**Professor John Cannon** held the chair of Modern History at the University of Newcastle upon Tyne until 1992. He has edited several titles, including *The Letters of Junius* (1978) and *The Blackwell Dictionary of Historians* (1988), which was awarded a Library Association prize for reference works. His other publications include *The Fox-North Coalition* (1969), *Parliamentary Reform* (1973), *Aristocratic Century* (1984), with Ralph Griffiths *The Oxford Illustrated History of the British Monarchy* (1986, 1998), *Samuel Johnson and the Politics of Hanoverian England* (1994), with Anne Hargreaves *The Kings and Queens of Britain* (2001), and *The Oxford Dictionary of British History* (2001).

## PREFACE

No two historians would agree on what should be included in a *Companion to British History*, nor perhaps is it desirable that they should. Much 'history' was partisan and contentious when taking place: Saxons killed Danes, Jacobites despised Hanoverians, methodists mistrusted Anglicans, chartists hated whigs; Gladstone was admired as a man of stern moral purpose and denounced as a fraud and humbug. We should not drain away controversy in order to try for some agreed verdict. It may be of some consolation to readers provoked by an omission or questionable inclusion that certain entries have been included, excised, and reinstated. I do not know of any infallible or purely objective test for inclusion and have often wished that I did.

Some features call for explanation. We have devoted considerable space to 'local history', with a general article on the subject and shorter entries on all the English and Welsh counties, the Scottish provinces, ancient kingdoms, modern regions, and on most important towns, together with entries on a number of castles, cathedrals, and country houses. This reflects not only the interest felt by many people in their immediate surroundings, but also that the distinction commonly made between national and local history is, in practice, difficult to sustain. The one-hour skirmish at Newburn, five miles west of Newcastle, on 28 August 1640, when the Scottish army crossed the Tyne with little trouble, helped to bring about the execution of Charles I and the abolition of the monarchy. National events must take place somewhere, and not necessarily in London, while local events can cast long shadows. The industrial revolution—if the phrase is still permissible—was in practice an agglomeration of forges and furnaces, mills and mines, shipyards and turnpikes, all over the British Isles.

This raises a further difficulty. The term 'national' begs the question 'which nation and whose nation?'—not in the sense beloved by Marxist historians (for whom nation was a tedious distraction from the class struggle)—but because though there was a British state, there was never a British nation, unless the term is used to describe the seventh-century Welsh. Packed into these small islands are four nations, and within each nation are further divisions and differences. Welsh and English, Irish and Scots differ, but so do north and south Wales, Portnaguran and Motherwell, Belfast and Dingle, Wolverhampton and Wisbech. The book attempts, within severe limits, to do justice to each nation, with articles on the kingdoms of England, Ireland, and Scotland and on the principality of Wales.

There is no way of avoiding the question 'what is history?' In the course of preparing this volume, I was told by many kind friends that I did not know what history was about. I fear they may be right. But, in my less submissive moments, I think a broad and eclectic 'seamless web' approach may be defended. We have, for example, included an article on the development of sport and brief references to individual sports. They will not be enough to please enthusiasts. But they make the point that most sports, as we know them, developed in the later nineteenth century and were in response to mass urbanization. They had an important political and national role. Indeed, post-Marxists, if conceding that religion is no longer the opiate of the masses, might wonder whether sport has taken its place, judging from the attention paid to it by the media. Irish nationalists were well aware in the nineteenth century of the relevance of sport to their own aspirations and begged their fellow countrymen to shun English games like soccer and tennis in favour of traditional Gaelic pastimes like hurling. In 1990 Norman Tebbit pointed out, in a pithy phrase, the connection between cricket and national identity, though he had little thanks for his pains.

Sport is but one example of the balance to be struck between traditional political and military history, and social, cultural, scientific, and economic history. Few readers would doubt that Handel's *Messiah*, Marks and Spencer, and the Grand National are as much part of the fabric of English life as the political parties, newspapers, and constitutional arrangements. Should one exclude the Proms (even if they represent only a part of English life) in favour of longer articles on the Bedchamber crisis of 1839, the Field of the Cloth of Gold, or the battle of Blore Heath? Are inventors, industrialists, and entrepreneurs, like Dunlop, Watt, Brunel, Royce, and Harland, intrinsically of less consequence than foreign secretaries, however transient? We have, I hope rightly, included substantial entries on the great industries—mining, gas, shipbuilding, motor manufacture, cotton, aeronautics—which have given employment to millions of people. We have tried to explore aspects of private and domestic life with articles on childbirth, housing, health, food and drink, retailing, holidays, and funerals, which attempt to chart some of those 'noiseless revolutions' which Macaulay, essentially a political historian, thought more significant than 'important events'.

The 'seamless web' approach involves even more difficult and controversial decisions. Though sport is included, sportsmen are not (save for W. G. Grace and Sir Stanley Matthews), since their fame, like that of performing artists, is usually by its nature fleeting. In relation to architects, painters, and men of letters, the problem is even more acute. Most people appreciate the importance of images and would acknowledge that we see the Tudor monarchy largely through the eyes of Holbein. Should we exclude him as not British and only a painter? Does the work of Vanbrugh at Blenheim or Castle Howard, or that of Sir George Gilbert Scott at St Pancras have no bearing on British history? Has any minister left a greater impression on the national mind (if there is such a thing) than Capability Brown? Do the lives of Robert Burns and Dylan Thomas not resonate in the identity of Scotland and Wales? We have included short entries on many authors, partly because not all readers will have the *Oxford Companion to English Literature* at their elbows, but more because to exclude them would leave a gaping hole in historical comprehension. Many authors, of course, played an important political role and would be included in even the most traditional survey—Milton, Dryden, Addison, Sheridan, Shelley, Byron, O'Casey. But even those less directly interested in politics—Shakespeare, Johnson, Jane Austen, Scott, Dickens, Wilde—illuminate the life and concerns of their own times. We cannot hope to do justice to them as writers, but we can suggest how they contribute to our understanding of and feel for the past—Trollope for the cathedral close, Wells for the draper's counter, Bennett the provincial printing office, Kipling the hill-station, Wodehouse the jolly weekend.

It is hardly possible to produce a work of this complexity without errors surviving. I would be glad to be told of them, preferably with compassion. Though we have tried to provide clear and authoritative entries, taking account of the most recent scholarship, contributors have also been encouraged to express their own opinions rather than offer bland and lifeless summaries. It would be a strange reader who agreed with all their judgements and some may not agree with any. Some opinions are bound to seem intrusive, unfair, or irritating. But if certain entries appear irreverent, we rely upon the irreverence of the reader who is, after all, at perfect liberty to dissent from dissent.

JOHN CANNON  
University of Newcastle upon Tyne

PREFACE TO THIS REVISED EDITION

In this revised edition, we have included fifty new entries, updated the bibliographical references, and modified more than nine hundred other entries. In doing so we have taken note of suggestions by reviewers and readers. We are grateful to people who have written in and would welcome further comments on this edition.

JOHN CANNON

## ACKNOWLEDGEMENTS

So many people have helped with the production of this volume that it is impossible to acknowledge them all individually, but I hope they will accept my thanks here and will approve of the book. I must however mention the staff of the Robinson Library in the University of Newcastle upon Tyne, particularly for their patience and kindness during the long stages of proofreading and checking. I would like especially to acknowledge the administrative skills of Sandra Dunkin, the organiser of victory—if victory it be—and the assistance of Dr Anne Hargreaves, whose help in the later stages was unstinted and who finished, as often happens, by supervising her supervisor. I would also like to express my gratitude to my collaborators at Oxford University Press, and in particular to Pam Coote, Alysoun Owen, Wendy Tuckey, and Alison Jones, who succeeded in turning a sometimes laborious task into a positive pleasure and whose contribution to this work has been so important. I would like to take the opportunity to thank Rebecca Collins for her great help with the revised edition.

## NOTE TO THE READER

Entries are arranged in letter-by-letter alphabetical order up to the first punctuation in the headword. For example, the entry on **Quebec, capture of** precedes **Quebec Act**. We have tried in all cases to use the most appropriate headword, particularly the name by which people were best known. It would be unhelpful to have entered **Disraeli** under 'Beaconsfield', a name by which he was known for only the last five years of his life, and it would be unreasonable to expect all readers to remember that Lord **Melbourne** was William Lamb. Where there have been second or third creations of a title, all the holders of that title are arranged together in straightforward alphabetical order for simplicity of reference. Holders of titles created in the Scottish peerage are distinguished by [S] after the headword, for example **Melville, George Melville, 1st earl of** [S], and similarly [I] denotes titles created in the Irish peerage.

An asterisk within the text indicates a cross-reference to another relevant headword. An item is normally marked with an asterisk only at its first appearance in any entry, and if the reference is merely incidental it has not been marked. We have not asterisked sovereigns after 1066 for England, or after Malcolm II (d. 1034) for Scotland, since they all have entries. 'See also' at the end of an entry indicates that there is another substantial entry with a bearing on the subject. Further reading lists have been confined to longer entries and are limited to key works, partly to save space, and partly because they tend to date rather quickly.

The subject index at the back of the book is intended to reinforce the system of cross-reference and make it easier for readers to identify entries of kindred interest. General entries are listed first, followed by specific examples. The words 'see also' in the index refer the reader to headwords within the index, not within the *Companion* text itself. The accompanying genealogies are not exhaustive lists of all the members of a dynasty, but are designed to illuminate specific family relationships, for example the important reconciliation of Norman and Saxon interests by the marriage of Henry I to a Saxon princess.

**abbeys and priories.** Abbots were the spiritual heads of the larger monasteries (abbesses for nuns), with priors in charge of smaller or daughter houses. Until the Reformation, some 27 mainly 'mitred abbots' attended the House of Lords. Great abbeys like Evesham, \*Pershore, Buckfast, \*Selby, or \*Sherborne had vast estates. The *Valor Ecclesiasticus* of 1535, which preceded the dissolution of the monasteries, identified some 563 religious houses. The largest group, with more than 170 houses and 22 nunneries, belonged to the \*Augustinian canons, whose first house at Colchester was founded c.1100. Next came the \*Benedictines, or black monks, with some 130 houses and over 60 nunneries. The \*Cistercians, or white monks, had some 76 houses in England and Wales, often built in remote areas, and the remains of \*Tintern, \*Rievaulx, and \*Fountains are among the most beautiful in the country. The proliferation after the Reformation of private estates such as \*Woburn abbey, Hitchin priory, or Grantham Grange demonstrates that most of the monastic estates finished up with the gentry or aristocracy. See also MONASTERIES. JRG

**Abbey theatre.** First permanent home of the Irish National Theatre, founded by Lady \*Gregory, Edward Martyn, and W. B. \*Yeats to foster native drama. Yeats's verse play *On Baile's Strand* was the opening production in 1904 but more dramatic scenes came four years later with riots at the first night of J. M. \*Synge's *The Playboy of the Western World*. Controversy also surrounded the staging of plays by \*Shaw and \*O'Casey, though the latter's *The Shadow of a Gunman* marked a decisive shift from Celtic twilight to Dublin tenement. The original building, on the corner of Abbey Street, was destroyed by fire in 1951. JNRS

**Abbot, George** (1562–1633). Bishop of Lichfield (1609), London (1610), and archbishop of Canterbury (1611–33). Born in Guildford, Abbot was educated there and at Balliol College, Oxford. As a fellow of Balliol (1583) and master of University College (1597) he established a reputation as a preacher. His sermons are eloquent and reveal his Calvinist theology. In 1604 he was among those appointed to prepare a new translation of the Bible. His defence of hereditary monarchy and work in Scotland promoting episcopacy (1608) coupled with the support of the earl of Dunbar won him the favour of James I and the primacy. From 1621 his ministry was overshadowed by his accidental killing of one of his gamekeep-

ers, and under Charles I his influence over the king's religious policy was eclipsed by that of William \*Laud. He was pious and kindly, but a poor administrator. JRG

**abdication crisis, 1936.** A constitutional *scandale* stemming from the determination of King Edward VIII, who succeeded his father George V on 20 January 1936, to marry Mrs Wallis \*Simpson, an American lady who had divorced her first husband and was about to divorce her second. At first Edward hoped that he might enter into morganatic marriage: Wallis would become his wife but not queen. \*Baldwin, prime minister, issued an ultimatum: the king must choose between the throne and Mrs Simpson. Edward chose the latter, and abdicated on 11 December. British public opinion was genuinely outraged at the prospect of the king marrying a twice-divorced American commoner, and there is much truth in the assertion that many Conservatives had been irritated by Edward's public indignation at unemployment and slum housing. None the less, had the king stood firm, it is difficult to see what the government could have done, short of denying him an income. GA

**Aberconwy, peace of, 1277.** This treaty, which brought to a conclusion the war between \*Llywelyn ap Gruffydd and Edward I, marked the beginning of the end of Llywelyn's considerable ambitions. His rule was confined to 'Lesser' Gwynedd, west of the Conwy, and five years later he was killed near Builth in a new rising. JAC

**Aberdeen,** an ancient royal burgh (1178) and centre for education with two universities by 1600, became a significant port and developed a range of industries after 1750. A diversified industrial economy including linen, cotton and woollens, shipbuilding and engineering, distilling, paper, white fish, and granite reduced the strains of economic change. In 1911 nearly half of total employment was in services, a sector which grew rapidly in the 20th cent. In 1970 oil was first tapped in the North Sea, and in 1975 the Forties field came on stream; Aberdeen became the capital of the British offshore oil industry. JB

**Aberdeen, battle of, 1644.** After his victory at \*Tippermuir on 1 September 1644, \*Montrose advanced upon Aberdeen with fewer than 2,000 men against a superior covenanting force under Lord Balfour. After heavy fighting on the 13th, Montrose's troops entered the city. Incensed

by the murder of a drummer-boy while negotiations were in progress, Montrose gave Aberdeen over to sack and pillage. JAC

**Aberdeen, cathedrals.** St Machar's cathedral, built on the site of a church founded by one of St \*Columba's disciples (c.580) and a subsequent Norman cathedral burnt by Edward III (1336), was battlemented against possible English attack from the sea and Highlanders from the mountains; its 15th-cent. ashlar facing was the first large-scale use of dressed granite in the area. It was alternately under presbyterian and episcopal rule 1560–1690, then wholly presbyterian. The glory of its surviving interior is the nave's oak ceiling bearing 48 heraldic shields (1520); the central tower, weakened in the Cromwellian period by removal of some of the buttresses to construct a barracks, fell after a storm (1688). The episcopal cathedral, erected 1816–17 as St Andrew's chapel, is regarded by American episcopalians as the mother church, since their first bishop (Samuel Seabury) was consecrated in Aberdeen in 1784 after reluctance by the Anglican authorities to perform the rite. ASH

**Aberdeen, George Hamilton-Gordon, 4th earl of** (1784–1860). Aberdeen represents a classic case of a politician whose reputation has been permanently sullied by an unfortunate premiership. As prime minister during the \*Crimean War he paid a high price for underestimating public anxiety about the conduct of the war. Yet he had a long career of public service behind him. Educated at Harrow and Cambridge he first made his mark as a diplomat. In the closing stages of the war against Napoleon he was closely involved with the maintenance of the Grand Alliance against France and with the negotiation of the peace of Paris in 1814. In 1828 he became foreign secretary in \*Wellington's administration and he was briefly secretary for war and the colonies in 1834–5. In 1841 he was once again foreign secretary under \*Peel. Through patience and sound judgement he achieved some improvement in Anglo-French relations, despite British suspicions of French policy in Spain and the South Seas, and happily settled the long-standing border dispute between Canada and the USA. He ended the war with China by the treaty of \*Nanking in 1842, which opened up five Chinese ports to British trade and leased Hong Kong to Britain. In domestic affairs Aberdeen loyally supported Peel, resigning with him after the repeal of the Corn Laws in 1846. Aberdeen did not lack political courage. He opposed \*Palmerston over the 'Don \*Pacifico' incident in 1850, believing that Palmerston was unnecessarily bellicose, and did not shrink from criticizing \*Russell over the \*Ecclesiastical Titles Bill in 1851.

When Russell's government fell in 1852 Aberdeen headed a ministry which held out every prospect of stability. He was widely respected as a man of sober judgement and sound temperament, and with Palmerston, \*Gladstone, Russell, \*Graham, and \*Herbert in the administration, the government lacked neither talent nor experience. But Aberdeen was unlucky in that he was drawn into war with Russia. Despite its notoriety the Crimean War was not without justification. British suspicions of Russia were well founded and of long standing, but although the political nation was

convinced of the wisdom of containing Russian designs, public opinion was soon appalled by the incompetence exposed by the war and demanded scapegoats. Critics forgot that they had often called for economies in defence spending. It was sad that a government which was drawn towards cautious domestic reform should fall victim to war hysteria, but Aberdeen could not resolve conflicting reactions among his colleagues to the pressures of war. He had little choice but to resign when \*Roebuck's motion calling for an inquiry into the condition of the army was carried in the Commons by 305 votes to 148 on 29 January 1855. A further complication was that Aberdeen could not call on party loyalty to see him through. His government was a coalition of Whigs, Peelites, radicals, and independents and the issues raised by the war accentuated differences between them. Aberdeen also faced clashes of personality within the government, Russell being the most difficult of several touchy colleagues. Aberdeen was a politician of integrity, intelligence, and goodwill, and a man of culture and discernment, but thrust into a position of leadership at a uniquely trying time, he was tested beyond endurance. JWD

Chamberlain, M. E., *Lord Aberdeen* (1983).

**Aberfan disaster.** On 21 October 1966 an avalanche of waste and sludge from a coal tip buried the primary school of this south Wales village, causing the loss of 144 lives, mostly young children. The subsequent inquiry blamed the tragedy on the lack of any National Coal Board tipping policy. SC

**Abernethy, submission of, 1072.** After the \*Norman Conquest, the boundary between England and Scotland remained in doubt and Malcolm Canmore, king of Scotland, gave refuge to \*Edgar the Atheling, whose sister he married. The north, having been harried by William the Conqueror in 1069–70, was once more harried by Malcolm. In 1072 William led an expedition to Scotland and at Abernethy, near Perth, forced Malcolm to submit, do homage, expel Edgar, and give hostages. JAC

**Abyssinian War, 1935–6.** Conflict between Abyssinia and Italy. Mussolini used a border incident on 5 December 1934 at Walwal, on the Eritrean and Somali frontier, as a pretext for pursuing his aim of imperial expansion in north Africa. The Italians invaded Abyssinia on 3 October 1935 without declaring war and captured the capital Addis Ababa on 5 May 1936. The League of Nations branded Italy the aggressor and imposed limited sanctions but to no avail. In 1941 the British evicted the Italians with the aid of Abyssinian nationalists. RAS

**Aclea, battle of, 851.** This was a major victory for King Æthelwulf of Wessex over Danish raiders. From 835 the Danes had launched a series of heavy plundering attacks on the south of England, and in 850, for the first time, wintered on Thanet in Kent. Men from 350 ships stormed Canterbury and London, driving the Mercian king Beorhtwulf and his army to flight, before facing the West Saxon king and his son Æthelbald south of the Thames. The Wessex men made 'the greatest slaughter of a heathen host' heard of to that day. AM

**Acre, defence of**, 1799. Bonaparte, in Egypt, advanced into Syria to menace the Turks, then in alliance with Britain. Sir Sidney \*Smith flung troops and guns into the fort of Acre, which resisted the French for two months. Bonaparte attempted to represent the rebuff as a great victory, explaining that there was no point in occupying a pile of rubble. But three months later he abandoned his troops and sailed back to France. JAC

**Acre, siege of**, 1189–91. The siege and capture of Acre during the Third Crusade was a great event. Acre was the largest port and chief town of the kingdom of Jerusalem and the siege commenced in 1189. Richard I joined the besiegers in June 1191, bringing heavy siege-engines. Despite efforts by Saladin to relieve the city, it surrendered on terms in July. But the crusaders' advance south on Jerusalem stalled and in October 1192 Richard left Acre on his ill-fated journey home. JAC

**Acton, Sir John, 1st Baron Acton** (1834–1902). Historian and liberal Roman catholic. From an old Shropshire family on his father's side, Acton had a German mother and was brought up as a Roman catholic mainly on the continent, and especially in Germany. He first came to public attention writing articles for liberal catholic periodicals, many of them reprinted in *The History of Freedom and Lectures and Essays in Modern History*. He reported the 1870–1 Vatican Council from a liberal catholic perspective, opposing papal infallibility. Acton was an MP 1858–65 (for Carlow) and was created a peer by \*Gladstone in 1869. He was a lord-in-waiting at court, 1892–5. To this point, Acton had a great reputation as a cosmopolitan historical polymath, whose great work on the history of liberty awaited publication. In 1895 he became regius professor at Cambridge, and delivered a famous inaugural lecture (11 June 1895). He edited, but did not contribute to, the *Cambridge Modern History*, which set the pattern for a century for the Cambridge approach to multi-authored textbooks. Acton never finished any of his own grand projects (his note-boxes in Cambridge University Library reflect a mind almost mad with compilation) but his published output was far larger than is often allowed. Central to Acton's interest in history was the role of freedom and the capacity of the individual, if correctly imbued with moral and political righteousness, to promote freedom and progress in church and state. Gladstone, for Acton, most nearly epitomized this capacity. Though not an easy author to read, Acton was a sharp epigrammatist; his most famous epigram—'Power tends to corrupt and absolute power corrupts absolutely'—was written in a letter to Mandell Creighton on 3 April 1887. HCGM

**Acton Burnell, statute of**, 1283. Edward I's chancellor, Robert \*Burnell, owned the castle of Acton Burnell in Shropshire. A Parliament there in 1283 provided for the easier recovery of debts by merchants by authorizing the mayors of London, York, and Bristol to take action. The intention was to encourage foreign merchants to trade in England by affording fair treatment. Defaulting debtors could be kept in prison on bread and water at their own

expense. The statute was amended two years later by the statute of \*Merchants. JAC

**Acts of Parliament**. See PARLIAMENT.

**Adam, Robert** (1728–92). Scottish architect who, with his brothers John (1721–92) and James (1730–94), trained in the office of their father William Adam (1689–1748), the leading architect of his day in Scotland. After a spell at Edinburgh University, and a grand tour, Robert Adam started his architectural practice in London in 1758 and soon developed a light and decorative style inspired by his travels in Greece and Italy. His interiors combine domes, columned screens, and apses with classically derived surface patterns in delicate colours. The unity of the 'Adam style' can be seen in Kedleston (1760–1), Syon (1760–9), Osterley (1761–80), or \*Kenwood (1767–9), with their elegant plasterwork, furnishings, and fabrics. Robert Adam's finest civic work was in Edinburgh, notably Charlotte Square (1791–1807), the \*Register House (1774–92), and the first stage of the university (1789–93). To this later period belong such buildings as Seton (1790–1) and Culzean (1777–92), both in the castle style, which reflect Robert Adam's interest in the Picturesque. In 1773 there appeared the first engraved volume of the *Works in Architecture of Robert and James Adam*. PW

**Addington, Henry, 1st Viscount Sidmouth** (1757–1844). Prime minister. During a long political career Addington suffered from the denigration of foes and the condescension of friends, yet he had remarkable powers of survival. The son of a country doctor, he was educated at Winchester and Oxford. Entering the Commons in 1784 he made little impact until \*Pitt pushed him as speaker in 1789. He proved himself to be capable and fair-minded, and because of his opposition to \*catholic emancipation he was George III's choice to succeed Pitt as prime minister in 1801. Addington appealed to the backbench country gentlemen, whose prejudices he shared. Despite its defects the peace of \*Amiens was initially popular and Addington's policies of fiscal economy were generally approved. His management of public finance was competent, but the breakdown of the peace settlement exposed his limitations and in 1804 he was replaced by Pitt. Raised to the peerage in 1805 he served at various times and with mixed fortunes in Pitt's second ministry, in the Ministry of All the \*Talents, and in \*Perceval's administration. When \*Liverpool formed his ministry in 1812 Sidmouth became home secretary, holding the office until 1821, when he remained in the government as minister without portfolio. At the Home Office Sidmouth was responsible for the surveillance of radical activity. His views were conservative and consistent. He opposed catholic emancipation and parliamentary reform. He believed in the traditional constitution and was convinced that concessions made to popular pressure would be dangerous and unsettling. Yet during several industrial disputes in the troubled post-Waterloo years he sympathized with the strikers, believing that employers should keep faith with their men. If his advice had been followed in 1819 there would have been no \*'Peterloo massacre': he had cautioned the magistrates at Manchester against seeking any confrontation with large crowds. Never-

## Addison

theless, whatever his misgivings, he thought it necessary to support the magistrates in the face of criticism. Though he had to rely on informers and spies for information about radical activists, he had a healthy scepticism about many of the alarmist stories passed on to the Home Office. He was dubious about the likely benefits of government intervention in matters of trade and had no wish to extend the powers of central government. After he left office in 1824 he remained a staunch opponent of catholic relief and parliamentary reform, voting against both measures in 1829 and 1832. Throughout his career he voiced the unspoken convictions of many country gentlemen with a tenacity they admired, and while at times he annoyed colleagues by vacillation, Sidmouth's proudest boast was that he had never deliberately hurt anyone. JWD

**Addison, Joseph** (1672–1719). English writer and politician. Educated at Charterhouse, Queen's College, and Magdalen College, Oxford, where he became a fellow, Addison found favour with the Whigs on account of *The Campaign* (1705), a poem celebrating \*Marlborough's victory at \*Blenheim. Appointed under-secretary of state in 1706, he was elected MP for Lostwithiel in 1708, accompanying the lord-lieutenant, Lord Wharton, to Ireland in 1709. Addison's close friendship with Richard \*Steele and Jonathan \*Swift led to his involvement in the \**Tatler* (1709–10), but he is best known for his contributions to the \**Spectator*, which included most of the 'Sir Roger de Coverley' papers and important essays on \*Milton and \*Locke. Addison was a crucial figure in the development of a 'polite and commercial' Whig ideology, and the morality propounded in the *Spectator* is the basis of his description as 'The First Victorian'. Addison's other works included the seminal travel book *Remarks on Several Parts of Italy* (1705), a tragedy, *Cato* (1713), which was favourably compared to Shakespeare by his contemporaries, and the stridently anti-Jacobite periodical the *Freeholder* (1715–16). Returning to office on the accession of George I in 1714, Addison became secretary of state, marrying the countess of Warwick in 1716. JAD

**'Addled Parliament'** (5 April–7 June 1614). The second Parliament of James I was bedevilled by rumours that certain members had undertaken to manage the crown's business, to ensure a positive outcome. Suspicion that their freedom of debate was thereby being undermined added to members' fears that James, by levying \*impositions, would be rich enough to rule without Parliament. James took his stand on the 1606 legal judgment in favour of impositions, but the Commons insisted that the judges had acted 'above their commission'. Deadlock ensued, and James therefore dissolved Parliament before any bills were passed. RL

**Adela of Louvain** (c.1100–51), queen of Henry I. Henry's second wife, Adela married him after the death of his only legitimate son in the \**White Ship* disaster. The marriage's chief—and unfulfilled—purpose was to provide Henry with a male heir. When it had manifestly failed to do so, Henry persuaded his chief subjects to agree to the succession of his daughter, the Empress \*Matilda, in January 1127. After

Henry's death, Adela married William d'Aubigny, earl of Arundel, for whom she produced an heir. DB

**Adelaide** (1792–1849), queen of William IV. Adelaide of Saxe-Meiningen was suggested by Queen \*Charlotte as a suitable wife for her son William Henry, then duke of Clarence, hoping that he would end his relationship with Mrs Jordan, actress and mother of his ten children. Marrying in July 1818, Adelaide's reserved personality complemented William's exuberant nature and, despite their differences, the marriage proved happy. The death of two infant daughters clouded Adelaide's life. But following William's accession in 1830, she performed her royal duties with dedication. Initial unpopularity sparked by a belief that she meddled in politics gave way to respect for her charitable works. Her health deteriorated after William's death in 1837 and she died twelve years later. SMC

**Aden.** A port in the Middle East, commanding the entrance to the Red Sea. In 1839 Aden was ceded to the British by the Turkish sultan and administered from British India. It became a free port in 1850 and was developed as a coaling station on the steamship route from Suez to Bombay. In April 1937 it became a British crown colony and in 1963 part of the South Arabian Federation of Arab Emirates. After the civil war (1965–7) the British withdrew from Aden and it became the capital of the People's Republic of South Yemen. RAS

**Admiralty.** The relationship of a highly skilled professional service with civilian control is bound to be difficult. With the navy, problems were multiplied by the very high cost of building and maintaining a fleet, which caused acute tensions when the era of the \*dreadnoughts coincided in the 1900s with demands for democratic welfare provision; together with the fact that until recently communications were so difficult that great discretion had to be allowed to the man on the spot. In 1798, before the critical battle of the \*Nile, the cabinet did not know where \*Nelson's fleet was in the Mediterranean, and Nelson did not know where Napoleon was.

Until a permanent royal navy came into being, organization did not need to be elaborate. A commander was appointed for the campaign, after which most of the vessels, being converted merchantmen, returned to their home ports. The first admirals were appointed in the late 13th cent., and in the 14th the custom grew up of naming one to command north of the Thames, one for the south and west. But Henry VIII made a considerable effort to strengthen naval power. In 1540 Lord \*Bedford was named lord admiral and in 1545 a Council for Marine Causes was established—the genesis of the Navy Board, the four commissioners having specified duties and fixed salaries. \*Buckingham, Charles I's favourite, was made lord high admiral and after his murder in 1628 the office was put into commission, largely to save money. This arrangement, with a 1st lord of the Admiralty, became permanent after 1708. Only between 1827 and 1828 was the office of lord high admiral revived, for the duke of Clarence (the future William IV), and the experiment was not an unmitigated

success. The growing importance of the navy in the 17th cent. was underlined by the fact that the lord high admiralship was taken at the highest level—by James, duke of York, 1660–73, Charles II himself 1673–84, and Anne's husband, Prince \*George of Denmark, 1702–8. In 1673–9 the 1st lord was Prince \*Rupert, cousin to the king; it is understandable that when, in 1877, the post went to W. H. \*Smith, eyebrows were raised.

The Navy Board took responsibility for administration and implementation, the Admiralty Board for appointments and strategy. Though a recipe for friction, this dual system survived for two centuries and presided over some of the navy's most glorious victories. The fleet to which Charles I had devoted considerable care deserted him at the Civil War. The Commonwealth regime abolished both boards, but found it necessary to replace them with commissioners of the Admiralty and naval commissioners, under whom the navy, particularly with \*Blake's leadership, acquitted itself well. Charles II in 1660 restored the old order and was fortunate enough to find in Samuel \*Pepys a remarkably capable civil servant, first as clerk of the acts and then as secretary to the Board of Admiralty. The same efficiency was scarcely maintained in the 18th cent. and the great victories were won more by tactics, morale, and personnel than by administration. Since the 1st lord was always a politician, often with no experience of the sea, professional naval advice came from a 1st sea lord, under a variety of names.

The dual system came to an end in 1832, again partly as a measure of economy, when Sir James \*Graham brought the Navy Board into the Admiralty structure and redefined channels of responsibility.

In the 20th cent. the degree of autonomy built up by the Admiralty was weakened by a number of factors—spiralling cost, an acceleration of technological change, and, not least, after 1945, by the remarkable shrinking of the navy itself. Winston \*Churchill as 1st lord and \*Fisher as 1st sea lord both convulsed and improved the navy before 1914. In 1931, for the first time since 1709, the 1st lord was briefly not a member of the cabinet, and in 1964, after a great run-down of the navy in the wake of the Second World War, the post of 1st lord was discontinued. In a unified Ministry of \*Defence the spokesman for the navy was the chief of naval staff and 1st sea lord. Ironically, the grandiose Admiralty Arch was completed in 1911, when the first challenge to British naval supremacy was becoming apparent. DDA; JAC

**Admiralty, Court of.** The High Court of Admiralty, whose first record dates from 1361, dealt with matters relating to crime on the high seas and cases involving maritime questions and foreign merchants. It applied principles of civil law and hence was popular with the cosmopolitan mercantile community. Its heyday was the Tudor period, when it was used to settle disputes relating to maritime contracts and matters of shipwreck and salvage. The court excited the hostility of Parliament and of the common lawyers, especially \*Coke, and declined in the 17th cent., losing most of its commercial jurisdiction to the common law courts. Admiralty remained a separate court until merged with the matrimonial and probate courts into the Probate, Di-

voce, and Admiralty division of the High Court in 1873. MM

**Admonition to the Parliament**, 1572. A puritan manifesto, composed by John Field and others, arguing against the authority of bishops and urging a presbyterian church government. It was not presented to Parliament but was published in June 1572 after a puritan bill had been abandoned, when the House was informed that the queen 'utterly misliketh it'. An *Answer to the Admonition* was offered by John \*Whitgift, future archbishop of Canterbury. JAC

**Adomnán, St** (c.628–704). Irish scholar, diplomat, and ninth abbot of Iona. Born into the royal Uí Néill dynasty and educated at Durrow, probably where he taught the future King Aldfrith of Northumbria, he moved in the 670s to Iona, where he wrote his *Holy Places*, based on a conversation with a Frankish bishop, Arculf. He visited Aldfrith twice (incorporating at least one journey to Abbot Ceolfriht of Monkwearmouth-Jarrow), in 686, as emissary of the king of Brega, and in 688, when he accepted the Roman Easter. Failure to convert his monks perhaps influenced his writing (688–92) a life of his kinsman \*Columba, the monastery's founder, and his return to Ireland in 692. A second visit there saw negotiation with Irish, Scottish, and Pictish kings, and promulgation of his *Law of the Innocents*, protecting non-combatants from violence, at the 697 Synod of Birr (Co. Offaly). Adomnán's cult flourished in Ireland and Scotland. AER

**Adrian IV** (c.1100–59). Name taken by Nicholas Breakspear, still the only Englishman to be elected pope. After studying at Paris, he became abbot of St Rufus in Avignon and then a cardinal in 1149. As papal legate to Scandinavia in 1152–3, he reorganized the churches there. Elected pope in 1154, he soon found himself at odds with the Emperor Frederick I (Barbarossa). In 1155–6 he granted lordship over Ireland to Henry II. According to a papal bull (known from its opening word as \**Laudabiliter*), Adrian made the grant so that Henry could reform 'a rough and ignorant people'—and scholars still debate whether or not the bull is a forgery. JG

**Adrian, Edgar Douglas, 1st Baron Adrian** (1889–1977). Scientist. Born in London, Adrian went to Westminster School and Trinity College, Cambridge, where he read science. Specializing in physiology, he became a fellow of his college in 1913 and then, obtaining a medical degree in record time, spent the First World War treating nervous disorders and cases of shell-shock. Adrian returned to Cambridge in 1919 and published extensively on the nervous system. He shared the Nobel prize in 1932, held the chair of physiology from 1937 to 1951, and was master of Trinity from 1951 to 1965. Among his many distinctions was the presidency of the Royal Society 1950–5. He was given the OM in 1942 and a barony in 1955. JAC

**Adullamites** was the name derisively given to Robert \*Lowe and nearly 40 Liberal MPs who opposed Lord \*Russell's programme of parliamentary reform in 1866. They were dubbed by John \*Bright on 13 March in allusion

## advertising

to the cave of Adullam (1 Sam. 22), to which David fled and was joined by everyone who was discontented. Their opposition brought about the fall of the government but a further measure of reform was then introduced by the Conservative government of \*Derby and \*Disraeli. JAC

**advertising.** From shop and inn signs, street cries, and handbills to commercial \*television, sports sponsorship, and e-commerce, promoters have long combined information and persuasion to encourage others to avail themselves of goods or services. The introduction of \*newspapers in the 17th cent. spurred consumerism in the 18th, since column ends were easily filled with advertisements for books, proprietary medicines (with glowing testimonials), public meetings and entertainments. Advertisement tax, introduced on newspapers in 1712, was abolished in 1853 and a golden age came with the return of illustrations, vastly increased expenditure, and the introduction of catchphrases and colour lithography. Over-enthusiasm led to excess, and parliamentary controls were introduced in 1889 (Indecent Advertisement Act).

The ethics and psychology of advertising began to be discussed and techniques studied more seriously. The \*First World War saw one of the most famous posters of all time—‘Your Country needs YOU’—and from the 1920s, when agencies were introduced, the industry began to put its house in order (Advertisement Regulation Act, 1925). Codes of standards, especially after the \*Second World War, encouraged greater sobriety, and techniques changed. Hoardings became less used and sandwich-men almost disappeared. The advent of commercial television (1955), followed by radio advertising (1972), proved pervasive. A renewed debate began on the propriety of some forms of advertising, and restrictions were placed upon tobacco promotion in particular. The industry established its own Advertising Standards Authority in 1962. In a free market economy, competitive advertising remains of crucial importance and, with the exception of the \*British Broadcasting Corporation, supports most of the media. ASH

**advowsons** are the right of appointing a parson in the Church of England to a parish or other church benefice. They can be held by the bishop of the diocese or by a patron (individual or corporate) who has the right to ‘present’ someone to the living, i.e. nominate a person to the bishop or ecclesiastical superior. The system survived from pre-Reformation power struggles between church and state until the right became protected in English civil law. Two Church of England reports in the 1960s recommended reform of the system and the Benefice Measure of 1978 provided for involvement of the parish in appointments but not for abolition of this form of patronage. JFC

**Adwalton Moor, battle of, 1643.** \*Newcastle and the \*Fairfaxes were manoeuvring in the spring of 1643 for control of Yorkshire. In the battle on Adwalton Moor, 30 June, 5 miles east of Bradford, the royalists outnumbered their opponents and after heavy fighting achieved an important victory. Bradford and Leeds fell immediately and Newcastle settled down to the siege of Hull. JAC

**Æd** (d. 878), ‘king of the Picts’ (876–8), anachronistically regarded as 4th king of Scotland. Son of \*Kenneth I, he succeeded his brother \*Constantine I. This was the worst period of Scandinavian devastation, and defeat and occupation in 875–6 must have left the kingdom shattered, affording an opportunity for those who wished to challenge the dominance of Æd’s family, which had monopolized the kingship for more than three decades. Two rivals on record are the obscure \*Giric and Æd’s nephew \*Eochaid, son of Rhun of Strathclyde. Either of these may have been Æd’s final opponent in battle at Strathallan (7 miles north of Stirling), which left Æd fatally wounded. A debatable source says that he was buried on Iona. DEB

**Ædan mac Gabhrain** (d. c.608), king of Dalriada. He was crowned on Iona in 574 by St \*Columba, his spiritual adviser, and was politically significant. Ædan established a powerful kingdom, first gaining authority over the Irish Dalriada at the convention of Druim Cett in 575. Successful campaigns included expeditions to the Orkneys and the Isle of Man. But in 603 he led a great army against the powerful Northumbrian king \*Æthelfryth at \*Degsastan, thought to be in Liddesdale. Soundly defeated and his army destroyed, he fled, which may be why, in Welsh tradition, he is known as ‘Ædan the traitor of the North’. AM

**Ælfheah** (954–1012), archbishop of Canterbury, was a monk at Deerhurst and at Bath before being appointed bishop of Winchester in 984. In 994 he is said to have visited Olaf of Norway, then on a raid at Southampton, converted him, and obtained a promise to leave England alone. In 1006 he succeeded Ælfric as archbishop of Canterbury. A Danish host burned Canterbury in 1011 and took the archbishop prisoner: ‘Then was he a captive, he who had been | The head of England, and of Christendom’ (*Anglo-Saxon Chronicle*). Ælfheah refused to be ransomed and on 19 April 1012 at Greenwich was battered to death. He was buried in St Paul’s and then in his own cathedral at Canterbury. He is recognized as a saint, usually as St Alphege. JAC

**Ælle** (d. c.514), founder of the South Saxon kingdom, is said to have landed near Selsey Bill in 477, traditionally with three sons and three ships, driving the Britons back into Andredesweald, a great wood across south-eastern Britain. His next recorded battle, in 485, took place near an unknown stream, Mearcudes burna, and in 491, Ælle and his son Cissa successfully stormed the fort of Anderida, near Pevensey, wiping out the Britons. Named by \*Bede as first of the \*bretwaldas, a powerful overlord, he was probably leader of a general Anglo-Saxon push against Britons in the south, but his disappearance from records after Anderida seems to coincide with a revival of the Britons, who, led by \*Ambrosius Aurelianus, were victorious in battle at \*Mount Badon. The site is uncertain and the date debatable (516 in the *Annals Cambriae*), but Bede placed the event c.493. AM

**Ælle** (d. 867), king of Northumbria (c.863–7 or, possibly, his reign was confined to 867). He was the last independent English king of Northumbria. Though probably not of royal birth, he sought to usurp power from his predecessor

Osberht at a dire time. Danish armies were in sight of taking York, and in November 866 they did. Ælle and Osberht united in an effort to regain the city on 21 March 867. They penetrated the walls, but both were then killed. JCa

**aeronautical industry.** Following the rapid development of powered flight at the beginning of the 20th cent., aircraft manufacture, in common with many other strategic industries, was given a great stimulus during the \*First World War. The military potential of fixed-wing aircraft for observation and combat was proved for the first time on any scale. Non-rigid airships were used on coastal patrol and anti-submarine work and later large rigid airships, the R33 and R34, were built, based on German designs. In July 1919 the R34 was the first aircraft to cross the Atlantic from Britain to America.

Regular civil aviation developed after the war, with the first daily service from London to Paris commencing in 1919. Several British companies joined to form Imperial Airways in 1924 and the network for both mail and passenger transport was gradually extended beyond Europe to outposts of the empire in Africa and Asia. In 1931 the company adopted the Handley Page aircraft, which could carry 40 passengers at 100 m.p.h. From 1934 the Empire Flying Boat, nicknamed the 'Queen of the Skies', carrying its passengers in considerable comfort, could cruise for 800 miles at 165 m.p.h. The British Overseas Airways Corporation (BOAC) was established 1939.

The \*Second World War changed the face of aviation and again brought major advances in aircraft design and propulsion, particularly turbo-prop and jet engines, leading to the development of much larger and faster civilian aircraft. Post-war expansion to meet military and civil aviation requirements brought further significant innovations, but at considerable cost. One prestige project typified the 'white-heat of technology' era of the 1960s, when Britain, in co-operation with France, operated at the limits of known technology in the race to produce a supersonic passenger transport aircraft. Concorde was developed, in spite of escalating cost and the uncertainty of its financial viability, swallowing hundreds of millions of pounds, in an exercise described by one expert as 'an unmitigated disaster without historical parallel'.

Despite an impressive performance in aero-engines and in other sectors of aerospace during the 1960s and 1970s, the commercial viability of some projects was questionable and deprived routine manufacturing of talented engineers and scientists. While remaining the third largest in the world after the USA and France, the British aerospace industry suffered badly during the periodic crises experienced by civil aviation and from reductions in defence orders. During the 1980s, collaborative development of civil and military aircraft, particularly with European partners, increased to save on costs of new production programmes. See also AIR TRAVEL.

ID

**Æthelbald** (d. 757), king of Mercia (716–57). In his time any member of an extended royal family had an accepted chance to capture the throne. This is the background to the young Æthelbald's being driven into exile in the reign of his second

cousin Ceolred, and to his succeeding Ceolred as king. \*Bede tells us something weighty about Æthelbald's success as king. Writing in 731 he says that all the kingdoms of the English, south of the Humber, are under the authority of Æthelbald. A charter of 736 describes Æthelbald in language which supports this claim, one terming him king of all the kingdoms of the South English and even king of Britain. His relations with the church were forceful. He seems to have established a firm exploitation of monasteries and he misconducted himself with nuns. He died at the hands of his own military household. Our fragments of knowledge suggest the creative authority of a mighty ruler. JCa

**Æthelbert** (d. 616), king of Kent (560–616) has a special importance as the king who welcomed the Christian missionaries led by St \*Augustine to England in 597. He exercised overlordship over all the English peoples south of the Humber, and as a direct result of his support the Christian mission was firmly established in the south-east, with bishoprics set up at his principal centre, \*Canterbury (where Augustine became the first archbishop), \*Rochester, and \*London. Sources suggest that he began his reign as early as 560 or 565, but it is likely that these dates refer to his possible date of birth and that his reign commenced in the late 570s or early 580s. At that stage Kent had firm contacts with the continent and sometime before 589 Æthelbert married Bertha, daughter of Charibert, a Frankish king of Paris. She was a Christian, and brought a Christian priest, the bishop Liudhard, with her. They practised their faith in a church on the site of St Martin's, east of the city wall: a fragment of the pre-Augustinian structure survives. Æthelbert allowed Augustine to preach, allotting him the church at St Martin's and a site in the city which became the cathedral church, and later a site for the monks outside the wall on which was built St Augustine's abbey, a burial place for kings and archbishops. The king was quickly converted, probably in 597, and many of his people with him. The new faith drew him into yet closer contact with Francia and ultimately with Rome, and provided him with literate servants. As a result the first extant Anglo-Saxon laws were drawn up, after the example of the Romans, making provision among other things for the incorporation of the Christian church into the social fabric of the kingdom. Æthelbert continued to exercise effective authority in the south-east but Kentish pre-eminence weakened after his death in 616, a perilous time both for his kingdom and for the Christian mission. HL

**Æthelburg** (b. c.605) was the Christian daughter of Æthelbert of Kent. Her marriage to the Northumbrian king Edwin (625) brought about his baptism and the initial conversion of his kingdom by Bishop \*Paulinus, who had accompanied her north. Edwin's defeat and death in 633 forced queen and bishop to flee back to Kent. AM

**Æthelfleda, lady of the Mercians** (d. 918), was the last independent ruler of Mercia. The daughter of Alfred of Wessex and his Mercian wife Ealhswith, she was married to Æthelred of Mercia, probably in the second half of the 880s. Even before his death in 911, Æthelfleda is recorded

## Æthelfryth

as exercising regalian power in the province in the 'Mercian Register', a fragment of a Mercian chronicle incorporated into some versions of the *\*Anglo-Saxon Chronicle*. In particular she is noted for providing a ring of burhs (fortified centres) around western Mercia and for conducting successful military campaigns against the Welsh, the Hiberno-Norse Vikings who were establishing settlements in Lancashire and Cheshire, and the Danes of York and the east midlands. Her campaigns against the Danes were in co-operation with her brother King Edward the Elder of Wessex and, although Æthelfleda has often been cited as evidence for the relative independence of women in Anglo-Saxon England, her position must be viewed in the context of the ambitions of her father and brother to annex western Mercia. These were realized after Æthelfleda's death in 918, when Edward deposed her daughter Ælfwynn and took over control of the province. BAEY

**Æthelfryth** (d. c.616), king of Northumbria (c.593–c.616), was said by *\*Bede* to be the cruellest enemy of the Britons, slaughtering, enslaving, and opening the way for further Anglo-Saxon settlement. It was probably Æthelfryth who defeated the British at Catterick (north Yorks.), lamented in the Welsh poem, *Gododdin*. His defeat of King *\*Ædan* at *\*Degsastan* in 603 effectively subdued the Irish in Scotland. His victory over the men of Powys at *\*Chester* c.616 was significant, separating Britons in Wales from their northern compatriots. But Æthelfryth's demise was at the hands of Anglo-Saxons. Threatened by Æthelfryth if he did not murder or hand over Edwin, claimant to the Northumbrian kingdom of *\*Deira*, who had taken refuge at his East Anglian court, *\*Rædwald* attacked, killing Æthelfryth in battle near the *\*river Idle* (Lincs.) c.616. AM

**Æthelheard**, king of the West Saxons (726–40). Little is known of this king who succeeded to the throne of Wessex when *\*Ine*, described in some sources as his kinsman, abdicated to go on pilgrimage to Rome. His succession was challenged by Atheling Oswald, who claimed descent from King *\*Ceawlin*. Æthelheard suffered from the expansion of Mercian power; Æthelbald of Mercia is recorded as taking control of Somerton in 733 and seems to have been able to grant land in northern Somerset and Wiltshire. Æthelheard was probably married to Frithugyth whose departure to Rome with Bishop Forthhere is recorded for 737. BAEY

**Æthelnoth** (d. 1038). Archbishop of Canterbury from 1020. Often referred to as 'the Good', and thought to have influenced *\*Cnut*, who was generous to Canterbury and granted him extensive powers of jurisdiction. Æthelnoth restored the church at Canterbury, damaged during Danish raids, and in 1023 had the remains of his martyred predecessor, *\*Ælfheah*, translated there with great ceremony. An arm of St Augustine of Hippo, bought by him at Pavia, was given to the abbey church at Coventry. An improbable account claims that, after Cnut's death, pledged to consecrate none but his son Harthacnut, he refused to crown *\*Harold Harefoot*. AM

**Æthelred** (d. c.716), king of Mercia (675–704). All we know of Æthelred, son of *\*Penda*, comes from episodic indications

of a career whose apparent paradoxes signal a world no less pious than brutal. Its realities can be glimpsed, not recapitulated. In 676 he ravaged Kent, and not least its churches. In 679 he won an important victory over the Northumbrians at the battle on the *\*Trent*. In 697 his nobles murdered his royal Northumbrian wife Osthryth. In 704 he abdicated to become a monk. JCa

**Æthelred** (d. 796), king of Northumbria (774–8/9, 790–6). Knowledge of Northumbrian history at this time is 'nasty, brutish, and short'. Æthelred was displaced after five years' rule by a member of another line, Ælfwald. Regaining power upon Ælfwald's murder in 790, Æthelred butchered Ælfwald's sons and sought to secure himself by marrying the daughter of *\*Offa* of Mercia, and faced the shock of the Viking sack of *\*Lindisfarne* in 793. In 796 he was murdered. With better sources we could better interpret these miseries. JCa

**Æthelred I** (d. 871), king of Wessex (865–71). The third son of *\*Æthelwulf* to succeed to the kingship of the West Saxons, Æthelred had to endure the first major onslaught of the Danes in their systematic attempt to conquer England. From bases set up in *\*East Anglia* in 866 they first turned their attention to *\*Northumbria* and *\*Mercia*, delaying moves against *\*Wessex* until the autumn of 870. After a series of skirmishes and battles with varying fortunes, Æthelred died on campaign in April 871, to be succeeded by his younger brother *\*Alfred*. HL

**Æthelred, lord of the Mercians** (d. 911). Of unknown origins, by 883 Æthelred was in control of that western part of Mercia which had been left under Anglo-Saxon control when Vikings conquered the rest of the province. Æthelred found it expedient to accept the overlordship of *\*Alfred* of Wessex and married his eldest daughter *\*Æthelfleda*, perhaps soon after Alfred had ceded control of London to him in 886. The two provinces co-ordinated activities against the Vikings, but Æthelred seems to have become increasingly plagued by ill-health so that well before his death in 911 Æthelfleda had become the effective leader of the Mercians. BAEY

**Æthelred II** (d. 1016), king of England (978–1016). Æthelred *Unræd*, the 'Unready', or more accurately the 'ill-advised', lost his kingship 1013–14, when the Danish king, *\*Sweyn Forkbeard*, forced him into exile in Normandy, the home of his second wife *\*Emma*, whom Æthelred had married in 1002. The Anglo-Saxon Chronicler who composed a full account late in Æthelred's reign was heavily biased against the king, painting a grim picture of impotence, vacillation, and treachery. Modern approaches have been kinder, noting solid evidence for effective government in the legal and financial spheres and pointing to the cultural and religious elements of strength in a period which produced in Ælfric the most polished master of Old English prose and in *\*Wulfstan*, bishop of Worcester and archbishop of York, one of the most competent statesmen and framers of secular and ecclesiastical law. No one denies the periods of political incompetence notably later in the reign, after 1006, when Æthelred relied too much on the advice of the treacherous

ealdorman Eadric Streona. It was indeed the king's deep misfortune that, no military leader himself, he had to face renewed Viking onslaught which reached a peak after the defeat and death of the ealdorman Byrhtnoth at the battle of \*Maldon in 991. This was followed by attempts to buy off the Danes by the payment of immense sums as \*Danegeld, a course of action suggested by Archbishop Sigeric. £10,000 was paid to them in 993, and further immense sums were levied sporadically throughout the reign, a wry tribute to the efficiency of Æthelred's tax collectors. Sporadic violent reaction also occurred as when on the morrow of \*St Brice's day, 13 November 1002, Æthelred ordered 'all the Danish men in England' to be slain. In the later stages of the reign things got completely out of hand, in spite of the bravery of individual leaders such as Ulfketel, ealdorman of East Anglia, and \*Edmund Ironside, Æthelred's son and successor. \*Ælfheah, archbishop of Canterbury, was martyred by the Danes in 1012, and Sweyn's success the following year may be attributed in part to English war-weariness and disenchantment with their natural leaders. After Sweyn's death, Æthelred was recalled on promise to rule justly and institute reforms but died on 23 April 1016 in London which was itself under immediate threat from \*Cnut's invading and ultimately victorious army.

HL

**Æthelthryth** (Ætheldreda, Audrey), **St** (c.630–79). Daughter of King Anna of East Anglia, and virgin wife of Tondbert, of the south Gyrwe, and secondly of Ecgrith of Northumbria, who eventually released her to monastic life at Coldingham, north of Berwick. Æthelthryth founded a double monastery at Ely on the East Anglian–Mercian frontier, perhaps the first south-eastern house for women. The promotion of her cult (in 695), by \*Wilfrid (who had received land for St Andrew's, Hexham, from her) and by her sister and successor Sexburh, showed Gallic influence and, after \*Æthelwold refounded Ely (c.970), gave title to church and to lands, to her community, and respectability as rulers of East Anglia to her royal West Saxon devotees. Her usefulness was as great as her sanctity. Bede wrote a hymn on virginity in her honour. Her cult survived the Norman Conquest.

AER

**Æthelwold, St** (c.908–84). Winchester-born leader of the 10th-cent. reformation, and major influence on King \*Edgar. Probably a noble, Æthelwold served King \*Æthelstan, was ordained priest by Bishop Ælfheah of Winchester, became a monk under \*Dunstan at Glastonbury, and was made, by King Edred, abbot of Abingdon (c.955) and, by Edgar, bishop of Winchester (963). He replaced the clerks of the Old and New Minsters with monks (964), and developed Winchester as a centre of art and learning. One of its products was Ælfric, later his biographer. Æthelwold's *Benedictional* (collection of blessings), which combined two liturgical traditions, proved very influential. Besides Abingdon, Æthelwold revived the monasteries of Peterborough, Ely, and Thorney, thereby reintroducing monasticism to the Danelaw. He was behind the *Regularis concordia*, a version of the rule of St Benedict, which he himself translated into English, with additions regulating communal prayer, pre-

scribed by the council of Winchester (c.970) for all English religious houses.

Perhaps the most forceful and austere of the reformers, Æthelwold was a wealthy patron of building, and ruthlessly efficient in acquiring estates. Historical tradition and cults of earlier saints were promoted to buttress his houses' claims, as was the cult of the Virgin. An inspiration was continental practice, especially that at Fleury-sur-Loire. Another was the golden age of monasticism as portrayed by Bede, which may explain Æthelwold's unusual policy that cathedral chapters should be monastic. Heavily involved in politics, he worked closely with Edgar and Queen Ælfhryth. Æthelwold elevated royal authority, for example implying parallels between king and Christ. The popularity of his cult, promoted by his pupil \*Wulfstan (of Winchester) possibly at his own request, was limited, though his biography was widely circulated until the 15th cent.

AER

**Æthelwulf** (d. 858), king of Wessex (839–58). The son of \*Egbert (802–39) and father of four kings, the youngest of whom was \*Alfred the Great (871–99), Æthelwulf is a far from negligible figure in Anglo-Saxon history. He was a competent military leader, acting as a subking in the south-east in his father's lifetime (829–39), and conducting substantial campaigns against the Danes at \*Aclea in Kent in 851 and against the Welsh of Powys (in support of his Mercian allies) in 853. Much of his personal interest seemed, however, to lie in ecclesiastical directions. He made generous provision for the financing of churches (his Decimations), apparently in the form of grants of a tenth of royal lands into the hands of thegns empowered to transfer proceeds to religious foundations. In 855 he yielded his authority to his eldest son Æthelbald, and went on pilgrimage to Rome, possibly accompanied by his young son Alfred, who would have been about 6. Æthelwulf was away from his kingdom for a twelvemonth, and on his return with a Frankish princess as a bride (a young girl, Judith, held to be only 12 years old) he was forced to agree to a division of the kingdom with his own authority confined effectively to the south-east until his death in 858. Æthelbald then succeeded to the whole kingdom, and also, in spite of the fact that she was his stepmother, married Judith.

HL

**Aetius, Flavius** (d. 454). Roman general. Gildas's work *On the Ruin of Britain* contains the passage known as The Groans of the Britons: 'To Agitius thrice consul, the groans of the Britons. . . the barbarians push us back to the sea, the sea pushes us back to the barbarians. Between these two types of death we are either slaughtered or drowned.' The Agitius of the text is usually identified as Flavius Aetius, consul for the third time in 446 and last effective Roman commander in Gaul. Other possibilities are Aegidius, appointed by the Emperor Majorian (457–61) as commander in Gaul and subsequently ruling independently till his death in 464 but never thrice consul; or another Flavius Aetius of similar date who was consul but whose career lay mainly in the eastern part of the empire. There is no evidence that any of these intervened in Britain.

ASEC

## Afghan wars

**Afghan wars.** From 1807, when the armies of Tsar Alexander I reached its northern borders, Afghanistan came to represent an uneasy neutral zone between the Russian and the British Indian empires around which 'the Great Game' was played. The British attempted to bring the kingdom under 'informal influence' but, when this broke down, launched three military interventions—in 1838–42, 1878–81, and 1919–21. None was successful. The first Afghan War against Dost Mohammed saw a British expeditionary force reach and capture the capital, Kabul. However, surrounding tribes rose up and forced a desperate retreat through mountainous country. Only one member of the original army of 16,000 lived to cross the Khyber pass back into India. The second war was precipitated by Lord \*Lytton's forward policies, which subsequently were repudiated by \*Gladstone's incoming 1880 government. The third war arose when Habibullah Khan demanded recognition by the British of the absolute independence of his kingdom. At first this was refused but British arms, once more, found the Afghan terrain and peoples intractable. Afghanistan's sovereignty at international law was formally recognized on 21 November 1921. DAW

**Africa, partition of.** Africa is the nearest continent to western Europe, yet its colonization lagged far behind more distant parts of the world. That was partly because of the health risks it presented to Europeans, and partly because there seemed little to take them there. The main exception was trade, in slaves and other goods, which could be carried on perfectly well through African and Arab middlemen at the coasts. A number of maritime nations had posts in Africa from the 16th cent. onwards, including the Portuguese, Spaniards, and—a little later—the Dutch and British in the west and south. As late as the 1860s, however, their presence in tropical Africa was marginal. Britain seemed content with this. In 1865 a parliamentary select committee recommended withdrawing from three of her four west coast settlements altogether. It was shortly after that, however, that interest in Africa hotted up again.

The reasons for this were the use of quinine as a prophylaxis against malaria; missionary activities; a new demand for Africa's natural products; booming trade to the East, which passed round Africa on two sides after the Suez canal was opened in 1869; and native rebellions, which tended to suck British troops and government inland. Other European countries also became involved, especially France in the north and west. In 1882 Britain took control of Egypt after a rebellion there against the local khedive and his growing dependence on European financiers threatened her own interests, particularly in Suez. That sparked off the main stage of the 'scramble for Africa', in which several European nations vied for control.

To prevent that leading to conflict, the German chancellor Bismarck called a conference in Berlin in 1884, which parcelled west and central Africa out amongst the claimants. That was done with relatively little fuss, mainly because none of the latter felt desperately strongly about it. The only new colony to feel the effects of this immediately

was the Congo 'Free State', chiefly because of its bloody exploitation by its new owner, the Belgian King Leopold II.

In the 1890s the action shifted to the east and south. Here the lion's share went to Britain, including the \*Sudan, most of east-central Africa, and the \*Rhodesias. This time the competition was somewhat keener, threatening conflicts with France over \*Fashoda in 1898, and Germany on the eve of the second \*Boer War. The risk, however, was felt to be worth it, both because of the reputed riches of the area and because these countries were seen as indirectly vital to the protection of Britain's trade routes to the East. By 1900 the process was more or less completed, leaving virtually the whole of Africa—barring only Ethiopia and Liberia—in European hands. JBP

**Africa Company.** See ROYAL AFRICA COMPANY.

**Agadir crisis, 1911.** A Franco-German colonial crisis triggered by a German gunboat in a Moroccan port (July 1911) led ministers to resolve an inter-service dispute over the role of the army in a hypothetical war with Germany by agreeing 'in principle' that it should be sent to the continent. CJB

**Agincourt, battle of, 1415.** Henry V landed in France on 13 August 1415 with an army of c.2,500 men-at-arms and 7,500 archers, laying siege to \*Harfleur. He may have intended a more extensive campaign, but as the town held out until 23 September, and his army was much depleted by dysentery, he decided to return forthwith to England via Calais. The march north was lengthier than expected as he was forced far inland in search of a crossing of the Somme. The French army, perhaps over 20,000 strong, attempted to block his approach to Calais. Henry had little choice but to give battle on 25 October though he now had only about 900 men-at-arms and 5,000 archers. He drew up his well-disciplined troops, all on foot, within 300 yards of the enemy, across a narrow front bordered by trees, with archers on the flanks. The French cavalry charged into this funnel, hampered by volleys of arrows and by the wet ground; the rear lines piled into the front. Many were killed or captured, amongst them the duke of Orléans. Against chivalric practice, Henry had some prisoners killed when he thought the French were regrouping and after an attack on his baggage, but this did not diminish the renown gained from this unexpected victory. AC

**Agreement of the People, 1647.** A set of counter-proposals from the more radical members of the army, largely in the lower ranks, who were concerned at the concessions which the army council had offered the king in the \*Heads of the Proposals. The Agreement, formulated in October 1647, became the basis for the discussions at the army debates in \*Putney. It wished the reformed electoral system to be related to the number of inhabitants rather than property or taxation and urged a substantial widening of the parliamentary franchise. \*Cromwell and \*Ireton retorted that the security of property would be undermined. When the Agreement was submitted to Parliament, it was rejected. JAC

**Agricola, Gnaeus Iulius.** Governor of Britain 77–83. Thanks to the fortunate circumstances first of Agricola's daughter having married the historian \*Tacitus and second that Tacitus' biography of his father-in-law survived, we are better informed about Agricola than any other provincial governor in the Roman empire. Agricola came of a senatorial family in southern Gaul. He progressed through the usual career of a senator, but was exceptional in spending all three of his periods of provincial service in Britain, culminating in an unusually long governorship. He first served in Britain as a military tribune at the time of the \*Boudiccan revolt (60/1). He returned as legate (commander) of *legio XX Valeria Victrix* 69–73, during which time his legion took part in the advance north of the Humber–Mersey line. He served as a consul in the year 77 and probably arrived in Britain as governor late in that year. Tacitus' account of Agricola's governorship is dominated by narratives of the seven seasons of campaigning, advancing Roman power far into Scotland and culminating in the defeat of the Caledonian tribes under \*Calgacus at the battle of Mons Graupius (83/4). The route of advance east of the Highland massif can be traced through the sites of 'marching camps', temporary campaign fortifications. In the intervals from fighting he is shown governing wisely and promoting Roman ways amongst the Britons. But our view of Agricola has been over-influenced by Tacitus' laudatory biography, portraying him as an exceptional general and a just governor. ASEC

**agricultural revolution.** This was traditionally regarded as a movement which took place simultaneously with the \*industrial revolution, and involved the invention and introduction of new crop rotations in which roots and artificial crops were cultivated, and which involved also improvements in livestock breeding, and the reorganization of the land as a result of parliamentary enclosure. Taken together, these changes were held to have raised the output and productivity of land in such a way that the population was fed (with some help from imports) without resort to massive labour inputs which would have slowed down the industrial revolution by restricting the flow of labour from the countryside to the town. Consequently agricultural productivity and labour productivity must both have risen; indeed, the twin achievements of 18th- and 19th-cent. agriculture are seen as the ability to match population growth with rising agricultural production, and structural economic change with major gains in labour productivity.

Without much doubt the end results deduced by this argument are correct. Food supply did more or less keep pace with population and urbanization, although there was some slack in demand c.1750 and a shortfall by 1815 of about 5 per cent, which was largely met by importing grain from Ireland. By 1850 an estimated 6.5 million extra mouths were being fed from home production compared with 1750. However, questions have been raised about the nature, and particularly the timing, of the agricultural revolution. Originally it was believed to have taken place alongside, and to have been a necessary concomitant to, the industrial revolution. Recent research has raised questions about this linkage. Although there is general agreement that English

agriculture underwent a fundamental technological transformation between the mid-16th and the mid-19th cents. which had a decisive impact on 'productivity' in terms of grain yields per acre, the timing and mechanics of this transformation remain in question.

Modern understanding of the agricultural revolution sees it loosely as a three-stage, overlapping, process. The first phase, completed by c.1750–70, saw two developments: first, the introduction of new crops, particularly root crops such as turnips and swedes, and legumes such as clover, trefoil, and lucerne, which could be grown in the fields between grain crops; and second, a considerable rise in the productivity of labour. As a result of these changes less land needed to be left fallow in order to restore its fertility, additional animal feedstuffs were grown allowing farmers to keep more cattle, and greater quantities (and quality) of manure became available. Farmers acted empirically because the scientific principles behind this process of fixing the nitrogen in the soil were not understood until well into the 19th cent., but from early beginnings in Norfolk the new crops were gradually adopted across the country. At the same time, rising labour productivity ensured that the new farming was not a drain on industrial production.

During the second phase of the agricultural revolution, lasting from around 1750 to 1830, demand increased rapidly. In this period the slack in the agricultural economy which had been partly taken up by grain exports disappeared and by the early 19th cent. an import balance existed despite a considerable growth in output. Few new crops were introduced in this period, but the reorganization of the land through enclosure (first by agreement and then by parliamentary means), and the gradual growth of larger farms, with their savings on capital inputs and their supposed higher quality of husbandry, brought a slow rise in productivity, and a growing trend towards regional specialization. Norfolk farmers had pioneered the cultivation of clover in England, but it was only after 1740 that the principal benefits of the new crop were felt and yields began to rise rapidly. The pressure on agricultural resources during the French \*Revolutionary and Napoleonic wars (1793–1815) led to additional land being brought (temporarily) into cultivation but also to higher prices as farm produce occasionally failed to keep pace with demand, and higher rents.

The third phase, beginning in about 1830, and sometimes called the second agricultural revolution, saw for the first time farmers using substantial inputs purchased off their farms, in the form of new fertilizers for their land and artificial feedstuffs for their animals. Together with the introduction of improved methods of drainage, of particular importance for the heavier claylands, the results were seen in the era of high farming—a phrase used of more or less any progressive practices—between the 1840s and 1870s, which soon gave way to a severe and prolonged agricultural depression.

Perhaps the most remarkable feature of the agricultural revolution was the absence of real technological advances. Although steam-powered machines were introduced for various processes in the agricultural cycle, the availability of labour, especially in the corn-growing areas of southern

## agriculture

and eastern England, seems to have slowed down the shift from labour to machinery, and it was not until the flight from the land during the late 19th-cent. depression that farmers began actively to introduce machinery.

In Scotland the agricultural revolution took a rather different form. Although, as in England, there has been a tendency to view it as a long-term change, it is now thought that, at least in the Lowlands, this underplays the transformation which occurred in the second half of the 18th cent. A rapid move towards single tenancies and production for the market was partly stimulated by the pace of population growth, and particularly of urbanization (notably Glasgow and Edinburgh) in the second half of the 18th cent., although Scottish industrialization prior to 1815 was partly at least a rural phenomenon, often via planned new settlements.

The result, in the second half of the 18th cent., was seen in the adoption of new technologies and crops, a shift to long leases with improving clauses written in, and higher productivity. Many of the existing farmers successfully adapted to the new demands upon them, so that there was no Lowland equivalent of the Highland clearances. In the long run the new agriculture enabled more food to be produced at lower cost and labour productivity rose as a part of this process. Overall the result was a radical departure from the patterns of the past in the last quarter of the 18th cent., not simply measured in terms of physical enclosure, but also in the more effective use of land involving liming, sown grasses, and the organization of labour. It was a structural change, and not simply a perpetuation and intensification of existing trends, since it produced a dramatic increase in crop yields, allowing Scottish cultivators to catch up on English levels of output in the space of a few decades, and resulted in a visible alteration of the rural social system in an equally short time.

JVB

Beckett, J. V., *The Agricultural Revolution* (Oxford, 1990); Kerridge, E., *The Agricultural Revolution* (1967); Mingay, G. E., *The Agricultural Revolution: Changes in Agriculture 1650–1880* (1977).

**agriculture** is the process of cultivating the land to grow crops. It reflects a level of civilization beyond that of early man, who lived by hunting wild animals and by eating natural produce of the earth such as berries.

The system of agriculture which spread across much of northern Europe in the late Saxon period including much of the British Isles, was that of common field, alternatively known as open field, farming. In this system land around the village was gradually colonized from the waste (assarted), and cultivated for crops. As each parcel of land was brought under the plough, it was divided between the various serfs or villeins in such a way as to ensure a reasonable mix of soil qualities, and the result was that each farmer acquired a selection of 'strips' scattered around the village. The system was adopted across much of the country but not everywhere. In parts of northern England, and in Kent, for example, other systems prevailed.

The common field system was best suited to a small population of predominantly rural people providing for their own needs, which could be supplemented by trading weekly in the local market. It ran into trouble as population

increased through the 16th cent., and piecemeal attempts were made to enclose the land. Initially these were resisted by the government on the grounds that enclosure produced engrossing and might eventually lead to a monopoly of land-holdings, and also because it was believed to bring unemployment. By the second half of the 17th cent., and the early years of the 18th cent., however, the situation was changing. As grain prices fell, or remained static, after about 1650, farmers tried to raise their output. On the claylands this was achieved by diversifying into the more lucrative dairying and rearing business. This put pressure on the resources of grass, and considerable enclosing activity took place with the intention of shifting out of mixed farming (with its traditional balance of animals and crops) into pasture farming, with an emphasis on the rearing and fattening of animals. In addition this regional specialization pointed towards more sophisticated marketing mechanisms and lower transport costs. It also enjoyed legal protection through the courts, and probably well over 20 per cent of the land area was enclosed by private means prior to 1750.

Enclosure meant, in effect, the abandoning of the old open field system with its emphasis on communal rights and obligations. Each farmer, far from having strips in each field, now had his own holding usually with an accompanying farmstead within the fields, and the village community began to take on a new shape.

From about 1760 the most common means of enclosing land was by parliamentary legislation—a reversal of the days in the 16th cent. when government opposed enclosure—and between 1750 and 1830 about 21 per cent of the land area of Britain was enclosed by this means. As a result, large tracts of the countryside were reorganized. The great expanses of the open fields were replaced by hedges, fences, and, in upland areas, dry stone walling. Closely associated with this change was a move towards larger and more compact farms. However, the speed of change, and the impact of enclosure on the productivity of farms, has been questioned. Enclosure raised rents, often between 50 and 100 per cent, and many landowners undoubtedly promoted enclosure because they anticipated a windfall in higher rental income, but these alterations were not a necessary reflection of either greater efficiency or greater productivity. These may have come in time as farmers were left to experiment and to adopt improved rotations and methods as they saw fit once they were no longer expected to conform to the rules of the manor court. Commoners, squatters, and others who had lived on the land but without a specific landholding were expropriated at enclosure, and few seem to have been able to make a living thereafter.

By the 19th cent. the typical pattern of farming was one in which individual farmers worked a designated holding, altering the balance of animals and crops according no longer to the rules of a manorial court—most courts lapsed at enclosure, and they were abolished in 1926 except in the Nottinghamshire village of Laxton where open field farming still continues—but to the covenants in their leases. Even so, many farms remained small, family concerns, rather than the larger holdings favoured by agricultural experts.

Agriculture enjoyed a period of considerable prosperity in the middle decades of the 19th cent. From the 1830s farmers began to use increasing quantities of artificial fertilizers and animal feedstuffs, pushing up productivity to new levels. In the wake of \*Corn Law repeal in 1846, drainage loans enabled many landowners to improve the quality of their clay lands, and the 1850s and 1860s are often known as the golden age of farming.

In the course of the 1870s a series of bad harvests, coupled with a rapid increase in the flow of food imports (grain and meat) from the Americas, led to depression. From 1879 until the Second World War, with only occasional respites, the agricultural sector of the economy was under considerable strain. Landowners, faced with falling rents and falling land values, sold out, particularly after 1918. Farmers, faced with competing in a market which was loaded against them by the policy of free trade, turned to smaller holdings employing less labour. One result, the so-called 'flight from the land', saw a rapid outflow of population from the predominantly arable counties, and the first serious shift into agricultural machinery by those farmers who remained.

Agriculture benefited briefly in the 20th cent. from plough-up campaigns and intensive cropping during the two world wars. Since 1945, and particularly since Britain entered the \*European Economic Community in 1971, the position has changed again. On average, farms are now much larger than they were in the 19th cent., and much more specialized. Output has risen spectacularly, and considerable areas of land have been removed from cultivation altogether under the European Community's 'set aside' scheme, to try to prevent the recurrence of food mountains. Small farms have now very largely disappeared, and the countryside has been transformed once again into large 'open' fields with the grubbing-up of the old enclosure hedges which had surrounded much smaller fields than those of today. Beckett, J. V., *The Agricultural Revolution* (Oxford, 1990); Finberg, H. P. R., et al. (eds.), *The Agrarian History of England and Wales* (Cambridge, 1967– ).

**Aidan, St** (d. 651). First abbot of \*Lindisfarne, site of his see (634–51). Sent from \*Iona, replacing a severer colleague, to work closely with King \*Oswald in restoring Christianity in Northumbria, Aidan's legacy was profound: Lindisfarne, and his royal pupil \*Hilda were stars in the later 7th-cent. firmament. Aidan's rejection of worldly behaviour and elevated associations partly explains the eclipse of his cult by \*Cuthbert's and his relative obscurity. We depend on \*Bede, in whose portrait, combining contemplation, industry in evangelization (royal estates providing his bases for preaching tours), study, sternness, asceticism, moderation, humility, and discretion, he embodies the episcopal ideals of Pope Gregory I and is a model for Bede's slothful contemporaries. His only defect was failure to accept the Roman Easter. Here Bede may have been defending Lindisfarne against \*Wilfrid's negative assessment of its traditions as expounded, apparently, at the Synod of \*Whitby. Some of Aidan's relics were taken from Lindisfarne to Ireland by

Colman, and his cult was revived at \*Glastonbury in the 10th cent. AER

**aids, feudal.** See FEUDAL AIDS.

**Ailred of Rievaulx** (1110–67), known as the 'St Bernard of the North', was the leading figure in the \*Cistercian order in England in the mid-12th cent. The son of a priest of Hexham (Northd.), he seemed set for a secular career, entering the service of David I of Scotland, c.1130. But in 1134 he entered the abbey of \*Rievaulx (north Yorks.), where he remained for nine years as novice and monk before being chosen as first abbot of Revesby (Lincs.), daughter house of Rievaulx. Just four years later he was recalled to be abbot of Rievaulx itself. Largely because of Ailred's inspiration and guidance, his gentleness and humanism, Rievaulx emerged as the chief centre of Cistercian influence in England. The monastery itself prospered and expanded, its numbers increasing to 150 choir monks and 500 lay brothers and servants, and four more daughter houses were established in England and Scotland. Ailred himself became a figure of national importance, beyond Cistercian circles, through his many friends, contacts, and writings. These include his treatise on friendship, the *Speculum caritatis*, and his Sermons on Isaiah, probably his finest work. Of delicate health, he was constantly ill and in pain in the last ten years of his life. He died in his beloved Rievaulx on 12 January 1167, and was buried in the chapter house. SL

**air travel.** Commercial carriage of passengers by aircraft or airship began only at the end of the First World War in 1919, based on war surplus, with the direct involvement of manufacturers—Handley Page in the UK, Junkers in Germany—in airline development. For much of the next 40 years, air travel offered an outstanding parable of British international economic failure, with route development lagging behind the market leaders, the imperial preoccupation in international travel, and modest aircraft design leading to the operation of a multiplicity of uncompetitive types. Paris and near-European routes were established in the early 1920s, and supported by subsidy from 1921. The Hambling Committee's recommendations led to the amalgamation into Imperial Airways in 1924, as the UK's 'chosen instrument', embodying an explicit British aircraft and engine policy. Imperial developed the routes to Singapore and the Cape to the neglect of Europe, and even there lagged behind the Dutch KLM (running services to Singapore by 1933).

Early routes combined air, rail, and sea: in 1932, Imperial's service to the Cape involved 33 stages and six changes of vehicle. Only with the flying boat did the routes to Alexandria (1937), Singapore and Sydney (1938), and the USA (1939) become fully 'airways'. The railways helped develop domestic routes, which proved largely uneconomic even with mail subsidy (1934), and were grouped into the UK's second 'chosen instrument', British Airways (1935). Continuing poor performance led the Conservative government to nationalize and integrate both under Lord \*Reith into the new British Overseas Airways Corporation in 1940.

## Aix-la-Chapelle

The war established air travel, accelerated aircraft technology, and created rapid growth by national carriers into the early 1950s, in which BOAC was a major participant. Continuing 'buy British' policy produced the first jet in the Comet (1952) and the first non-stop transatlantic aircraft, the Britannia (1957), but only one international commercial success, the Vickers Viscount (1953) which served British European Airways. The jet age truncated the competitive life of both the latter with the introduction of the Sud Aviation Caravelle (1956) on European routes, and the Boeing 707 for the Atlantic crossing (1958), ironically after BOAC had established the first scheduled jet service with the Comet 4.

Despite control by nationalistic and arcane regulations under the International Air Traffic Association (1945), real costs fell as larger and more efficient aircraft were introduced, especially with the Boeing 747. Aircraft displaced from premium routes were applied to the package holiday trade, in which Britain led development through the 1950s and 1960s, and liberalization favoured renewed growth by independent carriers from 1965: passengers carried by UK charters increased fourteen times in the decade from 1963. The consequent introduction of reduced fares to scheduled flights with the ABC (1973) and APEX (1975) schemes further expanded the market, in which British Airways, recreated by merging BOAC and BEA in 1974, faced real competition. Rationalization and subsequent privatization (1986) made BA an international leader and aggressive competitor, notably in respect of Freddie Laker's 'Skytrain' in the late 1970s, and Richard Branson's Virgin in the later 1980s. Air travel continued to grow as real fares fell, but the impact of the terrorist attack upon the World Trade Centre in New York in 2001 plunged the industry into severe crisis. JCh

**Aix-la-Chapelle, treaty of**, 1748. Between March and November 1748 all the belligerents in the War of the \*Austrian Succession met here to negotiate a settlement. The British and French put together an agreement that they persuaded their respective (and less powerful) allies to sign. There had been no clear victor in the war and the peace merely acknowledged the status quo. Prussia had made a separate peace with Austria in 1745, but her conquest of Austrian Silesia was recognized at Aix-la-Chapelle. Don Philip of Spain was granted the dukedom of Parma, and Anglo-Spanish trade disputes were adjudicated. The British handed back Louisbourg in America to France and the French withdrew from the Austrian Netherlands. The outbreak of the \*Seven Years War, after less than a decade, illustrates the fragility of the peace settlement. AIL

**Akeman Street**. This Roman road linked \*Cirencester and \*Verulamium, running across the south midlands via Alchester (Oxon.). It was probably laid out in the 50s AD. The modern name derives from the Anglo-Saxon words meaning 'oak-man'. No Roman name is known. ASEC

**Alabama case**. The *Alabama* was the largest (990 tons) of several potential commerce raiders built in Britain for the Confederate South in the American Civil War. They all broke early steam power records for Atlantic crossings.

Like them, the *Alabama* collected her armament outside Britain, and in two years of high seas raiding made 62 seizures of merchantmen. She was finally sunk in international waters off Cherbourg in June 1864 by the Union warship *Kearsage*. Arbitration in Switzerland in 1871 awarded higher damages against Britain, whose moral case was weak, than the sums claimed by the US government. Convention XIII of the 1909 London naval conference accepted that neutral powers were physically restricted in their dealings with belligerent warships; rights of passage for such ships were conceded. DDA

**Alanbrooke, Alan Brooke, 1st Viscount** (1883–1963). Soldier. Chief of the imperial general staff for much of the Second World War, Brooke was the son of an Irish baronet from Fermanagh and a member of the protestant ascendancy. After the Royal Military Academy at Woolwich from 1902 he spent the Great War on the western front as an artillery officer. During the inter-war period he had spells at staff college and at Imperial Defence College and at the outbreak of the Second World War was a lieutenant-general in charge of anti-aircraft defence. After commanding in France, he was appointed commander-in-chief home forces in 1940 after Dunkirk and the following year took over as chief of the imperial general staff. He was capable of standing up to and working with \*Churchill, whose boldness and imagination he complemented with sober planning, worked well with \*Cunningham (navy) and \*Portal (RAF), and appointed winning generals in \*Alexander, \*Montgomery, and \*Slim. Brooke was given a barony in 1945 and a viscountcy in 1946. JAC

**Alba, kingdom of**. The name 'Alba' was Irish and originally applied to Britain ('Albion'). It was then adopted by the kingdom created by \*Kenneth MacAlpin of \*Dalriada when he took over the kingdom of the Picts in the 840s. This was far from being the whole of Scotland, since Lothian south of the Forth was still held by the Northumbrians and much of the north, west, and the islands were under Norse influence. By the 11th cent. it was more commonly known as Scotia or Scotland. The dukedom of Albany, which merged with the Scottish crown, took its title from Alba, and it remains the Gaelic name for Scotland today. See also FORTRIU; SCOTS, KINGDOM OF. JAC

**Alban, St**. Protomartyr of Britain, known from early medieval hagiographies. These portray him as a Roman officer who sheltered a priest during one of the persecutions and was martyred at \*Verulamium. No date is given but dates in the early and the late 3rd cent. have been put forward. The description of the trial and passion of Alban reflects the actual topography of Verulamium and the medieval St Albans abbey may perpetuate the site of his death or burial; the shrine was in existence to be visited by Bishop \*Germanus of Auxerre in 429. ASEC

**Albany, Alexander Stewart, 1st duke of** [S] (c.1454–85). Second son of James II of Scotland, created earl of March [S] (1455), lord of Annandale, and duke of Albany (1458). As admiral of Scotland and march warden in the 1470s, Albany was an obvious focus for Scottish opposition to his brother

James III's English alliance (October 1474). Indicted for treason in October 1479, Albany fled to France, where he married and fathered the son who, as John, duke of \*Albany, would act as governor (1515–24) for James V.

