After 1700, faced with an impending European war and broken in health, William designated Marlborough to command the British forces in the Low Countries, disregarding both his past behaviour and his inexperience as a general. William's purpose was to ensure the continuation of his policy of containing and reducing French power, and the Dutch alliance, when Anne succeeded. In 1702 Marlborough, commanding Dutch forces also, manoeuvred the French out of territories bordering on the Dutch Republic. Anne made him duke. In 1703 the Dutch generals obstructed his offensive plans, fearing to risk everything on a major battle. But in 1704 French armies in Bavaria threatened to force the German allied princes to capitulate, isolating Britain's other major ally, the Emperor. However, these French armies put themselves in a strategically and logistically untenable position. Superb organization enabled Marlborough to march his army to the Danube where at \*Blenheim (13 August) he inflicted the greatest defeat the French had suffered for 150 years. Blenheim was fought in partnership with Eugene, the Emperor's general, with whom Marlborough worked harmoniously. Skill as a diplomat was vitally important since success depended on Marlborough holding the alliance together, a task that became more difficult as French defeats made the allies less fearful of Louis XIV. Marlborough pioneered personal diplomacy, travelling to Vienna, Berlin, and Hanover, and corresponding continually with allied sovereigns and ministers. In 1707 he diverted Charles XII of Sweden from attacking the emperor, and so disrupting the alliance.

In 1705 Marlborough failed in an invasion of France up the Moselle valley, but in 1706 he won a second massive victory at \*Ramillies and overran most of the Spanish Netherlands.

## Marlborough

This achievement was soured when the Dutch reaction made him decline the Emperor's offer of the lucrative governor-generalship of these provinces. In 1708 he totally defeated a French counter-offensive at \*Oudenarde, took the fortress of Lille, and planned a final invasion of France. The excessively expensive victory of \*Malplaquet (September 1709) prevented this and convinced a war-weary Britain that Marlborough and the Godolphin ministry were committed to an endless war. \*Swift pilloried him as motivated purely by greed. Dismissed by the Tory government in December 1711 Marlborough exiled himself. Reinstated by George I as captain-general, he supervised suppression of the Jacobite rebellion in 1715. JRJ

**Marlborough, statute of**, 1267. Called by Powicke 'the one great statute' of Henry III's later years, it arose from the king's quarrels with the baronial opposition and was based upon the provisions of \*Oxford (1258) and the provisions of \*Westminster (1259). The preamble declared that it would end 'the many tribulations and unprofitable dissensions' of the past and guarantee the 'peace and tranquillity of the people'. It confirmed \*Magna Carta but its primary purpose was to regulate wardship and to protect persons outside the lord's jurisdiction being forced to attend his court. JAC

**Marlowe, Christopher** (1564–93). English playwright, poet, and spy, reportedly an atheist and probably homosexual. Born in Canterbury (Kent), he was educated at Corpus Christi College, Cambridge, possibly beginning his brief career as a spy on the continent while still enrolled there, and receiving his degree only after intervention by the Privy Council. His plays, beginning with *Dido, Queen of Carthage* (c.1587), are energetic, restless, genèrically daring explorations of selfhood. Success came with his two-part epic of ambition and war, *Tamburlaine* (1587–8), and between 1588 and 1593 he wrote four more plays: *The Massacre at Paris*, *The Jew of Malta*, *Doctor Faustus*, and *Edward II*. The last two are generally considered his masterpieces, the former a deceptively simple tale of aspiration and damnation, which reconfigures the morality play tradition for the early modern stage, the latter a remarkably frank account both of a homosexual king's relations with his favourite and of the bleak outworkings of *realpolitik*. Shortly after a warrant for his arrest was issued in May 1593 on charges of atheism (and before he had completed his narrative poem *Hero and Leander*), Marlowe was killed, apparently in a pub brawl. GAM

**Marpelate tracts**. In 1588–9, six books and a broadside, published under the pseudonym of Martin Marpelate, were a severe indictment of the episcopal hierarchy and associated press censorship. Their rollicking irreverence made them the most popular prose satires of the period, but predictably incensed Elizabeth, the Privy Council, and the establishment. Some suspects were racked in order to identify the author, printers, and distributors, and writers such as Lyly and Gabriel Harvey commissioned to produce counterblasts. Despite the execution of \*Penry and the death in prison of \*Udall, the most probable author is now regarded as the puritan extremist Job Throckmorton. ASH

**marquis**. The title of marquis, second to duke in rank, was the last to be introduced into the peerage and was slow to catch on. The first marquis, Robert de Vere, earl of \*Oxford, was made marquis of Dublin in 1385 by Richard II, but within a year had been promoted duke of Ireland. The next, John Beaufort, earl of Somerset, was promoted marquis of Dorset in 1397, degraded in 1399, and offered reinstatement in 1402: he declined, explaining that the title had a foreign flavour. In 1714 there were still only 2 marquises in the English peerage, compared with 22 dukes and 74 earls. The eldest son usually takes his father's earldom as his courtesy title: younger sons and daughters are referred to as Lord James or Lady Mary, with the family surname. JAC

**marriage**, the act of marrying and the ceremony by which persons are made husband and wife, establishes links between the families of the bride and groom and guarantees the legitimacy of any children born in wedlock. Traditionally, two major values underpinned marriage: moral commitment of the partners to each other; and contractual commitment in relation to rights of property and succession.

The institution of marriage was an integral part of both church and state, with the state accepting the jurisdiction of the church in the licensing of marriage and in regulating the conditions in which it could take place. Although it was not a sacrament, in the mid-12th cent. Pope Alexander III ruled that for all Christendom the vows partners made to each other should be in the presence of witnesses, preferably, but not essentially, at the parish church door. Within the protestant churches of Great Britain this pre-Reformation tradition remained the legal requirement for marriage until Hardwicke's \*Marriage Act (1753), which compelled all marriage ceremonies to take place before a minister within the parish church building. Since the Council of Trent (1545 to 1563) had declared marriage one of the sacraments of the Roman church, catholics received this from their priest. The Marriage Act (1836) formalized many of the customs of previous eras. A superintendent registrar of births, marriages, and deaths had the duty of registering all marriages. The superintendent registrar was also empowered to license religious premises, other than Anglican churches, for the conduct of marriages, so that nonconformists and catholics could marry in their own places of worship. Additionally, register offices were set up in all cities and towns, for the marriages of those not wishing to have a religious ceremony. The Marriage Act of 1995 extended the range of places which could be licensed for the conduct of marriage to any location which was appropriately seemly and dignified. A number of bizarre places soon followed.

Until recently, when the importance of romantic love and individual choice became a higher priority, the selection of a marriage partner was usually the prerogative of the family of the bride or groom. At all levels of society marriage partners were usually chosen from within the same social and religious group. Amongst the nobility dynastic considerations, particularly the potential succession to title and property, guided the selection of a suitable spouse. In addition, male relatives had the responsibility of finding suitable marriage

partners for their female dependents, with its attendant dangers of the choice being made to benefit the guardian rather than the woman. There was also the problem of forced marriage, recognized by \*Magna Carta (1215), which included protection for wards and widows. In the Middle Ages there was no minimum age for entering into marriage, so that betrothal promises, which also had legal force, and marriage vows were sometimes exchanged by immature children. Such arrangements were recorded amongst aristocratic families, where their purpose was to secure dynastic alliances with a likely succession to title and property. The validity of such marriages was challengeable in the courts, where the marriage contract could be annulled if it could be established that the marriage had not been consummated. The testimony of witnesses present at the bedding of the married pair could be taken as evidence of consummation.

The establishment of a minimum age for legal sexual relations was relevant to the determination of who might enter into marriage. During the 19th cent. the ages of consent were fixed at 14 years for males and 16 for females and the ages were later raised to 16 years for both sexes, although marriage at such ages was very infrequent. In contrast, the age of majority for entry into all other legal contracts was 21 years, reduced to 18 years in 1968. It continues to be the case that all minors must seek parental permission to marry, and, for those without parents, permission must be obtained from a guardian, magistrate, or a person of standing.

The registration of marriages and the issuing of 'marriage lines' to be held by one of the spouses, usually the wife, were important procedures for establishing status and the legitimacy of children. Children born out of wedlock suffered discrimination, in that they could not inherit property or status as of right. In contrast to the rest of Britain, Scottish common law marriages, that is marriages which had not taken place in church, could be registered in the Sheriff Court office and subsequently had the standing of licensed marriages. Such documentation of the existence of a marriage became of greater importance for more and more people during the 19th cent. as growing numbers held property and as geographical and social mobility increased. In the 20th cent. such documentation was important for establishing the right to concessions on personal taxation. The promise to marry continued to have legal force and breach of promise cases could be brought by a fiancée whose reputation was deemed to have been tarnished by a broken engagement. Legal proceedings were costly and that, together with growing equality in the commitment to marriage in the 20th cent., meant that breach of promise cases were very infrequent.

Until the later 19th cent. husbands had virtually complete control over their wives and their property. The marriage contract was not an equal one. On marriage wives brought to their husbands total rights to their property and earnings, unless the wife's family had entered into a marriage settlement which limited what a husband might do with the wife's dowry. However, only far-sighted families with the money to pay for legal services made such arrangements. Wives' rights over their own property, earnings, and children began to be recognized by the \*Married Women's Property Acts of

the later 19th cent. The rights of a wife to manage her own financial affairs and to be wholly responsible for them were achieved in 1988 with legislation to assess husbands and wives as separate individuals, rather than as a married pair for taxation purposes.

In spite of access to divorce and the removal of the social stigma of living together out of wedlock, marriage and re-marriage after divorce remain highly valued, to the extent that marriage, often associated with expensive wedding ceremonies, continues to be part of the experience of the great majority of the population.

Brooke, C. N. L., *The Medieval Idea of Marriage* (Oxford, 1989);  
Gillis, J., *For Better, for Worse: British Marriages, 1600 to the Present* (New York, 1985); Stone, L., *The Family, Sex and Marriage in England, 1500-1800* (1977); — *Uncertain Unions: Marriage in England, 1660-1733* (Oxford, 1992).

**Marriage Act, 1753.** Sometimes known as Lord Hardwicke's Act (26 Geo. II c. 33), this was a fundamental reform of English marriage law. Before 1753 a free exchange of vows between a couple could create a perfectly valid marriage. This led to much abuse, notably the practice whereby most Londoners married secretly, and often drunkenly, in private chapels near the Fleet prison. The Act stated that only weddings conducted in church, according to the rubric of the English Book of Common Prayer, and with banns called, were valid. Since only \*Jews and \*Quakers were exempted from the scope of the Act, dissenting marriages were disallowed. Not until the Dissenters' Marriage Act of 1836 were they permitted to marry in their own chapels or by a civil contract.

JPB

**Married Women's Property Acts, 1870, 1882.** Prior to these a woman's property became her husband's upon marriage. Reformers sought the same rights for married women over their property as those enjoyed by men and unmarried women. Whilst recognizing the principle that, in certain circumstances, women should retain and control their own property, the 1870 Act was regarded as a 'feeble compromise' and the Married Women's Property Committee pressed for greater reform. The 1882 Act, allowing wives to acquire, hold, use, and dispose of their separate property, with recourse to the same legal protection as if unmarried, was a major victory.

AM

**marshal.** One of the great medieval offices of state. The marshal developed as deputy to the \*constable and had responsibility for the horses. He then picked up a number of additional duties, including keeping records of military service and adjusting disputes over precedence. From these duties derived the supervision of heraldry and of the \*College of Arms, and the organization of coronations, which remain among the duties of the earl marshal. In the reign of Henry I, the position was held by the Fitzgilberts. The fourth holder, William \*Marshal, was created earl of Pembroke and became so great a man in John's reign that the office increased in importance. It then descended via the Bigods and the Mowbrays to the Howards, and from 1483 has stayed with the dukes of Norfolk, save for the period 1572 to 1672. In Scotland, the comparable office developed in the 12th cent. and became hereditary in the Keith family from

## Marshal

c.1290. From 1458 they possessed the title earl marischal. The last Earl \*Marischal supported the Jacobite cause, fought at Sheriffmuir, and was deprived of all his honours in 1716.

JAC

**Marshal, William** (c.1147–1219). William the Marshal began life as the fourth son of a minor lord who was hereditary royal master marshal. From such modest beginnings, he rose to become earl of Pembroke (from 1189), through marriage to the heiress Isabella, and ultimately regent of England (1216–19) at the time of Henry III's minority, a spectacular example of the open-endedness of English aristocratic society at this point. The secret of his success lies in his service to Henry II and his sons, their patronage propelling him to great wealth and power. His martial prowess, quick wit, and integrity led Henry to appoint him as tutor in chivalry to his son, Henry the younger, in 1170. Thereafter, he rose rapidly in royal service, but great wealth came only with his marriage of 1189. From then on, he was one of the crown's greatest subjects. He acted as an associate justiciar during Richard I's absence on crusade and fought for him in Normandy and elsewhere on his return. He was estranged from John, but rallied to his cause during the civil war that followed Magna Carta. After John's death, William, more than any other perhaps, saved England for the Plantagenets following French invasion.

SL

**Marshall, Alfred** (1842–1924). Born in Bermondsey (London), and educated at St John's College, Cambridge, Marshall took the mathematics tripos (1862–5). By 1868 he was college lecturer in moral sciences at St John's College, with particular responsibility for teaching political economy. His reputation as the greatest British economist of his time was founded upon his *magnum opus*, *Principles of Economics* (1890). He dominated economics at Cambridge University almost to his death with many disciples, including A. C. Pigou, the young J. M. \*Keynes, and D. H. Robertson. Many believed that, where economics was concerned, 'it's all in Marshall'. His major contributions related to the economics of the stationary state, welfare economics, and partial equilibrium analysis; although claims could be made on his behalf for much that became part of economics textbooks over generations, including innovations relating to utility theory, economies of scale, and supply curves. JRP

**Marshalsea prison**, Southwark (London). It was established in the 13th cent. to act as a state prison serving the Marshalsea Court, which dealt with cases involving the royal household. It came under attack from Wat \*Tyler's rebels in 1381 and Jack \*Cade's men in 1450. After the Restoration, Marshalsea became a debtors' prison and as such featured prominently in Dickens's novel *Little Dorrit*. It was closed in 1849.

RAS

**Marston Moor, battle of**, 1644. In the early summer of 1644 Charles I's forces in the north were pressed between the Scots under Alexander \*Leslie, Lord Leven, and parliamentary armies under \*Fairfax and \*Manchester, moving into south Yorkshire. The marquis of \*Newcastle fell back upon York, heavily fortified. In June \*Rupert set out from Lancashire to relieve the city. On 1 July, crossing the Ure at

Boroughbridge, he outflanked his opponents massed west of York to intercept him, and made contact with the defenders. The following day he gave battle at Marston Moor, in flat pasture land 7 miles west of the city, with roughly 18,000 men against 27,000. \*Cromwell, with his first major command, was in charge of the cavalry on Fairfax's left wing. Rupert's defeat was severe and he was said to have been forced to hide in a bean-field. Though the full significance was masked by Charles I's success at \*Lostwithiel two months later, the north was lost to the royalist cause and Newcastle fled at once to the continent. JAC

**Martello towers**. On 8 February 1794 the English, with great difficulty, took a small fort at Cape Mortella on Corsica. It was little more than a pill-box but the British government was greatly impressed with its defensive potential and in 1804, when facing an invasion threat from Napoleon, began a building programme of similar forts on the south coast. They were designed to mount one gun and to have a garrison of 1 officer and 24 men. Seventy-four were erected in Kent and Sussex. Since, like the pill-boxes hastily erected in 1940, they were never put to the test, we shall never know how effective they would have proved. Surviving examples are at Folkestone, Sandgate, and Dymchurch in Kent. JAC

**Marten, Henry** (1602–80). Regicide. Educated at University College, Oxford, Marten trained as a lawyer. A republican member of the \*Long Parliament, he was expelled (1643–6) for his outrageous speaking against king and Lords and imprisoned in the Tower. After his release he led the extreme party associated with the \*Levellers and sided with the army against Parliament. He left the House in the second civil war to raise his own cavalry regiment. Closely involved in the king's trial, he was in the \*Council of State for the Commonwealth, though, as \*Cromwell's power increased, relations between them grew frigid. At the Restoration he surrendered himself and was tried, but his life was spared. Charles II, he declared, was king 'upon the best title under heaven, for he was called in by the representative body of England'. He spent the rest of his life in prison at Chepstow.

WMM

**martial law**. The term has been used in two senses which may cause confusion:

1. The rules which apply to military discipline and related matters. The discipline exercised over the army, particularly a standing army, required special rules and special measures. These rules are now more accurately called military law.

2. The rules and discipline which exist at times of public emergency, and displace the ordinary principles of the law. This notion has been of greater constitutional importance. A proclamation of martial law would therefore suspend or alter the usual operation of the law and people may be punished and, on occasion, even executed by order of special tribunals set up in this way. This was one of the grievances objected to in the \*Petition of right and the \*Bill of Rights.

The prevailing legal opinion is that there is no such thing as 'martial law' except in so far as the crown must have certain powers to act in the case of emergency, e.g. to put

down a rebellion. This is not a special code of law but rather an example of the principle of necessity. MM

**Marvell, Andrew** (1621–78). Satirist and poet. Son of a Yorkshire clergyman, Cambridge-educated with linguistic skills acquired from four years in Europe, Marvell tutored Lord \*Fairfax's daughter (when he wrote his best poetry) and a ward of \*Cromwell's before being eventually appointed (1657) as assistant in the Latin secretaryship to \*Milton, whom he later defended vigorously. Despite having served the Protectorate, he was able to accept the Restoration, though his forceful political tracts (some prudently anonymous) criticized corrupt and profligate government and railed at religious intolerance. He was elected MP for Hull in 1659 but, despite being moderately active in Parliament, was ineffective in the country party, though he continued to watch his constituents' interests until death from inappropriate treatment for an ague. Regarded by contemporaries as a political satirist, Marvell is now generally remembered as a metaphysical poet, eclectic but lyrical and delighting in nature (*Miscellaneous Poems*, posthumously 1681). ASH

**Marx, Karl** (1818–83). German revolutionary socialist. Born in the Rhineland to Jewish parents, Marx was educated in law, history, and philosophy at the Universities of Bonn and Berlin before obtaining his doctorate on Greek philosophy at Jena in 1841. A radical young Hegelian, Marx's left-wing and atheist views ruled out a university post, and he turned to journalism, editing the liberal *Rheinische Zeitung* in Cologne until it was suppressed by the Prussian authorities in 1843. From then on Marx became virtually an exile, fleeing first to Paris where he began his lifelong partnership with Friedrich \*Engels, then to Brussels to meet workers' groups, where he and Engels wrote the *Communist Manifesto* (1848) as a rallying call for the proletarian class to overthrow the bourgeoisie. Expelled from Brussels during the revolutionary fervour that swept through Europe in 1848, Marx returned to Cologne to edit the *Neue Rheinische Zeitung* during a short-lived period of democracy. In 1849 he was tried for sedition, and though found not guilty, was exiled once more, making his home in London, where he stayed for the rest of his life, studying and writing in the British Museum, and living off Engels's generous allowances. Apart from his involvement with the First International—the International Working Men's Association—in which he took the leading part from its inception in 1864 until its ignominious demise in 1872 because of his struggle against the anarcho-communist Michael Bakunin, Marx's entire bequest to the communist movement consisted of writing. His most important book was *Capital* in which he set out to expose the flaws in classical political economy by showing how capitalism was not a neutral economic system, founded on timeless laws of supply and demand, but a highly exploitative system, characterized by contradictions that would eventually undermine and destroy it. A new era of socialism—the dictatorship of the proletariat—would be ushered in, followed by communism—a stateless, egalitarian, and co-operative society, founded on the principle of providing for everyone according to their needs, not their wealth.

Marx's practical influence has of course been vast, in the establishment of communist regimes in eastern Europe, east Asia, and elsewhere during the 20th cent. However, the demise of communism in eastern Europe suggests that the enduring influence of Marx may lie more in theoretical terms—i.e. in his seminal contribution to our understanding of society as a system of relationships, ultimately reflecting its economic substructure (i.e. 'mode of production'). Marx as a sociologist may be of longer-lasting significance than Marx as a revolutionary. TSG

**Mary** (1542–87), queen of Scots (1542–67). The most thoroughly mythologized of the Stewart monarchs of Scotland, the key to Mary's career lies in her unique dynastic situation and her ultimately fatal attempts to exploit it. The sole legitimate heir to James V, she inherited the throne on 14 December 1542 when only 6 days old. The ensuing minority was dominated by the conflict between France and England for control of Scotland through the promise of the infant queen in marriage. Initially betrothed to Henry VIII's son Edward, the Scots' rejection of the match led to war with England and Mary's removal in 1548 to France and an eventual marriage to the Dauphin Francis.

The maintenance of French catholic interests in Scotland was the prime aim of the queen mother, \*Mary of Guise, whose increasing importance was recognized in 1554 when she replaced \*Arran as regent. Her daughter's marriage to Francis in April 1558 bound Scotland to a French monarchy heavily influenced by the militant catholicism and dynastic ambition of the young queen's Guise relatives. In catholic eyes Elizabeth Tudor was illegitimate and her accession to the English throne in November 1558 a usurpation of Mary Stuart's lawful right to succeed. When Henri II died on 10 July 1559, the new French monarchs, Francis II and Mary, united a dynastic inheritance encompassing potentially not just France and Scotland but also England and Ireland.

The potential was never realized, however, for the death of Francis on 5 December 1560 left Mary a childless widow. Her decision to return to Scotland in August 1561, where in 1559–60 a protestant revolution had seen the defeat and death of Mary of Guise and the establishment of an English-backed administration led by Mary's half-brother Lord James Stewart, was driven by the desire to pursue her dynastic ambitions within Britain. Spurning the opportunity to lead a catholic counter-revolution, Mary chose instead to deal with her half-brother, whose close links with Elizabeth held out the hope of official recognition in the English succession. While maintaining her own catholic household—thus leaving open communications with France and the papacy—Mary made no move against the newly reformed Scottish kirk.

Yet the stability of Mary's rule depended on a delicate balancing act which the explosive issue of her marriage was always likely to upset. Neither the threat of a foreign catholic match nor the tireless efforts of Lord James—now earl of \*Moray—persuaded Elizabeth to recognize Mary as her heir. If Mary's catholic marriage to \*Darnley on 29 July 1565 was a love-match, the rehabilitation of the Lennox Stewarts, whose claim to the English throne was second

## Mary I

only to that of Mary, was also a calculated diplomatic snub. Mary easily rode out the ensuing storm—an abortive rebellion by Moray which Elizabeth was impotent to support—but the problems posed by the rapid breakdown of relations with Darnley proved insoluble. Embittered by the now pregnant queen's refusal to grant him the crown matrimonial, Darnley joined the \*Rizzio conspiracy of March 1566, a protestant demonstration against the possibility of a catholic succession which proved futile. Mary gave birth to a son on 19 June 1566 and the future James VI was baptized a catholic on 17 December.

Mary's complicity in Darnley's murder on 10 February 1567 cannot now be established with certainty. However, her marriage on 15 May to the leading suspect, the earl of \*Bothwell, jeopardized her claim to innocence and handed her opponents the chance to destroy her. Moves to 'liberate' her from Bothwell led in July 1567 to her enforced abdication and the appointment of Moray as regent. Moray's regime was far from secure, however, and Mary mustered extensive support on her escape from confinement in May 1568. Although defeated at \*Langside, it was her ill-considered flight to England which sealed her fate. Characteristically, Elizabeth prevaricated endlessly over signing her dynastic rival's death-warrant. But Mary's incessant plotting and involvement in a series of catholic intrigues led finally to her execution at Fotheringhay on 8 February 1587. RAM

Fraser, A., *Mary, Queen of Scots* (1969).

**Mary I** (1516–58), queen of England (1553–8). Few lives can have been sadder nor few reigns more disastrous than that of Mary Tudor, victim of the dynastic and religious tensions in her family. Her birth to Catherine of Aragon and Henry VIII after three miscarriages and a dead infant son was the occasion for great rejoicing and it was presumed that a brother would follow. He did not, and Catherine's only other daughter in 1518 was dead at birth. Though Henry was proud of Princess Mary, his marriage was breaking down and Catherine took refuge increasingly in her religion and her Spanish ladies-in-waiting. Mary seems to have been a lively little girl, 'promising to become a handsome lady', according to one observer in 1522. From birth she was a pawn in the diplomatic game and in 1518, at the age of 2, was betrothed to the dauphin of France. Before she was 3 she accosted the admiral of France at a reception: 'are you the Dauphin? if you are, I wish to kiss you.' But two years later there was a marriage treaty with the Emperor Charles V and by 1523 rumours that she was to marry James V of Scotland. By this time the shadow of a possible divorce was falling across her: Henry had a healthy son by a mistress, the five years Catherine was his senior were all too apparent, and remarriage was increasingly discussed.

The effect of the annulment of her parents' marriage in 1533 was shattering. All her sympathies were with her mother, whom she was allowed to see only rarely until her death in January 1536. Unless the plea was conceded that she had been conceived in *bona fide parentum*, Mary was illegitimate, losing any claim to the throne and precedence at court. In the hard dynastic world of 16th-cent. Europe, her matrimonial prospects plummeted. Worse fol-

lowed. The execution of \*Anne Boleyn and her father's remarriage to \*Jane Seymour brought no respite, since the king continued to demand that she acknowledge that her mother's marriage had been invalid and recognize his own ecclesiastical supremacy. Desperate plans to flee to the continent and seek the protection of the emperor were mooted. But in June 1537, with the assistance of Thomas \*Cromwell, she submitted, was granted her own household again, and restored to precarious favour. The birth of a half-brother Edward in October 1537 appeared to remove any chance that she would ever be queen.

The remaining years of Henry's life were quieter for Mary and she was on good terms with his last wife, \*Catherine Parr. But her troubles had taken a heavy toll. She had lost much of her youthful vivacity, was often unwell, and in 1542 her life was said to be in danger. But she hunted, danced, was fond of dress, and enjoyed music, and the carousel of marriage plans never stopped. In 1541 her old governess of many years, Margaret, countess of \*Salisbury, went to the block, but in 1543 a statute restored Mary to the succession, after Prince Edward and any children Catherine Parr might have. From 1547 Edward VI's reign brought new trials. The king's two chief advisers, \*Somerset and \*Northumberland, promoted protestant doctrines and the young king grew up an eager reformer. When the Act of \*Uniformity of 1549 forbade the use of the mass, Mary continued to hear it and was warned. She replied that, in her conscience, 'it is not worthy to have the name of law'. Charles V gave her powerful support and the overthrow of Protector Somerset afforded temporary relief, but Edward, as he grew older, appeared even more determined than his ministers to bring her to heel. In March 1551 he summoned her before the council, declared that he 'could not bear it', and was told in reply that 'her soul was God's and her faith she would not change'. Her release from this stalemate came with the first signs of the illness that killed Edward on 6 July 1553.

Even then, Mary's succession was by no means certain. Edward had declared Lady Jane \*Grey his heir and on 9 July she was proclaimed queen. Mary had already fled to Kenninghall in East Anglia, where she had estates and much support, and on 10 July proclaimed herself queen. Northumberland's support collapsed within days and on 7 August Mary entered London to begin her reign. She was 37.

She had triumphed against all odds and it is not surprising that she attributed it to her steadfastness in her faith and to the help she had received from her co-religionists in Europe. She may have misjudged the widespread support she received at home for enthusiasm for the old religion, whereas it is more probable that it was recognition that, despite all the twists and turns of policy and fortune, she was Henry VIII's obvious heir, by birth and by his last will.

Mary had, as the imperial ambassador Renard pointed out, no experience of government at all. Until the spring of 1553 it did not look at all likely that she would ever be called to reign and, even then, the general assumption was that she would be guided by a husband. She turned at once to Renard for advice. The twin objectives of her reign were to restore the catholic faith and to negotiate a marriage which would hold out some hope that the succession would

not pass to her half-sister the Princess Elizabeth. Roles were now reversed. In the dark days for catholics in the reign of Edward VI, Mary's known resistance was a beacon of hope: now Elizabeth played the same part for reformers in Mary's reign, though, characteristically, she played it with more finesse and pliancy.

Healing the breach with Rome was not simple. The mass could be celebrated and certain bishops were soon suspended—\*Cranmer, \*Hooper, \*Latimer, \*Ridley—while \*Gardiner and \*Bonner, who had spent most of the previous reign in prison, were restored to their sees of Winchester and London. But many of the ecclesiastical changes had been introduced by statute and would require a parliament to abrogate them. Mary's first Parliament in the autumn of 1553 made a beginning by declaring her mother's marriage legal and by repealing most of Edward VI's religious legislation. But the gentry and aristocracy showed little enthusiasm for disgorging the monastic estates they had acquired, even when urged to do so voluntarily.

In view of her age and the need for an heir, marriage had to be arranged at once. Mary had a sentimental regard for her cousin Reginald \*Pole, whom she cannot have seen since she was 15, but he was committed to his life in the church. The claims of Edward \*Courtenay flickered for a moment and died. A young catholic, he had spent fifteen years in the Tower, was released and created earl of Devon, but proved, on closer acquaintance, a sore disappointment. When the Emperor Charles V suggested his son Philip, who had just become a widower, Mary was attracted by the Spanish connection and agreed readily. \*Wyatt's rising against the Spanish marriage—part of a wider conspiracy which misfired—threatened for a moment, but Mary stood firm and it collapsed. Princess Elizabeth was sent to the Tower under suspicion of complicity, but no evidence against her could be found. Philip himself arrived in the summer of 1554. Though he behaved with courtesy, his Spanish courtiers were in private disparaging: 'the queen is not at all beautiful,' wrote one, 'small and rather flabby than fat . . . a perfect saint and dresses badly.' Another, more pointedly, observed that he did not envy Philip his duty: 'to speak frankly it will take a great God to drink this cup.' At first the marriage seemed to have fulfilled its main purpose. Later in 1554 Mary announced herself pregnant. In the summer of 1555 an ornate cradle was prepared and rockers appointed. But no child arrived and in August 1555 Philip left for urgent business in the Low Countries.

Meanwhile the work of reconciliation to Rome went on. It was a joyful day for Mary in November 1554 when Pole returned at last from the continent and pronounced absolution from the sin of schism, and in March 1556 he succeeded Cranmer as archbishop of Canterbury. The supreme headship of the church was revoked by Parliament in December 1554 and acknowledgement made of the authority of the pope, who had sent Pole 'to call us home again into the right way from whence we have all this long while wandered'. Three statutes against heresy were revived. Mary's instincts at first had been for patience towards protestants and the overwhelming advice she received was not to drive too fast. But as opposition developed, her attitude stiff-

ened. A first victim, John \*Rogers, a London preacher, went to the stake at Smithfield in February 1555, and was followed by John Hooper, former bishop, at Gloucester, and by Robert \*Ferrar, deposed bishop of St David's, at Carmarthen in March. Latimer, Ridley, Cranmer, and some 300 others followed. Moderate catholics were dismayed: 'haste in religious matters', wrote Renard to Philip, 'ought to be avoided. Cruel punishments are not the best way.' But Renard's influence was in decline. There has been much discussion of the responsibility for the burnings, and Gardiner, Bonner, Philip, Pole, and Mary have been named in turn. Of these Mary was probably the gentlest, but she bears the main responsibility since she alone could certainly have stopped them.

In 1554 one of the Spanish entourage wrote that Philip 'fully realises that the marriage was concluded for no fleshly considerations but in order to . . . preserve the Low Countries'. Though the articles of marriage forbade England going to war to assist Spain, that was the intention, and in June 1557 Mary declared war on France. By an ironic twist, the emperor and Philip had quarrelled violently with the new pope, Paul IV. Mary found herself denounced by the pope as 'the wife of a schismatic', Cardinal Pole's legation was revoked, and he was summoned to Rome to answer charges of heresy. In January 1558 the French seized the initiative and besieged Calais. The great outpost of empire, English for more than 200 years, surrendered within a week.

There was little comfort in the short time remaining to Mary. Philip's second and last visit in 1557 had lasted a bare three months. But in January 1558 Philip was told by Mary that she was once more pregnant and the arrival of the child imminent. This time she deceived nobody but herself. On 30 March she made her will 'thinking myself to be with child' and conscious of the dangers of childbirth. That was no danger but there were others. Philip urged her to come to terms with her sister Elizabeth, an improving asset. Mary begged him to let the matter wait until he returned and not to be angry, 'for I have already begun to taste your anger all too often, to my great sorrow'. By the summer she was obviously ill and more and more people were paying their respects to Elizabeth. In October Mary added a sad codicil to her will, 'as I then thought myself to be with child'. She died on 17 November 1558, twelve hours before Cardinal Pole, telling her ladies that while she dozed fitfully she had seen 'many little children like angels, playing before her'. Her husband wrote politely, 'I felt a reasonable regret at her death' and the first act of her sister's first Parliament was to reclaim the governorship of the church which Mary had so enthusiastically abandoned.

Among Mary's first words as a toddler had been 'priest' and she was buried, not in royal finery, but in the plain garb of a religious order. Her failure was total and she died with no earthly hope. Modern historians have pointed to the constructive achievements of her reign—reform of the currency, attention to the navy, reorganization of the customs. Mary herself would have counted them as nothing against the collapse of her grand design. Her reign had begun full of promise, with a spontaneous rising on her behalf and a joyous welcome. The loss of Calais might have been redeemed,

## Mary II

though contemporaries were too close to see it, as later commentators did, as a blessing in disguise. But the burnings discredited the church she loved, sowed a harvest of hatred, and dogged the catholic cause for centuries to come. Mary did more than anyone else to make England a protestant nation. JAC

Loades, D., *Mary Tudor: A Life* (Oxford, 1989); Marshall, R. K., *Mary I* (1993); Ridley, J., *The Life and Times of Mary Tudor* (1973); Tittler, R., *The Reign of Mary I* (1983).

**Mary II** (1662–94), queen of England, Scotland, and Ireland (1689–94). Mary was the elder daughter of James, duke of York, by his first wife \*Anne Hyde, daughter of the earl of \*Clarendon, Charles II's first lord chancellor. Her parents did not convert to catholicism until the end of the 1660s, and she and her sister Anne (born 1665) were brought up as protestants, one of their preceptors being Henry \*Compton, their lifelong adherent. Their protestant faith remained central to the sisters' lives. Mary was tall, of striking beauty and winning charm, and without Anne's vindictive tendencies. Her marriage to her cousin William of Orange in 1677, of such profound political consequence, initially filled Mary with misgivings; and it proved childless. But she overcame her reservations, and though William was unfaithful to her they shared a taste for simple domesticity, however ambitious their building and garden projects in Holland and Britain alike. Mary was soon at home in Holland, and her return to England as queen in February 1689 was her first since marriage.

Mary's willing submission to William ensured that he held the executive power in the joint monarchy; but her strong awareness of her hereditary right made Mary share in the widespread scepticism about the legitimacy of her half-brother James Francis Edward, born to James II on 10 June 1688, so assuring a catholic succession to the crown. Mary's relations with Anne were cool owing to Anne's intense resentment at William being joint monarch. Mary acted as regent during William's prolonged absences in Ireland and on the continent 1690–4, and he implicitly trusted her application and judgement. Her death from smallpox in December 1694 was widely mourned, not least by the king himself. DDA

**Mary Bohun** (c.1370–94), wife of Henry Bolingbroke, later Henry IV. Mary, Henry's first wife, was the younger daughter and co-heiress of Humphrey Bohun, earl of Hereford, Essex, and Northampton (d. 1373). In 1380 she married Henry, earl of Derby, who thus became earl of Hereford and an important magnate in the lifetime of his father \*John of Gaunt. Their surviving children, born between 1386 (or 1387) and 1394, were Henry (later Henry V), Thomas, John, and Humphrey (later dukes of \*Clarence, \*Bedford, and \*Gloucester), Blanche, who married Lewis (IV), later elector of the Rhine Palatinate, and Philippa, who married King Eric VII of Denmark. Mary died in childbirth. RLS

**Marylebone Cricket Club.** The world's premier cricket club. The MCC was founded in 1787 by a group of noblemen headed by the earl of Winchilsea, Lord Charles Lennox, the duke of York, and the duke of Dorset and based at Thomas

\*Lord's ground in Dorset Square, London. It replaced the Hambledon Cricket Club as the country's leading club and governed the game for 182 years until control passed to the Cricket Council in 1969. During its rule the MCC set up bodies to administer county, test, and world-wide cricket affairs. Its importance as a playing club declined and from 1877 Middlesex Cricket Club shared its ground. RAS

**Mary of Gueldres** (d. 1463), queen of James II of Scotland. Daughter of Duke Arnold of Gueldres and niece of Philip the Good of Burgundy, Mary became James's queen in July 1449, and bore him at least seven children, of whom five survived—Mary, James (later James III), Alexander (duke of \*Albany), John (earl of Mar), and Margaret. After a decade of producing children, Mary took control of government after her husband's death at Roxburgh (August 1460), and showed herself an able diplomat, negotiating first with the Lancastrians (to obtain Berwick in 1461), and then switching sides to the victorious Yorkists. Mary founded Trinity College, Edinburgh, and built Ravenscraig castle, Fife. NATM

**Mary of Guise** (1515–60), queen of James V of Scotland. The daughter of Claude, duke of Guise, and thus a member of one of France's most militantly catholic families, Mary married James in June 1538. By him she bore two sons, who both died in infancy, and a daughter, Mary, who was barely a week old when her father died on 14 December 1542. In the ensuing minority, the dowager queen staunchly upheld French catholic interests in Scotland. In 1548 her daughter was contracted to marry the Dauphin Francis and in 1554 Mary was formally appointed regent. While this marked a tightening of French control, Mary pursued a conciliatory religious policy to ensure the acquiescence of the protestant nobility in the French marriage. With this achieved in April 1558, the need for conciliation lessened and the onset of more repressive policies sparked an inconclusive protestant rebellion in May 1559, whose outcome was determined by external factors. Rocked by the Tumult of Amboise in March 1560, France was unable to counter England's intervention on the protestants' behalf. Her forces besieged at Leith, Mary fell ill and took refuge in Edinburgh castle, where she died on 11 June. RAM

**Mary of Modena** (1658–1718), queen of James II. Mary of Modena was the second wife of James II, whose first wife \*Anne Hyde died in 1671. Since Charles II, James's brother, was unlikely to have further legitimate children, James's remarriage was imperative and a hunt for suitable partners began. Louis XIV urged the claims of Mary, an Italian princess who was tall, good-looking, and an ardent catholic. But her ambition was to enter a nunnery and she had to be persuaded that matrimony was an even more noble sacrifice. Consequently she reinforced James's catholic zeal, and after a shaky start, when she burst into tears at the sight of James, the marriage developed into one of affection, especially after James substituted piety for mistresses. Up to 1684 none of her five children survived and she had had several miscarriages. But after a visit to Bath in 1687, she gave birth to a son in June 1688. Protestants regarded the birth with suspicion and despair, and it was a factor in precipitating

their appeal to William of Orange. There is no evidence to support the rumour of a suppositious child and Mary gave birth to a healthy daughter in 1692. In December 1688 she and her infant son fled to France, and were followed by James. Mary remained at Saint-Germain after his death in 1701. She does not seem to have had great influence on policy, though concern for her safety in 1688 undoubtedly helped to bring about James's ill-judged flight. JAC

**Mary of Teck** (1867–1953), queen of George V. Mary of Teck, known before her marriage as Princess May, had a difficult task as queen in following \*Alexandra, who had been extremely popular. But her natural dignity, verging on stiffness, and a strong sense of duty, made her fill the role well. She dressed all her life as an Edwardian lady, which her husband liked, and as the decades unfolded seemed increasingly like a visitor from a bygone age. She was the only daughter of the duke of Teck, her mother being a granddaughter of George III and first cousin to Queen Victoria. By royal standards the family was not wealthy and faced a certain amount of condescension. At the age of 25 she was engaged to Albert Victor, duke of \*Clarence ('Eddie'), and after his sudden death married in 1893 his younger brother George, created duke of York. Their preference was for a quiet life at Sandringham: Mary was not boisterous, and took no interest in shooting and hunting, preferring reading and the collection of antiques and *objets d'art*. Despite a natural reserve, she took an active part in public visiting with her husband and, assisted by photography and later film, became a familiar and reassuring figure. During her long widowhood, she continued to appear in public while in no way overshadowing George VI or his wife Elizabeth. JAC

**Mary Rose.** Built between 1512 and 1514, the *Mary Rose* was one of the finest vessels of Henry VIII's navy. On 19 July 1545, under the command of Sir George Carew, and watched by the king and by Lady Carew, she sailed from Portsmouth to join in an engagement with the French fleet. Not far from the shore, while setting sail, she sank with the loss of hundreds of men, including the vice-admiral. Although not in deep water, attempts to salvage her failed. But the *Mary Rose* Trust, founded in 1979 with the support of the prince of Wales, succeeded in recovering the hull on 11 October 1982. It is now on public exhibition at Portsmouth. JAC

**Mary Tudor** (1495–1533), queen of France and duchess of Suffolk. Mary Tudor was Henry VIII's younger sister and from her descended the claim of Lady Jane and Lady Catherine \*Grey to the throne. Her mother \*Elizabeth of York died when she was 7 and the same year her elder sister \*Margaret married James IV of Scotland. In 1508, when she was 13, she went through a marriage contract with the future Emperor Charles V. But in 1514, as the result of a diplomatic *boulevercement*, she was married to the elderly king of France, Louis XII. 'She is very beautiful', wrote a Venetian merchant, 'and has not her match in all England—tall, fair and of a light complexion, affable and graceful.' Her ailing husband claimed to have performed valiantly on the wedding night but the court wondered whether the mar-

riage had been consummated. She was queen of France for three months, her husband dying on 1 January 1515. She had previously claimed from Henry the right to choose for herself should she be widowed and within a few weeks had made a private marriage to Charles Brandon, duke of \*Suffolk, sent to France to congratulate the new ruler. A public marriage at Greenwich followed in May 1515. The haste of the marriage seems to have been on Mary's side, agitated that she would be used as a pawn in French diplomacy and impressed by Suffolk's prowess at jousting. Her brother's wrath was assuaged by gifts of money and jewels. Her daughter Frances, born in 1517, married the marquis of \*Dorset and was the mother of Lady Jane Grey, proclaimed queen in 1553. JAC

**Maserfield, battle of**, 642. \*Penda of Mercia defeated and killed \*Oswald of Northumbria. Penda is said by \*Bede to have removed Oswald's head and hands and to have hung them on stakes, perhaps as an offering to a pagan god of war. Penda's actions helped facilitate the cult of Oswald and miracles were credited not just to his relics, but also to the place where he was killed. The site of the battle, which in British sources is called Coscoboy, is uncertain. It has sometimes been identified as Oswestry ('Oswald's tree') in Shropshire, but somewhere closer to the Northumbrian–Mercian border, the location of many other 7th-cent. engagements between Mercia and Northumbria, is more likely. BAEY

**masques** were a form of English courtly entertainment, involving dancing, speech, song, and instrumental music, that flourished from the later 16th cent. until 1640. In the later 17th and 18th cents. the term was also applied to self-contained musical entertainments, normally accompanying a spoken play. During the reigns of James I and Charles I the masque became an opulent affair, its allegorical or mythological plot symbolizing the monarch's political power and wealth. The most celebrated works involved the collaboration of the first poet laureate Ben \*Jonson and the architect Inigo \*Jones, who designed not only the spectacular stage effects and costumes but also the \*Banqueting House at Whitehall where the works were often performed. The songs, dances, and incidental instrumental music were normally written by different composers. The main characters or 'masquers' were courtiers who were joined by members of the audience for the 'revels'. Professionals were, however, increasingly used, particularly for the 'antimasques': grotesque or comic scenes first introduced in Jonson's *The Masque of Queens* (1609). The only masque whose music survives complete is *Cupid and Death* (1653 and 1659), which—unusually—experimented with Italianate recitative. After the Restoration the masque transferred to the professional theatre, where its tradition continued in \*Purcell's semi-operas. ECr

**Massachusetts Bay Company.** The company received a crown charter in 1629 for the settlement of a New England territorial grant. Its leading members were puritan gentry, divines, and merchants, who agreed that the charter should be transferred from London to Massachusetts. After extra-legal alterations, including restricting voting rights

## mass media

and office-holding to church members and the creation of law courts, the charter became the Massachusetts frame of government, until its vacation in 1684 and the imposition of a second charter (1691). Criticized for creating a semi-independent godly commonwealth by its enemies, it was cherished for this reason by the colony's political and religious leadership. RCS

**mass media** signifies the means by which communications—either factual or fictional—are transmitted to a mass audience through a variety of printing or audio-visual technologies. The purposes of communication have always remained the same: artists wish to entertain and stimulate; entrepreneurs aim to make money; governments and interest groups hope to inform or persuade; advertisers help to sell goods and ideas. What have changed are the technologies used, which, with the developments of industrial capitalism and mass urban populations, have become increasingly complex and all-embracing, causing continuing concern about the role and power of the mass media in the 'global village'.

Earliest advances in mass communications were in the written print technologies, where the printing innovations of \*Caxton in the 15th cent. developed eventually into the newspaper and magazine industry of the industrial era—first the broadsheet 'quality' press and periodicals of the early 19th cent., then the tabloid 'popular' press, magazines, and comics of the late 19th cent. New means of reproduction for drawings and photographs created more visual mass communications. When the illusion of movement was created by projecting still images at 16 frames per second in the 1890s, the powerful mass medium of \*cinema was created.

With the developing electrical technologies of the 19th cent., a realistic reproduction of the human voice was created, first in the gramophone and the telephone, which began to replace telegraphy from the 1870s. Experiments in wire-less telegraphy by Marconi in the 1890s confirmed that messages could be transmitted on sound waves, and with the human voice carried on these waves, the influential medium of \*radio was developed through the early years of the 20th cent. When a similar means of transmitting visual images was developed, \*television was launched in the 1930s, and when sound was married to cinema's silent images from the late 1920s, the inter-war range of innovative audio-visual media was complete. The quickening pace of technological change after the Second World War—with microchips, digitization, laser, and fibre optics bringing video, satellite, cable, CD-ROM, and the Internet—has meant that the media can now be used to transmit messages instantly on a world stage to the biggest mass audiences imaginable.

Accompanying each stage of the mass media's development have been struggles and debates over who owns and controls these vital means of communication, who can get access to them, and what messages should or should not be allowed. In Britain, there has been a tradition of strong government regulation, compared with the generally *laissez-faire* approach of free enterprise USA. Stamp duty and other taxes on the early press were meant to keep potentially seditious literature out of the hands of the masses—though

the working classes developed their own means of communication in the underground radical press. Ironically a more efficient way of controlling the masses' reading was developed when the government 'deregulated' the system with the abolition of stamp duty in 1855, and a flood of non-political popular papers arrived to divert the energies of the working class.

Television and radio have always been highly regulated—both the official 'voice of the nation' the \*British Broadcasting Corporation, and commercial 'independent' TV and radio stations. Where there is no direct government Act or royal charter to set standards, self-regulation has been encouraged, such as the film industry-sponsored British Board of Film Censors (now Classification) set up in 1912; press control bodies like the Press Council (now the Press Complaints Commission); broadcasting control bodies like the Independent Broadcasting Authority (now Independent Television Commission), the Radio Authority, the Broadcasting Complaints Commission, and the Broadcasting Standards Council. The problems of regulating a world-wide medium like satellite TV were major causes of concern to British politicians of the late 20th cent.

The phenomenon of the 'moral panic' has regularly followed the development of each new mass medium, with establishment fears that the young, the working class, the outsiders of society will be corrupted by the media products and contribute to the decline of society—whether it be Victorian 'penny dreadfuls', early cinema adventures, American comics in the 1950s, the 'video nasty' scares of the 1980s, or pornography on the Internet in the 1990s. Fears have also been regularly expressed about the swamping of British culture by brash American media-led values—Hollywood cinema, American comics, rock and roll music, and 'trashy' television.

From the left, the main concerns have centred round questions of ownership and control, with power concentrated in the hands of a series of media tycoons, from the early 20th-cent. newspaper magnates like Northcliffe, Rothermere (the \*Harmsworth brothers), and \*Beaverbrook to the late 20th-cent. multi-media owners such as Maxwell and Murdoch. Further concerns about the role of the media in transmitting ideology—both obviously in non-fictional news and propaganda, but also more innocuously in the form of apparently 'value free' entertainment—will ensure that the mass media remain a constant subject of controversy and debate. DJA

**master of the king's (queen's) music.** The title of the director of the monarch's private musicians. Inaugurated by Charles I in 1625 and first held by Nicholas Lanier, the post developed during the Restoration to include the direction of Charles II's band of 24 violins. Nowadays, however, the duties merely involve composing occasional works for state or royal events. Holders of the title have included John Eccles (1700–35), Maurice Greene (1735–55), William Boyce (1755–79), John Stanley (1779–86), William Shield (1817–29), Edward \*Elgar (1924–34), Arnold Bax (1942–52), Arthur Bliss (1953–75), and, since 1975, Malcolm Williamson. ECr

**master of the rolls.** One of the senior judges whose responsibilities include preserving the records of Chancery and who was custodian of the Public Records until 1958, when they were transferred to the \*lord chancellor. He also serves as president of the civil division of the Court of Appeal. The master admits solicitors to the Supreme Court and is responsible, through a tribunal, for their professional discipline. JAC

**Matapan, battle of, 1941.** At a time when Britain was standing alone against the axis powers, victories were scarce. In the Mediterranean, however, the Italian fleet was poorly led and badly deployed. On 28 March 1941, a British fleet under Vice-Admiral Pridham-Wippell, comprising three battleships, four cruisers, and an aircraft carrier, encountered the Italians off Cape Matapan. In an action characterized by the use of carrier-borne aircraft and radar, the British sank three of Italy's latest cruisers and two destroyers, while damaging a battleship—all for the loss of just two aircraft. JLP

**Mathew, Theobald (1790–1856).** Irish temperance apostle. Born in Tipperary, educated at Maynooth, he joined the Capuchins in Dublin. After ordination (1814) he took charge of the Little Friary among the destitute in Cork, where he opened free schools and founded a charitable society in St Vincent de Paul's tradition. Asked by Cork nonconformists to head their \*temperance movement (1838), he signed the pledge. Within nine months 250,000 followed him. As provincial of his order (1822–51), he addressed temperance meetings throughout Ireland. Travelling to London (1843), he held temperance meetings, met \*Peel, won public subscriptions, and warned the government of the incipient potato famine. His nomination by Cork clergy as their bishop was not ratified by the Vatican. He travelled in America preaching to catholic congregations and addressing temperance meetings (1849–51) despite ill-health, which caused him to refuse a bishopric on his return. He died at Queenstown. WMM

**Matilda (c.1030–83),** queen of William I and duchess of Normandy. The daughter of Count Baldwin V of Flanders, her marriage to William c.1050 was initially prohibited by the papacy on grounds of (unspecified) consanguinity. The couple made amends by founding two abbeys at Caen. The marriage seems to have been an exceptionally successful one, not just because it guaranteed the succession by producing nine known children, but also because Matilda was admirably suited to the role of deputy and supporter which medieval society required of aristocratic women. She frequently acted as regent during William's absences from Normandy and seems to have been a unifying force in an increasingly disunited family, maintaining some sort of mutual tolerance between her husband and their eldest son \*Robert Curthose up until her death. DB

**Matilda (c.1080–1118),** queen of Henry I and duchess of Normandy. First wife of Henry I and daughter of \*Malcolm Canmore, king of Scotland, and his queen St \*Margaret (the sister of \*Edgar the Atheling). Her marriage to Henry in 1100 was clearly intended to reinforce the legitimacy of his kingship by establishing a link with the old English royal

house; Henry's determination to marry her was such that he had to await a definitive ruling from the archbishop of Canterbury, St \*Anselm, whether she had once been a nun, which would have automatically prevented the marriage. Matilda appears to have performed competently the expected queenly role of supporting her husband's rule and frequently acted as regent in England when he was in \*Normandy. She is said to have kept a splendid, but pious, court and was a generous patron of artists and musicians. DB

**Matilda (Maud) (d. 1131),** queen of David I of Scotland. Widow of Simon de Senlis and daughter of Earl Waltheof of Northumbria and his wife Judith, William the Conqueror's niece, she married the future David I in 1113. This marriage, arranged by Henry I, was of profound significance for Scottish history. It brought the Scottish royal house the earldom of Huntingdon (Waltheof's other earldom), dependent status as tenants-in-chief of the English crown for English lands, and a deep involvement in English society which facilitated the processes of modernization in 12th-cent. Scotland. Matilda was a benefactor of several religious houses, including Elstow abbey (Beds.), and the mother of two Scottish princes, both of whom predeceased David. KJS

**Matilda (Maud), Empress (1102–67).** Matilda was the daughter of Henry I. When she was just 8 years old she left England for Germany to marry the Emperor Henry V, the ceremony occurring in 1114, and she only returned on his death in 1125. Matilda was designated as Henry I's successor in England and Normandy in 1127 since she was now his sole surviving legitimate offspring, Prince William having died in the wreck of the \*White Ship (1120). Her second husband, whom she married in June 1128, was \*Geoffrey of Anjou, only 14 years old, who inherited the county shortly afterwards. It was a very unhappy marriage, but the awaited heir, the future Henry II, on whom Henry I's hopes depended, was born in 1133, the first of three sons. But when Henry I died in 1135, his nephew Stephen of Blois staged a coup and took the English throne. Matilda landed in England in 1139 in pursuit of her right. She came closest to success in 1141, when Stephen was captured, but the crown eluded her, partly because of her mismanagement of the situation. It gradually became apparent that her task lay in maintaining her position in England and preparing the way for her son (later Henry II), altogether more acceptable to the English magnates and approaching manhood. In 1148 she retired to Normandy, but not entirely from political life. She occasionally acted as Henry II's viceregent and he relied on her counsels in a number of important matters. An impetuous, indomitable, haughty woman, Matilda was greatest in her offspring, but he owed much to her determination to fight for England. SL

**Matilda of Boulogne (c.1103–52),** queen of Stephen. Matilda was a doughty supporter of Stephen's cause in the civil war against the Empress \*Matilda. Heiress to the lands of the counts of Boulogne in France and England, she provided her husband with substantial resources and a power base in

## Matthew Paris

the home counties which facilitated his seizure of the kingdom in 1135. After 1135 she made a considerable contribution to his cause, playing a central role in disrupting the empress's plans during Stephen's imprisonment in 1141–2, and arranging an important marriage between their son \*Eustace and the daughter of the French king Louis VII in 1140, which gave her husband a useful ally. Stephen's cause declined quite rapidly after her death. DB

**Matthew Paris** (c.1200–59) is one of the greatest of all historians, partly because of his astonishing output, partly because of the remarkable comprehensiveness of his work, partly because of his historical method, and partly because of his extensive range of interests. He entered the monastery of St Albans in 1217 and spent most of his life there writing history. He wrote a series of saints' lives. He composed the *Gesta abbatum*, recording the history of his monastic house. His greatest work, the monumental *Chronica majora*, for which he is renowned, was the most comprehensive history yet written in England, and concerned not just with English affairs but with those of the entire known world from the Creation to Paris's own day. He also wrote the *Historia Anglorum*, a chronicle from 1066 to 1253, and two shorter histories, the *Abbreviatio chroniconum* and the *Flores historiarum*. Paris was also a significant artist, as shown by the compelling illustrations to his various texts, and an important cartographer. SL

**Matthews, Sir Stanley** (1915–2000). Footballer. Born at Hanley in the Potteries, Matthews made his début for Stoke City in 1932 and his first appearance for England in 1934, when he scored one of his comparatively rare goals. From 1947 to 1961 he played for Blackpool, returned to Stoke from 1961, and retired at the age of 50. He played for England on 54 occasions, and was Footballer of the Year in 1948 and again in 1963. He was knighted on his retirement. Matthews played on the right wing, providing crosses of pin-point accuracy for his strikers. His most famous game was the Cup Final of 1953, when Blackpool were trailing 1–3. In the last 20 minutes, Matthews turned on an extraordinary exhibition of wing play, mesmerizing opponents, to defeat Bolton Wanderers 4–3. His brilliant ball control was matched by his physical fitness and sportsmanship. JAC

**Mauchte, St** (d. c.535). Born in Britain, taken to Ireland by Christian parents, Mauchte became a disciple of St \*Patrick. When in Rome, he was allegedly consecrated by Pope Leo I. He returned to Ireland with twelve followers, eventually settling to build a monastery at Louth, and is claimed as its first bishop. The enormous community was said to include 200 bishops. Probably 90 when he died, one of many legends attached to him claims he lived for 300 years, a sentence pronounced on him by St Patrick for questioning the ages attributed to Old Testament patriarchs. AM

**Mau Mau rebellion.** The violent, grass-roots resistance movement launched by the Kikuyu and related ethnic groups against the British colonial government in Kenya in the 1950s. It had its origins in the sense of deprivation felt by the Kikuyu, who had lost much of their land to white settlers. However strong their resentment towards white

domination, most educated Kikuyu were anxious to avoid military confrontation. The movement consequently lacked high-quality leadership and failed to win support from other ethnic groups within the colony. Its defeat when confronted by trained soldiers and police, though protracted, was inevitable. KI

**Maurice, Frederick Denison** (1805–72). Anglican theologian and social reformer. Son of a unitarian minister, Maurice was ordained in the Church of England and became professor of theology at King's College, London, but was forced to resign in 1853 because of his unorthodox views on eternal punishment. Maurice rejected the narrow moralism of his day and called for a wider understanding of the kingdom of God. He was deeply moved by the political events of 1848 and declared himself a \*Christian socialist. In 1854 he founded the Working Men's College in London and became increasingly recognized as a leader of Christian social reform. Contemporaries like John Stuart \*Mill criticized Maurice as muddled and obscure; but to his friends he was a saintly and prophetic figure. His writings supported the tenets of the \*broad-church school of Anglicans (modernists) and also influenced the Christian socialist revival of 1877–1914. JFCH

**Mauritius** was long known to the Arabs. It was discovered by the Portuguese but settled by the Dutch who named it after Maurice of Nassau. The French East India Company took possession in 1715 and, under Mahé de la Bourdonnais, developed sugar, cotton, spice, and indigo plantations. The British captured it in 1810 and kept it as their own crown colony. When slavery was abolished, Indian indentured labour was imported to work the plantations. Representative government was established in 1947 and Mauritius became independent within the Commonwealth in 1968. In 1992 it adopted a republican constitution. DAW

**Maxton, James** (1885–1946). Socialist agitator. The son of a Glasgow schoolteacher, and initially a teacher himself, Maxton joined the \*Independent Labour Party (ILP) in 1904 and acquired a well-deserved reputation as a fiery but witty orator in the socialist cause. In 1916 he suffered imprisonment for calling a general strike on Clydeside in protest against the deportation of engineers who were opposed to wartime measures permitting the 'dilution of labour'—that is, the employment of those who had not served regular apprenticeships. In 1919 Maxton became an ILP organizer, succeeding to the chairmanship of the party in 1926; meanwhile he had been elected as ILP MP for Glasgow Bridgeton (1922–46). Jimmie Maxton was ever a rebel, the leading member of the Clydesiders whose unshakeable faith in Marxist socialism became a feature of parliamentary politics in the inter-war period. But he was also a perfect gentleman, much admired (if unloved) on all sides in the Commons. GA

**Maxwell, James Clerk** (1831–79). Maxwell was a mathematical physicist particularly eminent for his work on electromagnetism, and on the theory of gases. Educated in Edinburgh and Cambridge, his earliest work was on the stability of Saturn's rings. After holding chairs in Aberdeen

and in London, and managing the family estates in Scotland, he was in 1871 appointed to the professorship at Cambridge founded in memory of Henry \*Cavendish. He oversaw the building of the Cavendish Laboratory, where J. J. \*Thomson and Lord \*Rutherford were to work. He gave mathematical form to Michael \*Faraday's discoveries, leading to a new understanding of light and to the discovery of radio, and introduced statistical explanation into physics with his work on gases. He was an intellectual giant, who also wrote playful verse, and his early death was a great loss.

DK

**Mayflower.** The *Mayflower*, an unremarkable ship of about 180 tons, has been immortalized, since it carried the first Pilgrims to New England and because the Mayflower Compact of 21 November 1620 was agreed on board. This was a covenant by the adult males, many of whom were not previously known to, and were distrusted by, the Pilgrim leaders, to obey agreed laws and ordinances. It allowed the election of officials and the suppression of disorder, in the absence of a formal charter. An early exercise in self-government, it was later followed by the formal election of a governor and assembly.

RCS

**Maynard, Sir John** (1604–90). Lawyer. Maynard was born in Tavistock and educated at Exeter College, Oxford. He soon built up a successful practice on the western circuit and entered Parliament for Totnes in 1640. A zealous presbyterian, he was an implacable opponent of the king and prominent in the attacks upon \*Strafford and \*Laud. He continued his legal practice under the Commonwealth, served Richard \*Cromwell as solicitor-general, and was in the \*Council of State in 1660. Nevertheless, he prospered under the Restoration, was appointed king's serjeant, and knighted, though Pepys reported that he was far from popular. He remained in the House of Commons for the rest of his life, prosecuted Lord \*Stafford in the Popish plot, but was at hand to welcome William III. For fifteen months 1689–90, though very old, he served as commissioner for the great seal. Maynard was recognized as a good lawyer, a fine speaker, and an imposing man, willing to serve all regimes. 'In legal murder none so deeply read,' remarked Strafford's nephew mordantly in 1681.

JAC

**Mayne, Cuthbert** (c.1543–77). Catholic martyr. Mayne was born near Barnstaple and became an Anglican minister early in life, being admitted BA at St John's College, Oxford, in 1566. Through the influence of \*Campion he converted to catholicism, attended the seminary at Douai, and was ordained priest in 1575. In April 1576 he was sent to Cornwall but was captured within three months. It suggests considerable unawareness of his danger that, when taken, he was wearing an Agnus Dei and in possession of a papal bull. His case went to the council, which was greatly alarmed at reports of the spread of catholicism, and determined on severity. Mayne was executed as a traitor at Launceston in November 1577, being the first seminary priest to suffer martyrdom. His skull is preserved in the Carmelite monastery at Lanherne (Corn.) and he was canonized in 1970. JAC

**Maynooth seminary.** When catholic seminaries in France were closed by the Revolution, the Irish hierarchy asked to open one in Ireland. The British government approved, since it might remove young Irish priests from the contamination of foreign revolutionary doctrines, and \*Camden, the lord-lieutenant, laid the foundation stone of St Patrick's College, Maynooth, in 1796. The government provided an annual grant which the Ministry of All the \*Talents in 1806 wished to increase. In 1845 \*Peel, as part of his reorganization of Irish higher education, increased the grant again, leading \*Gladstone to resign from the cabinet, though his reasons for doing so remained a mystery, particularly after he had explained them. Peel's action was seen by the unbending Tories as yet another betrayal and there was massive petitioning against the bill. But when Gladstone found himself prime minister in 1868 he re-endowed the college as compensation for stopping the grant.

JAC

**mayors** have been familiar urban officials in England and America (but not Scotland) for so long that it is easy to forget their exotic origin. The word (*major*='greater') was used in the post-Roman West for officials with supervisory responsibilities for others, and was taken up by the elected heads of revolutionary town governments in northern France. In imitation of them, the Londoners elected a mayor when they formed a sworn association about 1190, and King John recognized the London mayoralty in 1215. In the later Middle Ages most leading English towns followed London's example, with an annually elected mayor as their chief official. The more important mayors were treated with great respect, and processed publicly with attendants such as a sword-bearer or mace-bearer; from the 15th cent. those of London and York came to be called lords mayor. Until the 19th cent. mayors exercised considerable power by both charter and by-laws, presiding over courts and having powers of arrest. Municipal reform since 1835 has allowed the multiplication of towns with mayors and lords mayor but has diminished their real power: they have become simply chairmen or chairwomen of their councils, and are expected to devote much time to ornamental and ceremonial functions. The London Lord Mayor's Show, originating with the medieval ceremony of the mayor going to Westminster to be presented to the barons of the Exchequer, has survived and grown to be one of the most famous civic pageants in the world. The 1997 Labour government, committed to \*devolution, instituted an elective mayor for London, with considerable executive powers.

DMP

**maypoles.** Ancient fertility emblems, brought in ceremonially from the woods on May Day, erected on village greens, and decorated with flowers as central features during festivities. Permanent poles were usually very tall. According to \*Stow, one London pole in Aldgate ward out-topped the adjacent church's steeple, hence St Andrew the Apostle being renamed St Andrew Undershaft; after the 1517 apprentice riot it remained hooked under house eaves along Shaft Alley until residents burned it in response to a sermon denouncing it as an idol (1549). Reviled by puritans because of associations with paganism and immorality, maypoles were forbidden in 1644, but reappeared after the

## Meath

Restoration for May Day or Oak Apple Day (29 May) celebrations. The shorter poles used today for plaited-ribbon dances are a late 19th-cent. import. ASH

**Meath (Mide), diocese of.** The Irish see of Meath in \*Armagh province was created in 1216 by the amalgamation of the dioceses of Clonard, Kells, and Duleek, after a confused period of 12th-cent. ecclesiastical history in the Clonmacnoise region. Though there was an Anglo-French bishop in John's reign, this was not regularly the case until after 1327. By the 15th cent. it was in the region of the Armagh province known as *inter Anglicos*, Meath being part of the 30-mile strip behind Dublin and Kildare, the English administrative centre. There are still dioceses of Meath in both the Catholic and Anglican churches, though the Anglican diocese was transferred from Armagh to the Dublin province in 1976. There are cathedrals at Trim and Kildare. WMM

**Meath, kingdom of.** Meath (Mide, 'middle province') became the fifth province of Ireland along with Ulster (Ulaid), Leinster (Laigin), Munster (Mumu), and Connacht (Connachta) after the Uí Néill established their supremacy over central and north Ireland in the 5th cent. It is not mentioned in the *Táin Bó Cuailnge* and must have come into existence afterwards. The dynasty was founded by Niall Noigiallach, a Goidel, with Tara as the centre of power and sanctuary. However, in the 8th cent. the kingdom of Meath collapsed and a separate kingdom of Brega was formed, taking in the present county of Meath, south Louth, and north Dublin. Though the two were reunited in the 11th cent. when Brega came to an end, Meath never regained its former importance. SMD

**mechanics' institutes.** Following the foundation of the London Mechanics' Institute (later Birkbeck College) in 1823, these adult education institutions spread rapidly, especially in the industrial areas of the north and midlands. Their original aim of providing science for artisans, however, proved impracticable and by 1840 they had become centres for 'rational recreation' and the 'diffusion of useful knowledge', frequented by lower middle-class clerks and tradesmen and a few better-off artisans. The membership nationally rose from 7,000 in 1831 to 200,000 in 1860. Mechanics' institutes were favoured by middle-class liberals as promoting self-help, respectability, and 'intellectual and moral improvement'. From the 1860s mechanics' institutes acquired a new role as night schools and examination centres for the Society of Arts and the Science and Art Department, thus becoming forerunners of technical colleges. JFCH

**medicine, development of.** The wort-cunning of the Anglo-Saxon leeches, allied to nursing skill, became displaced by the introduction of Salernitan doctrine into England as the great medieval schools at Montpellier, Paris, Bologna, and Padua were founded. Ancient and hence medieval medical knowledge had fused around the writings of the Hippocratic corpus and Galen, and was predominantly found in monasteries, where Christian tradition encouraged care for one's neighbour. Such knowledge became institutionalized within the medieval universities of Oxford and

Cambridge, which conferred the right to practise. But the bulk of the population had little access to physicians, seeking instead barber-surgeons, apothecaries, empirics such as bonesetters and tooth-drawers, or wise women. In principle subordinate to the medical faculties, these groups in practice had considerable autonomy; separation between the book-learned physicians and the practically-orientated surgeons grew as each developed their own professional structure, while the guilds sought to keep their own practice exclusive. The 16th-cent. attack on the doctrine of the humours (which emphasized symptoms rather than causes of disease) by the turbulent Paracelsus, and his rejection of authority, led to a split with the Galenists; the Paracelsians, or chemical physicians, became particularly prominent in northern Europe and England as they attempted a more rational approach to diagnosis and treatment, favouring metallic rather than herbal remedies. The College of Physicians (established 1518) suffered serious crises in the 17th cent. because of its continued identification with Galenic theory and its links with patronage, heightened by a resurgence of empiricism and knowledge based on experience rather than scholarship. As the natural sciences advanced and old Aristotelian ideas were discarded, observation and experiment gradually replaced theory and guesswork: William \*Harvey's explanation of the circulation of the blood was confirmed by Malpighi's microscopic identification of the capillary vessels, while Thomas Sydenham encouraged detailed bedside observation.

As the power of the guilds declined, unregulated groups of medical practitioners emerged, whose training and practice were controlled more by the growth of a cash economy, resulting in a highly competitive 'health-for-sale' market. The establishment of voluntary hospitals and new medical schools, with increased clinical training at the bedside, broke the monopoly of the medieval universities, while, outside the official schools, private courses in anatomy and midwifery could be purchased. Educated lay people had long had access to medical knowledge, but once microscopic anatomy, pathology, and the stethoscope were developed, and greater rigour demanded, such learning became increasingly exclusive to the professionals. The introduction of inoculation and then vaccination made slow inroads upon the scourge of smallpox, surgery began to acquire some respectability, obstetrics was increasingly in the hands of the midwives, specialities began to emerge through new explanations of disease, and public health and hygiene received more attention.

The 19th cent. was characterized by a rise in scientific medicine, convergence between the separate disciplines of physic and surgery, and commencement of regulation throughout the profession. The structure of the body being known, attention turned to its detailed function; the concept of the cell as the centre of all pathological changes finally destroyed the view that an imbalance in the humours underlay disease. General anaesthesia (1840s) increased the scope and practice of surgery, most noticeably after \*Lister's antiseptic principle had been introduced (1860s), dramatically reducing infections and mortality, especially in hospitals and after childbirth. Verification of the

germ theory transformed pathology, though maintenance of health was becoming as important a concern. The overall standard of medical education improved and medical societies burgeoned, but the existence of 21 separate licensing bodies stimulated the 1858 Medical Act, which created a central governing body and established a register of practitioners. Attempts to have a single portal of entry to the profession were thwarted though, and many unqualified practitioners persisted. Radiology, psychiatry, and tropical medicine having been established, the 20th cent. continued to change the face of medicine beyond recognition. Life expectancy increased steadily, particularly after commercial production of antibiotics and vaccines. Developments in immunology have enabled organ transplants and genetic disorders are slowly yielding their secrets, but heart disease and malignancies remain disturbingly prevalent. Improved communication and teamwork have replaced isolated study, with widespread advances in medical technology furthering claims to professional monopoly, if not élitism, at the same time as affecting medical education and generating funding crises. The introduction of the \*National Health Service in 1948 markedly altered the pattern of provision of health care, but morale within the profession has declined as, increasingly challenged, it struggles to adjust to changing cultural values and expectations. ASH

**Medina del Campo, treaty of**, 1489. In 1489 Henry VII was attempting to prop up Brittany against French encroachment and also pursuing a marriage between his heir \*Arthur and the infant Catherine, daughter of Ferdinand of Aragon and Spain. In March 1489 the treaty of Medina del Campo confirmed the marriage arrangements and concluded an alliance against France. Though the treaty was not formally ratified, it served as the foundation of Henry's foreign policy. But in 1491 the duchess of Brittany married Charles VIII of France and the realms were united. The marriage of Catherine and Arthur was postponed until 1501 and within five months Arthur had died. JAC

**Medway, battle of**, AD 43. A major battle of the Roman invasion campaign, it is identified only as having taken place at a river between the beachhead and the Thames, almost certainly the Medway. Unusually for the ancient world, it lasted two days. On the first day auxiliary troops swam across and killed the British chariot horses, and legionaries under the future emperor \*Vespasian also forced a crossing. The decisive combat took place on the second day, when the Roman general Hosidius Geta distinguished himself after nearly being captured. ASEC

**Medway, Dutch attack in the**, 1667. One of the most brilliant of all naval exploits, the Dutch attack upon the Medway anchorage was on 10–14 June, as the English were attempting to recover from the Plague and the Great Fire of London. Anticipating peace negotiations, Charles II had laid up many vessels. The Medway was protected by difficult access, sunken ships, and a boom, but the Dutch penetrated the defences and caused consternation. The *Royal Charles* was towed away to Holland, and the *Royal James*, the *Loyal London*, and the *Royal Oak* sunk. Peace was signed

at \*Breda the following month. Part of the stern of the *Royal Charles* may still be seen in the National Museum in Amsterdam. JAC

**Melba, Nellie** (1859–1931). Opera singer. Born of Scottish parents as Helen Porter Mitchell, near Melbourne (Australia), it was only after marriage to Charles Armstrong that her gifts were developed. She came to England largely by her own efforts, but her potential was not recognized and \*Sullivan refused her work. After study in Paris came a brilliant début in Brussels (1887) as 'Mme Melba', clearly derived from her birthplace. World-wide acclaim followed. She eventually had many operas in her repertoire but was identified predominantly with early Verdi, Gounod, and Donizetti—*The Times* referred to 'the exquisite voice and the perfect use of it'—and sensibly avoided Wagner. She studied roles with Verdi and (later) Puccini, subsequently making *La Bohème* her own. Immensely popular and honoured as 'Dame' because of her work for war charities, she bade farewell at Covent Garden in 1926, though her last charity concert appearance was 1929. ASH

**Melbourne, William Lamb, 2nd Viscount** (1779–1848). Prime minister. Melbourne was such an agreeable man—perhaps the most pleasant prime minister since Lord \*North—that it is not easy to form a detached judgement. In some respects he was an essentially 18th-cent. figure: his idea of government was static, if not negative—the maintenance of law and order, conduct of foreign relations (usually with tiresome powers), and the implementation of those changes that could neither be postponed nor avoided.

To appearances he was an archetypal old-fashioned Whig—lounging, aristocratic, amiable, amateurish. But appearances were deceptive. He was not of the old nobility. His grandfather was a clever attorney who had acquired a baronetcy and obtained Melbourne Hall by marriage: his father, an obscure MP and follower of the prince of Wales, added an Irish and then an English peerage. Though Melbourne's attitude of ironic unconcern was not a pose, he was capable of hard and sustained application. 'I am sorry to hurt any man's feelings,' wrote Sydney \*Smith, another ironist, 'and to brush away the magnificent fabric of levity and gaiety he has reared, but I accuse our minister of honesty and diligence.' But near the core of Melbourne was a sadness: 'the man was mournful in his heart of hearts,' wrote W. M. Praed, in a poetical assessment. His mother was pretty and charming but, as Melbourne was overheard muttering in old age, 'not chaste, not chaste': consequently it is uncertain who his real father was and the earl of Egremont is as good a bet as any. At the age of 26 he was unlucky enough to marry Lady Caroline Ponsonby, whose indiscretions, scenes, and tantrums reinforced Melbourne's horror of unpleasantness and confrontation, which she adored. Their only child was retarded. Politically Melbourne turned all this to advantage in that he was a sensible and conciliatory man among Whig prima donnas—\*Grey, \*Brougham, \*Durham, and \*Russell. But it also meant a reluctance to face disagreeable reality, and to some extent Melbourne was a Wilsonian figure, the very

man to hold the party together, but less well equipped to tackle the urgent problems of a great nation.

He grew up in a large, high-spirited cliquish family, went to Eton and Trinity College, Cambridge, and spent a year at Glasgow under Professor John \*Millar. With few pretensions to scholarship, he finished with a lifelong love of books and a well-stocked mind. His fortunes changed abruptly in 1805 when the death of his elder brother left him as heir to the peerage. He abandoned the legal career upon which he had started and began a political one. He joined the Whig opposition but was on the right of the party, and had much in common with \*Peel, \*Huskisson, and the liberal Tories. His rise was slow, and, indeed, coping with Lady Caroline was a full-time job. He was 48 before, in 1827, he held office in \*Canning's ministry as chief secretary for Ireland, and within a year he was out again, resigning with the Huskissons.

This limited service was of consequence since the Whigs, when they took office in 1830, were short of experience and Melbourne became home secretary in Grey's government. He showed unexpected firmness in dealing with the \*Swing riots in 1831 and the \*Tolpuddle martyrs in 1834. He was the obvious choice to succeed Grey in 1834. It was to his advantage that, after six years of reform, the country was not averse to a pause. But his colleagues were unusually quarrelsome, William IV mistrusted the government, and Grey scrutinized every action, looking for backsliding. After six months, the king turned out the ministry and brought in the Tories. Peel dissolved, failed to win a majority, and Melbourne returned, taking the opportunity to drop Brougham, one of the more impossible ministers.

It cannot be said that Melbourne's second administration made much of a mark. It was dependent upon Irish and radical votes and the Tory House of Lords killed off several of its measures. Melbourne soldiered on, swearing, jesting, despairing. But the succession of Victoria in 1837 changed everything. He experienced an Indian summer in which he basked in royal favour, the young queen hanging on every word, enjoying every joke. \*Greville wrote kindly: 'he is passionately fond of her as he might be of his daughter if he had one, and the more because he is a man with capacity for loving without having anything in the world to love.' He talked less and less about retirement and though his attitude to his opponents was generous, it merely confirmed to Victoria that they were horrid, horrid Tories. She and Melbourne were hissed at the races and 'Mrs Melbourne' was a vulgar taunt. The \*Bedchamber crisis of 1839, when Peel failed to form a ministry in the face of the queen's evident hostility, gave Melbourne's government two more years. It lost by-elections with regularity though surviving a sharp foreign crisis over Mehemet Ali with some skill. But in 1841 he went to the country and was defeated. The parting with Victoria was painful, even though an irresistible competitor in the shape of Albert had arrived. Melbourne kept in touch in a series of confidential letters of an unconstitutional nature. But in 1842 he suffered a stroke and well before his death in 1848 he was a figure from the past. 'Not a good or firm minister,' was Victoria's cool judgement on a man she had once adored.

As a prime minister, Melbourne does not rank high. He had no great achievements to his credit, no grand principles to enunciate. But he was kind, honest, and not self-seeking—he refused both the Garter and promotion in the peerage—and these are not inconsiderable virtues. JAC

Mitchell, L. G., *Lord Melbourne* (Oxford, 1997).

**Mellitus.** Bishop of London (604–19), archbishop of Canterbury (619–24). Mellitus was one of the missionaries sent from Rome in 601 to reinforce \*Augustine's original mission of 597. He was the recipient of a famous letter from Pope Gregory I urging that the English mission should, within the limits of orthodoxy, accommodate itself to practices of the pagans. He is the only missionary known to have made a return visit to Rome, attending a synod there in 610. In 617, when the Christian king of Essex was succeeded by pagan sons, Mellitus was driven from London. (Though they refused baptism they demanded the white communion bread.) A (temporarily) pagan king succeeded in Kent at much the same time, and Mellitus was exiled in Gaul before returning to become archbishop. \*Bede provides a detail or so about him: he was of noble birth; he suffered from gout. JCA

**Melrose abbey** (Roxburgh) was the first Scottish \*Cistercian abbey. A religious community had been established nearby (at Old Melrose) from Iona in the 7th cent. but by 1074 it was deserted and the site came into the hands of Durham cathedral. About 1136 David I of Scotland obtained the property by exchange and colonized his foundation from \*Rievaulx. David's stepson Waltheof became its second abbot and enjoyed a reputation for sanctity. With four daughter houses and an income in the mid-16th cent. of over £5,000, Melrose was the most influential of the Scottish Cistercian houses. It attracted considerable royal support: Alexander II was buried here in 1249, as was the heart of Robert I Bruce. However, its position near the Anglo-Scottish border made it vulnerable and it was sacked several times in the 14th cent. and again in 1545, and never fully recovered. It fell under lay commendation from 1541. The surviving ruins (celebrated by \*Scott) are amongst the finest Cistercian remains in Scotland. BJG

**Melun, treaty of**, 1593. Elizabeth and Henri IV of France pledged themselves at Melun not to make a separate peace with Spain. When Henri concluded a settlement in 1598 at Vervins, Elizabeth was indignant. JAC

**Melville, Andrew** (1545–1622). Scottish presbyterian leader and academic. Born in Forfar (Tayside), educated at St Andrews and Paris, Melville was professor at Geneva in close contact with Beza. As principal of Glasgow University (1574) he introduced significant academic reforms there, at Aberdeen (1575), and at St Andrews (1579), where he became principal of St Mary's College (1580). Ecclesiastically more extreme than \*Knox, he attacked residual episcopacy and, as moderator of the General Assembly (1578) which enthusiastically adopted *The Second Book of Discipline* with its Bezan ethos, drove the church's organization into extreme non-Erastian \*presbyterianism. The Scottish Privy Council threatened him with imprisonment (1584) but, though royal supremacy over the church was re-established (1585) and

bishops' jurisdiction restored, Parliament endorsed the presbyterian system (1592). When the tide turned again, James VI regained his ecclesiastical powers (1597) and Melville was deprived of his rectorship at St Andrews (1597). After deriding Anglican worship in London, he was summoned before the English Privy Council (1606), disputed with \*Bancroft, and was sent to the Tower without trial (1607–11). On release he went to Sedan University, France, where he died. WMM

**Melville, George Melville, 1st earl of** [S] (1636–1707). Melville succeeded to his father's barony when he was 7. An ardent presbyterian from Fife, he was implicated in the \*Rye House plot and gave support to the \*Monmouth rising. In exile he joined William of Orange. He was prevented by illness from taking part in the expedition of 1688 but followed soon after. He was raised to the earldom in 1690 and his family had great influence in Scotland during William's reign. Melville himself was secretary of state [S] 1689–90, lord privy seal [S] 1690–6, and lord president of the council [S] 1696–1702. His eldest son Lord Raith was treasurer depute [S] 1688–9 but predeceased his father; his second son Lord Leven was governor of Edinburgh castle 1689–1702 and commander-in-chief [S] 1706. An advanced Whig, Melville was dismissed by Anne in 1702. \*Macaulay characterized him as prudent and circumspect rather than talented: 'a very mean figure in his person, being low, thin, with a great head, a long chin, and little eyes' was Macky's unkind description. JAC

**mercantilism.** This general term, coined in 1763 by Mirabeau, is usually applied to the system of economic thought and policy which flourished between the 16th and 18th cents. Mercantilists were concerned to increase and sustain the power of the nation state by competition with hostile rival nations. Most characteristic were their ideas about trade and gold. Wealth was defined exclusively in terms of gold bullion reserves, so that a positive trade balance became a prime aim of policy to increase the currency reserves. Conversely a trade deficit represented disaster, through the loss of gold reserves in payment for the excess of imports over exports. Such notions supported the acquisition of colonies to provide necessary imports or exotic commodities like sugar and tobacco which, otherwise, would have to be bought from rivals in exchange for bullion. The \*Navigation Acts introduced in the 17th cent. by the English government represented a typically mercantilist attempt to manipulate the costs of trade by stipulating that goods in the colonial trade must be carried in English ships. Another characteristic mercantilist strategy lay in the granting of legal monopolies by the state, such as the franchise given to the \*East India Company to trade exclusively with specified territories. Mercantilist doctrine also favoured control of the domestic economy by the state. Advocates agreed that low wages and a growing population were necessary to sustain national prosperity. Workers should be kept on the brink of poverty because any surplus above the level of subsistence, it was feared, would be frittered away in indulgence and idleness.

Modern economic thought gives little support to the basic ideas of mercantilism. Few today, except perhaps

the mandarins in the Treasury, would subscribe to the view that national wealth should be defined exclusively in terms of gold reserves. Current theory regards the restriction of trade as damaging to economic growth. Similarly monopolistic control and the regulation of economic activity are perceived as sources of inefficiency. While historical evolution has rendered mercantilism unfashionable, and the evolution of economics has exposed some of its theoretical limitations, it had a rationale in the context of the power struggle of the early modern period, and provides important insights into the ideas which motivated policy at that time.

CHL

**merchant navy.** In the medieval period there was no absolute distinction between merchant ships and warships. In time of war ships were commandeered from ports, particularly on the south coast. When commandeered, they were largely floating platforms for archers and men-at-arms and tactics consisted of little more than grappling and boarding. Their routine employment was in exporting cloth, lead, tin, and coal, fishing, and conveying passengers. The stern rudder had been introduced by the 13th cent. and a few of the vessels were of 200 tons, though most were much smaller. They were clinker built, with a single square sail. They were vulnerable not only to the elements, but to pirates and privateers, and to the hostility of sailors from rival ports. The poor state of the roads meant a considerable amount of river and coastal traffic, mainly in barges or cogs.

In 1545, when Henry VIII assembled a fleet against the French, 56 of the 181 ships were royal. The *Great Harry*, built at Deptford in 1513, was of over 1,000 tons, others of 400 tons, but most smaller. Drake's *Golden Hind*, which circumnavigated the globe, was 160 tons, and the *Squirrel* of 8 tons crossed the Atlantic in 1580. Of the 177 ships called to give battle to the Armada, 34 were naval vessels: the remainder included craft only fit to make up the numbers.

The 17th cent. saw a considerable increase in the size of ships, particularly those belonging to the \*East India Company, founded in 1600. The *Trades Increase*, the Company's first vessel, was almost 1,000 tons and was wrecked in Java on its first voyage, and though its size was exceptional, 800-ton Indiamen were not. The great expansion of empire made enormous calls on shipping, the \*Navigation Act of 1651 helped to fight off the challenge of the Dutch, and the total tonnage of English merchant shipping increased five-fold between 1586 and 1686. Many of the vessels were engaged in the slave trade, which brought prosperity to Bristol, Liverpool, and, along with the tobacco trade, to Glasgow. Newcastle, Sunderland, Whitby, and Hull grew in importance as shipbuilding ports.

The 19th cent. saw the British merchant navy at its strongest before international competition had bitten deep. Steamships came in during the 1820s, at first for short-haul ferry services, where the problems of storing coal were not so acute. \*Brunel's *Great Western*, a paddle steamer, crossed the Atlantic in 1838 and inaugurated a regular service. His second vessel, the \**Great Britain*, launched in 1843, was made of iron, and screw-propelled. By 1847 the P. & O. line was running a regular steamship service to India. The great tea

## Merchants

clipper races of the 1860s were between vessels of a dying breed. By 1890 over half the tonnage of the merchant fleet were steamers, most of the remaining sailing ships being small coastal vessels. At that time Britain owned half of the world's tonnage.

From then onwards, the impetus faltered. Though the total British tonnage continued to increase, as a proportion of the world's shipping it fell steadily. By 1914 it was down to 39 per cent, with Germany, the USA, Norway, France, and Japan coming up fast. The size of ships had again increased enormously. The *Mauretania*, launched on the Tyne for Cunard in 1907 and built by Swan Hunter, was 31,938 tons; the *Olympic*, built in Belfast for White Star in 1911, was 45,324 tons; its sister ship the *Titanic* in 1912 was 46,392 tons.

The effect of two world wars accelerated Britain's decline. Between 1914 and 1918, 9 million tons of British shipping were lost, mainly to German U-boats, and building could not keep pace. Britain's share of world tonnage continued to slide, from 33 per cent in 1921 to 26 per cent in 1939. The Second World War repeated the pattern, 2,426 ships totalling 11 million tons being sunk, with the loss of 28,000 seamen.

After a pause in the immediate post-war period, the decline was resumed. Great passenger liners gave way to oil tankers of more than 200,000 tons, and cargo vessels to roll-on roll-off container ships. New countries put British ship-building yards out of business; flags of convenience, particularly from Liberia or Panama, took away registrations; over-fishing in the coastal waters produced unpleasant confrontations with Iceland, Denmark, and Spain, and cut fishing fleets drastically. In 1948 Britain still retained 22 per cent of the world's registered tonnage: by 1970 it was down to 8 per cent, and by 1986 to less than 3 per cent. Only some 30,000 are now employed as seamen, many of them on short-distance ferries. JAC

**Merchants, statute of,** 1285. This statute made at Westminster (13 Edw. I s. 3) strengthened the provisions in the statute of \*Acton Burnell for the swift recovery of debts in the interest of promoting trade. Proceedings could be instituted in more towns, to be named, debtors could be at once imprisoned on default, and were liable to lose all their lands. The statute did not apply to Jews. JAC

**Merchant Venturers.** One of the greatest trading companies. Privileged trading concessions can be traced back to the 13th cent. and the duke of Brabant granted a charter in 1296 to English merchants in Antwerp. Though a number of companies and merchants traded with different places, the Netherlands gradually predominated, particularly for the export of cloth. The London Merchant Venturers were closely associated with the Mercers' Company, sharing Mercers Hall until the Great Fire in 1666, and rivals of the Staplers' Company, which specialized in wool export. Henry VII granted them a charter in 1505, establishing a governor and 24 councillors. The company had links or affiliations with other towns, such as York, Newcastle, Exeter, and Bristol. They defended their cloth monopoly against numerous rivals and enemies at home and abroad. They complained frequently of the activities of interlopers and their relations with affiliated companies were far from cordial. Abroad they

struggled against the \*Hanseatic League and against the vagaries of foreign diplomacy. They switched their trading base repeatedly to retain or enhance their privileges, moving from Antwerp to Emden and then to Hamburg. During Elizabeth's reign they succeeded in seeing off the challenge of the Hanse, but protests against their monopoly persisted and the advocates of \*free trade gained ground. In 1689, immediately after the \*Glorious Revolution, the export of cloth was opened up by statute to all subjects, thus depriving the Merchant Venturers of their monopoly. They continued to trade until the Napoleonic wars. JAC

**Mercia, kingdom of.** Mercia dominated Anglo-Saxon politics in the late 7th and 8th cents. The name 'Mercians' means 'the borderers' and is thought to derive from their position between the Anglo-Saxon settlements of the east coast and British kingdoms of the west. The middle Trent valley was the heartland of the Mercian kingdom, which included the modern counties of Staffordshire, Leicestershire, Nottinghamshire, southern Derbyshire, and north Warwickshire. Within this area lay the Mercian episcopal centre of \*Lichfield (founded 669 and briefly an archbishopric during the reign of \*Offa) and the important royal centres of \*Repton and Tamworth. The Tribal Hidage, which may be a Mercian tribute-list of the late 7th cent. appears to show this core area surrounded by other provinces, including those of the Pecsæte (Peak District) and \*Lindsey to the north, the Wreocensæte (Wrekin) and \*Hwicce to the west, and numerous small peoples of the Middle Angles to the south and east.

The first Mercian king who is reliably attested is Cearl, whose daughter Cwenburh married \*Edwin of Deira in the early 7th cent., but it is not known how or whether he was related to any subsequent Mercian kings. It is usually assumed that it was \*Penda (c.626–55) who established Mercia as a major Anglo-Saxon kingdom. He and his son \*Wulfhere (658–75) followed an aggressive policy which enabled them to collect tribute from the southern Anglo-Saxon kingdoms, Northumbria, and probably some British kingdoms as well. Rivalry with Northumbria was intense for much of the 7th cent. and led to the deaths of several kings of both nations in battles, including those of \*Heathfield, \*Winwaed, and \*Trent, as well as by more underhand means. But although military force was the basis of their power, Penda and Wulfhere also established relationships with kings of other provinces, including those of the Hwicce, \*South Saxons, and \*East Saxons.

The 8th cent. was dominated by two very powerful kings \*Æthelbald (716–57) and Offa (757–96), both of whom claimed descent from Penda's brother Eowa. During their reigns many of the peripheral midland peoples were absorbed into Mercia and they attempted to extend Mercian control, as opposed to mere tribute-collecting overlordship, to eastern parts of Wales, East Anglia, and provinces south of the Thames. \*Kent and \*Sussex became Mercian provinces and their native rulers were deposed. \*Wessex remained independent, but lost territory south of the rivers Thames and Avon to Mercia. Unfortunately we have few written records produced in Mercia itself from this period,

but surviving remains which reflect the wealth and power of the 8th-cent. Mercian kings include Offa's Dike and the churches of \*Brixworth and Repton. The extended boundaries of Mercia were maintained by \*Cenwulf (796–821), but increasing discontent with Mercian dominance in Kent, East Anglia, and Wessex and rivalry within Mercia between different collateral lines weakened Mercian hegemony. When \*Egbert of Wessex defeated Beornwulf of Mercia at the battle of \*Ellendun in 825 he was able to permanently detach Kent, Sussex, Surrey, and the East Saxons from Mercian control. The only Mercian possession south of the Thames was Berkshire which seems to have been ceded to the West Saxons by Burgred (852–74).

However, West Saxon successes did not really threaten the main Mercian province. It was the 'great Danish army' led by the sons of Ragnar Lothbrok which shattered the kingdom in 874. Burgred was expelled, but Ceolwulf II (874–9) was allowed to rule in western Mercia (centred on the former Hwiccan province). The area became increasingly dependent on Wessex for survival and \*Æthelfleda of Wessex, a daughter of Alfred who had married Ceolwulf's successor \*Æthelred, was ruler of the province in the early 10th cent. When Æthelfleda died in 918, her brother \*Edward the Elder, who was already winning parts of eastern Mercia from Viking control, annexed western Mercia as well. Although the Mercians continued to have some distinctive identity and in 957–9 had Edgar as their own subking, for most practical purposes they were controlled through ealdormanries and shires as part of the kingdom of England. Although most Mercian shires are mentioned for the first time in 10th-cent. records, it is likely that their boundaries were influenced by earlier Mercian administrative arrangements, many of which in turn depended upon the bounds of once independent peoples who had been integrated into the Mercian province. BAEY

**'Merciless' Parliament**, 1388. The lords \*appellant, having defeated their opponents at \*Radcot Bridge in December 1387, dominated the Parliament which met from February to June 1388. Suffolk (Michael de la \*Pole) and \*Oxford had escaped to France, but many of their supporters, including Sir Robert \*Tresilian, lord chief justice of King's Bench, and Sir Nicholas Brembre, lord mayor of London, were put to death. Richard II reasserted his power the following year. JAC

**Merionethshire** (Meirionydd). County of north Wales deriving its name from Meirion, one of the sons of \*Cunedda, who supposedly moved from Strathclyde in late post-Roman times with his people, the \*Votadini, in order to offset the threat of Irish invasion. It was probably an early kingdom but became part of the kingdom of \*Gwynedd. The annexation of the lands of the last \*Llywelyn by the crown under Edward I led to the creation of the shire in 1284. The coastal commote of Ardudwy to the north, and of Penllyn and Edeyrnion in the interior, taken by Llywelyn Fawr from Powys, were added. At the Act of \*Union in 1536 the lordship of Mawddwy was added to the county.

The county is predominantly heavily glaciated mountains and uplands with a coast of cliffs and bays. Cadair Idris is its

highest point (2,927 feet) and it also includes the Aran and Rhinog mountains, as well as the Harlech dome. Bala Lake or Llyn Tegid is the largest natural lake in Wales. Much of the county is within the Snowdonia National Park.

The vulcanism, which forms much of the highland, fancifully known as 'the Ordovician ring of fire', produced metamorphosed rocks, and slate has been widely quarried, at Blaenau Ffestiniog to the north and Corris to the south. Sheep-farming and tourism are the main supports of the economy. But there is a Magnox nuclear power station at Trawsfynydd, now decommissioned. The drowning of Tryweryn 1957–63 to form Llyn Celyn to supply water for Liverpool led to massive protest. Merionethshire has 65.4 per cent of its population able to speak Welsh. Merioneth was once again linked to Gwynedd in 1974 when it became part of that new county, and with \*Caernarfonshire constituted a reformed Gwynedd in 1996. In 1991 the total population was 31,963. HC

**Merit, Order of.** The order was established by Edward VII in June 1902, limited to 24 persons in the armed forces or of distinction in art, science, or literature. It was based upon Frederick the Great's *Pour la mérite* and is in the personal gift of the sovereign. The founding members included Lord \*Kitchener, G. F. Watts the painter, and Lecky the historian. \*Elgar was given the order in 1911 and the first woman to receive it was Florence \*Nightingale in 1907 at the age of 87. JAC

**Merlin** was famous in myth and tradition as the soothsayer and magician at King \*Arthur's court. Fragmentary evidence of early oral traditions suggests Merlin's earliest incarnation was as the mythical Welsh poet-madman Myrddin. This figure's transformation into Merlin was probably the work of \*Geoffrey of Monmouth (c.1100–54), who welded Merlin onto the Arthurian myth. This process was consolidated in \*Malory's *Morte Darthur* (published 1485), and revived with the Victorian reinvention of the Arthurian legend. In the interim, Merlin was regarded as the prototype magician, and his 'prophecies' were frequently reworked and republished in the 16th and 17th cents. JAS

**Merseyside.** Conurbation in north-west England, centred on Liverpool, made a metropolitan county after local government reform in 1972. Encompassing the dormitory areas for Liverpool, Birkenhead, and Bootle, it thus included much of the Wirral peninsula (formerly Cheshire) and the west Lancashire coastal strip to Southport; divided into five districts, it had its own administrative metropolitan county council 1974–86. Integrated transport (rail and two road tunnels beneath the river Mersey, though nearly defunct ferries) aimed to assist commuters. A distinctive local dialect ('scouse') and wry humour contribute to a regional identity, with Liverpool as the main cultural focus. The metropolitan council was abolished by the Local Government Act of 1985 but the term 'Merseyside' remains in use as a geographical expression. ASH

**Merton, statute of**, 1236. As much a discussion document as a statute, it arose from an assembly at Merton (Surrey) in January 1236 in Henry III's reign, and was an attempt to

## Merton

clarify a number of miscellaneous points of law. Among the many issues, including rights of widows, heirs, and pasturage, was a difference between canon law and common law: canon law held that a subsequent marriage legitimated natural children, common law did not. Despite an earnest appeal by Robert \*Grosseteste, the barons refused to change the laws of England. Another difference of opinion was between the barons, who wanted authority to deal with malefactors in parks and common pasture land, and the king, who was reluctant to grant it. Powicke called the statute 'the first striking example of a changing attitude to law'. It was regarded as important, and copies were sent to all sheriffs and communicated to the king's representatives in Ireland.

JAC

**Merton, Walter de** (d. 1277). Clerical statesman. Educated at Oxford, Walter became a clerk in Chancery and amassed a large number of livings. He was employed by Henry III to negotiate from the pope recognition of Edmund, the king's son, as king of Sicily. In 1261–3 he was chancellor but was forced out by de \*Montfort's party and not reinstated after the royal victory at \*Evesham. But he acted as chancellor once more 1272–4 after Henry's death and while Edward I was absent on crusade, and was thanked on the new king's return. For the last three years of his life he was bishop of Rochester. The careful rules he laid down for the governance of his foundation Merton College, Oxford, in 1264 were copied at Peterhouse, the oldest of the Cambridge colleges, and greatly influenced the development of both universities.

JAC

**Mesopotamian campaign**, 1914–18. Following Turkey's entry into the \*First World War in November 1914, a small Anglo-Indian force landed in Mesopotamia. The purpose of the expedition was to protect the nearby Persian oilfields and to deny the Turks and their German allies access to the head of the Persian Gulf, from whence they might threaten British India. Encouraged by early victories, but inadequately supplied, the British advanced towards Baghdad, but were halted by the Turks in November 1915. A considerable British force was besieged at Kut and surrendered in April 1916. Prestige demanded that this defeat be avenged and in March 1917, with fresh troops and a new commander, the British finally occupied Baghdad. They then pressed slowly forward until, following an armistice with the Turks in October 1918, they had occupied the strategically important oilfields around Mosul in northern Mesopotamia.

DF

**Messiah**, Handel's most famous and frequently performed oratorio, was written in just over three weeks and first performed in Dublin on 13 April 1742. It was a great success, raising £400 for charity, and Handel revived it many times, often adding different arias for new soloists. Charles Jennens's libretto selects biblical texts concerning the birth, death, and resurrection of Christ, and this subject-matter, together with the unusually high proportion of choruses, has contributed to the work's lasting popularity with choral societies. The gentle lyricism of arias like 'I know that my redeemer liveth' and the jubilant grandeur

of the 'Hallelujah' chorus have survived countless rearrangements and doubtful performances.

ECr

**Metcalf, John** (1717–1810). Road-builder, known as 'Blind Jack of Knaresborough'. Blinded by smallpox at the age of 6, Metcalf proved extraordinarily adaptable, and became successively travelling fiddler and horse-dealer, recruiting for \*Cumberland's army in 1745, and was present at both \*Falkirk and \*Culloden, trading thereafter in Aberdeen stockings. He set up a stage-wagon to York (1754), and traded in horses and provender, before securing his first road-building contract in 1765, eventually constructing 180 miles in northern England, and employing at peak 400 men. He was perhaps the first to apply coherent principles to construction, based upon the excavation of firm foundations, ditch drainage, and convex section. Metcalf retired in 1792, and set down his achievements in his autobiography (1795).

JCh

**methodism** began as a religious revival in the 18th cent. and grew to become the largest of the nonconformist churches. Under the leadership of John \*Wesley, societies for cultivating religious fellowship were set up, intended originally as auxiliary to the established church, but soon forced into independence by the hostility of the clergy. The movement grew rapidly from the 1740s and developed distinctive institutions, notably the weekly class meeting of 10–12 members and an itinerant body of lay preachers, who visited the societies, preaching in the homes of members and in the open air. At Wesley's death in 1791, there were 72,000 members of methodist societies and perhaps nearly half a million adherents. By 1850 membership was about half a million and an estimated 2 million persons (one-tenth of the total population) were under direct methodist influence. In Yorkshire one-sixth and in Cornwall one-third of the total population attended methodist services in 1851. During Wesley's lifetime there was no open breach with the Church of England, but after his death the methodists became a separate denomination with their own chapels. Schismatic tendencies led to the establishment of a number of different methodist churches ('connexions'). Later in the 19th cent. a process of reunion began and was completed in 1932.

Theologically, methodism differed little from the evangelical wing of the Church of England, stressing personal conversion and salvation by faith in the atoning death of Christ. But socially methodism was a transforming force. Most of the 18th-cent. 'people called methodists' were of humble origin without advantages of education, wealth, or social position. However, their puritan virtues brought them worldly prosperity and, by the 1830s and 1840s, the big Wesleyan chapels in northern towns were dominated by wealthy mill-owners and businessmen. Official methodism in the 19th cent. was middle class and socially conservative. Yet underneath there was a more liberal and democratic spirit. Methodism in the 18th cent. was a popular movement, and most of the schisms which rent the central Wesleyan body until 1849 were attempts in one form or another to reassert this basic characteristic. The breakaway churches (such as the methodist New Connexion, \*primitive methodists, \*Bible Christians, protestant methodists, Barkerites,

Wesleyan reformers) were characterized by differences of organization and personalities, not doctrine. Methodism, unlike the Church of England, was essentially a layman's religion. In addition to the full-time ministers (who had the superintendence of a number of chapels in a circuit), there was an army of active lay helpers, numbering in 1850 some 20,000 local preachers, over 50,000 class leaders, together with trustees, stewards, prayer leaders, and Sunday school teachers. Around the chapel there developed an intense world of personal and social relationships, which lasted into modern times. Friendship, marriage partners, help and support in time of need, a sense of security and personal worth were assured to methodists, who were exhorted to 'watch over one another in love'.

Methodism made an important contribution to the leadership of working-class movements like \*trade unionism and \*chartism by providing opportunities for self-education and training in leadership and organization in running the chapel. The general culture of methodism was toward respectability through living a temperate, thrifty, hard-working life; and early government fears that methodism was potentially disruptive gave place to the realization that it was more a force for stability than conflict in a working-class community. Indeed, historians have argued (somewhat exaggeratedly) that it was methodism that prevented revolution in Britain during the revolutionary decades 1789–1848.

Methodism has been criticized as providing a useful work-discipline for Victorian employers, and also as a religion which encouraged pessimism, repression, guilt feelings, and psychic inhibitions. Certainly some of its manifestations were crude, emotional, narrow, and self-righteous. But to thousands of ordinary men and women, methodism offered a view of human nature which harmonized with and interpreted their own experiences. In a world full of disease, early death, injustice, and all kinds of insecurity, methodism brought joy and hope. When a miner or farm labourer or domestic servant 'found Jesus', their life was transformed. Methodism gave them a cheerful conviction that in God's providence there was a place for everyone, however humble.

JFCH

**Methuen treaty, 1703.** The long-standing trading links between England and Portugal were reinforced in 1662 by the marriage of Charles II to \*Catherine of Braganza. When the War of the \*Spanish Succession broke out in 1701, the assistance of Portugal was essential. The political alliance was followed in December 1703 by a commercial treaty, negotiated by John Methuen. The Portuguese agreed to allow in English woollen goods while the English offered a preferential duty on Portuguese wines. The treaty stayed in force until 1836 and helped to replace consumption of French burundy in England by port.

JAC

**Methven, battle of, 1306.** On 19 June 1306 a small force under Robert I Bruce was surprised and routed at Methven, near Perth, by an army commanded by Aymer de \*Valence, earl of Pembroke, acting for Edward I. Bruce fled, his wife and young daughter were captured, and his brother Neil subsequently taken prisoner and hanged at Berwick. But within a year Bruce regained the initiative.

JAC

**Middle Angles, kingdom of.** In Book 1 of his *Ecclesiastical History* \*Bede includes the Middle Angles among the major peoples of Anglo-Saxon England, but elsewhere in his work they appear only under Mercian control. The only known king of the whole Middle Angles is \*Peada of Mercia, who was appointed by his father \*Penda c.653. It was during his rulership that the Middle Angles were officially converted to Christianity through a mission from \*Northumbria, although the regular succession of bishops of the Middle Angles based at \*Leicester only began in 737. In the Tribal Hidage, which may be a Mercian tribute-list of the late 7th cent., the Middle Angles are not listed as such and seem to have been represented by a number of smaller units in the east and south midlands. These include the Faerpingas who may be identical with the Feppingas whom Bede identifies as a Middle Anglian district (*regio*) and whose territory seems to have included Charlbury in Oxfordshire. Another likely Middle Anglian group the South Gyrwe, probably based in the fenland around Ely, had their own ruler *princeps* Tondbert who married Princess \*Æthelthryth of the East Angles. The existence of these subgroups within Middle Anglian territory and the lack of any corporate history before their domination by Mercia had led some historians to doubt whether the Middle Angles had any prior political unity and to see them instead as a Mercian administrative creation. However, that does not seem to be what Bede believed and a similar substructure of *regiones* can be found in other 7th-cent. Anglo-Saxon kingdoms.

BAEY

**middle class.** The middle class has been an influential and often enigmatic presence in British history since the early 19th cent. It first gained sustained recognition as a group through the language of class used in the campaign for parliamentary reform in 1832. The use of the 'middle classes' (plural) recognized the vast range of status and wealth denoted by the term, from prosperous merchants and manufacturers to shopkeepers and master craftsmen. The theoretical identity of the middle classes was related to the control of property and capital, directly through ownership or indirectly through professional skills and accumulated savings. The increasing impact of this group on national life was identified with dissenting religion and with rapid changes in manufacturing and industry, especially in the coalfield areas. This account has been questioned in recent years. Historians have abandoned the notion of the \*'industrial revolution' as a sharp break in continuity. Provincial manufacturers have been shown to be relatively poor compared to London-based merchants and aristocratic land-owners. Dissenters had dominance and numerical superiority in a very limited number of areas. Indeed, the presence of a 'middling sort' since the late 17th cent. made an impact through patterns of consumption and urban life. However, middle-class formation requires not only middle status occupations, but also a self-aware social group, which can act and is identified in some sense as a unit. Dissent, manufacturing, and specific regional economic experiences may well have produced dynamic elements in middle-class development, such as the Manchester-based campaign for \*free

## Middlesex

trade and the development of municipal trading and government in Birmingham and Glasgow. Claims which base middle-class formation in economic change are countered by historians who see middle-class formation as a political and cultural development.

The British middle class never produced a formal class political movement. Few middle-class MPs entered Parliament immediately after the 1832 reform and middle-class politicians did not dominate the highest ranks of government until the 1860s. Middle-class formation and influence operated through two major social processes, which although not new became more important in the early 19th cent. The middle classes created an increasingly active public life of voluntary societies and pressure groups. These often had a major influence on the aristocratic-led government, such as the \*anti-slavery and \*anti-Corn Law movements. Others, like the school societies and voluntary hospitals, became incorporated in the activities of the state. This associational culture created and spread middle-class values beyond the formal boundaries of the group.

Middle-class influence was also expressed through a domestic culture based upon gender subordination, increasing standards of material consumption, a desire for order and security, and for the separation of home and work. The residential suburbs which grew rapidly in the last thirty years of the 19th cent. were an important expression of this.

There is considerable debate over the outcome of the turbulent years before 1850. Some see a victory for the middle class and its values of respectability, of rational negotiation in social relationships, and of freedom for profit-seeking within the regulation and support of the state. Others see the failure of an entrepreneurial spirit in the face of gentlemanly aristocratic-led capitalism, a failure responsible for the slow-down in British economic growth after 1870. Part of the problem lay in the lack of a coherent middle-class set of values. Ideologists of both right and left look for an aggressive profit-seeking middle class central to the conflict between capital and labour. In practice, such values and actions were tempered by a paternalistic sense of obligation, often guided by the dictates of evangelical religion.

The years after 1870 saw an increasing number of low-paid, salaried, and professional people included in the middle class, notably schoolteachers and clerks. Increasing feelings of insecurity, growing ambitions for children, and a desire to sustain higher standards of consumption led to new strategies based upon smaller families, birth control, and saving through insurance policies. The opening of the civil service to competitive examination and the growing importance of professional and scientific knowledge after 1870 increased the value and need for middle-class education.

In the 20th cent. the relationships of the middle class to property and to the rest of society changed. The number of salaried and professional people increased, especially in the state sector and in the managerial structures of large manufacturing and commercial corporations. Even small firms were owned through private limited liability companies rather than directly. Middle-class property and privilege

increasingly relied upon owner-occupied housing, distinctive forms of education, and superior pension rights. Older privileges were eroded by universal suffrage, by narrowing income differentials, and by the growth of a mass commercial culture.

See also CLASS; PROFESSIONS.

RJM

**Middlesex** was one of the smallest, oldest, and strangest of counties. The southern border was the Thames, from Staines to the Isle of Dogs. It was divided from Buckinghamshire in the west by the river Colne and from Essex in the east by the river Lea. Much of the western part was drained by the river Crane and its tributaries from Pinner to Isleworth and by the river Brent, starting near Barnet. The northern boundary with Hertfordshire ran roughly along the ridge of the watersheds of the Colne and Brent, adjusted in the Middle Ages to take account of manorial ownership.

In Roman times it formed part of the territory of the \*Trinovantes and their competitors the \*Cassivellauni. Very soon after the Roman arrival, Londinium developed as by far the largest town and the seat of government and this dictated the subsequent history of the area. \*Watling Street, the great road to the north-west, bisected the county from Tyburn to Elstree: \*Ermine Street, the road to York, ran just inside the eastern border, from Tottenham to Cheshunt. Since, until the opening of the M25, all the great routes radiated to and from London, crossing the county was not easy, and Palmer's Green in the east had little contact with Staines in the west, nor Enfield with Uxbridge.

That part of the territory which survived as Middlesex was probably too small to sustain an independent kingdom, unlike \*Sussex, \*Essex, and \*Wessex. But the existence of Surrey (the south land) suggests a brief Middle Saxon kingdom straddling the Thames. The importance of London meant that there was strong competition from neighbouring kingdoms. By the 6th cent. the area seems to have formed a province of Essex, and by the 8th it had been taken over by Mercia. In the later 9th cent., after the struggle between Alfred and the Danes, the region became part of Wessex. By then it was a recognized shire.

The development of Middlesex as a county was stunted by the influence of London in the south-east. It fell naturally into the diocese of London, founded in 604. In the 12th cent. the city of London was given the right to appoint the sheriff of Middlesex and the assizes were held at the Old Bailey. Though the original area was thinly populated, with forests in Enfield Chase, marshes in the east, and poor thin soil in the west, in the course of time it became one of the most densely populated areas in the world. The influence of London was so overwhelming that few Middlesex towns grew to any size. Apart from Westminster, none had their own parliamentary representation. Economically too, the shire was totally dependent upon London, and from an early period became a scene of market gardens and gentlemen's parks, of which Hampton Court (royal), Sion House (Northumberland), Osterley (Child), and Cannons (Chandos) were the most celebrated.

By 1700, London had half a million inhabitants, by 1800 nearly a million. At that time, setting aside towns like Edmonton, Chelsea, and Hammersmith, which were already London suburbs, the largest towns in the shire were Enfield with 6,000 people and Isleworth with 4,000, Uxbridge 2,100, Hendon 1,900, Staines 1,700, and Brentford 1,400. Of the six hundreds into which the county was divided, Spelthorne, Elthorne, Gore, Edmonton, and Isleworth had a total of 55,000 inhabitants, while the sixth, Ossulston, where the growth of London had taken place, had well over 750,000.

The political absorption of the county by London gathered pace in the 19th cent. The growth of the railway network brought another leap forward by the capital. In 1888 a considerable portion of south-east Middlesex, including Highbury, Hampstead, and Hammersmith, was sliced off to form part of the new county of London. In 1965, in another reorganization, the county disappeared altogether, most going to Greater London, but Staines and Sunbury moving to Surrey and Potters Bar to Hertfordshire. JAC

**Middleton, Charles Middleton, 2nd earl of [S]** (c.1650–1719). Middleton's father came from Kincardineshire, fought against \*Montrose and the royalists, but changed sides and was with Charles II at the battle of \*Worcester in 1651. At the Restoration he was created earl of Middleton [S]. His son succeeded to the peerage in 1673, was secretary of state in Scotland 1682–4 and in England 1684–8, despite adhering to protestant views. One of James II's chief supporters, he joined him in exile at Saint-Germain in 1693 and was then attainted. He retained much of his influence at the Jacobite court until 1713, and was given a Jacobite English peerage as earl of Monmouth in 1701. \*Burnet described him as pleasant and conciliatory and in December 1688 he attempted to dissuade James II from fleeing the country. After 1688 he was one of the leading Compounders, who urged compromise on James. But James's declaration of April 1693 offering assurances to his erring subjects was received with suspicion. \*Macaulay called Middleton 'one of the wisest and most moderate of the Jacobites'. JAC

**Middleton, John Middleton, 1st earl of [S]** (c.1608–73). From Kincardineshire, Middleton was a soldier of fortune. He began his military career in France but joined the Scottish covenanting army in 1639. He transferred to the service of the English Parliament and was active during the Civil War, particularly in the south-west. Returning to Scotland, he fought against \*Montrose at \*Philiphaugh. Next he changed sides and fought for the king at \*Preston, where he was taken prisoner, and at \*Worcester (1651), where he was wounded. In 1654 he joined with \*Glencairn in the unsuccessful Scottish royal rising but was defeated by \*Monck at Lochgarry. He escaped from the Tower of London to join Charles II in exile. At the Restoration he was created earl and served in Scotland as commander-in-chief and as commissioner to the Parliament. But his political career was less successful and in 1663 he was dismissed at the instigation of \*Lauderdale. In 1668 he was made governor of Tangiers, where he died. \*Clarendon thought him the best of the Scottish generals. By the time \*Pepys met him in the 1660s, though a legendary figure, he was over the hill—a

dull, heavy man . . . a good soldier but a debauched man, a drinking man'. JAC

**Midlothian campaign, 1879–80.** Unhappy in his Greenwich constituency, and retired from the Liberal Party's leadership, \*Gladstone accepted the Midlothian Liberal Association's invitation of May 1878 to contest the constituency of Edinburghshire (as Midlothian, the county around the Scottish capital, was technically known) at the 1880 election against Lord Dalkeith, the Tory candidate and son of the powerful duke of Buccleuch. With less than 3,500 electors the constituency was open to manipulation and both Buccleuch and Lord \*Rosebery for the Liberals spent heavily. Gladstone made a series of long and highly effective nationally reported speeches—six major speeches in 1879 and fifteen in 1880—attacking what he dubbed 'Beaconsfieldism' (the policies of Disraeli's government), especially its foreign, imperial, and financial politics. He denounced 'a catalogue of expedients' and 'a new method government', exposed the Tories' loss of moral equilibrium, and put forward 'six principles' of foreign policy. Political speech-making was by no means new to British politics, but the Midlothian campaign was the apogee of the popular presentation of politics through 'the platform' and established Gladstone as the dominant orator of the century. He easily won the seat and the campaign played a part in winning the great Liberal majority in the Commons (though present-day historians accord it a less significant role than contemporaries). It re-established him as the unavoidable leader of the Liberal Party. Lords \*Granville and Hartington (\*Devonshire) (the official party leaders) felt unable, despite strong pressure from Queen Victoria, to form a government, and Gladstone began his second administration.

HCGM

**military history.** The study of war and its effects has a long and distinguished history, dating back to at least 2500 BC, when the Chinese philosopher Sun Tzu wrote his treatise on *The Art of War*. European theorists came later, but the tradition which began with Julius Caesar's *Commentaries* nearly 2,000 years ago created a rich vein, culminating in the 1830s with Carl von Clausewitz's masterpiece *On War*. In all cases, practical experience and deep thought combined to ensure that the study of military history was both analytical and fruitful.

Such a tradition was largely absent from Britain, where military history was seen as the stuff of amateurs and arm-chair generals. The reason for this is not difficult to find: until the early 20th cent. Britain's wars tended to be fought at great distance from home, away from public gaze, while in times of significant threat, such as during the French Revolutionary and Napoleonic wars (1793–1815), naval rather than military affairs took precedence. Individual military historians emerged—William Napier's epic six-volume *History of the War in the Peninsula* began to appear in 1828—but they displayed a preference for straight narrative rather than insight. Indeed, this became a strong theme running throughout British military history and one that continues today. Exciting accounts of military deeds, designed to engage the reader's attention and reinforce national pride,

clearly have their place, but they do not offer deep analysis. More serious military history, using the events of the past to enhance understanding of war and prepare both the army and the people for future conflicts, only began to emerge in Britain after the traumas of the First World War. Historians such as Major-General J. F. C. Fuller and Captain Basil Liddell Hart used their experiences of the trench deadlock on the western front to speculate on the ways in which warfare might be changed to avoid horrendous casualties in the future. Their views on the use of the tank and aircraft to restore mobility to the battlefield may have found more favour in Germany than Britain during the inter-war period, but their use of military history laid a new emphasis on analysis and informed speculation.

This has continued to the present day and is seen as an integral part of the process of evolving and establishing war-fighting doctrine within the British army. Other factors may come into play, not least the influence of American thinking on war, but the British experience of conflict has been unique. It is reflected in the use of military history to support a doctrine which, while emphasizing large-scale conventional war, looks back just as much to the low-level counter-insurgency campaigns that form such an integral part of British army history. Moreover, the growing seriousness with which military history is being viewed in the British academic world provides a backcloth against which meaningful study can be made. JLP

**militia.** The British regionally-based volunteer armed forces (from the Latin *miles*, a soldier). Of Anglo-Saxon origin or earlier, the militia was established as an obligation for all freemen by the Assize of *\*Arms* of 1181. In 1558 Mary I created the new post of *\*lord-lieutenant* to command the militia in a county structure, and Charles II in three Militia Acts (1661–3) established its legal basis. Although militarily negligible throughout its existence, the militia was intended to repel any invasion, to secure order locally, and as a regional ‘constitutional force’ to balance royal control of the standing army. Service in the militia (and its mounted equivalent, the *\*yeomanry*) evolved to be essentially voluntary except in times of emergency, such as the 1757 Militia Act, which used a ballot. During the Napoleonic wars, the militia was supplemented by various ‘fencibles’, and after 1859 by the Rifle Volunteers. The 1852 Militia Act finally placed it under the secretary for war, and in 1881 militia regiments were attached to regular county infantry regiments. The 1907 *\*Territorial and Reserve Forces Act* abolished the militia by amalgamating all volunteer forces into the Territorial Force, renamed the Territorial Army in 1921, which continues in existence. SDB

**Mill, James** (1773–1836). Utilitarian philosopher. Son of a Scottish shoemaker, educated at Edinburgh University, Mill became an itinerant preacher but lost his faith and came to London in 1802 to work as a hack journalist. He fell under the influence of Jeremy *\*Bentham* and developed his ideas into a coherent philosophy, substituting strict puritanical morality for Bentham’s hedonism. Mill rather than Bentham formulated the distinctive *\*‘philosophical radicalism’* of the 19th-cent. British utilitarians. He contributed ideas on edu-

cation, political economy, psychology, penology, law, history, and political theory, which he set out in five books and over 1,000 essays. His best-known political work, the *Essay on Government* (1820), argued the case for representative democracy against monarchy and aristocracy and declared that the purpose of all government was to achieve the happiness of the whole community. EAS

**Mill, John Stuart** (1806–73). Utilitarian and liberal philosopher. The son of James *\*Mill*, a disciple of Jeremy *\*Bentham*, Mill was converted to Benthamite utilitarianism at the age of 15, but later rejected its egoistic psychology and mechanical concept of pleasure. He was employed for 35 years by the East India Company, afterwards serving as an independent member of Parliament for Westminster (1865–8), arguing for radical measures such as votes for women. In *Principles of Political Economy* (1848), Mill adopted a modified *\*laissez-faire* position, believing in the efficiency of free enterprise, but aware of the frequent failure of the market to maximize utility. In *Utilitarianism* (1861) Mill revised Benthamism, distinguishing between higher and lower pleasures, and affirming a moral duty to promote happiness. In *On Liberty* (1859) Mill wrote the most celebrated defence of individual freedom to appear in the English language, based on utilitarian values, not natural right. In *Considerations on Representative Government* (1861) he defended democratic participation, but only under strict conditions designed to protect the position of the virtuous élite. Finally, in *Subjection of Women* (1869) Mill defended the rights of women on equal terms with men—a landmark in the history of feminist writing. Mill’s legacy as a founding father of liberal thought is unrivalled. TSG

**Millais, John Everett** (1829–96). Painter and book illustrator. A scion of an old Norman family, settled in Jersey since the Conquest, Millais was a prodigy. He entered the Royal Academy Schools in 1840 and first exhibited there at 16. In 1848, with Holman *\*Hunt* and D. G. *\*Rossetti*, he founded the *\*Pre-Raphaelite Brotherhood*, of which he was the most technically brilliant. Great hostility was shown to his *Christ in the House of his Parents* (1850). He was attacked in *Blackwood’s Magazine*, which called the work ‘ugly, graceless and unpleasant’, and by Charles *\*Dickens*, later a friend, who thought it ‘mean, odious, revolting and repulsive’. He was defended by John *\*Ruskin*, whose former wife he married in 1855. After moving away from the Pre-Raphaelite style, he became a fashionable painter of portraits and costume history and is best known for *Ophelia* (1852), *The Blind Girl* (1856), and *Bubbles* (1886). Elected ARA in 1853, a full academician in 1863, and president of the RA just before his death in 1896, Millais was created baronet in 1885. JC

**Millar, John** (1735–1801). Millar was born in Lanarkshire, son of a minister. Educated at Hamilton Grammar School and Glasgow University, he became a lawyer and in 1761 accepted the regius chair at Glasgow, which he held for the rest of his life. The Glasgow Law School flourished under his supervision and his pupils included Lauderdale and *\*Melbourne*. Though in early life a friend of *\*Hume*, Millar was an advanced Whig, an advocate of parliamentary

reform, and sympathetic to the French Revolution. *Historical View of the English Government* (1787) was a Whiggish analysis, dedicated to Charles \*Fox: the Stuarts were roundly condemned as devoted to arbitrary principles. More influential was his *The Origin of the Distinction of Ranks* (1771). Heavily influenced by Montesquieu and Hume, it was a pioneering work in comparative sociology. Millar doubted the suggestion that a cold climate stimulates activity and encourages progress, and argued that commercial prosperity, by instilling a 'contemptuous and insolent behaviour to persons of superior rank and station', must undermine traditional authority. JAC

**millenarianism.** Belief in a future millennium (1,000 years) either preceding (premillennialism) or following (postmillennialism) the second coming of Christ, when he will reign on earth in a kingdom of his saints. Unlike postmillennialists, who anticipated a gradual progress towards the millennium through Christian, human agencies, premillennialists (or millenarians) looked for a sudden change through divine, cataclysmic action. Contemporary events were interpreted by reference to biblical prophecies or divine revelations concerning the immediate arrival of Christ on earth. Millenarian hopes and visions surfaced at the time of the \*Peasants' Revolt (1381) and again among 17th-cent. sects such as the \*ranter, \*Muggletonians, \*Fifth Monarchy men, and some early \*quakers. Prophets and prophesies continued into the 18th cent., and the French Revolution occasioned an outburst of both popular millenarianism (as among the followers of Joanna \*Southcott) and scholarly exegesis of the millennium by orthodox churchmen. Because of its concern with imminent change, millenarianism appealed to radical reformers and could be secularized into utopianism. It appeared as a strand in some of the revolutionary rhetoric of the 1790s and provided a vocabulary for Robert \*Owen and some of his followers. Later millenarian sects included \*Seventh day adventists, \*Plymouth brethren, and \*Jehovah's witnesses. JFCH

**millenary petition,** 1603. Elizabeth I, having authorized the establishment of a protestant church in England at the beginning of her reign, stood firm against any further changes. This angered those of \*puritan inclination, who believed that it preserved too many catholic vestiges in its structure and worship. They took advantage of the accession of a new monarch in 1603 to present James I with a petition, said to have 1,000 signatories, setting out their position. James responded by summoning the \*Hampton Court conference and using the millenary petition as its agenda. RL

**Milner, Alfred** (1854–1925). British administrator and ardent imperialist. After serving in Egypt (1889–92) and as chairman of the Inland Board of Revenue (1892–7), knighted 1895, Milner became high commissioner in southern Africa and governor of Cape Colony in 1897. Convinced himself of the incompetence of the government of the neighbouring Boer South African Republic (Transvaal), and of its unjust treatment of British residents, he undertook a campaign of criticism which led directly to the second Anglo-Boer War (1899–1902). He was created baron in 1901 and viscount in

1902. After the war he was mainly responsible for the revival of the all-important gold-mining industry and for initiating the move towards a closer union of the South African colonies and former republics, but his intense desire to retain Britain's overall control reinforced his unpopularity among the Boers. Returning to England in 1905 he took office again as a member of Lloyd George's war cabinet (1916–21). KI

**Milton, John** (1608–74). Milton was intended for the ministry by his father, a well-to-do London scrivener, and was educated at St Paul's School and Christ's College, Cambridge. He became increasingly dedicated to poetry, however, and after graduating spent long years in private study, nurturing a vocation to write a great Christian epic. But he put this aside soon after the \*Long Parliament met, believing that England was on the brink of a great new reformation, which he must serve with his pen, in prose. His first five tracts (1641–2) were directed mainly against the bishops. \**Areopagitica* (1644), a plea for a free press, presented a vision of England as 'a noble and puissant Nation rousing herself like a strong man after sleep, and shaking her invincible locks'. Neither his optimism nor his faith in his fellow-countrymen were to last. A series of tracts in favour of divorce (1643–5) brought him under the lash of the presbyterian clergy, and his sonnet to \*Fairfax (1648) breathed disillusion. The establishment of the \*Commonwealth brought him fresh hope, however, and his *Tenure of Kings and Magistrates* eloquently justified the trial of Charles I. Gratefully, the \*Council of State appointed him as its secretary for foreign tongues. Besides various diplomatic duties, this entailed writing (with the last of his eyesight) lengthy defences of the Commonwealth in both English and Latin. He eulogized Cromwell's \*Protectorate too, but gradually turned against its ecclesiastical policies and monarchical tendencies. By 1659–60 he was a thoroughgoing republican, and risked his life by publishing a virulently anti-monarchical tract on the eve of the Restoration. He was briefly imprisoned, but was spared to complete the epic masterpieces \**Paradise Lost*, *Paradise Regained*, and *Samson Agonistes*, whose composition he had postponed for so long. He was not an original political thinker and his polemical manners were deplorable, but he defended his ideals of Christian liberty and republican virtue with noble rhetoric and stoic courage. AHW

**Minden, battle of,** 1759. Ferdinand of Brunswick, commanding a force of 54,000 Hanoverian, British, and Prussian soldiers, manoeuvred to tempt a French army, 64,000 strong, out of seemingly impregnable positions at Minden. The French commander, the marquis de Contades, obliged on 1 August. A brigade of British and Hanoverian infantry, misinterpreting orders, launched a frontal assault on French cavalry in the centre and, against all odds, held firm when counter-attacked. Unfortunately the British cavalry, commanded by Lord George Sackville (\**Germain*), failed to move forward to exploit, and the French, having lost over 7,000, retreated. JLP

**Mines Act,** 1842. Parliament had already intervened in 1774 and 1799 to improve the position of Scottish miners, whose

## Minorca

bonds were described as akin to serfdom. In the 1830s a number of investigations into coal-mines revealed the extent of \*truck payments, employment of women and children, and disregard of safety. The first report on the employment of children in 1842, graphically illustrated, caused a sensation. Lord Ashley (\*Shaftesbury) took advantage of the indignation to steer through the Mines Act (5 & 6 Vic. c. 99) which forbade the employment of women underground, and of boys below the age of 10. Though inspection remained inadequate, it was an important breakthrough in protective legislation. JAC

**Minorca** is a Balearic island in the western Mediterranean of strategic importance, with Port Mahon a fine harbour. It was taken by the British in 1708 and retained at the treaty of \*Utrecht in 1713. At the outbreak of the \*Seven Years War in 1756, Admiral \*Byng's failure to prevent the French from capturing it brought down \*Newcastle's ministry and led to his own court martial and execution. It was returned to Britain again in 1763 by the treaty of \*Paris. Lost to a combined French and Spanish force in 1782 it was ceded to Spain in 1783, and though the British once more took the island in 1798, it was given back to Spain at the peace of \*Amiens in 1802. JAC

**minstrelsy.** The term minstrel signified those employed, by the crown, nobility, or urban corporations, as players of musical instruments. As the Middle Ages progressed there was an increasing demand for professional performers to play at special events such as weddings and banquets: entertainment of this sort was an integral part of aristocratic life-style. At the dubbing of Edward of Caernarfon in 1306, the crown paid 27 minstrels, playing various stringed, wind, and percussion instruments. Many of these were permanent members of the royal household, others were specially employed for the occasion. Documents suggest that the term often covered acrobats, jugglers, and other kinds of entertainers, such as, in 1306, Matilda Makejoy, 'saltatrix' (a female acrobat). Minstrels might also be employed as messengers and in sounding the curfew. They accompanied the late medieval English kings on military campaigns at home and abroad, being required to compose and perform works which celebrated great deeds and victories. This is thought to be the context within which the poem *The Siege of Cælarock* was written. The nobility had their own personal troops of minstrels who performed similar duties. Rates of pay seem to have been generous in both royal and aristocratic circles, and minstrels also received clothing from their masters in the form of liveries. AC

**Minto, Gilbert Elliot-Murray-Kynynmound, 1st Earl** (1751–1814). Minto was educated in Paris under the supervision of David \*Hume and at Oxford. He was called to the bar in 1774 and entered Parliament in 1776 in the Whig interest. He was a close friend of Edmund \*Burke and assisted him in the impeachment proceedings against Warren \*Hastings. He was appointed governor of Corsica in 1794, envoy to the court of Vienna from 1799 to 1801, and president of the Board of Control for East India Affairs in 1805. In 1806 he became governor-general of India. His period in office

saw the consolidation of British power in the subcontinent and, in prosecution of the Napoleonic wars, the extension of influence into south-east Asia. He dealt with the threat of Ranjit Singh's Sikh kingdom and captured Java and the Moluccas from the Dutch—although the latter were subsequently returned. He retired in 1813. DAW

**Minto, Gilbert John Elliot-Murray-Kynynmound, 4th Earl** (1845–1914). Minto was educated at Eton and Cambridge and joined the Scots Guards in 1867. He was famous for riding racehorses until he broke his neck in the 1876 Grand National. Thereafter, he became a newspaper correspondent in Spain, Turkey, and Canada and observer of the wars in Afghanistan and Egypt. A Liberal, he was appointed governor-general of Canada 1898–1904, and in 1905 became viceroy of India. His period in office was principally distinguished by his work with Secretary of State John \*Morley to pass constitutional reforms which introduced (albeit in a very restricted form) the principles of elected representation to the government of India. However, his relations with Morley were strained by his conservatism, which included reintroducing deportation without trial for nationalist 'agitators'. The Morley–Minto reforms are also remembered for introducing separate Hindu and Muslim 'communal' electorates. He retired in 1910. DAW

**missionary activity.** Along with evangelical zeal, an element often present in missionary work has been rivalry between Christian sects. Perhaps the first missionary to post-Roman Britain was \*Germanus, sent over in 429 by Pope Celestine I to combat the \*Pelagian heresy. Nor was rivalry long in appearing in \*Augustine's mission of 597 to reinvigorate Christianity: he was soon involved in a dispute with the \*Celtic church, whose own missionaries had made much progress in Scotland and north and west England. But within a century the English church was well enough established to send out missionaries of its own, \*Willibrord to the Frisians, \*Boniface to the Germans. During the Middle Ages, missionary enterprise was to some extent replaced by \*crusades. A mission from Pope Innocent IV in 1246 to the Mongol great khan was politely received but the message back invited the pope to submit or 'I shall make you understand'.

The Reformation renewed rivalries by formalizing the divisions of Christianity and the earliest post-Reformation missionaries were the \*Jesuit priests from Douai who strove to maintain or if possible extend the faith in Elizabethan England. Protestant counter-activity took at first the form of hunting them down, but later in the 17th cent. the considerable success of the Jesuits in America, India, Japan, and China stimulated protestant missions. In 1698 Thomas Bray, an Anglican clergyman, drew up plans for the \*Society for Promoting Christian Knowledge to supply libraries and missionaries to the colonies, and three years later the missionary work was handed over to the \*Society for the Propagation of the Gospel. In 1710 the SPG gave top priority to converting the American Indians but the other colonists wiped them out so fast that little progress could be made. Bray's links with Oglethorpe were partly instrumental in the foundation of the colony of Georgia as a haven for debtors,

where the \*Wesleys and \*Whitefield worked in the 1730s. As the methodists gathered strength, they also turned to missionary work, particularly after the French Revolution had encouraged evangelicalism. The Methodist Missionary Society was set up in 1786 and the Baptist Missionary Society in 1792. The first baptist missionary to India was William Carey, victim in 1808 of Sydney \*Smith's savage ridicule in the *Edinburgh Review*: missionaries, wrote Smith, an Anglican clergyman, were 'insane and ungovernable' and would lose Britain its Indian empire if not stopped. The \*London Missionary Society was established in 1795, the \*Church Missionary Society in 1799, and the British and Foreign Bible Society in 1804. Later in the century, there was much missionary interest in Africa, partly as a consequence of the fame of David \*Livingstone, who began working for the LMS in 1841. The LMS was avowedly undenominational, leaving the form of church governments for converts to decide. Elsewhere rivalries persisted. A mission to the Maoris in New Zealand made little immediate progress and when Bishop Selwyn, an Anglican, arrived in mid-century he warned the Maoris that the Wesleys were to be shunned as schismatics. Slowly the attitude of missionaries and their supporters changed. It was increasingly argued that missions should be self-destructing in the sense that they should lead to a self-governing autonomous local church. An ecumenical landmark was the holding of a World Missionary Conference in Edinburgh in 1910 which established an International Missionary Council. This, in 1961, was integrated with the World Council of Churches, started in 1948. JAC

**Mitchel, John** (1815–75). Irish nationalist. Mitchel's father had taken part in the '98 rising. Mitchel, a protestant, educated at Trinity College, Dublin, became a solicitor. A militant supporter of \*Young Ireland, he joined the staff of the *Nation*. An inflammatory article, pointing out how easy it was to cut the railway network around Dublin, led to a breach with \*O'Connell, anxious that his \*Repeal Association should not be smeared by violence. Mitchel founded a weekly paper, the *United Irishman*, in February 1848 and began publishing articles on drilling and the use of the pike. In March 1848 he was charged with 'treason-felony', sentenced to fourteen years transportation, and was on board boat when the abortive 1848 rising occurred. He was sent to Bermuda for a year and then to Tasmania, where he broke parole and escaped to America. There he founded a newspaper in New York, the *Citizen*, preaching hatred of Britain. In the Civil War he supported the South. Mitchel returned to Ireland in 1875, was elected MP for Tipperary, disqualified, and died. His *Jail Journal* (1854) has been called 'the bible of republicanism'. JAC

**'Model' Parliament** was the name given by \*Stubbs to Edward I's assembly at Westminster in November 1295 on the grounds that it was the first to include both knights of the shire and burgesses. But the phrase is inappropriate. Writs found later demonstrate that previous parliaments had a similar composition. Nor was the 1295 composition subsequently followed, since the lesser clergy gradually ceased to be summoned and made do with \*convocation.

But though the 1295 Parliament was less significant than Stubbs believed, it was a very large body. Almost 100 clergy (including 67 abbots), 8 earls, 41 barons, 73 knights, well over 200 burgesses, and 39 royal officials and judges meant that the number summoned certainly exceeded 400. JAC

**Molyneux, James** (b. 1920). \*Ulster Unionist leader. Born in Co. Antrim, Molyneux served in the Royal Air Force before election as an Ulster Unionist for Antrim South in 1970. Four years later, he succeeded Brian \*Faulkner and Harry West (who lost his seat) as leader of the party and held the post for a remarkable 21 years. Deeply suspicious of the \*Anglo-Irish agreement of 1985, he pursued an integrationist policy, retorting to cries of 'Brits Out!' that 'We are the Brits.' Brief of speech and a committee man by nature, he was in striking contrast to Ian \*Paisley, whose more intransigent \*Democratic Unionist Party made inroads into the UU position. But Molyneux was one of a long line of Ulster politicians to rely too much on the steadfastness of British governments. It was ominous in 1993 when Albert Reynolds, the Irish taoiseach and John \*Major issued the Downing Street Declaration, which announced that the British government had 'no selfish, strategic or economic interest in Northern Ireland'—widely understood in Orange circles as a coded message that it would pull out as soon as it could. This was followed in February 1995 by a Framework Document, signed by Major and Reynolds's successor, John Bruton, which envisaged cross-border institutions. Molyneux's position was totally undermined and two months after losing a crucial by-election in Down North in June, he resigned and took a life peerage. The experience of David \*Trimble, his successor, was not dissimilar. JAC

**monarchy.** Since heroic origins added to the prestige of monarchy, early Saxon chroniclers claimed descent for their dynasties from Woden, god of war. Later writers traced their monarchs to \*Brutus, great-grandson of Aeneas of Troy. \*Geoffrey of Monmouth was highly specific, explaining that Brutus landed at Totnes, overthrowing the race of giants, chief of whom was Gogmagog. Geoffrey's account, with Merlin's prophecy that Britain would be united, was used to claim supremacy over the Scots. Scottish chroniclers, not to be outdone, traced their monarchy's descent from Pharaoh of Egypt, whose daughter Scota had settled in their land.

More sober claims traced English monarchs back to Cerdic, king of Wessex in the early 6th cent. Even this was difficult to sustain, the royal blood running thin in places. Eighth-cent. Wessex kings are particularly badly documented and the link with Cerdic has largely to be taken on trust. Harold II had no royal blood at all, and William the Conqueror's claim was merely that his grandfather's sister, \*Emma of Normandy, had been married first to \*Æthelred, then to \*Cnut. But lineage was of such consequence that rulers whose claims looked shaky hastened to buttress them. The Conqueror's son Henry I married a Saxon princess, great-granddaughter of \*Edmund Ironside.

If we accept Cerdic as founder, the English monarchy dates back to about 519. The Scottish monarchy may be dated from c.843, when \*Kenneth MacAlpin of \*Dalriada

united Picts and Scots to form the kingdom of \*Alba. The role of the monarch was essentially that of battle-leader. As a consequence, strict primogeniture was slow to establish itself, since it could result in a child or a simpleton on the throne. Few monarchs lasted long enough for old age to be a problem. In the earlier period, the king was chosen from the extended royal family and was often a brother or a cousin of his predecessor. With expectation of life short, it was unlikely that the eldest son would be old enough for the task. \*Edgar's eldest son Edward was only 13 when chosen in 975 but the innovation was hardly encouraging since he was murdered within three years. As royal power grew, kings increasingly chose their sons or were succeeded by them. The earlier convention increased the chances of having an effective ruler, but added to the risk of disputes, and many early kings were overthrown, exiled, or killed by their kin.

Apart from waging war—admittedly at times a demanding business—early kings had little to do. They attempted very few of the activities of the modern state. Justice was dispensed by landowners themselves; the king did not make law, though he might declare what it was; there was little revenue to collect, though he was entitled to support and hospitality. There was no economic or education policy to supervise. One doubts whether the army spent much time drilling, an occupation which fascinated later rulers. Foreign relations consisted of sending envoys to neighbouring kings, arranging alliances, and negotiating marriages. The most sophisticated organization was the church and sensible rulers devoted care to choice of archbishops and bishops.

But the great effort needed to push back the Danes in the 9th and 10th cents. produced important developments in the institutions of Wessex. Burhs, erected as strong points, had to be built and garrisoned, naval vessels commissioned and manned, and all had to be paid for. At \*Winchester, the capital of Wessex and then of England until the 12th cent., more than 3,000 yards of walls necessitated a garrison of 2,400 men. There were well over 50 burhs and they included places of great importance—Worcester, Bedford, Oxford, Colchester, Nottingham, Exeter, Derby, Stafford, Bath, Chichester, and Manchester. Even if the garrisons were not permanent nor necessarily efficient, a remarkable organizational effort was required, and the Burghal Hidage shows a systematic attempt to ensure adequate support. By the reign of \*Athelstan a much more complex governmental structure is apparent and the kingdom of England has emerged. Indeed, by the reign of Edgar, one can see the outlines of a claim to British sovereignty, with the monarch rowed on the Dee in 973 by kings from Scotland, from Wales, and of the British.

The monarchy was still, and for centuries remained, dependent upon the personal ability of the ruler. The 11th-cent. Saxon kingdom was unable to sustain the momentum. The return of Viking raids at the end of the 10th cent. proved almost too much for Æthelred and at his death the kingdom passed rapidly to Cnut. Though his rule was firm, he was no great innovator. The royal bodyguard and a navy were maintained and the revenue to support them raised. But his Scandinavian and imperial ambitions left him little time to ponder English problems, and the law code for which he

is famous was largely derived from Edgar. Nor was \*Edward the Confessor, the last Saxon king, the man to invigorate government. The main development was the increasing use of the sheriff, a direct royal officer, to implement decisions in the shires.

With the Conquest in 1066 the kingdom was once more in alien hands, though to subjects accustomed to Scandinavian rule only a generation before, this may not have seemed novel, however unwelcome. By adding yet another people to be assimilated, the Conquest multiplied domestic problems, though the resentment felt by most of the English may have served to unify them. The first three Norman rulers were powerful. Their significance is seen more in relations with the other rulers in the British Isles than in domestic reform. Scotland felt the change quickly. William I paralleled the expedition by Cnut in 1031 with his own march to the Tay in 1072, which brought about the submission of Malcolm Canmore. His son William Rufus reoccupied Cumberland in 1092. Into Wales, the incursion of Norman lords began, particularly in the south, as early as one year after \*Hastings and William visited St Davids in 1081. The Norman attack upon Ireland was postponed until the 12th cent. and the reign of Henry II.

Since medieval government centred on the king, its efficacy varied greatly. Under strong rulers, the monarchy advanced, royal justice was extended, revenue increased, local government reorganized. Under weak rulers, control became slack and important concessions were made to subjects—\*Magna Carta in 1215, even if the immediate beneficiaries were the barons. Monarchs were frequently in danger since they were still expected to lead in battle: Edward II, Richard II, and Henry VI were deposed and killed, Edward V murdered, Richard III killed on the battlefield. The institution of monarchy was not in itself in danger—indeed, brutality often led to the survival of the fittest. Success in war, on the other hand, gave the king a strong, if not impregnable, position—William I, Edward I, Edward III, Henry V.

The prestige and standing of the monarchy was enhanced in a variety of ways. The \*coronation ceremony became more elaborate and more dignified. Some early coronations were so hasty that rehearsals could hardly have been possible. Harold was crowned the day after Edward's death, and Henry I apologized to \*Anselm for his coronation three days after succeeding Rufus, explaining that 'enemies would have risen up against me'. Monarchs were competitive. The kings of France were proud that, at the coronation of Clovis, an angel had appeared bearing holy oil: fortunately the balance was more than restored when the Virgin Mary herself presented \*Becket with holy oil, which was quickly incorporated into the English coronation ceremony. Scottish kings in the 13th cent. petitioned the pope for permission to include anointing, but the English kings protested and the Scots were forced to wait until 1329. Similarly, hearing that the kings of France practised the royal \*touch, English monarchs from Edward I onwards began stroking.

It was also of value to a monarch to be associated with great buildings and great deeds. The Confessor built Westminster abbey, consecrated just before his death, and Henry III rebuilt it. Rufus built Westminster Hall and Richard II

embellished it. Henry VI sponsored Eton and King's College, Cambridge. David I of Scotland founded the abbeys of Holyrood and Dunfermline, later turned into royal residences. Edward III's institution of the Order of the Garter was supported by a new chapel at Windsor, completed by Edward IV, and deliberately echoed the legendary deeds of King Arthur.

Cheaper was glory through the proliferation of titles. Edward I created his son prince of Wales in 1301; for decades the title of duke, first used in 1337, was reserved for members of the royal family. In 1483 the use of cloth of gold and purple was by statute limited to the king and his close relatives. By the 16th cent., the usual form of address had moved from 'Your Grace' or 'Your Highness' to 'Your Majesty'. By the 1530s the breach with Rome had added to the monarch's authority his headship over the church.

By the 16th cent., the traditional role of the monarch as battle-leader was declining, though George II still led his men at Dettingen as late as 1743. But as warfare became more professional and since guns were no respecters of persons, royal valour diminished in importance. Though Henry VIII pined for military glory, he was usually kept at a safe distance from the action, and the greatest victory of his reign at Flodden was achieved not by the king but by Lord Surrey (\*Norfolk). Circumstance in both England and Scotland facilitated the change. In England Edward VI was too young, Mary and Elizabeth ruled out by sex, though Elizabeth's heroic speech at Tilbury was an effective substitute. In Scotland, James IV died fighting at Flodden in 1513; James V was too ill to take the field at Solway Moss; Mary, queen of Scots, could not fight in person, though she urged her men on; and the inclinations of James VI and I did not run towards martial glory. Charles I was with his troops all through the Civil War, but as supreme commander rather than a fighting man—a role subsequently played by William III.

The Tudor period is usually regarded as the apogee of the English monarchy. Certainly it was stronger than in the 15th cent., when the Wars of the Roses produced frequent changes of ruler. None of the Tudor rulers was to be trifled with. Yet lawlessness and rebellion were not easily stamped out. Henry VII faced risings on behalf of the pretenders \*Simmel and \*Warbeck, Henry VIII the Pilgrimage of Grace, Edward VI's government \*Kett's rebellion, Mary the Lady Jane Grey episode and the Wyatt rebellion, Elizabeth the rising of the northern earls and innumerable plots against her life. Several of their policies returned to haunt their successors. The take-over of church powers added greatly to the patronage of the monarch but also involved him more directly in religious disputation at a time when the waves of controversy were beginning to run high. The pope was no longer a lightning conductor for disgruntled critics, and James I's attempts to hold the line—no bishop, no king—plunged his son into further difficulty. The Civil War, after all, began with Charles I's dispute over religion with his Scottish subjects. The vast proceeds of the dissolution of the monasteries were not merely squandered by the crown but finished up with the nobility, helping to strengthen its position. The house of Russell, which gained

enormously from the dissolution, was prominent in its opposition to the crown in the 17th cent. Henry VIII's use of Parliament to effect the Reformation, and Mary and Elizabeth's use to adjust it, gave it confidence to challenge the monarchy in the following century.

Though at one level the Civil War was disastrous for monarchy—the king beheaded, the institution abolished—in the end it may have helped its survival. The role of the army in the 1650s and the social upheaval of the Commonwealth period sobered the gentry and nobility and prepared the ground for the peaceful restoration of Charles II in 1660. The complex negotiations of the early 1640s, in which Charles I had described the role of the crown as a balancing one, pointed the way to a compromise between crown and Parliament. From the melodrama of James II's reign, the monarchy emerged strengthened—limited certainly in its formal powers and prerogatives, but more in touch with the wishes of the nation.

From 1688 onwards, though the monarchy retained fundamental powers, it was in slow constitutional retreat. The Bill of Rights removed the suspending power and the dispensing power as it had been employed. The prolonged warfare under William and Anne meant that the crown could no longer avoid annual sessions of Parliament and the timing of a dissolution became a matter for ministers, in practice if not in form. The right of veto fell into abeyance after Anne's reign. Though the choice of ministers remained an important prerogative it was increasingly limited by the growth of party loyalty, and the fiasco of Lord Bute at the start of George III's reign suggested that royal favourites would no longer serve. During George IV's reign the debility of the monarchy was apparent. The king could no longer prevent Catholic emancipation, though he regarded it, with some justice, as a breach of his coronation oath. In 1827 he contemplated leaving the choice of prime minister to the cabinet. Even the granting of honours fell largely into the hands of the prime minister and new orders had to be invented so that the monarch could retain some personal control.

But there were compensations in the changing role. It was not necessarily to the advantage of the monarch to be involved in the dust and reproach of day-to-day government, and the crown's retreat opened the way for a more national role. After the first three Georges, who had revealed little desire to show themselves to their subjects, George IV introduced a new note, with well-publicized visits to Scotland and Ireland. Victoria and Albert, a more appealing spectacle than a florid and elderly gentleman, were able to exploit the new railway age and built on George's foundations. Though Victoria was not a battle-leader, she undoubtedly became a symbol of the nation and of the empire, as her Golden and Diamond Jubilees in 1887 and 1897 demonstrated.

The 20th-cent. British monarchy survived when most others were swept away because it came to terms with democracy. The dangers that awaited it were, in the end, not red revolution or republican egalitarianism, but the more insidious difficulty of knowing what image to present in an age of rapidly changing standards. Like the church, the monarchy,

once regarded as a rock of stability and certainty in a confusing world, came to seem, by the end of the century, as confused as its subjects. Royal advisers tended to be modernizers or traditionalists. The abdication of Edward VIII in 1936 appears in retrospect less a grave constitutional issue than an early warning of the problems that would arise if the monarch, or members of the royal family, were not prepared to do their duty. Though few people still regarded the monarchy as a sacred institution, they expected, as \*Baldwin pointed out, high standards from it in exchange for its social privileges. The monarchy was not helped by the growth of a vulgar, censorious, and meretricious press. Universal education produced a nation of critics, less respectful than their 7th-cent. ancestors. An increasing number of subjects felt that members of the royal family wished to be ordinary people when it suited them, royal when it did not. The monarchy had survived 1,500 years by a process of adaptation to change, but the pace and nature of change at the end of the 20th cent. were so rapid that the monarchy was in danger, not merely of being left behind, but of seeming increasingly irrelevant.

Cannon, J. A., *The Modern British Monarchy: A Study in Adaptation* (Reading, 1987); Cannon, J. A., and Griffiths, R., *The Oxford Illustrated History of the Monarchy* (Oxford, 1988); Golby, J. M., and Purdue, A. W., *The Monarchy and the British People: 1760 to the Present* (1988).

**monasteries**, or religious communities of men or women living apart from secular society, had their origin in the early church in Egypt where hermits (the word monk is derived from the Greek *monos*, one alone) came together to live a common life of contemplation and work under the direction of an abbot (from Aramaic *abba*, father), such as Pachomius, generally regarded as monasticism's founder. Pachomius' codification of the monastic way of life (or 'rule') was followed by several others including those of Basil (most influential in the eastern church), Augustine of Hippo, Caesarius of Arles, and Benedict of Nursia or Monte Cassino. His rule later became dominant in the West. Monastic communities spread rapidly with the expansion of Christianity following the conversion of Constantine. The first monasteries in the British Isles were established in the 5th cent. in Ireland, probably from Gaul, where the most influential figure was Martin of Tours (d. 397). Thereafter communities spread throughout Celtic Britain, notable centres being at \*Iona under St \*Columba, at \*St Davids, and later at \*Lindisfarne (or Holy Island). Monasticism was introduced into Anglo-Saxon England by \*Augustine of Canterbury, himself a monk, the first community being St Augustine's, Canterbury (c.598). By c.650 many monasteries had been founded throughout Britain: some were communities of men and women, the most famous being \*Whitby ruled by its abbess, \*Hilda. They followed a wide variety of rules and customs. Attempts to standardize these under the rule of Benedict were made by \*Wilfrid of Ripon and Hexham, \*Benedict Biscop of Jarrow-Monkwearmouth, \*Theodore of Canterbury, and others, but were not wholly successful. The Viking raids that began in 787 and continued for over a century destroyed all the northern and eastern houses, while in areas less affected most fell under the control of secular lords, who

appropriated their property and appointed members of their family as lay abbots. Recovery accompanied Anglo-Saxon political recovery under the Wessex dynasty. Monasteries were founded, or refounded, often with support from the continent, particularly from Flanders and Lorraine, where there was a new reformed monasticism that looked for a more rigorous communal life, greater austerity, and freedom from secular authority, though operating in association with lay patrons and advocates. The nature and extent of the 10th-cent. reform, led by three monk-bishops, \*Dunstan of Canterbury, \*Æthelwold of Winchester, and \*Oswald of Worcester, who produced (c.970) with the support of King \*Edgar a new codification of the rule, the *Regularis concordia*, remains controversial, as does the state of Anglo-Saxon monasticism prior to the Norman Conquest. By 1066 there were some 35 male houses and 10 nunneries. Many, especially the former, were wealthy landholders, such as Winchester, St Albans, Bury St Edmunds, or Worcester, while the nunneries included great aristocratic institutions at Shaftesbury and Wilton. Virtually all were concentrated in the old kingdom of Wessex, the west midlands, and the Fens.

The Norman Conquest resulted in the seizure of some monastic lands by the invaders, but generally set-backs were temporary and monasticism was invigorated by new foundations such as Chester, Shrewsbury, St Mary's York, and Durham, as well as by the reforms of \*Lanfranc of Canterbury, whose *Constitutions* were widely adapted. These reflected contemporary good practice in Norman monasticism, and were influenced by \*Cluny, whence a number of priories were also established. The late 11th and 12th cents. also saw an increase in the number of houses for women, some of which belonged to new orders, such as the \*Gilbertines and that of Fontevraud. In 1128 the first \*Cistercian community in Britain was established at Waverley (Surrey). Cistercian monasteries and, to an even greater extent, \*Augustinian priories constituted the most numerous foundations of the 12th cent.

Thereafter monastic foundations declined markedly: few patrons had the necessary resources to endow a new community, though they might continue to support an existing one linked to their family or by tenurial relationship, while the crown became increasingly concerned at the loss of services and control occasioned by grants of land (in 'mortmain') to the church. Ecclesiastical patronage was especially directed at the new mendicant orders of \*friars, and \*chantries, frequently established in cathedrals and other churches to pray for the souls of donors and their families, tended to replace monasteries in the pious affections of the laity. Nevertheless the economy of most monasteries, some of which like Winchester and Christ Church, Canterbury, led the way in agricultural and administrative innovation, prospered during the 13th cent. The next century, however, saw serious structural crises consequent upon the \*Black Death, exacerbated in some instances by the Anglo-Scottish wars. The spiritual and intellectual condition of the late medieval monasteries is more controversial, but there is little doubt that there was decline from the 'golden age' of the 12th and 13th cents., as friars took the lead in theological debate and universities began to replace monasteries as

educational centres. By the time of the \*dissolution (1536–40) many monasteries were finding it difficult to attract sufficient recruits, though the *Valor Ecclesiasticus* (1535) revealed that many communities still enjoyed considerable revenues.

A few monasteries, notably Douai, were established on the continent by English Benedictine monks early in the 17th cent. and the Douai community returned to England after the French Revolution, a time when other continental monasteries transferred to England, forming the nucleus for the re-emergence of Roman catholic monasticism in England, while a number of Anglican communities were founded through the influence of the \*Oxford movement. **Monck, George, 1st duke of Albemarle** (1608–70). Monck, a stolid and taciturn soldier, played a crucial part in bringing about the \*Restoration of 1660. The younger son of a Devon gentry family, he had his career to make. In the 1630s he was in the Dutch service but at the outbreak of the Civil War joined the king. After a year in Ireland fighting against the rebels, he was captured at \*Nantwich in 1644 and sent to the Tower. At the end of the war, he returned to Ireland on the parliamentary side, fought a difficult campaign, and was captured by royalist forces in 1649. When released, \*Cromwell took him to Scotland, where he commanded the regiment that became the Coldstream Guards. When Cromwell pursued Charles II south to \*Worcester, Monck was left as commander-in-chief Scotland. In 1653 he was given naval command and had considerable success against the Dutch. Cromwell relied greatly upon him as a 'simple-hearted man' and nominated him to the 'other house' in 1657. On Cromwell's death, Monck's potential role as king-maker was obvious to all. The royalists began wooing him. When \*Lambert's troops in London expelled the \*Rump Parliament, Monck marched his men across the Tweed, brushing aside Lambert's forces. Parliament soon fell out with its deliverer and was forced to dissolve itself. Monck reopened negotiations with Charles II, effected his restoration, and met him on the beach at Dover. Next day he received the Garter and a week later his dukedom. He was again at sea in the second \*Anglo-Dutch War and served as a figurehead lord of the Treasury from 1667. His lack of ideology made him a consummate politician, moving with events. His wife, reputed a washerwoman, had great influence on him. \*Pepys found him 'a very heavy, dull man' and his devoted duchess 'a plain, homely dowdy'. JAC

**Mond, Alfred, 1st Baron Melchett** (1868–1930). Industrialist and politician. Son of a German Jew who came to Britain in 1862 and built up a large chemical firm, Mond began as a lawyer but moved into the family business, which, in 1926, became the nucleus of ICI. An advocate of the advantages of size in industry, Mond sought to reconcile capital and labour by profit-sharing and employee shareholding. He entered Parliament in 1906 as a Liberal, was 1st commissioner of

works 1916–21 and minister of health 1921–2 in \*Lloyd George's coalition government. In the 1920s he converted to imperial preference and took the Conservative whip. He was a convinced Zionist. His barony came in 1928. *The Times* obituary wrote that he had triumphed over 'a bad voice, a bad delivery, and a presence unimpressive to all but the caricaturists'. JAC

**Monkwearmouth**, at the mouth of the Wear, was founded in 674 by a Northumbrian nobleman, \*Benedict Biscop. All that now remains above ground of his monastery is the west wall of St Peter's church, begun with the aid of Gallic masons in 675, to which the surviving porch was added before 716. These fragments, together with documentary evidence, surviving sculpture, and the results of recent excavations, show that Biscop's work consciously evoked the buildings and culture of the Italian and Merovingian monasteries he had visited in his earlier continental travels. With the donation of \*Jarrow to Biscop in 682 Monkwearmouth became part of 'one monastery in two places' and by 716 there were 600 brethren at the two sites. Monastic life seems to have died in the 9th cent., though the early 11th-cent. tower shows that some ecclesiastical activity continued. Late in the same century the site became a dependent cell of the Durham Benedictines. RNB

**Monmouth, diocese of.** The diocese was created out of the ancient see of Llandaff in 1921, and is virtually coterminous with the county of \*Gwent. It is the smallest in the Church in Wales, few parishes being more than 25 miles from the cathedral. When the diocese was formed, there was no obvious choice for a cathedral. The ancient priory churches at Abergavenny and Chepstow were considered, as was the parish church at Monmouth. There was even a suggestion that the ruins of Tintern abbey be restored. In the event, the parish church of St Woolo in Newport, the most populous town, was chosen as the pro-cathedral, but its status was not confirmed until 1949. Since then this fine Romanesque church has been (in the 1960s) much enlarged. Of the eight bishops since the formation of the see, several have been notable scholars, including the canon lawyer C. A. H. Green (1921–8), the educationalist Derrick Childs (1972–86), and the theologians Edwin Morris (1945–68) and Rowan Williams (bishop 1992, archbishop of Wales since 2000). The rural character of much of the diocese is now changing. Within its borders are Cwmbran new town and an expanding industrial belt along the Severn estuary, between Caldicot and Newport. JRG

**Monmouth, James Scott, 1st duke of** (1649–85). Charles II's eldest and most favoured illegitimate son, Monmouth gained experience with the French army in 1672–4. Becoming an English general in 1678, he defeated the Scottish rebels in 1679. In that year his political ambitions began to soar when \*Shaftesbury, in his campaign to exclude the future James II from the succession, exploited the story that Charles had been secretly married to Monmouth's long-dead mother, Lucy Walter. Charles tried to discourage Monmouth's pretensions by exiling him, but an unauthorized return committed him to the opposition Whigs. They

## Monmouth rising

procured popularity for him as the 'protestant duke' but John \*Dryden pilloried him in his satirical poem *Absalom and Achitophel*. Implicated in the Whig \*Rye House plot to assassinate Charles and James he fled to Holland, from where he launched his disastrous invasion and rebellion after James succeeded Charles. After defeat he was executed under an Act of attainder. JRJ

**Monmouth rising.** While in exile in Holland radical Whigs persuaded the duke of \*Monmouth to invade England while \*Argyll invaded Scotland. Landing at Lyme in Dorset on 11 June 1685 with 80 followers only, but arms for 2,000, Monmouth depended on the Whigs rallying to him. The gentry were unwilling or (being in preventive detention) unable to do so. Promised diversionary risings in London and Cheshire failed to occur. However Whig rank-and-file supporters, mostly artisans in the depressed textile industry who, as dissenters, were also suffering religious repression, joined and formed an army of about 3,000 untrained infantry. Aware that this force was no match for the royal professionals, Monmouth conducted an irresolute campaign, failing to move quickly on Bristol, a potential source of mass support. He issued a declaration proposing radical political changes, but then proclaimed himself king in place of James II. Having lost the initiative, he gambled on a night attack (5–6 July) on the royal army camped at \*Sedgemoor, outside Bridgwater in Somerset. His men were routed. Monmouth was captured (8th) and executed in London a week later. He had never expected to lead what proved to be the last popular rebellion in England and did not know how to do so. JRJ

**Monmouthshire** was the most border of all counties, straddling England and Wales throughout its 400 years' history. It was bisected by the Usk, the Monnow, from which its name derived, forming the northern boundary, the Wye its eastern, and the Rhymney the western. The coastal plain and gentle hills of the south-east gave way to rugged mountains and valleys in the north-west.

In pre-Roman times, the area was part of the territory of the \*Silures. It was rapidly brought under Roman control, the remains at \*Caerleon and \*Caerwent being among the most impressive in the country. It stayed British after the Romans left, for some time formed an independent kingdom of \*Gwent, and at others was part of the kingdom of \*Deheubarth.

The Normans began systematic colonization after 1066, constructing castles at \*Chepstow, \*Raglan, Usk, Monmouth, White Castle. Skenfrith, \*Grosmont, and Abergavenny, as well as protected boroughs like Newport. The region was divided up into marcher lordships, which defended it as best they could from Welsh attacks: even so, Grosmont, Abergavenny, and Newport were burned in \*Glyndŵr's rebellion in the early 15th cent. The remote region was known mainly for the excellence of its archers and for the woollen Monmouth caps which were popular. Henry V was born in Monmouth, where his statue adorns the town hall. The advent of the Tudors, a Welsh dynasty, changed the status of the area. By the Act of \*Union of 1536, the territory was incorporated into England, joining with

land to the west of the Usk to form the new county of Monmouthshire. Its peculiar position was reflected by the fact that, like English counties, it was given two knights of the shire, but Monmouth had only one member and shared the representation with six contributory boroughs on the Welsh pattern. The most enduring interests were those of the Herberts, earls of Pembroke, who eventually concentrated on their Wiltshire properties; the Somersets, earls of Worcester and future dukes of Beaufort, who owned Troy House and Raglan castle; and the Morgans of Tredegar. The Somerset family dominated the borough of Monmouth, while the county was usually shared. The Somerset interest was powerful enough to secure the county for the king during the Civil War, though it was harassed by parliamentary forays from Gloucester. Charles I stayed at Raglan late in the war and it was the last royalist stronghold to surrender, in August 1646, when the garrison marched out with full honours. Along with Monmouth and Abergavenny castles, Raglan was then slighted.

The western parts of the county were little developed, though \*Camden noted in 1586 that they were 'not unserviceable to the industrious husbandman'. The large-scale exploitation of the coal and iron resources of Monmouthshire began in the early 19th cent., transforming the economic and political balance. Monmouth, the largest town in 1801 with 3,300 inhabitants, was by 1871 outstripped by Abergavenny, Pontypool, Blaenavon, Tredegar, and Newport. The last had grown from about 1,400 persons in 1801 to 40,000 by 1871 and more than 100,000 by 1961. Politically the county became first a Liberal, then a Labour stronghold. In 1831 Samuel Lewis wrote that there were churches in the shire where the services were in English, others in Welsh, and still others where the language alternated: 'the antipathy of the people to the introduction of the language and manners of the English is still inveterately strong . . . they stigmatise every thing assimilating to what is English with the epithet of *Saxon*.' By the mid-20th cent. the Welsh language had retreated and the opening of the Severn bridge in 1966, replacing the old Beachley–Aust ferry, suggested that Monmouth was being pulled back into the English economic orbit. The Local Government Act of 1972 moved the county back into Wales, restoring the name of Gwent, and Monmouth, which had always been on the eastern extremity of the county, lost its position to Cwmbran, a new town just north of Newport. Even this was not the last throw, for in 1996 a further reorganization of local government divided Gwent into four unitary authorities, one of which was to be called Monmouthshire. A better example of the importance which people attach to names could scarcely be found. JAC

**monopolies.** Strictly, monopolies exist when there is a single supplier in a market and a monopsony when there is only one buyer. More common is the notion of monopoly power where one actor can exert a strong influence over the way a market functions. Natural monopoly power is often associated with the existence of economies of scale but legal monopolies have been common in the provision of many forms of public goods and services. Adam \*Smith, in the

\**Wealth of Nations*, provided a sustained attack on monopolies but thought of them more as multi-firmed industries with statutory protection along the lines of the medieval guilds.

Attitudes towards monopolies have changed over time. Monopolies granted to courtiers by Elizabeth I and James I caused bitter resentment and there were fierce protests in Parliament. Monopolies were also introduced as a means of indirectly controlling supply, e.g. guilds and, recently, professional associations have codes of conduct which remove the need for direct controls. Conferring monopoly power has been a traditional way of stimulating investment—the \*turnpike system for roads. Legal monopolies may also be created to prevent inefficient duplication of supply. At the international level, monopoly trading power formed a key element in colonial development with singular powers being conferred on bodies such as the \*East India Company (1600).

Modern concerns about the effect upon consumers have led to state regulation of monopolies—through price controls or profit limits. Mergers which create monopolies are also subjected to scrutiny. The large-scale state ownership of monopolies is a relatively modern phenomenon stemming back to the nationalization programme of the Labour government of 1945–50. More recently (since 1979), following doubts about the economic efficiency of public ownership, there has been a return to regulated private monopolies.

KJB

**Monro, Alexander** (1697–1767). Scottish surgeon and anatomist. John Monro (1670–1740) had been so impressed by the system of medical education experienced at Leiden that he determined to introduce the same into Edinburgh, educating his son Alexander to play the principal role. After apprenticeship to his father and studies in London (under Cheselden), Paris, and Leiden (under Boerhaave), Alexander returned home to be admitted to the Incorporation of Surgeons by examination (1719). Rapidly appointed by the town council as ‘Professor of Anatomy in this city and college’, a public riot against body-snatching in 1725 encouraged him to move from Surgeons’ Hall to within the university walls. A brilliant extempore speaker, his lectures (in English, not Latin) covered anatomy, surgery, bandaging, and physiology, and he claimed 4,400 students passing through his hands. Thriving in practice as a surgeon-apothecary, his third son Alexander (1733–1817, later known as *secundus*) was educated to follow him, both being conjoint professors of anatomy by 1754. Awarded an MD (1756), Monro *primus* disenfranchised himself from the incorporation, modified his title to ‘Professor of Medicine and Anatomy’, and was received into the medical faculty of the university, thus essentially completing it as a medical school. ASH

**Montagu–Chelmsford Report.** The First World War both increased Britain’s need for Indian men and *matériel* and presented the Indian national movement with an opportunity to demand constitutional reform. Edwin Montagu, the secretary of state, was sent to India in 1917 and, together with Viceroy Lord Chelmsford, prepared the report which was to lead the country towards ‘responsible self-government’. It was enacted by Parliament in 1919.

However, the reforms, which were extremely cautious, proved a grave disappointment to Indian national opinion. \*Gandhi moved to leadership of the Congress by proposing a boycott of the first elections and ‘non-cooperation’ with the new constitution. DAW

**Montfort III, Simon de** (c.1170–1218). Simon is best known as the ruthless leader of the notorious Albigensian Crusade against the Cathar heretics of southern France. He first participated in the crusade in 1209, and this venture remained the centre-piece of his career thereafter. As with other participants, Simon’s motives are often considered to have been entirely cynical, but it should be remembered that he had previously gone on the equally notorious Fourth Crusade in 1202, significantly withdrawing from the army and going to the Holy Land when it became apparent that the crusade was being diverted from its intended goal, something which suggests genuine piety and a conscience. His significance for English history lies in his claim to the earldom of Leicester through his mother. King John initially accepted the claim but in 1207 seized all his English estates, only committing them through the earl of Chester for Simon’s use in 1215. His son, the more famous \*Simon IV, duly recovered them from Henry III. SL

**Montfort IV, Simon de, earl of Leicester** (1208–65). Earl Simon was no stranger to controversy in his lifetime, and has been the subject of extraordinary controversy ever since his death at the battle of \*Evesham (1265). Then, the victorious royalists dismembered his body in revengeful exultation; a detested traitor had met his end. But his followers found solace in the rapid emergence of a cult. Evesham abbey, where his mutilated remains were buried, became the centre of a pilgrimage, and the cult took hold so fast that the attempt was made to suppress it. But so strong was popular canonization that it defied suppression and, within thirteen years of his death, over 200 miracles had reputedly occurred. A ‘political’ saint was born.

It is as a supposed martyr for justice and the liberties of the realm that Simon has largely attracted both denigration and adulation ever since. Nineteenth-cent. scholars saw the \*baronial movement for reform, which Simon came to lead, as a formative phase in the making of the English constitution, his famous Parliament of 1265, to which knights and burgesses as well as barons and clergymen were summoned, being a crucial step on the road to democracy. A popular, creative statesman, the champion of oppressed classes, had emerged. The view of Earl Simon as a liberal statesman has been carried into our own times, most notably by Trehearne, but Powicke reacted sharply, considering Simon to be a fanatic, a moral and political crusader, whose arrogance and stubbornness wrecked the early promise of the reform movement enshrined in the provisions of \*Oxford (1258). Recent work, particularly on the early history of Parliament, has tended to diminish Simon’s reputation so far as his longer-term historical significance is concerned. What does seem clear is that Simon was no great radical or social reformer. Rather, he accepted the social order of his day and took support from whatever quarter he could once it became apparent that he could not unite the magnates behind

## Montgomery

him. But that does not necessarily mean that he was purely a cynical manipulator and self-seeker. Popular veneration suggests otherwise. SL

**Montgomery, Bernard** (1887–1976). General and then field marshal (August 1944), Montgomery was the most controversial general of the Second World War. Arrogant, confident, and self-centred, he did not endear himself to equals or superiors, but 'Monty' won the confidence of subordinates and ordinary soldiers. After capable service in France and Belgium in 1939–40 and in southern England, he rose to fame as commander-in-chief, 8th Army, in north Africa in 1942. With stronger forces and unequalled knowledge of his enemy's weaknesses, he directed the victory of \*El Alamein, forcing Italian and German withdrawal back to Tunisia. He was criticized for failure to cut off the retreating enemy. In Sicily and the south of Italy, he was alleged to show indifference to the needs of formations not under his command. The climax of his career was the command of ground forces in the attack on Normandy in 1944 until September. He aroused controversy after D-Day when his progress in capturing Caen was thought perilously slow. Montgomery undermined his reputation, then and since, by insisting that in battle everything followed his 'master plan', including the enemy. He showed high qualities in making cautious, 'balanced' provision for the unexpected: he claimed, however, that for him nothing was unexpected. After Eisenhower took over command, Montgomery continued to insist that he should control active operations. He delayed the clearance of the approaches to Antwerp for his unsuccessful \*Arnheim gamble. His boastfulness after the battle of the \*Bulge, when he was given temporary command, helped to reduce his influence in 1945. He became a viscount. RACP

**Montgomery, treaty of**, 1267. After the defeat of his ally Simon de \*Montfort in 1265, \*Llywelyn came to terms with Henry III at Montgomery. He was recognized as prince of Wales in exchange for homage and 25,000 marks. The treaty was the highest point of Llywelyn's power. JAC

**Montgomeryshire** (Sir Drefaldwyn). Border county of mid-Wales. It was created at the Act of \*Union with England in 1536 and was coincident with the Welsh kingdom of southern \*Powys. Powys, which covered much of mid- and north-east Wales, was split at the end of the 12th cent. and the south (Powys Wenwynwyn), separated from the north (Powys Fadog), was the basis for the county in the form of the Norman lordship of Powys, together with the crown lordships of Montgomery, Cydewain, Ceri, and Caus. The English name comes from the French home of the early conqueror, Roger de Montgomery.

Montgomeryshire comprises the eastern sloping plateaux of the Cambrian mountains, broken by a series of valley lowlands along the river systems of the river Severn and its tributaries, the Banwy, Vyrnwy, and Clywedog. However, it extends across the mountain massif to include part of the western flowing Dyfi drainage. The deeper upper parts of the valley systems have been used to create reservoirs for water supply for north-west England, notably Lake Vyrnwy (1880–90) for Manchester. The more recent

Llyn Clywedog (1968) is a regulator of river flow for downstream extraction. There was an early woollen industry in the towns of the Severn valley, and its demise, together with the closure of lead-mines and greater capitalization of agriculture, led to extensive depopulation. In response, Newtown was developed from 1967 under the New Towns Act and has a range of light industry.

Montgomery is pre-eminently border terrain; every aspect registers an east to west transition whether it be landscape, farming, or culture. Welsh is spoken by 23.3 per cent of the population but characteristically ranges from 4.6 per cent at Church Stoke on the border to 68.3 per cent at Llanbrynmair in the extreme west. In 1974 Montgomeryshire became a district in the county of Powys and was incorporated in the unitary authority of Powys in 1996. The population in 1991 was 51,527. HC

**Montrose, James Graham, 1st marquis of** [S] (1612–50). Though his activities were necessarily on a small scale, Montrose was the most brilliant commander on the royalist side during the Civil War and a ray of hope for a sinking cause. He inherited the earldom in 1626 when he was 14 and spent the years 1633–6 in continental travel. In 1639 he joined the covenanters but changed sides, and spent several months in 1641 in confinement in Edinburgh castle. He joined the king at Oxford, was raised to marquis in 1644, and appointed to command the king's forces in Scotland, such as they were. Montrose rode north from Carlisle with two companions and put together a scratch force, never many more than 4,000 men, composed mainly of Irish and Macdonalds. His speed of movement, courage, and tactical skill won him a series of remarkable victories against the odds—at \*Tippermuir (September 1644), \*Aberdeen (September 1644), \*Inverlochy (February 1645), \*Auldearn (May 1645), \*Alford (July 1645), and \*Kilsyth (August 1645). After Inverlochy, where his great enemy \*Argyll watched in discomfort, Montrose wrote to the king: 'I doubt not before the end of this summer I shall be able to come to Your Majesty's assistance with a brave army.' It was an illusion. No man could defy the odds for ever. At \*Philiphaugh in September 1645 he was surprised and beaten, and forced to flee abroad. Returning in 1650 with a forlorn hope, he was defeated at \*Carbisdale, betrayed, and hanged at Edinburgh in May. JAC

**Montserrat** is one of the Leeward Islands and a British colony. It was sighted by Columbus in 1493, disputed between France and Britain, and finally confirmed to Britain by the treaty of \*Versailles in 1783. It relies mainly upon tourism, cotton, and light industry, but was severely damaged by volcanic eruption in 1995. JAC

**Moore, Henry** (1898–1986). One of the greatest sculptors of the 20th cent. Drawing inspiration from primitive sculptures and Italian frescos, he intended his work to have 'a pent-up energy, an intense life of its own'. Moore taught at the Royal College of Art 1925–32 and at the Chelsea School of Art 1932–9. At about the same time as his first public commission, the *North Wind* relief on the London Transport Building (1928), Moore produced his first reclining figure. This theme,

together with that of mother and child, was repeated throughout his life. During the 1930s, Moore's style tended to the abstract and was disliked by traditionalists. But his series of drawings *Shelter*, of people sleeping in London Underground stations during the Second World War, brought him popular recognition. *Madonna* (1944) for St Matthew's church, Northampton, and *Three Standing Figures* (1947–8) in Battersea Park (London), resulted in many further commissions. He was given the OM in 1963. JC

**Moore, Sir John** (1761–1809). Soldier and military reformer. Moore was educated mainly on the continent before entering the army in 1776. In Corsica, on 10 August 1794, he led the storming party at the siege of Calvi. After an expedition against St Lucia in 1796 he was appointed governor of the island for a time. Moore distinguished himself in Egypt during the night-time landing operation at Aboukir on 22 March 1801. As a military reformer, Moore successfully developed light infantry tactics and training methods. In 1808 he assumed command of the British forces in the Peninsular War, but was killed at \*Corunna (16 January 1809) after conducting a hazardous but successful retreat. Napoleon commented: 'His talents and firmness alone saved the British army [in Spain] from destruction; he was a brave soldier, an excellent officer, and a man of talent.' RAS

**Moray, kingdom of.** Morayshire, the county centred on Elgin from the 12th cent. to 1975, was only a small part of the kingdom of Moray, which originally extended from the west coast facing the Isle of Skye across to the river Spey in the east, and from probably the river Oykel in the north to the central highlands in the south. The kingdom was created by the Gaels of northern Argyll, who advanced up the Great Glen and, with the Norse from Orkney, overcame the Picts in northern Scotland in the 9th cent. Throughout their history the kings of Moray were faced by powerful enemies to the north and south. In the north they struggled to resist the Norse earls of \*Orkney, eager to control the rich woodlands of northern Scotland as a supply of timber for their ships. In the south they strenuously resisted the ambitions of Scottish kings, who sought to make Moray part of their realm. The most famous king was \*Macbeth, who successfully turned the tables on the Scottish kings in the south and became king of Scots after killing \*Duncan I in 1040. Even though Duncan's son \*Malcolm (III) killed Macbeth in 1057, it was \*Lulach of the Moray dynasty who became king of Scots. Malcolm slew Lulach the following year, but seemingly had to recognize Lulach's son \*Mael Snechta, king of Moray, as heir to the Scottish throne. Only when Malcolm defeated Mael Snechta in 1078 can it be said that Moray's chances of dominating the Scottish kingdom were brought to a halt. Moray's hopes of regaining power were not extinguished, however. In 1130 Angus, Lulach's grandson, led an army south, only to be defeated decisively at Stracathro (25 miles north-east of Dundee). Despite conquest, colonization, and expulsion, the leading families of Moray continued to resist the kings of Scots until 1230. The days were over, however, when Scotland was a patchwork of regional kings. The king of Scots, the greatest regional power in northern Britain, brought all of the mainland north of the Tweed and

Solway within his realm, and Moray was dominated by a Fleming family, introduced by David I (1124–53) to pacify the area, who took Moray as their name. DEB

**Moray, Thomas Randolph, 1st earl of** [S] (d. 1332). Randolph was a nephew of Robert I Bruce and a stalwart of his regime. Captured fighting for Bruce at \*Methven in 1306, he changed sides but was captured again, this time by Bruce's men. He rejoined Bruce and, after this unpromising start, became one of his trusted allies and most reliable commanders. He was created earl in 1312.

In March 1314 he seized Edinburgh castle from the English in a brilliant night attack and fought prominently at \*Bannockburn. Next he campaigned in Ireland with Edward \*Bruce. He won more victories over the English at \*Myton in 1319 and at \*Byland in 1322. He was chief negotiator for the treaty of \*Corbeil in 1326 which laid the foundations for the 'Auld Alliance'. On the death of Bruce he acted as regent 1329–32 for the young David II. His standing is shown by the fact that his was the second name to appear on the declaration of \*Arbroath in 1320. JAC

**Moray, Alexander Stewart, 5th earl of** [S] (1634–1701). Moray was a descendant of Regent \*Moray, himself an illegitimate son of James V. He rose to high office after the Restoration, campaigning against the covenanted. From 1675–6 he was justice-general [S], a lord of the Treasury in 1678, and served as secretary of state [S] from 1680 to 1689. During the reign of James VII he was appointed commissioner to the Parliament summoned in 1686 to give relief to the Catholics and he subsequently announced his own conversion. In 1687 he received the Thistle. He was deprived of all his offices after the Glorious Revolution and was fined in 1693 for not attending Parliament. JAC

**Moray, James Stewart, 1st earl of** [S] (1531–70). Illegitimate son of James V and thus half-brother of Mary Stuart. As Lord James Stewart, he played a key role in the protestant rebellion of 1559–60, subsequently dominating the provisional government which negotiated Mary's peaceful return to Scotland in 1561. Rewarded in 1562 with the earldom of Moray, his policy of 'amity' with England was destroyed by Mary's marriage to \*Darnley in 1565, which pushed Moray into rebellion and temporary exile in England. Restored to favour the following year, he was judiciously absent abroad during the crisis triggered by Mary's marriage to \*Bothwell. On his return in August 1567, he was made regent for the infant James VI. His defeat of Mary at \*Langside in May 1568 lent his regime some credibility, but support for the Marian cause remained strong. In January 1570 he was assassinated by the Hamiltons, staunch supporters of the exiled queen. RAM

**Moray, James Stewart, 2nd earl of** [S] (c.1566–92). Regent \*Moray, assassinated in 1570, left a young daughter who was recognized as the countess of Moray. In 1581 she married the son of Lord Doune [S], who was in turn recognized as earl of Moray. He succeeded to the barony in 1590. He was murdered in a fray by his rival \*Huntly. The ballad 'The Bonny Earl of Moray' suggests that he was too much the favourite at court of \*Anne, James VI's new queen. JAC

## Moray

**Moray, Sir Robert** (c.1609–73). Moray, the son of a Scottish laird from Perthshire, was soldier, scientist, and politician. He spent many years in the French service, acting as go-between for Charles I, who knighted him in 1643. He took part in \*Glencairn's rising in Scotland in 1654 before returning again to the continent, where he practised music and chemistry. After the Restoration, Moray took a prominent part in the foundation of the \*Royal Society, acted as president, and looked after Charles II's private laboratory in Whitehall. Until 1670 he also collaborated with \*Lauderdale in the government of Scotland where, sympathetic towards the presbyterians, he exercised a moderating influence on government policy. But most of his time was spent in London at the court. \*Burnet, \*Pepys, and \*Evelyn wrote of him with affection and respect, and John \*Aubrey paid a glowing tribute to his disinterestedness: 'he was far from the rough humour of the camp breeding, for he was a person the most obliging about the court, and the only man that would doe a kindnesse gratis upon an account of friendship . . . as free from covetousness as a Carthusian.' JAC

**Morcar, earl of Northumbria** (c.1040–c.1090). Morcar was from the Mercian nobility, grandson of \*Leofric and his wife 'Lady \*Godiva', and son of \*Elfric, earl of East Anglia. The family was in rivalry with the Godwines. In 1065 Morcar and his brother Edwin joined a rebellion in Northumbria against Harold Godwinson's brother \*Tostig, and Morcar replaced him as earl of Northumbria. When Tostig returned with \*Harold Hardrada in 1066, Edwin and Morcar gave battle but were defeated at \*Fulford, near York. Harold retrieved the situation by killing Tostig and Harold Hardrada at \*Stamford Bridge, but Morcar and Edwin did not march south with him to \*Hastings, possibly because their forces were shattered. On Harold's death, the brothers tried to lead a resistance, failed, and submitted to William. In 1068 they rebelled and were again obliged to submit. After a further unsuccessful revolt in 1071 Morcar took refuge in the Isle of Ely, surrendered, and was imprisoned in Normandy. He was alive at the Conqueror's death in 1087 but Rufus returned him to prison and no more was heard of him. His elder brother Edwin was killed by his own men in 1071. JAC

**More, Hannah** (1745–1833). One of the best-known and most prolific polemicists of her day, Hannah More was born at Stapleton, near Bristol, and joined her sisters in running a school. She became acquainted with London literary circles and was a particular favourite with Dr \*Johnson. A poem *Sir Eldred* was well received (1776) and her play *Percy* had a good run at Covent Garden in 1777, thanks to David \*Garrick's support. Her growing evangelical interest was evident in *Thoughts on the Importance of the Manners of the Great to General Society* (1788). From her cottage at Cowslip Green, near Blagdon, south of Bristol, she started in the 1790s Sunday schools for the Mendip villages: 'I allow of no writing for the poor,' she told \*Wilberforce in a memorable phrase. Meanwhile the outbreak of the French Revolution gave her a chance to write simple and didactic tracts, in which the poor were invited to count their blessings, and which sold and were distributed in vast quantities.

She died a wealthy woman, leaving her money to religious institutions and charities. JAC

**More, Sir Thomas** (1478–1535). More, lawyer, humanist, and amateur theologian, held great intellectual and moral ascendancy over Henrician England, until his defence of the Roman catholic cause brought about his downfall. He practised common law in the 1500s, and married in 1505 despite previous plans to take holy orders. His legal and political career prospered in the 1510s and 1520s: he became under-sheriff of London (1510), master of requests (1518), and Speaker of the Commons (1523). He was knighted in 1521, and succeeded \*Wolsey as lord chancellor in 1529. Meanwhile, More became a celebrated enthusiast of humanism, and friend not only of other English scholars but also of Desiderius Erasmus. His \**Utopia*, which described an imaginary land whose inhabitants shaped their lives by natural reason, made his literary reputation, though scholarship has never been able to agree on the book's real intention. More's later religious writings had no ambiguities. He advised on Henry VIII's *The Assertion of the Seven Sacraments* against Martin Luther and rebutted Luther's refutation (1523). Licensed from 1528 to read heretical books and refute them, he wrote long, fervent catholic ripostes against William \*Tyndale and Simon Fish. The king's first marriage-crisis placed More in a quandary. He tried to persuade Henry to take \*Catherine back, and to persecute heretics, until failure forced his resignation from office in May 1532. When required to swear an oath to the new royal succession in 1534, More refused, but claimed that his silence over his reasons could not be construed as 'malicious' denial of royal claims. He was imprisoned and interrogated until one witness, Richard Rich, convinced himself that More had really denied the royal supremacy. Swiftly tried and condemned on perjured evidence (as he claimed), More finally spoke out in defence of the papacy, and was executed on 6 July 1535. He was canonized in 1935. EC

**Morgan, Sir Henry** (c.1635–88). Morgan was a buccaneer and adventurer in the Spanish main. He came from Glamorgan and was a nephew of Colonel Edward Morgan, lieutenant-governor of Jamaica, who was killed in 1665. The Caribbean was a scene of permanent warfare between the English and Spaniards. Morgan joined an expedition in 1666 led by a buccaneer, Edward Mansfield: when he was killed in action, Morgan was 'chosen' to lead the raiders. They captured Porto Bello, slaughtered the Spanish garrison, and ransacked the town—on the pretext that the Spaniards were preparing an invasion of Jamaica. Next Morgan plundered parts of Cuba, including the town of Maracaybo, and was appointed naval commander in the area, to be paid in plunder. He proceeded to capture Panama despite a pitched battle by its defenders. His atrocities caused his recall to England, but he gained favour with Charles II, was made lieutenant-governor of Jamaica in 1674, and knighted. He spent the rest of his life there as a stern defender of law and order. Ferocious and fearless, Morgan was a brilliant guerrilla leader and a scourge to the Spaniards.

JAC

**Morgan, William** (c.1545–1604). Bishop and Welsh scholar. Morgan was born in Cardiganshire and sent to St John's College, Cambridge. In 1575 he was made vicar of Welshpool, moving in 1578 to Llanrhaidadr Mochnant. He then undertook to complete the translation of the Bible into Welsh, begun by William \*Salesbury. The edition, including a revision of Salesbury's New Testament, appeared in 1588. Morgan was made bishop of Llandaff in 1595 and promoted to the slightly wealthier see of St Asaph in 1601. JAC

**Morgannwg, kingdom of.** The immediate post-Roman kingdom in south-east Wales was Glywysing, ruled over in AD 600 by Meurig ap Tewdrig. At a later period, it gave way to the kingdom of Morgannwg, which excluded Gwent, and may have been named after Morgan Hen ('Morgan the Old'), who died 974. The area was quickly penetrated by the Normans after 1066 and Robert \*Fitzhamon established the lordship of Glamorgan, beginning his castle at Cardiff c.1080. JAC

**Morley, John** (1838–1923). Journalist and politician. The son of a north country surgeon, and educated at Oxford, Morley used free-lance journalism as a stepping-stone to the editorship of the *Fortnightly Review* (1867–82), which under his direction became a major vehicle for the propagation of a new species of radical Liberalism, campaigning against jingoism, imperial adventures, repression in Ireland; it was Morley, together with Joseph \*Chamberlain and Charles \*Dilke, who formulated the so-called Radical Programme (1885). Elected to Parliament in 1883, Morley, now a Home Ruler, broke with Chamberlain over Ireland, serving as Irish secretary in Gladstone's last ministry (1892–4) and under Rosebery (1894–5). Morley denounced British policy in South Africa at the time of the Boer War, but virtually retired to write a much-acclaimed life of \*Gladstone. As a member of the Liberal governments of 1905–14 he was responsible for the reform of the British administration of India, resigning in 1914 over the issue of war with Germany. GA

**mormaers** were provincial rulers in the Gaelic kingdom of Scotland from the 10th to the 12th cents. The original area of the kingdom, stretching east of the Grampians from the Forth in the south to the Spey in the north, was divided into a patchwork of provinces ruled by a mormaer. They raised the men of their province for the defence of the kingdom, collected tribute from the province's peasants, and administered justice, assisted by the lawman of the province. The provinces were not large. Modern Perthshire included the provinces of Strathearn, Atholl, most of Menteith, and the Gowrie; Aberdeenshire included Mar and Buchan; the province of Fife was (at least by c.1100) confined to east Fife. South of the Spey only Angus and the Mearns corresponded to later counties. Outside the kingdom's core area the mormaers of Ross in the north of Scotland and the Lennox in the south (focused on Dumbarton and Loch Lomond) may have been created in the 12th cent.; while the ruler of \*Moray, an abnormally large province, stretching from Glenelg on the west coast to the Spey in the east, called himself a king, and was only referred to as a mormaer by

the king of Scots or his allies. Mormaers are first mentioned in 918, soon after the emergence of the new kingdom of the \*Scots. Some provinces, such as Angus, Strathearn, and the Gowrie, are almost certainly no older than the 10th cent. It might be supposed, therefore, that the position of mormaer was a creation of the new Gaelic kingdom of the Scots. A linguistic case, however, has been put for regarding *mormaer* as a Pictish word meaning 'great steward', and that it belonged to a Pictish system of local administration. The argument is complicated by *mormaer's* later philological development in Gaelic which can more readily be explained if *mormaer* was originally Gaelic 'sea steward', rather than a borrowing from a Pictish word meaning 'great steward'. It is true that mormaers are found inland, but an analogy may be made with Carolingian border officials 'margrave' and 'marquis' which became titles for members of the nobility far away from a frontier. It is possible, therefore, that mormaers were created c.900 as guardians against Scandinavian raids. In the 12th cent., chiefly by virtue of adopting primogeniture and 'military feudalism', mormaers developed into provincial earls. DEB

**Mormons**, or the Church of Jesus Christ of Latter Day Saints, result from visions experienced in Manchester, NY, during the 1820s by Joseph Smith (1805–44), enabling him to locate and translate *The Book of Mormon* (1827), a history of American religion from Babel to the 5th cent. AD, written on gold tablets in 'reformed Egyptian' and deciphered by sacred crystals which Smith had to return to the angel Moroni on completion. There followed seventeen years of sectarian vagabondage: founded in 1830, the sect settled in Kirtland, Ohio (1831–7), Jackson, Missouri, and Nauvoo, Illinois (1839), reaching Great Salt Lake Valley, Utah, in 1847. In that time twelve apostles were appointed, Smith became first president, received his revelation about plural marriages (1843), and was killed in prison. Mormonism's survival, therefore, owes most to Smith's successor Brigham Young (1801–77), who shaped Utah into a model state (polygamy was abolished in 1890). Mormonism had a recognizably evangelical core (acceptance of Scripture, faith in God and Christ, repentance, baptism as preparation for the gift of the Spirit), with a millennialist skin—belief in the Second Coming and the charismatic signs of the primitive church. *The Book of Mormon*, however, adds another dimension: baptism for the dead, securing heaven for the ancestors of Mormons; marriage binding beyond death; God as an exalted man, and Christ as a forerunner of Joseph Smith. The whole was expressed in lives of strenuous simplicity and aggressive missionary endeavour. The first Mormon missionaries reached England in 1837. Their methods were foolproof. Utilizing existing networks, they reached respectable artisans through sympathetic \*baptist or \*congregational ministers. Since the imminent Second Coming would be in America, converts made their way to Utah rather than form local congregations. Consequently few British Mormon churches can be traced to these early meetings and most have been founded since 1945. CB

**Morris, William** (1834–96). Poet, artist, craftsman, and socialist, Morris was educated at Marlborough and Oxford. At

## Morrison

first intended for the church, he changed to study architecture and then became a painter under the influence of \*Rossetti. He quickly realized he had no great talent for painting but that he could design, and in 1861 founded Morris & Co. to produce wallpapers, furnishings, and stained-glass windows. He raised the standards of English design and craftsmanship and through his Kelmscott Press, founded 1890, had a similar effect on book design and printing. A founding member of the Socialist League, many of his later writings were anti-industrialist, supporting a return to handicraft. In 1877, Morris founded the Society for the Protection of Ancient Buildings. JC

**Morrison, Herbert** (1888–1965). Labour Party politician and statesman. After he became secretary in 1915, Morrison's organizational skills accelerated the steady rise of the London Labour Party. Mayor of Hackney 1920–1, London county councillor from 1922, and MP for South Hackney in 1923–4, 1929–31, 1935–45 (and Lewisham 1945–59). Morrison led Labour to victory in the 1934 LCC elections. The culmination of his London-based successes was the 1951 Festival of Britain. After a brief spell as minister of supply (May–October 1940), for most of the wartime coalition he served as Churchill's high-profile and popular home secretary (1940–5). In the post-war Labour government, Morrison played a key co-ordinating role as lord president and leader of the Commons (1945–51) before an unhappy tenure as foreign secretary (March–October 1951). His 1931 London Passenger Transport Bill (whilst minister of transport 1929–31) provided the 'public corporation' model of nationalization adopted by the \*Attlee government; however after 1947 he urged 'consolidation'. Despite serving as Attlee's deputy for a decade (and having a sounder judgement over the timing of the 1950 and 1951 elections), Morrison was defeated in the Labour leadership contest in 1955, as he had been in 1935. SC

**mortality, bills of.** Weekly official returns of the deaths (later, also baptisms) in 109 London parishes, published by the Company of Parish-Clerks from 1592, probably prompted by the plague but limited to Anglicans in parish burial-grounds. Diseases and casualties for both sexes were distinguished by 1629, but the ignorance of the searchers, unreliable and venal 'antient matrons' who reported the cause of death to the parish clerks, occasioned notoriously imprecise diagnoses and distinctions. The figures nevertheless enabled John Graunt to compile the first known life table (1662). A national civil vital registration system was not established until 1837. ASH

**Mortimer, Edmund, 3rd earl of March** (1352–81). March inherited at the age of 8 and married a daughter of Lionel, duke of Clarence, second son of Edward III, who brought him vast possessions, particularly in Ireland. In 1377, when Richard II succeeded as a child, March was a member of the Regency Council and was influential both in Parliament and in the field, especially in Scottish matters. From 1379 he served as king's lieutenant in Ireland but died in Cork. Through his marriage, March established a family claim

to the throne. His great-grandson was Richard, duke of \*York, whose son gained the throne as Edward IV. JAC

**Mortimer, Edmund, 5th earl of March and Ulster** (1391–1425). Mortimer was the king's ward after the death of his father Earl Roger in 1398; he was kept in Henry IV's family circle. Potentially a valuable pawn because of his royal blood, he was apparently too amiable and unambitious to worry the Lancastrian establishment. He disclosed to Henry V the treasonable schemes of his brother-in-law Richard, earl of \*Cambridge. Until Henry's death, Mortimer was regularly employed, without distinction, in the French war. In 1424, Henry VI's council appointed him lieutenant of Ireland, where he soon died. Richard, duke of \*York, was his heir. RLS

**Mortimer, Roger, 6th Baron Wigmore** (c.1231–82). Mortimer was one of the most powerful marcher barons of Henry III's reign and preoccupied with resisting Welsh advance. His mother was a daughter of \*Llywelyn ab Iorwerth and he also inherited great estates through his marriage to a daughter of William de Braose. He succeeded to the title in 1246. At the outset of the political struggle in 1258, Mortimer stood with the baronial opposition to Henry III. But de \*Montfort's *rapprochement* with \*Llywelyn ap Gruffydd, with whom Mortimer was constantly at feud, caused him to change sides. He fought with the losing royal army at \*Lewes in 1264 and subsequently helped Prince Edward to escape captivity and take refuge at Wigmore. He took a leading part in de Montfort's defeat at \*Evesham in 1265, sending his head as a grisly trophy to his wife at Wigmore. Thereafter Mortimer worked closely with Edward, as prince and king, much involved in sometimes desperate campaigning against Llywelyn in the 1270s. JAC

**Mortimer, Roger, 1st earl of March** (c.1287–1330). A lord of the Welsh march, with major interests in Ireland, Roger Mortimer was one of the rebels who surrendered to Edward II in 1321. He made a dramatic escape from the Tower of London in 1324, and went into exile in Paris; it is probably there that he became Queen \*Isabella's lover. He was at her side during the invasion of 1326, and after the deposition of Edward II early in 1327 he, with the queen, dominated government until 1330. He became earl of March in 1328, and had no reservations in displaying his power, wealth, and position. This regime proved to be as corrupt and incompetent as that of the \*Despensers which it succeeded, and in 1330 in a remarkable coup the young king, Edward III, with a small group of followers seized Mortimer at Nottingham. His execution followed trial in Parliament. MCP

**Mortimer, Roger, 4th earl of March and Ulster** (1374–98). Mortimer was a great-grandson of Edward III through his mother Philippa, sole heiress of Edward's second surviving son Lionel, duke of Clarence, whose wife was heiress to the earldom of Ulster. As his father died in 1381, Mortimer spent many years in wardship. He won a reputation for knightly courage, liberality, and religious and moral laxity. He was killed in Ireland while acting as the king's lieutenant. The legend that in 1385 Richard II recognized Mortimer as

his heir to the throne comes from tainted sources and is otherwise improbable. RLS

**Mortimer's Cross, battle of**, 1461. The young earl of March (the future Edward IV) was at Gloucester when his father was defeated and killed at \*Wakefield. He marched north to intercept a strong Lancastrian force under the earl of Wiltshire and Jasper \*Tudor, earl of Pembroke, whom he defeated on 2 February at Mortimer's Cross, 4 miles south of Wigmore. On the morning of the battle, the Yorkists claimed three suns in the sky as a good omen. This was Edward's first important victory. Owen \*Tudor, Pembroke's father and grandfather of the future Henry VII, was taken prisoner in the fight and beheaded in Hereford market-place. JAC

**Mortmain, statute of**, 1279. Mortmain refers to property held by a 'dead hand' and therefore inalienable. Kings and barons objected to persons granting their land to a religious institution and receiving it back again, having shed, in the process, their military and other feudal obligations. The provisions of \*Westminster (1259) declared against alienation of land without the lord's permission. Edward I's statute of 1279 forbade such transfers on pain of forfeiture, to the chagrin of the clergy. Loopholes in the statute were found and repeated efforts were made to block them. After the Reformation, bequests were more likely to be made to charities or educational establishments, and exceptions to the prohibition of mortmain were made in favour of Oxford and Cambridge colleges, and trusts like the British Museum. JAC

**Morton, James Douglas, 1st earl of** [S] (d. 1493). Made earl of Morton by James II (1458). Although married to Joanna, sister of James II, Morton took little part in affairs of state. However he was briefly associated with the Kennedy faction, which controlled the minority government of James III between 1463 and 1466. He was also on the assize that forfeited Robert, Lord \*Boyd, and his rival faction in 1469, and possibly gave support in their fall. Morton frequently attended Parliament, but was hardly ever at court. He was one of the few magnates to remain loyal to James III in both the crisis of 1482 and that of 1488, although his son John, later 2nd earl, was involved with the treasons of Alexander, duke of \*Albany, in 1482. He showed no ill-will towards the regime of James IV, attending Parliament almost annually until his death. RJT

**Morton, James Douglas, 4th earl of** [S] (c.1516–81). The position of regent to young James VI of Scotland was not an enviable one. \*Moray, the first, was shot in 1570; \*Lennox was stabbed in 1571; \*Mar lasted a year before dying unexpectedly, with poison rumoured; Morton was the fourth and last, and had exercised effective power during the two previous regencies. He succeeded to the earldom in 1548, having married a daughter of the 3rd earl in 1543. In 1548 he was captured by the English and held in the Tower until 1550. He made useful contacts and his subsequent policy favoured an English alliance and support for the reformed religion in its English episcopal form. After Mary's return from France in 1561, Morton played an increasingly important role, first as chancellor [S] 1562–6 and again 1567–73. He took a leading

part in the murder of \*Rizzio, an equivocal one in the murder of \*Darnley, but in 1567 led the opposition to Mary and \*Bothwell, defeating their supporters in 1568 at \*Langside. He succeeded Mar as regent in 1572 and consolidated his position when Mary's supporters in Edinburgh castle were forced to surrender in 1573. His strong policy antagonized nobles and kirk alike, and in 1578 he was overthrown by \*Atholl and \*Argyll. Elizabeth's intervention afforded him a shaky return to office, though scarcely to power, until in 1580 he was charged with Darnley's murder and beheaded in 1581. A formidable man, Morton collected superlatives—greedy, grim, lewd, cruel—but his few years in power gave Scotland a little stability in the difficult early years of James VI, and he made a determined attempt to stamp out border raiding. JAC

**Morton, John** (c.1420–1500). Cardinal. Morton was one of the greatest ecclesiastical statesmen of the 15th cent. He came from Dorset and went to Balliol College, Oxford. A useful ecclesiastical lawyer, he advanced rapidly under the patronage of Archbishop \*Bouchier but, as an adherent of the Lancastrians, fell into disfavour after \*Towton in 1461. He escaped to the continent, returned with \*Warwick in 1470, and after the Lancastrian disaster at \*Tewkesbury in 1471 made his peace with Edward IV. In 1473 he was appointed master of the rolls and in 1479 bishop of Ely. During the short reign of Richard III, Morton moved into opposition and was again forced to flee the country, returning after Henry VII's triumph at \*Bosworth. Henceforth Morton was the mainstay of the new regime, becoming archbishop of Canterbury in 1486 and lord chancellor in 1487. In 1493 Henry obtained for him a cardinal's hat from Pope Alexander VI. The story of 'Morton's fork', which came from \*Bacon, credited him with financial rapacity, but he seems not to have had specific financial responsibilities. His extraordinary domination prompts comparison with \*Wolsey twenty years later. 'The very mother and mistress of wisdom', was Thomas \*More's assessment. JAC

**Morton, William Douglas, 6th earl of** [S] (1540–1606). Douglas was son of Sir Robert Douglas of Lochleven and, by his mother, a half-brother of the Regent \*Moray. He inherited the earldom of Morton in 1588 from a distant cousin. He was involved in the murder of \*Rizzio and in 1567–8 was in charge of Mary at Lochleven castle, from which she escaped with the help of his younger brother George. He fought with the anti-Mary forces at \*Langside in 1568 and remained a close supporter of his kinsman, the Regent \*Morton. A favourite at the court of James VI, he was commissioner to the Scottish Parliament in 1592 and 1593. JAC

**mortuary**. Formerly a gift of the second-best beast of a deceased parishioner to the incumbent of the parish church, later the second best of the moveable goods from the estate. Subsequently merely a payment, the 'Corse presente' was limited by statute to a maximum of 10 shillings (1529), with many exemptions, while remaining lawful to certain Welsh bishops and the archdeacon of Chester on the death of a priest within their respective jurisdictions. The custom persisted sporadically into the 18th cent.; the term now applies

more usually to a place for the temporary reception of the dead. ASH

**Mosley, Sir Oswald** (1896–1980). Labour politician, orator, and fascist. Born into the landed aristocracy and educated at Winchester, Mosley served with distinction during the Great War. From 1918 to 1924 he sat as MP for Harrow, first as a Conservative and then as an Independent. In 1924 he joined the Independent Labour Party, and was Labour MP for Smethwick 1924–31. Mosley epitomized the impatience of post-1918 youth with conventional party politics, which he felt was incapable of dealing with social and economic problems. In Labour he affected to see 'the forces of progress' as opposed to 'the powers of reaction', but as a member of the Labour government of 1929 he became disillusioned with its unwillingness to challenge Treasury orthodoxies, and was lured by the attractions of fascism as an ideology and of anti-Semitism as a device. His British Union of Fascists (formed 1932) failed to win a parliamentary seat, and was proscribed in 1940, when Mosley himself was interned. GA

**Mothers' Union.** Church of England women's organization, founded in 1876 by Mary Sumner, wife of a Hampshire rector, originally as a parochial body aiming to uphold 'the sanctity of marriage' and to nurture young families in a Christian environment. Having developed into a diocesan organization by 1885, it spread rapidly, launched its own journal, formed a central council (1895), and was granted a royal charter (1926); the first overseas branch was founded in 1897. It now operates throughout the Anglican Communion, admitting spinsters, men, and divorcees, and continues to promote stable family life, with active involvement in many social concerns. ASH

**motor-cycle racing.** Daimler's motor-bicycle of 1885 could reach 12 m.p.h. Britain lagged behind France and Germany in the development of racing at first but in 1907 Brooklands was opened and the first Tourist Trophy race in the Isle of Man was held. International competition was organized by the Fédération Internationale des Clubs Motor-cyclistes (FIM). Speedway racing was introduced into Britain from America in the 1920s and a league started in 1929. After considerable vicissitudes, it is now re-established and organized by the Speedway Control Board. JAC

**motor industry.** Manufacturing in Britain began during the 1890s in small workshops often in association with bicycle production. Business grew rapidly so that by 1913 British firms produced annually 34,000 vehicles. Rolls at the top end of the market and Morris at the other were already established. Specialist firms supplied many components for vehicle-building, including batteries, castings and sparking plugs, upholstery, tyres for wheels, and glass for wind-screens and windows.

During the 1914–18 war technological developments made possible supplies of powerful and more reliable vehicles. After the war motor vehicles took an ever-growing share of road transport. The first mass-production car-builder in Britain was Ford's, which initially assembled imported kits from the USA. However the company soon found it advantageous to manufacture in Britain cars, vans, and lorries

specially designed for the British market. Assembly-line methods for quantity production were adopted in the late 1920s by Herbert Austin and later by other British companies. During the 1930s the motor industry became the leading source of growth in the economy. In 1939 the world war gave additional impetus by the demand for military transport and fighting vehicles (including aircraft) and agricultural tractors.

Between 1945 and 1955 motor manufacturing had a pivotal role in the British economy. For example, by 1950 it contributed to the balance of trade by exporting 52 per cent of output. This position of world leader was lost to overseas competitors whose investment was matched by attention to design, quality, and sales and marketing skills. Simultaneously the British industry suffered from managerial and labour relations problems; over-manning was accompanied by inadequate attention to delivery at home and abroad.

The British-owned motor industry responded to its difficulties with a variety of strategies. Mergers and amalgamations created the British Motor Corporation, formerly Austin and Morris (Nuffield) in 1952, but its organizational difficulties had not been resolved fully when the company merged with Leyland in 1968. Leyland itself evolved from being a commercial vehicle producer by mergers with Standard Triumph and Rover. The Rootes group suffered difficulties and was acquired by the American Chrysler company in 1967 but subsequently it joined Talbot, a part of the French Peugeot group. Competition from German and Japanese companies in home and overseas markets was increasing. Managerial and investment problems precipitated the nationalization of British Leyland in 1977. It was privatized, and renamed Rover after its sale to British Aerospace. During the 1980s the motor industry was characterized by investments by overseas companies. By 1994 mass-production car-makers in Britain included BMW-Rover, Ford, General Motors, Honda, Nissan, Peugeot, and Toyota.

The few firms remaining in British ownership specialize in high-performance or quality cars, for example, Aston Martin and Morgan. Rolls-Royce, for nearly a century the flagship of the British motor industry, was taken over by Volkswagen of Germany in 1998. IJEK

**motor racing** began soon after Karl Benz invented the petrol-driven car in 1885. The first race took place on 11–13 June 1895 from Paris to Bordeaux. Road racing was popular on the continent but in Britain it was banned, leading to the development of closed circuits on private land. In 1906 H. F. Locke King built a 2.75-mile concrete track at his Surrey estate called Brooklands. It featured long, steeply banked turns to allow cars to corner at speed. The first Grand Prix was held at Le Mans in 1906 and thereafter racing became more professional.

New courses sprang up in Britain: Donnington Park near Derby (1933), Silverstone in Northamptonshire (1948), Brands Hatch in Kent (1949), and Oulton Park in Cheshire (1953). The British Grand Prix was first held in 1948. Britain made little impact on the sport, apart from the famous Bentley victories between the wars. It was not until the introduction of the World Drivers' Championship in 1950,

which provided a focus for the sport, that Britain made her mark. That year saw the launch of British Racing Motors (BRM) in an attempt to match the European competition. In 1958 Stirling Moss, driving a Cooper, won the Argentine GP. Cooper-Bristols pioneered the lightweight mid-engined car and the victory was seen as a triumph for the small, entrepreneurial British engineering companies. British racing engines, first the Coventry Climax and then the Cosworth, powered cars designed by John Surtees, Ken Tyrrell, Colin Chapman, and Frank Williams. Chapman, the innovative Lotus designer, developed and refined the rear-engined car.

In the 1950s Stirling Moss and Mike Hawthorn became household names. Graham Hill won the Drivers' Championship in 1962 and 1968, Jim Clark in 1963 and 1965, and Jackie Stewart in 1969, 1971, and 1973. James Hunt and Nigel Mansell followed suit in 1976 and 1992, and Damon Hill in 1996.

RAS

**motorways** are segregated roads devoted to trunk motor traffic. Conceptualized by Lord Montagu of Beaulieu in 1906, and proposed by private member's bill in 1924, they were evaluated by a parliamentary delegation to Germany in 1937, and a toll-financed route from London to Birmingham was surveyed in 1938, but became a casualty of rearmament. This reservation for specific users broke the principles of open access to the king's highway, and required permissive legislation in the Special Roads Act of 1949, a little-known feature of the \*Attlee government's integrated transport policy. The first true motorway was the Preston bypass of 1958, precursor to the opening of the first part of the M1 in 1959. The network grew slowly: by April 1963, only 194 miles were open, reaching 957 by 1973, 1,731 in 1984, and 1,969 in 1994.

Motorways cut journey times, halving the coach journey from Birmingham to London in 1960, and reduced fatal accidents to less than half the level of ordinary roads. They spread the commuting zone, especially around London, and shifted industrial location to such as the 'M4 corridor', and in the cities divided communities in ways unknown since the railway. Urban routes led to protest, starting in London's western suburbs over the M4, visible in the destruction of southern Leeds in the 1970s, and developing with the green movement in the 1980s. Space and resource requirements for motorways, their access roads, and service areas were high, around £2 million per mile in 1970, and attracted increasing public criticism as the road transport lobby demanded further investment. In the 1990s, toll- and traffic-charged private finance has been employed to escape the constraints of 'public expenditure', a return to the project of 1938. JCH

**Mount Badon, battle of**, c. AD 500. \*Gildas, the chronicler of the decline of Roman Britain, attached great significance to this British victory, which he saw as giving 40 years of respite from the Saxon advance. The most likely sites are Badbury near Swindon, or Baydon near Lambourn, both on the Wiltshire downs. Gildas associated the victory with the resistance led by \*Ambrosius Aurelianus: \*Nennius in the early 9th cent. introduced the name of King \*Arthur and dated it 516. JAC

**Mountbatten, Louis Francis Albert Victor Nicholas, 1st Earl Mountbatten of Burma** (1900–79). Naval commander and statesman. Mountbatten was born to a family closely related to the house of Windsor. After a spectacular career in the navy and in London high society, in April 1942 he was made commander of combined operations against occupied Europe. In August 1943 he became supreme allied commander for south-east Asia and led the campaign to recover Burma and Malaya from the Japanese. After the war, he showed himself particularly sympathetic to the causes of indigenous nationalism. In December 1946 he was appointed the last viceroy of India to oversee the transfer of power, which took place on 15 August 1947. In 1949 he resumed his naval career and was at the Admiralty, as 1st sea lord, at the time of \*Suez, over which he clashed sharply with the \*Eden government. He was chief of the defence staff from 1959 to 1965. He was murdered in Ireland by the IRA. DAW

**Mountjoy, Charles Blount, 8th Baron** (c.1562–1606). The Blounts were a Derbyshire family, ennobled by Edward IV as Yorkist supporters in 1465. Charles Blount succeeded his brother in 1594. He had fought in the Low Countries under \*Leicester, who had knighted him in 1587, and commanded a ship in the defeat of the Armada. He seems to have made a good impression on Elizabeth and was given the Garter in 1597. His big chance came in 1600 after \*Essex, a political ally, had so signally failed to subdue \*Tyrone in Ireland. Mountjoy was appointed lord deputy and won a crucial victory in 1601 at \*Kinsale when the arrival of a Spanish expedition forced Tyrone to abandon the guerrilla tactics that had been so successful and give battle. By 1603 Tyrone had surrendered. James I reappointed Mountjoy lord-lieutenant of Ireland, made him master of the ordnance, and promoted him earl of Devonshire. A patron of authors, Blount appeared a coming man, but died of inflammation of the lungs at the age of 44. Since the legality of his marriage to Essex's sister was disputed, he left no legitimate heirs. JAC

**Mozambique** is a republic in south-east Africa. Colonized by the Portuguese, it gained independence in 1975. A long-running civil war ended in 1992 and in 1995 the country was admitted to the \*Commonwealth as a special case, because of its very close links with \*South Africa and \*Zimbabwe. It had suffered severely in recent years from the flooding of the Zambezi and Limpopo rivers. JAC

**Mugabe, Robert** (b. 1924). Zimbabwean nationalist statesman. Mugabe was a founder-member of the Zimbabwe African National Union (ZANU) in 1963, but was arrested and imprisoned in 1964. He was released in 1975, having become leader of ZANU the previous year. Almost immediately, as joint leader with Joshua \*Nkomo of the Patriotic Front, he took up arms against the white-minority government led by Ian \*Smith. He played a decisive role in the peace negotiation held in London in 1979, and after the elections held in the following year became Zimbabwe's first African prime minister. His relations with his rival Nkomo followed an uncertain pattern until 1987, when they agreed to form a coalition government with Mugabe as executive president. A

## Muggletonians

convinced Marxist, he hoped to establish a one-party state; however, with the collapse of communism in Eastern Europe he agreed to abandon his plan in 1991 but insisted on redistributing land to benefit Africans; tension has continued as a consequence of the occupation of farms by 'independence veterans'. KI

**Muggletonians**, or 'believers in the third commission', were the followers of Ludowicke Muggleton (1609–98) and his cousin John Reeve (1608–58), the recipients in 1651–2 of revelations for which Reeve was to be the messenger and Muggleton the mouthpiece. Their denial of the Trinity, their claim to be the two witnesses of Revelation 11, and such beliefs as that heaven's government was left to Elijah during the incarnation led to Muggleton's conviction for blasphemy in 1653–4 and again in 1677, and to the controversies with \*quakers reflected in William Penn's *New Witnesses Proved Old Heretics* (1672). Their followers survived into the 19th cent. with a reading room in London, but neither preaching nor worship except readings of the founder's writings. CB

**Munich agreement.** 'Munich' has entered the English language as a synonym for betrayal and weakness, and historians continue to debate whether it would have been wiser as well as more honourable for Britain to have risked war rather than to require Czechoslovakia to surrender the Sudetenland to Hitler. At the time (30 September 1938), the commonest feeling in Britain was one of relief. Perhaps the most realistic verdict—given the national unpreparedness for war—was that it was a 'necessary defeat'. Neville \*Chamberlain, however, was not negotiating primarily to buy time for rearmament but in the belief that peace was possible. CJB

**Municipal Corporations Act, 1835.** A corollary to the 1832 parliamentary reform was local government reform. As with the Poor Law, the Whigs prepared the way with a royal commission to investigate the existing municipalities. This apparent willingness to precede reform by systematic inquiry was less than complete. The well-paid post as secretary to the royal commission went to the government's principal electoral manipulator, Joseph \*Parkes, whose conduct of the inquiry was partisan. The subsequent Act swept away the existing heterogeneous borough constitutions and replaced them by a standard form of councils consisting of mayor, aldermen, and councillors elected by ratepayers. Provision was made for the establishment of the same system in urban areas like Manchester and Birmingham which were without proper municipal institutions, if local ratepayers approved. The powers of the new councils were narrowly limited and few of them showed much inclination to spend ratepayers' money in expensive schemes of local improvement. NMcC

**Munster** was ruled by the Eóganacht dynasty from the 7th to the mid-10th cent., who were then overshadowed by Dál Cais, to whom \*Brian Boru (d. 1014) belonged. By the 12th cent. Brian's descendants, the O'Briens, were ruling north Munster (Thomond) from their capital at Limerick, while the main branch of the Eóganacht, the MacCarthys, were ruling south Munster (Desmond) from Cork. The province

was directly affected by the Anglo-Norman invasion of 1169 which saw widespread colonization, the O'Briens and MacCarthys being confined in the far west. Munster was gradually shired in the 13th cent., and was dominated by powerful Anglo-Irish families such as the Poers (in Waterford), Barrys, Roches (in Cork), the Butler earls of Ormond (Tipperary), and the Geraldine earls of Desmond (north Kerry and Limerick), who became increasingly integrated into Irish society. The establishment of the presidency of Munster in 1570 helped restore English government there, but a Desmond revolt in 1579 led to its plantation by English protestant settlers, and the defeat of the Irish forces at the battle of \*Kinsale in 1601 meant the collapse of the Gaelic ascendancy throughout Ireland. The 18th cent. was marked by agrarian disturbances, especially those by the \*'Whiteboys', while Ballingarry, Co. Tipperary, was the scene of a futile rebellion by the \*Young Irelanders during the Great Famine in 1848. Munster was the focus of much of the guerrilla warfare that characterized the War of Independence, 1919–21. SD

**Murdock, William** (1754–1839). Inventor. Murdock was born in Ayrshire and spent almost all his life in the employment of \*Boulton and \*Watt's firm at Soho. For many years he represented them in Cornwall, where they had sold many pumping-engines, which he maintained. While at Redruth he succeeded in lighting his house by coal-gas and in 1802 there was a great gas illumination at Soho to celebrate the peace of \*Amiens. There were difficulties in obtaining a steady light with no objectionable smell but during the 1800s gas lighting was installed in a number of factories and Murdock read a paper on the subject in 1808 to the \*Royal Society. He was also interested in the possibility of steam locomotion, though his employers were far from encouraging, and he experimented with compressed air and steam guns. There is a bust of Murdock by \*Chantrey in Handsworth church (Birmingham), along with busts of James Watt and Matthew Boulton. JAC

**Murphy, Father John** (c.1753–98). Irish rebel. Murphy was a leader of the Wexford insurgents during the Irish rising of 1798. A local man, he studied in Spain, became a catholic priest, returned to Ireland in 1785, and became an assistant in the parish of Boulavogue. In May 1798 he raised rebellion, defeated some local militia, and advanced to Enniscorthy. Having established a camp on Vinegar Hill, just outside the town, the rebels occupied Wexford, defeating a small government detachment under Colonel Walpole. But an attempt on Arklow was beaten off and Vinegar Hill stormed. Murphy escaped to continue the struggle, hoping to find support among the colliers at Castlecomer in Kilkenny. His fate is not known for certain. He may have been killed in battle on Kilcomney Hill, but it is more likely that he was captured and hanged. JAC

**Murray, Andrew** (d. 1297). An undeservedly unsung hero of the \*Scottish Wars of Independence, he came to the fore in 1297, when most prominent Scots had submitted to Edward I. He master-minded widespread risings in northern Scotland, advanced south with his supporters, and joined

forces with William \*Wallace. Together they brilliantly exploited English tactical errors at the battle of \*Stirling Bridge (11 September 1297) by waiting until the enemy had begun to cross the bridge over the river Forth, and then pouncing to massacre the vanguard while the rest watched helplessly from the other bank. This was the first full-scale defeat inflicted by the Scots in battle with the English since the early 11th cent., and vital in keeping the cause of Scottish independence alive. Wallace went on to invade northern England, but Murray was soon dead, apparently from wounds sustained at Stirling. KJS

**Murray, Sir Andrew** (1298–1338). Guardian of Scotland, 1332 and 1335–8. A member of the powerful family of de Moravia, he became prominent in 1326 when he married the sister of Robert I. After the death of the earl of Mar at the battle of \*Dupplin (1332) Murray succeeded as guardian, but was captured by the English towards the end of the year. Released and returned to office in 1335, he rapidly showed his ability by relieving Kildrummy castle and defeating and killing David of Strathbogie at the battle of Culblean (30 November 1335); recovering Gowrie and the Mearns in 1336; and recapturing his ancestral castle of Bothwell in 1337. His leadership put heart into the Scottish resistance, which was somewhat demoralized by his early death in 1338. He was a guerrilla leader of genius, though criticized for the destruction inevitable in this kind of warfare. BW

**Murray, Lord George** (1694–1760). Jacobite general. A younger son of the 1st duke of Atholl, a Whig, but an opponent of the 1707 \*Union, Lord George returned from France to fight for the Jacobites in the '15 under the leadership of his eldest brother, the marquis of Tullibardine. Escaping to France after failing to secure an indemnity, he returned to Scotland with the Jacobite invasion of 1719. After further exile and service with the Sardinian army, he obtained a pardon and went back to Scotland.

He joined Prince Charles at Perth in August 1745. As lieutenant-general, he was the real Jacobite commander. To him goes the credit for victory at \*Prestonpans, for the retreat from England in the face of superior cavalry, and for the victories at Clifton and \*Falkirk. He fought bravely at \*Culloden, while disapproving of offering battle. He died in the Netherlands. BPL

**Muscovy Company.** See RUSSIA COMPANY.

**museums.** The foundation of museums was an offshoot of the great explosion of knowledge in the early modern period which stemmed from the invention of printing, the voyages of discovery, the new interest in the classical world, and the increase in literacy, and it forms part of the Enlightenment. It is the counterpart of the attempt to classify and explain phenomena which stimulated the publication of encyclopedias and dictionaries, and for years the term *museum* was used to signify a study or library.

It was not unusual for 16th-cent. rulers to have collections, often of a miscellaneous character, partly because they exchanged so many gifts. In Britain the royal family

rarely took the lead, but a number of private citizens were avid collectors. Sir Robert Cotton (d. 1631) concentrated largely on manuscripts but also collected coins and fossils. Sir Walter Cope, his contemporary, had an Indian canoe, an Egyptian mummy, and an African necklace made of teeth. John Tradescant opened his 'Ark' at Lambeth, charging sixpence admission, and his son published a catalogue of the curiosities in 1656, claiming a dodo and many non-European plants. A rival commercial collection was Robert Hubert's, near St Paul's, who claimed 'thousands of other rarities of nature'. This collection, though primarily a museum of oddities, was purchased by the \*Royal Society, which could not look after it and eventually gave it to the \*British Museum. Museums long retained their quirky and unusual character and \*Johnson defined them in the 1750s as 'repositories of learned curiosities'. Tradescant junior bequeathed his collection to Elias Ashmole, who left it to Oxford University. The Ashmolean Museum opened in 1683 in what is now the Museum of the History of Science, and the general public was admitted on payment. The Balfour collection in Scotland, handed over in 1697 to the University of Edinburgh had a less happy fate, and was neglected and dispersed.

The change from private cabinets to public museums, initiated by the Ashmolean, was continued in 1753 by the foundation of the British Museum. Sir Hans Sloane (d. 1753) had a collection of more than 100,000 specimens, many of them plants from the West Indies, which he had visited. He left it to the nation, and the new museum, supported by a lottery, also incorporated the Harleian and Cottonian collections. Although the public was admitted, it was on a very restricted scale, and the principal librarian in the 19th cent. defended Saturday and Sunday closing on the grounds that it kept out 'sailors and girls whom they might bring with them'.

A great increase in museums, national and provincial, followed. The National Museum of Antiquities of Scotland was founded in 1780, the Royal Scottish Museum in 1854, the two amalgamating in 1985. The Ulster Museum began in 1831, becoming the national museum in 1961. The National Museum of Wales opened in 1907. The \*Victoria and Albert Museum (1852) and the \*Science Museum at South Kensington were part of a great complex triggered by the \*Great Exhibition of 1851. Most of the national museums have branches: the Science Museum runs the railway museum at York and the Museum of Photography, Film, and TV at Bradford. In addition to the great national museums, municipal museums were founded, assisted by friendly legislation: an Act for encouraging the establishment of museums in large towns (1845) permitted the raising of a halfpenny rate. The Liverpool Museum opened in 1851, the Birmingham Museum in 1885. In the 20th cent. the emphasis was on specialist collections—the National Maritime Museum (1934), the Royal Air Force Museum (1963), and a host of smaller museums devoted to motor cycles, trams, cider, musical instruments, costume, and teddy bears. Museum complexes such as the Ironbridge Trust at Coalbrookdale and open-air museums like Beamish in Co. Durham have proved very successful. After 1945 there was a determined effort to make museums less forbidding, to remove the glass

cases and drawers, and to use displays, films, and hands-on working models. Many villages have their own splendidly idiosyncratic local collections, even if they are housed in huts and open only on Tuesday afternoons. JAC

**music, development of.** The history of British music is inevitably coloured by geographical, political, and social factors. Continental influences loom large, although at times, as in the 15th cent., a distinctive English voice can be heard and the influence becomes reciprocal. The traditional perception of British music—that of a Tudor golden age followed after the death of \*Purcell by near-terminal decline only halted by an 'English Renaissance' at the end of the 19th cent.—is unjust, stemming from a fruitless search for individual composers to rank beside Purcell, \*Elgar, or \*Britten rather than a willingness to value more general 18th- and 19th-cent. developments.

Early musical history in Britain is largely a matter for conjecture, for no music has survived. There is evidence from the 7th cent. onward that the harp was popular throughout Britain, remaining to this day the traditional Welsh instrument. It was a common form of accompaniment for \*minstrels, allowing the singer his own flexible accompaniment. Part-singing clearly existed by the 12th cent., when \*Gerald of Wales observed that the Welsh sang not in unison, as in other countries, but in 'as many parts as there are singers'. \*Bede tells of the use of Roman chant in the 7th cent., although the earliest extant liturgical manuscripts of polyphony are the two 11th-cent. Winchester tropers, containing two-part *organum* in which a free part is added note-against-note to an original plainsong. The organ was also used liturgically at this time, alongside solo and choral singing, whilst the most famous piece of English medieval music, the six-part canonic 'Sumer is icumen in', also has an alternative Latin text.

The Old Hall Manuscript, the earliest of several important 15th-cent. English manuscripts, contains primarily mass movements. Many pieces are, unusually, attributed to specific composers, including Leonel Power, \*Dunstable, and 'Roy Henry', probably Henry V. Note-against-note technique is again prominent, although canon and isorhythm (a structural principle applying the same rhythmic pattern to repetitions of a plainsong melody) are also employed. Around 1500 the Eton Choirbook, a collection of polyphonic antiphons and Magnificats for the chapel at Eton College, looms large in every sense, as its 23-inch by 17-inch format allowed it to be read from a lectern by the choir. As with the Old Hall music, consonance and sonority are all-important, but now textures are more complex, with intricate ornamental rhythms and a greater number of parts allowing a much wider pitch range. A similar massive style can be seen in contemporary Scottish music, most notably the five masses by Robert Carver with their granite-like blocks of harmony, while in secular music the carol was popular for its memorable, simple melodies and repeated refrains.

At the Reformation, Henry VIII's suppression of the monasteries and collegiate churches meant that cathedral choirs and the Chapel Royal became the main musical centres. The imposition of the \*Book of Common Prayer in 1549 was

accompanied by the publication of various metrical psalters, whose simple four-part harmonizations of psalm tunes allowed the vernacular texts to be heard easily. Nevertheless, Elizabeth I's catholic sympathies allowed composers such as \*Byrd to write much Latin church music, including three fine masses, alongside complex Anglican services. Imitation between the voices now becomes a basic structural principle, while many works, particularly those in Latin such as \*Tallis's *Lamentations*, are powerfully expressive.

This high-point in British music coincided with a rise in music printing, something that also contributed to the popularity of the English \*madrigal, a genre originally imported from Italy. Instigated by Yonge's *Musica transalpina* (1588), it flourished for the next couple of decades with works by Morley, Weelkes, Wilbye, and \*Gibbons (composers who were all primarily church musicians). The rise in amateur music-making is also reflected in the importance of instrumental music, many works of the period being published as 'apt for Viols and Voyces', allowing some or all the voices to be replaced or doubled by instruments. Music specifically for viol consorts became increasingly sophisticated, with elaborate contrapuntal fantasias or 'Fancies'. Complex solo lute and keyboard works became virtuoso showpieces, culminating in the brilliant sets of variations in the *Fitzwilliam Virginal Book*. John \*Dowland, the leading lutenist of his day, also raised the lute song to unsurpassed heights.

As with the Reformation, so the Civil War and the Restoration had a profound impact on music. Cathedral choirs were disbanded and organs dismantled, although, ironically, the puritan closure of public theatres in 1642 seems to have encouraged composers to experiment briefly with all-sung opera rather than the traditional mixture of spoken dialogue and music found in the Stuart \*masque. During his exile Charles II had acquired French tastes, and his Restoration encouraged strong continental influences in music. Pelham Humfrey and Purcell brought a new, incisive style of string music to the Chapel Royal anthem as violins replaced the old viols, much to the horror of John \*Evelyn, who felt it 'better suiting a tavern or a Play-house than a church'. Solo 'verse' sections exploited the virtuosity of singers, something also featured in the ode—celebratory music for court occasions or for St Cecilia's Day.

Continental music continued to loom large into the 18th cent., both in the opera-house, where \*Handel's success created a vogue for Italian opera, and in instrumental music, where the popularity of Corelli's sonatas and concertos influenced numerous composers, including Handel and Geminiani in England and John Clerk in Scotland. Amateur interest in music steadily increased. Instrumental tutors were published and glees (simple part-songs for male voices) became popular. Handel's oratorios appealed to an increasingly middle-class audience, and England led the way in the field of public concerts, held in both halls and pleasure gardens. The Bach-Abel concerts ran from 1764 to 1782, while the impresario Salomon brought Haydn to London in the 1790s and commissioned his last twelve symphonies.

Music flourished in the provinces as well as in London, with the establishment of the \*Three Choirs (c.1715), Birmingham (1768), and Norwich (1770) festivals, and the

Edinburgh Musical Society (1720). A flourishing tradition of amateur choral singing built on the popularity of Handel's oratorios, especially *\*Messiah*; the Huddersfield Choral Society was founded in 1836, while the première of Mendelssohn's *Elijah* (Birmingham, 1846) typified the trend for British commissions from leading European composers. John Curwen's tonic sol-fa method for sight-singing was much used in schools and by choirs, especially Welsh male-voice choirs. This lasting tradition was fostered by the *\*Eisteddfod*, a festival held annually since 1880 but whose origins go back to the medieval bards, which has provided a focus for a national cultural identity. Many other British competitive festivals grew up, some involving the new vogue for *\*brass bands*.

The upsurge in music publishing at the beginning of the 19th cent. and the mass production of pianos by firms like Broadwood coincided with the presence of many foreign pianists in London (including Clementi, Dussek, Cramer, and *\*Field*). The piano became the main domestic instrument of Victorian Britain, where it was also used to accompany the singing of drawing-room ballads. In the opera-house, British composers remained overshadowed by their European contemporaries; the title 'The Royal Italian Opera' indicates the dominance of the Italian language into which even works by Mozart and Wagner were translated. Apart from the brilliant success of *\*Gilbert and \*Sullivan's* operettas, a true native style is difficult to identify. Outside the theatre, *\*Parry*, *\*Stanford*, and even that most 'English' of composers, *Elgar*, still spoke a predominantly Germanic musical language. The revival of interest in folk-song, spear-headed by Cecil Sharp, and in Tudor music, encouraged by the many editions from E. H. Fellowes, nevertheless fostered a new sense of 'nationalism' particularly in the work of *\*Vaughan Williams* and other English songwriters.

The 1945 première of Britten's *Peter Grimes* marked a new era. With a flair, unmatched since Purcell, for setting the English language, Britten's blend of traditional techniques with real dramatic understanding helped re-establish English opera, alongside the grittier, psychologically orientated works of *\*Tippett*. The founding of several fine orchestras, including the London Philharmonic, Royal Philharmonic, and three BBC orchestras in the 1930s and 1940s, established Britain's leading role in concerts and recordings. The British Broadcasting Corporation took over the Henry Wood *\*Promenade Concerts* in 1927 and has played a leading role in commissioning new works and encouraging new artists. The excellence of British orchestras, opera companies, and international festivals such as those at Edinburgh and Aldeburgh has become increasingly threatened by low state subsidies; the present disregard for the Arts Council bodes ill for music in 21st-cent. Britain.

See also FOLK-SONG; OPERA.

Caldwell, J., *The Oxford History of English Music: From the Beginnings to c.1715* (Oxford, 1991); Meckerness, E. D., *A Social History of English Music* (London, 1964); Young, P. M., *A History of British Music* (1967).

**music-halls** flourished in the second half of the 19th cent., but were under competition before 1914 from picture houses

and after 1922 from radio. They have been subjected to deadening Marxist analysis as 'the dominant form of cultural production in the context of a modernizing capitalist society' and were indeed socially conditioned, since they provided mass entertainment in the new large industrial towns. They developed from a variety of sources—from the music and acrobatics offered at pleasure gardens like *\*Vauxhall* and *\*Ranelagh* and from sing-songs at local taverns. The Eagle, in City Road, London (commemorated in 'Pop goes the weasel'), was an early concert hall and in 1838 the Rotunda in Southwark advertised itself as a music-hall. The first music-halls served food and drink at tables: only gradually was drink eliminated and the audience placed in rows of seats. Since the halls were of doubtful respectability and had frequent brushes with authority, the audience was predominantly working class or lower middle class, though middle-class patrons and even respectable ladies were more in evidence towards the end of the century.

The 'father of the music-hall' was Charles Morton, who opened the Canterbury at Lambeth in 1851 and transferred to the Oxford in 1861. By 1875 there were more than 300 music-halls in London and they were well established in the larger provincial towns: indeed, the Star at Bolton in 1832 has some claim to have been the first music-hall. They produced their own stars. Dan *\*Leno's* career began in the 1860s almost as soon as he could walk, and he died in 1904 at the age of 43. Marie *\*Lloyd* made her début at the Eagle in 1885 with a repertoire that included 'The boy I love is up in the gallery'. She too burned out and died relatively young in 1922. The careers of Harry *\*Lauder* and Gracie *\*Fields* were taking off as Leno's came to an end. The final blow to the music-hall tradition came with the spread of television in the 1950s, though *The Good Old Days*, from Leeds, had a long nostalgic run as a TV programme in the 1970s.

JAC

**Mutiny Act.** Before the *\*Glorious Revolution*, James II had collected a large army on Hounslow Heath to intimidate London. The *\*Bill of Rights* in 1689 declared that a standing army in peacetime was illegal without parliamentary consent and the procedure was adopted of passing an annual Mutiny Act which authorized the imposition of military discipline. The navy had been under statutory authority since 1661 and was less politically delicate since the fleet could hardly be used to threaten public liberties. In 1784 the Fox–North coalition toyed with the idea of rejecting the Mutiny Bill as a means of getting rid of William *\*Pitt's* minority government, but flinched from so drastic an action. The system was reorganized by the Army Discipline and Regulation Act of 1879.

JAC

**Myddleton, Sir Hugh** (c.1560–1631). The sixth son of Richard Myddleton, governor of Denbigh castle, and younger brother of Thomas, the much-married lord mayor of London, Hugh Myddleton was sent to London to train as a goldsmith/banker. Nevertheless he retained his connections with Denbigh and represented the borough in Parliament six times between 1603 and 1628. Interested in cloth-making, engineering, and sea trade, he is best remembered for his entrepreneurial feat of constructing the *\*New River*, an

## Mynydd Carn

artificial waterway created to improve London's water supply. Faced with difficulties from recalcitrant landowners and political opponents, the scheme eventually necessitated financial rescue by the king himself. It was completed by 1613, but the New River Company paid no dividends until 1633, and prospered only after 1640. In recognition of Myddleton's engineering skill and enterprise, James I confirmed his lease of the mines royal in Cardiganshire, and created him a baronet in 1622. ASH

**Mynydd Carn, battle of, 1081.** After 1066 Norman pressure began on north and south Wales, and a period of confused fighting among the Welsh princes ensued. But at Mynydd Carn, near St Davids, \*Gruffydd ap Cynan and \*Rhys ap Tewdwr defeated and killed their rivals Trahaearn, Caradog ap Gruffydd, and Meilys ap Rhiwallon of Powys, and established the supremacy of \*Gwynedd and \*Deheubarth. JAC

**mystery plays.** Best preserved of the vernacular religious drama which flourished in England, as on the continent, in the high Middle Ages, the mystery plays were known as 'the play of Corpus Christi', since originally performed at that festival. They versify and dramatize the biblical and apocryphal narrative of man's fall and salvation from Creation to Doomsday, with emphasis on Christ's trial, death, resurrection, and harrowing of hell. The plays offered religious instruction, entertainment, and a boost to civic pride and

commercial interests. Their dramatic impact was enhanced by music, special effects, and moments of comedy, and their contemporary relevance by the presentation, for instance, of high priests as bishops, and shepherds as medieval Yorkshiremen.

Major cycles survive from York (51 short plays) and Chester (25), together with documentation about their performance by trade guilds or 'mysteries' on wagons in the streets. The 32 'Towneley' plays are plausibly associated with Wakefield, and the 42 N-Town plays (formerly 'Hegge' plays or, misleadingly, *Ludus Coventriae*) tentatively with Lincoln or Norwich. One or two plays each survive from Coventry, Newcastle, Norwich, and Northampton, and records, but no texts, from several towns from Aberdeen to Canterbury. Suppressed by the protestant hierarchy around the 1570s, performance of the plays has enjoyed a revival since 1951. DCW

**Myton, battle of, 1319.** While Edward II was besieging Berwick in 1319, Robert I Bruce sent Sir James \*Douglas and the earl of \*Moray on a diversionary raid, deep into Yorkshire. They were confronted at Myton-on-Swale, just east of Boroughbridge, by a scratch army hastily collected by William Melton, archbishop of York. The Scots routed their opponents and Edward abandoned the siege. So many clerics joined the archbishop that the episode was known sardonically as the Chapter of Myton. JAC

**nabobs**, a corruption of the Urdu *nawab*, a governor or nobleman, was the fashionable term for men who had returned from India with ample fortunes, and often a taste for lavish living and political advancement. They were satirized by Samuel Foote in a highly successful play, *The Nabob*, put on at the Haymarket in 1772. Well-known nabobs included \*Clive, Sir Robert Fletcher, General Richard Smith, Sir Francis Sykes, and Paul Benfield. JAC

**Najerá, battle of**, 1367. This engagement, fought in northern Spain, contributed much to the renown of \*Edward, the Black Prince. He had intervened in Castile to assist Peter II (the Cruel), deposed by his half-brother, Henry of Trastámara. The victory on 3 April restored Peter to power. Within two years, however, Trastámara had regained the throne, this time with French help, and the Black Prince, having never received the financial reward Peter had promised, was forced to increase taxation in his principality of Aquitaine to cover the cost of his Spanish expedition. The battle is also known as Navarrete. AC

**Namibia**. After much missionary activity, South West Africa was annexed by Germany in 1884. After the First World War, the territory was administered as a mandate by South Africa. In 1966 the United Nations ended the mandate but South Africa retained control in the face of an increasing guerrilla war, waged by the South West Africa People's Organization. In 1990 the territory became independent and a SWAPO government was established. Much of the area is barren and the population is sparse. The main economic activity is the extraction of diamonds, uranium, and copper. JAC

**Nanking, treaty of**, 1842. The first \*Chinese War 1839–42 originated when the Chinese authorities seized and destroyed large quantities of opium, which British merchants were importing. After sporadic military and naval actions, the Chinese emperor agreed to open up trade, pay compensation for the loss of the opium, and cede \*Hong Kong. Queen Victoria wrote that 'Albert is very much amused at my having got the island of Hong Kong.' JAC

**Nantwich, battle of**, 1644. Throughout the Civil War, Charles I entertained excessive hopes of assistance from Ireland. In the summer of 1643 he negotiated an armistice with the catholic Confederacy, permitting a number of Irish royalists to cross to England. Lord \*Byron, holding

Chester for the king, sought to organize them and in January 1644 was laying siege to Nantwich. He was attacked on 24 January by Sir Thomas \*Fairfax and Sir William Brereton, and though he got his cavalry away, lost most of his new infantry, killed or captured. JAC

**Napier, Sir Charles James** (1782–1853). Soldier. Napier was commissioned into the army at the age of 12 thanks to the patronage of his cousin and namesake, Charles James \*Fox. He served in the Peninsular War (1808–11) and in the American War (1812–14). From 1819 to 1830 he was a military resident in Greece and was offered command of the Greek liberation army, which he declined for reasons of penury. In 1839 he was appointed military commander of the north of England during the chartist revolt. In 1841 he accepted a lucrative Indian staff appointment and, amidst considerable controversy, provoked the conquest of Sindh from which he made £50,000 in loot. He announced his victory with the famous signal 'Peccavi' ('I have sinned'). He left India in 1847 but returned in 1849 as commander-in-chief of the Indian army. However, he clashed with the governor-general, Lord \*Dalhousie, and resigned in 1851. DAW

**Napier, John** (1550–1617). Mathematician. Napier invented logarithms, greatly simplifying calculations involving multiplying and dividing. As Kepler put it, he doubled the life of astronomers (by halving the time they took number-crunching). He was 8th laird of Merchiston. Educated in France and then at St Andrews, he published his *Mirifici logarithmorum canonis descriptio* in 1614, with tables and explanations. The basic principle was to reduce multiplication to addition by using powers: thus  $10^2 \times 10^3 = 10^5$ . In the course of 20 years' work, he came up with the base 10 for logarithms, so that the examples above would be 2, 3, and 5. In 1617, he published *Rabdologia*, describing 'Napier's bones', or rods calibrated logarithmically; as developed into the slide rule, this was essential in science and engineering until the electronic calculator was invented. DK

**Napier, Robert, 1st Baron Napier** (1810–90). Soldier. Napier was born in Ceylon and almost all his career was in India. Entering the Bengal Engineers in 1826, he was twice wounded in the 1840s in the \*Sikh wars, and was wounded for a third time while defending \*Lucknow in the \*Indian mutiny of 1857. He was knighted in 1858. He served in the \*China Wars and in 1867 commanded an expedition

## Naseby

to Abyssinia where the eccentric King Theodore was holding English representatives prisoner. Napier defeated the royal troops at Magdala, the new capital, and King Theodore shot himself. Napier was given a barony in 1868, was commander-in-chief in India 1870–6, served as governor of Gibraltar 1876–82, and finished as a field marshal in 1883. JC

**Naseby, battle of**, 1645. The battle in the first civil war that extinguished royalist hopes which, after the defeat at \*Marston Moor, had rested largely on \*Montrose's brilliant Scottish campaign. In May 1645 Prince \*Rupert captured Leicester, forcing the parliamentarians to raise the siege of Oxford. The armies met on 14 June 1645 at Naseby, 12 miles east of Rugby. After initial success, the royalists were heavily defeated by superior forces. Even more damaging than the casualties was the loss of Charles's private correspondence, published by Parliament to the world as proof of his duplicity. Though fighting continued for a further year, the king was never able to put another major army into the field. A large obelisk north of the village, erected in 1823, offers the gnomic advice that kings should not strain their prerogatives nor subjects rebel. JC

**Nash, John** (1752–1835). Born in London, the son of a millwright, Nash was the most successful English architect of the early 19th cent. After a short apprenticeship, he enjoyed early success on his own account before money troubles forced him to retire to Wales, where he rapidly recovered financially, designing houses for the local gentry. His first public commission was Carmarthen county gaol. Returning to London, Nash quickly built up a large practice, at first in partnership with Humphry \*Repton, the landscape designer, then on his own, producing designs in an enormous range of styles. For most of his life he worked on grand projects for the prince regent, in particular on a most imaginative scheme for a garden city in the heart of London. Much of the work was completed by Nash's death, but now only Regent's Park remains as envisaged. Buildings as varied as All Souls', Langham Place, Marble Arch, and the Pavilion at Brighton point to Nash's imagination and eclecticism. JC

**Nash, Paul** (1889–1946). Painter and graphic artist. Originally intended for the navy, Nash failed to qualify and went to study art at the Slade School. Wounded during the 1914–18 war, he was appointed an official war artist and examples of his work from this time, *We are Making a New World* and *The Menin Road*, are in the Imperial War Museum. In the 1920s and 1930s Nash became established as one of the most individual painters of his day. Essentially a landscape artist, who saw himself as a successor to \*Blake and \*Turner, and influenced by modern European movements, his work was imbued with deep, sometimes prophetic symbolism. In the Second World War, he was again an official war artist; his *Totes Meer* (Dead Sea) and *Bomber in the Corn* hang in the Tate Gallery. He was also highly successful as a fabric and scenery designer, photographer, writer, and book illustrator. JC

**Nash, Richard** (1674–1762), later known as 'Beau' Nash. Son of a Swansea glass-maker, and briefly lured by the scarlet, Nash entered the Inner Temple (1693), but his self-

assurance, good manners, and dress concealed penury, hence his resort to preposterous wagers. Addiction to gambling drew him to Bath (1705), which, although fashionable, had few arrangements for comfort or entertainment. Good organizational skill and energy led to a position as master of ceremonies (later, additionally, at Tunbridge Wells), where, mixing kindness, generosity, conceit, and cynicism, he crusaded against overcharging, duelling, and informality. Although 'arbiter elegantiarum', Nash was primarily a professional gamester, so the 1739 and 1745 Acts against organized gambling undermined successively his income, display, and then authority. Despite his contributions to Bath's prosperity and the establishment of its Mineral Water Hospital, the corporation coldly watched its uncrowned king slide into poverty, but interred him in Bath abbey. ASH

**Natal**. Former British colony in South Africa. British traders and missionaries settled at Port Natal (Durban) in 1824. A British colony was declared in 1843 to check the spread of Afrikaner influence in the region and British settlers were officially encouraged though their numbers were never large in comparison with the black population. Sheep-farming and, at the coast, sugar-growing were the main sources of wealth. The dismemberment of Zululand in the 1880s and 1890s extended the boundaries of the colony and in 1910 the colonists reluctantly accepted the inclusion of their country within the South African Union. KI

**national anthem**. First published in recognizable form in 1744 (ambiguously as 'God save our Lord the King') but performed at Drury Lane, September 1745, specifically naming King George in response to the Jacobite threat, it was essentially a compilation of loyal phrases set to a recast Tudor galliard, and merely a patriotic song. Rapidly gaining widespread popularity, it was known as the national anthem by 1819 despite its anti-Scots references (still balefully resented by some north of the border). Subsequent political parodies, 'improvements', church use, translations, and overseas adoptions have made it one of the world's best-known tunes. ASH

**national debt**. Throughout history governments have had difficulty in maintaining the balance between income and expenditure, since the former relies on the raising of taxation which is seldom popular. The national debt is the excess of expenditure over revenue, often accumulated over many years and financed by borrowing. This debt grew markedly in the 18th cent. as a result of involvement in numerous wars. (See FINANCIAL REVOLUTION.) The Napoleonic wars lasted for a quarter of a century and were especially expensive. Public expenditure fell to a more modest scale throughout the 19th cent. and the national debt actually fell. It escalated in the 20th cent. as a result of war and the increasing state obligations for welfare payments such as social security and pensions. At the beginning of the century, public spending stood at about 10 per cent of national income, but since the Second World War it has varied in the 40–50 per cent range. But the rapid inflation in the 1970s created a large imbalance between taxation and expenditure and thus increased the deficit. The national debt, now more

usually known as the public sector borrowing requirement, has recently ranged between 6 and 8 per cent of national income. CHL

**National Front.** Established from several small extremist right-wing organizations in 1967, the National Front came to prominence in the 1970s after capitalizing on fears of increasing numbers of immigrants, whipped up by politicians like Enoch \*Powell. Although never close to winning a seat in Parliament, it had strong support in parts of London, the midlands, and some northern cities. After reaching a peak in early 1977, support declined, with a poor showing in the 1978 local elections. The decline was exacerbated by growing public criticism of its leadership, the adoption of restrictive policies on immigration by the Conservatives, and the growth of an active anti-fascist movement. The 1979 general election saw the National Front receive only 1.3 per cent of the vote. In 1982 the chairman, John Tyndall, left to form the British National Party, which has since supplanted the National Front on the extreme right. LHM

**national galleries.** Towards the end of the 18th cent., after most of the principal national galleries of Europe had opened, the idea of a National Gallery in London began to be discussed. During the 1820s two notable collections, of Sir George Beaumont and the Revd W. Holwell Carr, were promised to the nation and the Treasury was persuaded to purchase 38 paintings from the estate of city broker John Julius Angerstein. This growing national collection soon outgrew its first home in the Angerstein house in Pall Mall and in 1838 a new building housing the Royal Academy (until 1869) and the National Gallery opened in Trafalgar Square. Treasury grants, generous gifts, loans, and bequests allowed the collection to grow and the gallery to become one of the best and most representative in the world.

The National Gallery of Scotland opened in Edinburgh in 1859, with pictures from the Royal Institution, the Royal Scottish Academy, and the University of Edinburgh. Despite receiving no Treasury aid before 1906, the collection grew by discerning purchase, loans, and bequests. Assistance from the National Heritage Memorial Fund and the National Art Collections Fund has enabled some exceptional and controversial acquisitions, most notably the joint purchase with the Victoria and Albert Museum in London of Canova's sculpture *The Three Graces* in 1995. In 1960 a separate Scottish National Gallery of Modern Art was established for painting, sculpture, and graphic art of the 20th cent.

In Dublin, there was talk of a national art collection in the 1760s, yet it was not until 1864, following a successful exhibition paid for by railway owner William Dargan, that a National Gallery, Library, and Museum was opened. As in London and Edinburgh, the collection grew by Treasury funds, private donation, and gifts. A most generous bequest was that of Sir Hugh Lane, director of the Gallery, who died in the sinking of the liner *Lusitania* in 1915. His will gave almost his entire estate to the gallery. JC

**National Government.** The Labour government of Ramsay \*MacDonald in 1931 faced a severe economic crisis with

more than 2 million unemployed and a run on the pound. It fell in August when the cabinet split on a proposal to cut unemployment benefit. MacDonald consulted \*Baldwin, leader of the Conservative Party, and Sir Herbert \*Samuel, leading the Liberals during the illness of Lloyd George. Samuel urged a coalition and Baldwin agreed to serve under MacDonald. Intended as a temporary measure, the coalition stayed in power until the Second World War when \*Churchill in 1940 formed a wartime national government. MacDonald's new cabinet contained four Conservative ministers, four Labour, and two Liberals, but the great majority of the parliamentary Labour party repudiated the deal and expelled MacDonald. In the general election which followed in October 1931, the National Government won a landslide victory with 473 Conservative seats, 35 National Liberals, and 13 National Labour, against a Labour opposition reduced to 52 seats. Baldwin replaced MacDonald as prime minister in June 1935, dissolved in November, and won a handsome majority, though Labour went up to 154 seats. Baldwin gave way to Neville \*Chamberlain in 1937. In Labour demonology, MacDonald was the arch class and political traitor and the National Government a Tory sham. The poor showing of National Labour in the 1931 election (when MacDonald was himself beaten at Seaham) gave support to the second opinion, but MacDonald was under the impression that he was putting country before party and probably committing political suicide. A majority of his Labour cabinet had, after all, supported the unemployment benefit cut. George V's role has also been criticized. He urged MacDonald to remain as prime minister. But monarchs are often disposed to favour governments of national unity and the king had acted on the advice of the three party leaders. JAC

**National Health Service.** Established in 1948, the NHS grew out of the Second World War's reconstruction planning of social and medical services, after long debate over health-care provision (Dawson Report, 1920; Cathcart Report, 1936; Sankey Commission, 1937). The 1942 \*Beveridge Report assumed that a satisfactory social security scheme depended on 'comprehensive health and rehabilitation services for prevention and cure of disease and restoration of the capacity to work', available to all the community. The subsequent deadlock arising from self-interested opposition was broken by Aneurin \*Bevan, who established a tripartite administration: local authorities (for existing clinics and new health centres), panel practice, and nationalized hospitals (conceding some private practice for consultants, and giving teaching hospitals special status). Since the new service was entirely free to patients, funding had to come from taxation, but Beveridge's view that costs would lessen as the nation's health slowly improved had not allowed for the massive backlog of unmet need nor for technological advances such as joint replacements. The introduction of charges for prescriptions, dental, and ophthalmic treatment (1951) led to Bevan's resignation on grounds of principle. Accusations of extravagance proved unfounded (Guillebaud Report, 1956), and hospital-building, application of medical advances, and staff expansion continued to be sustained by economic growth. Under the aims of improved management

## national hunt

and services, the 1960s saw recommendations for the abolition of tripartite administration (new structure implemented 1974), with such reorganization being associated with more professional management. But implementation of policies formulated in a more confident economic climate led to increasing criticism of the use of business theory to solve the NHS's financial problems. Total spending continued to rise. As resources were shifted away from patient care into administration, justifications for internal markets to produce savings were unconvincing to many commentators; economies from ward/hospital closures or sale of assets seemed illusory, while the morale of many NHS employees plummeted. The opting-out of newly formed hospital trusts from local health board control and introduction of fund-holding for general practitioners threatened to recreate earlier inequality and fragmentation, despite the perceived need for better community and preventive medicine. Centralized bureaucracy, changing needs of patients, and serious under-funding have contributed to a now crumbling structure, with significant shortage of trained staff. Governmental reviews continue to promise reform, but public scepticism persists. ASH/JAC

**national hunt.** See HORSE-RACING.

**National Insurance.** In 1911 the \*Asquith government, reflecting changes in public attitudes towards the causes and cures for poverty, passed the National Insurance Act—Health and Unemployment, which introduced sickness and unemployment benefits to be paid for out of employers' and employees' contributions. This was the beginning of the contributory, non-means-tested half of the British social security system; in 1925 state insurance for contributory old-age pensions was added.

The 1946 National Insurance Act, based on the principles of the \*Beveridge Report (1942), established a comprehensive national social insurance scheme: employers, employees, and the self-employed were to make contributions, which would make the insured and their families eligible to receive categorical benefits when they suffered the contingencies insured against—unemployment, sickness and invalidity, widowhood and old age. Though the original intention was to create a fund of income-producing assets, the system was unfunded, based on the pay-as-you-go principle, with current contributors paying for the benefits of current recipients. MW

**nationalism** is a sense of shared identity and loyalty, based upon common history, language, culture, and traditions. Though it has much in common with religious and local loyalties, it may be distinguished since it almost invariably aims to be the basis of government. Its origins and development have been much disputed, since different attributes may appear at different times, and progress towards national self-determination is unlikely to be regular and uneventful. Within the same nation there often exist severe disagreements and deep enmities. To separate nationalism from regionalism or particularism is difficult and often depends upon the eye of the observer. Yorkshire is clearly not a nation, though it has 5 million people and well-defined char-

acteristics: Denmark and Catalonia, with 5 and 6 million, clearly are nations.

The tendency of recent scholarship has been to see the roots of European nationalisms deep in the past rather than regarding them as essentially 19th-cent. phenomena. A sense of English nationalism seems to have developed in the 9th cent. during the campaigns to drive back the Danes, though for centuries mistrust between Northumbria, Wessex, Mercia, and East Anglia persisted. English nationalism was reinforced after 1066 by resentment of Norman-French domination. But ironically the Normans did much to create a powerful state, which the English succeeded in recapturing in the 13th and 14th cents. The thrust of Norman advance into other regions of the British Isles stimulated rival nationalisms in turn. The military campaigns led by \*Wallace and Robert I Bruce, culminating in the declaration of \*Arbroath (1320), and those in Wales led by \*Llywelyn ap Gruffydd and \*Glyndŵr gained wide popular support because they convinced many people that they fought to liberate Scotsmen and Welshmen from English oppression.

From the personal union of England and Scotland in 1603, and more particularly from the governmental union in 1707, efforts were made to encourage a sense of British nationalism. While accompanied by military success, imperial achievement, and economic growth, it flourished. In the 20th cent., and especially after 1945, as economic and political problems multiplied, the concept of British nationalism faltered and Celtic nationalist parties began to have success. Ironically, the Conservative Party, which has always drawn most of its support from England, strongly endorsed British nationalism, with its identification with the monarchy and its use of the Union Jack. Conversely, a completely independent Scotland and Wales (without representation at Westminster) could well be a fatal blow to the electoral chances of the Labour Party.

Ireland always presented problems for the idea of a British people to parallel a British state. The link between protestantism and Britishness made governments reluctant to let the catholic majority in Ireland share the rights upon which popular Britishness became based, while the willingness of some catholics to look to Spain, France, or Germany for assistance encouraged the English to regard them as potential traitors. In addition, many members of the protestant ascendancy developed an Irish identity of their own and campaigns for increased powers for the Irish Parliament were led in the 18th cent. by protestants like \*Grattan and Wolfe \*Tone. They were inhibited however from playing the Irish card too strongly by their ambivalence towards the catholic Irish and by their need for English assistance should there be another catholic revolt.

