching at Edinburgh, Lister was appointed (1860) as regius professor of clinical surgery at Glasgow, where, interested in inflammation and concerned at high hospital mortality from 'septic diseases', he was one of the few to pursue the implications of Pasteur's recent work on fermentation and the beginnings of the germ theory. An open-minded, patient investigator, he laid the foundations of antiseptic management of wounds and surgical intervention, initially using carbolic sprays and gauzes, and thus reduced mortality and revolutionized hospital practice and the art of surgery. Like most pioneers, he encountered criticism and professional opposition, but recognition led to chairs at Edinburgh and London, honours such as presidency of the \*Royal Society, and a barony (1897). His work improved public confidence in both hospitals and surgery, and stimulated the infant science of bacteriology. ASH

**literacy**, the ability to read and write, is the measure usually taken as a key indicator of a country's economic and social advancement. Efforts by historians to pinpoint the exact level of literacy in Britain at any time have proved notoriously difficult, with estimates requiring further qualification by regional, gender, class, and rural/urban divisions, and by what level of literacy is meant. Estimates for mid-17th-cent. basic literacy, for example, range from 10 to 30 per cent of the population, with differences such as 15–20 per cent in the rural north, against 40–60 per cent in southern urban centres. The gender division is illustrated by one set of figures comparing 1841 and 1870, when a rise in male literacy of 67 per cent to 80 per cent was matched by a female rise from 51 per cent to 73 per cent.

The main early spurs to 'useful literacy' were religious or, later, economic, bringing strong associations with the protestant work ethic and the rise of industrial capitalism, whereby individuals sought literacy for their self-advancement, and capital (and eventually the state) encouraged it to create an educated literate work-force. These needs of the British capitalist nation state made education one of the first areas where the move from \*laissez-faire to intervention became evident. Through providing government assistance to voluntary institutions from the 1830s–1860s, and then intervening directly from 1870 with a series of \*Education Acts, the state mopped up most of the last traces of illiteracy.

While the agencies of the state made this undoubted contribution to the rise in literacy through education (serving also, according to the left, to extend a fair degree of 'social control'), the role of working-class self-help should not be ignored. For every paternalistic Society for the Diffusion of Useful Knowledge, there was a working-class equivalent Society for the Diffusion of *Really* Useful Knowledge, challenging the reformist ideologies of the \*mechanics' institutes, adult schools, working men's colleges, people's palaces, and religious, scientific, and philosophical societies, with a contrasting co-operative, trade union, chartist, socialist (and latterly Marxist) ideology.

Consequently, some historians have estimated that of the 1840 population—before compulsory state schooling—most adults had some form of education (allowing for class and regional variations), with 75 per cent able to do some reading and 60 per cent some writing. Through the 20th cent., the expansion of the audio-visual media led to demands for education to concentrate on *visual* literacy as much as its traditional task of ensuring written literacy. DJA

**Liverpool**, created a borough by royal will (1207) as a convenient place of embarkation for Irish campaigns, fluctuated in prosperity until the early 17th cent. when Irish industries developed and Chester declined. Of protestant temper, its value as a point of contact between Ireland and the northern royalists accounted for its importance in the Civil War, being twice besieged. Continuing to control the larger share of the Irish trade, Liverpool gained impetus from profitable commerce with the \*plantations (sugar, tobacco, cotton) and the rapid development of Manchester's textile industries. Both legitimate and illegitimate trade with the West Indies and South America enabled gain at the expense of Bristol and

## Liverpool

London, and led traders into the even more lucrative African traffic. Involvement in the slave trade brought riches and an unsavoury reputation, but the money improved transport and communication with productive Lancashire industries. When trade with the East Indies and Spanish America was thrown open and the American midwest began to expand, Liverpool's dominance of Atlantic trade and as an emigration port produced a cosmopolitan but overcrowded, unhealthy, politically corrupt, and turbulent city. Systematic attempts to reconstruct led to generally steady improvement, growth being accompanied by high levels of immigration (especially from Ireland), and continued establishment of new local industries. Despite extensive reconstruction of the business quarters after severe bomb damage in the Second World War, the subsequent de-industrialization of Liverpool has led to its being better known for its football teams, music groups, and comedians, yet it still exerts economic and cultural dominance over the surrounding metropolitan region. ASH

**Liverpool, Charles Jenkinson, 1st earl of** (1729–1808). Tory politician. Jenkinson was a 'man of business', serving Lord \*Bute as private secretary and under-secretary of state, 1761–2, and holding similar second-rank offices through to 1782. He was 'a born bureaucrat, of restricted sympathies . . . rigid in his ideas and authoritarian in his outlook', according to the *History of Parliament*. During Lord \*North's administration and particularly throughout the American War of Independence he was believed to be influential 'behind the scenes' and the secret agent of George III in the ministry. He was a close adviser of Lord North and supplied the king with information about the state of the government. He left office on the fall of North but returned under \*Pitt in 1784, becoming president of the Board of Trade 1786–1804 and chancellor of the duchy of Lancaster 1786–1803. He was made Lord Hawkesbury in 1791 and promoted earl of Liverpool in 1796. EAS

**Liverpool, Robert Banks Jenkinson, 2nd earl of** (1770–1828). Liverpool was a capable and intelligent statesman, whose skill in building up his party, leading the country to victory in the war against Napoleon, and laying the foundations for prosperity outweighed his unpopularity in the immediate post-Waterloo years. Son of a distinguished MP, Liverpool was educated at Charterhouse and Oxford. He was present at the fall of the Bastille in 1789 and never lost a dread of public tumult and mob violence. He entered the Commons while under age in 1790 and supported the war with France after 1793. After gaining experience at the India Board, he served \*Addington as foreign secretary, had two spells as home secretary, and between 1809 and 1812 proved himself as an efficient war secretary. When he became prime minister in 1812 the prospects for his ministry were uncertain but Liverpool soon showed that he was in command. The war against Napoleon was turning in favour of the allies. Napoleon suffered serious reverses in Russia and Spain in 1812. Liverpool had the ability to get the best out of his colleagues, to support them diligently, to restrain them when they became restless, and to work patiently towards broadening the ministry's support in Parliament and

in the country. He was adroit in handling the prince regent: by 1820 he had the advantage of knowing that his colleagues would follow him out of office if he had to resign. He was a good chairman but much more than a good listener. It was Liverpool who insisted that the prince regent could not accede to the \*Holy Alliance in a personal capacity. Within the Commons Liverpool cultivated the support of the country gentlemen. When their support was lost, as over the income tax in 1816, the consequences were embarrassing. Liverpool was protective towards the landed interest, but though he favoured a corn law he was compelled to accept a fixed duty in 1815 because his supporters were not prepared to accept a sliding scale. Liverpool was responsive to the commercial and manufacturing interests, grafting new economic ideas onto an essentially traditional outlook. He opposed parliamentary reform, but was eager to find some compromise on the catholic question short of full emancipation. He knew that the catholic issue had to remain an 'open question', for any attempt to impose uniformity upon his colleagues would precipitate the collapse of his ministry. Liverpool was determined to maintain public order but had no desire to strengthen the powers of central government. Lacking a police force he had to rely on the local magistrates for law and order. He reacted to events rather than anticipating them. At the time of the \*Peterloo affair in 1819 Liverpool criticized the Manchester magistrates in private but defended them in public. The \*Six Acts of 1819 were a response to the demands of nervous backbenchers for action. After 1820 the situation improved. The \*Cato Street conspiracy was the last gasp of expiring \*Jacobinism. The economy revived and Liverpool allowed his ministers greater freedom in reducing duties and stimulating trade. He appointed \*Canning as foreign secretary and gave more scope to \*Peel, \*Huskisson, and Robinson (\*Goderich). In his last five years as premier Liverpool accomplished much by way of cautious reform. The extent to which the government depended upon him was revealed when a stroke compelled his retirement in 1827. By the time of Liverpool's death in December 1828 the disintegration of the Tory Party was all too evident. In retrospect Liverpool had a remarkable ability to win widespread confidence and to impose cohesion on his ministry. He rose to the challenge of events with unfussy self-control. In war and peace he served the country well. JWD

Gash, N., *Lord Liverpool* (1984).

**Liverpool, diocese of.** Originally part of the far-flung diocese of Lichfield, then of Chester after 1521, the south-west part of Lancashire remained within the see of Chester when the diocese of Manchester was created in 1847, becoming the archdeaconry of Liverpool. It became a diocese in its own right in 1880. A new Anglican cathedral, designed by Giles Gilbert Scott, was commenced under the inspiration of Bishop Chavasse in 1904, though, after the death of co-architect George Bodley, Scott simplified the Gothic design. The cathedral was completed in 1978, generally as intended, apart from an economically enforced new west front. Made of the local red sandstone, set on raised ground, and having the highest interior of all English cathedrals, it dominates

the Merseyside skyline and awes worshippers. It is linked to its metropolitan counterpart (originally designed by \*Lutyens but completed by Gibberd) by a street named Hope, and their respective bishops have worked closely together for the community. ASH

**livery and maintenance.** See BASTARD FEUDALISM.

**livery companies** were organizations of master tradesmen which developed in the city of London during the Middle Ages. Their purpose was to control the numbers and character of new entrants. Originally livery referred to the special clothing of retainers and servants, but later the term became associated with distinctive costumes for grand occasions worn by high-ranking members of the companies. Prosperous companies erected their own guildhalls and endowed churches dedicated to the patron saint of their crafts, with chapels for their use. Most companies provided benefits for members and their dependants such as widows and children. The influence of the companies grew as their wealth increased: most of them made loans to the crown in exchange for privileges for their members. Such privileges ranged from the right to wear livery to having a role in the government of the city of London.

Livery companies lost control of specific trades by the 19th cent., but being a freeman conferred prestige. The companies continued to have political influence, only slightly modified by Victorian local government reforms. They have retained their independence to the extent that, currently, members of a company have the status of freemen of the city of London. They serve with the aldermen, sheriffs, and the lord mayor on the Court of Common Hall and participate in the selection of the lord mayor for each year. By 1979 there were 84 livery companies. Over time new companies have emerged, one of the most recent being the Guild of Air Pilots and Air Navigators. IJEK

**Livingstone, David** (1813–73). Scottish missionary and explorer. Livingstone arrived in South Africa in 1841 to assist in the work of the \*London Missionary Society. He was soon attracted northward in the hope of spreading the gospel in central Africa. His travels took him first to the Atlantic coast and then across the continent to the Indian Ocean. His encounter with the Arab-controlled slave trade led him to conceive a plan to open Africa to the civilizing influences of Christianity and legitimate commerce. His discoveries brought him fame in Britain and won him the support of the Royal Geographical Society. A second exploratory journey between 1858 and 1864 laid the foundation for Britain's involvement in Nyasaland (Malawi) and the circumstances of his death in the interior of Africa in 1873 proved to be the decisive factor in stimulating British action against the east African slave trade. KI

**Llandaff, diocese of.** Llandaff cathedral looks to the 6th-cent. saints \*Teilo and Euddogwy as its founders, and the shrine of the former was a place of pilgrimage until the Reformation. Work on the building of the present cathedral, and the definition of the territorial boundaries of the see, were however the responsibility of the first Norman bishop, Urban, early in the 12th cent. The cathedral still contains

several richly ornamented doorways and arches from this time. The diocese, the most populous in Wales, originally encompassed most of the counties of Glamorgan and Monmouth (Gwent), though the latter became a separate bishopric in 1921. None the less it has been calculated that half of the population of Wales lives within 25 miles of the cathedral, today in a suburb of Cardiff. The cathedral has had a chequered history. In the 17th and 18th cents. it fell into ruin, and was completely restored in the 19th, only to be partially destroyed again by German bombs in 1941. Restored by the architect George Pace, the cathedral now contains numerous works of art, including examples by Dante \*Rossetti, Jacob \*Epstein (his controversial *Majestas*), and Frank Roper. JRG

**Lloyd, Marie** (1870–1922). Music-hall artiste. Born Matilda Wood, but quickly rejecting the stage-name 'Bella Delmare' for 'Marie Lloyd' when first appearing in music-hall aged 15, she was soon performing in London's West End. Despite some pantomime roles, her forte was music-hall, where she specialized in character songs imbued with vitality, saucy, and skilled gesture ('Oh, Mister Porter', 'Wink the Other Eye'), highly rated by Beerbohm, Sarah Bernhardt, and Ellen \*Terry. A meteoric rise to fame was followed by world-wide tours. Talented, ever-popular, and incapable of hypocrisy, her reputation for salaciousness and irregular private life meant that by the official moral standards of the time 'the Queen of the Halls' was socially unacceptable; lavish generosity to the poor and war work could not prevent exclusion from royal command performances or near-deportation from New York. Latterly unhappy, overwork and domestic violence broke her health and hastened her final collapse. ASH

**Lloyd, Selwyn** (1904–78). Despite high office, Lloyd never fully emerged as a public figure of the first rank. A successful lawyer, he entered Parliament as a Conservative in 1945. Appointed to junior office in 1951, he rose steadily and was a surprise choice as foreign secretary in December 1955. Many, however, viewed his elevation as indicative of Anthony \*Eden's intention to take personal control of foreign policy—an impression not dispelled by Lloyd's role in the Suez crisis of 1956. He came near to achieving a negotiated settlement with Egypt in October. Though consistently loyal to Eden, Lloyd never seemed at ease about collusion with France and Israel. After \*Macmillan replaced Eden in January 1957, Lloyd retained the Foreign Office—a gesture of defiance on Macmillan's part over Suez. He moved to the Exchequer in 1960 where his tenure marked the high-water mark of Conservative economic planning in the post-war era. A victim of Macmillan's 'Night of the Long Knives' (1962), Lloyd's career enjoyed a renaissance as leader of the Commons (1963–4) and Speaker (1971–6). DJD

**Lloyd George, David, 1st Earl Lloyd-George** (1863–1945). Prime minister. Lloyd George made a greater impact on British public life than any other 20th-cent. statesman. He laid the foundations of what later became the \*welfare state, and put a progressive income tax system at the centre of government finance. He also left his mark on the system of

## Lloyd George

government by enlarging the scope of the prime minister's role. In 1918 he was acclaimed, not without reason, as the 'Man Who Won the War'. Yet until the appearance of a spate of sympathetic books in the 1970s his reputation remained remarkably low. This is partly attributable to the way in which his later career was clouded by financial scandal and by stories of his infidelities. But above all he was blamed by many Liberals for destroying their party in 1918, hated in the Labour movement for his handling of industrial issues after 1918, and disparaged by Conservatives for his radicalism. No one, it seemed, had an interest in defending him.

He grew up in a modest, but not poor, home in north Wales. Once he had qualified as a solicitor, he was able to use the firm's income to build his political career. In 1890 he rather luckily won a by-election as a Liberal in the marginal Conservative seat of Caernarfon Boroughs which he retained until 1945. However, a parliamentary career imposed a strain upon his marriage to Margaret Owen. While he found Westminster fascinating, she hated London and insisted on staying with the family in Criccieth. Left alone he found alternative company. His most prolonged extramarital relationship was with Frances Stevenson from 1911 until his death. Formally his secretary, Frances gave him vital support in his political work, and became, in many ways, a second wife; they had a daughter in the 1930s, and married in 1943.

After nearly a decade as a lively backbench rebel, Lloyd George became a national figure as a result of his courageous opposition to the South African War (1899–1902). In this he risked his seat and a certain amount of mob violence, notably in connection with a speech at Birmingham in 1901 when he was obliged to escape disguised as a policeman. In December 1905 his talents were recognized by \*Campbell-Bannerman, the new Liberal premier, who made him president of the Board of Trade.

Lloyd George's real breakthrough came in 1908 when \*Asquith promoted him as chancellor of the Exchequer. His unorthodox methods often caused irritation; he bypassed civil servants, read little, and preferred to make policy by discussion, especially on the golf course. Moreover, as he felt politically disadvantaged by his lack of a large private income, he was apt to grab an opportunity to make a quick profit; hence his involvement in the \*Marconi scandal. But Asquith had correctly seen that Lloyd George possessed the necessary political flair to be chancellor. His famous 'People's Budget' of 1909 solved the government's problems by levying extra taxes on a few large incomes and on items of conspicuous consumption like motor cars. This enabled them to pay for both \*old-age pensions and \*dreadnought battleships. When his budget was rejected by the peers Lloyd George quickly grasped the opportunity to attack the Conservatives for selfishly trying to preserve a privileged élite. He derided the peers as 'five hundred men, ordinary men, chosen accidentally from among the unemployed'. This restored the initiative to the Liberals and enabled them to retain their working-class vote in two general elections in 1910. Subsequently Lloyd George maintained his radical credentials with the 1911 \*National Insurance Act which introduced both health and unemployment insurance

for millions of people. During 1913–14 he again seized the initiative with the Land campaign which promised minimum wages for agricultural labourers and a rural house-building programme.

After the outbreak of war he stood out as the only minister whose reputation rose significantly. This was largely attributable to his success as minister of munitions from May 1915. The need to improvise and the freedom from departmental conventions meant that he was in his element in this job. However, his brief spell as secretary of state for war proved less happy because he found himself trapped by the conservative thinking of the military men. His frustration led him to join with Bonar \*Law in putting pressure on Asquith to streamline the war machine. The result—largely unintended—was Asquith's resignation in December 1916. Following the king's invitation Lloyd George managed to put together a government based on Conservative support plus a majority of the Labour members and a minority of the Liberals.

He made an immediate impact on the war effort by instituting a five-man war cabinet serviced by a cabinet secretariat under Sir Maurice Hankey. He also developed a personal secretariat of advisers. New ministries were created—Food, Shipping, Air, National Service, Pensions, Labour—to deal with the problems thrown up by the war, and non-party experts and businessmen such as Sir Eric Geddes were often appointed to them.

None the less, Lloyd George's premiership remained a precarious affair because he depended heavily on the Conservatives for his majority. Most Tories neither liked nor trusted him, but thought that the alternatives were worse. The sudden military victory in November 1918 gave Lloyd George immense prestige and, thus, a degree of bargaining power. Instead of returning to the Liberal Party he decided to organize his own Lloyd George Liberals and to fight the election in co-operation with the Conservatives.

As a result of his government's overwhelming victory in 1918 he retained office until 1922. Although restricted by the numerical dominance of the Conservatives he had major achievements to his credit: the parliamentary reform of 1918 which enfranchised women, the 1918 Education Act, the 1919 Housing Act, the settlement of the Irish question in 1921, and, of course, the treaty of \*Versailles. But in time both Liberal and Tory followers grew dissatisfied. Controversy over the huge funds the prime minister accumulated by the sale of honours undermined him; knighthoods were freely offered for £12,000 and baronetcies for £30,000. Finally at a meeting in October 1922 the Conservatives voted to cut their links with Lloyd George. He resigned immediately and never took office again.

Though he spent much of the 1920s engaged in Liberal Party infighting, he still made a major constructive impact on politics by means of his collaboration with J. M. \*Keynes and others over a detailed strategy for tackling unemployment. The Liberal Yellow Book, entitled *Britain's Industrial Future* (1928), formed the basis of the Liberal revival before the 1929 election. However, the electoral system prevented the party from translating its extra votes into seats, and Lloyd George was reduced to attempts to collaborate

with the new premier, \*MacDonald. He was too ill to join the National Government in 1931. Though widely expected to serve in Churchill's coalition after 1940, Lloyd George was not keen to do so, and the invitation never came. **MDP**

Gilbert, B. B., *David Lloyd George: A Political Life* (1987); Morgan, K. O., *Lloyd George* (1974); Pugh, M., *Lloyd George* (1988); Rowland, P., *Lloyd George* (1975).

**Lloyd's of London.** From the late 1600s to the late 1700s London coffee-houses were the centre of social and business life. From the 1690s merchants, bankers, and seafarers met in Edward Lloyd's coffee-house in Lombard Street, where they exchanged information and undertook shipping business. Merchants prepared to take a share of a marine risk would write their names on a policy one beneath the other, becoming 'underwriters'. Lloyd's was incorporated in 1871; in 1911 an Act allowed its underwriters to do insurance business 'of every description'. Still dominant in marine insurance, they also took on unlimited liability for unusual or specialized risks and reinsurance business. From the late 1970s Lloyd's experienced turbulent times: claims, particularly from natural disasters, became much larger, and there was incompetence, fraud, theft, and resignations. **MW**

**Llywelyn ap Gruffydd** (d. 1282), prince of Wales (1246–82). Known as Llywelyn 'the Last', his ambition to create a permanent, independent Welsh principality came close to realization. The second son of Gruffydd, son of \*Llywelyn ab Iorwerth, he may have been designated the heir of his uncle \*Dafydd ap Llywelyn. After Dafydd's death (1246) and the treaty of \*Woodstock with Henry III (1247), Llywelyn and his elder brother Owain were restricted to \*Gwynedd west of the river Conwy. By 1255 Llywelyn had defeated his brothers and restored his uncle's dominion: he advanced east of the Conwy, exploited divisions in England, and raided to south Wales. Most Welsh lords regarded him as overlord (1258) and Llywelyn took the title of prince of Wales. At \*Pipton (1265) Simon de \*Montfort acknowledged his status and promised Llywelyn his daughter (though the marriage did not take place until 1278). At \*Montgomery (1267) Henry III conceded recognition. But in Gwynedd, Llywelyn's rule alienated churchmen and his brother \*Dafydd, who deserted him in 1274; there was an attempt to assassinate Llywelyn in Powys. He also misjudged Edward I in refusing to fulfil his obligations as the king's vassal. The war of 1276–7 was a disaster for Llywelyn, who was confined once more to west Gwynedd by the treaty of \*Aberconwy (1277); he kept his title but only five Welsh barons were acknowledged to be his vassals. The uneasy peace was shattered by Dafydd's impulsive assault on Hawarden (1282) and, in the renewed struggle with Edward, Llywelyn was killed near Builth on 11 December. **RAG**

**Llywelyn ab Iorwerth** (1173–1240), prince of Gwynedd (1195–1240), known as 'the Great'. The son of Iorwerth 'Flatnose' and Margaret, princess of \*Powys, Llywelyn spent most of his life restoring and enhancing the hegemony of his grandfather \*Owain Gwynedd. A striking youth and a successful warrior at an early age, he acquired (from 1194) lands at the expense of his kinsmen, enabling him to master

\*Gwynedd by 1203. Good relations with King John brought recognition and his marriage to John's natural daughter \*Joan. But his aggression towards Powys made John retaliate (1210–11) and Llywelyn then allied with the French. He aided the rebel barons and exploited the civil war in England to extend his power to modern Carmarthenshire and Cardiganshire and east towards Montgomery, making himself lord of Powys by 1216. Henry III's regime recognized all this (1218), and despite hostilities with marcher lords like the Marshalls, he sustained his position by marriage alliances with other lords like the Braoses. He planned to perpetuate his principality by securing recognition from king and pope (1220–2) of his son \*Dafydd as his sole heir, even though this breached Welsh custom and alienated his elder son, the bastard Gruffydd. He took the evocative title of prince of Aberffraw and lord of Snowdon (1230), which seemed to imply suzerainty over other Welsh lords, and he compared himself to the king of Scots; but Llywelyn did not deny his own homage to Henry III. Llywelyn probably suffered a stroke in 1237 and after his death (11 April 1240) he was buried at Aberconwy abbey which he had patronized, leaving Dafydd to assert the position his father had bequeathed to him. **RAG**

**local government**, the administration of units smaller than the state, has a long but shadowy early history. Not only do many books on the subject begin only in 1835, but the purposes of local government are different, and the sources different, as one goes further back in time. In very early periods 'central' and 'local' government are difficult to separate, since many areas of Britain had independent or semi-independent rulers; and for centuries the primary purposes of local officials, as of central government, were seen to be defence, law, and order, rather than social services.

Britain before the Romans consisted of many tribal units. Those areas conquered by Rome were welded into a single province of Britannia (though in the 3rd and 4th cents. it was subdivided into two, and later into four and five, provinces). Within that province, however, most of the tribal units survived as *civitates* (city-states), with the larger towns governed separately as *coloniae* and *municipiae*. In the 5th and 6th cents. the pattern dissolved, and Britain became a patchwork of small states of both natives and invaders. As smaller states were absorbed into larger ones, old units often survived within them as administrative areas. By the 9th cent. Wessex was organized into shires, and as the kings of Wessex conquered the rest of England, they imposed the shire-system on it. By 1066 most of England, at least south of the Humber, was divided into shires, which in turn were divided into hundreds or (in the former Danish areas) into \*wapentakes (from *vápnatak*, the brandishing of weapons to show assent). Wales, however, was divided into independent principalities, each subdivided into commotes and hundreds (*cantref*s).

Each English shire (often called by the French name of county after 1066) was controlled by a royal official called a \*sheriff (shire reeve), whose powers and duties were greatly increased by the Norman kings; while in Lowland Scotland the kings created a similar pattern in the 12th cent., with sheriffdoms and thanages (under sheriffs and thanes

## local history

respectively). Similarly, when Edward I conquered independent Wales in 1276–83, he reorganized his conquests into shires on the English model, though he left alone the marcher lordships of south and east Wales. However, in none of the three countries was there a tidy and uniform system of administration. Some of the larger English towns, for example, acquired the status of counties corporate and excluded the county sheriffs altogether; while in both counties and towns there were numerous islands of exempt jurisdiction (immunities or 'liberties'). It should also be remembered that all of these arrangements applied only to secular administration; the church had its own administrative and judicial structure, with extensive powers over laity as well as clergy.