The remainder of his life consisted of a series of spectacular but unsuccessful come-backs—with English aid as 'Alexander IV' (July 1482), as lieutenant-general for James III (October 1482), with Douglas support in Annandale (battle of Lochmaben, 1484), and a remarkable gaolbreak from Edinburgh castle in the spring of 1485. Later the same year Albany was killed by a lance splinter at a tournament in Paris. NATM

**Albany, John Stewart, 2nd duke of** [S] (1484–1536). When James IV of Scotland was killed at \*Flodden in 1513, his son was 17 months old. Albany, a grandson of James II, was heir presumptive. His father had laid claim to the Scottish throne but was defeated and fled to France. Albany was summoned to become regent to his young cousin and held office from 1515 until 1524. Bred in France, Albany strove to restore the \*Franco-Scottish alliance and by the treaty of \*Rouen (1517) negotiated marriage for James V to a French princess. From 1517 to 1521 Albany was in France, weakening his Scottish position. In 1521 he effected a reconciliation with \*Margaret, the king's mother and sister to Henry VIII, and there were rumours of a possible marriage. In 1522 Henry VIII went to war, protesting that the king's life was in jeopardy, but Albany's grand preparations came to nothing. He resumed the contest in 1523 but again the campaign against northern England misfired, and he returned to France for good in 1524. The enduring legacy of his regency was a French marriage for James, though it did not take place until 1537. JAC

**Albany, Murdac Stewart, 2nd duke of** [S] (c.1362–1425). Son and heir of Robert, 1st duke of Albany (d. 1420), Murdac served as royal justiciar north of Forth. Captured by the English at \*Homildon Hill (1402), he spent more than thirteen years in captivity. Between 1413 and 1415 Murdac and his cousin James I were fellow-captives in the Tower of London and at Windsor.

Murdac returned to Scotland in 1416 and succeeded his father as governor in 1420. Less effective than Duke Robert, possibly because of his inability to control his surviving sons, yet a major political figure as heir presumptive to the throne, Murdac neither initiated nor firmly opposed James I's release in 1424. He officiated at James's coronation at Scone (21 May 1424), but was arrested in Parliament the following March, and beheaded with other members of his family at Stirling on 25 May 1425, victim of the political ambitions of James I. NATM

**Albany, Robert Stewart, 1st duke of** [S] (1339–1420). Third son of Robert II by his first wife Elizabeth Mure, and uncrowned ruler of Scotland for 32 years (1388–1420). While still a young man, Robert acquired the earldoms of Menteith [S] (1361) and Fife [S] (1371); he became royal chamberlain in 1382; and in December 1388 was made guardian for his infirm elder brother John, earl of Carrick [S] (later Robert III, 1390–1406). In 1398 Robert was created duke of Albany, a

title which reflected his ambitions for his family in the north, especially in Buchan and Ross. Three years later his nephew and rival David, duke of \*Rothesay died while under arrest, and though Albany was exonerated, circumstances were suspicious.

Albany's guardianship—and from 1406 governorship for the captive, uncrowned James I—was characterized by intermittent hostility towards England, consistent support (until 1418) of the antipope Benedict XIII, a growing commitment to the French alliance, and a ruthless elimination of political opponents, probably in pursuit of his family's claim to the throne. This final ambition remained unfulfilled. NATM

**Albert, prince consort** (1819–61). Albert was the second son of Ernest, duke of Saxe-Coburg, and Louise, daughter of Duke Augustus of Saxe-Coburg-Altenburg. His parents were divorced in 1826. He was a shy and delicate child and always lacked stamina but was exceptionally diligent and serious-minded. His tutor, Christoph Florschütz, was the dominant influence on his early years and gave him a love of learning, particularly in languages, history, the natural sciences, and music, which lasted throughout his life. He became a gifted composer and organist and made the Victorian court something of a centre of musical life.

The possibility of a match with his cousin Queen Victoria, who was the same age, was fostered by their uncle Leopold, king of the Belgians, and by Baron Stockmar, one of her advisers, but they did not meet until 1836 when they were both 17 years old. Victoria then found him 'extremely handsome', but at that stage neither thought of a lifetime's companionship. Albert enrolled at Bonn University and eagerly applied himself to study in natural science, political economy, and philosophy as well as developing his musical talent. When they met again at Windsor three years later Victoria fell instantly in love and Albert, unsure of himself at first, soon responded. Five days after their meeting she proposed to him and they were married on 10 February 1840.

If Albert was unexpectedly swept off his feet by Victoria's ardour, he was less enthusiastic about her country, nor did her subjects take to him. He was not thought important enough to marry the queen of England, and the facts that he was German, Victoria's first cousin, lacked wealth and position, and was hardly known in England all counted against him. He was variously (and wrongly) supposed to be a 'Coburg adventurer on the make', a political radical, a papist by inclination, and (even worse because accurately) an intellectual. Parliament reduced the allowance that was proposed for him from £50,000 to £30,000 p.a., and refused to grant him precedence next to the queen. Precedence was nevertheless conferred on him by letters patent, but he received no title and was not officially designated prince consort until 1857.

Victoria adored her husband and insisted that he should be by her side on state and ceremonial occasions which often made her nervous, but she was reluctant to admit him to a share in her political duties, so that in spite of their private happiness he was frustrated by his lack of influence and of opportunity to practise his slowly acquired theoretical knowledge of his new country's constitution and

## Albert Memorial

its social problems. He did however guide his wife towards political neutrality, weaning her from her previous Whig partisanship and reconciling her after 1841 to \*Peel, for whom he felt a strong affinity and intellectual sympathy. After 1842 he acted as Victoria's informal counsellor, private secretary, and sole confidant. He also strongly influenced her taste in music and art, with a strong bias towards early Renaissance style, as evidenced in his reconstruction of \*Osborne as their private family home. He took an interest in the workings of the royal household and set about modernizing and pruning household offices. In many ways he was a natural bureaucrat—he was efficient, painstaking, and absorbed by detail. He was happy to become, on Peel's suggestion, chairman of the Fine Arts Royal Commission and he threw himself energetically into his favourite project to make South Kensington a centre for the arts and for education. In 1847 he was elected chancellor of Cambridge University and he devoted a substantial share of his time thereafter to the reform and modernization of the university, with a particular concern for the development of scientific education and the raising of intellectual and pedagogic standards. His attempt to promote the causes of social improvement, science and technology, and the public patronage of the arts and sciences was summed up in the organization of the \*Great Exhibition of 1851, which he did a great deal to bring about. Nor was he inactive in other public fields. He attempted to guide British foreign policy in peaceful directions and tried to insist that \*Palmerston should submit his policies and dispatches to the queen. Palmerston's refusal led to his dismissal from the Foreign Office in 1851. Nevertheless, Albert was unable to avert the outbreak of the \*Crimean War in 1854 and Palmerston's return as prime minister in 1855. Almost his last act on his death-bed in 1861 was to tone down an aggressive dispatch to Washington on the \*Trent affair which probably averted war with the USA.

Perhaps Albert's most lasting contribution to his adopted country was the example he set, with Victoria, of a respectable and devout private life. They produced nine children, to whom Albert was a loving and devoted though heavy-handed father. His relations with his eldest son, the future King Edward VII, suffered from 'Bertie's' resistance to the ambitious and sometimes oppressive system of education which his father devised and supervised, aided by Victoria, who wished her son to become a second Albert, despite their temperamental difference. The relentless pressure placed on the prince of Wales resulted in his alienation from his parents and increased the anxieties from which Albert increasingly suffered. His habits of overwork and his consequently weakened physical constitution resulted in an inability, and perhaps a lack of will, to resist the attacks of ill-health which set in during the last year of his life and he died of typhoid fever on 14 December 1861 at the age of 42.

Albert has been described as 'perhaps the most astute and ambitious politician of his age', but his political successes were few. It was his fate to be a highly sensitive and intelligent man who failed to understand the mentality of his adopted countrymen or to realize how alien to them were his passions for intellect, hard work, and the patronage of

the arts and sciences. His marriage was not always easy, for Victoria was a strong and determined personality, but it was founded upon a genuine and profound love which by its example exerted a deep influence on the character of Victorian England.

EAS

Weintraub, S., *Albert: Uncrowned King* (1997).

**Albert Memorial.** When Prince \*Albert died in 1861 a competition was held for a national monument to him, which Sir G. G. \*Scott, inevitably, won. It took ten years to build, from 1863 to 1872. It stands in Hyde Park, just across Kensington Gore from the Albert Hall. The latter is cheap and rather boring, designed by an army engineer. The memorial makes up for that—tall, Gothic, spiky, colourful, and crammed with decorations and sculptures meant to celebrate the glorious achievements of the high Victorian age. It was handsomely restored at the beginning of the 21st cent.

BJP

**Albion** is a poetical personification for Britain. It was first used in classical literature in the 6th cent. BC and referred either to the Celtic name or to the white cliffs of Dover. \*Camden mentions that it had been related to Albion, son of Neptune. The phrase 'perfidious Albion' has been attributed to the marquis de Ximenes (1726–1817), though Bossuet in the 17th cent. had mentioned 'L'Angleterre perfide'. It was soon superseded by \*Britannia.

JAC

**Albuera, battle of, 1811.** On 16 May 1811 an Anglo-Spanish-Portuguese force of 35,000 men under Marshal Beresford blocked Marshal Soult's French army of 24,000 moving to lift the siege of Badajoz in Spain. Both sides lost heavily—two British brigades took 60 and 80 per cent casualties respectively. However the allied army succeeded in repulsing the French in a confused battle which featured the epic action of the 'astonishing infantry' of the Fusilier Brigade. Albuera, along with \*Fuentes de Onoro fought two weeks earlier, stabilized the situation along the Spanish-Portuguese frontier, but as Wellington said, 'another such battle would ruin us'.

GDS

**alchemy**, an art of ancient but uncertain origins, can be interpreted as an enquiry into man's relationship with the cosmos and the will of the Creator, manifested as either a devotional philosophy transforming sinful man into perfect being ('esoteric'), or attempted transmutation of base metals into gold or silver ('exoteric'), or an inextricable mixture of both. The catalyst required was the elixir of life, tincture, or philosophers' stone, the preparation of which long obsessed men of all ranks, despite its futility.

Probably arising in Hellenistic Alexandria, alchemy (*al-kimia*) was transmitted to Europe through Islamic culture, via 12th-cent. translations into Latin by men like Robert of Chester, Adelard of Bath, and the encyclopedist Bartholomaeus Anglicus. Whilst earlier Taoist alchemists had aimed principally for longevity, if not immortality, medieval western alchemists' objectives were gold-making or creating superior medicines, drawing on Aristotelian theory of the four 'elements' (air, fire, earth, water), old ideas that the planets were connected to certain metals, animistic beliefs, and current technical knowledge. The medieval idea

of unity of matter justified the approach that if lead and gold were both dense and soft, then merely changing greyness to yellowness should convert the common metal into the precious one. Obsession with chemical colour changes (series of black, white, iridescent, yellow, purple, red) was matched by symbolic and enigmatic language, as the basic procedures of calcination, sublimation, fusion, crystallization, and distillation absorbed much time and expense.

Since the gold-makers' skills rendered them vulnerable to avaricious magnates, caution and circumspection were advisable, but public credulity encouraged conjuring and dishonesty; \*Chaucer's bitterness in 'The Canon's Yeoman's Tale' suggests that he himself had been taken in. Practical alchemy, nevertheless, had much to offer medicine, giving rise to metallic rather than herbal remedies, much favoured by Paracelsus, and eventually to iatrochemistry.

Despite interest from John \*Dee, Kenelm Digby, the 'Wizard' 9th earl of \*Northumberland, Walter \*Raleigh, and even Charles II, alchemy received its death-warrant in the mid-17th cent. when Robert \*Boyle demolished the theory of the four 'elements'. Although it had led to the discovery of alcohol and the mineral acids, historians of chemistry view alchemy in general as fraudulent. Yet growing dissatisfaction with the mechanistic objectives of modern science has renewed interest in the alchemists' wider goals and debate about man and Creator. ASH

**Alcock, John** (1430–1500). Ecclesiastical statesman. Born in Beverley, Alcock attended the University of Cambridge and rose rapidly in the church. From 1472 to 1476 he was bishop of Rochester, transferring to Worcester in 1476, and to Ely in 1486. He was in high favour with Edward IV, holding office as master of the rolls, lord chancellor (joint), president of the Council of Wales, and as tutor to Edward, prince of Wales. Henry VII brought him back into service, employing him to baptize Prince \*Arthur, and appointing him again as lord chancellor and as comptroller of the royal works. Alcock was a benefactor of Peterhouse, Cambridge, and the founder of Jesus College. He is buried in the Alcock chapel in Ely cathedral. JAC

**Alcuin** (c.735–804) was a Northumbrian, probably noble, deacon, adviser to Charlemagne, and architect of the Carolingian Renaissance. He was born between 735 and 745, and succeeded his teacher Ælbert as master of the school at York in 767. He travelled on the continent, with Ælbert, and for Archbishop Eanbald, and after meeting Charlemagne at Parma in 781 was invited to his court. Traditionally described as head of the palace school, he was more a personal tutor to Charlemagne, who gave him several monasteries, including that of St Martin's at Tours, where he died.

Alcuin became involved in political life and influenced Charlemagne's thinking. Authorship of some of Charlemagne's texts is still credited to Alcuin, though not as many as was once the case. He wrote against the heresy of adoptionism (a political as well as a religious concern), he probably composed the letter to Pope Leo III wherein pope's and king's functions are defined, and he may have been partly responsible for Charlemagne's taking the Roman imperial title in the west (in 800). His writings include one of

the earliest, medieval, political essays. An ideal of warrior kingship is presented in Alcuin's poem on *The Bishops, Kings and Saints of York*, the first major extant Latin verse history in the medieval West, finished possibly as late as 792/3. This is a work of patriotism, centred on a unified Northumbria and the church at York; pro-Roman in outlook (omitting the controversies in the career of \*Wilfrid), it offers \*Edwin as supreme kingly example and Ælbert as ideal prelate, and advocates concord between political and spiritual rulers. It complements the exhortatory letters Alcuin sent to kings and his view of bishops.

Alcuin's correspondence also reveals that both he and Charlemagne were involved in English, particularly Mercian and Northumbrian, politics. Alcuin returned twice to England, once with papal legates (786) and in 790, for three years when he hoped to guide the conduct of King \*Æthelred of Northumbria.

Alcuin's writings include textbooks, saints' lives (including his kinsman \*Willibrord's in prose and verse), compilations of commentaries, missals, and other texts requested by correspondents, and Charlemagne's epitaph for Pope Hadrian I. His epitaph for himself became a literary model. His revisions of the lectionary (lessons to be read at mass) and of the (Latin) Vulgate text of the Bible became standard. He helped to introduce singing the Creed at mass and to disseminate the performance of penance on the continent. He encouraged the cults of the archangel Michael and the Virgin and of St Martin. His reception of visitors at Tours, and his acquisition of books from England, spread English influence. His pupils were many, often distinguished and influential.

Alcuin's thinking was influenced by Pope Gregory I and by \*Bede. His originality is to be found in his York poem, his intense interest in number symbolism, and his application of logic to theology.

He offers historians evidence (in his letters, more than 300 of which survive, mostly written between 794 and 804) for low standards in the late 8th-cent. English church and amongst the Northumbrian élite, and (in his York poem) for 8th-cent. Northumbrian history, the development of the York school, and York's wealth and commercial activity.

Alcuin's driving forces were friendship and teaching. Though devoted to Charlemagne, he protested against the treatment of the Saxons in conversion, and disagreed with him about the law of \*sanctuary. He believed it better to write books to serve the soul, than to dig vines for the body. AER

**Aldhelm** (c.639–709) was one of the most learned men of his time. Thought to be related to West Saxon kings and educated at Malmesbury under the Irish scholar Maildubh, he also studied briefly at the Canterbury school flourishing under Archbishop \*Theodore and Abbot Hadrian after 669. A distinguished scholar, teacher, ecclesiastically energetic, appointed abbot of Malmesbury c.675, and first bishop of \*Sherborne c.705, Aldhelm founded monasteries, built churches, and a surviving letter shows him writing to Geraint, king of \*Dumnonia, urging conformity with the Roman observance of Easter. He comments on being

## Alexander I

weighed down 'with the burdens of pastoral care' and 'great tumultuous uproars in secular affairs'. Yet it is said he would sing, minstrel-like, to attract passers-by in order to preach to them.

His sophisticated style of writing and use of obscure vocabulary and difficult Latin was greatly admired and imitated. Widely studied in England, his works were transmitted by missionaries to continental centres of learning, then reimported for the late 9th- and 10th-cent. revival of English learning. Extant works include ecclesiastical poems, rhythmical verse, and a number of letters. His *Letter to Acircius*, a metrical treatise incorporating a hundred 'riddles' or 'mysteries', was addressed to the Northumbrian king Aldfrith, probably his godson. His largest work, *De virginitate*, dedicated to the nuns at Barking (Essex), is a twofold treatise in prose and verse, which became a stylistic model for subsequent Anglo-Latin works. None of the vernacular poems he is said to have written has survived. AM

**Alexander I** (c.1077–1124), king of Scots (1107–24). The second of the three sons of \*Malcolm Canmore and Queen (later St) \*Margaret to become king, he succeeded his elder brother Edgar. He ruled north of the Forth–Clyde line while his younger brother David (later David I) governed Strathclyde and much of Lothian in his name, a power-sharing arrangement which indicates that these southern territories were still not fully incorporated into 'Scotland'. He maintained friendly relations with England by marrying Sybil, one of Henry I's illegitimate daughters, and by campaigning with Henry in Wales in 1114. Committed to reforming religious practices in accordance with European norms, he invited Augustinian canons to Scone, a key royal centre, and some Englishmen were appointed to bishoprics—though great care was taken to preserve the independence of the Scottish church from Canterbury and York. But his achievements as a modernizer were limited and much overshadowed by those of David I. KJS

**Alexander II** (1198–1249), king of Scots (1214–49). Son and successor of William the Lion, his ability as a ruler was 'above average'. He swiftly asserted himself against King John by allying with the barons of \*Magna Carta, who formally recognized Scottish claims to Northumberland, Cumberland, and Westmorland. In 1216 the Yorkshire rebels paid homage to him, and he marched as far south as Dover to meet Prince Louis of France who, as claimant to the English throne, acknowledged his right to the border counties (but not to Yorkshire). Following John's death and the royalist victory at \*Lincoln, the ground was cut from beneath the Scots, and in December 1217 Alexander made peace with Henry III and relinquished his war gains. These events introduced a new realism into Anglo-Scottish relations, and both kingdoms adopted more conciliatory policies. Unlike John, Henry III accepted Scotland's right to exist as a separate sovereign state, and Alexander recognized the futility of continuing to pursue the traditional Scottish goal of southern expansion. His marriage to Henry III's sister \*Joan reinforced the new understanding between the crowns, and by

the treaty of \*York (1237) he renounced all claims to the border shires. Scottish resources were now concentrated on the vigorous assertion of authority in the north and west of Scotland, which were thereby brought more firmly under royal oversight and control. Alexander campaigned in Argyll in the early 1220s; Ross and Caithness had finally been pacified by the early 1230s; and Galloway was at last brought to heel in 1234–5. He died of a fever on the island of Kerrera in Oban Bay while leading a major expedition against the Western Isles. KJS

**Alexander III** (1241–86), king of Scots (1249–86). Only son of Alexander II and his second wife, Marie de Coucy. The view that his reign from 1249 was a 'golden age' for Scotland was first fully articulated by 14th- and 15th-cent. Scottish chroniclers, who boosted his reputation in order to stress Scottish national identity and the political independence of the kingdom. Nevertheless, there is much to be said for their retrospective assessments. The reign began badly with the factional squabbles of Alexander's minority (1249–60), notably between the Comyns and the Durwards. Thereafter, however, Alexander dealt with the great lords firmly but sensitively, and crown–magnate relations were stable. Continuing earlier processes of consolidation and expansion, he and his war captains campaigned extensively in the west, and brought matters to a successful conclusion in 1266, when sovereignty over Man and the Western Isles was relinquished by Norway. Their annexation to Scotland, one of the greatest triumphs of Scottish state-building, was facilitated by amicable relations with England. Alexander had married Henry III's daughter \*Margaret in 1251, and although Henry intervened in the minority power struggles, he repeatedly reassured the Scots of his respect for their liberties, thus implicitly recognizing Scotland's status as an independent realm. It was a cruel set of circumstances which jeopardized this 'golden age'—the deaths of Alexander's three children between 1281 and 1284, and his own untimely death at the age of 44, when he was thrown from his horse while travelling during a storm to visit his second wife, Yolande de Dreux. Even so, by 1286 Scotland had emerged as a unified and sturdily autonomous state, able to meet and ultimately to overcome the challenges posed by both dynastic misfortune and the Anglo-Scottish warfare ignited by Edward I's imperialist ambitions in 1296. KJS

**Alexander, Harold Rupert Leofric George, 1st Earl Alexander** (1891–1969). From an Anglo-Irish aristocratic family, Alexander fought throughout the First World War, imperturbably and courageously, commanding a brigade at the age of 27. In 1919 he led a Baltic-German unit against the Red Army. In 1939–40 he served in France, and, until 1942, in Britain. Then he took charge of the British retreat from Burma. In August 1942, he became commander-in-chief, Middle East, but left \*Montgomery a free hand with the 8th Army.

Polite, elegant, and tactful, Alexander's 'easy smiling grace won all hearts' (\*Churchill). In ground command of Anglo-American forces in Tunisia he 'won the adulation of his American subordinates' (Bradley) while successfully directing the capture of Tunis and 250,000 enemy troops.

Soon, however, the Anglo-American campaign in Sicily exposed Alexander's inability to impose his orders on self-willed subordinates when Montgomery seized priority for his army over Patton's. In May 1944, when the break-out from the Anzio beachhead followed the allied breakthrough further south, the American general Mark Clark, out of vanity, went north to seize Rome rather than carrying out his orders to block the retreat of part of the German 10th Army. Perhaps Alexander's diffidence in enforcing his thoughts was because they came from his staff; 'Alex' himself had only 'the average brain of an average English gentleman' (\*Mountbatten). His style and amenability entranced civilian politicians, notably Churchill and \*Macmillan. On 12 December 1944 he became allied C.-in-C., Mediterranean, and field marshal, backdated to 4 June to restore his seniority over Montgomery. In 1946–52 he was the last non-Canadian governor-general of Canada, was given an earldom as Alexander of Tunis, and became minister of defence in Churchill's government until 1954. RACP

**Alexander, Sir William, 1st earl of Stirling** [S] (c.1576–1640). Alexander was born at Menstrie in Clackmannanshire. He established an early reputation as poet and dramatist, served at the court of Prince \*Henry, and was knighted. In 1614 James VI and I made him master of requests [S], a post he held until his death. He was given \*Nova Scotia to colonize in 1621, with baronetcies to provide support, but made little progress, and was eventually reduced to poverty. From 1626 until his death he served as secretary of state [S], was granted a viscountcy in 1630, and raised to the earldom of Stirling [S] in 1633. But his record was not distinguished. 'Unactable plays and unreadable poems' is a verdict on his literary output. His sojourn at Charles I's court at Westminster left him out of touch with Scottish opinion and he did little to arrest the drift towards collision in Scotland, which ultimately brought his master, Charles I, to trial and execution. JAC

**Alexandra** (1844–1925), queen of Edward VII. Born in Copenhagen, eldest daughter of the future Christian IX of Denmark, Alexandra retained warm Danish sympathies all her life. Her marriage to Edward, then prince of Wales, took place in 1863; she was hailed by \*Tennyson, poet laureate, as 'sea-king's daughter from over the sea'. The couple, popular with the public, took much of the attention shunned by the widowed Victoria, and became society figures. Alexandra, with her stately beauty, fitted the part admirably, acting as a foil for Edward's ebullience. The marriage was affectionate, though Edward was far from faithful. Alexandra's tolerance is revealed by her insistence, when the king was dying, that Mrs Keppel, his mistress, be sent for. Family life was the focus of her existence, partly because of her initial difficulty with English, and then her growing deafness. She did not engage in politics but devoted much of her time to nursing and hospitals: Alexandra Day was instituted in 1913 to sell paper roses for hospital funds. Privately she was a keen photographer and collected Fabergé eggs, adding to the great royal collection. Following Edward's death in 1910 she led a quiet, private life, mainly at Sandringham,

surrounding herself with her family. She is buried at Windsor. SMC

**Alexandria, battle of**, 1801. Napoleon's expedition to Egypt was cut off in August 1798 by \*Nelson's victory of the \*Nile, and a year later Napoleon abandoned his men and returned to France. In March 1801 a British force of 14,000 men was landed under Sir Ralph Abercromby and fought its way towards Alexandria. On the 21st, after heavy fighting in which Abercromby was killed, the French capitulated. Egypt was restored to Turkish rule. Abercromby's widow was given a barony in his honour. JAC

**Alford, battle of**, 1645. Alford was one of \*Montrose's brilliant victories. Pursued by William Baillie's troops, Montrose took his men up the glens and over the hills until Baillie retired on Inverness. On 2 July he found Montrose at Alford, 20 miles to the west of Aberdeen. Each side had between 2,000 and 3,000 men. Baillie's forces could not withstand the ferocity of Montrose's charge and were badly beaten. JAC

**Alfred** (849–99), king of Wessex (871–99). A popular image of Alfred is of national superman; destined by his father's (\*Æthelwulf) will to be king, despite having three surviving older brothers (Æthelbald, Æthelbert, and \*Æthelred I); saviour of the English from the Vikings; architect of a united England; founder of the navy, reformer of the army, town-planner, exponent of time and resource management; patron of the church; promoter of universal education and father of English prose; saintly, and easy to know, since we have more evidence for him than for any earlier king. Extreme revisionists emphasize his skill as propagandist, downgrading his achievements.

Perception of Alfred's personality, policies, and methods depends largely upon his seemingly intimate hagiographical biography by \*Asser. But there was probably a different side to Alfred's character. And if the denial of the text's authenticity, powerfully reasserted in 1995, should carry the day, then significant elements of the traditional reconstruction of Alfred's career will disappear.

Asser says Alfred was born in 849 in Wantage and married a Mercian lady in 868. The quality of his own writings suggests that he had a sound education in Latin. He assisted Æthelred against the 'great army' which invaded in 865, and his accession in 871 was most likely not a certainty. The 870s saw continuing war against the Danes, who were numerous, skilled, treacherous, well led, wanting conquest and settlement, not unattractive as allies or lords to rivals. They also damaged Christian faith and institutions. In 878, surprised by \*Guthrum at \*Chippenham, Alfred fled to Athelney (Somerset), but defeated the Danes in a desperate last-stand battle at \*Edington. The results were the treaty of \*Wedmore, Guthrum's baptism and retirement to be king of East Anglia. The army of Hæsten invaded in 892, and proved more difficult, but left in 896.

The West Saxon dynasty was the only one to survive the Viking threat and to this achievement Alfred added authority over all the English outside Danish control. Mercia (under Burgred) had been an ally, and was handled tactfully.

Alfred married his daughter \*Æthelfleda to Ealdorman \*Æthelred, probably of Mercian royal stock, allowed him to operate as subking, and the Mercian \*witan to survive, and ceded London after its recapture from the Danes (886). After this, all the English not subject to the Danes submitted to Alfred, and he represented them all in a treaty with Guthrum. Asser asserts that the Welsh too submitted.

Alfred's success depended on his own abilities and on his administration. Earlier dynastic stability will have contributed to royal control over local government, though Alfred's rota system for \*thegns' attendance at court and the system of division of his revenues are recorded by Asser alone. His new 60-oared design for 'long ships' was not immediately successful, his division of the \*fyrd into two (home and away) was perhaps to safeguard agriculture, or to allow military expense to be shared. His most ambitious and effective reform was the development of *burhs* (33 of them recorded in the slightly later Burghal Hidage). Various sites—old Roman towns, new towns, old or new forts—chosen so that nowhere in Wessex was further than 20 miles from one, were fortified and their defence and maintenance imposed on the people. Some 27,000 men were required in all. The *burhs* caused the 890s wars to be fought largely outside Wessex.

Some *burhs*, including \*Winchester, were given a common town-plan, suggesting that they were intended to be permanently inhabited commercial centres. Alfred's government was expensive. It is probable that he bought peace with heavy \*Danegelds, for example in 896. Wealth was necessary to ensure aristocratic support, for building, against Vikings, and also against dynastic rivals. Alfred's nephews Æthelhelm and Æthelwold challenged his disposition of Æthelred's property and could be expected to challenge his son \*Edward for the kingship. Asser asserts that Alfred spent lavishly on art, architecture, alms, and gifts to the church. His coinage shows he was not short of silver, and his will that he was hugely wealthy in 899.

Alfred's relationship with the church seems superficially harmonious. Ninth-cent. West Saxon kings seem not to have pressured the church economically: the \**Anglo-Saxon Chronicle* records Alfred sending alms to Rome, and receiving gifts from Pope Marinus, and Asser recounts his foundation of monasteries at Athelney and Shaftesbury (for women). Churchmen took part in war, and the archbishop of Canterbury was influential and probably predisposed towards the creation of one, unified kingdom. Ecclesiastical support may have facilitated Alfred's success. Yet evidence from Abingdon suggests Alfred was resented there as a despoiler, other evidence that he appropriated monastic properties, and it is as a threat to the church that he appears in a papal letter in 878.

The support Alfred needed was not automatic, so he attempted to teach his subjects about their duties, his authority, and their collective destiny. The authorship and dates of texts produced in his reign have been much discussed, and depend in part on the degree of credence given to Asser's account of Alfred's intellectual development. Alfred's law code referred to the laws of \*Æthelbert of Kent and of \*Offa of Mercia, and included \*Ine's, perhaps to appeal

to Kentish and Mercian sentiment and to indicate historical continuity. A law on treason and an oath of allegiance to the king (more fully documented in later codes) were introduced. The code's purpose was to promote the king as law-giver on Roman and biblical models, and Alfred's preface offers a history of law beginning with the Ten Commandments, suggesting that his people were a new people of God. The *Chronicle* was perhaps composed in 896–7 under Alfred's direction, its content and structure suggesting that it was commissioned to tie Alfred into West Saxon history and Wessex into world history, to emphasize Alfred's fitness to rule, to represent the West Saxon kings as struggling for Christianity against paganism, to set Alfred's cause and people in a context of contemporary world powers and events, and to celebrate his achievement (strong, peaceful rule in Wessex, destined to rule all England) as an inevitable result of history. The translations of Orosius' *History against the Pagans* and Bede's *Ecclesiastical History*, both likewise offering 9th-cent. Wessex a historical context, were also, probably, composed at Alfred's request.

Alfred proposed, in his prose preface to his translation of Pope Gregory I's *Pastoral Rule* (a treatise about the role of bishops but also applied to the kingly office), a programme of translation of books 'most necessary for all men to know'. He complained that clerical knowledge of Latin and educational standards generally had greatly declined. But his own and his team's activities betray this to be an exaggeration. Alfred himself refers to Asser, Plegmund, Wærferth, Grimbold, and John. For their attendance on and education of Alfred, some of their work, the plans for mass education, and for reading tests for ealdormen and reeves (administrators and judges), we depend on Asser. Alfred's *Pastoral Rule* was sent to his bishops, to educate them and to urge them to teach. He wanted all free men to be literate in English, and Latin teaching to be available to those intended for holy orders. Alfred also translated, more freely, two contemplative works, Boethius' *Consolation of Philosophy* and Augustine's *Soliloquies*, and a number of psalms.

Alfred's guiding principle in selecting texts is subject to debate. One factor was belief that to defeat their enemies the people needed God's help, and to deserve it they needed help in understanding his message. Contemplation was recommended by Gregory to prevent pride, the greatest danger of office. The translations emphasized what the authors thought, or implied, about power, authority, and social cohesion: the power of the king is awesome, the subject's duty to be his tool; wisdom, acquired through reading and study, will lead to office, power, success, and riches as well as happiness in the next world. These messages are deeply political.

The West Saxon take-over of England, 10th-cent. economic development, the *burhs* as sites of mints and centres of administration, can all be traced back to Alfred. Though vernacular literature failed to take off, the education of bishops may have contributed to the 10th-cent. reform movement. Alfred's legal innovations may have laid a foundation for the English common law of Henry II's time.

That Alfred was open to Carolingian influence is detectable in the oath of allegiance, his bridge-building, his educational programme, and his concept of kingship. Asser exaggerated his contemplative quality into something approaching neurosis. The reality was a ruthless, shrewd ruler with a keen historical sense, a sensitivity to public opinion, and a genuine sense of duty. He had learned his lesson from Pope Gregory, with whose character and situation he had much in common, and whom he may have made in part his model. The only early medieval monarch to combine significant personal activity in both rule and scholarship, he was doing what he wanted of his underlings and what Gregory enjoined.

AER

Frantzen, A. J., *King Alfred* (Boston, 1986); Keynes, S., and Lapidge, M. (trans.), *Alfred the Great: Asser's Life of King Alfred and Other Contemporary Sources* (Harmondsworth, 1983); Smyth, A. P., *King Alfred the Great* (Oxford, 1995).

**Alfred the Atheling** (c.1008–c.1037) was a younger son of \*Æthelred by \*Emma, daughter of the count of Normandy. Her second marriage, to \*Cnut, dispossessed the sons by her first marriage and they were brought up in Normandy. In 1035, on the death of Cnut, Alfred made an ill-judged visit to England. He was captured by Earl \*Godwine, blinded, and died in Ely. His elder brother \*Edward succeeded to the throne in 1042. Alfred's murder was quoted by Norman supporters in 1066 in justification for the deposition of \*Harold, son of Godwine.

JAC

**Algeciras.** A great-power conference (January–April 1906), which resolved the first Moroccan crisis of 1905–6, during which Germany had vainly tried to weaken or destroy the Anglo-French \*Entente. The British gave solid backing to France. The crisis is often seen as the first direct step to August 1914.

CJB

**Algiers, bombardment of**, 1816. On 27 August 1816, Lord Exmouth, in command of nineteen British warships and assisted by a Dutch squadron under Admiral van Capellan, bombarded Algiers for eight hours, destroying much of the town. The Dey then agreed to abolish Christian slavery in his dominions, which he had earlier refused to do.

RAS

**Allectus.** Imperial usurper based in Britain, AD 293–6. In 293 the western Roman empire was administered by Maximian and his junior \*Constantius Chlorus, and the usurper \*Carausius was operating in Britain and northern Gaul. In 293 Constantius took Boulogne, and Carausius was assassinated by his finance minister Allectus. Allectus himself then became a usurper. Recent archaeological excavations in London, south of St Paul's cathedral, indicate the presence of a palace which dendrochronological studies suggest dates to 293–4; Allectus may well have built it. In 296 Constantius invaded Britain and Allectus was slain in a battle near Silchester.

ES

**allegiance, oaths of.** The vicissitudes of oaths of allegiance reflect not merely dynastic fortunes but the changing priorities of different generations. The first oath of which we know, to \*Edmund in the 10th cent., offered 'fealty as a man ought to be faithful to his lord'. It was presumably to guard

against a vassal putting his lord before the king that William I imposed the oath at \*Salisbury in 1086 on his tenants-in-chief, and homage between vassal and lord normally included the phrase 'save the duty owed to the king'. Matters became more complex when religious and party issues were added in the 16th and 17th cents. Elizabeth's oath of allegiance in 1559 required the specific repudiation of any jurisdiction by any foreign prince, person, prelate, or potentate. After the \*Gunpowder plot, James I demanded an oath repudiating papal authority and promising to divulge 'all treasons and traitorous conspiracies which I shall know or hear of'. As soon as Charles I had been executed in 1649, Parliament asked for an oath approving the measure and accepting the abolition of the monarchy, and all the changes of regime up to the Restoration were accompanied by debates on an appropriate oath. Charles II made his office-holders swear that it was not lawful 'upon any pretence whatsoever' to take up arms against the king. During the excitement of the \*Popish plot, Parliament added oaths against transubstantiation, which James II promptly ruled aside in his \*Declaration of Indulgence of 1687. The next *bouleversement*, which brought in William and Mary, declared that Charles II's oath against taking up arms was no longer necessary, but the repudiation of non-resistance forced 400 \*non-jurors to resign their benefices. Dynastic and religious considerations continued to complicate allegiance until the 19th cent. Jacobites could not take the oath to George I and his successors, and Catholics, Jews, and atheists remained excluded from Parliament until the oath was amended in 1829, 1858, and 1888. The existing oath of allegiance, based upon the Promissory Oaths Act of 1868, is nearly as simple as that of Edmund.

JAC

**Allen, William** (1532–94). Founding principal of Douai College (1568–85) and cardinal (1587). A Lancashireman, educated at Oriel College, Oxford, he became principal of St Mary's Hall (1556–60), then joined Catholic exiles at Louvain (1561). Briefly in England (1562–5), he was ordained at Mechlin, visited Rome, and founded the college at Douai (1568) to give English Catholics university education and train missionary priests for reconverting England. He also instigated the Douai translation of the Bible (1582). Visiting Rome again (1575, 1579), he advised the pope about founding the English college there and inspired the Jesuit mission to England (1580). He retired to Rome (1585) in poor health, became cardinal-priest, and died there. Despite his political ineptitude in corresponding with Mary, queen of Scots, supporting the Armada, and misjudging the strength of English Catholic patriotism, he was a fine teacher, ardent for the reconversion of England. His college kept the core of English Catholicism alive against government attempts to extinguish it.

WMM

**Allenby, Edmund, 1st Viscount Allenby** (1861–1936). Soldier and administrator. After extensive service in Africa before 1914, Allenby fought in France as a divisional, corps, and army commander before being posted to Palestine in June 1917. In the Middle East he proved himself a master of mobile warfare. In October 1917 his troops defeated the Turks at Gaza and by Christmas he had occupied Jerusalem.

## Alliance Party

Further rapid progress was halted when his army was milked of reinforcements to be sent to France. But when he resumed his offensive in September 1918, operating in cooperation with Arab forces organized by Colonel T. E. \*Lawrence (of Arabia), he destroyed the Turkish armies in Palestine and Syria at the battle of Megiddo. Between 1919 and 1925 he served as high commissioner in Egypt. His notoriously bad temper earned him the nickname of 'the bull'. He received his peerage in 1919. DF

**Alliance Party.** Formed in April 1970 against the backdrop of accelerating communal violence to bridge the gap between the unionists and nationalists of Northern Ireland. The party was represented at the Sunningdale conference (December 1973) and in the power-sharing executive (January–May 1974): it has remained loyal to the broad principles embodied in the Sunningdale agreement (power-sharing between unionists and nationalists within a Union framework). Its share of the vote peaked in 1977, when its candidates secured 14.4 per cent in the district council elections: recent electoral performance has been weaker, settling usually at 7–8 per cent. The party has never been able to expand its base beyond middle-class liberals and the small, anti-sectarian section of the working class who once voted for the \*Northern Ireland Labour Party. However, as with other centrist parties, Alliance commands a respect and wields an influence beyond its electoral support. AJ

**Alma, battle of,** 1854. On 20 September, a week after disembarking in the \*Crimea, British, French, and Turkish troops under \*Raglan and St Arnaud launched an attack on Menshikov's forces blocking their advance on Sebastopol at the Alma river. After heavy fighting at bayonet point, the Russians were forced to retreat. Though Lord \*Aberdeen told Queen Victoria that 'we may fairly hope that the fall of Sebastopol cannot long be delayed', the fortress held out for another year. JAC

**almanacks** were booklets, of varying length, containing astronomical and astrological information, details of weights and measures, a calendar, and other matters of practical use. They frequently included predictions of political events or natural disasters, proverbs, and other moral sayings, while some of the longer ones were designed to be of use to specific trades or callings. The almanack was therefore useful, and, from about 1650, might also be entertaining, as the astrological aspects became taken less seriously and almanack writers began to satirize the genre. What is clear is that almanacks were sold in vast numbers: some 400,000 a year in England in the 1660s, which suggests that one in every three families might own one. Many were published annually, and some almanack writers, especially in the 17th cent., enjoyed a steady living. The almanack gradually became more utilitarian, and as such remained in use well into the 19th cent. JAS

**Almanza, battle of,** 1707. On 25 April an allied force under the command of Lord Galway and the marquis de Ruigny, comprising about 15,000 English, Dutch, and Portuguese troops, attacked a Franco-Spanish army under Marshal

Berwick that was twice its size near Valencia. Despite initial allied success, a Portuguese defeat on the right flank exposed the English and Dutch, over 3,000 of whom were forced to surrender. The battle marked the effective end of Archduke Charles of Austria's attempts to gain Spain, confirming the Bourbon succession under Philip V in all but Catalonia. JLP

**Almenara, battle of,** 1710. On the river Noguera in Aragon, on 27 July, an allied army of 24,000 troops, commanded by the Austrian Count Stahremberg, and including an English contingent under \*Stanhope, attacked a Spanish army of roughly equal size, commanded by General Villadarias with Philip V in attendance. Caught by surprise, the Spanish were defeated, chiefly by Stanhope's men, and the bulk of the army survived only because of the onset of night. Casualties were relatively light—about 400 allied and 1,300 Spanish. The battle marked a resurgence of allied fortunes in Aragon. JLP

**almshouses,** also known as *bede-houses*, are buildings, usually purpose-designed, to provide accommodation for aged or frail people. They were established at a time when there was no alternative welfare provision. Usually they were paid for by a benefactor, whose intentions were set out in a deed stipulating who might be given help.

The origin of almshouses lay in medieval monasteries, which built houses from which alms and hospitality were dispensed. The religious links remained: often almshouses were intended to contain small communities who had to attend regular services to pray for the souls of the benefactor and such other persons as might be specified. The houses frequently included a chapel and generally the priest who took the services supervised the residents. The range of care for the *bedesmen* or *bedeswomen* varied. Generous benefactors established funds to pay for fuel, clothing (sometimes a uniform), and even some food and drink. Some almshouses had the character of a 20th-cent. hospice and cared for the terminally ill. Nursing was sometimes a duty for those who were well enough to care for their less fortunate fellow-residents.

Benefactors usually specified that residents should come from a particular locality and be persons who had led respectable lives. Many permitted the admission of husbands and wives.

By the early 14th cent. the endowment of almshouses had become a favoured form of charitable bequest. Medieval examples still surviving include the Hospital of St Cross at Winchester (Hants). After the Reformation, almshouses continued to be established in many towns and villages, and are often architecturally agreeable or even distinguished. Benefactors often specified that only members of the Church of England were eligible. But when Thomas Cook of travel agency fame founded an almshouse in his native town of Melbourne (Derbys.), he did not insist on membership of any religious denomination, though he was himself a committed Baptist; he did, however, restrict admission to people living in the town. \*Trollope's novels *The Warden* (1855) and *Barchester Towers* (1857) turned on the wardenship of Hiram's Hospital at Barchester. IJEK

**Alnwick, battle of**, 1093. During the reign of Malcolm III of Scotland there were repeated clashes over the border with England. After William Rufus had taken possession of Cumberland and Westmorland, negotiations broke down. Malcolm invaded Northumberland and besieged Alnwick castle. A relief force on 13 November 1093 killed both Malcolm and his eldest son Edward. JAC

**Alnwick, battle of**, 1174. In pursuit of his claims to the northern shires, William I 'the Lion', king of Scotland, invaded England in 1173 and 1174. In 1174, having failed to take Carlisle, Wark, and Prudhoe castles, William in frustration decided to ravage the coastal plain of Northumberland. On the morning of 13 July, while most of his men were scattered across the countryside, William and the few knights he had with him were caught completely by surprise just outside Alnwick castle by a force loyal to Henry II led by Ranulf \*Glanvill. A sharp fight followed before William was led away in captivity to Henry II who imposed severe terms. The battle effectively ended the Great Rebellion (1173–4) in England. SL

**Alnwick castle** is a major medieval fortress in Northumberland and a principal residence of the Percy family since the early 14th cent. It stands above the river Aln amongst parkland created by Capability \*Brown around 1765. In its present form the castle is mostly mid-19th cent., the creation of Algernon, 4th duke of Northumberland, who employed Salvin to restore and improve the exterior and a team of Italian artists under Canina and Montiroli to decorate the interior. Probably founded soon after the Conquest, the castle was constructed in stone in the mid-12th cent., a shell keep clasped by two large baileys. There are extensive 14th-cent. additions; notably the main gatehouse and barbican, one of the most complete in the country. Alnwick is strategically placed straddling the eastern route into England and was frequently involved in Anglo-Scottish affairs. A cross in the park commemorates the death of Malcolm, king of Scots, at the siege of \*Alnwick in 1093. LR

**Alresford, battle of**. See CHERITON.

**Althorp, John Charles Spencer, Viscount, 3rd Earl Spencer** (1782–1845). By temperament Althorp preferred the pleasures of private life to the tribulations of politics. He was not an eloquent speaker but won the confidence of the Commons by his honesty and ability to convince backbenchers that he was one of themselves. In both the \*Grey and \*Melbourne administrations he was important as chancellor of the Exchequer. He welcomed the 1832 Reform Bill, was involved in drafting it, and prominent in securing its passage through Parliament, but in 1834 he could not support an Irish Coercion Bill and this contributed to Grey's decision to resign as premier. Melbourne believed Althorp's presence in the Commons was essential for the survival of his ministry and it was a great blow when Althorp succeeded his father as Earl Spencer in November 1834. The result was Melbourne's resignation. Althorp was happy to leave politics. He refused to be either lord-lieutenant of Ireland or governor-general of Canada and immersed himself in farming and country sports. Yet he had been both popular

and effective as leader of the House of Commons. His career confirms that in politics character often counts for more than intellect. JWD

**Amboyna massacre**, 1623. The island of Amboyna in the Moluccas became the focus of Anglo-Dutch rivalry in the spice trade. In 1623, the English settlement was wiped out by the Dutch, who were the dominant power in the region, and the English East India Company turned its attention towards the Indian subcontinent. The massacre soured relations between Dutch and English for many years. DAW

**Ambrosius Aurelianus**, 'the last of the Romans', was a British leader who emerged during the twilight years of Roman Britain to resist the onslaught of invading Saxons. Ever since the Saxons (under \*Hengist and Horsa?) had established themselves in Kent in AD 455, other areas of southern Britain had fallen under Saxon rule. The Britons fought back, and their greatest successes occurred in the late 5th cent. under Ambrosius Aurelianus. This resistance culminated in the battle of \*Mount Badon at which the Saxons were defeated; the Britons won a generation of peace. ES

**America**. The thirteen colonies later formed the United States of America. Contemporaries did not distinguish them from Britain's Caribbean or other mainland settlements. All except Georgia, founded in 1732, resulted from 17th-cent. crown grants, mainly to companies or proprietors. Most were eventually taken under crown control, so that by 1750 they had similar institutional and political systems. The original Indian inhabitants were gradually dispossessed and marginalized by armed, aggressive settlers.

In the south, Virginia (1607) became a royal province in 1624. Its neighbour, Maryland (see BALTIMORE), was taken under royal control, but reverted to proprietary rule in 1715. Tobacco, a major export crop, shaped the development of both colonies. The demand for labour was met by indentured servants from the British Isles, young persons who worked for a term of years in return for a free passage and the promise of future benefits. After about 1680 African slaves gradually displaced them. In South Carolina (1663) rice became the great export crop; here slavery was more concentrated and harsher. South Carolina and North Carolina, which had pockets of slavery and of free subsistence farmers, became royal colonies. In Georgia, founded by humanitarians as a refuge for poor persons and oppressed protestants, attempts to ban slavery and strong drink failed; it developed as a plantation-based society.

In the north, no staples dominated. Families rather than indentured servants went to Massachusetts (see MASSACHUSETTS BAY COMPANY), and to Connecticut, which received a royal charter in 1662. In both, the religious convictions of the early settlers and a congregational church system helped shape social and political institutions. Hostilities between congregationalists, baptists, and quakers played a major role in the development of religious toleration in Rhode Island, settled from 1636. New Hampshire, first settled by New England congregationalists and by more latitudinarian Anglican colonists, was chartered in 1679. These northern colonies had economies based on farming and maritime

undertakings, including shipbuilding (and timber exports from New Hampshire).

The middle colonies, founded after 1660, became the great receptacles of continuing white migration, of both independent families and servants. New York was granted to James, duke of York (later James II) in 1664. From it he granted New Jersey, in which there was a substantial Presbyterian Scottish interest, to a number of proprietors. Both territories later came under direct royal control. Pennsylvania's (see PENN, WILLIAM) early life was dominated by members of the Society of Friends. The Penns held it until the American Revolution. Its southern neighbour, Delaware, was formed from Pennsylvania's three lower counties. New York City and, especially, Philadelphia became substantial urban centres; their hinterlands and the region generally were characterized by successful farming, with a surplus of foodstuffs finding markets elsewhere.

In the 17th cent. the colonies were seen in Britain as receptacles for a surplus population. Traditional arguments that migration would relieve unemployment and reduce poverty as well as create markets for British goods and provide valuable sources of precious metals and raw materials persisted. By the end of the century, the need for a large labour force at home was stressed. Although immigration continued from mainland Britain, its major sources became northern Ireland and protestant Germany. This led to increasing religious diversity as Ulster presbyterians ('Scotch-Irish') and a variety of German baptists, Lutherans, and Moravians arrived. Even so, natural increase more than migration fed population growth. This was formidable, a distinguishing feature in the development of the colonies, underpinning a burgeoning self-confidence and a conviction that because of the availability of land a modest independence was attainable by the majority of white males in the New World, as it was not in the Old.

Westwards expansion and the settlement of the interior valleys filled the 'back country' from western Pennsylvania to South Carolina and settlers also moved into western New York and the Ohio region. Land speculation became a fact of colonial life. Land companies with American and British participants sought political favours from the colonial authorities and from the British government, while population pressures in the older settled regions caused social tensions.

Intercolonial and back-country versus seaboard rivalries lasted to and beyond the American Revolution. From the 1750s the British government began to increase its attempts to create an imperial policy embracing western settlement and Indian relations.

British opinion was that the colonies were primarily of value to the development of a profitable maritime commercial empire. An appreciation of the trading interdependence of the Atlantic colonies, for which southern Europe also became an important market, and of their direct trade with Great Britain, including their great potential as markets for English manufactured goods, grew in the century after 1650. Regulatory measures included various acts of trade ('Navigation Acts') from 1651 onwards in the face of Dutch competition. Foreign-built and/or -crewed ships were excluded from colonial trade and most exports and imports were to be carried via English and (after 1707) Scottish ports. From 1673 a Customs Service was created in the colonies. In 1696 the foundation of the Board of Trade provided a focus for colonial administration and attempts were made to tighten British control, especially during times of war.

These were not continued with any force under Sir Robert Walpole and the duke of Newcastle, a period characterized as one of 'salutary neglect'. Only renewed struggles with Spain and France, particularly from the late 1740s, and the rise of a group of imperially minded politicians and colonial governors, created demands for stronger executive control and greater colonial obedience. By this time colonial political identities were almost fully formed. The original crown charters had conferred large powers of self-government on the colonies, notably in allowing them representative assemblies with substantial legislative powers, chosen by wide electorates. These assemblies assumed fiscal authority and control of local government, a process shaped by the concurrent emergence of élite groups of successful families.

Such developments were accompanied by the growth of a political culture, with roots in English opposition to Stuart absolutism, drawing on 17th-cent. puritanism and vulgarized Lockianism, later mingled with the opposition rhetoric of country against court, and against Walpole's system, and a belief in New World purity and British corruption. The Great Awakening of the 1740s also revitalized protestant dissent and further distanced many Americans from the claims of an Anglican political and church establishment to authority. But denominational and other interest group rivalries, like those over land, caused internal conflicts. Yet a degree of cultural cohesion and awareness of shared political, commercial, and economic interests was stimulated by the productions of the colonial printing presses, particularly by newspapers. Virginians and New Englanders recounted their short histories as the successful creation of quasi-independent New World societies.

Warfare between France and England in North America in 1754, arising from rivalries in the Ohio valley, therefore necessitated co-operation between a mother country and colonies whose differences were masked by shared ambitions for commercial and territorial victory over a catholic power believed to be seeking universal monarchy. British

plans for colonial union in 1754 failed in the colonial assemblies. The course of the \*Seven Years War revealed the jealous self-interest of the colonial assemblies towards each other and towards London, despite royal governors' and English ministers' orders. Overwhelming advantages in terms of wealth and population enjoyed, for example, by New York and New England over French Canada, together with the deployment of British regular troops, failed to bring victory until 1759–60.

Success brought rejoicing for a God-ordained triumph of protestantism and liberty, even prophecies of a forthcoming millennium. The reality was a huge increase in the British national debt, provoking anxieties about bankruptcy and fears that colonial expansion, no longer checked by the French and their Indian allies, would precipitate expensive new conflicts with the frontier tribes, concerns fed by the Cherokee War (1759–61) and by a major middle-colony Indian war in 1763. These and British official memories of colonial military non-cooperation and illegal trade during the Seven Years War suggested that colonial dependence on crown and Parliament might need to be ensured by new British measures. The mood in America also altered as war-time spending was succeeded by deflation and depression and as credit crises in the mother country were increasingly felt. When British ministers introduced new measures to raise larger revenues from America, colonial political awareness was stimulated and diffused and intercolonial co-operation increased. Resistance and then revolution followed.

The loss of the thirteen colonies occurred, however, as British–American trade was again increasing and as British politicians were becoming more involved in schemes to profit from the opening up of western lands. Tobacco imports were changing Glasgow's commerce, Chesapeake wheat was beginning to feed Britain's own growing population, and enormous quantities of American products were being shipped to the sugar islands. British manufactured goods were also pouring into America, leading some historians to claim that the colonies were experiencing a 'consumer revolution'. Benjamin Franklin believed that the future prosperity of Britain depended on America and that the centre of the British empire might one day be found there. Isaac \*Barré told the House of Commons in March 1774 that 'You have not a loom nor an anvil but what is stamped with America.' Even George III mused on the interdependence of commerce and power, prophesying the West Indies following the Americans 'not [into] Independence but must for its own interest be dependent on North America: then Ireland would soon follow the same plan . . . then this Island would be reduced to itself, and soon would be a poor Island indeed, for reduced in her Trade Merchants would retire with their Wealth to climates more to their Advantage, and Shoals of Manufacturers would leave this country for the New Empire.'

Such views illustrate the impact of successful colonial growth on some contemporaries and hinted at the need for an imaginative readjustment of the view that the colonies were still the dependent children of the mother country. But the political nation upheld the sovereignty of crown

and Parliament over America. This must not be sacrificed to colonial or trading interests. Schemes on both sides of the Atlantic, either for granting the colonial assemblies a form of equality with the British Parliament or for managing the thirteen colonies by admitting their representatives to the British Parliament, as Scotland had been managed since the Act of Union, found no vital support. In 1776 the thirteen colonies, bolstered by the experience of more than a century of successful growth and a large degree of self-government, declared themselves 'free and independent states absolved from all allegiance to, or dependence upon, the crown and parliament of Great Britain'.

Greene, J. P., and Pole, J. R. (eds.), *Colonial British America: Essays in the New History of the Early Modern Era* (Baltimore, 1984); Simmons, R. C., *The American Colonies from Settlement to Independence* (New York, 1976).

**American Cemetery** (Cambs.). The American Cemetery, 2 miles west of Cambridge, is the resting place of more than 3,000 combatants, many of them bomber crews operating from East Anglia, who were killed in the \*Second World War. On a gentle slope, overlooking the valley of the Ouse, the land was given by the University of Cambridge. JAC

**American War.** See WAR OF 1812.

**American War of Independence, 1775–83.** The roots of American independence go as deep as the original settlements—colonists of a dissenting disposition with little cause for affection for their mother country, the development of a more egalitarian society without bishops or noblemen, colonial assemblies gaining political experience and anxious to extend their privileges, and a population increasing in size, prosperity, and confidence. In 1715 the colonists numbered fewer than half a million, of whom 70,000 were negro slaves. By 1770 there were more than 2 million. The ties with England were already weakening as many of the new settlers—Germans, Swiss, or Ulster-Irish—had no English connections. (See AMERICA.)

The crisis was triggered off by the \*Seven Years War, during which the British drove the French out of Canada. It had often been remarked that only the threat of falling prey to Spain or France kept the colonists in check. That check was removed at exactly the moment that the British became alarmed at the rising cost of the plantations: they were anxious to reduce clashes with the Indians and determined that the Americans should bear more of the imperial burden. The first objective produced a prohibition on expansion across the Allegheny mountains, the second produced \*Grenville's \*Stamp Act of 1764, which led to a storm of protest. Though the Stamp Act was repealed in 1766, the \*Declaratory Act which reaffirmed British sovereignty deprived the gesture of much of its appeal. The imposition of the \*Townshend duties provoked violence and the situation escalated. The \*Boston massacre of 1770 was followed by the seizure of the Gaspée in 1772 and the \*Boston Tea Party in 1773. By 1774 the Americans had summoned a congress to concert resistance and most Britons were convinced that the lawlessness of the colonists could not be tolerated.

Once fighting began at \*Lexington in 1775, Britain faced a difficult military task. To occupy and garrison so vast a country was out of the question. But many Americans, especially in the south, remained loyal to the crown and British armed intervention could give them the upper hand against the patriots. The first phase finished when \*Burgoyne's grandiose plan to drive down the Hudson river from Canada and cut off \*New England ended in capitulation at \*Saratoga in October 1777. Though the disaster could have been retrieved, it brought France and Spain into the conflict and placed in jeopardy Britain's command of the seas. Nevertheless the issue remained in doubt and \*Washington experienced great difficulty in holding his troops together. In 1780 \*Cornwallis led a major expedition to the southern colonies. He was cut off and his surrender at \*Yorktown in October 1781 brought the conflict to an end. American independence was recognized by the treaty of \*Versailles in 1783.

The short-term consequences were less dramatic than many expected. Though Britain's eclipse as a world power was confidently predicted, her economic recovery was swift, and the colonial development of Australia, New Zealand, India, and parts of Africa went some way to compensating for the loss of the first British empire. But in the long run there was a great shift of power across the Atlantic and the population of the USA passed that of the mother country soon after the American Civil War, in the 1860s. In the long perspective of world events, the colonization and the loss of America, together with the spread of the English language and English parliamentary institutions, seems the single most important development in British history. JAC

## Amherst, Jeffrey Amherst, 1st Baron (1717–97).

Amherst, a career soldier, was the son of a lawyer from Kent and advanced under the patronage of the Dorset family. He entered the army at an early age and was lieutenant-colonel by 28. After serving with distinction in the War of the \*Austrian Succession at \*Dettingen and \*Fontenoy, he was made commander-in-chief in America in 1758, and acquired a great reputation by the conquest of Canada. In 1761 he was created KB. At the outbreak of hostilities with the American colonies, Amherst was brought into the cabinet, raised to the peerage in 1776, and made formally C.-in-C. 1778–82. He seems to have acted more as a chief of staff than a strategist. He was dismissed at the fall of North's ministry, but brought back as C.-in-C. from 1793 to 1795. Systematic and methodical rather than dashing, he had a reputation for honesty and directness. George III, however, remarked sardonically in 1772 that Amherst's services, undoubtedly great, 'would not be lessened if he left the appreciating them to others'. JAC

**Amiens, mise of**, 1264. After the struggle between Henry III and the baronial party had gone on for several years, it was agreed to put the validity of the provisions of \*Oxford (1258) to Louis IX of France for arbitration. The point at issue was mainly whether the king should have an unrestricted right to appoint and dismiss his advisers. Each side sent representatives to the meeting at Amiens in January 1263, where Louis decided emphatically in favour of his fellow king, declaring the Provisions null and void.

The result was not to settle the dispute but to force de \*Montfort and his supporters into open rebellion. JAC

**Amiens, treaty of**, 1802. The treaty provided the only break in the long war between Britain and revolutionary and Napoleonic France from 1793 to 1814. By 1801 the conflict was near to stalemate. Britain had been unable to co-ordinate effective coalitions and her raids on the continent had proved unsuccessful: France had lost control of the seas and was unable to deliver a knock-out blow. The resignation of \*Pitt in 1801 made it easier for his successor \*Addington to seek peace. Britain retained Ceylon and Trinidad but restored the Cape of Good Hope to the Dutch. Malta was to be given back to the Knights of St John and guaranteed. The French were to withdraw from Naples and central Italy and Egypt was to return to Turkish rule. Each side dragged its feet on fulfilling the terms and the peace, little more than an armed truce, lasted only until May 1803, when Britain declared war. Napoleon then began planning an invasion of England. JAC

**Amritsar massacre**, 1919. On 13 April 1919 at Jallianwalla Bagh in Amritsar, General R. E. H. Dyer ordered his soldiers to fire on a protesting though unarmed crowd, killing 400 people. The shootings were for defiance of a martial law ban on assembly imposed under the Rowlatt Act, passed against sedition at the end of the First World War. The Act and the massacre became symbols of British oppression to the Indian freedom struggle, then developing a mass political following. Mahatma \*Gandhi led nation-wide demonstrations, which brought him to leadership of the Indian national movement. DAW

**anabaptists** or re-baptizers held that baptism should be postponed until people were capable of understanding the promises made and obligations accepted. But the hatred and persecution they encountered stemmed from the widespread belief that they intended to overthrow the whole social order. There were different groups within the movement but those anabaptists who held power in Münster 1533–5 were radical, advocating common property and practising polygamy. This served to smear the whole movement and 'anabaptist' became a term of abuse. Henry VIII thought them 'a detestable sect' and burned a number: James I in the preface to \**Basilikon Doron* denounced them as 'a vile sect' and burned more. Their doctrinal influence was on the Brownists, \*baptists, Hutterites, and Mennonites. JAC

**anarchism**. Though mistrust of the state and a desire for cheap and limited government is a commonplace in the British political tradition, formal anarchism has received little support. Anarchist elements have been traced in the Commonwealth period, though they were more probably collective agrarianists, and the theory developed only after the French Revolution in the 1790s. \*Paine declared that government was, at best, a necessary evil: 'a great part of what is called government is mere imposition.' \*Spence and \*Godwin went further. Spence's vision of the future was of parish communities, with minimal powers reserved for the state, while Godwin insisted that government was a 'brute engine', which had caused all the vices of mankind. Neither

had many disciples, though \*Shelley followed his father-in-law Godwin in calling government 'a mighty calamity'. The \*Cato Street conspiracy to murder the cabinet in 1820, the work of some of Spence's supporters, gave anarchism a lurid image. The First International split in 1871 between the supporters of Marx, who wanted a proletarian state, and those of Bakunin who argued, with some prescience, that it might itself become an engine of despotism. The small British groups made little impact. Sheffield anarchists in 1891 produced a short-lived paper and a group of Walsall anarchists were convicted at Stafford assizes in 1892 of conspiring to manufacture bombs. An even more sensational episode was the siege of 100 Sidney Street, Stepney, in 1911, with two foreign anarchists holed up, while the home secretary, Winston \*Churchill, helped to supervise a shoot-out. Peter the Painter (otherwise Peter Piaktoff) escaped the flames and disappeared from history. There was some interest in anarchist theory among left-wing circles involved in the Spanish Civil War in the 1930s. But fear of anarchy, an important ingredient of the conservative tradition, was always in Britain more influential than anarchism itself. JAC

**anchorites**, who had their origin in the early church, were solitary holy men or women ( anchoresses) living an ascetic life of contemplation and confined to a strictly enclosed cell that was often attached to, or inside, a church. Though initially subject to no rules, by the 12th cent. they were required to be licensed and controlled by the diocesan bishop. In England they were particularly numerous during the 11th and 12th cents. and were supported by many patrons, while treatises, including the *Ancrene Wisse*, were written for their spiritual guidance. BJG

**Ancrum Moor, battle of**, 1545. The death of James V after the disaster at \*Solway Moss in 1542 encouraged Henry VIII to propose a marriage between his only son Edward and the infant queen of Scotland, Mary. When the negotiations faltered, Henry resolved on a strong-arm policy, the famous \*'rough wooing'. In 1544 Hertford (\*Somerset) led a punitive raid which sacked Edinburgh. The following year another expedition, led by Sir Ralph Evers and Sir Brian Latoun, gutted Melrose. But the regent, \*Arran, and the earl of \*Angus gathered a Scottish army just outside the town and on 17 February inflicted a heavy defeat on the invaders, killing both the leaders. JAC

**Anderson, Elizabeth Garrett** (1836–1917). First English woman to qualify in medicine. Elizabeth Garrett was born in Aldeburgh (Suffolk), where she is buried. Inspired by the beginning of the organized women's movement, and aware that the liberal professions were closed to them, her tenacious efforts led to her becoming a licentiate of the Society of Apothecaries (1865) and the first female MD in France (1870). Concentrating on treating women and children, she founded a dispensary and then the first hospital wholly staffed by women, eventually becoming dean of the London School of Medicine for Women. Marriage to Skelton Anderson proved a help rather than a hindrance in her career. Always concerned with education and social improvement, Anderson's greatest service to the women's

cause was her normality. A sense of duty, courage, and unaffected manner combined to disarm a hostile profession, and served as a role model for others. ASH

**Andrew, St** (d. c. AD 60). Fisherman of Galilee, among the first of Jesus' disciples, and first missionary, bringing his brother Simon (Peter) to Christ. Little is known of his life after the Crucifixion, though it is generally thought he was crucified at Patras in Achaia. Among various legends is the claim that his relics were carried to Scotland by the 4th-cent. abbot St Rule, divinely led to present-day \*St Andrews. There he built his church, an evangelistic centre for the area. Patron saint of Scotland, the saltire cross associated with his death represents Scotland on the Union Jack. St Andrew's day is 30 November. AM

**Andrewes, Lancelot** (1555–1626). Bishop of Chichester (1605), Ely (1609), and Winchester (1619–26). Educated at Pembroke Hall, Cambridge, Andrewes was a scholar of great erudition, conversant with fifteen languages. One of those appointed to prepare a new translation of the Bible (1604), he was largely responsible for the Pentateuch and historical books of the Old Testament.

Both in his lifetime and subsequently his fame has largely rested on his ability as a preacher and devotional writer. His sermons were influential in formulating a distinctive Anglican theology. They owe much to the Greek fathers, particularly Chrysostom, but are none the less firmly founded in western catholic thought. In style they are complex, abounding in puns and containing untranslated quotations from Latin, Greek, and Hebrew, thus making great demands upon his hearers. His *Preces privatae* are carefully arranged, revealing Andrewes's rare but precious gift for the expression in writing of devotion and prayer. JRG

**Aneurin** (late 6th cent.). Bard. Almost everything known about Aneurin has to be conjectured from the epic poem he composed, *Y Gododdin*, recounting a disastrous raid on the Anglo-Saxons of \*Bernicia and \*Deira by the Britons of \*Gododdin in Lothian (c.600). But the text has been added to. \*Nennius, *Historia Brittonum* (c.796), named him along with \*Taliesin as one of the five Welsh bards during the struggle against the Northumbrians. Aneurin speaks as an eye-witness of the battle and of the dead heroes as his kinsmen, from which it has been inferred that he belonged to the Gododdin: others have suggested that he was a visiting bard, possibly from \*Elmet. A case has been made that he could have been a brother of St Deiniol, patron saint of Bangor. JAC

**Angevin empire**. The term is commonly used to describe the collection of lands held, or claimed, by Henry II and his immediate successors before Henry III renounced his claims in the treaty of \*Paris (1259). Henry II first brought the constituent parts of the empire together by combining under his rulership three distinct inheritances. These were, first, the former Anglo-Norman realm, comprising the duchy of Normandy and the kingdom of England, brought into being in 1066, split apart during Stephen's reign, and reunited under Henry in 1154 on his accession. He had become duke of Normandy in 1150, when his father \*Geoffrey

## Angevin empire

of Anjou, who had conquered the duchy in 1144, abdicated in his favour. Henry also claimed suzerainty over the duchy of Brittany, a claim inherited from his Norman ducal predecessors, and over Wales and Scotland, claims inherited from previous kings of England. Together, this was Henry's inheritance from his mother, the Empress \*Matilda, daughter of Henry I. From his father Henry inherited the county of Anjou (hence *Angevin* empire), and the counties of Maine and Touraine, the three lordships together conventionally described as Greater Anjou. Thirdly, there was \*Aquitaine, the inheritance of the heiress \*Eleanor of Aquitaine, which came to Henry as prince consort following their marriage in 1152. The core of the duchy consisted of Poitou and Gascony, with a host of other lordships over which the dukes of Aquitaine claimed suzerainty. Ireland also came into the Angevin orbit following Henry's invasion of 1171–2. Henry, accordingly, was lord of a vast block of territory stretching from the Pyrennees to Scotland, making him the most powerful ruler in western Europe at the time.

There has been much discussion of the origins of the empire. Was it fundamentally the product of Henry's opportunism, or the result of a good deal of genealogical chance and fortuitous development, or had any of Henry's dynastic predecessors planned the long-term union of the three inheritances? The latter seems distinctly unlikely. First, no one could have predicted that Eleanor of Aquitaine would become heiress to the duchy in 1137, and that, since she and her first husband, Louis VII of France, had only daughters, the duchy would revert to her on the annulment of the marriage in 1152. It is clear that she accepted Henry's overtures only because marriage to him made sense since, by then, he had possession of Anjou, which marched with her beloved Poitou to the north, was duke of Normandy, and was poised to take England. Second, there is no indication that either of Henry's parents envisaged the union of the Anglo-Norman realm and Anjou. Geoffrey, in particular, gave little help to Matilda in her fight for England against Stephen and, although he took over Normandy in 1144, he did so in his son's name, associating Henry in the government of the duchy from 1146. He kept the administrations of Normandy and Anjou separate, and abdicated in Normandy (but not Anjou) in Henry's favour in 1150. These are scarcely the actions of an empire-builder. Moreover, most historians now agree that Geoffrey intended permanent partition: Anjou to go to his younger son, Geoffrey the Younger, and the Anglo-Norman realm to Henry, a disposition reflected in the still contentious report of the death-bed will that he supposedly made in 1151. Third, although Henry was born of the marriage in 1128 between Geoffrey and Matilda, that does not necessarily mean that either of the negotiating parties, Henry II's grandparents, Henry I or Fulk of Anjou, envisaged a territorial union. There were, of course, successional implications, since Matilda, by then, was heiress to the Anglo-Norman realm, and Geoffrey was Fulk's heir, but it is inconceivable that anyone could have considered the union of the two inheritances as inevitable. Who could have predicted in 1128 that Matilda and Geoffrey would produce three sons?

In short, the evidence suggests strongly that it was Henry II himself who created the Angevin empire. His acquisitiveness and ambition led him to exploit the possibilities and, brushing aside his younger brother, to bring together the three different inheritances between 1150 and 1156, when Geoffrey the Younger rebelled but was forced to submit. The implications of this are of importance in considering the reasons for the failure of the Angevin empire to survive. If the empire was essentially the product of unforeseen developments and Henry's opportunism, and if, accordingly, its roots were shallow and artificial, then its decline and collapse in 1204, within fifteen years of its creator's own demise in 1189, is more explicable.

Naturally, there is more to it than that. Those who maintain that the empire's collapse was inevitable stress the fact that neither Henry II, Richard I, nor John sought to centralize. Rather, each lordship remained apart in its institutions, laws, and customs, with a bare minimum of 'imperial legislation', no common currency, and no single political centre. Moreover, even England and Normandy, the most intimately linked provinces, were going their separate ways by the end of the 12th cent. In particular, cross-channel landholding patterns were breaking up, with ever more distinct baronages residing either side of the Channel. No attempt was made to create one sovereign, independent entity. On the contrary, changing circumstances forced the Angevin lords to accept ever greater implications in their feudal relationship to the Capetian kings of France, so far as their French fiefs were concerned, culminating in the terms of the treaty of \*Le Goulet (1200). Only in England were they juridically equal to their French overlords. Again, there was no intention that the different dominions should pass as one inheritance. As early as 1169, at Montmirail, Henry II made plain his wish that each of his sons should receive a part. In addition, the sheer extent of the Angevin lands made effective government difficult, a problem exacerbated by the extraordinary rivalries and tensions within the ruling family itself.

Powerful though these arguments are, the fact remains that until 1202–3 the Angevin empire remained essentially intact. Structural weaknesses and deep historical trends at work there may have been, but do these alone explain the proximate timing of the collapse? Allowance must also be made for the growth of an external force that could make these internal 'weaknesses' count for something in the real world, and the comparative abilities of John and Philip II, the Capetian king at the time. Philip was much more of a match than his father Louis VII had been, partly because of his own abilities, but also because he commanded far greater resources, the result of Capetian territorial expansion combined with a much more intensive exploitation of royal rights in the 1190s. Philip also had a far more compact principality to defend than the sprawling land mass of the Angevin empire in France, which took up in expenditure much of the revenue generated. In addition, perhaps crucially, John played into Philip's hands. Between 1200 and 1204 he somehow managed to fritter away the advantages he had enjoyed, in particular by his gross mismanagement of the natural defenders of the Angevin empire in France, the

social élite such as the Lusignans, lords of La Marche, the Norman baronage, and William des Roches, the leader of the great lords of Anjou, Maine, and Touraine.

The combination of these factors meant that by the end of 1204 only the \*Channel Islands and a much reduced Gascony remained in John's hands. Neither he nor his son, Henry III, accepted the losses, but they were unable to retrieve the situation. In 1259 Henry bowed to what now can be seen as almost the inevitable and renounced his claims to Henry II's French inheritance. In return, Louis IX acknowledged him as rightful duke of Gascony. An era had come to an end.

**Angles.** See ANGLO-SAXONS.

**Anglesey.** Island county of north-west Wales, separated from the mainland by the Menai Straits. In 1974 it became the district of Ynys Môn in the county of Gwynedd, but was reconstituted as a county in 1996. Its location, together with the protective barrier of the Snowdonian mountains, made it a traditional centre of resistance to invaders, Roman and Norman. But after conquest by Edward I it was created a county of the principality of Wales in 1284, a status confirmed at the Act of Union of 1536.

Anglesey is a low plateau with hills rising no more than 500 feet. It was known as 'Môn mam Cymru' (Môn, mother of Wales) because of its productive cereal-growing, but present farming is primarily dairy. Economic development is also related to the major road/rail crossings of the island to the port of Holyhead, the major British link to Ireland. Two bridges cross the Menai Straits; \*Telford's Menai suspension bridge (1819-20) and \*Stephenson's Britannia tubular bridge (1846-50), originally rail but now both rail and road. Copper was mined on Anglesey but recent economic activity is related to a nuclear power station at Wylfa Head and an aluminium smelter. Tourism is also a significant employer, mainly along the coastline.

The population of the county was 69,149 in 1991. The island has been one of the cores of Welsh speech: 91.7 per cent spoke Welsh in 1901, a figure fallen to 62.0 per cent in 1991.

HC

**Anglesey, Henry William Paget, 1st marquis of** (1768-1854). Soldier and administrator. In 1793 Anglesey raised the Staffordshire Volunteers (later the 80th Foot) and the following year served in Flanders under the duke of York. In 1808 he commanded the cavalry with distinction during the \*Corunna campaign. At \*Waterloo he showed undaunted bravery whilst directing the cavalry and horse artillery. He led the heavy brigade in the terrible charge which overwhelmed the comte d'Erlon's division. He lost a leg in the battle and was created marquis for his services. In 1828 Anglesey became lord-lieutenant of Ireland. He favoured catholic emancipation, an opinion which led to his recall in 1829 by Prime Minister \*Wellington. Anglesey was reappointed by \*Grey and faced opposition from

\*O'Connell. In 1846 he was made a field marshal and master-general of ordnance. Anglesey is buried in the family vault at Lichfield cathedral.

RAS

**Anglicanism.** See CHURCH OF ENGLAND.

**angling** is the art of catching fish with rod, line, and hook, with live or artificial bait, and can be pursued at many different levels and in different ways. The name derives from the Old English *angle*, a hook. The success of Izaak Walton's *The Compleat Angler* (1653) testifies to the popularity of the pastime in the 17th cent. Competitive events were organized by local clubs, often based upon pubs, and commanded a very large following, particularly as the expanding railway network improved access to rivers, lakes, and canals. A National Federation of Anglers was formed in 1903.

JAC

**Anglo-catholicism.** Developing rapidly from original \*tractarianism in the late 19th cent., it reached its peak in the 1920s and 1930s. Charles \*Gore, with Halifax as lay leader for 50 years, transformed old tractarianism from a marginal phenomenon into the central force in the church; he achieved what \*Newman could not. Whereas tractarianism had stressed Anglican continuity from ancient times, extreme Anglo-catholicism became eventually a copy of ultramontane Roman catholicism, but at its best it was socialist in ethos, pastorally vigorous in socially deprived areas, such as east London and Portsea, with \*Lang and Garbett as incumbents, where the rest of the church was apathetic. After establishing more frequent communion, they added the trappings of candles, vestments, incense, reservation of the sacrament, and confession, but extremists went further with every Roman practice, including weekly non-communicating high mass and benediction, which appalled old tractarians. Bishop King of \*Lincoln was tried for excess (1890). \*Davidson, favouring comprehension, nevertheless prohibited benediction and devotions to the sacrament, but in vain. In the 1920s, with \*evangelicalism weakened, Anglo-catholicism was the moving force. The failure of Prayer Book revision (1928) encouraged extremists to use the Roman rite, just when a continental contrary wind, the liturgical movement, was blowing and young intellectuals such as \*Ramsey, Dix, and Farrer were developing a liberal catholicism. The 1960s devastated old Anglo-catholicism, while the evangelicals at Keele, by responding, weathered the radical storm. Moreover, the second Vatican Council (1962-5) by 'protestantizing' catholic liturgy and throwing out petty liturgical paraphernalia and birettas left the old-style Anglo-catholics an isolated group, for whom the ordination of women (1990s) became a major stumbling-block.

WMM

**Anglo-Dutch wars.** Three wars, 1652-4, 1665-7, 1672-4, provide a unique element of continuity between the Commonwealth and the restored monarchy. All were intended to redress the commercial imbalance between England and the Dutch Republic. In the first war security was also an objective. The Dutch rejected a union which the Commonwealth demanded (1651), and sent a fleet into English waters to prevent Dutch ships being searched. An accidental clash precipitated war, but the \*Rump soon identified commercial

## Anglo-Irish agreement

supremacy as its objective. The lighter-armed Dutch navy suffered heavy defeats, one in 1652, three in 1653, and their trade was paralysed. After \*Cromwell dissolved the Rump in April 1653 the majority in \*Barebone's Parliament wished to continue to total victory, but when his followers voted to dissolve Parliament Cromwell conceded lenient terms (April 1654). He did this because, by a separate agreement, the leading province of Holland excluded the house of Orange from all offices. As William II (d. 1650) had been the chief European champion of the exiled Stuarts and the Dutch were the only state with a navy that could cover an invasion (as 1688 was to show) this made the Commonwealth secure against external enemies.

James, duke of York (later James II), brought about the second war, assuming that victory was assured and that increased wealth could strengthen the crown. He defeated a rebuilt and stronger Dutch fleet off \*Lowestoft (June 1665) but failed to exploit the success. Each side won an expensive victory in 1666 but this campaign exhausted English finances. No fleet could be sent out in 1667. Shore defences failed to prevent the Dutch destroying English ships in the river \*Medway. The third war aimed to annihilate the Dutch Republic. The French overran its eastern provinces, but the English fleet could only fight drawn battles, one in 1672, three in 1673. An army was unable to land on the Dutch coast. This war, launched by the pro-catholic \*cabal, with France as an ally, became unpopular. Opposition, stimulated by William of Orange's propaganda, made Parliament refuse further money, forcing Charles to make peace. JRJ

**Anglo-Irish agreement**, 1985, signed at Hillsborough, Co. Down, on 15 November 1985, by Margaret \*Thatcher and the taoiseach (prime minister) of Ireland, Dr Garret Fitz-Gerald. The agreement was intended to promote reconciliation within Northern Ireland, a greater understanding between the unionist and nationalist traditions in Ireland, and co-operation between the British and Irish governments. It established an intergovernmental conference and an attendant secretariat, the latter based at Maryfield, Co. Down. Although the document recognized the constitutional rights of the majority, Ulster Unionists saw it as establishing a form of joint authority, and mounted a ferocious campaign of opposition in 1985–6. AJ

**Anglo-Irish ascendancy** (protestant ascendancy). Problematic labels generally applied to the dominant Church of Ireland landed interest: 'protestant ascendancy' appears to have been first coined in 1782. However, the origins of this interest lay with the land confiscations of the 17th cent. The Ulster plantation (1608–9) brought a substantial transfer of property from the Gaelic lords to English investors and settlers; the Cromwellian confiscations (1652–3) brought the expropriation of the great majority of catholic landowners throughout the rest of Ireland. The Restoration land settlement brought a minor catholic recovery, but this was short-lived. The victory of the Williamite cause in the war of 1689–91 paved the way for further confiscations, and—more importantly—for a series of measures designed to bolster the new protestant landed interest. These 'penal laws' targeted the residual catholic gentry,

and ensured a virtual protestant monopoly over freehold proprietorship until the end of the 18th cent.

The 18th cent. was, therefore, the golden age of the ascendancy. Rural economic growth after c.1740 helped to finance the widespread construction or remodelling of the 'big houses' (mansions), and the building of lavish town houses, most spectacularly in Dublin. The height of ascendancy political power came after 1782–3, with the grant of legislative independence to the gentry-dominated Irish Parliament. But increasingly powerful and vocal catholic and dissenter interests effectively challenged this dominance in the 1790s, and the apparent helplessness of the ascendancy during the 1798 rising made it vulnerable to English intervention. The Act of \*Union (1800) abolished the Dublin Parliament, and represented a severe blow to the political authority and prestige of the Irish landed interest. Further political set-backs came with \*catholic emancipation (1829) and with the rise of an ambitious and radical peasant nationalism. The land legislation of the British government at the end of the 19th cent. weakened the rights of Irish proprietors, and encouraged a transfer of land to the former tenant farmers. Land purchase legislation, especially the \*Land Act of 1903, facilitated this transfer, and brought a swift if relatively cushioned end to the economic predominance of the Anglo-Irish ascendancy. AJ

**Anglo-Irish treaty**, 1921. A truce on 11 July ended the war between the \*Irish Republican Army and the British army which had been raging since 1919. Eamon \*de Valera, president of Dáil Éireann, the constituent assembly of Ireland, met with Lloyd George to discuss a settlement. Deadlock ensued with Lloyd George wanting dominion Home Rule for Ireland and de Valera insisting on an independent Irish Republic. Negotiations began in earnest in October with Arthur \*Griffith and Michael \*Collins representing Ireland. After much debate a treaty was signed on 6 December whereby Ireland became a free state, with the six counties of Ulster remaining as part of the UK, but with full dominion status. It followed an ultimatum from the British that the Irish agree to their terms or face the renewal of war. The Dáil eventually accepted the treaty on 7 January 1922 by 64 votes to 57 and it came into effect on 6 December. RAS

**Anglo-Japanese treaty**, 1902. Concluded on 30 January to improve British security against France and Russia in the Far East, each party agreed to fight only if the other became involved in war with at least two other powers. The treaty promised to localize any war, and facilitated Japan's decision to attack Russia in 1904. It was renewed in 1905, each party agreeing to assist the other in a war with only one opponent. From 1911 the British also tried to use the alliance as a restraining influence on Japan. American objections brought about its demise in 1921–2. CJB

**Anglo-Russian entente**, 1907. The convention was concluded on 31 August 1907 to try to resolve the long-running Anglo-Russian rivalries in Persia, Tibet, and Afghanistan. The Foreign Office also looked to the entente to improve the balance of power in Europe and the Near East against Germany. Only Russian weaknesses after defeat by Japan

and revolution at home made agreement possible at that time. As Russia recovered from the war so rivalries began to revive in Persia, and some competition continued in Asia even after Britain and Russia found themselves fighting on the same side against Germany from 1914. CJB

**Anglo-Saxon art and architecture** now only survives fragmentarily and even what remains is not necessarily representative of what once existed. Our view of architecture, for example, is distorted by the near-total loss of all wooden buildings and by the Norman destruction of all pre-Conquest cathedrals. Similarly art in wood and fabric is now rare and whilst 5th- and 6th-cent. metalwork has been well preserved by burial in pagan graves, Christian material remained above ground and thus vulnerable to the destructive forces of changing taste, Viking and Norman looting, or the zealous cleansing of the Reformation.