Concessions to the Irish catholics after the Act of \*Union of 1801 ('too little, too late' is the easy cliché) failed to prevent the growth of a more militant Irish nationalism, which in turn led to the development of protestant resistance to \*Home Rule ('loyalism') and ultimately to the partition of Ireland in 1921. In Northern Ireland, the existence of a large catholic minority, with powerful friends, meant that ethnic nationalism remained the basis of politics, the protestant majority justifying discrimination on the grounds

that the Catholics were dangerous aliens. But since the claims of Ulster Protestants to be British were based on views of religion and history that had waning appeal on the mainland, they were frequently disappointed in the support they could expect and constantly haunted by fear of a British betrayal.

In Wales, the survival of the Welsh language gave a cultural focus to nationalism. In the 19th cent. dissatisfaction with the power of Anglicized landlords and the privileged position of the Anglican church was used by the Liberal Party to mobilize a Welsh-speaking population, already undergoing a cultural revival. The Welsh nationalist party, *Plaid Cymru*, inhibited at first by the predominance of English-speaking in south Wales, made considerable inroads in the 1990s, returning four MPs to Westminster at the general election of 1997, and claiming seventeen seats in the 60-strong Welsh Assembly in 1999.

Nationalism in modern Scotland emerged as the autonomy of civil society and local government obtained by the Act of Union of 1707 began to be eroded by the increased speed of communications, the integration of the British economy, and the expansion of the Westminster government's powers of intervention. The resentment of Whitehall, found in many regions, could take a nationalist form in Scotland. But although agitation secured the re-establishment of a Scottish secretary in the cabinet (1885) and led to the foundation of a Scottish Home Rule Association (1886), Scottish nationalism did not mobilize the masses. Scotland in the early 20th cent. turned increasingly to Labour, which had powerful reasons for not pursuing Scottish nationalism *à l'outrance*. Conservative and Labour lack of interest in Home Rule led to the foundation of the National Party of Scotland (1928), which metamorphosed into the \*Scottish National Party (SNP) in 1934.

Increasing dislike of economic and political centralization, and optimism that North Sea oil could provide a rosy future, led the SNP to shock by-election victories at Hamilton (1967) and Govan (1973). At the October 1974 general election, the SNP took 30 per cent of the Scottish vote and eleven seats. Although the SNP's challenge declined after the inconclusive \*devolution referendum in 1979, the Thatcher years were widely seen in Scotland as government by an English nationalist, and the Conservatives struggled to retain a single Scottish seat. The SNP gained six seats at Westminster in the general election of 1997, and 35 seats out of 129 in the Scottish Parliament, elected in 1999.

In the 21st cent. the effect of devolution upon nationalism remains unresolved. In eastern Europe and the Balkans small nations continue to assert their right to independence, while many economic forces throughout the world appear to make national boundaries increasingly irrelevant. English nationalists are faced with a war on two fronts. While their influence on the Celtic fringes is being challenged, the impact upon their own sovereignty of Brussels and the European Community increases. CNL/JAC

**nationalization.** Although the 1945 Labour government was chiefly responsible for enlarging the public sector of the British economy to over 20 per cent of GDP, coal,

railway, and even land nationalization had been advocated by Edwardian socialists and radicals. The First World War boosted the credibility of state intervention in industry and in 1918 the Labour Party committed itself to 'common ownership of the means of production'. However, it was Conservative-dominated governments which founded the Central Electricity Board (1926) and London Passenger Transport Board (1933) and 'nationalized' the BBC (1927) and British Overseas Airways Corporation (1939) as semi-autonomous 'public corporations'. Prior to the First World War, it was assumed that nationalization would take the form of a government department (like the Post Office) but in the inter-war period the Labour Party gradually accepted the 'Morrisonian model', which gave no concessions to either workers' control or direct administration by civil servants.

The Second World War gave further impetus to calls for public ownership; the succeeding Labour government followed its 1945 manifesto 'Let Us Face the Future' and nationalized the Bank of England, Cable & Wireless, coal (1946), inland transport, electricity (1947), gas (1948), and iron and steel (1949), generously compensating shareholders. Party-political strife over iron and steel (denationalized in 1953 but renationalized by Labour in 1967) scarcely detracted from the acceptance of Attlee's 'mixed economy' by the Conservatives. The latter even established the Atomic Energy Authority (1954) and nationalized Rolls-Royce, after it faced bankruptcy, in 1971. Further 'lame-duck' industries were nationalized by Labour in the 1970s, notably British Leyland (1975) and shipbuilding (1977). However, the \*Thatcher governments halted the process and began a 'privatization' programme in 1981; by 1996 the public sector of the economy had been virtually eliminated. SC

**national parks.** Proposals for national parks were first heard in the 19th cent. as industrial towns grew ever bigger and suburbs swelled. But advocates found it difficult to decide whether the parks should be places to which people could resort for relaxation and pleasure, or whether the public should be excluded as far as possible. The \*National Trust was founded in 1895, the Society for the Protection of Nature Reserves in 1912, and the Council for the Protection of Rural England in 1926. The CPRE obtained from \*MacDonald in 1929 an inquiry into the need for national parks, which reported in favour and recommended a National Parks Authority. Economic and political crisis then intervened, but the Forestry Commission was persuaded to create a number of national forest parks. The issue was taken up again after the Second World War and a National Parks Commission established in 1949, with power to designate national parks, and to identify areas of outstanding natural beauty, outside the parks, but in need of protection. The commission did not apply to Scotland. It would not own the parks, nor have direct administrative responsibility, but would operate through the county councils. The first parks, established in 1951, were Dartmoor, Snowdonia, the Peak District, and the Lake District, followed by the Pembrokeshire coast (1952), the north Yorkshire moors (1952), Exmoor (1954), the Yorkshire Dales (1954), Northumberland

## national portrait galleries

(1956), and the Brecon Beacons (1957). The New Forest and the Norfolk Broads were given 'equivalent status'. Forty areas of outstanding natural beauty have been recognized, including the Chilterns, Cotswolds, Gower, the Malverns, the Long Mynd and Wenlock Edge, and the Wye valley. In 1968 responsibility was transferred to the Countryside Commission, and a Countryside Council for Wales. There are no national parks or areas of outstanding natural beauty in Scotland, but national scenic areas have been designated and afforded some protection. The original predicament continues to cause problems and policy has to balance the interests of visitors and residents, which not infrequently clash over industrial and mining development. JAC

**national portrait galleries.** The English National Portrait Gallery was founded in 1856 at the urging of the 5th earl of Stanhope, supported among others by Prince Albert. The present building, opened in 1896 in London, was largely funded by a single benefactor, W. H. Alexander. The collection contains portraits of celebrated Britons in every medium including photography. In fulfilling the aim of the gallery to illustrate the nation's history, selections are made on the importance of the sitter rather than the quality of the artist, so there is great variation in the works. The National Trust properties of Montacute in Somerset and Beningbrough in Yorkshire also house a number of portraits from the NPG.

The Scottish National Portrait Gallery in Edinburgh was founded in 1882 with endowments from the owner of the \**Scotsman* newspaper, J. R. Findlay. The building on Queen Street houses portraits of eminent Scots, antiquities, and the national photography collection. A permanent exhibition portrays the history of the royal house of Stewart in portrait and artefact and includes a pastel of Prince Charles Edward ('Bonnie Prince Charlie') by de la Tour acquired in 1994 with help from the National Art Collections Fund. Since 1983, with a painting of Queen\*Elizabeth, the queen mother, the gallery has commissioned works direct. JC

**National Schools Society.** Because of the success of Joseph \*Lancaster in establishing non-sectarian schools, leading to the founding of the \*British and Foreign School Society, the bishops of the Church of England were anxious to promote a rival body. In October 1811 the National Society for Promoting the Education of the Poor in the Principles of the Established Church was formed. Dr Andrew \*Bell was engaged to organize monitorial schools, teaching both secular and religious subjects. From its inception, the society published a number of textbooks which were 'suitable' for its schools. A central branch for training teachers was established in Holborn, but later five other colleges were erected, including St Mark's and Whitelands, Chelsea, and St John's, Battersea. Starting with 52 schools attended by 8,620 pupils in 1811, the society rapidly expanded its activities; by the following year there were 230 schools with 40,484 pupils. In 1833 government grants were first given towards building the schools and in 1853 towards their maintenance. By 1888 the society's schools were educating 2,300,000 children.

After the 1902 Education Act, some local education authorities objected to contributing towards schools which were outside their control. The National Schools Society fought this issue in the law courts and obtained equal treatment for their schools. PG

**National Society for the Prevention of Cruelty to Children.** Despite late 18th-cent. \*humanitarianism and philanthropy, there was scant concern about neglect and abuse of children before 1870. Piecemeal legislation (work-practices, baby-farming) and local rather than national experiments in child welfare lagged behind growing concern for animals, but pioneer work in America observed by the Liverpool banker Thomas Agnew (1881) led to the formation of several provincial societies for the prevention of child cruelty 1883–5. Through the untiring efforts of a London congregational minister, Benjamin Waugh, the London society amalgamated with some provincial counterparts to form the NSPCC, which then co-ordinated efforts to promote legislation (1889). Initially contentious, since this 'Children's Charter' appeared to challenge parental rights, its enforcement via the society led to eloquent testimony to their work and strengthened amplified legislation. The NSPCC was incorporated in 1895, since when concern about criminal neglect has extended to general physical welfare, and national consciousness has been raised about children's civil rights. ASH

**National Theatre.** First proposed by Effingham Wilson (1848), but bedevilled by false starts, conflicts of interest, and two world wars, the idea of a state theatre received parliamentary approval (1949) but the promised funding was not forthcoming. The National Theatre company was finally incorporated in 1963, with Laurence \*Olivier as director and the Old Vic providing a nucleus of actors, but it was not until 1976, after financial difficulties and criticism, that the company moved into its permanent home, a three-theatre complex on the South Bank (London), partly state subsidized. Since 1988 the prefix 'Royal' has been permitted. ASH

**National Trust.** The National Trust was founded in 1895, largely by Octavia \*Hill, Sir Robert Hunter, and Canon H. D. Rawnsley of Westmorland. Its object was to preserve buildings or land of historic interest and beauty. The trust was incorporated by Act of Parliament in 1907 and a separate trust for Scotland established in 1931. The first acquisition was cliffs overlooking Cardigan Bay and the first large appeal in 1901 was to buy Friar's Crag at Derwentwater. The trust is now custodian for more than 350 stately homes and places, and the National Trust for Scotland for another 100, including the battlefields of Bannockburn and Culloden, Cliveden, Cragside, Culzean castle, Knole, Petworth, Powys castle, Wallington, and West Wycombe. JAC

**NATO** is the acronym for the North Atlantic Treaty Organization, established in Washington, DC, on 4 April 1949 by the USA, Canada, UK, France, and other west European countries. This was the culmination of diplomatic efforts by those, including the British government, who saw a defence alliance as vital to safeguard western Europe against

possible threats by the USSR. The signing of the Brussels treaty a year later was part of a strategy to convince US public opinion that American involvement was desirable. The treaty's anti-communist orientation was made clear in its preamble, which declared the parties 'determined to safeguard the freedom, common heritage and civilization of their peoples, founded on principles of democracy, individual liberty and the rule of law'. The signatories committed themselves to taking 'necessary action' to aid any member facing attack. The \*Korean War induced the formation of an integrated military command for NATO, which apart from occasional disputes over nuclear deterrence strategies and 'out of area' problems functioned well until the end of the Cold War. Britain however sought additional security through the possession of an independent nuclear deterrent and the cultivation of a 'Special Relationship' with the USA. Both its length of existence and its role in seeing off the Soviet challenge give NATO a claim to be among the most successful alliances in history. CNL

**Nauru** is a small Polynesian island, east of New Guinea, whose economy is based largely upon phosphate. Visited first in 1798, it became a German colony and was occupied by the Australians in 1914. After the First World War, it was administered as a mandate by Britain, Australia, and New Zealand and occupied during the Second World War by the Japanese. It became an independent republic in 1968 and is an associate member of the Commonwealth. JAC

**naval history.** In about 1436 Adam de Moleyns in *The Libelle of English Policy* wrote: 'Flemings to our blame, Stop us, take us, and so make fade the flowers of English state.' This may be the earliest polemic in English urging a system of mercantile protection, at a time when the fleet of Henry V had been dismantled. Nearly 150 years later Richard \*Hakluyt could view a more spacious world, and in a new dimension. In 1580, securing the translation of the Breton explorer Jacques Cartier's account of North American shores, Hakluyt insisted that the English should be throwing off 'their sluggish security and continual neglect' of opportunities the French were so actively seizing. The foothold gained, however tenuously, in Newfoundland (1583) and the founding of Virginia (1607–19), events occurring before and after the Spanish Armada of 1588, may have helped to assuage the proselytizing zeal of Hakluyt. But he, and such forwarders of enquiry as Lord \*Burghley, who confessed to 'fantasising of cosmography', encouraged the beginnings of naval history as a scholarly discipline, separable from the demands of canvassing causes. Canvassing of course continued—how could it not, given such issues as the state of the early 17th-cent. navy, the self-perpetuating problems of timber supply, and manning? But the triumphs over the Dutch and Spanish 60 years after the Armada afforded the English an awareness of the implications of maritime superiority.

No man in his time was better equipped to write a comprehensive naval history than Samuel \*Pepys, and by 1680 he had accumulated material for such a work which, he rightly believed, would 'consort mightily with my genius'. Unfortunately, Pepys did not complete his history; the one written

by a successor in the Admiralty secretaryship, Josiah Burchett (1720), is of value only for the period 1689–1713 of which Burchett had intimate knowledge. But in 1735 Thomas Lediard's two-volume history was of an altogether different calibre, and was usefully supplemented by John Campbell's *The Lives of the Admirals* (1742–5), which brought the personalities of past commanders into focus. It is questionable how far John Charnock's *Biografia navalis* (1794–8) advanced on Campbell, though his enquiries were pertinacious. In 1806 Charles Derrick, of the Navy Office, brought out the first valuable treatment of the navy's administrative history.

Possibly the first 'modern' panoramic treatment of the navy's history was W. L. Clowes's seven-volume work 1897–1903, but perhaps a more estimable contemporary was Sir John Knox Laughton, an indefatigable researcher and effective founder, in 1893, of the Navy Records Society. That year Derrick found a successor in M. M. Oppenheim, who brought out an administrative history of 1509–1660 (the volume designed to follow it never appeared). Coincidental with Britain's naval race with Germany, the great age of naval history scholarship arrived, and was dominated by Sir Julian Corbett (1854–1921) and Admiral Sir Herbert Richmond (1871–1946). The definitive history of the navy in the First World War *From the Dreadnought to Scapa Flow* (1961–70) was in fact written by an American, Arthur G. Marder, the Second World War being covered in S. W. Roskill's *The War at Sea* (1954–61). Both these distinguished historians, but especially Marder, enjoyed the inestimable benefit of perspective: today's historians have fewer bearings in a world where sea-borne missiles can destroy inland cities and where, irrespective of financial constraint, there are complex dilemmas in forward planning. Above all, British seafarers, the ultimate makers of naval history, are in drastic numerical decline.

DDA

**Navarino, battle of, 1827.** An accidental encounter fought on 20 October between a Turco-Egyptian fleet of 70 vessels, and a British, French, and Russian fleet of 28 ships, heavier than most of their adversaries. Navarino Bay is a commodious anchorage in the Morea (Greece), sheltered to the west by the island of Sphacteria and with only one navigable entrance. The Turkish government had prevaricated in acceding to an armistice with its insurgent Greek subjects negotiated by the tripartite powers. The allied fleet under Sir Edward \*Codrington put into Navarino with the formal intention of escorting the Egyptian ships to Alexandria and the Turkish to Constantinople. However, a distrustful Turkish commander opened fire, and in the ensuing engagement, in which the quality of allied gunnery much exceeded that of the Turks, the fleet of the latter was virtually destroyed. In 1830 Britain endorsed the Greek proclamation of independence of 1822. DDA

**Navarrete, battle of.** See NAJERÁ.

**Navigation Acts** were intended to protect English (later British) commerce from foreign competition. They originated in Tudor times and were based on ideas usually called \*mercantilist. This assumed that the volume of world trade was finite and that any gain by one country could only be at

the expense of another. The great Act of 1651 was aimed at the Dutch carrying trade. It required that all imports should be carried in ships either owned by English subjects or owned by the nationals of the country from which the goods came. Exports were similarly restricted. The Acts had the concurrent purpose of fostering the \*merchant navy, which retained an important defensive role. The Navigation Acts were abolished in 1849, a final step towards making Britain a free trade economy. IJEK

**navy.** 'For the regulating and better government of H.M.'s, ships of war and forces by sea, wherein, under the good Providence of God, the wealth, safety, and strength of the Kingdom is so much concerned' (Preamble to *Naval Discipline Act*, 1661); 'Fishermen, yachtsmen . . . river boatmen . . . manned their craft with volunteer crews and rushed them to the assembly point, although they did not then know for what purpose they were required' (Admiralty communiqué, *The Times*, 4 June 1940). Separated by three centuries, these records of mid-17th-cent. aspiration in the wake of Cromwellian successes against Dutch and Spaniards, and mid-20th-cent. summons of all seafarers from Sussex to East Anglia to rescue at Dunkirk the only army the nation possessed, proclaim the importance of naval power for an island. The first is a perception of state interest which dates back well beyond the \*Armada to the reign of Elizabeth I's grandfather Henry VII, and has never ceased to apply, while the second invokes the duty owed the realm by the subject best equipped to discharge it. That obligation can be traced back to \*Æthelred II's plight under Danish attacks at Sandwich in 1006, and probably to \*Alfred's native-found ships at Poole, again resisting the Danes, in 897. Yet few aspects of the crown's prerogative power were more strenuously questioned through the 17th, 18th, and 19th cents. than that to impress the subject for sea service. Not until 1853, when fixed terms of service in the navy and pension rights were made statutory, did age-old constraints cease to be obnoxious. There seems poetic justice that the first \*Victoria Cross was won by a non-commissioned seaman in the \*Crimean War.

Britain's place in the 'Viking World' was rendered most definitive through the person of \*Cnut (1016–35). King, or overlord, also in Denmark (1019) and Norway (1028), no English monarch had such distant dominions again until Charles II in the later 17th cent. Cnut's navy seems not to have been a personal apanage but an auxiliary, its periods of service specifically fixed by financial provision. In 1051 it was dispensed with by \*Edward the Confessor out of economy, though this Norman-raised king may also have intended to ease the succession to his crown of the rich and ecclesiastically regenerated \*Normandy. William I had continuous trans-channel ferry needs during his reign, after the first crucial shipment of an army to Pevensey in September 1066; and he, William II, and Henry I may have made some 40 Channel crossings in all. \*Portsmouth, a nascent naval base by the reign of John (1199–1216), or \*Southampton were their usual destinations. But did they pretend to naval power beyond such dictates, or occasionally commandeering the resources of English merchants trading with Scan-

dinavian, Flemish, or, later, Gascon ports? By the end of the 12th cent. the \*Cinque ports had long enjoyed privileges from the crown in return for an annual provision of ships and men. Through the 13th cent. these ports, joined by Winchelsea and Rye, provided the 'drive' for assembling royal fleets, though under Henry III (c.1255) they so resisted his weak authority that Henry had to look to the east coast shipbuilding ports. By this time the oared single sail 'long ship' or galley, still predominant in northern waters and the Mediterranean, was ceding place to wider-beamed and higher-sided vessels, furnished with fore and stern castles. These were more difficult to manoeuvre, but they could carry bowmen and projectiles in their castles and were more suitable for boarding an enemy, even if oar-power remained the handiest means finally to position a warship. Edward III's victory over the French at \*Sluys in 1340 must have featured such ships; and before the 14th cent. was out there was vital sail evolution through the development of the three-masted ship. The age-old side rudder also gave place to the stern-post rudder aligned on the keel, facilitating steering a few points off the wind.

The evolution of the navy in the 15th cent. has to be seen in the context of an ever-increasing volume of trading voyages, to Iceland, the Baltic ports, to the Basque coast and Portugal, and then the Newfoundland Banks. The east coast coal trade needed many ships, and Hanseatic competition in the shipment of English cloth to the processors in the Low Countries had to be countered. More distant trades made big ships economic: in 1400–25, 68 per cent of crown-hired ships were of less than 100 tons burthen, but by 1451 that percentage had dropped to 52. The three great ships of Henry V were each over 550 tons; the *Grace Dieu* of 1420, whose timbers yet lie in the Hamble river, was of over 1,000, though she may never have put to sea. These ships were unique, and possibly uniquely unserviceable. Around 170 years later, when England faced the Armada in 1588, only 14 of the 177 private ships enlisted for service were over 200 tons, and only 5 of the 34 'Queen's Ships' exceeded 500 tons. The late medieval small ship had a durable progeny in the navy of the Tudors, the dynasty which truly founded the navy with its yards at Portsmouth, \*Chatham, Deptford, and Woolwich, and which fostered native gun-founding. In 1546, Henry VIII's last year, the Navy Board was formed from the navy's principal officers: it was destined to serve as the executant of the fleet's construction, maintenance, and supply, the country's largest industrial undertaking until the 19th cent. The names of \*Hawkins, \*Pepys, and \*Barham are inseparable from its record, strained though the board's relations with the policy-making Board of Admiralty often were. The critical change in warship design came during the 40 years before 1588, the removal of the medieval 'castles' in favour of a lower superstructure, with ships' sides pierced for guns on wheeled carriages, which made for some ease of movement between decks and allowed for recoil. Through to the coming of the steam-powered 'ironclad' this was the basic character of the warship; the teamwork, ensuring high rates of fire, inculcated in motley crews described in the 18th cent. as of 'naturally generous dispositions though turbulent, fearless, or, rather, thoughtless of consequences',

made a singular contribution to Britain's awesome reputation at sea in the century of \*Vernon, \*Hawke, \*Rodney, and \*Nelson.

When in June 1808 Sir Arthur Wellesley (the future \*Wellington) spoke in Parliament of the navy as 'the characteristic and constitutional force of Britain', he was expressing a national sense of obligation to a service which, resolutely administered by Middleton (Barham) since 1778, and liberally provided for by \*Pitt in the 1780s, had earlier withstood the unprecedented challenges of the \*American War and had next reaped the laurels of victory under exceptional commanders. In the years to come the navy played a crucial role in supporting Wellington in the \*Peninsula. Wellington's logistical back-up had been prefigured, however modestly, by the first wintering of a British fleet in the Mediterranean in 1694–5; but few developments in Britain's Atlantic economy were more spectacular than the doubling of her exports to the Caribbean after 1808, following the Anglo-Spanish entente. At long last, and following \*Trafalgar, the book was closed on one of the most abiding and distracting of Britain's strategic preoccupations: the security of the West Indies possessions had exercised the minds of all thinking naval officers, as well as commercial lobbies, since the age of William III. This concern lay close to the beginnings of Britain's commercial empire in the 16th and 17th cents.—the \*Levant Company 1592, the Virginia Adventurers 1609, the \*Royal Africa Company 1660, above all the \*East India Company 1600—all undertakings calling for ships which must dwarf the warships of Elizabeth I. Some traces of her fleet's tonnage possibly survived even in the great battle fleets sent out under Cromwell; but by the time of Pepys's '30 ship' building programme of 1677, 'your ships' as he reminded Parliament, there may have been an average burthen tonnage of 1,200 for ships of over 70 guns as against 940 in 1660. The navy finally became 'royal' in name under Charles II, and it was of incalculable importance for its future self-identity that there was, deliberately, no discrimination against that religious dissent among seamen which had afforded the Cromwellian navy its special pugnacity.

The first steam-powered vessels in the navy were the paddle-driven frigates/sloops of the 1820s, but the navy's ships in the Crimean War did not look much different from those of 75 years before. Even *Warrior*, Britain's first screw-driven ironclad (1860), retained sail-power after modifications in 1887. Within the period 1867–90 there was a breath-taking acceleration in the power of warships, but seamen of all ranks lacked the training to exploit these advances. During the incipient naval race with Germany in the 1890s there emerged, in the fascinating and powerfully prophetic educator John Arbuthnot \*Fisher, the man who drove the navy into the 20th cent. What has to be understood about his 18,000-tons displacement \**Dreadnought*, with her 21-knot speed (launched February 1906), is that such a ship was waiting to be built: turbine and not reciprocated engine driven, and with a provision of uniformly heavy guns ensuring straddling salvos of the highest possible accuracy. Yet *Dreadnought* was rapidly overtaken by more powerful and faster sisters, and she herself played little part in the

First World War. Though included in the 1922 scrapping programme, *Dreadnought* had served her turn through her very launching and her specifications became common currency across the world. But at the end of his life (1920) Fisher was convinced that air power was inseparable from sea power in any future conflict, and that the capital ship had had her day—a glimpse of what was to happen in the Second World War to the *Prince of Wales*, *Repulse*, and *Hood*. The mine, the torpedo, and the submarine had already set the pace of change; and at the Coronation Review of 1953 only one British battleship remained, the 42,000-ton *Vanguard*, which had never seen action. Accompanied though she was at Spithead by five major aircraft carriers, these great ships lay among myriad smaller vessels of a versatility of purpose which would have won the approbation of a Fisher—and a Nelson.

Grove, E., *Vanguard to Trident* (1987); Hattendorf, J. B., and Knight, J. B. (eds.), *British Naval Documents 1204–1960* (Aldershot, 1993); Lewis, M., *The Navy of Britain* (1949).

**Nechtansmere, battle of**, 685. Fought at Dunnichen, near Forfar, it was an unmitigated disaster for Northumbria, which probably held the territory south of the Forth and had established overlordship of the Picts to the north. King \*Ecgrith fiercely attacked the Picts against all advice, including that of \*Cuthbert, bishop of Lindisfarne, who had foreseen the king's early death. Lured into a narrow mountain pass, Ecgrith and his army were slain. The defeat marked the beginning of decline in Northumbrian power. The Picts were freed from overlordship, and although \*Bede records that Ecgrith's successor Aldfrith 'restored the shattered fortunes of the kingdom', it was 'within smaller boundaries'.

AM

**Neerwinden, battle of**, 1693. Sometimes known as Landen. On 29 July Marshal Luxembourg with 80,000 men attacked William III with 50,000 near Liège. William suffered severe losses of men and guns, but retreated in good order and saved Brussels. But he admitted 'great chastisements'.

JAC

**Nehru, Jawaharlal** (1889–1964). Independent India's first prime minister. The son of Motilal Nehru, a prominent lawyer and leader of the Indian National Congress, Nehru was educated at Harrow and Cambridge and trained for the bar. He became politically active during \*Gandhi's first non-cooperation movement (1920–2). A socialist by conviction, he frequently clashed with Gandhi over tactics and policy. However, he was spellbound by the mahatma and remained personally loyal to him. In 1939 he was Gandhi's choice to displace fellow-socialist S. C. Bose as Congress president. Nehru played a leading role in the negotiations for independence in 1946–7 and was prime minister in India's first interim government. He was confirmed in office at three subsequent general elections. He was much impressed by the material achievements of the Soviet Union and sought to lead India in a similar direction. But he was also a democrat and had to modify many of his ideals accordingly. DAW

**Nelson, Horatio** (1758–1805). Emphasis should always be placed on Nelson's East Anglian background. Through

both his parents (via his mother Catherine née Suckling he was a great-great-nephew of Sir Robert \*Walpole) his roots were regional, and his father's pastoral duties in his living at Burnham Thorpe, where Nelson was born on 29 September 1758, brought Edmund Nelson's eight surviving children into daily contact with parishioners whose livelihood was wrung from field, marsh, and coast. All his life Nelson was profoundly aware of the drudgery of toil, whether on the furrow or the lower deck, and humanely responsive to the concerns of the least privileged. The influence of his strong-minded mother, who died when he was only 9, always remained with him. By 1801 only two of her six sons survived, and this year, probably the most testing of his life, when he parted from a blameless wife, became the father of two daughters by Emma \*Hamilton, and, after \*Copenhagen, assumed against his will a most challenging anti-invasion command reaching from Harwich down to Dover, stretched his highly strung temperament to its limits. A natural recklessness, which had underlain past feats and past censure, was snuffed out before the defences of Boulogne in August 1801, and fame itself was tasting sour for Nelson: a plan to quit England with Emma for the Sicilian dukedom of Brontë, given to him by a grateful king of the Two Sicilies in August 1799, had not been abandoned. But within eighteen months, by the time Nelson assumed the Mediterranean command in May 1803, he had found composure, and for this Emma Hamilton (then widowed) may claim some credit. The devotion shown him by the fleet also helped the serenity of the last three years, a potent contribution to Nelson's 'legend' in its ultimate form; and in May 1804 late proof of his mother's benign legacy breaks through in one of his innumerable letters: 'the thought of former days brings all my mother into my heart, which shows itself in my eyes.'

Nothing is known for certain about Nelson's earliest acquaintance with the sea, but he took so readily to navigation in Thames and Medway, and later through tropical shoals and rivers, to the grand moments at the Nile and Copenhagen that there may have been childhood experiences of north Norfolk's creeks, even if only by punt when angling. His entry to the navy in 1770 was through patronage, that of his uncle Maurice Suckling, comptroller of the navy 1775–8. For all his natural intolerance of regulation, Nelson was unfeignedly sincere in sustaining lifelong friendships with his seniors: Captains Lutwidge, no discourager of initiative, and Locker, a profoundly educative influence; Sir Peter Parker, who in June 1779 eased Nelson's promotion to a post-captaincy and so placed his feet on the ladder to becoming an admiral; Sir Samuel (Lord) \*Hood, and Sir John \*Jervis (earl of St Vincent). Through 'pull' in the right quarters Nelson made early voyages to the West Indies and the Arctic, followed by a spell in the East Indies during which he escaped death by malaria only through the care of Captain James Pigot. Examined for lieutenant in April 1777, Nelson immediately returned to the West Indies, and his years there, to July 1788 when he was within four months of being placed on half-pay back in England, formed him as a naval officer. A ten-month break at home and in France, June 1783 to the following spring, caused him briefly to consider standing for Parliament.

Before Maurice Suckling died he had predicted admiralship for his nephew (attained February 1797), while Hood, a friend of Suckling's, noted the young captain's exceptional dedication. Prince William Henry, the future William IV, to whom Nelson became a trusted councillor in the Leeward Islands, thought him 'no common being', and many from other walks of life were struck by his flair and address: we can yet recover something of Nelson's flavour through reading even a random sample of his 5,000 surviving letters, incisively lucid, often humorous, and with insights unexpected in a man apparently prone to self-absorption. His grasp of the essentials in commanding men was allied to administrative exactitude; and the latter quality prompted him to take issue with illicit American trade in the West Indies which, though a justifiable policy, placed his professional future at risk. The attraction he felt towards women suggests strong emotional cravings. Perhaps it was some self-knowledge which brought him to a marriage, grounded only in 'esteem', with Frances Nisbet (née Woolward) in March 1787. The match involved a serious misjudgement of Frances's likely capacities as a naval officer's wife: dutifully loyal to the navy, the maintenance of the same quality towards his spouse became a burden for Nelson, before ever he met Emma Hamilton.

If Frances Nelson could not comprehend her husband's professional zeal, neither could she share in his attachment to north Norfolk during his years of unemployment until, in January 1793, he was at length appointed to the 64-gun *Agamemnon* at Chatham. Nelson assured his wife he would 'come laughing back one day', and although no finality was intended, a marriage which had proved childless was even less likely to bring him back involuntarily. The seven years which ensued in the Mediterranean, broken only by sick leave September 1797 to March 1798, under the commands of Hood, Hotham, Jervis, and, least happily, Keith, saw Nelson become a surpassing commander for those who served under him, and a hero to his countrymen and -women. But they were costly, his wounds, as he drily commented, being 'tolerable for one war': a right eye lost at Calvi (Corsica) July 1794, an internal rupture at St Vincent February 1797, loss of his right arm in a foolhardy assault on Tenerife the following July, a head wound at the Nile in August 1798, which almost certainly affected his mental balance and increased his fear of blindness. This may be a charitable explanation, but it is a not unconvincing one, for the intensity of his passion for Emma Hamilton, his intoxication with the honours which fell to him from George III, Naples, Constantinople, Malta, his maladroit and insensate involvement in Neapolitan politics 1799–1800, and his flagrant disregard of a superior's orders at Copenhagen. A national hero, yet a flawed one, the last three years 1803–5, which included a further spell in the Mediterranean and the untiring, frustrating chase after Villeneuve to the West Indies and back in the summer before \*Trafalgar, confirmed Nelson's renown as a leader of men with an almost spiritual power to articulate the national will to resist Napoleon. He was given a barony after his victory of the \*Nile and advanced to viscount after the battle of \*Copenhagen.

Nicholas, N. H. (ed.), *The Letters and Despatches of Vice-Admiral Lord Nelson* (7 vols., 1844–6); Orman, C., *Nelson* (1947); Pocock, T., *Horatio Nelson* (1987).

**Nennius.** Author of the *Historia Brittonum*, c. AD 800, a principal source for the post-Roman period. Much of the *Historia* attributed to Nennius has been described as having 'all the historical reliability of fairy-stories'. Nennius' reference to \*Arthur may well fall into this category. However, Nennius also included some short passages derived from reputable earlier authors, such as Constantius of Lyons on St \*Germanus. Nennius himself wrote in his preface: 'coacervavi omne quod inveni' ('I have made a heap of everything I have found'). The result of Nennius' efforts is a well-intentioned but sometimes bizarre account of Britain in the 5th and 6th cents. which cannot be relied upon, although some scholars argue that Nennius preserved useful titbits of information. ES

**neo-classical architecture** was part of a European-wide movement, c.1760–1830, affecting also the fine and decorative arts, to which Britain made a substantial contribution. It was directly inspired by classical antiquity (i.e. the art and architecture of Greece and Rome) and associated with rationalist principles and Enlightenment ideals of the perfectibility of the human spirit through such means as civic 'improvements' and exposure to noble monuments.

Consequently, this imposing and severe style was frequently adopted for public buildings such as courts of justice, hospitals, museums, and schools; Edinburgh is a city particularly rich in neo-classical architecture, W. H. \*Playfair (1790–1857) being one of its leading exponents.

The first stirrings of the neo-classical mentality can be seen around 1760, when Robert \*Adam (1728–92) initiated a style based more on the direct inspiration of Roman antiquity than on Italian Renaissance, especially Palladian, architecture. Thus his south front of Kedleston Hall, Derbys. (1760–8), suggests the form of a triumphal arch. James Wyatt (1748–1813), who also studied in Italy, was said by his contemporaries to have further refined the Adamesque style, which, particularly for interiors, tended to be decorative. Sir John \*Soane (1753–1837) developed a personal neo-classical style founded on a deeply felt interpretation of the antique, exploiting the effect of domes and of simplified, pared-down ornament.

By c.1800, an interest in Greek antiquity, based on first-hand archaeological study, had largely supplanted the earlier Roman taste. Symptomatic of this was the acquisition of the \*'Elgin marbles' from the Parthenon at Athens. Earlier, the first volume of James Stuart and Nicholas Revett's *The Antiquities of Athens* (1762) had become a source book for the Greek Revival, a movement further encouraged by the important connoisseur and patron Thomas Hope (1769–1831). Neither Stuart nor Revett achieved much success as an architect. However, the former's redesign of the interior of Greenwich hospital chapel (1780–8) was influential, and it became obligatory for the new generation of neo-classical architects such as C. R. Cockerell (1788–1863), Sir Robert Smirke (1780–1867), and William Wilkins (1778–1839) to make extensive study tours of Greece. The aristocratic

amateur Sir Charles Monck also visited Greece, a fact reflected in his design for his own house, Belsay Hall, Northumberland (1807–17). Externally, this austere and seminal work made emphatic use of the Greek Doric order as did William Wilkins's characteristic Grange Park, Hampshire (begun 1809). Wilkins, a Cambridge graduate himself, also designed the new Grecian-style buildings of Downing College, Cambridge (1807–20).

An extreme example of the Greek Revival, this time employing the Ionic order, is the church of St Pancras, Euston Road, London (1819–22), by William and his son H. W. Inwood. It embodies features adapted from the Erechtheion, an Athenian temple which the younger Inwood (1794–1843) had studied at first hand. By the 1830s taste was changing in favour of different types of classicism, particularly Sir Charles \*Barry's neo-Renaissance style. TEF

**Nepal**, a kingdom in the Himalayas, was formed in the 18th cent. out of the expansion of the Gurkha clans of the Kathmandu valley. It is extremely diverse—embracing mountains and valleys and Indo-Aryan- and Tibetan-Burman-speaking peoples. In 1814–16 the kingdom was defeated by Lord \*Hastings and brought into tributary relations with British India. Its dynasty, a sacral Hindu kingship, has survived and has only recently accepted constitutional forms of monarchy. The country is among the poorest in the world and has long been dependent on the earnings of its famous Gurkha soldiers from service in British-Indian armies. DAW

**netball** is derived from basketball, which was invented in America in 1891, and introduced into Britain in 1895. It made rapid progress since it was particularly suitable for girls at a time of expanding female education. The national game is controlled by the All-England Women's Netball Association, founded in 1926. The International Federation of Women's Netball Associations was established in 1960. One of the best advertisements for the game is the lunchtime contests by office staff in Lincoln's Inn Fields, London. JAC

**Neville's Cross, battle of**, 1346. In 1346 Edward III resumed campaigning in France and in August won his great victory of \*Crécy. The French urged their Scottish allies to put pressure on England and in October David II led a large force across the border. On 17 October he had reached Durham and was confronted by local English forces at Neville's Cross, just to the west of the city. His adversaries were led by the archbishop of York, Ralph, Lord Neville, and Henry, Lord Percy. The Scots suffered severe losses and David II was captured. He remained a prisoner until 1357. JAC

**New Brunswick** was detached from \*Nova Scotia to form a separate colony when 14,000 loyalist refugees arrived from the USA in 1784. The economy boomed from 1809 after Napoleon had blocked timber supplies from the Baltic. Self-government was introduced in 1848 and in 1865–6 New Brunswick was the crucial battleground between supporters and opponents of the union of British North America. British Prime Minister Andrew Bonar \*Law and newspaper magnate Lord \*Beaverbrook were New Brunswickers. French-speaking Acadians make up one-third

of the population: in 1969, New Brunswick became Canada's only officially bilingual province. In 1987 the incumbent Conservative government lost all 58 seats in the legislature. GM

**Newburn, battle of, 1640.** Though the battle of Newburn was little more than a skirmish, it helped to bring Charles I to the scaffold. His attempt to impose upon the Scots, many of whom were \*presbyterian, a new prayer book led to armed resistance. The first \*Bishops' War in 1639 ended in negotiation, but the following year a large Scottish army, led by Alexander \*Leslie, crossed the border and was confronted by Lord Conway's troops, trying to hold the line of the Tyne. At the ford at Newburn, 5 miles west of Newcastle, on 28 August 1640, the Scots crossed with little difficulty, occupied Newcastle, and dictated such financial terms to the king that the calling of another Parliament was inevitable. The \*Long Parliament, the following year, executed \*Strafford and declared itself irremovable, save with its own consent. JAC

**Newbury, battle of, 1643.** After relieving Gloucester in September 1643, \*Essex was shadowed on his return journey to London by Charles's army. The royalists reached Newbury a few hours before their opponents, cutting off the retreat, and took up defensive positions just west of the town. The king's army was some 10,000 men, Essex's perhaps a little less. On 20 September battle commenced with an artillery exchange but the fighting, though heavy, was inconclusive. Charles, running short of ammunition, was obliged to withdraw to Oxford, leaving Essex free to return to the capital. A royalist victim in the battle was Viscount \*Falkland, their *chevalier sans peur et sans reproche* who, despairing of the war, rode deliberately to his death in a hail of bullets. JAC

**Newbury, battle of, 1644.** Charles I's staggering victory at \*Lostwithiel in September 1644, when most of \*Essex's infantry had been forced to surrender, enabled him to take the initiative once more. While the parliamentarians regrouped and re-equipped, Charles moved to relieve Banbury, Donnington castle near Newbury, and Basing House. On 27 October he dug in at Newbury to face a superior force under senior command of \*Manchester. The parliamentary army was large enough to permit an enveloping move, but the east-west attack was badly co-ordinated and beaten off. Under cover of darkness, the royalists retreated to Oxford, but they had shown more enterprise than their opponents and boosted morale. JAC

**Newcastle, William Cavendish, 1st duke of (1593–1676).** Newcastle was one of the leading royalist commanders during the Civil War. A man of vast estates in Nottinghamshire and Derbyshire, he made spectacular progress up the peerage ladder, moving from viscount (1620), to earl (1628), marquis (1643), and finally duke in 1665. As lord-lieutenant of Nottinghamshire from 1626 to 1642, he entertained Charles I lavishly at Welbeck in 1633 and at Bolsover in 1634. He was an almost automatic choice as commander in the north when war came and had considerable success, gaining control of most of Yorkshire through his victory at \*Adwalton

Moor in June 1643. In 1644 he was forced back to York by the advance of the Scottish army and Rupert's attempt at relief ended in the shattering defeat of \*Marston Moor, where Newcastle watched his own regiment of Whitecoats cut to pieces. He left at once for the continent and did not return until the Restoration. \*Clarendon thought his conduct inexcusable and, though granting him 'invincible courage', wrote severely: 'he liked the pomp and absolute authority of a general well, but the substantial part and fatigue of a general, he did not in any degree understand.' A cultivated man, Newcastle wrote books and treatises, corresponded with Thomas \*Hobbes, and was the subject of a memorable biography by his wife, published nine years before he died. JAC

**Newcastle, Thomas Pelham-Holles, 1st duke of (1693–1768).** Newcastle held important offices of state for over 40 years. The attention devoted to his personal idiosyncrasies, such as his incessant chattering and fear of damp beds, can lead to the more successful aspects of his career being overlooked.

Created a duke in 1715, Newcastle rose quickly to high office, becoming lord chamberlain in 1717 and secretary of state for the southern department in 1724. He was very much subordinate to fellow-secretary \*Townshend, but his prominence increased when \*Walpole edged Townshend out in 1730, though Walpole was to direct policy. As Walpole's grip on power loosened, Newcastle's loyalty loosened with it, and he successfully advocated war with Spain despite Walpole's misgivings. Walpole's fall in 1742 led to \*Carteret being promoted secretary for the northern department and he quickly won favour with George II. Newcastle and his brother Henry \*Pelham used parliamentary support to overwhelm Carteret's purely personal power and forced George II to dismiss him in 1744. In 1746 the Pelhams won control over the government, after resigning and obliging the king to invite them back.

Newcastle and Pelham, together with Newcastle's lifelong friend \*Hardwicke, ran the government 1746–54 upon a \*'broad-bottomed' principle, including as many political factions as possible within it. In this they were successful, both brothers being masters of patronage and electoral strategy, but it made for a lacklustre administration. Though Henry Pelham as 1st lord of the Treasury quickly became the 'prime' minister, Newcastle retained very wide powers over foreign affairs and patronage, particularly in the Church of England. Newcastle showed his limitations very clearly during the War of the \*Austrian Succession; his grasp of military matters was poor, and his desire to conduct the war through subsidies to potentially friendly countries was expensive and unsuccessful.

The death of Henry Pelham in 1754 dealt Newcastle a heavy blow and the previously peaceful political situation immediately dissolved into bitter rivalry. Newcastle took the post of 1st lord, but could not bring himself to give a minister in the Commons real power and \*Pitt and Henry \*Fox subjected the government to heavy attack. War with France commenced to a string of military disasters which led Newcastle to resign in 1756. In an astonishingly short

time, however, he returned as 1st lord in one of the most successful modern ministries, the Pitt–Newcastle coalition, 1757–61. Pitt brilliantly directed the war effort whilst Newcastle dealt with patronage and financial matters. The accession of George III in 1760 changed the political situation dramatically, and Newcastle soon followed Pitt out of office as the \*Seven Years War drew to a close.

The move to opposition was not easy for Newcastle. He was the link between the old Whigs of the Walpole era and the new Whigs guided by \*Rockingham, but although Newcastle served as lord privy seal in the Rockingham government 1765–6, he was increasingly marginalized. Throughout his career, Newcastle was most effective as deputy to a man of greater ability, be this Walpole, Pelham, or Pitt. AIL  
Kelch, R., *Newcastle* (1974).

**Newcastle Programme**, 1891. The split in the \*Irish Home Rule party in 1890 weakened the likelihood of a successful Home Rule Bill, and \*Gladstone did not attend that year's meeting of the National Liberal Federation. At the 1891 meeting in Newcastle upon Tyne he reaffirmed on 2 October the primacy of Home Rule, but associated it with reforms on the mainland by adopting various (but not all) of the proposals of the NLF Council, in particular: land reform; reform of the Lords; shorter parliaments; district and parish councils; registration reform and abolition of plural voting; local veto on drink sales; employers' liability for workers' accidents; Scottish and Welsh disestablishment. So detailed a 'shopping list' from an opposition leader was innovatory in British politics. HCGM

**Newcastle propositions**, 1646. At the end of the first civil war, Charles I fled from Oxford and surrendered to the Scots, who removed him to Newcastle. Negotiations for a settlement then began. In July, Parliament's commissioners demanded that the king should accept the \*covenant, institute a \*presbyterian form of church government, hand over control of the army for 20 years, and abandon leading royalists to punishment. Though Charles continued discussions for several months, the terms were totally unacceptable to him and his mind turned increasingly to escape. After six months, the Scots handed him back to Parliament. JAC

**Newcastle upon Tyne**. A city and river port in Northumberland, and the administrative and commercial centre of north-east England. Its urban history starts abruptly with a 'New Castle' begun by \*Robert, the Conqueror's son, in 1080, and a borough planted at its gate. Newcastle, like most of Northumberland, was held by the Scots in Stephen's reign, but retaken by Henry II. It was one of the most successful Norman 'new towns', rising to become the eleventh largest English town by 1377 and one of the top half-dozen in Tudor and Stuart times. Its growing importance was based on coal exports, controlled by the wealthy and powerful Company of Hostmen. The town was captured by the Scots in 1644, and Charles I was held there in 1646–7. Coal-exporting rose further in the 18th cent., followed by ship-building and engineering in the 19th; in the 20th it became part of a huge conurbation straddling the river Tyne. The medieval centre, though it retains much of its walls, was

largely replaced between 1825 and 1840 by the architect John Dobson and the visionary speculator Richard Grainger, making Newcastle 'the only major city in England with a planned commercial centre of that date' (Pevsner). DMP

**Newcastle upon Tyne, diocese of**. The see was created in 1882 out of the \*Durham diocese simultaneously with \*Wakefield, \*Southwell, and \*Liverpool, to provide further pastoral care for the rapidly increasing population of industrial Newcastle. The diocese, conterminous with the former county of Northumberland, is an area of major contrasts from highly industrial Tyneside to sparsely inhabited border territory. It contains \*Lindisfarne, the historic springboard of the Celtic mission to northern England in the 7th and 8th cents. The 14th-cent church of St Nicholas became the cathedral, its open lantern tower pre-dating that of \*Edinburgh St Giles. WMM

**Newcomen, Thomas** (1663–1729). Dartmouth ironmonger and inventor of the atmospheric steam-engine. He combined \*Savery's independent boiler with the piston in his first 'fire engine' of 1712 at Dudley, applying atmospheric pressure to the top of the cylinder in which steam was condensed to create a partial vacuum and drive down the piston linked by chain to the beam that transmitted the stroke to pumps. Its use was confined to pumping water from mines or to supply networks; diffusion was limited by under-boiling and the extension of Savery's generic patent to 1733, but extended to Wales, the midlands, and the Newcastle collieries; up to 60 had been installed by 1733, the best producing a *duty* (pounds of water raised one foot by a bushel of coals) of 3.75 million, but a lift of under 45 yards. \*Smeaton's improvements allowed such engines to supply most horsepower c.1800, and Thompson's patent (1792), effective rotary motion. JCh

**New Delhi** displaced \*Calcutta as the capital of British India in 1912. It was selected to stand adjacent to Old Delhi, an erstwhile capital of the Mughal empire, to emphasize continuity between the two imperial traditions. Many of its public buildings were designed by Sir Edwin \*Lutyens to provide a sense of grandeur, suggestive of power and permanence. But the impression was illusory—within 35 years the British had gone. New Delhi remains the capital and seat of government of the Republic of India and contains the diplomatic enclaves of all foreign governments. DAW

**New England** was the name given by Captain John Smith in 1614 to the coastline of America north of the Hudson river, between the 41st and 45th degrees. Two years later he published a *Description of New England*, claiming at least 25 fine harbours. The \*Mayflower settlers landed at Plymouth in 1620 and the name New England was applied to the colony at Plymouth (later absorbed by Massachusetts), New Haven (later part of Connecticut), Massachusetts, Connecticut, Rhode Island, New Hampshire, and Maine. A New England Confederation, or United Colonies of New England, in 1643, to co-ordinate defence, though ineffective, was an early example of inter-colony collaboration. The New England colonies, with their strong puritan tradition, ultimately became the core of American resistance in the War of

## Newfoundland

Independence and it was to cut them off from their neighbours in 1777 that \*Burgoyne began his march south from Canada down the Hudson river, which ended with his capitulation at \*Saratoga. JAC

**Newfoundland** was probably 'discovered' by John \*Cabot in 1497. Europeans soon exploited its cod fishery. Although Newfoundland was claimed for England in 1583 by Sir Humphrey \*Gilbert, sovereignty was disputed until 1713, and France retained rights of access to the coasts until 1904. Settlement was discouraged by the harsh environment and by British governments, which regarded the fishery as a source of personnel for the navy. Population reached 50,000 in the 1820s, drawn from the west of England and southern Ireland, the mix creating a rich culture, distinctive speech, and sectarian division. The last native Beothuk died in 1829. An assembly was introduced in 1832 and self-government in 1855. Newfoundlanders rejected union with Canada in 1869. The economy depended on fishing and most Newfoundlanders were poor. Facing bankruptcy, Newfoundland agreed in 1934 to rule by a commission of government appointed by Britain. Military bases in the Second World War brought prosperity and in 1948 Newfoundlanders voted by 52 to 48 per cent to become Canada's tenth province, formally joining in 1949. While population had almost doubled to 586,000 by 1986, Newfoundland relied on Canadian subsidies to survive. In 1992, even survival seemed threatened when international plundering of cod stocks forced the closure of the fishery. GM

**Newgate prison** was founded during the reign of Henry I in the west gatehouse of the city of London. It was extensively modified in 1423 following a bequest from the mayor of London, Richard \*Whittington. Warders were corrupt, as their offices could be bought and sold: drinking, gambling, and prostitution were commonplace in a harsh and squalid environment. It housed mainly serious criminals and from 1783 replaced \*Tyburn as the place for public executions. The prison was destroyed and rebuilt twice, once following the Great Fire of \*London in 1666 and again after the \*Gordon riots of 1780. Newgate, the most famous and forbidding prison in the land, finally closed in 1902. RAS

**New Guinea.** See PAPUA NEW GUINEA.

**New Hebrides.** See VANUATU.

**New Lanark** (Strathclyde), a factory village, was built by David Dale to exploit the water-power provided by the Clyde in 1784–5. Dale erected four cotton-mills and housing for over 200 families by 1793, the population consisting of Highlanders and pauper apprentices. In 1799 Dale sold New Lanark to Robert \*Owen, his son-in-law, and the village acquired a reputation as a profitable and contented community. Owen built schools and an Institution for the Formation of Character, demonstrating his commitment to environmental psychology and improving his work-force. After Owen, the village went through several changes of ownership and is now a museum conservation area. JB

**Newman, John Henry** (1801–90). Cardinal. The greatest catholic theologian and spiritual writer of the last 200 years,

and likely to be officially declared a saint, Newman was the leading convert of the \*Oxford movement. His published writings, including *An Essay on the Development of Christian Doctrine* (1845), sermons, and *Letters and Diaries*, profoundly influenced the second Vatican Council (1962–5), often called 'Newman's Council'. His writings on the Christian church brought ecclesiastical censure and, after a period of withdrawal and reflection, he became a catholic in 1845. Theological controversy pursued him through his life of pastoral ministry at the Birmingham Oratory, which he founded. Sensitive to the alleged and often real rebuffs of friends, but also to the demands of ecclesiastical authority, he was often at its mercy. He was delated to Rome for his writings on the laity and the shadow of suspicion was not lifted until he was made cardinal in 1878.

Newman was the son of a London banker and educated at Trinity College, Oxford. He became a fellow of Oriel College and held the living of St Clements, Oxford, which he resigned in 1843 before joining the catholic church. *Apologia pro vita sua* (1864) explained his spiritual and religious views. *The Idea of a University* (1852) was a plea for universities to offer a liberal education, for the cultivation of the mind. JFC

**Newmarket** (Suffolk and Cambs.) is the headquarters of flat racing, run on the downs since the reign of Charles II, who founded the Newmarket Town Plate and after whom the 'Old Rowley' mile course is named. It is the home of the Jockey Club, which built a coffee-house at the course in 1752. The best-known races include the 2,000 and 1,000 guineas, the Cambridgeshire, and the Cesarewitch. Newmarket is home to a large number of racing stables and to the National Stud. JAC

**New Model Army.** Created by the Long Parliament early in 1645 out of the three existing armies of \*Essex, \*Manchester, and Sir William \*Waller. Although run on administratively similar lines, the new army represented the triumph of Oliver \*Cromwell in his political struggle against Essex and Manchester. Purged of the old aristocratic and parliamentary leadership, the New Model, under the excellent generalship of Sir Thomas \*Fairfax, vanquished the king's forces at \*Naseby (June 1645). This battle was followed by an unbroken chain of victories ending in the surrender of the king in June 1646. There then ensued a political struggle with Parliament, now under the sway of the presbyterian peace party of Denzil \*Holles and Essex. This conflict, interrupted by the second civil war, culminated in the army's purging of Parliament (6 December 1648), and the subsequent trial of Charles I by a court dominated by New Model Army officers and their parliamentary allies. Having established undisputed mastery in England, the army went on to invade and eventually conquer Ireland (1649) and Scotland (1650). IJG

**New Orleans, battle of**, 1815. This battle was unusual in taking place after the \*War of 1812 was over. This conflict with the United States over disputes about maritime searches was a most unwelcome distraction to Britain during its struggle against Napoleonic France. Peace negotiations

began at \*Ghent in the autumn of 1814, but an expedition against New Orleans had already been planned, partly to humiliate the Americans, partly in the hope of prize money. There was no element of surprise, the troops were soon bogged down in swamps, and the defence was conducted by Andrew Jackson, later president of the USA. The main assault on 8 January 1815 failed. British dead included the army commander Sir Edward Pakenham and, with wounded, totalled 3,000. News arrived the following month that peace had been signed in December 1814. JAC

**Newport, treaty of**, 1648. The end of the second civil war found Charles I still at Carisbrooke in the Isle of Wight. In September, Parliament, alarmed at the growth of radicalism in the army, resumed negotiations with the king in the town hall at Newport. Charles made substantial concessions over episcopacy and control of the militia, but admitted privately that he negotiated 'merely in order for my escape'. When the negotiations foundered in November, the army seized power and the king was moved to Hurst castle on the mainland, as a preliminary to bringing him to trial. JAC

**'Newport rising'**, 1839. Parliament's rejection of the first \*chartist petition in July 1839 placed the chartist leadership in a quandary. There was not enough support for a 'sacred month' (general strike), while to begin an even bigger petition seemed daunting. The physical force men argued for direct action. In the Welsh valleys, the situation was enflamed by the imprisonment of Henry Vincent in Monmouth gaol. But the march on Newport led by John Frost on 3 November can hardly have been intended as more than a mass demonstration. Troops had been moved into the Westgate hotel, where some local chartists were held captive, and opened fire, killing at least fifteen. Frost and two others were tried for treason, condemned, and sent for transportation. To rescue Vincent, they were in the wrong place, and even if Newport had been seized, it would scarcely have brought the government to its knees. The 'rising' was a show of strength that went wrong. JAC

**New River**. As Elizabethan London grew, the demand for water outstripped supply, prompting Sir Hugh \*Myddleton to construct an artificial waterway from Ware in Hertfordshire (1609–13). Fed by the Chadwell spring, thirteen wells, and small tributaries, its 39-mile meander terminated at the New River Head, near King's Cross Road; it included over 40 sluices and two long aqueducts made from timber troughs lined with lead. Water distribution in the city was via some 400 miles of wooden pipes, some of which, despite leakage, were still in use about 1800. Subsequently straightened and shortened, it now ends at Stoke Newington waterworks. ASH

**New Ross, battle of**, 1798. On 5 June 1798 some 30,000 rebels from Wexford (Ireland), led by Bagenal Harvey and Father Philip Roche, launched an attack on New Ross, where there was an important bridge over the river Barrow. The defence, numbering 1,500 men under General Henry Johnston, was disciplined and determined. Government artillery inflicted heavy casualties and, after desperate hand-to-hand fighting, the rebels were driven off. The king noted

Johnston's exemplary conduct: \*Cornwallis wrote privately that Johnston, though a blockhead, was now considered 'the saviour of the south'. JAC

**New South Wales**, a member state of the federal Commonwealth of Australia, was founded 26 January 1788 as a penal colony when Britain annexed over two-thirds of the Australian continent. NSW was later separated into Tasmania (1825, settled 1803), South Australia (1834, settled 1836), Victoria (1851, settled 1834), Northern Territory (1863, incorporated as a federal territory in 1910, yet to achieve full statehood), Queensland (1859, settled 1824), and the Australian Capital Territory (1911). With an area of 310,372 square miles and 6,115,100 inhabitants (1995), of whom 3,736,000 reside in its state capital, Sydney, NSW is the most populous state. For a long time dominated by its convict past, NSW eventually became a thriving self-governing colony, utilizing its savannah grasslands to establish one of the world's largest wool-producing industries, and its coal, mineral, and forest resources to found manufacturing industries; and, with the advent of inland railways (1870–1900), extensive wheat-farming.

With its convict heritage, large unionized industrial population, and somewhat left-of-centre political attitudes, as well as its leading role in the export of wheat and wool, and Sydney's position as Australia's major stock exchange and growing importance as a company headquarters city, NSW is politically and economically Australia's most powerful state. Sydney's pre-eminence has been achieved against strong competition from Melbourne (1995 population 3,197,800), which long regarded itself as the more important financial and company centre. Sydney, with its famous bridge, ocean beaches (Bondi and Manly), and even more famous opera-house, provides Australia with its most readily identified international images. MJW

**newspapers**. It was well over 100 years from the invention of printing to the appearance of the first newspapers. A number of *corantos*, based on German and Dutch models, were published in the 1620s, but they were confined to London, carried very little English news, appeared erratically, and had print-runs of only a few hundreds. The Civil War stimulated the demand for news and in the 1640s the royalist *Mercurius Aulicus* waged ideological warfare from Oxford against the parliamentary *Mercurius Britannicus* in London. The authorities, republican or royalist, mistrusted news-sheets and in 1663 Sir Roger l'Estrange was given wide licensing powers as surveyor of the press. Two years later, the \**London Gazette* was started to provide official news. This thin government diet proved unpalatable and the broad-sheets which continued to appear were devoted more to mayhem and bawdy than to political information. The excitement of the \*Popish plot in the 1670s persuaded many printers to risk prosecution by producing unlicensed papers, and there were also several manuscript news-letters, expensive to produce, and distributed to a limited number of subscribers.

The growth of a newspaper press in a modern form dates from the failure to renew the \*Licensing Act in 1695. Several newspapers were quickly off the mark, including

the tri-weekly *Post Boy*, *Post Man*, and *Flying Post*, all of which survived until well into the 18th cent. In April 1702 they were joined by the first daily paper, the *Daily Courant*, and though its circulation was modest, it stayed until 1735. At the same time the provincial press made its appearance with the *Norwich Post* (1701), followed by the *Bristol Post Boy* (1702), *Exeter Post-Man* (1704), and the *Worcester Post-Man* (1709). Though casualties among newspapers were heavy, the general progress through the 18th cent. was remarkable. By 1760 there were four London dailies and by 1790 fourteen. Provincial papers multiplied even quicker: by 1760 there were 35 in existence, 50 by 1780, and 150 by 1821. Stamp duty, introduced in 1715 to curb papers, brought in £911 in its first year but by 1781 was yielding more than £40,000 p.a. to the revenue. Circulation was much larger, comment less restrained. *Mist's Weekly Journal* pursued \*Walpole in the 1730s, the *Middlesex Journal* attacked \*North in the 1770s, and \*Cobbett's *\*Political Register*, claiming a staggering 60,000 copies in the 1800s, sustained a long campaign for reform of Parliament. From cautious beginnings, the press had become a major political force. Parliament was obliged in the 1770s to abandon its attempt to suppress publication of its debates, and though prosecution of editors continued and the stamp duty was raised during the Napoleonic wars, public appetite grew. The stamped papers were expensive, but an unstamped press flourished, and papers could be read by the less wealthy in coffee-houses, pubs, and barbers' shops.

Sunday newspapers, at first much opposed, began in 1779 with the launch of the *Sunday Monitor*, joined in 1791 by the *Observer*, whose great days were well ahead in the 1920s. By mid-century the Sunday papers were outselling the dailies and had already acquired a reputation for sensational journalism. The *News of the World* began its career in 1843. Among the dailies, the prodigious success was that of *The \*Times*, started in 1785 as the *Daily Universal Register*, changing its name in 1788, and forging ahead in the 19th cent. with the introduction of steam printing and a news service so good that government ministers begged to know what was taking place. By 1850 it was selling four times the number of the *Morning Chronicle*, *Morning Herald*, and *Morning Post* combined, and claiming (1852) that it stood 'upon the breach between the present and the future, extending its survey to the horizons of the world'. Three years later, the abolition of the stamp duty enabled the *\*Daily Telegraph* to launch itself as a rival to *The Times* and by 1880 it was claiming 250,000 copies.

The 'newspaper revolution' of the late 19th and early 20th cents., which ushered in the 'popular press', was progression rather than a sudden change. Ever since newspapers began, the authorities had been anxious about their effect on the masses. The broadsheets of the 1640s had revelled in sex, violence, and the bizarre. George Reynolds in the 1840s mined a rich seam with *Reynolds Magazine*, offering articles and stories which sounded more lurid than they were—'Wagner, the were-wolf', 'Varney the Vampire', and 'Maniac of the Deep'. W. T. Stead's campaign in the *Pall Mall Gazette* in 1885 against the prostitution of young girls (for which he went to well-publicized gaol for two months) anticipated later crusades, not least in its ambiguity. What was changing

was the growth of a vast new reading public, benefiting from the introduction of compulsory elementary education in 1880, able to afford a paper, yet unprepared for long and strenuous reading. First to exploit the new market was George Newnes, whose *Tit-Bits* (1881) rocketed to success, with odd news items, tips and hints, and competitions. T. P. O'Connor followed with the *Star*, a London evening paper, in January 1888, and was selling 125,000 within the month, mainly to rail commuters. Next came Alfred \*Harmsworth, literally the first of the newspaper barons, with *Answers* (1888), *Comic Cuts* (1890), and *Home Chat* (1895), before launching the *Daily Mail* in 1896, selling at a halfpenny, and reaching 989,000 copies by 1900. Earnest citizens could not decide whether it was splendid that the masses were now reading, or shocking that they were reading trash.

In the post-1918 period, the national dailies increased their market share, largely at the expense of the provincial papers. The competition, even with an expanding readership, was fierce. The *Mail* was followed by the *Daily Express* (1900), the *Daily Mirror* (1903) which was selling more than a million copies daily by 1914, and the *Daily Herald* (1919), organ of the new \*Labour Party. Reliance on \*advertising revenue meant that circulation figures were of crucial importance and giveaway offers—pens, insurance, books, holidays—became common. Though the *Herald* peaked in the 1930s, it was handicapped because its readership had poor purchasing power and was unattractive to advertisers: when it closed in 1964 it still had nearly 5 million readers, but of the wrong mix. After the customary wartime boom from 1939 to 1945, the press faced new problems—sharply rising labour costs, and in the 1970s competition for advertisements from television. Ownership of the press passed from proprietors or families to large consortia with the resources to re-equip and compete. After a series of damaging confrontations with the unions in the 1970s (*The Times* was out of production for eleven months 1978/9), the papers began moving out of \*Fleet Street, with which they had been associated since the 17th cent., into purpose-built premises well away from the city of London. The quality papers continued to do well and at the bottom end of the market the competition in vulgarity would have won the approval of their 1640s predecessors. Over the past decades, the largest fall in circulation has been among the Sunday papers, reflecting the change to a day of shopping and vigorous leisure. In December 2000 the circulation of the *Sun* was 3.6 million, followed by the *Mail* (2.3), the *Mirror* (2.3), the *Express* (1.0), the *Telegraph* (1.0), *The Times* (0.72), the *Star* (0.5), the *Financial Times* (0.41), the *Guardian* (0.39), and the *Independent* (0.22). Among the Sundays, the *News of the World*, with its rather monotonous diet of which TV personality is cheating on whom, still outsells its rivals with 3.8 million copies, followed by the *Mail on Sunday* (2.3), *Sunday Mirror* (1.7), *People* (1.4), *Sunday Times* (1.3), *Sunday Express* (0.9), *Sunday Telegraph* (0.8), *Observer* (0.4), and *Independent on Sunday* (0.23).

**Newton, Sir Isaac** (1642–1727). Newton was born near Grantham after his father's death, on Christmas Day; his mother soon remarried, and he had a lonely upbringing. He went to Trinity College, Cambridge, in 1661; during the plague year, 1665–6, the undergraduates were sent home, and he is supposed to have thought of the nature of light, differential calculus, and the theory of gravity. In fact, all these things needed much further work over succeeding years. In 1669 he was appointed to the Lucasian chair of mathematics at Cambridge, where he divided his time between mathematical sciences, alchemy, and biblical study. He became a closet \*socinian, denying the doctrine of the Trinity; this made him even more secretive. In 1672 his first paper went to the \*Royal Society, containing his 'crucial experiment' to prove that white light is a mixture of all the colours. Because he believed that refraction inevitably produced coloured fringes, he advocated reflecting telescopes, and made one. His paper was criticized by Robert \*Hooke, to whom it had been referred, and Newton took umbrage. He did not publish his book, *Opticks*, until 1704, after Hooke was dead. It was the standard work for a century.

In 1684 Edmond \*Halley came to see him after discussing planetary orbits with Hooke and Christopher \*Wren, and found that Newton had worked out the laws of motion and of gravity which would account for them. With Halley as midwife, Newton's *Principia* was published in 1687. It begins with setting out the nature of space, time, and motion; then come the laws of mechanics, a proof that whirlpools of ether cannot explain the phenomena, and, finally, the demonstration that gravity and inertia fit the facts. He showed that attraction between planets will produce wobbles in their orbits, which were indeed observed. Nevertheless, attraction across void space seemed a mystery, and some of his eminent contemporaries were unwilling to accept his physics. He represented the university in Parliament, and in 1696 was appointed warden (later master) of the mint in London, where he supervised recoinage. By the time of his death, he was regarded with awe in Britain, and soon after came to stand as the symbol of enlightenment: a mind for ever voyaging through strange seas of thought, alone. DK

**Newtown Butler, battle of**, 1689. In the summer of 1689 Enniskillen, second only to Derry in importance in Northern Ireland, still held out against the Jacobite advance, a rallying-point and a great nuisance to their lines of communication. But when Mountcashel was ordered to pinch out the town, its defenders got their blow in first, attacking his troops at Newtown Butler on 31 July. Though heavily outnumbered, the Williamite forces carried the day, taking all the Jacobite guns and capturing their commander. It was the start of the turn of the tide. JAC

**new towns.** See GARDEN CITIES.

**New Zealand.** The two main islands of New Zealand, lying more than 1,000 miles to the east of Australia, have a land area of nearly 104,000 square miles, and are larger than the United Kingdom (94,000). South Island is rather bigger than

North Island, but contains only a quarter of the people. In the mid-1990s the population was  $3\frac{1}{2}$  million, most of them living in towns. The capital, Wellington, with 329,000 people, is in North Island; Auckland has nearly 1 million people, and Christchurch 318,000. Mount Cook in the Southern Alps rises to more than 12,000 feet and in North Island there are geysers and hot springs. The economy is still largely based on cattle- and sheep-rearing, with Australia, Japan, USA, and UK the main markets, but New Zealand wine flourishes, industry increases, and tourism expanded rapidly after the spread of fast air travel.

The first inhabitants were Polynesian people, ancestors of the Maoris, who settled by the 8th cent. Abel Tasman, the Dutch explorer, sighted the west coast of South Island in December 1642, but four of his men were killed by the Maoris and he did not land. The Dutch named the land New Zealand but showed no further interest in it. The first encounter confirmed the warlike nature of the natives. Captain \*Cook, in the 18th cent., guessed that there were 100,000 of them, but he had no means of knowing and the figure was probably a substantial underestimate. They lived mainly in North Island, expectation of life was little more than thirty years, and cannibalism was practised.

Not until 1769 was Tasman's initiative followed up when, on his first voyage, Cook circumnavigated both islands. Again, his landing found a hostile reception and several Maoris were shot in skirmishes. He revisited the country on his second and third voyages, reporting that it would sustain an industrious people and that the natives would be too divided to offer much opposition. Thereafter contacts increased, with whalers and sealers calling in for supplies. In 1814 a small Christian mission was established, with little success at first, but progress by mid-century. For fifty years, the situation was close to a state of nature. Increased contact brought diseases to which the Maoris were extremely vulnerable and the acquisition of guns allowed them to try to exterminate each other. The native population declined sharply. By 1838 there were some 2,000 Europeans living and trading in New Zealand—the English, in \*Darwin's opinion, 'the very refuse of society'. Disputes over land deals and violent clashes led many settlers to demand British protection. A New Zealand Association in 1837, supported by Lord \*Durham and E. G. \*Wakefield, was founded in London to encourage mass emigration. In 1839 an unenthusiastic British government sent Captain William Hobson to propose annexation to the Maoris to protect them from indiscriminate expropriation and in 1840 the treaty of \*Waitangi was signed, ceding sovereignty to the British in exchange for promises of security. The new colony was placed under \*New South Wales but in 1841 established in its own right.

The economic development of New Zealand was boosted by the discovery of gold in South Island in the 1850s, and, more enduringly, by the development of refrigeration in the 1880s, which enabled it to export cheese, butter, and meat to Britain. Constitutionally it progressed at remarkable speed, despite the protracted \*Maori wars which continued until 1872. As early as 1846 responsible government was granted, though suspended by the governor, Sir George

## Nigeria

Grey. A federal constitution was granted in 1852, with the country divided into six provinces, and was followed in 1856 by full representative government. The capital was moved from Auckland to Wellington in 1867. Though it took part in the negotiations, New Zealand did not join the Commonwealth of Australia in 1901 and in 1907 became a self-governing dominion. New Zealand sent a high proportion of its men to fight in the First World War and was given \*Western Samoa, a former German colony, as a \*mandate under the League of Nations at the end of the war: it became an independent state in 1962.

The population of New Zealand rose undramatically at first. The Maori population in 1896 was put as low as 42,000 and extinction seemed a possibility: it increased throughout the 20th cent. and by the 1990s was more than 400,000. The total population of New Zealand in 1907 was still less than 1 million, grew slowly in the 1920s, partly as a result of high wartime casualties, and had risen to 1.7 million by 1945. After that it rose quickly, reaching more than 3 million by 1975, before flattening out. As in South Africa, sport has been a bond of the emerging nation—the All Blacks' attempts to terrify their opponents with the Maori haka, the prominence of Maoris in rugby teams, and the development of the Western Samoans as formidable opponents. The New Zealanders have, with some truth, been described as 'genteel Aussies'.

JAC

**Nigeria.** Former British colony and protectorate in West Africa. British missionaries arrived in Nigeria in the 1840s and in 1853 Lagos was annexed as a British colony as part of the campaign to halt the West African slave trade. When the activities of legitimate British traders in the Niger delta region were threatened by French rivals, the British government took responsibility for the conquest of the interior in 1900. The presence of powerful Muslim emirates in the north and of disparate systems of tribal organization in the south resulted in the division of Nigeria by the British into three distinct administrative regions, amalgamated under one central authority in 1914. Cocoa and palm-oil products brought a measure of wealth to the two southern regions but the north remained poor. The religious and economic differences between north and south resulted in the creation of an uneasy federal system of government when Nigeria became independent in 1960. The declaration of independence by the province of Biafra in 1966 provoked a bloody civil war, and though the Biafrans were defeated in 1970, Nigeria, a large and populous country, remains a prey to military coups.

KI

**Nightingale, Florence** (1820–1910). Nursing reformer. Named after the city of her birth, liberally educated, she chafed at the restricted opportunities for women of her station but eventually found purpose in relieving suffering. She learned nursing skills from the deaconesses at Kaiserswerth, but her real talents lay in administration, where she could manipulate and assert her will. Invited to go out to Crimea (1854), her success in mitigating Scutari's appalling conditions stemmed from organization, discipline, hard work, and being outside the army structure. On return, exploiting the legend of the Lady with the Lamp though chronically

unwell, perhaps as a result of brucellosis (for 40 years), she undertook reform of the army medical services, then hospital architecture, nursing education, and sanitary reform in India. A person of considerable complexity, she raised nursing from disrepute to an honourable vocation, but was a lukewarm supporter of women's emancipation. ASH

**Nijmegen, treaties of, 1678–9.** Though England was not directly involved in the protracted Nijmegen negotiations, since the third \*Anglo-Dutch War (1672–4) had been wound up by the treaty of \*Westminster, her interests were much at stake. Louis XIV had clearly failed in his original intention of crushing the Dutch, yet he was still able to make significant territorial gains, including fifteen frontier towns and Franche-Comté. It was becoming obvious that France had replaced Spain as Europe's overmighty power and the shape of the coalition to restrain Louis 1688–1714 began to appear.

JAC

**Nile, battle of the, 1798.** The site of this annihilating encounter between thirteen British ships of the line under \*Nelson, and thirteen French under Brueys, is at the western end of Aboukir Bay. This extends some 18 miles south-west/north-east 20 miles east of Alexandria, close to Rosetta on the Nile delta. In the evening of 1 August 1798, after a chase of over two months, Nelson sighted Brueys's ships there, Napoleon having disembarked the 'Army of Egypt' at Alexandria a month before. Brueys had moored his ships in line about 3 miles offshore, but at intervals which prevented them from mutual support if attacked: their moorings betrayed their situation, since each ship was moored only at the bows, showing that each had room to swing to either side and yet be clear of shoals. In a night action five British ships attacked from the landward side where the French were least prepared for action, and seven from seaward, led by Nelson in *Vanguard*. By midday on 2 August all but two of Brueys's ships had surrendered, at no British loss. In consequence French land forces were both marooned and blockaded. Nelson was rewarded with a barony. DDA

**Nineteen Propositions.** In the summer of 1642, Charles I withdrew from London and prepared for war. On 1 June, Parliament sent to him at York nineteen propositions, which were more of a manifesto than a negotiating draft. They demanded complete political and military control. The king's answer, drafted by Colepeper and \*Falkland, was a skilful exposition of the case for a balanced constitution. The propositions would 'destroy all rights and properties, all distinctions of families and merit, and by this means this splendid and excellently distinguished form of government [would] end in a dark, equal chaos of confusion'. Though mainly a tactical manoeuvre for the middle ground, the answer was not forgotten and was much discussed as the basis for some form of limited or constitutional monarchy. JAC

**Nine Years War, 1689–97.** Also known as 'King William's War' or the 'War of the English Succession'. William of Orange accepted England's throne in 1688 in the hope that the nation's superior sea power and financial strength could be used in his struggle against Louis XIV's ambitions in the Netherlands and Germany. The French king's

support for the exiled James II in Ireland and his harassment of the English fleet early in 1689 made war inevitable, and in May William formed a Grand Alliance which included England, the United Provinces, and the Empire. What was initially envisaged as a short struggle to compel French recognition of the English succession developed into a prolonged conflict of unprecedented scale and financial commitment. In Ireland James's Franco-Irish army was soon defeated at the \*Boyne in July 1690 and the rebels finally suppressed in 1691. But England's naval mastery of the English Channel was initially weakened by the French fleet and several times invasion was threatened until in May 1692 the allies overwhelmed the French off \*La Hogue. Meanwhile, William was enmeshed in a desperate war in the Netherlands. In the slow, yearly grind of siege warfare he suffered a series of costly defeats before capturing the key fortress town of Namur in 1695, but his only real achievement was in preventing the French from completely overrunning Flanders. The war ended in September 1697 when the exhausted protagonists signed the treaty of \*Ryswick.

AAH

**Ninian, St**, properly Nynia, first apostle of the Scots. A very obscure figure mentioned by \*Bede and subject of a much later life by Ailred of Rievaulx. Bede says he was a Briton and he appears to have lived around the time of the ending of Roman Britain, probably in the 5th cent. He is linked with south-western Scotland outside the Roman wall by his association with Whithorn (Dumfries and Gallo-way), in the territory of the Novantae. Known to Bede in Latin as Candida Casa, the white house, its Anglo-Saxon name Hwitærn means the same. Recent excavations at Whithorn have revealed an important early medieval ecclesiastical complex, perhaps going back to the postulated time of Ninian.

ASEC

**nisi prius**. The statute of Westminster II, chapter 30, established this system which was an important factor in the growth of the \*common law. The Court of \*Common Pleas was established at Westminster palace after \*Magna Carta (1215), but the disadvantage of bringing cases before the justices there was that the jury, which had to come from the litigant's own locality, had to travel to Westminster to give its verdict. In order to avoid the inconvenience of this system, Edward I's legislation provided that the jury verdict should be given at Westminster 'unless before' the date arranged, the travelling justices visited the area and took the jury's verdict in their own local court. It was then ensured that justices should invariably visit the locality before the specified date, thus speeding and making more convenient the process of litigation in the common law court. MM

**Nkomo, Joshua** (1917–1999). Pioneer Zimbabwean African nationalist. After studying in South Africa, Nkomo returned to work on the Rhodesian Railways and became president of the black railway workers' union in 1951. He was elected president of the African National Congress (ANC) in 1957 and was founder and president of the National Democratic Party in 1960 and the Zimbabwe African People's Union (ZAPU) in 1961 as each of the earlier parties

was banned. Nkomo was detained by the white-controlled government from 1964 to 1974 and then led ZAPU, in alliance with Robert \*Mugabe's ZANU, in a guerrilla war against the government. In the peace negotiations held in London in 1979 he was overshadowed by Mugabe, and when the latter became prime minister of Zimbabwe in 1980, relations between the two remained uneasy. In 1987 ZANU and ZAPU united and, when Mugabe became the country's executive president, Nkomo was appointed vice-president.

KI

**Nkrumah, Kwame** (1909–72). Africa's most influential nationalist leader. After university education in the USA, Nkrumah helped to organize the fifth Pan-African Congress in Britain in 1945. Returning to the Gold Coast in 1947 he parted from the moderate leaders of the campaign for self-government to found the populist Convention Peoples' Party in 1949. Imprisoned after organizing a campaign of non-cooperation with the British colonial government in 1950, he was elected to Parliament in 1951 and was released from detention, becoming prime minister of the Gold Coast in 1952. He remained in office when the country, renamed \*Ghana, gained its independence in 1957, and became president of the Republic of Ghana in 1960. He worked hard to promote the political unification of Africa as a defence against neo-colonialism, but his financial extravagance and his increasingly authoritarian rule at home led to his overthrow in 1966. He subsequently lived in exile in Guinea. KI

**nobility**. See ARISTOCRACY.

**Nollekens, Joseph** (1737–1823). An English sculptor, Nollekens was the son of an Antwerp painter settled in England. Between 1760 and 1770, in Rome, he laid the foundations of his financial and artistic success. He made a fine, if not always honest, living, dealing in antique fragments and sculpture. Several portrait busts he carved at this time ensured that his reputation preceded him, and on his return to London he established a successful practice. Nollekens's sitters included royalty, literary men, and numerous politicians; William \*Pitt refused to sit for him, yet casts of the excellent bust which Nollekens made from a death mask and a portrait were extremely popular. Many of his monuments and busts are in Westminster abbey. Nollekens was established as notoriously mean in the biography written by his pupil J. T. Smith (1828). JC

**Nominated Parliament**. See BAREBONE'S PARLIAMENT.

**nonconformists**. See DISSENT.

**non-jurors** were the high churchmen of the late 17th-cent. Church of England, who refused the oath of allegiance to William and Mary after their accession in 1688. They held to the doctrine of the \*divine right of kings and believed, therefore, that the Stuarts remained the legitimate monarchs. Eight bishops (including \*Sancroft of Canterbury), 400 priests, and a few laymen refused the oath. They were dispossessed and tried to keep an alternative church in existence with illegal services in their churches, but were divided among themselves over the correctness of this. Their links with the Stuarts and the fears of restoration made them

## non-residence

unpopular in early Hanoverian England. They were linked in belief and religious principles to the Caroline divines of the 17th cent. and the \*Oxford movement of the 19th cent.

JFC

**non-residence.** Residence in one's place of ministry has been compulsory since early times for all bishops and benefited clergy, but absence became a substantial abuse in the later Middle Ages. Notable examples were \*Wyclif who, though he attacked the abuse, was himself not resident, and \*Wolsey who successively held several sees in *commendam* with the archbishopric of York. Non-residence was a major target of the reformers. The Council of Trent specifically banned it, as did the Anglican canons of 1604 and 1964–9. Nevertheless it was commonplace in the 18th cent. since many livings were too poor in themselves to support a priest; 60 per cent of incumbents were non-resident in 1808.

WMM

**non-resistance.** 'For who can stretch forth his hand against the Lord's anointed and be guiltless?' The doctrine of non-resistance flourished in the aftermath of the Civil War, holding that monarchs had total jurisdiction and that their subjects owed them total obedience. Sir Robert Filmer's *Patriarcha*, published in 1680 some 40 years after it was written, declared that the idea that 'the multitude may correct or depose their prince' was a 'damnable conclusion'. After the Restoration, the \*Corporation Act (1661) and the Act of \*Uniformity (1662) insisted on an oath that 'it is not lawful on any pretence whatsoever to take up arms against the king'. But James II's attack upon the Church of England placed many Tories in an acute dilemma and the majority abandoned non-resistance to support the invasion of William of Orange. In 1689, the statute 1 Wm. & Mar. c. 8 specifically declared that the previous oath against the lawfulness of resistance 'shall not from henceforth be required'. The last great debate on the subject took place during the impeachment of Henry \*Sacheverell in 1710. After 1714, with a Hanoverian on the throne and the Whigs firmly entrenched in power, the doctrine of non-resistance seemed less appealing to the Tories.

JAC

**Nonsuch, treaty of,** 1585. After years of characteristic hesitation, in August 1585 Elizabeth took a momentous decision. The fall of Antwerp persuaded her that, without aid, the Dutch rebels would be crushed by Philip II of Spain. Putting aside the temptation of sovereignty, she agreed, at Nonsuch palace, to place 7,000 men in the field at her own cost. \*Leicester was put in charge. Philip's response was the preparation of a great \*Armada.

JAC

**Nonsuch palace** near Cheam in Surrey was built on a grand scale round two courtyards by Henry VIII from 1538 onwards, sold by Mary, and repurchased in 1592 by Elizabeth. In the 17th cent. it belonged to \*Henrietta Maria, who reoccupied it at the Restoration. After her death Charles II gave it to his mistress the duchess of Cleveland, who had it demolished in 1682.

JAC

**Nootka Sound crisis,** 1790–1. In May 1789 two Spanish warships entered Nootka Sound on the west coast of

Vancouver Island, pulled down the British flag, seized vessels, and claimed the coast up to Alaska for Spain. The subsequent crisis was not resolved until autumn 1791 and coincided with a British general election. \*Pitt took over conduct of the negotiations from \*Leeds, his foreign secretary, mobilized a fleet, and gained redress at the Convention of Madrid. \*Fox and the opposition routinely denounced the reparations as inadequate.

JAC

**Nore naval mutiny,** 1797. Unlike \*Spithead, the Nore, at the mouth of the Medway, was not a fleet station but an assembly point. This helps to explain the mutiny's uncoordinated nature, though its causes were fundamentally the same as Spithead's and it lasted for a similar period, from 12 May to 16 June. The noisome conditions in the depot/flag ship *Sandwich*, with her complement swollen by articulate 'Quota Men' (provided by counties and ports under the Acts of 1795) such as the mutiny's apparent leader Richard Parker, sparked an agitation which was disseminated through the anchorage, since the Spithead royal pardon did not obtain there. The coherent pattern of the Spithead outbreak was lacking at the Nore, but Sheerness was nevertheless cowed, Thames traffic halted, and from there up to Yarmouth the navy's guard against the hostile Dutch fleet lowered. Starvation, and a popularly supported governmental attrition, smothered the mutiny; Parker, and 29 of his erstwhile confederates, were hanged.

DDA

**Norfolk** was the fourth largest of the traditional counties. From Yarmouth in the east to Sutton bridge in the west is over 70 miles. The county is separated from Suffolk in the south by the rivers Waveney and Little Ouse, and from Cambridgeshire to the west by the river Nene. Much of the eastern half is drained by the river Wensum, which rises west of Fakenham and flows through Norwich to join the Yare, which is joined by the Bure just before it enters the sea at Yarmouth: the western rivers Wissey and Nar are tributaries of the Great Ouse, which flows into the Wash at Lynn. From Yarmouth round to the Wash is coast, lashed by what \*Camden called that 'great, roaring ocean': the coast was so dangerous that when \*Defoe visited Cromer in the 1720s he noticed no barn, shed, or pigsty which was not 'built of old planks, beams, wales and timbers, the wrecks of ships and ruins of mariners' and merchants' fortunes'. The shire is mainly flat, a county of vast horizons and of nippy salt breezes blowing off the sea.

The county takes its name from the North-folk of the Saxon settlement. In Roman times it was in \*Iceni territory. It then became part of the Saxon kingdom of \*East Anglia, which retained some independence until the 9th cent., when it fell under Danish control. The difference between Norfolk and Suffolk was acknowledged early: the whole area was under the diocese of \*Dunwich until 673, when a new diocese was established at North \*Elmham, near East Dereham. Despite severe depredations—Thetford and \*Norwich were sacked by the Danes in 1004—the region grew in population and prosperity. Thetford, Yarmouth, and Norwich were flourishing towns by the time of the \*Domesday survey in 1086. Thetford gained a temporary advantage in 1072 when the bishopric was moved there from North Elmham,

but in 1094 it was transferred again, this time to Norwich, where it stayed. The great cathedral was started in 1096. Bishop's Lynn, which became King's Lynn at the time of the Reformation in 1536, may have existed before the Norman Conquest, probably as a place where salt was made, but its development as a major port was in the late 11th and 12th cents.

Norfolk's prosperity owed much to its geographical position. The long coastline, though hazardous, promised abundant fish. Yarmouth bloaters soon acquired a national reputation and the town remained in the top ten until the later 18th cent. After the Danish attacks had ceased the county was free from marauders. Unlike Northumberland or Herefordshire, it did not have to face Scottish or Welsh border raids, and during the Civil War, though there was skirmishing and King's Lynn suffered a month's siege in 1643, there was no fighting on the scale that Gloucestershire, Somerset, or Worcestershire saw. \*Kett's rising in 1549, mainly a protest against \*enclosures, did little permanent damage, though Norwich was taken and retaken. In the south-west of the county, schemes of improved drainage in the 17th and 18th cents. turned thousands of acres of fen into good agricultural land. Norwich became one of the great centres of the cloth industry and by Tudor times was the second town in the kingdom. Norfolk's nearness to London gave it great opportunities as the capital grew to unprecedented proportions and East Anglia became London's larder.

Defoe's visit in 1723 came when Norfolk's prosperity was still at its height. He was amazed at the 'prodigious number' of turkeys and geese driven up to London in vast droves of 1,000 or 2,000 birds. At Norwich, the clothiers 'employ all the country round in spinning yarn for them': nobody was unemployed who wished to work. At Yarmouth, so many vessels were crammed in by the quayside that 'one may walk from ship to ship as on a floating bridge'.

By 1800, the county's relative prosperity was over. As colonies were established, the ports of the west coast—\*Bristol, \*Liverpool, and \*Glasgow—had the advantage, and, in population, Norwich was surpassed by the new industrial towns of \*Manchester, \*Sheffield, and \*Leeds. Competition from the Yorkshire woollen industry and then from Lancashire cotton was severe.

In the 19th cent., Norfolk became something of a backwater, though connected by rail to London in the 1840s via Cambridge or Colchester. The growth of seaside holidays brought modest prosperity to Hunstanton, Cromer, and Sheringham and the Broads developed from the 1870s as a playground. \*Pevsner wrote in 1962 that parts of Norfolk remained curiously secluded, 'with many stretches and patches so remote that one cannot believe one is only one hundred miles from London'. But in more recent decades the pace has quickened as industry diversified—Colman's mustard, Matthews's turkeys, the Norwich Union—and the flight from London gathered pace. Population growth is well above the national average and Norfolk once more faces the problems of areas of outstanding beauty and tranquillity in a teeming nation. JAC

**Norfolk, Roger Bigod, 4th earl of.** See BIGOD, ROGER.

**Norfolk, Roger Bigod, 5th earl of.** See BIGOD, ROGER.

**Norfolk, Charles Howard, 11th duke of** (1746–1815). Known as Lord Surrey until he succeeded to the dukedom in 1786, Howard renounced the catholic faith in 1780 and embarked upon a political career as an advanced Whig. He served as MP for Carlisle 1780–6, spoke often in the Commons, was a keen advocate of parliamentary reform, and held office in the coalition ministry as a lord of the Treasury. Though he built up an electoral empire of eleven seats, his political standing was scarcely commensurate. But in 1798 he offered a toast to the 'Majesty of the People' at a public dinner at the Crown and Anchor tavern to celebrate Fox's birthday. Despite an apology to the king for 'unguarded expressions' he was dismissed his post as lord-lieutenant of the West Riding and lost his colonely in the militia. He was replaced as lord-lieutenant by \*Fitzwilliam, who was also dismissed in 1819 for condemning the massacre at \*Peterloo. Norfolk received partial restoration in 1807 when he was appointed lord-lieutenant of Sussex. \*Boswell found him a 'lively, affable, talking man' but some of his conviviality seems to have been due to drink. JAC

**Norfolk, John Howard, 1st duke of** (d. 1485). As grandson of the 1st duke, Howard was an heir general to the Mowbray titles and estates. From the death of his father in 1436, he was merely lord of the manor of Stoke Neyland (Suffolk). He was a retainer of the 3rd duke and perhaps on his nomination the first Yorkist sheriff of Norfolk in 1461, shortly before Edward IV knighted him on the battlefield of \*Towton. Thereafter he was one of the king's most valuable servants, in office at court and in East Anglia, in diplomacy and war on land and sea; he was enriched by generous rewards and his own enterprise, which included ownership of fourteen ships. He became Lord Howard in 1470, but Edward excluded him from the Mowbray inheritance by a parliamentary Act of dubious legality; this allowed its retention by the king's younger son Richard, in right of his late wife, sole heiress of the 4th duke. In 1483 Howard supported the usurpation of Richard III, who created him duke of Norfolk; that the title was at the king's disposal suggests that Prince Richard had died in the Tower of London, of which Howard was constable. That he was the only magnate killed fighting for Richard at \*Bosworth seems to confirm his complicity. RLS

**Norfolk, Thomas Howard, 2nd duke of** (1443–1524). Norfolk had a remarkable political and military career at the highest level, despite a bad start. His father was a prominent Yorkist, who fought at \*Towton, was created duke by Richard III, and died fighting at his side at \*Bosworth. The son was wounded at \*Barnet in 1471 and taken prisoner at Bosworth. He spent some years in the Tower before Henry VII restored his title as earl of Surrey and in 1489 made him chief justice in Eyre north of Trent, with heavy law and order responsibilities. From 1501 to 1522 he was lord high treasurer. In 1510 Henry VIII made him earl marshal for life and in 1513 he annihilated the Scots at the battle of \*Flodden, showing himself a capable and determined commander, even at 70. His reward was the dukedom of Norfolk. In

## Norfolk

the king's absence in France at the \*Field of Cloth of Gold in 1520, Norfolk acted as guardian of England. For a man who started on the wrong side, this was a crowning achievement. JAC

**Norfolk, Thomas Howard, 3rd duke of** (1473–1554). Norfolk picked a precarious path through the hazards of Tudor politics. He was closely related to the royal family. His first wife was a daughter of Edward IV; his second wife's grandmother was sister to Edward IV's queen; he was uncle to both \*Anne Boleyn and \*Catherine Howard. He was given the Garter in 1510 and after fighting under his father at the great victory of \*Flodden was created earl of Surrey when his father was made duke of Norfolk. From 1513 to 1525 he served as lord high admiral, was lord-lieutenant of Ireland 1520–2 and lord high treasurer 1522–47. He helped to bring down \*Wolsey and in 1534 presided over the trial of his niece Anne Boleyn. In 1537 he put down the rising of the \*Pilgrimage of Grace with severity. In 1540 he succeeded in ousting Thomas \*Cromwell. The disgrace of Catherine Howard rocked his position but he survived and held commands against the French and the Scots. The imprudence of his son Lord \*Surrey, in sporting the royal arms, brought a conviction for treason in 1546 and Norfolk escaped execution only because Henry VIII died. Throughout Edward VI's reign, Norfolk remained in the Tower but, as a catholic, was released by Mary, restored to his honours, and served against \*Wyatt's rebellion in January 1554, which was defeated largely by the zeal of his half-brother Lord William \*Howard. He died the same year at the age of 80. JAC

**Norfolk, Thomas Howard, 4th duke of** (1538–72). Norfolk was grandson of the 3rd duke. His father Lord Surrey was executed when he was 8. He and his grandfather were restored to their honours at the accession of Mary in 1553 and he succeeded as duke the following year. Elizabeth gave him the Garter in 1559 and employed him in Scotland to oust the French party. This proved his undoing. After the death of his third wife in 1567, he conceived a plan to marry Mary, queen of Scots, still a possible successor to Elizabeth. They had not actually met but went in for a good deal of literary swooning. In October 1569 he was committed to the Tower and in November his brother-in-law the earl of \*Westmorland led the rising of the \*northern earls, on behalf of Mary and the old religion. Norfolk was released in 1570 and assured Elizabeth that the marriage had been abandoned, but allowed himself to be drawn into the \*Ridolfi plot to replace Elizabeth by Mary. Norfolk's role was to liaise with a Spanish expedition which was to land at Harwich. He was again put in the Tower and executed in June 1572. His personal popularity was considerable but he was vain, vacillating, and timorous. The dukedom was restored to his great-great-grandson in 1660. JAC

**Norfolk, John Mowbray, 3rd duke of** (1415–61). After coming of age in 1436, Norfolk had a brief career in public service, in the relief of Calais from siege, as warden of the east march, and as an ambassador in Anglo-French negotiations. He allowed himself, however, to be implicated in the lawless activities of his steward Sir Robert Wingfield, which

led to their detention in the Tower of London in 1440. Norfolk next quarrelled with Wingfield, assaulting his house with cannon, and consequently returned to the Tower in 1448. His ambition to dominate the shire of Norfolk was frustrated by the more potent 'good lordship' of William de la \*Pole, duke of Suffolk. After Suffolk's fall, Norfolk expected to have a free hand. He joined forces with Richard of \*York in demonstrations against the new court clique in 1450. It compelled him, however, to dismiss his own councillors who favoured York, a purge which occasioned the anarchy reported in the \*Paston letters for 1453, after which Norfolk again veered towards York in a half-hearted way. The first battle of \*St Albans had been fought before his arrival. He agreed to York's attainer in 1459, but joined him after the battle of \*Northampton. He escaped to London from the Yorkist defeat at \*St Albans in 1461, was in the junta which recognized Edward IV as king, and fought in his victory at \*Towton. His last military exploit was the seizure of Caister castle from John Paston. Norfolk's foremost interest remained his own regional aggrandizement; he was unreliable as both political ally and noble patron. RLS

**Norfolk, Thomas Mowbray, 1st duke of** (1366–99). Mowbray was created earl of Nottingham on succeeding to his elder brother's lands in 1383, and received the title of earl marshal in 1386. He was one of the lords \*appellant who prosecuted Richard II's favourites in 1387–8. Subsequently he assisted Richard's despotic ambitions. In 1397 he arrested the duke of \*Gloucester and murdered him at Calais, and was one of the eight lords who indicted the king's victims in Parliament. His ducal title in 1397 was a reward, as was a share of the forfeitures. Soon afterwards Norfolk was accused of treason by Henry (later Henry IV), duke of Hereford; in consequence, both dukes were exiled. Norfolk died in Venice. RLS

**Norham, treaty of**, 1209. In August 1209, after some years of strained relations with the Scots, King John brought a large army to Norham, 7 miles west of Berwick-on-Tweed. In return for peace, William the Lion promised to pay £10,000 and handed over his two elder daughters for marriage into the English royal house. In February 1212 John secured a renewal of this treaty and, apparently, the right to arrange the marriage of William's son and heir, the future Alexander II. Although John failed to secure acknowledgement as feudal overlord of Scotland, these agreements emphasized William's submission and his dependence on English goodwill. KJS

**Norham adjudication**, 1291–2. Edward I's adjudication of the claims put forward by John \*Balliol and twelve others to the vacant Scottish throne, which began at Norham, near Berwick-on-Tweed, on 10 May 1291. On the death of \*Margaret 'the Maid of Norway' (1290), the Scottish royal house had failed in the main line. Edward insisted on intervening in the succession dispute, or '\*Great Cause', not as an impartial arbitrator, but as feudal overlord of Scotland; and his standing as such was recognized by the claimants, though not by the rest of the Scottish political community,

in June 1291. Their claims were scrutinized by a court of 104 'auditors' (assessors), and after the proceedings had resumed at Berwick, judgment was given on 17 November 1292 in favour of John Balliol, who was enthroned at Scone on 30 November. When on 26 December Edward extracted homage from Balliol as king of Scots, he was thereby unambiguously acknowledged as overlord of Scotland. KJS

**Norman architecture.** A version of the European Romanesque style of the early Middle Ages, introduced into England by the Normans after 1066. Used extensively for ecclesiastical and military purposes until the rise of Gothic during the early 13th cent., it is characterized by heavy, load-bearing masonry construction, comparatively modest window apertures, deeply recessed doorways, massive columns or piers, and the use of the round arch and its derivatives, the groin- and barrel-vaults. Ornament was usually restricted to repetitive, geometric mouldings such as those of the lozenge, chevron, or zigzag type. In comparison to practice on the continent, sculpture was very sparingly used.

The numerous monasteries, cathedrals (many of monastic origin), and castles which the Normans built symbolized their authority, the Norman castle in particular, with its 'shell' or rectangular keep, being an essential element of the subjugation process. In ecclesiastical buildings, the triforium, a windowless gallery above the main arcade, was of great importance, largely for structural reasons, in contrast to the enlarged clerestory of Gothic architecture. This can be seen in the nave (begun 1099) of Durham cathedral, an outstanding example of Norman work. Other Norman examples include the cathedrals of Chichester (nave 1114–48), Ely (nave begun c.1090), Norwich (nave, transepts, and choir 1096–1145), and Peterborough (nave, transepts, and choir 1118–c.1190), the church of St Bartholomew the Great, Smithfield, London (choir begun early 12th cent.), the keep and chapel ('White Tower') of the \*Tower of London (1078–90), Colchester castle (begun c.1071) and Castle Hedingham (c.1140), both in Essex, Oakham castle (late 12th cent.), and portions of Durham castle, especially the undercroft chapel (possibly as early as 1070–80). TEFT

**Norman Conquest.** William the Conqueror's victory at the battle of \*Hastings in October 1066 was followed by six years of campaigning, which irrevocably established the new king's grip on England. In the succeeding decades, the Norman kings and their followers expanded their power into Wales and Lowland Scotland. The sequence of events which led up to William's victory is uncertain, because of the existence of accounts which are contradictory and irreconcilable. It is undeniable that at some point, probably in the year 1051, an arrangement was made which William believed entitled him to claim the English succession as \*Edward the Confessor's legitimate heir. From William's point of view, it was irrelevant that Edward had made a similar promise on his death-bed to \*Harold Godwineson, since Harold had visited Normandy in 1064 or 1065 as Edward's ambassador and sworn an oath to accept William's succession. However, since this story is told exclusively in Norman sources and since later English sources cast doubt on both the purpose and the nature of the visit, it may not

be the whole truth. The massive support which Harold enjoyed in 1066 shows that the English regarded him as a popular and rightly chosen king. William's belief in the legitimacy of his kingship, which was buttressed by the support which the papacy gave in and after 1066, conditioned many of the developments which followed the battle of Hastings; not only was William's kingship legal, but so also was the settlement of thousands of Normans, Flemings, Bretons, and other Frenchmen which he sanctioned. A massive take-over of English land and resources accomplished within a framework of notional legality was largely complete by 1086, the year when \*Domesday Book was made.

On a longer-term perspective, it is arguable that the Conquest was the last in a series of conquests of lowland Britain and itself had relatively little impact on a broader evolutionary process of economy, society, landscape, and language. The newcomers were a small military élite who were gradually assimilated into Britain and whose connections with the continent were severed with the loss of Normandy in 1204. On the other hand, it is not unreasonable to think of the Norman Conquest as a decisive shift within this broader process; the England and the Britain which emerged from the Norman military take-over were surely significantly different from the one which would have developed if Harold had won. There can be no doubt that William and his successors governed through mechanisms which were essentially those of the late Old English kingdom. The new aristocracy claimed to exercise the same rights and powers over their peasants as their English predecessors had done. Not everyone, however, would accept this appearance of continuity at face value. William I, William II, and Henry I all intervened with increasing frequency in the shires; it is far from certain that Harold and his successors would have made the same use of the existing structures. At a local level, many estates were reorganized, apparently in the short term depressing the fortunes of the peasantry. It was also the case that the Conquest's creation of the cross-channel Anglo-Norman realm sucked England into the feuds between the territorial rulers of northern France and can be linked over centuries to the outbreak of the \*Hundred Years War. The new connection with France also established cultural connections which ensured that England's place in the 12th-cent. renaissance was more closely linked to developments in France than it would otherwise have been. The Conquest extracted England from the Scandinavian political orbit which had brought about the earlier conquest by \*Sweyn Forkbeard and \*Cnut and \*Harold Hardrada's invasion, defeated in 1066 by Harold Godwineson at the battle of \*Stamford Bridge. It is doubtful whether Wales, Scotland, and—ultimately—Ireland would have been as intensively colonized from England but for the presence there of a new aggressive aristocracy. DB

**Normandy, duchy of.** The origins of the duchy of Normandy lie in a grant of territory around Rouen made early in the 10th cent. by the king of the west Franks to a Viking chieftain named Rollo. This initial grant was supplemented by others and the whole was forged into a coherent political entity during the 10th cent. by Rollo's descendants. The

respective roles within the duchy's development of sustained Scandinavian connections and culture, as opposed to adaptation and assimilation into the territory's Frankish environment, is a controversial subject; while many aspects of Normandy's Scandinavian heritage remain very evident into the early 11th cent., the essentially Frankish and Christian character of its government and society surely indicates a process of assimilation to, and exploitation of, existing forms. By the first years of the 11th cent. Normandy still retained political and economic connections with Scandinavia and Scandinavian settlers in Britain and Ireland. But monasteries were being refounded, bishoprics were recovering, government was conducted according to patterns which were Frankish, and society was taking on a feudal structure typical of neighbouring regions. At the same time, Normandy became the centre of an extensive movement of conquest and colonization into southern Europe and Britain which lasted for much of the 11th cent. Why this should have happened is difficult to explain; internal turbulence and a dynamic inherited from the Viking past may play a part, but it is notable that northern French society as a whole was in a period of expansion. The great conquests in the Mediterranean and Britain are best interpreted as a Norman-led movement which absorbed the energies of a large number of enterprising individuals from many regions of northern France; the \*Norman conquest of Britain, for example, was a relatively short-lived migration involving Bretons, Flemings, and others, as well as Normans, led by a great war-leader William the Conqueror, a stereotypical—if outstandingly successful—ruler of a French territorial principality. Normandy's place at the centre of a colonizing movement came to an end by the early decades of the 12th cent., though its far-flung connections endured much longer. Its history is thereafter dominated by wars with other French principalities, which in certain fundamental respects are no more than a continuation of the volatile politics of northern France throughout the period of the duchy's existence. Henry I had to work hard to defend it, it was absorbed into the \*Angevin empire after its conquest by \*Geoffrey Plantagenet in 1144 and, subsequently, into the French kingdom in 1204 after its conquest by Philip Augustus. Its three centuries of independent existence supported some of the more remarkable exploits of the medieval period. Yet ultimately its history must be analysed in the context of the history of the French kingdom; its expansion was part of the expansion of Francia, its rise and fall was an element in the politics of that region, and its final conquest was brought about by the French king, to whom the dukes owed fealty. In the 12th cent. its internal history is characterized by a lack of enterprise and innovation once the great days of expansion had passed, a state of affairs evident in government, architecture, and learning. Many among its aristocracy possessed lands in Normandy and England, but others resided principally in the duchy; their actions assisted the drift to the status of a province of France. After 1204 many Anglo-Norman magnates abandoned their smaller Norman estates. This was followed by an extensive colonization of Normandy from France.

DB

**'Norman Yoke'.** The belief that Anglo-Saxon institutions had been essentially democratic until replaced by autocracy under the Normans, despite its implausibility, was held by many radicals in the 17th and 18th cents. One of its most powerful advocates was Edward \*Coke, who assured Queen Elizabeth that the Anglo-Saxons had had a parliament composed of two chambers, with boroughs and shires represented. The advantage of the theory to the opponents of Charles I was that they could shake off the charge that they were dangerous innovators and insist that they merely desired the restoration of ancient rights. The theory was so useful that it had a long run for its money. Major John \*Cartwright, the indefatigable exponent of parliamentary reform, was urging it in 1818, it was resuscitated by some of the chartists, and last heard when the House of Lords' resistance to \*Lloyd George's 'People's Budget' in 1909 was denounced as 'Normanism'. JAC

**North, Frederick, Lord, 2nd earl of Guilford (1732–92).**

North is one of several prime ministers—\*Walpole, \*Pitt, \*Asquith, and \*Chamberlain are others—whose careers were distorted by war. For the first five years of his ministry, he established a stable government, defused domestic problems, and introduced useful financial reforms. From 1775 onwards, he was increasingly overwhelmed by the American troubles, which not only brought him down, but established his popular reputation as a weak and ineffective minister.

North was the eldest son of Francis, 1st earl of Guilford, but in some ways his life resembled that of a younger son with a career to make. The family was not wealthy, nor his father generous, and since he lived to be 86, North inherited only two years before his own death. He did not use his position to enrich his family and ran into debt: when the king gave him £18,000 to clear it, it established a personal obligation that made it difficult for North to resign, though he admitted openly that he was not the man to wage war.

Returned to the House of Commons in 1754 for the family seat at Banbury, at the age of 22, North soon began moving up the ladder. He was a useful man of business, hard-working, fat, and cheerful. Almost the whole of his life he spent in the Commons, defended its privileges with tenacity, gauged its temper skilfully, and, according to Gibbon, became 'a consummate master of debate'. He was brought onto the Treasury Board in 1759 by his cousin the duke of \*Newcastle. He remained in office when Newcastle went out in 1762, mainly because he needed the money. He went out with \*Grenville in 1765, declined to serve with the Rockinghams, and came back into junior office in \*Grafton's administration in 1766. His great chance came in 1767 with the sudden death of Charles \*Townshend, whom he succeeded as chancellor of the Exchequer. He was now the main spokesman for the government in the Commons and conducted the difficult debates on the Middlesex election issue. When Grafton resigned in January 1770, North took over as 1st lord of the Treasury at the urgent entreaty of the king. He was 37.

His first few years in office were impressive. Government majorities were restored, the Wilkes issue receded, North's reputation climbed. His relations with the king were

excellent—he was given the Garter in 1772—and his mastery of the Commons undisputed. An acknowledged expert in finance, his budgets were received with scarcely a dissenting voice. He handled his first test—the dispute with Spain over the Falkland Islands—with skill and judgement. In his Indian legislation, he tried to co-ordinate activities under a governor-general, and it has been called ‘a revolution in policy’. His *\*Quebec Act* in 1774 was an important concession to the Catholics and helped to persuade Canadians in 1776 not to throw in their lot with the American rebels. Horace Walpole, no easy critic, wrote in June 1770 that North was ‘sensible and moderate’ and in 1773 that opposition was almost at a standstill. The American question, which ultimately brought him down, had its roots deep in the past. (See *AMERICAN WAR OF INDEPENDENCE*.) Once the French had been expelled from Canada during the Seven Years War it was not hard to perceive the possibility of American independence. The British, heavily burdened after the war, resented the colonists’ refusal to pay taxes. Grenville’s *\*Stamp Act* and Townshend’s duties brought in little revenue. North’s first action was conciliatory—to abandon all of Townshend’s duties save that on tea, retained more as a token of authority than a source of revenue. It is doubtful whether any prime minister could have gone further. The American response was the seizure of the revenue cutter *Gaspée*, the intimidation of customs officers, and the *\*Boston Tea Party*. Coercive measures against the colonists were inevitable. But once fighting began, North was marginalized and the military men took over. His conciliation proposals came too late to affect the issue. Repeatedly he begged to resign and warned the king that a stronger minister was needed: time after time the king refused, understanding the value of North’s parliamentary skill in presenting government policy. Only after the surrender at *\*Yorktown* in 1781, with his majority down to single figures, was North allowed to go.

The last ten years of his life were largely a postscript. He returned to office as home secretary in the spring of 1783 in the coalition with Charles *\*Fox*, but was unwell for several months and content to let his more vigorous colleagues make the running. Dismissed in December 1783, he slid gracefully into the role of a premature elder statesman, defending the Church of England from dissenting attacks and the constitution from dangerous innovation. His parliamentary following dwindled with the years and from 1786 he was blind and had to be led into the House. Too unimaginative to be a great statesman, North’s significance is as an extraordinary parliamentarian, whose sure touch in the House stayed with him to the end. JAC

Cannon, J. A., *Lord North: The Noble Lord in the Blue Ribbon* (1970); Thomas, P. D. G., *Lord North* (1976).

**Northampton, Assize of, 1176.** The Assize of Northampton was an important stage in the development and enforcement of English law in the reign of Henry II. In the form of instructions to royal justices, it tightened up the provisions of the Assize of *\*Clarendon* ten years earlier and has been seen as the response to a crime wave. The offences of arson and forgery were added to those into

which the justices were to inquire and severe punishments included the loss of the right hand. Trial was still ordeal by water. JAC

**Northampton, battle of, 1264.** When Simon de *\*Montfort* and his supporters took up arms in the spring of 1264, his second son Simon was besieged in Northampton by the king, Henry III. Despite de Montfort’s march to relieve it, the castle surrendered on 6 April and young Simon was taken prisoner. This set-back to the baronial cause was cancelled by their victory at *\*Lewes* in May, when the king was in turn taken captive. JAC

**Northampton, battle of, 1460.** The Yorkist leadership fled abroad after its ignominious and precipitate flight from *\*Ludford Bridge* in 1459, but returned in the summer of 1460. On 10 July *\*Warwick* and the future Edward IV encountered Henry VI’s army just south of Northampton, under the duke of Buckingham. The battle was decided quickly when Lord Grey of Ruthyn deserted the king. Henry was captured and his leading supporters, including Buckingham, executed. JAC

**Northampton, treaty of, 1328.** On 4 May 1328 Edward III, or more precisely his mother *\*Isabella* and Roger *\*Mortimer* who then controlled the government, recognized Robert I (Bruce) as king of Scotland and did not demand homage from him. This was a volte-face from the line which English kings had adopted since the mid-1290s in denying Scottish sovereignty, and reveals the weak position of the English in the wake of the deposition of Edward II and the abortive campaign against the Scots in Weardale in 1327. Edward III was subsequently determined to overturn this ‘*turpis pax*’, as the Meaux chronicler called it, and, encouraged by the success of Edward *\*Balliol* against Robert’s heir, invaded Scotland in 1333 to restore English lordship. AC

**Northamptonshire** is one of the quieter English counties, less affected by the industrial revolution than its western neighbours. The shire is traversed by the river Nene, which rises near Daventry and leaves near Peterborough. *\*Camden* called it ‘a noble river and a continual blessing to this province’. In the north, the Welland marks the border with Rutland and Leicestershire, and in the west the Chervell separates the county from Oxfordshire. Northamptonshire covered a great swathe of central England: Brackley in the west seems like a Cotswold town, Eye, east of Peterborough, is a fenland village.

In Roman times the region belonged to the *\*Coritani*. Towcester on *\*Watling Street* was a small Roman town and the Nene valley at Castor, on *\*Ermine Street*, was an important pottery centre. In Saxon times the shire was part of the kingdom of *\*Mercia*. *\*Peada*, son of *\*Penda*, founded a great monastery about 657 at Peterborough, which survived sacking by the Danes in 870. The first mention of Northampton is when a Danish army seized it in 917. When the area was recovered by *\*Edward the Elder* a little later, the Danish territory seems to have been the basis for the emergent county. Two remarkable Saxon churches are at *\*Brixworth* and *\*Earls Barton*. Hamtun, the chief

## North Briton

settlement on the Nene, became Northampton after the Norman Conquest to distinguish it from Southampton.

In the medieval period the shire was fertile and prosperous. Northampton was a town of importance. The massive castle was not finally destroyed until the railway station was built in Victorian times. Its charter dated from 1189 and parliaments were frequently summoned there. In 1460 it was the site of a bloody Yorkist victory and in 1645 the last major battle of the Civil War took place at \*Naseby, after Rupert's ephemeral victory at Leicester. In 1675 the greater part of Northampton was destroyed by fire. The rebuilding, possibly supervised by Henry Bell of King's Lynn, was much approved. \*Defoe commented in the 1720s that 'the great inn, at the George, the corner of the High Street, looks more like a palace than an inn'. The county produced corn and cattle and, according to Camden, was 'overrun with sheep'. Northampton horse fair was of national importance. Among the great landed estates were Althorp, Deene, Easton Neston, De la Pré, Boughton, and Burghley, though the parliamentary representation was dominated by the country gentlemen.

Although the industrial revolution came to Northamptonshire, it was gentler than elsewhere. Northampton was slow to tie into the growing canal network, but after the Grand Junction branch opened in 1815, connecting with London and Birmingham, it began to grow into a manufacturing town, specializing in boots. But the London to Birmingham railway bypassed it in 1838, and a loop line to Birmingham was only established in 1872. Peterborough, promoted to a bishopric in Henry VIII's reign, profited from the coming of the railways, became a major junction, and developed heavy engineering. Wellingborough, Kettering, and Rushden all profited from rail links to become boot centres, the latter trebling in population between 1881 and 1901. Corby, no more than a village in 1801, developed as a steel town, exploiting the local iron resources. Stewart and Lloyd's factory was established in 1934 and Corby was given new town status in 1950. Though it has grown to more than 50,000, its planned development was stunted by the decision in 1980 to abandon steel-making.

The county has suffered considerable boundary changes. In 1888 the soke of Peterborough, which retained special jurisdictions, was given its own county council, and in 1965 was merged with Huntingdonshire, before finding its way in 1972 into a substantially enlarged Cambridgeshire. The rest of Northamptonshire was not affected by the local government reorganization, and the Banham commission recommended in 1994 that the two-tier system should continue. JAC

**North Briton** was the satirical name John \*Wilkes gave to his weekly periodical, launched in June 1762 in opposition to \*Smollett's *Briton*, published in support of \*Bute's administration. It included severe attacks on the peace of \*Paris and general abuse of Scots. Issue no. 12 led to a duel between Wilkes and Lord Talbot, and when the government resolved in April 1763 to prosecute no. 45 as seditious libel, it let 'Wilkes and Liberty' out of the bottle. JAC

**Northbrook, Thomas George Baring, 1st earl of** (1826–1904). Baring's father was grandson of the founder of the banking firm, served as chancellor of the Exchequer under Melbourne 1839–41, was created baron in 1866, and died eight months later. Thomas Baring sat in the Commons as a Liberal 1857–66, and held a number of minor posts before serving as viceroy of India 1872–6, retiring after \*Salisbury had taken over as secretary of state for India in \*Disraeli's government. In India he succeeded Lord Mayo, who had been assassinated. Much of his time was devoted to attempting to deal with the Bengal famine, which he succeeded in holding in check. His desire to keep taxation down would, in any case, have ruled out expansionist policies. He was given an earldom on his retirement and served as 1st lord of the Admiralty in \*Gladstone's second administration 1880–5. He left the Liberals over Home Rule in 1886 and did not hold office again. A cautious, reserved, and conservative man, Northbrook was a typical Whig, committed to public service without much enthusiasm. JAC

**Northcliffe, Viscount.** See HARMSWORTH, ALFRED.

**Northcote, Sir Stafford, 8th baronet, 1st earl of Iddesleigh** (1818–87). Of a Devon gentry family and educated at Eton and Balliol College, Oxford, Northcote, a civil servant in the early 1840s, was \*Gladstone's secretary at the Board of Trade, then joint secretary to the 1851 \*Great Exhibition and co-author of the Northcote–Trevelyan Report on the \*civil service. A Peelite free trader and high churchman, he remained close to Gladstone in the 1850s. An MP from 1855, he was recruited by \*Disraeli to the Conservative ministry in 1859 and served in the cabinets of 1866–8. He became chairman of the \*Hudson's Bay Company and helped to negotiate the 1871 \*Washington treaty with the USA. Chancellor of the Exchequer in 1874–80, Northcote succeeded Disraeli as leader in the Commons in 1876, though his unease with the premier's policy over the Eastern Question became evident. He was joint leader of the Conservatives with \*Salisbury from 1881, but his emollient centrism, designed to attract moderate Whigs, brought criticism from his own side, particularly the \*Fourth Party *frondeurs*. In 1885 Salisbury, now premier, removed Northcote from the Commons leadership and gave him an earldom and the 1st lordship of the Treasury. Briefly foreign secretary in 1886, Iddesleigh died suddenly as Salisbury was replacing him. BIC

**northern earls, rising of the,** 1569. This was one of the most serious risings on behalf of the old religion during the Tudor period. Between November and December 1569, Thomas, earl of \*Northumberland, and Charles, earl of \*Westmorland, mustered a rebel army in the northern counties and gained initial success. The rebels carried the catholic banner of the five wounds of Christ, which had been used during the \*Pilgrimage of Grace, destroyed English bibles and Elizabethan Books of Common Prayer, restored traditional altars, and celebrated mass in Durham cathedral. In addition to the religious settlement, the earls complained of the queen's choice of 'divers disordered and evil-disposed persons', whose 'subtle and crafty dealing' had 'disordered

the realm and now lastly seek the destruction of the nobility'. The rising was suppressed by troops under Lord \*Sussex. The political underpinning for the rising was the proposed marriage between the duke of \*Norfolk and Mary Stuart, a catholic match supported by the earls. The plan was discovered and led to Norfolk's disgrace and execution. Westmorland escaped into exile but Northumberland, who fled to Scotland, was handed back and beheaded. SA

**Northern Ireland** was formed by the Government of \*Ireland Act 1920-1. It comprises the six counties of the north-east of the island: Antrim, Down, Armagh, Londonderry, Fermanagh, and Tyrone. To ensure a protestant majority, the nine counties of the historic province of Ulster were rejected as the boundary. Fermanagh and Tyrone, though possessing small catholic majorities, were included to provide a credible geographical entity. The British government had preferred an all-Ulster option, hoping that partition would therefore be temporary. Initially, loyalist opinion was opposed to the establishment of a separate province; but once Northern Ireland had been set up, it was seen as the crucial bulwark against Irish unification.

The artificial character of the province is demonstrated by the awkwardness of its title: parts of Donegal in the Free State/Republic are further north. It is frequently referred to as 'the six counties', \*Stormont, or 'the Northern Statelet', terms revealing the bias of the observer. The decision to draw the boundary according to county lines made little social, economic, or geographical sense. The natural hinterland of the city of Derry is Co. Donegal; Newry was cut off from much of its locale; isolated enclaves of catholics or protestants were created; border areas such as south Armagh saw no justification for being included in the new province; the erratic border itself divided farms, towns, and communities.

The circumstances of the province's formation dictated its turbulent subsequent history. The catholic minority, always over 30 per cent of the population, never accepted partition and usually boycotted the Belfast Parliament. The emerging Free State refused to recognize Northern Ireland. An \*IRA offensive in early 1922 threatened to destabilize the nascent province. In the \*Anglo-Irish treaty of December 1921, provision was made for a boundary commission, holding out hope of a substantial alteration of frontier. The commission did not meet until 1925 and no changes were finally made. Not surprisingly, the province established itself along the lines of a protestant state for a protestant people, with a heavy emphasis on security considerations.

After 1925, the province's future seemed more assured but still few concessions were made to the minority. Economic development was retarded by over-dependence on the British Treasury and by over-reliance on declining traditional industries. The government was dominated by narrow landed and commercial interests; all were members of the \*Orange order and preoccupied with appeasing their protestant constituents. Sir James \*Craig was prime minister 1921-40, Lord \*Brooke 1943-63. Unionist confidence was increased by their contribution in supplying bases and ports for Atlantic convoys, contrasting with the Free State's

neutrality. However, lack of foresight and general incompetence in government circles caused the effects of German bombing of Belfast to be severe; embarrassingly, fire services had to be secretly begged from Dublin.

The declaration of an Irish republic in 1948 caused the constitutional status of the province to be clarified in the \*Ireland Act of 1949. Dependence on Britain was increased by the new welfare state; unemployment became the worst in the UK; the disparity between west and east of the province grew wider. But the abject failure of the IRA offensive 1956-62 appeared to remove any immediate threat and increased catholic acceptance of the province. Terence \*O'Neill's attempts, as premier from 1963, to modernize the economy and reform the sectarian basis of the province highlighted all inherent tensions. Unionists divided over his reforms and the catholic minority demanded more substantial changes, mounting their first effective challenge via the civil rights movement from 1967. Police and special constabulary's reaction to civil rights demonstrations, together with the unionist backlash, resulted in major riots in Derry city and Belfast, and the belated intervention of British troops to restore order and ensure more fundamental reforms. The security situation deteriorated rapidly in 1969-72, resulting in further polarization of the two communities, the alienation of the catholic population from the British army, and the formation of the Provisional IRA. The British government's declaration of direct rule from Westminster in 1972 was followed by the establishment of a power-sharing executive in January 1974, which was brought down as a consequence of the loyalist strike within five months.

The 1970s and 1980s saw a continuous, if limited, IRA offensive against both the security forces and the economy; the growth of loyalist paramilitary retaliation; spates of sectarian assassinations and bombings in the province, in Britain, and occasionally in the Republic. Abortive attempts to restore some form of devolved government only revealed the extent to which violence had hardened divisions. Demands for political status for republican prisoners in 1981 led to further catholic alienation and support for \*Sinn Féin. While direct rule saw a considerable diminution in governmental discriminatory practices, little progress was made on economic performance. Unionist suspicions concerning British government intentions increased and the British taxpayer was progressively alarmed about the expense of continued involvement.

By 1985 and the \*Anglo-Irish agreement, attention turned to co-operation between the Republic and the British government on security and political matters. The level of violence, particularly by protestant paramilitaries, increased. A sense of exhaustion after 25 years of conflict, better Anglo-Irish government communications, European and American concern, and, finally, negotiations between the \*SDLP and Sinn Féin leaders, John Hume and Gerry Adams, all contributed to the Downing Street declaration of December 1993, the IRA cease-fire of August 1994, and the loyalist paramilitary one two months later. After a referendum, administration was handed back in 1998 to a Northern Ireland Assembly of 108 members, of which 24 represented SDLP and 18 Sinn Féin. But hopes for the peace process in the 21st

## Northern Ireland Labour Party

cent. were jeopardized by the reluctance of the IRA to begin serious disarmament, which led to the dissolution of the Assembly in 2003 and the re-imposition of direct rule.

MAH

Buckland, P., *A History of Northern Ireland* (Dublin, 1981); Wichert, S., *Northern Ireland since 1945* (1991).

**Northern Ireland Labour Party** (NILP). Founded in 1924, as a socialist alternative to the sectarian politics of Ulster. It strove to remain neutral on the partition question, but in 1949—after the declaration of an Irish republic—it came out in favour of the constitutional link between Northern Ireland and Britain. This helped its position in protestant working-class areas, while constraining its appeal to Catholics. Nevertheless, with unemployment rising in the late 1950s and early 1960s the NILP increased its vote, winning four Belfast constituencies in the Stormont elections of 1958 and 1962. Thereafter, the party faced greater challenges. A new Unionist prime minister, Terence O'Neill, proved to be an energetic champion of the local economy, and—with the establishment of new industries—unemployment fell. The renewal of communal violence in 1969 heightened sectarianism and put pressure on the NILP electoral base. The establishment of new parties in 1970–1 (the \*Social Democratic and Labour Party, \*Alliance) eroded different aspects of NILP support. The party polled well in the Westminster general election of June 1970 but thereafter rapidly declined: it survived with a minimal electoral following until 1987. AJ

**Northern Rhodesia.** See ZAMBIA.

**North Foreland, battle of**, 1666. A major engagement in the second Anglo-Dutch War, sometimes known as the St James's Day fight, was fought on 4 and 5 August in the Thames estuary and off the Suffolk coast. This was a continuation of the battle of the \*Downs after each side had repaired and resupplied. Albemarle (\*Monck) and Prince \*Rupert with 89 warships were confronted by a Dutch fleet of 88 vessels under Cornelis Tromp and de Ruyter. The English had the better of the exchanges but the Dutch made harbour. \*Pepys's laconic comment was: 'we keep the sea which denotes a victory, or at least that we are not beaten. But no great matter to brag on.' JAC

**Northumberland** is a large county of ancient origins as an independent kingdom and an early centres of British Christianity. A great border region, it is full of peel houses and castles, like Dunstanburgh, \*Alnwick, Prudhoe, \*Bamburgh, and Warkworth. The industrial development of Tyneside, largely a 19th-cent. phenomenon, is confined to the south-east corner. The rest is a shire of high fells and deep valleys, thinly populated, with small market towns like Corbridge, Haltwhistle, Morpeth, Rothbury, Wooler, and Alnwick. \*Berwick-on-Tweed is part of Northumberland geographically, though a county in its own right. The southern boundary is the Tyne, the northern the Tweed.

The main northern tribe in pre-Roman times was the \*Brigantes, though \*Camden placed the county under the Ottadini or \*Votadini. The crossing of the Tyne at the Pons Aelium must soon have become a settlement, the nucleus of Newcastle itself. Hadrian's Wall, which runs east-

west across the county, was for decades the limit of the Roman empire. In early Saxon times, the area formed part of the kingdom of \*Bernicia, which joined with \*Deira to the south in 651 to constitute \*Northumbria (the land north of the Humber), which for centuries disputed supremacy with \*Mercia and \*Wessex. The conversion of King \*Edwin in the early 7th cent. led to the foundation of a famous monastery on \*Lindisfarne or Holy Island, and the decision of the Synod of \*Whitby in 664 to follow the Roman practice of worship pulled Northumbria into a southerly orbit. In the late 8th cent. the area began to suffer from Danish raids and in the following century was in conflict with the Viking kingdom of \*York. In 920 it submitted to \*Edward, king of Wessex, at Bakewell, and subsequent attempts to recover its independence were of no avail. After the defeat at \*Carham in 1016 the lands north of the Tweed were ceded to the kingdom of Scotland.

Northumbrian resistance to the Normans after Hastings led to William I's despoiling of the area in 1069. It was not included in the \*Domesday survey, having yet to recover from the devastation. In the later Middle Ages it was the first line of defence against the Scots, the border region being divided up into marches. Vast power was wielded by the local lords, particularly the Percies of Alnwick. England's weakness under Stephen led to the Scottish king David I occupying the county and pushing his border south to the Tees. It was retaken by Henry II, though Berwick, in the far north, changed hands repeatedly. The remoter parts of the county like Redesdale, Coquetdale, and Allendale were under fitful control, border raiding was common, and bloody encounters, like \*Otterburn in 1388 when Percy fought Douglas, were not uncommon. Even in the reign of Elizabeth I, feudal loyalties remained strong, and more than 5,000 men turned out to support the Catholic rising of the \*northern earls, \*Northumberland and \*Westmorland, in 1569. The union with Scotland in 1603 gave some respite from cattle-raiding. The last spasm of lawlessness was produced by the Jacobite movement. Sir John Fenwick, a former member for the county, was executed in 1697 for conspiracy against William III, and Thomas Forster, another member, was supported by a number of shire gentlemen in the '15, though they did little save proclaim the old pretender at Warkworth and occupy Holy Island for one day.

Camden, in 1586, drew a picture of a county that was still wild and untamed: 'the county itself is mostly rough and barren, and seems to have hardened the very carcasses of its inhabitants.' One hundred years later, things were changing. Regular services plied the Great North Road, and Edmund \*Gibson wrote in 1695 that strangers were no novelty to the shire, nor had cause to be apprehensive: 'a roundlet of red wine is a greater rarity in a countryman's house in Middlesex than on the borders of Northumberland . . . the gentry are generally persons of address and breeding, the peasants are as knowing a people, and as courteous to strangers, as a man shall readily meet with in any other part.'

In so large a county, administration was bound to be decentralized. The assizes were held in Newcastle, but the elections for the shire at Alnwick. Quarter sessions were held at Newcastle, Alnwick, Morpeth, and Hexham in turn.

But Newcastle had always been by far the most important town and in the 19th cent. it grew disproportionately to its neighbours. From a base of about 28,000 in 1801, it was 87,000 by 1851, and by 1914, having swallowed its surrounding villages, had reached 271,000. The increase was due, in the main, to coal-mining and shipbuilding. In 1857, 4 million tons of coal was being exported from the Tyne: by 1888 it had reached 10 million tons, and by 1900 17 million tons. By the 20th cent. there were far more miners in the county than farm labourers. The long-established tradition of shipbuilding was transformed after 1850. Armstrong's works at Elswick were opened in 1847, \*Parsons' at Heaton in 1889. The political effect of this economic development was acknowledged in 1974 with the creation of a new county of Tyne and Wear, and although the new authority was itself abolished in 1986, the areas north of the Tyne did not return to Northumberland: instead Newcastle and North Tyneside were made unitary authorities. The decision of a Roman commander to cross the Tyne at Pons Aelium had lengthy consequences. JAC

**Northumberland, Henry, earl of** (c.1115–52). The only son and heir to David I of Scotland and grandson of \*Waltheof, earl of Northumberland (d. 1076). His father intervened against King Stephen but reached an understanding in 1136, resigning the earldom of Huntingdon to his son, who did homage to Stephen. The following year another settlement gave him the earldom of Northumberland, excluding Newcastle and Bamburgh. There is testimony to his bravery and piety. His sons Malcolm IV and William the Lion succeeded on the Scottish throne. JAC

**Northumberland, John Dudley, 1st duke of** (c.1505–53). Dudley had a brilliant but brief career at the very top of Tudor politics. His father, Henry VII's financier Edmund \*Dudley, was executed in 1510 when John Dudley was a small boy. His mother Elizabeth Grey, daughter of Viscount Lisle, remarried in 1511. Her second husband, Arthur Plantagenet, was an illegitimate son of Edward IV and therefore an uncle of Henry VIII. Dudley's early career was made under the protection of his stepfather, who was in high favour, created Viscount Lisle in 1523, given the Garter in 1524, and made governor of Calais in 1533. John Dudley began as a soldier, made a reputation for jousting, was knighted in 1523, helped to put down the \*Pilgrimage of Grace, and became deputy governor of Calais in 1538. His stepfather's disgrace and death did not affect Dudley's upward progress: in 1542 he was made warden of the Scottish marches, served as lord admiral, was created Viscount Lisle in turn, and in 1544 captured Boulogne from the French. After the death of Henry VIII, he worked closely with \*Somerset, Edward VI's uncle, and was advanced to the earldom of Warwick. He fought alongside Somerset at the battle of \*Pinkie Cleugh against the Scots and crushed the Norfolk rebels in 1549 at \*Dussindale. From October 1549 he supplanted Somerset and for the rest of Edward's short reign held power as lord president of the council. In 1551 he was created duke of Northumberland, the title vacant as a consequence of Sir Thomas Percy's involvement in the Pilgrimage of Grace. But Northumberland's position was rendered precarious by the

growing ill-health of the young king and in 1553 he turned to desperate measures to retain power. Edward issued letters patent setting aside the claims to succession of his half-sisters Mary and Elizabeth and nominating Lady Jane \*Grey. Northumberland then arranged a marriage between his son Lord Guildford Dudley and Lady Jane and on Edward's death declared her queen. The coup failed miserably and Northumberland surrendered at Cambridge to Mary's supporters. He was executed in the Tower, where his father had been. But his support for the reformed religion was of critical importance in moving England from the caesaro-papism of Henry VIII's last days to a protestant settlement. JAC

**Northumberland, John Neville, 1st earl of** (c.1431–71). The third son of Richard Neville, earl of Salisbury, John led family retainers in a private war with Percy followers headed by Thomas, Lord Egremont, which concluded with the Neville victory at Stamford Bridge (Yorks.) in 1454. He fought alongside his father at \*Blore Heath and was attainted in 1459, but was restored, created Baron Montagu, and appointed Henry VI's chamberlain after the Yorkists won control of government in 1460. Taken prisoner in the second battle of \*St Albans, he was freed after Edward IV's victory at \*Towton. Thereafter he was Edward's chief lieutenant in the north. He broke the Scottish siege of Carlisle in 1463 and was warden of the east march from 1463, defeating Lancastrian forces at \*Hedgeley Moor and \*Hexham in 1464. In reward, and to support his responsibilities, he was granted the forfeited title and estates of the Percy earls of Northumberland. Although John did not take part in his brother \*Warwick's machinations in 1469–70, Edward's design to reduce the Nevilles' power included restoring a Percy as earl of Northumberland and warden of the east march. John was created marquis of Montagu, a hollow promotion which threatened impoverishment. He consequently supported Warwick's restoration of Henry VI and was killed at the battle of \*Barnet. RLS

**Northumberland, Henry Percy, 1st earl of** (1341–1408). Heir to the 3rd Lord Percy of Alnwick, Percy's military career began in France under Dukes Henry and John of Lancaster; he remained a political associate of the latter, \*John of Gaunt. He was created earl at Richard II's coronation in 1377. In 1381 his (second) marriage to the heiress of Thomas Lucy of Cocker mouth (Cumberland) made him the predominant magnate in the border counties. Gaunt's appointment as lieutenant in the marches led to a breach, from which Northumberland emerged as sole warden in both marches in 1384, after which either he or his son Hotspur (Henry \*Percy) usually held one of the wardenships. They won both in 1399 as one of many rewards for their key role in Henry IV's usurpation. Fearing this regional hegemony was threatened, they revolted in 1403. Prevented from joining Hotspur, Northumberland survived to instigate Archbishop \*Scrope's rebellion; on its collapse he fled to Scotland and was deemed forfeit. He was killed in a skirmish at \*Bramham Moor (Yorks.). RLS

**Northumberland, Henry Percy, 3rd earl of** (1421–61). Percy was warden of the east march from 1440. He was

## Northumberland

entitled Lord Poynings following his wife's succession to that Sussex barony. The feud with the Nevilles and the death of his father, the 2nd earl, in the first battle of \*St Albans made him a Lancastrian partisan. He continued as warden despite being owed wages for several years. He helped to defeat Richard of \*York at \*Wakefield in 1460. The unruly conduct of his army of northerners alarmed the citizens of London; their success at the second battle of \*St Albans thus failed to win the capital. Northumberland was killed in the battle of \*Towton. RLS

**Northumberland, Henry Percy, 4th earl of** (c.1449–89). Edward IV kept Percy in detention after the death of his father, the 3rd earl, in 1461. He was restored to the earldom in 1470 and appointed warden of the east march to replace John Neville. Tension with Richard, duke of Gloucester (later Richard III), who had replaced \*Warwick in his northern lands and offices, was allayed by Northumberland being retained by the duke in 1474. He supported Richard's usurpation in 1483, but apparently resented the king's continuing interest in the north. He obeyed the call to arms against Henry Tudor but remained inactive at \*Bosworth Field. Henry VII soon realized that he needed Northumberland's services in the east march. He was killed in an anti-tax demonstration in Yorkshire. RLS

**Northumberland, Henry Percy, 8th earl of** (c.1532–85). Percy's brother, the 7th earl, was involved in the 1569 rising and executed in 1572. Henry Percy, who had made a reputation in border fighting in the 1550s, remained loyal to the queen and held Tynemouth castle on her behalf. The queen wrote acknowledging his fidelity during the rebellion and he succeeded to his brother's title under the special remainder. But he spent some time in the Tower 1571–2 under suspicion of plotting with Mary, queen of Scots, and was fined and released. He was once more arrested in 1583 in connection with the \*Throckmorton plot to welcome a Spanish invasion. In June 1585 he was found dead in the Tower from a pistol-shot, which the coroner declared had been self-inflicted. JAC

**Northumberland, Henry Percy, 9th earl of** (1564–1632). Northumberland inherited the title at the age of 21 in 1585 when his father, confined to the Tower, was found shot. He was given the Garter in 1593 and performed some military services. But his opportunity came with the death of Queen Elizabeth. He had corresponded with James I, urging him to make concessions to the Catholics, accompanied him on the journey south, and was made captain of the gentlemen pensioners. But \*Cecil was a secret enemy and Northumberland did not find court life much to his taste. In November 1605 he was arrested on suspicion of complicity in the \*Gunpowder plot. Thomas Percy, one of the conspirators, was a distant cousin, had been employed by Northumberland as constable of Alnwick castle, and had been made a gentleman pensioner. He had dined at Sion House with Northumberland the night Guy \*Fawkes was arrested. Northumberland protested his innocence, claiming that he was known to live a retired life, building and gardening. Nevertheless, he was kept in the Tower until 1621. A fellow-

prisoner for much of the time was Sir Walter \*Raleigh. The earl played chess, entertained well, had a good library, a laboratory, and patronized scholars. His scientific interests earned him a nickname, 'the wizard earl'. He was a difficult man and when his release was granted after sixteen years was reluctant to leave the Tower. He spent most of his remaining eleven years at Petworth. JAC

**Northumberland, Thomas Percy, 7th earl of** (1528–72). Percy's uncle, the 6th earl of Northumberland, died in June 1537 at the age of 35, it was said of grief at the execution of Anne Boleyn; his father Sir Thomas Percy died the same month, executed for his part in the \*Pilgrimage of Grace. Thomas Percy was restored in blood in 1549, and in 1557, after helping to suppress a rising in the north, was created earl of Northumberland by Mary. He was made warden of the east march in 1558 and given the Garter in 1563. But in 1569 he joined with the earl of \*Westmorland in the rising of the \*northern earls, which captured Durham and celebrated mass in the cathedral. On the collapse of the rebellion, he fled to Scotland but was handed back and beheaded at York in 1572. JAC

**Northumbria, kingdom of.** From the middle of the 6th cent. to the 870s when the Danes took over control at York, the Anglo-Saxons who dwelt north of the river Humber achieved their own often turbulent institutional life, ruled by kings. Its borders fluctuated widely, as did the degree of dependence (or in the 7th cent. overlordship) in relation to rulers further south in Mercia, East Anglia, and Wessex. At its greatest extent the kingdom embraced the lands which stretched from the Humber and the Mersey in the south to the Clyde and the Forth in the north, straddling the old Roman frontier on Hadrian's Wall, and especially strong in what was to become south-east Scotland as far as Edinburgh. Its political roots grew from two principal sources, the northern kingdom of \*Bernicia based on the gaunt fortress rock of \*Bamburgh, and the kingdom of \*Deira in the fertile vale of York. Rivalry between the two dynasties, both of which traced their origins to 6th-cent. rulers, bedevilled the politics of Northumbria. Bernicia was concerned with threats from the north from Picts and Scots, and Deira more entangled with the problems of the Mercian frontier. Even so in the 7th cent. under a succession of powerful rulers, \*Æthelfryth of Bernicia (d. 616), \*Edwin of Deira (616–32), the brothers, again with Bernician origins, St \*Oswald (633–41) and \*Oswiu (641–70), Northumbria was a dominant force in English political life. Edwin was said by \*Bede to have ruled over all the inhabitants of Britain, English and Britons alike, except for Kent; and Oswiu went even further in overwhelming and making tributary the Picts and the Scots of northern Britain. After the defeat and death of Oswiu's son \*Ecgrith at the hands of the Picts in 685 Northumbria lost aspirations to overlordship and the 8th and 9th cents. provide a sorry tale of unrest and violence at the royal level. Many kings were exiled or murdered after a short reign. Yet some feeling for the integrity of the kingdom and the mystique of the blood royal persisted, and in the cultural and religious spheres the kingdom continued to flourish and produce great work well into the 8th cent. The age of \*Bede

(672–735) saw the flowering of the Northumbrian renaissance when some of the finest literary and artistic work of the early Middle Ages was produced in the northern kingdom in the shape of the writings of the Venerable Bede and the great Gospel Books, of which the \*Lindisfarne Gospels is a supreme example. The monastery of \*Jarrow/Wearmouth and the prestigious school at York were focal points, together with Lindisfarne, for such enterprises, and in spite of political violence the school of York with its great library continued to flourish deep into the 8th cent. and was responsible for training one of the most influential and prolific scholars of the Carolingian age in the person of \*Alcuin (735–804). Towards the end of the century a fresh and disastrous new element was introduced with the first \*Viking attacks. In June 793 they brutally sacked the monastery at Lindisfarne, an event which sent shock waves throughout western Christendom. Alcuin, writing from the Frankish court, laid some blame squarely on the shoulders of the Northumbrian rulers whose kingdom had almost perished because of internal dissensions. Alcuin warned that the evil was not yet at an end; and his warning proved true. Scandinavian control of communications over the North Sea put Northumbria in the front line. Political mastery within Anglo-Saxon England had already passed south, first to Mercia and then in the 9th cent. to Wessex. When the Danes in the reign of \*Alfred (871–99) made their serious attempt to conquer England, the Northumbrian kingdom collapsed, leaving Danish kings after 878 in firm control of York and only vestiges of native English authority under ealdormen in the more northerly parts of the kingdom. The Danes remained in political control of York until 954. Thereafter no attempt was made to revive the kingship of Northumbria which was integrated, though with occasional manifestations of independence, in the kingdom of England. HL

**North Yorkshire.** See YORKSHIRE, NORTH.

**Norton, Caroline** (1808–77). Author and reformer. Caroline, a society beauty and granddaughter of Richard Brinsley \*Sheridan, married at the age of 19 the Hon. George Norton, brother of Lord Grantley. Her husband, an unpleasant bully, brought an action in 1836 for crim. con. (adultery) against Lord \*Melbourne, then prime minister, which was laughed out of court and formed the basis for \*Dickens's *Bardell v. Pickwick*. Norton continued to ill-treat his wife, preventing her access to her own children and trying to seize her literary earnings as poet and novelist. In her defence, Mrs Norton published, claiming the rights of mothers to custody and of wives to independent property. The Custody of Infants Act (2 & 3 Vic. c. 54) of 1839 gave the courts discretion to award custody of children up to the age of 7 to their mothers. The right of wives to independent property was introduced by successive \*Married Women's Property Acts in 1870, 1882, and 1893. Though Mrs Norton's literary reputation has faded, her position as a pioneer of women's rights is secure. JAC

**Norwich.** County town of Norfolk, situated on the river Wensum, and a cathedral city since 1094. It is not recorded before 900, yet by 1066 it was one of the three or four most

important towns in England, a position it retained until late Georgian times. It may have begun as a wic or trading port under the Vikings before rising rapidly to become a major town, in a way that still lacks explanation. The Normans transformed the city by building a castle and cathedral, and laying out a new French borough. From the 1140s to 1290 Norwich housed an important Jewry, and from 1194 the citizens accumulated privileges of self-government, while between 1297 and 1344 they built stone walls which enclosed an area of a full square mile (as much as London's). By this time it was the wealthiest provincial town, possessing a major Benedictine priory, 6 friaries, and 57 parish churches. In the 14th and 15th cents. textile manufacture became the dominant industry, especially of cloths called worsteds after a local village. In the 16th and 17th cents. it overtook its rivals to be once more the largest and wealthiest English town after London, its economy sustained partly by a massive immigration of refugees from the Spanish Netherlands who introduced the New Draperies. It also became a social centre for the East Anglian gentry. In the late 18th and early 19th cents. the textile industry declined in the face of Yorkshire competition, and Norwich reverted to its traditional function as a marketing and trading town with only modest industries. The city centre is still dominated by its cathedral, castle keep, and 32 medieval churches (more than in any other British town); the most notable modern accent is perhaps the city hall of 1932–8, inspired by Stockholm's town hall, and a reminder of Norwich's tradition of municipal socialism. DMP

**Norwich, diocese of.** The see, conterminous with Norfolk, was founded in 1094. Herfast (1070–85) moved the East Anglian see of \*Elmham to \*Thetford c.1072 to comply with the Council of London, but Herbert \*Losinga (1091–1119), monk of Fécamp and former abbot of Ramsey, moved it again c.1094 to Norwich, where he established a Benedictine monastic community. It was not until 1914, with the creation of the diocese of \*Bury St Edmunds and Ipswich, that Suffolk regained its own see for the first time since the Danish invasions. Norwich cathedral, monastic in origin, begun by Herbert Losinga in 1096, is a fine Norman building, but with 15th-cent. lierne vaulted roofs and spire. WMM

**Norwich Crusade, 1383.** Led by Henry Despenser, bishop of Norwich (1370–1404), this 'crusade' had scandalously mixed ecclesiastical, commercial, and political motives—with disastrous results. Supported by Pope Urban VI (Rome) in his move against Pope Clement VII (Avignon) and backed by Parliament, it was cheaper than \*John of Gaunt's planned 'crusade' against Castile—the cost being borne by ordinary people's alms, with the added objective of releasing Philip of Burgundy's stranglehold on the Flemish wool trade. Despite military experience, Despenser was no strategist. Landing in May, he took coastal towns, invaded Urbanist Flanders instead of Clementinist France, and besieged Ypres, but hastily abandoned all at Philip's approach. No Clementinists were converted, the route from Calais remained closed, and access to Flemish markets denied to English traders; the church and Despenser were

## Nottingham

discredited by the gross abuse of indulgences. Despensers was impeached. WMM

**Nottingham.** County town of Nottinghamshire, situated on the river Trent, and a city since 1897. It is first recorded as one of the 'five boroughs' of the Danes, succeeded by an English fortified town (burh) after 921. It quickly became a county town, and was extended after 1066 with a new 'French borough' and a major castle. In the 12th and 13th cents. it became a regional centre with self-government, town walls, and a major fair. The castle remained a royal stronghold, and it was at Nottingham that Charles I raised his standard in 1642. After the Restoration the town became a social centre for the county gentry, and the duke of Newcastle built a mansion on the site of the castle. Industry developed after 1700 with framework-knitting, and later lace-making, and the town grew rapidly. The burgesses, however, refused to enclose the surrounding open fields, and overcrowding became desperate. Not surprisingly, the Lords' rejection of the second Reform Bill in 1831 provoked riots, and the castle (the duke of Newcastle's mansion) was burned. By the time the fields were enclosed in 1845, the damage was done, and not until the 20th cent. did slum clearance remove Nottingham's notorious courts and alleys. DMP

**Nottingham, Daniel Finch, 2nd earl of** (1647–1730). A Tory politician, the sober Lord Nottingham was the chief standard-bearer of 'high-church' politics during the reigns of William III and Anne. He disapproved of James II's pro-catholic measures, but only when James fled in 1688 did he align with William of Orange. Appointed secretary of state, Nottingham's \*Toleration Act.(1689) ensured the preservation of Anglican supremacy after the revolution, though his plan to include presbyterians and other nonconformists in a broadened church proved unacceptable. He lost office in 1693. During his second term as secretary, 1702–4, his independent-mindedness again made him a difficult colleague and his campaign for a bill against \*occasional conformity endangered the ministry's war measures in Parliament. A leader of the Hanoverian Tories, and excluded from the 1710–14 Tory ministry, he was made lord president by George I in 1714 but quarrelled with the Whig ministers in 1716 and was dismissed. AAH

**Nottingham, Heneage Finch, 1st earl of** (1621–82). Finch was a barrister, son of one Speaker of the House of Commons and nephew of another, Sir John Finch. He avoided public life during the Commonwealth but after the Restoration his rise was rapid. He was returned as MP for Canterbury in 1660, transferring to Oxford University in 1661. As solicitor-general in 1660 he prosecuted the regicides, was promoted attorney-general in 1670, granted a barony in 1674, and from 1675 to his death was lord chancellor. In 1681, sixteen days after the death of the previous holder of the title, he was created earl of Nottingham. A skilful, hard-working, and conciliatory lawyer, he steered a shrewd course amidst the rapids of Charles II's reign. His house at Kensington, with fine gardens, was purchased after the Glorious Revolution by William III and became

\*Kensington palace. \*Pepys admired his eloquence greatly but \*Burnet seems to have found it old-fashioned and florid. JAC

**Nottingham, Thomas Mowbray, 2nd earl of** (1385–1405). Mowbray's father was created duke of \*Norfolk in 1397 by Richard II but the grant was annulled by Henry IV's first Parliament. A minor when his father died in 1399, Mowbray seems to have inherited his father's hatred of Henry IV. In 1405 he joined Archbishop \*Scrope in rebellion and shared his fate. RLS

**Nottinghamshire** is the county of the river Trent, which flows through it from south-west to north-east, forming the border with Lincolnshire for the last 20 miles: the Erewash divides the county from Derbyshire to the west and the Soar from Leicestershire to the south-west. Nottingham was an important river crossing. The Great North Road crossed the Trent at Newark and ran up the eastern side of the county through Tuxford and East Retford to Bawtry. The \*Fosse Way ran south-west to north-east, crossing at Newark on its way to Lincoln. \*Camden's *Britannia* placed the county in the territory of the \*Coritani and divided it into a sandy northern part, much of it covered by Sherwood Forest, and a heavier clay south-east. Sherwood Forest, though much diminished by Tudor times, 'still feeds an infinite number of deer and branchy-headed stags'. The area was disputed between \*Mercia, \*Lindsey, and \*Northumbria, and formed part of the diocese of \*Lichfield and then of \*York, until the separate see of \*Southwell was created in 1884.

The shire developed in Saxon times around Nottingham itself, where the rock made a strong defensive position. Various derivations of the name have been suggested but the earliest usage was Snotengaham, the settlement of Snot's people: the opening S, being difficult for the Normans to pronounce, was dropped after the Conquest. In 868 a large Danish army took possession of the town and was attacked by the men of Mercia and Wessex, but by the treaty of \*Wedmore of 878 it was retained by the Danes and formed one of their five boroughs. Though Danish rule lasted less than 50 years, Danish settlement was strong: there are many Scandinavian place-names—Fiskerton, Gunthorpe, Thoresby, Granby—and the shire was divided, not into hundreds, but into \*wapentakes. In the early 920s \*Edward the Elder recovered the town, and built fortifications and a connecting bridge. It was ravaged by \*Cnut in 1016 and when William I moved north in 1067 to deal with his recalcitrant subjects, he began the building of Nottingham castle.

Nottingham retained its importance throughout the medieval period, its goose fair in October attracting traders from all over the country. In the 17th cent. it developed as a social centre. Celia Fiennes, visiting in 1697, was impressed: 'the neatest town I have seen, built of stone and delicate large and long streets, much like London, and the houses loftily and well built.' She found Nottingham ale particularly agreeable. East Retford, Newark, Mansfield, and Worksop developed as market towns, but the area remained thinly populated. The \*dissolution of the monasteries strengthened the influence of the gentry and nobility and the shire

became famous for its landed estates. The Stanhopes gained 20 villages that had belonged to Shelford priory; Welbeck abbey found its way to the Cavendish family, Rufford priory to the Saviles, and Newstead abbey to the Byrons. As the gentry moved up the social scale, the north of the shire became known as the Dukeries, Newcastle having Clumber, Portland Welbeck, and Rutland Kelham. The duke of Kingston's estate was at Holme Pierrepont, east of Nottingham. 'The idea I gave Lord Rockingham of this county', wrote Sir George Savile in 1769, 'was four dukes, two lords, and three rabbit warrens, which I believe, takes in half the county in point of space.'

Nottinghamshire had taken an important part in the civil wars of the 17th cent. Charles I raised his standard at Nottingham in 1642, though the response had been disappointing. Seven brothers of the Byron family fought for the king. Newark sustained several sieges on behalf of the king and was rewarded for its loyalty after the Restoration with two parliamentary seats. It was at the Saracen's Head in Southwell that Charles surrendered to the Scots after his strange journey from Oxford.

The agricultural character of the shire began to change in the later 18th cent. The Trent had always been a busy thoroughfare, but was augmented in the 1770s by the Trent and Mersey canal; by the Chesterfield canal in 1777 serving Worksop and East Retford; and by the Grantham canal, opened in 1793. The development of a canal network made the transport of coal much cheaper and led to a great expansion of the Nottinghamshire coalfield. The same period saw the development of the textile industry, \*Hargreaves and \*Arkwright setting up factories in Nottingham. But a severe recession after the Napoleonic wars caused great distress and gave a radical tinge to local politics. Brandreth's \*Pentrich rising of 1817, though little more than a skirmish on the march to Nottingham, was in part the product of unemployment and low wages; in the reform crisis of 1831 the duke of Newcastle's mansion at Nottingham was burned; and Nottingham was the first town to return a chartist MP when it chose \*O'Connor in 1847. In the later 19th cent., prosperity returned and there was a diversification of local industries. \*Boot's Pure Drug Company was established in 1883; the Raleigh bicycle company had 800 employees by 1896; and Player's tobacco company employed more than 1,000 by 1898. Coaching towns like Tuxford and Blyth stood still as the railways passed them by, but Mansfield and Worksop expanded at roughly the same rate as Nottingham, and the balance remained the same. In the local government reorganization of the 1990s, the shire retained its county status, with Nottingham itself becoming a unitary authority. JAC

**Nova Scotia** owes its name to a 17th-cent. Scottish attempt at colonization. France ceded its claims to Britain in 1713. Halifax was founded in 1749, and an assembly introduced in 1758. British garrisons discouraged temptations to join the American Revolution. In the 19th cent. Nova Scotians exploited their timber resources and Atlantic orientation to create a trading economy based on the sailing ship. Self-government was achieved in 1848. After heated controversy,

Nova Scotia joined the dominion of Canada in 1867. Historians attribute subsequent sluggish development to the decline of the 'wood, wind, and water' economy. Nova Scotians, who retain a pronounced 'Bluenose' patriotism, blame the indifference of Canadian governments. GM

**nuclear energy** is obtained by releasing the binding energy which holds together atomic nuclei, for example, in uranium. This fission process was used in the development of the atomic bomb during the Second World War, but by the mid-1950s scientists had been able to control it within the reactor cores of experimental power stations to produce utilizable energy. The nuclear reactor releases energy in the form of heat which is used to generate steam, and the steam to generate electricity. Plutonium, a highly fissile material used in the manufacture of nuclear bombs, is a byproduct.

The Atomic Energy Authority oversaw the development of the nuclear industry, which from the outset proved controversial on strategic, cost, and environmental grounds. When in 1956 power was switched from the first generator at Calder Hall to the National Grid it was hailed as a great achievement but scant attention was paid to the real purpose of the programme, to breed plutonium for Britain's nuclear deterrent. An experimental fast reactor, built at Dounreay in the north of Scotland, began operation in 1959, and paved the way for the first fast-breeder reactor power station.

From the standpoint of the 1950s, discounting the perceived need for a nuclear deterrent during the Cold War, nuclear power seemed an excellent investment, given the likelihood that unit costs could be as little as a fifth that of fossil-fuel electricity. In the ensuing years the industry expanded, though the balance of cost advantage remained uncertain. But the upsurge of oil prices in the 1970s, coupled with uneasy labour relations in the coal-mines, added to the comparative economic attraction of nuclear power, which began to accelerate dramatically, as did the nuclear component of electricity output.

Successive British governments since the 1950s wanted to lessen dependence on petroleum-exporting countries, but with the development of North Sea oil and gas, this was less pressing. Energy requirements in general began to be adjusted as a response to the energy crisis, and this brought about a reassessment of the high-energy role of nuclear power. While in its early stages of development nuclear energy appeared environmentally inoffensive to the general public, increased concern was voiced about its safety following major disasters at power plants internationally during the 1980s, and about the twin problems of waste disposal and decommissioning of redundant plant. ID

**Nuffield, William Morris, 1st Viscount** (1877–1963). Born in Worcester, Nuffield attended school at Cowley where he became a cycle repairer and, by 1896, a manufacturer. By 1901 his partnership with Joseph Cooper produced motorcycles from components bought from midland suppliers. By 1903 he was repairing motor cars, and, in 1909 he was running the Morris Garage which sold various car models and had a hire department. In 1912 he established WRM Motors to sell his own Morris Oxford cars for £150, in 1914 producing 1,000 cars. The Cowley works made cars for the man in the

street with all profits reinvested in the firm. In the early 1930s assembly-line production was introduced for the Morris 8 and by 1938 annual output reached 100,000 vehicles. In 1951 the firm merged with \*Austin to become the British Motor Corporation. Lord Nuffield endowed educational and medical activities through the British United Provident Association, the Nuffield Foundation, and Nuffield College of Oxford University. IJEK

**nunneries.** In the early Anglo-Saxon period, monastic life for women was almost always in double houses, of which \*Theodore disapproved. In most of these, monks and nuns shared a church, though at Wimborne (Dorset) each group had its own church. An abbess ruled over the community. She was often of royal or noble birth and for centuries nunneries remained places for aristocratic women. \*Hilda of Whitby was related to King \*Oswiu of Northumbria and Wimborne was founded by two sisters of King \*Ine. The first double monastery was probably at Hartlepool, since Hilda is said to have modelled her foundation at Whitby upon it, c.650. In the largest of these houses at Wimborne, there were said to have been 500 nuns in the early 8th cent., and Shaftesbury, Wilton, Winchester, Romsey, and Amesbury were all flourishing foundations.

A number of double monasteries were destroyed during the Viking incursions, and when the monastic revival developed in the 10th cent. single houses were in favour. The second Council of Nicaea in 787 forbade the foundation of double monasteries. By 1275 there were ten Saxon nunneries surviving in England and Wales, and another 118 had been founded since the Conquest. After 1275 only another ten nunneries were established, including the famous one by the Thames at Syon, endowed by Henry V in 1414. Of the total of 138 nunneries between 1275 and 1535, well over half were \*Benedictine; there were 28 \*Cistercian nunneries, 18 \*Augustinian, 4 \*Franciscan, 2 \*Cluniac, and 2 \*Premonstratensian. In Scotland there were a dozen or so nunneries, mainly Cistercian, and in Ireland about ten of the 140 monasteries were nunneries, all of them for regular canonesses. By the time of the dissolution, there were some 125 English nunneries still in existence, sheltering about 2,000 women.

SMD

**nursery rhymes** are one of the more enduring forms of oral culture. Although taken for granted, some of them are of considerable longevity, dating from the 17th cent. or earlier. The origins of these rhymes vary enormously. Some lie in riddles, others in singing games. Many, however, originated from printed ballads and song books, genres which were firmly established by 1700, while others can be traced back to plays or folk-songs.

It has been suggested that many of these rhymes originally referred to historical events or personalities, although attempts to prove such arguments in individual cases are rarely convincing. There is a risk of over-interpretation: the analysis of nursery rhymes in John Bettenden Ker's *An Essay on the Archaeology of Popular English Phrases and Nursery Rhymes*, published in three volumes between 1834 and 1840, is, according to one modern authority, 'probably the most extraordinary example of misdirected labour in

the history of English letters' which has 'given delight to students of mania ever since'. Sometimes historical origins to nursery rhymes can be traced: thus 'Ring o' Roses' may refer to the plague of the 17th cent., while 'The Grand Old Duke of York' was almost certainly Frederick Augustus, son of George III, who led a less than successful campaign against the French in the Low Countries in 1793-5.

Most connections are hard to sustain. Thus there is no way of proving the early 18th-cent. notion that Old King Cole can be identified with the mythical founder of Colchester. The 'fine lady' riding her horse to Banbury Cross (a structure destroyed by the local puritans around 1600) has been variously identified as Queen Elizabeth I, Lady \*Godiva (there is a version of the rhyme referring to Coventry Cross), and the traveller Celia Fiennes (1662-1741), 'Fiennes' being corrupted as 'fine'. Such identifications are highly speculative.

It is far more profitable to use these rhymes, and the publications in which they were collected, as evidence of changing attitudes towards children and childhood. That so many of them had their origins in the 'adult' milieu of the theatre and the song book before coming to the nursery is suggestive of a certain relationship between the adult world and that of children, while the proliferation of nursery rhyme books around the middle of the 18th cent. supports the suggestion that new sensibilities towards children were developing then. This is a contentious area, and tracing changes in sensibility is always difficult. But the content and illustrations in books of nursery rhymes (the first of any substance published in 1744) would repay serious investigation, and would throw much illumination on the history of childhood. JAS

**nursing** did not develop as an organized profession until the mid-19th cent., despite the establishment of voluntary hospitals in the 18th. Until then, caring for the sick had been undertaken mainly at home by relatives and neighbours, whose knowledge and experience was variable though not always as minimal as detractors have claimed. The medieval religious orders had had infirmaries, where nursing duties were undertaken by lay brethren in charge of maintenance and catering, but after the \*dissolution of the monasteries the able-bodied poor were often used or required to tend their sick counterparts. The early voluntary hospitals, whose nurses were drawn mainly from the domestic servant class and not thought to require any special training, frequently insisted that convalescent patients helped out on the wards, and also refused to admit those with fevers, incurable, or venereal disease; such patients were dumped in workhouses, to be tended by healthier though often infirm paupers, since there were no special arrangements for the sick. John \*Howard, the prison reformer, commented on the poor state of hospital care in the 1780s, but it was not until 1840 that Elizabeth \*Fry established an Institute of Nursing Sisters at Bishopsgate, though the scale was small. Florence \*Nightingale's great contribution was twofold: the work in the Crimea of her 40 nurses, sent out by public subscription, dramatized the problem, and after the war she began systematically organizing nursing services with

her Nightingale School attached to St Thomas's Hospital, offering a year's course; her best pupils became matrons of other hospitals, which started their own courses. A parallel development was the district nursing scheme, initiated by William Rathbone of Liverpool, and developed through the Metropolitan Nursing Association, and then the Queen Victoria Institute for Nurses. Although the British Nurses' Association, founded in 1887, began to press for state registration of nurses, opposition to this did not lessen until a precedent was set by the far-reaching Midwives Act (1902);

the College of Nursing was established in 1916, but the Nurses Registration Act (1919) and the General Nursing Council (1920) developed out of the government's own bill rather than either of the two feuding bills submitted. Nurses are now recognized as important in the culture of a hospital; their training may come through a three-year course in hospital, specialized college, or degree course in a higher education institution.

JAC

**Nyasaland.** See MALAWI.

**Oakboys** in Ireland were the northern and protestant equivalent of the \*Whiteboys in 1771, protesting against compulsory service as road-menders. The campaign of intimidation was less violent than in Munster and lasted only a few months. JAC

**Oastler, Richard** (1789–1861). Factory reformer and anti-Poor Law agitator. Born in Leeds, the son of a leading Wesleyan, Oastler was educated by the Moravians at Fulneck, but became Church of England when he succeeded his father in 1820 as steward for Thomas Thornhill, the absentee landlord of Fixby Hall near Halifax. He was a romantic Tory, defending old values against utilitarian radicalism and political economy, attacking the vicar of Halifax over tithes in 1827, criticizing the employment of children in Bradford worsted mills in 1830, leading the \*Ten Hours campaign for factory reform, and denouncing the New \*Poor Law of 1834. His extreme language and immense popularity alienated his employer who had him imprisoned for debt (1840–4). As a staunch protestant, he opposed \*catholic emancipation but supported the movement to restore \*convocation for the government of the Church of England. His motto was 'Altar, Throne and Cottage'. ER

**Oates, Lawrence Edward Grace** (1880–1912). Having entered the army in 1898, Oates saw service in the South African War. His interest in sailing, hunting, and kindred pursuits led him to apply for a post on \*Scott's 1910 expedition to the Antarctic. He was in charge of the ponies and was chosen as one of the party of five which reached the South Pole in January 1912. On the return journey, Oates, unable to walk properly because of severely frost-bitten feet, decided that he was lessening his companions' chances of survival and on 17 March 1912 walked out into a blizzard saying, 'I am just going outside and may be some time.' His body was never found. RB

**Oates, Titus** (1649–1705). Perjurer and fabricator of the \*Popish plot'. Despite his status as an Anglican priest, Oates's penchant was for lies and petty crime. Recognizing by the mid-1670s that the surest way to advancement was to feed the public taste for catholic scare-mongering, he wormed his way into catholic counsels, learning their secrets, and became a member of the faith himself in 1677. In 1678, he unveiled to the government his highly wrought tale of a conspiracy to overturn the protestant establish-

ment for which corroborative evidence soon came to light. A wave of hysteria swept the country, the political impact of which was the \*Exclusion crisis, and Oates's accusations resulted in the execution of 35, including 9 Jesuit priests. From 1681, however, his testimony was increasingly discredited and he lost the court's protection. Tried in 1685 for perjury and condemned to life imprisonment, he was pardoned in 1689. AAH

**oaths.** From early days the taking of solemn religious oaths was regarded as an essential part of the political and social order. Monarchs swore oaths at their \*coronations, vassals swore oaths on doing homage, jurors swore oaths on being empanelled. Difficulties began at the Reformation when oaths were devised to make it impossible for catholics to take them: the Elizabethan Act of \*Supremacy in 1559 demanded an oath from all ministers, judges, graduates, or mayors that they acknowledged the queen as supreme governor of the church. The next century saw torment by oaths. Right-thinking persons in 1644 were required to take an oath to support the \*Solemn League and Covenant and in 1662 to repudiate it. \*Quakers were in the most disagreeable of all positions since their refusal to take oaths on principle was regarded as utterly subversive, and they suffered imprisonment and loss of property. James II, when duke of York, was forced to resign as lord high admiral because the oath of office under the \*Test Act contained a declaration against transubstantiation which, as a catholic, he could not take. The first group to obtain concessions was the quakers, who lobbied hard after the Glorious Revolution. In 1689 they were allowed to make a solemn declaration of loyalty, in 1696 they were permitted to affirm in civil cases, and in 1749 to affirm whenever an oath was required by statute, though they were still excluded from public office. A collision of oaths kept catholics out of Parliament until 1829, since George III insisted that any concession would damage the protestant constitution and breach his coronation oath. Jews remained ineligible for Parliament after 1829 since the oath was on the true faith of a Christian, and were not admitted until 1858. Atheists had to wait until after the \*Bradlaugh case. In 1888 the Oath Act cleared up the whole matter by permitting a solemn affirmation in all cases. JAC

**O'Brien, James (Bronterre)** (1805–64). Dubbed 'the schoolmaster of chartism'. An Irish barrister, O'Brien was the most theoretical of the chartists and might have rivalled

\*O'Connor for the leadership but for his unstable personality. An admirer of the French Jacobins and also of Robert \*Owen, he advocated revolutionary action, including physical force if necessary. But after imprisonment in 1840 for seditious speaking, O'Brien concluded that the use of force was impracticable, and supported a tactical alliance with middle-class radicals. He broke with O'Connor and elaborated plans for socialism and land nationalization through a National \*Reform League (1850). His influence was greatest in the early 1830s through his editorship of the *Poor Man's Guardian* and as a contributor to other radical journals.

JFCH

**O'Brien, Murrough.** See INCHQUIN, EARL OF.

**O'Brien, William** (1852–1928). Irish nationalist. A journalist from Co. Cork, O'Brien became editor of *United Ireland* in 1881 and was imprisoned for his \*Irish Land League agitation until released under the \*Kilmainham treaty. In 1883 he was returned to the Westminster Parliament in which he served until 1918. He was again imprisoned for six months in 1887 for supporting a rent strike and for a third time in 1890. In the Parnell split he was a moderate and worked for the reunification of the Irish Parliamentary Party in 1900. But he pursued an increasingly independent line and finished up leading his own small breakaway group. His passionate opposition to partition led him towards \*Sinn Féin. He did not stand for re-election in 1918 and declined nomination to the Senate of the Irish Free State, since he refused to accept the treaty and the partition it introduced.

JAC

**O'Brien, William Smith** (1803–64). Smith O'Brien was an unlikely, unwilling, and unsuccessful Irish rebel. The younger son of a protestant baronet from Co. Clare, with family links to the earls of Thomond, he was educated at Harrow and Trinity College, Cambridge. He served in Parliament 1828–31 and from 1835 when he was returned for Co. Limerick. He moved steadily into a nationalist stance, much influenced by \*Young Ireland, and in 1843 declared for repeal of the Union. He also moved from advocating peaceful agitation to toying with armed protest. In May 1848 he was prosecuted in Dublin for an inflammatory speech but no verdict was returned. A rising planned for August dwindled into a farcical riot at Ballingarry, Co. Tipperary, where O'Brien explained that he had no food to give his followers and did not intend any violence to property. An attack upon 46 policemen, holed up in Widow McCormack's cottage, was unsuccessful. O'Brien was sentenced to death, but pardoned against his will and transported. After six years in Tasmania he was released but took no further part in politics. He himself described the rising of 1848 as an 'escapeade'.

JAC

**O'Casey, Sean** (1880–1964). Irish playwright and author. His real name was John Casey, but was later changed to the more Gaelic Sean O'Casey. Self-educated, he had a natural talent for the theatre. He worked as a casual labourer until the age of 30 when he became involved in Irish politics as a member of the \*Gaelic League, the \*Irish Republican Brotherhood, Jim \*Larkin's Union, the \*Irish Citizen Army, and the Irish Socialist Party respectively. In 1916 he turned

to writing plays, but it was not until 1923 that one of his plays was staged. His three early plays, *The Shadow of a Gunman* (1923), *Juno and the Paycock* (1924), and *The Plough and the Stars* (1926), dealt with the impact of the Troubles on ordinary people. He was awarded the Hawthornden prize in 1926 for *Juno*, after which he moved to England, where he spent the rest of his life. His career began to wane after the production of the play *Within the Gates* (1934), which was set in London's Hyde Park, and he spent the rest of his life attempting to recapture his former popularity. His genius was particular to his Irish roots and subject-matter, and his inspiration faded once he cut himself off from them. O'Casey died in Torquay.

SMD

**Occasional Conformity Act**, 1711. This Act prevented nonconformists from taking communion in an Anglican church to qualify for national and municipal office according to the \*Corporation and \*Test Acts. Three previous attempts (1702, 1703, and 1704) had failed because the large Tory majority in the Commons (who aimed at depriving the Whigs of the electoral support of the nonconformists) had been frustrated by the Whig majority in the Lords. The less severe 1711 bill passed because the Whigs agreed to it in exchange for the support of the Tory earl of \*Nottingham (the instigator of all four bills) against the Harley ministry's peace policy. The Act was repealed in 1719.

CJ

**Ochakov crisis**, 1791. No sooner had the \*Nootka Sound confrontation with Spain been settled than \*Pitt was involved in a dangerous showdown with Catherine the Great's Russia, then at war with the Ottoman empire. Ochakov, a fortress on the Black Sea near Odessa, had been captured by the Russians in 1788. Pitt again took over negotiations from his foreign secretary \*Leeds, armed a naval squadron, and demanded Russian withdrawal. He was not supported by public opinion, which could not see why Ochakov should be of importance to Britain, particularly since Russia had already acquired access to the Black Sea through her conquest of the Crimea in 1783. Pitt's defence in the Commons was limp, and his majority declined. He resolved on retreat, precipitating Leeds's resignation, and Russia kept Ochakov. A humiliating climbdown for Pitt, at one point he also considered resignation.

JAC

**O'Connell, Daniel** (1775–1847). Irish catholic politician. Born into the catholic aristocracy and called to the Irish bar in 1798, he built up a successful practice as a barrister and by 1815 was the recognized leader of the movement for \*catholic emancipation. In 1823 he started the \*Catholic Association to mobilize catholic peasant opinion for emancipation, repeal of the Union, land reform, an end to tithes, and a democratic suffrage. In 1828 he stood successfully for Co. Clare in a parliamentary by-election, although as a catholic he was disqualified. Faced with civil war, \*Wellington's government conceded emancipation in 1829. O'Connell's campaign became a model for mass pressure-group politics and influenced both the \*Birmingham Political Union, formed later in 1829, and the \*chartist movement whose charter he endorsed in 1838. Though a democrat, his acceptance of the 1834 \*Poor Law, opposition to trade unions, and

support of the Whig government (1835–41) meant he was mistrusted by many British radicals, but he continued to hold the loyalty of most Irishmen through his National Repeal Association (founded 1841) until \*Young Ireland, with its more revolutionary version of Irish nationalism, broke away in 1846. His hopes shattered by the \*Famine, he died on pilgrimage to Rome the following year. ER

**O'Connor, Arthur** (1763–1852). Irish republican. Born in Mitchelstown (Co. Cork), into a landed family, his background was protestant but he was a sceptic. He sat in the Dublin Parliament as a follower of \*Grattan (1791–5), speaking in favour of \*catholic emancipation, but in 1796 joined the \*United Irishmen and conducted negotiations for the French invasion of that year. Imprisoned in Dublin for six months for seditious libel in 1797, he was arrested again on his way to France in February 1798. Tried for high treason and acquitted, he was detained on lesser charges but released into exile in France in 1803. In 1807 he married Condorcet's daughter and settled on an estate near Nemours which had once been Mirabeau's. He became a French citizen in 1818. His rationalism and capacity for organization marked him out as one of the ablest of Irish leaders. ER

**O'Connor, Feargus** (1794–1855). Chartist. An Irish barrister, O'Connor was MP (and follower of Daniel \*O'Connell) for Cork in 1832 and for Nottingham (as a chartist) in 1847. He was the greatest of the chartist leaders, the champion, as he said, of the 'unshorn chins, blistered hands, and fustian jackets'; and for ten years he was at the head of the movement. His influence came from his charismatic, flamboyant style of oratory, and his ownership of the chief chartist newspaper, the *Northern Star*. He was imprisoned in 1840 for seditious libel. Contemporaries like \*Lovett and some historians later attributed the failure of chartism to O'Connor's demagoguery and his promotion of the National Land Company (1845–51), designed to settle working people on agricultural smallholdings. O'Connor's appearance at the last great chartist demonstration on Kennington Common on 10 April 1848 marked the end of the mass platform as a pattern of popular radicalism. JFCH

**O'Connor, Rory** (Ruaidrí Ua Conchobair) (d. 1198), last \*high king of Ireland, became king of \*Connacht in 1156, and high king in 1166, and is widely perceived as a weak ruler. He banished overseas the \*Leinster king, \*Dermot MacMurrough, who returned with Anglo-Norman aid in 1167. Rory, initially conciliatory, reacted strongly to the arrival of the main body of Anglo-Norman forces in 1169, and made two failed attempts to eject them from Dublin. He did not submit to Henry II during his expedition to Ireland in 1171–2, but reached an accommodation under the short-lived 'treaty' of \*Windsor in 1175, which secured Rory's rule over the unconquered parts of the country. O'Connor's position was, however, gradually eroded and he suffered mounting opposition from within his own family, temporarily abdicating in favour of his son in 1183. He never recovered his former status and died at Cong in 1198, being buried in Clonmacnoise. SD

**Octavians.** A group of eight ministers, appointed by James VI in 1596 to bring order into the Scottish royal finances, possibly at the suggestion of Lord Drumcairn. The king promised not to override them. Their economies provoked protests and they were opposed by another court faction, the Cubiculars (bedchamber servants). Since they were in power for only a year and the task was daunting, progress was limited. James waxed 'very merry', explaining that he would not have one great man but servants he could hang if necessary, but there remains a hint of a non-royal independent bureaucracy. JAC

**Octennial Act, 1768.** Until 1768 the Irish Parliament existed for the lifetime of the king and general elections were therefore infrequent. A radical campaign in the 1760s demanded a Septennial Act and the institution of \*habeas corpus. In 1768 the English government gave way and accepted an Octennial Act, though refusing habeas corpus. Though the Act contributed to the vigour of Irish parliamentary life in the later 18th cent., its effect was mitigated by the unreformed electoral system and, with the Act of \*Union of 1801, it ceased to apply. JAC

**October Club.** A ginger group of Tory MPs formed after the election victory of 1710 to watch \*Harley and the moderates and hound the Whigs. They took their name from October ale, beloved of country gentlemen, and met regularly at the Bell Tavern, Westminster. At its peak, the club numbered 150 and its greatest triumph was the expulsion of \*Walpole in 1712 on charges of corruption. But it was weakened by the defection of the March Club, even more hostile to the ministers, and it did not long survive the electoral disaster of 1715. JAC

**Oda** (d. 958). Archbishop of Canterbury, known as 'the Good'. A remarkable, saintly Dane, whom \*Athelstan made bishop of Ramsbury (c.927), he proved useful to kings in their dealings with people of his race and speech; Athelstan sent him to Paris to treat with Hugh Capet (c.936) and later, with Archbishop \*Wulfstan of York, he arranged a treaty with \*Olaf Guthfrithsson after his invasion of northern England. As archbishop from 942, he ordered bishops to repair ruined churches and issued canons to improve clerical and lay standards. His contribution to 10th-cent. monastic reform has been underestimated. Deeply influenced by the recently reformed abbey of Fleury-sur-Loire, he took Benedictine vows and wore Fleury's habit on becoming archbishop. He sent for training there his nephew \*Oswald, future reforming bishop of Worcester. WMM

**Odo of Bayeux** (c.1036–97) was half-brother to Duke William II of Normandy (later William I of England). He was destined for an ecclesiastical career, receiving the bishopric of Bayeux from William in about 1049, when he was perhaps 13 years old, the first of many acts of patronage that were as much political as fraternal, since William intended Odo to strengthen ducal authority in Lower Normandy. He participated in the invasion of England in 1066, the \*Bayeux Tapestry, almost certainly produced for Odo, exaggerating his role. In 1067, he received Dover castle and the earldom of Kent, his particular remit being defence of the coast and

ports in this vital strategic area. Thereafter, he acted occasionally as the Conqueror's viceregent and accumulated enormous wealth in England, second only to the king. In 1082, William stripped him of his English lands and incarcerated him for reasons that remain obscure. Released in 1087, he joined the rebellion against William II 'Rufus' in 1088. This time he was exiled from England for ever and returned to Normandy. SL

**O'Donnell, Hugh Roe** (c.1571–1602). O'Donnell was married to a daughter of \*Tyrone. From 1587 to 1591 he was held in captivity in Dublin but escaped and built up a powerful position in Connacht. He drifted into open rebellion against Elizabeth, sharing Tyrone's victory at \*Yellow Ford in 1598. On hearing of the Spanish expedition to \*Kinsale in 1601, he moved south to join forces with Tyrone. They were routed by \*Mountjoy and O'Donnell left at once for Spain, where he died eight months later. His younger brother Rory \*O'Donnell took over the chieftainship. JAC

**O'Donnell, Rory, 1st earl of Tyrconnel** [I] (1575–1608). The second son of the chief of the O'Donnells, Rory joined his brother Hugh Roe and \*Tyrone in rebellion against Elizabeth from 1598 until 1602. After the disaster at \*Kinsale, Hugh Roe fled to Spain and died in September 1602. Rory assumed the chieftainship and submitted to Elizabeth's lieutenant \*Mountjoy. After a visit to James I in June 1603 O'Donnell was created earl of Tyrconnel but became increasingly dissatisfied. Learning that a plan to seize Dublin castle had been betrayed and fearing arrest, he joined Tyrone in the \*Flight of the Earls in September 1607. He spent his remaining months in Rome, where he died in July 1608, amid suspicions of poison. His son served in an Irish regiment in the Spanish army: a daughter, born after the flight, developed a taste for adventure in men's clothing and lived in poverty in Rome. JAC

**Offa** (d. 796), king of Mercia (757–96), came to the throne after a disputed succession with Beornred following the murder of King \*Æthelbald. He continued the expansion of Mercia from its midland base. By the end of his reign Offa had added the provinces of the \*Hwicce, the \*South Saxons, and \*Kent and had expelled their royal houses or reduced them to the status of ealdormen. But he also had strong opposition. Although he had gained control in Kent in 764, the Kentishmen recovered their independence after the battle of \*Otford in 776 and retained it until 785. \*Cynewulf of Wessex fought Offa at \*Benson c.779 and although he lost some parts of northern Wessex to Offa, remained an independent ruler. Offa may have had more influence in Wessex during the reign of Beorhtric, who married his daughter Eadburh in 786. Æthelbert of the East Angles presumably offered resistance as well since in 794 Offa had him beheaded. Offa's Dike still stands as testimony to the seriousness of his campaigns against the Welsh and also to his ability to exact military services from his subjects.

Offa was considered sufficiently powerful by his contemporary Charles the Great to warrant bringing into his sphere of influence by the bestowal of gifts. The two kings corresponded on trade between their kingdoms, and marriage

between their children appears to have been considered. Offa introduced the 'penny' coinage circulating in Francia and copied Frankish usage in including his portrait in the style of a Roman emperor. He may also have been influenced by Frankish example to attend to the moral and spiritual welfare of his people and drew praise from Charles's Northumbrian adviser \*Alcuin for encouraging 'good, moderate and chaste customs'. But, as is often the case with early medieval rulers, his interest in the church had political connotations as well. His presidency of a synod of the southern church in 786 attended by two papal legates helped stress that he was the dominant king of southern England. His wooing of the pope resulted in a grant of archiepiscopal status for the Mercian see of \*Lichfield in 787 and the consecration there of Offa's son Ecgrith as king of the Mercians later the same year. Archbishop Jaenbert of Canterbury, who was part of the Kentish opposition to Offa, seems to have refused to carry out the ceremony. It appears to have been opposed in Mercia as well. Alcuin was not surprised that Ecgrith only survived his father by 141 days for it was a judgement on the blood Offa had shed to secure his succession; perhaps a reference to the culling of rival royal claimants. BAEY

**Official Secrets Act, 1911.** The first Official Secrets Act (1889) was ineffective. It required the government to *prove* a suspect was a spy, even where it was obvious. The 1911 Act put this right, and extended the law further. It was passed in a panic, during an anti-German spy scare, and on a hot summer's day when many MPs had gone home. Section I dealt with espionage; section II, however, forbade the unauthorized revelation of any government information, however innocuous to national security. In 1985 Clive Ponting, a civil servant, was acquitted under it, against the evidence, because the jury felt he had acted in the public interest. That led to a third Official Secrets Act in 1989, which narrowed the range of information it covered, but made it impossible to plead 'public interest' as a defence. BJP

**oil.** See PETROLEUM INDUSTRY.

**Olaf Guthfrithsson** (d. 941), king of Dublin. Olaf succeeded to the throne in 934. His first years as ruler were spent in establishing his position in Ireland, where in 935 he raided the monastery of Clonmacnoise and in 937 overran Limerick. This freed him for an attempt to regain the Viking kingdom of \*York, from which his father had been expelled in 927 by \*Athelstan. But Olaf's grand coalition, which included the king of the Scots and the king of Strathclyde, was cut to pieces by Athelstan at \*Brunanburh, Olaf escaping in flight (937). After Athelstan's death in 939, Olaf renewed the struggle, occupied York, harried Mercia, sacked Tamworth, and forced \*Edmund to concede all the lands north-east of Watling Street. He was killed the following year at Tynningham, near Dunbar, and his successors were unable to hold the territories he had won back. JAC

**Olaf Sihtricsson** (d. 981), king of Deira (941–3, 949–52), king of Dublin (945–81). Olaf's father was \*Sihtric, king of \*Deira, whose second wife was \*Athelstan's sister. On Sihtric's death in 927, his brother Guthfrith took the throne

## old-age pensions

(Olaf being a child), but was at once dispossessed by Athelstan. \*Olaf Guthfrithsson regained it in 939 and on his death in 941 was succeeded by Olaf Sihtricsson, who had married a daughter of \*Constantine, king of the Scots. He could not hold the territories regained from \*Edmund, Athelstan's successor, and was driven out of his capital, York, in 943. He did, however, recover the throne of the Norse kingdom of Dublin in 945, may have briefly been restored in York in 949, and was again dispossessed by \*Erik Bloodaxe in 952. He managed to hold his kingdom of Dublin in the face of incessant warfare against the Irish, but at the end of his life suffered a severe defeat at Tara (980), abdicated, and spent his last months on Iona. JAC

**old-age pensions** were first paid to persons over 70 years of age on 1 January 1909. Their introduction had been debated for many years, raising questions about the redistribution of incomes and reducing the burden of poverty on people who had not sufficient resources to provide for themselves. A regular weekly payment by the state from taxation was preferred to any contributory scheme because of the high administrative cost. Only those with an annual income of less than £31 10s. a year, who had no criminal convictions, and who had never received support from the Poor Law were eligible for an old-age pension. Almost half a million people qualified. Later amendments increased payments to cope with inflation and after 1925 the age for support was lowered to 65 years. Pension entitlement began under the National Health and Insurance Act (1925) when worker, employer, and the state each contributed. Retirement pensions superseded the old-age pension in 1946 for all except those who had no contribution record after 1946. IJEK

**Old Bailey.** This is the popular name given to the Central Criminal Court in London, set up in 1834. It is the successor of the Old Bailey sessions of gaol delivery for \*Newgate prison and of \*oyer and terminer for the city of London and the county of Middlesex. The sheriffs of London were also sheriffs of Middlesex, and the lord mayor of London was included in the commissions of oyer and terminer and is still ex officio a judge of the Central Criminal Court. The jurisdiction of the Central Criminal Court extends throughout the whole metropolis. MM

**Old Sarum** was the original site of the city of Salisbury, abandoned in 1220 for the situation closer to the river Avon. By Tudor times it was totally deserted. It continued to return two members of Parliament until 1832 and became a symbol of the old regime, having, by the 18th cent., no more than a handful of voters and not knowing a contest between 1728 and its abolition in Schedule A of the \*Great Reform Act. JAC

**'Oliver the Spy'** became the mythic villain of generations of English radicals after allegedly egging on the \*Pentrich rebels in June 1817, and then betraying them. Three were executed as a result. Oliver's real name may have been William Richards, but no one knows for certain, because he vanished afterwards. BJP

**Olivier, Sir Laurence** (1907–89). Actor and director. Praised by Ellen \*Terry in a school play, Olivier became one of his generation's leading actors. Commencing in repertory, he established a reputation with Shakespearian roles and joined the Old Vic; after starring in film versions of *Wuthering Heights* and *Rebecca* in America, he returned to England to serve in the Fleet Air Arm, before helping rebuild the Old Vic after the Second World War. Handsome, charismatic, often generating a sense of risk, then youngest stage knight (1947), he directed and acted under his own management from 1950, revolutionized the art of filming Shakespeare (*Henry V*, *Hamlet*, *Richard III*), became director of the newly formed National Theatre Company (1962–73), and was the first actor to receive a life peerage. The outstanding success of Olivier's later career, before ill-health supervened, was as Archie Rice in John Osborne's *The Entertainer* (1957). One of the Royal National Theatre's stages is named in his honour. ASH

**Omdurman.** Town in central \*Sudan which came to prominence when the mahdi, a religious leader who led a holy war against the Egyptian government, made it his capital in 1885. Although British forces had occupied Egypt in 1882 the British government showed little interest in extending its influence further south until France cast covetous eyes on the region. In 1898 an Anglo-Egyptian army led by Sir Herbert \*Kitchener advanced into the Sudan. Early in September the battle for Omdurman took place, the town was occupied by Kitchener's forces, and the army of the mahdi was completely destroyed. KI

**O'Neill, Con, 1st earl of Tyrone** [I] (c.1484–1559). Con O'Neill's life was turbulent and his political course fluctuating. He became chief of Tyrone in 1519. He clashed repeatedly with successive lord deputies—\*Surrey, Skeffington, \*Grey, and \*St Leger—but came to terms in 1540, visiting Henry VIII at Greenwich, and being created by him earl of Tyrone in 1542, with remainder to his illegitimate son Matthew. From 1551 his authority was disputed by his legitimate son \*Shane, and he was driven to take refuge in the English \*Pale. JAC

**O'Neill, Daniel** (1612–64). Daniel O'Neill was an Ulster protestant and made a living in the 1630s as a volunteer soldier fighting for the Dutch. He returned to England when the \*Bishops' wars commenced and was captured at \*Newburn in 1640 fighting for the king. He dabbled in royalist conspiracy, was confined by Parliament to the Tower, but made his escape in women's clothes. He joined Charles's army in 1642 and in 1644 was sent to Ireland to raise troops. He returned to fight at \*Marston Moor, \*Lostwithiel, the second battle of \*Newbury, and \*Naseby. From 1645 to 1650 he was in Ireland trying to rescue the king's cause. He next joined Charles II in Holland, fought alongside him at \*Worcester in 1651, and escaped to The Hague. At the Restoration he became an MP, was given a pension and property, and in 1663 appointed postmaster-general. He died in 1664 causing Charles to regret 'as honest a man as ever lived and a good servant'. Clarendon admired his dexterity and adroitness. JAC

**O'Neill, Hugh, 3rd earl of Tyrone** [I] (1550–1616). O'Neill was brought up in England in the charge of Sir Henry \*Sidney and \*Leicester. On the death of his brother Brian in 1562 he succeeded to the earldom, though his title was not recognized by Elizabeth until 1585. He was sent to Ireland in 1568 after the death of Shane \*O'Neill as a counterweight to the influence of Turlough O'Neill, who claimed the headship of the family. But no sooner had he established his supremacy, by 1595, than he was in full-scale rebellion against Elizabeth, greatly encouraged by the catholic powers of Europe. He defeated and slew Sir Henry Bagenal at \*Yellow Ford in 1598, outmanœuvred \*Essex without great difficulty at their famous meeting in September 1599, and maintained resistance until crushed by Mountjoy in 1602. He was reconciled to James I but in September 1607 fled abroad with the earl of Tyrconnel. He died in exile in Rome, blind and powerless. JAC

**O'Neill, Owen Roe** (c.1590–1649). O'Neill was the military linchpin of the Confederation, which struggled for control of Ireland after the rising of 1641. He was a nephew of Hugh \*O'Neill, 3rd earl of Tyrone, and spent his early years in the Spanish service. He was not in Ireland at the start of the rising but arrived in July 1642 and took over command of the Ulster army from Sir Phelim \*O'Neill. He managed to keep an army together through all the extraordinary political vicissitudes of the next few years and in 1646 gained a significant victory at \*Benburb over Monro and the Scottish army. But the end of the Civil War in England enabled Parliament to strengthen its position in Ireland. The Confederation split badly on political tactics and O'Neill was declared a traitor in 1648 for supporting the intransigent line of Rinuccini, the papal nuncio. Early in 1649 he reached an agreement with \*Monck, who commanded the parliamentary forces in Ulster. It is doubtful whether he could have put up much resistance to Cromwell, who landed in August 1649, but he died in November of the same year. JAC

**O'Neill, Sir Phelim** (c.1604–53). O'Neill was one of the commanders of the Irish rebels or Confederation. In 1641 he captured Charlemont castle on the Blackwater and was put in charge of the army of the Ulster rebels. He claimed to be acting on behalf of Charles I but had great difficulty in maintaining his position until assisted by the arrival of Owen Roe \*O'Neill, with whom he subsequently quarrelled. He continued to fight for the Confederation and took part in the victory at \*Benburb in 1646, but was forced to capitulate to parliamentary forces in 1650. He failed to make good his escape and was put on trial in 1653. Refusing to purchase a pardon by implicating Charles I, he was executed in Dublin as a traitor. JAC

**O'Neill, Shane** (c.1530–67). The legitimate son of Con \*O'Neill, he was passed over in 1542 when his father was created earl of Tyrone, presumably because of his youth, and remainder given to an illegitimate son, Matthew. As soon as he grew up he claimed the inheritance, insisting that Matthew's claim was entirely spurious, and by 1557 had driven his father and Matthew O'Neill to take refuge in the \*Pale. In 1558 he killed Matthew, but at her succes-

sion Elizabeth offered to recognize him if he submitted to the lord deputy, \*Sussex. The negotiations broke down amid mutual mistrust, but O'Neill held his own against Sussex and in 1562 visited Elizabeth in London, where he and his followers (who spoke mostly Irish) created a sensation. On his return to Ireland, he resumed his warfare with gusto, particularly against the Macdonnells. Fresh attempts by Sussex and then Sir Henry \*Sidney to subdue him failed, but O'Neill, appealing to his old enemies the Macdonnells for support, was assassinated in June 1567. JAC

**O'Neill, Terence, Lord O'Neill of the Maine** (1914–90). Prime minister of Northern Ireland (1963–9). O'Neill, who saw himself as a modernizer, was keen to promote economic development within Northern Ireland, and to address the traditional hostility between unionist and nationalist, and between Belfast and Dublin: he welcomed Sean Lemass, the taoiseach (prime minister) of the Republic of Ireland, to Belfast in January 1965, the first such official visit since partition. However, he alienated hard-line loyalists without offering substantive concessions to the Ulster catholics. The rise of the Northern Ireland Civil Rights Association (founded in January 1967) brought further pressure on O'Neill. In November 1968 he conceded a five-point reform programme, but this satisfied neither the NICRA activists nor many of his unionist colleagues. He held an election in February 1969 in order to test his strength, but inadvertently intensified the divisions within his party. On 28 April 1969, against the background of a splintering unionism and relentless NICRA pressure, he resigned. O'Neill was a well-intentioned, if paternalistic, leader. Like Harold \*Wilson he was strong on the rhetoric of modernization; like Wilson he was susceptible to conspiratorial fantasies. AJ

**On Liberty** (1859) was John Stuart \*Mill's influential justification of individual freedom. In this book, Mill set out to establish a 'simple principle'—that the only legitimate reason for interfering with someone's action was to protect someone else; the good of the agent himself/herself was not sufficient warrant. Mill based his defence of liberty on utilitarian grounds, not on a natural right to freedom; arguing that on balance people were happier when left to choose their life-styles for themselves. He also believed that social well-being and scientific progress depended on the greatest possible freedom of expression and publication. His attack was directed not only at governmental paternalism but also at social conformity. TSG

**opera.** The general term, taken from the Italian *opera* meaning work, describes a staged drama in which the actors sing some or all of their parts. Opera involves a union of music, drama, and spectacle in varying degrees; although the first Florentine operas around 1600 emphasized the text through recitative—a form of heightened speech—music soon became the dominant partner. While all-sung opera has always been the norm in Italy, the strong British tradition of spoken drama favoured the \*masque, and spoken drama with music remained the pattern for dramatic works in English. Full-length, all-sung English operas were a rarity until the 20th cent.; for the previous 200 years the British

## Opium War

operatic scene was dominated by Italian imports. Only since the outstanding success of \*Britten's *Peter Grimes* in 1945 has Britain played a major role on the international operatic stage—ironically at a time when opera-houses have become 'museums', relying on revivals of well-known works in preference to commissioning new operas.

Music featured in Shakespeare's works and in Elizabethan choirboy plays, and the Stuart masques drew on this tradition. Even at the end of the 17th cent., \*Purcell's dramatic music for the professional stage fell into the category of 'semi-opera': spoken plays reworked to include a series of masques for subsidiary characters. French influence is apparent in both the staging, with elaborate sets, machinery, and costumes, and the music, including choruses and dances. Purcell's finest semi-opera *The Fairy Queen* (1692), an arrangement of *A Midsummer Night's Dream*, sets none of Shakespeare's text to music; nevertheless allegorical figures such as the Four Seasons are skilfully characterized by contrasting vocal styles and orchestration. Purcell's only 'true' opera, *Dido and Aeneas*, was performed at a girls' school in Chelsea (London) in 1689 and is modelled on Blow's court masque *Venus and Adonis*.

Davenant's *The Siege of Rhodes* (1656) was the first full-length, all-sung English opera, set 'in recitative musick' by several composers to overcome the Commonwealth ban on spoken drama. It included probably the first woman to appear on the public stage in London; the music is now lost. Its occasional successors did not catch on, and the early 18th-cent. London public turned to imported Italian opera. \*Handel's *Rinaldo* (1711), with its spectacular magic effects, was a stunning success, and for the next thirty years he produced a string of fine works, emphasizing the arias by reducing the amount of recitative in his *opera seria* librettos. Handel and the rival Opera of the Nobility imported leading Italian stars, including the famous castrati Senesino and Farinelli.

John \*Gay's enormously popular *The Beggar's Opera* (1728) began a brief vogue for ballad opera, with simple, popular tunes sung by actors interspersed with spoken English dialogue. The satirical treatment of London's low life appealed to a wider social range than the aristocratic *opera seria*, and the following decades spawned many short English works. These were often presented as afterpieces following spoken plays, such as Arne's patriotic *Thomas and Sally* (1760), while both serious and comic Italian opera, particularly the pasticcio using arias by various composers, remained dominant until the end of the 19th cent. Five Rossini and two Verdi operas were performed in the first Royal Italian Opera season at Covent Garden in 1847; even works by Mozart and Wagner were translated into Italian, although a German Ring was produced in 1882. Some English dialogue operas were successful—Balfe's *The Bohemian Girl* (1843) remained in the repertoire for nearly a century—and works such as Macfarren's *Robin Hood* (1860), MacCunn's *Jeanie Deans* (1894), and \*Stanford's *Shamus O'Brien* (1896) cultivated romantic nationalism in their choice of plots and use of folk-song. The most outstanding English works, however, were the brilliant operettas of \*Gilbert and \*Sullivan, achieving lasting popularity through their

blend of W. S. Gilbert's satirical texts with Arthur Sullivan's tuneful music.

In the early 20th cent., Stanford, Ethel Smyth, and \*Delius produced all-sung works that were strongly Germanic, although \*Vaughan Williams and \*Holst used folk-song to impart an English flavour. The reopening of London's Sadler's Wells theatre in 1945 with Britten's *Peter Grimes* heralded a renaissance in English opera, presenting a powerful drama full of well-drawn characters. Britten's setting of the English language (influenced by Purcell) and his large-scale motivic and tonal planning gave his operas an unrivalled power and direct appeal. His choice of plots with a strong social dimension is shared by Michael \*Tippett, whose Jungian symbolism and complex contrapuntal musical style are exemplified in his psychoanalytical *The Knot Garden* (1970). Other recent operatic composers include Peter Maxwell Davies and Harrison Birtwistle. ECr

**Opium War.** See CHINA WARS.

**Oporto, battle of, 1809.** On 12 May 1809 British forces in the Peninsula under Wellesley faced Soult's French army of 11,000 across the Douro opposite Oporto. Believing a frontal assault to be impossible, Soult was taken by surprise when the British used four wine barges to ferry troops across the river. The British occupied a convent which they held against French counter-attacks. When the French withdrew from the waterfront, the citizens of Oporto took many more vessels across to the British to speed up the crossing. Soult was forced to retreat, and by 19 May the French had been driven out of Portugal. GDS

**opposition.** The concept of a loyal parliamentary opposition grew slowly for two reasons. As long as the monarch played an active part in government, opposition was bound to be tainted with disloyalty: though the opposition to Charles I in the 1640s claimed to be loyal and conservative, it ended by cutting his head off and abolishing the monarchy. Secondly, the existence from 1688 until 1760 of an active Jacobite cause retarded the concept since some of the Tories in opposition undoubtedly wished to overthrow the regime itself. Nevertheless, the concept made progress in the 18th cent. and was helped by the fact that successive princes of Wales, who could scarcely be accused of treason, went into opposition to their father's government. Monarchs continued to find the concept suspect and the protestations of loyalty insincere: George III observed in 1778 that 'men who have been active in opposition rarely make useful servants to the crown'—a phrase which reveals a slightly old-fashioned attitude. Charles \*Fox, on the other hand, declared in 1783 that a 'systematic opposition to a dangerous government is, in my opinion, a noble employment for the brightest faculties'. The phrase 'His Majesty's Opposition' was first used jocularly by Hobhouse in 1826 and was so useful that it took root. The validity of the concept was subsequently recognized in a variety of ways. From 1937 the leader of the opposition received an official salary and is now provided with an official car and chauffeur: the chief opposition whip and two assistant whips also receive salaries. He is accorded prominence in public ceremonies, such

as the Armistice Day commemoration. All parliamentary parties have since 1975 received some public funding. Governments sometimes offer confidential information to opposition spokesmen, who are frequently wary lest it blunt their attacks. The concept of opposition is close to the heart of parliamentary democracy, not merely in curbing government, resisting encroachments upon liberty, and keeping ministers on their toes, but as a stabilizing factor by offering to the most embittered of citizens hope that governments do not last forever. JAC

**Orange Free State.** Former British colony in South Africa. Founded as a republic by Boers (Afrikaners) fleeing British rule in Cape Colony in the mid-19th cent., the Orange Free State retained its independent status until 1900 because of the absence of any resources which might attract the cupidity of foreigners and because its government pursued a policy of friendship with its neighbours. When the Transvaal declared war on Britain in 1899, the Free State's leaders felt bound by treaty to assist. The Boers were defeated and the country became the Orange River Colony in 1900. It was incorporated into the Union of South Africa in 1910. KI

**Orange order.** An Irish protestant organization run along masonic lines and dedicated to the preservation of the protestant constitution and the 'glorious and immortal memory' of King William III, the victor of the \*Boyne (1690). The order was founded in Loughgall (Co. Armagh) in September 1795 by the protestant veterans of a sectarian clash, the battle of the Diamond. It infiltrated the army and yeomanry, and was associated with the bloody suppression of the 1798 rising. Although it experienced a rapid initial growth, both geographically and socially, the order came under parliamentary scrutiny in 1835: the select committee report into its activities was couched in such critical terms that it went into voluntary dissolution. In the later 19th cent. the order enjoyed a revival: it was the vehicle by which the populist demagogue William Johnston mounted an assault on the Party Processions Act in 1867; and it was one of the organizational foundations of popular unionism in the early and mid-1880s. Since 1905 the order has been formally connected with the \*Ulster Unionist Party. The order continues to attract a large Ulster protestant membership (perhaps 80,000–100,000). Its most public face is the highly organized summer marches. AJ

**Ordainers.** The initial political crises of Edward II's reign culminated in 1310, when the king was forced to agree to the appointment of 21 Ordainers, chosen by a complex system of election. An initial six Ordinances were followed in September 1311 by the main Ordinances, an elaborate programme for reform of government which included a request for the exiling of the king's favourite, Piers \*Gaveston. Royal finance and the administration of justice were the subject of many clauses. The Ordainers included men of very different political attitudes. At one extreme was Edward I's former opponent Archbishop \*Winchelsey, and at the other the moderate earl of \*Gloucester, who was married to the king's niece and brother-in-law to Gaveston. The Ordinances were repealed in the statute of \*York of 1322. MCP

**Orderic Vitalis** (1075–c.1142), the great historian of the Normans, was born near Shrewsbury of mixed English and French parentage, but from 1085 lived his entire life at the abbey of Saint-Evroult in southern \*Normandy. His greatest historical work, the massive *Ecclesiastical History*, was composed from 1123 onwards and came to include material on many of the major events of his lifetime, most notably the expansion of Norman power throughout Europe and the \*Norman Conquest of England. Orderic's historical writing derives its importance from his insatiable curiosity and powers of observation; the vast array of information he assembled is invaluable for our understanding of the social history and religious life of his times. He continued the history up almost to the moment of his death and concluded it with a deeply moving autobiographical epilogue. DB

**orders in council.** In November 1806 Napoleon's Berlin Decree attempted to exclude British trade from the continent. The British government replied with the orders in council, using the emergency powers of the sovereign, approved by the Privy Council. The orders of November and December 1807 declared a blockade of any harbour that excluded British commerce and insisted that neutral vessels must visit British harbours and pay transit fees. The USA protested strongly and its resentment was one of the causes of the \*War of 1812. JAC

**Ordnance Survey.** One of the beneficial results of the '45 rebellion. The difficulties of both the campaign and the measures after Culloden persuaded Lieutenant-General Watson, deputy quartermaster-general, that better \*maps of the Highlands were needed. Much of the work, later extended to the Lowlands, was done by William Roy. In 1765 Roy was appointed to survey coastal areas of Britain and to report to the master-general of the ordnance. At the same time the newly formed \*Royal Society of Arts offered rewards for county maps. After Roy's death in 1790, the duke of Richmond, master-general of the ordnance, appointed a small team in 1791, the effective work falling upon William Mudge. Working from the headquarters of the Ordnance in the Tower, they issued in 1801 the first of a series of one-inch maps, the county of Kent. A survey of Ireland was started in 1825. JAC

**Ordovices.** Indigenous British tribe of the Iron Age and Roman periods whose territory covered much of mid-Wales. The Ordovices were the northern neighbours of the \*Silures and the southern neighbours of the \*Degeangli. After the Claudian invasion the Ordovices and the Silures were stirred into rebellion by \*Caratacus. Between AD 47 and 51 the governor P. \*Ostorius Scapula temporarily subdued the revolting tribes in Wales and elsewhere. His successor Aulus Didius Gallus also struggled against the Welsh tribes. \*Agricola finally defeated the Ordovices in 77–8. The tribe was incorporated into the province of Britannia and thus became a *civitas* (tribal administrative district). ES

**Oregon treaty,** 1846. The disputed eastern boundary between Canada and the USA was settled by the \*Ashburton treaty of 1842. The vast area between the Rockies and the Pacific known as the Oregon Territory was covered by a

## Orford

convention, extended from 1818, whereby subjects of both states had access. In 1845 James K. Polk was elected president on the slogan of '54° 50' or fight' and in his inaugural speech he insisted that America's claim was 'clear and unquestionable' and would be pursued by force if necessary. The \*Peel government, then in its last months, negotiated a settlement on the line of the 49th parallel, which required only minor revision in 1872. JAC

**Orford, Edward Russell, 1st earl of** (1652–1727). Russell was nephew of the 1st duke of Bedford, entered the navy in 1671, and saw much service in the second \*Anglo-Dutch War. Alienated from the court by the execution of his cousin Lord \*Russell, he signed the invitation to William of Orange in 1688 and landed with him at Brixham. He was promoted admiral in 1689 and gained the victory of \*La Hogue over the French in 1692. Though the victory was decisive, there was some disappointment that Russell's superiority of numbers had not told more emphatically. Russell commanded in the Mediterranean 1694–5 and in the Channel in 1696. The following year he was created earl of Orford. He served as 1st lord of the Admiralty 1694–9 and again 1709–10. He was impeached by the Tories in 1701 for involvement in the \*partition treaties but unanimously acquitted. Under George I, he resumed as 1st lord until 1717. He died without issue and in 1742 the title of Orford was revived for Sir Robert \*Walpole. JAC

**Origin of Species, The.** Charles \*Darwin's book of 1859 setting out the development of new kinds of creatures through natural selection, and inheritance with variability. After 20 years' work on a great tome, *Natural Selection*, he received in 1858 a letter from A. R. Wallace in Malaysia setting out that very theory. His friends published this and Darwin's earlier sketch, but nobody took any notice. So the *Origin* was meant to be a lengthy abstract, without notes or bibliography, of the full work; hence it looks deceptively accessible. Its readability, and basis in an immense bulk of varied evidence, carried the day, and made evolution scientifically respectable. DK

**Orkney.** A group of islands lying at the north-east tip of Scotland. The islands are rich in archaeological monuments. Skara Brae is a well-preserved prehistoric village, Maes Howe the best of a series of impressive prehistoric burial cairns, and numerous brochs and settlements attest to the islands' Pictish and Viking periods. Orkney, together with Shetland, became part of Scotland in consequence of the marriage of \*Margaret of Denmark-Norway to James III of Scotland in 1469; the marriage settlement provided for a temporary transfer of the islands until a cash payment was completed, but the cash was never forthcoming and Orkney and Shetland remained Scottish. Orkney is mainly low lying and fertile, with agriculture, fishing, and food-processing, and now oil-related activity, significant sources of employment. It constitutes a county of Scotland, which remained a unitary local administrative authority throughout the Scottish 1973 and 1996 local government reorganizations. CML

**Orkney, jarldom of.** From the late 9th cent. the fertile Orkney islands were the locus for a Norse jarldom, for

centuries the dominant power in northern Scotland. Orkney had been the seat of a Pictish subkingdom in the 6th cent., according to \*Adomnán.

Despite the origins of the jarldom being shrouded in obscurity, it is clear that the first jarl was Rognvald, also jarl of Møre in western Norway. He passed on the jarldom to Sigurd the Mighty, his brother. Sigurd, in partnership with Thorsteinn the Red from the Hebrides, turned his attention to the Scottish mainland. Together they are credited, in Icelandic tradition, with conquering Caithness, Sutherland, Moray, and Ross. Sigurd died (c.892) on one of his forays south, and may have been buried at Cyder Hall, on the banks of the river Oykel.

The jarls had sole possession of the archipelago, apart from periods when the king of Norway or his family attempted to establish a claim to authority, as, for example, in c.947, when the joint jarls, Arnkel and Erlend, were visited by the exiled \*Erik Bloodaxe, ex-king of Norway. They accompanied him to York, where he became king. They were still in his retinue at the battle of \*Stainmore in 954, where he and they were killed.

The jarldom entered its period of greatest power and influence during the late 10th to mid-11th cents., under Sigurd the Stout and his son by a daughter of the 'king of Scots', \*Thorfinn the Mighty. During this period, the authority of the jarls spread south down the western searoute towards Dublin. The beginning of this expansion is perhaps to be seen in the attack on \*Iona in 986, when the abbot and fifteen elders of the monastery were slain by a force of unidentified 'Danes'. It is unclear whether Sigurd's presence in the Hebrides amounted to conquest, but Icelandic tradition claims he gathered tribute from Man and the Isles. He was definitely a powerful player in the politics of the Irish sea province, as his presence, and death, at the battle of \*Clontarf in 1014 make clear. With Thorfinn, there is more solid evidence for his conquest of the Hebrides. He was remembered by the Icelandic historian Snorri Sturluson as 'the ablest jarl of these islands, and has had the greatest dominion of all Orkney jarls'. He is credited with the establishment of a bishopric and with building Orkney's first documented church. However, his political achievements were transitory. After his death in 1065, his conquest fell apart. AJE

**Orléans, siege of, 1428–9.** On 12 October 1428, Thomas, earl of \*Salisbury, laid siege to Orléans as part of a strategy to advance across the Loire. He died from gunshot wounds on 3 November, but the siege continued, with an attack on the English supply lines (the battle of the \*Herrings) being unsuccessful. The English were already weakened and deserted by their Burgundian allies, however, by the time Joan of Arc arrived on 29 April and were forced to raise the siege on 8 May. AC

**Ormond, James Butler, 1st duke of** (1610–88). Ormond, a protestant and a leading member of the Anglo-Irish ascendancy, succeeded to the earldom in 1633. After the departure of \*Strafford from Ireland in 1640, Ormond became the mainstay of royal authority, first as commander-in-chief, then as lord-lieutenant. He struggled with considerable

success after 1641 to keep a footing in the shifting sands of Irish politics. He checked the Irish rebels at Kilrush in March 1642 and again in 1643 at Ross, but the king, hard pressed, constantly urged him to negotiate, in the hope of obtaining troops to turn the scales in the Civil War. By the time a settlement was reached in 1646, the position in England had been lost. The following year, Ormond left Ireland, handing over Dublin to Michael Jones, representing the English Parliament. When he returned with royalist troops late in the second civil war, he was defeated by Jones at \*Rathmines and left the country in 1650. In exile until the Restoration, Ormond resumed his position in Ireland under Charles II, acting as lord-lieutenant from 1662 to 1669 and again from 1677 to 1685. He was given an Irish dukedom in 1661 and an English dukedom in 1682. At James II's accession, he retired from public life. Like Strafford, Ormond did not receive from the Stuarts the loyalty he gave. JAC

**Ormond, James Butler, 2nd duke of** (1665–1745). Butler, born in Dublin, was heir of the earl of Ossory. Succeeding in 1680, he lived with his grandfather, the 1st duke, in Ireland until 1682. He fought for James II against \*Monmouth's rising in 1685. Succeeding his grandfather in July 1688, he supported the petition to James for a free parliament, then accepted William of Orange, for whom he fought in Ireland and Flanders. A pillar of the Tory Party and Anglican church, he commanded unsuccessfully the 1702 expedition against Cadiz, and was twice a controversial lord-lieutenant of Ireland. He replaced \*Marlborough in 1712, restraining his troops in the field to facilitate Tory negotiations with France. Dismissed in 1714, despite his role in proclaiming George I, he was threatened with impeachment by the Whigs. Panicking, he fled to the Jacobite court. Jacobite failures to invade England deprived him of chances to display his military incompetence again, and he died exiled and insignificant. BPL

**Ormond, Thomas Butler, 10th earl of** [I] (1531–1614). 'Black Tom' Ormond inherited the title from his father at the age of 15 and was brought up as a protestant at the English court. From 1559 he was treasurer of Ireland and in 1588 was given the Garter, for zeal in tracking down the survivors of the Spanish Armada. Much of his life was spent campaigning in Ireland, in the 1560s and the 1580s against the earls of Desmond (\*Fitzgerald), his family's rivals, and in the 1590s with \*Essex against \*Tyrone. He died aged 83 having been blind for many years. JAC

**Orthez, battle of**, 1814. \*Wellington's troops crossed the Bidassoa into France in October 1813 but Soult's army continued to resist strongly, falling back on a series of river lines. On 27 February 1814, with a slight numerical superiority, Soult tried to hold the line of the Gave de Pau at Orthez, but was badly beaten. On 12 April 1814 Wellington occupied Toulouse, where he received the news of Napoleon's abdication. JAC

**orthodox church.** The eastern orthodox church dating from earliest Christian times has its centre at Constantinople (Istanbul), the residence of the ecumenical patriarch, who has primacy of honour over much of the 'intricate

tapestry' of the Christian East, including the Greeks, Serbs, Bulgars, Georgians, and Russians. In 1995 there were c.190 million adherents world-wide. The earlier rupture with Syriac monophysite churches was followed by the break with Rome and the West (1054), which the crusades intensified. Orthodoxy has always been closely associated with temporal power. Priests are usually married, though bishops are always celibate. Icons are central to devotion, but at the heart of orthodox life is the mystery of the liturgy with its chanting and ceremonial in icon-lined churches—an experience of 'heaven on earth'. Orthodoxy's greatest contribution to the West has been its mystical writings, ranging from 7th-cent. Symeon the New Theologian to the 18th-cent. *Philokalia*, and its practice of silent, contemplative prayer. British contacts with orthodoxy began with 16th-cent. merchants and Peter the Great's visit to England (1698). Since the 1950s orthodoxy has flourished in England with c.287,000 members (1995). WMM

**Orwell, George** (1903–50). Orwell, whose real name was Eric Blair, embodied the hopes and aspirations of the left in the 1930s, and the subsequent post-war disillusionment. His career began as a policeman in Burma, but in 1927 he returned to England to be a writer. The experience of poverty enabled him to write *Down and Out in Paris and London* (1930); *Burmese Days* (1931) followed. Based on personal experiences, it was critical of the British empire. But Orwell's breakthrough came when he was commissioned by Gollancz of the Left Book Club to write a study of poverty in England. *The Road to Wigan Pier* (1937) was a brilliantly emotive impression of working-class life.

The experience of fighting with the POUM militia against fascists in Spain, which almost led to his death, cemented Orwell's socialist ideas. *Homage to Catalonia* (1938), which aroused great hostility, was a graphic description of the Spanish revolution. *Animal Farm* (1945), the result of these experiences, launched an acerbic satirical attack on Stalinism. His final book, written in solitude on the Isle of Jura, was *1984* (1949), a grim warning of the dangers of totalitarianism. Over the course of his life Orwell developed a distinctive and quintessentially English revolutionary libertarian socialism of his own, which continued to inspire long after his life was cut short by tuberculosis in 1950. LHM

**Osborne House** (Isle of Wight). Soon after their marriage, Victoria and \*Albert looked around for a private residence, where their growing family could enjoy seaside holidays. In 1845 they purchased the Osborne estate near Cowes. Albert, with the assistance of Thomas \*Cubitt, builder of Belgravia, designed a large house in the Italian style. Victoria was devoted to it: 'we can walk about anywhere by ourselves without being followed and mobbed,' she wrote. She died there in 1901. Her son Edward VII was less enchanted, perhaps because he had been sent there as a youth to study. In defiance of his mother's wishes, he turned it into a naval college and convalescent home. It is now open to the public and contains many Victorian memorabilia. JAC

**Osborne judgment**, 1909. Osborne, a Liberal, went to law to stop his union, the Railway Servants, contributing to the

Labour Party. The case reached the House of Lords; their judgment was that unions could not use their funds to support a political party, a severe blow to the Labour Party. JB

**Ossian**, son of Fingal, father of Oscar, whose death—so James \*MacPherson claimed—marked the end of Celtic civilization in Scotland. MacPherson asserted Ossian's Scottish ancestry in spite of stiff and compelling counter-claims by the Irish and in spite of the fact that many thought that his translations of Ossian's 'poems' (1762–5) were forgeries. Nevertheless, the poems caused a literary sensation. They were translated into most European languages and even into Gaelic. In the event they turned out to be a mixture of genuine verses handed down by oral tradition and imaginative translation and pastiche by their editor. However, the Scottish tourist industry has every reason to be grateful for them. NTP

**Ostorius Scapula**. Second governor of Roman Britain, AD 47–52. Publius Ostorius Scapula's career before his arrival in Britain is unknown, though he had served as consul, probably in 45. On his arrival he expelled invaders from provincial territory. He may have ordered the disarming of Britain south-east of the Trent–Severn line, provoking the first revolt of the \*Iceni, quickly dealt with. He tried to cut off the tribes of Wales under \*Caratacus from supporters amongst the \*Brigantes of the north by advancing into the Cheshire Gap, but this provoked trouble. So Ostorius attacked Wales directly, first the \*Silures in the south, then the \*Ordovices of the centre. In 51 he brought Caratacus to bay in a hill-fort (possibly Llanymynech) and defeated him. Caratacus fled to Brigantia but was handed over by \*Cartimandua. The Silures continued to harry Roman forces and Ostorius died in 52 'worn out by the cares of his office'. ASEC

**Oswald, St** (c.604–42), king of Northumbria (634–42). Son of \*Ethelfryth and Acha, Oswald spent \*Edwin's reign in exile amongst the Irish, becoming a Christian. Defeating \*Cadwallon of Gwynedd, at \*Heavenfield (634), brought him \*Bernicia and \*Deira. With \*Aidan (from Iona) he restored Northumbrian Christianity. Oswald established an overlordship over Wessex (under \*Cynegils) and perhaps other English kingdoms, and probably the southern Picts and Scottish \*Dalriada, and is one of the so-called \*bretwaldas. \*Bede's portrait, influenced by the Old Testament, presents Oswald as an exemplar for kings, demonstrating that piety would strengthen power. Killed in a campaign against the pagan \*Penda of Mercia, at Maserfield, his cult was promoted by his niece Osthryth, queen of Mercia, who moved his remains to Bardney (where \*Offa was to adorn his tomb), and by \*Wilfrid, and taken by pilgrim-exiles and missionaries, including \*Willibrord, to Ireland and Germany. In 909 \*Ethelfleda of Mercia transferred his remains to Gloucester. His skull came to be preserved in the coffin of St \*Cuthbert. His hands and arms stayed in \*Bamburgh. AER

**Oswald, St** (d. 992). Archbishop of York. One of the three great monastic bishops of the 10th-cent. reformation, Oswald came from an East Anglian family of Danish origin who specialized in careers in the church. Archbishop \*Oda

of Canterbury was his uncle and another kinsman Oscytel was Oswald's predecessor at York. Oswald was first a priest at Winchester and then lived for a time in the reformed Benedictine monastery of Fleury-sur-Loire, before joining the household of Archbishop Oscytel. In 961 he was created bishop of Worcester and continued to hold that see after he was appointed to York in 971. Oswald introduced monks into the Worcester chapter, and founded or refounded monasteries at Westbury-on-Trym, Winchcombe, and Pershore, as well as at Ramsey in his native East Anglia. He was buried at Worcester. BAEY

**Oswin** (d. 651), king of Deira (644–51). \*Bede describes Oswin as handsome, pleasantly spoken, and courteous, a good and generous lord who ruled prosperously and was much loved. Humility was his greatest virtue. Bede tells how the king gave \*Aidan a good horse for difficult journeys, and was offended when the bishop gave it to a beggar. When Aidan asked if he valued the horse more than a child of God, Oswin knelt before him and begged his forgiveness. Aidan, moved to tears, predicted Oswin's early death as his subjects were unworthy of such a king. Conflict arose between Oswin and \*Oswiu, king of Bernicia. The two Northumbrian armies gathered, but Oswin, realizing Oswiu's greater strength, sent his men home. With one companion, he took refuge in the house of a friend who betrayed his trust. Oswiu had him murdered. AM

**Oswiu** (d. 670), king of Northumbria (642–70). Ruling \*Bernicia, Oswiu was responsible for the death of the Deiran king \*Oswin (651), his wife's kinsman. He seems to have gained nothing, and appeased his wife by founding a monastery at Gilling (Yorks.). Oswin's successor allied with the powerful Mercian king \*Penda, who, refusing to be bought off, attacked in 655, but was defeated and killed at the battle of \*Winwaed, near Leeds. Oswiu fulfilled his promise that, if victorious, he would grant twelve estates for monasteries and dedicate his infant daughter to God's service. The triumph gained Oswiu control of Deira and undisputed overlordship of the southern kingdom for a time. He used his influence to convert the Mercian prince \*Peada, and revive East Saxon Christianity. Oswiu is distinguished for his decision to conform with Roman traditions at the Synod of \*Whitby. Death thwarted his ambition to go to Rome, but he was one of few early kings to die naturally. AM

**Otford, battle of**, c.776. In the later 8th cent., \*Kent was struggling to retain its independence against the growing power of \*Mercia. In the 770s Kent's rulers were resisting their demotion to subkings. According to Henry of Huntingdon, the Mercians were victorious at this battle near Sevenoaks. But Stenton argues that \*Egbert of Kent defeated \*Offa and that Kentish independence was restored for some years. But after Offa's victory over \*Wessex at \*Benson, pressure was resumed and Kent subdued and absorbed into Mercia. JAC

**O'Toole, St Laurence** (Lorcan Ua Tuathail) (c.1130–80). Archbishop of Dublin. An ascetic, born in Kildare, O'Toole became leader (*coarb*) of the Glendalough community,

but reluctantly accepted the archbishopric of Dublin from Pope Gelasius in 1162. He attended a meeting (1167) called by the *Ará Ri* (high king), Rory \*O'Connor, king of Connacht, to improve religion and good government. Some historians have vilified him as a collaborator for mediating with O'Connor's rival \*Dermot MacMurrough, and Strongbow before the capture of Dublin (1170), for submitting to Henry II (1171), and negotiating terms in the treaty of \*Windsor (1175) after O'Connor's own submission. After attending the Lateran Council (1179) where Pope Alexander III confirmed Dublin's archiepiscopal rights and made him papal legate, he ruled strictly, trying to improve clerical discipline. Sent again by O'Connor to Henry II (1180), he was forbidden to return to Ireland. Following Henry to France, he died at Eu. He was canonized (1226). WMM

**Otterburn, battle of**, 1388. Though little more than a routine border skirmish, Otterburn was rendered remarkable by the number of ballads it inspired, including 'Chevy Chase', and by the ferocity of the encounter, which caused Froissart to describe it as 'one of the sorest and best fought, without cowards or faint hearts'. A large Scottish gathering near Jedburgh in the summer of 1388 resolved on a two-pronged campaign, one attack west towards Carlisle, the other across Carter Bar into Redesdale. The eastern army, under James, earl of \*Douglas, having ravaged as far as Durham, was pursued in retreat by Henry \*Percy ('Hotspur') and his brother Ralph. Late on 15 August the English caught up at Otterburn and went straight into the attack. As night fell, the battle developed into a series of hand-to-hand single combats. Both the Percies were captured but Douglas himself was killed. A second English force under the bishop of Durham arrived the following day but did not choose to attack. The dead from the battlefield were buried nearby at Elsdon. JAC

**Oudenarde, battle of**, 1708. As French forces under the duke of Burgundy and Marshal Vendôme laid siege to Oudenarde, the duke of \*Marlbrough marched against them at the head of some 78,000 English, Dutch, and German troops. The French offered battle on 11 July, but were badly deployed. Allied units on the left and right, commanded by Marshal Overkirk and Prince Eugene respectively, pressed in on the flanks, while Marlborough's infantry advanced in the centre. As the French right flank collapsed, over 6,000 French soldiers fell. A further 7,000 were captured. JLP

**outfangthief**. See INFANGTHIEF AND OUTFANGTHIEF.

**outlawry** originated as the community's way of dealing with a violent or dangerous wrongdoer. A declaration of outlawry deprived the outlaw of the protection of the king and the law; his property was forfeit to the king and he could be killed with impunity. By the 12th cent. outlawry had become a part of legal process as a sanction to compel a person to submit to the court's authority, especially in actions of trespass before the king's courts, and it was extended through this action to other civil actions. Outlawry was formally abolished in 1879 in civil cases. It was never

formally abolished in criminal matters, though it became obsolete. MM

**overseas trade**. Overseas, as opposed to internal trade, played a modest but expanding role in the pre-industrial economy. Primary products such as wool, tin, and lead were the mainstays of the English export trade, but the expansion of manufacturing is reflected in the growing proportion of wool exported as cloth, which had reached 50 per cent by the mid-15th cent. and was over 85 per cent by 1540. The major market for these products was north-western Europe, though there was also some trade to the Mediterranean. The main imports were textiles, wine, salt, and a wide range of luxury goods. The principal exports of Scotland and Ireland were wool, hides, fish, and grain, destined either for English or nearby European markets.

The concentration on the Low Countries began to weaken during the latter half of the 16th cent. when English merchants began to exploit more distant markets in Russia and the Levant. As exploration proceeded, trading was extended during the 17th cent. to Africa, India, the Caribbean, and North America. However, the development of overseas trade during the late 16th and 17th cents. provoked conflict with other European trading powers, notably the Dutch, Spanish, and French.

By the end of the 17th cent., when exports were roughly 5 per cent of the national income of England and Wales, the composition of trade was beginning to reflect an advancing economy. Imports consisted mostly of raw materials and food, and exports of manufactures. There was both a substantial increase in overseas trade and a change in direction, which set the pattern for subsequent growth during the 18th and much of the 19th cents., with India, Africa, and the North American colonies becoming significant. The \*East India Company, packed with Scots, secured a virtual monopoly over the trade to India and the East Indies via the Cape of Good Hope. At the same time the Navigation Acts were designed to give England a monopoly in the shipment of goods to and from the colonies. Though evasion was widespread, this legislation proved a major cause of friction with the Scots, who attempted their own colonial schemes in \*Nova Scotia and at \*Darien, until the Union in 1707 brought legitimate access to colonial markets. Irish merchants were also excluded until the free trade concessions of 1780. More critically, the restrictions contributed to rebellion in the North American colonies themselves.

Overseas markets for manufactures and as sources of supply of raw materials were central factors in British industrialization. By 1800, exports represented 13 per cent of the national income of England and Wales, and with the abandonment of protection in the 1840s expanded still more, reaching their peak in the 1870s at around 22 per cent. Trade cycles brought periodic booms and slumps, but the British economy was becoming more dependent on overseas trade, including 'invisible' earnings from finance, insurance, and shipping. Though the volume of international trade had expanded, Britain's share began to contract in the face of foreign competition from the USA, Germany, France, and other industrializing countries. The empire

## Owain ap Gruffydd

took a growing proportion of exports, but imperial trade, rather than a benefit, is increasingly regarded as having been a burden. This was obvious to contemporaries as early as the 18th cent. when Jamaican sugar sold for a higher price in Britain than on the world market, thanks primarily to the West Indian sugar lobby.

Uncompetitive imperial preference was less of a problem than the underlying weaknesses of an export economy heavily dependent on traditional industries, the disruption caused by two world wars and the depression, and the painful adjustments of modernization after 1945. In the face of continuing international competition, the industrialization of the Third World, and the loss of empire, Britain was forced into the European Community, with which a growing proportion of trade was conducted. ID

**Owain ap Gruffydd** (Owain Cyfeiliog) (c.1130–97), prince of southern Powys, was the nephew of \*Madog ap Maredudd, prince of \*Powys, whom he served (from 1149) in the commote of Cyfeiliog, from which he took his name. He resisted advances by \*Owain Gwynedd and \*Rhys ap Gruffydd of \*Deheubarth (though he married a daughter of each in turn); after Madog's death and the murder of Madog's eldest son (1160), he came to terms with fellow-princes of Powys and Henry II to establish his rule in southern Powys, probably from Welshpool. Having submitted to Rhys ap Gruffydd (1171), he married his daughter. Owain declined to aid Archbishop \*Baldwin and \*Gerald of Wales in preaching the crusade (1188) and was excommunicated as a result, but this did not prevent Gerald from lauding him as a capable soldier and wise ruler. A patron of poets, he composed at least one poem (about warriors in a prince's service, 'The Shepherds of the Severn') and his court poet was Cynddelw Brydydd Mawr. There was no better way of acquiring an enduring reputation. RAG

**Owain Gwynedd** (c.1100–70), king of Gwynedd (1132–70). Noted by contemporaries for his wisdom, prowess, and prudence, his creation of a large feudal principality in \*Gwynedd was an inspiration to his successors, skilfully propagated by his court poets. The second son of \*Gruffydd ap Cynan (d. 1137), king of Gwynedd, he and his brother Cadwallon helped their father to expand Gwynedd's power (1120s). As king (Cadwallon died in 1132), he strengthened his hold on church and state in Gwynedd, exploited the anarchy in England to advance south (he was at the Welsh victory near Cardigan, 1136), and he took his authority eastwards to the Dee (by 1165) despite hostility from the earl of Chester and \*Powys's rulers. His only major (and temporary) reverse was at Henry II's hands (1157), after which Owain wisely acknowledged English suzerainty. By his death (28 November 1170) he was the pre-eminent ruler in Wales; he was buried in Bangor cathedral. RAG

**Owen, David** (b. 1938). Former leader of the \*Social Democratic Party (SDP). After qualifying as a doctor Owen entered politics as a Labour MP. He rose swiftly, becoming foreign secretary in 1977 at the age of just 38. With the party's swing to the left, Owen became increasingly disaffected and helped to found the SDP as one of the 'gang of four'.

He became leader of the party in 1983 and envisaged a multi-party system with proportional representation. He worked hard to maintain the political integrity of the SDP and remained aloof from the merger with the Liberal Party after the 1987 general election. Owen continued to preside over a rump SDP until the party was wound up in 1990. He retired from the Commons in 1992 and was created baron of the city of Plymouth, the seat he represented for over twenty-five years. He has since acted as European Community Peace Envoy to the former Yugoslavia (1992–5). RAS

**Owen, Robert** (1771–1858). Cotton magnate and utopian socialist. Born in Newtown (Powys), Owen became a partner in cotton firms in Lancashire and at \*New Lanark (Strathclyde), where he managed the mills and village (1800–25), gaining a reputation as a successful and humanitarian businessman. His experience led him to publish *A New View of Society* (1814–18), in which he advanced propositions that character was formed by environment, and that a system of villages of co-operation rather than unplanned large industrial towns was conducive to social progress. Attacked for his secularism and millenarianism, he accepted the labour theory of value and favoured state intervention to offset the effects of depressions in his *Report to the County of Lanark* (1820); he espoused factory reform, the legalization of trade unions, a national system of education, and co-operation. Described as the 'Father of British Socialism', Owen could be regarded also as a protagonist of scientific management. JB

**Owen, Wilfred** (1893–1918). Most gifted of the poets who died in battle, though it was the war which transformed him from a minor follower of \*Keats and \*Shelley into a writer of the first rank. He joined up in 1915 but a meeting with Siegfried Sassoon at Craiglockhart military hospital two years later was crucial to his development: 'You have fixed my life—however short.' The poems he produced over the next twelve months go beyond Sassoon's more straightforward assault on complacency at home, but he was not primarily interested in technical innovation: 'I am not concerned with Poetry', he wrote, 'The Poetry is in the pity.' Describing himself as a 'conscientious objector with a very seared conscience', solidarity with the men under his command took him back to the front. In October 1918 he won the Military Cross and the following November he was killed in action on the Sambre canal, a week before the Armistice. JNRS

**Oxford, diocese of.** The see, now conterminous with Oxfordshire, Berkshire, and Buckinghamshire, was carved out of the vast \*Lincoln diocese by Henry VIII in 1542. Originally planned as the see of Osney and Thame with the cathedral at Osney, it was refounded in 1546 as the see of Oxford. The last abbot of Osney, Robert King, was the first bishop. Because initially the diocese was small, consisting only of Oxfordshire, and relatively poor, most late 17th- and 18th-cent. bishops were eager for preferment elsewhere. They were thus easy prey to politicians, keen to manipulate episcopal patronage. In 1845, however, the see was greatly enlarged by the addition of Berkshire (from \*Salisbury)

and Buckinghamshire (from Lincoln). Some Oxford bishops were, nevertheless, notable: John Fell (1675–86), also renowned in the university as dean of Christ Church; John Potter (1715–37) and Thomas Secker (1737–58), both future archbishops; Richard Bagot (1829–45), who had to cope with the complexities of the \*tractarian movement; and Samuel Wilberforce (1845–70), a great administrator and pioneer in modern standards of episcopal life and work. Other distinguished bishops were William \*Stubbs (1889–1901), the historian, and Charles \*Gore (1911–19), the Anglo-catholic leader, previously the first bishop of \*Birmingham. The cathedral, formerly St Frideswide's Augustinian priory church (1158–85), in Norman style with a 15th-cent. choir vault, is an integral part of Christ Church college. WMM

**Oxford, provisions of, 1258.** The struggle between Henry III and the baronial opposition culminated in civil war 1264–5. In 1258 the main grievance was Henry's attempt to acquire the kingdom of Sicily for his second son Edmund, and the influence of his Poitevin advisers: famine and lack of success in Wales added to the king's difficulties. A committee of 24 was appointed to meet at Oxford and limit the king's actions. The \*justiciarship was revived, a standing council of fifteen appointed, and Parliament was to be summoned three times a year. Though baronial control soon disintegrated, the provisions, and those of \*Westminster which followed in 1259, were a clear attempt to limit royal authority and listen to the opinions of the community. JAC

**Oxford, Robert de Vere, 9th earl of (1362–92).** According to a chronicler, the 9th earl was one of the young men brought up with Richard II who plotted the death of \*John of Gaunt in 1384. Oxford's inheritance was meagre for his rank, but Richard's favour enriched him; he was also raised in the peerage, to marquis of Dublin in 1385 and duke of Ireland in 1386. \*Thomas of Woodstock and other critics of the king were incensed by Oxford's conspicuous enjoyment of royal patronage. When Richard was planning to regain control of government in 1387, Oxford raised forces in Cheshire; they were defeated at \*Radcot Bridge (Oxon.). He was one of the royal favourites indicted in the \*Merciless Parliament of 1388, but had fled and remained in exile until his death at Louvain. RLS

**Oxford, St Mary the Virgin.** University and parish church. Adopted as the centre of the fledgling medieval university, St Mary's was the seat of its government, academic disputation, and award of degrees until the mid-17th cent.; the attached Old Congregation House (c.1320) contained the first university library. Considerably rebuilt in the perpendicular style, it hosted the trials of the Oxford martyrs (\*Latimer, \*Ridley, \*Cranmer) in 1554–6, gained the Laudian 'Virgin porch' whose Marian statue so incensed the puritans, heard \*Wesley and \*Newman preach, and saw the launch of the \*'Oxford' or 'tractarian' movement for the revival of catholic spirituality. ASH

**Oxford Group.** Founded by Frank Buchman (1878–1961), an American who had experienced new conversion (1908). Evangelizing (1920s) at Cambridge and especially Oxford, where his undergraduate following was strong—hence

the name—its influence rapidly spread through English professional classes. Vehemently anti-communist—Hitler was briefly respected (1936)—Buchman launched the Moral Re-armament movement (1938) which at its peak (1950s) claimed to effect international and industrial reconciliation. Though he held world conferences and had headquarters in USA and Switzerland, the thrill of 1920s group evangelism had moderated to MRA's 'undoctrinal moralism'. Criticized for shallow conversions, it nevertheless touched many outside the churches. WMM

**Oxford movement.** Founded by a group of clerical Oxford dons in the 1830s and 1840s, who sought to renew the Church of England through rediscovering its catholic inheritance. It was a response to the perceived decline of the Church of England into dangerous liberalism and excessive control by Parliament, which produced a desire to emphasize the spiritual and divine institution of the Church of England. Its starting-point is usually taken as \*Keble's Assize Sermon of 1833. The end of the first phase came with the reception of \*Newman into the Roman catholic church in 1845. Between 1833 and 1841 its leaders produced the *Tracts for the Times*, hence the alternative name of \*'tractarianism'. JFC

**Oxford Parliament, 1258.** The Oxford Parliament of June 1258 was summoned while there was much discontent with the rule of Henry III and irritation at the rapacity of his Poitevin relatives. By the provisions of \*Oxford, de \*Montfort and his supporters set up a council to control the king and supervise government. The experiment failed and led in 1264 to civil war. JAC

**Oxford Parliament, 1681.** The Oxford Parliament was the denouement of the great \*Exclusion crisis and established Charles II's supremacy for the last four years of his reign. The Shaftesbury Whigs who opposed him had won three general elections between 1679 and 1681. In April 1681 Charles summoned a parliament to Oxford where the influence of the London radicals would be less. Nevertheless, the Whigs expected royal capitulation and proposed another bill to exclude James, duke of York, from the succession. But a secret deal with Louis XIV to supply money enabled Charles to dissolve the Parliament after only one week. The Whigs offered no resistance. Three months later, \*Shaftesbury was arrested and the power of the Whigs broken. JAC

**Oxfordshire.** In Roman times the region belonged to the \*Dobunni tribe. Until 1972 the southern boundary of the county was the Thames, flowing past Kelmscott to Henley, a distance of some 70 miles: to the north, east, and west, the boundary was roughly the watersheds of the rivers Windrush, Evenlode, Cherwell, Ray, and Thame. Since they came together near Oxford, the shire had a pinched waist. It covered the area between the Cotswolds at Chipping Norton and the Chilterns at Watlington and, until modern times, much of it was heavily wooded.

The town of Oxford owed its existence to a ford and later a ferry, providing a north–south crossing at Hinksey. It developed early as an important Saxon centre. Councils were held there in the early 11th cent. and in 1066 it was the

sixth largest town in the kingdom. The Normans began building Oxford castle in 1071. As late as 1901, the population of 50,000 was almost double that of all the other towns in the county combined: Banbury had 7,300, Chipping Norton 3,700, Henley 3,500, Thame 2,900, Witney 2,800, and Bicester 2,700.

In the 7th and 8th cent. the area was disputed between \*Wessex, south of the Thames, and \*Mercia the midlands kingdom. Wessex seems to have held the region in the earlier part of the 7th cent., but surrendered it to Mercia. After \*Cuthred's victory at \*Burford in 752 it reverted to Wessex, only to be retaken by \*Offa after \*Benson in 777, together with some land south of the river. Wessex regained it after \*Ellendun in 825. It became a shire in the early 11th cent. when \*Edward and \*Æthelfleda were reorganizing Wessex's defences against the Danes, who burned Oxford in 1009. The county was therefore based upon a central strong point, like its neighbours Gloucestershire, Warwickshire, Northamptonshire, Worcestershire, and Buckinghamshire.

Ecclesiastical organization fluctuated in similar fashion. An early bishopric was established at Dorchester in 634, possibly because, along with Bicester, it had been a Roman town. But after 680 it was placed under Sherborne, a Wessex diocese. When Mercia regained control, the see was moved to Leicester. Dorchester recovered its position c.870, probably because Leicester had been overrun by the Danes. The bishopric stayed at Dorchester until after the Conquest but was transferred to Lincoln in 1072. For five centuries the shire remained a rather remote part of the vast Lincoln diocese, until a new see was created at Oxford itself in 1542, with the cathedral at Osney abbey, one of the recently suppressed monasteries. The last abbot became the first bishop. Three years later it was amalgamated with Christ Church.

Despite the intellectual and ecclesiastical importance of Oxford, the shire remained rural and secluded. \*Camden, in the reign of Elizabeth I, thought it rich and fertile: 'the lower parts cultivated into pleasant fields and meadows, the hills covered with great store of woods'. Those industries which did develop were agriculturally derived and small in scale—cloth manufacture of different kinds at Witney, Chipping Norton, and Banbury, saddles at Burford, lace and slippers at Bicester, leather at Bampton, brewing at Henley, glove-making at Oxford and Woodstock. As late as the 1830s, the shire could be described as having 'no manufactures of any account, being chiefly agricultural'. The *Victoria County History* in 1907 seemed to find this deplorable: 'the county is prevented, as if by fate, from ever attaining to the position of a great industrial centre'. The University Press, with 650 employees, was the largest industrial enterprise in Oxfordshire. Unknown to VCH, fate had already intervened in the shape of William \*Morris, who had opened a bicycle-repair shop at Oxford in 1901—the forerunner of the great car factory at Cowley.

The Thames crossing remained for centuries of great strategic importance. In the civil wars of Stephen's reign, Oxford changed hands, \*Matilda being besieged in the castle for three months in 1142. During Richard II's reign, de Vere, earl of \*Oxford, was defeated at \*Radcot Bridge.

In the Civil War of the 17th cent., Oxford was the king's capital. The royalist Parliament met there and it was a forward base against London. The parks and quads became encampments, trees and shrubs were cut down, and attendance at lectures languished. One of the first actions of the war was at \*Chalgrove Field near Watlington, where \*Hampden was mortally wounded and took himself off to die at Thame; and a much-needed royalist victory in the summer of 1644 was at \*Cropredy Bridge, north of Banbury. Oxford surrendered in 1646 a few weeks after Charles I had fled, disguised as a servant. Politically city and county continued to be royalist in sympathy. In 1681 Charles II summoned Parliament there and routed his Whig opponents. The county representation was in the hands of Tory country gentlemen and though the election of 1754 was one of the fiercest contests of the century, it was uncharacteristic, since there was no other contest between 1710 and 1826.

The Oxford canal, opened in 1790, and the network of railways which developed in the county in the 19th cent. speeded up internal communication, but did little to promote any great industrial growth. The Local Government Act of 1972 extended the shire south of the Thames, bringing in Abingdon, Wallingford, and Wantage—yet another victory for Mercia over Wessex. The M40 bisects the county from south-east to north-west, from Aston Rowant to Banbury. But north Oxfordshire remains peaceful and unspoiled, and \*Blenheim, once a Whig bastion in a Tory countryside, is one of the finest of all landscaped parks. JAC

**Oxford University.** When the quarrel between Henry II and Philip Augustus in 1167 made it impossible for English students to attend the University of Paris, the opportunity for developing a similar institution arose at Oxford. The town was already the residence of kings and by 1186 \*Gerald of Wales was lecturing to doctors, masters, and scholars. By the beginning of the 13th cent. there was a sufficient body of scholars to cause an encounter with the townspeople in 1209, leading to the long-running 'town versus gown' dispute.

Dominican friars established their main house of study there on arrival in England in 1221 and were followed in 1224 by the Franciscans. Divinity was constituted as a superior faculty and students were admitted who already possessed an arts degree. Until the \*dissolution of the monasteries, Oxford came within the diocese of Lincoln, with the chancellor appointed by the bishop. The first recorded chancellor was the great scholar Robert \*Grosseteste.

University colleges, endowed by patrons, were gradually formed where students resided during their long courses of study. Though the claim that University College was founded by \*Alfred the Great is no longer seriously entertained, the donation by William of Durham on which it was founded came in 1249. John \*Balliol left money which his widow applied to founding Balliol College in 1282. Earlier, in 1264, Walter de \*Merton, chancellor of England, devoted most of his fortune to establishing Merton College. Clerical patrons were particularly prominent and included \*William of Wykeham, who founded New College (1379), Richard

\*Foxe, who founded Corpus Christi College (1517), and Cardinal \*Wolsey, whose great college became Christ Church in 1546. Undergraduates were admitted for the first time about 1500. By Elizabeth's reign, there were fifteen colleges, including Oriel (1324), All Souls (1438), and Brasenose, refounded 1502 by William Smyth, bishop of Lincoln. As at Cambridge, they increasingly attracted the sons of wealthy or aristocratic families rather than poor scholars.

The Oxford statutes were revised in 1636 by Archbishop \*Laud, a great benefactor to the university. Oxford became associated with high-church views, reinforced after the 1640s when the city was the headquarters of the royalist army during the Civil War. In the early Hanoverian period it was reputed a nest of \*Jacobitism, though such disloyalty as there was caused the authorities little more than momentary irritation. More than two-thirds of its graduates entered the Church of England, and the \*Oxford movement in the 19th cent. reflected their concerns about priesthood.

The 19th cent. saw the beginnings of change. Degrees were no longer awarded without written examination. Honours degrees in both classics and mathematics were introduced in 1801, creating the 'double first', and a similar provision was made for science and law in 1890. Further

reforms followed the Oxford University Act of 1854, pushed through by \*Gladstone and instituting a new and less oligarchical constitution, and in 1871 the requirement that dons should be in holy orders was abandoned.

From the last quarter of the 19th cent. the number of Oxford colleges began to increase. The first two colleges for women were Lady Margaret Hall and Somerville (1879), and since 1937 colleges for postgraduate study, such as Nuffield, St Antony's, Linacre, and Wolfson, have been founded. PG

**oyer and terminer.** After the Assizes of \*Clarendon and \*Northampton, the commission of oyer and terminer was issued to the travelling justices to visit the shire and to receive the presentments of those suspected of crime in each hundred. They were instructed to hear and determine (oyer and terminer) each case. Before 1215 they decided whether those presented should be released or put to \*trial by ordeal. After 1215 when the Lateran Council of the Church forbade the participation of the clergy in ordeals, the justices presided over trial by \*jury. Until the assizes were abolished in the 1971 Courts Act, the commission was issued to the judges of assize and read out at the beginning of each assize session. MM

**Pacifico, David** (1784–1854). The case of ‘Don Pacifico’ provided \*Palmerston with a great oratorical triumph. A Portuguese Jew, Pacifico was born in Gibraltar and was therefore a British subject. In 1847, while a merchant in Athens, his house was destroyed in an anti-Jewish riot. The Greek government refused compensation, believing that his claim was inflated, whereupon Palmerston sent a naval squadron to the Piraeus and seized all Greek vessels. The House of Lords censured Palmerston’s actions by 169 votes to 132 but in the House of Commons, 29 June 1850, Palmerston carried the day by 310 votes to 264. His speech of 4½ hours concluded that as a Roman could say ‘Civis Romanus sum’, ‘so also a British subject, in whatever land he may be, shall feel confident that the watchful eye and the strong arm of England will protect him against injustice and wrong’. Palmerston’s stand earned him vast popularity and established his domination of politics for the rest of his life. JAC

**paganism.** In the late Roman world a *paganus* was a ‘rustic’, and the word’s shift to mean ‘non-Christian’ reflects a period when Christianity had spread among the upper classes and within towns, but not to the rural peasantry. Pagans need not share any common ground, but the Anglo-Saxons and Vikings recognized the same major gods and goddesses, but with slight variations in name (e.g. Woden/Odin), and although the native British had different deities these had responsibility for similar aspects of life such as warfare and fertility. The Romans had no trouble in assimilating the deities of either group with their own pantheon.

It is impossible to reconstruct fully the pagan beliefs and practices of either Celts or Germans as these were not written down. We have to rely either on the accounts of foreign observers such as \*Caesar or \*Tacitus, or on collections of legends recorded sometime after conversion to Christianity such as the Irish mythological literature or the Prose Edda of the Icelandic writer Snorri Sturluson. Occasionally parallels can be found between the written myths and archaeological evidence from periods of pagan practice; Scandinavian-influenced sculptures from Britain, for instance, appear to depict tales recorded by Snorri such as Odin’s battle with the wolf Fenrir.

However, one should not envisage either Celtic or Germanic paganism as having structures or doctrines comparable to those of the Christian church. The building of

temples and existence of a professional class of priests seems to have been more a feature of Celtic than Germanic practice. What may have mattered far more to the majority of people were localized guardian spirits who might be honoured at natural sites such as a spring, a grove of trees, or a hilltop. However, the need to ensure the support of deities with a wider remit for fertility or good weather would lead to some commonality of practice at key points of the agricultural and calendar year.

Christianity saw off the major pantheons of gods and goddesses without much difficulty and major festivals of the pagan year such as midwinter were replaced with appropriate Christian celebrations like Christmas. What was harder to eradicate was the attachment to local holy places, though healing springs, for instance, were sometimes absorbed into local saints’ cults. What came to be described as superstitious or magical practices by which people tried to control their destinies, heal illnesses, or see into the future persisted longest of all and have faint echoes today when we touch wood or throw a coin into a wishing-well. BAEY

**Paget, William, 1st Baron Paget** (1505–63). Paget, founder of a distinguished aristocratic family, was of modest origins. He was educated at Trinity Hall, Cambridge, where Stephen \*Gardiner, later bishop of Winchester, was master, and began his career in Gardiner’s service. He acted as secretary to \*Jane Seymour and \*Anne of Cleves, as ambassador to France, and then as secretary of state 1543–7. After Henry VIII’s death, Paget allied with Protector \*Somerset, was given the Garter, and served as chancellor of the duchy of Lancaster and as comptroller of the household. He was in disgrace in 1552 and degraded from the Garter, but restored to favour by Mary, whom he served as lord privy seal 1556–8. He retired from public life at the accession of Elizabeth. JAC

**Paine, Thomas** (1737–1809). Radical writer and revolutionary activist. Paine led an uneventful life as a stay-maker and exciseman before emigrating to Philadelphia in 1774, where he became involved in the American independence movement. In *Common Sense* (1776), he argued for American severance from the British empire, and for isolationism in American policy towards Europe. As revolutionary forces in France began to gather strength, Paine went to Paris to give his support, publishing *The \*Rights of Man* (Part I 1791; Part II 1792), defending the Revolution against the attack launched

by \*Burke in his *\*Reflections on the Revolution in France*. The popularity of the book in Britain was a source of considerable concern to \*Pitt's government. The French revolutionaries made Paine an honorary citizen of France, and he was elected to the French National Convention in 1792. However, Paine did not subscribe to the atheism of the revolutionaries, and in his *Age of Reason* (Part I 1794; Part II 1795), while attacking Christianity, he argued for the existence of the deity as a first cause. Nor did Paine support the execution of Louis XVI, and his plea for the king's life to be spared led to his dismissal from the Convention. Narrowly escaping execution in the Luxembourg prison, Paine found life in France under Napoleon intolerable and returned to his adopted America in 1802, passing his last years as a newspaper columnist. TSG

**painting.** The coming of Christianity with the building and decoration of churches marks a good point from which to look at recorded painting in Britain. Pope Gregory (late 6th cent.) agreed that paintings in church would assist the understanding of Christianity. Painting was done on manuscripts, walls, wood panels, glass, and tiles. The Anglo-Saxon artistic tradition was a mix of Roman and native British styles. One of the finest manuscripts, the *\*Lindisfarne Gospels* (c.698), illustrates this mixture. Illuminated manuscripts were painted on animal skins and richly decorated with subjects, including portraits of saints, stylized animals, and geometric designs.

Manuscript and panel painting continued throughout the Middle Ages, not always by monks, and covering subjects outside religion. Bestiaries were popular. The artists, who often travelled widely, rarely painted from life even when representing a living person. Sometimes, however, they needed a life model for a new experience, as the monk *\*Matthew Paris* did when he copied an elephant for a painting presented to Henry III (c.1255). There is small evidence in English painting of the 13th and 14th cents. of the skills shown in Italy and France at the same time, with little attempt to make the figures proportional or lifelike.

The Reformation brought a crisis to painting in Britain with protestants objecting to images of saints in church and home. Not only did religious commissions cease, except briefly under Mary I, but waves of iconoclasm during the reign of Edward VI, and intermittently until the final destructions in the Civil War, resulted in many examples of painting, sculpture, and glass being destroyed. The increased wealth of the nobility in the 16th and 17th cents. produced a vigorous demand for family portraits and most great houses contained a long gallery. But English artists did not have the prestige of foreign painters, which explains why William *\*Hogarth* is the first native artist represented in the National Gallery. The arrival in England of Hans *\*Holbein* momentarily changed the way in which portraits were painted. But although he was appointed court painter by Henry VIII, his skill as a painter was never fully exploited and his influence was minimal. After his death, his simple and direct style was replaced by more mannered paintings like the *\*Hilliard miniature Portrait of a Young Man* or the cult portraits of Elizabeth. Charles I was an important and knowledgeable

collector of art and a patron of *\*Van Dyck*. The safe option of portrait painting got artists through the Civil War with the Restoration seeing the Stuart court looking abroad for portraitists. The Dutch artist *\*Lely* spanned both Commonwealth and Restoration portraiture, as did Samuel *\*Cooper*, the miniaturist.

The 18th cent. was the great age of country house building and decoration. Fashionable gentlemen linked painting with taste and bought old masters or used foreign portrait painters. Hogarth campaigned on behalf of English artists, but his greatest success was not in portraiture but in social and moral commentary, like *The Rake's Progress* (1735), highly successful as prints. But in the next generation, British painters came into their own with *\*Reynolds*, *\*Gainsborough*, and *\*Ramsay* offering dignified and beautiful portraits. At court, the German *\*Zoffany* painted informal family groups called conversation pieces, a genre repeated for Queen Victoria by *\*Landseer* and *Winterhalter*. The foundation of the *\*Royal Academy* in 1768 acknowledged the improved position of the artist in society. Growing interest in art and new markets among the middle classes, who had less need for portraits, changed the rules of taste. New subjects, for example contemporary history in *\*West's Death of Wolfe* (1771), personal experience such as *\*Blake's* visions, and the portrayal of everyday life by *\*Wilkie*, signalled a change in attitude towards painting which led in turn to a reassessment of landscape painting. *\*Turner* and *\*Constable* represented very different interpretations of this genre, the latter breaking with tradition in attempting to paint only what he saw.

Breaks with tradition echoed the speed of change in the outside world. Artists wanted to be free to experiment while customers wanted to buy what they knew. Many 19th-cent. artists were underrated in their lifetime: the *\*Pre-Raphaelites* and later *\*Whistler* disregarded the conventions of their day and faced a barrage of criticism.