In late medieval England kings increasingly entrusted local government to resident gentry and burgesses, many of them acting under crown commissions, especially in the new offices of \*justices of the peace. In the 16th cent. the sheriffs lost further control of their counties with the institution of \*lords-lieutenant, and with increasing powers and responsibilities laid on the county justices. The parish became, after the Reformation, the basic unit of secular as well as ecclesiastical administration, and new parochial officials were introduced to deal with highway maintenance and poor relief. This English pattern was imposed on the whole of Wales in 1536–43, but in independent Scotland there were differences. Sheriffdoms began to evolve into counties only in the 16th cent., and their jurisdiction did not become completely coextensive with counties until 1747, when private jurisdiction of baronies and regalities, and traditional Highland clan jurisdiction, were abolished.

With this Scottish exception, central government interfered very little with existing local government structures between 1688 and the 1830s. However, during that 'long 18th century' those structures became increasingly inadequate, particularly as towns grew in size, and Parliament had to alleviate problems by delegating many responsibilities to groups of improvement commissioners, and from 1834 to Poor Law unions. In 1835 the \*Municipal Corporations Act transformed local government in England and Wales, creating standardized urban local authorities elected by rate-payers, and in 1872 sanitary districts were added. In 1888–9 the whole of British local government was reorganized, with \*county councils taking over most of the country, though some large towns were made all-purpose authorities outside the county structure. Within the counties, the sanitary districts were made into urban and rural districts (1894). In Scotland the Scottish Office, established in 1885, has since acted as an intermediary stage of government, taking over some of the functions exercised by local authorities in England and Wales. Otherwise the broad pattern persisted until 1974, when another reorganization divided England and Wales into counties and districts, and 1975, when a more drastic rearrangement produced new regional and district councils in Scotland.

From 1992–5 the Banham commission undertook another major review of local government in England, proposing the restoration of Rutland, the separation of Herefordshire and Worcestershire, and the abolition for all but ceremonial

purposes of the eight counties of Avon, Bedfordshire, Berkshire, Buckinghamshire, Cleveland, Dorset, Humberside, and Somerset. In the event, Rutland and Herefordshire were reconstituted as unitary authorities, and Bedfordshire, Buckinghamshire, Dorset, and Somerset retained their county councils. Local government in Wales was reorganized by the Local Government (Wales) Act of 1994 and in Scotland by the Local Government (Scotland) Act of 1994.

DMP

**local history** in medieval England chiefly took the form of histories of particular monasteries and their estates. A good example is the *Abingdon Chronicle*, c.1160. More comprehensive local history was provided by William of Malmesbury, whose *Gesta pontificum* (c.1125) has the earliest (though brief) historical/topographical accounts of a number of English places. In the mid-15th cent. William of Worcester made fuller descriptions of many more.

The *Itineraries* of John \*Leland (not published until 1710) were a similar but grander enterprise, part of the Tudor 'discovery of England'. He failed in his intention to complete a history of England arranged by shire, but William \*Camden's *Britannia* (1586) did provide such an account. An English translation (1610) and extended editions by \*Gibson (1695) and Gough (1789 and 1806) gave *Britannia* a long and useful life. William Lambard's *A Perambulation of Kent* (1576) began the noble series of English county histories. The title is significant. Writing a county's history and describing its present state ('chorography') went hand in hand. William \*Dugdale's *Warwickshire* (1656) set a new standard for county histories. Characteristic of such works was a commanding interest in the genealogies and lands of the \*gentry who patronized, and often wrote, them.

Such major histories followed as Francis Blomefield's *Norfolk* (1739–75), Edward Hasted's *Kent* (1778–99), and Robert Clutterbuck's *Hertfordshire* (1815). Few of these works were completed without a mighty struggle and financial peril. Plans for most such works from the 16th cent. to the 19th have left nothing behind, but at best a book covering part of the shire, more frequently a collection (often extensive) of manuscript materials, sometimes just a prospectus.

Parallel to the county histories were those of towns. The true founder of urban history in England is John \*Stow. His *Survey of London* (1598) retains the value of great learning and close observation. Other studies followed as, for example, William Somner's of *Canterbury* (1640). In this field also, major research such as that of John Kirkpatrick (c.1686–1728) on *Norwich* remained unpublished. On a lesser level, White Kenner's history of *Ambrosden* (1695) was innovative as a study of 'parochial antiquities'.

In the 19th cent. there was far more local history of most kinds. No doubt this was broadly in consequence of increases in population, wealth, and literacy and decreases in printing costs. Much was done by new local societies concerned with history and historical publication. The Society of Antiquaries of Newcastle upon Tyne was a pioneer. Its journal, *Archaeologia Aeliana*, has been in continuous publication since 1822. From the 1840s many comparable societies were founded, usually on a county basis. Their

journals impress. For example, *Norfolk Archaeology* (1847 on) demonstrates not only the learning of its contributors but also the excellence of Norwich printing and illustration. Such a provincial production more closely resembles a modern historical periodical than any produced nationally until the *English Historical Review* (1886). Local learning could now draw on the sources made available by the Record Commission (1802–37), the Rolls Series (1857–96), and, from the 1850s, via the new Public Record Office. Some 19th-cent. societies were concerned to publish records relating to their counties but the main movement for the foundation of county record societies came in the next century, Lincolnshire (founded 1910) and Northamptonshire (1920) providing important models. The clergy of the Church of England were important in all this, not least because of the force of the new interest in the medieval church and its buildings.

In the *Victoria County History*, inaugurated in 1899, old and new worlds married fruitfully. The project was to cover the whole of England, county by county, and, within the county framework, parish by parish. This was the near institutionalization of the collective ambition of local historians over 300 or so years. A new element was the presence of contributors such as John Horace Round, men of a new breed, trained in history at a university. One of these, Frank Merry Stenton, was appointed, at Reading, to a post of an unprecedented kind: 'Research Fellow in Local History'. Like his predecessor of 1160 he devoted himself to the early history of the abbey of Abingdon. In the 20th cent. the pursuit of local history was transformed by its study in universities. Particularly from the 1960s a flood of studies of all kinds appeared. The most influential of the university historians was William George Hoskins. His *The Making of the English Landscape* (1955) changed the understanding of our past. Hoskins was an English original: learned, opinionated, radical, conservative. His contributions were the introduction of a sense of landscape, for which shire-historians had found no place, fox-hunters though they sometimes were, and the capacity to see local history as a yeoman looking up, rather than a squire looking down. Much of his academic life was spent at Leicester, where he founded a school of local history.

Though local history became increasingly professionalized, the 20th cent. saw an enormous development in 'amateur' interest also. This was partly because local records became more readily available with the provision of professionally staffed county \*record offices. Such provision began to be made in the 1920s and 1930s. Fast development came in the decades after the war of 1939–45. This was the period in which local studies came to play a part in the school teaching of history. The most numerous users of the new record offices were in search of their own ancestors. The magnetism of \*genealogy is as strong in the 21st cent. as it was in the 17th and draws far more people.

**Locarno, treaties of, 1925.** These treaties (1 December 1925) briefly raised hopes that Europe was at last settling

down after the First World War. They confirmed the inviolability of the frontiers between France, Belgium, and Germany, and the demilitarization of the Rhineland. Britain, intent on European peace and security at the lowest cost to herself, refused to make any engagements to reinforce French commitments in eastern Europe. German entry to the \*League of Nations followed in 1926, while the key negotiators—Briand (France), Stresemann (Germany), and Austen \*Chamberlain (Britain)—continued to meet at the 'Geneva tea-parties' (1926–9). Locarno was at best a form of 'limited détente'.  
CJB

**Locke, John** (1632–1704). Perhaps the most influential English-language philosopher and political theorist, Locke is regarded as the founding thinker of liberalism. However, his influence on contemporaries was restricted by the political conditions of Charles II's last years. Locke lived in the household of \*Shaftesbury the Whig leader and like him had to go into exile. Locke's important works could not be published until after 1688, although written earlier. He advocated religious toleration, including it in the constitution he drafted for Shaftesbury's Carolina colony. His *Letter Concerning Toleration* (1689) contains two fundamental assumptions: that religion is a matter for each individual, and that churches are voluntary associations. These rule out religious coercion and uniformity, but political considerations led Locke to deny toleration to the intolerant (catholics, he argued) and atheists. His arguments lead logically to the principle and practice of separation of church and state. The *Two Treatises of Government* bases government on the consent of the governed, who need an authority to defend their property. A ruler who turns himself into a tyrant, as Charles II and James II had been doing, forfeits his authority and may be resisted. *An Essay Concerning Human Understanding*, Locke's main philosophical work, appeared in 1690. It and *The Reasonableness of Christianity* (1695) provoked more controversy than the political works.  
JRJ

**Lockhart, Sir George** (c.1630–89). Lawyer. Lockhart's father was a Scottish judge and his elder brother William a soldier and diplomat. George Lockhart served as advocate to \*Cromwell when he was protector, was pardoned at the Restoration, and became one of the leading advocates at the Scottish bar, defending \*Argyll at his trial for treason in 1681. In 1685 James VII appointed him lord president of the Court of Session. He was shot in March 1689 by an aggrieved private suitor. His elder son George, an active Jacobite, was killed in a duel in 1731: his younger son Philip was shot after the Jacobite surrender at \*Preston in 1715.  
JAC

**lollardy.** Described recently as 'the premature reformation', lollardy developed originally from \*Wyclif's teaching. Lollards (from middle Dutch *lollaerd*—a mumbler) were a motley group lacking theological coherence. Few lollards emulated Wyclif's intellectualism, but Oxford lollardy lingered on with a resurgence in the 1400s under William Taylor and Peter Payne. Though Archbishop \*Arundel dealt the death blow to academic Wyclifism at the Council of Oxford (1411), the last academic, Richard Wyche, was not put to death until 1440. Lollardy also attracted influential men, close to

## London

the court, some driven by genuine puritanism, some anticlerical, some selfishly cynical with eyes on clerical wealth. These included the archbishop of York's brother William Neville, and even Arundel's relatives had lollard friends. Providing havens for writing and copying texts, they patronized lollard preachers, which alarmed the government, who enacted the statute *\*De heretico comburendo* (1401) to arrest unlicensed preachers and sometimes hand them over for public burning. After Sir John Oldcastle's abortive revolt (1414) and death (1417), aristocratic lollardy was a spent force. Chased from university and aristocracy, lollardy became geographically disparate, embracing local artisans and yeomen farmers, who held negative, often simplistic, views. They banned organ music and church bells, but caused greater concern by criticizing transubstantiation, confession, indulgences, and pilgrimages. Though the authorities feared lollards as dangerously articulate with a backbone of literacy, their negative ideas had little popular appeal except for emphasis on Bible-reading. A small Wyclifite group produced the lollard Bible, the first full translation from the Vulgate (1390), a 'very literal almost unreadable version' which the Church unsuccessfully banned (1407). By leaving biblical translation in the hands of this radical group, ecclesiastical authority damaged the case for authorized Bible translation, which existed on the continent. Though lollardy went underground, its extremism made the mass of lower orders, already conservative, more so. Modern historians feel that Wyclif 'did little or nothing to inspire [the Reformation] and in effect [unintentionally] did every thing possible to delay' it by discrediting even moderate reform.

WMM

**London** (Roman). Londinium was the provincial capital of Roman Britain from c. AD 60 onwards. Roman remains have been located at the confluence of the rivers Thames and Fleet. The precise legal status of Roman London is much debated. It was probably a *colonia*, though it appears to have been something of a special case; the main impetus for its development probably came from the existence of a trading association of Roman citizens (the *conventus civium Romanorum*) taking advantage of London's superb geographical location at the hub of the network of Roman roads and on the banks of the navigable Thames. London's status appears to have been enhanced after \*Colchester (the original provincial capital of Roman Britain) was destroyed during the Boudiccan revolt of AD 60. A tombstone of the new procurator, Gaius Julius Classicianus, dating to the aftermath of the revolt, suggests that London had now become the seat of administration. Possibly London had been less severely damaged than Colchester. This would explain London's rapid development in the later 1st cent., when building projects included the first forum and basilica, the governor's palace, the public baths at Cheapside, and, dating to c. AD 100, a fort and adjacent amphitheatre.

ES

**London, diocese of.** The senior see after the two archbishoprics, it comprises Greater London and part of Surrey north of the Thames. Though a British bishop from London attended the Council of Arles in 314, \*Augustine did not establish a diocese for the East Saxons until 604, but pagan reaction soon forced \*Mellitus, the first bishop, to flee. The

set-back and popular veneration for Canterbury thwarted Pope Gregory's intention that London should be the metropolitan see. The true succession of London bishops restarts with Wine in 666, for Cedd, Celtic bishop of the East Saxons (654–64), was never based in the city. Many bishops of London have been translated to Canterbury, but, of those who were not, significant ones include Gilbert \*Foliot (1163–87), opponent of Becket; Edmund \*Bonner (1539–50 and 1553–9), papalist; Nicholas \*Ridley (1550–3), reformer, burned at the stake; Henry \*Compton (1676–1714), opponent of James II; Edmund \*Gibson (1723–48), Walpole's ecclesiastical manager; Mandell Creighton (1897–1901), the historian. \*St Paul's cathedral dates from the earliest years of the see, when significantly \*Æthelbert, king of Kent, not the king of the East Saxons, founded it for Mellitus. The medieval St Paul's, mostly 12th and 13th cent., was destroyed in the Great Fire of 1666. The present cathedral (1675–1710) by Christopher \*Wren is in Renaissance style and miraculously survived the London Blitz (1940–1).

WMM

**London, fire of, 1666.** The dangers of fire in any early town with close-packed wooden buildings were always considerable, but the blaze that started in Thomas Farriner's bakehouse in Pudding Lane, near London Bridge, in the early hours of Sunday, 2 September, has become known as the 'Great Fire'. \*Pepys saw it early, shrugged his shoulders, and returned to bed. But a driving east wind fanned the flames across firebreaks, and, despite the efforts of ward and parish officials and the lord mayor, they soon became uncontrollable. Residents gathered up what valuables they could and fled, many believing that the Dutch and French had started the conflagration. The wind persisted until Tuesday night, but it was not until Friday that the firefighters and county militia could assess the devastation. The Tower of London (to the east) had survived, but Old St Paul's cathedral, the Guildhall, Royal Exchange, 87 parish churches, 52 company halls, markets, gaols, and 13,200 houses had succumbed; the area damaged (463 acres) was greater than that in the 1939–45 Blitz, with losses estimated at the then almost incomprehensible sum of over £10 million. Charles II, who had placed his brother in control of the city to maintain order and discourage looting, rapidly introduced measures for recovery. Some of the rebuilding schemes submitted were too hurried to be practical, but under six commissioners a new city was built on the old plan though with improved access and hygiene, and in brick rather than wood. To commemorate events, the Monument was erected near the site of the outbreak (1677); to the inscription on the north panel the words 'But Popish frenzy, which wrought such horrors, is not yet quenched' were added in 1681 but removed in 1830.

ASH

**London, government and politics.** The exceptional size and resources of London gave it military significance in addition to its political importance as the capital. William the Conqueror granted London a charter, confirming its previous privileges, but also began building the White Tower, nucleus of the \*Tower of London, as a strong point. London did not replace the old Wessex capital of \*Winchester until the 12th cent. Indeed, as long as the king and his household were continuously on the move, the concept of a capital

could scarcely develop, but Edward the Confessor's decision to build his great abbey at \*Westminster, reinforced by William Rufus's building of \*Westminster Hall, and the beginning in 1176 of a stone \*London bridge, pointed the way. Before the Conquest, Saxon rulers had granted London remarkable privileges—a folk moot which met three times a year; the husting (Danish: *hus-ting* (house assembly) ) which met every week; aldermen to supervise justice in the ward moots. In 1018 London had paid one-seventh of the national tribute to \*Cnut and in the decades before the Conquest the \*witan had met there more often than anywhere else. Londoners added to their privileges in subsequent centuries in a long series of charters. Henry I granted them the right to elect two sheriffs who should also act for Middlesex, and in Richard I's reign they gained a mayor. During the convulsions of John's reign, they gained further concessions and the mayor of London was the only commoner to serve on the committee of 25 appointed to enforce \*Magna Carta. When representatives of the boroughs began to be summoned to Parliament in the late 13th and early 14th cents., London usually returned four members rather than the standard two—though even that grossly under-reflected its population and wealth.

The government of the city, as it developed, consisted of a Court of Aldermen, chosen for life; a Common Council of some 200 members, chosen annually by the wards; a Common Hall of some thousands, representing the liverymen; and ward moots or parish meetings. The wards were further divided into precincts—small neighbourhood units of 50 to 100 houses—which also met regularly. The Court of Common Hall elected the two sheriffs and nominated two members for the mayoralty, the Court of Aldermen choosing one. The executive was the mayor (after 1283 increasingly referred to as the lord mayor), the two sheriffs, a large number of paid officers, of whom the recorder and town clerk were the most important; and a host of lesser officials, paid and unpaid, down to precinct level, including scavengers, constables, night-watchmen, and rate-collectors. The wealth of the city from tolls and dues enabled each level of government to entertain itself well and award contracts to its friends and supporters. The lord mayor presided over the Court of Common Council, in which the aldermen also sat, and which acted as a kind of executive committee. There was a constant struggle for power between the component parts, the Common Council and even more the Common Hall tending to radical disenchantment with the national government, the aldermen, consisting of the senior and wealthy merchants, often on close terms with the government of the day. Seldom did the city speak with one voice on any political issue. Great influence was also exerted by the \*livery companies which developed from the medieval guilds: the Weavers' charter was granted in 1155, Fishmongers' 1272, Goldsmiths', Merchant Taylors', and Skinners' 1327, Drapers' 1364, Mercers' 1394, and Grocers' 1428. London's wealth and its closeness to the court meant that its representations had to be taken seriously, and its privileges included the right of direct access to the sovereign, which could be used to present irritating petitions and unwelcome advice.

On several occasions London was in the hands of rebels—Wat \*Tyler in 1381, Jack \*Cade in 1450, Thomas \*Wyatt in 1554—attempting to seize or intimidate the government. These incursions were rarely successful, partly because there was little government to seize, partly because it was difficult for rebel leaders to control their men once they had entered the city. Nor were Londoners—extremely conscious of their own privileges—greatly inclined to welcome peasants, Cornishmen, or Highlanders. Of more consequence in national affairs were the occasions when the city itself acted with unity and resolution. Londoners, with their close financial and trading links with the Low Countries, were very receptive towards reformed doctrines in the early Tudor period and London became the spearhead of the English \*Reformation. One hundred years later, it was in the forefront of the opposition to Charles I, and the Civil War may, in one sense, be seen as London versus the rest. The resources of the capital in men and money were the mainstay of the parliamentary cause and the pattern of the conflict was dictated by Charles's efforts to fight his way back into London after he had fled the capital in 1642. London gave strong support to \*Shaftesbury during the \*Exclusion crisis and forfeited its charter temporarily as a consequence, and for much of the 18th cent. was a thorn in the side of Whiggish aristocratic governments. The tensions between a Whig Court of Aldermen and a Tory/Jacobite Common Council led \*Walpole in 1725 to push through the City Election Act to strengthen aldermanic control. But radical London was not subdued. William \*Beckford and John \*Wilkes used London as their power base for attacks upon George III's ministers, the former even offering the king a well-publicized rebuke at an audience in 1770. In the 1790s the \*London Corresponding Society pressed for reform of Parliament and London played an important part in the \*chartist agitation of the 1840s. Later in the century London radicalism was less evident, partly because new towns like Birmingham, Manchester, and Sheffield had taken up much of the running, partly because London's enormous size made it difficult for politicians to organize it.

The growth of London also placed great strain on its governmental institutions. London itself had long before expanded beyond the city limits, taking in Southwark in 1550. By 1811, only one-tenth of the capital's population lived within the city's jurisdiction and the corporation had little desire to acquire responsibility for the remaining nine-tenths. What administration there was outside the city was left largely to parishes and vestries, supported by a patchwork of trusts, commissions, and charities. A leap forward in co-ordination came in 1829 with the Metropolitan Police Act but, significantly, it did not apply to the city proper, which set up its own police force ten years later. The \*Municipal Corporations Act of 1835 did not include London, whose government continued unchanged while some of the new councils like Birmingham acquired a reputation for municipal enlightenment. Not until 1888 was the London County Council established, taking in an area from Woolwich to Hampstead and from Wandsworth to Hackney. A second tier of 28 borough councils operated beneath, sharing responsibilities. The London County Hall, on the

south bank of the Thames, was opened in 1922 as a symbol and headquarters for the new authority. It was controlled first by the Liberals, from 1907 by the Conservatives (Municipal Reformers), and from 1934 by Labour. Herbert Morrison's leadership in the 1930s was intended to make Labour London a flagship for municipal socialism, particularly in housing and environmental matters. But London was once more reorganized in 1965, partly for party advantage, partly because Greater London had outgrown the LCC area. The Greater London Council supervised 31 boroughs and the cities of London and Westminster. The Conservatives held power at first but lost control to Labour in 1973. Dislike of its left-wing politics and jealousy of any rival source of authority caused the Thatcher government to abolish the GLC in 1986, leaving London as the only capital city with no overarching authority. Power was exercised by 33 borough councils. The 1997 Labour government proposed an elected mayor as London's executive, and, after a referendum, Ken Livingstone was chosen with his main task to improve London's transport. JAC

**London, growth of.** Describing London's growth is hampered by two problems. First, there are no reliable estimates of its population before the middle of the 16th cent. and secondly there is the contentious issue as to what geographical area 'London' covered. Before the 19th cent., 'London' is sometimes taken to mean the effective jurisdiction of the lord mayor, the city within and without the walls and the so-called 'liberties'. Others, however, take the limits of the London bills of mortality, as finally determined in 1636, to define the boundaries of the capital. In the 19th cent. the geographical area covered by the London County Council (1889–1965), sometimes called 'inner London', is referred to; elsewhere London can include that rapidly growing suburban area known as 'outer London' included within the jurisdiction of the short-lived Greater London Council (1965–86). London here refers to the widest definitions.

There is little doubt that London's growth is a historical phenomenon of startling proportions. It was Britain's biggest settlement as early as the 7th cent. It began a phase of rapid growth in the late 10th cent., in 1100 its population may have numbered 25,000, and by 1200 perhaps 40,000. Recent research suggests that the city numbered between 80,000 and 100,000 people by 1300. London's population contracted after the famine of 1315–18 and the Black Death (1348): its population still numbered only about 50,000 in 1500.

Sixteenth-cent. London grew more rapidly than England. The first well-grounded estimates suggest a population of about 75,000 in 1550, 200,000 in 1600, 400,000 in 1650, and over half a million by 1700. The 18th cent. saw an initial slowdown of metropolitan growth but the first census in

1801 revealed the population of London to be about 1,117,000. Before 1800 most of this growth had been fuelled by immigration since more people died in the capital than were born there, but thereafter London's expansion was by natural increase. Its population doubled again by 1851, when it contained 2,685,000 people and by 1901 it comprised a metropolis of some 6,586,000 inhabitants. London's growth peaked at about 8,700,000 on the eve of the Second World War. Since then out-migration to more distant suburban areas has seen the population of 'Greater London' fall, and in 1988 it contained just 6,700,000.