Wood was the medium of almost all secular architecture and our information consequently has to rely on the excavated post-holes and foundation-trenches of structures which have otherwise totally vanished. Essentially two types of building are represented in the archaeological record. One was the so-called 'sunken-featured building' with a half-subterranean floor or cellar. These seem largely to have functioned as workshops alongside a second type of structure, the rectangular 'hall'. These halls vary in their size and their constructional techniques, but at the royal level represented by palaces at \*Yeavering (Northd.) and Cheddar (Som.) they were obviously impressive structures reaching up to 100 feet in length.

Wood was also the natural medium for churches built in the Irish tradition brought to Northumbria by St \*Aidan and his followers in the 7th cent., and it continued to be an important medium throughout the period. Only Greenstead (Essex), however, now remains as an example of this once-widespread form. The alternative tradition of masonry architecture survives much more extensively. It was this tradition which was reintroduced to lowland Britain by the Augustinian mission to Kent in the late 6th cent. and enthusiastically exploited by Northumbrians such as \*Wilfrid and \*Benedict Biscop later in the following century. For such early ecclesiastics it is clear that the use of stone represented a statement of their identity with the rest of the Christian world and it is the same identification which is reflected in the fact that their early churches, such as Reculver (Kent) or Hexham (Northd.), show links in their plans, technology, and ornament to buildings in Gaul and Italy.

The great cultural renaissance of the late 8th and early 9th cents. under the Carolingian monarchy brought with it an attempt to emulate the scale and forms of classical antiquity; churches at \*Brixworth (Northants), Wareham (Dorset), and Cirencester (Glos.) seem to represent English responses to these continental movements, particularly in the form of their crypts. Despite the disruptions of \*Viking activity ambitious churches incorporating Carolingian features were still being erected or modified in the later 9th cent. \*Deerhurst (Glos.) and \*Repton (Derbys.) provide two well-dated examples and early in the following century

the new minster at \*Winchester, with its great aisled nave and projecting transepts, clearly echoes continental types. More typical, however, of a persistent characteristic of English architectural taste is a work which is broadly contemporary with the new minster, the church of St Oswald at Gloucester whose earliest phases lie between c.880 and 918. It has a crypt and western apse of Carolingian type but its basic unaisled form is highly conservative and could be paralleled as far back as King \*Cenwalh's 7th-cent. church at Winchester. The excavated sequence of the old minster at Winchester, indeed, shows that same conservatism persisting through into the period of the \*Benedictine reform movement: the building was extensively altered at both its east and west ends in 980 and 993-4 to give a total length exceeding 240 feet, but at its core, preserved like a relic, remained the building erected by Cenwalh in c.648.

Anglo-Saxon art mirrors the characteristics of ecclesiastical architecture; it responds creatively to foreign models but remains highly conservative in its tastes. In the pagan period, where our information now depends largely on surviving metalwork, it is essentially a non-representational art whose effects rely upon contrasts of line and colour and on the ambiguities of stylized animal motifs. This Germanic art found its most striking expression in the gold and garnet jewellery of \*Sutton Hoo. The Christian conversion brought with it both new media for Anglo-Saxon artists, such as books and stone carving, and an alien Late Antique aesthetic from the Mediterranean world. 7th- and 8th-cent. artists developed a fascinating range of responses to these imported concepts and their native inherited traditions. The range is well exemplified by two contemporary works of c.700, the Codex Amiatinus and the \*Lindisfarne Gospels. The Codex, written and illuminated at \*Jarrow, meticulously reproduced the art of its Italian model, whilst the Lindisfarne Gospels reinterpreted similar models in a more linear style and combined them with zoomorphic forms which reach back to Sutton Hoo. Analogous combinations of eclectic borrowing and conservative traditionalism characterize later English art of the 9th cent. and beyond.

The Viking invasions and settlements of the later 9th cent. divided the artistic culture of the country in two. In the north we see Scandinavian animal ornament and mythology grafted onto native Anglo-Saxon monuments like the crosses and grave-slabs of York minster, Leeds, and Gosforth (Cumbria). In the south, building upon the cultural realignments encouraged by King \*Alfred and his immediate successors, there was an artistic revival in the later years of the 10th cent. associated with the Benedictine reform movement which cautiously fused Carolingian and Ottonian motifs with long-established insular forms. By the end of the Anglo-Saxon period, in work like the Romsey Rood, Romanesque art was already emerging. RNB

Backhouse, J., et al., *The Golden Age of Anglo-Saxon Art* (1984); Fernie, E., *The Architecture of the Anglo-Saxons* (1983); Webster, L., et al., *The Making of England* (1991); Wilson, D. M., *Anglo-Saxon Art* (1984).

**Anglo-Saxon Chronicle.** Records of historical events, normally in Latin, were kept from the early days of Christian

## Anglo-Saxons

Anglo-Saxon England, notably in the form of genealogies, Easter tables, and monastic writings. For example, \*Bede, the greatest scholar of the age, was deeply interested in chronology. It was King \*Alfred, however, in the early 890s who was directly responsible for putting into shape the *Anglo-Saxon Chronicle* as we have it, providing a record of events on an annular basis in the vernacular Old English language. The *Chronicle* was kept up to date, clearly with encouragement from the royal court, at great ecclesiastical centres where literate clerks could be found. Surviving manuscripts associated with Canterbury, Worcester, York, and Abingdon provide very full accounts for some periods (the reign of Alfred and the reign of \*Æthelred conspicuously, and then the reign of \*Edward the Confessor and the Norman kings), but give only distressingly jejune entries at others. At Peterborough the *Chronicle*, initially copied from a Canterbury manuscript c.1121, continued to be kept as late as 1155, giving a full and lurid account of Stephen's reign in a language which was visibly changing from Old English into Early Middle English. HL

**Anglo-Saxons** is the name collectively applied to the descendants of the Germanic people who settled in Britain between the late 4th and early 7th cents. and to their ancestors. Their backgrounds varied. Some came as mercenaries, others as invaders. They included, besides Angles and Saxons, Jutes and other groups. Some had experience of Frankish Gaul and hence some acquaintance with Roman institutions and culture. The eventual use of the name 'English' and 'England' for people and territory probably owes something to the influence of \*Bede, whose *History of the English People* dealt with the whole. He followed Pope Gregory I, who knew the people as Angles.

Much about the invasion and settlement period is obscure, but for most of its history Anglo-Saxon England is one of the best-documented early medieval European societies. Besides Bede's *History*, historical sources include a number of saints' lives, and the \**Anglo-Saxon Chronicle*. Many letters survive, those of the Anglo-Saxon missionary to the continent, \*Boniface, of particular importance in our knowledge of the 8th-cent. church. Poetry, in the vernacular (Old English) and in Latin, religious and secular, can convey historical fact, religious ideal, ethics, and values. Some poets are anonymous, others, like \*Aldhelm and Cynewulf, are known. A great body of evidence relates to royal ideology, government, and administration: vernacular law codes (beginning with that of \*Æthelbert of Kent), charters, writs, and wills. Historians also benefit from the study of the language of vernacular texts, from that of place-names, of art (including sculpture), and of architecture. Art was often didactic, and choice of particular styles might indicate values and allegiances, as, perhaps in the cases of the Codex Amiatinus, and \*Wilfrid's churches. Archaeology, of burials, settlements, towns, kings' halls (for example \*Yeavering, Cheddar), monasteries, and churches, is critically important. Yet uncertainties remain. Gaps in the evidence, problems of its interpretation and of reconciling different types, generate lively debate. It is salutary to realize how important subjects depend on chance survivals or discoveries—the ship-burial

at \*Sutton Hoo (mound 1) and the poem \**Beowulf* for example.

From obscure beginnings the Anglo-Saxons formed a number of kingdoms. The 7th-cent. trend was a shift in the balance of power from south and east (\*Kent and \*East Anglia) to north and west (\*Northumbria, \*Mercia, \*Wessex), and the take-over of smaller kingdoms by larger ones, the so-called \*Heptarchy. The 8th cent. was a period of Mercian dominance and Northumbrian independence, the 9th of the rise of Wessex, and of the threat of the Vikings, who established their own kingdoms of East Anglia and Northumbria. In the 10th cent. Wessex united England.

To the forging of one people and one state \*Alfred, \*Athelstan, and \*Edgar made significant contributions. Encouragement of its desirability was to be found in the pages of Bede and in the needs of the church and the principles of its organization. Its cause was furthered by the leaders of the 10th-cent. reform movement. But the England of 1066 was not inevitable. Quite different borders could have been established. In the late 7th cent., for example, one kingdom south of the Humber and another north, including southern Scotland, was a possibility; in the 10th a kingdom pushing into Wales rather than the Scandinavian-held north. The 11th cent., marred by the unsuccessful \*Æthelred II (the Unready), the conquest by the Danish \*Cnut, \*Edward the Confessor, and the \*Norman Conquest, is not properly representative of the history, culture, and achievements of the Anglo-Saxons.

Society and culture changed over time. Anglo-Saxon paganism is not fully known. The great period of conversion was the 7th cent., an age of saints, especially in Northumbria (the missionary \*Aidan, the home-grown Wilfrid, \*Cuthbert, and others) and monastic foundations (including \*Lindisfarne, \*Whitby, \*Ripon, \*Hexham, \*Monkwearmouth-Jarrow) which were to be very rich. A stratified society, in which, for example \*ceorls and gesiths (royal companions) had different \*wergelds, its political life was dominated by the aristocracy, and it was subject to certain tensions. That between the bonds of lordship and of kinship was in-built. Historical development brought a growth in royal power and authority in a society wherein freedom and the participation in government of free men had a long history. On some issues—marriage and war, for example—the new religion might conflict with traditional values. Some features of Anglo-Saxon society seem alien, even incomprehensible, to some modern eyes: the practice of blood-feud, the institution of the retinue (war-band), both of which could contribute to a high level of violence and instability in élite society, the combination of genuine piety with ferocity in warfare, and its condoning by clerics. Yet others seem modern: the status of women has been seen as comparatively high, some queens and royal ladies, particularly \*Æthelfleda, lady of the Mercians, and abbesses, notably \*Hilda and Ælfflæd of Whitby, played an important part in political and religious life. Many aspects of government have, from Alfred onwards, a recognizably modern flavour.

The Anglo-Saxon arrival had ended Britain's involvement with Roman culture and institutions, but this was recreated

in the late 6th cent. Christianity, purveyed to the Anglo-Saxons almost entirely by non-British teachers, from the Irish, from Frankish Gaul, and from Rome (beginning with the mission of \*Augustine), brought England into the Mediterranean, Christian, Roman world, to which in the 8th cent. the English themselves contributed. Missionaries worked amongst the Anglo-Saxons' still pagan continental kin. \*Boniface was also prominent in Frankish church reform and functioned as representative of the pope to the Franks. Anglo-Saxon veneration of the papacy was strong and contributed to the growth of papal authority in the West. \*Alcuin of York was adviser to Charlemagne and a leading figure in the Carolingian Renaissance. After the disintegration of the Carolingian empire, Athelstan, who involved himself with foreign dynasties and politics, was perhaps the most powerful monarch in the West.

But England owed much to Europe. The books collected on the continent by \*Benedict Biscop, and the school of Canterbury, established by Archbishop \*Theodore, himself from Tarsus, brought her Christian culture and scholarship. From an early period Frankish support and influence were factors in English dynastic politics, most clearly visible in Charlemagne's support for some of \*Offa of Mercia's enemies, and in his involvement in Northumbrian affairs, but continuing in the 9th cent. Carolingian ideas concerning church reform and kingship, Carolingian administrative and governmental institutions and practices, Carolingian coinage, and Carolingian art all had an impact in the 8th cent. Alfred learned much from Carolingian example. The 10th-cent. reformers worked under the influence of continental ones, particularly the houses of St Peter's, Ghent, and of Fleury-sur-Loire. Government in the 10th and 11th cents. has much about it that seems Carolingian. Involvement with Normandy came in the late 10th cent. Trade, especially in slaves in the early period and wool in the later, brought great wealth, probably the main attraction for Cnut and William the Conqueror.

The Anglo-Saxon achievement was cultural, religious, economic, and political. Art, architecture, vernacular and Anglo-Latin writing, and scholarship are all remarkable. There were tensions between tradition and Christianity, but there were also compromises and accommodations, a fusion of cultures. Not, originally, an urban people, Scandinavian activity and the development of Alfred's *burhs* lay behind their 10th- and 11th-cent. towns. Coinage was firmly under royal control, changed, after the great reform of Edgar, at regular intervals. Prosperity sustained the frequent collection of large \*Danegelds. Government had in fact been well organized and ambitious quite early, as the Tribal Hidage and Offa's Dike testify. By the 11th cent., with its hundreds, shires, ealdormen and reeves, law courts, and tax-collecting, Anglo-Saxon England was, by European standards, remarkably sophisticated and advanced. There was no capital, but \*Winchester was almost a capital city. The country was united, though it was not uniform in every particular, and there are hints of lingering separatism in Northumbria. The compilation of William I's \*Domesday Book, which offers much information about late Anglo-Saxon England, would not have been possible without

Anglo-Saxon administrative genius. This genius, largely West Saxon, is visible elsewhere, in the rational distribution of mints in the 10th cent., and in the shire system, almost unchanged until 1974.

In administration and, ultimately, in language, the Anglo-Saxon legacy was long-lasting. Anglo-Saxon legal developments may have contributed to the English common law of the 12th cent. and may explain some of the differences between England and the other territories ruled by (the Angevin) Henry II, even after his legal reforms.

Anglo-Saxon history was of interest to some 12th-cent. scholars, for example Henry of Huntingdon and \*William of Malmesbury. In the 16th cent. it was studied for possibilities of precedent and justification for rejecting papal authority, in the 17th for advancing the claims of Parliament and people against despots, as descendants of witans and free assemblies. It was popular again in the Victorian period, as an important element in constitutional history and a theatre for national heroes and empire-builders.

There are many gaps and puzzles to stimulate and delight the modern enquirer, like the condition of the upper peasantry, minsters, and the origins of the parish system; the major overlordship attained by some kings, now popularly referred to as \*bretwaldas, and its role in the unification of England; continuity from the Romano-British past and into the Norman period, including the vexed matter of \*'feudalism' and its origins; and, of course, why the Normans won.

**Angus, Archibald Douglas, 5th earl of [S]** (c.1449-1513). Son and heir of George, 4th earl of Angus [S] (d. 1463), father of the poet Gavin \*Douglas, and the great political maverick of late 15th- and early 16th-cent. Scotland. Angus was involved in the seizure of James III at Lauder bridge (July 1482)—hence the much later nickname 'Bell-the-Cat'—his English treasons spanned more than a decade, and he rebelled against James III in 1488. Yet Angus was a friend of James IV, providing the king with his first mistress, Marion Boyd, the earl's niece, in 1492; he subsequently shared another mistress, Janet Kennedy, with the king; and he was chancellor from 1492 to 1497. Losing royal trust, Angus was warded (imprisoned) in Dumbarton and on Bute from 1501 to 1509. He opposed war with England in 1513, and missed \*Flodden (though two of his sons perished there), dying at Whithorn late in 1513.

NATM

**Angus, Archibald Douglas, 6th earl of [S]** (c.1490-1557). Douglas's father was killed at \*Flodden and he inherited the earldom from his grandfather in 1513. Later that year he married \*Margaret, queen dowager of Scotland. The daughter of the marriage became countess of \*Lennox and was mother of Lord \*Darnley, briefly king of Scotland. Angus was a member of the Council of Regency for James V 1517-21

## Angus MacFergus

and 1523–6 and chancellor in 1527. On bad terms with the young king and divorced by his wife, he was in exile in England from 1528 to 1542. He returned to Scotland in 1542 after the death of James, abandoned the English connection, and fought with some distinction at \*Ancrum and \*Pinkie. His great-nephew, the 8th earl, was active in the \*Ruthven raid of 1582. JAC

**Angus** (Oengus) **MacFergus** (c.690–761), king of the Picts. Under Angus Pictish power was at its height. Succeeding in 729 after a fierce internal struggle, Angus established himself as over-king and waged war on all his neighbours. The king of Atholl was defeated c.734 and his son drowned (a formal ritual killing): the king himself was drowned c.739. In 736 Angus attacked \*Dalriada and captured Dunedd. Next he is reported at war with the Northumbrians, his immediate neighbours to the south of the Forth. But when he turned his attention to the Britons of \*Strathclyde he was not so successful. With the aid of Eadberht of Northumbria, he captured their stronghold of Dumbarton in 756, but his army was wiped out ten days later. Though the details are suspect, Angus was clearly a formidable ruler, and the continuator of \*Bede's chronology bade farewell to him in 761 without regret: 'a tyrant murderer who from the beginning to the end of his reign persisted in bloody crime.' JAC

**Anjou.** District around the city of Angers in France ruled by counts from the 10th cent. onwards. The counts of Anjou won control of neighbouring regions (Maine and Touraine) and played a crucial role in the politics of northern France. This led, in 1127, to Henry I marrying his daughter \*Matilda to the young count, Geoffrey 'le Bel'—otherwise known as \*Geoffrey Plantagenet, allegedly because of his habit of wearing a sprig of broom (*planta genista*) in his cap. After Henry I's death, Geoffrey of Anjou conquered Normandy and bequeathed it, together with Anjou, Maine, and Touraine, to his elder son Henry in 1151. In 1154 Henry of Anjou became King Henry II of England and for the next fifty years Anjou remained the homeland of three successive kings of England: Henry II, Richard I, and John. Since Henry had married \*Eleanor, duchess of Aquitaine, in 1152, this meant that a count of Anjou had become ruler of huge dominions stretching from the Scottish border to the Pyrenees: the \*Angevin empire. Henry II, Eleanor, and Richard were all buried in Fontevraud (in Anjou), but in 1203–5 John's incompetence allowed Philip Augustus of France to wrest Anjou as well as Normandy from the family's grasp. In 1259, by the treaty of \*Paris, Henry III reluctantly acknowledged that Anjou belonged to the king of France. Later, at the highpoint of their success in the \*Hundred Years War, the English briefly won control of Maine. JG

**Annates, Acts in Restraint of**, 1532, 1534. These formed part of the campaign by Henry VIII's government, designed either to cajole the papacy into granting an annulment of the king's first marriage, or to give statutory authority for the English church to act independently of Rome. 'Annates' were taxes levied by the papacy on recently appointed, mostly senior, clergy. The Act in Conditional Restraint of Annates (23 Hen. VIII c. 20), passed in spring 1532, required

that these payments be suspended; any papal retaliation was to be ignored. This legislation passed both Houses of Parliament with much opposition. Henry VIII at once suspended the Act: Archbishop Thomas \*Cranmer was consecrated with papal approval in 1533. In the November–December 1534 session, after the pope had excommunicated Henry, the Act in Absolute Restraint of Annates (25 Hen. VIII c. 20) abolished annates entirely and ordered that bishops be elected by deans and chapters acting on royal nomination. Both statutes were repealed by 1 & 2 P. & M. c. 8 in 1554–5. EC

**Anne** (1665–1714), queen of England, Scotland (Great Britain from 1707), and Ireland (1702–14). The conventional picture of Queen Anne as a weak-willed and ineffectual monarch has been subjected to substantial revision. Re-examination of her political role has revealed a much less insipid personality, a woman of considerable assertiveness who, despite chronic ill-health, was a shrewd political operator and determined to rule. Her adherence to her own principles and prejudices often thwarted her ministers' more self-interested ends; and though she sometimes found herself having to give way to larger political pressures, it was seldom without prolonged struggle.

Her early experiences played an important part in forming her for the role she later assumed. She was the younger daughter of James, duke of York and his first wife Anne \*Hyde. The doctrines of the Church of England in which she was educated provided an important political and emotional prop for the rest of her life. In 1683, aged 18, she was married to Prince \*George of Denmark, a distant cousin, and their relationship quickly blossomed into one of lasting devotion. She made no secret of her growing antipathy towards her father on account of his catholicism, and after his accession as king in 1685 her small household and social circle stood out as a rallying point for protestant courtiers. Anne deserted her father at the revolution in 1688 and joined William of Orange and his wife, her elder sister Mary. Before long, however, relations with them became strained with bitterness and jealousy, especially after Anne succeeded where they had failed and produced a healthy son, the duke of Gloucester, in 1689. Anne's hatred of the king deepened as William persistently excluded Prince George from any share in government. Once more, therefore, she was forced during most of the 1690s to operate in a delicate adversarial situation in which she had her position to defend. But the experience sharpened her skills of political infighting and prepared her for the day-to-day dealings she would have with her ministers. Her particular intimates were the \*Marlboroughs and Lord \*Godolphin. In Sarah Marlborough, especially, she found the feminine comfort and support she needed as she endured one failed pregnancy after another. These gradually took their physical toll. By 1700, when her seventeenth and last pregnancy ended in miscarriage, she was, at 35, practically an invalid. That same year her one surviving child, William of Gloucester, succumbed to illness and died.

Anne became queen on William III's death in March 1702. She had patiently waited for what she had said would be her

'sunshine day'. In the early years of her reign, while her health allowed, she gave fresh impetus to court life and ceremonial in a conscious effort to elevate her regal image. Marlborough's martial triumphs on the continent were duly embodied in this process, and wherever she travelled she was received with acclamation. She stoutly opposed politically inspired suggestions that her Hanoverian heir be invited to reside in England in the firm belief that a rival court would diminish her own authority and *gloire*. Away from royal panoply, Anne industriously fulfilled the position she occupied at the centre of government. She presided once or twice weekly at cabinet meetings, conferred with individual ministers, regularly attended debates in the Lords, and gave active encouragement to major national ventures, such as the war with France, the union with Scotland (1707), and after 1710 the drive for peace.

Until 1710 her administrations were headed by the 'duumvirs', her old friends Godolphin, at the treasury, and Marlborough, in command of the army and directing the campaigns in the \*Spanish Succession war. Neither of them were party men in the conventional sense, but acted primarily as 'political managers' holding together ministries containing both Whigs and Tories. Like her predecessor, she was anxious to preserve her independence of manoeuvre and to avoid becoming the captive of 'party'. Indeed, much of her discernible political activity took the form of long and stressful feuds with senior politicians to avoid appointing party nominees. In 1702 the high Tory grandees, mindful of Anne's affinity with Toryism, expected the lion's share of governmental appointments, but she resisted their demands for a purge of Whigs. After 1705 Godolphin's efforts to persuade her to placate the powerful and well-organized \*Junto Whig faction, whom she knew would dominate her entirely, placed a growing strain on their association, but she reluctantly yielded to a series of Whig appointments. Sarah Marlborough's less tactful bullying on behalf of the Junto was a major source of irritation to the queen, but though the duchess frequently behaved abominably, Anne could ill afford to dismiss her, fearing that she would use her influence with Marlborough and Godolphin to induce them to resign.

The queen's third 'manager', Robert \*Harley, gradually gained her confidence and friendship with his notion of a 'moderate' ministry of both parties, a venture in which he was assisted by his cousin Abigail Masham, who had replaced Sarah as Anne's closest friend and confidante. However, in 1708 Harley's attempt to implement this plan with the queen's co-operation backfired when the 'duumvirs' forced Anne to dismiss him from his post of secretary of state. The Whig election victory later that year increased Junto demands for places in the administration, but it was only during the queen's desolation following the death of Prince George in October that Godolphin was able to override her wishes and impose more Junto appointees.

By 1710 Anne was willing to sacrifice Godolphin for Harley (later Lord Oxford), though the Tories' huge electoral success in the summer ruled out her favoured objective of 'moderation' and forced her to accept an exclusively Tory government under Harley's lead. Long accustomed to

Godolphin's tact, Anne disliked Oxford's high-handedness and equivocation, and by August 1713 had begun to turn against him. As her health became more precarious in 1714, Lord \*Bolingbroke seemed increasingly likely to succeed Oxford, by now ill and demoralized, although the queen remained non-committal. Two days after dismissing Oxford on 27 July, Anne fell mortally ill, but her acceptance of the politically neutral duke of \*Shrewsbury as next lord treasurer on the 30th was crucial in ensuring that after her death on 1 August the transition to the Hanoverian dynasty occurred without the political turmoil which many had feared.

AAH

Bucholz, R. O., *The Augustan Court* (Stanford, Calif., 1993); Gregg, E., *Queen Anne* (1980).

**Anne of Bohemia** (1366–94), queen of Richard II. Born in Prague, the eldest daughter of Emperor Charles IV, Anne was the first wife of Richard II, king of England, chosen for her nobility and gentleness and later known as 'Good Queen Anne'. The marriage took place on 14 January 1382 at St Stephen's chapel, Westminster, followed by her coronation on the 22nd. Plain and unassuming, Anne was devoted to Richard, helping him through severe depression. An educated woman, she used her influence, notably for the citizens of London (1392). On her death of the plague in 1394 at Richmond palace, Surrey, she was greatly mourned by Richard, who commissioned a magnificent tomb for her in Westminster abbey. She died childless.

SMC

**Anne Boleyn** (c.1507–36), 2nd queen of Henry VIII. The entanglement of personal motives with great political issues, which makes history both difficult and fascinating, is rarely more apparent than in Anne Boleyn's three years as queen to Henry VIII. She has been accused of bringing about the Reformation single-handedly. Sir Thomas Boleyn, descended from London merchants, was a courtier and became gentleman of the bedchamber to Henry VIII. Anne spent several years at the court of France. Returning in 1522 she was given a post in the household of \*Catherine of Aragon. The king's interest at this time was in her sister Mary, who became his mistress. Anne was dark-haired, with large eyes, composed and cultivated, with a mole on her neck and a malformed finger. By 1527 Henry was initiating annulment proceedings against Catherine, but not until 1532, it seems, did he and Anne become lovers—suggesting some steadiness of purpose on her part. Meanwhile her father had been given the Garter in 1523, created Viscount Rochford in 1525, and advanced to be earl of Wiltshire in 1529: her brother George was created Baron Rochford c.1530. Anne herself was made marchioness of Pembroke in September 1532. Henry's suit to the papacy had stalled. But early in January 1533 Anne knew she was pregnant and was married privately to Henry on the 24th. The birth of a princess, Elizabeth, on 7 September 1533 was a disappointment, but more ominous was a miscarriage in September 1534. The king was already beginning to look elsewhere: perhaps the excitement of the protracted chase had made the joys of possession rather brief. Publicly, Anne's position was strong—the Princess Mary had been declared illegitimate, and Anne's marriage was protected by a new Treason Law. But in January 1536 Catherine

## Anne of Cleves

of Aragon died—ironically a mishap for Anne, since it opened up the possibility of another marriage free from any dubiety. Anne was once more pregnant but at the end of the month, alarmed by news of Henry's heavy fall at a joust, she gave premature birth to a dead son. Henry was now paying marked attention to \*Jane Seymour, one of Anne's ladies-in-waiting. At the end of April 1536, Anne was accused of adultery with several men and incest with her brother George. On 2 May she was taken to the Tower, and just over a fortnight later, after a trial presided over by her uncle \*Norfolk, she was executed. The charges against her were preposterous and she denied them with dignity, but she had never been popular and they served their turn. Her daughter Elizabeth was deprived of her rank, but succeeded to the throne 22 years later. JAC

**Anne of Cleves** (1515–57), 4th queen of Henry VIII. The daughter of John, 3rd duke of Cleves, Anne was suggested by Thomas \*Cromwell as a wife for Henry VIII to strengthen the protestant alliance. On first meeting, in December 1539, Henry was dismayed to find her 'well and seemly . . . but nothing so fair as reported', alluding to \*Holbein's flattering portrait. He was persuaded to go through with the marriage in January 1540. Anne spoke little English and was not well educated, not sharing Henry's passion either for dance or music. Her jovial nature was not enough and Henry found her plain and homely. After Cromwell's fall and the swing in favour of catholicism, Henry sought swiftly to extricate himself, citing grounds of non-consummation, her earlier betrothal to a son of the duke of Lorraine, and, most tellingly, that he had never inwardly consented. The annulment was declared in July 1540, according Anne a handsome settlement and residences, on condition that she remain in England and accept the status of royal sister. Not surprisingly, Anne felt that she had fared rather well. Henry quickly remarried, making \*Catherine Howard his fifth wife. After Catherine's execution, there were rumours that Anne was to be recalled, and even that she was pregnant, but nothing came of it. She lived at Chelsea until her death in July 1557 and was buried with considerable ceremony at Westminster abbey. SMC

**Anne of Denmark** (1574–1619), queen of James VI and I. Anne was daughter of Frederick II of Denmark and Norway. The marriage to James VI on 23 November 1589 was followed by her coronation in May 1590. She was later suspected of favouring catholicism since she refused the sacrament at her coronation in England in July 1603. Her eldest son \*Henry Frederick, later prince of Wales, died in 1612, leaving his brother Charles (b. 1600) heir to the throne. Anne was interested in the arts, patronizing both Ben \*Jonson and Inigo \*Jones. An amiable woman, who enjoyed masques and dancing, her husband James, with a taste for theological disputation, found her frivolous. She suffered from gout and dropsy for many years, though her death in 1619 was sudden. She died intestate, leaving heavy debts. SMC

**Anne Neville** (1456–85), queen of Richard III. Anne was an important pawn in the ferocious political game of the later 15th cent. She was the second daughter of Richard Neville,

earl of \*Warwick ('the Kingmaker'). Her elder sister Isabella married George, duke of \*Clarence, one of Edward IV's brothers. In 1470 Anne was married to the young \*Edward, prince of Wales, heir to Henry VI. But her father was killed at \*Barnet in 1471 and her new husband at \*Tewkesbury, three weeks later. With the \*Yorkists temporarily on top, Anne was transferred to the other side and in 1472 became wife of Richard, duke of Gloucester, another of Edward IV's brothers, taking with her much of Warwick's former property. On Edward IV's death in 1483, Richard usurped the throne and Anne was crowned on 6 July. Her only son \*Edward, aged 8, was created prince of Wales in September 1483 but died in April 1484, leaving the royal couple childless. Richard became increasingly bitter and relations may have become strained. When Anne herself died in March 1485, speculation was rife and Richard was said to be casting around for a second wife. Her life as queen had lasted less than two years and her husband's as king did not last much longer. SMC

**Anselm, St** (1033–1109). Archbishop of Canterbury (1093–1109). Anselm was born at Aosta in northern Italy. We are especially well informed about his life because of the biographies written by Eadmer and the archbishop's own voluminous correspondence. Inspired by a monastic vocation, he travelled to northern France in the late 1050s, where he became a monk at Le Bec and a pupil of \*Lanfranc. Thereafter he rose to be both prior and abbot of the monastery. A great philosopher whose works include the *Monologion*, the *Proslogion*, and *Cur Deus homo*, his promotion to Canterbury in March 1093 occurred after William II had kept the archbishopric vacant for four years after Lanfranc's death in order to exploit its revenues. Anselm subsequently quarrelled bitterly with both William II and Henry I. His disputes with both kings ultimately focused on his belief that obedience was owed first and foremost to the papacy; those with Rufus also concerned Anselm's desire to protect the rights of Canterbury and his wish to reform clerical and lay morals. The arguments were given a sharper edge by the way in which the late 11th-cent. papacy, during the period known as the Gregorian reform, was asserting its moral and spiritual authority at the expense of long-established customs. By 1097 the breach between Rufus and Anselm was irreparable and the archbishop went into voluntary exile. He was recalled in 1100 by Henry I, who was anxious to give an appearance of legitimacy to his rule, and Anselm was for a time able to hold ecclesiastical councils and rule the church as he wished. In time fresh quarrels developed about the practice of lay investiture of bishops, still practised in England, although prohibited by the papacy since the 1070s, and in 1103 Anselm again went into exile. A settlement was not finally reached until 1106–7. The causes of these protracted quarrels remain difficult to interpret. In particular, the question of whether Anselm was a principled but other-worldly monk out of his depth in the rough-and-tumble of politics or an astute politician who calculatingly sought to increase the church's authority is the subject of a highly charged debate. Equally, while there is probably agreement that the kings should be seen as the protectors of the long-established

rights of the monarchy over the church in the face of dangerous innovations, some commentators regard the blasphemous and apparently cynical William Rufus as an oppressor whom no principled churchman could tolerate, while others think that he was mostly bluff and bluster. It is impossible to see Anselm as in any serious sense a revolutionary figure; his often-expressed wish to co-operate with kings and his determination to protect the property rights of his archbishopric—even against the papacy—clearly show this. But he possessed a sharper sense of the nature of authority and obedience than his Anglo-Norman contemporaries, a consequence undoubtedly of an outstanding philosophical mind, which made it difficult for him to accept compromises. He is in some respects representative of a changing intellectual and political climate, in which notions of authority were being redefined. His consistently expressed preference for the quiet world of the contemplative monk should not be allowed to conceal a robust personality who saw it as his God-given duty to engage with the world.

DB

**Anson, George, 1st Baron Anson** (1697–1762). A circumnavigator of the world, Anson shared some attributes with plundering Elizabethan ‘sea-dogs’ but his work also pointed Britain towards a modern commercial imperialism in the Pacific region. Entering the navy in 1712, Anson rose to command a Pacific expedition in 1739. He captured a Spanish treasure ship and sailed on westwards to reach home in 1744 a rich man. Further active service and politics qualified him for a peerage and spells as 1st lord of the Admiralty from 1751 to 1762. His careful reforms helped to ensure the naval triumphs of the \*Seven Years War.

RB

**anticlericalism**, hostility towards the church, occurs in every age, despite the existence of individual sanctity and devotion. One driving force behind the Cathar movement was abhorrence of ecclesiastical corruption and wealth. Later in England \*Wyclif criticized bishops as ‘dumb fools in the realm of hell’ and ‘devil’s proctors for dispersing the flock of Christ’. \*Chaucer drew attention to clerical avarice and worldliness. In 1376 the Commons, in presenting a petition ‘against the Pope and the cardinals’, said that clergy and chivalry had given place to simony and greed; the pope in Avignon did not feed his flock but sheared it. The statutes of \*Provisors (1351) and \*Praemunire (1353) reflected not just the king’s desire to protect his own authority, but also popular hostility towards clerical influence. This was also one of the driving forces of the 16th-cent. Reformation. Though ironically in England the years 1480 to 1530 were a great age of church building and piety, anticlericalism, strongly fuelled by \*lollardy and Lutheranism, was intense in the 1520s, for the church owned one-fifth of the wealth of England and its revenue was three times that of the crown. Besides ‘the pomp and splendour’ of worldly prelates, such as \*Wolsey, and criticism of ecclesiastical courts, pluralities, and tithes, articulated by increasingly well-educated lay contemporaries, many felt that this wealth could be better managed for educational and social needs. Even after the Reformation extreme sectarians despised Anglican clergy as ‘magicians, sorcerers, enchanters . . .’ The

clergy’s time-serving attitude in 1689 lost them further respect, for 95 per cent retained their benefices by readily transferring their allegiance from James II to William III. The removal of press censorship (1695) let loose a torrent of abuse which in \*Atterbury’s words encouraged ‘a settled contempt of religion and the priesthood’. Clerical internecine strife and electoral machination under Anne caused another tidal wave of Whig anticlerical legislation in the 1730s. Later in 18th- and 19th-cent. England anticlericalism rumbled on, though never with the political or religious intensity of catholic Europe; Anglican prelates were seen to add ‘plural livings almost as monopoly players acquire first houses, then hotels, in desirable sites’. A strong anticlerical strain in \*chartism designated the clergy as ‘the Church of a Selfish Aristocracy’ (1841). More dedicated clerical attitudes engendered by both \*evangelical and \*tractarian movements did much to dissipate this age-old antipathy.

WMM

**Anti-Corn Law League.** Agitation against the \*Corn Laws, which imposed duties on imported foodstuffs to protect British producers, increased after the Corn Law of 1815, and peaked in 1838–46. The creation of a Manchester Anti-Corn Law Association in 1838 led in 1839 to the establishment there of a national league. In 1839–40, it functioned solely as a propaganda organ, publishing attacks on the Corn Laws and sending out agents to preach free trade. This achieved nothing; the movement was short of money and had little prestige. Its leader, Richard \*Cobden, advocated direct political involvement, and the league contested a by-election at Walsall early in 1841. Its candidate was beaten, but his intervention forced the withdrawal of a moderate Whig opponent of free trade, gave the seat to a Conservative, and showed that the league did have some muscle. In the general election of 1841, a few free traders were returned, including Cobden himself, who proved a competent parliamentary spokesman. The league’s organization became increasingly sophisticated, and in 1843 *The Times* described it as ‘a great fact’ and claimed that ‘a new power has arisen in the State’. Centred in Manchester, despite a nominal move to London early in 1843, the league, under the chairmanship of an able organizer, George Wilson, became a model for later political agitations. It fought elections, and sought to multiply supporters on the electoral registers and expel opponents, by exploiting the registration provisions of the 1832 Reform Act. Propaganda continually increased in scope and variety. Considerable sums of money were raised, much of it from industrial interests who resented the dominance of the landed aristocracy and believed that protection of agriculture was an impediment to other commerce. In 1843 Cobden was joined in Parliament by John \*Bright, and their rhetorical partnership proved effective in and out of Parliament. Prevailing economic doctrines advocated the removal of impediments to trade, while the league mobilized moral and even religious arguments against the Corn Laws, which allegedly increased the price of ‘the poor man’s bread’. The irruption of the league into electoral politics quickened Whig conversion to free trade. The Conservative leader \*Peel won the 1841 election, but his commitment to the

## Antigua

Corn Laws weakened. Peel's budgets of 1842 and 1845, together with other measures such as the Canada Corn Act of 1843, cut tariffs and increased the isolation of the Corn Laws. No disaster followed this sequence of reforms, but instead a substantial recovery from the depression years of 1838–42. In 1845 and again in 1846, the potato crop, on which many Irish had become dependent, suffered a catastrophic failure, threatening widespread starvation. Peel decided that all obstructions to the import of food must go, including the Corn Laws. This split the governing Conservative Party, but with the aid of opposition forces, including Whigs and the league, Peel was able to repeal the Corn Laws in 1846. The league would never have been able to secure repeal by its own power, and its role in the final crisis was exaggerated at the time and later. NMCC

**Antigua** is one of the Leeward Islands in the eastern Caribbean. With Barbuda it forms an independent state within the Commonwealth. It was visited and named by Columbus but colonized in the 17th cent. by English settlers. The island relies upon agricultural exports and tourism. JAC

**Anti-Jacobin.** A weekly journal which ran from November 1797 until July 1798 under the editorship of William Gifford. Its prospectus declared its prejudices in favour of the established institutions of church and state, and its satire was directed against British radicals—\*Paine, \*Godwin, Holcroft, Thelwall—and their Whig allies, with side-swipes at the Noble Savage, sensibility, and Gothick. The contributors included \*Canning, George Ellis, John Hookham Frere, and the cartoonist James \*Gillray. On its demise it was succeeded by a monthly periodical review of the same name. Among its more savage and memorable items is the denunciation of the Whig as 'the friend of every country but his own', and Canning's celebrated 'The Friend of Humanity and the Knife-Grinder', in which the latter's supine contentment provokes the Friend to 'kick the Knife-Grinder, overturn his wheel, and exit in a transport of republican enthusiasm and universal philanthropy'. JAC

**antinomianism** ('against the law') held that the moral law was not a rule of life for believers, the opposition of matter and spirit implying the indifference of bodily functions. It was an occupational hazard of \*Lutheranism and \*Calvinism alike, lurking in the doctrine of justification by faith alone and the righteousness implied by such faith. Propounded during the Reformation by the Lutheran John Agricola, it was taken up by some \*anabaptists, and championed in England by Tobias Crisp (1600–43), flourishing in the 1650s. Its most egregious 18th-cent. representative was William Huntington, *Sinner Saved* (1745–1813), and its most telling refutation was Fletcher of Madeley's *Checks to Antinomianism* (1771). CB

**Antiquaries, Society of.** Founded in 1707 by a group of like-minded men meeting weekly at the Bear tavern in the Strand (London), it has had continuous existence since 1717. Gaining a royal charter (1751), then launching *Archaeologia* (1779), it moved to its present home, Burlington House, in 1875. ASH

**anti-slavery.** Slavery was regarded in later 18th-cent. Britain as essential to the exploitation of the West Indian colonies where, it was believed, only negroes were capable of working on the sugar plantations. As those colonies were thought to be the keystone of imperial prosperity there was strong opposition to any interference with the institution, particularly from centres like Bristol and Liverpool whose economies depended on the plantations or on the Atlantic slave trade which supplied them.

The moral objections to slavery arose mainly from the \*evangelical movement of the second half of the century, reflecting concern for the spiritual and physical welfare of all mankind. A national committee of nine quakers and three Anglicans was set up in London in 1787, headed by Granville \*Sharp with Thomas \*Clarkson as secretary. It was decided to aim first at the suppression of the slave trade, whose cruelty was the subject of widespread propaganda. In 1788 William \*Wilberforce, the son of a Hull merchant, joined the cause after his evangelical conversion, and supplied parliamentary leadership. He persuaded his friend William \*Pitt to give it unofficial backing and committees were set up in provincial towns, the most active being in Manchester. Over a hundred petitions were submitted in support of Wilberforce's parliamentary motion to end the trade in 1789. However, the economic arguments in favour of the trade prevailed, and after another unsuccessful attempt in 1791, the abolitionist cause suffered from the reaction against the French Revolution. The agitation was revived by Clarkson's speaking tours in 1804, by which time the economic importance of the West Indies had lessened, and in 1807 Lord \*Grenville, an early convert, gave his government's backing to an abolition bill, forcing it through the Lords.

The campaign to abolish slavery itself throughout the British empire began in earnest in 1823, when the Anti-Slavery Society was formed in London by evangelicals, quakers, and methodists. The leaders included James Cropper, a quaker merchant from Liverpool, Joseph Sturge, a Birmingham corn merchant, and in Parliament Henry \*Brougham, T. F. \*Buxton, T. B. \*Macaulay, and Wilberforce. A campaign during the 1830 general election encouraged \*Grey's government to put through a bill abolishing slavery in the British empire in 1833, substituting apprenticeship for seven years. This vestige of slavery was abolished from 1 August 1838. The movements against slavery and the slave trade marked an important stage in the development of middle-class pressure groups both in London and in the industrial provinces. See also SLAVE TRADE. EAS

**Antonine Wall.** The second and more northerly of the two walls constructed across northern Britain by the Romans in the 2nd cent. On the death of \*Hadrian in AD 138 his successor Antoninus Pius demonstrated his military capabilities by reoccupying Scotland up to the Forth–Clyde line. Following the example of his predecessor he had a linear barrier constructed, running from the Forth, west of modern Edinburgh, to the Clyde, west of modern Glasgow. Only half the length (37 miles) of Hadrian's Wall, the Antonine Wall was constructed of turf on a stone base. It apparently

differed from the earlier wall in having forts of varying sizes at intervals, supposedly the better to deal with local conditions. It also seemingly lacked the milecastles and turrets of Hadrian's Wall. Recent excavations have shown that in fact the Antonine Wall was laid out as a version of Hadrian's Wall and construction was well advanced before the changes which distinguish it were implemented. The wall was briefly abandoned, then reoccupied in the mid-150s, and abandoned for good after Antoninus' death in 161. ASEC

**Antrim** was until 1973 one of the six counties of Northern Ireland, with close links with Scotland, 13 miles distant from Torr Head: there is a major ferry route from Larne to Stranraer and Cairnryan. The county is bounded on the west by the Bann, and to the south by Lough Neagh and the Lagan. The Giant's Causeway is off the north coast and Belfast Lough indents the south-east coastline. The Glens of Antrim are in the north-east corner. Carrickfergus castle was built by John de Courcy in the 1170s and Antrim, Lisburne, Larne, Ballymena, and Coleraine developed as market towns before the spectacular growth of Belfast in the 18th and early 19th cents. Farming was diversified by the linen industry and in the 20th cent. by synthetic fibre production. The county has the smallest Roman catholic population in Northern Ireland and its three parliamentary seats were held in 2001 by the Ulster Unionist Party (two) and the Democratic Unionist Party (one, Ian Paisley). JAC

**Anzacs.** The Australian and New Zealand Army Corps was raised at the beginning of the First World War. Australia, with a population of 5 million, raised 322,000 volunteers, of whom 60,000 lost their lives—one of the highest casualty rates. New Zealand, with 1.1 million people, raised 124,000 troops, of whom 17,000 died. They took a major part in the 1915 landings at Gallipoli, a plan imaginative in concept, disastrous in execution. The Anzac establishment of a bridgehead on 25 April was met by savage resistance from the Turks, stiffened by their German allies. Anzac cove was evacuated in December 1915 and most of the survivors moved to the Western Front. 25 April is commemorated as Anzac day. JAC

**Apology of the Commons, 1604.** Less an apology than a vigorous assertion of parliamentary rights. It arose out of a dispute over the electoral return for Buckinghamshire, the Commons insisting that they were the sole judge of their own elections. Though the matter was compromised, they resolved to address the king. The apology was couched in respectful terms—James I was 'a king of such understanding and wisdom as is rare to find in any prince in the world'—but the House maintained that its privileges were of right, not of grace. 'The prerogatives of princes may easily and do daily grow,' James was advised. In these exchanges may be seen the shape of things to come. JAC

**Appeals, Act in Restraint of (1533).** The Act (24 Hen. VIII c. 12), largely the work of Thomas Cromwell, was a crucial step in Henry VIII's assertion of royal supremacy against the papacy. He had already moved against the clergy with accusations of praemunire and in 1532 forbade the payment of

\*annates or first fruits to Rome. The Act, passed in the first week of April, forbade appeals to Rome and had two objectives—to allow Cranmer to give a ruling on Henry's marriage to Catherine of Aragon which could not be appealed, and to intimidate the pope generally. The preamble declared majestically that 'this realm of England is an empire . . . governed by one supreme head and king . . . furnished with plenary, whole and entire power . . . without restraint or provocation to any foreign princes or potentates of the world'. A week later Anne Boleyn appeared as queen and six weeks later Cranmer declared that Henry's marriage to Catherine had been invalid. JAC

**appeasement** is generally used to describe the policy towards Nazi Germany pursued by Prime Minister Neville Chamberlain between 1937 and 1939, and has purely negative connotations. In fact, appeasement had a more respectable history and passed through several phases. British unhappiness with the vindictive reparations required to be paid by Germany after the First World War led to a policy of economic appeasement. Originally fixed, in 1921, at £6,600 million, the reparations total was reduced by almost three-quarters under the Young Plan of 1929. During the early years of Nazi rule in Germany (1933–6) a policy of economic appeasement also operated in relation to trade; in April 1933 an Anglo-German Trade Pact was concluded by Ramsay MacDonald's National Government, in the belief that although the Nazis were not likeable, one ought to do business with them.

Anglo-French acquiescence in Hitler's remilitarization of the Rhineland (March 1936), in violation of the treaties of Versailles and Locarno, marked a new phase of appeasement. In political circles in Britain, the Versailles settlement was widely blamed for the rise of the Nazis, and of Nazi sympathies amongst many ethnic Germans who, after 1918, found themselves excluded from Germany proper. In March 1938 Hitler ordered the *anschluss*, the union with Austria forbidden at Versailles, and almost at once indicated his determination also to meet the demands (real or imaginary) of Germans living in the Sudetenland, in Czechoslovakia, for union with Germany. Chamberlain could count on British public opinion for support of a policy aimed at giving the Nazis what they wanted. At Munich, on 29 September 1938, the Sudetenland was transferred to Germany, whilst more Czech territory was ceded to Poland and Hungary. Chamberlain, who visited Hitler twice during this crisis, was a national hero. Only after the German occupation of Prague (March 1939) was appeasement abandoned.

In its final phase, appeasement was an emergency measure. But it gave Britain a valuable year in which to rearm.

GA

**appellants.** Richard II's political opponents of 1387–8 are known as the appellants, for it was by means of the legal process of appeal that they proceeded in Parliament against the king's ministers and friends. The king had been humiliated in Parliament in 1386, when his chancellor Michael de la Pole, earl of Suffolk, was impeached. Richard's attempts to restore royal authority in the next year led to a short civil war, in which his favourite Robert de Vere, earl of Oxford,

## Apprentice Boys

was defeated at \*Radcot Bridge. In the \*'Merciless Parliament' of February 1388, Richard's five chief opponents, the earls of \*Gloucester, Arundel, Warwick, Derby, and \*Nottingham, appealed Suffolk, de Vere, the archbishop of York, Robert \*Tresilian (the chief justice), and Nicholas Brembre of London, accusing them of treason. The appeal was a long-established process in common law, but had not been employed in this way previously in Parliament. Legal argument was dismissed, and judicial combat rejected; the process permitted no right of reply. Tresilian and Brembre were promptly executed; the archbishop of York was translated to St Andrews, while Suffolk and de Vere both died in exile. In 1397 Richard II revenged himself on the appellants, engineering an appeal against Gloucester, Warwick, and Arundel. MCP

**Apprentice Boys.** The Apprentice Boys are an Ulster loyalist organization whose title celebrates the thirteen apprentices who shut the city gates of Derry before the Jacobite siege (April–July 1689). The commemoration of the siege by the Williamites of Derry began possibly in 1692, though it only became an annual event after c.1790: the first Apprentice Boys Club appears to have been formed in 1714. With the shifting sectarian balance in the city in the 19th cent. the Apprentice Boys took on a more defensively protestant character. Like the \*Orange order, the movement appears to have been in abeyance in the second quarter of the 19th cent., but to have enjoyed a growth after c.1850. The Apprentice Boys remain in existence, with a membership of around 10,000. AJ

**apprenticeship** refers to the period of service as a learner of a trade or handicraft. The apprentice, usually a boy at the beginning of his working life, is bound by a legal agreement to serve an employer for a fixed number of years in which the employer is reciprocally bound to instruct him. The system developed during the Middle Ages when guilds of craftsmen in particular trades, such as silversmiths and shoemakers, established control of their trades by regulating the number of recruits and their training. Contracts, or indentures, were enforced strictly and governed the premium to be paid for learning, the length of the training (usually seven years), and, in some cases, where apprentices lived. The statute of \*Artificers of 1563 gave magistrates power to compel compliance with apprenticeships. At the end of their apprenticeships trainees became journeymen, fully skilled tradesmen. If they could afford to set up in business they became masters in their own right. Apprenticeships were criticized as a system by which employers were enabled to pay low wages to a person whose skills might have been acquired in a relatively short time. Over time the power of many trade guilds declined and there were changes in the apprenticeship contracts. Amongst the more important was a reduction in the length of time to be served.

Apprenticeship in a wide variety of traditional skilled work continued into the second half of the 20th cent. However, challenges to such 'training on the job' combined with expanding provision of formal technical education led to a decline in traditional apprenticeship and the growth of full-

and part-time education as a means of entry into skilled work. IJEK

**Aquitaine.** Rich wine-producing region in the south-west of France. Originally a province in Roman Gaul, after the 9th cent. Aquitaine became a more or less independent duchy in the kingdom of France. In 1154 when \*Eleanor of Aquitaine's husband became King Henry II, the duchy became one of the king of England's dominions and remained so, though within fluctuating borders, until 1453. Until Edward III claimed the French throne for himself, the kings of England (as dukes of Aquitaine) owed homage to the kings of France. In 1202 King Philip Augustus pronounced the confiscation of all John's fiefs in France. While Eleanor of Aquitaine lived this had little effect in her duchy, but when she died in 1204 most of the lords and towns of inland Poitou (northern Aquitaine) transferred their allegiance to Philip. In 1224 Louis VIII conquered La Rochelle and the remainder of Plantagenet Poitou. This left a duchy of Aquitaine comprising little more than \*Gascony and from then on the two names were used interchangeably. Continuing Anglo-French disputes over the status of Aquitaine contributed to the outbreak of the \*Hundred Years War in the 1330s. By the treaty of \*Brétigny (1360) Edward III obtained Poitou and in consequence the Black Prince was briefly prince of a greater Aquitaine, but when war was renewed in 1369 these gains were soon lost. From then on the history of 'English' Aquitaine was essentially the history of Gascony. JG

**Arbroath, declaration of.** The name usually given to the letter of the Scottish barons to Pope John XXII, dated at Arbroath on 6 April 1320, which proclaimed the ancient independence of Scotland and denounced English efforts at conquest. It was part of Robert I of Scotland's response to his threatened excommunication for failing to observe papal demands for a truce. On receipt of the letter, the pope suspended the proceedings which he had taken against the Scots, and called on Edward II to make peace. The letter attracted little attention till the late 17th cent. when it was published during efforts to maintain the integrity of Scotland; since then it has often been described as a Scottish 'Declaration of Independence'. BW

**Arbroath abbey.** The \*Tironensian (reformed Benedictine) abbey of Aberbrothoc was founded in 1178 by William 'the Lion' (buried there, 1214); munificently endowed by him, it became one of the wealthiest and most privileged religious houses, with 'mitred' abbots. The declaration of \*Arbroath was signed there in 1320. After 1502 the abbots were replaced by 'commendators' (loyal servants of the crown); with the Reformation, the abbey estates passed to the Hamilton family, while the ruinous buildings became quarry material for much of the modern burgh. ASH

**Arch, Joseph** (1826–1919). Trade unionist and politician. Arch was the son of a Warwickshire farm labourer and began work on the farm at the age of 9 scaring birds. He gained experience in public speaking as a primitive Methodist lay preacher and in 1872 launched a National Agricultural Labourers' Union. It had considerable success and wages on

farms improved, though numbers dwindled in the face of strong counter-attacks by landlords and farmers. Arch entered Parliament as a Liberal in 1885 but was defeated the following year: he served again from 1892 until 1900—the first farm labourer in the House of Commons. He published an autobiography in 1898. JAC

**archaeology** as a discipline attempts to reconstruct the origin, prehistory, and history of the human race using material remains such as artefacts, settlements, earthworks, burials, and skeletal remains. It also uses evidence for human impact on the natural environment such as pollen, soil erosion, and animal and plant remains. Though it had its origins in history and art history in the last century, it has developed its own theoretical and methodological base, drawing on anthropology and geography for models, on biology for environmental reconstruction, geology for excavation techniques, and the natural sciences for analytical and dating methods. It thus encompasses in a unique way the arts, social sciences, and natural sciences.

Its relationship with history started as merely a means of illustrating or verifying information derived from written sources. However, increasingly archaeology has been able to fill in gaps, for areas and periods where written sources are rare or lacking, for aspects of society not covered in the texts, or even providing alternative or contradictory hypotheses to those based on historical evidence. However, like written sources, there are inbuilt biases, due to the processes of deposition and survival of archaeological data, the selection of field methods and excavation techniques, and the skills of observation and academic viewpoint of the excavator ('archaeologists only find what they are looking for').

In the 19th cent. archaeology rapidly established itself as the only means of studying pre-literate societies, and the great civilizations such as those of Egypt and Mesopotamia where written archives could be recovered. For societies where historical sources already existed, archaeology was marginal, and concerned primarily with antiquarianism or art history, the discovery of objects primarily for their intrinsic artistic quality, such as the sculpture and painted pottery of classical Greece, or the uncovering of plans of temples, churches, and castles.

With the shift in interest to social and economic questions, such as the nature of early farms, villages, and settlement patterns, archaeology came into its own, not only to illustrate the physical nature of, for instance, buildings described in the written documents, but also to answer questions on which the written sources were silent. In the period between the wars the lead was taken by southern Scandinavia. In northern Germany there were excavations such as those of the Viking trading port of Hedeby, or of the raised villages or terps of the Frisian coast. In Denmark the leading archaeologist was Gudmund Hatt who concentrated on settlements of the Germanic and Viking Iron Ages, reflecting the interests of the politically important Danish farming communities in their origins and environmental setting.

In Britain it was not until the 1950s that social and economic paradigms made their mark on archaeology, with excavations such as those by Brian Hope-Taylor of the

Northumbrian palace complex at \*Yeavering, or Maurice Beresford and John Hurst who initiated the study of the origin and demise of the deserted medieval village of Wharham Percy in North Yorkshire. In both cases the excavators consciously introduced the Scandinavian techniques of 'open area excavation', the stripping of large surfaces which are then systematically cleaned and recorded layer by layer. While respecting the stratigraphical sequence, this technique allows a better understanding of the ephemeral stone and timber buildings which are the norm in peasant societies. In the 1960s it was gradually adopted by prehistorians and finally Roman archaeologists, as their interests shifted from narrow culture-historical and historical interpretations to more socio-economic problems.

The new methods had a major impact on urban archaeology, as the town became envisaged more as an organic whole. Massive open area excavations of complex stratified sites in cities such as \*Winchester and \*York in the 1960s produced huge quantities of data and finds, forcing an increased specialization of archaeology in the 1970s. In many cases permanent teams, or 'units', were established to monitor urban renewal and excavate threatened sites, though only now has computerization allowed adequate recording techniques to be developed. This work has revolutionized our knowledge of urban development, and new scientific techniques such as dendrochronological dating are providing detail of a precision which can rival that of the written sources. See also INDUSTRIAL ARCHAEOLOGY. JRC

**archbishops** are, literally, chief bishops. By the 5th cent. AD the title was applied to the occupants of sees of major ecclesiastical importance, particularly those of metropolitan bishops. This designation originated in the bishop of the principal city of a district or division of a country, the *metropolis*, being the usual president of any assembly of bishops of that area. Ecclesiastically, such a district or division formed a province.

In western catholic Christianity many provinces reflected the divisions of the Roman empire. Thus Milan, residence of the emperors during the 4th cent., became the metropolitan see for much of northern Italy, and Arles, capital of Gaul and residence of the Roman governor, attained metropolitan status in 417. There is little evidence to suggest that, prior to the withdrawal of the Roman legions, the church in Britain was organized along provincial or metropolitical lines. Not until the arrival of \*Augustine (597) was \*Canterbury established as an archbishopric, and \*York did not become a separate province until the 8th cent.

In the Middle Ages the archbishops of Canterbury possessed wide powers. They could hold visitations of all the dioceses in the province and exercise spiritual oversight of any vacant see. They also confirmed and consecrated (but did not nominate) bishops-elect of dioceses in their province, and, by delegation to their archdeacons, enthroned them in their cathedrals.

However, attempts by Canterbury to assert its precedence over York were fiercely resisted, particularly in the 11th and 12th cents. The argument was not resolved until the 14th cent.—in Canterbury's favour. The attempt to

## archdeacons

establish a third archbishopric, at \*Lichfield, in the late 8th cent., was short-lived.

The independence of the Scottish bishops from the province of York was recognized by Pope Celestine III in 1192, though the primatial see (\*St Andrews) was not raised to archiepiscopal status until 1472. \*Glasgow became an archbishopric in 1492. The title of archbishop ceased to be used for these two sees of the episcopal church in Scotland after the revolution of 1688. Since 1704 the chief bishop of the Anglican church, designated the Primus, is elected from among the Scottish diocesan.

In Ireland \*Armagh, \*Cashel, \*Dublin, and \*Tuam all achieved archiepiscopal status during the 12th cent., the primatial see being at Armagh. The number of Anglican archbishoprics was reduced to two (Armagh and Dublin) by the Ecclesiastical Commission in the 1830s. JRG

**archdeacons.** Literally chiefs of the deacons. The office traces its origins to the New Testament church, where the ministry of Stephen and others is described in the Acts of the Apostles as their *diaconia*. The term *archidiaconus* emerged in the 4th cent., when Caecilianus was referred to as archdeacon of Carthage. He was the chief administrative assistant of the bishop in the diocese. As dioceses were established and grew in size, their bishops delegated administrative authority in a specified area to an archdeacon, thus giving him a territorial title, e.g. archdeacon of Cleveland, a practice discernible in England by the late 12th cent. The archdeacon became in effect an intermediary between the bishop and the parochial clergy. From the mid-12th cent. archdeacons held regular visitations, and following the third Lateran Council they became responsible for ensuring that church buildings and other church property in their jurisdiction were kept in repair. JRG

**archery** developed as a sport from the use of the bow and arrow in hunting and warfare. The English and Welsh long bow dominated the battlefield from the 11th to the 15th cent., and governments frequently forbade other sports, particularly football, in order to encourage archery practice. When guns developed and the bow became redundant as a weapon, the sport was maintained. The Company of Archers, founded in Edinburgh in 1676, eventually became a royal bodyguard. The Royal Toxophilite Society was established in 1781. The Grand National Archery Society, set up in 1861, developed into the national body and an international organization, the Fédération Internationale de Tir à l'Arc (FITA), was established in 1931. Archery was introduced into the Olympics in 1900, dropped in the 1920s, but brought back in 1972. JAC

**Arches, Court of.** This was one of the ecclesiastical courts. Before and after the Reformation, appeal from the consistory court of the diocese lay to the court of one of the two archbishops, York or Canterbury. The Court of Arches was the court of the Archbishop of Canterbury. It sat in the church of St Mary-le-Bow in London, acquiring its name from that venue since that church is built over arches. The court still hears appeals relating to clergy discipline in the Church of England as well as disputes over the

ordering of churches and the rules relating to burials in church grounds. MM

**architecture.** British architecture has a strongly national character, often nurturing indigenous traditions while at the same time developing distinctive, and occasionally imitative, versions of European or international styles. Scottish architecture tended to develop independently (to some extent even after the union of the crowns in 1603), until the Act of \*Union of 1707. Here castles, towers, and fortified manor houses, often with turrets and 'crow-stepped' gables, predominated during the Middle Ages; the 16th and 17th cents. saw the beginnings of the \*Renaissance, with a distinct French influence.

In England, after the Norman Conquest, Saxon architecture, often of wooden construction, was replaced by 'Norman'; this was, in effect, a version of the European Romanesque style, with fine ashlar masonry, heavy columns, and round arches. The Normans built castles and cathedrals which were not only centres of power in their own right, but symbolized the cultural and political superiority of the new regime.

The Gothic style flourished from c.1200 to the early 16th cent., with many uniquely British developments such as the late 'Perpendicular' phase. Further potential development along Gothic lines was curtailed by Henry VIII's \*dissolution of the monasteries in 1536. Henry's break with Rome over his divorce from Catherine of Aragon inhibited possible Italian Renaissance influence, then permeating Europe, as a result of which Tudor architecture often exhibits a curious mixture of Gothic, and half-digested Renaissance forms borrowed from German or Flemish pattern books. However, the Elizabethan and Jacobean periods saw the development of the first great aristocratic country houses (the so-called 'prodigy houses' such as \*Longleat, Wiltshire (from 1553), Burghley, near Stamford (1575–85), Wollaton, Nottinghamshire (1580–8), and \*Hatfield, Hertfordshire (from 1611)). The era also witnessed the emergence of the first designers to whom the word 'architect' was applied: John Shute (fl. 1550–70) was the first native architect to go to Italy and published in 1563 *The First and Chief Groundes of Architecture*, while Robert Smythson (c.1536–1614) had a substantial hand in the design of both Longleat and Wollaton.

Meanwhile, a more European culture was developing around the Stuart court; Rubens and \*Van Dyck were given patronage as was Inigo \*Jones (1573–1652), who made at least two lengthy visits to Italy. Jones's surviving works, much inspired by Andrea Palladio (1508–80), include the Queen's House, \*Greenwich (1616–35), and the \*Banqueting House, Whitehall (1619–22). Jones brought Britain once again into the mainstream of European architecture but was essentially a court architect and the Civil War prevented any widespread dissemination of his ideas. The Restoration saw the reintroduction of classicism, but in a different form. The architects of the 'English baroque' (c.1660–c.1720) turned for inspiration to the Italian baroque and to contemporary French architecture, although adapting this to English, and in ecclesiastical terms, specifically

Protestant, taste. They include: Sir Christopher \*Wren (1632–1723)—many churches in the city of London following the Great Fire of 1666 and, above all, \*St Paul's cathedral (begun 1666); Nicholas \*Hawksmoor (1661–1736)—the churches of St Mary Woolnoth (1716–27) and St George, Bloomsbury (1720–30), both in London, and Easton Neston House, Northamptonshire (completed 1702); and Sir John \*Vanbrugh (1664–1726)—\*Castle Howard, Yorkshire (1699–1726), \*Blenheim, Oxfordshire (1704–20), and Seaton Delaval, Northumberland (c.1718–29).

Following the Act of Union and the establishment of the Hanoverian dynasty, a desire to create a specifically British, rather than English, national identity saw the rise of the Palladian style (c.1720–c.1760). Numerous country houses (invariably surrounded by landscaped parks) and villas were built in this style: harmonious, symmetrical, and perfectly proportioned, so much so that practical considerations were often sacrificed for the correct adherence to classical rules.

The country house during the first half of the 18th cent. became virtually an emblem of cultural and political authority (e.g. \*Holkham Hall, Norfolk, mainly by William \*Kent, from 1734). One of the initiators of Palladianism was Richard Boyle, 3rd earl of \*Burlington (1694–1753), whose villa, Chiswick House, near London (c.1723–9), was inspired by the Villa Rotunda, near Vicenza, by Palladio himself. Palladian architects include Colen Campbell (1676–1729), William \*Kent (1685–1748), the latter closely associated with Burlington and also a painter, designer, and landscape gardener, and James Paine (1717–89). Palladian principles were also successfully adopted in the planning of cities and towns, as at Bath, and in the development of London's Georgian streets and squares.

By the third quarter of the century there was some reaction against this established taste; Robert \*Adam (1728–92) was able to create a fashionable style based on the introduction of neo-classical elements culled principally from the antique. Indeed, increasing interest in antiquity led to the 'Greek Revival' and to the further development of the \*Gothic Revival, the origins of which lie earlier in the century. Sir John \*Soane (1753–1837) developed an extremely personal neo-classical style, as in his now largely demolished works at the Bank of England from 1788, and played a part in architectural education and in furthering the status of the profession. His rival John \*Nash (1752–1835) was a versatile exponent of Picturesque architecture and was responsible for George IV's metropolitan 'improvements' in the area of what is now Regent's Park, London (1821–30).

The 19th cent. saw a continuing emphasis on stylistic revivals, particularly the Gothic Revival; Victorian architecture tends to be large in scale and highly decorative, reflecting the era's wealth and prosperity. Major Victorian architects include: Sir Charles \*Barry (1795–1860), A. W. N. \*Pugin (1812–52)—collaborators in the neo-Gothic rebuilding of the Houses of \*Parliament after 1835—Sir G. G. \*Scott (1811–78), Norman Shaw (1831–1912), and G. E. Street (1824–81). Late in the century, the Arts and Crafts movement, influenced by the ideas of William \*Morris (1834–96), rejected the dependence upon historical styles in design. An extremely

talented exponent of Arts and Crafts ideas in his early work, and of classicism in his later, was Sir Edwin \*Lutyens (1869–1944).

Twentieth-cent. British architecture tended to be conservative, apart from the work of comparatively isolated figures such as the Glaswegian Charles Rennie \*Mackintosh (1868–1928), at least until the Second World War; after this European modernism, with its simplified, functional forms, became universally accepted, partly due to the need for urban reconstruction. Major works of British modernism include the Royal Festival Hall, London (completed 1951 to the designs of Leslie Martin and Robert Matthew) and Coventry cathedral by Sir Basil \*Spence (completed 1961); also the New Towns of the 1950s and 1960s and many inner city housing estates (some of which are now regarded less sympathetically than at the time of their construction). A version of modernism, emphasizing the use of exposed concrete, became known as 'brutalism'; Sir Denys Lasdun's National theatre, South Bank, London, and the nearby Hayward Gallery/Queen Elizabeth Hall complex are examples of this (both designed in the 1960s). More recently, 'high-tech.' architecture, which celebrates the most up-to-date use of technology, has become important, as with Sir Richard Rogers's Lloyd's of London Building and Sir Norman Foster's Stansted Airport, Essex (both completed during the 1980s).

Throughout the British Isles there was a strong tradition of vernacular architecture until at least the 19th cent., when more standardized forms of design took over as a result of improved communications, the growth of the architectural profession (the Institute, later the Royal Institute, of British Architects founded 1834), and, with this, the influence of books and magazines. This makes use of local materials and techniques and therefore differs according to the region in which it is found. It tends to be relatively plain and functional, although it may incorporate features from 'high' or 'polite' styles.

**archives.** See RECORD OFFICES.

**Arcot, siege of,** 1751. Robert \*Clive, a young captain in the army of the \*East India Company, while attempting to relieve Mahomet Ali in Trichinopoly, was besieged in Arcot by a vastly superior French and Indian force. He defended it for fifty days until help came. It was Clive's first major victory and a check to French progress in the Carnatic. JAC

**Areopagitica,** an impassioned plea by John \*Milton (1644) for liberation of the press to a Parliament occupied with perceived offences by writers and printers, was written in response to the Licensing Ordinance of 1643 that no book should be printed unless previously approved by an authorized officer. Although aware that liberty was double-edged, Milton abhorred such control before rather than after publication, associating it with censorship in catholic countries and regarding it as discouragement to learning. He was ignored. The licensing system eventually lapsed in 1694, but

## Argyll

moral and practical problems relating to \*censorship remain. ASH

**Argyll, Archibald Campbell, 5th earl of** [S] (1532–73). A committed protestant whose political allegiances frequently changed and, at times, seemed inconsistent with his religious convictions. Signing the first 'Common Band' of the protestant nobles as Lord Lorne (1557), Argyll succeeded his father in 1558. However, he did not formally join the lords of the \*Congregation until May 1559. During the personal reign of Mary, queen of Scots, Argyll was a favoured privy counsellor until charged with treason on 5 December 1565, for his part in \*Moray's rebellion against \*Darnley. Having been reconciled with Mary in the spring of 1566, Argyll was later appointed lieutenant of her forces, losing at \*Langside in 1568. Abandoning the Marian cause to support James VI, he was made a privy counsellor by \*Mar in September 1571. On 17 January 1573, Argyll was appointed chancellor by \*Morton, an office he held until his death nine months later. PER

**Argyll, Archibald Campbell, 1st marquis of** [S] (c.1607–61). Campbell's father, the 7th earl, became a catholic, fought in the Spanish army in the Netherlands, and was declared a traitor in 1619. Campbell, as a protestant, took over the enormous estates at the age of 12, and succeeded to the earldom in 1638. His subsequent conduct was erratic, even granted the confused situation. A violent \*covenanter in 1639–40, he made terms with Charles I in 1641 and was advanced to the marquissate. He then rejoined the covenanting party but was routed by \*Montrose at \*Inverlochy and \*Kilsyth in 1645. Next he joined in welcoming Cromwell but in 1651 took part in Charles II's coronation at Scone, having been promised a dukedom and the Garter. He made his peace with the Cromwellian regime and served in the Parliament of 1659 as MP for Aberdeenshire. In 1660, at the Restoration, he set off to London to welcome back Charles II, but was arrested, and executed at Edinburgh. A small, red-headed, squinting man, Clarendon described him as of 'extraordinary cunning', though in the end his contorted tergiversations overwhelmed him. But he explained ruefully that he had lived in a 'distracted time'. JAC

**Argyll, Archibald Campbell, 9th earl of** [S] (1629–85). Campbell's father, the 1st marquis, had played an equivocal part in the civil wars and in 1661 was executed for treason. Campbell, who had fought on the royal side at \*Dunbar and \*Worcester, was restored to the earldom in 1663. His presbyterian sympathies placed him in jeopardy during James, duke of York's government of Scotland, and in 1681 he was accused of treason and lodged in Edinburgh castle. He escaped in disguise and joined \*Monmouth in Holland. Involved in the \*Rye House plot, he led an expedition to raise the west of Scotland in May 1685 to coincide with Monmouth's rising in the south-west of England. There was little support, divided counsels, and he was captured. Executed at Edinburgh, where his father had suffered before him, Argyll died with composure and bravery. JAC

**Argyll, Archibald Campbell, 10th earl of** (d. 1703). Scottish politician. Following the attainder and execution in 1685

of his father, the 9th earl, Argyll's chief objective was to assume his patrimony as head of the Campbell clan. Failing to obtain recognition from James II, he joined William of Orange in 1688 and accompanied him to England. Accordingly, he was admitted as earl of Argyll to the convention of Scottish estates in April 1689 which declared in favour of William and Mary, and in June his father's attainder and forfeiture of Campbell lands was rescinded. The political restoration of the house of Argyll, with its assertive leadership over the presbyterian Campbells, did much to quell lingering Jacobite unrest among other clans. By the mid-1690s he and the marquis of \*Queensberry effectively led the court interest in Scotland, though their alliance was frequently under stress. He was created a duke in 1701.

AAH

**Argyll, Archibald Campbell, 3rd duke of** [S] (1682–1761). Campbell succeeded his brother John in 1743, having been created earl of Islay [S] in 1706. He was a keen supporter of the Union and fought on the government side at \*Sheriffmuir in 1715. He held the privy seal [S] 1721–33 and the great seal [S] from 1733 until his death. From 1707 to 1713 and again from 1715 until his death he was a representative peer of Scotland. For many years he was the Whig government's adviser on Scottish affairs and, though his brother broke with Walpole in 1737, Islay remained in control of Scottish patronage. While his brother was high-spirited, imperious, and a celebrated orator, Islay was a man of business; Horace Walpole called him 'dark and shrewd' but a most useful man. JAC

**Argyll, Colin Campbell, Lord Lorne, 1st earl of** [S] (d. December 1492/January 1493). Colin Campbell was the grandson of Sir Duncan Campbell of Lochawe, 1st Lord Campbell [S] (1445), who died in 1453. Colin's elevation to earl (1458) was followed by a steady acquisition of lands and offices—justiciar south of Forth by 1462, master of the royal household a few years later, and Lord Lorne by 1470.

Argyll's life was one of contrasts, combining the attributes of a shrewd and hard-working royal councillor and the ambitions of an immensely powerful Highland clan chief. He supported the English alliance of 1474, yet opposed James III at Lauder (July 1482). In 1483 Argyll became chancellor, but was suddenly sacked by James III in February 1488. Joining the formidable magnate coalition against the king, Argyll recovered the chancellorship on James's death at \*Sauchie Burn, and held it throughout the troubled early years of the next reign. NATM

**Argyll, Colin Campbell, 6th earl of** [S] (c.1542–84). Campbell succeeded his half-brother in the earldom in 1573. After a quarrel with Regent \*Morton over certain crown jewels, brought to Argyll by his second wife, the widow of Regent \*Moray, he seized the young king James at Stirling in 1578 and forced him to dismiss Morton. Argyll was appointed lord chancellor [S] and held the post until his death. A reconciliation with Morton did not last and Argyll voted for his execution in 1581. JAC

**Argyll, John Campbell, 2nd duke of** (1678–1743). Soldier and politician. While still in his twenties, Argyll, as head of

the powerful Campbell faction, emerged pre-eminent among the Scottish magnates, and as lord high commissioner (1705) played a key role in opening negotiations for the Anglo-Scottish union. He afterwards commanded with distinction in the War of the \*Spanish Succession, though he conceived a lasting hatred of the duke of \*Marlborough, much to Tory delight. But his association with \*Harley's Tory administration turned sour during an embittered spell as commander-in-chief in Spain (1711–12). In 1712 he became commander of the army in Scotland, and in 1715 suppressed the Jacobite uprising, though with reluctance. He lost office during the Whig divisions of 1716–19 but was reinstated, and by 1725 his following was in control of Scottish affairs. His relations with \*Walpole deteriorated after the \*Porteous episode (1736–7), and in 1742 his Scottish contingent in the Commons contributed appreciably to the minister's downfall.

AAH

**aristocracy.** A vague term, derived from the Greek *aristokratia*, meaning the rule of the best. In ancient Roman society it was represented by the patricians. It is broader than \*peerage or even nobility. In common parlance, it was usually taken to mean the upper classes or 'betters' and was confined largely to landowners. Since, unlike peerage, there was no legal definition, it was a matter of opinion who constituted the aristocracy, whether the concept included the \*gentry, and, if so, how far down that group it went.

In origin, nobility applied largely to kings and their immediate families. As kingdoms grew larger, the surviving members of previous royal families were often incorporated into the aristocracy, together with particularly trusted advisers and supporters. A characteristic of aristocracy was therefore a tendency for it to grow larger. The early 7th-cent. laws of \*Æthelbert of Kent already distinguished eorls from ceorls for the payment of \*wergeld. Elaborate justification was scarcely needed. It was assumed that an eorl was a man of honour, whose word could be trusted on oath. Noble blood guaranteed bravery in youth and sage counsel in age.

Hereditary membership of the aristocracy was established at an early period, save for upheavals like the \*Norman Conquest, which brought in a new governing élite, and in most parts of the country the practice of primogeniture ensured the survival of estates intact. Only in Kent and in Wales did the custom of \*gavelkind produce the partible inheritance which reduced many noble families to penury on the continent.

In \*Alfred's day, governors of counties or regions were called \*ealdormen, though the reassertion of Danish influence in the early 11th cent. meant that the word gave way to *eorl*, which remained for three centuries the only recognized title. After the Norman Conquest the high aristocracy consisted of the 1,400 tenants-in-chief, to whom had been allocated all the land not expressly reserved for the crown or the church, and who held it directly from the king. But some of the subtenants also accumulated substantial property and formed part of the governing élite. The \*knightly class soon ceased to be purely professional soldiers and became

landed proprietors in their own right, acting as seigneurs or lords of the manor. The local jurisdiction which they exercised under the crown gave them great power at a time when government at Westminster was very distant.

The \*barons' who confronted John in 1215 were not peers in the formal sense and titles were so rare that in the reign of Henry I there were only eight earldoms in existence. Two developments in the 13th and 14th cents. transformed the situation. The summoning of parliaments, with a separate upper chamber, made it necessary to establish which lords were entitled to attend and began the process of separating lords of Parliament from the rest of the aristocracy. Secondly, a diversification of titles led to a considerable increase in peerage numbers. To the old title of earl was added dukedoms (1337) which were at first reserved for the royal family, marquisates (1385), baronies (1387), and viscountcies (1440). By the end of Henry VI's reign the peerage had grown to about 60. In the Tudor period, commentators like Sir Thomas \*Smith began to distinguish a greater nobility from a lesser nobility, or gentry. But the size of the greater nobility remained small, making it inevitable that it should rely upon the gentry for help in governing the country.

Two further developments in the Tudor period strengthened the position of the aristocracy. At the \*dissolution of the monasteries most of the estates found their way, sooner or later, into the hands of the nobility and gentry. The Russells were one of many families whose fortunes were established at this time, picking up many monastic estates, including Covent Garden and Woburn abbey. The removal of abbots from the upper house of Parliament after the Reformation left that chamber dominated by secular lords. The growing prestige of Parliament as an institution gave the aristocracy a powerful base from which to challenge the monarchy and defend itself against the commonalty.

The 17th cent. was full of vicissitudes. The lavish creation of titles by the early Stuarts, including the introduction of \*baronetcies, threatened to dilute the aristocracy and weaken its powers of resistance. The long struggle with the crown, which was attempting to find non-parliamentary sources of revenue, seemed at one stage to have brought down aristocracy and monarchy alike: in 1649, with the king executed and the House of Lords declared useless and dangerous, it looked as though the split in the upper classes had handed power to the forces of radical dissent. For many aristocratic families, the 1650s were particularly hard, their houses and property plundered, their church disestablished and derided, their income subject to swingeing taxes levied by the parliamentary victors. Worst of all was the short rule of the \*major-generals, several of them men of humble origins.

After the Restoration, the aristocracy recovered much of its wealth and influence. But the underlying rivalry with the crown re-emerged in the 1680s. This time the outcome was decisive, with gentry and nobility united against James II, and supported by most of the nation.

The 150 years following the \*Glorious Revolution of 1688 was the golden age of aristocrats, victorious on both flanks. They were no longer menaced by radicals or republicans, nor by a quasi-absolutist monarchy. Decades of Hanoverian

prosperity saw the manor-houses rebuilt and enlarged, the old muddy villages and duck ponds removed to a respectful distance, the parks enclosed and embellished. The greater aristocracy built up their estates, often in several counties, and protected them from the follies of spendthrift heirs by the \*entail or strict settlement. Their monopoly of office, national and local, was almost complete: cabinets were composed almost exclusively of noblemen, while the gentry, as justices of the peace, looked after the shires. Parliament itself was firmly under the control of the landed interest, though the trading towns sent their own merchants and businessmen to protect their concerns.

In an increasingly utilitarian age, rather less was heard of noble blood and more of service to the nation. Though the aristocracy retained a particular interest in the armed forces, and especially the cavalry, the invention of guns and the introduction of standing armies had deprived them of their former rationale as a military class. In \*Pitt's words, the iron barons were replaced by silken barons. Nevertheless, their claims were still formidable—that they were superior in education, experienced in making decisions, enjoyed the leisure necessary to consider public affairs, and, above all, that their great possessions gave them a unique concern for the well-being of the country, since they had so much to lose. They also claimed a distinctive political role, as a balancing or stabilizing force, which prevented the country from sliding into royal despotism or democratic licence.

Ideological challenge to noble ascendancy came with the American and French Revolutions, in which titles were abolished and aristocrats denounced. But the identification of egalitarianism with national enemies may have given the British aristocracy a further lease of life. More insidious dangers were developments not overtly political—the growing complexity of public business, which put the amateur at a disadvantage; the growth of new industrial towns, where the symbols of aristocracy were less obvious; the improvements in schooling, which meant that education was no longer the preserve of the wealthy; the eventual decline of agriculture until the great landed interest looked less a national concern than a farming lobby; perhaps, most of all, the gradual effects of new forms of taxation which steadily encroached upon aristocratic fortunes. Significantly, the introduction of a tax upon incomes, which Charles \*Fox rightly saw must do vast damage to aristocracy, came in the darkest moment of the war against revolutionary France in 1799. Nevertheless, judicious concessions, like the \*Great Reform Act of 1832 and the repeal of the \*Corn Laws in 1846, enabled the landed classes to preserve much of their influence throughout the 19th cent. But signs of decay were increasingly apparent and the extravagance of the Edwardian period had all the hallmarks of an Indian summer. The Great War of 1914 proved a cataclysm, but it was a crumbling building that was knocked down.

Gentry and aristocracy survive into the 21st cent. in their own world, but it is shrunken and private. They retain many houses and much social prestige, but the houses are often open to the public, with tea served in the stables; others, like Lambton castle, have been turned into fun-fairs, taken over

as schools, or developed as conference centres. Aristocrats are still much sought after as patrons, presidents, chancellors, and board members, but the days when a cabinet of nine could contain eight peers of the realm, the ninth being merely the son of a peeress in her own right, have vanished into the past.

L., *The English Aristocracy: A Comparative Synthesis* (Manchester, 1984); Cannadine, D., *The Decline and Fall of the British Aristocracy* (New Haven, 1990); Cannon, J. A., *Aristocratic Century: The Peerage of Eighteenth-Century England* (Cambridge, 1984).

**Arkinholm, battle of, 1455.** In the spring of 1455 James II of Scotland moved to rid himself of the powerful 'Black Douglasses'—James, earl of \*Douglas, and his three brothers, Ormond, Moray, and Balvenie—ravaging their estates. Douglas fled to England but the three brothers gave battle at Arkinholm on the Esk near Langholm on 1 May. They were utterly defeated. Moray was killed in the battle, Ormond captured and executed, and Balvenie fled. The power of the Black Douglasses was broken and a Parliament in Edinburgh in June declared them and their adherents traitors.

JAC

**Arklow, battle of, 1798.** Despite the repulse at \*New Ross on 5 June 1798 the Wexford rebels remained dangerous. They had captured Gorey, and threatened Arklow, opening a line of advance north to Dublin. But the government was given time to reinforce the small garrison at Arklow and when the rebels attacked on 9 June, in great numbers, they were driven back, largely by artillery. The rebellion lost impetus and Wexford was recaptured on 21 June.