The spirit of modernism informed the whole of the 20th cent., with artists experimenting with ideas and media. Some find modern art difficult to understand, or even repellent, but artists of the standing of Paul *\*Nash* and Graham *\*Sutherland* gave a deep insight into war, L. S. *\*Lowry* recorded the bleak factory spaces of an industrial society, and David *Hockney* introduced humour into painting. Though in many ways modern art has become over-specialized and divorced from everyday life, in another sense all are consumers of painting, which is everywhere—in advertising, in magazines, in greeting-card designs, on the street, and always variable. JC

**Paisley, Revd Ian** (b. 1926). The voice of intransigent Ulster unionism and anti-catholicism, Paisley's massive physical presence and booming voice is in the 19th-cent. Ulster evangelical tradition. He co-founded the Free Presbyterian Church (1951), and vigorously campaigned against the ecumenical movement. He led the resistance to the reforms of the *\*O'Neill* government from 1963 onwards, and rallied traditional loyalist support against the civil rights movement from 1967. Paisley launched the virulently anti-catholic, anti-communist *Protestant Telegraph* and Ulster Constitution Defence Committee 1966. He stood against O'Neill in the

## Pakistan

1969 Stormont election, was narrowly defeated, but was instrumental in O'Neill's fall. He became MP in 1970 and formed the \*Democratic Unionist Party in 1971, trumping competition from the Vanguard Unionist Progressive Party to represent working-class loyalism. His support was well beyond the confines of his church and he challenged the position of the middle-class \*Unionist Party. Paisley supported the Ulster workers' strike in 1974 which destroyed the power-sharing executive; opposed the Sunningdale agreement 1973, the \*Anglo-Irish agreement 1985, the Downing Street declaration 1993. A member of the European Parliament since 1979, Paisley is the most successful electoral vote-winner in the province. A vociferous opponent of the 'peace-process', which he denounced as a sell-out to terrorism, his party did well in the 2001 general election, winning Belfast North, Londonderry East, and Strangford from the Ulster Unionists, but losing Antrim South to them. MAH

**Pakistan** was created, and achieved its independence, on 15 August 1947 as the result of a partition of British India. It consisted of the former provinces of Sindh, Baluchistan, and the North-West Frontier together with the east of Bengal and the west of Punjab. These were all regions with a Muslim-majority population. Although Hindu-Muslim religious conflict had intensified during the 19th cent., it was not until the 1930s that the idea of a separate Muslim-majority state gained any currency. Not until the 1940s did the majority areas themselves, where the Hindu 'threat' was limited, show enthusiasm. M. A. \*Jinnah, the leader of the Muslim League, was the principal advocate of Pakistan. However, it is unclear that the Pakistan that emerged was at all what he demanded. The country, as it came into existence, was bereft of Kashmir, truncated between western and eastern halves, and disruptive of long-standing cultural, economic, and communications linkages with regions still in India. Chaotic conditions at the time of partition also led to at least half a million people being killed in ferocious 'communal' violence. The precise form that partition took, and the severity of loss of life, owed most to the precipitate withdrawal of the British under Lord \*Mountbatten. Since independence Pakistan has enjoyed a chequered history. Tensions with India have remained high and have led to three wars. East Pakistan seceded in 1971, amidst much bloodshed, to form the independent state of \*Bangladesh. Full general elections were not held until 1970 and democratic institutions have remained at risk from military coups. DAW

**palatinates** were border regions where the demands of security dictated that the local rulers should have special powers, particularly to raise troops and to administer justice to all levels. The earldom of Chester, created in 1071, gradually acquired palatinate privileges, its tenants-in-chief holding directly of the earl and paying all taxes to him. But after 1237 the earldom was taken into the crown and became in due course part of the territories of the princes of Wales. Not until 1543 however were Chester and Cheshire given representation at Westminster and the palatine courts survived until 1830. The privileges of Durham, the other great palatinate, go back beyond the Conquest to an independ-

ent \*Northumbria. The palatine powers were exercised by the bishops. Durham was not brought into the Westminster Parliament until the later 17th cent. and its privileges were not totally extinguished until 1836. The county of Lancaster was granted palatine status in 1351, though its privileges were less than those of Cheshire or Durham, and it was represented at Westminster from the outset. The palatine status remained with \*John of Gaunt and then descended through Henry IV with the crown. Certain palatine powers were claimed for the earldoms of Kent and Shropshire, for the viceroys of Ireland, and for the proprietors of some of the American colonies. Though the palatinates have often been described as 'imperia in imperio', where 'the king's writ did not run', many of the privileges were shared at a lower level with other landowners. The monarch, after all, appointed the bishop of Durham and could dispose of the earldoms. The earls and bishops palatine were powerful men, but subjects they remained. JAC

**Pale, The.** Originally implying a fence, and by inference the area enclosed by it, this was the name given to an area in Ireland in the late Middle Ages similar to the English Pale which developed in the 15th cent. in Calais. Its first recorded usage in Ireland is in a document that dates from 1446–7, when it clearly refers to that part of Ireland to which effective English government had shrunk. While the rest of the island was divided into large semi-autonomous lordships held by Anglo-Irish lords, or remained in the hands of native Irish lords, the Pale was the area surrounding \*Dublin in which the king's writ ran, and which a determined effort was made to defend. Its exact geographical dimensions, running from Dundalk to Dalkey, and including much of modern counties Louth, Meath, Kildare, and Dublin, were defined by the Irish Parliament in 1488 and at succeeding parliaments, while the famous 1494–5 Parliament held by Sir Edward Poynings passed an Act ordering the construction of a 6-foot bank and ditch around the whole district, parts of which still survive. SD

**Palestine**, awarded by the \*League of Nations to Britain as a \*mandate in 1922, proved an uncomfortable responsibility. \*Balfour's declaration in 1917 tried to square the circle by insisting that Britain would support a national home for the Jewish people while doing nothing to prejudice the position of the non-Jewish peoples of Palestine. Persistent Jewish immigration provoked fierce Arab resistance. The advent of the Nazis to power in Germany in the 1930s gave a strong boost to greater Jewish immigration which, in turn, led to Arab armed resistance. After the war, British control was shaken by her economic difficulties, by Zionist terror groups, and by international sympathy towards Jewish settlement. The United Nations' scheme for a partition of Palestine had little chance of acceptance and civil war had broken out before the British left in May 1948. A Jewish state of Israel was declared at once and immediately recognized by the USA. JAC

**Paley, William** (1743–1805). Paley wrote standard works on the evidences for Christianity. Senior wrangler at Cambridge, he was ordained and after tutoring at Cambridge

moved to clerical posts in Carlisle diocese, and then to Monkwearmouth (Sunderland). His *Evidences* was published in 1794, and his *Natural Theology* in 1802. Extremely successful, with more than 20 editions, they were required reading for undergraduates at Cambridge and at the infant university of Durham. Charles \*Darwin was most impressed by *Natural Theology*, and the \**Origin of Species* can be seen as a riposte to it. Paley argued that the world and the creatures in it are like watches, and must have had a Watchmaker: it is a classic expression of the Design argument for the existence of God, well organized, cumulative, and beautifully written. A clumsy man with a broad northern accent, Paley delighted in fishing. DK

**Palladianism.** A simple, harmonious, classical style of architecture derived from the works of Andrea Palladio, the Italian Renaissance architect. The first British architect to employ this style was Inigo \*Jones, designer to James I and Charles I. Little of his work survived the Civil War, but the Queen's House at Greenwich and the \*Banqueting House in Whitehall remained as ideals of classicism. The great revival of British Palladianism came during the first half of the 18th cent. with Colen Campbell, Richard Boyle (Lord \*Burlington), and William \*Kent. Campbell, the architect of Houghton Hall (Norfolk), the home of Robert \*Walpole, published his *Vitruvius Britannicus* in 1715, in reaction to the baroque style of \*Vanbrugh and \*Hawksmoor. He inspired Lord Burlington, described by Horace \*Walpole as 'The Apollo of arts', who commissioned Campbell to remodel Burlington House in London (1718–19). With William Kent, his protégé, friend, and collaborator, Burlington was responsible, as architect, patron, and arbiter of taste, for the development of English neo-classicism in the 18th cent. His designs include Chiswick House (London) with interiors by Kent and his masterpiece, the Assembly Rooms in York. JC

**Palmer, Samuel** (1805–81). English landscape painter and etcher. The son of a nonconformist bookseller, Palmer's was a learned and religious childhood. He first exhibited at the Royal Academy at 14 and through the painter John Linnell (later his father-in-law) met William \*Blake. In Blake's work, Palmer saw the means to express his own mystical tendencies and he became the most outstanding of Blake's followers. In 1826 Palmer moved to Shoreham (Kent). During his seven years there he produced his most exciting and visionary work (*In a Shoreham Garden*, *The Magic Apple Tree*). Following his return to London he married, then spent two years in Italy. From that point, what he described as his 'primitive and infantine feeling' faded and his work became more conventional. Examples of his painting may be seen in London at the Tate and Victoria and Albert Museum; in Oxford, Cambridge, and Manchester. JC

**Palmerston, Henry John Temple, 3rd Viscount** (1784–1865), Prime minister. A pupil of Dugald \*Stewart at Edinburgh, he went on to Cambridge University and shortly afterwards stood unsuccessfully as a parliamentary candidate there—his peerage being an Irish one, he was eligible to sit in the House of Commons. He was elected in 1807

for a pocket borough in the Isle of Wight and subsequently represented Cambridge University 1811–31, Bletchingley 1831–2, Hampshire South 1832–4, and Tiverton 1835–65.

Palmerston was perhaps the most famous foreign secretary of the 19th cent. He began his long career as a lord of Admiralty 1807–9 and then served in the relatively junior office of secretary at war from 1809 to 1828. He declined a seat in the cabinet not so much from modesty, as he claimed, as from doubt whether \*Perceval's government would last. In the Commons he largely confined himself to the necessary business of his office and, a later colleague recollected, 'he slept much in the House of Commons, and never omitted, if he could get away by twelve o'clock, to trot home in his cabriolet, and dress himself, and go to some party'. He kept racehorses and was much liked by the ladies. This carefully cultivated image as a man about town however belied the industry which he brought to his office, laying the foundation for his later success as a hard-working and knowledgeable foreign secretary.

Palmerston became a follower of \*Canning, and resigned with his fellow-Canningites from \*Wellington's administration in 1828 over the question of parliamentary reform. He was not an enthusiastic reformer, however, and when he decided to join \*Grey's ministry rather than return to Wellington in 1830 it was another example of his ability to spot the winning side. He was a somewhat reluctant supporter of Grey's Reform Bill though he was a loyal colleague.

Palmerston modelled his foreign policy on Canning's. He was foreign secretary from 1830 to 1841, excepting only the interlude of \*Peel's 'hundred days', and again from 1846 to 1851. His principles were to defend British political, strategic, and economic interests in Europe and overseas, to remain aloof as much as possible from long-term commitments, to mediate in European disputes to preserve peace, and to assert British power when necessary. His first great success was his settlement of the Netherlands crisis of 1830–9, when as chairman of the London conference of great powers he secured the independence of Belgium under international guarantee and with a monarch, Leopold of Saxe-Coburg, who was friendly to Britain. This prevented the Low Countries from falling under French control, a long-established objective of British policy. He saw France as Britain's major potential enemy and was always concerned to preserve the \*Vienna settlement of 1815 which placed restrictions on future French expansion. Thus he also tried to prevent the Spanish and Portuguese thrones from falling under French influence, though without full success. He generally supported 'liberal' constitutional movements in Europe, as being more likely to be friendly to Britain than absolutist regimes, but his attitude was wholly pragmatic and non-ideological. He opposed Russia not because of the tsar's absolutism but because of the threat to British interests in southern Europe and Asia; yet he was willing to co-operate with Russia to thwart French ambitions in the Middle East for the sake of British commercial expansion there. British trade with Turkey increased eightfold between 1830 and 1850. He was less successful in Afghanistan but he followed a policy of extending British control in north-west India. All these policies were popular with the British public and

## Pandulf

Palmerston followed Canning in cultivating public opinion as a source of support. His prosecution of the \*'Opium War' against China, designed to force the Chinese to open some of their markets to British trade, was received with moral disapproval in some quarters, but was beneficial in economic terms.

Palmerston as foreign secretary was outstandingly successful. Peace was maintained, the cost of military and naval establishments reduced, and yet British power, prestige, and trade were enhanced. Palmerston's popularity as 'John Bull' was sealed by his robust defence in 1850 of a Portuguese merchant named Don \*Pacífico who claimed British citizenship and who appeared to have been victimized by the Greek government. Palmerston's appeal to patriotic sentiment and his bullying attitude towards weaker nations came to be seen as the hallmarks of his 'gunboat diplomacy'. His confidence led him too far in 1851, however, when he sent congratulations to Louis Napoleon on his *coup d'état* in Paris without first consulting the queen or his colleagues and he was dismissed. He remained in the government as home secretary but became prime minister by popular demand when \*Aberdeen's ministry collapsed during the \*Crimean War.

Palmerston's foreign policy gave the Liberal Party a somewhat incongruous electoral appeal but in domestic affairs his attitudes were never particularly 'liberal'. He strenuously opposed further electoral reform. In Europe, his support for 'liberal' movements such as Italian independence, or in the European revolutions of 1848, was always secondary to his concern for national interests which required stability in Europe.

Palmerston was tall and handsome; he had many affairs and was nicknamed 'Cupid' but he did not marry until he was 55, chiefly because of his attachment to Emily Lamb, wife of Lord Cowper, which began in 1813 and lasted until his death. They had at least four children out of wedlock and he also had children by other women. In 1839, two years after Cowper's death, they married and enjoyed another 25 years of 'unfamiliar married bliss'.

Bourne, K., *Palmerston: The Early Years 1784–1841* (1982); Ridley, J., *Lord Palmerston* (1970); Southgate, D. G., *The Most English Minister* (1966).

**Pandulf** (d. 1226). Bishop of Norwich. Born in Rome, Pandulf was sent by Innocent III to negotiate an end to the dispute with King John, which had brought England under \*interdict. He arrived in 1211 and demanded the restoration of Archbishop \*Langton. John refused and Pandulf departed. He was sent back in 1213 by which time John's position had weakened and he sued for terms, doing homage to the pope for his kingdom. Henceforward Pandulf advised John and was created bishop of Norwich in 1215, though he was not consecrated until 1222. After John's death, Pandulf took a prominent part in the government of the country during the minority of Henry III, forming a triumvirate with Hubert de \*Burgh and Peter des \*Roches. He did much to restore the royal position after the vicissitudes of John's reign. But Langton's return from Rome resulted in Pandulf's legatine authority being

cancelled in 1221 and his installation as bishop followed. He died in Rome but was buried in his cathedral at Norwich.

JAC

**Pankhurst, Emmeline** (1858–1928). \*Suffragette leader. A superb platform speaker with a fine physical presence, Emmeline Pankhurst came to symbolize the women's struggle for the parliamentary vote. Her personal experience of hunger strikes and forcible feeding in prison inspired many women to support the women's cause.

Emmeline acquired radical views from her father Robert Goulden, a Manchester cotton-manufacturer. In 1874 she married the Liberal lawyer Dr Richard Pankhurst and followed him into the \*Fabian Society and the \*Independent Labour Party. She won election as a Poor Law guardian in 1894 and as a school board member in 1900. Following Richard's death in 1898 Emmeline fell under the influence of her eldest daughter Christabel, who became increasingly impatient with the failure of the ILP to give priority to women's suffrage. As a result they established the Women's Social and Political Union in 1903, moved to London, and adopted militant tactics. She received her first term of imprisonment in February 1908 for entering the lobby of the House of Commons. Subsequently she decided to vary her methods by attacking property: 'the argument of the broken pane of glass is the most valuable argument in modern politics.' After a spate of window-breaking in the West End in March 1912 she was charged with conspiracy to commit damage and awarded a nine-month sentence. In February 1913 she accepted responsibility for a bomb which exploded at \*Lloyd George's house at Walton Heath and was sentenced to three years' penal servitude. Under the terms of the \*Cat and Mouse Act she was rearrested twelve times.

On the outbreak of the First World War, Emmeline abandoned militancy to devote herself to assisting recruitment. After 1918, when women finally received the vote, she supported herself by means of lecturing tours in the USA and Canada. She returned to Britain in 1926 and became the Conservative candidate for Whitechapel.

MDP

**papacy, relations with.** \*Augustine of Canterbury was the somewhat reluctant papal missionary to the Anglo-Saxons, sent by Gregory the Great in 596–7. According to \*Bede, 'Lawrence the priest and Peter the monk were sent to acquaint Pope Gregory that the nation of the English had received the faith of Christ and that he himself was made their bishop.' As Roman order spread over the western church, English ecclesiastical contacts with the papacy grew. As early as 605, \*Mellitus, bishop of London, conferred in Rome with Pope Boniface on matters concerning the English church. The encouragement of pilgrimage and papal investiture of bishops with the pallium (the symbol of office), as recorded enthusiastically by Bede, were among the means used to secure the 'Romanizing' of Christianity.

Kings were among the first English and Celtic visitors to Rome. \*Cædwalla of Wessex was baptized as an adult by the pope in 689. He died soon after and was buried in St Peter's. \*Ine of Wessex spent time in Rome and helped to create the English pilgrims' hospice. Concen, king of Powys, died there

in 854 and \*Alfred the Great was taken to Rome as a child of 5 by his father. Papal authority over the church in Britain also extended through churchmen like \*Benedict Biscop who made five visits in all. By the 10th cent. Rome was the recognized source of ecclesiastical authority and it was established practice for archbishops of Canterbury to go for investiture by the pope—despite the fact that Alsiné froze to death on the Alps in 958 on his way to Rome for that purpose.

The Norman Conquest strengthened ties between England and continental Europe but the Norman kings deliberately kept themselves apart from Rome. Indeed they hindered communication with Rome and would not allow subjects to travel there without permission. This began a battle over control of the church in England, culminating in the dispute between Henry II and Thomas \*Becket, vigorously supported by the pope, Alexander III. Becket's murder in 1170 shocked Christian Europe, which hailed him as a martyr for the freedom of the church from royal power, and his relics were enshrined in Rome as well as in Canterbury.

Traffic increased between Rome and the English church as ecclesiastical government became more complex. There was a continuous presence of Englishmen in the medieval Roman curia. The heyday for papal employment of the English was probably under Urban VI and Boniface IX (1378–1404), after which it declined, despite England's broadly pro-papal attitudes. Diplomatic and royal links had become stronger and between 1417 and 1467 the English took to keeping a king's proctor in the curia to deal with ecclesiastical appointments. Yet at the same time, archbishops of Canterbury had ceased to attend Rome to receive the pallium. None of the five archbishops of the 15th cent. was consecrated in Rome and only one went there for any purpose. English cardinals ceased to live in or visit Rome. Even \*Wolsey, a strong candidate for papal election in 1521 and 1522, did not attend either conclave.

By the early 16th cent. royal links with Rome were more important than strictly ecclesiastical ones. Under Henry VIII the English pilgrim hospice in Rome became known as the King's Hospice. Tudor enthusiasm for the papacy led to the appointment of a cardinal-protector for England in 1492—the first in Europe. The Roman residence of the English ambassador, the Palazzo Torlonia, was a gift from the English cardinal-protector to Henry VIII, who in turn gave it to the papal legate Lorenzo Campeggio. His role in Anglo-papal relations was unique, for despite being the trusted ally of Henry and Wolsey, his judgment on the marriage case in 1528 went against the king and led to the final breach with Rome.

As royal–papal relations disintegrated and authority over the English church was seized by the Tudors, it became vital for the catholic resistance to retain links with the papacy. In 1538 the King's Hospice in Rome was taken under papal control and Cardinal Reginald \*Pole appointed as warden. Pole, whose career was dedicated to trying to reconcile the Roman and English factions, returned to England when Mary Tudor appointed him archbishop of Canterbury. He died within hours of the queen herself in 1558.

Particularly after the excommunication of Elizabeth I in 1570, relations with the papacy were at a low ebb. Catholics retained semi-covert contacts through the hospice which from 1579 became a seminary training English priests. During the reigns of Elizabeth I and James I, protestants could only visit Rome in defiance of a government ban. Gradually, as some of the heat went out of Anglo-papal conflicts under Charles I and his catholic queen \*Henrietta Maria, it became possible to re-establish quasi-diplomatic relations between Rome and the English court. Three papal envoys were appointed to London, before the Civil War dashed Roman hopes.

The short-lived and disastrous attempt by James II to restore catholicism to England put paid to any restoration of relations with the papacy for all but the small recusant catholic community. After the fall of the Stuarts, diplomatic relations were strained by papal support for the \*Jacobite court, which settled in Rome from 1717. The chill began to lift after the death of James III (the 'Old Pretender') in 1766 when the papacy refused recognition of the royal claims of Charles Edward \*Stuart and later of his brother \*Henry, cardinal duke of York. By the end of the 18th cent. the cardinal duke of York, who had impoverished himself supporting Pius VI against Napoleon, was in receipt of a royal pension given by George III. By 1806 Britain found herself in an unlikely alliance with the papal states resisting Napoleonic bullying and fire-power. Cardinal Ercole Consalvi, Pius VII's secretary of state, became the first Roman cardinal since the 16th cent. to set foot in England, when he arrived on diplomatic business concerning the treaty of \*Vienna in 1815.

Nineteenth-cent. contacts were prickly as the papacy became more insistent on retaining temporal power over the papal states and English catholicism reasserted itself. Unofficial or semi-official government envoys were sent to Rome—Lord Minto in the 1840s before the catholic hierarchy was restored, and Odo Russell in the 1860s during the Risorgimento. British government policy from the 1850s favoured Italian unification and opposed the pope's intransigence over the papal states. Yet Queen Victoria sent Pius IX a letter of condolence on the loss of his lands. \*Gladstone heatedly opposed the decrees of the first Vatican Council in 1869–70, fearing that the definition of papal infallibility would lead to papal interference in civil governments. Not until the creation of the British legation in 1915 were formal diplomatic relations re-established with Rome. In the meantime the papacy gained a greater emotional power and ecclesiastical authority in the hearts and minds of English catholics, encouraged by Cardinals \*Wiseman and \*Manning. The office and person of the pope took on an almost mystical power and ecclesiastical government was dominated by constant recourse to Roman judgement. Thus while English catholics became 'more Roman than Rome', deeply rooted protestant anti-papalism, based on folk memory, continued to be difficult to eradicate. JFC

## Papineau

**Papineau, Louis-Joseph** (1786–1871). Papineau was leader of the *patriote* party in Lower Canada (modern Quebec), and the voice of a vocal nationalism, which by 1834 confronted the British government with demands for effective control of the province. In response, the House of Commons in March 1837 authorized the governor to ignore the Assembly, which was refusing to vote taxes. Lower Canada simmered with protest until November, when an attempt to arrest Papineau triggered open rebellion. British forces suppressed the uprising with much loss of life. Papineau went into exile, returning to Canada in 1845 and later campaigning against the abolition of the seigneurial system. GM

**Papua New Guinea** is an independent monarchy within the Commonwealth with the queen as head of state. It is formed by the eastern half of the large island of New Guinea together with a number of adjacent islands to the east and north. The western part of the island was claimed by the Dutch and is now part of Indonesia. In the 19th cent. the Germans and British took increasing interest in eastern New Guinea. In 1906 British sovereignty was transferred to Australia and in 1914 Australian troops occupied the German settlement. It was handed to Australia as a \*mandate in 1921. During the Second World War there was heavy fighting after the Japanese invaded. Its economy depends upon coffee, tea, bananas, and the mining of gold and copper. JAC

**Paradise Lost**. Epic poem by John \*Milton (1667) concerning mankind's disobedience and consequent expulsion from Paradise through Satan's agency. Derived principally from the biblical account of the fall of man but illuminated by Milton's breadth of scholarship and shaped by his involvement in the Commonwealth cause, it has become the blind poet's best-known work through its panoramic vistas and mastery of language. \*Dryden's acknowledgement ('that Poet has cutt us all out') was later echoed by \*Hazlitt's commendation that its musicality was unsurpassed. The sequel *Paradise Regained* (1671) is concerned with Christ's temptation in the wilderness, his resistance atoning for Eve's frailty. ASH

**Paris, treaty of**, 1259. By this Anglo-French treaty of 13 October Henry III surrendered his claim to the Plantagenet lands of northern France which his father John had lost in the first decade of the century. In return, his possession of Aquitaine in south-west France was confirmed by Louis IX of France. The treaty clearly stated that Henry should pay liege homage to Louis for his French lands. The subsequent exercise of French sovereignty, combined with the reluctance of English rulers to demean themselves by paying homage, and continuing controversies over the extent of English landholdings in France, led to a series of wars from the 1290s. AC

**Paris, treaty of**, 1295. In 1292 Edward I placed John \*Balliol on the throne of Scotland. Two years later, when war broke out between Edward and Philip IV of France, Edward called on Balliol to give him support. But a number of Scottish barons sent to France and on 23 October 1295 signed a treaty of mutual assistance which became the basis for the long-lasting \*Franco-Scottish alliance, the 'Auld Alliance'. Balliol

threw in his lot with the pro-French party, refused a summons to join Edward at Newcastle and in 1296 was defeated and deposed. But the \*Scottish Wars of Independence were only beginning. JAC

**Paris, treaty of**, 1303. The treaty of 1259 did not end friction over England's possession of Gascony, and war between Philip IV of France and Edward I broke out again in 1294. After complex negotiations, the treaty of Paris in 1303 confirmed Edward's fealty to Philip for the territory and arranged for the marriage of Prince Edward to the French princess \*Isabella. Edward I was free to turn his attention to his last campaign in Scotland. JAC

**Paris, treaty of**, 1727. Philip V of Spain was far from reconciled to the loss of \*Minorca and \*Gibraltar to Britain after the War of the \*Spanish Succession. In 1725 a Spanish–Austrian *rapprochement* forced Britain, France, and the Dutch into a defensive treaty of Hanover and in February 1727 the Spaniards began a siege of Gibraltar. It was beaten off, Austria gave Spain little support, and in May 1727 a preliminary settlement was agreed at Paris. A major European war was avoided but Anglo-Spanish tension remained. JAC

**Paris, treaty of**, 1763. Though the treaty of Paris, which brought to an end the Seven Years War, gave Britain great gains, including Canada, supremacy in India, Grenada, St Vincent, Dominica, Tobago, Senegal, and Minorca, it was denounced by the opposition as wholly inadequate and the duke of \*Bedford, chief negotiator, was accused of betraying his country. \*Pitt complained that Britain had abandoned its ally Frederick of Prussia and that the treaty 'obscured all the glories of the war and surrendered the dearest interests of the nation'. A more plausible view is that it was so triumphant that it invited Spanish and French revenge and European jealousy, which was given its opportunity in the War of \*American Independence. JAC

**Paris, treaty of**, 1814. The treaty was concluded between France and the victorious allies (Austria, Great Britain, Portugal, Prussia, Russia, Spain, and Sweden) on 30 May. Napoleon Bonaparte had abdicated on 6 April and the allies wished to offer a generous peace to help the restored king, Louis XVIII. France was allowed to keep her frontiers as on 1 January 1792, thus retaining some of the gains of the revolutionary period. With some exceptions, she regained her colonies. She was to return archives but not the looted art treasures to the countries she had conquered. By a secret clause, the former Austrian Netherlands (Belgium) were to be united with Holland, under the Dutch king. Switzerland was to be neutral. Germany and Italy, which had been reconquered from the French, were to be reconstituted as mosaics of separate states. Details of the territorial settlement were to be determined at a congress to meet shortly in Vienna. MEC

**Paris, treaty of**, 1815. This treaty (20 November), after Napoleon's Hundred Days and defeat at the battle of Waterloo, was more severe than the first treaty of 1814. With a few exceptions, France had to withdraw to the frontiers of 1790. She also had to pay an indemnity of 700,000,000 francs

and agree to an allied army of occupation in certain frontier regions for a period of up to five years. It had previously been agreed that France would restore the looted works of art to their owners.

MEC

**Paris, treaty of, 1856.** This treaty was signed at the end of the \*Crimean War by Austria, France, Great Britain, Prussia, Russia, Sardinia, and Turkey. It was meant to strengthen the security of the Ottoman (Turkish) empire and limit the power of Russia. The other powers undertook to respect the integrity of Turkey and admitted her to the Concert of Europe: in return the sultan promised good treatment of his Christian subjects. The Black Sea was to be neutralized, its waters open to the merchant ships of all nations, but closed to warships. This meant the dismantling of the Russian Black Sea fleet. The free navigation of the Danube was guaranteed and, in return, Russia ceded some territory, mainly in Bessarabia, to Turkey. In 1870 Russia unilaterally abrogated the Black Sea clauses.

MEC

**parish churches.** There are parish churches of all sizes, ages, and architectural styles, with internal fittings equally diverse. What is common to all of them is that they are buildings at the centres of their communities, that is of the 'community of the parish'. As such they embody the history of groups of people often otherwise poorly documented, in an area of importance in their lives; a history which in some cases stretches back for over 1,000 years. In the past religion played a much more important role than it does for the majority today. The rights and wrongs of how God should be worshipped aroused great passions, and parish churches have been built and rebuilt, furnished and refurnished throughout their history in conformity with these shifting and often conflicting ideals of worship. The abiding interest of parish churches is their diversity and the light they can throw on the practice of religion in thousands of communities over hundreds of years.

A parish is a territorial area, with a church at its centre, served by a priest having the 'cure of souls'. The parochial system developed piecemeal from the 10th cent., but was in place by the 13th. From then until the early 19th cent. the parish and priest was supported by a landed endowment, the \*glebe; by a tax payable by the parishioners, the \*tithe; and by various, semi-voluntary, offerings like \*mortuaries. It was within the community of the parish that ordinary people received Christian teaching and the sacraments of the church; baptism, confirmation, marriage, and burial. The parishioners supported their priest through their tithe payments, but their obligations did not end there. By the early 13th cent. at the latest it was established that the rector could only be expected to maintain the fabric of the chancel of the church from his income, the parishioners being responsible for the upkeep of the nave of the church and for the books and vestments needed for the services held within it. The imposition of this collective responsibility resulted in the emergence of a real sense of community in the later Middle Ages, with the people taking a dominant role in the organization of parish life and the form and development of the church building and its contents, through their elected representatives, the \*churchwardens.

There are examples of parish church buildings from all periods, like the Saxon church of Escomb (Co. Durham), the Romanesque church of Kilpeck (Herefordshire), or the great Decorated church of St Mary Redcliffe (\*Bristol). But the majority of surviving medieval churches were added to piecemeal, by the people who used them and worshipped in them. The entire community might contribute to the rebuilding of the whole or a part of the fabric, as happened at Bodmin (Corn.), but generally additions were made by individuals or groups within the parish, the individual patron, or the trade and religious guilds. Two generations of the Canynges family, merchants of Bristol, contributed substantially to the rebuilding of St Mary Redcliffe; whilst the trade guilds attached to St Michael's, Coventry, built a series of guild chapels leading off the aisles of the church, and the Palmers' Guild of Ludlow, a society dedicated to assisting pilgrims, had a large chapel built in the parish church of St Laurence. The Reformation brought an end to the extensive rebuilding of the later Middle Ages and there are comparatively few churches built between the mid-16th and early 19th cents. The churches built by \*Wren after the Great Fire of \*London are an exception, and there are fine Hanoverian churches at Stoke Edith (1740–2) and Shobdon (1752–6) in Herefordshire. The 19th cent. saw another massive church-building programme as the Church of England tried to provide for the growing population; in 1815 about 8½ million, by 1850 over 17 million, and by 1901 32½ million. About half of all those parish churches which remain in use were built after 1815: these include Victorian rebuildings of older churches but more often represent the foundation of new parishes in the expanding industrial centres. These churches are often in the Gothic or, more particularly, the 13th-cent. Gothic style. Victorian churchmen perceived in the Middle Ages a Christian ideal which they sought to emulate.

Parish churches may not often have been rebuilt after the 16th cent. but their interiors were often remodelled. The numerous altars, and images of the saints in stone, wood, glass, paint, and needlework, were swept away in the Reformation and its aftermath. In the 19th cent. church interiors were completely remodelled along the lines advocated by the Victorian reformers to provide space for the proper celebration of the liturgy. Thus, whereas parish churches are of very diverse architectural styles, their interior arrangements are generally 19th cent., and reflect a desire for both processional space and a focus on the altar. The interior space was unified by creating level floors for the nave and aisles. The sanctuary was screened off and raised above the floor of the nave by steps, the altar was returned to its medieval position near the east wall, railed off and raised on further steps, so that space was created for the parish choir and organ within the east end. An unrestored interior like Holy Trinity, Goodramgate (York), shows by contrast the chaotic nature of a medieval interior, with its varying floor levels and with its added 18th-cent. pulpit and box pews; St Mary, Whitby, has also kept its box pews.

Anderson, M. D., *Looking for History in British Churches* (1951); Cox, J. C., and Ford, C. B., *The Parish Churches of England* (5th edn. 1946–7); Duffy, E., *The Stripping of the Altars* (1992);

## Parish Councils Act

Randall, G., *The English Parish Church* (1982); Smith, E., *English Parish Churches* (1976).

**Parish Councils Act**, 1894 (more properly the Local Government Act). The Act completed the great reform of \*local government in the 19th cent. Towns had been given elected councils by the \*Municipal Corporations Act of 1835 and \*county councils had been established in 1888. There had been considerable pressure in the Liberal Party for parish councils to develop grass-roots democracy and they were included in the \*Newcastle programme of 1891. \*Gladstone's legislation introduced urban and rural districts, parish councils for villages of over 300 inhabitants, and parish meetings for hamlets. The Act gave women, whether married or not, the right both to vote and serve. Its passage in the Commons and Lords was strongly contested and the severe limits placed on the revenue-raising powers of the new councils meant that few of them had much room for action. The urban and rural districts were swept away by the Local Government Act of 1972, but parish councils survived, save in Wales, where community councils were established.

JAC

**parishes, origins of.** Traditional theories that the English parish system was the brainchild of Archbishop \*Theodore of Tarsus (668–90) are no longer held. English dioceses, geographically much larger than Italian counterparts, could not be administered from the centre and needed more local oversight, but origins of the parochial system remain obscure. \*Paulinus, bishop of York (627–34), built some local churches and so did the 7th-cent. Celtic mission to Northumbria. \*Bede (d. 735) mentions houses of prayer. His advice to Archbishop Egbert (734) shows that no organized system then existed; he advised him to seek aid by 'ordaining priests and instituting teachers who may devote themselves to preaching the word of God in the individual villages, and to celebrating the celestial mysteries and especially to performing the sacred rites of baptism'. Some of the injunctions of the Synod of Clofesho (746) speak of bishops' instituting priests to local churches. Thus the parish system gradually and unobtrusively evolved in the 8th cent. probably by a two-way process, from the diocesan centre outwards and from local private churches towards the centre. Soon after the conversion period the only 'parish' was that surrounding the bishop's cathedral or 'head-minster', with his clergy journeying out to convert and minister to the flock. Distances demanded the development of more remote local centres, 'ordinary minsters' (large collegiate churches) subsidiary to the cathedral, whose districts were the size of the modern rural deanery. In turn from these spread groups of 'field-churches', usually already built by thegns as chapels to their private halls. These were the centres of embryo parishes. Some may have been pagan temples newly blessed as the thegn was converted or replaced. Little is known about these, because the thegn had no formal charter from the king and his church was simple and wooden, thus leaving no trace. It was his own property, served by a poor priest in return for glebe land of 2 virgates, twice as much as a ceorl. In addition the priest was allowed fees for baptisms, marriages, or supervising ordeals. Private

churches became normal appurtenances for thegns. Other 'field-churches' developed like the minsters as royal or episcopal foundations within minsters' districts, especially on newly cultivated territory. Yet others, founded by kings or bishops as their own, were later known as 'peculiar', withdrawn from ordinary diocesan jurisdiction. Founders could sell or bequeath the church at will. The parish system developed as churches continued to be built in villages throughout the Anglo-Saxon period and by the Norman Conquest it was for the most part fully developed. The tension, however, between the lord's dominance of his priest and the rightful desire by the bishop for oversight had to be partly alleviated by the third Lateran Council's injunction (1179), giving the bishop the right of institution to the benefice. In the course of time, governments found the parish a very useful administrative unit, particularly for dealing with poor relief. It then became even more necessary to establish the exact boundaries of parishes, and the annual perambulation, or 'beating the bounds', usually done on Rogation Day, became an important event. Nevertheless, until well into the 19th cent. the pattern of the 10,000 parishes remained chaotic, with separated pockets, disputed areas, and countless idiosyncrasies.

WMM

**parish registers.** Records of baptisms, burials, and weddings were kept in England following an order of Thomas \*Cromwell in 1538. Registers began in Scotland in the 1550s and 1560s, although few survive before the 17th cent. Irish parish registers, too, do not normally start before that century and those that do usually cover only the protestant Church of Ireland; few registers recording the majority catholic population start until the 18th cent. Register-keeping in England was poor during periods of religious conflict, such as the reigns of Edward VI or Mary I, or during periods of civil unrest such as the Civil War and Interregnum (1642–60). The form and content of English parish registers was altered by a brief dalliance with civil registration under the \*Protectorate (1653–60) and also by Hardwicke's \*Marriage Act (1753) and Rose's Act (1813).

Before civil registration in 1837 parish registers provide historical demographers with the best means of calculating population statistics. Their techniques involve the counting of monthly totals of events in parish registers (aggregative analysis) and the reconstruction of individual families by linking together baptisms, burials, and marriages (family reconstitution). The reliability of their results, however, depends on overcoming the many deficiencies of Anglican parochial registration, since registers record church ceremonies, rather than births, deaths, and marriages. Many babies died before baptism, and, over time, an increasing proportion of the population deserted the Church of England so that by the 1810s English registers contain only about two-thirds of the nation's births and deaths.

JPB

**Parisi.** British tribe and *civitas*. The Parisi as their name suggests seem to have ancestral links, betrayed in particular by their unusual 'chariot-burials', to a Gallic tribe of the same name. Overshadowed by their far more powerful neighbours, the \*Brigantes, it is possible that they acquiesced in the Roman occupation of their territory, which

lay in the East Riding of Yorkshire. The geographer Ptolemy ascribes one town to them, Petuaria (Brough on Humber), and it is from here that an inscription survives which appears to confirm the existence of the *civitas*. It is likely that Petuaria served as the tribal capital. KB

**Park, Mungo** (1771–1806). A child of the \*Scottish Enlightenment, Park's Edinburgh medical and botanical training and Sumatran experience led \*Banks to choose him to explore the interior of west Africa for the African Association in 1795. From the Gambian coast he reached the Niger near Segu, ending long controversy by proving that the river flowed eastwards. A more ambitious expedition for the British government ended in disaster in 1806 when Park was killed at Bussa much further down the Niger. His fate remained a mystery for 20 years, as did the termination of the Niger. Park's *Travels* of 1799 have remained in print ever since. RB

**Parker, Matthew** (1504–75). Archbishop of Canterbury. Born in Norwich and educated at Corpus Christi College, Cambridge, Parker was successively chaplain to \*Anne Boleyn, master of Corpus Christi (1544), vice-chancellor (1545 and 1549), dean of Lincoln (1552), and archbishop. Close to Bucer and a supporter of Lady Jane \*Grey, he was deprived under Mary and lived in obscurity. As a diffident, scholarly man, he reluctantly agreed to the primacy at Elizabeth's request. His consecration in Lambeth palace in 1559 by four former Edwardine bishops was unusually significant, for it claimed to transmit valid succession to the Anglican episcopate despite catholic denials. Though earlier associated with Cambridge reformers, his patristic studies gave him independence, and a distaste for extreme protestantism. The major architect of the Elizabethan settlement, Parker courageously promoted theological comprehension within liturgical conformity, a middle road between Rome and calvinism. For this he revived convocation, revised the Thirty-Nine Articles (1563), initiated a new translation of the Bible, the 'Bishops' Bible' (1568), and published his 'Advertisements' (1566), enjoining the use of cope and surplice. WMM

**Parkes, Joseph** (1796–1865). Parkes was an early example of the kind of man needed by the politics of lobbying—the parliamentary agent. He was born in Warwick, was much influenced by \*Bentham, became a solicitor, and married a daughter of Joseph \*Priestley. In 1828 he was secretary to a committee which lobbied successfully for the transfer of East Retford's parliamentary seats to Birmingham, and in the reform crisis of 1832 he acted as go-between for the Whig ministers in their dealings with the \*Birmingham Political Union. Though Parkes was not inclined to underestimate his services, it was tactically useful to the Whigs to have radical pressure. Parkes's reward in 1833 was to be made secretary to the committee looking into municipal corporations, which, not surprisingly, reported that there was vast dissatisfaction and substantial reform of local government was needed. Next, under the patronage of Lord \*Durham, he threw himself into the registration of voters in the Reform Association, which spawned the \*Reform Club in 1836. He continued to

work for the Whigs in election matters until 1847, when he was appointed taxing master in Chancery. JAC

**parks and recreation grounds.** There was little need for public parks until the great urbanization of Victorian Britain, since before then most towns were small and green fields not far away. London, by far the largest town, had the royal parks, particularly St James's, Green Park, Hyde Park, Greenwich, Richmond, and, later, Regent's Park. But access to the parks was severely limited. They had walls, with lodges and janitors, and only respectable citizens were allowed in. Railings did not replace walls until the mid-19th cent. The great pleasure gardens, \*Vauxhall and \*Ranelagh, were far too expensive for ordinary people. Outside London, some large towns were fortunate: Bristol had its incomparable downs, Edinburgh its meadows, and Newcastle upon Tyne its Town Moor, protected by an early Act of 1774. But as the industrial towns doubled and redoubled in size, the need for action to provide open spaces and to preserve existing commons became obvious. Robert Slaney, MP for Shrewsbury, obtained a select committee in 1833 and, though a very modest affair, it opened up the subject, reporting that provision in Manchester, Birmingham, Sheffield, Leeds, Hull, Wolverhampton, and Blackburn was bad. It also drew attention to the urgent need to preserve Primrose Hill in London and Parliament responded by purchasing the site in 1836 for £300. In 1841 Parliament voted £10,000 for public parks on a matching financial basis, but by 1849 only five towns—Dundee, Arbroath, Manchester, Portsmouth, and Preston—had taken advantage of the offer. The Public Health Act of 1848 allowed corporations to raise funds for 'public walks and pleasure grounds'. A further Act of 1855 extended permission to London, with Finsbury Park the first to be created. These cautious approaches had been reinforced by many examples of philanthropy or self-help. Victoria Park (Bath), west of Royal Crescent, was started in 1829 to revive the fading glories of the spa; Joseph Strutt gave Derby its arboretum in 1840; Birkenhead, Manchester, and Liverpool all opened parks in the 1840s. In the later 19th and early 20th cents. the pace quickened, assisted by another Public Health Act of 1907. Manchester was said to have 57 parks by 1920. The late 20th cent. saw retrogression. Few new parks were created, though a good deal of landscaping was carried out, particularly in new towns and on motorways. But roundabouts, car parks, motorways, and sports centres have all encroached on parks, public and private. Desperate town-planners have often seemed less enlightened than their Victorian forebears, and no jewel, not even Petworth, is safe. The combination of rising maintenance costs, straitened budgets, and persistent vandalism has made some parks dismal places, the pavilion roofless, the bandstand gutted, and the lavatories boarded up. JAC

## Parliament

**English Parliament.** Parliament is a servant which became a master. It originated with three royal needs; the need of monarchs to obtain advice and information; the realization that subjects were more likely to pay taxes if they knew what

## Parliament

they were for; and the need to find some way of dealing with complaints, grievances, and petitions from all over the realm. The third function of Parliament gradually atrophied as, in the Middle Ages, an elaborate network of local and national courts was established, though the concept of the High Court of Parliament survives in the appellate jurisdiction of the House of Lords and petitions are still submitted. Two other characteristics which have survived are that the advice is not always palatable, nor the taxation paid cheerfully even after explanation given. Representative institutions developed for similar reasons in many other European countries, though they varied in composition and powers according to local circumstances.

In a general sense, Parliament may be traced back to the Saxon \*witan and the Norman \*council, each of which included the chief men of the realm, lay and clerical. But the development of Parliament as a wider, national body, with a representative element, reflects the incessant demands of government for more money, and a change in the distribution of wealth brought about by the spread of commerce and the growth of towns. Feudal dues were intended to be exceptional—for the king's marriage, his ransom, or the knighting of his son—but chronic warfare, particularly against France, demanded ever-increasing taxation and made it impossible for the king to 'live of his own'. Consequently, Parliament developed at moments of crisis, usually associated with a disputed succession, or domestic or foreign war.

Any institution which survives over eight centuries must have adapted and changed its functions. In Saxon and Norman times, a good deal of public business was done at crown-wearings, ceremonial occasions at Christmas, Easter, and Whitsun. Since the great men were expected to attend to show respect, it was easy to consult them. Charters often referred to the consent of the barons, since it was to the king's advantage that his policies should be known to have the support of all important subjects. In the course of the 13th cent., these meetings came to be referred to as discussions—*colloquia* or *parliamenta*. But though their purpose was to assist the king, they could also be turned against an unpopular or unsuccessful monarch. In December 1203 John left Normandy to seek urgent help from his barons at Oxford in saving the duchy: they promised obedience but demanded 'the rights of the kingdom inviolate'. In 1234, the council at Gloucester forced Henry III to dismiss his unpopular foreign adviser Peter des \*Roches. In 1257, when the king was absent fighting in Gascony, his regents called another council to appeal for money. Though they augmented the barons with representatives of the lower clergy and two knights from each shire, the money was not forthcoming. During the conflict between Simon de \*Montfort's party and the king, each side used Parliament in turn: de Montfort's Parliament in January 1265 included both knights and members from certain boroughs.

By this time, Parliament was becoming a familiar institution, usually, but not invariably, meeting at Westminster. But its composition still varied considerably. The lesser clergy, summoned for the first time in 1257, attended irregularly thereafter, and then dropped out, using \*convocation instead. Edward I's \*'Model' Parliament of 1295, called

to provide funds for war against the Scots, included 2 archbishops, 18 bishops, 67 abbots, 3 heads of religious orders, 48 lay barons, the lower clergy, 2 knights from each shire, and 2 burgesses from 110 boroughs—a total of more than 400 members. Though not a model in the sense that its composition was subsequently adhered to, it was very different from a small council of 40 to 50 members. For some years, composition and procedures remained flexible. In 1305 all members not of the council were sent home early, though the Parliament continued. In 1372, the burgesses were held back after the knights had been dismissed to see whether they would make a separate grant.

The next important step in the evolution of Parliament was the separation into houses. Previously there had been only one chamber, with groups of committees breaking off for discussions: the burgesses had a largely silent role as spectators. At first the knights of the shire tended to identify with the barons as the landed or aristocratic interest, but in the course of the 14th cent. they sat increasingly with the burgesses. The lay lords and the greater clergy then came to form the upper house.

We must not however exaggerate the importance of Parliament at this stage in the regular business of government. Attendances were not always good, partly because travel was difficult, partly because involvement was not always welcome. Sessions were short—sometimes no more than a week, often a month or so. But the Commons were beginning to assert themselves. Taxation, which had been voted jointly, was said in the reign of Henry IV to be by the Commons 'with the assent of the Lords'—a significant change.

The early part of the 15th cent. saw further advances. The \*Hundred Years War against France led to incessant demands for supply, and in the Wars of the \*Roses which followed, each side made use of parliaments as an instrument and to demonstrate support. With the return of more stable conditions, the use of parliaments diminished. Edward IV summoned only one parliament in the last five years of his reign and Henry VII only one in the last twelve years of his.

The Tudor period saw a great leap forward, the power of Parliament and that of the monarchy advancing together. Henry VIII's use of Parliament to regulate the succession and to reform the church strengthened its authority and the elimination of the abbots from the Upper House left the lay lords in a strong majority. In 1536, the Act of \*Union brought the principality of Wales into Parliament's range. Yet, by and large, it remained under royal control. During Elizabeth's reign there were signs of restiveness, but in the last ten years of her reign, Parliament was in existence for only some seven months.

In the course of the 17th cent., Parliament made a decisive breakthrough. The ineptitude of James I and Charles I lost them control and lack of trust led in 1642 to civil war. But the result was stalemate. The restoration of the monarchy in 1660 could be seen as proof that, as kings had always argued, it was the bulwark against anarchy or despotism. Few vital royal prerogatives were lost. Yet Parliament in 1660 was far from discredited. It had demonstrated a remarkable capacity to improvise in government and to wage war, and

an important part of Charles II's appeal from exile had been his promise to summon a free parliament: none of his predecessors, he assured the speaker rather excessively, had greater esteem for parliaments than he had. Even so, relations with parliaments during the rest of his reign were often fraught. The balance tipped in 1688. After James II's flight, the House of Commons took advantage of the situation to improve its position in relation to the new monarchs. The financial settlement given William III was deliberately ungenerous: 'when princes have not needed money,' declared Sir Joseph Williamson, with great candour, 'they have not needed us.' Twenty-five years of almost continuous warfare, on a scale never before seen, guaranteed annual sessions and assured Parliament of a regular and inescapable place in the machinery of government. Ministers like \*Harley and \*Walpole learned how to control Parliament through patronage and cajolery and made reputations as managers. The 'corruption' of Hanoverian politics, which used to be greatly deplored, is no more than a testimony to Parliament's enhanced position, since no one bribes when they can ignore or intimidate. They were helped in their task by the Act of \*Union with Scotland in 1707 since the 45 MPs and 16 representative peers who arrived at Westminster were, by and large, penurious and purchasable.

In many ways, Parliament after the revolution was at its zenith. The government of aristocracy and gentry, who had a near monopoly of wealth, leisure, and education, seemed natural and inevitable and could boast of notable achievements. The constitution was greatly admired, at home and abroad. The standard of debate was high, with orators like \*Pulteney, \*Murray, \*Chatham, \*North, \*Fox, \*Burke, \*Sheridan, \*Pitt the Younger, and \*Canning. In 1801, the Act of \*Union with Ireland meant that, for the first time, Parliament could claim total sovereignty over the British Isles, though the result was not an unmixed blessing.

Yet even when Parliament was at its strongest, there were tremors. The breakaway of the Americans in 1776 foreshadowed the time when Canada, Australia, India, New Zealand, Ireland, and the colonies would follow suit. At the same time, Parliament, with great reluctance, allowed reports of its proceedings to appear in newspapers. 'This', Pulteney had once declared, 'looks very like making us accountable without doors for what we say within.' He was right and through that gap public opinion forced an entrance. The movement of population, the growth of great unrepresented towns, and the development of a more critical, utilitarian attitude gnawed at the foundations of aristocratic rule. In 1832 the first great reform took place. As its opponents gloomily forecast, it led, by stages, to full democracy, though not at the speed which they had envisaged. A continuous series of adjustments, many of them piecemeal, changed the nature of Parliament—the abolition of religious tests, more equal electoral areas, payment for MPs, extension of the franchise through to 1948. Though the \*Parliament Act of 1911 stripped the House of Lords of much of its remaining power, the introduction of life peerages in 1958 gave it an unexpected and new lease of life. A further reform in 2000 deprived the hereditary peers of their seats. The institution of \*referenda—on the \*European Eco-

nomic Community and on devolution—took some powers away from Parliament itself, handing them directly to the electors, and critics of the EEC argued that the very sovereignty of Parliament had been surrendered.

There is still much criticism of Parliament as an institution, though less than in the 1930s. The domination of party is deplored by many people who would never dream of voting for an independent. The introduction of TV does not seem to have much effect in improving decorum. But the familiar accusation that Parliament is a talking-shop is based upon a misunderstanding. It is not, and never has been, a governing body, but a check upon government. Whether it does that well is much debated. In the prime minister, the Commons found a master more powerful than kings in the past, even if his ultimate deterrent, a dissolution, is little more than a threat of mass suicide. But events in many countries remind us that there are worse things than talking-shops: there are civil wars. See also COMMONS, HOUSE OF; LORDS, HOUSE OF. JAC

**Irish Parliament.** The Irish Parliament was instituted at much the same time as the English, Sir John Wogan summoning an assembly in 1295 to Kilkenny, which included the lords and two knights from certain counties. Burgesses were added in 1311. The native Irish were excluded as 'not fit to be trusted with the counsel of the realm'. Though an Act of 1542 allowed the native Irish to take part, Parliament remained an Anglo-Irish institution. Control was exercised through \*Poynings's law (1494), which subjected the Irish Parliament to the English Privy Council. More counties and boroughs were brought in during the 17th cent., and after the Glorious Revolution the Commons consisted of 64 knights, 234 burgesses, and 2 representatives from Trinity College, Dublin. There were some 80 peers in the House of Lords.

Though the Irish Parliament had a splendid building on College Green, begun in 1729, real power was in the hands of the lord-lieutenant and the English government. Debates were often eloquent and the castle government paid much attention to management, but they did not engage directly on the levers of power. Until the \*Octennial Act of 1768 parliaments lasted the length of the reign: there was no parliament between 1666 and 1692 (save for James II's Assembly of 1689), and the first Parliament of George II in 1727 lasted until 1760. Sessions were held every other year.

Throughout much of the 18th cent. there were repeated attempts to wriggle free from English control. Not until England began to run into difficulties after the \*Seven Years War were concessions forthcoming. The granting of the Octennial Act in 1768 came at a time when the English were anxious to increase the Irish army to cut military expense, and the repeal of Poynings's law in 1782 came when the \*Volunteers carried a clear threat in the midst of the American War.

The grant of legislative independence ushered in the final phase of the Irish Parliament, which has been bathed in a golden light as \*Grattan's Parliament'. \*Pitt's commercial propositions had to be withdrawn in 1785 and the Irish Parliament cut loose during the Regency crisis of 1789. But in

## Parliament

the end the decisive factor was that law and order broke down in the great rising of 1798. Without a union, Ireland would, wrote the lord-lieutenant \*Camden, be 'dreadfully vulnerable in all future wars', and Pitt seems to have resolved on a union the very day he ordered 5,000 more troops to Ireland to put down the rebellion. By the Act of Union of 1801 the Irish Parliament was suppressed and representation transferred to Westminster. The new parliament house in Dublin, no longer required, became the Bank of Ireland.

JAC

**Scottish Parliament.** The Scottish Parliament differed significantly from its English counterpart. No equivalent of the Houses of Commons and Lords ever existed; instead, the three estates—clergy, barons, and burgh commissioners—asssembled in one chamber. Legislation, from the early 15th cent., was drafted by the \*lords of the Articles, a smaller committee elected by the estates, before being passed in full Parliament. Likewise many judicial matters were delegated to a committee of lords auditors. Parliament was supplemented by the institutions of general council, until the late 15th cent., and from the 16th cent. by the \*Convention of Estates, effectively parliaments without judicial powers. In the past these bodies were accused of making the Scottish Parliament constitutionally defective—simply a 'rubber stamp' for royal decisions. This opinion is now substantially discredited.

Evolving from the king's council of bishops and earls, Parliament is first recorded in 1235, referred to as a *colloquium*. In the early 14th cent. the presence of knights and freeholders became important, and from 1326 burgh commissioners attended, because of the need to secure their consent for taxation. In the 15th cent. Parliament was often willing to defy the king, repeatedly opposing taxes for James I (1406–37), and frequently openly critical of James III (1460–88). By refusing to forfeit the duke of \*Albany (d. 1485) between 1479 and 1481, it seriously undermined the king's authority. Called in this period on average more than once a year, Parliament was expected to provide support for many crown policies. However, it could be a dangerous place for a monarch, and James IV (1488–1513) avoided meetings after 1509.

The composition of Parliament remained the same in the 16th cent., although following the \*Reformation many opposed the presence of the clergy, particularly as they were essentially crown nominees. Shire commissioners attended Parliament from 1594, again as a result of the need to collect tax. By James VI's reign (1567–1625), the Committee of the Articles was heavily dominated by crown supporters, creating parliamentary weakness.

With the Scottish constitutional settlement (1640–1), the royal prerogative was curtailed, and Parliament took control of the executive, a precedent for the English Long Parliament. The \*Interregnum saw a union of parliaments (1657), but the Scottish Parliament returned strongly after the Restoration (1660). In 1689 the attendance of clergy was abolished, followed by the Committee of the Articles (1690). Parliament's strength was such that the crown turned to corruption to undermine its autonomy. Bribery and parlia-

mentary division, rather than dominant unionism, best explain the crown's ability to secure a parliamentary majority in favour of incorporating union with England (16 January 1707). Finally dissolved on 28 April 1707, the Scottish Parliament has remained important to Scottish national identity, and in 1999, after a referendum, it was restored. RJT

**Welsh Parliament.** Though there is no evidence of a Welsh parliament as a regular part of government, there was a tradition of consultation. \*Llywelyn called an assembly of magnates at Aberdovey in 1216 to decide on the territorial divisions of south Wales. \*Glyndŵr is said to have summoned two parliaments—at Machynlleth in 1404 and at Harlech in 1405—to the second of which four influential men from each commote (hundred) were summoned. Since Glyndŵr was anxious to assume the trappings of monarchy, there is no reason to disbelieve the reports. Some representatives from Wales were summoned to the English Parliament in 1322 and 1327 but Wales was not included in the regular representation until after 1536. In 1999, after a referendum, a Welsh Assembly was instituted. JAC

**Parliament, Acts of.** The procedure whereby a bill becomes an Act of Parliament is lengthy and has evolved over many centuries. The main stages of a bill in the House of Commons are first reading, second reading, committee, report, and third reading. The first reading is purely formal with the title of the bill read out. If the bill is controversial, the second reading debate is likely to occupy a full parliamentary sitting. The debate is about the policy or principle embodied in the bill, not its detail. At the end of the debate, a division is likely to be called, which the government will usually win. However, most bills, in number though not in significance, are uncontroversial and not subject to a division.

After second reading, most bills are sent to a standing committee for detailed discussion. The standing committee consists of between 16 and 50 members, chosen to reflect the party balance and for their knowledge or experience of the bill's subject-matter. The bill (unless guillotined) is considered clause by clause, amendment by amendment. The minister may respond to criticism by bringing in amendments to his own bill, or by promising to consider amendments when the bill is reported back to the full House. The inbuilt government majority will ensure that most opposition amendments are defeated, but there are occasional revolts by government supporters, and governments are sometimes outvoted in committee. Some very important bills, especially those of constitutional significance, will go

for their committee stage not to a standing committee but to the committee of the whole—i.e. the full House, sitting under rather more flexible procedure.

The bill, as amended, goes back to the full House for its report stage: this is a rather less thorough and less time-consuming version of the committee stage, but taken on the floor of the House. The government's majority in the House as a whole is usually more reliable than in committee, and the minister may take the opportunity to reverse defeats in committee.

The last stage is the third reading, when the House once again debates the principle of the bill. If, as is likely, it passes at this stage, the bill will go to the House of Lords to undergo a similar process. The main difference is that the committee stage in the Lords will be taken (normally) in the full House. The bill may be amended by the Lords and, exceptionally, rejected. If passed with amendments, the bill goes back to the Commons to consider the changes. For the bill to become law in that session, the two Houses will have to agree on the full text. The bill is then sent to the monarch for royal assent, which is invariably given.

The procedure outlined is that for public bills. Private bills, those relating to a particular corporation, individual, or company, go through a distinct, complex, and semi-judicial process. Private bills should not be confused with private members' bills, which are simply public bills introduced by a backbench MP.

HB

**Parliament, Houses of** (London). The competition for the Houses of Parliament was won in 1836 by Sir Charles Barry in the required 'Gothic or Elizabethan' style. Construction started in 1840, but the building was incomplete when Barry died 20 years later and was finished 1860–70 by his son Edward Middleton Barry (1830–80). The plan is clear and formal, with the House of Commons and House of Lords on either side of an axis. Yet the external composition is medieval, not to say picturesque, partly due to the Victoria Tower and the Clock Tower (housing Big Ben), and to the turrets and central *flèche* which disguise heating and ventilation ducts. Much of the detail, including the richly embellished interiors, is by A. W. N. Pugin. The House of Commons and adjacent areas were destroyed in the Second World War but rebuilt by Sir Giles Gilbert Scott and Adrian Scott in a Gothic manner.

PW

**Parliament Act**, 1911. Though the immediate cause of the Parliament Act was the House of Lords' rejection of Lloyd George's budget in 1909, the deeper cause was the late 19th-cent. disintegration of the Whig Party which carried the Liberal Unionists into the ranks of the Conservatives, thus confirming a permanent Conservative majority in the Upper House and placing Liberal legislation at the mercy of the peers. The Act declared that a money bill could be presented for royal assent after one month, even without the Lords' consent, and other public bills after two years. The duration of Parliament was changed from seven to five years. It was carried in the Lords by 131:114 only after Asquith, prime minister, had extracted from a reluctant George V a pledge to create enough Liberal peers if necessary to carry the measure. The most immediate consequence was that the

House of Lords could no longer veto Irish Home Rule. By the Parliament Act of 1949 the delaying power of the Lords was reduced to one year.

JAC

**parliamentarians** was the polite name given to the opponents of Charles I in the civil wars. The pejorative term was roundheads. Charles's decision not to summon his own Parliament at Oxford until 1644 and his evident mistrust of it gave his adversaries some advantage. But Cromwell also found great difficulty in dealing with parliaments during the Commonwealth.

JAC

**parliamentary reform** is a general term covering a variety of proposals and changes which need to be carefully distinguished. Alterations to the composition, powers, procedure, and structure of Parliament have continued since the first parliaments were summoned in the 13th cent., but a sustained campaign for parliamentary reform did not develop until the 18th cent. After the Septennial Act of 1716 there were intermittent calls for shorter parliaments, for a reduction in the number of placemen to lessen the growing power of the executive, and for the abolition of some rotten boroughs to give more representation to the counties. These were modest proposals that would have increased the already overwhelming influence of the aristocracy and gentry. More radical suggestions were put forward during the Wilkes agitation in the 1770s when the case for manhood suffrage was deployed for the first time since the Civil War period. A comprehensive reform programme was put forward by the Westminster Committee, affiliated to the Yorkshire Association in 1780, calling for manhood suffrage, equal electoral areas, annual parliaments, secret ballot, payment of members, and the abolition of the property qualification for MPs—the six points of the Charter 60 years later.

Legislative response was at first slow. A few small boroughs were reformed in the 1770s and 1780s for gross corruption but no review of the entire electoral system was undertaken. Statutes against bribery were largely ineffective. But a series of major changes came 1828–32. Repeal of the Test and Corporations Acts in 1828 allowed protestant dissenters to become MPs and the following year the same concession was extended to Roman Catholics; the Great Reform Act of 1832 abolished 56 of the smallest boroughs and brought great new towns like Manchester, Birmingham, Sheffield, and Leeds into the representation, introducing a standard franchise for the boroughs. Further legislation in 1867, 1884, 1918, 1928, and 1969 extended the right to vote eventually to all men and women over 18. Religious disabilities were removed when Jews were allowed to become MPs in 1858 and atheists in 1886. The long-standing problem of bribery and intimidation at elections was dealt with by secret ballot in 1872, reinforced by the Corrupt Practices Act of 1883.

JAC

Modern consideration of reform of Parliament has been concerned with different aspects. In earlier centuries, the term 'parliamentary reform' connoted measures to make Parliament more representative and more independent of the executive. Today, making Parliament more representative is usually associated with *electoral reform*: parliamentary

reform is concerned with the organization of the House of Commons.

The advent of mass democracy brought renewed fears of growing parliamentary subservience to the executive. At first such fears focused on the powers of the party whips, and these anxieties reached their zenith soon after the Second World War. More recently, discussion has centred on the procedures of the House. The way the Commons did its business almost insensibly strengthened the power of the executive: ministers, backed by the resources and experience of their departments, had a near monopoly of knowledge. The problem is that so much of the business of the House is transacted on the floor of the House itself. Until the procedural reforms of the 1960s and 1970s, the role of committees in the House was limited. The legislative standing committees were appointed to consider the committee stage or detailed amendments to bills, the principle of the bill having been already approved at the second reading. These standing committees had a fluctuating membership and no subject specialism. In the American Congress, by contrast, the Agriculture Committee or the Foreign Relations Committee of Senate are specialized and their composition relatively permanent. The British standing committees are designated by letters of the alphabet, Standing Committee A, Standing Committee B, and so on. The only element of specialization is that members are chosen in the light of their knowledge of the subject-matter of a particular bill: thus, former teachers and members of education authorities may be appointed to standing committees dealing with education bills.

The consequences of non-specialization and fluctuating composition are twofold. Members do not gather the sort of informed authority that a long-serving member of a specialist committee will have, and cannot challenge the government in the same way. Nor can the committees develop a corporate identity that can compete with the overriding loyalty of party.

What these arrangements do is to reinforce, almost insensibly, the claims of party allegiance. Most of the debates take place in a chamber that is, at best, half-full: when the division bell rings, members appear as if by magic, asking 'which is our lobby?' It is not that members vote against their consciences: on most issues their consciences have nothing to say. It is only on the great issues of the day—a Suez affair, for example—that members are likely to feel the tug of conscience. Thus, what has been called the Prussian discipline of the two great parliamentary parties owes as much to the mundane arrangements of the House as to the power of the whips.

For some fifteen years after the end of the Second World War, the House went on its way complacently, ignorant of the often radically different procedures of other legislatures. A proposal in 1959 to set up a select committee on the colonies was denounced as a radical constitutional innovation which would detract from the sovereignty of the full House. Not until the 1960s did discussion switch from the (alleged) power of the party machines to the institutional arrangements of the House. Bernard Crick's seminal *Reform of Parliament* (1964) saw in the House's lack of information its

major weakness. The elections of 1964 and 1966 brought into the House a new generation of backbenchers hungry to play a more active role in its work. The Wilson government responded with the establishment of a few select committees with powers to inquire into the workings of particular activities of government, such as science and technology. This experiment, though tentative, set the pattern for more extensive change. The \*Heath government continued on similar lines. Margaret \*Thatcher's arrival in office saw the setting up of the modern select committee system, with committees which broadly paralleled the various government departments. The task of these committees is not to legislate but to *inquire*, by questioning ministers and civil servants. This takes place in a setting which discourages, if it does not wholly prevent, the easy evasions of question time.

The departmental select committees have now become part of the accepted practice of the House. Their scope remains limited for they have no power to consider particular bills, which are still referred to the standing committees. On the other hand, their reports present information with a detail not hitherto normally available.

These procedural changes have been accompanied by a loosening of party ties in floor votes. Backbenchers are now more willing to cast occasional votes against their party. This assertion of greater freedom began in the 1966 Parliament and seems to have continued. Yet the change must not be exaggerated; party loyalty remains overwhelmingly the chief determinant, or at least the chief correlate, of voting. Parliamentary reform and the greater independence of backbenchers have dented, but not greatly impaired, the supremacy of party in the House of Commons. HB

**Parnell, Charles Stewart** (1846–91). The most effective and charismatic Irish constitutional nationalist leader. Born in Co. Wicklow into an Anglo-Irish protestant family, Parnell inherited the Avondale estate, and became MP for Meath in 1875. He quickly associated with the obstructionist wing of the Home Government Association. He led the 'New Departure' of 1878–9, bringing together ex-Fenians, Irish-American nationalists, and advocates of land reform. He became president of the \*Irish Land League in 1879, and forced \*Gladstone to grant major changes in the 1881 Land Act. To preserve control of an increasingly radical movement, Parnell initially resisted the Act's implementation and was imprisoned. In the \*'Kilmainham treaty', 1882, he agreed to an amended Land Act and to keep to parliamentary opposition only. For the next three years, Parnell concentrated on developing a disciplined parliamentary party, enabling advantage to be taken of the favourable electoral circumstances in 1885–6. Skilful manoeuvring of support between Conservatives and Liberals culminated in Gladstone's Home Rule Bill 1886, the summit of Parnell's career. Following the bill's defeat, his effectiveness was compromised by the Liberal alliance and his remoteness from Ireland. Accused of association with Fenian violence in *The Times* in 1887, he was proved innocent in February 1889, only to be ruined by being cited as co-respondent in O'Shea's divorce in 1889/90. Deserted by an unholy alliance of the nonconformist Liberal conscience with the catholic

hierarchy, Parnell was forced to choose between resignation or alliance with the Liberals. After his party split, he led unsuccessful polemical campaigns in by-elections in early 1891. Parnell wed Katharine O'Shea in June 1891, but died that autumn. The melodramatic circumstances of his fall encouraged a romantic myth which obscured his essential conservatism and the limitations of his achievement. His long-term aim to reconcile declining landlordism with advancing nationalism failed totally. MAH

**Parr, William, 1st marquis of Northampton** (1513–71). Parr was the son of Sir Thomas Parr of Kendal and the younger brother of \*Catherine Parr, Henry VIII's last wife. He took part in suppressing the \*Pilgrimage of Grace in 1536 and was created Baron Parr of Kendal in 1539. The following year he became captain of the gentlemen pensioners and in April 1543 was appointed warden of the Scottish marches and given the Garter. In July 1543 his sister became queen and her relatives began to prosper. Parr's uncle was made Baron Parr of Horton and the same day he was advanced to the earldom of Essex. He fought in the French campaigns of 1544 and at the accession of Edward VI was made marquis of Northampton. He was influential during Edward's reign as a leading protestant, though his campaign against the Norfolk rebels in 1549 finished in humiliating defeat. In 1550 he was appointed lord chamberlain. On the death of Edward, Northampton backed Lady Jane \*Grey and when her cause collapsed was sent to the Tower for execution. Surprisingly he was pardoned, though he lost his titles and most of his estates. But his fortunes rose again when Mary died. Elizabeth restored him to his titles and gave him back the Garter. He remained in favour for the rest of his life and the queen paid for his funeral at St Mary's, Warwick. JAC

**Parry, Sir Hubert** (1848–1918). Together with Charles \*Stanford, whose music he detested, Parry inspired what is called the 'English musical renaissance' of the later 19th cent. This was despite an unpromising educational background—philistine \*Eton—and a talent which was not of the very highest class. That talent none the less produced some fine second-rank works, of which his Fourth Symphony, Piano Quartet, and shorter choral settings are perhaps the best. Parry succeeded \*Grove as director of the \*Royal College of Music in 1894. He is best known for the tune he wrote for \*Blake's 'Jerusalem', first performed at a patriotic concert in 1916, much to his unease, for he was not a tub-thumper. Later he was delighted when Millicent Fawcett asked if it could be adopted as the suffragist anthem. His radicalism did not, however, prevent his rising to the top of the British musical establishment, from which position he helped \*Elgar, who was a tub-thumper, and the greater composer of the two. BJP

**Parsons, Sir Charles** (1854–1931). Engineer. A son of the 3rd earl of Rosse [I], Parsons grew up at Birr castle in Ireland before going to Trinity College, Dublin, and St John's College, Cambridge. His father was a distinguished chemist and astronomer and Parsons's education was scientific. After Cambridge, he took an apprenticeship at the

Elswick works in Newcastle of Sir William \*Armstrong, of whom he spoke later with great admiration. He began working on electricity supply and by 1884 had constructed a turbo-dynamo. In 1889 he founded Parsons of Heaton on the Tyne and a power station at Newcastle was operating by turbo-generation by 1890. Parsons then applied turbines to ships, building the *Turbinia*, by far the fastest vessel afloat, and preserved in the Newcastle Discovery museum. Turbines were adopted for both warships and passenger liners, helping *Mauretania* (1906) to hold the blue riband of the Atlantic for many years. Parsons was given a knighthood in 1911 and the Order of Merit in 1927. He has been called the most original engineer in Britain after James \*Watt. A shy, quiet man, his relaxation was fishing. JAC

**Parsons, Robert** (1546–1610). Jesuit missionary. Born in Somerset to protestant parents, he resigned his Balliol fellowship and was received into the Roman church at Louvain, before offering himself to the Society of Jesus (1575). A workaholic with a powerful personality, he was sent to England with \*Campion in 1580, enjoined to stay apolitical, but his sole aim soon became its return, by persuasion or force, to Rome. He stayed a year in great danger. For nearly 20 years he was one of the most ardent promoters of the Spanish invasion, his diplomatic and language skills enabling him to deal easily with kings and popes. After failure of the \*Armada, he concentrated on his order's internal affairs, but, as a controversialist (one of the best writers of his day), made as many enemies amongst catholics as protestants because of his traitorous activities, especially after publication of his *Conference about the Next Succession* (1594), which supported the Infanta Isabella for the English throne. His missionary zeal combined with political intrigue contributed much to the popular image of Jesuitry. ASH

**partition treaties**, 1698, 1700. The imminent death of Carlos II of Spain, without children, so soon after the end of the \*Nine Years War persuaded European powers to try to settle the Spanish Succession without bloodshed. By the first treaty, signed in October 1698 by Louis XIV and William III, the Spanish inheritance was to go to Joseph Ferdinand, electoral prince of Bavaria, with compensation to the dauphin of Naples and Sicily and to the Archduke Charles of Milan and Luxembourg. The prince of Bavaria died within a few weeks. By a second treaty in 1700, the Archduke Charles was to take the lion's share, with France receiving Naples, Sicily, and Milan, to be exchanged for Lorraine. But when Carlos II died in October 1700, leaving by will Philip of Anjou, Louis's grandson, as sole heir, Louis abandoned his treaty obligations and accepted. The War of the \*Spanish Succession followed. JAC

**party system**. Though parties have existed in Parliament since the later 17th cent., many MPs prided themselves on their independence, and party ties were loose and often personal. There was little supporting organization in the country, save for *ad hoc* committees at election time, and little of the paraphernalia of discipline and propaganda which characterizes modern parties. In the later 18th cent., as public

opinion became more vocal, there were indications that parties were improving their organization and encouraging coordinated effort, particularly for electoral purposes, but the influence of individual patrons remained great. Mass parties were a late 19th-cent. development, reflecting the growth of the electorate, and the need for an army of enthusiastic helpers in the larger constituencies. The National Liberal Federation, founded in 1877, was a body separate from the traditional and informal Liberal party organization within the House of Commons. The two were eventually grafted together, and a similar process occurred on the Conservative side. In contrast, the Labour Party was founded as a body outside Parliament, whose task was to elect Labour members to the House of Commons.

The general election of 1992 was contested by more than 90 parties, but few had much chance, under the existing electoral system, of returning an MP. It is difficult to believe that the Jolly Small Brewers Party (polled 343 at Worcester) or the Forward to Mars Party (91 at Huntingdon) threatened the supremacy of the main parties. In 2001 over 80 parties put up candidates, the Wessex Regionalists polling 167 at Wells and 66 at Winchester. The tiny parties, however valuable they may be in representing opinion, do not really form part of the party system.

That system, as it has developed, fulfils four important functions. First, the parties raise finance and mobilize a massive voluntary organizational effort, especially when their role in local government is taken into account. Running the party machine, particularly if the party is in power in a large city, demands much time and trouble, but leaves the parties with some independence from the state. Secondly, the parties act as a valuable conduit for public opinion, with procedures for formulating party policy, conferences for giving their approval, and manifestos on which the party will fight a general election. Thirdly, the parties have their own mechanisms for choosing local and parliamentary candidates and some method of electing their party leader, who becomes prime minister if their party wins a majority of seats. They offer a valuable training in democratic politics and many cabinet ministers have begun their careers as local chairmen, treasurers, and councillors. Lastly, the system offers alternatives to the voters and provides a safety valve against frustration and disappointment. We should therefore carefully distinguish democratic parties from the political parties found in many authoritarian forms of government, which are merely an extension of state power. The party system in a democratic society is a means both of contributing to government and of containing it. HB; JAC

**Passaro, Cape, battle of.** See CAPE PASSARO, BATTLE OF.

**Passchendaele, battle of,** 1917. The British army tried to advance from the Ypres salient in southern Belgium towards the Belgian ports of Ostend and Zeebrugge for several reasons. \*Haig believed that he could defeat the German army and win the war in 1917. The navy supported him because they wanted to drive the Germans away from the Channel ports where they menaced Britain's communications with the continent. \*Lloyd George allowed Haig to continue because he feared that, if the British were not seen

to be actively fighting, the French might go the way of tsarist Russia and collapse. The battle began on 31 July 1917, but fierce German resistance, heavy rain, and the destruction of the drainage system of the Flanders plain by the artillery meant that the advance literally bogged down in the mud. Haig continued the operation until mid-November, at a cost of some 260,000 British casualties, but failed to reach the coast. DF

**Paston letters.** Private correspondence (15th–17th cents.) of a Norfolk family, that of the 15th cent. in particular providing significant insights into the social history of the pre-Reformation period. Not only a family saga (Margery's clandestine marriage to their estate manager in 1469 caused consternation), business affairs, property matters, and associated litigation trace the progress of 'new' gentry, despite some archival fragmentation. Although property was confined mainly to East Anglia, their interests were far from parochial, so accounts of national events leaven those of regional politics and matrimonial negotiations, all reflecting social attitudes, culture, and the state of the English language. ASH

**Patay, battle of,** 1429. After Joan of Arc had relieved Orléans, the English fell back to bridgeheads on the Loire at Meung, Jargeau, and Beaugency. The first two were soon lost, and in attempting to relieve the third, the troops of Lords Talbot (\*Shrewsbury) and Scales were overwhelmed on 18 June by the French, in whose company was Joan. Talbot was captured and imprisoned until 1433. Sir John Fastolf, in command of the rear, escaped but was subsequently charged with having acted dishonourably. The battle put paid to English expansionist ambitions and facilitated Charles VII's advance to Rheims for his coronation. AC

**Paterson, William** (1658–1719). Founder of the \*Bank of England. Paterson was born in Dumfries but brought up in England. He made a rapid fortune in trade in America and the Low Countries. A supporter of the Glorious Revolution, he was engaged during the \*Nine Years War in government finance and pressed upon the government the establishment of a national bank to help finance the war. In 1694 when the bank was founded, Paterson became a director. He withdrew the following year and became involved in schemes to improve London's water supply. He was one of the leading protagonists of the \*Darien venture and worked for the Company of Scotland raising investment. He was lucky to survive the first expedition in 1698, in which his wife and only son perished, but continued to be consulted by the government, urging a union with Scotland. When negotiations began, Paterson advised on the financial and economic aspects of the treaty. A prominent example of the \*commercial revolution of the period, Paterson was one of the first to advocate the systematic study of economics. JAC

**Patrick, St** (c.389–c.461). Patron saint of Ireland. Born in Britain, in his youth he was seized by raiders and taken to Ireland. In slavery for six years, he was sustained by prayer. Told in a dream of his impending return home, he made his way to the coast and joined a merchant ship, facing many dangers before rejoining his family. In clerical training, he

seems to have spent some years in France at the monastery of Lerins and at Auxerre, where he was probably consecrated by St \*Germanus before embarking on his evangelistic work in Ireland. Despite hostile druids, he apparently impressed the high king Laoghaire and was favoured by many chieftains. Often at risk, he was fearlessly determined to destroy paganism. Through his efforts, countless numbers were baptized and confirmed, many clergy ordained, and his see established at \*Armagh, whence he began to organize the emerging church on Roman diocesan lines. In popular legend, the saint who expelled snakes from Ireland was a miracle-worker. Patrick's own 'Confession', and letter to Coroticus, reveal a deeply caring man, not well educated, but with a complete trust in God. AM

**patriot king.** The concept of a patriot king was largely an opposition device of the early Hanoverian period. It hinted that the first two Georges were more interested in Hanover than in Britain and deplored the exclusive confidence they placed in the Whigs. The concept was most fully worked out in \*Bolingbroke's treatise *The Idea of a Patriot King*, written in 1738 for \*Frederick, prince of Wales, who was then heading the opposition to \*Walpole. The 'essential character' of a patriot king was 'to espouse no party but to govern like the common father of his people'. When the young George III in 1760 gloried in the name of Britain and declared war on parties, the patriot programme seemed to be fulfilled, though harmony did not noticeably follow. There is no evidence that George III read Bolingbroke and the ideas were commonplace in court circles. But they helped to persuade Horace \*Walpole and \*Burke that George had been brought up on prerogative notions and contributed to the interpretation of his reign as a reassertion of royal authority. JAC

**patriots.** The name was appropriated by the opponents to \*Walpole since it implied that the interests of the nation were neglected by a supine and corrupt government. William \*Pitt, in particular, beat the patriotic drum when he inveighed against Britain's subservience to Hanover, a 'despicable electorate'. Ministers, in reply, were scornful of patriotic rhetoric: 'it is but refusing to gratify an unreasonable or insolent demand,' declared Walpole, 'and up starts a patriot.' The phrase was so overworked that it became pejorative, indicating factious and self-seeking opposition—hence Johnson's famous (and much misunderstood) remark in 1775, 'Patriotism is the last refuge of a scoundrel.' JAC

**patronage, artistic.** Patronage goes beyond the act of purchasing art. Traditionally a patron offered the means of support to the artist, a home, a pension or place, as well as specific payments. The monarchy, church, and aristocracy were the great patrons of medieval architecture, art, and music: Edward the Confessor built Westminster abbey, Henry III rebuilt it, and Henry VII added the east chapel; Henry VI endowed Eton College, Christ's College and King's College, Cambridge. Many of the Oxford and Cambridge colleges were founded by clerics: Peterhouse, Cambridge, by Hugh de Balsham, bishop of Ely (1284),

New College, Oxford, by \*William of Wykeham, bishop of Winchester (1379), Corpus Christi College, Oxford, by Richard \*Foxe, bishop of Winchester (1517), Christ Church, Oxford, by Cardinal \*Wolsey (1525). Among the many aristocratic patrons were Humphrey, duke of \*Gloucester (d. 1447), and John \*Tiptoft, earl of Worcester (d. 1470), whose gifts of books formed the basis for the Bodleian Library, Oxford.

The tradition of religious patronage declined after the Reformation, as much of the wealth of the church was alienated and clerics ceased to dominate political life as \*Morton and Wolsey had done. Elizabeth I encouraged the cult of majesty, patronizing artists like \*Hilliard and Hans Eworth to convey her image of royal splendour. Inigo \*Jones was involved in architecture, decoration, and the design of \*masques for the courts of James I and Charles I, and the first poet laureate was Ben \*Jonson in James I's reign. Thomas, earl of \*Arundel, patron to several painters including Rubens, introduced \*Van Dyck to Charles I, the last great royal patron of arts. The Civil War put many artists out of work or into exile, yet patronage continued. Peter \*Lely prospered under Charles I and II, as well as under \*Cromwell, who, along with other parliamentarians, sat for portraits by Robert Walker. Cromwell also loved music and retained a small group of domestic musicians. The Restoration brought back the Stuarts but not intensive royal patronage. Charles II recognized his duty to the arts but salaries or pensions were often erratically paid. He was, though, an enthusiastic patron of the theatre and horse-racing, while many of the noblemen who followed him out of exile both practised and patronized literature.

The beginnings of the 18th cent. saw increasing political patronage of the arts. The \*Kit Kat Club, a group of influential Whigs, whose members included the writers \*Congreve and \*Addison, artists \*Vanbrugh and \*Kneller, and politicians \*Walpole and \*Newcastle, extended patronage over all aspects of art and music. Among traditional patrons, returning grand tourists commissioned or rebuilt great houses, and filled them with decoration, paintings, sculpture, silverware, and furniture. Chandos was patron to \*Handel and the duke of Richmond patron to Canaletto, who spent nine years in England. Lord \*Burlington befriended William \*Kent, financed his publications, and collaborated on several of his Palladian designs. George I and George II enjoyed music and patronized Handel and the opera, and employed the sculptors \*Rysbrack and \*Roubiliac.

Increasing prosperity meant a role in patronage for the general public. The \*Three Choirs Festival of Worcester, Gloucester, and Hereford was founded in 1713; books were published by subscription; prints and engravings and later caricatures from artists like \*Hogarth and \*Rowlandson sold in large numbers. New money from industry went into the arts: \*Wedgwood the potter was patron of George \*Stubbs and Joseph \*Wright of Derby. In the 19th cent. the \*Pre-Raphaelites found support among the industrialists of the midlands and north of England, and throughout the century wealthy art lovers like Angerstein, Tate, and Wallace made generous gifts to public galleries. At a

## Paulinus

lower level, the newly formed borough and county councils filled their foyers with sculptures and their corridors with portraits of chairmen, mayors, and aldermen.

Patronage of art is now institutionalized. Few individuals in a century of heavy taxation have the wealth to support the arts but royalty still sits for portraits, even if the commissioning organization pays the artist. New town corporations place lonely sculptures on wind-swept grassy banks. But in the main it is orchestras or bodies like the BBC who commission new music, and universities which find funds for painters or poets in residence. Funding comes from a diversity of sources, from the Arts Council to the National Lottery. An artist is unlikely to have a home provided by a patron. He will be paid but not by a long-term stipend. He may receive the freedom of a city but not a government office. He retains his independence, which Dr \*Johnson valued more than a patron, 'who supports with insolence and is paid with flattery'. JC

**Paulinus, St** (d. 644). First bishop of the Northumbrians. A Roman monk, tall, dark, thin-faced with an aquiline nose, according to \*Bede one of \*Mellitus' party sent in 601 by Pope Gregory I to help \*Augustine in Kent. He was consecrated by \*Justus, apparently on 21 July 625, to accompany the Princess \*/Æthelburg to Northumbria to marry \*Edwin, but the dating is controversial. Paulinus may have met Edwin previously, at the court of \*Raedwald of East Anglia, and baptized him at York, his episcopal seat, in 627. He preached at Yeavering, Catterick, Lincoln (where he consecrated \*Honorius to succeed Archbishop Justus), and elsewhere, and introduced the building of churches in stone. After Edwin's death (633) at \*Heathfield Chase, Paulinus fled to Kent and took up the see of \*Rochester, where he was buried in the church of St Andrew. AER

**Pax Romana** was the peace and consequent potential development brought by inclusion in the Roman empire. The *lex Iulia de Vi Publica* outlawing the carrying of weapons except when hunting or travelling was probably enforced in Britain. This did not abolish brigandage or invasion, but helped create stability. ASEC

**Peacock, Thomas Love** (1785–1866). Peacock had modest private means but earned his living as an official in the East India Company. He wrote essays, poetry, plays, and pamphlets, but is best known for his novels, *Headlong Hall* (1816), *Melincourt* (1817), *Nightmare Abbey* (1818), *Crotchet Castle* (1831), and *Gryll Grange* (1860–1). Peacock was a friend of \*Shelley in his youth and radical in politics, but he grew increasingly independent, and his satirical victims included ardent Romantics as well as 'march of mind' men like Henry \*Brougham. The novels are quirky and an acquired taste, with little plot and much conversation, but offer vignettes of Peacock's contemporaries—\*Repton (Milestone in *Headlong Hall*), \*Malthus (Fax in *Melincourt*), \*Coleridge (Flosky in *Nightmare Abbey*), Shelley (Foster in *Headlong Hall*). JAC

**Peada** (d. 656), king of the \*Middle Angles (c.653–6), was a son of \*Penda of Mercia, who appointed him king. Shortly afterwards Peada married Alhflaed, daughter of \*Oswiu of Northumbria, and as a condition of marriage

agreed to become a Christian and to allow evangelization by a mission from \*Lindisfarne. After Oswiu defeated Penda at the battle of \*Winwaed in 655, he appointed Peada king of the southern Mercians, keeping control of the northern Mercians himself, but, according to \*Bede, Peada was murdered the following Easter through the treachery of Alhflaed. BAEY

**Pearse, Patrick** (1879–1916). Pearse was the son of an English-born stonemason, a non-practising lawyer, dramatist, and headmaster of St Enda's School (Dublin), which he ran on Gaelic Revivalist lines. A leading member of the \*Gaelic League, he supported \*Home Rule up to 1912: the Ulster crisis caused him to advocate a militant nationalism and to join the \*Irish Republican Brotherhood. He became a dominant voice in the Irish Volunteers and a member of the IRB military council which planned the \*Easter Rising. His philosophy of blood-sacrifice appeared to anticipate and justify the course of events during and after the rising. Pearse read the declaration of the Provisional Irish Republic outside the General Post Office on 24 April 1916; gave orders for surrender five days later; and was executed on 3 May. The traditional view of him as a heroic voice of Irish nationalism has recently been questioned, but while impractical and unstable, he was, nevertheless, inspirational. MAH

**peasantry.** Although widely used, in a British context the term 'peasant' has no obvious contemporary definition which fits the way it is employed today. Medievalists have questioned whether Britain ever had a social group to which the word peasant was applicable, and would certainly question the continued existence of such a group beyond the Middle Ages. Even the famous \*'Peasants' Revolt' of 1381 was referred to by the chronicler as a rustic rather than a peasant tragedy. In literary sources the term was occasionally used of labourers, implying someone of low birth and inferior standing, rather than a small owner and/or occupier in the countryside. This link with rural labour can be found into the 19th cent. The term also acquired romantic overtones, with the peasantry depicted as the humble members of a fast-disappearing rural society, a Hardy-esque chorus.

By the later 19th cent. historians writing of England from a European perspective often saw peasants as small freeholders, copyholders, and even farmers. Modern anthropological definitions of peasant societies allow the term to be employed for what has been called 'analytical simplicity', largely because it is widely used (as in the French term *peasant*) to mean simply a countryman. As a result, it has been employed as a useful shorthand term without specific definition. Most historians use the term to mean small landowners and/or small farmers, but it can also be used loosely to include the cottager, the commoner, and the squatter; in other words, of the social group which depended on common rights (at least prior to \*enclosure) and stitched together an income from farming, labouring, and a range of other activities. As such, 'peasant' refers to some of the least identifiable rural dwellers, simply because they do not appear in the written record.

The term has also become a catch-all for the social group largely displaced through the economic conditions prevailing in the post-Restoration period, or at enclosure. Some have argued that the term is inappropriate after 1750 because by then England had no peasantry in the continental sense of the word. However, it is accepted that peasants survived in Ireland and in thinly populated parts of Wales and Scotland, and even in some of the pastoral upland counties of northern and western England. Recent scholarship asserting a stronger survival of 'peasant-type' rural dwellers than has often been accepted suggests the term still has a currency.

JVB

**Peasants' Revolt.** This rebellion in 1381 was the first large-scale popular uprising in England. It began in Essex, in the village of Fobbing. Kent soon followed, and the rebels moved rapidly to London. There were also significant risings in East Anglia, Bury St Edmunds, and St Albans. The rapidly changing economy, in the aftermath of the \*Black Death, provides one explanation for the rising; the inadequacy of the government, the church, and the failure of the war with France another. The spark to the revolt was provided by the third \*poll tax, which was to be levied uniformly at 1 shilling a head, and so bore particularly hard on the poor. Commis-sions to investigate the low level of returns provoked the Essex uprising. The rebellion took a dramatic and strongly political turn in London, where the rebels took and executed the archbishop of Canterbury, Simon \*Sudbury, the treasurer, and others. Radical demands were made by Wat \*Tyler, one of the peasant leaders, at Smithfield: serfdom was to be abolished; there was to be no law save the law of Winchester (an obscure request); outlawry was to be abandoned; lordship was to be divided between all men. There should be only one bishop, and one prelate; the wealth of the church should be distributed among the people. Wat Tyler was killed at this meeting. Resistance elsewhere in the country was short-lived. Perhaps the one lasting achievement of the revolt was that very few poll taxes were levied again in England for some 600 years. MCP

**Peckham, John** (c.1220–92). Archbishop of Canterbury. Born in Sussex and educated at Oxford, Peckham became a Franciscan. After teaching in Paris (c.1250) as a distinguished Augustinian scholar, like \*Kilwardby often in conflict with Aquinas, he returned to Oxford (c.1270), and became provincial minister of the English Franciscans (c.1275). After lecturing in Rome (1277–9), he reluctantly accepted papal nomination to Canterbury (1279). Scholarly, austere, living in humility, a friar at heart, and yet outspoken and combative, he had a high idea of archiepiscopal authority, vigorously exerting it through penetrating provincial visitations and, with 'garrulous frankness', resisting Edward I's encroachment on ecclesiastical authority. At his Reading council (1279), he excommunicated all pluralists and those impeding church courts, which Edward answered by compelling him to withdraw and by limiting church acquisition of lay property by the statute *De religiosis*. WMM

**Pecock, Reginald** (c.1395–c.1460). Bishop of Chichester (1450–9). A Welshman, educated at Oriel College, Oxford,

Pecock was fellow there (1414–24) and under Humphrey, duke of \*Gloucester's patronage became master of Whittington College, London (1431–44), bishop of St Asaph (1444), of Chichester (1450), and a privy counsellor (1454–7). A rationalist himself, he tried to win over \*lollards by vigorous argument—'by cleere witt [to] drawe men into consente of trewe faith'—rather than by burning, which involved him in controversy with conservatives. A sermon at St Paul's Cross (1447), defending non-preaching bishops, offended reformers. His works include *Repressor of Over Much Blaming of the Clergy* (1455), the first theological treatise in English since 1066, his *Book of Faith* (1456) promoting the authority of reason, and *The Provoker* questioning the authorship of the Apostles' Creed. As a Lancastrian and arraigned for heresy (1457), he was expelled from the Privy Council and forced to resign his see (1459) after public recantation. He was confined in Thorney abbey (Cambs.), where he died.

WMM

**peculiar people.** Evangelical sect, also known as 'Plumstead peculiars' or 'Banyardites', founded in Rochford by the ex-Wesleyan James Banyard (1800–63), in 1838, and confined to south-east Essex and nearby parts of London and Kent. After Banyard's deposition (1855), their ablest leader was a Southend credit-draper, William Heddle (1846–1948). Distinctive in name, appearance, and habits, their men clean-shaven and their women black-bonneted, they developed an order of bishops, elders, and helps, serving circuits or dioceses. Taking the Bible as their rule, their emphases on divine healing, the imminence of the Second Coming, and pacifism led to well-publicized court cases, since they refused conventional medicine and became conscientious objectors in 1916. Renamed the Union of Evangelical Churches, they associated themselves with the Fellowship of Independent Evangelical Churches in 1956.

CB

**Peel, Sir Robert** (1788–1850). Prime minister. Peel was born into a family which had recently become wealthy through cotton manufacture. His father became a baronet in 1800, and Peel was destined for a political career without direct involvement in industry. He was educated at Harrow and Oxford, where his contemporaries mainly came from established governing groups. Like his father, a traditional church and king Tory, Peel was a loyal supporter of \*Pitt's wartime government. When he was 21, his father bought him a parliamentary seat for the Irish borough of Cashel. He was widely seen as an able man and in June 1809 became under-secretary for war and colonies. He quickly earned a reputation as a fine parliamentary speaker. In 1812 he became chief secretary for Ireland, described as 'one of the most difficult and laborious offices under the government'. During his six years there he developed administrative skills and acquired a defensive armour of apparent aloofness. He had a strong physique but by 1818 overwork had impaired his health and he resigned. But he retained close links with ministers and was responsible for piloting through the return to cash payments in 1819. In 1822 Peel became home secretary in \*Liverpool's government. He introduced several important measures, including far-reaching reform of

## peel towers

the criminal law and the creation of the Metropolitan Police. He also distinguished himself as a leading opponent of \*catholic emancipation, increasing his status with many Tories in and out of Parliament. He left office in 1827, refusing to serve under \*Canning, who supported catholic emancipation, but returned after Canning's early death. When \*Wellington felt obliged to concede emancipation in 1829, Peel resigned but then yielded to Wellington's pleas to return to office and skilfully piloted emancipation through the Commons. This earned him the enmity of many of his old admirers and raised doubts as to his trustworthiness. After the Tory government fell in 1830, Peel increasingly emerged as leader of the opposition to the new Whig ministry. He opposed the \*Great Reform Act, but tried to keep within bounds the enmity of right-wing Tories towards the Whigs.

Peel began to establish a national reputation for moderation, exemplified by his \*Tamworth manifesto, in which he accepted the Reform Act and committed his Conservative Party to a policy of cautious reform, while pledging to conserve all vital national interests. This was a successful ploy, although its vagueness held the seeds of future trouble since it was easy to disagree as to what vital national interests were. The manifesto was issued for the general election after William IV dismissed his Whig ministers late in 1834. Peel became prime minister with a minority of seats. In the following election his party gained about 100 seats, but not a majority. The Whigs forced Peel's resignation and returned to office, but the following years saw them weaken both in Parliament and in the country. The 1837 election brought further Conservative gains. Peel's moderation and obvious ability attracted many supporters, though this involved a dangerously broad range of political opinion, from reactionary Tories to moderate reformers. Deepening economic and political troubles brought the Whigs in 1841 to propose a more radical financial policy which involved reductions in tariffs, including the \*Corn Laws which protected agriculture. Peel then defeated ministers on a no-confidence motion, took office, and dissolved. In the ensuing election Peel won decisively. He had projected an image of strength and responsibility, while the Whigs had seemed to many voters both financially inept and culpably weak in face of \*chartist agitation. Although the country was suffering grave social and economic troubles, he used the winter of 1841–2 to mature plans for recovery and in the 1842 budget scored a major success. He slashed tariffs as impediments to commerce and revised the Corn Laws downwards. Unlike the Whigs, he was strong enough to balance this loss of revenue by enacting direct taxation on incomes. Ensuing years saw further moves towards free trade, including a second comprehensive tariff-cutting budget in 1845, and growing restiveness in some Conservative quarters, as Peel's commitment to the preservation of the Corn Laws became doubtful. To him, agricultural protection was now no more than a commercial expedient, but to many Conservatives this bulwark of the landed interest was a vital national concern. The \*Anti-Corn Law League's agitation increased right-wing anxiety. From 1842 onwards, Peel's Conservative critics had warned that free trade policies would fail, but economic recovery by

1845 seemed to confound them. By then Peel was at heart a free trader, although he knew that to attack the Corn Laws was politically perilous. In 1845 the potato crop failed, bringing catastrophe to Ireland. Peel determined to take the opportunity to repeal the Corn Laws. He was unable to persuade his cabinet to back him, and resigned, but when the Whigs failed to form a ministry late in 1845, he returned to office. He had lost some right-wing ministers and alienated many backbenchers and supporters outside Parliament. He introduced his repeal measures cleverly, offering concessions to the landed interest, but failed to preserve his position when the aristocratic Lord George \*Bentinck and the political adventurer Benjamin \*Disraeli succeeded in organizing protectionist opposition. With his own following among the Conservatives and support from Whigs and radicals, Peel succeeded in repealing the Corn Laws in 1846. At the same time, disaffected Conservatives joined the opposition in defeating an Irish Coercion Bill, in order to bring Peel down. He resigned immediately after this defeat and never held office again. For the remainder of his life he possessed great influence, since the political scene was fragmented after the Conservative rift, and enjoyed great prestige in the country. His status owed much to the widespread belief that as a minister he had preferred the public good to his own retention of power. The conviction that under Peel a legislature dominated by the landed interest had sacrificed the Corn Laws to the need to feed the people played a part in ensuring that subsequent change in 19th-cent. Britain was evolutionary rather than revolutionary. NMcC

Gash, N., *Mr. Secretary Peel* (1961); — Sir Robert Peel (1971).

**peel towers** were temporary refuges, often attached to manor houses, farms, or churches, and commonly built in the 15th and 16th cents. They were normally two storeys, the lower one for cattle, with slit windows, if any, in thick stone walls, and a narrow stair or ladder leading to the upper storey. Of little use against regular forces, they offered some protection against border raiders and were mainly to be found either side of the Anglo-Scottish border. There are good examples at Corbridge and Elsdon in Northumberland. On the Welsh border, strong church towers, like those at Ewyas Harold and Rowllstone, probably served a similar purpose. JAC

**Peep o' Day Boys** was the name adopted by Ulster presbyterians in the 1780s and 1790s to confront the catholic \*Defenders. On 1 September 1795 they routed their adversaries in a pitched battle at the Diamond, near Armagh, killing many of them. They then joined in the foundation of the \*Orange order. JAC

**peerage.** The formal body of aristocracy, distinguished by titles and by the right to sit in the House of Lords. Though the rank of earl preceded the Conquest, it was hardly necessary to define the peerage closely until the House of Lords developed as a regular element in Parliament in the 13th cent. To the ranks of baron and earl were added duke (1337), marquis (1385), and viscount (1440). The peerage remained small until the end of Elizabeth's reign, when there were just over 50 English peers, but the impecuniosity of

the early Stuarts led them to sell titles and by 1641 there were more than 130 peers. Apart from attendance in Parliament, their main privileges were access to the monarch and the right to trial by the House of Lords. By the Act of \*Union of 1707 the Scottish peerage was closed, sixteen representative peers elected to the House of Lords at Westminster, and a new peerage of Great Britain instituted. After 1801, the Irish peerage was severely limited, 28 representative peers elected, and a new peerage of the United Kingdom established. From 1780, the number of peers increased greatly as bankers, industrialists, scientists, and men of letters were ennobled to augment the landed aristocracy. The greatest change however was the introduction of life peerages from 1958. By 1993 there were more than 1,000 peers, 758 of them hereditary and 382 life peers. Those bishops who sit in the Lords do so, not as peers, but as lords of Parliament. Hereditary peers were deprived of their seats in the Lords in 1999 by the Labour government. JC

**Peerage Bill.** This bill, introduced into the Lords in March 1719 by the \*Sunderland/\*Stanhope ministry and dropped in April due to the uncertain position of the Commons, had three aims: to protect the chief ministers against impeachment should the prince of Wales, who opposed them, succeed to the throne; to settle the unsatisfactory Scottish representation in the Lords; and to maintain the existing peerage's social position, by limiting creations. The bill laid down that (excluding royal princes) the king could create only six more peerages, then further peers only on the extinction of titles; the 16 Scottish elected peers were to be replaced by 25 hereditary ones. The bill was reintroduced in December 1719, easily passed the Lords, but was defeated in the Commons largely due to the opposition of Robert \*Walpole. CJ

**peine forte et dure.** After the Lateran Council of the church in 1215 forbade the clergy to take part in ordeals, the king's justices had no means of trying the guilt or innocence of suspected criminals. After a number of experiments they developed the trial \*jury of twelve men to decide. Since this jury was an innovation and not part of the Englishman's customary rights, the accused was always asked if he was willing to be tried by jury—to 'put himself upon the county'—and if he refused, jury trial would not be proceeded with. Under the statute of \*Westminster I (1275), Parliament provided that anyone who refused to accept jury trial should be put into a 'prison forte et dure' until he agreed to it. By some error this section came to be interpreted as '*peine forte et dure*', which in turn came to be literally interpreted as the placing of weights upon the hapless prisoner, increasing until he either consented to jury trial or perished. In 1772 the *peine forte et dure* was abolished. MM

**Pelagius.** Early 5th-cent. Christian theologian of British or Irish extraction. Pelagius travelled to Rome as a monk c. AD 400 and was deeply disappointed by the lax moral standards there. He preached that strenuous efforts were needed to avoid sin and attain individual salvation. The theologian \*Augustine was appalled by this insistence on the effectiveness of free will, and Jerome called Pelagius 'a fat hound

weighed down by Scotch porridge'. Pelagius twice suffered excommunication, and where and when he died is unknown. After his death the Gallic monks remained sympathetic to Pelagius' views, but the new sect of Pelagianism was denounced by the Roman ecclesiastical authorities as a heresy. St \*Germanus was sent to Britain in 429 to counter its influence in the British church. ES

**Pelham, Henry** (c.1696–1754). Prime minister. Pelham was 1st lord of the Treasury for over ten years (1743–54) and highly regarded by his contemporaries. But time has faded his reputation between the vividly coloured careers of \*Walpole and \*Pitt the Elder. Pelham's career began under the wing of his elder brother, the duke of \*Newcastle, who brought him into Parliament (MP for Seaford 1717–22 and Sussex 1722–54). The brothers quickly realized that Walpole was becoming the man to support. Pelham became secretary at war in 1724 and paymaster-general in 1730, though his status, certainly in the 1730s, was higher than his offices suggest.

After Walpole's fall in 1742 he recommended Pelham as his successor to George II, who favoured \*Carteret, the new secretary of state for the northern department. However, in obtaining the Treasury in 1743 Pelham had a firm power base and by the end of 1744 Carteret had resigned. In February 1746, following the retreat of the Jacobites, the king considered replacing his ministers. The Pelham brothers and their many followers resigned, forcing the king to accept them back on their own terms. This 'storming of the closet' was of great constitutional significance, demonstrating that government could only work with ministers of whom Parliament approved.

Though Pelham was now thought of as 'prime' minister, the government was really a triumvirate of Pelham, Newcastle, and \*Hardwicke. Newcastle shaped foreign policy, but Pelham controlled the purse strings. Hardwicke often had to mediate between the brothers, who, though extremely fond of each other, were not temperamentally suited. Pelham pursued a policy of including as many political factions in government as possible, leading to an era of undoubted calm. Central to maintaining this calm was the smooth operation of the government's vast patronage system, which Pelham ensured with his bland affability, eye for detail, and, crucially, his presence in the Commons. He also had the respect of talented young politicians such as \*Pitt and Henry \*Fox, which Newcastle did not.

Pelham's common sense and restrained style was important in preventing excessive reprisals against the Highlanders following the Jacobite rising of 1745, in restraining Newcastle's policy of subsidy payments to allied countries during the War of the \*Austrian Succession, and in damping down the popular clamour that followed the bill to naturalize Jews in 1753. But these were essentially reactions to events. Pelham instituted useful Treasury reforms and piloted Hardwicke's 1753 \*Marriage Act through the Commons, but it was not part of his political philosophy nor his personal inclination to encourage change.

Pelham's death in 1754 surprised his colleagues and marked a decided change of pace in British politics. George

## Pembroke

It's declaration upon hearing of it, 'Now I shall have no more peace,' would have seemed to Henry Pelham a compliment. AIL

Wilkes, J., *A Whig in Power: The Political Career of Henry Pelham* (Evanston, Ill., 1964).

**Pembroke, Richard de Clare, earl of** (c.1130–76), commonly known as 'Strongbow'. A member of the aristocratic Clare family—according to \*Gerald of Wales 'his blood was better than his brains'—he inherited his father's earldom of Pembroke in 1148 but, being a supporter of Stephen, forfeited it when Henry II came to the throne. In 1166, still out of favour, he decided to accept \*Dermot MacMurrough's offer of his daughter Eva (Aoife) in marriage and the succession to the kingdom of Leinster in return for military assistance against Dermot's Irish enemies. In 1170, in defiance of Henry's wishes, he took a force to Ireland and occupied Dublin and Waterford, where he married Aoife. In 1171 he succeeded Dermot as king. Alarmed by this Henry II invaded Ireland, forcing most Irish kings to recognize him. But by the time he left in 1172 he had recognized Richard both as earl and as his representative in Ireland. Strongbow's gamble had succeeded and the English invasion of Ireland had begun. JG

**Pembroke, Thomas Herbert, 8th earl of** (1656–1733). Pembroke had a long and distinguished political career, was sword-bearer at five coronations, and was a keen patron of the arts. He succeeded to the title in 1683 and was appointed lord-lieutenant of Wiltshire, but fell into disfavour with James II after refusing to discipline boroughs and was dismissed in 1687. He supported William of Orange, though, as a Tory, he favoured a regency. He was 1st lord of the Admiralty 1690–2, lord privy seal 1692–9, lord president of the council 1699–1708, viceroy of Ireland 1707–8, and lord high admiral 1708–9. He served frequently as a lord justice (regent), was a commissioner to negotiate union with Scotland, and a strong supporter of the Hanoverian succession. Holmes described him as 'a man of mild Tory sympathies and the centre of any coalition ministry'. \*Locke dedicated to him the *Essay Concerning Human Understanding* (1690), and \*Berkeley his *Principles of Human Knowledge* (1710). JAC

**Pembroke, William Herbert, 1st earl of** (c.1507–70). William Herbert's grandfather was a Yorkist earl of Pembroke, executed at Northampton in 1469, but his father was illegitimate. The family estate was at Ewyas Harold, north-east of Abergavenny. \*Aubrey describes him as 'a mad, young, fighting fellow', who could neither read nor write. He held minor court office but his great chance came in 1543 when his sister-in-law \*Catherine Parr married Henry VIII. He was knighted, given the estates of the abbey of Wilton, and appointed a gentleman of the bedchamber. In 1549 he helped to suppress the western rising and was given the Garter. After backing the duke of \*Northumberland against his rival \*Somerset, he took many of the executed duke's estates and in 1551 was created earl of Pembroke. He did homage to Lady Jane \*Grey in 1553, but changed step nimbly and retained Mary's favour. He commanded her forces against \*Wyatt in 1554, stayed at court under Elizabeth,

and was lord steward for the last two years of his life. Aubrey wrote of him as founder of the house of Herbert at Wilton: 'from a private gentleman, and of no estate, but only a soldier of fortune . . . at the dissolution of the abbeys, in few years from nothing slipt into a prodigious estate.'

JAC

**Pembroke castle**, started about 1090, exploited a loop in the Pembroke river, and dominates the small town. Begun by Arnulf de Montgomery, a son of Roger de Montgomery, earl of Shrewsbury, it has an inner and outer bailey. It was taken over by Henry I as a royal castle, extended by Gilbert de Clare and Richard Fitzgilbert (1st and 2nd earls of \*Pembroke), and in the early 14th cent. by Aymer de \*Valence. It later passed to Jasper \*Tudor, half-brother to Henry VI, and Henry VII was born there. It was never captured in the medieval period. In the first civil war (1642–6) it was held for Parliament, and in the second (1648) for the king. It surrendered to \*Cromwell in July 1648 after a siege and was slighted. JAC

**Pembrokeshire**. County of south-west Wales. The county was created at the Act of \*Union with England in 1536. The peninsula, part of the Welsh kingdom of \*Deheubarth, was conquered by Arnulf de Montgomery, who established the lordship of Pembroke in the south. This was later to become the palatine earldom of Pembroke, which included the lordship of Tenby and the baronies of Daugledau, Carew, and Walwynscastle. To that basis was added the smaller lordships of the north of the peninsula, Cemaes and Cilgerran, together with the episcopal lands of St Davids (Pebidiog, or Dewisland), the cathedral city of the patron saint of Wales, as well as those of the centre, Haverfordwest and Narberth, and the barony of Llawhaden which belonged to the bishops of St Davids. Henry I reinforced the occupation of the south by promoting a Flemish immigration. The result was that the county had a distinctive dual character, markedly English to the south, Welsh to the north. So clear was the dividing line that it acquired a name—the Landsker. In 1974 the county became part of \*Dyfed, but, reflecting the basic internal contrast, it was divided into two districts, South Pembrokeshire and Preseli. To a degree the divide marks a physical contrast between the low coastal plateau of the south and the Preseli mountains of the north.

Pembrokeshire has been pre-eminently an agricultural county, the southern section being one of the few areas of arable land in Wales, its mild maritime climate giving rise to early vegetable- and flower-growing. A further distinctive feature is its fine coast and offshore islands (Skomer, Skokholm, and Ramsey). The whole coast is designated a heritage coast and makes up the Pembrokeshire National Park. Tourism is in consequence a major economic aspect. The coast is broken by the major sea inlet (ria) of Milford Haven. Once a major fishing port, it is now dominated by oil refineries, developed for supertankers.

North-south contrasts dominate the county, 68.8 per cent speaking Welsh at Crymych in the north but only 4.6 at Manorbier in the south. The district percentages in 1991 were 8.2 in South Pembrokeshire and 24.4 in Preseli.

The population in 1991 was 109,534. In 1996 the county was reconstituted as a unitary authority. HC

**penal laws.** The general name given to the enactments against Roman catholicism made between the accession of Elizabeth I and 1700. They enforced the Elizabethan religious settlement and tried to protect political activity from the influence of the pope and catholic Europe. The overall effect was to drive catholicism underground and to create recusancy. Catholics were placed beyond the political pale and evolved an informal and illegal network of religious and social connections.

Rejection of papal authority was imposed by an oath of allegiance in 1563, stating that 'no foreign prince, person, prelate, state or potentate hath or ought to have any jurisdiction, power, superiority, pre-eminence or authority, ecclesiastical or spiritual within this realm'. Refusal of the oath was treasonable. After the excommunication of Elizabeth I in 1570, the purpose of legislation changed from securing royal supremacy to defeating the new recusant missionary campaign. Priests were tried and executed for treason, particularly after the Acts of 1584–5 which made it treasonable for a priest to enter England. In 1581 an Act to retain the Queen's Majesty's subjects in their due obedience was passed, declaring it treasonable to pervert people from their religious or political allegiance.

James I reinforced the legislation and further regulations limited the freedom of catholics in movement, professional activity, and inheritance of property. The laws of the Restoration period, especially the \*Test and \*Corporation Acts, kept the catholic community on the margins. Catholics suffered for the disastrous reign of the last catholic king James II under laws barring them from carrying arms, inheriting or buying property, sending children abroad for education or teaching in a school, and offering a £100 reward for the prosecution of a priest.

Had this massive penal code been enforced, it could have eradicated English catholicism, but catholics survived and even flourished in its shadow. Local imposition was sporadic and the Hanoverian mind found religious persecution distasteful. The \*Jacobite threat disappeared and repeal of the penal laws became possible. This happened in three main relief Acts of 1778, 1791, and 1829. JFC

**Penda** (d. 655), king of Mercia, can in many ways be seen as the anti-hero of \*Bede's *Ecclesiastical History*—a resolute pagan, responsible for the deaths of many Christian kings in battle, including that of St \*Oswald at \*Maserfield. However, Bede also admitted that he allowed Christian missionaries to preach in areas under his control and that he was *vir strenuissimus* 'a man exceptionally gifted as a warrior'. Penda first appears in recorded history in 626 battling with rulers of the West Saxons for control of the province of the \*Hwicce. The \*Northumbrians apparently first encountered him in alliance with \*Cadwallon of Gwynedd at the battle of \*Heathfield in 633 and he also fought at least two major battles with the \*East Angles. Penda's energetic campaigns from his midland base greatly increased the territory under Mercian control and enabled him to establish a wide-ranging overlordship, recognized in Northumbria and parts of Wales

as well as in the southern English kingdoms. It was \*Oswiu of Bernicia's challenge to his authority as overlord which led to Penda's death at the battle of \*Winwaed in 655, where he had come with 30 *duces regii*, probably commanders leading military contingents from his subject provinces. BAEY

**Peninsular War, 1808–14.** Provoked by Napoleon's intervention in Portugal and his imposition of his brother Joseph on the throne of Spain, the war in the Iberian peninsula marked a turning point in the Napoleonic War. By closing Spanish and Portuguese ports to British trade Napoleon had hoped to compel Britain to sue for peace, but his intervention aroused massive popular hostility in Spain and Portugal. Although they were often defeated, the Spanish armies continued to defy the French, while Spanish guerrillas held down large numbers of French troops. When the Spaniards asked Britain for assistance the decision to commit an expeditionary force was a bold one. Initially British opinion exaggerated the likelihood of early success, and only in 1809 did the British accept that the war would be long and arduous. Under \*Wellington the British collaborated effectively with the Portuguese, whose army was retrained by British officers. In the winter of 1810–11 Masséna's attempt to drive the British into the sea was thwarted by the lines of \*Torres Vedras, a masterpiece of military engineering and a tribute to Anglo-Portuguese co-operation. Thereafter Wellington regularly challenged the French, knowing that his Portuguese base was secure. In 1812 he won the dramatic battle of \*Salamanca, and in 1813 he exploited British sea power to conduct a brilliant campaign in northern Spain which reached its climax at the battle of \*Vitoria. After expelling the French from Spain, Wellington invaded southern France in 1814. Throughout the Peninsular War, Wellington used the 'reverse slope defence' to establish the superiority of the line over the column. Choosing his ground carefully, he drew up his main force behind a ridge, while light infantry impeded the French advance. The French were handicapped by their lack of artillery and cavalry, which had ensured the success of the column elsewhere. The war in Spain sapped the energies of the French military machine and encouraged the Russians, Prussians, and Austrians in their resistance to Napoleon. It established Wellington's renown as a general and restored the reputation of the British army in the field. JWD

**Penn, William** (1644–1718). Penn, son of Admiral Sir William Penn, educated at Oxford and Lincoln's Inn, exhibited an early religious sensibility, rejecting a conventional career to join the \*quakers. Their leading legal spokesman, international propagandist, and public witness, his advocacy of liberty of conscience and religious toleration found some support from Charles II and James, duke of York, and Penn's wealth aided his efforts. Although a prolific pamphleteer, he rejected the violence of English politics at the \*Exclusion crisis. He suffered for his royal friendships at the Glorious Revolution. Penn gained an extensive American proprietary in 1681, drafting a constitution for Pennsylvania embodying his very liberal political ideas. The colony lost rather than (as he hoped) gained him a fortune; he faced growing opposition there and in England. One of the few

## penny post

colonial proprietors who actually visited America, he died in penury and self-pity. RCS

**penny post.** See HILL, SIR ROWLAND; POST OFFICE.

**Penruddock's rising**, 1655. Soon after Charles II's flight into exile after the defeat at \*Worcester in 1651, his supporters began to plan a general rising in England. The schemes, taken up by the royalist conspiracy of the Sealed Knot, were soon known to \*Cromwell's government, which took vigorous counter-measures. On 8 March 1655 only 100 supporters turned up to a rendezvous at Marston Moor which was to have seized York, and even fewer near Morpeth for an attack on Newcastle upon Tyne. A small Wiltshire rising under John Penruddock, a local gentleman, got off the ground four days late, but never numbered more than a few hundred. The rebels held Salisbury for some hours, marched to Blandford, and then retreated into Devon, pursued by Commonwealth troops. At South Molton they were rounded up by a small cavalry force. Penruddock was executed at Exeter in May 1655. Cromwell's response to the disorders was to introduce the rule of the \*major-generals. JAC

**Penry, John** (1563–93). Puritan writer. A *de facto* clergyman though never taking holy orders, and regarded by some as pioneering Welsh nonconformity, Penry's concern about the lack of preaching ministers in his native Wales so displeased Archbishop \*Whitgift that he was briefly imprisoned and the offending *Treatise* seized (1587). As his attacks on the established church coincided with appearance of the \*Marprelate tracts, he was ineluctably drawn into the controversy; friendship with \*Udall and Job Throckmorton, and close association with Robert Waldegrave's secret printing press, made him a prime suspect for 'Martin Marprelate', though he was merely sympathetic collaborator and co-ordinator rather than author. He fled to Edinburgh (1589) but returned to London in 1592, allying himself to Henry \*Barrow and the separatists, only to be captured the following March and imprisoned. Despite slender evidence when tried at the Queen's Bench, he was indicted, convicted, and hanged. ASH

**Penselwood, battle of**, 1016. An encounter in the struggle for the crown between \*Edmund Ironside and \*Cnut after the death of \*Æthelred. The place is given in the *Anglo-Saxon Chronicle* as Peonnan near Gillingham and has consequently been identified as in Kent or at Penselwood on the Dorset–Somerset border. A case can be made out for each. Penenden Heath in Kent (pronounced 'Pennendn') is 4½ miles south of Gillingham. Cnut certainly besieged London in the course of 1016, while the battle of \*Sherston, later in the summer, was in Wiltshire. The result at Penselwood was inconclusive but the Danish victory at \*Ashingdon, closely followed by Edmund's death in November 1016, left Cnut master of the kingdom. JAC

**pensions, old-age.** See OLD-AGE PENSIONS.

**Pentecostal churches** believe that the Pentecost experience remains accessible. Consequently they stress baptism in the Spirit, which they distinguish from conversion or water

baptism. This conveys power to practise the gifts of the Spirit: speaking in tongues, prophecy, healing, exorcism. Although similar beliefs are discernible among 2nd-cent. Montanists, 16th-cent. \*anabaptists, 19th-cent. \*Irvingites, and later offshoots of revivalism, 20th-cent. pentecostalism began at the Asuza Street mission, Los Angeles, 9 April 1906, when members started to speak in tongues. The movement reached England via Norway in 1907, when an ex-methodist, T. B. Barratt, influenced the rector of Monkwearmouth, spread to Wales, where the Jeffreys family of Maesteg founded the Elim foursquare gospel alliance, and thence to Ireland. The largest British churches are the assemblies of God (formed in the United States in 1914), the apostolic faith church, the Elim churches (their foursquare gospel can be encapsulated in Christ—saviour, healer, baptizer in the Spirit, and coming king), and the New Testament Church of God, with its strength among West Indian communities. Their worship is spontaneous, with emphasis on extempore prayer, believer's baptism, and the Lord's supper. Their doctrines are those of world-denying conservative protestantism. Their rapid 20th-cent. growth, especially in Latin America and Africa, attracted the label of Christendom's 'Third Force', after Roman catholicism and protestantism. CB

**Pentland rising**, 1666. Support for the \*covenant was strong in south-west Scotland and clandestine conventicles continued after the Restoration, the covenanters fined for not attending their parish churches. In November 1666 an incident at Dalry, near New Galloway, sparked off a rising. The covenanters occupied Dumfries and advanced upon Edinburgh by way of Lanark. But their numbers dwindled in the face of heavy rain and fewer than 1,000 of them were intercepted and dispersed at Rullion Green, near Penicuik in the Pentland Hills. Retaliation was severe with 30 executions and many transportations. JAC

**Pentrich rising**, 1817. Demobilization, rapid industrialization, and agricultural recession made the post-war years miserable. In November 1816 the \*Spa Fields riots culminated in an attack upon the Tower and were followed by the suspension of habeas corpus. The march of the \*Blanketeers from Manchester followed in March 1817. The east midlands had its own problems of unemployment among textile workers. In the summer of 1817, \*Oliver, the government spy, reported the likelihood of risings. On 8 June several hundred men assembled at Pentrich and Ripley and began the 14-mile march to Nottingham, where, their leader Jeremiah Brandreth assured them, they would find mass support. They found none and in heavy rain were easily dispersed by the hussars. Brandreth, who had killed a man on the march, was executed with two others, and 30 rioters were transported. The subsequent revelation of the role of Oliver as *provocateur* embarrassed the government. JAC

**Pepys, Samuel** (1633–1703). Diarist, naval official, bibliophile, musician, member of Parliament, president of the Royal Society, twice master of Trinity House, Pepys lived through an epoch of increasing sophistication in govern-

ment, when capacity and drive could help a man rise high, especially if assisted by patronage. Pepys's patron was his cousin Edward Montagu, a naval commander under the republic who promoted Charles II's restoration and became earl of \*Sandwich. Pepys was appointed clerk of the acts (secretary) to the Navy Board in 1660 when that body effectively ran the navy under James, duke of York. The young secretary's assiduity rapidly won him esteem, and some dislike. But, weathering the disasters of the second Dutch War, Pepys was appointed the first secretary of the Admiralty in 1673. Though out of office 1679–84, a victim of the \*'Exclusion' agitation, his return saw Pepys become the crown's minister for the navy until the Glorious Revolution. Then he was forced from office as too closely associated with James II.

For all his contributions to the navy's well-being, however, Pepys has become much the best-known Englishman of the 17th cent. through his diary, or 'Journal', kept in shorthand and complete secrecy between January 1660 and May 1669, and first transcribed in 1822. Sometimes priggish, it is guileless in self-revelation. 'Traits of actual speech fleck its pattern' and mark the author as a journalist of genius, in his own words 'ever with child to see any strange thing'. Pepys's scholarly discrimination is plain from his library, scrupulously preserved in Magdalene College, Cambridge.

DDA

**Perceval, Spencer** (1762–1812). Prime minister. Perceval was the seventh son of John, earl of Egmont. At Trinity College, Cambridge, he associated with the evangelical group led by Isaac Milner, being studious and earnest, modest and timid. Having to make his own way in the world, he trained for the bar and practised on the midland circuit. His appointment as a commissioner of bankrupts in 1790 enabled him to marry Jane, daughter of Sir Thomas Wilson, MP for Sussex, but they had to live in lodgings over a carpet shop in Bedford Row until he increased his income. He came to notice as a junior counsel for the crown in the trials of the radicals Tom \*Paine and Horne \*Tooke but he declined \*Pitt's offer of the chief secretaryship in Ireland in 1795 because the salary would not support his increasing family. His connections from the midland bar helped to secure him election as MP for Northampton, where he was deputy recorder, in 1796.

Perceval was a conscientious and popular member, giving handsomely to local charities. \*Wilberforce thought him the most generous of evangelical Christians: he gave away all that he could spare, disapproved strongly of gambling and hunting (though he was a steward of Northamptonshire races), and would have made adultery a criminal offence. He refused to transact business on Sundays, held regular family prayers, and was a student of biblical prophecy. A thoroughly orthodox Anglican, he was accused of religious bigotry, but he objected not to the practice of religion by catholics and nonconformists, but to their being allowed political power. He considered the primacy of the Church of England as essential to the security of the state and he was a most determined opponent of \*catholic emancipation. Nevertheless, he was conscious of the existence of abuses

in the Anglican church and supported efforts to end pluralities and non-residence of the clergy and to increase low clerical incomes. He supported missionary work, especially in India, popular education through the Anglican \*National Schools Society, and the abolition of slavery and the slave trade.

Perceval's forensic skills made him an effective parliamentary speaker and he became solicitor-general under \*Addington in 1801 and attorney-general in 1802. He agreed to stay on under \*Pitt in 1804 only on condition that there should be no concessions to the catholics. On Pitt's death in 1806 he was seen as one of the contenders for leadership of the Tories, together with \*Castlereagh, \*Canning, and Hawkesbury (\*Liverpool) and he helped to bring about the defeat of the Whigs in the general election of 1807 by campaigning against the catholics. In \*Portland's ministry of 1807–9 he became chancellor of the Exchequer and was given the chancellorship of the duchy of Lancaster as well, to augment his income. He reluctantly accepted the leadership of the House of Commons as a compromise candidate and, after the duel between Castlereagh and Canning brought about Portland's resignation, he was appointed prime minister in October 1809, with the king's enthusiastic approval.

Perceval was by no means an ineffective prime minister. He survived the crises of the inquiry into the \*Walcheren expedition and the \*Burdett riots in London in 1810 and doggedly supported the expedition to the Peninsula which, against all expectation, was to play a major part in the eventual defeat of Napoleon. He modelled his financial policies on Pitt's and at least kept the war effort going. On George III's final relapse into insanity in 1810 he was confirmed in office by the prince regent, but his career was brought to a sudden and tragic end on 11 May 1812 when he was assassinated in the lobby of the House of Commons by an aggrieved and deranged Russia merchant named John Bellingham, who mistook him for Castlereagh.

Perceval was small in stature—he was nicknamed 'Little P.'—pale in complexion, and usually dressed in black. Lord \*Holland likened him to Robespierre in appearance. He was a staunch conservative, a devout evangelical Christian, and a tireless campaigner against inhumanity. His spotless private life and his integrity in public life were in total contrast to the lives of most politicians of his age.

EAS

Gray, D., *Spencer Perceval* (Manchester, 1963).

**Percy, Henry** (1364–1403), known as 'Hotspur'. Eldest son of the earl of \*Northumberland, Percy was first appointed sole warden of the east march in 1385; Scottish borderers were soon calling him 'Haatspore'. On an evening in early August 1388, he was captured at \*Otterburn while pursuing a Scottish army, a battle immortalized in verse as 'Chevy Chase'. Soon ransomed, he was warden of the west march for five years from 1390, and from 1396 succeeded his father in the eastern wardenship, continuing there after Henry IV's usurpation, which he had assisted. Father and son defeated a Scottish invasion at \*Homildon Hill in 1402; the king's order against the ransom of their prisoners was one reason for their rebellion. Its objective may have been

## Percy

the coronation of Edmund \*Mortimer, the nephew of Hotspur's wife. Percy was making for Wales to join Owain \*Glyndŵr when the king intercepted him near \*Shrewsbury; he was killed in the battle. RLS

**Percy, Henry, 1st Baron Percy** (1273–1314). Percy's father Sir Henry, who died seven months before his son was born, fought for Henry III at \*Lewes and married the daughter of John de \*Warene, earl of Surrey, by the king's half-sister. Young Percy accompanied his grandfather on the \*Dunbar campaign in 1296, was knighted, and subsequently summoned to Parliament as a baron. Most of the rest of his life was devoted to warfare against the Scots. In 1310 he joined the \*Ordainers in their opposition to Edward II and was present at the capture of \*Gaveston, though not party to his murder. He was summoned for the campaign which ended at \*Bannockburn, but it is not certain that he attended, and he was dead four months later. He is said to have excelled at knightly arts, purchased the estate of Alnwick, and laid the foundations of the great border family. His son Henry fought with success at \*Neville's Cross in 1346 when David II of Scotland was captured. JAC

**Percy, Thomas** (1729–1812). Percy was the son of a grocer from Bridgnorth in Shropshire and educated at Christ Church, Oxford. He took orders, from 1757 to 1782 held the living at Easton Maudit in Northamptonshire, and for the rest of his life was bishop of Dromore in Co. Down. A scholar and antiquarian, he began early in life collecting ancient ballads, having rescued from a friend in Shifnal an old manuscript folio of verse which the maids were using to light the fire. Negotiations with printers were difficult, but he received encouragement from Shepstone and from Samuel \*Johnson, who wrote the dedication. *The Reliques of Ancient English Poetry* came out in 1765 and was a leap forward in the preservation and understanding of medieval \*ballads. Johnson's ridicule and well-known parodies were directed, not at Percy's ballads, but at contemporary imitations. Percy's scholarly interests were increasingly hampered by his episcopal duties and by failing eyesight. JAC

**periodicals**, popularly known as magazines, is the branch of the press industry which publishes on a regular, or periodic, basis, usually every week or month. In terms of numbers, the trade or technical press dominates Britain's periodical publishing, but in terms of mass readership, it is the consumer magazine which is of most interest.

Even more than newspapers, periodicals are aimed at a very specific market, gathering together articles of interest to a particular gender, age, class, region, or special interest group. Where a more general periodical has been a success, it has often been due to the novel and authoritative slant it has put on current affairs to supplement newspaper coverage, such as the *Illustrated London News* or \**Punch* in the 19th cent., or *Picture Post* in the 20th cent.

The most prominent specialist groups served by periodicals in British history have been adherents of various political positions; the 'cultured' social classes; women; and children. The longest tradition has been political commentary, with the growth of 'courants', 'diurnalls', and 'mer-

curies' in the early 17th cent. conveying the latest news and comment. After being suppressed at the \*Restoration, they flourished in the early 18th cent. with writers like \*Defoe (*Review*), \*Steele and \*Addison (*Tatler* and *Spectator*), and \*Swift (*Examiner*). The 18th-cent. 'taxes on knowledge', which attempted to restrict the press, helped create a literature of dissent, which particularly flourished in the early 19th-cent. radical press (*Poor Man's Guardian*, \**Political Register*, *Black Dwarf*, *Northern Star*, and *Reynold's News*). While most political comment became confined to the daily and Sunday press in the 19th and 20th cents., the occasional political magazine has flourished, such as the *Spectator* (1828), *The Economist* (1843), and the *New Statesman* (1913), or satirical scandal sheets such as *John Bull* and *Private Eye*.

General cultural periodicals, appealing to the top ranks of society, first appeared in the late 17th cent. in titles such as the *Gentleman's Journal* and the *Athenian Gazette*, continuing in the 18th cent. with the \**Gentleman's Magazine*, the *Scots Magazine*, and in the 19th cent. with the \**Edinburgh Review*, the \**Quarterly Review*, and *Blackwood's*. Lower middle-class equivalents appeared with the printing revolution of the 19th cent., such as *Tit Bits*, the *Strand Magazine*, and *Pearson's Weekly*.

Magazines for women have appeared in unbroken tradition from the late 17th cent., with the *Ladies' Mercury* (1693). Titles of the 18th and 19th cents. such as the *Ladies' Magazine*, the *Englishwoman's Domestic Magazine*, and the *Lady* appealed to the leisured classes, and constructed the identity of domesticity that has come to be associated with women's magazines. Only the rare periodical, such as *The Female Friend* (1846), raised any issues of women's rights, a task similarly undertaken in the 1970s by the feminist *Spare Rib* challenge to the dominance of *Woman*, *Woman's Own*, and *Woman's Realm* with their domestic ideology.

Magazines for children—with an ideology of improvement, as opposed to comic amusement—have a tradition stretching from the late 18th-cent. *Juvenile Magazine* (1788) to the classic Victorian *Boy's Own Paper* (1879) and *Girl's Own Paper* (1880). Unlike women's magazines, this market tended to decline in the 20th cent., with comics becoming the dominant periodical fare of children. See also COMICS; NEWSPAPERS. DJA

**Perkin, William Henry** (1860–1929). Chemist. Perkin's father was a distinguished chemist, who discovered a new dyeing process producing mauve from coal-tar, and maintained his own private laboratory. After studying in Germany, Perkin was appointed in 1887 to the chair of chemistry at Heriot-Watt College, Edinburgh. In 1892 he moved to Owen's College, Manchester, holding the chair of organic chemistry. Next he moved to the Waynflete chair at Oxford in 1912, where a new laboratory was opened in South Parks. His renown was as a practical experimental chemist and as a remarkable research supervisor. JAC

**Perpendicular architecture** was the last, great, culminating phase of \*Gothic architecture in England, so called because of the vertical lines of its window tracery and the similar effect of panelling, executed in stone, covering wall surfaces. Complex and decorative, it also makes use of the

'four-centred' arch, allowing extended, sometimes enormous, window apertures. Ever more intricate 'stellar', 'fan', and ultimately 'pendant' vaulting systems are also typical. So distinctively English was this style, and of such longevity (c.1350–1550), that the term 'Perpendicular' fails to convey its true importance; as John Harvey suggested it was, in effect, the national style of English Gothic and as such a major contribution to European art.

No complete English cathedral dates from the Perpendicular period, but many 14th- and 15th-cent. parish churches, especially in wool-rich East Anglia, exemplify the richness of this architecture; so too do the royal chapels of St George, Windsor (1475–1528), and of Henry VII, Westminster abbey (begun 1503), and, on a smaller scale, the numerous late Gothic chantries and tombs often inserted into earlier ecclesiastical buildings. The Divinity School, Oxford (1424–83), with its remarkable pendant-vaulted roof, is another excellent example. Quintessentially Perpendicular is \*King's College chapel, Cambridge (1447–1515), where the new, more open concept of space and light is seen to advantage in a building almost like an elaborate cage of glass and stone. This had later parallels in the development of domestic architecture during the Tudor period, as at \*Hardwick Hall, Derbyshire ('more glass than wall').

The Perpendicular style seems to have originated in the remodelling of the choir and east end of Gloucester cathedral (carried out c.1337–67) by the king's master mason, William Ramsey (d. 1349). Here the aisles are disguised and thus the spatial concept is remarkably unified, accentuated by panelling, tracery, vaulting, and, above all, the light pouring in through the gigantic east window itself. Ramsey reminds us of the increased importance and status of named architects (or designer-masons) at this time, a process initiated during the earlier periods of Gothic architecture. There was, for example, John Wastell, responsible for the completion of King's College Chapel, Cambridge, the central tower of Canterbury cathedral (1493–7), and probably for the retrochoir at Peterborough cathedral (c.1496–1508), and, above all, the prolific royal masons William Wynford (c.1320–1405) and Henry \*Yevele (c.1320–1400). Wynford re-designed the nave of Winchester cathedral (from 1394) and the influential Yevele, who was the king's master mason from 1360 until his death, was responsible for the nave and south transept of Canterbury cathedral (begun 1379). One of the last great works of Perpendicular Gothic was \*Bath abbey (1501–39), designed by Robert and William Vertue.

TEF

**'perpetual peace', treaty of**, 1502. James IV of Scotland gave considerable assistance to Perkin \*Warbeck, the Yorkist pretender against Henry VII in the 1490s. But in a change of policy after Warbeck's death he negotiated in 1502 a treaty of perpetual peace with England, guaranteed by the papacy and sealed in 1503 by James's marriage to Henry's eldest daughter \*Margaret—\*Dunbar's 'Marriage of the Thistle and the Rose'. The treaty itself lasted no longer than most perpetual treaties. By 1513 the two countries were at war and James was slain at \*Flodden. But the longer consequences were remarkable. A series of unforeseeable contingencies

brought the great-grandson of the marriage to the throne of England in 1603 as James VI and I.

JAC

**Perrot, Sir John** (c.1527–92). Lord deputy of Ireland. Perrot was one of many who came to grief in the bogs of Tudor Irish politics. A Pembrokeshire man, he established his reputation as a jousting knight and was knighted at Edward VI's coronation. As a protestant he was in some difficulty during Mary's reign but Elizabeth chose him to help carry the canopy of state at her coronation. From 1570 to 1573 he was governor of Munster, spending most of his time dealing with James \*Fitzgerald. After some years mainly employed as vice-admiral of the Welsh seas, he was sent back to Ireland in 1584 as lord deputy. His first action was to subdue the Macdonnells in Ulster. But he found the Dublin Parliament difficult to deal with, quarrelled violently with colleagues, and was recalled in 1588. In 1591 he was sent to the Tower on a charge of treason, accused of speaking against Elizabeth and plotting with Philip of Spain. He died while under sentence of death.

JAC

**Pershore abbey** (Worcs.). A religious community established here in the late 7th cent. became a \*Benedictine house in the reign of \*Edgar (957–75) through the influence of Bishop \*Oswald of Worcester. Many of its endowments were later granted to Westminster abbey by \*Edward the Confessor, patronage which caused considerable friction between the two abbeys in the 13th cent. Two disastrous fires, in 1233 and 1288, combined with reduced agricultural revenues, brought considerable indebtedness, from which Pershore never recovered, and by the time of its dissolution in 1539, though it had an assessed income of nearly £650, the abbey was experiencing major economic and disciplinary problems.

BJG

**Persian War**, 1856. The Crimean War ended in March 1856 but a new war with Persia followed in November after the shah had seized Herat, a disputed city in the north-west of Afghanistan. Sir James Outram led a punitive expedition of 6,000 in January 1857. Peace was signed on 4 March whereby the shah withdrew from Herat and promised not to intervene in Afghanistan.

JAC

**Perth, James Drummond, 4th earl of** [S] (1648–1716). Perth, who inherited the title when he was 27, became James VII and II's chief adviser in Scotland. In 1682–4 he was justice-general [S] and from 1684 until 1688 chancellor [S]. He began as a presbyterian, moved to the Church of England, and as soon as James succeeded declared himself a catholic. His brother Lord Melfort was secretary of state [S] and governor of Edinburgh castle. Both men were given the Thistle in 1687. At the revolution, Perth tried to escape by boat, but was brought back to Kirkcaldy and imprisoned until 1693 at Stirling. He was then sent into exile. James created him duke of Perth in 1690 and he spent the rest of his life at Saint-Germain. His brother was made duke of Melfort in 1692. Perth's son, the 2nd Jacobite duke, fought at \*Sheriffmuir in 1715 and his grandson, the 3rd duke, at \*Culloden in 1746.

JAC

## Perth

**Perth, treaty of, 1266.** The failure of Haakon IV's great expedition at \*Largs in October 1263 led to a vigorous Scottish counter-attack, which subdued the Inner Hebrides. On 2 July 1266 Magnus IV of Norway, Haakon's successor, signed the treaty of Perth with Alexander III of Scotland. In return for four payments of 4,000 marks and a tribute of 100 marks in perpetuity, the Norwegians surrendered sovereignty over all the Western Islands and the \*Isle of Man. They retained possession of \*Orkney and Shetland. The Isle of Man had to be subdued and at length fell under English rule, but the Western Islands remained Scottish. JAC

**Peterborough, Charles Mordaunt, 3rd earl of (1658–1735).** Politician, soldier, and diplomatist. Known until 1697 by his earlier title of earl of Monmouth, Peterborough's cleverness ran to dishonesty and to any ministry was a liability and a worry. An opponent of James II, he mixed with Whig radicals and was an early associate of William of Orange. In 1689 he was given the senior Treasury post of 1st commissioner, for which he was totally unsuited, and resigned a year later. He remained an assertive influence at William III's court, however, quarrelling and plotting against those whom he believed were thwarting his own ambitions. In 1696, when he accused \*Shrewsbury and \*Marlborough of involvement in the Fenwick conspiracy, he was sent to the Tower. In their propaganda the Tories claimed him as their hero after the expeditionary force he commanded captured Barcelona and overran Valencia in 1705, but his unreliability cost him any further advancement, and he was fortunate to escape parliamentary censure. AAH

**Peterborough, diocese of.** The see, now comprising Northamptonshire and parts of Cambridgeshire and Leicestershire, was founded by Henry VIII in 1541 out of the \*Lincoln diocese. In the 7th cent. \*Penda's son \*Peada founded a monastery here which was rebuilt and dedicated to St Peter in 970, hence the town's name. In 1837 Leicestershire was transferred to the see from Lincoln. Distinguished bishops include the historian Mandell Creighton (1891–7), author of *The History of the Papacy*. The cathedral was built between 1118 and 1237 as the Benedictine abbey church. It has a dignified Norman nave, a 13th-cent. west front, and 15th-cent. fan-vaulted retrochoir. \*Catherine of Aragon was buried there. WMM

**Peterloo.** The massacre, derisively dubbed 'Peterloo', took place in St Peter's Fields (Manchester) on 16 August 1819. A radical reform meeting of 60,000–100,000 people was violently broken up by the local yeomanry who were ordered by the magistrates to arrest the speaker, Henry \*Hunt. Eleven people were killed and over 400 wounded. The government promptly congratulated the magistrates and rushed through the \*Six Acts. There was an immediate national outcry from liberals and reformers of every shade, angrily portrayed in \*Shelley's *The Masque of Anarchy* and *England in 1819*. To middle-class reformers and Whigs, Peterloo was a warning of the aspirations of the unenfranchised. To working-class reformers Peterloo became a symbol. It was condemned at mass meetings throughout the country and was commemorated for many years after-

wards. 'Remember the Bloody Deeds of Peterloo' proclaimed chartist banners 20 years later. JFCH

**Peter's Pence** or Rome-scot began in Saxon times as an annual tribute of 1 penny from each household to the papacy. After the Conquest, it became a total payment of about £200 p.a., collected by the bishops. Attempts to increase it were strongly resisted. Though the amount of revenue involved was insignificant, the claim of tribute was of symbolic importance. Monarchs could put pressure on the papacy by withholding payment and by Henry VIII's statute of 1533 (25 Hen. VIII c. 21) it was abolished altogether. JAC

**Petillius Cerialis** was governor of Britain 71–73/4. Probably originating from Umbria, Cerialis is first attested in Britain as legate of *legio IX Hispana* during the \*Boudiccan revolt. Attempting to stem the rising after the sack of Colchester he was defeated, and spent the rest of the revolt besieged. Subsequently he probably married the daughter of the future emperor \*Vespasian. When Vespasian came to power in 70 Cerialis was appointed joint commander of the large force to suppress the revolt of Civilis in the lower Rhineland. From there he was posted to Britain. His governorship saw the resumption of military expansion following the deposition of \*Cartimandua of the \*Brigantes. The areas of modern Lancashire and Yorkshire were annexed and forces may have penetrated further north. Cerialis probably held the consulship before governing Britain, and again in 74 and possibly also in 83. ASEC

**petition of right, 1628.** Charles I's levy of a \*forced loan in 1626–7 and his imprisonment of non-contributors led the Commons in 1628 to frame a petition outlawing non-parliamentary taxes and arbitrary imprisonment. Charles, concerned to preserve his prerogative, gave an ambiguous reply, to which the Commons responded by withholding their offer of a much-needed money grant. The king, with ill grace, therefore authorized a second, conventional, reply which turned the petition into law. When it was printed, Charles included only his first response, thereby arousing fears that he would renege on his promises, but in the event he scrupulously adhered to the letter of the petition. RL

**Petroc, St (6th cent.).** Particularly associated with Cornwall, Petroc allegedly renounced royal responsibilities in Wales for a religious life. With his followers, he went to Cornwall where he founded monasteries at Padstow and Little Petherick. Later accounts of his life include stories of travels and numerous miracles, portraying him as a typical Celtic saint, alternating between community life and solitude. He died at Treravel and was buried at Padstow, the original centre of his cult, later replaced by Bodmin, where his shrine and relics were taken. Renowned in Cornwall, his cult became widespread in Devon and Wales and in Brittany, where his stolen relics were taken in the late 12th cent. Henry II intervened for their return to England and \*Walter of Coutances provided a fine ivory head reliquary, which was hidden during the Reformation and

rediscovered over the porch of Bodmin parish church in the 18th cent. AM

**petroleum industry.** The industry came to maturity in the 20th cent. but it has a longer history. One of the curiosities of the \*Ironbridge Gorge was a spring of natural bitumen discovered in 1786. In 1847 a petroleum seepage was discovered in a Derbyshire coal-mine; this yielded 300 gallons per day and required refining. James 'Paraffin' Young (1811–83), a technical chemist, developed the technology. He wrongly imagined that the petroleum had been condensed from the coal and began to distil oil-bearing coals and shales. The best was Torbanite, found near Bathgate (Scotland); Young patented his process in 1850 and founded the Scottish shale-oil industry. His technology was transferred to the petroleum industry.

In 1890 petroleum was discovered in Sumatra, and the Royal Dutch Company was formed. Marcus Samuel, an overseas merchant, began shipping Russian kerosene in 1892; he formed the Tank Syndicate the following year, the ancestor of Shell Transport and Trading Company (1897). By 1914 America controlled 65 per cent of the world's output.

In 1900 William Knox D'Arcy, a successful English speculator in Australian gold-mining, accepted an oil concession in Persia and formed the Anglo-Persian Oil Company. This was the origin of British Petroleum. In 1903 Admiral 'Jackie' \*Fisher decided that, as an experiment, fuel oil should be tried in two battleships, and this proved to be economic without impairing performance. In 1905 Burmah Oil Company contracted to supply fuel for the navy, but the naval race with Germany encouraged Winston \*Churchill and Fisher to secure strategic supplies of petroleum. Burmah and the government became the leading shareholders in Anglo-Persian, and in 1914 the navy's requirement for 277,000 tons of fuel oil was met.

Despite disarmament, the inter-war years witnessed an expansion of markets: the first mass-produced British cars and the development of aviation increased the demand for petrol. Major refineries were built in Britain at Llandarcy and Grangemouth as the potential of the petrochemical industry was recognized. Oil became the fuel of the world's merchant marine and important in electricity generation and domestic heating.

These developments became more significant after 1945. Petroleum was the fastest-growing component in the energy sector until 1973. For strategic reasons and to save imports the government favoured home-based refining. Capacity was increased, and new plant was built at Stanlow (1947) and Fawley (1951); in 1953 29 million tons were refined, and in 1980 133 million tons. Some refineries were very large by 1980: all but 3 per cent of output was refined in plants with a capacity of over 1 million tons, and three, Fawley (Esso), Kent (BP), and Shell Haven (Shell), were at 10 million tons or more.

In the 1970s the petroleum industry was affected by two major shocks. The first was increased prices engineered by OPEC, a cartel of the leading exporting countries, and this was followed by the Arab–Israeli War (1973). Prices, which had remained stable between 1950 and 1972 at £7/8

per ton despite inflation, increased more than fourfold by 1974 and thereafter to over £60 by 1979. Oil consumption fell, and the search for alternative oilfields grew apace. Viable oilfields were discovered in the North Sea off Scotland in 1971 and by November 1975 the Forties field was on stream. North Sea production, largely pioneered by American investment and technology, in 1981 exceeded home demand. Capital formation between 1976 and 1979 averaged over £2 billion. This expansion brought new jobs, new government revenue, compensated for the decline in manufacturing in the 1980s, and assisted the balance of payments. JB

**pets.** The keeping of animals and birds for companionship is probably as old as human society, and there is medieval evidence for cherished lap-dogs and hunting-dogs which were kept for more than utilitarian motives. The cats and toads which were adduced as witches' familiars provide evidence from lower down the social scale. Pet-keeping as an activity with wider economic and social significance emerges as part of the rise of 'consumer society' in post-Restoration England, with the development of selective breeding to emphasize approved characteristics (for dogs as well as cattle and sheep) and the introduction of new species which could display the purchasing power and discernment of the owner (as with the rapid diffusion of goldfish). A full-scale pet industry emerged in Victorian Britain, as the élite trends of earlier years found echoes in a growing middle-class public, and the competitive display of newly defined breeds found formal expression in the proliferation of shows and clubs of fanciers. Working-class pet-keeping was decried by those who complained of uncontrolled mongrels roaming the streets and regarded expenditure on pets as a feckless waste of scarce resources, but the demand for commercially produced pet foods, clothing, and other accoutrements which built up firms like Spratts, whose advertisements helped to sustain the specialist press, came from higher up the scale. Commercial, practical, and recreational motives were often combined with affective ones, as book titles like *Cats for Pleasure and Profit* (1908) confirmed, and the romantic anthropomorphism which was exhibited (for example) in some of Wordsworth's poetry in the early 19th cent. was widely diffused a century later. By the Edwardian years the full range of attitudes to pets which still endured at the end of the 20th cent. could already be identified, and the pet supply and servicing industries had become big business.

JKW

**Petty, Sir William** (1623–87). Born in Romsey (Hants), his education took him to the Jesuit College, Caen, and later to Leiden, Utrecht, Amsterdam, Oxford, and London, where his studies focused upon medicine. With doctorates in both physics and medicine, he became professor of medicine, then anatomy, at Oxford University (1648), taking a chair in music in 1651 at Gresham College, London, and at the same time acting as medical officer to the English army in Ireland. In this latter connection he undertook a topographical survey of land in Ireland later assigned to Cromwell's soldiers (as well as to himself). Hence his work covered many subject areas. His best-known and most influential publications were *Political Arithmetic* (1678) and *Treatise of*

## petty sessions

*Taxes and Contributions* (1662), two texts in economics. They both placed emphasis upon the use of economic statistics in determining economic policy. Two years before his death he became adviser to James II. JRP

**petty sessions.** These were the regular courts held by the \*justices of the peace to try minor criminal offences summarily—i.e. without a jury. The office of \*justice of the peace dates back to the conservators of the peace, appointed by Richard I, but the most important legislation instituting the office was passed in the 14th cent., notably the Justices of the Peace Act, 1361. The first courts held by the justices were the \*quarter sessions, but by statute and practice justices were also empowered to hear cases 'on examination' or summarily. These petty sessions (from French *petit* or lesser) were first so called in the first half of the 19th cent. They dealt with most criminal offences and, as the magistrates' courts, they continue to do so. MM

**Petworth House** in Sussex is on the edge of the small market town, though it manages to create its own serene world. The property belonged originally to the Percy family, from whom it passed to the Wyndhams, earls of Egremont, via the 6th duke of \*Somerset. Somerset rebuilt the house in the 1690s, the architect remaining unknown. The long west front gives directly onto the park, landscaped by Capability \*Brown, with the south downs in the distant background. The 3rd earl of Egremont gave hospitality to \*Turner, many of whose paintings are preserved at Petworth, along with others by \*Reynolds, \*Gainsborough, \*Wilson, \*Zoffany, and Opie. JAC

**Pevensey, battle of**, 491. The *Anglo-Saxon Chronicle*, in remarkable and suspicious detail, records a Saxon attack in 491 led by \*Ælle and his son Cissa on Britons entrenched in the old Roman fort of Anderida or Andredes-cester, near Pevensey. The place was stormed and 'there was not even one Briton left there'. It sounds a very plausible episode in the establishment of the kingdom of \*Sussex. Cissa gave his name to the chief town of the region, Chichester. JAC

**Pevsner, Sir Nikolaus Bernhard Leon** (1902–83). A German-born art historian, Pevsner came to Britain in 1934 as a refugee from Nazism. He lectured and wrote widely on art and architecture, was a founder member of the William Morris and Victorian societies, and Slade professor of fine art at Oxford and Cambridge, as well as professor of the history of art at Birkbeck College, London. Of his many publications, including the *Pelican History of Art* (begun 1953), the best known is *The Buildings of England*, which he began in 1949 and worked on for 21 years. Through these county guides he aimed to record every notable architectural object from the distant past to the present day to provide books of interest to travellers and to tell the story of England through her buildings. He achieved the status of 'Look in Pevsner', was made CBE in 1953, and knighted in 1969. JC

**Philip II of Spain** (1527–98), consort of Mary Tudor. Philip's marriage to Mary in July 1554 was part of Spain's long struggle against the French. Son of the Emperor Charles V, he

was regent of Spain between 1542 and 1548 and king from 1556 until his death. Although he was not crowned, Philip took the style of king of England. Mary was overjoyed with her young husband and bitterly disappointed when the marriage produced no heir. From Philip's point of view the marriage served its purpose by drawing England into the conflict with France, the effects of which were summed up by Armigail Waad in 1558—it had 'consumed our captains, men, money, victuals' and lost \*Calais, England's last continental possession.

After Mary's death in 1558, Philip offered himself as a husband to Elizabeth. Though she refused, England needed Spain as a counterbalance to France. But by 1565 many councillors were convinced that Philip intended to overthrow Elizabeth, place Mary Stuart on the throne, and restore catholicism. There was a sharp anti-Spanish turn in policy in 1569 which set the pattern for the rest of Elizabeth's reign. Philip was involved in plots against her—\*Ridolfi and \*Babington—and formal invasion plans—the great Armada in 1588, and further scares in 1595, 1596, and 1597. Elizabeth, for her part, sent an army into the Spanish Netherlands in 1585 and offered to support Philip's Morisco subjects against the Spanish government in the late 1580s. SA

**Philippaugh, battle of**, 1645. \*Montrose's brilliant Scottish campaign, which had begun in August 1644 when he met up with a small force from Ireland, received its first check at Philippaugh, near Selkirk, when he left the Highlands and came down towards the borders. Severely weakened by desertions, his troops were surprised on 13 September 1645 and outnumbered by \*Leslie. Though most of the cavalry escaped, the survivors of the Irish infantry surrendered, only to be massacred in cold blood. JAC

**Philippa of Hainault** (c.1314–69), queen of Edward III. Edward married Philippa in 1328. Her main achievement was to provide him with at least twelve children, of whom nine survived infancy. Chroniclers praised her, and she was probably an important influence on the king, though her personality is difficult to recapture. She spent more time in the company of her husband than did most queens, even on occasion accompanying him in France. She is probably best known for her intervention in 1347, when she is said to have pleaded with Edward not to execute the six 'Burghers of Calais' when they surrendered the keys of the town to him. In 1352 there were complaints about disorder on her estates, and the role of her officials. She could be extravagant, and this may explain the amalgamation of her household with that of the king in her final years. MCP

**philosophical radicals** is a loose term for the group of reformers in the early 19th cent. who based their approach to government and society largely on the \*utilitarian theories of Jeremy \*Bentham, though they were also influenced by \*Malthus, \*Ricardo, and Hartley. The leading proponents were James and John Stuart \*Mill, George \*Grote, and John \*Roebuck, supported by the *Morning Chronicle*, *Westminster Review*, and *London Review*. Their immediate objectives were an extension of the franchise, frequent

parliaments, secret ballot, law reform, and the dismantling of the system of aristocratic government. Their efforts to construct a radical party in Parliament after 1832 did not succeed: 'they did very little to promote any opinions,' wrote J. S. Mill, 'they had little enterprise, little activity.' But the general influence of utilitarian ideas permeated politics and, particularly in the period 1820 to 1850, produced an 'age of reform'. The term 'philosophical radicals' was popularized by J. S. Mill in his *Autobiography* (1873) and introduced into history by the French historian Halévy in *The Growth of Philosophical Radicalism* (1904; trans. 1928).

JAC

**Phoenix Park murders.** Late in the afternoon of 6 May 1882 Lord Frederick \*Cavendish, newly appointed chief secretary for Ireland, and Thomas Burke, his under-secretary, were walking in Phoenix Park (Dublin) when four men leapt from a cab and stabbed them to death. Soon afterwards newspaper offices in Dublin received black-edged cards, claiming the outrage for a nationalist group called the 'Irish \*Invincibles'. They were never caught. The immediate political effect was a new bout of 'coercion' in Ireland, against Prime Minister \*Gladstone's more conciliatory instincts. In 1888 *The Times* claimed it had proof that \*Parnell had been implicated; but it turned out to have been fooled—not for the last time—by a forgery.

BJP

**photography.** In an age of film, television, and holiday snapshots, it is hard to remember that until comparatively recently people had little idea what their rulers or celebrities looked like, nor much impression of foreign parts, save for the odd painting or engraving. Some rulers turned this to advantage. The Tudors gave much thought to the public image their portraits presented and Elizabeth ordered the destruction of unflattering reproductions. Occasionally the situation produced embarrassment. Rushing to meet his new bride, \*Anne of Cleves, Henry VIII complained that she was not at all like \*Holbein's portrait and that he would not go through with the marriage were it not for offending her brother.

The origins of modern photography are to be found in the camera obscura (darkened room), described in the 16th cent., in which a shaft of light produced an inverted image. This could be improved if a lens was used and the inversion corrected by a mirror. The problem was to capture and reproduce the image. The German physicist Schulze demonstrated in 1727 that a mixture of chalk, nitric acid, and silver could retain an image. Thomas Wedgwood, son of the potter, experimented in the early 19th cent., but his pictures faded on exposure to light. In 1837 the French painter Daguerre produced a photograph of part of his studio and exhibited it in Paris in 1839. But since the exposure time was protracted, daguerreotype was unsuitable at first for portraits, nor could it be reproduced. Fox \*Talbot had already begun his own experiments at Lacock abbey in Wiltshire, using a negative, and on hearing of Daguerre's work arranged a public demonstration the same month at the \*Royal Institution in London. His technique was called calotype (beautiful image). By the 1850s photography was a commercial success. We have no photographs of \*Mel-

bourne or Sir Robert \*Peel but several of Prince \*Albert and \*Palmerston. Two early and celebrated portraits are of Isambard Kingdom \*Brunel, taken by Robert Howlett in 1857, and of Alice Liddell (the original 'Alice') by Charles Dodgson in 1859. Roger Fenton's photographs from the Crimea, reproduced in the *Illustrated London News*, gave readers their first impressions of the scenes of war, followed in America in the 1860s by pictures of the Civil War. The census of 1851 showed that already 51 persons gave their occupations as photographers: by 1901 there were more than 17,000. At the end of the 19th cent. newspapers regularly carried photographs and the Kodak No. 1 box camera, marketed from 1888 by George Eastman, catered for the amateur photographer. The development in the 1900s of the cinema and the spread of television just before and after the Second World War meant a breadth of visual experience never known to people before.

JAC

**Picquigny, treaty of,** 1475. Edward IV's great campaign in northern France in 1475 was something of a non-event. Greatly dissatisfied with the help he had received from his Burgundian allies, the king was very willing to make terms at Picquigny near Amiens, on 29 August. There was to be a seven-year truce; free commercial exchange; provision for arbitration of disputes; a marriage between the dauphin and \*Elizabeth of York; and a regular payment by Louis XI of France to Edward. In England the payments were seen as tribute, in France as a bribe or retainer. The *rapprochement* did not last long and the marriage never took place.

JAC

**Picton, Sir Thomas** (1758–1815). Soldier. Born in Pembrokeshire, he joined the army at 13, but was put on half-pay at the peace in 1783. In 1794 he volunteered for service in the West Indies and fought with distinction, being appointed governor of Trinidad, captured from the Spaniards, in 1797. Accusations of cruelty forced his resignation in 1803 and legal actions continued until 1810 when he was cleared on the grounds that Spanish law still operated. By that time he was in Portugal with \*Wellington and fought gallantly in the \*Peninsular campaign. In 1813 he was knighted and promoted lieutenant-general. As soon as Napoleon left Elba, Picton rejoined Wellington, was wounded at Quatre-Bras, but took his post at Waterloo two days later. He was killed by a bullet at the head of his men, roaring them on. There is a statue of Picton at Carmarthen and the top hat he wore at Waterloo is preserved at Sandhurst.

JAC

**Picts.** An indigenous tribe or group of tribes in Scotland during the Roman and post-Roman periods. They are first mentioned in AD 297 by Eumenius who calls them 'half-naked enemies' of the Britons. 'Picts' is probably a Latinized word meaning 'painted people'. Classical writers, among them Julius \*Caesar, refer to the British habit of body-painting with materials such as woad. The Picts, along with other Britons, may even have been tattooed.

It is difficult to determine whether they had a substantive ethnic identity or if 'Picti' was merely a convenient label given by classical writers to all tribal peoples in Scotland in the later Roman period. A Roman poet observes in AD 310 that the Emperor Constantius chose not to acquire the

## piepowder courts

woods and marshes of the 'Caledones and other Picti'. The \*Caledonians were certainly one major tribe north of the Forth–Clyde frontier, whereas it would seem that 'Picti' were a whole group of tribes, possibly a new federation.

An important historical attestation of the Picts is provided by Ammianus Marcellinus, who records attacks on Roman Britain by Picts, Scots, Irish, and Saxons culminating in the 'Picts' War' of AD 367–8. Count Theodosius was sent to recover the situation and he restored the province after a major campaign. St \*Patrick refers to the Picts of the 5th cent. as 'most shameful, wicked and apostate' after they bought some of his Christian converts from slave dealers. \*Gildas refers to 'marauding Picts', savages with more hair on their faces than clothes on their bodies, who came by sea from the north and raided post-Roman Britain. In the 8th cent. Bede believed that at the time of St \*Columba's mission the Picts were divided into northern and southern groups, the latter having been converted to Christianity by St \*Ninian. According to legend, the last king of the Picts was killed at the instigation of \*Kenneth MacAlpin c. AD 842.

Archaeologically, the Picts are possibly represented by a number of carved standing 'Pictish symbol stones' found throughout Scotland. These probably date from the 6th–10th cents. AD and are incised with a wide corpus of symbols inspired by Celtic, Anglo-Saxon, and Christian iconography. ES

**piepowder courts** were the courts attached to fairs and markets and were probably so called because of the dusty feet (*pieds poudrés*) of the travelling merchants. When the king gave a town or community the franchise to hold a fair or market, he also granted the right to hold a court to decide disputes between merchants at the fair and to deal with criminal offences occurring during the fair. The judges in these courts were merchants. Piepowder courts were popular with the mercantile community, being quick, effective, and not unduly hampered by procedural technicalities. However they gradually declined, especially after statutes limited their jurisdiction in the 15th cent., and by the end of the 16th cent. most had fallen into disuse. MM

**Piers Plowman.** Late 14th-cent. poem by William \*Langland. Over 50 manuscripts survive, representing progressive revisions known as the 'Z', 'A', 'B', and 'C' texts, of which 'B', comprising a prologue and twenty passus, is the most frequently read.

Cast in the familiar medieval form of a quest, the poem uses a series of dream-visions to trace the tortuous progress of 'Will' from intellectual wrangling to spiritual understanding as he searches for Truth and then for Do-Wel, Do-Bet, and Do-Best. The climax presents Christ's mortal 'joust' and triumph over hell with extraordinary power; yet the close brings another departure, as Conscience, frustrated by corruption within Christendom, sets out to walk the world in search of Piers Plowman. Piers, who has appeared as type of the virtuous poor, ideal Christian, and almost Christ himself, has by now fused into St Peter as archetypal pope. Throughout the poem, personified abstractions such as the comically

depraved Seven Deadly Sins interact, and overlap, with contemporary caricatures including the self-indulgent Master of Divinity and the besmirched pilgrim Haukyn the Active Man. Langland's passionate commitment to spiritual and social reform finds expression in his restless and emphatic alliterative lines, and in a complex battery of literary devices including allegory, recurrent metaphors, word-play, and Latin quotation. DCW

**pigeon-fancying.** Pigeon clubs are usually confined to small areas to ensure equality of weather conditions, but the birds may fly up to 500 miles. The pigeons, which used to be transported by rail, are now taken to the starting-point in specially constructed road vehicles. The performance of each pigeon is very carefully monitored and recorded, and breeding and feeding rigorously controlled. The speed of the birds varies with wind conditions but they average 40 m.p.h. and speeds up to 90 m.p.h. have been recorded. They are descended from the rock doves (*Columba livia*) and have been used since ancient times for carrying messages: Reuters, the international news agency, founded in 1850, relied at first on pigeons. The modern sport developed in the later 19th cent., as the railway network spread, particularly in Belgium and Britain. The Royal National Homing Union of Great Britain was founded in 1896 and the international body, the Fédération Colombole Internationale (FCI), in the 1950s. It is one of the most demanding of sports, for breeders and for pigeons. In bad weather a large proportion of the birds do not survive. JAC

**Pilgrimage of Grace, 1536–7.** The Pilgrimage was a widespread northern rising against Henry VIII's religious policies and the greatest challenge to his position during his reign. It seems to have been triggered by the \*dissolution of the smaller monasteries, began at Louth in Lincolnshire, spreading to Yorkshire and then to Cumberland and Westmorland. The rebels, who took the badge of the five wounds of Christ and called themselves pilgrims, were led by Robert \*Aske and for some weeks commanded overwhelming numbers. Henry's response was to temporize, to offer pardons, and to attempt to split gentry from commoners. By the spring of 1537 most of the rebels had dispersed and he was able to take a bloody revenge on the pilgrims. Aske was executed at York and Lord \*Darcy, who had surrendered Pontefract castle to the rebels, was beheaded on Tower Hill. The weakness of royal control which the rising had demonstrated led at once to the establishment of the \*Council of the North in October 1537 to reassert authority. JAC

**pilgrimages,** visits to shrines or holy places, were undertaken for a variety of reasons—from piety, as thanksgiving or penance, in hope of a cure, or as a form of holiday. The great and mighty could visit Rome, Jerusalem, or Compostella: \*Ine of Wessex went to Rome to die c.726; the real \*Macbeth visited Rome in 1050; Henry IV died before he could fulfil his intention to see Jerusalem. Other people visited the great national shrines—\*Becket's at Canterbury, \*Cuthbert's at Durham, or the Virgin Mary's at \*Walsingham. But there were many other shrines with regional or local fame—St \*Hugh at Lincoln, St \*Guthlac at

Crowland, St Joseph at Glastonbury, St \*Ninian at Whit-horn, St \*Chad at Lichfield, St \*David in west Wales. Rather unlikely candidates for veneration included Simon de \*Montfort, \*Thomas of Lancaster at Pontefract, and Edward II at Gloucester. The possession of sacred relics was of great spiritual and financial value to religious communities, and to their towns: Walsingham was said by Erasmus to have 'scarcely any means of support except for the tourist trade'. Monks promoted the cult of their own saints and could write disparagingly of others. The church encouraged the practice of pilgrimages through the imposition of penances and the granting of indulgences, and substitutes could even be sent. As early as the 5th cent., St Augustine of Hippo complained of dubious relics and Erasmus in 1526 launched a strong attack on the vulgarity and commercialism of pilgrimages. Though protestant reformers disapproved strongly of pilgrimages, the concept of life as a pilgrimage survived in \*Bunyan's *\*Pilgrim's Progress*. Among catholics, pilgrimages continue, particularly since 1858 to Lourdes and since 1879 to Knock, in Co. Mayo, Eire. JAC

**Pilgrim Fathers.** The leaders of the Plymouth settlement on Cape Cod, made under a Virginia Company grant in late 1620. Religious dissidents from Scrooby (Notts.) had exiled themselves to Leiden in Holland, but decided their Englishness could better be preserved in English America. After a terrible early mortality and with Indian help, the colonists, not all of whom were associated with the Leiden group, survived and increased. The first Thanksgiving was celebrated in November 1621. The Pilgrims' fortitude and their religious and communal values, rather than the chaotic individualism of early Virginia, have been traditionally commemorated by later generations. RCS

**Pilgrim's Progress.** Religious allegory by John \*Bunyan, published in two parts (1678, 1684). Widely regarded as a classic in puritan literature, it renders Bunyan's own spiritual progress (recounted in *Grace Abounding*) into a more objective universalized myth, embodied by the solitary pilgrim Christian's search for the Celestial City. Allegorical figures (Giant Despair, Hopeful), satirical portraits of hypocrites or backsliders (Mr Worldly-Wiseman), and realism enliven an episodic series of adventures, though each reflects a step in the puritan stages of conversion. Part II, centred around Christian's wife, is more concerned with problems in non-conformist communities than with the individual. ASH

**pillory.** Social corrective combining public humiliation and discomfort, occasionally death. The offender's hands and neck were immobilized within a hinged pair of planks attached to an upright post on a platform, erected in open spaces, usually for an hour on market-day. Generally a sentence for acts that aroused common resentment and hostility (e.g. dishonest commerce), it also forewarned potential victims by public identification. The spectators' mood could vary. \*Defoe found them kind (1703), but taunts and pelting with eggs, vegetables, and vermin were more common; if real anger prevailed, stones could prove fatal. The practice was abolished in 1837. ASH

**Pinkie Cleugh, battle of, 1547.** One of the first decisions taken by \*Somerset when he became protector for Edward VI in 1547 was to settle the long-running war against Scotland with a decisive blow. The Scots had rejected proposals for a marriage between the young king of England and the infant Mary, queen of Scots, and had formed an alliance with France. The Scottish army, under \*Huntly and \*Arran, had a numerical advantage on 10 September when the two sides met at Pinkie Cleugh, east of Edinburgh, near Musselburgh. The Scots had the better of the early exchanges, but superior cavalry and the help of some warships gave Somerset a crushing victory. He went on to occupy Edinburgh but was unable to sustain his position. JAC

**pipe rolls.** The great rolls of the \*Exchequer are preserved in the Public Record Office from the reign of Henry II to that of William IV. Their nickname is taken from their tubular appearance. Since they include the accounts of the sheriffs and deal with crown revenue and crown lands, they are a very valuable historical source. A society for the publication of pipe rolls was founded in 1883 and has published nearly 100 volumes. A useful survey of the system of the Exchequer is to be found in volume 1 of the society's new series (1925). JAC

**Pipton-on-Wye, treaty of, 1265.** An agreement between \*Llywelyn ap Gruffydd and Simon de \*Montfort, the baronial leader who had Henry III in custody. On 19 June Llywelyn capitalized on civil war in England to secure advantageous terms from the barons, consolidating his control of the central marches of Wales. In return for £20,000 over ten years, Simon recognized Llywelyn's title as prince of Wales and vassal of the king, and his suzerainty over the Welsh nobility; he also promised Llywelyn further lands and castles on the English border. Although Simon was soon dead at \*Evesham (4 August), Henry III concluded a similar peace with Llywelyn at \*Montgomery (25 September 1267), confirming his title and status of prince, and his right to the allegiance of Welsh nobles. Llywelyn's power was at its height. RAG

**piracy.** The oldest profession of the sea, piracy in British coastal waters by Saxon or north German seafarers may have become common by c. AD 400; with the Viking era, from c. AD 800, depredations by Norse adventurers became seasonal events. Essentially, however, piracy was pursued without the sanction of any higher authority unless, as was not infrequently the case, it had a measure of official connivance. This may partly explain why early sea laws in the west, which by implication place piracy 'without the law', do not seem to do so explicitly. In England, before the emergence of the Court of Admiralty in the 14th cent. the crown accorded substantial 'self-regulation' to the ports of the realm, but it did not do so lightly: in 1343 Edward III forthrightly condemned piracy in Dartmouth, for such abuse of foreign ships injured the royal preserve of relations with other states. An expanding sea-borne commerce, which in volume of shipping seems to have reached its first peak in England in about 1570, made piracy in waters which individual governments might pretend to control difficult if not

impossible to counter. The quintessence of this situation lay in the Caribbean archipelagos of Spain's transatlantic empire, where a theoretical dominion was frequently challenged, and sometimes (Britain's treaty with Spain of 1670 is a case in point) with the active concurrence of Madrid. If there was a European precedent for the Spanish monopolistic approach it was in the \*Hanseatic League, with its self-protective commercial overlordship of northern waters in the 14th and 15th cents. Hanseatic power explains why English piracy flourished in the south-west, whence it reached into Biscay, the chief medieval source of salt and wine, rather than upon the coasts fronting the North Sea.

For all the dexterity and legalism of Elizabeth I's responses to Spanish allegations of piracy, it is inescapable that piracy there was; and that if government was a circumspect backer of \*Hawkins and \*Drake it was transparently a gainer from their daring. Elizabethan piracy was essentially a business venture, even if the force of a protestantism determined to challenge the papal award of the western hemisphere to Spain and the eastern to Portugal in 1494 should not be underrated. With the 17th cent. came piracy's great age in the West Indies. The Spanish need to purchase West African slaves from English and other slavers, Spain's extended communications which themselves invited rootless seafarers to prey upon cargoes of fabulous wealth, combined with the loose proprietorial hold on those islands Spain virtually conceded to Britain, such as New Providence in the Bahamas, or had lost to her through war, pre-eminently \*Jamaica. The heyday of \*Morgan, Teach (Blackbeard), Avery, Roberts, Kidd, though of hardly more than 50 years' duration, was symptomatic of Spain's equivocal self-defence in central America. Through her reforms at home, and a series of better-structured commercial treaties, institutional piracy did not recur in the later 18th cent., and had little place in South America's 19th-cent. independence movements.

The 'internationalism' in modern maritime law may stem from such 17th-cent. jurists as Grotius, but marine technology has so varied that law as to blur 'old law and custom'. The submarine as a weapon of war in the early 20th cent., independent in operation as well as invisible, unable to afford assistance to torpedoed ships' companies, was plainly seen in some British circles as piracy re-emerging in a fresh and terrible guise. Only in 1917, with Germany's unrestricted U-boat war, did Britain cross the Rubicon and respond in kind.

DDA

**Pitt, William, 1st earl of Chatham** (1708–78), known as Pitt the Elder. In 1735 Pitt launched his belligerent political career by insulting King George II over his son's marriage and was dismissed from the army commission he had held since 1731. Thereafter Pitt quickly established himself as a leading speaker against \*Walpole's ministry and its policy of support for \*Hanover.

Walpole's fall did not immediately bring Pitt into the government, but after turning his oratorical fire on \*Carteret, he was given the post of paymaster-general in 1746. He refused to make money from this lucrative post. The king's enmity ensured, however, that he remained outside

the cabinet. Pitt dextrously altered his attitude towards support for Hanover during the War of the \*Austrian Succession, one of a series of shifts on this and other issues marking his change from opposition to government. Henry \*Pelham, the prime minister, kept Pitt quiet, but upon Pelham's death in 1754, Pitt entered the great struggle between leading politicians. The new minister, the duke of \*Newcastle, would not give power to a serious rival in the Commons; consequently Pitt and Henry \*Fox joined forces to ridicule Newcastle's minions to devastating effect. Fox was the first to break ranks and join Newcastle, but when the \*Seven Years War began with the loss of \*Minorca and defeats in America, Pitt came to be seen by many as the country's only hope. With great reluctance George II invited him to form a government with the duke of \*Devonshire nominally at its head in December 1756. It soon became apparent that no government would have the combination of skill and numerical strength in Parliament necessary to prosecute the war unless Pitt and Newcastle acted together; thus, in July 1757, Newcastle was appointed 1st lord with Pitt as secretary of state for the southern department.

Pitt unquestionably acted as leader of the war effort. He had the backing of independent MPs (notably through his encouragement of the Militia Bill), dominated the cabinet, showing singleness of purpose and an immense capacity for detail. He inspired the military and the country at large and won the confidence of Britain's major ally, Prussia. Once again he found it necessary to alter his position to one of support for large-scale engagements in Europe, but excused this by declaring that 'America has been conquered in Germany.' Pitt's goal was colonial expansion, and by 1761 Britain had driven the French from Canada, India, and most of the Caribbean.

Pitt had won George II's respect, though never his affection, by the time of the king's death in 1760, but when George III's reign commenced his position was less secure. The new king, encouraged by his tutor \*Bute, wanted peace. Pitt disagreed, and after another year of military success, he resigned over the cabinet's refusal to permit attacks upon the Spanish in October 1761, stating, 'I . . . will be responsible for nothing that I do not direct.' War with Spain soon followed. In the Commons, Pitt condemned the peace settlement but Fox's managerial skills ensured that the treaty was overwhelmingly approved.

The 1760s was a decade of political instability due in no small measure to Pitt himself. He refused to ally with any political faction, uniformly support the king, or retire. His strongest feelings were reserved for America and he bitterly attacked his brother-in-law Prime Minister \*Grenville for passing the \*Stamp Act. However, he would not agree with the \*Rockingham faction either, who repealed the Act.

The king persuaded Pitt to form a ministry in July 1766. Pitt (hitherto popularly known as 'the Great Commoner') took the title of earl of Chatham and the office of lord privy seal (with the duke of Grafton as 1st lord). Within months he had plunged into a state of virtual insanity. Chatham officially resigned in October 1768, but did not regain his senses until late 1769. The final decade of Chatham's life was divided between illness and dramatic appearances in the Lords

to attack \*North's American policies. He was against American independence, but believed, as late as 1778, that an imperial settlement could be reached. In April 1778 Chatham was escorted to the Lords by his favourite son, William \*Pitt the Younger, but during debate collapsed and died on 11 May.

The complexity of Pitt's character added to the mystery, fear, and reverence that surrounded him. He was a skilled orator and yet a three-hour speech (not uncommon) left his listeners with memories of just a few sentences. He is said to have required his under-secretaries to stand in his presence, yet could declare, 'he should be prouder to be an alderman than a peer'. He despised the concept of party and yet arranged posts for his followers. He had a romantic, deferential view of monarchy but demanded personal control of policy. Pitt had few friends, no sense of humour, and found it difficult to treat people as equals, but he was a devoted father and husband. He spared his sons the Etonian thrashings he had suffered, educating them and his daughters at home, rigorously but lovingly. His wife Hester supported him diligently during his lifelong bouts of gout and mental disorder. For a man with so many problems, in office for such brief periods, to be regarded as one of the country's greatest premiers testifies to the scale of his achievements.

AIL

Ayling, S., *The Elder Pitt, Earl of Chatham* (1976); Black, J., *Pitt the Elder* (Cambridge, 1992).

When Pitt took office in December 1783 few thought his ministry would survive. He faced an opposition majority in the Commons. But several factors worked in his favour. He had the unflinching confidence of the king; the Fox–North coalition was unpopular; and he was able to win over opinion in the Commons. He called the opposition's bluff over their threat to refuse supplies and he was able to distance himself from the unpopular Shelburne. At the general election of 1784 Pitt won a decisive victory.

During his peacetime administration he achieved much in the fields of fiscal, economical, and commercial reform. He cut customs duties and stimulated trade, set up a sinking fund in the hope of paying off the national debt, and put government loans and contracts out to tender. Having established his mastery in public finance he negotiated a commercial treaty with France and ended Britain's diplomatic isolation by entering into alliance with Prussia and Holland in the aftermath of the Dutch crisis of 1787. But there were frustrations and disappointments. Pitt's proposals for a moderate reform of Parliament were defeated; he was compelled to drop his scheme for free trade with Ireland; plans to improve the defences of Portsmouth and Plymouth had to be abandoned; the abolition of the slave trade had to remain an open question within the government. These set-backs reflected Pitt's acceptance of conventional ideas about the role of the crown and the functioning of the cabinet, and his vulnerability to shifts of opinion among the country gentlemen in the Commons. Pitt did not see himself as a party leader and neglected to build up a party within Parliament. This made him all the more dependent on the support of the king and unable to overcome opposition on controversial questions within the cabinet. His position was threatened in 1788 when the illness of George III presaged a change of government. But Pitt saw off the Foxite challenge. He studied precedent, stood forth as the defender of the rights of the king and the privileges of Parliament, and insisted that Parliament had the right to decide who should be regent and on what terms. When the king recovered in 1789 Pitt seemed invincible. He knew when to yield to political pressure, as over the impeachment of \*Hastings, and was adept at turning the ideas of others into practicable policies. By 1789 the confidence and prosperity of the country had been restored after the humiliation of the loss of the American colonies.

When the French Revolution broke out in 1789 Pitt was sympathetic to reform in France but was determined to stay out of European complications if possible. As late as February 1792 he affirmed his expectations for fifteen years of peace in Europe. But with the collapse of the French monarchy and the aggressive policies pursued by the French republic his hopes were shattered. He was under pressure from those who feared radical movements in Britain and Ireland, especially when these were seen to be inspired by Jacobinical ideas. The outbreak of war in 1793 was a disaster for Pitt. His hopes for further reform were indefinitely postponed and he became transformed into 'the pilot who weathered the storm', a symbol of the nation's resistance to the French republic and empire. The war was long, arduous, and inconclusive. Though loyalism was the dominant

feeling in Britain there was much economic distress and rebellion broke out in Ireland in 1798. Pitt had tried to appease Ireland by granting civil rights to Irish Catholics and enfranchising the Catholic freeholders in the Irish counties. Though the rebellion was crushed, Pitt was convinced that the credibility of the Dublin Parliament was destroyed. He carried an Act of Union with Ireland, hoping to follow it with Catholic emancipation. He was thwarted on the Catholic question, partly by the opposition of George III, partly by hostility within his own government, and partly by the unpopularity of Catholic relief in Britain. He resigned in 1801, giving general support to Addington's ministry from the back benches and approving the peace of Amiens when it was signed in 1802.

During his years out of office he was criticized for failing to build up his party. He had recognized that a more dominant role for the prime minister was a desirable accompaniment of cabinet government, but when Addington left office in 1804, Pitt once again felt the constraints of the contemporary system. Despite their differences Pitt wanted to bring Fox into a coalition as foreign secretary. George III vetoed this appointment. As a result, the Foxites and Grenvillites refused to serve. Pitt's health was now in decline and the strains of office wore him out. He built up a coalition to defeat Napoleon, but hopes of a decisive end to the war were dashed by Napoleon's victory at Austerlitz in 1805. On 23 January 1806 Pitt died. He left behind him a band of younger men whose talents he had recognized and fostered and a legend which shaped popular Toryism in the early 19th cent. Yet, to the end of his life, Pitt regarded himself as an independent Whig. With a little ingenuity Victorian conservatives and liberals could claim to stand within the Pittite tradition when it was expedient for them to do so. In this sense Pitt became part of a national mythology. JWD

Ehrman, J., *The Younger Pitt: The Years of Acclaim* (1969); — *The Younger Pitt: The Reluctant Transition* (1983); — *The Younger Pitt: The Consuming Struggle* (1996).

**Place, Francis** (1771–1854). The 'radical tailor of Charing Cross' was associated, either directly or indirectly, with virtually every reform movement from the corresponding societies to chartism. He rose from being a journeyman breeches-maker into a prosperous shopkeeper and employer, from Jacobinism to respectability, and became a disciple of Bentham and Mill. His skill as a backroom organizer was demonstrated in the London Corresponding Society, the Westminster elections, the repeal of the Combination Acts, the 1832 Reform Bill agitation, and chartism. Place believed in working-class advancement through self-help, education, and extension of the franchise. He eschewed violence and advocated alliance with the middle classes. Place accumulated a huge collection of books, pamphlets, and papers of all kinds (now in the British Library) on which historians have relied heavily, without always appreciating the extent to which the record is coloured by Place's partisan views. JFCH

**place Acts.** As soon as parliaments were established as annual events after the Glorious Revolution, ministers began to consider how to use patronage to obtain reliable

majorities. Oppositions countered by proposing place bills to preserve the independence of the House of Commons from encroachment by the executive by disqualifying members under government influence. A fierce struggle raged in William III's reign, with bills defeated in the Lords or vetoed by the king. Nevertheless, statutes were passed excluding commissioners of the excise and of the customs. The grandest attempt was in the Act of Settlement of 1701, which forbade membership of the Commons to any person holding an office or place of profit under the crown: if implemented, it would have divorced executive and legislature on the American pattern. But the provision was circumvented by the device of re-election on taking office, which lasted until 1926. Subsequent campaigns were ragged and ineffective. After the fall of Walpole, an act to exclude commissioners of the navy was carried and a place measure became part of the Rockinghams' campaign for economical reform in the 1770s. Clerke's Act in 1782 excluded government contractors. But the cumulative effect was slight, government influence being more than sustained by the vast growth of the civil service, army, and navy. JAC

**place-names** provide a rich source of historical information, often for areas and subjects which are otherwise not well documented. The initial stages of their study are the province of the linguist because the original meaning of the majority of names is no longer immediately intelligible. The evolution of the name 'Eboracum' through 'Everog' and 'Eoforwic' to 'Iorvik' and thus to modern 'York' provides a good example of the complexities involved. Though the explanation of this sequence is a linguistic matter, it clearly has important implications for any historian concerned with settlement continuity and the changing control of this major centre.

England's place-names have been intensively explored by the English Place-Name Society and its publications provide the basic data for most of the country. They show that the majority of English names were formed in the Germanic languages of the Anglo-Saxon and Scandinavian settlers of pre-Norman Britain. It is to the Anglo-Saxons that we owe names ending in *-ham* and *-tun*, both indicating a village or farm, whilst the Scandinavian settlers spawned the numerous names in the north and east of the country which contain the elements *-by* ('farm'), *-thorpe* ('secondary settlement'), and *-thwaite* ('clearing'). The relative dating and interpretation of all of these elements is still, however, a controversial issue. Other language groups are less well represented in the onomastic palimpsest; the relative paucity of Celtic names, together with the survival of only a small number of Romano-British names, is, for example, particularly marked and is obviously of relevance to studies of settlement and social change in the 5th and 6th cents. Similarly the advent of a Norman aristocracy added only a few French names, though the representation of their scribal system changed the spelling (and later, by extension, the pronunciation) of many English names. In the post-medieval period, names have continued to be coined; to this group belong most street-names and field-names which are

valuable sources on changing patterns of industry, trade, and agriculture.

Scotland's names are linguistically equally complex, though they have been less intensively studied. There is an early stratum of P- Celtic elements (Gallo-Brythonic) which appear to represent the Pictish language: the c.300 names in *pit-* ('piece of land'), such as *Pitlochry*, or the *-pevr* ('radiant') of *Strathpeffer* provide good examples of a group whose distribution is markedly north-eastern. Old English and Scandinavian forms to the south of the Forth–Clyde line reflect various extensions of Northumbrian and English power after the 7th cent. whilst the distribution of Scandinavian elements like *setr* ('dwelling') and *stathir* ('dwelling'; 'farm') is the result of Norse activity in the northern and western isles and adjacent coastlands. It is, however, the Gaelic names which give Scottish maps their distinctive appearance. Within these can be seen forms like *sliabh* ('mountain'), largely limited to Dalriada and Galloway, which represent a pre-7th-cent. phase. These contrast with the more widespread distribution of other names such as those containing *baile* ('hamlet'; 'farm') which show the extent of Gaelic usage before the 17th cent. and the language's decline in the Lowlands.

Place-names in Wales are more readily intelligible to native speakers than those elsewhere in Britain for they have shared the general development of the Celtic language. But even here the linguistic make-up is far from straightforward, with interesting forms of Anglicization (e.g. *Prestatyn*—'village of the priests') and traces of Scandinavian naming (e.g. *Swansea*—'Sveinn's island') around the coast.

RNB

**plague.** Bubonic plague is a disease of rats, spread to humans by fleas deserting dead or dying rat hosts. The bacillus *Yersinia pestis* is either transmitted by direct flea bite or via flea faeces entering the bloodstream. Occurring primarily in the summer, it causes fever, vomiting, and inflammation of the lymphatic glands to give the characteristic swellings or buboes. Bubonic plague kills between 60 and 80 per cent of those infected. Still more lethal is *pneumonic* plague, which occurs when the bacillus enters the lungs and is then transmitted by droplet infection. Although it might have helped to cause the exceptional mortality of the \*Black Death in 1348–9, the pneumonic variety played only a minor role in plague epidemics after the early 15th cent.

Plague arrived in England in 1348 as part of a European pandemic that lasted until the early 18th cent. No subsequent plague epidemic had the same ferocious impact as the Black Death. Recent estimates put the death toll at something like 47 per cent of the entire population. The disease returned, albeit with diminished force, in secondary national epidemics in 1360–2, 1368–9, 1375, and 1390–1. After the late 14th cent. plague tended to occur on a regional rather than a national level, although in 1413, 1434, 1439, and 1464 it was country-wide. It remained a frequent scourge: in one 15th-cent. Canterbury priory 16 per cent of all monks died of plague.

The overall impact of plague on the national death rate, however, diminished progressively. From the late 15th cent.,

plague increasingly became a disease of towns and cities, where man and rat lived in closest proximity, or hit villages located on lines of communication. Between 1544 and the 1660s, no plague epidemic ever affected more than one in five English parishes. Our historical perceptions are coloured by the experiences of those minority of communities which were devastated. Norwich lost a third of its population in 1579. London accounted for one-third of *all* plague deaths that occurred in England between 1570 and 1670. The capital lost at least 25 per cent of its inhabitants in 1563, and a further 20 per cent or so perished in 1603 and again in 1625. The last 'Great Plague' in London in 1665, recorded in \*Pepys, killed about 56,000 people.

Plague was interpreted as God's punishment on sinful man. Epidemics therefore provoked penitential acts of worship, fastings, and exhortations to moral and religious improvement. In the 17th cent., the increasing identification of the poor as carriers and chief victims of plague reinforced attempts by their social superiors to control and reform their behaviour. The disease disappeared from Britain after the mid-17th cent. Scotland's last serious outbreak was 1645–9, England's was 1665–6. Why the plague disappeared is still debated, but it was probably due to the much more efficient quarantining of ships, which prevented the initial importation of the disease, and to increased use of brick rather than wood in houses, which reduced the contact between humans and rats.

JPB

**Plaid Cymru** (Welsh Nationalist Party). Plaid Cymru was established in 1925 mainly to campaign for the protection of Welsh language and culture. After the Second World War the organization took on the functions of a political party to tread the parliamentary road to Welsh independence. During the 1960s its policies became more economically motivated, aimed at reducing unemployment, halting the migration of Welsh youth, and replacing declining traditional industries. It had little success until 1966 when it won a by-election at Carmarthen. In the election of February 1974 two seats were gained—Caernarfon and Merioneth. Plaid Cymru exploited the minority position of the Labour government (1974–9) to force discussion on constitutional change. However, the March 1979 devolution referendum was a blow to the party. From a turn-out of 58.3 per cent, only 11.8 per cent voted for a Welsh assembly.

The break-through which Plaid Cymru had been looking for came with the referendum of September 1997, which voted by a narrow majority to establish a National Assembly. At the subsequent election in 1999, the party won 17 of the 60 seats in the Assembly, making substantial inroads into the Labour vote, taking seats at Islwyn, Llanelli, and Rhondda. Disappointing results in the election of 2003 led to the resignation of the party's leader, Ieuan Wyn Jones.

RAS

**Plantagenets.** The Plantagenet dynasty took its name from the *Planta genesta*, or broom, traditionally an emblem of the counts of Anjou. Members of this dynasty ruled England from 1154 to 1399. However, in conventional historical usage, Henry II (son of Count \*Geoffrey of Anjou) and his sons Richard I and John are normally termed the Angevin

## plantations

kings, and their successors, up to Richard II, the Plantagenets. The term Plantagenet was not used until about 1450, when Richard, duke of \*York, called himself by it in order to emphasize his royal descent from Edward III's fifth son, Edmund of Langley. MCP

**plantations** was the name employed for colonial settlements and the supervising body of the first British empire was known as the Board of \*Trade and Plantations. One of the earliest attempts was Sir Humphrey \*Gilbert's expedition to \*Newfoundland which failed and cost him his life (1583). His half-brother Sir Walter \*Raleigh sponsored the equally ill-fated attempt on Roanoke Island (Virginia), which began in 1585 and was deserted by 1589. American settlement resumed in James I's reign with Virginia (1607), Plymouth (1620), followed by Massachusetts Bay (1628), Maryland (1634), Connecticut (1635), Rhode Island (1636), and New Haven (1638). Gilbert and Raleigh were also much involved in the Tudor plantations of Ireland. After the initial expedition by \*Pembroke (Strongbow) in the 12th cent., the English \*Pale had led a precarious existence. A new series of plantations began in the reign of Mary and Philip (Queen's County and King's County), was continued by Elizabeth, and urged on by James I and Charles I, who encouraged English and Scottish settlement in Ulster. During the Commonwealth, many of \*Cromwell's soldiers were given vast estates in Ireland. Native Irish resistance to expropriation was a factor in the risings of 1598 and 1641 and in the support given to James II after 1688. The effect of the Tudor and Stuart plantations was to set the pattern of Irish politics for the next 400 years. JAC

**Plassey, battle of**, 1757. Aware that the French-supported nawab Siraj-ud-Daula was intent on further rebellion against East India Company rule, Robert \*Clive led a force of about 1,000 European and 2,000 Indian soldiers to confront him. He found Siraj on 23 June at Plassey, on the banks of the Bhagirathi river, at the head of 50,000 men. However, a rainstorm soaked Siraj's artillery powder and Clive, who had kept his powder dry, opened a devastating fire when the nawab's cavalry tried to charge. Siraj fled, leaving Clive in control of Bengal. JLP

**Playfair, John** (1748–1819). Mathematician and natural philosopher. Playfair was the son of a presbyterian minister, educated for the kirk, a professor of mathematics and, later, natural philosophy at Edinburgh 1785–1819, and author of a standard edition of Euclid (1795). A friend of the great geologist James \*Hutton, Playfair developed into a geologist of note by virtue of a lucid and attractive commentary on Hutton's dense and brilliant theory of the earth. The *Illustrations of the Huttonian Theory* (1802) did much to popularize and clarify the business of Victorian geology. Playfair was a popularizer of the best sort. His *Dissertation on the Progress of Mathematical and Physical Science since the Revival of Letters in Europe*, a supplement to the *Encyclopaedia Britannica* (1816), was one of the best histories of that subject. NTP

**Playfair, Lyon** (1818–98). Playfair was a chemist and statesman, and one of the organizers of the \*Great Exhibition of 1851. Educated at Edinburgh and then at Giessen, where

Justus Liebig had built up a great research school, Playfair worked in textiles in Manchester, and met John \*Dalton. In 1845 he moved to London, to the School of Mines, an ancestor of Imperial College; he realized that although the \*Crystal Palace seemed to show Britain as the workshop of the world, in fact other countries were overtaking her. In lectures, and from 1868 as a Liberal MP and minister, and after 1892 as Baron Playfair, he promoted awareness of the importance of science for the prosperity of the country. He became a great spokesman for technical and scientific education; with his wide circle of friends in high places, including Prince \*Albert, he has been compared to Joseph \*Banks as an influential figure. DK

**Playfair, William Henry** (1790–1857). Scottish architect who perhaps studied under Wyatt and Smirke in London. He returned to Scotland in 1816 to complete Robert \*Adam's building for Edinburgh University, and thereafter made his mark on the Scottish capital with his public buildings, notably those on the Mound—the Doric Royal Institution (now the Royal Scottish Academy, 1822–6, enlarged 1832–5), and the Ionic National Gallery of Scotland (1850–7), overlooked by the Gothic towers of Free Church College (now New College, 1846–50). On Calton Hill he designed monuments to his uncle John \*Playfair and Dugald \*Stewart (1831), as well as the City Observatory (1818), and the National Monument, in collaboration with C. R. Cockerell (1824–9, unfinished). Non-Grecian buildings by Playfair in Edinburgh include Donaldson's hospital (1842–54), in a Jacobean style, and St Stephen's church (1827–8, later altered), which calls to mind the London churches of \*Hawksmoor. PW

**pleas of the crown.** The notion of the pleas of the crown can be traced back to Anglo-Saxon times to describe those wrongs which were the particular concern of the king and for which the king was entitled to take a fine (wite). Later under the Norman kings and their successors the term came to mean those pleas or cases which concerned the king as distinct from pleas between subjects—common pleas. Although these pleas were principally what we would now regard as crimes, some were to develop as torts (civil wrongs), notably trespass, which was a plea of the crown because the writ alleged that it was a wrong 'vi et armis et contra pacem regis' ('by force of arms and against the king's peace'). Increasingly the pleas of the crown became the substance of the criminal law—indeed the great classic of the criminal law was Hale's *Pleas of the Crown*. MM

**pleasure gardens** for the public, with entertainments and light refreshments, began in the 17th cent., but their heyday was the Georgian period, with more leisure and surplus income. They aimed at enchantment and elegant relaxation—coloured lights in the trees, flowers and arbours, music, fountains and fireworks, breakfasts and supper parties, masquerades and dancing, flirtation, and, above all, the pleasure of seeing and being seen. In London, \*Vauxhall and \*Ranelagh were augmented by less ambitious gardens at Marylebone, Hampstead, Sadler's Wells, Islington, and elsewhere. Bath had its own Vauxhall in Bathwick meadows by

1742 and Bristol its Vauxhall gardens near the Hotwells. Celia Fiennes noted 'a sort of spring garden' at Newcastle upon Tyne in 1698 and a new Ranelagh garden opened there in 1760. They did much to improve public taste and discourage boorishness but fell victim, in the end, to changing demand: the *ton* found them increasingly vulgar, the *hoi polloi* too tame. JAC

**Plimsoll, Samuel** (1824–98). Radical MP. Born in Bristol, a congregationalist, Plimsoll was successively a solicitor's clerk, manager of a brewery, and honorary secretary for the \*Great Exhibition of 1851. In 1853 he became a coal merchant in London, gaining an extensive knowledge of coastal shipping. Elected to Parliament for Derby in 1868, he proposed a compulsory load line to prevent shipping accidents and obtained a royal commission on the subject in 1873. His anger at the greed of shipowners who resisted his plans led to his temporary exclusion from the Commons in 1875, but his persistence was rewarded with the Merchant Shipping Act of 1876 and the load line soon came to bear his name. Out of Parliament after 1880, he retained his interest in shipping, publishing a pamphlet on cattle ships in 1890, and became president of the Sailors' Union the same year. ER

**Plunket, St Oliver** (1629–81). Catholic archbishop of Armagh and primate of Ireland (1670–81). Born in Meath, educated in Rome, Plunket was successively professor of theology there (1657–69) and archbishop of Armagh after consecration in Ghent. He was on good terms with successive viceroys. Diligent in his diocese, he also went on mission to the Hebrides (1671). An ultramontane, he established firm ecclesiastical discipline and raised standards, and, though in dispute with Archbishop Talbot of Dublin over precedence, presided at the synod (1670). Threatened with expulsion after the English Test Act he went into hiding (1674), but was arrested in Dublin (1678) and falsely accused of involvement in the \*Popish plot. Tried in London on a trumped-up charge of conspiring to bring a French army to Ireland, Plunket was convicted of treason and, despite general agreement of his innocence, was hanged, drawn, and quartered at Tyburn. His relics are in Downside abbey (Som.). He was canonized in 1975. WMM

**Plunket, William, 1st Baron Plunket** (1764–1854). Lawyer. The son of a presbyterian minister at Enniskillen, Plunket was educated at Trinity College, Dublin, and studied law at Lincoln's Inn. He was elected to the Irish Parliament in 1798 and opposed the Act of Union. In 1807 and 1812–27 he sat at Westminster, pursuing a \*Grenvillite line, and was given a peerage in 1827. He became solicitor-general [I] 1803–5, attorney-general [I] 1805–7 and 1822–7, and lord chief justice of Common Pleas 1827–30. Lord Grey then appointed him lord chancellor [I] and he served with one short interruption from 1830 until 1841. A wealthy and successful lawyer, Plunket (though a protestant) was an ardent advocate of catholic emancipation. \*Greville commended his speech in favour of the Reform Bill in October 1831, and five years after his death bracketed Plunket with \*Grattan and \*Burke as great parliamentary orators. JAC

**Plunkett, Sir Horace** (1854–1932). Plunkett was a lifelong advocate of agricultural co-operation. A younger son of the 16th Lord Dunsany [I], he was born in Gloucestershire, but spent his early years rearing cattle in America. In 1889 he settled in Ireland and began preaching co-operative farming. He became a member of the \*Congested Districts Board in 1891 and entered Parliament the following year as a Unionist. The Irish Agricultural Organization Society (1894) led to a Department of Agriculture for Ireland in 1899, in which Plunkett served for seven years as vice-president, despite losing his parliamentary seat in 1900. But like many moderates, his political hopes foundered on growing militancy in Ireland. Reluctantly converted to \*Home Rule, he urged Ulster not to stay out. When it did, he became in 1922 a member of the Senate of the Irish Free State, but returned to England after his house had been burned down in 1923. In January 1920 Plunkett was reported dead by mistake and had the dubious pleasure of reading his own obituary notices. JAC

**pluralism** is the holding of more than one ecclesiastical benefice with cure of souls simultaneously. Although consistently denounced by the church, there was never a time, certainly from the Middle Ages onwards, when pluralism did not take place. There were many reasons for its continuance. The poverty of many benefices often made the holding of more than one a necessity. Shortage of clergy—increasingly a problem in the 20th cent.—was another reason. Today many Anglican clergy in rural areas are technically pluralists, holding three or more grouped benefices simultaneously—though now with official approbation and authority. The Church of England from the 16th cent. onward made efforts to reduce or regulate the incidence of pluralism, but not until the passage of the Pluralities Act of 1838 was there any real success. Even that Act protected the position of most of those already in possession of more than one benefice, and not until the last quarter of the century did its provisions come fully into force. JRG

**Plymouth** owes its importance to the magnificent estuary into which drain the rivers Plym and Tamar. The original settlement was at Sutton, the name Plymouth being attached to the harbour. Sutton Prior was a borough in the 13th cent. and Plymouth developed from a small fishing village. By \*Leland's time, in the 1530s, it was 'very large' with 'a goodly rode for great shippes'. The war against Spain in Elizabeth's reign brought Plymouth into national prominence. \*Drake and his colleagues sailed from the Hoe to defeat the Armada and \*Essex left in 1596 with his expedition against Cadiz. During the civil wars, Plymouth was of great strategic importance as a parliamentary bastion in a predominantly royalist region and resisted repeated attempts to subdue it. After the Restoration it increased with the growth of the navy. The royal citadel, to strengthen the defences, was begun in 1666 and the dockyard at Devonport was developed in William III's reign. In the course of the 18th cent., it passed \*Exeter in population, though Plymouth, Stonehouse, and Devonport were brought under one administration as late as 1914. As a vital naval base,

## Plymouth brethren

within easy bombing range from occupied France, Plymouth suffered heavily in the Second World War, and the subsequent replanning did not command total enthusiasm. The population in 2002 was 250,000. JAC

**Plymouth brethren**, Christian brethren, or Darbyites, began in Dublin in the mid-1820s when groups of young men, several from \*Trinity College, met for communion regardless of denomination. With no intention of starting a separate movement, they did exactly that, thanks to J. N. Darby (1800–82), a non-practising barrister who had recently resigned his Anglican orders. Growth in the 1830s was followed by predictable tensions in the 1840s, especially in Bristol and Plymouth. These culminated in the 'Bethesda Question' (1848), which divided brethren into open and exclusive sections. Henry Craik (1804–66), of Bethesda, Bristol, believed that all Christians should be welcome at the breaking of bread. Darby did not; for him, believers were called from the ruined church to witness against the errors of the last days. Thereafter Darby led the exclusives while men like A. N. Groves (1795–1853), the Exeter dentist who became a missionary to Baghdad and India, were associated with the open. Despite this division they remained similar in beliefs and structure: a world-denying pietism; the Bible as their supreme rule; an interest in prophecy and the Second Coming; believers' baptism; weekly breaking of bread; no set liturgy; no ordained ministry, though many full-time evangelists; a congregational polity with no co-ordinating organization. Despite their fissiparous tendencies, they spread steadily. In England and Ireland they attracted an educated membership with rather an aristocratic veneer. In Scotland, where they benefited from the revival of 1859–60, they spread in industrial and fishing communities, especially in the north-east. They also spread in Europe and the empire with missions ('Christian Missions in Many Lands') in central Africa, India, and Latin America. Popularly stamped with the exclusive image, reinforced in the 1960s when one exclusive section withdrew its members from universities and professional activities, their ideal atmosphere is better seen as one of spiritual and intellectual liberty set in a context of brotherly love. CB

**poaching**. The punishment for poaching in the king's forest in Norman times was severe: Richard I's assize of 1198 threatened deer-stealers with blinding and castration. Though the royal forests were exceptional, and savage punishments were relaxed, poaching, in its various forms, continued as a major irritant until rural society gave way to town life in the later 19th cent. G. M. Trevelyan wrote that 'there never was a truce in the poaching war'. One of the earliest poems, *The Parlement of the Thre Ages* (c.1350), begins with a magnificent account of the shooting of a hart with a crossbow at night. The \*Peasants' Revolt of 1381 was one of the first insurrections in which demands for the relaxation or abolition of the game laws were made. In the jittery period that followed, Parliament complained (1389) that servants and labourers absented themselves from church to go hunting with dogs in 'parks, warrens and coneyries', and enacted that the right to hunt should be restricted to owners of property worth at least 40 shillings a year. Although in

popular mythology the poacher is a solitary operator, organized gangs made an early appearance. Having just won the battle of \*Bosworth (1485) Henry VII was called upon by his Parliament to tackle the problem of malefactors in Kent, Surrey, and Sussex who 'in great number, some with painted faces, some with visors' roamed the woods at night. Such behaviour was declared a felony. During the civil wars of the 17th cent., the relaxation of law and order gave poachers much freedom and after the Restoration, in 1671, there was an effort to tighten up. Game was reserved for freeholders of property worth £100 p.a., copyholders worth £150, and the son and heir of esquires and above: these persons could hunt over other people's land and appoint gamekeepers with right to search. In a desperate attempt to reduce poaching, an Act of 1755 totally forbade the sale of game, which led to a thriving black market. At the same time, improvements in guns prompted landowners to breed game in greater numbers. Poaching was then no longer a question of pinching rabbits from a common or trout from a stream but organized attacks upon private property. The poaching war of the later 18th and early 19th cents. saw bloody affrays, with the landowners defending their game with spring-guns and man-traps. *Blackwood's Magazine* wrote in 1827 that there was 'a war raging against the aristocracy', and poaching was an important element in the \*Swing riots of 1830. Even in the midst of the reform crisis, Parliament found time to legislate. The Game Reform Act of 1831 repealed 27 previous acts, declared a close season for hunting, allowed tenants to hunt and shoot on their own land, and introduced a system of certificates which gave permission to kill game, subject to the law of trespass. But any improvement in relations was temporary, for further improvements in guns led to vast *battues*, in which 1,000 birds might be shot in one day. Breeding enough birds became a large industry and the crops consumed by the birds caused bitter resentment. Confrontation between gamekeepers and poachers continued. But after the Great War the ruling class was less keen on mass slaughter and poaching became incidental rather than endemic. JAC

**pocket boroughs** or nomination boroughs were constituencies where the patron could usually control the return of the members of Parliament. They were often, though not invariably, burgrave or corporation boroughs with small electorates. The Frankland family of Thirkleby commanded two seats at Thirk between 1688 and 1832 without once facing a contest: Sir James Lowther returned nine members in 1784. The number of seats under patronage has been put at over 250 in 1761 out of a total of 558. JAC

**poet laureate**. James I awarded Ben \*Jonson a pension in 1616 and he and Sir William Davenant (1637) were widely recognized as laureates. But the first court appointment of a laureate was in 1668 when Charles II chose \*Dryden. In the 18th cent. the laureate was expected to produce birthday odes and wedding verses. Among the more distinguished laureates were \*Wordsworth (1843) and \*Tennyson (1850); less distinguished were Whitehead (1757), Pye (1790), and Alfred Austin (1896). The present poet laureate is Andrew Motion. JAC

**Poitiers, battle of, 1356.** \*Edward, the Black Prince's blood-ing had been at Crécy in 1346 and he spent much of the next ten years campaigning in France. In August 1356 he was before Bourges but threatened by a much larger army under John II of France. The English attempted to retreat towards Bordeaux but found their way blocked at Poitiers. The Black Prince offered terms, hoping to avoid battle, but on 19 September the French attacked. Archers, lying in ditches and behind hedges, broke up the first assaults, and in their last attack the French were taken in the flank. The large number of prisoners included the French king. Since King David of Scotland, captured at \*Neville's Cross in 1346, was still a prisoner, Edward III now had two kings on his hands. JAC

**Poland, relations with.** Poland excited little interest in Britain before the partitions of that country between 1772 and 1795. Although widely regarded as a crime, the first partition was not seen as a threat to the balance of power, though in the early 1790s difficulties with Russia encouraged the British to look to Poland as an alternative economic partner (including naval stores) in the east. During the second and third partitions Britain was preoccupied with the war with revolutionary France, and in 1814–15 Russian military control denied Britain any effective say in the future of Poland. This story was repeated during the uprisings by the Poles against their Russian overlords in 1830–1 and 1863. \*Palmerston recognized in the second instance that nothing could be done without France, and he feared that Napoleon III might seize the opportunity to make other major territorial changes in Europe.

The upheavals at the end of the First World War enabled Poland to re-emerge as an independent state, but British ministers often thought the Polish leaders reckless and ambitious. The guarantee of Poland in March 1939 owed much to the fear that German expansion in eastern Europe might be the prelude to war in the west. It was still hoped, however, that Hitler could be persuaded to negotiate. Although the German invasion brought Britain into the war in September 1939, it was assumed that Poland could not be saved and that its reconstitution was dependent on an allied victory in the west. Churchill tried to mediate between Stalin and the Polish government in exile in London later in the war, but their aims were incompatible, and diplomacy could not prevent a communist take-over by 1947. The British sympathized strongly with the reform movement (Solidarity) from 1980, but their trading interests conflicted with American efforts to impose sanctions a year later. CJB

**Pole, Edmund de la, 3rd duke of Suffolk (c.1472–1513).** Pole's mother was Elizabeth, sister to Edward IV and Richard III: Henry VIII's mother was his first cousin. Pole was therefore close to the throne, a dangerous position in Tudor times. He succeeded his father as duke in 1492 but because the family had lost estates was recognized as earl only. His elder brother John, earl of \*Lincoln, had perished in rebellion at \*Stoke in 1487. Henry VII gave him the Garter around 1496 but in 1501 he resumed the title of duke, went abroad, and set up as Yorkist claimant. He was attainted, handed

back to Henry VII and placed in the Tower. Henry VIII had him executed in May 1513. JAC

**Pole, John de la, 2nd duke of Suffolk (1442–92).** Pole was originally married to his father's ward Margaret \*Beaufort, daughter and heir of John, duke of Somerset (d. 1444). The marriage was annulled and he married Richard of \*York's daughter Elizabeth. He was demoted to earl in the proscription of Yorkists in 1459, but earned reinstatement as duke by serving in Yorkist armies in 1461. His rewards from Edward IV, his brother-in-law, were insubstantial. He was apparently a political lightweight, never a royal councillor, loyal enough to support Edward against \*Warwick, but an embarrassment through his high-handed efforts to dominate East Anglia. Suffolk survived by acquiescing to the accessions of both Richard III and Henry VII, even having some favour from the latter after the rebellion of his son, the earl of \*Lincoln, in 1487. RLS

**Pole, Margaret de la.** See SALISBURY, COUNTESS OF.

**Pole, Michael de la (c.1330–89).** Son of William de la Pole (d. 1366), merchant of Hull and a major financier of Edward III's campaigns in France, Michael served the crown in various military and diplomatic capacities before becoming chancellor of England in 1383. He enjoyed the favour of Richard II, being created earl of Suffolk in 1385. When Richard lost control of the government in 1386, Pole was impeached for supposed malpractices concerning the French war which was going badly. In 1387 the king declared the impeachment void, but further attacks by the \*appellants led to Pole's flight in December 1387 and he was declared guilty of treason. Stripped of all his lands and honours he died in exile in Paris in September 1389. AC

**Pole, Reginald (1500–58).** Cardinal and archbishop of Canterbury. Pole was a younger son of Margaret, countess of \*Salisbury, daughter of George, duke of \*Clarence: he was therefore of the blood royal and his mother was governess and companion of Princess Mary. Intended from the beginning for the church, he spent 1521–7 on the continent in study. On his return he was made dean of Windsor and on \*Wolsey's death seems to have declined the archbishopric of York. Increasingly opposed to the king's divorce policy, he went abroad again in 1532. Asked for his opinion by the king, Pole produced in 1536 a strong counter-statement, placing his relatives in England in acute danger. His nomination as cardinal increased their peril: his eldest brother was executed, his nephew died in the Tower, his mother was beheaded in 1541. Pole remained on the continent in constant fear of assassination. On Mary's accession in 1553 he was anxious to return to England at once and found it hard to understand why there should be delay. He came back as legate in November 1554 and in March 1556 succeeded \*Cranmer as archbishop of Canterbury. But the return of England to the faith—the object of Pole's life—was fraught with problems. The burning of protestants caused great outrage; the nobility were most reluctant to return church lands; Mary's husband \*Philip found himself at war with the papacy and Pole's legatine authority was revoked. He died on the same day as Mary in November 1558. Pole's

dedication to his church was beyond question, but his long absence from England and the terrible fate that had overcome his family rendered his judgement questionable. JAC

**Pole, William de la, earl, marquis, and 1st duke of Suffolk** (1396–1450). Suffolk had a chequered career in the French war from 1417 to 1437. As an associate of Cardinal \*Beaufort, he became steward of Henry VI's household in 1432. This position enabled him to make himself the king's chief councillor after Beaufort's death, create a household faction, and monopolize royal patronage, so that he prospered while crown revenues dwindled. He was made duke in 1448. He continued Beaufort's quest for peace by negotiation. In 1444 he headed two embassies to France which arranged Henry's marriage to the dowerless \*Margaret of Anjou but only a short truce; its extension to 1449 had to be bought by the surrender of Maine. The failure of Suffolk's diplomacy was exploited by enemies, including the duke of \*Norfolk and Lord Cromwell, who had suffered by his manipulation of royal favour and legal procedures. Impeachment by Parliament led to his banishment and murder at sea. RLS

**police.** For years Britons resisted having a proper police force, because they associated it with repression, especially of the French kind. They also feared it would raise their rates. This was despite rampant crime in the 18th cent., which in the absence of police was dealt with by draconian penalties, especially death, designed to deter. In the more humane 19th cent., however, the sight of poor folk being strangled for minor offences became less acceptable, and other methods of crime prevention were sought. The middle classes also worried about public order, in an era (c.1790–1820) of serious riot and rebellion. Their only recourse was the army, backed up by even tougher sanctions. That could be counter-productive. \*Peterloo, for example, and the \*Cato Street executions set people against the government. A gentler means of public control was required.

Sir Robert \*Peel devised his first police bill while chief secretary for Ireland, leading to the creation of the Irish Constabulary in 1822. In 1829 he persuaded Parliament to accept something similar (though not so militaristic) for London, to be called the Metropolitan Police. For its first years it was clearly on trial. Its commissioners, therefore, proceeded cautiously. All policemen were put in a distinctive uniform, so that they could not be taken for 'spies'. They were unarmed, except for short batons. Rules of conduct were demanding. Of its first 2,800 recruits, 2,238 were dismissed from the force, sometimes for simply taking a drink or a nap. But it worked. The police became accepted by a suspicious middle class, and eventually by large numbers of the working classes too. They may have deterred crime (though figures are unreliable; and other factors, like rising prosperity, were active). They developed methods of dealing with public demonstrations which were subtle but effective. Other areas of the country called the 'Met' in to help. After 1833 they were permitted to set up their own forces, on the London model. Most did. Those which did not were finally made to by Acts of 1856 (England and Wales) and 1857 (Scotland).

Another later development was the growth of a plain clothes detective branch. That began in London in 1842, but consisted initially of only eight men. They tended to be distrusted. In 1877 a scandal implicated three of the detective branch's four inspectors in a turf fraud they were supposed to be investigating. That provoked a shake-up, out of which the present-day Criminal Investigation Department was born in 1878. In the 1880s the latter spawned the police's first political arm: a 'Special Branch' formed initially to look after Irish-American \*Fenian bombers, but later extended to \*anarchists, \*suffragettes, and other sources of irritation to the government. The same period saw the police taking on other duties: regulating vice, drink, and gambling, for example, and watching out for foreign spies.

The police's most controversial role has always been its public order one. Its problem was that keeping order in times of civil unrest could be interpreted as acting for the state against the democracy. Strikes were the most difficult case. The 1890s, 1920s, and 1980s saw the police brought into the political arena in this way. In 1918 they had a strike of their own, which created another kind of concern. In general, the British police have maintained their image of being 'consensual', though periodically accused of racism. BJP

**Political Register.** The best-known radical newspaper in the early 19th cent. It was launched by William \*Cobbett in January 1802 as a weekly, supported by William \*Windham, and pursued a fiercely right-wing anti-French stance. But Cobbett soon moved to a radical position, condemning the Whigs as mere temporizers and calling constantly for reform of Parliament. In 1816 he brought out a cheap edition—the famous 'Twopenny Trash'—which sold in tens of thousands. It ceased publication in 1836, the year after Cobbett's death. JAC

**poll tax.** A fixed amount of tax per head, or poll. Poll taxes first came to prominence in the late 14th cent. when they were imposed to pay for the war in France (the \*Hundred Years War). The taxes of 1377, the 'tallage of groats' (4 pence per person over 14 years, 'except real beggars'), and 1379, 'the evil subsidy', were at higher rates than usual; and the \*Peasants' Revolt of 1381 arose from that year's tax of 1 shilling per head. Violence against collectors and justices turned to rebellion and the rebels converged on London where Wat \*Tyler and John \*Ball became their leaders. Poll taxes were very occasionally used in the 15th to 17th cents., the last time being 1698. However at the end of the 20th cent., Margaret \*Thatcher's Conservative government reintroduced the tax, under the name community charge (1990–3, 1989–93 in Scotland), to replace domestic rates for the finance of local government. As in the 14th cent., evasion and riots ensued; and the tax was, in part, the cause of Mrs Thatcher's downfall. MW

**polo** is derived from the Tibetan word for a willow stick and originated in the East, probably among the horsemen of central Asia. It was very popular in Persia and variants were played in India, Japan, and China. British tea-planters and cavalry officers adopted it in India and inter-regimental

competitions were organized. The first game in Britain was held in London in 1871 and the Hurlingham Club, at Fulham, founded in 1875, established itself as the governing body of the sport. It was included in the Olympic Games between 1908 and 1936. Since it involves the ownership or hire of several ponies for each player, it is unlikely to sweep the country, but it still has a considerable following in Argentina and in Britain is played mainly by army officers. JAC

**poor.** 'A decent provision for the poor', declared Samuel \*Johnson, 'is the true test of civilization.' But identifying the poor with any precision has proved difficult for those wishing to help them and for historians wishing to study them. Poverty is clearly a relative and approximate term.

Efforts to identify the poor using systematic measurements were attempted from the later 18th cent. onwards and were part of the debate about the extent of poverty in Britain. The destitution of orphans, the aged, and the sick was accepted as a reasonable claim for public support, but the extent of poverty among physically fit adults was disputed. Sir Frederick Eden attempted in 1797 to document the lives of the poor in terms of expenditure on food, fuel, clothing, and shelter, but his studies were criticized as unsystematic and unrelated to the basic minima needed to maintain a healthy life. Similar shortcomings were found in the anecdotal account *London Labour and the London Poor* published by Henry Mayhew in 1851. Investigators of the London Statistical Society (later the Royal Statistical Society of London) and the Manchester Statistical Society attempted to be more scientific by initiating studies of intakes per head of various commodities of food and drink, but it was not until 1886 that a survey of the budgets and consumption of necessities of a large sample of the London poor was undertaken by Charles \*Booth.

Booth's calculations rested on assumptions about the level of expenditure needed to maintain a healthy life. He allowed no expenditure for entertainments or pleasure. Even with disciplined expenditure on necessities only, his survey showed that almost 30 per cent of the population of London lived below 'the poverty line'. Using similar criteria to Booth's, Seeböhm \*Rowntree undertook a survey of the poor in York in 1900 and identified a similar proportion of the population living in poverty. Medical examinations of the men volunteering for military service in the Boer War and those serving in the two world wars provided evidence of the effects of long-term poverty. Many of them were rejected as unfit, probably because they had suffered from inadequate diet and care during their childhood and youth. Such evidence was used to support the arguments in favour of comprehensive social welfare and of the 'welfare state' established during the 1940s.

Debates about the extent and condition of the poor and the limits of state \*welfare continue. However, in spite of popular hostility to scroungers, the evidence suggests that the proportion of the poor in modern Britain is similar to that of the past. IJEK

**poor laws.** During the Middle Ages, canon law required each member of the parish to pay a tax of one-tenth, a tithe, of their income to the church. From this income the rector

was required to set aside one-third each year for the relief of the poor. The money was intended to provide for the regular needs of the poor in the parish, such as orphans, the old, and the infirm. It was not intended to remove the duty of Christian charity to give help in times of crisis and emergency.

This parochial system was undermined when tithe incomes began to be appropriated for other uses. For example, papal licences permitted tithe revenues to be claimed by other institutions within the church. In England some of the richer abbeys acquired tithe income in this way. The situation worsened when tithes became a fixed levy rather than a true tenth of incomes within a parish. By the beginning of the reign of Richard II in 1377, about one-third of parishes no longer had any tithes available for the support of the poor and others had depleted resources.

The state intervened to make good the shortcomings in the parochial system with the Acts of 1388 and 1391. These legitimized begging and stipulated that the able-bodied poor should look to their birth parish or the parish where they usually lived for support. Poor relief through the allocation of tithe income, where it existed, and begging elsewhere, continued until the Poor Law of 1536. This required the better-off members of each parish to collect money to support the 'impotent', who were defined as the infirm and children. Those who were fit but unemployed could expect no direct help. However, parish funds, where available, could be used to provide employment for them. Initially, giving to the parish collection was a matter of strong moral obligation, but in 1563 it became a legal requirement. Justices of the peace (magistrates) were given the task of determining what should be paid by each householder and an Act of 1572 required that the basis of payment should be reviewed regularly.

Such piecemeal legislation was replaced by a coherent system for England and Wales by the Poor Law Act of 1601. This required each parish to be responsible for its own poor. Justices of the peace had the duty of setting up a framework for the administration of the law, together with the minister of the parish and those householders designated as members of the parish meeting or vestry. The vestry had the authority to raise the necessary money by collecting a rate, the level of which depended on the estimated value of each property in the parish. In practice, some parishes, mainly in large towns, came under the control of a small group of powerful ratepayers including the magistrates and minister, who formed a select vestry. The decisions of all vestries were enforced, on a day-to-day basis, by the parish constable and, where appropriate, by paid officials, who collected rates and acted as overseers of the poor.

Care of the poor varied from place to place. Some parishes bought cottages to house the homeless or built a house where the poor might live. In small rural parishes relief, in money and in kind, was sometimes provided for the poor in their own home. Such a system assumed a settled agrarian society with few itinerants seeking help. In an effort to control the consequences of increasing population movements following the civil wars of the mid-17th cent., the Act of Settlement of 1662 obliged parish authorities to give poor

## pop art

relief only to those either long resident or born in the parish. All others seeking assistance had to return to their place of origin.

During the 18th cent. there were changes in response to increasing numbers of poor amongst those who had migrated to work in expanding industrial areas. The earlier system continued, but the law was amended to allow Poor Law authorities to attempt novel solutions to the problem of the increasing numbers of those seeking relief. Some parishes combined to form a union, which built a workhouse and required those who were poor but able to work to live within it. The poor who entered the workhouse had to wear a uniform and were referred to as paupers. It was hoped, not always justifiably, that the work undertaken in the workhouse would cover its costs. At the end of the 18th cent. rural poverty in southern England grew so persistently that the Berkshire magistrates met at \*Speenhamland and devised a system of poor relief in cash which supplemented inadequate wages. This system was taken up by other authorities and persisted in some places until the Poor Law Amendment Act of 1834.

The Act of 1834 put into practice a system which had operated in the previous decade in the parish of Southwell (Notts.). Relief was given only to those poor who agreed to accept the strict regime of the workhouse, where the conditions provided were funded at a level below that affordable by a person in work. In addition, the new Act created a commission to supervise the establishment of unions of parishes in England and Wales. These unions were to be administered by boards of guardians comprising magistrates and parish ministers of the Church of England, ex officio, and representatives of parishes elected by ratepayers.

All the evidence from official reports and popular literature shows that the Act was loathed by the poor. However, although it was amended on several occasions to make it more appropriate to meet the needs of large urban areas and to respond to the problems of trade depressions and the special needs of children, the basic system remained in place until 1929 when provision for the poor was transferred to county and county borough councils. IJEK

**pop art** began in Britain in the mid-1950s and then spread to America. The movement was based upon the assumption that all aspects of modern life, including advertising, cinema, popular music, and consumer goods, were in themselves art-forms. The term was coined by art critic Lawrence Alloway, one of a number of artists, architects, and critics, known as the Independent Group, who met at the Institute of Contemporary Art in London. Among the more important names associated with British pop art were Eduardo Paolozzi, Richard Hamilton, Peter Blake, and David Hockney. JC

**Pope, Alexander** (1688–1744). English poet and master of the heroic couplet. Largely self-educated, the son of a Roman catholic draper, and crippled by a tubercular condition during his adolescence, Pope was always an outsider, although his precocious poetic talents quickly brought him to the attention of the literati. He made his reputation with his *Pastorals* (1709), the verse *Essay on Criticism* (1711), and the

heroic-comical *Rape of the Lock* (1712, 1714). *Windsor-Forest* (1713), at once a paean to peace and a celebration of British imperialism, led to his vital association with \*Swift, \*Gay, and the Scriblerus Club, and his later involvement in political satire, particularly at the expense of \*Walpole, beginning with *The Dunciad* (1728). While the *Moral Essays* (1731–5) and *An Essay on Man* (1733–4) employed moral and philosophical themes to expose contemporary failings, the more strident criticism of the *Imitations of Horace* prepared the way for the apocalyptic revised *Dunciad* of 1743. Although suspected of Jacobite sympathies because of his opposition to Walpole and George II, Pope's party allegiances are difficult to establish with confidence. Financially independent as a consequence of his translations of Homer, Pope moved in 1718 to Twickenham, where he spent the rest of his life, indulging his passion for gardening. JAD

**pop groups.** A term normally relating to popular music since the 1960s, when a new form of British pop music emphasized small groups of musicians playing guitars and drums, rather than star soloists. Centring on Liverpool, it drew elements from rock and roll, rhythm 'n' blues, and skiffle into a strong rhythmic style. The most famous group of this period, the \*Beatles, produced their first record in 1962, while their 1967 album *Sergeant Pepper's Lonely Hearts Club Band* exemplifies their musical range and the strong psychedelic influence typical at this time. In the late 1960s groups like Pink Floyd developed 'progressive rock', with complex compositions exploiting electro-acoustic sounds. The Rolling Stones and the Who were more aggressive, fostering a style that led in 1976 to punk rock with its noise, antisocial dress, and offensive behaviour. In the 1970s many groups adopted the Caribbean rhythms of reggae, an influence continued in the 1980s through the rhythmic speech of rap. ECR

**Popish plot,** 1678. Comprised of 43 articles deposed by two skilful fabricators, Titus \*Oates and Israel Tonge, before a London magistrate in September 1678, the 'plot' was a tissue of lies. It purported to reveal a Jesuit conspiracy to assassinate Charles II, assuring the succession to the catholic James, duke of York, through a French invasion of Ireland and a Jesuit-directed government in London. The ground had been prepared for the story's reception at least since 1672, owing to doubts over Charles's Anglican orthodoxy and his manipulation of a parliament he had kept in being since 1661. Immediately the plot compelled the king to dissolve Parliament; in the longer term it precipitated judicial murder and unprecedented party strife over excluding James from the succession. DDA

**population.** Despite the work of John Graunt, whose *Observations on the London bills of \*mortality* came out in 1662, and his friend Sir William \*Petty, whose *Political Arithmetick* was published in 1690, little was known for certain in the 18th cent. of the size of the population of Britain or even whether it was increasing or diminishing. Dr Richard Price in 1779, at a time when population growth was accelerating, argued that the population of England and Wales had decreased since the Glorious Revolution.

Since the country was at war with France and Price concluded that the French population was rising, this caused much alarm. In the absence of accurate statistics, the debate which followed was bound to be inconclusive. In Parliament it was argued that a census would provide Britain's enemies with valuable information but John Rickman in the 1790s lobbied with success and the first census for England, Wales, and Scotland was held in 1801. In 1821 the first complete census for Ireland was made. Though the census methods were crude by modern standards, the institution of decennial censuses offered a systematic basis for estimates and one which Rickman helped to refine and improve. The publication of \*Malthus's *Essay on Population* in 1798, revised and expanded in 1803, ensured that the subject received great attention for many years. The study of population in all its aspects has become an important branch of historical investigation, particularly since the Second World War, with the foundation of the journal *Population Studies* in 1947 and the establishment of the Cambridge Group for the History of Population and Social Structure in 1964.

Three broad generalizations may be offered. First, that the population history of the four peoples of the British Isles has been different and that there have been marked divergencies and changes within each group. Second, that until the late 18th cent. the population was small, with considerable fluctuations dependent upon the birth and death rates, harvests and famines, plague and warfare, immigration and emigration. From the late 18th cent., there was a sudden acceleration of growth until parts of England, the central region of Scotland, and parts of south Wales became among the most densely populated areas of Europe. Third, that in England, the growth of London from Tudor times was so rapid that it forms, in itself, a special factor.

Very few conclusions have been agreed about the population of the British Isles before the Norman Conquest. Large-scale migrations of Angles, Saxons, Jutes, Danes, and Norsemen, and substantial movements between Ireland, Scotland, and Wales, make estimates very hazardous. The population of Roman Britain remains highly conjectural with a disturbing divergence of scholarly opinion between 1 million and 6 million for the later 2nd cent. It has been suggested that London may have had 30,000 inhabitants, Colchester and Cirencester 15,000, Lincoln and Gloucester 5,000, and the remaining towns between 2,000 and 3,000. A figure of 20,000 has been proposed for Wales, though there is no way of checking it. Nor is it easier to offer figures for the subsequent Saxon period, since we cannot be sure to what extent devastation and warfare were offset by new arrivals. The consensus puts the figure for England towards the end of the Saxon period at about 1½ million, which would suggest a substantial decrease from later Roman times, and the towns significantly smaller—London at 12,000, York 8,000, Norwich and Lincoln 5,000. The most prudent historians of Ireland and Scotland refuse to suggest or endorse any estimates for those countries.

There is little disagreement that the population of England increased greatly between 1066 and the plague disasters of the mid-14th cent., though much less agreement about the exact figures. If the estimates for William I's reign, based

on Domesday Book returns, are correct, the population was about 1½ million and had more than doubled by 1300 to about 4 million. This was part of a general European pattern, assisted in England after the Conquest by the absence of major invasions and a lessening of internal conflict. The increase had almost certainly slowed by the time the \*Black Death struck, since the early 14th cent. saw adverse climatic changes and a pressure on subsistence which produced periodic famine. Plague then struck four times between 1349 and 1375 with devastating consequences. Estimates of mortality may be inferred from the death of clerics, which is recorded, and by information from particular villages or estates. But each source of evidence is open to hazard. The clergy as a profession might be unduly at risk from their obligation to visit and succour victims and therefore the 50 per cent death rate in the dioceses of Exeter, Winchester, Norwich, and Ely may not have been replicated in the country at large. Similarly, though all twelve of the bishop's villeins at Cuxham in Oxfordshire perished from plague in 1349, there were other villages and areas comparatively little affected. In short, it seems that over 40 per cent of the population died, with profound political and economic consequences. The Black Death also visited Ireland, Wales, and Scotland. Only in Scotland does the mortality seem to have been significantly lower, perhaps because the plague was at its most deadly in crowded towns and ports.

Recovery from the Black Death and its later visitations was slow. The population of England may have been reduced to about 2½ million. The poll-tax returns for 1377 have been employed to suggest total numbers, with the usual difficulties, but at least offer evidence on population distribution: East Anglia and the east midlands were most densely populated, the north and west much less so. Not until the middle of the 15th cent. did the rate of increase pick up and even then it was patchy. But during Tudor times, the population reached its pre-plague position and by the end of the 16th cent. stood at just over 4 million. Rickman, in an analysis of parish register returns, printed a preface to the 1841 census suggesting a figure of 4.3 million for 1600. The population of Ireland was about 1 million, that of Scotland perhaps a little less, with more than half of the inhabitants north of the Tay. Wales was still very thinly populated with about 350,000 people: Carmarthen, the largest town, had no more than 2,000 people—less than one-hundredth of the size of London—and followed by Brecon with 1,750. Elsewhere the size of towns was beginning to increase. At over 200,000 London was already the largest town in western Europe and outstripping all its rivals. The population of Norwich was about 15,000, Bristol and York about 12,000, Newcastle and Exeter, around 10,000—all of them important provincial centres and with good water communications.

From the 17th cent. the sources for demographic study improve. Thomas \*Cromwell ordered the keeping of parish registers from 1538, but many incumbents did not at first do so, and some registers have been destroyed by fire, flood, wars, and mice. They are augmented from 1629 onwards by the regular London bills of mortality. The high Tudor growth rate was not sustained throughout the whole 17th cent., when emigration, civil war, and plague dampened

## population

the increase. The population of England and Wales rose to about 5.4 million by 1656 and then steadied, or even declined slightly. The population of Wales cannot have increased greatly and by 1700 may have been 400,000. Scotland was affected by plague in the 1640s, heavy emigration to Ulster, and by severe famine in the 1690s. Its population in 1700 was probably little higher than in 1600: Edinburgh, by far the largest town, had between 30,000 and 40,000 people. Despite heavy warfare, the Irish population may have doubled by 1687 and reached well over 2 million by 1700, with Dublin beginning to grow rapidly. London continued to grow disproportionately, had reached half a million by 1700, and was larger than all the other urban centres together. Of great political importance for the future was the expansion of the American colonies, at about 250,000 by 1700, of whom some 10 per cent were negroes: New York, Boston, and Philadelphia were already sizeable towns, edging towards 10,000.

There were few indications at the beginning of the 18th cent. that the British Isles were on the threshold of a population explosion. Population increase had, if anything, slowed down, though the country had recovered from the ravages of the Black Death. The causes of the acceleration have been extensively debated. The establishment of voluntary hospitals and improved methods of combating smallpox were bound to be slow in their effect since they did not operate much outside urban areas. Plague at last disappeared, though contemporaries could not be certain that it would not return. Agricultural yields were improving and the development of turnpike roads and canals later in the century enabled food to be transported more quickly to areas of shortage. But any explanation must have a European dimension since the increase was a general one. The early view that the population rise was largely due to a falling death rate has been increasingly challenged, partly because the increase accompanied widespread urbanization and 18th-cent. cities were by no means healthy places. More emphasis is now placed upon a significant rise in fertility rates, as a result of people marrying earlier, and because a smaller proportion of the population remained unmarried. The move to towns may have freed young men to marry, since their labour was no longer needed on the family farm which could not support several households.

Though the causes of the great acceleration are still far from agreed, the consequences are clear. From the 1740s onwards, the population began to rise, not to fall again as it had so often in the past, but a sustained and incremental growth. From 5.7 million in 1750, the population of England reached 8.6 million by 1800 and 16.5 million by 1850. The Scottish population also grew, particularly in the industrial and trading towns of the central region, though less rapidly than that of England—from 1.2 million in 1750 to 1.6 million by 1800 and 2.8 million by 1850. But the most startling increase was in Ireland, where from about 3 million in 1750, it reached 5 million by 1800, and in 1845, on the brink of the famine, stood at well over 8 million, dangerously dependent on the potato harvest.

The Irish \*Famine, from 1845 to 1848, was a unique event in modern European demography and its effects comparable to those of the Black Death. One million people died

of starvation and disease, the birth rate fell, and there was a large-scale exodus, mainly of younger people, in the decades after the disaster. Well over a million people left Ireland in the 1840s, another million in the 1850s, and 850,000 in the 1860s—mainly for North America, and especially from Munster and Ulster. Co. Clare, with 286,000 people in 1841, had 85,000 100 years later. The Irish population was down to 6.5 million by 1851, 5.8 million by 1861, 4.4 million by 1901. A hundred years after the famine, it stood at 4.3 million, just over half what it had been in 1845.

In the rest of Britain, the sustained growth was felt in every part of public life. Internationally, it changed Britain's relative position. In 1550 the population of Spain and Portugal was double that of the British Isles: by 1914 the position was reversed. Just before 1914 the population of the United Kingdom passed that of France. But of greater long-term significance was the transformation brought about from the 17th cent. onwards by emigration, which brought into being the USA, Canada, Australia, and New Zealand and effected a fundamental shift in world power. At home, despite Malthus's fears of extra mouths to feed, agricultural improvements meant that fewer farm labourers could support more and more factory workers. The increase provided labour for the industrial expansion and purchasing power to sustain it. The internal balance of England shifted as the great industrial towns of the north developed. In Scotland, Glasgow rose from a town of 10,000 in 1688 to a conurbation of a million in 1901: in Wales, the balance of population moved to the mining areas of the south and Cardiff, a town of 1,800 people in 1801, had 128,000 inhabitants by 1901. The old electoral system, with its little Wiltshire and Cornish boroughs, looked increasingly absurd after 1801, when the census revealed that three of the six largest English towns—Manchester, Birmingham, and Leeds—had no MPs at all. The shift of power to the north after the \*Reform Act of 1832 and the \*Municipal Corporations Act of 1835 gave vast influence to the \*dissenters, who dominated towns like Bradford, Leeds, Manchester, and Halifax. The churches found their urban parishes swelling out of control, and there were massive building efforts by the dissenters in the earlier 19th cent. and the Anglicans in the later.

The population of England and Wales continued to rise in the 20th cent., though at a reduced rate. By 1996, England and Wales totalled 50 million, Scotland 5 million, Northern Ireland 1½ million, and Eire 3½ million. England became by far the most densely populated of the major European powers—four times the density of France, and on a par with Holland and Belgium. From this stemmed many social problems: of law and order, bearing in mind that a second-division football match in the 1990s might well attract a crowd twice the size of the second largest city of Stuart England; of traffic jams, road rage, and general transport policy; of noise pollution and broader environmental questions. The slowing down of the birth rate after the Second World War meant an ageing population, with heavy demands on medical care and for pensions. The general movement out of older towns led to the problem of decaying city centres. Substantial immigration from the Commonwealth in the 1950s and 1960s produced suburbs and, in some cases,

whole towns where the character of the community had changed. Though demography is a rarefied and demanding discipline, its implications are profound. JAC

Connell, K. H., *The Population of Ireland, 1750–1845* (1950); Flinn, M. W. (ed.), *Scottish Population from the Seventeenth Century to the 1930s* (Cambridge, 1977); Houston, R. A., *The Population History of Britain and Ireland, 1500–1750* (1992); Vaughan, W. E., and Fitzpatrick, A. J. (eds.), *Irish Historical Statistics: Population 1821–1971* (Dublin, 1978); Wrigley, E. A., and Schofield, R. S., *The Population History of England, 1541–1871* (Cambridge, Mass., 1981).

**Porson, Richard** (1759–1808). Scholar. Of comparatively humble family in Norfolk, Porson's youthful promise was so obvious that means were found to send him to Eton. Further contributions sent him to Trinity College, Cambridge, where he was elected to a fellowship. In July 1792, being unwilling to take holy orders, he lost the fellowship, but five months later was elected to the regius chair of Greek. He did not lecture, rarely visited the university, but studied in London, producing a celebrated edition of Euripides. The London Institution elected him librarian, at a good salary, but his attendance was hardly adequate. His health deteriorated quickly, partly as a result of drink. A reclusive scholar, unpredictable, eccentric, and untidy, his life was textual commentary. In his last illness, he finished up, speechless, in St Martin's workhouse, which advertised to see if anyone could identify 'a tall man, apparently about 45 years of age, . . . and having in his pocket a memorandum book, the leaves of which were filled with Greek lines, written in pencil'. JAC

**Portal, Charles, 1st Viscount Portal** (1893–1971). Portal came from a Berkshire gentry family of Huguenot ancestry. After Winchester and Christ Church, Oxford, he joined the army at the outbreak of war in 1914 but in 1915 transferred to the \*Royal Flying Corps, and flew more than 900 sorties before 1918. Promoted air marshal in 1939 he took over Bomber Command in 1940, but after six months became chief of the air staff, which he retained until the end of the war. Tall, hawk-like, and able, he protected \*Tedder and, like most people, found 'Bomber' \*Harris difficult to work with. After the war he served as controller of the atomic energy establishment at Harwell (1946–51) and as chairman of the British Aircraft Corporation (1960–8). Eisenhower thought Portal the finest of all the war leaders, 'greater than Churchill', and \*Churchill himself remarked that Portal 'had everything'. JAC

**Porteous riots**, 1736. In Edinburgh on 14 April 1736 the hanging of a smuggler sparked an angry reaction from the watching crowd, and as the body was cut down stones were thrown at the town guard. The troops then opened fire, though Captain John Porteous always denied that he gave the order. Six were killed and about a dozen more injured. The provost feared the mood of the populace and had Porteous arrested; he was tried by the Court of Judiciary and sentenced to be executed. But the government, concerned that the partiality of these proceedings had compromised its authority in the city, granted Porteous a temporary reprieve. Resentment was widespread, and on 7 September a mob of 4,000 stormed the Tolbooth prison,

seized the captain, and hanged him. A parliamentary inquiry in 1737 resulted in punitive measures against the city, but the episode cost \*Walpole much Scottish support in Parliament, which played an important part in his downfall in 1742.

AAH

**Portland, battle of**, 1653. Naval engagement in the first Anglo-Dutch War, which developed into a running fight up the Channel from 18–20 February. A large fleet under \*Blake encountered Martin Tromp's fleet off Portland Bill escorting a convoy. Tromp lost twelve warships but saved most of the convoy. JAC

**Portland, Hans Willem van Bentinck, 1st earl of** (c.1649–1709). Dutch confidant of William III. Entering the household of William of Orange in the early 1660s, Bentinck went on to become the prince's close friend and right-hand man, playing an important diplomatic role in the preparations for William's invasion of England in 1688. On becoming king, William rewarded Bentinck handsomely with English lands and honours, and in April 1689 he was given an earldom. A general in both the English and Dutch armies, he attended the king throughout his campaigns in Ireland and Flanders, and his informal negotiations with the French in 1697 opened the way for peace. But his vast wealth and close proximity to William made him deeply unpopular. He was impeached in 1701 for keeping English ministers in ignorance of his negotiations with France over the partition of Spain, but was never put on trial. He retired from court following William's death in 1702. AAH

**Portland, William Cavendish-Bentinck, 3rd duke of** (1738–1809). Portland began his career as a follower of \*Newcastle and rose to the status of second in command to \*Rockingham, succeeding the latter as official head of the Whig opposition in 1782. He shared the leadership with the party's principal Commons spokesman, Charles \*Fox, whose charismatic personality has obscured Portland's underrated role. As nominal premier during the short-lived Fox–North coalition ministry, Portland conducted a series of difficult negotiations with the king, which belie his reputation for weakness and indecision. The \*India Bill crisis, which precipitated the fall of the coalition, set the pattern of politics for a decade, with Portland and Fox the twin leaders of an increasingly organized Whig opposition. Although Portland was a hard-working party organizer, the limitations of his leadership were revealed both during the \*Regency crisis and, more seriously, by the repercussions of the French Revolution, heralded by \*Burke's jeremiads. The duke long resisted the pressure to break with Fox, but in 1794 led the conservative Whigs into coalition with Pitt. As home secretary (1794–1801) Portland favoured the use of surveillance and repression to counter the threat of radicalism. He was also a prime mover in the recall of \*Fitzwilliam from Ireland in 1795 over the question of catholic emancipation—though the assertion that this amounted to a betrayal is not borne out by the surviving evidence. The Fitzwilliam episode contributed to the decline of the Portland Whigs as a distinct group within the ministry and by the early 19th cent. Portland had ceased

## Portland

to be a party leader, but had become an elder statesman, respected by the king. For this reason the aged and infirm duke became the figurehead prime minister (1807–9) in a ministry containing the germs of the Toryism that was later to flourish under \*Liverpool. Portland's career ended on a sour note with the unseemly duel between two of his cabinet colleagues, \*Canning and \*Castlereagh, an event for which the duke's misguided prevarication must be held partly responsible. DW

**Portland, Richard Weston, 1st earl of** (1577–1635). Of an Essex family, Weston trained at the Middle Temple and sat in the House of Commons for various constituencies until raised to the peerage. After administrative and diplomatic posts, he was appointed chancellor of the Exchequer in 1621 and held the post until 1628 when he became lord treasurer. In 1628 he was given a barony, appointed to the Garter in 1630, and advanced to the earldom in 1633. After \*Buckingham's murder, he was the most influential of Charles I's ministers. A catholic, he was sympathetic to Spain and determined to avoid war, partly to reduce reliance upon Parliament. \*Clarendon's long account is hostile, claiming that he was imperious, unpopular, and ambitious. But his policies appear moderate and Charles's difficulties began soon after Portland's death. JAC

**Portsmouth** is not mentioned in \*Domesday Book (1086) but began to develop on Portsea Island as Portchester, on a Roman site, started to silt up. It was granted a charter by Richard I in 1194 and the growth of the navy in the 16th cent. established it as a major town. Henry VII began a dry dock there in 1495, the \*Mary Rose sank off Portsmouth harbour in 1545, and the duke of \*Buckingham was stabbed to death in the Greyhound Inn in 1628 when leaving for the expedition to La Rochelle. From the time of Charles II, Portsmouth became the chief naval base. The Royal Naval College was founded in 1720, the \*Royal George went down in the harbour in 1782, and on 15 September 1805 \*Nelson hoisted sail in \*Victory for \*Trafalgar. His flagship is preserved at Portsmouth today. By 1801 the town had a population of 32,000, 94,000 by 1861, and 189,000 by 1993. The naval presence has diminished but Portsmouth has developed engineering and tourism. There are ferry sailings to the Isle of Wight and to France and northern Spain. JAC

**Portsmouth, diocese of.** The see, comprising south-east Hampshire and the Isle of Wight, was carved, with \*Guildford, out of the \*Winchester diocese in 1927. It has a close association with the Royal Navy. The cathedral, the former parish church of St Thomas of Canterbury, originally built c.1190, has an Early English east end and a late 17th-cent. nave and tower (1683–95). Further extensions were completed in 1992. WMM

**Portsmouth, Louise de Kéroualle, duchess of** (1649–1734). Of Breton lineage, Louise de Kéroualle accompanied Henrietta Anne, sister of Charles II, to England in 1670; Charles's despair at Henrietta's sudden death and obvious infatuation with Louise encouraged Louis XIV to send her back to England. Her baby-faced charms led Charles to call her 'Fubbs' (fubby=chubby), though her emotional

outbursts prompted 'the weeping willow' from Nell \*Gwyn, and she rapidly rose to become 'the most absolute of the king's mistresses'. Her son by Charles (1672) was created duke of Richmond and she herself made duchess of Portsmouth in 1673. Universally unpopular as Frenchwoman and catholic, she was mercenary, recklessly extravagant, and haughty to inferiors; her Whitehall apartment, extended and altered 1672–4 (further rebuilt 1678), was so luxuriously furnished and full of silver plate as to surfeit \*Evelyn. James II offered reassurances of protection, but after the 1691 fire she returned to France. ASH

**Portugal, relations with.** The first treaty with 'England's oldest ally' dates from 1373. \*John of Gaunt led English forces in the mid-1380s on the side of Portugal against Castile, and the alliance was confirmed by the treaty of Windsor in 1386. The modern connection dates from a treaty concluded by \*Cromwell in 1654 which gave the English considerable trading advantages. Ties were further strengthened by Charles II's marriage to \*Catherine of Braganza in 1662. The \*Methuen treaty of 1703 was another milestone. The complementary character of the English and Portuguese economies, the importance of Portuguese independence and its colonies to Britain, the value of its ports (notably Lisbon and the Tagus estuary) to the Royal Navy in many parts of the world, and Portugal's need for a defender against its larger neighbour, together made for a strong but uneven connection. In 1808 the British initiated military operations in Portugal which developed into the ultimately victorious Peninsular campaign. \*Wellington for a time was forced to hold out around Lisbon behind the famous \*Torres Vedras lines. In 1826 a small British force arrived in Lisbon to defend the constitutional regime from reactionary groups assisted by Spain. In the early 1830s the British gave further indirect aid against the reactionary forces of Dom Miguel, and, with France, warned against meddling by the absolutist great powers. Britain under \*Palmerston continued to show a sometimes controversial interest in the independence and political stability of Portugal. With the fall of the autocratic regime of Dr Caetano in 1974 Britain (with other European states) provided support to parliamentary groups at a time when a communist take-over was considered possible. CJB

**positivism** was the philosophical system originated by Henri, comte de Saint-Simon, and developed by Auguste Comte. Positivists hold that science is the only valid form of knowledge, and that 'positive' facts—the sole subject-matter of science—are the only valid objects of knowledge. We must accept the natural world as we experience it, and not attempt to go behind nature in search of some ultimate reality or metaphysics. For positivists all aspects of human life, including politics, ethics, and even religion, could be established on a scientific basis, since human values were themselves simply facts. According to Comte, there have been three phases of intellectual development. The first was the theological stage, in which events in the physical world were explained in terms of external miraculous powers. The second was the metaphysical stage, in which natural events were assumed to be caused by some intrinsic

quality or vital spirit within natural phenomena. Only in the third, the scientific or positive stage, has mankind advanced beyond pseudo-explanation to genuine knowledge. Progress depends upon scientific development, and the ultimate society is one ruled by a sociocracy, a scientific élite, dedicated to the worship of humanity (the positivist divinity which replaces God). Comte had few British disciples, though Buckle was attracted by positivism. But he influenced many scientists, philosophers, and sociologists, and positivism became part of the western scientific attitude in the 20th cent. TSG

**Post Office.** Before the 17th cent., royal ministers had their own king's messengers, but private persons sent letters through servants or friends. Henry VIII had a master of the posts in 1512 but he served only the government. The first attempt at a public system was in 1635 when a service was established to important towns, carrying letters at 2 pence per sheet per 80 miles. Under the Commonwealth, \*Thurloe was appointed postmaster-general in 1657 and the arrangement was continued at the Restoration. In 1680 a London penny post was started and soon taken over by the government; penny posts were established in large provincial towns in the later 18th cent. Members of both Houses of Parliament had the privilege of free postage (save for the penny post) and gave large numbers of franks to friends, constituents, or even business colleagues: the privilege was not abolished until 1840. Two 18th-cent. developments were Ralph Allen's scheme of cross-country services, followed by John Palmer's introduction of scheduled mail coaches. Rowland \*Hill's plan of penny postage was adopted in 1840 in the teeth of powerful opposition: prepayment through stamps was introduced and there was no extra charge for mileage. It was followed in the 1850s by the introduction of pillar boxes (a suggestion of Anthony \*Trollope), which put an end to the bellmen who had rung for final collections. The services offered by post offices proliferated—the introduction of telegrams delivered by messenger boys; the establishment by \*Gladstone in 1861 of the Post Office Savings Bank; and the beginning of parcel post in 1883. Penny post was a casualty of the First World War, the rate going up to 1½ pence in June 1918, and after the Second World War inflation brought constant increases. The start of the use of post offices for a variety of welfare payments was the decision in 1908 to deliver \*old-age pensions through them. JAC

**Potsdam conference,** 16 July–2 August 1945. This overlapped a British general election, \*Churchill and \*Eden being replaced midway by \*Attlee and \*Bevin (Labour). The Americans and Russians, however, observed no significant change in British policy, with both struck by Bevin's pugnacity. A compromise was reached on German reparations—the Treasury having earlier expressed its concern at the cost of the British occupation zone unless reparations were restricted and Germany treated as one economic unit. Churchill hoped that the acquisition of the atomic bomb by the USA would increase the bargaining power of the West with the USSR as well as hasten the end of the war with Japan. CJB

**Potter, Beatrix** (1866–1943). Writer and illustrator of children's books. Born in London, taught by governesses, she combined her early love of drawing with a keen interest in natural history, copying flowers and drawing small animals kept as pets or found on summer holidays in Scotland and the Lakes. Illustrated anecdotes about her pet rabbit, sent to amuse a convalescing child, inspired her first published book, *The Tale of Peter Rabbit*, in 1901. It was soon followed by *The Tale of Squirrel Nutkin*, *The Tailor of Gloucester*, and others. Immediately successful, they remain nursery classics with Mrs Tiggywinkle, Jeremy Fisher, and Jemima Puddleduck among many favourite characters. In 1905 she bought Hilltop Farm in the Lake District and in 1913 married William Heelis, a solicitor. Ultimately a successful sheep-breeder and landowner, actively concerned with the preservation of the Lake District, she left her extensive property to the National Trust. AM

**Powell, J. Enoch** (1912–98). The key to what might appear Powell's maverick political career was belief in Britain. Educated at King Edward's School, Birmingham, he began as a classicist, was a fellow of Trinity College, Cambridge, and then professor of Greek at Sydney. During the war he rose to brigadier. Elected to Parliament in 1950, he was a keen advocate of monetarism and resigned as financial secretary to the Treasury in the \*Macmillan government in 1957, though returning as minister of health in 1960. He declined to serve under \*Home in 1963 and never held office again. His outspoken hostility to coloured immigration led \*Heath to sack him from the shadow cabinet in 1968, though his proposals for repatriation had considerable popular support. He was at odds with his party once more over Europe, bitterly denouncing the loss of British sovereignty, and he retired in February 1974 advising his supporters to vote Labour. Miraculously reborn as an Ulster Unionist in October 1974, he won the Down South seat and held it until 1987, tenaciously defending Ulster's position against encroachment and concession. Like many intellectuals, his logic guided him into passionate and uncompromising positions. JAC

**Powys.** County of the middle Welsh borderland. The name derives from the Welsh kingdom of post-Roman times. With Norman control it was divided into a series of marcher lordships which were themselves integrated in 1536 into the counties of Denbighshire and Montgomeryshire. It was not until the Local Government Act of 1972 that the name was revived and given, not completely appropriately, to the new county formed by the merging of Montgomeryshire, Radnorshire, and Breconshire. The White Paper 'Local Government in Wales' referred to it as 'a reasonably homogeneous area, even though its resources are poor'. The adverb 'reasonably' hides considerable diversity, but it was because of limited size (Radnorshire had a population of only 23,360) and resources that no changes were made in 1994 and in spite of active campaigning by Montgomeryshire, Powys was retained in 1996 as a unitary authority, with only minor adjustments. HC

## Powys

**Powys, kingdom of.** A Welsh kingdom that survived the English conquest as part of the march of Wales. Although its origins are unclear, the name may come from *pagus* (or *pagenses*), the Roman term for the hinterland of the \*Cornovii; but the first reference to Powys dates from the 9th cent. Its kings claimed descent from northern Britons, a royal centre at 'Pengwern' (?Shrewsbury), and a role in resisting early English invaders. There does seem to have been a kingdom covering central Wales and modern Shropshire whose eastern part was overrun by Mercians from the mid-7th cent. Powys withstood encroachments from England and \*Gwynedd throughout its existence, although the Welsh custom of partible inheritance caused rivalries among the ruling family. The most powerful prince, \*Madog ap Maredudd, was the last to rule over all Powys. After his death (1160) it was divided, Powys Wenwynwyn (the south) being named after his nephew's son, with a centre at Welshpool, and Powys Fadog (the north) after his grandson, with its centre at Dinas Brân. By 1300 both were absorbed into the polity of the marcher lordships. The name survived in Welsh tradition and in the castle and barony of Powis; in the local government reorganization of 1972 it was given to the combined counties of Brecon, Radnor, and Montgomery, much of which had never been part of earlier Powys. RAG

**Poyning's law,** 1494. Sir Edward Poyning served as lord deputy in Ireland from 1494 to 1496. A parliament summoned at Drogheda in December 1494 declared that the English Privy Council must approve the summoning of any Irish parliament and agree to legislation, and that English laws applied to Ireland. Despite Irish protests, the position was reaffirmed by 6 Geo. I c. 5 in 1719 which stated that Ireland 'is and of right ought to be subordinate unto and dependent upon the imperial crown of Great Britain' and that the Irish House of Lords had no appellate jurisdiction. Poyning's Act was not repealed until 1782, when the \*Rockingham's conceded Irish legislative independence. JAC

**Praemunire statutes.** The statutes of Praemunire, the first dating from 1351, were passed to prevent the pope from interfering with the king's rights in relation to clergy benefices in England. The statutes imposed penalties on anyone who invoked papal authority to oust the jurisdiction of the king's courts. In 1363 a statute provided that any persons who offended against the statutes must answer for their action before the king's \*council. This was to be of great significance in the Reformation period and was one of the principal grounds for arraigning before the council those who sought to appeal to Rome, or to accept the authority of the pope after Henry VIII's break with Rome. MM

**Pragmatic Sanction.** An edict of 1713 attempting to ensure the undisputed and undivided succession of the Habsburg lands when Charles VI should die by setting aside the claims of his elder brother's daughters in favour of any daughters he should have. The cause of great diplomatic activity in the 1720s and 1730s, it did not suffice to prevent Maria

Theresa being attacked in 1740 by Prussia, France, Spain, Saxony, and Bavaria. Britain came to her assistance and helped to place a pragmatic army in the field. JAC

**Prayer Book.** See BOOK OF COMMON PRAYER.

**Prayer Book rising,** 1549. The regime of Protector \*Somerset at the accession of Edward VI moved sharply towards protestantism and in January 1549 Parliament ordered the new \*Book of Common Prayer in English to be used. The day after it was introduced at \*Sampford Courtenay in Devon the villagers demanded that their priest should say the old mass, complaining that the new service was like some 'Christmas game' and in a language they could not comprehend. Joined by insurgents from Cornwall, they besieged Exeter. Protector Somerset, with \*Kett's rising in Norfolk to deal with as well, moved cautiously, but on 17 August at Sampford Courtenay, Lord Russell (\*Bedford) subdued the rebels. Somerset's hesitancy helped to undermine his position. Lord Russell was rewarded by promotion to the earldom of Bedford. JAC

**Premonstratensians** (also known as the 'white canons' or 'Norbertines') were founded at Prémontré (north-eastern France) in 1120 by St Norbert who, after his conversion, was a canon at Xanten (his birthplace) before becoming a wandering preacher. In 1126 he was appointed archbishop of Magdeburg. The early community followed an austere interpretation of the \*Augustinian rule, heavily influenced, however, by the \*Cistercians. Originally the order included double houses of canons and nuns, but these were suppressed in 1140, the nuns being housed in separate nunneries, of which there were initially four in England. The first house of canons was established in England in 1143 at Newhouse and by the dissolution there were 35 English communities, one in Wales, and several in Scotland, including Dryburgh. Foundations were never very prosperous, perhaps reflecting the relatively modest status of most of their patrons and benefactors: the wealthiest abbey at the dissolution was Torre (Devon) with a net annual income of nearly £400. BJG

**Pre-Raphaelites** (1848–c.1854). The Pre-Raphaelite Brotherhood, also known by the initials PRB, was a short-lived, essentially English, association of seven artists, including Holman \*Hunt, \*Millais, and Dante Gabriel \*Rossetti. Disliking what they felt was the superficiality of 16th-cent. Italian art, they sought to recapture the direct religious sincerity of pre-Renaissance painting. The movement was very literary, painting deeply symbolic historical, poetic, or religious subjects with great attention to detail, using pure, bright colours. 'The Pre-Raphaelites had but one idea—to present on canvas what they saw in Nature' (Millais).

The work of the Brotherhood was, at first, well received. Only when the meaning of the initials PRB, on their paintings, became understood was there a protest, the brothers accused of blasphemy and of setting themselves up as better than Raphael. The influential art critic John \*Ruskin intervened on their behalf in 1851, and their reputation began to improve. Other artists adopted the brotherhood technique so that many paintings thought of as typically Pre-Raphaelite

were not in fact painted by the founders. By the early 1850s the brotherhood was in decline and had dissolved by 1855. Rossetti founded a second brotherhood at Oxford with Edward Burne-Jones and William Morris (c.1860s–90s). JC

**Prerogative.** See ROYAL PREROGATIVE.

**presbyterians** were supporters of \*calvinism, preaching the doctrine of the elect and advocating church government by a hierarchy of courts—the kirk session, the presbytery in a locality, the synod in a region, and the general assembly, consisting of ministers and elders, governing the whole church. Ultimate authority was the Bible and services gave great prominence to preaching. The leading exponent of presbyterianism in the Elizabethan church was Thomas \*Cartwright, responsible for the \*millenary petition to James I in 1603, which objected to surplices, bowing at the name of Jesus, and other ceremonies. They were in strong opposition to Archbishop \*Laud, and after his imprisonment dominated the \*Westminster Assembly called by Parliament in 1643 to reform the church. The Westminster Confession which they put forward and which was accepted by Parliament in 1648 was a presbyterian statement and the basis for their domination during the \*Commonwealth and \*Protectorate. Bishops were abolished, statues and pictures removed, ceremonies cleansed. In Scotland, presbyterianism, brought by John \*Knox from Geneva in 1559, made rapid progress and was the core of the \*solemn league and covenant, adopted in 1643.

After the Restoration, the fortunes of English and Scottish presbyterianism diverged. In England, hopes of a compromise with the Church of England faded fast and many of the 2,000 ministers forced out by the Act of \*Uniformity in 1662 were presbyterians. Thereafter, presbyterianism formed a declining dissenting sect, vulnerable to \*socinian and \*unitarian arguments in the early 18th cent. and outdistanced by the \*Methodists in the later 18th cent. The Presbyterian Church in England, re-established in 1844, was reported to have only 76 places of worship in 1851—one-fifth the number of \*Quaker meeting-houses. After severe persecution in the reigns of Charles II and James II, the Scottish presbyterians emerged triumphant in 1690, when their church was recognized as the established \*Church of Scotland. Its special position was guaranteed by the Act of \*Union of 1707. JAC

**press-gangs.** The British crown possessed an ancient right to seize for naval service 'seamen, seafaring men and persons whose occupations or callings are to work upon vessels and boats upon rivers'. The 18th-cent. jurist \*Blackstone stated that 'The power of impressing men for the sea service by the royal commission . . . is of very ancient date, and has been uniformly continued by a regular series of precedents.' The power was implicitly recognized in statutes from the late 14th cent. onwards. The term 'impress' derives from the 'imprest' money paid to recruits for the armed forces. Several attempts to replace this system of arbitrary conscription failed. A 1696 scheme for registering seamen for limited periods of service was abandoned in 1711. Pitt's Quota Acts of 1795 also failed to remove the need for impressment.