London's early growth owed much to its development as a seat of government in the 13th and 14th cents., and to its increasing share of the nation's overseas trade. Disproportionate growth thereafter also occurred because it was a world city, not merely a national capital. The development of its financial institutions in the late 17th cent., its role as a colonial and then imperial capital in the 18th and 19th cents. are vital in explaining its phenomenal expansion. JPB

**London, treaty of, 1357.** David II of Scotland was captured at Neville's Cross in 1346 and taken to the Tower of London. Protracted negotiations for his release came to nothing until the treaty of London of May 1357. The Scots paid a large ransom and gave hostages, but the question of the succession in Scotland was left to one side. The treaty was confirmed at Berwick in October. JAC

**London, treaty of, 1358.** Draft treaty. Edward III's diplomatic hand was considerably strengthened by the capture of John II of France at Poitiers. This treaty, to which the latter seems to have agreed, would have given Edward Aquitaine, Poitou, Ponthieu, and Calais in full sovereignty, as well as a ransom payment of 4 million écus, yet without obliging him to drop his claim to the French throne. It was never ratified, and Edward subsequently increased his demands in a second treaty (March 1359), to include Normandy, Anjou, and Maine. It may be that he had set his demands deliberately high so that the inevitable French refusal would justify the renewal of war. He invaded again in October 1359 with his largest ever army, aiming, it seems, for a coronation at Rheims. AC

**London, treaty of, 1423.** Anglo-Scottish agreement finalizing the terms of James I's release from English custody. King James was to pay 60,000 marks in English coin, 10,000 of which would be remitted as the dowry of his queen, Joan Beaufort. A seven-year truce was subsequently made at Durham (March 1424). NATM

**London, treaty of, 1474.** In 1473 Edward IV was preparing an attack upon Louis XI of France but having difficulty mustering allies. In July 1474, by the treaty of London, Charles of Burgundy agreed to recognize Edward as king of France and join his campaign, in exchange for territorial concessions. But in 1475 Burgundy gave little help, Edward's campaign was inconclusive, and an Anglo-French settlement was reached at Picquigny. JAC

**London, treaty of, 1518.** The victory of Francis I, the young king of France, over the Swiss at Marignano in 1515

threatened the balance of power in western Europe. \*Wolsey and Henry VIII began constructing an anti-French alliance which soon collapsed. In 1518 they switched policy to a *rapprochement* with Francis and the treaty of London followed. Tournai, captured by the English in 1513, was to be handed back for compensation; Mary, Henry's 2-year-old daughter, was to marry the dauphin; France was not to support the anti-English party in Scotland; there was to be a treaty of universal peace and a crusade against the Turks. Though endorsed by the meeting of Francis and Henry in 1520 at the \*Field of Cloth of Gold, the peace did not hold and the *rapprochement* did not prosper. By 1521 Wolsey was negotiating for a marriage between Mary and Charles V, the Habsburg emperor, and a visit by Charles in 1522 agreed plans for an attack upon France. JAC

**London, treaty of**, 1604. When James I succeeded Elizabeth, he found his new kingdom at war with Spain in support of the Dutch. After lengthy negotiations in London, a suspension of hostilities was converted into peace. James refused to recall 'volunteers' in the Dutch service but agreed that they should not be recruited in his dominions. The vexed question of trade with regions claimed by Spain was left unresolved. Spanish ships in distress were to be permitted to seek refuge in English ports. Englishmen in Spain would not be harassed by the Inquisition provided that they caused no public scandal. Though James reserved the right to represent the Dutch case should they wish to open negotiations, the treaty was widely regarded as abandoning them. Reconciliation with Spain remained a major objective with James for the rest of his reign. JAC

**London, treaty of**, 1827. This was an attempt by Canning in company with Russia and France to protect British interests during the Greek revolt against Turkish rule by a partnership with Russia. It followed an earlier protocol (April 1826) which aimed at securing internal autonomy for a tribute-paying Greece. The three powers demanded an immediate armistice, and an allied fleet under Admiral \*Codrington was sent with vague instructions to prevent further fighting. In the event the Ottoman navies were destroyed at \*Navarino in October 1827. The treaty was a step on the road to an independent Greece in 1832. CJB

**London, treaty of**, 1831. The settlement of the Belgian question was the first test for \*Palmerston on becoming foreign secretary in Lord \*Grey's administration. Belgium, previously the Austrian Netherlands, had been reunited with Holland in 1815 to form a barrier to French expansion, but had rebelled in August 1830 and declared itself independent. Under threat from the Dutch, the Belgians looked to France for assistance, provoking fears of renewed French aggrandizement. A conference of the great powers in London in February 1831 recognized Belgian independence and, when the Dutch refused to submit, French troops marched in. When they proved reluctant to leave, Palmerston dropped hints of war. By the treaty of November 1831 Belgian independence and neutrality were guaranteed. The Dutch refused to accept until 1839 when a second treaty of London repeated the assurances. Palmerston had pre-

vented any French territorial acquisitions and helped to establish a constitutional state, under Leopold of Saxe-Coburg. In accordance with the guarantee of 1839, aimed at protecting Belgium from France, Britain declared war in 1914 when Belgium was invaded by the Germans. JAC

**London, treaty of**, 1840. This was concluded with Russia, Austria, and Prussia to secure the ultimate return of Syria from Egypt to Turkey. While it provided for the closing of the Straits to all warships (to Britain's disadvantage), it ended whatever unilateral advantages Russia had enjoyed under the treaty of Unkiar-Skelessi (1833). \*Palmerston finally persuaded sceptical cabinet colleagues that France, which was backing Egypt, would not risk war. Allied forces speedily restored Syria to Turkish rule. The settlement was confirmed by all the powers, including France, by the Straits Convention of 13 July 1841. CJB

**London, treaty of**, 1871. The treaty of Paris, at the end of the Crimean War, declared the Black Sea to be neutral and demilitarized. In 1870, during the Franco-Prussian War, Russia took the opportunity to repudiate the clause. Since there was nothing a conference in London could do but acquiesce, it passed a pious resolution that states could 'rid themselves of their treaty engagements' only with the consent of the other signatories. JAC

**London bridge**, for centuries the sole thread across the Thames, saw both ceremonial entries into the city and rebellious challenges; the gruesome custom of displaying traitors' heads above the gatehouse, commenced with William \*Wallace (1305), was discontinued in 1661. \*Rennie's 1831 stone bridge was sold and re-erected (1971) in Arizona. ASH

**Londonderry** was until 1973 one of the six counties of Northern Ireland. Its border with Antrim to the east is the river Bann, the river Foyle marks it off from Donegal in the Irish Republic to the west, and the border with Tyrone to the south runs through the Sperrin Mountains. It is dominated by Londonderry itself, near the mouth of the Foyle, with a population of nearly 100,000. As \*Derry, it was a see from 1254; there is also a Roman catholic bishopric. In 1610 the city of London took over the area for colonization and began building the walls. In 1689, as a protestant bastion, it withstood the famous siege by James II's troops. Later it became a centre for linen manufacture and in the 20th cent. diversified into chemicals and light industry. The naval facilities of Lough Foyle were of great importance during the Second World War since the Irish Republic had reneged on its treaty obligations. Civil rights demonstrations and disorder in the city in 1969 were the beginning of the renewed troubles that have haunted Northern Ireland for many years. The county is divided between catholic and protestant. In 2001 the Foyle division returned a \*Social Democratic and Labour Party member to Westminster, and in Londonderry East a \*Democratic Unionist took the seat from the \*Ulster Unionists. JAC

**Londonderry, siege of**, 1689. When William of Orange landed at Brixham, Lord-Lieutenant \*Tyrconnel, to furnish

Irish troops for England, had weakened his Ulster garrisons. In December both Londonderry and Enniskillen shut their doors against fresh garrisons, and, after the rout of the Ulster protestants at Dromore in March 1689, became crowded with refugees. In April James II himself advanced against Londonderry. Governor Robert Lundy was prepared to surrender, but was overthrown by a popular rebellion and replaced by Major Henry Baker and the Revd George \*Walker.

The besiegers lacked artillery, and their communications were harassed by the aggressive Enniskillen men. Londonderry, however, was ill provided and had 30,000 mouths to feed. It was in extreme danger before a Williamite supply ship broke the besiegers' boom on Lough Foyle on 28 July, terminating the siege. Apart from securing the Williamite bridgehead in Ulster, the siege became a symbol of populist defiance and distrust of official leadership in protestant Ulster.

BPL

**London Gazette.** Published as the *Oxford Gazette* prior to 5 February 1666, this bi-weekly was an immediate success, despite its dullness, since it carried all the official news. Competition from new, livelier publications after 1695 and the Stamp Act (1712) led to a decline in importance and sales, though not demise.

ASH

**London Missionary Society.** Founded in 1795 as a non-denominational body to proclaim 'the glorious gospel of the blessed God' abroad, it adopted the name London Missionary Society (1818) and became mainly \*congregationalist. The first mission to Tahiti (1797) only became successful under John Williams (1817), translator of the New Testament into Rarotongan (1834), who was killed and eaten (1839). Brief success in Sierra Leone was followed by lasting success in South Africa under John Philip, where its most celebrated missionaries were Robert Moffat and David \*Livingstone. There were also missions to India and under Robert Morrison to Guangzhou, China (1807–34), the first protestant missionaries there. Since 1973 it has been known as the Council for World Mission.

WMM

**London University** was founded largely on the initiative of Lord \*Brougham. Opening in 1828, University College had no religious entrance requirements and became known as 'the godless institution of Gower Street'. In the following year, in contrast, King's College was founded to promote 'the doctrines and duties of Christianity'. By a charter of 1836, the university, consisting of King's, University College, and some medical schools, became an examining body, offering degrees to students who had studied elsewhere. From 1858, matriculation examinations were added, which required candidates to pass five subjects at the same examination. Women were admitted to examinations from 1867 and three colleges were opened for them in 1870 and the 1880s.

The Selborne royal commission (1889–90) recommended that teaching powers were needed for London. The Gresham royal commission (1892–4) favoured a single university authority. These changes were implemented in 1900 and a federal structure adopted. London has a vice-chancellor and

a principal, and consists of schools of the university, medical schools, postgraduate medical schools, and senate institutes. Senate House and a nucleus of colleges were built in Bloomsbury in the late 1930s.

PG

**Long, Walter** (1854–1924). Conservative statesman. After holding junior office, Long entered the cabinet in 1895 and held a variety of middle-rank ministerial positions until the Conservative electoral disaster of January 1906. Between 1906 and 1910 he consolidated his position within the first rank of Conservative politics, emerging as a moderate tariff reformer and as an enthusiastic patron of Irish unionism. He was a contender for the Conservative leadership in November 1911, but—with Austen \*Chamberlain—withdrawed in favour of Bonar \*Law. It is doubtful whether he had either the equanimity or the political subtlety to lead the Conservatives, though he certainly represented an antidote to Balfourian sophistication. He was appointed president of the Local Government Board at the formation of the first wartime coalition in May 1915, and became colonial secretary when the Lloyd George coalition was formed in December 1916. He was 1st lord of the Admiralty, his last ministerial post, between January 1917 and February 1921: he received a viscountcy after his retirement. A conscientious though unimaginative administrator, who held a representative significance as a leader of landed Toryism, Long is often depicted as a dull-witted squire, but was ferociously ambitious and strategically alert.

AJ

**Longchamp, William** (d. 1197). Bishop and statesman. Longchamp was born in Normandy and was taken up by Richard, heir to Henry II, who appointed him chancellor of Aquitaine. When Richard succeeded in 1189, Longchamp was made chancellor of England, given the see of Ely, and became a papal legate. In the long absences of Richard, he was the most powerful man in the kingdom. With the bishop of Durham, he was appointed joint \*justiciar in 1189 and sole justiciar the following year. A recent arrival, with little or no English and a domineering manner, he was far from popular. Richard's brother John acted as a rallying-point for opposition to Longchamp; his seizure of \*Geoffrey, archbishop of York, scandalized many; and in 1191 he was besieged in the Tower and forced into exile on the continent. Richard continued to employ him on diplomatic and financial matters and he made two more brief visits to England in 1193 and 1194. He died at Poitiers on a mission to Rome. The hatred of most chroniclers, particularly \*Gerald of Wales, makes it hard to know the truth, but Longchamp was said to be stunted, lame, and uncouth.

JAC

**Longitude Act, 1713.** See HARRISON, JOHN.

**Longleat** near Warminster in Wiltshire was one of the earliest of the great Elizabethan show or prodigy houses, started before Wollaston (1580s) or \*Hardwick (1590s). It was begun by Sir John Thynne, who had done well out of the \*dissolution of the monasteries. The advising architect was Robert Smythson, later employed at Wollaston and Hardwick. Its main feature is the great expanse of windows. \*Brown and \*Repton were both employed in the 18th cent.

on the great park. The Thynne family, subsequently viscounts Weymouth and marquises of Bath, were among the earliest to perceive the commercial potential of aristocracy, and the lions of Longleat are probably better known than the architecture. JAC

**Long Melford church** (Suffolk), dedicated in honour of the Holy Trinity, was completely rebuilt in the second half of the 15th cent. Surviving inscriptions, glass, and wall-painting testify to the prominence of the Clopton and Martin families, among others, in this rebuilding. Very unusually, some idea of what the interior of the late medieval building looked like can be got from a description by Roger Martin, who was a recusant in the reign of Elizabeth I, and who wrote down all he could remember of the furnishings of his parish church. He also gave details of the ceremonies that made up the liturgical year, which included bonfires, feasts, and processions. LR

**Long Parliament, 1640–60.** Charles I's defeat by the Scots in the 'Bishops' wars' diminished both his reputation and his financial resources, leaving him with no option but to summon Parliament in November 1640. But the initiative was seized by his critics, who impeached his chief minister, \*Strafford, and pushed through a bill forbidding the dissolution of Parliament without its own consent. Further Acts, in mid-1641, abolished the instruments of prerogative rule, such as \*Star Chamber, outlawed prerogative taxation, and provided for triennial parliaments, thereby restoring the traditional constitution. Members of both Houses were broadly united behind these measures, but when their leaders, distrusting Charles, proposed to take away his right to appoint ministers or control the army, they alienated the conservatives and opened the way to civil war. Even after victory had been secured there were continuing divisions between radicals and moderates over the shape of the post-war settlement, and these were only resolved by a radical coup in December 1648, when Colonel \*Pride 'purged' the Commons of its moderate members.

England was now governed by the 'Rump' of the Long Parliament, which executed the king, abolished the monarchy and House of Lords, and declared a republic. But this was the limit of its radicalism, and army leaders like \*Cromwell, who had been looking to the Rump to take the lead in reforming both state and church, became angered and frustrated. Faced with the prospect of continuing stalemate, Cromwell called in troops to expel the Rump in February 1653 and set up a new regime. The Long Parliament remained in abeyance until 1659, when the army generals who seized power after Cromwell's death briefly recalled the Rump. But not until early 1660, when \*Monck ordered the readmission of the excluded members, did the full house reassemble. By this time, however, the need for new elections was overwhelming, and in March 1660 the Long Parliament voted to dissolve itself. RL

**lord advocate.** The post dates from the 15th cent. when the lord advocate quickly became a prominent officer of the Scottish crown. He had a legal and political role, becoming public prosecutor with a seat in Parliament. From 1746 the

lord advocate was largely responsible for the management of the Scottish administration until the department of the secretary for Scotland was established in 1885. Today the lord advocate advises the government on Scottish legal matters and has complete discretion over criminal prosecution in Scotland. He is often an MP and a member of the Privy Council. The post is political and changes with the government. RAS

**lord chamberlain.** See CHAMBERLAIN, LORD GREAT.

**lord chancellor.** \*Edward the Confessor first created the post of chancellor, which has always remained one of the leading offices of state. The chancellor was keeper of the great seal and acted as chief secretary to the king, drawing up charters and writs. When the office of \*justiciar ended in the mid-13th cent. the chancellor became the most important man in the country after the king. He was a leading adviser and presided over meetings of the \*great council. In the 14th cent. the chancellor entered the legal system when he began to hear appeals from subjects unable to obtain justice from the common law courts. From this it evolved that the chancellor became a judge in his own court, the Court of \*Chancery, operating in accordance with the 'principles of equity'. The modern role of the lord chancellor thus straddles both political and legal spheres. He presides over the highest court of appeal in the country, the House of Lords. He is also part of the legislature, acting as Speaker in the Lords. Finally, the lord chancellor is a government cabinet minister responsible for the operation of the English judicial system. RAS

**lord chancellor of Ireland.** The earliest chancellor of Ireland was Stephen Ridel, appointed in 1189. An Irish Chancery was established in 1232 and granted to the chancellor of England, who normally executed the duties by deputy. Later the office was held by English lawyers. As a result, the development of the Irish Chancery followed closely that of the English equity system. Since 1922 there has been one lord chancellor for the whole of the United Kingdom, who is always chosen from the English bench or bar. RAS

**lord chief justice.** The second highest post in the judicial ranking. Since the days of Sir Edward \*Coke, the chief justice of King's Bench has informally used the title of lord chief justice. It is only since 1875 that it has been the statutory title of the president of the Queen's Bench Division of the High Court of Justice. With the creation of the High Court, in 1875, it was decided there was no necessity to retain three separate common law divisions. However it was important to avoid the demotion, or compulsory retirement, of the senior judges as this would have broken the constitutional principle that judges were irremovable. In 1880 the deaths of Sir Alexander Cockburn (chief justice of Queen's Bench) and Sir Fitzroy Kelly (chief baron of the Exchequer) meant that the offices of chief justice of Common Pleas and chief baron of the Exchequer could be abolished. The Exchequer and Common Pleas were merged with the Queen's Bench Division and Lord Coleridge, former chief justice of Common Pleas, became lord chief justice of England. Unlike the lord

## lord high steward

chancellor, the lord chief justice has no political role and remains in office after a change of government. RAS

**lord high steward.** Originally purely a household officer, the task of the steward, or seneschal, was to place dishes on the royal table, but like many comparable offices it gathered other duties and rose in prestige. Eventually, as lord high steward, he performed at coronations and presided over the trial of peers. The lord steward, at first the deputy, retains the household responsibilities and remains an officer of the court. In the 12th cent. the office of lord high steward belonged to the Bigods, earls of Norfolk, but was taken over by de \*Montfort as earl of Leicester. After his death at \*Evesham, the office was given to Edmund Crouchback, Henry III's son, and then merged with the crown. It therefore became necessary to make temporary appointments for particular occasions. At the trial of Lord \*Stafford in 1680, Lord Chancellor \*Finch was created lord high steward so that he could preside; in 1760, at the trial of Lord Ferrers for murder, Sir Robert Henley was hastily given a peerage and appointed. In Scotland, the office became hereditary in the 12th cent. in the Stewart family, who became monarchs in the 14th cent. JAC

**lord justice clerk.** Scottish legal post. Originally the lord justice clerk of Scotland was clerk and assessor to the \*Justiciar's Court. The court, usually presided over by peers, had professional lawyers as clerks. Gradually the post increased in importance and by the late 16th cent. the holder was always a member of the Privy Council. By the late 17th cent. he had become one of the judges in the court itself. Reforms in 1672 created the High Court of Judiciary, the central criminal court of Scotland. The lord justice clerk was usually working head of the court, although he ranked second to the lord justice-general. In the \*Court of Session he ranked equally with the other judges until the reorganization of 1808 when he was made president of the second division of that court. Today the lord justice clerk is the holder of the second highest judicial office in Scotland. RAS

**lord justice-general.** Scottish legal post. From the 15th cent. the lord justice-general was recognized as the supreme judge of criminal cases in Scotland, superseding the post of \*justiciar. The office, usually held by peers, was hereditary in the Argyll family from 1514 until 1628. Though the office continued to be held by noblemen after the reorganization of courts in 1672, the effective work was done by the \*lord justice clerk in the High Court of Judiciary. In 1830 the Court of Session Act declared that after the death of the existing office-holder, the 3rd duke of Montrose, the office of lord justice-general would be merged with that of the lord president of the \*Court of Session. RAS

**lord keeper.** The great seal of England was normally in the custody of the \*lord chancellor. But an office of vice-chancellor or sealbearer in the 12th cent. developed into the separate office of lord keeper. The lord keepership seems to have been used when the holder did not have the standing necessary for the chancellorship and in 1562, by an Act 5 Eliz. c. 18, it was confirmed that the lord keeper-

ship carried the full authority of the chancellorship. Bishop \*Williams, the last clerical holder of the seal, was lord keeper 1621-5, Sir Nathan Wright from 1700, and Sir Robert Henley from 1757, though he was subsequently made chancellor. When no adequate candidate was available, the seal could be put into commission, last done in 1835. JAC

**lord president of the council.** A regular member of the cabinet for much the same reasons as the \*lord privy seal—it is useful to the prime minister to have ministers whose duties are small and who can be asked to undertake special responsibilities or fill the role of elder statesmen. The office originated in Tudor times when the \*Privy Council was evolving from the medieval council. The earliest certain holder of the post was the duke of \*Suffolk, brother-in-law to Henry VIII, from 1530. An Act of 1529, 21 Hen. VIII c. 20, gave the president precedence below the \*treasurer and the \*chancellor but above the \*lord privy seal. The lord president's responsibilities are now residual. Lord \*Harrowby held the post for a remarkable fifteen years 1812-27; \*Balfour held it 1919-22 and 1925-9, and Stanley \*Baldwin 1931-5. JAC

**lord privy seal.** The privy seal developed early in the 13th cent. when the use of the \*great seal was too cumbersome or the king was travelling. From 1275 there was a keeper of the privy seal and the office was upgraded in 1487 when Bishop \*Foxe was designated lord privy seal. By the end of his long tenure, the office had established itself as one of the most important in the realm. Though the privy seal, in turn, became too formal an authorization and was superseded by the signet, the lord privy seal found new tasks, presiding over the Court of \*Requests, set up in the Tudor period to provide justice for poor men. The use of the privy seal was finally abolished in 1884 but by that time the lord privy seal had long established his position as a member of the cabinet. Being without portfolio, he is now available to take on special governmental responsibilities. JAC

**Lords, House of.** The upper chamber of the British Parliament. Originally part of the \*great council or the king's council of the Norman and Plantagenet monarchs, the Lords became separated from the Commons in the reign of Edward III. It has been in continuous existence since, except between 1649, at the end of the English Civil War, when it was abolished by a unanimous vote of the Commons, and 1660, when it reassembled at the Restoration of Charles II. Its membership then consisted of the 'lords spiritual' (the bishops) and the 'lords temporal' (the hereditary and life peers). Before the Reformation the spiritual lords (who then included abbots and priors) were in a majority. After 1529, when the abbots and priors were removed, the House was dominated by the lay peers, whose numbers expanded enormously, particularly after the late 19th cent. With the introduction of life peerages in 1958 (which also allowed peeresses in their own right to sit for the first time), the hereditary element in the House (while still a theoretical majority) declined in its daily attendance. The Labour government of 1997 deprived hereditary peers of their right of

attendance, without being sure what the ultimate composition of the House was to be.

The numerical strength of the lords spiritual was fixed at the Reformation to include the archbishops of Canterbury and York and the 24 bishops (an increase of 5 bishops on the pre-Reformation period). Upon the expansion of English sees, which began with the creation of the bishopric of Manchester in 1847, it was enacted that the number of bishops sitting in the Lords should not be increased. The current lords spiritual consist of the archbishops, the three senior bishops of London, Durham, and Winchester, and the 21 next in seniority of consecration.

Since the Anglo-Scottish Union in 1707, the Scots peerage had assembled in Edinburgh (or by sending a proxy or signed list) to elect sixteen \*representative peers at each general election to sit in the House. By-elections were held when necessary. By votes of the House in 1709 and 1711, Scottish peers who held British titles (i.e. titles conferred after the Union) were not allowed to vote in Scottish peerage elections, nor to sit in the Lords. These votes were reversed in 1782. In 1963 the Act which allowed peers to renounce their titles on their succession also abolished the election of Scottish representative peers (the last election took place in 1959), giving all peers of Scotland rights of membership.

At the Union with Ireland in 1801, the Irish peers met in the Irish House of Lords in Dublin and elected 28 representative peers for life. All subsequent elections to fill a vacancy were conducted by post. The last election took place in 1919, and no vacancies were filled after the creation of the Irish Free State in 1922, although those peers already elected remained members of the Lords. The last Irish representative peer died in 1961. The Irish Act of Union also allowed for the election of four representative bishops of the Anglican Church of Ireland.

The House of Lords is the highest court of appeal, a function developed since the late 13th cent. when Parliament was regarded as the highest court of royal justice, though the control by the House of appeals from the English courts of common law may be traced back to the king's great council. This control was later extended to the Courts of \*Chancery or equity in England (1677), and to the courts of Scotland (by the Union) and Ireland (by an Act of 1720). The appeals were heard by the whole House and any member could take part. An increased work-load led to the problem of finding judicial personnel, and eventually (after a failed attempt in 1856 to create a judicial life peer) led to the creation in 1876 by the Appellate Jurisdiction Act of the modern judicial powers and practice of the House. These included salaried 'lords of appeal in ordinary' (who were to hold peerages only during their terms of office), though the Act did not disqualify any peer from taking part in judicial proceedings. A further Act of 1887 allowed the lords of appeal to retain their peerages for life.

Over the years the powers of the House of Lords *vis-à-vis* the House of Commons have been severely curtailed. This process probably began in 1407 when Henry IV agreed that money grants were to be initiated in the Commons. By resolutions of 1671 and 1678 the Commons asserted their exclusive right to control taxation. The custom was that

the Lords could reject, but not amend, a money bill, but rejection was rarely used as it invariably led to a crisis between the Houses. The rejection by the Lords of the Finance Bill in 1909, which contained \*Lloyd George's 'People's Budget', including such important social measures as old-age pensions, led to a major constitutional crisis which was resolved by two general elections and the promise of a massive creation of peers given by King George V to Prime Minister \*Asquith. The Lords backed down and the resulting Parliament Act of 1911 drastically reduced the powers of the Lords to those of limited delay. A money bill could receive the royal assent after one month even though the consent of the Lords had been withheld, while other public bills could only be delayed by two years (reduced to one year by the Parliament Act of 1949). Upon the massive Labour victory in 1945 the marquis of \*Salisbury, the leader of a permanent inbuilt Conservative majority in the House, established an understanding that the Lords would not delay legislation that had appeared in the winning party's election manifesto. Designed to avoid conflict with the \*Attlee government, this understanding has sometimes led to the House being more critical of Conservative than Labour legislation.

Until 1801, when an increase in membership resulting from the Union with Ireland necessitated a larger venue, the Lords had met in the white chamber of the old palace of Westminster. It then moved to the white or lesser hall. After the fire of 1834 which destroyed large parts of the old palace, the Lords occupied the painted chamber until they moved in 1847 into their present chamber in the new palace. Between 1941 (when the Commons' chamber was destroyed by German bombing) and 1950 the Commons met in the House of Lords, while the Lords met in the royal robing room.