JAC

**Ark Royal.** The name given to a series of warships in the Royal Navy. The first *Ark Royal*, originally called *Ark Raleigh*, was purchased by the crown in 1588. It was used as the flagship of Lord \*Howard of Effingham against the \*Armada. In the 20th cent. the name was given mainly to aircraft carriers.

RAS

**Arkwright, Sir Richard (1732–92).** Born in Preston, one of thirteen children, Arkwright was apprenticed to a barber, and established a business in Bolton. Travelling around northern textile districts to buy hair for wig-making, Arkwright met craftsmen attempting to improve cotton production and lured John \*Kay away from his employer in the 1760s; together they produced the water frame, a roller-spinning machine which Arkwright patented (1769). This, powered by water or a horse capstan, was the basis of Arkwright's fortune. His first horse-driven factory was established at Nottingham (1769) to supply Midland hosiers in partnership with Samuel Need and Jedediah Strutt of Derby. In 1771 he moved to Cromford (Derbys.) and was dominant in the early cotton industry. Lancashire cottonmasters successfully attacked his patent (1781 and 1785), but Arkwright deserves the title of 'father of the factory system' because of his organization of production. Knighted (1786), he became high sheriff of Derbyshire in 1787.

JB

**Arlington, Henry Bennet, 1st earl of (1618–85).** Having fought for the crown in the Civil War, the future foreign

minister of Charles II represented him at Madrid during Cromwell's alliance with France against Spain. Bennet believed in Anglo-Spanish friendship even if this conflicted with the Portuguese alliance strengthened through Charles II's marriage in 1662: like all future members of the \*cabal' Arlington was the inveterate foe of that marriage's promoter, \*Clarendon. Financially dependent on office, he was weak in ameliorating Anglo-Dutch relations, though in 1666 he married a Dutch wife. Distrustful of France, as secretary of state Bennet was similarly flaccid in falling in with Charles II's French policies. Neither conscience (he professed himself a catholic on his death-bed) nor better judgement prevented his contriving Charles's first secret treaty of \*Dover with Louis XIV in May 1670. He was granted a barony in 1665 and promoted to an earldom in 1672. Disgraced as secretary in 1673, Arlington became an Admiralty commissioner, and assisted in withdrawing the garrison at Tangier. Latterly he played the 'Maecenas' at his seat at Euston (Norfolk). DDA

**Armada, Spanish.** The invasion fleet sent against England by Philip II of Spain in July 1588 comprised some 138 vessels (including warships, ancillary craft, and requisitioned transports), perhaps 7,000 seamen, and 17,000 soldiers, and siege equipment for use in England. The number of soldiers would be doubled once the forces of the duke of Parma in Flanders were embarked in the Armada at Calais for passage to England. The English naval forces comprised 34 royal warships and some 170 privately owned ships, preponderantly drawn from East Anglia and Kent. Variable in quality, these ships did have a national identity, whereas the Armada included ships from Portugal, Naples/Sicily, Venice, Ragusa, and north Germany. Quite apart from the unmanageable scale of the Armada's preparation and the Spanish government's financial weakness, the quality of English guns and their handling were of an order with which the Spaniards could not compete. Yet the English, in their turn, could not compete with Spanish soldiery if it came to hand-to-hand fighting at sea, or in a land campaign. Hence the English fleet, under Lord \*Howard of Effingham's overall command out of Plymouth, and including Lord Henry Seymour's patrols in the Dover Straits, looked to its more manoeuvrable ships and more effective fire-power to avoid being grappled by the enemy.

Philip II's purposes behind the Armada were to end English attacks on Spain's commerce with her American dominions, to assert his sovereignty in Flanders, which Elizabeth had been impugning since 1585, and, above all, to bring heretic England back into the fold of Rome. He had himself a claim to Elizabeth's crown which, if success was granted to the enterprise, Philip would use in the best interests of Spain and the true faith. On the English side the issues were the defence of a protestant realm that included catholic Ireland, vigilance against the threat posed by Spanish power in Flanders, and the protection of Elizabeth's person and the 'Englishness' of her queenship.

Under the command of the duke of Medina-Sidonia, not a professional commander but experienced in fleet logistics, the Armada took three weeks to make Corunna from

Lisbon. From the Lizard Point in Cornwall on 29 July its disciplined crescent formation was only twice broken by English forces (two of its ships were lost) before it reached Calais on 6 August. Here Parma had failed to prepare his troops, and had critically underrated Dutch naval forces, which sealed off his sea exits. The Armada's congestion made it vulnerable to Howard's fireship attack on the night of 7 August, and on the following day there was heavy Spanish loss of life in a sustained battle off Gravelines. The shoaling coast and southerlies of increasing strength prevented Medina-Sidonia from standing in again for Calais, and deteriorating weather drove a dispersed Armada up the North Sea, pursued by Howard whose ordnance, and the health of his crews, were now spent. Driven round Scotland and Ireland, in unseasonably severe weather, two-thirds of the Armada were brilliantly navigated back home, but upwards of 30 ships were lost in the Hebrides and western Ireland. Some 11,000 Spaniards may have died. Although the elements had principally saved England, the campaign brought her high international repute, while Spain proved she could place a huge naval force in northern latitudes. The campaign's outcome saw neither state radically altering its policies. DDA

**Armagh** was the smallest of the six counties of Northern Ireland. It borders the Irish Republic to the south, Co. Down to the east, Tyrone and Lough Neagh to the north and north-west. The chief town is Armagh which has been an archbishopric since the 12th cent.: there is also a Roman catholic archbishopric. Portadown and Lurgan in the north are of local importance. The northern parts of the county grow fruit and there is farming and light industry. The catholic population is strong in the south and in 1921 Armagh council protested against the creation of Northern Ireland and was dissolved. Armagh forms a parliamentary constituency with Newry and in 2001 returned a Social Democratic and Labour Party member with a comfortable majority. JAC

**Armagh** (Ard Machae), **archiepiscopal diocese of.** Its strong associations with St \*Patrick make Armagh inevitably the seat of both the Catholic and Anglican primates of all Ireland. Traditionally founded by St Patrick in 444, the original church community, contrary to Celtic tradition, was headed by bishops, but from the 8th cent., in Celtic style, the 'heir of Patrick' was always an abbot with bishops subordinate. With the advent of 10th/11th-cent. Roman reform Abbot Cellach was consecrated bishop (1106). By the Council of Raithbressail (1111) Armagh became the metropolitan see of Leth Cuinn (northern half of Ireland) with twelve dioceses. Later, by the Council of Kells-Mellifont (1152) when Ireland was divided further into four provinces, the province of \*Tuam for western Ireland was carved out of Armagh, while Armagh, with its eleven dioceses, still retained overall primacy. In the late 20th-cent. troubles both primates of Armagh have worked for reconciliation. Armagh has two cathedrals, both dedicated to St Patrick. The Anglican one on the site of a 5th-cent. church is 19th cent. with a 10th-cent. crypt. The catholic cathedral is neo-Gothic (1840-73).

## Arminianism

A notable Anglican archbishop was James \*Ussher (1625–56). WMM

**Arminianism.** Under Elizabeth I, though against her will, the Church of England eschewed ritual and adopted the grim Calvinist belief that God, when creating human beings, had predestined them to either salvation or damnation. The 1590s saw a reaction set in, similar to that which was taking place in Holland under the impetus of Jacob Arminius, and English anti-predestinarians came to be called Arminians, even though they were an autonomous movement. The Arminians were given only limited advancement by James I, but with the accession of the high-church Charles I in 1625 they came to dominate the episcopal bench, especially after the appointment of \*Laud as archbishop in 1633. Not all Arminians were ritualists, but their critics lumped them together as crypto-catholics and Charles's identification with them was one of the principal causes of the lack of trust between him and his subjects which led to the collapse of royal rule. RL

**armour.** There are relatively few surviving pieces of medieval date, so the study of armour is largely dependent on the evidence of monumental effigies, manuscript illuminations, and documentary sources such as accounts and inventories. Three periods of development have been identified. The first period, c.11th–13th cents., saw the predominance of mail. A knee-length mail hauberk, sometimes hooded, was worn over a padded garment (aketon). By the mid- to late 12th cent., a surcoat of linen was commonly worn over the hauberk. Helmets were at first conical with a descending plate to protect the nose, but developed into rounder, cylindrical forms with visors (the great helm). In the third period, from the late 14th to early 16th cents., full plate armour was worn, covering the trunk as well as the legs and arms. A padded coat (or arming doublet) would be worn under a solid breast- and backplate. Helmets came in many shapes, often protecting the whole head by means of a visor. It is a myth that this plate armour was heavy and that it limited a man's mobility. It was very well articulated, and often lighter than the mail hauberk. Even in this third period mail might still be worn to protect the groin and armpits. The second period links the first and the third but overlapped with both. It saw the development of the coat of plates, a cloth-covered body armour which was essentially a fabric garment reinforced internally with metal plates (subsequently called the brigandine). This might be worn with mail, and also with solid, and later articulated, plate protection on the arms, hands, legs, and feet. The great helm persisted but was giving way to the head-hugging bascinet, which sometimes had a visor. Changes in armour appeared gradually, and armies would have sported many different styles. Our picture of armour is too often derived from the top of the range—the most expensive, up-to-date apparel of the aristocratic and knightly classes. The rank and file continued to rely well into the later Middle Ages on mail shirts, reinforced cloth armours (brigandine and jak) and simpler headgear (sallets, kettle hats, etc.). Moreover, tournament armour can be misleading. Because of the desire to protect life in what was, after all, a sport, it tended to be

heavier and more defensive than armour for war: visors, for instance, were *de rigueur*, whereas there is strong evidence that faces might be left uncovered in battle. The most expensive and most fashionable armours in the later Middle Ages came from northern Italy and southern Germany, each with a distinctive style. These armours were exported in large quantities. In 1512 for instance Henry VIII purchased 2,000 light armours (i.e. protecting the body and arms only) from Florence and a further 5,000 the following year from Milan. Generally speaking, however, the rank and file had to make do with locally produced, and probably often recycled, armour. Armours developed in tandem with weapons. Swords of the first period were long and weighty, designed to deliver a heavy blow capable of cutting through mail. As both the coat of plates and the fully articulated armour left certain body areas vulnerable, a thinner, lighter, sharply pointed sword was more appropriate, used in thrusting as well as cutting fashion. The move to plate left the shield largely redundant. Heraldic devices shifted from the surcoat to the material covering the plates, although armour of the third period was often decorated by etching and painting. Breastplates and helmets continued well into the age of artillery and survive today in ceremonial armours. AC

**Arms, Assize of.** Henry II made an Assize of Arms in 1181. It bound all freemen of England to swear on oath that they would possess and bear arms in the service of king and realm. The assize stipulated precisely the military equipment that each man should have according to his rank and wealth. Every knight, for example, was to have a hauberk, helmet, shield, and lance, whilst lesser men with rent or chattels valued at 10 marks were to possess a short coat of mail, an iron headpiece, and a lance. At first, the assize was applied by itinerant justices, who were to proclaim the assize in the shires, take the oaths required, enrol the names of all those liable, and arrange for local juries to make assessments of individuals' wealth. In the 13th cent., however, this became the responsibility of each sheriff and two knights of the shire. The assize, frequently renewed, effectively revived the old Anglo-Saxon \*fyrd duty. SL

**Arms, College of.** See COLLEGE OF ARMS.

**Armstrong, William Armstrong, 1st Baron** (1810–1900). Armstrong was the son of a Newcastle merchant. Although trained as a solicitor, he was interested in technical experiments from boyhood. Financial backing from fellow-members of Newcastle's business community facilitated in 1847 his establishment of the Elswick engine works near Newcastle to manufacture hydraulic machinery. During the \*Crimean War he became involved in gun-making and this led in 1859 to the Elswick Ordnance Company. Between 1859 and 1863 this company supplied 3,000 guns to the British forces. During the later 19th cent. it became one of the world's leading engineering, shipbuilding, and armaments firms, taking over the rival Whitworth company in 1897. In 1900 the company employed 25,028 workers and had a weekly wage bill of nearly £37,000. Armstrong acquired a Northumberland estate at Cragside in 1863 and commissioned the architect Norman Shaw to build a man-

sion for him there. He received a knighthood in 1859, and a peerage in 1887.

NMcC

**army.** The exact origins of the British army are lost to history, although its red parade uniforms have been fancifully traced back to the colour of the tunics of King \*Arthur's bodyguard. A vestige of late Roman military customs and practice can be seen in the law codes and military organization of the earliest British kingdoms. Long before the Norman Conquest, military obligation seems to have divided into two basic forms which have remained constant until modern times. One was an obligation for common service by all adult males, established in English law as the \*militia by the Assize of \*Arms of 1181. The other was a small permanent standing army, usually represented in the medieval period by the warriors of the royal household. To these were added an obligation upon individuals to serve the crown on a temporary basis, and a tradition of employing and paying mercenary troops, who might on occasion be the same people. Although women have always played a major part in warfare, they have been almost entirely excluded from combat roles until very recently.

By early modern times, English armies consisted almost entirely of troops paid in some fashion. However, any form of standing army was considered a potential instrument of royal despotism, and was also beyond the financial resources of the monarchy to maintain. The \*Yeomen of the Guard, founded by Henry VII in 1485 as a small royal bodyguard, is the earliest unit of the British army that has survived to the present day. Other modern units trace their descent from mercenary forces in the service of various kingdoms during the same period. The granting of money by Parliament to finance armies on a temporary basis became one of the most important issues between crown and Parliament. It reached a crisis in 1639–41 when Parliament refused Charles I money to repel a Scots invasion, and would not trust him with control of an army to suppress the Irish rebellion.

The direct ancestor of the modern British army is usually considered to be the parliamentary \*New Model Army of 1645. However, its part in enforcing Cromwell's rule in England and in subjugating Scotland and Ireland helped to establish a prejudice against soldiers which lasted well into modern times. The first properly constituted standing army, of tiny proportions, was created in 1661 by Charles II from royalist and parliamentary units of the Civil War, and entitled 'His Majesty's Guards and Garrisons'. For the next century the army grew at an irregular rate, partly from the need to find garrisons for overseas possessions, and partly for European wars. The existence and function of the army (unlike that of the Royal Navy) was based on royal prerogative rather than statute, an issue which came to a head in the reign of James II and played a part in his overthrow. Thereafter the 1689 \*Declaration of Rights established that a standing army was illegal without Parliament's approval, granted every year in the \*Mutiny Act until 1953, when this was replaced by a five-yearly Armed Forces Act. The issue of direct royal control over the army largely died away during the reign of Queen Anne

and the Hanoverians. George II became the last British monarch to lead his army personally into battle at \*Dettingen in 1743.

Particularly after the Act of \*Union with Scotland of 1707, and the subsequent defeat of \*Jacobite uprisings a large army at home was not required. Instead, the British needed a minimum force to keep order (particularly before the establishment of police forces in the 19th cent.), garrisons for their overseas possessions, and small forces to contribute to coalitions for European wars. The British army developed in a manner regarded by European standards as both eccentric and old-fashioned, with a central core of units providing the basis for a much larger army that could be expanded and disbanded according to need. The existence of this permanent standing army was first acknowledged by a royal warrant of 1751 setting out the official precedence of units.

Whereas in some countries the army became the focus of political and social reform, in Britain it was always seen as the last bastion of reaction. Particularly after the French Revolution, the army was deliberately kept apart from British society (through the building of barracks), and practices regarded as obsolete in continental warfare, such as officers purchasing their commissions, regiments having considerable autonomy from central authority, and the flogging of soldiers, persisted well into the 19th cent. Parliamentary fears of militarism meant rigid control of the army's budget, a deliberately divided command system, and a toleration of inefficiency in order to keep the army politically weak. Officers were drawn largely from the lesser gentry, with an admixture of the aristocracy, and recruits from the poorest classes.

It was easy to forget that by the end of the 19th cent. Britain was a major continental land power with a large permanent army, because neither the continent nor most of the army was European. Particularly after the loss of the American colonies in the \*American War of Independence (1775–83), the largest single focus for the British army was India, following the crown's absorption of the East India Company army as the Indian army in 1858. Garrisoning British India (the frontiers of which stretched from modern Iran to Thailand) with both British and Indian troops became the major army role of the late 19th cent. A series of reforms following the \*Crimean War (1853–6), associated in particular with the abolition of purchase by Edward \*Cardwell in 1871 and with the creation of the 'county regiments' structure ten years later, produced a largely infantry army to serve overseas. Experiences such as the inability of the British to intervene effectively in the Franco-Prussian War (1870–1) and the revelation of serious military deficiencies in the Second \*Boer War (1899–1902) produced more reforms to prepare the army for warfare in Europe, most particularly associated with Richard \*Haldane. Like many other late Victorian or Edwardian reforms, these actions have continued to determine much of the structure and ethos of the late 20th-cent. army, despite the removal of their original justification.

The British tradition of a small long-service army for use overseas, virtually unique in European historical development, meant that at the start of the \*First World War

(1914–18) Britain was the only belligerent country without conscription, introduced with reluctance in January 1916. The creation of a mass citizen army for the war, at first entirely by voluntary methods, was of great social as well as political significance for Britain, marking the first real contact between the army and British society since the Civil War. Ultimately the British army was the most successful of the war, inflicting a crushing defeat upon Germany, previously regarded as the dominant European land power. Although all belligerents suffered terribly from the effects of mass mechanized warfare, British losses were not markedly worse than those of any other major power. However, with no shared military tradition to draw upon, the social and cultural impact of the war upon Britain was devastating, and persisted to the end of the 20th cent. At the war's end, the mass conscript army structure was abandoned, and the army returned to its role as a long-service garrison for the empire by 1922, with considerable enthusiasm on all sides.

The experience of the First World War enabled Britain to cope rather better with the \*Second World War (1939–45). For the first time in British history peacetime conscription was introduced in 1939, shortly before the outbreak of war. However, the demands of a genuinely global war for naval and air forces, and the growing erosion of distinctions between naval and land warfare, or even between civilian and military occupations, all contrived to keep the British army in the field considerably smaller than in the First World War. Although Britain (the only country save Germany to fight, with its empire, from the start in 1939 to the end) once more emerged victorious, it faced in 1945 a changed military situation. In particular the traditional roles of the British army of garrisoning the empire and fighting in Europe were ceasing to be relevant. After 1945 Britain maintained, again for the first time in its history, peacetime conscription (known as National Service) until 1963, after which, largely for cultural and social reasons, the army reverted once more to an all-volunteer force. Its two major roles were from 1949 membership of \*NATO (the North Atlantic Treaty Organization) as part of the collective defence of western Europe against the Soviet Union until 1991, and covering the 'Retreat from Empire', a succession of wars as Britain dismantled its empire, beginning with the independence and partition of India in 1947. The most significant war for the army in this period was in Northern Ireland (1969–94), Britain's longest war since medieval times.

The army in the last decades of the 20th cent. was faced with the same issues that had confronted it since the 18th. It was once more largely separate from its own society, subject to rigid budgetary control, generally ill-equipped to cope either with changes in the nature of warfare or of Britain's role in the world, socially reactionary, and badly in need of reform. However, it has also remained the most effective military instrument obtainable for the minimum financial, political, and social cost which successive governments have been prepared to pay.

Ascoli, D., *A Companion to the British Army, 1660–1983* (1983); Carver, M., *The Seven Ages of the British Army* (1984); French, D., *The British Way in Warfare, 1688–2000* (1990); Pimlott, J., *The Guinness*

*History of the British Army* (1993); Strachan, H., *European Armies and the Conduct of War* (1983).

**Arnhem, battle of**, 1944. British and Polish parachute troops attempted to secure bridges at Arnhem over the Rhine in September 1944, while US forces seized crossings further south over rivers and canals at Eindhoven and Nijmegen. \*Montgomery expected to exploit operation Market-garden by outflanking German defences and surrounding the Ruhr even before using Antwerp for supplies. The Americans succeeded; the British drop met overwhelming counter-attack from SS Panzer divisions resting nearby, organized by Model's Army Group HQ, which actually saw the parachutists descend. Montgomery's decision to attack in spite of warnings from ULTRA intelligence was a gamble in an attempt to finish the European war in 1944. RACP

**Arnold, Matthew** (1822–88). Poet and critic. Son of Thomas \*Arnold, headmaster of Rugby school, Matthew was educated also at Winchester and Oxford, before election to an Oriel fellowship (1845). From 1851 to 1883 he was an inspector of schools, sent to study systems in Europe, and became a leading propagandist for improved secondary education in England. Emerging as a mature poet by 1853, with a recognizably Celtic temperament (from his mother), he was professor of poetry at Oxford 1857–67, but subsequently turned to literary then social criticism. He broadened the accepted form of the critical essay, and in *Culture and Anarchy* (1869) famously classified English society into 'Barbarians, Philistines and Populace' as it lagged behind continental ideas; refusal to comply with Victorian complacency about England's perceived world-wide supremacy was unforgivable to many. Arnold's religious liberalism found voice in subsequent works which sought to free Christianity from 'doctrinal lumber, despite his own admiration for \*Newman.

ASH

**Arnold, Thomas** (1795–1842). Headmaster of Rugby School. Arnold was educated at Winchester and Corpus Christi College, Oxford, obtaining a first in classics. In 1818 he was ordained deacon and became vicar of Laleham, Middlesex. Appointed to the mastership of Rugby, a prosperous public school, in 1828, he built a chapel at the school, then an unusual feature. Dr Arnold brought with him what has been termed 'muscular Christianity', a good picture of which can be found in Tom Hughes's *Tom Brown's School-days* (1857). Arnold's weekly sermons were aimed at improving the character of the pupils and imbuing them with a sense of duty to the community. At the same time, games were seen as a means of stimulating team spirit. Arnold stamped his imprint on public school education of his day.

PG

**Arran, Thomas Boyd, earl of** [S] (d. c.1474). As son of Robert, Lord Boyd, Thomas benefited greatly from the coup of July 1466, when James III (1460–88) was seized at Linlithgow. By his father's influence he was made earl of Arran, given extensive lands, and was married to Mary, elder sister of the king (1467). This was resented by James III and many nobles, who felt Mary should have been married abroad. Arran was one of the ambassadors who concluded the treaty

of Copenhagen, by which \*Margaret of Denmark married James III, and Orkney and Shetland were pawned to the Scottish crown (1468). However, while on the embassy, the Boyds were removed from power. Arran fled to Bruges with Mary, and was forfeited (1469). An attempt to return to Scotland in 1471 was abandoned when James III detained his wife, following her earlier return. He subsequently resided in England until his death. RJT

**Arran, James Hamilton, 2nd earl of** [S] (c.1517–75). Arran was a great-grandson of James II of Scotland and succeeded to the earldom in 1529. On the death of James V in 1542 he was heir presumptive to the Scottish throne, Mary being a tiny infant. From 1543 he was regent on her behalf. At first pro-English and anxious for a marriage between Mary and Edward VI, when this fell through and war followed, he abjured protestantism and moved towards the French interest. When Mary was sent to be brought up in France, Arran was created duke of Chatelherault. In 1554 he gave up the regency to \*Mary of Guise, though he retained hopes of a marriage between Queen Mary and his own son. He opposed the \*Darnley marriage and was obliged to leave the kingdom between 1565 and 1569. On his return, he supported the queen's party. Even allowing for the vicissitudes of Scottish politics, his course seems vacillating and uncertain. JAC

**Arran, James Hamilton, 3rd earl of** [S] (c.1538–1609). Arran's father was regent of Scotland and heir presumptive from 1542 until James VI was born in 1566. Arran himself was one of the many contenders for the hand of Elizabeth, and, failing that, of Mary, queen of Scots. He was abroad from 1550 to 1559 and on his return to Scotland became a leader of the protestant party. But in 1562 he was declared insane and in 1581 was persuaded to resign his earldom in favour of his relative James Stewart. The resignation was cancelled in 1586 on grounds of incapacity, but Arran played no further part in public life. JAC

**Arran, James Stewart, 4th earl of** [S] (c.1550–95). James Stewart was a second son of Lord Ochiltree [S]. After service with the Dutch he returned to Scotland in 1579 and was soon in favour with James VI, who appointed him a gentleman of the bedchamber in 1580. He took an active part in the prosecution of \*Morton for complicity in the murder of \*Darnley, James's father. His relative the 3rd earl of Arran, who was insane, was placed in his charge and in 1581 consented to renounce the earldom in Stewart's favour. In 1583 he was temporarily ousted by the protestant lords in the \*Ruthven raid, but recovered his position in 1584 and had \*Gowrie executed. He became chancellor [S] and for a time wielded great power. But he was overthrown in the coup of November 1585, attainted, and exiled. Though he returned, he never recaptured his former influence and in 1595 was murdered by Sir James Douglas in revenge for his part in Morton's downfall. JAC

**Arras, Congress of**, 1435. Marked an attempt by the papacy and the Council of Basle to bring about peace between England and France. It was presided over by two cardinals and attended by embassies representing Henry VI (who

claimed to be king of France by the terms of the treaty of \*Troyes), Charles VII of France, and Philip, duke of Burgundy, still technically in alliance with the English but already moving towards a *rapprochement* with Charles. It came to naught because the English refused to abandon Henry VI's rights to the French throne. They withdrew their delegation on 6 September, leaving the way clear for a Franco-Burgundian alliance, the treaty of Arras, finalized on 21 September. AC

**array, commissions of**. This was a means of raising local troops between the \*fyrd and the feudal levy and the militia of modern times. The commissions instructed individuals, usually gentry or noblemen, to raise troops in their area and were first issued by Edward I. They were a heavy burden, particularly if the cost fell upon the township or locality and Parliament succeeded in obtaining a number of concessions. Edward III promised in 1327 not to employ the men outside their county, save in case of invasion; in 1344 that the crown would pay wages if they were asked to serve outside the kingdom; in 1350 that they would only be issued with the consent of Parliament. A statute of Henry IV in 1402 repeated the limitations, declaring that they 'shall be firmly holden and kept in all points'. After mid-16th cent. it was more convenient to ask the \*lords-lieutenant to raise levies and commissions fell into disuse. Charles I in desperation, on the eve of civil war, revived them, issuing the first in May 1642 to some Lancashire gentry. \*Clarendon thought it had been a mistake to resort to antique procedures, 'a thing they had not before heard of', and they were at once declared unlawful by Parliament. JAC

**Arrow War**, 1856–60. The *casus belli* of the war occurred when the ship *Arrow* was boarded at Canton, in October 1856, by the Chinese, who arrested the crew on suspicion of piracy. Although the crew and owner were Chinese, the ship was registered in Hong Kong and flew the Union Jack. The incident was used by western powers as an opportunity to extract concessions from China. On 29 December 1857 an Anglo-French force occupied Canton and then proceeded to \*Tientsin where a treaty was signed in June 1858. China agreed to open ports and receive legations at Peking. However, in 1859 British and French ministers were refused permission to enter Peking. A second Anglo-French force landed at Pei-Tang on 1 August 1860 and took Peking in October. On 18 October the treaty of Peking ended hostilities, the Chinese agreed to honour the Tientsin treaty and ceded Kowloon, the mainland opposite Hong Kong, to Britain. See also CHINA WARS. RAS

**Arsuf, battle of**, 1191. On 22 August 1191 Richard I led the armies of the Third Crusade out of Acre southwards towards Jaffa, whence they would strike inland to Jerusalem. Nothing better demonstrates Richard's tactical sense and generalship than the march and the battle that followed. The army marched close to the sea-shore, its right flank protected by Richard's fleet, which accompanied it and kept it supplied. Saladin's forces harassed the crusaders, but could not break their close formation and Saladin realized that he would have to risk open battle if he were to halt

## art galleries

the advance. On 7 September, on the plain to the north of Arsuf (some 12 miles from Jaffa), the two armies met. The day was won when the massed crusader cavalry charged and forced Saladin to withdraw. The march to Jaffa was resumed. SL

**art galleries.** In medieval England, as elsewhere in Europe, the church was the most important patron of art, and the first paintings and statues seen by the public were in churches and monasteries, many of whose collections were dispersed or destroyed at the Reformation. Private collections in palaces and noble houses began in the 16th cent., but only a few could see them. Charles I was a great English patron, particularly of painting, but after 1649 the royal collection was dispersed in a period of puritan disdain for art.

Art collecting was at its peak in the 18th cent., a gentleman's pride demanding that this evidence of his family, wealth, and good taste should be on show. Noblemen on the grand tour often sent back large numbers of paintings and sculptures, of varying quality. Some collections in country houses were open to visitors on specific days, though admission fees and difficulty of access filtered out the lower orders.

The first London institution to open its art collection to the public was the Foundling hospital in the 1740s, partly sponsored by William \*Hogarth. After 1768 the Royal Academy exhibitions were popular, though again the poor were excluded by admission charges. Not until the 19th cent. did public art galleries develop, although governments remained slow to grant funds. The lead was taken by private patrons. In 1814 Dulwich Gallery became the first major public gallery after Sir Peter Bourgeois left his collection to Dulwich College. The Fitzwilliam Museum at Cambridge, endowed by the 7th viscount, opened in 1848, the Bowes Museum at Barnard Castle in 1892, and the Burrell Collection at Glasgow in 1983. Government funds were voted for the National Gallery in 1824. The National Portrait Gallery (1856) and the National Galleries of Scotland (1859) and Ireland (1864) were largely privately funded.

Legislation in 1845 and 1850 encouraged local authorities to provide public museums and art galleries, and the great provision of municipal galleries was largely a Victorian achievement, often assisted by private donors. Birmingham opened its art gallery in 1867 (Rossetti, Brown); Dundee 1873; Liverpool's Walker Gallery 1877; Nottingham 1878; York 1879 (Etty); Manchester 1882 (Hunt and Millais); Leicester 1885; Aberdeen 1885 (Dyce); Leeds 1888; Norwich 1894 (Crome and Cotman); Glasgow 1902; Newcastle's Laing Gallery 1904; Bristol 1905; Cardiff 1912. Two notable galleries, the Tate and the Wallace Collection in London, were launched by private donations in the 1890s, Kenwood House and the Courtauld Institute in the 1920s and 1930s.

Concern that many great works of art were leaving the country, especially to the USA, prompted the foundation of the National Art Collections Fund in 1903 to assist British galleries to make purchases. From 1946 the Arts Council of Great Britain has paid subsidies to the arts, including galleries. Other funding comes from the National Heritage Memorial Fund and, in recent years, the National Lottery. JC

**Arthur.** King Arthur and his circle are creations of medieval writers drawing on history, folklore, mythology, and imagination. Though British in his historical dimension, as a figure of legend and romance Arthur belongs to European culture and has been transplanted to that of America. Arthurian material has been continually reshaped and developed, reflecting aspects of contemporary life, morality, and aspirations. The literature is vast, embracing literary scholarship, historical and archaeological investigations of British responses to the Anglo-Saxon invasions, fiction, and enthusiastic attempts to identify sites and persons.

The 'real' Arthur is a hero referred to in the British poem the \**Gododdin* (c.600), in the 9th-cent. \**Nennius' Historia Brittonum* (as victorious 'leader of battles', including \*Mount Badon, against Anglo-Saxons), and in two entries in the 10th-cent. *Annales Cambriae*. The original warlord, who defies identification, was developed by the 9th- and 10th-cent. Welsh into a great Welsh victor. British tradition from areas conquered by the Anglo-Saxons had migrated to unconquered Wales, and the 9th and 10th cents. saw both Welsh cultural revival and a prospect of Welsh success against the English. An inspirational national figure was needed. His manufacture both used and influenced early Welsh poetry. Arthur grew into a ruler and hero, possibly absorbing other heroes.

Welsh tradition in turn contributed to oral traditions in Cornwall, and in Brittany, where it came to be believed that he still lived. It was probably Breton bards who were responsible for the Round Table motif.

But Arthur and his world were definitively formed in the 1130s by \*Geoffrey of Monmouth in his fictional *History of the Kings of Britain*. In this, Arthur is the ideal king, conqueror of much of Europe, attacking even Rome. Finally defeated and mortally wounded, he is borne to Avalon. Geoffrey's purposes perhaps included justifying the desire of the current rulers of England to be independent of France, and consoling the Welsh for English domination by giving them a glorious history.

Arthur's court proved a magnet for heroes and their deeds, and in much Arthurian material Arthur's own profile is low, his function that of a reference point. The legend of Tristan and Isolde, one of the most popular, was tacked on to Arthur's. Other tales, however, developed out of it. The Grail element, combining Celtic traditions of magical testing-vessels and blessed food-producing horns with Christian sentiment, first crystallized in French. Chrétien of Troyes in the 1170s and 1180s also introduced courtly love, made the Round Table a centre of chivalry, and identified Arthur's capital as Camelot. The first treatment in (Middle) English was Layamon's *Brut* (late 12th cent.), which introduced the element of faerie. The greatest English production was the late 14th-cent. *Sir Gawain and the Green Knight*.

The cult of chivalry was a European phenomenon. Arthurian romances portrayed its ideals, and some of its organization and trappings. Arthurian characters and deeds were emulated in tournaments, sometimes in Arthurian dress, and in ceremonial, as in Edward III's foundation of the Order of the \*Garter. The material had a religious element, yet the ethos was not ecclesiastical; the lesson was that

the path of the Christian knight could lead to salvation, and one of its implicit ideas was that of crusade. Arthurian matters could be politically useful. Honour paid by Edward I to what were apparently bones of Arthur and Guinevere, at Glastonbury in 1278, was flattering to the Welsh, while emphasizing that hope for a Messianic delivery from him was pointless.

In the early modern period the popularity of Arthurian material declined. Changes in war, government, and economy made the chivalrous, aristocratic knight obsolete and the Renaissance made classical literature more popular. It survived in the English-speaking world because of Sir Thomas \*Malory. His work, completed about 1469, retailed the story as a tragedy. It was printed in 1485 by \*Caxton, who saw it as a moral, didactic work, as the *Morte Darthur*.

Henry VII exploited Welsh interest, naming his elder son \*Arthur, and making him prince of Wales in 1489, but Arthur's significance under the Tudors was chiefly in pageantry and in literature. He featured in some pageant decorations, but there was little attempt to connect him with Tudor monarchs. There was some drama and poetry, and Arthur was taken up by Edmund \*Spenser in his *Faerie Queene*. \*Shakespeare, however, gave him no attention.

Arthur's historicity had not been accepted by everyone. William of Newburgh, \*Gerald of Wales, and Ranulf Higden were openly critical of Geoffrey of Monmouth's history, but Geoffrey carried the day until the late 16th cent. The Italian Polydore Vergil had sparked controversy in his *Anglica historia*, written at Henry VII's request and published in 1534. John \*Leland defended Arthur against him in 1544. Scottish perception was subtly different. Hector \*Boece's *History of the Scots* (1526) incorporated some reworkings, mostly to Arthur's detriment, as if Arthur were an Englishman and offensive to Scottish pride. The development of historical scholarship was fuelled in part by perceptions that Anglo-Saxon history might yield support for protestantism and the break with Rome, and that the ancient British might have been rather like the indigenous people of the recently discovered New World.

Arthurian romance was next popular in the 19th cent., though \*Dryden wrote a play which was set to music by \*Purcell. Sir Walter \*Scott and William \*Wordsworth wrote some Arthurian material, but the boom began with \*Tennyson's poems, from 1832, based on Malory. Tennyson's characters often symbolize particular qualities, and his works are moralizing. Other Arthurian writers include Algernon Swinburne, William \*Morris, Matthew \*Arnold, and (satirically) the American Mark Twain.

Emphases similar to those in literature have been apparent in the visual arts. Most Arthurian art has been in the Gothic style, with a consistent range of images. The medieval period generated manuscript illumination, sculptured decoration of churches, tiles, misericords, caskets, embroidery, *objets d'art*, and frescos, in England and on the continent. Tristan and Isolde was the most popular legend, particularly with women in convents. The Round Table now in Winchester castle was built probably for Edward I, and painted for Henry VIII. Above a Tudor rose is Arthur, originally with Henry's face, and royal symbols. Early mod-

ern art preferred secular, contemporary themes, and neglected the elements with Roman catholic implications, the Grail quests.

Nineteenth-cent. didacticism found numerous expressions, including the decoration (1851–64) of the Queen's Robing Room in the new palace of Westminster with Arthurian scenes, in fresco, to illustrate moral qualities. Arthurian scenes were also used for the Oxford Union murals in 1857, undertaken by a group of \*Pre-Raphaelite artists, who produced many Arthurian works. In general Arthur seldom appears; he is eclipsed as a hero by Galahad and Lancelot, and the most influential of Tennyson's poems were *The Lady of Shalott* and *Elaine*.

In the 20th cent. Arthurian settings and circles proved an enduring theme for novelists and poets of very different kinds. British musical treatments include works by Boughton, Bax, \*Parry, and \*Elgar. There have been a number of films.

Many attempts have been made to identify Arthurian sites. Through the ages Camelot has been located at Cadbury (where an Iron Age hill-fort was a centre of British power in the late 5th cent.), Caerleon, Colchester, Winchester, Tintagel, and, recently and controversially, near Stirling. The origin of Arthur's association with Cornwall is not clear. According to Welsh tradition, Kelliwic, possibly Killibury castle, was his base. Dozmary Pool and Loe Pool are associated with the Lady of the Lake. Castle Dore and Tintagel (with their late 5th- and early 6th-cent. secular aristocratic dwellings) are 'identified' as settings for Tristan and Isolde. Glastonbury (where the Tor was occupied in the Dark Ages) was associated in the mid-12th cent. with an abduction of Guinevere, and became identified with Avalon. In 1190 or 1191 the monks 'discovered', fraudulently, the burial of Arthur and Guinevere, and in the mid-13th cent. they added Joseph of Arimathea, with whom the Holy Grail was associated, to their history. The enduring resonance of Arthurian romance was underlined in the hopeful application to John F. Kennedy's presidency of the USA of the name of Camelot.

AER

Barber, R., *King Arthur: Hero and Legend* (Woodbridge, 1986); Morris, R., *The Character of King Arthur in Medieval Literature* (Cambridge, 1982); Whitaker, M., *The Legends of King Arthur in Art* (Woodbridge, 1990).

**Arthur, Prince** (1187–c.1203). A young Plantagenet prince murdered by his uncle King John. As the posthumous only son of Geoffrey and Constance of Brittany, Arthur was duke of Brittany from the moment of his birth. Greater prospects opened up in 1190 when his uncle, Richard I, nominated him as heir presumptive to the throne, but by 1199, when Richard died, John had taken over as the acknowledged successor. Some of the barons of \*Anjou revived Arthur's claim but were soon outmanoeuvred. His moment came in 1202 when King Philip Augustus, at war against John, decided to recognize Arthur as rightful ruler of Normandy and Anjou. Unfortunately for Arthur he was captured by John at Mirebeau in August 1202, imprisoned at Rouen, and never seen again. Ever since the image of the murdered young prince has done much damage to John's reputation. JG

**Arthur, prince of Wales** (1486–1502), was the eldest son of Henry VII and \*Elizabeth of York and the elder brother of Henry VIII. At the age of 15 he was married to \*Catherine of Aragon and set up court at Ludlow. Five months later he was dead of consumption and buried in Worcester cathedral. It is doubtful whether the marriage was ever consummated and Catherine married Henry VIII in 1509. JAC

**Articles of Grievances**, 1689. The \*Glorious Revolution gave both the English and Scottish \*Conventions the opportunity to reassert parliamentary powers. The English \*Declaration of Rights in February 1689 was followed by a Scottish \*Claim of Right and Articles of Grievances in April 1689. The Articles protested against the \*Committee of Articles which, by arranging the business of Parliament, had usurped much of its power. William's commissioner \*Hamilton was reluctant to give way, fearing to lose control, but his successor \*Melville conceded the point in 1690 and the committee was abolished. JAC

**Artificers, statute of**, 1563. A regulation of labour, which sought to banish idleness, advance husbandry, and yield 'a convenient proportion' of wages. Growing concern at the number of masterless men, increasing vagabondage, and escalating crime underlay the outline of terms and conditions of service between masters and servants, in an effort to reduce notorious discord. All unmarried persons below 30 who had received craft training could not refuse to serve if requested, those between 12 and 60 compellable to serve in husbandry were defined, and unmarried women between 12 and 40 could also be made to serve. Wage rates were to be set yearly at the Court of Chancery, after receipt of local recommendations, and then proclaimed in every county. To control undue mobility, anyone failing to carry letters testimonial was punishable for vagrancy. Regulations for apprenticeship concerned eligibility, age, duration, and grievance; refusal to be bound was punishable. ASH

**Arundel, Henry Fitz Alan, 12th earl of** (1512–80). Arundel steered a dextrous course through the rapids of mid-Tudor politics. He was in high favour with Henry VIII, who was his godfather, served with distinction against the French, and was awarded the Garter. He succeeded his father in 1544. During the reign of Edward VI Arundel was at odds with the duke of \*Northumberland and spent a year in the Tower. In 1553 he ostensibly supported Lady Jane \*Grey, doing homage to her, but took out an insurance by reporting everything to Mary. At the crisis he arrested Northumberland at Cambridge. Under Mary he was Lord Steward and, as a fellow-catholic, once more in favour. In Elizabeth's reign, he was mentioned as a possible husband. But he was implicated in the \*Ridolfi plot in 1571, spent more years in captivity, and in the later 1570s lived in quiet retirement. JAC

**Arundel, Philip Howard, 13th earl of** (1557–95). Philip Howard's father was the 4th duke of \*Norfolk, executed in 1572: his mother, daughter of Henry, earl of \*Arundel, died soon after his birth. The dukedom was under attender from 1572 but in 1580 Howard succeeded his grandfather as earl of Arundel. He was accused of complicity in the

\*Throckmorton plot. In 1584, much under the influence of his wife, he converted to catholicism, and the following year was arrested while attempting to leave the country. He was attainted and imprisoned in the Tower. In 1588 he was tried for treason as having prayed for the success of the \*Armada, was condemned to death and died after seven more years in prison. His son Thomas was restored to the titles by James I in 1604 and created earl of Norfolk by Charles I in 1644. JAC

**Arundel, Thomas Howard, 14th earl of** (1585–1646). Howard's father was a catholic convert and spent the last eleven years of his life in the Tower, where he died in 1595. Howard was restored to the title by James I in 1604, received the Garter in 1611, and converted back to protestantism in 1615. In 1621 he was made earl marshal for life. In 1639 he was put in charge of the army to restore order among the Scots, but since the campaign ended without fighting, his military qualities were not tested. He was lord steward 1640–1 and presided over the trial of \*Strafford. He escorted Princess Mary to Holland in 1642, was created earl of Norfolk in 1644, and died at Padua in 1646. \*Clarendon disliked him, finding him pompous and self-interested. He was also disparaging about Howard's pretensions to learning—'willing to be thought a scholar'—but Howard was an assiduous collector of works of art and a patron of men of scholarship. JAC

**Arundel, Thomas** (1352–1414). Archbishop of Canterbury. The third son of Richard FitzAlan, 8th earl of Arundel, Thomas was an Oxford undergraduate when he became bishop of Ely in 1374. When the baronial critics of Richard II took control of his government in 1386, Arundel was appointed chancellor and promoted to the archbishopric of York in 1388. He was replaced as chancellor after Richard's resumption of authority in 1389, but again held the office from 1391 until he was translated to Canterbury in 1396. Next year, Richard destroyed the leadership of the former opposition. Arundel's brother, the 9th earl, was beheaded, and Arundel exiled and deprived of his archbishopric by fictitious translation to St Andrews. He regained Canterbury in 1399 by supporting Henry IV's usurpation, most prominently as principal spokesman in the quasi-parliamentary assembly which seemingly legalized Richard's deposition. In the new reign, Arundel had considerable influence in the king's council, and was again chancellor from 1407 to 1410, when his resignation marked the rise of a faction headed by Prince Henry (later Henry V). On its fall, Henry IV reappointed Arundel as chancellor, in 1412. The accession of Henry V in 1413 ended Arundel's role as a power behind the throne. Despite his obvious personal interest in the revolution of 1399, he was also a vigorous defender of the English church from heresy and anticlerical threats. RLS

**Arundel castle** in Sussex was started by Roger, earl of Shrewsbury, soon after the \*Norman Conquest. It was later in the possession of the Aubigny family until 1243, passed by marriage to the Fitz Alans until 1580, and subsequently to the Howards, dukes of Norfolk. Pevsner is scathing about the 19th-cent. restoration of the castle—'silly, appalling, a piece of open-air fancy dress'. JAC

**Ascham, Roger** (1515/16–68). Protestant classical scholar and educator, born in Yorkshire. He went up about 1530 to St John's College, Cambridge, which was already famous for piety and learning, and was there influenced by Sir John \*Cheke, whom he supported on Greek pronunciation. Ascham himself taught Latin, Greek, and logic, being also university public orator, and, though seemingly always subject to health and money difficulties, sought wider responsibilities. His *Toxophilus, the School of Shooting* (1545), a finely observed and beautifully written account of the merits of archery, 'English matter, in the English tongue, for English men', secured him patronage. After tutoring both Princess Elizabeth and the future Edward VI, Ascham went on embassy to Germany in 1550, and briefly visited Venice, where he found 'all service to God lacking'. A sympathizer with Lady Jane \*Grey, he suffered little under Mary, for whom he acted as Latin secretary; and was in favour with Elizabeth. Ascham's best-known work, *The Schoolmaster, or Plain and Perfect Way of Teaching Children the Latin Tongue* (1570), advocated an education based ultimately on Quintilian, applied so as to persuade rather than force English young people to live, speak, and write well. This patriotic purpose is reinforced with dispraise of the current Italianized English fashion. Like *The Schoolmaster*, Ascham's Report on Germany was published posthumously. JBT

**Ashanti** (Asante) **wars**. The Ashanti empire, located in the hinterland of the Gold Coast of west Africa, reached its peak in the late 18th cent. An attempt by the Ashanti to establish their dominion over the territory adjacent to British trading posts in 1807 threatened British legitimate trade, but because of Britain's vacillation over its role in the region did not lead to armed conflict until 1824 when the Ashanti were victorious. The judicious intervention of George Maclean, chief administrator of the British Gold Coast settlements, induced the Ashanti to waive their claims over the coastal peoples, but the British government's ambivalence emboldened the Ashanti to seize the coastal territory again in 1863. After another reversal of policy, Britain sent a military force under Sir Garnet \*Wolseley to challenge Ashanti claims in 1873. Wolseley marched north and destroyed the Ashanti capital, Kumasi. In 1874 the land south of Ashanti was declared to be a British crown colony. The rapid expansion of French and German colonization in the region induced Britain to demand Ashanti submission in 1896. When the Ashanti resisted, another British expedition (1900–1) finally destroyed the empire, which became a British crown colony in 1902. KI

**Ashburton treaty**, 1842. After the \*War of 1812, relations between Britain and the USA remained difficult, with a number of problems including border disputes in Maine. In 1841 when \*Peel took office, the situation was bad enough to call for naval deployments in case of war. Peel dispatched Lord Ashburton, who had an American wife, as a special envoy. By the treaty, signed in April 1842, Britain dropped the right of maritime search, the Maine border was adjusted, and the rest of the boundary with Canada agreed as the 49th parallel. The Oregon question remained at issue but one of

the last acts of Peel's government in 1846 was to reach a settlement on that as well. JAC

**Ashdown, battle of**, 871. In 870 a large Danish army established camp at Reading and began raiding the surrounding countryside. \*Æthelred, king of Wessex, and his brother \*Alfred gave battle at Ashdown on the Berkshire downs about 8 January 871: this was Alfred's home territory since he was born at Wantage. The struggle raged round a stunted thorn-bush and, according to the *Anglo-Saxon Chronicle*, 'fighting went on till nightfall'. The Danes were driven back—the first major check to their advance—but a follow-up against their camp failed. Æthelred died within weeks and, his sons being too young to lead in battle, Alfred became king. JAC

**Ashdown, Sir Jeremy John Durham** ('Paddy') (b. 1941). Liberal Democrat Party leader. Ashdown served in the Marines and in the diplomatic service before election to Parliament for Yeovil in 1983. He succeeded Sir David \*Steel as party leader in 1988 and presided over a very successful recovery from the difficulties of the alliance with the \*Social Democrats. His party held ten seats when he became leader, rising to 47 at the general election of 1997. Ashdown edged the party nearer to Labour, partly because of personal rapport with Tony \*Blair, partly in the hope of winning a measure of proportional representation, and Liberals co-operated with Labour in the Scottish Parliament and in the Welsh Assembly. He became an effective parliamentary and television performer, particularly on foreign affairs, where he could draw on previous experience. The accusation of sanctimoniousness is one directed at many leaders of minority parties which do not have responsibility in government. In 1999 he made way for Charles \*Kennedy as leader, and retired from the Commons in 2001, taking a life peerage. JAC

**Ashington, battle of**, 1016. This was the final battle in the struggle between \*Edmund Ironside and \*Cnut and took place south of the river Crouch in Essex. The defection of Eadric, ealdorman of Mercia, who led the Magonsæte from Herefordshire and Shropshire from the field, contributed to a crushing Danish victory, with 'all the flower of the English nation' cut down. The two leaders met subsequently at Deerhurst in Gloucestershire to divide the kingdom but Edmund's death weeks afterwards gave the whole realm into Cnut's hands. JAC

**asiento** (Spanish: contract) was the concession made by Spain to Britain at \*Utrecht in 1713 of the right to supply negro slaves to the Spanish empire. It had previously been held by the Portuguese and the French. Intended to last for thirty years, the trade was never as profitable as the British hoped and disputes about its implementation were among the causes of the War of \*Jenkins's Ear in 1739. At \*Aix-la-Chapelle in 1748 the British argued for an addition of the four years lost by warfare, but in 1750 relinquished the concession for £100,000 compensation. JAC

**Aske, Robert** (d. 1537). A Lincolnshire attorney, Aske led the \*Pilgrimage of Grace in 1536–7, a widespread rising against the \*dissolution of the monasteries and in favour

of the old religion. An outbreak in Lincolnshire was followed by Aske's Yorkshire rising, strong enough to persuade Henry VIII to offer pardons and agree in November 1536 to grant Aske an audience. But after renewed activity in January 1537, Aske was seized, sent to the Tower of London, and in July executed in York. A moderate who had persistently tried to restrain his followers and urged them to trust Henry's honour and good faith, Aske paid with his life for such naïvety. JAC

**Askew, Anne** (1521–46). Protestant martyr. A Lincolnshire gentlewoman devoted to biblical study, Anne Askew regularly entered into textual debates with the clergy and was ultimately dismissed by her husband for offending them. Examined in London for heretical views on the sacrament in 1545, she was arraigned again the following year and sentenced to burn. She was racked in the Tower, her prosecutors vainly seeking evidence against suspected reformists at court, including \*Catherine Parr. Weakened by torture, she was carried by chair to the stake and supported there by a chain, refusing a final offer of pardon for recantation. AM

**Asquith, Herbert Henry, 1st earl of Oxford and Asquith** (1852–1928). Prime minister. Between 1908 and 1914 Asquith enjoyed an outstanding record, pushing through a series of major constitutional and social reforms. However, he had less success as a wartime premier from 1914 to 1916, and his reputation declined during the undignified period of infighting within the Liberal Party from 1918 to 1926.

Asquith's early life was spent in Morley and Huddersfield where his relatives were minor employers in the woollen trade. He soon left these modest origins behind him and advanced by means of a scholarship to Balliol College (1896), to the bar, and to a safe seat in Parliament—East Fife—which he held from 1885 to 1918. His first wife Helen, by whom he had five children, died in 1891, and when he remarried in 1894 it was to a very different character, Margot Tennant, the daughter of a wealthy Scots chemicals magnate, Sir Charles Tennant. Margot was a terrible snob who insisted on calling her husband Henry not Herbert, and described him as 'incorrigibly middle-class'. Her chief motive in marrying him seems to have been ambition; she correctly saw him as prime ministerial material. Yet despite Margot's undoubted loyalty to Asquith and his party, the marriage was, for him, a very mixed blessing. Margot's extravagance severely stretched his barrister's income; her involvement with high society accelerated his own pronounced taste for the pleasures of metropolitan life; and her tactlessness and perpetual interference in politics compounded his hostility towards the enfranchisement of women.

Though his attendance at Westminster was restricted by the need to maintain his legal income, Asquith's abilities were quickly recognized. His systematic working habits, skill in mastering a brief, and capacity for retaining huge quantities of information made him a formidable parliamentarian. 'Bring out the sledgehammer,' \*Campbell Bannerman used to cry when he wished to strengthen his front bench with Asquith's debating talents. In 1892

\*Gladstone gave him the vital experience as home secretary which placed him in line for the premiership.

Subsequently, however, Asquith's career entered the doldrums for a time. In 1898 he declined the chance to lead the Liberals in the Commons, largely for financial reasons, though this problem was eased in 1901 when Sir Charles Tennant settled an annual income of £5,000 on Margot. Worse, Asquith became associated with the \*Liberal Imperialist cause during the South African War which detached him from the mainstream of the party. He even joined a cabal designed to force Campbell-Bannerman to go to the House of Lords when the Liberals next took office. However, between 1903 and 1905 he worked his passage back into favour by championing the \*free trade cause against the protectionism propagated by Joseph \*Chamberlain. When offered the Exchequer in December 1905 he quickly accepted.

Asquith proved to be one of the most important, innovative chancellors of modern times. He made it compulsory to provide an annual return of income to the Inland Revenue; he drew up the scheme for non-contributory old-age pensions; and he prepared the ground for the 'People's Budget' of 1909 by forcing the Treasury to abandon its opposition to a supertax on incomes above £5,000. This record puts Asquith in the school of New Liberalism, but he was too good a politician not to respect the traditional Liberal causes. He was, for example, a first-rate temperance speaker, notwithstanding his pronounced fondness for alcohol.

When Campbell-Bannerman retired in 1908 Asquith seemed to be the natural successor as prime minister. He presided over a highly talented cabinet, and was never afraid to promote able and ambitious men like \*Lloyd George and Winston \*Churchill. His working partnership with Lloyd George, whom he made chancellor, proved to be an immense source of strength to the party and the government until it broke down during the Great War. As premier Asquith played a key role in supporting Lloyd George's 1909 budget against criticism in the cabinet. As a result of the ensuing controversy he led the Liberals through two general elections in 1910 and ultimately resolved the problem that had hampered them since Gladstone's days; the 1911 \*Parliament Act curtailed the powers of the House of Lords and excluded it altogether from financial legislation.

The outbreak of war brought further proof of Asquith's skills. Against expectations he succeeded in taking his cabinet to war with only two resignations and thus kept the Liberal Party together; it was widely accepted that his leadership helped to maintain national unity over British participation in the war. However, his cold, legalistic temperament was not well suited to the emotional atmosphere of war-time. He began to suffer from a failure to cultivate the press and from a feeling that he lacked the determination to win the war. Asquithian cabinets—during which the prime minister often wrote long letters to Venetia Stanley, a young woman with whom he had become infatuated—were protracted and inconclusive affairs. But he was essentially unlucky that neither the generals nor the admirals proved capable of scoring a military victory. His decision to form a coalition government with the Conservative and Labour

parties in May 1915 was the beginning of the end for Asquith, though it seemed a clever move at the time. Increasingly the Liberals began to blame him for right-wing policies like conscription. When presented with an ultimatum by Bonar Law and Lloyd George in December 1916, he misjudged his strength by resigning. The result was a new coalition under Lloyd George and a split in the Liberal party. This led to the disastrous 'coupon' election in 1918 in which Asquith lost his seat and the Liberals were displaced by Labour on the opposition front bench. Though he achieved a come-back by winning a by-election at Paisley in 1920, he was by then a largely negative force, intent upon keeping the party out of the hands of Lloyd George. He finally surrendered the leadership in 1926.

MDP

Jenkins, R., *Asquith* (1964); Koss, S., *Asquith* (1976); Spender, J. A., and Asquith, C., *Asquith* (2 vols., 1932).

**Asser** (d. 909). Bishop of Sherborne. Author of the *Life of King Alfred*, Asser was a Welshman who was a monk and priest at St David's in Dyfed until recruited by Alfred of Wessex in 885 to become one of a group of scholars at his court who assisted the king with his own studies and translations. His famous biography of Alfred was written by 893 and makes use of the recently completed *\*Anglo-Saxon Chronicle*. Asser added to the work his own observations and discussions with the king and others at the court. It is a major source for the reign, but it must be remembered that the portrait of Alfred has been carefully modelled to fit 9th-cent. perceptions of a good Christian king. Asser lovingly records the many gifts he received from Alfred, and he may have been created a suffragan bishop based in Exeter before succeeding Wulfsize c.900 as bishop of Sherborne.

BAEY

**assizes.** The word has a number of different meanings in legal history. It was used to describe (a) a session (or sitting) of an official body, especially the king's council (e.g. the Assize of \*Clarendon 1166); (b) the edicts or enactments made at such sessions; (c) the forms of action or procedures instituted by such edicts and available as writs to would-be litigants in the royal court (e.g. the Grand Assize and the petty assizes of novel disseisin, mort d'ancestor, and darrein presentment, all introduced by Henry II); (d) the system of travelling courts which became part of English life from the reign of Henry II until 1971. From the time of Henry I, the king's justice was locally administered by justices appointed by the king, sometimes administered by itinerant 'justices in Eyre'. From Henry II's reign the General \*Eyre became a familiar institution until its decline in the 14th cent. The country was divided by Henry II into six judicial circuits for the purpose of bringing royal justice to all regions.

The Assizes of Clarendon and \*Northampton (1166 and 1176) provided that those suspected of serious crime should be presented on oath by twelve men of each hundred to the king's justices, members of the \*Great Council and later the judges of the common law courts—who therefore travelled round the country receiving these presentments and, after the abolition of the ordeals in 1215, presiding at trials by jury for serious crime. At first in the General Eyre and later

under the commissions of \*oyer and terminer and \*gaol delivery, they would hear criminal cases.

When the petty or possessory assizes were instituted by Henry II, the writs which set them in motion called on the sheriff to summon a group of neighbours (the 'inquest' or jury) to give an answer under oath, before the royal justices, to a specific question relating to disseisin. The justices were therefore said to 'take the assizes'; indeed, the barons demanded in \*Magna Carta that the justices should travel round regularly for this purpose.

So the 'justices of assize' travelled round to hear cases of serious crime and at the same time to take the assizes, i.e. receive the verdicts of the inquest jury in the possessory assizes. Increasingly with the growth of royal justice into the common law, and especially after the reign of Edward I, they also in effect heard civil cases under the \*nisi prius system.

In the 13th cent. the term 'assize' came to be the general term applied to the visits of the judges on circuit. After 1340 the justices of assize were required to be justices of the Court of \*Common Pleas or \*King's Bench or serjeants at law.

The assizes continued until 1971 on the circuits ordained by Henry II, the assize towns, which were centres of importance in the Middle Ages, being visited periodically and with considerable ceremony by assize judges, who would hear serious criminal and important civil cases. Although the Courts Act 1971 abolished the assizes, senior judges still go 'on circuit' to hear cases in important modern centres of population.

MM

**associations** were a stage in the development of lobbies to express opinion and influence policy. They began innocuously as demonstrations of loyalty at times of crisis. \*Burghley and \*Walsingham sponsored an association to protect Queen Elizabeth in 1584 against the machinations of Mary, queen of Scots' supporters. Another association to support and, if necessary, avenge William III followed the discovery of Fenwick's conspiracy in 1696: the signatories wore orange ribbons with gold letters declaring 'National Association for King William'. The archbishop of York launched an association in 1745 to repulse the young pretender and safeguard the Hanoverians. But associations could be turned to other purposes. The \*Yorkshire Association in 1780 called for economical reform and Lord George \*Gordon's Protestant Association deplored concessions to the catholics. The speaker of the House of Commons reflected conservative attitudes when he expressed his 'total disapproval of the committees and associations: they were in his opinion extremely improper.' In the 1790s, under the shadow of the French Revolution, Lord Henderland denounced the \*Friends of the People—an association for parliamentary reform: 'what occasion for such associations, with such names?' \*Shelburne in 1795 referred to associations as a discovery as momentous in politics as any in science, and J. F. \*Stephen, in his sardonic way, observed in 1850 that 'for the diffusion of any blessing of which mankind can partake, there is a committee'.

JAC

**Astley, Sir Jacob** (1579–1652). A professional soldier who fought for the king all through the Civil War and was given a barony in 1644. He was present at the beginning and end of the conflict. At Edgehill on 23 October 1642 he led his troops into battle with a soldier's prayer: 'O Lord, thou knowest how busy I must be this day. If I forget thee, do not thou forget me.' At the end, in the market-place of Stow-on-the-Wold, on 21 March 1646, he surrendered the king's last sizeable force. Sitting on a drum, he told his captors, 'you may now go to play, boys, unless you fall out among yourselves.' JAC

**Astor, Nancy W.** (1879–1964). Politician, and daughter of an American railway developer in Virginia. Nancy Astor had an unhappy first marriage, which ended in divorce in 1903. The following year she travelled to England, marrying Waldorf Astor three years later; when Waldorf, Conservative MP for Plymouth, Sutton, succeeded to the peerage in 1919, Nancy was returned in his stead at the subsequent by-election, becoming only the second woman to be elected to Parliament and the first to take her seat (Constance Gore-Booth having declined, along with the other Sinn Féin MPs, to sit in 1918). As a parliamentarian (1919–45) Nancy was outspoken—perhaps too much so—in favour of those causes she held dear: opposition to divorce (despite her own experience); raising to 18 the age at which it was legal to purchase alcohol; lowering to 21 the voting age for women; above all, appeasement of Nazi Germany. The Astor home, Cliveden, became a by-word for appeasement, but in fact Nancy was anti-Nazi, refused to meet Hitler, and had her name included on a Nazi blacklist. GA

**astrology.** The idea that the motion of the stars and the planets might affect human life dates from ancient times, although astrology as a rigorous, 'scientific' system originated with the Greek mathematician Ptolemy in the 2nd cent. AD. In the Middle Ages, astrology, by then rendered compatible with Christianity, was thought to fall into two broad subcategories: natural astrology, the everyday influence of the planets in normal activities, such as the practice of medicine; and judicial astrology, which aimed at predicting events and giving advice.

The influence of astrological thinking was considerable, and many educated Britons between the 15th and late 17th cents. accepted its principles. It was especially important in medicine, where the casting of a horoscope was thought an important aid in diagnosing disease and in prescribing remedies. It also had ramifications in physiology, botany, and metallurgy. More dangerously, astrology acquired political overtones, and more than one astrologer found himself in trouble for predicting the death of the monarch or other significant events.

The golden age of astrology in Britain was the 17th cent., with several astrologers gaining considerable reputation, status, and income. The two most important figures were William Lilly (1602–81) and John Gadbury (1627–1704). Lilly, who also operated as a medical practitioner and almanack writer, acquired a wide fame and a good income, some impression of the seriousness with which astrology was taken being conveyed by the fact that his predictive talents were enlisted

by Parliament during the civil wars. Gadbury, conversely, rejected his early parliamentary sympathies, became an ardent royalist, and flourished after the Restoration of 1660.

The early 18th cent., however, marked the point at which educated opinion, under the influence of new scientific thinking, was beginning to reject astrology. Yet it continued to enjoy a wide currency outside the educated élite, while even at that social level the issue was one of the recategorization of astrological terms rather than total rejection. More research is needed, but even preliminary investigations have uncovered groups of provincial astrologers who found a ready clientele among the middling sorts in their localities, and, as modern tabloid newspapers and women's magazines demonstrate, this ancient science, while having moved downmarket, is not entirely dead. JAS

**asylum** was the right Britons proudly afforded generations of foreign refugees fleeing from religious or political tyrannies in their own countries to Britain's relatively more tolerant shores. Early beneficiaries were the French Huguenots who came there after Louis XIV's outlawing of protestantism in 1685. Like most best British liberties it rested on the absence of any laws to exclude them, rather than one to protect them specifically. During the French wars this was modified, by an Alien Act passed in 1793; but still thousands of royalists sought shelter in Britain, and the Act was repealed in 1826. A similar Act in 1848–50 was never implemented.

Throughout Victoria's reign, therefore, refugees poured in, mostly left-wingers. They included Mazzini, Marx, Victor Hugo, Herzen, Kropotkin, and Louis Napoleon (from the other side). Some of them brought valuable skills, as the Huguenots had done: the Rossettis, for example, were refugees originally, and another Italian exile, Panizzi, became principal librarian of the British Museum; but they also caused problems with governments abroad. In 1858 a great row blew up with France after the ex-refugee Orsini's attempt on the life of Napoleon III with a bomb. That led to \*Palmerston's fall when he tried to appease the tyrant emperor.

When Britain's free-entry policy was eventually dropped, it was for social rather than political reasons. None the less the 1905 Alien Act, directed against Jews, did specifically exempt refugees. The first real inroad into this traditional British freedom, as with many others, came during the \*First World War. Refugees still entered Britain after that, but on sufferance, rather than as a right. In the 1980s and 1990s, when the increase in persecution in the world made asylum more necessary than ever, the issue came to the fore in politics. BJP

**asylums** for the insane had medieval origins in Britain, with London's Bethlem Hospital (\*Bedlam) the most famous. Its shortened name passed into the language in association with foolishness, loss of control, and the abdication of reason and humanity, as befitted a prevailing frame of mind in which madness was equated with descent into brutishness and kept in check with chains and whips. The patients in Bedlam were a spectacle for curious visitors in the 17th and 18th cents. During the latter century a private mad-

house system developed, as medical entrepreneurs made claims for cure as well as management and security. At the turn of the 18th and 19th cents. reformers such as Pinel in France began to claim that asylums could be turned into therapeutic environments, in which insanity could be cured by seclusion from external stresses and a system of moral management could lead patients back into recognizing the need for acceptable, self-disciplined behaviour. This line was taken by the Tuke family at their York Retreat, an asylum for quakers which became a model for later developments. An Act in 1808 empowered counties to set up asylums for pauper lunatics with a view to possible cure as well as custody. Such asylums gradually spread, and the emergence of the 'non-restraint' system under practitioners like John Conolly provided an additional legitimacy, as locks and chains were struck off and a humane regime based on an appeal to reason supposedly took over. In 1845 legislation required the general establishment of pauper asylums, and commissioners in lunacy were established to inspect, remedy abuses, prescribe best practice, and deal with alleged cases of wrongful confinement, when patients were certified and confined at the behest of relatives who would benefit financially from their incarceration. Charles Reade's mid-Victorian novel *Hard Cash* dealt forcefully with this issue; but the promise of cure made asylums seem more legitimate and less frightening even as the pauper asylums became less able to live up to the reformers' promises. As they filled up with incurable patients and were unable to attract or train staff with appropriate attitudes, patient-staff ratios increased, pauper asylums reverted to custodial control rather than cure, and doctors' pretensions to understanding and treating insanity failed to develop beyond asylum management. Huge 'museums of madness' proliferated in the late 19th cent., and silted up with long-term inmates. The abuses of the system came to seem to outweigh its humanitarian and therapeutic pretensions, and physical as well as moral restraints were reintroduced. The emergent psychiatric profession had used 'moral treatment' to enhance its credibility, but failed to deliver cures in significant numbers. The sheer scale of Victorian investment in the system, and the administrative power of the psychiatrists, kept it in being until the last quarter of the 20th cent., when a fashion for decarceration and the liberation of inmates led to replacement with so-called care in the community, whose limitations were quickly made apparent in the absence of appropriate funding. With all its defects, the asylum was more than (as one critic suggested) 'a convenient place to get rid of inconvenient people': it was a refuge for those who could not cope, and the failure of alternative systems showed that it had its virtues as well as its drawbacks for patients, as well as for those who sought to shape and sanitize the social order through the promotion of custodial care. JKW

**atheism** is a philosophical term derived from the Greek *ἄθεος*, meaning the absence of a god, but is usually translated as disbelief in or denial of the existence of God. Dogmatic denials of God have been rare outside popular unbelief. More usual is the argument from the insufficiency

of evidence for the existence of a God, which might more properly be termed scepticism or agnosticism. Speculative atheism goes further in denying the possibility of evidence to demonstrate the existence of God.

Atheistic views were held among the Greek Atomists of the 5th cent. BC, but within Christendom such views have been marginal. In the 16th cent., when the word atheism came into use in English, it was a term of abuse, and English philosophers long preferred the theory of Isaac \*Newton (1642–1727) that the origin of motion is external to matter rather than the materialist theory that motion is a property of matter. Natural theology in 18th-cent. England meant not scientific materialism (atheism) but the existence of at least a remote external first cause of the universe (\*deism). In this respect, English thought differed from that of continental Europe where Spinoza (1632–77) argued that God and the material world were the same thing. Materialistic ideas, however, could be derived from the philosophy of John \*Locke by writers such as Anthony Collins (1676–1729)—the first author to use the term 'free thinker'.

Collins was spurned in England but read on the continent, where atheism became a commonplace of the French Enlightenment, especially in the writings of Baron d'Holbach (1723–89), whose *Système de la nature* (*System of Nature*) was influential in popular atheistic thought for the next hundred years. Atheism remained a dangerous creed to profess. Aikenhead, a youth, was hanged at Edinburgh in 1697; Whiston lost his chair at Cambridge in 1710 because his religious views were unsound; and \*Shelley, the poet, was expelled from Oxford as an undergraduate in 1811 for distributing a tract on 'The Necessity of Atheism'. In Britain the best-known atheist, Thomas \*Paine (1737–1809), was in fact a deist whose *Age of Reason* was written to counter the progress of French atheism. As loyalist propaganda in the 1790s was directed against those radical ideas in religion and politics associated with the French Revolution, atheism became identified with lower-class subversion, though only a few radicals, such as William \*Godwin (1756–1836) and Jeremy \*Bentham (1748–1832), were actually atheists.

In the 19th cent., materialistic atheism was taken up in the radical anticlerical publications of Richard \*Carlile (1790–1843), Charles Southwell (1814–60), George Jacob \*Holyoake (1817–1906), and Charles \*Bradlaugh (1833–91). Holyoake was an atheist in the sense that he saw no evidence for the existence of God, and to avoid the opprobrium associated with atheism he adopted the word \*secularism instead; but Bradlaugh was a speculative atheist, influenced by Spinoza, who argued that in a world in which matter is all there can be no evidence for any God beyond nature. Though one could argue that this philosophy, known as monism, is actually pantheism rather than atheism, the two were equated in popular thought. Not until 1886 was Bradlaugh, an avowed atheist, allowed to take his seat in Parliament.

With the development of scientific ideas in the 19th cent., theories of the universe and of biological evolution which dispensed with explanations requiring the existence of God gained influential support, though many intellectuals preferred Thomas \*Huxley's word 'agnosticism' to describe their views rather than outright atheism. Even in the

## Athelstan

early 21st cent., when large numbers of people live a materialistic life-style of practical atheism, the word atheism still lacks social respectability and public figures prefer to avoid its use. ER

**Athelstan** (d. 939), King of England (924–39). One of the greatest of Anglo-Saxon kings, Athelstan, son of \*Edward the Elder, succeeded in uniting all of England under his rule. Early in his reign he consolidated his position south of the Humber. Brought up in the household of his father and of his aunt, \*Æthelfleda, effective ruler of the Mercians, he was well received by the Mercian as well as by the West Saxon nobility. At a meeting held at Hereford he brought the Welsh to submission, and their princes, notably \*Hywel Dda, the ablest among them, regularly attended his courts. His military successes were great. From 927 he established direct control of York. He led expeditions against the Scots, culminating in a battle at \*Brunanburh in 937 when he and his brother and successor, \*Edmund, led a joint force of West Saxons and Mercians to victory against a composite force of Scandinavians, Irish, and Scots, aiming to overthrow his domination in the north. No fewer than five kings and seven earls from Ireland and the son of the Scottish king were killed in the battle. Athelstan established a firm internal peace, issuing important codes of law, calculated to apply to all his subjects, and also confirming local peace agreements. His central courts developed into virtual national assemblies, attended by magnates drawn from all England, as well as Welsh princes. On the international scale he extended the range of the monarchy, arranging marriages for his sisters with Hugh, duke of the Franks, and with the future Otto the Great of Germany. He protected in exile Louis IV (d'Outremer), king of France (936–54), and brought up at his court a future king of Norway in the person of Haakon Haraldsson, known as Athelstan's fosterchild. His charters, written in a very elaborate Latin style, betray an advanced secretariat for the age, and accord the king formal titles that indicate effort to express his special dignity. His coinage was placed under strong royal control, and after 927 his style on coins was normally given as *rex totius Britanniae*, king of all Britain. Not all his work proved immediately enduring. After his death, the English hold on the north weakened and Scandinavian princes returned to York. Athelstan's reign, nevertheless, marks a vital stage in the move towards the unification of England under the West Saxon dynasty. HL

**Athenry, battle of**, 1316. The battle, east of Galway, on 10 August 1316, was a heavy defeat for the O'Connors, who were in alliance with Edward \*Bruce. They were opposed by an Anglo-Irish force led by Richard de Bermingham and William de Burgh. Their chief Felim O'Connor was slain, and their power broken. But Edward Bruce continued his struggle to create an Irish kingdom for himself. JAC

**athletics** covers a large and increasing number of events, including sprints, marathons, discus, pole-vaulting, shot-putting, high and long jump, pentathlon, and triple jump. Running races, especially for wagers, have always been common but the first organized meeting in Britain seems to have

been held at the Royal Military Academy, Woolwich, in 1849. The supervising body in Britain is the Amateur Athletic Association and world-wide the International Amateur Athletics Federation (IAAF), whose Olympics Organizing Committee is responsible for the Olympic Games. The IAAF has been much exercised in recent years by the problem of drug use, which can dramatically improve performances, and a number of competitors have been disqualified. In Scotland there is a strong tradition of professional athletics. The Powderhall Sprint was first run in Edinburgh in 1870 and professional meetings continue to be held, usually in the Meadowbank stadium. JAC

**Atholl, James Murray, 2nd duke of** [S] (c.1690–1764). Though not chief of a major clan, Atholl was one of the greatest men in the Highlands because of his vast estates and because of his possession of the extensive regality of Atholl, two-thirds of the county of Perthshire, in which he exercised powers just short of full sovereignty.

His elder brother William, marquis of Tullibardine, was attainted after the '15. His father had not countenanced the rising, so it proved possible to obtain an Act of Parliament in 1715 transferring the succession to James. He succeeded in 1724. His rights were confirmed by an Act in 1733, when he also succeeded Islay (\*Argyll) as lord privy seal. In 1738, through Stanley ancestry, he inherited the sovereignty of the \*Isle of Man.

In 1745 James fled safely south, leaving Tullibardine, the Jacobite duke, to take control of the Perthshire complex. By joining \*Cumberland's army on its march north, Duke James secured his return. Among the beneficiaries was John, son of Lord George \*Murray, who despite his father's attainder was allowed to succeed as 3rd duke, after selling to the crown the lordship of Man. BPL

**Atholl, John Murray, 1st marquis of** [S] (1631–1703). Murray's grandfather was earl of Tullibardine but resigned the title in 1626 on promise of the earldom of Atholl, given to his son in 1629. Murray succeeded in 1642 at the age of 11 and in 1653 joined Lord \*Middleton in the Highland rising on behalf of Charles II. At the Restoration he was in favour. From 1663 to 1676 he served as justice-general [S] and in 1670 succeeded a cousin as earl of Tullibardine. From 1672 to 1689 he was keeper of the privy seal and in 1676 was raised to the rank of marquis. In 1679 he fought with \*Monmouth against the covenanters at \*Bothwell Bridge, and took an active part against \*Argyll's invasion of 1685, earning a reputation for brutality. In 1687 James II gave him the Thistle. His vacillation at the \*Glorious Revolution earned him widespread mistrust and, in the end, he took refuge in visiting Bath to take the waters, while \*Dundee was raising the clans for James II. He played little part subsequently but his son, a staunch Williamite, was secretary of state [S] 1696–8. Macaulay declared that 'his abilities were mean, his temper false, pusillanimous and cruel'. JAC

**Atholl, John Murray, 1st duke of** [S] (1660–1724). Murray was a strong supporter of the \*Glorious Revolution, was created earl of Tullibardine in 1696, and succeeded his father as marquis of Atholl in May 1703. A month later he was

raised to the dukedom and was given the Thistle in 1704. From 1696 to 1698 he served as secretary of state [S], resigning on losing ground to the \*Queensberry interest, and lord privy seal from 1703. But in 1705 he resigned and offered vigorous opposition to the \*Union, arguing that Scottish opinion had not been properly consulted and that Scotland would be underrepresented at Westminster. Henceforth he acted with the Tories. His first son was killed at \*Malplaquet; his second son took part in the '15 and the '45; his third son succeeded him; his fourth son was out in the '15, and his fifth son, Lord George \*Murray, was a pillar of the Jacobite cause in both the '15 and the '45. JAC

**Atholl, John Stewart, 4th earl of** [S] (c.1528–79). Atholl succeeded his father as a boy. He was a strong Roman catholic and supported the cause of Mary, queen of Scots. He opposed the religious reforms of 1560 and was appointed to the council in 1561 on Mary's return from France. At \*Corrichie in 1562 he helped to put down a rising by his father-in-law, Lord \*Huntly. He gave support to the \*Darnley marriage but opposed \*Bothwell and was against Mary in the confrontation at \*Carberry Hill. He was in the Council of Regency until \*Moray's return in 1567. In 1578 Atholl joined forces with \*Argyll to challenge the regent \*Morton and was appointed chancellor [S]. A reconciliation restored Morton to the council but in April 1579, immediately after banqueting with Morton at Stirling, Atholl fell ill and died. Rumours of poison circulated at once but Morton denied it at his own execution in 1581. JAC

**Atholl, Walter Stewart, earl of** [S] (c.1360–1437). Second son of Robert II's second marriage, to Euphemia Ross, and the only one of Robert's sons not to acquire an earldom in his father's lifetime. Lord of Brechin until 1402, Walter Stewart acquired the earldom of Caithness [S] in that year, and that of Atholl [S] and the lordship of Methven in 1404. His main territorial ambitions centred on the earldom of Strathearn [S], which he received in life-rent from his nephew James I in 1427.

Atholl was already an old man when his sons David and Alan predeceased him. Fears that James I was seeking to undermine his position in Perthshire led Atholl and his grandson Robert to organize a successful assassination plot. The king was murdered at the Perth Blackfriars (20 February 1437), but Atholl failed to win the ensuing struggle to control the young James II, and was beheaded for regicide on 26 March 1437. NATM

**Atholl, John of Strathbogie, earl of** (d. 1306). Scottish earl who played a leading if inconsistent role in the Wars of Independence. He was captured at the battle of \*Dunbar (1296) and imprisoned in the Tower of London. Reconciled with Edward I, he became warden of northern Scotland in 1304. He subsequently reverted to the Scottish allegiance, attended the coronation of Robert Bruce, his brother-in-law, in 1306, and was retaken by the English three months later, shortly after the Scottish defeat at \*Methven. Hanged in London from an exceptionally high gallows, then decapitated and burned, he was the first earl to be executed in England since 1076. His fate shows Edward I's cruelty and

vindictiveness, but it was also a logical development of the English view that the Scots, far from fighting a just war, were rebels and traitors against their lawful sovereign lord. KJS

**Atlantic, battle of the, 1939–45.** A decisive Second World War battle, the struggle diverged from pre-war expectations. Before the war British naval experts thought 'Asdic' countered submarines and, like the highest German authorities, considered surface warships the best means of interrupting transport to Britain of food, munitions, and troops. Hitler allotted priority to submarines only after the fall of France, which gave German submarines greater range from Bay of Biscay harbours. In the first half of 1941 the Germans began to win, using 'wolf-packs' of submarines to overwhelm convoys. Ships sunk exceeded new building. In June, however, the British began to decode orders, generated by German 'Enigma' machines, giving U-boat assembly areas in the Atlantic. In July 1941, shipping losses from submarine attack fell to less than one-third of those in June in spite of more U-boats. Early in 1942, the Germans recovered; they began to read allied convoy orders and again made their own orders indecipherable. Losses to allied ships exceeded combined British and American building. In 1943, however, at twelve times the volume of 1941, US construction far exceeded losses. Greater numbers and better weapons now gave victory to the British, Canadians, and Americans. 'Very long-range' aircraft and small escort aircraft carriers improved allied reconnaissance and attack, as did airborne and shipborne short-wave radar, together with high-frequency direction finding, which enabled warships to locate U-boats as soon as they made radio signals. Depth charges, to destroy submerged U-boats, were improved. The allies won the battle of the Atlantic for good in summer 1943. Victory, first over German surface vessels—most dramatically the defeat of the pocket-battleship *Graf Spee* in 1939 and of the *Bismarck* in 1941—and then over German submarines enabled British survival and the build-up of American forces in Britain for the liberation of France in 1944 and the defeat of the Germans in 1945. RACP

**Atlantic charter.** This was drawn up at the first of the \*Churchill–Roosevelt wartime meetings (9–12 August 1941) during one of the darkest periods of the war. Above all a political gesture and propaganda exercise, the charter had less effect on American isolationists than hoped. The two powers renounced territorial aggrandizement; condemned territorial changes contrary to the wishes of the people concerned; pledged that peoples should be free to choose their own form of government, and to live in freedom from want and fear. The two leaders were not in entire agreement. Churchill insisted on qualifying American proposals to guarantee equal access to the world's riches to 'all States, great or small' by calling for 'due respect for . . . existing obligations' within the empire. Roosevelt for his part diluted Churchill's plea for an 'effective' post-war international organization by agreeing to no more than the ultimate 'establishment of a wider and permanent system of general security'. A British bid for Soviet endorsement elicited only a vague statement of approval. CJB

## atom bomb

**atom bomb.** See NUCLEAR ENERGY.

**Atrebrates.** A British tribe and *civitas*. The tribe seems to have either origins or close relationships in Gaul (France) where a tribe of the same name is recorded by \*Caesar. Indeed, the king of the Gallic Atrebrates, \*Commius, fled to Britain and appears to have established a dynasty ruling over the British tribe. From about 15 BC, the Atrebrates seem to have re-established friendly relations with Rome, and it was an appeal for help from the last Atrebatian king, Verica, which provided \*Claudius with the pretext for the invasion of Britain in AD 43. The tribal capital was Calleva (\*Silchester), which after the granting of *civitas* status in the later 1st cent. was known as Calleva Atrebatum. The tribal territory administered from here lay south of the Thames in Berkshire and the adjacent parts of Wiltshire, Hampshire, and Surrey. The name Atrebrates means 'settlers' or 'inhabitants'. KB

**Attacotti.** A British tribe or people. Little is known of the Attacotti, whose name means 'oldest inhabitants', perhaps a reference to their ancient origins. They seem to have inhabited a corner of north-western Britain, most probably the Outer Hebrides, although Ireland and north-west Scotland have also been suggested as their homeland. They are mentioned only in late Roman sources such as Ammianus Marcellinus and St Jerome, amongst whom they had a reputation for savagery. St Jerome, in particular, accused them of cannibalism. According to Ammianus they took part in raids on the province of Britain in AD 365, and two years later joined with other enemies of Rome in the *barbarica conspiratio* which overwhelmed the frontier defences of Britain. Nevertheless by the end of the 4th cent. Attacotti are recorded serving with the Roman army, one unit even being attached to the imperial bodyguard, the *auxilia palatina*. KB

**attainder, Acts of.** These were unpleasant political weapons whereby the accused was denied a proper trial and the normal laws of evidence could be set aside. In form they were bills of Parliament, passed by both Houses and receiving the royal assent: life, property, and titles were all forfeit. Parliamentary indictment was used against the \*Despensers, favourites of Edward II, and during the Wars of the \*Roses, Lancastrians and Yorkists in turn used attainders against their opponents. Thomas \*Cromwell was attainted in 1540 without being heard in his own defence. The attainder of \*Strafford, after his impeachment had broken down, was a crucial episode in the power struggle before the Civil War and Charles I's assent was both imprudent and shabby. In 1689 the Jacobite Parliament at Dublin used attainder wholesale against the supporters of William III. One of the last attainders in England was against Sir John Fenwick for plotting to assassinate William III, but there was uneasiness at the method of proceeding. \*Ormond and \*Bolingbroke were deprived by Acts of attainder in 1715 after they had fled rather than face impeachments. Accusations which did not demand death, such as the bill against Francis \*Atterbury, bishop of Rochester, in 1722, were known as bills of pains and penalties. JAC

**Atterbury, Francis** (1663–1732). Anglican priest and high-church Tory. A King's Scholar at Westminster school, Atterbury was then educated in the fiercely royalist and high Anglican Christ Church, Oxford, where he became a don. When James II tried to catholicize Oxford University, the leading seminary of the Church of England, Atterbury was prominent in opposition. By 1710 Atterbury was the leading Tory spokesman for the high-church vision of a revitalized Anglican church–state and a strong defender of the rights of \*convocation. By the time he became bishop of Rochester and dean of Westminster in 1713, he was of the radical Tory school epitomized by Henry St John (\*Bolingbroke). The destruction of the Tory Party after 1715 appalled him. No Jacobite before 1716, he was driven to Jacobite intrigue by one-party tyranny and Whig Erastianism. Detected and exiled by a bill of pains and penalties forced through by \*Walpole in 1723, he was a minister of the exiled court until 1728, but long before his death had become totally disillusioned by its incompetence and incorrigible proselytizing. BPL

**Attlee, Clement, 1st Earl Attlee** (1883–1967). Prime minister. The son of a solicitor, Attlee grew up in a comfortably middle-class environment. He was educated at Haileybury and University College, Oxford, where he read history. Called to the bar in 1905, he forsook the law for a career in social work after viewing poverty at first hand in London's East End. Meanwhile Attlee became committed to socialism, joining the \*Fabians in 1907 and the \*Independent Labour Party in 1908. He volunteered for military service in the \*First World War, fighting with distinction in Gallipoli, Mesopotamia, and France. In later years he retained the title of 'Major', clearly setting himself apart from the strong anti-militarist strain within the Labour movement.