Press-gangs hunting seamen came either from individual warships or from the Impress Service which developed within the navy in the later 18th cent. and reached its peak of sophistication during the Napoleonic War. In 1809 the service employed 24 captains and 56 lieutenants. With death rates in the navy very high, particularly in the West Indies, seizure by a press-gang was no light matter. Impressment fell into disuse after 1815, as social changes made its harshness unacceptable, but no satisfactory alternative for manning the navy was developed until much later in the 19th cent. NMC

**Preston, battle of, 1648.** The first civil war ended in 1646 when Charles I gave himself up to the Scots at Southwell. Late the following year, he signed an \*'Engagement' with the Scots, agreeing to a presbyterian church order for three years. In the spring of 1648 a series of uncoordinated risings heralded the second civil war. In July a sizeable Scottish army under \*Hamilton crossed the border near Carlisle, shadowed by \*Lambert. \*Cromwell wound up his operations in Wales and hastened to join Lambert. Hamilton missed his chance to crush Lambert before the junction could be effected at Knaresborough. The parliamentary force then crossed the Pennines to cut off Hamilton's retreat to Scotland. Hamilton had substantially more men, but they were badly strung out and were caught still disorganized outside Preston on 17 August. When the royalists withdrew south during the night, a running fight developed. Hamilton's infantry surrendered at Warrington: he and his cavalry were eventually rounded up at Uttoxeter. The defeat at Preston spelled Charles's doom since the army leaders now regarded him as a man of blood, impossible to deal with. The king was executed in January 1649 and Hamilton six weeks later. JAC

**Preston, battle of, 1715.** The Jacobite rising in Northumberland was under the command of Thomas Forster, member of Parliament for the county. He occupied Holy Island for one day, failed to take Newcastle, and joined with Scottish Jacobites at Rothbury. The rebels then made for Lancashire, where they hoped to find support, moving through Brampton, Penrith, and Kendal. At Preston they were bottled up by Hanoverian forces led by Carpenter and Wills, and capitulated on 14 November. Forster subsequently made a daring escape from Newgate and joined the pretender abroad. JAC

**Prestonpans, battle of, 1745.** Charles Edward \*Stuart's first and critically important victory in the '45 rising was gained on 21 September at Prestonpans, on the coast east of Edinburgh. The Hanoverian army of some 2,300 men, under the command of Sir John Cope, had been ferried from Inverness to Dunbar to cut off the rebels' advance south. The issue was decided within a few minutes by a fierce Highland charge at dawn. Cope, forced to flee to Coldstream and Berwick, was much ridiculed, but his dispositions were perfectly sound and he was exonerated by a court martial. JAC

**Pretoria, convention of, 1881.** This convention brought to an end the first \*Boer War, which followed the British

## prices

annexation of the Transvaal in 1877. The Boers were given self-government, but the British retained suzerainty and the conduct of foreign relations. This shaky compromise was undermined by the discovery of gold on the Witwatersrand south of Pretoria in 1886. JAC

**prices** reflect the payments made by consumers for the goods and services that they buy. Prices relate not only to the goods bought in shops but also to factor inputs. Inputs prices reflect the payments required to attract factors of production into the market—i.e. wages, rent, interest, and profit for labour, land, capital, and entrepreneurship respectively. While monetary prices are the norm today, in earlier times prices were represented by the relative worth of goods used in trade. Indeed, there are still many goods and services which have no money prices attached to them because they are outside the market process.

Prices for individual commodities vary as market conditions of supply and demand fluctuate. If demand rises then, without a commensurate increase in supply, prices will also rise. Equally, a contraction in supply will, other things unchanged, result in higher prices. In the past, for instance, the price of foodstuffs fluctuated considerably according to the nature of the harvest—poor harvests in the 1840s, for example, pushing up the price of wheat and potatoes. Speculation about future market conditions can also result in price changes with anticipation of shortages pushing up prices. There may also be price rises if the currency is debased (e.g. the gold content of coins reduced) or confidence is lost in its acceptability.

A general rise in prices across all commodities is inflation and a fall in prices is deflation. The rate of inflation in Britain has fluctuated considerably although never to the same extent as experienced in countries such as Germany, which suffered hyperinflation in the late 1920s. Britain was affected by the severe inflation experienced across the Roman empire under Diocletian in the 3rd cent. but price data do not exist for England until the Middle Ages. The medieval period saw only modest overall general price rises although there were periods of rising prices—e.g. after the \*Black Death had swept Europe (1348/9)—interspersed with periods of falling prices. This trend continued through the next centuries but with bouts of rapid price rises. These periods of high inflation were often associated with wars and the pressures to finance them. Wars increase the demand for goods but reduce the available resources to produce them. Prices rose, for instance during the Revolutionary and Napoleonic wars (1793–1815). There have also been times, most notably in the Tudor period, when the currency has been debased, reducing its value and creating general price rises. Since the deflation of the Great Depression of the 1930s, however, Britain, in line with other industrial countries, has experienced consistently gradually rising prices. The price increases have generally been low, 2–4 per cent a year, but have included a period of quite rapid inflation—over 10 per cent p.a.—in the early 1980s.

The underlying causes of general price rises are disputed but, since high levels of inflation are seen as socially inequitable and can reduce confidence in a country's economy,

understanding them is important for policy-making. Traditionally, classical economists supported the quantity theory of money as explaining price levels. The idea, in its simple form, was that any increase in money supply directly pushes up prices. To contain inflation, advocates of this school look to controlling the money supply. The more recent Keynesian theories focus on aggregate demand and market distortions—demand pull theories of inflation. They emphasize the role of price controls and the regulation of total expenditure.

The state has periodically attempted directly to regulate prices. There is a long history of price controls over monopoly suppliers. When markets are perfectly competitive, no individual actor has sufficient influence to affect prices—they are determined by Adam \*Smith's 'invisible hand'. Where markets are imperfect, those with monopoly (or monopsony) power can withhold supply and increase prices beyond the competitive level. Action is then taken either to limit prices by reducing the monopoly power of the supplier or by acting directly on the prices permitted.

At various times in recent history there have also been efforts by government to control the general prices (e.g. price and incomes policies) especially during wartime and as a counter-inflation strategy. In some instances (e.g. for periods of rationing during the world wars) the price mechanism has been abandoned over parts of the economy. Macro-efforts at price control have, however, in general, proved to be singularly unsuccessful as long-term policies, producing political difficulties and tending to run against the natural tide of market forces. KJB

**Pride's Purge** was a military *coup* by \*Fairfax's army, organized by Commissary-General \*Ireton and executed on 6–7 December 1648 by Colonel Thomas Pride. Its purpose was to prevent the conclusion of the so-called treaty of \*Newport between the Long Parliament and Charles I, whom it would have reinstated on terms that the army considered unsafe and unjust. Ireton had intended to dissolve the Parliament, but was persuaded by friendly members to purge it instead, upon their promise that it would soon dissolve itself. Pride prevented 231 known supporters of the treaty from entering the House, and imprisoned 45 of them. What was left became known as the \*Rump. AHW

**Priestley, Joseph** (1733–1804). Chemist, clergyman, and political theorist. Priestley was born in Yorkshire and educated at Batley Grammar School and at Daventry dissenting academy. An amateur scientist of great renown, his discovery of 'dephlogisticated air', later named oxygen by Lavoisier, transformed the study of chemistry. As a theologian, Priestley moved from \*presbyterianism via arianism to a unitarian position. He argued against the atonement; questioned traditional views of the person of Christ; and rejected the doctrine of Christ's perfection. He was a lively polemicist. His *Essay on the Principles of Government* (1768) was a strong plea for liberty, and he campaigned for the repeal of the Test and Corporation Acts and for the abolition of the slave trade. An incautious phrase in his *Letter to Edward Burn* (1790) caused him to be satirized as 'Gunpowder Priestley', plotting to blow up the British constitution, and brought

down upon him the wrath of the Birmingham 'church and king' mob. In July 1791 it burned his house, wrecked his laboratory, and destroyed most of his papers. Priestley left England and spent the rest of his life in Pennsylvania.

TSG

**prime minister.** The modern office of prime minister developed over several centuries. Medieval and early modern monarchs often had chief ministers and advisers on whom they greatly relied and who wielded vast power—men such as Cardinal \*Morton in Henry VII's reign, \*Burghley under Queen Elizabeth, and \*Buckingham for James I and Charles I. But they depended totally upon the favour of the monarch, as the fate of \*Wolsey, Thomas \*Cromwell, and \*Clarendon demonstrated. The crucial change came after 1688 when it became necessary to summon Parliament every year, and the ability to manage it, and particularly the House of Commons which held the purse-strings, became a vital political qualification. Robert \*Harley, later earl of Oxford, in Anne's reign, had some of the attributes of a prime minister, including a keen understanding of the growing power of the press, but the title of first prime minister is usually given to Sir Robert \*Walpole, though the term was derogatory and he denied it. His 21 years in office (still a record) reflected political judgement, financial acumen, debating ability, but also his standing at court, and he nearly lost power in 1727 on the death of George I. The subsequent development of the office depended upon the gradual development of party, which limited the king's choice of minister; on the growing complexity of public business, which demanded a co-ordinating hand; on the slow decline in the influence of the monarch, whose personal approbation remained useful but, by the 19th cent., was no longer essential, as the long careers of \*Liverpool, \*Palmerston, and \*Gladstone demonstrated; and on the development of an organized public opinion, expressed through a reformed electoral system, which substituted the choice of the voters for the choice of the monarch.

Lord \*North during the American War was still inclined, particularly in moments of crisis, to shuffle off responsibility: in 1778 he told the Commons that 'he did not think our constitution authorized such a character as that animal called a prime minister'. But William \*Pitt, a stronger man, took a more determined view of the office, in both theory and practice, observing in 1803 that 'there should be an avowed and real minister, possessing the chief weight in the council, and the principal place in the confidence of the king . . . There can be no rivalry or division of power. That power must rest in the person generally called the First Minister, and that minister ought, he thinks, to be the person at the head of the finances.'

As the office grew in stature, the prime minister gradually took over many of the powers of the monarch—the granting and timing of a dissolution of Parliament, the appointment and replacement of ministerial colleagues, and, above all, the granting of honours. Monarchs fought rearguard actions and occasionally won successes, but the general drift was against them. Two heavy blows came in quick succession. In 1832 William IV, with great reluctance, agreed to create

enough Whig peers if needed to carry Lord \*Grey's reform bill, thus allowing a vital royal prerogative to fall into the hands of a determined prime minister: three years later, when he dismissed Lord \*Melbourne, he was obliged to recall him after \*Peel had failed to win a majority at the general election. Even at court, the monarch was often on the defensive. As early as 1755 George II complained that \*Newcastle 'meddled with the bedchamber', and in 1839 Victoria fought another rearguard action in defence of her 'ladies'.

Though the power of the office was clearly established by the mid-19th cent., it retained something of its disreputable flavour and was slow to be acknowledged. But in 1865 \*Bagehot wrote bluntly that 'the Queen is only at the head of the dignified part of the constitution. The prime minister is at the head of the efficient part.' In 1878 at the Congress of \*Berlin, Beaconsfield (\*Disraeli) was referred to as 'Prime Minister of Her Britannic Majesty', and in 1905 a royal warrant gave the prime minister precedence after the archbishop of York.

JAC

The development of the office of prime minister has been closely linked to the growth of the party system. For all but ten years of the 20th cent. to the present the prime minister has been the leader of the majority party in the House of Commons. The three exceptions were \*Lloyd George (1916–22), \*MacDonald (1931–5), and, for a few months in 1940, Winston \*Churchill. Lloyd George was first appointed during the First World War, and MacDonald held office as head of an ostensibly coalition government after the 1931 financial crisis. Churchill became prime minister in 1940 without at the time being party leader, but within five months he had assumed that role. The office depends on the holder being able to command the continuing support of a majority of the House of Commons.

The powers of the prime minister, though not closely defined, are extensive. He appoints all the other ministers, can transfer them to different offices, or dismiss them altogether. He chairs the meetings of the cabinet and appoints ministers to the numerous cabinet committees. Although he lacks a department of his own, he controls the cabinet office, and his personal policy unit. Honours, such as knighthoods, peerages, and other decorations, are awarded on his recommendation. As leader of the government, he exercises a general if not always clearly articulated authority over policy.

The impact of a prime minister on national policy varies with both the forcefulness of his or her own personality, and the setting in which he or she works. Thus Margaret \*Thatcher took care to appoint numerous opponents (the so-called Wets) within the party hierarchy to her first cabinet. After two years she felt strong enough to purge the government of the leading Wets; and after her sweeping election victory of 1983, she dismissed her foreign secretary, Francis Pym. However, in later years she felt constrained to appoint men who had served their apprenticeships under her arch-rival, Edward \*Heath.

In spite of their great powers, prime ministers have been inhibited by fear of losing office. Labour leaders used to be elected by their colleagues in the parliamentary party. Since 1981 they have been chosen by an electoral

## primitive methodists

college, consisting of all Labour MPs and delegates from trade unions and constituency Labour parties. Until 1965 Conservative leaders used to 'evolve'. Sometimes, though not often, there was a recognized heir apparent. More frequently, when the party was in office, a candidate was presented to the monarch after consultations had taken place among the party's grandees (the 'Magic Circle', as one ex-minister sourly put it). Since 1965, the party leader, whether in or out of office, has been elected by the Conservative MPs, and since 1974 the leader has had to run the gauntlet of re-election each year.

The provision for annual re-election makes the leader, even when prime minister, highly vulnerable. Margaret Thatcher resigned in 1990 after she had narrowly failed to win outright on the first ballot and when it became clear that she was likely to lose on the second. For years she had dominated the political landscape. She went down to defeat for two reasons: accumulating evidence that, though she had won three elections in a row, she had become an electoral liability, and resentment of her high-handed and to some arrogant style of leadership.

Yet even before the introduction of the annual re-election of the leader, there were obvious limitations to a prime minister's power. \*Baldwin, \*Eden, and \*Macmillan suffered severe criticism, though the first held on until the age of 70, and the other two left office because of ill-health. \*Chamberlain resigned in 1940 after losing the support of a section of his party and Churchill was edged out as his abilities lessened with age. It follows that the apparently vast powers of the prime minister are often subject to stringent limits. His overriding need is to have the support of his party in the Commons.

In recent years it has become fashionable to describe the office of prime minister as presidential. The official doctrine is that the prime minister is simply the first among equals, and the rule of collective responsibility emphasizes the collegial character of the cabinet. The office was conceived as being on the model of a team leader rather than an autocrat. Whenever the post is held by a strong prime minister, the assertion that it has become presidential is propounded, and a contrast is drawn between the office in the 19th cent. and today. The comparison has some force. The urgency of many decisions in the modern world, the increased importance of foreign affairs, media emphasis on the personality of the prime minister, have all tended to enhance the office at the expense of departmental ministers. Yet it is easy to exaggerate the change. The gladiatorial contests between \*Gladstone and \*Disraeli anticipated the modern concentration on the rival party leaders. Similarly, crucial decisions were sometimes taken by the prime minister and a few colleagues, with the cabinet sidelined. Most of the Liberal cabinet in 1914 were unaware of the extent of the Anglo-French conversations relating to a possible war with Germany.

The rule of a prime minister such as Thatcher will always give colour to the image of the prime minister as all-powerful. But though it may be conceded that there is a long-term trend towards the enhancement of the office, there are frequent fluctuations, as dominating prime

ministers are followed by more diffident successors. Thus a Thatcher is succeeded by a \*Major, a Macmillan by a Douglas-Home. The bitter price Thatcher paid for her overbearing style suggests that an excessively presidential attitude may exact its own penalties.

HB

Barber, J., *The Prime Minister since 1945* (Oxford, 1991); Blake, R., *The Office of Prime Minister* (Oxford, 1975); King, A. (ed.), *The British Prime Minister* (2nd edn. 1985); Van Thal, H. (ed.), *The Prime Ministers* (2 vols., 1974-5).

**primitive methodists** broke away from the main Wesleyan body and formed their own connexion in 1811, led by Hugh Bourne, a carpenter, and William Clowes, a potter, who had been expelled for holding American-style camp-meetings at Mow Cop (Staffs.). Condemned by the middle-class churches as ranters, the primitive methodists provided a form of evangelism attuned to the needs of labouring people. In a crowded cottage or plain village chapel, listening to a local preacher who was a working man or woman, they felt at home in a way they seldom did in the parish church. The 'prim's' were noted for their open-air, hell-fire style of preaching, their revivalist, tented camp-meetings, their acceptance of women preachers, and their teetotalism. Until the 1840s they re-enacted the religious 'enthusiasm' of \*Wesley's early preachers and suffered similar persecution. Thereafter the primitive methodists became more respectable and conservative, evolving from a sect into a denomination. Authority in the church became more centralized, though the power of the laity at local level was greater than in other methodist connexions. By the 1850s the primitive methodists had over 100,000 members, concentrated particularly in the Potteries, the Durham and Northumberland coalfields, Yorkshire, Lincolnshire, and Norfolk. In 1932 they joined the United Methodist Church. JFCH

**primogeniture.** The character of the inheritance custom has a great bearing on the social and political evolution of a country. Primogeniture, inheritance by the eldest son, developed in England after the Norman Conquest and had military implications—that the \*fief should not be subdivided lest it become incapable of fulfilling its feudal obligation. There were always regions where the custom did not apply—\*gavelkind was widespread in Kent and in parts of Wales giving partible inheritance, and the custom of \*borough English in some places gave inheritance to the younger son. One consequence of primogeniture, especially when buttressed by \*entail, as it was in the 17th and 18th cents., was to encourage the accumulation of large estates and restrict the proliferation of small proprietorships or peasant holdings. Since it applied also to titles, it meant that the English nobility was a small group contrasting with thousands of impoverished noblemen to be found in many parts of the continent. But the custom had its critics and the plight of younger sons, forced to seek their fortunes because they had poor expectations, is a commonplace of 18th-cent. novels and drama. Primogeniture was abolished by legislation in 1926 in England and in 1964 in Scotland.

JAC

**Primrose League.** Victorian Conservative organization. Founded in 1883 by Lord Randolph \*Churchill and John Gorst, the Primrose League was intended to enable the Conservatives to adapt to the extension of democracy. The Tory leaders feared that any popular organization would eventually challenge their authority. However, the league avoided this problem because it was not officially part of the Conservative Party, and because it made no claim to influence the party's policy.

The key to its success lay in combining political propaganda, often in the form of lantern slides, with a regular programme of social activities. These included music-hall, dances, teas, summer fêtes, train excursions, and cycling clubs, all available very cheaply. Though derided by opponents as a 'matrimonial agency', the league benefited greatly from its social role. By 1886, 200,000 members had been enrolled, and by 1891 over a million, of whom half were women. This made the league the largest political organization in Britain in its heyday—the late 1880s and 1890s. Thereafter it suffered a steady decline and after 1918 its membership was largely absorbed into the official party structure. MDP

**Prince Edward Island** was ceded by France in 1763, becoming a separate colony in 1769. The island was granted to absentee proprietors in 1767. It was called St John's Island until 1799. Most settlers came direct from the British Isles, bringing sectarian conflict. Attempts by tenants to dispossess landlords provided models for land legislation in Ireland. Although the dominion of Canada was planned at a conference in Charlottetown, the island's capital, in 1864, Prince Edward Island remained aloof until 1873. L. M. Montgomery's *Anne of Green Gables* (1908) was set on 'the only island there is'. GM

**prince of Wales.** The title 'prince of Wales' was not of great antiquity when it was bestowed by Edward I on his 16-year-old son Edward in 1301. \*Llywelyn ab Iorwerth had called himself 'prince of Aberffraw and Lord of Snowdon'. \*Dafydd ap Llywelyn had taken the title prince of Wales in 1244, though he failed to gain papal recognition, but Henry III was forced to acknowledge \*Llywelyn ap Gruffydd in the 1260s. Llywelyn was killed in 1282. The adoption in 1301 was presumably a gesture of conciliation by Edward I, though the tradition that his infant son, born in \*Caernarfon castle, had been shown to the people is a later invention. The title has since been reserved for the heir apparent and is held with the dukedom of \*Cornwall. Of the 21 holders of the title since 1301, 14 have succeeded to the throne. JAC

**printing** with movable types, or letterpress, as opposed to printing using carved wooden blocks, was invented by Johannes Gutenberg of Mainz c.1440, though there is evidence that a Dutchman, Coster of Harlem, made a similar breakthrough about the same time. One of Gutenberg's associates, Peter Schoffer, produced a psalter in 1457, the first known book with a printed date. In 1462 the sack of Mainz dispersed printers and their equipment, the process being introduced to England by William \*Caxton in 1476. It did

not reach Scotland until 1507 when the first printing press was set up in Edinburgh by Walter Chapman and Andrew Myllar.

Early printers used a wooden press, types, paper, and ink. The primitive press, constructed of wood and iron, was a screw press resembling a wine or cloth press. The plate, or 'platen', was applied by a vertical screw, hand operated by a lever, to the printing surface, or 'forme', placed horizontally on the bed of the press. Ink was applied to the type by dabbers, known as ink balls, a technique which survived until the development of the ink roller at the beginning of the 19th cent. Printers at first made their own types, but typefounding, an early instance of mass production, soon became a separate trade. Although many improvements were made, the process remained essentially the same until the early 19th cent.

Printing and publishing, which were closely allied, grew slowly until the latter half of the 18th cent. This was partly due to censorship, which intermittently constrained publication, and partly to the high cost of paper, which was also heavily taxed. While censorship continued until the early 19th cent., paper became cheaper and could be produced in continuous sheets following the introduction of paper-making machines developed in France by Nicholas Louis Robert (1798) and Henri Fourdrinier (1806). John Dickinson, an English paper-maker, patented the first cylinder machine in 1809. Paper could thus be produced in larger sizes and greater quantities than by hand.

The 19th cent. also brought significant developments in the industrialization of printing itself. Lord Stanhope developed the first all-metal platen press in 1804. At the same time the screw mechanism was improved, resulting in greater and more even pressure on the forme, and the ink roller greatly increased the speed of production. The improved Stanhope press doubled the output of the traditional wooden press. Even greater gains in productivity were made following the introduction of the first practical mechanized printing press developed by Friedrich Koenig in 1811. It was designed to feed single sheets of paper through a cylinder press and in 1814 was modified for *The Times*, to become a two-feeder machine printing on both sides of the paper at once. The first power-driven platen press was developed about 1822.

*The Times* continued to lead the field with a steam press, producing 5,000 copies per hour, in 1827. Another important breakthrough was the rotary press with types fastened round a cylinder, introduced in 1848, and, after a further period of development, the continuously running rotary press, where a stereotyped printing surface was attached to the cylinder, pioneered at *The Times* in 1868. With subsequent refinements, this remained the standard method of newspaper-printing for over a century.

Pictorial reproduction was greatly influenced by the development of photography. Wood blocks and wood engravings, the commonest means of illustration, were gradually replaced by the photo-engraved line block and later by the half-tone block in which gradations of tone were simulated by typographic dot-formations of varying pattern and size. The monochrome half-tone process, introduced in 1872, was

## prisons

refined by the end of the 19th cent. to allow full colour reproduction. Similar technology was adopted in the book-printing trade.

Composing methods, using movable type, underwent a parallel revolution with the development, initially in the USA during the 1880s, of composing and casting machinery operated from keyboards. For nearly a century, the text to be printed was cast in hot metal, using monotype to set single characters or linotype to set text line by line. Thus, despite mechanization, printing remained a skilled occupation and historically a highly unionized craft, notably in the newspaper industry, which expanded dramatically in the early 20th cent.

Consequently the print unions had a long history of confrontation with the press barons. The printers' solidarity was threatened and ultimately undermined during the 1970s and 1980s by a move away from hot metal to computerized typesetting using high-speed optical methods and electronic page make-up systems. The introduction of new technology led to dramatic rationalization and to redundancies in printing and related trades. In London, bitter strikes and lock-outs resulted from the movement of newspaper printing from its traditional heartland in \*Fleet Street to new production units in the East End. Elsewhere in newspaper-printing, notably in Manchester and Glasgow, similar effects were felt. Book-printing, like publishing, was also transformed by the new technology. Printing has always had important backward linkages to paper manufacture and the metal trades, and, with increasing mechanization during the 19th cent., to engineering. It was also closely linked after the mid-18th cent. to the development of \*publishing, of both books and newspapers. ID

**prisons.** The first use of prisons in England was to detain an accused until trial or to keep a convicted criminal until execution. Under the Anglo-Saxons and the Normans, and throughout the Middle Ages, criminals were punished by fines and, for serious crime, death or mutilation. Minor criminals might also be punished in the village or manor by whipping, the stocks, or the \*pillory.

With the advent of the system of presentment of those suspected of serious crimes, introduced by the Assizes of \*Clarendon and \*Northampton by Henry II, it became necessary to keep suspects until the royal justices arrived to receive the presentments made by twelve men of each hundred. The first prisons were therefore the local lock-up or the castle keep. In addition the church had its own prisons, reputedly less uncomfortable than those of the secular powers.

In the sphere of civil law, each central court of common law had its prison (such as the \*Marshalsea for the Court of \*King's Bench). Imprisonment for contempt of court was and still is possible and the Court of \*Chancery became notorious for imprisoning those who were deemed to be in contempt. Imprisonment for debt was also common and was not abolished until late in the 19th cent.

The development of imprisonment as a penal sanction took place comparatively late in English history. Prison as we know it had a number of predecessors; convicted crim-

inals might be locked up in gaols but this practice was not widespread. At different periods society provided work-houses, \*Bridewells' or houses of correction, and, in the 18th and 19th cents., the 'hulks' or convict ships, depicted in \*Dickens, used for convicts as well as for prisoners of war.

Before the 19th cent. prisons might be 'farmed out' to private individuals, who would charge prisoners for their accommodation and food. During the 19th cent. prison became an important penal sanction though it was not until the 1850s that it became the prevailing form of punishment, especially after the end of \*transportation. The condition of English prisons was deplorable; males and females could be and were crowded into cells together. Overcrowding, dirt, and low hygiene as well as a miserable diet made the prisons breeding places for disease such as typhoid—indeed an illness known as 'gaol fever' was common, and many inmates died in prison.

In the 18th cent. certain reformers became aware of the appalling conditions in English prisons—two of the most famous being John \*Howard, the great prison reformer who gave his name to the Howard League for penal reform, and Elizabeth \*Fry who worked for the improvement of the lot of women in prison.

In 1865 the principle was introduced of work for prisoners. In 1895 the Gladstone Committee was set up to review the prisons and reform followed. Gradually during the 20th cent. corporal punishment, penal servitude, and hard labour were abolished for prisoners and the rehabilitative aspect of prison re-emphasized, but the prison system remains an object of controversy up to the present day. MM

**privateering** was a device for commerce raiding in time of war whereby a privately owned, manned, and armed ship could operate on the high seas as a conventional warship, yet, in the event of making captures, was entitled to a very substantial share of their adjudicated value. The share was always capable of variation as between the sanctioning authority, usually the crown, and the proposer, prior to a voyage; and in every instance the agreement was encapsulated in the 'letter of marque', carried by the privateer as her warrant. In England privateering can be dated back to the late 13th cent., but the late 17th cent. and the whole of the 18th witnessed the apogee of the practice, pursued with especial vehemence by the French and the Dutch, and also by the seaboard colonies of North America during the \*American War of Independence. Privateering was abolished by the convention of Paris (1856). DDA

**Privy Council.** The fate of most councils or committees is to grow too large to be effective and to be replaced by an executive or inner caucus, like a series of Russian dolls. The \*council of late medieval times became too big and in the late 1530s a smaller Privy Council was set up. To a considerable extent this was the work of Thomas \*Cromwell, though how much \*Wolsey contributed and how much was left to Cromwell's successors is debated. In 1540 the Privy Council, with some twenty members, acquired a clerk and a minute book. It became the work-horse of late Tudor government. As such it made many enemies. The Long Parliament replaced it in 1649 by a \*Council of State, but

Richard \*Cromwell restored it, and it was continued by Charles II after 1660. But its great days were by then over. The emergence of the cabal in the 1670s and James II's use of an inner cabinet in the 1680s heralded its fate, and it began to lose importance, first to the cabinet council, then to the cabinet. Its defenders offered a rearguard action and the Act of \*Settlement of 1701 declared that government business should be transacted in the Privy Council and that all counsellors should sign their advice. The clause was repealed by 4 Anne c. 8 s. 24 in 1705 before it could take effect. As the Privy Council continued to grow, its duties became almost purely formal, though the \*lord president of the council is invariably a cabinet minister and supervises a number of functions in relation to education, science, and charters. Its judicial committee of legal experts acts as a court of appeal for British dependencies, the Isle of Man, and the Channel Islands. By 1994 the membership of the Privy Council had risen to more than 400.

The Scottish Privy Council dated from the late 15th cent. After the union of the crowns in 1603, though the crucial decisions were taken in London, the Scottish Privy Council had considerable influence as the day-to-day executive. It was abolished immediately after the Act of \*Union of 1707. JAC

**pro-Boer** was the misleading name given to those who opposed the government's policy of fighting the \*Boer War of 1899–1902. Few of them actually sympathized with their country's enemies. Most were either old-fashioned Gladstonian Liberals, or socialists. Some were physically assaulted by \*jingois. \*Lloyd George and J. A. \*Hobson both forged their reputations as pro-Boers. BJP

**proclamations** were part of the royal prerogative to deal with emergencies or to make enactments while Parliament was not in being. They were therefore normally only temporary measures and it was accepted that they could not touch life, limb, or property. Nevertheless, under the Tudors they dealt with a large variety of matters—the sale of meat, courtesy to the French ambassador, exile for anabaptists, reduced access to Windsor castle, prohibition of the export of leather, and discouragement from playing dice, cards, or tennis. The statute of Proclamations of 1539 reminded subjects that proclamations had the force of statutes, 'as though they were made by act of parliament'. The Act was repealed in 1547 but James I's use of proclamations led to a protest in the petition of grievances of 1610 that they were encroaching upon statute and could 'bring a new form of arbitrary government upon the realm'. James was unusually conciliatory and accepted \*Coke's view that proclamations could not create new offences. Charles I made considerable use of them, but they were too necessary to government to be abolished, though their employment after the Restoration ceased to be controversial and they were often exhortatory in nature. JAC

**professions.** In English, the word 'profession' has since the 16th cent. been applied to a limited number of occupations in which a specific body of knowledge is used to solve problems for clients. By the 18th cent. these involved a social

status well above that of trade and handicrafts and included the upper ranks of law, medicine, the church, and maybe the military. The authority of knowledge was often linked to the status of gentleman, which many had by birth, and others gained by achievement.

Social and economic change in the first half of the 19th cent. brought many challenges to the authority of the 'traditional' professions. The medical men faced rising expectations, the failure of urban public health, and public anger over body-snatching and dissection. The lawyers met the demands of the rational law reformers and the ridicule of people like Charles \*Dickens in his account of \*Chancery in *Bleak House*. The authority of the church was already compromised by the disputes between establishment and dissent. The military met mid-century condemnation for the incompetence of the \*Crimean War.

Response centred upon the reform and creation of a series of qualifying associations. There were 7 in 1800, 20 more by 1880, to which 39 were added by 1914. They sought to control entry, to set standards, and ultimately to supervise training and the development of professional knowledge. The British Medical Association was formed in 1856 and its authority gained legislative backing in 1858. It had developed from the Provincial Medical and Surgical Association (1834) which itself had recognized that the old division between physicians, surgeons, and apothecaries had been replaced in functional terms by the general practitioner. The Law Society, founded in 1825, came to supervise examinations in the 1870s. New areas of knowledge and knowledge application also organized. The Institute of Civil Engineers, founded in 1818, came to supervise examinations in the 1890s. Other groups, such as schoolteachers, did not gain full control of entry and work conditions but a variety of organizations worked to raise standards and improve public perception of their work. By 1900, an increasing amount of professional training was taking place in universities and colleges, rather than through the personal relationship of apprenticeships.

The 20th cent. not only saw a rapid increase in the areas of work and knowledge regarded as professional but also fundamental changes in the workplace relationships of many professions. In the 19th cent., doctors, lawyers, and self-employed schoolteachers collected fees directly from clients. A few like the poor law surgeon from the 1830s and the school board teacher (1870/2) had begun to work for salaries. After 1900, this trend accelerated. Professional people worked for a growing number of state agencies and private sector corporate bodies. Here they joined a new group of career salaried managers, who applied new management 'science' to industrial organization and created their own professional organizations. Professional and managerial occupations accounted for less than 10 per cent of the occupied male population in 1900 but grew to around 20 per cent by the 1970s. They were distinguished from wage labour by a greater degree of workplace autonomy, by better working conditions, and often by career progression, sick pay, holidays with pay, and pensions. In some senses the emphasis on service and standards, and on status derived from knowledge and training, challenged profit and capital

## Promenade Concerts

accumulation in the value system of British society. At the same time the experience and often the ideological views of professionals in the public sector were very different from those in the private sector, where the market and profits still dominated, although usually mediated by professionals like accountants. RJM

**Promenade Concerts.** London's leading concert series. The Queen's Hall Promenade Concerts were established by impresario Robert Newman and conductor Henry \*Wood in 1895. Initially they were all given by Wood and the Queen's Hall Orchestra, which was replaced by the BBC Symphony Orchestra in 1930 following the BBC's adoption of the series, but later various orchestras and conductors were involved. After the Queen's Hall was bombed in 1941, the series moved to the Royal Albert Hall, becoming the Henry Wood Promenade Concerts on Wood's death in 1944. William Glock's tenure as head of music at the BBC (1959–72) saw a broadening of repertoire, ranging from medieval music to Stockhausen and including 'semi-staged' operas. The concerts have fostered many new British works, while their unique, vibrant atmosphere culminates in the exuberant 'Last Night of the Proms'. ECR

**prophecies** were, during the medieval and early modern periods, a source of interest and concern throughout the political and social hierarchies. They could involve exact predictions, but were also frequently ambiguous statements, often taking the form of an 'ancient' piece of verse or quasi-proverbial wisdom, usually attributed to a past person, either real or mythical (prophecies attributed to \*Merlin surfaced regularly). The genre was wide ranging, and acquired added credibility from its association with biblical prophecy. Prophecies were numerous, and (like proverbs) could be reworded or reinterpreted to suit changing circumstances or local conditions.

Prophecies assumed a serious political dimension under the Tudors, when they were frequently interpreted by central government as bearing on political or dynastic changes. Henry VIII, Mary Tudor, and Elizabeth I all included prophecies as a species of seditious words in their treason legislation, while the closing months of Edward VI's reign saw intense anxiety over prophecies as the regime crumbled.

The political instability of the 1640s and 1650s gave new life to political prophecies, but, as with so many aspects of the 'magical' world, interest in prophecies among the educated had dwindled by 1700, although prophecy still retained its hold among the less educated. JAS

**prorogation** is the royal power, now exercised by the prime minister, to suspend the session of Parliament. Since 1854 the sovereign has not appeared in person but has delegated the task to commissioners. Prorogation suspends all parliamentary activity save impeachment and the judicial work of the House of Lords. Bills must be reintroduced. Clearly the prerogative of prorogation, like dissolution, could be used tactically, to allow time for negotiation or for tempers to cool. Charles I prorogued Parliament in June 1628 rather than listen to more remonstrances against tonnage and

poundage. When he prorogued the 1629 Parliament, the Speaker was held down in his chair to allow protests against innovations in religion. The prorogation was followed by a dissolution and eleven years elapsed before another parliament sat. JAC

**prostitution**, the sale of sex for money, predominantly by females with male clients and frequently associated with criminal activity, has always been affected by cultural values. Brothels first sprang up in Southwark where Roman soldiers guarded the Thames crossing, to develop into the Bankside stewards that became part of the bishop of Winchester's liberty in the early 12th cent. and were regulated by Henry II (1162); the church took a pragmatic view since the revenue was highly profitable to both bishop and king. After the outbreak of virulent syphilis throughout early 16th-cent. Europe, stricter controls were imposed and brothels briefly closed. With the Reformation, moral rather than health concerns began to prevail, so prostitutes were publicly humiliated and imprisoned for 'correction'. Puritanism merely hardened existing attitudes. Whereas upper-class prostitutes of the demi-monde were involved in sexual liaisons outside marriage in order to gain influence and social advantage, most whores were regarded as social lepers. During the 19th cent. governments made efforts to regulate the practice, particularly around naval and military garrisons (a third of all sick cases among soldiers were venereal in origin by 1864). Female prostitutes were subject to humiliation and callous treatment under the Contagious Diseases Acts of the 1860s, only repealed in 1886 after the campaigns of Josephine \*Butler. Female prostitution is now legally tolerated, though with prohibition of open solicitation, but young women are still forced into the practice by poverty or homelessness. Homosexual male prostitution, particularly in large cities, is increasing. IJEK

**protectionism.** While international trade has been recognized as a major influence on the growth of the world economy throughout history, virtually all countries at all times have sought to protect either the whole economy, or at least part of it, from the rigours of international competition by imposing barriers. The protection of industries perceived as vital to the national interest in terms of future growth, current employment, or military security have all been identified as worthy of protective support. This has usually taken the form of a tariff, or government levy, on imported goods to bring their price up to or even above the price of home-produced goods. Thus domestic producers are protected against the impact of foreign imports. Besides tariffs, quotas, and other forms of overt discrimination, there exist less obvious non-tariff barriers to trade, such as technical specifications written to favour domestic producers, differential tax regimes, and customs delays together with a variety of bureaucratic regulations. A familiar modern example of protection is the support given to agriculture in the \*European Economic Community. This has been so successful that, far from being swamped by a massive tide of cheap food imports as was feared when the Common Agricultural Policy (CAP) was originally devised, farmers in the European Union have become large-scale exporters to the

rest of the world. Support of domestic industry can also take the form of subsidies to help exports, a payment allowing exporters to offer competitive prices in international markets without having to reduce their costs by an equivalent amount.

Protective barriers distort trade patterns, and bring about redistribution of income. A tariff imposed on imports raises domestic prices so that consumers are worse off. The government gains tax revenue from the tariff and producers gain from the price increase. The redistribution of welfare benefits between different groups in society frequently leads to political disputes. The repeal of the \*Corn Laws in 1846 redistributed income away from wealthy agriculturalists to manufacturers, although not to any great extent. The repeal also redistributed income to consumers through the fall in food prices, although the scale of this is uncertain. (See *FREE TRADE*.) \*Chamberlain's tariff campaign of 1903 was intended to redistribute income to industrialists by protecting sectors like the steel industry from the effects of cheap imports. More recently, the CAP has effected substantial redistribution to the advantage of producers and the detriment of consumers and taxpayers. Since the distribution of agriculture is uneven throughout the European Community, some countries have enjoyed a substantial welfare gain from these policies, notably Ireland and Denmark, while others, like Germany and the United Kingdom, have lost. Protection always entails some loss of efficiency because the lowest price obtainable through competition is replaced by a higher subsidized price. The result is over-production in the home market by suppliers who are less efficient than they would be if exposed to world-wide competition, consumer loss through higher prices, and an increase in government revenues from tariffs. A reduction in the level of protection will have the opposite effects: a fall in prices from which consumers gain, increased competitive pressure on producers, and a loss in government tariff revenue. CHL

**Protectorate.** The Protectorate was established on 16 December 1653 when Oliver \*Cromwell became head of state as lord protector. Since his power rested on a formidable army, whose officers had devised the Protectorate's constitution, the \*Instrument of Government, his regime has often been called a military dictatorship. The description needs to be qualified. The restraints imposed by the Instrument were considerable, and Cromwell welcomed them. Serving officers were always outnumbered by civilians on his council, and formed only a tiny minority among the justices of the peace, to whom local government had been restored. The size of the army was progressively reduced; the numbers stationed in England and Wales varied between 11,000 and 14,400. With rare exceptions, the rule of law was well respected, and political prisoners were extremely few. Religious liberty officially stopped short of 'popery or prelacy', but in practice was broad.

Cromwell's first Parliament refused to ratify the constitution and proceeded to frame one of its own; he dissolved it in January 1655. Shortly afterwards, \*Penruddock's rising gave his military councillors a temporary ascendancy, and the result was the regime of the \*major-generals. These

officers did not supersede the local magistracy in their eleven districts, but their duties went far beyond suppressing royalist conspiracy and they were much resented, not least for their inferior birth. Their regime was running down, however, long before Parliament terminated it by refusing to legitimize the levy on the royalist gentry (the 'decimation') which paid for it.

This second Protectorate Parliament (1656–8), from which the council excluded over 100 elected members, reflected a growing division between conservative civilians and supporters of the military. Led by the former, it presented Cromwell with a new constitution, the \*Humble Petition and Advice, naming him as king and restoring other more traditional ways. His senior officers strongly opposed it, but Cromwell accepted it, though without changing his title of Protector. Their influence thereafter diminished, and \*Lambert, author of the Instrument of Government, was forced into retirement after refusing the new councillor's oath. Cromwell resumed his policy of healing old wounds, but died on 3 September 1658. His son \*Richard's Protectorate lasted only eight months, not so much because he was personally inadequate—his one Parliament gave his government more support than either of Oliver's had done—as because the disgruntled military 'grandees' were bent on recovering their old political influence. By bringing Richard down, they wrecked the 'Good Old Cause' that they professed to serve. AHW

**protestantism.** The term originated with the protest of the reforming minority at the diet of Spires in 1529 against the catholic majority. As a general description of the anti-catholic position, it was adopted with some caution: several of the churches into which the new movement dissolved were strongly opposed to each other, while conservatives were not anxious to stress the role of individual conscience in religious matters. The common protestant ground was rejection of papal authority, emphasis on the Bible, devotion to preaching, clerical marriage, and a more austere ceremonial. The main divisions of protestantism were \*calvinism, \*lutheranism, and zwinglianism, with the Church of England claiming an autonomous and independent position.

In Scotland, a protestant regime in its \*presbyterian form was established in 1560 and survived, amid great vicissitudes, to become the national religion in 1690. Protestantism also made much headway in northern Ireland, where Scottish influence was strong, but much less in the south which remained predominantly catholic. In England, the consolidation of the protestant Church of England owed much to the misjudgements of catholic monarchs Mary and James II, and to the upsurge of national enthusiasm produced by the long struggle against catholic Spain.

Catholic polemicists in the 16th cent. argued that the appeal to private conscience must, in the end, lead to religious anarchy. Protestantism was not long in dividing—indeed it was born divided—over the nature of the eucharist, the role of bishops, the importance of good works, and the method of baptism. The fissiparous nature of the movement continued to the 20th cent., with splits, secessions, and schisms in most denominations. Even the \*methodists, one of the

## provincial council of church

more sober sects and themselves a split from Anglicanism, divided into Wesleyan Methodists, Calvinistic Methodists, Methodist New Connexion, Primitive Methodists, Wesleyan Methodist Reformers, Bible Christians, and Wesleyan Methodist Association, while the religious census of 1851 identified Wesleyan Christian Union, Benevolent Methodists and Temperance Wesleyans. In the late 20th cent., falling membership, financial problems, and a more ecumenical spirit prompted a number of protestant reunions—the \*Free Church of Scotland rejoined the \*Church of Scotland in 1929, the Presbyterian Church of England merged with the Congregational Church to form the United Reform Church in 1972—but though relations between protestants and catholics are much warmer than in the 19th cent., re-unification has yet to come about. JAC

**provincial council of church** [S]. Ordained to be annual meetings of a metropolitan and his suffragans; bishops in Scotland received special permission to hold provincial councils in a papal bull dated 1225, despite having no archbishop until 1472. These councils were to deal with clerical excesses and the reformation of morals, to ensure canonical laws were read and observed, and, generally, to act as the governing body of the Church in Scotland. The provincial councils of 1549, 1552, and 1559, for example, passed numerous statutes for the internal reform of the church, designed to counter the criticisms and growth of the reform movement in Scotland. PER

**Provisors, statute of**, 1351. The papal practice of appointing to benefices (provisions), or granting reversions, was much resented, particularly since many of the clerics were foreign. Edward III was anxious to assert his own rights against both cathedral chapters and papacy. The Parliament of 1351 legislated against the practice (25 Edw. III s. 4), declaring the nominations invalid, and the restrictions were repeated and strengthened by a second Act in 1390. But Richard II, who needed papal support, reached a concordat with the papacy in 1398 which conceded much of the ground gained. JAC

**Prussia, relations with**. Regular diplomatic contact between Britain and Prussia dates essentially from the Hanoverian succession. The two states were closely allied for most of the \*Seven Years War (1756–63), an alliance which allowed Britain to devote many of her resources to overseas expansion while Prussia preoccupied large French forces in Europe. Prussia and Britain were briefly allied against France in 1793–5, but their most significant collaboration occurred in 1815 when their armies defeated Napoleon at \*Waterloo. The British did not share the Prussian desire for a harsh peace against France in 1814–15, and \*Castlereagh briefly aligned Britain with Austria and France to reduce Prussian demands for Saxon territory. Rather he wanted a balance in Germany between the Prussians and the Habsburgs, hoping that together they might help to restrain France and Russia. He thus favoured a Prussian presence on the Rhine. Thereafter Prussia's association with the reactionary powers (Russia and Austria) usually discouraged friendship, although Prussia contributed to the isolation of

France in the Near Eastern crisis of 1840. Britain's role in the Schleswig-Holstein question (1848–64) was understandably unpopular in Prussia, although from 1847 \*Palmerston intermittently showed interest in the emergence of a strong north German power which he hoped would improve the balance in continental Europe as a whole. His successors, despite periods of distrust of Bismarckian methods and Prussian militarism, broadly welcomed German unification in 1870–1 in the belief that this would make for stability in the heart of Europe. CJB

**Prynne, William** (1600–69). Puritan lawyer, antiquarian, and politician. Educated at Oriel College, Oxford, and Lincoln's Inn, Prynne was hauled before the Court of \*Star Chamber in 1634 for publishing the *Histriomastix*. This work, a 1,000-page denunciation of female actors and of theatre in general, was interpreted as an attack on Charles I and \*Henrietta Maria. Prynne was rewarded with the loss of his ears. His attacks on the bishops landed him a second time before Star Chamber in 1637, where he was sentenced to lose what remained of his ears. After his release by the \*Long Parliament in 1640, Prynne was instrumental in securing the conviction and death of his enemy Archbishop \*Laud. He next turned his fire against religious radicals and the \*New Model Army. The army cordially returned his hostility, and had him arrested at \*Pride's Purge (6 December 1648). He continued to write long-winded pamphlets against the republic, popery, and quakerism during the 1650s. When the Long Parliament was recalled, Prynne introduced the bill in March 1660 for its dissolution. As a member of both Convention and Cavalier parliaments, he remained a presbyterian and resumed his attacks on bishops. JJJ

**Public Health Act**, 1848. An Act of Parliament for England and Wales (11 & 12 Vic. c. 63) was carried following an agitation organized by Edwin \*Chadwick and the Health of Towns Association. It created a General Board of Health in London and local boards of health with wide powers to enforce standards of public hygiene where the death rate exceeded 23 per 1,000 or where 10 per cent of ratepayers petitioned for a local board. Though the General Board was disbanded in 1858, over 700 local boards had been set up in England and Wales by 1871 and the Act was extended to Scotland in 1867. A consolidating measure created medical districts for the whole of Britain in 1875. ER

**Public Record Office**. See RECORD OFFICES.

**public schools**. During the Middle Ages, the \*grammar school provided education for poor scholars intended for the church and for the sons of noblemen. This included such schools as \*Eton and \*Winchester. By the 18th cent. a number of 'Great Schools' had emerged, including \*Harrow, \*Rugby, Sherborne, and Canterbury.

Other changes during the early 19th cent. stimulated the demand for public schools. These included the spread of railways which enabled wealthy parents to send their children to board at far-off schools; the increase in political power of the middle classes after the 1832 Reform Act; and the rise of the \*professions. Reforms in public schools

were introduced by heads such as Samuel Butler at Shrewsbury (1793–1836), and Dr Thomas \*Arnold at Rugby (1828–42), who were clerics. The school chapel became the focal point of life, discipline was enforced through prefects and team games emphasized. Proprietary schools, such as Marlborough (1843) and Haileybury (1864), often more progressive than the older public schools, were established to meet the demand from the middle classes. At first day schools, they later accepted boarders.

Criticism of some of the public schools, such as \*Westminster and Charterhouse, was so persistent that a royal commission was appointed in 1861, under Lord \*Clarendon, to investigate conditions in the nine large public schools Winchester, Eton, Westminster, Charterhouse, Harrow, Rugby, Shrewsbury, St Paul's, and Merchant Taylors'. Whilst broadly satisfied, the commissioners made a number of recommendations which were embodied in the Public Schools Act (1868). Governing bodies were reformed and schools such as Harrow developed a modern side. The Endowed Schools Bill (1869) threatened further intervention by the state into the affairs of schools, especially limiting the powers of headmasters. Edward Thring, headmaster of Uppingham, organized a meeting of thirteen heads at the school in December 1869 to oppose these contentious clauses. The meeting eventually became the annual headmasters' conference, membership of which denoted public school status.

Attempts were made in the 20th cent. to bridge the gap between public schools and the state-provided sector. The Fleming Report (1944) and the first report of the Public Schools Commission (1968) (Newsom) were impracticable. The second report (1970) (Donnison) was more positive, but the advent of a Conservative government avoided further threats. The term public school has now been superseded by independent school. PG

**publishing.** Publishing, in the modern sense, dates from the 19th cent. when the book publisher became distinct from the bookseller and printer. Monasteries and then universities had the virtual monopoly of book production before the introduction of \*printing, which made possible publication for a wider readership. Broadsheets and pamphlets, often with woodcuts or engravings, and produced mainly for propaganda purposes, were among the earliest publications designed for a popular audience.

The first \*Copyright Act was passed in 1709. It freed author and publisher from printers' monopolies and gave them the right to negotiate for royalties and other terms. It also gave the public free access to an author's work after a given time. During the 18th cent. the bookseller supplanted the printer in dominance of the book trade. This coincided with increased demand for books from circulating libraries and the more affluent members of the public. Religious, philosophical, and topographical works were published in large numbers, though eventually overtaken in popularity by the novel.

The earliest publishers were booksellers who sold authors' works direct to the public. Among the first were Longman's, established in 1724, and John Murray, founded in

1765. The subsequent development of publishing during the 19th cent. was a consequence of higher levels of literacy and improved printing technology. The Publishers' Association was established in 1896. Apart from newspapers, publication for a mass market was pioneered during the 19th cent. in periodicals serializing novels, like those of \*Dickens, with the complete novel produced later in inexpensive format. J. M. Dent's Everyman's Library, established to make available cheap editions for a popular market in 1906, was a forerunner of Allen Lane's paperback Penguin imprint, launched in 1935, which revolutionized the industry and public reading habits.

While many publishers produced books on a wide range of subjects, some specialized in particular fields, for example, legal, medical, scientific, and management studies. University presses, including those of Oxford, Cambridge, Manchester, Wales, and Edinburgh, were established to publish academic works. Another specialist branch, cartographic publishing, producing charts, maps, and atlases, grew in importance during the late 18th and 19th cents., pioneers being John Bartholomew, William Lizar, and the \*Ordnance and Geological Surveys.

Outside London, the nucleus of the industry, Edinburgh became an important centre of publishing and printing, especially after the success of Sir Walter \*Scott's novels, but the publishing industry there, after flourishing during the 19th and first half of the 20th cents., was a victim of progressive metropolitan take-overs. Publishing in Glasgow, though never on the scale of Edinburgh, suffered a similar fate. Nevertheless Scottish publishing, in common with that in Wales, has experienced a revival since the 1960s. ID

**pubs.** The term 'public house', denoting premises licensed for the sale of alcohol, became current in the late 17th cent. and was increasingly applied to what had hitherto been known as inns and taverns. It became a standard term for a drinking-place in the early 19th cent., only for matters to be complicated by the Beer Act of 1830, which allowed so-called beerhouses to be set up on payment of a derisory annual fee to the Excise, opening the floodgates to a spectacular proliferation of decidedly down-market drinking-dens, most of them in the front rooms of terraced houses. Publicans, as such, were licensed by the magistrates, and were angry that these new competitors were exempted from this surveillance; but they could sell wines and spirits as well as beer, and in practice their bigger premises and more respectable image helped them to survive and flourish during an extended Victorian heyday. Pubs at this time offered transport, information about job opportunities, facilities for changing money, meeting-rooms for a variety of societies, and increasingly entertainment, as the informal singalong became more formalized as the 'free and easy' and in some cases grew into the \*music-hall, with purpose-built premises attached to the pub, which might eventually take on a separate life of their own. Pubs also became centres for popular sport, offering refuges for pedestrianism when it was driven from the streets and for cock-fighting and dog-fighting when they became formally illegal. In the 1860s

## Pugin

and 1870s publicans were among the most important patrons of emerging football teams, the same man being behind the foundation of both Everton and Liverpool. As licensing laws were tightened up from the late 1860s and early 1870s it became more difficult for pub provision to keep pace with urban expansion, and late Victorian and subsequent residential areas (even working-class ones) have fewer and larger pubs than older districts. More capital was expected of pub providers, and architectural display became more elaborate as a marker of respectability, while breweries took over increasing numbers of pubs as tied houses, and 'landlords' increasingly became tenants or even managers in all but name. Disreputable pubs in older areas were already being sacrificed in exchange for new licences before the First World War, which saw even stricter regulation of licensing hours and introduced the afternoon 'gap' which has only recently been restored. During the inter-war years new 'roadhouses' in what came to be known as 'bypass Tudor' appeared in favoured suburban locations, while simply furnished old-fashioned rural pubs, patronizingly idealized by the likes of G. K. \*Chesterton, fell into decline. The most drastic changes in pub architecture and internal arrangements were left for the late 20th cent., with theme pubs, fake Victoriana, and a range of new entertainments, coupled with the restoration of women and children to the centre of pub life, the provision of better food, and the impact of restrictions on drink and driving. The remaking of the pub during the last quarter of the 20th cent. involved the most sudden and dramatic changes in the whole history of this venerable institution. JKW

**Pugin, Augustus Welby** (1812–52). Architect and pioneer of the Victorian Gothic Revival. Before Pugin, 'Gothick' architecture had been largely a romantic plaything of rich dilettantes. He saw something deeper in it. According to Pugin, Gothic was the only Christian—by which he meant Roman catholic—style. His book *Contrasts* (1836) set drawings of medieval buildings beside drawings of their modern—square, crude, simple—equivalents, in order to show how much more attractive the former were. It was grossly unfair, but influential. Pugin was commissioned to put his set-square where his mouth was all over the country. Alton Towers (1836), Scarsbrick Hall (1837), the catholic cathedrals of Birmingham (1841) and Newcastle (1844), and the lush Perpendicular-style detailing of the new Houses of Parliament (1840–52)—the classicist Charles \*Barry did the main plan—are some of the results. They are not the greatest examples of the genre; but Pugin should really be judged by the inspiration he gave to better architects (like \*Scott and \*Butterfield) after him. Besides, he died very young, after religious fanaticism turned to certifiable madness in his late thirties. His son, E. W. Pugin (1834–75), another short-liver, carried on his work. BJP

**Puisset, Hugh de** (c.1125–95). Bishop of Durham. Puisset was a great aristocratic churchman, who held the wealthy see of Durham, with palatine powers, for more than forty years. He was a nephew of King Stephen and received his first preferment (an archdeaconry) from Stephen's brother \*Henry of Blois, bishop of Winchester. Next, an-

other relative, William Fitzherbert, archbishop of York, gave him the post of treasurer in the diocese. In 1153, probably before he was 30, he was made bishop of Durham. Politically he seems to have been circumspect. He stayed out of the \*Becket controversy and played an equivocal role in the rebellion of 1173. For years he maintained resistance to the authority of Geoffrey, archbishop of York. A hint at his essentially secular attitude came at the start of Richard I's reign, when the king was raising funds for the crusade. Hugh purchased the earldom of Northumberland and the \*justiciarship. He was ousted from the justiciarship by William \*Longchamp and surrendered the earldom in 1193. He lived in great style, built lavishly, patronized learning, and fought his corner. JAC

**Pulteney, William, 1st earl of Bath** (1684–1764). Pulteney was Whig MP for Hedon (1705–34) and Middlesex (1734–42), becoming secretary at war in 1714. He supported \*Walpole and \*Townshend in opposition during the Whig schism from 1717 to 1720, but felt insulted when not offered a post in the reunited Whig administration. Thereafter he became alienated from Walpole and in 1725 made a final break with him, joining \*Bolingbroke in attacking the ministry in print via the \**Craftsman*. On the accession of George II in 1727 he was disappointed not to replace Walpole. His greatest triumphs in opposition were the destruction of the \*excise scheme in 1733 and his agitation for war with Spain, which eventually brought down Walpole in 1742. But Pulteney refused to take office and was created earl of Bath. Disappointed once more at not being made first minister in 1743, he tried to overthrow Henry \*Pelham in 1746 but failed to form a government. Thereafter he played no part in public affairs. Pulteney was one of the first politicians to head a sustained appeal to public opinion, only to raise hopes which he dashed. With a great reputation as a debater, he was increasingly mistrusted by his allies among the 'patriots'. His failure to effect reform or root out corruption after Walpole's fall was thought by many to reveal factiousness and self-seeking and he was accused of avarice. 'A paltry fellow', was the disillusioned \*Johnson's terse dismissal. CJ

**Punch**, a satirical weekly periodical, was founded in 1841 under the editorship of Henry Mayhew and Mark Lemon, early contributors including \*Thackeray, Hood, and Tenniel. Famous for its cartoons, and a former stand-by in professional waiting-rooms, it closed in 1992 due to debt, but reappeared in 1996 under new ownership. ASH

**Purcell, Henry** (1658–95). The outstanding musician and composer of his time in Britain. Like other 17th-cent. musicians, Purcell's career began in the church, first as a chorister at the Chapel Royal, then as organist at Westminster abbey composing anthems. At court he enjoyed the favour of successive monarchs composing odes on special occasions, but his works for Mary II are the best known, composed when Purcell was reaching the height of his powers, just before his premature death. The music he composed for her funeral is of a truly majestic solemnity and profundity. He also composed for the theatre, particularly for works by John \*Dryden, and his own operas achieved considerable

success. However what is now most often heard, and regarded as his masterpiece, *Dido and Aeneas*, was originally written for performance by schoolgirls in 1689 and only became appreciated over a decade later. Unlike most of his contemporaries Purcell was influenced by Italian as well as French styles, but what distinguishes his work is the personal element. Like Christopher \*Wren in architecture he took from a variety of sources what he wanted, but added a distinctive, personal contribution, the product of his genius. JRJ

**puritans.** During the reign of the catholic Mary Tudor (1553–8) many hundreds of English protestants went into exile on the continent, where they experienced forms of worship which were 'purer' than those prescribed in the 1552 \*Prayer Book because they contained virtually no trace of catholicism. Returning to England at the beginning of Elizabeth I's reign, they hoped to create an established church closer to continental models, but the queen insisted on a comprehensive settlement. The Elizabethan church therefore retained a number of 'impure' ceremonial practices, which a minority of hard-line clergy refused to accept. They were harried by the government, under the name of 'puritans'. The conforming majority, both clerical and lay, shared many of their reservations but were willing, albeit reluctantly, to obey the orders of their royal governor. They were helped by the fact that in its theology, if not its practice, the established church was \*calvinist. This remained the case under James I, despite the failure of the \*Hampton Court conference, but the accession of Charles I in 1625 brought the high-church \*arminians to power. By insisting that they alone constituted the true Church of England, and by calling all its low-church adherents puritans, the arminians drove the conforming majority into opposition. This opened the way to the destruction of the established church after the collapse of Charles's rule, but the victorious puritans were divided about how to replace it. The \*presbyterians wanted a state church similar but not identical to that in Scotland, whereas the independents insisted on autonomy for individual congregations. Matters were complicated by the proliferation of sects demanding freedom to worship as they pleased. Continuing puritan divisions throughout the Interregnum created a backlash which found expression in the re-establishment of the Church of England after the restoration of the monarchy in 1660. The legislation known as the \*Clarendon code imposed severe penalties upon nonconformists, and sporadic persecution of puritans continued until the \*Glorious Revolution. Only in 1689 did the Toleration Act permit protestant nonconformists to worship freely, but even so they remained officially barred from public life. RL

**purveyancing** was the means of supplying the king and his court on progress with the provisions and services they needed at prices to be fixed by royal officers. Consequently the subject was lucky to be paid inadequately, if at all. Purveyancing for war supplies was an even heavier burden and a major grievance during the protracted warfare of Edward I's reign. Since the king could not have palaces and stores everywhere, purveyancing was the only way

he could travel his realm. \*Magna Carta attempted to regulate it; *Speculum regis* of c.1331 declared it a cursed prerogative; the \*Ordainers of 1310 moved against it, and it was still a matter of loud complaint in the reigns of James I and Charles I. It was finally abolished during the Civil War. JAC

**Pusey, Edward Bouverie** (1800–82). A leader of the \*Oxford movement, Pusey contributed to the series which led to the alternative description of \*'tractarians'. He also gave the movement another nickname by maintaining the tradition of the tractarians within the Church of England after \*Newman's secession to Roman catholicism. Pusey fought a rearguard action to prevent others following and his supporters, dedicated to restrained and respectable high churchmanship, became known as 'Puseyites'. He refused to be drawn into the ritualism which for many was the natural consequence of the Oxford movement, but supported the revival of Anglican monastic life, particularly for women. He was unique in England in his deep knowledge of contemporary German theology and was also a prodigious scholar of Syriac, Arabic, and Hebrew. A prime mover in making the writings of the church fathers more widely known, he was appointed regius professor of Hebrew in Oxford at the age of 28. JFC

**Putney debates.** These occupied the general council of the army from 28 October to 1 November 1647, and were recorded almost verbatim by its secretary William Clarke. The council included two officers and two soldiers ('agitators') elected by each regiment, and the central question was whether to continue seeking a negotiated settlement with the king. Representatives of the \*Levellers put before it a revolutionary alternative, an \*Agreement of the People, and the ensuing arguments for and against manhood suffrage were memorably eloquent. The outcome was inconclusive, for with mutiny threatening in several regiments the general council agreed on 8 November to its own suspension. AHW

**Pym, John** (1584–1643). Parliamentarian. One of the few members of the Commons who realized that poverty was driving Charles I into arbitrary rule, Pym consistently, but vainly, argued the case for restoring the crown's finances. But his attitude towards the king hardened with the conviction that Charles, by patronizing the \*arminians, was opening the door to catholicism, and in 1628 he led the impeachment of a royal chaplain who had publicly affirmed the king's right to impose non-parliamentary taxation. Pym was by then a political client of the earl of \*Bedford, and drafted the petition calling on the king to summon Parliament which was drawn up at Bedford's London house in September 1640. When the \*Long Parliament met in November, Pym was the driving force behind the impeachment of Charles's chief minister \*Strafford, but he also supported Bedford's plan to reach an accommodation with the king. Had it succeeded, Pym would have been appointed chancellor of the Exchequer, with responsibility for the royal finances. The revolt of the Irish catholics in 1641 confirmed Pym in his belief that the king was involved in a 'popish plot' to destroy English religion and liberties, and in order to

## Pyrenees

compel him to co-operate with Parliament he pushed through the \*Grand Remonstrance. Not surprisingly, he was one of the \*five members whom the king sought to arrest in January 1642. Pym's major contribution to the parliamentary cause came in 1643 when he persuaded members to impose an excise to meet the costs of war and to accept the \*Solemn League and Covenant as the price of Scottish support. RL

**Pyrenees, battle of the,** 1813. Following \*Wellington's offensive in the spring of 1813, Marshal Soult's army of

88,000 men attempted to lift the siege of the French-held towns of San Sebastián and Pamplona in northern Spain. The series of actions that resulted are known as the battle of the Pyrenees. Soult achieved surprise and forced small British forces to retire from the key mountain passes at Maya and Roncesvalles on 25 July. Wellington met Soult at Sorauren near Pamplona on 28 and again on 30 July and won hard-fought victories. On 2 August the French retreated, ceding the initiative to Wellington.

GDS

**Quadruple Alliance.** 1. 1718. After the War of the Spanish Succession, Philip V of Spain was anxious to regain territory. France, Britain, and the Dutch formed a defensive \*Triple Alliance in 1717, which the Emperor Charles VI joined in 1718. The other allies agreed to support the Hanoverian succession in Britain. The emperor was to be given Sicily, and Sardinia was to go to Savoy. A British naval squadron defeated the Spanish fleet off \*Cape Passaro immediately after the treaty had been signed in 1718, and a French invasion of Spain in 1719 forced Philip to come to terms.

2. 1815. At the end of the Revolutionary and Napoleonic wars in 1815, the victorious powers—Britain, Russia, Prussia, and Austria—formed a Quadruple Alliance to maintain the peace and to hold periodic conferences to consider matters of common interest—the so-called \*Congress system. Meetings were held at Aix-la-Chapelle (1818), Troppau (1820–1), and Verona (1822), but differences between the allies were soon apparent. See HOLY ALLIANCE.

3. 1834. In the 1830s, the young queens of Portugal and of Spain were challenged by their uncles. Britain and France formed a Quadruple Alliance with Spain and Portugal in 1834 to protect them, as constitutional rulers, against intervention by Metternich. ‘All my own doing’ was \*Palmerston’s claim, and he saw the alliance as a counter-balance to the despotic powers of Eastern Europe. But the alliance was short-lived and the liberalism of the queens suspect.

JAC

**quakers**, or Society of Friends, are said to have derived their name either from ecstatic shuddering or from George \*Fox’s advice to Justice Bennet in 1650 to tremble at the word of the Lord. They originated during the religious tumult of the 1650s, had no formal ministry or service, and professed the principle of the ‘inner light’, a sense of the direct working of Christ. Their refusal to pay tithes, insistence upon addressing everyone as thou, refusal to doff hats to authority, and the extravagant behaviour of some of their members, shocked a hierarchical society, and they were fiercely persecuted before and after the Restoration. The earlier excesses of the movement were soon abandoned and they acquired a reputation for sobriety and peaceableness. Quaker organization was based on a monthly meeting, quarterly county meetings, and an annual meeting in London. They benefited from the \*Toleration Act of 1689 and in 1696 were allowed to affirm rather than take an oath. There was

considerable emigration to Pennsylvania, founded on quaker principles. They were not enthusiastic evangelists and did not share in the rapid growth of dissent in the early 19th cent., having 413 meeting-houses in 1800 and 371 in 1851. Quakers refuse military service but are often prominent in ambulance and medical corps. JAC

**Quarterly Review.** This was the Tory riposte to the very successful *Edinburgh Review*, which had been launched in 1802. It was started in 1809 by Sir Walter \*Scott, George Ellis, and John Wilson \*Croker, with William Gifford as editor. The early contributors included \*Canning and Robert \*Southey. By the middle of the century the taste for magisterial, learned, and lengthy reviews was beginning to decline. JAC

**quarter sessions.** The office of \*justice of the peace can be traced back to the ‘keepers of the peace’ in 1195 and ‘conservators of the peace’ during the reigns of Henry III and Edward I, but the principal statutory provisions establishing the justices of the peace were those of the 14th cent., especially the Justices of the Peace Act, 1361. By a statute of 1362, the justices of each county were to meet four times a year and these sessions were therefore known as ‘quarter sessions’. At these sessions presentments of those suspected of crime were made to the justices and other matters, outside the realm of the purely judicial, referred to them. Between them the \*assizes and quarter sessions dealt with all serious crime. From time to time, the commission issued to the justices put certain limits on the range of crimes which could be dealt with at quarter sessions, but in 1590 it was finally settled that they had jurisdiction to try all offences, though it was provided that certain justices should be present where cases were difficult, and some cases were reserved for the assizes.

During the 18th cent. the practice arose of reserving the many capital cases for the assizes, and by the Quarter Sessions Act 1842 the jurisdiction of quarter sessions over such offences as treason, murder, felonies punishable with penal servitude for life, and certain other offences was removed. In 1914 quarter sessions were given appellate jurisdiction over petty sessions in certain circumstances. Quarter sessions were abolished by the Courts Act 1971. MM

**Quatre Bras, battle of**, 1815. After resuming control of France in 1815 on his return from Elba, Napoleon advanced

## Quebec

into Belgium, striking with his main force against the Prussians at Ligny. A subsidiary force under Marshal Ney headed towards the vital crossroads at Quatre Bras. Although initially outnumbered, elements of the Anglo-Dutch army defended stoutly until reinforcements, and \*Wellington himself, arrived. A French corps spent the day marching between Quatre Bras and Ligny, and participated in neither battle. By nightfall, Wellington had 36,000 men to Ney's 20,000, and was able to fall back to the position at \*Waterloo, having won an important strategic victory. GDS

**Quebec, capture of, 1759.** This ended French sovereignty in Canada. British sea power reduced the fortress of Louisbourg (1758), opening up the St Lawrence. Despite fears that the strongly entrenched French, under the brilliant Montcalm, could be dislodged only by a long siege, \*Wolfe's troops, with a surprise night manoeuvre, followed by a pitched battle, achieved an epic victory. While Quebec's capture formed the summit of British imperial success, problems of taking Canada into British control and the lessening of colonial anxieties about French power contributed to the circumstances leading to the revolt of the thirteen colonies. RCS

**Quebec Act, 1774.** This followed but was not part of the \*Intolerable Acts. It settled matters relating to the British acquisition of French Canada by recognizing the catholic church, allowing the exercise of French law, denying Quebec an elected assembly, and extending its boundaries to the Ohio. Opposed by only a few parliamentarians and by virulent British anti-catholics, it was fervently condemned in the thirteen colonies, as an attack on protestant and constitutional liberties and on their territorial expansion and as confirmation of the malign intentions of Lord \*North's ministry and of the British crown and Parliament towards America. RCS

**Queen Anne's Bounty** was a product of the strong Anglican resurgence during her reign, caused partly by concern at the apparent progress of dissent since the Glorious Revolution. In 1703 the queen announced that she would devote the income from \*first fruits, which had been appropriated from the papacy at the Reformation, to the relief of poor clergy, and trustees were appointed to administer the scheme. In 1710 Parliament made funds available for the building of 50 new parish churches in London. JAC

**Queensberry, James Douglas, 2nd duke of [S] (1662–1711).** Queensberry's father was promoted marquis in 1682, duke in 1684, and 1682–6 was lord high treasurer [S]. Nevertheless, he came to terms with William quickly after the Revolution. Douglas (Drumlanrig until he succeeded in 1695) was one of the first to join William, was a gentleman of the bedchamber 1689–1702, lord privy seal [S] 1696–1702, and received the Garter in 1701. As commissioner to the Scottish Parliament, Queensberry played a crucial role in carrying the \*Union in Anne's reign. After losing control of the Parliament in 1704, and suspected of Jacobite intrigues, he was briefly replaced by \*Tweeddale. A spell in opposition demonstrated his usefulness and he was re-appointed commissioner and resumed as lord privy seal [S]

in 1705. Handsomely rewarded for his part in effecting the Act of Union, he was granted a large pension, served 1707–8 as a representative peer, and in 1708 was created duke of Dover in the British peerage. From 1709 he was in charge of Scottish affairs but died early. Vilified by the Jacobites as an arch-traitor, Queensberry seems to have been moderate, persuasive, and personally agreeable. JAC

**Queensberry, John Sholto Douglas, 9th marquis of [S] (1844–1900).** Douglas inherited the title at the age of 14. He was a representative peer of Scotland from 1872 until 1880, when he lost re-election, largely for his outspoken support for \*Bradlaugh. A keen amateur boxer, he helped in 1867 to draw up the Queensberry rules, which governed boxing. His life was turbulent. His first wife obtained a divorce and his second marriage was annulled. A younger brother died climbing the Matterhorn. His first son died in a shooting accident in 1894. His third son, Lord Alfred Douglas ('Bosie'), formed a friendship with Oscar \*Wilde, of which his father violently disapproved. Queensberry's notorious card, left at Wilde's club, provoked Wilde to the action for criminal libel which ruined him. JAC

**Queensberry, William Douglas, 5th duke of [S] (1725–1810).** Son of William Douglas, earl of March [S], whom he succeeded at the age of 6, Douglas became duke in 1778 when his cousin's sons died young. From 1760 until 1789 he was a lord of the bedchamber to George III and received the Thistle in 1763. From 1761 to 1786 he was a Scottish representative peer and was then created a British peer as Baron Douglas. After wobbling in the \*Regency crisis of 1789, he was deprived of his position in the bedchamber. A small, irritable, and foul-mouthed man of stupendous wealth, he was well known in gambling and racing circles and as a man about town. In his declining years, as Old Q, toothless and deaf, he was constantly to be seen on the balcony of his house in Piccadilly, watching life go by, an antiquated beau. JAC

**queen's counsel** (king's counsel). These were barristers appointed in the late 16th cent. to assist the law officers of the crown in the conduct of legal affairs. Unlike the \*serjeants at law they belonged to the \*Inns of Court. During the 18th cent. they ceased to be closely connected with the crown and the title came to be merely a mark of honour for distinguished barristers. They are said to 'take silk' on appointment, as they then wear a silk gown instead of a 'stuff' gown. To some extent they replaced the serjeants at law whose office died out in the 19th cent. in that they became the senior members of their profession. MM

**Queenston Heights, battle of, 1812.** The first major battle of the \*War of 1812 occurred when 1,000 New York State militia crossed the Niagara river and unexpectedly scaled the river cliffs. The British commander, Sir Isaac Brock, was killed leading a charge. British reinforcements and Indian allies eventually forced the surrender of over 900 Americans at a cost of 28 British fatalities. It was believed that Brock's last words were, 'Push on, brave York volunteers', addressed to colonial troops. Queenston Heights thus became a symbolic Canadian rejection of the USA. Brock and

his second-in-command, militia officer John Macdonell, were ceremonially reburied on the battlefield in 1824, and a memorial column was erected in 1853. GM

**Queen's University**, Belfast, was founded as Queen's College, Belfast, under Sir Robert \*Peel's Colleges Act (1845): in common with the two other colleges created by the Act (at Cork and Galway), Queen's Belfast first admitted students in 1849. The colleges were at first constituent parts of the Queen's University in Ireland (1850), and later, alongside University College, Dublin, more loosely associated with a new Royal University of Ireland (1880). The Irish Universities Act (1908) created both a National University of Ireland (binding the colleges of Cork, Galway, and Dublin) and a new Queen's University of Belfast out of the former Queen's College. Since 1908 the social character of the university has been transformed: once a small and largely presbyterian body (the college had only 195 students in the session 1849–50), Queen's now reflects, if still inadequately, the increasing political and economic strength of the catholic community in Northern Ireland. AJ

**quia emptores**, also known as the statute of \*Westminster 1290. This statute of Edward I brought to an end the practice of subinfeudation. Before then it was possible for a tenant to grant land to another tenant, who would owe him service, thus creating a further subtenancy and extending the feudal ladder. The statute *quia emptores* provided that where a tenant of land alienated that land, he could not create a new relationship of lord and tenant with the purchaser, who would instead 'stand in the shoes' of the seller. The effect was to preserve order, to prevent extending the feudal 'ladder', and to safeguard the lords' interests in their tenants' services. The end of subinfeudation, coupled with the vicissitudes of \*escheat, forfeiture, and the failure of heirs led to

the crown acquiring the overlordship of much land by the reign of Henry VIII. MM

**Quiberon Bay, battle of**, 1759. This bay lies on the Biscay coast of France between Lorient and Saint-Nazaire. Here, on 20 November 1759, was fought one of the most brilliant engagements in the annals of naval warfare. Britain stood in danger of invasion by France, and by November Sir Edward \*Hawke had blockaded the fleet of Conflans in Brest since the previous May. When the weather blew Hawke off station, Conflans was able to break out, but early on the 20th Hawke, a little superior in strength, had news that Conflans's 24 ships had entered Quiberon. He risked everything by following the French into this barely known anchorage in fading light and heavy squalls, and did indeed lose two ships through weather, though their crews were saved. But six French ships were destroyed in the ensuing action, and many of the remainder suffered irreparable damage in flight. Hawke considered that 'all that could possibly be done has been done', and the French admiringly conceded his achievement. DDA

**quo warranto proceedings**. The *quo warranto* inquiry was instituted by Edward I when he succeeded to the throne in 1272. Among other measures he instituted proceedings whereby his royal justices investigated the claim of every lord who claimed to have a franchise of a hundred court—a \*court leet—inquiring 'by what warrant' the lord made such a claim. The lord had to prove that such jurisdiction had been granted, usually by royal charter. However, Edward allowed lords to show that they had acquired the franchise by prescription 'from time immemorial'; in practice that they had exercised such jurisdiction since 1189, the accession of Richard I. MM

**R 101 airship.** The larger of two rigid airships commissioned by the government in 1924. Designed by Barnes Wallis, it was built to carry up to 50 passengers on the long-haul route to India. It set out from Cardington on its maiden voyage on 4 October 1930 with an official party, including the secretary of state for air. At 2 a.m. the following morning it touched the ground on its approach to Beauvais, caught fire, and exploded. Only four people survived. The disaster put an end to the use of airships in Britain.

RAS

**race relations.** A thorough survey of race relations in Britain would demand a history of the British Isles, since one of its persistent themes has been the interplay of the native peoples, the intervention of Romans, Saxons, Danes, and Normans, and the reception of Jews, Palatines, Huguenots, and, after the Second World War, citizens from the Commonwealth. It would also include a study of the rise and fall of the first and second British empires. Before the 20th cent., governments did not often intervene to protect newcomers or promote racial harmony. \*Cnut was anxious to hold a balance between his Danish and English subjects; Henry VIII in 1535 complained that 'rude and ignorant' people were stirring up 'discord, division and murmur' between his Welsh and English subjects; and James I took the earliest opportunity to recommend 'mutual love' between his Scottish and his new English subjects. Racial questions were usually complicated by other considerations, particularly religion and employment. French Huguenots in the 17th cent., because of their religion, were on the whole welcomed; Jews and Irish Catholics less so. In its modern form, race relations developed mainly through the \*anti-slavery campaign in the late 18th and early 19th cents. Opponents of emancipation justified slavery on arguments of racial inferiority, offensively expressed by Thomas \*Carlyle in an essay on 'The Nigger Question' in *Frazer's Magazine* for 1849. Immigration from the Commonwealth in the 1950s and 1960s, particularly from India and the West Indies, placed the question on the political agenda. The 1965 Race Relations Act, passed by the Wilson government, prohibited discrimination in places of public resort, such as hotels or restaurants, made the promotion of hatred on grounds of 'colour, race, or ethnic or national origins' an offence, and established a Race Relations Board to hear complaints. The measure was extended by further Acts in 1968 and 1976, the last providing for a Race

Relations Commission to promote 'equality of opportunity and good relations'.  
JAC

**Radcot Bridge, battle of, 1387.** The accession of a 10-year-old king, Richard II, in 1377 led to baronial rivalry. In 1386 five noblemen, Arundel, Derby (the future Henry IV), \*Gloucester, \*Nottingham, and Warwick, formed an alliance, the lords \*appellant, to remove two royal favourites, Michael de la \*Pole, duke of Suffolk and \*Oxford (created duke of Ireland in 1386). Suffolk was impeached and forced to flee. De Vere, earl of Oxford, raised an army in Cheshire in December 1387 and marched south to join the king. He was intercepted at Radcot Bridge, just east of Lechlade, on 20 December and trapped between armies led by Derby in front and Gloucester behind. Oxford fled and joined Suffolk in France.  
JAC

**radicalism** seeks a fundamental change in political structures through a programme of far-reaching but constitutional reform. Its features include some or all of individualism, democracy, minimal government, a market economy, freedom of speech and publication, and opposition to tradition, hereditary privilege, and religious influences.

There was never a single radical party in Britain, though three loose groupings may be identified. The \*philosophical radicals were the \*utilitarian followers of Jeremy \*Bentham (1748–1832) who formed a small but influential reforming group in the 1830s, including George \*Grote and Joseph \*Hume within the Commons, and Edwin \*Chadwick, Joseph \*Parkes, and James and John Stuart \*Mill outside Parliament. Their ideas were publicized through the *Westminster Review*. Secondly, from the later 1830s, the \*Manchester School radicals, led by \*Cobden and \*Bright, campaigned for \*free trade and against aristocratic privilege through organizations such as the \*Anti-Corn Law League. They were supported by nonconformist religious opinion opposed to the established church. Thirdly, outside Parliament, admirers of Thomas \*Paine's *\*Rights of Man* (1791–2) formed a loose alliance of democratic agitators which gave leadership to the \*chartist movement (1838–52). These extremists were often in conflict with the other, more middle-class radicals. To a large extent they coalesced in the later 1850s into the radical wing of the \*Liberal Party under \*Gladstone's leadership. Notable parliamentary radicals in the 1870s and 1880s were Charles \*Dilke, Joseph \*Chamberlain, and Charles \*Bradlaugh. Radicalism declined

as the most advanced school of progressive political opinion with the rise of socialist ideas at the end of the 19th cent. ER

**radio** was the dominant sound medium of the first half of the 20th cent., and—though now less popular than television—still has a residual power in areas such as news and music. The solution to the technical problem of how to send telegraph and telephone messages without connecting cables was found in the late 19th cent. when wire-less means of communication became viable with the discovery by Hertz of electromagnetic waves. In Britain, Italian inventor Marconi developed the first wireless telegraph in 1896, sending airwave messages in Morse code over the Atlantic in 1901. The development of the thermionic valve in America by Lee de Forest and in Britain by John A. Fleming allowed speech to be turned into radio waves, and the First World War brought rapid developments in this means of transmitting messages on the airwaves.

After the war, electrical companies such as Marconi's experimented with transmitting entertainment items to the many amateur radio receivers throughout Britain. After initial attempts to ban such activities, the government decided to license the experiments, leading to the creation in 1922 of the \*British Broadcasting Company as a monopoly private consortium of radio companies, responsible to the post-master-general and supported by a licence fee.

With its elevation to a corporation in 1927, the BBC set the tone for radio in Britain over the next 40 years—a paternalistic diet of information and education, with some concessions to entertainment in the form of light musical and variety items. Challenges from the more populist fare of other radio stations—Radio Luxembourg from 1933, American Forces Radio in the Second World War, and offshore pirate radio stations in the 1960s—brought gradual revision to programming policy. The biggest changes to British radio however came in the early 1970s with government legislation to permit commercial radio, under the name of Independent Local Radio (ILR). Capital and LBC in 1973 were the first of a network of stations that grew up throughout the country over the next few years, under the guidance of the Independent Broadcasting Authority (now the Radio Authority). ILR's populist fare often proved more successful than the BBC national and local radio in certain areas, and under Conservative free enterprise policy in the 1980s and 1990s, the expansion of commercial radio was cemented with licences to new national, regional, local, community, and ethnic stations. The pattern of radio consumption has been irrevocably changed, and the BBC entered the 21st cent. with fundamental questions about its position in British culture and society still unanswered. DJA

**Radnorshire** (Sir Faesyfed). County of mid-Wales created at the Act of \*Union with England in 1536. It was part of the Welsh kingdom of \*Powys but was subject to Saxon attack both before and after the construction of \*Offa's Dike. It was rapidly overrun by the Normans, and the north, the Welsh cantref of Maelienydd, became Mortimer land, whilst the south, the Welsh cantref of Elfael, was taken by the Braoses. These two areas were eventually formed into the new county, the smallest of the Welsh shires. Incorporated

into Powys as a district in 1974, it became part of the Powys unitary authority in 1996.

Radnorshire was both the smallest and the poorest of the pre-1974 counties. It was mainly made up of the high moorlands of Radnor Forest (2,660 feet) and the drainage system of the upper Wye and its tributaries, the Claerwen, Elan, Irfon, and Ithon.

Given its physical character, sheep-farming is the dominant agricultural enterprise, but in the 19th cent. the exploitation of mineral springs gave rise to small spas which are now tourist centres. Water resources have also been developed mainly to supply the English midlands. The Elan valley reservoirs were constructed between 1892 and 1906. Forestry is another activity and the complex of upland, lakes, forests, and former spas underpins tourism.

As a consequence of its early Anglicization Radnorshire has a low proportion of Welsh speakers. Even in 1901 only 6.2 per cent spoke Welsh, a figure lowered by construction workers on the dam sites. In 1991 the percentage was 8.3. The total population in 1991 was only 22,982. HC

**Raeburn, Sir Henry** (1756–1823). Raeburn was born and worked all his life in Edinburgh. He was the leading Scottish portrait painter of his day, recording many of the personalities of the city and a number of Highland chieftains before the time of depopulation and emigration. Largely self-taught, he visited London in 1784 on his way to study in Italy and met \*Reynolds, whose style influenced him in a way that his Italian experience did not. Having married a wealthy widow in 1780, he added to their fortune by buying land on the outskirts of Edinburgh which he developed speculatively. In 1812 he was elected ARA and a full RA three years later. In 1822, when George IV visited Edinburgh, he knighted Raeburn, creating him king's limner and painter for Scotland the following year. Raeburn's portraits of Mrs Scott-Moncrieff and of the Revd Robert Walker skating on Duddingston Loch are among many of his works in the National Gallery of Scotland. JC

**Raedwald** (early 7th cent.), king of the East Angles. Baptized under the influence of King \*Æthelbert of Kent, he compromised with his heathen wife and subjects, adding a Christian altar in his temple alongside those to pagan gods. Sheltering the Deiran royal exile \*Edwin, c.616, he was under pressure from the Northumbrian king \*Æthelfryth to kill him or hand him over. His wife persuaded him that to betray a guest was unworthy of so great a king. At this time, Raedwald was probably asserting his overlordship in the south. Pre-empting Æthelfryth's threats, he attacked, defeated, and killed him by the \*river Idle (Lincs.), securing the Northumbrian kingdom for Edwin. Raedwald's name is often linked with the famous ship-burial at \*Sutton Hoo. Whether or not it is his grave, it represents the wealth, contacts, and power of such a man. AM

**Raffles, Sir Thomas Stamford** (1781–1826). Raffles was born off the coast of Jamaica on board his father's merchantman. He joined the \*East India Company in 1795 and was appointed to Penang where he rapidly rose to be secretary to the council. In 1810 he was made agent to the Malay states to

## ragged schools

prepare an invasion of Java, then under the control of the Batavian Republic. He governed Java between 1811 and 1816, instituting far-reaching economic reforms. When the island was restored to the Dutch, he returned to England and was made a fellow of the Royal Society. In 1818 he became lieutenant-governor of Fort Marlborough (Sumatra). Fearing Dutch influence over the region, he persuaded the company to found a settlement at Singapore. He raised the flag there on 2 June 1819 and, by the time of his final return to England in 1824, had established it as an important port.

DAW

**ragged schools** were elementary schools for street children pioneered at the beginning of the 19th cent. by John Pounds, a Portsmouth cobbler, 'to chase away ignorance, to relieve distress, and to teach the Gospel'. The Ragged School Union, with the 7th earl of \*Shaftesbury as president, was formed in 1844 to further this object. Within a few years, most large towns had ragged schools. Other urgent needs were also supplied: food, clothing, and footwear. In 1851 the shoeblack brigades were formed as a means of giving employment to their pupils. Schemes of emigration to the colonies were also introduced. After 1870 the union concentrated on Sunday schools.

PG

**Raglan, Fitzroy James Henry Somerset, 1st Baron** (1788–1855). Lord Fitzroy Somerset, eighth son of the duke of Beaufort, was appointed aide-de-camp to Lieutenant-General Sir Arthur Wellesley, the future duke of \*Wellington, in 1808. He accompanied the duke throughout his campaigns in the Iberian Peninsula (1808–14) and was badly wounded at \*Waterloo on 18 June 1815. Despite this, he remained on Wellington's staff. In 1852—the year of the duke's death—Somerset was created Baron Raglan, and two years later given command of British forces in the war against Russia. When those forces invaded the Crimea in September 1854, it soon became apparent that Raglan was not suited to high command, for although promoted to field marshal, he was widely criticized for orders leading to the \*'Charge of the Light Brigade' at \*Balaclava on 25 October. He died of dysentery in the Crimea on 25 June 1855.

JLP

**Raglan castle** (Gwent), half-way between Monmouth and Abergavenny, was probably first built in the 1070s to support the Norman invasion of south Wales. In the early 15th cent. the castle came by marriage to William ap Thomas, whose son Sir William Herbert rose to prominence under Edward IV as the first earl of Pembroke. The castle became the centre of an important lordship and home of one of the wealthiest men in the kingdom. It was completely rebuilt incorporating the latest defensive features, including a great tower designed for the use of cannon, as well as sumptuous domestic accommodation for Pembroke's family and household. It was probably at Raglan that the young Henry Tudor, the future Henry VII, was housed under the supervision of Pembroke's wife Anne Devereux. In 1492 the Herbert barony passed by marriage to Sir Charles Somerset, created earl of Worcester in 1514. During the Civil War Raglan was garrisoned for the king. After a protracted siege the castle surrendered in August 1647 and was slighted. After the

Restoration, Henry Somerset, first duke of Beaufort, built a new house at Badminton transferring some fittings from Raglan.

LR

**rail system.** Means of conveyance by wheeled vehicles guided on fixed tracks, especially when propelled by locomotive. English usage of the flanged wheel and long-distance horse-drawn links between mines and water transport distinguished the wagon-way from the European *hund* (truck). It is first recorded at Woolaton (Notts.) c.1604 and Broseley (Shropshire), and was introduced by Huntingdon Beaumont to Northumberland by 1605. Diffusion of 'wagon-ways' was widespread around the rivers Tyne and Wear in the century after 1660, and lesser systems appeared in Shropshire, Yorkshire, Cumberland, and Fife. Charles Brandling's wagon-way built to supply Leeds with his coal was the first to employ the private act to secure wayleave (1758), and to apply steam commercially in the Murray and Blenkinsop locomotive (1812). The wagon-way was an integral element of most canals, advanced with the introduction of iron rails from the 1790s, and attained its ultimate development in the Stockton and Darlington railway (1825).

The Liverpool and Manchester railway (completed 1830) was the effective transition to the rail system, being designed for steam haulage throughout; for communication between two major towns; and to convey passengers as a principal element of the business. Secondary consequences followed: the exclusion of public access on grounds of safety; by this the establishment of monopoly; and transport at speeds beyond that of a horse transformed the psychology of travel. It was followed by the Grand Junction from Crewe to Birmingham (1837) and the London and Birmingham railway (1838). England thus established a long-distance link between the capital and the industrial north-west. The companies founded in or before the 'railway manias' of 1836–7 and 1844–7 had largely completed the rail system by 1854, with more than 6,000 route miles open, and a further 3,200 authorized. The third mania of 1863–6 concentrated upon branch and subsidiary lines, and London suburban development, bringing route mileage to over 15,500 by 1870.

Subsequent development continued the pattern: the bridging of the Scottish estuaries of the Tay (1878 and replacement 1887) and Forth (1890) completed the direct line to Aberdeen, and the Severn tunnel (1886) cut journey times into south Wales, but no major additional trunk routes were added after 1870. The Midland railway attempted to abandon the last navy-built trunk line, the Settle–Carlisle (opened 1876), in 1868–9, but was forced to complete, and the Great Central's entry to London at Marylebone (1894) was a highly engineered superfluity. Mileage in Britain reached 21,000 by 1914 and was maintained until 1938, before falling to below 19,000 at the end of the 1950s and 12,000 in 1970, of which passenger mileage was around 9,000.

Remarkable traffic growth before 1914 was accompanied by rising costs and falling levels of profit. Freight rose from c.38 million tons in 1850, to 167 million in 1870, and 513 million in 1912, of which 60 per cent was coal and coke, and passenger journeys grew from 73 million in 1850 to 337 million in 1870, and 1,580 million in 1912 (c.2,000 million

including London). Competition in services and facilities, the rising ratio of running costs to gross receipts, and falling labour productivity characterized much of the period 1870–1914. Railway direct employment peaked at just under 750,000 in 1921. The railway system was more important to the British economy in 1914 than in 1870, measured by its estimated specific contribution to economic growth, or 'social saving'.

Passengers gained accordingly in the quality and volume of services: sleeping cars were introduced in 1873, as were the first lavatories outside royal trains; the 'express' from the 1870s; the Pullman in 1874; dining cars in 1878; and corridor stock in the early 1890s. All were costly in terms of passengers carried per ton hauled: the best corridor stock before 1914 carried 2.4 passengers per ton, 30 per cent better than the ratio for 1875, but comparing poorly with suburban carrying capacity of 3.5. This growing weight of trains demanded increasing investment in more powerful locomotives.

The system had been the creation of individual joint-stock companies, perhaps Britain's first experience of large-scale business, which provided the core securities traded in the new provincial stock exchanges. There were 366 railway companies in the mid-1860s, and still around 100 in 1914, and the system was unplanned by comparison with that of Belgium or France. Government competition policy inhibited amalgamations, but 'end-on' linkages such as the LNWR (1846), the NER (1854), and territorial monopolies such as the Great Eastern (1854) did emerge, and left the system dominated by four English and three Scottish units at the grouping into four companies in 1923. London's Underground Electric Railways Company, formed by Charles Tyson Yerkes in 1900 to establish a coherent system, soon neared bankruptcy and merged into the London General Omnibus Company in 1912, taking in the remaining tube lines in 1913. Most joined the London Passenger Transport Board in 1933, and London Transport on its formation in 1948.

The pressures of the First World War left the system severely run down, and the grouping of 1923, a compromise between public and private ownership, failed to eliminate wasteful competition in cities such as Birmingham and Leeds, and coincided with the downturn of traffic and the rise of road competition. In response, only the Southern railway electrified extensively, at a cost of £21 million, and was able to improve services to its short-haul passenger base at reduced fares: for the system as a whole, investment proved insufficient to redress falling income, and operating ratios remained poor. Nationalization in 1948 found an exhausted system, beset by the structural and competitive weaknesses of pre-war years, in urgent need of modernization, rationalization, and the standardization of its equipment. Subsequent experience of shifting government policy, uneven conditions of competition with road and air travel, and uncertainty about the balance to be struck between commercial and service objectives left a still under-capitalized system, privatized in the 1990s in a dutch auction of subsidies, and Railtrack in possession of a potential property bonanza. But spectacular crashes at Paddington

and Hatfield, together with persistent complaints of poor service, led to Railtrack being put into administration in 2001 by the government, and its shareholders facing the probable loss of most of their investment. JCh

Dyos, H. J., and Aldcroft, D. H., *British Transport: An Economic Survey from the Seventeenth Century to the Twentieth* (Leicester, 1969); Freeman, M. J., and Aldcroft, D. H. (eds.), *Transport in Victorian Britain* (Manchester, 1988); Gourvish, T. R., *British Railways, 1948–73: A Business History* (Cambridge, 1986); Simmons, J., *The Railway in England and Wales, 1830–1914*, vol. 1: *The System and its Working* (Leicester, 1978); Simmons, J., and Biddle, G., *The Oxford Companion to British Railway History* (Oxford, 1997).

**railway stations** had no distinctive history until the Liverpool and Manchester railway of 1830, with the opening of Manchester Liverpool Road and Liverpool Crown Street: the light passenger traffic on the Stockton and Darlington had run in a horse-drawn coach from inns. Both consisted of two-storey classical town houses, controlling access to a departure platform, the model for the first phase of British railway development. No intermediate stations were built.

Initially, stations were located on the fringes of the urban area to ease access and economize on land costs. Facilities shared by different railway companies normally proved unworkable and led to their proliferation. Some early developments were able to trace a route to central locations through undeveloped land: London Bridge (1836), and in the 1840s, the Great Western's route to Paddington ran to the fringe of London's built-up area. Curzon Street (Birmingham), Oldham Road (Manchester), and Bridge Street (Glasgow) were similarly approached through uncongested lands in the 1830s and 1840s.

Competition intensified the pressure to attain more central termini, and made the first mile for every railway by far the most expensive. Town-centre land values were consistently expensive: the London and Birmingham's entry from Camden Town to its new Euston terminus in 1838 cost an additional £380,000, and the imposition of a supplementary fare, in addition to a renewed call on the shareholders. Routes of entry were selected to affect the minimum number of most co-operative landowners. The new Hunt's Bank (Victoria) terminus for the Manchester and Leeds (1839) affected more than 250 properties, but most lay in the hands of two owners, the earl of Derby and Lord Ducie, who also controlled the line for the link to Liverpool (1842). Only at Birmingham New Street did civic support create an equivalent to the grand central station of many European cities.

This was precluded for London in 1846, when the Royal Commission on Metropolis Railway Termini recommended the exclusion of termini from the city north of the river, creating the 'London quadrilateral'. Development was thus concentrated upon New Road in the north; east of the City; south of the river; and west of Park Lane. Seven of the fifteen termini London acquired by 1894 broke these precepts. Other cities too saw the wasteful proliferation of termini, with, by 1900, five in Glasgow, three each in Liverpool and Leeds, and four in Manchester. With sidings and other facilities, railway stations both defined the central business districts of Victorian cities and occupied up to 9 per cent of inner urban land.

The characteristic elements of British station design emerged early: the open-box 'U-shaped' terminal of platforms fronted by service buildings at Nine Elms (1838); the 'train shed' of ribbed iron supporting glass at Newcastle Central (1846); and the railway hotel at Euston in 1839. Hotels were first integrated at the U-planned Paddington station in 1854. Railways led the adoption of Greenwich time nationally, promoted through the station clock, standardized by telegraph to the Royal Observatory from 1852. Architecture rapidly became an element in competition by 'quality', and aped the classical temple (Euston, Newcastle, Huddersfield) and the Italian villa, popular for country stations but employed at Chester General (1848); it reached its creative height with the Midland Grand Hotel at St Pancras (1876); and admitted nationalist aspiration in the Scottish baronial style adopted at Dundee West (1889). Intermediate stations employed local materials, echoing the regional vernacular, with a characteristic corporate style: Italianate villas for the London, Brighton, and South Coast railway; French Renaissance châteaux (GWR); or Swiss chalets (Furness railway).

Separate goods stations were modelled on the integrated warehouse and trans-shipment operations of the canal companies: the Camden depot of the London and Birmingham (1830s) developed into the separate goods station and wholesale market, as at King's Cross (1852 and 1864), and the two-tier goods and passenger station at Broad Street (1865). In the smaller towns these tended to displace livestock and provisions markets, and by the 1880s auction markets at railheads were extinguishing the long-distance droving trades. Redundant passenger stations, such as Birmingham's Curzon Street, were converted to goods use.

Stations as interchanges for sea travel or river crossings effectively served new ports: Lowestoft by the Great Eastern, from 1844; Penarth by the Taff Vale for coal (1865); and Hartlepool (1840). Before dining cars (King's Cross to Leeds, 1878), there were designated refreshment stops: by contract until 1895, all Great Western trains stopped at Swindon for a ten-minute refreshment break, leading to its nickname 'Swindleum'; and Normanton's grand suite of rooms provided dinner for the Midland's Scottish route.

New station developments took place with the creation of the London Metropolitan railway in 1863, the completion of the Circle Line (1884), and the beginnings of deep 'tube' services in the capital (Monument to Stockwell, 1890). Suburban stations proliferated around London and other cities as passenger facilities were generally improved.

Evidence on numbers is lacking before 1947, when passenger and passenger/freight stations peaked at 6,701, and all stations, including freight units only, at 8,448 in 1950, before falling to 4,877 and 7,283 respectively in 1960, and 2,446 and 2,868 in 1970. Post-war contraction concentrated upon freight units, which collapsed in the Beeching cuts from 1963, and less than a quarter of stations were engaged with freight by 1970. This facilitated some station redevelopment, as in the rebuild of Birmingham New Street incorporating a shopping mall (1972), but the performance of British Railways' portfolio compared poorly with that of the general property market in the 1970s. Since 1970,

some new development has occurred in 'park-and-ride' stations, of which the first, Bristol Parkway (1972), remains the distinctive success, followed in the 1980s by new commuter station developments or reopenings under the initiative of local Passenger Transport Executives.

**Raleigh, Sir Walter** (c.1554-1618). Raleigh's spectacular career was broken by the mistrust of James I. Of Devon gentry stock, Raleigh was half-brother of Sir Humphrey \*Gilbert, with whom in 1578 he shared a short expedition at the expense of the Spaniards. He spent 1580-1 in Ireland and on his return rose rapidly in court favour under the patronage of \*Leicester. Knighted in 1584 and returned to Parliament, he became warden of the stannaries, captain of the queen's guard, lord-lieutenant of Cornwall, and was granted vast estates in Ireland. His attempts to promote the colonization of Virginia ended in failure, though they introduced tobacco and potatoes into England. He did not take part in the naval action against the Armada in 1588 but was greatly employed in the land operations. But as the star of \*Essex rose at court, Raleigh's began to wane and he fell into disgrace with the queen after an affair with one of her maids of honour, Elizabeth Throckmorton, despite their subsequent marriage. In 1595 he led an expedition to the Orinoco in search of gold and in 1596 took part in the attack on Cadiz. His prospects were further undermined by the correspondence which Henry \*Howard, earl of Northampton, established with James VI of Scotland, which succeeded in discrediting Raleigh. As soon as James succeeded in 1603, Raleigh was stripped of all his offices, was tried for treason, condemned to death, and imprisoned in the Tower. Not until 1617 could he obtain release to lead a second Orinoco expedition, which proved a disaster. He brought back no gold and his son was killed. James then had him executed on the original charge. During his long years in the Tower, Raleigh wrote his *History of the World*, brooding much on time and vicissitudes. It has grand passages and became popular, but Raleigh only reached 130 BC and as a work of history it was old-fashioned before it appeared. John \*Aubrey included Raleigh in his *Brief Lives*. Raleigh's 'graceful presence was no mean recommendation' to Queen Elizabeth, who liked 'proper men'. Raleigh was a 'tall, handsome and bold man, but damnable proud . . . he spake broad Devonshire to his dying day.' JAC

**Ramillies, battle of**, 1706. \*Marlborough's second major victory in the War of the Spanish Succession, in the Spanish Netherlands (modern Belgium) north of Namur, is regarded as his masterpiece. A bold advance by a French army of about 70,000 under Villeroi was intercepted by a roughly equal number of allied forces (British-Dutch-Danish) under Marlborough, and routed in a battle dominated by tactical subtleties. French losses were over 13,000, allied losses about 3,500. As a result France was forced permanently onto the defensive in the war, any French threat to the United Netherlands was ended, and Brussels, Antwerp,

and most of the Spanish Netherlands came under allied control. SDB

**Ramsay, Allan** (1713–84). Portrait painter, born in Edinburgh, son of the poet Allan Ramsay. He studied in Edinburgh, London, Rome, and Naples, settling in London in 1739 and quickly establishing himself as the leading portraitist of the capital. He was particularly successful in painting women. 'Mr. Ramsay is formed to paint them,' said Horace \*Walpole, and Ramsay was a serious rival to \*Reynolds. He became a favourite painter of the royal family and was appointed principal painter in ordinary to George III in 1767. His employment at court and his career as a portrait painter ended in 1773 when he suffered an accident to his right arm. The rest of his life was spent in travel, writing, and conversation. His friends included David \*Hume, for whom he painted Rousseau, Adam \*Smith, and Samuel \*Johnson, who said of him, 'You will not find a man in whose conversation there is more instruction, more information, and more elegance, than in Ramsay's.' JC

**Ramsay, Sir William** (1852–1916). Chemist. Ramsay was born in Glasgow and educated at Glasgow University. He developed an interest in chemistry, the profession of his grandfather, a manufacturer of dyestuffs, and studied in Germany. Appointed to the staff at Glasgow in 1874, he moved to Bristol in 1880 to take the chair of chemistry and became principal in 1881. From 1887 until his retirement in 1912 he was professor at University College, London. Ramsay's greatest discoveries were of the inert gases argon, helium, neon, krypton, and xenon, and his demonstration that radium produces helium when disintegrating and that this source of energy might be harnessed. He was knighted in 1902 and received the Nobel prize for chemistry in 1904. JAC

**Ramsbury, diocese of.** Founded in 909 by \*Edward the Elder in his reorganization of the \*Winchester diocese, Ramsbury comprised Wiltshire and Berkshire. In 1058 it was merged with \*Sherborne, which in 1075 was moved to \*Salisbury (Old Sarum). WMM

**Ramsey, Michael** (1904–88). Archbishop of Canterbury. Ramsey was born in Cambridge, the son of a congregationalist minister, and was educated at Repton, where the headmaster was Geoffrey \*Fisher, the man he ultimately succeeded as archbishop. In 1928 he was ordained as a curate in Liverpool, but soon returned to academic life (1930) when he joined the staff of Bishop's Hostel, Lincoln, training men for the ordained ministry. It was as an academic theologian, and as a spiritual writer and director, that he made a major contribution to the life of the church. At the age of 35 he became divinity professor at Durham, and after the war returned to his native Cambridge as regius professor of divinity. In 1952 he was consecrated as bishop of Durham, becoming archbishop of York in 1956 and finally of Canterbury in 1961. Ramsey made notable contributions to debates on moral, social, and political concerns, and was an enthusiastic ecumenist, whose personal relationship with Pope Paul VI was close, but who at the same time was deeply saddened by the failure of moves to reunite the Anglican and meth-

odist churches. As primate he travelled widely throughout the Anglican Communion. He retired in 1974, and devoted his latter years to writing and to teaching on prayer and spirituality. He died in 1988. JRG

**Ranelagh** was the chief rival as a pleasure garden to \*Vauxhall and claimed to be a cut above its competitor. It opened in April 1742 in the grounds of a house built in the 1690s for Lord Ranelagh. The chief attraction was the great Rotunda, demolished in 1803 when the gardens closed. \*Johnson thought Ranelagh the finest thing he had ever seen but used it as yet another example of the vanity of human wishes: 'it went to my heart to consider that there was not one in all that brilliant circle that was not afraid to go home and think.' Mozart performed there in 1764 at the age of 8. The site was adjacent to Chelsea hospital, where new gardens, still extant, were laid out in the 1860s. JAC

**ranters.** An anarchic quasi-religious movement which emerged in 1648 and horrified orthodox puritans. Ranters were never an organized sect, and their writings were so heterogeneous that their very existence as a movement has recently been denied. Contemporaries, however, had no doubt that they existed. Ranters typically believed in an immanent God, present in all his creatures, man above all; men and women who attuned themselves to the godhead within them were free of sin, since all God's work is good. Groups of them scandalized the godly by their unbridled dancing, drinking, smoking, swearing, and sharing of sexual partners. Through lack of organization and the extreme hostility of magistrates and ministers, their heyday was short. AHW

**Ranulf Flambard** (c.1060–1128). A Norman cleric whose nickname—Flambard meaning incendiary—probably reflects the burning and destructive eloquence which he turned against the king's enemies. His role as political and financial adviser to William Rufus—in 1097 Flambard was managing, to his own and his king's profit, no less than sixteen vacant bishoprics and abbeys—made him notorious in the church circles in which most contemporary historians moved. In 1099 he was made bishop of Durham. In 1100 Henry I, in a gesture calculated to win support, threw Flambard into the Tower. Within six months he escaped and made his way to Normandy. He helped to plan Duke Robert's 1101 invasion, yet soon afterwards was back in Henry I's favour and restored to Durham. Here, though his life-style scandalized the monks, he won applause as an effective defender of the rights of the see, a generous patron, and a great builder. JG

**rapes.** \*Domesday Book shows Sussex in 1086 divided into five secular 'rapes', strips running from north to south, each named after its Norman lord, and containing a castle and a harbour. Each had a sheriff and they seem to have been, in effect, miniature shires. The names and nature of the rapes suggest that they were a post-Conquest creation. But the word 'rape' is Old English and a pre-Conquest origin is also suspected. In any case rape arrangements were altered post-Conquest. Battle abbey gained jurisdiction equivalent to

## rates

that of a rape; and a new rape (of Chichester) was created before 1275. JCA

**rates** are taxes on the occupiers of land and buildings. Various Acts in the 16th cent. provided for a poor rate for the relief of the sick and destitute, but in England 'the rates' date back formally to the Poor Relief Act of 1601, which made the parish the administrative unit for rating and gave 'overseers' (churchwardens and substantial householders) the power to tax. In 1647 an ordinance consolidated the church rate with the poor rate. As local authorities provided new services, additional rates were levied.

The Rating and Valuation Act (1925) brought in the general rate and made county boroughs, boroughs, etc. the rating authorities (in place of the overseer) and the units of rating (in place of the parish). The rates were unpopular because they were mildly regressive and paid by only part of a local electorate. In the 1970s and 1980s various investigations, the Layfield Report (*Local Government Finance*, 1976) and two Green Papers ('Alternatives to Domestic Rates', 1981, and 'Paying for Local Government', 1986) set out alternative local taxes. Domestic rates, but not business rates, were abolished in 1989–93, in Scotland, and in 1990–3, in England and Wales, when they were replaced by the community charge or \*poll tax. MW

**Rathmines, battle of**, 1649. In June 1649 Michael Jones and the parliamentary forces were besieged in Dublin by \*Ormond. Reinforcements from England enabled him on 2 August to make a sortie and destroy Ormond's camp at Rathmines. JAC

**Ray, John** (1607–1705). Naturalist. The son of an Essex blacksmith, Ray was enabled to study at Cambridge, where he subsequently taught for thirteen years. Although ordained episcopally in 1660, he declined to subscribe to the Act of Uniformity, so lost his fellowship in 1662. Supported by prosperous friends, he then pursued his career as a naturalist, attempting a systematic description of all living things. His expeditions around Europe as well as Britain recorded antiquities, local customs, and institutions in addition to flora and fauna. Botany remained his first love, however, and he laid the foundation for a system of classification based on all structural characteristics, setting out many of the natural orders now employed by botanists. His three-volume masterwork *Historia plantarum* (1686–1704) and his precision of terminology have led to him being regarded as the father of natural history in Britain. ASH

**Reading.** County town of Berkshire, situated where the river Kennet joins the Thames. A small borough by 1086, it grew partly thanks to Henry I's foundation of a major Cluniac abbey (1121), where he was buried. The abbey dominated the town until the dissolution (1539), and not until 1542 did Reading become an autonomous borough. From the 14th to the 17th cents. it flourished through cloth-making: it was temporarily the eleventh wealthiest English town under Henry VIII, and Archbishop Laud was the son of a Reading clothier. The town suffered badly in the Civil War; was only of modest importance in the 18th cent.; but revived as an industrial town in the 19th ('Biscuitopolis'). DMP

**Reading, Rufus David Isaacs, 1st marquis of** (1860–1935). After a bumpy start, Isaacs had an unusually varied and distinguished career. The son of a Jewish fruit merchant from the East End of London, he left school at 14 to join the family business. He next turned to stockbroking but was 'hammered' in 1884. His third start was reading law. He was called to the bar in 1887 and quickly established himself. Entering Parliament as a Liberal for Reading in 1904, he was solicitor-general by 1910 and attorney-general the following year. Though singled in the \*Marconi scandal of 1912, he was appointed lord chief justice in 1913 and given a barony. After successfully negotiating a government loan from America, he was promoted viscount in 1916 and earl in 1917. Next, from January 1918 until 1919 he was ambassador to the USA at a critical time of the war. Reading resumed his legal career, but in 1921 was sent to India as viceroy, remaining there during a tense period until 1926. His third promotion in the peerage came on leaving office. Even then he was not finished and crowned his remarkable performance by acting from August to November 1931 as foreign secretary while the \*National Government was being formed. JAC

**Rebecca riots**, 1838–44. These riots in west Wales took place over a long period and, coinciding with the \*chartist agitation, caused the government much concern. They originated as protests against \*turnpikes which, because of the many small trusts, imposed heavy burdens on farmers and local people. They took the form of night attacks on toll-houses and -gates, the rioters often well organized, with blackened faces and wearing women's clothes. Their name came from the biblical reference—'the seed of Rebecca shall possess the gates of her enemies' (Gen. 24: 60). But they extended also to attacks upon workhouses, protests against tithes, and personal grudges. Workhouses were destroyed at Narbeth in 1839 and at Carmarthen in 1843. The government employed troops, police, and spies to control the situation, but the eventual remedy was an Act of 1844 (7 & 8 Vic. c. 91) to ease and reduce tolls. JAC

**record offices.** Article 24 of the Act of Union of 1707 guaranteed that Scottish records would remain in Scotland. The Register House in Princes Street, Edinburgh, designed by Robert \*Adam, was begun in 1771 and completed in 1827. It is said to be the first building erected to house national archives. New Register House (1859–63) holds records of Scottish births, deaths, and marriages.

After a select committee report and a Public Records Act of 1838, the Public Records Office was opened in Chancery Lane, London. The Victorian building was begun in 1851 with Sir James Pennethorne as architect and has been several times extended. A further Record Office was opened in Kew in 1977. The archives were the responsibility of the master of the rolls until 1959 when the lord Chancellor took over. The enormous miscellany of records includes \*Domesday Book and \*Magna Carta, Guy Fawkes's signature, Dick Turpin's indictment, Nelson's will, and Edward VIII's abdication document. Wills were formerly held in Somerset House, London, parliamentary archives by the House of Lords Record Office at Westminster, and births, deaths, and marriages since 1837 by the General Registry Office. The

Public Record Office for Northern Ireland was set up in Belfast in 1923.

The great majority of county record offices have been established since the Second World War, often beginning with one archivist in a picturesque but unsuitable building before moving to purpose-built but duller premises in the 1960s. The Bedfordshire County Record Office dates from 1913 and claims to be the oldest archives department. It was followed before the Second World War by Surrey (1928), Warwickshire (1931), Kent (1933), Oxfordshire and Somerset (1935), Gloucestershire (1936), Buckinghamshire and Essex (1938), and Hertfordshire (1939). Fifteen more record offices were opened in the 1940s. In addition, archives are held by many colleges, societies, libraries, museums, diocesan offices, and by city and town record offices. The most complete list is in *British Archives*. Non-public records are catalogued in the National Register of Archives, kept by the Royal Commission on Historical Manuscripts (est. 1869); the Scottish register is kept by Register House. JAC

**recruiters.** In 1641 Charles I gave his consent to a bill which declared that the \*Long Parliament could not be dissolved save by its own consent. That Parliament sat until 1653 when \*Cromwell forcibly dissolved it. Out of just over 500 original members, about 200 joined the king and many others died or were killed: the small size of the House of Commons became a political embarrassment. After 1645 the absentees were replaced by 'recruiters', returned at by-elections, and by March 1647 244 new members had been brought in. By the time of its dissolution, fewer than 100 members of the pre-war House of Commons were in attendance. JAC

**Reculver** was a fort of the \*Saxon Shore on the north coast of Kent. In the Roman period the Wantsum channel separating the Isle of Thanet from Kent was open water. Reculver was built to a traditional fort design at the north-east of the channel in the early 3rd cent. Regulbium is listed in the *Notitia dignitatum* as garrisoned by *cohors I Baetasiarum*. Marine erosion since the Roman period has removed about two-fifths of the northern part of the site. ASEC

**recusants** were catholics who refused to attend church as required by law (1559). Though initially tolerated, Mary, queen of Scots' arrival (1568), the rising of the \*northern earls (1569), Elizabeth's excommunication (1570), and the \*Ridolfi plot (1571) hardened the government's attitude. Obeying the excommunication bull's provisions became treasonable. Because the Spanish (and the 17th-cent. French) threat made recusancy seem synonymous with treason, persecution increased. The mission of English priests from Douai (1574) and of Jesuits, such as \*Campion and \*Parsons (1580), strengthened catholicism—there were 400 priests in England by 1603. Recusants thus faced further penalties; saying or hearing mass was punishable by fine and imprisonment (1581), the recusancy fine was increased to £20 a month, and being a priest was punishable by death (1585). Between 1581 and 1603 180 recusants, including 120 priests, were executed. Nevertheless the catholic aristocracy, strong in the north and west, who preferred a quietist approach continued to practise; others, 'church papists', nominally at-

tended church, while secretly practising catholicism. After temporary alleviation under the \*Declarations of Indulgence (1672, 1687, 1688), they were not included officially in the Toleration Act, though afterwards authorities normally turned a blind eye to their worship. Civil disabilities were not removed until the \*Catholic Emancipation Act (1829). WMM

**Redmond, John** (1856–1918). Redmond, a lawyer, was born in Co. Wexford. He became clerk of the House of Commons in 1880, and an Irish Parliamentary Party MP from 1881. He led the Parnellites from 1891 and the entire party from 1900. His great opportunity appeared to come with the introduction of the third Home Rule Bill in 1912, but when opposition in Ulster and in the Tory Party mounted, Redmond seemed increasingly weak and over-dependent on the Liberal alliance. He underrated the depth of Ulster resistance. He sought to undercut opposition to his leadership by taking over the leadership of the Irish Volunteers and ensured that the war's increasing unpopularity would reflect on his party. Redmond failed to react effectively to the British execution of the \*Easter Rising's leaders in 1916, and weakened on the partition issue during \*Lloyd George's Home Rule negotiations. In 1917, his leadership of Irish nationalism collapsed under Sinn Féin challenge. He died before the final defeat of his party in the 1918 general election, but events had overtaken his youthful radicalism, and he had failed to reconcile his nationalism with his respect for the British Parliament. MAH

**Red River rebellion, 1869.** In 1869 the Hudson's Bay Company sold its territorial rights to the new dominion of Canada. Both parties largely ignored the Métis of the Red River, a French-speaking community of part Indian descent. Led by Louis Riel, they established a provisional government in December 1869. While the Canadian government negotiated, through fur-trader Donald A. Smith, Riel ordered the shooting of Ulsterman Thomas Scott to uphold his authority. An expeditionary force, commanded by Garnet \*Wolseley, reached the settlement in August 1870, after Riel had escaped. The Red River became the province of Manitoba in 1870. Riel was hanged in 1885 after leading a second western rebellion. GM

**reeve** (Anglo-Saxon *gerefa*). Reeve was the general medieval term for a supervising official and is found in a number of different contexts. The shire-reeve (*scire-gerefa*), appointed by the king, was for centuries the chief royal representative in the counties: the right to elect one's own sheriff was a valuable privilege, granted sparingly. The sheriff lost many of his judicial functions to the royal justices and the JPs and was superseded in the 16th cent. by the lord-lieutenant, though the post remains prestigious. The sheriff's deputy was the hundred-reeve, who held the hundred court. The term was also used for the chief officer of a town—a port-reeve or burh-reeve—until overshadowed in the larger towns by the office of mayor or lord mayor. The manorial reeve was one of the most familiar officials for most peasants. He was elected by the tenants but sometimes nominated by the lord, and was responsible for the organization of communal

## referenda

tasks, usually working with the lord's bailiff, and under the supervision of the lord's steward, who might have oversight of several manors. A notable description of the functions and duties of a manorial reeve before the Norman Conquest is to be found in 'Gerefa', a postscript to the tract *Rectitudines singularum personarum* ('Rights and Ranks of People'). JAC

**referenda.** British politicians were traditionally reluctant to agree to referenda, fearing that they would weaken the power of Parliament to decide. In the 1890s a UK referendum was proposed to block \*Irish Home Rule, in 1910 \*Balfour suggested a referendum on tariff reform, and in 1945 \*Churchill considered a referendum on extending the life of Parliament. None took place. There is the problem that the vote may be less on the merits of the particular proposal than on the immediate popularity of the government: the timing of a referendum is therefore of crucial importance. Since many voters might abstain, either from apathy or principle, referenda have often been accompanied by conditions, demanding a positive vote by a certain proportion of the electorate and a certain size of turnout. There is the question which electorate should be consulted. For years referenda were discredited in the public mind by plebiscites organized by totalitarian governments which inevitably produced a gratifying majority. Nevertheless, they had attractions for governments on issues upon which they were badly split, acting, in Jim \*Callaghan's pithy phrase, 'as a rubber life-raft'. Like most innovations referenda were introduced into British politics with little regard for the long-term implications.

In 1973 a referendum for Northern Ireland on continued membership of the UK produced a 98 per cent support of those voting. But since the Catholics boycotted the vote, it decided little, nor was it clear why the other citizens of the UK were not entitled to vote, the outcome of which might have been different. The 1975 referendum on membership of the \*European Economic Community produced a strong yes vote, but as the powers of the EEC increased, demands for a fresh referendum were heard. The 1979 referendum on devolution resulted in a simple majority in favour in Scotland, but not the 40 per cent of the electorate required, while in Wales the proposal was defeated by 4:1. But referenda in 1997 produced approval for a Scottish Parliament and a Welsh Assembly, both of which were established.

EEC leaders have sometimes shown a distinctly cavalier attitude towards referenda, and when the Danes in 1992 and the Irish in 2001 voted 'the wrong way', suggested that they must think again. At the heart of the increasing reliance on referenda is dissatisfaction felt by many voters at the difficulty in registering their opinion on a specific issue amid the many other issues brought up at a general election. Voters and minority groups may continue to press for referenda as a form of direct democracy, perhaps in the shape of the 'initiatives' allowed in many US states. But governments are likely to be less enthusiastic. CNL/JAC

**Reflections on the Revolution in France** (1790) by Edmund \*Burke exemplified the ideology of conservatism. Part I refuted the claim of Dr Richard Price that the French revolutionaries were following the English revolutionaries of

1688, in demanding a right to determine their own constitutional system. On the contrary, the English Whigs had sought to protect the established Anglican constitution from subversion by James II, a Roman Catholic. In Part II, Burke enumerated the false principles of the revolutionaries in France, including libertinism, egalitarianism, disrespect for private property, atheism, and, above all, rationalism. He feared that the spirit of \*Jacobinism, unless challenged, would sweep through Europe undermining all traditional institutions. TSG

**Reform Acts.** The transition from the unreformed system of 1830 to full democracy in the 20th cent. was effected by seven franchise measures—the Acts of 1832, 1867, 1884, 1918, 1928, 1948, and 1969—supported by a number of other reforms.

It is not possible to form an exact estimate of the size of the electorate before 1830, since there was no registration, assessments are unreliable, and we cannot be certain of the number of votes uncast. In addition, though registration of voters was introduced by the Act of 1832, it was at first very imperfect until party managers realized how many votes were going to waste. \*Grey's Reform Act introduced a standard franchise of £10 householders in the towns and augmented the franchise in the counties by allowing tenants at will to vote—the Chandos clause. The biggest increase was certainly in Scotland, where the electorate jumped from 4,500 to 65,000; in Ireland the electorate nearly doubled, from 49,000 to 90,000, and in England and Wales the increase has been put at from 435,000 to 653,000. Most of the new voters were middle-class citizens and many of the working classes were disappointed to find themselves excluded. Though as a debating ploy the Whigs insisted that the Act was a final settlement, agitation for an extension of the franchise soon recommenced and was an important ingredient in the \*chartist programme of the late 1830s. By the second Reform Act of 1867, introduced by \*Disraeli after Lord John \*Russell's measure had foundered on party disunity, the vote was extended to working-class urban electors on the basis of household suffrage, adding some 938,000 to the existing electorate of 1,056,000. By 1884 natural increase had raised the UK electorate to some 3 million. \*Gladstone's Act of that year raised it to 5 million, bringing in large numbers of county voters. With the majority of adult males now enfranchised, the total exclusion of women became more prominent and by 1897 a majority of MPs had been converted to the general principle of enfranchising women. The First World War did not so much change attitudes as enable politicians to climb down with some dignity and the 1918 measure went through with little disagreement. Even so, the vote was restricted to women over 30, so that they should not form a majority in the electorate, bearing in mind the heavy male casualties during the war. The electorate was increased by some 7 million to more than 21 million (13 million men, 8.5 million women). Three more measures brought about almost complete adult suffrage. In 1928 the age limit for women voters was brought down to 21, giving the vote to 5 million extra 'flappers'. The Labour government's Act of 1948 ended plural voting by taking away the

business vote and the special university representation. In 1969, with little controversy, the voting age was lowered to 18, bringing in another 3 million voters. At almost every extension, apprehension was expressed that the new voters would prove fickle and irresponsible: in every instance they behaved very much like the older voters they had joined.

Of equal importance were accompanying redistribution measures, legislation against undue influence and corruption, and the introduction of democracy into local government. The redistributive clauses of the Great Reform Act of 1832 were probably its most dramatic feature, with the total abolition of 56 'Schedule A' boroughs, including Old Sarum, Gatton, Dunwich, and Hindon, and the award for the first time of parliamentary representation to great industrial towns like Manchester, Birmingham, Leeds, Sheffield, Bolton, Blackburn, Bradford, and Wolverhampton. Further redistribution was effected by the 1867 Act, which deprived 38 small boroughs like Honiton, Stamford, and Dorchester of one of their two seats; brought in Burnley, Middlesbrough, Gravesend, and 7 other boroughs with one seat (two for Chelsea); and gave an extra third seat to Birmingham, Liverpool, Leeds, and Manchester. An even more drastic redistribution accompanied the 1884 Act. Seventy-nine towns with less than 15,000 population lost both members, and a further 36 with less than 50,000 lost one: the Act moved a long way towards single-member constituencies, which predominated in the 20th cent.

The struggle for purity of elections was laborious throughout the 19th cent. The introduction of the secret ballot in 1872 did not solve the problem. The \*Corrupt Practices Act of 1883 made more impact by tightening up control of election expenses, though isolated instances of bribery continued to be revealed.

Local government reform was effected by the \*Municipal Corporations Act of 1834, which set up elected councils in the larger towns; by the \*County Councils Act of 1888, which replaced the old government in the shires by justices of the peace by 62 elected councils; and by the \*Parish Councils Act of 1894, hailed as a great measure of local democracy, but hamstrung by financial limits and watered down by 20th-cent. legislation. JAC

**Reformation.** Although 'reform' means many things, 'the Reformation' always denotes the 16th-cent. division of Latin Christendom into protestant and catholic. \*Protestantism rejected the catholic belief that salvation comes through grace received in the sacraments and other rites of the traditional church; it restricted the church's role to one of proclaiming the unmerited gift of divine forgiveness. The \*Church of England, established by statute in 1559, was unambiguously protestant. However, hindsight, and the diversity of later Anglicanism, has led many to argue that the Church of England stands somehow midway between catholic and reformed traditions.

**1. Before the Reformation.** The church in England c.1500 was devoutly catholic and loyally papalist. Many parish churches were extravagantly rebuilt, and lavished with vessels and ornaments which foreign visitors thought worthy of

a cathedral. Kings and popes usually got on well: royal orators and cardinals-protector handled the nation's business at the curia, and royal nominees were accepted for major church posts. The 'English heresy', \*lollardy, always threatened the church more in theory than practice: while it called for disendowment of the hierarchy, it had little effect on church wealth, privileges, or even attendance.

**2. The early English reformers.** The fame of the German Reformation leader Martin Luther (1483–1546) caught the imagination of some English followers in the 1520s. Churchmen including Thomas Bilney (c.1495–1531), Robert \*Barnes (d. 1540), and the Bible translator and controversialist William \*Tyndale (c.1494–1536) reinterpreted the Reformation message. However, their support was confined to young university students and those with foreign connections. They posed no threat, though Thomas \*Wolsey burned heretic books publicly, and Thomas \*More wrote against Tyndale.

**3. The royal marriage and the 'humanist' phase.** Henry VIII's failure to secure papal annulment of his first marriage led to the break with the papacy during 1532–6. This policy required theoretical justification if the king was to carry such a profoundly catholic nation into schism. Thomas \*Cromwell recruited a number of young humanist writers, whose propaganda pieces criticized both the papacy and some aspects of the old cults, such as papal indulgences. The Ten Articles of 1536 and the two sets of Injunctions of 1536 and 1538, together with the 'Bishops' Book' of 1537, sought to strip away many of the festivals, relic-cults, shrines, and even parts of the service for the dead. Nevertheless, these moves were not avowedly 'protestant': Henry VIII detested Luther and loathed the Swiss heresies against the presence of Christ in the sacrament. Though Thomas Cromwell's commissioners who toured the doomed monasteries in 1535–6 mocked spurious relics and hunted dissolute monks, the ensuing abolition of the monastic order had no declared religious rationale. During 1539–43 conservative tendencies stopped the embryonic protestantism of Henrician England in its tracks: certain catholic beliefs and practices were reaffirmed, 'sacramentarian' heretics burned, and Bible-reading restricted by statute. Nevertheless, Henry never ceased to trust his reform-minded archbishop Thomas \*Cranmer, and even suggested to a bemused ambassador in 1546 that he and the French king might together abolish the mass.

**4. Public protestantism under Edward VI.** All ambiguity was swept away in the next reign. Revision of the mass-book began almost at once, leading in 1549 to the publication of Cranmer's first, very cautious, \*Book of Common Prayer. Meanwhile royal commissioners ruthlessly stripped parish churches of most of the ornaments and furniture associated with the old cult. Distinguished continental reformers such as Martin Bucer and Pier Martire Vermigli settled in the universities and influenced further changes in worship. In 1552 a revision of the Prayer Book simplified the apparatus of worship to the barest protestant essentials, and its abusive

## Reform Club

anti-papal rhetoric left no room for doubt. The Forty-Two Articles of Doctrine in 1553 set out reformed beliefs.

**5. Catholicism restored, 1553–1558.** Mary I inherited religious legislation, in her eyes *ultra vires* and void, which took some eighteen months to reverse. Nevertheless, priests and laity restored the mass at the mere breath of royal suggestion. In 1554 most 'scandalously' married priests accepted their humiliation and went back to saying mass. Once owners of monastic lands were assured of their titles, papal authority was received back with some enthusiasm. Protestantism remained confined to cells mostly in southern and eastern England. The impact of the campaign which burned c.280 heretics between 1555 and 1558 was greater in hindsight (helped by \*Foxe's martyrology) than at the time. Many counties saw no burnings or only a few; latterly they took place in London at dawn, attended only by groups of demonstrators from the clandestine congregation.

**6. A precarious settlement, 1558–1563.** Elizabeth, daughter of \*Anne Boleyn and legatee of the schism, found the catholic hierarchy much more stubborn than in 1531–3. Re-establishment of the royal supremacy and abolition of the mass required an almost clean sweep of the episcopate, and careful management of Parliament, which wrecked the proposals several times. It is now generally accepted that catholic resistance was the chief reason for the delay, caution, and occasional ambiguity of the Elizabethan church settlement. The anti-papal abuse of the 1552 Prayer Book was excised from the 1559 version; ineffectual efforts were made to restore some vestments and restrain priestly marriage. Even the \*Thirty-Nine Articles approved by convocation in 1563 were altered by the queen herself, probably to placate conservatives.

**7. The making of a protestant people.** The new bishops chosen by Elizabeth from leading reformed clergy in 1559, and most protestant zealots, assumed that the concessions made to tradition were temporary sops, to be discarded once the regime was secure. To their increasing horror and bewilderment, they found that the queen obstinately refused to strip away the veneer of ritual, and tried to stick it back where it was removed illegally. She feared that combative, doctrinaire protestant preaching still risked alienating parts of the kingdom and sparking a religious war: the restoration of the mass during the \*northern earls' revolt of 1569, and her excommunication by the pope in 1570, lent these fears substance. In the 'puritan' controversies of the 1570s Elizabeth found and nurtured a faction of clerics led by John \*Whitgift (archbishop of Canterbury 1583–1604) which believed with equal zeal in protestant dogma, episcopal church government, and traditionalist ceremonial. So was the peculiar hybrid 'Anglican' church, founded both on Foxe's *Martyrs* and on \*Hooker's *Ecclesiastical Polity*, brought to birth by the end of the 16th cent.

Cameron, E., *The European Reformation* (Oxford, 1991); Cowan, I. B., *The Scottish Reformation: Church and Society in Sixteenth-Century Scotland* (New York, 1982); Dickens, A. G., *The English Reformation* (1964); Donaldson, G., *The Scottish Reformation* (Cambridge, 1960);

Haigh, C. (ed.), *The English Reformation Revised* (Cambridge, 1987); Sheils, W. J., *The English Reformation, 1530–1570* (1989).

**Reform Club.** Founded in 1836, the Reform Club was a radical initiative, drawing in Whig support. It was a riposte to the Tory \*Carlton Club and reflected the desire for better organization, particularly of electoral registration, after the Great Reform Act. The founders included Lord \*Durham, Joseph \*Parkes, and Molesworth. It drew together the Westminster Club and the Reform Association, and \*Barry's premises at 104 Pall Mall opened in 1841. The success of the club was as much gastronomic as ideological, since it employed an outstanding French chef, Alexis Soyer. JAC

**Reform League, 1865–9.** The Reform League was established in 1865 to press for manhood suffrage and the ballot. The president was Edmond Beales and the secretary George Howell, and more than 400 branches were formed. It collaborated with the more moderate and middle-class Reform Union and its parliamentary spokesmen included \*Gladstone and John \*Bright. It gave strong support to \*Russell's bill in 1866 and the \*Hyde Park riots, a by-product of the mass protest meetings in July 1866, helped to push through \*Disraeli's second Reform Act. The League ran parliamentary candidates at the general election of 1868 but with little success and was dissolved in March 1869. Historians dispute whether popular pressure was decisive or whether the second Reform Act was the outcome of high political manoeuvring. JAC

**regalia.** The English coronation regalia is kept in the jewel house of the Tower of London. The collection of a regalia for coronation purposes added to the solemnity and antiquity of the occasion and seems to have been begun by the monks of Westminster abbey. But almost everything was destroyed during the \*Commonwealth as items of superstition. Only a 12th-cent. anointing spoon survived: an ampulla, in the shape of a golden eagle, to hold the holy oil, was made for the coronation of Charles II in 1661. On the same occasion, a copy was made of St Edward's crown: a second, imperial, crown was made for Victoria in 1838. An orb, signifying authority, was also made in 1661, and two sceptres, with a dove and a cross. Bracelets were occasionally used and in 1953 the dominions gave Elizabeth II a pair. Two swords of justice and a sword of mercy (Curtana) date from the early 17th cent.: a fourth sword, the sword of state, was made in 1678. A sword of offering was made for the coronation of George IV in 1821. For the Scottish royal regalia, see HONOURS OF SCOTLAND. JAC

**Regency.** Though there have been several regencies in British history, the term is usually confined to the period 1810–20 when George, prince of Wales, acted as regent on behalf of George III, who had gone mad. The Whigs confidently expected that the regent would bring in his old friends and began cabinet-making. He did not, and the Tories remained in office throughout the period. It was a time of acute contrasts. Until \*Waterloo in 1815 the country was still at war, with bread shortages, \*Luddite riots, and severe distress. The post-war years were no better: agricultural depression, widespread unemployment, and the dislocation of early

industrialization fuelled radical protest, exemplified at \*Peterloo. The fashionable world retained its poise. Beau \*Brummell, the prince's friend, was the arbiter of elegance. Harriette, Amy, and Fanny Wilson entertained the gentlemen. The prince regent pressed on with his Pavilion at \*Brighton until the prime minister, Lord \*Liverpool, pointed out what offence it gave at a time of national distress and warned that the cabinet would not find a penny more. The radicals—\*Cobbett, \*Hunt, \*Hazlitt, and \*Shelley—and the caricaturists—\*Cruikshank and \*Rowlandson—had plenty to aim at. The prevailing taste in architecture, costume, and furniture was severely classical, aiming at balance and restraint, and rarely lapsing into extravagance. The finest monument to the period is the Regent Street and Regent's Park complex, built by John \*Nash. JAC

**Regency crisis**, 1788–9. In October 1788 George III appeared to have gone mad. It was expected that the prince of Wales would become regent, dismiss \*Pitt, and call on \*Portland and \*Fox to form a ministry. Although a regency bill was prepared, it was not enacted because of the unexpected recovery of the king in February 1789. DW

**regicides**. After the second civil war in 1648, most army leaders despaired of reaching an agreement with the king that would be honoured and resolved to put him on trial. Fifty-nine signed Charles's death warrant in January 1649. At the Restoration, the remains of \*Cromwell, \*Ireton, and \*Bradshaw were taken from Westminster abbey and hanged at Tyburn. Of the 41 regicides still alive, 9 were put to death. Thomas \*Harrison, one of Cromwell's major-generals, told the court, 'This was not a thing done in a corner.' JAC

**Register House** (Princes Street, Edinburgh) contains the Scottish national archives. It was built by Robert \*Adam and was in use by 1778, though completion took many years. One of the finest features is the magnificent dome. The equestrian statue of the duke of \*Wellington, facing North bridge, is by Sir John Steele and was erected in 1852. JAC

**regium donum** (royal gift) originated as a grant of £600 p.a. by Charles II to augment the salaries of Irish presbyterian ministers in 1672 when he was trying to win support for his \*Declaration of Indulgence. It was revived by William III, who increased it to £1,200 p.a., but was much disliked by high Anglicans as breaching the principle that only the Church of England should have support from the state. By the end of Anne's reign it was paid irregularly. George I increased it to £1,600 p.a. and in 1723 extended the principle to England by giving £500 p.a. for the widows of dissenting clergy. The regium donum became a significant precedent when \*Pitt's government decided in 1795 to support the training of Irish catholic priests. The English grant was abolished in 1851, the Irish in 1869 when the Irish church was disestablished, though with compensation for the presbyterians. JAC

**Regni**. A British *civitas*. The *civitas* of the Regni appears to be an artificial creation of the Roman government. It seems to have been based on a kingdom created by them in AD 43

for their client-king \*Cogidubnus from the southern part of the territory of the \*Atrebates. During the invasion period, \*Chichester harbour was used by the Roman general \*Vespasian as a safe base to supply his troops campaigning in south-west England. Cogidubnus subsequently built his palace over the Roman camp. The special status of Cogidubnus and his kingdom is perhaps reflected in the choice of the name Regni, or Regneses, which means simply 'the people of the kingdom'. Only when Cogidubnus died, perhaps around AD 80, did the kingdom disappear and the *civitas* take its place. The boundaries of the *civitas* were marked by the river Meon in the west and the river Wey to the north, and probably ran just beyond Beachy Head to the east, thus encompassing much of the Sussex and Hampshire downland. The capital of the new canton, however, was located at its south-western corner, where the major Iron Age stronghold at Chichester was succeeded by the Roman town of Noviomagus. KB

**Reith, John, 1st Baron Reith** (1889–1971). Reith stamped his image on the first 40 years of the \*British Broadcasting Corporation. The son of a minister of the Free Church of Scotland, 'famous for his impassioned advocacy of righteousness in every department of human activity' (as his son put it), he was born at Stonehaven in Kincardineshire. He began as a railway engineer and was badly wounded in the First World War. In 1922, at something of a loose end, he saw an advertisement for general manager of the new BBC and was appointed. Reith created his own vision of an austere, sober, and responsible corporation, with important educational and religious obligations. He stayed until 1938 and then went to Imperial Airways, but at the outbreak of war was brought into Parliament, serving as minister of information, minister of transport, and minister of works. He and \*Churchill disliked each other and he was abruptly dismissed in February 1942. Though after the war he held a number of important commercial posts, the draft title for his post-1938 memoirs was 'Adrift'. A tall, gaunt, impressive, and fierce man, he had no concept of compromise and his diaries are full of unpleasant and savage remarks about colleagues. His conceit bordered on megalomania: with Churchill as prime minister, Reith deplored the lack of leadership—'and I might have given it—a lot of it'. He was knighted in 1927 and given his barony in 1940. JAC

**reivers** or moss-troopers were the names given to border raiders. There was little protection against them, save the building of \*peel towers and bastle-houses as temporary refuges. Liddesdale on the Scottish side and Redesdale on the English were notorious nests for reivers. Repeated agreements were made between the monarchs of England and Scotland to permit the border wardens to bring offenders to justice and a special code of border law operated. Even after the personal union of the kingdoms in 1603 it remained difficult to put down raids. JAC

**religious toleration**, a principle accepted without question by most people in the 21st cent., came about more by a process of exhaustion than by the triumph of reasoned argument. Few people in the 16th cent. doubted that state

## Remonstrants

and church had not only the right but the duty to put down religious \*dissent. They assumed that religious truth was God-given and absolute; that a country divided in religion would be fatally weakened; that nonconformists were potential traitors who would make common cause with co-religionists in other countries; that the exercise of private judgement would, in the end, undermine all authority and produce a shattered and anarchic society, in which everything was permissible.

The \*Reformation brought about toleration neither by design nor directly, but as a by-product. None of the great reformers—Luther, Calvin, Zwingli—were tolerant of their opponents. In defence of his own position, Luther was first obliged to challenge papal authority, then to expound the right of the secular ruler to declare the religious policy of his state. That formula was accepted in the Augsburg peace of 1555—*cuius regio, eius religio* (the ruler shall decide religion). Only \*catholicism or \*lutheranism were permitted choices and there was no provision for toleration. But in practice political considerations sometimes made rulers embrace toleration. Countries like Prussia, which were chronically short of labour, might find it imprudent to drive out subjects and might welcome refugees from less tolerant states: the Hohenzollerns who, as \*calvinists, were of a different faith from the vast majority of their lutheran subjects, might think twice before insisting on their formal rights. Augsburg even contained a slight measure of practical toleration in that, in a vastly divided Germany, subjects might move to a more friendly state.

Nevertheless, for decades the dream of a reunited Christendom dominated, either by force or by theological compromise. Force failed. The Emperor Charles V was unable to reconquer northern Europe in the 1550s and the Thirty Years War ended in 1648 with the religious boundaries largely unchanged. Well-meaning men arranged conferences and debates where rival theologians could agree on fundamentals and reach common ground. They failed at Marburg in 1529, at Worms and Regensburg in 1541, at Regensburg again in 1546. Even conferences to unite the protestants failed. James I summoned anglicans and puritans to \*Hampton Court in 1604 without success: Charles II called the \*Savoy Conference between anglicans and presbyterians in 1661. It failed. Under these dispiriting circumstances, the few voices calling for toleration were accorded increased attention. Could we not have, asked \*Milton, 'a little generous prudence, a little forbearance of one another, and some grain of charity?'

In England there had been little need for a hunt after heretics until the late 14th cent., when \*Wyclif's teaching combined with social unrest to produce \*lollardy. The authorities responded with the act of 1401 \**De heretico comburendo*—on the burning of heretics. In the 16th cent., Henry VIII executed catholics for treason, reformers for heresy; Mary burned reformers; Elizabeth executed catholic priests. \*Anabaptists, regarded with peculiar horror, were hunted down by rulers in almost all countries. The seed-time for toleration in England was after the civil war, when sects multiplied and the victorious parliamentary army demanded from the presbyterians toleration for \*baptists,

\*congregationalists, and independents. \*Cromwell lent his vast prestige to the cause of toleration, readmitting \*Jews to England after a gap of nearly four hundred years.

The Restoration in 1660 saw a lurch backwards, with Parliament passing severe legislation against catholics and dissenters. But, again, the exigencies of politics called for tactical behaviour and Charles II and James II both issued \*Declarations of Indulgence. In the crisis of 1688, when the dissenters held the balance between the anglicans and the king, they supported the revolution, and reaped the reward from William III in 1689 in the \*Toleration Act, which at least permitted freedom of worship. It was far from complete. Toleration did not apply to catholics, who faced a battery of \*penal laws, nor to anti-Trinitarians. In Scotland, \*episcopalians were persecuted as crypto-Jacobites. Even protestant dissenters did not have full civil rights and could neither sit in Parliament nor on corporations unless their consciences were flexible. But the narrow basis was gradually broadened, with concessions to the \*quakers over oath-taking and to the Scottish episcopalians over lay patronage. Underpinning the shift in policy was the start of a change in attitude. In his *Letter on Toleration*, published in 1689, \*Locke caught a new mood of calm reason: persecution created, not converts, but hypocrites, 'for no man can, if he would, conform his faith to the dictates of another . . . All the life and power of true religion consists in the inward and full persuasion of the mind.'

There remained the problem of civil equality. No catholic and few dissenters could be MPs. But once the catholics had demonstrated their loyalty in the 1745 invasion, small concessions were made, and in Ireland catholics were given the vote in 1793. Though full emancipation for catholics was held up in 1801 by the refusal of George III to sanction it, it was granted in 1829. Dissenters were allowed into Parliament in 1828 and more concessions on tithes and on marriages followed. In 1858 Jews were allowed into Parliament. At length, in 1886, after the \*Bradlaugh case, even atheists were admitted to Westminster. From the beginning of the Reformation, it had taken a mere 350 years. JAC

**Remonstrants.** See RESOLUTIONS.

**Renaissance** (rebirth) characterizes the impulse, initiated in Italy, towards improving the contemporary world by discovering and applying the achievement of classical antiquity. The movement was at its strongest from the time of Petrarch (1304–74) through the 'long 16th cent.' (1450–1625). 'Renaissance' is now generally used to describe the politics, beliefs, philosophy, science, scholarship, discourse, literature, handwriting, printing, painting, engraving, sculpture, architecture, and music of that period. The 20th cent. identified stages of this renaissance (pre- or proto-, early, high, and late), as well as earlier revivals of classical studies (Carolingian, Byzantine, 12th-cent.), and unrelated other 'renaissances' (American, Bengal, black).

'Renaissance' was first used alone in the 19th cent., though Giorgio Vasari (1550) saw a '*rinascità delle arti*' in his own time, and Voltaire two centuries later a '*renaissance des lettres et des beaux-arts*' in Medicean Florence. 'Renaissance' *tout court*, current French in the 1830s and employed in

1842 by Queen Victoria to define a style, was influentially used by Jules Michelet as title for a volume of his *Histoire de France* (1855). The concept of an epoch marked by 'the discovery of the world and of man' was taken up in Jakob Burckhardt's *Kultur der Renaissance in Italien* (1860). For Burckhardt the defining emphasis of the Renaissance was secular and individual; the new attitudes he detected in the Italy of that epoch to nature, morality, religion, affairs, art, and literature made him see it as inaugurating the modern era. Some later historians intensified Burckhardt's stress on paganism. Others reacted against it both by indicating continuities with medieval Christianity and by positing earlier renaissances. Post-Burckhardtian valuation of social, economic, and political factors has led to stress on difference in continuity, with classical learning, defence of the active life and of the virtue of possessions seen as coexistent with earlier knowledge and ideals.

The Renaissance discovery of classical antiquity was essentially a revival of learning, which Petrarch believed had dispelled the ignorance which had prevailed since late antiquity. Petrarch's mode of studying and transmitting the Latin classics became the province of the 15th-cent. (*h*)*umanista*, or teacher of Latin and Greek (hence 'humanist' and, but not until the 19th cent. \*'humanism'). From the 15th cent. onwards, humanist activity spread to other countries. At the turn of the 15th–16th cents. German imperial scholarship claimed a *translatio studii* parallel with the Carolingian *translatio imperii*. Later German humanists such as Melancthon were usually advocates of the \*Reformation. Greek studies flourished especially in 16th-cent. France.

The English Renaissance was influenced by the Italian indirectly, through France, Burgundy, and the Netherlands, as well as directly. In its earliest phase, the patronage of Humphrey, duke of \*Gloucester (1390–1447), was important; later, under Henry VII, William \*Grocyn and Thomas \*Linacre, after Italian experience, won a reputation for Greek. From about 1500, however, the chief force in English humanism was the concept of *pietas literata*, or evangelical humanism, associated with Erasmus. The friendship of Erasmus with John \*Colet and with Thomas \*More was particularly significant. Colet's St Paul's School was influenced by Erasmus; he and More translated Greek together; his *Praise of Folly* (1511) was dedicated to More.

England produced no humanist scholar of the first rank, More's *Utopia* being the finest Latin achievement of its early Tudor phase. Many classical and humanist works were translated into the vernacular, however. A pattern of civility on the Italian model was offered by Sir Thomas \*Elyot (*Book Named the Governor*, 1531) and Sir Thomas Hoby (translation of Castiglione's *Courtier*, 1561). Machiavelli's *Prince*, known in the 1530s, was printed in Italian at London in the 1580s, as were works by the philosopher Giordano Bruno. Greek studies were notable, from the 1520s especially in association with the Reformation. Erasmus' Greek New Testament with Latin translation (1516–19) was used by Martin Luther for his German New Testament (1521); William \*Tyndale used both for his English version (1526–34); later reformed English versions, including the Authorized (1611), kept much of Tyndale's language.

A protestant Renaissance poetic tradition embodied by Edmund \*Spenser, who was also, like John \*Donne, influenced by Italian Renaissance poetry, poetics, and Neoplatonism, extends to Andrew \*Marvell and John \*Milton. Sir Thomas Wyatt and Henry Howard, earl of \*Surrey, had earlier introduced Italian lyric forms. In drama, \*Shakespeare, Christopher \*Marlowe, and Ben \*Jonson were much indebted to the Italo-classic tradition.

The visual arts and architecture of Renaissance England remained predominantly traditional, in spite of the presence of Italian sculptors and of north European painters such as Hans \*Holbein the Younger, Rubens, and \*Van Dyck. The first English architect and designer of international stature was Inigo \*Jones, the Palladian (1573–1652). Music similarly remained traditional until the flowering of the Italian fashion (1575–1625).

The Renaissance in Scotland was notable for logical and theological studies, and for its connections with French humanism. Its earlier stages produced three of the finest poets of their time in Robert \*Henryson (d. 1490), William \*Dunbar (d. c.1515), and Gavin \*Douglas (d. 1522); Douglas was also the first translator of the whole of Virgil's *Aeneid* into any British vernacular. George \*Buchanan (1506–82) won a lasting European reputation as humanist, poet, and historian; he was also tutor to the young James VI and I.

(ed.), *The Cambridge Companion to Renaissance Humanism* (Cambridge, 1996); Panofsky, E., *Renaissance and Renascences in Western Art* (Stockholm, 1960); Rice, E. F., Jr., and Grafton, A., *The Foundations of Early Modern Europe, 1460–1559* (2nd edn. New York, 1994); Skinner, Q., *The Foundations of Modern Political Thought, i: The Renaissance; ii: The Reformation* (Cambridge, 1978).

**Rennie, John** (1761–1821). Millwright and civil engineer from Phantassie (Lothian). Rennie learned millwrighting from Andrew Meikle, but added an academic education at Edinburgh, consulting in Scotland before his first major project, \*Watt's Albion Mills in London (1784–8). He continued to advise on mills, but became primarily a civil engineer, of canals, the Kennet and Avon (completed 1810) and Rochdale (1804), the first Pennine crossing; bridges (famously Waterloo (1817), Southwark (1819), and London (1831), excelling in the design of the elliptical arch and use of ironwork); Bell Rock lighthouse (1810) and numerous dock and harbour works (London (1805), Holyhead (completed 1824), and the massive breakwater at Plymouth (from 1811)); and urban water supplies, including Edinburgh, Manchester, and Leeds. Rennie also developed engineering technologies, with iron mill works (1784), the diving bell (at Ramsgate, 1813), and the steam bucket-dredger, critical to his work at Hull (1803–9), and advised the Admiralty to adopt the steam tug, seen in the *Comet* (1819).

JCh

**Renunciation Act**, 1783. Pressure from the Irish \*Volunteers during the American War forced the British government in 1782 to repeal the Declaratory Act of 1719 (6 Geo. I c. 5) which had affirmed the authority of the British Parliament over Ireland. After a few weeks, Henry Flood

## Repeal Association

launched a new agitation, insisting that the concession was inadequate. To 'remove all doubts' a Renunciation Act (23 Geo. III c. 28) was hastily passed in 1783 explaining that the Irish people were subject only to laws passed by the Irish Parliament. But as long as the lord-lieutenant was a British cabinet minister, Britain remained in control. JAC

**Repeal Association**, 1840–8. \*O'Connell's \*Catholic Association was suppressed when catholic emancipation was carried in 1829 but agitation for the repeal of the Union soon recommenced. For some years O'Connell preferred to work with the Whig governments but in 1840, faced with the prospect of a Tory government under \*Peel, he responded by organizing the Repeal Association, supported by the 'repeal rent', collected mainly by catholic priests. It drew up petitions, arranged candidates, sponsored monster meetings, claimed 3 million supporters, and employed 50 headquarters staff. In 1843 the government banned a meeting at Clontarf and four months later O'Connell was sent to gaol for conspiracy. The association was weakened by splits over tactics of violence, O'Connell's death in 1847, and the impact of the Famine. It was replaced in 1848 by a short-lived Irish League. JAC

**representative peers.** At the time of the negotiations for Union in 1707, there were more than 130 Scottish peers to 170 English ones. To unite them in one House would have given the Scots disproportionate influence. By the Act of \*Union, Scotland was awarded 16 representative peers, to be elected by their colleagues before each session. Since the Scottish peerage was not replenished, the constituency was constantly shrinking until by 1800 there were fewer than 70 electors. The practice soon developed of circulating government and opposition lists and, under normal circumstances, the Scottish representative peers were useful allies of government in the House of Lords. A similar formula was adopted at the Union with Ireland in 1801. There were then some 260 English peers and 170 Irish. The Act gave Ireland 28 representative peers and four spiritual peers. But the lay Irish peers, unlike the Scots, were elected for life and those who were not chosen could sit in the House of Commons. The four bishops lost their seats when the Church of Ireland was disestablished in 1869 and no elections for Irish peers were held after the creation of the Irish Free State in 1922. The last Irish representative peer, Lord Kilmorey, died in 1961. By the Peerage Act of 1963 all the remaining Scottish peers were declared members of the House of Lords. Irish peers were still excluded but were made eligible to sit in the Commons for any constituency. JAC

**Repton.** A 'double monastery', founded in the late 7th cent., it had close associations with the Mercian royal house. The Mercian prince St \*Guthlac began his monastic career at Repton, and several Mercian kings and princes were buried there including Merewalh, \*Æthelbald (d. 757), and \*Wiglaf (d. 840). It was also the burial place of Wiglaf's grandson Wigstan, murdered in 849 and shortly afterwards recognized as a saint. The crypt of the present church may have been originally a free-standing mausoleum in which Wiglaf and Wigstan were buried. In 873–4 Repton

was used as a winter fortress by the Viking great army. Recent excavations have revealed details of the fortifications and a mass burial, probably of those who died of disease during the occupation. The church was a significant minster in the later Saxon period and was created an Augustinian priory in 1153. BAEY

**Repton, Humphry** (1752–1818). The leading landscape gardener after Lancelot 'Capability' \*Brown and a contemporary of Sir Uvedale Price (1747–1829) and Richard Payne Knight (1750–1824). Knight attacked Brown's smooth and artificial style in his poem *The Landscape* (1794), to which Price added *An Essay on the Picturesque* defining the Picturesque as an aesthetic category as distinct from \*Burke's Sublime and Beautiful. Generally Repton followed Brown, but introduced formal parterres, terraces, and steps near the house, and used arbours, conservatories, lodges, and cottages. Although Repton undertook a few architectural commissions on his own, and some in a brief partnership with \*Nash, most were largely left to his sons John Adey (1775–1860) and George Stanley (1786–1858). Repton's celebrated technique of explaining his designs involved using 'Red Books' with sliding panels indicating the effects 'before' and 'after' improvement. Examples of Repton's work executed between 1800 and 1810 are Cassiobury (Herts.), Harewood (Yorks.), West Wycombe (Bucks.), and Woburn abbey (Beds.). Repton's *Sketches and Hints on Landscape Gardening* of 1795 lists 57 Red Books already prepared by that date, and this and his other publications were brought together by John Claudius Loudoun (1783–1843) in *The Landscape Gardening and Landscape Architecture of the Late Humphrey Repton*, Esq (1840). PW

**republicanism.** After the only British experience of a republic, the \*Commonwealth of 1649–60, republicanism did not have its own party nor was it a major constituent of the programme of other parties or movements. Unlike most of Europe and America, where republicanism was regarded as a prerequisite of democracy, the extension of popular government in Britain was attained without revolution or overthrow of the monarchy. Nevertheless, republican sentiment was common among British radicals in the late 18th and 19th cents. Supporters of the American and French revolutions and admirers of Thomas \*Paine were usually republicans, as also were the plebeian radicals of the 1820s and 1830s, notably the followers of Richard \*Carlile, who published the *Republican* from 1819 to 1826. Some chartists were openly republican, as witness two late chartist journals, C. G. Harding's *Republican* (1848) and W. J. Linton's *English Republic* (1851–5). Periods of monarchical unpopularity stimulated republicanism. This was so during the Regency and again in the late 1860s and early 1870s, when a group of Liberal MPs, including Sir Charles \*Dilke and Joseph \*Chamberlain, revived the republican cause, fuelled by Queen Victoria's withdrawal from public life, the cost of the royal family, and the scandals associated with the prince of Wales. At the same time popular republicanism was spread by Charles \*Bradlaugh and the secularist movement; and a short-lived journal, the *Republican*, appeared in 1870. Republican clubs were formed in London and throughout the country during 1870–2. The

labour and socialist movements of the 1880s and 1890s were republican in principle. But, as with earlier radical and reform movements, republicanism was only one of the constituents and not a major part of the programme. British republicanism has been a matter of principle or sentiment rather than an issue of practical politics. JFCH

**Requests, Court of.** A minor court of equity. It was originally a committee of the king's \*council, set up in the reign of Henry VII to hear 'poor men's causes' and causes involving the king's servants. Unlike other conciliar courts, it was not abolished in 1641 but faded away during the 17th cent. The masters of requests were often civilian lawyers who practised in the \*ecclesiastical courts and the Court of \*Admiralty. In the 18th and 19th cents. attempts were made to supply the deficiency of cheap and accessible justice by the establishment of local courts of limited jurisdiction called courts of requests. These were superseded in 1846 by the \*county courts. MM

**resolutions,** 1650. Efforts to rally Scottish resistance after \*Cromwell's crushing victory at \*Dunbar in September 1650 were handicapped by the kirk's insistence that only godly men were fit to uphold the cause. The remonstrants—zealous presbyterians mainly from the south-west—complained that Charles II was not to be trusted: their moderate opponents retorted with 'resolutions' that qualification for service in the army be relaxed. Though the remonstrants protested that crypto-royalists were being recruited, the army was still not strong enough to do battle. Instead, it marched south into England and was cut to pieces at \*Worcester. JAC

**Restoration.** The restoration of the monarchy in 1660 was due more to the failure of alternative republican regimes than to the efforts of loyalists. An army junta dispersed the \*Rump Parliament in October 1659 but failed to rally civilian support. Dissident garrison soldiers restored the Rump and General \*Monck invaded England with the army of occupation in Scotland. He quickly realized that the Rump no longer possessed the consent of the nation; he therefore restored the MPs who had been excluded from the Commons in 1648, on condition that they dissolved Parliament so that new elections could be held. The resulting \*Convention—so called because it had not been summoned by the crown—invited Charles II to return. Suggestions that conditions should be attached came to nothing.

Restoration meant the return of legality, ending arbitrary or 'sword' government and changes enforced by a politicized army. Arbitrary high courts disappeared and Charles I's prerogative courts were not revived. Parliaments were again to be elected on the traditional franchises and by the old constituencies. The Lords returned. Levels of taxation fell sharply as most of the army was disbanded. An amateur militia replaced it. An Indemnity Act pardoned all except the regicides. The Convention contained a majority of former parliamentarians but old cavaliers in the 1661 Parliament tried to modify what had been done. Charles successfully resisted their attempts to exclude from office all who had fought his father and to restore estates to cavaliers who had lost them. This Parliament strengthened the crown with

new treason laws, a \*Licensing Act establishing censorship, and a purge of urban corporations. It also enacted the \*Clarendon code restoring the church and it was this narrow settlement that provoked bitterness and lasting division. JRJ

**retail trade.** Until the late 18th cent. selling directly to consumers was largely conducted from domestic premises or market stalls, and augmented by visits from travelling traders with pack-horses. Items sold were mostly local and seasonal, farm produce or locally made artefacts. In England places with a market were usually not more than 15 miles apart, the distance a horse and cart could travel and return the same day. Only at fairs did vendors come from long distances.

In most towns the principal thoroughfares were the favoured locations for shops with living accommodation. Purpose-built shops, separate from the producer's home, with extensive displays and facilities for customers, emerged only in the later 18th cent. The 'Wedgwood Room' concept of space set aside to sell specialist items to better-off customers was a major innovation.

During the 19th cent. increasing population produced more purchasing power, with consequences for the organization and development of retailing. Markets and fairs became less important as a wide range of products, carried by regular and reliable transport, became available in established shops. Most towns by the middle of the century supported at least one shop specializing in the sale of 'ironmongery'. Some of these businesses became the core of department stores.

Department stores with purpose-built premises are said to have started with Joseph Whiteley's in Bayswater (London). All cities saw the development of similar shops which met the needs of various social classes. From its beginnings, Harrods (1849) sought upper-class trade whilst others such as Marshall & Snellgrove concentrated on middle-class customers. Many of these department stores developed into chains and all large cities had several of these stores by the end of the 19th cent.

Consumers seeking an alternative to commercial retailing supported the self-help model pioneered in \*Rochdale (Lancs.) of a retail co-operative shop. Beginning in 1844 the concept spread rapidly throughout the British Isles. Co-operatives sold quality-guaranteed produce at affordable prices mainly to the urban working class. Commercial shops selling a limited range of groceries of low price and standard quality were begun by David Greig and Thomas Lipton in Glasgow. Their chains spread rapidly after the mid-1870s to most towns. They were so successful that other firms imitated their methods, not only in groceries but in butchery and other products. Shops, such as F. W. Woolworth and Marks & Spencer, which sold a variety of products were further examples of retailing success in the 20th cent.

In recent decades, consumer choice has expanded with the goods available unconstrained by locality or season. At the same time independently owned retail outlets have declined. Private car ownership stimulated the development of supermarkets and hypermarkets from the late 1950s, adding

## retainers

to the retail competition in food, home improvement equipment, and household goods and furniture. Since the early 1980s some stores have been relocated in large purpose-built shopping malls and, whilst providing choice for consumers, they have caused a decline of the traditional urban shopping centre. 'Internet shopping', introduced in the 1990s, has not expanded as fast as anticipated. IJEK

**retainers.** See BASTARD FEUDALISM.

**Revocation Act, 1625.** When Charles I succeeded his father he already had difficult relations with the Scottish kirk. He increased these in 1625 by a prerogative Act of Revocation, whereby church or royal property which had been alienated since 1540 was taken back by the crown. This greatly alarmed the nobility and raised the spectre of a wholesale attack upon property rights. Charles then compounded his blunder by sending a Roman catholic adviser, Lord Nithsdale, to enforce the measure. Though the matter was compromised, it was an inauspicious start to the new reign—the 'ground stone of all the mischeiffe that followed after'. JAC

**Revolutionary and Napoleonic wars (1793–1815).** Following its defeat of the Prussians at Valmy in September 1792, revolutionary France announced its expansion to its 'natural frontiers' and war against the states of the *ancien régime*. In response Britain sent an army under the duke of \*York to Flanders in 1793, joining the Dutch and Austrians in the 'War of the First Coalition'. After an inept campaign the defeated Dutch made peace and the remnants of York's army were evacuated in March 1795. Expeditions against French colonies in the West Indies 1793–6 met with mixed success, although in 1795 the British seized Cape Town and Ceylon from their former Dutch allies. Naval victories over the French in 1794 ('the \*Glorious First of June'), the Spanish at \*Cape St Vincent in February 1797, and the Dutch at \*Camperdown in October 1797 confirmed Britain's mastery of the seas.

The British government responded to radicalism and possible revolt at home with repression, suspending \*habeas corpus in 1794. A French-backed rebellion in Ireland 1797–8 was also violently suppressed, as were naval mutinies at \*Spithead and the \*Nore in 1797. The cost of the war, including the creation of an army of 220,000 and 80,000 militia, forced Britain off the gold standard in 1797. A programme of barracks-building was started in 1798 deliberately to isolate soldiers from radicalism.

In 1795 Prussia and Spain made peace with France, and in 1796 Spain re-entered the war on the French side. The defeat of Austria, which made peace by the treaty of Campo Formio in October 1797, ended the first coalition. This was followed by Napoleon's expedition to Egypt in 1798, intended to support Britain's enemies in India, which came to nothing with the destruction of the French fleet at the \*Nile in August 1798, the defeat of Tipu of Mysore by an Anglo-Indian army under Arthur Wellesley (\*Wellington) in May 1799, and the elimination of the French in Egypt by Abercromby at \*Alexandria in March 1801.

Britain formed the 'second coalition', including Austria, Russia, Portugal, Naples, and Ottoman Turkey, in autumn 1798, but a renewed expedition to the Netherlands under York in 1799 again achieved little. Austria was defeated by Napoleon at Marengo in June 1800, and made peace by the treaty of Lunéville in February 1801. Russia also made peace, joining with Sweden, Denmark, and Prussia to form the \*League of Armed Neutrality in 1800. This collapsed after the assassination of Tsar Paul and the destruction of the Danish fleet by the British at \*Copenhagen in April 1801.

The treaty of \*Amiens in March 1802 between Britain and France ended the 'War of the Second Coalition'. But continued French expansion in southern Europe, together with support for Britain's enemies in India, brought a renewed declaration of war from Britain by May 1803, followed by another abortive French-backed rebellion in Ireland in July. The Indian threat was ended by Wellesley's defeat of the Mahratta Confederacy at Assaye in September 1803, leading to a negotiated peace in India by 1806.

On 2 December 1804 Napoleon proclaimed himself emperor of the French, leading to British treaties with Russia, Austria, and Sweden in the 'War of the Third Coalition'. Despite the failure of Napoleon's plans to invade Britain and the destruction of his fleet by Nelson at \*Trafalgar in October 1805, he drove Austria out of the war with victories at Ulm and at Austerlitz, leading to the treaty of Pressburg in December. This was followed by Napoleon's humiliating defeat of Prussia at Jena in October 1806. Russia was also defeated at Eylau and Friedland, and accepted the treaty of Tilsit of July 1807, leaving France dominant in central Europe.

Against Britain, his remaining enemy, Napoleon resorted to economic warfare ('the Continental System'), one by-product of which was the Anglo-American \*War of 1812–15. Unsuccessful British expeditions were mounted against Buenos Aires 1806–7, Naples 1806 (despite the victory at Maida), and \*Walcheren island in the Netherlands 1809–10. A French campaign against Portugal, begun in November 1807, was complicated by a Spanish revolt in May 1808, followed by the arrival of a British army under Wellesley in August (the start of the \*Peninsular War). The convention of \*Cintra (also in August) allowed the French to withdraw, and a failed offensive under Sir John \*Moore in October led to retreat and evacuation through \*Corunna in January 1809 after Moore's death. In April Wellesley returned to the Peninsula, which became the main British theatre of the war, with victories over the French at \*Talavera in July 1809 (for which he was made Viscount Wellington), \*Fuentes de Onoro in May 1811, Badajoz and \*Salamanca in April and July 1812, and \*Vitoria in June 1813.

In June 1812 Napoleon attacked Russia, reaching Moscow. Thereafter his army disintegrated through supply problems, disease, Russian attacks, and finally winter. Austria and Prussia rose in revolt, and at Leipzig ('the battle of the Nations') in October 1813 Napoleon was again defeated by a combined Russian-Austrian-Prussian force. In February 1814 Wellington crossed into France from Spain, by March the Prussians had reached Paris, and on 20 April Napoleon abdicated, being exiled to Elba.

The final flourish of the Napoleonic wars was the 'Hundred Days', Napoleon's escape from Elba on 1 March 1815 and return to power in France, culminating in his decisive defeat by a coalition army under Wellington at \*Waterloo on 18 June 1815, and his exile to St Helena. SDB

D., *British Strategy in the Napoleonic Wars 1803–1815* (Manchester, 1992); Pimlott, J., *The Guinness History of the British Army* (1994).

**Reynolds, Sir Joshua** (1723–92). Portrait painter, born in Devon to a scholarly and clerical family. Educated at his father's school, Reynolds showed early skill in drawing and portraiture and by 1743 was in practice on his own. His portraits already included classical allusions which gained him many patrons among the grand tourist gentry. In 1749 he travelled to Europe, spending two years in Italy studying the old masters and making many influential friends. On his return to London his great success allowed him to move in circles of intellect and wealth. Almost every person of note in the second half of the 18th cent. had their portrait painted by Reynolds. In 1764 he formed the Club, whose members included Samuel \*Johnson, Edmund \*Burke, Oliver \*Goldsmith, and Adam \*Smith. In 1768, on the founding of the Royal Academy, Reynolds was the obvious choice for president, although the patron, George III, did not like his pictures. In 1769 he was knighted and awarded an honorary doctorate at Oxford. Among Reynolds's finest portraits are those of the courtesan Nelly O'Brien (1760–2), of his fellow-club members Goldsmith (1770), Baretti (1774), and \*Gibbon (1780), and the grand painting of \*Heathfield, defender of Gibraltar (1788). Between 1769 and 1790 he wrote and delivered an influential series of *Discourses* on art. JC

**Rheged, kingdom of.** A 6th-cent. British kingdom round the Solway Firth and southern Galloway, its capital was possibly Carlisle. In Roman times the inhabitants of the area had been the Novantae. Its best-known ruler, Urien, much praised by \*Taliesin, was said to have attacked the \*Bernicians c.580 and to have been killed some ten years later besieging \*Bamburgh. Rheged disappeared in the 7th cent., but \*Oswiu's first wife was said to have been a descendant of Urien, which might have facilitated a Northumbrian take-over. JAC

**Rhodes, Cecil** (1853–1902). Imperialist and capitalist, probably in that order. In 1870 Rhodes went to \*Natal to help his brother grow cotton, but amassed a huge fortune in diamonds and gold. The early appearance of the heart and lung ailments that were eventually to kill him prompted him to make a series of wills from his 25th year onwards, devoting his money to expanding the British empire, so that eventually it would even reabsorb the USA. On a more practical level he became prime minister of the Cape in 1890; opened up the country north of the Limpopo, modestly naming it \*Rhodesia; and was involved in the \*Jameson Raid. When he died, his final will provided for a series of scholarships to Oxford open to young colonials, Germans

(because of the racial affinity), and Americans (in preparation for re-entry). BJP

**Rhodesia** was the name given to an irregularly shaped region of southern Africa, bounded by Bechuanaland, the Congo, German east Africa (Tanganyika), and Mozambique, first exploited by \*Rhodes's British South Africa Company in the 1890s. In 1964 the northern part became the independent nation of \*Zambia, leaving the white minority in Southern Rhodesia (now just plain 'Rhodesia') to mount a rearguard action against black rule, through a 'Unilateral Declaration of Independence'—independence, that is, from British suzerainty—issued in 1965. That caused constant trouble for successive British governments, especially from other \*Commonwealth countries, who expected them to put the rebellion down by force. Eventually the native peoples won their own battle, helped by international sanctions; and Rhodesia achieved legal independence as the majority-ruled state of Zimbabwe in 1980. BJP

**Rhodri** (d. 878), king of Gwynedd, Powys, and Deheubarth (844–78), known as Rhodri Mawr ('the Great'). The son of Merfyn Frych ('the Freckled'), king of \*Gwynedd, and Nest of \*Powys, Rhodri assembled a dominion that inspired others to attempt the same; the later dynasties of Gwynedd and \*Deheubarth were proud of their descent from two of his sons. Rhodri acquired Gwynedd when his father died (844), Powys through his mother and uncle (855), and \*Seisyllwg (modern Carmarthenshire and Cardiganshire) after his wife's brother died. He contended with the Vikings, defeating them in battle (856), but 20 years later they forced him into exile. After his return, he was killed by Mercians and his dominion collapsed; it was not forgotten. RAG

**Rhuddlan, statute of,** 1284. Sometimes known as the statute of Wales, this was in fact a royal ordinance, not issued by Parliament. It was intended to settle the government of Wales after the execution of \*Dafydd ap Gruffydd in 1283. English criminal law was to be introduced, under a justice of Snowdon, but Welsh custom and law were to operate in civil proceedings, and especially property matters where partible inheritance was common. Six sheriffdoms were established in Anglesey, Caernarfon, Merioneth, Flint, Carmarthen, and Cardiganshire. The statute was followed in 1301 by the creation of Edward I's son as \*prince of Wales. JAC

**Rhys ap Gruffydd** (1132–97), king of Deheubarth (1155–97), known as 'the Lord Rhys'. The younger son of \*Gruffydd ap Rhys, king of \*Deheubarth, and Gwenllïan, daughter of \*Gruffydd ap Cynan, king of \*Gwynedd, he married Gwenllïan, daughter of \*Madog ap Maredudd, king of \*Powys. He did not unite the three kingdoms, but after \*Owain Gwynedd's death (1170) he was regarded as 'the unconquered head of all Wales'. He helped his brother Maredudd to combat the Anglo-Normans and when Maredudd died (1155) he became king. He acknowledged the overlordship of Henry II (1158), who tried to limit his dominion; but Rhys rebelled and in 1164–5 seized Cardigan and surrounding territory. Henry II respected his power and after Anglo-Norman lords were diverted to Ireland (1169) they came to terms, and Rhys was receptive to

## Rhys ap Tewdwr

Anglo-Norman culture and organization. He rebuilt Cardigan and Dinefwr castles, extended his power in \*Dyfed, exploited his resources effectively, and encouraged the new religious orders; he even held an \*eisteddfod at Cardigan (1176) and may have codified Welsh law. Richard I was less sympathetic and hostilities marred the years before Rhys's death on 28 April 1197 (and burial in St David's cathedral). In the hands of his quarrelsome sons, his kingdom disintegrated. RAG

**Rhys ap Tewdwr** (d. 1093), king of \*Deheubarth (c.1078–93), known later as Rhys the Great. A descendant of \*Hywel Dda, he came to power in 1075, though only at the battle of \*Mynydd Carn (1081), and with \*Gruffydd ap Cynan's aid, did he defeat his rivals and relatives. By then the Norman advances in Wales had begun. William I travelled to St Davids in 1081, probably to assert his authority over Rhys, who may have acknowledged the king's overlordship. Rhys's power was resented by other Welsh rulers, and in 1088 those in Powys forced him into exile in Ireland; the Scandinavians of Dublin helped him to return. He also defeated his rivals in Deheubarth (1091). After William I's death (1087), Rhys tried to stop further Norman incursions, but was killed near Brecon. His son \*Gruffydd was taken to Ireland for safety; when he returned, he failed to recreate his father's dominion. RAG

**Ribbonmen** were members of Irish catholic secret societies between the Napoleonic wars and the rise of the \*Fenians. They wore white ribbons in their hats to aid identification at night. The aims of their loosely structured organization were nationalist but vague and they have been compared with the Mafia. JAC

**Ricardo, David** (1772–1823). Born in London of Dutch parents, Ricardo's career 1793–1814 was as a stockjobber, initially in the family firm. Accruing a reasonable fortune, he bought the country estate of Gatcombe Park in 1814; by 1819 he was elected member of Parliament. Much of his time was devoted to the study of mathematics, sciences, and political economy; this led to *On Principles of Political Economy and Taxation* (1817), where the influence of Adam \*Smith's *Wealth of Nations* is to be seen. His work was highly significant, with great originality in theoretical economics across a broad subject area, covering the theory of value and distribution and particularly the law of rent. He is credited also with the theory of comparative advantage which proposed international specialization in traded products and was the foundation of the \*free trade argument. JRP

**Rich, St Edmund** (c.1170–1240). Archbishop of Canterbury. Born at Abingdon, he studied at Oxford and Paris where he was a renowned teacher of logic (c.1185–90). A 'saintly man of courage and candour', he was an ascetic, though remaining a secular. While treasurer of Salisbury (c.1222–34) Rich preached the crusade at the pope's request (c.1227). As primate (from 1234), he maintained \*Langton's ideals by resisting both royal and papal power. He threatened to excommunicate Henry III for not dismissing his ministers and rebuked him for inviting Otto, papal legate, into England (1237). Differences with king, papacy, and his Canterbury

monks were such (1240) that he retired to Pontigny, where he died. His 'brief . . . poignant and dramatic' primacy was lived out in the thick of controversy, but after his death his memory was treasured by all, kings and friars, rich and poor. He was canonized (1247) and his shrine at Pontigny visited by Henry III and Edward I. WMM

**Richard I** (1157–99), king of England (1189–99). Richard has attracted legends as bees are proverbially attracted to the honey-pot. The process began in his own lifetime. Already, by 1199, the epithet Cœur de Lion/Lionheart was being applied, and within another 50 years certain episodes in his life had taken on a legendary significance. The myth-making has continued ever since with inevitable distortions and misunderstandings of the historical Richard.

In the popular imagination today, Richard is a national English hero, the valorous warrior and glorious crusader who struggled against all the odds to come within an ace of recapturing Jerusalem from the equally legendary Saladin on the Third Crusade. On returning from crusade, he was shipwrecked and captured by Duke Leopold of Austria, who shamelessly sold him on to Emperor Henry VI. This allowed John, Richard's evil brother, to scheme with Philip II of France. But Richard so impressed his imperial captor by his courtesy, dignity, bearing, and self-possession that he was soon released—to turn the tables on his enemies at home. The massive bronze statue of Richard in Westminster Palace Yard captures superbly the Ricardian qualities admired for centuries. A powerfully muscular Richard, imposing and magnificent, sits on horseback, in full armour and wearing a crown, his sword triumphantly raised aloft.

Yet English Richard was not, nor even Anglo-Norman. Although born in Oxford, he briefly visited England just twice before his accession in 1189. As king, he spent a mere six months in England. He was born of French parents, Henry II and Eleanor of Aquitaine, and only from Edith (\*Matilda), his great-grandmother, wife of King Henry I, did he derive any 'English' blood. Richard spoke no English; his vernacular tongue was the French of Poitou, in which he composed troubadour poetry. He willed his body for burial in Fontevraud abbey (Poitou), his heart for interment in Rouen cathedral (Normandy). He was French through and through.

Despite this, most modern historians have judged him from an Anglocentric viewpoint. He might have been a warrior second to none, they argue, but he was an utterly irresponsible king of England, who plundered English wealth in pursuit of his own glory in France and the Holy Land, and who recklessly endangered the security and stability of his island realm. In lighter vein, but just as telling, are the words of Sellar and Yeatman: 'he went roaring about the Desert making ferocious attacks on the Saladins and the Paladins, and was thus a very romantic king. Whenever he returned to England he always set out again immediately for the Mediterranean and was therefore known as Richard Gare de Lyon.'

Since 1948 another legend has grown up. This was when J. H. Harvey, in his book *The Plantagenets*, sought to prove that Richard was homosexual. His claims have come to be

widely accepted, and it is as a homosexual that Richard appears in many modern novels, films, and plays, and even in *Encyclopaedia Britannica*. Gillingham has effectively demolished Harvey's claims, but this one has taken deep root.

Modern scholarship is at last beginning to reveal another Richard, more balanced and credible. This has only become possible by considering him as *not* first and foremost an English king, but rather the lord of the French-based \*Angevin empire which he inherited as a whole in 1189; by allowing for the international pull of the crusade and the duty to participate therein, an imperative acknowledged by contemporary western princes; and by examining carefully Richard's political and diplomatic skills. His military reputation remains intact. Indeed, it has been enhanced. The inspired battlefield commander of tradition, and brilliant tactician—as evidenced, for example, by the march from \*Acre to Jaffa and the battle of \*Arsuf (1191)—is increasingly seen as a master of planning and logistics. His crusade, involving the raising, fitting out, and dispatch of a fleet from northern waters to the east Mediterranean, is a superb example of administrative efficiency. His campaigns in France on his return, to undo the damage wrought by his treacherous brother John in concert with Philip II, reveal not just military competence of the highest order, but also a very sure sense of strategy backed up by effective diplomacy. For Richard set about constructing an international coalition against Philip, designed to enable him to concentrate on the struggle in the crucial heartland of the Angevin empire.

It has also become apparent that had Richard not been shipwrecked and captured, he would have returned home to find the governmental structure of the Angevin empire intact as he had established it before departure for the crusade in 1190. Far from setting out on crusade without a care for the security of his various dominions, England included, Richard did what he could in the short time available to him. In brief, he was one of the ablest men to have sat on the throne of England.

SL

Gillingham, J. B., *Richard the Lionheart* (2nd edn. 1989); — *Richard Cœur de Lion: Kingship, Chivalry and War in the Twelfth Century* (1994).

**Richard II** (1367–1400), king of England (1377–99). Richard's failures have attracted more interest than the successes of greater rulers. His reign was characterized by aristocratic opposition and political ineptitude.

Richard became king in 1377 aged 9. There was no formal regency, but the government during his early years was dominated by his uncle \*John of Gaunt. The French war was going badly, and royal finances were in an unsatisfactory state. The imposition of the third \*poll tax was a major cause of the outbreak of the \*Peasants' Revolt in 1381; this was the occasion of Richard's first independent political action, when he faced the rebels at Smithfield, witnessed the slaying of Wat \*Tyler, and saved the situation by his own intervention. The king's subsequent moves to play a greater political role led to escalating crises. In 1386 the chancellor, Michael de la \*Pole, was impeached; Richard infuriated Parliament by declaring that he would not dismiss even a kitchen boy at its request. He provocatively appointed

his favourite, Robert de Vere, earl of \*Oxford, to be duke of Ireland.

There has been much debate whether Richard had high, possibly novel, concepts of the nature of monarchy. In the summer of 1387 he asked the justices questions about the constitutional position and the right of Parliament to act as it had done in 1386, which suggests that he was very conscious of the problems he faced. The issues were settled less by legal argument than by force, for the defeat of de Vere at \*Radcot Bridge in the autumn of 1387 left Richard defenceless. He may even have been deposed for a brief period after Christmas 1387, until his opponents fell out over the question of who should replace him. The so-called \*Merciless Parliament of 1388 conducted a purge of government, using the weapons of appeal and impeachment against royal ministers and favourites, including de la Pole and de Vere. Richard was clearly deeply angered by what took place, and his desire for revenge provides one explanation for some of the later events of the reign.

The return of John of Gaunt from Spain in 1389 brought a renewed sense of purpose and direction to government, although relations between John and the king were not always easy. The work of the Merciless Parliament was undone, as far as was possible, in 1389, and Richard wisely did not revert to the excesses which had led to crisis in 1387. He was prepared to allow some control of affairs by the council; the regime was relatively financially stable, and significant efforts were made to deal with problems of lawlessness. There was barely any overt opposition to Richard between 1388 and 1397, although from 1393 discontent began to develop once again, partly as a result of hostility to the king's policy of negotiating a peace with France, and also because of resistance to his plans for re-establishing strong English rule in Ireland. In 1397 the refusal of the earls of \*Gloucester and Arundel to attend a council made their displeasure at royal policy all too evident, and the final crisis of the reign began.

In September 1397 Richard moved against those he regarded as his enemies in a carefully managed Parliament, at which the threatening presence of his Cheshire archers ensured that all would go his way. Archbishop \*Arundel was impeached and exiled. Royalist magnates brought appeals against the earls of Gloucester, Arundel, and Warwick. Arundel was executed, Warwick exiled, and Gloucester almost certainly murdered. Forfeited lands were granted out to Richard's supporters, and five new dukes created. The Arundel lands in north Wales were combined with the earldom of Chester, and a powerful new principality and royal power base was created. Charters were extracted at Shrewsbury early in 1398 from representatives of the southern counties, giving the king virtually unlimited powers. The grant of the principal customs revenues for life in 1398 gave Richard's regime new financial strength. The 1397 Parliament had dealt with the senior appellants of 1388; in 1398 a dispute between Henry Bolingbroke, duke of Hereford (John of Gaunt's son, later Henry IV), and the duke of \*Norfolk led to the exiling of the two men, after Richard prohibited a judicial duel between them at Coventry. In March 1399 Bolingbroke's Lancastrian inheritance was confiscated. In

## Richard III

May the king embarked on a new expedition to Ireland. This was disastrous for, in June, Bolingbroke, duke of Lancaster after his father's death, invaded England. In the king's absence, there was little resistance. On his return from Ireland, Richard was taken in north Wales, and on 30 September, a broken man, agreed to abdicate, and was deposed in Parliament. Since 1397 his regime had been narrowly based, with men such as the knights Bushy, Bagot, and Green playing a dominant part. Government was conducted by means of threats and fear, with a high-handed use of legal form. Richard certainly thought the law should be on his side. Suggestions that he had an elevated and clearly articulated theory of royal government are not convincing; arguments which see Richard as reacting to the humiliations he had suffered during the years up to 1388 are more plausible. Richard did not long survive his deposition and died at Pontefract, probably early in 1400. MCP

Saul, N., *Richard II* (New Haven, 1997); Tuck, J. A., *Richard II and the English Nobility* (1973).

**Richard III** (1452–85), king of England (1483–5). Richard is one of England's most controversial figures, immortalized as evil personified by \*Shakespeare, sanctified by a society dedicated to clearing his name. Born at Fotheringhay (Northants), he was the youngest son of Richard of \*York and Cecily Neville. He was still a child when his brother Edward IV became king. Stalwartly loyal to his brother, he shared in the triumph of 1471, distinguishing himself on the field of \*Barnet. He was handsomely rewarded by Edward IV who granted him the Neville estates and royal offices in the north of England. With these, and \*Warwick's daughter \*Anne as his duchess, he made himself even more powerful in the north than the Kingmaker. In 1480 he led the war against Scotland, secured the recovery of Berwick in 1482, and was rewarded early in 1483 with the grant of a county palatine in Cumberland.

In April 1483 Richard's future was put in doubt by the death of his brother. By a series of palace coups, he seized power, first at the end of April to secure himself as protector of the realm in the minority of his nephew Edward V and secondly in June to make himself king. He was crowned on 6 July. In September his enemies in the southern counties raised rebellion in the name of Henry Tudor. Even though they were joined by the duke of \*Buckingham they were easily dispersed. Richard reigned for two further years in a climate of intensifying crisis as, with French support, Henry Tudor planned to invade England. The two finally came to blows on 22 August 1485 near Bosworth in Leicestershire. Although he fought courageously, Richard was overwhelmed and killed in the mêlée. He was buried at the Greyfriars, Leicester. Fifty years later, when the friary was dissolved, his remains were discarded.

Almost every aspect of Richard's career is controversial. Loyal to Edward IV before 1483, he is seen by many to have devoted his energies to the well-being of the north. But it has also been argued that he was single-mindedly pursuing his own aggrandizement. The coup of 1483 is interpreted as justifiable self-preservation, a skilfully executed usurpation, or a sequence of ill-considered reactions. Some maintain he

was shocked to discover his nephews were bastards; others that he made up the story to justify his usurpation. His reign has been seen as a valiant attempt to administer justice impartially, or as tyranny in which his northern retainers occupied the south. On the one hand he was genuinely pious, on the other hand he was a cynical hypocrite.

Above all looms the controversy over his crimes. He is probably to be found not guilty of the murder of \*Edward at Tewkesbury, of manipulating the destruction of \*Clarence, of poisoning his queen; probably a party to the murder of Henry VI; and not proven on the princes in the Tower. Henry VII and the duke of Buckingham have been proposed as alternative culprits. Yet the fact remains that the boys were widely believed to be dead by the middle of September 1483 and Richard himself was believed by contemporaries to have been responsible. The belief that he had destroyed innocent children may have had a bearing on his failure to hold the throne.

It is almost impossible to get to the bottom of all these controversies; partly because insufficient evidence has survived; partly because so much is coloured by propaganda (that put out by Richard himself as much as that generated by Henry VII); partly because he divided opinion sharply in his day; and partly because over 500 years the stories of Richard III have taken on their own independent life. Thus Richard III has become a literary figure. This was so from the very beginning, for the supposed peculiarities of his birth and the hunchback, for which he is renowned, were but inventions to signify evil. Indeed were it not for the fascination of the stories, the only failed usurper of the 15th cent., who reigned but for two years and a bit, would have scarcely troubled the scorers. AJP

Horrox, R. E., *Richard III* (Cambridge, 1989); Pollard, A. J., *Richard III and the Princes in the Tower* (Stroud, 1991); Ross, C. D., *Richard III* (1981).

**Richard, earl of Cornwall** (1209–72), king of the Romans (1257–72). The younger brother of Henry III, he was granted vast estates by his brother, notably the earldom of Cornwall (with its tin-mines), which made him the richest man in England after the king, who frequently turned to Richard for loans. Although he exerted great influence over Henry, and at times of crisis dominated his policies, he was by no means always in agreement with his brother. In particular, he led the baronial opposition to Henry in the late 1230s. But he remained solidly loyal in the years of baronial reform and rebellion (1258–65), for his pains suffering the indignity of being captured in a windmill, after the battle of \*Lewes (1264). In 1257 he was elected king of Germany, the only Englishman to wear that crown, but he never fully established his authority over the country before his death. SL

**Richard de Bury** (1281–1345). Bishop of Durham. From Bury St Edmunds, Richard studied at Oxford and became a Benedictine monk at Durham. He was appointed tutor to Prince Edward and, after his succession in 1327 as Edward III, was given great preferment. In 1333 he was made bishop of Durham and in 1334–5 was chancellor. A patron of learning, he was said to have more books than all the other bishops combined. His own treatise *Philobiblon*, a guide to library

practice, was first printed in 1473. He endowed a library at Oxford attached to Durham College, laying down careful rules for its management. After the Reformation, the college was absorbed into Trinity College. JAC

**Richard of Chichester** (c.1197–1253). Bishop of Chichester. Born of an ordinary family at Wych (Droitwich), he studied in poverty at all three famous European *studia*, Oxford, where he became chancellor (1235), Paris, and Bologna. One of an outstanding group of dedicated 13th-cent. men led by \*Grosseteste, he belonged to Edmund \*Rich's household, went into exile with him, and was present at his death. In spite of Henry III's opposition, he became bishop of Chichester in 1245 by the active support of Archbishop Boniface and Pope Innocent IV, by whom he was consecrated at Lyons. A saintly man, he showed 'immense pastoral concern' for his diocese and raised clerical standards. He was canonized in 1262. WMM

**Richardson, Samuel** (1689–1761). Novelist. Born in Derbyshire, Richardson settled in London and became a master printer. His first novel *Pamela or Virtue Rewarded* (1740–2) was published when he was 51. *Clarissa Harlowe* and *Sir Charles Grandison* followed in 1744 and 1753. They were instant successes. They dealt with the manners and morals of relatively ordinary people attempting to survive in a naughty world with some degree of happiness and self-respect. They were salacious enough to make excellent reading. As such they caught a taste for a contemporary interest in manners and morals started by \*Addison and \*Steele's *Tatler* and *Spectator*. They established the value of epistolary writing as a vehicle for fiction. Richardson was much read in France where Marivaux had already established sentimental fiction; Rousseau's *Nouvelle Héloïse* is indebted to him. NTP

**Richborough**, site of the Claudian invasion, major port, and supply base, was later a fort of the \*Saxon Shore. Lying at the southern entrance to the Wantsum channel between the mainland and the Isle of Thanet, Richborough was the site of the Roman invasion in 43. Excavation in the 1930s revealed the double ditches and a gate of the beachhead defences. In the Flavian period a monumental four-way arch commemorated the acquisition of Britain. In the later 1st and 2nd cents. Rutupiae was a cross-channel port and a major military supply base. In the mid-3rd cent. the arch base was surrounded by triple-ditched earthwork defences. These were replaced in the later 3rd cent. by the stone defences of a square 8-acre fort of late Roman type. In the *Notitia dignitatum* the garrison is listed as *legio II Augusta*. The fort probably had a church in its north-western corner. A civil settlement with possible amphitheatre lay to the south. ASEC

**Richmond castle** (Yorks.) was the centre in the Middle Ages of the great honour of Richmond. The lands were held before the Norman invasion by Edwin, earl of Mercia, who seems to have retained them until 1068 when he rose in revolt. The honour was then granted to Alan the Red, son of Eudes, count of Penthièvre, who was related to the dukes of Brittany. This connection meant that his successors to the honour were often subjects of both the kings of England

and of France, which in the disturbed relations between the kingdoms in the Middle Ages often meant that the honour was forfeit to the crown. The centres of the Anglo-Saxon estate were at Gilling and Catterick, but Earl Alan seems to have preferred Richmond as the site for his castle, which is a naturally strong one, and building started in the 1070s. This castle is of 'ringwork' type, with the domestic range, of which the 11th-cent. Scolland's hall survives, placed above the river cliff opposite the gate. The defences of the castle were strengthened during Henry II's reign by the addition of a keep, built over the original gate passage. LR

**Richmond palace** began as a manor house at Sheen (Surrey) and was much used by Edward III, who died there. Henry V restored it and, after a disastrous fire in 1497, Henry VII rebuilt it on the grand scale, giving it his own title of Richmond. Mary used it frequently and Elizabeth died there, but during the civil wars it fell into decay. Only the lodge remained, used in the 18th cent. by George II and Caroline, \*Frederick and Augusta, and George III and Charlotte. Ambitious plans by George III to build a new Gothic palace, employing James Wyatt, were abandoned after his death. The present Kew palace, built privately in 1631, was known as the Dutch House. It was used as a royal nursery and private retreat and Charlotte died there in 1818. JAC

**riding** is a term indicating a third part. By 1086 Yorkshire was divided into North, West, and East Ridings, all three converging on York. The arrangement may well be of Scandinavian origin. For a time ridings had courts; their jurisdiction is uncertain. It appears that in the 11th cent. the term was also applied to the divisions of Lincolnshire: Lindsey, Holland, and Kesteven. Furthermore, medieval Lindsey was divided into North, South, and West Ridings. The Yorkshire ridings became independent counties by the Act of 1888; the arrangements being much altered by local government legislation of 1972 and 1996. JCa

**Ridley, Nicholas** (c.1500–55). One of the celebrated 'Oxford martyrs', Ridley played a significant role in shaping the protestant Church of England under Edward VI. A Northumbrian by birth, he studied at Newcastle, Cambridge, Paris, and Louvain, and around 1524 became a fellow of Pembroke College, Cambridge. In 1537 Archbishop \*Cranmer chose him as a chaplain; in 1540 he returned to Pembroke as master. Soon after the accession of Edward VI, he was made bishop of Rochester. He played a role in the drafting of the first, moderate but controversial 1549 version of the \*Book of Common Prayer. In 1550 he was translated to London when the then bishop, the staunchly catholic Edmund \*Bonner, was deposed and imprisoned. There he introduced some of the protestant liturgical innovations which were adopted nationally in the second Book of Common Prayer (1552). He was implicated in the duke of \*Northumberland's plot to divert the succession to Lady Jane \*Grey; however, it was for heresy rather than treason that Mary I pursued him. Ranged against catholic antagonists at the Oxford disputation of 1554, he defended himself bravely. He was degraded on 30 September 1555, and

## Ridolfi plot

executed by burning at Oxford on 16 October, alongside the former bishop of Worcester, Hugh \*Latimer. EC

**Ridolfi plot**, 1571. Organized by the Italian banker Roberto Ridolfi, this was one of many conspiracies to free Mary, queen of Scots, and promote the catholic cause. Ridolfi was questioned by English authorities in October 1569 but the following year began to plan Mary's escape, with Thomas, duke of \*Norfolk, Philip II of Spain, the Spanish ambassador, and the pope. The plot was uncovered by the agents of William Cecil, Lord \*Burghley, and led to the execution of Norfolk for treason in 1572. Ridolfi escaped.

SA

**Rievaulx abbey** (Yorks.) was founded in 1131 in the Rie valley by Walter Espec, lord of nearby Helmsley, in consultation with St Bernard, abbot of Clairvaux, and Archbishop \*Thurstan of York. It was the second \*Cistercian abbey to be established in England. Under the abbacy of St Ailred, who had joined the abbey as a monk soon after its foundation, it flourished, becoming the largest Cistercian community in England. At Ailred's death (1166) it was said to contain 140 monks. Its lands were concentrated in north Yorkshire and the basis of its economy was pastoral farming, particularly wool production. It attained its greatest prosperity in the first half of the 13th cent. and though it had declined somewhat by the end of the century, it still possessed some 12,000 sheep. However, it was never one of the wealthiest Cistercian abbeys: in 1322 it was sacked by the Scots, a disaster from which it never fully recovered. At the dissolution Rievaulx had a net income of c. £278. The extensive ruins of the abbey constitute perhaps the finest surviving buildings of any English Cistercian house, and the east end of the abbey church, rebuilt c.1225, is a masterpiece of English Gothic architecture.

BJG

**Rights of Man, The** (Part I 1791; Part II 1792). Thomas \*Paine's defence of the principles of the French Revolution against the attack launched by Edmund \*Burke in his *\*Reflections on the Revolution in France* (1790). Part I traced the origins of the Revolution and explicated the Declaration of the Rights of Man made by the National Assembly. Part II denounced the hereditary system, prophesied the immediate overthrow of the monarchy, argued that the only defensible form of government was representative democracy, and sketched the outlines of a system of state welfare. For these views Paine was indicted for treason by the British government, and hurriedly left England for France to take up his seat in the National Convention as the elected member for the *département* of Calais.

TSG

**Ripon, diocese of**. Though the modern bishopric was not carved out of the \*York diocese until 1836, Ripon's early ecclesiastical history is inextricably associated with \*Wilfrid. About 650, Celtic monks from Melrose and Iona founded a monastery here, but in 661 Wilfrid, by then in Roman orders, became abbot and introduced the Benedictine rule. Consecrated bishop of York while in Gaul and finding on his return that \*Chad had already been appointed to York, he initially used Ripon as his seat. On Chad's move to \*Lichfield in 669, Wilfrid was restored to York, but for a

short spell following 678 Ripon remained a bishopric under Eadhaed. Growth of industrial population, especially round Leeds, in the 19th cent. led to the creation of the modern diocese, simultaneously with \*Manchester. The present cathedral is the former late 12th-cent. Augustinian minster, transitional in style, though the nave is early 16th cent. The Saxon crypt is all that remains of the stone church, built c.678 by Wilfrid.

WMM

**Ripon, George Frederick Robinson, 1st Marquis** (1827–1909). Son of the 1st earl of Ripon (\*Goderich), he was returned to the House of Commons as a Liberal in 1852, succeeding to the title in 1859. He was a loyal \*Gladstonite, serving as under-secretary and then secretary of state for war and for India. In 1880, upon Gladstone's re-election, he was appointed viceroy of India to reverse the belligerent Afghan policies of his predecessor, Lord \*Lytton. His time in India proved highly controversial among the Anglo-Indian community. He advanced the causes of Indian education and local self-government, but also introduced the notorious Ilbert Bill which attempted to enforce non-racial principles of justice. He retired from India with the defeat of Gladstone's government in 1885 but remained politically active into old age. He was colonial secretary in 1892 and lord privy seal 1905–8.

DAW

**Ripon, treaty of**, 1640. The treaty of Ripon brought to an end the second \*Bishops' War between Charles I and the Scottish \*covenanters. The Scottish army occupied Newcastle and in September 1640 the royalist garrison of Edinburgh castle surrendered. Charles had little to negotiate with. By the terms of the armistice, the Scots were left in occupation of the six northern counties and were to receive expenses of £860 a day. The final peace settlement was to be concluded in consultation with the English Parliament. The king had lost control of the situation.

JAC

**Riot Act**, 1715. The Riot Act (1 Geo. I s. 2 c. 5) was hastily passed in July 1715 by a Whig Parliament to deal with the threat of Jacobite insurrection. It provided that, if twelve or more persons, tumultuously assembled, refused to disperse within one hour of a magistrate reading a proclamation, they would be guilty of a felony and could face the death penalty. Persons assisting the dispersal were indemnified. But a secondary motive was to clarify the law of riot, which the case of Dammaree in 1710 had shown to be defective. Daniel Dammaree, a London waterman, had been involved in the \*Sacheverell riots and had helped to destroy dissenting meeting houses. He was charged with constructive treason in levying war against the queen. Though found guilty, he had been pardoned, since the interpretation seemed strained. But if the Act was intended to stiffen magistrates, it was a doubtful success. The procedure which became known as 'reading the Riot Act' was difficult to carry out and the proffered indemnities offered little protection: magistrates were reluctant to read the proclamation and troops even more reluctant to open fire. The proclamation was read for the last time in 1919 but the Act was not repealed until 1967.

JAC

**Ritchie, William** (1781–1831). Founder of the *\*Scotsman*. Ritchie was a solicitor from Fife. In 1817, irritated by the refusal of the Edinburgh papers to print his criticisms of the Royal Infirmary, he joined with Charles Maclaren and others to launch the *Scotsman*. It began as a weekly, became bi-weekly in 1823, and was first issued as a daily in 1855. His elder brother John (1778–1870) began life as a weaver and draper, but took over the paper after William's death and became sole proprietor. JAC

**River Idle, battle of the**, 616. According to *\*Bede*, *\*Edwin*, young son of Aelle, king of *\*Deira*, was driven out of the kingdom by *\*Æthelfric*, king of *\*Bernicia*, and at length took refuge with *\*Rædwald*, king of East Anglia. *Rædwald* resisted demands by *\*Æthelfryth*, successor to *\*Æthelfric*, to surrender Edwin and accompanied him to the river Idle, west of Gainsborough, where they won a great victory. Edwin took both Deira and Bernicia and the united *\*Northumbria* made a vigorous effort at domination, Edwin claiming the *\*bretwalda*-ship. JAC

**River Plate, battle of the**, 1939. A German 'pocket battleship', *Graf Spee*, heavily armoured, with 11-inch guns, sinking British merchant ships in the South Atlantic, was attacked on 13 December 1939 by three British cruisers, *Exeter* (8-inch guns), *Ajax*, and *Achilles* (both 6-inch guns). Though putting *Exeter* out of action, *Graf Spee* withdrew to Montevideo in the Plate estuary. Captain Langsdorff then blew up and sank *Graf Spee* rather than fight the superior British force he expected and shot himself. Early in 1940 HMS *Cossack* entered Norwegian waters and liberated merchant seamen taken prisoner by the *Graf Spee* and transferred to the *Altmark*. British confidence in the skill and daring of the Royal Navy was confirmed. RACP

**rivers**. In the early 21st cent. motorways stride so effortlessly across great rivers that it is easy to overlook the part they have played in British history. We can distinguish a number of different aspects.

(a) They were potentially defensible barriers and often formed the boundaries between early kingdoms or later shires. When *\*Ostorius* set out to subdue Britain, he conquered, according to *\*Tacitus*, the heartland between Severn and Trent. For centuries the Trent and the Humber were the border between north and south England; and the border between England and Scotland, which fluctuated considerably, eventually settled on the Tweed. The Severn, likewise, was at one time the border between England and Wales, until the English pushed it west to the Wye. In the south, the Thames was the effective border between Mercia and Wessex, and neither side found it easy to consolidate gains across the river. Even small rivers were important markers. When *\*Alfred* divided the kingdom at *\*Wedmore* in 878 with the Danish leader *\*Guthrum*, they took the lands east and west of the river Lea. When England was divided up into shires in the 11th cent. rivers were frequently the boundaries—the Tamar, Somerset Avon, Colne, Stour, Ouse, Welland, Dove, Teme, Tyne, Tees, and Mersey.

(b) Loops and angles of rivers often provided the opportunity for a defensible settlement. The most spectacular

example is perhaps at Durham, where the river Wear curls round the rocky promontory on which castle and cathedral are built. But there are many others. Shrewsbury is on a loop of the Severn; Bristol grew where the Frome joined the Avon, York where the Foss joined the Ouse; Malmesbury where the Tetbury and Sherston branches of the Avon converged.

(c) River crossings, by ford or bridge, were of critical importance in both peace and war. They were the natural sites for castles—at Worcester, Oxford, Hereford, Bedford, Cambridge, Carlisle—and the stream of carts and horse-men invited taverns and inns, smiths and stables. Ipswich, Exeter, Gloucester, London, Newcastle all grew up at the first point where the river or estuary could be crossed. Many of the battles in British history were fought at or near river crossings—to prevent escapes, cut off reinforcements, or obstruct junctions. Simon de *\*Montfort* was trapped at *\*Evesham* in 1265 in the bend of the Avon; *\*Thomas of Lancaster* was caught at *\*Boroughbridge* in 1322 at the crossing of the Ure; *\*Percy (Hotspur)* in 1403, trying to reach his ally *\*Glyndŵr* in Wales, found that the king had taken possession of the crossing at Shrewsbury; the English Civil War began in 1642 with a cavalry skirmish at Powicke bridge, south of Worcester, on the river Teme.

(d) Rivers facilitated communication and, until the introduction of turnpikes and macadamization in the 18th cent., transport by water was quicker and less fraught than by road or footpath. Towns on estuaries which provided harbours—Plymouth, Hull, Southampton—were particularly well placed, but inland navigation was also important. Few great towns were to be found far from rivers. With the development of river improvements and then canals in the 17th and 18th cents., inland ports—Bewdley, Gainsborough, Rotherham, Reading—flourished. The smallest barge had a capacity vastly greater than the sturdiest packhorse. Even small rivers, if improved, could be turned to good use. *\*Defoe* commented in the 1720s that Leominster's prosperity was due to the river Lugg, 'lately made navigable to the very great profit of the trading part of this country, who have now a very great trade for their corn, wool and other products of this place into the river Wye, and from the Wye into the Severn, and so to Bristol'.

(e) The water supply, provided that it was not too contaminated, enabled settlements to grow into thriving towns. There can be little doubt that one reason for the abandonment of Old Sarum in the early 13th cent. for Salisbury was that the old borough on its chalk hill (chosen for its defensive strength) had little water, while the new site to the south was at the confluence of the Avon, Nadder, and Bourne.

(f) Rivers became valuable sources of power as soon as water-mills were introduced during the 9th cent. By the time of Domesday there were said to be more than 5,000 mills. In the later Middle Ages, power began to be applied to industry, notably to cloth manufacture, first in fulling, then to other processes. This gave a great advantage to areas with good rivers like west Wiltshire, the Cotswolds, and the Yorkshire dales. JAC

**Rivers, Anthony Woodville, 2nd Earl** (1442–83). The eldest brother of \*Elizabeth Woodville, he benefited from the marriage of his sister to Edward IV. He fled into exile with Edward IV in 1470, returning in triumph in 1471. He was thereafter entrusted with the upbringing of the prince of Wales and given extensive power in the principality and marches as the president of the prince's council. Shortly after Edward IV's death, he was seized at Stony Stratford by Richard of Gloucester, whom he had taken to be his ally. On 22 June he was summarily executed at Pontefract. Rivers enjoyed a high reputation among his contemporaries for his chivalry, piety, and learning. After his death he was found to have been wearing a hair shirt. But he was no naïve idealist; he was on the contrary a shrewd and alert politician, outwitted by another. AJP

**Rivers, Richard Woodville, 1st Earl** (c.1410–69). Father of Elizabeth, queen of Edward IV. He was raised to the peerage in 1448 on account of his marriage to \*Bedford's wealthy widow. Following distinguished service in France, he remained attached to the Lancastrian court, fighting on the losing side at \*Towton. However, he had made his peace with Edward IV by 1463. After his daughter became queen, he rose rapidly in favour, incurring the hatred of the earl of \*Warwick. He was one of the first victims when the King-maker rebelled in 1469, being killed at \*Edgecote Field. AJP

**Rizzio, David** (c.1533–66). Servant of Mary Stuart, brutally murdered in the presence of the pregnant queen by a group of conspirators including Mary's husband \*Darnley. Born in Turin, and arriving in Scotland in 1561 in the entourage of the Savoyard ambassador, Rizzio drew Mary's attention through his musicianship, but later acted as her secretary. Contemporary suggestions that he was a papal agent and the father of the queen's unborn child are palpably false. He was the victim of the protestant nobility's growing insecurity and Darnley's search for a scapegoat following the queen's refusal to grant him the crown matrimonial. RAM

**roads.** Medieval Britain inherited around 10,000 miles of Roman road, combined with an extensive network of trackways following less clearly defined routes. Difficult terrain and hills led to multiple pathways being employed, many still visible to aerial photography, and recognized by the statute of \*Winchester (1285), which prescribed a 400-foot clear tract for main roads as a preventive to brigands. Such largely 'soft' roads were capable of bearing extensive traffic, including from the 14th cent. enhanced use of carts, their tracks leading to fords and bridges. These, and customary uses, were recorded in place-names, such as Saltersford. Early maps show Britain's trunk roads: \*Matthew Paris (c.1250) mapped the route from Dover via London to Berwick; and the Gough map (c.1360) records around 3,000 miles of roads, 40 per cent on the Roman lines, and the local networks in Yorkshire and Lincolnshire.

From the 16th cent., traffic growth combined with closer definition of property boundaries to channel roads more precisely. Concentrated usage from the 1560s by wagons impacted adversely on this strip, and legislation introduced four days a year of 'statute labour' for all householders (1555,

extended to six days in 1563) with their equipment, in place of common obligation, and from 1662 this could be commuted to rates. Continuing pressures after 1600 led to county initiatives to create paved causeways for packhorses, to adopt and erect bridges, and to signpost the way (directed by statute in 1697). Road books began with Ogilby's *Britannia* (1675), and became pocket-sized with Bowen (1720). The increasing employment of vehicles, even in the Pennines, enforced the realignment of roads to less demanding gradients, changes further developed by \*turnpikes. Legislation was passed to preserve road surfaces by restricting the size and draught teams of vehicles (1621, 1662, 1741) and the breadth of wheels (1718, 1753). Higher standards of engineering on \*Telford or \*McAdam principles after 1810 reduced the need for such restraints, but weight-related tolls priced the economical steam carriages available from the later 1820s off the turnpike.

The dualism of road management lasted to 1894, when the parish repair was eliminated: turnpike debts had soared as long-distance traffic was lost to the railways from the late 1830s, but despite some consolidation into unitary trusts—London (1826) and south Wales (1844)—and dissolution by the Local Government Board from 1872, most turnpike trusts lasted until the new county councils (1888), and the last to 1895. By then, road usage had already revived for feeder services to and from railways; into the growing towns; for the safety bicycle after 1880, and steam and motor vehicles. Rising traffic and the heavy dust created by automobiles led to the improvement of surfaces by tarring from 1904, replacing one environmental hazard with another, as the run-off from roads poisoned fish. The 'Red Flag' and 4 m.p.h. legislation of 1865, intended to restrict road steam locomotives, had restrained all traffic growth, and only in 1896 were speed limits raised to 14 m.p.h. (reduced by the Local Government Board to 12 m.p.h.), raised to 20 m.p.h. in 1903, and abolished outside built-up areas in 1930.

Road use grew rapidly from the mid-1920s, with around 3 million commercial vehicles, motor-cycles, and cars registered in 1938, and the 1930s were a 'golden age' for all but casualties: 120,000 were killed on British roads, 1918–39. The period thus saw the introduction of new speed limits, the driving test, and Hore-Belisha's pedestrian crossings (1934); the transfer to county authorities of responsibility for major roads (1929); and of 4,500 miles of 'trunk' roads to the ministry (1936). Road-building was a favoured object of unemployment relief schemes. The concept of a segregated motorway was discussed, evaluated by a delegation to Germany in 1937, and the London to Birmingham route surveyed (1938). Post-war, passenger miles by road quadrupled between the 1950s and the 1990s, and ton miles of goods rose rather more, with by 1990 more than nine-tenths of all traffic on roads. Their full economic and environmental costs were more slowly appreciated, but the success of roads has made them a central item of the public policy debate in the 1990s. JCh

**Robert I** (Robert Bruce) (1274–1329), earl of Carrick (1292–1306), king of Scots as Robert I (1306–29). Grandson of

Robert \*Bruce, the competitor for the Scottish throne in 1291, Bruce never lost sight of his claim to the throne, but after John \*Balliol's enthronement in 1292 had little prospect of attaining it. After John's resignation in 1296, Edward I starkly refused any consideration of the Bruce claim. Despite the Scots' continued loyalty to their deposed king Bruce was deeply involved in the rising of 1297, and continued in resistance even after the defeat at \*Falkirk (22 July 1298). He served as joint guardian from 1298 probably to early 1300, and remained on the Scottish side till 1302.

Then however he made his peace with Edward. He still nursed hopes of the crown; but he had little chance in Scotland while Balliol was still being treated as the legitimate sovereign. He was also regularly at odds with the Comyn family who were Balliol's leading supporters. Bruce's desertion certainly reduced the chances of Balliol's restoration; and resistance to Edward collapsed in 1304.

Bruce's next move, the coup of 1306, remains hard to explain. We know that in 1304 he made a secret pact with Bishop Lamberton of St Andrews, a future ally. We know also that he tried to negotiate with John \*Comyn of Badenoch just before he revolted openly early in 1306, and that the result was a quarrel in which Comyn was murdered. But Bruce's decision to seize the throne was clearly already taken, since his actions after Comyn's death were carefully planned and rapidly executed. Barrow has suggested that Bruce had been biding his time till Edward was close to death, and that in 1306 he judged the time ripe. Events proved him right, though only just.

Bruce was crowned as Robert I on 25 March 1306; but though Edward was sick he was not to be trifled with. Robert himself was defeated at \*Methven (19 June 1306) by Edward's newly appointed lieutenant Aymer de \*Valence; and, probably in July, at Dalry in Perthshire, by a Scot, John Macdougall of Argyll. Kildrummy castle was captured by Valence in September. Robert's supporters and relatives were hunted down and executed; he himself had to go into hiding.

He reappeared in Ayrshire in the spring of 1307, and Edward I died in July. Edward II had little energy to spare for Scotland for some years, and this enabled Robert to overcome his internal enemies. The power of the Comyns was destroyed at the battle of \*Inverurie. Others, such as the earl of Ross, were won over. The king's brother Edward \*Bruce gradually reduced English authority in the south-west, while Robert himself concentrated on the western Highlands and Islands. By 1314, effective English power was limited to Lothian.

The years from 1308 also saw King Robert's grip over government tightened. In a parliament at St Andrews in 1309, declarations were issued in the name of the nobles and the clergy, asserting Robert's right to the throne as the lawful successor of Alexander III, and denouncing the aggression of Edward I in terms which set the pattern of Scottish national propaganda for centuries to come. Robert I was now widely accepted in Scotland as the rightful king. His authority was confirmed by the decisive victory of \*Bannockburn (24 June 1314), following on the recapture of Edinburgh and Roxburgh castles earlier in the year.

Only Berwick and a few other border strongholds remained in English hands; and the rest of the war was fought by raids into the north of England. Berwick itself was recaptured in 1318.

In the rest of his reign, Robert I showed himself a masterful king. He was willing to be reconciled with his former enemies, and readily accepted the loyal service of those who were willing to submit; those who would not were exiled. His two chief problems were to secure the succession (his lack of a direct male heir until the birth of his son David in 1324 required three successive 'tailzies' (entails) of the crown in the parliaments of 1315, 1318, and 1326); and to secure his recognition by other rulers. He fell foul of the papacy by his refusal to comply with a papal truce in 1317, as a result of which he was eventually excommunicated in 1320. An earlier excommunication for the sacrilegious murder of John Comyn may have been lifted in 1308. That of 1320 was resented as a result of the appeal usually known as the 'declaration of \*Arbroath'; from then on, the pope was prepared at least to give King Robert his proper title. English recognition was more difficult. Edward II would not concede it; and it came only after his deposition. At last in 1328, by the treaty of \*Edinburgh/\*Northampton, the English government admitted that Robert was king, and agreed to a marriage between his heir and a sister of the young Edward III as an earnest of a settled peace between what it recognized were two separate and independent nations.

Robert died, perhaps of leprosy, on 7 June 1329, having secured both his own position and the independence of his country. It was hardly his fault that Edward III overturned the settlement of 1328 only five years later. Robert I did not create the sense of an independent identity for Scotland: that had roots that went back long before the death of Alexander III and the conflicts that followed; but ever since his death, he has been the great hero of the Wars of Independence, the man who foiled Edward I's attempt to assert his authority over Scotland, and who defeated all efforts by Edward II to recover the position which Edward I had lost in 1306. BW

Barrow, G. W. S., *Robert Bruce and the Community of the Realm of Scotland* (3rd edn. Edinburgh, 1988); Duncan, A. A. M., 'The War of the Scots, 1306–1323', *Transactions of the Royal Historical Society*, 6th ser. (1992), 125–51; Nicholson, R., *Scotland: The Later Middle Ages* (Edinburgh, 1974).

**Robert II** (1316–90), steward of Scotland (1326–71), earl of Strathearn (1357–69 and 1370–1), the first Stewart king of Scots (1371–90). Grandson of Robert I of Scotland and heir presumptive to the throne by the 'tailzie' (entail) of 1318. The birth of a son to Robert I in 1324 left Robert only as heir presumptive failing a direct heir to David II. He was several times king's lieutenant during David's minority and captivity, but showed himself inactive against the English and ineffective in government.

Robert was 55 when he eventually succeeded the childless David. For a time he proved more capable than his earlier career would have suggested. Too old to take the field himself, he made good use of the younger nobles to exploit the weakness of English authority during the senility of Edward III and the minority of Richard II. Payment of David's ransom was stopped in 1377; and by the early 1380s most of the

## Robert III

lands in English occupation had been recovered. By that time, however, Richard II was emerging as a determined ruler, while Robert II's age was telling. In 1384, as more open war was breaking out, a general council, apparently with his consent, deprived Robert of control of justice, which was given to his son John, earl of Carrick, the future Robert III. He was in turn succeeded in 1388 by the king's second son Robert, earl of Fife, and future duke of \*Albany. Robert II died in April 1390, at the age of 74.

The 15th-cent. chronicler Walter Bower stressed the prosperity of Scotland at the time, the maintenance of peace and order, and the fact that Robert left Scotland almost entirely free of English control. Later writers have been less flattering, though it seems that at least till 1384 he was an effective and successful ruler. Unfortunately he left a large number of descendants from his two marriages, and rivalries between the various lines repeatedly disturbed the peace of Scotland, at least until the death of James I.

BW

**Robert III** (c.1337–1406), earl of Carrick (1368–90), king of Scots (1390–1406). Eldest son of Robert, steward of Scotland, later Robert II. His baptismal name was John, but he took the name Robert when he became king. In his own alleged words, Robert III was 'the worst of kings and the most wretched of men!' His reign was marked by disorder and by violent quarrels among his relatives and leading nobles, which the elderly king proved unable to stem.

From 1384, the incapacity of his father left John responsible for the administration of justice; but in 1388 he himself was incapacitated by a kick from a horse, and his brother Robert, earl of Fife, was made guardian, an office which he continued to hold for a year or two after John's accession in 1390 as Robert III. Neither Fife nor the king himself proved able to contain the flood of disorder, particularly in the north, where Forbes was sacked in 1390, and Elgin in 1391 by another of the king's brothers, Alexander, earl of \*Buchan, the 'Wolf of Badenoch'.

Robert was faced in 1398 with a struggle for power between Fife, created duke of \*Albany in that year, and the king's 20-year-old son David, created at the same time duke of \*Rothesay, and appointed in his turn lieutenant for a period of three years. Rothesay proved energetic, but his energy aroused hostility. In 1402 he was removed from office in a coup evidently organized by Albany and the earl of \*Douglas, and died in captivity shortly after. Robert III could do nothing to check the power of these nobles, despite the disastrous result of a battle which they provoked against the English at \*Homildon Hill (14 September 1402). In 1406 he tried to send his remaining son James (b. 1394) to safety in France, but he was captured by 'pirates' off Flamborough Head and sent to captivity in England. Robert's death followed almost immediately on the shock of the news.

BW

**Robert, earl of Gloucester** (c.1090–1147), was Henry I's favourite from among his many illegitimate sons and was advanced by him to be one of the leading magnates of the Anglo-Norman realm. In 1135 Robert apparently accepted King Stephen's succession, but in 1138 he declared

his support for his half-sister \*Matilda, and was thereafter the empress's most powerful supporter. His large estates in the west of England and Normandy provided a base for her campaigns. His importance to her cause is illustrated by the way in which he was exchanged in 1142 after his capture at Stockbridge for the captive King Stephen, himself taken at the battle of \*Lincoln in 1141, and by the fact that Matilda left England very soon after his death. In 1142 he brought the future Henry II to England for the first time.

DB

**Robert of Bellême, earl of Shrewsbury** (b. c.1054). Soldier. The eldest son of one of William the Conqueror's closest aides, Roger of Montgomery, he inherited his father's French estates, including Bellême, in 1094. He was notable for his consistent loyalty to \*Robert Curthose, supporting him in 1077 against his father, in 1087–8 against Rufus, and in 1101–6 against Henry I. When Curthose granted Normandy to Rufus for the duration of his crusade, Robert served as one of Rufus' principal commanders, winning a great reputation for his military skill—and possession of the earldom of Shrewsbury, when his own younger brother Hugh died in 1098. But he also became notorious for cruelty and some—though not all—contemporaries seem to have thought that this justified Henry I arresting him in 1112 while under safe conduct and keeping him in prison until he died at an unknown date.

JG

**Robert Curthose, duke of Normandy** (c.1050–1134), the eldest son of William the Conqueror, was designated as heir to \*Normandy before 1066 and succeeded his father there, despite a series of quarrels and two periods of exile. Any hopes Robert may have had of obtaining England were, however, dashed by his father's death-bed bequest in 1087. Two attempts in 1088 and 1101 to wrest the kingdom from his brothers William II and Henry I failed and in 1106 he was himself ousted from the duchy by Henry after the battle of \*Tinchebrai. He was thereafter kept in prison until his death. Contemporary sources portray Robert as brave, but ineffective; a harsh verdict given that his difficulties in Normandy and Maine can be interpreted as the consequence of a reaction against his father's oppressive rule and that his two brothers unquestionably commanded greater resources. His heroic contribution to the First Crusade shows him as a redoubtable warrior capable of prospering in a great military enterprise. His nickname, literally 'Short Boots', is said to have been conferred by his father.

DB

**Robert of Jumièges** (d. c.1052). Archbishop. Born in Normandy, Robert Champart became abbot of Jumièges in 1037 and made the acquaintance of the future Edward the Confessor. He followed Edward to England and was made bishop of London in 1044. In great favour with the king, he was hostile to the powerful \*Godwine family. In 1051 the king appointed him archbishop of Canterbury, but he was not popular as a Norman, and his attacks upon the Godwines precipitated a sharp crisis. The Godwines were driven into brief exile, but when they returned in strength in 1052, Robert fled to the continent. Though he gained papal support, he was unable to recover his see and \*Stigand, an

ally of Earl Godwine, was appointed in his place. The inability of the king to save his friend and adviser suggests the power of the Godwine family, and William the Conqueror used Robert's deposition as propaganda in his descent upon England in 1066. JAC

**Roberts, Frederick Sleigh** (1832–1914). Field marshal. Roberts first demonstrated his talents as an army officer during the Indian mutiny (1857–8). During the second \*Afghan War (1878–80) he defeated Ayub Khan's army at the battle of Kandahar and was created baron of Kandahar in 1892. From 1885 to 1893 he was commander-in-chief in India and came to prominence once again during the second Anglo-Boer War (1899–1902). The British forces had suffered several humiliating defeats before Roberts arrived in South Africa to take command, when his strategy led to the capture of the two Boer (Afrikaner) republican capitals, Bloemfontein and Pretoria. Wrongly assuming that all that remained was a straightforward tidying-up operation, Roberts handed over command to his deputy, who was left to conduct a prolonged guerrilla war. Created viscount and then earl in 1901, Roberts served as C.-in-C. of the British army from 1901 to 1904. KI

**Robertson, William** (1721–93). Historian. Son of a presbyterian minister, educated for the kirk at Edinburgh University, Robertson became the leader of a group of moderate presbyterian clergy who took control of the General Assembly of the kirk in 1752 and dominated its politics until 1805. Their power base lay in the universities and in the support they received from government. Robertson became the greatest of Edinburgh University's principals in 1762; it was under his leadership that the university became the most admired of the enlightened world. His *History of Scotland* (1759), *History of the Reign of Charles V* (1769), and the *History of America* (1777) constituted a vast history of the modern world set in the context of a general history of the progress of civilization, notable for the elegance and sophistication with which Robertson employed the so-called 'conjectural history' of the Scottish Enlightenment as a context for the history of great events. They established Robertson as a historian of the first rank, regarded as the equal of Voltaire and \*Hume, and much admired by \*Burke and \*Gibbon. NTP

**Robey, George** (1869–1954). Comedian. Born George Wade, son of a civil engineer, and educated in London, Dresden, and briefly at Cambridge, Robey began to appear at Birmingham's smoking-concerts and rose rapidly. With a London debut in 1891, he quickly established a successful career in music-hall, variety, pantomime, revue, operetta, and musical comedy. Belonging to the greatest period of music-hall, he was billed as 'The Prime Minister of Mirth', relying on gesture and facial expression while wearing pseudo-clerical black. Impeccable diction (even in patter songs), timing, and mimicry contributed to memorable character-monologues. During the \*First World War, Robey appeared in revues, and raised large sums of money for wartime charities (CBE 1919), making similar efforts in 1939–45. Radio, in later years, seldom did him justice, but

films, a solitary stage appearance as Falstaff (1935), television, and concerts occupied him into his eighties. He was knighted early in 1954. ASH

**Robin Hood.** Along with King \*Arthur, Robin Hood is one of the most enduring of legendary heroes. In part this is because the details are so vague that the stories can be added to and adapted to the interests of different generations. The early versions emphasized Robin's skill with a bow, the later ones that he robbed the rich to help the poor. Maid Marian, who provides the love interest, was a 16th-cent. addition to the story. The earliest reference is in Langland's *Piers Plowman* (c.1377), in which one character remarks that he knows the rhymes of Robin Hood. The earliest detailed written source has been dated to about 1400 and a Scottish source was in existence by 1420. The stories are set in the 1190s, with King Richard away on crusade and his shifty brother John misgoverning the country. Though many genuine references to persons with the correct or similar name have been found, some even outlaws, it is most unlikely that the stories were based on one person. The area of the greenwood is usually taken as Sherwood Forest in Nottinghamshire, or Barnsdale near Wentbridge in Yorkshire, but Barnsdale in Rutland is also a possibility. The many Robin Hood wells and caves are subsequent namings: Robin Hood's Bay, south of Whitby, is first mentioned in 1544. Though authority in the shape of the sheriff is mocked, the satire has been steadily sanitized. In the original versions Robin, though an outlaw, was loyal to Richard and ultimately pardoned. The 16th and 17th cents. promoted him to be the rightful earl of Huntingdon, and the egregious Stukeley in the 18th cent. produced a pedigree, giving him royal blood and tracing his ancestry back to \*Waltheof, earl of Northumberland in the 11th cent. The original poems were intended for minstrel performance but plays, novels, films, and cartoons eventually followed. JAC

**Robinson, John** (1650–1723). Diplomat and bishop of London. A Yorkshireman of humble origins, educated at Brasenose College, Oxford, he became chaplain to the English embassy to Sweden (c.1680) while still an Oxford don (1675–86), and, remaining abroad until c.1709, won a reputation as a competent envoy to Sweden; he accompanied Charles XII to Narva. Later he was successively dean of Windsor (1709), bishop of Bristol (1710) and of London. As lord privy seal under \*Harley (1711) and joint plenipotentiary, he represented Britain at the peace negotiations at \*Utrecht (1712–13). Partly responsible for Britain's advantageous terms, he was made bishop of London in 1713. A Tory, but opposed to \*Bolingbroke, he backed Harley and the Hanoverian succession. More of a professional diplomat than a cleric, Robinson was the last ecclesiastic to hold high political office. WMM

**Robinson Crusoe.** This fictional autobiography, published anonymously in 1719 by Daniel \*Defoe, has attained the status of myth. Although its indebtedness to the true story of the experiences of Alexander Selkirk has been greatly exaggerated, Crusoe's shipwreck and subsequent desert-island experience is central whether it is approached

## Rochdale Pioneers

as traveller's tale, religious allegory, or proto-novel. Modern critics tend to follow Marx in discounting its religious burden, viewing it as an allegory either for the growth of capitalism or of western imperialism. Defoe cashed in on the original's tremendous success, publishing *Farther Adventures* (1719) and *Serious Reflections* (1720). The many imitations are known as *Robinsonades*. JAD

**Rochdale Pioneers** is the name given to William Cooper, Charles Howarth, and the other 26 founders of the \*Co-operative movement, whose retail shop opened in Toad Lane in 1844. They had been encouraged by a lecture from George \*Holyoake the previous year on self-help. It began on a very small scale, opened only on Saturday and Monday evenings with the members serving in the shop. The principle on which they acted was that profits should be redistributed to purchasers by means of a dividend. By 1851 there were 130 similar shops and by 1862 450 co-operative enterprises. As the volume of business expanded, the original social, political, and educational objectives were pushed into the background by commercial considerations. JAC

**Roches, Peter des** (c.1175–1238). A cleric from the Touraine, he entered royal service in the 1190s and was rewarded with the bishopric of Winchester in 1205. He remained loyal to the king throughout John's quarrel with the papacy and was appointed \*justiciar in 1213 and then guardian of the young Henry III in 1216. He was a key figure in the minority government, his military skill helping to win the 1217 battle of \*Lincoln. Ousted by his rival Hubert de \*Burgh in 1227, he went on crusade—and did much to enhance his reputation—before returning to England and, for a while (1232–4), regaining his dominant position at court. Although certainly not indifferent to religion, his career priorities laid him open to criticism—'sharp at accounting, slack at scripture' said one satirist. The most prominent of the foreigners active in English politics, labelled 'the Poitevins' by their opponents, Peter was an easy target. JG

**Rochester, diocese of.** Now comprising west Kent, Rochester is the second oldest English see, founded by King \*Æthelbert of Kent in 604, with \*Justus as first bishop. \*Paulinus, the former missionary to Northumbria, expelled in 632, was bishop of Rochester (635–44). Despite its vulnerability to the 9th-cent. Danish invasions, it survived intact. The diocese consisted only of west Kent until the addition of Essex and most of Hertfordshire from \*London in 1845; this proved unsuccessful and they were removed to form the \*St Albans diocese in 1877. In compensation Rochester was given eastern and mid-Surrey from \*Winchester, which proved equally unsuccessful. In 1905 the Surrey area was taken to form part of the new \*Southwark diocese (1905). The medieval bishopric had a small population compared with those of the midlands and north, but in the 19th and 20th cents. it became densely inhabited. Distinguished bishops include John \*Fisher (1504–35), executed with Thomas \*More for refusing to recognize Henry VIII's supremacy and later canonized. A noted 18th-cent. bishop was

Francis \*Atterbury (1713–23), deprived of his bishopric for Jacobite sympathies. The cathedral, alongside the 12th-cent. castle, has an impressive late Norman nave, completed in 1130 with additions (1179–1240). WMM

**Rochester, Laurence Hyde, 1st earl of** (1642–1711). Laurence Hyde was the second son of the historian and lord chancellor and younger brother of the 2nd earl of \*Clarendon, lord privy seal and lord-lieutenant of Ireland in James II's reign. His sister \*Anne married the duke of York (later James II) in 1660 and died in 1671. Hyde served in the House of Commons 1660–81, was employed on diplomatic missions, and was made 1st lord of the Treasury 1679–84 (not the post it later became). He was rewarded with a viscountcy in 1681 and an earldom the following year. When James succeeded in 1685, Rochester and Clarendon, brothers-in-law to the king, carried all before them. Rochester was given the Garter, appointed lord president of the council 1684–5, and then lord treasurer. But James dismissed him, though with a generous pension, in 1686 when he refused to convert to catholicism. A fierce high Tory, he accepted William and Mary after the Revolution, was lord-lieutenant of Ireland 1700–3 and lord president of the council again 1710–11. \*Burnet thought him 'of far greater parts' than his brother and for years he and \*Nottingham were regarded as the pillars of high Toryism. A capable and experienced politician, Rochester was said to be handicapped by a quick temper: 'when he was in a rage,' wrote Macaulay, 'and he very often was in a rage, he swore like a porter.' JAC

**Rochester, John Wilmot, 2nd earl of** (1647–80). Poet and courtier. Wilmot's father fought for the king in the Civil War, was created a baron in 1643, and advanced to the earldom in 1652. Wilmot inherited the title at the age of 11, spent a year at Wadham College, Oxford, fought as a volunteer in the naval battle off \*Lowestoft in 1665, and was appointed a groom of the bedchamber the following year. Sympathizers say that he was then corrupted by the court, but it seems to have had good material to work on. In 1667 he married an heiress, whom he had attempted to abduct. He was a crony of \*Buckingham, with a reputation as a wit, debauchee, drunkard, and patron. Some of his poems circulated in manuscript during his lifetime: the collected poems came out in 1680 and 1691. Much of the output is tediously coarse, but there are occasional jewels. His epigram on Charles II is justly famous—'who never said a foolish thing, nor ever did a wise one'. \*Johnson, in the *Lives of the Poets*, while deploring Rochester's depravity, praised 'a mind which study might have carried to excellence'. JAC

**Rochester castle** (Kent) stands above the river Medway whose crossing it controlled. The first castle on the site was an enclosure within the Roman city walls. The present castle, also originally a 'ringwork', was begun by \*Gundulf, bishop of Rochester, for William Rufus 1087–9. The castle was transformed by the addition of a tower keep built 1127–40, after Henry I had granted the castle to the archbishop of Canterbury and his successors. The keep, which is 70 feet square and rises to the height of 113 feet to the parapet, was designed to be the defensive heart of the

castle and also to contain the best residential accommodation, which is arranged on three floors above a basement. The grandest suite, presumably intended for the archbishop himself, is on the second floor and has its own chapel. The defensive strength of the castle was demonstrated in 1215 when rebel barons held it against King John. The royal forces took the castle only after they managed to dig a mine under the south-east angle tower, which caused the tower to collapse.

LR

**Rockingham, Charles Watson-Wentworth, 2nd marquis of** (1730–82). An often underrated politician, Rockingham contributed significantly to the emergence of a distinct Whig ideology. Although his two periods as prime minister (1765–6 and 1782) were brief and unhappy, Rockingham achieved a great deal as a party leader, despite a profound aversion to public speaking and recurrent bouts of ill-health. Having held a court appointment from 1751, Rockingham resigned in November 1762 and joined the opposition to Lord \*Bute. He was appointed 1st lord of the Treasury in 1765 and successfully orchestrated the repeal of the \*Stamp Act in 1766. Rockingham, nevertheless, believed in the necessary subservience of the colonies and repeal was accompanied by a \*Declaratory Act, asserting British legislative supremacy. Dismissed in March 1766 because of his continuing suspicions of Bute's influence, he remained in opposition for the next sixteen years. The Bute myth was integral to Rockinghamite ideology in the 1760s, but was gradually transcended by a more sophisticated interpretation which abandoned Bute as the target, but remained focused on secret influence. Rockingham and his followers constantly reiterated that they were the only true Whigs and, by force of repetition, a diffuse term was reclaimed: the Rockinghamites gradually developed a near monopoly of the title 'Whig Party'. This ideology was unashamedly élitist: one central belief was that the country's natural leaders, the Whig aristocracy, had been excluded from power by George III. Much was made of the supposedly increased power of the crown and it was suggested that the political advantages derived from granting places and contracts ought to be reduced. \*Economic reform, as this was called, was favoured rather than parliamentary reform. Rockingham was at best ambivalent towards the latter and, upon his regaining office in 1782, economic reform was adjudged sufficient for immediate circumstances. Rockingham's return to power, in the wake of Lord \*North's fall, was irresistible, since his party was the largest in opposition. Rockingham insisted on becoming 1st lord of the Treasury, but his premiership was undermined by the king's insistence on cabinet office for \*Shelburne, whom Rockingham rightly mistrusted. Ministers were soon at loggerheads and Rockingham's unexpected death in July 1782 may have simply hastened a looming political crisis. Rockingham's party survived his death, led jointly by Charles \*Fox and \*Portland, confirming that this had become more than just a personal faction.

DW

Hoffman, R., *The Marquis* (New York, 1973).

**Rockingham, Council of**, 1095. This was an important episode in the medieval relations of church and state.

\*Anselm had become archbishop of Canterbury in 1093 at a time when there were rival popes, Urban II and Clement III. He asked William Rufus for permission to seek the pallium from Urban, and was refused. On 25 February 1095 a council at Rockingham attempted to resolve the question of divided allegiance and urged Anselm to conform to the royal will. Though the conflict was compromised and Rufus recognized Urban, the pope refused to depose Anselm. The archbishop spent the years 1097 to 1100 abroad, returning only after Rufus' sudden death. But his relations with Rufus' successor Henry I were also difficult.

JAC

**Rodney, George Brydges** (1719–92). Admiral. Rodney's family was distantly connected to the fabulously rich and influential James Brydges, duke of Chandos, and this may account for Rodney's rise to a naval captaincy at the age of 23. Yet he was born to straitened circumstances, and a certain resentment in his complex character may not have been helped by a reputed education at Harrow School. Always solicitous towards the concerns of the lower deck, Rodney conspicuously failed in his relations with brother officers, and his ill-starred quest for wealth could prejudice his commands out of a greed for prize money. His service spanned the mid-18th-cent. wars and he became well acquainted with the West Indies theatre; at home he was an assiduous applicant for parliamentary seats. Promotion to rear-admiral in 1759 did not afford future financial security, and during 1775–8 Rodney was effectively bankrupt and self-exiled. Yet the special exigencies of the American War proved his salvation, and with his relief of Gibraltar (1779) and his saving of Jamaica through his defeat of de Grasse at 'the \*Saints' on 12 April 1782, Rodney's lasting fame, though significantly not his fortune, was assured. Created a peer, his closing years were dogged by sickness and litigation.

DDA

**Roe, Richard**. One of the fictitious individuals used in the old procedure of ejectment. Ejectment was a writ which developed from trespass *de ejectione firmæ* to enable a leaseholder to recover his leasehold land. Since it was speedy and effective, the procedure was attractive to freeholders, who in order to avail themselves of the writ pretended that a lease had been granted to a fictitious individual—John Doe—who became the plaintiff. The defendant's lessee—also fictitious—would be Richard Roe (or William Styles). The action was abolished in 1852 but these fictitious names are still used in the common law, especially in the USA, to disguise a real litigant.

MM

**Roebuck, John** (1718–94). An entrepreneur and inventor, Roebuck was born in Sheffield, studied in Edinburgh, and took a medical degree at Leiden. His early efforts in Birmingham led to a partnership with Samuel Garbett to produce sulphuric acid. He then set up a factory at Prestonpans to make sulphuric acid, then pottery, and finally cast iron. In 1760 he opened the Carron ironworks near Stirling, using pit-coal rather than charcoal, and specializing in ordnance. For many years Carron was the largest British foundry. Roebuck's later venture into coal-mining proved disastrous, despite collaboration with James \*Watt to try to prevent

## Roebuck

flooding. His grandson was the radical MP John Arthur \*Roebuck. JAC

**Roebuck, John Arthur** (1801–79). Radical MP for Bath (1832–7, 1841–7) and Sheffield (1849–68, 1874–9). Born in Madras, raised in Canada, and qualified as a barrister, Roebuck was nicknamed ‘Tear ‘Em’ for his fierce attacks on aristocracy, privilege, and inefficiency. As a \*Benthamite and friend of J. S. \*Mill, Roebuck proposed a system of state education, supported the New Poor Law, and helped \*Lovett draft the Charter. In 1855 he moved for a committee of inquiry into the conduct of the Crimean War, which resulted in the fall of \*Aberdeen’s government. From the exposure of military inefficiency, Roebuck went on to campaign for administrative (civil service) reform. He believed in *laissez-faire*, and opposed sabbatarianism, factory legislation, and trade unions. As he grew older, Roebuck became increasingly interested in foreign causes and his radicalism became nationalistic. He advocated overseas colonization and supported the South in the American Civil War. JFCH

**Roger** (c.1065–1139). Bishop of Salisbury. Roger joined the future Henry I’s entourage in the 1090s and rose rapidly after Henry seized the English throne in 1100, becoming bishop of Salisbury in 1102. His role was to preside over the administration of the king’s English finance and justice. In particular he was closely associated with the development of the accounting techniques of the \*Exchequer, which was first referred to in 1109. He was the chief of a small administrative group who supported members of Henry’s family, such as Queen \*Matilda, when they acted as regents during Henry’s lengthy absences in \*Normandy, and who operated as itinerant royal justices. Roger was himself regent 1123–6. He remained in office after Henry’s death, but in 1139 incurred King Stephen’s distrust for reasons which are not entirely clear, and was arrested and deprived of his power. DB

**Rogers, John** (c.1500–55). Martyr. Born in Birmingham and educated at Pembroke College, Cambridge, Rogers took holy orders but became a reformer under the influence of \*Tindal, whose English edition of the Bible he prepared for the press. He spent much of his time on the continent and married a Flemish wife. In Edward VI’s reign, Rogers was in favour and given London preferments, and immediately after the king’s death preached at St Paul’s Cross, by order of Lady Jane \*Grey’s council, warning the people against popery. By January 1554, after Mary had established her claim to the throne, Rogers was in prison and in February 1555 he was burned at Smithfield—the first of the protestant martyrs. The French ambassador wrote that Rogers died with such composure that it might have been a wedding. JAC

**Rolls, Charles Stewart** (1877–1910). Rolls was the third son of a wealthy Monmouthshire landowner, who served as Conservative MP for Monmouth 1880–5 and was created Lord Llangattock in 1892. He studied mechanical engineering at Trinity College, Cambridge, where he was a bicycling enthusiast. In 1895 he imported a Peugeot car from France and was stopped outside Victoria station by a policeman who pointed out that he needed a man with a red flag to

precede him: his journey back to Cambridge took just under 12 hours. In 1900 he won a gold medal for a motor race from London to Edinburgh. In 1905 he joined forces with another engineer, F. H. \*Royce, and with Claude Johnson to establish a company producing cars at Derby: the *Motor Trader* warned that ‘we cannot help thinking that the promoters have made a very weak appeal to the investing public’. Rolls concentrated on sales and publicity. Greatly interested in aviation, he made many balloon flights, and in June 1910 crossed the Channel and back non-stop in a Wright brothers aeroplane, completing the journey in 1½ hours. The following month he was killed in a flying accident at Bournemouth and buried at Llangattock-Vibon-Avel, near Monmouth. A good statue of Rolls, holding a model aeroplane, stands in Agincourt Square, Monmouth. RAB; JAC

**Roman Britain.** Britain was the Roman province Britannia, AD 43–410. Although there had been increasing contact between Britain and the classical world during the late Iron Age, the first official Roman presence in Britain was that of Julius \*Caesar in 55–54 BC. In AD 43 Emperor \*Claudius invaded Britain on the pretext of dealing with troublesome tribal princes and druids. The island was subsequently occupied by the Romans who took advantage of Britain’s mineral and agricultural wealth. The process of the incorporation of the province into the social and economic systems of the Roman empire is known as ‘romanization’, and the speed and manner with which the Britons became Romanized is currently the subject of academic debate.

Within a generation the British landscape had changed considerably. The Roman army built legionary fortresses, forts, camps, and roads, and assisted with the construction of buildings in towns. A number of important military installations, notably the legionary fortresses, were built close to pre-existing tribal centres (*oppida*) which then became the focus of important Romano-British towns, such as \*Colchester. The earliest phases of towns, dating to the mid-1st cent., reveal timber strip buildings—houses and shops—as well as stone public buildings such as Roman temples and administrative headquarters. The Romans also brought their particular style of architecture to the countryside in the form of \*villas. Some very large early villas are known, such as Eccles in Kent and \*Fishbourne in Sussex. The latter is often assumed to be the palace of the pro-Roman British king \*Cogidubnus, although this is impossible to prove.

\*Tacitus tells us that the Romans experienced a number of tribal revolts in the 1st cent. and used the long-established practice of combining treaties with decisive military action to quell unrest. Rome created three client kingdoms: the \*Iceni, the \*Brigantes, and the \*Atrebates. In AD 60 the Iceni rose up under the leadership of \*Boudicca, destroying the Roman towns of Colchester, London, and St Albans. The crushing of the Boudiccan revolt was followed by a period of expansion of the Roman province, including the subjugation of south Wales. Between AD 77 and 83 the new governor \*Agricola led a series of campaigns which enlarged the province significantly, taking in all Wales, Anglesey, northern England, and southern Scotland. Agricola was however recalled by the Emperor Domitian and subsequently

Roman military attention was turned to the Danube; as a result Roman troops were withdrawn from Scotland. Rome thus lost its chance to conquer the whole of the island of Britain, and the 'natural' northern border of Roman Britain was apparently seen as the Tyne–Solway isthmus.

There has been much debate about the date of the introduction of a 'true' money economy into Roman Britain. It is now generally accepted that although the Roman troops brought their cash wages and purchasing power with them into Britain, they did not change the socially embedded economic structures of Britain overnight. However, by the late 1st/early 2nd cents. AD the imposition of taxation and the increasing availability of and desire for Roman consumer goods—such as imported fine ware pottery—led to a wide-scale use of coins as currency, even on the humbler farmsteads where the majority of the native population lived.

The 2nd cent. also saw important military and urban developments, particularly under the Emperor \*Hadrian. He visited Britain following military disturbances, and in AD 122 ordered the construction of \*Hadrian's Wall between the Tyne and the Solway. It was built ostensibly to separate the province from the barbarian north, but probably also acted as an effective customs barrier and a testament to the power of Rome. In AD 139–42 the Emperor Antoninus Pius abandoned Hadrian's Wall and constructed a new frontier defence system between the Forth and the Clyde—the \*Antonine Wall—but its use was short-lived and Hadrian's Wall was again the main northern frontier by AD 164.

Roman towns fell into one of three main types: *coloniae*, *municipia*, and *civitates*. The *coloniae* of Roman Britain were Colchester, \*Lincoln, \*Gloucester, \*York, and possibly \*London, and their inhabitants were Roman citizens. The only certain *municipium* was \*Verulamium (St Albans), a self-governing community with certain legal privileges. The *civitates*, towns of non-citizens, included the bulk of Britain's administrative centres, such as the tribal capitals of \*Silchester, \*Winchester, and \*Canterbury. Roman towns were grid-planned and their character created by a combination of official Roman involvement and acts of public munificence by wealthy locals desirous of increasing their chances of attaining public office. Towns usually contained temples, public baths, aqueducts, and an amphitheatre, most acquiring such a range of facilities by the mid-2nd cent.

On the evidence of the relative quantities of inscriptions associated with the construction of public buildings, it has been mooted that whereas towns flourished in 2nd-cent. Britain the 3rd cent. saw a decline. Such negative evidence must however be interpreted carefully. The 3rd cent. may well have been simply a period of consolidation after a long period of growth. During the 2nd and the 3rd cents. larger and more elaborate town houses appeared, probably inhabited by the indigenous urban élite. Urban earthworks of the 2nd and 3rd cents. were often adorned with elaborate stone gateways and external towers and represent a substantial investment of resources in the development of defences which would have been a symbol of civic pride.

By the 4th cent. the towns were dominated by stone-built 'mansions', and there were also profound changes in the countryside. Villas grew in size and became more enclosed,

exemplified by 'courtyard villas' such as \*Chedworth. It was in the early 4th cent. that the majority of British villas were embellished with mosaics, an apparent investment in the agricultural basis of the province's wealth in this period.

The impression of the religious life of the province is one of complexity and harmony. Romans and incomers from other provinces introduced their own religious customs, such as the worship of Isis and Bacchus, without destroying indigenous Celtic beliefs. This religious integration was facilitated by fundamental similarities between Celtic and classical cults. The evidence for Christianity in Roman Britain reflects this amalgam of beliefs; the great 4th-cent. silver hoards from Mildenhall, \*Canterbury, Traprain Law, and \*Corbridge all combine pagan and Christian motifs.

Epigraphic and literary evidence suggests that the Britons adopted Latinized names (e.g. Tiberius Claudius Cogidubnus) and that the élite (at least) spoke and wrote Latin. The indigenous Gaelic or 'Celtic' language of the Roman province Britannia also continued to be spoken; it survives today as Welsh and Cornish.

The end of Roman Britain followed barbarian raids and settlements in north-western Europe such as the 'Picts' War' of AD 367–8. In AD 401–2 troops were withdrawn from Britain by \*Stilicho to defend Italy, and in AD 408–9 Britain was attacked by Saxons. In AD 410 the Emperor Honorius told the cities of Britain to look to their own defence.

The year AD 410 does not however mark a sudden and dislocating end to Roman Britain. The reported accounts of contemporary figures such as St \*Patrick and St \*Germanus, coupled with archaeological evidence from sites such as the Roman town of \*Wroxeter, suggest strongly that Romanized life in Britain continued well into the 5th cent.

**Roman catholicism.** See CATHOLICISM.

**Romanesque architecture.** See NORMAN ARCHITECTURE.

**Roman legions** formed the core of the Roman army. Each legion of heavily armed infantry consisted of some 5,000 Roman citizen men. The legionary soldier was recruited aged 18–20 for a period of 25 years. Good promotion prospects and a pension of a land grant ensured a constant supply of recruits. The rest of the army—infantry and cavalry—was made up of auxiliaries (the *auxilia*, or 'aids') who did not have to be Roman citizens. Auxiliaries were sometimes provincial specialists, such as the famed Syrian archers.

The legions which invaded Britain in AD 43 under the command of \*Aulus Plautius were the *II Augusta*, *IX Hispana*, *XIV Gemina*, and *XX Valeria*. With auxiliaries, the force totalled some 40,000 men. The *II Adiutrix* replaced the *XIV Gemina* during a major reorganization of military dispositions in the 60s/70s AD. Each legion was based in a legionary fortress. The *II Augusta*, for example, was based variously at fortresses in \*Exeter, \*Gloucester, and \*Caerleon.

## Romanticism

Extensively excavated forts include those of \*Hadrian's Wall, notably Birdoswald, Vindolanda, Chesters, and Housesteads. Such research indicates that the Roman army which invaded Britain in AD 43 was very different in structure from that which abandoned the province in AD 410. ES

**Romanticism** was a European phenomenon, at its height in Britain from 1785 to 1825, a movement of all the arts, though in England literature and painting predominantly. In its modern sense, the term seems to have originated in Germany, by association with romance languages and the characteristics of medieval romance. For Goethe and Schiller it signalled our alienation from the order and harmony of an earlier classical world, the resultant melancholy one of its most representative tones.

\*Coleridge used the word in recalling his aims for *Lyrical Ballads* in 1798. He was to procure a 'willing suspension of disbelief' for 'persons and characters supernatural'. A taste for supernatural terrors had already been exploited by the novelists Horace \*Walpole and Matthew Lewis. The poets learned from them. \*Wordsworth's contribution to *Lyrical Ballads* illustrates another aspect of the Romantic impulse. In the 1800 preface, the manifesto of English Romanticism, he investigated the relationship between language and nature as Herder had done before him, though the German took his inspiration from the supposedly more 'natural' genius of the early English writers. Later, \*Constable recommended that the painter seek perfection 'at its PRIMITIVE SOURCE, NATURE'. The appeal of the ballad, stimulated by \*Percy's *Reliques* (1765), lay in its folk form; the sophisticated Wordsworth imitated its simplicity, but his interest in 'low and rustic life' was more than aesthetic. Poetry and politics went hand in hand. \*Hazlitt suggested that 'this school of poetry had its origins in the French Revolution, or rather in the sentiments and opinions which produced that revolution'. \*Blake shared his friend Tom \*Paine's antipathy to 'Priestcraft and Tyranny', and where direct action was suppressed, it surfaced in verse.

In claiming that 'passion speaks truer than reason' Hazlitt echoed Rousseau, founding father of the movement with its new emphasis on subjectivity and emotion. 'The way to all mysteries heads inward', wrote Brandes in the year Wordsworth chose the growth of his own mind as a subject for epic. In his notebook, Coleridge recorded that 'in looking at objects of nature . . . I seem to be seeking a symbolical language for something within me that already and forever exists'.

Increasingly the 18th cent. was dismissed as an age of prose. Blake's quarrel with Sir Joshua \*Reynolds lent an edge to his work as an engraver, his 'wiry bounding line' challenging the ideals of the Academy. \*Turner followed Wordsworth to the Alps, while his extraordinary *Rain, Steam and Speed* looks to the future. In arguing that 'if poetry comes not as naturally as the leaves to the tree it had better not come at all', \*Keats illustrates the cult of spontaneity and of organic metaphor.

The displacement of reason by imagination as the faculty by which the truth is apprehended was a commonplace of the period. Coleridge's famous definition of it as 'the liv-

ing power and prime agent of all human perception' owes a good deal to Kant and Schelling, but there was always a certain native resistance to German metaphysics. The second generation of Romantics had other priorities; Keats questioned Wordsworth's cultivation of 'the egotistical sublime', while for \*Shelley Wordsworth had betrayed the hopes of the Revolution. As that Revolution receded, and young radicals became old Tories, the dynamism of the movement was dispersed or transmuted, though its currents can be felt into the present century. JNRS

**Rome, treaty of.** Signed by France, Belgium, Italy, the Federal Republic of Germany, the Netherlands, and Luxembourg on 25 March 1957, it established both the \*European Economic Community (EEC) and European Atomic Energy Community (Euratom) from 1 January 1958. The EEC treaty set out objectives (such as eliminating mutual tariff barriers, establishing a common external tariff, and formulating a Common Agricultural Policy) to be achieved within twelve years and outlined the communities' institutions and rules. Britain stayed aloof, disliking the shared sovereignty implicit in the treaty's supranational institutions and expecting that the negotiations would fail. CNL

**Romilly, Sir Samuel** (1757–1818). Legal reformer. Born of a Huguenot family in London, he abandoned religion in favour of Rousseau and continental reformers, including Dumont (later editor of \*Bentham's works), Beccaria (the Italian legal reformer), and Mirabeau (the French revolutionary leader). An initial enthusiast for the French Revolution, he successfully defended John Binns, the Irish radical, on a sedition charge in 1797. In 1800 he became a king's counsel in Chancery and in 1806 Whig solicitor-general. He sat as MP for Queenborough (1806), Wareham (1808), Arundel (1812), and Westminster (1818), opposing the \*Corn Law in 1815, and the suspension of \*habeas corpus in 1817, and supporting the abolition of slavery and \*catholic emancipation. Romilly wished to reduce the number of capital crimes but most of his time was spent powerless in opposition. He committed suicide four days after the death of his wife in 1818. ER

**Romney, George** (1734–1802). Painter, mainly of portraits. He was born in Lancashire and worked in the north of England until 1762, when he left his wife and children to go to London, where he attracted a fashionable clientele. Between 1773 and 1775 he was in Italy, which inspired him to plan a number of literary and historical works that rarely went beyond the sketching stage. About 1781 he became infatuated with Emma \*Hamilton and is probably best known for his many portraits of her. A fast and prolific painter who, according to John \*Wesley, 'struck off an exact likeness at once, and did more in an hour than Sir Joshua [\*Reynolds] did in ten', Romney rarely exhibited and never at the Royal Academy. In his later years he became insane, returning home to die. JC

**Rooke, George** (1650–1709). Admiral. One of the most successful naval commanders of his day, promoted admiral in 1690, Rooke was unusual among his naval contemporaries in being a Tory and was linked, through two of his three

marriages, with the prominent Tory earl of \*Nottingham, William III's secretary of state (north) and *de facto* navy minister 1689–94. Rooke was at Bantry Bay (1689), \*Beachy Head (1690), and \*La Hogue (May/June 1692), where he distinguished himself and gained his knighthood. A year later he commanded the ill-fated 300-ship Smyrna convoy, but escaped blame for this débâcle. An MP for Portsmouth 1698–1708, Rooke held a command with the Dutch at the Copenhagen Sound in 1700 which called for prudent diplomacy between Denmark and Sweden. In 1702 he burnt a Franco-Spanish fleet at \*Vigo, and in August 1704 commanded at the capture of Gibraltar, subsequently fighting a bitter though drawn battle with the French Toulon fleet off Malaga. His success invited the jealousy of the Marlborough faction and this command proved his last. DDA

**root and branch petition**, 1640. Charles I's opponents made most of the running in the \*Short and \*Long Parliaments of 1640. On 11 December, the Commons received a petition from Londoners demanding the destruction of episcopacy, 'root and branch'. A bill to implement it and to substitute a \*presbyterian form of church government was introduced in 1641 but made no progress. But when the king's position deteriorated rapidly after the attempt to arrest the \*five members in 1642, he was obliged in February to consent to 17 Car. I c. 27, whereby the bishops were excluded from the House of Lords. JAC

**Rorke's Drift, battle of**, 1879. Ford across the Buffalo river, 70 miles north of Pietermaritzburg, South Africa; site of a battle in the \*Zulu War. On 22 January 1879 a force of 139 British troops left to guard the ford was attacked by between 3,000 and 4,000 Zulus, who had not been directly involved in the Zulu victory earlier in the day at \*Isandhlwana. The British had hastily prepared a strong, defensive position, and the Zulus' tactics proved ineffective when confronted by the courage and disciplined rifle fire of the British troops. All their attacks having been repulsed with heavy losses, the Zulus withdrew at dawn the following day. No fewer than eleven VCs were awarded among the survivors. KI

**Rosebery, Archibald Philip Primrose, 5th earl of** (1847–1929). Prime minister. From an early age Rosebery seemed destined for a glittering public career. He enjoyed outstanding oratorical powers, considerable wealth, much enhanced by his marriage to Hannah Rothschild in 1878, and inherited his peerage in 1868. But faults of temperament severely hampered him. He was sent down from Oxford without a degree because he insisted on running his horse in the Derby. This lifelong passion for the turf—his horses won the Derby three times—complicated his relations with strait-laced Liberal nonconformity. Without the steadying influence of his wife, who died in 1890, Rosebery seemed to lose what little taste he had for the mundane business of party management and legislation. He said, with some truth, that he had been drawn into politics by force of circumstances and always hated it. Thus, despite his advantages, Rosebery largely failed as prime minister, and his career yielded no substantial achievements.

It was a sign of Rosebery's diffidence that he refused office from \*Gladstone in 1872 and 1880, served from 1881 to 1883 when he resigned, and then declined the Scottish Office in the same year. Yet his political reputation steadily rose. The departure of many Whigs over the \*Home Rule issue in 1886 made Rosebery a vital figure in the House of Lords, and he thus became a young foreign secretary in that year.

For a time he enjoyed wide acclaim. On the one hand he had the confidence of the queen, who chose him as Gladstone's successor in 1894. On the other hand he seemed to many radical Liberals to be better attuned to social problems than Gladstone. One sign of this was his election as first chairman of the London County Council in 1889.

But his chief interest was foreign and imperial affairs. He developed a Liberal vision of the British empire as a 'Commonwealth of Nations', and as chairman of the Imperial Federation League he advocated a more cohesive structure involving regular colonial conferences and formal colonial representation on the Privy Council. As foreign secretary (1892–4) he resisted party pressure to withdraw from \*Uganda and imposed a protectorate on that territory.

On his succession to the premiership in 1894, Rosebery's career collapsed. He fell out with colleagues over the death duties in \*Harcourt's budget and his wish to drop Irish Home Rule. On the defeat of his government in the Commons in 1895 he promptly resigned, forcing the Liberals into a disastrous election. A year later he quit as leader. Subsequently he attacked the Liberal position over the South African War and promoted a separate organization of \*Liberal Imperialists. In a famous speech at Chesterfield in 1901 he called for a 'clean slate', by which he meant dropping traditional Gladstonian causes like Home Rule. However, Rosebery was easily outmanoeuvred by \*Campbell-Bannerman, and the rest of his career was spent as a crossbencher increasingly out of sympathy with the radical reformism of Edwardian Liberalism. MDP

James, R. R., *Rosebery* (1963).