**Lord's cricket ground**, home of the Marylebone Cricket Club and of the Middlesex County Cricket Club, was opened in 1887 by Thomas Lord from Yorkshire in Dorset Square, near Regent's Park. The first match was between Middlesex and Essex. In 1809 he was obliged to move to St John's Wood, a little to the north. The first test match on the ground was between England and Australia in 1884. JAC

**lords of Articles.** See COMMITTEE OF ARTICLES.

**lords-lieutenant** came into existence at a time of considerable unrest after the death of Henry VIII. Protector \*Somerset appointed the earl of Shrewsbury in 1547 to be his lieutenant in the counties of Yorkshire, Lancashire, Cheshire, Derby, Shropshire, and Nottinghamshire and to muster the levies: other lieutenants were appointed a little later. The system was extended in 1549 when there was widespread rioting. Subsequent monarchs found it a useful office and the lord-lieutenant became the chief

## Losecoat Field

royal representative in each shire, usually, though not invariably, a leading nobleman. He suggested to the \*lord chancellor persons fit to serve on the bench and acquired, in the course of time, considerable electoral influence. The growth of a standing army and the reforms of 1871 deprived the lord-lieutenant of most of his military responsibilities, but social prestige remained. JAC

**Losecoat Field, battle of, 1470.** Soon after his capture by \*Warwick's supporters after the defeat of his troops at \*Edgecote, Edward IV succeeded in regaining some freedom of action. In the spring of the following year, Warwick gave covert support to a Lancastrian rising in Lincolnshire, led by Sir Robert \*Welles. Edward defeated the rebels without much difficulty on 12 March 1470 near Empingham, 5 miles west of Stamford. In the rout the rebels tore off their incriminating coats and badges. Welles and his father were beheaded. JAC

**Losinga, Herbert de (c.1054–1119).** First bishop of Norwich (c.1094–1119). Possibly a Lotharingian by descent but English-born, Losinga was educated at Fécamp (Normandy), where he became prior, before moving to Ramsey (Hunts.) as abbot (c.1088) and buying the bishopric of Thetford (1091). Sensitivity forced him to Rome to resign on grounds of simony (1094), but Pope Urban reinstated him. Losinga moved the see to flourishing Norwich (1094), where he started building the impressive cathedral (1096) and monastery on the lines of Canterbury and Durham, but using the Fécamp customary. Fatherly to his Norwich monks, an energetic, enterprising bishop and reputable scholar, he was superior to most contemporaries. Like his predecessors, he unsuccessfully tried to subvert the prestigious independence of Bury St Edmunds abbey. He contributed to the literature over lay investiture and Henry I sent him to Rome to back his case. WMM

**Lostwithiel campaign, 1644.** Charles I's stunning success at Lostwithiel rescued the royalist cause when almost at its last gasp. \*Marston Moor in early July 1644 had been a devastating blow to the king. He was given respite through \*Essex's ill-conceived excursion into Cornwall. The people were hostile, liaison with the fleet bound to be difficult, and it was not clear what strategic advantage the county would afford, even if it could be held. Unsurprisingly, Charles took the opportunity to pursue Essex and cut off his retreat. Essex was bottled up in the Fowey peninsula, heavily outnumbered and desperately short of supplies. His cavalry managed to break out, and Essex himself abandoned his troops, but 6,000 of the infantry were forced to surrender on 2 September. Since the royalists could neither feed them nor guard them with safety, they were disarmed and allowed to leave. Many of them died or were killed on their way home. JAC

**Lothian** is the name applied to the tract of land bounded by the Forth and Tweed rivers, which was absorbed into \*Northumbria in the 7th cent. and became firmly part of Scotland in the 10th cent. Its name was perpetuated in the counties of East, West, and Midlothian and, from 1973 to 1996, in an administrative region of Scotland, comprising the

city of Edinburgh and the counties of East Lothian, West Lothian (except Bo'ness), and Midlothian (except Heriot and Stow). The region was dominated by Edinburgh, the capital of Scotland, with a population of about 435,000, whose employment was derived mainly from administrative, financial, professional, and tourism services; for the remainder of the region's 750,000 people, including those in Livingston new town, manufacturing, including electronics, was more important. The region was abolished in 1996 and its territory divided between four all-purpose councils, Edinburgh, East Lothian, Midlothian, and West Lothian. Whatever the administrative structure, the number and strength of the institutions based in Edinburgh—notably, the banks, the Church of Scotland, the Scottish Office, the Parliament—cannot fail to ensure that the area round Edinburgh retains a large part of the leadership which it acquired when medieval kings of Scotland made it their capital and when ships at the quayside at Leith unloaded French claret and Calvinist theology. CML

**Loudoun, John Campbell, 1st earl of [S] (1598–1662).** Loudoun played a dexterous part in the tortuous politics of mid-17th-cent. Scotland. The foundation of his career was his marriage to the granddaughter of the master of Loudoun, a baroness in her own right. Loudoun was raised to the earldom in May 1633 but, since he opposed Charles I's policies, the promotion was not confirmed until 1641. In the meantime, he had become a prominent member of the \*covenanting party. In 1640 he was sent briefly to the Tower on a charge of treasonably urging Louis XIII of France to intervene, though he claimed that only friendly mediation was intended. Nevertheless, bereft of friends, Charles I was obliged to appoint him chancellor of Scotland and 1st commissioner of the Treasury in 1641. He supported Scottish intervention in the Civil War and was a member of the team which negotiated with the king at \*Uxbridge in 1645 and \*Carisbrooke in 1647. In 1650 he issued a fierce denunciation of \*Montrose at his trial. He was on the losing side at \*Dunbar, took part in Charles II's coronation at Scone in 1651, but surrendered to \*Monck in 1655. At the Restoration, he was deprived of the chancellorship and fined. Though Clarendon accused him of a 'loose and vicious life', Loudoun seems to have been devoted to a \*presbyterian form of church government. JAC

**Loudoun Hill, battle of, 1307.** After the defeat at \*Methven in 1306, Robert I Bruce fled and his followers were savagely treated. He resumed campaigning the following spring and on 10 May inflicted a sharp defeat on a superior force under Aymer de \*Valence at Loudoun Hill, near Kilmarnock. The initiative Bruce had regained was reinforced when Edward I died in July 1307. JAC

**Louisbourg** on \*Cape Breton Island was the keystone of 18th-cent. French strategy in the North Atlantic. Massive fortifications were commenced in 1719–20, and completed shortly before a British and American colonial force captured the 'Dunkirk of North America' in 1745. Restored to France in 1748, Louisbourg was a thriving fishing and trading port as well as the key to the French colony in

the St Lawrence valley. Captured again after heavy bombardment in 1758, Louisbourg was razed by the British in 1760. Since 1961, the fortress has been partly rebuilt as a regional development and heritage project. GM

**Louviers, treaty of**, 1196. When Richard I left the Third Crusade and was imprisoned in Germany, Philip Augustus of France launched an attack on Normandy. Once Richard was released he began a successful counter-attack. At Louviers, in January 1196, Richard recovered most of the territory that had been lost. But after John's accession, the whole of the duchy of Normandy was lost in 1204. JAC

**Lovett, William** (1800–77). Chartist. Born in Newlyn, Lovett migrated in 1821 to London, where he became a cabinet-maker and soon immersed himself in radical reform movements, such as \*Owenite co-operation, the National Union of the Working Classes, and the National Political Union. In 1836 he founded the London Working Men's Association, from which emerged the \*chartist movement. Helped by Francis \*Place and J. A. \*Roebuck, Lovett drafted the People's Charter, and from 1838 was a national chartist leader, though he soon quarrelled with \*O'Connor, whom he denounced as 'the great I am'. Lovett was arrested in 1839 following riots in Birmingham and spent a year in gaol. On his release he concentrated on 'knowledge chartism', emphasizing education, self-help, and alliance with the middle class. But from 1842 he became increasingly marginalized from chartism; and in his later years turned to teaching, writing, and the support of liberal-radical causes, including \*temperance, international peace, and the abolition of slavery. JFCH

**low church**. As against the \*high-church view of the Church of England, low churchmen minimized continuity with the medieval past and the role of bishops and sacraments. Their views owed more to the reform of the 16th cent. but were often described in the late 17th and 18th cents. as \*'latitudinarian'. Politically, they favoured the revolution settlement and were generally Whig in sympathy. Therefore, the accession of the Hanoverians brought them into the ascendancy and also into the political machine. Theologically they represented a liberal arminian view, opposed to calvinism which developed in one direction in Wesleyan methodism. The term passed out of use until the 19th cent. when it was recovered in contrast to the high-church views of the \*Oxford movement. By then it had taken on some of the characteristics of the \*evangelical revival and shed its lukewarm latitudinarianism. To counter the tractarian influence, low churchmen and evangelicals often made common cause with the increasingly popular protestant nonconformist congregations. Whereas the high-church emphasis was on salvation within the divinely appointed church through a sacramental system, the low church emphasized personal salvation through individual conversion and close attention to Scripture as the inspired word of God. Low-church worship was consciously anti-ritualist and held fast to the \*Book of Common Prayer. JFC

**Lowe, Robert** (1811–92). Liberal politician. An albino and a sharply sarcastic debater, Lowe cut a distinctive political

figure. Of Anglican clerical family and educated at Winchester and Oxford, he went to New South Wales and made his name on the legislative council and money from legal practice and property transactions. Back as a Liberal MP (later London University's first member), he gained a reputation for free market and anti-democratic views, the latter apparently sharpened by Australian experience. As vice-president of the Privy Council and responsible for popular education, he introduced the 1862 'revised code' linking government grants to examination results in basic subjects, antagonizing the religious denominations and the teachers. Out of office Lowe fronted the Whig \*'Adullamite' revolt against the 1866 Reform Bill, bringing down \*Russell's government and putting the Conservatives in office. When they passed a comparably 'democratic' measure, Lowe concluded it was necessary 'to compel our future masters to learn their letters'. Chancellor of the Exchequer in \*Gladstone's 1868 government, Lowe, after early success, had to withdraw his 1871 budget and was moved to the Home Office in 1873 under a cloud of departmental mismanagement. A public speech criticizing the queen in 1876 led to withdrawal and apology in the Commons, but failing eyesight and personal unpopularity also weakened Lowe's position. He was created Viscount Sherbrooke in 1880. A notable administrative and educational reformer, Lowe suffers in reputation from the sharpness of his anti-popular language. BIC

**Lowestoft, battle of**, 1665. A heavy engagement in the second Anglo-Dutch War between the English fleet, commanded by James, duke of York (later James II), \*Sandwich, and Prince \*Rupert, and a Dutch fleet under Jacob van Opdam, on 3 June. Pepys wrote that the noise of the gunfire could be heard in the streets of London. Opdam was killed when his flagship blew up and the Dutch losses were severe. 'A great victory, never known in the world,' was Pepys's summary. JAC

**Lowry, Laurence Stephen** (1887–1976). Painter. The only child of a Manchester estate agent, Lowry worked all his life as a clerk, retiring in 1952 as chief cashier. He never married. He painted in his spare time, studying at the Municipal College of Art and then at the Salford School of Art. He sold his first painting in 1930, and exhibited two years later at the Royal Academy, to which he was elected in 1962. His style was simple, almost naïve. His range was wider than sometimes suggested, with good portraits of himself and his parents, but his popularity came from his canvases of the mills and factories of his native Lancashire, dotted with small trudging workers—'God's ants' was one description. He was inevitably hailed as the spokesman of alienation in modern industrial society, but his Bruegel-like figures often seem more preoccupied than crushed, and the prevailing bleakness is shot through with quizzical humour. The Lowry Centre at Salford was opened by the queen in 2000. JAC

**Lucan, George Charles Bingham, 3rd earl of** (1800–88). Born into an aristocratic family, George Bingham became an officer in the British army by purchase in 1816. After ten years of further purchase, he gained command of the 17th Lancers. Bingham had a reputation for personal bravery but

## Lucknow

was also ruthless and harsh. He relinquished his command in 1837, succeeding to the title of Lord Lucan two years later. Despite his lack of recent military experience, in 1854 Lucan was appointed to command a cavalry division for service against the Russians. Landing in the Crimea in September, the cavalry accompanied the rest of the army in an advance on Sebastopol; on 25 October, during the battle of \*Balaclava, Lucan's poor relations with his brother-in-law Lord \*Cardigan contributed to the ill-fated \*'Charge of the Light Brigade' under Cardigan's command. Lucan rose to the rank of field marshal in 1887. JLP

**Lucknow** or Luknau was the capital of Awadh annexed by the British in 1856. During the \*Indian mutiny, the British residency was subjected to a long siege beginning in June 1857. Sir Henry \*Lawrence, the chief commissioner, was killed in August and the town's relief was not accomplished until 16 November. DAW

**Lucy, Richard de** (d. 1179). Justiciar. De Lucy was one of the chief props of Henry II's reign. He came from the knightly class. He originally supported Stephen and by the treaty of \*Winchester of 1153, which arranged the succession, he was put in charge of the Tower. He was joint justiciar with the earl of Leicester until 1168 and sole justiciar until 1178. He supported the king against Thomas \*Becket, who excommunicated him in 1166 and again in 1169 as 'a promoter of royal tyranny'. In the great crisis of Henry's reign in 1173-4, when the king was campaigning against rebels on the continent, de Lucy was the mainstay at home, driving back William the Lion of Scotland and defeating the rebel earl of Leicester at \*Fornham St Genevieve. He held the office of justiciar for well over twenty years and was known as 'the loyal'. JAC

**Luddites.** Machine-breakers, so called after a mythical leader, General Ludd. In 1811-16 textile workers in the east midlands, south Lancashire, and west Yorkshire met secretly in public houses or on the moors, took oaths, and smashed the machinery of mill-owners who refused their demands. The attacks were for specific industrial objectives: the destruction of shearing frames and gig mills (Yorkshire), power looms (Lancashire), and resistance to the breakdown of custom in the midlands framework-knitting industry. These were economic grievances which sprang from structural and technical changes in the industry, aggravated by trade depression, unemployment, and high prices. At a time when trade unions were illegal, Luddism may be interpreted as collective bargaining by riot: frame-breaking in the east midlands was an attempt to coerce employers rather than hostility to machines as such. Some Luddites may have harboured revolutionary intentions: the organization was so shrouded in secrecy, and so difficult to penetrate, as to support fears of an underground movement aiming at armed insurrection. Despite the deployment of spies and informers and 12,000 troops in the north and midlands, the government experienced great difficulty in dealing with the Luddites who, after their nightly attacks, disappeared into sympathetic local communities. Eventually the Luddite bands were tracked down and the

reputed leaders executed or transported. The background to Luddism in Yorkshire is vividly described in Charlotte Brontë's novel *Shirley*. JFCH

**Ludford Bridge, battle of**, 1459. After \*Salisbury's victory at \*Blore Heath, he marched to Ludlow to join his allies \*Warwick and \*York. They were confronted by a large Lancastrian force led by Henry VI himself. After a skirmish on 12 October near the bridge over the Teme, the Yorkist leaders fled, leaving their troops to surrender. JAC

**Ludlow, Edmund** (c.1617-92). Ludlow was one of a group of austere republicans that included \*Vane and \*Haselrig. His father Sir Henry Ludlow, a Wiltshire landowner, represented the county in the \*Long Parliament and was a fierce opponent of the king's policies. Ludlow himself joined \*Essex's army in 1642 and fought throughout the war, mainly in Haselrig's cavalry. Returned for Wiltshire in 1646, he signed the king's death warrant in 1649. In 1651-5 he served in Ireland, though disapproving \*Cromwell's Protectorate. Returning to Parliament in 1659, he opposed Richard \*Cromwell and, after his fall, joined Haselrig in the \*Council of State. He was about to join \*Lambert's rising when it collapsed and at the Restoration in 1660 he escaped to the continent. Charles II's supporters hunted for him with considerable zeal. He took refuge in Switzerland and survived plots against his life. In 1689 he misjudged the situation in England, returned to London, and was obliged to flee again when a proclamation was issued for his arrest. His memoirs, first issued in 1698/9, are an important source for the Commonwealth period. JAC

**Ludlow castle** (Shropshire), standing on a cliff above the river Teme, has long been regarded as a romantic and picturesque ruin, attractive to artists and writers. As early as 1772 public walks were laid out round the castle. Founded soon after the Conquest by the de Lacy family as a strong point in the turbulent march area, the castle and town remained important throughout the Middle Ages. In 1473, when Edward IV sent his son to Ludlow, the castle became the headquarters of the nascent \*Council of the Marches, which between 1534 and 1641 was the focus of government for the Welsh border. The castle was often the residence of the princes of Wales. Edward V was there when he succeeded in 1483 and Prince \*Arthur and \*Catherine lived there briefly after their marriage until the prince's death in 1502. The political importance of Ludlow made it also a cultural centre. In 1634 John \*Milton wrote the masque *Comus* for John, earl of Bridgwater, then president of the council, and it was performed in the castle by members of his family on 29 September. LR

**Lugard, Sir Frederick, Baron Lugard** (1858-1945). Colonial administrator. Lugard started as a soldier and adventurer, then got drawn into east Africa's religious wars (protestant converts v. catholic converts), until the area (\*Uganda) was formally annexed by Britain in 1894. Then he helped the Royal Niger Company in the west, and when its charter ran out became British commissioner in northern Nigeria. While there he devised a new way of governing 'natives', called 'indirect rule', or ruling them according

to their own customs rather than by imposing alien ones. He later justified this philosophically, in a seminal book called *The Dual Mandate in British Tropical Africa* (1922); but it clearly had practical advantages too. The *Dual Mandate's* other message was that colonies should be run for the benefit of both their subjects and the world as a whole. That made Lugard an obvious choice for the League of Nations Permanent Mandates Commission, on which he sat from 1922 to 1936. BJP

**Lulach** (d. 1058), king of 'Scotland' and Moray (1057–8). His mother Gruoch belonged to the royal dynasty which failed in the male line in 1034. She married \*Macbeth after the death of Lulach's father Gille Comgáin, king of \*Moray, in 1032 at Macbeth's hands. Lulach probably allied with \*Malcolm Canmore against Macbeth, and became king of Scotland when Malcolm killed Macbeth in 1057. Four and a half months later Lulach was himself Malcolm's victim, slain 'by treachery' at Essie (west of Aberdeen), probably on 17 March 1058. According to a debatable source his body was taken to Iona for burial. He is the last king of Moray recognized as king of Scotland in Scottish king-lists. DEB

**Lullingstone** was a Romano-British villa in the Darent valley, Kent. Originating in the late 1st cent., by the late 2nd cent. the residence contained a sunken *nymphaeum*, later housing two fine marble busts. The house was extensively remodelled at the beginning of the 4th cent., including a mosaic of Europa and the Bull. The northern end was partitioned off to form a Christian chapel whose wall-paintings included the *chi-rho* (the Christogram) and praying figures, preserved by having collapsed into the former *nymphaeum*. Nearby were a circular shrine and a temple-mausoleum, as well as agricultural buildings. ASEC

**Lumphanan, battle of**, 1057. On 15 August 1057 \*Malcolm Canmore defeated and killed \*Macbeth. The version given in Shakespeare's play runs together several encounters in different places. Dunsinane (Dunsinnan) is about 6 miles north of Perth; Lumphanan, whither, according to \*Holinshed, Macbeth fled, is due west of Aberdeen. JAC

**lunacy**. A term describing insanity, once considered to have been due to changes of the moon, now used legally and colloquially but not by clinicians. In the middle ages, the symptoms and behaviour of those with mental disorders or defects were often ascribed to demonology or witchcraft, and some sufferers were cared for by monastic orders: \*Bedlam hospital, first used for 'distracted' persons 1377, was attached to the priory of St Mary Bethlehem. Many were allowed their liberty if not dangerous, but increasingly they were deliberately segregated, often in company with vagabonds and malefactors, undergoing callous or barbarous treatment (ducking, whipping, chaining to the wall), and becoming a public spectacle for entertainment.

It was not until the latter half of the 18th cent. that a more enlightened approach was adopted (York Retreat, 1796) and the mid-19th cent. that an extensive programme of mental hospital construction was undertaken. Lord \*Shaftesbury, long interested in the problem and appointed a lunacy commissioner in 1828, secured passage of the Lunacy Act (1845)

which distinguished through medical certification 'persons of unsound mind' from social rejects. Optimism about curability was misplaced despite the emerging science of psychiatry, and hospital crowding led to a lapse to custodianship again. Subsequent psychotherapeutic, physical, and pharmacological approaches, if sometimes controversial, have generally proved beneficial, but de-institutionalization of patients and their return to the community in the second half of the 20th cent. was not without problems. At law, lunacy is regarded as mental unsoundness that relieves a person of criminal responsibility for their conduct, but all legal tests for insanity put forward have attracted criticism, and many think the issue of responsibility less important than identification and treatment of the disturbed. ASH

**lutheranism**. While the views of Calvin were largely expounded in one treatise, his *Institutes*, those of Martin Luther (1483–1546) had to be gleaned from a number of tracts and sermons, and developed over time. The most definitive statement was the Formula of Concord, drawn up thirty years after his death by reforming scholars and published, with additions, in the *Book of Concord* (1580). Luther took the Bible as the ultimate authority for Christians and his main belief was justification by faith alone: it was therefore essential for Christians to understand the Bible and Luther made his own celebrated translation into German. He recognized three sacraments: baptism, the eucharist in both kinds, and penitence. He was as committed to predestination as Calvin, finding no freedom for the human will. He disapproved of the mass, came to mistrust monasticism, advocated (and practised) clerical marriage, and taught the doctrine of the real presence in the eucharist. As his quarrel with the papacy developed, he was led to emphasize the supremacy of the secular ruler in religious matters and most of the Lutheran churches accepted the authority of bishops.