With the war over Attlee became mayor of Stepney and was elected to Parliament as member for Limehouse in 1922. He immediately became parliamentary private secretary to Ramsay \*MacDonald and was appointed under-secretary at the War Office in the short-lived Labour government of 1924. Attlee broadened his experience when serving under Sir John \*Simon on the Statutory Commission on India after 1927. There he revealed those qualities of moderation, diligence, and attention to detail which were to characterize his political life. He became chancellor of the duchy of Lancaster in November 1930, but was soon promoted to be postmaster-general. When this second Labour government collapsed in the summer of 1931, Attlee refused to follow MacDonald when the latter re-emerged as prime minister of an all-party \*National Government.

Ironically, Labour's catastrophic performance in the general election of that year worked to Attlee's advantage. So depleted was the party's front bench that Attlee faced no opposition when the pacifist George \*Lansbury was forced out of the leadership in 1935. Even so, it was widely expected that Attlee would be only a stop-gap leader pending the return of some of the party's senior figures to the House of Commons. After the general election of 1935, however, he successfully retained his position in a contest with Herbert \*Morrison and Arthur Greenwood. Few imagined that he

would hold on to the leadership—without serious challenge—for the next 20 years.

For many Labour activists Attlee's greatest virtue lay in the fact that he was unlikely to follow MacDonald in abusing the office of party leader. Yet it was always easy to underestimate his qualities. He was no orator. Even his private conversation was clipped and uninformative. But Attlee emerged as a consummate politician and expert party manager, capable of controlling difficult and wilful colleagues. During the 1930s he played his part in curbing the excesses of Labour's left and re-establishing Labour as a viable party of government. Attlee was ill at the outbreak of war in September 1939, but in May 1940, following the debate on the ill-fated Norwegian campaign, he made it clear that Labour would not serve in a government headed by Neville \*Chamberlain.

Under Winston \*Churchill Attlee served successively as lord privy seal, dominions secretary, and lord president. From 1942 he was also designated deputy prime minister and was the most powerful figure on the home front. This certainly gave him more opportunity than Churchill enjoyed—or perhaps desired—to think about the challenges of the post-war world. With the resumption of party politics in the general election of 1945 Attlee was the beneficiary of the mood of popular radicalism which had swept through the electorate during the war years. He emerged as the head of the first majority Labour government in British history.

As prime minister 1945–51 Attlee helped shape the development of British politics, in both the domestic and foreign arenas, for the next quarter-century. The administration presided over a substantial extension of the public ownership of British industry, the development of the welfare state including the creation of the National Health Service, and the establishment of Britain's position within the western alliance. Attlee headed a talented, if not always harmonious, group of senior ministers, which included Ernest \*Bevin, Hugh Dalton, and Herbert \*Morrison. The overall coherence of the government was testimony to his qualities. Despite considerable difficulties, Labour sustained its public support and never lost a by-election throughout the Parliament.

Though Labour was again victorious in the general election of 1950, its massive majority of 1945 was all but wiped out. Party unity came under severe strain, while the outbreak of the \*Korean War imposed new difficulties. The government struggled on but its creative energy was largely exhausted. Conservative tactics in the House of Commons made the business of government difficult and Attlee went to the country again in October 1951. Labour was narrowly defeated and the moment was perhaps opportune for Attlee to resign the leadership. Mounting problems within the party, the emergence of a clear left–right split, and the absence of an obvious successor convinced him that he should carry on. But as leader of the opposition Attlee engaged in little more than an exercise in damage limitation, failing to define a new role for the Labour movement. After a further electoral defeat in 1955, Attlee resigned and went to the House of Lords with an earldom.

A modest man by nature, Attlee came to enjoy great respect from the majority of those who worked under him and the electorate at large. Though the ideas of central planning, state intervention, and welfarism, which dominated his government, have been less in vogue over the last two decades, his historical reputation remains high. Attlee's standing as one of the most successful of peacetime prime ministers of the 20th cent. seems beyond challenge. DJD

Harris, K., *Attlee* (1985); Pearce, R. D., *Attlee* (1997).

**attorney-general.** The chief law officer of the crown who acts as the crown's representative in legal proceedings. The origins of the office are disputed but have been attributed to the medieval king's attorney and the king's serjeant. The title attorney-general of England was first used in 1461. The attorney-general acted as assistant to the House of Lords but had ceased to attend by 1700. After some dispute, it was confirmed in 1670 that the attorney-general could be a member of the House of Commons and this has been the case since then. During the 17th cent. the attorney-general was often accused of undue subservience to the monarch and of being over-zealous and overbearing in prosecuting in state trials, as in the notorious prosecution of Sir Walter \*Raleigh by \*Coke in 1603. The modern attorney-general is a hybrid member of the government in that he is the government's legal adviser and representative, but also has historic functions relating to the administration of the law, e.g. the issue of a *nolle prosequi* to prevent the continuance of a prosecution, the giving of consent to certain prosecutions and the bringing of 'relator actions' on behalf of the public in certain cases, e.g. public nuisance. In these cases he is required to be non-political. MM

**Attwood, Thomas** (1783–1856). Banker, currency reformer, and founder of the \*Birmingham Political Union, Attwood argued that the economic ills of the nation were caused by hard money, and that the cure lay in an abundant supply of paper currency instead of gold. Although now remembered chiefly for his support of parliamentary reform, he always saw this as secondary to the need for a change in monetary policy. Attwood regarded himself as the representative of the Birmingham 'industrious' classes, meaning businessmen, masters, and skilled workers in the small-scale industries of the midlands. This was the basis on which he built the middle–working-class alliance in the BPU in 1830–2, which he attempted (less successfully) to incorporate in 1837 in the early \*chartist movement. He was returned for Birmingham in the reformed Parliament of 1832 and wrote continuously on monetary reform from 1816 to 1847. JFCH

**Aubrey, John** (1626–97). A Wiltshire country gentleman of antiquarian interests, reduced to penury by litigation and imprudence. The only work he published himself was *Miscellanies* (1696), dealing with astrology and the occult, but his copious notes on antiquity and topography were used by others. In 1680 he sent to Anthony à Wood at Oxford his *Minutes of Lives*, sketches mainly of contemporaries. They were not published until 1813 and a full, though bowdlerized, edition waited until 1898. They became a classic of quizzical

## Auchinleck

humour. The best known is his description of Thomas \*Hobbes, also from north Wiltshire and, though forty years older, educated by the same schoolmaster. To Aubrey, we owe Hobbes at 40 taking up Euclid's theorems and declaring, "'By God, this is impossible" . . . This made him in love with Geometry.' But the other lives contain vivid glimpses of 17th-cent. characters. Dr Kettell, president of Aubrey's college, Trinity, Oxford, who 'dragged with one foot a little, by which he gave warning (like a rattlesnake) of his coming'; \*Prynne, with his 'long, quill cap, which came 2 or 3, at least, inches over his eyes, which served him as an umbrella'; Dr Corbet, bishop of Oxford, at confirmation—'there was a man with a great venerable beard; sayd the Bishop, *You, behind the Beard.*' Aubrey quarrelled with Wood, whose unkind description has something of Aubrey's own vivacity: 'a shiftless person, roving and magotie-headed, and sometimes little better than crazed.' JAC

**Auchinleck, Claude** (1884–1981). British general and field marshal. Originally an officer in the Indian army, Auchinleck succeeded Wavell as commander-in-chief, Middle East, in July 1941. On 17 November the 8th Army, under Alan Cunningham, attacked westward into Cyrenaica. Rommel counter-attacked on 22 November and Cunningham decided to retreat, but Auchinleck took direct command and replaced Cunningham by Neil Ritchie on 26 November. The 'Crusader' offensive continued, clearing Cyrenaica by 6 January. Rommel counter-attacked again on 21 January and drove the 8th Army back to the Gazala line by 4 February. Churchill felt Auchinleck to be dilatory in offensive action and Rommel struck first in May 1942. The 8th Army was defeated by concentrations of German armour, outflanking ill-coordinated resistance. By mid-June the 8th Army's retreat, with the rapid fall of Tobruk, became near rout. On 25 June Auchinleck took over direct command, organized a defence at El Alamein, and finally stopped Rommel. However, in August, Churchill flew to Cairo, and substituted \*Alexander and \*Montgomery respectively as C.-in-C. and army commander. Montgomery blackened Auchinleck's reputation by suggesting that he planned further retreat if Rommel resumed serious attacks. Auchinleck ended his career as C.-in-C. of the Indian army. He refused a peerage, distressed by the partition of India. RACP

**Auchinleck manuscript.** This document, presented to the Advocates' Library by Alexander Boswell of Auchinleck (1744), now in the National Library of Scotland, is one of the most important surviving manuscripts of pre-Chaucerian poetry (assigned 1330–40). Its wide-ranging miscellany of religious and secular material, dominated by metrical romances, is almost entirely in English. ASH

**Auckland, George Eden, 1st earl of** (1784–1849). Auckland was a Whig who served as president of the Board of Trade under \*Grey and as 1st lord of the Admiralty under \*Melbourne. In 1835, he was appointed governor-general of India. The most important developments of his period in office concerned external relations. He pursued commercial expansion from India into Afghanistan and central Asia. He was responsible for undertaking the first \*Afghan War,

which initially was prosecuted with success and gained him an earldom. However, incautious policies towards 'the tribes' soon stirred revolt. In the winter of 1841–2, British forces were obliged to retreat and were shot down or frozen to death in the snow. Of 16,000 men who set out from Kabul only one, Dr Brydon, survived beyond the Khyber pass to proclaim himself, famously, 'the army of the Indus'. Lord Auckland was recalled in disgrace in February 1842. DAW

**Auckland, William Eden, 1st Baron** (1744–1814). Politician and diplomat. A younger son of the well-known Durham family, Eden trained as a lawyer after leaving Oxford. He entered Parliament in 1774 for Woodstock and quickly established himself as a useful man, with a particular interest in economic matters and in penal reform. He was employed by Lord \*North in the abortive negotiations in 1778 with the American rebels, served as chief secretary in Ireland from 1780 until 1782, and stayed with North during the coalition. But soon afterwards, he accepted an invitation from \*Pitt to negotiate a commercial treaty with France and was pilloried in the *Rolliad* as a chief rat. He was subsequently employed as ambassador to Spain and then Holland, raised to the Irish peerage in 1789 and to the British in 1793. From 1798 until 1804 he served as joint postmaster-general, and during the Ministry of All the Talents was president of the Board of Trade. Eden was a capable man of business and an agreeable companion but acquired a reputation for self-seeking. JAC

**Auden, W. H.** (1907–73). Poet, essayist, and dramatist, whose name is often given to the literary generation of the 1930s when, it has been said, 'the red flag was intertwined with the old school tie'. After Oxford, time in Berlin offered release and a new perspective on his own society, Marx, Freud, and \*Eliot all influencing *Poems* (1930). Yet he was as ready to write 'in praise of limestone', the Icelandic sagas, or simple human love. Intellectually restless, a brilliant chronicler of the times, in 'Spain' (1937) he wrote one of the definitive poems of a 'low, dishonest decade'. On the eve of war he emigrated. American Auden omits the line from 'Spain' about 'the conscious acceptance of guilt in the necessary murder' and the long 'New Year Letter' (1941) shows a new engagement with Christianity. Increasingly the benign man of letters, he wrote the libretto for Stravinsky's *The Rake's Progress* (1951), returning to Oxford four years later as professor of poetry. JNRS

**Audley, Thomas, 1st Baron Audley of Walden** (1488–1544). Audley was a lawyer from Essex, who became town clerk of Colchester in 1514 and was elected to Parliament for the borough in 1523. He was a member of \*Wolsey's household but avoided going down with his master. He succeeded \*More as speaker, an influential role in the Reformation Parliament. On More's resignation as chancellor in 1532, Audley was appointed keeper of the great seal and in 1533 lord chancellor. In this capacity he presided over the trials of More, \*Fisher, and the accomplices of \*Anne Boleyn. In 1538 he was given a barony and he acquired the estates of the abbey of Walden at the \*dissolution of the monasteries. In 1540 he received the Garter and saw through the attainder against Thomas \*Cromwell. His property passed, via a

daughter, to a grandson, created Lord Howard de Walden, then earl of \*Suffolk, who built Audley End. Audley's reputation was as a complete time-server and his motto was said to have been 'Had I done nothing I had not been seen; if I had done much, I had not been suffered.' JAC

**Audley End** (Essex) lies on the river Cam, near Saffron Walden. It was originally Walden abbey and passed at the \*dissolution of the monasteries to Lord \*Audley. It then descended to Lord \*Suffolk, who rebuilt from 1603 onwards. Only half of the original house survives, the rest having been pulled down in 1749. Robert \*Adam worked on the interior and built the bridge, and the gardens were landscaped by Capability \*Brown. JAC

**Aughrim, battle of**, 1691. The battle of the \*Boyne in July 1690 did not end the conflict in Ireland. The Jacobites held Limerick and Galway and much territory west of the Shannon. The task of subduing them was left to William's Dutch commander, Ginkel, who took Athlone on 30 June 1691 and crossed the Shannon. The Jacobites, under the command of Saint-Ruth, a French nobleman, dug in near Aughrim, defended by bogs, streams, and stone walls. On 12 July Ginkel, with just over 20,000 men, launched his attack against the same number. Heavy fighting continued all day but after Saint-Ruth had been killed the Jacobites broke, losing guns and ammunition. Galway surrendered later in July, Limerick in October. JAC

**Augustine, St** (d. c.604). Prior in the pope's own monastery, Augustine was chosen by Gregory the Great to lead an evangelistic mission to the Anglo-Saxons. On the journey, his companions sent Augustine back to Rome to express their growing apprehension. Gregory returned him with messages of encouragement, and his authority confirmed as their abbot. In 597 they landed on Thanet in Kent, where \*Æthelbert was the most powerful king south of the Humber, and his Frankish wife \*Bertha was a Christian. Fearing witchcraft, the superstitious Æthelbert received the monks outdoors. Impressed by their sincerity, he supplied them with food, a house in Canterbury, shared use of an old Roman church with Bertha, and permission to preach. \*Bede records that the simplicity of their lives and their comforting heavenly message led some to conversion, and Æthelbert himself was ultimately baptized. Augustine returned to Arles, in Gaul, for episcopal consecration, after which he is said to have converted thousands. He established his see in \*Canterbury, where he built his church, and outside the walls founded the monastery of SS Peter and Paul (St Augustine's).

Augustine turned to Gregory for instructions on organization, management, and discipline. Gregory advised tolerance of irregularities committed in ignorance, recognized the difficulty of eradicating old customs immediately, and suggested adapting existing festivals and temples for Christian worship. He supplied more personnel, books, relics, and furnishings for the churches, sent an archbishop's pallium for Augustine, and a plan for the organization of all England.

Augustine is perhaps overshadowed by Gregory, perceived apostle of the English, who conceived and directed

the mission. Yet Gregory's letters reveal a diligent servant who faced enormous difficulties in securing a new church based on orthodox Roman lines. Although he failed to win the co-operation of British clergy in his few available years, Augustine established Christianity, and introduced to an illiterate Germanic society the influence of Mediterranean civilization, through Latin learning and classical architecture. With him, Æthelbert produced the first written law code, providing for matters secular and ecclesiastical. With Æthelbert's crucial support, he consecrated two bishops, establishing sees at \*Rochester in Kent and in East Saxon \*London. To secure continuity, he consecrated his successor, \*Laurentius, before he died. Although the church suffered early set-backs, it was rooted in Kent where Augustine, first archbishop of Canterbury, established his see and provided training for those who would continue his work. AM

**Augustinian canons** (or 'Regular' or 'Black' canons) had their origin in the mid-11th-cent. ecclesiastical reform movement. Earlier communities of clerics (or 'canons') staffing cathedrals and large churches and organized (sometimes loosely) in a quasi-monastic rule had long existed, and following the Carolingian reform many observed the mid-8th-cent. rule of Chrodegang of Metz. This had largely fallen into disuse by the 11th cent. and reformed canons, particularly in southern France, Italy, and Germany, increasingly adopted a rule based on that drawn up for communities founded by St Augustine of Hippo (354–430). This was usually expanded by local communities, and in the 12th cent. some versions were as ascetic in character as that of the \*Cistercians. Many, though not all, Augustinian priories were sited in towns, particularly in continental Europe, where their canons fulfilled a wide range of roles, serving in parish churches and cathedrals, running hospitals (such as St Bartholomew's, London), and functioning as teachers. They were perhaps the most ubiquitous of all monasteries in the medieval world, appealing to a wide cross-section of lay patrons. In England, where the first truly Augustinian priory was founded at Colchester c.1100, they tended to be more contemplative, often emerging from communities of hermits, being sited in remote places, and were barely distinguishable from the reformed \*Benedictines, such as the Cistercians. The majority of English foundations were made in the first half of the 12th cent.: many were small, but some, like Leicester or Cirencester, retained their prosperity and prestige till the \*dissolution. BJG

**Augustinian** (or Austin) **friars** were founded by Pope Alexander IV in 1256 from a number of small hermit communities in Italy. They were given the rule of St Augustine of Hippo (see AUGUSTINIAN CANONS) which the \*Dominicans, whose constitution they largely followed, also observed. Though they were a mendicant order they continued some eremitical observances and their first foundations were located away from towns. Soon, however, they established themselves in urban areas and in England, where their first community was founded in 1248–9 at Clare, by the \*dissolution they were found in nearly 40 places, usually substantial towns or ports, such as Grimsby, Hull, and King's Lynn, as well as Oxford and Cambridge. The Cam-

## Auld Alliance

bridge house was a centre of the early Reformation in England, and Luther was an Augustinian friar at Erfurt. BJG

**Auld Alliance.** See FRANCO-SCOTTISH ALLIANCE.

**Auldearn, battle of,** 1645. \*Montrose was unable to follow up his great victory at \*Inverlochy in February 1645 when many of his followers returned home. The campaign resumed the pattern of march and counter-march. This time a covenanting army under Sir John Hurry tried to surprise Montrose on 9 May at Auldearn, east of Nairn. The issue was decided by a spirited cavalry counter-attack by the Gordons and Hurry fled to Inverness. JAC

**Aulus Plautius** was the general commanding the Roman invasion of Britain in AD 43. Consul in 29, he had probably governed the military province of Pannonia on the middle Danube; experience together with political and family influence made him a suitable choice for \*Claudius' British expedition. After a delay caused by the troops' fear of Britain as the island beyond Ocean, the invasion was successfully mounted with four legions and an equivalent number (c.20,000) of auxiliary troops. The major settlement at Camulodunum (\*Colchester) surrendered in the presence of the emperor. By the time Plautius left Britain in 47, the greater part of the island south-east of the Humber-Severn line was under Roman control. On his return to Rome he was accorded an *ovatio* (a lesser form of triumph), the last recorded instance of this ceremony. ASE

**Auray, battle of,** 1364. Sir John \*Chandos, who had fought at \*Crécy and \*Poitiers, was engaged in 1364 in supporting the claims of John de Montfort to the duchy of Brittany against those of Charles de Blois. On 27 September, while besieging Auray, he was attacked by Bertrand du Guesclin. The French were defeated, Blois killed, and du Guesclin captured. JAC

**Austen, Jane** (1775–1817). Country parson's daughter who became one of England's best-loved novelists. As she says in *Emma* (1816), 'one half of the world cannot understand the pleasures of the other', and for some, minute attention to nuances of bygone manners makes her simple romances rapidly parochial. For others, her awareness of the realities of money and class and their bearing on human happiness will always be compelling. Though she rejected suggestions to try her hand at historical subjects, confident that '3 or 4 families in a Country Village is the very thing to work on', it is misleading to think of her as a miniaturist. The Napoleonic wars occupy her only in letters from her sailor brothers, and she is less consciously concerned with the condition of England than novelists later in the century, but her penetration and seriousness reflect an admiration for Dr \*Johnson. He could not have matched the sprightly ironic comedy of *Pride and Prejudice* (1813) but would have appreciated the more sombre moral dilemmas of *Mansfield Park* (1814). Three years later, still unmarried, she was dead, leaving her sister Cassandra to supervise the publication of *Northanger Abbey* and *Persuasion* (1818). JNRS

**Austin, Herbert** (1866–1941). Motor car manufacturer. Austin served his engineering apprenticeship at Langlands Foun-

dry, Melbourne. He became manager of the Wolseley Sheep Shearing Company and in 1893 returned to England to work for the company in Birmingham. He was one of the first British engineers to envisage the possibilities of the petrol-driven car and built his first three-wheeled Wolseley car in 1895. In 1905 he went into business for himself as the Austin Motor Company Ltd. at a 2.5-acre site at Longbridge, Birmingham. By the following year he produced 120 cars with a work-force of 270. Invention, design, and technical skill were Austin's strengths. The Austin Seven (Baby Austin), launched in 1922, brought motoring within the means of the masses. Along with the Austin Twenty (1919) and the Twelve (1921), these models enabled the company to survive the difficult post-war period and expand. By 1939 the company employed 20,000 people and produced 76,482 cars on a 200-acre site. RAS

**Australia, Commonwealth of.** A federation of six states, \*New South Wales (founded 1788), Western Australia (1829), Tasmania (formerly Van Diemen's Land, 1825), South Australia (1834), Victoria (1851), and Queensland (1859) and the self-governing Northern Territory (1863), together with Australian Capital Territory (1911), Norfolk (1856), Heard and McDonald (1947), Cocos (1955), Christmas (1958), and Coral Sea (1969) Islands, and the Australian Antarctic Territory (1933).

Australia is the smallest, most arid, and least populated of the world's continents. Its mainland, together with Tasmania, is nearly 3 million square miles—i.e. 35 times the size of Great Britain—and had a population of 19 million in 1998. Australia took its name from the mythical Southern Continent first postulated by classical geographers, *Terra Australis Incognita*. First sighted by Portuguese and Spanish navigators during the late 15th cent., it became known through 17th- and 18th-cent. Dutch, British, and later French voyages.

Australia's Aboriginal people entered the country more than 40,000 years ago across a land-bridge created during a low sea-level period. They greatly modified the Australian environment by the extensive use of fire and hunting to extinction of its mega-fauna, and developed a distinctive way of life centred around hunting and gathering, in which women and children played a key role. Aborigines gave animate and inanimate things quasi-religious properties and their cultures revolved round a seasonal cycle of life, whose origins were explained by a creation known (in translation) as the Dream Time. Completely isolated from the rest of the world, Aborigines developed a strong attachment to and intimate knowledge of the land (which they regarded as Mother). Although they appeared to have no socio-political system, they developed a complex web of social, lineal, and trade relations, which could extend over large areas. Estimates put their population at the time of the coming of the British at 500,000.

The modern era began with the arrival on 26 January 1788 of the 1st Fleet of eleven vessels under the command of Captain Arthur Phillip RN, who took formal possession of land already named New South Wales and claimed on Britain's behalf in 1770 by Captain James \*Cook. Extending

westward as far as longitude east 135 degrees (extended to 129 degrees E. in 1834), New South Wales, with Sydney its capital, excluded New Holland, known to the Dutch East India Company from about 1610, but thought of little value. The British began to occupy New Holland in 1827, and with the formal possession and change of name to Western Australia and the founding of the Swan River Colony under Captain Stirling RN in 1829, Britain laid claim to the whole continent. New South Wales, the first colony, was subsequently divided into five separate colonies.

Britain's decision in 1786 to occupy New South Wales was partly to compensate for the loss of the American colonies to which unwanted convicts (some 50,000 before the \*Declaration of Independence in 1776) had been sent; and partly to protect Britain's control of the sea route to Asia via the Southern Ocean.

On arrival at \*Botany Bay on 18 January 1788, Captain Phillip, finding it less fertile than he had anticipated, sailed a few miles into Port Jackson (now Sydney Harbour), where, on 26 January, he commenced landing 736 convicts (including 188 women) along with a military guard of 210 officers and men. He was followed by the commercially organized 2nd and 3rd Fleets, which embarked a further 3,100 convicts, of whom nearly 300 died from maltreatment during the voyage. The transportation of convicts to New South Wales ceased in 1840, to Van Diemen's Land in 1853 (shortly afterwards renamed Tasmania), and to Norfolk Island in 1855. Between 1850 and 1868, 10,000 convicts were shipped as a subsidy to poverty-stricken Western Australia, making a grand total of 160,000 convicts transported before 1868. Convictism's real legacy is Australia's distinctively authoritarian executive-style government. The Aborigines offered no effective resistance to the British who, presuming them to be 'savages', applied the principle of *vacuum domicilium* (or *terra nullius*).

The early days of New South Wales were under near famine conditions and the colony was not self-sufficient in wheat until 1797. Free settlers were loathe to emigrate to such a distant land because it lacked a staple product and was tainted by convictism. However, the crossing of the Blue Mountains behind Sydney in 1813 revealed a belt of millions of acres of rich savannah grasslands. Here, flocks of fine wool-bearing merino sheep (first imported from the Cape Colony in 1797) spread out and by 1880 it supported over 60 million sheep. The export of wool provided the staple upon which to found a viable economy, helped end convict transportation, and created a new class of politically powerful and capitalist large-landholding squatters (graziers).

Exploration by sea from Sydney had already established that Tasmania was an island (George Bass, 1796) and a later circumnavigation (Matthew Flinders, 1803) established the true extent of the Australian continent. Inland exploration was initially directed toward the discovery of a supposed inland sea and new grasslands (Charles Sturt, 1830 and 1845; Hamilton Hume and William Hovell, 1824; and Thomas Mitchell, 1836). Later explorations culminated in a series of trans-Australian expeditions, the most famous of which were E. J. Eyre (1851), L. Leichhardt (1844–5),

Augustus Gregory (1855–6), John McDouall Stuart (1860–2), R. O'H. Burke and W. J. Wills (1861), and John Forrest (1874).

The discovery of gold in 1851 caused a dramatic leap in immigration and the combined population of New South Wales and Victoria rose from 267,000 in 1850 to 886,000 in 1860; 538,000 were located in the newly proclaimed colony of Victoria. Melbourne, its capital, rapidly became Australia's financial and industrial centre. A miners' revolt at Eureka Stockade near Ballarat in 1854 eventually forced the introduction of democratic reforms far in advance of those in England. These included the adoption of secret ballot (1856), adult male franchise (1857), paid parliamentarians (1870), and eventually votes for women (1908). The electoral power of the surplus population created by the gold rushes led to the breakup of the squatters' vast landholdings into family-operated cereal, hay, and dairy farms 1869–91.

After the repeal of the British \*Corn Laws in 1846, South Australians began to develop 'dry-land' wheat farming technologies in the 1850s. These were later adopted by new-land farmers in Victoria and New South Wales. Land clearing boomed, using rollers (Mullenizing, invented 1868), the stump plough (1876), harvesters (strippers, 1835), and with the introduction of refrigerated shipping (1882) came the export of dairy products and fresh meat to Britain.

The gold rushes and the rise of agriculture encouraged commerce, finance, trade, and industry in Sydney and Melbourne, the latter growing to more than half a million by 1900. The spread of wage labour in mines, factories, ports, and shearing sheds saw the rise of trade unionism during the 1870s. The defeat of the great strikes of 1888–95 led to the setting-up of union-backed Labour parties. The first, but short-lived, minority Labour governments took office in Queensland in 1899, and federally in 1904.

The 1880s was an era of reckless bank lending, and even more reckless borrowing by the land boomers. The inevitable bank crash of 1893 caused great distress and unemployment and also brought to an end 'marvellous Melbourne'. The discovery of gold in Western Australia (Coolgardie, 1892, and Kalgoorlie, 1893) partly alleviated the recession.

The latter part of the 19th cent. was also a highly formative period for Australian culture: the founding of universities (Sydney, 1850; Melbourne, 1853; Adelaide, 1874; Tasmania, 1890); the writing of Australian novels and poetry, among them works by Henry Lawson (1867–1922); the beginnings of Australian science and technology (Australasian Association for the Advancement of Science, Sydney, 1888); the development of Australian-rules football (first game 1858) and of Australian prowess in sport (the 'Ashes', 1882).

Following a series of meetings during the 1890s, six colonies agreed by referendum to become a federation. This was inaugurated on 1 January 1901 as the Commonwealth of Australia under a written constitution, based on that of the USA. One of the Commonwealth government's first acts was to introduce the so-called 'White Australia policy' to protect the Australian working man's standard of living. The outbreak of the First World War in 1914 severely tested the new federation. An Australian Imperial Force (AIF) comprising 322,000 troops was sent overseas to fight alongside the

allies, of whom 60,000 died or were killed in action. The period between the First and Second World Wars was at first prosperous with assisted British immigration until development was stopped by the Great Depression of the 1930s. At times, unemployment exceeded 25 per cent of the work-force. Australia's support for British empire preference helped maintain her exports to Britain. High gold prices, a devalued Australian currency, and the introduction of tariffs, subsidies, and marketing boards to protect local industry and primary producers may have staved off an even worse calamity, but Australia's dependence upon overseas capital and markets remained unchanged.

With the fall of Singapore in 1942, the withdrawal of the British to India, and the Japanese invasion of Papua New Guinea, the Second World War came to the shores of Australia with the bombing of Darwin. Wartime Labour Prime Minister John Curtin turned to America for military help. Australian forces played an important part in the Pacific War and were the first to defeat the Japanese on land in the battle for New Guinea (Kokoda).

After 1945, the wartime industrialization of Australia was continued behind tariff walls. The nationalization and welfare state ambitions of the governing Australian Labour Party were brought to a halt with the Australian High Court's rejection of the ALP's Bank Nationalization Act (1948) as unconstitutional, and the electoral success of Robert Menzies and his conservative coalition government in 1949. The coalition governed in times of increasing prosperity until defeated by the ALP in 1972 under the leadership of Gough Whitlam in a revolt against the conservatism and alleged uniformity of the Menzies era. The Menzies era (he served as prime minister until 1966) was one of the *embourgeoisement* of urban Australia involving the spread of the suburban family owner-occupied house (the 'quarter acre block') and car ownership.

Post-war mass European immigration, assisted by the Labour government, was made possible by an assured British market, a high Australian tariff wall, a 1960s boom in mining, especially for bauxite and iron ore, and the discovery of new reserves of petroleum, natural gas, and coal. 500,000 European immigrants, one-third from the British Isles, came to Australia 1945–9. Immigration peaked at 170,000 in 1952. The balance shifted toward Asian migration after the end of the war in Vietnam in 1972, whence Australia had accepted more than 100,000 refugees. Australia's population, which had passed the million mark by 1860 and the 5 million mark by 1920, was by 1970 more than 12.5 million.

Under the Whitlam Labour government (1972–5) tariffs were reduced and some economic reforms introduced. But the government ended in turmoil, was dismissed by the governor-general, Sir John Kerr, in 1975 and replaced after a general election by a coalition (Liberal and Country Party) under the leadership of Malcolm Fraser (1975–83). The Whitlam government's initiatives in Aboriginal affairs (already made full citizens by referendum in 1966), heritage, environment, family law, and health care were continued by the new government.

Despite massive majorities, the Fraser government was thought indecisive and, because of Kerr's action, regarded by

some as lacking legitimacy. Labour was returned to power in 1983 under the leadership of former labour union leader, Robert Hawke. Replaced by his rival and federal treasurer Paul Keating in 1992, Hawke's government sought accord with the labour unions, introduced a programme of financial and industrial deregulation, improved health and welfare, superintended the 200th anniversary of the British settlement of Australia, and failed in its attempt to change the constitution.

The rise of a new nationalism, epitomized by Whitlam's recognition of China and North Vietnam, and his tour of Asian countries, the Fraser government's multi-cultural initiatives, and Hawke's celebration of the winning of the America's Cup in 1983, sought to include the new Asia-Pacific and multi-cultural horizon. Keating took the new nationalism further by forging closer links with Asia and pushing his republican ideas. He was returned to office in 1993 when coalition leader John Hewson failed to convince the people of the need to introduce a goods and services tax. Keating, with his self-proclaimed republican 'big picture vision' for Australia, his polemical style, and what was believed to be his arrogance, was roundly defeated in the 1996 election by a John Howard-led coalition. The 1996 election represented the third occasion (the others in 1949 and 1975) on which a reformist Labour government, often using ideas taken from the conservatives (deregulation and market economics being most recent), had been rejected by an electorate saturated with change.

Australia looks west to Europe, east to the USA, and north to her burgeoning Asian neighbours. Although now officially multi-cultural, Australia has still not resolved her relation with her own indigenous people, the Aborigines. The granting of native title by federal law in 1993 will in the long run markedly change the position of Aborigines, but unlike Australia's European and Asian immigrants, a high proportion of the nearly 300,000 Aboriginal people are still both culturally and geographically 'fringe dwellers'.

With the rise of the new industrializing countries of east Asia, Australia's relative industrial and economic strength has dramatically declined. Australia has yet to face the fact, for example, that personal incomes in Singapore are on a par with those of an Australian worker. Furthermore, since Australia no longer has preferential access to European markets, it is now in direct competition with other primary raw material producers. Though retaining all the political, organizational, and governmental structures inherited from Britain, Australia is no longer the Anglo-Celtic culture that she was before 1945.

(ed.), *Great Events in Australia's History* (Frenchs Forest, 1988); Molony, J., *The Penguin History of Australia* (Ringwood, 1987).

**Austria, relations with.** At the end of the First World War, the Austro-Hungarian empire, which had fought alongside Germany, was dismembered by the treaty of \*Saint-Germain-en-Laye. Austria was reduced to a state of just over six millions, one-third of whom lived in Vienna—'a pathetic relic' in Harold Nicolson's words. Many Austrians

concluded that only union with Germany—Anschluss—could make a viable state, but this was specifically forbidden by the treaty of \*Versailles. The new state suffered severe economic and financial difficulties. A plan in 1931 for a customs union with Germany was vetoed by France and the subsequent collapse of the Creditanstalt bank helped to precipitate the world economic crisis. In 1934 the Austrian Chancellor Dollfuss, who had suppressed the Social Democrat opposition and taken emergency powers, was murdered by Austrian Nazis. Austria was briefly protected by Mussolini's Italy, but Mussolini's stock fell after the inglorious invasion of Abyssinia and he was obliged to come to terms with Hitler, who had made the Anschluss his top priority. In March 1938 when Dollfuss's successor, Schuschnigg, announced a plebiscite on union with Germany, Hitler sent in troops. Anthony \*Eden, British foreign secretary, resigned over Chamberlain's insistence on trying to conciliate Mussolini and the British ambassador in Berlin, Sir Neville Henderson, could scarcely be persuaded to make even a token protest: 'I was always convinced that Austria was bound to become part of Germany in some form sooner or later. Austria is now eliminated and without bloodshed,' he wrote. A plebiscite, conducted under Hitler's auspices, produced a 99 per cent vote for union.

During the Second World War the British government considered the possibility of Austria as part of a post-war confederation to remedy its economic isolation but was frustrated by the Soviet Union. After the war, Austria was reconstituted with its 1937 boundaries and occupied by the four allies for ten years. A peace treaty was postponed until 1955, when Austria was declared a neutral power and joined the United Nations. Its political stability, in contrast to the pre-war position, was remarkable, but the search for economic breadth continued. In 1959 it joined EFTA which, as an economic bloc, did not infringe Austrian neutrality, and in 1973, when Britain joined the EEC, Austria negotiated associated status. In 1995 Austria joined the EEC. JAC

**Austrian Succession, War of the.** Most of western Europe was plunged into war through Frederick the Great's invasion of Austrian Silesia in December 1740 (though Britain was already fighting the War of \*Jenkins's Ear with Spain). There followed eight years of continental and colonial warfare that killed half a million people. The European fighting took place in three theatres, the Low Countries, Italy, and central Europe. Spain and France were closely allied, with periodic links to Prussia. Britain, Piedmont-Sardinia, the United Provinces, and Austria were ranged against them. British, Austrian, and Dutch troops, often under the duke of \*Cumberland's command, fought against the French in the Low Countries. George II himself fought at \*Dettingen (1743), but before the peace of \*Aix-la-Chapelle in 1748, the French army had thrust deep into Dutch territory. In Italy, Britain provided financial and naval support for the Austrians and Piedmont-Sardinians against a Franco-Spanish army seeking to carve a kingdom

for Don Philip of Spain. In central Europe, British money helped Maria Theresa in her fight for the territorial survival of Austria against the powerful onslaughts of France and Prussia. At sea Britain was triumphant, the French navy having been destroyed by late 1747, largely due to the skill of \*Anson and \*Hawke. This placed the French economy under great strain by barring access to her colonies. In India the French had moderate success, but in America the British predominated, capturing the fort of Louisbourg in June 1745.

At home, the war helped to end the career of \*Walpole and assisted the rise of \*Carteret. The suggestion that Britain was supporting others for little gain was used by the \*Pelham brothers to oust Carteret in 1744, but the policy of subsidizing allies continued. Apart from the Jacobite rising of 1745–6, the conflict seemed remote to the British people and was not a 'popular war' in the manner of the \*Seven Years War. Its inconclusiveness demonstrated its futility. AIL

**Authorized Version.** See BIBLE.

**Avon** was a new county, formed under the Local Government Act of 1972. It was based upon Bristol, Bath, and Weston-super-Mare, but incorporated a slice of Gloucestershire, including Sodbury, Thornbury, and Marshfield, and a part of north Somerset, including Clevedon, Chew Magna, Radstock, Midsomer Norton, and Steep Holme. The name was taken from the river Avon, which runs through Bath and Bristol. There was considerable opposition to the proposal, particularly from Somerset. The county town was Bristol. Avon was abolished in 1996. JAC

**Avranches, compromise of.** On 21 May 1172, at Avranches cathedral (Normandy), Henry II was publicly absolved by papal legates from complicity in the murder of Archbishop Thomas \*Becket on condition that he provide 200 knights to serve in the Holy Land for one year, take the cross himself and fight either in the Holy Land or against the Moors in Spain, restore all properties seized from the church of Canterbury, allow appeals from the English church to Rome, and abolish all evil customs prejudicial to the church which he had introduced. The agreement paved the way for the re-establishment of sound relations between church and state in England after the Becket affair. SL

**Aylesbury case.** This was a protracted legal wrangle which led to a dispute between the two Houses of Parliament. Matthew Ashby, a Whig elector at Aylesbury in 1700, was prevented by the mayor from voting. He took his case to the House of Lords, which supported him: the House of Commons then insisted that it was the sole judge of election matters. The rivalry between the two houses was exacerbated by party feeling, the Whigs being strong in the House of Lords. The matter was unresolved when Parliament was prorogued. JAC

**Babbage, Charles** (1792–1871) Babbage made the first (clockwork) computers. He studied mathematics at Peterhouse, Cambridge, and in 1828 was elected to the Lucasian chair of mathematics, which \*Newton had earlier held. Meanwhile Babbage had been one of a group including John \*Herschel and William \*Whewell who had brought the Cambridge syllabus up to date. He hoped to eliminate errors in mathematical tables by calculating and printing them mechanically, and in 1834 oversaw the construction of his difference engine. Before it was finished, he saw how much more powerful it would be as an analytical engine, but the government cut off finance: the principles were later realized electronically. He was an irascible man, writing on *The Decline of Science in England* (1830), and in 1837 a *Bridgewater Treatise* in which the world was a great computer programmed by God. DK

**Babington plot**, 1586. Anthony Babington (1561–86), a Derbyshire gentleman and a catholic page in Mary Stuart's service in England, was contacted by John Ballard, a catholic priest. The plan involved twelve men, six of whom were detailed to kill Elizabeth; the others, with Spanish and papal help, were to secure the freedom of Mary. Babington's failure was engineered by Sir Francis \*Walsingham, who recruited a catholic, Gilbert Gifford, as an agent. Trusted by Babington and his fellow-conspirators, Gifford's job was to pass messages, hidden in a beer barrel, from Mary to the French ambassador: in fact the whole network was set up by Walsingham, who read the notes in transit. Babington was executed in September 1586. The plot sealed the fate of Mary by convincing Elizabeth that she was incorrigible. SA

**Bacon, Francis, 1st Baron Verulam, 1st Viscount St Albans** (1561–1626). Lawyer, philosopher, and essayist. The son of a prominent lawyer, Bacon went to Trinity College, Cambridge, and then to the Inns of Court. In constant need of money, in 1584 he became an MP. In the course of his public career, he prosecuted the earl of \*Essex, his former patron: he became much disliked. On the accession of James I Bacon achieved rapid promotion, prosecuting \*Raleigh, raised to the peerage, and ending up as lord chancellor. But in 1621 he was convicted of taking bribes, and though soon pardoned and released, he had to give up public life.

His witty and pithy *Essays* were first published in 1597, and are splendid examples of English prose; and in 1605 he brought out his *Advancement of Learning*. In this first exercise

in writing about science, he was highly critical of the humanistic education he had received at Cambridge, and saw classical texts as flotsam carried down on the river of time. He believed that the Bible and the Book of Nature were, rightly understood, compatible; and that scientific knowledge properly applied would bring us back to the state of Adam and Eve in the garden of Eden. In 1620 he published his *Novum organum*, presenting his philosophy of science in the form of aphorisms, many of them memorable. In retirement, he collected and published information of a rather miscellaneous kind, in what was to be the *Great Instauration*: his title-pages indicate that he saw himself as an intellectual Columbus, revealing the new world of science to his contemporaries, and bringing back ships freighted with useful knowledge. He died a martyr to science, from a chill caught trying to preserve a chicken by stuffing it with snow. After his death, the fragmentary *New Atlantis* was published in 1627: with its vision of an island governed by an Academy of Sciences, founded 'for the knowledge of causes, and secret motions of things; and the enlarging the bounds of human empire, to the effecting of all things possible'. This is the most accessible and exciting of his writings on science.

Bacon is an important figure in the \*scientific revolution; Robert \*Boyle and other founders of the \*Royal Society saw themselves as his disciples. His was a cautious experimental method, the mind being cleared of preconceptions or 'idols' and proceeding by induction and generalization to the discovery of causes or 'forms'. He was sceptical about mathematics, as Aristotle had been; and was similarly doubtful about the motion of the earth, and the atomic theory. He was scornful about his contemporary William \*Gilbert, who had done careful studies of magnetism. Galileo praised Copernicus for defying common sense; Bacon's science was organized common sense; and his vision of utility was gripping.

Britain's industrial revolution depended upon this kind of thinking, but the systematic application of science was a feature only of the 19th cent. Britons in the 1790s saw Baconian science as safe; the French *philosophes* had been led into dangerous speculation, and had brought atheism and revolution upon their country. Baconian induction lay behind the public health measures of the 19th cent., and John Stuart \*Mill sought to formalize his methods in his *System of Logic* of 1843. All efforts to show that inductive inference can

bring certainty seem, however, to have failed; and in the 20th cent., while Baconian induction was often taught to schoolchildren as 'the scientific method', it fell out of favour amongst philosophers of science. Nevertheless, we can appreciate his vision of the scientist not as a spider, which spins webs; nor as an ant, which rushes around seizing upon everything; but as a bee, which collects nectar and turns it laboriously into honey.

DK

Wormald, B. H. G., *Francis Bacon* (Cambridge, 1991).

**Bacon, Sir Nicholas** (1510–79). Statesman. Nicholas Bacon, a great work-horse of Elizabeth's government, owed his rise in part to college friendship. He came from Suffolk and was at Corpus Christi College, Cambridge, with Matthew \*Parker, afterwards archbishop of Canterbury. Later, he formed a friendship with William Cecil (\*Burghley), whose wife's sister he married in 1553. He read law at Gray's Inn and was employed on the \*dissolution of the monasteries: though his suggestion of an academy for statesmen was not followed up, he managed to acquire a number of estates for himself. He served as MP for Westmorland (1542) and for Dartmouth (1545). From 1540 to 1547 he was solicitor to the Court of Augmentations and from 1547 to 1561 attorney to the Court of \*Wards. Though a protestant, sympathetic towards puritanism, he survived Mary's reign without disaster. Bacon's boat came in, with that of his two friends, at Elizabeth's accession. Cecil was reappointed secretary of state in November 1558, Bacon became keeper of the great seal in December 1558, and Parker archbishop of Canterbury in 1559. Bacon was capable of offering independent advice and increasingly hostile towards Mary, queen of Scots. He received Elizabeth frequently at his house at Gorhambury, completed in 1568. Fat and cheerful, he was also efficient and honest. Elizabeth's reluctance to grant peerages presumably deprived Bacon of that honour, though he was knighted in 1558. His son Francis \*Bacon, lawyer and scholar, was created Baron Verulam in 1618 and Viscount St Albans in 1621.

JAC

**Bacon, Roger** (c.1214–92). Philosopher. A Franciscan friar, much of Bacon's life is obscure, but he was born in Somerset and probably studied at Oxford before teaching in Paris. From c.1250–7 he was again in Oxford but his Franciscan superiors returned him to Paris, where he was under a cloud and in confinement. In 1265 Pope Clement IV asked him to prepare a treatise on the knowledge of the day. This high patronage did not last, for Clement died in 1268, and Bacon was soon in trouble again. His *Opus majus*, dating from the 1260s, attacked authority and sophistry and has been hailed as a foundation work in modern science. Bacon laid stress on useful knowledge, on ascertaining facts, and on the need for experimentation. He proved that air is necessary for combustion, and his prophecies included flight and submarine travel. His work in \*alchemy gained him a popular reputation as a magician, exploited by Robert Greene in *Friar Bacon and Friar Bungay* (c.1590). This showed Bacon at Brasenose College making a brazen head which would prophesy, 'read a lecture in philosophy', and build a brazen wall to keep England safe.

JAC

**Baden-Powell, Robert** (1857–1941). Founder of the \*Boy Scouts. Baden-Powell joined the army in 1876 and specialized in reconnaissance and scouting. In 1897 he was appointed to command the 5th Dragoon Guards stationed in India. He used the opportunity to develop scouting training methods based on powers of observation, deduction, and initiative. He explained his methods in *Aids to Scouting* (1899). During the Boer War he took part in the defence of \*Mafeking. His improvisation and organization helped the British to hold out for 217 days against overwhelming forces. Mafeking was relieved on 17 May 1900 to wild rejoicing in London and Baden-Powell returned to England a popular hero. He was made inspector-general of the cavalry in 1903 and from 1908 held a post with the Territorials. He retired from the army in 1910 to devote his energies to the Boy Scout movement he had founded several years earlier. He was awarded the OM in 1937.

RAS

**badminton** took its name from the Gloucestershire seat of the dukes of Beaufort, where it is believed to have evolved in the 1870s from the older game of shuttlecock. It was much played in the Indian army and rules were drawn up in Poona. A Badminton Association was founded in 1893, an Irish Union in 1899, a Scottish in 1911, and a Welsh in 1928. An International Federation was formed in 1934. The convenience of a vigorous and sociable under-cover game led to its rapid spread, particularly in Scandinavia and the Far East.

JAC

**Baffin, William** (d. 1622). Explorer. Baffin, believed to be a Londoner, made a number of voyages in the 1610s looking for the North-West Passage. His measurements and observations were remarkably accurate. He was killed in India in a skirmish with the Portuguese. In 1821 the large island he had discovered to the north of Hudson Bay was named after him.

JAC

**Bagehot, Walter** (1826–77). Journalist. From a banking family in Langport (Som.), his father a unitarian, Bagehot attended University College, London, and began to study law. But he moved into banking, wrote copiously, particularly for the *National Review*, and from 1860 edited his father-in-law James Wilson's paper *The Economist*. Though capable of brilliant writing and subtle insights, much of Bagehot's work is marred by a habitual superciliousness towards the 'stupid' masses and his inability to resist a *bon mot*. His best-known work, *The English Constitution*, which came out in the 1860s, was enormously successful and seriously misleading. Written at the time of Victoria's seclusion after Albert's death, it is understandable that Bagehot should have underestimated both the weakness of the monarchy and its non-party character: 'the queen must sign her own death warrant if the two Houses unanimously send it up to her' is more piquant than profound. The distinction between the efficient and the dignified parts of the constitution, so much admired, was hardly novel, and the suggestion that the only rights the monarch had were to 'be consulted, encourage and warn' is too pat. But since the book became recommended reading for George V and George VI when princes, it helped to establish the position it claimed to describe.

## Baginbun

G. M. Young thought Bagehot 'the wisest man of his generation', but a less respectful commentator called him merely 'a television man before his time'. JAC

**Baginbun, battle of**, 1170. In 1169 Richard de Clare, earl of \*Pembroke, known as Strongbow, decided to seek territory in Ireland. A small advance party commanded by Raymond le Gros dug in on the coast at Baginbun Head, between Hook Head and Wexford, and was attacked by a vastly superior force of Norsemen and Irish. The invaders were successful. Strongbow then joined them, took Waterford and Dublin, and declared himself king of Leinster. The first English foothold in Ireland had been obtained. JAC

**Bahamas**. These islands lie off the coast of Florida and form an independent state within the Commonwealth. The larger islands include Grand Bahama and Andros: the capital, Nassau, is situated on New Providence Island. Their strategic position covering the entrance to the Gulf of Mexico gave them more than local importance. The economy depends greatly on tourism and on the large mercantile fleet flying the Bahamian flag. The queen is head of state and appoints the governor-general. Originally sighted by Columbus, they were first claimed by Spain and then, in the 17th cent., colonized by English settlers, some of them from Bermuda. For decades they remained bases for pirates. Some of the islands changed hands during the \*American War of Independence but were restored to Britain in 1783. The duke of Windsor was governor during the Second World War. JAC

**Baillie, Robert** (1599–1662). Cleric. Baillie was born in Glasgow and educated at the university there. Appointed to a living at Kilwinning in Ayrshire, he took part in the Glasgow Assembly, protested against \*Arminian innovations, and served with the army of the \*covenant. In 1642 he was appointed professor of divinity at Glasgow and rapidly became one of the leading presbyterian spokesmen. He represented the Scottish kirk at the \*Westminster Assembly and was dismayed at the Erastianism and tolerance of many of the English. \*Cromwell he thought lax and that his power should be broken: the independents, shockingly, 'expressed themselves for toleration not only to themselves, but to other sects'. But, with the cunning of the righteous, Baillie wrote of the independents: 'we purpose not to meddle in haste, till it please God to advance our army, which we expect will much assist our arguments.' Later, Baillie became a leader of the \*resolutionists. In 1660 he declined a bishopric but was appointed principal of Glasgow University. His *Letters and Journals* have been much used. JAC

**Baird, John Logie** (1888–1946). Television inventor. Baird came from Helensburgh (Dumbartonshire) and studied electrical engineering at Glasgow University. In poor health, he moved to Hastings in 1922, where he experimented with a crude home-made transmitting apparatus. By 1925 he was able to demonstrate shadowy television in Selfridge's store and followed with a public demonstration to members of the Royal Institution. His machine is preserved in the Science Museum at south Kensington. In 1927 he formed his own company. An experimental BBC television service was

started in 1929 and regular broadcasts from Alexandra palace in 1936. Baird was greatly disappointed that, after trials, the service used a rival high-definition transmitting system, developed by Marconi-EMI. In 1937 the Cup Final and in 1938 the Boat Race were shown on television, but when the service closed down at the start of the Second World War, there were still only 20,000 sets in use. JAC

**Bakewell, Robert** (1725–95). Bakewell was considered by Lord Ernle to be one of the pioneers of the agricultural revolution as a result of his animal breeding activities at Dishley, near Loughborough, particularly the 'New Leicester' breed of sheep. The principle of selective breeding was known before Bakewell began his experiments in 1745, and his work was not unique. However, he gained considerable contemporary prominence because he was solely a specialist breeder. He selected more rigorously than other landlords and was more sophisticated in the choice of animals he selected from. Earlier breeders had lacked his foresight and patience, and had not enjoyed the resources to breed exclusively from the finest animals. Bakewell also played an important role in cattle breeding, and by applying the same principles that had given him success with the New Leicesters he developed the New Longhorn. JVB

**Balaclava, battle of**, 1854. On 25 October 1854 the Russian commander in the Crimea, Menshikov, attempted to lift the siege of Sebastopol by attacking with 25,000 troops towards the British base at Balaclava. The 'thin red line' of 93rd Highlanders repulsed a charge by Russian cavalry. This was followed by a successful attack on the main body of the Russian horse by the numerically inferior British heavy [cavalry] brigade and by the notorious \*Charge of the Light Brigade. The battle was a victory for the allies, commanded by Lord \*Raglan and General Canrobert, although the Russians retained the Causeway Heights. GDS

**balance of power** meant different things at different times and operated centuries before it was ever defined. Article I of the first treaty of \*Paris of May 1814 spoke of establishing 'a system of real and permanent Balance of Power' in Europe. Writing of the period before 1914 the British foreign secretary, Sir Edward \*Grey, said, 'I imagine it to mean that when one Power or group of Powers is the strongest "bloc" in Europe, our policy has been, or should be, that of creating, or siding with, some other combination of Powers, in order to make a counterpoise to the strongest Power or Group and so to preserve equilibrium in Europe.' Grey had in mind the balance between the Triple Alliance of Germany, Austria, and Italy and the Dual Alliance of France and Russia. In 1864 another foreign secretary, Lord \*Palmerston, had provided a definition which was still closer to that of 1814 than to that of 1914. He said, 'It means that it is to the interest of the community of nations that no one nation should acquire such a preponderance as to endanger the security of the rest; and it is for the advantage of all that the smaller Powers should be respected in their independence and not swallowed up by their more powerful neighbours. That is the doctrine of the balance of power and it is a doctrine worthy of being acted upon.' The doctrine was

always strongly attacked by radicals. Richard \*Cobden called it a 'figment', which he could never understand. John \*Bright rejoiced that it was dead, intemperately proclaiming that it had burdened the nation with debts, killed hundreds of thousands of Englishmen, and 'desolated' millions of families. Cobden and Bright objected to it, in part, because it was associated with the preservation of the Vienna settlement, arrived at at the end of the Napoleonic wars. The aim had been to ensure stability. So long as the territorial balance then created between the five great powers was preserved, no one power would be strong enough to disturb the peace. If any tried, the other four would automatically form a coalition against it. It has convincingly been argued that Bismarck destroyed the open self-balancing Vienna system by his obsessional creation of tight alliances to protect the newly unified Germany.

MEC

**Baldwin** (d. 1190). Archbishop of Canterbury. Native of Exeter, after a spell as archdeacon of Totnes, where he became a celebrated canonist, Baldwin entered the Cistercian monastery at Ford, Devonshire (c.1170), becoming abbot and then bishop of Worcester (1180). He was Henry II's own choice as archbishop in 1184, after an election disputed by the Benedictine monks of Canterbury whose hostility he soon provoked in a struggle famous throughout Europe. He took the cross (1188), preaching the crusade in Wales with 'the energy and style of Bernard of Clairvaux'. Henry sent him unsuccessfully to patch up a peace with Philip Augustus, as a prelude to the crusade. After attending Henry on his death-bed and crowning Richard I, he set out for the East. Heading the English advance guard, he arrived at the siege of \*Acre (October 1190), deputized for Patriarch Heraclius, but died soon after.

WMM

**Baldwin, Stanley** (1867–1947). Prime minister. Educated at Harrow and Cambridge, Baldwin entered the family ironmaster's business but on his father's death in 1908 was elected to succeed him as Conservative MP for Bewdley (Worcs.), thus entering Parliament at a comparatively late age. Baldwin served in the Lloyd George coalition governments from 1917 to 1922, but became increasingly alarmed at the amorality and adventurism associated with the later years of Lloyd George's premiership. Baldwin made the key speech at the Carlton Club meeting of Conservative backbenchers in 1922 that brought down Lloyd George, after which he served as chancellor of the Exchequer in the short-lived Conservative administration of the dying Andrew Bonar \*Law, succeeding to the premiership in May 1923. Baldwin's industrial experience told him that free trade had had its day, and, acting more from impulse than from guile, he determined on its abolition. But he had already told a Conservative conference that he was not 'a clever man' and knew 'nothing of political tactics'. The truth of this was demonstrated by his decision to call a general election almost at once on the issue of protection. The Conservatives lost their overall majority, thus permitting the formation of the first Labour government.

But while Baldwin lacked Lloyd George's political cunning, he preserved in public life values of probity, charity,

and conciliation which struck chords with British public opinion. He was known to be a man of simple country pleasures who had, during the Great War, donated one-fifth of his private fortune to reduce the size of the war loan. In a political atmosphere heavy with the rhetoric of class antagonism, Baldwin's conciliatory spirit and appeal to moderation seemed far preferable to a Labour Party tinged with extremism and a Liberal Party in a state of civil war. Following the general election of 1924, which saw the Liberal Party reduced to 40 seats, the Conservatives emerged with a majority of over 200 in the Commons. Baldwin was once more prime minister.

The composition of the cabinet was not, however, conducive to the pursuit of the policy of national unity which Baldwin had preached. In order to make peace with the Conservative free traders, Baldwin gave the Exchequer to Winston \*Churchill, and in order to appease the Tory evangelical moralists he appointed as home secretary William Joynson-Hicks, a man who held deep anti-Jewish prejudices. His one inspired appointment was to put Neville \*Chamberlain in charge of the Ministry of Health. Churchill's return to the gold standard (1925) had a very predictable effect on employment, and the cabinet took an equally predictable line on the \*General Strike the following year. Baldwin brushed aside George V's advice to pursue a military solution (packing the king off to Sandringham), and appealed instead to the quietist instincts of the British public and to the moderate elements within the Labour movement. This policy paid handsome dividends, since the Trades Union Congress abandoned the miners and called off the industrial action. However, in 1927, and against his own better judgement, the cabinet pushed through the vindictive Trade Disputes Act, by which the principle of 'contracting out' of the political levy collected by trade unions was replaced by 'contracting in'. It was hoped that this provision would reduce Labour Party membership and income, which it did, but the Act did Baldwin's government little credit, and may have played a part in the Conservative defeat at the polls in 1929.

Between 1929 and 1931 Baldwin fought a bitter duel with the empire free traders, led by the press barons Lords \*Beaverbrook and \*Rothermere. The experience of 1924 lay heavily upon him. The age of free trade was clearly drawing to a close, but Baldwin understood better than most the sensitivities this issue aroused within his party, and he grew ever more indignant at the challenge which the protectionists were mounting to his leadership. On 17 March 1931 he made a dramatic appeal to the Conservative public to choose between him and 'the engines of propaganda for the constantly changing policies, desires, personal wishes, personal likes and personal dislikes of two men . . . What the proprietorship of these papers is aiming at is power, but power without responsibility—the prerogative of the harlot throughout the ages.'

Baldwin survived, and his leadership of the Conservative Party was never again seriously challenged. In 1931 he agreed to serve under Ramsay \*MacDonald as lord president of the council, succeeding MacDonald as prime minister in 1935. Baldwin was not slow in perceiving the vital necessity of a

programme of rearmament in the face of international aggression. But he overestimated the strength of pacifism within British society, wrongly fearing the effect of a policy of rearmament on his own popularity, and (through higher taxation) on economic recovery. The result was a strategy as hypocritical as it was cynical, and does not redound to Baldwin's credit. In November 1935 he called a general election, during the course of which he protested his support for the \*League of Nations. The election resulted in a resounding Conservative victory, but Baldwin's advocacy of the League was in fact a sham. Baldwin knew that the League's sanctions against Italy (which had invaded Abyssinia) would not be effective if they excluded oil; it was precisely for this reason that he supported them. When his foreign secretary, Sir Samuel \*Hoare, signed an agreement with Pierre Laval, the French prime minister, proposing the cession of Abyssinian territory to Italy, Baldwin forced him to resign, though in the view of many he ought to have resigned himself.

Baldwin's handling of the abdication crisis, the following year, cannot be faulted. In advising Edward VIII against a morganatic marriage to Mrs \*Simpson he acted with the utmost constitutional propriety, and with the backing of the Labour leader Clement \*Attlee, and of the dominion prime ministers. The smoothness of George VI's succession was due primarily to Baldwin's calm assuredness. He stayed in office long enough to attend the new king's coronation; two weeks later, aged almost 70, he resigned, accepting the customary earldom.

Stanley Baldwin, pipe in hand, was an avuncular figure, the epitome of British middle-class moderation against a turbulent and menacing European backdrop. He also symbolized the inter-war Conservative Party's suspicion of intellectuals and preference for second-class minds. Baldwin cannot be called a great thinker, or a great statesman: he is dwarfed by Lloyd George who preceded him and Winston Churchill who came afterwards, and in his own premiership was outclassed by his chancellor, Neville Chamberlain. Yet he could act decisively (witness the speedy passage of the 1936 Public Order Act, to curb the pseudo-military provocations of the \*British Union of Fascists) and he was more honourable than most politicians of his generation. Perhaps for this reason he and Clement Attlee had a high regard for each other. There is much truth in the view that Baldwin helped 'tame' the Labour Party, and that the triumph of constitutionalism within its ranks, and its increasing respectability within British society (leading, ultimately, to Labour's 1945 election victory), owed something to Baldwin's patronage.

GA

Baldwin, A. W., *My Father* (1955); Jenkins, R., *Baldwin* (1987); Middlemass, R. K., and Barnes, A. J. L., *Baldwin* (1969); Williamson, P., *Stanley Baldwin* (Cambridge, 1999).

**Balfour, Arthur James, 1st earl of** (1848–1930). Prime minister. Essentially a mid-Victorian, Arthur Balfour seems miscast as a 20th-cent. prime minister. He was the last representative of the traditional landed class to rise to the top and achieved it largely through the patronage of the 3rd marquis of \*Salisbury. Naturally fitted for life in a rural

vicarage or an Oxford college, Balfour did in fact produce an original work, *A Defence of Philosophic Doubt* (1879), which his critics thought summed up his approach to politics admirably.

Balfour grew up on the family estate at Whittingehame in the Scottish borders; his father had been a Tory MP and his mother was a sister of Robert Cecil, the future Lord Salisbury. Though a member of the Souls (a cross-party group of gifted young politicians), the young Balfour remained a solitary, intellectual figure, especially after the death in 1875 of his intended wife, May Lyttelton. He never married. Having no particular purpose in life, he decided to enter politics, and from 1874 to 1885 represented Hertford, the Cecil family's pocket borough. A poor speaker, Balfour underlined his rather detached position by involvement with Lord Randolph \*Churchill's \*'Fourth Party'.

However, around 1885–6 Balfour's career took off. He left the security of Hertford and, despite his distaste for mixing with the electorate, contested a new, popular constituency, East Manchester, which he held until 1906. Acting as, in effect, his uncle's secretary, he entered upon a lengthy apprenticeship for the prime ministership. He served briefly as president of the Local Government Board (1885) and as secretary of state for Scotland (1886), but really made his reputation as chief secretary for Ireland (1887–91). In that role Balfour adopted a twofold strategy. First he ruthlessly suppressed rural violence, earning thereby the epithet 'Bloody Balfour'. Second, he attempted to conciliate nationalist opinion by policies of social interventionism, including the sale of land to tenant farmers on easy terms, and investment in light railways and seed potatoes.

By promoting his nephew as leader of the House in 1891–2 and 1895–1902, Salisbury placed him in line for succession as prime minister in the latter year. Unhappily, Salisbury also bequeathed to Balfour the accumulated problems of his own prolonged reign. In particular, the financial cost of the South African War led Joseph \*Chamberlain to take up the cause of tariff reform. Though Balfour cleverly manoeuvred Chamberlain into resigning from the cabinet, this only led him to launch a campaign from 1903 onwards which largely captured the party for protectionism. Balfour struggled to maintain party unity by offering a compromise acceptable to Tory free traders and protectionists. This meant adopting 'retaliation', in effect to use the threat of tariffs to force other states to reduce their barriers against British goods. However, Balfour's clever dialectics merely convinced colleagues that he did not care very much about the issue, and earned him the contempt of both sides. Free traders felt he had failed to support them in their constituencies, while the protectionists blamed his ambiguous approach for losing the 1906 election. None the less, although immersed in this controversy, Balfour's government did take several important initiatives including the passage of the 1902 \*Education Act, the Anglo-French \*Entente of 1904, and the establishment of the Committee of Imperial Defence and the Royal Commission on the Poor Laws.

After 1906 the parliamentary party became predominantly protectionist in sympathy and Balfour exercised little effective leadership. In 1909 he made no attempt to stop the

Tory majority in the Lords from rejecting \*Lloyd George's budget. This proved to be a serious error. It resulted in Balfour having to lead his party through two unsuccessful elections in 1910, and as a result 1911 saw the development of a 'Balfour Must Go' campaign. He resigned—the first in a long line of modern Tory leaders to fall victim to their own backbenchers.

Yet a remarkably long career as a respected elder statesman still awaited Balfour. From the outbreak of war in 1914 he became an unofficial adviser to the Liberal government, and not surprisingly, \*Asquith appointed him 1st lord of the Admiralty in the coalition of May 1915. Subsequently he served Lloyd George as foreign secretary (1916–19) in which capacity he produced the famous \*Balfour declaration committing the government to the establishment of a national homeland in Palestine for the Jews. His last role was as lord president of the council under Lloyd George (1919–22) and under \*Baldwin (1925–9). MDP

Zebel, S. H., *Balfour* (Cambridge, 1973).

**Balfour declaration.** Partly with a view to securing the support of world Jewry for the allied war effort, \*Lloyd George's government authorized Foreign Secretary A. J. \*Balfour to send a letter (2 November 1917) to Lord Rothschild (lay leader of Anglo-Jewry) pledging the support of the British government for the establishment, in Palestine, of a 'National Home' for the Jewish people, but safeguarding the rights of Palestine's non-Jewish inhabitants. The terms of this declaration were incorporated into the \*mandate for Palestine granted to Britain by the League of Nations, on the basis of which considerable Jewish settlement there was permitted between the two world wars. Growing Arab resentment and violence led to the abrogation of the declaration by Neville \*Chamberlain's government in 1939. GA

**Ball, John** (d. 1381). Contemporary chroniclers saw John Ball as the evil genius behind the \*Peasants' Revolt of 1381. Very little is known about this man, who in a letter ascribed to him referred to himself as formerly a priest of St Mary's, York, and then of Colchester. A member of the ecclesiastical underworld, he had been formally prohibited from preaching in 1366. Early in 1381 his attacks on the established church order led to his excommunication and imprisonment at Maidstone in Kent, from where the rebels released him. He was soon linked by chroniclers with \*lollardy, but his preaching during the revolt, with its egalitarian message, was in a well-established tradition. After the rising, Ball was sentenced to be hanged, drawn, and quartered. MCP

**ballads.** Defining a ballad is difficult, since it is an adaptable and flexible art-form which has changed with the times. Intended for singing, the metre and language is usually simple and direct, the colours bold, the humour broad, with a chorus to encourage the company to join in. The earliest ballads were often heroic narratives—'Sir Patrick Spens', 'The Battle of Otterburn', 'Flodden Field'. They were meant for minstrels to sing in baronial halls. But with the advent of printing, ballads could be sold as broadsheets and could appeal to a wider audience. They soon acquired a satirical and disrespectful tone which made the authorities

uneasy. The ballads of \*Robin Hood were particularly popular, and Bishop \*Latimer complained that he had once found an empty church because the congregation was off on Robin Hood's Day—'a traitor and a thief'. The first collection of ballads seems to have been *A Handful of Pleasant Delights* (1566). Samuel \*Pepys was a great collector of ballads and left 1,400 to his Cambridge college, Magdalene. The great revival of interest in old ballads came with the publication of Thomas \*Percy's *Reliques of Ancient English Poetry* in 1765, which helped to kindle the enthusiasm for the medieval past that characterized the Romantic movement. But by this time ballads were of great variety—love-sick swains, horrible murders, betrayals, pirates, and domestic infighting. Charles \*Burney deplored the vulgarization of ballads when he remarked in 1802 that a ballad was 'a mean and trifling song such as is generally sung in the streets'. But the ballad had still some way to fall—to Mrs Dyer baby farmer, the dying cowboy, Frankie and Johnnie, and irreverent wartime ditties about the sergeant-major. Their value as a guide to changing taste was put by John \*Selden in his *Table Talk* in the 17th cent.: 'more solid things do not show the complexion of the times so well as ballads and libels.' JAC

**ballet** is a dramatic entertainment by dancers, usually in costume with scenery and accompanied by music. Originating as elaborations of social dances in the lavish court spectacles of Renaissance Italy, it developed in France following the marriage of Catherine de Medici to Henri II in 1533. The *ballet de cour* mixed poetry, vocal and instrumental music, dancing, costumes, and scenery—the same recipe as that of the English \*masque, a similar celebratory entertainment including both professional dancers and members of the court.

The establishment of the Académie Royale de Danse in 1661 was rapidly followed by Lully and Molière's numerous *comédie-ballets*, and the strong influence of French dance and Lully's music is clearly apparent in late 17th-cent. English stage works such as \*Purcell's *Dido and Aeneas*. Dance continued to be incorporated into opera. When Marie Sallé came to Covent Garden in 1734, creating a stir in the ballet *Pygmalion* with her loose muslin dress and free hair rather than panniered skirts and wig, \*Handel included dance music for her troupe in his operas. Also popular in London at this time was pantomime, often performed between the acts of plays or operas. The dancing-master John Weaver claimed credit for the first pantomime with *The Tavern Bilkers*: probably the 'Comical Entertainment in a Tavern between Scaramouch, Harlequin and Punchanello' advertised at Drury Lane theatre in 1703. The theatre director John Rich was a famous Harlequin in many productions, although Weaver's *The Loves of Mars and Venus* (1717) ignored grotesque *commedia* characters and offered what he termed 'scenical dancing' and mime.

Sallé's expressive dancing, together with the English pantomime and the acting style of David \*Garrick, influenced Jean-Georges Noverre, the greatest proponent of the new *ballet d'action* whose central dramatic narrative was conveyed entirely by dance, mime, and music without spoken or sung text. Among Noverre's pupils was

Charles-Louis Didelot, who worked in London at the turn of the 19th cent. Carlotta Grisi, the first Giselle (Paris, 1841), married choreographer Jules Perrot, formerly partner of the great Romantic ballerina Marie Taglioni. The couple worked at Her Majesty's Theatre, London, in the 1840s, and Perrot's *Pas de quatre* (1845) brought together four of the world's leading ballerinas: Taglioni, Grisi, Cerrito, and Grahn.

As with Noverre, the concept of a unified art-work was also central to Sergei Diaghilev's Ballets Russes, whose company had annual London seasons from 1911 to 1914. Diaghilev commissioned many of the leading artists of his time: choreographers Fokine, Massine, and Balanchine; designers Bakst, Picasso, and Cocteau; and numerous composers including Stravinsky, Debussy, Satie, and Ravel. Diaghilev helped establish classical ballet as a serious art-form and trained many of the key figures in British ballet: Marie Rambert, who in 1926 formed the company that became known as the Ballet Rambert (from 1987 the Rambert Dance Company); Ninette de Valois, who established the Vic-Wells Ballet at Sadler's Wells (known as the Royal Ballet from 1956); and Alicia Markova, whose mantle as the leading British ballerina passed to Margot Fonteyn. Renowned for her effortless technique, grace, and dramatic involvement, Fonteyn's later career included an acclaimed partnership with Rudolf Nureyev.

Among leading British choreographers are Frederick Ashton, John Cranko, Kenneth MacMillan, and Antony Tudor, while important composers writing specific ballet scores included \*Vaughan Williams, Bliss, and \*Britten. Britten also exploited dance in his operas *Gloriana* (1953) and *Death in Venice* (1974). There are now numerous touring dance companies in Britain, some specializing in modern dance. ECr

**Balliol, Edward** (c.1280–1364). Son of John \*Balliol, king of Scots, and himself titular king of Scots (1332–56). He had good prospects in youth, being betrothed in 1295 to the niece of the French king, and recognized as heir to the Scottish throne as late as 1301. But the Wars of Independence marginalized the Balliols, and after his father's death in 1313 Edward lived in obscurity in Picardy.

Edward III's coup in England (1330), and his distaste for the settlement with Robert I which \*Isabella and \*Mortimer had accepted in 1328, opened up new possibilities. There were others who had lost Scottish estates in the wars, and in 1331, Balliol returned to England and put himself at the head of a group of 'disinherited', who hoped to take advantage of the youth of David II. Landing at Kinghorn they were at first dramatically successful: after a victory at \*Dupplin Moor outside Perth (11 August 1332), Balliol was made king at Scone. By the end of the year, however, he had been forced to flee ignominiously to England. This provoked Edward III to intervene in person, defeating the Scots at \*Halidon Hill outside Berwick (19 July 1333), and reimposing Balliol as king. In 1334 Balliol had to pay the price, performing liege homage to Edward for his kingdom, and ceding much of southern Scotland to Edward III's direct rule.

There followed five years of devastating guerrilla warfare before Balliol's attempt was proven to have failed. Though he himself took part in several expeditions, he was evidently only the agent of Edward III, and for much of the time remained in England. However he did not abandon his claims, and after David II's capture at \*Neville's Cross (17 October 1346) even made moves to reassert his position; but to no avail. In 1356, disgusted with his prospects and burdened by age, he resigned his title to Edward III in return for a pension.

He has been slightly treated by many Scottish historians, but he had little opportunity to reveal his abilities and there is no contemporary comment on his character. BW

**Balliol, John** (c.1250–1313), king of Scots (1292–6). The son of John Balliol of Barnard Castle, he was descended through his mother from David earl of \*Huntingdon, the brother of William the Lion, king of Scots (1165–1214). The Balliol family held lands in France, in northern England, and in Galloway. These last gave John a stake in Scotland and a number of strong supporters when the crown became vacant on the death of \*Margaret, the 'Maid of Norway', in 1290. In addition, he was linked with the powerful Comyn family through the marriage of his sister to John \*Comyn of Badenoch.

The verdict of Edward I's Parliament at Norham went to Balliol as descended from the eldest of the three daughters of William the Lion's brother; and he was duly enthroned as king of Scots on 30 November 1292. There is every reason to think that this judgment was acceptable to most Scots.

Edward I, however, had insisted that all the claimants acknowledged his right to be lord superior of Scotland, a claim for which there was little unambiguous evidence. Balliol therefore had to perform homage and fealty to Edward before his enthronement. This enabled Edward to assert what he believed to be his rights over Scotland and Edward's claims plagued John's entire reign. He faced nine appeals to Edward from disgruntled litigants, in the course of which he had in 1293 to appear in Edward's Parliament and was humiliatingly adjudged to be in default. Far more serious was Edward's demand in 1294 for military service in his French wars by John himself and all the most prominent nobles of Scotland. Edward was for the moment distracted by a serious Welsh revolt, and the Scots were able to get away with excuses. But it was clear that Edward would not let this go on indefinitely, and the Scottish nobles, distrusting King John's determination to resist, set up in July 1295 a council of twelve which took power out of John's hands. The council allied formally with Philip IV of France in October 1295; and prepared to resist Edward by force. From this point, John lost control. In 1296 Edward I took Berwick. Scottish resistance was destroyed by Earl \*Warrene at \*Dunbar, and John was forced to resign his kingdom into Edward's hands at Montrose in July. Balliol was brought a prisoner to London; and the rest of his career had little impact. Though the Scottish opponents of Edward continued till 1304 to act in his name, and though in 1302 Edward I recognized that his restoration was still a possibility, Balliol himself in 1298 declared formally that he never

wanted to have anything to do with Scotland again, because of the treachery of the Scots. In 1299 he was transferred to papal custody and in 1301 was released to his ancestral lands in Picardy, where he died in 1313. Balliol was clearly not able to resist Edward I; yet his only Parliament enacted sensible measures to administer the western Highlands, which suggests that in other circumstances he could have been an effective king. BW

**Ballymore Hill, battle of**, 1798. Father Murphy, leading the Wexford rebels, ambushed a small detachment of British troops on 4 June near Enniscorthy, killing their commander, Colonel Lambert Walpole, and taking several guns. Though no more than a skirmish, it gave great encouragement to the rebels. JAC

**Balmoral** (Aberdeenshire). The Scottish holiday home of the royal family. The present house was built in 1853–6 for Queen Victoria by the architect William Smith of Aberdeen (1817–91) as a replacement for an earlier house in Jacobethan style erected in 1834–9 by his father, John Smith (1781–1852). ‘This dear paradise’, as she called it, is a white granite mansion in Scots baronial style, and embodies modifications suggested by Prince \*Albert. The design of \*Osborne, the Queen’s stuccoed Italianate villa on the Isle of Wight, had also benefited from the prince’s involvement from 1845 to 1851, in this instance as a collaborator with Thomas \*Cubitt (1788–1855)—the builder and property developer described by Robert Kerr as ‘perhaps as near an approach to an architect as any man not an architect could be’. Queen Victoria spent part of every spring and autumn at Balmoral, her love of Scotland finding public expression in her books *Leaves from the Journal of Our Life in the Highlands* published in 1869, with a second part, *More Leaves*, appearing in 1883. PW

**Baltimore, George Calvert, 1st Lord** (c.1580–1632). Royal servant, MP, and secretary of state from 1619 to 1625, Calvert relinquished office when he openly declared his conversion to catholicism. He shared with his catholic father-in-law, Lord Arundell of Wardour, a wish for an American lordship, beginning a settlement at Ferryland, in his short-lived Province of Avalon, in Newfoundland. Calvert, who visited the Chesapeake, obtained from Charles I in 1632 proprietary rights to land carved out of Virginia north of the Potomac. The Maryland (named after Charles I’s catholic wife) charter gave the Baltimore family palatinate powers of government and has been characterized as representing Charles’s ‘idealized picture of a restored monarchical authority in England’. Calvert died in 1632; his sons, Cecilius, the second baron, and Leonard, the first governor, introduced religious toleration in order to encourage Roman catholic settlement but protestants later became numerous and dominant. RCS

**Bamburgh castle** in Northumberland is sited on an outcrop of basalt rock, overlooking the North Sea. A citadel of the Anglo-Saxon kings of \*Bernicia, it was close to their palace at \*Yeavering and the royal monastery of \*Lindisfarne. Later the site became a centre of power of the earls of Northumbria. Between the 10th and 12th cents. control of the north of England was disputed between the kings of England and of Scotland, the earls being a

powerful independent force. In 1095 William Rufus took it by force from the then earl, Robert Mowbray, as part of his bid to control the north. After that the castle remained in royal hands until the 16th cent., except when held by Henry, earl of Northumberland, son of King David of Scots, during the reign of Stephen, when Scottish influence in Northumberland was in the ascendant. It is likely that the keep was begun by David and Henry, and completed by Henry II of England, after he recovered the castle in 1157; and that the castle had achieved its full extent, of three wards each with its own gate, by 1250. It was allowed to fall into decay after being severely damaged in the siege of 1464, when held by the Lancastrians against Edward IV. \*Warwick the Kingmaker pounded it with heavy guns, despite the king’s wish that it be taken ‘whole, unbroken with ordinance’. Its present condition is due to modern restorations, especially by Lord \*Armstrong. LR

**Bamford, Samuel** (1788–1872). Lancashire radical and poet. Brought up a Wesleyan in Middleton near Manchester, he worked as a warehouse boy, farm labourer, on coal ships plying between Tyneside and London, and as a bookseller before setting up as a hand-loom weaver. Under the influence of William \*Cobbett he became a radical, founding the Middleton \*Hampden Club in 1816 and being arrested for treason for advocating parliamentary reform in 1817. Acquitted of this charge, he was present at the \*Peterloo massacre of 16 August 1819 as leader of the Middleton contingent and was sentenced to a year in Lincoln gaol for treason. This ended his radical career. He returned to hand-loom weaving and when this failed turned unsuccessfully to writing and public readings of his poetry. His autobiography was written in 1841–3 to justify his turbulent past and warn \*chartists against the use of violence. ER

**Banbury, battle of**. See EDGECOTE.

**Bancroft, Richard** (1544–1610). Archbishop of Canterbury. Born in Lancashire and educated at Christ’s College, Cambridge, Bancroft was successively canon of Westminster (1587), chaplain to Archbishop \*Whitgift (1592), bishop of London (1597), and archbishop (1604). From 1597 he was virtually acting primate during Whitgift’s illness and attended Elizabeth at her death. A powerful advocate of episcopacy, whether preaching as canon of Westminster or making overtures to secular catholic clergy rather than Jesuits, his profound animosity towards presbyterianism was evident at the \*Hampton Court conference (1604). As archbishop, he was tough with potential schismatics, helped restore episcopacy to Scotland, and secured the passage through convocation of the canons of 1604, the Latin corpus of Anglican canon law, virtually unmodified until \*Fisher. A man of scholarly interests, Bancroft zealously supported work on the 1611 translation of the Bible and sought to improve intellectual standards of the clergy. WMM

**Banda, Hastings Kamuzo** (c.1902–97). Malawian nationalist statesman. Banda trained as a doctor in the USA and in Scotland and practised medicine in England (1945–53) and in Ghana (1953–8). He protested ineffectively against the creation of the Central African Federation in 1953, but returned

## Bangladesh

home to lead the campaign against federation as president of the Nyasaland African Congress in 1958. In 1959 the colonial government declared a state of emergency and Banda was imprisoned. He was released a year later and became successively minister of natural resources and local government in 1961 and prime minister in 1963. In the latter year, the Federation was dissolved, Banda retaining his office when Nyasaland became independent and was renamed \*Malawi in 1964. Malawi became a republic in 1966 with Banda as president, an office he assumed for life in 1971. He remained consistently pro-western in his foreign policy but governed autocratically at home. KI

**Bangladesh** proclaimed itself an independent and sovereign state on 25 March 1971 although it was not until 15 December that \*Pakistan conceded this status. Previously, the country had been known as East Pakistan, united with West Pakistan in the state created at the time of India's partition in 1947. Prior to this, the region consisted of the most eastern districts of the British Indian presidency of \*Bengal. These were marked by a Muslim-majority population in contrast to the Hindu majority of West Bengal. Religious tensions, reinforced by class cleavages, began to rise towards the end of the 19th cent. and reached fever-pitch in the 1940s. The proposal for the 1947 partition won the support of the majority of both Muslims and Hindus in the Bengal Legislative Assembly. However, East Bengal's place in the new Pakistan was never comfortable. Power was narrowly concentrated in the landed-military élites of the West. The East felt itself to be an exploited and alien colony. In the 1960s, a movement developed around the Awami League demanding, at the very least, provincial autonomy. It was repressed but reasserted itself strongly in 1970 when President Yahya was obliged by US pressure to hold Pakistan's first general elections. The Awami League won 160 of the 162 East Pakistan constituencies. West Pakistan's military and political leaders struck back, arresting the president of the Awami League and unleashing tanks on Dakha. A *Mukti Bahini* guerrilla movement responded. Brutalizing violence drove 10 million refugees into neighbouring India, whose army then intervened. On 15 December 1971, West Pakistan forces surrendered and the 'liberation' of Bangladesh was confirmed. DAW

**Bangor, diocese of.** The foundation of the church at Bangor is ascribed to Deiniol in the 6th cent., his sphere of influence as a bishop extending throughout the principality of \*Gwynedd in north-west Wales. Work on the cathedral began in the 12th cent. under Bishop David (1120–39). It was extended during the episcopates of Anian I (1267–1307) and Anian II (1309–28). The nave and aisles were rebuilt late in the 14th cent., and the tower by Bishop Skevington in the 16th. Much alteration and restoration was undertaken in the 19th cent. under the direction of Gilbert \*Scott.