**Roses, Wars of the**. Once applied to the whole of the 15th cent., the name is now given to the sequence of plots, rebellions, and battles that took place between 1455 and 1487. They are so called because of the notion that, fought between the dynasties of Lancaster and York, Lancaster was represented by a red rose, York by a white. In fact the idea of the warring roses was invented by Henry VII after he seized the throne in 1485. He claimed to be the heir of Lancaster and represented his marriage to \*Elizabeth of York, the heiress of Edward IV, as the union of the red and white roses, bringing peace and prosperity after the war and ruin of the preceding decades. While the actual phrase 'Wars of the Roses' did not appear until the 19th cent., the idea of the warring roses was rooted in Tudor propaganda.

There were three distinct phases of civil war: between 1455 and 1464; 1469 and 1471; and 1483 and 1487. In the first two fighting for the control of royal government led to outright war for possession of the crown; the third was dynastic from the start. There was also a strong element of rivalry for local dominance, especially in northern England between the Percies and the Nevilles. The scale of the fighting and the

## Rosicrucians

extent of disorder were much exaggerated by Tudor writers. The most intense period was between July 1460 and March 1461, but as a whole there were barely more than two years' military activity throughout the thirty-year period. Civilian casualties and physical destruction were light; most were able to go about their normal affairs.

Nevertheless, especially in 1459–61 and 1469–71, there was considerable instability as the houses of Lancaster and York competed for the throne. In 1455 the duke of \*York led his supporters in a successful rebellion against Henry VI. In 1459 they rebelled again, were at first defeated, but were victorious at \*Northampton in July 1460. Four months later York claimed the throne for himself. Although he was defeated and killed at the battle of \*Wakefield, his heir Edward seized the throne and won a decisive victory at \*Towton. In 1469 Edward in his turn faced rebellion from \*Warwick the Kingmaker. Warwick too endeavoured to rule the kingdom by force, but also found it impossible, and resorted to the restoration of Henry VI. Edward IV, however, had the last word, defeating Warwick at \*Barnet and a Lancastrian army at \*Tewkesbury. The virtual destruction of the Lancastrians seemed to have brought the wars to an end. They were reopened when Edward's brother Richard III made himself king in 1483. Henry Tudor then emerged as a claimant to the throne. Leading an alliance of die-hard Lancastrians and supporters of the deposed Edward V, he swept to power at \*Bosworth in August 1485. He brought the wars effectively to an end when he defeated a Yorkist invasion at \*Stoke (by Newark, Notts.) in 1487.

In the later 20th cent., historians much debated the origins and causes of the wars. Some, arguing that in 15th-cent. politics everything rested on the fitness of the king to rule, put the entire blame on the shoulders of Henry VI. But there were deeper causes in the social, economic, and political trends of the later Middle Ages, which suggest that any monarch would have faced severe problems. Nevertheless the recovery of royal authority under the Tudors was rapid. No great political or social change resulted: the old feudal nobility did not destroy itself, nor did the Tudors represent a new middle class. The most lasting impact of the Wars of the Roses has been on the historical imagination. Lewis \*Carroll used his schoolboy knowledge of them as a recurring motif in *Alice in Wonderland*. And they have come to be a byword for anarchy: the last months of the \*Callaghan administration in 1979 were dubbed with telling effect 'the Winter of Discontent' from the opening line of Shakespeare's *Richard III*. AJP

Ross, C. D., *Wars of the Roses* (1976).

**Rosicrucians.** Members of a world-wide fraternity who claim to continue the old Rosicrucian tradition. Its origins are obscure. The order was reputedly founded by a Christian Rosenkreuz (who had acquired the Arabs' secret wisdom) in 1418 but first mentioned only c.1614. There is still debate whether this esoteric brotherhood of magician-scientists ever existed. Wide interest was aroused, and new societies with alchemical interests came under the umbrella of its name, since elements of occultism were reflected in claims of ability to prolong life and transmute metals. The Lon-

don physician Robert Fludd (1574–1637) spread Rosicrucian ideas in several medico-theosophical books. A Rosicrucian society arose in mid-19th-cent. England, as an offshoot of masonry (the twin emblems of a rose and a cross were venerated by freemasons as symbolic of Christ's resurrection and redemption), but there is no historical continuity with any earlier group. ASH

**Ross, James Stewart, 1st duke of [S]** (c.1477–1504). Second son of James III, he received more favour from his father than the duke of Rothesay, the future James IV. In particular James III proposed him as part of a marriage alliance with England, but not his elder brother (1486); and made him duke of Ross, an act that precipitated Rothesay into the rebellion that ended with James III's death at \*Sauchie Burn (1488). Potential trouble continued. Ross had links with James III's councillor Archbishop William Scheves, and Henry VII's spy John Ramsay (1496). James IV solved this problem by making Ross archbishop of St Andrews (1497). Thus Ross was removed as focus for opposition, the king could reclaim his secular estates, and his substantial ecclesiastical revenues went to the crown. Chancellor, in name only, from 1501, Ross died shortly before reaching the canonical age for consecration, 27. RJT

**Ross, Sir James Clark** (1800–62). Ross was involved in eight Arctic and Antarctic expeditions after joining the navy in 1812. Those of 1818 and 1829–33 were with his uncle John \*Ross, those of 1819–20, 1821–3, and 1824 with Sir William Parry. With Ross he discovered the Magnetic Pole, while with Parry he reached 110 degrees west in Melville Sound. His first Arctic command in 1836 was followed by appointment in 1839 to lead the navy's first full-scale Antarctic expedition which was also a terrestrial magnetism investigation. In specially strengthened ships, *Erebus* and *Terror*, Ross reached further south than anyone hitherto and got through the pack ice to the continent itself where an ice shelf and an island were later named after him. He called the mainland Victoria Land and it became the locus of all the major British Antarctic forays of the 20th cent. The final venture of Ross was to return to the Arctic in 1848–9 to search for \*Franklin. RB

**Ross, Sir John** (1777–1856). Originally with the East India Company, Ross joined the navy in 1805 and became an Arctic explorer. He led the 1818 expedition which sailed into Lancaster Sound from Baffin Bay but inexplicably turned back. The error was retrieved when, in 1829–33, he headed a privately financed expedition employing very inefficient steam vessels for the first time in the Arctic. The ships went under sail through the Strait to explore the Boothia Peninsula and King William Island. Here, in 1831, Ross's nephew James Clark \*Ross located the North Magnetic Pole. After service as British consul in Stockholm, Ross made an unsuccessful return to the Arctic to search for \*Franklin in 1850. RB

**Rossetti, Dante Gabriel** (1828–82). Poet and painter. Rossetti was born in London, the son of an Italian refugee. Taught drawing by \*Cotman, he also worked with Ford Madox Brown, before coming under the guidance of

Holman \*Hunt in 1848. His first major work, *The Girlhood of Mary Virgin*, was also the first to bear the initials PRB (\*Pre-Raphaelite Brotherhood). He soon moved away from brotherhood principles to follow what \*Millais called 'his own peculiar fancies', his best painting being done during his association with the model Elizabeth Siddal, whom he married in 1860. In 1857, following a suggestion by John \*Ruskin, Rossetti and others including William \*Morris and William Burne-Jones were involved in the decoration of the Oxford Union. Technical difficulties caused the paintings to degrade quickly. At the end of his life, which was marred by ill-health, Rossetti lived virtually as a recluse. JAC

**Rotary clubs.** The first Rotary club was founded in 1905 by Paul P. Harris, a Chicago attorney, to promote service and fellowship among the business community. There was to be a member from each profession or branch of business and meetings were to be held in their rooms in rotation. In 1912 an international association was formed, changed in 1922 into the Rotary International. The clubs sponsor scholarships for study abroad. JAC

**Rotherham, Thomas** (1423–1500). Archbishop of York and chancellor. Born in Yorkshire and educated at King's College, Cambridge, Rotherham was chaplain to the earl of Oxford (1461), where he met \*Elizabeth Woodville, Edward IV's future wife. This contact helped him to become keeper of the privy seal (1467–74), bishop of Rochester (1468–72), bishop of Lincoln (1472–80), chancellor (1474–83 and 1485), and archbishop (1480–1500). Involved diplomatically with France and Burgundy, he was present at Edward IV's meeting with Louis XI at \*Picquigny (1475). In Gloucester's coup following Edward's death (1483), Rotherham was suspected of being pro-Woodville, surrendered the great seal, and was imprisoned until after Gloucester's coronation as Richard III. Henceforth he had little political involvement except briefly as chancellor under Henry VII. He established a school in Rotherham and was a benefactor of Lincoln College, Oxford. WMM

**Rothermere, Viscount.** See HARMSWORTH, HAROLD.

**Rothés, John Leslie, 1st duke of** [S] (1630–81). Leslie's father, the 6th earl, was in high favour with Charles I but died in 1641 at the age of 41. Leslie marched south with Charles II in 1651 and was taken prisoner at \*Worcester. At the Restoration, honours were showered upon him. He became president of the council [S] 1660, lord high treasurer [S] 1663, captain-general of the forces [S] 1664. In 1667, through \*Lauderdale's influence, he was dismissed from office but made lord chancellor [S] for life, despite his protests that he had no legal knowledge nor learning. In 1680, when the duke of York was in Scotland, Rothés was created duke [S] but died the following year, his health undermined by good living. Rothés's letters in *The Lauderdale Papers* (Camden Series) are idiosyncratic and ungrammatical. JAC

**Rothesay, David Stewart, 1st duke of** [S] (1378–1402). First son and heir of Robert III of Scotland. Known as earl of Carrick when his father succeeded, he was created duke in 1398, along with his uncle Robert, duke of \*Albany,

presumably to hold the balance between them, as rivals. Rothésay gained the advantage in 1399 when he was appointed king's lieutenant for three years, giving him power on behalf of his incapacitated father. He beat off attacks by 'Hotspur' (Henry \*Percy) and by Henry IV himself. But early in 1402 he was seized on his way to St Andrews and died shortly after at Falkland. Though Albany was formally exonerated, suspicion lingered. Rothésay's death left his brother James to succeed on his father's death in 1406. JAC

**Rothschild, Lionel** (1808–79). Banker and politician. Rothschild's father, of an international family of German Jews, came to England in 1797 to conduct business and was greatly employed in financing the Napoleonic wars. Lionel succeeded to the English business in 1836, supplied loans for the \*Crimean War, and provided \*Disraeli with £4 million in 1876 for the purchase of the \*Suez canal shares. Returned to Parliament in 1847 for London as a Liberal, Rothschild could not take the required oath as a Christian and was not allowed to sit. Though re-elected in 1849, 1852, and 1857, it was not until the law was changed in 1858 that he could take his seat. His son Nathan was created Baron Rothschild through \*Gladstone in 1885, the first practising Jew to be ennobled. Disraeli offered an idealized portrait of Rothschild in *Coningsby* (1844) as Sidonia, a man of profound wisdom, though it is not clear what it was: a less flattering portrait was given by \*Trollope, who is said to have drawn on Rothschild for elements of Melmotte, the great fraudulent financier in *The Way We Live Now* (1874). JAC

**rotten boroughs** was the term used before 1832 to describe parliamentary constituencies where the voters had almost disappeared. A classic example was Old Sarum, which had been deserted since the inhabitants moved down the valley to Salisbury in 1220. But it was close run by other boroughs, such as Gatton in Surrey, which was down to 20 voters at the Restoration and only two 100 years later, or Dunwich, a once thriving port, which had long since crumbled into the sea. They were defended as affording opportunities for new non-landed interests—brewers, bankers, nabobs—to obtain representation. Chatham (\*Pitt) denounced them in 1766 as the rotten part of the constitution and declared they would not last the century. Most of them finished up in Schedule A of the \*Great Reform Act. JAC

**Roubiliac, Louis François** (c.1705–62). French sculptor. Roubiliac settled in Britain about 1732 and made his reputation with a statue of \*Handel, now in the Victoria and Albert Museum. He taught at St Martin's Lane Academy, the forerunner of the \*Royal Academy, and worked as a modeller for the Chelsea china factory. His busts show great vividness and energy, conveying character and age. He is often compared to his rival \*Rysbrack, whose work was more restrained. There are several Roubiliac busts at Trinity College, Cambridge (including one of Sir Isaac \*Newton), in the \*National Portrait Gallery, and in the Royal Academy. Roubiliac also made several monumental sculptures for Westminster abbey, which include another of Handel and

## Rouen

the particularly popular and dramatic monument of 1761 to Lady Elizabeth Nightingale. JAC

**Rouen, treaty of, 1517.** The defeat at \*Flodden left Scotland with an infant king, James V. The duke of \*Albany became regent in 1515 and on 26 August 1517 negotiated the treaty of \*Rouen with Francis I of France. Mutual support against England was to be cemented by a French marriage for the young king. The treaty was not ratified until 1522. Albany then launched an attack upon northern England which was a fiasco. The marriage of James to \*Madeleine, daughter of Francis, did not take place until 1537. JAC

**rough music** was a component of folkloric rituals classified under the generic continental term of *charivari*, or such English ones as skimmington, riding the stang, or simply riding. These rituals probably emerged in the later 16th cent., and usually involved satirical representations by sections of the community of conduct they regarded as reprehensible. At first they were directed against wives who offered violence or insubordination to their husbands, but later they might be directed against wife-beating husbands, or even employers in industrial disputes. The 'rough music' was the discordant beating of pots and pans that usually accompanied these ceremonies. JAC

**'rough wooing', 1544–8.** The birth of Mary, queen of Scots, in December 1542, only a week after her father's death, seemed an ideal opportunity to unite the thrones of England and Scotland. Prince Edward, Henry VIII's heir, was 5 years old and the English pressed for a marriage agreement. By the treaty of \*Greenwich in July 1543 Mary was to be betrothed before she was 10 and thereafter brought up in England. When the Scottish Parliament in December 1543 rejected the treaty, preferring to stay with the French alliance, Henry retorted with a punitive expedition led by Lord Hertford (\*Somerset), devastating the south-east border—ironically dubbed the 'rough wooing'. The Scots split and rival parliaments were summoned at Edinburgh and Stirling. A second expedition in 1545 devastated Melrose but the Scottish victory at \*Ancrum Moor in February put heart into the resistance and Hertford led another raid at harvest-time. In September 1547, after Henry's death, Hertford, now Protector Somerset, led an army to victory at \*Pinkie Cleugh, but consolidation proved hard. The Scottish reply, by the treaty of \*Haddington, was to accept a proposed marriage between Mary and the dauphin and she was taken to France in July 1548. With justice, Henry's policy has been described as 'never very sophisticated' and 'incredibly stupid as well as brutal'. JAC

**roundheads.** Scornful nickname coined to describe first the soldiers, and then the whole party which supported Parliament during the Civil War. It arose, explained Lucy \*Hutchinson, 'from the puritans' custom of wearing their hair cut close round their heads', like apprentices, who shortened their hair to demonstrate their contempt for love-locks. This was in contrast to the flowing tresses of the royalist cavaliers. The people against whom the nickname was directed did not hesitate to embrace it. A roundhead, averred one pamphleteer, was 'a good, honest, zealous, and

true protestant', called by God to do his work. 'A Round-head's use is of many sorts and kinds', another writer told the troops, 'but all for good; and first to set forth the splendour of glory of God.' This sense of being God's chosen people was an important ingredient in the morale of the parliamentary armies. By the late 1640s, after the roundheads' military triumph against the king, the word seems to have fallen into disuse. JJC

**Roundway Down, battle of, 1643.** After Charles I's march on London at the outset of the Civil War in 1642 had been halted, the following year developed into a war of manoeuvre. After savage fighting on \*Lansdowne on 5 July, both sides were badly mauled. \*Hopton made off to Devizes, where he was penned into the town and bombarded by \*Waller with superior numbers. But reinforcements from Oxford enabled Hopton on 13 July to counter-attack his opponents in rolling chalk downland just outside the town. Waller's cavalry suffered severely on steep grassy slopes and he lost all his guns and 1,400 men. JAC

**rowing.** Organized competitive rowing, like most sports, developed in the 19th cent., though the Irish comedian Doggett founded his sculling race on the Thames for the Coat and Badge in 1715. The Oxford and Cambridge \*Boat Race was first rowed in 1829. \*Henley regatta was established in 1839, the main events being the Grand Challenge Cup for eights and the Diamond Sculls for single oarsmen. Rowing was recognized as an Olympic sport in 1908. Professional contests were common and popular in the 19th cent., with heavy betting on the result, but died out in the 20th cent. JAC

**Rowlandson, Thomas (1756/7–1827).** Artist. Social commentator rather than caricaturist, sardonic rather than angry, Rowlandson's eye for life's comedies and absurdities led him to favour types rather than individuals, burlesque rather than biting satire. A Royal Academy student and fascinated by physiognomy, his prodigious output of pen-drawings, water-colours, and prints, demonstrating mastery of line and billowing rococo shapes, were so full of gusto that he has been seen as a personification of his age. If inclined to the characteristic excesses of the period (hard drinking, gambling, promiscuity), his view of the world depicted its manners, vices, politics, and incidents, but without censoriousness. A friend of \*Gillray, he worked for the publisher Ackermann, creating 'Dr Syntax', but technique and vision suffered after 1800 in consequence of his productivity, and he founded no school. ASH

**Rowntree, Benjamin Seebohm (1871–1954).** Rowntree, of the York, Liberal, quaker, chocolate-manufacturing family, conducted a local survey of poverty, the first of three during his life, published as *Poverty: A Study of Town Life* (1901). He classified poverty in two categories: families endured primary poverty when the four basic requirements of food, fuel, shelter, and clothing were not met from income, no matter how carefully managed; secondary poverty occurred when families had the income to cover the basic necessities, but did not have money for other essentials such as medicine. Rowntree concluded that 9.91 per cent of York's population were living in primary poverty and

17.93 in secondary poverty. These combined figures were so close to \*Booth's earlier calculations for London as to demonstrate that the problem of poverty was general. JB

**Rowton Heath, battle of,** 1645. After \*Naseby, Charles I's hopes were of reinforcements from Ireland or of a junction with the victorious \*Montrose in Scotland. Chester, held by a royalist garrison, was the key to both strategies. In September, Charles moved northwards through north Wales to Chester, unaware that Montrose's brilliant run of success had already come to an end at \*Philiphaugh. On 23 September Charles relieved the garrison but the following day Langdale's cavalry was badly cut up by Poyntz's horsemen at Rowton Heath, just south of the city. JAC

**Roxburgh, John Ker, 1st duke of** [S] (c.1680–1741). Ker succeeded his brother as earl of Roxburgh at the age of 16. When in his twenties he was secretary of state [S] 1704–5, along with \*Tweeddale. A warm advocate of the Union, he was created duke in 1707 and served as a representative peer in the parliaments of 1707, 1708, 1715, and 1727. In 1714–16 he was keeper of the privy seal [S] and fought bravely for the Hanoverians at \*Sheriffmuir in 1715. From 1715 until 1725 he was again secretary of state [S]. Awarded the Garter in 1722, he lost favour in 1725 when he was suspected of encouraging the Shawfield riots against the malt tax and of favouring \*Carteret against \*Walpole. He spent the rest of his life in retirement at Floors. Roxburgh was said to be a ready speaker and a cultivated and agreeable man. JAC

**Royal Academy of Arts** (London). In 1768 the artist Benjamin \*West, with the architect William \*Chambers, approached George III for his approval of a national academy to foster a school of art, set standards of good taste, and provide for the free exhibition of works of excellence. The first president was Sir Joshua \*Reynolds, whose famous *Discourses*, delivered over a period of 20 years, laid down the basic concepts of the academy which was to form 'a repository for the great examples of the Art', an important function before the establishment of the National Gallery in 1824. During the 19th cent. the academy was slow to accept innovation and its reputation declined. Since the mid-20th cent., policy has been more liberal and the annual summer exhibition a popular event, although whether it fulfils the function of exhibiting the best contemporary work is open to question. JC

**Royal Africa Company.** A number of short-lived charters in particular areas had been granted in the late 16th and early 17th cents., but the Royal Africa Company was not established until 1672. It traded with west Africa for gold and ivory but its main concern was to supply slaves to the West Indian islands. The company defended its charter with the argument that it was obliged to provide forts to protect warehouses, and it survived after reorganization in 1750 until 1821. JAC

**Royal Air Force.** The RAF was formed in April 1918 when the \*Royal Flying Corps and the \*Royal Naval Air Service were amalgamated to improve co-ordination. The new service was given its own minister and its own ranks: the other

two services were amused at airmen who did not fly and at the plethora of marshals. After the armistice the new force was drastically reduced, falling to fewer than 50 aircraft in 1922 for home defence. Defended by Lord \*Trenchard, it struggled for its independent existence against the army and navy. Even so, the RNAS was resurrected in 1924 as the Fleet Air Arm, jointly administered until 1937 when it was handed over to the navy. A cadet college was opened at Cranwell in 1920 and a staff college at Andover in 1922. The basic problem was how to obtain adequate resources from governments in acute financial difficulties and often committed to the cause of disarmament. Strategically, it was a question of striking a balance between offence and defence—bombers and fighters. Trenchard was a strong believer in the smallest possible fighter force—just enough to keep the civilians quiet. For many years the doctrine that the bomber would always get through, especially when supported by the prime minister, \*Baldwin, suggested that defence was useless. But the invention of radar in 1935 and the successful flights of the Hurricane (1935) and Spitfire (1936) tipped the balance back to defence.

It is not easy to compute exact figures for aircraft at the outbreak of the Second World War in 1939 since some were trainers, some unserviceable, and some obsolescent. The Germans had substantial but not overwhelming numerical superiority with some 4,000 planes to Britain's 2,000: the French air force, in poor shape, had some 1,500. But while the British figures included sedate Gloster Gladiators and Hawker Furies (not very furious with a top speed of 223 m.p.h. and introduced in 1931), the Luftwaffe had been completely re-equipped after Hitler's rise to power.

A major problem for the Royal Air Force was the spread of its commitments, especially after the entry of Italy (1940) and Japan (1941) extended the war to north Africa and the Pacific. But it received vital help from the Dominions' air forces, which provided about a quarter of the squadrons. From the fall of France in May 1940 the role of the RAF was essentially defensive, save for raids on enemy airfields and occasional bombing attacks to boost morale. During the Battle of Britain its resources were severely stretched, even more in trained aircrew than in machines, with the life expectation for fighter pilots down to four or five weeks. On 8 August 1940, Goering issued an order to 'wipe the British Air Force from the sky'. But his first surprise was that the Stuka dive-bombers, which had spread such terror in Poland and France, proved slow and vulnerable to Spitfires and Hurricanes. The Luftwaffe, operating over enemy territory and using bombers, suffered disproportionate losses in aircrew. The number of planes lost is a matter of dispute, since both sides issued exaggerated claims for kills, but the Germans lost about twice the number of machines. What is not in dispute is that the Royal Air Force was not destroyed, that Goering switched to softer targets with raids on British cities, and that operation Sealion, the invasion of Britain, was called off.

Meanwhile Coastal Command struggled against the U-boat menace. More than 120 merchant ships were sunk in the month of March 1943 alone. But by May 1943 better-organized convoys, improved weapons of attack, and the

## Royal British Legion

introduction of new long-range aircraft like the Sunderland, Catalina, and Liberator, which could bridge the 'Atlantic gap', gave Britain the edge.

The counter-offensive could now develop. The strategic issue became whether a massive bombing campaign could pound Germany into surrender without the need for a bloody invasion. The great proponent of that view was 'Bomber' \*Harris. In June 1942 he mustered a scratch force of just over 1,000 aircraft (including training personnel) for a demonstration onslaught on Cologne, and followed up his success with a memo against 'the disastrous policy of military intervention in land campaigns of Europe'. But the evidence is dubious. \*Churchill pointed out that civilian morale is often surprisingly resilient under intolerable suffering, mass bombing was less destructive of the German war effort than had been hoped, and aircraft losses were very heavy. Bomber Command lost 55,000 men during the war—more, it has been said, than all the officers killed in the First World War. Until the end of 1944 German production of tanks, guns, and fighter aircraft continued to increase, with factories camouflaged and dispersed. Allied air power was also needed to cover the Normandy landings in June 1944, to deal with the V1 flying bombs which began to arrive in Britain a week after D-Day, and to attack launching sites for V2 rockets from September 1944 onwards.

Since the end of the Second World War, the Royal Air Force has taken part in a number of campaigns—the Berlin Airlift of 1948/9 when 147 planes flew more than 63,000 sorties; the \*Suez operation in 1956 when Egyptian airfields were bombed; the \*Falklands War of 1982 when the possession of Ascension Island was critical and air cover was provided largely by ship-borne Harriers; and the \*Gulf War of 1990 when the Tornado squadron in its low-level attacks had a bad first week. But its main tasks from the 1950s were to carry the British nuclear deterrent in the V-bomber force and to retain operational efficiency in the face of shrinking resources.

JAC

Raleigh, W. A., and Jones, H. A., *The War in the Air: Being the Story of the Part Played in the Great War by the Royal Air Force* (6 vols., Oxford, 1922– ); Terraine, J., *The Right of the Line: The Royal Air Force in the European War 1939–1945* (1985).

**Royal British Legion.** Essentially a product of the Great War, the Legion emerged from amalgamation of rival voluntary societies in 1921 as a non-party association of ex-servicemen, in response to demobilization confusion and disillusion in a time of industrial unrest. Disbursements to alleviate distress (sickness, unemployment), employment offices and schemes, disabled retraining, and increasing pre-occupation with pensions followed. Poppy Day (derived from the emblem of Flanders's fields) started cautiously in 1921, to become the best known of appeals. A royal charter came in 1925, then royal patronage. In the Second World War, legionaries everywhere contributed to national and civil defence (air-raid duties, Home Guard), and remembrance festivals were revived. While interest grew in provision for the aged and incapacitated, and war-grave pilgrimages, the Legion's principal service to 'second-generation' ex-servicemen concerned pensions. ASH

**Royal College of Music.** London music conservatoire for the training of performers, composers, and teachers. Founded in 1883 and based on the former National Training School of Music, it opened with 50 scholars and 42 fee-paying students under the directorship of George \*Grove. \*Stanford was an influential founding professor there (1883–1924), as was \*Parry (1883–1918), who succeeded Grove as director in 1894. The Britten Opera theatre was opened in 1986. The college owns valuable collections of musical instruments and archival material. ECR

**royal commissions.** Though there was an element of investigation in each, it is scarcely helpful to suggest, as some writers do, that the \*Domesday survey of 1086 or the inquiry into the state of the monasteries in the 1530s should be regarded as early examples of royal commissions. In neither case were they panels of persons appointed to investigate and advise. The preferred 18th-cent. method of proceeding—apart from leaving things alone—was the select parliamentary committee. This had some disadvantages: composed of MPs it was likely to be partisan; few MPs had the time to devote to a thorough inquiry; and it was almost impossible to take the committee round the country to gather evidence. From 1800 onwards, with increasing concern for social questions, royal commissions multiplied—11 in the first decade, 46 in the fourth, 75 in the sixth. The period immediately after the Great Reform Act saw a number of extremely influential reports—on the Poor Law (1834), municipal corporations (1835), employment of children in mines (1842), and the state of the large towns (1844). The defects of royal commissions are not inconsiderable. They are expensive, slow, and there is no guarantee that action will follow. Indeed, cynics regard them as an admirable way of disposing of awkward issues until after the next general election. JAC

**Royal Exchange.** The first Royal Exchange building was erected by Sir Thomas \*Gresham in 1565–7 as a bourse where merchants and bankers could meet. Modelled on the Antwerp Bourse, it lay in the city of London between Threadneedle Street and Cornhill. Elizabeth I proclaimed it the Royal Exchange on her visit in 1570. In the 19th cent. it housed the foreign exchange market. It was twice destroyed by fire (1666 and 1838) and twice rebuilt. In 1982 its central glass-domed courtyard was refurbished and occupied by the financial futures market. MW

**Royal Flying Corps.** The Royal Engineers experimented with balloons in the 1870s and a small factory was established at Chatham in 1883. Several balloons were used for observations during the \*Boer War. Blériot's flight across the Channel in 1909 and the German Zeppelin programme persuaded the army to set up an Air Battalion in 1911 and the RFC was established in April 1912, with a Central Flying School at Upavon on Salisbury Plain. In 1914, 4 squadrons went to France with 63 aeroplanes, most of them BE2 bi-planes (Blériot Experimental), made at the Royal Aircraft Factory at Farnborough. The first reconnaissance was carried out on 19 August. The early role of the corps was scouting, with the odd hand-grenade tossed over the side of the

cockpit, but the buildup of forces and the invention of the synchronized machine-gun, firing through the propeller, led to frequent dog-fights. Albert Ball, flying an SE5, shot down 43 German planes before he was killed in May 1917: the total was surpassed by the Canadian William Bishop (72) and Edward Mannock (73). The corps' defensive capabilities were demonstrated on 3 September 1916 when William Leefe Robinson shot down Zeppelin SL 11 while it was raiding London. In 1918 air warfare was reorganized to assist co-ordination. The RFC amalgamated with the Royal Naval Air Service to form the \*Royal Air Force, with its own minister. JAC

**Royal George.** On 29 August 1782 Admiral Kempenfelt at Spithead was preparing his flagship, the *Royal George*, to sail to the relief of Gibraltar. It was an old vessel and patched up for service. When her guns were run over to one side to give the ship a list and enable repairs to the hull to be made, she sank at once, drowning the admiral and up to 800 crew and families. The vessel was never recovered and was eventually blown up. JAC

**Royal Institution.** Founded in 1799 to apply science and technology to the improvement of the lives of the poor. The leading members included \*Banks, Count Rumford, Thomas Bernard, Henry \*Cavendish, and \*Wilberforce. It received a royal charter the following year and moved into the premises in Albemarle Street which it still occupies. Its main activity has been to popularize science through public lectures and its success was assured by Humphry \*Davy and then Michael \*Faraday, who had started as Davy's assistant in 1813. Subsequent lecturers have included John \*Tyndall, Sir James Dewar, T. H. \*Huxley, \*Rutherford, and Julian Huxley. Though it is doubtful whether the institution has had much effect on the condition of the poor, it has done a great deal for the diffusion of scientific knowledge. JAC

**Royal Irish Academy.** The academy was founded in Dublin in 1785 and was given royal recognition the following year. Its aims were the exploration and preservation of Irish culture, collecting manuscripts, and publishing transactions on a variety of topics. Its first president was Lord \*Charlemont and the founder members included \*Grattan and \*Gandon. JAC

**Royal Irish Constabulary.** See IRISH CONSTABULARY.

**royalists.** See CAVALIERS.

**Royal Marriages Act,** 1772. Prompted by the unsanctioned marriage of George III's brother Henry, duke of Cumberland, an Act was passed in 1772 making it illegal in future for any member of the royal family under the age of 25 to marry without the previous consent of the crown: all such marriages to be declared null and void. The Act created problems for the future George IV when he married Mrs Fitzherbert in 1785 at the age of 23, and is still in force. DW

**Royal Naval Air Service.** When the \*Royal Flying Corps was founded in 1912 it had a military and naval wing. The latter soon adopted the name Royal Naval Air Service, which

was officially recognized in July 1914. It then possessed 39 aircraft, 52 seaplanes, and 7 airships. Their main responsibility was defence against submarines, including bombing of their bases, observation for the fleet, and coastal defence against Zeppelins. Seaplanes could be carried on cruisers, but not until August 1915 did an adapted seaplane take off from *Campania* and it was two years later that a seaplane relanded on its carrier. The RNAS was amalgamated with the RFC in 1918 to form the \*Royal Air Force. But the special requirements of the navy led to the creation of the Fleet Air Arm, jointly administered until 1937 when it was placed under naval control. JAC

**Royal Navy.** See NAVY.

**Royal Opera House** (Covent Garden, London). The original Covent Garden theatre was opened by John Rich in 1732; \*Handel used it for operas and oratorios, including the first London performance of \**Messiah*, while the second half of the century saw both plays and English operas. In 1808 the theatre was destroyed by fire, reopening the following year and from 1847 housing the Royal Italian Opera in direct rivalry with Her Majesty's theatre. It burned down again in 1856; the present building designed by E. M. Barry opened in 1858. Many German and French operas were translated into Italian, although in 1892 'Italian' was dropped from the Royal Opera's title and *The Ring* was given in German under Mahler. Patti was London's first Aida (1876), while \*Melba sang there many times. The dominant conductor during the first part of the 20th cent. was \*Beecham, while more recent musical directors include Solti and Davis. After the Second World War the theatre became home to the permanent Covent Garden Opera Company and Sadler's Wells Ballet (later known as the Royal Opera and Royal Ballet). Covent Garden has seen the premières of works by \*Holst, \*Walton, \*Britten, and especially \*Tippett. ECR

**Royal Philharmonic Society.** London concert society formed by professional musicians in 1813 to promote primarily orchestral and instrumental music. For the first Philharmonic Society concert, the orchestra was led by the violinist Salomon and directed from the piano by Clementi. Spohr claimed to be the first director to use a baton in 1820, while later famous conductors included Mendelssohn, Sterndale Bennett, \*Sullivan, Tchaikovsky, Nikisch, \*Wood, \*Beecham, and, for a single disastrous season, Wagner. New commissioned works included Beethoven's 'Choral' Symphony (1825) and Mendelssohn's 'Italian' Symphony (1833). The society was granted its 'Royal' title in 1913 and has awarded a prestigious gold medal since 1871. ECR

**royal prerogative** is a term which has changed its meaning considerably. In modern times it mainly refers to a reserve or discretionary power entrusted to the monarch, though it is far from clear what that power is. In the medieval period the term was used largely to describe feudal rights. There was no implication of reserve power since the medieval monarch had massive immediate power, making all important appointments, granting honours, estates, and charters, issuing proclamations, dispensing justice, and declaring war and peace, limited mainly by custom and prudence. In the

## Royal Scottish Academy

later medieval and early modern period, the meaning began to change again to signify powers peculiarly close to the monarch—honours, foreign policy, marriage, and succession. The most lofty assertions of royal prerogative came from Richard II and James I—perhaps when the monarchy was under pressure and as a defensive reaction. Too many definitions of prerogative are theoretical rather than factual. James I wrote that ‘it is presumption and sedition in a subject to dispute what a king may do’—a case of whistling in the dark; while \*Blackstone’s observation in his *Commentaries* (1765) that ‘the king has the sole prerogative of making war and peace’, while nominally correct, was fundamentally misleading.

Many of the constitutional conflicts in the reigns of John, Henry III, and Edward II turned on aspects of the prerogative—e.g. the king’s right to \*tallage. Even more basic royal powers were under fire in the 1370s when the Commons began to impeach royal ministers and in 1395 when they asserted their right to approve taxation. But the great struggle over the prerogative was decided largely in the 17th cent. At the end of her reign Elizabeth ran into criticism for granting \*monopolies by prerogative and promised redress while reasserting her right: James I was obliged to give way completely on that issue, the statute of Monopolies of 1624 declaring that they were ‘altogether contrary to the laws of this realm’. The House of Commons recorded mournfully in its \*Apology of 1604 that ‘the prerogatives of princes may easily and do daily grow . . . the privileges of the subject being once lost are not recovered but with much disquiet’. Eighty years of disquiet reversed that situation. First Parliament attempted to safeguard its own position since, as long as the monarch could dismiss and summon it at will, its power was precarious: an Act of 1641 demanded \*triennial parliaments and, though it was modified after the Restoration, it was made effective in 1694. \*Purveyancing—the right of the crown to buy at its own prices—for centuries a bone of contention, was formally abolished in 1660, along with \*benevolences, \*forced loans, and the surviving \*feudal dues. \*Habeas corpus in 1679 protected subjects from imprisonment without trial. More prerogatives were removed by the \*Bill of Rights after the revolution of 1688—the power to suspend laws, and the power to dispense with laws in individual cases ‘as it hath been assumed and exercised of late’. Two other measures help to bolt the door—the prohibition of a standing army in peacetime without the consent of Parliament; and the strengthening of the independence of the judges by appointing them on good behaviour (not at will), a practice adopted by William III and confirmed by the Act of \*Settlement of 1701.

After 1688 the monarchy retained formidable powers, but over the next 150 years most of its prerogatives either fell into abeyance or were appropriated by the prime minister. The right to veto legislation was not exercised after 1708 and is presumably defunct. The power to call a general election is now exercised on the advice of the prime minister. Choice of ministers remained a tug-of-war throughout the 18th and early 19th cents. but is now a matter for the prime minister. Except for some special orders, honours are now given on

the advice of the prime minister: the crown lost an important prerogative when William IV agreed in 1832 to create peers to carry the \*Great Reform Bill if necessary. It is not easy to know what prerogatives are left to the monarch in the early 21st cent. In a crisis, he or she retains a certain power of initiative: George V begged the warring politicians in 1910 and again in 1914 to negotiate but the results were not encouraging. Though the monarch retains some reserve power in the choice of prime minister, he or she acts carefully on advice, and changes to the method of selecting the party leaders have greatly reduced the area of uncertainty. As \*Churchill once declared, ‘the prerogatives of the crown have become the privileges of the people’. JAC

**Royal Scottish Academy.** In the 18th cent. the opportunities in Edinburgh for exhibition did not stop the flow of Scottish painters to London where there was greater demand as well as the possibility of becoming a Royal Academician. On the initiative of the artists themselves, the Scottish Academy was founded in 1826 and received its royal charter in 1838. Membership became an important factor in fostering the idea of a separate Scottish School and the annual exhibitions at the RSA became popular with English as well as Scots artists. JC

**Royal Society.** The oldest surviving scientific body in the world, the Royal Society was founded in 1660 and obtained its first charter in 1662, for the promotion of natural knowledge. Religion and politics were excluded; and the charter brought respectability, and the right to publish. In 1665 Henry Oldenburg, the secretary, began a journal, *Philosophical Transactions*, which evolved from letters to papers, and still continues. Earlier groups had flourished and collapsed, but the Royal Society with its elected president, secretary, treasurer, and council could go on indefinitely. Unlike the Paris Academy of Sciences founded soon after, it was and is a kind of club, and it was not until Humphry \*Davy was president in the 1820s that a majority on council had published any science. Joseph \*Banks reigned for over forty years, 1778–1820; but since the mid-19th cent. terms of office have been limited, and entry strictly controlled. Instead of a group of mostly amateur enthusiasts, the society by the 1870s had become a body of distinguished professional scientists, so specialized that in the 1880s the *Philosophical Transactions* was divided into ‘physical’ and ‘biological’ parts. Since the mid-19th cent. the society has received a parliamentary grant to support research, and increasingly it has advised governments about science, so that it has come to function more like an academy. It has a splendid library, but has never had a laboratory. DK

**Royal Society for the Prevention of Cruelty to Animals.** The RSPCA, the largest animal welfare organization, grew out of the humane movement’s concern about abuse of working animals, entertainments (cock-fighting), and slaughterhouse conditions. Early bills were defeated, but the group formed by Revd Arthur Broome to enforce Martin’s Cattle Cruelty Act (1822) pursued both prosecution and propaganda and the Society was founded in 1824. Princess Victoria’s patronage, royal endorsement (1840), and

burgeoning auxiliary societies outside London increased the society's prestige, and its influence began to spread overseas. A network of local branches and animal shelters evolved, and the crusade continues against transit offences and illegal sports, and for wild mammals' protection. ASH

**Royal Society of Arts.** Founded in 1754 by William Shipley, a drawing-master from Northampton, supported by Viscount Folkestone and Lord Romney. Its objective was to 'encourage Arts, Manufactures and Commerce' and the method was to raise funds by subscription in order to award prizes for useful talents and inventions. The early members included \*Johnson, \*Goldsmith, \*Hogarth, \*Gibbon, \*Pitt, \*Chippendale, and \*Banks. In 1774 it moved into the premises in the Adelphi, built by the \*Adam brothers, which it has occupied ever since. The society was largely instrumental, with its patron Prince \*Albert, in planning the \*Great Exhibition of 1851. It holds meetings nationally and locally and publishes a journal. JAC

**Royal Titles Act,** 1876. After the Indian mutiny in 1857, sovereignty in India was transferred to the crown and the governor-general became a viceroy. The elevation of Wilhelm I to be Emperor (of Germany) seems to have upset Victoria, who asked her private secretary in 1873, 'why have I never officially assumed this title?' The change of prime minister in 1874 from \*Gladstone to \*Disraeli enabled the measure to go ahead, despite objections that the title was un-English. By the Royal Titles Act (39 & 40 Vic. c. 10) the queen became Empress of India. JAC

**Royal Ulster Constabulary.** Created under the terms of the Constabulary Act (1922) as a police force for Northern Ireland, the RUC was modelled on the \*Royal Irish Constabulary (disbanded in 1922), being armed and centrally controlled. The initial establishment was 3,000 men, and it was the original intention to allocate one-third of this total to catholic recruits: however this quota was never filled. The RUC lost 6 men and had 30 wounded during the \*Irish Republican Army campaign (1956–62); just under 200 full-time RUC men and over 100 RUC Reserve were killed between 1969 and 1994, while over 7,000 were injured. The 'troubles' brought radical change to the force: it was restructured along English lines in 1970, following the Hunt Report, and enlarged from 3,500 members in March 1970 to almost 8,500 members by November 1991. The Patten report in 1999 on the reorganization of the force leaned so much towards the nationalists that it may have done more to retard than promote the peace process. The RUC was replaced in 2001 by the Police Force of Northern Ireland. AJ/JAC

**Royal Victorian Order.** The order was founded in 1896 for members of the royal household and is at the personal disposal of the monarch. The classes are Knights Grand Cross, Knights Commander, Commander, and Member. The chapel of the order is at the Queen's Chapel, Savoy (London). The Royal Victorian medal is associated with the order. JAC

**Royce, Sir (Frederick) Henry** (1863–1933). Royce was an engineer whose first large commission in 1882 was to install

a system of electric street lighting in Liverpool. Two years later he moved to Manchester and established his own electrical engineering firm. With the advent of the automobile he was drawn into this new field and in 1904 produced his first motor car. His early vehicles so impressed the automobile enthusiast C. S. \*Rolls that the two men entered into partnership in 1906 as Rolls-Royce Ltd. Royce provided the engineering talent, and developed the superb marque of large, 40–50 horsepower motorcars of which the Silver Ghost was the first, to be followed by the Phantom and Wraith models in the 1920s. Rolls was killed in an aeroplane accident in 1910, and Royce suffered a severe illness in the following year as a result of overwork. In the \*First World War he responded to pleas from the British government by manufacturing the Eagle aeroplane engine, and he went on to design other aero-engines, some of which won the Schneider trophy in 1929 and 1931. Royce was created a baronet in 1930. RAB

**rugby football.** William Webb Ellis is credited with inventing rugby in 1823 by picking up the ball while playing football at Rugby School and running with it. The claim is much disputed but there is little doubt that rugby developed at public schools out of a large-scale, few-rules, mauling scrum game. Other schools played with different shapes and sizes of ball until the oval ball gained favour to facilitate handling and passing. Definition of the code began in 1863 when the Football Association was formed and outlawed handling and hacking. Richmond, Blackheath, and some London clubs stayed with the handling code and in 1871, at the Pall Mall restaurant, the Rugby Football Union was formed. The Scottish Rugby Union followed in 1873, the Irish in 1874, and the Welsh in 1881. As in soccer, the balance moved in favour of northern clubs and there were accusations of professionalism, under the pretence of expenses and broken-time payments. In 1895 St Helens, Wigan, and a number of northern clubs formed a breakaway union, which became the Rugby Football League in 1922. The number of players was reduced from fifteen to thirteen and scrums restricted to produce a fast handling game, which would attract spectators. Rugby league also gave rise to a large number of amateur clubs.

The first rugby union international match was played at Raeburn Place (Edinburgh) in 1871 between Scotland and England, and the Calcutta Cup was introduced in 1879. The spread of the game to the former dominions and some unlikely spots such as Romania allowed the introduction of World Cup competitions in the 1980s. Rugby league made little progress in southern England but spread to Australia, New Zealand, and France, allowing international 'test' competitions.

The two codes, amateur and professional, treated each other with disdain for many years and those union players who turned professional, often with marked success, were at once banned from the amateur game. But the advent of television and the growth of commercial values after the Second World War led to a gradual thaw. Rugby union introduced a league system, with promotion and relegation, expenses became ever more substantial, and the ban

## Rugby School

on players returning after playing rugby league was lifted in 1995. Full professionalism followed. In 1996, in two exhibition matches between the two codes, Wigan outplayed Bath 82–6 at Maine Road (Manchester) in the league game; at Twickenham, in the return match under union rules, Bath won 44–19.

NJB

**Rugby School** is a boys' public school founded by Laurence Sheriff, a merchant grocer of London, in 1567. Originally built opposite the parish church, the school became unfit for use in 1748 and was rebuilt on its present site consisting of a school house, quad, chapel, and a magnificent playing field. In 1797 the 'Great Rebellion', a mutiny by the pupils, was dealt with by soldiers with fixed bayonets and drivers with horsewhips. The game of rugby takes its name from the school where the sport is said to have originated. The subsequent high reputation of the school stems from the headmastership of Thomas \*Arnold.

PG

**'Rule, Britannia!'** A song with chorus from the final scene of Thomas Arne's masque *Alfred* (words by James Thomson and David Mallett), first performed at the prince of Wales's residence Cliveden in 1740. It was published shortly afterwards as 'The celebrated ODE, in Honour of Great BRITAIN call'd Rule BRITANNIA'. It has been quoted by various composers, including Beethoven in a set of piano variations and his 'Battle' Symphony. It has become a second British national anthem and is traditionally sung at the last night of London's \*Promenade Concerts, frequently by a redoubtable mezzo-soprano.

ECr

**Rump Parliament.** What remained of the Long Parliament's House of Commons after \*Pride's Purge. Claiming to be the representative of the sovereign people, it assumed full legislative authority, and its early acts (January–May 1649) set up the tribunal that sentenced Charles I to death, abolished the monarchy and the House of Lords, and declared England to be a commonwealth. Regarded by the army as a mere caretaker government, it soon readmitted many more than its original 70 or so members, forgot its promises of early elections, took on a more conservative temper, and settled down to surviving. It only came under serious pressure to make way for a successor when \*Cromwell and his officers returned from the wars in Scotland and Ireland in 1651, and even then it sought to hold elections only to the many vacant seats. Eventually it introduced a bill for a genuinely new parliament, but the army remained unsatisfied, and Cromwell forcibly expelled the Rump on 20 April 1653. The army reinstated it in May 1659 after a coup against Richard \*Cromwell, but interrupted it again from 13 October to 26 December. Its independent existence finally ended when General \*Monck readmitted the members 'secluded' in Pride's Purge on 21 February 1660.

AHW

**Runcie, Robert** (1921–2000). Archbishop of Canterbury. After war service as a tank commander, winning the MC, Runcie graduated from Brasenose College, Oxford. He was successively principal of Cuddesdon Theological College (1960), bishop of St Albans (1970), and archbishop (1980). A liberal catholic, witty and intelligent, he developed

Canterbury's quasi-patriarchal role by frequent visits overseas, including at least seven to Africa, two to China, and several to eastern Europe and in 1988 to the USSR. To 'Europeanize Canterbury' he fostered relations with other west European churches, whether catholic or protestant. As the first archbishop to propose 'an ecumenical primacy' for Rome, he welcomed Pope John Paul II on the first ever papal visit to Canterbury cathedral (1982). Vilified by the media for compassion towards bereaved Argentinians after the \*Falklands War (1982) and also for *Faith in the City* (1985), a report exposing poor urban conditions, Runcie also faced controversy over women's ordination. The first women deacons were ordained in his primacy (1987). He retired in 1991.

WMM

**Rupert, Prince** (1619–82). Prince Rupert had two military careers, as an army officer until 1646 and as a naval commander thereafter. Son of \*Elizabeth, queen of Bohemia, a grandson of James I, and first cousin to Charles II, he was born in Prague just before his parents were driven out at the start of the Thirty Years War. In his teens he gained military experience in Holland, but was taken prisoner by the Austrians in 1638 and spent nearly three years in captivity. Within months of his release, he travelled to Nottingham and placed himself at the service of his uncle Charles I. For the next four years he was the toast of the royalists, the terror of the roundheads, and the mainstay of the king's war effort, more sober than \*Goring, more resourceful than \*Hopton. His forte was the cavalry raid, surprising outposts, sweeping down on garrisons, catching the enemy off guard. He fought in the first skirmish of the war at Powick Bridge, commanded the right wing at \*Edgehill, led the daring raid which culminated in \*Chalgrove Field, and harassed \*Essex at the first battle of \*Newbury. His relief of York in 1644 was a tactical masterpiece and his subsequent defeat at \*Marston Moor was probably due to his understanding that the king had given him 'peremptory' orders to engage, though heavily outnumbered. He took overall command of the royal forces in November 1644 when it was too late and was defeated at \*Naseby in June 1645. Sent to hold Bristol, he surrendered in September 1645, causing a bitter breach with the king, who reproached him for 'so mean an action'. Rupert left the country in July 1646.

The next few years were spent commanding small naval squadrons. He took a fleet to Ireland in 1649 but was outgunned by \*Blake, and from 1650 to 1652 cruised in the Mediterranean and West Indies, preying on parliamentary shipping and attempting by privateering to improve royal finances. His chance to exercise high naval command came after the Restoration, when he returned to England and shared responsibility in the second and third \*Anglo-Dutch wars with \*Monck (Albemarle) and James, duke of York. Confronted by tough and experienced Dutch admirals, his triumphs were less heady than on land, though the action off \*Lowestoft in 1665 was an important victory.

After the Restoration, Rupert was prominent at the court of Charles II. He retained his reputation as a dashing leader of men, yet he was already a figure from the past, solemn among the wits and gallants of the new generation. He

suffered from a head wound gained fighting for the French against the Spaniards in 1647 and survived two operations for trepanning. The combination of high rank, strong views, and a life spent in camps and on board ships made him forthright, though he was not devoid of political judgement. A lifelong servant of the Stuart cause, he is buried in Westminster abbey. JAC

**Ruskin, John** (1819–1900). Ruskin was the most influential art critic of his time as well as a talented draughtsman and water-colourist. The son of a wealthy wine merchant, he was able to travel extensively after Oxford, developing his artistic knowledge. His large written output gave him enormous influence over public opinion; he successfully defended the \*Pre-Raphaelites and championed \*Turner. While continuing to write prolifically on art, after 1860 he also wrote on social, political, and economic matters. These writings emphasized his view of the moral function of the arts as a 'visible sign of national virtue'. Ruskin disliked the effects of the industrial revolution, but also resisted plans to improve mass design in industry, as commercially tainted. In 1870 he was appointed Slade professor at Oxford and endowed the Drawing School there. His last years were marred by mental illness and he died in the Lake District having rarely spoken for several years. JC

**Russell, Bertrand, 3rd Earl Russell** (1872–1970). In his long and complex life, Russell took many roles. He was a grandson of the Lord John \*Russell who had introduced the \*Great Reform Bill in 1831. After a distinguished mathematics and philosophy course at Trinity College, Cambridge, he was elected to a fellowship. His major early work was *Principles of Mathematics*, written by 1910 but not published until 1930. It was followed by *Principia mathematica* (1911) and *The Problems of Philosophy* (1912). During the First World War Russell's pacifist activities resulted in the loss of his fellowship. In the inter-war years he lectured and wrote copiously, was increasingly tempted to set up as sage, and produced facile, readable essays. In 1938 he took an academic post in America and stayed there for most of the Second World War. His *History of Western Philosophy* (1945) sold well and removed his financial troubles. He was given the OM (1949) and the Nobel prize for literature (1950). His private life continued to be as demanding as ever, with four marriages, and innumerable affairs. From 1954 onwards he took a prominent part in the \*Campaign for Nuclear Disarmament, instantly recognizable in public demonstrations against the bomb. His judgement became foolish and he declared that Harold \*Macmillan was worse than Hitler. By his supporters he was regarded as a man of vast moral authority, by his opponents as a rather dotty peer. JAC

**Russell, Lord John, 1st Earl Russell** (1792–1878). Prime minister. A small, cocky man, with an abrasive and resilient personality, Russell was the third son of the duke of Bedford and was educated at Westminster and Edinburgh University. He entered Parliament in 1818, sitting for several constituencies until returned for the City of London in 1841, which he represented until his elevation to the peerage as Earl Russell. He first made his mark in taking a leading role

in the repeal of the \*Test and Corporation Acts as they affected protestant dissenters in 1828 and he supported \*catholic emancipation in 1829. In \*Grey's administration he helped to draft the Reform Bill, introduced it in the Commons, and was prominent in securing its passage through Parliament. Russell used the argument of 'finality' with such enthusiasm that he earned the nickname 'Finality Jack'. Ironically his later career demonstrated that the reform carried in 1832 was not the final step but the first in taking Britain down the road to democracy. Russell was never an advocate of universal suffrage, however. In the 1860s he favoured reducing the franchise qualification but not the total abolition of a property level. In the abortive Reform Bill introduced during his second premiership in 1865–6 he sought to lower the household franchise in the boroughs from £10 to £7. During his long career Russell served in many offices of state. He was home secretary and colonial secretary under \*Melbourne, leader of the House under \*Aberdeen, foreign secretary under first Aberdeen and later \*Palmerston. He was twice prime minister: from 1846 to 1852 and again in 1865 to 1866. Russell never disguised his convictions. This made him a wayward colleague. In 1845 he became a convert to the repeal of the \*Corn Laws. Outraged by what he saw as papal aggression he denounced the revival of catholic bishoprics in England in 1850 and introduced the controversial \*Ecclesiastical Titles Bill in 1851. He had strong sympathies with Italian nationalism. During the American Civil War he kept Britain neutral but refused to accept responsibility for the damage inflicted on Federal commerce by the Confederate raider the \*Alabama, which had been built on the Mersey. He sympathized with the Poles and the Danes but could do little to help them. Though associated in the public mind with Palmerston, Russell's relationship with his famous colleague was often stormy. Russell had been happy to see Palmerston go after the approval he had given to Louis Napoleon's coup in December 1851. In turn he fell victim to Palmerston's desire for revenge when in 1852 his government was defeated on its militia proposals. Russell was almost as difficult a premier as he was a colleague. He often failed to consult colleagues and, though he was quick to identify crucial issues and to see the need to act, he was less successful in carrying his colleagues with him. In his second premiership he introduced parliamentary reform, which he believed had been thwarted by Palmerston for too long. But he could not manage shifting opinions within the Commons and had the mortification of going out of office and seeing \*Disraeli carry a Reform Bill which was more advanced than that which Russell had proposed. Russell did not lack intelligence but his judgement was questionable. As a Whig, standing within the Foxite tradition, he edited the correspondence of Charles James \*Fox for publication, but his enthusiasm for his subject outran his skills as an editor. JWD

Prest, J., *Lord John Russell* (1972).

**Russell, Lord William** (1639–83). Russell, son of the earl of Bedford, entered Parliament in 1660 for the family borough of Tavistock and became a leader of the \*Shaftesbury Whigs. In 1678 he moved an address asking Charles II to

## Russia

remove his brother James, duke of York, from his counsels and in 1680 he joined in presenting the duke as a notorious papist. He was a strong advocate of the bill to exclude James from the throne. But the court took its revenge. In 1683 Russell was accused of complicity in the \*Rye House plot to assassinate James and Charles and was beheaded in Lincoln's Inn Fields. After the Glorious Revolution, his services to the Whig cause were recognized in the dukedom granted to his father, the patent of which described Russell as 'the ornament of his age'. The *Complete Peerage*, by contrast, called him a 'canonised ruffian'. JAC

**Russia, relations with.** The search for the North-East Passage to Asia in the 1550s opened up a direct route to Russia, and led to a mutually advantageous trade until the 1620s. But once Russia became the leading power in the Baltic from 1709, Britain (with her huge demand for naval stores from that region) had to take considerable account of this new force. In 1780 Catherine the Great organized the Armed Neutrality coalition in response to Britain's naval blockade methods during the \*American War of Independence. By the end of the century Britain was also beginning to fear Russian expansion at the expense of the Ottoman empire. The two powers co-operated in the overthrow of Napoleon (1814–15), but only for each to feel that the other had profited excessively from the war. Competition was soon renewed over the Ottoman empire and to some extent in Persia. Fear of Russia in central Asia was the cause of two British bids to turn \*Afghanistan into a client state (1839–42 and 1878–80).

Meanwhile in Europe Russia was distrusted as an ultra-reactionary power which seemed all too anxious to interfere in the affairs of other states, though first \*Canning (1826–7) and then \*Palmerston (1839–41) worked briefly with Russia in Near Eastern crises. Later fears of Russian ambitions at the expense of the Ottoman empire and outrage among British progressives against Russia as the defender of autocracy led to the \*Crimean War (1854–6). Russia and Britain nearly came to blows again in the Near East in 1878 as well as over Penj-deh (Afghanistan) in 1885. Only defeat by Japan and revolution at home in 1905 forced Russia to conclude an \*entente with Britain in August 1907. The two were rarely comfortable partners, even during the First World War.

The Bolshevik triumph in November 1917 was followed by civil war in which Britain gave some support to the counter-revolutionaries (the Whites). Anglo-Soviet relations in the inter-war years were at best distant and usually frigid. Despite the rise of Nazi Germany from 1933 it was not until the British guaranteed Poland in March 1939 that they saw the need for some sort of agreement with the USSR. The half-heartedness of British approaches was only partly responsible for Moscow's final decision to opt for the Nazi-Soviet pact in August 1939. From June 1941 Britain and the USSR were allies in the war against Germany, the Anglo-American landings in northern France in June 1944 being dependent on the Soviet pressure on Germany in the east. But British worries soon began to accumulate concerning the scale and implications of post-war Soviet and communist influence in Europe. For 40 years from the late 1940s Britain was

deeply involved in the \*Cold War struggle with the USSR, though the governments of \*Churchill, \*Eden, and \*Macmillan in particular helped to pioneer the search for greater restraint in the conduct of East-West rivalries. CJB

**Russia Company.** The pioneers of a North-East Passage to Russia were rewarded by the English government in 1555 with a trading charter with exclusive rights. The tsar also granted them special privileges. The charter was confirmed by an Act of 1566. Fur and timber were imported, cloth exported. Dutch competition and the tsar's hostility to a republican regime made difficulties during the Commonwealth and the company ceased to trade corporately. The monopoly was opened up by an Act of 1699 and trade with Russia flourished in the 18th cent. JAC

**Rutherford, Ernest** (1871–1937). Rutherford's work in radioactivity and nuclear physics changed our views of matter. He was born in New Zealand, and on graduating won a scholarship to go to Cambridge to work with J. J. \*Thomson. In 1898 he went to McGill University in Canada, where he proved that radioactivity was subatomic chemical change: one element was turning into another spontaneously, but at a definite rate. This new alchemy made his reputation. In 1907 he moved to Manchester, and in 1919 succeeded Thomson at the Cavendish Laboratory in Cambridge, where he built up one of the greatest research schools in the history of science, far more than the sum of its parts. Artificial nuclear fission, and the existence of neutrons, were among the facts demonstrated there. The bluff Rutherford was especially good at devising relatively simple and decisive experiments. He was made a peer in 1931. DK

**Ruthven raid,** 1582. This was an episode in the faction fighting during the minority of James VI of Scotland. Resentful of the influence of the king's cousin Esmé Stuart, who led the pro-French and pro-catholic party and had been created earl in 1580 and duke of \*Lennox in 1581, a protestant group, led by the 1st earl of \*Gowrie, seized the 16-year-old king and held him captive for ten months. Stuart was forced to return to France but James escaped in June 1583 and took refuge in St Andrews. An insincere reconciliation was followed in 1584 by Gowrie's execution. JAC

**Ruthwell cross** (Dumfries and Galloway). Though now heavily restored, this carving epitomizes the classical tastes of early Anglo-Saxon monastic art. Originally some 17 feet high, it is elaborately decorated on all four sides. The narrow faces carry full-length panels of vine-scroll; around their borders is a runic text of part of the Old English poem *The Dream of the Rood*. The broader faces are divided into a series of deeply cut figural panels whose iconography, and accompanying Latin inscriptions, focus on the recognition of Christ's divine power, particularly as expressed in the eucharist. The carving probably dates to the first half of the 8th cent. RNB

**Rutland** was for more than seven centuries a tiny county, some 17 miles across, and only one-fortieth the size of Yorkshire. It had no clear geographical definition but was pleasant, gentle, wooded countryside, hunted from the 1720s by

the Cottesmore. There were only two towns, Oakham, the county town, and Uppingham, famous for its school, founded in 1584.

In the early Saxon period, Rutland formed part of the kingdom of the \*Middle Angles, and then of \*Mercia. The existence close at hand of Stamford, one of the five Danish boroughs, must have meant considerable Viking influence, at least in the eastern half. It had not acquired county status by the time of the Norman Conquest, but was given as their personal property to successive queens. When John granted it to \*Isabella in 1204, it was described as a county, and at the end of the century was given two knights of the shire, like the other counties. In the absence of much middle-class element, Rutland was totally under the domination of the gentry and nobility, particularly the owners of Exton, Burley-on-the-Hill, Normanton, Whisendine, and the Cecils of Burghley, near Stamford. Elections were very rarely contested, and the Noel family held one seat from 1727 until 1883, save for 1841–7. The county lost one of its two seats in 1885.

During the Civil War, Rutland was under parliamentary control and formed part of the Midland Association, though there was skirmishing and raiding. The population in the 1970s was no more than 25,000, of whom 5,000 lived in Oakham. By the Local Government Act of 1972 the county was merged with Leicestershire, though a vigorous protest movement continued. The campaigners triumphed in 1997 when Rutland was restored as a unitary authority. JAC

**Rye House plot, 1683.** This quasi-republican plot, the plans for which were never finalized, was directed against the persons if not the lives of Charles II and James, duke of York. Disclosed to the crown in June 1683, it would have involved intercepting the royal brothers at the Rye House (near

Hoddesdon, Herts.) on their return from Newmarket. This return had in fact been brought forward owing to a fire at Newmarket, and hence the plot was forestalled. Charles II could now be quite relentless in upholding James's succession rights after \*Exclusion's failure, and such opponents as \*Russell and \*Sidney suffered through a wide application of treason law. DDA

**Rysbrack, John Michael** (1694–1770). Flemish-born sculptor, who settled in England about 1720 and was soon making portrait busts for most of the leading men of his day, often using a classical style new to Britain, as in his statue of Sir Robert \*Walpole as a Roman senator, in Houghton Hall (Norfolk). A prolific artist, especially skilful in handling equestrian subjects, for instance his William III in Bristol, his approach was simple and dignified. Although \*Roubiliac overtook him in popularity, Rysbrack remained a formidable rival. There are numerous monuments in Westminster abbey and other examples of Rysbrack's work in the Royal Collection, cathedrals, noble houses, and galleries throughout Britain. JC

**Ryswick, treaty of, 1697.** In July 1697 the treaty brought to an end the \*Nine Years War, in which Louis XIV's France faced a grand coalition of England, the emperor, the Dutch, and Spain. Louis agreed to return most of his territorial acquisitions or *réunions* made since \*Nijmegen, but retained the important fortress town of Strasbourg. He recognized William III as king of England while refusing to order James II to leave French territory. The Dutch were allowed to garrison \*barrier fortresses in the Spanish Netherlands. The treaty, negotiated with much difficulty, lasted only four years before the \*War of the Spanish Succession broke out. JAC

**sabbatarianism.** Strict observance of the sabbath (Hebrew *shabbath*—to rest) as a rest-day in accordance with the fourth commandment 'Remember the sabbath day, to keep it holy'. Christians transferred commemoration from the traditional seventh day to Sunday to honour Christ's resurrection—by worship rather than absence of work. Nevertheless Constantine decreed limits of Sunday work (321). Sabbatarianism was uniquely enforced by 17th-cent. English and Scottish presbyterians, especially in the \*Interregnum. For puritans sabbath-keeping had to be total. Puritan magistrates' inflexible enforcement led James I to issue his \*book of sports (1618, reissued in 1633), allowing sabbath participation in morris-dancing, maypole, and rush-bearing. Vehemently opposed as 'iniquity established by law', this prompted many to emigrate to America. Eighteenth-cent. church courts were still hearing cases of sabbath-breaking by work, 'tippling', or games. The evangelical revival made sabbatarianism fashionable, so that on a Victorian Sunday there was no sport or pleasure, not even reading of serious secular literature. In the 20th cent. there was progressive relaxation until by the 1990s Sunday trading was freely allowed. WMM

**sac and soc.** Medieval legal phrase, possibly of Danish origin, referring to manorial jurisdiction. It was at the expense of the hundred court, though not the county court. Though each word had its original and precise meaning, it became what Stubbs called 'a mere alliterative jingle', which did not bear close analysis. The phrase survived in the privilege of the soke of Peterborough, where special jurisdiction over eight hundreds was granted to the abbey of Peterborough. JAC

**Sacheverell riots, 1710.** These erupted in London's West End on the night of 1/2 March 1710 following the third day of the impeachment of Dr Henry Sacheverell. This outspoken high Anglican Oxford don was on trial at Westminster Hall for publishing a sermon condemning the Whig government for undermining the fabric of church and state through its favouritism towards dissenters. Rioters from a broad cross-section of London society, inspired with church fervour and anti-government hatred, demonstrated their sympathy for the doctor by sacking and burning six prominent dissenting chapels. The trial and the riots heralded the collapse of the \*Godolphin ministry in August. AAH

**Sacket's harbour, battle of, 1813.** During the \*War of 1812, British and American forces struggled for control of Lake Ontario. In May 1813 Sir George Prevost, governor-general of Canada, launched an attack upon the American base at Sacket's harbour, at the east end of the lake, but was repulsed. Initial success was cancelled by Prevost's caution. JAC

**Sadler, Sir Ralph (1507–87).** Sadler spent much of his life among the Scots, a nation he thought 'unreasonable, rude, beastly and inconsistent'. But at least he was rewarded and died a wealthy man. His career began under the patronage of Thomas \*Cromwell. He was made a gentleman of the privy chamber in 1536, knighted in 1538, and appointed a secretary of state in 1540. Though he served in most of the parliaments during his lifetime, he was not of the first rank as a speaker. He was employed in several missions to James V of Scotland and after his death in 1542 returned to try to negotiate a future marriage between Prince Edward and Mary, queen of Scots. When this went wrong and resulted in war, Sadler took the field. A strong protestant, he was under a cloud in Mary Tudor's reign but on Elizabeth's accession was sent back to Scotland to foster the reforming party. In 1568 he negotiated with the Scots over Mary and forwarded the incriminating Casket Letters. In 1569 he helped to suppress the rising of the \*northern earls. His last active service was to have charge of Mary, 1584–5. From 1568 he was chancellor of the duchy of Lancaster. Small in stature, he was reputed competent and honest. JAC

**sailing** covers a great range of activity from ocean racing to 12-foot dinghy competitions, or merely messing around in boats. At the top end of the sport is the America's Cup, preserve of millionaires and syndicates, and named after the famous yacht which caused such a sensation when it visited Cowes in 1851. The Fastnet race, started in 1925, is from Cowes to Ireland and back to Plymouth. Yachting was admitted to the Olympics in 1908. The governing body is the Royal Yachting Association, which organizes Cowes week in August. There is a Dinghy Cruising Association, and large numbers of local competitions are arranged by clubs, in rivers and estuaries, gravel pits and reservoirs. JAC

**St Albans, battle of, 1455.** The first battle of St Albans on 22 May was little more than a hand-to-hand skirmish in the streets of the town. But since it ushered in the Wars of the

\*Roses, the consequences were important. Richard, duke of \*York, had marched south, demanding from Henry VI the dismissal of his rival the duke of \*Somerset. The Yorkist victory was largely owing to Richard, earl of \*Warwick ('the Kingmaker'). Somerset and his supporters Northumberland and Clifford were killed, Henry VI captured, watching the proceedings. JAC

**St Albans, battle of,** 1461. The second battle of St Albans took place on 17 February 1461. Queen \*Margaret hastened south to exploit her crushing victory at \*Wakefield and rescue her husband Henry VI, held captive by \*Warwick. The Yorkists were again defeated, despite some novel netting traps and devices, but Warwick salvaged some troops and joined the future Edward IV from Wales. Henry VI was released by his queen, who failed to follow up her advantage and allowed Edward to beat her to London. JAC

**St Albans, diocese of.** Now conterminous with Bedfordshire and Hertfordshire, the see was founded in 1877 from parts of the \*Rochester diocese (Herts., Essex and north Woolwich). This was a failure, and Essex and north Woolwich were removed in 1914 to form the new see of \*Chelmsford; in return St Albans gained Bedfordshire from \*Ely, a more natural liaison. The city, well known for its early history as \*Verulamium, a principal Romano-British city, was where St \*Alban, the first British martyr, reputedly met his death. Because of this Pope Hadrian IV gave its wealthy Benedictine abbey, founded by \*Offa of Mercia c.794, special precedence over all other English monasteries. Its abbot headed his colleagues in 14th-cent. parliaments. \*Matthew Paris, the medieval chronicler, was a St Albans monk from 1217 to 1259. The cathedral is the former abbey church, which served the parish after the \*dissolution. Built between 1077 and 1088 to replace the original Saxon church of Offa, it is basically Norman with 13th-cent. additions. Its exterior is the second longest (521 feet) in Europe, after \*Winchester. Recently a new chapter house has been completed (1982) and St Alban's shrine restored (1993). WMM

**St Andrews** is a city, royal burgh, and university town in the north-east of the county of Fife in Scotland, some 55 miles north of Edinburgh. It developed from a royal fortress of the Picts situated on the site later built over by St Andrews castle. Celtic clergy were attracted to nearby Kilrymont. Never technically part of the medieval burgh, this area fostered the cult of St \*Andrew, which became national. Between 1160 and 1318 was built the cathedral which with its 357-foot long nave was the largest church in Scotland.

A municipality was erected under Bishop Robert around 1140. In 1412–13 Bishop Wardlaw and Pope Benedict XIII incorporated and chartered St Andrews University, the nation's first. An important medieval town, and from 1472 the seat of an archbishop, St Andrews was a cockpit of the Reformation. John \*Knox retired there, while Andrew \*Melville, father of Scots presbyterianism and bane of King James VI and I, was head of St Mary's College. Still the university of Scotland's aristocracy in the 17th cent., it declined in the 18th due to Jacobite associations, reviving in the 20th. Uniquely good

golfing facilities helped the town to become a residential and resort centre from the mid-19th cent. BPL

**St Asaph, diocese of.** It is claimed that the church at St Asaph (Llanelwy) was founded by St Kentigern (Mungo), a fugitive from Strathclyde, in the 6th cent. The cathedral, however, bears the name of his successor, Asaph. Later, as a territorial diocese, the see approximated to the native Welsh principality of Powys, extending from the Conwy in the west to the Dee in the east, and as far south as Newtown in Montgomeryshire. The area of the diocese remains little changed today, and is made up of contrasting regions. Many of the popular north Wales coastal resorts, the industrial heartland of Deeside, the populous town of Wrexham, and the largely Welsh-speaking upland farming districts of Merionethshire come within its borders. The ancient Welsh *clas* (monastic community) at St Asaph seems to have survived into the 12th cent., for the Norman diocese dates only from 1143, and serious work on the cathedral—the smallest in England and Wales—does not seem to have begun before 1230. Most of the church dates from the 14th cent. Severely damaged in the Owain \*Glyndŵr revolt, and again under the Commonwealth, it was subject to a major restoration by Gilbert \*Scott between 1867 and 1875. JRG

**St Brice's Day massacre,** 13 November 1002. Considered a cardinal blunder committed by King \*Æthelred, who is said to have ordered the killing of all Danes in England on that day. This is scarcely credible, considering the numbers involved. Yet some action was taken, probably provoked by Pallig, the Dane who, after taking Æthelred's gifts, broke his pledge of loyalty by joining raiders ravaging the south coast. The murder of Pallig's wife Gunnhild, sister of the Danish king \*Sweyn, may well have provoked Sweyn's invasion in 1003, which was followed by continual onslaught, until in 1017 a Danish king was on the English throne. AM

**St Christopher and Nevis** are part of the \*Leeward Islands in the eastern Caribbean and form an independent republic within the Commonwealth. The islands were visited by Columbus and for some time disputed between Spain, France, and Britain. They were confirmed as a British colony at \*Utrecht in 1714. The principal resources are sugar and tourism. JAC

**St Davids, diocese of.** The cathedral of St \*David, which still houses the bones of the patron saint of Wales, is one of the outstanding buildings in the principality. On the site of David's monastery, famous as a centre of learning and for the austerity of its community life, the present cathedral dates from the early 12th cent. and the episcopate of Bishop Bernard. Bernard persuaded Pope Calixtus II to canonize David, and also to decree that two pilgrimages to St Davids were equal to one to Rome, a decision which ensured the popularity of the shrine until the Reformation. Bernard's church was entirely rebuilt by Peter de Leia (1176–97) and enlarged in the 14th and 15th cents. The diocese originally covered the greater part of south-west and mid-Wales, until 1923 when the newly created see of Swansea and Brecon removed Breconshire, Radnorshire, and parts of west Glamorgan from its jurisdiction. It is largely rural, and much of

## Saint-Germain

the population bilingual, with few large towns other than Llanelli. In the years since Bernard there have been many notable bishops, including the protestant martyr Robert \*Ferrar, William \*Laud, and the distinguished patristic scholar George Bull. JRG

**Saint-Germain, treaty of**, 1919. Peace treaty with Austria after the First World War, signed on 10 September 1919. Austria lost all the non-German parts of her former empire. South Tyrol went to Italy; Slovenia, Bosnia-Herzegovina, and Dalmatia to Yugoslavia; Bohemia and Moravia to Czechoslovakia; Galicia to Poland; and the Bukovina to Romania. The union of Austria and Germany was forbidden and the Austrian army was restricted to 30,000 men. Austria was made liable for reparations and a note attached to the treaty declared that Austria must take her share of responsibility for the war. RAS

**St Germans, diocese of**. \*Aethelstan created this specifically Cornish see by dividing the see of \*Crediton in 931, though the Celtic church, \*Canterbury, and Crediton had in turn provided episcopal oversight for the region. Poverty enforced its reunion with Crediton in 1027. The combined see moved to \*Exeter in 1050. WMM

**St Helena**, a volcanic island in the South Atlantic, is 1,200 miles from Africa and 1,800 from South America. With a length and breadth of 10 miles by 6, it is roughly the size of Jersey. The \*East India Company took possession of it in 1659 as a port of call and it has been a British colony ever since. The capital is Jamestown and the population more than 5,000. The British government, much exercised after \*Waterloo to know what to do with their unwelcome guest the Emperor Napoleon, found it more secure than Elba, from which he had escaped without difficulty. Lord \*Liverpool described it as 'particularly healthy' and 'the safest station that could be found'. Bonaparte spent the last six years of his life at Longwood, under the anxious supervision of the governor, Sir Hudson Lowe. JAC

**St James's palace**, though still nominally the headquarters of the British monarchy, since ambassadors are accredited to the court there, is not well known and has been much patched. Originally it was the leper hospital of St James's. Henry VIII purchased the property, still in the fields outside London, in 1532 and began building round four courtyards. The basic pattern is still red-brick Tudor. His daughter Mary liked the place and her heart and bowels were buried at the Chapel Royal. Prince \*Henry and his younger brother Prince Charles held court there and Charles II, when prince of Wales, escaped from custody there in 1648. During the Commonwealth, it was used as a barracks. At the Restoration, Charles began its renovation and the park, with its lake, was laid out. Nearby Pall Mall was the pitch for the fashionable croquet-like game which the royal princes brought back from their exile in France. The palace was greatly used during the next 100 years, since \*Greenwich had been given up and \*Whitehall was burned in 1698. The 'warming-pan baby', later to become the Old Pretender, was born there in June 1688, when the palace was the residence of James II's wife \*Mary of

Modena. Queen Anne spent most of her time there and at Kensington palace, and the  $\frac{2\frac{1}{2}}$ -year-old Samuel \*Johnson was taken to St James's to be \*touched for the evil by the queen in 1712. George II and Caroline spent much time there and it was to St James's that Frederick, prince of Wales, hustled his wife, in labour, in 1737. Damaged in a fire in 1809, the palace was still much used by Victoria, who was married in 1840 in the Chapel Royal. But gradually \*Buckingham palace replaced it for most state occasions, and St James's is now given over to grace-and-favour residences and used only occasionally for grand receptions. JAC

**St Kitts**. See ST CHRISTOPHER.

**St Leger, Sir Anthony** (c.1496–1559). Lord deputy of Ireland. Of a Kentish family, St Leger married the niece and heiress of \*Warham, archbishop of Canterbury, and rose under the patronage of Thomas \*Cromwell. In 1537 he was leader of a commission to report on Irish affairs and was knighted in 1539. In 1540 he succeeded \*Grey as deputy of Ireland, with a policy of reasserting royal authority, a first step being Henry VIII's adoption of the title king of Ireland. Several of the Irish chiefs, and particularly \*O'Neill, were brought to submit. St Leger was given the Garter. He was retained in office on Henry's death in 1547 but returned to England in 1548. When his successor died shortly afterwards, St Leger was sent out again but recalled in 1551 on suspicion of being too conciliatory towards Irish catholics. Mary's reign saw him reinstated for the third time (1553) and he served until 1556, when accusations of peculation were brought against him. His long term of office gave some coherence to English policy and he was credited with a cautious and moderate approach. JAC

**St Lucia** is one of the \*Windward Islands in the eastern Caribbean and an independent member of the Commonwealth with the queen as head of state. It became a French colony in the 17th cent., and changed hands frequently in the 18th cent. before being ceded to Britain in 1814. It relies upon bananas and tourism. JAC

**St Michael and St George, Order of**. The order was founded by the prince regent in 1818 and is reserved mainly for diplomats. Originally it commemorated British rule over Malta and the Ionian Islands, but the scope has been widened. There are three classes—Knight Grand Cross, Knight Commander, and Companion, with the equivalent female rank of Dame. The order's chapel is in St Paul's. JAC

**St Paul's cathedral**. The first cathedral was founded by \*Æthelbert, king of Kent, on the site of a former Roman temple (604); destroyed by fire, it was rebuilt in stone (675–85) by Bishop Earconwald, whose shrine attracted many medieval pilgrims, but was destroyed by Vikings (962). The third building burned down in 1087, and its replacement, known as 'Old St Paul's', outshone anything previously seen in London. Initially in Norman style, it developed into a great Gothic cathedral with a towering spire, the largest church in England and third largest in Europe. The spacious walled precincts contained Paul's Cross, an

open-air pulpit, whence papal bulls, royal proclamations, and impassioned sermons, while the cathedral itself was used for royal ceremonies and thanksgivings. Deprived of much of its revenue by the Reformation, structural decay set in; houses and shops were erected against its walls, and the nave became a common thoroughfare ('Paul's Walk') and place for conducting business. Repairs were makeshift until Inigo \*Jones altered the west front and attempted to strengthen the entire fabric (1634–43), but the parliamentarians turned the nave into cavalry barracks and appropriated the rest of the repair fund. A 'loathsome Golgotha' by 1660, \*Wren offered a design to the 1663 royal commission, but, although it had been hoped that the cathedral would escape the conflagration, the only thing to survive the Great Fire was John \*Donne's effigy. Wren's 'Warrant Design' was approved in 1675, fortunately permitting 'variations, rather ornamental than essential', of which he took full advantage; progress was slow, but it was completed within his lifetime. A resting-place for naval and military commanders (\*Nelson, \*Wellington) as well as Wren himself, it has continued as a focus for state services, surviving the Blitz and retaining a close relationship with the city, although its skyline dominance has lessened from recent office-building.

ASH

**Saints, battle of the**, 1782. This was the last important naval action in the \*American War of Independence. The loss of naval superiority in the western Atlantic in 1781 forced \*Cornwallis to surrender at \*Yorktown. The French and Spanish then began picking off British West Indian islands and an invasion of Jamaica was expected. \*Rodney left Plymouth in January 1782 with reinforcements and on 10 April 1782 won an important victory over de Grasse at the battle of the Saints in the Leeward Islands. The British had a slight superiority in capital ships. The French lost seven vessels, de Grasse was captured, and the threat to Jamaica removed. Though too late to affect the war with the American colonies, Rodney's victory enabled Britain to make a respectable peace with France and Spain, and he received the thanks of Parliament and a peerage. JAC

**St Vincent and the Grenadines** form part of the \*Windward Islands in the eastern Caribbean and are an independent state within the Commonwealth. They are believed to have been named by Columbus but became a French colony until ceded to Britain by the peace of \*Paris in 1763. The chief exports are arrowroot, sugar, and bananas. JAC

**Salamanca, battle of**, 1812. In July 1812 the French, under Marshal Marmont, with 42,000 men manœuvred to cut \*Wellington off from his base in Salamanca. Wellington, with 46,000 men, gave ground and appeared to retreat. On 22 July, 6 miles south of the city, Marmont sent his leading division to harass the British. However Wellington was already in position, quickly overcame the division, and then attacked Marmont's centre with a deadly rifle volley and bayonet charge. Marmont was wounded and the French were driven from the field with losses of 13,000. Wellington had destroyed the main French army in Spain and Joseph

Bonaparte, the French puppet king, was forced to evacuate Madrid. RAS

**Salesbury, William** (c.1520–c.1584). Welsh scholar. Born in Denbighshire and educated at Oxford, Salesbury studied law. He converted to protestantism and began writing in the Welsh language. His collection of Welsh proverbs, published in 1546, is said to have been the first book printed in Welsh. Salesbury followed it with a Welsh–English dictionary in 1547. In 1563 he was commissioned to translate the Bible and Book of Common Prayer into Welsh, within four years. By 1567 only the New Testament was ready. Salesbury did not complete his translation of the Old Testament and his New Testament was replaced by a revised version, issued by William \*Morgan in 1588. JAC

**Salisbury** (Sarum). Cathedral city in Wiltshire. It originated with an Iron Age hill-fort which housed successively a Roman, Anglo-Saxon, and Norman town. In the 1070s it acquired a cathedral, which in the 12th cent. was a major intellectual centre. In 1219 the bishop moved to a new, level site 1½ miles south; a large cathedral was built in uniform style c.1220–1320, its tower crowned by the tallest surviving medieval spire in Europe. The bishop also laid out a new town on a grid plan, the best-known planned town of medieval England. The city flourished through the cloth industry, becoming the fourth largest English town in the 15th cent.; acquired independence from the bishops in 1612; and lost its cloth industry in the 18th cent. The original town (\*Old Sarum) had long been deserted, and was the most notorious of the \*rotten boroughs until disfranchised in 1832. DMP

**Salisbury, diocese of**. Now roughly coterminous with Wiltshire and Dorset, the see was founded c.1075 when the West Saxon bishopric of \*Sherborne, united with \*Ramsbury in 1058, was moved to Old Sarum. From 1496 to 1499 the Channel Islands, previously under Coutances, were temporarily attached to Salisbury before passing on to \*Winchester. In 1542 Dorset and some Wiltshire parishes were incongruously assigned to the new Bristol diocese until 1836, when Salisbury regained Dorset. Bristol retains the north Wiltshire deaneries. Some medieval bishops were significant as officers of the crown. Most distinguished of all, perhaps, was \*Roger of Salisbury (1107–39), responsible, as Henry I's justiciar, for major developments in royal administration. Others include Hubert \*Walter (1189–93), later archbishop and justiciar under Richard I and John; Richard Poore (1217–28), scholar and noted ecclesiastical administrator; John Waltham (1388–95), treasurer of England in the turbulence of Richard II's reign; Gilbert \*Burnet (1689–1715), historian and Whig supporter of William III. The Norman cathedral, built next to the castle by Osmund the first bishop, at Old Sarum, north of the modern city, is now a ruin, but replaced on lower ground by the present magnificent cathedral, conceived by Herbert Poore (1197–1217), begun by his brother Richard in 1220, and completed c.1258. The exterior is a splendid example of Early English architecture with its slender 14th-cent. spire, the tallest in England, rising 404 feet above the water-meadows.

## Salisbury

Liturgically important was the Sarum Rite, largely compiled by Richard Poore, widely used in the late Middle Ages and an important source for the 16th-cent. English Prayer Book. WMM

**Salisbury, Robert Gascoyne-Cecil, 3rd marquis of** (1830–1903). Prime minister. Salisbury was an unlikely candidate for such a long tenure of the premiership. A younger son of an ancient Tory house, he was intellectual, withdrawn (with little taste for aristocratic sports) and unsociable, seriously high church, sharp-edged in political controversy. From 1863, at odds with his family over his happy but non-aristocratic marriage, he supplemented his allowance by regular journalism (over 600 *Saturday Review* articles and 33 for the *Quarterly Review*), so that we have more of his thinking in print than that of any other prime minister. Though he was an MP for a family borough from 1853 and in \*Derby's cabinet in 1866, his prickliness and rigidity made him an awkward colleague and a natural resigner. Anti-democratic and anti-populist in both instinct and argument and long distrustful of \*Disraeli as a political mountebank, Cranborne (as he then was) resigned with two cabinet colleagues in early 1867 over the borough franchise proposals in the government's Reform Bill. Out of office he remained a trenchant critic of Disraeli and a standing threat to his leadership. In 1869 he succeeded to the marquissate and the great house at \*Hatfield, and succeeded Derby as chancellor of Oxford University and a foremost defender of its Anglican character. He agreed reluctantly to join the government of 1874, clashed with Disraeli over the Public Worship Regulation Bill and was clearly a potential dissident in the Eastern Question crisis. Disraeli had, however, worked to cultivate Salisbury, and when Derby and \*Carnarvon resigned in the critical moment in early 1878 Salisbury threw in his lot with Disraeli and accepted the Foreign Office. His motives seem to have included a desire to effect a desperately needed settlement (which he helped Beaconsfield to do at the Congress of \*Berlin) and a distrust of colleagues, a realization of the importance of the Conservatives' hold on office and of resisting \*Gladstone's campaign in the country, and an ambition to succeed the ageing Beaconsfield. When the latter died in 1881, Salisbury became party leader in the Lords and co-leader of the whole party with \*Northcote. Angered by Liberal land legislation for Ireland, he played a leading role in the obstruction of Liberal measures in the Lords, including the 1884 Franchise Bill which was held up until accompanied by a Redistribution Bill, and began to elaborate a theory of the governmental mandate to regulate relations between the two Houses. Helped by \*Churchill's insubordination in the Commons, Salisbury got the better of his rival Northcote, a more centrist and emollient figure, and in 1885 was the premier in the Conservative caretaker government. He maintained a tactical ambiguity in Irish policy to assist an informal electoral alliance with the Irish party, but, once Gladstone had declared for \*Home Rule after the election, Salisbury mounted a resolute defence of the Union and skilfully exploited Liberal divisions. By summer 1886 he was back in office, though still without a Conservative majority and dependent on the support of the \*Liberal Unionists.

This uncomfortable position lasted until 1892 and Salisbury had to make various policy concessions (over Irish land purchase, education, and county councils, for example) to conciliate his allies, particularly the demanding \*Chamberlain. This made Salisburian government look more progressive than it would otherwise have done. By 1887 Salisbury had disposed of both Northcote and Churchill and in 1891 he installed his nephew \*Balfour, who had made his name with a policy of resolute coercion in Ireland, as leader in the Commons. (Nepotism became a feature of Salisbury's ministries and was resented by those outside the Hatfield circle.) For most of his time as premier Salisbury held the Foreign Office rather than the 1st lordship of the Treasury, though the arrangement reflected no lack of interest in domestic politics. In diplomacy he displayed a skill which kept policy on a steady track and away from the alternating extremes of Gladstone and Disraeli earlier; he saw bipartisanship as the ideal. He also kept Britain clear of entangling alliances (the ironic description \*'splendid isolation' has stuck to this policy), though he was a successful negotiator in reconciling differences over colonial claims.

In opposition Salisbury led the Lords in its overwhelming rejection—by 419:41—of Gladstone's second Home Rule Bill in 1893. He was also ruthless in exploiting the queen's Unionist preferences; some of his confidential dealings with her from opposition went beyond accepted constitutional bounds. After the Liberal resignation in 1895 Salisbury brought the Liberal Unionists under Hartington into a formal coalition with the Conservatives and this Unionist government won the election and another in 1900 (the 'khaki' election) when the opportunity of the \*Boer War was seized. By now Salisbury's vigour was declining—the approach to war had seen Chamberlain rather than the premier in control of policy—and his policies were looking dated to younger politicians. He resigned the Foreign Office in 1900 and the premiership in 1902. He did not live to see the sharp divisions caused within Unionism by Chamberlain's tariff reform campaign.

Though Salisbury spent a notable proportion of his later career in office, his governments were either minorities or Unionist coalitions, so that, outside diplomacy, he never had the command of policy to which he aspired. Over the church, which remained dear to his heart, his governments disappointed him. Though a high aristocrat at a time when events were moving against the aristocracy, he recognized the importance of cultivating middle-class and urban opinion, particularly after the 1885 Redistribution Act, and gave firmer support to central office and extra-parliamentary organizations, overseen by the party agent 'Captain' Middleton, than his predecessors had done. He was a free market ideologue, reflecting the spread of \*laissez-faire ideas from the Liberals to the political right, and an upholder of property rights at a time when bourgeois property, alarmed by Irish developments, trade unionism, and intellectual socialism, was moving rightwards. The Conservative Party became more responsive to business interests (the city of London swung its way) and more hostile to trade unionism; the \*Taff Vale case came at the end of Salisbury's premiership. His success owed much to Gladstone's talent for

wreaking havoc upon the Liberal Party, and upon the Liberal Unionist Hartington's support from 1886 onwards. In his later years Salisbury became more relaxed about the simplistic fears of veiled class war—the have-nots plundering the haves—which he had expressed in his early writings. Much of Salisbury's politics had dated by the end of the century and modern Conservatives have tended until recently to make little of him in comparison with more presentable figures like \*Peel and Disraeli. Salisbury was too much the anti-democrat, too much the free marketer, for his party's comfort in an age of democracy and welfare economics. Only in the \*Thatcher era did his reputation improve and his politics find reappraisal. The toughness and ruthlessness he displayed in his party's interests as well as his own do not easily date.

Blake, R., and Cecil, H. (eds.), *Salisbury: The Man and his Policies* (1987); Roberts, A., *Salisbury: Victorian Titan* (1999).

**Salisbury, Robert Gascoyne-Cecil, 5th marquiss of** (1893–1972). Conservative politician. Cecil entered Parliament in 1929 and served as junior minister at the Foreign Office. He resigned in February 1938 in support of \*Eden's opposition to opening talks with Mussolini. Returning to government under \*Churchill, he was spoken of as a possible foreign secretary. His peerage—after elevation to the Lords in 1941—was felt to be a handicap for such an office. He continued to prosper after the war, particularly as a result of his close friendship with Eden, and he was one of the more prominent cabinet members during the Suez crisis of 1956. On domestic issues, however, he found himself at odds with the thrust of post-war Conservatism and soon lost sympathy with the premiership of Harold \*Macmillan. The occasion of his second resignation was the freeing of the Cypriot leader Makarios from imprisonment in 1957. In his later years he became a focal point for right-wing dissatisfaction, especially through his association with the Monday Club and his support for the white regime in Southern Rhodesia.

DJD

**Salisbury, Thomas Montagu, 4th earl of** (1388–1428). Like John Holand (\*Exeter), Salisbury was restored by Henry V to estates forfeited by his father. He amply earned this favour by outstanding service in the French war from 1415 onward. He held Normandy after \*Clarence's defeat and death in 1421. He remained there after Henry's death and was \*Bedford's principal field commander. He defeated the French at \*Cravant, took part in Bedford's victory at \*Verneuil, and captured Le Mans. Salisbury began the siege of \*Orléans but died, an irreparable loss, before Joan of Arc's campaign.

RLS

**Salisbury, Richard Neville, 5th earl of** (1400–60). Neville was the first son of the (second) marriage of Ralph, 1st earl of \*Westmorland, and \*John of Gaunt's daughter Anne Beaufort. From 1420 to 1436 he was warden of the west march. Here he built Penrith castle after he inherited his father's estates in Cumberland and Yorkshire in 1425, in accordance with a settlement which impoverished the 2nd earl of Westmorland. Royal offices increased his north country dominance. He gained the earldom of Salisbury by marriage

to its heiress. He served in France in 1431–2 and 1436–7. Warden again from 1443, he remained a member of the Beaufort faction controlling the king's council, to his profit both financially and as a source of patronage to his retainers. Percy opposition to his regional preponderance led to violence in which his son John was a ringleader, and became a reason for Salisbury's breach with the court after 1453 and his alliance with Richard of \*York. He was chancellor in York's first protectorate and fought with him at \*St Albans; in 1459, at \*Blore Heath (Staffs.), he defeated royalist forces opposing his junction with York. Following the Yorkist collapse, he was attainted and took refuge at Calais, returning with his son \*Warwick to defeat the royalists at \*Northampton. He was murdered after the battle of \*Wakefield, probably by Percy retainers.

RLS

**Salisbury, Margaret Pole, countess of** (1473–1541). Margaret Plantagenet was a daughter of George, duke of \*Clarence, and a niece of Richard III. She married Sir Richard Pole who died in 1505. After the execution of her brother the earl of \*Warwick in 1499, she was sole heiress to the dukedom of Clarence and the earldoms of Salisbury and of Warwick, and was granted the title countess of Salisbury in 1513. From 1520 until 1533 she was governess to Princess Mary and subsequently offered to continue at her own expense. But after her son Reginald \*Pole was made a cardinal in 1536, Henry VIII moved against the Pole family. Her eldest son Lord Montagu was executed in 1539 and her younger son Geoffrey sentenced to death. The countess was attainted in 1539 and executed in the Tower two years later, the executioner bungling the beheading. She was the last of the Plantagenets.

JAC

**Salisbury, oath of**, 1086. In August 1086 William I summoned 'landowning men of any account' to attend at Salisbury and swear allegiance to him and to be faithful against all other men. The oath was demanded at a time of crisis when the Conqueror was facing revolt and invasion. It has been much discussed and has been seen as an attempt to limit the fissiparous nature of feudal obligations: others have argued that the intention was to reinforce feudal duties. There seems little doubt that it was intended as a practical assurance and reminder rather than as a constitutional statement.

JAC

**Salisbury, treaty of**, 1289. When Alexander III of Scotland died in a fall from his horse at Kinghorn in March 1286, he left no children, but a granddaughter, \*Margaret, 'the Maid of Norway', aged 3. A regency was established. In November 1289 commissioners from Norway, England, and Scotland reached agreement at Salisbury, later confirmed by the Scots at \*Birgham. The young queen was to be brought to Scotland within a year and was not to be married without Edward I's consent. His intention was to marry the Maid to his son Edward and unite the two kingdoms. But the death of the young queen in September 1290 on the voyage threw all arrangements into confusion.

JAC

**Salt, Sir Titus** (1803–76). Salt, a worsted manufacturer and creator of the model village of Saltaire, entered the wool trade as a stapler and then moved into spinning (1834). By

## Salvation Army

clever technical adaptation, he exploited supplies of imported fine wools such as mohair and alpaca, manufacturing excellent worsteds for the women's fashion market. A radical Liberal, Salt was a paternalist, who wanted to provide a good environment for his workers; he moved from central Bradford and created Saltaire between 1850 and 1875. He rationalized production, previously in several plants, in one great mill (1853), designed in the Tuscan Renaissance style by Lockwood and Mawson of Bradford and built between the Midland railway line and the river Aire. Housing and community facilities at Saltaire were excellent. Knighted in 1869, Salt contributed to many charities and despite an introverted nature served the city of Bradford in almost every capacity, including MP (1859–61). JB

**Salvation Army.** In 1865 William \*Booth and his wife launched the 'Christian Mission to the Heathen of our Own Country' in Whitechapel (London), and this mission expanded into the Salvation Army (1878). It was both a religious community and an evangelistic agency. Its doctrines were those of evangelical revivalism: sin, conversion, justification by faith, hell, and heaven. At the 'holiness meetings' of the army, the emotional scenes and sudden conversions were reminiscent of early methodist revivals. The aim was to reach out beyond the established churches to working-class non-worshippers at their own cultural level. The officers and soldiers (i.e. members) of the army were themselves working men and women, who had experienced conversion and practised self-denial. At their open-air meetings, with bands and banners and sales of the *War Cry*, they sometimes met with violent opposition. From the late 1880s the army turned to social action, establishing slum posts, night shelters, and schemes for assisting the unemployed. The military organization of the Salvation Army ensured strict discipline of the members under the dictatorship of Booth and (later) his family. A tribute to the success of the Salvation Army was the foundation in 1882 by the Church of England of its own \*Church Army. JFCH

**Sampford Courtenay, battle of,** 1549. The Cornish rebels against the Prayer Book in English in the summer of 1549 declared that they would not accept the new service which was 'but like a Christmas game'. Later in June they crossed the Tamar and laid siege to Exeter. The protector to the young King Edward VI, \*Somerset, was in a difficult position, with widespread risings in Norfolk and other parts of the country. Early in August a punitive force under Lord Russell (\*Bedford) drove the insurgents from Clyst St Mary with heavy loss and relieved Exeter. The remainder were routed on 17 August at Sampford Courtenay, near Okehampton. The Norfolk rising was suppressed at the end of the month. JAC

**Samson** (1135–1211). Abbot of Bury St Edmunds. A Norfolk man, educated in Paris, Samson taught at the abbey, took vows (1166) and was elected abbot in 1182. A shrewd, hard-headed businessman typical of his age, he speedily restored abbey finances after years of mismanagement. Not a great spiritual leader, still less a saint, he was an upright, God-fearing, just, and enthusiastic administrator with qualities

essential for running a 13th-cent. abbey with its numerous estates and buildings; he rebuilt part of the abbey and founded a hospital and a school. Though previously unknown to the papacy, he was drawn into public service by being appointed papal judge-delegate. He led his knights in the siege of Windsor (1193) and travelled to Germany to visit the imprisoned Richard. His powerful local influence, if unpopular, was beneficial in a turbulent age. A man of affairs, he nevertheless wrote an account of the miracles associated with St Edmund's shrine. The abbot was one of \*Carlyle's 'heroes' in *Past and Present*. WMM/JAC

**Samson, St** (c.485–c.565). Born in Wales, educated and ordained at Llantwit (South Glamorgan), Samson's missionary endeavours established his renown in Cornwall, the Channel Islands, and Brittany, where he spent his last years. Establishing the monastery at Dol (Brittany), with which he is linked, he is said to have founded many more in the province. After negotiations with King Childebert in Paris, for Brittany's rightful heir (555), he gained royal approval for a foundation at Pental (Normandy), and seems to have been a signatory at the Council of Paris, c.557. Chief among Breton saints, Samson died at Dol. AM

**Samuel, Sir Herbert, 1st Viscount Samuel** (1870–1963). Samuel's father, who died when Samuel was 7, was a Jewish banker. After taking a first in history at Balliol College, Oxford, Samuel entered Parliament as a Liberal in 1902. In the Liberal government of 1906 he served as under-secretary for the Home Office and entered the cabinet in 1909 as chancellor of the duchy of Lancaster, transferring to the postmaster-generalship the following year. He was home secretary when \*Asquith resigned in 1916, followed him into opposition, and lost his seat at the 'Coupon' election of 1918. In 1920–5 he served as high commissioner in \*Palestine and in 1926 presided over a commission on the coal industry which, by recommending a cut in wages, helped to provoke the \*General Strike. Samuel returned to Parliament in 1929 and was acting leader of the party (in the absence of \*Lloyd George) at the time of the crisis of 1931. He joined \*MacDonald's \*National Government as home secretary but resigned the following year when it moved towards protection. He was given a peerage in 1937. Respected rather than outstanding, Samuel's career rose and fell with the fortunes of his party. JAC

**Sancroft, William** (1617–93). Archbishop of Canterbury. Sancroft was a graduate and fellow of Emmanuel College, Cambridge (1637), but during the Interregnum moved to Suffolk (1651) and then to Europe (1657). He became master of Emmanuel (1662), dean of York, then of St Paul's (December 1664), where he worked closely with \*Wren on the new cathedral, consequently refusing the bishopric of Chester (1668). As archbishop (1678), he hoped to refurbish clerical learning and Anglican discipline, especially through the church courts. He crowned James II (1685), but refused to sit on his Court of \*Ecclesiastical Commission. Leader of the seven bishops petitioning the king against the \*Declaration of Indulgence (1688), he was committed to the Tower, tried, but acquitted. After James's departure, Sancroft refused

to swear allegiance to William, was deprived of his see (1690), and, as the leading non-juror, lived in Suffolk until his death.

WMM

**sanctions.** The economic boycott of a country refusing to follow international conventions. Sanctions were the chief coercive method of the \*League of Nations under article xvi of the covenant. In October 1935 they were imposed on Italy after her invasion of Abyssinia. However, vital materials such as oil, steel, and iron were excluded and Italian trade with non-league members was not disrupted. This undermined the effectiveness of the sanctions, which were lifted in July 1936. More recently, United Nations mandatory sanctions include trade restrictions placed on \*Rhodesia after the unilateral declaration of independence in 1965, on South Africa in the 1980s due to apartheid, and on Iraq following the invasion of Kuwait in 1990. The effectiveness of trade sanctions is questionable as they are easily circumvented. Mrs \*Thatcher stood against other Commonwealth nations in opposing the adoption of sanctions against South Africa as she believed they would have little practical effect and damage the British economy.

RAS

**sanctuary.** Originally open land where the divine was present, but later associated with a religious building or part of it, its sacred character afforded protection where no blood was to be shed. Recognized first in Roman law (4th cent.) and by the church (Council of Orléans 511), Christian sanctuaries were later protected under English common law whereby a fugitive charged with any offence except sacrilege or treason could delay punishment by reaching sanctuary, often by grasping the ring or knocker of any church door. He had the choice of submitting to trial or, clad in sackcloth, confessing crime to a coroner and swearing to leave the kingdom after 40 days, in which case he became an outlaw, forfeiting all his goods and his wife, who was then regarded as a widow. If he did neither, he was starved into submission. Often abused, sanctuary became a source of dispute between church and state. Chief Justice \*Tresilian was seized from sanctuary and executed (1388). Archbishop \*Bourchier threatened to excommunicate lay officers who breached sanctuary (1463). It was even more abused by political fugitives in the Yorkist–Lancastrian struggles, especially in Westminster and St Martin-le-Grand, London, by debtors, and ‘a rabble of theues, murtherers and malicious heyghnous Traitours’. Pope Innocent VIII (1487) and Henry VIII (1540) limited the privilege, the latter to seven cities. Sanctuary was abolished for criminals (1623) and for civil cases (1723).

WMM

**Sandringham House** (Norfolk) is the private country estate of Her Majesty the Queen. Sandringham has been owned by four generations of monarchs, starting with Edward VII who bought it in 1860 when prince of Wales. At first he made only minor alterations, but in 1870 he and Princess \*Alexandra started to rebuild the house to the designs of the architect Albert Jenkins Humbert (1822–77), a royal favourite whose work includes the mausoleum at Frogmore and Whippingham church, near Osborne on the Isle of Wight. The style adopted at Sandringham was Elizabethan,

the materials a harsh red brick and stone dressings. After Humbert’s death, Sir Robert William Edis (1839–1927) acted as the architect for a ballroom in 1883 and further additions in 1891 following a fire. The elaborate main entrance-gates in wrought and cast iron are by Thomas Jeckyll and were shown at the International Exhibition in London of 1862. Sandringham House contains royal portraits and collections of porcelain, jade, quartz, and enamelled Russian silver, whilst royal memorabilia are displayed in the museum in the grounds. King George VI was born at York Cottage, Sandringham, and died in 1952 at the house.

PW

**Sand River convention,** 1852. Appointed governor of Cape Colony and high commissioner in southern Africa in 1847, Sir Harry Smith tried at first to reimpose British authority over the people of Dutch descent—Boers (Afrikaners)—who, dissatisfied with British rule, had quitted the colony some years earlier. The realization that such a policy might lead to endless strife forced Smith to reconsider his plan and to approve the Sand river convention which recognized the independence of Boers living north of the Vaal river. A similar convention was signed with the Boers residing north of the Orange river two years later.

KI

**Sandwich, battle of,** 1217. After suffering considerable losses at the battle of \*Lincoln (May 1217), Prince Louis of France sent home for further reinforcements in his bid to become king of England. King Henry III’s regency council realized that it was imperative to prevent these troops landing and a great sea-battle took place off Sandwich on 24 August 1217. The English sailed to windward of the French and engaged their flagship. Knights and sailors were tormented and blinded by powdered lime thrown from the English ships and carried by the wind. The flagship was boarded and overpowered. The other troopships managed to sail back to France, but the ships carrying stores were largely seized by the English. It was a decisive engagement, ending Louis’s hopes in England.

SL

**Sandwich, Edward Montagu, 1st earl of** (1625–72). Montagu’s cousin, the 2nd earl of \*Manchester, was a leader on the parliamentary side during the Civil War. Montagu joined him as a young man and fought at \*Marston Moor and \*Naseby. He sat in all the Commonwealth parliaments, was a member of the \*Council of State in 1653, and took his seat in Cromwell’s ‘other house’ in 1658. He also saw considerable naval action. Early in 1660 he was reappointed general of the fleet and took it over to Charles II’s cause, carrying back the king in his flagship. He was rewarded by the Garter and the earldom of Sandwich. From 1660 to 1670 he was master of the great wardrobe. He was often in employment, bringing over \*Catherine of Braganza in 1662 and serving as ambassador to Spain 1666–8. In the second \*Anglo-Dutch War, he was victorious at the battle of \*Lowestoft, but lost his life in the third war in the action off \*Southwold Bay in 1672. His body was identified by the Garter star he was wearing. Sandwich was on close terms with both \*Pepys and \*Evelyn.

JAC

**Sandwich, John Montagu, 4th earl of** (1718–92). A politician of considerable achievements and a discerning patron

## sanitation

of the arts, particularly music, Lord Sandwich is most frequently recalled as the inventor of the sandwich—popularly supposed to have sustained him during lengthy spells at the gaming table, but perhaps more attributable to his known practice of working long hours in the office. Sandwich's political ambitions were focused on the Admiralty, where he thrice served as 1st lord (1748–51, 1763, 1771–82), demonstrating both administrative ability and a pragmatic approach to reform. The longer-term benefits of Sandwich's initiatives were reduced by the exigencies of war and he was unjustly blamed for the failings in naval preparedness revealed by the \*American War of Independence. It is, however, now appreciated that Sandwich deserves credit for the improved naval situation in the latter stages of the war, which enhanced British bargaining power during the peace negotiations. DWT

**sanitation.** See HEALTH.

**Saragossa, battle of,** 1710. A mixed force of Austrians, Dutch, British, and Portuguese, under the Archduke Charles, attacked on 19 August 1710 the Spaniards defending Saragossa. \*Stanhope commanded the British troops on the left. After a decisive victory, they went on to occupy Saragossa and advanced on Madrid. JAC

**Saratoga, surrender of,** 1777. \*Burgoyne's 1777 expedition was ill defined, over-ambitious, and badly executed. The plan to drive south from Canada along the Hudson river to Albany, isolating the New England colonies, sounded plausible. But it was not clear, in an area of dense forest, how the New Englanders would be isolated, what Burgoyne would do when he got to Albany, or even whether he could obtain the supplies and ammunition to get there. Above all, the strategy depended upon a degree of co-ordination almost impossible to attain with armies hundreds of miles apart and communication hazardous. Burgoyne left Canada towards the end of June and had an initial success when the enemy abandoned Fort Ticonderoga. But in August a large foraging party was annihilated at \*Bennington. The march was slow and painful, supplies inadequate, and the enemy vigilant. On 19 September Burgoyne encountered Gates at Bemis Heights and lost more men he could not replace. He fell back on Saratoga and was surrounded. An attempt to break out on 7 October was repulsed and on 17 October Burgoyne and nearly 6,000 men surrendered on terms. The disaster helped to bring the French into the war as allies of the American rebels. JAC

**Sarawak** (north-west Borneo) long had trading links with Siam and China and, in the 15th cent., fell under the influence of the sultanate of \*Brunei. In 1841 the sultan offered it as a rajadom to Sir James \*Brooke, who had helped to put down a revolt of the local Dayaks and Malays. Sarawak was recognized as an independent state by the USA in 1850 and by Great Britain in 1864. It was overrun by the Japanese in 1942 and, after the war, became a British crown colony. Representative government was established in 1963 and Sarawak joined the \*Malaysian Federation. DAW

**Sargent, John Singer** (1856–1925). American painter who settled in England and became the outstanding portraitist of his time. Born in Italy, Sargent studied there and in Paris, where he became a good friend of Monet. A scandal surrounding his portrait *Madame Gautreau* caused him to leave Paris in 1884/5. He settled in London where he remained until his death, although he visited the USA frequently and retained his citizenship. His portraits of high society brought him great success and he was elected ARA in 1894, RA in 1897. After about 1907, he took few commissions; he travelled and concentrated on water-colour landscapes as well as some mural paintings in America. He was an official war artist during the First World War and his powerful *Gassed* hangs in the Imperial War Museum. JC

**Sark, battle of,** 1448. Renewed border skirmishing saw Henry Percy, future 3rd earl of \*Northumberland, defeated by Hugh Douglas, earl of Ormond, on 23 October 1448. The encounter took place on the river Sark, near Gretna. Percy was taken prisoner and had to be ransomed. The following year the English burned Dumfries and Dunbar, and the Scots Alnwick and Warkworth. JAC

**Sarsfield, Patrick** (c.1650–93). Jacobite earl of Lucan. Born to a catholic family of mixed Anglo-Norman and Gaelic ancestry, Sarsfield entered the Irish army in 1678. He then served in the English regiments which Charles II detached to fight in the army of Louis XIV of France, but returned to England at the succession of James II in 1685, and helped to crush \*Monmouth's rising. When James and \*Tyrconnel radically catholicized the Irish army Sarsfield was a beneficiary, commanding Irish troops in England in 1688. He fled to France with James, returning with him to Ireland in 1689.

In the war that followed Sarsfield rose rapidly to major-general. After fighting at the \*Boyne, he emerged as the voice of the Gaelic nobility to whom Tyrconnel's exclusively Anglo-Norman counter-revolution offered nothing. His attacks on Williamite supply lines forced the raising of the first siege of \*Limerick but, after defeat at \*Aughrim, he concluded the second siege of Limerick on terms which allowed him to sail for France. Louis XIV made him a French general, James II a peer in 1691. He was mortally wounded at the battle of \*Landen. BPL

**Sauchie Burn, battle of,** 1488. In the summer of 1488, James III of Scotland was faced with a large rebellion, led by Archibald Douglas, earl of \*Angus, and supported by the heir to the throne, the 15-year-old Prince James. The king gathered supporters from the north and east and advanced through Stirling to the site of Bannockburn. On 11 June his army was routed and he was killed, possibly while in flight. JAC

**Saunderson, Edward James** (1837–1906). Orangeman. Saunderson was a protestant of Irish gentry descent in Cavan, with hunting, sailing, and the militia as his great interests. From 1865 to 1874 he served in Parliament as a Liberal, but was defeated by a Home Ruler. \*Parnell's rise caused a hardening of attitude and from 1881 until his death he was a Conservative MP. He developed into a lively and aggressive opponent of the nationalists and a leading

member of the \*Orange order. Vehemently opposed to \*Gladstone's Home Rule Bill in 1884, he warned that Orangemen would take up arms if it went through, and in 1892 he declared that though Parliament could pass a Home Rule bill 'you have not the power to make us obey it'. Rebuked on 2 February 1893 in the House for calling Father MacFadden 'a murderous ruffian', he changed it to an 'excited politician'.

JAC

**Savery, Thomas** (c.1650–1715). Savery was a military engineer who attained the rank of trench master by 1696, and acquired the title of 'Captain'. His inventiveness was perhaps stimulated by his knowledge of tin- and copper-mining in his native Devon. Savery's outstanding achievement was the invention of a machine for raising water by steam pressure, for which he took out a patent (No. 356) in 1698, calling it 'the miner's friend'. The device was essentially a pressure vessel which raised water partly by the direct pressure of steam, and partly by condensing the steam to create a vacuum, thus allowing the water to be raised by atmospheric pressure. The second part of this cycle was subsequently adopted by Thomas \*Newcomen in his radically different and much more successful atmospheric engine of 1712, but he was obliged to co-operate with Savery under the terms of the latter's patent. While it is possible that he borrowed ideas from other inventors, Savery was the first person to demonstrate a workable steam-engine.

RAB

**Savoy conference**, 1661. This was an attempt to reach a compromise at the Restoration between the presbyterians and the Anglicans. Twelve clerics from each side met at the Savoy hospital in April 1661 under the chairmanship of \*Sheldon, bishop of London and a future archbishop of Canterbury. The negotiations broke down and in July the delegates reported that 'they could not come to any harmony'. The revised Prayer Book did little to ease puritan consciences, the bishops were reinstated in the House of Lords, and a thousand presbyterian ministers resigned or were ejected from their livings. The dream of a comprehensive church had faded.

JAC

**Saxons.** See ANGLO-SAXONS.

**Saxon Shore.** A coastal network of late Roman forts stretching from Brancaster to Portchester intended to repel attacks by Saxons. The name 'Saxon Shore' (*litoris Saxonici*) appears only in the *Notitia dignitatum*, a document drawn up c. AD 408. The *Notitia* is an administrative handbook, concerned with the organization of late Roman military units. Interpretation of the functioning of the Saxon Shore is notoriously difficult, but the *Notitia* appears to list units stationed at sites in south-eastern Britain. The nine forts listed in Latin have been identified with late forts surviving in varying states of preservation at Brancaster (Branodunum), Burgh castle (Gariannonum), Bradwell (Othona), Reculver (Regulbium), Richborough (Rutupiae), Dover (Dubris), Lympne (Lemanis), Pevensey (Anderita), and Portchester (Portus Adurni). A possible further 'lost fort' may be at Walton castle. The overall commander of the military network was the *comes*, normally translated as 'the Count of the Saxon Shore'.

For a long time the Saxon Shore was regarded as being an entirely new creation of the 4th cent. AD. Seven of the listed units are new to the army of Britain as known in the principate (the Roman system of government 27 BC–AD 284). The appearance and style of the Saxon Shore forts themselves is new and different; they had high thick walls, massive rounded external towers, and more readily defensible secure gates. However, a closer examination of the evidence indicates continuity between the \**classis Britannica* (the Roman fleet in the Channel) of the principate and the military dispositions discernible in the late empire. Archaeology has revealed an impressively large *classis Britannica* fort at Dover, and there is epigraphic evidence, in the form of stamped CL.BR tiles, for *classis Britannica* structures of the 2nd and 3rd cents. at Lympne, Portchester, and Pevensey. At Reculver there are archaeological indications of a 1st-cent. fortlet.

ES

**Saye and Sele, William Fiennes, 1st Viscount** (1582–1662). Saye and Sele was a leading member of the radical, win-the-war faction in the House of Lords during the 1640s. As early as the 1620s he was a critic of arbitrary government and illegal taxation. During the 1630s he gave himself to puritan colonization schemes in the New World. Saye refused to pay \*ship money, and declined the military oath imposed by Charles on the nobility at the outbreak of the \*Bishops' wars with Scotland. In the \*Long Parliament he continued to work with the radical opponents of the regime despite being appointed to the Privy Council. He backed both the \*self-denying ordinance of 1645, which excluded the aristocracy from the leadership of the parliamentary armies, and the creation of the \*New Model Army. In 1647, as the leading political Independent in the House of Peers, he worked closely with \*Ireton and the council of the army in drafting the \*Heads of the Proposals. This projected settlement was the most generous ever offered the king during the course of the civil wars. Politically inactive after 1649, Saye devoted himself to religion. In 1654 he published *Vindiciae veritatis*, arguing for a minimal role for the magistrate in regulating men's beliefs. Upon Charles II's return in 1660 he was again appointed to the Privy Council.

IJG

**Scapa Flow** in the Orkneys is a magnificent natural harbour and naval base, commanding the approaches to both the North Atlantic and the North Sea. It was developed immediately before the First World War when the fleet increased in numbers and the vessels in size. The German high seas fleet was escorted to Scapa in 1918 and on 21 June 1919 the 74 vessels were scuttled. At the start of the Second World War, a brilliant U-boat action torpedoed the *Royal Oak* at anchor with the loss of over 800 lives. The naval base was closed in 1956.

JAC

**Scarlett, James, 1st Baron Abinger** (1769–1844). Born in Jamaica and educated at Trinity College, Cambridge, Scarlett became an extremely successful lawyer and in 1819 was brought into Parliament by \*Fitzwilliam as a Whig. His maiden speech went off well and \*Tierney wrote that he had 'a better parliamentary manner than any lawyer I

## Scheveningen

recollect'. But Scarlett could not quite sustain this brilliant début and all through the 1820s the Whigs were in opposition. In 1827 he took office with \*Canning as attorney-general, resigned in 1828, and resumed in 1829. The following year he gave strong opposition to the Whig Reform Bill and was obliged to change patrons, coming in for one of Lord Lonsdale's boroughs. He seemed to have switched allegiance at the wrong moment and on the death of Lord Tenterden in 1832 was passed over for lord chief justice. But \*Peel's brief minority government in 1834 made him lord chief baron of the Exchequer with a peerage. Scarlett was more successful as an advocate than either a parliamentarian or a judge. JAC

**Scheveningen, battle of**, 1653. Naval battle off the Dutch coast during the first \*Anglo-Dutch War. Martin Tromp was ordered to sea to try to break the English blockade under \*Monck. Tromp was killed early in the action on 10 August and the Dutch lost eleven vessels. It is sometimes known as the battle of Texel. JAC

**Schism Act**, 1714. An extreme Tory measure designed to stamp out \*dissent by preventing nonconformists and Catholics educating their children in their own schools. Teachers (except in the universities and those who taught the young at home) had to apply for licences, which would only be granted if they had taken the Anglican sacrament within the previous year, had sworn the oaths of allegiance, abjuration, and supremacy, and had made the declaration against transubstantiation. A licensed teacher who subsequently attended non-Anglican worship was to be disqualified. On the day the Act was due to take effect, Queen Anne died, and her successor, George I, took no steps to enforce it. It was repealed in 1719. CJ

**Schomberg, Frederick Herman, 1st duke of** (1615–90). Schomberg was one of the greatest soldiers of the 17th cent. His father had been ambassador for Frederick of the Palatinate to James I and his mother was a daughter of the 5th Lord Dudley. Born in Heidelberg, he pursued a military career with the Swedes and Dutch before entering French service in 1652 and rising to be a marshal of France. A Huguenot by religion, he left France in 1685 at the revocation of the edict of Nantes and accompanied William of Orange to England in November 1688. After the success of the Glorious Revolution, he became a naturalized Englishman in 1689, was given the Garter, and created duke of Schomberg. In the summer of 1689 he took over William's forces in Ireland and was killed at the battle of the \*Boyne encouraging his troops: 'allons, Messieurs, voilà vos persécuteurs.' His son, the 3rd duke, had a distinguished military career under William III. JAC

**schools**. The earliest elementary schools date from the Middle Ages. They consisted of song schools and reading schools, the former to train boys as choristers, the latter to teach youths to read and write. Education was free and the schools were usually endowed. From the time of the Reformation, there was a variety of private, petty, and parish schools, usually taught by people who had other occupations. The \*charity schools, particularly those provided by

the \*Society for Promoting Christian Knowledge, provided widespread elementary schooling for the poor. As urban and industrial changes took place in the later 18th cent., \*Sunday schools provided part-time schooling for working children. Rival religious bodies supplied the monitorial schools at the beginning of the 19th cent., the \*British and Foreign School Society (1808) and the \*National Schools Society (1811). The need for universal elementary education was recognized by 1870, when school boards were established to provide buildings where necessary. During the 20th cent., as the need for a more child-centred education was recognized, the elementary school became the primary school, catering for children up to the age of 11. Infant and junior departments, separate or combined, were established.

The distinctive feature of secondary schools from the earliest time was the predominance of Latin. To teach this the \*grammar school was established throughout England, varying in size and social intake. Alongside these, from Tudor times, were the private schools, usually kept by clergymen, with boarding facilities. In the following century, modern schools or academies, offering a literary and scientific education, flourished. These often catered for specific occupations, such as the army, business, or trade. Girls were almost exclusively educated at home, by parents or by tutors. The leading grammar schools during the course of the 19th cent. developed into more exclusive \*public schools. A new type of public school, the proprietary school, established by non-profit-making church and secular companies, received recognition in towns where alternative education was frequently not available.

Secondary schooling was reformed after the Endowed Schools Act of 1869 and provision made for the first time for the daughters of the middle classes. After the 1902 \*Education Act, the rise of the municipal grammar school increased the provision of secondary education. Comprehensive secondary schools replaced the majority of grammar schools from the 1960s. There are now other types of schools at this level, including sixth-form colleges, grant-maintained, and city technology colleges. PG

**Schools Act (Scotland)**, 1696. In 1616 the Scottish Privy Council decreed that in Scotland a school should be established in every parish. This was ratified by the Scottish Parliament in 1633 and a further Act for Founding Schools passed in 1646. These statutes were re-enacted by the Scottish Parliament in an Act for Settling Schools in 1696. A uniform system of parish schools came into being; the salary of the schoolmaster was paid by the heritors (landowners) and the schools were supported out of the rates. It was a further 200 years before a similar system was established in England. PG

**Schooneveld, battle of**, 1673. In May 1673, during the third \*Anglo-Dutch War, it was resolved to attack the Dutch in the Schooneveld, off the island of Walcheren. \*Rupert was joined by a French squadron, which gave him some superiority over a Dutch fleet under de Ruyter and Cornelis Tromp. The first engagement on 7 June was inconclusive. On 14 June the Dutch attacked in turn and a running fight developed. Once more the result was inconclusive—'a grand

skirmish rather than a straight fight' was the French commander's comment—though the Dutch had prevented a threatened landing. JAC

**Science Museums** (Kensington). The museums are the fruit of the \*Great Exhibition of 1851. It made a profit, and land was bought in Kensington Gore; Prince \*Albert hoped to establish there a great cultural centre, but to many people it seemed remote from central London. In 1862 the next exhibition was staged there; in 1864 the underground railway station was authorized; and the Department of Science and Arts ran what grew into the Science Museum. Richard Owen, superintendent of natural history at the British Museum, campaigned from 1861 to have 'his' exhibits moved to a new building, and in 1881 the Natural History Museum opened its doors. DK

**scientific revolution.** Herbert Butterfield called attention in 1948 to the tremendous intellectual change he saw taking place during the 17th cent., when the modern scientific world-view was propounded by Francis \*Bacon, Galileo, Descartes, and their disciples. This change was reflected in institutions, notably the \*Royal Society and the Paris Academy of Sciences, and in publications—especially journals. It meant a break with the servile attitude to Aristotelian philosophy, and also with Platonic toying with \*magic. The science which had made the running was astronomy: the heavens had been demystified, and the power of mathematics demonstrated. Bacon's view that experiments must be fruitful made science seem a matter of organized common sense, accessible not only to a highly educated élite but to craftsmen: having been something for a few soloists, science now acquired a chorus.

Butterfield's thesis went with the self-image of the great thinkers of the 17th cent., and made history and philosophy of science fashionable. It has been criticized by medievalists who have seen little new in the New Philosophy; by historians of medicine, where magical and Aristotelian ideas (in Paracelsus, and in William \*Harvey) went with progress; and by students of \*astrology, \*alchemy, and apocalyptic, who have shown how important these were to people we think of as 'modern'. Research into rhetoric has indicated how important that was for virtuosi anxious to promote their world-view: the plain style, sometimes verbose, was chosen deliberately to carry conviction. To be too ready to see modernity among the fellows of the Royal Society was to write Whig history.

Butterfield had seen one revolution: but it might be that, like the French, science has had several. Thomas Kuhn in 1962 came to see things this way. A science came into being when a mass of facts was ordered by someone, whose work became paradigmatic and led to a period of normal science, which has something in common with painting by numbers or solving puzzles. It is dogmatic, and deals with questions difficult to answer; but there comes a time for questions difficult to ask, when anomalies have blurred the picture, and a revolution and new paradigm are needed. This will be incommensurable with the old one, and the change is like a religious conversion, a leap of faith; the revolutionary has to work to make converts, and the middle-aged will probably

refuse to shift. Thus we have revolutions associated with Galileo, Isaac \*Newton, Charles \*Darwin, and perhaps Michael \*Faraday or J. J. \*Thomson.

A. L. Lavoisier succeeded before his death in the Terror in 1794 in changing the language of chemistry in accordance with his new theory of combustion. His great book came out in 1789, and he was self-consciously bringing about an intellectual revolution, using that frightening word—which previously had evoked feelings of a return to the good old days. He and his contemporaries were Kuhnians before Kuhn, though no doubt he believed that like Newton his paradigm would last for ever, and that only one revolution per science was required. Nineteenth-cent. chemists had a great respect for tradition, and liked to look back through their 'fathers in science' to Lavoisier's time; but there were other claimants for his title, including Humphry \*Davy with electrochemistry, John \*Dalton with his testable atomic theory, and Marcellin Berthelot with chemical synthesis.

Studies of the 19th cent. indicate how many elements of modern science we owe to that epoch rather than to an earlier period, and may make us wonder if it was not the Age of Science, or the period when science began to revolutionize everyday life. Formal courses in physical sciences began with the revolutionary École Polytechnique, where the teachers also undertook research, and were then taken up in the German universities. At Giessen, Justus Liebig began laboratory instruction and then independent research for the PhD degree from 1825; and his pupil A. W. Hofmann came to Britain in 1845 at Prince \*Albert's instigation to start the Royal College of Chemistry, subsequently part of Imperial College, London. Science was no longer a matter of informal apprenticeship.

The Royal Society was joined in 1831 by the more open and democratic \*British Association for the Advancement of Science, promoting public awareness and local pride. It had earlier been joined by specialized societies, dedicated to natural history, geology, and astronomy; and later to chemistry, statistics, and physics. John \*Herschel decided not to specialize, but for most people this was not possible. Education began to divide the scientists (a word coined by William \*Whewell in 1833) from humanists; and as the former divided into chemists and physicists, and then further into organic or physical chemists, so the latter began taking degrees in history or English. Scientific societies with narrower and narrower scope were founded, with journals addressed to experts only.

Science also became a profession. Davy was one of the first in Britain to make his way by research and lecturing in a great London institution; with an expanding educational system, this became more possible as the 19th cent. went on. The earliest scientific societies (outside medicine) had been learned ones; but during the 19th cent., as science at last really became useful, they were joined by societies promoting the interests of qualified engineers and applied scientists.

Exponential growth also became evident in the 19th cent., so the question whether there was one scientific revolution or many, or evolution, is open. Clearly, science has been developing in ways that Bacon could only have dreamed of,

## Scilly Isles

and it has transformed the way we see the world. Whereas Bacon and Galileo hoped that science would bring certainty, where the church and the ancients had failed as authorities, and T. H. \*Huxley thought that science had never done anybody any harm, we are now sadder and wiser. DK

C., and Westman, R. S. (eds.), *Reappraisals of the Scientific Revolution* (Cambridge, 1990); Shea, W. R. (ed.), *Revolutions in Science: Their Meaning and Relevance* (Canton, Mass., 1988).

**Scilly Isles.** A group of 50 granite islands, five of them inhabited, lying 30 miles off Land's End in Cornwall. The largest islands are St Mary's and Treco. Belonging to the abbey of Tavistock in the Middle Ages, they passed to the Godolphin family and in 1933 to the crown. Piracy, wrecking, and smuggling were not unknown before market gardening and tourism took over. The population is just over 2,000. JAC

**Scone, stone of.** A block of sandstone, long associated with the inauguration of early Scottish kings at Scone (Perthshire) but seized by Edward I in 1296; since 1308 every anointed English sovereign has been crowned on the special coronation chair built to contain it, thereby claiming overlordship of Scotland. It was transferred briefly to Westminster Hall for \*Cromwell's investiture as lord protector (1657). Buried for safety in the Islip chapel 1939–45, it was stolen by Scottish Nationalists on Christmas morning 1950, but was yielded up to Arbroath abbey the following April before being returned to Westminster abbey. In 1996, 700 years after its seizure, Elizabeth II authorized the stone's return to Scotland. ASH

**scot and lot** was a contribution towards municipal expenses, largely poor relief, scot being the amount and lot the share. In 37 parliamentary boroughs in the period before 1832, including Westminster with 12,000 voters, the right to vote was restricted to scot and lot payers, excluding the poorest inhabitants. The franchise led to frequent disputes about the exact character of the payments made and who made them. JAC

**Scots, kingdom of.** In the 9th cent. a new kingdom emerged out of the ashes of the kingdom of \*Fortriu and in succeeding centuries became the dominant political force in north Britain. It was born out of the wreckage wrought by Scandinavian incursions in eastern Scotland. In 839 the Gaelic dynasty which had almost monopolized the kingship of Fortriu for half a century was annihilated in battle. Fortriu's heartland in eastern Perthshire was repeatedly devastated, reaching a nadir of desperation in 875 when Danes inflicted another crushing defeat at the battle of \*Dollar (east of Stirling) and drove the defenders back to the highlands of Perthshire. These Scandinavian attacks were not, however, followed by attempts to colonize eastern Scotland; the aggressors were often involved in struggles to control \*York and \*Dublin, the chief Scandinavian centres of power in Britain and Ireland, and used eastern Scotland as a staging post for attack or a haven for retreat. In eastern Scotland, as in other parts of Europe devastated by Scandinavian attacks,

the raiders' immediate legacy was political and social dislocation. What brought misfortune to many could, however, also offer the opportunity for a few to refashion political relationships to their own advantage. By the beginning of the 10th cent. a Gaelic lineage—the descendants of \*Kenneth MacAlpin—had succeeded in entrenching itself as the rulers of eastern Scotland. For the first time in eastern Scotland kingship was monopolized by a single dynasty. With this new kind of kingship came a new identity for the kingdom and its people. From 900 the kingdom was no longer 'Fortriu' (or 'Pictland'), but \*Alba, the Gaelic word for Scotland; and its people were no longer referred to as 'men of Fortriu' (or 'Picts'), but now became *Albanaig*, the Gaelic for 'Scots' (literally 'inhabitants of Alba'). The medieval kingdom of the Scots was born.

Alba had originally been the Gaelic word for Britain. It is hard to believe, however, that this term for the new kingship was adopted c.900 because of any claim to rule all Britain. The territory which the first kings of Scots held firmly in their grasp was probably little larger than an 11th-cent. English earldom. Until as late as the early 13th cent. Alba, 'Scotland' (or Albania/Scotia in Latin), was used to refer to the area east of the Grampian mountains stretching north from the river Forth to (approximately) the border with \*Moray. In the 13th cent. 'Scotland' came to be used regularly by Scots themselves to refer to the whole of what is now mainland Scotland.

The survival of this new kingdom can be attributed largely to the long reign of \*Constantine II. He succeeded his cousin \*Donald II, the first recorded 'king of Scotland (Alba)', in 900, and reigned for at least four decades. The emergence of 'Scotland' in this period can, therefore, be compared with other new countries of a similar size, such as Flanders and Normandy, which rose out of the ashes of Scandinavian devastation.

Constantine II's reign was also crucial to the kingdom's survival because he halted the Scandinavian tide of destruction. In 904 a Danish army led by the sons of Ivarr was defeated in battle in Strathearn (southern Perthshire). The kingdom was not attacked again by Vikings for more than 50 years. Constantine's success at keeping the Danes at bay was, however, achieved principally by a policy of *rapprochement*. His daughter married the Danish king of Dublin, while Constantine himself may have had a Danish wife: his son \*Indulf bore a Scandinavian name. The culmination of this new relationship with the Danes was a grand alliance of Scots, Danes, and Britons of \*Strathclyde against \*Athelstan, king of England. In 937 a campaign was launched backing \*Olaf Guthfrithsson's claim to be king of York, but the army of the allies was destroyed at \*Brunanburh. The threat of Scandinavian aggression returned briefly during the reign of Constantine's son Indulf (954–62), killed defending the kingdom from a Norwegian raid. This was the last occasion, however, when a king of Scots lost his life during a Scandinavian incursion. The possibility of raids from the north remained, but they no longer threatened to overwhelm the kingdom.

When the new kingdom of 'Scotland' emerged in the 10th cent. from its grim struggle for survival it was well placed to

expand and dominate north Britain. It was based initially on the fertile lands of Strathmore and Strathearn. Its natural rival in the north was the kingdom of Moray which harnessed the resources of the rich Lowlands surrounding the Moray Firth. The kings of Moray, however, faced constant pressure from the Scandinavian earls of \*Orkney, and as a result their ability to challenge the kings of Scots was seriously weakened. They served, indeed, as a buffer protecting the kingdom of the Scots from the full power of the earls of Orkney. But the greatest danger to the kingdom would have arisen from a rejuvenated \*Northumbria stretching from Edinburgh to York. In the 7th cent. Northumbria had established itself as the dominant force in north Britain, but had since imploded into internal chaos and had been largely conquered and settled by Danes. The Danish kings of \*York, however, constantly looked west to \*Dublin in an attempt to establish pre-eminence among the Scandinavians in Britain and Ireland, and in turn were targeted by kings of Dublin. This left northern Northumbria—\*Lothian and the Merse—as a buffer zone between the kingdom of Scotland and York, which the Scottish kings endeavoured to bring under their control. In Indulf's reign Edinburgh was captured, and later \*Edgar, king of the English, recognized \*Kenneth II's claim to Lothian. In the late 10th cent. Northumbria south of the Tweed was revived as an earldom and was at times able to match the kings of Scots. It is likely that Kenneth II was driven out of Lothian by the earl of Northumbria in 994/5, but Scottish rule as far as the Tweed was decisively reasserted by \*Malcolm II at the battle of \*Carham (south-west of Berwick) in 1018. By this time the king of the Britons of Strathclyde (or king of the Cumbrians) had become a client of the king of Scots, and after the accession of \*Duncan I, king of the Cumbrians, to the Scottish kingship in 1034 it appears that the two kingdoms were ruled by one line of kings. When \*Macbeth, king of Moray, became king of Scots in 1040, Moray, too, became bound into the kingdom of the Scots, though it remained a springboard for dynastic rivals to the Scottish kingship until 1230. By the mid-11th cent., therefore, the kingdom had begun to assume a form recognizable as the Scottish kingdom of the Middle Ages and beyond. With the Norman conquest of Northumbria in 1070 the north of England was left without the strong regional leadership provided by the native earls, and the kings of Scots sought to exploit this to their advantage. Their ambition to expand into northern England was only relinquished in 1237.

The success of the kingdom of the Scots in this period was second only to that of the kings of \*Wessex, who during the 10th cent. brought most of what is now England under their rule. The new English realm was undoubtedly more powerful than its northern counterpart. This was already evident in the 930s, which saw on the one hand an English army penetrate deep into Scotland and, on the other hand, the destruction of a combined Scottish, Danish, and British force in England. English kings, however, made no sustained effort to conquer Scotland, and attempted merely to neutralize kings of Scots through agreements or submissions which were rarely of enduring significance. These agreements included English recognition that Strathclyde (in

945) and Lothian (c.975) fell within the king of Scots' sphere of influence. Britain's division into two power blocks had begun, and eventually crystallized into the kingdoms of England and Scotland.

Britain's nascent geographical polarity was not, however, reflected culturally. The territories ruled by the king of Scots included regions which were predominantly Welsh (in the south-west) and English (in the south-east), as well as Anglo-Danish settlers in the kingdom's heartland. Gaelic was the predominant language, and Gaelic institutions such as professional castes of poets and judges, or churches founded on the cults of Gaelic saints such as \*Columba and \*Brigit, were at the apex of the kingdom's culture and society. Gaelic saints, cultural institutions, and language were not, however, exclusively Scottish, but showed how the Scottish kingdom was but one region of a homogeneous Gaelic high culture which stretched from Munster to Moray. This Gaelic high culture was not isolated or backward, as some have supposed, but identified itself firmly as part of contemporary Christendom. A number of leading Gaelic kings and churchmen went on pilgrimage to Rome, including Macbeth. Neither was the Scottish kingdom closed to English and Scandinavian influence, as is suggested by the existence of 'shires' before 1100 and the custom of 'fencing' a court of law. Its cultural receptivity has, indeed, been immortalized in a string of church towers in the midlands built c.1100: two, at Abernethy and Brechin, are Irish round towers; others, however, as at Dunblane, Muthill, and Dunning, are northern English in style.

As far as the kingdom's core north of the Forth was concerned, cultural diversity did not mean that it suffered a lack of cohesion. The church was led by a chief bishop (at St \*Andrews); and the area between the Forth and the Spey was bound together by a network of provincial rulers (\*mormaers) and local officials (thanes) who kept order and mustered the able-bodied for defence. This is not to say that internal strife was unknown; but it could be withstood, even when it involved protracted rivalry for the kingship itself, following the failure of the royal dynasty in 1034. The solidity of the kingdom's core proved a firm foundation for the expansion of royal power after 1100.

(ed.), *Scotland in Dark Age Europe* (St Andrews, 1994); Duncan, A. A. M., *Scotland: The Making of the Kingdom* (Edinburgh, 1975); Smyth, A. P., *Warlords and Holy Men: Scotland 80–1000* (1984).

**Scotsman.** One of the two daily newspapers which has laid claim to be Scotland's 'national' newspaper, the other being the *Herald* (formerly *Glasgow Herald*). Their competitiveness has symbolized the Edinburgh–Glasgow rivalry for pre-eminence in Scotland. Both have followed a broadly similar trajectory—founded as weeklies (the *Herald* as the *Glasgow Advertiser* in 1783, the *Scotsman* in 1817), becoming dailies in the 1850s; and politically turning from an early Liberalism to Unionism and a broad Conservatism over Gladstone's Irish Home Rule policies. Both were latterly acquired by press magnates—the *Scotsman* by Lord Thomson in 1953, and the

## Scott

*Herald* by Sir Hugh Fraser in 1964, then 'Tiny' Rowland in 1979. DJA

**Scott, Sir George Gilbert** (1811–78). Architect. Scott was the most famous and successful of Victorian Gothic master builders; and also the most correct stylistically, except when it came to railway stations. The most famous of those is St Pancras in London (1865), a kind of Disneyland castle in bright orange brick. A few years earlier he had submitted a similar design for the new Foreign Office in Whitehall, only to have it vetoed by \*Palmerston on the grounds that Scott would 'Gothicize the whole country' if given his head. This was called the 'battle of the styles'. Scott lost it, but not the commission itself, if he promised to carry it out in an Italian Renaissance style, which he did. The result probably vindicates Palmerston's pig-headedness. Scott was also a restorer—even an over-restorer—of hundreds of ancient churches. His talent was inherited by his grandson, Sir Giles Gilbert Scott (1880–1960), who built Liverpool's Anglican cathedral in his grandfather's favourite style, and Battersea power station in a more modern one. BJP

**Scott, Sir Robert Falcon** (1868–1912). Scott had entered the navy as a boy in 1880 and by 1897 was a lieutenant and torpedo officer. He was noticed by Sir Clements Markham whose influence led to his appointment as leader of the Royal Geographical Society and Royal Society Antarctic Expedition of 1901–4. He proved a capable captain of the *Discovery* and leader of the personnel who carried out much scientific and exploratory work in the Ross Sea and Victoria Land region. Scott himself, with \*Shackleton, made a sledge journey to beyond 82 degrees south in 1902. Now famous, Scott was chosen to lead an official expedition in 1910 in the *Terra Nova*, designed to get a party to the South Pole. Scott led four others who reached the Pole on 18 January 1912 only to find that Amundsen had preceded them there by just over a month. All five eventually perished on the horrendous walk back to their base. Scott's journal read, 'We shall stick it out to the end. . . . It seems a pity but I do not think I can write any more.' News of this epic tragedy led to national mourning, a posthumous knighthood for Scott, and the founding of the Scott Polar Research Institute. However, it is now widely believed that Scott's nobility and bravery could not compensate for the wrong decision (probably encouraged by Markham) to use man-hauled sledges for polar travel. RB

**Scott, Sir Walter** (1771–1832). Poet, novelist, man of letters. Scott distilled the literary and historical culture of the \*Scottish Enlightenment into the first great European works of historical fiction. A patriot and publicist, he placed Scotland on the international tourist map as a land of enlightenment and romance. The son of an Edinburgh lawyer, educated for the Scottish bar, Scott remained an active lawyer for the rest of his life, becoming latterly sheriff depute of Selkirk and principal clerk of Session. His literary career began in the school playground, telling stories to his friends. He first made his mark as a poet, collecting, editing, and adapting border ballads and later writing enormously popular narrative poems of which the *Lay of the Last Minstrel*

(1805) and *Marmion* (1808) are probably the best. His career as a novelist began in 1814 with the publication of *Waverley*, followed by another 24 novels which appeared at almost yearly intervals until the end of his life. In addition he edited standard editions of \*Swift and \*Dryden, wrote a series of lives of the novelists, a profusion of reviews, and an enormous personal correspondence. By the early 1820s he was sometimes writing more than 15,000 words per day. He built Abbotsford out of his substantial profits, turning it into an extraordinary physical embodiment of his taste for antiquities, real and phoney, and his more modern respect for creature comforts. Bankruptcy in 1825 and failing health overshadowed his later years, but yielded a *Journal*, a work of genius, posthumously published and surprisingly little read. Scott was a man universally liked, known, and admired. NTP

**Scottish Enlightenment.** A relatively new term, said to have been invented in 1909 when W. R. Scott described Francis \*Hutcheson as the father of the Scottish Enlightenment. It became fashionable in the 1960s when social scientists began exploring the history of their disciplines, and is now used generally and imprecisely to describe the intellectual, material, and moral culture of Scotland during the long 18th cent. It is a culture associated with the middling ranks of Scottish society, with the Scottish universities, and with the clubs, societies, and salons of Edinburgh. Ideologically it was a culture concerned with the defence of the revolution settlement, the Hanoverian succession, the Act of Union, and the presbyterian establishment. It was concerned with the civilizing functions of commerce and culture and with the problems of developing the institutions and manners appropriate to the preservation of a free commercial polity. Intellectually, the Scots owed important debts to the Dutch, the French, and the English as well as to their own intellectual traditions. Philosophers like \*Hutcheson, \*Hume, \*Smith, Ferguson, and Reid were interested in the principles of human nature, the meaning of sociability, and the truths of natural religion. Their conclusions made possible the development of a remarkable theory of progress which was instrumental in shaping the political economy of Smith, the histories of Hume and \*Robertson, and the historical fiction of \*Scott. Scottish medical professors developed a model for explaining the physical constitution of man which was particularly sensitive to the nervous system and to environmental determinants of health. Joseph \*Black's research into the properties of heat made possible James \*Hutton's revolutionary theory of the earth. Poets like Ramsay, Ferguson, \*Burns, and Scott reactivated the resources of vernacular literature with the new aesthetics developed by the philosophers and historians. It is sometimes argued that the architecture and town-planning of the \*Adam family and the portraiture of Allan \*Ramsay and Sir Henry \*Raeburn needs to be viewed in the same way. Perhaps the most lasting monument to the Scottish Enlightenment is the New Town of Edinburgh, a vast project which would testify to the civilizing power of commerce by turning Edinburgh into a modern Athens. It bankrupted the city. NTP

**Scottish National Party (SNP).** The SNP was formed in 1934 after a merger between the National Party of Scotland and the Scottish Party. The party is committed to securing independence for Scotland.

The SNP won their first parliamentary seat in 1945 when Dr Robert McIntyre was returned at a by-election for Motherwell. However the SNP had no great electoral success until the 1960s. In November 1967 Winnie Ewing captured Hamilton from Labour and the SNP had a high profile in the 1968 local elections. By 1974 the SNP had eleven seats in Parliament and polled over 30 per cent of the vote in Scotland. But in 1979 a referendum failed to endorse a Scottish Parliament with only 32.85 per cent of the electorate backing it (against the 40 per cent needed). From this time there was a waning in SNP fortunes. In the 1979 general election, their share of the poll dropped to 17 per cent and they lost all but two seats.

In 1990 Alex Salmond became party leader, confirming the SNP as a left of centre social democratic party. It accepted a Scottish Parliament as a step towards complete independence, within a European framework. The SNP obtained six seats at the general election of 1997, and 35 of the 129 seats in the Scottish Parliament elected in 1999. The following year John Swinney replaced Alex Salmond as party leader, but his authority was weakened when the SNP did badly in the 2003 elections, its representation reduced from 35 to 27 seats.

RAS/JAC

**Scottish Wars of Independence, 1296–1357.** The name usually given to the prolonged wars between English and Scots after the death of Alexander III of Scotland in 1286. The death of his heir \*Margaret ('the Maid of Norway') in 1290 left a number of 'competitors' for the vacant throne, of whom the chief were John \*Balliol and Robert \*Bruce, grandfather of the future Robert I; in 1292 Edward I, who claimed to be 'Lord Superior of Scotland', awarded the crown to Balliol. Edward however was determined to assert what he saw as his rights to overlordship; and Balliol found it impossible to maintain the independence of his kingdom. In 1295 the Scottish nobles took power out of Balliol's hands, made an alliance with Edward's enemy Philip IV of France, and prepared to defy Edward. A crushing campaign in 1296 forced Balliol to resign the crown. Edward took Scotland into his own hands and compelled the bulk of the Scottish landed classes to do homage to him.

This was however only the start of a struggle which lasted till 1357. There were three stages: first a 'revolt' against Edward in the name of King John, which was not finally subdued in 1304; secondly, the recovery following the rising of Robert Bruce in 1306, which ultimately secured the recognition of Scottish independence in 1328; and thirdly, the revival of attempts at English conquest under Edward III, which lasted till the treaty of \*Berwick in 1357.

The first stage opened with widespread revolts in the early months of 1297, led by William \*Wallace in the south, and Andrew \*Murray in the north. They joined forces to win the devastating victory of \*Stirling Bridge in 1297; but Wallace's defeat at \*Falkirk in 1298 left the leadership in the hands of the nobles, who continued under a succession of guard-

ians to resist Edward till 1304 when they were forced to submit. Edward then proceeded to what seems a statesman-like reorganization of Scottish government with the support of most of the Scottish leaders.

His hopes however were shattered by the revolt of the younger Robert Bruce in 1306. The result was to reopen the rivalries between the Bruce and Balliol factions which had been obvious in the late 1280s and early 1290s. Bruce's enemies, notably the widely connected \*Comyn family, were driven firmly onto the English side, and for many years the Wars of Independence took on the aspect of a civil 'War of the Scots'. Bruce was rapidly crowned as Robert I, but as rapidly defeated twice, and by the end of 1306 was in hiding. Edward however died on 7 July 1307, which gave the respite Robert needed. In the next few years he gradually eliminated the English garrisons by a masterly policy of guerrilla warfare. By 1314 few remained; and the decisive defeat of Edward II at the battle of \*Bannockburn left Robert secure. It was the only occasion after 1307 when he took on the English in a set battle.

The war then became a war of raids on the north of England which caused widespread suffering, but had little effect on the stubborn Edward II. A diversion into Ireland under Robert I's brother Edward \*Bruce (1315–18) alarmed the Anglo-Irish settlers but failed to get the support of the Irish themselves, and collapsed with Edward's death in 1318. Peace only became possible after Edward II's deposition. By the treaty of \*Edinburgh/\*Northampton of 1328, Robert I was formally recognized as king of Scots, and his son and heir, the future David II, was married to \*Joan of the Tower, a sister of Edward III.

The peace did not last. Robert I died in 1329, when David was aged only 5. The temptation was too great for Edward III, who wanted to establish his authority. He encouraged the son of John Balliol, Edward \*Balliol, to attempt to seize the throne; and the Scottish leaders were forced to confront the invaders in battles, in which the English were twice victorious, at \*Dupplin Moor (1332) under Edward Balliol, and at \*Halidon Hill (1333) under Edward III himself. Balliol was established as king; much of the south was ceded into English control; and the rest was to be held as a vassal kingdom. In 1334 David II had to flee to the safety of France.

The threat was more serious than is often allowed—many, perhaps most, of the Scottish nobles contemplated at one time or another coming into Edward's peace; but a long guerrilla war gradually wore down the occupiers, and in 1341 David II was able to return. Unfortunately, he continued the policy of raids into England, in one of which he was captured in 1346 and remained a captive till 1357. This led to a renewed English occupation; and parts of southern Scotland remained in English hands for a long time. However, by 1357, Edward III agreed to David's release under ransom. Though the treaty of \*Berwick ignored the real issues of Scottish independence, no further attempts at subjection were made till the 1540s, so that the Wars of Independence can be said to have ended with the treaty of 1357.

They had distorted irretrievably the relations of the two countries. In the 13th cent. Scotland and England had been

## Scott Memorial

developing in ever closer friendship. By 1357 they were, and long remained, enemies. This was the disastrous consequence of Edward I's political misjudgements after 1292.

**Scott Memorial** (Edinburgh). This tribute to the Scottish novelist Sir Walter Scott dominates Princes Street, despite being described by \*Ruskin as 'a small vulgar Gothic steeple on the ground'. The design of water-colourist and self-taught architect George Meikle Kemp, it was completed in 1846, two years after Kemp was found drowned in the Union canal. The seated figure of Scott, wrapped in a shepherd's plaid, his hound Maida at his feet, was sculpted by Sir John Steell. Other sculptors carved the 84 statuettes of Scott's characters and Scottish historical figures which decorate the ornate spire.

JC

**Scrope, Richard** (c.1350–1405). Archbishop of York. The third son of Henry, Lord Scrope of Masham, Scrope was chancellor of Cambridge University in 1378 and a doctor of laws. From 1381 he was an auditor at the papal court until the pope appointed him to the bishopric of Coventry and Lichfield in 1386. After some diplomatic service to Richard II, he was promoted to York in 1398. He made no opposition to Henry IV's usurpation, assisting at his coronation. In 1403, however, he may have favoured the Percy conspiracy, and in 1405 \*Northumberland apparently prompted Scrope to revolt. Supported by \*Norfolk, the earl marshal, he published in York a manifesto denouncing Henry's misgovernment, attracting a dangerously large following which assembled on Shipton Moor. Archbishop and earl were enticed to a rendezvous with Ralph Neville, earl of \*Westmorland, who arrested them. After the king's arrival, they were summarily executed. Scrope was buried in York minster, where his tomb attracted pilgrims.

RLS

**scutage** or shield-money was commutation in lieu of knight service as a fixed levy on the fee. From an early period after the Norman Conquest it became difficult to raise an adequate number of knights to form the royal army, nor was their military prowess necessarily satisfactory. The person holding the fee might be old, infirm, or even a female. There were therefore advantages to both sides in allowing landowners to buy themselves out, and as early as 1100 the term scutage had come into use. But the temptation to monarchs to raise the levy and to impose scutage more often made the issue controversial. John increased both the rate of scutage and the frequency of demands and an article of \*Magna Carta declared that scutage must be imposed only 'by common counsel of our kingdom'. When Edward I revived scutage in 1279 for his Welsh expedition he met with opposition, and Edward III's attempts to levy scutage for a Scottish campaign in 1327 were largely unsuccessful, the arrears of payment having to be wiped off.

JAC

**sea power** enables a state to use the oceans for commerce and war, while denying these facilities to enemies or rivals and controlling neutral shipping. This has been true since early periods. Sea-battles such as Salamis (480 BC) and Mycale (479 BC) played a part in compelling the Persian king Xerxes to abandon his invasion of Greece. During the struggle between Carthage and Rome for control of the western Mediterranean, fleet engagements at Mylae (260 BC), Cape Ecnomus (256 BC), and the Aegates Islands (241 BC) were equally decisive. The defeat of Marcus Antonius at the naval battle of Actium (31 BC) established the Julio-Claudian imperial dynasty of Rome. Two invasions of Japan launched by the Chinese Mongol emperor Kublai Khan in 1274 and 1281 were disastrous failures because of terrible losses inflicted on their fleets by storms. In 1571, the Christian victory at Lepanto crippled Ottoman naval power in the eastern Mediterranean and delivered a decisive check to Muslim western expansion. Successive Spanish armadas against the protestant English and Dutch, including major efforts in 1588 and 1639, failed because the attackers were unable to win command of the sea. Three hard-fought naval wars between Britain and the Dutch, in 1652–4, 1665–7, and 1672–4, were caused by commercial competition and rival claims to sea power. The victories of the British and Dutch fleets, now in alliance, at Barfleur and \*La Hogue in 1692 safeguarded the Glorious Revolution of 1688 against a Stuart restoration backed by France. The 18th cent. saw a series of wars in which sea power was crucial, in a world in which sea-borne commerce and overseas empires had expanded markedly. The French Revolutionary and Napoleonic wars (1793–1815) saw the culmination of naval warfare in the age of the sailing warship. Nelson's victory at the \*Nile in 1798 established British control of the Mediterranean, and \*Trafalgar on 21 October 1805 set the seal on British naval superiority. During the 19th cent., Britain's naval predominance sustained her world-wide commercial and imperial power, despite revolutions in warship design, including steam propulsion and protective armour.

The late 19th cent. saw increased scholarly analysis of the nature of sea power. Foremost was the American naval officer A. T. Mahan. He sought to explain Britain's success in attaining maritime hegemony, stressing that command of the sea in war could only be attained by the destruction or neutralizing of the enemy fleet. His first book, *The Influence of Sea Power in History, 1660–1783* (1890), was particularly influential.

By 1914, while the heavily armed and armoured battleship was still seen as the principal naval weapon, the introduction of torpedoes and submarines had already necessitated protective screens for major warships. In the 1914–18 conflict allied sea power facilitated the dismemberment of Germany's overseas empire and enforced a blockade of Germany and Austria-Hungary. In both the First and Second World Wars, Germany's unrestricted submarine warfare at times seemed potentially decisive. Britain's dependence on overseas trade made her particularly vulnerable, though the introduction of the convoy system reduced losses and the allied navies eventually triumphed.

During the Second World War, advances in naval aviation introduced a further element into the struggle for naval

supremacy. The Italian battle fleet, at anchor in its \*Taranto base, was badly damaged by a tiny force of obsolescent Fleet Air Arm aircraft in a raid in November 1940. In December 1941, planes from a Japanese carrier force crippled the American Pacific battle fleet at anchor at Pearl Harbor, though fortunately the American aircraft carriers were away at sea. Japanese sea power was vital in the allied defeats in the Far East in early 1942, but the survival of the American carriers brought a major Japanese defeat in the battle of Midway in June 1942. The principal Japanese striking force suffered disastrous losses in an engagement in which the main warships involved never saw each other, strikes by carrier aircraft proving decisive. Sea power was important in the European theatre of war, in the battle of the Atlantic, and in the north African campaigns, but its most convincing demonstration was in the allied advance in the Pacific between 1942 and 1945. 'Island-hopping' campaigns, moving ever closer to the Japanese home islands, were made possible by the development of forces capable of keeping the sea for long periods, backed by a sea-borne supply system. Before the atomic bomb brought Japan to surrender, her defeat had been ensured by the success of American submarines and aircraft in decimating Japanese shipping, depriving the Japanese war machine of oil and other vital raw materials. Since the 1960s, the submarine armed with nuclear missiles has become the single most potent embodiment of sea power.

NMCC

**seaside holidays** were an English invention of the mid-18th cent. Orthodox medicine adopted sea-bathing and advocated formal therapeutic bathing regimes, for patients suffering from a variety of diseases. At Scarborough, by the 1730s, visitors to the spa were combining sea-bathing with other treatments, and a sojourn at Bath was increasingly followed in the late 18th cent. by a visit to Weymouth. Dr Russell, the great proponent of sea-bathing, based himself at Brighton, which from the mid-18th cent. became the most fashionable of the emerging genre of seaside resorts. Royal patronage from the prince of Wales, the future George IV, made Brighton fashionable and attracted pleasure-seekers as well as those seeking cures. Other resorts, especially in Kent and Sussex, followed suit. Brighton already had over 40,000 inhabitants at the 1841 census, and the railways opened out new markets. The middle-class family holiday, with bathing and sandcastles for the children and 'nigger minstrels' and German bands for their elders, became a mid-Victorian institution, as did the seaside pier. The railways also made cheap trips to the seaside for the working classes possible, and the Lancashire cotton towns pioneered the working-class seaside holiday from the 1870s, flocking to Blackpool in particular, as the traditional wakes holidays were transformed and fairgrounds migrated to the coast. By 1914 the British seaside resort network was well established, catering for all classes and all tastes, with huge pleasure palaces and sophisticated fairground technology at the popular resorts. The inter-war years saw a greater concentration on fresh air and a freer approach to bathing, by this time recreational rather than therapeutic. British seaside resorts reached their peak of popularity in the 1950s, after

the introduction of paid holidays. But when cheap travel to new Mediterranean resorts became available, in conjunction with the popularization of sunbathing, British resorts struggled to compete. By the 1970s many smaller places were in terminal decline, and the British seaside holiday, threatened by pollution and new holiday fashions, is currently an endangered species. JKW

**Sebastopol, siege of.** The chief event of the \*Crimean War 1853–6. From 27 September 1854 British, French, and Turkish (and later Sardinian) armies maintained the siege of Sebastopol, the main Russian naval base in the Crimea. The town was never completely surrounded, being accessible from the north throughout. Not until 1855 were the allies strong enough to assault the town's chief bastions in earnest. The French captured the White Tower on 7 June 1855 but the British assault on the Redan on 17 June was a failure. In a joint attack on 8 September the British again failed to hold the Redan but the French captured the Malakov, the key to the town. The Russians evacuated Sebastopol that night, keeping it under fire. Although the allies destroyed the docks in January 1856 they never occupied the city, which was still disputed when the war ended. SDB

**Second World War.** Germany made the Second World War: a necessary condition was a nationalist German government ready, even eager, to use force. Hitler did not create the social and economic conditions that gave him power, but he brilliantly exploited them to develop a state usable for his own purposes, which went further than most Germans would consciously have ventured. The Nazis, who preached violence to forge unity between social classes, included those whose first aim, to increase German power in the world, required the co-operation of the military, the civil service, and industrialists, and also Nazis whose first, egalitarian, aim was to destroy the influence of those privileged groups. Hitler reflected and helped to win the dominance among Nazis of those who wanted international power. His coming to power was with the help of German conservatives who combined with the Nazis to resist socialists, in preference to working with socialists to block the Nazis.

Hitler's strength lay in the support of voters; many voted Nazi through despair at the depression of 1930–2. Arguably, it was the consequence of the treaty of \*Versailles after the First World War and its insistence on reparations payments by Germany which forced the maintenance of deflationary policies to keep up the exchange value of the mark, as well as recent memories of the catastrophic inflation of 1923, itself even more plausibly the result of the enforcement of reparations. Hitler, and the expansionist German nationalists he stood for, seemed a result of Versailles. Most British opinion concluded that those, especially the French, who had tried to enforce Versailles were to blame and that to soften the nationalism of Hitler's Third Reich the remaining grievances of Versailles should be remedied. Hence, British 'appeasement'. Towards Germany, even towards Hitler, conciliation seemed better than confrontation. France should be restrained and the anti-fascism proclaimed by the Soviet Union checked. Without the United Kingdom (and the British empire), restraint on the militarily reviving

## Second World War

Germany could not be effected and though French governments attempted to work with Italy and the Soviet Union, Italy was weak in resources and the Soviet Union struggling to exploit its own. As Hitler understood, British policy determined how far he could move towards a 'purified' German nation, self-sufficient and militarily invulnerable, without engaging in war. Until 1939, with British acquiescence, Hitler won success after peaceful success: restoring compulsory military service, creating an air force, remilitarizing the Rhineland, absorbing Austria, annexing the German-inhabited areas of Czechoslovakia, and then, in March 1939, destroying Czechoslovakia altogether. Hitler's growing support in Germany, as foreign success went with full employment, steadily increased his freedom of action.

In Britain, however, appeasement became unpopular. Neville Chamberlain, its leader, felt obliged to threaten force to compel German restraint and insisted that change to German benefit should take place only by way of negotiation. On 31 March 1939 he pledged Britain to defend Poland, and tried, at last, to build a 'peace front'. Chamberlain's policy was to persuade, or coerce, Hitler into acceptance of moderate change which would leave intact Britain's capacity to defend her independence. The British aim was to preserve the European balance of power, Hitler's to destroy it. In 1939 the British obstructed him. But the alliance attempted between Britain, France, and the USSR failed. Probably Stalin observed Chamberlain's reluctance to make a Soviet alliance because it would be too provocative to Germany and wreck chances of renewed Anglo-German concord. Stalin thought it safer to make his own bargain with Hitler, took up appeasement, and agreed to help Hitler to destroy Poland.

After an attempt to persuade Britain not to interfere, Germany attacked Poland, in theory to solve German grievances about Polish mistreatment of ethnic Germans, in fact to increase German resources, 'living space'. At dawn on 1 September 1939 began what became the Second World War. On 3 September Britain and France declared war on Germany. The unusually vicious nature of the German government already made morally desirable the defence of European balance.

As expected, Poland did not last long against German attack and was partitioned with the USSR. Anglo-French strategy was defensive, waiting to build up their armed strength. In May and June 1940 it went badly wrong. France, defeated by a German attack in May 1940, whose main weight was further south than anticipated, surrendered in June. Italy joined Germany, tempted by the prospect of participation in a prospective peace conference. Hitler could now organize Europe to support the German war effort. Everything seemed possible: the British would surely give in. Carefully calculating, while offering inspiring calls to arms, Churchill led the cabinet to resist, assuming, correctly, that the navy and air force could prevent German troop landings in sufficient force to occupy England in 1940 and that US economic help would enable protracted defence. The victory of the RAF in the Battle of Britain in 1940 blocked invasion, but in 1941 German submarines nearly defeated Britain; British code-breaking came to the rescue in June.

In 1941 Hitler decided to attack the USSR before the defeat of Britain. In 1940 President Roosevelt, hesitantly, had decided to try to keep Britain fighting. In 1941, therefore, Hitler feared that the war in the west might escalate into war with the USA and decided, after tentative attempts to make a new bargain with Stalin, to defeat the USSR first. His advisers expected success in 1941. It went wrong. Roosevelt, concerned to maintain a world balance of power, gave help to the USSR. The 'Lend-Lease' Act permitted him to supply countries at war without payment. Like Churchill he strove to keep the Red Army fighting. The Red Army wore down the German army while the Americans made tanks, aircraft, and ships; hence Hitler's defeat.

In the 20th cent. Japan maintained expanding population by trade, either by co-operating in the international structures or by forceful seizure of raw materials, especially fuel. In 1930-45 the Japanese authorities used force to counter trade barriers erected by foreign countries, threatening British and Dutch rubber, tin, and oil. The US government, working to maintain a world balance of power in 1940 and 1941, tried to check Japan by denying raw materials. The Japanese, with the threat from the USSR met by the Germans, decided to seize essential resources. In December 1941 encouraged by Germany, Japan attacked the US Pacific fleet at Pearl Harbor and invaded Malaya, Burma, and the Dutch East Indies. Hitler, conscious that the USA was already an opponent, and still hopeful of victory over the USSR, clarified the conflict by declaring war on the USA. The Second World War involved Germany, Italy, and Japan against the USA, USSR, and the British empire, with France overrun by Germany, and China, divided between nationalists and communists, uncertainly united in resistance to Japanese attempts to control Chinese resources and trade.

The British empire and the USA fought a world war. Both gave priority to defeating Hitler. The main effort against Japan came from the USA. The failure of the Chinese to defend territories from which Japan could be attacked reduced the British role in Burma from the expansion of the line of communications to China to the defence of India and the eventual reassertion of British power in Malaya and Singapore.

In Europe the American army hoped to concentrate all Anglo-American resources in the United Kingdom to invade Europe at the earliest date possible. Churchill and the British thought Germany must first be weakened by campaigns in north Africa and Italy. Roosevelt agreed with Churchill in order to avoid delay in bringing some US forces into action in the European theatre; partly he wanted to maintain US public interest in the war against Hitler, partly to demonstrate US eagerness to take some burden off Soviet forces. Thus, their main operations were delayed and British and US ground forces became fully engaged against the German army only after the landings in Normandy in June 1944. By September 1944 the allies had defeated Germany; Anglo-American forces closed to the Rhine, the Red Army had taken Romania, territorial losses and bombing ended German ability to sustain war for much longer. However, SS coercion and fear of the allies, especially the Soviets, enabled Hitler to delay the end until May 1945.

In the Pacific, Japan, too, continued the war long after defeat brought about by attacks by US submarines on transport ships and US bombing attacks on Japanese industry. Japanese authorities, led by the emperor, accepted defeat only after the use of two atomic bombs, developed in time in the USA.

In Europe the war created a partition, which lasted for more than 40 years, between communist states, influenced or controlled by the USSR, and societies dominated by more or less tempered liberal capitalism. The partition came surprisingly peacefully, though with particular problems in Poland, accepted in the end as belonging to the communist sphere, and with increasing tension for a time in Germany, where an administrative partition agreed during the war lasted for several decades. In the East partition brought devastating and protracted conflict in China, where communists triumphed in civil war; in Korea, split in two, after a fierce war; and in Indo-China, where conflict lasted for decades. Here, as in Europe, capitalism is recovering among 'communist' states, but in Asia liberalism is less evident.

Germany, Italy, and Japan, the defeated countries, are today more agreeable to live in and far more prosperous than were the countries that precipitated the bloodshed of the Second World War. All, so far, are more tolerant societies. The Nazis demonstrated to rational human beings the dangers of the menacing idiocy of racial prejudice by carrying it through to its chilling conclusion in the mass murder of Jews, as enemies of 'Germanic and Aryan purity'.

In 1940 the United Kingdom, inspired by Churchill, continued to fight. The British preferred American domination to Hitler's. In 1945 the USA became the greatest power in the world, and, with the collapse of the Soviet empire in the 1990s, perhaps the only super-power.

**secretaries of state.** Like many other great offices, the secretaryships of state grew from comparatively modest beginnings. The development from a mere clerk to a policy-maker was largely a 16th-cent. phenomenon. In medieval usage, 'secretary' retained a slightly sinister meaning as one who was privy to secrets, and was used to describe \*Gaveston and \*Despenser, the favourites of Edward II. As first the \*great seal and then the \*privy seal were regarded by monarchs as too public, the keeper of the signet rose in importance. In the reign of Edward IV, a principal secretary holding the signet was appointed, but the jump in status was not until Thomas \*Cromwell became principal secretary in 1534. Two years later he added the privy seal and became the engine of government. Cecil (Lord \*Burghley) held the post of secretary under Edward VI and Elizabeth (1550–3 and 1558–72) and his son Sir Robert \*Cecil 1596–1600. From 1573 until 1590 the post was filled by \*Walsingham. In the reign of James I the convention was established of appointing two secretaries. After the Restoration, the posts were divided into a secretary of state for the north and

for the south—the former conducting diplomacy with the protestant powers of northern Europe, the latter with the catholic powers of southern Europe. This strange system, bound to cause problems, survived for more than 100 years, partly because one secretary usually took the lead: few people doubted that William \*Pitt, secretary for the south 1757–61, carried more weight than his colleague the earl of Holderness. In 1768 a third secretary was appointed to administer the American colonies, but it was an ill-fated experiment since they declared themselves independent in 1776.

A major reorganization took place in 1782 when the southern secretaryship was converted into the \*Home Office and the northern secretaryship into the \*Foreign Office. After that there were periodic increases in the number of secretaryships. Henry \*Dundas was made secretary for war in 1794 and also took on colonial responsibilities; a separate secretaryship for the \*colonies was created in 1854; a secretaryship for India after the mutiny, in 1858; a secretaryship for air in 1918. In the 20th cent., though the foreign and home secretaries retained their identities and importance, the others suffered from repackaging according to the vicissitudes of time. The colonial secretary found his department shrinking when, in 1925, a separate secretaryship for dominion affairs was set up. Since his main task after the Second World War was to wind up the British empire as rapidly as possible, his reward in 1966 was abolition. The secretary for dominion affairs did not long outlast him and, having changed his name to the secretary for Commonwealth relations in 1947, was swallowed up by the Foreign Office in 1968. The secretary of state for India vanished in 1947 when India became independent, and the secretary for air disappeared when an integrated Ministry of \*Defence was established in 1964. Meanwhile the proliferation of secretaryships illustrated the law that grand titles increase as power diminishes—for industry (1963), education and science (1964), employment (1968), social services (1968), environment (1970), and transport (1976).

The early evolution of the secretaryship in Scotland from the reign of David II followed a similar course to that in England, with the office emerging from the keepership of the signet. In 1558–71 it was held by William \*Maitland, in 1661–80 by \*Lauderdale, and after 1680 usually by two persons. At the Union of 1701 \*Mar and Loudoun were re-appointed as secretaries of state, but in 1709 \*Queensberry became a single third secretary. This arrangement lasted until the Jacobite rising of 1745, after which no secretary of state for Scotland was appointed until 1885. A secretaryship for Wales was set up in 1964. In Ireland, the lord-lieutenant had the main responsibility, but was assisted by a powerful chief secretary who, from 1859 onwards, was usually a member of the cabinet. This post lapsed when the Irish Free State was set up in 1922, but a secretary of state for Northern Ireland was appointed in 1972 after direct rule had been imposed on the province. JAC

**secret ballot** was advocated as early as 1656 by James \*Harrington in *Oceana*, discussed in pamphlets at the time of the Glorious Revolution, argued by \*Defoe in 1708, and

## secret service

became a persistent radical demand in the 18th cent. It was adopted by both France and the USA for their new constitutions. Nevertheless, when the reform committee proposed it in 1831 it was struck out by \*Grey and the cabinet, to the great relief of William IV. The issue was then taken up by George \*Grote, became one of the \*chartists' six points, and was urged in the Commons by Henry Berkeley. Opposing it in 1842, George Byng declared that 'a real Englishman would never conceal his feelings and opinions' and Sir James \*Graham agreed that only 'dirty and hypocritical cowards' would wish to vote in secret. In 1856 it was introduced into the new constitutions for South Australia and Victoria. A select committee in 1869 reported in favour and in 1872 \*Forster succeeded in carrying the measure against some opposition by the House of Lords. The introduction of secret ballot did not eliminate bribery and corruption but was a blow to the influence of the propertied classes, particularly when the franchise was further extended in 1884.

JAC

**secret service.** The British secret service traces its history back to Elizabeth I's secretary of state Sir Francis \*Walsingham; but, being secret, there is no way of telling if it is really older than that. Walsingham used it mainly to sniff out foreign-aided catholic plots. The playwright Christopher \*Marlowe is supposed to have been one of his spies; or murdered by one; or both. (Espionage is a confusing field.) Most later ministers used covert intelligence to a greater or lesser extent, though never in a formal, institutional fashion. The only British secret service agency with a continuous history from the 17th cent. onwards was the \*Post Office, which used to open letters, decipher them, reseal them, and send them on their way. During the Napoleonic years these activities were stepped up, as one might expect, in circles where French revolutionary contagion was thought likely to catch on. This continued through to 1820, when suspicions of *agent provocateur* activities by a number of government agents, including one known as \*'Oliver', provoked such public outrage that the practice was discontinued.

For most of the Victorian years Britain had virtually no secret service, mainly because it was thought to be immoral, counter-productive, and foreign. (There was a 'secret service fund', but that was spent on other things.) It started up again around the turn of the 20th cent., with the formation first of the London \*Police Special Branch in 1881-7, to look after American-Irish and continental anarchist dynamiters; and then of MI5 and MI6 in 1909, in response to the German threat. The \*First World War saw their activities expand enormously. Afterwards they became a permanent though invisible feature of the British political scene.

Their achievements have been mixed. They undoubtedly contributed to the allies' victory in the \*Second World War. Hitler admired them hugely, crediting their successes at lying and deception to the influence of the English public school. On the other hand they made some terrible errors; were almost immobilized by Russian 'moles' in the 1950s and 1960s; and are strongly suspected of having plotted treacherously against Labour governments in 1924 (the \*Zinoviev letter) and 1976.

**sects.** See DISSENT.

**secularism** was the word adopted by George Jacob \*Holyoake in the early 1850s to describe a system of morals and social action shaped exclusively by this-worldly considerations, irrespective of religious beliefs. The word was derived from the secular education movement for the complete separation of religious teaching from other forms of education.

Christians in 19th-cent. Britain argued that atheists, lacking belief in divine judgement, must be immoral and incapable of exercising civil rights. Holyoake wished to avoid the negative connotations of the word \*atheism by finding an alternative which stressed the positive nature of an ethical life inspired to do good for its own sake. Regarding religion as an irrelevance, he argued that secularism could extend beyond the bounds of atheism to include all enlightened reformers.

Local secular societies were formed in the 1850s, incorporating earlier groups of anticlerical and atheistic radicals who had supported Richard \*Carlile and Robert \*Owen. In 1866 these were brought together by Charles \*Bradlaugh in the National Secular Society though, unlike Holyoake, Bradlaugh argued that atheism was a necessary precondition for secularism. Ironically, secularism as a movement declined from the mid-1880s partly because society was becoming more secularized, making the campaigns of secularism seem unnecessary, although the National Secular Society continues as a pressure group for the complete secularization of state education, repeal of the blasphemy laws, disestablishment of the Church of England, and the removal of all religious influences in politics, law, morals, and society.

ER

**Security, Act of [S], 1704.** The Scottish Act of Security was, paradoxically, an important step towards Union. After the failure of the \*Darien scheme in 1700, the Scots were bitter towards England. Proposals for a union failed and the Scottish Parliament pointedly refused to follow the English Act of \*Settlement (1701), which ensured succession to the Hanoverians. Instead, their Act of Security left the Scottish succession to be resolved by Parliament later and declared that the successor in England would not be named if Scottish grievances over religion, liberty, and trade were not met. To point the threat, the Scottish militia was put in readiness. Anne refused consent but, reluctant to force the issue in the midst of a great war, gave way in 1704. The two countries were now on collision course and, after retaliation from both sides, negotiations commenced which resulted in Union in 1707. James Mackinnon called the statute 'an ultimatum rather than an Act of Parliament'.

JAC

**Sedgemoor, battle of, 1685.** Sedgemoor was that most desperate of ventures, a surprise night attack. \*Monmouth landed at Lyme Regis on 11 June 1685 and was proclaimed king at Taunton on the 20th. But he gained little support from the gentry or nobility and his scratch army failed to take Bristol or Bath. He was pursued to Bridgwater by a royal army under Lord Feversham, with John Churchill, the future duke of \*Marlborough, as second in command.

Monmouth's men outnumbered their opponents, but Feversham's were trained soldiers. The royal army drew up east of Bridgwater, behind the line of the Bussex rhine, a waterlogged ditch. On the night of 5 July, Monmouth led out his men in total silence, past the village of Chedzoy, hidden by darkness and night mist. But with still a mile to go, the alarm was given. Once the element of surprise had been lost, Monmouth's fate was sealed. His cavalry was soon dispersed and the infantry, firing wildly, ran short of ammunition. As dawn broke, Feversham's men advanced and the fight was over. Monmouth was found hiding in a ditch on Cranborne Chase two days later, taken to London, and beheaded on Tower Hill on 15 July. His supporters were cut down, the rest rounded up in Weston Zoyland church, transported, or hanged by Judge \*Jeffreys. JAC

**Seditious Meetings Act**, 1795. In the autumn of 1795 high bread prices reinforced a demand for parliamentary reform and the London \*Corresponding Society held a mass open-air meeting at Copenhagen House (Islington) on 26 October. Three days later, on his way to open Parliament, George III was hooted and the window of his coach shattered. \*Pitt's government responded with the Seditious Meetings Act (36 Geo. III c. 8), which forbade meetings of more than 50 people without prior permission from a magistrate, and the Treasonable Practices Act (36 Geo. III c. 7), which threatened with transportation for up to seven years anyone speaking or writing against king, government, or constitution. Both bills were vigorously contested by the Foxite opposition but carried by large majorities. Though Pitt has been accused of exaggerating the threat for party advantage, there seems little doubt that he was genuinely alarmed. JAC

**Seisyllwg, kingdom of**. An early Welsh kingdom of obscure origin, though it may have been established by Seisyll ap Clydog, king of Ceredigion, by extending his dominion south to the Tywi valley (c.730). His descendant Angharad married \*Rhodri Mawr, who temporarily combined it with \*Gwynedd (871). Later (904), it was absorbed into the wider kingdom of \*Deheubarth under \*Hywel Dda; thereafter, Seisyllwg ceased to be an independent kingdom and its name fell into disuse. RAG

**Selborne, Roundell Palmer, 1st earl of** (1812–95). Lawyer. Palmer got off to a flying start. He was educated at both Rugby and Winchester, moved on to Christ Church, Oxford, was president of the Union, and gained a first-class degree. He studied law at Lincoln's Inn and entered Parliament in 1847 as a supporter of Sir Robert \*Peel. He became solicitor-general in \*Palmerston's administration in 1861 and moved up to attorney-general in 1863, holding the post until 1866. A strong churchman, he disapproved greatly of the disestablishment of the Irish church in 1869 and refused \*Gladstone's offer of the lord chancellorship, with a peerage. But on the resignation of Lord Hatherley in 1872 with failing eyesight, Palmer succeeded him as lord chancellor, holding office 1872–4 and again 1880–5. He was created baron in 1872 and advanced to earl in 1882. Increasingly uneasy at the radical trend of the Liberals, he parted with them on \*Irish Home Rule in 1886, writing sadly in his *Memorials*, 'my idols were

broken'. Henceforth he gave independent support to the Conservatives. Palmer's brilliant intellect, vast memory, and powers of application were widely recognized, and the complete reorganization of the law courts in the \*Judicature Act of 1873 was his work. His son and grandson also had distinguished political careers. JAC

**Selby, battle of**, 1644. In the spring of 1644, the royal army in the north, under \*Newcastle, was at Durham, to prevent a junction of the Scots with the parliamentary forces under the \*Fairfaxes. But on 11 April John Bellasyse, holding Selby, south of York, was badly defeated, lost 1,600 men and all his guns, and was taken prisoner. York, the king's northern capital, was in imminent danger and on 13 April, as soon as he heard the news, Newcastle struck camp and moved south to hold the city. Rupert's attempt to relieve York later in the summer led to the crushing royalist defeat at \*Marston Moor. Selby was the stone that started the avalanche. JAC

**Selby abbey** (Yorks.) was founded c.1070 by King William I for Benedict, a monk of Auxerre, who had become a hermit at Selby, and who had brought with him a relic of St \*Germanus of Auxerre. Its estates and its appropriated churches were concentrated in south-east Yorkshire and northern Lincolnshire and in wealth it was second only to St Mary's York amongst the \*Benedictine houses of Yorkshire. Its net income in 1535 was nearly £740. This supported a community of some 30 monks in the late Middle Ages. Selby's abbot was regularly summoned to Parliament as a spiritual lord. BJG

**Selden, John** (1584–1654). Selden, 'the father of English legal history', was one of the most distinguished antiquarians of Stuart England. A lawyer of the Inner Temple, he served as MP for Lancaster (1623), Great Bedwyn (1626), Ludgershall (1628), and in the Long Parliament of 1640 for the University of Oxford. Selden was born in Sussex of lesser gentry stock. He practised law, but his main interests were history and politics. From 1607 he issued a stream of learned works, mainly on legal history, of which a history of tithes (1617) is best known. His legal knowledge made him useful to the opposition to Charles I, when debates often turned on precedents. He took part in attacks upon the royal favourite \*Buckingham in 1626 and collaborated closely with \*Coke in 1628 on \*habeas corpus. The court took reprisals and from March 1629 to May 1631 he was imprisoned. In the early days of the Long Parliament he was a moderate and there were rumours that he might join the court. But he did not and in 1643 was put in charge of records in the Tower. Meanwhile, Selden continued to publish, including an important treatise on the law of the sea (1636) and another on the privileges of the baronage (1641). Many of his books and archives finished up in the Bodleian library. His *Table Talk* was published in 1689. \*Clarendon paid the highest tribute to his learning and kindness. The Selden Society was established in 1886 by \*Maitland and others to encourage the study of English law. JAC

**self-denying ordinance**, 1645. Growing dissatisfaction in Parliament with the inability of \*Essex and \*Manchester to finish the Civil War led to a proposal, late in 1644, for

## self-help

a self-denying ordinance, whereby members of both Houses of Parliament could no longer hold commissions. This was ingenious, since members of the House of Commons could, if they chose, resign their seats, but peers could not divest themselves of their titles: the House of Lords consequently rejected it. Brought forward again in 1645 after more royalist successes, it passed on 3 April. Essex, Manchester, and \*Waller resigned, clearing out the old guard, and paving the way for the \*New Model Army under Sir Thomas \*Fairfax. \*Cromwell was given special exemption from the ordinance. JAC

**self-help.** Social and moral doctrine that people should rely on their own efforts and not look to the state for help. In the 19th cent. self-help took two forms: collectivist, as with \*friendly societies, mutual improvement societies, \*cooperatives, and \*trade unions; or individualistic, as with the practice of sobriety, thrift, hard work, and self-education. Self-help, as popularized by Samuel \*Smiles, was middle-class advice how working people might better themselves without upsetting the status quo or seeking public relief when sick, aged, or unemployed. It also harmonized with the skilled artisan tradition of independence.

JFCH

**Selgovae.** A British tribe in southern Scotland. This tribe, whose name is thought to mean 'hunters', is referred to by the Greek geographer Ptolemy. His information places them in the southern uplands of Scotland centred in the upper Tweed basin, sandwiched between the \*Votadini to the east and the Novantes to the west. Their principal settlement was on Eildon Hill, where an initial fortified enclosure of only 3 acres was enlarged in the years before the Roman invasion to a hill-fort of some 40 acres. Inside, the remains of over 300 huts can still be traced, so that the population of the Selgovae capital must have run into four figures. It was abandoned at the time of the Roman conquest c. AD 79, briefly described in \*Agricola's biography written by his son-in-law \*Tacitus. The native hilltop stronghold was replaced by a Roman fort, Trimontium (Newstead), at the foot of the hill. KB

**Selsey, diocese of.** \*Wilfrid, formerly of \*Ripon and \*York, created this see, conterminous with Sussex, in 681. When he returned to \*Hexham in 686, Selsey was united with \*Winchester until Selsey's revival some years later. After the Council of London (1075), the see moved to \*Chichester. WMM

**Septennial Act,** 1716. This Act prolonged the life of Parliament from a maximum of three years (as the 1694 Triennial Act required) to seven years. Its pretext was the Jacobite uprising in 1715. But by delaying the next election until 1722 the new Whig ministers succeeded in evading electoral judgement until they had consolidated themselves in power and weakened their Tory opponents. Following the 'rage of party' of Queen Anne's day, the longer periods between elections did much to quieten political life and entrench the Whigs in government for the next three decades. The \*Parliament Act of 1911 shortened the duration of parliaments to five years. AAH

**Septimius Severus.** Roman emperor 193–211. Lucius Septimius Severus was born at Lepcis Magna in north Africa. Consul in 190, he was governor of Pannonia Superior on the Danube when he was proclaimed emperor on the assassination of Commodus, gaining the support of the Senate. He was opposed by the governor of Britain, \*Clodius Albinus, whom he killed at the battle of Lyons in February 197. It may have been after this that the province and army of Britain were divided in two. After a series of wars against the Parthians, Severus' attention was drawn back to Britain by trouble with the Scottish tribes. He took the field with his sons \*Caracalla and Geta in 208 and reconquered the Lowlands, establishing a garrison fortress at Carpow on the Tay. Increasing ill-health led to his death early in 211 at York. ASEC

**serfdom** is the general term for servitude to a superior, but distinguished from slavery by being regulated by custom. The name masks a great variety of arrangements. There were large areas of England where it had never applied, particularly in Kent, the old Danelaw, and parts of the west country. Though the basic obligation of the unfree was to work for three days a week on the lord's demesne, to assist at harvest time, and to pay certain dues, the details differed from estate to estate. It was understood that serfs and their families should not be moved from their lands as chattels, but there are instances where it was done. The nearest that serfdom came to being a complete system was in the two centuries after the Norman Conquest. Before then personal vassalage was common, but a considerable proportion of peasants were slaves. By the 13th cent. the pattern was beginning to unravel as more and more villeins obtained their freedom and became copyholders. The system withered away, though it was a slow process, and as late as 1549, in \*Kett's rebellion, there were demands that bondmen should be made free. In Scotland serfdom disappeared even sooner, and had gone by the 14th cent., though clan and family loyalties remained strong and \*heritable jurisdictions survived until the 18th cent. By a remarkable throwback, a system akin to serfdom was introduced in Scotland in the 17th cent. to control the supply of labour in coal-mines and salt-pans, especially in Fife. In 1701 a statute declared that \*habeas corpus did not apply to the miners and in 1708 it was enacted that a collier escaping could be brought back within eight years. The system was finally abolished as late as 1799 (39 Geo. III c. 56) when the colliers were declared 'free from their servitude'. JAC

**serjeant at law.** The order of serjeants at law, dating at least from the early 14th cent., consisted of the leaders of the legal profession and until 1846 they alone had the right to plead cases before the Court of \*Common Pleas, the most important of the common law courts for medieval civil litigation. The characteristic of their office was the distinctive 'coif' and they were members of Serjeants' Inn. It was necessary to be a serjeant at law in order to become a judge in the common law courts, but by the mid-16th cent. the office had declined in importance and was often conferred merely as a preliminary to judicial appointment. The order of serjeants was dissolved in the 19th cent. MM

**Settlement, Act of, 1701.** This statute, 12 & 13 Wm. III c. 2, is strange and betrays the mixed motives of its authors. The immediate problem was to provide for the protestant succession after the death of Anne's son, the duke of Gloucester, in July 1700. This was done by putting aside more than 50 catholic claimants and offering the succession to \*Sophia, electress of Hanover, a granddaughter of James I. But the Tory majority in Parliament took the opportunity to tack on a number of incongruous clauses designed to limit the powers of the monarch, who was not to leave the country or engage in war without parliamentary approval. Placemen were not to sit in Parliament, judges were to hold office on good behaviour, and government business was to be conducted in the \*Privy Council, where counsellors were to sign their advice. Royal pardons were not to be issued against impeachments. The clauses devoted to the succession took effect in 1714, when Queen Anne was succeeded by Sophia's son George I. The other clauses were either repealed or circumvented. The clause forbidding placemen to sit in Parliament, which would have divorced legislature and executive, was nullified by the clumsy device of re-election on taking office. JAC

**Settlements and Removals, Act of, 1662.** The end of the Civil War period left the Elizabethan \*Poor Law arrangements in confusion, since many people had left their native villages and towns, some to join armies, others to find work. Charles II's \*Cavalier Parliament brought in an Act 'for the better relief of the poor of this kingdom' (13 & 14 Car. II c. 12) which governed poor relief until the reform of 1834. Though overseers and justices had often tried to move on the indigent poor there was no Elizabethan statute to justify doing so, save for 'vagrant rogues'. The Act of 1662 offered the drastic solution that any persons, not necessarily begging or asking for relief, but only 'likely to be chargeable' might be expelled to their native parishes by a removal order granted by two JPs. In addition to being a gross infringement of personal liberty, the arrangements were bound to lead to disputes between parishes which, according to Rickman in 1822, had become 'the main employment of Quarter Sessions since the Revolution'. Though there were hundreds of cases of severe hardship, the law cannot have been rigorously enforced since the cost of removal and litigation, which fell upon the parish, was considerable, and the growth of towns suggests that movement remained possible. But in *The \*Wealth of Nations*, Adam \*Smith wrote: 'there is scarce a poor man in England, of forty years of age, who has not, in some part of his life, felt himself most cruelly oppressed by this ill-contrived law of settlements.' The first substantial concession did not come until 1795 when it was enacted that persons should not be removed on suspicion that they might become a charge on the poor rate, but on evidence that they had become so. JAC

**seven bishops, trial of the, 1688.** Seven bishops, including Archbishop \*Sancroft, arrested for petitioning against the public reading of James II's second \*Declaration of Indulgence (1688), were tried for 'seditious libel'. The cheering which broke out among James's soldiers on Hounslow Heath when the verdict of acquittal was known was an

ominous sign for the king. The trial contributed, with the birth of James II's male heir, to James's overthrow and the succession of William III and Mary II. Five of the seven subsequently refused the oath to William. WMM

**Sevenoaks, battle of, 1450.** In June 1450 Henry VI advanced with a sizeable force into Kent to confront Jack \*Cade's rebels. But on the 18th a detachment under Sir Humphry Stafford was routed and the commander killed. Though little more than an ambush, it was enough to undermine morale in the royal army. Henry left for safer parts and Cade went on to occupy London. JAC

**seventh-day adventists.** Largest of a group of sects focusing on the Second Coming—the return of Christ in glory to judge the living and the dead. They originated in the USA in 1831 when William Miller, a baptist farmer, announced the Coming for 1843, recalculated to 1844. When that failed to happen Miller recanted, but Ellen (Harmon) White held that Christ had in fact come to cleanse the sanctuary of heaven, thus commencing the Final Judgement. This would take place quietly, with evildoers annihilated rather than eternally damned. Her followers observed the sabbath from Friday sunset to Saturday sunset, hence their name, adopted in 1861. They practised believer's baptism. Other distinctive beliefs included the sleep of the soul after death. Originally vegetarian and opposed to political activity and state education, they have become widely regarded for the medical and educational emphasis of their missionary work. They reached England in 1878 with a mission to Southampton. CB

**Seven Years War, 1756–63.** In the years immediately after the War of the Austrian Succession, a 'diplomatic revolution' took place in Europe. France and Austria, with support from Russia, Sweden, and Saxony, aligned themselves against Frederick II of Prussia, effectively surrounding his country. In 1756 Frederick made a pre-emptive strike into Saxony, followed a year later by an advance into Bohemia. As his enemies responded by threatening Prussia from all sides, Frederick turned to Britain for aid. An 'Army of Observation' under the duke of \*Cumberland was deployed to western Germany, comprising Hanoverian, Hessian, and Prussian troops, but when the French invaded, Cumberland was beaten at \*Hastenbeck (26 July 1757) and forced to sign a convention to disband his army. This was countermanded by the British prime minister, William \*Pitt (the Elder), who sent British units to reinforce the remains of Cumberland's army, under the command of Ferdinand of Brunswick. As Frederick II fought for his own survival, winning victories against the French at Rossbach (November 1757) and the Austrians at Leuthen (December 1757), the British, now known as the 'Army of Execution', prepared for action in the west. Initially, the British did well, winning a victory against the French at Krefeld in 1758, but in the following year they were forced to pull back towards Hanover. A hard-won victory at \*Minden on 1 August 1759 allowed the 'Army of Execution' to consolidate its hold over western Germany, but the war was by no means over. Further east, Frederick had managed to survive only by fighting desperate battles at

Zorndorf (1758) and Kunersdorf (1759); he had to fight further battles at Liegnitz and Torgau (1760) and at Schweidnitz (1762), shifting his armies from one side of Prussia to the other to defeat the French, Austrians, and Russians in turn. Only when Russia withdrew from the war on the death of the Tsarina Elizabeth in 1762 did Frederick receive any respite. The war ended in February 1763 with the peace of \*Paris.

But the fighting was not confined to Europe. Preoccupied with their war against Prussia, the French were in no position to protect their overseas possessions, and Britain took full advantage. In North America spasmodic fighting between British and French settlers had been going on for years. In 1758 Pitt dispatched an expeditionary force of 12,000 men under General \*Amherst to capture the fortress of Louisbourg on Cape Breton Island and, when this proved successful, ordered a more ambitious advance into French-held Canada. On the night of 12–13 September 1759 Major-General James \*Wolfe, commanding no more than 3,000 men, mounted a surprise attack on Quebec on the upper reaches of the St Lawrence river. Carried there by a British fleet under Admiral Saunders, Wolfe's men scrambled up cliffs to the south of Quebec under cover of darkness and, as dawn broke, faced a force of about 5,000 French soldiers under the marquis de Montcalm on the Plains of Abraham. The ensuing battle was short and decisive; although both Wolfe and Montcalm were fatally wounded, the French retreated and Quebec fell. Montreal followed, leaving Britain in control of much of Canada.

By then, the British had also consolidated their power in India, where the pro-French nawab Siraj-ud-Daula was defeated by Robert \*Clive at the battle of \*Plassey in 1757 to give the East India Company control of Bengal. By 1761, when the French outpost at Pondicherry surrendered to General Eyre \*Coote, this control had been extended into the Carnatic.

JLP

**Seville, treaty of, 1729.** In 1727 Spain, with Habsburg support, began a siege of \*Gibraltar, held by the British since 1704. It was not pressed with much vigour and an armistice was agreed in 1728. By the treaty of Seville in 1729 Spain restored Britain's commercial concessions while Britain agreed to support Spanish claims in Italy. The question of Gibraltar was tacitly abandoned. Disagreement within the British ministry obliged \*Townshend, secretary of state for the north, to resign, leaving \*Walpole supreme.

JAC

**Seychelles.** These islands in the Indian Ocean were first marked on Portuguese charts in 1502 but not settled by whites until 1742 when Lazare Picault took possession of them for the French East India Company. They were named in 1756 after Louis XV's finance minister Moreau de Sechelles. The French developed 'secret' spice plantations on them to undercut Dutch monopolies. In 1810 they were captured by the British and retained at the peace of Paris. They were administered along with \*Mauritius until 1872 when they became separate under their own governor and council. The Republic of the Seychelles came into existence on 27 June 1976.

DAW

**Seymour, Lady Catherine** (1540–68). Lady Catherine was the younger sister of Lady Jane \*Grey, her grandmother being \*Mary Tudor, sister of Henry VIII. She was only 13 when the disastrous abortive coup took place. Her sister and father were both executed and the earl of Pembroke, to whom she had been betrothed, broke off the contract. In 1560 she made a secret marriage to the earl of Hertford: Elizabeth sent them both to the Tower. As next in succession to the crown, Catherine was in the midst of intrigue. Philip of Spain considered the possibility of a marriage and in 1562, when the queen was believed to be dying of smallpox, it was mooted to bring Lady Catherine out of the Tower and proclaim her. But the queen recovered and Lady Catherine spent the last six years of her life under house arrest with various guardians.

JAC

**Seymour, Sir Edward** (1633–1708). Tory politician. Opinionated, arrogant, self-seeking, and complex, Seymour was one of the most formidable parliamentarians of his age and a thorn in the side of any government. On becoming an MP in 1661, he set out as an aspiring careerist. At heart a country gentleman, he wavered between a craving for high office and an attachment to 'country principles', often giving the impression of being motivated by pure self-interest. He was a skilful if authoritarian Speaker of the Commons (1673–8, 1678–9), and opposed \*'Exclusion' despite his anti-catholicism. In 1688 he joined William of Orange at Exeter, but like many Tories harboured misgivings about William's claim to be king *de jure*. After a troubled spell as a Treasury lord (1692–4), he was for the rest of William's reign a heavy-weight opponent of the Whig ministers. Featuring among Anne's new 'high-church' appointments in 1702, his opposition to \*Marlborough's costly land campaigns earned him dismissal in 1704.

AAH

**Seymour, Thomas Seymour, 1st Baron** (1508–49). Seymour played for high stakes and lost. He was the brother of \*Jane Seymour, Henry VIII's third wife, and the younger brother of \*Somerset, protector to the young Edward VI. His spectacular rise began with his sister's marriage in May 1536. He was made a gentleman of the bedchamber and employed on important diplomatic and military missions. In 1544 he was appointed master-general of ordnance for life and lord admiral. As soon as his nephew became king in 1547 he was created a peer and given the Garter. Within months of Henry VIII's death he had married his widow \*Catherine Parr, to his brother's indignation. On her death in childbirth, he seems to have aimed at marriage with Princess Elizabeth, whom he had certainly treated with familiarity. But in January 1549 he was accused of conspiring against his brother, of whom he was envious. He was said to have tried to suborn the young king with lavish presents and urged him to exert his authority. Condemned by attainder, he was executed on Tower Hill. Edward noted his uncle's death in his diary without undue grief and Elizabeth is reported to have dismissed him as 'of great wit but very little judgement'.

JAC

**Shackleton, Sir Ernest Henry** (1874–1922). Almost the antithesis of \*Scott as an explorer, Shackleton was impetuous and restless and his experience was in the merchant

marine rather than the Royal Navy when he successfully applied to join Scott's Antarctic expedition of 1901–4. Sledging with Scott himself, he reached 82 degrees south in 1902. After a variety of experiences including unsuccessful parliamentary candidature, Shackleton raised enough support to take his own expedition back to the Antarctic in 1907–8 where he discovered and named the Beardmore Glacier as a route onto the 10,000-foot plateau at the centre of the continent. Shackleton himself reached 88 degrees south, only 97 miles from the Pole. Now a hero, he was later encouraged to lead an official expedition aiming to explore from the Weddell Sea and cross the continent to the Ross Sea. Ordered to go ahead despite the Great War, Shackleton lost his ship *Endurance* when it was crushed by ice in November 1915. With sledges and small boats, he led his men to Elephant Island by the following April, sailed in an open boat to South Georgia, returned to rescue his men, and then visited the Ross Sea. After some diplomatic service in South America and military service in Russia in 1919, he set out on a third Antarctic expedition in 1921 but died suddenly after reaching South Georgia. RB

**Shaftesbury, Anthony Ashley Cooper, 1st earl of** (1621–83). Politician. As chancellor of the Exchequer 1661–72, Shaftesbury (then Lord Ashley) was a minor but hard-working and able member of Charles II's early ministries. Promoted to the more prestigious office of lord chancellor in 1672, and made an earl, his deism and attachment to parliamentary government put him at odds with the king's increasingly obvious pro-French and pro-catholic policy and its sinister threat of royal absolutism, and he was dismissed in 1673. He then went into systematic opposition. From 1679 he led the \*'Exclusion' campaign to bar the catholic duke of York from the succession, exploiting the \*Popish plot to generate anti-catholic feeling. Despite poor health, he succeeded in unifying the disparate opposition groups in Parliament into an electorally successful party of 'Whigs' and employed demotic and propagandist tactics to rouse popular support. Hounded in his last months on a charge of treason, he died in Holland early in 1683.

AAH

**Shaftesbury, Antony Ashley Cooper, 7th earl of** (1801–85). Philanthropist and social reformer. Lord Ashley (as he was styled until 1851 when he succeeded his father) was a strict evangelical who devoted his whole life to promoting, both in and out of Parliament, a succession of reform causes: the Ten Hour Bill; the 1842 Mines Act; reform of the lunacy laws; abolition of child chimney-sweeping; public health and slum housing; ragged schools; the plight of agricultural labourers; training for destitute children (the Shaftesbury homes). He was motivated by a deep religious faith which was simple, rigid, and exclusive. He believed in the literal truth of every word in the Bible. Shaftesbury was the most active champion of Victorian evangelicalism as applied to all aspects of public life. He was chairman of the Lord's Day Observance Society and the Working Men's Lord's Day Rest Association; and was influential (through his family connection with \*Palmerston, the prime minister) in the appoint-

ment of evangelicals to bishoprics. Politically he was a Tory and opposed all forms of popular democracy. JFCH

**Shakespeare, William** (1564–1616). Dramatist and poet. Baptized in Stratford-upon-Avon on 26 April 1564, William was the son of John Shakespeare, a glovemaker and prominent Stratford citizen who became mayor and justice of the peace during William's childhood. He was educated at the Stratford grammar school, and married Anne Hathaway, daughter of a successful local farmer, eight years his senior (and already pregnant at the wedding) in 1582. Myths abound about the 'lost years', but there is negligible evidence of his activities between leaving school and beginning work as an actor and playwright in London in the late 1580s. He started as an actor, continued as a playwright, and developed as an administrator and entrepreneur: by the time of his death, on 23 April 1616, he had established his status as a major shareholder in the King's Men, the principal acting company of his time, and was a successful and wealthy man.

Shakespeare wrote approximately 42 plays, in a range of genres and styles, which occupy the principal place in the canon of English literature and which are the subject of a considerable theatrical and critical industry (as well as of substantial tourist revenue). Quotations from Shakespeare remain an often unwitting part of everyday speech; productions of his plays remain hugely popular, both in theatres and in the cinema; his style and verse techniques have come to define 'literariness'; and his history plays in particular are, for many people, the only source of information readily available for a considerable period of medieval history.

His earliest plays are mostly comedies and histories—*The Two Gentlemen of Verona* and *The Taming of the Shrew* are probably the very earliest—for a variety of companies and theatres. He wrote the first play (*The First Part of the Contention*, generally better known as *2 Henry VI*) in the four-play cycle known as the 'first tetralogy' in 1591, completing it with the best known of his earlier histories, *Richard III*, the following year. These plays emerged from a rapidly changing culture fascinated by historiography and particularly by the function of history in the analysis of current affairs. Shakespeare drew on contemporary histories of England, notably \*Holinshed's *Chronicles*, for accounts of the events he dramatized, but he rarely left his source (already the product of careful selection, omission, and collaboration) unaltered. His portrayals of kings—most notably of Richard III—have bequeathed a fixed, but often wholly inaccurate, sense of their historical personalities.

The first tetralogy preceded Shakespeare's attachment to the Lord Chamberlain's Men in 1594; it was for that company, and for their first playhouse, the Theatre, that he wrote the 'second tetralogy', his most popular group of history plays—*Richard II*, *1 and 2 Henry IV*, and *Henry V*—which turned back to the period immediately prior to that delineated in the earlier histories to plot the rise to power of Henry Bolingbroke and the accession to the throne of his son, Henry V. Both tetralogies attest to the lasting impact on English society of the Wars of the \*Roses (which had occupied much of the previous century) and to the need of the Tudor dynasty, only relatively recently established, to

mythologize and legitimize its claim to power. The historiographical focus of the plays shifts: where the earlier histories had adopted a wave-like, cyclical structure and a providentialist outlook—principal characters emerging and fading in succession, attention devoted to overarching issues of causation—the later histories focus on the character of the young Henry V, edging away from providential history and depicting a world in which ‘miracles are ceas’d; | And therefore we must needs admit the means | How things are perfected’ (*Henry V*, 1. i. 67–9). As Phyllis Rackin notes, Shakespeare’s Prince Hal ‘anticipates the Tudors in using the resources of theatrical role-playing to produce the perfect image of royal authority that he could not inherit from the ambiguous genealogy that left him the throne’.

The move to the new \*Globe theatre in 1598–9 marked a new phase in Shakespeare’s writing career and the demise of the Shakespearian history play ‘proper’. The common assumption is that, as it became clearer that civil war was not likely to follow the death of the Virgin Queen Elizabeth, the plays’ function as lightning rods for succession anxiety gradually diminished. For the Globe, Shakespeare turned to other genres, writing his mature comedies (*As You Like It* and *Twelfth Night*) and his major tragedies (*Hamlet*, *Othello*, *King Lear*, and *Macbeth*), as well as his later tragicomedies or romances (*Pericles*, *The Winter’s Tale*, *Cymbeline*, and *The Tempest*)—these latter plays affected also by the company’s acquisition of an additional playhouse, the smaller, indoor Blackfriars theatre—and putting his Holinshed aside.

But his Jacobean plays none the less exhibit a strong consciousness of their cultural and historiographical function. The Lord Chamberlain’s Men had become the King’s Men at James I’s accession, and played regularly at court. *King Lear* and *Macbeth*, for example, by depicting dark alternatives, acknowledge the role of James I in reunifying Britain, and both *Lear* and *Cymbeline* delve far back into mythical British history in search of complex political resonances. Shakespeare’s penultimate (and collaborative) play, *Henry VIII, or All is True*—echoing another underestimated Shakespearian history, the energetically ambivalent *King John*—offers a complex, and not wholly complimentary, picture of the status of history and of ‘truth’ in the mid-Jacobean period, representing a vacillating, casually adulterous Henry, a cruel, machiavellian \*Wolsey, and a haughty yet sympathetic \*Catherine of Aragon, and culminating in the birth and christening of the baby Elizabeth and a prophecy from \*Cranmer that implies a certain frustration with the direction of James’s policies, foreign and ecclesiastical.

Shakespeare wrote at a unique period in the history of the British theatre—for the range of his audiences, for the cultural resonance of theatrical institutions—and his plays cannot fairly be dismissed as ‘mere’ fiction or entertainment. It is a commonplace of current literary criticism that Shakespearian drama both responded to and shaped public perspectives on history and politics at a time of considerable, and hugely productive, cultural anxiety, ‘shaping fantasies’ for a developing nation state.

**Shannon, Richard Boyle, 2nd earl of [I]** (1728–1807).

Boyle’s father was Speaker of the Irish House of Commons and was raised to the peerage on resigning. Boyle attended Trinity College, Dublin, and entered the Irish Parliament as soon as he was 21. He inherited the title in 1764. He acted closely with his wife’s family, the Ponsonbys, and was one of the \*undertakers whose power Lord \*Townshend as lord-lieutenant in 1768 wished to destroy. From 1766 to 1770 he was master-general of the ordnance, vice-treasurer of Ireland 1781–9, and given a British peerage in 1786 as Baron Carleton. He wobbled on the Regency question in 1789, apparently under pressure from his wife, and was dismissed. But he served again as a lord of Treasury [I] from 1793 to 1804 and exerted himself and his great influence to carry the Act of \*Union in 1801. JAC

**Sharp, Granville** (1735–1813). Anti-slavery campaigner.

Born in Durham, son of the archdeacon of Northumberland and grandson of an archbishop of York, Sharp was employed in London as a government clerk when in 1765 he befriended Jonathan Strong, a runaway slave. The ensuing legal disputes culminated in the \*Somerset case (1772) in which slavery was declared not to exist in England. In 1783 he formed the idea of an African settlement for freed slaves (\*Sierra Leone, 1787), in 1787 he chaired the committee for the abolition of the slave trade, and in 1807 founded the African Institution to work for the total suppression of the trade following its abolition in the British empire. In his religious beliefs he was a millenarian churchman, founding the Society for the Conversion of the Jews in 1808 and the Protestant Union against \*catholic emancipation in 1813. ER

**Sharp, James** (1613–79). Archbishop. Sharp was educated at Aberdeen University and appointed professor of philosophy at St Andrews. In 1649 he was admitted to the living at Crail and rapidly became a leader of the resolutioners, the more moderate presbyterian group. At the Restoration he worked closely with \*Monck and was sent to Breda to negotiate with Charles II. \*Burnet accused Sharp of systematic hypocrisy in praising \*presbyterianism while working to restore episcopacy. He was appointed royal chaplain in Scotland, made archbishop of St Andrews in 1661, and confirmed in the primacy. He then began a determined attack upon the presbyterian clergy he had just left. In 1668 he escaped a serious attempt at assassination but in 1679 fell into the hands of a \*covenanting group in Fife and was murdered. The incident led to the covenanting rising, suppressed at \*Bothwell Bridge, and was used by Scott in *Old Mortality*. JAC

**Shaw, George Bernard** (1856–1950). Dramatist. Ambitious to write, Shaw left Dublin and his childhood’s genteel poverty to join his mother and sisters in London (1876), where he spent hours voraciously in the British Museum’s reading room and embraced socialism. His novels rejected, he eventually found steady work as literary, music (‘Corno di

Bassetto'), and theatre critic. Now orator, polemicist, and force behind the \*Fabian Society, he began to write his own plays, influenced by Ibsen and trying to move the English stage away from affectations to a new *gravitas*: *Widowers' Houses* (1892), considering slum landlordism, and *Mrs Warren's Profession*, on organized prostitution, were radical, unromantic, and offensive to many. Prolific, passionate, and witty, he is now regarded as the most significant playwright of the 20th-cent. English-speaking world (Nobel prize for literature, 1925); *St Joan* (1924) is considered a masterpiece, but *Pygmalion* (1916) remains the most popular. Shaw's anti-war speeches (1914) drew much criticism, but he continued political writing into old age, outliving his time. ASH

**Shawfield riots, 1725.** After the \*Union of 1707 taxation policy remained a delicate matter in Scotland. The imposition of the malt tax on Scotland by exasperated Tories in 1712 provoked a determined attempt at repeal of the Union and it was not levied. In 1724 a move to raise revenue by 3 pence on every bushel of malt, though half the rate in England, provoked severe riots in Glasgow. Shawfield, the home of Daniel Campbell, MP for Glasgow Burghs, was plundered. One result was that \*Roxburgh, secretary of state [S], was dismissed and henceforward Walpole relied upon the earl of Islay (\*Argyll). JAC

**Sheffield** was a comparatively late developer among the great English cities. Its situation was determined by the river Sheaf joining the Don: William de Lovetot built a castle in the angle in the 12th cent. together with a bridge. The property passed to the earls of Shrewsbury and thence to the dukes of Norfolk. As early as the 14th cent. Sheffield had a national reputation for cutlery, since \*Chaucer's Miller from Trumpington had a 'Sheffield whittle', a short dagger or knife, in his hose. By \*Leland's day, in the 1540s, it was 'the chief market town of Hallamshire'. Its development as a great steel town depended upon local supplies of iron, the water-power of the Loxley, Rivelin, and Porter, as well as the Sheaf and Don, and sandstone for grinding. \*Camden's *Britannia* (1580s) found Sheffield 'remarkable, among many other places hereabouts, for blacksmiths, there being much iron digged up in these parts'. The Cutlers' Company was granted a charter under the master cutler in 1624. Mary, queen of Scots, was held prisoner in the castle for thirteen years in the custody of George, earl of Shrewsbury, and the castle changed hands several times during the Civil War. \*Defoe in the 1720s found the town 'very populous and large, the streets narrow, and the houses dark and black, occasioned by the continued smoke of the forges, which are always at work'. Two innovations in the 1740s and improved communications brought about the vast expansion. Thomas Boulsover invented Sheffield plate, silver on copper, and Benjamin Huntsman a new process for making steel: the Don was made navigable to Tinsley in 1751 and turnpike roads were opened to Chesterfield (1756), Wakefield (1758), and Worksop (1764). By 1801, Sheffield, with a population of 31,000, was the tenth town in England. It was given parliamentary representation by the Great Reform Act of 1832, acquired a town council in 1843, and by 1861 was fifth largest, with 185,000 people. It became a city in 1893,

gained a university in 1905, was given cathedral status in 1914. But perhaps it took greater pleasure from passing Leeds in population in 1911. By the 1990s communications had been further improved with the M1 motorway, the population exceeded half a million, and it was the capital of the South Yorkshire metropolitan region. JAC

**Sheffield, diocese of.** This see, comprising south Yorkshire, was created in 1914 out of the \*York diocese. Even by the 1870s Sheffield contained one-third of the York diocese's population and the inhabitants successfully resisted inclusion in the new \*Wakefield diocese of 1888. Though a suffragan see of Sheffield was established in 1901, only the rapid extension of the Doncaster coalfield enabled the passage of the Three Bishops Bill (for Sheffield, \*Chelmsford, and \*Bury St Edmunds) in 1913. Despite its long, thin, unnatural shape, with three distinct areas (possibly Doncaster would have been a better centre), the see was successfully welded together by the first two bishops, Leonard Burrows (1914–39) and Leslie Hunter (1939–62), the latter being particularly noted for his devotion to social welfare. The cathedral is the former Perpendicular parish church (c.1430), reconstructed in 1880, with further extensions completed in 1966. WMM

**Shelburne, William Petty, 2nd earl of (1737–1805).** Shelburne was intelligent and able, but deemed untrustworthy by most of his social and political equals. He entered the army in 1757, became an MP in 1760, and went to the Lords in 1761, succeeding his father as earl of Shelburne and Baron Wycombe. Initially a follower of \*Bute, he shifted his allegiance to the elder \*Pitt (later earl of Chatham) and served under him, from 1766, as southern secretary. Chatham's illness left his ministry rudderless and prone to squabbling. Shelburne was frequently at odds with his colleagues and after a disagreement over foreign policy with the *de facto* premier, \*Grafton, was marked for dismissal. Grafton only withheld sentence for fear of precipitating Chatham's resignation. From his sick-bed, Chatham misread the situation and, believing Shelburne to have been removed, resigned. This comedy of errors was straightened out, but the net result was the departure of Shelburne and Chatham. After Chatham's death in 1778, Shelburne was the leader of the Chathamites and consequently mistrusted by the \*Rockinghamites, who referred to him as Malagrida, an infamous Jesuit schemer. The fall of \*North in 1782 presented George III with an uncongenial recourse to opposition, which he mitigated by playing off Shelburne against the Rockinghamites. Shelburne was a willing accomplice and cultivated the king's personal favour. As home secretary (March–July 1782), he created difficulties over patronage and was at variance with the foreign secretary, Charles \*Fox, over the peace negotiations, which involved both their departments. Shelburne employed his own representatives in Paris and tried to undermine the Rockinghamite policy of conceding, from the outset, American independence. Rockingham's death in July 1782 precipitated a cabinet crisis, with the king insisting on Shelburne's succession to the premiership. Fox and the firmer Rockinghamites resigned and then coalesced with the Northites to force Shelburne's

## Sheldon

resignation in February 1783. Although created marquis of Lansdowne in 1784, Shelburne never regained high office. His failings as a politician stemmed from his restless imagination, his attachment to intrigue, and his personal manner, which was alternately obsequious and stubborn. As an intellectual patron Shelburne was more successful, gathering around him such luminaries as Joseph \*Priestley, Jeremy \*Bentham, and Richard Price, sometimes referred to as the Bowood circle, taking their name from Shelburne's country residence. DW

**Sheldon, Gilbert** (1598–1677). Archbishop of Canterbury (1663–77). A graduate of Trinity College, Oxford, Sheldon was fellow, then warden (1626), of All Souls. Spiritual adviser to Charles I in the Civil War, he was ejected from All Souls (1648) and briefly imprisoned. He returned in 1659 and at the Restoration became bishop of London (1660). A keen protagonist of uniformity, he succeeded \*Juxon as archbishop (1663) and arranged with \*Clarendon to end separate taxation for the clergy (1664). As chancellor of Oxford (1667–9), he had the Sheldonian theatre built at his own expense with \*Wren as architect. A man of deep spirituality, he was equally critical of dissent and Charles II's suspected popery. WMM

**Shelley, Mary Wollstonecraft** (1797–1851). Author. Only daughter of the radical philosopher William \*Godwin and early feminist Mary \*Wollstonecraft, pretty, bookish Mary eloped with the young Percy Bysshe \*Shelley to Europe in 1814, marrying him on his wife Harriet's suicide (1816). Her most famous novel *Frankenstein* (1818) arose from \*Byron's ghost-story contest one 'wet, ungenial summer' by Lake Geneva, being overseen by her husband at every stage; this founded the genre of 'scientific Gothick' later exploited by horror-film makers. After the poet's death (1822), Mary returned to England and became a professional writer in order to educate her only surviving child Percy Florence Shelley. Devotion prompted editions of her husband's works to perpetuate his memory, while her letters and journal are further rich biographical sources. ASH

**Shelley, Percy Bysshe** (1792–1822). Perhaps the least accessible of the Romantic poets, though recent attention to his radical politics has modified the Victorian picture of 'a beautiful and ineffectual angel'. Son of a Whig landowner, a precocious and unconventional career at Eton and Oxford was followed by a precipitous first marriage and, soon after, elopement to the continent with the daughter of William \*Godwin and Mary \*Wollstonecraft. Already he had published *Queen Mab* (1813), later revered in \*chartist circles. 'Ode to the West Wind' (1819) best represents his impetuous idealism and technical accomplishment, foreshadowing *Prometheus Unbound* (1820), which imagines a bloodless revolution where 'mankind had only to will that there should be no evil and there would be none'. The sad reality was recognized in *The Masque of Anarchy* when news of the \*Peterloo massacre reached him in Italy and *A Philosophical View of Reform* shows a more measured concern. Neither were published in his lifetime, abruptly ended by an accident at sea. JNRS

**Sheraton, Thomas** (1751–1806). English furniture designer. Sheraton was born in Stockton-on-Tees, where he learned cabinet-making, probably never returning to this trade after his move to London about 1790. He was principally occupied writing several manuals on furniture design, the most popular, *The Cabinet-Maker and Upholsterer's Drawing Book* (1791–4), including treatises on geometry, architecture, and perspective. A fervent baptist, he also published numerous religious tracts. Sheraton's many chair-back designs were simple and elegant, employing straight lines and delicate marquetry of animals, flowers, or musical instruments. Other designs were more ingenious, providing furniture with several purposes, always enhancing the beauty and qualities of the woods. Although influential, none of Sheraton's books brought him financial success and he died insane in direst poverty. Often acerbic in print, his obituary in the *Gentleman's Magazine* described him as 'a very honest, well-disposed man'. JC

**Sherborne, diocese of.** The see, carved out of \*Winchester in 705 by King \*Ine for the oversight of all west Wessex, was further split in 909 by \*Edward the Elder; Sherborne retained Dorset, Devon and Cornwall went to \*Crediton, Somerset to \*Wells, and Wiltshire and Berkshire to \*Ramsbury. In 1058 Sherborne was reunited with Ramsbury and in 1075 the combined see was moved to Old Sarum (\*Salisbury). The superb fan vaulting in the Benedictine abbey church is 15th cent. WMM

**Sherborne abbey** (Dorset) was founded c.700 as a community of secular canons. It was lavishly endowed by the kings of Wessex, some of whom were buried here during the 9th cent. It was reformed c.998 as a house of \*Benedictine monks by \*Æthelred II under the guidance of Bishop Wulfsig III of Sherborne. Following the Norman Conquest the episcopal see was transferred to \*Salisbury. Sherborne retained close links with Salisbury, enjoying the patronage of its bishop \*Roger (1102–39). Most of its endowments were concentrated in Devon and Dorset, though it also acquired interests in and around Cydweli (Dyfed). At the \*dissolution it had a net income of nearly £700. Its church, which survives, was rebuilt in the 15th cent. following a riot of townspeople in 1436 which destroyed the earlier church. BJG

**Sheridan, Richard Brinsley** (1751–1816). The son of an Irish actor, Sheridan achieved fame as both dramatist and politician, making his way by merit, with the additional advantage of influential friends, notably Charles \*Fox and the prince of Wales. Sheridan's major works were all produced before entering Parliament in 1780: *The Rivals* (1775), *The Duenna* (1775), *The School for Scandal* (1777), and *The Critic* (1779). 'Sheridan', according to Horace \*Walpole, was 'one of the most perfect comic writers . . . his plots are sufficiently deep, without clumsy entanglement' and his 'characters strictly in nature—wit without affectation'.

Sheridan was a superb political orator, achieving fame during the campaign against Warren \*Hastings; one memorable speech, on 8 February 1787, lasted an astonishing 5 hours and 40 minutes. For all his ability, Sheridan never attained cabinet rank, and served only as under-secretary

at the Foreign Office (1782), Treasury secretary (1783), and treasurer of the navy (1806–7). His predominant loyalty was to Fox; but Sheridan's intrigues in the \*Regency crisis were not approved. Mutual antagonism between Sheridan and \*Burke contributed to the disintegration of the Whig Party in the 1790s, with Sheridan flaunting his admiration for the French principles Burke despised. Sheridan never became the revolutionary some anticipated, and was a patriot with regard to Napoleonic France. His private life was eventful, even disreputable: he cheated openly on both his wives, drank to excess, and borrowed extensively from friends. He died in straitened circumstances, caused partly by losses incurred from his involvement with Drury Lane theatre. DW

**Sheriffmuir, battle of**, 1715. Leading the Jacobite rising, \*Mar rallied his forces at Perth and commanded 9,000 men: \*Argyll, with much smaller numbers, took up position at Stirling. On 13 November the armies did battle at Sheriffmuir, near Dunblane. In a confused encounter, each army's right wing carried the day, but Argyll retired to Stirling in good order. Mar was unable to follow up his advantage, abandoned Perth, retreated to Aberdeen, and, at length, took ship for France. JAC

**sheriffs**. Reeves were Anglo-Saxon officials, and the king's reeves had special duties to keep order and collect royal dues. By the 11th cent. English kings put each shire under a *scirgerefa* ('shire-reeve', sheriff) who administered justice and collected revenues. Their powers and duties were greatly increased by the Normans, and they became notorious for high-handedness. Henry II was driven to hold an Inquest of Sheriffs into their activities, and to remove many from office (1170), but complaints of their maladministration long continued: the sheriff of Nottingham in the \*Robin Hood ballads represents the type. The crown's long-term solution was to spread the exercise of local administration and justice, especially, from the 14th cent., through \*justices of the peace; since the 16th cent. sheriffs have been largely county figureheads. In Scotland, where sheriffs were introduced in the 12th cent., they have been chief judges of sheriffdoms: and in those English towns taken out of county administration, sheriffs are elected urban officials responsible to the \*mayor. The sheriffs of American counties kept up, in the 19th cent., something of the role of earlier English sheriffs; and the 'posse' of the Wild West is the *posse comitatus* (force of the county) which medieval sheriffs could summon to pursue suspects and repress riots. DMP

**Sherston, battle of**, 1016. This was one of a series of encounters between \*Edmund Ironside and \*Cnut in the summer of 1016 and took place just west of Malmesbury. The Saxons were victorious but their advantage was soon cancelled by the disaster at \*Ashington. JAC

**Shetland** is a group of islands in the northern North Sea, some 150 miles from the north-east tip of the Scottish mainland. Once annexed by the Vikings and subsequently part of the kingdom of Norway, Shetland (together with Orkney) became part of Scotland in 1469. It is a county of Scotland and has remained a unitary local administrative authority.

More than Orkney, Shetland has asserted its cultural separateness from Scotland, most notably by the annual 'Viking' midwinter festival of Up-Helly-A. North Sea oil has had a significant effect on the economy: one of the main terminals for landing oil from pipelines is at Sullom Voe, and the local authority negotiated with the oil companies a deal which generated considerable revenue for the islands, which were able to cut local taxes and build up a development fund for the future. CML

**shipbuilding** was a widely scattered industry before the 18th cent., ships normally varying between 50 and 100 tons. For four centuries the Thames and Medway were the principal shipbuilding rivers for large ships and the location of the main naval dockyards. Technical innovations threw the advantage to the Tyne, Wear and Tees, Mersey, and Clyde with relatively deep water, cheap coal and iron, and expertise in building marine engines.

The Clyde was a latecomer as a major shipbuilding river. The main hull-builders were downriver at Greenock and Port Glasgow. Deepening the river served both commerce and industry, for Glasgow's engine-builders came to dominate British shipbuilding. Labour costs in the new shipyards were lower than on the Thames, and technical innovations gave the Clyde major advantages. In 1813–14 this region produced only 4.5 per cent of the British tonnage, and this market share remained relatively constant until the 1840s. In the production of iron river steamers the Clyde falteringly led the way in the early 19th cent. but between 1840 and 1870 produced two-thirds of British steam tonnage. Early marine engines used fuel prodigally; Glasgow engineers solved this problem and also improved boilers and methods of construction and propulsion: the screw propeller replaced the paddle in the 1840s; compound engines were installed from 1853, dramatically cutting coal consumption; iron hulls increased the scale of shipping, reducing freight costs and encouraging the growth of international trade. Glasgow became the home base for many shipping lines, including Cunard, and their orders tended to go to Clyde yards.

Steam and iron eclipsed wood and sail in the 1850s. Steam tonnage, which in 1850 represented under 7 per cent of British output, accounted for 70 per cent by 1870. About 24,000 of 47,500 men working in shipbuilding in 1871 were resident in Scotland, all but a few employed in the Clyde yards. They produced at least one-third of British tonnage—mostly specialist vessels—every year from 1870 to 1914. The Wear initially challenged the Clyde, producing about one-third of Britain's merchant tonnage in the 1830s, but the north-east increasingly specialized in lower-cost tramp shipping. Belfast was essentially an extension of Clyde capacity, and by 1914 one firm, \*Harland and \*Wolff, dominated its shipbuilding just as Cammell Laird on the Mersey and Vickers-Armstrong at Barrow controlled regional output.

The integration of iron, steel, coal, and shipbuilding as major exporting industries explains why the economy which made shipbuilding regions prosperous before 1914 should be a source of economic weakness after 1920. The long decline of shipbuilding had a downward multiplier effect on these

## ship money

regional economies which became the depressed areas of inter-war Britain.

Demand for capital goods declined rapidly after 1920, but shipbuilding suffered most. World capacity had been grossly inflated during the First World War, but peacetime demand was reduced by the decline in world trade. In 1933 launchings from British yards fell to 7 per cent of the 1914 figure. Foreign orders for new ships were markedly reduced. Britain was slow to move into the production of motor vessels which were most in demand; foreign governments provided subsidies to retain orders within their own boundaries. In 1930 'National Shipbuilders' Security Limited' was formed to reduce the number of shipyards and excess capacity. By 1937, 28 firms had been bought and closed, with a capacity of about 3,500,000 tons. The government in 1935 sponsored an ineffective 'scrap and build' scheme whereby owners were subsidized to scrap 2 tons of shipping for every new ton they ordered.

Rearmament and the Second World War revived shipbuilding, and after 1945 the world dollar shortage drove ship-owners to order in Britain. World trade expanded and kept the boom going, but increasingly foreign yards benefited from this exceptional demand. The Clyde produced a third of British tonnage in the early 1950s (although demand was greatest for tankers and cargo ships); the Wear and Tees a quarter and the Tyne about one-sixth; Belfast, the Mersey, and Barrow nearly one-quarter. In 1956 Britain was third in export sales behind Germany and Japan; by 1977 she produced 4 per cent of world output (compared with 60 per cent in 1910-14), and British owners were ordering ships from overseas. Asia, with its low labour costs and modern equipment, became the most significant continent for ship production. The government responded by further rationalization under British Shipbuilders (1977), a public corporation. Technically backward, the industry was faced with closures and redundancies until the government returned firms to private ownership and a process of private investment in the 1980s. Shipbuilding survives but subject to intense foreign competition. See also MERCHANT NAVY. JB

**ship money** was an occasional tax on property, traditionally levied in port towns for their protection by the navy. Because Parliament, together with its power to grant taxes, had been dissolved in 1629, Charles I lacked money both for the fleet and for other expenses. In 1634 he therefore levied ship money in London, extending the tax in the following year to the whole country. In 1635, 1636, and 1637 it produced a high yield, but resistance developed and in 1638 it produced only one-third of the assessed amount. John \*Hampden, a Buckinghamshire squire, and others refused to pay on principle. There followed a test case on the legality of non-parliamentary taxation, including ship money. To the perturbation of the property-owning classes, the judges found for the king, though by a majority of only 7:5. In 1641 Parliament declared ship money illegal. MW

**Shippen, William** (1673-1743). Jacobite parliamentarian. The son of a clergyman, Shippen trained as a barrister. He became a Tory MP in 1707, and, but for one short interlude (1709-10), remained in Parliament for the rest of his life.

During the Tory administration (1710-14) he emerged as an outspoken member of the Jacobite wing of the party, and in 1711 took an active part in the inquiry of corruption against the duke of \*Marlborough. In 1712 he married one of the wealthiest heiresses. With the ostracization of the Tory Party after George I's accession in 1714, Shippen settled into a routine of unrelenting opposition to successive Whig ministries. In the Commons he was invariably hostile to the Hanoverian dynasty, maintaining that the German connection undermined the British constitution. Such remarks earned him a spell in the Tower in 1717. Though leader of the Jacobite MPs by the later 1720s, he always shunned any form of conspiratorial activity with the pretender. AAH

**shires.** See COUNTIES.

**shooting,** as a sport, may be divided into shooting at animals or birds, or shooting at targets in competition. Pheasant- and grouse-shooting reached its peak in the vast country-house gatherings of Edwardian England: game was rigorously preserved and \*poaching caused much ill-feeling in rural society. Big-game shooting, largely in Africa and India, was fashionable in the 19th and early 20th cents. A regular feature of overseas royal visits was a big-game shoot: George V on a visit to Nepal in 1912 claimed 21 tigers, 8 rhino, and 1 bear in a fortnight's shooting. Organized target-shooting in Britain dates from the mid-19th cent. The National Rifle Association was founded at Wimbledon in 1860 and transferred in 1880 to Bisley in Surrey. The Queen's Prize, first awarded in 1860, remains one of the most coveted honours. Bisley is the venue for regular summer competitions, for different classes of weapons, including small-bore rifles. Shooting was included in the first of the modern Olympics in 1896. JAC

**shops.** Britain has been described as a nation of shopkeepers, but shops did not really come into existence until the later Middle Ages. Before then, buying and selling occurred through fairs, market-stalls, artisans' workshops, or itinerant pedlars. Progression from open market to covered market-hall extended as the frequency of markets increased and permanent storage for merchandise was required: a shop on street level at the front of the house had workshop/service rooms behind and dwelling-rooms above, the shutter of its large unglazed window being let down to form a display counter. As trading began to separate from manufacture, London became a shop-window for the whole country, its own shops smart, seductive, and increasingly stocked with imported goods. The provinces could hold their own, though: Celia Fiennes (1698) found Newcastle's 'shops are good and are of distinct trades, not selling many things in one shop as is the custom in most country towns and citys'.

With growth in population in the 18th cent., a burgeoning middle class, and money available for more than bare necessities, towns expanded and \*retail trade gained in vigour. As shops became more numerous, hence more competitive, projecting shop-signs became larger and heavier, so increasingly dangerous, until they were banned (1762), after which they were affixed over doorways or flat against the frontage.

Even though railway development enabled fresh food to reach town shops more easily, much food sold was adulterated, but it was not until 1872 that inspectors were empowered to procure samples for analysts' reports. Not only could goods be transported more quickly from producer or manufacturer to retailer, but customers could travel easily into towns to purchase. The number and variety of shops increased considerably, sometimes grouped in arcades, larger windows enhanced display, and large speciality stores transformed themselves into departmental stores modelled on the French pattern; by the First World War, these were widely established.

As the family tradition of shopkeeping began to decline, shops were transformed from places fulfilling known needs to premises attracting new customers and creating new wants. One route to growth was the \*Co-operative movement, founded in 1844 by the \*Rochdale Pioneers. If a retailer opened additional shops, his chain of stores could reduce operating costs, standardize quality, and offer special price reductions yet still increase profits (W. H. \*Smith, \*Boots). Supermarkets, whose pattern was set in 1930s America, did not develop in Britain much before the 1960s; they operate primarily on a self-service basis, and tend to drive small independent food retailers out of business. Since the Second World War, there has been a growth in shopping precincts, then malls, often financed by real estate developers, which aim to provide for every need under a single roof in attractive, climatically controlled environments; out-of-town supermarkets rely on car ownership, so usually provide generous, free parking. Corner shops and village stores have suffered accordingly, though catalogue houses and e-commerce attempt to fill the gap for non-food purchasing.

ASH

**Short Parliament**, April–May 1640. The first \*Bishops' War ended inconclusively because Charles I was not strong enough to fight the Scots. He summoned Parliament in 1640 in the expectation that it would provide the funds for him to do so. But the Commons were more concerned with grievances, in particular the growth of \*arminianism and the crown's resort to prerogative taxation such as \*ship money. Some members were prepared to compromise. Others, like \*Pym, preferred deadlock since this would benefit the Scots, whom they regarded as allies in the struggle to preserve the true protestant faith in both kingdoms. In the end, Charles lost patience and brought proceedings to an abrupt close.

RL

**Shovell, Sir Clowdesley** (1650–1707). Naval commander. Entering the service in 1664 as a cabin boy, Shovell achieved a reputation for unflinching courage and skill during his Mediterranean commands in the 1680s, was knighted in 1689, and promoted to rear-admiral in 1690. In the naval war against the French during the 1690s he proved an effective operational commander, with an important share in the victories at \*Beachy Head (1690) and Barfleur (1692), while in 1695–6 he was second in command in a series of successful attacks on French ports. He was appointed full admiral in 1695. In the early years of Anne's reign he commanded in several Mediterranean actions including the

capture of \*Gibraltar and the battle off Malaga in 1704, and in 1705 assisted Lord \*Peterborough to capture Barcelona. Returning from the unsuccessful Toulon mission in 1707, his flagship was wrecked off the Scilly Isles. Washed ashore, but supposedly murdered for his emerald ring, he was interred at Westminster abbey.

AAH

**Shrewsbury**. County town of Shropshire, its old centre built on a defensive hill nearly surrounded by the river Severn. It has been a regional centre since Anglo-Saxon times, a military strong point in the Welsh marches, and a centre of cloth trading and manufacture from the Middle Ages to the 19th cent. In the 16th and early 17th cents. it was also, with \*Ludlow, a centre of the \*Council for Wales in the Marches. It has a fine legacy of historic buildings, especially timber-framed houses of the Tudor and Stuart period. Holy Cross abbey (Benedictine), near the English bridge, has a fine early Norman nave. There is a very pleasant riverside walk, past the boathouses of Shrewsbury school, and outside the old school (c.1600) is a seated statue of Charles \*Darwin, one of the distinguished former pupils. The railway station nearby is jolly mock Tudor.

DMP/JAC

**Shrewsbury, battle of**, 1403. Henry IV learned of the rebellion of Hotspur (Henry \*Percy), in league with Owain \*Glyndŵr, Thomas Percy, earl of \*Worcester, Archibald, earl of \*Douglas, and Edmund Mortimer, when he was at Burton. A forced march carried his troops westwards to Shrewsbury to join his son Henry, prince of Wales, campaigning in Wales. Possession of the bridges over the Severn would prevent a junction between Hotspur, marching south from Chester, and Glyndŵr, believed to be advancing from south Wales. Hotspur arrived to find the town in royal hands. Glyndŵr did not join him, and his father, the earl of \*Northumberland, got no nearer than Pontefract. Hotspur was outnumbered and his recruits untrained, but he resolved to give battle rather than risk retreat and disintegration. He chose a small ridge 3 miles north of the town, near the village of Berwick, and dug in. The early exchanges on 31 July went in favour of the rebels but Hotspur was killed and his followers fled. Worcester was captured and executed at Shrewsbury two days later: Douglas was held in prison until 1408. The new Lancastrian dynasty had survived its first major test.

JAC

**Shrewsbury, Charles Talbot, 1st duke of** (1660–1718). The last person to hold the office of lord treasurer. Brought up a Roman catholic, Talbot converted to Anglicanism in 1679, and was one of the 'Immortal Seven' who, in 1688, signed the letter inviting William of Orange to invade. In 1689 he was appointed secretary of state, but became disillusioned with growing party strife, resigned in 1690, and went into opposition (being suspected of Jacobite sympathies). In 1694 he again became secretary of state and was created a duke (having succeeded as earl of Shrewsbury in 1668). Appointed lord chamberlain in 1699, he resigned on health grounds in 1700. He lived abroad (1700–7), chiefly in Rome, and upon his return became alienated from his former Whig associates. He was appointed lord chamberlain in the Tory ministry (1710–14),

## Shrewsbury

and lord-lieutenant of Ireland in 1713. On the dismissal of \*Harley, Queen Anne appointed Shrewsbury lord treasurer (30 July–11 October 1714), thwarting \*Bolingbroke's ambition, and upon the queen's death (1 August) he helped to secure the Hanoverian succession. His final office was again as lord chamberlain (1714–15). CJ

### **Shrewsbury, Elizabeth Talbot, countess of** (1518–1608).

'Bess of Hardwick' was one of the most remarkable women in Elizabethan England. The daughter of a Derbyshire squire, she gained wealth and status through four increasingly ambitious marriages, the last (in 1567) to George Talbot, earl of Shrewsbury. Two alliances between their respective children created a dynastic structure. The Shrewsburys were given charge of Mary, queen of Scots (1569–84), but a daughter's marriage to \*Darnley's younger brother (the union producing Arabella \*Stuart) provoked Elizabeth I's displeasure. After the earl's death, Bess, intriguer, termagant, and by then the richest woman in the kingdom, was free to concentrate on her building and furnishing at \*Chatsworth and \*Hardwick Hall, and her extensive business concerns based on land and cash; her shrewdness, energy, and strength of purpose made her feared, but she could be generous and lavish. Two of her sons founded the dukedoms of Devonshire and Newcastle. ASH

### **Shrewsbury, John Talbot, 1st earl of** (c.1387–1453).

Talbot was the most renowned in England and most feared in France of the English captains in the last stages of the \*Hundred Years War. Having fought briefly under Henry V, he returned to France in 1427, where he served until his death at \*Castillon in 1453. The only battles in which he was in command (\*Patay and Castillon) were defeats; his reputation rested on his persistence, dedication, and vigour, qualities which made him a master of the small-scale war of thrust and counter-thrust that characterized the defence of Normandy between 1434 and 1444. His service to the cause of Lancaster was acknowledged in 1442 by his elevation to the earldom of Shrewsbury. A tough, cruel, and quarrelsome man, he came to be regarded as the last of the old chivalric breed. His tomb is in St Alkmund's, Whitchurch. AJP

**shrines.** These pilgrimage centres, claiming to house either relics of Jesus' life or of the saints or statues of the Virgin Mary, to be visited either for more effective prayer, to obtain indulgences, or for healing, were a central element in medieval life. England could not emulate Jerusalem, the ultimate place of \*pilgrimage, Rome with its multitude of relics, or Compostella. Nevertheless, like other countries, England had shrines of great popularity, journeys to which were less arduous and expensive. Relics of Jesus' life were sparse indeed in England, though Bromholm priory (Norfolk), Waltham and Reading abbeys, and Canterbury all claimed to possess fragments of the True Cross. Canterbury's vast collection also included thorns from the Crown of Thorns and part of Jesus' seamless robe, while Reading had St James's hand and Glastonbury Joseph of Arimathea's Holy Thorn. Shrines of saints' mortal remains were almost as potent. Before 1066 the most popular included Durham (St \*Cuthbert), St Albans, and Bury (St \*Edmund), which

all faded in the late 12th cent. before the brighter light of Westminster (St \*Edward), Worcester (St \*Wulfstan), and—by far the most popular—Canterbury (St Thomas \*Becket). Miracles also occurred at the tombs of the less worthy—Simon de \*Montfort, \*Thomas of Lancaster, Archbishop Richard \*Scrope of York, all opponents of kings—and of kings themselves, Edward II and Henry VI. In late medieval England as elsewhere, as devotion to the Virgin Mary intensified, her shrines at Westminster, Doncaster, Ipswich, and above all at \*Walsingham grew in importance. The last was much patronized and frequently visited by Henry III, Edward I, and their successors, so that by the Reformation it attracted offerings that surpassed even those at Canterbury. Late medieval shrines, encrusted with jewels, were an easy prey for reformers and for the covetous eyes of the crown. WMM

**Shropshire** is a large and beautiful county. The hilly southern part includes the Wrekin, the Long Mynd, Clee Hill, and Wenlock Edge: the north, adjoining Cheshire, is flatter, with some notable meres. The Severn, running from west to south-east, bisects the county: the Teme, which forms the boundary with Herefordshire, drains the southern part, the Tern much of the north. Shrewsbury grew up as an important crossing over the Severn and as a bastion against the Welsh. Whitchurch is the chief town of the northern half, Ludlow, in Tudor times home to the \*Council in the Marches of Wales, of the south.

In Roman times, the area fell between the \*Cornovii and the \*Ordovices; \*Caratacus' last stand against \*Ostorius' Roman legions may have been at Caer Caradoc, near Church Stretton. The Roman road \*Watling Street ran through the county and Viriconium (\*Wroxeter), where it crossed the Severn, was an important legionary base. The region was disputed between Britons and Saxons and at one stage much of it belonged to the kingdom of \*Powys, whose capital, Pengwern, may have been at Shrewsbury. By the 8th cent. it formed part of the kingdom of Mercia and Offa's Dike runs through the western parts of the shire, from near Oswestry to near Clun in the south-west. Bridgnorth was mentioned in the *Anglo-Saxon Chronicle* as early as 895, when a Danish army wintered there, and Shrewsbury in 1016. For ecclesiastical purposes, the area came under \*Lichfield, until the parishes south of the Severn were moved into the new diocese of \*Hereford. By the 10th cent. it was in existence as a shire. The *Anglo-Saxon Chronicle* in 1006 referred to it as Scrobbesbyrigscir, after the town.

The Normans, finding Saxon pronunciation difficult, called the county Salopescira and studded it with castles, at Shrewsbury, Ludlow, Bishop's Castle, and Clun. Even so, the western parts were defended against the Welsh with difficulty. Taking advantage of English weakness during Stephen's reign, the Welsh took Oswestry in 1149 and, though it was recovered, it was once more destroyed by \*Llywelyn during John's reign in 1213. The county was again at risk during \*Glyndŵr's rising in the early 15th cent., when Clun was destroyed, but Glyndŵr's allies, the Percies, were defeated just north of Shrewsbury in 1403 and Henry \*Percy (Hotspur) killed.

The Severn crossing and the proximity to Wales made Shropshire important during the Civil War. Charles I, having raised his standard at Nottingham in 1642, made straight for the area and delivered a recruiting speech at Wellington. Many of the men who fought in the first battle at \*Edgehill came from Shropshire. The county remained royalist territory but suffered from raids and incursions. There was a vicious exchange at Stokesay castle, where adversaries fired at point-blank range between the castle and the church. The loss of Shrewsbury itself in February 1645 to a daring raid from the parliamentary garrison at Wem was a heavy blow to the royalists. Charles II took refuge at Boscobel in the east of the county after his defeat at \*Worcester in 1651 and the celebrated oak tree, in which he hid, was a place of pilgrimage for years.

Until the 18th cent. Shropshire was overwhelmingly an agricultural county, famous for sheep, but the development by the \*Darby family of a great mining and iron industry at \*Coalbrookdale produced the strange phenomenon of blast furnaces and chimneys amid lush wooded valleys. The \*Ironbridge, built in 1777, and now the centre of a splendid museum complex, was for decades regarded as one of the wonders of technological progress.

Shrewsbury retained its primacy as county town without difficulty, hosting the assizes and the parliamentary elections. When Celia Fiennes visited it in 1698 it had its own water supply and 'an abundance of people of quality', who took walks in the abbey gardens, amongst orange and lemon trees, hollies, myrtles, and aloes. Thirty years later, \*Defoe found it 'beautiful, large, pleasant, populous and rich: they speak all English in the town, but on a market-day you would think you were in Wales.' A statue of Llywelyn kept guard over the Welsh bridge. In the later 18th cent. Shrewsbury became a fashionable provincial centre, with regular assemblies, horse-races, balls, and concerts. Its central position was enhanced by the coming of the railways in the mid-19th cent., which confirmed its importance as a route centre. In 1851 its population was over 20,000, with Ludlow, Whitchurch, Market Drayton, Bridgnorth, and Oswestry about the 5,000 mark. The county was not affected by the Local Government Act of 1972, but the balance of population began to change with the development of a new town in the east, absorbing Dawley, Oakengates, and Wellington. It was renamed Telford, after the great engineer who was county surveyor from 1788 to 1834. By 2002 Shrewsbury, with a population of 97,400, had been overtaken by Telford with 153,000. Yet it is also a county trapped in amber. If Dorset is Hardy country, Shropshire belongs to \*Housman, buried at Ludlow, and poet of Clun, of Uricon and Wenlock Edge, 'the land of lost content'. JAC

**Sickert, Walter Richard** (1860–1942). British artist. Born in Munich, Sickert's Danish/Irish parents came to England in 1868. After a short career as an actor, he studied at the Slade School before joining the studio of Whistler through whom he met Degas, who became a close friend. In frequent visits to France, Sickert mixed with other artists and writers who influenced his style. His best work shows a deeply personal view of music-hall and seedy town life. He wrote extensively

on diverse topics, often to *The Times*, whose obituary spoke of his 'insatiable curiosity especially in low-life'. He was intrigued by unsolved crimes, particularly the case of Jack the Ripper. In 1934 he became a Royal Academician, a position he resigned the following year over a point of principle. Sickert's work is represented in many British galleries, especially the Tate in London and the Walker in Liverpool.

JC

**Siddons, Sarah** (1755–1831). Actress. The eldest of Roger Kemble's twelve children, her early years were spent travelling widely with the family company until marriage to the young actor William Siddons. Her first London season (1775/6) was a failure, but, having established a reputation in the provinces, she reappeared at Drury Lane and rapidly regained recognition in a theatre where neo-classicism and tragic posing were replacing the relative naturalism of \*Garrick's day. Described by \*Hazlitt as 'tragedy personified', painted by \*Reynolds as *The Tragic Muse*, and acting with her brother John, she inspired admiration rather than affection, though as her girth increased (a Kemble characteristic) some poses threatened to become grotesque and empire-line dresses were unflattering. A strong voice and declamatory style contributed to a legend that she sustained until her farewell at Covent Garden in 1812, when she played Lady Macbeth, the role most associated with her.

ASH

**Sidney, Algernon** (1622–83). Sidney was a famous Whig martyr and apologist. His brother, the 3rd earl of Leicester, was a strong supporter of the Commonwealth and Sidney fought for Parliament at \*Marston Moor, where he was wounded. He refused to serve on the court that tried Charles I but joined the \*Council of State in 1652. He disapproved of Cromwell's Protectorate but rejoined the Council of State in 1659. At the Restoration he was abroad on diplomatic missions and prudently decided to stay there. He returned to England in 1677 just as the \*Popish plot was about to explode. He joined Shaftesbury's Whig opposition and, though a theoretical republican, took money from Louis XIV to embarrass Charles II, leaving \*Macaulay to lament that a 'hero, philosopher and patriot' should have fallen so low. In 1683 he was tried before \*Jeffreys for involvement in the \*Rye House plot and convicted on shaky evidence. A manuscript discourse on government, written in reply to Filmer in 1680, and not published until after Sidney's death, was produced to show that he advocated that the people were the source of all authority and had the right to bring tyrannical monarchs to justice. In his statement at the block, Sidney wrote that he died for 'that Old Cause in which I was from my youth engaged'. Macaulay wrote that he died 'with the fortitude of a stoic' but \*Burnet, while admitting Sidney's bravery and sincerity, observed that his 'rough and boisterous temper could not bear contradiction'.

JAC

**Sidney, Sir Henry** (1529–86). Lord deputy of Ireland. Sidney, of Penshurst (Kent), was brought up with Prince Edward who was eight years younger, and on his accession was made a gentleman of the privy chamber. In 1551

## Sidney

he married the daughter of \*Northumberland. He backed Northumberland's attempted coup on behalf of Lady Jane \*Grey in 1553 but distanced himself in time to avoid disaster. Though Northumberland perished, Sidney still had \*Leicester as a brother-in-law and patron. In 1556 he accompanied \*Sussex to Ireland, acting as deputy in his absence. Elizabeth appointed him lord president of the marches in Wales in 1559, a post he held for the rest of his life. In 1565 he was given the Garter and sent back to Ireland as lord deputy. His first task was to deal with Shane \*O'Neill who was in rebellion, but who was assassinated in 1567. By 1571 Sidney had had enough of trying to pacify Ireland and resigned. But fresh rebellions led to his recall in 1575. This time the difficulty was expense, since Elizabeth was unwilling to accept that Ireland could not be subdued on the cheap. He was replaced in 1578. Though clearly an able man, his forward policy was never adequately supported. His son was the poet Sir Philip \*Sidney. JAC

**Sidney, Sir Philip** (1554–86). Soldier and poet. Born in the year of Mary's marriage to the king of Spain, Sidney was named Philip in his honour. Educated at Shrewsbury (his father being lord president of the Council in the Marches of Wales) and at Christ Church, Oxford, he was devoted to study. From 1572 to 1575 he was on the continent, and was in Paris on the night of the massacre of St Bartholomew. In 1583 he married the daughter of Sir Francis \*Walsingham, served in Parliament, and continued to win golden opinions from all his acquaintance. But in 1585 when \*Leicester, his uncle, was given command of the forces against Spain in the Low Countries, Sidney was made governor of Flushing, a key port. He volunteered to join Leicester in the attack upon Zutphen, was wounded in the thigh, and died of gangrene nearly a month later. His death was received with great grief. But the story that he gave his own bottle of water on the battlefield to a dying soldier was first reported by his friend Fulke Greville many years after his death and is suspiciously like a story of Alexander the Great. He left much unpublished work, including the sonnets, *Arcadia*, and the *Apologie for Poetrie*, but his posthumous reputation depended as much upon his character and courage as on his poetry. JAC

**Sierra Leone.** Former British west African colony and protectorate. British anti-slavery campaigners established a home for freed slaves in Freetown in 1797. The settlement became a British colony in 1808 and a naval base from which the British government could conduct its campaign against the slave trade. The educational opportunities provided for the freed slaves by Christian missionaries produced a reservoir of talent which, lacking an adequate outlet in Sierra Leone which was poorly endowed with natural resources, proved invaluable in extending British influence and trading interests throughout west Africa. Until the mid-20th cent. Sierra Leone continued to exert a powerful influence on the cultural development of British west Africa, especially through Fourah Bay College, founded in 1828 and attended by Africans from other British dependencies, but British economic activities were concentrated elsewhere. A British protectorate was declared over the Sierra Leonean hinter-

land in 1896 and the colony and protectorate together became independent in 1961. It has suffered since from political dissension and civil war. KJ

**Sigeberht** (d. 635), king of the East Angles (c.630–5), became a baptized Christian when exiled in Gaul. Returning to reign, he introduced Christianity into East Anglia, aided by the Burgundian bishop \*Felix, and secured the future of his church by founding a school. During his reign he received the Irish monk \*Fursa, who established a monastery on the Suffolk coast. Described by \*Bede as devout and learned, he ultimately resigned his earthly kingdom, entering his own monastery. Attacked by the powerful Mercian king \*Penda, the East Angles tried to persuade their erstwhile distinguished royal commander to lead them. When Sigeberht refused to fight, they dragged him out of his monastery, hoping his presence would inspire the soldiers. Refusing to carry anything but a staff, he was killed by the heathen army. AM

**Sigurd, jarl of Orkney** (d. 1014). Sigurd succeeded his father Hlodve as jarl of Orkney, then under Norse rule, c.988 and extended his power over northern Scotland and the Isle of Man. In 995, under pressure from Olaf Trygvason, king of Norway, he accepted baptism. In 1014, in alliance with Sihtric, king of Dublin, Sigurd campaigned against \*Brian Boru, high king of Ireland, but was killed at \*Clontarf. He was father of \*Thorfinn. JAC

**Sihtric** (Sigtryggr) (d. 927), Norse King of York. A grandson of Ivarr the Boneless, 'king of all the Scandinavians of Ireland and Britain', Sihtric (nicknamed 'Squinty') joined forces with another grandson, Ragnall, in 917 to recover Dublin, lost in 902. Moving out from Waterford, they devastated Munster and Leinster and recaptured Dublin. Next, Sihtric won a crushing victory over Niall, king of Ulster. In 920 he left Ireland to succeed Ragnall as king of York. Sihtric refused to acknowledge \*Edward the Elder as his overlord, but after his death in 924 proposed an alliance with his successor and in 926 married Eadgyth, a sister of \*Athelstan of Wessex, and is said to have been converted. Roger of Wendover reported that Sihtric repudiated both his wife and his new religion. He may have then been dispossessed, since a year later he was dead and Athelstan reigned in York. The Scandinavians succeeded in recapturing the kingdom and in 941 Sihtric's son \*Olaf was in possession. SMD

**Sikh wars.** The wars of 1845–6 and 1848–9 originated over the Sutlej river area of north-west India between the Sikh sect in Punjab and the British. General Sir Hugh Gough defeated the numerically superior Sikh army at Mudki (18 December 1845), Ferozeshah (21 December) and Sobraon (10 February 1846). The Sikhs renounced their claims to the territory and recognized British supremacy. However in 1848 they launched a rebellion. After an initial set-back at Ramnagar on 22 November, Gough defeated the Sikhs at Jallianwalla (14 January 1849) but sustained heavy casualties. Reinforced, he finally broke Sikh resistance on 22 February 1849 at Gujrat. Thereafter the Sikhs remained loyal to the British. RAS

**Silchester** was a Romano-British *civitas*-capital of the \*Atrebatas on the present Hampshire–Berkshire border. The site was extensively if inexpertly excavated at the end of the 19th cent. and the resulting plan of Calleva remains the most comprehensive of a western Roman provincial town. In the half-century before the Claudian invasion Silchester was the site of an important *oppidum*. Development after the invasion was swift, with street-grid, large central timber structures, and possibly the baths. Eventually the developed town was surrounded by a 2nd-cent. earthwork and 3rd-cent. stone defences enclosing 100 acres. At the centre was the stone-built, Hadrianic forum. Other public buildings included the baths, an earth-and-timber amphitheatre, and temples. The Victorian excavations did not examine the buildings of the earlier Roman period, but showed that by the 4th cent. much of the interior of the town was occupied by large residences, often with mosaics, with commercial premises along the main east–west street. Also dating to the 4th cent. was a small probable church south-east of the forum. Objects indicate occupation into the 5th cent., but thereafter the site was deserted. ASEC

**Silures.** A British tribe and *civitas*. The Silures are mentioned by several Roman authors, among them Pliny, Ptolemy, and \*Tacitus. Tacitus actually described their physical characteristics—swarthy and curly-haired—and suggested that their ancestors migrated from Spain. Their territory was south-east Wales, and for a time in the period around AD 45–57 they led the British opposition to the Roman advance westwards. Tacitus described them as a strong and warlike nation, and for ten years or more the Romans fought to contain rather than conquer them. Although defeated and occupied by the early 60s, their bitter resistance may explain the late grant of self-governing *civitas* status to them only in the early 2nd cent. A capital was established on a previously unoccupied site at \*Caerwent and was given the name Venta Silurum, but it never matched in size (45 acres) or public buildings the *civitas*-capitals of southern England. KB

**silver jubilees**, 1935, 1977. The success of Victoria's \*Golden and \*Diamond Jubilees (1887, 1897) persuaded George V's advisers to celebrate his 25 years on the throne with a thanksgiving service (marred, in the king's view, only by 'too many parsons'), street parties, jubilee mugs, and the like. 'I remember so well both Queen Victoria's jubilees,' wrote the king, 'and can't yet realise that I am having one now.' The silver jubilee of his granddaughter Elizabeth II followed a similar pattern, adding a dash of colour to what had been, in some respects, a sombre reign. JAC

**Simeon, Charles** (1759–1836). A leading evangelical. Born in Reading, Simeon had religious experiences at Eton (1776) and again at King's College, Cambridge. A fellow of Queens' and later vice-provost of King's, after taking orders (1782) he became incumbent of Holy Trinity, Cambridge (1783–1836). Despite initial hostility his pastoral work won people over. He became well known as an evangelical. After Charles Grant, an East India Company director, had drawn his attention to missionary work in India (1788), Simeon advised

on chaplaincy appointments there; he was subsequently a founder of the \*Church Missionary Society (1797) and supported the British and Foreign Bible Society. He gathered a large following of young men, especially among undergraduates. Today his name is permanently commemorated in the Simeon Trust, which purchases church patronage and administers it for evangelically minded clergy. WMM

**Simmel, Lambert** (c.1475–c.1535). Simmel, one of the many pretenders to the throne of Henry VII, was put forward as Edward, earl of \*Warwick, nephew of Richard III, escaped from the Tower. He appears to have been the son of an Oxford tradesman. He was taken up by Richard Simon, a priest, and supported by the Yorkists. In May 1487 he was crowned as Edward VI in Dublin, summoned a parliament, and the following month was brought over to England with a formidable invading force. Henry VII met it at \*Stoke, 2 miles south-west of Newark, and was victorious. Simmel, a mere pawn, was pardoned and set to work as a scullion in the royal kitchens, living out the rest of his life in safe obscurity. The real earl of Warwick was executed in 1499. JAC

**Simon, Sir John** (1873–1954). Liberal politician and eminent barrister. Simon's collection of high offices—home secretary, foreign secretary, chancellor of the Exchequer, and lord chancellor—was unique in the 20th cent. He rose from modest beginnings through sheer brain power to achieve cabinet rank: before the First World War he had been appointed solicitor-general (1910) and attorney-general (1913). Thereafter his career suffered with the decline of the Liberal Party. But he returned to government in 1931 as foreign secretary at the head of his own band of Liberal National MPs. It was an inauspicious time to hold this office and Simon's reputation declined as first Japan, then Italy and Germany, challenged the authority of the League of Nations. He was more suited to the Home Office (1935–7), playing an important part in the abdication crisis, but as chancellor of the Exchequer (1937–40) his cautious financial control failed to take sufficient account of the need to rearm. In 1940 Churchill sent him to the Lords as lord chancellor, a position for which his legal talents well qualified him. Once thought of as a radical among Liberals, he was, by the end, for practical purposes a Conservative. His intellectual gifts made him reluctant to reach clear-cut decisions. But his greatest failing in public life was an inability to relate to others and a widespread—but not always deserved—reputation for insincerity. DJD

**simony.** Although particularly associated with the purchase of preferment or office in the church, simony is strictly the acquisition by financial means of any spiritual benefit. The name comes from that of Simon Magus, recorded in Acts 8. Consistently denounced by councils of the church throughout the centuries, it has remained a temptation not universally resisted. JRG

**Simpson, Sir James** (1811–70). Anaesthetic pioneer. Youngest son of a Scottish village baker, Simpson entered Edinburgh University in 1825, to graduate MD (1832) and proceed rapidly to the chair of midwifery (1839). Excited by the new use of sulphuric ether as an anaesthetic agent, but concerned to find a substance more manageable and

## Simpson

effective, he self-experimented with other volatile fluids before settling on chloroform (1847). Despite its rapid popularity, his advocacy for its use in natural childbirth as well as surgical intervention led to intense criticism from moralists and theologians until Queen Victoria's delighted approbation after the delivery of her ninth child (1853). A baronetcy was bestowed in 1866. Always in a hurry, but with foresight and an intensely critical mind, Simpson's contributions to obstetric science and foundation of gynaecology considerably improved their credibility, while his wider interests included hospital infection and design, acupuncture, and archaeology. ASH

**Simpson, Mrs Wallis** (1896–1986). Wife of Edward, duke of Windsor. Born into a Baltimore family, Bessie Wallis Warfield first married an aviator, Earl Winfield Spencer, but his fondness for drink led to separation and ultimately divorce. Mrs Spencer travelled the world, but on returning to Baltimore she met an English businessman, Ernest Simpson, also in the throes of divorce. In 1928 Mrs Spencer became the second Mrs Simpson, and moved with her husband to London. Two years later an American friend, Thelma, Lady Furness, introduced her to Edward, the prince of Wales. In 1934 Mrs Simpson and Prince Edward became lovers. Mrs Simpson lacked beauty, but oozed wit and charm; Edward, infatuated, found in her the feminine sympathy and understanding he craved. In 1936 she divorced Mr Simpson, and Edward gave up his throne in order to marry her. The couple enjoyed a devoted but childless marriage of some 35 years; she is buried next to him at Frogmore. GA

**Sinclair, Sir Archibald, 1st Viscount Thurso** (1890–1970). Sinclair held the post of secretary of state for air from the formation of \*Churchill's government in 1940 until the end of the Second World War. Son of a Scottish baronet, he entered the Life Guards in 1910 and became a close friend of Winston Churchill, his senior by sixteen years, and they served together on the western front. Sinclair was returned to Parliament in 1922 as a Lloyd George Liberal. He took office with \*Samuel in the National Government of 1931 but resigned a year later on the issue of protection. When Samuel lost his seat in 1935, Sinclair took over as leader of the Liberals. He declined to serve under \*Chamberlain in 1939 but accepted Churchill's invitation. Sinclair's reputation suffered from his amiability and he was regarded by some as Churchill's creature, but his place in the cabinet was political, and he stood up to Churchill over \*Teddier and Sholto-Douglas. He lost his seat in 1945 but Churchill sponsored his viscountcy in 1952. JAC

**Sinn Fein.** The Gaelic for 'we ourselves'. Formed as a series of clubs in Ireland and led by the journalist Arthur \*Griffith at the beginning of the 20th cent., until 1916 Sinn Fein was more important for ideas than organization. It stressed the need for self-sufficiency in economic and cultural affairs, advocated passive resistance and the *de facto* establishment of an Irish government as the means of achieving nationalist ends, less appropriately suggesting a dual monarchy along Austro-Hungarian lines for resolving the Ulster question. The British authorities inaccurately referred to the Sinn

Fein rising 1916. From 1917 it was used as an umbrella title for the advanced nationalist party which supplanted the parliamentary party. Following its triumph in the 1918 general election, Sinn Fein formed the Dáil government, but in the Anglo-Irish War it took a back seat in the military campaign and became the political arm of the \*Irish Republican Army. Splitting over the \*Anglo-Irish treaty, under \*de Valera it supported the republican fight in the civil war 1922–3. In 1926 Sinn Fein divided again over the issue of recognition of the Free State Dáil: the minority adhered to an abstentionist policy and retained the Sinn Fein title, the majority formed the Fianna Fáil Party. In the following decades, it lost popular support, though remaining significant as the political wing of the IRA on both sides of the border. It abandoned its traditional abstentionist policy over the hunger strikes in 1981 and became increasingly popular among the catholic working class in Northern Ireland, challenging the electoral dominance of \*SDLP, under the leadership of Gerry Adams in Belfast and Martin McGuinness in Derry. From 1998 until 2002 Sinn Fein took part in the power-sharing administration resulting from the 'Good Friday' agreement. MAH

**Singapore** was an important trading port between the 11th and 16th cents. In 1819 Sir Stamford \*Raffles re-established it as a counterweight to Dutch influence in the region and it became a crown colony in 1867. It developed with the exploitation of south-east Asian rubber, tin, and oil and was made a major naval base in 1921. On 15 February 1942 the Japanese received its surrender. After the war it remained separate from the Malay Union and was given its own constitution in 1955, which led to self-government in 1959. Singapore initially joined, but then withdrew from, the Malaysian Federation (1965). DAW

**sinking fund.** Originally devised in 1717 as one of numerous schemes to reduce the \*national debt. Legislation provided that any surplus funds from government revenues were to be reserved for paying off both capital and interest accumulated before Christmas 1716. A new scheme, in 1786, administered by national debt commissioners, declared that the dividends on government stock would be used to pay off debt in the following year so that eventually the debt would be abolished. But at the end of the Napoleonic wars the national debt was £16 million greater than it would have been without the sinking fund because of the obligation to purchase stock at low interest rates during the war with funds borrowed at high rates of interest in the market. It was phased out during the 19th cent. CHL

**Siward, earl of Northumbria** (d. 1055). Of Danish descent and gigantic stature, Siward seems to have come to England with \*Cnut and had been made earl of \*Deira by 1026. He subsequently served \*Harthacnut and \*Edward the Confessor, becoming earl of all Northumbria. In 1054 he led an expedition to Scotland, defeated \*Macbeth, and installed \*Malcolm Canmore on the throne. A man of great valour, he was said by Henry of Huntingdon to have lamented in York in 1055 that he was not dying in battle but 'like a cow', and arming himself from head to foot, met death as

a warrior. His earldom went to \*Tostig, Harold Godwine-son's brother. Siward appears in Shakespeare's *Macbeth*.