Lutheranism's greatest success was in north Germany and in Scandinavia. In England, his reputation was marred by a sharp theological exchange with Henry VIII, to whose *Defence of the Seven Sacraments* (1521), which had won from the papacy the title 'Defender of the Faith' for the king, Luther replied with *Against Henry King of England* (1522). The sequel was unfortunate for Luther. He was persuaded in 1525 to offer a humble apology for the 'hasty and speedy' printing of his book: Henry's retort was contempt for the man and his views, which were 'abominable and odious.' Many English churchmen thought it wise to distance themselves from Luther and to insist that the English Reformation, though having much in common with the German, was autonomous and independent. After Luther's death, the influence of Calvin and Geneva on the English clergy, and certainly on the Scottish, was much greater than that of lutheranism. JAC

**Lutyens, Sir Edwin Landseer** (1869–1944). English architect who embraced both classicism and Arts and Crafts ideals. Starting in 1896 with Munstead Wood (Surrey) for the gardener Gertrude Jekyll (1843–1942), Lutyens's early houses include Deanery Gardens, Sonning, Berks. (1899–1902), Tigbourne Court, Witley, Surrey (1899–1901), and Folly Farm, Sulhamstead, Berks. (1905). All demonstrate his ingenious planning and his imagination, sensitivity,

## Lydgate

and wit in the use of brick, tile, stone, and other traditional materials. In contrast, Heathcote, Ilkley (1905–7), and Gledstone Hall (1922–6), both Yorkshire houses, are grand and formal. Lutyens's commitment to classicism is best seen in such London office buildings as Britannic House (1920–4) and the Midland Bank (1924–37), and in his design for the Roman catholic cathedral, Liverpool (1929–44), whilst his free and whimsical interpretation of historical styles was finely expressed in his Viceroy's House, New Delhi (1912–31). Lutyens's Cenotaph in Whitehall (1919–20), noble though it is, lacks the eerie grandeur of his memorial to the missing of the Somme at Thiepval, near Arras, France (1927–32). PW

**Lydgate, John** (c.1370–c.1450). Poet. Born in Lydgate, a village in Suffolk south of Newmarket, he became a Benedictine monk at Bury St Edmunds. In 1421 he was made prior of Hatfield Broad Oak in Essex, but from 1432 spent the rest of his life back at Bury. Lydgate's enormous output—twice the size of Shakespeare's—was written under the patronage of Humphrey, duke of Gloucester, and Henry V, but has not been greatly admired. His main work is a long poem describing the siege of Troy. *The Falls of Princes*, a paraphrase and translation of Boccaccio, established that discord was dangerous in a state—a truth which could have been conveyed in less than 36,000 lines. Joseph Ritson, an 18th-cent. commentator, thought him a 'voluminous, prosaick and drivelling monk': a less savage critic referred to his 'prosodic incompetence and long-winded prolixity'—serious defects in a poet. JAC

**Lyndhurst, John Singleton Copley, 1st Baron** (1772–1863). Lord chancellor. Born in Boston (Mass.), son of J. S. Copley the elder, the portrait painter, he came to England, attended Cambridge University, and was called to the bar in 1804. He was appointed solicitor-general in 1819 and prosecuted the Cato Street conspirators and in the 'trial' of Queen Caroline. He became attorney-general in 1824, master of the rolls 1826, and Tory lord chancellor 1827–30, 1834–5, and 1841–6. A leading opponent of the Reform Bill, and a tower of strength to the Conservative Party in the Lords

after 1830, he was a vigorous and effective speaker even in his later years. In 1856 at the age of 84 he was instrumental in defeating the government's plan to create life peerages. Benjamin Haydon wrote in 1845 that he looked like 'a superannuated Mephistopheles'. EAS

**Lynedoch, Thomas Graham, 1st Baron** (1748–1843). General. On 3 September 1785 Graham participated in the first cricket match to be played in Scotland. After the death of his wife (whose portrait by Gainsborough hangs in the Scottish National Gallery) in 1791, Graham turned from managing his estate to a political and military career. In 1794 he became Whig MP for Perthshire and raised the Perthshire Volunteers. He distinguished himself at the capture of Minorca in 1798 and obtained permanent military rank through the influence of Sir John Moore. Lynedoch subsequently became Moore's aide-de-camp during the Corunna campaign. After commanding a brigade in the ill-fated Walcheren expedition (1809), Lynedoch returned to the Peninsular War and defeated the French in March 1811 at Barrosa. He then joined Wellington, assisting in the capture of Ciudad Rodrigo (January 1812) and commanding the left wing at Vitoria (June 1813). The following year he was created a peer and in 1817 co-founded the United Service Club. RAS

**Lytton, Edward Robert Bulwer-Lytton, 1st Earl** (1831–91). Son of the historical novelist, Lytton was educated at Harrow and privately on the continent. He enjoyed a successful career in the diplomatic service and became attached to the Conservative Party interest. He was also a poet and friend of the Brownings. He was appointed viceroy of India in 1875 by Disraeli and organized the great 'durbah' proclaiming Victoria queen-empress in 1877. His administration was principally distinguished for its aggressive external policies which, in 1878, brought about the second Afghan War. His army set off for Kabul. However, a change of government at home saw him recalled and Lord Ripon, his Liberal successor, sued for peace. In 1887 Lytton was appointed ambassador to Paris by Lord Salisbury. DAW

**Maastricht, treaty of.** Popular name for the treaty on European Union, signed on 7 February 1992 at Maastricht in the Netherlands by the twelve EEC members. The treaty amended the treaty of \*Rome and Single European Act, making institutional changes, increasing the competence of the European Union (EEC), and giving the European Council (meetings of heads of government) greater powers in the fields of defence and immigration. John Major, the British prime minister, obtained opt-outs for the social chapter and single currency and claimed the negotiations as a victory. This satisfied neither those who wanted full participation, nor Euro-sceptics who feared a loss of sovereignty. CNL

**Mabinogi** (*Mabinogion*). A cycle of early Welsh tales preserved in two 14th-cent. manuscripts: the White Book of Rhydderch (Llyfr Gwyn Rhydderch) and the Red Book of Hergest (Llyfr Coch Hergest). The *Mabinogi* comprises the four branches of Pwyll, Branwen, Manawydan, and Math. These four branches are found with seven other tales and together they are known as the *Mabinogion* (a misnomer first applied to the tales by Lady Charlotte Guest), one of which, the tale of Culhwch and Olwen, is the earliest Welsh \*Arthurian tale. The content is mythological and imaginative, an example of the Celtic genius at its best. SMD

**McAdam, John Loudoun** (1756–1836). Road surveyor. Returning as a loyalist from New York in 1783, McAdam settled in Ayrshire, and managed the British Tar Company; selling his modest estate in 1795 to discharge debt, he re-emerged at Falmouth from 1798 as a naval prize-monger. His travels turned interest into profession, as he covered nearly 19,000 miles in 1,900 days on the road, 1798–1814, making the observations that formed his 'principles': employing small stones direct onto the subsoil as the method of making effective roads largely impermeable to water. These were presented to the House of Commons in 1811, and further observations (1819–20) came in dispute with \*Telford, whose roads proved more durable but expensive. McAdam secured appointment as surveyor-general of the Bristol roads from 1816, and unpopularly consolidated his dynasty across Britain: McAdam, three sons, four grandsons, and a brother-in-law held 136 surveyorships in England and 8 in Scotland, 1816–61, with a total of around 3,700 miles of turnpike road. His fame led to the use of the term 'macadamize'

as early as 1824, and was revived in Hooley's patent *Tar Macadam* (1901). JCh

**Macartney, George, 1st Earl Macartney** (1737–1806). Born in Ireland and educated at Trinity College, Dublin, Macartney had a varied career. He was envoy to St Petersburg (1764–7); a chief secretary for Ireland (1769–72); and captain-general of the Caribbee Islands (1775–9). In 1780 he was appointed governor of \*Madras. He arrived at Fort St George during a time of great troubles. The Madras Council was riddled with corruption and Hyder Ali, the sultan of Mysore, stood at the gates of the fort threatening, with French naval help, to drive the English into the sea. Macartney re-established some semblance of internal order and engaged Mysore in a truce. After returning to England in 1786, his most important office was as first British ambassador to the court of Peking (1792–4), where his relations with the imperial court soon became strained. His final office was that of governor of the Cape of Good Hope (1796–9). DAW

**Macaulay, Thomas Babington, 1st Baron** (1800–59). Poet, historian, and politician. Of Scottish presbyterian ancestry, he was the son of Zachary Macaulay, the evangelical anti-slaver and co-founder of the \*Clapham sect. A child prodigy, educated at Trinity College, Cambridge, he acquired an early reputation as a Whig orator and a later reputation as a formidable contributor to the \**Edinburgh Review*, where he first published most of his greatest essays. A Whig MP for Calne, Leeds, and Edinburgh, he became secretary at war, paymaster-general, and was involved in drafting a new penal code for India. His *Lays of Ancient Rome* appeared in 1842, four years after he had projected the future *History of England*. The *History* was published between 1848 and 1862. Originally intended as a history of England since 1688, Macaulay had only reached 1702 by the time of his death. The *History* can be regarded as a triumphant reply to David \*Hume's *History of England* and its attack on the Whig historiographical tradition, setting the terms of a new Whig historiography which survived until the middle of the 20th cent. NTP

**Macbeth** (d. 1057), king of Moray (1032–57) and king of 'Scotland' (1040–57). Macbeth's reputation as a tyrannous usurper is, of course, anachronistic. His career is none the less the stuff of drama. He lived during unprecedented

## McCarthy

uncertainty for both the kingship of \*Moray and the Scottish royal succession. Nevertheless, he became the only person from northern Scotland to rule the Scottish kingdom for more than a few months, and the only king of Scotland to visit Rome (in 1050) where, we are told, 'he scattered money like seed to the poor'. He was also the first to bring Norman knights to Scotland. So strong was his position that he retained the Scottish throne in 1054, despite defeat at Dunsinnan (north of Perth).

Macbeth's family was riven by a feud that claimed the life of Macbeth's father in 1020, which Macbeth avenged in 1032 by burning his cousin Gille Comgáin, king of Moray. He married Gille Comgáin's widow Gruoch, perhaps in an attempt at reconciliation, but probably also because she belonged to the Scottish royal kindred. Macbeth, whose mother may have been a daughter of \*Malcolm II, only benefited from the opportunity afforded by the royal dynasty's extinction in 1034 when he killed \*Duncan I (probably) at Pitgavenny (near Elgin) in 1040. In 1045 he reached his zenith when he crushed Duncan's father. After Dunsinnan, however, he was forced to accept the return of Duncan's son \*Malcolm Canmore from exile, and in 1057 was killed at \*Lumphanan (west of Aberdeen) by Malcolm, probably in collusion with Gille Comgáin's son \*Lulach. DEB

**McCarthy, Justin** (1830–1912). Irish politician and writer. McCarthy was a journalist who was elected as Home Rule MP for Co. Longford in 1879. He moved to represent Derry City in 1886, but returned as MP for North Longford (1892–1900). As vice-chairman of the Irish Parliamentary Party he acted as mediator between \*Parnell and the Liberal government in November 1890, at the time of the O'Shea divorce: when Parnell was rejected by the majority of his parliamentary party, McCarthy assumed the chairmanship, a position which he held until 1896. He pursued a second career as a popular historian and novelist, producing in 1877 a successful *History of Our Own Times*. He retired from politics in 1900, but remained a prolific author until his death. He was awarded a civil list pension in 1903. His reputation remains burdened by Parnell's brutal observation that 'he was a nice old gent for a tea party'. AJ

**Macclesfield, Thomas Parker, 1st earl of** (1667–1732). Parker was the son of a Staffordshire attorney and educated at Trinity College, Cambridge. Returned for Derby as a Whig MP in 1705, he took a leading part in the prosecution of Dr \*Sacheverell in 1710. From 1710 to 1718 he was lord chief justice of Queen's Bench and was made Baron Parker in 1716. He removed to the lord chancellorship in 1718 and became earl of Macclesfield in 1721. In 1725 he was accused of peculation and forced to resign. Though he was a favourite with George I, he had never been close to Sir Robert \*Walpole, who did nothing to save him. After a unanimous verdict of guilty at the impeachment, he was fined £30,000. Macclesfield admitted privately that he had accepted gifts from masters in Chancery on taking office but pleaded that it was the common practice. He took no further part in public life. JAC

**McCormack, John** (1884–1945). Irish tenor who took American citizenship in 1917. After studying in Italy, McCormack made his British operatic début at Covent Garden in 1907, reappearing every year, sometimes alongside \*Melba, until 1914. In 1909 he made his New York début, gaining popularity during the next decade with the Metropolitan, Boston, and Chicago opera companies. His acknowledged limitations as an actor, however, led him to abandon the stage for a concert and recording career. He was a particularly fine interpreter of Handel, Mozart, Verdi, German *Lieder*, and Irish folk-songs, with a sweetness of tone and a stylish technique, although his later career reached a wider public through a preponderance of popular sentimental ballads, sometimes of dubious quality. ECr

**MacCormick, John MacDonald** (1904–61). A Glasgow lawyer and son of a sea-captain, MacCormick was a leading founder of the National Party of Scotland in 1928. A Presbyterian by religion, he had originally been a supporter of the \*Independent Labour Party. In 1934 the National Party merged with the Scottish Party to form the \*Scottish National Party. MacCormick lost control of the party in 1942 to more radical leaders, who opposed the war. He then formed a Scottish Convention which summoned a 'Scottish National Assembly' in 1947 to call for devolution. The Labour Party's strong opposition persuaded MacCormick to launch a new covenant in 1949, which called for a Scottish Parliament and attracted 2 million signatures, but made little headway. MacCormick stood repeatedly for Parliament under a variety of banners; for Glasgow, Camlachie (1929) as SNP; Inverness-shire (1931 and 1935) as SNP; Glasgow, Hillhead (1937) as SNP; Inverness-shire (1945) as a Liberal; Paisley (1948) as 'National', losing to Labour in a straight fight; Borders (1959) as a Liberal. His consolation was election as rector of Glasgow University 1950–3. MacCormick surveyed his political career in *The Flag in the Wind* (1955). JAC

**MacDonald, Flora** (1722–90). Born on South Uist, but educated in Edinburgh, Flora's help was enlisted during a visit to the island of Benbecula for Charles Edward \*Stuart's escape to Skye, after \*Culloden. Reluctant, but persuaded to succour one in distress, she sought a passport from her stepfather (in charge of the militia) to enable her to cross the Minch with a manservant and 'an Irish spinning maid, Betty Burke'; the party then travelled from Kilbride to Portree for a boat to take Charles to Raasay. When the escape became known, she remained self-possessed throughout her arrest and subsequent brief detention in the Tower of London. Once Jacobitism had become a safe lost cause, her actions were heavily romanticized. Described by \*Johnson as 'a woman of soft features, gentle manners, and elegant presence' on meeting her in Kingsburgh (1773), Flora MacDonald emigrated to North Carolina the following year, but later returned to Skye. ASH

**MacDonald, James Ramsay** (1866–1937). Prime minister. Between 1900 and 1929 Ramsay MacDonald contributed more than any other individual to building the Labour Party into a credible, national party of government. Throughout his career he retained a consistent vision of a democratic

socialist movement which would unite middle-class radicalism with working-class votes and achieve its goals by parliamentary means. As prime minister and foreign secretary in the first Labour government of 1924 he went a long way to demonstrating Labour's fitness to govern. Yet under pressure, defects of temperament undermined his effectiveness. Basically a shy and insecure man, despite his achievements, MacDonald depended greatly upon the support of his wife Margaret Gladstone; her early death in 1911 dealt him a blow from which he never recovered. His loneliness made him vulnerable to friendships in aristocratic circles later in life. But to his critics his fondness for the marchioness of Londonderry looked like social climbing and a desire for acceptance by the establishment. This was all the more natural when the failures of his second government led to his participation in the \*National Government in 1931. This decision immediately destroyed his standing on the left; and he has been regarded as a traitor ever since.

Born into poverty in Lossiemouth on the north-east coast of Scotland, MacDonald was the illegitimate child of a servant girl and a farm labourer. His early career in the 1880s took him back and forth across the borders of Liberal and Labour politics. He joined the Rainbow Circle, worked as secretary to a Liberal MP, and could well have emerged as a Liberal politician had he managed to get elected to Parliament earlier. But by the 1890s he had become a leading figure in the new \*Independent Labour Party. He fought several elections without success, handicapped by the lack of a trade union base and his own poverty. He supported himself by journalism and, from 1896, his wife's personal income. By 1900 he was sufficiently well known and respected to be invited to serve as secretary to the new Labour Representation Committee which became the Labour Party in 1906. In this capacity he was directly responsible for what proved to be the crucial breakthrough for the party. In 1903 he negotiated an electoral pact with Herbert Gladstone, the Liberal chief whip, which meant that the Liberals would refrain from running candidates in 29 of the 50 constituencies contested by Labour at the 1906 general election. In 24 of the 29 seats Labour candidates proved successful, including MacDonald himself, elected for Leicester.

As an MP his oratorical powers and capacity for mastering legislative detail made him the outstanding parliamentarian on the Labour bench. In 1911 he became chairman of the parliamentary party. In this period he suffered attack from socialists such as Ben \*Tillett and Victor Grayson for excessive loyalty towards the Liberal government. He also encountered much resistance from local ILP activists who wished to field candidates in Liberal constituencies in by-elections. However, up to 1914, it appears that he intended to maintain the pact.

The First World War interrupted both this strategy and MacDonald's steady rise. By opposing British entry into the war he put himself in a minority and gave up the party chairmanship. Instead he founded the \*Union of Democratic Control, a pressure group which advocated a negotiated peace and a \*League of Nations. As a result he was vilified by the right-wing press, which even published a copy

of his birth certificate. In the chauvinistic mood of the 1918 election MacDonald suffered a heavy defeat at Leicester.

He achieved his come-back in 1922 when he became the member for Aberavon. Now that opinion had turned against the pre-war arms race and wartime casualties, he gained much credit for the principled stand he had taken in 1914, and many left-wing MPs supported him in the contest for the party leadership in which he narrowly defeated J. R. Clynes. For some years MacDonald stood out as a popular hero to socialists, but he took care to smother radical policies, such as the capital levy, which he thought likely to lose votes.

MacDonald deserves great credit for the skill with which he played a difficult hand in the aftermath of the 1923 election. With only 191 MPs he was invited to form a government. He deliberately avoided any deal with the Liberals, so as to prevent a return to the client relationship Labour had enjoyed before 1914. He strengthened his administration with former Liberal and Conservative ministers, avoided controversial economic policies, and, as foreign secretary, played a constructive role in reducing German reparations. Although the government was defeated in Parliament after nine months, MacDonald had largely succeeded in his object of establishing Labour as a competent governing party.

During the next five years the inability of the \*Baldwin government to tackle unemployment helped Labour to a further advance. In 1929 they won 288 seats, not far short of a majority. But this time MacDonald's conventional economic policy proved inadequate; the commitment to the gold standard, an over-valued pound, and the restoration of British export markets proved fatal. As unemployment mounted the prime minister seemed indecisive and self-pitying—the 'Boneless Wonder' in \*Churchill's derisive phrase. By August 1931 the balance of payments deficit obliged the cabinet to attempt to restore confidence by balancing its budget. But it split over proposed cuts in unemployment benefit. MacDonald astonished his colleagues by accepting the king's invitation to lead a \*National Government with the Liberals and Tories. Though originally seen as a temporary expedient, the National Government rapidly assumed a permanent form by holding a general election in October 1931. MacDonald thus retained the premiership until 1935 and continued in office until 1937. An isolated and ineffectual figure, he presided over a disastrous phase in foreign policy in which the \*League of Nations collapsed in the face of aggression by the fascist dictators; he clung to office largely because he had nothing else to live for.

Elton, G., *The Life of James Ramsay MacDonald* (1939); Marquand, D., *Ramsay MacDonald* (1977); Morgan, A., *J. Ramsay MacDonald* (Manchester, 1987).

**MacDonald, John, 4th lord of the Isles** (1434–1503). According to a MacDonald chronicler of the 17th cent., John, 4th lord, was 'a meek, modest man . . . and a scholar, more fit to be a churchman than to command so many irregular tribes of people'. He succeeded his father Alexander, 3rd lord, in 1449, aged 15, and was almost immediately involved

## Macintosh

in efforts to defend his huge inheritance—which included not only the Hebrides and western coastline from Lewis to Kintyre, but also the earldom of Ross—from predatory neighbours (especially the earl of Huntly), discontented lordship families, and a hostile crown.

MacDonald's rebellion of 1451, and his bond with Crawford and Douglas (1451/2), put him on the wrong side in the James II–Black Douglas civil wars of the 1450s. In 1462 he made the treaty of \*Westminster-Ardtornish with Edward IV of England, an abortive pact which envisaged the tripartite division of Scotland between MacDonald, his cousin Donald Balloch, and the forfeited 9th earl of \*Douglas. Summoned for treason, MacDonald finally forfeited his earldom of Ross in 1476, and lost his credibility in the Isles at the same time, with his illegitimate son Angus and—much later—his grandson Donald Dubh seeking to provide the focus for a reunited MacDonald lordship. The forfeiture of the lordship (1493) left John MacDonald a pathetic pensioner of the crown until his death at Dundee in January 1503. The Achilles heel of the lordship had always been Ross, control of which fell to Alexander Gordon, earl of Huntly. NATM

**Macintosh, Charles** (1766–1843). Industrial chemist. Macintosh, born in Glasgow, was an extremely inventive scientist, who experimented with the production of dyestuffs, alum, steel, and bleaching powder. His work on possible uses for coal naphtha, a by-product of the gas industry, led to a patent in 1823 for producing waterproof clothing, using India rubber dissolved in naphtha. His factory at Manchester was taken over by the North British Rubber Company. JAC

**Mackenzie, Sir Alexander** (c.1764–1820). Probably from Inverness, Mackenzie joined a fur-trading company beginning to operate from Lake Athabasca in what is now Canada. In 1789, seeking a waterway along which the furs might be carried to the Pacific, he reached the Great Slave Lake and from there followed the Mackenzie river down to what, disappointingly for him, but an exploratory feat, turned out to be the Arctic Ocean. Four years later, he set out again westwards along the Peace river and then through the Rocky Mountains to reach the Pacific coast at Dean Channel north of Vancouver, so becoming the first known man to cross the North American continent north of Mexico. He returned to Britain to publish an account of his travels and was knighted in 1802. RB

**Mackenzie, Sir George** (1636–91). 'Bloody Mackenzie' was a nephew of the 2nd earl of Seaforth [S], briefly secretary of state [S] to Charles II in exile. A lawyer by profession, he opposed the rule of \*Lauderdale at first but in 1677 was appointed king's advocate [S]. In this capacity he harassed the \*covenanters, particularly after the skirmish at \*Bothwell Bridge in 1679. He rated his services to the crown highly and is reported to have boasted that he deserved a statue riding behind Charles II's in Parliament Square. His use of torture and his legal ingenuity earned him his nickname and the 1680s were known in covenanting circles as 'the killing

time'. He took no part in public life after the Glorious Revolution. JAC

**Mackenzie, Sir George.** See CROMARTY, 1ST EARL OF.

**Mackenzie, Henry** (1745–1831). Novelist and man of letters, once described by \*Scott as 'the Scottish Addison'. Son of an Edinburgh physician, he was educated for the law in Edinburgh and London. His first novel *The Man of Feeling* (1771) established him as a sentimental novelist in the tradition of Marivaux and \*Sterne. He was the moving spirit in a group of Edinburgh men of letters who published the *Mirror* (1779–80) and *Lounger* (1785–7), the last popular imitations of \*Addison and \*Steele's *Spectator*. Mackenzie was the first critic to recognize the importance of \*Burns. A Tory loyalist and close associate of Henry \*Dundas, he became controller of customs in 1804. Unfortunately, his novels have not worn well. NTP

**Mackenzie, William Lyon** (1795–1861). Mackenzie was born in Dundee and emigrated to Upper Canada (now Ontario) in 1820, where he became a newspaperman and radical politician. Stung by his abuse, in 1826 Toronto Tories smashed Mackenzie's printing presses. In 1831 Mackenzie's attacks provoked Tories to expel him from the Assembly, an overreaction which the British government countermanded. In 1834 Mackenzie became first mayor of Toronto, but in 1836 reformers were routed in Assembly elections. During 1837 Mackenzie organized armed demonstrations and threatened revolt, but lost control of events. Rebellion broke out on 4 December. Mackenzie escaped to the USA, but an amnesty enabled him to return to Canada in 1849. GM

**Mackintosh, Charles Rennie** (1868–1928). Scottish architect and designer, a leading exponent of the Glasgow School of art nouveau. He designed a number of houses in and around Glasgow at the turn of the century but his best work was the designs for the Glasgow School of Art, its library, and extensions made between 1897 and 1909, which show bold lines and minimal decoration. His furniture and interior designs, often made in collaboration with his wife Margaret Macdonald, are characteristically art nouveau while avoiding florid excess. Especially fine were those for the Willow Tearooms in the centre of Glasgow. His work was highly influential in Europe but less so in Britain. He moved to London in 1923 but his practice folded soon after and he retired to the south of France where he concentrated on painting in water-colour. JC

**Mackintosh, Sir James** (1765–1832). Scottish philosopher, historian, lawyer, and politician. A man of many talents, Mackintosh read philosophy at Aberdeen University, qualified in medicine at Edinburgh in 1787, and was called to the bar in London in 1795. He contributed to literary journals, and wrote a celebrated critique of \*Burke's *Reflections on the Revolution in France*, entitled *Vindiciae Gallicae* (1791)—which however he subsequently regretted. Mackintosh became recorder of Bombay in 1804, a post which carried a knighthood, and he returned to England to take up a parliamentary seat in 1813, speaking in defence of civil liberty against the authoritarian policies introduced by the post-war Tory

administration. He also became professor of law and general politics at Haileybury (1818–24). His main writings were *Dissertation on the Progress of Ethical Philosophy* and *History of England from Earliest Times*, both published in 1830. TSG

**Maclise, Daniel** (1806–70). Historical and portrait painter and caricaturist. Born in Cork, the son of a Scottish soldier, Maclise became a student of Cork Academy when it opened in 1822, and of the Royal Academy Schools in London in 1828. Between 1830 and 1838, *Fraser's Magazine* published a series of his character drawings of literary men of the day, under the pseudonym Alfred Croquis. One of these was of his friend Charles \*Dickens for whom he also did book illustrations. In 1840 he was elected RA but later declined the presidency and a knighthood. Between 1857 and 1866 he was occupied with his best-known work: two frescos for the royal gallery of the new House of Lords, *Wellington and Blücher at Waterloo* and *The Death of Nelson*, of which \*Rossetti said, 'These are such "historical" pictures as the world perhaps had never seen before.' JC

**Macmillan, Harold** (1894–1986). Prime minister. Anglo-American by birth, Macmillan proceeded from Eton to Balliol College, Oxford, where he secured a first in classical moderations shortly before the outbreak of the \*First World War. During the war he was badly injured and spent the last stages of the conflict hospitalized. After the war he served as ADC to the governor-general of Canada before going into the family publishing firm.

Macmillan was elected as member for Stockton at his second attempt in 1924. He was not a conventional Conservative and had earlier toyed with Liberalism. In Parliament he associated himself with a group of progressive Tories, styled the YMCA, but his career suffered a blow when he lost his seat in the 1929 general election. He won it back in 1931, but his unconventional views seemed to preclude a ministerial career. In domestic politics he was greatly influenced by the poverty of the north-east and was attracted by the ideas of the Cambridge economist J. M. \*Keynes to stimulate recovery from the depression. The publication of *The Middle Way* in 1938 showed Macmillan's commitment to a mixed economy and considerable government intervention. Such ideas became commonplace in the post-1945 Conservative Party; a decade earlier they marked Macmillan out as an intellectual rebel. Macmillan was also at odds with the foreign policy of the National Government and resigned the Conservative whip for the last year of \*Baldwin's premiership. A critic of the Munich agreement of 1938, he was overshadowed in the public mind by the more elegant though intellectually less able Anthony \*Eden.

When \*Churchill became premier in May 1940 Macmillan's ministerial rewards were initially small. But in 1942 he made his first major political advance with his appointment as minister of state for north Africa. Macmillan took easily to his new authority and struck up a good working relationship with General Eisenhower.

Macmillan lost his Stockton seat again in the general election of 1945, but was soon returned to Parliament following a by-election in Bromley. He rose steadily in the Conservative Party, but lacked popular appeal and still trailed Eden

and R. A. \*Butler among the coming generation. He showed an interest in European integration, though perhaps not to the extent he later claimed. As minister of housing after 1951 Macmillan achieved credit as the man who fulfilled the Conservative pledge to build 300,000 houses in a single year. He served briefly as minister of defence, but became foreign secretary when Eden succeeded to the premiership in 1955. Too forceful in this post for Eden's liking, he was transferred to the Exchequer after six months. Relations with the prime minister were never fully restored.