The diocese has an area of over 1,500 square miles and includes the island of Anglesey, the holy island of Bardsey, burial place of many of the Welsh saints, and the mountainous countryside of Snowdonia. Worship in many of the churches is conducted in the Welsh language. William \*Morgan, translator of the Bible into Welsh (1588), was

born in the diocese. His work was revised later by John Davies, rector of Mallwyd, the chaplain of the bishop of Bangor. More recently the notable priest and poet R. S. Thomas was rector of Aberdaron on the Lleyn peninsula, drawing much of his inspiration from the area. JRG

**Bangorian controversy.** Loosed by Benjamin \*Hoadly, a low-church Whig cleric, appointed to the bishopric of Bangor in 1715. The following year he launched an attack on the \*non-jurors, arguing that their deposition had been lawful. In 1717 he followed with a sermon 'My kingdom is not of this world', in which he adopted a most extreme position—that Christ had not vested authority in any secular persons, that private judgement was sacrosanct, and that sincerity of belief was the ultimate test. Hoadly appeared to his opponents to open the floodgates to religious anarchy and William \*Law and others commenced vigorous pamphlet warfare. The revival of religious controversy was extremely unwelcome to Whig ministers and when the matter was raised in the lower house of \*convocation, that body was hastily prorogued, not to meet again until 1852. JAC

**Bank Charter Act, 1844.** The culmination of government efforts to create an effective legal framework to achieve a stable currency, the Act defined the roles of the Bank of England. One department had the exclusive duty of issuing notes having a minimum value of £5 as legal tender in England and Wales. It was to ensure that notes had an equivalent backing of bullion in its vaults, combined with a fiduciary issue defined by the Treasury. The other department undertook banking business, acting as the regulatory body for the banking system with powers which included fixing the minimum cost (interest) of borrowing money. IJEK

**Bank Holiday Act, 1871.** Introduced by Sir John Lubbock, this Act compelled the clearing banks to close on certain days, thus making them public holidays. In England and Wales Easter Monday, Whit Monday, the first Monday in August, and Boxing Day became public holidays. In Scotland New Year's Day, the first Monday in May and August, and Christmas Day were declared holidays. RAS

**banking.** A system of trading in money which involved safeguarding deposits and making funds available for borrowers, banking developed in the Middle Ages in response to the growing need for credit in commerce. The lending functions of banks were undertaken in England by money-lenders. Until their expulsion by Edward I in 1291, the most important money-lenders were Jews, since they were not bound by canon law which forbade usury. They were replaced by Italian merchants who had papal dispensations to lend money at interest. In the 13th cent. credit was essential to finance commerce and major projects. The most important was the wool trade but other examples included large buildings such as Edward's castles in north Wales. When Italians had their activities in England curtailed in the early 14th cent., they were replaced by English merchants and goldsmiths, whose rates of interest were sufficiently low to avoid the usury laws. These sources of banking activity were the mainstay of commerce until the later 17th cent.

Monarchs had borrowed from merchants and landowners for centuries. By the late 17th cent., constitutional changes, particularly the growth of parliamentary power over government expenditures, required a more regulated framework. The \*Bank of England, founded in 1694, gave the government and other users of credit access to English funds. Similar developments occurred in Scotland and Ireland. These banks remained without serious competition until the later 18th cent., when expanding commercial and manufacturing activities gave scope to merchants, brewers, and landowners to establish banks based on their own cash reserves. These commercial banks took deposits, made loans, usually for limited periods, and issued promissory notes whose value was backed by bullion in the vaults combined with a fiduciary issue which depended on the likely scale of withdrawals. Errors of judgement sometimes occurred and 'runs on the bank' took place when depositors feared for the security of their money and demanded its return.

Fluctuations in the value of money because of the return to a gold-based currency after the end of the Napoleonic wars (1815) precipitated a series of crises. To stabilize the currency the government eventually introduced the 1844 \*Bank Charter Act, which gave the Bank of England two functions, that of supervising the note issue as part of the currency and that of monitoring the activities of the banking system. Regulatory powers were put in place in 1845 to control banking in Scotland and Ireland.

From their earliest days, banks required loyal staff who did not accept bribes, steal money, or give information about accounts to unauthorized persons. Literate and numerate staff received high salaries, retirement pensions, and various privileges including holidays and social facilities. Their work required systematic record keeping which grew in volume and complexity during the 19th cent. when cheques replaced banknotes for many business transactions. In 1773 banks established the London Clearing House to process cheques rapidly.

In the 19th cent., overseas trade and the expanding British empire reinforced the place of London as a centre of merchant banking. The probity, knowledge, and skills of these specialist bankers attracted business from foreign firms and governments seeking loans in Britain. Some British firms employed merchant banks to arrange their supply of capital finance. This usually involved share or bond issues which were traded on the stock markets. Such arrangements made possible the rapid development of railways, heavy engineering, mines, and large commercial developments. Many of these merchant banks survive, including Rothschilds, Lazard Brothers, Baring, Kleinwort Benson, and Schroders. Internal commerce and trade were funded mainly by a larger number of separate local banks which, after the middle of the 19th cent., became consolidated into a much smaller number of banks covering much of England. Numbers continued to diminish so that by 1980 banking was dominated by four companies: Barclays, Lloyds, Midland, and National Westminster.

London's dominance as the banking centre, not only of Britain but of the financial world, was not challenged until

the 20th cent. with the growth of competing international economies such as the USA and Japan. None the less, London remains a major centre of merchant banking.

Within Britain, banking has been characterized, largely because of technological innovation, by an increasingly sophisticated provision of traditional banking services and an expansion of services associated with consumer credit. The business of safeguarding and lending money is often arranged through machine-readable cards and continuous access by telephone. Since the Financial Services Act of 1986, banks face more competition with many banking services being provided by building societies, trustee savings banks, and the Post Office. IJEK

**Banks, Sir Joseph** (1743–1820). Explorer, and for over forty years president of the \*Royal Society. Educated at Harrow, Eton, and Christ Church, Oxford, Banks developed an extracurricular interest in botany. Graduating in 1763, instead of going on a grand tour, he sailed to Newfoundland and Labrador on HMS *Niger*. Inheriting great wealth in land in 1764, he resolved to join Captain \*Cook's voyage to observe Venus from Tahiti and then to search for the unknown southern continent (1768–71). Accompanied by a staff including artists and the botanist Carl Solander, he observed ethnography and botany in Tahiti, New Zealand, and New South Wales. Returning a hero, he was in 1778 elected president of the Royal Society, holding the office to his death. Having learned his science as one of a large and expensive team involving the armed forces, not unlike modern 'big science', he spent his working life administering it. Seeing unity as strength, putting down what he saw as rival institutions, but promoting the \*Royal Institution, \*Kew Gardens, and the colonization of Australia, he became the formidable autocrat of science in Regency Britain. DK

**Banks of England, Ireland, and Scotland.** Founded in 1694, the Bank of England was a private company, the first to offer services in England. By the 19th cent. it had become the central bank and the currency manager for the state, although these powers were not formally enshrined until the Bank Charter Act of 1844. In 1946 it was taken into public ownership, and in 1997 the Labour government gave it the important task of deciding the national rate of interest.

The Bank of Ireland was created by legislative charter of the Irish Parliament in 1783. Although it dominated banking in Ireland during its first half-century, its position was never that of a central bank. It continues to function as a commercial bank whose head office is in Dublin.

The Scottish Parliament in 1695 licensed a partnership to establish the Bank of Scotland with the intention of providing coherence for the finances in Scotland. However, the bank ran into difficulties which encouraged others to set up competing banks. After the Act of \*Union in 1707 the Scottish financial system was linked to that of England although the Bank of Scotland together with other Scottish banks retains the right to issue its own banknotes. IJEK

**bannaret and banret.** By origin, a knight who brought his men into the field under his own banner and who ranked next to a baron. By extension, a title granted for deeds of

## Bannockburn

valour in the field in the presence of the king, who shaped the pennon by cutting off its points. Edward III made John de Copeland a knight banneret for capturing the king of Scotland at \*Neville's Cross in 1346 and Sir Richard Croft was dubbed by Henry VII after the battle of \*Stoke in 1487. Though knights banneret took precedence over the new order of baronets established by James I, they died out, partly because, after the civil wars, few kings took the field in person. JAC

**Bannockburn, battle of**, 1314. Early in 1314 Edward II assembled a large army to restore his crumbling authority in Scotland and to relieve Stirling castle, besieged by supporters of Robert I Bruce. The English had a marked superiority in numbers and thought it unlikely that the Scots would offer a pitched battle. But Bruce massed his spearmen, dug pits to protect them from the cavalry, and in a preliminary encounter on 23 June, the English knights suffered badly. On the following day, the Scots gained the upper hand in heavy fighting and the English fell back in confusion. Edward was forced to flee and narrowly escaped capture. The Scottish victory was decisive and reaffirmed the independence of the country. JAC

**Banqueting House** (Whitehall). The Banqueting House is one of the finest rooms in the country. Built by Inigo \*Jones for James I, between 1619 and 1622, it was one of the few buildings to survive the fire at Whitehall palace in 1698. It was intended to be part of a great new complex which was never completed. The severe and classical features, based on Palladio's designs, were a new form of architecture. The ceiling was finished in 1634 by Rubens and is largely devoted to themes illustrating the wisdom and virtue of James I: its baroque exuberance is in strange contrast with the restraint of the hall. It was from this building that Charles I stepped through a window to the scaffold in 1649. Cromwell declined the crown there in 1657 and William and Mary accepted it there in 1689. In the 18th cent. it was used as a royal chapel. The Banqueting House is open to the public and still used on grand occasions. JAC

**baptists** formed one of the main protestant dissenting groups, holding that baptism should be undertaken by adults who could understand the ceremony and its significance, and that it should involve total immersion in water. These views may have been inherited from the 16th-cent. \*anabaptists, but baptists managed to shed the odium which had attached to the earlier group. The first baptist community was established in London in 1612 and the movement spread rapidly, in Britain and in the American colonies. The writings of John \*Bunyan in the Restoration period gained for baptists widespread respect. They did little more than maintain their numbers in early Hanoverian England but in the early 19th cent. expanded greatly and by 1851 had more than 2,700 congregations in England and Wales. Of these the large majority were Particular Baptists, who had retained a \*Calvinist outlook, as against the General Baptists who had moved towards \*unitarianism. Baptist churches and educational institutions are extremely strong in the United States. JAC

**Barbados**. An island in the eastern Caribbean some 200 miles north-east of Trinidad. Extending 21 miles by 14, it is a little larger than the Isle of Wight. It was uninhabited in 1627 when settled by the English, who began growing sugar cane in the 1630s. In 1665 it survived an attack by the Dutch. The capital is Bridgetown and tourism is augmented by light industry. The population in 1996 was 259,000 and since 1966 it has been an independent state within the Commonwealth. JAC

**Barbour, John** (d. 1395). Medieval Scottish poet, author of *The Bruce*. Barbour was probably born in south-west Scotland (c.1325), and became archdeacon of Aberdeen diocese (1357). In this position he played a significant role in political and ecclesiastical affairs, attending general council to discuss David II's ransom (1357), and travelling abroad to Oxford and France.

From the accession of Robert II (1371) he was closely associated with the royal court, acting as a clerk of audit and auditor of Exchequer regularly until 1385. He also received considerable financial patronage from the king, some undoubtedly for his compositions. *The Bruce* (written 1375–7) is the earliest substantial poem in Scots to survive. It deals with the reign of Robert I (1306–29), and is based on oral and written testaments, often of contemporaries. He is also known to have written *The Brut* and *The Stewartis Original*, which do not survive. RJT

**Barebone's Parliament**. When Cromwell expelled the \*Rump on 20 April 1653, he had no plans for an alternative government and no authority to call elections to a new Parliament. After deliberation, he and his council of officers decided to vest the supreme authority in a nominated assembly, initially for sixteen months. Together they chose 144 members to represent all the English counties, and also Ireland, Scotland, and Wales. The assembly met on 4 July and soon voted to call itself a Parliament; it gets its familiar sobriquet from Praise-God Barebone, leather-seller, lay preacher, and MP for London. Barebone was not a typical member, however, for at least four-fifths of the House were gentlemen, and moderate men clearly outnumbered religious and political radicals. But the latter strove disruptively for extreme changes in religion and the law, until the moderate majority, to Cromwell's relief, staged a walk-out on 12 December and resigned their authority back into his hands. AHW

**Barham, Charles Middleton, 1st Lord** (1726–1813). Middleton was a cousin of Henry \*Dundas, the future intimate of Pitt the Younger, treasurer of the navy and secretary at war. Hence Middleton had access to the centre of government almost from the time he became comptroller of the navy in 1778, when still in the rank of captain. His active naval career had been more profitable than distinguished, but he found his métier in the comptrollership, held until 1790 in weekly communication with Pitt and in combination with his parliamentary seat at Rochester. Appointed to the Admiralty Board in 1794 Middleton resigned in 1795; but 10 years later his enduring reputation brought him to the 1st lordship in succession to Dundas, when Middleton was cre-

ated Lord Barham. His outstanding administrative record was crowned by a provident foresight which ensured the ship-strength available to \*Nelson at \*Trafalgar. DDA

**Baring, Evelyn, 1st earl of Cromer** (1841–1917). Proconsul. Baring's father was an MP and younger brother of the great banker Lord Ashburton, his mother the daughter of an admiral, and the family seat at Cromer Hall (Norfolk). Baring spent the years 1858–72 in the Royal Artillery and then went to India as private secretary to his cousin, Lord \*Northbrook, the viceroy. In 1877 he began his life's work when he was sent as commissioner to Egypt to attempt the enormous task of placing its finances and administration on a firm footing. For thirty years he was the effective power in the land, comptroller-general from 1879 to 1880, consul-general 1883–1907. Restoration of Egyptian solvency meant withdrawal from the Sudan and Baring acquiesced, with misgivings, in the choice of \*Gordon to carry out the task, watching helplessly when Gordon was trapped and overwhelmed at Khartoum. Not until the 1890s was \*Kitchener able to restore Egyptian control over the Sudan. Baring, meanwhile, accumulated honours—a barony in 1892, viscountcy in 1899, and earldom in 1901. Edward VII gave him the Order of Merit in 1906. He retired from ill-health in 1907 and published a two-volume work on *Modern Egypt* the following year. JAC

**Barnardo, Thomas John** (1845–1905). Philanthropist. During the protestant religious revival in Dublin in 1862, Barnardo gave up his job to devote his time to evangelizing work. In 1866 he entered the London Hospital as a missionary medical student and visited slums where he was saddened by the number of homeless and neglected children. Barnardo abandoned his plans to go to China as a missionary in order to help them. On 15 July 1867 he founded the East End Juvenile Mission for the care of sick and destitute children. Under the patronage of Lord \*Shaftesbury he opened a boys' home at 18 Stepney Causeway, later followed by a series of similar houses known as 'Dr Barnardo's Homes'. In 1876 he started the Girls' Village Home in Barkingside (Essex). In 1882 he began sending children to Canada for training and resettlement. His work expanded both at home and in Canada and before his death he had rescued 59,384 children and assisted as many as 500,000. RAS

**Barnes, Robert** (1495–1540). Protestant martyr. Barnes, born in Norfolk, became prior of an Augustinian friary in Cambridge. He adopted Lutheranism and in 1526 was brought before \*Wolsey to answer charges of heresy. Barnes recanted and subsequently spent several years in Germany, where he stayed with Luther. He was recalled to England by Thomas \*Cromwell, to whom his support of the royal supremacy against the papacy might be of use. Barnes was employed on several diplomatic missions in Germany and Scandinavia and was involved in negotiating Henry VIII's marriage with \*Anne of Cleves. The breakdown of that marriage weakened his position and that of his patron. Cromwell was beheaded on 28 July 1540 and two days

later Barnes, attainted for heresy, was burned at Smithfield. JAC

**Barnet, battle of**, 1471. \*Warwick, Edward IV's great ally at \*Towton, turned against him in 1470 and drove him out of the kingdom. Returning in March 1471, Edward landed near Hull and moved south. Warwick, in possession of London, marched out to confront him. They met at Barnet, 14 miles north, on 14 April. Warwick had some 15,000 troops, Edward rather fewer. The action began early in the morning with mist still thick on the ground. Warwick's men won initial success, but confusion and mistaken identity led to cries of treason and a fatal collapse of morale. Warwick himself, fighting on foot, was cut down trying to reach his horse. Three weeks later, Edward secured his position beyond doubt with his crushing victory over Queen \*Margaret at \*Tewkesbury. JAC

**baronets** are hereditary knights and at first their elder sons could be knighted on their 21st birthday. The order was instituted by James I in 1611 as a means of raising money for the army in Ulster. Irish baronetcies followed in 1619 and Scottish in 1625. The latter were originally of \*Nova Scotia since the intention was to support that colony. Baronets remained commoners and were therefore eligible for membership of the House of Commons. Pledges to limit the number granted were soon broken. JAC

**barons.** The name was first used loosely to mean any great landowners or lords and then acquired a precise meaning as the lowest of the five ranks in the peerage. The word came into use after the Conquest to describe the more important tenants-in-chief. Their special privileges released them from the authority of the \*sheriff: they led their own men whereas lesser lords brought their men to the sheriff's levy. In time a class of greater barons emerged who were summoned specifically to the host or the king's council. The emergence of Parliament in the 13th cent. meant that barons were summoned by writ to the House of Lords and then sought to make the privilege hereditary. From 1387 onwards, barons could be created by letters patent, which in time replaced summons by writ as the normal method of creation. But from 1385, the establishment of superior titles of duke, marquis, and viscount pushed barons into the lowest rank of the nobility. The hereditary principle was first breached in 1876 when law lords were given life baronies and in 1958 life peers were admitted to the House of Lords, holding baronies. JAC

**baroque** is a term widely applied by art historians to the whole spectrum of European art in the 17th and early 18th cents. Possibly used by Iberian jewellers to categorize imperfectly formed pearls, or originating in the Italian *barocco*, dismissal of a dubious theory with an extravagant conclusion, baroque meant a style in architecture, painting, music, and furniture which flouted classical standards.

In 17th-cent. Britain baroque was never whole-heartedly embraced or permitted to overwhelm classical models. Here a protestant ethos was decisive because, quintessentially, baroque was represented by the grandeur of Counter-Reformation Rome as projected by Bernini, Borromini,

## barrier treaties

and their demanding Barberini patron Pope Urban VIII (reigned 1623–44); the fulsome interior decoration of the Pitti palace in Florence by Pietro da Cortona (1641–6) would never have been wanted for an English great house.

No painter who has been labelled 'baroque' has surpassed Rubens, the supreme colourist. While it should be remembered that he was ever a master of line, and had a practical knowledge of contemporary architecture, it is striking how, in England, Rubens's greatest surviving decorative scheme, the ceiling of the Whitehall \*Banqueting House (late 1630s), is 'reined in' by the building's austere character. This situation is reversed in Nicholas Stone's porch for St Mary's church, Oxford (1633), where barley-sugar ('solomonic') columns, redolent of Bernini, support a traditional fan-vaulted roof. In drawing, \*Lely's 31 depictions in black and white chalk of a Garter procession, made in the 1660s, are regarded as among the most accomplished of baroque drawings. Their swagger is exactly suited to their theme. In baroque woodwork, Grinling \*Gibbons's choir stalls in St Paul's cathedral are unsurpassed in England. While the English and Dutch shared in an ebullient use of brick, in stone (emanating from the fertile minds of \*Vanbrugh, \*Hawksmoor, Talman, and Archer) there was a profoundly native adaptation of baroque. With these men there arrived a startlingly exaggerated interpretation of such classical features as entablatures, finials, pedestals, and pilasters, above all at \*Blenheim, \*Castle Howard, Seaton Delaval, and \*Chatsworth (all built between 1685 and 1725).

The Vanbrugh-esque had no counterpart in music because Britain shared sufficiently in the common currency of continental music. The ever-developing organ catered splendidly for the observational requirements of reformed churches, and it was symptomatic of the era that musicians such as Tomkins, Lawes, Locke, and \*Purcell benefited from royal rather than ecclesiastical patronage: the two latter furnished music for great occasions of state which would have sounded no less appropriate in catholic milieux. DDA

**barrier treaties.** After their experience in 1672, when they were almost overrun by the French, the Dutch sought guarantees against renewed aggression. Their proposal was to garrison certain fortresses in the southern Netherlands, under Spanish sovereignty until \*Utrecht, under Austrian subsequently. Britain supported these demands while being anxious at the commercial advantage the Dutch might obtain. In 1715, as part of the Utrecht settlement, the Dutch were given the right to fortify seven towns, including Tournai and Namur, and to share one other with the Austrians. The Austrians were to provide the cost out of local revenues. The fortresses were a persistent cause of irritation between the Dutch and the Austrians and served little military purpose, being easily overrun in 1745. JAC

**Barrosa, battle of,** 1811. Since 1810 Cadiz had been besieged by the French under General Victor. In January 1811 an Anglo-Spanish force attempted to lift the blockade by landing 50 miles to the south at Trafalgar and marching north to attack the French from the rear at Chiclana. On 5 March Victor, hiding in Chiclana Forest, attacked the allied flank and captured Barrosa ridge, the key strategic point on

the field. General Graham (\*Lynedoch), commanding the British troops, in a bold but bloody counter-attack managed to repulse the French. The Spanish army, under General La Peña, did not intervene and allowed the French to escape when the English were too tired to pursue. RAS

**Barrow, Henry** (c.1550–93). An early puritan separatist, Barrow was born in Norfolk, educated at Clare Hall, Cambridge, and became a member of Gray's Inn. While living a dissolute life, he had a conversion experience (c.1580) and dedicated himself to theology, especially \*Brownist ideas. Arrested in 1586, he was examined personally by \*Whitgift and \*Burghley. From prison he smuggled his illicit writings to the Netherlands. Eventually he and John Greenwood were tried for writing 'with malicious intent' and hanged. Separatism multiplied rapidly, but the separatist churches of London and Amsterdam deriving from Barrow were regarded as the 'ancient' churches of the separation. WMM

**Barrow, Isaac** (1630–77). Scholar. Barrow was born in London and sent to Trinity College, Cambridge, where he became a fellow. His royalist sympathies led him to spend 1655–9 abroad but at the Restoration he rose rapidly. In 1660 he was elected to the chair of Greek at Cambridge and in 1663 became the first professor of mathematics at Cambridge, resigning in 1669 to make room for Newton. In 1673 he was elected master of Trinity, where he began building the great Wren library. Barrow's reputation was largely as a mathematician and as a preacher: his sermons, though extremely long, were regarded as models of lucidity. His attack upon the doctrine of papal supremacy, published posthumously, was also highly regarded. JAC

**Barrow, Sir John** (1764–1848). Promoter of exploration. As a member of Lord \*Macartney's staff, Barrow was on the famous embassy to China in 1793 and then with him at the \*Cape of Good Hope after the British take-over; he wrote accounts of both ventures. Barrow had made some useful travels in the little-known South African interior and drew maps. He became 2nd secretary at the Admiralty in 1806 and remained there using the position to promote British exploration, official and semi-official, most notably of west Africa and of the north polar region. Barrow was a founder member and key figure in the foundation of the Royal Geographical Society in 1830 and set it on its path as the premier promoter of 19th-cent. exploration. RB

**Barry, Sir Charles** (1795–1860). Versatile Victorian architect who espoused a diverse range of styles. After travel in 1817–20 through France, Italy, Greece, Turkey, Egypt, and Syria, he returned to London and built several churches in a Gothic idiom, including St Peter's, Brighton (1824–8). Turning to the Greek revival, he designed first the Royal Institution of Fine Arts (1824–35) and then the Athenaeum (1837–9), both in Manchester. By this time he was using Italian *palazzi* as models for the Travellers' (1830–2) and Reform Clubs (1838–41) in Pall Mall. Barry never lost his genius for flexibility, and elsewhere used Tudor Gothic (as at Canford Manor), Jacobethan (as at Highclere castle), and even Scottish baronial (as at Dunrobin). His *magnum opus*, the Houses of \*Parliament, won in competition in 1836, was

in the required 'Gothic or Elizabethan' style, but its construction took its toll on Barry's health and hastened his death in 1860. PW

**Barry, James** (1741–1806). A history painter, Barry was brought from Ireland to London by Edmund \*Burke, who also paid for him to visit Italy, where he was influenced by the Renaissance great masters. He was elected ARA in 1772, RA in 1773, and appointed professor of painting in 1782, but his truculence alienated other Royal Academy members who petitioned the king to have him expelled in 1799. Between 1777 and 1783/4 he worked for almost no payment on six large pictures on the theme of the Progress of Human Culture, in the Society of Arts, London. Grand-manner history painting was little appreciated by British patrons, yet Barry persisted, enduring poverty and squalor, to become the only British painter to follow consistently the precepts set by \*Reynolds for this style. JC

**Bartholomew** (d. 1184). Bishop of Exeter. Eminent Norman theologian and expert canon lawyer, Bartholomew was appointed archdeacon in 1155. His election to the see in 1161, urged by \*Theobald of Canterbury, was supported by Thomas \*Becket. After Theobald's death, he was chosen by Henry II to help secure Becket's election to Canterbury, then in 1164 took part in an embassy seeking papal intervention in the crisis between king and archbishop. During the Becket controversy, he seemed to steer a middle course. Bartholomew's presence at the controversial crowning of \*Henry the Young King (1170) is uncertain, but Becket asked that he should not be papally censured with others involved. Considered by Pope Alexander III to be a great luminary of the English church, in his later years Bartholomew often acted as judge-delegate for the papal court. AM

**Barton, Elizabeth** (c.1506–34). Prophetess. Known as the Maid of Kent, Elizabeth Barton, a domestic servant, developed religious mania, with trances and visions. She was taken up by local catholic priests and used to discredit Lutheran ideas. But when she took up the cause of \*Catherine of Aragon and declared that Henry VIII would die if he divorced her, the Maid moved into deep waters. For a time she was protected by \*Warham, \*More, and \*Fisher, but when \*Cranmer succeeded Warham as archbishop he interrogated Barton and obtained a confession that her revelations were feigned. With several of her associates she was executed at Tyburn in April 1534. JAC

**Basilikon doron** (1598), a manual on the practice of kingship, was written by James I and VI for his eldest son, Prince \*Henry. Though less polemical in tone than *The Trew Law of Free Monarchies*, composed about the same time, it made apparent James's exalted view of kingly power. James wrote the *Basilikon doron* for his own enjoyment and initially distributed it only among his family and close friends. Mass publication, in England, came in March 1603, on the eve of James's accession to the English throne, when the *Basilikon* quickly became a best seller and fuelled fears of the new king's absolutist tendencies. RL

**bastard feudalism.** The term bastard feudalism, seemingly invented in 1885, has come to be adopted as a convenient label to distinguish a social structure different from its predecessor in the post-Conquest period. The essence of the original feudal system introduced by William I was that tenants of manors or other substantial units of land had obligations to their lords, of which fealty, suit of court, and military service were the most common. With bastard feudalism the bond between a man and his lord was not tenurial but financial, not hereditary but personal; it was often made by a written contract, an indenture, by which a retainer undertook, in return for a pension, to attend and ride with his lord whenever required, suitably armed and equipped.

The proliferation—if not the origin—of this pattern of relationships coincided with the \*Hundred Years War. Edward III and his successors raised their invading armies by indentures with lords and other captains who undertook to provide certain numbers of mounted men and archers. They in turn recruited parts of their contingents by similar contracts. All were to be paid wages of war: these were not feudal armies. The core of a lord's company would be the men already retained to follow him 'in peace and war'. It was therefore in the king's interest that lords had organized companies available for military service, not only for campaigns abroad but for emergencies like foreign invasion or domestic rebellion.

The political hazards of this dependency could be reduced by good kingship. Public order was assisted if lords kept their retainers in order, as by arbitrating in their quarrels. It was otherwise when lords competed for regional dominance, as did the dukes of Norfolk and Suffolk, and the Nevilles and Percies, in a period of weak monarchy. 'Livery and maintenance' could weaken the administration of justice. In 1384 the parliamentary Commons complained that wrongdoers expected to escape retribution through the patronage of the lords whose liveries of cloth or badges they wore. Sheriffs and justices of the peace retained by a lord would not be impartial: juries could be packed or intimidated.

For many landed gentry, the best safeguard available was to have the 'good lordship' of a noble protector by becoming his retainer. Social aspirations may have helped to swell retinues, because tradesmen and rustic tenants able to wear a lord's livery could describe themselves as 'yeomen'; while those of more dignified standing were known as 'gentlemen'. Both these personal descriptions became widely used in the 15th cent., particularly in indictments of riotous assemblies. Eventually bastard feudalism was curbed, though not abolished, by Henry VII's conciliar jurisdiction and his statute of 1504, which prohibited retaining without royal licence. RLS

**Bastwick, John** (1593–1654). Bastwick was an indefatigable opponent of \*Laud and the bishops. Born in Essex, he went to Emmanuel College, Cambridge, and then practised as a physician. In the 1630s he published several pamphlets urging presbyterianism and denouncing the church which was 'as full of ceremonies as a dog is of fleas'. In 1637, with

## Basutoland

\*Prynne and Burton, he was sentenced to the pillory, to a fine, life imprisonment, and to have his ears cropped. \*Clarendon subsequently described him as 'a half-witted, cracked-brained fellow', but admitted that it was unwise to treat gentlemen 'as the poorest and most mechanic mal-factors used to be', since it was much resented by professional men and 'treasured up wrath for the time to come'. Bastwick was exiled to the Scillies but brought back in triumph by the \*Long Parliament in 1640. He subsequently served in the parliamentary army and continued to wage pamphlet warfare until his death. JAC

**Basutoland.** See LESOTHO.

**Bath** (Roman). The Roman settlement of *Aquae Sulis* developed where a number of thermal springs erupt from the floor of the Avon valley. Chief of these is the King's Bath Spring which delivers nearly 250,000 gallons of water a day and was the focus of Roman activity. Also within the Roman site were the far smaller Hetlin (Hot Bath) and Cross Bath Springs. Late Iron Age coins recovered from the spring and the presence of a presiding Celtic goddess, *Sulis* (assimilated to *Minerva*), suggest pre-Roman veneration. The religious and thermal precinct at Bath is the earliest and grandest Roman civil building complex in Britain. Constructed probably from the 60s, it comprised a precinct containing a tetra-style classical temple, on axis with which was an altar. Laid out on a series of cross-axes were the reservoir capturing the King's Bath Spring and the baths complex, which consisted of a large, covered, lead-lined bath (the Great Bath) with subsidiary baths to east and west. The date, size, plan, classical style of the temple, and detail of the architectural stonework and sculpture mark the complex as exceptional in the western part of the empire. Round about 200, major refurbishment of the buildings included modifications to the temple, the replacing of the timber roofs of the baths with a tile barrel-vault, and the enclosing of the reservoir within a barrel-vaulted containing building. Excavation of the main spring has yielded over 12,000 Roman coins and 130 lead tablets inscribed in Latin with curses (*defixiones*) as well as intaglios and other offerings to the deity, where the steaming spring issues from the underworld. In the later 4th cent. maintenance of the complex started to lapse, with silt accumulating. After the end of Roman rule and technology, the waters backed up and eventually the complex fell into ruin, though the town is mentioned in the *Anglo-Saxon Chronicle* for 577. Protected in the 3rd cent. by a defensive/precinct wall enclosing 25 acres, the springs and their temples and baths lay west of the Avon. To the east, in the Walcot area, seems to have been the main focus of a town presumably serving both the sacred complex and the local country-dwellers. ASEC

(post-Roman) After the collapse of Roman power, Bath did not slide into total insignificance. \*Edgar was crowned there in 973 and in 1090 the diocese was transferred from Wells to Bath. The *Gesta Stephani* of 1138 referred to visitors from all over England making their way to the baths. \*Leland, in the 1530s, commented that Bath was much frequented by people 'diseased with lepre, pokkes, scabbes and great aches'. Queen Elizabeth paid a brief visit in 1591 but

found the smell disagreeable. Anne of Denmark went there in 1615 but in 1631 Dr Edward Jorden warned that the water was too dirty to drink. A regulation by the corporation in 1648 does not inspire confidence: 'no person shall presume to cast or throw any dog, bitch or other live beast into any of the said baths.' \*Pepys visited in 1668, enjoyed the music, but thought it could not be clean to have so many bodies in the same water. \*Mary of Modena was said to have conceived her son James in September 1687 while visiting.

The transformation of Bath into the fashionable spa of Georgian England was primarily the work of two men—Richard 'Beau' \*Nash and John Wood. Nash was master of ceremonies from 1705 to 1761 and imposed order and decency upon what was potentially an unruly and difficult clientele, insisting that rank be put aside—the 'happy secret of uniting the vulgar and the great'. To the baths were added concerts, receptions, balls, fireworks, the theatre, milliners, booksellers, coffee-houses, card parties, and pleasure walks in Spring Gardens (1735) and Sydney Gardens (1795). Wood began the massive reconstruction of Bath from medieval huddle to Georgian spaciousness, under the patronage of Ralph Allen, whose estate at Prior Park above the city provided the stone. Queen Square (1729–36) was followed by the Mineral Water hospital (1737–42), North and South Parades (1740–8), and Gay Street (1750s). John Wood, junior, added the Circus (1754–8) to his father's design, Royal Crescent (1767–75), and the Assembly Rooms (1769–71). The glory of Bath lasted until the early 19th cent., by which time success had bred disaster and Nash's vulgarians had taken over. Catherine Morland in Jane Austen's *Northanger Abbey* (1818) found that in the Pump Room on Sundays there was 'not a genteel face to be seen'. JAC

**Bath, Order of the.** Bathing as a symbol of purification was an element in the creation of spotless knights and the practice grew up of dubbing numbers of knights on grand occasions like coronations. By the time of Henry V they were known as knights of the Bath, though no order existed. In 1725 John Anstis, Garter King of Arms, suggested the 'revival' of the order. \*Walpole and George I agreed, partly to add lustre to the new regime, partly to fend off aspirants. The red ribbon became coveted. The Order was extended in 1815 and 1847. It has a military and civilian division, with three categories in each—the Knights Grand Cross (GCB), Knights Commander (KCB), and Companions (CB). Women members are dames. The dean of Westminster is usually its dean and the chapel of the order is Henry VII's chapel in Westminster abbey. JAC

**Bath abbey** is a fine example of late Perpendicular building. Begun in 1499 by Bishop Oliver King, it replaced a larger Norman foundation. The architects, the Vertue brothers, were also responsible for Henry VII's chapel at Westminster: each has magnificent fan vaulting. The bishop is said to have been encouraged by a dream showing the ladder to heaven, and the scene is reproduced on the west front. The abbey was a Benedictine foundation and fell into neglect after the \*dissolution of the monasteries, but, being in the middle of the town, was taken over in 1573 as the parish church. JAC

**Bath and Wells, diocese of.** The present see, created in 909, is roughly coterminous with the old county of Somerset. Though Wells itself was founded in c.704 as a religious centre by \*Ine, king of Wessex, and his nephew \*Aldhelm, first bishop of \*Sherborne, it was not until 909 that \*Edward the Elder split the bishopric of Sherborne into four, Wells being the new see for Somerset, and Athelm, a monk from Glastonbury nearby, the first bishop. In 973 \*Dunstan crowned \*Edgar as king of all England at \*Bath abbey. The first Norman bishop, John de Villula (1088–1122), became abbot of Bath, to which in accordance with the Council of London (1075) he transferred his see (1090). This led to friction between the monks of Bath and the canons of Wells over episcopal elections. In 1176 Pope Alexander III resolved the dispute by declaring the cities to be joint-sees and ordering the chapters to hold elections together. Complications intensified when Savaric, bishop of Bath and Wells (1192–1205), became abbot of Glastonbury and styled himself 'bishop of Glastonbury'. In 1245 Pope Innocent IV finally resolved the matter in favour of joint elections and the retention of the title 'Bath and Wells'. Later bishops were often important nationally. Robert \*Burnell (1275–92), chancellor of England, Edward I's friend and adviser, Thomas Beckington (1443–65), Latin secretary to Henry VI, and Thomas \*Wolsey (1518–23) held the see in *commendam*. Though at the Reformation the bishopric lost over half its estates it nevertheless had further notable bishops, including William \*Laud (1626–8), later Charles I's archbishop, and Thomas \*Ken (1685–91), the saintly non-juror. Despite the bishopric's relative lack of importance, its bishops still retain the shadow of former glory, the privilege, along with bishops of Durham, of supporting the sovereign during the coronation. The magnificent 13th-cent. cathedral at Wells stands within a complex of buildings, including the moated bishop's palace, started by Burnell, and the 14th-cent. Vicars' Close.

WMM

**Bathurst, Henry, 2nd Earl Bathurst** (1714–94). Bathurst's career spanned politics and the law. He was an MP from 1735 to 1751 and became a king's counsel in 1746 and a judge of the common pleas in 1754. As a politician Bathurst opposed the Walpole ministry and was later active in the interest of \*Frederick, prince of Wales. After the latter's death Bathurst supported government and his elevation to the bench was at the recommendation of Lord \*Hardwicke. The untimely death of Lord Chancellor Yorke in 1770 resulted in Bathurst serving as a commissioner for the great seal until he was unexpectedly promoted to the chancellorship in January 1771. He was consequently raised to the peerage as Baron Apsley and, in 1775, succeeded as Earl Bathurst. As chancellor he was competent and even-handed, but not especially noteworthy. A loyal Northite, he surrendered the chancellorship to Thurlow in 1778, but served as lord president from 1779 until the fall of the ministry in 1782.

DW

**Bathurst, Henry, 3rd Earl Bathurst** (1762–1834). Bathurst's grandfather was one of the twelve Tory peers created in 1712 to carry the treaty of \*Utrecht and in 1772, aged 88, had been promoted earl; his father was lord chancellor 1771–8 and lord president of the council 1779–82. As

Lord Apsley, Bathurst entered Parliament on the family interest at Cirencester as soon as he was of age and was appointed a lord of the Admiralty by \*Pitt, a personal friend. He held the post until 1789 when he became a lord of the Treasury, and from 1793 to 1802 was a commissioner of the Board of Control. He had a long career in the Tory ministries of the early 19th cent.—president of the Board of Trade 1807–12, secretary for war 1812–27, and lord president of the council 1828–30. He was given the Garter in 1817. He held a number of valuable sinecures and according to \*Greville, once his secretary, made moderate talents go a long way.

JAC

**'Bats, Parliament of',** 1426. Competition between Humphrey, duke of \*Gloucester, and Henry \*Beaufort, bishop of Winchester, to dominate government in the minority of Henry VI assumed dangerous proportions with a riot on London bridge, 30 October 1425. A Parliament was called to Leicester for 18 February 1426, then adjourned to Northampton. Members and their attendants had orders not to come armed, but many carried clubs or 'bats'. The quarrel was submitted to arbitration. Peace was made, for the time being. Beaufort resigned as chancellor and went abroad.

RLS

**Battle abbey.** Founded by William I in fulfilment of a vow made before the battle of \*Hastings, it was commenced on lower ground to the west nearer water and shelter, but the Marmoutier monks were angrily ordered to rebuild with the high altar over the spot where Harold II fell; it was consecrated to St Martin (1094). The Benedictine house had a remarkable range of privileges as well as generous endowments, and grew in wealth and fame despite intermittent havoc from plague. It was surrendered in 1538 and the church destroyed, but the great gatehouse and other abbey buildings still stand.

ASH

**Baugé, battle of,** 1421. On 22 March 1421 Thomas, duke of \*Clarence, while campaigning in Anjou, was killed in a rash sortie. Lord Tankerville was also killed, and \*Somerset, Fitzwalter, and Huntingdon captured. No more than a nasty reverse, Baugé heralded the French recovery after \*Agincourt. Henry V left for France to restore the situation and died on the campaign in 1422.

JAC

**Baxter, Richard** (1615–91). Puritan divine. A Shropshireman, Baxter was educated locally. Sickened by a brief spell at the royal court, he returned home to study for ordination, after which he became master of Bridgnorth Grammar School (1638). Contact with nonconformists, however, sowed doubts about Anglicanism and episcopacy. After a spell as vicar of Kidderminster (1642) and parliamentary army chaplain, he became disillusioned by both sides in the Civil War. In 1660 he welcomed Charles II back, but his inflexibility at the \*Savoy conference helped its breakdown. After refusing the see of Hereford, he preached in London until ejected after the Act of \*Uniformity (1662). The outstanding personality among the dissenters of 1662, he was imprisoned on several occasions for preaching without licence. Having helped overthrow James II, he welcomed William and Mary. A

## Bayeux Tapestry

prolific writer and man of conscience, he occupied a unique place in contemporary religious life. WMM

**Bayeux Tapestry.** An extraordinary work: simultaneously, it is a major work of art, unique for its time, a stunning piece of propaganda in support of the Norman claim to the English throne in 1066, and, archaeologically speaking, a record of immense importance for the study of a host of subjects ranging from contemporary ship construction and navigation, military tactics, and equipment, to the more homely—clothes and fashions, furniture and fittings. In considerable detail, it portrays 626 people, 202 horses, 55 dogs, 505 animals of various sorts, 37 fortresses and/or buildings, 41 boats and ships, and innumerable weapons, clothes, and agricultural implements.

Strictly speaking, the tapestry is an embroidery, some 230 feet long and around 20 inches high. It is worked in eight coloured wools on a plain linen ground, its masses of colour, in couched and laid work, defined by stem or outline stitch. It was produced in six separate pieces, the consistent quality indicating very close monitoring by the overall designer. It consists of one single horizontal line of action set within two borders (above and below), and takes the form of a sequence of vignettes, which provide an episodic account of events.

Politically, the tapestry records some of the events of 1064/5–6 which culminated in the death of Harold II at the battle of \*Hastings. But it is certainly not objective. The tapestry seeks to impart a political message which splices with its overarching moral—the inevitable fate that awaits any man who breaks a solemn oath sworn on the relics of Bayeux cathedral. Since Harold is shown swearing such an oath to Duke William of Normandy in full public view, the tapestry's story is that of Harold's downfall after he committed perjury by taking the English throne on Edward the Confessor's death. William in this context is but the rod of divine vengeance.

Internal evidence indicates that the tapestry was produced for Bishop \*Odo of Bayeux, William's half-brother. It is now generally accepted that it was made in England, probably in Kent, of which Odo was earl (1067–82). If the attribution to Odo is correct, then it must have been made between 1066 and 1097, when Odo died; and if it is English, then a date in the 1070s or early 1080s is most likely as Odo rebelled in 1082, was imprisoned for five years, and lost Kent. The tapestry is housed at Bayeux near Caen in Normandy. SL

**Beachy Head, battle of,** 1690. Command of the Channel was of critical importance in 1690, when William III and James II struggled for control of Ireland and the French threatened to invade England as a diversion. In June, de Tourville put to sea with a French fleet of 78 vessels. \*Torrington, commanding the joint Anglo-Dutch fleet, was apprehensive and cautious: 'the odds are great,' he wrote, and his main objective was not to hazard his fleet. On 29 June the brunt of the action fell upon the Dutch, who lost six ships. Torrington withdrew to the safety of the Thames estuary, leaving the French to dominate the Channel. Torrington was sent to the Tower, court-martialled, but acquitted. JAC

**beagling** is the hunting of hares on foot with the aid of beagle hounds, specially bred for the purpose. It was practised in the classical world and held its popularity in England until gradually replaced in the 18th cent. by fox-hunting. The mounted version, practised by harriers, was common in the 19th cent. but has since declined. Many of the remaining packs of beagles are owned by military establishments or by public schools. JAC

**Beale, Dorothea** (1831–1906). Headmistress. Born into a pious family, Dorothea Beale's religious convictions led her into teaching and a lifetime's commitment to the cause of education for women. She entered Queen's College, London, in 1848 where her ability was recognized by the offer of the post of mathematics tutor, followed by the headship of the college's preparatory school. But it is as principal of Cheltenham Ladies' College that she is best remembered. In 1858 the college was in danger of closure. Beale improved the calibre of the teaching staff and broadened the syllabus, with dramatic results. 'A benevolent despot' in the words of DNB, she enforced a rule of silence, hoping to eliminate what she considered the female vice of gossiping. She was instrumental in establishing St Hilda's Hall, Oxford, as a teachers' training institution. She died from cancer in 1906 leaving £55,000 to the college. SMC

**bear-baiting.** Reputedly introduced from Italy in the 12th cent., the spectator sport of setting dogs onto a bear chained to a stake occurred usually in an arena known as a bear garden, such as that at Bankside, south of the Thames, attended by Henry VIII and Elizabeth. Many Tudor nobles kept bear 'sleuths' (packs), generally well looked after, but they were not a purely aristocratic indulgence: town councils had official bears, and baits were held at markets and fairs. In Paris Garden, another regular venue in Southwark, a grandstand collapsed in 1583, killing or injuring many of the spectators. Despite Macaulay's remark that the puritans hated bear-baiting for the pleasure afforded the spectators rather than concern for the bear, there were stirrings of disapproval, but the sport remained popular and declined only slowly, not legally banned until 1835. Street-names such as Bear Lane, near Blackfriars Bridge, attest to its place in social life. ASH

**Beatles.** The Beatles, a 1960s Liverpool pop group, were the decade's most commercially successful rock-pop musicians and a social phenomenon ('Beatlemania') in crystallizing youth culture. The later musical experimentalism of John Lennon (murdered, 1980) and Paul McCartney, the main songwriters of the 'Fab Four', subverted, revolutionized, and continues to influence popular culture for younger generations. ASH

**Beaton, David** (c.1494–1546). Cardinal. Beaton was the nephew of Archbishop Beaton or Bethune of Glasgow and St Andrews, whom he succeeded as archbishop in 1539. He already held a French bishopric, was a cardinal, and had been much employed in James V's French matrimonial negotiations. After James's death in 1542 \*Mary of Guise relied upon him greatly and he was chancellor [S] 1543–6. He strongly resisted the proposed marriage between

the infant Mary, queen of Scots, and Prince Edward of England (later Edward VI). His life-style was magnificent and his behaviour profligate. In March 1546 Beaton was instrumental in the burning of George \*Wishart, a reformer. Two months later, friends of Wishart burst into the castle of St Andrews and murdered the archbishop. His nephew, James Beaton, was the last catholic archbishop of Glasgow, serving from 1552 until 1560, when he retired to France. JAC

**Beatty, Sir David, later 1st Earl Beatty** (1871–1936). Admiral. In 1914 Beatty was one of the youngest admirals in the Royal Navy, and, as commander of the battle-cruiser squadron of the Grand Fleet, held one of the navy's most prestigious appointments. He led the battle-cruisers at the \*Dogger Bank and \*Jutland, where he lost three of his ships. Beatty was a demonstrative, flamboyant, and aggressive commander, much admired by those who served under him. In December 1916 he succeeded \*Jellicoe as commander of the Grand Fleet. But despite his own criticisms of Jellicoe's lack of aggression at Jutland, for the rest of the war he pursued the same Fabian strategy designed to keep the German surface fleet bottled up in harbour. At the end of the war he was appointed 1st sea lord, a post he held until 1927. During this period he was responsible for the post-war reorganization of the navy and acted as a member of the British delegation which helped to draft the Washington naval treaty, an agreement which prevented the outbreak of a naval arms race between Britain and the USA. DF

**Beauchamp, Guy de, 10th earl of Warwick** (c.1270–1315). Warwick's father was prominent in Edward I's reign in campaigns against the Welsh and Scots. Warwick succeeded to the earldom in 1298 and fought at \*Falkirk with distinction. But at Edward II's accession, he quarrelled violently with the favourite \*Gaveston and in 1310 was one of the \*Ordainers trying to control the king, and working closely with \*Thomas of Lancaster. In 1312 he handed over Gaveston to be executed after he had been held in Warwick castle. He refused to serve in the \*Bannockburn campaign and died the following year: in the circumstances suggestions of poison were inevitable. JAC

**Beauchamp, Richard, 13th earl of Warwick** (1382–1439). Warwick's early years were spent fighting Welsh rebels with Prince Henry (later Henry V) and winning an international reputation as a paragon of chivalry. His pilgrimage to Jerusalem in 1408–10 was punctuated with 'feats of arms' in France, Italy, and Prussia. He served Henry in major embassies and the conquest of Normandy. Although a regular member of Henry VI's council, and in charge of the young king's education from 1428 to 1436, he still periodically campaigned in France. He was appointed lieutenant-general there in 1437 and died in Rouen. With his great landed wealth, well-served administration, and enjoyment of royal favour, Warwick dominated the west midlands. He is commemorated by a gilded bronze effigy in his chapel in St Mary's, Warwick, and an illustrated panegyric by the Warwickshire antiquary John Rous (d. 1491). RLS

**Beaufort, Edmund, duke of Somerset.** See SOMERSET, EDMUND BEAUFORT, DUKE OF.

**Beaufort, Henry** (c.1375–1447), cardinal bishop of Winchester. The second son of \*John of Gaunt and Catherine Swynford, Beaufort rose rapidly in the church, becoming bishop of Lincoln in his early twenties, translating to Winchester in 1404. As half-brother of Henry IV, he was rarely far from the heart of Lancastrian government, being chancellor of England under three kings in 1403–5, 1413–17, and 1424–6. A capable administrator and tireless diplomat, his skills and wealth were indispensable to the regime for over forty years. Yet his relationship with the royal family was ambivalent. He quarrelled both with Henry V, over his acceptance of a cardinal's red hat, and with Humphrey of \*Gloucester for pre-eminence in England during the minority of Henry VI. His immense wealth secured him in power, guaranteed by extensive loans made to the crown from 1417. He shamelessly used his position to the advantage of his family, but there can be no doubting his commitment to the dynasty. In his later years he endeavoured, without success, to achieve a peace settlement with France. Being created cardinal legate in 1427, he was content to be the papal representative in England. Proud, ambitious, and avaricious, delegating his spiritual responsibility in his diocese to subordinates, he stands as the exemplar of a worldly political prelate in late medieval England, outshining even Thomas \*Wolsey. He was buried in Winchester cathedral. AJP  
Harriss, G. L., *Cardinal Beaufort* (Oxford, 1988).

**Beaufort, Joan.** See JOAN BEAUFORT.

**Beaufort, Lady Margaret** (1443–1509). The mother of Henry VII, Margaret Beaufort was one of the most remarkable women of the 15th cent. She was married to Edmund Tudor, earl of Richmond, as a child and conceived Henry when she was only 12. Tudor died when she was six months pregnant; she outlived two further husbands, but had no more children. She was separated from her son in 1461, when he was 4, and apart from a one-week reunion in 1470, did not see him again until he was king. Nevertheless, she devoted herself to his cause. By 1482 she was near to completing terms for his return from exile in Brittany. However, Edward IV's death and the accession of Richard III intervened. Tudor now became the pretender to the throne and Margaret threw herself into the conspiracy which triumphed on the field of Bosworth. As mother of the king, for 24 years Margaret wielded immense political influence. She was the only person to whom he deferred. She outlived Henry, her last service being to help manipulate the succession of her grandson Henry VIII, dying two weeks after his coronation. A small, birdlike woman, in later years troubled by failing eyesight and arthritis, she was renowned for her piety, sponsoring the publication of devotional literature. She was the founder of two colleges at Cambridge, Christ's and St John's. Her portrait hangs in both colleges, whose great gates are adorned with her heraldic imagery. At Oxford, she founded the first chair of divinity, and the first women's college, Lady Margaret Hall (1879), was named after her. AJP

**Beaufort, Thomas, duke of Exeter.** See EXETER, THOMAS BEAUFORT, DUKE OF.

## Beaumaris castle

**Beaumaris castle**, on the south coast of Anglesey, was started for Edward I after the Welsh revolt of September 1294, although it may have been planned as early as 1283/4. Edward's castle-building was directed at maintaining control of Wales by isolating the area of Snowdonia, the focus of Welsh resistance, and separating it from Anglesey, the main grain-growing region. Beaumaris formed part of a strategic ring of fortresses designed to make Edward's conquest permanent. The castle was built over the site of Llanfaes, a Welsh royal manor and principal port of the island. The houses of the town were dismantled and re-erected in the new English borough of Beaumaris, close by, the inhabitants being transported to Newborough or re-established in the English town. Work, under the direction of Master James of St George, was pushed forward rapidly, and the project demonstrates the resources Edward was able to deploy. By the end of the first building season, in November 1295, over £6,700 had been expended. This included over £2,000 on materials, together with the wages of the 450 masons, 375 quarriers, and 1,800 other workmen employed, plus payment of the garrison. Master James reported to the Exchequer that nowhere were the walls less than 20 feet high; that the majority of the towers had been begun and that gates had been hung and could be locked at night. But by 1300 all work on the castle had ceased, as Edward diverted resources into the Scottish wars. Work was resumed between 1306 and 1330 but the castle was not completed. Its defences were not threatened until 1646, when it was garrisoned for Charles I in the Civil War. LR

**Beaverbrook, Lord** (1879–1964). Newspaper proprietor. Born to a Scots-Canadian family in Ontario, William Aitken worked as a company negotiator, and used his business acumen to become a millionaire. In 1910 he journeyed to England, where his fellow Scots-Canadian, Andrew Bonar \*Law, found him a seat as a Conservative MP. Beaverbrook's penchant for making friends with men and women of influence served him well. He cultivated the acquaintance of \*Lloyd George, played a murky part in Lloyd George's overthrow of \*Asquith, and was rewarded with a peerage (1916) and membership of the Privy Council (1918).

Beaverbrook had, meanwhile, bought the *Daily Express*. He discovered he had a natural flair for journalism and this, combined with his business sense, helped boost the paper's popularity: by 1936 it had achieved a world-record circulation of 2.25 million copies per day. In 1923 he acquired control of the *Evening Standard*. Beaverbrook used his newspapers as vehicles for his own idiosyncratic views: empire free trade, support of Edward VIII during the \*abdication crisis, and for Neville \*Chamberlain over Munich. In 1940 Churchill made him minister of aircraft production. The choice was inspired. Beaverbrook's ruthless methods helped ensure the victory of the Royal Air Force in the Battle of Britain. GA

**Bechuanaland.** See BOTSWANA.

**Becket, Thomas** (c.1120–70). Archbishop of Canterbury who was murdered in his own cathedral and so became a saint. Son of a Norman merchant settled in London, Becket worked as an accounts clerk to a banker (a cousin of his)

before entering the service of Archbishop \*Theobald of Canterbury in 1145. He became Theobald's confidential agent and was rewarded with the rich archdeaconry of Canterbury. Soon after being crowned by Theobald, Henry II appointed Thomas chancellor. In this office he displayed a wide range of talents, administrative, diplomatic, and military. He also enjoyed an ostentatiously lavish life-style. His zeal in the king's interests, even when they appeared to conflict with the church's, gave Theobald cause for concern and, not surprisingly, led Henry to believe that Thomas was his loyal friend. When Theobald died, Henry decided that Thomas should succeed him. This ran counter to the strong Canterbury tradition that the archbishop ought to be a monk. Reluctantly the cathedral monks agreed to elect the king's good servant. On 2 June 1162 Becket was ordained priest, and the next day consecrated archbishop.

At once Becket began to oppose the king, even on fairly routine matters which raised issues of principle only for someone who was determined to find them. He began to campaign for the canonization of \*Anselm, a monk-archbishop who had defied kings. Many attempts have been made to explain the volte-face but, in the absence of good evidence for Becket's state of mind in 1162–3, they remain highly speculative. The earliest lives of Becket, in Latin by \*John of Salisbury, Edward Grim, and William fitzStephen, in French by Guernes of Pont-Sainte-Maxence, do little to unravel the mystery; written in the shadow of his murder and canonization, they present the martyred saint.

Whatever Becket's motives, Henry felt betrayed. Twelfth-century church-state relations bristled with problems which could be, and since the ending of the \*Investiture contest normally were, shelved by men of goodwill. King and archbishop were soon quarrelling over a wide range of issues, among them the question of 'criminous clerks', i.e. \*benefit of clergy. In January 1164 Thomas reluctantly but publicly accepted the constitutions of \*Clarendon, and then infuriated the king and confused his fellow-bishops by trying to wriggle out of his commitment. At the Council of Northampton (October 1164) Henry brought charges against Becket arising out of his conduct while chancellor. Becket, seeing that the king was determined to break him, fled in disguise to France, where he remained in exile until 1170, studying canon law, leading an ascetic life, and claiming to be defending the rights not only of the church of Canterbury but of the church as a whole. Both Louis VII of France and Pope Alexander III urged a reconciliation, but neither Henry nor Thomas could trust the other. After years of fruitless negotiations, the coronation of \*Henry the Young King in June 1170 by the archbishop of York brought matters to a swift conclusion. In Becket's eyes crowning the king was a Canterbury privilege. He agreed terms with Henry. This enabled him to return to England with the intention of punishing those who had infringed that privilege. In November he excommunicated the archbishop of York and two other bishops. They complained to the king, then in Normandy. Henry's angry words prompted four knights to cross the Channel and kill Becket on 29 December 1170, a murder that shocked Christendom. Little more

than two years later, in February 1173, he was canonized by Alexander III.

During his lifetime few churchmen thought that Becket's truculence did much to help the cause of Canterbury, of the English church, or of the church in general. Probably no one thought his conduct was that of a saint, even if he had taken to wearing coarse and lice-ridden undergarments. But his murder changed everything. It put Henry in the wrong. It forced him to do penance and to make concessions, though none of lasting significance. The church of Canterbury clearly gained. *The \*Canterbury Tales* bear eloquent witness to the fact that for centuries Becket's tomb in the cathedral was the greatest pilgrimage shrine in England. In 1538 Henry VIII declared Becket a traitor, but though he destroyed the shrine, he could not eliminate the cult. JG

Barlow, F., *Thomas Becket* (1986).

**Beckett, Samuel** (1900–89). Irish novelist and playwright, whose *Waiting for Godot* (1952) was to the 1950s what *The Waste Land* was to the 1920s. A play in which 'nothing happens, twice', it was followed by others paring away character and action in a *reductio ad absurdum* raised to the level of metaphysical inquiry. *Not I* (1972) lasts only fifteen minutes and all we see is a shadowy auditor and a woman's mouth from which words stream, expressing, in Beckett's words, 'that there is nothing to express . . . together with the obligation to express'. From 1937 settled in Paris and writing in French, his affinities were with Sartre and Heidegger, though an earlier Cartesian dualism often shaped his work. As a story-teller and novelist he was indebted to James \*Joyce, and his trilogy, completed in 1953 with *The Unnameable*, though not for the faint-hearted, is redeemed by touches of the master's sly humour. JNRS

**Beckford, William** (1709–70). Beckford was a new man in the aristocratic world of Hanoverian politics and a link between traditional Toryism and \*Wilkite radicalism. His great wealth came from Jamaican estates and he was frequently reminded, when tribune of the people, that he was a slave-owner. Sent to England to be educated at Westminster and Oxford, he remained and was elected MP for Shaftesbury in 1747. In 1754 he transferred to London, where he had built up an electoral interest, strengthening his position by bringing two brothers into Parliament. From 1756 onwards he was a supporter of \*Pitt. Early in the reign of George III he launched a series of attacks upon aristocratic oligarchy and called for a measure of parliamentary reform. He was lord mayor of London in 1762/3 and again in 1769/70 when he presented a Wilkite petition to the king, accompanying it with a well-publicized rebuke, which was subsequently inscribed on his statue in the Guildhall. He died unexpectedly a month later, leaving several illegitimate children, and a 10-year-old son, who became the author of *Vathek* and the recluse of Fonthill. JAC

**Bedchamber crisis**, 1839. After the resignation of Lord \*Melbourne in 1839 Robert \*Peel was summoned to form a ministry. Peel mentioned casually to the queen the changes he thought should be made to the royal household. He wanted the queen to dismiss those ladies of the bed-

chamber whose husbands were Whigs. Subsequently Peel received a letter from Victoria stating that the removal of the ladies of her bedchamber would be repugnant to her feelings. The queen appealed to Melbourne and, in their desire to support her, the Whig statesmen reluctantly returned to their posts. With the fall of the Whig administration in 1841 the question rose again. This time the prince consort arranged for the ladies in question to resign voluntarily and this compromise settled the difficulty. RAS

**Bede, St** (672/3–735). First English historian, author of the *Ecclesiastical History of the English People* (c.731). Deacon, priest, and monk, Bede is generally associated with \*Jarrow, but probably lived mostly in the monastery of \*Monkwearmouth, which he entered in 679/80. Bede owed his scholarship, and much of his outlook, to their founder, \*Benedict Biscop. He travelled a little to Lindisfarne and York.

History was not his prime concern. He wrote biblical commentaries, hagiography, hymns and homilies, textbooks of instruction in Latin, and scientific texts, and, to Egbert (bishop of York), a letter criticizing episcopal and monastic standards in Northumbria.

Bede was particularly interested in miracles and in the calculation of dates and time. Some of his scientific scholarship was advanced and his historical influence profound. His commentaries were soon in heavy demand on the continent. He was the first systematically to use the *anno domini* dating system and his idealized portrait of the 7th-cent. church inspired King \*Alfred and Bishop \*Æthelwold, who attempted its re-creation. Modern scholars, attempting reconstruction and deconstruction, depend heavily upon him.

In historical writing Bede was influenced by the 4th-cent. Eusebius of Caesarea, but the greatest non-biblical influence upon him was probably Pope Gregory I. His purposes were varied. The prime one was to facilitate the salvation of his people. The *Ecclesiastical History's* parade of exemplars, like \*Aidan, \*Cuthbert, and \*Oswald, to remedy contemporary defects entailed, inconveniently for modern scholars, much selection. The English are given a Roman historical context and destiny. To Bede's imposition of order on a more complex past, his so-called list of \*bretwaldas can be related. He may have felt that a 'national' history would encourage 'national' unity. He may have been offering a Christian alternative to traditional secular sagas.

Bede was in touch with highly placed people (including King \*Ceolwulf, Acca, bishop of Hexham, and Egbert), his contacts brought information, and he was interested in the wider world. Yet lack of experience outside his monastery may have made him so idealistic as to be considered isolated, not sharing other clerics' interests. But the quarrels generated by \*Wilfrid may have inspired his presentation of an alternative version of 7th-cent. ecclesiastical history to that offered in Wilfrid's biography. Whether considered as the 'opposition' view or a 'compromise' to reconcile two parties, it suggests sensitivity to, and perhaps involvement in, politics.

Well written and researched, Bede's works are subtle and complex. Some attempt was made to promote his cult, but Viking raids caused Monkwearmouth and Jarrow to be abandoned c.800. Remains claimed to be Bede's were discovered in the mid-11th cent., and moved to Durham cathedral, where they remain. Bede was recognized as a doctor of the church by Pope Leo XIII in 1899. AER

**Bedford, John of Lancaster, duke of** (1389–1435). The third son of King Henry IV, John was created duke of Bedford by his brother Henry V in 1414. Throughout his life he identified himself with his brother's policies, especially in pursuing English claims to the French throne. He was lieutenant of the kingdom during Henry's absences in France. He also proved himself an able soldier, commanding the ships which defeated the French fleet at the mouth of the Seine before relieving \*Harfleur in August 1416. After Henry's death in August 1422 he was appointed regent of France. In alliance with John, duke of Brittany, and Philip, duke of Burgundy, whose sister Anne he married in June 1423, Bedford prosecuted the war in France, at first with considerable success. But his position in France was made difficult by both lack of funds and the uneasy state of England induced partly by the actions of his brother Humphrey, duke of \*Gloucester, who was acting as lord protector to the infant Henry VI. After the failure of the siege of \*Orléans in 1429 Bedford resigned the regency in favour of Philip of Burgundy but retained the government of Normandy, where he continued to pursue English policy, securing the coronation of the young Henry VI in Paris in December 1431. The death of Duchess Anne and Bedford's marriage to Jacqueline, daughter of the comte de Saint-Pol, in 1433 destroyed friendly relations between England and Burgundy and seriously undermined the English position in France. Bedford died at Rouen in September 1435, his policies in ruins, after the failure of peace negotiations at the Congress of \*Arras, which had seen Duke Philip finally desert the English cause and make his peace with France. Bedford, though pursuing the English cause, was universally respected. Some years after his death King Louis XI of France, on being counselled to deface his tomb, is said to have replied, 'let his body rest in quiet; which when he was living, would have disquieted the proudest of us all; and as for the tomb, which, I assure you, is not so worthy as his acts deserve, I account it an honour to have him remain in my dominions.' LR

**Bedford, Francis Russell, 4th earl of** (1593–1641). Bedford hoped to resolve the political crisis of early 1641, since he was acceptable to Charles I as well as the parliamentary leaders. In concert with his client John \*Pym, a key figure in the Commons, he planned to accept office in the king's government, take control of the Treasury, and restore the royal finances with the aid of a substantial parliamentary grant. In return, Charles would abandon both \*Strafford and the \*Arminians and return to traditional rule in church and state. Bedford was prepared to save Strafford's life, which Charles made a condition, but could not carry his parliamentary associates with him. At this critical moment, he was struck down by smallpox and died on 9 May. RL

**Bedford, John Russell, 1st earl of** (c.1485–1555). The founder of the fortunes of the house of Russell was born in Dorset of gentry stock and became a gentleman of the bedchamber to Henry VII and Henry VIII. In the 1520s he was much employed in diplomatic and military matters. From 1529 to 1536 he was MP for Buckinghamshire and in 1537 became comptroller of the household. In 1539 he was created baron and given the Garter. From 1540 to 1543 he served as lord high admiral and from 1542 to his death as lord privy seal. His gains from the \*dissolution of the monasteries were gigantic, and included Tavistock in Devon, Woburn in Bedfordshire, and Covent Garden in London. In 1549 he helped to suppress the western rising and was advanced to the earldom of Bedford. Though he endorsed the proclamation of Lady Jane \*Grey in 1553, he succeeded in retaining the favour of Mary. The DNB remarks demurely that he was 'by no means in favour of the restoration of the abbey lands to their original uses'. In his *Letter to a Noble Lord*, \*Burke declared that 'the grants to the House of Russell were so enormous . . . as to stagger credibility'. Russell he dismissed as 'the prompt and greedy instrument of a levelling tyrant'. JAC

**Bedford, John Russell, 4th duke of** (1710–71). Succeeding to one of the wealthiest dukedoms in Britain in 1732, Bedford developed a political following which made him a valuable catch for any ministry. He served as 1st lord of the Admiralty (1744–8) and as southern secretary (1748–51), resigning after lengthy bickering with \*Newcastle. Bedford returned to office in 1757 and was lord-lieutenant of Ireland until 1761. In September 1762 he went to Paris as ambassador responsible for the peace negotiations and signed the resultant treaty in February 1763. After a brief estrangement from administration, he joined the \*Grenville ministry as lord president in September 1763. Thereafter his followers often acted with those of Grenville, fully supporting a hard-line attitude towards the American colonies. Following protracted negotiations in 1767 the Bedfordites entered the \*Grafton ministry; the duke himself, though approving the junction, was in poor health and chose not to accept office. Bedford's life was contemporaneous with the era of 'personal parties' and the office-hungry Bedfordites were criticized, even by contemporaries, as a faction motivated principally by self-interest. DW

**Bedford level** was by far the most ambitious drainage scheme attempted in the Fens. A group of 'adventurers', under Francis, 4th earl of \*Bedford, was granted authority in 1630 to proceed and Vermuyden, the Dutch engineer, put in charge. The main objective was to shorten the course of the river Ouse in order to increase its outfall: the most important cut was the old Bedford river from Earith to Salter's Lock, 21 miles long, and bypassing Ely. There was strong opposition from local people, acute financial and technological difficulties, and an interruption caused by the civil wars. The work was officially declared complete in 1652, though much of the reclaimed land was of dubious value and maintenance proved expensive, because of silting and peat shrinkage. See also CAMBRIDGESHIRE. JAC

**Bedfordshire** is a small, low-lying, and predominantly agricultural county, drained largely by the river Ouse, which meanders across it from west to east, and its tributaries, the Ivel, Ouzel, Flit, and Hiz. The southern boundary runs along the chalk ridge of the Chilterns. In pre-Roman times it formed part of the kingdom of the Catuvellauni. The Roman road Watling Street crossed the south-west corner. In 571 a victory of the English over the Britons seems to have secured the northern parts of the area for the kingdom of the \*Middle Angles, and later for \*Mercia. In the 9th cent., Alfred, king of \*Wessex, divided the region with Guthrum, the Danish leader, who took the lands east and north of a line from the Lea to Bedford and up the Ouse to Stony Stratford. Forty years later, it was recovered by \*Edward the Elder, king of Wessex, who fortified the town of Bedford in 919. It proved strong enough to beat off a Danish raid in 921 but succumbed once more to the Danes in the early 11th cent. By that time Bedfordshire was taking shape as a county and was mentioned in the *Anglo-Saxon Chronicle* for 1011. Bedford itself commanded an important river crossing over the Ouse, became a local route centre, and was the point from which the river was navigable by barges. In \*Domesday Book it was, like the other county towns nearby, given separate treatment, but the report was unusually brief.

County and borough received parliamentary representation in the 13th cent. There were several long-established county interests. The Greys held Wrest Park from the 13th cent. onwards; the St Johns Bletso and Melchbourne Park from the 15th cent.; the Osborns Chicksands Priory from the 16th; and the owners of estates at Luton Hoo, Southill, and Ampthill also had influence. But the emerging and dominating interest was that of the Russells, whose acquisitions at the \*dissolution of the monasteries included Covent Garden and Woburn abbey, and who became earls of Bedford in 1550 and dukes in 1694.

Despite its nearness to London, Bedfordshire remained something of a backwater. Celia Fiennes in the 1690s and \*Defoe in the 1720s found Bedford a pleasant town, with a sprinkling of gentry, and Defoe admired the quantities of wheat the county produced. The cottage industry of straw-plaiting brought a modest prosperity, but in 1793 John Byng described Bedford as a 'vile, unimproved place'. The 19th cent. saw dramatic changes. By 1851 Luton had overtaken Bedford as the largest town. A boost to the local economy was the coming of the railways: the line from Bedford to St Pancras opened in 1868. Brick-making developed as an alternative to the declining hat trade and Luton turned to engineering. The Vauxhall car company established its headquarters in the town in 1907. In the extreme south of the county, on Dunstable downs, lies Whipsnade Zoo, opened in 1931. By 1961 Bedford's population had risen to 63,000, Luton's to 131,000.

The most famous native of the county was John \*Bunyan, author of the *\*Pilgrim's Progress*. He was born at Elstow, just south of Bedford, and his cottage survives in the village. He spent twelve years in Bedford gaol after the Restoration for his nonconformist views but in 1874 a statue was erected in the town in his honour.

The Banham commission proposal of 1994 to abolish the county was not accepted, and Bedfordshire remains, with Luton as a unitary authority. JAC

**Bedlam**, more properly **Bethlem hospital**, was originally attached to the priory of St Mary Bethlehem outside Bishopsgate, founded in 1247 by Simon FitzMary, sheriff of London, and used for the 'distracted' from 1377. After the priory's dissolution (1546), it was granted to the city, and from 1557 jointly managed with \*Bridewell. The only public madhouse and a popular resort for sightseers from the early 17th cent., it became infamous for the callous cruelty meted out to the insane—'bedlam' is still used figuratively for any place of uproar. The hospital was relocated from Moorfields to Lambeth (1815), and is now at Beckenham (Kent), linked with the Maudsley Hospital. ASH

**Beecham, Sir Thomas** (1879–1961). Self-taught English conductor. Financed by the family business (for which his spell in advertising produced 'Hark! the herald angels sing! | Beecham's Pills are just the thing'), Beecham founded many leading orchestras, including the Beecham Symphony Orchestra (1909), London Philharmonic Orchestra (1932), and Royal Philharmonic Orchestra (1946), with whom he made many fine recordings. He also created the Beecham Opera Company (1915), performing in London and the provinces, and was artistic director at Covent Garden (1932–9), where he conducted several *Ring* cycles. His vast repertoire included many small-scale 'lollipops', although he was an early champion of the operas of Richard Strauss and, most notably, the music of \*Delius. His elegant, meticulously phrased performances of Haydn and Mozart became legendary, as did his caustic, witty *bons mots*. Although he maintained that he simply chose the best players and let them do the rest, his genius as a conductor is indisputable. ECr

**Beechey, Sir William** (1753–1839). Portrait painter. Beechey was born in Burford (Oxon.), entered the Royal Academy Schools in 1772, and from his first exhibition four years later, enjoyed a modest success. He moved to Norwich in 1781 before returning to London, where for many years he was a fashionable painter. In 1793 he was elected ARA and in the same year appointed portrait painter to Queen Charlotte and instructor to the princesses. A careful painter, he paid meticulous attention to making his paintings durable. Ironically, the painting considered his best and certainly his most ambitious work, for which he was knighted and elected RA in 1798, *King George III Reviewing the 10th Hussars and the 3rd Dragoons*, was destroyed by fire at Windsor castle in 1992. JC

**Beeton, Mrs** (1836–65). Isabella Mary Beeton, née Mayson, was born in 1836 in London. Although her father died when she was 4, she received a rounded education, attending finishing school in Heidelberg and becoming an accomplished pianist. However, it is for her cookery and household management books that she is remembered. In 1856 she married Samuel Orchard Beeton, a publisher. Mrs Beeton became a regular contributor to his monthly household publication,

## Beggar's Opera

writing both a cookery column and a fashion feature. Despite her own poor health, she gave sound advice on diet and domestic science. Her practical style coupled with attractive illustrations ensured popular and enduring success for her book, *Household Management*, published originally in instalments between 1859 and 1860. Mrs Beeton died following the birth of her fourth son. SMC

**Beggar's Opera, The.** John Gay's ballad opera began its record-breaking run at the theatre in Lincoln's Inn Fields on 29 January 1728. A satire on Italian opera set in Newgate prison and making use of folk-tunes and popular songs, the ubiquitous references to statesmen, politicians, and 'great men' were interpreted as reflections on the conduct of Sir Robert \*Walpole, the prime minister, who, through the characters of Macheath and Peachum, was likened both to a highwayman and to the thief-taker and racketeer Jonathan \*Wild. Although the sequel, *Polly*, was suppressed, Bertolt Brecht subsequently extended the range of Gay's satire in *Die Dreigroschenoper* (*The Threepenny Opera*) to indict the capitalist system *tout court*. JAD

**Behn, Aphra** (1640–89). Dramatist and novelist, Aphra Behn was born on 10 July 1640 at Wye, Kent. Her early childhood, spent in the West Indies, later provided inspiration for her novel *Oroonoko*, a forerunner to Rousseau's 'natural man'. Her marriage to a wealthy merchant in 1663 gave her entrance to the court of Charles II. In 1666, Charles chose Behn, then widowed, to carry out spying missions in Holland. She returned to England to concentrate on writing, her reputation as an intelligent and intrepid woman much enhanced. Acclaimed as the first professional female writer, Behn's output was prolific. Although much of her work was published anonymously to overcome male prejudice, fellow Restoration writers, including \*Dryden, held her in esteem. Behn's continual efforts to promote herself and her works eventually affected her health. She died on 16 April 1689 and was buried in Westminster abbey. A sour epitaph read, 'Here lies a proof that wit can never be defence enough against mortality.' SMC

**Bek, Anthony** (c.1240–1311). Bishop of Durham. Bek came from Lincolnshire, went to Oxford University, and in 1270 entered the household of Prince Edward. He accompanied Edward on crusade and returned with him when he succeeded as Edward I in 1274. A year later he was made constable of the Tower. Henceforth he was one of the king's closest advisers, accompanying him on campaigns in Wales and Scotland, fighting at \*Falkirk, and given the lordship of the Isle of Man. In 1283 he was elected bishop of Durham, where he possessed palatine powers. Extremely wealthy, Bek lived in great pomp and was given the title patriarch of Jerusalem by Pope Clement V. A protracted dispute with the priory of Durham caused him to lose favour with Edward I, but Edward II, from 1307 onwards, supported him, and he was able to bring his feud with the priory to a successful conclusion. JAC

**Belfast** is the second largest city in Ireland, and the economic and political capital of Northern Ireland. Although the Normans established a fort at Belfast in the 12th cent., a

substantial town only developed at the beginning of the 17th cent.: Belfast benefited from the Ulster plantation, and from the patronage of the lord deputy, Sir Arthur \*Chichester, and was incorporated by royal charter in 1613. The economic collapse of Chichester's descendants, the earls of Donegall, after the mid-18th cent. liberated the town from a constrictive leasing policy, and—in combination with the success of the local cotton industry—induced a period of rapid growth. But the most remarkable years of expansion were from c.1860 to the First World War, which coincided with the marked development of the shipbuilding and engineering industries, and the consolidation of linen manufacturing: the population of Belfast grew from 87,000 in 1851 to 349,000 by 1901. Belfast was incorporated as a city in 1888, and its chief magistrate raised to the dignity of lord mayor in 1892. With the Government of \*Ireland Act (1920), and the partition of the island, Belfast became the administrative capital of the newly created Northern Ireland.