JAC

**Six Acts**, 1819. Repressive measures to deal with the radical reform agitation which culminated in \*Peterloo. The Acts (a) prohibited most meetings of over 50 people; (b) gave magistrates powers to search private houses for arms; (c) prohibited drilling and military training by civilians; (d) strengthened the laws against blasphemous and seditious libel; (e) limited the right of an accused to adjournment of trial to prepare his defence; (f) increased the stamp duty on newspapers and cheap pamphlets to 4 pence, thus hitting the radical press. However, the decline of popular radicalism after 1820 was as much due to improved economic conditions as to the Acts.

JFCH

**Six Articles, Act of**, 1539 (31 Hen. VIII c. 14). The Act gave legal and penal authority to a set of highly reactionary statements on issues of church belief and practice. The Six Articles, decided by debate within the House of Lords and approved by convocation, upheld (a) the catholic doctrine of the transubstantiation of the substance of the eucharistic elements into the body and blood of Christ, in its most exclusive form; (b) the view that one need not receive both bread and wine in the communion; (c) the obligation of priests to remain celibate; (d) the binding character of vows of chastity; (e) private masses; and (f) auricular confession. The Act decreed that denial of the first article was to be punished by burning as a heretic; denial of the others, and priestly marriage, was ultimately punishable by hanging. In keeping with the Act's traditional nickname of the 'whip with six strings', this was not a reasoned doctrinal statement, but a legal snare designed to trap protestant believers. Bishops Shaxton of Salisbury and \*Latimer of Worcester resigned their sees in protest. The passing of the Act seems to have resulted from a temporary ascendancy in the king's council of conservative opponents of Thomas \*Cromwell, especially the duke of Norfolk and Bishop Stephen \*Gardiner. The Act was enforced very little during the life of Cromwell, and sporadically afterwards. It was repealed in the first Parliament of Edward VI in 1547. EC

**Skippon, Philip** (d. 1660). Major-general of the infantry in the \*New Model Army. From a Norfolk gentry family, and a man of puritan piety, Skippon distinguished himself as the leader of the London trained bands, and as commander of the infantry in \*Essex's army from 1642 to 1644. At \*Naseby (June 1645) he commanded the New Model foot, and was severely wounded. In the second civil war (1648) he was again put in command of the London militia, and prevented the city from falling into royalist hands, and giving assistance to the royalists in Essex and Kent. Though appointed one of the king's judges, he never attended a session of the High Court of Justice. During the Interregnum he held high office but exercised little political influence. Having acquired confiscated crown, church, and royalist land, he died rich.

IJG

**slave trade**. The slave trade of Great Britain, and those of other European countries, transformed the indigenous

African and surpassed the Muslim trades. Britain's became the largest national trade. About 75,000 Africans were carried in British ships in the 17th cent.; in 1701–1800 the numbers were about 2.5 million out of the 6.13 million slaves exported, reflecting the expanding demand from the British plantations, especially the sugar colonies, as well as exports to Spanish America. Between 1701 and 1810 British North America received about 348,000 slaves, the British Caribbean about 1.4 million.

The English trade after 1600 was first conducted by monopolistic chartered companies, of which the Guinea Company (1618) lasted until the 1650s. The Royal Adventurers into Africa (1660, 1663) was succeeded by the \*Royal Africa Company (1672–1752). However, private traders were always active, even before the company's quasi-monopoly was ended in 1698, and numerous merchant partnerships were involved. The royal family's patronage of trading and colonizing companies in the 17th cent., particularly the duke of York's, and the granting of parliamentary subsidies for the maintenance of African forts and trading posts in the next, mirrored the involvement, if not the direct participation, of all classes of British society. Slaves were traded for an increasing number of English commodities, so that by the early 18th cent. groups as diverse as Devon textile producers and iron manufacturers from the Birmingham area sought to influence legislation. The trade was viewed as a pillar of the plantations and necessary to economic and commercial expansion. Lawyers, legislators, and churchmen viewed it as morally and theologically justifiable. The \*quakers were unusual in their early attacks on it as contrary to Christian equality and compassion.

The slave trade has given rise to a vast historical literature. Topics examined include: the regions of west Africa from which the slaves were brought—the major regions for the European trade as a whole were roughly west central Africa (2 million), Bight of Benin (1.2 million), Bight of Biafra (814,000), Gold Coast (677,000), Sierra Leone (483,000), and Senegambia (210,000)—how these changed over time and the extent to which preferences for Africans from one or another region could affect the market; the organization of the trade on the African coast; the nature of slave voyages, the size of ships, the treatment of slaves, and their mortality rates; the sex and age ratios of the slaves taken from Africa; the volume of the trade; its impact on African societies. Econometric analyses have been complemented by studies examining the growing unease over the cruelties of the trade, part of the change in sensibilities, expressed in the literature of benevolence and sentimentalism, that found expression in the writings of, for example, William \*Cowper, Samuel \*Johnson, and the \*Wesleys. Other studies have looked sympathetically at the black population of 18th-cent. England and have documented the lives of individual Africans.

The trade was critical to the production of major colonial commodities, especially sugar, tobacco, and rice, whose export helped shape the global market economy of the late 17th and 18th cents. as well as sectors of the British economy. Its importance for certain British ports is well known. \*Liverpool's dominance is clear and Liverpudlians were in

## Slim

the forefront of opposition to reform. Figures for 1750–76 suggest 1,868 ships sailed from there to Africa, 588 from Bristol, and about 260 from London. However, while profits from the trade in some periods may have run at about 9 per cent, arguments that it provided important investment capital, contributing to the British industrial revolution, are now discounted. See ANTI-SLAVERY. RCS

**Slim, William, 1st Viscount Slim** (1891–1970). Soldier. Born in Bristol and brought up in Birmingham, Slim joined the army in 1914, emerging twice wounded from the war with the rank of major. He spent most of the inter-war years with the army in India and in 1940 was sent with a brigade to Eritrea to fight the Italians. In 1942 he was given a command in \*Burma and in October 1943 took over the 14th Army. The following year he won a great victory in repelling a major Japanese offensive and was able to launch a counter-attack to recover Burma, with a brilliant diversionary movement towards Mandalay. After the war he served as chief of the imperial general staff from 1948 and was governor-general of Australia 1953–60. He was given the Garter in 1959 and a viscountcy in 1960. Slim was a fighting general, bluff and pugnacious, 'the finest general the Second World War produced' according to \*Mountbatten, and known to his men as 'Uncle Bill'. JAC

**Slioch, battle of**, 1307. The first of two battles which confirmed Robert I, king of Scots, in his position after the death of Edward I. Probably in October, Robert captured the Comyn castle of Inverlochy, near the modern Fort William, marched up the Great Glen destroying Urquhart and Inverness castles, and attacked Elgin and Banff. He then fell seriously ill and had to retreat to a more secure position at Slioch, just east of Huntly. His enemies, the earls of \*Buchan and Atholl, made an unsuccessful attack on Christmas Day. A second attempt on 31 December found Robert's position too strong, and he was able to withdraw to safety, and prepare for the decisive victory at \*Inverurie. BW

**Sluys, battle of**, 1340. At \*Halidon Hill in 1333 the Scots discovered that Edward III was rather more formidable than his father. In 1337 Edward went to war with Philip VI of France who built up a vast armada at Sluys on the Flemish coast for an invasion of England. Edward attacked it on 24 June 1340. The French lashed their ships together to form a floating platform, protected by archers and artillery. Edward's vessels crashed into them and ferocious hand-to-hand fighting lasted all day. A few French vessels made their escape but the armada was totally destroyed. JAC

**Smeaton, John** (1724–92). One of the founders of the civil engineering profession. Born in Leeds, where his father was a lawyer, Smeaton demonstrated a practical aptitude which won him rapid recognition as a craftsman and instrument-maker. He was commissioned to rebuild the lighthouse on Eddystone Rock, 15 miles south of Plymouth, and completed this in 1759 with a remarkably innovative design which set the pattern for all subsequent offshore lighthouses. It was after this that he set up a consultancy business, styling himself a 'civil engineer' to distinguish his profession from that of the military engineers. His commissions included canals

such as the Forth–Clyde canal in Scotland, many distinguished masonry bridges such as those at Perth and Coldstream, harbours such as that at Ramsgate, and a succession of water-mills and steam-engines. In 1771 he took the lead in establishing the Society of Civil Engineers, the first professional institution for engineers. RAB

**Smiles, Samuel** (1812–1904). Popularizer of the dominant social values of middle-class Victorian Britain. By profession a doctor, Smiles worked for a time as a radical journalist in Leeds before settling down as secretary (i.e. chief executive officer) to a succession of railway companies. In his leisure time he wrote a series of books, of which \**Self-Help* (1859) was the most successful, selling over 250,000 copies during his lifetime. Smiles's heroes were the self-made men who laid the foundations of Britain's industrial greatness. *Self-Help* was a collection of potted biographies of men who had risen from poverty and obscurity to wealth and influence, interspersed with moral reflections and proverbial wisdom. Smiles's original aim was to show how working men might better themselves. However, for large sections of the working class this was simply impracticable; and in the later 19th cent. Smiles appeared to critics of capitalism as the banal apologist for bourgeois success. JFCH

**Smith, Adam** (1723–90). Famous son of Kirkcaldy (Fife) and educated at Glasgow University, Smith graduated at the age of 14. After six years at Balliol College, Oxford, he became professor of logic, then moral philosophy, at Glasgow University. In 1764–6 he was tutor to the duke of Buccleuch, followed by advisory work for Charles \*Townshend; in 1778 he was appointed commissioner of customs for Scotland in which role he remained until his death. Although his reputation was founded on *The Theory of Moral Sentiments* (1759), his *magnum opus* was *An Inquiry into the Nature and Causes of the \*Wealth of Nations* (1776). This book was the foundation of the classical school in Britain. It analysed the operation of free market economies where the key players were motivated by self-interest and profit maximization. Out of it economists saw an 'invisible hand' at work and the division of labour, which was eventually responsible for the wealth of nations. Most interpretations have labelled Adam Smith a parent of \**laissez-faire* economics, but he was much more interventionist than this. Nevertheless, he was an advocate of an economy based primarily upon \*free trade, private enterprise, and 'perfect' competition wherever possible. JRP

**Smith, Frederick E., 1st Lord Birkenhead** (1872–1930). Lord chancellor. Educated at Birkenhead and Oxford, Smith made a name for himself as a barrister in Liverpool where (1906) he was elected as a Conservative MP. His rhetorical onslaughts against the Liberal government brought him to the attention of the Tory die-hards, and in 1911 he joined the opposition front bench. In 1915 he became solicitor-general and then attorney-general in the wartime coalition government, and in 1919 was appointed lord chancellor; from 1924 to 1928 he served as secretary of state for India. Smith has been unfairly characterized as an unmitigated reactionary. Though a supporter of Ulster's right to opt out of Home

Rule, Smith did his best to bring about a compromise in the Irish question, and played a key part in the negotiations which led to the Irish treaty of 1921. He also devoted much energy to law reform; the passage of the Law of Property Act (1922) was largely due to his efforts. GA

**Smith, Ian Douglas** (b. 1919). Rhodesian politician, advocate of white rule. In 1961 Smith founded the Rhodesian Front, a party which rejected the proposal of the government of the Federation of Rhodesia and Nyasaland to offer more representation for blacks in Parliament. When the federation was dissolved (1963), Smith became prime minister of Southern Rhodesia in 1964. He rejected Britain's plan for black majority rule in the colony and in 1965 unilaterally declared Rhodesia's independence. He then fought a powerful rearguard action against British attempts to reverse the declaration. In response to the imposition of economic sanctions by the UN he severed Rhodesia's links with the Commonwealth and in 1970 declared the country to be a republic. The civil war subsequently waged by black nationalists against his government forced Smith to take part in negotiations in London, as a result of which black majority rule was introduced in 1979. KI

**Smith, John** (1938–94). Scottish QC who became leader of the Labour Party (1992–4). Smith was chosen to succeed \*Kinnock both as someone who had held office (minister of state, Department of Energy 1975–6; minister of state, Privy Council Office 1976–8; secretary of state for trade 1978–9), and as a political heavyweight who possessed the gravitas that Kinnock lacked. Even so, his 'shadow budget' of 1992 had contributed to Labour's defeat. Smith, though much respected, was not perhaps as good as he was painted. He never dominated the Commons or captured the national imagination as \*Wilson had done as leader of the opposition. And although he broke the trade union block vote at the 1993 party conference, his longer-term strategy for Labour was not entirely clear. Cruelly, his greatest contribution to Labour's progress was his sudden death in 1994 from a second heart attack. This brought the youthful Tony \*Blair as his successor. AS

**Smith, Sir Sidney** (1764–1840). Admiral. Smith entered the navy in 1777 and saw action in the American War at Cape St Vincent (16 January 1780) and off the Chesapeake (5 September 1781). In 1785–7 he studied French at Caen before spending a year with the Swedish navy. In 1793 he was posted to Toulon and returned with dispatches after its fall. Smith was given command of the frigate *Diamond* which he used to conduct partisan warfare along the French coast. He was captured in 1796 off Le Havre and imprisoned in the Temple, Paris. Two years later he escaped and returned to command the *Tigre* in Levant. The most famous episode in his career came in 1799 when he undertook the defence of Saint-Jean d'\*Acre (3 March–8 May) and heroically repulsed Napoleon. Smith possessed a vainglorious streak to his character, but also showed great valour and judgement. He died in Paris and was buried in Père-Lachaise. RAS

**Smith, Sydney** (1771–1845). One of the ablest polemicists in a period of remarkable vitality. His father was severe, often

in financial difficulties, and ungenerous. Sydney was educated at Winchester and New College, Oxford, where he took orders and became a fellow. After two years in Netheravon in Wiltshire as a curate, he became tutor in 1797 to Michael Hicks Beach and then to his younger brother William. The continent being closed by the war, they settled in Edinburgh. During his stay there, he launched in 1802 the *\*Edinburgh Review* with his friends \*Brougham and \*Jeffrey and contributed to it for 25 years. From 1806 Smith was rector of Foston near York, which he held until 1829, when he moved to the living of Combe Florey in Somerset. In 1807 his *Peter Plymley* letters, published anonymously and urging religious liberty, had a great success. Smith was an ardent advocate of \*catholic emancipation, had a distaste for the excesses of methodists—'there is not a madhouse in England where a considerable part of the patients have not been driven to insanity by the extravagancies of these people'—and his speech at Taunton in 1831 on parliamentary reform ('Mrs Partington and the Atlantic Ocean') became an instant classic. When his Whig friends came to power in 1830, \*Grey gave him a canonry at St Paul's, but he was passed over for a bishopric, which hurt him. Though Smith's facetiousness can appear mechanical, and even desperate, he was genuinely funny, and there is testimony to dinner-table companions reduced to helplessness and servants forced to leave the room in stitches. JAC

**Smith, Sir Thomas** (1513–77). Scholar and statesman. Smith was born in Saffron Walden of prosperous parents and educated at Queens' College, Cambridge. In the early 1540s, with his friend \*Cheke, he plunged into the controversy about the pronunciation of Greek. In 1543 he was made professor of civil law. Under Protector \*Somerset he prospered as a protestant. He was appointed provost of Eton, dean of Carlisle, and a secretary of state, and was given a knighthood. He survived Somerset's fall with some difficulty and took a back seat under Mary. Elizabeth restored him to favour and he was involved in negotiating the treaty of \*Troyes in 1564. In 1572 he was reappointed secretary of state, using his influence on behalf of the Scottish reformers. His best-known work is his *Discourse on the Commonwealth of England*, published posthumously in 1583 and frequently reprinted. It is a description of the mechanics of government in 1565, with a famous, and disputed, account of the role of Parliament. JAC

**Smith, W. H.** A nation-wide chain of retail outlets of books, newspapers, stationery, recordings, games, and other leisure products. William Henry Smith (1792–1865) was born in London where his widowed mother ran a small newspaper business. W. H. Smith extended it, laying the foundations for growth during the second half of the 19th cent. As the railway network expanded, the company secured concessions for kiosks to sell newspapers and periodicals at principal stations from most railway companies. Until 1960 many of the high street shops also ran lending library departments. In partnership with \*Boots, the company assumed control of Do-It-All, the household goods supermarket chain. W. H. Smith's son (also W. H.), who entered politics, was satirized

## Smollett

by \*Gilbert and \*Sullivan as 'ruler of the Queen's Navee' when 1st lord of the Admiralty (1877–80). IJEK

**Smollett, Tobias** (1721–74). Novelist. Son of a prosperous Dumbarton laird, Smollett became the best-known London-Scottish man of letters of his generation. His life was dogged by financial disaster and he took to \*Grub Street out of necessity. Much of his literary career was the stuff of hack writing—translations, political and historical journalism, travel writing. But he was a cut above the rest. His 'Continuation' of \*Hume's *History of England* was not only lucrative but a serious foray into contemporary history. His *Critical Review* founded in 1756 was a respected and popular literary journal. His early picaresque novels *Roderick Random* (1748) and *Peregrine Pickle* (1751) are minor classics. His last novel *Humphry Clinker* (1771), set in London, the English provinces, Wales, and Scotland, is the first genuinely British novel. It is also a major classic of comic fiction. NTP

**smuggling** refers to covert movement of goods into or out of the country in order to evade taxes or limitations on imports or exports, and involves practical difficulties relating to clandestine activity and risks of detection by customs and excise. It was so extensive and organized in the 18th cent. as to be considered a trade in its own right, but one able to benefit rather than suffer by the disruption of war. If hampered by high naval presence in inshore waters, smugglers could flourish when the navy's forces were stretched and revenue officers corrupt. The 1740s and 1770s were accordingly profitable, and \*Wesley found his congregation at Rye in 1773 intensely reluctant to stop the habit. Although the gangs were predominantly comprised of labourers or artisans, who regarded the practice as a legitimate part of the local economy, the contraband reached all sections of society. The risks entailed encouraged ingenuity: Horace \*Walpole's jacket came via a banker cousin in Paris, probably in the diplomatic bag; in 1792 Parson \*Woodforde had to hide tubs of rum and brandy since he was liable to a £10 fine for each illicit purchase under 19 Geo. III c. 69 (which not only fined the supplier £50 but deliberately encouraged 'informing'); more recently, weapon parts have been disguised as engineering components, and clothes have been impregnated with powdered drugs. Flourishing wherever there are high duties (luxuries like silk, spices, wines and spirits, and tea in the 18th cent.), bans, or embargoes (narcotics in the 20th cent., arms in all periods), estimates of the value of the trade, of the loss of revenue to government, and of damage to individuals or businesses can only be conjectural. IJEK

**Smuts, Jan Christian** (1870–1950). South African soldier, diplomat, statesman, and scholar. Having trained as a lawyer in England, Smuts, an Afrikaner, fought against the British in the second Anglo-Boer War (1899–1902). He became one of the main architects of the unification of South Africa within the British empire, but under Afrikaner leadership (1910). During the First World War he commanded British troops in east Africa before serving with distinction in Lloyd George's war cabinet (1916–19) and in the peace negotiations in Versailles, when he was a vigorous protagonist of the

\*League of Nations. He was not so successful as prime minister of the Union of South Africa (1919–24 and 1939–48) because his attachment to the British empire and Commonwealth angered the Afrikaners, who also resented his intervention in the Second World War. Although critical of the apartheid policy introduced after 1948 he always believed that whites should continue to govern the country. KI

**Snowden, Philip** (1864–1937). Labour politician. Snowden came from humble Yorkshire weaving stock, but managed to obtain a junior post in the civil service. Through a process of self-education he converted himself to socialism, joining the \*Independent Labour Party, of which he became (1903–6 and 1917–20) national chairman; he entered Parliament in 1906 as MP for Blackburn, later representing Colne Valley. During the 1920s his revolutionary ardour dimmed; he opposed the \*General Strike (1926) and resigned from the ILP the following year. Snowden's grasp of fiscal matters led to his appointment as chancellor of the Exchequer in the Labour governments of 1924 and 1929–31, but far from pursuing a socialist economic policy he revealed himself as a devotee of the balanced budget and an unrepentant supporter of \*free trade. Following the collapse of the minority Labour government in 1931, Snowden joined Ramsay MacDonald's National Government, thus retaining his Exchequer portfolio, but the following year (by then a viscount) he resigned on the issue of free trade. GA

**Soane, Sir John** (1753–1837). English architect. Following an apprenticeship and successful studies at the Royal Academy, between 1778 and 1780 Soane travelled in Italy on a scholarship awarded by George III. In 1788 he won the competition to design a new Bank of England and remained as surveyor to the Bank until 1833. Of this, his most important work, only some fine interiors remain. Two houses he designed for himself show his mature style; Pitzhanger Manor, Ealing, is now a library, while 13 Lincoln's Inn Fields is the Sir John Soane Museum, containing his collection of antiques and paintings. Dulwich College Art Gallery, another most original design, was destroyed in 1944, but faithfully rebuilt. Less successful than his great rival John \*Nash, from whom he differed in every respect, Soane was probably a truer interpreter of the period's taste for the classical. He was knighted in 1831. JC

**soccer.** See FOOTBALL.

**Social Democratic and Labour Party** (SDLP). The SDLP has been the most effective institution representing the catholic minority in Northern Ireland since the province's establishment. It was formed in 1971 as a coalition between the old Nationalist Party members, republican socialists, and civil rights campaigners, and represented the enlarging catholic middle class. It was initially led by Gerry Fitt, representative of Belfast's Labour tradition. The SDLP accepted the position as opposition party within Stormont, but boycotted it over the implementation of internment in 1971. It joined the power-sharing executive of 1973–4 and suffered from its rapid collapse. In 1979 John Hume was elected leader and developed effective contact with politicians in Dublin, Brussels, and the USA. Its

electoral dominance among the catholic community has been challenged by \*Sinn Fein, particularly over the hunger strikes of 1981. Hume led a peace initiative in 1993–4 in talks with the Sinn Fein leader Gerry Adams; their agreement provided background to the Downing Street declaration of December 1993, and the republican cease-fire of August 1994–January 1996. At the general election of 2001, the SDLP retained its three seats for Newry and Armagh, Foyle, and Down South.

MAH

**Social Democratic Federation.** Founded in June 1881, but did not add the 'Social' to its name until 1884. By then it had also become socialist, in a Marxist sense, under the influence of H. M. \*Hyndman. Unfortunately neither Marx himself nor Engels supported it. It also suffered other early blows: by the defection of William \*Morris's anarcho-socialists to form the rival Socialist League in December 1884, for example; and when it was discovered in 1885 to have accepted 'Tory gold'. It was never a mass party, but it did exert considerable influence, especially initially, and assisted in the birth of the \*Labour Party in 1900. It soon denounced Labour, however, as being insufficiently dedicated to the class war; and thereafter continued as the voice of militant socialism and trade unionism, until it came to be upstaged by the Moscow-inspired \*Communist Party of Great Britain after 1920.

BJP

**Social Democratic Party.** The late 1970s saw a marked rise of the left within the \*Labour Party. There were demands for the mandatory reselection of MPs, and for the choice of the party leader to be taken from MPs and lodged in an electoral college, which would include the trade unions and the constituency parties. Dissatisfaction with the \*Callaghan government (1976–9) intensified such pressures. Leading ex-ministers began to contemplate breaking away from Labour to form a new party. The signal came when the party conference in January 1981 voted to vest the election of party leader in an electoral college, in which MPs would have only 30 per cent of the votes. Twelve MPs, led by Shirley Williams, Bill Rodgers, David \*Owen, plus Roy \*Jenkins (chancellor of the Exchequer in the 1966 Wilson government), formed a Council for Social Democracy, soon transformed into the SDP.

The first task was to create a party structure, the second to negotiate an alliance with the \*Liberals. The Alliance involved a division of the constituencies between the two parties, and the nomination of a prime minister-designate, the choice being Jenkins. In the first months, the Alliance was highly successful, winning by-elections at Croydon NE, Crosby, and Glasgow Hillhead, where Jenkins was returned. At the end of 1981, 50 per cent of a national sample said they would vote for the Alliance if a general election was held at once. By April 1982, 29 sitting Labour MPs and one Conservative had joined the SDP.

Early in 1982 polls indicated a falling-off of support, possibly instigated by the \*Falklands War, which rallied opinion to Mrs \*Thatcher's Conservative government. Another influence was signs of economic recovery. In the general election of 1983, the Alliance won 26 per cent of the national vote outside Northern Ireland, only 2 per cent behind Labour.

But the working of the British electoral system awarded the Alliance only 23 seats, against Labour's 209.

Jenkins resigned as leader of the SDP at once and was replaced by David Owen. Relations with the Liberals became more strained. The Alliance won some by-elections spectacularly and did well in local elections. But it was hampered by the retreat of the left inside the Labour Party, and in the 1987 general election the strains in the Alliance became more visible. Its vote dropped to 23 per cent and a few days after the election David \*Steel, leader of the Liberals, delivered an ultimatum—either a merger or the Alliance should be dissolved. Owen bitterly opposed a merger and resigned when a majority of his members supported it. The two parties then formed the new Social and \*Liberal Democrat Party. Owen and two other MPs stayed aloof in an independent SDP but it had lost most of its support. Owen retired from Parliament at the 1992 election and the two other SDP MPs were narrowly defeated. HB

**social history.** G. M. Trevelyan's often quoted 'Social history might be defined negatively as the history of a people with the politics left out' is as thought-provoking as it is misleading. The result was a diffuse agenda of great breadth from family and household to furniture, dress, and photography. This was given coherence around the notion of 'Englishness'. He began in the 14th cent. because this was the period in which 'the English people first clearly appear as a racial and cultural unit'. He finished with a vision of a society experiencing increasingly rapid change and 'progress . . . particularly in education and social services'. In a book written in the shadow of an uncertain war, the last footnote ended, 'If we win this war, it will have been won in the primary and secondary schools' (1941). None the less the tradition of social history which dominated the 1950s and 1960s had come out of the side door of the \*Fabian Society guided by the Hammonds and the \*Webbs.

Social history inherited from the \*Scottish Enlightenment a sense of a society progressing by stages to a more civilized condition. There was a keen awareness, derived from Marxism, of the impact of economic structures. The sense of national identity and purpose explicit in Trevelyan was implicit in the development of social history. The Anglocentric British state was the reference point for the bulk of research. The dominant agenda grew from the Fabian perspective. It included work and the impact of economic change, social conditions, especially health and housing, social movements, notably trade unions and organizations campaigning for social change, and social reform based upon legislation and the growth of state intervention. This writing was organized around two key assumptions. The first identified a major and disruptive change in the late 18th and early 19th cents. called the '\*industrial revolution'. The second sought understanding and explanation through the concept of social \*class. These assumptions were common to the work of authors as different as Asa Briggs, E. P. Thompson, and Harold Perkin. Although Thompson's work initially divided its readers by political persuasion, its long-run importance was to widen the agenda of social history and to bring to the

front the tension between human agency and economic determinism as a basis for explanation.

The 1960s and 1970s brought an increasing engagement between social science and the understanding of the past. The initial impact was evident in the study of social class but most notable in demography and \*family history. The recognition of the distinctive nature of the nuclear family-based household in Britain was one outcome. This engagement brought another tension to social history, that between the social scientist's desire to generalize and the historian's respect for the particularity of time, place, and person. This period saw a dramatic increase in the sources and methods employed by social historians: parish registers, parliamentary poll books, oral history, the early use of computers, and the interpretation of landscape were some of the additions to the repertoire.

The 1970s and 1980s released social history from a variety of self-imposed inhibitions. There was a rapid extension of the range of 'legitimate' topics. \*Urban history with its awareness of the complex interactions and variety of the town played a major part. Social theory, much of it from the Chicago school of urban sociology, was important here, but the urban historians also sustained a tradition of social history which sought an elegant account of the texture of the past, a sort of organized poetry of facts. The most crucial impact was probably women's history with its rapid development into gender history. Leading writers displayed a deep dissatisfaction with existing categories and agendas such as the Fabian concern with paid (mainly male) work in the cash economy.

In the past 25 years the British have written more social history than in the rest of their history-writing history. The agenda has extended to an almost unlimited range of topics. Politics, often through studies of the nature of the state, has been reintegrated. Ethnic, racial, religious, and national identities have been added to those of gender and class. The greater understanding of the 17th and 18th cents. has questioned the notion of the 'industrial revolution' as a discontinuity.

In the 1990s the British displayed a hunger for their own history, not just as a nation state unit in the manner of Trevelyan, but as a reflection of multiple identities, Scottish, Irish, Welsh, the regionality of the English, in terms of work, gender, religion, ethnicity, leisure interests, social and moral enthusiasms. As a result 'social history' has become part of the mainstream of British culture. The political debate of the 1980s and 1990s directly involved interpretations of social history through concepts such as 'Victorian values' and 'middle-class failure'. Leisure and cultural products as varied as tourism, television, and living space involved historical understanding through the notions of 'heritage' and 'restoration'. Social history has become not just an intellectual base for understanding the past but a crucial element in the relationship of past and present and in the multiple identities of the late 20th and early 21st cents. RJM

**socialism.** The word first appeared in 1827 as a description of the doctrines of Robert \*Owen. Socialists emphasized a social, as opposed to an individualist, approach to life,

especially economic organization. Owenite socialism (also known as co-operative, utopian, or communitarian socialism) aimed to change society by the establishment of experimental communities, in which property was held in common and social and economic activity was organized on a co-operative basis. Between 1825 and 1847, seven Owenite communities were founded in Britain. None of them flourished long; but from the co-operative trading stores, established by working men to accumulate funds for starting a community, came the modern \*Co-operative movement. Owenism provided a critique of capitalism and an alternative political economy based on a general labour theory of value. It did not survive as a movement beyond the later 1840s. The idea of co-operative socialism was continued by the middle-class \*Christian socialists of 1848–54. Throughout the 1860s and 1870s little was heard of socialism.

In 1884 came a revival, beginning with the \*Social Democratic Federation (SDF), founded in 1881 as the Democratic Federation from various radical clubs in London. It was basically Marxist and most of the leading socialists were for a short time in its ranks. The Socialist League, under the leadership of William \*Morris, split off from the SDF in 1884; and in the same year the \*Fabian Society was formed by a group of middle-class intellectuals who derived their socialism not from Marx but from \*utilitarianism. In 1893 the \*Independent Labour Party was founded in Bradford, and despite its title was committed to socialism.

Membership of most socialist organizations signified a commitment to certain principles (of which some version of 'the collective ownership of the means of production, distribution, and exchange' was the most important), followed by a list of 'immediate' reforms such as the eight-hour day, state pensions, and free, secular education to 16. There were also other expectations and motivations. For some, the revolt against Victorian society was paramount; some were appalled by the waste and inefficiency of capitalism and wished to replace it by a more rational system; others found in socialism a new religion; and a few believed in class struggle and revolution.

Numerically the socialists were only a small body—probably no more than 2,000 in the 1880s and perhaps 20,000–30,000 by 1900. The failure to build a mass socialist party (as in Germany or France) in the 1890s encouraged socialists to look to the \*trade union movement for wider support, with the result that in 1900 a Labour Representation Committee based on an alliance of socialist societies and trade unions was formed, and in 1906 this became the \*Labour Party. It did not adopt a specifically socialist programme until 1918. Thereafter the Labour Party was the main vehicle for an empirical, reformist, welfare-statist type of socialism in Britain, which reached its apogee in the Labour victory of 1945 with its ensuing programme of nationalization and welfare legislation. For many ardent socialists the Labour Party was inadequate, and their sectarian inclinations encouraged the formation of numerous minority movements, including the \*Communist Party, from 1920 to the present. Their differences were mainly about the means by which socialism could be attained,

especially the issue of revolutionary action (variously defined) versus constitutional, reformist measures. JFCH

**socialism, Christian.** The belief that Christ's teachings led to socialism and that the church should actively promote social reform. After the collapse of \*Owenism and \*chartism, a group of middle-class Christian socialists, disturbed by the alienation of working people from organized religion, promoted co-operative socialism among working men from 1848 to 1854, led by F. D. \*Maurice, Charles \*Kingsley, and J. M. Ludlow. The movement was revived in the 1880s mainly by high-church Anglicans influenced by Maurice's liberal theology. Its main institutions were Stewart Headlam's Guild of St Matthew (1877–1909), the Christian Social Union (1889–1919) founded by the Oxford scholars Charles Gore and Henry Scott Holland, and the Church Socialist League (1906–24) which drew upon the traditions of Yorkshire radicalism and the inspiration of Gore's monastic Community of the Resurrection at Mirfield, and whose best-known propagandist was Conrad Noel. Non-institutional Christian socialism was also found among nonconformists, especially \*congregationalists.

JFCH

**Society for Constitutional Information.** Founded in 1780 by Major \*Cartwright and other middle-class radicals to promote parliamentary reform, the SCI flourished until 1783, but thereafter made little headway, partly because its energies were diluted by efforts in support of \*anti-slavery, prison reform, and the civic emancipation of dissenters. The SCI actively promoted Paine's \**Rights of Man* and other radical publications, and under the leadership of \*Horne Tooke collaborated with other reform societies, metropolitan and provincial. After the government repression and treason trials of 1794, the SCI ceased to meet, without being formally dissolved.

JFCH

**Society for Promoting Christian Knowledge (SPCK).** Founded (1698) by Thomas Bray (1656–1730) and others to provide religious literature for those without nearby libraries. As Bishop \*Compton of London's Commissary for Maryland, Bray aimed to promote 'Religion and Learning in any part of His Majesty's Plantations abroad, and to provide Catechetical Libraries and free schools in the parishes at home'. Though it handed over to the \*Society for the Propagation of the Gospel its American and West Indian missionary work, SPCK, albeit Anglican, supervised the German-Danish Lutheran Mission in south India, which SPG took over in 1825. As the third oldest English publisher, printing and distribution of literature remains its major task, its shop in Bath being the first (1835). SPCK was the main distributor of the Bible, though the King's Printers and Oxford and Cambridge held the publishing copyright, and has been the principal Prayer Book publisher in different languages.

WMM

**Society for the Propagation of the Gospel in Foreign Parts (SPG).** Founded on the recommendation of Thomas Bray, founder of the \*Society for Promoting Christian Knowledge (1701), with Archbishop \*Tenison as its first president. Its aim was 'to settle the State of Religion as

well as may be among our own people [in the plantations] . . . and then to proceed in the best Methods towards the Conversion of the Natives'. At first it aimed at the American colonies and the plantations in the West Indies. It not only requested bishops for the colonies, for which Tenison himself bequeathed £1,000, but also purchased a house for a bishop in New Jersey. Dean \*Swift was rumoured to be the likely first bishop of Virginia. Queen Anne's death, however, prevented its realization. SPG was instrumental in making mission part of Anglican life. An SPG college was founded in Barbados (1716). WMM

**socinians** denied Christ's deity and existence before his birth as a man, holding, however, that his birth was miraculous and that he possessed divine qualities. Used, particularly in the 17th and 18th cents. as a term of abuse against any suspected of unorthodox views of the trinity, it in fact describes a stage of \*unitarianism and underlines its international development, deriving from the Italians Lelio Sozzini (Socinus) and his nephew Fausto. The former (1525–62), developing protestant views c.1546, and received by Melancthon and Calvin, was challenged in Geneva about the Trinity, but settled undisturbed in Zurich. His nephew (1539–1604), who published a denial of Christ's deity in 1562, lived in Poland from 1579, where the minor (reformed) church encapsulated his views in the Racovian catechism (1605). CB

**Sodor and Man, diocese of.** According to tradition \*Patrick converted Man c.447. There was certainly a succession of Celtic bishops, but it was probably not until the reign of \*Edward the Confessor that the present see of Sudreys (the southern isles) was founded to include the Isle of Man and the Hebrides. The title 'and Man' is probably a 17th-cent. scribe's mistake. In 1152 the see was transferred from the \*York province to the Norwegian archiepiscopal province of Trondheim. Sudreys itself was returned to York in 1542 without the Scottish islands which had been detached in 1334. Between 1425 and 1553 there were both English and Scottish successions of bishops. There are Manx-language editions of the Prayer Book (1765) and the Bible (1772). The former cathedral of St German's in the island castle at Peel, now a ruin, reputedly dates from 447. WMM

**Solemn League and Covenant.** An agreement between the Long Parliament and the Scots brought about by the failure of Parliament's war against the king. Adopted by the Scots Estates on 17 August 1643 and sworn by members of the House of Commons on 25 September, the covenant promised to reform religion in England and Ireland on \*presbyterian lines. In return, the Scots undertook to invade England with an army of 20,000. The Scots kept the bargain, which turned the tide of the Civil War against the king. But Parliament's half-heartedness in adopting presbyterianism prompted the Scots to transfer their support to the king in 1648 when he recognized the validity of the covenant as a voluntary engagement. Charles II was also required to swear the covenant when he was crowned king of Scotland in 1650. IJG

## solicitor-general

**solicitor-general.** The 'junior' of the two law officers of the crown. The precursor of this office was the 'king's solicitor' first mentioned in 1461 and the title 'solicitor-general' was first used in 1515. From 1525 onwards the office of solicitor-general was a 'stepping stone' to the office of attorney-general, whose deputy and subordinate he was. The solicitor-general was accepted without controversy as a member of the House of Commons and although, like the attorney-general, he was a law officer of the crown, he did not incur the same odium politically as he did not prosecute for criminal libel. The solicitor-general was more familiar with \*Chancery than his colleague and for that reason, on at least one occasion, in 1733, the solicitor-general was created lord chancellor, whereas the attorney-general became lord chief justice. Despite the title, the solicitor-general is a barrister. There is a separate solicitor-general for Scotland, who acts as deputy to the \*lord advocate. MM

**Solomon Islands.** The Solomon Islands are in the South Pacific, east of New Guinea, and export copra and coconuts. In 1886 Germany and Britain agreed to spheres of influence but the German sphere, including Bougainville, was later administered by Australia. During the Second World War there was extremely heavy fighting, particularly on Guadalcanal, where Japanese and Americans struggled for control of an important airfield. JAC

**Solway Moss, battle of,** 1542. When war broke out in August 1542 between Henry VIII and his nephew James V of Scotland, an English raid was defeated at Hadden Rig. James then assembled a large army for a counter-stroke towards Carlisle. But he remained at Caerlaverock, while his troops under Oliver Sinclair moved south along the Esk valley. On 24 November, at Solway Moss west of Longtown, they were surprised and routed by a much smaller English force, led by Thomas Wharton, Thomas Dacre, and John Musgrave, losing 1,200 prisoners, including many noblemen. James, already in poor health, died three weeks later. JAC

**Somerled, lord of the Isles** (d. 1164). Somerled claimed descent from Gofraid mac Fherghusa, son of the founder of the kingdom of \*Dalriada. He established his position in Argyll and Kintyre at the expense of the Norse and fought for David I at the battle of the \*Standard in 1138. About 1140 he married a daughter of Olaf, king of Man, and in the 1150s began a campaign to make himself master of Man and of the Isles. After a naval victory, he forced Gofraid of Man in 1158 to take refuge in Norway. Somerled was at peace with Malcolm IV, David's successor, in 1160, but four years later they clashed and Somerled took an expedition to Renfrew, where he was killed. The Isles were then divided between his remaining sons. JAC

**Somers, John, 1st Baron Somers** (1651–1716). Lawyer and Whig politician. Called to the bar in 1676, Somers made his name as an outstanding barrister. He was elected in 1689 to the Convention Parliament and was among the principal draftsmen of the \*Bill of Rights. After that his advancement was rapid, becoming solicitor-general (1689), attorney-general (1692), lord keeper (1693), lord chancellor

(1697), and a peer (1697). A leading \* Junto Whig, he was one of the few English politicians in whom William III closely confided, but in 1700 Tory jealousy brought about his dismissal. Though out of office during Anne's early years, he helped to promote much-needed reform in the legal system, supported the war against Louis XIV, and played an important role in the passage of the Regency Act (1706) and the \*Union with Scotland (1707). By 1708 the queen's coolness gave way to appreciation of his statesmanlike qualities and he became lord president, but went out with his fellow-Whigs in 1710. At George I's accession he was given a seat in the cabinet. AAH

**Somerset** was before 1972 one of the largest counties, 70 miles from Frome in the east to Exmoor in the west. It forms the southern hinterland of the Bristol channel and has an unusual variety of topographical features—the bare Mendips north of Wells, the marshes around Glastonbury, the wooded Quantocks west of Bridgwater, and the high Cotswolds north of Bath. Since, despite a vigorous cloth industry and substantial deposits of coal, iron, and lead, it escaped the worst ravages of industrialization, it remains one of the most beautiful of shires. The largest town, \*Bath, which was not lost to Avon until the reorganization of 1972, had then only 85,000 people and was twice the size of the next largest town, Taunton.

The northern parts of the shire drain into the rivers Avon and Frome, which form the border with Gloucestershire and Wiltshire, and the central parts into the Parrett and its tributaries the Cary, Yeo, and Tone. The border with Devon runs through Exmoor and the Blackdown hills, and in the east the shire merges with the chalk hills of Wiltshire west of Salisbury Plain. The northern parishes look towards Bristol and Bath, the south-western towards Taunton, and the south-eastern towards Yeovil.

In Caesar's time, the area was in the territory of the \*Belgae. It fell speedily to the Romans, who were exploiting the lead-mines of Mendip as early as AD 49. The \*Fosse Way, from Lincoln to Exeter, bisected the county north-east to south-west. The hot springs at Bath were almost certainly known before Roman times and the city, Aquae Sulis, grew up quickly. Ilchester, on the Fosse, was another important development. After the Roman withdrawal, the area was shielded from Saxon advance for some time by Selwood forest to the east, and the legends of \*Arthur arose from British resistance. The battle of \*Mount Badon, around AD 500, may have been at Little Solsbury Hill, near Bath, or on the Wiltshire downs to the east: a British defensive victory, it held up the Saxon advance. But in 577 a Saxon victory at \*Dyrham, east of Bristol, gave them control of the northern parts, the rest falling after their victory at Peonnan in 658 when, according to the *Anglo-Saxon Chronicle*, \*Cenwulf drove the Britons in flight to the Parrett. The region then became part of the kingdom of Wessex. \*Ine is said to have refounded the monastery at Glastonbury and to have fortified Taunton. His nephew \*Aldhelm built a church at \*Wells (c.704), which became a see in 909 when jurisdiction was transferred from \*Sherborne. By this time the region was acquiring its own identity as a shire, taking its name from

Somerton, then the county town, and adding the suffix *sæte*—‘the people of’.

Somerset suffered severely from the ravages of the Danes, who destroyed \*Glastonbury in 873 and Somerton in 877. \*Alfred’s resistance was organized from the marshes around Athelney. The submission of \*Guthrum, the Danish leader, was at Aller, near Somerton, and the treaty dividing up southern England was agreed in 878 at \*Wedmore, near Axbridge. At the Domesday survey, Bath was a city of national importance; Ilchester, Milborne Port, Taunton, Langport, Axbridge, and Bruton of local significance.

After the Norman Conquest, Glastonbury abbey, with its traditions of Joseph of Arimathea and of Arthur, became one of the wealthiest monasteries in the kingdom. Work on the new Wells cathedral started c.1184. Somerton and Ilchester were in sharp decline by Tudor times, but Taunton, Frome, and Yeovil prospered as cloth towns. Glastonbury lost its estates at the \*dissolution of the monasteries and its last abbot was hanged on the Tor. The most famous purchaser was ‘Little Jack Horner’, whose plum was the estate of Mells. The church lands seem to have been widely distributed and no overriding aristocratic interest arose, partly also because the shire was large with many market towns. Consequently it gained a reputation for independence, to which was added, in the cloth towns, a strong tradition of religious dissent. In the Civil War, the towns were largely parliamentary in sympathy. Taunton, led by Robert \*Blake, withstood a protracted siege from \*Goring’s men in 1645 and the royalist army was later routed by \*Fairfax at \*Langport. At the Restoration, Taunton was punished by the forfeiture of its charter and the demolition of the town walls. It gave a warm welcome to \*Monmouth in 1685 and paid for it after \*Sedgemoor in corpses swinging from innumerable gallows.

The 18th and 19th cents. saw great changes in the county. Bath’s greatest period of fashion came under Beau \*Nash in the 1750s. Later in the century, large parts of central Somerset were reclaimed from persistent flooding by rhynes and sea-walls: one of the most ambitious, the King’s Sedgemoor drain, straightening the course of the river Cary, was finished in 1791. The 19th cent. saw a diversification of the economy. In 1801 Bath was still the ninth largest town in England and retained its unique character. Street, which had been no more than a village, became a sizeable town after Clarks shoe factory was built there in 1825; Bridgwater, long a local port, added brick- and tile-making, and Shepton Mallett grew on the production of cider. The Brendon hills produced iron for south Wales until the last mine closed in 1911. The Somerset coalfield had a brief burst of prosperity. By 1868 there were 64 small pits at work around Radstock and production peaked just before the First World War. It declined sharply after 1945 and the last pit was abandoned in 1973. The most remarkable growth in the county was at Yeovil and at Weston-super-Mare. Yeovil had fewer than 3,000 people in 1801 but developed into a manufacturing town, specializing in aircraft. Weston’s growth was even more spectacular. In 1801 it had only 138 inhabitants, but the cult of seaside holidays and the arrival of Brunel’s railway in 1841 sent it into orbit. By 1914 the population had passed that of Taunton. Clevedon and Portishead, without

the beaches to rival Weston, retained more of their Victorian charm.

By a strange piece of legislation in 1972 the northern parishes of the shire were hived off to form the southern part of the new county of Avon. Though Avon was itself abolished in 1996, the parishes were not returned to Somerset. Proposals to abolish the shire for all but ceremonial purposes were successfully resisted, but the northern region was divided between two unitary authorities, Bath and north-east Somerset, and north Somerset (based upon Weston-super-Mare). JAC

### **Somerset, Edmund Beaufort, 1st duke of** (c.1406–55).

Entitled count of Mortain from 1427, and earl of Dorset from 1438, Beaufort was frequently employed in the defence of Lancastrian France, with the backing of his uncle, Cardinal \*Beaufort. He succeeded to the titles of his elder brother John (d. 1444), but not to his lands. To the chagrin of Richard of \*York, Somerset was appointed lieutenant-general of France in 1447; by 1450 all Normandy had been lost to the French. York accused him of treason, but he became the dominant favourite of Henry VI, created duke 1448 and captain of Calais in 1451. Being a grandson of \*John of Gaunt, Somerset may have been suspected of kingly ambitions while Henry was childless. He was prominent in the suppression of York’s rising in 1452, but was himself imprisoned for trial during York’s first protectorate. Having alienated the Nevilles by a territorial dispute with \*Warwick, Somerset gained the support of the earl of \*Northumberland; both were killed in the first battle of \*St Albans. RLS

### **Somerset, Charles Seymour, 6th duke of** (1662–1748).

Charles Seymour succeeded to the dukedom at the age of 16 when his elder brother was shot in Italy, and married the heiress to the vast Percy estates. He was gentleman of the bedchamber to Charles II and James II and given the Garter in 1684. But in 1687 he refused to make a public introduction to the papal nuncio and was dismissed by James from his post and his lord-lieutenancies. At the Glorious Revolution, he joined William of Orange, but his support for Princess Anne in her family quarrels with her sister and brother-in-law kept him out of favour. When Anne succeeded in 1702, he was appointed master of the horse. In 1708 he gave support to \*Marlbrough and \*Godolphin in their power struggle against \*Harley and lost his post in 1712 as a consequence. In 1714 his attendance at the council on Anne’s death strengthened the Hanoverian position, and he was restored to the mastership. His nickname ‘the proud duke’ testified to an arrogance of which many stories were circulated. Horace \*Walpole thought ‘his whole stupid life one series of pride and tyranny’ and \*Macaulay that his pride was ‘almost a disease’. JAC

### **Somerset, Edward Seymour, 1st duke of** (c.1500–52).

The foundation of Somerset’s career was that he was elder brother of \*Jane Seymour, Henry VIII’s third wife, and therefore uncle to Edward VI. His father had been a gentleman of good family at Wolf Hall in Wiltshire. Somerset’s early career was in \*Wolsey’s service and he was knighted in France in 1523. His progress was by no

## Somerset

means spectacular until his sister's marriage in May 1536. A week later he was made Viscount Beauchamp and the following year earl of Hertford. Great honours followed—the Garter in 1541, lord high admiral 1542–3, lieutenant-general in the north 1544–5, when he waged war against the Scots. On Henry VIII's death in 1547, with his nephew aged 9, he became protector of the realm and duke of Somerset. For 2½ years he was the effective power in the land. In August 1547 he consolidated his position with a third campaign against the Scots ending in victory at \*Pinkie Cleugh. But his relations with his younger brother Thomas, created Baron \*Seymour and made lord high admiral in 1547, were difficult. Six months after Henry's death, Thomas Seymour married his widow \*Catherine Parr and when she died in September 1548 transferred his hopes to Princess Elizabeth. He was arrested in January 1549 and executed two months later.

During 1549 Somerset's position collapsed completely. The \*prayer book issued under his auspices provoked a serious rising in Cornwall and Devon in June, and was followed in July by \*Kett's rebellion in Norfolk. The second was put down by \*Northumberland, who now emerged as Somerset's chief rival. In October Somerset was deprived of his protectorate and sent to the Tower. Though he was pardoned the following year and restored to the council, he was again sent to the Tower in October 1551 and executed in January 1552.

Somerset's character and policy have proved controversial. Kindly and amiable in the view of some Victorian commentators, one contemporary thought him 'dry, sour and opinionated', while even an ally, Sir William \*Paget, warned him that 'Your Grace is grown in great choleric fashion.' The sentimental view of Somerset as 'the good duke' overthrown by the nobility because he showed too much sympathy for the people's complaints against enclosures is not easy to reconcile with his greed for estates. A better soldier than politician, Somerset lost control of the situation, made concessions to rebellion, and convinced his noble colleagues that he was a dangerous man to have in charge. More remarkable is that he was allowed a second chance by his opponents: fallen ministers did not often emerge from the Tower. JAC

**Somerset, William Seymour, 1st duke of** (1587–1660). William Seymour was a great-grandson of Protector \*Somerset, and son of Lord Beauchamp, who died before inheriting his father's title of earl of Hertford. He had royal blood since his grandmother, Lady Catherine Grey, was a direct descendant of \*Mary Tudor, Henry VIII's sister. He succeeded his grandfather as earl in 1621. In 1610 he had gone through a private marriage to Arabella \*Stuart, cousin of James I. Both were placed in the Tower and Arabella died there in 1615. Seymour escaped to France and lived there until 1616, when he was allowed to return. He was created marquis of Hertford in 1641. Originally sympathetic to the moderate opposition, he joined Charles I at the outbreak of war, fought in the west, and was groom of the stole at Oxford in 1644. At the Restoration, he was given the Garter and reinstated in the dukedom a month before his death. JAC

**Somerset case.** In 1771 the American master of James Somerset, a negro slave, attempted to send him out of England to be sold. Abolitionists pleaded \*habeas corpus on his behalf. \*Blackstone, in his Oxford lectures, had already denied that English law recognized slavery. In a famous judgment on 22 June 1772, which he made with some reluctance, \*Mansfield declared that slavery was odious and unknown to common law. Somerset was given his freedom. Though the implications of the judgment have been much discussed, it seems clear that slavery was not recognized in England subsequently. JAC

**Somerville, Mary** (1780–1872). Mathematician and scientist. Born into genteel poverty in Scotland, Mary Fairfax married secondly her cosmopolitan medical cousin William Somerville (1812), leaving Edinburgh for London in 1816. Largely self-taught but with zest and capacity for learning, she had developed an interest in mathematics, which William encouraged, and an informal apprenticeship under the foremost philosophers led to a long and distinguished career, since scientific society was then wide open to the talented and well connected. Her mastery of French mathematics and expository skill made important contributions to the modernization of its English counterpart, while *On the Connexion of the Physical Sciences* (1834) helped define these more precisely; if not a creative scientist like \*Herschel or \*Faraday, her books brought knowledge and clarity to a broad public. Rational but compassionate, Mary Somerville was widely accepted as the leading scientific lady in Europe, honoured accordingly, and posthumously commemorated in the foundation of Somerville College, Oxford. ASH

**Somme, battle of the**, 1916. When he became commander-in-chief, \*Haig wanted to advance from Ypres to liberate the Belgian coast. However, the allies had already concerted their operations for 1916, so he agreed to take part in an Anglo-French offensive further south, astride the river Somme, where the British and French armies met. This was part of a plan by which each of the allied armies would attack simultaneously and compel the Germans to sue for peace by Christmas 1916. Haig hoped that he would break through the German defences in a single day. But despite a lengthy bombardment, when his infantry advanced on 1 July, they suffered nearly 60,000 casualties and only dented the German line. The battle continued until mid-November, by which time the British had suffered approximately 400,000 casualties and advanced a maximum of only 8 miles. DF

**Sophia, electress of Hanover** (1630–1714). Sophia was a granddaughter of James I by his daughter \*Elizabeth, who had married the elector palatine. On the death in 1700 of Anne's last surviving child, William, duke of Gloucester, Sophia was the next non-catholic heir, and was recognized in the Act of \*Settlement of 1701. She died at Herrenhausen seven weeks before Anne and her son George Lewis succeeded as George I. JAC

**Sophia Dorothea** (1666–1726). Divorced wife of George I. Sophia Dorothea married her cousin George in 1682, but in

1694 was surprised in a rendezvous with her lover Count Königsmarck. He was never seen again, and she was divorced and honourably confined at the castle of Ahlden in Celle until her death. Her infidelity allowed the Jacobites to imply that George's children might not have been his own. JAC

**South Africa, Republic of.** Former British dominion. During the French Revolutionary War, British troops seized the Dutch settlement at the \*Cape of Good Hope to protect Britain's trade route to the Far East. Handed back in 1802, the Cape was again captured in 1806 and became Cape Colony. The Dutch settlers (Boers/Afrikaners), spreading eastward, had come into conflict with Bantu-speaking peoples migrating southward along the coast. That conflict was inherited by the British colonial administrators and frontier skirmishes took place for a considerable part of the 19th cent. Many Afrikaners, too, were irked by British rule and migrated eastward and northward to found the self-governing republics of \*Transvaal and the \*Orange Free State. British policy vacillated between expansion and retrenchment, but in 1843 a British colony was declared in \*Natal to the east of the Cape. Continuing clashes with the overwhelmingly numerous Bantu-speaking peoples encouraged successive British governments to press for a confederation of colonies and republics in the hope of strengthening the position of the white population, but the proposal was strongly resisted by the Afrikaners.

Diamonds were discovered at Kimberley in 1868 and Cape Colony quickly claimed ownership of the district. When gold was found in the Transvaal in the 1880s there was no doubt about the ownership of the land but the exploitation of the vastly rich discovery depended heavily upon outside capital. This became the excuse for British intervention in the Transvaal which led to war between British and Afrikaners from 1899 to 1902. After the war the republics became British colonies and were joined with the older colonies in the Union of South Africa in 1910 under a predominantly Afrikaner government. The British government was relieved to shift responsibility for South African affairs onto other shoulders.

The majority of white South Africans supported Britain during the First World War, but with Afrikaners in the majority among the white population there was growing opposition to membership of the British empire. South Africa's participation in the Second World War was less enthusiastically received by many whites. Nevertheless, with gold as the main source of foreign exchange and with a sound agricultural and pastoral farming industry, the white population prospered. A policy of white domination had always been accepted by both British and Afrikaners, but the victory of the National Party in the 1948 elections saw the policy carried to such extremes as to arouse international condemnation, resulting in South Africa's quitting the British Commonwealth in 1961 and becoming a republic. South Africa returned to the Commonwealth in 1994 after the policy of apartheid had been abandoned. KI

**Southampton.** A seaport which gave its name to Hampshire as early as 755, though it is no longer the county town.

Saxon Hamwic was the chief port of the kingdom of Wessex; its successor, on a slightly different site, has been a major port since the 11th cent. Kings embarked there (including Henry V before Agincourt), and Venetian and Genoese ships traded there. It lost ground to London in Tudor and Stuart times, but recovered from the 1840s with new docks and the railway, and is now the leading British deep sea port on the Channel. DMP

**Southampton, Henry Wriothesley, 3rd earl of** (1573–1624). Wriothesley's father, a catholic, was imprisoned in the Tower 1571–3 under suspicion of encouraging \*Norfolk's proposed marriage to Mary, queen of Scots. Wriothesley succeeded to the earldom at the age of 7 and grew up as a follower and companion of \*Essex, whose cousin he married. He took a prominent part in Essex's rising in 1601, was sent to the Tower, and was considered very fortunate not to lose his head. At the accession of James I, who had worked closely with Essex, he shot into favour, being given the Garter at once and having the earldom restored. He did not however play a leading role in the reign and is of interest mainly as the patron of Shakespeare, who dedicated to him *Venus and Adonis* (1593) and *Lucrece* (1594). Southampton died of fever in 1624 while fighting as a volunteer in the Dutch service. JAC

**Southcott, Joanna** (1750–1814). A religious fanatic, of Devon farming stock, Joanna was in domestic service in Exeter. Originally called to \*methodism (1791), she soon had religious experiences and started 'sealing' her writings. She visited Bristol (1798), published *The Strange Effects of Faith* (1801), and moved to London (1802), where she began the practice of 'sealing the faithful' who, according to the Book of Revelation, were to be 144,000. She claimed to be 'the Lamb's wife' (Rev. 12) who would give birth to 'the second Christ' in 1814; instead she died of brain disease. Her bizarre following, surviving into the 20th cent., believed she would rise again. She left a box, directed to be opened after 100 years with 24 bishops present (cf. Rev. 4: 4). When opened (1927), with one bishop present, it contained merely a nightcap, book, lottery ticket, dicebox, and some coins. WMM

**South-East Asia Treaty Organization (SEATO).** A US-led security pact designed to contain communism in south-east Asia to North Vietnam. Britain, France, Australia, New Zealand, the Philippines, Pakistan, and Thailand were the other signatories of the founding treaty of Manila (September 1954). SEATO never developed a NATO-style integrated command structure, and the fight against communism was carried out by the USA (culminating in the Vietnam War disaster) rather than SEATO, which was officially disbanded in 1977. CNL

**Southern Rhodesia.** See RHODESIA.

**Southey, Robert** (1774–1843). Southey had a strange career, moving from extreme radicalism in the 1790s to a gloomy conservatism and fear of revolution by the 1810s. Born in Bristol, he was educated at Westminster and Balliol College, Oxford, where he met \*Coleridge and planned a liberated American settlement, Pantisocracy, on the banks of the

## South Sea bubble

Susquehanna. In 1794 he joined with Coleridge in a drama, *The Fall of Robespierre*. An annuity enabled him to settle at Greta Hall (Keswick), with Coleridge and \*Wordsworth nearby. He was made poet laureate in 1813 and from 1835 received a pension of £300 p.a. from the government. Of greatest historical interest in his vast output was the *Life of Nelson* (1813), the *History of the Peninsular War* (1823–32), his essays for the \**Quarterly Review*, and the curious *Colloquies on the Progress and Prospects of Society* (1829), which, though ridiculed by \*Macaulay, contained some uncomfortable insights into the onset of unbridled industrialism. Always highly strung, his mind gave way completely after a disastrous second marriage in 1839. JAC

**South Sea bubble.** The 1720 financial crisis resulting from the collapse of the South Sea Company. Founded by \*Harley in 1711 as a Tory alternative to the Whig financial establishment, the company in 1719 proposed (and in 1720 the ministry accepted) to take over three-fifths of the national debt (about £30 million). In return for trading privileges and accepting 5 per cent interest until 1727 and thereafter 4 per cent, the company was to pay £7 million immediately. A fever of speculation followed and its shares rose from 130 per cent to over 1,000 per cent in six months. Other companies climbed on the bandwagon, and in an effort to drive its rivals to the wall, the company spread alarm. Panic selling ensued and the market collapsed, ruining thousands of investors. \*Walpole produced a plan (which helped to secure his supremacy in the ministry) to stem the disaster by transferring a proportion of the stock to the \*Bank of England and the \*East India Company. Subsequent parliamentary investigations, prompted by a public outcry, revealed corruption on a wide scale, which implicated some ministers and George I himself. CJ

**Southwark, diocese of.** The see, founded in 1905, is roughly coterminous with Greater London south of the Thames, with east and mid-Surrey; an area originally under \*Winchester, but after 1877 under \*Rochester. Notable bishops have been Cyril Garbett (1919–32) and Mervyn Stockwood (1959–81). Under Stockwood and his successive suffragan bishops of Woolwich, John Robinson (1959–69) and David Shepherd (1969–75), the diocese was regarded as avant-garde in many ecclesiastical fields, pastoral ministry, liturgical worship, and popularization of radical theology. Many claimed that 'South Bank religion' led the way in modernizing the Church of England. The cathedral is the former Augustinian priory church of St Mary Overie, founded in 1106 and the parish church after the dissolution. It is predominantly Early English in style with 19th-cent. renovation. WMM

**Southwell, diocese of.** This see, now roughly coterminous with Nottinghamshire, was created in 1884, following rapid population growth in the 19th cent. Initially it had combined Nottinghamshire, from the \*Lincoln diocese, and Derbyshire, from \*Lichfield, but, as the two counties proved incompatible, the new \*Derby diocese was created in 1927. In 1935 Southwell moved from the Canterbury province to York. It was a return home, for Nottinghamshire had

been in the York diocese before its move to Lincoln in 1837. Southwell with its medieval minster, one of three (with Ripon and Beverley) in the old York diocese, and its ancient ecclesiastical associations became the see instead of Nottingham, the industrial centre. The cathedral is the former minster church, founded in 1108, dissolved in 1540, but restored in 1558. It has a fine Norman nave and transepts with a 13th-cent. choir and chapter house, where the stonework with its distinctive Southwell foliage is unique.

WMM

**Southwold or Sole Bay, battle of,** 1672. Naval engagement off the Suffolk coast in the third \*Anglo-Dutch War on 7 June 1672 between de Ruyter with 91 ships and a slightly larger Anglo-French force, under the command of James, duke of York. Most of the fighting was between the Dutch and the English. De Ruyter lost more ships but the English fleet was badly damaged and Lord \*Sandwich, admiral of the Blue, drowned. JAC

**South Yorkshire.** See YORKSHIRE, SOUTH.

**Spa Fields riot,** 1816. One of a number of popular incidents provoked by hunger and revolutionary feeling in the wake of the French wars. A great meeting in north London on 15 November addressed by Henry 'Orator' \*Hunt turned into a drunken quasi-insurrection when a part of the crowd marched threateningly into the city after arming itself with weapons stolen from a gunsmith's shop. Its leaders were later tried for high treason, but acquitted when the main witness against them, the spy Castles, was revealed as a bigamist, brothel-minder, and agent provocateur. BJP

**Spain, relations with.** Recurrent quarrels with France ensured that the English were normally aligned with Spain in the early Tudor period. This changed under Elizabeth I for reasons of religion, the queen of Scots' claim to the English throne, growing English interest in the success of the Dutch revolt against Spain, and the struggle for trade in the New World. An outright confrontation from 1585 led to its first great climax, the defeat of the Spanish \*Armada, in 1588. Spanish efforts to injure England continued for some time, and the English were slow to recognize the decline of Spain in relation to the rise of France and the Dutch. Good sense finally prevailed with Charles II's commercial treaty of 1667. Spain was again frequently numbered among England's enemies in the next century, partly as an ally of France, partly for reasons of empire and trade, and also because of the British possession of \*Gibraltar seized during the War of the Spanish Succession. \*Wellington, however, found many invaluable allies during the \*Peninsular War against Napoleon (1808–14). In the 1830s, Britain and France successfully backed professedly liberal monarchists against the absolutist Carlists and the \*Holy Alliance. Yet Britain and France were as much rivals as allies, with the former suffering defeat over the Spanish marriages in 1846. Neither power, however, secured lasting advantage given Spain's recurrent political instability. This reached its climax in the devastating Civil War of 1936–9 when the British government—anxious to localize the conflict—opted for non-intervention to the

great dismay of those who saw this conflict primarily in terms of the struggle against fascism in Europe. CJB

**Spanish blanks conspiracy**, 1593. A number of Scottish noblemen were in negotiation with Philip II of Spain to restore catholicism in Scotland. In 1593 a messenger was apprehended bearing blank letters with signatures. Under torture, he implicated \*Huntly, Erroll, and Angus, but the mysterious affair was eventually compromised. JAC

**Spanish Succession, War of the**, 1702–13. Britain's involvement in a new war with France so soon after the conclusion of the \*Nine Years War in 1697 arose from William III's anxiety to prevent Louis XIV incorporating the Spanish kingdom and its possessions in the Netherlands and Italy into a French 'universal monarchy'. When the imbecile Carlos II of Spain died childless in November 1700 Louis disregarded his own agreement with William III in the \*Partition treaty of 1699, whereby the Spanish possessions were to be divided between Bourbon and Austrian Habsburg claimants, preferring Carlos's will which bequeathed everything to Louis's grandson, Philip of Anjou. British politicians and public opinion were cautious about renewing war with the French, but there was little option when in 1701 Louis provocatively declared Philip king of Spain, invaded the Spanish Netherlands, and recognized James II's son as 'King James III'. At The Hague in September William III brought Britain, the United Provinces, and Austria together in a Grand Alliance which was later joined by Prussia, Hanover, and other German states.

Under \*Marlborough's command Anglo-Dutch forces concentrated on driving back the French from their advanced positions in the Spanish Netherlands. The duke's superlative generalship relied upon rapid manoeuvre in the field, where infantry musket-fire could be deployed with devastating effect, in contrast to the slow-paced siege warfare that had dragged out William III's campaigns in the 1690s. His close accord with Lord Treasurer \*Godolphin ensured that the British war effort remained well resourced. By 1706 the British nation was shouldering an army budget of £2.75 million, half of which was spent on the war in Flanders. From 1704 the allies won a series of spectacular victories over the French. In that year, as the Franco-Bavarian forces were coming close to winning the war in Germany, Marlborough swiftly marched his 40,000-strong Flanders army up the Rhine and into Bavaria where, joining the imperial regiments under Prince Eugene, he defeated the French and their allies at \*Blenheim on 14 August, thereby enfeebling French action in Germany for the rest of the war. Marlborough pressed on in Flanders and following his victory at \*Ramillies in May 1706 reconquered most of the southern Netherlands. In August 1708 he repulsed a major French counter-attack at \*Oudenarde.

In Spain, Britain's war to replace Louis XIV's grandson Philip V with the allied candidate, the Archduke Charles of Austria, was less successful. Portugal joined the coalition in 1703 and committed British ministers to a policy of 'no peace without Spain'. But while important strategic benefits were obtained, such as the capture of \*Gibraltar (1704) and \*Minorca (1708), facilitating naval control of the western

Mediterranean, advances on the Spanish mainland were short-lived and provoked much dissatisfaction in Parliament. In 1709 the carnage and near-defeat for Marlborough at \*Malplaquet demonstrated that the war on France's northern frontier had reached stalemate, while in Spain in December 1710 the allied army under General \*Stanhope was pushed into retreat and humiliatingly beaten at \*Brihuega.

In Britain the Tories, long convinced that Whig ministers were deliberately prolonging the war in the interests of wealthy city financiers, had come to power in 1710 determined to end the enormous cost and stabilize the soaring national debt. Though Marlborough continued to extend his hold over the French north-eastern border, the government denied him resources to finish the war, and in December 1711 he was removed from his command. As British troops were withdrawn from the Netherlands, the Dutch and Austrians found themselves exposed to defeat. Meanwhile, Archduke Charles's succession in April 1711 as emperor rendered the war for him in Spain unfeasible, as no one was prepared to countenance a massive Austro-Spanish monarchy. Peace negotiations commenced in January 1712, and in March 1713 the treaty of \*Utrecht was signed between the allies and France. AAH

**spas** were places with springs or wells containing salts which were claimed to improve the physical, mental, and spiritual health of people drinking or bathing in the waters. The term became current during the 17th cent. to describe towns which emulated Spa in the Ardennes in Belgium which had just risen to fame. Several British towns owed their prosperity to the benefits of health-giving waters long before the 17th cent., for example, \*Bath, whose hot springs were used in the Roman town of Aquae Sulis and which regained fame in the Middle Ages, and \*Walsingham in Norfolk, a centre of \*pilgrimage in the later Middle Ages.

Fashionable visitors, including royalty, gave prestige to Bath and Tunbridge Wells in the 17th cent. but these and other towns grew in prominence later. They had lodging-houses to let to wealthy patrons in the season with space for their servants to sustain comfortable living. In the early 19th cent. Cheltenham offered the first purpose-built luxury hotel. 'Taking the Waters' did not occupy all the time and energies of visitors. Elaborate provisions were made: theatres, ballrooms, libraries, specialized shops and services, excursions to places of interest, and religious devotions. Elegant buildings, residential, religious, and public, were set in well-maintained, lit, and policed streets. Success attracted imitators for the growing health and leisure business. A late entrant was Buxton in Derbyshire which remained popular throughout the 19th cent. Failed projects included Glastonbury in Somerset during the 18th cent. and Ashby de la Zouch in Leicestershire in the 19th cent. Most British spas declined in popularity during the 19th cent. because of competition from foreign resorts which catered for a much more diverse clientele. IJEK

**Speaker**. The office of Speaker originated as a spokesman for the House of Commons in its dealings with the crown in the course of the 14th cent. The first formal acknowledgement of the Speaker as 'prolocutor' was to Sir Peter de la

Mare, knight of the shire for Herefordshire, in 1376 at the end of the reign of Edward III. He was followed in 1377 by Sir Thomas Hungerford, previously regarded as the first Speaker. The office was at first highly political. Sir Peter launched an attack on the king's advisers, clashed with \*John of Gaunt, and as soon as Parliament was dissolved, was put in prison: Hungerford, chosen by the next Parliament, was John of Gaunt's steward. Clearly the royal government had decided it must command the office. The struggle for control continued for centuries and even after the crown's influence had been reduced, the election of Speaker often remained a trial of party strength. The post of Speaker was therefore one of considerable risk, physical and political, and the protestations of reluctance to serve, now a pleasant ritual, were once genuine. Though there is no evidence that de la Mare acted as a chairman of debate, such a function was a logical development from the role of spokesman, especially as legislation increased in volume. John Hooker's *Order and Usage how to Keep a Parliament* (1571) notes the Speaker's duty to 'direct and guide that House in good order', but he had probably been doing that since the 15th cent.

In the fierce disputes between the king and Parliament in the early 17th cent., the Speakers were in an extremely difficult position. Speaker Finch reminded the Commons in 1629 that 'I am not less the king's servant for being yours': nevertheless, he was held down in the chair when he tried to carry out the king's instructions to adjourn. But in 1642, with the wind blowing the other way, Speaker Lenthall defied Charles I demanding the arrest of the \*five members, and declared, 'I have neither eyes to see, nor tongue to speak in this place, but as the House is pleased to direct me.' By the end of the century, the Speaker was relatively free from royal pressure, though elections continued to be made on a party basis. In 1841, however, \*Peel urged the Conservative majority not to oppose the re-election of the Liberal Speaker on the grounds that it should not be a party matter. The first Labour Speaker, Dr Horace King, was elected in 1965, the first woman Speaker, Betty \*Boothroyd, in 1992.

In the last 100 years or so changes in parliamentary procedure have laid new duties on the Speaker. They began with devices to overcome Irish parliamentary obstruction in the 1880s. But governments are always short of time, with more legislation than the House can consider in a session. Hence the imperative to limit debate. The two most important devices involving the Speaker are the closure, and the selection of amendments (the kangaroo). The Speaker must see that the right of the majority (normally the government) to pass legislation is balanced by respect for the rights of the opposition and the other minorities. The closure is a motion 'that the question be now put'. With a government bill, this will be moved by a whip. The Speaker must decide whether or not to accept the motion: if carried, as is likely, debate ceases forthwith. The opposition may feel that the matter has not been adequately discussed and the Speaker has to balance their view against that of the government.

A bill may attract a lot of amendments and, indeed, one way of delaying the passage of a bill is to propose many

changes. The Speaker has the power of selecting amendments for debate: those not called fall by the wayside. Moreover, the chair seeks to focus debate by grouping amendments according to subject-matter. The decision whether or not to call an amendment may have important political consequences: for instance, to call an amendment tabled by a rebel faction on the government side may expose the government to defeat, at the least to unfavourable publicity.

The impact of the Speaker is even greater when the House is dealing with private members' bills. Rejection of a closure motion is inconvenient for the government but further time for debate can be found (though at a cost). With a backbench bill, failure to enforce the closure in the second reading debate may be fatal: the private member is allowed no second chance.

The modern Speaker has to be an impartial chairman. The office needs tact, sensitivity, and skills of an unusual order. The responsibility for calling members to speak (and even more for not calling) may become contentious; the use of unparliamentary language may have to be checked; members may need protection against unfair interruptions. The Speaker has to reconcile the almost inarticulate assumptions of parliamentary government with the needs of a mass democracy.

The Speaker has a ministerial scale salary, a pension, a suite in the palace of Westminster, and a peerage on retirement. In precedence, the Speaker comes after the royal family, archbishops, lord chancellor, prime minister, and lord president of the council. In the House of Lords, the lord chancellor acts as Speaker, but may speak and vote in debate.

JAC; HB

**Spectator.** The most famous periodical of Anne's reign appeared daily between March 1711 and December 1712, and was briefly revived in 1714. It was reprinted regularly throughout the 18th cent. Professing to be 'above party', the *Spectator's* essays on social, moral, literary, or philosophical themes, mostly written by \*Addison and \*Steele, subtly promoted Whig values, \*Macaulay's portrait of a Tory being clearly influenced by the character of Sir Roger de Coverley.

JAD

**Speenhamland poor relief system.** Growth of population and acute distress during the Revolutionary and Napoleonic wars placed great strain upon the poor law system. In 1795 the price of bread, the labourer's staple diet, reached record levels. On 6 May 1795 the Speenhamland justices, meeting at the Pelican Inn (Berks.), resolved to give outdoor relief to families on a sliding scale in proportion to the cost of a loaf. The system was widely adopted but increasingly criticized as ruinously expensive, an invitation to farmers to pay low wages leaving the poor rate to make up the difference, and an encouragement to farm labourers to breed without restraint in order to get extra assistance. The \*Poor Law Amendment Act of 1834 accordingly moved against the system in favour of indoor relief in workhouses.

JAC

**Speke, John Hanning** (1827–64). British soldier and explorer. Speke became famous as the result of two explora-

tory journeys in eastern Africa. In the course of the first, led by another Briton, Richard \*Burton, which reached Lake Tanganyika in 1858, Speke conceived the idea that Lake Victoria was the source of the White Nile. Burton and others rejected the claim and Speke led another expedition (1860–3) which confirmed his earlier opinion, but because he was unable to circumnavigate Lake Victoria or to follow the Nile along the whole of its course to the sea, his claim was again challenged. Later explorers proved him to have been right. Speke died in a shooting accident. KI

**Spence, Sir Basil Urwin** (1907–76). Scottish architect who leapt to prominence with his prize-winning design for Coventry cathedral (1951; completed 1962) which brought together such artists as Geoffrey Clarke, Jacob Epstein, Elisabeth Frink, John Hutton, John Piper, Patrick Reyntiens, and Graham \*Sutherland. Spence trained at Edinburgh College of Art, worked for \*Lutyens on the Viceroy's House, New Delhi, in 1929–30, and practised in Edinburgh during the 1930s. Spence designed the Sea and Ships Pavilion at the Festival of Britain in 1951, and with partners undertook extensive university work at Cambridge, Edinburgh, Newcastle, Southampton, Sussex, and elsewhere. His other buildings include churches, housing, schools, and the chancery at the British embassy, Rome (1971). Spence was a gifted designer and draughtsman, with a powerful belief in the creative role of the architect, and his architecture was often picturesque—as at Mortonhall crematorium, Edinburgh (1967), set in a rolling landscape and calling to mind Gunnar Asplund's Woodland Crematorium, Stockholm. Like Lutyens before him, Spence was knighted and held the Order of Merit. PW

**Spence, Thomas** (1750–1814). Artisan radical reformer and bookseller from Newcastle whose 'Plan' (first announced in 1775 and subsequently elaborated in later publications) argued that all land should be publicly owned. Spence believed that all injustice, inequality, and exploitation stemmed from the private ownership of land. He therefore proposed that the land and all wealth from it should be held communally by the inhabitants of each parish. Local hostility and personal misfortune in 1787 caused him to move to London, and from 1792 he was an active member of the London \*Corresponding Society. His numerous radical pamphlets and token coins attracted government attention, and he was arrested and imprisoned in 1792, 1794, 1798, and 1801. Spence originally hoped to effect his plan by education, and indeed advocated language reform. But after his prison experience, he conceded the probable need for physical force, though he was not implicated in the insurrectionary activities of some of his followers. JFCH

**Spencer, Herbert** (1820–1903). Philosopher. Spencer was the son of a Derbyshire schoolteacher of radical and dissenting views. In the 1840s he joined Sturge's Complete Suffrage Union and in 1848 became subeditor of *The Economist*. His *Social Statics*, published in 1851, allowed the state only the minimum of defence and police functions: the struggles of individuals would, Spencer argued, strengthen the nation in an evolutionary fashion. Despite considerable nervous af-

fliction, he published *Education* in 1861, advocating a child-centred approach and emphasizing the importance of science. He next moved into sociology and had publishing success. But his main thesis—the need to limit the intervention of the state—was at variance with the spirit of the times. The miscellany of his thought gave him influence, but he was not a trained thinker or a wide reader, and his fame faded fast. His *Autobiography* appeared in 1904 and renewed anxiety about the state led to some revival of interest in the 1980s. JAC

**Spencer, John Poyntz, 5th Earl** (1835–1910). A prominent Whig/Liberal politician. He was lord-lieutenant of Ireland in 1868–74 and again in 1882–5, years when the Irish question was of central importance, as social and religious protest led to political nationalism. Spencer fully supported the Liberal Irish reforms of 1868–74, though not playing a great part in promoting them. In 1882–5 he played a more direct role, combining coercion with political concession. Spencer strongly supported \*Irish Home Rule in 1885–6—the most prominent Whig aristocrat to do so enthusiastically. In 1892–5 he was 1st lord of the Admiralty, in 1894 promoting naval expansion against the wishes of Gladstone (even so, Gladstone thought Spencer should succeed him as prime minister). He led the Liberals in the Lords in 1902–5, but illness spoilt his chances of the premiership in 1905. His library (sold to cover losses from the agricultural depression) forms the basis of the John Rylands library (Manchester). Spencer was known as the Red Earl from the colour of his beard (not his politics); he was a great-great uncle of Diana, princess of Wales. HCGM

**Spenser, Edmund** (1552–99). Elizabethan poet, mythographer, and colonial administrator. Educated at Merchant Taylors' School and Cambridge, Spenser briefly belonged to the household of the earl of \*Leicester, and his political affiliations remained those of the Sidney/Leicester circle. His pastoral, *The Shepheardes Calender*, effectively marks the beginning of the Elizabethan 'golden age' of poetry; his masterpiece, *The Faerie Queene* (Books 1–3, 1590)—a vast, consciously archaic chivalric allegory—is the finest example both of the 'cult of Elizabeth' and of the project for a 'reformation' in English poetics. He published the sonnet sequence *Amoretti* (culminating in 'Epithalamion') and *Colin Clouts Come Home Agayne* in 1595, and a year later *Fowre Hymnes and Prothalamion*. His last published work, *A View of the Present State of Ireland*, advocated harsh colonial measures. His estate at Kilcolman was, perhaps fittingly, destroyed during the \*Tyrone uprising, and he fled to England in 1598 where he died a year later. GAM

**Spion Kop, battle of**, 1900. A battle of the second \*Boer War (1899–1902), famous at the time for its slaughter. The battle arose from repeated British attempts to relieve the siege of \*Ladysmith. The highest point of the Tugela Heights, Spion Kop ('Lookout Mountain'), is 1,470 feet high, and was defended by a Boer force of about 7,000 under Louis Botha. Lieutenant-General Sir Charles Warren ordered a night attack by 1,700 troops under Major-General E. R. P. Woodgate to capture the heights and dig in. As the

## Spithead naval mutiny

fog lifted after dawn on 24 January the British found themselves in a position completely exposed to enemy fire. Amid much confusion some reinforcements were sent, until eventually 2,500 men held the position. After dark the British retreated, having lost about 250 dead including Woodgate, and 1,000 wounded. Boer casualties were about 300. SDB

**Spithead naval mutiny, 1797.** While this mutiny lasted a calendar month, 16 April to 14 May, its roots had a century's growth. The Channel fleet was immobilized, with men withholding further service until grievances over pay, provisions, and leave had been redressed. Their case was firmly yet reasonably put by 33 'delegates', and the mutiny might have been terminated as early as 23 April had the royal pardon, which reached Portsmouth that day, been accompanied by evidence that Parliament had also voted the appropriate financial supply. Not until 10 May could the seamen be satisfied on this score, but Earl \*Howe's prestige and conciliatoriness, buttressed by a fresh pardon, was decisive in bringing what had in effect been a strike to an end. DDA

**'splendid isolation'.** For most of the 19th cent. Britain was diplomatically isolated, in the sense of having what \*Palmerston called 'no eternal allies' to whom she owed favours, except in circumstances where her own interests were affected. The obverse of this, of course, was that no other country owed favours to her. That served tolerably well while she and her European neighbours followed different paths in the world; but growing colonial rivalry between them at the end of the century changed all that. This was the context of Canadian premier Sir Wilfrid Laurier's description of Britain's situation in February 1896 as one of 'splendid' isolation, arising, he claimed, 'from her superiority'. Others at that time were beginning to doubt this. Joseph \*Chamberlain in particular feared for the future of the \*British empire if it could not find an ally in Europe, and negotiated with Germany behind his prime minister's back. That came to nothing; but early in the new century Britain did abandon isolation, at least partially, through a treaty with \*Japan (1902), \*'ententes' with France (1904) and \*Russia (1907), and then, of course, involvement in the First World War. BJP

**sport, development of.** Organized competitive sport with codified rules, governing bodies, league or knock-out competitions, and restrictions on space and time is a product of the Victorian era. The classic case of the remaking of a traditional collective test of strength and ingenuity into a recognizable modern sport is that of \*football. In the form inherited by the early Victorians, football was usually a calendar custom, often associated with Shrove Tuesday or Easter, played between neighbouring villages or parts of towns, with no restrictions on number of players, few on duration of game, and custom rather than codified rules dictating what was permissible. Rules were imposed through the playing of football of various kinds at the public schools, from which it was disseminated as part of an evangelical culture of muscular Christianity in a drive to reform the urban working class. \*Rugby and association football

emerged from this background as most of the traditional football games were suppressed or atrophied, though a few survived, as at Ashbourne or Workington. But as football became a popular sport it developed a momentum of its own, and dominant clubs evolved, especially at first in northern industrial towns, attracting paying spectators, crystallizing local loyalties and identities, and (paradoxically) leading managements increasingly drawn from local business rather than the churches into employing professionals drawn from elsewhere. In football, by the 1880s, they came especially from Scotland, and in rugby a little later from Wales. Association football came to terms with professionalism, while it was the rock on which rugby split, with the emergence of the Northern Union in 1895, allowing payment for absence from work, opening the way to the full professionalism of what became known as rugby league. The formation of the Football League in 1888 set the seal on the new world of association football as a spectator sport, with routine five-figure attendances, and football soon became a great British cultural export. Football had been reclaimed by the industrial working class in its revised form, without the trappings of muscular Christianity, and as a focus for the communal loyalties of the manufacturing towns, although a stratified system of lesser clubs and leagues was emerging by the turn of the century, with emphasis on participation as well as spectatorship. Restrictions on dividends ensured that even when football clubs were run as businesses their main role was to maximize enjoyment and interest rather than profits.

This remaking of sport took on different guises for different games. \*Cricket had been codified earlier, though rule changes continued, and a distinctive Saturday-afternoon form emerged in the late 19th cent. to suit the needs of industrial populations, although Sheffield working men were capable of taking days off in mid-week to watch Yorkshire. Prize-fighting gave way to \*boxing on a similar principle to the transformation of football, though on a one-to-one level and with a wider gulf between amateur and professional. New games were invented in mid-Victorian times, with \*lawn tennis (originally sphairistike) and \*croquet designed to facilitate the polite mingling of the sexes in expansive suburban garden settings, the milieu for Betjeman's Miss Joan Hunter Dunn. \*Rowing and \*athletics saw particularly bitter conflicts between amateur and professional ethics, exacerbated by the amateurs' fear of professionals' competitive advantages arising from their work, especially as watermen on the Thames. Cricket resolved the amateur/professional problem partly through the division of labour, with bowling the duty of professionals and batting the prerogative of amateurs, though the distinction was never complete. Certain kinds of blood sports were driven underground by early Victorian legislation against cruelty to animals, although \*fox-hunting never went the way of \*cock-fighting or bull-baiting, and the proletarian enjoyment of coarse \*fishing survived and prospered alongside the artificially exclusive world of fly-fishing. This raises the question of what constitutes a sport, and activities such as \*billiards or \*darts posed problems for the Victorians in this regard, as, in a more intellectual dimension, did \*chess. Problems of social context, and of the physical versus the

cerebral, raised their heads here. The role of women in sport was also problematic, as ideas about proper ladylike behaviour and the proper form of the female body conflicted with developing cults of health and energy at the turn of the century. The morality of sport was also difficult in relation to gambling, especially but not exclusively in the context of \*horse-racing, which became a commercialized spectator sport in the later 19th cent. while continuing to be regulated, at least nominally, by the aristocratic Jockey Club. So the development of sport was raising large issues at the turn of the century in forms which were to prove enduring as the commercialization of sport proceeded in the 20th cent., and as big business interests penetrated sport to an increasing extent. The tensions between the Olympic ideal, sport for its own sake, and participation in a spirit of fairness being the dominant motive on the one hand, and professionalism, spectatorship, and the acceptance of gambling on the other, have roots which can be traced back over a century or more to the formative years of sport as we know it. JKW

**Spottiswood, John** (1565–1639). Archbishop. Spottiswood was born in 1565, and, though originally a strict \*presbyterian, his Erastianism led him to embrace James VI and I's policy of appointing bishops to oversee the Scottish church. He was appointed archbishop of Glasgow in 1603, and, after the General Assembly in 1610 effectively abolished presbytery by agreeing that ordination and discipline should be the prerogative of the bishops, he obtained episcopal consecration in England. In 1615 he was translated to St Andrews, which at that date included Edinburgh. Under Charles I, Spottiswood did his best to temper the king's zeal and the heavy-handedness of Archbishop \*Laud, and was present in St Giles in 1637 when riot ensued over attempts to impose a new liturgy. He left Scotland in 1638, and died in 1639. JRG

**Spurs, battle of the**, 1513. In 1513 Henry VIII began his second campaign against France, in alliance with the emperor, and laid siege to the town of Théroutanne. On 16 August a French cavalry force, attempting to relieve the town, fled in disarray, leaving many prisoners. Théroutanne surrendered the following week. Magnified as the battle of the Spurs, the skirmish testified to the military prowess of the young king. JAC

**squash rackets** derived from rackets and originated at Harrow. An Association was formed in 1928 and by 1939 more than 200 clubs were affiliated. The International Federation was set up in 1967. The sport was given a considerable boost by the Royal Air Force, which built courts at almost all stations, and it became fashionable in the 1980s as fierce and competitive exercise for young business executives. JAC

**squire** is a term which has come down in the world. Originally it applied to a young man attendant on a knight, bearing his shield, and, by the late 14th cent., entitled to his own coat of arms. \*Chaucer's Squire, a dapper young man, served his father. By Tudor times, the terminology was changing. William Harrison (1577) referred to 'esquire, which we commonly call squire'. In the 17th cent. it developed into a general term for the lord of the manor,

well below the level of nobility, but far above yeomen. \*Addison offered an idealized version in the *Spectator* (1711/12) in the form of Sir Roger de Coverley, worshipped by his servants and tenants: in the *Freeholder* (1715–16) he drew the antithesis in Squire Foxhunter, an ignorant boor, cursing the Hanoverians and complaining that there had been no good weather since the days of Charles II. \*Fielding's Squire Western in *Tom Jones* (1749) offered support for \*Macaulay's much-criticized portrait of the squirearchy as drunken clowns. The term 'esquire', like that of 'gentleman', was gradually applied to any man as a suffix, and its final degradation was as a 20th-cent. term of pert familiarity. See GENTRY. JAC

**Sri Lanka** or Ceylon was settled during the 6th cent. BC by peoples from the Indian subcontinent, who subsequently converted to Buddhism. Hindu Tamils conquered the island in the 11th cent. AD but were eventually driven back to a northern enclave. The powerful Kandyan kingdom arose in the central region and was first encountered by the Portuguese in 1505. They established a hold over the south-west coast until moved on by the Dutch in the 17th cent. The Dutch took over virtually the entire seaboard and developed a lucrative spice trade which became the envy of the British in India. In 1795 the \*East India Company invaded but mismanaged their rule. When Ceylon was finally ratified in British possession at the treaty of Amiens (1802), it was made a crown colony. The British displaced the kings of Kandy in 1818 and developed Ceylon as a plantation economy. The emergence of an important Sinhala and Tamil middle class permitted advanced constitutional experiment. A legislative council was established as early as 1912 and a universal franchise adopted in 1931. Ceylon was granted independence within the Commonwealth in February 1948 and, in 1972, adopted a republican constitution under the ancient name of Sri Lanka. DAW

**Stafford, John** (d. 1452). Archbishop of Canterbury. The illegitimate son of Sir Humphrey Stafford of Southwick (Wilts.), Stafford was an Oxford doctor of civil law by 1413. Like John \*Kemp, he entered Henry V's service after a short career in the court of Canterbury and was his last keeper of the privy seal. While treasurer of England (1422–6), he became bishop of Bath and Wells in 1424 and was advanced to the archbishopric in 1443. As a protégé of Cardinal \*Beaufort, he was appointed chancellor in 1432. He held the office for eighteen years, latterly as one of the small coterie of councillors headed by the duke of Suffolk (William de la \*Pole); he resigned when Suffolk was banished. It is likely that he was rarely seen in his Kentish diocese, where the rebels in 1450 called him 'the devil's shepherd'. RLS

**Stafford, William Howard, 1st Viscount** (1612–80). Howard was a younger son of the earl of \*Arundel and was brought up as a catholic. After marrying the sister and heiress of the 5th Baron Stafford in 1637, he was created Baron Stafford in 1640 by Charles I, and almost immediately advanced to the viscountcy. But he did little to help the royalists during the Civil War, which he spent mainly in Holland in some poverty. In 1678 he was accused by Titus

## Staffordshire

\*Oates of complicity in the \*Popish plot, kept in the Tower until 1680, tried in Westminster Hall, and executed. James II created his son earl of Stafford in 1688. \*Evelyn, who attended Stafford's trial, commented that he was 'not a man beloved, especially of his own family', but added, sensibly, 'I can hardly think a person of his age and experience should engage men, whom he never saw before,' and his guilt seems very doubtful. JAC

**Staffordshire** is one of the counties most affected by the industrial revolution. The county town has never dominated the shire. In pre-Conquest days, it was overshadowed by Tamworth and Lichfield, in modern times by the Black Country towns and the Potteries.

The core of the county is the river Trent, rising north of Stoke, then flowing through Stone and Rugeley to leave the shire at Burton. The Dove, joining the Trent north of Burton, forms the boundary with Derbyshire. Stafford itself is on the river Sow, which joins the Trent south-east of the town. The border with Cheshire runs along the river Dane, a tributary of the Weaver, and the north-west border with Shropshire follows the Tern. The northern parts of the shire are hilly, running up to the Peak District. Cannock Chase, south-east of Stafford, was for centuries almost impassable, and the Staffordshire rivers were not navigable until the 18th cent. Even as late as the 19th cent., Arnold \*Bennett could describe his county as 'lost in the midst of England'.

In Roman times, the region was part of the territory of the \*Cornovii. \*Watling Street crossed the southern part of the county, intersecting with the \*Icknield Way near Lichfield. It subsequently became the heartland of the kingdom of \*Mercia. Tamworth, on the river Tame, was the royal city of the Mercian kings and Lichfield the ecclesiastical capital. St \*Chad establishing the bishopric there in 669. Stafford, first appearing as Staeford—the ford by the landing-place—may have been where St Bertelin founded a hermitage, though its position as county town was presumably because it was more central than the others. In the later 8th and 9th cents. the power of Mercia declined, first defeated by Wessex, then overrun in the 870s by the Danes. Since, by the treaty of \*Wedmore of 878, the Danes took the lands east and north of Watling Street, most of Staffordshire was in their hands, though Danish settlement was less intense than in the shires to the east. Under \*Edward the Elder, the Mercians counter-attacked. \*Æthelfleda, the lady of the Mercians, recovered Tamworth and Stafford in 913 and fortified them: she died in 922 at Tamworth. The outlines of the shire were now appearing and it is mentioned in the *Anglo-Saxon Chronicle* for 1016 by name.

Throughout the Middle Ages, Staffordshire remained remote and inaccessible. Poor communications and the relative insignificance of the county town meant that many market towns achieved a genuinely independent existence—Leek, Stone, Walsall, Wolverhampton, Newcastle under Lyme, Rugely, and Uttoxeter. In the assessment for \*ship money in 1635, Stafford paid only £20, Walsall £25, and Lichfield £100. Industry was vigorous, but mainly local. Celia Fiennes, on her tour by horseback in the 1690s, noted

near Beaudesert 'the coal pits where they were digging, they drew up the coal in baskets with a little wheel, or windlass, like a well'. \*Defoe in the 1720s was greatly impressed by the horse fairs at Penkridge, but a little disappointed in Stafford—'we thought to have found something more worth going so much out of the way'. \*Dickens, in the next century, was even more disparaging, describing Stafford as 'dull and dead'.

The transformation of Staffordshire's economy came in the 18th cent., with the development of potting, brewing, engineering, and mining, all greatly assisted by the new canals. The outlines of the canal network were apparent in the 1770s, when \*Brindley opened the Staffordshire and Worcester to link up with the Severn; the Trent and Mersey, through Burton, Rugely, Stone, and the Potteries, brought access to the north-west; the Birmingham canal to the midlands and south; the Caldon canal, opened in 1777, linked Etruria to Froghall, with a branch to Leek. The work of the canals in bringing the county into a national orbit was completed by the railways. The Grand Junction, opened in 1837, linked Warrington and Birmingham via Stafford; the Birmingham and Derby, via Tamworth and Burton, opened 1839; the Trent valley line, via Stone, opened in 1849. The effect upon the county was dramatic. The deposits of iron and coal in south Staffordshire began to be exploited on a national scale: Matthew \*Boulton started his Soho works at Handsworth in 1762 and was joined in partnership by James \*Watt. In the north of the county, Josiah \*Wedgwood opened his Ivy House works at Burslem in 1759, setting up as a master potter, and ten years later built the great Etruria works. Burton on Trent, favoured by such good water that brewers for miles around carried it in carts, was exporting to the Baltic by the mid-18th cent.: William Worthington set up in business in 1744, William Bass in 1777. The first census of 1801 registered the changing situation. The population of Stafford with 3,900 was already surpassed by Stone, Lichfield, Leek, Wolverhampton, Newcastle, Rowley Regis, and West Bromwich above the 5,000 mark, Burslem 6,500, Walsall 10,000, and Stoke, a comparative newcomer, at 16,000. In the course of the 19th cent. the southern parts of the shire were swallowed up in Birmingham, and the six pottery towns came together, after difficult negotiations, in 1910 to form the unique federated borough of Stoke-on-Trent. By the local government reorganization of 1972, Staffordshire lost Walsall and Wolverhampton to the new West Midlands authority. In the 1990s Staffordshire retained its county status, with Stoke-on-Trent as a unitary authority. JAC

**stage-coaches** were road vehicles offering public scheduled stage carriage of passengers. London had its hackneys by the mid-1620s, the first stage-coach—to St Albans—was recorded in 1637, and services developed on the radial routes to the capital 1650–1715. Small (four-seat) and expensive, they offered carriage at speed and cost two to three times that by stage wagon. By the late 1750s, the London-based network was largely complete, and services differentiated between 'flying' and 'old' or 'slow' coaches, and in the last quarter of the century suburban short stages developed. Regular services between leading provincial centres developed

only from the 1770s, apart from \*Bath, which had coaches from Exeter, Salisbury, and Oxford 'in the season' from the 1750s. The size and appointment of coaches grew in the late 18th cent., and John Palmer's Post Coach network from 1784 set a reference point of standards for schedules as journey times were reduced. Manchester was 80 hours from London in 1750, 27 in 1808, and around 20 in 1832; the inside coach fare was £2 5s. in 1760, £3 3s. 6d. in 1808, and £4 4s. in 1832, significantly cheaper in real terms, as increased speeds eliminated many overhead costs—meals, inn accommodation, and so on—compared with the 1760s; and the market for coaches grew as the industry more than doubled its productivity. Passenger mileages grew at least tenfold 1770–1840, and in the peak year, 1836, there were around 10 million passenger journeys.

The industry originated with services run co-operatively by owner-drivers, using inns as their infrastructure. Bookings were made through them, and in central London groups of streets came to specialize in services to specific areas, like later railway stations: Aldersgate and Smithfield effectively monopolized services to Yorkshire and Lincolnshire. Debts led to innkeeper control, largely complete by 1750, and thereafter concentration grew, with large firms predominant in the London trade by the 1820s. William Chaplin (1787–1859), an innkeeper's son, was employing 68 coaches, 1,800 horses, and 2,000 men in 1838, and was the 'Napoleon of coach proprietors', then shrewdly disinvesting to become chairman of the London and South-Western railway. Stage-coaches collapsed precipitously in the 1840s and 1850s, relegated to feeder and link services, and to serving peripheral areas beyond the advancing tide of the railway.

JCh

**stained glass**, initially a Christian art-form but subjected to changing attitudes and technical developments, is part of Britain's artistic heritage. Although the cathedral at York was glazed in the 7th cent., the use of pieces of coloured glass held together by lead strips (derived from mosaic and enamelling) did not appear in England until the 12th cent., notably at Canterbury. As Romanesque church architecture, where windows weakened structure, yielded to Gothic's soaring delicacy, partnership between mason and glazier enabled greater illumination, with supporting tracery part of the design. Medieval stained glass was essentially didactic, though the clergy were not unaware of the spiritual impact of luminescence and ever-changing light: the Scriptures were expounded, saints glorified, Jesse trees recollected Christ's ancestry, and great rose windows imagined the Apocalypse or the Last Judgement. Workshops were highly organized, while glaziers, artists in their own right and influenced by French and then Flemish models, kept stocks of cartoons (working drawings) which could be adapted for different glazing structures and then passed down from father to son. With important regional centres at Oxford, Coventry, and York, English glaziers were most prolific in the 14th cent., when glass-painting made extensive use of yellow stain and windows abounded with details of donors. The great east window at York (1405–8) typifies the high quality of the period, but purity of art-form began to decline as

cathedral-building yielded to college chapels (\*King's, Cambridge) and parish churches (\*Fairford), and Renaissance influences encouraged naturalism and realism. The Reformation reacted iconoclastically to all religious imagery, with the loss of much stained glass, though heraldic windows for private houses and some churches were still produced. Destruction was most rampant during the Civil War, when cathedrals were sacked and men like Dowsing and Culmer gloried in their work. Simultaneous widespread warfare in Europe created a dearth of coloured glass, hence the virtual demise of the art. The Gothic Revival of the later 19th cent. led to renewed interest in both technique and history—Winston, Chance (who recreated 'antique' glass), Burne-Jones, \*Morris—before art nouveau designers such as Tiffany used it decoratively for lampshades and light fittings. The bulk of significant 20th-cent. work came after the Second World War, when the use of steel frames and reinforced concrete enabled huge walls of glass, experimentation in technique and colour, and a return to its incorporation as an integral element in architectural design. ASH

**Stainmore, battle of**, 954. The death at Stainmore of \*Erik Bloodaxe, son of Harold Fairhair of Norway, brought to an end the Scandinavian kingdom of York, which reverted to Wessex. The place of the battle, on the old route from Scotch Corner to Penrith, suggests that Erik had already been expelled from the city and was intercepted while escaping to Viking allies in Scotland or Ireland. JAC

**stallers** were officials in the late Anglo-Saxon household. The name derives from Danish and they were introduced during the reign of \*Cnut. There were seven of them in the reign of \*Edward the Confessor and they were clearly men of property and standing. Their duties included provisioning the army, a responsibility later taken by the \*constable. Ralph the Staller held one of the posts before the Conquest and remained in favour, being created earl of Norfolk. His son lost the title and position after a rebellion against the Conqueror. JAC

**Stamford**. Small town on the Lincolnshire border, at a strategic point where the Great North Road crosses the river Welland. It originated with a Danish fortress, flourished commercially, and in the 13th cent. hosted one of the great international trading fairs of England. It declined in the late Middle Ages, and the Cecils (who lived nearby at Burghley House) stifled its development until 1872 to retain control of the properties electing MPs: Lord Exeter forced the main railway line to go through Peterborough instead. The town remains a gem, full of 17th–19th-cent. stone houses, and 'we may perhaps be grateful to the Cecils for the feudal obstinacy which kept their town from growing . . . There are too many Peterboroughs, and not enough Stamfords, in modern England' (W. G. Hoskins). DMP

**Stamford Bridge, battle of**, 1066. A victory for King \*Harold Godwinson over \*Harold Hardrada, king of Norway, and his own brother \*Tostig, both of whom were killed. Harold Hardrada was seeking to enforce a purported promise of succession to the English kingdom by King \*Harthacnut. Little is known about the battle, which took

## Stamp Act

place on the Derwent just east of York, save that it was fiercely fought and that Harold Godwinson surprised his opponents. Harold's success indirectly assisted William the Conqueror, who was given time to establish a secure base on the south coast before the battle of \*Hastings. DB

**Stamp Act, 1765.** The Stamp Act, introduced by George \*Grenville, was the most important single piece of parliamentary legislation affecting British-American relations. It imposed duties on goods and services (legal documents, appointments to public offices, ship's papers, etc.) in the British colonies in order to raise money for military expenses in America. Protests against Parliament's right to tax the colonies, widespread discussions of political liberty, crowd violence, and trade boycotts followed. In Britain, petitions from British merchants and manufacturers led to its repeal by the \*Rockingham Whigs, ostensibly for commercial reasons in 1766. This was accompanied by the \*Declaratory Act's simultaneous enactment. RCS

**Standard, battle of the, 1138.** The border between Scotland and England was far from settled in the 12th cent. and David I of Scotland was eager to acquire Northumbria and Cumbria. The civil war in England between Stephen and \*Matilda gave him an opportunity to intervene and a period of border campaigning ended in August with a Scottish foray into north Yorkshire. It was met by a local force under \*Thurstan, archbishop of York, and Raoul, bishop of Durham, on the 22nd at Cowton Moor, south of Darlington. The English fought under the banners of St \*Cuthbert, St Peter of York, St John of Beverley, and St \*Wilfrid of Ripon, which accounted for the name 'battle of the Standard'. Though the saints were successful and the Scots defeated, the encounter was not decisive. David retained possession of the northern counties and was residing at Carlisle when he died in 1153. JAC

**Stanford, Charles Villiers (1852–1924).** Irish composer, teacher, conductor, and writer on music. Educated at Cambridge, where he was organist of Trinity College and conductor of the University Musical Society, Stanford studied composition at Berlin and Leipzig and met Meyerbeer, Offenbach, and Brahms, who was a profound influence. A fluent and prolific composer in almost every genre, Stanford was a leader of the late 19th-cent. 'English musical renaissance'; indeed, as professor at the \*Royal College of Music from its inception in 1883 (he was also professor at Cambridge from 1887), he taught most of Britain's leading composers, including \*Vaughan Williams, \*Holst, Ireland, Bliss, and Howells. Stanford raised standards in British choral music and particularly in Anglican church music. The influence of Irish folk-song is reflected in his six Irish Rhapsodies, the opera *Shamus O'Brien* (1896), and the third 'Irish' Symphony (1887), although his Germanic style has earned the description 'like leaving and returning to Ireland for a holiday in Germany'. ECR

**Stanhope, James Stanhope, 1st Earl (1673–1721).** Soldier, diplomat, and politician. Stanhope came to prominence in the War of the Spanish Succession where he was largely responsible for the campaign of 1710, including the disaster

at \*Brihuega, where he was captured. He was a Whig MP 1702–13 and 1714–17, was created a viscount in 1717 and an earl in 1718. From the accession of George I, Stanhope was continuously in office as secretary of state for the southern department (1714–16), for the northern department (1716–17, 1718–21), and 1st lord of the Treasury and chancellor of the Exchequer (1717–18). Foreign policy was Stanhope's main interest, his aim being to safeguard the Hanoverian succession by ending Britain's isolation by building up a series of alliances ensuring collective security. He teamed up with the 3rd earl of \*Sunderland (who was interested in domestic policy), and together they dominated the ministry until Stanhope's death (particularly during the Whig schism of 1717–20 when \*Walpole and \*Townshend left the government). Stanhope's diplomatic triumphs were the negotiation of the \*Triple and \*Quadruple Alliances in 1717 and 1718. He used the British navy in the Baltic and the Mediterranean to maintain the balance of power. At home he supported the Whig supremacy by trying to ensure the dominance of the existing ministry with the \*Septennial Act (1716), the \*Peerage Bill (1719), and the repeal of the \*Occasional Conformity and \*Schism Acts (1719). CJ

**Stanley, Sir Henry Morton (1841–1904).** The most effective, if ruthless, of the 19th-cent. explorers of Africa, Stanley was born in a Welsh workhouse but became a journalist in the USA. Sent to Africa by the *New York Herald*, in October 1871, he uttered the immortal words 'Dr Livingstone, I presume' on finding the explorer at Ujiji on Lake Tanganyika. In 1874–7 he led a well-financed expedition across the continent which solved nearly all the remaining puzzles of Africa's basic geography, including the course of the Zaïre (Congo) river. Engaged by King Leopold, he established the beginnings of the Congo Free State in 1879–84 and then, from 1886 to 1889, led what was a great imperialist as well as exploratory expedition through the forbidding Ituri Forest to link up Leopold's state with the Upper Nile region, thought to be held by Emin Pasha. The venture was an epic of determination on Stanley's part, but created controversy and scandal because of Stanley's methods and his high-handed attitude to his companions. RB

**Stanley, Thomas, 1st earl of Derby (c.1435–1504).** Thomas Stanley succeeded his father in 1459 as Baron Stanley and lord of the Isle of Man. He served as steward of the household to Edward IV and then to Richard III, who gave him the Garter. In December 1483 he was appointed constable of England for life. But his second wife, whom he married about 1482, was the widow of the earl of Richmond and mother of the future Henry VII. Before \*Bosworth, Richard suspected Stanley's fidelity and took his son Lord Strange as hostage. Stanley took no part in the battle and his younger brother Sir William Stanley intervened against Richard at a critical stage. Stanley is said to have placed the crown of England on Henry's head. His reward was speedy. He was made steward of the duchy of Lancaster and created earl. His brother's execution for treason in 1495 does not appear to have shaken his position. JAC

**stannaries** (from the Latin *stannum*, tin). The region of tin-mining in Cornwall and Devon, which acquired special jurisdiction. Tin- and lead-miners, being isolated communities, had their own customs and conventions. King John's charter of 1201 empowered the lord warden of the stannaries to try all cases except land, life, or limb. The warden appointed stewards to conduct regular trials, with appeals to a vice-warden. The jurisdiction of the warden survived until 1873, that of the vice-warden until 1898. The stannaries also had parliaments for both Devon and Cornwall: each consisted of 24 representatives, nominated by the four stannary towns in each shire. The Cornish parliament met last in 1752. The jurisdiction of the stannary courts was a matter of considerable dispute, since outsiders tried to restrict it to the actions of miners against other miners, while their opponents argued for a wider interpretation. JAC

**staple.** A staple was a trading centre in England or occasionally abroad, where traders deposited certain important commodities, bought and sold there. Edward II is regarded as the 'father of the English Staple' since it was during his reign that the Ordinance of the Staple (1313) made the system compulsory. The aims of the system, of particular importance in the 14th and 15th cents., were to regulate commerce in important commodities, especially wool, wool cloth, leather, and tin, and, by confining trade to a few named staple towns, to facilitate the collection of tolls or customs duties, and to bring trade under the control of royal officials who could ensure the maintenance of quality. The courts of the staple decided issues within the statutes. Because of England's importance as a trading nation, the staple system was also significant politically as an instrument of diplomacy. MM

**Star Chamber.** The origins of the Court of Star Chamber have been disputed, but it undoubtedly arose as an offshoot of the king's \*council. The origins of its name have also been debated but it probably derived from the fact that the king's council sat as a judicial tribunal in the 'camera stellata', a chamber with a starred ceiling, built in 1347 at Westminster. The court did not owe its existence to a statute of 1487 (described as the statute *pro camera stellata*) though this statute was regarded by some later commentators as its origin. The court was at first little more than an aspect of the council, but it became prominent especially under the Tudors as a court which would control 'over-mighty subjects' and prevent abuses of the courts and the justice system, as well as threats to public order. It also provided civil remedies to petitioners seeking redress which was unavailable at \*common law. However its main role was the enforcement of statutes and the prevention of public disorder, including riot, libel, and sedition. It was at first popular, but under the Stuarts became hated because of its increasingly draconian rulings on libel and sedition and its savage punishments. Having become a byword for tyranny, it was abolished by the \*Long Parliament in 1640. MM

**statutes.** See PARLIAMENT, ACTS OF.

**steam-engines** are machines employing steam pressure and condensation to generate motion. Thomas \*Savery's

device (1698) pumped water by partial vacuum, without moving parts, and while engines on his principles were still in use in the 1790s, \*Newcomen's atmospheric cylinder/piston engine erected near Dudley in 1712 established the fundamental principles of steam power. James \*Watt's separate condenser of 1769 (and reciprocation from 1782) became a source of much-improved technical efficiency once \*Wilkinson's improved cylinder boring became available (1774), and expressed itself in economy of coal use: by the 1790s Watt engines consumed 70 per cent of the fuel of a comparable \*Smeaton atmospheric device. Higher capital costs meant that coal prices determined the adoption of Watt technology, and industry located onto the cheapest available coal, still providing half its steam-power in 1800 with atmospheric engines.

Mine drainage was its primary application, where coals were cheap and many engines ran on unsaleable slack, with brewing and milling, water supply, and textiles following, the last before the 1820s often employing stationary steam-power through water-wheels for the even torque needed by early machinery. Wider applications from the 1790s owed more to \*Trevithick's high-pressure non-condensing and direct acting engines, which powered the first successful marine applications with Symington's *Charlotte Dundas* (1802—though experimentally proven by Jouffroy at Lyons in 1781), and his validation of the steam carriage (1801) and locomotive (1804). Steam was proven at sea by the voyage of Dodd's *Thames* from Glasgow to London (1815) and entered general coastal service during the 1820s; and on railways by the Rainhill trials of 1825.

Steam-power in cotton more than doubled 1835–56, and was followed by woollens and linen; the Cornish boiler dif-fused to produce high pressures at reduced fuel costs; and \*Stephenson long-boiler and Kitson outside-frame locomotives established the basic pattern of railway motive power. From the Grand Junction's establishment of Crewe (1837), British railways manufactured their own locomotives, with occasional purchases from specialists such as Beyer Peacock, who were otherwise confined to export markets, producing long-term losses in standardization and technical progress. The economical compound steam-engine was little used on British railways, where coal was cheap, whereas it became a standard unit for factory power, and in its ultimate triple-expansion form (after 1880) the key to British shipping and shipbuilding dominance. From the early 1900s, \*Parsons's marine steam turbine provided still greater speed and economy. Plentiful coal supplies, and the extensive coal/steam engineering industrial base, hereafter represented elements of inertia slowing Britain's adoption of electricity and internal combustion. JCh

**Steel, David** (b. 1938). Liberal leader. Son of a Church of Scotland cleric, Steel was educated at George \*Watson's College and Edinburgh University, reading law. When returned to Parliament at a by-election for Roxburghshire in 1965, he was the youngest MP. Steel served as chief whip before defeating John Pardoe for the Liberal leadership in 1976 on the resignation of Jeremy \*Thorpe. His twelve years as leader saw collaboration then fusion with the \*Social

## Steelboys

Democratic Party, and steady progress. From thirteen members in 1976 the Liberals had seventeen in 1987. He retired from the leadership in 1988 and was succeeded by Paddy \*Ashdown. He was knighted in 1990 and made a life peer in 1997. From 1999 he has been presiding officer of the Scottish Parliament, sitting as one of the additional members for Lothians region. JAC

**Steelboys.** One of the many Irish agrarian protest movements. It was largely provoked in the early 1770s by rack-renting on the estates of the marquis of Donegal and confined mainly to presbyterian Ulstermen. JAC

**Steele, Sir Richard** (1672–1729). Irish writer, soldier, and politician. Educated at Charterhouse and Merton College, Oxford, Steele entered the army, rising to the rank of captain, before turning to writing plays. Appointed gazetteer in 1707, a post he held until 1710, Steele embarked on a hugely successful journalistic career, assisted by \*Addison in the \**Tatler* and then the enormously popular \**Spectator*. Elected MP for Stockbridge in 1713 and recruited by the Whigs to head their propaganda campaign against the \*Harley administration, Steele responded with papers like the *Guardian* and the *Englishman*, as well as *The Crisis*, the bombastic pamphlet for which he was expelled the House in March 1714. Rewarded for his services on the Hanoverian succession, Steele was knighted and appointed supervisor of Drury Lane theatre. He continued to publish pamphlets and periodicals, and had a success with his sentimental comedy *The Conscious Lovers* (1722). JAD

**Steelyard.** The Steelyard, on the site of Cannon Street station (London), was for more than three centuries the headquarters of the \*Hanseatic traders. They were charged with the repair and defence of Bishopsgate, but were deprived of their privileges by Elizabeth in 1598 in retaliation for restrictions placed upon English merchants in the Holy Roman empire. JAC

**Steenkirk, battle of**, 1692. William III, defending Brussels against the French, launched a surprise attack on 3 August on Marshal Luxembourg, who was separated from Boufflers. William made use of a discovered spy to gain a temporary advantage but Boufflers's troops joined in at the end of the day. The struggle was bloody but inconclusive and the Dutch commander Solms was much blamed for not bringing his men to help the British. William confided to Heinsius, 'you can easily understand how much it grieves me that I have not been able to do better.' JAC

**Stephen** (c.1096–1154), king of England (1135–54) and duke of Normandy (1135–44), was the third son of Stephen, count of Blois, and Adela, daughter of William the Conqueror. During his reign England plunged into a civil war in which neither side possessed the resources or the ability to achieve outright victory. Stephen was brought up at the court of his uncle Henry I, becoming one of the wealthiest of the Anglo-Norman magnates. Although he was among the first to take the oath to accept Henry's daughter \*Matilda as heir to the throne, he used the opportunity created by the confusion which followed Henry's death to seize the kingdom in

December 1135. Subsequently accepted in Normandy, he seemed at first to have secured his rule over the entire Anglo-Norman realm and was able to obtain papal confirmation of his right. The reasons for the subsequent decline in his fortunes have been much discussed. He seems to have lacked the capacity to command the loyalty of the magnates, and he faced very large problems which, in strategic terms, were certain to be difficult to overcome. Symptomatic of the former were the sporadic revolts which took place early in his reign, the rivalries at court which led to the defection of Earl \*Robert of Gloucester in May 1138 and the attempt to arrest Bishop \*Roger of Salisbury and his brothers in 1139. Manifestations of the latter were the secure bases available to his rival Matilda provided in Anjou by her husband \*Geoffrey and in western England by Robert of Gloucester, disturbances in Wales, and the fact that her supporters included the king of Scots, David I. Stephen always appears to have been needed in too many places at the same time; in 1137, for example, he had to abandon his only campaign in Normandy because he believed that he ought to be in northern England to confront the Scots. Stephen's cause declined once Matilda was established in England from 1139 and—dramatically—after his capture at the battle of \*Lincoln in 1141. Although he was sustained in 1141–2 by his queen \*Matilda and was released from prison in 1142 after the capture by his supporters of Robert of Gloucester, his position was already seriously compromised. His enemies controlled western and parts of northern England and Count Geoffrey completed the conquest of Normandy in 1144–5; subsequent campaigns in England in the 1140s, mostly in the Thames valley, only confirmed the stalemate. The existence of two established centres of power in England and Normandy created an impossible dilemma for the Anglo-Norman magnates, especially for those with land in both territories. Most sought increasingly to withdraw from the conflict and many tried to protect their local power by treaties with their neighbours; this has wrongly been described as 'the Anarchy', when it was in fact often the only way in which some kind of order could be kept. Stephen also fell foul of the papacy because of a disagreement over the succession to the archbishopric of York, which had serious consequences when the pope (Eugenius III) refused to accept Stephen's son \*Eustace as his heir in 1152, and instead transferred his support to Matilda's son, the future Henry II, as the direct descendant of Henry I. Henry's cause was further strengthened when he succeeded to the duchy of Normandy in 1150–1. In 1153, with the magnates refusing to fight a pitched battle which would have been decisive, Stephen accepted Henry as his heir by the treaty of \*Winchester. Henry's succession followed peacefully after Stephen's death on 25 October 1154, a sign that all were weary of the civil war. Stephen deserves admiration for the way he sustained a difficult cause for so long; he besieged castles successfully and he established (not always reliable) supporters in earldoms to cement local power. But he lacked the ruthlessness required to prosecute his cause successfully; in particular, the way in which he allowed Matilda and Henry respectively to escape his grasp in 1139 and 1147 did his prospects no good at all. DB

Chibnall, M., *The Empress Matilda* (Oxford, 1991); Crouch, D. B., *The Beaumont Twins* (Cambridge, 1986); Davis, R. H. C., *King Stephen* (3rd edn. 1990); Stringer, K. J., *The Reign of Stephen: Kingship, Warfare and Government in Twelfth-Century England* (1993).

**Stephen, James FitzJames** (1829–94). Stephen was the son and grandson of distinguished lawyers and educated at Eton, which he disliked, and at Trinity College, Cambridge. He embarked on a legal career, but augmented his income with articles in the *Saturday Review*, the *Cornhill Magazine*, and the *Pall Mall Gazette*. After 2½ years in India on the council, which he described as a second university education, he was appointed a judge in 1879. His baronetcy came in 1891 when ill-health forced him to retire early. Large and formidable, he expressed his views trenchantly, was hostile to democracy, and mistrustful of sentiment: 'the French way of loving the human race is one of their many sins which it is most difficult to forgive.' He was a great admirer of \*Hobbes, the apostle of strong government. Stephen's most important works were *Liberty, Equality, Fraternity* (1873), a critique of John Stuart \*Mill's *On Liberty*, and a *History of the Criminal Law* (1883). His candour is frequently refreshing, sometimes brutal. His younger brother Leslie Stephen was the founding editor of the \**Dictionary of National Biography* and father of Virginia \*Woolf. JAC

**Stephen Harding, St** (d. 1134). Third abbot of Cîteaux. A native and monk of Sherborne (Dorset), Stephen joined the abbey of Molesme near Dijon. Fervently ascetic, he helped Abbot Robert tighten Benedictine life there, but, facing opposition, they left for Cîteaux, a barren, marshy place, to follow the rule more rigorously. Stephen, the driving force, became third abbot (1109), but Cistercian austerity caused numbers to decline until Bernard's arrival (1111) with 30 followers retrieved the situation; the order revived and spread, Stephen himself founding thirteen other houses and appointing Bernard abbot of Clairvaux. He wrote *Carta caritatis* (1119), which was Cistercianism's foundation document, and with its centralized structure, its annual visitation, and general chapters became a model for all future religious foundations. Stephen's administrative ability complementing Bernard's emotional appeal made Cistercianism spread rapidly—over 100 Cistercian houses were founded in his lifetime, the first in England at Waverley, Surrey (1128). WMM

**Stephens, James** (1825–1901). Fenian. Stephens, a protestant railway engineer from Kilkenny, was one of the few who joined Smith \*O'Brien in the abortive 1848 rising. He escaped to France and returned to Ireland in 1856. He found little nationalist enthusiasm but resolved to organize an Irish republican cause. Such a movement should have a dictator, 'perfectly unshackled' in charge, and Stephens volunteered for the role. In 1858 he founded what later became the \*Irish Republican Brotherhood, drawing on his experience with revolutionary groups in France. An excellent organizer, he was said to be 'vain, despotic and overbearing beyond any man I ever saw'. On a fund-raising trip to America 1858–9 he joined in founding the \*Fenian Brotherhood and in 1863 launched the *Irish People*, a weekly newspaper. But while the Fenians were still drilling, the government struck and

raided the *Irish People* offices. Stephens was later arrested but escaped and fled to America. The American Fenians then organized an abortive attack upon Canada, a rather devious way of liberating Ireland. When Stephens urged a further postponement of any Irish rising, he lost all credibility, and his successors in the leadership initiated the rising of 1867. Stephens was allowed to return to Ireland in 1885.

JAC

**Stephenson, George** (1781–1848). Son of a colliery workman, without schooling, George Stephenson became one of the most famous of all engineers. Beginning work at the age of 8, in early manhood he earned a reputation for managing the primitive \*steam-engines employed in collieries. In 1815 he invented a safety lamp for use in coal-mines, after risking his life repeatedly in earlier tests. He was responsible for the adoption of locomotives by the Stockton and Darlington railway and then the Liverpool and Manchester railway. His *Rocket* was triumphantly successful in the Rainhill trials of 1829. When he recommended the use of locomotives on these early railways, he knew that the available machines could not provide the necessary power, but he was confident that these technical problems would be overcome. This moral courage, and his innate ingenuity, paved the way for later railway contracts and aided Stephenson's rise to wealth and distinction. NMCC

**Stephenson, Robert** (1803–59). Only son of George \*Stephenson, Robert was born when his father was still an obscure north-eastern colliery workman. At first, he was dependent on his father's success, acting as his assistant in railway and other projects, and managing the Forth Bank works in Newcastle, an important centre of early railway engineering. By mid-century, he had acquired an independent reputation as one of the world's most famous engineers. His achievements at home and abroad included many railways and bridges, including the High Level bridge at Newcastle (1849), the Royal Border bridge, Berwick (1850), the Menai Straits bridge (1850), and the Victoria bridge at Montreal (1859). He was Conservative MP for Whitby from 1847 until his death. A popular figure, a generous philanthropist, and a considerate employer, he was buried in Westminster abbey amidst widespread mourning. NMCC

**Sterne, Laurence** (1713–68). Novelist and humorist. Son of a low-ranking infantry officer but educated through a cousin's bounty at Jesus College, Cambridge, where he embraced \*Locke's philosophy and contracted tuberculosis, Sterne was ordained and collated to a Yorkshire living (1738). Voracious reader, moderately successful rural parson though a persistent philanderer, his satire on local ecclesiastical courts jeopardized preferment but encouraged him to entrust the parish to a curate and concentrate on writing. *Tristram Shandy* (1759) prompted both applause and abuse for its sentimentality and salaciousness, though, freeing the novel from straightforward narrative, it has since been seen as begetter of 'stream-of-consciousness' writing. Sterne revelled in the literary esteem and social notoriety he found in London, but was forced to forsake England briefly for France for health reasons, this providing material for his

## Stevenson

*Sentimental Journey* (1767). His corpse was exhumed by London resurrectionists but escaped dissection for secret reburial, being finally interred at Coxwold (his last Yorkshire living) in 1969. ASH

**Stevenson, Robert Louis** (1850–94). Writer. A spirited but sickly child, Stevenson abandoned engineering studies at Edinburgh for law but, although admitted as advocate (1875), never practised: rejecting parental calvinism for liberal bohemianism, he was determined to write. Much of his life was spent journeying in search of health after tuberculosis developed, and this provided material for future publication; it was while in France that he met his future wife, the American Fanny Osbourne. His output covered essays, short stories, poetry (*A Child's Garden of Verses*), travelogues, and collaborations with his stepson Lloyd Osbourne, while delighting readers with Scottish romances (*Kidnapped*, *Catriona*) and story-telling (*Treasure Island*, *Dr Jekyll and Mr Hyde*). Financially independent after his father's death (1887), Stevenson took the whole family to the South Seas, settling eventually at Vailima (Samoa), where his health improved partially and he gained a reputation as 'Tusitala' ('Teller of Tales'). ASH

**Stewart, Alexander.** See BUCHAN, 1ST EARL OF.

**Stewart, Dugald** (1753–1828). Philosopher. Son of a distinguished mathematician, Stewart studied under Adam Ferguson, Thomas Reid, and Adam \*Smith. He was professor of moral philosophy at Edinburgh 1785–1820. A noted lecturer and teacher, Stewart's classes drew huge audiences and shaped the intellectual world of a rising generation of young Whig politicians. His philosophy was a critical distillation of the metaphysical and moral philosophy of the \*Scottish Enlightenment. His metaphysics were shaped by Reid's critique of \*Hume's scepticism, his moral philosophy by a critique of Smith. He gave an influential series of classes on Smith's political economy, which played an important part in disseminating that text. The \**Edinburgh Review*, founded by his pupils, was an indirect but important monument to his teaching. His critical lives of Adam Smith, Thomas Reid, and William \*Robertson and a long critical dissertation on the progress of metaphysics since the Renaissance are notable early essays in the history of philosophy and have played a significant part in placing the philosophy of the Scottish Enlightenment in a historical perspective. NTP

**Stewart, James.** See ROSS, 1ST DUKE OF.

**Stigand** (c.1000–72), archbishop of Canterbury (1052–70), was a worldly prelate, whose extensive lands placed him among the wealthiest magnates in \*Edward the Confessor's England. Promoted rapidly by the king, he held the bishoprics of Winchester and Canterbury in plurality after 1052, an arrangement for which there were precedents in England, but which was illegal in canon law. His appointment to Canterbury after the Norman \*Robert of Jumièges had been forced into exile was also deemed uncanonical by the papacy. He was at first apparently accepted by William the Conqueror, even though he had crowned \*Harold

Godwinson. This was presumably a consequence of William's early policy of trying to work with the native English. But in 1070 a case for his removal was built up from his numerous irregularities and he was deposed by a papal legate. He died a prisoner in 1072. DB

**Stilicho.** Late Roman general. In AD 395 Honorius became ruler of the western empire, but effective power lay with the outstanding military and political personality of his time, 'enigmatic Stilicho, half-Roman and half-German'. Stilicho's career was marked by hostility towards the eastern empire and a reluctance to deal comprehensively with the Germanic tribes threatening the western empire, whose support he might need. His career impinged on Roman Britain: in 396–8 he ordered an expedition against the barbarians troubling Britain, restoring peace in 399; but in 401–2 he withdrew troops from Britain to defend Italy. Eventually he was accused of conspiring with the German Alaric to usurp imperial power, surrendered to Honorius, and was executed in 408. ES

**stipendiary magistrates** are paid magistrates who are professional lawyers. The normal mode of trial of minor criminal offences is by a bench of lay magistrates, but in the 18th cent. the problem of crime in London, exacerbated by the lack of a police force, led to the establishment in 1792 of paid magistrates for the metropolis. In 1813 a stipendiary magistrate was appointed for Manchester and later legislation provided that boroughs and urban areas could request the appointment of a stipendiary. In 1839 those appointed were to be barristers; since 1949 solicitors may also be appointed. MM

**Stirling Bridge, battle of**, 1297. Edward I's victory at \*Dunbar in 1296 did not keep Scotland subdued for long. On 11 September 1297 a large English army, under John de \*Warrene, earl of Surrey, and Hugh de Cressingham, was caught by William \*Wallace crossing a narrow bridge over the Forth near Stirling. Cressingham was killed and Edward's conquest had to begin again. JAC

**Stirling castle**, which stands on a dolorite hill over 400 feet above sea level, occupies an important strategic position controlling the main ford of the river Forth; it is thus a link between the Highlands and the Lowlands of Scotland. The castle is of unknown age, but from the time of Alexander I (d. 1124) until the union of the Scottish and English crowns in 1603 it was an important royal centre, rivalling Edinburgh as Scotland's capital. Called the 'Key to Scotland', the castle changed hands many times during the Wars of \*Scottish Independence. It fell to the English in 1296, was recovered in 1297, but fell again to Edward I in 1304. It was to relieve a siege on the castle that Edward II risked a battle at \*Bannockburn, 2½ miles to the south in 1314. When Robert the Bruce was victorious he had the building dismantled, so fearful was he of the consequences of losing it. Edward \*Balliol surrendered the castle to Edward III in 1334 but the Scots regained it in 1339. As a result of this turbulent history, the fortifications and palace buildings within the irregular enclosure are of the 15th cent. and later. LR

**Stock Exchange.** The London Stock Exchange was founded in 1802, providing a mechanism for the increasing volume and complexity of financial transactions which had developed in the 18th cent. Prosperous merchants, and institutions such as insurance companies, which had massive resources, supplied the investment to the government, ever short of funds, to individuals, characteristically for improvements to landed estates, and to business. The scale of formal investment increased massively in the second half of the 19th cent., with a marked orientation towards international operations which the city of London still retains. Provincial stock exchanges also flourished rather briefly in the Victorian period, often with strong local specializations, such as Oldham in cotton and Sheffield in steel. CHL

**stocks.** The growth of government spending from the late 17th cent. onwards, frequently for war, stimulated the search for ways to raise funds. The issue of government stock, effectively a form of IOU, dates from this time. In 1696 the Exchequer Bill was introduced, offering 3 pence per day interest on a subscription of £100. In 1749 a plan was introduced to consolidate all the different loans taken out by the government, reducing the rate of return to a standard 3 per cent p.a., while making the loans irredeemable, meaning that there was no obligation to pay off the capital. These consolidated loans were established in 1752 as '3 per cent consols'. While this investment was free of the risk of default it was exposed to changes in prices. While the nominal rate remained fixed, the fact that consols were actively traded amongst merchants, brokers, and speculators caused the value to vary. Consols sold above par yielded a lower rate of return than 3 per cent, while those sold below par yielded a higher rate. But they proved to be a secure and flexible monetary instrument, since they could be bought conveniently through any attorney. Consols also became a useful source of government income. CHL

**Stoke, battle of,** 1487. Lambert \*Simnel, posing as Edward, earl of \*Warwick, son of the duke of \*Clarence and nephew to Edward IV, raised support in Ireland and was crowned in Dublin as Edward VI. He landed near Lancaster and was supported by the earl of \*Lincoln. His forces met with those of Henry VII at Stoke, near Newark, on 16 June. After heavy fighting, with perhaps 20,000 men involved, Lincoln was killed and Simnel captured. With a humour or clemency not much apparent in the Wars of the \*Roses, Simnel was given menial employment at court. JAC

**Stoke-on-Trent** was formed in 1910 as a federation of six Staffordshire pottery towns—Tunstall, Burslem, Hanley, Stoke, Fenton, and Longton. The development of the conurbation was largely 19th cent. and owed much to the canal network, begun with the Trent and Mersey in 1775, which greatly facilitated the transport of pottery. The growing importance of the area was recognized by the Reform Act of 1832 which grouped the towns into the parliamentary borough of Stoke. By 1851 the total population was some 137,000 and by 1901 in excess of 300,000. An experiment after 1910 with the new council meeting in the six towns in turn was soon abandoned in favour of permanent headquarters at

Stoke. There was considerable boundary extension and Stoke became a city in 1925. In Stoke City and Port Vale the area has two of the oldest clubs in the Football League. The population in 2002 was 254,400. JAC

**Stonehenge** (Wilts.) is the best-known archaeological site in the British Isles. It is spectacular—over 70 worked standing stones set in an incomplete circle, an inner horseshoe shape and various outliers, with capping stones used as lintels to link the standing stones at a height of up to 22 feet above ground—but what survives is but the ruin of the final phase of a structure, including earthen banks, set in a complex of other ritual and burial monuments and field systems dating from c.4000 to c.1500 BC. By what means and why Stonehenge was built has fascinated antiquarians at least from John \*Aubrey (1666); in 1740 William Stukeley firmly attributed the monument to the (Iron Age) druids—an anachronistic association which has persisted with modern 'druids' and New Age travellers visiting Stonehenge to observe the midsummer sunrise. The monument was orientated to mark sunrise at the midsummer solstice (and sunset at the midwinter solstice), but whether it has further astronomical significance is debatable. The stones of which it is constructed include 'bluestones' probably from Wales—memory of the transport of which may underlie \*Geoffrey of Monmouth's story that the magician Merlin moved a stone circle from Ireland to Salisbury. CML

**Stopes, Marie** (1880–1958). Birth control pioneer. Methodical and brilliant as a palaeobotanist, with an international reputation in her twenties, but disordered emotionally, her radical vision of an ideal marriage and clarification of sexual conduct prompted deep changes in social attitudes. Encountering fierce hostility from the catholic church and much of the medical profession, many of whom were nearly as ignorant as the public, in a background of moral panic engendered by post-First World War venereal disease figures, she faced libel and lawsuits with courage. With her second husband, she opened Britain's first birth control clinic at Holloway (1921), and published a stream of successful sociological works, but indifferent poetry and plays. Passionate but arrogant and opinionated, with an alarming indifference to others' feelings, hence isolated, her crusades attacking prejudice and prudery nevertheless encouraged social reform and the economic emancipation of women. ASH

**Stormont** is the grandiose building in a Belfast suburb which housed the Northern Irish Parliament 1932–72. Its absurdly lengthy drive possesses an imposing statue of a defiant Sir Edward \*Carson. The word became a synonym for intransigent unionism. H. M. Pollock, minister of finance in the first Northern Irish government, said: 'It was the outward and visible proof of the permanence of our institutions.' Since 1972 and direct rule from Westminster, it has been little used: the castle alongside it houses British government officials. MAH

**Stow, John** (1525–1605). Self-taught antiquary and historian, famous for his *Survey of London* (1598), which he revised and extended in 1603. Stow, a third-generation Londoner, began his career in 1547 as a working tailor, but by 1560 was

## Stowell

building up an important manuscript collection. Before his *Survey*, Stow produced the *Annales of England* (revised edition, 1592) as well as other antiquarian works. His *Survey of London* takes the form of a perambulation of London by ward. Based on both manuscript and oral evidence, its most evocative passages are those where Stow includes his own personal opinions and memories. He was sympathetic to the old religion and wrote at a time when London was growing rapidly. His *Survey*, therefore, contains many observations on the decline of community spirit, regret at the destruction of monuments during the Reformation, and laments about the building of suburban slums. JPB

**Stowell, William Scott, 1st Baron** (1745–1836). Stowell began his life as an academic after gaining a scholarship to Corpus Christi College, Oxford, in 1761. He went on to become fellow and tutor at University College, Oxford, in 1765. After gaining his MA (1767) and BCL (1772) he became Camden reader in ancient history 1773–85. However, Stowell always desired to enter the law. In 1780 he joined Middle Temple and became a barrister working in the Admiralty and ecclesiastical courts. He served as MP for Oxford University 1801–21 and in the main opposed reform, but it was his legal career that had lasting influence. He served as a judge in the High Court of Admiralty from 1798 until 1828, and on many maritime points his judgments are still the only law. His younger brother was Lord Chancellor \*Eldon. RAS

**Strafford, Thomas Wentworth, 1st earl of** (1593–1641). Wentworth made his name as a champion of constitutional rule by opposing the \*forced loan of 1626. However, in the 1628 Parliament he suggested the compromise which culminated in Charles I's acceptance of the \*petition of right. This opened the way to a career in government, and in 1633 the king sent him to rule Ireland. Strafford did so in such a despotic manner that he aroused fear and hatred in England, and when Charles, after the disastrous \*Bishops' wars, called Strafford to his side and made him an earl, he promised that he would not 'suffer in his person, honour, or fortune'. Although Strafford advised Charles to summon Parliament, he planned to intimidate it by charging its leaders with treason for abetting the king's Scottish enemies. However, \*Pym struck first by impeaching Strafford for the greater treason of alienating the king from his subjects. At his trial, in March 1641, Strafford defended himself so ably that acquittal seemed likely. The Commons therefore changed tack, passing a bill of attainder, which simply declared Strafford's guilt and sentenced him to death. Despite the pressure from angry mobs baying for the blood of 'black Tom the tyrant', the king delayed his response until Strafford urged him to give his assent, 'for prevention of evils which may happen by your refusal'. A few days later, Strafford was executed on Tower Hill. Charles subsequently realized that his consent had been a blunder, morally and politically. RL

**Stratford, John de** (d. 1348). Archbishop of Canterbury and chancellor. Born in Stratford-upon-Avon and trained in law at Merton College, Oxford, he entered royal service. While at Avignon on papal business, he was appointed

bishop of Winchester (1323) by the pope, much to Edward II's annoyance. Stratford later supported Edward II's deposition (1327) in Edward III's favour. As Edward III's principal counsellor and chancellor in the 1330s and archbishop of Canterbury from 1333, he negotiated with France and Scotland and accompanied him to Flanders at the outbreak of war. On Edward's return in 1340 he furiously, but unjustly, attacked Stratford for financial incompetence. Stratford stood his ground, insisting on appealing to Parliament, thus confirming the principle of peers being tried by peers in Parliament. Reconciliation followed in 1341 but in later years Stratford only advised on ecclesiastical matters. WMM

**Stratford de Redcliffe, Stratford Canning, 1st Viscount** (1786–1880). Diplomat. Son of a London merchant and cousin of George \*Canning, Stratford Canning was sent to Eton and King's College, Cambridge, before entering the Foreign Office. He served in Denmark, Turkey, Switzerland, and the USA. He was in Constantinople at the time of the battle of \*Navarino (1827) and again as ambassador 1841–58. He urged the Turks to resist Russian demands in the exchange which led to the \*Crimean War. In 1852 he was made viscount and in 1869 was given the Garter. His title, which the *Complete Peerage* understandably calls 'a strange medley', commemorates the 15th-cent. Cannyngees who were associated with St Mary Redcliffe, Bristol. Canning, with a handsome presence and majestic manner, was one of the grandest of old-style diplomats. Malmesbury wrote that his talents were undisputed but that he was so 'despotic and irritable' that they were only of use in certain situations. JAC

**Stratford-upon-Avon.** Birthplace of \*Shakespeare. For many years after the death of Shakespeare in 1616, Stratford, originally where a Roman road crossed the river, remained a small Warwickshire market town and route centre. It was known for its fair in September and for its fine late 15th-cent. bridge. It suffered considerably from fires in 1594, 1595, and 1614. The event which put it on the map was \*Garrick's Shakespeare Jubilee of 1769 which, though nearly washed away by rain, attracted great attention. Present places of pilgrimage include the birthplace in Henley Street, the grammar school, Anne Hathaway's cottage at Shottery, and Holy Trinity church, where Shakespeare is buried and commemorated in an unimagined monument. New Place, which he purchased in 1597, was subsequently pulled down, and a museum has now been erected on the site. The first Memorial theatre, completed in 1879, was destroyed by fire in 1926 and replaced by the present building in 1932. JAC

**Strathclyde** was the name of an ancient British kingdom, centred on the Clyde valley, with its capital at the natural fort of Dumbarton, and absorbed into Scotland c.1018. The name was adopted in 1963 by one of Glasgow's universities, and from 1973 to 1996 was used for an administrative region. The 1973 local government reorganization of Scotland was an attempt to rationalize the previous system of cities, burghs, and rural areas, which reflected historical rather than contemporary population patterns, into regions big enough to exploit economies of scale in services such as

education, police, water, roads, and transport; smaller districts became responsible for other local authority services. Strathclyde, which incorporated Glasgow and the counties of Bute, Dunbarton, Lanark, Renfrew, Ayr, most of Argyll, and the Kilsyth area of Stirlingshire, illustrates the problems of such reorganization: it contained 2.3 million people, nearly half Scotland's population. The region was unpopular with people living in its more rural parts, who felt it was dominated by Glasgow and its surrounding industrial areas (guaranteeing a large Labour majority in the regional council), and with other regions, which felt overwhelmed by its size. Government awareness of this unpopularity and concern that the two-tier administration was inefficient, reinforced perhaps by the Conservatives eventually controlling none of the regions, led to the abolition of the 1973 structure and its replacement, from 1996, by all-purpose authorities—in Strathclyde's case, nineteen new councils, corresponding roughly to the previous districts. CML

**Strathclyde, kingdom of.** The kingdom of Strathclyde, at its greatest extent, stretched from Loch Lomond in the north to Cumbria in the south. Its kings were Brittonic/Welsh, and were variously described by contemporaries as kings of the (northern) Britons or kings of the Cumbrians, though they are often referred to simply as kings of Dumbarton, the fort which tops the massive rock which projects from the north bank of the Firth of Clyde. The first king who can be identified is Coroticus (Ceredig) to whose warband St \*Patrick addressed a scathing letter sometime in the 5th cent. The last Brittonic king was probably Owain the Bald who died in 1018 fighting in the army of \*Malcolm II of Scotland at the battle of \*Carham (south-west of Berwick).

Strathclyde was remarkable for being the only Brittonic kingdom outside Wales to survive the Anglo-Saxon onslaught of the 6th and 7th cents. \*Gododdin (centred on Edinburgh), \*Rheged (somewhere in northern England and southern Scotland), and \*Elmet (around Leeds) vanished. It survived the aggression of Picts and Gaels as well as Angles, and scored some notable victories—such as the defeat and death of Domnall Brecc, king of Dalriada (Argyll) at Strathcarron (near Falkirk) in 642, or the defeat of the Picts—who had recently conquered Argyll—in 750 at Mugdock (north of Glasgow), or the defeat and death of \*Cuilén king of Scots and his brother \*Eochaid in Lothian in 971. For extended periods, however, they were clients of more powerful kings. They submitted to kings of Northumbria in the 7th cent. and again after an invasion by a combined force of Picts and Angles in 756, which led to Anglian colonization of Kyle (mid-Ayrshire). The kingdom fell increasingly under the power of kings of Scots after being weakened by the destruction of Dumbarton in 870 by Vikings and ravaged by \*Edmund, king of the English, in 945. It is often alleged that \*Duncan I was installed as king by his grandfather \*Malcolm II, following Owain the Bald's death, but the evidence for this is open to question. Kings of Scots no doubt held sway over Strathclyde for most of the 11th cent.; the last semi-independent ruler was David, brother of Alexander I of Scotland, before he became David I in 1124.

By the 11th cent. Gaelic began to eclipse Welsh, though Welsh was still spoken in some areas in the mid-12th cent. This, plus Anglian settlements in the west and Norse colonization in Cumbria, gives the place-names of the region a striking cultural mix. Cultural diversity is also apparent in the remarkable collection of 10th- and 11th-cent. sculpture at Govan (in the west end of modern Glasgow), which displays Scottish, Scandinavian, and Anglian influence. Govan was the kingdom's most important religious site at that time. Glasgow may originally have been the leading church of the kingdom with St Kentigern (or Mungo) (d. c.603) as its first bishop. It had its status as the chief church of the region vindicated by David in the early 12th cent. Although the kingdom disappeared as a political entity, it had an after-life as the diocese of \*Glasgow, and briefly (1973–96) as the administrative region of Strathclyde. DEB

**Stratton, battle of, 1643.** Much of 1643 was devoted by king and Parliament to establishing local domination. In most areas, there were divided loyalties and towns to be made secure. Even in Cornwall and Devon, royalist strongholds, there was considerable support for Parliament. \*Hopton suffered an embarrassing ambush at the hands of James Chudleigh on Sourton Down, near Okehampton, on 25 April, but on 16 May caught Lord Stamford and Chudleigh at Stratton in Cornwall and defeated them heavily, taking Chudleigh prisoner. JAC

**strict settlement.** See *ENTAIL*.

**Stuart, Arabella** (1575–1615). The niece of \*Darnley, first cousin to James VI and I, and a possible successor to Elizabeth on the throne of England. She avoided implication in the \*Bye and \*Main plots in 1603 but her secret marriage in 1610 to William Seymour (\*Somerset), who had royal blood through his grandmother Lady Catherine Grey, alarmed the king and she spent most of her remaining years in the Tower. JAC

**Stuart, Charles Edward** (1720–88), the 'Young Pretender'. Elder son of James Francis Edward \*Stuart, the son and heir of the exiled James II and VII, Charles was the Jacobite prince of Wales. He was born in December 1720 in Rome to James and his teenage Polish wife Clementina Sobieska. Another son, Henry \*Stuart, was born in 1725 to this unstable marriage. Charles was a robust and wilful child, who was nominally blooded for war by being present at the age of 13 for a few days at the siege of Gaeta.

Early in 1744 he left Italy for France carrying his father's commission as prince regent, having been summoned to accompany a proposed French invasion of England. It was cancelled. In July 1745 Charles sailed for Scotland to raise a rebellion in the Highlands, with the hope of stimulating French aid. Total self-confidence, plus a limited grasp of reality, and the outstanding generalship of Lord George \*Murray, carried him through a conquest of Scotland and march to Derby which made him a hero. His period of hiding after his defeat at \*Culloden endeared him to romantics as 'Bonnie Prince Charlie'. Yet he was an embarrassment to Louis XV (who was seeking peace) on his return to France, from which he had to be expelled. The rest of his

## Stuart

life was a protracted anti-climax, full of failed relationships and alcoholism. He died in Rome in 1788. BPL

**Stuart, Cardinal Henry Benedict** (1725–1807). The younger son of James \*Stuart, and latterly Jacobite cardinal-king, he was born in March 1725 in Rome and was his father's favourite son. He was kept ignorant about Franco-Jacobite intrigues in 1744, but did go to France to support his brother Charles in 1745. In 1747, in political despair, he accepted a cardinal's hat. Charles, who had not been informed, was embittered. Reconciliation came late. After the death of Charles in 1788, Henry styled himself 'Henry IX'. It was an empty title. When the French revolutionaries invaded Italy, confiscating his property, George III pensioned him. He died in Frascati in 1807, and is buried in St Peter's, Rome, with his father and brother. The monument was paid for by the prince regent, later George IV. BPL

**Stuart, house of.** One of Europe's most resilient royal dynasties, the Stewart or Stuart family ruled Scotland in direct descent for over three centuries from 1371 to 1688, inheriting also the thrones of England and Ireland in 1603. The family was of Breton origin, holding the office of *dapifer* or steward to the archbishops of Dol in Brittany before settling in Scotland at the invitation of David I who gave Walter FitzAlan the honorific title of high or royal steward in 1158. The title was subsequently made heritable and the family was known by the surname Stewart until the mid-16th cent. when, under French influence, it was modified to Stuart. The family's place in the royal succession came through the marriage of Walter, 6th high steward, to Marjory, daughter of Robert I Bruce. In 1371, the death without issue of Robert I's only son, David II, led to the accession of Robert Stewart (1316–90), the sole heir of Walter and Marjory, as King Robert II. The royal dynasty he founded proved remarkably durable, surviving recurrent periods of minority rule in the 15th and 16th cents. (including the succession in 1542 of a female infant), and going on to preside over the multi-kingdom empire created in 1603 when the Stuart king of Scots, James VI, inherited also the Tudor thrones of England and Ireland. Having weathered assassination (James I), rebellion (James III), deposition (Mary), and execution (Charles I), the dynasty's luck finally ran out in 1688 when the 12th Stuart monarch, James VII and II, was ousted in the \*Glorious Revolution. Though his successors could legitimately claim (increasingly diluted) royal Stuart blood, the direct descent and indefeasible hereditary right of the exiled 'pretenders' provided the ideological basis of the abortive Jacobite rebellions of the 18th cent. RAM

**Stuart, James Francis Edward** (1688–1766), the 'Old Pretender'. Son and heir of James VII of Scotland and II of England and Ireland by his second wife, \*Mary of Modena. The oddity of the catholic James II as head of the Anglican church-state was acceptable to protestant opinion only because his heir was the protestant Mary, daughter of a first marriage and wed to William of Orange. The birth of Prince James in June 1688 precipitated the Glorious Revolution. He was taken to France at his father's command in December 1688.

The propaganda querying his parentage was false, but the decision by Louis XIV to recognize him as heir to the British thrones when his father died in 1701 helped precipitate the War of the \*Spanish Succession. He participated in an abortive invasion of Scotland in 1708. In 1713 he was expelled from France to Lorraine. In late 1715 he joined the Scottish rising, fleeing from Montrose in the following spring. He was in Spain during the 1719 rising in the Highlands, returning to Italy to marry the Polish princess Clementina Sobieska, by whom he had two sons, \*Charles and \*Henry, and little happiness. He spent the last Jacobite rising, the '45, as a papal pensioner in Rome, happy to abdicate if Prince Charles succeeded. Latterly he had little to do except attend religious services. He died in January 1766. BPL

**Stubbs, George** (1724–1806). English anatomist and animal painter, especially of horses, Stubbs's work captures the English gentleman's enjoyment of rural life, at its peak in the prosperity of the mid-18th cent. Stubbs's paintings of race-horses, often with owner or groom, were particularly popular both in original form and as prints. Another recurring theme, of a lion attacking a horse, recalled an event Stubbs saw on a visit to north Africa. His anatomical skills ensured that the power and beauty of animals was captured without sentimentality. In 1766 Stubbs published *Anatomy of the Horse*, the result of ten years of dissection and drawing. At his death he was working on an anatomical study (now at Yale) comparing various species. Working with Josiah \*Wedgwood, he produced enamel paintings on earthenware including one of Warren \*Hastings, in the Memorial Hall in Calcutta. There are examples of Stubbs's work in the Royal Collection and principal galleries throughout Britain. JC

**Stubbs, William** (1829–1901). Bishop and historian. Stubbs was one of the last of the Victorian scholars who, like \*Macaulay, could pursue a separate career yet make a massive contribution to historical study. Born at Knaresborough, son of a solicitor, he remarked that under the shadow of the great castle, he could hardly fail to be interested in history. On graduating from Christ Church, Oxford, in 1848, he became a fellow of Trinity, Oxford, but in 1850 moved to a college living at Navestock in Essex. His private studies led to the regius chair of modern history at Oxford in 1866, which he held until 1883, when he became bishop of Chester, and from 1888 of Oxford. His *Select Charters* (1860) became prescribed reading for generations of undergraduates, he edited nineteen volumes of the *Rolls series*, and his *Constitutional History* appeared from 1873 to 1878. Though a devoted Tory and a high churchman, his historical approach was whiggish: of the English constitution he wrote that his aim was to trace 'a distinct growth from a well-defined germ to full maturity'. Stubbs was severely taken to task by 20th-cent. historians for sentimentality towards Parliament as an institution. But by refusing to acknowledge the context in which he lived and worked, they convicted themselves of the very fault of which they complained so loudly. JAC

**submission of the clergy**, 1532. By the submission, which convocation passed on 15 May 1532, the English church sur-

rendered its right to make provincial ecclesiastical laws independently of the king. It followed a campaign against the legal autonomy of the church, probably managed by Thomas \*Cromwell. The clergy promised to issue no new canons without royal licence, and to submit existing canons to a royally appointed committee for revision. It was passed with only seven bishops present, of whom three gave full assent. Sir Thomas \*More, a supporter of church immunities, surrendered the lord chancellorship the following day. Although it was a significant humiliation for the clergy, no major revision of church law followed. The submission was enacted as statute (25 Hen. VIII c. 19), later repealed under Mary I in 1554–5. EC

**subsidies** are transfer payments, usually made by government to individuals, groups, or institutions, to bring about a redistribution of welfare which could not be achieved through market forces. If a particular export industry is unable to maintain production and employment because international prices are too low, a subsidy on exports from the government might increase the firms' revenues sufficiently to keep them in operation. Governments have used subsidy payments to fulfil social objectives by subsidizing the cost of public sector housing through grant payments to local authorities which, in turn, have often subsidized the rents charged to benefit tenants on low incomes. The term 'subsidy' was also used, until the 18th cent., to describe grants of taxation. CHL

**Succession, Acts of**, 1534, 1536, 1543. Henry VIII used statutes to make the adjustments to the succession that his complicated matrimonial history necessitated. The first Act (25 Hen. VIII c. 22) declared Mary illegitimate as a consequence of his divorce from \*Catherine of Aragon. The second (28 Hen. VIII c. 7) after \*Anne Boleyn's execution declared both Mary and Elizabeth illegitimate and vested the succession in any future offspring of Henry's new wife, \*Jane Seymour: in the absence of legitimate issue the king was authorized to decide the matter by letters patent or will. The third Act (35 Hen. VIII c. 1), while recognizing Edward's claim, declared that should he die without heirs, Mary and Elizabeth would succeed in turn. By his will, made in December 1546, Henry repeated these arrangements but added that the succession would then go to the Suffolk line, offspring of his younger sister \*Mary. The Stuart line, descendants of his elder sister \*Margaret, was ignored. These repeated changes, from a man anxious to establish a clear succession, could only store trouble for the future. Lady Jane \*Grey's claim in 1553 was from the Suffolk line. Ironically, the winners, 56 years after Henry's death, were the Stuarts, whom he had tried to push aside because of his dislike of the Scots. JAC

**Sudan.** Former Anglo-Egyptian condominium. Britain became involved in the Sudan as a result of her occupation of \*Egypt in 1882. Formerly an Egyptian dependency, the Sudan was conquered by Muslim revivalist forces in 1885. Fearing that French colonial expansion in the region might threaten her control of the Red Sea route to India, Britain agreed to assist Egypt in reconquering the Sudan, which was

achieved at the battle of \*Omdurman in 1898. Britain and Egypt then ruled the country as a condominium and Britain tried to expand the Sudan's limited economy by encouraging cotton-growing. Independence was granted in 1956. KI

**Sudbury, Simon** (d. 1381). Archbishop of Canterbury. An Oxford doctor of civil law by 1349, Sudbury was an auditor in the papal court at Avignon until he was promoted to the bishopric of London in 1362. He served Edward III in embassies to Flanders and was a member of his council. Appointed archbishop in 1375 he incurred odium for supporting \*John of Gaunt. In 1380 he was appointed chancellor and asked Parliament to grant the third poll tax. During the \*Peasants' Revolt, his reported hostility to the rebels caused them to hunt him down; he was captured in the Tower of London and beheaded. RLS

**Suetonius Paullinus.** Governor of Britain 58–61. A native of Umbria, he waged a successful mountain campaign in Mauretania in 42. This experience may have influenced his posting to Britain, where he spent most of his governorship campaigning in Wales. Eventually in 60 he penned up the last resistance and the last of the druids in the island of Anglesey. Batavian auxiliaries forced the Menai Straits, the Britons were slaughtered, and the sacred groves put to the axe. At the moment of triumph, news came of the \*Boudiccan revolt in East Anglia. Suetonius reached London with his cavalry, but could not save it or Verulamium, before rejoining his advancing infantry in the midlands, where he destroyed the British force in battle. The new procurator, \*Classicianus, fell out with him and a commission under the imperial freedman Polyclitus removed him on a pretext, though not in disgrace. ASEC

**Suez canal and crisis.** The 106-mile canal links the Mediterranean, at Port Said, to the Red Sea. It was built by the international Suez Canal Company, under the guidance of Ferdinand de Lesseps, and opened in November 1869. The British gained an interest in 1875 when \*Disraeli purchased 40 per cent of the shares from the khedive for the government. It operated according to the Suez canal convention, signed at Constantinople in 1888, which promised free navigation. The canal was protected by British troops from 1883 until 1956. In July 1956 the Egyptian government, under Nasser, nationalized the canal despite the fact that the Canal Company's concession ran until 1968. Anglo-French military intervention in November failed to regain control of the canal, which reopened in April 1957. It was again closed during the 'Six Day War' of June 1967 and did not reopen until 1975. RAS

**Suffolk** is one of the largest and most beautiful of shires and its greater distance from London has saved it from some of the ravages inflicted on its southern neighbour \*Essex. The 'south folk', from whom the county took its name, formed part of the kingdom of the \*East Angles, which survived from the 6th cent. until overrun by the Danes in the later 9th cent. The county boundary to the south is the Stour, to the north the Little Ouse and the Waveney. The twin pivots of the county are Bury St Edmunds, described by \*Leland as 'a

## Suffolk

city more neatly seated the sun never saw', and Ipswich, in \*Camden's words 'the eye of the county'. The division between east and west is of long standing and in 1888, the two sections were given separate county councils. They were reunited in 1972.

In Roman times, Suffolk was part of the territory of the \*Iceni, and the \*Icknield Way cuts across the county from Thetford to Newmarket. In AD 61 \*Boudicca's rebellion slaughtered thousands of Romans and their allies and burned Colchester, Verulamium, and London. Burgh castle, defending the port of Caistor-by-Yarmouth, is one of the most impressive Roman remains in the country. By the 7th cent. the kingdom of East Anglia was of importance. The \*Sutton Hoo ship-burial, near Woodbridge, dating from c.630, is almost certainly the grave of one of their kings, probably \*Raedwald, who died c.625 and claimed, as \*bretwalda, sovereignty over the other English kingdoms. A diocese was established at \*Dunwich, c.630, later shared with North \*Elmham.

By the 8th cent. East Anglia was experiencing difficulty in fending off Mercia and Wessex. The area suffered severely from Danish raids from 861 onwards. In 870 King \*Edmund was martyred, allegedly transixed with arrows, and his body taken eventually to Beodricsworthe, to be known in future as Bury St Edmunds. The region fell under Danish rule from 878, when the treaty of \*Wedmore allotted it to \*Guthrum, but was recovered by \*Edward the Elder in the 920s. Dunwich lost its episcopal status to \*Thetford, and then \*Norwich.

The shire of Suffolk, now taking shape, was not an administrative unit, though treated separately in Domesday. There were two large liberties in west and east, the former belonging to the abbot of Bury, the latter to the prior of Ely. The rest was 'geldable' land, paying taxes directly to the king. Even this was further divided into an Ipswich district and Beccles in the north. The geldable area contained so few hundreds that, until the reign of Elizabeth, it shared a sheriff with Norfolk.

Throughout the Middle Ages, Suffolk was dominated by the two liberties and the many other religious houses. Strife between the abbot of Bury, one of the greatest of all foundations, and the townsfolk was sustained. In 1327 the town rioted and burned much of the abbey: in 1381, during the \*Peasants' Revolt, the lord chief justice and the abbot were beheaded. At the \*dissolution of the monasteries, the abbey was soon ransacked, though Camden wrote in the 1580s, 'the very carcass of its ancient greatness hath something of beauty'. The estates went mainly to the gentry and nobility, and a number of their towns were given parliamentary representation—Orford in 1512, Sudbury 1559, Aldeburgh and Eye in 1571, and Bury, belatedly, in 1614. In the 18th cent. the gentry began improving their estates, and Suffolk contains splendid examples of the work of William \*Kent at Euston, 'Capability' \*Brown at Ickworth and Heveningham, and \*Repton at Glemham Hall and Henham Hall.

Suffolk's prosperity was built on sheep, corn, and fish. The cloth trade, in the later Middle Ages, produced the profits for the fine churches at \*Long Melford, Framlingham, Lavenham, Eye, and Bury. In the absence of mineral

resources or heavy industry, population grew slowly. Dunwich's decline, due to erosion, was evident by the 14th cent., but Ipswich remained a busy port and Lowestoft became a major fishing harbour, particularly after the advent of the railway in 1847. But in the villages there was a steady drift from the land in the later Victorian period: of 531 parishes in the 1901 census, more than 400 had lost population since 1851. Felixstowe developed as a seaside resort in the 19th cent. and after 1945 became a substantial container-port, dealing with Europe. JAC

**Suffolk, Charles Brandon, 1st duke of** (1484–1545). Brandon managed a spectacular career from modest beginnings. A son of Sir William Brandon, standard-bearer for Henry VII at \*Bosworth, where he was killed, Brandon's rise began with the accession of Henry VIII in 1509: the king was seven years his junior. They were both fond of athletic pursuits and Brandon excelled in jousting. In 1515 he was given the wardship of Elizabeth, Lady Lisle, and created Viscount Lisle. The Garter followed. He fought in the campaign in France in 1513 and in February 1514 was made duke of Suffolk a few months after the death of the last de la Pole duke. His most extraordinary advance came in 1515 when, six weeks after the death of her husband Louis XII, he married \*Mary, queen of France and sister of Henry VIII. Brandon bought himself out of the king's anger with gifts. After this, despite Mary's death in 1533, he continued in favour, serving as earl marshal 1524–33, lord president 1530–45, chief justice in Eyre south of Trent 1534–45, and lord steward 1540–5. He commanded against the \*Pilgrimage of Grace in 1536 and campaigned in France in 1544. His two sons died of the sweating sickness in 1551, when the dukedom became extinct. JAC

**suffrage.** Since suffrage (the right to vote) can be the key to political power, it has been contentious since representative institutions came into being. The original county franchise seems to have included all freemen, whether freeholders or not. But an Act of Henry VI's reign in 1429 declared that 'great, outrageous and excessive numbers of people . . . of small substance and of no value' were voting at elections, and went on to limit the franchise to freeholders with land worth 40 shillings a year, free of all charges. This remained the franchise until 1832. But the effect of inflation, particularly in the Tudor period, was to weaken the qualification and increase the total electorate. The issue became lively after the Civil War. At the \*Putney army debates, \*Cromwell and \*Ireton opposed Rainborough and the radicals who pressed for a great extension of the franchise: where would it end, demanded Cromwell, if men 'who have no interest but the interest of breathing' were given the vote? In fact the subsequent Commonwealth regime cut the franchise dramatically to £200 p.a. property, though the old franchise was restored in 1660. \*Shaftesbury was still complaining in 1679 that 'men of mean and abject fortune' were voting.

In parliamentary boroughs the franchise had always varied but there were four main groups—corporation, freeman, burgage, and inhabitant householder. They ranged from Westminster, Bristol, and Coventry with thousands of voters, to Gatton, a \*rotten borough with two voters, and

Malmesbury, where the thirteen members of the corporation elected the two MPs. The Scottish representation was extremely narrow, before and after the Union of 1707. The burgh electorate totalled some 1,250, the counties about 2,500. In the whole country, there were fewer voters than in Suffolk.

In the 18th cent. arguments for extending the franchise were heard with increasing frequency without quite getting onto the political agenda. \*Wilkes argued in 1776 that 'the meanest mechanic, the poorest peasant and day labourer' was entitled to a vote, but nobody supported him and Lord \*North retorted that he was surely 'not serious'. From 1832 onwards, however, a number of measures, several of them claiming to be final, enlarged the suffrage to full democracy. By the \*Great Reform Act the urban franchise was made uniform at the £10 householder level, and in the counties the £50 copyholder was brought in to join the freeholders. The Scottish electorate rose from some 5,000 to 65,000. Radicals were far from satisfied and within a few years manhood suffrage was one of the six points of the \*charter. It was strenuously opposed, \*Macaulay insisting in 1842 that universal suffrage was 'utterly incompatible with the very existence of civilization'. The second Reform Act of 1867 moved one step closer, giving the vote to borough householders, including many working men, and the 1884 Act, by extending the same franchise to the counties, brought the total electorate to well over 5 million. The introduction of \*secret ballot in 1872 had freed voters from landlord or employer influence, though many continued to vote deferentially.

By the later 19th cent. the campaign to give the vote to women was well under way, though they had to wait until 1918, and then were given the vote only if they were over 30. The electorate was more than doubled and, at 22 million, was fast approaching that universal suffrage Macaulay had so much feared. Women under 30 gained the vote in 1929 and in 1969 the inclusion of persons between 18 and 21 brought in another 3 million new voters. The electorate in 2001 was estimated at more than 44 million (England and Wales just over 39 million, Scotland just under 4 million, Northern Ireland just over 1 million) out of a population of 56 million. Of these, 32,800,000 or some 75 per cent cast their votes. The vote is not available to convicted felons or certified lunatics, but is granted to resident citizens of the Republic of Eire. JAC

**suffragettes** were feminists who adopted militant methods to campaign for the parliamentary vote for women. Though by far the most famous members of the women's movement before 1914, their contribution to winning the vote has been much diminished by modern scholarship.

The term 'suffragette' was coined by the *Daily Mail* to distinguish them from the suffragists who had been working for the vote since 1866. The movement originated with Mrs Emmeline \*Pankhurst and her daughters Christabel and Sylvia, who founded the Women's Social and Political Union in 1903. They regarded militancy as justified in view of the failure to achieve the vote after 40 years of campaigning. In particular, the Pankhursts argued that women would

have to force the government to introduce its own bill instead of relying upon backbench legislation. To this end they attempted to mobilize public opinion against the post-1905 Liberal government. Initially this involved interrupting the meetings of leading politicians, attempting to enter the lobby of the House of Commons, and intervening at by-elections at which electors were urged to vote against Liberal candidates. However, the growing violence used by the police and the hostility of the public towards the suffragettes led them to change tactics. This involved window-breaking, setting fire to pillar boxes and buildings, destroying the turf at golf courses, ambushing cabinet ministers, and dramatic incidents like the slashing of a painting, the *Rokeby Venus*, by Mary Richardson in 1914.

As a result the authorities began to impose prison sentences on the suffragettes, who went on hunger strikes. In order to avoid the death of a suffragette in custody attempts were made at forcible feeding. However, this proved dangerous to health, and thus in 1913 the government resorted to special legislation, dubbed the \*'Cat and Mouse Act', to allow the authorities to release hunger-strikers but rearrest them when their health had improved. In 1913 Emily Wilding Davison foiled the government's strategy when she threw herself under the king's horse on Derby Day and died of her injuries.

Up to 1908 militancy attracted much publicity and pushed women's suffrage higher up the political agenda. This led more women to join the non-militant organizations than hitherto. The Pankhursts also proved notably successful as fund-raisers. Using Sylvia's artistic talents they marketed a wide range of products bearing suffragette slogans and colours (purple, white, and green). Mrs Pankhurst also undertook American lecture tours to raise money in 1909, 1911, and 1912.

On the other hand, their campaign clearly set back the cause by antagonizing many non-militant women and by alienating pro-suffrage members of Parliament. But the crucial weakness lay in the Pankhursts' hostility towards the labour movement and their failure to mobilize working-class men and women. This lack of a genuine mass movement explains why the government freely employed the police against them. By 1914 the Pankhursts' autocratic style had reduced the WSPU to a beleaguered group, loyal to the family, but losing impact outside it.

The outbreak of war in August 1914 rescued them from the impasse. They quickly accepted an amnesty whereby prisoners were released and militancy suspended. Mrs Pankhurst and Christabel effectively abandoned not only militancy but the women's cause itself. During the war they attempted to build a new role, this time in alliance with the government, by speaking on recruiting platforms and touring the industrial districts to urge workers not to go on strike. In the process they moved further to the right. In spite of, or perhaps because of, the suspension of the Pankhursts' campaign, the vote was granted to 8.4 million women in June 1918, and at the 1918 election their efforts were rewarded when the coalition leaders agreed to give Christabel their support as a parliamentary candidate in Smethwick. She was, however, defeated by Labour, and

## suicide

the Women's Party created to promote her candidacy promptly folded. Thereafter Mrs Pankhurst spent much of her time lecturing in North America, Christabel gave up politics for religion, and Sylvia adopted several causes including the British \*Communist Party and the defence of Abyssinia against Italian occupation in the 1930s. Most ex-militants left public life, though some, such as Lady Rhondda, pioneered new women's organizations including the Six Point Group and the Open Door Council. Militant methods, however, were not resumed. MDP

**suicide.** Whereas in ancient Greece and Rome (for example, Socrates and Seneca) and in Japan (seppuku or hara-kiri) suicide was sometimes considered honourable, the judaeo-Christian tradition and Islam have rejected the taking of one's own life as self-murder. God alone gives life and takes it away. But martyrdom, dying for a religious cause, blurs the distinction. Early Christian martyrs were almost theatrically suicidal as they went to death; mass suicide of Jews at Masada (AD 74) and at York (1190) and of cultic followers in Guyana (1978) also makes distinction difficult. Augustine (428), later church councils, and Aquinas condemned suicide as sinful and secular powers made it a crime. The custom of burying suicides in unconsecrated ground at crossroads, with stakes driven through their hearts to prevent their ghosts causing harm, ended in 1823 and property ceased to be confiscated (1870). Though no longer criminal in Britain (1961), suicide is still widely regarded as sinful. The issue is now ethically complicated by the advance of medical science, whereby the life of the elderly or terminally ill can be greatly extended to the detriment of themselves, relatives, and society. Meanwhile 'living wills' to prevent unnatural lengthening of life become more commonplace. WMM

**Sullivan, Sir Arthur** (1842–1900). Sullivan's musical pedigree was Mendelssohnian and the influence may be traced in much of his music, particularly *Iolanthe*. He was born in Lambeth Walk (London), son of a professional musician at one time bandmaster at Sandhurst. Blessed with a fine voice, Sullivan was a chorister at the Chapel Royal and was publishing by the time he was 13. In 1856 he won the Mendelssohn scholarship and entered the Royal Academy of Music. From 1858 to 1861 he studied at Leipzig. At the age of 21 his incidental music for *The Tempest* won great acclaim. In 1866 he produced his only symphony and was offered the professorship in composition at the academy. The following year his short comic opera *Box and Cox* received its first performance. The year 1870 saw the overture *Di Ballo*—stylish and elegant—and 1873 the oratorio *The Light of the World*. The great collaboration with \*Gilbert got off to a faltering start in 1871 with *Thespis* but took fire in 1875 with *Trial by Jury*. *Pinafore* (1878), *The Pirates of Penzance* (1879), and *Mikado* (1885) followed in quick succession. The Savoy theatre, specially built by D'Oyly Carte for the operas, opened in 1881. Sullivan's serious work continued with *The Golden Legend* (1886) and *Ivanhoe* (1891). The last of the collaborations, *The Grand Duke*, was put on in 1896. He was knighted in 1883 at \*Gladstone's suggestion. His popular pieces included 'Onward Christian Soldiers' (1871) and 'The

Lost Chord' (1877), written on the death of his brother Frederick. Sullivan possessed a wealth of melody, brilliant orchestration, considerable poetry, and much humour. The serious work is good; the comic operas incomparable. JAC

**sumptuary laws** appear to have reflected a view of society as a pyramid of social groups which had to be held together by preventing too great a variation in overt affluence. Such laws were enacted in many countries between the 14th and 17th cents., and sought to prevent ostentatious display by the wealthy, and to keep the lower orders in their place. A statute of 1337 in England restricted the wearing of furs to those with an income of £100 p.a., while a later scale confined ermine to the richest and restricted the poor to the furs of humble creatures, such as the cat, coney, or fox. By the Tudor period, English laws applied only to clothing and were repealed at the end of the 16th cent. Such laws were used for other forms of social engineering, by Peter the Great for whom western dress was a means to modernize Russia, while the English tried to impose a dress code on the Irish as a civilizing stratagem. CHL

**Sunday observance.** See SABBATARIANISM.

**Sunday schools.** The English Sunday school movement is usually associated with Robert Raikes of Gloucester (1735–1811), the founder of the Sunday School Union. From 1782 Raikes established classes, often on Saturdays as well as Sundays, for children of the poor who were in employment for the rest of the week. Adults also received instruction. The curriculum was partly secular, consisting largely of reading, writing, and religious education. The movement saw its task as the inculcation of religion and the elimination of radical ideologies which had spread since the industrial revolution. A century after the movement began, over  $\frac{3}{4}$  million children in England were attending these schools. As economic conditions improved, restrictions on the use of child labour increased and with the introduction of day schools the role of the Sunday school became restricted to religious instruction taught on Sundays. PG

**Sunderland, Charles Spencer, 3rd earl of** (1674–1722). Whig politician. Son of the 2nd earl, he entered Parliament in 1695 and shone as a gifted Whig spokesman. His marriage in 1700 to a daughter of the \*Marlboroughs enhanced his political connections, and it was to the duchess and Lord Treasurer \*Godolphin that he owed his appointment as secretary of state (southern department) in 1706, becoming the first \*Junto leader to attain office under Queen Anne. Impetuous and temperamental, his determination to see \*Sacheverell impeached cost him the queen's favour in 1710. Much to his mortification he was given only token office at George I's accession, and intrigued against the effective leaders \*Walpole and \*Townshend until in 1717 he replaced the latter as secretary of state (northern). In 1718 he became 1st lord of the Treasury and shared leadership of the administration with \*Stanhope. His scheme for reducing the national debt led to the \*South Sea bubble in 1720, the fall-out from which forced him to surrender the premiership to Walpole in 1721. He nevertheless retained personal influence

with the king, dying suddenly in the midst of the election in 1722. AAH

**Sunderland, Robert Spencer, 2nd earl of** (1641–1702). Clever, urbane, and supremely self-confident, Sunderland was undoubtedly the most durable politician of the late Stuart age. After an ambassadorial career, he was appointed in 1679 secretary of state but dismissed in 1681 for supporting \*'Exclusion'. Through his influence with Charles II's mistress Louise de Kéroualle he was reappointed in 1683 and for the next six years was effectively chief minister. An expert in foreign affairs, he promoted royal pro-French policies, and in addition to his control over patronage master-minded James II's catholicizing campaign, becoming a catholic himself in 1688. Upon William's 'invasion', Sunderland insisted that James reverse his policy, but was dismissed. Briefly exiled in Holland, he returned in 1690, reconverted, and by 1693 had emerged as William III's political 'manager' behind the scenes, a role which he fulfilled without taking office until 1697 when he was made lord chamberlain. Parliamentary hostility forced his resignation shortly afterwards, but the king retained him in his counsels. AAH

**Super anxietatibus**, 1176. William the Lion, king of Scotland, captured at Alnwick in 1174, was obliged to make sweeping concessions to Henry II at the treaty of \*Falaise, including homage for his kingdom. He also promised that the Church of Scotland would be subject to the Church of England. The archbishop of York claimed authority over the bishops of Whithorn and Glasgow. But by the bull *Super anxietatibus*, Pope Alexander III forbade the archbishop to exercise that authority and, in effect, freed the Scottish church from English control. The terms were repeated by the bull \**Cum universi* in 1192. JAC

**Supremacy, Act of**, 1534 (26 Hen. VIII c. 1). This Act, passed in the sixth session of the Reformation Parliament in November–December 1534, defined the headship of the English church, which Henry VIII had progressively asserted over the previous two to three years. The Act claimed merely to 'confirm and corroborate' the pre-existing right of the king and his successors to be supreme head on earth of the Church of England. Already in the preamble to the Act in Restraint of \*Appeals of 1533, the 'Supreme Head and King' had been defined as having 'whole and entire power' over clergy and laity alike. However, whereas earlier legislation had limited itself to specific fiscal and legal aspects of church authority, the Act of Supremacy conferred personally on the king all spiritual authority to reform abuses and correct doctrine. On 15 January 1535 Henry included the supreme headship in the royal style, and around then transferred its authority to a spiritual 'vicegerent', the layman Thomas \*Cromwell. Such personal control over spiritual issues, as well as spiritual people, was unique to the Henrician supremacy; the title of supreme head was abolished by Mary I in 1554–5 (1 & 2 P. and M. c. 8), to be replaced by the more muted title of 'Supreme Governor' under Elizabeth I. EC

**Surrey**, once a kingdom, became, in the course of the 19th cent., largely a suburb and dormitory of London. Its main

ivers, the Mole and the Wey, drain into the Thames, which forms the northern boundary. Across the middle of the county run the chalk downlands, from Farnham to Guildford along the Hog's Back, and east to Dorking and Reigate. The southern border with Sussex is the line of the Weald, for centuries densely forested and a great obstacle to travel. Separating Surrey from Hampshire to the west were the sandy and infertile soils around Bagshot, and as late as the 19th cent. much of the county remained uncultivated. The meaning of the name—Suth-rige—as the land or region of the south people prompts the suggestion that the area may have formed part, in the early Saxon period, of a larger kingdom with \*Middlesex or \*Essex. So small a kingdom was bound to have difficulty in resisting more powerful neighbours, particularly \*Kent, \*Mercia, and \*Wessex. Ecclesiastically, it came at an early period under the authority of the bishopric of \*Winchester, founded in 660.

The region suffered considerably from Danish attacks from the 9th cent. onwards. In 851 a Danish force was cut to pieces at Ockley, south of Dorking, but there were further depredations in the 870s and again in the 1010s. By the latter date, Surrey had become a recognized county unit. Kingston upon Thames, close to the Wessex–Mercian border, was a royal town, and a number of Wessex coronations and burials took place there.

But as early as the \*Domesday survey in 1086 the future pattern of the county could be perceived. Much of the shire was still waste and relatively inaccessible. Only two towns were separately identified—Guildford, the county town, and Southwark, itself a suburb of London: the other towns were of only local significance. Surrey remained a predominantly agricultural county, producing mainly for the London market. \*Camden, visiting towards the end of Elizabeth's reign, found the shire 'exceeding pleasant: the parks are everywhere stored with deer, and the rivers with fish'. But \*Defoe, surveying west Surrey 150 years later, was less impressed: 'here is a vast tract of land, some of it within seventeen or eighteen miles of the capital city, which is not only poor, but even quite sterile, given up to barrenness, horrid and frightful to look on, not only good for little, but good for nothing—much of it is a sandy desert.' Guildford was busy, though the assizes were not held there; Woking 'is very little heard of in England', Leatherhead 'a little through-fare town'. But towards London it was different. There were large numbers of gentlemen's seats, Croydon was 'a great corn-market' for the capital, and Southwark had 'a prodigious number of inhabitants'.

In the first census of 1801, we can trace the effects of the capital on the county. The inner towns were still small—Kingston 4,400, Epsom 4,400, Farnham 4,300, Godalming 3,400, Dorking 3,000, and Guildford 2,600. But Lambeth had 28,000, Newington 10,000, and Southwark 66,000. By the 1840s the railways were pushing out into the shire. In 1851 Lambeth was 139,000, Southwark more than 100,000. By 1901 the suburbs had taken over—299,000 in Lambeth, 259,000 in Camberwell, 169,000 in Battersea, 134,000 in Croydon. In the 1990s, Surrey retained its county status.

The pivotal point of the county may be said to be at Merstham, where the M25 crosses the Gatwick to Victoria

## Surrey

line, reminding us that, because of its geographical position, Surrey has historically been a county of people on the move. JAC

**Surrey, Henry Howard, Lord** (c.1517–47). Grandson of Thomas, duke of \*Norfolk, the victor of \*Flodden. In high favour at the court of Henry VIII, he was made KB, given the Garter and, at one time, considered as a possible husband for the Princess Mary. He served against the Scots in 1542, then against the French, and 1545–6 was governor of Boulogne. But in December 1546 he was accused of treason for quartering the arms of \*Edward the Confessor and beheaded on Tower Hill on 19 January 1547. His father, also attainted, escaped execution when Henry died on 28 January. Surrey, though clearly proud and indiscreet, was victim of Henry's senile suspiciousness and the machinations of his rival the earl of Hertford (\*Somerset). He was a poet of some note. JAC

**Surrey, kingdom of.** The name 'Surrey' means the southern region, and at some time must have been linked with Middlesex north of the Thames. This could have been relatively late in the story of Anglo-Saxon settlement. There is no royal dynasty associated with Surrey, and the most impressive evidence for its early history is a charter of c.672–4 granting land at Chertsey to Eorcenwold, bishop of London, issued by Frithuwold, a subking for the Mercian ruler \*Wulfhere. Indeed the early history of Surrey must be looked for in the existence of small groups practising transhumance into the weald after the pattern of similar groups which have been identified in Sussex and Kent. These smaller units may well have developed into larger regions centred on Kingston and Wallington in central and eastern Surrey and on Woking and perhaps Godalming to the west. The fortunes of Surrey were naturally closely bound up with the fortunes of London. The powerful Mercian kings of the 8th cent. maintained control, but in 825, when \*Egbert of Wessex defeated the Mercians at \*Ellendun, the people of Kent and Surrey and the South Saxons submitted to him because, in the words of the *Anglo-Saxon Chronicle*, 'they had been wrongfully forced away from his kinsmen'. From that time Surrey was an integral part of greater Wessex. HL

**Susa, treaty of, 1629.** In 1627 Charles I, already at war with Spain, began a conflict with Louis XIII of France. Attempts to relieve the Huguenot port of La Rochelle, besieged by Richelieu's troops, having failed, peace was made at Susa in Savoy in April 1629. Louis and Charles agreed not to interfere in the religious affairs of each other's kingdoms. JAC

**suspending power.** Though the monarch could not arbitrarily repeal a statute, he claimed, as executive, the right to suspend its operation. This was an intelligible safeguard at a time when parliaments were summoned infrequently. Controversy began when Charles II, who disapproved of the penal laws against religious dissidents, issued a \*Declaration of Indulgence in 1672 to circumvent them. He was forced by the Commons to withdraw it. James II repeated the attempt in 1687 and indicted the \*seven bishops for questioning the validity of his actions. The bishops were acquitted, Sir John Powell declaring, 'if this be once allowed, there will need no

Parliament.' The same day, a message was dispatched to William of Orange, begging him to rescue the liberties of the subject. By the \*Bill of Rights in 1689 the suspending power of the crown was abolished. See DISPENSING POWER. JAC

**Sussex** was for centuries a byword for inaccessibility, cut off by the north downs and the heavily wooded weald, and proverbial for muddy lanes. It was one of the larger of the shires—80 miles from Chichester harbour in the west to Rye in the east. Almost all the rivers drain south into the Channel—the Arun, Adur, Ouse, Cuckmere, and Rother. The south downs run across the county west–south-east, falling into the sea at Beachy Head.

In Roman times the local tribe was the \*Regni, ruled over in Caesar's day by \*Commilus. At the time of the Roman conquest, the king was \*Cogidubnus, who submitted and whose title was recognized. The Roman capital was \*Chichester (Regnum) and a later fort was built at Pevensey (Anderida). The Saxon settlement in the area is curiously and perhaps deceptively precise. The *Anglo-Saxon Chronicle* relates that \*Ælle and his three sons came to Britain in 477 (perhaps earlier?) and that one of the sons, Cissa, took Pevensey in 491 and slew all the Britons. Some support is given by the assumption that Chichester is derived from Cissa-centre. By \*Bede's time, the kingdom of the South Saxons—Sussex—was well established. Though its geographical isolation did not allow for easy expansion, neither did it permit easy conquest, and the line of Sussex kings continues until the later 8th cent., when the region fell under \*Mercia and then \*Wessex. The first bishopric for the area was established by \*Wilfrid at Selsey c.681, but transferred by \*Stigand to Chichester soon after the Norman Conquest.

The size of the area made it a manageable unit for the shire system which developed in the 10th cent., but there were several local characteristics. First, the county was, uniquely, divided into six \*rapes—strips centred on Chichester, Arundel, Bramber, Lewes, Pevensey, and Hastings. The word is of Old English origin, though it has been suggested that they were Norman military areas. Secondly, the difficulties of east–west communication meant that Sussex fell naturally into sections. The rape of Hastings was probably the territory of the Haestingas, who formed a subkingdom. Later, the county divided into a western section, based on Chichester, and an eastern section, based on Lewes. When parliamentary representation developed in the later medieval period, the convention was to choose one MP from each section. In 1832, when the county was awarded four MPs, the convention was formalized and the divisions of East and West Sussex created.

The sea coast being difficult and the only large harbours at Chichester and Rye, the Sussex ports remained local. The connection with Normandy ensured a modest prosperity but the spectacular medieval development was in iron manufacture, eked out by smuggling. \*Camden, writing in the 1580s, noted that Sussex was 'full of iron mines everywhere . . . a great deal of meadow-land is turned into ponds and pools, for the driving of mills by the flashes; which

beating with hammers upon the iron, fill the neighbourhood round about, night and day, with their noise.' But in the late 17th cent. cheap Swedish iron, the exhaustion of the forests, and competition from Shropshire led to a decline, and by 1788 there were only two furnaces left.

Dr John Burton, a fastidious observer, drew an unflattering portrait of Sussex farmers in the mid-18th cent., deploring 'the inelegant roughness and dull hilarity of their conversation; being illiterate, they shun the lettered, being sots the sober. Their whole attention is given to get their cattle and everything else fat.' The transformation of Sussex from a remote rural county of farms and small market towns was the result of two developments—the growing taste for seaside holidays and the coming of the railways. Brighthelmstone was described by \*Defoe in the 1720s as 'a poor fishing town, old built', fast eaten away by an 'unkind' sea. In the 1750s Richard Russell, a physician, drew attention to the value of sea-bathing and built some lodgings. The prince regent's visit in 1782 and his plans for the Pavilion put \*Brighton on the fashionable map and thereafter its growth was prodigious. By 1801 it was already nearly twice the size of Chichester and by 1851 bigger, at 65,000, than all the other Sussex towns put together. The Sussex coast, only 50 miles from London, was one of the first regions to be opened up by the railways, the London to Brighton arriving in 1841 and throwing out branches east and west in the next few years. By 1901 Brighton was well over 100,000 and had acquired county borough status in 1888. It was now pursued by other local resorts. Hove, its neighbour, had a population of 100 in 1801 but 29,000 100 years later. By 1901, Eastbourne had 42,000, Hastings 52,000, and Worthing 20,000. Bognor left its run until the 20th cent., profiting from the convalescence of George V in 1929. The concentration of population along the coastal fringe has been mitigated by the development of Crawley, one of the first post-war new towns, with a population by 2002 of 97,000. East and West Sussex retain their county status, with Brighton as a unitary authority.

Among the great attractions of Sussex are the Pavilion, Arundel, Goodwood, Sheffield Park, Uppark, and Battle abbey. \*Kipling lived at Bateman's at Burwash in East Sussex, Hilaire Belloc at Shipley, near Horsham. Debussy wrote his tone poem *La Mer* while staying at the Grand Hotel, Eastbourne, in 1905. JAC

**Sussex, East.** By a long-standing tradition, the large county of Sussex had its eastern and western parts, looking to Lewes and to Chichester. The county courts, quarter sessions, and usually the assizes were held alternately, and in 1832 the Reform Act recognized the situation by giving two representatives to each division. In 1888 separate county councils were established for East and West Sussex, and this arrangement was continued by the Local Government Act of 1972. In the 1990s East Sussex retained its county status, with Brighton and Hove made a unitary authority. JAC

**Sussex, kingdom of.** Sussex was ruled by its own kings from the time of \*Ælle (c.477), who is said by \*Bede to have been the first overlord (\*bretwalda) of the southern English, to the end of the 8th cent., but for most of that period the

kings (sometimes referred to not under a royal title but as *duces* or \*ealdormen) were subordinate to other rulers. In spite of its relatively small size and compact geographical location from the south coast to the weald, Sussex was a complex political unit. Its earliest charters show that it was divided among a number of kings at times with a marked division between East Sussex, probably centred at Lewes, and West Sussex with a centre in the Chichester area. Hastings and its immediate surroundings always preserved individual characteristics, closer to Kent and even as late as 771 referred to specifically as the land of the *gens Hastingorum*. Socially Sussex developed in some isolation. It was the last substantial kingdom to receive Christianity, owing its conversion to St \*Wilfrid during his exile from Northumbria in the early 680s. Wilfrid was granted an extensive estate at Selsey by Æthelwath, who was himself a Christian, and from 709 Selsey became the centre for a bishopric, ultimately transferred to Chichester in 1075. In the 8th cent. Sussex was tributary to the Mercian kings, but after 825 the West Saxon dynasty under \*Egbert and his successors took control, treating it, together with Surrey and Kent, as a suitable subkingdom for West Saxon princes. \*Alfred established an important burh at Chichester, and Sussex was easily absorbed into the shire system of later Anglo-Saxon England. HL

**Sussex, Thomas Radcliffe, 3rd earl of** (c.1525–83). Radcliffe was well connected. His mother was a daughter of the 2nd duke of \*Norfolk: his grandfather had married the niece of Elizabeth, Edward IV's queen. He fought with distinction in the French campaign of 1544 and at \*Pinkie in 1547. Though he signed the proclamation of Lady Jane \*Grey in 1553, his father was one of the first to declare for Mary and was in command of her forces at Framlingham. Radcliffe's wobble does not seem to have done him harm. He was summoned to Parliament in his father's barony of Fitzwalter, made captain of the gentlemen pensioners, and entrusted by Mary with the suppression of \*Wyatt's rising. He succeeded his father as earl in 1557 and was given the Garter. In 1556 he was sent by Mary to Ireland as lord keeper with instructions to promote the catholic cause. He was active against the O'Neills in Ulster and led a punitive expedition against their allies, the Scots of the Islands. Elizabeth reappointed him, making him lord-lieutenant, but his renewed campaign against the O'Neills made little progress. He resigned in 1565 and from 1568 to 1572 was lord president of the Council of the North, helping to put down the rising of the \*northern earls in 1569. From 1572 until his death he was lord chamberlain. At court he was a rival to \*Leicester, of whom he spoke scathingly. JAC

**Sussex, West** was given a separate county council in 1888, with its county headquarters at Chichester, and the arrangement was continued in 1972. The Banham commission in 1994 recommended no change in the two-tier system for West Sussex, which retains its county status. See SUSSEX, EAST. JAC

**Sutherland, Graham** (1903–80). Painter. Sutherland studied art at Goldsmiths College, London, after abandoning a

## Sutton Hoo

railway engineering apprenticeship. His early work, influenced by Samuel \*Palmer, was in etching and engraving, before he moved into ceramics and painting. During the Second World War, as an official war artist, he produced powerful studies of air-raid devastation in London and Swansea. A number of important public commissions followed, including a *Crucifixion* for St Matthew's, Northampton (1944), and, one of his most celebrated works, the design for the tapestry *Christ in Glory* in the new Coventry cathedral in 1962. A portrait of Somerset Maugham (1949), now in the Tate Gallery, was the first of several strong representations of famous people. That of Winston \*Churchill was commissioned by Parliament, but destroyed by the sitter's wife. Sutherland's first love remained landscape, especially in Wales, where he established a gallery at Picton castle. JC

**Sutton Hoo.** A site containing up to 20 Anglo-Saxon burial barrows (c. AD 400–700) on the east bank of the Deben estuary in south-east Suffolk, opposite Woodbridge. Since 1982 archaeologists have shown that the barrow area, almost 10 acres, was superimposed on an extensive burial field in use since the 2nd millennium BC, and possibly associated with a stock-rearing society. The region as a whole is rich in 'find spots' over 2½ millennia: Sutton Hoo is here centrally situated, and the barrows given a context as a 'compound'.

In 1938 three barrows were excavated, one of which had been a boat-burial. In pre-AD 800 Europe the only other group of comparable burials is at Vendel-Valsgärde in central Sweden. In 1939 the largest barrow, some 120 feet in length and over 12 feet high, was opened. The depth of its extraordinarily rich deposit, almost certainly the inhumation of a king, possibly \*Raedwald who died about AD 625, had protected it from robbery. The deposit lay in the centre of a 90-foot-long rowing boat, the largest known from this era. The objects, of supreme local craftsmanship in gold, of lesser craftsmanship in eastern Mediterranean silver, and including a whetstone sceptre and a mysterious 'iron standard', immeasurably widened knowledge of 'Dark Age' culture. While a fragmented helmet had been unusually wrought from one piece of iron, the shield boss and sword pommel can only be paralleled by Swedish finds. Though virtually all traces of a corpse had been dissolved by the acidic sand, the evaluation of the furnishings required the expertise of 96 investigators over 30 years. This revelation of the Germanic world of the 'Age of Migrations' stands comparison with the tomb of Tutankhamun. The finds have now been returned to Sutton Hoo. DDA

**Swan, Sir Joseph Wilson** (1828–1914). Born at Sunderland and educated in local schools, Swan was apprenticed to a local pharmacist. In his spare time he carried out electrical and other experiments. He attended lectures and read scientific books and journals at the Sunderland Athenaeum, before moving to Newcastle upon Tyne, where he became a partner in a pharmacy. A photographic business and a scientific instruments department were soon added. Swan invented an improved photographic printing technique, the 'Carbon Process' (1864) and the 'Bromide Paper' (1879), which is still in use. In December 1878 and February 1879 he demonstrated his first incandescent electric bulbs. To

provide his lamp filaments, Swan invented the first synthetic fibre. Legal disputes between the Swan and Edison lighting interests were solved by creating a joint venture. Swan lived in the south of England from 1883; he received many honours, including fellowship of the Royal Society in 1894 and a knighthood in 1904. NMcC

**Swansea.** Town of south Wales located at the mouth of the river Tawe (Abertawe). The name, Scandinavian in origin, reflects post-Roman Viking activity, but there is no evidence of settlement until the site was developed as a castle borough by Henry de Beaumont, the first Norman lord of Gower. After 1717 it became the centre of the early Welsh metallurgical industry, mainly copper, lead, and silver. Coal and coke transformed the industry and a specialization developed in coated steel plate, tinplate, and galvanized sheet. Initially production was in small mills but now only one integrated plant remains. An associated chemical industry devastated the lower Swansea valley but it has been extensively reclaimed. The port role is reflected in an oil refinery. Swansea acquired city status in 1969 and is now an industrial and administrative centre for the western coalfield. Its population in 2002 was 231,000. Ten per cent spoke Welsh. HC

**Swansea and Brecon, diocese of.** In 1923, three years after the disestablishment of the Church in Wales, those parts of the ancient diocese of St Davids within the counties of Breconshire, Radnorshire, and western Glamorgan were formed into a new see of Swansea and Brecon, with the cathedral at the medieval priory church of St John in Brecon itself. The name of the see reflects the two focal points. The northern part of the diocese, the old archdeaconry of Brecon, is almost entirely rural, sparsely populated, and overwhelmingly dependent upon agriculture. By contrast the southern part, centred upon the city of Swansea, is almost entirely urban and industrial. Throughout the diocese's short history there has been pressure for the see to be in Swansea, rather than in a small town 40 miles away, but it remains a diocese with two centres. In recent years the elevation of the large parish church of St Mary in Swansea, rebuilt after bombing in 1941, to collegiate status has gone some way to giving the two ends of the diocese a degree of parity. There have been seven bishops of Swansea and Brecon since the formation of the see, but none have become archbishops of Wales whilst holding it, though two did subsequently on translation to Llandaff. JRG

**Swaziland.** Former British high commission territory. In the 19th cent. the Bantu kingdom of Swaziland was under intermittent threat from Zulus, from would-be Boer (Afrikaner) settlers, and from British administrators in \*Natal. In 1906, along with \*Botswana and \*Lesotho it was placed under the jurisdiction of a British high commissioner. When the Union of South Africa was created in 1910 the three territories were excluded from its authority because of British qualms about the Union's racial policy, which subsequent events were to justify. Nevertheless, Swaziland relied heavily upon its economic contacts with South Africa, which were strengthened after the country became independent in 1968. KI

**Sweden, relations with.** Sweden became a great power in northern Europe in the 17th cent., a matter of importance to England on account of both Baltic naval stores and Swedish championship of the 'protestant' cause. Charles XII further enhanced Sweden's importance, and the British were soon torn between concern over Russian advances in the Baltic and suspicion of Charles's own ambitions. Under George I (with his Hanoverian interests) the British briefly became the enemy of both. In the end fears of Russian preponderance meant that Britain played a leading role in seeking peace between Sweden and her western enemies, an outcome assisted by the death of Charles XII in 1718. Sweden, however, was soon in decline, and Britain enjoyed only limited success in the bewilderingly complicated rivalries in the Baltic region in the 18th cent. Between 1812 and 1814 she played a leading role in the transfer of Norway from Denmark to Sweden, as a reward for the Swedes casting their lot against Napoleon. In 1814 the British put pressure on the Norwegians to accept the change, while trying to secure for them as much autonomy as possible. CJB

**Swedenborgians** were followers of Emanuel Swedenborg (1688–1772), a Swedish scientist and diplomat who taught that there are correspondences between the visible forms of nature and the invisible world of the spirit. In 1787 some of his followers started the New Jerusalem church. Their teaching that the end of creation could be achieved only through man had radical implications and they were particularly strong in Manchester where they were known as \*Bible Christians under the leadership of William Cowherd, a Church of England curate, Joseph Brotherton, MP for Salford, and James Scholefield, supporter of Henry \*Hunt and Feargus \*O'Connor. ER

**Sweyn Estrithsson** (d. 1074), king of Denmark (1047–74). Overshadowed by the energy and glamour of his rival \*Harold Hardrada, king of Norway, Sweyn nevertheless contributed mightily to the stabilization of the Danish monarchy and at various stages posed a significant threat to the rulers of England. The son of \*Cnut's sister Estrith and Jarl Ulf (Earl \*Godwine's brother-in-law), Sweyn was actively interested in English affairs in the 1040s when two of his brothers, Beorn and Osbern, were prominent among the Anglo-Danish nobility at the court of \*Edward the Confessor. Concentration on Danish security after 1047 precluded serious prosecution of a claim to the English throne as Cnut's heir but Sweyn's existence as a possible heir to the childless Edward and his powerful Danish fleet made him a consistent element in the tangled northern politics of the age. After the death of Harold Hardrada at \*Stamford Bridge in September 1066 and the subsequent Norman conquest of England, Sweyn came to the forefront of English politics. In 1069 he sent a huge fleet which sacked York, inflicting a rare defeat on the Normans. He intervened in person in the spring of 1070 in Humberside and off the East Anglian coast in support of \*Hereward's resistance at Ely. William, however, came to terms, more or less buying him off, and Sweyn's death on 28 April 1074 signals a virtual end to any revival of Cnut's Anglo-Danish kingdom. HL

**Sweyn Forkbeard** (d. 1014), king of Denmark (c.985–1014), king of England (1013–14). For some 20 years before 1013 Sweyn Forkbeard was involved in sporadic heavy raiding against England, in 994 in the company of Olaf Tryggvason of Norway, later an arch-enemy. Attacks intensified after 1004, some said in revenge for the murder of his sister Gunnhild during the massacre of \*St Brice's Day, 1002. His principal effort came, however, in 1013 when, accompanied by his son \*Cnut, he invaded England through the Humber and the Trent, setting up his base at Gainsborough, where he was recognized as king by most of Anglo-Danish England, east of Watling Street. He then moved south where Oxford and Winchester surrendered immediately. Only London, incongruously defended in \*Æthelred's interest by the Viking chieftain Thorkell the Tall, held out against him, and when London finally submitted towards the end of the year, Æthelred was forced to flee to Normandy. For five or six weeks Sweyn was thus in control of all his newly conquered kingdom of England, but on 3 February 1014 he died at Gainsborough. Cnut was too inexperienced at that stage to do more than withdraw to Denmark, leaving behind him a reputation for cruelty and treachery, and opening the way for Æthelred's return. HL

**Sweyn Godwineson** (d. 1052). The eldest son of Earl \*Godwine, Sweyn was awarded an earl's title in 1043 but a wild streak in his nature led to personal disaster. In 1046 he seduced the abbess of Leominster, fled to Denmark, and on his forced return to England, apparently for some unspecified crime committed in Denmark, became responsible for the murder of his own cousin, Earl Beorn, at Bosham. This further crime was regarded as especially heinous. Beorn had been interceding with King \*Edward on Sweyn's behalf. By special procedures more Scandinavian than English, Sweyn was adjudged 'nothing' in an assembly of the whole army, that is to say 'a man without honour'. He was outlawed and took refuge in Flanders. The influence of his father and the support of Bishop \*Ealdred enabled him to return and he was appointed to an earldom which involved extensive jurisdiction in the western shires. His new powers did not last long, and he went into exile again in the autumn of 1051, this time with the rest of the Godwine family. He died on his way back from a penitential pilgrimage to Jerusalem, and so did not live to enjoy the rewards reaped by his brothers on their successful return to England in 1052. HL

**Swift, Jonathan** (1667–1745). Irish writer and clergyman, Swift's disturbing satiric vision and eccentricities have given rise to countless myths and legends about his life. Educated at Kilkenny School and Trinity College, Dublin, Swift became secretary to Sir William \*Temple, taking holy orders in 1695. The witty and notorious *A Tale of a Tub* (1704), an exposé of abuses in religion and learning, established Swift's reputation, and in 1710 he was recruited as a ministerial propagandist, writing the *Examiner* (1710–11) and *The Conduct of the Allies* (1711), an influential pamphlet defending the Tory government's peace overtures to France. Rewarded for his services by the deanship of St Patrick's, Dublin, Swift became embroiled in Irish politics after 1714. His later writings in prose and verse, most notoriously the scathing *Modest*

## swimming

*Proposal* (1729) for eating beggars' babies to solve the country's economic problems, largely consist of outspoken denunciations of English and Irish politicians. Despite the enduring relevance of \**Gulliver's Travels* (1726), Swift's reputation has suffered from the savagery and scatology of his satire, as well as his attacks on women. Myths have accumulated in particular around his relationships with Esther Johnson and Esther Vanhomrigh (the 'Stella' and 'Vanessa' of his poems), and his mental stability, principally on account of the debilitating bouts of vertigo and deafness, the result of Menière's syndrome, from which he suffered throughout his adult life. JAD

**swimming** was until recently confined to those living by lakes, rivers, or near the sea. The development of public baths and pools in the 19th cent. gave, for the first time, a chance for large numbers of people to learn to swim. After some early unsuccessful attempts, the Metropolitan Swimming Association was formed in 1869 and later became the Amateur Swimming Association. Like most of the sporting associations established in the later 19th cent. the ASA emphasized amateur status, trying to ensure that swimming remained free from corruption, whether from cash prizes or gambling. The feat of Captain Matthew Webb in swimming the English Channel from Dover to Calais in 1875 captured much attention for the sport. It was included in the Olympics in 1896 and an international regulatory body established in 1908. By the late 20th cent., swimming for leisure, along with competitive swimming, diving, water polo, synchronized, and long-distance swimming, was the most popular participant sport in Britain. JAC

**Swing riots**, 1830. Collective action by agricultural workers began in east Kent late in August 1830 with two attacks on the hated threshing-machines, which were believed to take winter work away from agricultural labourers. The disturbances continued until December and spread to much of southern and eastern England. The protesters combined demands for higher wages and tithe reductions with destruction of the threshing-machines. Barns and hay ricks were fired, and threatening letters—often signed by the mythical 'Captain Swing'—were sent in all directions. Hobsbawm and Rudé, in their classic study of the riots, considered them to be mainly a southern and East Anglian phenomenon, but subsequent research has revealed just how widespread Swing riots really were, with virtually every county south of the Scottish border involved. More than 1,400 separate incidents have been recorded. In the wake of the disturbances 19 people were executed, 481 transported, and more than 700 imprisoned. JVB

**syndicalists**. Disliking capitalism and fearing that the triumph of communism would merely introduce a different form of state oppression, syndicalists argued for the transfer of power to the trade unions, if necessary through a general strike. Their theorists included Proudhon and Sorel, they

formed links with anarchist groups, and had considerable influence in France, Italy, and Spain. In Britain their main contribution was to the concept of \*guild socialism. British trade unionists showed little interest in the theory and their creation of the Labour Party was a direct repudiation of syndicalist tactics: Ramsay \*MacDonald wrote a short book in 1912 denouncing syndicalism as class warfare. There was some syndicalist involvement in the labour unrest before 1914 and the \*General Strike of 1926 was certainly condemned by some as syndicalist, though few of the strikers had such grandiose ambitions. Though the slogan 'All power to the trade unions' does not seem to have much contemporary appeal, concern at the power of the state, capitalist or communist, remains a live issue. JAC

**Synge, J. M.** (1871–1909). Most gifted of the dramatists in the early days of the \*Abbey theatre. After studying Irish in his native Dublin and music in Germany he gravitated towards Paris, but a meeting with \*Yeats in 1896 helped persuade him of the literary possibilities of his own country and language. Visits to the Aran Islands encouraged the development of a poetic prose based on the patterns of native speech. In *Riders to the Sea* (1904) he invested the life of the islands with something of the dignity of Greek tragedy and *The Playboy of the Western World* (1907) better embodied the spirit of the new literature than the more academic efforts of Yeats and Lady \*Gregory. Like *In the Shadow of the Glen* (1903) it angered bigoted nationalists, reluctant to see Ireland's dirty linen washed in public; the use of the word 'shift' was found particularly offensive. JNRS

**synods**. A synod is a meeting of clergy, or clergy and laity, convened to discuss and decide upon matters of doctrine, church policy, and discipline. The meeting of bishops and representatives of the churches in the early centuries, the ecumenical councils, formulated through decree agreed statements of orthodoxy and belief. Throughout its history, however, all branches of the Christian church have summoned more local councils, synods, and assemblies, to debate and to rule on matters of current concern. Today in the Church of England a general synod meets once or twice a year with the traditional agenda. However, from the 19th cent. there was an increasing recognition that synods of the church should include lay as well as clerical representation, and the General Synod as now constituted contains three 'houses', the bishops, representatives of the clergy, and of the laity, the latter two made up of those successful in an electoral process. When the Church in Wales was disestablished in 1920, the synod then set up, the Governing Body, was given such a constitution. The process of democratization has spread through all levels of church life, and is common in different forms to most denominations. The fundamental purpose of the synod, however, remains the same. JRG

**Tacitus.** Roman historian born c. AD 55. He is the principal surviving historian of Roman Britain, dealing with the first forty years of the province. Unfortunately the portion of the *Annals* dealing with the Claudian invasion has not survived. Other passages of the *Annals* tell us of the governorships of \*Ostorius Scapula and Didius Gallus, and there are further snippets in the *Annals* and the *Histories*. In 77 he married the daughter of \*Agricola, soon to be governor of Britain, and his biography of his father-in-law survives. After a geographical introduction, he builds up to Agricola by belittling previous governors. The exceptionally long governorship of Agricola is structured by his seven seasons of campaigns, ending with the victory at Mons Graupius. In civil affairs Agricola does what a virtuous governor should. Though a very useful source, the *Agricola* should not be taken at face value. ASEC

**Taff Vale judgment,** 1902. Over 1,000 employees of the Taff Vale railway went on strike in 1901, and Beasley, the general manager, sought an injunction against their union, the Amalgamated Society of Railway Servants; this was first granted and then dismissed on appeal. However, the company's appeal to the House of Lords was successful, the union was sued for damages, and in December 1902 the Taff Vale Railway Company was paid £23,000. With costs, the union paid a total of £42,000. A crippling blow to trade unionism, this judgment was one reason why unions supported the infant Labour Representation Committee. JB

**Táin Bó Cuailnge** is the central story of the 8th-cent. Ulster cycle of heroic tales. The earliest versions are recorded in the 12th-cent. *Lebor na hUidre* (Book of the Dun Cow), the 12th-cent. *Book of Leinster*, and the 14th-cent. *Yellow Book of Lecan*. Set in pre-Christian Ireland, the *Táin* is the tale of a cattle-raid and invasion of Ulster by King Ailill and Queen Medb of Connacht, initiated as a result of their desire to capture the Brown Bull of Cuailnge. Cúchulainn single-handedly defends Ulster until the war-band can come to his aid. When they arrive the Connacht forces are decimated and in the end the Brown Bull is found dead. SMD

**Tait, Archibald** (1811–82). Archbishop of Canterbury. A Scottish Presbyterian by upbringing, Tait was educated at Glasgow University and Balliol College, Oxford. He was successively headmaster of \*Rugby (1842), dean of Carlisle (1849), bishop of London (1856), and archbishop (1869).

Ecclesiastically he had to cope with the advance of both liberalism and ritualism. Though a low churchman, he was no evangelical—'a big man, intelligent and able and rock-like and not in the least narrow'. Having protested against Newman's *Tract 90* (1841), he viewed the Anglican church not in \*tractarian terms as the catholic body in England, but as the national church, whose hallmark was comprehension. To preserve this, despite his own inclinations, he courageously and consistently vetoed prosecutions for ritualism under the Public Worship Act (1874). A conscientious bishop, he impressed Londoners by preaching in the open air in working-class areas and visiting them during a cholera epidemic. WMM

**Talavera, battle of,** 1809. On 28 July Wellesley's British army of 20,000 men, co-operating with Cuesta's Spanish army of 34,000 men (who saw little action), were attacked by 46,000 French commanded by King Joseph Bonaparte and Marshal Jourdan. A night attack achieved surprise but was thrown back. Then the French mounted a series of assaults against the British centre, followed by a turning movement in the north. All were unsuccessful. Although Talavera was a clear British victory, Wellesley, who had been abandoned by Cuesta, retreated to Portugal. As a reward for his victory, Wellesley was created Viscount \*Wellington. GDS

**Talbot, William Henry Fox** (1800–77). Pioneer of photography. A prosperous country gentleman from Lacock abbey (Wilts.), Talbot went to Harrow and Trinity College, Cambridge. An amateur scientist, in 1833 he began experiments to see if permanent images could be recorded on sensitized paper. In January 1839 his progress was reported to the Royal Institution and the Royal Society, explaining how 'natural objects may be made to delineate themselves without the aid of the artist's pencil'. His work was rivalled by Daguerre in France and other inventors. Daguerre's images were clearer, but Talbot's use of the negative made for easy reproduction. In 1867 he was awarded the gold medal at the Paris Exhibition. Talbot's book *The Pencil of Nature* appeared 1844–6, including 24 photographs, one of them a famous view of the boulevards in Paris, and a magnificently evocative 'The Open Door'. JAC

**Talents, Ministry of All the,** 1806–7. A coalition government formed in February 1806, following \*Pitt's death. Supposedly embracing 'All the Talents', it was composed of the

## Taliesin

followers of Lord \*Grenville and Charles \*Fox, bolstered by those of Lord Sidmouth (\*Addington). Some former Pittites were, nevertheless, excluded, despite their acknowledged abilities. The resignation of the Talents in March 1807 was precipitated by George III, who rejected a limited measure of catholic relief and demanded that this question never again be raised. The king called on the excluded Pittites, under \*Portland, to form a replacement ministry. This change-over did not, however, destroy the Talents' greatest achievement: the abolition of the slave trade in May 1807.

DW

**Taliesin** (6th cent.). Bard. Taliesin and \*Aneurin were two of the five great bards referred to by \*Nennius in his *Historia Brittonum* (c.796). Taliesin's surviving work records the deeds of Urien, king of the Britons, in \*Rheged and his struggle against the Anglo-Saxons, just as Aneurin does for \*Gododdin: 'And when I'm grown old, with death hard upon me, I'll not be happy save to praise Urien.' But establishing the corpus of Taliesin's work has proved difficult and only a few poems in the *Book of Taliesin* are accepted by most scholars. He may have come from Powys and settled in Rheged as a resident bard, but his very existence has been strenuously denied by some.

JAC

**tallage** was the very valuable right of the king (and of other lords) to impose taxation on his demesne, including his boroughs. It could not be refused, though it could be negotiated, and the civic authorities were normally left to distribute the burden. Edward I's incessant warfare against Wales, Scotland, and France placed severe tax demands on his subjects. In the crisis of 1297, after he had left for France, he was urged to let tallage come under parliamentary control. But the document which was taken to be a statute, *De Tallagio non concedendo*, was only a preliminary demand and the *Confirmatio cartarum*, which the king eventually granted, was much less explicit and did not concede parliamentary control. Tallages continued to be demanded at intervals until 1340, when Edward III agreed that the consent of Parliament must be obtained.

JAC

**Tallis, Thomas** (c.1505–85). English composer and organist, whose early career included short periods at Dover priory, St Mary-at-Hill in London, Waltham abbey in Essex, and Canterbury cathedral. By 1545 he was a gentleman of the Chapel Royal, where he remained, also acting as organist, until his death. Thus, unusually, Tallis served four monarchs, something apparent in his music. His early works for Henry VIII involve traditional catholic polyphony, whereas the six years of Anglican liturgy under Edward VI required new styles, reflecting Cranmer's desire for clear syllabic word-setting as in the simple four-part 'If ye love me'. The return to catholicism under Queen Mary saw some of Tallis's most elaborate music, probably including the massive six-part antiphon 'Gaude gloriosa Dei mater'. Finally, Elizabeth's catholic sympathies, despite her official protestant religion, allowed Tallis to publish his *Cantiones sacrae* jointly with Byrd (1575) and to write some of his finest Latin church music, including the two darkly emotional sets of *Lamentations* and his technical masterpiece, the 40-part motet 'Spem

in alium'. A small amount of consort and keyboard music also survives.

ECR

**Tamworth manifesto**, 1835. \*Peel's manifesto to his constituents is often regarded as the foundation document of modern Conservatism. The Tory Party, badly beaten at the election of 1832, faced another general election and could hardly campaign on repealing the Great Reform Act, depriving Birmingham, Leeds, and Sheffield of their new representation, and restoring Gatton, Hindon, and Old Sarum. Peel, leading a minority government, explained that he now considered the Reform Act 'a final and irrevocable settlement, which no friend to peace would attempt to disturb' and that his general policy would be 'the firm maintenance of established rights, the correction of proved abuses and the redress of real grievances'. This left open who was to decide what was proof, what the word 'real' signified, and what would happen if the reform of abuses threatened established rights. Peel conceded that his statement was 'necessarily vague' but added detailed comments on certain contemporary issues. The manifesto has been seen as the foundation for a policy of prudent adjustment or as a recipe for continual surrender. \*Disraeli in *Coningsby* (1844) took the latter view: 'the awkward question naturally arose, what will you conserve? The prerogatives of the crown, provided they are not exercised; the independence of the House of Lords, provided it is not asserted—everything, in short, that is established, as long as it is a phrase, and not a fact.' But when Disraeli took over from Peel as leader of the Conservative Party and faced a similar dilemma over the \*Corn Laws, the party's pledges were conveniently forgotten.

JAC

**Tanzania**. Formerly Tanganyika and \*Zanzibar. Previously a German dependency, Tanganyika became a British mandated territory after the First World War. Having few natural resources, it proved unattractive to white settlers who were, in any case, unwelcome to British administrators because of the country's mandatory status. This, together with the absence of any dominant ethnic group with aspirations to hegemony, meant that the country developed peacefully, if unspectacularly. Its progress towards independence in 1961 was equally without serious incident. The following year Tanganyika became a republic with Julius Nyerere as president, and in 1964 joined with Zanzibar to become Tanzania.

KI

**Tara, hill of** (Co. Meath). A sacred site for at least two millennia, going back as far as the Neolithic period, the hilltop shows evidence of many structures. The Neolithic 'Mound of the Hostages' was erected c.2000 BC; during the Iron Age, a hill-fort was constructed on the summit, taking advantage of the natural view of the plain. It later became a central site for the five provinces to hold assembly and conduct markets and fairs. In Irish mythology Tara is the royal seat of kings, and many rites and rituals associated with kingship were enacted there.

SMD

**Taranto, battle of**, 1940. On 11 November 1940, 21 Swordfish aircraft from HMS *Illustrious* launched a torpedo attack at night on the Italian fleet at anchor off Taranto. Two aircraft were lost but heavy damage was done and

the remaining Italian vessels sought more remote harbours. This Fleet Air Arm victory was particularly welcome at a bad time during the Second World War and was followed up in March 1941 by the naval success off Cape \*Matapan. JAC

**tariff reform.** See PROTECTIONISM.

**Tasmania** (formerly Van Dieman's Land), a 26,282-square-mile island 150 miles south of Victoria, and member state of the federal Commonwealth of Australia, has a population (2002) of 470,000. Hobart (population 195,000), established 1803, is the largest city and state capital. Its Aboriginal inhabitants, none of whose descendants now survive as full-blooded Aborigines, numbered c.4,000 at the coming of the British. The island's original inhabitants probably came across Bass Strait during a period of low sea level.

Discovered by Dutch navigator Abel Tasman in 1642 and named Van Dieman's Land it became infamous, following British occupation in 1803, for its ill-treatment of convicts (especially at Hell's Gate and Port Arthur) and the extermination of its Aboriginal population. Its name was changed to Tasmania in 1856 to help rid the island of its evil reputation. Until the 1860s Tasmania was Australia's major wooden shipbuilding centre and an important exporter of food to the mainland. The island lost population and was adversely affected by the discovery of gold in Victoria in 1851.

The island's agricultural settlements and typically small farms are concentrated in its northern and south-eastern lowland areas leaving the mainly rugged, mountainous, and high-rainfall forested western two-thirds largely uninhabited. The latter was for a time after 1880 important for the mining of tin, gold, lead, silver, and copper (Queens-town, Zeehan, and Mount Lyell). Today the island's mountainous centre and west's main economic resources are tourism and the production and export of hydroelectricity to lowland centres of metal-refining and paper and pulp and cement manufacture. Tasmania's natural beauty has encouraged a strong environmental movement. The island is politically notable for its adoption of the Hare-Clark system of proportional representation. MJW

**Tate Gallery.** During the 19th cent. British art was poorly represented in the national collections. The 1840s and 1850s saw a number of important bequests to the nation, including that of sculptor Sir Francis \*Chantrey, who left his fortune for the purchase of 'Works of Fine Art . . . [by] artists resident in Great Britain', and the enormous Turner bequest, which the National Gallery was unable to house adequately. In 1890 the sugar magnate Henry Tate gave 60 modern English paintings to the National Gallery provided that a gallery was made available. The offer was twice withdrawn as arguments delayed the provision of a suitable site and funding for a new gallery. Eventually the government offered the prison site at Millbank, London, and the Tate Gallery opened in 1897.

Wealthy benefactors have continued to aid expansion; in 1987 the Turner bequest was finally housed as the artist intended, in the extension funded by the Clore Foundation. The Bankside power station was converted into the Tate

Modern, opened in 2000, and the original gallery was re-named Tate Britain. JJC

**Tatler.** A periodical edited by Richard \*Steele under the pseudonym 'Isaac Bickerstaff', it appeared three times a week between April 1709 and January 1711. \*Addison was an important collaborator. Mixing news, political opinion, and social comment, the *Tatler* gradually assumed the format to be made familiar by the *Spectator* of a single essay on a social, moral, literary, or philosophical theme. JAD

**Tawney, R. H.** (1880–1962). Tawney made a significant impact in four interrelated roles, as Christian \*socialist, social philosopher, educationalist, and economic historian. In 1908 he became the first tutorial class teacher in an agreement between the \*Workers' Educational Association and Oxford University. The classes he took became renowned for their excellence. A member of the WEA executive for the next 42 years, Tawney wrote voluminously and incisively on educational matters, including contributions to several government reports such as the Hadow Report. As a socialist, he wrote *Secondary Education for All* (1922), which informed Labour policy for a generation. Other achievements included a role on the Sankey Commission (1919) and a part in writing *Labour and the Nation* in 1928. His two most influential books, *The Acquisitive Society* (1921) and *Equality* (1931), exercised a profound influence on socialists in Britain and abroad and anticipated the welfare state. Tawney was also a professor of economic history from 1931, having made his reputation with *Religion and the Rise of Capitalism* (1926). In his later years he grew unhappy at the return of affluence after wartime austerity, and at the growth of values he had devoted his life to combating. LHM

**taxation** represents a transfer of resources from citizens to government. Without it government could not function. Taxation is divided into indirect taxes (levied on sales of goods and other transactions) and direct taxes (levied primarily on persons). The original objective of taxation was to raise revenue to finance public expenditure, often on wars, but taxes have subsequently been adopted (especially tariffs) to protect domestic industries and, in the 20th cent., used as an instrument for the redistribution of income. The advent of Keynesian economics in the post-Second World War period has seen taxation used as a tool of macro-economic policy with rates varied as a stabilizer against economic fluctuations. There has also been a tradition of taxes at urban and regional levels to finance local expenditures.

There is a range of criteria which governs a good tax system. Adam \*Smith's four canons in the *Wealth of Nations*, that taxes should be based on a person's ability to pay, and that they should be certain, convenient, and economical, remain valid today, although the emphasis on each has changed with time. The problem is that in many instances the most certain, convenient, and economical tax to collect involves taxing those least able to pay.

While modern taxation is conducted using monetary transfers, there is a long history of taxation involving transfers in kind; most notably labour services or agricultural output. The Roman period saw the taxation of consumption

## Tay bridge

and trade (customs duties) and forms of poll (*tributum*) and land taxation were employed. Inheritances were also taxed. During the Middle Ages these taxes gave way to the authority of the sovereign to levy taxes in a more or less arbitrary manner. The results were direct service obligations and *aids* (essentially gifts and tributes), although transit duties and market fees were also used. Export duties were first introduced in England on hides and wool in 1275. Gradually, a number of, often short-lived, indirect taxes were introduced (e.g. the \*window tax) especially at times of national emergency. As overseas territories were acquired, new forms of taxation were developed relating to trade. These provided additional revenue but often bred resentment amongst colonists—as in North America, which felt unrepresented in the political decision-making processes.

Levies on capital or income were not considered a normal means of financing government, except in exceptional circumstances, until the 19th cent. The taxation of incomes was initiated by \*Pitt the Younger in 1799 as a temporary measure to assist financing the wars with France and only became a permanent feature of the British fiscal system after its re-introduction in 1842 during a period of tariff reform. Its introduction required a more sophisticated institutional infrastructure and brought with it, as the appropriate sphere of government became more clearly defined, the development of tax law. The growth in importance of direct taxation for income redistribution policy has led to graduated rates and allowances which, combined with an explicit corporate income tax, has added to the institutional bureaucracy.

Indirect taxation has traditionally been on property, especially at the local level, either on the capital or rental value of land (rates), or levied at death (death duties). Excise duties, taxes levied on particular types of goods such as alcoholic drinks, petrol, and tobacco, increased in importance in the 20th cent. They are often depicted as taxes on luxury goods. A general sales tax, purchase tax, was only introduced in 1940, and then seen initially as a temporary measure. It was subsequently replaced by a multi-stage value added tax, where taxes are imposed at each stage of the production process. KJB

**Tay bridge.** The wide estuary of the river Tay on the east coast of Scotland presented a formidable obstacle to transport. The first bridge over the estuary was designed by Thomas Bouch for the North British Railway Company. It was almost 2 miles long, consisting of 85 wrought-iron lattice-girder spans supported on cast-iron columns with masonry foundations, and was completed in 1877. Queen Victoria crossed it in the summer of 1879, and knighted its designer on the spot. But at the end of that year, on 28 December 1879, several spans collapsed in a severe storm while a train was crossing, sending 74 people to their deaths. The subsequent inquiry concluded that the bridge was 'badly designed, badly constructed and badly maintained', and found Bouch mainly responsible for these defects. The disaster alarmed the engineering profession and ensured that the replacement bridge was built within ample safety

margins. A new road bridge was opened over the estuary in 1966. RAB

**Taylor, Jeremy** (1613–67). Bishop of Down and Connor. Born in Cambridge, and educated at Gonville and Caius College, he was successively fellow of All Souls, Oxford (1635), rector of Uppingham (1638), and chaplain to Charles I. After joining the royalist army he was captured (1645), but after release lived in Carmarthenshire as chaplain to Lord Carberry where he wrote *Liberty of Prophesying* and the devotional works *Holy Living* and *Holy Dying*. After a spell in London ministering to episcopalians (1653–8) and as lecturer at Lisburn (Ireland) (1658), he became bishop of Down and Connor (1661). The presbyterians there would 'talk with no bishop' and Taylor ejected 36 ministers. His severity ensured the establishment of presbyterians as a separate ecclesiastical community. His plea to \*Sheldon for a move to England (1664) was unheeded and he died at Lisburn. WMM

**Tayside.** From 1973 an administrative region in east Scotland created from the city of Dundee, all Angus and Kinross, and most of Perthshire. The combination of urban and rural populations meant that none of the political parties could be confident of a majority, and Conservative, Labour, and the Scottish National Party have all provided the convenor. In 1996 it was divided into three all-purpose authorities (Angus, Dundee, Perth and Kinross) whose boundaries are almost the same as the previous districts. In addition to survival of older industries—some jute is still woven—agriculture (especially soft fruit), food-processing, and manufacture of hole-in-the-wall cash machines are important to the economy; among the services in which the region specializes are wholesaling and insurance. The most distinctive offerings to tourism are surviving Pictish monuments, castles, and Royal Research Ship *Discovery* (at Dundee). ASH

**technology** is the study of the techniques whereby human beings make and do things. It is thus as old as humanity itself, as our species is distinguished by its intelligent use of tools and other artefacts, so that the field of enquiry in the history of technology stretches back at least 2 million years. Over most of this time, however, incremental advances in technological sophistication were slow and slight in a hunting-gathering nomadic society, although gradually improvements were made in the shaping of stone, in the control of fire, and in weapons for hunting and fighting. About 10,000 years ago, in a few well-favoured environments, advances in the techniques of growing crops and domesticating animals made possible the emergence of a more settled form of life, which encouraged the development of new techniques in cooking, baking, distilling, pottery-making, and, eventually, metalworking. This was the 'neolithic revolution', which prepared the way for the first 'civilized' communities, with their new features of social organization in towns, and the skills of literacy and numeracy.

While technology is as old as humankind, science—the systematic understanding of the environment—is only as old as civilization, because it depends for its effectiveness on the sort of cumulative knowledge which only becomes possible with literacy and numeracy. The relationship between

science and technology is frequently very close, but it is important to recognize that they are different exercises: technology derives from practical techniques, and is never far from the earthiness of tools and artefacts, whereas science has a strongly conceptual and speculative element, some of which operates at a high level of abstraction. In technology, the emphasis is rightly on good design—fitness for purpose—by which an artefact can best fulfil its function.

Amongst the techniques associated with the rise of civilizations, the inventions of metalworking were most formative because they brought quantum jumps in human weaponry and thus influenced the ability of one society to dominate another. Nevertheless, modern society is characterized by an extraordinary range of techniques whereby every aspect of life has been transformed: power sources have been mastered, materials exploited, productivity increased in both agriculture and industry, and an endless stream of artefacts has been manufactured. Power to make and do things—the mainspring of technological development—has been derived from the steam-engine, the internal combustion engine, electricity, and nuclear fission. New materials have come from the \*chemical industry and from the molecular engineering of new plastic substances. Old industries, like pottery, glass-making, and textiles, have employed new machinery and processes. New industries, like electronics, have sprung up to provide myriad everyday services. Transport has been transformed, so that rapid journeys are now feasible to all parts of the world, and previously slow methods of communication have become immediate. Information technology is currently doing much to change our perceptions, and space technology holds out a prospect of infinite exploration. Technology, always important in human societies, has become omnipresent, vastly complicated, and indispensable. RAB

**Tedder, Sir Arthur** (1890–1967). Tedder read history at Cambridge, then joined the RFC in the First World War. He commanded the Middle East Royal Air Force, May 1941 to February 1943. Next he was in charge of allied air forces in the Mediterranean before becoming deputy supreme commander of 'Overlord'. He was responsible for securing the co-ordination of all allied aircraft in the invasion. Tedder made compatible the independence of air forces from ground and naval forces, essential for flexibility, with quick support from the air when needed.

Tedder's contribution to allied success, especially in Normandy, 1944, involved 'interdiction': preventing enemy supplies and reinforcements from reaching the battlefield by attacking road and rail transport, direct and prompt tactical support for ground troops, using fighter-bombers as mobile artillery, and his occasional diversion of British and American heavy bombers to support big offensives. He showed tactful impartiality and lessened the damage done by the bumptious vanity of Generals \*Montgomery and Patton. He became marshal of the RAF and was made viscount in 1946. RACP

**Teheran conference**, 28 November–1 December 1943. This was the first of the 'Big Three' wartime meetings. It was here that \*Churchill became uncomfortably aware of

the extent to which British power was declining in relation to his allies. He had to bow to American and Soviet insistence on limiting military operations in the Mediterranean in favour of the earliest possible second front in northern France (June 1944). Churchill did what he could to protect the future of the Polish government in exile, while broadly agreeing to the drastic post-war movement westward of Poland's frontiers. CJB

**Teilo, St** (6th cent.). Teilo is associated in Welsh triads with SS \*David and \*Cadoc as one of the Three Blessed Visitors to the Isle of Britain. Twelfth-cent. sources claim Teilo was born near Penally (Pembrokeshire), studied first under Dubricius, then with a Paulinus (St Pol). There he met St David, whom he allegedly accompanied on a pilgrimage to Jerusalem. Crossing to escape the plague, he spent some years in Brittany, staying with \*Samson of Dol. His ministry was centred, however, on his monastery at Llandeilo Fawr, where he eventually died. Though his name is associated with Llandaff cathedral, the Book of Llandaff's claim that he succeeded Dubricius in the see is insubstantial. The most fantastic story relates to his death, when priests from Llandaff, Llandeilo Fawr, and Penally argued over possession of his body. During the night, it miraculously became three, resolving the dispute. AM

**Tel-el-Kebir, battle of**, 1882. In the third quarter of the 19th cent. Egypt's external debt became so great that Britain and France took control of the country's finances. The heavily taxed peasantry, led by an army officer, Ahmed Arabi, rebelled against their khedive (governor), whom they held responsible for their plight. British troops under Sir Garnet \*Wolseley landed in Egypt to support the khedive and in a surprise attack destroyed Arabi's army at Tel-el-Kebir, 130 miles north-east of Cairo. Arabi surrendered and pleaded guilty to rebellion, but liberal opinion in England ensured that his sentence was exile rather than death. KI

**television** is the most powerful and influential audio-visual medium at the start of the 21st cent. As with so many technologies, no one inventor or country can take full credit for the invention of television. But among the claims of Germany, USA, Russia, and Japan, Britain's reputation will always remain strong due to the dominating presence of John Logie \*Baird. His dedication through the 1920s to developing 'seeing-by-wireless' made him a key figure in the process, though his particular mechanical model was a failure and the television we have today is the electronic model developed by his rivals, the Marconi-EMI Company team, led by Isaac Schoenberg.

From the 1870s, when the idea of the 'telephonescope' was first mooted by Edison, progress with 'seeing by electricity' was made in various countries. Key developments in Germany—Nipkow's mechanical scanning disc (1884) and Braun's cathode ray tube (1897)—were used by Scottish scientist A. A. Campbell-Swinton in 1908 to elucidate the basic principles of modern television—the conversion of light and shade into electrical signals to be transmitted from a camera to a receiver on the same airwaves as wireless radio.

With developments interrupted by the First World War, it was not till 1923 that Baird took up the running, with his elaboration of Nipkow's mechanical system producing a primitive 30-line picture for public demonstration in 1925 and 1926, and sending images by wire across the Atlantic in 1928. His negotiations with the \*British Broadcasting Corporation, who held the monopoly on broadcasting, resulted in experimental transmissions in 1930 and 1931, including an outside broadcast of the 1931 Derby, to the handful of TV sets which had begun to be manufactured.

By this time, however, the newly formed EMI had joined forces with the Marconi Co. to develop the alternative electronic scanning system that had come from the cathode ray tube. With its greater number of lines producing a clearer picture, it highlighted the clumsy limitations of Baird's mechanical system. Though Baird was able to push his definition up to 240 lines, the Marconi-EMI team reached 405 lines by the time the Selsdon Commission of 1935 had recommended that the BBC run trials of the two systems with the aim of setting up a national television service.

The world's first continuous television service started broadcasting from Alexandra Palace in November 1936, duplicating the programmes in the two rival systems. After a few months, it was clear that the electrical system had the advantage of power and consistency over Baird's, and the greater potential for future development, so it was duly adopted. Over the next few years, Baird's wayward genius was to demonstrate almost every innovation which would eventually become staples of television—colour, the giant screen, and primitive videotape recording.

Until its close-down with the war in 1939, the BBC broadcast some 20 hours per week to the 20,000 TV sets in the south-east, mixing special events such as the coronation, Remembrance Day, and Chamberlain's Munich flight with a regular diet of sport, drama, and music.

The post-war popularity of television was boosted with coverage of the 1946 Victory Parade, and, especially, the 1953 coronation. But the BBC's monopoly was soon to be broken with the 1954 Television Act introducing commercial television (or Independent Television, ITV)—a series of regional stations throughout Britain, making their own programmes and selling their own \*advertising, under the central regulation of the Independent Television Authority (later to become the Independent Broadcasting Authority, then the Independent Television Commission). Since then the popularity of television has mushroomed, with viewing generally shared equally by the BBC and ITV, and with new specialist stations coming from the BBC in 1962 (BBC2), and from ITV in 1982 (Channel 4).

Technological advances have included the better definition of 625 lines from 1962; colour on BBC2 from 1967 and on BBC1 and ITV from 1969; domestic video recorders from the late 1970s; and, most crucially, satellite TV, from the experimental launch of Telstar in 1962. Within 25 years, the arrival of Rupert Murdoch's Sky TV and the promise of digital broadcasting has demonstrated the power of satellite and cable, providing a massive choice of channels for the consumer, breaking down national frontiers, and presenting a major challenge to the BBC

and the well-regulated traditions of British television broadcasting. DJA

**Telford, Thomas** (1757–1834). Civil engineer from Eskdale (Dumfries). Apprenticeship as a stonemason laid the basis for Telford's move via Edinburgh to London, where he worked on Somerset House (1782), being introduced to \*Chambers and \*Adam, before work at Portsmouth dockyard (1784). The patronage of William \*Pulteney took him to Shrewsbury (1786), where he restored the castle, and built the gaol and the reputation that led to his appointment as 'general overlooker' of the Ellesmere canal in 1793, and his transition to civil engineer. Distinguished canal work followed with his aqueduct at Pontcysyllte (1805), the Caledonian canal (1822), contributions to Sweden's Gotha canal (1832), the Birmingham and Liverpool Junction (1835), the last main line, and his replacement tunnel at Harecastle on the Trent and Mersey (1826). As adviser to the British Fisheries Society (1796) he was invited to undertake road- and bridge-building in the Scottish Highlands, and between 1803 and 1824 was responsible for the construction or remodelling of 1,200 miles of road, all constructed on his 'Roman' principles, with adequate foundations. His creation of the Shrewsbury–Holyhead road (from 1802) was a parallel developmental project, and at Menai (1825) and Conwy (1826) led to his pioneering development of suspension bridges that was to influence \*Brunel and others. Nicknamed by \*Southey 'the colossus of roads', he succeeded \*Rennie as Britain's leading civil engineer, and was a founding member of the Institute of Civil Engineers in 1828. JCh

**temperance movement.** A powerful social and political force in Victorian Britain. Though it did not succeed in eradicating drink, it helped to control it. Between 1831 and 1931, spirit consumption per head p.a. fell from 1.11 gallons to 0.22, and beer from 21.6 gallons to 13.3: in the same period, consumption of tea per head rose from 1.24 pounds p.a. to 9.67 pounds. Direct propaganda was not the only factor in this change: others included growing respectability, improved amenities, more comfortable homes, and a decline in occupations of heavy labour where drink was a necessity. The chief support of the temperance movement was the dissenting bodies, who carried it as an issue into the \*Liberal Party, which adopted local option on the sale of drink as part of its \*Newcastle Programme in 1891. As a consequence, the brewing interest gravitated increasingly to the \*Conservative Party.

The movement began in the late 1820s with the formation of a number of local temperance societies. In the course of the century, there was a great proliferation of leagues and societies, but the leading organizations were the British and Temperance Society (1831), the British Association for the Promotion of Temperance (1835), the National Temperance Society (1842), and the United Kingdom Alliance (1853), a political pressure group demanding prohibition. One of the best publicized groups was the Band of Hope, founded in Leeds in 1847 to appeal to children, organizing outings and publishing a periodical *Onward*. One reason for the multiplicity of groups was a difference of opinion which soon emerged between the advocates of moderation in drinking

and those who demanded total abstinence—or teetotalism. A trusted technique was to persuade men to ‘take the pledge’—an action first agreed in 1832 by seven workmen in Preston. The movement often took the form of a religious revival and was referred to as a crusade: one teetotal group was even included with the churches by the religious census of 1851, along with temperance Wesleyans and temperance Christians. Drink was ‘the demon’, the pledge echoed baptism, and the solemn reading of the names of backsliders was a form of excommunication. The nature and austerity of the pledge differed from group to group: many northerners preferred ‘the long pledge’—refusing to offer alcohol to others as well as abstaining oneself—while the south preferred ‘the short pledge’. The temperance movement was a vast and sustained effort, appealing to large numbers of ordinary people and giving them experience of recruiting, organizing, and public speaking. JAC

**Templars.** Established in Jerusalem in 1118 as a small group of knights pledged to protect pilgrims journeying to the Holy Places. In 1128 they gained papal support and a rule, owing much to \*Cistercian custom, was compiled for them by St Bernard of Clairvaux. Until the fall of \*Acre (1291) they played an important, but not uncontroversial, role (with their rivals, the \*Hospitallers) in the defence of the crusading states.

Their first, and largest, house in England was established just outside the city of London and moved to a site (the ‘New Temple’) off Fleet Street in 1161. They attracted considerable land and cash grants, much of which was used for the order’s needs in Palestine, and their estates were organized as preceptories. Their wealth (and ultimate military failure) led to accusations of heresy, particularly in France in 1307–8, where King Philip IV in association with Pope Clement V brought about the brutal demise of the order, finally suppressed in 1312. In England, as generally elsewhere, their property was ceded to the Hospitallers: many Templars were executed or imprisoned. BJG

**Temple, Sir William** (1628–99). Diplomat and author. Educated at Cambridge and eventually successful in his patient courtship of Dorothy Osborne, Temple moved from Ireland to England in 1663 and became \*Arlington’s protégé. Accredited envoy at Brussels (1665), with a baronetcy the following year, he negotiated the \*Triple Alliance as ambassador at The Hague (1668), but judiciously retired to England and his orangery at Sheen as relations deteriorated; pro-Dutch, he was recalled to negotiate the 1674 treaty which ended the Dutch War, and then, with \*Danby, successfully arranged the alliance between Charles’s niece Mary and William of Orange (1677). Although undertaking reorganization of the Privy Council, disillusion increased, and he retired from politics (1681) to pursue gardening, fruit-growing, and writing at Moor Park, where his secretary 1689–99 was Jonathan \*Swift. Temple’s literary reputation rests on his essays, despite Swift’s satire of his style in *The Battle of the Books*. ASH

**Temple, William** (1881–1944). Archbishop of Canterbury. Born in Exeter, Temple was educated at Balliol College,

Oxford. He was ordained while fellow of Queen’s (1904–10) only after hesitation. He was successively headmaster of Repton (1910), rector of St James’s, Piccadilly (1914), bishop of Manchester (1921), archbishop of York (1929) and of Canterbury (1942). Influenced by the \*Workers’ Educational Association and Student Christian Movement, he was, like his friend, R. H. \*Tawney, socialist in his thinking. He was essentially modern, looking for a synthesis of Christian faith and modern culture in his *Mens creatrix* (1917), *Christus veritas* (1924), and *Christianity and Social Order* (1942). Later dubbed ‘intellectually the most brilliant archbishop since \*Anselm’, he also had great administrative ability and towered over the English ecclesiastical scene. Chairman of the Doctrine Commission (1925), he was also, with \*Bell, a major architect of ecumenism. He spoke out in vain for the Jews suffering under Nazism. His early death was a blow to all. WMM

**Tempsford, battle of**, c.918. \*Edward the Elder and his sister \*Æthelfleda, lady of the Mercians, launched a sustained counter-attack upon Danish-held territory. In c.918 he stormed a large Danish camp at Tempsford, east of Bedford, killing the leader Guthrum II. Danish resistance in East Anglia crumbled. JAC

**Tenant League.** The Irish Tenant League was formed in 1850 to agitate for tenants’ rights, in part to replace the repeal campaign. One objective was to extend the \*Ulster custom, which gave some protection over rents and evictions. The league offered support to sympathetic parliamentary candidates and organized petitions, but its tenants’ rights bills made little progress. The Ulster supporters, who had feared an erosion of their own rights, soon parted company from the catholic south and the revival of agricultural prosperity took the edge off discontent. \*Gladstone’s \*Land Act of 1870 conceded some of the rights claimed. JAC

**tenant right** was a phrase much in use in Irish politics, especially after the famine of 1846. Since custom and practice differed from province to province and from estate to estate, the term was not precise and landlords complained that tenants devised new rights as soon as old ones were conceded. The immediate aim of the \*Tenant League, formed in 1850, was to secure the \*Ulster custom, whereby a tenant could sell his goodwill or interest in a farm, thus gaining some compensation for improvements. The three Fs for which the league later campaigned were free sale, fixity of tenure, and fair rent—all of which were slogans difficult to quantify and to adjudicate on. \*Gladstone’s \*Land Act of 1870 legalized the Ulster custom where it existed. The \*Irish Land League of 1879 renewed the campaign, organizing rent strikes and boycotts and resisting evictions. Gladstone’s second Land Act of 1881 conceded free sale, improved security of tenure, and introduced a machinery for deciding what was a fair rent. After 1885 the Conservatives moved towards facilitating land purchases, turning tenants into independent farmers. By that time a number of landlords were only too glad to sell up and be expropriated. \*Palmerston’s

## tenants-in-chief

comment—'tenant right is landlord's wrong'—was the other side of the coin. JAC

**tenants-in-chief** were those who, after the \*Norman Conquest, held their lands directly from the king. Their names are given in \*Domesday Book (1086) and are mainly those who had fought alongside William at Hastings or their descendants. The Conqueror kept about one-fifth of the land of England, the church had a quarter, and the tenants-in-chief about half. Domesday records some 1,400 of them, but land was concentrated in very few hands and some eleven magnates owned nearly half of the tenants-in-chief's share. They were under obligation to produce a quota of knights on demand, though they could sublet (subinfeudate) provided the obligation was met. The larger tenants-in-chief may be regarded as the forerunners of the later nobility. JAC

**Tenerife, battle of**, 1657. On 20 April 1657 \*Blake won his last great victory, attacking a force of sixteen Spanish vessels at harbour in Santa Cruz, protected by shore batteries. Every enemy vessel was destroyed and all Blake's ships, some of them badly damaged, survived. The crushing blow helped to bring the long war to an end. JAC

**Ten Hours Act** (1847). This Act, limiting the work of women and young persons (aged 13–18) in textile mills to ten hours a day for five days in the week and eight hours on Saturday, was the result of a sustained campaign from the 1830s managed in Parliament by Lord Ashley (\*Shaftesbury) and John \*Fielden and in the factory districts of Yorkshire and Lancashire by Richard \*Oastler and the short-time committees of working men. Although adult hours were not reduced until the system of working children in relays was suppressed in 1853, the Act was a triumph of welfare legislation over \*laissez-faire doctrine. JFCH

**Tenison, Thomas** (1636–1715). Archbishop of Canterbury. A graduate of Corpus Christi College, Cambridge, Tenison was ordained privately (c.1659). He was rector of St Martin-in-the-Fields (1680–92) and St James's, Piccadilly (1686–92), archdeacon of London (1689–92), bishop of Lincoln (1692–5), and archbishop (1695). With his friend John \*Evelyn he was a zealous supporter of the 1688 revolution. As archbishop, he was close to William III and crowned Anne and George I, but, as a leading advocate of the Hanoverian succession, he was isolated by extreme Tories. He successfully steered the church through the \*convocation controversy, though convocation itself was abandoned. He showed compassion for the poor, and promoted voluntary societies and charity schools, the foundation of the \*Society for Promoting Christian Knowledge and the \*Society for the Propagation of the Gospel, and the demand for bishops in America. 'Dull and prosaic . . . yet a great primate' is a modern assessment. \*Gibson wrote of his 'great goodness and integrity' and 'natural sedateness' which preserved the church from shipwreck in stormy times. WMM

**tennis**. See LAWN TENNIS.

**Tennyson, Alfred, 1st Baron Tennyson** (1809–92). Tennyson was the first poet to be made a peer of the realm, since \*Macaulay, author of *Lays of Ancient Rome*, had been an

active politician. He was the son of a Lincolnshire rector and attended Louth Grammar School and Trinity College, Cambridge. His first volume of poetry in 1830 sold badly, though it contained 'Mariana': the next volume in 1832 included 'The Lady of Shalott'. His collected volume in 1842 established him as a major poet, he was given a pension in 1845, succeeded \*Wordsworth as poet laureate in 1850, and was given his barony during \*Gladstone's ministry in 1884, apparently at Queen Victoria's suggestion. Much of his work, though not always his best, was based upon historical or legendary themes: 'Morte d'Arthur' and 'Idylls of the King' (1842, 1859); a translation from the Anglo-Saxon of 'The Battle of Brunanburh' (1880); and several historical plays, including *Queen Mary* (Mary Tudor, 1876), *Harold* (1877), and *Becket* (1884). JAC

**Territorials**. With a large navy to support, it was always necessary for Britain to augment her army with a reserve force. The \*militia was not always popular, nor particularly effective, and in periods of crisis was supplemented by \*volunteer and fencible corps, often regarded as personal fiefdoms by their colonels. In 1907, \*Haldane, Liberal secretary of state for war, determined to bring order into a confused situation by establishing a Territorial Force, which absorbed the militia. In 1921 it became the Territorial Army and remains in existence, on a reduced scale. Though intended initially for home defence, its members fought overseas in both the world wars. JAC

**terrorism**, notoriously difficult to define, is the deliberate attempt by self-appointed groups to employ violence, often indiscriminately, to attain their objectives, national, political, religious, or criminal. Its object is to create panic, weaken resolve, destroy opponents, discredit governments, and produce political and economic dislocation. In Britain, an early terrorist attempt was the \*Gunpowder plot of 1605 which would have killed the king and many members of Parliament. Edmund \*Burke claimed that the French Revolution of 1789 had introduced a new concept of terror, supported by governments themselves. The \*Cato Street conspirators of 1820 intended to murder the British cabinet at dinner as the prelude to an insurrection.

Britons became familiar with terrorist outrages—the maiming of cattle, destruction of crops, burning of houses, and murder of opponents—during the Irish agitations of the 19th cent. Great indignation was felt in 1867 at the murder of a policeman by \*Fenians, though the perpetrators, who were hanged, were regarded by Irish nationalists as the 'Manchester martyrs'. The later 19th cent. saw an increase in assassinations, often by \*anarchists. In the USA, Presidents Lincoln, Garfield, and McKinley were killed (1865, 1881, 1901); Alexander II of Russia was blown up by a bomb in 1882; the empress of Austria shot in 1898; King Humbert I of Italy murdered in 1900; and Stolypin, the Russian reformer, shot at the opera in 1911. The murder of the Archduke Franz Ferdinand and his wife in 1914 led directly to the \*First World War.

After 1945, terrorism acquired new dimensions, with links between international groups, and growing disregard for the loss of innocent lives. Mahatma \*Gandhi was assassinated

in 1948, President Kennedy in 1963, Aldo Moro, a former prime minister of Italy, kidnapped and murdered by the Red Brigade in 1978, Lord \*Mountbatten killed by the IRA in 1980, and Indira Gandhi killed by one of her own bodyguards in 1984. Car-bombs and aircraft hijacking became increasingly common and, in the Middle East, suicide-bombers proved hard to stop. In 1988 nearly 300 people died when Pan Am flight 103 was destroyed over Lockerbie; the Real IRA killed 26 people and injured 200 more with a bomb at Omagh in 1998. These atrocities were dwarfed on 11 September 2001 when the World Trade Centre at New York was destroyed by supporters of Osama bin Laden with the loss of nearly 3,000 lives. Britain joined in the coalition to root out the al-Qa'eda terrorist network in Afghanistan, and in the 2003 campaign in \*Iraq which overthrew Saddam Hussain. JAC

**Terry, Ellen** (1847–1928). Actress. Born into an acting family and brought up on the boards, Alice Ellen Terry left the stage for some years until concern for her children's future prompted a return in 1874 under Charles Reade. She joined \*Irving as his leading lady at the Lyceum theatre (1878), where her beauty and grace of movement enhanced his productions; appearing in Britain and America, their famous partnership lasted until 1902, though she had already commenced her 'paper courtship' with \*Shaw in the 1890s. Enormously popular, her vitality and stagecraft were underpinned by intelligence, yet all her successes, except in \*Shakespeare, were in sentimental melodrama. An unconventional approach to life was accompanied by humour, frankness, and generosity. When Terry became too old for many roles, and eyesight and memory began to fail, she turned to lecture-recitals here and abroad. She was created dame in 1925. ASH

**Test Act**, 1673. Usually linked to the \*Corporation Act, but a later addition to the code of laws excluding non-members of the Church of England from public office (25 Car. II c. 2). It required all office-holders under the crown, including MPs, to receive communion according to the rites of the Church of England at least once a year. They were also required to take oaths of supremacy and allegiance to the crown and to make a declaration against transubstantiation. This was aimed more particularly at recusant catholics and the repeal of the Test Act was the principal aim of the successful \*catholic emancipation campaign led by Daniel \*O'Connell in the late 1820s. JFC

**Tettenhall, battle of**, 910. With the death of \*Alfred the Great in 899, his son \*Edward succeeded to the Wessex crown. Together with his sister \*Æthelfleda, 'the lady of the Mercians', Edward began to forge a strong English kingdom. The Danes invaded in 910 and the king marched his army to Staffordshire to intercept them. On 5 August the Saxons fought a pitched battle with the Northumbrian Danes. Edward won a convincing victory and extended his kingdom as far north as the Humber. RAS

**Tewkesbury, battle of**, 1471. The last and one of the bloodiest battles of the Wars of the \*Roses. Queen \*Mar-

garet, still defending the claims of her husband Henry VI, landed at Weymouth the same day that Edward IV defeated \*Warwick at \*Barnet. She moved towards Wales and the north-west to collect support, with Edward marching from Windsor to intercept her. Yorkist supporters denied her a crossing of the Severn at Gloucester, obliging her to make for Tewkesbury. Her troops were caught before they could safely cross and forced to give battle on 4 May 1471, facing south. An attack by the duke of Somerset on the right failed and in the subsequent flight \*Edward, the young Lancastrian prince of Wales, was killed, near the abbey mill. Somerset was executed, Queen Margaret captured, and Henry VI murdered the same month. The slaughter is commemorated in the name Bloody Meadow and the Lancastrian cause never recovered from the disaster. JAC

**Tewkesbury abbey** (Glos.) developed from a religious community founded in the 8th cent., ceded after many vicissitudes to the \*Benedictine monastery of Cranborne c.980. Robert \*Fitzhamon, lord of Gloucester, lavishly endowed Tewkesbury c.1090 and in 1102 Cranborne became its dependency. During the next century Tewkesbury flourished, establishing cells at Bristol and Cardiff. It continued to attract powerful patrons such as the de Clares, Despencers, and Beauchamps, many of whom were buried in the abbey. In spite of financial difficulties at the end of the 15th cent., in 1535 Tewkesbury had a net income of c. £1,600, making it the wealthiest monastery in the west midlands. At the \*dissolution the Romanesque abbey church (which survives) became the parish church. BJG

**Texel, battle of the**, 1673. On 21 August was fought the last battle in the third Anglo-Dutch War. The Dutch were expecting a large convoy from the Indies and were also threatened with an invasion. De Ruyter took the initiative though at a considerable disadvantage against a joint Anglo-French fleet under \*Rupert. Cornelis Tromp in the *Gouden Leeuw* fought an individual action against Sir Edward Spragge in the *Royal Prince*, much to the advantage of the former. Dutch superiority in gunnery gave them the upper hand, though no major ships were lost on either side. But the convoy came home safely and the proposed landing was abandoned. Peace followed six months later. JAC

**Teyte, Dame Maggie** (1888–1976). English soprano. After studying in London and Paris, Teyte made her public début while still under 18 in a Mozart festival at Paris in 1906. She was chosen and coached by Debussy in 1908 to succeed Mary Garden as Mélisande in his opera *Pelléas et Mélisande*, and he also accompanied her in recitals of his songs. Teyte sang in England with the Beecham Opera Company (later the British National Opera Company) and in the USA with the Chicago (1911–14) and Boston (1914–17) opera companies. Between the wars her British activity centred on operetta and musical comedy, but later concerts and recordings returned particularly to French song, benefiting from her interpretative insights and the clean, pure tone of her singing. ECR

**Thackeray, William Makepeace** (1811–63). Novelist. Born in Calcutta, the son of a collector in the East India

Company, he was educated at Charterhouse and Cambridge. This Indian background and his public school were to figure prominently in *The Newcomes* (1853–5). Having studied drawing in Paris and German at Weimar (where he met Goethe) he began a career as a journalist in London. He was a notable early contributor to *\*Punch* (founded 1841) and to *Fraser's Magazine* (founded 1830) and in 1860 became the editor of the dynamic new *Cornhill Magazine*. His real breakthrough came with the monthly part serialization of *Vanity Fair* (1847–8), a novel set at the time of Waterloo and its aftermath. Thackeray's growing interest in the culture of the 18th cent. is reflected in his novels *Barry Lyndon* (1844), *Henry Esmond* (1852), and its sequel *The Virginians* (1857–9) and in his two lecture series published as *The English Humourists of the Eighteenth Century* (1851) and *The Four Georges* (1855–7). ASL

**thanes.** See **THEGNS**.

**Thatcher, Margaret** (b. 1925). Prime minister. Britain's first woman prime minister and one of the most controversial, she won three resounding election victories in a row for the Conservatives (1979, 1983, and 1987), before they rejected her as party leader and premier in 1990, a ruthless act of political ingratitude.

Mrs Thatcher was educated at Kesteven and Grantham Girls' School and Somerville College, Oxford, and entered Parliament in 1959. Beforehand she had been a research chemist (1947–54) and a lawyer (she was called to the bar in 1954). Between 1970 and 1974 she was secretary of state for education, a position in which she earned the sobriquet of 'Margaret Thatcher, milk snatcher' for abolishing the free supply of milk to schoolchildren. This was mild compared to the abuse she endured later.

As leader of the opposition, between 1975 and 1979, she repudiated the legacy of her predecessor as Tory leader, Edward \*Heath, and, under the influence of Sir Keith Joseph, a former colleague in Heath's cabinet, moved towards that ideal of political patriotism, low taxes, private ownership, balanced budgets, and individual initiative which later became known as Thatcherism. However, if the goal was financial stability, permanently low inflation, reduced government spending, and lower taxes, it proved illusory. Her record as prime minister began and ended with severe recessions (the worst since the 1930s) leading to a reduced industrial base and very low overall growth rates. She failed to reverse Britain's relative decline, although for a few years, until Nigel Lawson and John \*Major threw it away, it looked as if she had established the right conditions for doing so. The trade unions were tamed; Arthur Scargill's miners went down to defeat after a year-long strike aimed at overthrowing the government; most state-owned companies were privatized; and income tax was significantly lowered. However, rising indirect taxes, rising interest rates, rising inflation, plus the introduction of the hugely unpopular \*poll tax, meant that when a crisis erupted over Europe in 1990, Mrs Thatcher lacked the political support needed to survive.