An ardent proponent of the Suez adventure in 1956, Macmillan profited by its failure. Though he pressed the financial necessity of bringing the operation to an end, his earlier enthusiasm ensured the backing of the Conservative right. To the surprise of many he was preferred to Butler when ill-health forced Eden's resignation in January 1957.

As prime minister Macmillan displayed political skills which few had anticipated. Against the odds, he restored party morale after Suez and led the Conservatives to a third successive electoral victory in 1959. In the meantime he repaired the special relationship with America, badly damaged by Suez, using his wartime friendship with Eisenhower to advantage. His calm self-assurance stood him in good stead, especially when the whole of his Treasury team resigned in 1958. By 1960 Macmillan stood at the height of his power. The nickname 'Supermac' encapsulated the public's acclaim. His progressive views of the 1930s still dominated his thinking as he strove to maintain full employment (at the cost, it has been argued, of stoking up inflation) and speeded up the process of decolonization. But then problems arose. The collapse of the summit conference of 1960 was a particular blow and helped persuade Macmillan to seek British admission to the European Common Market. This quest ultimately met with the veto of General de Gaulle. Meanwhile difficulties mounted on the domestic front. Many sensed panic when Macmillan dismissed a third of his cabinet, including the chancellor, in the famous 'Night of the Long Knives' in July 1962. Thereafter the government was beset by a series of sex and spy scandals in which Macmillan's image as an Edwardian patrician, once an asset, now suggested someone out of touch with the modern world. Illness precipitated Macmillan's resignation at the time of the Conservative Party conference in October 1963. He left the Commons a year later, somewhat discredited. In his long retirement, however, Macmillan's reputation enjoyed a considerable renaissance, especially after his elevation to the peerage as earl of Stockton in 1984 at the age of 90.

Macmillan was a complex individual. An external self-confidence was matched by inner doubts and depression, exacerbated no doubt by his wife's long-standing affair with Robert Boothby. The years of his premiership remain controversial. For some they represent a period of unprecedented prosperity; for others a time when a blind eye was turned to underlying problems in the British economy.

Aldous, R., and Lee, S. (eds.), *Harold Macmillan and Britain's World Role* (Basingstoke, 1991); Horne, A., *Macmillan* (2 vols., 1988–9); Turner, J., *Macmillan* (1994).

## MacPherson

**MacPherson, James** (1738–93). Man of letters, and the moving force behind the discovery of the *Poems of \*Ossian*. Taken up by the Edinburgh literati in 1760 as a Gaelic speaker with a taste for bardic verse, he was sent to the Highlands to search for more substantial works. These were quickly discovered, translated, and published 1762–5, prefaced by long and influential essays by MacPherson and the critic Hugh Blair. MacPherson was immediately accused of forgery, a charge which he resented, but never tried to rebut. His literary career faltered although his free version of the *Illiad* (1773) is not without interest and his *History of Great Britain from the Restoration to the Accession of the House of Hanover* (1775) achieved a limited success. He died in 1790, having made a living as a government propagandist and a fortune as agent of the nabob of Arcot. NTP

**Macready, William** (1793–1873). Actor. Macready had a long and successful career in the age of Mrs Siddons and Kean. The son of an Irish actor settled in London, he took up the stage when his father's ventures collapsed, appearing at Birmingham in 1810 as Romeo. He first appeared on the London stage at Covent Garden in 1816, but not until his Richard III in 1819 was his popularity firmly established. He transferred to Drury Lane in 1833 and went into management in 1837. A boisterous American tour in 1849/50 led to serious rioting, and he retired in 1851. Scholarly in his approach to his parts and with considerable versatility, Macready was also difficult, moody, and, at times, violent. His own favourite role was Macbeth. JAC

**McTaggart, William** (1835–1910). Painter. McTaggart was born in Kintyre (Strathclyde), in a poor labouring family. He studied in Glasgow and Edinburgh, meeting his expenses by painting portraits, and first exhibited in 1856. He became a regular exhibitor at the Royal Academy and Royal Scottish Academy, but refused to work in London, saying, 'I would rather be first in my own country than second in any other.' He decided early on to concentrate on landscapes, undertaking portraits only when he needed money. By the 1870s the sea and boats were the most recurrent themes of his work. Following public reports on the Highland clearances in the 1880s, McTaggart painted a series of works showing emigrants leaving Scotland. In 1897, to celebrate the thirtieth centenary of the death, on Iona, of St \*Columba, McTaggart painted incidents from the life of the saint. He was elected ARSA in 1859 and RSA in 1870. JC

**Madeleine of France** (1520–37), queen of James V of Scotland. The eldest surviving daughter of Francis I of France, Madeleine married James V in Paris on 1 January 1537. The French king, at war with the Emperor Charles V and facing renewed hostilities with England, paid a high price for maintaining Scottish friendship. James was originally offered the daughter of the duke of Vendôme, but on travelling to France to negotiate the marriage found her 'hunch-backed and misshapen'. He held out for Madeleine and a dowry of 100,000 livres, plus the annual rent on a further sum of 125,000 livres. Madeleine herself favoured the match, despite warnings that her fragile health would not survive the Scottish climate, and sailed for Scotland in May 1537. She died

only weeks later on 7 July. The following year the Franco-Scottish alliance was renewed through the marriage of James V to \*Mary of Guise. RAM

**Madog ap Maredudd** (d. 1160), prince of Powys (1132–60). The Welsh princes took advantage of the civil war in England during the reign of Stephen to rebuild their position after the reign of Henry I. Madog inherited Powys from his father Maredudd ap Bleddyn in 1132 and had to deal with the expansionary ambitions of \*Owain, prince of Gwynedd, on his northern border. Around 1150 he joined with Ralph, earl of Chester, in an attack but was defeated. He maintained a watchful neutrality in 1157 when Henry II fought Owain. After his death, Powys was divided into north and south lordships (Powys Fadog and Powys Wenwynwyn). JAC

**Madog ab Owain Gwynedd**. Legendary hero. Madog was reputed to have sailed westwards c.1180, never reappeared, and was supposed to have discovered America. In 1790 John Evans set off to find the lost Welsh tribes but was disappointed: Robert \*Southey wrote a poem 'Madoc' in 1805. The first mention of the story is in Tudor times, 400 years after the event, and it is merely one of countless heroic myths. But John \*Dee in 1577 used the legend of Madog to argue that a great Welsh colony had been established in America by King \*Arthur, and he coined the term 'British empire'. JAC

**Madras** was founded by Francis Day of the English \*East India Company in 1639. It stood north of the Portuguese settlement of São Tomé on a strip of the Coromandel coast famous for its textiles. A fortification (named after St George) was built and became the headquarters of company activities. However, in the 18th cent. the Coromandel cloth trade declined and Madras was overtaken by \*Calcutta in company esteem. Fort St George was seized by the French in 1746 although subsequently returned. The city became the capital of a presidency in the 19th cent. but suffered economic stagnation. Its population in 1901 was 400,000. DAW

**madrigals**. A term originating in 14th-cent. Italy but later applied to Italian and English secular vocal music of the 16th and 17th cents. The 16th-cent. Italian madrigal grew up around 1520, reaching England through Italian-trained court musicians and imported manuscripts. Anthologies of Italian madrigals with English translations, such as Nicholas Yonge's *Musica transalpina* (1588) and Thomas Watson's *Italian Madrigalls Englished* (1590), provided a model for the native English madrigal, which began with Thomas Morley's *Canzonets or Little Short Songs to Three Voyces* (1593) and flourished briefly until c.1620.

Morley, the most prolific English madrigalist, favoured a light-hearted style and frivolous pastoral verse, writing canzonets and strophic ballets (the latter modelled on works by Gastoldi with their 'fa-la' refrains) as well as true madrigals. He also edited *The Triumphes of Oriana* (1601), a collection of madrigals by 21 Englishmen in praise of Elizabeth I; each ends with the phrase 'Long live fair Oriana', although in fact both Elizabeth and Morley died soon afterwards. Other composers, such as \*Gibbons, Wilbye, Weelkes, and Ward, wrote in a more serious vein, expressive Italianate

chromaticisms and dissonances reflecting imagery in the text. After 1600 the madrigal lost ground to the lute ayre, and many publications blur the boundary between the madrigal and other genres. Its popularity with amateur singers has continued until the present day. ECR

**Mael Snechta** (d. 1085), king of Moray (c.1058–c.1078). A son of \*Lulach, it is likely that he succeeded his father as king of \*Moray after his death at the hands of \*Malcolm III. Mael Snechta himself suffered a serious defeat by Malcolm III which may have broken his power. He died peacefully in 1085; there is a suspicion that he may have retired to a monastery. He is credited in a near-contemporary Irish source as being king of Scotland. Although his name does not appear in medieval Scottish king-lists, it is possible that his reign has been suppressed or, what is more likely, that he was initially recognized as Malcolm III's successor. DEB

**Mafeking** is a small town in the north-east corner of Cape Province (South Africa), where a British garrison was besieged for seven months during the second \*Boer War, before being relieved on 17 May 1900. That gave rise to the most notorious displays of \*jingoism back in Britain, for which a new word—'mafficking'—was coined; and made the reputation of the commander of the garrison, \*Baden-Powell. BJP

**Magersfontein, battle of**, 1899. As Lord Methuen, commanding a British division, advanced to relieve the Boer siege of \*Kimberley, he crossed the Modder river and approached the Magersfontein heights. A Boer force of 9,000 men under General Cronje lay in wait, and when Methuen's Highland Brigade tried to turn the enemy flank at night on 11 December, the Boers inflicted heavy punishment. Unable to advance further, the British withdrew, having suffered over 1,000 casualties. Simultaneous British disasters at Stormberg and Colenso led to the period being dubbed 'Black Week' by the press. JLP

**magic** is a phenomenon whose reality has been accepted in most societies. Differentiating it entirely from \*witchcraft is difficult, the generally accepted distinction being that whereas the ability to perform witchcraft is innate or inherited, magic involves the use of techniques and skills which can be learned.

Magical beliefs and practices existed at all social levels in the medieval and early modern periods, and were enmeshed in medical and scientific thought and techniques. The acceptance of \*astrology and \*alchemy as serious intellectual activities, the influence of hermetic writings and Neoplatonism, all of them accepting the reality of mystic forces, were symptomatic of widespread magical beliefs. It is instructive that, during the 15th cent., both the Scottish and English royal houses thought themselves to be threatened by plots involving the use of occult powers.

The interconnection between magic and what the modern mind accepts as legitimate intellectual activity is demonstrated by the career of John \*Dee (1527–1608), a mathematician of European repute, who while still young was offered the professorship of mathematics at the University of Paris. Later he travelled to eastern Europe, and

resided in Prague, then an important intellectual centre. In between, he became virtual astrologer-royal to Elizabeth I. His advice was called for when fears arose of a plot to kill her by witchcraft and when the court was debating the deeper significance of the appearance of a new comet in 1577. From 1584, however, he became increasingly involved in attempts to make contacts with angels, and raise spirits. He was popularly regarded as a witch, although Dee and others like him regarded their activities as lawful.

That body of intellectual changes which is known as the \*scientific revolution downgraded magic as a serious area of study or means of explanation among the educated, although the interest of \*Newton and \*Boyle in alchemy demonstrates that the process was not straightforward. Among the lower orders, however, belief in magic continued well into the 19th cent. The medical advice and other services offered by cunning men and women were more readily and cheaply available than those of middle-class professionals, were more culturally familiar, were frequently as effective, and provided psychological comfort. JAS

**Magna Carta** was sealed by King John on 15 June 1215 at Runnymede (Berks.). It followed a period of intense political and military activity after John's ignominious return to England in October 1214 following the decisive battle of \*Bouvines which ended his hopes of recovering his lost French lands. Shortly after, in late 1214 or early 1215, the rebels decided to demand from John a charter of liberties, their initial grievances and demands expressed in the so-called 'Unknown' Charter (January–June 1215) and the Articles of the Barons (early June). Magna Carta was the product of long and hard negotiation. It was designed to be a negotiated peace, bridging the extreme rebels on the one hand, and John and his supporters on the other. But in this it was a total failure for John had no intention of adhering to Magna Carta, agreeing to it only to gain time, and without goodwill and trust on both sides the charter was unworkable. In September 1215 civil war began in earnest. The charter's achievement and significance lie elsewhere, for it laid down standards to be observed in the future by the crown and its agents, for the first time in written law establishing defined limitations to royal rights. It was the abuse of unwritten custom by John and his predecessors and their exploitation of the vaguenesses of the feudal relationship which Magna Carta sought to remedy. But this could only occur once the charter was brought back to life as a royalist manifesto after John's death by the regency government of Henry III. With the reissues of 1216 and 1217, and the definitive version of 1225 (much briefer than the original), the charter became a statement of law, confirmed and interpreted in Parliament and enforced in the law courts. Some of its chapters still remain on the statute book, a measure of its remarkable and enduring significance for the law of the UK, USA, and elsewhere. SL

**Magnentius**, a usurping emperor 350–3, was at his elevation an army commander in Britain. He was probably born at Amiens. In 350 he was proclaimed emperor by the Gallic cabal which deposed Constans. He crossed to the continent

## Magnus

and was defeated by Constantius II at the costly battle of Mursa in Pannonia in 351. It was two years before Constantius could press home his advantage and kill Magnentius at the battle of Mons Seleucus in Gaul. After Magnentius' death, vicious reprisals were visited on his supporters in Britain. ASEC

**Magnus, St** (c.1075–c.1117). Magnus was the victim of his ambitious cousin Haakon, who intrigued with the Norwegian king Magnus Barefoot to bring about the downfall of their fathers, ruling earls of the Orkney Islands. The king installed his own son in their place. Magnus was seized, compelled to take part in coastal raids, but refused to fight against the Welsh at Anglesey. He finally escaped, taking refuge first at the Scottish court, then in a bishop's house in Britain, living a life of prayer and penitence. When the Norwegian king died, Haakon returned to rule the Orkneys. Magnus claimed his share of the earldom, but within a few years Haakon determined to dispose of his political rival. Magnus, with a few retainers, was invited to meet and confirm a covenant of peace, but was confronted by Haakon and a large armed retinue. Offering no resistance, he accepted his death, absolving the man ordered to kill him. Kirkwall cathedral is dedicated to him. AM

**Magnus Maximus.** Army commander and usurper of the late Roman period. In AD 383 the British commander Magnus Maximus led an uprising which resulted in the assassination of the western *Augustus* (emperor) Gratian, son of Valentinian I. Frontier problems were occupying the eastern *Augustus*, Theodosius I, and he was unable to send help in time to rescue Gratian. Indeed he even recognized Magnus Maximus' claims to the throne for a while. Magnus Maximus gained control of the western Roman empire, ruling from Trier. Theodosius finally avenged Gratian in 388, defeating and killing Magnus Maximus after the usurper moved against Italy. ES

**Magonsaete, kingdom of the.** Although the Anglo-Saxon kingdom which was contemporaneous with the diocese of Hereford is usually referred to as the kingdom of the Magonsaete, the name is not recorded until the 9th cent. The people of the province may originally have been known as the West Angles and be the 'Westerna' of the Tribal Hidage. The first element of 'Magonsaete' is possibly derived from Magnis, the Roman town of Kentchester, and the royal family, recorded for the late 7th and early 8th cents., seems to have been based in its vicinity. The earliest recorded king is Merewalh, who is described in a late 11th-cent. source as a son of \*Penda of Mercia. Other evidence supports the idea of kinship with the Mercian royal house, including the burial of Merewalh at \*Repton. Merewalh is said to have married Eormenburga, a Kentish princess, and sources connected with their daughter St Mildburga, for whom the monastery of Much Wenlock was founded, provide information for the family and the early history of the province. The last known ruler Mildfrith, son of Merewalh, died c.735 and it would appear that the province became a Mercian ealdormanry after that date. BAEY

**Maiden castle** is perhaps the most spectacular Iron Age hill-fort in Britain. However, this 50-acre hilltop 3 miles south of Dorchester has a longer history stretching back to the neolithic, when a causewayed enclosure was constructed on its eastern end. Subsequently around 3500 BC a bank barrow 600 yards long was built along its central spine.

The Iron Age fort, initially enclosing 25 acres, was built over the neolithic camp around 600–500 BC. Its double eastern gateway, subsequently elaborated by the addition of stone revetting and outworks, already hinted at a special status compared to other neighbouring sites, and this was confirmed around 400–300 BC when the defended site was doubled in size. The defences were gradually elaborated by the addition of further ramparts, finally achieving their present form around 100 BC. Wheeler argued that the multivallate ramparts were for defence in depth against sling warfare, and certainly it was defended against Roman attack around AD 43–5, as skeletons with wounds from sword cuts and ballista bolts were found buried in the east entrance. In the 4th cent. AD a small Romano-Gallic temple was constructed in the interior. JRC

**Maidstone, battle of,** 1648. Although the Kentish royalists in 1648 had assembled an army of 11,000 men, they dispersed them among several towns, leaving only 2,000 in Maidstone. Sir Thomas \*Fairfax, after assembling a 4,000-strong parliamentary force, attacked the town on 1 June. Though heavily outnumbered, the defenders resisted fiercely, using their cannon to deadly effect in the town's narrow streets. Under heavy rain they were eventually overpowered. This defeat prompted most of the Kentish royalists to desert, while the remainder—fewer than 3,000—fled north to Chelmsford and Colchester. JJC

**Main plot,** 1603. Regarded by the government as the principal conspiracy to distinguish it from the \*Bye plot. The Spaniards were said to have encouraged a scheme to replace James I by his cousin Arabella \*Stuart in the hope of obtaining peace. \*Raleigh, already out of favour with the new monarch, was implicated on the dubious evidence of Lord Cobham. They both spent almost all their remaining days in the Tower. JAC

**Maitland, Frederick William** (1850–1906). Historian. By common consent, Maitland was one of the great British historians, with remarkable influence after a comparatively short academic career. Educated at Eton and Trinity College, Cambridge, he began as a lawyer but switched to history. He performed a vast amount of editorial work on medieval records, most of it for the Selden Society, but his most famous book was a *History of English Law* (1895) of which his co-author, Sir Frederick Pollock, wrote only a fraction. Maitland was elected professor of the laws of England at Cambridge in 1898, which he held at Downing. 'A model of critical method, a model of style and a model of intellectual temper,' was A. L. Smith's comment. JAC

**Maitland, John Maitland, 1st Baron** [S] (c.1545–95). Maitland succeeded his father in 1567 as keeper of the privy seal [S]. He and his elder brother Sir William \*Maitland were strong supporters of Mary, queen of Scots.

He was forfeited in 1571 and took refuge with his brother in Edinburgh castle. He was lucky to escape with his life when in 1573 the castle was forced to surrender. But when James VI came of age, Maitland found himself in favour. In 1584 he was knighted and made secretary of state for life, and from 1587 until his death he was lord chancellor [S]. On the occasion of the coronation of Anne of Denmark in 1590, he was made a peer as Maitland of Thirlestane. His influence was used to support the presbyterian party and he favoured good relations with England. Maitland's son was created earl of Lauderdale.

JAC

**Maitland, Sir William** (c.1528–73). Maitland of Lethington began his career in the service of \*Mary of Guise, regent for Mary, queen of Scots, but in 1559 denounced the French alliance and urged an understanding with the English. His embassy to Elizabeth resulted in the treaty of \*Berwick in 1560. Mary's return from France placed him in jeopardy but he was employed to persuade Elizabeth to recognize Mary as heir. Though unsuccessful, he continued to be employed in English negotiations, informing Elizabeth of Mary's intention to marry \*Darnley. He had complicity in the murders of \*Rizzio and Darnley, opposed \*Bothwell, and encouraged a marriage between Mary and \*Norfolk. He was now one of Mary's leading supporters and, surrounded by enemies, took refuge in Edinburgh castle in 1571. Two years later the castle was besieged, largely by English troops. Maitland was forced to surrender and, already ill, died shortly afterwards. He had a high reputation as a diplomat and was an accomplished man of letters, but it is not easy to perceive much consistency in his policy. Maitland's younger brother John exercised great influence with James VI in the 1580s.

JAC

**Major, John** (b. 1943). Prime minister. Major entered the House of Commons in 1979 after a career in banking and during the next decade had a meteoric rise to power. His parliamentary career began in the whips' office (1983–5) which clearly left its mark on him, and then in the Department of Health and Social Services (1985–7). He became chief secretary to the Treasury in 1987 but two years later, still a political unknown, was chosen by Mrs \*Thatcher to replace first Sir Geoffrey \*Howe as foreign secretary, then Nigel Lawson as chancellor of the Exchequer. Unable to make a mark at the Foreign Office, he made his reputation as chancellor by persuading a reluctant Mrs Thatcher to enter the exchange rate mechanism at a rate of his choosing, which events proved to be too high. In 1990, on Mrs Thatcher's resignation, Major defeated Douglas \*Hurd and Michael \*Heseltine for the leadership, attracting support as Thatcher's political heir. As prime minister he stuck to the ERM policy until the pound was forced out of the system in September 1992 by market forces. This disaster cost him much credibility since recovery, when it came, was based on a floating pound and reduced interest rates, the opposite of his campaign platform in 1992, when he had won the general election against the odds.

Relations with Europe were at the heart of Major's difficulties as prime minister. The Tory Party was split on the issue, yet in 1992 he agreed to sign the treaty on European

unity at \*Maastricht, which laid down a timetable for a single currency and established majority voting in almost every area of policy. It even foresaw a European army and police force and made all British subjects citizens of a new state, the European Union. The concessions Major gained in the negotiations appeared cosmetic and it was not easy to understand how he could claim to have won 'game, set and match'. Lady Thatcher opposed ratification, and the treaty was pushed through the House of Commons only by brutal government whipping.

Major's popularity, based in part on the contrast he offered to his predecessor, declined sharply. The run on the pound had been extremely expensive and produced record unemployment, record deficits, and record tax increases. A 'back-to-basics' initiative, intended to improve the moral climate of the nation, foundered amid Tory scandal and sleaze. The government's policy towards the \*National Health Service alienated many voters. In 1994 Major attempted to recapture the initiative by tackling the Irish problem, although it involved, contrary to previous assurances, negotiating with the \*Irish Republican Army. But the declaration that the British government had no 'selfish, strategic or economic interest' in Northern Ireland confirmed Ulster's fears of further betrayal, and although a cease-fire brought welcome relief, it did not last. In spite of a considerable economic recovery, Tory divisions over Europe continued to fester, although in 1995 Major beat off a challenge to his leadership from John Redwood, representing the anti-Europe sceptics. Further difficulties were caused by the protracted scare over British beef, which killed its export market and imposed severe financial strains on both government and industry. Major showed little enthusiasm to face the electorate and postponed a general election until the last possible moment. In May 1997 his party suffered a severe defeat and he resigned immediately. Though widely regarded as honest and well-intentioned, and considerably more popular than his party, Major's years as leader were dogged by misfortune and he rarely seemed in advance of events. He retired from his seat at Huntingdon at the general election of 2001.

AS

**major-generals, rule of the.** The division of England into twelve military districts, each under the direct rule of a major-general, was in part a consequence of the breakdown of the \*Instrument of Government, in part \*Cromwell's response to \*Penruddock's rising in March 1655. The emergency measure was deeply resented by many of the local gentry, the natural rulers of the shires, and the major-generals were bitterly attacked as men of low birth. Others disliked the attempt to impose laws against immorality and irreligion. As soon as a Parliament was called in January 1657, it refused to provide funds for the scheme and a search for a new government settlement began. Though the regime of the major-generals was neither as ruthless nor as effective as has been suggested, it stayed in the national mind as a dire warning against army rule and religious fanaticism.