The swift expansion of Belfast partly determined its politics. Rapid, uneven growth was accompanied by an alteration of the sectarian demography: the proportion of catholic citizens grew from virtually nothing at the beginning of the 18th cent. to one-third by the late 19th and 20th cents. A shifting denominational balance in company with rapid growth brought fluid sectarian frontiers within the city, and political instability: intercommunal violence, notably in 1857, 1864, 1886, and 1921–2, became almost endemic. The industrial growth of the city—unique in an Irish context—brought closer links with the British economy and with the empire: this, in combination with a protestant domination of capital, helped to determine the predominantly unionist character of the city's politics. AJ

**Belgae.** A British *civitas*. The Romans applied the name Belgae to a whole group of tribes in north-west Gaul, but the appearance of a *civitas* of this name in Britain is something of a mystery. According to Ptolemy its territory included not only \*Winchester but \*Bath and a nearby, but as yet unidentified, settlement called Ischalis. It seems likely that Ptolemy has made an error here (he made others) since the resulting shape of the territory of the Belgae would bear little resemblance to pre-Roman tribal geography and would be something of an administrative nightmare. If the *civitas* was actually focused around Winchester there is still a problem, since this area seems to have been part of the old kingdom of the \*Atrebates. The *civitas* of the Belgae was therefore most probably an artificial creation of the Roman administration, like the neighbouring *civitas* of the \*Regni, and was created at about the same time in c. AD 80 following the death of King \*Cogidubnus. Its administrative capital at Winchester was known as Venta Belgarum. The town walls enclosed about 140 acres, and though there were extra-mural suburbs, its population was probably no more than 3,000–4,000. KB

**Belgium, relations with.** The British played a major part in the creation of the state of Belgium 1830–9, the government soon deciding after the initial success of the Belgian revolt against the Dutch that an independent state was compatible with national interest, provided it was not subject to

French influence and its neutrality was internationally recognized. Fears of French ambitions in Belgium intermittently surfaced until 1870, and help to explain British distrust of Napoleon III. From 1905 the German threat did much to give British military planning a primarily continental emphasis, and it was German defiance of Belgian neutrality in August 1914 which moved public opinion so decisively in favour of war. Germany again infringed Belgian neutrality in 1940, but the Franco-British advance to assist the victim only facilitated the success of the German outflanking drive through the Ardennes. The massive evacuation from Dunkirk followed. CJB

**Belize** in central America, south of Mexico, is a little larger than Wales. It was originally part of the Maya empire. English colonists were repeatedly driven out by the Spaniards. In 1862 it was formed into a colony as British Honduras and was renamed Belize in 1973. Though it became independent in 1981, British troops remained as protection against Guatemalan claims. Belize is a constitutional monarchy, with the queen as head of state, within the Commonwealth. Its main exports are sugar, bananas, and mahogany. JAC

**Bell, Alexander Graham** (1847–1922). Inventor of the telephone. Born in Edinburgh, Bell followed his father, who was a distinguished authority on the physiology of the voice, in teaching his system of 'visible speech' to the deaf. In 1870 he emigrated with his parents to Canada and in 1873 was appointed professor of vocal physiology at Boston University. It was during his research that Bell conceived the idea of the electrical transmission of speech. The American physicist Joseph Henry encouraged him to perform practical experiments and in June 1875 the first rough telephone was constructed. In March 1876 the first complete intelligible sentence was transmitted. Bell took out a patent which was fiercely contested but eventually upheld by the US Supreme Court. In 1877 Bell went to Europe to promote the new telephone. He won a 50,000-franc prize for his invention which he used to establish the Volta laboratory at Washington for research into deafness. RAS

**Bell, Andrew** (1753–1852). Founder of the Madras system of education. Bell was educated at St Andrews University, Scotland, after which he settled in Virginia, becoming a tutor. He returned to England, gaining a doctorate of divinity at St Andrews, and sailed for India in 1787. Two years later, Bell became superintendent of the Madras Male Orphan Asylum, founded by the East India Company. The teachers were few and inefficient, so Bell experimented with a system of mutual instruction whereby clever young boys were placed in charge of other boys. This system was described in a pamphlet written by Bell in 1797 shortly after he returned to England and was adopted in a number of schools. There was open rivalry with Joseph \*Lancaster, who claimed to have originated the system. The Church of England in 1811 formed the \*National Schools Society for Promoting the Education of the Poor with Bell as its first superintendent. PG

**Bell, George** (1883–1958). Bishop of Chichester (1929–58) and leading ecumenist. Born in Hampshire and educated

at Christ Church, Oxford, Bell was successively chaplain to Archbishop \*Davidson (1914), dean of Canterbury (1924), and bishop of Chichester. From 1919 he strove tirelessly for Christian unity and, as chairman of Life and Work (1932), was a leading international protagonist, responsible for founding the World Council of Churches. Present in Berlin at Hitler's accession (1933) and later personally confronting Hess and Ribbentrop, he foretold the evils of Nazism. A confidant of Bonhoeffer, the German dissident pastor—whom he met secretly in wartime Stockholm—and of the anti-Nazi confessing church, he tried in vain to obtain British support for wartime German resistance; he persistently opposed demands for German unconditional surrender and condemned obliteration bombing. With vast ecclesiastical experience, he seemed the obvious choice for Canterbury (1944), but his outspokenness possibly cost the nation and the church the benefit of his primacy. A profoundly pastoral diocesan bishop, he was a lover of English literature. He reintroduced religious drama—the first since the Reformation—to cathedral life, commissioning for Canterbury Masefield's *Coming of Christ* (1928) with music by \*Holst, and \*Eliot's *Murder in the Cathedral* (1935). WMM

**Bell, Gertrude** (1868–1926). Traveller, archaeologist, and diplomatist in the Middle East. Bell took a first in modern history at Oxford at the age of 18 and then made herself expert in Persian before turning to Arabic in 1899 when she first visited the Middle East. Four major caravan journeys through the Syrian and Arabian region and some archaeological digs between 1905 and 1913 led to an RGS medal and several books, the best known being *The Desert and the Sown*. With her large knowledge of the Turkish empire she was recruited as a British political officer in the Great War. Although not always able to reconcile Foreign Office and government of India policies and herself sometimes erratic in her general support of the Arab cause, she became an important figure, especially in the mandated territory of \*Iraq, which emerged after the war. One result of her influence with King Feisal and British officials was the opportunity to build on her earlier scholarly interests by setting up the museum in Baghdad. RB

**Bell, Henry** (1767–1830). Bell was apprenticed as a millwright, but spent part of his career as the proprietor of a hotel in Helensburgh, where he conceived the idea of a steamboat to bring his clients more easily from Glasgow. Another Scotsman, William Symington, had already demonstrated the effectiveness of a steam-engine in a canal boat in 1789, and Robert Fulton was experimenting with small steam-powered vessels in France and America around the same time. Bell, however, deserves the credit for converting the idea into an economically viable proposition, commissioning the first commercially successful steam vessel, *Comet*, which was launched on the river Clyde in 1812. *Comet*, a 30-ton boat equipped with a 3-horse-power steam-engine, plied regularly between Glasgow and Greenock until it was wrecked in 1820. RAB

## Benbow

**Benbow, John** (1653–1702). Admiral. Of the ‘tarpaulin’ rather than ‘gentleman’ breed of naval commander, Benbow was born in Shrewsbury. Entering the navy he showed diligence in navigation which a later, and enforced, spell in the merchant service only enhanced. In the Mediterranean he entered the circle of those favoured by Arthur \*Herbert and, after the revolution, such valuable patronage brought him dockyard posts and naval commands. Benbow was master of the fleet at \*Beachy Head in 1690, and prominent at Barfleur in 1692, when he also bombarded St Malo. Promoted admiral in 1696 Benbow then commanded a squadron before Dunkirk, and in the western Channel. His chief claim to fame was his West Indies command 1701–2, of great consequence at the start of the \*Spanish Succession War. In May 1702, in action against a French force under Du Casse, Benbow was mortally wounded, at the same time being deserted by his captains, two of whom were shot after trial. He died at Port Royal (Jamaica), but lived on in a celebrated sea-song as ‘Brave Benbow’. DDA

**Benburb, battle of**, 1646. After the Irish rebellion of 1641, the situation was extremely confused. The Irish catholic confederacy fought against royalists, parliamentarians, and with a Scottish army sent over under Monro to protect the Ulstermen. In 1643 a truce or ‘cessation’ enabled \*Ormond to begin sending troops back to England to fight on behalf of the king. After Charles surrendered to the Scots in May 1646 hostilities in Ireland continued. In June, Monro’s troops were badly beaten at Benburb on the Blackwater by Owen Roe \*O’Neill and the confederates, a victory celebrated at Rome with a *Te Deum*. Parliament’s response was to send first Michael Jones, then Oliver \*Cromwell, to restore English rule. JAC

**Benedict Biscop** (628–c.690) at 25 left his position at \*Oswiu’s Northumbrian court to undertake the first of several pilgrimages to Rome. Twenty years later, after becoming a monk at Lerins (near Cannes), accompanying Archbishop \*Theodore from Rome to Canterbury, and spending two years supervising the monastery there, he returned to Northumbria, founding the twin monasteries of \*Monkwearmouth (674) and \*Jarrow (681/2). He imported stonemasons and glaziers from Gaul, on his frequent travels he collected books, relics, pictures, and other ‘spiritual treasures’, and not least brought John the arch-cantor from Rome to teach Roman monastic office. Concerned to establish not only a centre of learning, but also a stable, obedient order, his rule, with Benedictine overtones, combined the best of seventeen monasteries observed on his travels. Enriched by his own experiences of Mediterranean culture and monasticism, the foundations became centres of intellectual achievement, notably producing the saint and historian \*Bede. AM

**Benedictines**. The monastic order of St Benedict of Nursia (c.480–c.550) had its origins at Monte Cassino, south of Rome, where c.540 Benedict drew up a rule, drawing heavily on antecedent Rules, such as those of St Augustine of Hippo and Caesarius of Arles. This concise codification, detailing the practice of communal spiritual and contemplative life,

remained one of several monastic rules in western Europe but gradually, partly through the unifying influence of the Carolingian empire, became dominant, until challenged by the rule of St Augustine in the 11th cent. Apart from its structured articulation of the monastic life, one of its chief strengths was its adaptability, and many interpretations were introduced, often in an effort to enforce greater asceticism and discipline, of which amongst the most influential were those of Benedict of Aniane (c.750–821) in the Carolingian empire, Cluny, founded in Burgundy in 909, and Cîteaux, also in Burgundy (1098).

The first Benedictine abbeys in England were probably those founded by \*Wilfrid of York at Ripon and Hexham at the end of the 7th cent. Thereafter the order spread rapidly in England, and soon supplanted communities of Celtic and other observance, though these survived for many years in Celtic Britain. Important abbeys were established in the north, e.g. at \*Jarrow-Monkwearmouth; in the south-east, especially at \*Canterbury, where the existing monasteries of Christ Church and St Augustine’s were reformed on Benedictine lines; in the south-west, e.g. at \*Glastonbury and \*Malmesbury. With the rise of the kingdom of \*Mercia further notable foundations were made in the midlands, especially in the Severn valley, while others emerged in the fenlands, such as Peterborough. The Viking raids of the 9th cent. severely affected most Benedictine houses, some of which were totally destroyed; others were refounded, and some new ones founded in the mid-10th cent. under the influence of \*Æthelwold, bishop of Winchester, Archbishop \*Dunstan of Canterbury, and \*Wulfstan, bishop of Worcester, all themselves monks. Though the extent of this monastic reform has been questioned there remains little doubt that there was a considerable revitalization of the monastic movement. Following the Norman Conquest some abbeys lost land, but most soon recovered under new, Norman abbots, and attracted widespread patronage, as did St Albans and Westminster, and new abbeys were founded, such as Chester, St Mary’s York, Durham, and Selby. There was also an increase in the number of Benedictine nunneries, though the most prestigious were Anglo-Saxon foundations like Shaftesbury or Wilton. Though later challenged by the emerging universities the following two centuries perhaps marked the high point of Benedictine cultural, artistic, and scholarly influence, at centres such as Winchester, Bury St Edmunds, and St Albans.

The Benedictines were also challenged by the rising appeal to lay society of new orders, like the \*Cistercians and the \*Augustinians, and the \*friars who presented a new spirituality, and attempts were made at internal reform and centralization of an order that now numbered several hundred houses. By the 16th cent. the number of Benedictine monks had declined significantly and, though many remained wealthy institutions till their \*dissolution, their dynamic had largely been lost. BJG

**benefit of clergy** was fought for by Archbishop Thomas \*Becket and conceded by Henry II in 1176 in the aftermath of Becket’s murder. It exempted clergy from trial or sen-

tence in a secular court on charges arising from a range of felonies and offences. This exemption extended from tonsured clerics to include nuns, and later it was allowed to all who could prove themselves literate by reading a verse of Scripture when charged with certain violations of the law. The reasoning was that literacy was the accepted test of clerical status. It was abolished by Parliament in 1827. JRG

**benevolences.** These so-called free gifts, offered out of the goodwill or *benevolentia* of the subjects, were outlawed by statute in 1484, but monarchs continued to solicit them at times of financial crisis or when parliamentary grants were not available. They eventually fell into disuse because of their low yield. \*Forced loans were more effective. RL

**Bengal, acquisition of.** On 12 August 1765 the Mughal emperor Shah Alam proclaimed the English \*East India Company his *diwan* (administrator) for the revenues of the provinces of Bengal, Bihar, and Orissa. This confirmed the company's transformation from a trading to a political power in India and made Bengal the 'bridgehead' of its new empire. The transformation had begun in south India in 1746 when the company and its French rival had backed different candidates for the nawabi of Arcot. It continued in Bengal between 1757 and 1764 when, first, Robert \*Clive had defeated the army of Siraj-ud-Daula, the nawab of Bengal, at Panipat; and then Sir Hector Munro had overcome the forces of the Mughal emperor at Buxar. The process was brought to completion in 1773 by Warren \*Hastings, who removed the last residual powers of the nawab of Bengal and took not only revenue but all aspects of the administration of the region into company hands. DAW

**Bennett, Arnold** (1867–1931). Like George \*Eliot, Bennett was a fine novelist of provincial middle-class society—in his case that of the Potteries, a landscape of canals and kilns and trams and chimneys and dust. *The Old Wives' Tale* (1908) tells the story of two sisters, daughters of a draper in Bursley (Burslem). *Clayhanger* (1910) recalls the introduction of steam-printing into the Potteries and begins with two lads watching a horse-drawn canal barge bringing china clay up from Cornwall. *Riceman Steps* (1923) moves the scene to Clerkenwell and the date to the 1920s, but stays with the same kind of people running a second-hand bookshop and a grocer's with pretensions to be a confectionery. Bennett, born in Hanley, started by following his father's career as a solicitor but went to London in 1888 where he made a living editing and writing reviews and short stories. From 1902 until 1912 he lived in Paris. Bennett's shabby, hard-working characters have something in common with those of \*Gissing, whom he tried to help, and with those of H. G. \*Wells, with whom he maintained a lengthy friendship and literary correspondence. JAC

**Bennington, battle of, 1777.** On his march south from Canada to split the rebellious American colonies, \*Burgoyne found himself at Fort Edward short of supplies. He dispatched a raiding force under a German officer, Baum, with 800 scratch troops to Bennington. There they were confronted on 16 August by a force twice their size under John Stark. Baum was killed and his expedition wiped out.

The loss of men made Burgoyne's position still more hazardous. JAC

**Benson, battle of, c.777.** This was an important victory in Oxfordshire in the fluctuating struggle between \*Mercia and \*Wessex. \*Offa of Mercia defeated \*Cynwulf of Wessex and took possession of territories south of the Thames. JAC

**Benson, Edward** (1829–96). Archbishop of Canterbury. Born in Birmingham and educated at Trinity College, Cambridge, he taught at \*Rugby and was successively first master of Wellington College (1859–72), first bishop of Truro (1877), and archbishop (1883). Close to Frederick Temple, he wrote supporting him over *Essays and Reviews* (1860). At Truro he successfully campaigned for a cathedral and planned the first service of Nine Lessons and Carols. Less at home in politics than \*Tait, as a friend of \*Gladstone he firmly supported church establishment. A lover of pagantry, with a high sense of the dignity of Canterbury, he dealt with the ritualist case against the saintly Bishop Edward King of Lincoln in a revived archiepiscopal court, thus reclaiming for Canterbury oversight of common worship. Benson acquitted King on all but two counts—the most courageous thing that has come from Lambeth for the last 200 years'. WMM

**Bentham, Jeremy** (1748–1832). English utilitarian and philosophical radical. Educated at Oxford University, Bentham qualified as a barrister before he was 20, though he never practised law. He was highly critical of English law for its obscurantism, and devoted his life to systematizing it on the basis of utility. In his first substantial publication *A Fragment on Government* (1776), Bentham launched a broadside against \*Blackstone's defence of England's constitution. He dismissed the concept of inalienable natural rights as contemptuously as he dismissed precedent; the only rights that existed were legal rights, and they could never be unqualified. His most important contribution to moral philosophy was contained in his *Introduction to the Principles of Morals and Legislation* (1789), where he elaborated his theory of utility in terms of the greatest happiness of the greatest number, and thereby established utilitarianism as a systematic theory of moral and political decision-making. In his 'felicific calculus', he demonstrated how alternative courses of action could be evaluated by estimating the total quantity of pleasure they would generate; the action that promised the most pleasure was rationally the one to be chosen. Bentham became famous with Dumont's exposition of his views in *Traité de législation civile et pénale* (1802) and was honoured in various countries, including France, Russia, and the USA. His most lasting achievement, however, was to inspire the radical forces in England calling for reform. His intellectual leadership of the philosophical radicals was a critical factor in achieving many of the legal, social, industrial, economic, and political reforms that took place in England during the 19th cent. Towards the end of his life Bentham had become a legendary figure in the reform movement. He had established its literary organ in the *Westminster Review*, and he was instrumental in creating Univer-

## Bentinck

sity College, London, to disseminate rational ideas to future leaders of society. TSG

**Bentinck, Lord George** (1802–48). Bentinck personified integrity in politics and sport. A son of the duke of Portland, Bentinck was private secretary to \*Canning, his uncle by marriage, and an MP from 1828. With other Canningites he abandoned \*Wellington in the late 1820s, though supporting \*catholic emancipation, and backed \*Grey's ministry and, with reservations, the Reform Bill. With the \*Derby Dilly, he moved back towards the Tories. Declining office from \*Peel in 1841, as he had from Grey, Bentinck remained silent in the House and devoted his time to sport, above all the turf, where as owner, breeder, rider, and enemy of sharp practice he became a leading figure. In 1845–6 he emerged as an enraged opponent of Peel's policy of \*Corn Law repeal, which he saw as betrayal: 'What I cannot bear is being sold!' His personal and social standing helped to give him the leadership of the protectionist revolt in the Commons and, though failing to prevent repeal, he succeeded in bringing down Peel's government. Bentinck, who had sold his stud and immersed himself in economic statistics, continued to champion protectionism but, liberal in religious matters, he alienated his party by voting for the admission of \*Jews to Parliament in late 1847 and resigned the leadership. Returning briefly, he died suddenly of a heart attack. \*Disraeli's *Lord George Bentinck* (1852) was a notable work of political piety and self-promotion. BIC

**Bentinck, Lord William** (1774–1839). Soldier and administrator. Bentinck joined Marshal Suwarroff's army in Italy and served with the Austrian forces during the campaigns of 1799 and 1801. In 1803 he became governor of Madras but was recalled after being held responsible for the sepoy mutiny at Velore in July 1806. He subsequently saw action in the Mediterranean, commanding the British forces in Sicily (1811) and conducting a successful expedition against Genoa (1814). From 1827 to 1835 Bentinck acted as governor-general of Bengal. He instituted financial reforms to eradicate debts created by the recent Burmese War, reorganized the legal system, abolishing such practices as suttee (widow-burning), improved communications, introduced education programmes, and opened up official posts to natives. In 1833 he became the first governor-general of India after the East India Company Charter Act. RAS

**Bentley, Richard** (1662–1742). Scholar and polemicist. After attending Wakefield Grammar School and St John's College, Cambridge, Bentley came under the patronage of Stillingfleet, later bishop of Worcester, and was appointed royal librarian in 1694. His reputation as an outstanding classicist was established by the controversy over the *Letters of Phalaris*, which Bentley showed to be forgeries. In 1700, he was elected master of Trinity, Cambridge, where he remained until his death. His relations with the fellows were acrimonious and there were repeated attempts to deprive him of his mastership, all of which Bentley managed to defeat. Of his later publications, his edition of *Horace* (1711) was most admired. Despite their political differences, \*Johnson wrote handsomely of him that 'the many attacks

on him were owing to envy, and to a desire of being known, by being in competition with such a man'. JAC

**Beowulf**. Anglo-Saxon poem. This anonymous epic of 3,182 lines is preserved in BL Cotton Vitellius A. XV, written c.1000. Provenance, date, and genesis are uncertain: Northumbria or Mercia in the 8th cent. have long been favoured, although some recent scholarship proposes Viking Age alternatives.

The principal setting is southern Scandinavia c.500, but there is also reference, direct or indirect, to \*Hengist, King \*Offa, and other figures from English history. The stately and complex narrative is composed in the alliterative metre common to most early Germanic poetry, and is enhanced by rich description, decorous speeches, and moral reflection. It surveys Danish dynastic legend before depicting three great monster fights which conform to international story-types. In the first two, the young Geat hero Beowulf frees King Hrothgar and the Danes from the predations of the evil fen-dwellers Grendel and his mother; in the last, Beowulf, now an aged king, loses his life while slaying a treasure-guarding dragon. Interlacing the main plot are quasi-historical feuds and wars which emphasize the rhythms of joy and sorrow, youth and age, life and death which permeate the poem. *Beowulf* is deeply concerned with the ideals and tensions of the heroic life, especially strength, wisdom, loyalty, and the quest for glory. Whether it is also a 'mirror for princes', Scandinavian propaganda, a Christian critique of heroism, or a Christian allegory of salvation is more contentious. DCW

**Berengaria** (c.1164/5–c.1230), queen of Richard I. The daughter of Sancho VI of Navarre, Berengaria was married to Richard in an alliance intended to protect his southern frontiers while he was occupied on the Third Crusade. On her journey to the Holy Land, Berengaria was shipwrecked off Cyprus and threatened by the ruler, Isaac Comnenus. Richard captured the island, thus ensuring a strategic supply base for campaigns in Palestine, and married Berengaria, who was also crowned queen, in Limassol in May 1191. Thereafter, she saw her husband only rarely and England never. There were no children. After Richard's death in 1199, Berengaria lived on her dower lands at Le Mans, France, where she was famed for her almsgiving. Denied by King John, she only received her marriage settlement under Henry III. Just before her death, she founded a Cistercian monastery at L'Épau, where she is buried. JC

**Beresford, John** (1738–1805). Irish politician. Beresford was a pillar of the \*Anglo-Irish ascendancy and strongly opposed to concessions to the catholics. The second son of the earl of Tyrone, he was elected to the Irish Parliament in 1760 for Waterford, which he represented until his death, first at Dublin and from 1801 at Westminster. He held office as a commissioner of revenue and from 1780 as first commissioner and was the centre of a powerful family interest. His position was threatened in 1795 by \*Fitzwilliam, the new lord-lieutenant, who described Beresford as 'virtually king of Ireland' and dismissed him. 'An old rotten, stinking jobber' was Fitzwilliam's private opinion to \*Burke.

Beresford fought back and Fitzwilliam told \*Pitt he must choose between them. Pitt did so and Fitzwilliam was recalled. A duel between him and Beresford was averted by the dramatic intervention of a magistrate. Beresford resumed office and gave strong support to the Act of \*Union. His brother became archbishop of Tuam in 1794. JAC

**Berkeley, George** (1685–1753). Philosopher and bishop. One of the most renowned philosophers of his day, Berkeley was born in Kilkenny of English descent. He became a fellow of Trinity College, Dublin, but spent 1713–20 in London or on continental travel, becoming well acquainted with \*Pope, \*Swift, and Arbuthnot. In 1720 his essay 'Towards Preventing the Ruin of Great Britain', provoked by the South Sea crisis, attacked luxury and the new commercialism. In 1724 he was appointed dean of Derry but his main interest was in raising support for a college in Bermuda to preach the gospel and he was in America 1728–32. From 1734 he was bishop of Cloyne and spent almost all his later years in the diocese, apart from a last few months in Oxford. His idealist philosophy, attacking the materialism of \*Locke and \*Newton, is to be found largely in *Treatise Concerning the Principles of Human Knowledge* (1710) and *Three Dialogues* (1713). JAC

**Berkeley castle** (Glos.) is unusual in being still a family residence, having been in the hands of one family, the Berkeleys, since the Norman Conquest. The shell keep was built soon after 1067, the curtain walls in the late 12th cent., and the great hall in the mid-14th cent. Edward II was brought here in 1327 and, it seems, brutally murdered. JAC

**Berkshire** is an area south of the upper Thames, which separated the county from Oxfordshire and Buckinghamshire, flowing from Lechlade, via Oxford, Abingdon, Wallingford, Reading, Henley, Marlow, Maidenhead, to Windsor. The southern parts are drained by the Kennet, which flows through Hungerford and Newbury to join the Thames at Reading. Through the centre of the county run the chalk hills, from Uffington, via Wantage, to Streatley—the line of the \*Icknield Way and the Berkshire Ridgeway. There were therefore two east–west corridors—one north of the downs, one south.

In Roman times, the area was the territory of the \*Atrebates. From the early days of the Saxon occupation, it was disputed between \*Mercia and \*Wessex. Mercia gained the upper hand in the mid-7th cent. and the region was still held by \*Offa of Mercia in the 770s. It was recaptured by King \*Egbert for Wessex in the early 9th cent. and became an important part of the kingdom: Wantage was a royal estate and \*Alfred the Great was born there. It was probably one of the earliest shires to be organized and placed under an \*ealdorman: it was first mentioned by the *Anglo-Saxon Chronicle* under 860, when Æthelwulf, earldorman of Berkshire, fought against the Danes with the men of Hampshire. The name has caused difficulty. In the *Chronicle* it appears as Berrocscire, and \*Asser, Alfred's biographer, explained it as a wood, where box was abundant: this seems rather slight for a place-name.

It was first in the diocese of \*Dorchester, just across the river in Oxfordshire, then in \*Winchester, and from 909 in \*Ramsbury in Wiltshire, whence it was finally transferred to the new diocese of \*Salisbury. This suggests that it was border country, lacking a powerful capital. A large monastery was established at Abingdon in 675 and, well before the Conquest, the crossing-points at Wallingford, Reading, and Windsor had grown into small towns. In 1066 William crossed the Thames at Wallingford on his triumphant march from Hastings. He took over many of the estates of the previous royal family and began building the castle at \*Windsor, soon established as a major royal residence. Its position astride some of the main routes to London gave Berkshire strategic importance. In the civil war between King Stephen and \*Matilda in the 12th cent., Wallingford castle was held for the latter and withstood repeated sieges. In John's reign, it was again held for the king against his barons, and in Henry III's reign was taken by Simon de \*Montfort before the battle of \*Lewes. During the 17th-cent. civil wars, the county was on the border between royalist and parliamentarian: Wallingford was held throughout the war for the king, Windsor for his opponents. The two battles of \*Newbury in 1643 and 1644 were fierce but inconclusive: Donnington castle held out for the king until the last month of the war.

Berkshire remained a quiet rural area, the downs feeding the sheep, and Newbury and Abingdon gaining reputations for cloth. The wealth of John Winchcombe, 'Jack of Newbury', in the early Tudor period was legendary and his exploits were commemorated in ballads and chapbooks. Reading's place on the river gave it steady prosperity: in the 1720s, Defoe found it 'large and wealthy, the inhabitants rich and driving a very great trade'. But the extensive areas of downland and the barren, sandy heathland in the east kept the population down. The Kennet and Avon canal in the south, opened in 1810, gave a modest boost to trade, but the Wiltshire and Berkshire, a narrow canal completed in 1809, had desultory traffic from the beginning. The market towns of the shire remained small, until the great expansion of Reading itself—9,000 in 1801, 60,000 by 1901, 134,000 by 1991: Huntley and Palmer's biscuit partnership dates from 1841. Didcot grew considerably in the 20th cent. as a rail junction, but Wantage, Wallingford, and Faringdon, bypassed by the main lines, stayed small: Wallingford had a population of 2,800 in 1851 and 2,700 in 1901; Faringdon declined from 3,400 to 2,900; Wantage increased slowly from 3,000 to 3,700. Berkshire remained essentially a shire to be passed through, from east to west. Brunel's Great Western railway cut a large swathe through the north of the county in the 1830s by way of the valley of the White Horse, and the Taunton to Reading line, through Hungerford and Newbury, opened in 1847. The M4 motorway, completed in 1971, bisected the county from Bray in the east to Membury in the west. Many of the industries retained farming connections—brewing or horse-racing, with stables at Lambourn and East Ilsley, and important courses at Ascot and Newbury. Twentieth-cent. industries included atomic research at Harwell and Aldermaston. By the local government reorganization of 1972, the county gained Slough and

## Berlin

Eton from Buckinghamshire, but lost Abingdon, Faringdon, Wantage, and Wallingford to Oxfordshire—Mercia's belated triumph. At the same time, the growth of Bracknell, one of the earliest post-war new towns, meant that the balance of the county population had tipped dramatically towards the east, succumbing to the pull of London.

After the Banham commission report of 1994 the county was abolished, save for ceremonial purposes, and replaced by six unitary authorities, Reading, Wokingham, Slough, Bracknell Forest, Windsor and Maidenhead, and West Berkshire (Newbury). JAC

**Berlin, Congress of, 1878.** A summit conference which met in the German capital, under the presidency of Bismarck, in June 1878. All the European great powers and Turkey were represented. Lord Salisbury and Lord Beaconsfield (Benjamin Disraeli) represented Britain. It had been summoned because European opinion was uneasy at the gains Russia had made by the treaty of San Stefano at the end of the recent Russo-Turkish War. Many questions were settled by secret agreements before the congress assembled. San Stefano had provided for a 'Big Bulgaria', an autonomous principality including half the Balkan peninsula, which seemed likely to be under Russian influence. This was divided and part returned to Turkish jurisdiction. Austria was to 'occupy and administer' Bosnia and Herzegovina, although they remained under Turkish suzerainty. Britain was to lease Cyprus from Turkey. This gave her a forward base in the eastern Mediterranean to cover the Suez canal, opened in 1869. In return, Britain promised to maintain Turkish interests in Asia Minor. The independence of Serbia, Montenegro, and Romania was recognized but Romania had to cede southern Bessarabia to Russia. Disraeli returned to London boasting that he had secured 'peace with honour' but Salisbury later concluded that they had 'backed the wrong horse' in trying to prop up the Turkish empire. Pan Slavism was temporarily checked but the emerging Balkan nations remained dissatisfied. MEC

**Bermuda** is a group of islands in the western Atlantic, some 600 miles from the east coast of the United States. It has the status of a dependent territory with internal self-government. It was named after the Spanish explorer Juan Bermudez, though it remained in British hands from 1612 onwards. The economy relies heavily upon tourism. JAC

**Bernicia, kingdom of.** This kingdom may have had its origins in Anglo-Saxon settlements around the rivers Tyne and Wear, but it expanded rapidly in the late 6th and 7th cents. to control all the land between the Tees and the Forth, largely through absorption of British kingdoms, including Rheged and that of the Gododdin. The first recorded king was Ida (c.547–59). His grandson Æthelfryth (592–616) and great-grandsons Oswald (634–42) and Oswiu (642–70) were responsible for the aggressive military expansion which enabled Oswald and Oswiu to establish a wide-ranging overlordship over other Anglo-Saxon and Celtic kingdoms. The supremacy of the Bernician dynasty in northern England was only seriously challenged by Edwin of Deira (617–33) who ruled in both Bernicia and

Deira, but by the end of the reign of Æcgfrith (670–85) the Deiran dynasty had been obliterated in the male line and Deira integrated with Bernicia to form the province of Northumbria. The disastrous defeat of Æcgfrith by the Picts at Nechtansmere put an end to further overlordship or conquest of the northern Celtic peoples.

In spite of some evangelization in the province by Bishop Paulinus of York, the main period of conversion for Bernicia was in the reign of Oswald, through a mission of Irish monks from Iona who were established at Lindisfarne. In Oswiu's reign problems became apparent because of variations in customs, including methods of calculating Easter followed by the Ionan church, and that of Deira which had been established by missionaries from Rome. At a synod at Whitby in 664 Oswiu decided that Deira's 'Roman' customs would prevail.

When much of Deira was overrun by Scandinavians after 867, Bernicia (or a substantial part of it) re-emerged in effect as a separate province in which the main powers were a dynasty known as 'ealdormen of Bamburgh' and the community of St Cuthbert from Lindisfarne, which eventually settled in Durham. BAEY

**Bertha**, daughter of the Frankish king Charibert, married King Æthelbert of Kent sometime before 597, on condition that she could continue to practise her Christian faith. With her personal bishop, Liudhard of Senlis, she used the old Roman church of St Martin, Canterbury. She did not convert her pagan husband. Pope Gregory the Great, writing to her in 601, rebuked her for this, but it seems likely that the relationship with the greater Merovingian rulers influenced Æthelbert's acceptance of Augustine's Christian mission in 597. Praising her recent part in the English conversion, Gregory compared her to Helena, mother of Constantine the Great. Described by him as educated, Bertha would be able to read and possibly write Latin, and may be perceived as a figurehead of change in Anglo-Saxon society, heralding the advent of Christianity and literacy. Dates are unknown, but she died before 616. AM

**Berwick, James FitzJames, 1st duke of (1670–1734).** Berwick spent almost all his life abroad in foreign military service. He was a natural son of James, duke of York, by Arabella Churchill, sister of the future duke of Marlborough. Born and educated in France, Berwick volunteered to join the emperor's forces besieging the Turkish redoubt of Buda in 1686. His father's succession as James II suggested a great career in Britain. He was created duke in 1687, made governor of Portsmouth (a post of responsibility in troubled times), and awarded the Garter. But James's flight in 1688 condemned Berwick to a life of distinguished exile. He fought for his father in Ireland and then settled down in France, being naturalized in 1702 and created a marshal of France in 1706. Sent to Spain to restore the flagging fortunes of Philip V, he won a great victory at Almanza in 1707. He was given French and Spanish dukedoms, which still survive in the family. In 1734, at the age of 64, still fighting for his adopted country in the War of the Polish Succession, he was killed outside Philipburg by a stray cannon-ball. His reputation was as a brave soldier and a

sensible adviser. Montesquieu wrote of him that 'he was brought up to support a sinking cause'. JAC

**Berwick, treaty of**, 1357. David II, king of Scotland, was captured at \*Neville's Cross in 1346. Eleven years later, by the treaty of Berwick, he was ransomed for 100,000 marks, with hostages given for security. JAC

**Berwick, treaty of**, 1560. The years 1558–60 were critical in Anglo-Scottish relations. The death of Mary Tudor in 1558 placed a protestant on the English throne. Mary, queen of Scots, became queen of France in 1559, with her mother \*Mary of Guise as regent for her in Scotland. Her catholicizing policy was opposed by the lords of the \*Congregation, a group of noblemen, supported by the zeal of John \*Knox. The regent held the port of Leith, vital for communication with France. By the treaty of Berwick of February 1560, Elizabeth I undertook to support the rebellious lords. In June 1560 Mary of Guise died and later in the year Mary, queen of Scots, was widowed. Though one must be careful before hailing the treaty as the turning-point towards a protestant Scotland and union with England, there is little doubt that it turned the scales in the struggle between the old and new religions. JAC

**Berwick-on-Tweed**. Northumbrian coastal town at the mouth of the river Tweed. Berwick was a disputed Anglo-Scottish border town and changed hands thirteen times before finally being recognized as English in 1482. The Elizabethan fortifications, built in 1558, followed the latest Italian system, designed to give fire cover to every part of the wall, and are the only surviving walls of their kind. The castle was an important border fortress but declined after the 1707 Union. It was eventually demolished to make way for a railway station, the platform of which runs over the great hall where Edward I made his famous decision to support John \*Balliol for the Scottish crown in 1291. The barracks, built in 1719 following complaints by townsfolk against billeting and probably designed by \*Vanbrugh, were among the first to be built in Britain. Berwick has three very different bridges. The 17th-cent. Old Bridge is an elegant structure which took a quarter of a century to build. The Royal Border Bridge, an impressive railway viaduct, was designed by Robert \*Stephenson and built 1847–50. It has 28 arches and stands 126 feet above the water. The Royal Tweed Bridge, of concrete construction, was built in 1928 to carry the main road north. RAS

**Besant, Annie** (1847–1933). Secularist, socialist, and theosophist. Born in London of Irish descent, Annie Wood married the Revd Frank Besant in 1867, but the marriage broke up in 1873 over her religious doubts. She moved to London where in 1874 she made her first public speech, on 'The Political Status of Women', and joined Charles \*Bradlaugh's National Secular Society. Largely at her insistence, in 1877 they republished *The Fruits of Philosophy*, an old birth-control pamphlet by Charles Knowlton. The subsequent trial, which was inconclusive, gave unprecedented publicity to birth-control arguments. She now worked closely with Bradlaugh to promote \*secularism, but after 1884 was drawn into so-

cialist politics and in 1887 helped plan the \*'Bloody Sunday' demonstration in Trafalgar Square. The following year she organized the Bryant & May's matchgirls' strike and was elected to the London School Board. In 1889 her views shifted to theosophy of which she became the leader, and in 1894 she moved to India, where she devoted the rest of her life to Indian nationalism. ER

**'Bess of Hardwick'**. See SHREWSBURY, ELIZABETH TALBOT, COUNTESS OF.

**Bessemer, Sir Henry** (1813–98). Bessemer distinguished himself as a professional inventor responsible for many ingenious ideas. By far his most successful invention was the process which bears his name for making steel—previously an expensive material in short supply—available in bulk. Invented in 1856, the process involved blowing air through molten cast iron so that it combined with excess carbon in the melt to produce mild steel in substantial quantities. This caused a brief but spectacular display while the reaction took place. Steel from 'Bessemer converters' came to be used extensively in railway lines, ship plate, and forgings for large guns. Despite the occurrence of technical problems in its early development, the process was widely adopted in iron- and steelworks in Britain and elsewhere during the following decades. The invention secured public recognition and many honours for Bessemer, including a knighthood in 1879. RAB

**Betjeman, Sir John** (1906–84). Poet laureate and essayist, whose eccentricity and accessibility have encouraged an undervaluation of his literary gifts. His *Collected Poems* (1958) sold over a million copies and as broadcaster he became a national institution, championing Victoriana and the disappearing 'Metro-land' of his youth. Unhappy at Marlborough, he blossomed at Oxford, where he moved in literary circles and went on to write for the *Architectural Review*. His first book, *Mount Zion* (1931), testifies to an enduring fascination with the Anglican church, and hymn forms are often reflected in his traditional metrics. Cornwall and the home counties repeatedly engage his 'topographical predilection', and he documents the doings of middle-class suburbia with a mixture of nostalgia and irony. He has something of Thomas \*Hardy's sadness and simplicity, but a greater capacity for enjoyment—of remembered tennis parties, for example, with Miss J. Hunter Dunn, 'furnish'd and burnish'd by Aldershot sun'. JNRS

**Bevan, Aneurin** (1897–1960). Perhaps the greatest and certainly one of the most controversial of Labour Party politicians, Bevan was born in Tredegar, a miner's son in a dissenting family. His creation of the National Health Service in 1948 remains Labour's most enduring legacy to the people of the United Kingdom. During the war years he was virtually a one-man opposition to \*Churchill and had no ministerial experience when \*Attlee appointed him minister of health in 1945. He resigned when his cabinet colleagues in 1951 imposed charges on dental and ophthalmic treatment in order to pay inflated defence estimates during the Korean War, a resignation they must have anticipated. He was not an easy colleague to work with. He twice lost the party whip

## Beveridge

(1939 and 1955) and in the 1950s he opposed party leadership on defence and foreign affairs. He and his wife Jenny Lee, also an MP, were regarded by many party workers as the socialist soul of Labour. His followers became known as Bevanites and were accused of forming a party within a party around the *Tribune* newspaper. But they also found Bevan difficult, especially after he denounced unilateral nuclear disarmament at the 1957 party conference, declaring that no Labour foreign secretary should be sent 'naked into the conference chamber'. Thereafter he was reconciled with \*Gaitskell.

A brilliant orator, who mastered a residual stammer, he was capable of taking on Churchill and \*Lloyd George. His jeer in 1948 (much interpreted) that the Tories were 'lower than vermin' gave his adversaries a propaganda feast. He was the most loved and hated politician of his time. AS

**Beveridge, William H.** (1879–1963). Social reformer. Educated at Oxford, Beveridge joined Toynbee Hall, in London's East End, where he met Sidney and Beatrice \*Webb. Impressed by social-insurance arrangements in Prussia, he used his position as a leader-writer for the *Morning Post* to press the case for comprehensive welfare provision in Britain. In 1908 he joined the Board of Trade and played a major part in drafting the Labour Exchanges Act of 1909 and the National Insurance Act of 1911.

In 1919 Beveridge became director of the London School of Economics (LSE), which the Webbs had founded. While firmly establishing LSE's reputation in the social sciences, his inclination to autocracy caused inevitable clashes; in 1937 he resigned, to become master of University College, Oxford. At the outbreak of war in 1939 Beveridge hoped to be put in charge of wartime manpower administration. But his unhappy relationship with the trade unions in the First World War (he had helped to draft legislation restricting wartime collective bargaining) ruled this out. Instead he was asked to chair an inquiry into post-war social services. His two reports on social insurance (1942) and full employment (1944) formed the basis of the Labour government's welfare legislation in the later 1940s. He was given a peerage in 1946. GA

**Beverley.** Yorkshire town, in the marshlands of the Hull valley. John, bishop of York, founded or restored a monastery there, where he was buried (721); he was later canonized as St John of Beverley (1037). The monastery was succeeded by a collegiate church or minster, which became a major pilgrimage centre thanks to John's shrine. A town developed north of the church, and its rights of sanctuary included the whole town. The archbishops of York were lords of the town, and in the 1120s \*Thurstan granted its burgesses the same liberties as York. The minster, rebuilt c.1220–1400, surpasses in both size and beauty some English cathedrals. The town flourished not only as an ecclesiastical centre, but through textiles, and by 1377 was one of the twelve largest English towns. Its trade and industry decayed in the 15th and 16th cents., and the suppression of the college (1548) further impoverished the town. In the 17th and 18th cents. prosperity returned as Beverley became effectively the administrative and social capital of east Yorkshire. In the 19th cent. it became a byword for electoral corruption,

and was disfranchised in 1870 after a scandalous election, in which the novelist \*Trollope unsuccessfully contested the seat. DMP

**Bevin, Ernest** (1881–1951). Trade unionist and Labour politician. The illegitimate son of a village midwife, Bevin left school at 11 but rose to become one of Britain's most respected foreign secretaries. After a succession of manual jobs and considering becoming a baptist minister, Bevin became a full-time official of the Dockers' Union in 1911. By 1914 he was one of the union's three national organizers. By 1920 he had become assistant general secretary. Bevin gained national attention in the immediate post-war years through his evidence to the Shaw Inquiry in 1920 on dock labour and his efforts to use trade union power to end British intervention in the Russian civil war. He was convinced of the need to consolidate union organization and master-minded the amalgamation of eighteen unions into the Transport and General Workers' Union, of which he became the first general secretary in 1922. The failure of the \*General Strike of 1926 underlined his belief that unions should negotiate from strength.

The collapse of the Labour government of 1929–31 compelled Bevin further into the political arena and he played a major role during the 1930s in committing Labour to realistic policies on the economy and rearmament. A devastating speech at the 1935 party conference helped remove the pacifist George \*Lansbury from the leadership. By 1937 Bevin was chairman of the TUC and one of the most influential figures in the Labour movement.

When Labour joined \*Churchill's wartime coalition in May 1940, the prime minister made the surprise but inspired appointment of Bevin to the ministry of Labour. At the age of 59 he entered Parliament. Though he did not always fit easily into the Commons, his contribution to the war effort was invaluable. Probably no other figure could have secured the same level of co-operation from the work-force.

With the election of a majority Labour government in 1945 Bevin went, not as he had expected to the Treasury, but to the Foreign Office. Here he laid the foundation stones of British foreign policy for the next 40 years. To the disappointment of Labour's left wing but the approval of the Conservative opposition, Bevin took a consistently strong line towards the Soviet Union in the developing Cold War. Indeed he saw it as Britain's task to contain Soviet expansion until the USA was persuaded to commit its resources fully to the same end. Under Bevin's powerful influence the government went ahead with the construction of a British atomic bomb, seized the opportunities offered under the Marshall Plan, and played a leading role in the creation of \*NATO in 1949. Only over the question of Palestine was his stewardship a failure. Many considered he would make a better prime minister than Attlee, but he refused to be drawn into any intrigues.

Bevin had been in poor health since the 1930s. After the 1950 general election he was no longer capable of fulfilling his duties and in the end had to be eased reluctantly out of office by Attlee. He died within a month. Bevin was a man of great intelligence, despite his lack of formal education. He

won the unqualified respect of his ministry and left an enduring mark on British diplomacy.

DJD

Bullock, A., *Ernest Bevin* (3 vols., 1960–83).

**Bewcastle cross** (Cumbria). This carving is a major example of Anglo-Saxon sculpture. Stylistically it is closely linked to the nearby \*Ruthwell cross and can be similarly dated to the first half of the 8th cent. Panels of vine-scroll, interlace, and key-pattern cover three sides of the now-headless monument, whilst on the west face there are depictions of John the Baptist and Christ in Majesty. These are set over a lengthy runic inscription whose damaged text shows that the cross was commemorative; the falconer depicted at the bottom of this face may be a portrait of the deceased.

RNB

**Bewick, Thomas** (1755–1828). English animal artist and engraver, born near Newcastle upon Tyne, where he spent most of his life and established a school of engraving. He was apprenticed at 14 to Ralph Beilby, an engraver and jeweller with whom he was later in partnership for 20 years. A bird-watcher and countryman, Bewick's finest work is in natural history illustrations particularly to a number of his books, including *A General History of Quadrupeds* (1790) and *A History of British Birds* (1797, 1804). He is equally admired for his tailpieces, which are exquisite miniature scenes of shrewdly observed incidents of rustic life and manners in Georgian England. Regarded as the father of modern wood engraving, Bewick halted the decline of engraving into a primarily reproductive technique and brought to it new expressive possibilities. His *Memoirs* were published in part in 1862 and in full in 1975.

JC

**Bible.** The Bible is a library of different literary types rather than a single book (Greek *biblia*—books (plural)). The larger part, the Old Testament (OT), is a collection of Jewish sacred writings, originally in Hebrew and consisting of teaching (or Law—*Torah*), history, prophecy, and poetry, all expressing the Jewish experience of God—a literature of faith rather than of scientific or historical observation. The 'canon' of the Hebrew OT was not endorsed by Jewish authority until c. AD 100 by which time the Septuagint, its Greek translation (Alexandria, 3rd cent. BC) combined with other Greek writings (the Apocrypha), was prevalent amongst Hellenistic Jews. Though the western church accepted 'old Latin' versions of the Septuagint, Jerome made a new Latin translation from the original Hebrew (390–410). Known as the Vulgate, this, with the Apocrypha, was authorized by the Council of Trent (1545–63) and the first Vatican Council (1870). Protestant churches never gave the Apocrypha similar authorization. The New Testament (NT), originally in Greek, also includes diverse literary forms from early Christian experience—letters of Paul and other apostles, historical narrative (Acts), apocalyptic writing (Revelation), and four gospels which are not history but arrangements of remembered acts and sayings of Jesus, retold with the eyes of faith specifically to promote faith. The New Testament 'canon' gradually emerged and was not fixed until c.382.

The first English translations were patchy and spasmodic—paraphrases attributed to \*Cædmon (c.680), \*Bede's translation of part of John's Gospel (673–735), 9th–10th-cent. glosses, free translations of Genesis 1–12, Psalms 1–50, the gospels (10th cent.), and Middle English metrical versions. The first full versions were 14th-cent. NT translations from the Vulgate, made under \*Iollard influence. Illicit MS translations continued to appear, until a powerful impetus was provided by printing of the Vulgate (1456), the Hebrew text (1488), and Erasmus' Greek NT (1516), which inspired \*Tyndale to make the first English NT translation from the original Greek in Worms (1526) and of the Pentateuch from the original Hebrew (1529–30). \*Coverdale, whose first complete English Bible (1535) was partly based on Tyndale, superintended publication of the Great Bible (1539–40), which Thomas \*Cromwell ordered to be placed in churches. A new version (1557), issued in Geneva—the first with verse-divisions—formed the basis of the so-called Geneva Bible, dedicated to Elizabeth (1560) and widely read at all levels in her reign. \*Parker, however, authorized yet another, this time more Latinate, revision of the Great Bible, the Bishops' Bible (1568)—also with verse-divisions, but 'incompetent, both in its scholarship and verbosity'. Meanwhile exiled English catholics in Rheims translated their own NT from the Vulgate (1582), followed by the OT at Douai (1609–10). At the \*Hampton Court conference (1604) James I commissioned a panel of 54 to produce the King James (or so-called Authorized) Version of 1611, a comprehensive revision of previous translations, using the Latinate Bishops' Bible as the basis. In fact, the translators wisely relied heavily on the Geneva version and therefore Tyndale (without attribution), though with some unfortunate Latinized-English amendments. Its superb quality enabled it to supplant all previous versions, and for 250 years it was the only one used. It supplied the epistles and gospels for the 1662 Prayer Book, though Coverdale was retained for the psalms. The next two centuries saw little new, except for slight revisions in John \*Wesley's *Explanatory Notes on the New Testament* (1755) and in the catholic Rheims–Douai version (1749–50). Though new scholarship led to a conservative Revised Version (1881–5), translations proliferated in the 20th cent.: James Moffatt (1922, 1924), Ronald Knox (1945, 1949), followed by the Revised Standard Version (1952)—embodying modern scholarship and meaning, but retaining the Tyndale–King James style—the New English Bible (1961, 1970), Jerusalem Bible (catholic) (1966), and others. The influence of the Bible, especially of the 1611 version and thus Tyndale, on English culture and language has been incalculable, not only in literature, but in daily aphorisms and forms of thought. This version spread to America and round the growing British empire. It has been admired for 'its simplicity, its dignity, its power, its happy turns of expression . . . the music of its cadences, and the felicities of its rhythm'. For Victor Hugo England had 'two books, the Bible and Shakespeare; England made Shakespeare, but the Bible made England.' The emphasis placed on Bible reading was a great incentive to book publication. Though protestant fundamentalists regard it as literally inspired, most Christians, catholic, evangelical, or liberal, for whom Chris-

## Bible Christians

tianity is a religion of a person not a book, use it as a basic source. Politically too it has been rummaged for causes both revolutionary and reactionary. It can be all things to all men. As William \*Blake put it, 'Both read the bible day and night, but thou read'st black where I read white.' For \*Macaulay, 'if everything else in our language should perish, [the Bible] would alone suffice to show the whole extent of its beauty and power'. WMM

**Bible Christians** were a methodist connexion founded in 1815 in north Devon by William O'Bryan (1778–1868), a Wesleyan farmer of Anglican and quaker descent, an attractive but refractory personality. Despite a stress on lay representation, it maintained a strong view of the ministry, which included women. Closest in temper to \*primitive methodism, its political attitudes aligned it with \*dissent. Its emphases on mission and education were reflected in Samuel Pollard (1864–1915) of south-west China, and Shebbear College (founded 1841) under Thomas Ruddle (1839–1909), 'the North Devon Arnold'. The Bible Christians joined with the New Connexion and United Free Churches in 1907 to form the United Methodist Church which, in turn, entered the methodist church in 1932. CB

**Bible Society.** The evangelical revival's largest pan-denominational organization was formed in 1804 to promote the international distribution of the Scriptures. Based in London, with a committee of fifteen Anglicans, fifteen dissenters, and six foreigners, its fundamental principle was that only bibles authorized by public authority should be circulated, without note or comment. By 1825 it had issued 4,252,000 bibles in 140 languages and its auxiliaries flourished nation-wide. Buffeted by crises over the inclusion of the Apocrypha (1823–6) and trinitarianism as a basis of membership (1831), it maintained its interdenominational appeal and by the 1970s issued 1,000,000 bibles annually, in over 1,000 languages. CB

**Biddle, John** (1615–62). Religious controversialist. Biddle, a bright lad from Wotton under Edge (Glos.), was sent to Magdalen College, Oxford, and became a schoolmaster at Gloucester. But he developed and published doubts of the divinity of the Holy Ghost and was repeatedly imprisoned during the Commonwealth, spending 1655–8 in confinement on the Scilly Islands. The Restoration did not assist him and in 1662 he was once more arrested, dying in prison. JAC

**Biedcanford, battle of**, c.571. Though Biedcanford was clearly an important battle, it is difficult to identify. The *Anglo-Saxon Chronicle* seems precise, attributing a victory over the Britons to Cutha, brother of \*Ceawlin of Wessex, who went on to take the towns of Lygeabyrig, Aeglesbyrig, Benesington, and Egonsham. These have with some confidence been identified as Limbury (now part of north Luton), Aylesbury, Benson, and Eynsham. But the detail is much disputed. Stenton denied that the name referred to Bedford. Historians have puzzled whether Britons could have been holding the vale of Aylesbury as late as 571. Hence Oman suggested that the struggle must have been between fellow-Saxons, while Myres argued that the event had been mis-

placed by at least 100 years and must refer to a 5th-cent. Saxon breakthrough. JAC

**Big Ben**, the name given to the clock in the eastern tower of the Houses of Parliament, Westminster. was originally applied only to its 13-ton bell, supposedly named after Sir Benjamin Hall, commissioner of works (1859). Famous for its accuracy, its chimes have become familiar nation-wide through radio and television. ASH

**Bignor.** Roman villa. Situated on the edge of the Weald to the north of Chichester, the villa at Bignor was uncovered by the antiquary Samuel Lysons (also responsible for the uncovering of \*Woodchester) between 1812 and 1820. Starting from modest beginnings at the turn of the 1st and 2nd cents., the villa had developed by the middle of the 4th cent. into one of the largest and most palatial in Britain. It is particularly noteworthy for the number and quality of its mosaics. ASEC

**Bigod, Roger, 4th earl of Norfolk** (c.1212–70). Bigod's grandfather had been one of the barons who enforced \*Magna Carta on John. He succeeded his father in 1225 at the age of 12 or so, having been brought up at the Scottish court of Alexander II, whose sister he married. In 1246 he succeeded as hereditary earl marshal. He fought in campaigns in Wales and France on behalf of Henry III, but in 1258 became a leader of the baronial opposition to restrain the king. In the ensuing conflict he seems to have steered a careful course, siding with de \*Montfort when he was in power, but making his peace with the king after \*Evesham. JAC

**Bigod, Roger, 5th earl of Norfolk** (1245–1306). Bigod was one of the most powerful barons in Edward I's reign. He succeeded his father Hugh Bigod, justiciar, in 1266 and his uncle as earl and hereditary marshal of England in 1270. His life was spent in the service of Edward I and he saw much campaigning in Wales and Scotland: he was present at the defeat of \*Wallace at \*Falkirk in 1298. But relations with the king, who made heavy demands on his subjects, were by no means easy. In 1297 Bigod refused to lead a campaign in Gascony. 'You will either go or hang', Edward is reported to have said, to be met with the retort, 'I will neither go nor hang.' Edward was forced to give way and confirm charters, but the dispute simmered on and surfaced once more on the Scottish campaign of 1298. Bigod's political position was weakened by heavy debt and in his last years he was obliged to come to terms with Edward. JAC

**billeting.** The right of the crown to demand accommodation for its troops was always part of the royal prerogative, and derived from the subject's duty to help the king against his enemies. Though it was never popular, since remuneration was often inadequate and slow, it did not become a major constitutional issue until the 17th cent., when Parliament was watchful for encroachments upon the liberties of the subject and the Stuart kings were very short of money. The \*petition of right (1628) complained that 'great companies of soldiers and mariners have been dispersed into divers counties and the inhabitants against their will have

been compelled to receive them into their houses . . . to the great grievance and vexation of the people'. Though Charles accepted the petition, the grievance continued, and in 1640 he told Yorkshire petitioners sharply that the right of billeting was a 'necessary power'. After the \*Glorious Revolution, the law was modified: ordinary citizens were not required to find billets, but innkeepers were obliged to accept troops and a scale of charges laid down. Not until a programme of barrack-building was carried through in the 19th cent. was the issue finally put to rest. JAC

**billiards and snooker.** Billiards is a game of some antiquity which evolved as a popular pursuit in the 19th cent. A version was played in the 16th and 17th cents. with a hoop and a king-pin as a skittle. A modern billiards room was opened in Covent Garden and then in many London clubs, with a slate base, three balls, and rubber cushions. A Billiards Association was founded in 1885, a Control Club in 1908, and the two amalgamated in 1919 into the Billiards Association and Control Council. Snooker developed from it in the Indian army and is believed to have taken its name from the slang term for a new cadet. Billiards has never achieved wide popularity but snooker acquired a considerable TV following and its simpler variant, pool, is played in many pubs, since the tables are smaller. JAC

**Bill of Rights.** Passed by Parliament in December 1689 this gave statutory force to the \*Declaration of Rights presented to William and Mary on 13 February 1689, and agreed by them after they had jointly accepted the crown of Great Britain. The bill closely followed the declaration in its recital of ancient rights, and the recent abuses of the royal prerogative by the catholic James II, deemed to have abdicated and hence vacated the throne. The question of any contractual character the crown might possess was skirted. The succession was now stated to lie in the heirs of the bodies of the protestant Mary, and then her younger sister Anne. None could succeed who were of the catholic faith, or had married catholics. Prerogative power to dispense with law in specific instances was rendered subject to statutory sanction; and Parliament claimed the right to override a royal pardon. This received statutory recognition in 1701 through the \*Act of Settlement. DDA

**Birgham, treaty of,** 1290. Anglo-Scottish treaty, initially drawn up at Birgham (Berwickshire) on 18 July and ratified at Northampton on 28 August 1290. It provided for the marriage of \*Margaret 'the Maid of Norway', granddaughter and successor of Alexander III, to Edward of Caernarfon (later Edward II), son and heir of Edward I, on condition that Scotland should remain an independent sovereign kingdom ruled by Margaret. It became redundant on Margaret's death in September 1290; but had the marriage taken place and children issued from it, it is possible that a lasting Anglo-Scottish union, similar to the union of the crowns of 1603, would have been achieved. KJS

**Birkbeck, George** (1776–1841). Son of a Yorkshire banker, Birkbeck qualified in medicine at Edinburgh and at 23 was appointed to succeed Thomas Garnett as second holder of the chair of natural philosophy (science) at the new

Andersonian Institution in Glasgow. The course of free lectures he introduced on science for working men was highly successful, 500 attending with 'striking regularity, good order, with the most ardent attention'. In 1823 these led to the foundation of the Glasgow Mechanics' Institute, with Birkbeck as patron. Birkbeck had moved to London in 1804 to obtain greater security and better remuneration and practised medicine with success. In 1824 he helped to found the London Mechanics' Institute, renamed the Birkbeck Institution in 1866, and Birkbeck College in 1907. With his friend \*Brougham he was one of the founders of the University of London and served on its council. JAC

**Birkenhead, HMS,** 1852. On 25 February 1852 at night the paddle-steamer *Birkenhead* taking 480 soldiers and 13 women and children for the Kaffir War struck a rock and sank off Cape Town. The troops were ordered to stand fast on deck to avoid swamping the women's boat and almost all perished in shark-infested waters. Hailed by the Victorians as a matchless example of courage, it has also been condemned as a needless sacrifice. JAC

**Birkett, William Norman** (1883–1962). Lawyer. Birkett was the son of an Ulverston draper. He was educated at Barrow Grammar School and served in his father's shop in Ulverston before going to Cambridge to read theology. He was called to the bar in 1913, took silk in 1924, and was appointed a judge of the Queen's Bench Division in 1941, having briefly sat in Parliament as a Liberal. In 1946 he was one of two British judges who sat on the International War Crimes Tribunal at Nuremberg. He was appointed to the Court of Appeal in 1950 and in 1957 he became a life peer. A great English advocate, in the tradition of Marshall \*Hall and Edward \*Carson, he was outstanding as counsel in many cases, criminal and civil. He was also an accomplished broadcaster and after-dinner speaker. MM

**Birmingham.** The rise of Birmingham from local to national importance was largely an 18th-cent. development, when improvements in turnpike roads and canals enabled it to turn to advantage its central situation. The name indicates the ham or settlement of the people of Beorma, presumably a Saxon leader, and at the time of Domesday Book (1086) it was no more than a tiny hamlet, with five villeins and four smallholders. It grew during the Middle Ages, acquiring a market, but was overshadowed politically by Warwick and Coventry. Birmingham's reputation for cutlery began early, for in the 1530s \*Leland found it 'a good market town', with one long street by the brook: 'there be many smiths in the town that use to make knives and all manner of cutting tools,' exploiting the local coal and iron. \*Camden, 40 years later, was more enthusiastic—it was 'swarming with inhabitants and echoing with the noise of anvils': the upper part of the town had 'an abundance of handsome buildings'. During the civil wars, Birmingham declared for the Parliament, which must have found its guns, pikes, and swords of great value: \*Clarendon, on the king's side, accused it of 'hearty, wilful, disloyalty'. Being near the front line of each side, it was repeatedly harassed but suffered no permanent damage. By 1700 it

## Birmingham

had well over 10,000 inhabitants. It still had no parliamentary representation and no corporation, which cynics thought a great advantage, since it allowed the people to shun politics and concentrate on business. But by 1830 the \*Birmingham Political Union had taken the lead in pressing for reform and the town acquired two MPs in 1832 and a council in 1838. Under the mayoralty of Joseph \*Chamberlain in the 1870s Birmingham became celebrated for municipal enterprise, and Mason's College, founded in 1870, received a charter as a university in 1900. Birmingham's economy diversified, with Cadbury's established at Bournville in 1879, General Electric in 1896, the Dunlop Rubber Company at Castle Bromwich in the 1890s, and the Austin Motor Company in 1905. The development of the railway system in the 19th cent. and the motorway network in the 20th helped Birmingham to continue to exploit its geographical position, and during the Edwardian period it overtook Liverpool and Manchester as the second city in England and Wales. JAC

**Birmingham, diocese of.** Largely coterminous with north Warwickshire and including the city of Birmingham, the see was created mainly out of the diocese of Worcester in 1905, after a campaign which had been launched in 1888 by Bishop Philpott of Worcester. Other great industrial cities such as Bristol (1542), Manchester (1848), Liverpool (1880), and Newcastle (1882) already had their own sees. Charles \*Gore, who had been bishop of Worcester from 1902, transferred to the new see and held it until 1911, when he moved to Oxford. Bishop Barnes, a local man, who held the see from 1924 until 1953, was a mathematician, whose attacks on the doctrine of the real presence and impatience with miracles caused him to be accused of heresy. Bishop Wilson, his successor (1953–69), had been bishop of Singapore at the time of the Japanese occupation and had ministered the gospel in captivity. The cathedral is the former parish church of St Philip, built in baroque style by Thomas Archer (1711–19) with 19th-cent. windows by \*Burne-Jones and William \*Morris. JAC

**Birmingham Political Union.** Formed in 1830 by Thomas \*Attwood to press for parliamentary reform as a remedy for economic distress and inspired by the successful campaign for \*catholic emancipation. Led by local businessmen and manufacturers, the BPU aimed to unite middle- and working-class reformers in a programme of peaceful and orderly change based on currency reform and household suffrage. It rapidly became a preponderant factor in Birmingham political life; and as the Reform Bill crisis deepened, the BPU organized a series of huge reform demonstrations, becoming the pattern for similar political unions elsewhere. After the passing of the 1832 Reform Bill, the BPU fell apart and was virtually dissolved in 1834. A revival came in 1837, but the BPU was soon swallowed up by \*chartism, which possessed a more powerful working-class dynamic. JFCH

**Birmingham riots, 1791.** A foretaste of the great conservative revulsion against the French Revolution, directed against its sympathizers. Joseph \*Priestley, a unitarian scientist, had foolishly written of placing gunpowder beneath

superstition and error, and was henceforth known as 'Gunpowder Priestley'. On 14 July 1791, after a dinner to celebrate the storming of the Bastille, his house, library, and scientific apparatus were destroyed by the mob, while the authorities were suspiciously inactive. Several dissenting meeting-houses were also burned before dragoons from Nottingham arrived to restore order. Four rioters were executed. JAC

**birth control** techniques appear to have been widely available long before the 19th cent. Herbal mixtures were advocated to reduce the sex drive or induce abortion. Such mixtures usually worked by causing violent vomiting or diarrhoea, although recent research has indicated that some ingredients, such as the herb savin, might well have produced uterine contractions. Contemporaries also seem to have been aware of the withdrawal technique since at least the early 18th cent., when the practice of coitus interruptus was linked by quack literature to an awesome list of debilitating medical complaints, including deafness, blindness, and loss of memory. Male contraceptives, known since at least the 16th cent., were advertised by the early 18th cent., when such 'armour', made of animal gut, was used, largely by upper-class men, to avoid contracting venereal infections from prostitutes. The 1820s and 1830s saw the first open discussion of birth control techniques, and the dissemination of (sometimes inaccurate) contraceptive knowledge amongst the working classes. More public debate followed the creation of the so-called Malthusian League (1877–1927) which distributed some 3 million pamphlets advocating birth control during its existence.

Before the third quarter of the 19th cent., however, there is little statistical evidence that English couples were practising much family limitation. The only important qualification is that marital fertility was on the low side (i.e. significantly lower than its potential biological maximum) due apparently to the contraceptive effect of relatively long periods of breast-feeding. Birth control before 1870 was restricted to higher social classes and some groups of industrial workers, such as those in the textile industry.

All this changed after 1870 when, within a few generations, Britain, in common with most other European countries, underwent the so-called fertility transition. Between 1880 and 1930 the fertility of women of child-bearing age declined by over 60 per cent and the average size of British families fell by almost two-thirds. This declining birth rate was due largely to the adoption of birth control within marriage. It is also clear that the contraceptive techniques used in the early stages of this decline were largely traditional methods such as abstinence, coitus interruptus, and 'safe periods' rather than mechanical aids such as condoms, caps, or sponges. It remains unclear why couples, particularly working-class couples, chose to limit the size of their families from the late 19th cent. Since traditional birth control methods were used, fertility decline was not 'caused' by any increase in the supply of mechanical contraceptives. It is unlikely, too, that improving survival chances of infants promoted a desire to reduce completed family size, since the fertility decline appears to have antedated the fall in

infant mortality. In the end, the adoption of birth control within marriage may have been due to a new determination of women to limit the size of their families, prompted by the impact of feminist arguments, growing medical information regarding the dangers of repeated childbirth, and the impact of universal compulsory schooling in 1880, which reduced the contribution children might make to the household economy.

The most dramatic effect upon family and social life, however, came in the later 20th cent. with the increasing use of 'the pill', including, late in the century, the 'morning-after' pill. Among the consequences were an increase in the number of couples cohabiting rather than marrying, and in the number of single-parent families. See also CHILDREN. JPB

**bishops.** The office and work of a bishop has evolved from that of the apostles in the New Testament church. That church recognized two differing forms of ministry, that which was local and settled (pastors and teachers) and the itinerant ministry of apostles, prophets, and evangelists. The scope of the apostolic ministry is clearly revealed in the work of Paul as founder of churches, arbiter in matters of doctrine, faith, and discipline, and in his appointment of elders to supervise individual Christian communities. The word *episcopus* (bishop), literally 'overseer', well defines this apostolic ministry. The letters of Ignatius of Antioch (c. AD 100) show that by that date the work of the bishop as chief pastor, preacher, and liturgical president was becoming established, and by the time of Irenaeus of Lyons (c. AD 170) the office of bishop was widely recognized and accepted.

The jurisdiction of a bishop, within which he exercises his ministry, is a diocese, a word taken from a territorial administrative unit of the Roman empire. There were certainly Christians in the British Isles by the beginning of the 3rd cent. AD (they were mentioned by Tertullian c.208) and several bishops in the country by 314, when three of them attended the Council of Arles. The churches in Wales, Ireland, and Scotland remained episcopal during the period Christianity was forced underground in England after the withdrawal of the Romans.

The gradual re-establishment of the Christian church in England and revival of episcopal government followed the mission of \*Augustine (597), but early Anglo-Saxon dioceses could be vast in extent and often conterminous with the kingdom in which their see was placed. After the Norman conquest, the sees of a number of bishops were transferred to larger towns (e.g. \*Sherborne to \*Salisbury, \*Selsey to \*Chichester), thus creating the diocesan map which endured until the Reformation. The reformed Church of England retained bishops and Henry VIII established five new dioceses (\*Bristol, \*Chester, \*Gloucester, \*Oxford, and, briefly, Westminster). With the development of major conurbations in the 19th cent. further dioceses were founded (\*Ripon 1836, \*Manchester 1848, \*St Albans and \*Truro 1877, \*Liverpool 1880, \*Newcastle 1882, \*Southwell 1884, and \*Wakefield 1888), a process which continued into the 20th (\*Birmingham and \*Southwark 1905, \*Chelmsford, \*Bury St Edmunds, and \*Sheffield 1914, \*Bradford 1920,

\*Blackburn 1926, \*Derby, \*Guildford, \*Leicester, and \*Portsmouth 1927). JRG

**Bishops' wars, 1639–40.** Charles I assumed, with good reason, that religious diversity was a source of weakness in a state. In 1637, therefore, he ordered the Scottish Presbyterian church to use a new prayer book on the English model. This provoked a protest movement which culminated in the drawing up of a national \*covenant to defend 'the true religion'. Charles raised an army to enforce his will but his troops were an undisciplined rabble and rather than risk fighting he accepted the pacification of Berwick in June 1639. This brought to an end the first of the so-called Bishops' wars, but in 1640 Charles again took up arms. The outcome was worse. The Scots promptly invaded England, brushed aside Charles's army at \*Newburn, outside Newcastle, on 28 August, and occupied the north-east of the country. They were now secretly collaborating with the king's opponents and refused to contemplate withdrawing unless and until he summoned Parliament. Charles's policy had collapsed. RL

**Black, Joseph (1728–99).** Chemist who showed that gases enter into chemical reactions. Black studied medicine at Glasgow University with William Cullen, and then migrated to Edinburgh where in 1754 he submitted his MD dissertation on *magnesia alba*, a remedy for stomach aches. This he extended into a paper in 1756. He followed a cycle of reactions, in which 'fixed air' (carbon dioxide) is driven off from the stone on heating, leaving a powder akin to quicklime. With water it is slaked; and then slowly absorbs or fixes air or gas again to turn back into the starting substance. In 1756 he succeeded Cullen as professor of chemistry (within the medical school) at Glasgow, and in 1766 in Edinburgh. He also noted how much heat was needed to turn ice into cold water, or boiling water into steam: the phenomenon of *latent heat*. He was an early convert to Lavoisier's new chemistry. DK

**Black and Tans** was the nickname, derived from a Limerick hound pack, or the colour of the uniform, for an auxiliary police force recruited in Britain 1920–1 from ex-servicemen to reinforce the hard-pressed Royal \*Irish Constabulary (RIC). The ill-disciplined force was associated with drunken brutality and reprisals against the Irish community following \*Irish Republican Army (IRA) atrocities. It is frequently confused with auxiliaries formed from army officers, established several months later. The Black and Tans soon became synonymous with talk of British oppression, and in the Irish Republic the conflict 1919–21 is often called 'The Tan War'. MAH

**Blackburn, diocese of.** The see, created in 1927 mostly out of the \*Manchester diocese, comprises much of Lancashire except for Liverpool and Manchester, a mixture of countryside and cotton-mill towns. The cathedral is the former parish church of St Mary's, built in 1818, early Gothic Revival in style, extended in the 1930s, 1950s, and 1960s. WMM

## Black Death

**Black Death.** An epidemic of catastrophic proportions, the Black Death first struck England in the summer of 1348, and spread rapidly from the south coast, reaching virtually all parts of the country within twelve months. This first outbreak probably killed between a third and a half of the population, as is shown by figures showing death rates for the clergy, and for peasant landholders. The plague struck again in 1361, and further outbreaks followed as the disease became endemic. It is usually considered to have been bubonic plague, spread by fleas and rats, but its rapidity and morbidity were much greater than any previous outbreak, perhaps because it took a highly infectious pneumonic form. The Black Death had major economic effects, although these did not become fully apparent until the 1370s. The area under arable cultivation was sharply reduced, as demand for cereals fell, and some lands were turned over to pasture. Labour became more expensive, and attempts to revive peasant labour services were unsuccessful. The plague also caused social dislocation, notably with a rapid turnover of peasant holdings. The aristocracy suffered less than the population at large, and the workings of government were little affected. MCP

**'Black Dinner', 1440.** Later title given to the beheading, following a banquet in Edinburgh castle on 24 November 1440, of William 6th earl of Douglas [S] and his brother David, on the orders of Chancellor Crichton. Neither Douglas was forfeited, and their removal was probably planned by their uncle James 'the Gross', who became 7th earl of Douglas. NATM

**Blackheath, battle of, 1497.** A formidable rising of Cornishmen in the summer of 1497 protested against taxation to support Henry VII's campaign against James IV of Scotland, arguing that this was a purely northern responsibility. Under the leadership of Thomas Flammock and James, Lord Audley, the rebels marched through Wells, Salisbury, and Winchester towards London, where they caused great panic. But Lord Daubeney and the earl of Oxford led the army prepared for Scotland against the insurgents at Blackheath and dispersed them. Flammock and Audley were executed. JAC

**Black Hole of Calcutta.** By legend, on 20 June 1756 Nawab Siraj-ud-Daula, Robert \*Clive's great enemy, packed 146 Englishmen captured at Calcutta into a small guardroom. The next day only 21 were left alive. There is today much dispute about Siraj-ud-Daula's culpability and the actual number of victims, which may only have been 43. DAW

**Black Parliament, 1320.** A parliament held at Scone on 4 August 1320 to try conspirators who had intended to kill Robert I and place Sir William Soulis, the son of a competitor in the \*Great Cause, on the throne. Soulis was sentenced to life imprisonment, while five others were acquitted. Some were not so fortunate. Sir Roger Mowbray, dead before the trial, was none the less sentenced to be drawn, hanged, and beheaded, although Robert I's clemency prevented the mutilation. Four others were drawn behind horses, hanged, and beheaded. These punishments were unusual by Scottish

standards, and shocked Scots more than the initial treason. RJT

**'Black Prince'.** See EDWARD THE BLACK PRINCE.

**Blackstone, Sir William (1723–80).** Blackstone is acknowledged as one of the greatest writers on the common law. He was both a practising barrister and an academic—an unusual combination at the time—and in 1758 was appointed as the first Vinerian professor of law in the University of Oxford. It was not yet possible in the 18th cent. to study the common law in the universities of Oxford and Cambridge and his lectures in Oxford, designed to enlighten undergraduates, were a masterly survey of the subject. His *Commentaries* have been one of the most authoritative and revered sources of English law and have frequently been acknowledged as such in the courts (e.g. his description of the prerogative). Like a number of distinguished lawyers, he was not quite at home in the House of Commons, where he sat from 1761 until 1770, when he was appointed to the bench of Common Pleas. MM

**Blackwater, battle of.** See YELLOW FORD.

**Blackwood, William (1776–1834).** Born in Edinburgh, Blackwood established himself in the book trade and then went into publishing. In 1817 he launched a magazine to counter the Whig tendencies of the \**Edinburgh Review*, founded in 1802, but less ponderous than the Tory \**Quarterly Review* (1809). After a faltering start, *Blackwood's* established itself, with Lockhart, John Galt, John Wilson, and James \*Hogg among its authors. During its first year, *Blackwood's* published a series of severe attacks on 'the Cockney school of poetry'. Lockhart dismissed \*Keats's *Endymion* as 'calm, settled, imperturbable drivelling idiocy', and the comments on \*Hazlitt were so virulent that he was able to get damages from Blackwood. The magazine was continued by his son John Blackwood, and survived until 1980. JAC

**Bladensburg, battle of, 1814.** The defeat of Napoleon in 1814 allowed Britain to take the offensive in the \*War of 1812 against the USA. A force of 4,000 men, under General Robert Ross, some of them peninsular veterans, was landed at Chesapeake Bay. A militia force at Bladensburg on 24 August was brushed aside and the British entered Washington, burning the White House in retaliation for the American sack of Toronto in 1813. JAC

**Blair, Anthony ('Tony') (b. 1953).** Prime minister. Educated at Fettes College, Edinburgh and St John's College, Oxford, Tony Blair followed his elder brother William to Lincoln's Inn and qualified as a lawyer. He entered Parliament in 1983 as Labour MP for Sedgfield, Durham, and soon made his mark as an articulate and forceful speaker and an adroit TV performer. He was elected to the shadow cabinet in 1988 and was spokesman on Home Affairs when John \*Smith died in 1994. Blair won the leadership contest with ease, defeating John Prescott and Margaret Beckett. He pursued Neil \*Kinnock's policy of working to shed Labour's 'loony left' image: 'New Labour' 's reward was a massive majority at the general election of May 1997. Insisting that his administration would be radical and reforming, Blair undertook a

series of initiatives, not all of which seemed thought out. The consequences of devolution in Scotland, Wales, and London appeared to surprise the government when local people claimed influence and the nationalists did well. Abolition of the hereditary element in the Lords was carried through without, it seemed, much idea of what was to follow. Blair's sympathy for the EEC was inhibited by the poor performance of the euro, and he found some difficulty in wooing the business community without alienating traditional Labour support. Knitting together Old and New Labour proved at times hard. Nevertheless, Blair's personal popularity remained high and at the general election of 2001 he was returned to power with his majority intact—one of the most remarkable achievements of modern politics. His second term of office has been dominated by the need to combat international terrorism. JAC

**Blake, Robert** (1599–1657). Admiral. Educated at Oxford, where he was said to have expressed republican views, Blake volunteered for the parliamentary army in 1642, and distinguished himself at the sieges of Lyme and Taunton. In February 1649 he was one of three colonels appointed admiral and general at sea by the Commonwealth. His first assignment was to neutralize the royalist navy under Prince Rupert besieging Kinsale. Having done this, he chased Rupert to Lisbon. By mauling Rupert's forces, blockading Lisbon, and seizing the annual fleet returning from Brazil, Blake forced Portugal and Spain to recognize the authority of the Commonwealth. He had completed a revolution in naval warfare. Fleets permanently in the service of the state had been replaced by ships impressed or hired from merchants for the occasion. This achievement he shared with the Council of State and Sir Henry Vane of the Admiralty Committee, but it was Blake who won the loyalty and maintained the efficiency of the new navy. However, while an inspiring commander, he could boast no innovating skill in naval tactics. Defeated by the Dutch commander Tromp at Dungeness (30 November 1652), he avenged his humiliation at Portland and Beachy Head (18–20 February 1653). In 1654 he was given command of the Mediterranean fleet, where he campaigned against Turkey and Spain. His victory over the Spanish West Indies fleet in April 1657 was the occasion of a public thanksgiving in London. Blake suffered from chronic illness, especially after being wounded in 1653, and died at sea while returning to England after the Spanish campaign in August 1657. IJG

**Blake, William** (1757–1827). Artist, engraver, philosopher, visionary, and poet. Blake regarded art, imagination, and religion as one and aimed to create, through poetry and painting, a 'visual symbolism' to express his 'spiritual vision' and 'mystical philosophy'. After drawing school and apprenticeship to an engraver, Blake briefly attended the Royal Academy where he was at odds with Joshua Reynolds. Returning to engraving, he became engrossed in what he called 'illuminated painting', an attempt to produce books in the style of medieval illuminated manuscripts. His first major work was *Songs of Innocence* in 1789, and *Songs of Experience* was published in 1794. Blake longed for fame and an enthusiastic audience, to build a New Jerusalem, but refused

to compromise to make his work more accessible. He spent many years in poverty, saved only by the patronage of artist John Linnell and others. He spent his later years drawing rather than writing, surrounded by admirers, who included Samuel Palmer. Individual, nonconformist, experimental, Blake's work still challenges and mystifies, yet it includes two of the best-known poems in the English language, 'Tyger, tyger' and 'Jerusalem'. JC

**Blanketeers, March of the**, 1817. This was another episode in the troubled post-war period. After the Spa Fields riots of November 1816, the government suspended habeas corpus and banned meetings of more than 50 people unless authorized by a magistrate. A large gathering of some 5,000 weavers met in St Peter's Fields (Manchester), on 10 March 1817, intending to march to London to petition the prince regent for redress. They carried blankets and rugs with them. After the Riot Act had been read, most were dispersed by the cavalry, but 300 reached the bridge at Stockport, where almost all were turned back. A handful reached Leek. The episode is described by Samuel Bamford in *Pas-sages in the Life of a Radical*. JAC

**blasphemy** is open to wide definition, but within the Christian tradition is normally defined as a profane utterance or an impious speech against God or established religion. Blasphemy occasionally troubled the medieval church, but became more common after the Reformation, when a plurality of views coexisted with increased official concern over religious orthodoxy. Perhaps the most celebrated victim of the blasphemy laws was James Nayler, who in 1656 parodied Christ's entry into Jerusalem by riding a donkey into Bristol. He was whipped in both London and Bristol, stood on the pillory, bored through the tongue, branded on the forehead, and kept in Bridewell at Parliament's pleasure. As late as 1832 a bookseller named Eaton was imprisoned and pilloried for attacking the Bible. The 19th cent., however, saw a modification of the law on blasphemy. The key case was *Ramsay v. Foote* (1883), which established that it was not blasphemous to attack the fundamentals of religion if 'the decencies of controversy' were observed. This remains the legal position. JAS

**Blatchford, Robert Peel Granville** (1851–1943). English socialist and nationalist. Author and journalist, Blatchford wrote for the British newspaper the *Sunday Chronicle* 1885–91, before co-founding the *Clarion* in 1891, a popular socialist weekly, which he edited for 20 years. He had become a socialist as a result of his revulsion at the conditions of the slums of Manchester, but his socialism was uneasily combined with a fierce nationalism arising out of his seven years' service in the army. He became involved in the labour movement, and used the *Clarion* as a vehicle for his socialist views conveyed in a low-brow style of writing, pitched to working-class and lower middle-class readers. Blatchford's socialism was the homely message of William Morris, not the revolutionary doctrine of Karl Marx, and it was so successfully transmitted that it spawned a host of organizations—such as the Clarion Scouts, the Clarion Field Clubs, and the National Clarion Cycling Club—established

## Blenheim

to promote socialist fellowship. Blatchford became leader of an influential group within the labour movement—the Clarionettes, siding with the \*Social Democratic Federation against the \*Independent Labour Party. His most important book *Merrie England* (1894), which sold over 2 million copies, has been described as the best recruiting document ever produced by socialists in Britain. However, Blatchford's nationalistic beliefs gradually pulled him away from the labour movement. His support for the \*Boer War alienated fellow-socialists, and his advocacy of \*conscription, when war broke out in 1914, finally severed his connections with the labour movement. TSG

**Blenheim, battle of**, 1704. In early 1704 the French and Bavarians in the War of the Spanish Succession were threatening the imperial capital of Vienna. The duke of \*Marlborough marched from the Low Countries to the Danube to link up with his allies and force battle on the enemy. On 19 May 1704 Marlborough's multi-national army set off from Bedburg. He kept his objective secret, to deceive both the enemy and also his Dutch allies, who might have objected to such a risky strategy. The ploy worked and the Anglo-Dutch army united with the armies of the margrave of Baden and Eugene of Savoy. On 13 August 1704 Marlborough attacked the 60,000-strong Franco-Bavarian forces under Marshal Tallard at the village of Blindheim (or Blenheim) in Bavaria. Marlborough and Eugene attacked on the flanks of the enemy position, forcing Tallard to weaken his centre. A major French counter-attack was beaten off with the aid of Eugene's cavalry. The battle was decided by a major blow against Tallard's centre, which gave way as Eugene pushed forward on the right flank. The Franco-Bavarian force lost 38,000 men while the victors lost 12,000. The threat to Vienna was lifted and Bavaria fell to the allies. GDS

**Blenheim palace** (Oxon.). Home of the dukes of Marlborough and birthplace of Sir Winston \*Churchill. Situated in Woodstock, close to Oxford, Blenheim palace was given to John Churchill, 1st duke of \*Marlborough, in gratitude for his victory in 1704 over the French at the battle of \*Blenheim during the War of the Spanish Succession. The architect was Sir John \*Vanbrugh, soldier and dramatist, whose genius (in Swift's words) 'without single thought or lecture, [had] hugely turn'd to architecture'. In 1699 Vanbrugh had prepared drawings for \*Castle Howard for the earl of \*Carlisle, and here and at Blenheim he was assisted by Nicholas \*Hawksmoor. Blenheim is the more dramatic and confident of the two designs, in part due to its striking situation high on a hill; Henry Wise (1653–1738) was largely responsible for the formal gardens near the palace, and a plan of 1709 signed by \*Bridgeman shows the main avenue stretching across Vanbrugh's bridge into the park beyond. From about 1764 this area was planted and flooded by Capability \*Brown. The palace itself consists of a pedimented centre block, with flanking courts on each side; the forms are imaginative, powerful, and highly modelled, with that abstraction of classical elements typical of the two architects. Inside the heroic scale is sustained in the great hall, saloon, library, and other rooms, with their paintings, furniture, bronzes, and tapes-

tries: Grinling \*Gibbons, Laguerre, \*Rysbrack, and Sir James Thornhill are among the artists and craftsmen represented. During the early 20th cent. the 9th duke of Marlborough engaged the Frenchman Achille Duchêne to restore the north forecourt, replant the elm avenue leading to it, and create formal gardens on the east and two water terraces (completed 1930) on the west. Sir Winston Churchill is buried in the churchyard at Bladon, on the south-east edge of Blenheim Park. PW

**Bligh, William** (1754–1817). Sailor. Born in Plymouth, Bligh joined the navy at 16 and sailed with \*Cook on his last voyage. In 1787 he was given command of an expedition to the Pacific to procure bread-fruits, taking HMS *Bethia* renamed *Bounty*. Fletcher Christian, his mate and the leader of the mutiny, was a friend and Bligh's own choice. Bligh was an excellent navigator, not a brutal commander by the standards of his day, but irritable and prone to bad language. After the mutiny on 28 April 1789, he and eighteen men were placed in an open boat. They reached Timor after 41 days and well over 3,500 miles, with the loss of only one man, killed by natives. On his return to Britain, Bligh was court-martialled and exonerated. He resumed his career, served as governor of New South Wales, and died a vice-admiral. JAC

**Blitz**. British colloquialism for air attacks on UK towns, particularly at night in 1940–1, especially on London, derived from *Blitzkrieg*, lightning war, said to be the preferred German method. Night air attacks meant, however, German acceptance of slow attrition. Towns important for war, like Belfast, Manchester, Sheffield, Glasgow, Hull, Plymouth, Coventry, suffered but the main 'Blitz' descended on London, which was bombed every night but one for over two months. Human casualties were less than feared; damage to buildings greater. The indirect effect of homelessness on war production was greater than the destruction of factories. Death, injury, and homelessness lowered morale; survivors drew strength from self-esteem and comradeship. This was especially true in London where size enabled effective concentration of help for victims. In 1940–1, before the attack on the USSR diverted the German air force, about 42,000 were killed in the UK and more than 50,000 seriously wounded. RACP

**Bloemfontein, convention of**, 1854. The British government was puzzled by the Great Trek of 1836–7 when thousands of Boer farmers moved out of the Cape and left British jurisdiction. In 1845 it annexed \*Natal and in 1848 Sir Harry Smith followed up by annexing the \*Orange River Territory, pursuing the Boers. But it was difficult to establish effective control and in 1852 the British signed the \*Sand river convention acknowledging the independence of the Boers in the Transvaal in the hope that they would not assist the Boers in the Orange River Territory. But the Orange River Territory remained unstable and, in a startling switch of policy in 1854, by the Bloemfontein convention, power was handed back to the Boers in the form of a provisional government. This arrangement did not prove satisfactory and two Boer wars later resulted. JAC

**Blois, treaty of**, 1572. Elizabeth I, excommunicated by the pope in 1570, was in a very vulnerable position and in 1571 the \*Ridolfi plot against her life was exposed. To protect herself, she sought reconciliation with the French, who had supported Mary, queen of Scots, but were in rivalry with Spain. \*Walsingham conducted negotiations and on 21 April 1572 Charles IX of France agreed at Blois to a treaty of mutual defence. The main result was that the French ceased to support Mary's followers in Scotland, preparing the way for a protestant settlement there. JAC

**Bloody Assizes** was the name given to the mass trials of \*Monmouth's rebels in 1685, presided over by \*Jeffreys and four other judges. Nearly all the 1,300 prisoners were undoubtedly guilty of treason, for which the sentence was death by hanging, disembowelling, and quartering. The revulsion against the treatment of the rebels, and the legend which subsequently developed, were provoked by the conduct of the trials. The judges indicated that pleas of not guilty would invariably mean death sentences by ordering execution on the day of conviction. These examples produced pleas of guilty which enabled courts to sentence 500 in two days at Taunton, 540 at Wells in one. Most of those convicted were kept in suspense for weeks before being executed or ordered for transportation. The executions of some 250 were dispersed in towns over the area of the rebellion, and to increase the impact further pickled heads and quartered bodies were publicly displayed throughout the western region. James II's queen and courtiers took profits from the sale of those transported to the West Indies. The emotion generated by the repression is still very much alive locally. JRJ

**'Bloody Sunday'**, 1887, 1920. The encounter on 13 November 1887 in Trafalgar Square between radicals and Irish and police, supported by troops, attempting to enforce a ban, left two demonstrators killed, though no shots were fired. A small incident by most standards, it shocked Victorian England. 'Bloody Sunday' in Dublin on 21 November 1920 saw a different scale of savagery. Fourteen British officers were murdered in their homes or hotels by the \*Irish Republican Army, and in the afternoon \*Black and Tan troops opened fire on a Gaelic football crowd at Croke Park, killing twelve. JAC

**Bloomsbury Group**. A circle of artists, writers, and critics meeting in private houses in Bloomsbury, London, who in their revolt against the artistic, social, and sexual restrictions of Victorian society were an important influence on cultural and intellectual life in the early decades of the 20th cent. Most had studied at Cambridge, and were influenced by the philosopher G. E. Moore, whose *Principia ethica* (1903) emphasized the importance of personal relationships and aesthetic experience. Among leading members were Clive and Vanessa Bell, E. M. \*Forster, Roger Fry, J. Maynard \*Keynes, and Virginia \*Woolf. JC

**Blore Heath, battle of**, 1459. \*Warwick's father, the earl of \*Salisbury, supported the duke of \*York in 1459 when he rebelled against Henry VI. He marched from Yorkshire to join York, who was in Wales, near Ludlow. Royalist forces

mustered under Lord Audley at Market Drayton to prevent the junction and attacked Salisbury's men on Blore Heath, 3 miles east of the town, on 23 September. Audley was defeated and slain, and Salisbury joined York. The following year he fought on York's side in the defeat at \*Wakefield and was beheaded after the battle. JAC

**Blyton, Enid Mary** (1897–1968). Children's author. Born in East Dulwich (London), Blyton trained as a kindergarten teacher. Her first books, collections of poems in *Child Whispers* and stories in *The Enid Blyton Book of Fairies*, were published in 1922 and 1924. She edited a number of publications such as *Sunny Stories* and the *Enid Blyton Magazine*. Her wide range of books included a popular series of school stories beginning with *The Naughtiest Girl in the School* (1940) and the well-known 'Famous Five' and 'Secret Seven' adventures. Noddy and his Toyland friends became television personalities reproduced in numerous commercial products. A prolific writer, widely translated, her work has been severely criticized for its limited style, moral attitudes, and for perceived racist, sexist, and snobbish elements in the middle-class, privileged world of her stories, which nevertheless have been popular with children. AM

**Boat Race**. The Oxford and Cambridge universities' challenge race for eights was first rowed at Henley in 1829, with Oxford winning. It moved to London in 1836 and became an annual event in 1839. The race is over 4¼ miles from Putney to Mortlake. JAC

**Bodiam castle**, 15 miles north of Hastings (Sussex), has often been cited as a typical late medieval castle in which the defensive provision was secondary to domestic comfort. Its present appearance, a picturesque ruin surrounded by a wide moat full of water lilies, masks its serious military purpose. Built in 1385, at a time of threatened French invasion, to fortify the river Rother, which was at that time navigable by sea-going ships as far as Bodiam, the castle has wide water defences to keep attackers at a distance and to control access, and was one of the earliest castles to incorporate gunports. The main approach to Bodiam, via a causeway protected by a 90-degree turn, three drawbridges, a tower and barbican, in addition to a heavily defended gatehouse, is a prime example of the principle of multiple defence. As evidence of its importance, the castle was not slighted in the 17th cent. but maintained as part of the south coast defences against attack. LR

**Bodley, Sir Thomas** (1545–1613). Bodley, a benefactor to the University of Oxford, was born in Exeter. His family were protestants and took refuge in Germany and Switzerland during Mary's reign. Bodley was educated at Magdalen College, Oxford, and elected a fellow of Merton. About 1583 he became gentleman usher to the queen, probably through the patronage of \*Walsingham or \*Leicester. In 1584 he was returned to Parliament for Portsmouth and in 1586 for St Germans. Bodley was then employed on a number of diplomatic missions to Denmark, France, and Holland, returning to England in 1596. He was considered as a possible secretary of state but devoted the rest of his life to restoring the Duke Humphrey Library at Oxford. It was reopened in

## Boece

1602, and named after Bodley in 1604, when he was knighted. James I visited the new library in 1605. Bodley is buried in Merton chapel, where there is a monument. JAC

**Boece** (Boethius), **Hector** (c.1465–1536). Scottish historian. A contemporary of Scottish historian John Major, with whom he attended the University of Paris (c.1485), he became a professor at Montaigu College (c.1492–8). In 1498, Boece made the acquaintance of William Elphinstone, bishop of Aberdeen, who enlisted his aid for the establishment of a university (later King's College) where Boece became principal. His first publication was his lives of the bishops of Mortlach and Aberdeen, printed in Paris in 1522. His only other published work, the *History of Scotland*, was printed in 1527. It ranged from the earliest times to the reign of James III: a second edition, continued by Ferrerius, was published in Paris in 1574. This is the earliest history of Scotland with the exception of the summary work of Major. In 1530–3 it was translated into Scottish prose from the Latin by John Bellenden, archdean of Moray, at the request of James V. Prone to the legendary, it lacks credibility as a historical narrative. SMD

**Boer wars.** The first Boer War (1880–1) was hardly more than a skirmish, won by the Boers (Dutch-origin South African farmers) after a famous victory over a British force at \*Majuba on the northern frontier of \*Natal. That gave the Boer republics of the \*Transvaal and \*Orange Free State the independence they craved from the British empire, in most things except foreign policy. Britain accepted this while they were poor and backward. That soon changed, however, when the vast Witwatersrand goldfield was discovered in the Transvaal in 1886, offering untold riches to whichever power controlled it. In 1899 Britain went to war again against the Boers, and got it back. It would be too simplistic, however, to assume that this was out of mere cupidity.