Just as she had not been expected to win the Tory Party leadership in 1975, her rapid rise to international fame took many by surprise. There had been little in her record to

suggest that she had any talent for diplomacy, yet from the start of her premiership, she made her mark in international affairs. In 1979 a peace settlement was negotiated at Lancaster House which ended the Rhodesian question and paved the way for an independent \*Zimbabwe. Such a settlement had eluded international negotiators since 1965, although it must be conceded that events in Africa, plus Lord \*Carrington's diplomacy, had more to do with the success than Mrs Thatcher's personal input. Her own triumph, which made her an international celebrity, came with victory over Argentina in the \*Falklands War of 1982, when, having been taken by surprise by the Argentine invasion (Carrington resigned), Mrs Thatcher dispatched a battle fleet to the South Atlantic, which recaptured the colony. The bravery and efficiency displayed by the armed forces, the collapse of the reactionary Argentine dictatorship, and the leadership provided by the prime minister, enabled Mrs Thatcher to win a remarkable triumph in the 1983 general election. Thereafter she developed a 'very, very special relationship' with the US president, Ronald Reagan, and despite some differences (the Soviet oil pipeline, \*Grenada, nuclear disarmament) worked very closely with him to end the \*Cold War. She also managed to develop a close relationship with the Soviet leader Mikhail Gorbachev, of whom she remarked, after they first met: 'That is a man I can do business with.' British contacts with eastern Europe intensified and Gorbachev, like western leaders, used Mrs Thatcher as an intermediary with President Reagan. When she finally visited Moscow, she received a triumphal welcome. Other aspects of her diplomacy were more controversial. These included the \*Anglo-Irish agreement of 1985, the joint agreement with Peking over the future of \*Hong Kong (1984), her resistance to economic sanctions against South Africa, and the scepticism with which she greeted the prospect of German re-unification.

Her policy towards the European Community was, however, most controversial of all. Her first instincts had been conventional. She had campaigned enthusiastically for a Yes vote in the 1975 referendum and always believed that her approach was constructive. She helped achieve closer co-operation on foreign policy, and the Single European Act which was signed in 1986 received her full backing as a means of extending Thatcherite free enterprise across a European single market, despite the concessions involved to majority voting. On the other hand, she had had to battle mightily in order to secure the annual British rebates agreed on in the Fontainebleau accord (1984) and was horrified by Jacques Delors's ideas regarding a European Social Charter, and even more so by European economic and monetary union. In her famous Bruges speech (1988), she declared her opposition to future integration, although she was persuaded by her cabinet colleagues Sir Geoffrey \*Howe and Nigel Lawson to promise to enter the exchange rate mechanism, a move which came under John Major as chancellor and which proved a disaster. By 1990, however, after having rejected economic and monetary union at a summit in Rome, she was deserted by Sir Geoffrey Howe, who, bitter at having been dismissed as foreign secretary, and fearful lest his long-standing federalism be rendered futile, resigned

from her government and challenged Michael \*Heseltine to contest the party leadership. In the ensuing contest, Mrs Thatcher won the first round, but was deserted by her cabinet—over whom she had never exercised full control and who were weary of her autocratic style—and withdrew from the leadership race. She was succeeded by John Major as Tory leader.

She was accused by many of having broken with the post-war consensus in British politics and, indeed, she herself regularly denounced the concept. In fact, she had responded to a changing consensus and had influenced that change by her personality and policies. The high unemployment of her years in power had not been intended. The welfare state had grown under her as never before. Her defence and foreign policies had been totally conventional. She had made no constitutional innovations and had if anything been slow to dismiss her cabinet critics. Privatization had proved popular. So too had trade union reform. In the end she contributed to her own undoing by retaining key ministers whose policies, priorities, and philosophies were fundamentally different from her own. In this sense, the Iron Lady proved an unexpectedly weak prime minister. AS

Campbell, J., *Margaret Thatcher* (2000); Harris, K., *Thatcher* (1988).

**theatre** is a general term that covers plays, players, places, and spectators; although it is predominantly a pretence that entertains, with varying degrees of spectacle, themes in drama may reflect and challenge contemporary issues. There is little trace now of Roman theatre in Britain other than remnants of multi-purpose amphitheatres, a few masks, and the name of a player (*Verecunda*), but these suggest quite widespread, broadly based performance. Itinerant popular entertainers like dancers, mimes, minstrels, and story-tellers then preserved fundamental skills, while folk-plays developed out of seasonal celebrations and mimetic elements in dance, passed on through oral tradition; some of these became integrated into the church's liturgical calendar. The later middle ages saw a growing taste for civic pageantry and development of \*'mystery plays' (biblical histories portrayed on fixed staging or pageant-wagons hauled through the streets, often under the auspices of craft guilds). Liturgical drama began to yield to more secular morality plays, 'interludes' provided a link between *mimi* and the early professional touring companies, mummings and disguisings were indoor and court-linked (later merging into \*masques), and, by the late 15th cent., nobles began to take players' troupes under their own protection. The creation of the royal household post of master of the revels (1494) not only legitimized theatre but established control over an institution that was increasingly secular and mainly professional.

In the 16th cent., companies of strolling players, performing in inn-yards on trestle stages or private banqueting-halls, flourished despite strong disapproval from puritan preachers and city fathers bothered about public order. The first public playhouse was built in Shoreditch, London (1576), by James Burbage, a member of the earl of \*Leicester's company of players, resembling a modified inn-yard with a raised platform stage, central yard usable for other activities but

unroofed, and surrounding galleries with varying admittance charges. Others soon followed south of the river Thames (Rose, Swan, \*Globe) and prospered. The actors owned the theatres, ran a repertory system, and jealously guarded their unpublished scripts; absence of scenery, making act/scene divisions unnecessary, challenged playwrights' and actors' skills alike. All players had to be competent dancers and singers, but dramatists like \*Marlowe, \*Shakespeare, and \*Jonson replaced earlier short, rhymed verse with poetic drama. As women were forbidden to perform, boy-actors took all female roles, hence their relative rarity and tendency to be breeches-parts. Private indoor theatres were mostly used by boy companies (Children of St Paul's or the Chapel Royal) presenting rather artificial dramas to a limited, wealthy audience. On James I's accession, the three leading adult companies came under royal protection, which inevitably led to adaptations tailored to royal rather than popular tastes. \*Anne of Denmark, however, encouraged development of the court masque, for which extravagant, one-off entertainments Ben Jonson frequently provided the words and Inigo \*Jones spectacular, Italianate scenery and costume.

Although playhouses closed briefly during episodes of plague, they were shut down altogether on the outbreak of the Civil War (1642). For the next eighteen years there was rigorous suppression, but players went 'underground' and short entertainments known as drolls were frequently performed. After the Restoration, Charles II, an avid theatre-goer, who had become familiar with European theatre during exile, issued two patents which granted a monopoly of performed drama in London until 1843. Killigrew (forming and running the King's Company) at \*Drury Lane and Davenant (the Duke's Company) at Lincoln's Inn Fields initially revived old plays (though with happy endings to *King Lear* and *Romeo and Juliet*, and singing witches in *Macbeth*) until their own playwrights (Etherege, \*Wycherley, then \*Congreve, \*Vanbrugh, and Farquhar) created bawdy comedies of manners, played to fashionable rather than popular audiences. Aphra \*Behn, who produced fifteen plays (1671–89), was the first woman professional playwright. Theatres were roofed, perspective scenery introduced, and actresses now permitted; initially untrained but quickly proving highly popular with the rowdy audiences, their make-up had to be exaggerated because of poor indoor illumination, and its excessiveness revolted \*Pepys when he visited Nell \*Gwyn.

Despite the success of marionette theatres, early 18th-cent. theatre was limited, dramatic rather than operatic but increasingly sentimental and mediocre, with audiences predominantly middle-class. Prompted by \*Fielding's attack on \*Walpole and his administration, especially in *The Historical Register for 1736* (which virtually invented the satirical revue), the 1737 Licensing Act confirmed the monopoly of the two patent theatres, Drury Lane and \*Covent Garden (built 1732, inheritor of Davenant's Duke's House), authorized the lord chamberlain to act as censor, and hindered expansion of smaller unlicensed theatres. Ingenuity to circumvent this was boundless: a 'concert', or sale of chocolate, punch, or toothpaste, might be accompanied by free

entertainment conducted as a 'rehearsal'. Theatrical evenings became the norm, mixing full-length drama, songs, dances, and ever-popular afterpieces (farce, pantomime). Provincial theatre was provided by travelling companies on defined circuits—Tate Wilkinson ran the York circuit, Sarah Baker covered Kent, and Austin's company eventually covered c.1,100 miles each year in the north of England. These stock companies were training-grounds for young actors such as \*Garrick, who eventually introduced a more naturalistic style of acting, improved lighting, and stage-design (though contemporary costume still prevailed) at Drury Lane, banished spectators from the stage, and resuscitated Shakespeare. The comedies of \*Goldsmith (*She Stoops to Conquer*, 1773) and \*Sheridan (*The School for Scandal*, 1777) typified the eventual reaction to sentimental drama, but there was a growing demand by unsophisticated audiences for popular entertainment, to be met by melodrama (to which even John Philip Kemble and Mrs \*Siddons had to submit), harlequinade in pantomime (Joseph Grimaldi was a favourite clown), burlesque, and, later, \*music-hall and vaudeville.

Even before the Theatres Act (1843) broke the monopoly of Drury Lane and Covent Garden, many new, small theatres had arisen, increasingly specialized to cater for differing tastes, and lit by gas which provided more controllable stage illumination; more authentic costumes and stage settings were introduced, plush seating appeared, and auditoria were darkened. Competition from music-hall and the rise of the actor-manager encouraged bravura performances and flamboyant productions under brighter electric light (eventually necessitating stage-managers), but men such as Henry \*Irving helped to raise actors' status. The satirical libretti of W. S. \*Gilbert and brilliant but artificial comedies of Oscar \*Wilde in the late 19th cent. began to yield to the growing realism and concern with social problems that European dramatists such as Chekhov and Ibsen had begun to explore. \*Shaw's 'plays unpleasant', looking at some current abuses, were considered offensive, but the importance of the dramatist was regaining ground, as also were repertory companies and the idea of a supervisory director or producer. Farce, drawing-room, and musical comedy nevertheless continued to retain popularity.

British theatre after the Second World War was fragile. Many London theatres were bomb-damaged, an entertainment tax was imposed, and competition with film, radio, and television was increasing. Actor–audience relationships were challenged, and, although a brief revival of poetic drama occurred, plays such as John Osborne's *Look Back in Anger* (1956) rejected upper-class sophistication for local accents and 'kitchen-sink' drama. Experimental work such as free improvisation and 'fringe' theatre emerged, though reaction to such 'alternative' theatre led to revivals and new musicals (*Oliver*, *Cats*). Censorship was eventually abolished in 1968. The \*National Theatre finally opened on the South Bank in 1976, and its company, together with the Royal Shakespeare Company, has not only restaged classical plays but also commissioned new large-scale works (Shaffer's *Royal Hunt of the Sun*, 1964; Nicholas Nickleby, RSC, 1980). Most professionals now graduate from drama schools.

Arts Council subsidies have proved insufficient, and industrial sponsorship of productions is heavily encouraged.

ASH

**thegns** was a title given to those members of society in late Anglo-Saxon England who held at least five hides of land and were under the obligation of serving the king in battle. Their nearest predecessor was the *gesith*, their successors the knights of the post-Conquest period. The rank was hereditary but could be attained by \**ceorls* who came to own five hides. Though there were many gradations within the ranks of thegns, their \**wergeld* in Mercia and Wessex was six times that of a *ceorl*. The spelling has been preferred by historians to distinguish them from Scottish thanes, who were barons or clan leaders.

SMD

**Theobald** (d. 1161). Archbishop of Canterbury. Theobald's long tenure of the archbishopric was in an exceptionally turbulent period. He became abbot of Bec in Normandy in 1137 and was appointed to Canterbury by King Stephen in 1138. In the civil war which raged Theobald managed to keep some balance between Stephen and his rival Matilda. But much of his time was devoted to beating off attacks on his authority. He suffered from the prominence of Stephen's brother \*Henry of Blois, who was bishop of Winchester, a papal legate, and an ambitious cleric. In 1148 he incurred Stephen's wrath by attending a papal council at Rheims and retorted with an interdict which was little regarded. There was a further dispute in 1152 when Theobald refused to crown Stephen's son \*Eustace, and another resort to interdict. He fought a long-running battle against St Augustine's monastery at Canterbury, clashed with the rival archbishop of York, and resisted the claims of the archbishop of Armagh to the primacy of Ireland. After Henry II succeeded in 1154, life was easier, with \*John of Salisbury to advise and assist him. But much of his archiepiscopate looks like a dress rehearsal for the even greater convulsions under his successor Thomas \*Becket.

JAC

**Theodore of Tarsus** (c.602–90). Sent by Pope Vitalian as archbishop of Canterbury, with Hadrian, who became abbot of St Augustine's, Theodore arrived in 669. Two deaths had left the see vacant for five years. Plague had drastically reduced church leaders and monastic communities, and rekindled some heathenism. The church lacked organization and had not achieved the uniformity promised at \*Whitby (664). Theodore toured his province, eliminating irregularities, consecrating bishops, and in 672 summoned the first synod of the whole English church at \*Hertford. Deaths and depositions afforded opportunities to divide large dioceses. By his death, Theodore had built up the episcopate and created an organized, united church under Canterbury. In his primacy monasticism progressed, the use of charters confirming land grants grew, and with Hadrian, the Canterbury school flourished, attracting scholars from far afield.

AM

**Thirty-Nine Articles.** The articles are those finally agreed by the convocations of the Church of England in 1571. They comprise a set of doctrinal statements which were intended to define the position of the reformed Church of England in

respect of the disputes and questions over matters of faith and order current at the time. Printed as an appendix to the 1662 \*Book of Common Prayer (where they are dated 1562, the year of their original formulation), their declared purpose is 'for the avoiding of diversities of opinions and for the establishing of consent touching true religion'. The articles encompass Trinitarian doctrine, justification, predestination and election, the authority of the church and of general councils, as well as the ordering of ministry, the disciplines expected of the faithful, and the position of the sovereign and of civil magistrates *vis-à-vis* the church. They steer a careful—and sometimes ambiguous—path between catholic and reformed doctrines. Subscription to them is still required of the clergy, but since 1865 only a general affirmation that what is expressed in them is agreeable to the Word of God and not a more particular and searching assent to each one individually is required. JRG

**Thirty Years War.** The war, from 1618 to 1648, was primarily a conflict between the Habsburgs and their Spanish allies against France, Sweden, and the Dutch. There were two reasons why England might be drawn into it. The *casus belli* was the decision by the Bohemians to defy the Habsburgs and offer their throne to Frederick of the Palatinate, who was married to \*Elizabeth, daughter of James I. Secondly, there was a religious element to the war which, despite France's opposition to the Habsburgs, was seen by many protestants as a catholic crusade. England took little part in the conflict and for the last ten years was preoccupied with her own troubles. James resisted pressure to intervene, partly because Parliament's enthusiasm for war was not matched by enthusiasm for supply, partly because he was seeking a Spanish marriage for his son Charles. After the breakdown of the negotiations, Charles demanded war with Spain: the expedition of 1625 was a fiasco. He then compounded his difficulties by becoming involved in war with France as well, a masterpiece of incompetence, which meant that he was now fighting both sides. The expedition in 1627 to relieve La Rochelle was no more successful than that of 1625. Luckily, Charles's relations with Parliament were so bad that he was obliged to make peace with both countries and leave them to fight it out without English assistance. The conflict was concluded by the treaty of Westphalia in 1648, by which time Charles was a prisoner awaiting trial. JAC

**Thistle, Order of the.** The origins of this Scottish order of knighthood are unclear but it seems to have been founded by James III about 1480. It lapsed after the Reformation but was revived by James VII and II in 1687 and again by Anne in 1703. It now numbers sixteen, including the sovereign. The insignia is a star with the cross of St Andrew and a green thistle superimposed. The chapel of the order is in St Giles' cathedral, Edinburgh. JAC

**Thomas, Dylan** (1914–53). Poet. Born in Swansea, son of a schoolteacher, Thomas began as a journalist, publishing his first book *18 Poems* in 1934 and following it in 1936 with *25 Poems*. He married in 1937 and settled in the coastal village of Laugharne, south of Carmarthen, working for the BBC and

lecturing. A collection of short stories of a strongly autobiographical nature, *Portrait of the Artist as a Young Dog*, came out in 1940. Though he knew no Welsh, Thomas's roistering life-style led some to accuse him of being a stage-Welshman. *Deaths and Entrances* (1946) and *Collected Poems 1934–52* were well received, but Thomas died on a lecture tour of the USA. His radio play *Under Milk Wood* (1954) was greatly acclaimed as a portrait of Welsh life in the fictitious village of Llareggub. JAC

**Thomas of Lancaster** (c.1278–1322) was one of the most powerful magnates during the reign of Edward II and a thorn in the side of the king. He was the son of Edmund Crouchback, a younger son of Henry III and was therefore first cousin to Edward II. Succeeding to the earldom of Lancaster in 1296, he served against the Scots during Edward I's reign. But as soon as his cousin succeeded, Thomas moved into opposition. He took an active part against the royal favourite \*Gaveston, was one of the \*Ordainers appointed to supervise the young king, and brought about Gaveston's execution in 1312. He refused to serve in the \*Bannockburn campaign of 1314 and profited from the king's humiliation to increase his own influence. In 1316 he was appointed chief counsellor and in 1318 he and Edward were briefly reconciled at the treaty of \*Leake, taking part in the unsuccessful campaign against the Scots in 1319. But by 1321 he was once more at odds with the king over the \*Despensers, whom he forced into exile. In 1322 he was captured at \*Boroughbridge and executed at Pontefract in the king's presence. Though the experiment with conciliar government recalls de \*Montfort's career under Henry III, Thomas's activities seem to have been purely factious. Surprisingly a cult grew up at Pontefract and miracles were said to have been performed. The earldom passed to his younger brother, whose great-grandson took the throne as Henry IV. JAC

**Thomas of Woodstock.** See GLOUCESTER, THOMAS, DUKE OF.

**Thomas, J. H.** (1874–1949). Jimmy Thomas, one of the most colourful politicians of his day, was an h-dropping, hard-drinking gambler and a joy to the cartoonists. Brought up in Newport (Mon.) by a washerwoman grandmother, he became a GWR engine-cleaner and rose rapidly in the Amalgamated Society of Railway Servants. Elected as a Labour MP in 1910 for Derby, a railway town, Thomas gave strong support to the war effort. \*MacDonald appointed him Colonial Secretary in 1924 when *The Times* hailed him as a man who had demonstrated Labour's fitness to govern. In 1929 he became Lord Privy Seal with a special brief to tackle unemployment, but moved in 1930 to the Dominions Office. In the crisis of 1931 he stayed with MacDonald, held his seat at Derby, and retained his cabinet post. His career ended abruptly in 1936 when he was censured for a budget leak: 'he let his tongue wag when he was in his cups', remarked \*Baldwin charitably. Thomas resigned both post and seat, telling the Commons, in a moving farewell, 'my vices, if they are vices, have always been open and never disguised'. JAC

**Thomson, J. J.** (1856–1940). Discoverer of the electron. After study in Manchester, Thomson gained a scholarship

## Thorfinn

to Trinity College, Cambridge. In 1884 he became Cavendish professor, working on electricity and gases. Michael \*Faraday and then William Crookes had thought that the rays coming from the negative pole, or cathode, were charged particles, but with Wilhelm Röntgen's discovery of X-rays, most Germans supposed that cathode rays were similar, radiation akin to light. Thomson, with better vacuum pumps, devised an experiment in which the rays were deflected by a magnetic field, and then deflected back again by an electric field. This proved they were negatively charged particles, or *corpuscles* as he called them following Robert \*Boyle, and he calculated their ratio of charge to mass, showing how much smaller they were than atoms. Thomson was knighted in 1908, served as president of the Royal Society 1915–20, and was master of Trinity College, Cambridge, from 1918 to his death. DK

**Thorfinn, earl of Orkney** (c.1009–c.1065). Though the saga sources are far from specific, it is clear that 'Thorfinn the Mighty' wielded great power. He succeeded his father \*Sigurd as earl of Orkney when a small boy in 1014. He was a grandson of \*Malcolm II of Scotland. He fought against \*Duncan I, his cousin, and may have divided the kingdom with \*Macbeth. They certainly defeated and killed Duncan, and seem to have stayed in harmony until Macbeth's own death at \*Lumphanan: it is said that they visited Rome together. Thorfinn built a cathedral at Birsay in Orkney. His daughter married \*Malcolm III of Scotland and his sons fought alongside \*Harold Hardrada at \*Stamford Bridge in 1066. JAC

**Thorpe, (John) Jeremy** (b. 1929). Liberal leader. Son of a Conservative MP, Thorpe was educated at Eton and Trinity College, Oxford, where he was president of the Union. He began a legal career but in 1959 was elected as a Liberal for North Devon, succeeding \*Grimond as party leader in 1967. A flamboyant and entertaining leader, his party slumped badly in 1970, reduced to six seats, but recovered to fourteen at the first election of 1974. He was forced to resign as leader in 1976 after bizarre allegations, involving homosexual relationships, the shooting of a pet dog on Exmoor, and culminating in a trial for conspiracy to murder in June 1979. The previous month he had lost his seat to a Conservative in an election in which Auberon Waugh stood as a Dog Lovers candidate. Though Thorpe was acquitted, he took no further part in Westminster politics. His reminiscences *In My Own Time* were published in 1999. JAC

**Three Choirs Festival.** An annual festival, originally termed 'Music Meeting', based in turn on the cathedrals of Gloucester, Hereford, and Worcester. The festival was inaugurated around 1716 in aid of charity and its early years were increasingly devoted to the music of \*Handel. It has done much to foster English choral music, especially the works of \*Elgar, often using choirs drawn from the three cathedrals and conducted by one of the three organists. Premières have included Elgar's *The Dream of Gerontius* and works by \*Parry, \*Vaughan Williams, \*Holst, Bliss, Bax, Howells, and Peter Maxwell Davies. ECr

**Throckmorton, Sir Nicholas** (1516–71). Diplomat. Of gentry stock from Coughton Court (War.), Throckmorton was related to \*Catherine Parr, Henry VIII's last wife, and joined her household. From 1545 until 1563 he was in most parliaments and was in favour during the reign of Edward VI, being a zealous supporter of the reformed religion. In Mary's reign he was accused of complicity in \*Wyatt's rebellion but was acquitted: he did not serve in Mary's parliaments of 1555 or 1558. With the accession of Elizabeth, Throckmorton's career prospered and he represented her at the court of France (helping to negotiate the treaty of \*Troyes). He was next employed in Scottish affairs but his sympathy for Mary, queen of Scots, caused him to fall into disfavour. His reputation as a 'machiavellist' and his equivocal conduct at the accession of Mary may have led to mistrust and he did not achieve high office. JAC

**Throckmorton plot, 1583.** This was one of many conspiracies to free Mary, queen of Scots, and put her on the throne in place of Elizabeth. Francis Throckmorton was son of Sir John Throckmorton, chief justice of Chester, disgraced in 1579. Francis Throckmorton, a catholic, spent the early 1580s on the continent and in 1583 was acting as go-between for Mary and Mendoza, the Spanish ambassador in London. When he was arrested a list of catholic conspirators and details of possible invasion ports were found. Throckmorton confessed under torture and was executed at Tyburn in July 1584. Mendoza was expelled, and left threatening to return with an army. JAC

**Thurles, Synod of, August 1850.** This was a national synod of Irish catholic bishops, whose decisions, submitted to Rome for ratification, were consequently binding. The Queen's Colleges were secular institutions, established in Ireland by Act of Parliament in 1845, to make higher education available to all denominations. They were widely criticized as 'godless'. Catholic opposition sought papal support and, by a narrow margin, the Synod of Thurles voted to forbid priests accepting posts and to urge parents against enrolling their children. AM

**Thurloe, John** (1616–68). The son of an Essex clergyman, Thurloe was a lawyer under the patronage of Oliver St John. He did not take up arms in the Civil War, but in 1652 was appointed secretary to the \*Council of State and was soon put in charge of Commonwealth intelligence gathering. He was an MP 1654 and 1656 and a member of \*Cromwell's second council. Remarkably efficient, devoted to Cromwell, Thurloe presided over an international espionage network. After Cromwell's death he transferred his allegiance to his son \*Richard, and served in the Parliament of 1659 for the University of Cambridge. After the fall of Richard Cromwell, he was reappointed secretary of State and tried to dissuade \*Monck from bringing back Charles II. He survived a charge of treason at the Restoration and was allowed to return to his practice at Lincoln's Inn. His vast collection of state papers found their way into the Bodleian Library, but seven bulky volumes were published by Thomas Birch in 1742. JAC

**Thurlow, Edward, 1st Baron Thurlow** (1731–1806). A distinguished lawyer who appeared with success in several important constitutional cases. He was solicitor-general 1770, attorney-general 1771–8, and became lord chancellor as Baron Thurlow in 1778. He was a formidable presence on the woolsack and dominated the House of Lords. \*Fox remarked that ‘No man could be so wise as Thurlow looked’. Except during Fox’s ministry of 1783 he remained lord chancellor until 1792, but he alienated \*Pitt by intriguing with the prince of Wales during the \*Regency crisis of 1788–9 in the hope of retaining office if the prince became regent. Pitt tired of his independence in the cabinet, where he was regarded as the king’s representative, and compelled George III in 1792 to choose between them. Thurlow then retired. EAS

**Thurstan** (d. 1140). Archbishop of York. Born in Bayeux, Thurstan was secretary to Henry I. As part of the unending dispute between Canterbury and York he refused consecration in 1114 by the archbishop of Canterbury and was eventually consecrated at Rheims (1119), receiving the pallium from Pope Calixtus II. With his fiery personality he vigorously championed the independence of York from Canterbury; the pope decided in York’s favour (1126), though Canterbury with legatine authority could still claim obedience. He organized and inspired Yorkshire forces against David I of Scotland’s invasion and defeated him at the battle of the \*Standard (1138). An intimate friend of St Bernard, Thurstan strongly supported the growth of Cistercianism. \*Rievaulx and \*Fountains were founded with his assistance. In his last years he wanted to resign his see to become a Cistercian himself, but was refused. He became a Cluniac before dying at Pontefract abbey. WMM

**Tichborne, Chidiock** (c.1558–86). Tichborne, from Hampshire, was a devout catholic and became involved in the \*Babington conspiracy to murder Queen Elizabeth and release Mary, queen of Scots, from captivity. He was arrested in August 1586, tried, and executed as a traitor with the full rigour of the law. In the Tower of London, awaiting his death, he wrote an exquisite threnody. JAC

**Tien-Tsin, treaty of**, 1858. The second Opium War began in October 1856 when the Chinese authorities at Canton seized the British-registered *Arrow*. In June 1856 at Tien-Tsin, the Chinese agreed to receive a British diplomat at Peking, open up more treaty ports, pay an indemnity, and legalize the opium trade. Russia, America, and France obtained similar concessions. A punitive expedition to Peking in 1860 forced the confirmation of the terms, and Kowloon, opposite Hong Kong, was ceded in perpetuity. JAC

**Tierney, George** (1761–1830). Whig politician, MP 1790 and 1796–1830. An early devotee of democratic principles, nicknamed ‘Citizen Tierney’, he joined the Association of the \*Friends of the People and helped to draw up their report criticizing the state of the representative system 1792–3. He spoke frequently in Parliament after 1796, ignoring the Whig ‘secession’ of 1798–1802. Disillusioned by events in France, he moderated his reformist views. After 1801 he advocated co-operation between the Whigs and \*Addington, and joined

Addington’s government in 1803 as treasurer of the navy. An intimate of the prince of Wales, he served as president of the India Board in the \*‘Talents’ ministry of 1806–7. Returning afterwards to opposition, Tierney acted as chief whip and parliamentary manager to the Whigs under Grey and in 1817 was elected their leader in the Commons, but he was frustrated by their disunity and lack of energy and became depressed and pessimistic. He accepted office in \*Canning’s cabinet as master of the mint but failed to persuade \*Grey to join the government. After Canning’s death he was dogged by ill-health and was less active. He was a formidable parliamentary speaker but too moody and inconsistent to be a successful leader. EAS

**Tillet, Ben** (1860–1943). Trade unionist. A Bristol man, Tillet spent his early years in the navy and merchant marine. Coming to the London docks he was shocked at the misery and poverty of casual labour and organized a docker’s union. The great dockers’ strike of 1889, for a basic wage of 6 pence an hour, was a sensation, and succeeded, partly through the mediation of Cardinal \*Manning. Admitting that he hated strikes, as he had seen too much of the suffering they caused, Tillet campaigned for compulsory arbitration. He continued to build up dockers’ and transport organizations, which came together in 1922 to form the Transport and General Workers’ Union. Tillet threw himself into the war effort in 1914 and made recruiting speeches, to the disgust of many of his Labour colleagues. He served in Parliament for North Salford 1917–24 and 1929–31, and was chairman of the TUC 1928/9. A fine open-air speaker, Tillet was no theoretician and shocked some of his audience at the foundation meeting of the \*Independent Labour Party in Bradford in 1893 with a fierce attack on doctrinaire socialists. He outlived his fame, drank too much, and reminisced. JAC

**Tillotson, John** (1630–94). Archbishop of Canterbury. As a graduate and fellow (1651) of Clare Hall, Cambridge, calvinistic writings impressed Tillotson. Though initially nonconforming, he was ordained (c.1661). As lecturer at St Lawrence Jewry (from 1664), he ‘revolutionised preaching style’, weaning some away from extreme puritanism. Despite some anti-catholic sermons, Charles II, who admired his preaching, appointed him royal chaplain and dean of Canterbury (1672). With \*Baxter he supported comprehension of nonconformists (1674–5). Favoured by William III (1689), he became dean of St Paul’s (1689) and was nominated by the Canterbury chapter to exercise archiepiscopal authority during \*Sancroft’s suspension, reluctantly accepting the see of Canterbury (1691) on Sancroft’s deprivation. Despite his personal views, he was tolerant towards non-jurors and worked with \*Nottingham, the moderate Tory secretary of state, to preserve peace in the church. WMM

**Times, The**. This newspaper has come to represent the ‘establishment’ of Britain and British journalism in popular perception. Founded in 1785 as the *Daily Universal Register*, it adopted its current title three years later, and its masthead symbol of the clock in 1804. *The Times* pioneered many of the staples of modern journalism—news gathering from

## Tinchebrai

foreign—especially war—correspondents; editorial independence from government; use of illustrations and advanced print technologies. After its late 19th-cent. decline, *The Times* was bought and revived by \*Harmsworth in 1908, since when it has been the object of desire of most of the great newspaper magnates—Lord Astor, Lord Thomson, and currently Rupert Murdoch. DJA

**Tinchebrai, battle of**, 1106. Henry I and his elder brother \*Robert of Normandy had been in contention over the succession to England and Normandy since 1100, when William II 'Rufus' died. In 1106 Henry sought to settle the issue. Whilst besieging Tinchebrai castle (near Vire, south-west Normandy), Henry was challenged by Robert, who had decided to risk battle. This was extremely rash since Henry enjoyed immense numerical superiority. The battle, fought on 28 September 1106, lasted barely an hour and settled the political issue once and for all. Robert's army was destroyed and he himself was taken to England where he was successively imprisoned in the castles of Wareham, Devizes, Bristol, and, finally, Cardiff. SL

**Tindal, Matthew** (1655–1733). One of the leading deists of the early 18th cent., Tindal came from Devon and attended Lincoln College, Oxford. In 1678 he obtained a fellowship at All Souls. After a brief flirtation with catholicism during the reign of James II, he moved into a low-church Erastian position and his book *The Rights of the Christian Church Asserted* (1706) scandalized high churchmen. Its sequel *A Defence of the Rights of the Christian Church* (1709) was burned by order of the House of Commons in 1710. His most celebrated work came out in 1730. In *Christianity as Old as Creation*, Tindal argued the case for natural religion. Though frequently accused of free thinking, he retained his fellowship at All Souls until his death. JAC

**tin-mining** was undertaken in Cornwall and Devon in pre-historic times and continued into the 20th cent. Early mines exploited alluvial deposits near the surface but by the 16th cent. underground working following veins of ore had become the norm. Flood waters limited access to some tin deposits and deeper mining only became practicable during the 18th cent. when \*Newcomen beam-engines made it possible to pump water from the workings. Tin combined with copper made bronze; and tin combined with lead made pewter. Both these alloys were used for many purposes for centuries. Coal replaced charcoal for smelting tin ore in the later 17th cent. as the demand for tin grew. Large quantities of coal from south Wales and Somerset were used at the tin-mines. Cornish production supplied most of the needs of Britain and Europe until the mid-19th cent. when many mines were worked out. The increased demand was met from Peru, and, later, Malaya. Demand for tin rose rapidly in the late 19th cent. to make tinfoil (steel with a coating of tin) for rust-free containers for food. IJEK

**Tintern** (Gwent), a \*Cistercian abbey, was founded in 1131 by Richard de Clare, lord of Chepstow, and was the first Cistercian community in Wales. The majority of its endowments (most of them in south-east Wales) were acquired before 1200, by when it had established two daughter

houses, at Kingswood and Tintern Minor. The patronage of the Bigod family, particularly at the end of the 13th cent., brought further property and financed the rebuilding of the abbey church. Like most Cistercian abbeys, Tintern's economy declined during the late Middle Ages, and the number of monks fell. However, some building work continued and at the time of its dissolution in 1536 Tintern was the wealthiest monastery in Wales. The surviving remains acquired fame from \*Wordsworth's poem, and are amongst the finest of any Cistercian abbey in Europe. BJG

**Tippermuir, battle of**, 1644. Fought on 1 September 1644, this was the first in \*Montrose's great run of victories. Out-numbered by more than two to one, he routed Lord Elcho's poorly trained troops just outside Perth, and went on to occupy the city. JAC

**Tippett, Sir Michael** (1905–98). Composer. Of Cornish stock, Tippett studied at the Royal College of Music, before further tuition in composition. Briefly a member of the Communist Party (1935), but increasingly disillusioned with politics, then the darkening European scene, his pacifist beliefs deepened (gaoled 1943, as a conscientious objector), though his humanitarianism found practical outlet as director of Morley College, successor to \*Holst. Although one of the most significant composers born in the 20th cent., Tippett was slower to mature than \*Britten, but developed a strong personal idiom based on complex rhythms and long lyrical phrases; to symphonies and chamber-music were added oratorio (*A Child of our Time*, 1941) and operas with his own libretti (*The Midsummer Marriage*, *The Knot Garden*), pervaded with themes of reconciliation. Despite his powers of imagination and inventiveness, public recognition came late—not until the 1960s in Britain (knighthood 1966), and the 1970s in America. ASH

**Tiptoft, John, 1st earl of Worcester** (c.1427–70). Unusually for a peer's heir, Tiptoft spent three years with a tutor in University College, Oxford, immediately before his father's death in 1443. His creation as earl in 1449 coincided with his (first) marriage to the widowed duchess of Warwick. He was treasurer of England from 1452 to 1454, and probably became a sympathizer with Richard of \*York. In 1458 he distanced himself by going to Jerusalem, afterwards touring Italy and studying at Padua until 1461; humanists enjoyed his patronage, and he collected books later bequeathed to Oxford University. Edward IV appointed him a councillor and constable of England. Tiptoft became notorious for his trials of traitors, allegedly by 'the law of Padua' but actually by the supranational law of arms. He was captured when \*Warwick restored Henry VI, tried, and executed. RLS

**Tironensians**. Founded by St Bernard of Tiron (c.1046–1117), a former Benedictine monk of Poitiers, who became a hermit at Tiron (near Chartres), this Benedictine congregation was one of several ascetic communities established in the early 12th cent., of which the \*Cistercians were the most successful. Though most of its abbeys were in France, and only a few very small houses were established in England and Wales, the Tironensians flourished in Scotland,

where there were four abbeys (Kelso to which the first community founded at Selkirk c.1113 moved in 1128, Kilwinning, Arbroath, and Lindores), which enjoyed considerable popularity. BJG

**Titanic.** The largest passenger liner afloat, until the early morning of 15 April 1912, on its maiden transatlantic voyage, when it struck an iceberg and sank. Because its owners, the White Star Line, considered them an unnecessary extravagance, there were sufficient lifeboats to save no more than a minority of the passengers: 1,513 died altogether, out of a total complement of 2,224. Most of them were men, because the women were allowed into the lifeboats first (there were some compensations for not having the vote), and lower class, because they were in the most dangerous parts of the ship. The ship's band famously continued playing on the sloping deck as she sank, ending its selection with 'Nearer, my God, to thee'. The *Titanic* became a national symbol for both hubris and courage. BJP

**tithe.** The payment, originally in kind, of a tenth of the produce of land was at first a voluntary religious duty for the benefit of the poor, pilgrims, and churches, but by the 10th cent. it was compulsory, replacing the old church-scot for the maintenance of the church and clergy, and enforceable with heavy penalties, perhaps the loss of nine-tenths of annual income and later even excommunication. When lords built private churches on their land, tithe, at first still payable to the original church, soon went to the lord's family with only a portion to the priest. Similarly in parishes appropriated to a monastery, tithe was paid to the monastery and after the dissolution to their lay successors. With the spread of protestant nonconformity in the 17th cent., the payment of tithe became extremely contentious, leading to innumerable lawsuits. Resentment of tithe was still a factor in the \*Swing riots of 1830 and the \*Rebecca riots in south Wales in 1842–3. By the Tithe Commutation Act (1836) all tithe was commuted to rent-charges. Acts of 1918 and 1925 led to full, compulsory redemption of rent charges, which through the 1936 Tithe Act were replaced by redemption annuities, the crown issuing redemption stock to tithe owners with final extinction after 60 years (1996). Capital loss to the church by this Act was c. £17.7 million. In Scotland, tithes were known as teinds. WMM

**tobacco industry.** This originated in the 16th cent. and was attacked by James I in his *Counterblaste* (1604). Yet smoking spread, and snuff-taking became fashionable. There were three products, cut tobacco for pipes, roll tobacco for chewing and smoking, and snuff. The cost of entry to the industry increased and by 1840 it was beginning to concentrate in large towns. Mass production of manufactured tobacco was made possible by Robert Legg, the inventor of the automatic cutting machine (1853). Among the upper classes cigars became popular in the 1840s and late in that decade cigarettes were first introduced. Cigarettes became popular with servicemen during the \*Crimean War, and their production greatly expanded after 1856. Light yellow tobacco, produced in Virginia, commonly replaced Turkish tobacco in handmade cigarettes by 1860. The introduction of the

Bonsack machine (1881) led to the mass production of cigarettes and was adopted by \*Wills, the leading company in the tobacco industry. Wills formed the Imperial Tobacco Company in 1901 by merging the leading British manufacturers. Since 1960 medical evidence of the effects of addiction and the correlation between smoking and lung cancer has clearly hit domestic demand, but the industry has developed extensive markets overseas. JB

**Tobruk, battle of, 1941.** The Libyan port of Tobruk, 50 miles from the Egyptian frontier, was captured from the Italians by British forces on 22 January 1941. Axis forces under Rommel subsequently defeated the British, but it was decided to hold Tobruk, which Churchill described as a 'sally port' deep behind Axis lines. The siege of Tobruk began on 10 April 1941, and the port was relieved by the British on 10 December 1941. Tobruk was subsequently captured by Rommel on 21 June 1942 and finally retaken by the British following the battle of \*El Alamein in November 1942. GDS

**Toc H.** The movement was founded in 1915 when Revd Philip ('Tubby') Clayton acquired a house in Poperinghe, near Ypres, as a rest-home for troops. It was called Talbot House, after Gilbert Talbot, son of the bishop of Winchester, who was killed in action, and was known by its Morse-code initials. Based upon Christian and charitable principles, the movement received strong support from Edward, prince of Wales, was given a royal charter in 1922, and had more than 1,000 branches throughout Britain and the empire. Its symbol was a lamp. JAC

**Toleration Act, 1689.** As the Act's title, 'for exempting [dissenters] from the penalties of certain laws', indicates, it did not grant whole-hearted toleration but has been hailed as 'the grand landmark . . . in the history of dissent', for after comprehension failed, it legally sanctioned schism. Those unable to accept Anglican liturgy could worship in *unlocked* meeting-houses, licensed by the bishop, provided that the minister subscribed to the Thirty-Nine Articles except on baptism and church government. Catholics and unitarians were excluded. Non-Anglicans continued to suffer civil disabilities imposed by the \*Clarendon code until 1828. By the 1720s even the Whigs, now landed gentry, despising the mainly urban dissenters, made no attempt to extend civil rights. WMM

**Tolpuddle martyrs.** In 1834 six agricultural labourers from the village of Tolpuddle in Dorset, who formed a trade union lodge, were sentenced to seven years' transportation under an Act of 1797 forbidding 'unlawful oaths'. Their leader, George Loveless, was a methodist and seems to have been in contact with delegates from Robert \*Owen's \*Grand National Consolidated Trade Union, who advised on the necessary ritual and initiation ceremony, including an oath of loyalty. Although unions were no longer illegal after the repeal of the \*Combination Acts, and the Tolpuddle men sought only to resist a reduction in wages, the government feared rural unrest, including rick-burning and machine-breaking. The harsh sentence provoked a campaign of petitions and mass demonstrations organized by

## Tone

the GNCTU. Two years later the six were pardoned. In 1838 they returned home, but five of them later emigrated to Canada. JFCH

**Tone, Wolfe** (1763–98). Irish patriot. Tone was born into a middle-class protestant family in Dublin, educated at Trinity College, Dublin, and trained as a lawyer. He was an eloquent advocate of catholic relief, gaining prominence through his *Argument on Behalf of the Catholics of Ireland* (1791) and as assistant secretary to the Catholic Committee (1792). He was involved with the foundation, in 1791, of the United Irish Society, a constitutional radical organization with clubs initially in Belfast and Dublin. However, his politics grew more militant, and in 1794–5 he was implicated in the trial, for treason, of a French agent, William Jackson. After a brief exile in the USA (August–December 1795), Tone served as United Irish emissary in France (1796–8), seeking French military assistance for the Irish republican cause. He was involved with two abortive French expeditions (in 1796 and 1798), being captured in October 1798. Convicted of treason in November, he committed suicide rather than suffer a public hanging. Despite his origins as a Whig and a constitutionalist, he is widely revered as the father of militant Irish republicanism. AJ

**Tonga** is a group of volcanic islands, forming an independent kingdom within the Commonwealth. It lies to the east of Fiji in the South Pacific and exists on fishing and the export of copra and bananas. Cook, who visited several islands on his second and third voyage in the 1770s, called them the Friendly Islands. JAC

**tonnage and poundage** were customs duties which Parliament granted to Tudor monarchs for life. However, the crown's resort to \*impositions led the first Parliament of Charles I to refrain from making the customary lifetime grant. The king reacted by ordering the collection of the duties on an *ad hoc* basis until such time as Parliament granted them. Parliament refused to do so, however, and the 1629 session concluded in uproar with the passing of a resolution against the collection of tonnage and poundage, framed by Sir John \*Eliot. Only in 1641 did the \*Long Parliament at last grant the duties, but for a limited period, declaring that the earlier prerogative levies were illegal. RL

**Tories.** The Tories were one of the two main political parties between the later 17th and mid-19th cents. Their existence as a parliamentary 'party' was not continuous but evolved and changed over time in response to issues and personalities, their party pretensions sometimes weakened by division, or disappearing entirely. The term Tory (from *toraihe*, Irish for bandit or bog-trotter) was first applied by the Whigs to the court supporters of James, duke of York, during the \*Exclusion crisis, 1679–81. Their notions of God-ordained kingly authority, 'divine right', entailed a deep attachment to the Anglican church, and to typical Tories crown and church were the chief preservatives of the political, religious, and social order. James II's catholicism forced them into choosing between their king and their church, and though most chose the latter, many were still unwilling to regard William III as rightful king, or to accept the Whig-

gish notion of parliamentary authority enshrined in the \*Declaration of Rights. Under King William, the country Tories (as opposed to court Tories who took office) identified with the squirearchy and pursued their prejudices against the \* Junto Whigs, the toleration of dissenters, the expense of continental war, the 'monied interest', and the expansion of government influence and bureaucracy. Out of their alliance with disaffected Whigs emerged the 'new Tory Party' during the late 1690s under Robert \*Harley's leadership. The Tories were more at ease under Queen Anne (1702–14), whom they regarded as a legitimate successor of James II. But despite their electoral popularity, they were frequently split ministerially and in Parliament over war strategy, the persecution of dissenters, and the Hanoverian succession, a situation worsened towards the close of the reign by the open rivalry between Harley (as Lord Oxford) and \*Bolingbroke.

The adherence of some die-hard Tories to the \*Jacobite cause after George I's accession in 1714 allowed the Whigs to discredit all Tories as disloyal and dangerous, and until the 1760s they were kept out of government office, with only a few admitted in the localities to the magisterial bench. But as individuals many retained their importance in local politics and administration, while as a component of opposition in the Commons, where they numbered more than 100, they displayed continued sensitivity in issues concerning the church and the royal prerogative. As a result of George III's ending of proscription during the early 1760s, the Tories went their different ways, some aligning with the government, some with the various Whig factions, and others remaining as independent country MPs. Tory values, however, with their focus on the church and the sanctity of governmental authority, continued to have an important place in political argument, featuring significantly in the debates on America and in the 'conservative reaction' towards the end of the century. Under the impact of the French Revolution, the younger \*Pitt's ministry was frequently derided by the Foxite opposition as 'Tory', though this did not become a meaningful political label again until after Pitt's death in 1806. Out of the factionalism of the early 19th cent. gradually emerged the Toryism of \*Liverpool and \*Peel, the latter credited with the ideology of Conservatism. The term 'Tory' is still used, often pejoratively, to refer to the modern Conservative Party. AAH

**Torres Vedras.** The lines of Torres Vedras were a system of defensive fortifications constructed by \*Wellington's engineers in 1809, and were situated 40 miles north of Lisbon to protect the city from French attack during the Peninsular War. They consisted of a series of forts and gun emplacements in three lines stretching some 30 miles from the river Tagus to the sea. Wellington fell back on the lines in October 1810 and held Masséna's French army at bay. In November Masséna was forced to retire to Spain with his army in poor condition. RAS

**Torrington, battle of,** 1646. By 1646, after the heavy defeats at \*Naseby, \*Langport, and \*Philiphaugh, though Charles I still had armies in the field, the Civil War had become largely a mopping-up operation. \*Hopton, one of the

best royalist commanders, took over the remnants of \*Goring's army in the south-west, numbering some 3,000 men. At Torrington in north Devon, while hoping to come to the relief of Exeter, he was attacked on 16 February by Sir Thomas \*Fairfax's much larger force, was wounded, and forced back into Cornwall, where he was obliged to surrender the following month. JAC

**torture.** In his important work *De laudibus legum Angliae*, Chief Justice Fortescue (c.1385–1477/9) describes torture as being foreign to English law, which he praised in comparison with the civil law of the European continent. Certainly torture was a feature of the civil law system and was used to discover truth where an inquisitorial form of trial was used. However, although not used by the common law courts, it was used by the \*council when investigating offences and, particularly in the reign of Henry VIII and Elizabeth I, the use of torture, notably the use of the rack, was common. Torture was also occasionally used by the Court of \*Star Chamber. Although the common law itself did not use torture as a means of obtaining evidence, it did in practice torture those who refused to accept trial by jury under the \*peine forte et dure. Torture was permitted under Scottish law, but was abolished immediately after the Union by 7 Anne c. 21 s. 5 (1708). MM

**Tostig, earl of Northumbria** (c.1025–66), younger brother of \*Harold, who was briefly, in 1066, king of England, and of \*Eadgyth, \*Edward the Confessor's queen. With Tostig's appointment to Northumbria, his family seemed set to dominate the English kingdom. But he was driven out by a local rebellion in 1065. He blamed Harold for not attempting to secure his reinstatement, and in exile raised a force which raided the English coast. Achieving little, he joined the army led by \*Harold Hardrada, king of Norway, and was killed at the battle of \*Stamford Bridge. Tostig's unpopularity in Northumbria may well have made the wary Harold reluctant to support him. Whatever the case, their bitter quarrel had disastrous results since, united, the two brothers would surely have been able to do much more to prevent the \*Norman Conquest than was ultimately possible. DB

**touching for the king's evil** was an instant medieval royal tradition. On learning that their rivals the Capetian kings of France claimed divine healing powers, the kings of England, from Henry I onwards, followed suit. Curiously it was only scrofula that could be cured. The ceremony developed into a very formal one, with the monarch stroking the sufferer's throat, while a cleric intoned 'They shall lay their hands on the sick and they shall recover' (Mark 16). If they did not, they at least had a gold medallion to show for it. James I disliked the practice but Charles II is said to have stroked more than 90,000 people. William III discontinued the ceremony. Jacobites insisted that the touch had deserted a usurper but claimed that the exiled Stuarts had effected miraculous cures. Queen Anne revived it and one of the last persons to be stroked was the young Samuel \*Johnson in 1712. The Hanoverians gave it up, though in France Charles X was still stroking when removed by revolution in 1830. JAC

**Toulouse, battle of, 1814.** On 10 April 1814 \*Wellington launched an assault against the city, losing 5,000 men. However, after fierce fighting, Marshal Soult and the French were driven out with the loss of 3,000 men. The victory came hours before Napoleon's abdication in Paris on 11 April. RAS

**tourism** is a stage beyond trail-blazing as an explorer or adventuring in little-explored and possibly dangerous places as what might be called a traveller. It depends on an infrastructure providing guidance, accommodation, and perhaps entertainment, on however rudimentary a level, for those who seek pleasure and interest in journeys away from home territory. It follows beaten paths, and sometimes receives contemptuous responses from the more self-consciously imaginative and adventurous: even Revd Francis \*Kilvert, thinking himself a little off the conventional routes of Cornwall in the early 1870s, felt able to denounce (repeatedly) the common 'tourists' he encountered. There is a case for presenting \*Chaucer's Canterbury pilgrims and their medieval counterparts as early tourists, but the phenomenon of tourism has its most obvious roots in the \*grand tour of Europe which British aristocrats opened out in the 17th and 18th cents., seeking cultural awakening and worldly experience in (especially) northern Italy and buying sculptures and paintings to take back to adorn their country houses. Cultural tourism was soon supplemented by landscape tourism, as the cult of the picturesque, the romantic, and the sublime led British aristocrats to alpine passes and glaciers, as well as to landscapes vivified by classical connotations; and the pursuit of the picturesque encouraged tours like those of Lord Torrington or Sir Richard Colt Hoare in search of distinctive scenery and novel sensations, which could be transmogrified into the stuff of polite cultural exchange through the sketchbook and the printed word. Architecture also became part of the fashionable passing show, as did ruins and natural history, and the country houses of the aristocracy and the birthplaces or chosen subjects of literary lions or artists also became objects of the tourist gaze.

The age of the steamship and the railway brought a widening of the tourist market in Britain, as the middling and even the lower middle classes began to aspire to travel in search of entertainment and enlightenment, and cheaper transport and more accessible arrangements made this a realistic possibility. The foremost name here is Thomas Cook, the Leicester temperance reformer, who inaugurated cut-price continental travel, with all arrangements made by his firm, after modestly inaugurating his activities with a temperance excursion from Leicester to Loughborough. Cook's tourists, as they became known, were derided by those who laid claim to effortless expertise in cultural analysis, and their passage through places such as Cologne cathedral, guidebooks in hand, eager not to miss a single point, was the subject of condescending comment in periodicals like \*Punch from the 1860s onwards. But tourism was to prove an enduring growth industry, as higher real incomes and expanded free time spread down the social scale, and the cultural rewards for being able to talk about interesting holidays became enhanced accordingly. Alongside the

## tournaments

rise of spas and seaside resorts (from the 18th cent.), which catered for seekers after health and entertainment as well as those with more exacting aspirations, there were regions which offered mountain air and scenery, literary associations, and interesting flora and fauna as well as architecture and classical allusions; and the market for British tourism had extended throughout and beyond Europe by the turn of the century, including Cook's popular tours to the Holy Land. The growth of tourism promoted markets in souvenirs and fake works of art, and the tourist gaze transformed the societies at which it was directed. This was already a source of complaint before the First World War, though some utilitarian and progress-celebrating writers like Harriet Martineau, writing in this case about the mid-Victorian Lake District, celebrated the progress and enlightenment which tourism brought in its train, pointing out its capacity for generating employment. Not everyone was so optimistic. The problems and possibilities opened out by an ever-expanding tourist industry, and by its popularizations (especially for the affluent middle-class British market), continued to be the focus for anguished debate in the inter-war years, although it was not until the advent of cheap air travel and package tours to the Mediterranean from the 1960s that a real sense of cultural crisis could be detected on a broad front. The debates on tourism at the end of the 20th cent. differed more in degree and emphasis than in kind from those which were already being aired a century earlier.

JKW

**tournaments.** By the later Middle Ages, the term tournament covered all kinds of armed combat, both team and individual, performed competitively in public. Originally, however, the term applied specifically to the meeting of two teams in a quasi-battlefield situation. In England and France, this form of combat was commonly described as a 'hastilude', literally a game with spears, whereas a 'joust' was generally a contest between individuals, on foot or on horseback, although the competitors often formed teams. Indeed, it has been suggested that Edward III's Order of the Garter, founded c.1348, was initially intended to comprise two equal-sized tournament teams, headed by the king and his eldest son \*Edward the Black Prince. Tournaments were essentially sporting and social occasions rather than a means of developing skills for war. They were often banned in England in times of overseas war (Henry V particularly disapproved of them), since they had been closely connected with baronial disquiet in the first half of the 13th cent. It was possible for young men of relatively low status to make a mark through their prowess, but in general the participants were already of noble or at least knightly birth. Moreover, it was an expensive activity, requiring increasingly sophisticated equipment, not only for show and identification, but also for protection because the combats were often exceedingly dangerous and specialized tournament armours and weapons were necessary: in these respects, a close analogy can be drawn with Formula One motor racing today. It was undoubtedly a spectator sport, involving much pageantry and ritual. Its popularity in England was boosted by the personal enthusiasm and participation of Edward I;

from his reign onwards, the royal court was the focus of both leadership and patronage to a degree unparalleled elsewhere in Europe. Edward III followed in his grandfather's footsteps, developing the \*Arthurian analogies to the full, but after the reign of Richard II royal patronage, and with it the tournament in England, declined until its revival under Henry VIII.

AC

**Tours, truce of, 1444.** With the struggle in France moving against them in the 1440s, the English wished to use a marriage negotiation for Henry VI to obtain a settlement. At Tours in May 1444, Suffolk (William de la \*Pole) promised to surrender Maine in exchange for a two-year truce and Henry was betrothed to \*Margaret of Anjou, niece of Charles VII of France. The break in hostilities lasted only until 1449 when Charles attacked Normandy and took Rouen.

JAC

**Tower of London** (White Tower). Built by William the Conqueror within the south-east corner of the old Roman walls of London as one of three fortresses intended to secure the city. As London became increasingly important as the centre both of government and of commerce, the castle was enlarged and updated by successive kings, especially by Edward I and Edward III, until it became a complex concentric fortification. But no royal castle in the Middle Ages was used solely for defence and the Tower became the site of a multitude of offices and departments. Its multifarious role was summed up by John \*Stow in his *Survey of London* in 1598: 'This Tower is a citadel to defend or command the city [of London]; a royal palace for assemblies or treaties; a prison of state for the most dangerous offenders; the only place of coinage for all England at this time; the armoury for warlike provision; the treasury of the ornaments and jewels of the crown; and general conservator of the most records of the courts of justice at Westminster.'

Even in the later Middle Ages the kings had preferred to reside when in London at their palace at \*Westminster. Traditionally, however, the new sovereign spent the night in the Tower before his coronation, going in procession to Westminster for the ceremony. The last king to make this procession was Charles II. The Tower has gradually been stripped of most of its other functions. It is still a royal castle, houses the crown jewels, and retains a small military presence but its other offices were relocated in the 19th cent.; the royal mint was moved to new premises on Tower Hill in 1811–12; and in the 1850s the documents held in the Tower were moved to the newly built Public Record Office in Chancery Lane. The historic collection of weapons in the armouries is all that remains of the arsenal, moved to Woolwich after 1841, and to Leeds in 1995.

The importance of the Tower as a prison and military strong point remained. Each political crisis caused the Tower to be placed in readiness and saw it housing a crop of political prisoners. Even the duke of Wellington, constable of the Tower 1836–52, fearing that the country was close to popular revolution and that the Tower would be a target, had its defences repaired and strengthened and new barracks built with accommodation for a garrison of nearly 1,000 men. He also argued that the Tower was 'the best if not

the only good place of security' for state prisoners, although few were held there. During the two world wars some German spies were executed by firing squad in the Tower and prisoners were again housed there, the last being Rudolf Hess, after his flight to Britain in 1941. LR

**towns.** Since Britain was the first country in the world to urbanize, i.e. to have over half its population living in towns, but also for many centuries lagged behind other European countries in the degree of its urbanization, there is an interesting paradox at the heart of British urban history. It is also bedevilled by semantic debate: what is a town? Much older literature concentrated on legal status and discussed 'boroughs', whereas recent scholars stress more social and economic criteria. The best definition is perhaps that of Susan Reynolds, that a town is a permanent human settlement which forms a social unit distinct from the surrounding countryside, and in which a significant proportion of its population lives off non-agricultural occupations.

Though there were large settlements in Iron Age Britain, true urbanism began with the Roman occupation of southern Britain. Leading Romano-British towns included a strikingly high proportion of those towns which topped urban league tables until the industrial revolution—\*London, \*Lincoln, \*York, \*Winchester, \*Canterbury, etc. Though they are often seen as primarily administrative and social rather than economic centres, which ceased to be towns when Roman administration collapsed in the 5th cent., that may be too simple. Their strategic positions, and their reoccupation in the Middle Ages (with one or two exceptions like \*Silchester and \*Wroxeter), suggest that they were as well sited as they could be in relation to the economic exploitation of British pre-industrial conditions.

Some Roman towns may have continued, under native leadership and invading Anglo-Saxons, as 'central places', with royal palaces or religious centres, but true town life seems to have revived in the 7th and 8th cents. Large trading towns (*wics* or *emporia*) developed both alongside old Roman fortified sites (London, York, and \*Southampton) and in at least one case on a new, non-Roman site (\*Ipswich). Meanwhile small towns developed inland around royal and ecclesiastical centres, especially after the foundation of cathedrals and major churches. Urban life may have been disrupted by the Viking raids and conquests of the 8th and 9th cents., and King \*Alfred initiated or developed a system of fortified settlements (*burhs*) to resist them; but the Vikings themselves stimulated urban growth and trade in eastern England. Under the kings of united England (954–1066) existing towns flourished and new towns were founded.

The Normans after 1066 further developed towns in England and also in south Wales, many of them dominated or protected by a castle, while in Scotland towns emerged in the 11th and 12th cents. A developing commercial economy in the 12th and 13th cents. led to the expansion of many towns and the creation of many new ones, including hundreds of small market centres. Large towns acquired communal defences and chartered privileges, and London rapidly acquired a unique status as a capital city and the only British town comparable to the great continental towns. Its

population may have reached 80,000–100,000 by 1300, while towns as a whole may have accounted for 15 per cent of the English population; the proportion was much lower in Wales and Scotland. The \*Black Death of 1348–50 killed a high proportion of townspeople, and some historians have seen it as ushering in a period of late medieval urban decay. However, there is much evidence that many towns, though reduced in size, flourished, and certainly liberties were granted to many towns by both English and Scottish monarchs.

The 16th and 17th cents. saw some recovery in the size of towns, since although their mortality rates were high (bubonic plague returned periodically until the 1660s), they attracted large numbers of immigrants. The most outstanding case was that of London, which grew rapidly both in absolute and in relative terms, becoming by 1700 the largest town in western Europe and at least 20 times as large as any other English town. In the 18th cent., however, industrial and commercial development, including better communications, allowed many other towns to grow rapidly. This huge urban growth disrupted old institutions and attitudes and led to the municipal reforms from the 1830s onwards.

In the 19th and 20th cents. towns continued to grow in relative as well as absolute terms, while nearly all British people have come to share an essentially urban culture, whether or not they live in towns. The total urban population of England and Wales reached 54 per cent by 1851, 78 per cent by 1901, and 81 per cent by 1951 (for Scotland similar calculations give 52 per cent by 1851 and 65 per cent by 1891). With proportions so high, it becomes increasingly difficult to separate urban from national history, and it becomes possible to write national history from an urban perspective.

Clark, P., and Slack, P., *English Towns in Transition 1500–1700* (Oxford, 1976); Corfield, P. J., *The Impact of English Towns, 1700–1800* (Oxford, 1982); Reynolds, S., *An Introduction to the History of English Medieval Towns* (Oxford, 1977); Waller, P. J., *Town, City and Nation: England 1850–1914* (Oxford, 1983).

**Townshend, Charles** (1725–67). Townshend dashed across the political sky in the 1760s like a comet, blazed, and was gone. A grandson of 'Turnip' \*Townshend, he was returned to Parliament on the family interest at Great Yarmouth when he was 21 and held a variety of junior posts in the 1750s and early 1760s. In 1766 he became chancellor of the Exchequer in Chatham's (\*Pitt) ministry. The weakness of the ostensible first minister, \*Grafton, and the illness of Chatham, gave Townshend his head. In May 1767 he delighted and amazed the Commons with his 'champagne' speech, of which few reports survive. At the same time he pledged himself to raise a revenue in America by the imposition of a range of duties, a policy made all the more necessary by his failure to carry the land tax at 4 shillings, which left him short of budgetary income. Having lit the fuse for an American time-bomb, he died in September 1767 of a fever at the age of 42. Lecky called him 'the spoiled child of the House of Commons'. JAC

**Townshend, Charles Townshend, 2nd Viscount** (1674–1738). Townshend succeeded to his peerage and the headship

## Townshend

of the leading Norfolk political family in 1687. Though from a Tory background, he became a Whig closely associated with the \*Junto, specializing in foreign affairs. In 1713 he married Robert \*Walpole's sister and the following year became secretary of state for the northern department. Shifted to the less powerful post of lord-lieutenant of Ireland in 1717, he resigned from the government along with Walpole and remained in opposition during the Whig schism until 1720 when he became lord president of the council, returning to the northern department the following year. From 1722 he and Walpole ran the administration, with Townshend concentrating on foreign affairs, and though Walpole can be considered first minister because of his control of the Treasury, the ministry should be viewed as a duumvirate until at least 1727 when Townshend began to lose ground to his brother-in-law. Disagreement over foreign policy led to his resignation from the ministry in 1730. In retirement he devoted himself to agriculture on his estate at Rainham, and has come down to posterity as 'Turnip Townshend'. CJ

**Townshend, George** (1724–1807). George Townshend, elder brother of \*Charles, had a distinguished military and political career. An army officer, he was second in command to \*Wolfe in Canada and took over when Wolfe was killed. He succeeded as viscount in 1764 and from 1767 to 1772 was lord-lieutenant of Ireland. During this time he tried to free the castle from the \*undertaker system and made important concessions to the Irish Parliament. On his return, he was master of the ordnance throughout the rest of North's ministry and held the post again in 1783 under the coalition. He was out of office after 1784 though he became marquis in 1786 and was promoted field marshal in 1796. His brother was a brilliant mimic: George Townshend was an equally brilliant amateur caricaturist. JAC

**townswomen's guilds**, emerging out of the women's suffrage movement and modelled on the remarkably successful rural \*women's institutes, were founded in 1928 with a programme of 'comradeship, arts and crafts and citizenship' for the urban ordinary housewife. Similarly non-party and non-sectarian, with a firm framework, their social and educational emphasis was reassuring, and guilds burgeoned throughout the UK. During the Second World War, their monthly magazine the *Townswoman*, which aided continuity, offered practical advice and encouragement, while the extent of poverty and degradation revealed by the evacuation programme encouraged subsequent public and social welfare interests. Pioneering work in adult education was accompanied by organizational strengthening and overseas links, but membership began to fall in the 1970s as structural rigidity came under challenge and younger women failed to come forward. Learning how to serve had begun to yield to women's changing aspirations and increasing economic emancipation. ASH

**Towton, battle of**, 1461. Towton is unique among British battles, being fought in a blinding snowstorm. It saw the largest armies ever assembled in the country, with more than 50,000 men involved, including most of the nobility.

Edward IV, the 19-year-old Yorkist claimant in the Wars of the \*Roses, was proclaimed king in London early in March 1461 and pursued his adversaries north. Queen \*Margaret and her hapless husband Henry VI were at York. The armies clashed at Ferrybridge on 28 March and did battle the following day at Towton, 10 miles towards Tadcaster. The slaughter was great and the Lancastrians routed. Henry and his wife fled to Scotland while Edward returned to London to be crowned. JAC

**tractarianism** was the name applied to the first stage of the \*Oxford movement, derived from a series of *Tracts for the Times* written between 1833 and 1841 by a group of Oxford high churchmen, including Hurrell Froude, \*Keble, \*Newman, \*Pusey, and Isaac Williams. Their context, signalled by Keble's Oxford assize sermon on 'National Apostasy' (14 July 1833), was alarm at the onslaught of Roman catholicism, dissent, and 'liberalism', focused by the Whig government's abolition of ten Irish bishoprics in what appeared to be a revolution in the relations between church and state. Tractarians insisted on the church's authority to teach catholic truth to the English as the divinely commissioned agent of Christ and his apostles, and their exploration of this authority began a movement which decisively affected English Christianity's understanding of sanctity, worship, and religious practice. The furor provoked by Newman's Tract 90, on the Thirty-Nine Articles, ended the series and his reception into the Roman catholic church closed the tractarian phase, but their influence set the Anglican pace for the rest of the century. CB

**trade**. Economic development has, from the earliest times, been manifest in and driven by trade, which has been one of the principal mechanisms by which prosperity has increased. One of the reasons for trade is specialization of production. Some examples are obvious. European countries are not very successful in growing bananas. Similarly, the distribution of natural resources like coal, iron ore, and oil has always been unequal. Thus each country specializes in producing those commodities in which it has a comparative advantage. Specialization allows economies of scale because it is more efficient to produce for a large world market than for a much smaller national market. Britain in the 19th cent. relied very heavily on export markets to sustain its textiles, engineering, and mining industries. Trade can be envisaged as an indirect form of production. The commodities imported rather than produced at home will always require less productive inputs than would be required under home production. Trade is thus an unqualified benefit to all parties, irrespective of whether trade is fair or a country is competitive.

But the fact that trade is universally advantageous does not mean that the benefits are equally distributed. Changes in the composition of output resulting from trade will produce both gains and losses. The impact of imperial free trade policies on 19th-cent. India boosted the export of raw cotton to Britain but had a devastating impact on Indian cotton manufactures. Similarly British manufacturers gained from access to overseas markets, while wheat producers suffered from competition from cheap grain from the USA.

The overall gain is derived from the fact that, in principle, those who gain from trade could compensate those who lose and still be better off than they were initially. In an ideal world in which there existed unrestrained trade and free movement of labour and capital between countries, the price of inputs like labour and capital would be the same everywhere. There would be, in fact, a single integrated world market. In reality this is far from the case. Variations in natural resources, in which some countries are rich (Russia) and some are relatively very poor (Japan), and in technology, barriers to trade, and historical experience of development have maintained and augmented these differences.

There is little doubt that international trade and specialized production played a major part in the growth of the industrial economies in the 18th and especially the 19th cent. The depression of the 1930s was marked by the lowest level of international trade for centuries, while the boom in the 1950s and 1960s was as manifest in trade as in output and incomes. But many in the less developed countries have argued that trade has not been beneficial for them since they have been peripheral to those with greater comparative advantage. Indeed it has become a radical criticism of the free market system that it prospered through the exploitation of the less developed countries by the industrial nations. Attention is drawn to the experience of countries like Brazil or Egypt, which experienced growth without development through a comparative advantage in exporting raw materials, such as coffee, rubber, and cotton. Hence the support for import substitution policies and attempts to persuade the developed world to help by allowing trade on terms favourable to the less developed. Neither strategy was successful. But in the 1970s and 1980s the 'four tigers' of south-east Asia (Hong Kong, Singapore, South Korea, Taiwan) achieved unparalleled growth rates through the export of manufactures, from textiles to engineering and electrical goods, and thus provided a reminder of the benefits of trade.

CHL

**Trade, Board of.** The origins of the department may be traced back to 1621 when, in the face of a trade recession and a difficult Parliament, a number of committees were appointed, under the guidance of \*Cranfield, to consider the matter. At the Restoration, Charles II appointed separate councils for trade and for plantations, brought together by \*Shaftesbury in 1672, who took the presidency. His successor, \*Danby, reorganized it with William Blathwayt as secretary. In 1696 when the problem of coinage was again giving trouble, a permanent Board of Trade and Plantations was set up, with eight core members, supported by the great officers of state. The earl of Bridgwater took the presidency and John \*Locke was one of the first commissioners. The business of the board was primarily colonial administration and policy. \*Gibbon found, when appointed in 1779, that 'our duty is not intolerably severe' and in 1782 the board fell victim to the \*economical reform of the Rockinghams. Pressure of business soon demanded a replacement. As early as March 1784 \*Pitt's government appointed a new committee, upgraded in 1786 to a board, with Jenkinson as president and given a peerage as Lord \*Liverpool. The post was not at

first highly regarded and the president was not necessarily in the cabinet. But as extra responsibilities were acquired and economic growth became a major consideration, the prestige of the department rose and politicians of the calibre of \*Gladstone, Joseph \*Chamberlain, \*Churchill, \*Lloyd George, \*Cripps, and \*Wilson took it on. Since 1945 the presidency has often been held with some other post as governments reshuffled organization in desperate attempts to find the golden key to prosperity.

JAC

**Trades Disputes Act, 1906.** The Liberal government introduced a bill based on the recommendations of the royal commission (1903). It proposed statutory recognition of unions and the separation of their benefit funds from strike and general funds. The trade unions and Labour MPs were not satisfied with the government's bill and introduced a private member's bill. The Labour bill was accepted by the Liberals and formed the basis of the Trades Disputes Act. This indemnified unions against civil proceedings; their funds were protected against claims for damages, thus discounting the \*Taff Vale judgment (1902). This very privileged position survived until 1927.

JB

**Trades Union Congress.** At an early stage of trade union development, the idea of a co-ordinating body emerged and in 1834 the \*Grand National Consolidated Trade Union was founded. It attracted many members but few funds, and the secretary absconded with what there were. It lasted less than a year. But during the next three decades there was a substantial growth of trade union membership, particularly in the skilled trades. The Amalgamated Society of Engineers was founded in 1851, the Amalgamated Society of Carpenters in 1860, together with a Glasgow trades council 1858 and a London trades council 1860. In 1868 a meeting of 34 delegates in Manchester resolved that annual meetings were desirable, though no machinery was devised. The new organization set up a parliamentary committee in 1871 to lobby on legislation. In 1900 a Labour Representation Committee was established—the forerunner of the \*Labour Party in 1906. The Scottish TUC was founded in 1897. By 1893 there were more than a million trade unionists affiliated to the TUC, 6 million by 1920, and 12 million by 1979, after which membership went into marked decline. The electoral difficulties of the Labour Party after 1979 caused its relationship to the TUC to be constantly reassessed.

JAC

**Trade Union Act, 1871.** Passed by \*Gladstone's administration following the recommendations of the Royal Commission on Trade Societies (1867), the Act clarified the legality of trade unions and provided for their funds to be protected under the Friendly Society Act, 1855. Penal clauses, initially included in this Act, were incorporated in the Criminal Law Amendment Act, 1871. Intimidation, obstruction, and molestation were difficult to define at law; \*Disraeli's government legalized peaceful picketing in 1875 (Conspiracy and Protection of Property Act). These measures did not solve the complex issues of behaviour during industrial disputes but they did indicate the growing electoral importance of skilled urban workers.

JB

## trade unions

**trade unions**, retaining some of the benefit functions of the old craft guilds, emerged in the 18th cent. as conflicts between capital and labour increased and state protection collapsed before the rise of the \*factory system. More intensive exploitation occurred in the factory, but factory workers were in a minority for most of the period 1780–1900, and skilled handicraft societies set the style of unionism. They were subject to prosecution under English common law as combinations in restraint of trade. Fear of revolution led to the \*combination laws of 1799–1800; this legislation was ineffective, forcing unions underground. Eventually, unions were given legal recognition under the Act of 1825. Most unions were local, small, and based on public houses or 'houses of call', but some of them had a primitive national organization.

Owenite utopianism stimulated the rise of general unions. Older unionism existed alongside attempts to found a \*Grand National Consolidated Trade Union; when this grandiose organization collapsed in 1834–5, continuity was maintained by 'the aristocracy of labour'. After the depression of the early 1840s national unions of skilled trades either revived or were founded. There is little justification for using the term 'New Model Unionism' about the formation of the Amalgamated Society of Engineers (1851); there was no radical reorganization and no new characteristics. The ASE was merely one successful example of a process proceeding from the 1820s. Skilled unions had always insisted upon efficient organization, strikes being a last resort, collective bargaining the norm, and death, sickness, or unemployment benefits provided. Trades councils were created by unions; from the London Trades Council emerged the \*Trades Union Congress (1868).

Legal recognition and protection of funds became an issue after the *Hornby v. Close* decision revealed that unions lacked these basic rights; hence the pressure for the Acts passed in the 1870s. The revival of socialism in the 1880s coincided with depressions and the creation of new unions for the semi-skilled and the unskilled, paying lower entry fees and prepared to be militant. Membership of unions rose from about 750,000 in 1888 to over 4 million by 1913. Individual unions increased in size. Some grew organically, others as a result of amalgamation. Industrial strife was widespread in the years before 1914, provoked by falling living standards and a growing radicalism associated with \*syndicalist ideas. The Triple Alliance of transport workers, miners, and railwaymen was in existence by 1914 and had a strategy of sympathy strikes in place. Thus the ground was drawn for the sharp class conflicts of the 1920s including the \*General Strike of 1926. Trade union membership declined during the Great Slump, only reviving in the late 1930s.

The Second World War (1939–45) led to the direction of labour and full employment. Trade union membership increased from about 6,250,000 in 1939 to nearly 8 million in 1945. By 1979 there were about 13,500,000 members or 58 per cent of those in work. More industrial unions were created at the expense of traditional craft unions, but demarcation disputes and unofficial strikes were frequent.

After 1979 trade union membership fell to under 10,250,000 by 1988 or 37.6 per cent of the labour force, and

the number of unions declined from 453 in 1979 to 330 in 1987. Hostile legislation designed to remove union power over the labour market beginning with Acts of 1980 and 1982 was a feature of the policies of \*Thatcherite Conservatism. Single union agreements with 'no strike' clauses were common, as plant bargaining began to replace national negotiations. A significant change was the Labour Party's distancing itself from the union movement, with which it had been closely associated since its birth. JB

**Trafalgar, battle of**, 1805. Fought on 21 October 1805, 20 miles south of Cadiz and 12 miles south-west of the shoaling Cape Trafalgar, this most famous of engagements in the era of sail lasted from midday to about 5 p.m. In the course of it, 18 of the 33-strong combined fleet of France and Spain surrendered to the British under the command of Lord \*Nelson, supported by Cuthbert \*Collingwood heading the fleet's southerly (lee) division, and Lord Northesk, in the rear of Nelson's northerly (weather) division, which he himself headed in \*Victory. The two divisions, comprising 27 ships in all and separated north-south by a mile, advanced at right angles against the Franco-Spanish line from the west. By midday this line was on a northerly bearing for Cadiz, having a few hours before been on a southerly one, as if for the Straits. In consequence Villeneuve's and Alava's dispositions of their ships were fatally confused, though their often inexperienced crews fought with great bravery. The British engaged 'pell mell' at the closest quarters without losing a ship, Nelson's exhortation to 'every man to do his duty' being echoed by rates of fire which no other fleet of the day could approach. Nelson's victories removed all possibility of Napoleon launching an invasion of Britain.

Trafalgar was the quintessence of the implicit abandonment, in progress during the previous half-century, of opposing fleets engaging in formal parallel lines, but it was Nelson's personal genius which conferred on the battle a resonance which transcended innovation. Following his death at the battle's close, when some 500 British and at least 2,000 Spaniards and French had died (followed by many more drowned in the ensuing week-long gale), there was no active pursuit of Nelson's ideas, a retrograde conservatism being deemed the better part of audacity.

DDA

**Traherne, Thomas** (1637–74). Religious writer. Son of a Hereford shoemaker but enabled to study at Oxford, Traherne was ordained in 1660 and held the living of Credenhill (near Hereford) 1661–74, though he resided at London and Teddington 1669–74 as domestic chaplain to Sir Orlando Bridgman, lord keeper of the great seal. Despite his literary intensity, only *Roman Forgeries* (1673), which attempted to substantiate charges against the Roman church for tampering with early Christian church records, was published in his lifetime. *Christian Ethicks* (1675) and *Thanksgivings* (1699) were posthumous, but manuscripts for *Centuries of Meditations* (instructing a friend in the way of 'felicity') and *Poetical Works* had to await chance discovery on a London street bookstall in 1896, whilst *Poems of Felicity* was unearthed later in the British Museum. A mystic poet like \*Herbert and \*Vaughan, Traherne was acknowledged by contemporaries

for piety and scholarship, though has since been charged with naivety.

ASH

**trained bands** were the county- and city-based militia regiments, which, except for London and a few counties, played little significant part in the civil wars. The London regiments were built up to a strength of 18,000, mainly infantry, by 1643. Officered by the commercial leaders of the city, their rank and file comprised mainly apprentices and hired men rather than householders. They were employed in patrolling the Thames valley, but also played a critical role at \*Turnham Green, the siege of Gloucester, and the first battle of \*Newbury. Increasingly unwilling to leave London, they saw their role taken over by permanent standing armies in 1643 and 1644. The attempt by the moderate peace party of Denzil \*Holles to use the London trained bands in the projected presbyterian counter-revolution of 1647 was an abject failure: when summoned to defend London against the invading \*New Model Army, the men refused to stir.

IJG

**trams.** Light rail systems for passenger carriage, predominantly urban in use, named after the pre-1800 wagon-ways of the north-east, were introduced to Europe from the USA in the 1850s. With the low rolling resistance of rails, trams offered a smooth ride, with considerable economy in horsepower: a two-horse, 2-ton tram could carry 50 passengers, double the load of an omnibus with a similar team. Established in five centres in 1859–62 by George Francis Train, using unacceptably protuberant rails, Britain's tramways effectively began with the Liverpool system in 1868. The Tramways Act of 1870 facilitated growth, but its provision for municipal purchase at current value after 21 years ultimately inhibited innovation. Because of weight problems, steam traction had limited application to British tramways, but electrification was critical to advance, and was retarded by the Act. First applied on third-rail Siemens principles to the Newry tramway in the 1880s, electrification became generalized using overhead conductors, and was successfully proven in the demonstration line provided by Thomson-Houston in Leeds in 1890. Electrification spread quickly in municipalized tramways, beginning with Bristol (1895) and Glasgow from 1898, where municipal tramway enterprise reached a height.

Trams catered for the 'better-off' workers, and provided a well-lit and reliable service, producing star-profiled growth of towns and cities, as property values and development followed the tramlines outward. They proved correspondingly profitable, producing rather better dividends than railways around 1900, attracting demands for municipal regulation of monopoly. The next 25 years saw booming traffic: journeys rose from 992 million in 1899–1900 to 4,706 million at their peak in 1927–8, and route miles peaked in 1924 at 2,605. One could travel by municipal tram from Leeds to Liverpool in the 1930s, with but a short walk between end-on networks. They declined steadily thereafter, with some traffic being transferred to the trolleybuses, pioneered by Leeds and Bradford in 1911, but which, at their peak, only carried a little over 2,000 million passengers. Trams proved relatively inflexible from the 1920s, although

some cities, such as Leeds, introduced new express routes in the early 1920s. They were starved of capital as their profits were milked to hold down the rates: new investment might have slowed decline, but could not prevent it, and by 1938 route mileage had fallen to half its peak level. The British urban tram largely disappeared by the mid-1950s, often amid poignant municipal ceremony. Concern over incipient urban gridlock led in the 1990s to revivals in Manchester and Sheffield, though still with massive problems of undercapitalization, and more tramlines may yet be disinterred.

JCh

**transport** was critical to the evolution of the nation state, and explains some of Britain's historical differences from its European neighbours. It helped to determine the early success of England as a political entity, its patterns of social and geographical mobility, and the close economic integration that helped to make Britain the first 'industrial nation'.

Post-Roman Britain lacked a single capital, and its transport system was diffuse, focused on the port, market, church, and seigneurial hall in a plurality of political and economic zones. In England, the gradual emergence of \*London as capital city in the 13th and 14th cents. re-established the hub of a transport system, and the crown, the law, the court, the Exchequer, and associated institutions created a powerful centripetal influence, never replicated in Scotland or Wales. London's influence on Britain's transport grew thereafter, through its disproportionate demand for provisions and its dominance in international trade. Its function as central location for services, and for craft and business training, meant that by 1700 perhaps a quarter of England's population had experienced life in the capital. \*Turnpikes reinforced this focus, but after 1750 \*canals and \*railways also reflected other urban demands, and created a transport system profiled as a St Andrew's cross, centred on the midlands, and framed by coastal shipping, and the Edinburgh–Glasgow route. The decline of traditional industries in the 20th cent., with the growth of \*air travel, and the rise of services and big government, increasingly restored London as the sole hub of British transport.

Transport influenced perceptions of distance and time, and through this the sense of place. In the horse-drawn world before 1770, market and county town were objects of weekly and seasonal travel, the capital a place for temporary or life-cycle migration; a century later, London and Edinburgh were accessible to overnight visitors from most parts of England and Scotland; by the 1980s London's \*rail commuting zone, bounded by the 100-minute journey, enveloped Bristol (122 miles distant), Birmingham (105), Norwich (114), and Doncaster (159), radically 'reshaping' the country. The railways also unified Britain into a single time zone in the 1850s, and the telegraph's instantaneous communication transformed the transmission of news beyond that of the fastest post or courier. With such transport change, and the induced shift in the perception of this island, the linguistic confusion of 'county' and 'country', so common before 1700, declined and disappeared.

The transport of information interacted with that of goods, and thus personal experiences of scarcity or plenty,

## transportation

and local and regional autonomy in the supply of food or fuel. The provisioning of medieval London, in 1400 around 4 per cent of the nation, was a complex transport problem demanding the integration of carts, river vessels, and coasters, which increased as that proportion rose to 11 per cent in 1700. Londoners dined on the meat of the Highland and Welsh cattle that had walked in droves south; on Dales sheep and Norfolk turkeys and geese also driven overland; on Thames-borne cheese, treated generically as 'Double Gloucester'; with Fulham or Putney vegetables, sustained by the reciprocating transport of manure; and washed them down with London porter, brewed from the dark malts shipped down the River Lea. Each shift in transport dislocated the equilibrium of supplies, and induced hostility from the threatened or the dispossessed: from the early modern grain wagon attacked by villagers as the proximate cause of their hunger, to Newcastle upon Tyne's vehement opposition to the navigation of Sunderland's river Wear, to those who mobbed James \*Brindley or George \*Stephenson as they came to survey their parish for canal or railway, and to the modern road 'nimby', transport has been keenly political, carrying high economic stakes. Britain's relatively small size and favourable endowment with water transport permitted its pre-railway transport systems to induce intense regional specialization, urbanization, and the economic growth of the first \*'industrial revolution', where other nations attained merely developed industrial regions without complete social transformation.

Transport too provided for personal travel long before the coming of modern systems. The great \*pilgrimages developing from the 14th cent., to \*Canterbury, \*Walsingham, or even Compostella, crowded the roads and led to the creation of commercial \*inns. Medieval law implied a fifteen-mile round trip for market day, a near-universal transport experience, and marriage horizons commonly extended beyond the parish boundary, with courtship energetically pursued by foot or horse.

The cheapening effect of successive transport innovations has democratized travel over the very long term, especially train, bus, and motor car, but we must not allow suburban prejudices to blind us to the extent to which their impact was creative. Neither have six centuries of transport change, mass urbanization through migration, and industrialization been sufficient wholly to dissociate surnames from the *pays* from which they stemmed. By the mid-19th cent. Britain had the transport almost perfectly to integrate its political, economic, urban, and social systems, and yet preserved specificity of place and voice long afterwards. Transport must therefore be seen as a critical contributory factor in the historical process, not a dominant determinant. JCh

**transportation** was a form of punishment devised in England to exile convicted criminals to the American colonies from c.1650 and after the War of Independence to Australia between 1788 and 1868, when it was abolished. The system arose out of England's lack of state-organized prisons and the overcrowding of what few prisons there were, including converted warships (hulks) anchored in the river Thames. Transportation, systematized by the Transportation Act of

1779, was not only a more humane alternative to hanging, but, by removing the persons out of society for at least seven years (mostly for life), achieved the same effect while, at the same time, providing the opportunity for redemption and a useful source of cheap near-slave labour in settler colonies. It is estimated that some 210,000 convicts were exiled between 1650 and 1868; 50,000 to the American colonies, the remainder to Australia. The landing of the first convicts at Sydney Cove in Port Jackson (in preference to Botany Bay which proved unsuitable) in January 1788 was the first of a series of convict settlements throughout eastern Australia, where evidence of convict labour can still be seen in roads, bridges, and public buildings. The harshest treatment was reserved for those who committed further crimes in Australia and for whom conditions at the punishment centres on Norfolk Island and Van Dieman's Land (renamed Tasmania) were almost beyond belief. A large number of those transported came from Ireland, especially after the 1798 Irish rebellion. These, by modern-day standards, were mostly political prisoners and, together with the post-famine migrants, account for the high proportion of persons of Irish descent in Australia. MJW

**Transvaal.** Former British colony in South Africa. Founded as an independent republic by Boers (Afrikaners) fleeing British rule in the mid-19th cent., the Transvaal was annexed by Britain in 1877 but regained its internal autonomy in 1881. The discovery of immense reserves of gold in the years which followed led to an influx of foreign, predominantly British, miners whose treatment by the Boer government was used by the British government as the pretext for demands which the Boers rejected, and which culminated in war in 1899. The Transvaal was again annexed by Britain and became part of the Union of South Africa in 1910. KI

**treason.** For centuries the evolution of the law of treason was to extend the number of offences and the ferocity of the punishment. Petty treason (abolished in 1848) was a breach of trust, such as the murder of a parent by a child, a husband by his wife, or a master by his servant. High treason was a crime against the state which meant, in practice, against the monarch. \*Alfred's law declared that a man's life and property were forfeit if he plotted against the king. Edward I set the precedent for hideous punishments when \*Dafydd ap Gruffydd at Shrewsbury in 1283 was drawn to the gallows on a sledge, hanged, cut down while alive, disembowelled, and his head and limbs exhibited in different towns. Edward III's statute of 1352, which became the basic definition, made it treason to encompass the death of the king, or to violate the queen, the king's eldest daughter (if unmarried), or the king's eldest son's wife, and added fresh offences, such as counterfeiting the \*great seal or the coinage, or killing the \*chancellor, \*treasurer, or judges in the operation of their royal duties. New crises brought new offences. After the \*Peasants' Revolt in 1381 it was made treasonable to start a riot, Henry V made it treason to clip the coinage, and Henry VI to extort money by threatening to burn down a house. The scope of treason was widened still further by 'constructive treason', which allowed judges to 'interpret' the Act of 1352. The Tudors added more than 60 treason

statutes. Henry VIII made it treason to deny his royal supremacy, or to refuse to admit it, and each of his marriages, separations, or divorces was buttressed by a fresh treason law. His daughter Elizabeth made it treason to declare her a heretic or usurper. The panic over the French Revolution produced the Treasonable Practices Act of 1795 which declared that it was treason to contemplate the use of force to make the king change his counsels or to intimidate Parliament, and a high misdemeanour, punishable by transportation, to encourage hatred or contempt of the government or constitution. The Act was made permanent in 1817 and extended to cover the prince regent.

Mitigating legislation was slow in making its appearance. An Act of 1695 allowed the defendant counsel, a copy of the indictment five days before the trial, and declared that two direct witnesses were necessary. In 1814 \*Romilly succeeded in carrying an Act not to cut traitors down still alive and disembowel them, though the Lords insisted that they should still be quartered. In 1870 quartering and beheading was also renounced. By the Treason Act of 1945 the procedure as in a murder trial was to apply, though by repealing the Act of 1695 the safeguard of two witnesses was removed. The first person to be tried under the new legislation and the last person to be executed as a traitor was William Joyce, 'Lord Haw-Haw'. It was at least doubtful whether he was not an American citizen, and evidence that he had broadcast from Nazi Germany was provided by only one witness, though the accused did not deny it, and presumably thousands of witnesses might have been summoned. JAC

**treasurer.** The official who guarded the Norman treasure at Winchester in the reign of William I seems to have been more of a custodian than a minister or counsellor. The modern office has been traced back to the reign of Henry I, c.1126, and quickly established itself as of major importance. When the \*Exchequer split into a judicial and a financial side, the treasurer's responsibilities increased, since he was involved in the legal process, as well as presiding over the receipt of the royal revenues. The title lord treasurer, or lord high treasurer, came into use in the Tudor period. Thereafter the post was held by prominent figures such as Protector \*Somerset, Lord \*Burghley, and Sir Robert \*Cecil. But from 1612 the practice grew up of putting the Treasury into commission and the last lord high treasurer was Lord \*Rochester 1679–84. That opened the way for the 1st lord of the Treasury to become the head of government or first minister and in the 18th cent. the long tenures of \*Walpole, \*Pelham, \*North, and \*Pitt were based upon their financial expertise. As the demands on the prime minister increased and financial questions became more complex, the office of \*chancellor of the Exchequer rose in importance.

In Scotland, the office of treasurer was introduced by James I, who had spent nineteen years in captivity in England as a youth. In 1617 it was formally declared to be the leading ministry, but lapsed at the Act of Union in 1707. JAC

**Treasury.** The Treasury has its antecedents far back in time as all governments have faced the need to secure revenues. But the recognizably modern Treasury has its principal roots

in the late 17th and early 18th cents. Its emergence as a major organ of state was precipitated by a fairly sudden and large increase in government spending. Prior to the 20th cent. such an increase was invariably the result of military involvement, and at the beginning of the 18th cent., commitments in Ireland, Flanders, Africa, and the Caribbean accumulated a bill of £45 million. (See NATIONAL DEBT.) The increase in expenditure produced a proliferation of stratagems to pay for it. One means was, of course, new taxation, which was imposed on salt, stamps, hackney coaches, and, especially, on land. The latter was a form of embryonic income tax in that it levied a fixed quota on each county from their landed ratepayers. New customs and excise duties were introduced and there were increases in those already in operation. Such an expansion in taxation required a bureaucracy to organize the operation of the revenue system and this, in turn, needed to be managed. This became the task of the Treasury. The Exchequer and Audit Department Act of 1866 established the practice of consolidating the annual tax proposals into a single Finance Bill. This created the first effective machinery for a retrospective annual audit of government spending, and effectively established the Treasury as custodian of financial propriety. It did not exercise control at that time because hostility to centralization was widespread. But it meant that the role of the Treasury was 'cast in a narrow mould—essentially negative, harnessed to a defective concept of economy and a static concept of government. They meant adjudication, not inspiration; parsimony not efficiency; conservation, not growth.' This perception was reinforced by two major concerns of 19th-cent. policy, elimination of the national debt and the preservation of \*free trade, both of which required tight fiscal control.

As government involvement in economic affairs increased in the 20th cent. together with the massive increase in the ratio of public spending to national income, so the role and influence of the Treasury became extremely important. Indeed, the most obvious manifestations of financial probity, including the control of public expenditure, maintenance of the exchange rate, and a tight fiscal and monetary stance to combat inflation have been persistently at the heart of the economic management strategy of the Treasury, which has always strongly favoured stabilization over growth. Very often, incumbent administrations have adopted the Treasury view and followed policies consistent with its aims. Its close links with the city of London and its control over the \*Bank of England have secured the primacy of financial considerations in economic policy. Thus policy was devoted to the restoration of the exchange rate after the First World War until the policy was rendered untenable by the depression at the end of the 1920s. But maintenance of the exchange rate dominated policy until the late 1960s and the eventual collapse of the Bretton Woods regime, and again in the late 1980s in the context of the Exchange Rate Mechanism. The other part of the strategy has been control of expenditure, an uphill struggle given the massive spending increases in two world wars and the demand-driven government commitments to pay pension, unemployment, and welfare benefits. The elimination of the national debt in the 1980s marked the success of a long-term Treasury aim, albeit very

## Trenchard

temporary, since the deficit reappeared at the end of the decade with a ferocious potency. CHL

**Trenchard, Hugh, 1st Viscount Trenchard** (1873–1956). Soldier and airman. 'Boom' Trenchard began his service career as an infantryman. By 1912, when he learned to fly, he was a major whose career appeared to be going nowhere. But by 1915 he was a major-general in command of the \*Royal Flying Corps in France. The RFC was then part of the army but when the \*Royal Air Force was established as the world's first independent air force in 1918, Trenchard became its first professional head as chief of air staff, a post he held with only a brief interruption until 1929. After 1918 he fought tenaciously to preserve the RAF's independent existence by claiming that the next major war could be won by bombing alone. This theory had a powerful appeal to a nation anxious to avoid a repetition of the war on the western front, but proved to be hopelessly wrong during the \*Second World War. DF

**Trent, battle on the**, 679. \*Æthelred, king of Mercia, defeated \*Ecgrith, king of Northumbria, and regained authority over \*Lindsey. The site cannot be localized. \*Bede's account has specially revealing elements. He emphasizes how Archbishop \*Theodore successfully urged acceptance of a blood-price for the Northumbrian king's brother who had been killed. Long peace followed. Second, Bede relates a miracle story about Irma, a Northumbrian noble, captured by the Mercians. It shows that it was normal for captured nobles to be killed, lesser men enslaved; and that lesser captives were sold to a Frisian slave merchant, who took them, chained, to London for export. JCa

**Trent case**, 1861. In November 1861, soon after the start of the American Civil War, a Federal warship, the *San Jacinto*, stopped the British packet *Trent* and took off two Confederate envoys, Mason and Slidell. \*Palmerston suspended export of arms to the North and sent reinforcements to Canada. War seemed likely but the prince consort, a dying man, softened the cabinet's protest. The Federal government apologized, disavowed the captain, and liberated the envoys. But relations between Britain and the North were further strained by the \*Alabama incident. JAC

**Trenton, battle of**, 1776. \*Washington's attack upon Trenton in New Jersey, though small scale, gave a welcome victory after the loss of New York in September 1776. Early in the morning of Christmas Day, the Americans attacked the Hessian garrison under the command of Colonel Rall. Nearly 1,000 Hessians were taken prisoner and their commander killed. JAC

**Tresilian, Sir Robert** (d. 1388). From Cornwall, Tresilian practised law in Oxford, where he advised Exeter College, served in Parliament, and was appointed a justice of King's Bench in 1377. Political feeling ran high in the early years of Richard II's reign. In 1381 Tresilian was chief justice, trying, with severity, many of the participants in the \*Peasants' Revolt, including John \*Ball. He was associated with the royalist group in its struggle against the \*appellants. In 1388, along with Suffolk (Michael de la \*Pole) and \*Oxford,

he was indicted for treason by the \*Merciless Parliament. Condemned in his absence, he was captured in February, probably in violation of sanctuary, and immediately hanged at Tyburn. JAC

**Trevithick, Richard** (1771–1833). Cornish engineer and inventor whose genius did not extend to business. A mine engineer from 1790 before erecting his first engine at Ding Dong (1795), he developed high-pressure, non-condensing engines from 1797 to patent both in 1802. His attainments include demonstrating the first practical steam carriage at Camborne (1801) and locomotive at Penydarran (1804), venting steam by the chimney to improve draught; a hydraulic engine and plunger pump for mines (1798); a steam barge (1805); iron storage tanks and iron ships (1808–9); a near-complete Thames tunnel (1809); a Cornish boiler and engine (1812); a portable agricultural engine (1812); a screw propeller (1815); and a tubular boiler (1816). Bankrupt in 1811, mining ventures led him to South America, 1816–27, at a loss, followed by a final flurry of patents including superheating and the jet propulsion of ships (1831). None made him a living, and he died the employee of a Kentish foundry, two of his sons succeeding where he failed in combining engineering with economy. JCh

**trial by battle**. Before the Norman Conquest, guilt or innocence in legal disputes were decided by \*compurgation, where a party would summon a number of 'oath helpers' to swear to the reliability of his oath, or especially in cases of 'criminal' accusation by one of the ordeals, fire, cold water, hot water, or accursed morsel (see TRIAL BY ORDEAL). To these methods the Normans, with their strong militaristic tradition, added trial by battle. The parties, or champions on their behalf, would fight in formal single combat and the winner would be deemed to be the successful party in the case. Trial by battle fell into disuse, especially with the decline of the appeal of felony and the decline of writ of right in disputes over freehold land. However, it was not abolished until 1819, after the accused was challenged to combat in the case of *Ashford v. Thornton*. MM

**trial by ordeal** was used to decide the guilt or innocence of a suspected criminal by invoking divine justice. There were several forms of ordeal in Anglo-Saxon and Norman England. In one the accused held a red hot iron or put his hand in a flame. The hand was then bound up and examined after several days. If the wound was healing, the accused was deemed innocent but if it festered, this was believed to show guilt. In ordeal by cold water, used particularly for villeins, the accused was thrown, bound, into a pond or river. If he sank, he was deemed to be innocent, but if he floated he was regarded as guilty—the water was rejecting him. In ordeal by accursed morsel, the accused was required to eat a piece of meat with a feather or other foreign body in it, and was adjudged guilty if he choked. The ordeal was administered within a religious service. When in 1215 the Lateran Council of the church forbade clergy to take part in ordeals, they fell into disuse and were eventually replaced by jury trial. MM

**Triennial Acts, 1641, 1664, 1694.** These were attempts to curb the prerogatives of the crown in summoning and retaining parliaments. The first, 16 Car. 1 c. 1, passed in February 1641 and committed Charles I to summon a Parliament at least every three years and to keep it for at least 50 days. This was repealed in 1664 and replaced by an Act, 16 Car. II c. 1, declaring that the king should summon Parliament at least every three years but providing no mechanism for enforcing it. Charles II was in breach of the Act from March 1684 and James II from November 1688. The third Act, 6 & 7 Wm. & Mar. c. 2, passed in 1694 after William had vetoed a previous measure. It laid down that Parliament must be summoned within three years of the previous one and could not be retained more than three years. The first provision was rendered nugatory by financial demands that necessitated annual sessions; the second was abrogated by the \*Septennial Act of 1716. JAC

**Trimble, (William) David** (b. 1944). \*Ulster Unionist leader. Educated at Bangor Grammar School and Queen's University, Trimble lectured in law at Queen's until elected to the Westminster Parliament for Upper Bann in 1990. His reputation then was as a hard-liner. In 1995 he defeated John Taylor for the leadership after James \*Molyneux had retired. Since 1998 he has been first minister of the devolved government of Northern Ireland and was awarded (with John Hume) the Nobel peace prize the same year. Most of his time has been devoted to holding his party together and preserving the 'peace process' in the face of \*IRA intransigence and British government weakness. JAC

**trimmer.** The term acquired popularity from the publication in 1688 of \*Halifax's pamphlet *The Character of a Trimmer*, which appealed for moderation in politics, condemning 'madmen in two extremes [who] agree to make common sense treason'. Why, asked Halifax, do we play the fool by throwing the names Whig and Tory at each other, as boys do snowballs? Since moderation is rarely admired, the term soon acquired a pejorative meaning of waverer or time-server. JAC

**Trinidad and Tobago** (neighbouring islands) lie off the coast of Venezuela and form an independent republic within the Commonwealth. Trinidad was discovered by Columbus and colonized by Spain. In 1797 it was captured by Sir Ralph Abercromby and ceded in 1802. Tobago, originally a Dutch colony, was taken from the French in 1793, restored by the treaty of Amiens in 1802, and recaptured in 1803. The islands were united in 1888 and became independent in 1962. The capital is Port of Spain and the population is more than 1¼ million. The main economic resources are oil, natural gas, and tourism. JAC

**Trinity College, Dublin.** Founded by charter of Elizabeth I dated 21 December 1591, Trinity, both a college and a university, was intended for 'the education, training and instruction of youths and students . . . that they may be better assisted in the study of the liberal arts, and in the cultivation of virtue and religion'. The Elizabethan college, situated outside the walls of the city, was largely modelled on \*Cambridge. The period of growth was in the 18th cent.

when the lord-lieutenant, the duke of Dorset, entered his son as a student in 1731. The college thenceforth attracted the nobility and gentry and its graduates included \*Berkeley, \*Burke, \*Goldsmith, and \*Grattan. Unlike \*Oxford and Cambridge at this time, Trinity practised religious toleration, allowing both nonconformists and Roman Catholics to follow a full college course, though Catholics were barred from taking a degree until the Act of 1793. PG

**Trinovantes.** A British tribe and *civitas*. The Trinovantes are the first British tribe to be mentioned by a Roman author, appearing in \*Caesar's account of his invasion of 54 BC. Already at this early date, they seem to have been engaged in a power struggle with the neighbouring tribes to the west who were to be forged into the kingdom of the \*Catuvellauni under Tasciovanus. Caesar took them under his protection, but eventually they succumbed and c. AD 10 were absorbed by \*Cunobelinus, who moved the Catuvellaunian capital to Camulodunum (\*Colchester). Thus, at the time of the Claudian conquest, the Trinovantes had no independent existence. However, the inevitable reduction of the huge Catuvellaunian kingdom provided the opportunity for the Trinovantes to be restored as a tribal entity. But the imposition of a Roman colony on their old tribal centre, and the abuses and expense which this brought, created resentments which spilled over at the time of the \*Boudiccan revolt in AD 60–1. Despite their role in the rebellion, within fifteen years the Trinovantes had been given local self-governing status as a *civitas*. The seat of their government is uncertain; it may have been Camulodunum but Chelmsford (Caesaromagus) is also a possibility. KB

### Triple Alliance.

1. 1668. Alarmed at the growing power of Louis XIV's France, which was overrunning the Spanish Netherlands, the Dutch and the English formed a defensive alliance in January 1668, which was joined by the Swedes. Louis was obliged to make peace and at Aix-la-Chapelle his gains were modest. He set to work to break the alliance and succeeded in 1670, when Charles II of England signed the treaty of \*Dover at the expense of the Dutch. Louis's great invasion of Holland followed in 1672.

2. 1717. Soon after the death of Louis XIV in 1715, the Regent d'Orléans of France sought a *rapprochement* with Britain to check the ambitions of Philip V of Spain. An understanding was reached in 1716 to guarantee the succession in France and Britain and to expel the Pretender from French soil. By the accession of the Dutch in January 1717 this was converted into a Triple Alliance and when the Emperor Charles VI adhered to it in 1718 it became a \*Quadruple Alliance.

3. 1788. After the War of American Independence, Pitt's government was concerned at Britain's diplomatic isolation. Political instability in Holland in 1786 gave rise to fears of French aggrandizement and in 1787 the Prussian army intervened to suppress the pro-French party. This was followed by a series of treaties in 1788 between Prussia, Britain, and Holland to guarantee each other's territories.

4. 1882. The adherence of Italy to the Dual Alliance of Germany and Austro-Hungary in 1882 produced the Triple

## Trojan legend

Alliance, which lasted until the outbreak of war in 1914. France, Russia, and Britain responded with the Triple Entente (1894–1907), thus dividing Europe into two armed camps. JAC

**Trojan legend.** See BRUTUS.

**Trollope, Anthony** (1815–82). Trollope's reputation suffered from the frank admission in his *Autobiography* (1883) that he set out to write 1,000 words an hour, checked by his watch. Many took this as evidence that he was a mere journeyman, a word-spinner. But his stock has risen dramatically, and, like \*Eliot and \*Bennett, he is a historian's novelist, filling in the social background with care and detail. Though a contemporary of Dickens (1812–70), he seems to belong to a later generation, having dropped much of the moralizing, the sentimentality, and the Gothic caricaturing. His political novels are greatly admired, but there is something in the criticism that they show the political world with politics left out. Indeed Trollope was not very familiar with politics, and did not greatly enjoy what he saw of it—particularly as Liberal candidate for the corrupt borough of Beverley in 1868. Nor is it easy to retain patience with Trollope's favourite character, the duke of Omnium, a languid Whig. He is better at drawing clerics in his Barchester novels—Revd Obadiah Slope in *Barchester Towers* (1857) or Revd Septimus Harding in *The Warden* (1855); Irish plotters in his early novel *The Macdermots of Ballycloran* (1847); civil service rivalry in *The Three Clerks* (1858); or perhaps, most memorably, shady plausible swindlers like Ferdinand Lopez in *The Prime Minister* (1876), or Melmotte in *The Way We Live now* (1875), a novel that haunts after more than 100 years. Trollope's life was uneventful—that of a hard-working Post Office official, whose claim to fame was the introduction of pillar boxes in the 1850s. JAC

**Trotskyites.** Trotsky's condemnation of Stalinist Russia as a vicious state bureaucracy found considerable support in Britain, but his call for permanent revolution less so. After his murder in 1940, Trotskyism in Britain was disputed between the Revolutionary Socialist League and the Workers' International League, which joined forces in 1944 to form the Revolutionary Communist Party. Later parties sympathetic to his analysis were the Socialist Workers' Party and the Workers' Revolutionary Party, but more influential were supporters of Militant Tendency, whose paper *Militant* was launched in 1964 and who achieved considerable support in the \*Labour Party in the early 1980s. JAC

**Troyes, treaty of**, 1420. By this Anglo-French treaty, ratified on 21 May, Henry V became heir and regent to the mad Charles VI of France. This was by adoption, not by virtue of his subsequent marriage to \*Catherine, Charles's daughter (2 June). After the death of Charles, France and England were to be under one ruler. The dauphin (later Charles VII) was thus disinherited. Henry's triumph derived from his military success and from Burgundian support after the dauphinist murder of Duke John at Montereau (10 September 1419). The treaty preserved the laws and government of each kingdom, but gave Henry direct control of Normandy until Charles VI died. In fact Henry died first: it

was his baby son Henry VI who became king of the 'double monarchy'. AC

**Troyes, treaty of**, 1564. At her accession in 1558, Elizabeth inherited from Mary a war against France in which \*Calais, a 200-year-old possession, had been lost. By the treaty of \*Cateau-Cambrésis (1559), the French promised to restore Calais after eight years or pay a large indemnity. In 1562 Elizabeth was tempted to intervene in the French wars of religion, supporting the Huguenots and taking possession of Le Havre as a pledge for Calais. But the garrison was decimated by disease and Le Havre was forced to surrender. At the treaty of Troyes in April 1564 peace was signed, both sides reserving their rights on Calais which, in effect, meant that it was lost for ever. JAC

**truck**, the payment of wages in food and kind, was an old form of exploitation by employers in outwork industries and spread with industrialization. In a minority of cases the practice was benign, since basic supplies were not otherwise available. Commonly, employers' shops supplied adulterated food and drink at high prices ('tommy rot'); there was unrest in communities so badly served. Codifying Acts prohibiting truck were passed in 1831 (which was generally evaded) and 1887; a royal commission in 1870 found the practice still existed in some areas. Truck died a natural death as retailing spread and workers became better organized. JB

**Truro, diocese of.** The see, roughly coterminous with Cornwall and the Isles of Scilly, was created in 1877. Episcopal oversight of Cornwall, previously Celtic, passed to \*Canterbury after \*Egbert's victory over the Cornish c.838, and finally to \*Credon (909). The separate see for Cornwall, \*St Germans, only lasted from 931 to 1027, before reunion with Credon and a move to \*Exeter (1050). Not until 1877 did Cornwall have its own see again. Notable bishops of Truro include Edward \*Benson (1877–83), later archbishop, and Walter Frere (1923–35), previously superior of the Community of the Resurrection, Mirfield (1902–13 and 1916–22), scholar, liturgist, and promoter of Christian unity. The last Anglican ritual riots occurred at St Hilary in 1932. The cathedral, consecrated in 1887 and completed in 1903, incorporated the dilapidated south aisle of St Mary's 16th-cent. parish church. The architect was J. L. Pearson and the style Early English neo-Gothic Revival. WMM

**Tuam, archiepiscopal diocese of.** Though this Irish see had bishops in the early 12th cent., the Council of Kells-Mellifont (1152) established it as an archbishopric, carved out of Armagh province, with six dioceses in the far west of Ireland. As late as the 16th cent. it was still part of *ecclesia inter hibernos* and all its bishops were Irish. Its cathedral, however, probably had a secular chapter after the continental pattern from the 1190s. In 1593 catholic Archbishop James O'Hely went to Spain to ask for aid against Elizabethan adventurers. Tuam is still a catholic archbishopric, but in 1839 the Anglican province of Tuam was reunited with Armagh. It thus ceased to be an archbishopric; the diocese now includes Killala and Achonry. There are cathedrals at Tuam and Killala. St Mary's Anglican cathedral at Tuam is 19th

cent., but incorporates a barrel-vault chancel and a fine east window of the 12th–14th-cent. church. WMM

**Tudor, house of.** This is something of a misnomer. The important descent for Henry VII, who founded the dynasty when he defeated Richard III at \*Bosworth, was the direct line from Edward III through \*John of Gaunt and the Beaufort dukes of Somerset, and though the branch was illegitimate, it had subsequently been legitimized. The Welsh link, of which Henry and the Welsh made so much, was quite subordinate. Henry V's widow \*Catherine de Valois made a private marriage with a minor courtier, Owen \*Tudor, later executed at Hereford in 1461 after the battle of \*Mortimer's Cross. Their son Edmund married Margaret \*Beaufort, great-granddaughter of Gaunt, thus bringing a second royal link into the equation. Henry VI created his half-brother earl of Richmond in 1452. The Tudors were in essence a Lancastrian dynasty and the red rose seems to have been one of the badges of the Beauforts: it was deliberately exploited in the pageant to mark Henry VII's visit to York only eight months after Bosworth. Henry moved quickly to end the old feud with the house of York by marrying \*Elizabeth, daughter of Edward IV and sister of the two princes in the Tower. The dynasty used propaganda to stress the sanctity of Henry VI and the villainy of Richard III.

Few dynasties have produced five strong-minded rulers in succession, for though Edward VI died at 15, the marks of authority were already visible. Mary, the least fortunate of the Tudors, was certainly not lacking in courage, as her behaviour during the Lady Jane \*Grey coup and the \*Wyatt rising demonstrated. Henry VII, Henry VIII, and Elizabeth were in command, even if their policies may be questioned. This must be remembered when discussing the nature of Tudor government, for it is never easy to separate political structures from purely personal and non-transferable ability. J. R. Green in the 1890s credited the Tudors with creating a 'new monarchy'. This interpretation is now in retreat, with emphasis on evolutionary developments: nevertheless, the contrast between Tudor strength and the chaos that succeeded it remains. In some respects the Tudor period was the apogee of monarchy. The Tudors were ruthless in dealing with challenges to their authority, whether from possible claimants to the throne, like the earl of \*Warwick (d. 1499) or Lord \*Surrey (d. 1547), or from rebels in the field (the \*Pilgrimage of Grace 1536, or the Rising of the \*northern earls 1569). Yet beneath authority, there were weaknesses, some of which did not fully reveal themselves until the Stuarts succeeded. Each Tudor met serious rebellion, with no standing army to quell it: within two years of Bosworth, Henry VII faced Lambert \*Simnel and his supporters, and three years before the end of her reign, Elizabeth faced \*Essex's rebellion. The Reformation, though greatly adding to royal power by making the monarch head of church as well as head of state, also introduced bitter schism. Having displaced the pope, the monarch had to take the blame for what was done in religious matters and found it exceptionally difficult to please all sides. The enormous wealth of the monasteries was not only dissipated by

the crown but augmented the influence of the nobility. The financial position of the monarchy, built up by Henry VII, was run down by his successors, and Elizabeth handed over large debts to James I. Lastly, partly by bad luck and partly by mismanagement, the dynasty failed to provide for its own survival in the form of heirs, lasting for only three generations and 118 years. But Stuart rule soon brought back golden memories of Tudor England. JAC

**Tudor, Jasper, 1st earl of Pembroke and 1st duke of Bedford** (c.1431–95). The second son of Owen \*Tudor and \*Catherine of Valois, Jasper was created earl of Pembroke in 1452, at the same time as his elder brother Edmund became earl of Richmond. He was one of the few die-hard Lancastrians. Ruling Wales on behalf of Henry VI from 1457, he refused to come to terms with Edward IV after 1461. He led an expedition to Wales in 1468, and returned again in 1470 during the restoration of Henry VI. But after the defeat of the Lancastrians at \*Tewkesbury in May 1471, he fled once more, taking with him his 13-year-old nephew Henry Tudor, earl of Richmond (later Henry VII). He remained in exile for fourteen years, returning in triumph in 1485. Thereafter, back in Wales, and promoted duke of Bedford, he remained until his death Henry VII's principal lieutenant in the principality and the marches. AJP

**Tudor, Owen** (c.1400–61). A humble Welsh servant of \*Catherine of Valois, widow of Henry V, he secretly married her about 1428. Their first-born Edmund was the father of Henry VII. There is probably no truth in the rumour that the real father of Edmund Tudor was Edmund Beaufort, whose close friendship with Catherine was brought to a hasty end shortly before the marriage. Tudor's sons were promoted by their half-brother Henry VI. Owen Tudor was a victim of the Wars of the Roses, executed by Edward, earl of March (later Edward IV), at Hereford following the battle of \*Mortimer's Cross. On the scaffold he is reputed to have declared, 'That head shall lie on the stock that was wont to lie on Queen Catherine's lap.' AJP

**Tull, Jethro** (1674–1741). Once considered a pioneer of the \*agricultural revolution through his invention of the seed drill c.1700 when he was farming near Wallingford. The 'invention' was made famous by his book *The Horse-Hoing Husbandry* published in 1733, but today his role appears less influential. The seed drill (which we now know he did not originate) came into widespread use only from the 1820s. Seed drills and horse-drawn hoes were originally invented in the late 17th cent., but were adopted only slowly until improvements were made to Tull's designs in the 1780s. JVB

**Tullibardine, William Murray, marquis of** (1689–1746). One of the most determined Jacobite leaders. Second son to the 1st duke of \*Atholl, he became heir when his elder brother was killed at \*Malplaquet. He took part in the '15, fought at \*Sheriffmuir, was attainted, and fled to France. In 1717 he was created duke of Rannoch by James III, the Old Pretender. He returned to Scotland in 1719 and again escaped. Despite poor health, he embarked with Prince Charles in 1745 and was given the honour of unfurling the banner at Glenfinnan. His brother James, the duke, fled

## Tunstall

from Blair Atholl, and Murray was able to entertain the prince there. After \*Culloden he surrendered and was lodged in the Tower, where he died in July 1746. Lord George \*Murray was his younger brother. JAC

**Tunstall, Cuthbert** (1474–1559). Bishop. Tunstall was a distinguished scholar and ecclesiastical statesman, whose religious balancing act, in a period of startling change, kept him in high office for almost the whole of his life. Of Lancashire gentry stock, he attended Balliol College, Oxford, before moving on to Cambridge and Padua. The patronage of \*Warham, to whom he was chancellor, brought him swift promotion. By 1522 he was bishop of London, in 1527 keeper of the privy seal, and much employed by Henry VIII on diplomatic missions. Though he disapproved of Henry's adoption of the headship of the church, Tunstall continued to serve. He succeeded \*Wolsey as bishop of Durham in 1530 and in 1537 became president of the Council of the North. He was out of sympathy with the reforms of Edward VI's reign and fell into disfavour on \*Somerset's overthrow, being deprived of his see in 1552. Mary restored him to it but he could not accept Elizabeth's Act of \*Supremacy and lost his bishopric once more in 1559, at the age of 85, a few weeks before his death. JAC

**Turks and Ottomans, relations with.** Serious British strategic interest in the Ottoman empire began in the late 18th cent. when it was hoped that the Turks would act as a barrier to Russia's southern and south-westward expansion. But the latter's advance continued, and British governments (especially from the 1820s) tried in various ways to ensure that the Ottoman empire itself (and such parts as broke away) should not be dominated by Russia. The future of Constantinople and the Straits caused special concern, and this increased with the development of the Suez route to India. The British also valued naval access to the Black Sea in order to threaten southern Russia (as in the \*Crimean War in 1854–6). India, it was often thought, could best be defended by command of the Black Sea. Turkey in Asia also formed part of the defences against a Russian threat to the Persian Gulf. From the 1890s, however, interest turned from the Straits to Egypt as the key to British strategy in the eastern Mediterranean. The Ottoman alliance with Germany in the \*First World War was answered by British campaigns from the Persian Gulf and Egypt which brought about the collapse of Turkish rule from Mesopotamia to Syria. It was not until 1923, at the conference of \*Lausanne, that the British accepted that the new Turkish republic might act as a bulwark against Bolshevik Russia in the Near East. Demands by the USSR at the end of the Second World War for more influence at the Straits caused further alarm, but by 1947 the USA had become the main executors of the latest versions of the policies of Palmerstonian Britain. CJB

**Turner, Joseph Mallord William** (1775–1851). British land- and seascape artist. Born in London the son of a barber, Turner was precociously talented. He entered the RA Schools in 1789, had a drawing exhibited at the academy in 1790, and was elected a full academician in 1802. He became

professor of perspective in 1807. In 1792 he made the first of many sketching tours he was to undertake over the next 50 years, throughout the British Isles and Europe. A prolific artist of amazing range of subject and style, he began work in water-colours, quickly founding both a reputation and a fortune, which made him independent of changing public taste. At home in both oils and water-colours, he took the use of each almost to the limits of artistic possibility. His work was not appreciated by everyone, but his supporters included Thomas \*Lawrence, John \*Ruskin, and the earl of Egremont, whose large collection at \*Petworth (Sussex) now belongs to the National Trust. He died in eccentric obscurity under a false name. A taciturn and miserly man, secretive of his methods, yet meticulous in documenting his artistic development, Turner's will left about 300 oils and over 19,000 water-colours and drawings to the nation. The conditions of the bequest were ignored until 1987 when a special Turner Gallery was opened at the Tate in London. *Frosty Morning* (1813), *Chichester Canal* (1828), *The Fighting Temeraire* (1839), *Rain, Steam and Speed—the Great Western Railway* (1844), hint at Turner's wide diversity of theme and style. JC

**Turnham Green, battle of**, 1642. Like Valmy in the French Revolution, the battle of Turnham Green had an importance out of all proportion to the actual fighting. Charles I's best hope of winning the Civil War was to bring it to a quick end before the superior resources of Parliament could be brought to bear. After the indecisive encounter at \*Edgehill on 23 October, the king resumed his leisurely march on London, giving his adversaries time to regroup. By the time he reached Brentford on 12 November, the remains of \*Essex's army had been reinforced by the trained bands, bringing it up to 24,000 men. After inconclusive negotiations and some skirmishing, Charles's advance came to a halt the following day at Turnham Green. Outnumbered and unable to use his cavalry, Charles retired to Oxford. He was never again as close to London until he was brought there for his trial in January 1649. JAC

**turnpikes** were a means of financing road maintenance by tolls charged on users, named from the gate used to restrict access. First applied to part of the Great North Road in 1663 on a temporary basis, the principle was employed from 1695 in a series of private Acts to supplant inadequate parish repair under the statute of 1555. Initially administered by justices of the peace, management by trustees was introduced in 1706, and generalized by 1714. Trusts covered on average 30 miles of road, and were a systematic response to traffic growth: most of the thirteen radial routes from London had been turnpiked by 1750, as had much of the network centred on the leading provincial towns of Bristol, Hereford, Worcester, and Leeds. 'Turnpike mania' 1750–72 saw the addition of 500 trusts, covering 15,000 miles, and the spread of the system into Wales and Scotland; further peaks occurred in the mid-1790s and 1820s, one-third in the industrial districts of Yorkshire and Lancashire. Turnpiking was limited to trunk and busy urban routes, and covered only 17 per cent of over 126,000 miles of roads by 1838.

Turnpiking represented a major transport innovation in applying use-based revenues to the increased investment that improved road quality. Mortgage finance was used from the 1750s to permit large-scale engineering work, bridge-building, and improvement of both surfaces and lines. The benefits were reflected in reduced travel times: Edinburgh, ten days from London by the fastest coach in 1754, was only four days away by 1776, and 40 hours by 1840. The cost of travel fell substantially in real terms, and road transport became up to three times more productive between the 1690s and the 1840s as a result of turnpiking. National perceptions of distance shifted fundamentally, and travel began to become a consumer good. JCh

**Turpin, Dick** (1706–39). Highwayman. Dick Turpin became a popular hero and the stuff of legend. He was, in fact, a leader of a gang of Essex ruffians, whose speciality was robbery with violence. He went into partnership with Tom King, whom he accidentally shot in a skirmish. Turpin escaped to York, where he traded in horses, and was hanged on 7 April 1739 for stealing a mare. The story of the celebrated ride to York to establish an alibi was told of John Nevison, or 'Swift Nick', who was hanged at York in 1685: it was given fully by Defoe in his *Tour*, published in 1724. There is no reference to the ride in contemporary accounts of Turpin's life or trial, and the story owed its Victorian popularity to W. H. Ainsworth's novel *Rookwood* (1834). Turpin and Tom King were a very popular pair of Staffordshire China figures, now collectors' items. JAC

**Tuvalu** became independent within the Commonwealth in 1978. It was formerly the Ellice Islands and was part of the Gilbert and Ellice colony. The nine small islands lie some 2,500 miles north-east of Australia. They were visited in 1819 by the ship *Rebecca*, which belonged to Alexander Ellice, a Montreal shipowner. JAC

**Tweeddale, John Hay, 1st marquis of** [S] (1625–97). Tweeddale's father Lord Hay was advanced to the earldom of Tweeddale by Charles I in December 1646, presumably as part of the negotiation for the \*Engagement. The son had been sympathetic to the \*covenant and fought against the king at \*Marston Moor, but in 1648 supported the Engagement and joined the Scottish army which was defeated at \*Preston. He attended Charles II's coronation at Scone in 1651 and succeeded to the earldom in 1653. He then came to terms with the Cromwellian regime. After the Restoration he was a member of the Privy Council [S] 1661–74, dismissed through the influence of \*Lauderdale, but reinstated in 1680. He gave strong support to William and the Glorious Revolution and was raised to the marquissate in 1694. From 1692 until 1696 he was lord chancellor [S] and served as commissioner to the 1695 Parliament. In 1696 he was abruptly dismissed by William as a scapegoat for England's anger at the \*Darien venture which, it was felt, would drag England into war with Spain. Burnet observed of him, not unreasonably, that 'he seemed to think that what form soever was uppermost it might be complied with'. JAC

**Tweeddale, John Hay, 2nd marquis of** [S] (1645–1713). Tweeddale's father played an important role in Scottish

politics from the Restoration until 1696 and Tweeddale was a privy counsellor [S] 1670–4 and again in 1684. He joined his father in supporting William in 1688 and succeeded to the marquissate in 1697. In Anne's reign, he was one of the leaders of the 'Flying Squadron', a loose alliance of Scottish peers, whose political tacking earned them their name. He was plucked from opposition in 1704 and made commissioner to the Parliament. But his efforts to confirm the Hanoverian succession ran into difficulty and he was replaced by \*Argyll. During 1704–5 he served as lord chancellor [S]. Tweeddale helped to carry the Union and was a representative peer 1707–8. His character was said to have been amiable and his politics moderate. JAC

**Twickenham stadium** (Middx.). The headquarters of the Rugby Football Union. The site was purchased by William Williams in 1907, laid out with stands and provided with a car park. It has since been added to and has a capacity of more than 60,000. JAC

**Two Treatises of Government** (1690). Composed by John \*Locke between 1681 and 1689, the treatises were not published until 1690. Locke's purpose was twofold: in Part I to demolish the \*divine right of kings theory held by Sir Robert Filmer; and in Part II to establish his own theory of government, resting on the consent of the governed and respect for natural rights. The book is regarded both as a justification for the Whig revolution and settlement in England in 1688–9, and as the foundation of, and inspiration for, liberal constitutionalism throughout the western world. TSG

**Tyburn**, the name borrowed for the Middlesex gallows from a nearby tributary of the river Thames, was the principal place of execution in London from 1388 until 1783 (near the modern Marble Arch). In the hope that witnessing an execution might prove deterrent, hanging days were public holidays, hence enormous, unruly crowds (the more affluent on grandstand seating) awaited the carts from Newgate gaol on the condemned prisoners' oft-perceived day of glory. After the spectacle, the bodies were buried nearby or removed for dissection. The bodies of \*Cromwell, \*Ireton and \*Bradshaw were exhumed and hanged at Tyburn in January 1661. ASH

**Tyler, Wat** (d. 1381). The most famous leader of the \*Peasant's Revolt in 1381, Tyler was a man of obscure origins. He may have worked as a tiler in Essex; he was said to have served with Richard Lyons, a wealthy London merchant in France; some sources, almost certainly wrongly, identified him with another peasant leader, Jack Straw. He first emerged as a major leader in Kent at the end of the first week in June 1381, seizing Canterbury on 10 June and heading the march to London on the next day. On 15 June he was the spokesman at Smithfield. His demands were radical. The young king Richard II ordered the mayor, John Walworth, to arrest Tyler, and in a struggle he was killed. A man of eloquence, charisma, and courage, he achieved more in two weeks than many men in a lifetime. MCP

**Tyndale, William** (c.1494–1536). Translator of the Bible. Tyndale was probably from a Gloucestershire family and

## Tyndall

entered Magdalen College, Oxford, in 1510. He became tutor to the children of Sir John Walsh of Old Sodbury, but soon removed to London and the continent, visiting Luther at Wittenberg. Meanwhile he worked on his English translation of the New Testament. Printed in Germany, copies smuggled into England were seized and burned by the authorities. In 1528 Tyndale issued *The Obedience of a Christian Man*, which argued for complete submission to temporal power, but his *Practice of Prelates* in 1530 attacked both \*Wolsey and Henry VIII's proposed divorce. His subsequent controversy with \*More turned on the question whether the authority of Scripture or of the church was paramount. In 1535 Tyndale was seized by servants of the Emperor Charles V and burned as a heretic at Vilvoorde near Brussels in October 1536. Tyndale's translation, based on Erasmus' Greek version, was much used by the Authorized Version issued in 1611, and his great phrases roll round the heads of Christians and non-Christians alike—'God shall wipe away all tears from their eyes'; 'And though I bestowed all my goods to feed the poor, and though I gave my body even that I burned, and yet had no love, it profiteth me nothing'; 'the last enemy that shall be destroyed is death.'

JAC

**Tyndall, John** (1820–93). Physicist, lecturer, and foe of organized religion, Tyndall grew up in Ireland; after surveying and teaching, he went to Marburg in 1848 to study with R. W. Bunsen. In 1853 he got a professorship at the \*Royal Institution, and from 1867 followed Michael \*Faraday as superintendent. He worked on heat and on bacteria, translated important papers from the German, and in 1874 as president of the \*British Association for the Advancement of Science delivered in Belfast an address declaring that scientists would wrest the whole of cosmology from theologians. He was an ally of T. H. \*Huxley. Tyndall was an expert and enthusiastic mountaineer (and student of glaciers), calculating how high the energy in a ham sandwich would take him; his writings about the alps are suffused with pantheism. His ice-axe is preserved in the Zermatt museum.

DK

**Tyne and Wear** was one of the six English metropolitan county councils that existed from 1974 until their abolition in 1986. The Redcliffe-Maud Report of 1969 followed the royal commissions of 1937 and 1963 in suggesting a single local authority for the industrial area of Tyneside, but the Heath government added the Wearside borough of Sunderland. The county council (always Labour controlled) had fewer conflicts with its constituent districts and a less confrontational relationship with central government than some other metropolitan counties. Tyne and Wear is still used as a geographical description for the former council's territory.

CNL

**Tynwald**, meaning the assembly field, is an institution unique to the Isle of Man and is the successor of the Norse meeting of freemen. It meets on Tynwald Day, 5 July, on Tynwald Hill and is attended by the president of Tynwald, the lieutenant-governor, the bishop, the deacons, the Legislative Council, and the House of \*Keys. Its

main task is to ratify or approve laws and to appoint boards which serve as administrative committees. The Tynwald shares with the Icelandic Althing the claim to be the oldest surviving parliamentary institution.

JAC

**Tyrconnel, Richard Talbot, 1st Earl** (I) (1630–91). Talbot, a younger son from Co. Kildare, fought for the king in the 1640s and escaped from the destruction of Drogheda in 1649. In the 1650s he was appointed a groom of the bedchamber to the duke of York in exile and for the rest of his life his fortunes followed his patron's. He fought alongside the duke at the naval battles off \*Lowestoft in 1665 and at Sole Bay (\*Southwold) in 1672 and, though a catholic, was made colonel of a regiment of horse. As soon as the duke became James II, Talbot was created earl and in 1686 appointed lieutenant-general of the army in Ireland. In 1687 he succeeded \*Clarendon as lord-lieutenant and began consolidating the catholic position. Tyrconnel was the 'new deputy' whom 'brother Teague' welcomed in \*Lillibullero'. After the Glorious Revolution he was made a jacobite duke, fought at the \*Boyne, carried on the rearguard action, and died in Limerick just before it was forced to capitulate. A brave and well-built soldier, running to corpulence in age, Tyrconnel was regarded by most as hot-headed and lacking in judgement. Macaulay dismissed him as a drunken swaggerer.

JAC

**Tyrell, Sir James** (d. 1502). Reputed to have been the murderer of the two princes in the Tower. His grandfather Sir John Tyrell had been Speaker of the House of Commons in Henry VI's reign. Tyrell fought on the Yorkist side at \*Tewkesbury in 1471 and was knighted after the battle. Richard, duke of Gloucester, made him a knight-banneret in 1482, and after Richard's coronation Tyrell became master of the horse. He is said to have supervised the murders when the constable of the Tower, Sir Robert Brackenbury, refused. When Richard died at \*Bosworth, Tyrell was at Guisnes, where he was constable. Henry VII employed him and he was granted pardons in June and July 1486. But in 1501 he surrendered Guisnes to Suffolk (Edmund de la \*Pole), a claimant to the throne, was arrested, and was executed at the Tower in May 1502. He is said to have confessed to the murders before his death. The validity of this confession, if ever made, is a key element in the controversy about the fate of the two princes.

JAC

**Tyrone** was the largest of the six counties of Northern Ireland before the local government reorganization of 1973. The border with Londonderry to the north ran across the Sperrin Mountains; to the west was Donegal in the Irish Republic, Fermanagh to the south-west, Monaghan and Armagh to the south-east. Omagh, near the centre of the county, is the chief town: it suffered severely in a bomb attack in 1998, in which 26 people were killed. Strabane, Dungannon, and Cookstown are local centres. The diocese of \*Clogher in the south dates from the 12th cent.: the Church of Ireland cathedral was built in 1744 and is dedicated to St Macartan. Clogher is also a Roman catholic diocese, though the cathedral is in Monaghan. The main occupations are in farming, fishing, and tourism. Since the 17th cent. the

county has had a mixed religious population and in 1921 the county council was dissolved after declaring allegiance to the Irish Free State. For Westminster parliamentary purposes

the south is united with Fermanagh. At the general election of 2001, West Tyrone, Fermanagh and South Tyrone, and Mid Ulster all returned Sinn Féin MPs.

JAC

**Udall, Nicholas** (1505–56). Dramatist. Udall was educated at Winchester and Corpus Christi College, Oxford, took up teaching, and became headmaster of Eton and, at the end of his life, at Westminster. Like most Tudor pedagogues he was reputed a heavy flogger. His sympathies were with Lutheran reform and he prospered during the reign of Edward VI but managed to survive in that of Mary. Udall translated from the classics and wrote Latin plays, but is remembered as the author of the earliest known English comedy, *Ralph Roister Doister*, an imitation of Plautus, performed about 1552. The subject-matter is the wooing of a widow by Roister, a simple-minded braggart who comes to grief, and must have owed its popularity to the opportunities it presented for knockabout humour. JAC

**Uganda.** Former British protectorate in eastern Africa. The search for the source of the White Nile first brought the region to Britain's attention in the 1860s. British missionaries reached Uganda in 1877 and the difficulties in which they became involved, together with Britain's interest in Egypt, to the north, led to the declaration of a British protectorate in 1894. The presence of well-organized indigenous societies was responsible for the decision, taken early in the 20th cent., to develop Uganda as an African, rather than as a white settler, dependency. This, in turn, led to the introduction of indirect administration, using modified indigenous institutions, and the policy was made economically viable by the encouragement of cotton, and later of coffee, to provide foreign exchange. The road to independence in 1962 was bedevilled only by the problem of accommodating the powerful, centrally located kingdom of Buganda in a unified state. KI

**Ulster.** The northern province of Ireland, comprising the counties of Antrim, Down, Armagh, Cavan, Monaghan, Fermanagh, Donegal, Tyrone, and Londonderry. It was dominated by Gaelic lords until the 17th cent.; the Normans under John de \*Courcy and Hugh de Lacy establishing a foothold in eastern Ulster in the late 12th and early 13th cents.: de Lacy was created earl of Ulster by King John in 1205. The Norman intrusion was both socially and geographically confined: Ulster remained the most Gaelic, and—from the perspective of English governors in Dublin—inaccessible part of Ireland until the plantation of 1609. The flight of the Gaelic lords in 1607 after the failure of \*Tyrone's rebellion opened the way to mass confisca-

tions of land by the crown, and the redistribution of this property through a programme of colonization. The Ulster plantation embraced the six central and western counties of Ulster: an earlier plantation in Monaghan (1593) was allowed to stand, and the eastern counties, long characterized by informal British settlement, were also untouched. The destruction of Gaelic society continued during the Commonwealth, when massive confiscations occurred in eastern and southern Ulster: the Gaelic aristocracy was, by 1660, all but annihilated. The victory of the Williamite forces in Ireland by 1691 confirmed this territorial distribution, and opened the way to further British migration. However, the weak economic condition of Ireland at the beginning of the 18th cent. stemmed this tide, and indeed produced a flow of presbyterian emigrants. The mid- and late 18th cent. saw economic growth throughout most of Ireland, and at this time Ulster emerged as the centre of the Irish linen industry, \*Belfast developing as a significant industrial centre. The commercial success of especially eastern Ulster in the 19th cent., allied with the substantial British and protestant population, helped cut the region off from the rising nationalist fervour elsewhere in Ireland: by the time of the first \*Home Rule Bill (1886), there was broad support for the maintenance of a constitutional link with Britain. In 1920 the island was partitioned, with the six most unionist counties—the new \*Northern Ireland—obtaining a separate devolved parliament and government. This partition settlement was confirmed by the \*Anglo-Irish treaty of 1921, and by the Boundary Commission of 1925: it was further underwritten by the \*Ireland Act (1949), passed by the United Kingdom House of Commons after the declaration of a republic by Dublin in 1948. However, the dominant unionist social and political culture of Northern Ireland came under increasing challenge from the nationalist minority, benefiting from improved access to higher education, but still economically and culturally disadvantaged. Between 1969 and 1994, in the context of a low-grade civil war conducted between loyalist and republican paramilitaries and the Royal Ulster Constabulary and British army, an untenable position of unionist political predominance was gradually undermined. Although 'Ulster'—the old provincial label is still sometimes applied to Northern Ireland—looks set to remain with Britain, it is probable that its governing institutions will more faithfully reflect its cultural and political diversity. AJ

**Ulster** (Ulaíd), **kingdom of**. The most powerful of the four provinces in the *\*Táin Bó Cuailnge*, along with Connachta (Connacht), Laigin (Leinster), and Mumu (Munster). The province of the Ulaíd consisted of the whole of northern Ireland with its high seat at Emain Macha, near Armagh. In the *Táin*, the king of the Ulaíd is Conchobor mac Nessa, a prince of the Érainn, and his enemy is Medb of Connachta. The *Táin*, a story of Ulster heroes, preserves a tradition which may depict an 'heroic' culture of the sub-La Tène period, dating back to the 4th cent. As a result of political upheavals and the rise of the Uí Néill in the 5th cent., Ireland was subsequently divided into fifts (coiced). *\*Armagh* became the most important Irish town and was subsequently the seat of an archbishopric. The kingdom of the Ulaíd was gradually destroyed and partitioned by the sons of Niall Noígiallach with the aid of Connachta. This conquest established the Uí Néill in the north, whose territory included Armagh, Monaghan, Tyrone, and the greater part of Fermanagh and Derry. The result was the creation of two new kingdoms of Airgialla in the first conquest and Ailech after the conquest of Donegal c.428, later known as Tír Conaill (Tyrconnel) and Tír Eógain (Tyrone). The small kingdom of *\*Dalriada* on the Antrim coast migrated to Scotland in the course of the 5th cent. The Uí Néill kingdom was greatly weakened by Viking expeditions from the 9th cent. onwards. SMD

**Ulster covenant**, 1912. The Parliament Act of 1911 reduced the Lords' veto to a delay and in April 1912 the third Home Rule Bill was introduced. The protestant response was to bring forward a covenant on 'Ulster Day', 28 September 1912, pledging the signatories to use 'all means which may be found necessary to defeat the present conspiracy to set up a Home Rule Parliament in Ireland'. It was signed by 237,000 Ulstermen and accompanied by a campaign to drive catholics out of employment in the dockyards. Both sides began preparing for armed conflict and the *\*Ulster Volunteer Force* was founded in January 1913. JAC

**Ulster custom** was the name given to the informal rights of Ulster tenants. These included security of tenure so long as the rent was fully paid, and the freedom to sell the right of occupancy to any new tenant who met with the landlord's approval. In practice the Ulster custom was not uniformly honoured in Ulster, and was not confined to the province. The custom had initially no legal force. In 1847 the *\*tenant rights advocate* William Sharman Crawford attempted to gain legalization for the custom, but failed. Only in 1870, through *\*Gladstone's Land Act*, was this objective nominally attained. AJ

**Ulster Special Constabulary**, 1920–70. Formed as an auxiliary armed police force by the new Northern Irish government, the Ulster Specials in 1922 consisted of 'A' full-time, 'B' part-time, 'C' reserve with 5,500, 19,000, and 7,500 members respectively. Always dominated by old *\*Ulster Volunteer Force* and *\*Orange order* members and seen as a ruthless sectarian force by the catholic minority, it was reluctantly paid for by the British Treasury. After the early turbulent years of the province, the 'A's and 'C's were disbanded. The

'B' Specials became a target for criticism of their aggressive policing of civil rights marches in the late 1960s. The Hunt Report (October 1969) recommended their replacement by a new part-time security force, soon known as the Ulster Defence Regiment. The new, avowedly non-sectarian, force failed to recruit many catholics and was destined to be almost as controversial as the 'B' Specials. MAH

**Ulster Unionist Council**. Created in 1904–5 as a representative body for Ulster unionism. Comprising originally 200 members (100 representing the local unionist associations, 50 representing the Orange order, and 50 co-opted members), the council was subsequently expanded and restructured: it was governed by a standing committee of 30. A new constitution was accepted in 1946. This gave belated recognition to the political institutions created by the partition settlement of 1920; it also provided for an enlarged standing committee and a new tier at the pinnacle of the representative pyramid, the executive committee. Although the representative significance of the UUC was overshadowed by the Unionist parliamentary party in the Northern Ireland House of Commons, since 1972 its strategic importance has been restored. AJ

**Ulster Unionist Labour Association**. Created in July 1918 as a working-class adjunct to the Ulster Unionist Party, it benefited from the social Toryism of its patron, Edward *\*Carson*. The UULA won three of the eight Unionist seats in Belfast at the general election of December 1918; six UULA candidates were returned to the first Northern Irish Parliament in June 1921. Thereafter, the UULA parliamentary voice—a combination of deference and sectarianism—grew frailer, weakened by the retirement of Carson from politics in 1921 and by defeats in the 1925 Northern Ireland elections. AJ

**Ulster Unionist Party**. Formed in 1904–5 as the *\*Ulster Unionist Council* to resist the threat of all-Ireland devolution, it consisted of representatives of local unionist institutions, the presbyterian church, the Orange order, and loyalist MPs. It brought protestant landowners, businessmen, and working class together successfully to oppose the third Home Rule Bill, 1912–14. It was led by southern unionist Sir Edward *\*Carson* 1910–21, and then by Sir James *\*Craig*, key organizer in the preceding period and the first Northern Ireland prime minister 1921–40. The Ulster Unionists became the single party controlling the Northern Ireland government and Parliament 1921–68, resisting constitutional reforms and concessions to the catholic minority until *\*O'Neill's* premiership in 1963. Representing highly conservative social and economic views, it always had locally based interests at heart. Through control of local and provincial government, it was frequently accused of gerrymandering and sectarianism. The civil rights crisis from 1967 and the reluctant involvement of the British government placed enormous strains on party unity and resulted in a challenge from traditional unionist sources. It divided over the power-sharing executive 1973–4, the majority deserting Brian *\*Faulkner's* leadership and helping its demise. It has remained the majority representative of Northern unionist

## Ulster Volunteer Force

opinion, despite an increasing challenge from the \*Democratic Unionist Party, leaving it with primarily middle-class support. The UUP opposed the \*Anglo-Irish agreement 1985, but extremely cautiously supported the Downing Street declaration of 1993 and the Good Friday agreement of 1998. The latter placed a severe strain on the party as the IRA reneged upon its commitment to decommission its weapons. MAH

**Ulster Volunteer Force (UVF).** Formed in 1913, as the military backup to Ulster loyalist resistance to the third Home Rule Bill, and led by ex-British army officers and generals, the UVF achieved success in the Larne gun-running. Its membership totalled 100,000. It ceased with the First World War, but its veterans were the basis of the \*Ulster Special Constabulary, formed in 1920–1. The name was resuscitated in the mid-1960s for a secret protestant paramilitary force, responsible for sectarian assassinations, preceding the outbreak of widespread violence in 1969. Outlawed in the 1970s, it remained less popular and active than the Ulster Defence Army (UDA), with which it frequently clashed. The prominence of its long-imprisoned leader, Gusto Spence, in the announcement of the loyalist ceasefire in October 1994 has inflated its significance. MAH

**Ulundi, battle of, 1879.** Last battle of the \*Zulu–British War of 1879. A force of 10,000 men under General Chelmsford headed for Ulundi, 115 miles north-east of Durban, the seat of Zulu chief Cetewayo. On 4 July 1879 they engaged a Zulu force of 20,000 men. Chelmsford's army marched forward in a square formation with infantry forming the walls and cavalry riding within. The Zulus attacked but were cut down by rifle fire, and harried by the cavalry as they fled. They lost over 1,500 men, breaking the power of the tribe. The British lost just 15 killed and 78 wounded. RAS

**unauthorized programme, 1885.** Between 1883 and 1885 Joseph \*Chamberlain and John \*Morley organized publication in the *Fortnightly Review* of a series of articles—on land, housing, religion, education, and taxation—republished as *The Radical Programme* (1885) with a fiery preface by Chamberlain, promulgating 'a definite and practical programme for the Radical party'. The programme was 'unauthorized' as it lacked the Liberal Party leadership's approval, \*Gladstone especially deploring its 'constructive' (i.e. socialistic) direction. Within a year 'Radical Joe' was allied to the Unionists, some of the items of his programme becoming even more 'unauthorized', and an embarrassment to him for the remainder of his career. HCEM

**undertaker system.** For many years the English administration in Dublin castle kept control of the Irish Parliament by reaching agreements with leading Irish borough patrons, who 'undertook' to construct a government majority and see through business. In exchange they received extensive patronage. Lord \*Townshend, appointed lord-lieutenant in 1767, resolved to end the system, but was unable to do more than shuffle the personnel. The concessions which he made, including the \*Octennial Act, paved the way for legislative independence and \*Grattan's Parliament. The influence of

undertakers was not fully removed until the \*Union of 1801. JAC

**unemployment.** This apparently simple concept has been the source of great disagreement amongst economists in recent decades. Indeed the principal differences between major schools of thought are reflected in views about the nature and even the existence of unemployment. The term is an abbreviation and, fully stated, should be 'involuntary unemployment', to exclude those of working age who, for a variety of reasons, choose to be unemployed. The actual level of unemployment at any given time is a source of endless disagreement, reflected in the different mechanisms by which it can be defined and measured. In the past decade, British official statistical estimates of unemployment have changed on several occasions. But even the achievement of perfect measurement would not resolve the disputes. Nineteenth-cent. definitions of involuntary unemployment assumed that it was the result exclusively of friction in the economic system, a term used to denote the fact that economic change entails both the creation of new jobs and the disappearance of existing ones. For this, and for many other reasons, individuals periodically choose or are obliged to change jobs. The period of adjustment between the loss of a job and the commencement of a new one represents frictional unemployment. It is generally agreed that this is a real phenomenon and that some unemployment of this type will exist in any economy. For some authorities this constitutes both a full definition of unemployment and a complete explanation of it. Any unemployment beyond this is voluntary in that workers choose leisure rather than work at prevailing wage rates. Those who subscribe to this view agree that there is a natural rate of unemployment, which may vary, and will be the result of both frictional change and prevailing wage rates. For them the only way to reduce unemployment is for workers to choose work rather than leisure and to price themselves back into employment by accepting lower wages. There is an equally large body of opinion which does not accept such an interpretation, holding the view that unemployment can be reduced or increased by government intervention. In the 1930s \*Keynes suggested expenditure on public works as a vehicle for creating employment. More popularly, in recent decades, measures have been advocated to stimulate consumer spending, such as tax cuts, as a means of increasing opportunities for work.

Unemployment was initially recognized as a major economic and social problem between the wars, when the numbers of those unemployed increased well above the levels which could be explained as a temporary frictional readjustment, and because unemployment in industrial areas of the country including south Wales, Scotland, and much of northern England rose to very high levels. Post-war governments committed themselves to maintaining 'full employment', without actually defining what that entailed, but the problem reappeared in the 1970s and 1980s. By then inflation had replaced unemployment as the source of major anxiety for politicians and their constituents, and policies to curb inflation pushed unemployment rates upwards. The problem

has thus re-emerged as a central issue dividing both economists and politicians, and the debate remains as heated and inconclusive as ever.

CHL

**Uniformity, Acts of**, 1549, 1552, 1559, 1662. By enforcing the use of successive Prayer Books, the Acts provided liturgical conformity in Books of *Common Prayer* instead of the diverse uses of Sarum, York, Bangor, and Lincoln. Constitutionally and ecclesiastically, though not liturgically, the 1549 Act was 'a momentous moment', because Parliament set a precedent by itself authorizing doctrine and liturgy, a royal preserve since 1534. Liturgically the 1549 book, broadly an abridged Sarum rite in English, catholic in tone, made little change. The 1552 book marked a Zwinglian shift; the mass became the communion, tables replaced altars, the surplice replaced eucharistic vestments. Despite recent debate as to Elizabeth's intention, the 1559 book was decidedly comprehensive. Catholic elements were added to the 1552 book and vestments were to be as in 1548. The 1661 Prayer Book (authorized 1662) roughly followed 1559, and was uniformly used until the 20th cent., though \*Anglo-catholic ritualists often illegally used Tridentine rites in English. WMM

**Union, Act of (Ireland)**, 1801. United the parliaments of Great Britain and Ireland, abolished the Irish Parliament in Dublin, and ended Irish legislative independence granted in 1782. The Act originated from Britain's difficulties in governing Ireland especially after the \*Irish rising of 1798, and was designed to strengthen British security against France. The first bill in 1799 failed because of the opposition of powerful protestant interests which dominated the Irish Parliament. They were bought off by bribery and lavish promises of honours and titles and the Act came into force on 1 January 1801. In place of her own House of Commons of 300 members, Ireland was given 100 MPs at Westminster, drawn from the counties and larger boroughs, while 28 Irish peers were elected for life by the whole Irish peerage to represent them in the Lords. Four bishops of the Church of Ireland, serving in rotation, also entered the Lords. The Act was intended to pave the way for catholic emancipation in Ireland but George III refused to consent and \*Pitt, the prime minister, resigned. The Act was always unpopular in Ireland, Daniel \*O'Connell and later Charles Stewart \*Parnell leading the agitation for repeal, but it lasted until 1920. EAS

**Union, Act of (Scotland)**, 1707. United England and Scotland and established the kingdom of Great Britain. In 1603 there was a union of crowns when James VI of Scotland became James I of England but, despite the king's wish the two countries remained independent states until 1707 (except for a brief legislative union during the Interregnum). After 1688 William III was anxious to promote union and in 1700 the House of Lords approved a bill authorizing the appointment of commissioners to negotiate, but the Commons did not agree. The process was restarted on the accession of Anne in 1702, but commissioners did not meet until April 1706, as there was much opposition or indifference in both countries. The English government was driven to seek a union when in 1705, to try to extract economic concessions, the Scottish Parliament passed an act allowing

Scotland to choose a successor to the Scottish crown on Anne's death, putting the prospect of the Hanoverian succession in jeopardy. The articles of union negotiated by the commissioners formed the basis of the Acts passed by both the English and Scottish Parliaments.

The unitary state of Great Britain was established on 12 May 1707 with Anne as queen, and the succession guaranteed in the house of Hanover. The Scottish Parliament was abolished, and Scottish representation in the British parliament consisted of 45 MPs and 16 representative peers (the numbers based on the respective sizes of the two economies). Free trade between North Britain (Scotland) and South Britain (England) was established, and England's colonies were open to the Scots on an equal footing. The Scots retained their own legal system (though the House of Lords soon established its position as the highest court of appeal from the Scottish courts), as well as their own Privy Council (this, however, was abolished in 1708). The established churches were to remain the same: Anglican in England and presbyterian in Scotland.

The Union did not settle the problem of mistrust between the two nations, and though England secured immediately the succession and thus her northern frontier (one of her main objectives), Scotland's chief expectation of economic benefit was several decades in coming. CJ

**Union, Act of (Wales)**. A 20th-cent. term applied to two Acts of Parliament (1536, 1542/3) in which Wales was declared 'incorporated, united and annexed' to the English realm. The 1536 Act laid down principles 'for laws and justice to be administered in Wales in like form as it is in this realm'; the Act of 1542/3 contained further details. This legislation completed social, administrative, and judicial developments in the principality and marcher lordships of Wales since Edward I's reign. It sprang from the circumstances of the 1530s: Henry VIII's divorce and the breach with Rome, royal supremacy over the church, and associated problems, and order and defence. It was also part of an attempt to bring uniformity and control to provincial government, by attacking franchises; it expressed ideas about royal sovereignty and reflected the bureaucratic genius of Thomas \*Cromwell. The 1536 Act created five shires (Monmouth, Brecon, Radnor, Denbigh, and Montgomery) in addition to the six of the old principality (Carmarthen, Cardigan, Anglesey, Caernarfon, Merioneth, and Flint) and existing counties palatine, Pembroke and Glamorgan. Equality at law was granted to the Welsh, and English law, which had made great advances in Wales, became official usage. Each Welsh county had one MP (prosperous Monmouth two), and each county town had one parliamentary burgess (except poor Harlech), with 'contributory' boroughs providing support. The 1542/3 Act created the Court of Great Sessions, with twelve shires grouped in four circuits and Monmouth joining the Oxford circuit, an anomaly that created uncertainty as to whether Monmouthshire was or was not Welsh. The \*Council in the Marches received statutory recognition with supervisory judicial powers. The English language, which had made considerable inroads, was the language of administration and justice, a sore point later

## Unionist Party of Northern Ireland

on. The measures were welcomed by influential Welshmen and were regarded as a boon for long after; the growth of Welsh nationalism in the 20th cent. modified this view.

RAG

**Unionist Party of Northern Ireland.** Established in September 1974 by the unionist supporters of the Sunningdale agreement (December 1973), which created the power-sharing Northern Ireland executive (January–May 1974). The Ulster Unionist leader Brian \*Faulkner, who had helped to negotiate the agreement, failed to carry the majority of his party with him: his supporters at first accepted the label 'Unionist pro-Assembly', but later organized as UPNI. The party's share of the poll shrank from 7.7 per cent in the Convention elections of 1975 to 1.9 per cent in the council elections of 1981. Consistently weak performances after 1977 brought the dissolution of the party in 1981. AJ

**Union Jack.** National flag of the United Kingdom. The earl of Nottingham's designs after the accession of James I and VI yielded to the 1606 superimposition of the red cross of St George (England), bordered by its own white field, upon the saltire of St Andrew (Scotland) on a blue field. An Irish harp at the centre was added by Cromwell but withdrawn after the Restoration. On the union of Great Britain and Ireland (1801), the diagonal red cross of St Patrick was combined while still maintaining the individuality of each emblem. Its dramatic design has influenced many other national flags.

ASH

**Union of Democratic Control.** Founded in September 1914 by a group of liberal intellectuals, including J. A. \*Hobson, Norman Angell, and Bertrand \*Russell, who believed that wars came about through secret diplomacy, and that they would cease if the people had more say. By the time it started up, the Great War had come along to prove them (as they saw it) right. During the war they agitated vigorously for a negotiated settlement, for which they—and especially their secretary, E. D. Morel—were continually harried as subversive pacifists. Afterwards they campaigned against armaments and alliances, until 1967, when the UDC was dissolved. BJP

**unitarians** deny the deity of Christ. They believe that only the Father should be worshipped, but their attitude to Jesus varies, reflecting their application of reasoned individual judgement to the Bible, and their reluctance to formulate creeds. Their views developed with the Reformation, notably through Michael Servetus (1511–53), the physician burned in Geneva, Bernardino Ochino (1487–1564), the friar turned Lutheran whom \*Cranmer invited to England in 1547, and Lelio and Fausto Sozzini. By the 17th cent. they had communities in Poland, Hungary, and England, where John \*Biddle's (1615–62) *XII Arguments* qualify him as the father of English unitarianism. They grew congregationally in the 18th cent. from \*presbyterian, independent, and general \*baptist churches, although avowed unitarianism only became legal in 1813. Joseph \*Priestley (1733–1804) and Theophilus Lindsey (1723–1808) were that century's outstanding unitarians; the former had been an independent and the latter an Anglican clergyman. With no co-ordinating

body before the British and Foreign Unitarian Association of 1825, superseded in 1928 by the General Assembly of Unitarian and Free Christian Churches, they none the less produced a distinctive social, political, and intellectual culture, represented by such families as the Martineaus, Chamberlains, Wicksteeds, and Holts, and such institutions as Manchester College, Oxford. In Scotland, where Thomas Aikenhead's mockery of the trinity led to Britain's last execution for blasphemy (1697), their corporate existence dates from 1776; in Ireland their strength lies with the non-subscribing presbyterians originating in the early 18th cent. and reinforced after 1829. CB

**United Empire Loyalists** was the term coined by the governor of British North America, Lord Dorchester, in 1789 to designate those citizens of the thirteen colonies who remained loyal to Britain during the American Revolution and fled to what is now Canada or returned to England. Some went to Nova Scotia, and in 1776 loyalists were transported to Halifax from Boston when the army withdrew, and again in 1783 with the fall of New York. Many settled in Nova Scotia, New Brunswick, Prince Edward Island, Quebec, and Ontario, and a small number later returned to the USA. SMD

**United Irishmen.** A society formed in Belfast and Dublin in 1791 by Theobald Wolfe \*Tone and James Napper Tandy to agitate for parliamentary reform and equal religious rights. Revolutionary events in France made them more radical in 1793, while fears of growing catholic strength caused many protestants to secede and form the \*Orange Society. In 1795 the United Irishmen were reconstituted as a secret society pledged to work for a republic. A rising with French help was thwarted when the invasion force was scattered by a storm off Bantry Bay in 1796. The government now encouraged the Orange Society to help suppress the United Irishmen, which increased its appeal to catholic peasants resentful of tithes and rents. A rising fixed for May 1798 was aborted by the arrest or flight of the leadership and the peasants were routed at \*Vinegar Hill in June, shortly before Tone arrived with a small French invasion force. Irish-inspired subversion, also present in Britain in the later 1790s, was destroyed with the exposure of the Despard plot in 1802 and the failure of Robert \*Emmet's rising in Ireland the following year. Though some protestants remained in the United Irishmen, the society's legacy was one of anti-protestant republican nationalism based on armed struggle. ER

**United Kingdom.** See GREAT BRITAIN.

**United Nations.** The UN replaced the failed \*League of Nations after the Second World War. The term was first used in the 1942 declaration by 26 anti-axis states. Wartime negotiations between Russia, America, China, and Britain produced a blueprint for a new global security institution, rejecting \*Churchill's preference for institutionalized spheres of influence. Following minor amendments at the San Francisco conference in 1945, the United Nations came into being on 24 October 1945 with 51 member states. By 2000, there were 188.

The institutions of the UN bore some similarity to those of the league, though the General Assembly was empowered to act on majority votes, rather than the principle of unanimity. But the five main powers, UK, USA, USSR, France, and China, gave themselves a power of veto in the Security Council, which Britain retains, though her right to do so has been questioned.

The effectiveness of the UN in maintaining global security has rested to a large extent on the superpowers being in agreement. UN peacekeeping activities proliferated at times of relaxation during the \*Cold War, and after 1989, but were rarer when the two main powers were trading vetoes with each other in the 1950s or the 1980s. The UN was able to intervene in the \*Korean War because the USSR at the time was boycotting the Security Council.

In the League of Nations, the absence of the USA and Russia allowed Britain and France to play leading roles, which have not been repeated in the UN. Britain's reliance on her understanding with the USA has limited her scope for independent initiatives. In addition, the 'clubby' traditional style of British diplomacy has fitted uneasily at times into the rhetorical style which became common in both the General Assembly and the Security Council at the height of the Cold War.

The United Nations has occasionally proved useful to Britain—for example, in relieving her of her burdensome commitments in \*Palestine in 1947. Although the General Assembly condemned Britain's action over \*Suez in 1956, the dispatch of peacekeepers to the canal enabled Britain to extricate herself with some dignity. British soldiers have also played a part in UN peacekeeping activities, notably in \*Cyprus and in Bosnia. But strong disagreements over policy towards \*Iraq in 2003 weakened UN authority. CNL

**United Scotsmen.** This small radical and revolutionary organization, closely modelled on the larger \*United Irishmen, started in 1793 and was suppressed in 1799. The first group, in Glasgow, was formed shortly after the prosecutions of the leaders of the \*Friends of the People made many radicals despair of peaceful agitation. The society's object was an independent republican regime. An attempted rising in Perthshire in 1797 led to an Act in July to suppress it and in January 1798 George Mealmaker was sentenced to fourteen years transportation. A second Act in 1799 completed the suppression of the movement. JAC

**United States of America, relations with.** American success in the \*American War of Independence (1776–83) was followed by a period in which trade above all helped the British and the ex-colonists to learn to coexist. This trend was interrupted by the \*War of 1812, confused alike in its origins and conduct. It was inconclusive, and left \*Castlereagh hoping that time would ultimately resolve such contentious issues as neutral rights. British conservatives feared the appeal of American democracy among radicals at home, while governments suspected that the USA might try to exploit British involvement in any war with a European power. Disputes over the Canadian border, however, were mostly settled by 1846, while British moves towards \*free trade helped to persuade many in the USA that war was unneces-

sary. Although tensions during the American Civil War included a major scare with the North (the \*Trent incident in 1861–2), the British were becoming resigned to the fact that Canada could not be defended against a determined US assault. Serious imperial and naval rivalries with other powers also persuaded them after 1895 to accept such paramountcy as the USA chose to exert in the New World.

Thus the \*First World War found US neutrality tempered by the fact that Britain was already viewed as the least obnoxious of the imperial powers. British interference with American trade with Germany was more than offset by huge purchases from the USA, though Anglo-American relations were paradoxically very strained during the winter of 1916–17 until the resumption and intensification of the German submarine campaign brought the USA into the war in April. Relations cooled after 1918 over such matters as trade and naval rivalries until these were eclipsed by German and Japanese aggression, and American fears of the axis—especially from 1940—led to Lend-Lease and indirect assistance at sea. The USA became a belligerent in December 1941. Even so, and despite the highly successful wartime alliance (1941–5), the Attlee government briefly showed interest in a western European/British Commonwealth Third Force.

Lack of resources and the Russian threat finally persuaded the British to opt for the 'Special Relationship' with the USA, a relationship which—though assisted by a common language and various personal and cultural ties—was based essentially on shared interests and fears. Thus the USA frequently encouraged Britain to persevere in a world role so that it could benefit from Britain's Commonwealth bases as well as its own facilities in the British Isles (America's unsinkable aircraft carrier off the coast of Europe). Even after Britain's withdrawal from east of Suez and its entry to the \*EEC (1973), the two remained intimately connected in such areas as nuclear weapons, intelligence, and the pursuit of freer trade in the world. They assisted each other in the \*Falklands (1982) and \*Gulf (1991) conflicts. But relations were inevitably weakened by the ending of the \*Cold War. CJB

**universities.** In the Middle Ages, the *studium generale*, a place of learning open to all, was the equivalent of the term 'university'. Instruction was by learned men and degrees were awarded as a title of honour. From the 12th cent., Paris was the intellectual centre of this activity, where luminaries such as Peter Abelard (1079–1142) were both students and teachers.

Similar institutions were established in England, at \*Oxford about 1185 and at \*Cambridge in 1209. For the following six centuries, the two universities, which mainly provided a liberal education for the aristocracy and gentry, retained their exclusiveness. The attempts to establish a university at Durham during the Commonwealth foundered at the Restoration in 1660. Restrictions on non-Anglicans led to the founding of University College, London, in 1828 and the University of \*London eight years later, with its affiliated colleges and degree-granting powers. Scotland had a long tradition of university education which was available for

## 'Unlearned' Parliament

dissenters. St Andrews (1410), Glasgow (1451), Aberdeen (1494), and Edinburgh (1583) attracted many English students.

Until the early 19th cent. there were no universities in the north of England. However, in 1832, the clergy of Durham cathedral decided to support a university based in the Norman castle, though restricted to students who subscribed to the \*Thirty-Nine Articles. The university, which received its charter in 1837, was based on the Oxford and Cambridge model. Most of its (male) graduates entered the church.

A new impetus for change and expansion in higher education came largely from the growth of science and its applications to an industrial society. One example of this was the setting up of a Royal Commission on Scientific Instruction and the Advancement of Science in 1872, chaired by the 7th duke of Devonshire. One of its main findings, published in 1875, was the need for more and better-trained science teachers, in which universities could help. Owens' College, Manchester, opened in 1851, had been a forerunner, though many of its students were part-time and did not aim at a degree.

Civic pride was also one of the prime motives for creating universities, which received benefactions from Jesse \*Boot at Nottingham, Mark Firth at Sheffield, and Josiah Mason at Birmingham, which also later attracted money from the American steel millionaire Andrew \*Carnegie. University colleges were set up at Southampton (1862), Newcastle (1871), Leeds (1874), Bristol (1876), Sheffield (1879), Birmingham (1880), Nottingham (1881), Liverpool (1881), Reading (1892), and Exeter (1895).

In the 1880s, one development was the northern federation of provincial colleges. Owens' College, Manchester, was joined by Liverpool in 1884 to form the federal University of Victoria, and by Leeds in 1887. Until then the students of these colleges had been prepared for external London degrees: under the new charter, the university awarded its own. The federation lasted until 1903, when individual charters were granted.

The University of Wales followed a similar pattern of an upsurge in civic awareness. Colleges were founded at Aberystwyth (1872), Cardiff (1883), and Bangor (1884). It was not until 1893 that a charter was granted to the University of Wales, giving the body degree-awarding rights in place of the London external degree. University College, Swansea, joined the federation in 1923.

The lack of opportunities for the higher education of women led to the founding of the university extension movement. Extramural classes had been held for women by professors at King's College, London, as early as 1847. In 1867 Josephine \*Butler and Anne Clough became president and secretary respectively of the North of England Council for Promoting the Higher Education of Women. The success of the courses, which were very well attended, led Cambridge to establish university extension in 1873, sending lecturers to Nottingham, Derby, and Leicester. This was swiftly followed by the London Society for the Extension of University Teaching in 1876 and at Oxford in 1878. The newer civic universities were also soon heavily involved in the work, later developing departments of extramural studies. Women's colleges were instituted at Cambridge—

Girton (1869) and Newnham (1871), with Anne Clough as principal—and at Oxford—Lady Margaret Hall (1879) and Somerville (1879), followed by others.

Whilst the University of London had grown into a teaching institution with 24 schools by 1900, subsequent university expansion was slight; in the inter-war period, only two new colleges outside London were founded, at Hull and at Leicester. Government funding was supplied to the universities and from 1919 was administered by the University Grants Committee (UGC).

After the Second World War, there was a great demand for more university places as the birth rate rose. The University College of North Staffordshire, now Keele University, was founded in 1949, and in the years 1961–5, East Anglia, Essex, Kent, Lancaster, Sussex, Warwick, and York. Newcastle, previously linked with Durham, became a university in its own right. The Robbins Committee on Higher Education (1963) recommended that nine colleges of advanced technology (CAT) should become full universities, including Aston, Bath, Bradford, Loughborough, and Salford. At the same time Strathclyde, Dundee, and Heriot-Watt were founded in Scotland. Northern Ireland has \*Queen's, Belfast, a 19th-cent. foundation, and the University of Ulster at Coleraine.

Innovations in the structure of university organizations and curricula are a recent feature of the system. The Open University (1966) provides degree and other courses for students over 21, operates an open admissions policy, and uses distance learning. The University of Buckingham (1976) is the only independent university in the United Kingdom, offering two-year honours degree courses. A more informal organization is the University of the Third Age (U3A), which provides educational opportunities for the over-50s.

Following the recommendations of the White Paper 'Higher Education: A New Framework' (1991), the 1992 Education Act abolished the distinction between polytechnics and universities. There are now almost 100 universities whose finances are determined by the Higher Education Funding Council (HEFC), which replaced the UGC.

**'Unlearned' Parliament**, 1404. This nickname was given to the Parliament summoned by Henry IV in 1404 to meet at Coventry, after the king ordered that no lawyers should be returned, since they concentrated too much on their own professional business. The instructions were resented and the rebels of 1405 demanded a free Parliament. JAC

**urban history** can be defined variously. Histories of individual British towns have been written for over four centuries; studies of towns and urbanization in general came later; while as an academic discipline British urban history is no more than 40 years old.

An interest in the history and antiquities of towns can be traced back to Anglo-Saxon times, and by the 13th cent. London had civic annals. From the end of the 16th cent. true urban histories started to appear, the first published

being John \*Stow's *Survey of London* (1598). Between the 17th and 19th cents. many towns received substantial histories, though in general they contain undigested raw materials, 'the uncooked potatoes and not the finished meal'. A controversial literature after the 1688 revolution produced one enduring work of urban scholarship (Madox's *Firma burgi*, 1726), while another, in connection with the municipal reform of the 1830s, generated a *History of the Boroughs and Municipal Corporations of the United Kingdom* by Merewether and Stephens (1835), still a useful corpus of information.

A new direction was taken at the end of the 19th cent. under German and American influences. The most notable pioneers were Charles Gross (1857–1909) and F. W. \*Maitland (1850–1906), who laid the foundations of British urban history as of so much else. They and their pupils initiated a period of meticulous scholarship (mostly on medieval municipal history) which lasted until the 1940s, though the histories of individual towns fell behind American standards. However, at the end of that period new works were appearing which heralded wider perspectives both on the periods covered (breaking out of the medieval strait-jacket) and on themes dealing with society and economy as well as institutions. Hoskins's *Industry, Trade and People in Exeter, 1688–1800* (1935) and W. H. Chaloner's *The Social and Economic Development of Crewe, 1780–1923* (1950) were notable pioneer works.

The subject was transformed in the 1960s largely through the influence and inspiration of H. J. (Jim) Dyos (1921–78). He not only wrote and edited important exemplars, but founded an Urban History Group (1962), with its own *Newsletter* (1963) and *Yearbook* (1974) on the American model. He also developed work in his own University of Leicester, formalized since 1985 as a Centre for Urban History. Work has proliferated since the 1960s, in Wales and Scotland as well as England, and there is a separate Scottish Urban History Group. Other disciplines have been brought to bear on the subject, including archaeology, cartography, and historical geography. A large body of urban archaeological data has been produced and partly published; three volumes have so far appeared of a *British Atlas of Historic Towns*; and an Urban Morphology Research Group at the University of Birmingham has developed the pioneering approaches of M. R. G. Conzen in the historical study of town plans.

DMP

Clark, P., (ed.), *Cambridge Urban History of Britain*, (3 vols., Cambridge, 2000).

**Urien** was the late 6th-cent. ruler of \*Rheged, the British kingdom centred on Carlisle. The 9th-cent. British writer \*Nennius described his power and \*Taliesin, poet at Urien's court, praised him as warrior and protector. He is said to have led a coalition against the Angles in the northern kingdom of \*Bernicia and to have been killed c.590 besieging \*Bamburgh. Through \*Geoffrey of Monmouth and \*Malory, Urien was brought into the Arthurian legend and his activities transferred to south Wales. AM

**Ursulines.** Monastic order established in 1535 by St Angela Merici, a lay Franciscan, at Brescia (Italy). Originally intended for religious women living in their own homes as teachers, the order became communal in 1566 under the guidance of

St Charles Borromeo, while from 1612 the Ursulines of Paris, and later throughout France (where the largest number of communities were concentrated) and beyond, were strictly enclosed following an \*Augustinian rule. The order became famous for missionary and educational activity, particularly in North America. In 1900 most Ursuline communities (which followed differing institutes) were united in the 'Roman Union'. BJG

**Uses, statute of, 1535.** The use was a legal device whereby property could be held by one person for the benefit of another, e.g. when a landowner was absent on crusade. But, by extension, it might be employed to evade or avoid obligations, defraud creditors, or escape legislation against \*mortmain. Henry VIII pressed strongly that uses should be restricted, arguing that his revenue was affected, but the Parliament of 1532 was unwilling to legislate and was told sharply 'not to contend with me'. In 1535 Parliament accepted 27 Hen. VIII c. 10, which complained of 'subtle inventions and practices' and restored obligations to the beneficiary. Landowners remained indignant, the rebels in the \*Pilgrimage of Grace demanded redress, and Henry made concessions in the Wills Act of 1540. Chancery lawyers then began to circumvent the statute of Uses by devising new forms of trust. JAC

**Ushant, battle of, 1778.** After France's entry into the American war, Augustus Keppel was dispatched with a fleet of 30 ships to watch Brest. On 23 July he sighted a French fleet of similar size off the Breton coast under d'Orvilliers. Though manœuvring went on for four days and a good deal of damage was inflicted, the result was indecisive, no ships being captured or sunk. The political consequences were more spectacular. Keppel was a Whig hero and his opposition friends hinted that he had been betrayed by Sir Hugh Palliser, who had commanded the rear. Palliser demanded a court martial on Keppel, which he conducted. Keppel's political friends flocked to Portsmouth to give moral support and were jubilant when he was acquitted and the charges declared malicious and unfounded. It was then Palliser's turn to be court-martialled. Though acquitted, he was censured for not keeping Keppel fully informed. Meanwhile a French squadron had escaped from Toulon to America, where it gave substantial help to the rebels. JAC

**Ussher, James** (1581–1656). Archbishop of Armagh. Born in Dublin and educated at Trinity College, Dublin, Ussher was successively professor of divinity, vice-chancellor (1615), bishop of Meath (1621), and archbishop (1625). He drafted the 104 Articles approved by the Dublin convocation (1615). On returning from absence in England (1623–6), he signed the Irish bishops' protest against toleration of popery (1626). Despite his predestinarian theology, he was friendly with \*Laud. During his tenure the disputed primacy of Ireland was settled in Armagh's favour and the Bible in Irish language was permitted, but Scottish settlers resented the imposition of unmodified Anglican articles. After leaving Ireland (1640), he held the see of Carlisle in *commendam*. Though suggesting modified episcopacy with synods (1641) acceptable to presbyterians like \*Baxter, he remained

## usury laws

an episcopalian royalist. Ussher was a distinguished scholar, contributing to early Irish history and biblical chronology: his argument that the world was created in 4004 BC held the field for decades. WMM

**usury laws.** The idea that it is wrong to profit from lending money is found in the Old Testament, and was linked to the belief that there exists a just or fair price for every commodity. In the 4th cent. the church banned clerics from making loans to each other. In the reign of Charlemagne, this instruction was extended to include all Christians. But church doctrine did not forbid interest being paid as compensation for the use of capital tied in some venture. This double standard endured throughout the medieval period. The usury laws coexisted with the widespread acceptance that payment of interest was legitimate in some circumstances, such as by merchant banks on deposits. CHL

**utilitarianism** is the moral philosophy which asserts that the maximization of happiness is the ultimate aim of all human conduct. Philosophers since the time of Aristotle have stressed the ethical value of happiness, but not until the 18th cent., with the work of Helvetius, Beccaria, and \*Hume, was there a theory which defined moral worth exclusively in terms of happiness. According to Jeremy \*Bentham, the systematizer of utilitarianism, an action is right if, and only if, it promotes the greatest happiness of the greatest number.

Bentham presented utilitarianism as a practical guide to both individual and collective decision-making, developing a 'felicific calculus' to measure the net amount of happiness producible by alternative courses of action. The practical influence of utilitarianism in shaping social policy in Britain from the mid-19th cent. has been considerable. It became the ideological driving force behind the reform movement known as \*philosophical radicalism, which tested all institutions by the principle of utility. Many far-reaching changes in the social security system, the treatment of employees and tenants, and the regulation of public health owed their origin in large part to the spirit of utilitarian ideas. This influence remains strong today: the theory of welfare economics, the concepts of marginal utility and cost-benefit analysis, and the modern preoccupation with obtaining value for money in the public services all exemplify the utilitarian interpretation of 'is it right?' in terms of 'will it work better?'

However, utilitarianism has been much criticized. It has been objected that it is impossible to reduce complex moral issues to a simple mathematical formula, however elegant, and that no rational criterion exists for balancing the great harm done to an individual by taking away his property, against the potential happiness which could be derived by 200 other persons to whom it might be distributed. Critics argue, also, that justice demands protection of basic human rights such as life and liberty irrespective of calculations of utility. On the utilitarian principle, it is possible to justify the execution or imprisonment of an innocent person in order to defuse a revolutionary situation or even to placate an angry mob. But such an act would violate justice, according to those who, like Kant and Hegel, argue that the right is prior to the good, and that it is immoral to commit wrong

for the purpose of promoting utility. John Stuart \*Mill sought to answer this criticism by pointing out that the principle of justice promoted social utility in the long term, if not always in the immediate short term. Mill's position later became known as 'rule-utilitarianism' or indirect utilitarianism. Overall utility is best served by adherence to secondary rules such as justice, even though in a particular case, taken in itself, an act of injustice could have more good than evil consequences.

The critics also point out that utilitarianism is essentially an aggregative principle, and lacks a defensible distributive criterion. Whatever distribution of goods maximizes social utility is endorsed by utilitarianism irrespective of who gets what. Critics find this distributive arbitrariness unacceptable; for them justice demands that good should be distributed on the basis of some non-arbitrary criterion, such as desert, entitlement, or need. TSG

**Utopia.** Politico-philosophic work by Thomas \*More (1516), initiating a literary genre. Steeped in literary \*humanism, More sought for the best form of government through discussions with the fictitious Raphael Hythloday, addressing problems of counsel (from both monarchal and advisory viewpoints) and social concerns such as theft, before expanding into a more general analysis of Tudor England. This is followed by Hythloday's account of the 'New Island of Utopia' ('No-place'), but its egalitarian commonwealth appears flawed since, despite religious freedom and absence of hunger and homelessness, personal freedom is restricted. If welfare democracies are anticipated, shadows of modern totalitarian regimes hover. ASH

**Utrecht, treaty of, 1713.** This was part of the general settlement ending the War of the \*Spanish Succession. France and Spain recognized the Hanoverian succession, and France agreed to expel the old pretender from French soil. Philip V of Spain abandoned his claim to the French throne. Many territorial changes, partly designed to create strong barrier states on the borders of France, occurred. The most important were that France retained Alsace, Philip retained Spain and the Indies but lost his other possessions in the Netherlands and Italy to the Emperor Charles VI, Britain gained French territory in North America, and Gibraltar and Minorca from Spain, the Dutch were allowed to garrison \*barrier towns in the former Spanish Netherlands, and Savoy gained French territory and Sicily. CJ

**Uxbridge, treaty of, 1645.** The so-called treaty of Uxbridge was in fact an abortive negotiation. The fluctuating fortunes of war in 1644 persuaded Parliament to propose an armistice for discussion. Commissioners met at Uxbridge on 29 January to negotiate on three main issues—the church, the militia, and Ireland. On none of these points was any progress made. Charles refused to abandon episcopacy or take the covenant; to hand over control of the militia; or to allow Ireland to be subdued by parliamentary forces. Nor would he abandon supporters like \*Rupert, whom Parliament refused to include in a general pardon. The negotiation was abandoned on 22 February. The last chance of ending the war by compromise had gone. JAC

**vaccination**, a term first used by \*Jenner (1798) for inoculating cowpox matter (*vacca* = cow) to produce immunity from the far more virulent smallpox, has since come to mean the creation of immunity from infectious diseases in general. Its benign effect on death rates from smallpox led to gradual abandonment of earlier techniques, but not without opposition. The 1840 Vaccination Act prohibited inoculation and permitted vaccination of the poor at ratepayers' expense; the 1853 extension made the practice compulsory, though it was not universally enforced. An organized movement to repeal compulsory vaccination developed after 1871, leading eventually to amendments of previous statutes (1898). Nevertheless, with compulsory notification of infectious diseases and better trained public health officers, vaccination and revaccination rapidly reduced the prevalence, morbidity, and mortality of smallpox. Subsequent vaccines (using attenuated or altered viruses) against diphtheria, polio, measles, whooping cough, and rubella have largely controlled these diseases. ASH

**Vagrancy Acts.** Vagrancy was a phenomenon which particularly worried late medieval and Tudor society, not merely because it often led to crime, but because 'masterless men' seemed to threaten the whole social structure. The breakdown of the authority of lords of the manor freed men and women to move, and unemployment, demobilization, enclosures, and high prices could combine to produce destitution and vagrancy. London, by far the largest town in the country, produced its own vagrants and imported others from the neighbouring counties. In 1608 Thomas Dekker, the playwright, wrote that suburbs were 'caves where monsters are bred up to devour the cities themselves'.

One of the earliest government interventions came in 1351, after the \*Black Death had caused an acute shortage of labour. The statute attempted not only to control wages and enforce contracts but declared punishment for persons fleeing from one shire to another. Another flurry of legislation came after the \*Peasants' Revolt of 1381. An Act of 1383 authorized JPs to apprehend vagabonds and another Act of 1388 insisted that anyone leaving his abode or service must carry letters patent explaining the purpose of his journey. Tudor legislation on the subject was both frequent and fierce. The Parliament of Henry VII in 1495 enacted that vagabonds should be put in the stocks for three days and three nights on bread and water. Henry VIII improved upon

this in 1531 declaring that an able-bodied vagrant should be 'tied to the end of a cart naked and be beaten with whips till his body be bloody', and then sent back to his place of birth or last employment. In 1535 it was announced that on a second offence any 'valiant beggar or sturdy vagabond' would lose part of his right ear, and on a third offence would be hanged. Branding was introduced in 1547 and the vagabond was to be sold into slavery. By 1572 they were to be flogged and have their ears bored and by 1604 they would be branded on their shoulder with the letter 'R' for rogue. Hanging for repeat offences was certainly no idle threat: four vagrants, including one woman, were hanged in Middlesex in 1575/6. Transportation was also introduced after 1597, mainly to the new American colonies. A different approach was \*Bridewells, where work was provided: opened in London in 1553, they were soon imitated in other towns and counties. After the Restoration the problem of vagrancy diminished, partly because paupers were given help in their parishes of origin, partly because an expanding economy provided better opportunities for employment. The increasing expense of \*poor relief led in the early 19th cent. to reorganization of the whole system, but vagabondage had ceased to terrify. JAC

**Valence, Aymer de, earl of Pembroke** (c.1270–1324). Valence's father William was a half-brother of Henry III, being a son of John's widow Isabella by her second marriage, and came to England in 1247. He fought on the king's side in the baronial wars and commanded against the Welsh in the 1280s. Aymer de Valence inherited in 1296 and spent his early years campaigning in Scotland, fighting at \*Falkirk (1298) and defeating Robert I Bruce at \*Methven in 1306. The following year he was himself defeated by Bruce at \*Loudoun Hill. In 1307 he was recognized as earl of Pembroke by virtue of his mother, a granddaughter of William \*Marshal, earl of Pembroke (d. 1219). In Edward II's reign he was at first an \*Ordainer but switched to the king's side after the murder of \*Gaveston, who was seized from his custody. He fought with the king at \*Bannockburn and was subsequently employed watching the Scots and on diplomatic missions. His widow founded Pembroke College, Cambridge. JAC

**Vanbrugh, Sir John** (1664–1726). Dramatist and architect. A good imitation of Renaissance Man, Vanbrugh was of Dutch descent. His grandfather settled in London as a merchant; his father moved to Chester after the Great Fire of

## Vancouver

London; his mother was the granddaughter of a peer. Vanbrugh began as a soldier, was made a captain, and spent 1688–92 in captivity in France. In 1696 he had an enormous success with his delightful comedy *The Relapse, or Virtue in Danger*, with its bravura role of Lord Foppington. He followed it in 1697 with *The Provok'd Wife*, and in 1705 *The Confederacy* was put on at the Queen's, Haymarket, which Vanbrugh had built. His last play, *The Journey to London*, was finished by Cibber and had great success as *The Provok'd Husband*. Meanwhile, Vanbrugh's career as an architect developed after he began building \*Castle Howard in 1701 for the earl of \*Carlisle. He was appointed comptroller of the board of works in 1702, Carlisle herald in 1703, and Clarendoux herald in 1704. His work on Blenheim palace began in 1705 and involved him in protracted and rancorous exchanges with Sarah, duchess of \*Marlborough. He was knighted by George I at Greenwich on his arrival in 1714 and was appointed architect of Greenwich hospital. Among his many buildings are Kimbolton 'castle' (1707), King's Weston, near Bristol (1710–25); Morpeth town hall (1714); the north front at Grimsthorpe (Lincs.) for the duke of Ancaster (1715–30); Eastbury (Dorset) for \*Dodington (1716–18); Floors castle for the duke of Roxburgh (1718); Seaton Delaval (Northd.) (1718–29), and much rebuilding at Lumley castle, Co. Durham (1722–4). His usual style is an extravagant and idiosyncratic baroque. Vanbrugh married late in life and his widow outlived him by 50 years: his only son was killed at \*Fontenoy. JAC

**Vancouver, George** (c.1758–98). Born in King's Lynn, Vancouver was originally only a seaman on \*Cook's second voyage, but rose to command in the Royal Navy. After further service with Cook, he was sent in 1791 in *Discovery* to re-establish British claims to \*Nootka Sound, disputed with Spain, to explore the north-east coast of the Pacific, and to seek the North-West passage. His voyage revealed the chain of islands along the coast, including the large island which bears his name. He died just before the account of his expedition was published in 1798. RB

**Van Dyck, Anthony** (1599–1641). Portrait painter. In the opinion of Rubens, that master's finest pupil, the Antwerp-born Van Dyck had imbibed in Italy all the influences of Titian before he encountered the connoisseurship of Charles I in England. In 1632 he became 'Principal Painter in Ordinary to their Majesties' and was knighted in 1633, undertaking large compositions to project the mystique of the king's royalist convictions. In its range and quality this *œuvre*, together with many commissions depicting the Caroline aristocracy, was without precedent in England. In the course of one decade, Van Dyck mirrored the frailest of the European monarchies with such mastery that, in British portraiture, only \*Gainsborough and \*Lawrence may be considered rivals. Though he never intended to settle in England, and purchased property in Flanders, Van Dyck died in London in December 1641, helplessly witnessing the extinction of a world he had himself gone far to create. As a result of the sales of the royal collection following Charles I's execution, some of Van Dyck's work of the 1630s was lost to England. DDA

**Vane, Sir Henry the elder** (1589–1655) and **Sir Henry the younger** (1613–62). Politicians of contrasted character. The father was a worldly minded courtier, adroit, thrusting, industrious, and bent on accumulating a great landed estate. The son was a radical puritan with mystical leanings, and in middle life a doctrinaire republican. What they shared was political skill—and some deviousness in exercising it.

Through purchase or patronage, the elder acquired a succession of posts in the royal household, won Charles I's confidence, and became a privy counsellor in 1630. Favoured also by the queen and the marquis of \*Hamilton, he rose in February 1640 to secretary of state. As such, he recorded \*Strafford's fatal words about using an Irish army 'to reduce this kingdom', which his son leaked to \*Pym. Gradually he aligned himself, with the future parliamentarians, until Charles stripped him of all his offices. With his son, he sat on the Committee of Both Kingdoms and in the \*Rump.

The younger Vane sacrificed a promising career at court in 1635 for the religious liberty of Massachusetts, where within six months he was elected governor. But through supporting the unorthodox Anne Hutchinson he got deep into religious controversy, clashed seriously with the general court, resigned, and returned home in 1637. In the Long Parliament he rapidly became a leader of the war party, a close ally of \*Cromwell, and after Pym's death its most influential single member. But by 1648 he and Cromwell were parting company, and he held aloof from the king's trial. He was very active, however; in the government of the \*Commonwealth, and he regarded Cromwell's \*Protectorate as a betrayal of its republican principles. His subversive tract *A Healing Question* (1656) cost him four months' imprisonment, but he returned to prominence with the restored Rump in 1659. He was excepted from pardon at the \*Restoration, but Charles II granted the Convention's plea for his life. To the shame of the king and the Cavalier Parliament, he was nevertheless executed in 1662. AHW

**Vanuatu**, an independent republic in the Commonwealth, was formerly the islands of the New Hebrides, so named by Cook. They lie 1,000 miles east of Australia and have a population, largely Melanesian, of about 160,000. Their main support is agriculture (cocoa, coffee, and copra), fishing, and tourism. From 1906 they were under a condominium run by France and Britain, but became independent in 1980. JAC

**vassal** was the term used to describe a person who had taken a formal oath of allegiance to a superior and was derived from a Celtic word meaning 'youth'. In its simplest form it was no more than commending oneself to a lord for protection, but it became more complex when estates and benefices were granted in exchange for specified duties. It was upheld by the ceremony of \*homage. In Anglo-Saxon England vassalage remained largely personal. The Normans introduced the continental practice of endowing the vassal with a \*fief: this did not imply outright ownership of the land and the vassal could not alienate, though he could subcontract and create his own vassals by the process of subinfeudation. In exchange, the vassal performed carefully defined duties, such as knight service, and aids for particular occasions. The lord retained rights over marriage and

wardship, since they might affect the integrity of the fief, and could demand a payment on inheritance. By the 13th cent. the arrangements were unravelling as lords increasingly paid \*scutage rather than perform knight service and vassals tried to commute their own obligations. Though at the outset the greatest lords were themselves vassals of the king, as tenants-in-chief, the term eventually acquired a pejorative meaning as slave, vagabond, or miscreant. JAC

**Vaughan, Henry** (1622–95). Poet and mystic. After two years at Oxford, Vaughan commenced legal training in London but returned home to Breconshire at the outbreak of war in 1642. Briefly clerk to a royalist judge, and possibly on military service until 1646 when the puritans controlled south Wales, he turned his attention to medicine, and practised successfully, though no degree or licence has been traced. He began to publish poetry in 1646, but George \*Herbert's influence led to rejection of 'idle books', and it is for his religious poems that he is now best known, though they were largely disregarded in his own day; *Silex Scintillans* ('The Glittering Flint', 1650, Part II 1655) and the prose *The Mount of Olives* (1652) reflect his spiritual rapture and fresh creativeness. Welsh sentiment led Vaughan to assume the title 'Silurist', since his native county had formerly been inhabited by a local tribe called the \*Silures. ASH

**Vaughan Williams, Ralph** (1872–1958). English composer, conductor, writer, editor, and teacher, who believed passionately in the need for direct communication with his audience. Vaughan Williams studied composition with Charles Wood at Cambridge and with \*Parry and \*Stanford at London's \*Royal College of Music, where he established a lifelong friendship with fellow-composer Gustav \*Holst. He scored a great success with his first published work, the delightful song 'Linden Lea' (1902). He also took lessons with Bruch in Berlin and Ravel in Paris. Vaughan Williams drew heavily on his native heritage: he edited *The English Hymnal* (1906), and works like the *Fantasia on a Theme of Thomas Tallis* (1909) reflect his great interest in Elizabethan music. He also collected folk-songs, which influenced his modal harmony and melodic style, contributing to an influential 'Englishness'. The finest of his nine symphonies are the fiercely dissonant No. 4 (1935), the modal No. 5 (1943), whose luminous spirituality draws on the 'morality' (opera) *The Pilgrim's Progress*, and the war-torn No. 6 (1948) with its desolate hushed 'Epilogue'. His film music included *Scott of the Antarctic* (1948). ECR

**Vauxhall gardens** (London), just south of the Thames, opened soon after the Restoration as New Spring gardens, and were visited by \*Pepys, who complained of high prices. In 1732 Jonathan Tyers arranged a grand reopening, attended by Frederick, prince of Wales. The central features were the Rotunda and a famous statue of \*Handel by \*Roubiliac, erected in 1738. In 1749 a rehearsal of Handel's *Music for the Royal Fireworks* in celebration of the peace of Aix-la-Chapelle, brought 12,000 people to Vauxhall. Most visitors came by water. Leopold Mozart, in London in 1764 to show off his extraordinary son, wrote: 'I thought I was in the

Elysian fields, with a thousand glass lamps turning night into day.' In the 19th cent. there were increasing complaints of rowdiness and vulgarity, and the gardens closed in the summer of 1859. They were soon built over. JAC

**Vereeniging, treaty of**. This brought the second \*Boer War to a close. At the beginning of May 1902 the Boers agreed to treat for 'limited independence'. On the 31st at Vereeniging in southern Transvaal they accepted Britain's final offer: that they stop fighting and declare themselves subjects of King Edward VII, in return for which they would get their lands back, with compensation for buildings and crops that had been destroyed; be allowed the use of their language in schools and law courts; and be given self-government as soon as possible, with a racist franchise if that was what they really desired. BJP

**Verneuil, battle of**, 1424. The first task of John, duke of \*Bedford, regent for the infant Henry VI, was to preserve and, if possible, extend Henry V's gains in France. In the summer of 1424 he began a campaign to conquer Anjou and Maine, but was confronted at Verneuil on 17 August by a superior French force, under the command of two Scots, the earl of \*Buchan, recently made constable of France, and Archibald, earl of \*Douglas, veteran campaigner of Henry IV's reign. English archers repeated their success at \*Agincourt, nine years earlier. Buchan and Douglas were both killed and the duc d'Alençon taken prisoner. JAC

**Vernon, Edward** (1684–1757). Admiral. Second son of James Vernon, secretary of state to William III, Vernon entered the navy at the age of 15, and was given his first command in 1706. In 1722 he came into Parliament as MP for Penryn but moved into opposition and lost his seat in 1734. At the outbreak of the war with Spain in 1739, Vernon offered his services and was sent to the West Indies with the rank of vice-admiral. On 21 November 1739 his forces stormed the fortress of Portobello in Panama. Vernon became a national hero. London made him a freeman, taverns were named after him, and the tiny resort outside Edinburgh commemorated his great victory. But attempts to repeat the success at Cartagena, Santiago, or Panama failed and Vernon returned home in December 1742. Returned to Parliament for Ipswich he became a noisy critic of government and though promoted admiral in 1745 was dismissed from the service in 1746 for publishing his letters to the Admiralty. 'Henceforth', wrote Namier, 'he was merely a picturesque and turbulent politician, embarrassing to his friends . . . the erstwhile firebrand had become a bore.' JAC

**Versailles, treaty of**, 1783. The treaty of Versailles, at the end of the \*American War of Independence, was less disadvantageous to Britain than had seemed likely, partly because of \*Rodney's naval victory at the \*Saints in April 1782 and partly because of the failure of de Bussy's expedition to India. The independence of the thirteen American colonies had to be recognized, but that had been inevitable after the surrender at \*Yorktown in 1781. The Americans retained their fishing rights off Newfoundland and Congress promised 'earnestly to recommend' the restitution of estates to the loyalists. In the West Indies, France restored

## Versailles

her conquests, save for Tobago, and in India Britain restored France's conquered possessions. Britain gave up Florida to Spain, retained \*Gibraltar, for which Spain had pressed strongly, but ceded \*Minorca. In Africa, France ceded the \*Gambia but gained Senegal. The Fox–North coalition succeeded in bringing down \*Shelburne's government on the peace preliminaries, mainly by deploring the treatment of the American loyalists, but after taking office was unable to obtain much modification of the original terms. JAC

**Versailles, treaty of, 1919.** The peace treaty between Germany and the victorious allies at the end of the \*First World War. It was signed on 28 June 1919 in the hall of mirrors of the palace of Versailles, where the German empire had been proclaimed in 1871. The allies tried to combine the British and, especially, the French desire for security against Germany with the USA's determination to see international relations based on new and more moral principles. Germany had to surrender Alsace and Lorraine to France and considerable territory to the reconstituted Poland. She was not to be allowed to rearm. The Germans particularly resented the fact that they had to accept liability for all war damage and pay 'reparations' to the allies. The treaty also established the new \*League of Nations. MEC

**Verulamium.** Romano-British town, capital of the \*Catuvellauni, predecessor of St Albans (Herts.). In the late Iron Age Verulamium was a major *oppidum*. The Catuvellauni seem to have been pro-Roman and after only brief military presence the new Verulamium started to develop. By the time of its destruction by \*Boudicca in AD 60 it had a small street-grid and Roman-style buildings. By 79 it was able to dedicate its elaborate new forum and in due course acquired public baths, a theatre and temple complex, a *macellum* (covered market), and monumental arches, and may have been promoted a *municipium*. In the mid-2nd cent. an expansive circuit of earthwork defences with impressive stone gates was unfinished, possibly because of a disastrous fire in the town in the 150s. In the 3rd cent. the defences were completed in stone on a slightly reduced line. In the 1st and 2nd cents. private housing at Verulamium was principally artisan. From the later 2nd cent. large residences were built, dominating the town in the 4th cent. some lasting into the 5th. Verulamium was the site of the martyrdom of \*Alban. Bishop \*Germanus of Auxerre visited his shrine in 429, and the present cathedral may perpetuate its site. ASEC

**Vespasian.** Roman emperor AD 69–79. Titus Flavius Vespasianus was born in AD 9 at Reate in Sabine country. In 43 as legate of *legio II Augusta* he took part in the invasion of Britain, distinguishing himself at the \*Medway battle and going on to reduce the south-west, defeating two powerful tribes and reducing twenty hill-forts. For these services he was awarded the *ornamenta triumphalia*. Late in 66 he was appointed to command the suppression of the Jewish revolt and was proclaimed emperor in 69 following Nero's suicide. Vespasian was the ultimate victor of the 'Year of the Four Emperors', founding the Flavian dynasty. His financial prudence corrected the profligacies of Nero and allowed him

to build the Temple of Peace and the Colosseum in Rome. In Britain the advance north was resumed under his kinsman by marriage, \*Petilius Cerialis. ASEC

**Victoria (1819–1901),** queen of the United Kingdom of Great Britain and Ireland (1837–1901) and empress of India (1877–1901). We know more about Queen Victoria than almost any other person in history. For more than 80 years she was the focus of attention and comment. From the age of 13 until a week before her death she kept a diary, and though much of it was later destroyed by her daughter Princess Beatrice, the early parts survived, and transcriptions and extracts were made. She maintained, particularly in her later years, a voluminous correspondence with her ever-growing and far-flung family, much of which has been printed. In 1868 she published her own *Leaves from the Journal of our Life in the Highlands* and followed it in 1884 with *More Leaves*. There are many excellent portraits of her and she is the first British monarch of whom we have photographs. We can trace her from a small girl of 7 watering the flowers at Kensington palace to a tired old lady of 81 at Osborne House, receiving news about the Boer War from Field Marshal \*Roberts. When she was born the stage-coaches lumbered up the Great North Road and Nelson's \*Victory was still in service: when she died, London to Edinburgh was eight hours by train and pre-dreadnoughts were being laid down in the shipyards of Europe.

Victoria would have agreed that her life fell into three parts—before \*Albert, with Albert, after Albert. The death in childbirth in November 1817 of Princess \*Charlotte, only daughter and heir to the prince regent, prompted a famous 'rush to the altar', since none of the seven royal brothers had legitimate offspring, nor any of their sisters, of whom five survived. The duke of Cambridge married in May 1818. His elder brothers, the dukes of Clarence and Kent, were married in a joint ceremony a month later. Clarence's two daughters died as infants, leaving the probable succession to the duke of Kent's daughter the Princess Victoria, born 18 May 1819, christened Alexandrina, and known at first as 'Drina'. Eight months later her father was dead, taken off by pneumonia in winter at Sidmouth, leaving her to be brought up in a household almost totally female and totally German. Her mother, Princess Victoria of Leiningen, had a boy and girl by her first marriage, and was of the house of Saxe-Coburg: recently arrived in England, she found the language difficult. The other person in constant attendance was Fräulein Lehzen, brought over as governess and companion from Hanover when the princess was 6 months old. They lived at Kensington palace, Victoria sleeping in her mother's room until she came to the throne. The princess adored her half-sister Feodora, but she was twelve years older than Victoria, and went off to Germany to marry when Victoria was 8. The centre of the princess's life was her 132 dolls, given imposing names and elaborate costumes. Years later Feodora reflected on 'that dismal existence of ours'.

Victoria grew up intelligent and self-possessed. Later in life she regretted that she had not had a more systematic education, but she read widely, spoke several languages,

sang well and drew competently, enjoyed music and the theatre. Her upbringing, though sheltered, endowed her with an artlessness and directness—a lack of introspection—which is rare, and never left her. Inevitably the duchess of Kent was on bad terms with George IV and even worse with his successor William IV, to whose demise she looked forward with ill-concealed relish. A clash over precedence meant that the duchess and the young princess boycotted William's coronation in 1831, the princess writing that not even her dolls could console her. 'I longed sadly for some gaiety', she wrote to her uncle Leopold at 16, 'but we have been for the last three months immured within our old palace.' Her correspondence with Leopold, king of the Belgians and avid to advise her, showed a growing interest in politics, national and international, even if she saw them, as she always did, in highly personal terms. As news of the gravity of King William's illness emerged in 1837 she wrote to Leopold: 'I look forward to the event which it seems is likely to occur soon with calm and quietness: I am not alarmed at it . . . I trust that with goodwill, honesty and courage, I shall not, at all events, fail.' Leopold redoubled his bombardment on 'the trade' of kings. She could never praise the English too much: like the French they were 'almost ridiculous in their own exaggerated praise of themselves'. At her first council, \*Greville wrote that 'she appeared to be awed, but not daunted'.

Victoria's education for life started with her first prime minister \*Melbourne, whom she liked from their first audience, and who stood for father-figure and first love. His kind and pleasant manner, mellow and relaxed, eased her into her new duties: after five days she wrote to Leopold, 'I do regular, hard, but to me delightful work.' Melbourne turned many things into fun. Lord Amelius Beauclerk, a naval aide-de-camp, asked permission to wear a sash: Melbourne thought not—'Your Majesty had perhaps better say that you can make no change . . . particularly considering Lord Amelius's figure.' Greville wrote, not unkindly, in 1839 when the queen's affection for Melbourne had dragged her into the \*Bedchamber crisis, 'Melbourne is everything to her . . . her feelings are sexual, though she does not know it.'

She told Melbourne that she might not marry at all: 'I don't know about that,' replied Melbourne, sensibly. In October 1839 Leopold played his trump card, sending Victoria's cousin Albert over from Saxe-Coburg on approval. Victoria grew agitated, the subject of marriage was very disagreeable, and she tried to postpone the visit. In the event, one look was enough. 'It was with some emotion that I beheld Albert,' she wrote, 'who is beautiful . . . so excessively handsome.' Two days later, even disconcerting the urbane Melbourne, she declared that no time should be lost, and the following day she sent for Albert to propose marriage. The second phase of her life had begun.

Victoria took to matrimony *con brio*. 'We did not sleep much,' she confided to her journal after the wedding night. 'You cannot imagine how delightful it is to be married,' she told a female cousin about to embark on the same adventure. Then, to her dismay, within six weeks there were signs of pregnancy. Victoria was quite unsentimental about

babies—'nasty objects'—but after the birth of the princess royal in November 1840, eight more arrived in rapid succession: the future Edward VII in November 1841, the last princess in April 1857. Victoria had no wish to look after the children herself, especially when they were tiny, but her life became a strange juxtaposition of public and private. April 1841 found her with Princess Victoria 6 months old and war with China: 'Albert is so much amused at my having got the Island of Hong Kong, and we think Victoria ought to be called Princess of Hong Kong in addition to Princess Royal.' The great chartist demonstration in April 1848 was only three weeks after the birth of Princess Louise and the royal family prudently departed to their new house at Osborne. Two months after Prince Arthur's birth in 1850, \*Peel died from a fall from his horse: Victoria, who had found him 'such a cold, odd man' when he had nearly replaced Melbourne in 1839, now mourned him as a father. The Crimean War was still raging in December 1855 when the 14-year-old prince of Wales submitted a disastrous six-and-a-half-line examination paper on his ancient history course. Albert's influence grew with the years, particularly after the success of the \*Great Exhibition in 1851, and in 1857 Victoria gave him the unprecedented title of prince consort. But pressure of work and his own sense of duty took its toll. 'I am sure if I had a severe illness', he once remarked, 'I should give up at once. I would not struggle against it.' In December 1861, he caught typhoid and died at the age of 42.

Victoria faced a widowhood of 40 years. To some, even in her own day, her grief seemed excessive. It was not an age that took death lightly, nor is it easy to say how much other people should mourn. There was a touch of morbidity and some gestures were repeated when the estimable John Brown, her Scottish manservant, died in 1883. There was also perhaps a touch of remorse since she had always inclined to the view that Albert made a fuss about his ailments. For several years, her disappearance from public life was total. Albert's room at Osborne was left untouched, his towel laid out and his hot water brought, busts and statues commissioned, an official biography commanded from Theodore Martin, and plans laid for the erection of the Albert memorial and its afterthought, the Albert Hall. But slowly the family took over as it grew inexorably—such 'swarms of children', wrote Victoria without enthusiasm. Her nine children produced by the time of her death 40 grandchildren (31 still alive) and a further 40 great-grandchildren. Life became a welter of match-making, weddings, christenings, teething, mumps, visits, and birthdays (remembered or missed)—and, the penalty of advancing years, of deaths. In the midst of the Franco-Prussian War old Baroness Lehzen died, the last link with Victoria's childhood. In 1879 the prince imperial, Napoleon III's only son, was killed while a volunteer with the British army in South Africa—'those horrid Zulus', lamented the queen. \*Disraeli, once detested for his unkindness to Sir Robert Peel, long a dear friend, died in 1881, 'the Queen bowed down with this misfortune'. In 1892 there was a terrible shock when 'Eddy', the prince of Wales's eldest son, succumbed to pneumonia at Sandringham. And gradually the courts and thrones of Europe filled up with Victoria's relatives and

## Victoria and Albert Museum

descendants. Willi, the princess royal's son, became emperor of Germany in 1888: Alix, a granddaughter, married Nicholas II, tsar of Russia, in 1894; cousin Alexander ('Sandro') was briefly king of Bulgaria and, in due course, granddaughters became queens of Sweden, Norway, Spain, Greece, and Romania. The tiny lady in the wheelchair was 'the matriarch of Europe'.

Her political influence as queen has been much debated and analysed, but the more extravagant claims should not be entertained. In the give and take of appointments over more than 60 years, the queen was bound to have victories and defeats. It has been suggested that she was personally responsible for choosing \*Aberdeen and \*Rosebery as prime ministers. But in 1852, when \*Derby's ministry was defeated over Disraeli's budget, Derby himself advised her to send for \*Lansdowne and Aberdeen, united in the new Liberal coalition. Lansdowne, at the age of 72, declined to become prime minister and the queen, agreeing that he was too old and infirm, authorized Aberdeen to form a government. She had little choice. Rosebery, in 1894, was already foreign secretary and the almost unanimous choice of the cabinet, who dreaded serving under \*Harcourt. The queen did not consult \*Gladstone, the outgoing prime minister, but since he would have recommended \*Spencer who would have recommended Rosebery, the result would have been the same. The two politicians she most distrusted were \*Palmerston ('Pilgerstein') and Gladstone ('half-crazy'), but this did not stop the former being prime minister for nearly ten years and dying in office at the age of 81, nor the latter being prime minister on four occasions. Her importance lies in her role, with Albert, in restoring the dignity and reputation of the monarchy. She rescued it from a situation in which George III had been mad for the last ten years of his reign; George IV's private life was scarcely very private since his estranged wife gatecrashed his coronation demanding to be let in; William IV had a bevy of no fewer than fifteen illegitimate children, the FitzClarences, to be found anywhere in the royal palaces. Though her friendship with Melbourne and her consequential Whig partisanship gave much offence at first and her seclusion after Albert's death fuelled a brief republican movement, Victoria's standing rose with the years, and she enjoyed memorable triumphs at her \*Golden and \*Diamond Jubilees in 1887 and 1897. Much of it, of course, was illusion, and her ministers and advisers were aware of the importance of public opinion in a way that had scarcely occurred to anyone in previous centuries. The queen mother and empress was a tiny, fat old lady, painfully short-sighted, gobbling her food and eating too much. But nobody took liberties. The ribald jokes about John Brown had bounced off her, and H. G. \*Wells's mother, the housekeeper at Uppark, was not the only woman to identify with the poor widow of Windsor, 'with a passionate loyalty'. Bismarck, the arbiter of Europe, faced an audience in 1888 nervously and came out saying, 'That was a woman.' Though the queen herself did not fit the stereotype of 'Victorian England' (she never quite got over the dislike she had taken to bishops as a toddler), the phrase took hold so firmly that one wonders how other countries manage without the adjective. She remained to

the end a mass of contradictions—self-centred yet considerate and dutiful; homely yet grand; excitable and passionate but with shrewd judgement. At her death Henry James the novelist, a sophisticated observer of human nature, wrote: 'we grovel before fat Edward—Edward the Caresser, as he is privately named . . . But I mourn the safe and motherly old middle-class queen, who held the nation warm under the fold of her big, hideous Scotch-plaid shawl . . . I felt her death more than I should have expected.'

JAC

Longford, E., *Victoria R.I.* (1964); Strachey, L., *Queen Victoria* (1921); Weintraub, S., *Victoria* (1983).

**Victoria and Albert Museum.** After the success of the \*Great Exhibition (1851), a museum of manufactures was quickly established in Marlborough House; however, despite maintaining strong links with the design schools established in the 1830s because of perceived lapses in design standards from the impact of mechanization upon traditional crafts, its collecting policies became increasingly antiquarian. The first director was Henry Cole, a pioneer of public relations, who oversaw the construction of new but heterogeneous buildings at South Kensington (opened 1857), a site suggested by Prince \*Albert. Administrative chaos after Cole's retirement eventually led to the severance of the sciences to their own museum, and the new, renamed building designed by Webb (imposing but impractical) was completed by 1908. Arrangements on craft lines did not cede to chronological presentations until after 1948, but, likened to 'an extremely capacious handbag', the 'V. & A.' has become a leading museum for world-wide decorative art.

ASH

**Victoria Cross.** The highest award for conspicuous gallantry, instituted in 1856 during the Crimean War. Unlike most previous honours, it was open to all ranks and unclassified. The ribbon is crimson and the inscription 'For Valour' was Queen Victoria's suggestion. But her wish that the abbreviation should be BVC (Bearer of the Victoria Cross), lest the recipient be confused with vice-chancellors, was not followed. The original crosses were made from metal of Russian guns captured at \*Sebastopol. The first award went to Lieutenant Charles Lucas for gallantry in the Baltic on 21 June 1854 in seizing a live shell which had landed on the deck of HMS *Hecla* and throwing it overboard. In June 1857 the queen made awards to 62 persons in a Hyde Park ceremony. The VC is given sparingly and in 1994 there were fewer than 40 survivors.

JAC

**Victory, HMS.** The oldest warship in commission in the navy, *Victory* serves as flagship to the commander-in-chief, Naval Home Command. She was designed as a 100-gun ship by Sir Thomas Slade in 1759. Her 150-foot keel was laid that July, but she was not launched until 1765 and only first commissioned in 1778 during the American War of Independence. Though a three-decker of over 2,000 tons with a complement of 850, *Victory* sailed as well as a two-decker, and her endurance and longevity can be attributed to the six years between laying down and launching, which critically seasoned her timbers. She was the fifth ship of the name in the navy, wearing the flags of Keppel, Kempenfelt, and Lord \*Howe before \*Nelson hoisted his on 30 July 1803. As his

flagship at \*Trafalgar, *Victory* was severely damaged, but had further spells of service before being hulked at Portsmouth in 1824. In the 1920s she was dry-docked, and by the bicentenary of Trafalgar in 2005 it is expected she will have been returned to her state on the eve of the battle in every particular. DDA

**Vienna, Congress of**, 1814–15. Napoleon's abdication in April 1814 was followed by a preliminary settlement, the first treaty of \*Paris, which restored the Bourbon monarchy, returned most of France's colonies, allowed her the boundaries of 1792, and approved the union of Belgium and Holland. But twenty years of warfare, in the course of which boundaries had been constantly changed and new states created, demanded a general European settlement. The Congress opened in September with Castlereagh representing Britain. Strong disagreement between Prussia, Russia, and Austria over the fate of Saxony threatened allied unity and allowed Talleyrand, the French representative, to play a balancing role. In March 1815 everything was thrown into the melting pot by Napoleon's escape from Elba, and not until he had been defeated in June at \*Waterloo were the arrangements safe. The terms of the settlement with France were then made more severe, giving her the 1790s boundaries, and insisting on an indemnity and an army of occupation. Belgium and Holland were united in the hope that they would be a more effective barrier to French aggression than either the Spanish or Austrian Netherlands had been; Piedmont was strengthened as a barrier in Italy, where Austria, with Milan, Lombardy, and Venetia, became the dominant power; a kingdom of Poland was established under the rule of Tsar Alexander; Prussia was compensated in the west for territorial losses in the east; the neutrality of Switzerland was guaranteed; Denmark lost Norway to Sweden, which had changed sides at the last minute; Hanover's gains included East Frisia; Britain retained the Cape of Good Hope, Ceylon, Tobago, St Lucia, Malta, Mauritius, the Ionian Islands, and Heligoland. By the \*Quadruple Alliance, which accompanied the second treaty of \*Paris in November 1815, the system of \*congresses was established to adjudicate future problems. The Congress of Vienna was a prime example of \*balance of power diplomacy. The first piece of the settlement to collapse was the union of Belgium and Holland, which disintegrated in 1830. JAC

**Vienna, treaty of**, 1731. By the second treaty of Vienna of March 1731, Britain guaranteed Maria Theresa's succession to the Habsburg dominions under the pragmatic sanction, while the Emperor Charles VI agreed to wind up the Ostend Company, a competitor to the \*East India Company. The Austro-British understanding in the War of the \*Spanish Succession was thereby restored. But when Maria Theresa was attacked in 1740, British assistance was far from wholehearted. JAC

**Vigo Bay, battle of**, 1702. In August 1702, at the outset of the War of the \*Spanish Succession, Sir George \*Rooke and the duke of \*Ormond led an abortive expedition against Cadiz. On the way back they received news that a large Spanish treasure fleet and its escort was harboured in

Vigo Bay, protected by a heavy boom. On 12 October they breached the boom and annihilated the enemy, sinking 11 men-of-war and taking 10 war vessels and 11 galleons. Though most of the treasure had been landed, the gains were enormous. JAC

**Viking** is an Old Norse term, of disputed derivation, which only came into common usage in the 19th cent. to describe peoples of Scandinavian origin who, as raiders, settlers, and traders, had major and long-lasting effects on northern Europe and the Atlantic seaboard between the late 8th and 11th cents.

Archaeological evidence suggests that trading activity between Britain and Scandinavia had existed from at least the 6th cent. In the later years of the 8th cent., however, contemporary documents record the beginnings of more aggressive contact, with Viking raids on weakly defended coastal sites in both Britain and Francia; the sacking of \*Lindisfarne in 793 was but one of a series of such attacks. After a period in which Viking fleets concentrated on Ireland, raids along the English coast intensified from c.835, affecting trading centres like Southampton, London, and Canterbury. This pattern of attacks on England changed significantly in 850 when a Danish army overwintered on Thanet in Kent; a more permanent presence was now envisaged. In 866 the 'great raiding army' invaded East Anglia, after several years fighting in the Carolingian empire, and one branch of this group subsequently captured the commercial and political centre of \*York in 867; from this base attacks were launched on \*Mercia, \*East Anglia, and \*Wessex. In 867, under Halfdan, the army established a permanent settlement on lands around York and this was followed by a similar take-over of territories in eastern Mercia in the following year. The final years of the century saw a military and political struggle for power in southern England between the Danes and \*Alfred (871–99), who ruled the only remaining Anglo-Saxon kingdom of Wessex; during this period recognition of a distinct legal and administrative system in the Scandinavian-settled areas north of the Thames–Chester line emerged with the establishment of \*Danelaw c.886. Alfred's successors in the early years of the 10th cent. gradually re-established their power over the Anglo-Scandinavian midlands and north but it was only with the expulsion of the last Viking king of York, \*Erik Bloodaxe, in 954 that England achieved a precarious political unity under a single crown. Yet, despite its subjection to southern kings, northern England remained a distinct entity for centuries, its linguistic, legal, and cultural structures long bearing the mark of its Scandinavian settlement.

The Danelaw Scandinavians in eastern England were largely of Danish origin. During the first two decades of the 10th cent., however, groups from Norway, together with second-generation settlers familiar with western Scotland, arrived in Cumbria in a colonization which is now largely detectable only in place-name evidence. There are also traces of a secondary settlement from the Norse stronghold of \*Dublin in the Cheshire Wirral at about the same date.

The middle years of the 10th cent. were largely free of Scandinavian activity in England, but a second wave of

widespread raids began early in the reign of King \*Æthelred (978–1016); these increased in intensity until 991 when the first of a series of payments of \*Danegeld was made. The ultimate aim was now political domination of England and this was eventually achieved by \*Cnut who became king of England and of Denmark in 1017. Anglo-Scandinavian relationships had a complex history after his death in 1035 but the defeat of \*Harold Hardrada at \*Stamford Bridge immediately before the battle of \*Hastings represented the last important Scandinavian attempt to conquer England. Ironically the Norman victory of 1066 ensured that the English throne then passed to a descendant of Scandinavians who had settled in northern France.

Elsewhere in Britain (outside Ireland) Scandinavian raids and colonization are less well recorded. Apart from a few coastal place-names there is little trace of any impact on Wales. By contrast archaeological and onomastic evidence in \*Orkney, \*Shetland, the Hebrides, together with the \*Isle of Man, points to heavy Norwegian settlement from the early 9th cent. Much of this western area remained as a recognizable political entity (the 'kingdom of the \*Isles') until 1266, whilst the Scandinavian settlement of Orkney and Shetland accounts for their continued allegiance to Norway which only ended in 1469.

Why Scandinavian peoples should suddenly have emerged as such an influential element over an area reaching from North America to the Black Sea is still far from clear. Early historians sought explanations in political consolidation in Scandinavia and military weaknesses in Francia and Britain; climatic and population changes were also invoked as were patterns of inheritance which partitioned land to the point where holdings were too small to sustain a subsequent generation. More recently the emphasis has moved to explanations involving technical improvements in ships and navigation and to the manner in which growing trade in northern Europe may have attracted the increasingly aggressive involvement of entrepreneurial merchants from Denmark, Norway, and Sweden who made little distinction between legitimate and piratical trade. Equally controversial in recent years among British historians has been the problem of the number of people involved in the English raids and settlement; most historians probably now recognize that, whilst the raiding armies may have been relatively small, the linguistic evidence must argue for a large-scale settlement.

Viking activity clearly opened up new international markets for cities like York and \*Lincoln. The Scandinavian presence also undoubtedly accelerated changes which were already taking place in England; thus both the decline of monasticism and the rise of Wessex at the expense of other kingdoms can be detected long before the Vikings arrived. There can however be no questioning the fact that the initial raids and subsequent land-taking were socially and politically disruptive. Monastic chroniclers may have exaggerated the extent of the devastating effect of raids—Lindisfarne, for example, continued as a monastic centre for some 75 years after its looting in 793—but the loss of church lands to settlers, with the consequent diminution of ecclesiastical resources, resulted in a major dislocation of England's

diocesan organization and also accounts for the fact that the late 10th-cent. \*Benedictine reform movement failed to penetrate the Anglo-Scandinavian north.

Crawford, B., *Scandinavian Scotland* (Leicester, 1987); Loyn, H. R., *The Vikings in Britain* (1977); Richards, J. D., *Viking-Age England* (1991); Roesdahl, E., *The Vikings in England* (1981).

**villas, Roman.** 'Villa' is a Latin word for farm, which has been appropriated by antiquaries and archaeologists to denote Romano-British rural establishments which exhibit Roman-style architecture, however debased. In general this means buildings to a rectilinear plan, often involving the use of stone and recognizably different from what is known of late Iron Age structures. Modern approaches might add differences in economic basis and social make-up as distinguishing the villa. Villas develop from the late 1st cent., often overlying Iron Age buildings and are seen as the indigenous aristocracy taking on Roman ways. By the first half of the 4th cent. there were probably 1,000 villas, ranging from simple cottages to vast palatial complexes such as \*Bignor and \*Woodchester. The larger villas were equipped with hypocausts, mosaics, painted walls and ceilings, but they remained the centres of agricultural estates. More recent work has concentrated on two aspects. One is the excavation of the hitherto-neglected agricultural dependencies and the reconstruction of the villa economy; the other is the examination of villa plans to elucidate social structures. Villas were in decline in the later 4th cent. and passed out of use in the first half of the 5th.

ASEC

**Villaviciosa, battle of, 1710.** Abandoning Madrid in November 1710, the allies retreated. The British and Dutch moved towards Aragon, the Austrians towards Navarre. Franco-Spanish forces pursued, catching the Anglo-Dutch at \*Brihuega on 9 December. The following day Marshal Vendôme, at the head of 21,000 French soldiers, attacked General Stahremberg's 13,600 Austrians at Villaviciosa. It was a bruising engagement—the Austrian left wing was cut to pieces, while the right and centre made some headway—but neither side was strong enough to exploit its limited success.

JLP

**villein** was the term used to describe a peasant in a state of \*serfdom—i.e. subject to a lord and under obligation to perform labour services. The term 'villanus' was used in \*Domesday Book without any derogatory flavour to indicate persons who lived in 'vills'—and therefore formed the largest social class. Though not free men, they were above the bordars and cottars who held less land, and well above the slaves, who had been numerous in Saxon England. But the term is not precise and status and duties varied from manor to manor, region to region, and over time. There was very little villeinage in Kent, in the old Danelaw, most of the north, and parts of the west. Villeins on crown estates were likely to have more privileges. As royal justice developed, the status of villeins sank, since they had no access to royal courts and could not serve as jurors. There were several ways in which they could escape from villeinage—by purchasing freedom from the lord (\*commutation); by escaping to a town for one year and one day; by taking holy orders

(with the lord's permission). By the end of the 14th cent. villenage was clearly disintegrating, villeins changing their status to that of copyholders. JAC

**Vimeiro, battle of**, 1808. The first major battle of the Peninsular War. British troops under Arthur Wellesley (\*Wellington) landed in Portugal at Mondego Bay on 1 August 1808 to assist the Portuguese by marching on Lisbon 30 miles to the south. The French, under Junot, numbered 14,000 and attacked on 21 August but were repulsed by Wellesley with 17,000 men. The French retreat might have become a rout but for the intervention of Wellesley's more cautious superior officer, Sir Harry Burrard, who landed during the course of the battle. The victory was later marred by the controversial terms of the convention of \*Cintra. RAS

**Vinegar Hill, battle of**, 1798. Part of the Wexford rebels in the Irish rising made camp on Vinegar Hill, just outside Enniscorthy, where they terrorized the protestants of the neighbourhood. On 21 June 1798, having recovered from their initial surprise, government forces under General Lake stormed the hill. Pikes and numbers were no match for artillery, and the rebels dispersed and were forced back to Wexford with heavy losses. JAC

**Virgin Islands**. A group east of Puerto Rico, shared between Britain and the USA. The British islands form a crown colony. They were visited and named by Columbus but colonized by the English from the later 17th cent. Tourism is their chief source of income. JAC

**viscounts** are the fourth highest grade in the peerage, taking precedence over barons. This was the last of the five grades to be created: in 1440 Henry VI made John, Lord Beaumont, a viscount. The title was never particularly popular. In 1838, when Melbourne was educating the young Queen Victoria, she remarked that there had been very few viscounts at her coronation: 'there are very few viscounts,' he replied, 'they are a foreign title and not really English.' JAC

**Vitoria, battle of**, 1813. Decisive battle of the Peninsular War between Wellington with 75,000 men and Joseph Bonaparte with 58,000 men. Wellington launched an attack 8 miles from Vitoria with a main assault from the west and thrusts from the hills to the north and south. Despite a determined stand the French centre crumbled and both flanks were turned. Joseph lost 7,000 men, 143 guns, and much booty. The battle ended Napoleon's rule in Spain and the French retreated across the Pyrenees. Tsar Alexander ordered a Te Deum to be sung to celebrate the victory, the first time this had been done for a foreign army. RAS

**Volunteer movement** (Ireland). After France and Spain had entered the American War of Independence, many Irish volunteered to defend their country against invasion. By 1780, 40,000 were under arms. This also gave them political leverage which they used to wring concessions from the British government—first commercial advantages

offered by \*North in 1780, then the repeal of \*Poynings's Law and the grant of legislative independence from the \*Rockinghams in 1782. But when the Volunteers moved on to discuss parliamentary reform, they split on the rock of the catholic question. The coming of peace in 1783 also deprived them of their tactical advantage and after the Dublin convention of November 1783, the movement faded rapidly. JAC

**volunteers**. Since from time immemorial it had been regarded as the duty of citizens and free men to defend their country, governments could scarcely object if, in moments of crisis, volunteers came forward to offer their services. Yet they were not necessarily very efficient, often tiresome in their personal demands, and, as the case of the Irish volunteers suggests, a potential political threat. Henry \*Fox in 1745 doubted whether one should trust a man to raise a regiment who could not raise half a crown and Hanbury Williams wrote of the duke of Bolton that 'he much dislikes both guns and pikes, but relishes the clothing'. Volunteer corps were raised by private donations, reinforced by public appeals, but, as weapons of war grew more sophisticated and expensive, governments had to find substantial assistance. A number of corps were raised in 1690 to deal with a threat of French invasion, again in 1715 and 1745 to cope with the Jacobite risings, and again in 1779 during the American War of Independence. But the biggest response was during the Revolutionary and Napoleonic wars, and again in 1859 when there was yet another threat of war with France. By 1901 there were 230,000 volunteers, augmented by the Royal Navy and Royal Artillery Volunteers, the \*militia and the \*yeomanry. \*Haldane's reforms of 1907 reorganized them into the Territorial Force, later the \*Territorial Army. JAC

**Vortigern**. A leader of the Britons in the immediate post-Roman period. \*Bede gives AD 449 as the year of the *adventus Saxonum* (the coming of the Saxons) and the story of Vortigern falls into the years following this date. Vortigern appears to have been a sub-Roman ruler in southern England, who, in order to protect his realm, is said to have invited two Saxon warriors, \*Hengist and Horsa, and their troops into Britain to act as a mercenary force. They revolted against Vortigern and set up their own rule in Kent in the 450s. ES

**Votadini**. Indigenous British tribe of the Iron Age and Roman periods whose territory covered the eastern part of Lowland Scotland. The ancient geographer Ptolemy, writing in the mid-2nd cent. AD and using sources probably dating to the time of \*Agricola's expeditions 70 years earlier, names four tribes inhabiting the area south of the Forth–Clyde isthmus: the Novantae, the \*Damnonii, the \*Selgovae, and the Votadini. Many hill-forts are known within the territory of the Votadini, notably the important tribal centre of Traprain Law; the site has yielded a number of significant Roman finds including a hoard of late Roman silver. ES

**Wade, George** (1673–1748). One of the best-known soldiers of early Hanoverian Britain, Wade was the grandson of a Cromwellian officer who had settled in Westmeath (Ireland). He joined the army in 1690 at the beginning of more than twenty years of almost incessant warfare and by the end of the War of the \*Spanish Succession in 1714 had risen to major-general. In 1715 he was returned to Parliament for Hindon and in 1722 transferred to Bath, where he built up a powerful political base and where his fine house in the abbey courtyard still stands. From 1724 to 1740 he commanded in Scotland, where his programme of military road-building was designed to facilitate troop movements. Promoted to field marshal in 1743 he fought an unremarkable campaign in Flanders the following year. He was given charge of the army at Newcastle upon Tyne during the Jacobite invasion of 1745 though his conduct appears to have been sluggish.

JAC

**wages** are the returns earned by workers for their labour. Real wages reflect the actual purchasing power of these returns adjusted by price levels, while money wages involve no adjustment for inflation. The importance of wages has grown since the \*enclosure movement resulted in hired labour replacing self-employment on the land and as industrialization produced the \*factory system.

Real wages in 12th-cent. England were closely correlated to pressures of population change. Population growth in the 12th and 13th cents. reduced per capita output and famines resulted in years of bad harvests. The considerable impact of the \*Black Death (1348–9) on the labour force acted as a counter-balance and following it real wages rose considerably. By the 15th cent. the wages of skilled workers attained a level not reached again until the latter half of the 19th cent. Increased population pressure in the 16th cent. brought real wages down and after 1600 the index of real wages was about half its level a century earlier. The period following the Civil War saw a gradual improvement which continued through the mid-18th cent. as the \*agrarian revolution offset the effects of a rising population. Higher farm production also contained the fall in wages which accompanied the Napoleonic wars. Real wages rose slowly through the 19th cent. as industrialization expanded and, with the marked exception of the Great Depression and the world wars, rose throughout the 20th cent.

The pattern of money wages is different, with both a remarkable consistency characterizing long periods from the 13th until the mid-20th cent. and the absence of any major falls. Real wage adjustments have generally come about through price inflation effects. Only major shocks have brought about significant upward shifts in monetary wages—the Black Death, the Tudor debasement of the currency (1532–80), and the Napoleonic wars. The recent past has seen money wages rising since the investment boom of the post-Second World War period. Initially this may have been explained by the reluctance of employers to limit wage rises when productivity was rising rapidly but subsequently expectations on the part of labour made it difficult to contain further rises.

Various theories have been developed to explain levels of real wage. The classical economists Adam \*Smith and David \*Ricardo in the late 18th cent., although arguing that wages are an essential material necessity of production, tended to treat them as part of a distribution process—an approach continued by Karl \*Marx. Alternatively, T. R. \*Malthus placed considerable emphasis on the effects of population on wages—if real wages rose above subsistence population growth would push them down again. The neo-classical framework associated with Alfred \*Marshall focused on the role of real wages in balancing the supply of labour and the demand for its services as reflected by its marginal product. Neo-Keynesian economists have paid more attention to imperfections in the labour market, which make structural changes difficult as aggregate levels of demand change.

KJB

**Waitangi, treaty of**, 1840. In 1839 the British government dispatched Captain William Hobson to New Zealand where piecemeal and uncontrolled development had already undermined traditional Maori culture. At Waitangi in February 1840 a majority of the Maori chiefs present agreed to cede sovereignty to Queen Victoria in exchange for confirmation of their land and protection. Hobson declared himself lieutenant-governor and proclaimed British sovereignty in May 1840. But Maori disappointment at the persistent encroachments upon their land led to the \*Maori wars from 1844 until 1872. In 1994 a New Zealand government apologized for breaches of the treaty and promised compensation. JAC

**Wake, William** (1657–1737). Archbishop of Canterbury. A graduate of Christ Church, Oxford, after ordination (1682)

Wake was chaplain to the English ambassador in Paris. His contact with Gallican divines at the Sorbonne gave him a continuing interest in the French church. Afterwards he was successively canon of Christ Church, Oxford (1689–1702), dean of Exeter (1703–5), bishop of Lincoln (1705), and archbishop (1716). However, Wake broke with the Whigs by opposing \*Hoadly's appointment to Bangor (1715), the suspension of \*convocation (1717), and the repeal of the \*Occasional Conformity and \*Schism Acts (1718). From 1723 his influence was eclipsed by \*Gibson of London. Always personally tolerant, his primary objective was to preserve the traditional latitude of the Anglican church without allowing degeneration into licence. Ecumenical before his time and risking governmental antipathy, he negotiated with the French church for possible union (1717–20) and encouraged intercommunion with continental Lutheran and reformed churches.

WMM

**Wakefield, battle of**, 1460. The Yorkist victory at \*Northampton in the summer of 1460 had put Henry VI in the power of Richard, duke of \*York. In October a reconciliation was effected, whereby Henry continued as monarch but recognized York as his heir. Queen \*Margaret refused to accept this and raised troops in the north. York and \*Warwick's father \*Salisbury marched to meet her but were routed on 30 December at Wakefield, just outside York's castle of Sandal. Salisbury and York were executed after the battle, the latter's head being exhibited on the walls of the city of York, wearing a paper crown.

JAC

**Wakefield, diocese of**. The see, comprising parts of south Yorkshire, was created in 1888 to cope with the rapidly rising population. It did not, however, include Sheffield, which remained fiercely independent. Like the other new sees of \*Southwell, \*St Albans, and redrawn \*Rochester, created at the same time, it was not a natural unit, but this was no obstacle to the first bishop, William Walsham How (1888–97), who powerfully welded the diocese together, after a remarkable spell as suffragan bishop in east London (1879–88). The cathedral is the former All Saints' parish church, dating mostly from 14th cent. with a 15th-cent. west tower and a 20th-cent. east end by Gilbert \*Scott.

WMM

**Wakefield, Edward Gibbon** (1796–1862). Wakefield, whose father and uncle were authors, was a wild youth who demanded to be removed from Westminster School, disliked Edinburgh High School, and made a runaway marriage with a ward of Chancery. Released from that scrape by the death of his wife, he attempted a second runaway match with a schoolgirl and was sent to gaol for three years. On his release he took up the cause of colonization, urging emigration to Australia and pointing out that the policy of granting free lands produced an acute shortage of labour. In 1838 Wakefield accompanied Lord \*Durham on his mission to Canada and had considerable influence on the final report. He then transferred his interest to \*New Zealand, organizing a company to send out settlers and contributing to the formal annexation of that country in 1840. In 1852 he left for New Zealand but suffered a final breakdown a year after his arrival. Wakefield's achievement was to encourage

a more systematic and coherent attitude towards colonial development.

JAC

**Walcheren landing**, 1809. Britain did not find it easy to wage war against Napoleonic Europe. Despite the catastrophic failure of the landing in Holland in 1799, the British government resolved in 1809 to try again, using troops recently withdrawn from Portugal. The object was to capture Walcheren, the island on which Flushing stands, menace Antwerp, and encourage the Dutch to rise against the French. Lord Chatham commanded 40,000 men, with Sir Richard Strachan in charge of a very large fleet. There was no element of surprise, French resistance was fierce, the commanders quarrelled, and the army was decimated by dysentery and fever. Some 106 men died in action, 4,000 from disease. The enterprise was abandoned.

JAC

**Wales, march** (or marches) **of**. Comparable to 'mark' (German) and 'marche' (French), signifying, from the 11th cent., the frontier or borderland between the English shires and unsubdued Welsh kingdoms. It was an extensive and fluctuating region covered by a large number of lordships, from the north-east coast of Wales (e.g. Denbigh lordship) to the far south-west of Wales (e.g. Pembroke lordship). It arose from the Anglo-Norman conquests from the 11th cent. onwards, and parts were a theatre of war until the late 13th. By 1300 the march enjoyed stability, politically and militarily, governmentally and socially. Its distinctive society embraced native and immigrant, Welsh, English, and French languages, and peculiar customs and laws. 'Marcher lords' enjoyed great authority to govern and exploit; the king's writ did not run and the common law did not normally operate there. Although marcher lordships had common characteristics, they formed a diverse and fragmented polity. There was no effective, supervisory authority, and the march acquired a reputation for independence and lawlessness. These matters were seriously addressed from Edward IV's reign by a \*Council of the March', developing from the councils of English princes of Wales. The march played a significant role in English politics, for many marcher lords were English nobles and their lordships provided men, money, power, and a refuge in uncertain times. By the Act of \*Union (1536), the marcher lordships were absorbed in new or existing English or Welsh shires; but marcher lords survived and so did some of their rights over land and tenant.

RAG

**Wales, principality of**. The term refers to the territorial dominion of the last Welsh princes of Wales; the estate granted to English princes of Wales after 1301; and the entire land of Wales following the Act of \*Union (1536). The first Welsh ruler to call himself prince of Wales (1244) was \*Dafydd ap Llywelyn; he was recognized by the pope and his principality was based on \*Gwynedd, of which his father \*Llywelyn ab Iorwerth had been prince. Dafydd's nephew \*Llywelyn ap Gruffydd (d. 1282), prince of Wales, had a more extensive principality in north, north-east, and central Wales of which he was either direct ruler or overlord; his title and principality were acknowledged by Henry III to be hereditary (1267). Llywelyn's brother \*Dafydd (d. 1283)

claimed to be prince of Wales, but his principality was swiftly conquered by Edward I, who annexed and united it to the English crown (1284). This modified principality, which included all royal lands in north Wales (much of Llywelyn's principality) and west Wales (formerly either royal enclaves or lordships held by Llywelyn's vassals), was bestowed in 1301 on Edward I's eldest surviving son, Edward, as the first English prince of Wales. From time to time thereafter, this principality was the territorial endowment of the heir to the throne. It covered half of Wales and should 'never be separated from the crown, but should remain entirely to the kings of England for ever' (1301). The title of prince lapsed for periods (e.g. between the accession of Edward II in 1307 and the creation of the Black Prince as prince of Wales in 1343), few heirs who were created prince of Wales in the Middle Ages reached manhood, and some heirs apparent were not created princes of Wales. However, the principality of Wales had a continuous existence as part of the inseparable crown estate, to be periodically vested in the king's eldest son, to be governed and exploited by him.

Edward I outlined an elaborate scheme of government for the principality of Wales in the statute of \*Wales (1284). It was based on existing arrangements and hence had two sectors, of three counties in north Wales (Anglesey, Caernarfonshire, and Merioneth) based on Caernarfon, and of two counties in west Wales (Carmarthenshire and Cardiganshire) based on Carmarthen. Each sector had a justiciar with political and judicial competence, and a chamberlain with financial competence; each county had shire officials and great sessions; more local administrative arrangements were based on the commote with Welsh and English elements. The two sectors were frequently referred to, inaccurately, as the principality of north Wales and the principality of west (or south) Wales. Ultimately responsible to the king's court, council, and officials at Westminster, or (when there was one) to the prince's council, in practice the principality of Wales was a separate and independent jurisdiction. It was a development of Llywelyn's principality, rather than a clear break with it, and it was larger than Llywelyn's in some respects, in others smaller than his: Flintshire, though a royal shire, was attached for administrative convenience to Cheshire and lay outside the principality of Wales; the English princes were overlords of several marcher lordships in the north-east which had been part of Llywelyn's principality.

The council of Edward IV's eldest son began to undertake responsibility for order not only in the principality but also (by 1476) in the marcher lordships and border English shires and so had a Wales-wide authority (as the \*Council in the March) that was the germ of the arrangements made by the Act of Union (1536). These arrangements consolidated Wales administratively and constitutionally by extending the machinery of government of the principality of Wales to Wales as a whole, including Flintshire and the March. Thus, the 'country and dominion of Wales' became conterminous with the principality of Wales, and was so regarded from the 16th cent. onwards. This principality retained peculiar features of law and justice, with separate courts albeit dis-

pensing English common law, until, first, the Council of Wales and the March was abolished as a prerogative court in 1689 and, second, the great sessions were abolished in 1830 and the judicial system assimilated to that of England. The revenues from rights of jurisdiction and lands continued to accrue to the crown and could be granted to individual princes of Wales by special Act of Parliament—though not all princes were granted them. In 1760 they were surrendered by George III along with the crown's hereditary revenues in return for a 'civil list'; thereafter, no principality lands or financial rights could be bestowed on a prince (in contrast to the duchy of \*Cornwall).

Yet the concept of the principality of Wales within the United Kingdom survived, largely because of the distinctive culture, language, and sense of identity of the Welsh. Although in modern times prior to the 20th cent. princes of Wales visited their principality rarely, both prince and principality were a focus of Welsh sentiment. The investiture of Prince Edward (later Edward VIII; 1911) took place in an atmosphere of national euphoria, during a picturesque ceremony held at Caernarfon castle in deference to spurious tradition; that of Prince \*Charles (1969), though more controversial, was enthusiastically welcomed by most Welsh people.

**Wales, statute of.** See RUDDLAN.

**Walker, George** (1618–90). Walker, an elderly Church of Ireland clergyman, was the heart and soul of Londonderry's resistance to James II after the Glorious Revolution. He held a living at Donaghmore, near Dungannon, and began raising troops early in 1689. In April he went to Londonderry and acted as joint governor throughout the siege. After its relief he was sent to London with an address to William III, which he presented at Hampton Court, received the thanks of the House of Commons, was honoured by both universities, and was in line for promotion to the bishopric of Derry. He joined William at the start of his Irish campaign and was shot dead at the battle of the \*Boyne. Walker's *True Account of the Siege of Londonderry* appeared in 1689 and is an important source.

JAC

**Wallace, William** (d. 1305). Scottish patriot and commander at the battles of \*Stirling Bridge (1297) and \*Falkirk (1298). Wallace came of a middling family, retainers of the Stewarts in the neighbourhood of Paisley. Nothing reliable is known of his date of birth or early life; nor is it easy to explain his emergence as a Scottish leader in 1297.

In that year there were many prominent Scots anxious to resist Edward's 'take-over' of the previous year, including Wallace's lord, James, the hereditary steward of Scotland. But there was no co-ordinated or open rising, only miscellaneous outbreaks in the early part of the year. In May Wallace killed the English sheriff of Lanark in an affray. He was joined by Sir William Douglas in an attack on the English justiciar at Scone. Others, including Robert Bruce, earl of

Carrick, the future Robert I, were also prepared to join in. This rising might easily have achieved nothing, since determined English action quickly persuaded many of the prominent leaders of the Scots to make terms; but in May another movement had started in Moray, with an attack on Inverness led by the young Andrew \*Murray, son of a leading baron. These twin risings, by Wallace and Murray, attracted increasing support, including that of the earls of Fife and \*Buchan, and Bruce openly took the Scottish side. By August, Murray and Wallace had joined forces and threatened Stirling. Their astute tactics at the battle of Stirling Bridge, and the ineptitude of the English commander Earl \*Warrene, resulted in a dramatic victory, which put Edward I's position in Scotland in peril. Murray, however, was wounded and died a few months later.

The Scottish kingdom existed once more, and was to maintain its existence, nominally in the name of the absent King John, till 1304. By early 1298 Wallace had been knighted, and emerged as sole guardian. By June, however, Edward was leading an army of some 12,000 men to repress what he regarded as a revolt. At Falkirk, in more open ground than at Stirling, the English knights and archers were devastating. The Scots were routed and Wallace escaped into hiding, resigning his guardianship immediately.

His next task was abroad. In 1299 he led a mission to the French court to get more active support from Philip IV, and seems to have stayed in Paris for most of the next year. By 1303 Wallace was back in Scotland, again fighting in the south. By 1304, Edward had triumphed. Almost all the Scottish leaders submitted on negotiated terms. On 24 July Stirling, the last castle to be held against Edward, surrendered, and only Wallace and John de Soules remained in resistance.

Wallace was now a fugitive. In August 1305 he was captured, and there followed a show trial on 23 August, and immediate execution for 'treason', of which, as he had never sworn allegiance to Edward, he could not justly be accused. From that day, Wallace has been regarded as one of the greatest heroes in Scotland's national history. BW

**Waller, Edmund** (1606–87). Poet. Waller mixed poetry and politics. Born in Buckinghamshire of a very wealthy family, he went to Eton and King's College, Cambridge. He was returned to Parliament for Ilchester in 1624 when he was no more than 17 and was in the \*Short and \*Long Parliaments in 1640. Related to both \*Hampden and \*Cromwell, he was outspoken in 1642 for negotiations with the king and acquired the reputation of a bold royalist. But when 'Waller's plot' to seize London for the king was unmasked in 1643, he made an abject apology and confession to Parliament, which saved his life while leaving his brother-in-law to be hanged. Waller paid a crippling fine, spent seven years in France, and then made his peace with Cromwell, on whom he wrote a famous panegyric. Nevertheless, he rescued his political career at the Restoration, served in Parliament 1661–79 and again in 1685, held office as a commissioner of trade and plantations, spoke frequently, and reminisced cheerfully. He seems to have had a genuine belief in religious toleration. Much of Waller's poetry was pleasant social verse, but occasionally he hit a deeper note with 'Go, lovely rose'

and 'Of the Last Verse in the Book'. \*Johnson, in his *Lives of the Poets*, devoted much space to Waller, praising his elegance and gaiety: 'he is never pathetick and very rarely sublime.' JAC

**Waller, Sir William** (1598–1668). MP and parliamentary general during the Civil War. Educated at Magdalen Hall, Oxford, and Gray's Inn, Waller saw military service on the continent during the Thirty Years War. He was elected to the \*Long Parliament, commissioned colonel under \*Essex, and later major-general for the region around Gloucester. Emboldened by early military successes, he became a critic of Essex's leadership, but his own reputation suffered with his defeats at \*Roundway Down (July 1643) and \*Cropredy Bridge (June 1644). His nickname 'William the Conqueror' was turned against him. Forced to resign his commission by the \*self-denying ordinance in 1645, Waller turned into a supporter of the Essex–Holles faction in parliament, and an opponent of the religious toleration advocated by the \*New Model Army. He was one of eleven MPs whose impeachment the army advocated. Arrested in 1648, he suffered three years' imprisonment. With the restoration of the Long Parliament in 1660 he resumed his seat, and was elected to the \*Convention Parliament the same year. IJG

**Wallingford, treaty of.** See WINCHESTER, TREATY OF.

**Wallis, John** (1616–1703). Mathematician, grammarian, and founder member of the \*Royal Society. A Cambridge graduate, from 1649 he was Savilian professor of geometry at Oxford. During the Civil War he worked on codes for the parliamentary side. In a famous controversy, he showed that Thomas \*Hobbes had failed to square the circle; he was also involved in other disputes with contemporaries. He was an important participant in scientific groups meeting during the Interregnum, which were the nucleus for the Royal Society, founded in 1660. In 1652 Wallis published his study of English grammar. He was an important and influential mathematician, producing books on arithmetic (especially series), geometry, algebra, and mechanics. He invented our symbol for infinity, translated Greek works, including some of Archimedes, and wrote an interesting memoir of his own life. DK

**Walpole, Horace, 4th earl of Orford** (1717–97). The youngest son of Sir Robert \*Walpole, Horace Walpole became the most gifted letter-writer in English history. When he entered Parliament in 1741 his father's long administration was tottering to its fall. Though he remained in the Commons until 1768 he made no mark and his preferred role was that of observer. The places and pensions provided by his father afforded him a comfortable bachelor existence and he lavished great attention on the Gothic villa at Strawberry Hill (Twickenham) which he purchased in 1748 and where he installed his private printing press. Much of his time was devoted to correspondence with his many friends and acquaintances. But he also wrote substantial works. *The Castle of Otranto* (1764) was an early example of the Gothick horror novel and *Historic Doubts on Richard III* (1768) fathered a minor academic industry. His *Memoirs of the reigns of George II and George III* were greatly used by 19th-cent.

historians, but Walpole had much spite, lurid suspicions, and a taste for melodrama, which he worked into his narrative. Above all, he was chiefly responsible for the story that George III aimed at autocracy, a legend which poisoned the wells of scholarship for decades. Walpole succeeded to the peerage at the age of 74, but never took his seat in the Lords. JAC

**Walpole, Sir Robert, 1st earl of Orford** (1676–1745). Traditionally known as Britain's first prime minister. From a Norfolk gentry family, Walpole was the Whig MP for Castle Rising (1701–2) and King's Lynn (1702–12, 1713–42). His first posts were as secretary at war (1708) and treasurer of the navy (1710). His part in the administration of the War of the \*Spanish Succession and his management of the trial of Dr \*Sacheverell earned him the hatred of the Tory Party and he was dismissed in 1710, impeached for corruption, sent to the Tower (1711), and expelled from Parliament (1712). At the Hanoverian succession he rejoined the government, along with his brother-in-law Viscount \*Townshend, as paymaster-general, being promoted to 1st lord of the Treasury and chancellor of the Exchequer in 1715. In 1717 he, Townshend, and several followers left the \*Sunderland/\*Stanhope ministry. During the ensuing Whig schism Walpole opposed the repeal of the \*Occasional Conformity and \*Schism Acts (1718), and successfully defeated the \*Peerage Bill in the Commons (1719). In April 1720, with most of the schismatic Whigs, he rejoined the government in the office of paymaster-general.

Walpole was not the first 'prime minister'; several of his immediate predecessors (such as Sunderland, \*Harley, and even \*Godolphin) were so regarded, and the term was in common use (though often pejoratively). The starting date of Walpole's premiership is a matter of some controversy. One historian has recently suggested that it should be dated from 1720 (since he was in control of the Treasury as paymaster-general, John Aislabie, the chancellor of the Exchequer, being a figurehead), rather than from the traditional date of his promotion to the chancellorship in 1721. Despite his brilliant financial acumen, which saved the administration and the dynasty in 1720–1 from the disaster of the \*South Sea bubble, and his control of the nation's finances and the secret service money (the major source of patronage), neither of these dates marks his true dominance of the ministry. Both Stanhope (who died prematurely in 1721), and more particularly Sunderland (who also died unexpectedly in April 1722), retained the confidence of George I until their deaths. Until 1724, when he was manoeuvred into the lord-lieutenancy of Ireland, \*Carteret (a protégé of Sunderland's favoured by the king) was a potential rival. Further, from the very beginning of the reconciliation of the Whigs in 1720, Townshend was a major force to be reckoned with, particularly through his control of foreign policy after 1721 (an area dear to the king) and the House of Lords after 1722. Townshend remained in office until his resignation in 1730, and for most of the 1720s the ministry should be seen as a duumvirate. Only in the late 1720s did Walpole become the unquestioned prime minister, partly through forcing the most talented of his Whig opponents, led by

\*Pulteney, into opposition. These self-proclaimed \*'patriots' worked fitfully with the Tories in the 1730s, but were no real threat to Walpole, until he began to lose his grip in the early 1740s.

Walpole's major contribution to politics was his development of the cabinet system, of the 'party of the crown' (which he based on the work of Harley) through extensive use of patronage, and of the Commons as the centre of parliamentary power. His refusal of a peerage in 1723 (it went to his son), which astounded contemporaries, signalled the beginning of the latter development.

Following the South Sea crisis, Walpole's establishment of the Whig hegemony was largely accomplished as a result of his handling of the \*Atterbury plot in 1722–3, which he used to drive home the fear of \*Jacobitism, a label he had great success in attaching to his Tory opponents, and which, in the final analysis, prevented effective and sustained co-operation between them and the Whig 'patriots'. The smear of Jacobitism proved very effective for the rest of his ministry. His ruthless control of political patronage was the foundation on which he built his control of the administration. This is best illustrated by his removal in 1734 of several peers from colonels' commissions of regiments for voting against the government, though such positions were, in effect, regarded as private property, and the dismissals caused consternation amongst the political élite.

His sure grip on politics occasionally wavered. One such occasion was the \*Excise scheme in 1733, which aroused so much opposition that Walpole was forced into dropping the proposal before the second reading. Another was his loss of favour in Scotland by his too repressive measures over the \*Porteous riots in 1736. Yet another was his opposition to war with Spain in 1739, to which he was forced to agree by both the patriot opposition and members of his own government. The poor handling of the war eventually led to his downfall in February 1742 as he lost control of the House of Commons, one of two essential props to his power. The other was the support of the monarch (first George I, and then George II, though the latter's was uncertain before his accession in 1727), which he retained to the end, along with that of Queen \*Caroline who, until her death in 1737, provided invaluable support.

Walpole was created earl of Orford upon his resignation, and helped from the Upper House to baffle efforts to impeach him for corruption. He took part in debates in the Lords, and continued to give advice to George II when asked. He devoted much of his time to Houghton in Norfolk, the palatial house he had built and stocked with art treasures. He died in debt CJ

Dickinson, H. T., *Walpole and the Whig Supremacy* (1973); Holmes, G., 'Sir Robert Walpole', in Holmes, G. (ed.), *Politics, Religion and Society in England, 1679–1742* (1986); Plumb, J. H., *Sir Robert Walpole* (2 vols., 1956–60).

**Walsingham.** Marian shrine, Norfolk. The earliest shrine, dedicated to the Holy House of Nazareth, was built by the lady of the manor, Richeldis de Faverches, traditionally to commemorate her vision of the Blessed Virgin (1061). Both shrine and adjacent Augustinian priory gained fame and

wealth from pilgrims and their bequests, until destruction 1538–9. Interest in Walsingham began to revive in 1897. The present Anglican shrine, which includes an Orthodox chapel, contains a newly carved statue of Our Lady of Walsingham, while Roman catholic devotion utilizes the reconsecrated Slipper Chapel, which marked the last stage of Walsingham Way. ASH

**Walsingham, Sir Francis** (c.1532–90). Walsingham matriculated at King's College, Cambridge, in 1548 and was taught by the prominent humanist (and \*Cecil's father-in-law) Sir John \*Cheke. He travelled abroad 1550–2, began common law training at Gray's Inn in 1552, and studied civil law at Padua from 1555. He became privy counsellor and principal secretary in 1571 and held the post until his death. Walsingham was a strong protestant, watchful against catholic plots and anxious for a European coalition of protestant powers. He helped to draft the 'bond of Association' in 1584 to protect Elizabeth from conspiracies, though Cecil had developed the idea in 1569. Walsingham had a reputation as an intelligence expert and in 1568 warned of a European plot to free Mary Stuart. One of his lines should stand as his epitaph: 'there is less danger in fearing too much than too little.' SA

**Walter, Hubert** (c.1140–1205). Viewed by many as one of the greatest royal ministers of all time. Introduced into Henry II's service by his uncle Ranulf \*Glanvill, his career blossomed under Richard I. Created bishop of Salisbury in 1189, he accompanied Richard as his chief of staff on crusade. His performance in such challenging conditions led to his being promoted in 1193 to take charge of both secular and ecclesiastical government as \*justiciar and archbishop of Canterbury. In 1195 he was made papal legate. While Richard stayed in his French dominions, Hubert administered England, supplying the king with the men and money he needed to fight Philip of France. On John's accession he was appointed chancellor; the chancery rolls, for centuries the principal records of English central government, date from his period in office. He still found time to summon and preside over reforming church councils. JE

**Walter of Coutances** (d. 1207). A trusted servant of the Plantagenet kings who governed England for two years while Richard I was on crusade. His diplomatic and administrative skills brought him the bishopric of Lincoln in 1183 and Rouen in 1184. He set out on crusade with Richard but news of tension in England between John and \*Longchamp persuaded the king to send him back from Sicily in spring 1191 with discretion to use confidential letters appointing him \*justiciar if and when he judged it necessary. When John tried to use the controversial arrest of \*Geoffrey archbishop of York to topple Longchamp in October, Walter produced Richard's letters—much to John's chagrin. Walter remained in charge until December 1193, setting up the machinery for the collection of England's share of King Richard's ransom. The fall of Normandy meant that in 1204, as archbishop of Rouen, he had to invest Philip Augustus as duke of Normandy—just as earlier he had invested Richard I and John. JE

**Waltham Black Act**, 1722. The statute of 9 Geo. I c. 22 has long been held up as a specimen of draconian 18th-cent. legislation. It originated in response to an outbreak of organized poaching in Windsor Forest and near Waltham (Hants), and declared that to go abroad in woodland areas, commons, or on the high road in disguise or with blackened face was a felony without benefit of clergy and punishable by death. The gangs were so ruthless and intimidating that more and more offences were specified until the Act became a compendium of rural disorder—cutting down trees, maiming cattle, setting fire to ricks, breaking down fishponds, writing threatening letters, and shooting at people. In the end fifty or more offences were included in the Act. Passed for three years, it was continued until 1758 and then made permanent. It was abolished, largely at the instigation of \*Mackintosh and \*Peel, in 1823. JAC

**Waltheof** (d. 1076). Waltheof was the son of \*Siward, earl of Northumberland and victor over \*Macbeth, who died in 1055. Waltheof did not then inherit the earldom, presumably because he was too young, and it passed to \*Tostig, brother of Harold Godwinson. But on Tostig's exile in 1065, Waltheof became earl of Huntingdon. In 1069 he joined the Danish attack on York, but submitted to William the Conqueror in 1070, and was made earl of Northumberland two years later. He was also given a niece of the king in marriage. But in 1075 he was on the fringes of another conspiracy against William, who had him executed at Winchester the following year. The cause of his downfall has been discussed, but presumably William was exasperated at a man who had rebelled once, been given a royal bride, and was disloyal again. A man of great strength and piety, Waltheof was revered by some after his death and reputed to have been a hero to the English, though his ancestry was Danish. On this showing he was technically the last Englishman to be an earl in the Norman period. JAC

**Walton, Izaak** (1593–1683). Biographer. Of Staffordshire yeoman stock and member of the Ironmongers' Company, this kindly Fleet Street tradesman lived through political and religious turmoil at ease with the higher clergy, and sufficiently royalist to be entrusted briefly with Charles II's 'lesser George' jewel (1651). Immortalized through the quiet charm of his *Compleat Angler* (1653), where he is pastoralist rather than preceptor, he was better known to contemporaries for his lives of \*Donne, Wootton, \*Hooker, \*Herbert, and Sanderson, and as provider of tributes for friends' works. The serenity and gentle humour of his 'mild pen' prompted sentimental rather than critical appreciation in the 18th cent., after \*Johnson's admiration of the lives had led to a literary revival, but later commentators have emphasized the subjectivity and irregularities, though admitting his good intentions. Ending his days with family at Winchester, he was buried in the cathedral there. ASH

**Walton, Sir William** (1902–83). English composer and conductor of his own music. Walton was a chorister and undergraduate at Oxford, although he remained a largely self-taught composer. He was adopted by the Sitwell family, causing a stir with his 'entertainment' *Façade* (1921–2), in

## Wandewash

which Edith Sitwell's poems were recited through a megaphone to music whose elements of parody and jazz parallel the Parisian scene in the 1920s. The Viola Concerto, first performed by Hindemith in 1929, helped establish a less controversial reputation; the lyricism apparent here increased in later works. The dramatic paganism of *Belshazzar's Feast* (1931), although initially startling to audiences with its raw energy and powerful orchestration, lies firmly within the English choral tradition. The long gestation of the 1st Symphony (1932–5) reflects the difficulties Walton often experienced, resulting in a comparatively small output. His film music is also justly renowned, especially the score for Olivier's *Henry V* (1943–4). ECr

**Wandewash, battle of**, 1760. On 22 January 1760 Sir Eyre Coote defeated the forces of the Count de Lally at Wandewash, in south India, to signal the dominance of the English East India Company over its French equivalent. After Wandewash, Coote went on to capture the French capital of Pondicherry. The victories brought to an end hostilities which had begun in 1746. The French, especially under Governor Dupleix, enjoyed early success in the south. But Coote brought men and money from the rich province of Bengal, where the English already had power, which proved decisive. DAW

**Wantage code**. King Æthelred's third law code. Issued at Wantage (Berks.) possibly in 997, it showed royal confirmation of local court customs in the five boroughs of the Danelaw. Twelve leading thegns in each wapentake were to swear on relics neither to accuse an innocent man nor conceal a guilty one, the earliest reference in English law to what was effectively a sworn jury of presentment. The validity of a unanimous verdict was confirmed, but the agreement of eight thegns was allowed when opinions differed, a first assertion of this principle in England. AM

**wapentakes** in England were, from the 10th cent., subdivisions of shires in the Danelaw, corresponding to hundreds elsewhere. The terms applied in Derbyshire, part of Lancashire, Leicestershire, Lincolnshire, Nottinghamshire, Rutland, and Yorkshire, though perhaps not in the East Riding. The early 12th-cent. (unofficial) *Laws of Edward the Confessor* raise a problem. They say that when anyone accepted the headship of a wapentake, all the leading men met him at the usual meeting-place, and as he dismounted and raised his lance, they touched it with theirs. This account, whether representing truth or learning, takes the 'wapentake' back to an ancient Germanic world. JCa

**Warbeck, Perkin** (1474–99). Warbeck was a troublesome pretender to Henry VII's crown. He claimed to be Richard, duke of York, the younger of the two princes, sons of Edward IV. He was in fact born in Tournai. When he appeared in Cork in 1491 he was taken up by a number of people who wished to embarrass Henry, including the earls of Kildare and Desmond, Charles VIII of France, and Margaret, dowager duchess of Burgundy. In 1494 he was recognized by Maximilian, Holy Roman emperor, as king of England and provided with an expeditionary force. In 1495, James IV of Scotland welcomed him and gave him his cousin in mar-

riage. In 1497 he landed in Cornwall, won some support, but failed to take Exeter or Taunton. He surrendered at Beaulieu and was spared his life on confession. In 1499, having attempted to escape from the Tower, he was hanged at Tyburn. His wife, daughter of the earl of Huntly, was treated kindly by Henry and made three further marriages. JAC

**wardrobe**. Financial institution. As its name suggests, the wardrobe was originally the place in which the king's robes were placed for safe keeping, and where cash was held from which the king's personal expenses might be paid. Under Henry III it developed its scope of action, having more moneys paid into it and thus providing an easily accessible source of funds for the king, enabling him to bypass the Chancery and Exchequer. The keeper of the wardrobe was also the treasurer of the household; he received moneys for its upkeep, checked the accounts of its departments and rendered them to the Exchequer. The wars of Edward I and his successors boosted the wardrobe's significance further by making it the equivalent of a war treasury which travelled with the campaigning king, receiving war funds from the Exchequer as well as directly from other sources of royal income, and paying soldiers' wages. In the 1320s there were attempts to curb the independence of the wardrobe and to place it more firmly under Exchequer control. Subsequent rulers, however, continued to use the wardrobe for both regular household and military expenses although the Yorkist and early Tudor kings placed greater emphasis on the chamber for their private and 'secret' expenses. The great wardrobe was abolished in 1782 and its duties concerning the royal household transferred to the lord chamberlain. AC

**Wards, Court of**. This court was set up in 1540 by Henry VIII to enforce the lord's rights of wardship and marriage which had existed, since the Norman Conquest, as feudal incidents. After the statute of Quia emptores 1290 ended the practice of subinfeudation, the crown gradually became the lord of many estates. Increasingly payments had taken the place of feudal incidents. The purpose of the Court of Wards was to enforce payment of these ancient feudal dues to the crown and thus to increase the income of the king. This court was later combined with the Court of Liveries to become the Court of Wards and Liveries. It was abolished in 1656. MM

**Warrenne, John de, 7th earl of Surrey** (c.1231–1304). Warrenne was a staunch supporter of Edward I. He inherited the earldom in 1240 when a boy of 9 or so. He was a little older than Edward I and in 1247 was married to Henry III's half-sister Alice de Lusignan. This gave him connections with Henry's continental relatives who were so much disliked in England. During the civil war he supported Henry and was on the losing royal side at the battle of Lewes in 1264. The following year he joined Prince Edward and took part in the campaign that ended with de Montfort's death at Evesham. He was a guardian during Edward I's absence during the early weeks of his reign, was much employed in the later 1270s and 1280s against the Welsh, and in the 1290s

against the Scots. In 1296 he inflicted a sharp defeat on the Scots at \*Dunbar but the following year was badly beaten by \*Wallace at \*Stirling Bridge. He was retained for the 1298 campaign when Edward defeated the Scots at \*Falkirk. JAC

**Warene, John de, 8th earl of Surrey** (1286–1347). Warene succeeded his grandfather as earl in 1304 at the age of 18. In 1306 he married Edward I's granddaughter Joan, but the marriage was unhappy and Warene scarcely built on his great position. He was instrumental in the capture of \*Gaveston in 1312 though not in his subsequent murder. He refused to join Edward II's campaign which ended in \*Bannockburn and showed little inclination for martial glory. He took an active part in 1322 against \*Thomas of Lancaster, with whom he had long been at feud and remained a supporter of Edward II until his deposition. During Edward III's reign, Warene supported the claims of Edward \*Balliol, a cousin, and received the earldom of Strathearn [S] from him. Much of his energy was devoted to his complex domestic life and advancing his numerous illegitimate offspring; his political conduct seems hesitant and indecisive. JAC

**Warham, William** (c.1450–1532). Archbishop of Canterbury. Born in Hampshire and educated in law at New College, Oxford, Warham frequently served as a diplomat (1491–1502) and negotiated Prince \*Arthur's marriage to \*Catherine of Aragon (1496). He was successively master of the rolls (1494), bishop of London (1502), archbishop (1504), and lord chancellor (1504–15). A patron of the New Learning, he was chancellor of Oxford University (1506). From 1515 \*Wolsey, as cardinal, lord chancellor, and papal legate, constantly overshadowed Warham. Though originally disapproving of Henry and Catherine's marriage, he had crowned them, but was Wolsey's assessor in the secret inquiry of 1527. Under pressure he signed the petition requesting papal consent for a divorce. Though he led convocation's offer to buy off penalties of \*praemunire (1531), conscience provoked him to protest formally (1532) against the anti-papal Acts passed since 1529. Described as 'morose and inflexible', he was nevertheless competent and conscientious. WMM

**War of 1812.** The last conflict between Britain and the USA began when the British blockade of Napoleonic Europe and naval impressment of American sailors inflamed relations. Western American politicians campaigned for conquest of Canada to open land for settlement and eliminate Indian resistance. Congress declared war on 16 June 1812—four days after \*Castlereagh had announced relaxation of the blockade. The Americans failed to overrun Canada, despite battles including \*Queenston Heights (1812), Chrysler's Farm (1813), Lundy's Lane, and Chippewa (1814). The British retaliated for the destruction of York (later Toronto) in April 1813 by occupying Washington in August 1814 and burning the White House. Indians played a significant role as British allies. American pride was salvaged by unexpected victories at sea, and on the Lakes. The heaviest fighting took place at \*New Orleans after peace had been concluded. The war was ended by the treaty of \*Ghent, with its causes unresolved.