JAC

**Majuba Hill, battle of**, 1881. Majuba Hill was the only major battle of the first \*Boer War (1880–1), which arose

## Malachy

from the British annexation of the Republic of the \*Transvaal in 1877. In December 1880 the Boers rose in revolt, laying siege to isolated British garrisons. A relief column of 1,100 soldiers and sailors led by Major-General Sir George Pomeroy-Colley was checked at Laing's Nek (pass) in January 1881. The area is dominated by Majuba Hill, rising 1,100 feet above it. At night, on 26 February, Pomeroy-Colley led a force of about 400 men onto the hill, failing to reach the summit by dawn. The defending Boer force of 3,000 men also sent contingents onto the hill, and in the ensuing fight the British were driven off with 287 casualties compared to 7 Boers. Pomeroy-Colley was killed, and (the future General Sir) Ian Hamilton lost the use of his hand. By the convention of \*Pretoria of 5 April the Transvaal regained its independence. SDB

**Malachy, St** (c.1094–1148). Malachy was a great reforming bishop in Ireland, when hereditary succession linked church with clan, sacraments were neglected, and old customs frequently prevailed over canon law. His own nomination as archbishop of \*Armagh, 1129, was strongly opposed by his predecessor's kin and took several years to resolve. Journeying to Rome, 1139, Malachy stayed with Bernard of Clairvaux. They became firm friends, and with monks trained under Bernard, Malachy established a Cistercian monastery at Mellifont (Co. Louth). Appointed papal legate to Ireland, his wish to remain at Clairvaux was denied, but it became his final resting place when he died there *en route* to Rome. AM

**Malawi.** Former British central African protectorate of Nyasaland. The missionary explorer David \*Livingstone led the first group of Britons to the region in 1859 and after initial set-backs Nyasaland became a thriving centre of missionary activity. A British protectorate was declared in 1893. Early hopes of economic development rested upon the introduction of white settlers although cotton-growing by the indigenous people was later encouraged. Economic motives also led to the creation of the Central African Federation of the Rhodesias and Nyasaland in 1953, but African opposition resulted in its dissolution in 1963. Nyasaland became independent as Malawi in 1964 and a republic in 1966. KI

**Malaysia,** or the Malay archipelago, was long famous for its trade. In the 15th cent., an important sultanate arose at Malacca and the region was subject to Islamic conversion. The Portuguese took Malacca in 1511 and, subsequently, the Dutch exercised a pervasive hegemony. English interest began in 1786 with the foundation of Penang and increased in the 1820s with the development of the Straits Settlement. The settlement became a crown colony in 1867. It was amalgamated with other sultanates, previously held as protectorates, to form the Federation of Malaya in 1948. In 1957 the Malaysian Federation became independent. DAW

**Malcolm I** (d. 954), son of \*Donald II, was king of 'Scotland', but the sources are confused whether he became king in 940, 943, or 945. This may simply be due to copying errors, or may also reflect a period of political uncertainty as Malcolm attempted to oust the aged \*Constantine II, who resigned the kingship and retired to monastic life. Malcolm

was evidently aggressive and ambitious, and succeeded in extending the power (if not necessarily the territory) of his kingdom both north and south. He led a victorious army into \*Moray, raided northern England as far as the Tees, and in 945 won \*Edmund, king of Wessex's recognition that the kingdom of \*Strathclyde/Cumbria lay within his sphere of influence. His only recorded set-back outside his kingdom was as part of an alliance with Britons and Saxons (probably against \*Erik Bloodaxe in York) defeated in 952 by a Scandinavian force. He was killed by the men of the Mearns at Fetteresso (south of Aberdeen). DEB

**Malcolm II** (d. 1034), king of 'Scotland' (1005–34). Son of \*Kenneth II, Malcolm was known to later generations as 'the most victorious', and at his death was described by an Irish chronicler as 'the honour of all the west of Europe'. His career was not always so, however. He became king in 1005 by killing his first cousin Kenneth III at Monzievairstad (west of Perth), and in the following year invaded northern England as far as Durham, but was thoroughly defeated. Despite this reverse he successfully re-established control over \*Lothian by a famous victory at \*Carham (west of Berwick) in 1018 which proved decisive in bringing Northumbria as far south as the Tweed under the rule of the king of Scots. He apparently controlled the kingdom of \*Strathclyde after the death of its king in 1018, and possibly appointed his grandson \*Duncan (I) to rule over it. He could not escape the power of \*Cnut, however, and submitted to him in 1031/2. His last year saw more dynastic violence, killing another cousin in 1033, before himself dying in old age (perhaps assassinated). He was the last direct male descendant of \*Kenneth I to hold the kingship. DEB

**Malcolm III** (d. 1093), king of 'Scotland' (1058–93). Malcolm 'Canmore' ('big head' or 'great leader') was the son of \*Duncan I and his mother was probably Northumbrian. He was a child when his father was killed by \*Macbeth in 1040. Malcolm found refuge in England, and was backed by \*Siward, the Anglo-Danish earl of Northumbria, who led an army into Scotland in 1054 defeating Macbeth at Dunsinnan (north of Perth). Despite this victory Malcolm won only the recovery of his lands. On 15 August 1057 Malcolm killed Macbeth at \*Lumphanan (west of Aberdeen), but \*Lulach, Macbeth's stepson and cousin, won the kingship. It is possible, however, that Malcolm and Lulach were allies against Macbeth, whose rise to power probably involved killing Lulach's father as well as Malcolm's. After only eighteen weeks on the throne Lulach was killed 'by treachery' by Malcolm at Essie (west of Aberdeen). Malcolm's grip on the kingship was only secure, however, after he defeated Lulach's son \*Mael Snechta, king of \*Moray, in 1078.

Malcolm's struggle against Mael Snechta made him an ally of Moray's traditional foe, the earl of Orkney, whose close relative Ingibiorg he married. Malcolm was already a widower, however, when the Anglo-Saxon royal family fled to Scotland in 1070, and he took \*Edgar Atheling's sister \*Margaret as his second wife. Malcolm supported her zeal for ecclesiastical reform. His attention now focused on Northumbria, which he raided repeatedly despite

submitting to William the Conqueror in 1072 at \*Abernethy (south-east of Perth). In August 1093 he laid the foundation stone of Durham cathedral; two months later he was killed on a raid at \*Alnwick. DEB

**Malcolm IV** (c.1141–65), king of Scots (1153–65), later known as 'the Maiden'. Grandson and successor of David I, his uncontested enthronement in 1153 at the age of 12 reflects the contemporary strength and prestige of the Scottish monarchy. He and his advisers continued to implement David I's Normanizing policies, despite mounting native opposition led by Fergus of Galloway and \*Somerled of Argyll. Whether interpreted as a conservative Celtic reaction against modernization or viewed merely as hostility to the spread of royal power, this resistance had been contained by 1164—a fact of crucial importance for Scotland's future development. In other respects, Malcolm was less successful. After the crisis of Stephen's reign, Henry II swiftly restored English royal might, and at Chester in 1157 Malcolm had to surrender the northern English counties in return for the earldom of Huntingdon. Another indication that the balance of power had shifted back in England's favour was his presence on Henry's expedition to Toulouse in 1159, when Henry knighted him. The epithet 'the Maiden' was first applied in the 15th cent., in recognition of Malcolm's well-attested reputation for chastity. KJS

**Maldives.** The Maldive islands lie 400 miles south-west of Sri Lanka. Their population was converted to Islam in the 12th cent., and in the 14th cent. the sultanate was secured by the ad-Din family who ruled for the next 600 years. The Portuguese briefly established a settlement 1518–28 but the islands were left as a dependency of the prevailing power in Sri Lanka. In 1887 the British government placed them under a direct protectorate. The sultanate was overthrown for a republic in 1952 but restored in 1954. From 1956 to 1986 the RAF maintained an important air base at Gan. DAW

**Maldon, battle of**, 991. In August 991 Byrhtnoth, ealdorman of Essex, was defeated and killed by a Danish force led by Guthmund and Olaf Trygvason at Maldon on the river Blackwater in Essex. Byrhtnoth's heroic death was commemorated in one of the greatest Anglo-Saxon battle poems, *The Battle of Maldon*. JAC

**Malmesbury abbey** (Wilts.) grew from a community established by an Irish hermit in the mid-7th cent. This was soon expanded by \*Aldhelm, later bishop of Sherborne. It received the patronage of Wessex kings, especially \*Aethelstan, who was buried there. The community was reformed as a \*Benedictine house during \*Edgar's reign. A substantial library was built up during the abbacy of Godfrey (c.1090–1105) and a monk, William of Malmesbury (c.1095–c.1143), was the greatest historian of 12th-cent. England. The abbey continued to flourish till the \*dissolution, when it had a net income of c.£800. BJG

**Malory, Sir Thomas** (d. 1471). The identity of Malory, author of *Le Morte Darthur*, is not certain. The author referred to himself as a 'knight-prisoner'. The most likely sug-

gestion is Sir Thomas Malory of Newbold Revel (War.), who had been in prison for crimes of violence. If it is correct, he had been knighted in 1445, served in Parliament for Warwickshire the same year, and was a follower of \*Warwick the Kingmaker. Of several other candidates who have been proposed, only Thomas Malory of Papworth (Cambs.) and Thomas Malory of Hutton Conyers (Yorks.) seem worth serious study, though neither of them appears to have been knighted. Malory's famous volume was a compilation from various sources, mainly French, and was printed by Caxton in 1485. JAC

**Malplaquet, battle of**, 1709. As allied (British-imperialist) forces under the duke of \*Marlborough and Prince Eugene laid siege to Mons, a French army under Marshal Villars moved towards them from the south-west. Unable to leave Mons until reinforcements arrived, the allies allowed Villars to build entrenchments to the north-east of Malplaquet. When the allies finally advanced on 11 September they faced heavy opposition, and although the French were forced to retreat, the costs to both sides were horrific. At least 12,000 French were lost, while allied casualties may have been more. JLP

**Malta.** The island of Malta, of great strategic significance, lies 60 miles south of Sicily: it is 17 miles in length and 9 across. Malta was acquired by Britain at the end of the Napoleonic wars in 1814, having belonged to the Knights of St John from 1530. From 1940, when Italy entered the Second World War, it was subjected to constant bombing until 1943 and received the George Cross as a tribute. It became independent in 1964 and was declared a republic in 1974. The grand harbour in Valletta is capacious but the main resource today is tourism. JAC

**Malthus, Thomas Robert** (1766–1834). Though Malthus's views were extremely controversial, his character was pleasant and his life uneventful. He was born near Guildford, his father having private means. After attending Jesus College, Cambridge, he was elected to a fellowship (1793), took holy orders, and became a curate in Surrey, and from 1805 taught at the East India Company College at Haileybury. His most celebrated work, the *Essay on Population* (1798), was directed at the facile optimism of Condorcet and \*Godwin. Malthus argued that while population, unchecked, would increase geometrically, subsistence would increase only arithmetically. Consequently any improvement in the standard of living would soon be wiped out. This, Malthus admitted in his preface, had a 'melancholy hue'. He produced a revised and much enlarged edition in 1803, and appealed for 'restraint'—by which he meant late marriage—to prevent population outstripping support. His theory was seized upon by those who wished to argue that progress or amelioration must be an illusion, and his condemnation of the Poor Laws for encouraging breeding had important consequences. But the simplicity of Malthus's basic proposition reveals its naivety, and it had little statistical support. As the standard of living improved, people did not breed to the maximum but took steps to limit the number of their children. JAC

**Man, Isle of.** See ISLE OF MAN.

## Manchester

**Manchester.** Sited where natural routes crossed and bridges could be maintained, the Roman military station Mamucium or Mancunium controlled the \*Brigantes, while acting as a supply base. In medieval times it was a dependency of the capital manor of Salford, becoming a trading centre within an agricultural community, and during the Civil War was strongly parliamentary, although some prominent local families remained stubbornly catholic. Encouraged by the moist atmosphere, soft water, and nearby coal supplies, local textile industries so flourished that Manchester became their chief commercial centre as well as a manufacturing and finishing site. New production methods and transport facilities (e.g. Bridgewater canal) greatly increased output, and the merchants and manufacturers began to organize a factory system. Population expansion from immigrants attracted by employment opportunities resulted in social and political problems because of the conflict between a still feudally run market town (enfranchised only in 1832) and a burgeoning industrial centre. Crowded, makeshift dwellings and dangerous sanitary conditions underlay a strong working-class radical movement and the so-called \*'Peterloo massacre' (1819), but unemployment and \*Luddism were tempered by the rise of trade unionism and methodism. Belief in free trade prompted \*Cobden and \*Bright to push for the repeal of the Corn Laws, and the city's political temper began to harden into Liberalism. Prosperous, confident, and progressive, the merchant princes of Victorian Manchester invested in bricks and mortar, railways, and the ship canal, but the smoke pushed residents into the suburbs; its commercialization attracted accusations of philistinism, and poverty and squalor persisted. Home of the *Manchester Guardian*, Victoria University, and the Hallé Orchestra, it was a city of enormous vitality in its cultural and intellectual life. After the decline of cotton, the huge variety of engineering projects and distributive trades helped maintain it as a regional and metropolitan centre, with less air pollution, but service industries are replacing these in their turn, and it remains a city in transition. The metropolitan area as a whole has become a magnet for Commonwealth immigrants into Britain. ASH

**Manchester, diocese of.** The rapid population expansion of the industrial north led the ecclesiastical commissioners of 1835 to recommend that Chester diocese be relieved by the creation of two new sees of Ripon and Manchester. The order in council (1838) to constitute the latter foundered on the sensitive issue of increasing the number of bishops in the House of Lords and the accompanying proposal to fuse Bangor and St Asaph. Manchester diocese was eventually established in 1847, with the constitutional innovation that bishops' seats in the Lords were occupied in order of consecration. Covering Lancashire, except for Liverpool district, Furness, and Cartmel (transferred to Carlisle), the initial archdeacons of Manchester and Lancashire were augmented by those of Blackburn (1877) and Rochdale (1910); Blackburn became a separate diocese in 1926. Suffragan bishops were appointed at Burnley (1901), Whalley (1905), Hulme (1924), and Middleton (1926).

A grandiose scheme to build a new cathedral worthy of the see was realistically replaced by restoration of the dilapidated parish church of St Mary, St George, and St Denys, a collegiate church since 1422, with fourteen carved minstrel angels supporting the nave roof. No other English cathedral except Coventry suffered so severely in the Second World War. ASH

**Manchester, Edward Montagu, 2nd earl of** (1602–71). Parliamentary commander during the Civil War. Manchester (Mandeville until inheriting the earldom in 1642) was sympathetic towards \*presbyterianism and a leading opponent of the king in the years before the outbreak of war. He fought in the opening battle at \*Edgehill and was in command at \*Marston Moor and at the second battle of \*Newbury. Clarendon remarked that he was 'universally acceptable and beloved' and he seems to have been sweet-tempered and conciliatory. Praise from opponents did not endear him to zealots on his own side and in November 1644 \*Cromwell launched a fierce attack upon him in Parliament, accusing him of lethargy and of hankering after compromise. He was forced to resign by the \*self-denying ordinance in the spring of 1645. He survived to help bring about the restoration of Charles II, was made a knight of the Garter in 1661, and held high court office for the rest of his life. JAC

**Manchester, Greater.** A term first used in 1914 to describe a commercial rather than municipal focus in north-west England, but now applied to the major conurbation which was created a metropolitan county after local government reform (1972). Although smaller than the 'Selne' (SE Lancs./NE Ches.) area proposed by the Maud Commission (1969), it nevertheless had ten constituent districts and included the crescent of industrial towns to its north and dormitory areas in Cheshire. Of the six such counties created, it is the only one to be named after its central city, and had its own county council until 1986. ASH

**Manchester martyrs,** 1867. On 18 September an attempt was made to rescue \*Fenian leaders Thomas Kelly and Timothy Deasy from police custody in Manchester. During the attempt, Police Sergeant Charles Brett was killed, causing strong anti-Irish feeling. Three Fenians, William Allen, Michael Larkin, and Michael O'Brien, were executed for the murder on 23 November. There was widespread indignation in Ireland and the 'martyrs', as they became known, were given a public funeral attended by over 60,000 people. The incident did much to raise recruitment to the \*Irish Republican Brotherhood and increase distrust of the British authorities. RAS

**Manchester School.** This provided a convenient label to identify many of the 19th-cent. advocates of \*laissez-faire and, in particular, \*free trade. Widespread support for free trade developed amongst the manufacturers of the cotton industry in Lancashire and Cheshire. The intellectual focus for this movement included Richard \*Cobden and John \*Bright whose economic philosophies dominated the Liberal Party for much of the period. The initial case for removing mercantilist regulations of trade had been made

by Adam \*Smith in *The \*Wealth of Nations* (1776). In Lancashire and elsewhere support grew rapidly in the early 19th cent. with the aim of making exports and imports as easy as possible without the restraints of taxation or protective laws, such as \*Navigation Acts. Associated with the free trade movement was the Manchester Statistical Society, founded to publish research which could advance their cause. IJEK

**mandates.** After the First World War, the colonial territories of the defeated powers were distributed to the victorious allies, under the general supervision of the \*League of Nations, which set up a Permanent Mandates Commission. It was insisted that the mandated territories would move towards self-government. Britain acquired Iraq, Trans-Jordan, and Palestine from Turkey, and Tanganyika, West Togoland, and South Cameroons from Germany. South Africa took German South West Africa, Australia became responsible for New Guinea, and New Zealand for Western Samoa. Iraq became independent in 1932. After the Second World War, a United Nations trusteeship replaced the mandate scheme and the territories moved rapidly towards independence. Britain relinquished its mandate for Trans-Jordan in 1946 and for Palestine in 1948; West Togoland joined Ghana in 1957; South Cameroons joined East Cameroons (a former French mandate) to form an independent state in 1961. Tanganyika became independent in 1961 and joined with Zanzibar in 1964 as Tanzania. Western Samoa became independent in 1962 and Papua New Guinea in 1973. The independence of former German South West Africa was retarded by South Africa's refusal to obey United Nations rulings and a guerrilla war developed. The territory achieved independence under the name of Namibia in 1990. JAC

**Mann, Tom** (1856–1941). Socialist and trade union leader. Born near Coventry and apprenticed as an engineer in Birmingham, Mann moved to London in 1877 and was active in the \*Social Democratic Federation from 1885. He achieved notoriety as a leader of the London dock strike of 1889, was elected first secretary of the \*Independent Labour Party in 1893, stood unsuccessfully for Parliament on three occasions in the 1890s, and founded the Workers' Union in 1898. In 1901 he visited New Zealand and Australia, where he started what became the Socialist Party of Australia. Returning in 1910, he founded the Industrial Syndicalist Education League and led the Liverpool transport workers' strike of 1911. In 1916 he joined the British Socialist Party and in 1919 became first secretary of the Amalgamated Engineering Union. Between the wars he was a leading member of the \*Communist Party. Unlike some of his contemporaries, he never lost his working-class roots or subsided into conservatism in old age. ER

**Manners, Society for the Reformation of.** Such societies, which sprang up in the 1690s in London and the larger provincial towns, were a mixture of evangelicalism and social control. The early signs of the \*commercial revolution, accompanied by great anxiety about the spread of free thinking, persuaded many conservatives that vice, drunkenness, and luxury were rotting the fabric of society. The church

courts were no longer keen to enforce morality and sabbath observance. The societies brought prosecutions against vice and protested against lewd plays and lascivious entertainments, such as masquerades. By the early years of George I's reign, they were bringing more than 2,000 prosecutions a year. They acquired considerable unpopularity. Magistrates found them tediously zealous and as early as 1698 \*Defoe commented that 'we do not find a rich drunkard carried before my Lord Mayor'. Their support collapsed in the 1730s, despite the efforts of Bishop \*Gibson. \*Wesley and the methodists revived them in the 1750s but by 1766 Wesley wrote that this 'excellent design is at a full stop'. The disappointing results of the crusades did not prevent the establishment of a Society for the Suppression of Vice in 1802. JAC

**Manning, Henry Edward** (1808–92). Cardinal. Manning was born in Hertfordshire, son of a wealthy banker and MP. Educated at Harrow and at Balliol College, Oxford, he was president of the Union in 1829. An enigmatic and complex figure, he was an Oxford high churchman and gained ecclesiastical preferment rapidly, becoming archdeacon of Chichester in 1840, where he remained until his conversion to catholicism ten years later. The strong ideas expressed in *The Unity of the Church* (1842) helped him into a powerful position in English catholicism. He voiced strong support for the papal states and was the chief proponent of papal infallibility at the first Vatican Council (1869–70). From 1865 Manning was the second cardinal-archbishop of Westminster. He was, and remains, a contentious figure, accused by some of scheming and power-mongering. Yet he was much loved as a champion of Irish Home Rule and as the hero of the working classes in London. His intervention in the bitter London dock strike of 1889 has been called 'the crowning act of his archiepiscopate'. JFC

**manor houses** were the habitat of the gentry, the headquarters of the squire. In medieval England they were both governmental and economic units. The lord of the manor dispensed justice through his court and could call upon the villagers for labour and financial assistance. It is not clear to what extent Roman \*villas fulfilled these functions or how widespread the development was in Saxon times. There was always considerable diversity. Some wealthy men owned many manors, others but one: some villages had no resident lord of the manor, others had two. Manors and villages did not necessarily coincide. Though the growth of royal justice and the development of a freer economy undermined the position of the lords of the manor in the later medieval period, their social prestige remained high and their increasing functions as \*justices of the peace went some way to compensating, since most could expect to be on the bench, unless excluded by party animosity or personal idiosyncrasy.

The essential feature of medieval manor houses was the great hall, the living and sleeping quarters of the lord's followers and servants, as well as his family. The fireplace was normally in the middle, the gentry often had a dais or table at one end (as in a college hall), and there was little privacy. Some defence was afforded by moats, which also supplied fish, or stockades, though the manor house must

## manorial courts

be distinguished from the castle, which was the preserve of the mighty. At Boothby Pagnell, Lincolnshire (c.1200), and Donington, Leicestershire (c.1280), the hall was on the first floor, for comfort and security. Lower Brockhampton (Herefordshire) had a moat, though more ornamental than formidable, and Stokesay in Shropshire had a great hall, to which towers were subsequently added: each of them acquired a free-standing half-timbered gatehouse in the Tudor period. Gradually, with greater attention to privacy, manor houses became less public and more comfortable, with windows, carpets, and more furniture. The old great hall was sometimes partitioned to make smaller rooms. A remarkably ornate late Tudor house is Little Morton Manor in Cheshire, which retained the great hall, but added a long gallery at the top for recreation or receptions. Other houses were rebuilt, or sometimes moved, to take them out of village mud or poultry. By the Stuart period the withdrawal from communal living had gathered pace. Though the stately homes had vast reception rooms and bedrooms for many guests, the average manor house catered for the immediate family and its servants. After the Restoration, the retreat from the public gaze accelerated, with walls erected, lodges built, drives constructed, roads diverted, and the parks planted and embellished. Milton Manor (Oxon.), built soon after the Restoration, is severely classical: the moat has given way to an elegant pond, the great hall has gone, and in the following century a library was added. At Ramsbury Manor in Wiltshire, built in the 1680s, the great hall has dwindled into an imposing entrance hall. We must not exaggerate the grandeur of manor houses. Many remained little more than farm-houses and others stayed in their villages. The manor house at Woolsthorpe in Lincolnshire, where \*Newton was born in 1642, was only 20 years old, and a very modest dwelling in the middle of the hamlet, hardly distinguishable from other good residences. Capability \*Brown, having made his fortune improving aristocratic parks, bought himself a small manor house at Fenstanton in 1768, near the church and in the town. The prestige of the gentry remained high, since they often owned the \*advowson and had a cousin or an uncle in the rectory as well. Their influence declined markedly in the 19th cent. as they lost their local powers to elected councils, but the position of the squire remained important in Victorian times and is still significant in some villages today. JAC

**manorial courts.** After the Norman Conquest the system of feudal landholding required the lord of the manor to provide a court for his tenants. Such 'seigneurial' courts were the court of the honour and the court baron, for free tenants, and the court customary for unfree tenants or villeins. The court of the honour, the principal manorial court, soon fell into disuse. The court baron was attended by all free tenants who were both its suitors and its judges. It decided questions of tenure, the fulfilment or non-fulfilment of feudal services, the payment of feudal dues, and disputes between free tenants of the same lord. The court customary (or hallmoot) was the court for unfree tenants or villeins and was presided over by the lord's steward or bailiff. It decided matters relating to performance or non-performance of

feudal services and also disputes between unfree tenants (e.g. debts and minor assaults) and tenants who held by unfree tenure. It also ensured that the agricultural services and land use necessary to the proper upkeep of the manor were duly performed. The lord would frequently have the franchise to hold the local hundred court to take the view of \*frankpledge and to hear minor criminal cases, such as assaults, nuisances, and breaches of the Assizes of Bread and Ale. This \*court leet was also therefore a 'manorial' court, though its jurisdiction arose not from the feudal relationship *per se*, but from royal grant.

Eventually the distinctions between the seigneurial courts and the courts leet became blurred; the court baron faded into oblivion and the court customary survived as a court for free and unfree tenants alike. This court and the court leet were both held by the lord's steward in the same place, traditionally the hall of the manor. The manorial courts had declined by the 15th cent., but many of the courts leet survived as the basis of new towns and local government. MM

**manorial system.** A term used by historians to describe the method of estate management of landowners in the Middle Ages and in Tudor and Stuart times. Landowners whose estates embraced the major part of a village or a whole cluster of small villages found it convenient to administer such property by establishing a manor. In some places where a large village was divided in ownership among several landowners, there were several manors. It seems probable that manors existed in Anglo-Saxon times but that the structure of control changed according to the needs of the landowners.

By the 13th cent. most manorial lords had established two courts, \*leet and baron, which met at the same place and whose proceedings followed one another. These had a senior officer of the lord or even the lord in the chair and all tenants were required to attend these meetings (known as suit of court) whether they were free or bond in status. Between them these courts dealt with all matters relating to the maintenance of boundaries, preservation of property, and changes in tenure. They regulated the pattern of agriculture, for example the rotation of crops in the common fields, and the manorial market. Enforcement of decisions rested on the officials appointed by the court. Where the lord of the manor had a demesne farm, the court appointed a \*reeve to supervise the farming activities, using labour services and collecting rents. Usually at Michaelmas the reeve presented an annual account to the lord or senior administrator. When demesne farming dwindled or disappeared, the reeve remained as a rent collector.

So long as \*villeinage (serfdom) had importance, the courts reinforced status by requiring some labour services over and above that fixed by custom and practice. Those who wished to leave the manor had to seek permission or be penalized by a fine.

Where urban communities developed within manorial boundaries, appointments of constables and other local officers such as street masters provided some of the necessary organization for town government. Their duties usually

included fire precautions, and coping with dangerous structures and nuisances, such as dumping rubbish in the street. These functions continued well into the 19th cent. in some places. IJEK

**Mansel, John** (d. 1265). Mansel was a clerical counsellor to Henry III and greatly employed as administrator, diplomat, and soldier. In exchange he was given a large number of benefices. He began with a post in the Exchequer in 1234 and held the great seal 1246–7 and 1248–9. He represented the king's interest on the committee and council set up under the Provisions of \*Oxford in 1258 and under pressure the king was obliged to dismiss him in 1261. When the civil war began in 1263, Mansel took refuge in the Tower before escaping to France to try to raise troops. He was again a royal representative at the mise of \*Amiens in January 1264, which led to civil war, but died before the great royal victory at \*Evesham in 1265. Defending him in 1262, Henry wrote: 'he was trained under my wing. I have tested his ability, his character and merits since his boyhood.' JAC

**Mansfield, William Murray, 1st earl of** (1705–93). Judge. In 1742 Mansfield became solicitor-general with a seat in Parliament for Boroughbridge. He was an effective debater, second only to \*Pitt. \*Newcastle relied heavily on Mansfield and was reluctant to see him become chief justice of King's Bench in 1756. However Mansfield remained in the cabinet until 1763 and was attacked by \*Junius for being a 'political judge'. He set about reforming the slow practices of the court, developed and clarified commercial law, and, when the occasion arose, adapted the law to the needs of his day. He twice refused the lord chancellorship, preferring the security of a non-political post. Mansfield hated religious persecution and his house was burned during the \*Gordon riots (1780); his country house, \*Kenwood, at Hampstead escaped. He retired in 1788 with a reputation as the greatest judge of the 18th cent. RAS

**Maori wars, 1844–72.** The treaty of \*Waitangi in 1840 was not accepted by all chiefs, nor was the confirmation of Maori land rights easy to implement. The Maoris were a warlike people and clashes continued between Maoris and settlers, and between Maori tribes. The first period of warfare began in 1844 at Kororareka and remained small scale, since most Maori tribes held aloof. A small British force took casualties but regained control by 1847. The second conflict developed after repeated incidents in Taranaki, beginning in 1860 and continuing as a guerrilla war, flaring up and dying down, until 1872. One thousand settlers and colonial troops lost their lives, and perhaps twice that number of Maoris. Three million acres of Maori land were confiscated, some restored, but the sale and loss of Maori territory continued. JAC

**maps** can have political and military, as well as geographical, significance. They have been printed by governments wishing to claim territories. The islands named on British maps after Lord Falkland are shown on Argentine ones as Las Malvinas. For years Irish nationalists referred to Northern Ireland as 'the six counties'. They have played a part in identifying nations, since it is not easy to have a strong sense

of nationality if one does not know where one's fellow-nationals live or what the terrain is like. English map-making, not surprisingly, leapt forward in the Tudor period.

Roman Britain did not make use of maps. The early Roman conquerors must have relied upon native guides and interpreters. Once a road system had been developed, they used itineraries, numbering the routes and setting up milestones. The Antonine Itinerary of the Empire in the 4th cent. showed fifteen roads in Britain, and more than 100 place-names, with distances. Ptolemy's 2nd-cent. map showed the British Isles. Their juxtaposition to the mainland of Gaul was plausible, but Hibernia was too small, and northern Scotland tilted over to the north-east. Even if available it would have been no use to travellers or messengers.

Medieval map-makers began to fill in some detail. The Mappa Mundi (c.1280), now in Hereford cathedral, was as much theological as geographical, and centred on Jerusalem: Scotland was shown as an island and Ireland was divided by the Boyne. A much better map had been produced some 30 years before by \*Matthew Paris, showing recognizable details like the Cornish peninsula and East Anglia: it had no roads and some rather strange rivers. A century later came the Gough map (named after the 18th-cent. collector Richard Gough and now in the Bodleian), perhaps an official road map, good on England and with distances shown. By the Tudor period engraved maps of some accuracy were being produced, though Ireland and northern Scotland continued to give trouble. Mercator in 1564 offered a map of the British Isles, with information passed on by Lawrence Nowell, dean of Lichfield, perhaps through John \*Dee. Elizabeth's government in the 1570s gave assistance to Christopher Saxton, and in James I's reign John Speed produced famous maps, including the *Realm of the Empire of Great Britaine* (1611–12). Itineraries or strip-maps were still much in use for travellers and an important series was produced by John Ogilby in 1675.

By the 18th cent. county maps (some sponsored by the \*Royal Society of Arts), estate maps, and town maps were becoming common, as well as oceanic charts and harbour maps. Technological advances included a marked wheel for measuring distances accurately, a greatly improved theodolite, and the gradual elimination of picturesque but irrelevant detail. The Jacobite rebellion of 1745 gave an unexpected boost to map-making, since the absence of reliable maps of northern Scotland had proved an obstacle to the work of 'pacification'. The \*Ordnance Survey began by surveying Scotland and then turned its attention elsewhere, producing from 1801 onwards a series of excellent county maps.

In the 19th cent. large-scale maps were produced, and cartographers turned to surveying colonial territories. In Britain, pocket-sized itineraries were being printed deep into the 20th cent., but with the vast increase in motor travel, particularly after 1945, road atlases became the best sellers, complete with distance charts, town maps, places of interest, and detailed indexes. JAC

**Mar, John Erskine, earl of [S]** (c.1510–72). Mar's grandfather died at Flodden. Mar commenced a clerical career but abandoned it when his two elder brothers died. He

succeeded his father as Lord Erskine in 1555 and was recognized as the rightful earl of Mar in 1565. A member of the reforming party, he had custody of the infant James VI and was active against Mary. In 1571–2 he was regent, though real power was in the hands of \*Morton, and after his death his widow remained governess of the king until 1578. His son John was one of the leaders of the \*Ruthven raid in 1582 in which the young king was kidnapped, and was disgraced in 1584. But, unlike \*Gowrie, he worked his way back into favour and became one of James's closest friends. He followed the king to England in 1603 and was given the Garter. From 1616 to 1630 he was treasurer [S]. JAC

**Mar, John Erskine, 11th earl of** [S] (1675–1732). Debts being his inheritance, Mar entered politics in 1696 as place-man in the court party in Scotland, led by the duke of \*Queensberry until his fall in 1704. Mar rejoined him in office in 1705, helping him push the Act of \*Union through the Scots Parliament in 1707. Elected to Westminster as a representative Scots peer, by 1713 he was supporting a motion for repeal of the Union.

Having failed to attract the favour of George I, he sailed for Scotland to raise the standard of Jacobite rebellion on the Braes of Mar. The national response was spectacular, but he ruined the enterprise by sheer incompetence. After 1716 he lived in exile, until 1725 in association with the exiled dynasty, though after 1719 as a double agent currying favour with the Westminster government. He pottered with plans for economic improvement after 1725, but died unrestored to his estates. BPL

**Mar, John Stewart, earl of** [S] (c.1459–80). Fourth son of James II, created earl of Mar 1459. Although a royal brother, Mar took almost no part in the affairs of state, and little is known of his life apart from his execution, by early 1480, and subsequent forfeiture. A contemporary explanation of Mar's execution as punishment for association with witches and warlocks may be the result of royal propaganda following an execution that seems to have had little provocation. It is most likely that he was executed covertly to avoid parliamentary opposition, and for little reason apart from James III's paranoia, possible opposition to the king's indictment of Alexander Stewart, duke of \*Albany, in October 1479, and fear of a new focus for extensive dissatisfaction. Mar's death is prominently, and often luridly, described in later chronicles, and was probably exploited by the 1488 rebels as part justification for their actions. RJT

**marches of Scotland.** The Anglo-Scottish border. The border lands of both England and Scotland were divided into two or three marches. Northumberland with Berwick-on-Tweed was the east march 'towards Scotland' and Cumberland and Westmorland the west march. Adjacent Scottish shires were likewise arranged. In both kingdoms, wardens were commissioned by their sovereigns to protect and restrain inhabitants of their marches from cross-border crime in times of truce, and to mobilize and direct them in wartime. War in the 1380s caused the English wardenships to be given a dangerous character for the following century. Instead of several commissioners, a single warden was

appointed for each march. He was engaged by indenture for one year, later for more, at an annual rate of payment which would be doubled (at least) in wartime; with these large sums he was to employ as many soldiers as he considered necessary. Magnates with lands in the marches, and therefore tenants, were normally appointed. Percy and Neville wardens were to lead their private armies of marchmen against the king and each other. Tudor wardens were not great magnates and less well paid. Most of Northumberland was put under a warden for the middle march. The wardenships were abolished in 1603, when the two kingdoms came under the personal union of James VI and I. RLS

**marches of Wales.** See WALES, MARCH OF.

**Marchmont, Patrick Hume, 1st earl of** [S] (1641–1724). Hume succeeded his father as baronet at the age of 7. A strong presbyterian, he represented Berwick in the Convention of Estates in 1665 and 1667, and was MP for Berwickshire 1669–74 and 1689–90. His opposition to \*Lauderdale in the 1670s led to two spells of imprisonment. He was implicated in the \*Rye House plot and in 1685 joined \*Argyll's abortive rising on behalf of \*Monmouth. Next he threw in his lot with William of Orange, accompanying his expedition in 1688. He was created Lord Polwarth [S] in 1690, with an orange in his coat of arms, and advanced to an earldom in 1697. From 1696 until 1702 he was chancellor [S] and in that capacity used his casting vote for the immediate execution of Aikenhead, an 18-year-old youth charged with blasphemy—'the worst action of his bad life', in \*Macaulay's words. At the accession of Anne, his influence waned, though he exerted himself to carry the Union. Macky remarked that he was 'a lover of set speeches' and Macaulay ridiculed his loquacity: *Complete Peerage*, more tersely, called him a 'turbulent scoundrel'. His son, the 2nd earl, was a vigorous opponent of Sir Robert \*Walpole in the 1730s. JAC

**Marconi scandal.** An Edwardian political-financial controversy. The scandal arose out of a contract for the construction of a chain of wireless stations between the English Marconi Company and the British government represented by the postmaster-general, Herbert \*Samuel, who was a wholly innocent party. One of the company's directors, Godfrey Isaacs, was also a director of the American Marconi Company which had no holdings in the English company but stood to benefit indirectly from its success. In April 1912 Godfrey offered shares in the American company to his brother Rufus Isaacs (attorney-general), \*Lloyd George (chancellor of the Exchequer), and Alexander Murray (Liberal chief whip). Lloyd George unhesitatingly bought 1,000 shares at £2 each before they went on sale to the public at a price of £3.50.

In July rumours of ministerial speculation surfaced, notably in *Eye Witness*, a journal edited by Cecil Chesterton, which coined the phrase 'Marconi scandal'. This was taken up by the opposition and led to the appointment of a House of Commons select committee. Though this exonerated the ministers, its verdict was essentially a party political one, for Murray had purchased additional shares for Liberal Party

funds and subsequently disappeared to Bogotá in South America.

MDP

**Margaret** (1283–90), queen of Scots (1286–90), known as ‘the Maid of Norway’. Daughter of Eric II of Norway, she succeeded her grandfather Alexander III, whose children had all predeceased him, at the age of 3 in 1286, and her premature death four years later was one of the most significant events in medieval British history. Her betrothal to Edward of Caernarfon (the future Edward II), agreed by the treaty of \*Birgham, was intended to perpetuate Anglo-Scottish peace through dynastic union. But she died at Kirkwall in Orkney on her way from Bergen to Scotland. This tragedy led to a disputed succession in Scotland, to Edward I’s ill-judged interventions in Scottish affairs, and to the \*Scottish Wars of Independence.

KJS

**Margaret, St** (c.1045–93), queen of Malcolm III of Scotland. Mother of Kings Edgar, Alexander, and David. Her father \*Edward, son of \*Edmund Ironside, was exiled from England by \*Cnut, and ultimately found refuge in Hungary, where Margaret was born. Hungary had only recently converted to Christianity, and it has been suggested that Margaret owed her religious zeal to the atmosphere of the Hungarian royal court. She returned with her father to England where he died soon after. The Norman conquest of England in 1066 left Margaret’s brother \*Edgar as the last hope of the English royal dynasty; but, following an unsuccessful rising in 1070, he and his family took refuge in Scotland, where Margaret was soon espoused to Malcolm III. Her commitment to piety is testified by her support for pilgrims to St Andrews, her help for \*Iona, her patronage of ascetics, and her foundation at \*Dunfermline of a cell of three monks from Canterbury—the first Benedictine community in Scotland.

Her sanctity was celebrated soon after her death in a biography written for her daughter Queen \*Matilda of England. This work may, naturally, have exaggerated her role in reforming the church in Scotland. Her posthumous significance, however, was chiefly that she gave inspiration as well as prestige to the Scottish royal dynasty which, by the time of her canonization in 1250, had made the Scottish throne its own by following her lead in ‘Europeanizing’ its realm.

DEB

**Margaret of Anjou** (1430–82), queen of Henry VI. The daughter of René of Anjou, her marriage to Henry VI was part of the terms of the truce of \*Tours. Virtually dowryless, and quickly compromised by the cession of Maine to her father, she was never popular in England. Her life was made more difficult by her husband, whose mental health failed in 1453 when she was pregnant with her only child. After his birth she began to play an active part in politics and by 1456 was the leader of the court faction. She was a formidable woman, who, convinced that the duke of \*York represented a threat to her son’s inheritance, set out to destroy him. In the event the thing she most feared came about when Edward IV usurped the throne. Portrayed by Yorkist propaganda as a ruthless virago, her reputation has suffered because of the fatal combination of being

French and on the losing side. She fled to France with her son in 1461 and schemed for her husband’s restoration, succeeding in 1470, only for her hopes to be dashed when her son was killed at \*Tewkesbury on 4 May 1471 and her husband murdered a fortnight later. She spent the rest of her life in obscure retirement in France. She was the first founder of Queens’ College, Cambridge.

AJP

**Margaret of Burgundy** (1446–1503) was a sister of Edward IV. After considerable negotiation, she was married in 1468 to Charles, duke of Burgundy, amid lavish celebrations. The marriage had great diplomatic significance in creating an alliance against Louis XI of France, and the duke gave assistance to Edward IV in 1470 when he was driven into exile. Margaret’s husband was killed at the battle of Nancy in 1477 fighting against the Swiss. After Henry VII took the throne of England, she continued to support the Yorkist cause, giving refuge to both Lambert \*Simnel and Perkin \*Warbeck. \*Caxton was in her service 1470–6.

JAC

**Margaret of Denmark** (1457–86), queen of James III of Scotland. Daughter of Christian I of Denmark-Norway (1448–81). The royal marriage took place at Holyrood in July 1469. The queen bore her husband three sons, James (IV), James (duke of \*Ross), and John (earl of Mar). Her near-contemporary Italian biographer Sabadino described Margaret as having more skill than her husband in running the kingdom. Certainly she played some part in politics following James’s incarceration in Edinburgh castle in 1482, and the two may have become estranged. Margaret had charge of her sons at Stirling castle, where she died in July 1486.

NATM

**Margaret of England** (1240–75), queen of Alexander III of Scotland. Eldest daughter of Henry III, she married Alexander III at York on 26 December 1251. Her early married life was disrupted by the factional quarrels of Alexander’s minority (1249–60), and Henry III was frequently concerned for her welfare, himself coming to Scotland to see her in 1255—and to back a new government by Scottish nobles who had his confidence. She later made several visits to the English court, and in 1261 gave birth at Windsor to her eldest child Margaret (married to Eric II of Norway in 1281). Her sons Alexander and David were born in 1264 and 1273 respectively. Apparently a beauty and deeply pious, she was buried in Dunfermline abbey. By 1284 her three children were also dead, which left as heir to the Scots throne her granddaughter Margaret, ‘the Maid of Norway’.

KJS

**Margaret of France** (c.1282–1318), queen of Edward I. Edward’s second wife, whom he married in 1299, has attracted little attention from historians. She was some 40 years younger than her husband, and there is no evidence to suggest that she was as close to him as his first queen \*Eleanor of Castile had been. The marriage was the result of diplomatic moves in the aftermath of the war of 1294–7 between England and France; Margaret was a daughter of Philip III of France by his second marriage. The ceremony was an occasion for considerable celebration, but Margaret was never crowned queen. She bore Edward a son, Thomas, in admirably short order. A second son, Edmund, and a

## Margaret Logie

daughter, Eleanor, followed. Margaret performed the traditional queenly function of interceding with the king to obtain pardons more extensively than had her predecessor Eleanor, and used her influence to help reconcile the king with his eldest son Edward when the two quarrelled bitterly in 1305. Edward did not grant her a generous landed endowment, and there are indications that she suffered some financial problems. Her widowhood was uneventful. She was notably pious, and patronized the Franciscans, in whose London church she was buried in 1318, rather than at Westminster beside her husband. MCP

**Margaret Logie** (d. c.1375), queen of David II of Scotland. Daughter of Sir Malcolm Drummond and widow of Sir John Logie. After the death of David II's first wife in 1362, Margaret Logie was openly recognized by the king as his 'beloved'. The relationship seems to have been among the causes of a revolt in the early part of 1363. On its suppression, the two were married. Margaret had, by her first marriage, at least one son, who received generous grants from David, favours which may have aroused hostility. There were however no children of her marriage to David and in 1370 the king divorced her, probably to leave him free to marry again. Margaret fled the country and appealed to the pope. David died in 1371, but the process was still dragging on when Margaret herself died some four years later. BW

**Margaret Tudor** (1489–1541), queen of James IV of Scotland. Elder daughter of Henry VII of England, Margaret was married to James at Holyrood on 8 August 1503, and bore her husband six children—four sons and two daughters—of whom only one, Prince James (James V), born in April 1512, survived. Perhaps significantly, Margaret's second son was christened Arthur, recalling the recently deceased heir to the English throne, Prince \*Arthur, and reflecting the Scottish king's claim to Henry VIII's throne if the Tudor line should fail.

After James IV's death at \*Flodden (1513), Margaret threw her energies into politics during the magnate struggles of her son's minority (1513–28). She married Archibald Douglas, earl of \*Angus (1514), but divorced him in 1526 to marry Henry Stewart, Lord Methven. She took a prominent part in James V's coup of June 1528, and died at Methven (1541).

NATM

**Marischal, George Keith, 10th Earl** [S] (c.1693–1778). Marischal was the son of a Jacobite sympathizer and succeeded to the earldom in 1712. The title carried with it the hereditary marshalship of Scotland. In 1715 he joined in the earl of \*Mar's rising on behalf of the pretender, fought at \*Sheriffmuir, and was attainted. With his brother James he embarked on the abortive rising of '19 and was wounded at \*Glenshiel. Thereafter their lives were spent largely abroad, mainly in the service of Frederick the Great. The younger brother became a Prussian field marshal and was killed at Hochkirchen in 1758. The earl served as ambassador to France 1751–4 and to Spain 1759–61. He passed on useful information about the family compact between France and Spain to George II and was pardoned in 1759, though not restored to his title. In 1763 he returned to his native

Scotland and recovered many of the family estates, but found the climate disagreeable, preferring that of Prussia, to which he returned. In later years he spoke bitterly of the selfishness and ingratitude of the Stuart family. \*Boswell, in his European tour of 1763/4, was befriended by Marischal and Rousseau also describes him in the *Confessions*. JAC

**market gardening.** There was little need for market gardening in medieval society since towns were small, and monasteries and large estates supplied most of their own needs. But in London gardeners petitioned in 1345 for permission to sell their own produce in public. The growth of the new industry dates from Tudor and Stuart times. Henry VIII's gardener, Richard Harris, had an orchard in Teynham (Kent) producing cherries, pears, and pippins (eating apples), said to have been 'the chief mother for all the other orchards of those kind of fruits'. A rash of market gardens developed in the small villages of Middlesex, Surrey, Kent, and Hertfordshire, sending their produce in by carts, which brought back the night soil and manure on which productivity depended. Samuel Hartlib, writing in the 1650s, suggested that market gardening began to 'creep into England' from Holland and Flanders about 1600 and that old men could remember the first gardeners in Fulham, growing cabbages, cauliflowers, turnips, carrots, and parsnips 'all of which at that time were great rarities'. The Gardeners' Company, still in existence, was founded in 1605 and Fulham parsnips, Hackney turnips, and Sandwich carrots were already sought after. Stocks Market, on the site of the Mansion House, had been in existence for some centuries but was increasingly challenged by \*Covent Garden, started as a few sheds and stalls. Celia Fiennes, in her travels in the 1690s, noted at Gravesend (Kent) many gardens 'convenient for to convey the cherries to London' by water. As the larger provincial towns like Bristol and Norwich grew in size, they acquired their own market garden hinterland. The development of the railway network in the 19th cent., providing quick and cheap transport, changed market gardening from a strictly local to a national business. The Great Western railway brought the Thames valley as far as Wiltshire into the London orbit. The Great Northern opened up parts of Bedfordshire, most villages sowing produce down to London, but Sandy supplying Yorkshire, Tyneside, and even Scotland. Evesham, too distant at first from London, exploited rail links to Birmingham and then Manchester. Diversification into market gardening enabled farmers to face increasing competition in corn and meat from overseas in the 1870s, and with improved rail and road communications, specialist areas began to appear. The Channel Islands went over increasingly to early potatoes, while the Scilly Isles sent their first early spring flowers to London in 1865. A short-lived but intensive development was in the Lea valley in Hertfordshire just north of London, where glasshouses and greenhouses proliferated, producing tomatoes and cucumbers, from the 1880s, dominated the area, and had vanished by 1960. Tomatoes were a rare and unusual delicacy when Rochfords of Turnford opened one greenhouse in 1883 and were followed by a number of Danish entrepreneurs—Larsens, Jensens, Hansens, Rasmussens. Cheshunt was said in 1898 to have

more acres under glass than the rest of England outside Middlesex and Kent. By 1960 the nurseries had moved out to the south coast around Worthing or had sold up for Greater London overspill housing. In the 1970s the spread of supermarkets offered tempting contracts to some gardens operating on a large scale, but also brought increasing foreign competition. A number of market gardens turned themselves into garden centres, selling garden furniture, grass seed, tropical fish, and gnomes—one of the redoubtable growth areas of the late 20th-cent. economy. JAC

**markets** provide public opportunities for buying and selling at a fixed time and place. For centuries they have played a vital role in the economy. During the Middle Ages lords of manors established markets at the centre of settlements on their estates or at crossing points on major routes. Until the industrial revolution and the development of permanent shops, markets were the usual way of trading in everyday goods; exceptional items were bought at fairs or in very large towns.

Manorial lords levied a rent on each stall-holder in exchange for the right to trade on a particular day of the week. Markets usually served the population within about 10 or 12 miles, which was as far as a laden horse-drawn cart could journey to and fro in a day, whilst allowing time to trade. However, some markets became famous for the sales of special produce, drawing merchants from further afield.

Markets usually took place in the main streets where traders erected their stalls or pens for animals or other livestock. Such streets often show their function by their spaciousness and were given names such as Market Place, Market Street. Other places carried names such as Butter and Hen Cross, Cattle Market, Haymarket, or Lace Market. In larger towns, markets were held in different locations on different days. During the Middle Ages, the naves of many parish churches frequently served as covered markets. However, the unseemly conduct of some traders led to the discontinuation of this practice and the erection of special market halls.

By the 20th cent. markets had become associated with the sale of either fresh local produce or cheap mass-produced goods. IJEK

**Marks, Simon** (1888–1964). Marks was the son of Michael, a Russian Jewish refugee, who began penny bazaars in Leeds market. Born in Leeds, Simon attended Manchester Grammar School, where he formed a lifelong friendship with Israel Sieff, subsequently brother-in-law and business partner. Michael, with Thomas Spencer as partner, expanded the penny bazaars into the clothing and textile retail chain of Marks & Spencer. It was not until after the First World War that Simon consolidated the Marks family control and with Sieff adopted policies to expand the company. They established stores with a distinctive style, emphasizing light and hygienic surroundings, value for money to customers through quality and standard of design, together with a strong policy of welfare for staff. Between the world wars, Marks & Spencer diversified into food. However clothing and textiles remained important and in 1960 the firm supplied 10 per cent of all such purchases in Britain. In the

later 1990s however increasing competition, particularly in clothing, caused difficulties and the value of M&S shares fell.

IJEK

**Marlborough, John Churchill, 1st duke of** (1650–1722).

The most successful general of his age, Marlborough was from 1704 until 1710 the leading European statesman, eclipsing even Louis XIV. Son of an impoverished royalist squire he owed the start of his dual career as courtier and soldier to the future James II. He gained military experience in Tangier and under Turenne in the French service. From page he became confidential emissary to James, and in 1685 after playing a decisive part in defeating \*Monmouth's rebel army he became a major-general. After 1683 he and his wife Sarah also developed an intimate and lasting connection with the future queen Anne.

Churchill made a massive contribution to the success of the \*Glorious Revolution by organizing a network of officers who defected to William, so preventing James from making William fight a Bosworth-style battle. As reward he became earl of Marlborough. He organized and led a combined operation that took Cork and Kinsale in southern Ireland (1690), but by championing Anne against her sister Mary he provoked his dismissal from all posts (1692). Alienated, he made promises to Jacobite agents but this was principally an insurance policy against James's possible restoration.