The diversion of troops to Canada limited forces available for the \*Waterloo campaign. GM

**War Office.** The centre of British army administration from at least 1661 until the emergence of the Ministry of Defence in 1963, the War Office was designed to impose civilian control over military affairs. Before 1855, it was run by the curiously named secretary at war, whose duties lay as much towards the monarch as Parliament, but in the light of disasters in the Crimea, all administrative duties were consolidated under the secretary of state for war, a cabinet post. This had the advantage of rationalizing what had been, hitherto, a chaotic administrative structure, but as the need for military advice to politicians grew, both in response to the development of empire and the emerging threat from Germany in the early 20th cent., clashes between the secretary of state and military men became inevitable. In 1914 these clashes were dealt with by appointing Lord \*Kitchener, an experienced soldier, as secretary of state. His death two years later allowed the politicians to reassert some measure of control. Similar problems were avoided during the Second World War when Winston \*Churchill, as prime minister, assumed the role of 'minister of defence' and downgraded the influence of the War Office. Moreover, the nature of the war necessitated inter-service advice, and this further undermined the importance of a strictly army organization. Although the War Office was revived after 1945, hopes of continued independence faded in light of a need for consolidated inter-service policies and economy. The Ministry of \*Defence was the answer. JLP

**Warriston, Archibald Johnston, Lord** (1611–63). Johnston was born in Edinburgh, educated at Glasgow University, and became a lawyer. He helped to frame the national \*covenant in 1638 and was appointed procurator of the kirk. In the temporary lull of 1641 Charles I appointed him to the Court of Session as Lord Warriston. He was much employed in negotiation with the English Parliament and strongly disapproved of the \*Engagement in 1648. After the Cromwellian conquest of Scotland, he was deprived of all offices, but in 1657 was reappointed lord clerk register [S], a post he had held 1649–51. He also attended Cromwell's House of Peers and was a member of the \*Council of State in 1659. After the Restoration, Warriston fled to the continent, but was seized at Rouen, taken to Scotland, and hanged at the market cross in Edinburgh. \*Burnet, his nephew, wrote that \*presbyterianism was 'to him more than all the world'. His son James was secretary of state [S] from 1692 to 1696. JAC

**Warwick, Richard Neville, 1st earl of** (1428–71), known as 'the Kingmaker'. Warwick was the mightiest of overmighty subjects, who was instrumental in putting Edward IV on the throne in 1461, deposing him in 1470, and restoring Henry VI. So powerful was he in the early years of Edward IV that one Frenchman wittily remarked of England, 'they have two rulers, Warwick and another, whose name I have forgotten'. Warwick owed his power to his vast estates, combining in his own hands no fewer than four earldoms. Neville resources enabled the Yorkists successfully to overthrow Henry VI in 1461. In the next four years

## Warwick

Warwick proved indispensable to Edward IV. Lavishly rewarded and allowed to take virtual control of northern England, he resented loss of influence after 1465. He first withdrew from court (1467) and after two abortive rebellions (1469 and 1470) he resorted to the restoration of Henry VI. However, the restoration was short-lived and on Easter Sunday 1471 Warwick was defeated and killed by Edward IV at \*Barnet. Warwick has generally had a bad press as over-ambitious. But his inherited wealth inevitably made him a power in the land. He was an astute politician, instinctively knowing how to exploit popular feelings for his own advantage. He was an inept general, and this, finally, was his undoing. AJP

**Warwick, Edward Plantagenet, 2nd earl of** (1475–99). Warwick's father was George, duke of \*Clarence (brother of Edward IV and Richard III), who was murdered when Warwick was 3. His mother was a daughter of \*Warwick the Kingmaker. On the death of his only son in 1484, Richard III is said to have considered Warwick as a possible heir. After Henry VII's victory at \*Bosworth, he was placed in the Tower. In 1487 Lambert \*Simnel claimed to be him and was crowned in Dublin, whereupon Warwick was taken publicly to St Paul's to quell the rumours. He remained in the Tower until November 1499 when he was accused of conspiring with Perkin \*Warbeck and executed. JAC

**Warwick castle**, sited on a cliff above the Avon, was founded by William the Conqueror in 1068 and has been the seat of the earls of Warwick from the 11th cent. It began as a motte and bailey castle, a stone castle from at least the 12th cent. The present castle owes much to the major rebuilding under the powerful Beauchamp earls, Thomas (d. 1369) and his son, also Thomas (d. 1401). The domestic range, above the river, was extensively remodelled as was the front towards the town, which was provided with an elaborate gatehouse and barbican and two wall towers, known as Guy's Tower and Caesar's Tower. The work, begun by the first Thomas, is dependent on French models, parallels work being carried out at \*Windsor by Edward III, and reflects closely the power and wealth of a man who was a hero of \*Crécy and \*Poitiers and a founder member of the Order of the \*Garter. The new towers demonstrate the integration of domestic accommodation and fortification, each being elaborately defended but having also several self-contained apartments for important members of the household. LR

**Warwickshire** was an archetypal Mercian shire, regular in shape and taking its name from the chief town. The southern parts are drained by the Avon and its tributaries, the northern by the river Thame, which joins the Trent. The eastern border runs along the line of Watling Street, the west along Icknield Street, and the shire is bisected north-east to south-west by the Fosse Way. \*Camden placed it in the territory of the \*Cornovii and divided it into the arable south, or Fielden, and the wooded north around the forest of Arden. The Fielden territory had been part of the land of the \*Hwicce. The area was included in the diocese of \*Lichfield in the early 7th cent. but the southern parts were

hived off to the see of \*Worcester. Warwickshire formed the heartland of the kingdom of Mercia: in the 8th and 9th cents. Tamworth was the chief residence of the Mercian monarchs and Warwick was refounded in 914 by \*Æthelfleda, lady of the Mercians.

It remained a rural county throughout the Middle Ages. Warwick itself was a significant provincial city, \*Kenilworth and \*Warwick castles important until the civil wars, and \*Coventry had a reputation for cloth-making. During the civil wars, the shire was held for the most part by the parliamentarians Lords Warwick and Brooke, with strong support from Coventry and Birmingham, proving too powerful for the royalist Lord Northampton. The gradual improvement in transport through inland navigation, turnpikes, and finally railways brought Warwickshire into the national orbit. In 1825, just before the railway era, the Birmingham canal was paying 70 per cent, the Coventry canal via Atherstone 44 per cent, the Oxford canal via Rugby 32 per cent, the Grand Junction linking up with the Thames 13 per cent, and the Warwick and Birmingham canal 11 per cent. The Liverpool to Birmingham railway opened in 1837, the London to Birmingham in 1838.

The modern history of the county is the development of industry in the northern parts around \*Birmingham and Coventry, exploiting the proximity of woodland, coal, and iron resources. Camden described Birmingham in Elizabeth's reign as 'swarming with inhabitants and echoing with the noise of anvils'. It passed Coventry in size during the 17th cent. and by 1700 had grown to around 15,000 people. Birmingham's dissatisfaction with its lack of representation in Parliament was demonstrated in 1774 when it captured one of the two county seats, previously the preserve of Tory country gentlemen. The demand for direct representation grew. In 1812 one of the county MPs was censured for his 'inattention' to the commercial interests of the shire and in 1819, to dramatize the situation, Birmingham radicals 'elected' a legislative attorney. \*Attwood's \*Birmingham Political Union played an important part in the passing of the \*Great Reform Act of 1832, whereby Birmingham received two MPs. In the later 19th cent. Birmingham was granted city status and under Joseph \*Chamberlain led the way in progressive local government. To nail-making, small arms, cutlery, and button-making was added industry of all kinds: Cadbury's moved to Bournville in 1879 and the Austin Motor Company opened at Longbridge in 1905. By 1911 the population was well over half a million.

\*Stratford-upon-Avon owed its fame as a tourist attraction largely to the Shakespeare jubilee of 1769, organized by David \*Garrick. The Memorial theatre opened in 1932. The salt springs at Leamington had been known since Tudor times, but the expansion of the town was 19th cent., the Pump Room opening in 1814. Nuneaton developed as a textile centre, Courtauld's setting up a factory in 1920, and Rugby grew steadily after the opening of the London to Birmingham railway, on which it was an important junction. The county lost several parishes to \*West Midlands in the local government reorganization of 1972. In the 1990s Warwickshire retained its county council, with Birmingham, Coventry, and Solihull as unitary authorities, and Warwick,

Rugby, Stratford, North Warwickshire, and Nuneaton and Bedworth as district councils. JAC

**Washington, George** (1732–99). First president of the USA. Washington's ancestors came from Northamptonshire and the first of the family to settle in Virginia was John, in 1657. George Washington was his great-grandson. He inherited the Mount Vernon estate in 1752 when his half-brother died. His first military experience was gained in the Virginia militia, he was with Braddock when he was killed in 1755, appointed commander of the Virginia forces at the age of 23, and elected to the state legislature. After attending the first and second continental congresses in 1774 and 1775, he was elected commander of the congress forces. His early years in command were necessarily defensive, largely concerned with gathering, training, and retaining some sort of army. His first victory of any importance was at \*Trenton in December 1776 and he held his army together through the terrible winter at Valley Forge in 1777–8. French support from 1778 onwards helped to turn the tide, though as late as 1780 Washington could write, 'I have almost ceased to hope.' At the end of hostilities, on 19 April 1783, he led the triumphal march into New York. When the Federal constitution was adopted, he was the obvious choice for the presidency, and was unanimously elected and re-elected in 1789 and 1793. He retired in 1797 to spend his last two years back in Mount Vernon. Tall, with natural authority and genuinely reluctant to serve, Washington was honest, patient, and shrewd. JAC

**Washington, treaty of**, 1871. The USA claimed compensation from Britain for the depredations of the \**Alabama*, a Confederate warship built in England during the Civil War. Also in dispute was access to the Canadian fisheries and ownership of San Juan Island off British Columbia. The five-man British commission included Canada's prime minister, Sir John A. Macdonald, who was trapped into surrendering the fisheries to placate the Americans. Britain agreed to arbitration: San Juan was awarded to the USA, and \$15.5 million was paid for the *Alabama* claims. Although a poor settlement for Britain and Canada, the treaty was a milestone in international arbitration. GM

**watch and ward** was an attempt at a more effective policing system, which started in 1233 with a specific incident and became firmly established. After disturbances, Henry III ordered all vills (townships) to arrange guards at night and apprehend suspicious persons. The instructions were repeated in 1242, with details on numbers of men and weapons, again in 1253, and in Edward I's reign were promulgated in the statute of \*Winchester of 1285. Watch and ward was still being maintained in the 18th cent. and its modern echoes are the neighbourhood watches set up in many suburbs and villages in the 1980s. JAC

**Waterford** (Port Láirge), **diocese of**. Originally a Norse city and thus an object of Anglo-Norman colonization of Ireland, it was a suffragan see of \*Canterbury from 1096, when Malchus, a monk of Winchester and later archbishop of \*Cashel (1111–35), was consecrated by \*Lanfranc. Waterford was first listed as a bishopric at the Council of Kells-

Mellifont (1152), though there was no regular succession of bishops until 1175. As it was a royal town, from 1225 bishops tended to be Anglo-French. After long Irish and papal resistance, Lismore was merged with Waterford, as English influence spread. The bishopric was sometimes a reward for administrative service; Stephen Fulbourn, bishop (1274–86), was justiciar of Ireland (1281–8) and it was held by English bishops from then onwards. In the 1590s there was a Jesuit college in Waterford which sent boys to the continent for training. Waterford and Lismore is still a catholic bishopric in the province of Cashel, but the Anglican see was merged with the Cashel diocese in 1833. WMM

**water industry**. Water for human consumption was traditionally obtained from wells, ponds, or rivers. This remained adequate until rapid urbanization during the 17th and 18th cents., particularly the growth of London and the industrial cities elsewhere, brought about the need for better supply. The solutions, sought during the 19th cent., invariably came in response to the related problems of public hygiene and the spread of water-borne diseases, such as typhus and cholera.

Among the earliest developments were the companies established in London using water from the Thames and its tributaries, one of the first being the \*New River scheme undertaken by Sir Hugh \*Myddleton in 1609. During the 17th cent. other companies were established, notably the York Buildings Company, sanctioned by letters patent from Charles II in 1675 and incorporated in 1691. The water was taken from the river by canals equipped with sluices and pumped by horse-powered gins to cisterns on higher ground, from which it was conveyed to wealthy customers' dwellings by service pipes, connected to 7-inch. wooden pipes laid through the streets. Public supply in London and other towns until the early 19th cent. was by similar conduits of wooden (and later iron) pipes to carry spring or well water to lead cisterns, which fed subsidiary lead pipes supplying communal taps or water carriers.

But as population increased, water supplies became contaminated by sewage and other effluent, creating major problems of public health in the larger towns, particularly after the first \*cholera epidemic in 1831–2. A series of investigations culminating in Edwin \*Chadwick's *Report on the Sanitary Condition of the Labouring Population* (1842) acted as spurs to improvement. Self-cleansing sewers of improved design required a constant supply of water under pressure and this was easier to provide in some places than others. The Metropolitan Board of Works scheme, designed by Joseph Bazalgette for the drainage of London, and the largest for the time, was not completed until 1865. As in other 19th-cent. schemes, steam power was used for pumping.

During the early stages of industrialization, canal-building and the use of water power as a prime mover led to a greater understanding of hydraulics and water engineering. Both of these developments necessitated the construction of dams, sluices, and water channels, the design of which influenced the construction of reservoirs for water supply under gravity. Two of the earliest, using earth with a core of puddled clay, were those of the Edinburgh Water Company (1822)

## Waterloo

and the Shaws waterworks for domestic and industrial supply in Greenock (1825–7). Many similar structures were built in the Pennines, south Wales, and other suitable locations. However, these dams were relatively small and their strength limited. There were disastrous collapses at Holmfirth near Huddersfield in 1852 and Dale Dike near Sheffield in 1864. Traditional methods of dam construction were abandoned and replaced by masonry dams, the first being built at Vyrnwy in Wales to supply Liverpool, begun in 1881 and completed in 1892.

As demand increased, other natural or man-made reservoirs were developed. Glasgow tapped Loch Katrine in the Trossachs, Manchester the resources of the Lake District, while Birmingham, like Liverpool, exploited the potential of Wales. There the drowning of valleys for English water supply caused considerable local resentment, particularly among Welsh nationalists. However, from the age of 'gas and water' civic pride in the 19th cent., water supply was traditionally a non-political issue, controlled by local authorities and water boards. During the 1980s, amid much political controversy, it became one of several nationalized industries to be sold to the private sector. The difficulty of maintaining a regular supply to homes and industry of such stupendous quantities of water, compounded by the occasional drought, has meant that the water industry in the 1990s has been much in the public eye. ID

**Waterloo, battle of**, 1815. In June 1815, Napoleon struck into Belgium, hoping to destroy \*Wellington's Anglo-Dutch army and Blücher's Prussians before they could unite. After the battle of \*Quatre Bras on 16 June, Wellington's inexperienced army of 67,000 men (of whom less than a third were British) fell back to a ridge near Waterloo. The 89,000 strong Prussian army, badly mauled at Ligny on the same day, also retreated. The French Marshal Grouchy pursued Blücher with 33,000 men, fighting an action at Wavre on 18 June, but failed to prevent the Prussians from marching to Wellington's aid.

The battle began on 18 June with an unsuccessful attack on Hougomont, a fortified farmhouse on Wellington's right flank. A major attack developed in the centre, but the French infantry were driven back. Then for about 90 minutes the French made a series of fruitless attacks with unsupported cavalry on unbroken allied infantry squares. The arrival of Prussian forces compelled Napoleon to send part of his élite Imperial Guard to his right flank. By 6.30 p.m. the key farmhouse of La Haye Sainte had fallen to the French, and an all-out assault might have broken Wellington's lines. However, Napoleon prevaricated, and only released his reserve—the Imperial Guard—at 7.00. The repulse of the Guard was the signal for the rout of Napoleon's army. With Blücher's men pouring on the field, Napoleon was finally defeated. GDS

**Watling Street** is the later name for the major Roman road from Dover through Canterbury to London and thence via \*Verulamium to \*Wroxeter (later the basis for \*Telford's Holyhead road, the A5). Whether the sections either side of London were seen as unitary in the Roman period is debatable; they are now united by their Anglo-

Saxon name *Wæcelinga Stræt*, 'the street of the people of Wæcel'. ASEC

**Watson, George** (d. 1723). A merchant in Edinburgh, Watson became accountant to the Bank of Scotland, set up in 1695. He left a bequest for 'the maintenance and education of the offspring of decayed merchants'. Building started in 1738 and Watson's hospital opened in 1741 with twelve boys. His institution became a day school in 1870 and a girls' school opened the following year. JAC

**Watson-Watt, Robert** (1892–1973). Scientist. Born in Brechin of a family related to James \*Watt, Watson-Watt studied engineering at University College, Dundee. During the First World War he was posted to the Royal Aircraft Factory at Farnborough, which had begun studying the use of radio to predict atmospheric storms. The work was continued after the war at Slough and then at Teddington. In the 1930s his team became involved in air defence against bombers. By 1935 Watson-Watt was able to present a paper on 'The detection of aircraft by radio method'. A successful experiment led to a new unit being set up near Felixstowe. By 1938 the basis of a radar defence system had been established and played a crucial part in the Battle of \*Britain in 1940. Watson-Watt was knighted in 1942 and published an account of his work in *Three Steps to Victory* (1957). JAC

**Watt, James** (1736–1819). Instrument-maker to Glasgow University, where he applied principles of latent heat to the \*Newcomen engine to patent the separate condenser in 1769, and found a career as leading steam engineer, conducted mainly (1775–1800) in partnership with \*Boulton. Watt generated a subsequent flow of patents: principally sun-and-planet rotary motion (1781), reciprocration (1782), and parallel motion (1784), though his engines were dependent upon \*Wilkinson's patent boring machinery (1774). They were high in prime cost, and their economy offset by patent premiums, and sold best where coal was expensive and higher power required, leaving others to supply more than half Britain's horsepower in 1800. Watt stopped his assistant's experiments with steam carriages, enthusiastically protected his patents, remained committed to low-pressure operation, and probably retarded steam innovations before 1800. Other research led to his patenting of a damp-paper letter copier (1780); experiments with the properties of air; the principle of the marine screw; and many measuring devices, in addition to his re-specification of \*Savery's 'horsepower' as a standard unit. He retired at the expiry of the patent in 1800, and lived a gentlemanly country life at Handsworth and Rhayader. JCh

**Waugh, Evelyn** (1903–66). Novelist and satirist whose early books *Decline and Fall* (1928) and *Vile Bodies* (1930) chronicle the doings of the Bright Young Things at Oxford and after with an ironic detachment approaching the grotesque. He consolidated his reputation with more material drawing on his own experience, in *A Handful of Dust* (1934), of a harrowing divorce; in *Scoop* (1938) as war correspondent in Africa; but the central event in his life was conversion to Roman catholicism in 1930. Though middle-class himself, son of a successful publisher, like the narrator of *Brideshead Revisited*

(1945) he cultivated the aristocracy and the old order assailed by contemporary vulgarity. If his latter-day persona as irascible country gentleman sometimes verged on self-parody, in *The Sword of Honour* trilogy (1962) he convinces us that the concept is more than another name for snobbery. JNRS

**Wavell, Archibald Percival** (1883–1950). British general, commander-in-chief Middle East from July 1939, he directed campaigns against Italians after June 1940. In Cyrenaica he won a series of spectacular victories in December 1940 to February 1941, taking prisoner 130,000 Italians. He was then ordered to give priority to helping Greece. There, and in Africa, German contingents inflicted defeat and in spring 1941 both Cyrenaica and Greece were lost. In July \*Auchinleck took over and Wavell became C.-in-C., India. In December 1941, Wavell became C.-in-C., south-west Pacific area, and faced violent Japanese attacks: he could not stop the loss of Malaya, Singapore, the Dutch East Indies, and Burma. Promoted field marshal and viscount, he became viceroy of India in June 1943. At the end of the war he attempted the impossible search for agreement on the future of India between Hindus and Muslims, Congress and the princes. In February 1947 he was replaced by Lord \*Mountbatten, who, to Wavell's dismay, accelerated the end of British rule. RACP

**Wealth of Nations, The.** Adam \*Smith's treatise was published in 1776 when the old mercantilist system was fast breaking down. Few books have been more influential. In simple and direct language, Smith argued the case for \*laissez-faire with a minimum of government intervention, though he conceded the need for regulation to protect national security, such as fostering shipping. He did not believe that politicians had any competence in directing economic activity, nor did he like their motives—'there is no art which one government sooner learns of another than that of draining money from the pockets of the people'. In a remarkable passage, he insisted that the endeavour of each individual to better himself advanced the common good, as though 'led by an invisible hand to promote an end which was no part of his intention'. Not until \*Malthus and \*Ricardo were Smith's optimistic assumptions seriously challenged. JAC

**Webb, Sidney** (1859–1947) and **Beatrice** (1858–1943). Fabian socialists, social reformers, and historians. Married in 1882, the Webbs formed a partnership of unparalleled significance for the development and introduction of left-wing social policies in Britain. They wrote many books together on social history, and held many public offices. Sidney served on the London County Council from 1892 to 1910, became a Labour MP for Seaham in 1922, becoming president of the Board of Trade in 1924, and as Baron Passfield in 1929 serving briefly as secretary of state for the dominions and colonies.

The Webbs' approach to social reform was gradualist; they rejected Marxist theories of class struggle, and believed that socialism would be achieved by a process of 'permeation'—i.e. the inculcating of socialist ideas into the minds of the power élite in Britain. In the 1930s, however, the Webbs became disillusioned with the progress of socialism in Britain and turned their attention to the USSR, which they

visited and found so impressive that in their last substantial book, *Soviet Communism: A New Civilisation?* (1935), they abandoned their piecemeal approach to political and social change. TSG

**Wedderburn, Alexander, 1st earl of Rosslyn** (1733–1805). Wedderburn was a member of a Scottish legal family and an associate of David \*Hume and Adam \*Smith's Edinburgh circle. He was called to the English bar in 1757 and entered Parliament in 1761. He supported \*Bute, \*Grenville, and \*North, becoming solicitor-general 1771–8 and attorney-general 1778–80. He was a frequent and effective speaker in the Commons, with a reputation for intrigue and self-advancement. Appointed lord chief justice of Common Pleas in 1780 as Baron Loughborough, he remained a follower of North and helped to negotiate the coalition with \*Fox in 1783. After the French Revolution, Loughborough attempted to negotiate a junction between \*Pitt and the opposition to support war against France but was tempted by Pitt's offer of the lord chancellorship and crossed the House alone. He was consulted by George III as to whether the coronation oath forbade him to consent to catholic emancipation. He left office with Pitt in 1801 and received the earldom of Rosslyn. EAS

**Wedgwood, Josiah** (1730–95). Potter, industrialist, and social reformer, Wedgwood was born into a Staffordshire family of potters and was at work by the age of 9. Shrewd and innovative in manufacture, design, and marketing, he capitalized on 18th-cent. fashion and snobbery, setting up on his own in 1758, and opening the great Etruria factory in 1769. Aware that 'a name has a wonderful effect', he presented his newly improved creamware to Queen \*Charlotte and obtained her permission to call it Queen's Ware, multiplying his sales in Britain and Europe. A notable commission came from Catherine the Great in 1774: a 952-piece service, now in the Hermitage Museum in St Petersburg, decorated with exquisite and accurate detail of 18th-cent. houses and countryside.

Wedgwood was keenly interested in the social and political problems of his day, much involved in road and canal development, and constantly reviewed the working and living conditions of his employees. His views were liberal/radical, he was sympathetic towards American independence in the 1770s, welcomed the French Revolution, and was a fervent supporter of the abolition of slavery. JC

**Wedmore, treaty of**, 878. The agreement made between King \*Alfred and the Danish leader \*Guthrum at Wedmore proved a turning-point in the Danish wars. From their fortified position at Chippenham the Danes had threatened to overrun all Wessex, but Alfred emerged from his refuge at Athelney, inflicted a severe defeat on the Danes at \*Edington, and forced peace on Guthrum on condition that he would himself accept baptism and that his army would leave Wessex. There followed a series of formal ceremonies which involved Alfred standing as sponsor at baptism for the Danish leader at Aller near Athelney and the unbinding of the chrism at Wedmore. Guthrum with 30 of his chosen companions spent some twelve days with the

## weights and measures

king and was greatly honoured by him. The Danes kept the substance of the arrangement, moving the army back to Cirencester and ultimately to East Anglia. Guthrum accepted the baptismal name of Athelstan and, as far as can be judged, the Christian faith. The accord reached at Wedmore foreshadowed the partition of England into much of the south and west, which remained in English hands, and the Danelaw of the north and east. HL

**weights and measures.** The history of weights and measures in Britain is dominated by efforts at standardization, nationally and locally, for many variations existed for measures in the different countries of the British Isles.

In England, Saxon weights and measures, based roughly on the standards prescribed by \*Offa, king of Mercia, were used for centuries, being confirmed after the Norman Conquest by William I and subsequently in 1215 by \*Magna Carta. The ounce was approximately 450 grains, i.e. slightly heavier than the modern one. An ordinance of Henry III in 1266 defined both coinage and commercial weights for the first time. There was some effort to relate English weights to those of the cities of the \*Hanseatic league, the principal market for wool, the country's major export. This act established a 16-ounce pound for commercial weight.

A new standard of bulk weight was enacted by Edward III in 1340, when the treasury at Winchester became the repository for weights with denominations of 7, 14, 28, 56, and 91 lbs. The standard corresponded roughly with that of Florence, another major market for English wool, indicating that one stone should weigh 14 lbs. During the reign of Henry VII, weights and measures were put on a statutory basis by an Act of 1497 and later under Elizabeth I a series of ordinances culminated with that of 1588 aimed to standardize bulk and precious metal weights. The hundredweight and the ton were standardized at 112 lb. and 20 cwt. (2,240 lb.) respectively. These Acts also set standards for liquid and linear measures, which were distributed to all the main cities and boroughs in England and Wales, though adoption was gradual and inspection difficult.

North of the border, despite similar attempts to disentangle the confusing system of Scottish weights and measures, there was no serious attack on the problem until the Restoration. In 1661 a parliamentary commission proposed the introduction of national standards with certain burghs having custody of particular weights and measures. Accordingly, Edinburgh would keep the ell for linear measure, Linlithgow the firlok for dry measure, Lanark the troy stone for weight, and Stirling the jug for liquid capacity.

The \*Union of 1707 should have brought standardization throughout Great Britain but in reality it was not until an Act of 1824 that the uniformity recommended by the Carysfort parliamentary inquiry in 1758–60 was statutorily established. British standards then became known as imperial measure. More precise instruments, particularly for use in scientific experiments and in cartography, led to greater standardization of both weights and measures.

While many attempts have subsequently been made to substitute metric for imperial measure, the former, though widely used in industry, and scientific and professional

spheres, has not yet replaced traditional standards. A further step towards standard metrification with Europe was taken in 1995, though, as an act of kindness, the British people were allowed to continue to drink pints of milk or pints of beer, and to travel, if they wished, in miles. ID

**welfare state.** There are many theories as to why the welfare state developed, from the radical view of its serving the needs of capitalism by maintaining political stability and providing healthy, educated workers, to the democratic perspective that it arose from the demands of the working class expressed through the ballot box. It has been called 'an erratic and pragmatic response of government and people to the practical individual and community problems of an industrialised society'.

In the *laissez-faire*, capitalist, self-help ideology of the 19th cent. fears of dependency and disincentives for the poor resulted in harsh measures based on the workhouse. At the turn of the century \*Booth's (London) and \*Rowntree's (York) studies, revealing the facts of poverty and showing its origins in social and economic conditions, helped to raise awareness of the problem and set the stage for reform.

Measures taken by \*Asquith's Liberal government, with \*Lloyd George as chancellor, represent the foundations of the British welfare state. Non-contributory old-age pensions (1908), paid for by higher taxes ('the People's Budget', 1909), and the \*National Insurance Act—Health and Unemployment (1911) were the most important reforms. In the inter-war years the problem of unemployment dominated social policy; the insurance scheme could not cope and in 1931 the dole was cut and a family means test implemented, a return to relief based on Victorian deterrent values.

The Second World War threw people together, and in the relative social cohesion of the war years they determined that 'never again' should there be a return to the misery of the 1930s. The \*Beveridge Report (*Report on Social Insurance and Allied Services*, Cmd. 6404) gave shape to these ideas. Beveridge identified 'five giant evils of Want, Disease, Squalor, Ignorance and Idleness' and, to fight each evil, 'five giants on the road to reconstruction': social security, a national health service, housing provision, state education, and a commitment to full employment. In July 1945 a Labour government, fully committed to wholesale reform, was elected in a landslide general election victory. Led by Clement \*Attlee, it lasted until 1951 and founded the modern British welfare state.

Poverty was to be conquered by a commitment to full employment together with social insurance. The coalition government's 1944 Employment White Paper made explicit all-party acceptance of Keynesian demand management to combat unemployment. Social insurance provisions, based on Beveridge, were a move from selectivity to comprehensive coverage. Compulsory contributions to a National Insurance scheme provided for incomes during sickness, unemployment, widowhood, and retirement; there was also a means-tested safety net, national assistance (now income support), and family allowances (now child benefit). The \*National Health Service Act (1946) provided for free health care for all regardless of means, and the birth of the NHS in

1948 was a triumph for Aneurin \*Bevan, minister for health. Education reform had been initiated by R. A. \*Butler, Conservative education minister in the coalition government, in his 1944 Education Act. The school-leaving age was to be raised to 15 and there was free secondary education for all. Finally, council housing was to solve the problem of homelessness and squatting which followed the end of the war.

Throughout the 1950s and 1960s there was cross-party consensus on the welfare state. In the 1970s the consensus was challenged from the right by neo-liberals who wanted to 'roll back the state'. Their arguments, together with rising unemployment, reawakened concern over costs and a 'dependency culture'. The election of a Conservative government under Margaret \*Thatcher in 1979 led to debate on the future of the welfare state, but few measures to reduce its scope were taken until after the third Conservative election victory in 1988. The debate continues: broadly there are two interrelated issues: the universalist One Nation approach versus a means-tested safety-net system, and the sustainability of the costs of provision. MW

**Welles, Richard and Robert** (d. 1470). Lionel, Lord Welles, and his son Richard, Lord Willoughby, fought against Edward IV at \*Towton in 1461, when Lionel was killed and subsequently attainted. By fighting for Edward against Lancastrians in 1464, Richard earned the reversal of the attainder and thus recovered his father's title and estates. Then, in a private feud, he sacked the house of Thomas Burgh at Gainsborough. Determined to restore order, Edward summoned Richard and planned a formidable royal visitation of Lincolnshire. At this point, apparently, \*Warwick and \*Clarence fomented a rebellion to oppose Edward's arrival. His rapid march caught them unprepared. The locals assembled by Richard's son Robert were scattered at Empingham, in an action known as \*Losecoat Field on 12 March 1470. Richard and Robert Welles were executed; Warwick and Clarence fled to France. RLS

**Wellesley, Richard, 1st Marquis Wellesley** (1760–1842). British administrator and the eldest brother of the duke of Wellington. In 1784 Wellesley entered parliament as MP for Beeralston where he sympathized with the free trade movement but opposed parliamentary reform. In 1793 he became a member of the India Board and from 1797 to 1805 acted as governor-general of Bengal. British rule was threatened by the French in alliance with Tipu Sahib of Mysore and the nizam of Hyderabad. Wellesley retorted by taking control of Mysore, the Carnatic, Hyderabad, and Oudh, bringing native princes under British influence. He served as foreign secretary in \*Perceval's cabinet and in 1812 tried unsuccessfully to form an administration. Wellesley championed the rights of Catholics in Ireland and in 1821–8 and 1833–4 acted as lord-lieutenant of Ireland. In 1835 he became lord chamberlain. RAS

**Wellington, Arthur Wellesley, 1st duke of** (1769–1852). Soldier and prime minister. Arthur Wellesley was the third surviving son of the earl of Mornington, an impoverished Irish peer. Educated at Eton, he was regarded by his family

as a dreamy introspective youth; the army was thought to be the only possible career for him. After a year at a French military academy at Angers, he entered the army by purchasing a commission. Early experience in the campaigns in the Low Countries during the first years of the Revolutionary War showed how things should not be done. His great chance came in India, where his elder brother was governor-general. Arthur established his military reputation by winning the spectacular victories of Assaye and Argaum over the Mahrattas in 1803. His campaigns in India were invaluable in preparing him for the type of war he was to fight in Portugal and Spain. In 1808 he was sent as commander of the first detachment of British troops to Portugal. Winning the battle of \*Vimeiro he was prevented from following up his victory by the caution of his superiors, and he was recalled with them to face a court of inquiry after the armistice of \*Cintra, which was seen in England as craven. Wellesley had signed the agreement under orders, but was bitterly attacked by opposition politicians. Cleared by the inquiry he resumed command of the British army in Portugal after the death of \*Moore. Shrewdly exploiting natural features and the engineering skills of the British army to construct the lines of \*Torres Vedras he ensured that the British army would not be pushed into the sea. Thereafter his Portuguese base was firm, and although collaboration with the Spaniards was often fraught with difficulties, he repeatedly challenged the French, proving the superiority of the British line over the French column. But he was more than a defensive general. He was bold when necessary, as the assaults on the fortresses of Badajoz and \*Ciudad Rodrigo showed, and in the battles of \*Salamanca, \*Vitoria, and the \*Pyrenees he was as resourceful in attack as he had been in defence. The end of the Peninsular War saw him as the most famous British general since \*Marlborough. The battle of \*Waterloo in 1815 confirmed his stature and his fame. He was without vanity and had little time for romantic delusions about military glory. For Wellington the greatest misery next to a battle lost was a battle won. He cared for his men and husbanded their lives, scorned extravagant gestures, and despised popularity.

After 1815 Wellington was prominent as a diplomat and politician. He had owed much to \*Castlereagh; now he became one of his trusted lieutenants in the complex diplomacy of the post-war era. He also became a member of \*Liverpool's government, believing that it was his duty to serve the state in whatever capacity might be required of him. After the death of \*Canning and the failure of the \*Goderich ministry, Wellington became prime minister in January 1828. Many Conservatives saw him as pledged to the maintenance of the existing order in church and state, but while he did not desire Catholic emancipation he was aware that it might be unavoidable. When in 1828 a crisis erupted in Ireland he chose to grant Catholic emancipation rather than risk civil war. This earned him the hatred of the ultra-Tories and he fought a duel with Lord Winchelsea. He had already lost the support of the liberal Tories because of his dislike of Canning's foreign policy. In 1830 Wellington attempted to rally conservative opinion by affirming his resolute opposition to parliamentary reform. The tactic

failed to restore confidence in his administration. In November 1830 he was defeated on the civil list in the Commons and resigned. Although Wellington opposed the Reform Bill he realized that opposition had to be attuned to the realities of politics. He therefore led 100 Tory peers from their seats in the Lords to allow the Reform Bill to pass in June 1832, preferring reform to the prospect of the Upper House being swamped by newly created peers. In 1834, during the crisis provoked by \*Melbourne's resignation, Wellington became a caretaker prime minister for some three weeks and after 1835 he played an important role as an elder statesman. The service of the crown and the preservation of public tranquility were his chief priorities. He helped to secure the repeal of the Corn Laws in 1846. His final years saw him as a popular figure and on his death in 1852 he was mourned as a great soldier and outstanding public servant.

Wellington's attitudes were those of an Anglo-Irish aristocrat. He distrusted democracy, had little time for the vagaries of popular opinion, and saw politics in terms of fending off disaster rather than inaugurating utopia. His influence upon the army was conservative, though he was more perceptive than many contemporaries in understanding the role of the army in peacetime. Gifted with a cool intellect, the capacity to penetrate to the essentials of any problem surely and quickly, and the ability to express himself with lucid incisiveness, Wellington deserves his reputation as a great commander and a man of selfless integrity.

Bryant, A., *The Great Duke* (1971); James, L., *The Iron Duke* (1992); Longford, E., *Wellington: The Years of the Sword* (1969); — *Wellington: Pillar of State* (1972).

**Wells, H. G.** (1866–1946). Shopkeeper's son who jumped the counter to become successful author and eventually teacher-at-large to the human race. A scholarship to what is now Imperial College, London, where he studied under T. H. \*Huxley, suggested the power of science to make us free, though it was an imaginative energy which fuelled his early romances *The Time Machine* (1895) and *The War of the Worlds* (1898). Moving in literary and \*Fabian circles, he saw the novel as a medium for discussing problems 'raised in such bristling multitude by our contemporary social development'. Perhaps no one did more to shape that development, and after the First World War he increasingly abandoned fiction for analysis and exhortation. The best-selling *Outline of History* (1920) offered mankind 'salvation by history', lasting world peace only to be secured by learning its lessons. Yet Wells's faith in human potential was not blind to obstacles to be overcome, and in the novels too comedy and pessimism are mingled.

**Wells cathedral.** See BATH AND WELLS.

**Welsh language.** The oldest language spoken in Britain, with an unbroken history from Brythonic origins as part of the Celtic family of Indo-European languages from which most European languages derive. Its development was powerfully affected by external linguistic influences: Latin of Rome and the Christian Middle Ages; Irish, a Goidelic form of Celtic; Norse to a minor extent; and especially Eng-

lish following the Germanic invasions of Britain, and French after the Norman Conquest. Germanic and English advances westward led to the separate development of Brythonic Celtic in Wales, Cumbria, and Cornwall: only Welsh survives; Cumbric died out in the 11th cent. and Cornish in the 18th. At the same time, Welsh, the language of that part of Britain which the invaders called foreign (*Wealas*), acquired its characteristics of initial mutations, a complex word order, and an accent on the penultimate syllable. Those who used this language called themselves *Cymry* (fellow-countrymen).

Welsh appeared as a recognizable language before AD 600; up to the mid-12th cent., when French and English influences became strong, Old Welsh has left few traces apart from inscriptions, manuscript glosses, and Welsh poetry in saga or prophetic vein and usually recorded in manuscripts of the 13th and 14th cents., e.g. *The Book of \*Aneurin* and *The Book of \*Taliesin*, and perhaps too the prose tales known as the \**Mabinogi*. Middle Welsh from the mid-12th cent. to the early 15th was rich in prose and popular verse, whose writers were patronized by Welsh princes and then (after 1283) by gentry of Welsh and immigrant lineage. Several dialects also emerged: according to \*Gerald of Wales (d. 1223), Welsh 'is more delicate and richer in north Wales', but 'the language of Ceredigion in south Wales . . . is the most refined'. The same influences that enriched the language set the scene for its decline, for trends in government and society, immigration and town foundation, popularized Latin, French, and especially English in the later Middle Ages. The Act of \*Union (1536) sought to replace Welsh with English in official contexts; although this was not fully practicable, it discouraged its use and patronage, and the gentry gradually ceased to speak Welsh, adopting English surnames instead of Welsh patronymics.

Salvation came with printing and the Reformation, especially with the translation of the Scriptures and the Prayer Book into Welsh (1567, 1588). The dignity of William \*Morgan's Bible (1588) set a standard for literary Welsh thereafter. Educational, antiquarian, publishing, and religious movements in the 17th and 18th cents. ensured its survival as a spoken and written tongue; indeed, the 18th cent. saw a renaissance in Welsh culture. Even after half a century of industrialization, in 1801 80 per cent of Wales was Welsh-speaking; the borderland and southern littoral had not been so for centuries. Industrialization was not at first an enemy to Welsh, for many migrants to the southern valleys were Welsh-speaking, and in 1851 there were more Welsh-speakers than in 1801; but as a proportion of the expanding population they were a declining number (from 80 to 67 per cent between 1801 and 1851). The popularity of English among the upper classes, the demands of British education, the cosmopolitan industrial and commercial centres, immigration, and mass media and communications undermined Wales's linguistic character and portrayed the language as old-fashioned. By 1901, 50 per cent of Wales's population spoke Welsh; thereafter the decline was relentless, the figure standing at 19 per cent in 1981 (about 500,000 people), mostly in the rural west and north-west. In North America, too, where Welsh was implanted by emigrants in

the late 19th cent., social and religious changes produced decline.

Yet since the 18th cent., Welsh literary culture has shown some creativity: an interest in Welsh history and tradition (including the \*eisteddfod), a vigorous Welsh press, active nonconformity, the growth of national sentiment, and the foundation of national institutions (notably a library, museum, and university) in the late 19th and early 20th cents. More recently, opinion has focused intently on the question of the language's survival. It has been buttressed by academic study and a literary renaissance, acceptance at all levels of education, as well as by pressure groups, even perhaps violent protests. Official milestones are the report on *The Legal Status of the Welsh Language* (1965), the Welsh Language Act (1967) which enshrined the principle of equal validity with English, a Welsh TV channel (1982), and the Welsh Language Board (1993) to oversee its use and fate. It remains to be seen whether this nurturing will enhance its vitality and stem its overall decline. RAG

**Welsh Nationalist Party.** See PLAID CYMRU.

**Wembley stadium.** The Great Stadium at Wembley Park, London, was built to coincide with the British Empire Exhibition of 1923. Work was completed just four days before hosting its first Football Association Cup Final on 29 April 1923. It has since been a venue for a multitude of sports, including boxing, hurling, speedway, greyhound meetings, horse shows, and show jumping events. The Rugby League Cup Final has been played at Wembley every year since 1929 (except 1932). The greatest moments in its history were the hosting of the 1948 Olympic Games and the 1966 World Cup. Its complete rebuilding from 2000 has proceeded with confusion and acrimony. RAS

**Wensleydale's peerage case.** In 1856 Sir James Parke, judge of the Court of Exchequer, was raised to the peerage with the title of Baron Wensleydale. However, the patent which conferred the title stated his barony was to be held 'for the term of his natural life'. This was an attempt to revive a right not used since the time of Richard II. There was strong feeling in the Lord's against such a move. Lords \*Lyndhurst, \*Brougham, and Campbell were united in opposing the change. After great argument, the government gave way and conferred on Parke an ordinary patent of peerage. Life peerages were postponed until 1958. RAS

**wergeld** was the fixed amount, or blood-price, payable by a killer and his kin to his victim's kinsmen. A man's kin was obliged to seek vengeance for his untimely death, but payment of wergeld was an alternative to blood-feud, and a means of keeping order in a violent society. The amount of wergeld was also an important mark of social status. In the earliest written Anglo-Saxon law code, a nobleman's wergeld was 300 shillings, three times that of a \*ceorl. AM

**Wesley, Charles** (1707–88). Hymn-writer. Like his brother John, Charles was educated at Oxford, ordained in the Church of England, and became a leading methodist preacher. Methodism, it has been said, was born in song; and this was facilitated by the magnificent collection of hymns writ-

ten by Charles Wesley, perhaps the greatest hymn-writer England has ever known. Favourites like 'Hark! The Herald Angels Sing' and 'Jesus, Lover of my Soul' became familiar far beyond the bounds of methodism. The Wesleys understood the use of hymns for popular devotion and instruction. In Charles's eucharistic and advent hymns, or his celebration of the sacramentalism of daily life, traditional Christian teaching was restated, and indeed became part of the religious discourse for the next 200 years. Charles disapproved of John Wesley's ordinations and remained closer to the Church of England. JFCH

**Wesley, John** (1703–91). Founder of methodism. Educated at Christ Church, Oxford, and elected a fellow of Lincoln College, Wesley was ordained in the Church of England. At Oxford in 1729 he gathered round him a group of devout Christians who were nicknamed methodists because they sought to follow strictly the method of study and practice laid down in the statutes of the church. After a short-lived missionary journey to Georgia, during which he was much influenced by some Moravian brethren, Wesley experienced a sudden conversion (1738). He felt that after much searching he had 'found spiritual rest' and that his mission was to evangelize England. For over 50 years Wesley travelled all over Britain on horseback, averaging 5,000 miles annually, preaching thousands of sermons, often three times a day. Finding the churches closed to him, he began field-preaching and organized local religious societies and a body of lay preachers, which became virtually a church within the church. When the movement spread to America, Wesley was led to ordain a superintendent or bishop. Wesley wished methodism to remain within the Church of England, but this was not possible, given official Anglican hostility and the desire of conference (the supreme body of methodism) for independence. JFCH

**Wessex, kingdom of.** The origins of the kingdom of Wessex are obscure. Archaeological evidence shows that the communities of Germanic settlers established in the middle Thames region in the late 5th and early 6th cents. constituted one of the principal elements, but literary evidence emphasizes a more southerly origin in the movement of \*Cerdic and his successors in the early 6th cent. from a base in the Portsmouth area into Hampshire and Wiltshire. The Isle of Wight and the Meon valley in eastern Hampshire were settled by a people of \*Jutish origin. Historic shape was given to Wessex in the reign of \*Ceawlin (560–91), who claimed descent from Cerdic and was described by \*Bede as a \*bretwalda (overlord). At the battle of \*Dyrham near Bath in 577, he won a victory over the Britons which left him in control of Bath, Cirencester, and Gloucester. His people at this stage, or possibly only the ruling group, were known as the *Gewisse*, but also as the West Saxons to distinguish them from the other Saxon folk who gave their names to Sussex, Middlesex, and Essex. They accepted Christianity in the 7th cent. and bishoprics were set up (apparently representing the duality of the predominant groups) at \*Dorchester-on-Thames (634) and at \*Winchester (662). Under two powerful kings, \*Cædwalla (685–8) and \*Ine (688–726), the West Saxons extended their political control

over Devon and Somerset. A significant British element of acknowledged legal status survived in the kingdom. Ine died on pilgrimage to Rome and for the rest of the 8th cent. Wessex played a subordinate part to \*Mercia in English affairs. Revival came in the 9th cent. during the reign of \*Egbert (802–39). After his defeat of the Mercians at \*Ellendun in 825 the *Anglo-Saxon Chronicle* referred to him as \*bretwalda, and indeed for a brief period he seems to have been recognized as overlord by all the English kingdoms, including Mercia (830–1). This did not prove permanent, but the south-east and East Anglia continued to acknowledge his lordship. The creation of a greater Wessex, involving effective mastery of all lands south of the Thames, can firmly be attributed to his reign. His son \*Æthelwulf (839–58) and his grandsons, especially his youngest grandson, \*Alfred the Great (871–99), consolidated the West Saxon hold over Sussex, Surrey, and Kent. But the whole political structure of England was changed in the second half of the 9th cent. by the Danish invasions. Alfred's heroic defence resulted in the peace of \*Wedmore (878) which left all England north and east of Watling Street and the river Lea in Danish hands. Alfred regained London after 886 and skilfully exploited his position as sole surviving effective representative of the ancient ruling English dynasties. He emphasized the elements of Christian kingship and legal lordship over his own people, and extended it over the Mercians and over all Christian English under Danish rule. From that point onwards the story of the kingdom of Wessex folds absolutely into the story of the kingdom of England. Danish kings and warlords were gradually conquered and their territories reabsorbed into England in the reigns of Alfred's son \*Edward the Elder (899–924), and grandsons \*Aethelstan (924–39), \*Edmund (939–46), and \*Edred (946–55). After 954 and the death of \*Erik Bloodaxe, the last Scandinavian ruler of York, we deal with a unitary kingdom of England. Intrinsic reasons within Wessex explain why Wessex emerged as the nucleus of such a kingdom: better communications, greater agrarian wealth, proximity to the continent, control of the south-east with its economic and political potential in London, Kent, and Canterbury. Geographic and strategic advantage came to Wessex from its distance from the main thrust of Danish attack across the North Sea. Full credit also must be given to the West Saxon dynasty in the critical century, 871–975, notably to Alfred and ultimately to his great-grandson \*Edgar (959–75), who laid heavy emphasis on their position as Christian monarchs, extending the range of their legitimate authority beyond the West Saxon people to embrace all the Christian inhabitants of England. HL

**West, Benjamin** (1738–1820). History and portrait painter. West was born a British subject in Pennsylvania, remaining a loyalist all his life. He learned to paint in America, and studied for three years in Italy before settling in London in 1763. He was a founder member of the Royal Academy, becoming the second president on the death of \*Reynolds. In 1769 he began a long association with George III when the king commissioned a series of pictures for Buckingham House and, later, several for the state rooms at Windsor castle. In 1772 West was appointed historical painter to

the king, but he refused a knighthood. His *Death of Wolfe* (1771), described by Reynolds as revolutionary, broke with the tradition of painting heroes in classical costume and showed contemporary dress. JC

**Westbury, Richard Bethell, 1st Baron** (1800–73). Lawyer. Bethell was born in Bradford on Avon (Wilts.) and went to Wadham College, Oxford. After Middle Temple he began practising with great success. In 1851 he entered Parliament for Aylesbury as a Liberal, was made solicitor-general in 1852 and attorney-general in 1856. His ambition for the lord chancellorship was widely known and he obtained it, with a peerage, in 1861. He began a series of legal reforms but in 1865, peculation having been discovered in his office, a select committee found in him a 'laxity of practice and want of caution'. One of Bethell's weapons had been vituperative sarcasm, together with overweening self-confidence, which did not help him in the crisis. He was censured by the House of Commons and obliged to resign. JAC

**Western European Union (WEU).** This international security organization was initiated on 6 May 1955 when the Federal Republic of Germany and Italy joined the existing \*Brussels Treaty Organization. This was a consequence of the refusal of the French National Assembly to ratify the European Defence Community plan (EDC). The collapse of the plan was in part due to the British government's refusal to take part in supranational (as opposed to intergovernmental) security organizations, and the emergence of the WEU can be seen as a fulfilment of British goals. The pledge made by Britain to maintain troops in Europe in peacetime was a major innovation in foreign policy.

\*NATO remained the primary West European security organization, but from 1958 to 1973 the WEU structure allowed the British government to consult with the six WEU states that had formed the \*EEC without involving other NATO members. Following British accession to the EEC, ministerial meetings of the WEU ceased. The organization was reactivated from 1984 to strengthen European influence within NATO and to promote EC foreign policy co-ordination (European Political Cooperation, EPC). Britain was among the states that prevented the integration of WEU into the European Union's supranational structure, instead confirming it as an intergovernmental institution in the \*Maastricht treaty. The WEU played a prominent role in the Bosnian crisis in the 1990s. CNL

**Western Isles** is the name given to the administrative region which since 1973 has been the local government area for the Outer Hebrides (Lewis, Harris, North and South Uist, Benbecula, Barra, Eriskay, and other small islands). Until 1973 Lewis was part of the county of Ross and Cromarty, and the other islands of Inverness-shire. Although the islands are diverse geologically, they are mostly rocky or peaty with sandy shores, supporting very limited agriculture, mainly in crofting townships, which provide some of the raw material for the woollen goods manufacture for which Harris is famed. Various attempts to diversify manufacturing (most notably Lord Leverhulme's establishment of Leverburgh, in Harris) have had very limited success). The isolation of the

Western Isles has helped Scottish Gaelic to survive as a living language, with distinctive accents in the different islands, and the local authority fosters Gaelic, for example by bilingual road and street signs.

CML

**Western Samoa** is a group of mountainous South Pacific islands with a population of about 165,000. Since 1962 they have been formed into an independent nation and joined the Commonwealth in 1970. The capital is Apia and the main crops are copra, cocoa, and bananas. In 1899 eastern Samoa was annexed by the USA, Western Samoa by Germany. In 1914 troops from New Zealand, 1,600 miles to the south, occupied Western Samoa and it became a New Zealand \*mandate in 1920.

JAC

**West Indies** is the general geographical term for the many islands of the Caribbean, the largest of which are Cuba, Hispaniola (politically Haiti and the Dominican Republic), \*Jamaica, Puerto Rico, \*Trinidad, Guadeloupe, and Martinique. After Columbus' landing on San Salvador in 1492, Spain claimed the whole region, concentrating first on Hispaniola, then on Cuba and Puerto Rico. Sugar plantations were established and black African slaves introduced. The first inroads into the Spanish monopoly came when Spain, in the early 17th cent., was still struggling to put down the Dutch revolt in Europe. English settlement started at \*St Kitts (1623) and \*Barbados (1627), followed by \*Antigua and \*Montserrat (1632), Anguilla (1650), and the conquest of Jamaica in 1655 by a Cromwellian expedition. The \*Bahamas, claimed as early as 1629, did not receive much attention until after the Restoration. Meanwhile, France had acquired Guadeloupe and Martinique (1635), \*Grenada in the 1640s, and had established a foothold on the western part of Hispaniola. Dutch settlements were on Curaçao and St Eustatius in the 1630s, and the Danes, entering the race comparatively late, acquired St Thomas in the Virgin Islands in 1666 and purchased St Croix from the French in 1733. Control by European governments was necessarily fitful and the West Indies gained its reputation for piracy and buccaneering.

The 18th cent. saw incessant warfare between the colonial powers, towns repeatedly sacked, and islands taken and retaken, often for use as bargaining counters at the peace. Tobago changed hands so often that its inhabitants were said to live in a state of betweeny: at one stage, Charles II, who did not have it, granted it to the duke of Courland. Admiral \*Vernon became a national hero in Britain in 1739 when he sacked Porto Bello, Spain's base in Panama, at the start of the War of \*Jenkins's Ear. At the end of the \*Seven Years War in 1763, Britain retained Grenada, \*Dominica, \*St Vincent, and Tobago at the expense of France. When British sea power wobbled during the War of \*American Independence, the French and Spanish took Grenada, Montserrat, St Kitts, St Vincent, and the Bahamas, but had to return them at the treaty of \*Versailles in 1783, retaining only Tobago.

During the \*Revolutionary and Napoleonic wars, Britain added Trinidad from Spain (1802) and \*St Lucia from France (1814). By this time the West Indies were beginning to lose some of their economic importance to Britain, and the West Indian lobby some of its influence in Parliament. The slave trade was abolished in 1807 and slavery in the British empire

in 1833. The colonial distribution did not change greatly in the course of the 19th cent. The western part of Hispaniola, ceded by Spain to France in 1697, saw a black rising in the 1790s and established its independence as Haiti in 1804; the other two-thirds of the island threw off Spanish rule in 1821, only to fall under Haitian domination, and the Dominican Republic was not established until 1844. British rule in Jamaica was shaken by a rising in 1865, and the governor Edward Eyre recalled in disgrace, but control was reasserted. As a result of the war between Spain and the USA in 1898, Puerto Rico was annexed to the USA, and Cuba was declared an independent state, though under American tutelage.

Since the Second World War, the great majority of West Indian islands of any size have become sovereign states. In 1945 only Cuba, Haiti, and the Dominican Republic were independent. In 1958 the British introduced the West Indian Federation, long an aspiration, to improve political and economic co-operation, but it rapidly fell victim to inter-island rivalries. Jamaica resented that the capital was in Port of Spain, Trinidad, 1,000 miles away, and voted in a referendum to pull out. Trinidad followed suit and the Federation was wound up in 1962. Jamaica and Trinidad then became independent, followed by Barbados (1966), Bahamas (1973), Grenada (1974), Dominica (1978), St Lucia (1979), St Vincent (1979), Antigua (1981), and St Kitts and Nevis (1983). Two of the enduring legacies of British colonialism are the use of the English language and an awesome addiction to cricket.

JAC

**West Midlands.** The metropolitan county of West Midlands was the creation of the Local Government Act of 1972. It brought together the county boroughs of Birmingham, Wolverhampton, Walsall, Dudley, Warley and West Bromwich, Solihull, and Coventry. In addition, Brownhills was transferred from Staffordshire; Halesowen and Stourbridge from Worcestershire; Sutton Coldfield from Warwickshire; and a number of parishes from the rural district of Meriden. The county headquarters was at Birmingham. The authority was abolished, along with the other metropolitan counties, by the Local Government Act of 1985.

JAC

**Westminster, palace of.** From the time of Edward the Confessor to the early years of the reign of Henry VIII, Westminster was the main royal residence. The palace grew up around the abbey built by the Confessor on Thorney Island and consecrated in December 1065, a week before the king's death. The abbey was completely rebuilt by Henry III from 1245 onwards, though far from finished in his lifetime. William Rufus built the great hall and first held court in it in 1099: it was reroofed by Richard II and for centuries was the home of the law courts, the place of impeachments and state trials, and the venue for the coronation banquet. John began the building of St Stephen's chapel, which was taken over after the Reformation by the House of Commons. Henry II built domestic rooms for the household, including the great chamber, and Henry III added the painted chamber, adorned with biblical stories. In Edward III's reign the Jewel Tower was built,

## Westminster

later to be used as the House of Lords Record Office. By the 15th cent., the palace was a rabbit warren of rooms and corridors, swarming with servants and lawyers, and liable to flooding. In 1512, soon after a grand celebration in honour of the king's young son, who died a week later, there was a disastrous fire. Henry moved to Whitehall and the palace of Westminster was totally given over to public offices. After the fire of 1834, only Rufus' great hall was left. The rest was rebuilt according to the design of Sir Charles Barry, assisted by Augustus Pugin. JAC

**Westminster, provisions of**, 1259. The provisions of Westminster formed a stage in the conflict between Henry III and his baronial opponents led by Simon de Montfort. By the provisions of Oxford in June 1258 Henry had agreed to a mechanism of control, including the appointment of a supervising committee of fifteen. On 13 October 1259 in Westminster Hall, a detailed and miscellaneous programme of law reform was approved in response to a number of petitions and complaints. It clarified rights of inheritance and of wardship, tried to prevent lords from forcing attendance at their courts, and forbade the transfer of property to monastic institutions without the consent of the lord. It also included populist clauses restricting the offices of state and the command of fortresses to Englishmen. The provisions were reissued in 1262 and 1264 and incorporated in the statute of Marlborough of 1267. The activities of the manorial courts were brought under closer scrutiny. JAC

**Westminster, statute of**, 1275. The first statute of Westminster, promulgated in Edward I's first Parliament in 1275, was a great survey of the existing law, whose 51 clauses dealt with a vast variety of problems. The intention was to redress some of the grievances which had been felt during the new king's absence and which had been revealed by the hundred roll inquiries of 1274-5. Among the items mentioned were shipwrecks, elections, rapes, coroners, bail, cattle-rustling, wardship, tolls, feudal aids, and guardianship. The statute revealed a more positive attitude towards law, accepting the need to modify and adapt it. JAC

**Westminster, statute of**, 1285. The lengthy statute 13 Edw. I, usually known as Westminster II, was designed to remedy miscellaneous grievances at law. The most important provisions were to tighten up the donor's rights over gifts of property; to improve the lord's command of services due to him by enabling him to sue in the royal courts; to protect the rights of the owners of advowsons; and to increase the security of property by imprisoning bailiffs suspected of dishonesty in royal gaols. The statute was part of a determined attempt by Edward I to regulate a mass of law and custom and impose fairer solutions. JAC

**Westminster, statute of**, 1290. The statute 18 Edw. I, known as Westminster III, was intended to prevent magnates being deprived of their feudal rights, such as escheat, marriage, or wardship, by the sale of estates. It was declared that, on sale, the same feudal rights must continue and that land could not 'come into mortmain'. The statute is often known by the opening words 'Quia emptores' ('be-

cause purchasers'). It is generally accepted that the statute failed to hold the position. JAC

**Westminster, statute of**, 1931. The immediate cause of the statute was the complaint of Mackenzie King, prime minister of Canada, that the governor-general had acted unconstitutionally in 1926 in refusing him a dissolution. This led the imperial conference of that year to discuss constitutional relationships. Balfour, philosopher by inclination, defined Britain and the dominions as 'autonomous communities, equal in status, in no way subordinate one to another'. The statute of Westminster, 22 Geo. V c. 4, confirmed this position, leaving the crown and membership of the Commonwealth as the only link. Governor-generals were selected on the advice of the dominion's prime minister and the Westminster Parliament specifically gave up any claim to legislate for a dominion, save at its own request. Cosgrave, the prime minister of the Irish Free State, gave assurances that the new powers would not be used to change the 1921 settlement. His successor, De Valera, did exactly that and a trade war ensued. The bonds of empire were tenuous indeed. JAC

**Westminster, treaty of**, 1462. Edward IV, hoping to recover some of the influence in Scotland lost by the Wars of the Roses, agreed in 1462 at Westminster (sometimes called the treaty of London) with John Macdonald, lord of the Isles and earl of Ross, and James, 9th earl of Douglas, that they should become his vassals and help him to gain the Scottish throne. They would then share the lands north of the Forth. Nothing came of the grandiose plan and it took Edward twenty years to recapture the border fortress of Berwick. JAC

**Westminster, treaty of**, 1654. Though the Dutch had suffered more during the first Anglo-Dutch War, the treaty which concluded it was mild, since Cromwell was anxious to bring to an end this damaging quarrel between two protestant nations. The English Navigation Act of 1651 remained on the statute book and the Estates of Holland agreed to exclude the House of Orange from public life, thus removing a potential source of assistance to the Stuarts in exile. But the issues of sovereignty, saluting the flag, fishing rights, search, and contraband, which had been so prominent at the start of the war, were compromised. JAC

**Westminster, treaty of**, 1674. The treaty, signed on 19 February, brought to an end the third Anglo-Dutch War. Since the Dutch were anxious to make a separate peace in order to concentrate their resources on defeating the French, they offered concessions which did not reflect the balance of the fighting. They agreed to salute the English flag, pay a small indemnity, and return New Amsterdam, recaptured in August 1673. JAC

**Westminster abbey** has been the setting for the coronation of English monarchs since 1066, when William the Conqueror was crowned in the new church of Edward the Confessor, perhaps to underline continuity; from Henry III to George II sixteen monarchs were buried there. There was a monastery on the isle of Thorney by the

Thames before Edward began his great building c.1050 but there is no certain evidence when it had been founded. \*Harold Harefoot was buried there in 1040 at the end of his short reign. Nor is there anything above ground surviving of Edward's church, dedicated on 28 December 1065, with the king absent on his death-bed. It was however on a grand scale. The present abbey was begun by Henry III in 1245 and was much influenced by contemporary French styles: it is the highest of great English medieval churches and therefore seems narrow. The body of Edward the Confessor was moved there in 1269. The chapter house where, until the Reformation, Parliament met was one of the earliest parts to be completed. Building on such a scale was inordinately expensive and progress in finishing the abbey was very slow. The nave was not completed until the reign of Henry VII, who began his own addition—the fan-vaulted chapel. Work had already started on the foundations for the two western towers.

The abbey's close connection with the monarchy saved it from the fate of most other abbeys at the Reformation, which were turned into parish churches or plundered for their stone. The abbot's house was taken over by Lord Wentworth and the bishopric established in 1540 suppressed (leaving Westminster's claim to be a city). Mary began the restoration of the monastery but at the end of her brief reign it was closed again and the buildings made over to \*Westminster School. Though the abbey suffered from the iconoclasts of the 1640s, its prestige helped it during the Commonwealth: \*Cromwell had the stone of \*Scone taken to \*Westminster hall for his inauguration as lord protector and was given an elaborate funeral in the abbey, only to be disinterred in January 1661. \*Wren began the work of restoring the fabric of the abbey after years of neglect but not until 1745 were the western towers completed, to the design of Nicholas \*Hawksmoor. By that time the tradition of affording the great and mighty burial in the abbey was well established, as a British pantheon. \*Spenser was buried in what became known as Poets' Corner in 1599, \*Newton in 1727, \*Pitt in 1778, Samuel \*Johnson in 1784. At length the abbey became too crowded to permit of further burials. But among the host of memorials, the most moving is that which commemorates the dead of the Great War, a brass to a 'British warrior, unknown by name or rank'. JAC

**Westminster Assembly**, 1643. Set up by the Long Parliament to reform the English church, it consisted of 30 members of both houses and 121 ministers of varying opinions. Though most members favoured \*presbyterianism, a forceful minority of independents, to Scottish astonishment, opposed it. The Scots, despite wanting full-blown non-Erastian presbyterianism in England, agreed to the \*Solemn League and Covenant (1643), which resulted in English presbyterianism being firmly under parliamentary control. The assembly produced a calvinistic *Directory of Worship* (1644) to replace the Book of Common Prayer, the presbyterian *Westminster Confession*, and two presbyterian *Westminster Catechisms*, which were its most enduring work. WMM

**Westminster cathedral**. Commissioned by Cardinal Herbert Vaughan, the third archbishop after the restoration of

the Roman catholic hierarchy in Britain, it was designed by J. F. Bentley in neo-Byzantine rather than Gothic style and built 1895–1903; outspoken opposition from many quarters was accompanied by derision ('Vaughan's Folly'), and his attempt to establish Benedictine monks at the cathedral was unsuccessful. The neo-Renaissance exterior, which includes a lofty campanile, contrasts bands of Portland stone with terracotta brick, but the interior decoration, richly ornamented with marble and mosaic, remains unfinished. The choir has long sustained an outstanding reputation for polyphonic music. ASH

**Westminster hall**, built by William Rufus (1097) as an extension of Edward the Confessor's palace, is the only surviving part of the original palace of \*Westminster. Used initially for feasts, then early parliaments, it developed into an administrative centre, housing the Courts of Common Pleas, King's Bench, Chancery, Exchequer, and Star Chamber. From mid-17th to mid-18th cent., legal activities proceeded alongside stalls selling books and trinkets, rendering it a fashionable haunt. The hall has suffered fires and floods, seen coronation banquets, trials (\*More, Charles I), and lyings-in-state (\*Gladstone, \*Churchill) under its hammer-beam roof, and is now linked to the House of Commons. ASH

**Westminster School** was founded shortly after the building of Westminster abbey. Henry VIII made the last abbot the first dean of the school in 1540. It was refounded by Elizabeth I 20 years later, connecting the school closely with her father's foundations of Christ Church, Oxford, and Trinity College, Cambridge. The great headmaster Richard Busby during his 57 years at the school (1638–95) increased its prestige, attracting the ruling classes. In 1848 there were eight former pupils in Lord John \*Russell's ministry. Following the report of the Public School Commission 1864, the school was separated from the abbey, whilst retaining a religious connection. PG

**Westmorland** was one of the smaller counties, about 40 miles from Stainmore in the east to Bowfell in the west. The greater part was fell country and the market towns—Appleby, Kendal, Kirkby Lonsdale, and Kirkby Stephen—were small. The southern part was drained by the rivers Lune and Kent running into Morecambe Bay, the northern by the Eden, draining into Solway Firth. Down the middle of the county ran the Tebay gorge, made by the Lune, and followed in 1846 by the railway and in 1971 by the M6 motorway. The administrative arrangements reflected the topography of the shire. It was divided into two baronies, north and south, each in turn divided into two wards. The barony of Kendal was in the diocese of York, and then of Chester: the barony of Westmorland was in the diocese of Carlisle. Not until 1856 were they both placed under Carlisle. The population was thinly spread. In 1811, the county had only 45,000 inhabitants, 7,000 in Kendal, 2,200 in Appleby, and just over 1,000 in Kirkby Lonsdale and Kirkby Stephen.

The name Westmorland seems to mean the country west of the moors—i.e. the Pennines. It formed part of \*Britannia territory, was occupied by the Romans, colonized by

## Westmorland

Anglo-Saxons pushing out the Britons, and became a rather loosely attached part of the kingdom of \*Northumbria. From the early 10th cent. there was considerable Norse settlement, from Ireland and the Isle of Man, leaving evidence in words like fell, ghyll, tarn, and how. There was also penetration south by Scottish and Pictish settlers. \*Aethelstan established political control in 927, negotiating with the kings of Scotland and the Picts at Eamont bridge, just south of Penrith. But Westmorland remained very much a border area, not integrated into the kingdom of England, and too remote and poor to receive much attention.

At the time of the Domesday survey in 1086, the Kendal barony was treated as part of Lancashire, while the northern parts of the area were not included at all. Much of the district remained under Scottish control until William Rufus in 1092 seized Carlisle and built a frontier castle there. Its establishment as a recognized county may have been as late as the 13th cent. but by 1290 it was represented in Edward I's parliaments by two knights of the shire.

The natives of Westmorland relied heavily upon sheep-farming in the south, cattle-rearing in the north, with a useful cloth industry in Kendal. Appleby, the county town, suffered greatly from Scottish raids, since it was athwart an easy line of advance across Stainmore towards Durham and York. It was sacked in 1173 and again in 1388. \*Camden in 1586 commented that there was 'nothing remarkable about it besides its antiquity and situation . . . it is of so little resort, and the buildings so mean, that if antiquity did not make it the chief town of the county, and the Assizes were not kept in the castle, where is the publick gaol for malefactors, it would be but very little above a village.'

\*Defoe, writing in the 1720s before the Romantic movement, found Westmorland 'eminent only for being the wildest, most barren and frightful of any thing that I have passed over in England, or even in Wales'. But by the mid-18th cent. travellers were discovering the charms of the Lake District and, with Ullswater, Helvellyn, Grasmere, and Windermere, Westmorland became better known. Its status as a national treasure owed much to the Lakeland poets in the early 19th cent. By mid-century railways were probing into the region—to Windermere in 1847, Conistone 1859, Keswick 1864, and Lakeside at Newby Bridge by 1869. Purists shuddered. R. S. Ferguson wrote in 1894 that 'nowadays railways and cheap trips have opened the district to everyone. The Liverpool man and the Manchester man have claimed it as their own, and studded the banks of Windermere with villas fearfully and wonderfully made . . . steam gondolas plough the waters once dear to Wordsworth.' In the 1990s, tourism is still the salvation and despair of the region. But, with the passing of years, gondolas on Windermere, Conistone, and Ullswater and steam trains to Lakeside have come to symbolize a bygone age of tranquillity.

By the local government reorganization of 1972, the county was merged with Cumberland and north-west Lancashire to form \*Cumbria. JAC

**Westmorland, Charles Neville, 6th earl of** (1542–1601). Westmorland, a catholic, succeeded his father in the title and great estates in Durham in 1564. Five years later he

joined his neighbours Lord Dacre and the 7th earl of \*Northumberland in the rising of the \*northern earls to release Mary, queen of Scots, from captivity and restore the old religion. After initial success, occupying Durham and Ripon and saying mass in the cathedrals, he fled before Lord \*Sussex and went into exile, never to return. He survived as a pensioner of Spain, implicated in many plots against Elizabeth's life. This was the last baronial rising in England and, significantly, in the northern counties where personal loyalties remained. Raby castle and the Neville estates were taken into crown hands and sold in the 1630s to Sir Henry \*Vane, father of the parliamentarian, and ancestor of the earls of Darlington, dukes of Cleveland. JAC

**Westmorland, Ralph Neville, 1st earl of** (c.1364–1425). Son of the 3rd Baron Neville, he succeeded to the title and great northern estates in 1388. He supported Richard II and was created earl in 1397. But he joined Henry Bolingbroke, his brother-in-law, in 1399 and was made marshal for life. He stayed loyal to Henry IV and was given the Garter in 1403. Neville profited considerably from the defeat of the Percies in 1403, taking many of their estates, and was primarily responsible in 1405 for crushing the rising of \*Nottingham, Archbishop \*Scrope, and \*Northumberland, it was said by treachery. His children by two marriages numbered 23: \*Warwick the Kingmaker was his grandson. JAC

**Weston, Richard.** See PORTLAND, 1ST EARL OF.

**West Sussex.** See SUSSEX, WEST.

**West Yorkshire.** See YORKSHIRE, WEST.

**Whewell, William** (1794–1866). Polymath, historian and philosopher of science, and Cambridge reformer, Whewell came from Lancashire where his father was a carpenter. At Cambridge with John \*Herschel he reformed the mathematics courses; at Trinity College he served as tutor, professor of mineralogy, professor of moral philosophy, and finally master. His study of Kant made him unhappy with the prevailing understanding of science, going back to Francis \*Bacon. Whewell believed that in science an intuitive leap must be associated with careful induction, and used this insight to display the history of science as a matter of finding the appropriate fundamental ideas in the various sciences. He believed that God's existence could not be proved, but that science could deepen and refine faith. Involved in numerous scientific bodies, he was greatly respected; but Sydney \*Smith said that science was his forte, omniscience his foible. DK

**Whigs.** The Whigs were one of the two main political parties in Britain between the later 17th and mid-19th cents. The term, which derived from 'whiggamore', the name by which the Scots \*covenanters had been derogatorily known, was first used by the Tories during the \*Exclusion crisis to brand the opponents of James, duke of York. Whiggery thus began as an oppositional and populist ideology, which saw political authority stemming from the people, a 'contract' existing between them and their king, whom they might resist if he overrode their interests. The Whigs naturally placed emphasis on parliamentary, as opposed to monarchical,

authority, while their libertarian creed made them espouse toleration for protestant dissenters. Early Whig principles played a key part in shaping the 1689 revolution settlement, though the Whigs themselves soon became divided over their attitudes to power-holding. Court Whigs ignored the party's populist attitudes and recognized the monarch's position in a 'mixed' or 'balanced' constitution. Their experience in office 1694–8 gave them a pragmatic view of government; they supported the wars against Louis XIV, sought partnership with London's extensive business interests, and made beneficial use of patronage. Under their aristocratic \*Junto leaders they acquired remarkable cohesion as a parliamentary party and achieved effective electoral organization. The smaller group of country Whigs remained critical of government, and under \*Harley in the later 1690s were absorbed into the 'new Tory Party'. As firm supporters of the Hanoverian succession the Whigs presided over George I's accession in 1714 and afterwards engineered the long-term proscription of their Tory rivals. The resulting 'Whig oligarchy' achieved a hitherto unseen stability in political life over the next few decades, with power concentrated in the hands of the great Whig families. Even so, Whig discontent with \*Walpole's administration grew appreciably in the 1730s and helped to topple him in 1742.

By the mid-1750s the ruling 'old corps' Whigs under Pelhamite direction were losing their party motivation under the vicissitudes of factionalism, and George III's antipathy to party resulted in many being removed from office. By the 1760s all politicians regarded themselves loosely as Whigs, but the term was consciously appropriated by the remnants of the old corps who had regrouped as an aristocratic country party led by \*Rockingham. Their consciousness as a 'party' was promoted by \*Burke in the 1770s and 1780s, with economical reform and the reduction of the power of the crown essential to their evolving ideology. The political crisis at the end of the American war brought them briefly to office until Rockingham's sudden death in July 1782. In 1783 they were the driving force behind the \*Fox–North coalition, but the king's long-standing hatred of Fox hastened their dismissal, enabling him to appoint the younger \*Pitt to head a government of essentially non-party Whigs. The Rockingham Whigs, now led by the duke of \*Portland and Charles James Fox, split in 1794 over their reaction to the French Revolution, with 'conservative' Whigs under Portland joining Pitt's administration, and the Foxites remaining in opposition. The latter kept alive the name of Whig, associating it with political, religious, and social reform, thereby contributing to the ideological context of the \*Reform Act of 1832. The mid-19th cent. saw Whiggery largely subsumed into liberalism, though some, like \*Devonshire, alienated by Gladstone's concession of \*Irish Home Rule in 1886, finished up in the Conservative Party. AAH

**Whistler, James Abbott McNeill** (1834–1903). Painter and etcher, born in Massachusetts. Dismissed from West Point, Whistler joined the US navy, where as a cartographer he learned etching and decided on a career in art. He went to Paris in 1855 before settling in London in 1859, where he

enjoyed an early success, not only for his art but also for his flamboyant life-style. Often controversial, he conducted a number of campaigns against both critics and public. In 1877 he sued \*Ruskin for libel and although he won his case and was awarded one farthing in damages, the expenses bankrupted him. In one year, he was able to restore his fortunes with the sale of etchings made in Venice. His later life saw both artistic and financial success, with his salon in Chelsea a fashionable gathering place. In 1890 he published *The Gentle Art of Making Enemies*, a collection of caustic letters and comment. JC

**Whitby, Synod of**, 664. The Northumbrian church, which began with \*Paulinus and Roman Christianity, was revived by \*Aidan, who introduced Celtic customs from Iona. The most controversial difference, the dating of Easter, was the main issue at Whitby. \*Bede highlights the inconvenience when King \*Oswiu's Celtic Easter conflicted with his queen Eanfled's Roman observance. As the dates rarely diverged, it is possible the debate was prompted by political tension between Oswiu and his son Alhfrith, subking of Deira. Influenced by \*Wilfrid, whom he made abbot at Ripon, expelling Celtic adherents, Alhfrith had recently adopted Roman practices.

Key Northumbrians representing the Celtic cause at Whitby were Abbess \*Hilda, Cedd, bishop to the East Saxons, and Bishop Colman of Lindisfarne. Wilfrid was spokesman for the visiting Frankish bishop Agilbert from Wessex, and his priest Agatho, main advocates for Rome. Oswiu's decision to conform with the greater body of Roman Christianity may have been politically expedient. He probably defused a situation created by Alhfrith, and won vital papal acknowledgement of his supremacy in England. Whitby prepared the way for unification of the English church by \*Theodore, next archbishop of Canterbury. AM

**White, Gilbert** (1720–93). Naturalist. Born in his grandfather's vicarage in the village of Selborne (Hants), into a scientifically minded family, White was educated at Oriel College, Oxford (fellow, 1744), and ordained in 1747, but preferred a Hampshire curacy to a 'fat goose living' elsewhere to stay close to the family home The Wakes (inherited eventually, with tortoise). A scientific naturalist by intention and committed diarist and record-keeper, observant, accurate, and unassuming, he started a 'Garden Kalendar' in 1751 which developed into 'The Naturalist's Journal' (1768); this, with letters and papers, provided source material for *The Natural History of Selborne* (1788), subsequently an English classic, reflecting concern for the behaviour of living things rather than dead specimens, and evoking village life. Gardening was one of White's greatest pleasures, but he regularly visited London, Oxford, and relations, was essayist and poet, corresponded with other naturalists, and influenced local husbandry. ASH

**Whiteboys** was the name adopted by agrarian rebels in Ireland from 1761 onwards. The immediate cause of the outrages seems to have been the enclosure of common land for pasture, but grievances soon included tithes and

## Whitefield

extortionate leases. Bands of armed men rode at night with comparative impunity, levelling walls, maiming cattle, and burning houses. The centre of the movement was Munster, where the native Irish were poorest. Supported by widespread intimidation, it was difficult to deal with and continued for some decades. JAC

**Whitefield, George** (1714–70). Evangelist. Born at the Bell Inn, Gloucester, which his father kept, Whitefield entered Pembroke College, Oxford, as a servitor in 1732. Attracted by the Oxford \*methodists, he openly joined them in 1735. Ordained deacon and then priest (January 1739), he went to America for the first of seven visits in 1738. If his first sermon reputedly drove fifteen hearers mad, his breakthrough as an evangelist came in February 1739 when he preached in the open air to 200 Kingswood colliers. This daring irregularity made his name and soon he was preaching to thousands. He first used extempore prayer in 1738, giving up the surplice in America, where he also exchanged pulpits with dissenters. His championship of predestination interrupted his friendship with \*Wesley in the late 1740s and the breach between calvinist and arminian methodists remained unhealed. From 1741 Whitefield's London base was Moorfields tabernacle, with other tabernacles at Norwich (1751), Bristol (1756), and elsewhere. In 1744 he met Lady \*Huntingdon, proving no match for her 'tip-top gentility'. He is said to have delivered 18,000 sermons, preaching 40–60 hours a week. He visited Ireland, Scotland, and Wales as well as America, where he died, worn out, at Newbury Port, New Hampshire, in September 1770. Fair, stout, irritable, orderly, and punctual, with an inimitable voice, his weakness as an organizer has obscured his lasting influence as the \*evangelical revival's greatest preacher. CB

**Whitehall palace** as a royal residence lasted some 150 years. It began life as the London residence of the archbishops of York and was called York Place. \*Wolsey spent lavishly on it and, on his fall in 1529, it was seized by Henry VIII, who had lost the greater part of Westminster palace by fire in 1512. He added a tiltyard for tournaments, a tennis court, cockpit, and bowling alley, and bought up fields to the west which eventually became St James's Park. The palace remained ramshackle, a collection of miscellaneous buildings linked by galleries, with the main road from Charing Cross to Westminster running right through it. Elizabeth I entertained her suitor the duc d'Alençon there in 1581 in a number of makeshift canvas pavilions. Her successor James I resolved to build a fitting reception hall. His first attempt was burned down in 1619, but the second, the \*Banqueting hall, designed by Inigo \*Jones, was finished by 1622. Charles II used the palace a great deal after the Restoration with various suites fitted out for his assortment of mistresses, but William III disliked it and began developing \*Hampton Court and \*Kensington palace, in the country, as alternatives. A disastrous fire in 1698, which left only the Banqueting hall standing, provided the opportunity to abandon a palace that was too sprawling, public, and inconvenient. By the 18th cent. it was being taken over for government offices. JAC

**Whitelocke, Bulstrode** (1605–75). Whitelocke's father was a judge and he was called to the bar after graduating from St John's College, Oxford. Returned to the Long Parliament for Marlow in 1640, he took the parliamentary side, but was moderate in tone and prominent in peace discussions. In 1648 he was made one of four commissioners for the \*great seal, a position he held several times subsequently. He took no part in the trial of the king. From 1653–4 he was ambassador to Sweden, leaving an account of his negotiations. Close to \*Cromwell, he urged him to accept the crown, served in 1657 as a member of the House of Lords, and was on the \*Council of State under Richard \*Cromwell. At the Restoration he profited from his moderate stance, \*Clarendon writing charitably that he had been 'carried away with the torrent'. He was allowed to live in retirement without harassment. Given his position, it is not surprising that Whitelocke has been regarded by many commentators as a trimmer and time-server, but he is a reminder that many men did not wish to take sides or place themselves in peril. His *Memorials of the English Affairs*, first published in 1682, is useful, but of even greater value is his diary, covering the whole of his life, first printed in 1990. JAC

**White Ship.** Its wreck on 25 November 1120 destroyed Henry I's plans for the succession, because his only legitimate son William died aged 17 in the disaster. An immediate second marriage to \*Adela of Louvain produced no male heir, so, in 1126, Henry nominated his daughter, the Empress \*Matilda, as his successor. The *White Ship* was sailing from \*Normandy to England, on one of the many routine voyages made necessary by the cross-channel Anglo-Norman realm, when it hit a rock in the Seine estuary. Two contemporary chroniclers say that the crew was drunk. DB

**Whitgift, John** (c.1530–1604). Archbishop of Canterbury (1583–1604). Born in Lincolnshire, Whitgift was educated at Pembroke Hall, Cambridge, a centre of reform, where he remained throughout Mary's reign. Ordained (1560), he was successively Lady Margaret professor of divinity (1563–7), master of Pembroke Hall (1567) and Trinity College (1567–77)—where he expelled \*Cartwright—regius professor of divinity (1567–9), dean of Lincoln (1576), bishop of Worcester (1577), and archbishop in succession to \*Grindal. Though strongly calvinist, he vigorously defended \*episcopacy and Anglican liturgy and ritual. As archbishop, he worked hard for uniformity; his Six Articles (1583) insisted on the Thirty-Nine Articles, the Book of Common Prayer, and the royal supremacy, to be enforced by the Court of \*High Commission. Despite his fierce offensive against puritans, he upheld calvinist doctrines of predestination and election in the Lambeth articles (1595). WMM

**Whithorn, diocese of.** Established in 731 as one of the four northern bishoprics under \*York, its centre in extreme south-west Scotland was on the site of a Celtic monastery founded by \*Ninian (c.440). It failed to survive the Danish invasions of the 9th cent. and was not revived. The site has been extensively excavated. WMM

**Whittingham, William** (c.1524–79). Translator of the Bible. Educated at Oxford, where he became a fellow of All Souls,

Whittingham travelled on the continent from 1550, mixing in calvinist circles. He spent the reign of Mary in exile, succeeding John \*Knox in 1559 as minister at Geneva. Much of his time was devoted to a new translation of the Bible, the 'breeches version', published in Geneva in 1560. Until the issue of the Authorized Version in 1611, this was by far the most popular translation. Returning to England in 1560, he was appointed by Elizabeth to the deanery of Durham in 1563. Objection was made to his puritan tendencies, including dislike of the surplice, and he was said not to have been validly ordained. He died before these charges had been adjudicated. JAC

**Whittington, Richard** (d. 1423). Mercer and benefactor. Youngest son of a Gloucestershire landowner, Whittington established himself in London, dealing in valuable imported silks and velvets, and thrice becoming master of the Mercers' Company. He regularly loaned large sums of money to the crown, but his licence from Henry IV to ship wool from London without paying the normal heavy export duty and two separate terms as collector of customs and subsidy in London and Calais enabled him to recoup the debts. A city alderman in 1393, he was elected mayor three times (1397–8, 1406–7, 1419–20). When Whittington died widowed and childless, his executors devoted his great wealth to further public works, including improvements to St Bartholomew's hospital, Guildhall, and Newgate gaol. The Whittington charity remains active. The myth introducing a cat, his early poverty, and eventual knighthood evolved in the early 17th cent., but retains its charm today in pantomime. ASH

**Whittle, Sir Frank** (1907–96). Born in Coventry, Frank Whittle, inventor of the jet engine, began his career as an apprentice with the Royal Air Force at RAF College, Cranwell. While still a student he developed the idea of the gas turbine or 'jet' engine, but was discouraged by the technical and administrative difficulties in Britain in the 1920s. But from 1934–6 the RAF seconded him to Peterhouse, Cambridge, where he took 1st class honours in Mechanical Engineering. In the lead-up to the Second World War he was assigned to a special project to develop the engine, and despite shortage of materials and much official incomprehension was brilliantly successful. His team produced a viable gas turbine and installed it in an aeroplane to create the first British jet fighter in the closing stages of the war. Other inventors, in Germany and Italy, had been working on similar lines but it was Whittle's expertise which was taken up in Britain and the USA to produce the radically new generation of jet aircraft after the war. Whittle lived the last 20 years of his life in the USA, was awarded the OM in 1986, and at a thanksgiving service in Westminster Abbey in November 1996 was saluted by a fly-past of six jets. RAB

**Wiglaf** (d. 840), king of Mercia (827–9 and 830–40). Wiglaf's family background is not known, but he came to power in 827 at a time when several cadet lines were competing for the throne and, perhaps to help consolidate his position, he married Ælflæd, the daughter of Ceolwulf I. In 829 Wiglaf was expelled by King \*Egbert of Wessex who had already

greatly reduced Mercian control south of the Thames. Egbert ruled Mercia for a year, but Wiglaf returned in 830 and reasserted Mercian control in Middlesex and Berkshire. In 836 he presided over a church assembly at Croft (Leics.), which was attended by the archbishop of Canterbury and all the southern bishops. Wiglaf was the only one of his line to rule; his grandson Wigstan was murdered by the son of Wiglaf's successor Beorhtwulf and was subsequently venerated as a saint at \*Repton, where he and Wiglaf were buried. BAEY

**Wihtrred** (d. 725), king of Kent (690 (as joint king), sole ruler 692, 694–725). Wihtrred is chiefly remembered for laws issued in 695, the third and last of the surviving Kentish 'codes'. Much of its emphasis is ecclesiastical. The first clause grants the church immunity from taxation. Others seek to enforce the church's rules on marriage, fasting, and the observance of the sabbath. We cannot assume that such laws were necessarily much more than indicative of the aspirations of ecclesiastics who played a large part in drawing them up. But it is important that they *could* have stood for much more; for an enforced godly regime. Certainly Wihtrred was a major benefactor to monasteries. A characteristic of his Kent was wealth: an abundant silver coinage of 'sceattas' was minted there, and Kent lay at a great maritime crossroads. The silver coins and the pious efforts of Wihtrred's reign must relate to this and to one another in ways no less important than hard to disentangle. JCa

**Wilberforce, William** (1759–1833). Evangelical philanthropist and anti-slavery campaigner. Born in Hull, the son of a merchant, and educated at St John's College, Cambridge, he was MP for Hull (1780), Yorkshire (1784–1812), and Bramber (1812–25). Following his conversion (1784–85) he became a leading evangelical, helping found the Proclamation Society to prosecute blasphemy and vice (1787), the Society for Bettering the Condition of the Poor (1796), the \*Church Missionary Society (1799), and the \*Bible Society (1804). His *Practical View of Christianity* (1797) went through 15 English and 25 American editions by 1825. In 1787 he joined the campaign against the slave trade, which he promoted in Parliament through his friendship with Prime Minister \*Pitt, though his inept tactics may have delayed success, which came only in 1807. In 1823 he joined the \*Anti-Slavery Society, though ill health forced his retirement from public life in 1825. ER

**Wild, Jonathan** (c.1682–1725). Thief-taker and anti-hero. Trained as a buckle-maker, Wild's imprisonment for debt brought him into contact with the underworld, then into handling stolen property. He circumvented the 1707 Act which made fences accessories by deliberately planning robberies from identifiable victims, from whom he could then claim reward money on return of their property. Ostensibly an instrument of justice by apprehending criminals whose conviction would be rewarded, he simultaneously organized his own thieves into allotted gangs, supporting but controlling them by 'bringing them to justice' if he chose. His activities prompted a statute whereby receiving a reward for returning deliberately stolen goods was an offence

comparable to the felony (1718), but the self-delusion that his public services outweighed his own crimes eventually ended at Tyburn. ASH

**Wilde, Oscar** (1854–1900). Dublin-born aesthete, dramatist, and, by his own declaration, genius. At Oxford Pater and \*Ruskin entranced him more than his classical studies, though a visit to Greece confirmed his commitment to the artist's life. His early *Poems* (1881) were derivative but his personality, extravagantly displayed on an American tour the following year, was original. 'To become a work of art is the object of living,' he wrote, anticipating *The Picture of Dorian Gray* (1891), though much of his art went into his conversation. Something of its brilliance survives in essays like 'The Critic as Artist' but in the theatre he found his true *métier*: 'I took the drama, the most objective form known to art, and made it as personal . . . as the lyric or sonnet.' At the height of his powers, his ambivalent relationship to Victorian society most subtly deployed with *The Importance of Being Earnest* (1895), disaster struck. Publicly reviled, convicted of sodomy, he was sentenced to two years' hard labour in Reading gaol. Five years later, neglected in Paris, he was dead. JNRS

'Wild Geese' was the name given to catholic Irish professional soldiers who served in the armies of European sovereigns, especially after the conclusion of the Williamite war (1689–91) in Ireland. In fact connections of this kind long predated 1691, but the treaty of \*Limerick of 1691 sent 12,000 Irish troops to join the French army, and thereafter the combination of discouragement at home and opportunity abroad kept the flow of men going. They served with distinction in the armies of France, Austria, and Spain. Their leaders inevitably began to be absorbed into the ruling class of the great catholic monarchies, especially after 1759, when the last hope of Stuart restoration vanished. The French Revolution abolished the Irish Brigade in 1791. It also destroyed their monarchical Counter-Reformation world. BPL

**Wilfrid, St** (c.634–c.709). Bishop of Northumbria. Noble, Northumbrian, sent by Queen Eanflæd to study at \*Lindisfarne, Wilfrid then travelled to Kent, to Lyons, and to Rome. Back home, he introduced Roman ways in the monastery of Ripon, given to him by Alhfrith of Deira, was ordained by Agilbert, Frankish bishop of Wessex, for whom he spoke at the Synod of \*Whitby (664) in favour of the Roman Easter, and was sent for consecration in Paris as bishop for the Northumbrians.

His subsequent career was stormy, involving deprivation (664–9, 678–86, 691–706) and divisions of his see, appropriation of assets of his monasteries, disagreements with the Northumbrian kings Ecgrith and Aldfrith and with the archbishops of Canterbury \*Theodore and Berhtwald, visits to the pope to appeal (he put in some missionary work in Frisia in 678–9 *en route*), imprisonment, exile, and Northumbrian councils (Austerfield in 703 and Nidd 706). While not at home, he worked amongst the South Saxons, the West Saxons in the Isle of Wight, and in Mercia. He died as bishop of \*Hexham at Oundle in 709 or 710 and was buried at

Ripon. His relics were moved to Canterbury, probably in 948, by Archbishop \*Oda.

The Wilfridian view, expressed in the partisan life attributed to Eddius Stephanus, was apparently that the good in the Northumbrian church was Roman, that it had been introduced by Wilfrid, and that, like a latter-day Old Testament prophet, he was persecuted by persons with ignoble motives. The historical perception of the opposition, strong at Whitby (under \*Hilda), \*Lindisfarne, and perhaps \*Jar-row, possibly enunciated in \*Bede's measured account, differed, giving Wilfrid less prominence. Wilfrid's episcopal style and ideals resembled those in Gaul, where bishops had large sees, huge estates, and a high political profile, combining personal asceticism with public grandeur. Theodore implicitly favoured smaller sees, as more manageable and less corrupting, while Irish bishops tended to be glorified priests, inferior in most ways to abbots. There were questions of which monastery could establish precedent for supplying bishops to a see, Whitby having designs on York. Wilfrid may have wanted archiepiscopal status for York.

Wilfrid was in many respects—his ferocity, retinue, the loyalty of his followers, and his death-bed distribution of treasure—an ecclesiastical version of a traditional aristocratic warlord. His wealth was, however, not out of line, which suggests that other considerations irritated his kings. He refused to persuade Queen \*Æthelthryth to consummate her marriage to Ecgrith, and if, as is possible, the estates which she had given Wilfrid at Hexham would have reverted to Ecgrith when she retired, had she not alienated them, Ecgrith's irritation must have been compounded. Wilfrid's promotion of Æthelthryth's cult was perhaps in part to emphasize his own sanctity. His promotion of King \*Oswald's cult makes it plausible that he supported claims of Oswald's offspring to the Northumbrian kingship, against those of \*Oswiu's family. Wilfrid's activities in Mercia and his friendship with Mercian kings, notably \*Wulfhere and \*Æthelred, might also have rendered him suspect.

The intensity of feeling Wilfrid aroused is testimony to his importance. Conversion (of Frisians and Anglo-Saxons), foundation of monasteries (including Oundle in Mercia and Selsey in Sussex), and building (his crypts at Ripon and Hexham survive) were grist to his mill. His churches were in Gallic style, proclaiming his allegiances. He also brought from Gaul esteem for the rule of St Benedict, to whose English diffusion he contributed. He was a channel for Roman influence, promoting the cult of the Virgin, but he did not dramatically enhance papal authority. AER

**Wilkes, John** (1725–97). Described on his coffin as 'A Friend of Liberty', Wilkes was the central figure in a number of constitutional disputes which extended the political rights of ordinary citizens. After a rakish and dissolute youth, he became MP for Aylesbury in 1757. A leading opponent of Lord \*Bute, Wilkes was arrested after the publication on 23 April 1763 of an article in No. 45 of his paper, the \*North Briton, and charged with seditious libel. He successfully challenged the use of \*general warrants which had been issued, but was condemned by Parliament for publishing a scandalous,

obscene, and impious libel. Wilkes fled to the continent in 1764. On his return in 1768 he was treated as a popular hero and elected MP for Middlesex. However, he was imprisoned for libel and expelled from the Commons, despite repeated re-election for Middlesex. 'Wilkes and Liberty' became the slogan of the London crowds who demonstrated in his support from 1763 to 1774, when he became lord mayor of London and was able to assume his seat as MP for Middlesex. Wilkes advocated complete religious toleration and supported the American colonists. He was a champion of mass politics, henceforth one of the strands in popular radicalism. JFCH

**Wilkie, Sir David** (1785–1841). Scottish painter renowned for his lively representations of the commonplace in Scottish life. His first important work, now in the National Gallery of Scotland, was *Pitlessie Fair* (1804), while *The Village Politicians* (Scone palace) confirmed his reputation when it was submitted to the Royal Academy in 1806. Wilkie had many important patrons, including the duke of Wellington and the prince regent, who commissioned *The Penny Wedding* in 1818. He was painter-in-ordinary to three monarchs and knighted in 1836. Between 1825 and 1828, Wilkie was in Europe and his later works, showing Italian and Spanish influences, were less popular. In 1840 he visited the Holy Land to paint authentic biblical scenes. On the return journey he died at sea, an event commemorated by Turner in *Peace: Burial at Sea* (Tate Gallery). JC

**Wilkins, John** (1614–72). One of the most prominent of the remarkable group of amateur scientists in the mid-17th cent. He attended Oxford and took holy orders, becoming chaplain to a number of noblemen. In his first book, *Discovery of a World in the Moon* (1638), he argued that man could reach the moon and that it could be made habitable. The 'invisible college' of scientists which he organized was the forerunner of the Royal Society, established in 1660 with Wilkins as secretary. Joining the parliamentary side in the Civil War, he was appointed warden of Wadham College, Oxford, in 1648 and in 1656 married a sister of Oliver Cromwell, retaining his college headship. In 1659 he transferred to the mastership of Trinity College, Cambridge, and though he lost it at the Restoration, he was made dean of Ripon in 1663 and bishop of Chester in 1668. His reputation was as a conciliator and latitudinarian, anxious not to oppress the dissenters. Though some sneered at him as a time-server and trimmer, it is extraordinary that a man could live in such turbulent times and win such widespread praise. Burnet wrote that Wilkins had 'as great a mind and as good a soul' as any man he had known, and Evelyn, a close friend, thought him 'universally beloved by all that know him'. Aubrey wrote that Wilkins was 'no great read man, but one of much and deep thinking, and of a working head'. JAC

**Wilkinson, Ellen** (1891–1947). One of Britain's best known and most successful female politicians. After completing a history degree at Manchester University, she became an organizer for the National Union of Women's Suffrage Societies and then, in 1915, for the National Women's Organization of the Amalgamated Union of Co-operative

Employees. Although an early Communist Party member, she became Labour MP for Middlesbrough (1924–31) and for Jarrow from 1935. It was in the 1930s that 'Red Ellen' made her reputation as a crusader for the unemployed with extensive involvement in the Unity campaign, the famous Jarrow march, and in the campaign against fascism in Germany and Spain. Her fiery oratory became legend. By the outbreak of war she had risen from rebel to frontbencher and was given a position in the Home Office in 1940. As minister for education 1945–7 her career has been regarded with disappointment by some. Yet she achieved much: the implementation of the 1944 Education Act, the raising of the school-leaving age to 15, despite Treasury opposition, the building of new schools, and the introduction of 'school milk'. Her achievement was more impressive given the unfavourable prevailing economic conditions. She died of bronchitis in 1947. LHM

**Wilkinson, John** (1728–1808). One of the most remarkable ironmasters and entrepreneurs of his day, Wilkinson was born in Cumberland. His father made money producing box-irons and then moved near to Wrexham, where he made high-quality cylinders, much used by Boulton and Watt. John Wilkinson established furnaces at Coalbrookdale, using coal in place of charcoal, and diversified his output. Iron barges on the Severn carried his wares, he provided the ironwork for the great Iron Bridge in 1779, and manufactured lead pipes. But his most profitable line was boring cannon. Said to be harsh and combative, he amassed a large fortune. His sister married Joseph Priestley and in 1792 Wilkinson was reported to be sympathetic towards the French Revolution, paying his workmen in *assignats*. The DNB remarks coyly that 'his domestic arrangements were of a very peculiar character' and he left three illegitimate sons. Known popularly as 'Iron-mad Wilkinson', he was buried on his Cumberland estate near Ulverston in an iron coffin inside an iron tomb, roofed by an iron pyramid, and with an inscription, in iron letters, that he had himself composed. JAC

**William I** (1027/8–87), king of England (1066–87) and duke of Normandy (1035–87), known as 'the Conqueror', was born at Falaise in Normandy. His father was Robert the Magnificent, duke of Normandy (1027–35), and his mother was Herleva, a woman about whose origins various theories have been developed, but who was certainly an established partner of the duke. William's succession to the duchy occurred when he was 8 and had the prior agreement of the Norman magnates and of his lord, the king of France. The first years of his rule in Normandy were turbulent and his survival at times precarious. He faced rival claimants from within his own family and his illegitimate birth was sometimes mocked by contemporaries—his other nickname ('the Bastard') was used in his own lifetime—but, after defeating Norman rebels in 1047 and 1053–4, he established a formidable control within the duchy which was never thereafter seriously threatened. For reasons which are not entirely clear, his overlord the French king turned against him in the early 1050s and he had to overcome invasions led by Henry I of France and the count of Anjou, Geoffrey Martel,

## William II

in 1053–4 and 1057. William began to make territorial gains to the south of Normandy in the 1050s and in 1063 acquired the large county of Maine. In 1051 he received a promise of succession to the English kingdom from \*Edward the Confessor, apparently out of gratitude for the protection which Edward had been given while in exile in Normandy, and in 1066 he defeated \*Harold Godwineson at the battle of \*Hastings to make good his claim. William appears initially to have tried to rule conquered England with the support of an aristocracy which was a mixture of natives and Normans, but it is clear in retrospect that there was no trust between the two groups and that the policy was doomed to failure. Six years of often brutal campaigning, which included the notorious 'harrying of the orth' in the winter of 1069–70, were needed to complete the subjugation of William's new kingdom. He thereafter relied almost exclusively on his northern French followers, a new aristocracy whose dominance is clearly revealed by \*Domesday Book. After 1072 he visited England infrequently, usually to deal with crises such as the revolt of the earls in 1075 or the threatened invasion from Denmark in 1085. The last decade of his life was troubled by the revival of enemies in northern France, dissensions within the ruling group of Normans fomented by his eldest son \*Robert Curthose, and threats of invasion of England from Scandinavia. On his death-bed, he divided his lands between Robert Curthose, who received Normandy, and his second surviving son, William Rufus, who was given England. The reasons for this division are not definitively known; it is probable that years of conflict had made him distrust Robert, whose claims to Normandy were none the less undeniable, and that he was influenced by a long-standing custom whereby territorial provision was often made for the younger sons of the Norman ducal kindred.

William's achievement was based on a powerful personality, which appears to have overawed almost all who came into contact with him, and a strong physique which made him one of the most formidable warriors of his day. A capacity for often excessive cruelty and for leadership in war was combined with an unbending will and a shrewd political mind. His power base in Normandy was constructed around a small inner circle of kinsmen and associates who were ruthlessly advanced at the expense of rivals. Members of this group were also at the centre of Norman rule in England. His wife \*Matilda, to whom he was faithful in a way which is remarkable among contemporary medieval kings, often acted as his deputy in Normandy when he was in England. He cleverly ensnared Harold Godwineson in a web of perjury, by obliging him to swear the celebrated oath at either Bonneville or Bayeux, and he skilfully used his reputation as a religious reformer to secure the papacy's sponsorship of the war of conquest of 1066 and its co-operation in the reorganization of the English church which followed, in which Archbishop \*Lanfranc of Canterbury was a skilled and well-chosen collaborator. Intelligently and probably cynically, he used Edward the Confessor's promise of the succession to construct a framework of legality within which lands could be transferred from the dispossessed English to French newcomers; even if this was a disorderly process exacerbated by the rapacity of many of

the conquerors (to which William himself seems at times to have turned a blind eye), the idea of legal continuity created a structure within which royal authority could sometimes operate effectively. He maintained English overlordship over Wales and Scotland. He enjoyed a measure of good fortune, most notably in the deaths in 1060 of his major rivals in France, the French king Henry I and Count Geoffrey Martel, which enabled him to intervene in England without having to be much concerned about possible threats to the duchy. He was also lucky in that Harold Godwineson's victory at the battle of \*Stamford Bridge over \*Harold Hardrada removed a contender whom William would otherwise have had to fight and in that \*Edgar the Atheling was not a credible alternative around whom the English could unite after 1066. William's death was followed by a civil war between his sons over his inheritance, which was not finally resolved until Henry I's reunification of Normandy and England in 1106. This struggle is testimony to the solidity of William's achievements, since his sons were basically fighting to continue them. Almost every aspect of the \*Norman Conquest is controversial. But there can be no doubt that it was William's formidable abilities which laid the foundations for its success.

DB

Bates, D., *William the Conqueror* (1989); Douglas, D. C., *William the Conqueror* (1964); Fleming, R., *Kings and Lords in Conquest England* (1991).

**William II** (c.1060–1100), king of England (1087–1100), known as 'Rufus', the second son of William the Conqueror, was a ruler whose reputation has suffered because of the opinions of contemporary ecclesiastics, appalled by his sometimes cynical attitude to religion. William became England's king as a result of his father's death-bed bequest. Whether his succession should be interpreted as involving the disinheritance of his elder brother \*Robert Curthose is a controversial matter which cannot be conclusively resolved from the existing sources. Whatever the case, the consequence was that William rapidly faced widespread revolt in England in 1088 in support of Robert, who had acquired \*Normandy. A major motive for revolt, quite apart from personal loyalties towards Robert, was certainly that the great magnates holding cross-channel estates feared the implications of having the territories under two different rulers. After defeating his opponents, William set out to weaken Robert's increasingly fragile hold on the duchy, organizing expeditions there in 1091 and 1094. In 1096 Robert mortgaged the duchy to William in order to take part in the First Crusade, and from then until his death, William ruled over his father's cross-channel realm and regained some of the authority over Normandy's neighbours which his brother had lost. William also consolidated Norman rule in northern England, establishing effective royal power at Carlisle, and he supported the continuing Norman-French penetration of Wales. William's notoriety is based partly on the rapacity of his financial exactions and in particular on the way in which such established royal rights as that of administering bishoprics and abbeys during vacancies were ruthlessly exploited. The king also had a habit of making provocative remarks which offended the susceptibilities of

more scrupulous clergy and he lacked the sincerity of belief which had ensured his father's good relations with the church. All of these factors contributed to his quarrel with St \*Anselm, the gifted theologian and philosopher whose appointment to Canterbury had been dramatically sanctioned by the king as he lay seriously ill at Gloucester in 1093. A series of arguments culminated in the archbishop going into exile in 1097 and remaining out of England until after William's death. Historians differ as to the central causes of this conflict and where personal responsibility should be placed; it is certain that the king lacked tact, but most bishops continued to work with him and to support him. William can be seen as personifying the masculine military virtues of his age; the fact that he never married led to suggestions of homosexuality and several clerical commentators accused him of sexual depravity. In most respects, his reign was a success, but his blustering and inflammatory personality made him enemies. He was killed while hunting in the New Forest on 2 August 1100. His death was probably an accident; all arguments that he was murdered rest on highly circumstantial evidence. His death did, however, come at a very convenient time for his younger brother, the future Henry I, who was nearby and who reacted with such promptness that he was crowned king within three days of his brother's death. The nickname 'Rufus' first appeared in the early 12th cent., and refers either to red hair or to a ruddy complexion. DB

Barlow, F., *William Rufus* (1983).

**William I** (c.1142–1214), king of Scots (1165–1214), later known as 'the Lion'. Younger brother and successor to Malcolm IV, he was granted the earldom of Northumberland by his grandfather David I in 1152, and never accepted the loss of the border counties to Henry II in 1157. When Henry faced a major rebellion in 1173–4, William invaded Northumberland and Cumberland in a disastrous bid to reassert Scottish control. Captured at \*Alnwick, he had to recognize Henry as the superior lord of Scotland by the treaty of \*Falaise. Scottish independence was restored by the quitclaim of \*Canterbury, and in 1192 the papacy confirmed that the Scottish church was free of all external authority save the pope's. But Anglo-Scottish relations remained tense and, while Scotland retained its formal independence, King John imposed stringent terms by the treaty of \*Norham. Although William's conflicts with the English crown distracted his attention from the Highlands and Isles, his long reign nevertheless saw important advances on the lines laid down by David I, and 'against his few startling failures we must set a larger though less dramatic record of unflagging achievement'. New burghs were founded outside the traditional royal heartlands; Anglo-Norman families gained new estates, especially north of the river Tay; and the bishopric of Argyll was established in about 1192. Though native lords were by no means excluded from William's favour, the intensification of royal control triggered a series of rebellions along the periphery, in Galloway, Moray, Ross, and Caithness. The crushing of these risings was striking testimony to William's resources and ability; but a contrast must still be drawn between the effectiveness

of royal power in the Lowlands and its much more restricted nature in the far north and west. In addition, the Isles remained, however loosely, under the overlordship of Norway. William died at Stirling and was buried in Arbroath abbey, which he had founded in honour of St Thomas \*Becket. Not until the 14th cent. was he referred to as 'the Lion', an epithet evoking his reputation as an enforcer of justice. KJS

**William III** (1650–1702), king of England, Scotland (as William II), and Ireland (1689–1702), prince of Orange. Appointed stadtholder of Holland and Zeeland, and captain-and admiral-general of all the Dutch provinces for life in July 1672, these posts were rendered hereditary in 1674 and 1675, when William was additionally elected stadtholder of Utrecht and Gelderland. He was the only child of William II of Orange and Mary Stuart, eldest daughter of Charles I, and was born on 4 November, eight days after his father's death, at a time of extreme crisis in Orange's relations with Amsterdam, always the seat of anti-Orangist sentiment. Twenty years of republican rule then ensued, setting the Orangist interest at a discount: it was excluded from all future participation in Holland's government, the young prince's upbringing being left to his mother and then to his redoubtable paternal grandmother, Amalia van Solms. Like his cousin and lifelong antagonist Louis XIV, William's early life was overshadowed by adversity, though this proved preparation for an astute character with a destiny of exceptional challenge. Impressively educated in sciences and languages, and severely tutored in Dutch republican doctrine, William yet had his Stuart ties, the exiled Charles II conferring the Garter on his infant nephew in 1653. Charles's restoration in 1660 in fact saw Orange's readmission to Holland's public life, the 10-year-old William being ceremonially received at Amsterdam.

During the 1660s William, puny in stature and incurably asthmatic, reached manhood. The Dutch republicans tried to bolt the door against any renewed Orange challenge. In 1667 the Holland stadtholderate was abolished, and the other six provinces following suit in 1670. William's first visit to England in November 1670, when he was received with gratifying honour, left him distrustful of Charles II, who was now planning the dismemberment of the Dutch republic in conjunction with Louis XIV. The Anglo-French attack in 1672 brought forth so strong an Orangist reaction that the Dutch savagely discarded republican government and bore the 22-year-old William upwards as the embodiment of resistance to aggression. In the formation of an anti-French front, William attained European stature and, returning to England in October 1677, was able to take momentous advantage of Charles II's embarrassed foreign policies by marrying his 15-year-old cousin Princess Mary, the elder and indubitably protestant daughter of James, duke of York, a professed catholic since 1670. William's underlying objective, frustrated by Charles II's wiles and Louis XIV's bribes, was to bring England into the anti-French front, but since Mary at this time was heir to the British crown, after her father, William manifestly enhanced his own more distant claim through his mother. The duke of York's last son

## William IV

by his first marriage had died in 1671, but his second duchess, the Italian \*Mary of Modena, at 19 only four years the senior of Princess Mary, might well have a healthy son. From different motives the British and French monarchs resolved to acquiesce in the Orange marriage. Difficult though the marriage proved to be for two people of very different temperaments, and remaining childless, it enabled William to play the dynast and laid the foundation for his intervention in England's affairs in November 1688. His visit in July 1681 confirmed William's view that the collapse of the opposition to his father-in-law's succession would indefinitely prolong British non-alignment in Europe's struggle against France. His 'failure' to prevent \*Monmouth's attempt against James II from Holland in May 1685 may have been calculated, William presuming that the expedition would end in disaster.

In November 1685 James II's assertion of the prerogative on behalf of his non-Anglican subjects alienated the most loyal Parliament a Stuart king had known. That William could prepare to intervene in England in the spring of 1688, some three months before he received the celebrated 'Invitation' of 30 June to rescue English liberties 'before it be too late', was owing to a series of reverses for France, and misjudgements by Louis XIV. The French thrust across the Rhine in September 1688, which enabled William to take 40,000 men in 400 ships across to England in autumn weather six weeks later, was occasioned by a series of diplomatic reverses which threatened the collapse of French policy towards Germany. No less consequential was Louis XIV's revocation of the Edict of Nantes in October 1685 which united behind Orange a spectrum of Dutch protestant opinion of unprecedented breadth. Further, the French government endeavoured to arrest economic decline by reimposing in 1688 its harsh tariffs of 1667, a measure devastating for Dutch textile and dairy product exports. If William's move into England brought a renewal of war between the republic and France, even Francophile Amsterdam now accepted that the French market could only be prised open by a resort to arms.

William had no illusions about English dislike of his countrymen, but his experience as a Dutch prince with more influence than real authority was providential for his exercise of Britain's 'Revolution' kingship. He never doubted, and gratefully recognized, Mary's own contribution to the device of the joint monarchy, and her death on 27 December 1694 prostrated him for months. With whatever reservations, the couple had accepted the radical drift of the traditionally based \*Declaration of Rights in February 1689; and subsequent statutory changes in treason law and judicial tenure coincided with William's own preferences. But his rule in Scotland, where he delegated too much, is a blight on his record; and those terms in the Act of \*Settlement of 1701 which placed limits upon the executive were unmistakably censorious. His conduct of the war against France, once Jacobite forces had been defeated in Ireland in 1691, placed him and his ministries under unrelenting parliamentary scrutiny, the more severe since coherent political parties were still in germination. How much the reforms in British public finance, for example the founding of the \*Bank of

England in 1694, owed to initiatives from William is uncertain, since such reforms had begun under Charles II. What is clear is that William's contribution to the disclosure of foreign policy to Parliament opened a new era in crown-Parliament relations, even if this was occasioned by strident criticism of his use of prerogative power in this area. When he died on 8 March 1702 he had won a measure of international recognition for Britain's protestant succession, and had endeavoured to resolve peaceably, in partnership with Louis XIV, the problem of the Spanish succession. No British king has stood higher than William in international renown.

DDA

Baxter, S. B., *William III* (1966); Jones, J. R., 'William and the English', in Wilson, C., and Proctor, D. (eds.), 1688: *The Seaborne Alliance and Diplomatic Revolution* (1989); Robb, N. A., *William of Orange: A Personal Portrait* (2 vols., 1962-6).

**William IV** (1765-1837) king of the United Kingdom of Great Britain and Ireland (1830-7), king of Hanover. The third son of George III, born 21 August 1765, he seemed unlikely to become king. He entered the navy at 13 as a midshipman and soon demonstrated that despite enthusiasm for the service, his talents were limited and his manners rough. He saw active service in the War of \*American Independence, and became a warm admirer and friend of \*Nelson, but his naval service was accompanied by a private life which was far from respectable. George III's first serious illness led to the prince's return home in 1789. He now became duke of Clarence. In 1790 he met Mrs Jordan, an actress, with whom he was to live for many years and who bore him ten children. Although he received promotions to rear-admiral, vice-admiral, and in 1799 admiral, the navy refused his pleas for a return to active service. His long affair with Mrs Jordan ended acrimoniously in 1811, the year in which he became admiral of the fleet. In 1814 he briefly hoisted his flag at sea, commanding the naval escort for Louis XVIII's return to France from his English exile. The death of George IV's daughter Princess \*Charlotte in 1818 led to William's marriage to \*Adelaide of Saxe-Meiningen, a widowed Bavarian princess. The marriage was a generally happy one, with Adelaide taking care of William's illegitimate children. The duke of Kent died in 1820, leaving a single daughter, Victoria, and the duke of York, George III's second son, died without issue in 1827. George IV's health was failing. William, by now the probable successor, was already in his sixties. In 1827 he was given the resurrected dignity of lord high admiral, intended as an honorific title, but his clumsy attempts to make its nominal authority effective led to his resignation after only fifteen months. He had made serious errors of judgement, but he had also tried to improve naval gunnery, reform the promotion system, and limit flogging. He had also helped the navy to obtain its first steam vessel, the *Lightning*. George IV died on 26 June 1830, and 'Silly Billy' became king, with little in the way of helpful previous experience. He had occasionally spoken in the House of Lords, showing himself more liberal than most of his brothers, supporting catholic emancipation and opposing slavery. He marked his accession by the conferment of titles on his illegitimate children, and exhibited an

obvious and sometimes undignified zest for his new role. He also showed a willingness to work hard and an antipathy to extravagance, both of them contrasting with the attitudes of his predecessor. He inherited a political crisis, as the end of a long period of Tory ascendancy approached and \*Wellington's government faltered. Unlike George IV, William had no objection to Whig ministers, telling his new premier Lord \*Grey that he had 'complete confidence in your integrity, judgement, decision and experience'. During the reform crisis of 1831–2, he facilitated the enactment of that \*Great Reform Act which was crucial in ensuring the peaceful evolution of Britain. William's enthusiasm for change was limited, and in November 1834, having tired of his Whig ministers and disliking the unscrupulous political manoeuvres of men like \*Brougham and \*Russell, he dismissed the government and recalled the Tories under \*Peel. This proved a premature and unsuccessful ploy. The new government made gains at the ensuing general election, but not a majority, and William was forced to take the Whig ministers back again for the remainder of his reign. William's relations with his sister-in-law, the widowed duchess of Kent, Princess Victoria's mother, were difficult. He was determined to survive to see the young princess achieve her majority and so prevent her mother's regency. He lived for a month after Victoria's 18th birthday and died on 20 June 1837. His young successor wrote of him, 'Whatever his faults may have been, . . . he was not only zealous but most conscientious in the discharge of his duties as a king. He had a truly kind heart and was most anxious to do what was right.'

NMcC

Ziegler, P., *King William IV* (1971).

**William, Prince** (b. 1982). Elder son of \*Charles, prince of Wales, and Princess \*Diana, and second in line to the throne, William was educated initially at Wetherby preparatory school and at Ludgrove, where in 1991 he accidentally sustained a fractured skull. Eton, then a gap year, preceded further studies at St Andrews University, immediately prior to which he commenced royal duties. The earlier public acrimony between his parents led to suggestions that Prince Charles should step aside in favour of his son, but this is most unlikely. A tall, personable young man, with a striking resemblance to his mother, he is already attracting the media attention that pursued her.

ASH

**William the Atheling** (c.1102–20). Heir to the thrones of England and Normandy, who died in the wreck of the \*White Ship. According to William of Malmesbury, as the son of a Norman father (Henry I) and an English mother (Queen \*Matilda), he represented the hope of reconciliation between the two peoples, conquerors and conquered. But his father's careful preparations for his unchallenged succession were brought to nothing on 25 November 1120. Like nearly everyone on board the \*White Ship, he was drowned when it hit rocks—allegedly because the crew was drunk—as it left the Norman port of Barfleur.

JG

**William Longspee II** (c.1212–50), eldest son and heir of Countess Ela of Salisbury (d. 1261) and William Longspee I (d. 1226), is chiefly remembered for his crusading deeds

and the manner of his death. He went on crusade twice, which suggests a genuine crusading enthusiasm. He first accompanied \*Richard of Cornwall to the Holy Land in 1240–1. Then, in 1247, he took the cross again and with some 200 English knights joined Louis IX of France in Egypt in 1249. The army advanced from Damietta towards Cairo, but was halted by a waterway it was unable to cross until a ford was discovered. On 8 February 1250 the vanguard, including the English under William, crossed at dawn with instructions to secure a bridgehead and advance no further. But Count Robert of Artois rashly goaded the rest of the vanguard into an assault upon the town of Mansourah, where they were overwhelmed in the narrow streets. A legend concerning William's supposed exemplary last stand rapidly developed in England, a vehicle for adulation of the English and savage denunciation of the French. For over a century William enjoyed a considerable reputation as a national crusading hero.

SL

**William of Malmesbury** (1095–c.1143) was a monk, born of Anglo-Norman parentage, who set out to write the history of the English in two books, the *Gesta Regum Anglorum* ('The Deeds of the Kings of the English') and the *Gesta Pontificum Anglorum* ('The Deeds of the Bishops of the English'). Both were completed before 1125 and are important commentaries not just on the English past, but on the Anglo-Norman present and the traumas of the \*Norman Conquest. Malmesbury was exceptionally learned and widely read. He produced many other works and at the end of his life was writing a contemporary history, the *Historia Novella*, dedicated to \*Robert, earl of Gloucester. He is admired as a historian because he travelled to undertake research, because he criticized and evaluated his sources, and because he wrote in a good, classically based, Latin style.

DB

**William of Occam** (c.1289–1349). Occam is a village near Guildford in Surrey, from which William presumably took his name. An Oxford Franciscan, he is said to have been a pupil of \*Duns Scotus and may have later studied in Paris. His thought developed when his order became involved in a protracted and acrimonious dispute with the papacy on the subject of evangelical poverty, which the Franciscans embraced. Occam's writings in defence of his order led to a summons to Avignon and a condemnation by Pope John XXII. In 1328 Occam and his superior fled to Munich, where they were given protection by the emperor, Lewis of Bavaria. The continuing controversy led Occam to examine the question of sovereignty and the relations of church and state. He argued that the papacy had no standing in temporal matters and that within the church it was subordinate to a general council: though the sovereignty of temporal rulers originally derived from the people, it could not be challenged, save for gross turpitude. In his general methodology, he emphasized both the power and limitations of logic: it could not touch revealed truth and faith, and since it dealt largely with terms of argument, the principle of economy should apply and as few assumptions as possible should be made—hence, 'Occam's razor'.

JAC

## William of St Carilef

**William of St Carilef** (d. 1096). Bishop of Durham. A secular priest at Bayeux, he took monastic vows at St Carilef (Maine), became prior there, and then abbot of St Vincent. In 1080 William I chose him as bishop of Durham where, following the English pattern, he replaced the cathedral's secular canons with monks from \*Monkwearmouth and \*Jarrow (1083). William II made him justiciar, but after implication in the 1088 rebellion, he was arrested and tried. He surrendered his castle to the king before going into exile in Normandy. Restored in 1091, he surprisingly supported the king against \*Anselm at the Council of \*Rockingham (1095). After another northern rebellion, he was summoned to Windsor, where he died. A great builder, on his return from exile (1091) he brought plans for the magnificent new cathedral, started in 1093. WMM

**William of Wykeham** (1324–1404). Bishop of Winchester, keeper of the privy seal, chancellor of England. Possibly the son of a Hampshire serf, he entered royal service (c.1348) and superintended the rebuilding of Windsor castle. As bishop of Winchester (1366), he was the greatest ecclesiastical pluralist of the century with twelve appointments, headed by the archdeaconry of Lincoln. As chancellor (1367), he was efficient rather than statesmanlike. The tide of anticlericalism forced him to resign (1371) to make way for laymen. He was briefly chancellor under Richard II (1389–91), but took no further part in politics. He is chiefly remembered for his benefactions to education by founding New College, Oxford (1379), and \*Winchester College (1382), the latter a unique corporation, independent of cathedral or monastery, a model for Henry VI's \*Eton and \*Wolsey's Ipswich college. He also resumed the rebuilding of the cathedral at his own expense. WMM

**Williams, John** (1582–1650). Archbishop of York, lord keeper. A Welshman, educated at St John's College, Cambridge, Williams was successively dean of Salisbury (1619) and Westminster (1620–40), lord keeper (1621–5), bishop of Lincoln (1621–41), and archbishop (1640). Adviser to \*Buckingham, he succeeded \*Bacon as lord keeper. 'Pragmatic, talkative and worldly-wise', he advised Prince Charles against his journey to Madrid (1623). Though at odds with Charles I, Buckingham, and later \*Laud, his difference with Laud has been exaggerated, for, like him, he preferred order to dogma. A moderate calvinist, he was nevertheless a 'supple bishop', advocating music, ornaments, and compromise over the altar's position, and criticizing Geneva as 'fit only for tradesmen and beggars'. Opposed by extreme Laudians, he was suspended (1637) and imprisoned for anonymously publishing *The Holy Table, Name and Thing* (1636). On release (1640), he worked for compromise between Anglicans and extreme puritans. Favoured by Parliament, he was translated to York, but then imprisoned for leading a bishops' protest against exclusion from Parliament. Released on bail (1642), he escaped, was enthroned at York, and, a royalist, fled to Wales where he died. WMM

**Williams, Roger** (c.1603–83). Colonist. Williams was born in London, attended Pembroke College, Cambridge, and took holy orders. In 1630 he left England for Massachusetts

but his belief that magistrates should have no power over conscience gave him an uncomfortable time when he was appointed to the church at Salem. His sympathy for the local Indians also made him suspect to many of his fellow-colonists. Expelled from Massachusetts in 1636, he founded a settlement at Providence and in 1639 established a baptist church, though he subsequently became a seeker, acknowledging no creed. In 1644 he visited England and obtained a charter of self-government for Providence—the foundation of Rhode Island. The colony soon became known for its tolerant attitude and \*Jews and \*quakers were allowed to settle. In 1654–7 Williams served as governor. \*Milton, whom he knew well, admired him as a champion of religious liberty: Cotton Mather thought he had 'a windmill in his head'. JAC

**Willibrord, St** (658–739). Northumbrian monk and missionary to Frisia. He was educated at \*Wilfrid's Ripon, then for twelve years at Rath Melsigi (Clonmelsh, Co. Carlow) in Ireland, under Egbert, who in 690 directed him to work, as Wilfrid had, in Frisia. Consecrated archbishop (as Clement) of the Frisians by Pope Sergius I in 695, he was given Utrecht for his see by the Carolingian mayor of the palace, Pippin II. His monastery at Echternach (in modern Luxembourg), founded in 698, possibly as a base for work in Thuringia and Hesse, enjoyed Pippin's patronage. Its school and scriptorium were famous between the 8th and 10th cents. Willibrord took the cult of \*Oswald to Europe and prepared the way for the missionary \*Boniface, but his preaching in Denmark failed and whatever ecclesiastical administrative structure he established lapsed. He was buried at Echternach and soon venerated as a saint, his kinsman \*Alcuin writing his biography. His cult flourished more in Holland and Luxembourg than in England. AER

**Willoughby, Francis, 5th Lord Willoughby de Parham** (c.1614–66). Willoughby succeeded to the barony at the age of 4. At the outbreak of the Civil War, his presbyterian sympathies led him to join the parliamentary side as cavalry commander in Lincolnshire. But he grew despondent at the turn of events and in June 1644 wrote to Lord Denbigh, 'we are all hasting to an early ruin . . . nobility and gentry are going down apace'. He remained with Parliament until in 1647 he was accused of treason, when he fled to join the royalists in Holland. Charles II appointed him governor of Barbados and he began colonizing Surinam. But in 1652 he was forced to capitulate, returned to England, and took a risky part in royalist conspiracies. At the Restoration he returned to Barbados as governor. He survived heavy fighting against the Dutch and French in 1665 but the following year was drowned in a hurricane. Bulstrode \*Whitelocke, the diarist, was his brother-in-law. 'Charming, impetuous, self-opinionated and quarrelsome' is a modern verdict. JAC

**Willoughby, Sir Hugh** (d. 1554). A minor landowner with some military experience, Willoughby was chosen, possibly by Sebastian \*Cabot, to be captain-general of the fleet sent by London merchants to find the North-East Passage in 1553. The expedition sailed around the north of Norway

but Willoughby's lack of navigational skills and maritime experience may account for the disaster which overtook him. One of the other ships took \*Chancellor into the White Sea, but Willoughby became lost. His journal claimed that he reached as far north as 72 degrees, presumably on Novaya Zemlya, but this is in doubt. It is certain that he and his crew wintered on the Kola Peninsula, were alive in January 1554, but perished later that winter. RB

**Wills, W. H. and H. O.** A tobacco firm established in Bristol and by the end of the 19th cent. the largest in Britain. In contrast with many other tobacco importers, by the mid-19th cent. the directing members of the Wills family understood the nature of retailing and in particular the significance of brand names in selling to an increasingly literate mass market. Their successes with distinctive pipe tobaccos and a diverse array of cigarettes built a strong market (Passing Clouds 1871, Three Castles 1877, Woodbine 1888). In 1883 they bought the rights to the Bonsack cigarette-making machine enabling them to dominate cigarette-manufacturing in Britain until the 20th cent. In response to international competition, Wills led mergers to form British and American Tobacco in 1902. The family members were patrons of many charities, the most significant being the University College of Bristol, granted its charter in 1909. IJEK

**Wilmington, Spencer Compton, 1st earl of** (c.1674–1743). A younger son of the earl of Northampton, he entered the Commons in his twenties and became Speaker in 1715. At the accession of George II in 1727 he was expected to become first minister, having served as treasurer to the prince, but was outmanœuvred by \*Walpole without difficulty. Compensation came in the form of a barony (1728), an earldom (1730), and the lord presidency of the council from 1730 until 1742. A ponderous and formal man, he succeeded Walpole as first minister in 1742, but old, unwell, and with little taste for leadership, he merely presided for a year until his death. Lord \*Hervey, one of his many critics, dismissed him as a 'plodding, heavy fellow . . . a subaltern rather than a commander'. JAC

**Wilson, Harold, 1st Baron Wilson** (1916–95). Prime minister. The son of an industrial chemist, Wilson won an exhibition in history to Jesus College, Oxford. In the event he read politics, philosophy, and economics, gaining a first. In 1940 he joined the war cabinet secretariat as an economist, developing a particular expertise in the area of fuel and power. Elected MP for Ormskirk in 1945, Wilson became parliamentary secretary at the Ministry of Works and in 1947 entered the cabinet as president of the Board of Trade, aged only 31. He resigned from the government in 1951 along with Aneurin \*Bevan, but was careful to distance himself from Bevan by insisting that his specific quarrel was over excessive expenditure on rearmament. His action established his credentials—not entirely deserved—as a left-winger when Labour began to factionalize in the 1950s.

In opposition Wilson progressed steadily up the hierarchy of the National Executive Committee and shadow cabinet and was made shadow chancellor in 1956 soon after \*Gaitskell became party leader. He was out of sympathy

with Gaitskell's efforts to 'modernize' the party following Labour's third successive electoral defeat in 1959 and unsuccessfully challenged him for the leadership in 1960. His action did not prevent him being made shadow foreign secretary. Wilson's opportunity came with Gaitskell's unexpected death in January 1963: in the contest for the succession he defeated George \*Brown and James \*Callaghan.

Wilson inherited a party which had recovered its electoral credibility and proceeded to add his own distinctive contribution. His position on the centre-left enabled him to unite the Labour movement in a way Gaitskell would have found difficult. His comparative youth and his call for a technological revolution struck a chord with the optimism of the 1960s. He seemed to stand for the future just as certainly as the Conservatives' Edwardian patricians, Harold \*Macmillan and Alec \*Douglas-Home, represented the past. In the circumstances, Labour's victory in the election of 1964 was less surprising than the narrowness of the overall majority of four seats.

Yet hopes that Wilson's election might mark a new beginning for Britain were largely disappointed. His first cabinet was elderly and uninspiring. Wilson himself remained wedded to many traditional attitudes, especially Britain's role as a world power and the importance of sterling as an international currency. The creation of a new Department of Economic Affairs, designed to shake off the overweening control of the Treasury, proved a failure. The electorate, however, was ready to give Labour the benefit of the doubt. A parliamentary majority in single figures was scarcely a basis for innovative government and in 1966 Labour achieved a comfortable majority at the polls.

Increasingly, however, Wilson seemed to lose any sense of direction. Politics by gesture appeared to replace long-term strategical planning. Wilson's undoubted cleverness became an end in itself. The quality of pragmatism on which he prided himself seemed to degenerate into mere opportunism. Wilson maintained party unity, but at the expense of blurring over internal differences. There was no transformation of the national economy, though Roy \*Jenkins, as chancellor, established a reputation for prudent administration. Britain's application to join the Common Market in 1967 came up against General de Gaulle's veto. The qualities of the government seemed to be encapsulated in Labour's attempt to reform the trade union movement. Wilson and his employment secretary, Barbara Castle, invested much of their credibility in the proposed 'In Place of Strife' legislation but were obliged to accept humiliating defeat.

Opinion polls none the less suggested another Labour victory in 1970 and Wilson's defeat at the hands of Edward \*Heath came as a considerable shock. In opposition Labour's centre of gravity moved significantly leftwards, a trend which Wilson accommodated without apparent difficulty. He returned to power in 1974 still exuding self-confidence but lacking the apparent dynamism of a decade earlier. In the eyes of many, the new government allowed too much influence to the trade union leaders under the so-called Social Contract. The most threatening issue, however, as far as the internal dynamics of the party were

## Wilson

concerned, was membership of the \*EEC. Wilson had opposed Heath's action in taking Britain into the community on the somewhat spurious grounds that the terms of entry were unacceptable. In 1975, Wilson allowed the issue of continuing membership to go to a referendum with members of the cabinet openly opposing one another.

There seems little reason to doubt Wilson's assertion that he had decided to stand down early from the premiership at the time he returned to office in 1974. He had perhaps lost his enthusiasm for the game of politics. He was concerned, with some justification, at the attempts of sections of the security services to destabilize his government. Yet his resignation in 1976 was met with disbelief—a commentary, no doubt, on the reluctance of other prime ministers to hand over the reins of power. He stayed on in the Commons until 1983 without playing much of a role, perhaps because of the onset of a debilitating illness. But his reputation rapidly declined, partly because of some curious nominations in his resignation honours list—the judgement of character had never been one of his strengths. Recent attempts at rehabilitation note his excellent record in electoral terms, his capacity to keep the Labour movement relatively united, the continuing economic problems of the last two decades and the important social legislation passed by his first administration. DJD

Pimlott, B., *Harold Wilson* (1992); Zeigler, P., *Wilson* (1993).

**Wilson, Sir Henry** (1854–1922). Soldier. Wilson was unusual amongst British soldiers in that he was an ardent Francophile and enjoyed the company of politicians. Between 1910 and 1914 he served as the director of military operations at the War Office, preparing plans to send the British army to France in the event of war with Germany. When that war came he served in a variety of liaison posts in France until, in February 1918, \*Lloyd George dismissed Sir William Robertson and Wilson succeeded him as chief of the imperial general staff. But soon the prime minister was complaining that his new adviser was as committed to deploying the bulk of the British army on the western front as his predecessor had been. In 1922 Wilson retired from the army and became a Unionist MP for an Ulster seat, only to be murdered on his own doorstep in London by the \*IRA.

DF

**Wilson, Richard** (1714–82). Landscape painter. Born in Wales, the son of a clergyman, Wilson's formal training and early career were in portrait painting, but, while in Italy between 1750 and 1756, he decided to concentrate on painting landscape in the classical style. On his return to England, his pictures brought him fame but little employment. He was a founder member of the Royal Academy and appointed librarian in 1776, by which time he had almost ceased to paint. An abrasive character, Wilson was often critical of his contemporaries. He referred to \*Gainsborough's 'fried parsley' landscapes and while serving on the hanging committee of the RA would wash over brightly coloured paintings to reduce them to his more restrained tones. He is now regarded as the first great British landscapist and an important influence on 19th-cent. landscape painting. JC

**Wilton diptych.** A small portable altarpiece of two hinged oak panels, painted and gilded on both sides, almost certainly intended for the private devotions of Richard II. Resplendent with exquisite tooling and expensive pigments, its artist is unknown and the date, author, and motive of commission remain uncertain. A rich but cryptic icon of priestly views of kingship, ambiguous figures of Richard with SS Edmund, Edward the Confessor, and John the Baptist face the Virgin and Child with angels; on the exterior a white hart (Richard's personal emblem) lies couchant, adjacent to other heraldic emblems and arms. It was first recorded in the collection of Charles I, then reputedly given by James II to Lord Castlemaine, before purchase by the earls of Pembroke at Wilton House, from which it takes its name, but has been in the National Gallery since 1929. ASH

**Wiltshire** is one of the larger counties, more than 50 miles from north to south. It is not easy to perceive much geographical coherence and the balance of the county has constantly changed. The northern towns of Cricklade and Malmesbury had little contact with Mere or Downton in the south, save occasionally at shire meetings, held often for convenience at Devizes in the middle. For decades there was a rough understanding that the two county parliamentary seats would be shared by north and south—a convention formalized after the \*Great Reform Act of 1832, which established two divisions with two seats each. Most of Wiltshire was prosperous farming country, the north famous for cheese, the south for butter, and the middle, around Salisbury plain, given over to sheep. On the western fringes, around Trowbridge, Bradford, Westbury, and Melksham, there was a domestic cloth industry, described by \*Defoe in his tour of the 1720s as very flourishing.

The county took its name from Wilton, on the river Wylde, a tributary of the Salisbury Avon. As Wilton declined, prosperity shifted first to Old Sarum, then to New Sarum or Salisbury, which, by Tudor times, was one of the ten largest towns in the kingdom, with a population of 8,000. The diocese of the county, founded in 905, also moved around, beginning at \*Ramsbury, moving to \*Sherborne, and finishing at the two Sarums. The foundation stone of the great cathedral at Salisbury was laid in 1220. In modern times, with the development of Swindon as a railway town, the balance swung again: a hamlet of just over 1,000 people at Old Swindon in 1801 became by 1881 by far the largest town in Wiltshire, with 17,000 people, and, by the 1990s, had risen to more than 170,000.

In pre-Roman times, the area was one of the most thickly populated in the country, the settlers preferring dry chalk lands to the damp and heavily wooded valleys. Wiltshire is the richest of all counties in prehistoric remains, festooned with barrows, and in Stonehenge and Avebury claiming two of the greatest sites in Europe. Though the tribes of the \*Durotriges and the \*Atrebates had a reputation for bravery, the region fell easily to the Roman advance. The Romans do not seem to have found it congenial and there are comparatively few remains from that period. By the later 6th cent. it had succumbed to the Saxons, who won a decisive victory at Old Sarum in 552. In the early 9th cent. it

was heavily disputed between \*Mercia and \*Wessex and was a centre of \*Alfred's struggles against the Danes. The first evidence of its emerging identity is a reference in the *Anglo-Saxon Chronicle* for 800 to the defeat of the \*Hwicce from Gloucestershire by the Wilsætes, under their ealdorman Woxtan. In 898 there was a further reference to Ædelm, 'Wiltunscire ealdorman'. The most remarkable survival from the Saxon period is the tiny church at \*Bradford on Avon, used as a cottage for many years and only rediscovered in 1856.

In the 13th cent. Wiltshire acquired parliamentary representation, and eventually no fewer than sixteen of its boroughs were given seats, rivalling Cornwall in profusion. The county had a reputation for sturdy independency. Though there were several aristocratic families—the Herberts at Wilton, the Howards at Charlton, and the Bruces at Tottenham Park—the county was too large for one magnate to dominate. The nobility avoided expensive county contests, concentrated on their neighbouring boroughs, and left the shire representation largely to the country gentlemen.

During the Civil War, the region lay between royalist and parliamentary areas and saw much fighting. Wardour castle was held for the king by Lady Arundell, surrendered in 1643, but was retaken by her son and destroyed rather than let it be used by the enemy. \*Hopton's victory over \*Waller at \*Roundway Down in 1643 delivered most of the shire into royalist hands and they held Devizes until 1645. \*Penraddock's rising on behalf of Charles II in 1655 was a damp squib, captured Salisbury for one day, and fizzled out.

The 19th cent. saw considerable distress in parts of the county. The cloth industry found competition from Yorkshire hard to meet and there was agricultural depression, especially after 1815. At Great Bedwyn in 1821 \*Cobbett noted 'a group of women labourers, who presented such an assemblage of rags, as I never before saw', and at Cricklade he remarked, 'the labourers seem miserably poor. Their dwellings are little better than pig-beds . . . in my whole life, I never saw such human wretchedness equal to this; no, not even among the free negroes in America.' 'This Wiltshire', he concluded, 'is a horrible county.' In the \*Swing riots of 1830, there were more prosecutions in Wiltshire than in any other county, mainly for machine-breaking.

The diffuse character of the shire made it difficult to agree on a suitable administrative headquarters. Quarter sessions met in turn at Marlborough, Devizes, Salisbury, and Warminster, and local loyalties resisted attempts to centralize. The county council, instituted in 1888, began by meeting at Trowbridge, Salisbury, Swindon, and Trowbridge in turn. By 1930 the position was intolerable. It was carried to meet at Devizes, only for the vote to be reversed when the Trowbridge United football ground became available. County hall opened there in 1940. Wiltshire retained its county council in the 1990s, with Swindon as a unitary authority, and Kennet, North Wiltshire, Salisbury, and West Wiltshire as district councils.

JAC

**Wimbledon.** The most prestigious lawn tennis club in the world. Wimbledon is the home of 'the Lawn Tennis Cham-

pionships on Grass', the oldest and most important of all the lawn tennis tournaments. The event is staged by the All England Club and the Lawn Tennis Association, the game's ruling body in England. The first championship was held on 9 July 1877 at the club's original ground in Worple Road, Wimbledon, in south-west London. In 1922 the club moved to its present ground in Church Road. In 1884 women's singles and men's doubles matches were introduced and 1968 saw the first open championship after the amateur/professional player distinction was abolished.

RAS

**Winceby, battle of,** 1643. Sir John Henderson, royalist governor of Newark, set out in October 1643 to relieve Bolingbroke castle, near Horncastle. His force was intercepted by parliamentary cavalry under \*Manchester, \*Fairfax, and \*Cromwell and badly cut up on the 11th. Though a small-scale action, the victory was a valuable boost to sagging roundhead morale and the ease with which the parliamentary cavalry triumphed was ominous.

JAC

**Winchelsey, Robert de** (d. 1313). Archbishop of Canterbury. Born in Kent, educated at Paris where he was rector and at Oxford where he was chancellor (1288), Winchelsey was a distinguished scholar and administrator. Though elected archbishop in 1293, he only returned from Rome after consecration in 1295. As an unyielding upholder of ecclesiastical independence, he obeyed Boniface VIII's bull *Clericis laicos* by refusing Edward I's request for clerical taxation (1296) until the pope compromised (1297). Winchelsey, with the barons, again confronted Edward at the Lincoln Parliament (1301), removing Walter Langton, the treasurer, which Edward never forgave. Suspended by Pope Clement V, Edward's former vassal (1306), Winchelsey went into exile. Restored (1307), he actively opposed \*Gaveston despite sickness, and was one of the lords \*Ordainers (1310). WMM

**Winchester** (Roman) was Venta Belgarum, capital of the probably artificial *civitas* of the \*Belgae. Situated at the intersection of the north-south valley of the Itchen through the east-west chalklands, there is some evidence for late Iron Age activity and a post-conquest military site. By the late 1st cent. the town, unusually, had earthwork defences; augmented in the 2nd cent. and fronted in stone in the 3rd, they enclosed 143 acres. Limited excavation in the interior has located parts of a street-grid, the site of the forum, a temple, and a number of houses. Extensive 4th-cent. cemeteries suggest that Winchester was still a major centre of population, but they passed out of use at the beginning of the 5th cent., at the same time as the abandonment of the buildings in the interior. A few sherds of Anglo-Saxon pottery are associated with this final phase.

ASEC

(post-Roman) Winchester revived as a bishop's seat (662), but urban life did not return until a planned and fortified town (\*burh) was laid out within the Roman walls, probably by King \*Alfred. The city expanded dramatically between the 10th and 12th cents., ranking by c.1110, with Norwich, second in size after London, and sharing with Westminster the developing functions of a national capital. Besides the cathedral, it possessed royal and episcopal palaces, 57 parish

## Winchester

churches, and one of the four great trading fairs of England. However, it declined from the 12th cent. as the close links with the monarchy slackened. Since the 15th cent. it has been only a modest provincial town, though Charles II commissioned a palace there in 1683, and may have toyed with creating an English Versailles. The long decline has left Winchester with a rich urban fabric, as well as 'the richest architecturally of all English bishops' sees'. Important excavations in 1961–71, the first major urban archaeological programme in Britain, have revealed the entire plan of the pre-Conquest cathedral and much else. DMP

**Winchester, battle of**, 1141. In February 1141 \*Matilda captured her rival Stephen at Lincoln and imprisoned him at Bristol. But she quarrelled with his brother \*Henry of Blois, bishop of Winchester, and began a siege of his castle. Stephen's queen then led a relief force which, on 14 September, scattered the besiegers and captured \*Robert of Gloucester, Matilda's illegitimate brother and chief supporter. When Stephen and Robert were exchanged, Matilda lost the advantage she had gained at Lincoln. JAC

**Winchester, diocese of**. Roughly coterminous with west and central Hampshire and the Channel Islands, Winchester is the fifth senior see after \*Canterbury, \*York, \*London, and \*Durham, and with them its bishop always has a seat in the House of Lords. The first signs of a bishopric were in c.660, when \*Cenwalh appointed Wine as bishop, but there was no regular bishopric until the West Saxon see was moved there from \*Dorchester in c.663. In 705 the diocese was divided, Hampshire, Surrey, Sussex, the Isle of Wight staying under Winchester, the remainder west of Selwood going to the new see of \*Sherborne. In c.909 \*Edward the Elder further reduced it to Hampshire and Surrey by removing Berkshire and Wiltshire for the new diocese of \*Ramsbury. Though it was marginally enlarged by the addition of the Channel Islands from \*Salisbury in 1499, the bishopric was further diminished by the creation of the \*Guildford and \*Portsmouth dioceses in 1927. The hegemony of Wessex from \*Egbert's reign onwards increased the see's importance, and in the 11th cent. Winchester became the national capital. Significant bishops include Swithin (852–62), Egbert's adviser; \*Æthelwold (963–84), the monastic reformer who replaced Winchester's secular canons with monks; William Giffard (1107–29), a Benedictine, the first of nine post-Conquest Winchester bishops to be chancellors of England; \*Henry of Blois (1129–71), Stephen's brother and papal legate. In c.1142 Henry even requested metropolitan status for Winchester. Others include Peter des \*Roches (1205–38), a Poitevin, guardian in Henry III's minority; \*William of Wykeham (1367–1404), founder of New College, Oxford, and \*Winchester College; Cardinal \*Beaufort (1404–47), Henry IV's half brother; Stephen \*Gardiner (1531–51 and 1553–5), chancellor under Mary; Lancelot \*Andrewes (1619–26), scholar and preacher; and Samuel Wilberforce (1869–73). The present cathedral, the longest in Europe (556 feet), begun in 1079 under Walkelin (1070–98), is still basically Norman with Early English and Perpendicular additions, and contains the remains of the Saxon kings and a shrine of St Swithin. WMM

**Winchester, statute of**, 1285. Edward I's reign saw a determination to enforce law and order. After complaining that local people were reluctant to do justice to strangers, the statute (13 Edw. I) declared that each district or hundred would be held responsible for unsolved crimes. Highways were to be widened and cleared of shrubbery in which robbers might lurk. Each man was to keep arms to take part in the \*hue and cry when necessary. JAC

**Winchester, treaty of**, 1153. For many years this agreement between Stephen and his rival Matilda's son Henry was known as the treaty of Wallingford. In fact, the negotiations were at Winchester and were ratified at Westminster. The death of Stephen's son \*Eustace, in his twenties, had broken the back of Stephen's cause, and on 6 November 1153 he agreed to recognize Henry as his heir. Stephen died the following year and the prince succeeded as Henry II. JAC

**Winchester, William Paulet, 1st marquis of** (c.1483–1572). 'More of a willow than an oak' was reported to have been Paulet's engaging assessment of himself and, indeed, anyone who could negotiate the vicissitudes of Tudor politics and hold high office in four reigns needed to be pliant. The son of Sir John Paulet, who held land in Somerset and Hampshire, William Paulet probably had legal training and built up a powerful local position. For many years he was associated with the profitable control of wardships—first as joint master and master of the wards 1526–40, then as master of the Court of \*Wards 1540–2, then as master of wards and liveries 1542–7. In the Parliament of 1529 he sat for Hampshire. From 1537 to 1539 he was treasurer of the household for Henry VIII, created baron St John in 1539, and given the Garter in 1543. From 1543 to 1545 he was lord chamberlain, lord steward 1545–50, lord president of the council 1545–50, and lord high treasurer 1550–72. Clearly he was a more than useful work-horse. In Edward VI's reign, he backed \*Northumberland against \*Somerset, was created earl of Wiltshire in 1550, and marquis of Winchester 1551. The only time when his footwork faltered was in supporting Lady Jane \*Grey in 1553, but he abandoned her quickly enough to retain Mary's confidence, and continued in office under Elizabeth. He remained an influential figure well into his eighties, entertaining Elizabeth grandly at Basing, which he had rebuilt. JAC

**Winchester Bible**. The Winchester Bible (1160–70), probably commissioned by \*Henry of Blois, is the finest of several large bibles produced through 12th-cent. contact with Byzantine art in Norman Sicily. Others are at Cambridge (for Bury St Edmund's) and at Canterbury. Designed for ceremonial use rather than individual study, the volume was, like altar-missals, ornately decorated. Each book in the Bible was designed to begin with a fully decorated capital letter, usually of figures rather than foliage. It has been described as 'the giant of 12th century English Romanesque century manuscripts'—in a great period of art and culture. WMM

**Winchester College**. In about 1330 \*William of Wykeham attended a grammar school in Winchester. He later

incorporated it in a new establishment, St Mary College of Winchester, founded by charter on 20 October 1382. The school consisted of a warden, 10 fellows, 2 masters, 3 chaplains, 70 scholars, and 16 choristers. The scholars, selected on a nation-wide basis, were prepared for entry to New College, Oxford, which Wykeham had founded in 1369. Entrants to the college were trained for holy orders. Winchester became a public school and flourished under George Moberly, headmaster from 1835 to 1866. PG

**Winchester palace** was started by Charles II in 1682 with \*Wren as architect. Substantial progress was made but it was far from finished when Charles died in 1685 and his successor, James II, beset with problems, abandoned the project. In the Seven Years War and the War of American Independence, the shell of the palace was used for thousands of prisoners of war. In the early years of the Revolutionary War it gave shelter to French refugee clergy, but in 1796 was handed over to the military for use as a gaol. What was left of it was destroyed by fire in 1894. JAC

**Windham, William** (1750–1810). Statesman. Educated at Eton and University College, Oxford, Windham was a close friend of Edmund \*Burke and Dr \*Johnson, being a pall-bearer at the latter's funeral. In 1784 he became MP for Norwich and was one of the members charged with the impeachment of Warren \*Hastings. He was secretary for war in the Pitt administration of 1794 to 1801 with a seat in the cabinet. Windham opposed the peace of 1802, an unpopular view at the time which cost him his Norwich seat. He assisted \*Cobbett in founding the \**Political Register* and returned to government at the War and Colonial Office in \*Grenville's 'Ministry of All the \*Talents' (1806–7). He introduced a plan for improving the condition of the military forces by increasing pay and reducing terms of service. Windham died of a tumour in 1810. His diary was published in 1866. RAS

**window tax.** William III's window tax (1696) was imposed on every dwelling except cottages. The rates were 2 shillings for houses with less than 10 windows, 6 shillings for 10–20 windows, and 10 shillings for more than 20 windows. It led to the stopping up of windows, often temporarily until the assessment had passed, many houses were built with fewer windows, and in Edinburgh a row was built without bedroom windows. During the Napoleonic wars the tax was increased on several occasions and by 1815 the yield was a substantial £2 million. In 1823 the tax was halved and in 1851 abolished. Throughout its existence it was hated because of the inspections to count windows, because the wide definition of a window permitted any hole in the wall, including coal holes, to be counted, and because it was regarded as a tax on light and air. MW

**Windsor, house of.** The Hanoverians, who were summoned in 1714 as the nearest protestant heirs, were related to the Stuarts and previous British dynasties through \*Sophia, electress of Hanover, mother of George I and granddaughter of James VI and I. The original family name was Guelph. They were often known as the Brunswick line since the correct name for Hanover was first

Brunswick-Calenberg-Göttingen and then Brunswick-Lüneburg. The first six rulers, up to Edward VII, married Germans: Edward in 1863 married \*Alexandra of Denmark, but his son George V married Mary of Teck, German by title, though brought up in Britain. Their cousins were the Battenburgs.

When war broke out in 1914 the German antecedents of the royal family were a source of embarrassment. Prince Louis Battenburg, 1st sea lord, was obliged to resign his post and, somewhat against his will, George V ordered the Garter banners of the kaiser and his family to be removed from the walls of St George's chapel at Windsor. In 1917, as a gesture of identification with the nation, George declared that all German titles and honours would be renounced and that the family would be known in future as Windsor. The new image was perfect and well received, save for some ribaldry from the kaiser. Various alternatives had been mooted: Tudor was rejected because of the image of Henry VIII, FitzRoy as smacking of bastardy, Plantagenet as unintelligible, and Stuart as dispiriting. The Battenburgs became Mountbattens and the Tecks were made Cambridges. In 1936 when Edward VIII abdicated he was given the title duke of Windsor. JAC

**Windsor, treaty of,** 1175. In 1171 Henry II took an expedition to Ireland to establish his authority. He received the submission of Normans and Irish alike, save for Rory \*O'Connor, king of Connacht, who claimed the high kingship of Ireland. But in 1175 O'Connor came to terms at Windsor, becoming the king's man. In return, Henry recognized his authority as high king outside the \*Pale. The arrangement did not work well and in 1185 Henry sent his youngest son John to rule Ireland. JAC

**Windsor castle** (Berks.) is the premier castle of England as well as its largest. It is situated beside the river Thames and on the edge of Windsor Great Park, formerly a popular hunting ground of kings. Windsor castle was founded by William the Conqueror, who adopted the typical Norman design of motte and bailey, and was first used as a royal residence by Henry I. The original wooden structure was replaced by stone from 1165 to 1179 by Henry II, who also constructed the prominent Round Tower. St George's chapel, Windsor—which has long served as the last resting place of sovereigns—was begun by Edward IV in 1475 and is notable for its fan vaulting, monuments, stalls, and stained glass. The conversion of Windsor from fortress into palace began in the 16th cent. and continued in the 17th when Charles II commissioned Hugh May (1621–84) to refurbish the royal apartments. Subsequently extensive remodelling was carried out for George III from 1796 by James Wyatt, and by his nephew Sir Jeffry Wyatville for George IV from 1820 to 1830. Prince Albert died at Windsor in 1861, and to commemorate her husband Queen Victoria converted Henry III's chapel into the present Albert memorial chapel. Set in the surrounding Home Park at Windsor is Frogmore House, whose picturesque grounds may have been designed by Sir Uvedale Price, with a lake and a Gothic temple by Wyatt, and the royal mausoleum (1862–71), domed and Romanesque, by A. Jenkins Humbert and Ludwig Grüner.

## Windward Islands

In the centre of the mausoleum is a monument to the queen and prince consort, with two white marble effigies by Baron C. Marochetti of 1864–8. PW

**Windward Islands.** A southern continuation of the chain of islands in the Caribbean known as the Lesser Antilles, with Puerto Rico to the west and \*Trinidad to the south. They include \*Dominica, Martinique, \*St Lucia, and \*St Vincent, with \*Barbados lying to the east. Martinique is a *département* of France. JAC

**Wingate, Orde** (1903–44). Soldier. Wingate's father was a colonel in the Indian army and Wingate was born in India. His parents were Plymouth brethren. Commissioned in the Royal Artillery in 1923, he was sent to the Sudan in 1940 to lead an invasion of Italian-held Abyssinia, and with a small force, assisted by supporters of Haile Selassie, captured Addis Ababa in May 1941. He was then put in charge of the Chindit force to operate in Burma behind the Japanese lines, using radio to keep in touch and supplied from the air. A successful sortie in 1943 led to a more ambitious campaign for 1944, but Wingate was killed in an air crash in the jungle early in the operation. In a memo of July 1943 \*Churchill had called him 'a man of genius and audacity . . . quite above the ordinary level'. JAC

**Winstanley, Gerrard** (b. 1609). Digger leader. Born in Wigan and apprenticed in London, he failed in trade, and from 1643 worked as a cowhand in Surrey. His twenty tracts (twelve being of substantial length) were all written between 1648 and 1651, and included manifestos for the \*Digger movement. Before that they were strongly \*millenarian, but the Digger writings give a boldly secular twist to familiar texts and tenets. God is 'the great creator Reason'; the Fall begat property and subjection, when men's covetousness overcame the law of righteousness in their hearts; the millennium will come when they restore the land to common ownership and live as equals. But Winstanley's thought never lost its scriptural roots, and he never advocated defying the state or dispossessing landlords by force. His final work, *The Law of Freedom*, proposed a polity for those who voluntarily embrace a communistic commonwealth. It is highly authoritarian, and its penalties for breaches of its code make chilling reading. Little is known of his subsequent life. AHW

**Winthrop, John** (1588–1649). Governor of Massachusetts. Of a prosperous Suffolk clothier's family, Winthrop went to Trinity College, Cambridge, and then studied law at Gray's Inn. Of strong puritan principles, he became increasingly disillusioned with the state of England—'evil times are coming when the church must fly to the wilderness.' In 1630 he left for America with a group of like-minded families, having been elected governor of the tiny colony of Massachusetts, which had then no more than 700 settlers. During the first summer he founded the settlement at Boston and some thousands of new settlers came in. Winthrop was governor until 1634, and then 1637–40, 1642–4, and 1645–9. He was involved in all the religious disputes of the day, gradually adopting a more austere line towards dissent. The journal

which he kept from 1630 onwards is an important source for early colonial history. JAC

**Winwæd River, battle of**, 655. Here \*Oswiu of Bernicia successfully challenged the overlordship of \*Penda of Mercia and was able to take temporary control of Mercia and permanent control of Deira. Penda was killed in the battle and many of his supporters drowned when they tried to escape across the flooded river. The Winwæd has been identified as the Went, a tributary of the river Don which drains into the Humber; the battle would therefore have taken place near the Mercian/Northumbrian border. BAEY

**Wiseman, Nicholas** (1802–65). First cardinal-archbishop of Westminster. Born of Irish parents in Seville, Wiseman was educated in Co. Durham and at the English College, Rome, where he later became rector (1828–44) and titular bishop (1840). Pius IX sent Wiseman as pro-vicar-apostolic to the London district in 1848 and then (1850) appointed him cardinal, intending to restore the English catholic hierarchy with Wiseman as archbishop. So great was English resentment that Parliament passed the Ecclesiastical Titles Act (1851), prohibiting catholics from assuming episcopal territorial titles. Wiseman's moderation and sensitive administration assuaged suspicions; the Act was repealed (1871) without ever being invoked. Chiefly remembered for restoring the English hierarchy and placing 'Roman catholics of England on the map', Wiseman was also a linguist and scholar. WMM

**Wishart, George** (c.1513–46). One of the first Scottish protestant martyrs. Wishart came from Pittarow near Montrose. He seems to have taught at Montrose and, after accusations of heresy, moved to Bristol, where in 1539 a George Wishart was forced to make a public recantation. After visiting Germany and Switzerland, he became a fellow of Corpus Christi College, Cambridge, before returning to Scotland in 1543. There he commenced itinerant preaching with John \*Knox as a disciple. He was arrested in 1546, taken to Cardinal \*Beaton's castle at St Andrews, and tried for heresy. His defence was an appeal to Scripture against the authority of the church. Two months after Wishart was burned, Beaton himself was murdered in the castle by Wishart's friends. JAC

**witan** is the plural of Old English *wita*, a wise man, a counsellor. It was used by Anglo-Saxons sometimes in composition with *gemot* (an assembly) to indicate a royal or national conciliar meeting. The significance of these meetings must, over a long period, have varied. Some have seen all such conciliar assemblies as essentially under royal control: to the contrary was the Victorian view that these could be 'nationally' representative. \*Bede, writing c.731, certainly believed that decision on the conversion of a kingdom could be the subject of possibly formal, conciliar debate. The 11th-cent. evidence is just enough to indicate that some conciliar meetings had elements of formality in summons and procedure, perhaps enough to indicate some conciliar independence. The nature of councils in between these periods is even more obscure; but participation in royal elections must sometimes have been important. JCa

**witchcraft.** Belief in witchcraft, the capacity to do evil or good through occult means, has been present in most human societies. Scattered references to witchcraft practices survive from all parts of the British Isles from an early date, and become more numerous when medieval sources are considered.

It was, however, the 16th cent. which saw important changes in both England and Scotland. Educated opinion in both countries was affected by a new demonological theory which reinvented the witch as a member of a conspiracy against Christendom. For the populace, conversely, witchcraft meant either *maleficium*, the doing of harm by witchcraft, or seeking medical advice or other services from the 'good' witch, most often referred to in England as a cunning man or woman. The new demonological thinking allowed a harder official line against witches. An English Act of 1542 had been repealed, but 1563 saw the passing of legislation against witchcraft in both England and Scotland.

Loss of most relevant trial records makes the English situation immediately after 1563 unclear. In the south-east (notably in Essex), trials and executions for witchcraft rose steadily, peaking in the late Elizabethan period, and were declining by the 1630s. In other areas the peak came in the Interregnum. Most English prosecutions were brought against individual witches, the only large-scale panic coming in East Anglia in 1645-7. This was associated with the 'Witch-Finder General', Matthew Hopkins, and involved accusations against 250 witches, of whom perhaps 100 were executed. Trials declined after the Restoration, with the last known execution for witchcraft coming in Devon in 1685, and the last trial in 1712. It seems unlikely that more than 500 people were executed for witchcraft in England. Many others, most of them cunning folk, were tried but suffered lesser penalties.

In Scotland, a different pattern emerged. There were few trials before 1591, but in that year mass prosecutions, followed by numerous executions, occurred. Accusations revolved around an alleged satanic plot against James VI, and the experience moved him to write a tract against witches, the *Daemonologie*. Other mass persecutions came in 1597, 1629, 1649, and most ferociously in 1661-2. Although peasant concerns over *maleficium* remained important, the most consistent influence behind the mass trials was the aggressive Calvinism of the Scottish kirk. Accusations were concentrated in the Lowlands, where the kirk's Christianizing campaign was most intense. Witchcraft beliefs doubtlessly flourished in the Highlands, but the encouragement to prosecute witches was lacking there. Moreover, the Scottish legal system, unlike the English, permitted the torturing of suspects in criminal investigations. Overall, perhaps 1,000 people were executed for witchcraft in Scotland.

The statutes against witches in both countries were repealed in 1736. Over the second half of the 17th cent. scepticism among the educated, never entirely absent, had become stronger. The reasons for this are not entirely clear. The notion that it was somehow related to new scientific ideas is unconvincing when subjected to close scrutiny. A more useful clue lies in the scepticism which leading judges in both Scotland and England showed when trying

witches. The difficulty of proving witchcraft provoked a more general questioning, while there was also a powerful cultural shift. Many educated people, while unable to deny the theoretical possibility of witchcraft, felt uncomfortable with what they increasingly regarded as something symptomatic not of a satanic sect, but of popular superstitions.

Belief in witchcraft was retained among the populace at large, and when folklorists began to collect materials in the 19th cent. they found witchcraft beliefs flourishing everywhere from Cornwall to the Scottish Highlands. By the 20th cent., better communications, mass schooling, and the decline of those 'face-to-face' communities where witchcraft suspicions operated eroded such beliefs. At the same time, interest in the occult was renewed among educated urban dwellers, and there are currently many people who consider themselves to be witches, and as such to be adherents to a pre-Christian religion. They have little historical basis for such opinions. JAS

**Woburn** (Beds.). Woburn abbey came into the hands of the 1st earl of \*Bedford, along with Covent Garden and estates in Devon, at the \*dissolution of the monasteries. It was an early \*Cistercian foundation of 1145. Part of the present mansion dates from the 17th cent., but the west and south ranges are 18th cent., by Flitcroft and Henry Holland: one of the best rooms is the library, built by Holland in the 1790s. The park has a bridge by \*Chambers and was extensively redesigned by \*Repton. The dukes of Bedford were among the earliest noblemen to perceive the commercial potential of country houses and Woburn has a zoo and amusements. JAC

**Wodehouse, P. G.** (1881-1975). Wodehouse was the son of a judge in Hong Kong but was born in Guildford. His parents stayed in the colony and from the age of 2 Wodehouse was brought up in England by relatives or hired governesses. Dulwich College he thought 'like heaven'. He began as a bank clerk which he hated, but made his way into journalism and in 1919 published *My Man Jeeves*. The success of these stories prompted an avalanche of Bertie Wooster novels and stories. During the Second World War Wodehouse was captured in France by the Germans, who released him and allowed him to broadcast to America. This foolish action gave great offence in Britain and after the war he lived in the USA, becoming an American citizen. He was given a knighthood a few days before his death. Wodehouse's stories acquired in time a period flavour of bright young things and made a very successful television series. Like most good writers, he created his own imaginary world, full of daff men and determined women. JAC

**Wolfe, James** (1727-59). Born in Westerham (Kent) into a military family, Wolfe was an intelligent and articulate professional soldier. He fought at \*Culloden and with distinction in the Rochefort expeditionary force. Marked out by William \*Pitt for Canadian service, he served bravely at Louisbourg in 1758, then returned to London, where he dined with Pitt and Temple, exhibiting 'gasconade and bravado'. Appointed a major-general, he led the assault on \*Quebec in 1759. Suffering from poor health, he was also

criticized for poor generalship by fellow-officers. However, his tactical success and youthful death in victory on 13 September 1759 ensured his entry to the pantheon of British heroes, into patriotic street literature and folk memory. His call to his soldiers to 'remember what their country expects from them', echoed in Nelson's Trafalgar signal, and his statement that he would rather have written \*Gray's 'Elegy' than capture Quebec, are not forgotten.

RCS

**Wolff, Gustav Wilhelm** (1834–1913). Co-founder of the Belfast shipyard Harland & Wolff. Wolff, of German Jewish descent, was the nephew of the Liverpool business tycoon G. C. Schwabe. He joined the Belfast shipyard Robert Hickson & Co. as personal assistant to the manager, Edward Harland, and assisted Harland in his purchase of the company in 1858. Wolff was at first in charge of the drawing office, later—in 1861—entering into a full partnership with Harland. His business acumen was of considerable value to the firm, with which he remained associated until 1906. However, his verdict on his entrepreneurial record was modest: 'Sir Edward [Harland] builds the ships, Mr Pirrie makes the speeches, and, as for me, I smoke the cigars.' Like Harland he was an active Conservative and Unionist politician, representing East Belfast in Parliament (1892–1910). Sitting together in the House of Commons, Harland and Wolff were dubbed by the parliamentary wags 'Majestic' and 'Teutonic' after two of their shipyard's finest vessels. AJ

**Wollstonecraft, Mary** (1759–97). Author and early feminist writer. Mary Wollstonecraft worked for a London publisher, James Johnson, until leaving England for Paris in 1792 to study the French Revolution. Returning to London, she became part of a group of radical and progressive thinkers who included William \*Godwin, Thomas \*Paine, William \*Blake, and William \*Wordsworth. In 1796 she became Godwin's lover, and they married the next year—only six months before her death, which followed the birth of their daughter Mary (future wife of Shelley and author of *Frankenstein*).

Mary Wollstonecraft wrote four books, the most influential of which was *Vindication of the Rights of Woman* (1792). This was the first major statement of feminism by an English writer, and in it Wollstonecraft argued that the French revolutionary principles of liberty and equality applied to women as much as to men. Though rambling and ill organized, it captured the public imagination by its verve and optimism for a future egalitarian society. TSG

**Wolseley, Garnet, 1st Viscount Wolseley** (1833–1913). Soldier. The son of an Irish major, Wolseley joined the army in 1852 and served with distinction in the Burmese War and the Crimean War, being seriously wounded on two occasions. He was in India at the time of the mutiny and took part in the second Opium War against China in 1860. From 1861 he was in Canada, where he crushed the \*Red River rebellion in 1870 and then won more fame in the \*Ashanti War of 1873–4. His victory at \*Tel-el-Kebir in Egypt over Arabi Pasha in 1882 made him a national hero. He was promoted general and given a barony. Though his

expedition in 1885 failed to rescue \*Gordon, Wolseley was not held responsible and was promoted viscount. He finished in 1894 as field marshal, one of the busiest and most successful of Victorian soldiers. His appointment as commander-in-chief in 1895, in succession to the duke of \*Cambridge, gave him the chance to implement some of the army reforms he had long advocated, though ill-health forced him to resign in 1899. All his victories, it has been remarked, were gained in colonial conflicts, but he did what was asked of him. Queen Victoria in 1874 found him 'thin and grey, but well, and a very smart, active, wiry-looking man, full of energy'. JAC

**Wolsey, Thomas** (c.1472–1530). Cardinal. Thomas Wolsey, cardinal-minister to Henry VIII, dominated the political and ecclesiastical life of England from 1515 to 1529. His relatively modest origins (reputedly the son of an Ipswich butcher) were not unusual for a senior cleric; it was the contrast between his origins and life-style which drew notice. He studied at Oxford and became a fellow of Magdalen College around 1497. He soon left scholarship to serve as chaplain to Henry Deane, archbishop of Canterbury, from 1501, became a royal chaplain from 1507, and the king's almoner in 1509. For helping to organize Henry VIII's first campaign in France (1513), he was rewarded with the bishoprics of Lincoln and newly captured Tournai in 1514, and the archbishopric of York shortly afterwards. In 1515 he became both cardinal and lord chancellor of England. In 1518 the pope honoured him with the special status of legate *a latere*, outranking the legatine status held by every archbishop of Canterbury; in 1524 this title was, uniquely, given for life.

With such an accumulation of posts, and vast energy, Wolsey took responsibility under the king for nearly all areas of government policy. A primary aim was to win military and diplomatic success for Henry. After the costly first campaign in France, Wolsey tried to magnify his master through grandiose peace negotiations (the treaty of \*London, 1518, and the \*Field of Cloth of Gold, 1520); he also tried to steer England into a position as arbiter and broker between the much wealthier monarchies of France under Francis I and Austria-Spain-Burgundy under Charles V. However, England was drawn into invading France in 1522 and 1523, forcing heavy and much-resented taxation, for which Wolsey was blamed. Attempts to side with France after 1525 backfired: a cloth embargo on the Habsburg Netherlands in 1527–8 had to be abandoned because of the harm done to England.

In domestic affairs Wolsey used his position as lord chancellor to pursue traditional policies with unusual verve and aggression. He revived Henry VII's campaign against those gentry and nobles who 'retained' excessive numbers of supporters to overawe royal justice. In 1517 he instituted commissions to search out those who had broken the law against converting arable farms into sheep-runs. He expanded the scope of the prerogative courts' equity jurisdiction, attracting a flood of civil suits to \*Star Chamber and offering redress to poor plaintiffs in what later became the Court of \*Requests.

Wolsey's management of the church was less creative. He enjoyed his pro-papal status as legate, gratuitously thwarting the primate's jurisdiction at times. There is no evidence that he seriously coveted the papacy for himself, though the idea of setting him up as an anti-pope was briefly canvassed to resolve the royal marriage crisis. He had neither the moral reforming zeal of \*Colet nor the taste for theological polemic of John \*Fisher. However, he had a good eye for intellectual gifts in others; and his educational foundations, including the great unfinished project of Cardinal College, Oxford (later refounded as Christ Church), allow him to rank with Bishops Richard \*Foxe in Oxford and John Fisher in Cambridge. Dissolving multiple monasteries to endow a college and a school, however, set a dangerous precedent.

Historians have argued unfruitfully whether Wolsey or Henry VIII was really in charge of England before 1529. Contemporaries regarded the cardinal's power as quasi-regal, and his vastly ostentatious household, larger and more ritualized than the king's, contributed to that impression. Henry did not like to read papers and absented himself from duties for long periods. However, the king could intervene decisively and stubbornly via his secretaries, and occasionally did. His penchant for war created problems Wolsey would not have chosen to set himself, and brought ill-deserved public hatred on the minister. At intervals Wolsey felt the need to protect himself against hostile courtiers close to the king: he restructured the king's privy chamber in 1519 and again in 1526, and gave his own magnificent palace of \*Hampton Court to Henry in 1525.

Henry's desperate need for the annulment of his first marriage required Wolsey to ask of the papacy the one thing it could not grant. Wolsey attempted to have the issue devolved to a commission composed of himself and the roving Cardinal Campeggio, but the queen's appeal to Rome thwarted this plan. Wolsey, who planned a diplomatic second marriage to a French bride for Henry, had no control over \*Anne Boleyn, who fed the king anticlerical and anti-Wolsey propaganda in the months leading up to the sudden loss of all his offices in October 1529. Wolsey pleaded guilty to an absurd charge of \*praemunire arising out of his legate status, and temporarily retired to church affairs; but when he dabbled unofficially in diplomacy in the summer of 1530 he was denounced as a traitor, and died on his way to London to answer, at Leicester, on 29 November 1530.

Wolsey's unpopularity with the political nation has been blamed for much of the anticlerical sentiment expressed in the 1529 session of Parliament. It is, however, probably too harsh to place the subsequent misfortunes of either church or state on him. For his accumulation of offices, and many of the unpopular policies he followed, the king was personally responsible. Wolsey's moral failings and pompous style were comparable to those of other cardinal-ministers in Europe at the time. It was only in the light of the religious earnestness of the 1530s and 1540s that his ministry came to appear so incongruous. EC

Gunn, S. J., *Cardinal Wolsey* (Cambridge, 1991).

**women's institutes.** Founded in Canada (1897) for improving women's education in domestic science, the first

UK institute was formed on Anglesey (north Wales) in 1915 and the first county federation (Sussex) in 1917. Written off as a wartime experiment that would not last, their determination to better the lives of rural communities led to rapid expansion, a magazine (*Home and Country*), and self-government; non-party, non-sectarian, and well organized, they broadened interests, broke down social isolation, and began to demand a voice in public affairs (health care, adult education). Concern to protect its non-political principle led the NFWI to declare in 1938 that it could not, as an institution, take part in a war effort. It was criticized for this stance, even though individual members were quite free to join the Women's Voluntary Service, Women's Land Army, or Civil Defence. Many in fact did so, while others contributed substantially to the evacuation programme, fruit-preserving, and sock-knitting. Their love of festivals has created a popular image confined to making jam and singing Blake's 'Jerusalem', but they have demonstrated that they can be a powerful pressure group. ASH

**'Wonderful' Parliament**, 1386. Parliament met on 1 October and demanded the dismissal of Richard II's chancellor and favourite, Suffolk (Michael de la \*Pole). Richard refused and talked wildly of seeking aid from the king of France. But he was forced to agree to Suffolk's impeachment. JAC

**Wood, Sir Henry J.** (1869–1944). English conductor. Initially an organist and composer, although he also taught singing for much of his life, Wood studied at London's \*Royal College of Music. He made his conducting début in 1888; he also helped \*Sullivan prepare *The Yeomen of the Guard* and *Ivanhoe* and conducted the British première of Tchaikovsky's *Eugene Onegin* (1892), reflecting his lifelong promotion of new Russian music. In 1895 Wood founded the enormously influential Queen's Hall \*Promenade Concerts, which he conducted until his death, introducing countless new works to the British public. He encouraged many young British performers and composers, conducting the Royal Academy of Music student orchestra for twenty years. His meticulous markings of scores and parts, his well-organized rehearsals, and his clear technique with a very long baton (described in his book *About Conducting*) allowed him to make the most of often minimal rehearsal time. His *Fantasia on British Sea-Songs*, an arrangement written in 1905 for the centenary of Trafalgar, has become an immovable part of the Last Night of the Proms. ECR

**Woodchester** is a major Romano-British villa in the Cotswolds near Stroud (Glos.). It originated on a small scale in the 2nd cent. By the first half of the 4th cent. it consisted of at least three courts in echelon. The outer court was probably agricultural. The middle court was flanked by a large store-building and a residence, perhaps of the agent. The principal range of the inner court contained a huge reception room, floored with the largest mosaic in Roman Britain, depicting Orpheus and the beasts. Other rooms were floored in mosaic. One was probably a sculpture gallery. ASEC

**Woodforde, James** (1740–1803). Woodforde was a country parson whose diary from 1758 to 1802 has survived. His life

## Wood's halfpence

was uneventful. He was born in Somerset, son of a cleric, and educated at New College, Oxford. After ten years as a Somerset curate, he returned briefly to college before becoming rector of Weston Longueville, a college living near Norwich, where he spent the rest of his life. He had a lively interest in food, in his servants, and he played whist and went fishing. Great events largely passed him by and he devoted one hundred times the space to the king and queen's visit to Sherborne in 1789 than he did to the French Revolution. The diary is full of little vignettes—'poor Thomas Barnes, who had been a long time killing himself by liquor'; old Mr Reeve who broke Woodforde's gum—'he is too old, I think, to draw teeth, can't see very well'; Andrews the smuggler, who 'frightened us a little by whistling under the parlour window just as we were going to bed'; 'Mr Townshend's gamekeeper who goes by the name of Black Jack' and shot Woodforde's dog, Pompey. JAC

**Wood's halfpence**, 1722. There was a shortage of coin in Ireland in 1722 and much of it was old and worn. Since there was no mint in Ireland, a patent was granted to a Wolverhampton ironmonger, William Wood, to supply just over £100,000 in halfpennies and farthings. Though Sir Isaac \*Newton, as master of the mint, testified that the coins were satisfactory, there was vociferous protest from Ireland and an almost total refusal to handle the money. Swift's anonymous *Drapier's Letters* in 1724–5 raised a flame: 'if a madman should come to my shop with a handful of dirt raked out of the kennel, I would pity or laugh at him; and if Mr Wood comes to demand any gold or silver, in exchange for his trash, can he deserve or expect better treatment?' \*Walpole revoked the patent in 1725 and Wood was privately compensated. The episode suggests how tense Anglo-Irish relations were and the resentment left by the Act of 1720 which reaffirmed that Ireland was 'subordinate to the imperial crown of Great Britain'. JAC

**Woodstock, Assize of**, 1184. The king's hunting in royal forests was protected in the Norman period by severe laws. Henry II enforced them fiercely, partly because of his own love of the chase, partly to raise revenue. This assize, also known as the Assize of the Forest, summarized previous laws. Stubbs suggested that it was milder than previous practice, but since punishments included blinding, mutilation, and castration, that is not easy to credit. By clause 9, the clergy were brought into the sway of the forest laws and Henry encouraged foresters 'not to hesitate' to arrest them. JAC

**Woodstock, treaty of**, 1247. For some years the treaty of Woodstock was the high-water mark of English advance against Wales. When \*Dafydd ap Llywelyn died in 1246 without sons, his nephews Owain and \*Llywelyn ap Gruffydd made peace with Henry III. They gave up their lands east of the Conwy and agreed to hold north Wales by military service. But Henry III's struggle with his barons enabled Llywelyn to recover much of his power and in 1258 to declare himself prince of Wales. JAC

**Woolf, Virginia** (1882–1941). The daughter of Sir Leslie Stephen, editor of the *DNB*, Virginia Stephen was a sensitive

child. Abused at the age of 6, the death of her mother when she was 13 caused a breakdown. She was engaged at one time to Lytton Strachey but in 1912 married Leonard Woolf. The physical side of the marriage was unappealing to her given her preference for lesbian relationships. With her husband she founded the Hogarth Press and their house became a centre for the \*Bloomsbury Group of artists and writers. Despite her delicate health she sustained a large output of essays, reviews, and novels—*Mrs Dalloway* (1925), *To the Lighthouse* (1927), and *Orlando* (1928), which experimented with 'stream of consciousness' technique and was a great success. *The Common Reader*, a book of essays (1925), also sold well and a second and even better *Common Reader* came out in 1932. In 1929 she published *A Room of One's Own*, surveying the difficulties confronting women, which became a classic of feminist literature. A protracted bout of depression in 1941 led her to drown herself in the river Ouse in Sussex. SMC

**woollen industry**. This responded early to the possibilities presented by water power, and the fulling mill, introduced in the late 12th cent., spread widely thereafter, although hand-finishing of cloth survived in remote rural societies until the 19th cent. Distaff spinning was replaced by the wheel in the 14th cent., and the loom was improved constantly to help weaving productivity. Quality control was exercised by town guilds, but country districts were free of regulation. This aided the rise of rural clothiers who sold in cloth halls, exports to the principal European markets in the Low Countries being supplied via Blackwell Hall in London and managed by the \*Merchant Venturers' Company.

Although cloth exports rose remarkably from the late 15th cent., the introduction into East Anglia from the 1560s of 'new draperies', mainly worsteds, by protestant immigrants fleeing persecution added to the product range available to both the home and foreign market. Manufacture was often controlled by merchants who put out materials to be made up by workers in their own homes. A few entrepreneurs tried to concentrate production, intending to raise productivity by closer supervision of the labour force and able to control quality and raw materials directly.

By 1700 the woollen industry was Britain's most important industry with a range of products from luxury to plain goods. Its links with agriculture were intimate; its parliamentary lobby was therefore strong. John \*Kay's 'flying-shuttle' (1733), intended for use in the woollen industry, was only slowly adopted, compared with its use in fustian-weaving. Merchant clothiers expanded production in areas with the lowest labour costs, often building large loom-shops. Improvements were made in carding and scribbling, the preparatory processes, and in the 1780s worsted-spinning was first mechanized, using \*Arkwright's water frame, and wool-spinning followed (1810) with the application of \*Crompton's mule. Most mills were small and in the 1830s on average employed fewer than 50 workers. As late as 1858 only about half those employed in the industry worked in factories. The transition to the factory system was clearly slow. However, technical change did meet resistance

from the croppers or shearmen who finished off cloth and were being replaced after 1800 by the gig mill and shearing frame. The croppers and shearers were the backbone of \*Luddism, especially in Yorkshire.

The industry fared well for most of the 19th cent. The home market was buoyant, and 'new' products such as tweed hosiery, mohair, and alpaca found extensive markets overseas. South Africa, Australia, and New Zealand added significantly to wool supplies from the 1850s. Wool imports increased fivefold between 1850 and 1885. Yorkshire and the west country dominated the industry, although the Scottish borders exploited the demand for tweed and hosiery until the 1970s.

From the 1870s foreign competition and tariff barriers in Europe and the USA began to hit exports. An atomized industrial structure of small family firms did not help. The combination of spinning and weaving within the single business became general and was often accompanied by the integration of finishing and dyeing. The real disaster occurred after the First World War. The contraction of world trade in the great inter-war slump hit hard. Too much equipment was obsolescent, and the lack of capital investment adversely affected productivity. However, the industry was saved by tariff protection from 1932 and the revival of the home market in the late 1930s. Man-made fibres attacked the industry from the 1950s, especially the production of carpets, and its future rested with reacting rapidly to changes in fashion and markets. Decline was rapid after 1965. JB

**Worcester.** Cathedral city on the river Severn, and county town of Worcestershire. A modest Roman town, it was re-occupied by a cathedral (680) and later by a fortified town (burh) c.890. From the 14th to the 17th cents. it flourished as a river port and cloth-making city. Its peak national ranking came in the 17th cent. (twelfth largest English town in 1662), but it suffered severely for supporting the royalists in the civil wars, especially after the battle of \*Worcester. In the 18th and 19th cents. it prospered more modestly through porcelain and glove manufactures. The cathedral is a fine 13th/14th-cent. building housing the tombs of King John and Prince \*Arthur; the city retains much of its historic fabric despite appalling central redevelopment in the 1960s ('the sack of Worcester'). DMP

**Worcester, battle of, 1651.** In July 1650 Charles II landed in Scotland and was crowned at Scone on 1 January 1651. But finding his army outflanked by \*Cromwell, he moved south in August, making for the old royalist strongholds of Wales and the west midlands. Cromwell pursued him with an army almost twice the size of his own, and caught up with him at Worcester. The royalists dug in, cutting all the bridges except that between the city and the suburb of St John to the west. Cromwell's response was to bring up barges from Upton to the south and construct pontoon bridges over the Severn and the Teme. He attacked on 3 September, the anniversary of his great victory over the Scots at \*Dunbar. Charles II conducted operations with considerable skill from the tower of the cathedral and a counter-attack to the east of the city made some progress. But in the end, superior numbers prevailed and his army was wiped

out as a fighting force. Charles was swept out of Worcester to the north and began his extraordinary escape. In his report of the battle, Cromwell wrote, 'it is, for aught I know, a crowning mercy'. Thus the civil wars ended near Powick bridge, where they had started nine years before. JAC

**Worcester, diocese of.** Now roughly coterminous with Worcestershire, it was created by \*Theodore in c.679 out of the large Mercian see for the \*Hwicce people who inhabited Gloucestershire, Worcestershire, and half Warwickshire. The Worcester diocese was reduced in size by the creation of the see of \*Gloucester in 1541 and \*Birmingham in 1905, though it also briefly (1836–1918) included the \*Coventry area until its own diocese was created. Despite the Danish invasions, there was continuity of episcopal succession. \*Oswald (961–92), a monastic reformer, replaced the cathedral's secular canons with monks. He also held the archbishopric of York in plurality from 972, as did his successors until 1016 and for a short spell after 1040. Notable bishops were \*Wulfstan (1062–95), a man of great sanctity, Hugh \*Latimer (1535–55), burned at the stake, Edward Stillingfleet (1689–99), a latitudinarian scholar, and Charles \*Gore (1902–5), an Anglo-catholic writer, who also successfully campaigned for the creation, out of his own see, of the Birmingham diocese of which he became first bishop (1905–11). The cathedral, though Norman in plan with Norman crypt and chapter house, was largely refashioned in the 19th cent. with a Perpendicular cloister. It contained the shrine of Wulfstan (destroyed at the Reformation) and houses the tomb of King John. WMM

**Worcester, pact of, 1264.** After Simon de \*Montfort's victory at \*Lewes in May 1264, he attempted to subdue Roger \*Mortimer and the marcher lords. On 12 December at Worcester, a compromise was reached whereby the lords were to go to Ireland for a year and a day, Prince Edward's possessions were to pass to de Montfort, but the prince was to be released. Everything was overturned by de Montfort's defeat and death at \*Evesham in August 1265, when his head was sent as a trophy to Mortimer's wife at Wigmore. JAC

**Worcester, Thomas Percy, 1st earl of (c.1344–1403).** The younger brother of the 1st earl of \*Northumberland, Percy had a distinguished career in the French war from 1369 to 1388, interrupted by service on the Scottish border, at sea, and in \*John of Gaunt's expedition to Spain. From 1390 he held office in Richard II's household and was rewarded with the title of earl and a share of the spoils for his part in the destruction of the king's enemies. In 1399, however, he abandoned Richard in favour of Henry IV and served as admiral, ambassador, and lieutenant in south Wales; for a while he was apparently Henry's principal noble councillor. As the Beauforts and Nevilles gained royal favour, Percy influence was threatened, and this helped to explain why Worcester joined Henry \*Percy's rebellion: as in 1399, his first loyalty was to his family. He was beheaded after the battle of \*Shrewsbury. RLS

**Worcester, treaty of, 1218.** After John's death in 1216, he was succeeded by his son Henry III, aged 9. \*Llywelyn ab Iorwerth had profited from the divisions of John's reign and

## Worcestershire

controlled most of Wales. At Worcester in 1218 his power was acknowledged, he was recognized as Henry's lieutenant during the minority, and the royal castles of Carmarthen and Cardigan were placed in his hands. The accommodation soon broke down. JAC

**Worcestershire** is bisected by the river Severn, which enters the county at Bewdley and leaves it near Tewkesbury; it is joined from the west by the Teme and from the east by the Avon and its tributaries. It was well wooded. The Malverns formed the boundary with Herefordshire in the south-west and the other hills include Bredon Hill, beloved of poets and composers, and the Lickey, Clent, and Abberley hills. The early importance of Worcester was as a river crossing and it retained its strategic significance until the 17th cent. One form of the name was Wigornaceastre, which may derive from the people of the Wyre forest. The area formed part of the territory of the \*Hwicce and then of the \*Mercians. It was in the diocese of \*Lichfield until Worcester was established as a separate see in the later 7th cent.

Though sheltered from Welsh attacks by Hereford to the west, the county was for centuries a border area, and fell under the jurisdiction of the \*Council of the Marches in Tudor times. Four great abbeys were early established, at Pershore, Evesham, Malvern, and Worcester itself. The cathedral at Worcester was rebuilt several times before the Norman Conquest. The present building was started in 1084 by St \*Wulfstan.

It was a fertile and flourishing county. In the 16th cent. \*Camden wrote of Worcester that it 'really deserved admiration both for its antiquity and beauty' and noted that the shire was celebrated for its perry and for the salt springs at Droitwich. The strategic position of Worcester made it of great importance during the civil wars, since its bridge dominated access to Wales and to royalist recruits. Indeed, the civil wars may be said to have begun and finished in the city. The first skirmish in September 1642 was \*Rupert's cavalry action at Powick bridge and the last battle in September 1651 saw Charles II driven out of the city by Cromwell's men. The flamboyant Guildhall, built in the safer 1720s, paraded the city's loyalties with statues of Charles I and Charles II.

Worcestershire retained its prosperity in the 18th cent. but the character of the county was beginning to change. Tom Jones and Mrs Waters spent a disturbed night at the White Lion at Upton on Severn, where the landlady confessed that she sold her perry as champagne: 'to be sure it is as well tasted and as wholesome as any champagne in the kingdom.' Upton itself, in the extreme south of the county, remained a tiny market town, preserved in a lovely time warp, but in the north mining and industry was changing the face of the shire. There had always been local industries and the Severn was always a busy thoroughfare. Droitwich salt-pans went back to Domesday, Kidderminster was famous for textiles and then carpets, while there were glass manufactories at Stourbridge from Tudor times. In the 17th cent. the Foleys established nail-making at Stourbridge on a grand scale and set up a great county interest: the burned-out remains of their house at Great Witley are an impressive and sombre testimony to departed grandeur. The development of a

canal and railway network brought Worcestershire more into the national context, as it did Warwickshire. Stourport was scarcely more than a solitary inn in the 1770s when it became the junction of the new Staffordshire and Worcester canal with the Severn, but subsequently developed into a busy town. Great Malvern jumped from a small local spa to a national one in the middle of the 19th cent. with the popularity of hydropathy. The southern and western towns of Evesham, Pershore, and Tenbury remained small, but the northern parts were sucked into the Black Country complex. Yardley, King's Norton, and Halesowen were swallowed up by Birmingham; Dudley developed into a great mining and industrial centre, far exceeding Worcester in population. By the local government reorganization of 1972, the county lost parishes in the north to the new \*West Midlands area, but was merged with its neighbour Herefordshire. 'The Malverns are no more,' it was declared. But the forced marriage, resented by Herefordshire, ended in divorce in 1998. Worcestershire continues as a county, with district councils in Bromsgrove, Malvern Hills, Redditch, Worcester, Wychavon, and Wyre Forest. JAC

**Wordsworth, William** (1770–1850). Greatest of the Romantic poets for 'the union of deep feeling with profound thought' his friend \*Coleridge admired in his work. From Cambridge a visit to France on the first anniversary of the Revolution fired his enthusiasm for the people's cause: 'Bliss was it in that dawn to be alive, but to be young was very heaven!' His loyalties divided by the outbreak of war and separated from the woman who bore his child, he settled in Dorset with his sister Dorothy. The conditions of the rural poor preoccupied him and a \*Godwinian rationalism coloured his thinking; at this period Coleridge judged him 'at least a semi-atheist'; *Lyrical Ballads* (1798) was written to show that 'men who do not wear fine clothes can feel deeply' and a copy presented to Charles James \*Fox. After 1800, back in his native Cumberland, a more subjective vein emerged in *The Prelude* (not published until 1850), the long poem on the growth of his own mind. A long life saw some hardening of poetical arteries and political attitudes; later commentators have generally preferred the poetry of his radical youth. JNRS

**Workers' Educational Association** (WEA). Founded in 1903 by Albert Mansbridge (1876–1952), a cashier at the Co-operative Permanent Building Society, whose own formal education had ended at the age of 14. Mansbridge considered that the University Extension movement, established in 1878 and originally intended for the education of the working classes, had been largely taken over by the middle classes. To remedy this, Mansbridge launched an Association to Promote the Higher Education of Working Men, changing its name to the Workers' Educational Association two years later. He sought the help of Oxford and Cambridge for the new movement, which would provide high-level education for co-operators, trade union members, and reading circles. The creation of the university tutorial class, where students pledged themselves to attend courses for three years, was probably Mansbridge's greatest achievement. By the outbreak of the First World War the movement

had proved a success, with every university providing tutors. But middle-class infiltration persisted. PG

**workhouses.** The workhouse was an Elizabethan invention designed to provide a disciplined and productive environment for the able-bodied poor, at a time when rising urban poverty was putting pressure on existing systems of almsgiving and emergent local taxation. Its origins lay in manufacturing towns such as Norwich. The idea was slow to spread until the 18th cent., and an Act of 1723 enabled parishes to band together to support a shared workhouse out of their income from rates. Many of the resulting ventures soon became places of refuge for the aged and impotent poor and for unmarried mothers rather than supervised workplaces, and it was difficult to find work (apart from the maintenance of institution and inmates themselves) which would not compete with outside workers. Some attempts were made to make relief to the able-bodied conditional on entry into the workhouse, but outdoor relief in various forms continued. The workhouse really rose to prominence with the \*Poor Law Amendment Act of 1834, which required each of the new unions of parishes to provide a central workhouse which would classify the poor by age, sex, and circumstances and accommodate them under conditions which were 'less eligible' than the worst that prevailed outside. No relief was originally to be given outside these workhouses, which soon became known to potential inmates as 'bastilles' after the French Revolution symbol of repression. In practice, the system was generally less fearsome than intended. Outdoor relief continued to be provided in many places: it was cheaper and more flexible than the workhouse, in both agricultural areas of seasonal unemployment and manufacturing districts where the workhouse would have been swamped in every trade depression. In industrial areas such as south Lancashire new workhouses were not built for over thirty years in some unions, after angry demonstrations when the new system was being introduced in 1837. Many people incorporated the workhouse into personal survival strategies, using the casual ward system to sustain them in their wanderings in search of work or going inside as a refuge from inclement winter weather. But the great achievement of the 1834 Act was to attach such a stigma to poor relief, and create such a fear of the workhouse, that many proud people preferred starvation or prostitution to admission into the 'bastille'. Such attitudes were fuelled by scandals such as that of the Andover workhouse where starving inmates ate the rotting bones they were grinding, and by the Anatomy Act of 1832 which provided that unclaimed pauper bodies from the workhouse could be given up for dissection. This deterred people from seeking medical relief, and although many workhouses developed hospital functions, the charitably funded infirmaries were preferred. Conditions in workhouse hospitals could still be appalling in the 1860s and 1870s, especially in the venereal and insane wards. Even when the workhouse premises passed into the National Health Service as hospitals after the Second World War, the stigma remained and many elderly people were terrified of entering them. The workhouse in English social history (it was not

given such a prominent role in the different history of the Scottish Poor Law) has acted above all as symbol and reinforcement of the conversion of poor relief from a right to a source of shame, which was the main purpose and effect of the 1834 Act. JKW

**working class.** The 18th cent. often talked of the poor, labourers, and artisans as part of its language of ranks and orders. Somewhere in the early years of the 19th cent. such groups were identified by contemporaries and later historians as a working class, or more frequently 'the working classes'. This identity was seen as a response to their position as wage earners faced with an intensification of capitalist relationships of production, namely relationships which involved private property and production for profit, mediated by cash. The responses and experiences which accumulated to form the relationships of class included opposition to machinery, the dramatic fall in real wages experienced by hand-loom weavers, and the political inspiration of radicalism. In the 1820s and 1830s, \*trade unions, especially in the textile and mining industries, became a focus of industrial conflict more extensive than anything experienced by the mainly craft associations of the earlier century. The \*chartist movement of the 1830s and 1840s became a focus of many working-class ambitions and gained mass support for a political programme demanding universal manhood suffrage. Many historians see chartism as a product of the economic experiences of the working classes. Others see chartism as a political movement which offered little analysis of economic relationships in terms of capitalist exploitation, but offered a radical attack upon political privilege and corruption as a base for explaining 'the people's' poverty. Debate also exists on the meaning of trade union conflicts. Many reflect particular trades and localities with little sense of the relationships of wage labour as a whole.

The 1860s saw the establishment of a more institutionalized trade union movement with legal status and centralized bodies like the \*Trades Union Congress (1867). This period saw a move from unstable conflict to social peace often identified with the influence of a \*'labour aristocracy' of skilled workers prepared to co-operate with the owners of capital. The change was more broadly based and related to improvements in working-class living standards, the acceptance of many working people into political life, especially in the Gladstonian Liberal Party, and the development of a more sophisticated employer paternalism. It was a period in which the wage relationship was still partial and imperfect. Subcontracting, payment in kind, and gender and supervisory hierarchies mediated between labour and capital.

By the 1890s, a distinctive working-class culture had emerged, based upon a sense of neighbourhood and mutual support, especially amongst women, upon old and new leisure patterns built around the public house, spectator sports like \*football and the \*music-hall, and upon a labour movement consisting of a variety of institutions like the retail \*co-operative societies, trade unions, socialist Sunday schools, and the ILP (\*Independent Labour Party). These values have been called 'populist', involving a pride in work and in mutual support in the face of poverty, a delight in having a good

## working men's clubs

time, a derision of privilege, and a regional pride. Such populism could as easily move to a Union-Jack-waving nationalism as to a conflict-orientated sense of class. It represented a sense of cohesion which lasted into the 1950s and was celebrated by Richard Hoggart's *The Uses of Literacy* (1957).

The working class faced major periods of conflict in the late 19th and early 20th cents. culminating in the \*General Strike of 1926. This was related to the impact of new technologies, often involving de-skilling, to new management strategies, and to unstable and competitive conditions in world trade. Conflict was firmly related to wages and conditions and there is little evidence of any ambitions for revolutionary change. Socialism in the 1918 constitution of the Labour Party embodied a willingness to use any means including nationalization in the attack on poverty. Major success came with the 1945 Labour government, the \*welfare state, and the nationalization of key elements of capital.

By the 1950s, the life-style of the bulk of the working class had been transformed by so-called 'Fordist' relationships, in which social stability depended upon high productivity, high wages, and the consumption of an increasing variety of goods. A mass culture of film, football, and television began to entail a more private life-style. This was threatened in the 1970s, by de-industrialization, an accelerated shift in the economic structure of Britain away from traditional industries such as coal-mining, textiles, and iron and steel, accompanied by mass unemployment and new forms of poverty.

The problems of writing and understanding working-class history in Britain lie in its political meaning. The initial writings were undertaken by those seeking the origins and inspiration for the \*Labour Party in a long march of labour history from Tom \*Paine's *\*Rights of Man*, through \*chartism and the \*TUC, to the achievements of the 1945 government. Others led by Edward Thompson in *The Making of the English Working Class* wanted to reposition the Marxist tradition of British history and secure a recognition for the agency and creativity of working-class people, in place of a deterministic view of the impact of economic relationships. Recent writing has reflected the uncertainties and multiple identities of the late 20th and early 21st cents.

See also SOCIAL HISTORY; CLASS.

RJM

**working men's clubs.** Clubs which brought working men together sociably took many forms, including \*friendly societies for mutual insurance and gatherings in pubs or beer-houses for news and information and to enjoy shared interests and pursuits such as music and gardening. But the working men's club movement, as such, was a product of philanthropic and controlling concerns within the mid-Victorian middle classes, anxious to reclaim the working man from the pub and its temptations to alcoholic, political, and other excesses, and conscious that formal educational provisions like the \*mechanics' institutes were a minority taste. Clubs in which men could gather for uncontentious reading, games without gambling, and sociability without alcohol were proliferating, especially under temperance movement auspices, by the 1850s. The prime mover in the foundation of the Workingmen's Club and Institute Union, established in 1862, was the Revd Henry Solly, a unitarian

minister whose experiments in Lancaster had convinced him of the viability of this approach to social reform. After the 1867 Reform Act opened out working-class urban electorates the political parties also became involved, especially the Conservatives, whose clubs were popular because of a lack of inhibitions about beer and billiards. But the CIU itself soon threw off most of the restrictions intended by its original patrons, and beer (ostensibly in moderation, as befitted a respectable, self-controlled membership) soon appeared as part of the clubs' attractions, followed by musical and comic entertainment of a kind not envisaged by the reformers. As with other cultural initiatives promoted from above, working men took what they wanted from the CIU and rejected the rest, and by the end of the 19th cent. the movement was firmly set on the road to the current emphasis on relaxation, sociability, drink, and glamour: a far cry from the godly, righteous, sober, and improving aims of the founders.

JKW

**Workmen's Compensation Act, 1897.** This Act, passed by Lord \*Salisbury's government, was a significant step in establishing employers' liability. The foundation of the \*Trades Union Congress in 1868 saw increased pressure for compensation for accidents at work, and in 1876 a select committee was set up, under the chairmanship of Robert \*Lowe. It resulted in an Act of 1880 which offered up to three years' wages in damages if the employer or an authorized superintendent had been negligent. A number of employers pressed their work-force to contract out of the legislation in exchange for a company accident fund. In the 1890s Joseph \*Chamberlain campaigned for compensation 'irrespective of the cause of accident' and, though colonial secretary, was largely responsible for the Act of 1897, which established that an employee was entitled to compensation for any accident not his own fault, even if there was no negligence on the part of the employer. Employers could offset the cost of the scheme by taking out insurance and the amount of compensation was carefully limited. It applied to railways, factories, mines, and quarries, but not to seamen or domestic servants. Sir William \*Beveridge described workmen's compensation as 'the pioneer system of social security'.

JAC

**World War One.** See FIRST WORLD WAR.

**World War Two.** See SECOND WORLD WAR.

**Worms, treaty of, 1743.** In an attempt to gain the balance in the War of the Austrian Succession, Lord \*Carteret persuaded Maria Theresa and George II to sign the treaty of Worms with Charles Emmanuel of Sardinia, offering him subsidies and territorial concessions in exchange for support. But the move was cancelled by France bringing Spain into the war on her side and the strength of the combined Franco-Spanish fleets held out hopes of a successful Jacobite invasion of Britain. The treaty of \*Aix-la-Chapelle which concluded the war in 1748 was on the basis of *status quo ante bellum*.

JAC

**Wren, Sir Christopher (1632–1723).** Wren was an instinctive mathematician and geometrician, whence came the con-

structional resource evident in the span of the Sheldonian theatre, Oxford (1664–9) and the dome of St Paul's (1705–11). Perhaps these disciplines held any baroque tendencies in check, though Wren's father's high Anglicanism, family links with the court, and a visit to Paris in 1665 might otherwise have predisposed him. A more reticent individualist than Inigo Jones, as an astronomer Wren's individualism was of the age of Newton, in which spatial values were pre-eminent. As an architect he is only conjecturally associated with country houses. His proven work ranges from the Royal Observatory, Greenwich (1675), to \*Hampton Court palace (1689–1702) and \*Greenwich hospital (1696–1702). Apart from his masterpiece, St Paul's, Wren designed some 25 churches for London between 1670 and 1694. In 1669 surveyor-general of the king's works (until 1718), Wren was knighted in 1673, the year of his celebrated portrait bust by the mason-sculptor Edward Pierce. DDA

**wrestling** is one of the oldest sports in the world and has always had a large number of local and national variants. It was included in the Olympic Games in 704 BC. In Britain, Cumberland and Westmorland, and Cornwall and Devon, developed their own versions, and it formed an important part of the Cotswold Games which flourished at Chipping Campden in the 17th cent. Wrestling was introduced into the revived Olympic Games in two forms—the Graeco-Roman and the free-style. Sumo-wrestling and judo are Japanese variants, the latter of which has become widely popular. Professional wrestling on TV had a considerable following in the 1970s but the bouts became so ludicrous that its appeal wilted. JAC

**Wright, Joseph** (1734–97). Painter, known as Wright of Derby, where he was born and spent most of his life. He earned a living as a portrait painter, while he experimented with the effects of light and industrial and scientific subjects, reflecting the interests of his day and earning him the patronage of \*Wedgwood and \*Arkwright. Two of his best-known works come from this period, *A Philosopher Lecturing on the Orrery* (1766, Derby) and *An Experiment on a Bird in the Air Pump* (1768, Tate). During the 1770s he travelled in Italy, less inspired by the great art than by an eruption of Vesuvius, which he painted eighteen times, and a Roman firework display. Although in 1775 Wright failed to replace \*Gainsborough in Bath, some of his best portraits come from the early 1780s, while in later life he concentrated more on landscape painting. His work is well represented in British galleries, especially at Derby. JC

**writs.** The writ was originally an administrative command issued by the king to a subject, often an official such as the sheriff. After the Norman Conquest, and especially after the reign of Henry I, the king might issue a writ to permit a subject to have his case heard before the king's person or his \*curia regis. In the reign of Henry II it became necessary for any person seeking to bring an action against another in relation to title to freehold land to obtain the king's writ to institute proceedings. After this, the issue of writs by the \*Chancery or writ office became the regular way of obtaining a hearing in the king's court. The common law was built

up from the collection of writs issued by Chancery and the 'Register of Writs', which grew from the reign of Henry III, formed the basis of the common law. Each writ had its own procedure and special features. At times the Chancery was more ready to grant new writs, but after the development of Parliament and the provisions of \*Oxford 1258, it became less easy to obtain new writs. However, the story of the common law is the story of the development of new writs or 'forms of action' and their acceptance by the courts. MM

**Wrotham Heath, battle of**, 1554. Widespread risings against Mary's marriage to Philip of Spain did not take place as planned, but Sir Thomas \*Wyatt managed to rouse considerable numbers in Kent. Part of his force under Sir Henry Isley was caught at Wrotham Heath, between Sevenoaks and Rochester, on 28 January, and dispersed by Sir Robert Southwell, sheriff of the county. The remainder went on to threaten London, but the rebellion collapsed in early February. JAC

**Wroxeter.** 5 miles east of Shrewsbury was the Romano-British town of Viroconium Cornoviorum, the *civitas* of the \*Cornovii, where Watling Street crossed the Severn. The original settlement was a fortress, manned at first by *legio XIV* and, after AD 66, by *legio XX*. When the army left in AD 90 to move to its base at \*Chester, Viroconium developed as an important civilian settlement, with an aqueduct, baths, drainage, forum, and temple. The theory of a catastrophic sacking and burning by the Saxons has now been abandoned and the town seems to have suffered slow decay as people moved to \*Shrewsbury instead. JAC

**Wulfhere** (d. 675), king of Mercia (658–75). Wulfhere was in hiding after his father \*Penda's defeat and death until a successful rising in 658 expelled the Northumbrians and made him king. He was a Christian: how he became one is unknown. Events in his reign illuminate the relationship between a king's role and his faith. Wulfhere had authority over Essex; his ecclesiastical interventions there were both edifying, and less so. He sent a mission to reconvert part of Essex which had apostacized (c.664). He sold the see of London to Wine in the first known English act of simony (666). His relations with Sussex interweave power and piety. Its king, Æthelwath, became converted, no doubt because Wulfhere was his overlord. When he was baptized at the Mercian court Wulfhere 'adopted him' (presumably stood as his godfather) and, as 'a sign of adoption' gave him the Isle of Wight and adjacent lands. Wulfhere's power flagged at the end of his life: he was defeated c.674 by the Northumbrians and lost control of Lindsey. JCa

**Wulfred** (d. 832). Archbishop of Canterbury. Wulfred came from a wealthy family in Middlesex and was archdeacon under his predecessor Æthelheard. As archbishop from 805 Wulfred reformed the cathedral chapter at Canterbury along lines favoured in the contemporary Frankish church and reintroduced observance of the canonical hours and a common dormitory and refectory. He also consolidated and reorganized the community's lands in Kent and the south-east, as well as building up those of his family. He opposed minster or monastic churches coming under secular

## Wulfstan

ownership and became embroiled with the Mercian king \*Cenwulf and his daughter Cwenthryth over control of the former proprietary churches of the Kentish royal house. As a result Cenwulf suspended Wulfred from his office between 817 and 821 and the matter was not resolved until a compromise was achieved with Cwenthryth in 826.

BAEY

**Wulfstan, St** (c.1009–95). Bishop of Worcester. Born near Warwick and educated at the monasteries of Evesham and Peterborough, he took vows at Worcester where he became prior. Renowned for his sanctity and care for the poor, he reluctantly accepted the bishopric after Archbishop Aldred of York's tenure of the see in plurality had ended (1062). Politically useful, he was Harold's emissary to win loyalty in the north, but after the Norman Conquest he swore allegiance to William I. He supported William II against the Welsh (1088). Though from 1080 Wulfstan was the last surviving English member of the episcopate, he was stricter in enforcing Hildebrandine decrees on celibacy even than \*Lanfranc, requiring married clergy to put away their wives. By his preaching he helped William I suppress the Irish slave trade at Bristol. He was canonized in 1203. WMM

**Wyatt, Sir Thomas** (c.1521–54). Wyatt's father was a poet, courtier, and diplomat, with extensive estates in Kent. Wyatt inherited in 1542 and was attached to Lord \*Surrey, who fell into disfavour in 1547 and was executed. Wyatt was outraged in 1554 at Mary's decision to marry Philip of Spain, on national and religious grounds, and joined in what was intended as a national rising but finished up confined to Kent. He led his motley troops with some dash. The rebels suffered a set-back at \*Wrotham Heath but recovered the initiative when the duke of \*Norfolk led an ill-judged advance. Wyatt moved towards London but Mary refused to flee. Repulsed at London bridge and the Tower, he crossed the Thames at Kingston, but found Ludgate closed and his forces deserting. He was executed on Tower Hill on 11 April. The attempt was badly co-ordinated and unclear in its objectives and served to send Lady Jane \*Grey, still confined to the Tower, to her death and place Princess Elizabeth in much peril. JAC

**Wycherley, William** (1641–1716). English poet and playwright, aptly said to have 'fondled his age whilst abusing it'. Educated in France, at Queen's College, Oxford, and then in the Inner Temple before establishing his reputation for witty if risqué satire on contemporary morality with his four plays, *Love in a Wood* (1672), *The Gentleman Dancing-Master* (1673), *The Country Wife* (1675), and *The Plain-Dealer* (1677), Wycherley incurred Charles II's displeasure by his secret marriage in 1679 to the widowed countess of Drogheda. By the early 18th cent., largely on account of his *Miscellany Poems* (1704), Wycherley had become mentor to aspiring poets such as Alexander \*Pope. Wycherley's *Post-humous Works* were published in 1728. *The Country Wife* and *The Plain-Dealer* are still regularly performed. JAD

**Wyclif, John** (c.1329–84). Religious reformer. An Oxford-educated Yorkshireman, he was the leading philosopher of his day, briefly master of Balliol (1360) and warden of Canterbury Hall (1377). As \*John of Gaunt's protégé, he was

diplomat and government propagandist, persistently attacking clerical wealth and privilege, despite his own non-resident benefices, but, when condemned by the pope (1377), he was protected by Gaunt and Oxford University. The papal schism (1378) fuelled his attacks on catholic fundamentals—papal authority, confession, transubstantiation, and monasticism. His belief in the sole authority of Holy Scripture inspired Wyclif to start a translation, but his criticism of eucharistic doctrine (1379) went too far for his allies. After condemnation by Oxford (1381) and Archbishop \*Courtenay, he withdrew to Lutterworth (Leics.), where he died. Highly strung, uncompromising, humourless, he was as a practical reformer 'conspicuously maladroit' and, rather than seeking martyrdom, he sought protection. Though not himself implicated, the \*Peasants' Revolt (1381) discredited his ideas which became 'the touchstone of heresy', pursued by the \*lollards and in Bohemia by John Hus. The Council of Constance (1415) condemned Wyclif's views, and his remains were exhumed and burned. WMM

**Wyndham, Sir William** (c.1688–1740). Politician. Wyndham owed his position as a leader of the Tories in the Walpole period to three things—his standing as a well-connected Somerset baronet, his oratorical and debating ability, and the fact that he was one of the few remaining Tories who had any experience of office. He succeeded his father at the age of 7 and entered Parliament at 21 at a by-election in Somerset in 1710, just before the great Tory victory at the general election. Pushed by \*Bolingbroke, he was made master of the buckhounds 1711–12, secretary at war 1712–13, and chancellor of the Exchequer in 1713. He was dismissed at once by George I in 1714 and after Bolingbroke fled to France in 1715 planned a Jacobite rising. Arrested in bed, he spent some months in the Tower, but was released through the influence of his father-in-law, the duke of \*Somerset. Thereafter Wyndham gradually loosened his Jacobite ties and protested himself a Hanoverian Tory. He worked closely with Bolingbroke and \*Pulteney in the opposition to \*Walpole but his early death prevented him from profiting from Walpole's fall, and left his colleagues lamenting his lost leadership. JAC

**Wyvill, Christopher** (1740–1822). A Yorkshire squire and clergyman, Wyvill was the main instigator of the county movement for parliamentary reform. Disillusioned by the loss of America and the policies of Lord North, the gentry of Yorkshire in 1779 formed the \*Yorkshire Association to press for curbs on government expenditure and patronage (\*'economical reform'), an increase in the number of independent (i.e. county) MPs, and annual parliaments. Wyvill was secretary and then chairman of the association. Through mass meetings, petitions to Parliament, and letters to the press, he organized an impressive campaign which spread to other counties. Unlike the \*Wilkite and later radical reform movements, supported by merchants, tradesmen, and labouring people, the county associations drew in men of landed property. The Yorkshire Association disintegrated after the ending of the American war; and Wyvill's efforts at reform were eclipsed by more radical movements inspired by the French Revolution. JFCH

**Yalta conference,** 4–11 February 1945. \*Churchill was increasingly fearful of the rising power of the USSR, but agreed that she was entitled to a buffer zone in eastern Europe. He agitated for some western influence in the reorganization of the Polish government and strove to promote free elections in the east. He also ensured that France was given an occupation zone in Germany, but was less successful in resisting Stalin's demands for huge reparations. Britain had little say over plans for the Far East, though a proposal to return \*Hong Kong to China was dropped. Nevertheless, after Yalta Churchill briefly seemed hopeful concerning the future. CJB

**Yeats, Jack B.** (1871–1957). Painter. Brother of W. B. \*Yeats the poet, Jack Yeats became the best-known Irish painter of his day. He was born in London, son of a good portrait painter, and attended (sometimes) the Westminster School of Art. He began as a water-colourist and illustrator before turning to oils. Most of his life was spent in Ireland, his family originating from Sligo, about which he published in 1930. He collaborated with J. M. \*Synge. Yeats's work is characterized by the boldness of its drawing and the vigour of its colours. Perhaps his most immediately attractive paintings are his sketches of Irish characters, painted with gentle irony—the *Race Card Seller* (1909), the *Lesser Official* (1913), and the *Steam-boat Captain* (1925). JAC

**Yeats, W. B.** (1865–1939). Dublin-born poet, dramatist, and essayist. His early years were spent in England where his painter father introduced him to William \*Morris and his circle. *The Wanderings of Oisín* (1889) reveals a late Romantic fired with enthusiasm for things Irish though his relationship with the nationalists remained equivocal, too much so for his more committed first love, Maud Gonne. He preferred to associate himself with the Anglo-Irish, 'bound neither to Cause nor to State . . . the people of \*Burke and \*Grattan'. Though in England at the time of the \*Easter Rising, in poetry he recorded its 'terrible beauty'. An inveterate myth-maker, his lifelong addiction to the occult was tempered by involvement in public affairs, the resulting tensions evident in his best volume *The Tower* (1928). By now honoured with the Nobel prize and a seat in the Senate, he had little liking for \*de Valera's Ireland. As the 1930s drew on, he contemplated the coming cataclysm with savage satisfaction. JNRS

**Yeavinger.** Residence of early Northumbrian kings. \*Bede records the existence of the *villa regalis* of Ad Gefrin on the river Glen where \*Paulinus baptized newly converted Northumbrians in 627 in the presence of King \*Edwin. Following the identification of cropmarks suggesting large halls in the vicinity of the British hilltop site of Yeavinger Bell, the site was dug by Brian Hope-Taylor and the results published in 1977. His excavations uncovered not only a series of massive wooden halls, which can be paralleled on other early high-status Anglo-Saxon sites, but a number of other structures not so easily matched elsewhere. These include a palisaded enclosure, a possible pagan temple, and what appears to be part of a Roman amphitheatre. Hope-Taylor stressed the evidence the site provided for collaboration between the Northumbrian kings and their predominantly British subjects. There have been many criticisms of aspects of Hope-Taylor's report including his methods of dating, his reconstruction of the buildings, and their cultural interpretation, but these do not detract from the basic interest of the site or its importance in the debate about the nature of Anglo-Saxon conquest and the relations between Anglo-Saxons and British. BAEY

**Yellow Ford, battle of the,** 1598. Sometimes known as the battle of the Blackwater, this was one of the last great victories of the Irish over their English antagonists. The great Hugh O'Neill (\*Tyrone) was in rebellion and even his opponents conceded that he had brought together, not a scratch army capable only of guerrilla warfare, but a trained and equipped body of troops who could engage the enemy in pitched battle. The encounter was precipitated by an English attempt to relieve an advanced fort on the Blackwater. Sir Henry Bagenal's advance was fiercely resisted on 14 August 1598 and when he was killed, his army of 5,000 fled. One result of the disaster is that Elizabeth's favourite \*Essex was sent to retrieve the situation. JAC

**yeomanry.** A force of volunteer cavalymen, formed on a county basis, and first embodied in 1794 to meet the challenge of the French Revolution. They were not under any obligation to serve outside the kingdom and during the \*Boer War a special force of Imperial Yeomanry was raised. Despite regular training, discipline was not always good. The Irish Yeomanry, raised in 1796, was almost exclusively protestant and put down the 1798 rising with great severity. The Lancashire and Cheshire Yeomanry got into difficulties

## yeomen

in 1819 trying to disperse the crowd at \*Peterloo. The yeomanry was merged with the \*Volunteers in 1907 to form the \*Territorial Army. JAC

**yeomen.** Legally a yeoman was a freeholder who could meet the qualification for voting in parliamentary elections, but the term came to be employed more widely than this. In 18th-cent. Cumbria, freeholders, customary tenants, and tenant farmers were all encompassed by the term yeoman, while in other parts of the country it was virtually unknown. In 1566 Sir Thomas \*Smith defined his fellow-Englishmen as gentlemen, yeomen, and rascals, and in the early 17th cent. Thomas Wilson included in a similar list yeomen, and 'yeomen of meaner ability which are called freeholders, copyholders and cottagers'. Another contemporary distinguished in 1674 between yeomen (farmer-owners), farmers (tenant farmers), and labourers, while a law dictionary of 1720 referred to yeomen as 'chiefly freeholders, and farmers; but the word comprehends all under the rank of gentlemen, and is a good addition to a name &c'. By the early 19th cent. a slightly narrower definition seems to have been gaining ground. For the agricultural writer Arthur \*Young, yeomen were only freeholders who were not gentry, and the same definition was used by witnesses before the 1833 Select Committee on Agriculture. The tables of landowners prepared by John Bateman in the 1870s on the basis of the so-called New Domesday of 1873-4 used the term of two categories: greater yeomen, those owners with between 300 and 1,000 acres, and averaging around 500 acres; and lesser yeomen with between 100 and 300 acres, averaging about 170 acres. However, he recognized that this was but a makeshift title.

The imprecision of the term yeoman has raised acute difficulties for historians concerned 'with the small landowner-cum-farmer. Mantoux, early in the 20th cent., used the term more or less without reserve. He was followed by Clapham—although he admitted to being aware of the 'varying uses of the word yeoman, both by contemporaries and by historians'—but since the 1960s historians have increasingly eschewed the word because of its romantic and sentimental overtones, as the sturdy inhabitants of a long-departed rural idyll. Phrases such as 'small owner-occupier', 'farmer-owner', and 'owner-cultivator' are thought to be more precise, even if they lack any contemporary justification. JVB

**Yeomen of the Guard** are a royal bodyguard founded in 1485 for the coronation of Henry VII. They have retained their Tudor uniforms and their duties include searching the cellars of Parliament before a state opening. The Yeomen Warders of the Tower, or Beefeaters, established in Edward VI's reign, have a similar uniform. JAC

**Yevele, Henry** (d. 1400). Architect. Yevele, probably from Derbyshire, began as a stonemason, moved to London, and became a freeman in 1353. In 1360 he was appointed by Edward III master mason in charge of the palace of Westminster and the Tower of London. At the palace he was responsible for the Clock and Jewel Towers. He was reappointed by Richard II in 1378 and his responsibilities widened to include general supervision of the king's

works. In the 1390s he supervised the rebuilding of Westminster Hall. Yevele may have also constructed the tomb of Edward III and in 1395 was commissioned to erect a tomb for Richard II and his late wife Anne of Austria. He finished as a man of substantial property with several estates. JAC

**York** (Roman). A Roman legionary fortress, *colonia*, and provincial capital, Eboracum was founded in the early 70s AD as a fortress for *legio IX Hispana*. After the withdrawal of *IX Hispana*, its place was taken by *legio VI Victrix*, which remained in garrison, probably until the end of the Roman period. The fortress lay between the rivers Ouse and Foss. Originally built in timber, it was rebuilt in stone either side of 100. Across the Ouse a civil settlement grew up which was promoted *colonia*, probably when York became capital of the new province of Britannia Inferior at the beginning of the 3rd cent. York remained a provincial capital in the 4th cent. and a bishop attended the Council of Arles in 314. Comparatively little is known of the *colonia*, but there were large public buildings, including baths, and private buildings with mosaics, attesting to prosperity of a provincial capital. Inscriptions and burials show a wide range of beliefs besides Christianity, and inscriptions also attest to traders with links to Rouen, Bourges, and Bordeaux. Fortress and *colonia* seem to have been abandoned early in the 5th cent. ASEC

(post-Roman) York re-emerges in historical record in 627 when the first Christian king of Northumbria was baptized there, and a bishopric established (an archbishopric from 735). By the 8th cent. it was a flourishing river port; between 866 and 954 it was in Viking hands, and was the capital of Danish and Norwegian kings, who fostered a commercial city (Jorvik) of international importance. In 954 it was absorbed into England, and by the 12th cent. it was the fourth wealthiest English town, with one of the largest \*Jewish communities (victims of a massacre in 1190). From 1212 to 1213 it acquired privileges of self-government, and intermittently between 1298 and 1337 acted as a temporary English capital during the Scottish Wars of Independence. Its golden age was the century c.1360-1460, when a boom in cloth-making and overseas trade made it the largest English town after London. From about 1460 it declined, despite strong support from Richard III, who had close links with the city. A modest recovery began with the residence in York of the king's \*Council in the North (1561-1641), although the civil wars (especially the siege of 1644) were damaging. Late Stuart and Hanoverian York flourished greatly as a social capital, but the city fell back in relative importance in the 19th cent., though the coming of the railways allowed some industry: growth was sufficient to create the usual problems of overcrowding and poverty, made notorious by B. S. \*Rowntree's classic study. Its relative lack of industrialization and war damage has left it with a rich legacy of historic buildings, including an almost intact circuit of medieval walls and gates. DMP

**York, Edmund of Langley, 1st duke of** (1342-1402). Edmund, the fourth surviving son of Edward III, was endowed with lands in Yorkshire in 1347 and created earl of Cambridge in 1362. Negotiations had then begun for his marriage to the count of Flanders's heiress; they foundered

when the pro-French pope refused a dispensation. Edmund's marriage in 1372 to the dowerless second daughter of Peter the Cruel was arranged to protect \*John of Gaunt's Castilian aspirations. He was frequently engaged in military operations from 1359 onward, always in a junior role save in an abortive expedition to Portugal in 1381–2. In English politics he was likewise overshadowed by his brothers Gaunt and \*Thomas of Woodstock, although Richard II appointed him regent in his absences and he was created duke in 1385. In 1399 York was unable to raise an army against Henry (IV) and joined the Lancastrian bandwagon. RLS

**York, Edward of York, 2nd duke of** (c.1373–1415). The elder son of \*Edmund of Langley (whom he succeeded as duke in 1402), in 1390 Edward was created earl of Rutland by Richard II, with whom he was a particular favourite. He was a prominent supporter of Richard's coup in 1397, when his rewards included the title of duke of Aumale, which he lost after Henry IV's usurpation. He was accused of murdering \*Thomas of Woodstock, betraying Richard in 1399, revealing the plot to kill Henry, and in 1405 conspiring against Henry. He continued, however, to serve Henry in Wales and Gascony. Edward commanded the van of Henry V's army at \*Agincourt, where he was killed. As he was childless, his nephew Richard was heir to his great estates; many were in the east midlands, where he founded Fotheringhay collegiate church, where he was buried. RLS

**York, Frederick Augustus, duke of** (1763–1827). The second son of George III, Frederick was made bishop of Osnabrück when he was 6 months old, but pursued a career in the army. In 1793 he commanded an expedition against the French in Flanders. After a bright cavalry victory at Beaumont in April 1794, he was badly beaten at Turcoing in May, and recalled. In 1795 he was made field marshal and in 1798 appointed commander-in-chief. A second expedition to Holland in 1799 proved even more disastrous and culminated in a humiliating capitulation at Alkmaar. In 1809 after allegations in Parliament that his mistress, Mary Anne Clarke, had used her influence to sell army commissions, he was forced to resign, but came back in 1811 and held the post until his death. His father's death in 1820 left him next in succession to his elder brother George IV, whose only daughter, Princess \*Charlotte, had died in 1817. Though not a successful commander in the field, the duke was a good administrator and cared much for the army. Baron Stockmar wrote of him that he was 'very bald, and not a very intelligent face'. But he was unlucky to be remembered chiefly in a nursery rhyme. JAC

**York, Richard Plantagenet, 3rd duke of** (1411–60). The son of the earl of Cambridge, who had rebelled against Henry V in 1415, and the heir to the estates, titles, and claims of the earls of March. Because of his blood and claim to the throne (1447–53 he was heir presumptive) he was always kept at arm's length by the king and his court. He served twice (1436–7, 1440–5) with some distinction as the king's lieutenant in Normandy. Failure to be reappointed in 1445 led to a bitter feud with his successor Edmund Beaufort, duke of \*Somerset. After the loss of Normandy he endeavoured to

force his way into office, espousing the cause of financial and administrative reform. He was rescued from political oblivion by the collapse of the king's health in 1453 and his appointment as protector of the realm. The recovery of the king in 1454 led to his renewed exclusion, and thereafter he was set on a course of armed opposition which led in 1460 to his laying claim to the throne. He was killed in battle at \*Wakefield two months after he had been officially recognized as Henry VI's heir and his head stuck on the walls of York with a paper crown on it. York harboured a justifiable grievance against the court, but he was not a particularly able or astute politician. It is also conceivable that Henry VI's suspicions of his motives were well founded and that he had long coveted the throne which his heir Edward IV seized three months after his death. AJP

**York, house of.** 15th-cent. royal dynasty. Historians from the Tudor period onward viewed the Wars of the \*Roses as a dynastic contest between the houses of Lancaster and York. This interpretation appears in the papal dispensation for the marriage of Henry VII and \*Elizabeth of York, daughter of Edward IV, in 1486.

The title was first created in 1385 for Edmund of Langley duke of \*York, 4th surviving son of Edward III, and descended to his son Edward, duke of \*York in 1402. His heir was Richard of \*York, son of his brother Richard of Conisborough. A hereditary right to the throne by York was inferior to that of the Lancastrians descended from \*John of Gaunt, Edward III's third son to reach maturity. From his mother, however, Duke Richard could trace descent through the Mortimer earls of March from Lionel, Edward's second surviving son. In 1460 he claimed the crown as Lionel's heir.

By this date there had been intermittent hostilities since 1455, and this was the second time victory in battle by York and his allies had won control of Henry VI's government. His friends had not fought to make him king, as was apparent by their dismayed reaction to his claim and the eventual compromise that he should be Henry's heir. After York's death, they recognized his son as King Edward IV. His claim was confirmed by battles in 1461 and again in 1471, when the main Lancastrian dynasty was extinguished; its former ministers, like John \*Morton, now entered Edward's service.

The Yorkist monarchy was destroyed by Richard III's usurpation. Courtiers of Edward, believing Richard had murdered Edward's sons Edward V and Richard, agreed to accept Henry Tudor as king if he married their sister. Risings for this purpose failed in 1483; it was achieved at \*Bosworth in 1485.

Continental enemies encouraged opposition to the Tudor king. Edward IV's sister \*Margaret, duchess of Burgundy, assisted the pseudo-Yorkist claimants Lambert \*Simmel and Perkin \*Warbeck. \*Pole and \*Courtenay descendants of Richard of York, some known as 'the white rose', fell victim to Henry VIII's paranoia. Pride in his own Yorkist ancestry was shown by naming his children Edward (VI) and Elizabeth, and by his burial in Edward's chapel of St George in Windsor castle. RLS

## York

**York, kingdom of.** The Viking kingdom of York has attracted great attention since the Coppergate excavations revealed so much about Jorvik and its inhabitants. Post-Roman York was in the kingdom of \*Deira, taken over in 655 by its northern neighbour \*Bernicia to form the kingdom of \*Northumbria. In 867 York was seized by Danish raiders from the Viking kingdom of \*Dublin, led by Ivarr and his brother Halfdan. Holding the new conquest did not prove easy. Halfdan was killed in Ireland in 877 trying to assert his claim to Dublin. Halfdan II, who held the kingdom in 910, was killed at \*Tettenhall in Staffordshire fighting against \*Edward the Elder. York's next ruler, Ragnall, a grandson of Ivarr, submitted to Edward in 920. The later decades of the kingdom were chaotic. England's suzerainty seems to have lasted since Ragnall's successor \*Sihtric was married to a sister of \*Athelstan, who took over the kingdom on Sihtric's death in 927, turning out Sihtric's brother Guthfrith and ruling it until 939. Guthfrith's son \*Olaf then recaptured York but died soon after. Sihtric's son \*Olaf could not hold it. From 944 the kings of England took over again until 947 when \*Erik Bloodaxe, the last of the York Vikings, established a shaky rule. He was killed at \*Stainmore in 954, possibly fleeing to Dublin. Henceforward the kingdom formed part of England, under \*Edred and \*Eadwig. The relative prosperity of Jorvik—its busy international trade, thriving workshops, and well-established mints—is perhaps a warning not to judge exclusively by chronicles, which tend to record death, destruction, and disaster, rather than peaceful progress. The archbishops of York, particularly Wulfhere and Wulfstan, seem at least to have accommodated themselves to Viking rule, perhaps to prevent the region falling to the southern English. JAC

**York, metropolitan diocese of.** The present province of York, founded in 735, comprises the fourteen dioceses of northern England. The York diocese itself, founded by \*Paulinus in 625, is now conterminous with eastern Yorkshire. Though Roman York, capital of north Britain, had a bishop who attended the Council of Arles (314), it was not until 625 that Paulinus founded the English see, after arriving from \*Canterbury; success was short-lived, for King \*Edwin, whom he had converted, was defeated and killed at \*Heathfield in 632 by \*Penda of Mercia. Christianity returned a few years later, but under Celtic auspices from \*Lindisfarne. After the Synod of \*Whitby, the Roman bishopric was restored, first under \*Chad (664), then under the turbulent, dynamic \*Wilfrid (669–78). Pope Gregory's blueprint for a northern province of twelve sees under Paulinus as archbishop, thwarted in 632, was not fulfilled until 735 under \*Egbert (c.732–66), the patron of \*Alcuin's Northumbrian renaissance. The north was so poor that the province only contained four of the twelve planned sees. Disputes between Canterbury and York over primacy were protracted. York's claim to be independent of Canterbury was enhanced by Kent's political decline. Eighth-cent. York led culturally, politically, and ecclesiastically. Under Thomas of Bayeux (1070–1100) the contest developed in earnest. With William I's support in 1072, \*Lanfranc (Canterbury 1070–89) was successful in resolving the matter in his favour. The

dispute, renewed in 1118 with Pope Calixtus II's support for \*Thurstan of York, continued for two centuries until Innocent VI (1352–1405) effected a compromise, though in Canterbury's favour. York was to have metropolitan authority over the north as 'Primate of England', while Canterbury was to have national precedence as 'Primate of all England'. Meanwhile, in 866 the Danish occupation forced the archbishop to move. So feeble was the see that from 972 to 1016 and for a short spell after 1040 it had to be held in plurality with \*Worcester. \*Oswald (972–92) was renowned with \*Dunstan and \*Æthelwold for his monastic reforms and fine episcopal administration in both sees. York minster is of mixed styles (13th to 15th cent.) with the broadest and tallest nave in England and a Norman crypt. It has the largest display in England of medieval glass from three centuries.

WMM

**York, statute of, 1322.** Immediately after the execution of \*Thomas of Lancaster, Edward II summoned a parliament at York and by this statute (16 Edw. II stat. 1) repealed the \*Ordinances of 1311 which had limited his authority. It added that matters concerning the king, the realm, and the people should be debated in Parliament with the assent of magnates and the community of the realm. Stubbs argued that this was a powerful affirmation that the Commons must be present at Parliaments, that Edward was using the Commons to balance the power of the magnates, and that the statute 'embodied in a very remarkable way the spirit of the constitution'. Later historians have been more cautious, pointing out that the statute declared what had been the custom, not a novelty, that 'the community of the realm' did not necessarily mean the Commons, and warning against seeing the statute as a great leap forward in parliamentary influence. JAC

**York, treaty of, 1237.** The kings of Scotland had long-standing ambitions to acquire Cumberland, Westmorland, and Northumberland. In the 12th cent. David I ruled at Newcastle and died at Carlisle. But in 1237 at York, under papal auspices, Alexander II and his brother-in-law Henry III reached agreement. The Scottish king abandoned any claim to the northern counties in exchange for estates within them, notably in Tynedale and at Penrith, to be held of the king of England and subject to English jurisdiction. The arrangement had to be repeated at a meeting of the two kings at Newcastle in 1244. JAC

**Yorkists.** The three kings of England between 1461 and 1485 (Edward IV, Edward V, and Richard III) were so named because they were descended from Richard of \*York. The term is also applied to their retainers, recognizable on effigies by their collars of suns and roses; to their supporters during the Wars of the \*Roses; and to those who challenged Henry VII after 1485. Like the Lancastrians, the Yorkists were not a political party. Indeed, during the Wars of the Roses, most of the nobility and gentry bent with the wind, happy to be Lancastrian, Yorkist, or Tudor according to political circumstance and personal advantage. AJP

**Yorkshire,** the largest county in England, was bounded to the south by the Humber (which formed part of the

ancient dividing line between northern and southern England), to the north by the Tees, and extends east-westwards from the North Sea into the Pennine hills, corresponding to lands settled by Halfdan's invading Danish army after 876. They divided it into three ridings ('thridings') for easier administration, the meeting-place for the North Riding being at the Yarles tree (probably near Thirsk), that for the East Riding at Craikhow (near Beverley), and possibly York for the West Riding; the subdivisions called \*wapentakes took their names from the meeting-places of their courts (Agbrigg from a bridge, Ewcross from a cross). The Danes were by no means the first European settlers: Eboracum (York) had been provincial capital of the Romans' Britannia Secunda, 6th-cent. Angles had formed the nucleus of the kingdom of \*Deira, and some Norse immigration had occurred in the west from Lancashire and Westmorland. After the Norman Conquest, William's 'harrying of the north' left devastation, reflected in the Domesday survey. The wolds became subject to forest law, but Cistercian settlement transformed much from desolation to sheep-run—\*Rievaulx abbey was founded 1131, \*Fountains 1132, Byland 1147—and the monks soon became famous for their wool production. Although the see had been raised to an archbishopric in 735, enhancing the area's national importance, it was not until 1070, when Thomas of Bayeux became archbishop of York, that the struggle for precedence between Canterbury and York began, not to be settled until the 14th cent. The might of the Norman barons was symbolized by their castles (Knaresborough, Richmond, Scarborough); although their families were allowed to consolidate power to counteract repeated threats of Scottish invasion, Yorkshire medieval nobility was decimated and humbled during the Wars of the Roses. Opposition to the closure of the lesser monasteries in 1536 and resentment of an increasingly centralized government in the south found outlet in Robert \*Aske's \*Pilgrimage of Grace, but this failed and monastic lands passed to loyal or opportunist families (Cholmley, Fairfax, Ramsden, Ingram), creating wide estates with substantial residences, though recusancy persisted despite the failure of the rising of the \*northern earls (1569). York and Beverley's decline in the Tudor wool trade was the West Riding's gain, and it became one of the three major regions of the English cloth industry; Sheffield's cutlery industry was well established, Hull became one of England's busiest outports, and Whitby a coaling port. Yorkshire's integration into national life steadily increased.

In 1642 Charles I abandoned London to set up court at York, but Hull, strategically vital, refused to admit him, and Scarborough (at this stage) was in parliamentary hands. The civil wars (when Sir Thomas \*Fairfax gained military prominence) saw confused street fighting and one major battle: the clothing towns changed hands repeatedly, but York's surrender after \*Marston Moor (1644) spelled the end of the royalist cause in the shire, leaving the county depressed and with a badly damaged wool trade; recovery was so slow that the Restoration was welcomed. In 1697 Celia Fiennes noted coal pits, sampled various springs in and around Harrogate, was impressed by Newby Hall but dismayed by York's mean appearance apart from the

minster; \*Defoe found early Georgian Yorkshire endowed with thriving market towns (Doncaster, Ripon, Richmond), though he was more impressed by its horses and stone bridges than its spas. But the pace of industry was increasing, aided by improvements in the road network, canals to implement an already extensive river system (expanded to link with Lancashire counterparts, e.g. Leeds–Liverpool canal) and accelerated enclosure; the East and North Ridings remained predominantly agricultural or moorland, but the West Riding was transformed, since it sat at the northern edge of a huge coalfield that additionally contained iron. Inventiveness, initiative, and mechanization changed cottage industry into the harshness of 'dark, satanic mills'; Leeds was hailed as the principal seat of woollen manufacture, Bradford the centre of the worsted trade, and Sheffield was the focal point of the iron and steel industry, all experiencing massive increases in population and associated social problems. The advent of the railway in the 19th cent. (including the heroic Settle–Carlisle line) opened up some once isolated places while York developed into an important railway centre. The First World War shifted industrial emphasis to arms manufacture and khaki cloth, and encouraged agriculture; the ensuing slump hit the county badly, but both industry and agriculture rose again to the demands of renewed warfare after 1939, this time including aircraft production (Sheffield). In subsequent decades traditional industries (textiles, coal, iron and steel) declined, but the strong sense of community barely wavered. In the local government reorganization of 1972, there were many changes. The county was divided into North \*Yorkshire, South \*Yorkshire, and West \*Yorkshire, losing the east riding to \*Humberside, and Middlesbrough and Redcar to \*Cleveland. In a further reorganization in the 1990s, East Riding was reconstituted as a unitary authority, and South and West Yorkshire divided into nine unitary authorities. A separate country to many because of its intense local patriotism—cricketers born outside Yorkshire were long ineligible to play for the county—the blunt-spoken, thrifty inhabitants yet retain an identity that many other shires have lost.

ASH

**Yorkshire, East Riding.** Along with the other two \*ridings of Danish ancestry, East Riding, based upon Hull and including Beverley, Bridlington, Driffield, and Market Weighton, was given county status in 1888. In the 1972 reorganization of local government most of it was united with north Lincolnshire to form \*Humberside, gaining Goole from West Riding, but losing many parishes to North \*Yorkshire. After Humberside had been abolished in 1996, it was reconstituted as a unitary authority (with county status for ceremonial purposes), with Hull as a separate unitary authority. Outside Hull it is pleasant farming country. JAC

**Yorkshire, North.** The county of North Yorkshire was created by the Local Government Act of 1972. It was substantially different from the old North Riding, losing a slice to \*Cleveland, including Middlesbrough, Guisborough, and Yarm, gaining Filey and Norton from the East Riding, and adding a large part of the former West Riding, including Harrogate, Ripon, Knaresborough, Skipton, Selby, and

## Yorkshire

Tadcaster. The county town is Northallerton. It retained its county status in the local government reorganization of the 1990s, with York as a unitary authority. JAC

**Yorkshire, South.** Since there was no south riding to build on, the metropolitan county of South Yorkshire, set up by the Local Government Act of 1972, was a new creation. It was based on the county boroughs of Sheffield, Rotherham, Barnsley, and Doncaster, augmented by parts of the West Riding around Penistone, Cudworth, and Hemsworth, and parishes taken from Nottinghamshire, including Finningley. It was abolished under the Local Government Act of 1985 and its major towns created unitary authorities. JAC

**Yorkshire, West.** The new metropolitan county of West Yorkshire, established by the Local Government Act of 1972, was built upon the county boroughs of Leeds, Bradford, Halifax, Dewsbury, Huddersfield, and Wakefield. There were substantial changes compared with the old West Riding, which lost large areas in the north-west to Cumbria and Lancashire; Harrogate, Ripon, and Selby to North Yorkshire; and a slice around Penistone and Cudworth to South Yorkshire. It was abolished with the other metropolitan counties in 1985, and divided into the unitary authorities of Bradford, Calderdale (Halifax), Kirklees (Huddersfield), Leeds, and Wakefield. JAC

**Yorkshire Association.** Formed in December 1779 to lobby for \*economical reform—a reduction of places and pensions—at a time of high taxation during the American War. Though conservatives denounced associations as potentially seditious, a number of other counties formed committees and joined with Yorkshire in petitioning Parliament. Their greatest success came in April 1780 when \*Dunning's motion, deploring the influence of the crown, was carried against Lord \*North, and in 1782 the short-lived \*Rockingham administration undertook some useful reforms. But Christopher \*Wyvill, founder of the association, had difficulty in holding his supporters in line. They soon moved on to advocate parliamentary reform and a split developed between the radicals of the Westminster Committee, pushing for manhood suffrage, and moderate reformers, content to augment the representation of the counties. The end of the war took much wind out of the association's sails, though \*Pitt moved for parliamentary reform in 1783 and again in 1785. The association was a remarkable attempt to mobilize public opinion and bring it to bear on Parliament, looking back to the \*Wilkes and forward to the \*chartists. JAC

**Yorktown, surrender at,** 1781. After his costly victory at \*Guilford courthouse in March 1781, \*Cornwallis moved north into Virginia. Early in August he dug in on the coast at Yorktown, where communication with New York would be easier and supplies could be brought in. But the ships which arrived were French. Cornwallis, with 6,000 men, was blockaded by 9,000 Americans under Washington and 6,000 French under Rochambeau. Heavy bombardment during the first two weeks of October did great damage to Cornwallis's defences and ammunition began to run low. A rescue operation from New York took too long to get

started and arrived too late. On 19 October, the British surrendered with full honours of war, marching out to the tune 'The World Turned Upside Down', when 'cats should be chased into holes by the mouse'. Back in England, \*North received the news like a man taking a ball in the chest: 'oh God, it is all over', he exclaimed. JAC

**Young, Arthur** (1741–1820). Farmer, journalist, and agricultural writer. Often regarded as a pioneer of the \*agricultural revolution, Young began his working life as a small farmer at Bradfield, his family home in Suffolk. In 1767 he took the tenancy of a 300-acre farm in Essex, from which he soon moved on—reputedly paying another man £100 to take the tenancy off him—to Hertfordshire where he held the tenancy of a farm from 1768 until 1777. After two years in Ireland (1776–8) he returned to Bradfield where he farmed and settled to work as a writer and journalist, founding in 1784 the *Annals of Agriculture* of which he edited (and often largely wrote) 46 volumes until 1809. In 1785 he inherited the small family property at Bradfield, and in 1793 he became secretary to the Board of Agriculture with a salary of £400. Despite his lack of success as a practical farmer, Young's prolific writings, his trenchantly held opinions, and his position at the Board of Agriculture all helped to build up his reputation as one of the foremost popularizers of the new ideas and practices of the agricultural revolution. JVB

**Young England** was a small Tory parliamentary group of the 1840s, which included Lord John Manners, George Smythe, Baillie-Cochrane, and \*Disraeli. They were greatly concerned with the 'condition of the people' question and their vague solution was a restoration of the trust and respect which they believed had once existed between nobility and people and a reaffirmation of the position of the church. They drifted into hostility towards the Tory leader Sir Robert \*Peel, and dissolved with his fall in 1846. Disraeli wrote of the movement in *Coningsby* (1844), *Sybil* (1845), and *Tancred* (1847). It was not difficult to ridicule. Lord John Manners believed that a reintroduction of the practice of \*touching for the king's evil might raise the tone of society and produced the memorable couplet: 'Let wealth and commerce, law and learning die, But leave us still our old nobility.' \*Wordsworth, provoked by the name, wrote a sonnet denouncing 'beardless boys' and the *Morning Herald* thought the movement 'tomfoolery and mental dandyism'. Yet their attitude to the poor, if condescending, was generous, and echoes of Young England survived as elements in Disraeli's later vision of Tory democracy. JAC

**Younghusband, Sir Francis** (1863–1942). Commissioned into the army, Younghusband transferred to the Indian Political Department in 1890. In its service, he visited Manchuria in 1886 and then made his way back to India in a pioneering journey across the Gobi Desert and the Karakoram Range. Service as a political officer in the Pamirs region included further exploration, as did his work as British commissioner to Tibet in 1902–4. His central Asian and Himalayan explorations led to his election as president of the Royal Geographical Society after his retirement in 1910 and he enthusiastically promoted Everest expeditions.

Devout Christianity allied with an interest in Eastern mysticism also led him to promote understanding between different faiths. RB

**Young Ireland** was a group of patriotic middle-class intellectuals associated with the repeal movement of Daniel \*O'Connell: its original leaders included Thomas Davis (1814–45), John Blake Dillon (1816–66), and Charles Gavan \*Duffy (1816–1903). Gavan Duffy's journalistic experience was essential to the success of the *Nation*, a newspaper founded in 1842 to promote the inclusivist nationalism of the Young Ireland movement. Growing tensions between Young Ireland and O'Connell's Repeal Association came to a head in July 1846, when a split occurred on the issue of physical force: the more militant Young Irelanders seceded from the Association, and, led by William Smith \*O'Brien (1803–64), formed the Irish Confederation. The fall of the July monarchy in France, combined with pre-emptive arrests of Confederation leaders by Dublin castle, further stimulated the militants, and the organization staggered into rebellion in July 1848. This was easily suppressed, and the Confederation broken; but the intellectual legacy of Young Ireland, expressed in the secular cultural nationalism of Davis, or in the vitriolic republican polemic of John \*Mitchel (1815–75), has had a lasting influence. AJ

**Young Men's Christian Association (YMCA).** Founded (1844) by a group of twelve young draper's assistants headed

by George Williams (b. 1821) for 'the improving of the spiritual condition of young men engaged in drapery and other trades', who then lived in appalling urban conditions. Meeting for prayer and Bible study, they impressed Lord \*Shaftesbury, who became the YMCA's first president (1851–85). It spread rapidly throughout Britain and, after the \*Great Exhibition (1851), world-wide. The first world conference met in Paris (1855). From the first fully ecumenical, it provides social welfare for armed services in war and in 100 countries works towards 'better health, education and social welfare in the developing world' without distinction of race or creed, otherwise aiming merely at 'contagious evangelism without proselytism'. WMM

**Young Women's Christian Association (YWCA).** Founded independently of the \*YMCA (1855, but united 1877) by Emma Roberts with her Prayer Union of 23 young women 'to offer service with their prayers', and Emily Kinnaird whose London hostel, originally for Florence \*Nightingale's nurses *en route* for the Crimea, became a hostel for girls in need of safe, cheap accommodation. Lord \*Shaftesbury became its first president (1878). The World YWCA was formed in 1894. Today it provides social welfare among women and girls in war and peace in 90 countries and in the UK safe, affordable housing for homeless, needy women. WMM

**Zambia**, previously known as Northern Rhodesia, is a republic within the Commonwealth and has a population of nearly 9 million. \*Livingstone visited the Victoria Falls in 1855. The region subsequently came under the control of \*Rhodes's British South Africa Company, until in 1924 it was made a British protectorate. It has zinc, lead, and coal, but the main mineral resource is copper. In 1953 it was joined with Nyasaland and Southern Rhodesia to form the Central African Federation, but this was dissolved in 1963. It became independent in 1964 with Kenneth Kaunda as first president. The capital, Lusaka, has nearly 1 million people. JAC

**Zanzibar**. Former British protectorate. Britain first became involved in Zanzibar in the 19th cent. because the island was one of the main depots for the export of east African slaves. A succession of able British consuls-general exerted an informal protectorate over the island, and the arrangement was regularized in 1890 when Britain became responsible for the administration of Zanzibar and the adjacent islands on the sultan's behalf. The slave trade was formally abolished in the sultan's dominions in 1897. The export of cloves succeeded the slave trade as the protectorate's main source of income. Zanzibar became independent in 1963 and joined with Tanganyika to form \*Tanzania in 1964. KI

**Zeppelin raids**. The first air raid on Britain by German airships took place in January 1915. In theory the Zeppelin attacks were directed against naval and military targets. In reality, poor weather, limited night-time visibility, and frequent navigation errors meant that they dropped their bombs indiscriminately on civilian targets. In 51 raids the Zeppelins killed 556 people and injured 1,357. These attacks caused localized panic which interrupted industrial production but in the longer term failed to have an appreciable impact on Britain's war effort. By 1916 British defences were taking an increasing toll of the attackers. Of the 80 Zeppelins which the German navy built between 1912 and 1917, 23 were shot down or destroyed on the ground, and another 31 destroyed in accidents. By bringing home the reality of war to the civilian population, the Zeppelins only reinforced the already widespread British conviction that they were engaged in a struggle for good against evil. DF

**Zimbabwe**. See RHODESIA.

**Zinoviev letter**. Supposed to have brought down the first Labour government of 1924. It bore the signature of Grigori Zinoviev, president of the Communist International (Comintern) in Moscow, and was addressed to the \*Communist Party of Great Britain, calling on it to sow subversion among the armed forces of the crown. There is a faint possibility that it was a forgery; and a stronger likelihood that it was deliberately 'leaked' by the British \*secret services, who intercepted it, shortly before the October 1924 general election, in order to scare voters over to the Conservatives. Conservative central office and certain sympathetic newspapers were also in the plot. BJP

**Zoffany, Johann** (c.1733–1810). Painter of portraits, conversation pieces, and theatrical scenes, Zoffany was born in Germany and came to England about 1758 after studying in Italy. He began by painting clock faces and doing hack work, before turning to painting theatrical scenes, especially depicting David \*Garrick. He was favoured by the royal family. George III nominated him for the Royal Academy in 1769 and recommended him to the duke of Tuscany. He worked in Italy from 1772 to 1779, later going to India where he made a fortune painting English colonials and Indian princes. He returned to England in 1789 but painted little after 1800. His work is of particular interest to historians for its great attention to detail. JC

**zoos**. The earliest zoos were miscellaneous private collections of animals for curiosity rather than scientific study. Monarchs occasionally offered strange beasts as gifts and courtesy necessitated that they should be cherished. Henry I had a menagerie at Woodstock which included lions, leopards, lynxes, camels, and a porcupine. From the 13th cent. onwards, lions were kept in the \*Tower of London. They were joined by an elephant sent to Henry III in 1254 by Louis IX of France. As diplomatic contacts became more permanent, housing the gifts caused problems. The Russian ambassador presented Charles II with two pelicans, which went to the menagerie in St James's Park, the Moroccan ambassador gave two lions (sent to the Tower) and thirty ostriches (sent to the park). Private citizens made their own collections. Sir Sanders Duncombe, a physician, had a small zoo in the 17th cent., and \*Pepys received from the consul at Algiers a lion cub, which he kept at Admiralty headquarters in Derby House. Animals were also exhibited for private gain. \*Evelyn in 1684 gives a detailed description

of the first rhinoceros to be seen in England, and a crocodile. The governor of New South Wales in 1792 sent George III the first kangaroo to be trans-shipped.

Many of these menageries were open, at least to the respectable public, for a small fee, but public zoos waited until the 19th cent. The Zoological Society of London was founded in 1826, with Sir Humphry \*Davy as a supporter and Sir Stamford \*Raffles as first president. Its premises in Regent's Park were opened to the public in 1828. The society's collection was augmented in 1830 by the transfer of the royal menagerie from Windsor (one of William IV's cost-cutting exercises) and in 1834 when the animals from the Tower were brought across, including more than 100 rattlesnakes. In 1843 a reptile house was opened, an aquarium in 1853, and an insect house in 1881. The first hippopotamus arrived in 1850, a sea-lion in 1856, and a gorilla in 1887 (it died), but the first giant panda not until 1938. By that time the society had opened Whipsnade on Dunstable Downs (1931), still one of the most delightful of all zoos.

Meanwhile, private and municipal zoos multiplied. George Wombwell's travelling menagerie was very popular from the 1820s, though he pepped up the entertainment with animal fights and exhibitions. The Dublin Zoo opened in 1831, Bristol in 1835, and Manchester in 1836. The Royal Zoological Society of Scotland, founded in 1909, purchased the Corstorphine estate at Edinburgh in 1913 and completed the zoo by 1927. After 1945 safari parks and country-house zoos proliferated, the 'Lions of Longleat' leading the way. Though zoos are regarded primarily as amusement and treats for the children, their work in publishing, lectures, and seminars is of critical importance, and much of their income in recent years has been devoted to preserving species. JAC

**Zulu War**, 1879. The war was the unforeseen result of the desire of Lord \*Carnarvon, the British colonial secretary, to unite the British colonies and Boer (Afrikaner) republics in

South Africa to guarantee the security of white settlers. Sir Bartle \*Frere, sent out as high commissioner to implement Carnarvon's plan, concluded that Cape Colony would not co-operate as long as the Transvaal Boers were at loggerheads with their Zulu neighbours. Theophilus Shepstone, a colonial servant thought to have unparalleled knowledge of the Zulus, and who had formerly supported their claims against the Boers, had recently annexed the Transvaal for Britain and now sought to win the Boers' favour by taking up their cause. In spite of receiving the report of a boundary commission which insisted that the Transvaalers' claims against the Zulus had no justification, Frere accepted Shepstone's statement that Zulu military strength constituted a threat to stability in South Africa. Against Carnarvon's strict instructions, Frere demanded impossible concessions from the Zulu ruler and then invaded Zululand in January 1879. The British government accepted the *fait accompli* and superior British arms overcame the courage and inappropriate tactics of the Zulus who surrendered in July. It was not Britain's intention to annex Zululand so the country was first split into thirteen districts under chiefs who had little support. The renewed aggression of the Boers after the Transvaal had reasserted its internal autonomy in 1881 induced Britain to recognize their claims over a portion of Zululand and the remaining Zulu territory was incorporated into the British colony of \*Natal. KI

**Zutphen, battle of**, 1586. During the Netherlands War of Independence, Elizabeth I sent troops under the earl of \*Leicester to aid the rebels. In 1586 they laid siege to Zutphen in the eastern Netherlands, defended by a Spanish garrison under Prince Alexander of Parma. The Spanish sent a relief column and on 22 September Leicester attempted to intercept it, but without success. He was forced to retire after suffering considerable losses, including the death of his own nephew, Sir Philip \*Sidney. The town was relieved and the siege abandoned. RAS

## 2,000 years of British history

'much of the joy of this book is that it has so much to offer different readers . . . the information provided is vast but varied'

Jeremy Black, *Times Higher Education Supplement*

When was the first motorway opened? What did the Levellers believe in? Who was the last person ever to be gibbeted? What was the book of sports? Where did the Rebecca riots take place? Who were the peculiar people?

With over 4,000 A-Z entries, written by a team of over 100 distinguished scholars led by one of the leading authorities on British history, *The Oxford Companion to British History* offers a wealth of fact and insight into two millennia of British life—the people, the places, the events, and their contexts, and the social, economic, and cultural changes that have influenced the way we live now.

**COMPREHENSIVE** As well as monarchs, battles, and treaties, there are entries on the wider aspects of British history, from advertising to architecture, badminton to Boudicca, Iain Duncan Smith to dentistry, and Zanzibar to zoos.

**UP TO DATE** Now available for the first time in paperback, the text has been updated and revised to take into account the events, people, and institutions that left their mark as Britain entered a new millennium.

**A FRESH APPROACH TO HISTORY** In addition to providing reliable information the *Companion* offers interpretation and analysis giving readers a sense of how history and people relate to each other.

**ACCESSIBLE** Designed to meet the needs of a variety of readers, this is the essential guide for academics, students, anyone who wants a comprehensive reference work on all aspects of British history.