Britain had other reasons for noticing the Boers' new wealth. One worry was that if it made them too powerful, they could threaten her supremacy in the rest of South Africa, possibly in league with Germany. The aftermath of the \*Jameson Raid fuelled that fear. The kaiser sent a telegram congratulating the Boer president for repelling the raid. Britain regarded that as unwonted interference in the one aspect of the Transvaal's affairs she had not surrendered control over. The republic was behaving cockily in other ways too. A lot was made of its slightly less liberal 'native policy' by comparison with Britain's, which had been one of the reasons for setting up the independent Boer states in the first place. There were also complaints of mistreatment of immigrant diggers ('uitlanders') in the goldfields, though these were mostly invented or exaggerated. Britain negotiated to ease these grievances, but possibly not genuinely. Her main agent in South Africa, \*Milner, seems to have wanted war. British troops were poured in. In the end, on 10 October 1899, it was the Boers who issued the ultimatum, but under provocation. Most foreign opinion saw Britain as the aggressor, an evil Goliath against the David who was pluckily standing up to his bullying.

David did surprisingly well initially. The first months of the war went disastrously against Britain, with the Boers

advancing deep into Natal and holding several British garrisons under siege. Only in May 1900 did the tide begin to turn, mainly through the sheer force of the numbers Britain could deploy. By October the Transvaal had been largely reconquered, Kruger, its president, had fled, and both republics were annexed to the British flag. Back in London the government used the opportunity to call a snap 'khaki' election, which it won. But the war was not over yet. The Boers continued a 'guerrilla' kind of warfare, which was only crushed in the end by a policy of methodical land-razing, farm-burning, and herding non-combatant Boers—mainly women—into unhealthy 'concentration camps'. In June 1901 \*Campbell-Bannerman, the Liberal leader, publicly attacked all this as 'methods of barbarism', which shocked patriots, but seemed to touch a wider chord.

When the last Boers eventually surrendered, in May 1902, most Britons were heartily sick of the war. They had won, but at a price. 5,774 Britons had been killed (more than on the other side), and 22,829 injured. The Boers had been beaten, but not bowed. In the treaty of \*Vereeniging (31 May) they stuck out in defence of their racial policies, and got their new masters to back down on that. Resentment continued to simmer, contributing to more Boer rebellions later, and South Africa's withdrawal from the \*Commonwealth in 1961. In Britain, the army's poor showing proved salutary, leading to a cessation of aggressive \*imperialism for a while, and a great national self-examination, especially of her 'decadence'. The war also boosted anti-imperialism. Overall, therefore, the Boer War was probably not a good one to have won. BJP

Nasson, B., *The South African War 1899–1902* (1999).

**Bohun, Humphry de, 3rd earl of Hereford** (c.1249–98).

Bohun succeeded his grandfather as earl of Hereford in 1275. As constable of England and one of the great marcher lords he was employed against Llywelyn and the Welsh. But he was one of the lords who became increasingly irritated by Edward I's incessant demands for military service and heavy taxation. In 1297 he and Roger \*Bigod, earl of Norfolk (constable and marshal respectively), refused to serve in Gascony unless the king was also present. Though deprived of his office, he had to be reinstated, obtaining confirmation of \*Magna Carta and the Forest Charter against arbitrary taxation. He took part in Edward's successful Scottish campaign in 1298 with some reluctance and continued friction with the king over the rights of the baronage meant that the victory at \*Falkirk was not followed up. He died at the end of that year. JAC

**Bohun, Humphry de, 4th earl of Hereford** (c.1276–1322).

Bohun succeeded his father as earl of Hereford and constable of England in 1298 when there was still considerable tension between Edward I and his leading barons. But in 1302 he married a daughter of Edward I, widow of John, earl of Holland. In the reign of Edward II, Bohun was a leading \*Ordainer and took part in the murder of \*Gaveston. He was taken prisoner by the Scots after the defeat at \*Bannockburn, but exchanged. His opposition to the \*Despensers in 1321 led him to take up arms with \*Thomas

of Lancaster, and he was killed at their disaster at \*Boroughbridge. JAC

**Bolingbroke, Henry St John, 1st Viscount** (1678–1751). St John was Tory MP for the family seat of Wootton Bassett (1701–8) and Berkshire (1710–12), secretary at war (1704–8), secretary of state for the northern department (1710–13) and for the southern department (1713–14). He was in charge of the negotiations for the peace of Utrecht (1713) ending the War of the Spanish Succession. In 1712 he had been, to his disappointment, created Viscount Bolingbroke, hoping to become an earl. This ‘snub’ contributed to the growing rift between him and Prime Minister Robert \*Harley, which effectively paralysed the Tory ministry. Dismissed office by George I he was impeached and attainted. He fled to France into the service of the pretender as his secretary of state, from which post he was also dismissed in 1716. He was pardoned and returned to England in 1723, and was restored to his estates in 1725, though barred from the House of Lords. Moving into opposition to \*Walpole, he provided much of the intellectual backbone to the ‘patriot’ and Tory parties with his philosophical and political writings, particularly in the *Craftsman*. He retired to France in 1735, and wrote essays on history, including his most famous work *Patriot King* (1738). CJ

**Bombay.** An island off the west coast of India originally in Portuguese possession. It was given to Charles II in 1661 as part of the dowry of \*Catherine of Braganza. In 1673, the English \*East India Company moved its west-coast station there from Surat. Initially, the town grew quickly, reaching a population of 60,000 by 1677. But it stagnated through the 18th cent. under the shadow of the Maratha empire on the mainland. Following the defeat of the Maratha Peshwa in 1818, Bombay city became the capital of a large presidency embracing Maharashtra, Gujarat, and Sindh. Its port thrived on trade to China and the Far East and was served by a cosmopolitan commercial community. From the 1860s, it began to develop as an industrial centre. By 1901 its population had reached 850,000, making it the third largest city in the British empire after London and \*Calcutta. DAW

**Bondfield, Margaret G.** (1873–1953). Trade union leader and first woman cabinet minister. Bondfield left school at 13 and became a shop assistant. She immersed herself in socialist politics, eventually joining the Fabian Society. Her first-hand knowledge of the plight of shop-workers assisted her promotion within the National Union of Shop Assistants, of which she became assistant secretary (1898), but she also identified with a number of feminist causes, including women’s suffrage and campaigns for maternity and child welfare schemes. Elected to Parliament in 1923, she served in the Labour government of 1924 as parliamentary secretary to the ministry of labour, and in the second Labour government (1929–31) as minister of labour. Her deep nonconformist outlook and her devotion to teetotalism were in part responsible for an increasingly conservative outlook on problems of unemployment and family welfare. She identified herself with the fiscal conservatism of Philip \*Snowden, and in August 1931 supported the cabinet’s de-

cision to cut unemployment benefit. At the general election, she lost her seat. GA

**Boniface, St** (c.675–754). St Boniface was possibly the greatest of early Anglo-Saxon missionaries. Named Wynfrith, trained in monasteries at Exeter and Nursling (Hants), he left England in 718, working first with \*Willibrord in Frisia before beginning his own work in Hesse and Thuringia as regional bishop. Appointed archbishop in 731 and ultimately papal legate, supported by Frankish rulers, he became a leading ecclesiastical figure in Europe. In 754 he returned to evangelize in Frisia, where he and his followers were killed by heathen robbers. In establishing an organized church under the authority of the pope, setting up sees in Bavaria, and effecting the reform of the Frankish church, he contributed to the extension of papal authority in Europe. His success depended on fellow Anglo-Saxons joining him, as bishops in new sees, monks, nuns, and teachers in new foundations, which, like his great abbey of Fulda on the borders of Hesse and Thuringia, became centres of English learning. Surviving correspondence shows Boniface engaged in formal consultation with the pope and leading Anglo-Saxon churchmen, in personal exchanges, particularly with nuns and abbesses who sent him books and vestments, and actively concerned about religious and moral affairs in England. AM

**Bonner, Edmund** (c.1500–69). Bishop of London. Born in Cheshire and educated at Broadgates Hall, Oxford, Bonner in turn loyally served \*Wolsey as his chaplain until his death and then, strongly anti-papalist, Henry VIII and Thomas \*Cromwell by courageously pleading Henry’s divorce (1532) and his appeal to the pope against excommunication (1534). Successively bishop of Hereford (1538) and London (1539), he was deprived and imprisoned under Edward VI for objecting to the new \*Book of Common Prayer (1549). He was restored by Mary (1553) to his London see, which was now enthusiastically puritan. Coerced by the court, he had to implement repression under the re-enacted medieval statutes. His contemporary description, ‘bloody Bonner’, was ill deserved, for the council accused him of leniency. To accompany repression with positive re-education, he published *Profitable and Necessary Doctrine* (1555–6). Deprived again by Elizabeth, he died in Marshalsea prison. WMM

**Book of Common Order.** Published (1564) as the Church of Scotland’s regulations for public worship. Its predecessor, brought from Geneva by John \*Knox (1559), possibly originated among English refugees in Frankfurt. Because a metrical psalter was added (1564), it was known as the ‘Psalm-book’. A Gaelic version was published (1567). Often revised since 1867, the Book’s 1940 version, incorporating insights of the modern liturgical movement, was perhaps the most progressive liturgy until the second Vatican Council (1961–5). Newer versions have appeared (1979 and 1994) affirming the centrality of the eucharist as the principal Sunday service. WMM

**Book of Common Prayer.** By a proclamation of 23 September 1548, Edward VI set up a commission of twelve bishops and clergy to oversee the preparation of ‘one uni-

## Book of Homilies

form order [of service] throughout the kingdom'. This 'Windsor Commission' (so-called from its meeting-place) seems to have refined and emended a draft prayer book prepared by Archbishop Thomas \*Cranmer, for the bench of bishops approved its work only a month later. The Act of \*Uniformity (March 1549) ordered the exclusive use of the new Book of Common Prayer from Whitsunday (9 June) that year. The Prayer Book contained morning and evening offices, and forms for the administration of the sacraments (e.g. baptism and the eucharist) as well as the psalter. It was a response to the desire of Cranmer and other reformers for a single, convenient provision for the public worship of the church in the vernacular. It drew heavily upon the work of the continental reformers as well as upon existing Latin service books.

After 1549, reformed ideas, particularly from Germany and Switzerland, rapidly gained ground among English scholars, and these were reflected in the Second Prayer Book, issued in 1552. This book was probably little used, as the accession of Mary I saw a temporary return to the older Latin services.

In 1559 a modified 1552 Prayer Book came into use under Elizabeth I, and this in its turn formed the basis of the 1662 book, which remained the norm of Anglican worship until the 20th cent. Attempts to revise the Prayer Book in 1928 were frustrated by Parliament, but since 1980 there has been an authorized *Alternative Service Book* in England. JRG

**Book of Homilies.** Published soon after the accession of Edward VI, though written five years before, the *Book of Homilies* contained twelve sermons composed by some of the leading reformers of the English church, including \*Cranmer and \*Latimer. The homilies were to be read to the people by the clergy in place of a sermon. By supporting justification by faith, ignoring teaching on the eucharist, and attacking some popular religious customs, they revealed the reforming sympathies of their composers. Contributions of more conservative scholars such as Bishop \*Bonner were confined to less contentious subjects, e.g. love and charity. JRG

**book of sports.** Sunday, the one non-working day in the week, was traditionally a time for recreation, but \*puritan clergy and local officials, equating it with the sabbath, kept it 'holy' by banning customary pastimes. This threatened to alienate public sentiment from the established church and to endanger social stability by dividing communities. In 1618, therefore, James I issued a declaration asserting the right of all persons to engage in 'lawful recreation' on Sundays after divine service. Charles I reissued this 'book of sports' in 1633, thereby further widening the gap between royal government and the 'godly'. RL

**Books of Discipline,** 1560, 1578. Both works expounded an ideal never fully realized. The *First Book of Discipline* (1560) was largely the work of the uncompromising Calvinist John \*Knox, a blueprint for the government of the reformed church in Scotland. It was heavily dependent upon the *Ordinances* of Calvin's church in Geneva, with which Knox was personally acquainted. The book's implementation was,

however, opposed by many of the Scottish nobility. Knox died in 1572 and three years later Andrew \*Melville, principal of Glasgow University, began drawing up a *Second Book of Discipline*, intended to purge the Scottish church of the last vestiges of episcopal government. JRG

**Boot, Jesse** (1850–1931). Boot was born in Nottingham, where his father, a Wesleyan lay preacher, ran a herbal medicines shop. Jesse followed in his father's footsteps. Their sales to co-religionists benefited from John \*Wesley's advocacy of herbal medicines. During the later 19th cent., Boot saw the advantages of meeting demands for mainstream medicine and employed a legally licensed pharmacist to dispense drugs in every shop. Retailing activities grew by offering a wide range of general items as well as Boot's own pharmaceuticals. The business became nation-wide by establishing branches and by purchasing chains of other retailers, for example Day's in the London area. In 1920 Jesse Boot sold the business to the American company Rexall. However, in 1933 the latter's financial difficulties enabled the Boot family to regain control. Currently the firm is an international corporation based in Nottingham. IJEK

**Booth, Charles** (1840–1916). Booth, a wealthy Liverpool shipowner and social investigator, refused to accept the findings of the \*Social Democratic Federation that about 25 per cent of the working population were living in poverty. He found that official statistics were substantially defective and began his own investigation using statistical techniques to come to accurate conclusions. Booth published seventeen volumes on the life and labour of London's poor between 1889 and 1903. His main finding was that the SDF estimate was too low: 30.7 per cent were living in poverty. Only 0.9 per cent were responsible for their own poverty: the main causes were inadequate wages and precarious employment. He drew a poverty line at £1.05 per week for a 'moderate family' and felt that the state should help the honest poor and, in particular, provide old-age pensions. Booth greatly influenced the practice of later social investigators and the Liberal government (1906–14). JB

**Booth, William** (1829–1912). Revivalist and founder of the \*Salvation Army. Of lower middle-class background, Booth joined the methodists in Nottingham and in 1844 was converted. After experience in several different methodist connexions (including a ministry in 1858 in the methodist new connexion) he rejected them all as too staid and middle class to reach the mass of people needing salvation. Strongly supported by his wife Catherine, also an active methodist, he set up a mission in London's East End in 1865, from which developed the Salvation Army. For some time Booth waged his holy war solely on the spiritual front; but experience showed that poverty was a great impediment to salvation, and in his book *In Darkest England* (1890) he outlined plans for social reform. Booth was extremely authoritarian and the military structure of the Salvation Army reflected his temperament. No theologian, he was at times anti-intellectual: 'do not argue, but pray,' he advised his officers. JFCH

**Boothroyd, Betty** (b. 1929). First woman \*Speaker of the House of Commons (1992–2000). Born in Yorkshire and educated at Dewsbury College of Commerce and Art, Betty Boothroyd was briefly a dancer with the Tiller girls before making a career in the Labour Party. She contested a number of seats from 1959 before election in 1973 for West Bromwich, transferring in 1974 to West Bromwich West. She served as deputy Speaker 1987–92 and was elected Speaker in 1992 with the support of 74 Conservative MPs. A remarkably successful Speaker, she was assisted by an imposing presence and a firm but conciliatory manner. Since 1994 she has been chancellor of the Open University. JAC

**Booth's rising**, 1659, was one of many attempts by royalists to overthrow the commonwealth regime. \*Penruddock's rising in Wiltshire in 1655 had failed completely but in 1659 Sir George Booth succeeded in rousing a substantial number of supporters in Cheshire to exploit the uncertainty following the death of Oliver \*Cromwell. Anticipated risings elsewhere failed to get off the ground and John \*Lambert crushed the rebels without difficulty at Winnington bridge on 19 August. Booth was imprisoned in the Tower but released in 1660 and formed part of the deputation sent to Breda to beg Charles II to return. He was created a peer in Charles's coronation honours. JAC

**Borders**. From 1973, an administrative region of Scotland, comprising the counties of Berwick, Peebles, Roxburgh, and Selkirk and a small part of Midlothian; these counties together, historically, formed much of the frontier zone facing England. From 1973 to 1996 it shared local government functions with its districts of Berwickshire, Ettrick and Lauderdale, Roxburgh and Tweeddale, but in 1996 it became an all-purpose local authority. A hilly area, its economy has continued to be dominated by sheep-farming and textile-manufacturing and services, with a growing presence of tourism attracted by its legends (perpetuated in the border ballads), its castles and abbeys, its peaceful countryside, and its small towns. CML

**Borneo, North**. North Borneo is ethnologically part of the southern Philippines. Although the Spanish touched the region in the 16th cent., it was not until Alexander Dalrymple's expedition of 1759 that it was connected to the outside world. The \*East India Company opened and closed several settlements and, in 1846, Labuan was occupied as a crown colony. In 1877 the British North Borneo Company began to move inland and, effectively, to establish a government. The Japanese invasion of 1941–2 ended this informal arrangement and eventually led to crown colony status in 1946. Representative government and membership of the Malaysian Federation followed in 1963. DAW

**Boroughbridge, battle of**, 1322. \*Thomas of Lancaster and the earl of Hereford (\*Bohun), in rebellion against Edward II and the \*Despensers, retreated into Yorkshire to join the Scots. At Boroughbridge, on 16 March 1322, they found the crossing of the Ure blocked by a strong force of infantry and archers commanded by Sir Andrew Harcla, sheriff of Cumberland. Hereford was killed and Lancaster, who sur-

rendered, was executed for treason. Harcla, created earl of Carlisle, enjoyed his new honours for only a year, hanged by Edward in 1323 for treasonable contacts with the Scots. JAC

**borough English** was the custom that lands should descend to the youngest son or daughter, or, in default of issue, to the youngest brother of the deceased. Also known as ultimogeniture, it was therefore the opposite of primogeniture, the more widespread convention. The name originated from a case in Nottingham in 1327 when the English borough, or part of the town, held to ultimogeniture, the French (Norman) part to primogeniture. In fact it was not particularly common in boroughs. It was found more especially in the south-east and not at all in the north. The origin and intention of the custom has been much discussed but scarcely illuminated. Even \*Maitland is less persuasive than usual, suggesting that the youngest is the 'hearth-child' and that the custom may be a trace of an ancient religion centred on the hearth. It survived in some places until 1925. JAC

**boroughs**. The word 'borough' ('burgh' in Scotland) has caused endless confusion in British history through its changing meanings and through its relationship to other terms for urban settlements. The Old English (Anglo-Saxon) terms *burg*, *burh*, and *byrig* were used originally for fortified places, including villages and royal halls. By 1086, however, \*Domesday Book was using the word, in its Latin form *burgus*, to mean 'town', whether fortified or not, and was referring to its inhabitants as *burgenses* (burgesses), or at least to those who paid their share of borough dues. In the 12th cent. burgage tenure came to be seen as the normal characteristic of an English borough: each burgess held a burgage, usually a house with little other land, for a money rent. In the 13th cent. the larger towns developed rules to define who were 'free burgesses' (or, in cathedral towns, citizens), and to ensure that burgesses, the only townspeople with political rights, were defined as those who were sons (or sometimes widows or daughters) of burgesses, who had served an apprenticeship, or had paid a fee. These rules were enforced in many towns until the 17th and 18th cents., ensuring that a restricted proportion of the urban population (mostly male) were the only ones who could run businesses and elect municipal officials and councillors.

Between the 13th and 17th cents., as many towns grew in importance and acquired privileges from the crown or from their lords, 'borough' developed multiple meanings. From the late 13th cent. royal officials tended to confine the word 'borough' to the more privileged urban places, and to distinguish certain boroughs as having separate juries for the administration of justice; they have been called 'juridical boroughs'. Others, not always the same, have been termed 'taxation boroughs' because they paid royal taxes at different rates from other towns and rural settlements, especially after 1334. Finally, sheriffs in the 13th and 14th cents. had to choose which places in their counties were suited to be represented in parliaments: these are often called 'parliamentary boroughs', though the concept is a later one. By the 16th and 17th cents. 'borough' was being used chiefly in two senses: as a legally corporate town, usu-

## Boscawen

ally with privileges granted by royal charters, and as a town which sent members ('burgesses') to Parliament. Most important towns were both by the 17th cent., but a few places without chartered privileges were parliamentary boroughs (e.g. Gatton), while some important and growing towns were not represented in Parliament, and either had no borough privileges, or had lost them after having enjoyed them in the Middle Ages (e.g. Birmingham and Manchester).

The problem had become one of fossilized and self-perpetuating rights: the crown could create new boroughs in both senses, but rarely chose to disfranchise those old boroughs which had ceased to be important. Furthermore, corporate boroughs often changed their regulations to ensure self-perpetuating and unelected bodies of aldermen and councillors, while the crown was concerned to ensure that they also returned conformist members of Parliament. After the Restoration commissioners appointed under the \*Corporation Act remodelled many urban corporations, and many more were remodelled by new charters imposed by the government in 1681–8. These charters were cancelled after the revolution of 1688, which reintroduced the old system in all its variety, and it remained intact throughout the 18th cent. while the anomalies between boroughs and other towns became more glaring.

Modern boroughs begin with the 1830s. The 1832 \*Reform Act revised the parliamentary franchise, both in terms of which boroughs were represented and of who was entitled to vote. In 1835 the \*Municipal Corporations Act dissolved the corporations of nearly 200 boroughs, and replaced them by councils elected by ratepayers. New places were incorporated as boroughs, such as Birmingham and Manchester in 1838. Successive Acts since the 1830s have continued to revise the numbers and areas of boroughs in both senses, and in 1888–9 many larger boroughs or burghs were excluded from the new county councils and made all-purpose authorities (county boroughs in England and Wales, counties of cities in Scotland). Since the 1974–5 reorganizations of British local government, the title 'borough' has also been applied to some districts which are more rural than urban (e.g. east Yorkshire and north Bedfordshire). The semantic confusions of the word clearly continue. DMP

**Boscawen, Edward** (1711–61). Boscawen was a younger son of Viscount Falmouth. He went to sea at 14 and was given his first command in 1741. Wounded in the action off \*Cape Finisterre in 1747, he was promoted admiral—the youngest in the navy—and sent in charge of an expedition to India. From 1742 until his death he was MP for Truro, and from 1751 a lord of the Admiralty. In 1758 he commanded the naval force sent to take Louisbourg, and the following year was dispatched to the Mediterranean to prevent a French squadron at Toulon joining a Channel invasion fleet. In August he pursued the squadron of seven ships under de la Clue into \*Lagos Bay in Portugal and destroyed it. Boscawen was a determined and pugnacious sailor and, though a stern disciplinarian, was noted for the attention he paid to the health of his men. JAC

**Boston**, on the river Witham in Lincolnshire, was once one of the greatest English ports. It became a town only after

1066, but rapidly flourished by exporting wool. In the 13th cent. it paid more tax than any port except London, and was home to one of England's international fairs. It declined in the 15th cent., but was still enough of a port to send emigrants to America in 1630, giving its name to the state capital of Massachusetts. It is still dominated by the medieval church of St Botolph ('Boston stump') with its 272-foot tower, 'the most prodigious of English parochial steeples' (Pevsner). DMP

**Boston 'massacre'**, 1770. The 'massacre' resulted from the clash, probably engineered by radical elements, between British troops, who fired without orders, and an urban crowd, on 5 March 1770 in Boston (Mass.). Three persons were killed and two later died from wounds. Its propaganda value was quickly utilized, notably by Paul Revere, the engraver; radical patriots, who controlled the Boston town meeting, used traditional arguments against redcoats and 'standing armies' to force the withdrawal of troops to an island fort. In an ensuing trial, the soldiers and their officer were acquitted of manslaughter. The incident alarmed moderate colonial opponents of British measures as well as the British government. RCS

**Boston Tea Party**, 1773. This marked a distinct stage on the road from resistance to insurrection in North America. The unpopular tea duty was continued after the repeal of the other \*Townshend duties. In 1773 the East India Company was allowed to export dutied tea directly to America. The patriotic leadership in Boston failed to gain undertakings that tea would not be landed. A group of men disguised as 'Mohawks or Indians' 'emptied every chest of tea' on board three ships into Boston harbour on 16 December 1773. This unchecked attack on British property provoked the \*'Intolerable Acts' of 1774. RCS

**Boswell, James** (1740–95). Writer. Educated at Edinburgh High School and Edinburgh University, the son of Lord Auchinleck, Boswell owes his significance to the writer and poet Samuel \*Johnson. Their friendship enabled him to write *Life of Johnson* (1791) as well as *Journal of a Tour to the Hebrides* (1785). Boswell's non-Johnsonian literary achievement was his *Account of Corsica* (1768). The *Life* is a milestone in English literature. It provides witty yet profound insights into one of Britain's finest writers and a strong flavour of 18th-cent. society. The power of Johnson's personality shines through every page. However, Boswell and Johnson met for the first time only in 1763 with the latter already in his fifties, and though they had a strong friendship, they were not as inseparable as the *Life* may suggest. Boswell was a vain man who found it difficult to control his emotions, being prone to depression, drink, and whoring. He was a fame hunter, obsequious to his targets (notably Corsican General Paoli, the reckless politician John \*Wilkes, and Johnson), but occasionally rude and haughty to those he considered 'lesser men'. He lacked sufficient dedication to be a successful lawyer and his hopes of entering Parliament were never realized. Without Johnson, Boswell's life would have been one of high but unfulfilled aspirations. AIL

**Bosworth, battle of**, 1485. Richard III's usurpation of the throne of his nephew Edward V was challenged by Henry Tudor, the future Henry VII, whose own remote claim came through his descent from \*John of Gaunt. Henry landed at Milford Haven and advanced by way of Shrewsbury and Lichfield. Richard concentrated his forces at Leicester where he could watch events. The armies met on open ground on 22 August near Market Bosworth, 11 miles west of Leicester. Richard chose a strong position on Ambien hill, but his considerable superiority in numbers was offset by the defection of Lord \*Stanley and his brother and the inactivity of the earl of \*Northumberland, who commanded the royalist rearguard. Richard was cut down fighting on foot and his body slung on horseback for burial at Grey Friars, in Leicester. JAC

**Botany Bay**, discovered on 29 April 1770 by Captain \*Cook, who first named it Stingray Bay, later Botanists' (Harbour and Bay), and finally Botany Bay in his journal, probably to honour the botanists aboard HMS *Endeavour* led by Sir Joseph \*Banks as well as to mark its floral novelties. Banks later (1786) advocated Botany Bay as an ideal place for a penal colony on account of its supposed fertility. The first fleet under Captain Arthur Phillip landed there on 20 January 1788 and, finding Banks's account much exaggerated, moved on to Port Jackson, landing there at Sydney Cove. Nevertheless, the name Botany Bay became synonymous with Australia, first as a convict settlement, and later as a generic name for fine-quality Australian yarn. Today much of the shores of Botany Bay are taken up with Sydney's southern suburban residential development. Botany Bay is also the site of Sydney's (Kingsford-Smith) international airport. MJW

**Bothwell, James Hepburn, 4th earl of** (c.1535–78). Bothwell's grandfather perished at Flodden. The family influence was in Liddisdale and the south of Scotland. He succeeded as earl in 1556. Though a protestant, he was at first a supporter of \*Mary of Guise and strongly anti-English. He had no part in the murder of \*Rizzio, and as relations between Mary, queen of Scots, and \*Darnley deteriorated, he became close to the queen. In 1567 events moved to a melodramatic climax. In February, Bothwell was the chief instigator of the murder of Darnley, blown up at Kirk o' Field. On 7 May he was divorced, on 12 May created duke of Orkney, and on 15 May married to Mary at Holyrood palace. The marriage lasted no more than a month. Outraged at his elevation, his enemies confronted him. Mary and Bothwell fled to Borthwick castle, from which Bothwell escaped, but after the encounter at \*Carberry Hill on 15 June, they parted for ever—Mary to captivity in Lochleven castle, Bothwell to Orkney and Shetland. Thence he fled to Norway, under Danish rule. The king of Denmark resisted appeals to extradite or execute him but as a useful pawn, he was kept in prison, first in Malmö, then in Dragsholm on Zealand, where he died insane. His embalmed body is preserved in a crypt in the church at Faarveje nearby. Bothwell's rough wooing may have appealed to Mary, neither of whose previous husbands were powerful men—she would 'go with him to the world's end in a white petticoat', she was re-

ported to have said. Bothwell's behaviour does not suggest high intelligence—kidnapping or offers of single combat were his mainstay—and his brief spell at the top suggests Mary's folly rather than his ability. JAC

**Bothwell, Francis Stewart, 1st earl of** [S] (c.1563–c.1612). Stewart was the nephew of the 4th earl, who was the third husband of Mary, queen of Scots, and a grandson of James V. His uncle having died in Denmark in 1578, Stewart was created earl of Bothwell in 1581 and in 1583 appointed lord high admiral. Though a strong supporter of the reformed religion, his behaviour was as turbulent as that of his uncle. In 1588 his men killed Sir William Stewart in an affray in Edinburgh. For a time he remained a favourite with James VI and was appointed joint governor of the realm when the king went to Denmark to fetch his bride. But the following year he was accused of consulting witches about the king's death and stripped of his offices. In retaliation, Bothwell raided Holyrood palace in December 1591 to seize the king, but failed. He tried again in July 1593 at Falkland and once more failed. Meanwhile the king's efforts to capture Bothwell had also failed. Next Bothwell forced himself into the king's presence to beseech pardon and in April 1594 there was another confrontation at Leith, which decided nothing. But having lost the support of the kirk, Bothwell fled to France in 1595 and spent the rest of his life abroad in poverty. The association with his uncle's murder of James's father \*Darnley and the connection with witchcraft go far to explain James's terror, but Bothwell's actions appear to be purely factious and random. JAC

**Bothwell Bridge, battle of**, 1679. After the murder in May 1679 of Archbishop James \*Sharp of St Andrews, a zealous episcopalian, the \*covenanters rose in the south-west. They defeated John Graham of Claverhouse (Viscount \*Dundee) at \*Drumclog on 1 June and occupied Glasgow, but were routed by James, duke of \*Monmouth, at Bothwell Bridge on the Clyde on 22 June. JAC

**Botswana.** Former British protectorate of Bechuanaland. British influence in the region was established by representatives of the \*London Missionary Society and traders operating northward from Cape Colony in the early 19th cent. Its importance in British eyes was as the road to the interior of Africa from the Cape, but it was not until pressure from the Boers of the South African Republic (\*Transvaal) to the east and the establishment of a German colony to the west threatened that road that the British government declared a protectorate in 1885. South African claims to the territory were resisted and it became independent in 1966. KI

**Boudicca.** British queen of the \*Iceni tribe. Boudicca made her mark on history by leading the British rebellion against the Romans in AD 60/1, which came close to driving them out of Britain. Her husband Prasutagus had become a client king of the Romans at the time of the invasion, and the arrangement had survived the succession of Nero in AD 54. However, when Prasutagus died in AD 60 the Romans decided to incorporate his kingdom into the province of Britain. The take-over seems to have been badly handled and, according to the Roman historian Tacitus, ended up

## Boulton

with Boudicca being flogged and her two young daughters raped. The rebellion which she instigated was joined by the Iceni's neighbours, the \*Trinovantes, and by other disaffected British tribesmen. They captured and destroyed the new Roman colony at \*Colchester, repeated their success at the flourishing port of \*London, and then settled old scores by destroying \*Verulamium, the capital of their traditional foes the \*Catuvellauni. The Roman governor \*Suetonius Paulinus eventually managed to assemble a large enough force somewhere in the midlands on the line of \*Watling Street to take on the rebels in a pitched battle. The British were defeated and the rebellion collapsed. Boudicca died shortly afterwards, by her own hand according to Tacitus. Of Boudicca herself we know little, although Dio Cassius describes her as tall and severe, with long fair hair, a penetrating gaze and a rasping voice. She seems to have been no figurehead but a formidable leader. KB

**Boulton, Matthew** (1728–1809). Birmingham entrepreneur and engineer. Boulton developed his father's button and stamping business from 1759, applying a dowry to establish his new Soho Works (1760–2). Like his associate \*Wedgwood, he integrated manufacturing with mercantile functions and a coherent marketing approach to his products. Already chronically short of water power by 1771, he acquired a two-thirds share of \*Watt's 1769 patent (1773), and entered partnership (1775), managing the business and the defence of patent rights. Their new engine (1776) particularly suited Cornwall, where coal was expensive, and 40 per cent of their reciprocating horsepower had been installed by 1800. Their distinctive rotative engine was complete by 1787, and 4,000 horsepower was in use by 1800, over half in Lancashire, Staffordshire, London, and Yorkshire. They joined the Albion Flour Mill project (1784), and centralized production in their new Soho Foundry (1796). As the partnership ended, Boulton applied steam to minting at Soho (c.1800) and the Tower (1805), and exported mints to Russia, Denmark, and Brazil (1800–11). JCh

**boundary commission.** Redistribution of parliamentary constituencies had always been accompanied by accusations that they were made for party advantage, but movements of population, particularly in the 20th cent. from city centres to suburbs, meant that readjustment of boundaries was a constant need. The problem was tackled by the Redistribution of Seats Act of 1949 which set up four permanent boundary commissions, for England, Scotland, Wales, and Northern Ireland, to review and report regularly. The chairmanship was to be taken by the Speaker. Schedule 2 of the Act defined the rules the commissions were to follow and laid down that each constituency should have one MP. JAC

**Bounty, HMS.** A 215-ton armed vessel, originally the *Bethia* but renamed after extensive alterations and refitting at Deptford (1787) for a specific mission to transport breadfruit trees from Tahiti in the South Seas to the West Indies. She was small, overcrowded, and undermanned, so fragile discipline contributed to mutiny by some of the crew under the leadership of master's mate Fletcher Christian, near Tonga (28 April 1789); Captain William \*Bligh and eighteen

loyal crewmen were set adrift in the long boat. The mutineers sailed eastwards, to settle eventually on Pitcairn Island (1790), where the *Bounty* was stripped and then burned. ASH

**Bourchier, Thomas** (c.1410–86). Archbishop of Canterbury. A great-grandson of Edward III, Bourchier became chancellor of the university and bishop of Worcester while studying at Oxford. Because of his 'great blood', he was chosen as archbishop in 1454 by the baronial council ruling during Henry VI's insanity. He welcomed the Yorkist descent on London in 1460, and was one of the nobles who agreed to Edward IV's assumption of the crown. He probably applied himself to his pastoral duties, for he held no political office (apart from a short term as chancellor in 1455–6) and seemed ready to accept *force majeure*, crowning both Richard III and Henry VII. From 1473, Bourchier was the first archbishop of Canterbury to hold the title of cardinal. RLS

**Bourges, treaty of**, 1412. This agreement between \*Henry IV, king of England, and a group of French lords headed by the duke of Orléans arose out of the French civil war. In return for Henry's aid against the Burgundians, Orléans was prepared to accept English claims to sovereignty over the duchy of Aquitaine. Henry duly dispatched an army of 4,000 under his second son, Thomas, duke of \*Clarence, in July 1412, but as the Orléanists had meanwhile come to a temporary peace with Burgundy, the terms of the treaty were never fulfilled. AC

**Bouvines, battle of**, 1214. On 27 July 1214 was fought one of the most decisive battles in European history. Near Bouvines (Flanders), the army of Philip II 'Augustus', king of France (1179–1223), crushed the forces of the coalition ranged against him: an expeditionary corps from England, dispatched by King John under the command of William Longspee I, earl of Salisbury; the detachments of Rhineland princes beholden to John through English silver; and Otto of Brunswick, John's nephew and Holy Roman emperor, eager to destroy Philip since he supported Otto's rival for the imperial throne, Frederick II of Hohenstaufen. Philip's victory laid open the way to Hohenstaufen dominance in Germany and Italy, confirmed the Capetian gains made at John's expense in Normandy, Anjou, and elsewhere in the years 1202–4, and set John upon the road to Runnymede and \*Magna Carta. SL

**Bower, Walter** (d. 1449). Author of the *Scotichronicon*, and abbot of Inchcolm (1417–49). He was born in Haddington in east Lothian (1385), entering St Andrews cathedral priory as a youth, and probably graduated from St Andrews University shortly after its foundation (1410). As abbot of Inchcolm he promoted the revival in interest in Scottish saints at his abbey, dedicated to \*Columba. He was intimately involved in government in the reigns of James I and II, administering collection of taxes raised for James I's ransom in 1424, and attending parliaments and general councils as late as 1445.

He is best remembered for the *Scotichronicon*, a Latin chronicle of Scotland composed in the 1440s, based on Fordun's 14th-cent. chronicle, but altering and continuing it to the death of James I. Bower's intimate knowledge of

the contemporary government and church makes the *Scotichronicon* an invaluable source for late medieval Scotland. RJT

**bowls** is one of the oldest and most popular of all sports and like many others blossomed in late Victorian Britain: London, which had only one municipal green in 1895, had 76 by 1907. The modern game developed when biased bowls were brought into use, permitting considerable tactical play. Hereford has a bowling green within the city walls which is said to date from the 15th cent. and to be the oldest in existence: James IV of Scotland had a green at Holyrood palace in the early 16th cent. Standard rules were drawn up in 1848–9 by W. W. Mitchell, a Glasgow solicitor, and were widely accepted. The Scottish Bowling Association was formed in 1892, the English in 1903, and the International Board in 1905. Crown green bowls, played on a convex green, was popular in the midlands and north. By 1914 there were said to be 600,000 crown green players in the north of England, competing for considerable money prizes. The English Bowling Association, strong in London and the south, remained resolutely amateur. Indoor bowls has made much progress in recent years, partly through the advent of television. JAC

**Bow Street runners** were constables attached to the Bow Street Police Office. Professional thief-takers had been established there by the magistrate Sir John Fielding in the mid-18th cent., but were too few to cope with escalating crime. Seven police offices were established in London in 1792 on the Bow Street pattern, though for defined districts; the unlimited jurisdiction of Bow Street enabled its six 'runners' to range widely and gain prestige for their vigilance and detective skills. Valuable public servants but poorly paid, hence increasingly corrupt, they were superseded by the Metropolitan Police Act (1829). ASH

**Boxer Rising**, 1900. The spread of European influence led to strong anti-foreign feelings in northern China. Encouraged by Dowager Empress Tzu Hsi, young Chinese formed an organization called the Society of Harmonious Fists or 'Boxers'. They attacked converts to Christianity, missionaries, and workers on foreign-controlled railways. British Admiral Seymour led reinforcements to safeguard foreign nationals but was fired upon from the forts at Taku. On 20 June a Boxer uprising occurred in Peking where the German minister, Baron von Ketteler, was killed and other foreign legations besieged. A six-nation force landed at Tientsin on 14 July and marched 80 miles north-west to relieve Peking on 14 August. RAS

**boxing** developed from uncontrolled encounters, in which wrestling, kicking, gouging, biting, hair-pulling, and kicking opponents when down were practised. Early prize fights went on until one of the combatants could not continue: Mendoza fought Henry Lee over 53 rounds in 1806. James Figg in the 1720s was hailed as the champion of All England and his protégé Jack Broughton tried in the 1740s to introduce some elementary rules, such as rounds. By 1838 London Prize Ring rules were in use, with a roped-off ring. The Queensberry rules from 1867 onwards took some time to

establish themselves: they included padded gloves, 3-minute rounds, and a 10-second knock-out. Weight divisions were gradually introduced where previously heavyweights had dominated. The Amateur Boxing Association was set up in 1880 and boxing was brought into the Olympic Games in 1904. In professional boxing, the British Board of Control has supervised since 1919, though international authorities have proliferated. The introduction of radio and then television has vastly increased the purses which boxers can command. JAC

**Boycott, Charles Cunningham** (1837–97). Boycott came from Norfolk and after a career in the army retired as a captain. He was engaged in 1873 as land agent by Lord Erne for his Mayo estates. In September 1880 at Ennis, \*Parnell announced a new policy of ostracizing an opponent of the \*Irish Land League 'by putting him into a sort of moral Coventry . . . as if he were a leper of old'. Boycott was an early victim and the following month his crops had to be harvested by Orange volunteers, protected by hundreds of police and military at great cost. John \*Dillon used the phrase 'boycotting' on 17 November in a speech at Cashel and it was reported in *The Times*. The verb made its way into French, German, and Russian, as well as English. JAC

**Boyd, Robert, Lord** [S] (d. c.1482). Created Lord Boyd (1452), he took a minor role in government until orchestrating his family's seizure of the young James III at Linlithgow (July 1466). He was subsequently politically ruthless, excluding his brother Alexander from power, and appointing himself governor of the persons of the king and his brothers (October 1466). He pursued a policy of self-aggrandizement, elevating his son to the earldom of \*Arran, and marrying him to Mary, the king's sister, a deeply unpopular action (1467). He successfully arranged the treaty of Copenhagen (1468), by which the king married \*Margaret of Denmark, and the Scottish crown eventually gained possession of Orkney and Shetland. However, the Boyd faction's hold on power remained tenuous, and they were ousted while Boyd was in England (1469). Forfeited by Parliament (1469), Boyd fled to Bruges and later England (1471), following a failed attempt to return to Scotland. RJT

**Boyle, Robert** (1627–91). Famous for his work on air pressure, Boyle was the youngest son of the 1st earl of Cork. After Eton, he went on a grand tour in 1639–44, and during the 1650s belonged to the 'invisible college', so called because they never all met together at once, associated with John \*Wilkins at Wadham College, Oxford. Crucial in the \*scientific revolution in England, this was a nucleus for the \*Royal Society, in which, though very important, Boyle would never take office. With Robert \*Hooke in Oxford he made and experimented with an air pump, and hit upon the law of gas pressure, discovering a new variable. A godly man who brought prestige to natural philosophy, he was a great advocate for a version of the atomic, or *corpuscular*, theory of matter: having been impressed by the Strasbourg clock, he sought mechanical explanations of all phenomena. DK

**Boyne, battle of the,** 1690. James II's attempt in the summer of 1689 to reassert his rule over all Ireland faltered on the resistance of \*Derry and Enniskillen. The Williamite victory at \*Newtown Butler in July 1689 was the start of the counter-attack. Derry was relieved the following day and \*Schomberg landed on 13 August. In June 1690 William III arrived to take personal command and began his advance south. The Jacobites decided to give battle on the line of the Boyne, 30 miles north of Dublin. When they met on 1 July, James's army was some 25,000 strong, William's a little more. William hoped to outflank his opponents by crossing the river to the west towards Rosnaree, but the attack bogged down. In the end, the day was decided largely by a frontal assault across the Boyne, with the advantage of numbers beginning to tell. The Jacobites managed an orderly retreat and William's forces were in no condition to pursue. Though casualties were not heavy, the outcome was decisive. Schomberg was killed in action; William was in Dublin for a Te Deum on 6 July; James, explaining rather unnecessarily to his supporters 'I do now resolve to shift for myself', was safe on board a boat at Duncannon within two days. JAC

**Boys' Brigade.** Founded by William Alexander Smith in Glasgow in 1883. Smith started the brigade as a means of controlling the boys who attended his Scottish free church Sunday school. He sought to use military drill and discipline for the religious and moral improvement of the boys. The first meeting was held on 4 October 1883 in the Mission Hall, North Woodside Road, Glasgow. The crest of the brigade was an anchor and its motto 'Sure and Steadfast'. The uniform consisted of a 'pill-box' cap, belt, and haversack. During the 1890s the organization spread across Scotland and then into England. It remained primarily a religious organization despite the efforts of the War Office to incorporate the brigade into a national cadet force administered by the Territorials. The appeal of the brigade has been reduced in the modern era by alternative leisure interests for youth. RAS

**Boy Scouts.** Youth movement founded by \*Baden-Powell in 1908. Baden-Powell was inspired to establish the Boy Scouts by the interest shown in his army training manual, *Aids to Scouting*, by younger boys and by the example of the \*Boys' Brigade. He held a trial camp on Brownsea Island in Poole Harbour from 29 July to 9 August 1907. It mixed boys from different social backgrounds and split them into small units of five, each with its own leader, to promote independence and self-reliance. The camp was a success and the following year Baden-Powell established the Boy Scouts, with the financial aid of Sir C. Arthur Pearson, and wrote *Scouting for Boys*. Groups sprang up all over the country and within two years there were 100,000 members. His aim was 'to counteract if possible the deterioration moral and physical which shortened our rising generation, and to train the boys to be more efficient and characterful citizens'. Scouting was accused of simply being military training under a different name but Baden-Powell placed emphasis on personal development, with the motto 'Be Prepared'. Unlike the Boys' Brigade, he did not believe in drilling boys as it destroyed

individuality and dulled enthusiasm. Scouting had an imperial influence, as Baden-Powell explained: 'Scoutcraft includes the qualities of our frontier colonists, such as resourcefulness, endurance, pluck, trustworthiness etc.'

Other branches were added to the organization; the Wolf Cubs in 1914, the Rover Scouts in 1919, and the Beavers in 1982. In 1920, at London Olympia, a Jamboree was held consisting of Scout troops from around the world. It was here that Baden-Powell was named Chief Scout of the World. Today the movement has spread to 150 countries and has around 16 million members. See also GIRL GUIDES. RAS

**Bracton, Sir Henry** (c.1210–68). Bracton, 'the flower and crown of English' Jurisprudence' (Maitland) and one of the greatest writers on the common law, was born in Devon and became the dean of Exeter cathedral, where he is buried. He served during the reign of Henry III as a justice in Eyre and a justice of King's Bench, but his fame rests on his great work *De legibus et consuetudinibus Angliae* ('On the Laws and Customs of England'). This remarkable work is one of the most important books in English legal history. It was much influenced by notions of canon law and Roman law, which at this time was being 'received' in many European countries. But Bracton's authorship of *De legibus* is now doubted and it has been suggested that most of the book was written by others, and merely revised by Bracton himself. MM

**Braddock Down, battle of,** 1643. Parliament and the king were still contending for local supremacy in the south-west in the early days of 1643. At Braddock Down, near Liskeard, on 19 January 1643, Sir Ralph \*Hopton defeated a parliamentary force, taking 1,250 men and all their guns. JAC

**Bradford.** In medieval times, \*York and \*Hull were the chief Yorkshire towns. Though Bradford received a charter as early as 1251, it remained a cloth town of local importance: a fulling mill is recorded for 1311. \*Leland, visiting in the 1530s, thought it a 'praty quik market toune' (busy), 'standing much by clothing', the same size as \*Leeds, but only half the size of Wakefield. During the 17th cent. it lost ground. Celia Fiennes in the 1690s did not mention it and \*Defoe in the 1720s ignored it, though he devoted a long description to Leeds. Its revival was due to the development of the worsted trade and the growth of the canal network. Bradford canal, completed in 1774, and the link to the Leeds and Liverpool canal (1777), gave access to the east and west coasts. By the early decades of the 19th cent., Bradford had begun its prodigious growth. In 1832 it was given two MPs, elected its first borough council in 1847, and by 1851 was the seventh largest town in the country, with a population of well over 100,000. From 1846 onwards it was also joined to the rapidly growing railway system, via Leeds. Two remarkable Bradford entrepreneurs were S. C. Lister and Titus \*Salt. Lister, son of Bradford's first MP, was an inventor and mill-owner, gave Lister Park to the borough, and finished as Baron Masham. Salt developed in the 1850s the extraordinary community of Saltaire, round the great mill—an influential example of early town-planning. In

the 20th cent. Bradford was less well served. It suffered comparatively little from the attentions of the Luftwaffe but severely at the hands of post-war town planners. Many evocations of Edwardian Bradford, when wool was still king, are to be found in the works of J. B. Priestley, particularly *Bright Day*, a threnody for 'Bruddersford' trams. JAC

**Bradford, diocese of.** The see was created in 1919 out of sections of the \*Wakefield and \*Ripon dioceses, to accommodate the increasing population in this heartland of the woollen industry. It comprises parts of western Yorkshire and a small area of Lancashire. Among notable bishops were A. W. F. Blunt (1931–55), whose address to his diocesan conference on 1 December 1936 began the chain reaction culminating in Edward VIII's abdication. Roy Williamson (1984–91) was noted for his interfaith work and community relations. The cathedral is the former 15th-cent. parish church with 18th-cent. fittings and notable modern extensions (1953–65). WMM

**Bradford on Avon,** Anglo-Saxon chapel of St Laurence. This small but ambitious Wiltshire building has a lofty nave from which low arches lead into a square-ended chancel, a north chapel, and a now-destroyed southern chamber. Its masonry is of very high-quality ashlar which is elaborately decorated externally with pilaster strips, string courses, and blind arcading. These features, together with the manuscript analogues for the carved angels above the chancel arch, suggest a Late Saxon construction date; the recorded grant of the minster to Shaftesbury nuns in 1001 would provide an appropriate context. RNB

**Bradlaugh, Charles** (1833–91). Radical, atheist, and republican lecturer and journalist. Born in London, he rose from solicitor's clerk and part-time \*Secularist lecturer to become one of the most formidable public speakers and unofficial legal advocates in Victorian Britain. He owned and largely edited the *National Reformer* from 1862, formed the National Secular Society in 1866, and launched the National Republican League in 1873. New heights of notoriety were achieved with the republication and prosecution of the 'Knowlton Pamphlet' with Annie \*Besant in 1877. In 1880 he was elected to Parliament for Northampton, but as an avowed atheist was not allowed to take the oath of allegiance. His attempt to secure entry to the Commons, not successful until 1886, made him the leader of democratic opinion in Britain. In Parliament, he took a special interest in Indian affairs and gained some credit for his resolute opposition to socialism. ER

**Bradshaw, John** (1602–59). President of the High Court of Justice which tried and condemned Charles I to death. An undistinguished lawyer, Bradshaw may have been selected because he had assisted John \*Lilburne in his judicial appeal in 1645, and because none of the leading judges would act. At the trial he found himself out of his depth. Discomfited by the king's challenge to the court's legality, Bradshaw twice ordered him removed. At the end of the trial, after sentencing Charles as a 'tyrant, traitor and murderer', he denied the king's request to be heard. Elected president of the \*Council of State, Bradshaw nevertheless challenged

\*Cromwell's right to dismiss the \*Rump Parliament in 1653. A committed republican, he continued to be a thorn in Cromwell's side, being elected to the protector's parliaments of 1654 and 1656, but prevented from taking his seat. When the Rump was recalled in 1659, Bradshaw resumed his presidency of the Council of State, but died a few months before the Restoration. He was posthumously attainted of treason, and along with those of other deceased regicides, his corpse was exhumed and hanged, and his skull impaled in Westminster Hall. IJG

**Bradwardine, Thomas** (1290–1349). Archbishop of Canterbury. Probably born in Sussex and educated at Merton College, Oxford, and often regarded as the most eminent English mathematician of the age, he earned the title of 'Doctor Profundus' by writing *De causa Dei contra Pelagium*, stressing Augustinian views of grace and election. As university proctor during a dispute between the university and the archdeacon of Oxford (1325), he achieved the university's royal exemption from episcopal jurisdiction despite an appeal to the pope in Avignon. Later, accompanying Edward III as royal confessor to Flanders and France, he was at Crécy and the siege of Calais and helped negotiate the subsequent treaty. He became archdeacon of Norwich (1347) and, as Edward's choice, archbishop (1349). After being consecrated, at the king's request, by the pope in Avignon, he returned to London only to die of the plague almost immediately. WMM

**Bramham Moor, battle of**, 1408. Henry Percy, earl of \*Northumberland, who had been lucky to escape disaster in 1403 when the revolt of his son Hotspur was crushed at \*Shrewsbury, raised rebellion against Henry IV again in 1408. He marched south to Thirsk but, in the middle of a bitter winter, found little support. He was defeated and killed at Bramham Moor, near Wetherby, on 20 February 1408 by Sir Thomas Rokeby, sheriff of Yorkshire. JAC

**Brandywine, battle of**, 1777. \*Burgoyne set out from Canada on his march south against the American rebels in June 1777. The following month, \*Howe took a large force from New York by sea, landed in Maryland, and moved north. \*Washington moved south to protect Philadelphia and took up position on the Brandywine Creek. On 11 September Howe outflanked him, pushed him back, and went on to occupy Philadelphia, driving out the Congress. But British elation was short-lived when news came through in October that Burgoyne had surrendered at \*Saratoga. JAC

**Braose, William de** (d. 1211). King John's treatment of William is the most notorious example of his capricious approach towards his subjects. William, a major Welsh marcher lord, and lord of Limerick (Ireland), supported John's disputed claim to the throne in 1199 and served the king well in the early years of the reign. But his capture of John's nephew and dynastic rival \*Arthur of Brittany, at Mirebeau (Poitou) in 1201, proved his downfall, for he was one of the few who knew that Arthur had been murdered. There is no evidence that William sought to use this knowledge against John, but John became increasingly concerned about his loyalty. From 1205, he determined to destroy him

## brass bands

after Matilda, William's wife, blabbed something about Arthur's fate when John, typically, demanded their sons as hostages. John ruthlessly hounded the family. Matilda and her sons disappeared, and William died in exile in France in 1211. SL

**brass bands** are wind bands comprising brass instruments, sometimes with percussion, as opposed to military bands which mix brass and woodwind. The standard British scoring is: 1 soprano cornet in E flat, 8 or 9 cornets in B flat playing in four parts (3 or 4 solo, 2 second, 2 third, and 1 ripieno), 1 flugelhorn in B flat (often doubling the ripieno cornet), 3 tenor horns in E flat (solo, first, and second), 2 baritone in B flat (first and second), 2 euphoniums in B flat (one part), 2 tenor trombones (first and second), 1 bass trombone, 2 basses in E flat (bass tubas playing one part), and two basses in B flat (one part), with optional percussion.

The rise of the brass band in England coincided with the development of valved brass instruments, particularly the cornet, allowing a wider chromatic range. These powerful new instruments were ideal for open-air performance. Many cavalry regiments had mounted brass bands, while amateur civilian bands rapidly became popular. Throughout their history brass bands have been particularly associated with the north of England, often being attached to collieries or factories. The Stalybridge Old Band (1818) may have been the earliest band; others were soon formed in Wales (1832) and Scotland by the 1860s. Some of today's leading bands, including Black Dyke Mills Band and Besses o'th'Barn Band, have a history stretching back to the mid-19th cent. Estimates suggest over 20,000 British bands in existence around 1900; many were associated with religious organizations, and for more than a century brass bands have been very successfully promoted by the Salvation Army.

Increasingly high standards of performance were fostered by the many brass band competitions, such as those at Belle Vue (Manchester), and the National Brass Band Festival held at Crystal Palace, London, until 1936. The strict rules of the National Brass Band Club lay down the standard scoring required and ensure the amateur status of all but the conductor. Contests are rigorously judged and include a compulsory test piece. Although much of the band repertoire comprises arrangements of variable quality, original works have been written by many leading composers, including \*Elgar, \*Holst, and Rubbra, and, more recently, Henze, McCabe, Horowitz, and Edward Gregson. ECR

**Breadalbane, John Campbell, 1st earl of** [S] (1635–1717). Campbell took part in \*Middleton's rising in 1653, which was defeated by \*Monck. He obtained his peerage in a curious way, becoming creditor to the earl of Caithness, on whose death he was given estates and title, and married the widow. When in 1681 the Privy Council decided in favour of Caithness's male heir, Campbell was compensated with a new title as earl of Breadalbane. In 1689, though sympathetic to James II, he made his peace with William after \*Killiecrankie and from 1692 to 1696 was a lord of the Treasury [S]. He was much involved in the negotiations which led to the proclamation of August 1691 and the subsequent \*Glencoe massacre, though a later inquiry cleared him.

He did not take part in the discussions on the \*Union, though he served as a representative peer 1713–15. In 1715 he sent some of his men to join \*Mar's rising, but escaped punishment, perhaps because he was 80 years of age. He was described as cheerful and agreeable, but Macky wrote that he was 'wise as a serpent, and as slippery as an eel'. JAC

**'Bread or blood' riots**, 1816. The years after \*Waterloo saw high prices, unemployment, and a trade recession, causing widespread distress. The agricultural labourers of the fenland were a depressed group, badly paid and housed. They complained of tithes, enclosures, threshing-machines, and the hiring of Irish labour, and arson, tree-cutting, sheep-stealing, and cattle-maiming were not infrequent. The worst disturbance was at Littleport in May 1816 when a large crowd was dispersed by the yeomanry, with two killed and nearly 100 arrests. Tried by special commission at Ely on 17 June, 24 were sentenced to death. In the event, five were hanged and nine transported. The protesters were said to have carried placards threatening 'Bread or blood'. JAC

**Brecon cathedral.** See SWANSEA.

**Breconshire.** Border county of south Wales taking its name from the Welsh kingdom of \*Brycheiniog which can be identified from the 8th cent. Its Norman successor was the lordship of Brecon, one of the lordships of the \*march. At the Act of \*Union with England in 1536 the lordships of Brecon and of Builth to the north, together with the smaller lordships of Blaenllynfi and Hay, were merged to form the county which was sometimes called Brecknockshire. In 1974 it became a district of the new county of Powys and remained part of that county after the revision of 1996.

Breconshire is dominated by highland, including the Brecon Beacons (Pen-y-Fan 2,906 feet), one of the country's national parks, the Black Mountains, and Fforest Fawr. Only some 6 per cent of the county is below 500 feet, the lower land being formed by the valleys of the rivers Wye and Usk.

Breconshire is predominantly agricultural with the Old Red Sandstone rocks giving the soil a distinctive red character in the south. Livestock farming includes cattle and sheep on the lower land, but extensive sheep runs on the higher ground. The southernmost fringe overlaps with the South Wales Coalfield where, although mining has ceased, some light industry has replaced it.

The county retains its distinctive border character, highly Anglicized in the east, less so in the west. Welsh speakers constitute only 5.7 per cent in the vale of Grwney on the English border but 40.7 per cent in Llywel on the western fringe. The percentage for the county was 23.0 in 1991. The total population is 41,488. HC

**Breda, declaration of**, 1660. In April 1660, while he was still in exile in Holland, Charles II issued the Breda declaration. It was a skilful political document, rightly described as 'Hyde's masterpiece', conciliatory but vague. It promised a general amnesty, save for some regicides, payment of arrears to \*Monck's troops, and an assurance that 'tender consciences' in religion would be respected. Most contentious issues were left to a free Parliament. But after the

king's return in May 1660 and the breakdown of the \*Savoy conference, persecution of dissenters was resumed. JAC

**Breda, treaty of**, 1667. Signed on 31 July, the treaty brought to an end the second \*Anglo-Dutch War. The most important clause in the long run left England in possession of New Netherlands, including New Amsterdam, renamed New York. The \*Navigation Act of 1651 was modified to allow the Dutch to bring to England exports from the southern Netherlands and from Germany. The vexed questions of search, contraband, and saluting were compromised. JAC

**Breedon** church, dramatically set on a Leicestershire hill, stands on the site of an Anglo-Saxon monastery and houses an extensive collection of 8th- and 9th-cent. stone sculpture. The most important are fragmentary sections of two lengthy friezes. The narrower frieze is now some 24 feet long and carries scroll-work whose details can be paralleled in Carolingian manuscripts and Italian sculpture of c.800; this was set internally. The contemporary broader frieze was placed externally and is some 45 feet long. It employs a wide range of plant, animal, bird, and human motifs which draw on both Carolingian and Byzantine sources. RNB

**Brémule, battle of**, 1119. Fought on 20 August between Henry I and Louis VI of France. Louis invaded Normandy in support of William Clito's claim to the duchy and was keen to bring Henry to battle. His enthusiasm led him to launch poorly controlled cavalry attacks against the English and Norman household troops, most of whom were fighting on foot. Henry himself received some blows on his helmet, but the French were beaten off and fled in disorder. The contemporary Norman historian Orderic Vitalis noted that the quality of their armour and the chivalrous preference for capturing (and presumably ransoming) the enemy meant that of the 900 knights engaged in 'the battle of the two kings' only three were killed. JG

**Brentford, Patrick Ruthven, 1st earl of** (c.1573–1651). Ruthven was a professional soldier who spent most of his life in the Swedish service, rising to lieutenant-general. In 1638, well over the age of 60, and with war clouds gathering, he returned to Scotland, was created Lord Ruthven [S], and appointed governor of Edinburgh castle, which he was forced to surrender to the \*covenanters in 1640. He was advanced to the earldom of Forth [S], fought at \*Edgehill, and won a smart encounter a little later at Brentford, taking it as his title in 1644 when he was given an English earldom. After the wars, he was in exile with Charles II but returned to Scotland with him and died at Dundee. Ruthven was a brave, battered, and resourceful soldier of vast experience, but \*Clarendon complained that his understanding had been impaired by 'immoderate drinking'. JAC

**Brétigny, treaty of**, 1360. After the Black Prince's great victory at \*Poitiers in 1356, Edward III resumed campaigning in 1359. But though inflicting great damage he was unable to land a knock-out blow and negotiations commenced in May 1360 at Brétigny, near Chartres. King John's ransom was to be cut and, in exchange for abandoning his claim to the throne of France, Edward was to have Guînes and Aquitaine

in full sovereignty. These sweeping gains could not be substantiated and, after John's death, Charles V of France continued to claim suzerainty. See also CALAIS, TREATY OF. JAC

**bretwalda**. It would be a venial sin, but sinful all the same, to regard the term 'bretwalda' as having caused more trouble than it is worth. It first appears in the \**Anglo-Saxon Chronicle's* annal for 829. The A version says \*Egbert of Wessex was the eighth king who was bretwalda (ruler of Britain). The other versions use 'brytenwalda' (wide ruler). There is dispute as to which term is 'right'. It is not helped by a questioned charter of \*Athelstan (934) which in its English version uses 'brytenwalda', but in its Latin uses 'King and ruler of this whole island of Britain' as the equivalent. More significant is the relationship of the term to \*Bede's statement that there were seven rulers who had *imperium* over much or all of our island: the earliest \*Ælle of Sussex (late 5th cent.), the latest \*Oswiu of Northumbria (d. 670). The 9th-cent. annalist plainly had this passage in mind. Historians have long employed the term 'bretwalda' in relation to Bede's crucial statement. Thus, independently of the question 'which is the "right" form?', the use of 'bretwalda', 'bretwaldaship' as terms of historical art is the focus of dispute on the organization of power in early England.

If, as is likely, 'bretwalda' is an early term, it is of a poetically glorifying kind, not relating to any position which could or can be specifically defined. By a related argument Bede's observation on *imperium*, and who held it, derives from some topos of grouping rulers in sevens (to be found later in \*Nennius's idea of seven Roman emperors who ruled in Britain). Two questions arise. First, whence did Bede get his information, or 'information'? Why, for example, dig up the exceedingly obscure Ælle? Second, granted the almost infinite obscurity of early political arrangements, may not Bede (who could have known more about these matters than we do) be transmitting traditions which derive from something which lay between the poetically rhetorical and the institutionally defined? Historians' discussion of what they call 'bretwaldaship' also involves discussion of elements in early 'overlordship', such as the right to tribute and to participation in land grants. JCa

**brewing** is as ancient as distilling, and had a long evolution prior to its expansion during the 18th and 19th cents. to become a large-scale industry pioneering mass production. Its basic raw materials are barley, hops, and water, and the process involves the infusion of malted barley and water, followed by fermentation of the liquid or wort drawn from the mixture. In the medieval period ale-brewing prevailed and it was not until the early 15th cent. that hops were added to the wort for flavouring and as a preservative. The resulting beverage was known as 'beere' or 'biere' to distinguish it from ale, which was rarely hopped. Many householders from the gentry downwards, and most retailers, brewed their own beer.

From the beginning of the 18th cent. rising population accelerated a long-term trend towards larger breweries. Among the more important firms established at the time were Whitbread, Guinness, and Younger. From the outset these and other family firms dominated an industry which

## Brian Boru

expanded rapidly along parallel paths. Every town of consequence had its brewery, while in the cities like London, Edinburgh, and Dublin much larger units began to evolve. The spectacular growth of Burton upon Trent was in part due to the excellence of the local water, but it also benefited from the town's central position once a national canal network had been established. The size of a brewery generally reflected the size of its immediate market, since beer is a bulky commodity and transport costs were high. Partly to counter this, brewing had its own peculiar marketing arrangements, with a high proportion of output sold through tied houses under the ownership of the brewing companies themselves. Concentration also made the industry an increasingly easy target for the excise, though the strength of beer and the duties payable have varied considerably since the 18th cent.

The expansion of the industry during the latter half of the 19th cent. outstripped its earlier growth. Brewing benefited from rapid advances in science and technology, especially from a deeper understanding of the chemistry involved, and from developments like refrigeration and bottling. The Institute of Brewing was set up in 1886 to disseminate this research. By this time the brewing industry encompassed hundreds of firms of various sizes across Britain, retailing beer through thousands of outlets. The industry was pervasive in other respects. Through its raw material needs it retained close links with agriculture and the countryside; it continued to be conspicuously taxed; and the sale of beer was increasingly enmeshed in complex licensing laws. In all these areas, especially when the \*temperance movement was active, the industry was forced into the forefront of national politics.

The years from the First World War to the late 1950s were characterized by rationalization and amalgamation, an almost continuous decline in production, and increased taxation. Notable product changes, begun in the Victorian era, saw a shift from dark, heavy beers to lighter, brighter beers and ales. Lager, pioneered by Tennent in Glasgow and Jeffrey in Edinburgh, along with bottled beers, increased greatly in popularity. Experimental canning was tried in the 1930s. After some painful readjustment in the 1950s and early 1960s, the industry was dominated by six conglomerates, mainly producing keg and lager beers. However, about 80 regional and local brewers managed to maintain their independence, and partly encouraged by the Campaign for Real Ale, successfully maintained the production of traditional cask beers.

ID

**Brian Boru** (d. 1014), usually regarded as the greatest of Ireland's \*high kings, belonged to what had been a minor \*Munster dynasty, Dál Cais (based in the lower Shannon basin), which rose to prominence in the mid-10th cent., ending the supremacy of the Eóganacht dynastic federation. Brian's father, Cennétig mac Lorcáin, began the family's rise to power and died in 951 as king of north Munster (Thomond). Brian succeeded his brother Mathgamain in 976 and rose swiftly, dominating the Viking towns of Limerick and Waterford, and quickly establishing himself as king of all Munster. At this point he emerged as a challenger to

the reigning high king, the midlands ruler Mael Sechnaill mac Domnaill of the southern Uí Néill, who in 997 acknowledged Brian as king over the southern half of Ireland and who finally submitted to Brian as high king in 1002. Brian set about asserting his dominance throughout the island, adopting the title 'Emperor of the Irish' in 1005. A revolt by the Leinstermen and the Hiberno-Norse of Dublin led to Brian's great victory over them in the battle of \*Clontarf in 1014, at which, however, he himself was slain. His descendants, who remained powerful in Thomond for centuries, bear the surname O'Brien.

SD

**Bridewell.** The London Bridewell, set up in 1555, was the first 'House of Correction' and the term was often used henceforth to describe such institutions. The 16th cent. saw a massive increase in the numbers of poor and indigent, and houses of correction, with stern regimes of hard work, were used for the punishment and reformation of petty offenders or groups who were regarded as anti-social or idle, such as players of unlawful games, fortune-tellers, minstrels, tinkers and pedlars, hedge-breakers, vagabonds, and gypsies. In 1610 houses of correction were set up generally throughout England. The distinction between them and prisons was abolished in 1865.

MM

**bridge** developed in the 19th cent. from whist and is believed to have originated in the Near East. The word itself is doubtful, but may derive from the Russian *biritch* meaning no trumps. The essential difference from whist is the bidding process to establish the trump suit and the forecast. Contract bridge replaced auction bridge in the 1930s. A world championship was founded in the 1950s. The large number of local bridge clubs are affiliated to the English Bridge Union, which issues points, enabling players to qualify as club masters, district masters, and the like.

JAC

**Bridgeman, Charles** (d. 1738). Royal Gardener to George II 1728–38, Bridgeman played a major role in the evolution of the English landscape garden. Stylistically his work lay between the geometric layouts of the late 1600s and early 1700s and the freer designs of William \*Kent and Lancelot 'Capability' \*Brown. Bridgeman fused formal elements (parterres, avenues, geometric ponds and lakes) with the transitional (mounts, lawns, irregular *cabinets*), and the progressive (ha-has, winding walks, irregular lawns and woods, and statuary and garden buildings used to exploit key vantage-points). For the crown he was active at \*Hampton Court, \*Kensington, \*Richmond, \*St James's Park, and \*Windsor, whilst his private commissions included Claremont, Eastbury, and Wimpole. Outstanding among his independent clients was Viscount Cobham of Stowe in Buckinghamshire, whose celebrated landscape was recorded in the perspective views of Jacques Rigaud and Bernard Baron published by Sarah Bridgeman, the gardener's widow, in 1739. Bridgeman was a collaborator with \*Vanbrugh, \*Gibbs, \*Kent, and Flitcroft, and friend of the painters Mercier, Thornhill, and Wootton, and of \*Pope, Prior and other *literati*. As Horace \*Walpole noted in his *Observations on Modern Gardening*, first published

in 1780, Bridgeman had 'many detached thoughts, that strongly indicate the dawn of modern taste'. PW

**bridges.** Britain's pre-1100 wooden bridges do not survive, except as place-names, but extensive activity continued throughout the Middle Ages, and few new bridge sites were added before 1750 to those identifiable in 1500. Bridge-building was one of the three communal obligations, an object for pious work, and for seigneurial enterprise. There had been a Roman \*London bridge, but its continuous history dates from that constructed of wood in 993, and rebuilt of stone from 1176. Some early bridging works were extensive: Aldreth Causeway (c.1100) was one of two constructed across the fenland to the Isle of Ely. Many towns levied *pontage* tolls to erect and maintain bridges, and there were also religious links: Queen \*Matilda endowed Barking abbey to maintain Bow bridge, c.1150, and chapels were recurrent features of medieval bridges, as at Wakefield and Derby. Bridging points formed the core of medieval new towns, such as Chelmsford (c.1200) and Leeds (1207). Bridges replaced many fords and ferries in the later Middle Ages, and indicated widespread growth of vehicular traffic. Medieval stone bridge construction was robust and coped with much traffic growth, and widening and strengthening engineering works did not become generalized until after 1750.

Responsibility for bridges lay with parishes or land-owners, but uncertainty led to the statute of Bridges (1531) providing for fall-back maintenance by the county, and by 1602 48 bridges had become the responsibility of the West Riding. Heavily used bridges also required special procedures: private Acts were employed increasingly in the 18th cent. to create commissions to finance major bridges and new crossings by tolls, beginning with Westminster (1736) initiated with a dedicated lottery. General county responsibility did not come until 1888. Private Acts were thus used for many of the eight bridges added to London before 1820 (including Kew in 1759), and three of these—Vauxhall, Waterloo, and Southwark (1816, 1817, 1819)—effectively created the new suburbs of Brixton, Kennington, and Camberwell. Trunk turnpike development built major bridges, notably on \*Telford's Holyhead road at Conwy and the Menai Straits (1815–19).

Significant development functions came also with the great aqueducts at Barton on the Bridgwater canal (1761), which obviated the need for locks, and Telford's cast-iron construction at Pontcysyllte (1805) carrying the Ellesmere canal over the Dee at 127 feet. \*Ironbridge, Coalport (1779), and Sunderland (1796) pioneered the application and diffusion of cast iron to bridge construction, and laid the basis for the railways, although \*Brunel and \*Cubitt still used timber extensively in the 1840s. Railways employed brick and cast and wrought iron to bridge Britain's great estuaries and rivers between the 1840s and the 1870s: the Dee, the Severn, the Tamar, the Solway Firth, the Menai Straits, and the Tay. Even before the failure of materials and design on the last (1879), steel had established itself as the critical construction material, and demonstrated its strength in the Forth bridge (completed 1890).

Twentieth-cent. bridge-building was correspondingly dominated by steel and concrete for roads. The great railway crossings were replicated from the 1960s by road bridges, all bar the Tay on the suspension principle, and new crossings of the Thames and Humber were added. Lightweight box-girder construction speeded the building of over-bridges from the 1960s, despite initial collapses, and \*motorway and trunk road building provided an immense stimulus to their use: the first stretch of the M1, opened in 1959, had 183 bridges in its 75 miles, and was constructed in 586 days. JCh

**Bridgwater, Francis Egerton, 3rd duke of** (1736–1803). Bridgwater succeeded his brother as duke in 1748 at the age of 11. His education was neglected and he grew up slovenly and uncouth. After the collapse of his proposed marriage to the widowed duchess of Hamilton (one of the Gunning sisters) in 1758, he devoted almost all his time to exploiting the coal resources on his Lancashire estates. To this end he employed \*Brindley in 1761 to construct a 6-mile canal from Worsley to Salford, with a famous aqueduct at Barton over the river Irwell and followed it with the Manchester to Liverpool canal, of 28 miles, along which he ran a passenger service taking nine hours. Though his enterprises imposed vast financial burdens on him, in the end they paid off and made him one of the richest men in the kingdom. He died unmarried and was buried at Little Gaddesden (Herts.), near his Ashridge estate, where his memorial inscription read: 'he sent barges across fields the farmers formerly tilled.' JAC

**Brigantes.** A British tribal federation and *civitas*. The name means 'upland people' or 'hill-dwellers', which is appropriate to the Pennine heartland of the tribe. Their territory, however, included coastal plains as well, for Ptolemy confirms that they held most of northern England from coast to coast. Not surprisingly, such a vast area was not the fiefdom of a single tribe but rather of a loose confederation. Some of the federal tribes are known to us by name—the Setanti, the Lopocares, the Gabrantovices, the Tectoverdi, and the \*Carvetii. Each tribe no doubt had its own capital but there may also have been a central place for the whole federation, possibly at Almondsbury near Huddersfield or at Stanwick near Scotch Corner. Certainly by the time the Romans reached their southern borders, the Brigantes were led by a single ruler, Queen \*Cartimandua, with whom the Romans established treaty relations. Internal schism and instability led to Roman invasion and occupation in the later 1st cent. Eventually a *civitas* was established, perhaps during \*Hadrian's visit to the province, with its capital at Aldborough (*Isurium*), but much of Brigantian territory probably remained under direct military government throughout the Roman occupation. KB

**Brigittines.** Established c.1346 as a double order of men and women by St Bridget of Sweden (c.1303–73). They followed the \*Augustinian rule and constitutions drawn up by Bridget, including the 'Rule of the Saviour'. There was only one English house, Twickenham, founded and richly endowed by Henry V in 1415 and transferred to Syon in 1431. This had a considerable reputation for contemplative

## Bright

devotion until its \*dissolution in 1539, after which it was briefly refounded by Queen Mary in 1557, before its nuns fled in 1559 to Flanders, whence, after many vicissitudes and travels, their successors returned to England in 1809. BJG

**Bright, John** (1811–89). Radical politician and son of a Rochdale textile manufacturer, his first public speech (on temperance, 1830) and first political campaign (against church rates in Rochdale, 1834) mark the strong quaker influence on him. A leading public speaker for the \*Anti-Corn Law League (1839–46), Bright was elected MP for Durham (1843), Manchester (1847–57), and thereafter Birmingham. He supported \*free trade, opposed legislation limiting the hours of adult workers in textile factories, and, in the 1850s, called for peace, retrenchment, and reform, gaining unpopularity for his opposition to the \*Crimean War. He also took up the cause of India, opposing the renewal of the East India Company's Charter in 1853 and advocating devolved government in India under Westminster control, but when offered the secretaryship of state for India by \*Gladstone in 1868 he declined it because of its military responsibilities. He favoured extending the franchise to adult male householders in 1866, but was never a true democrat. He entered Liberal cabinets as president of the Board of Trade (1868–70) and chancellor of the duchy of Lancaster (1873–4, 1880–2), resigning on the latter occasion in protest at the naval bombardment of Alexandria. He was a long-standing advocate of church and land reform in Ireland, but attacked Gladstone's \*Home Rule proposals in 1886. Said to be the most belligerent of pacifists, Bright was one of the greatest orators of the 19th cent. ER

**Brighton.** This was originally Brithelmston, a Sussex fishing village where, according to tradition, Charles II spent a night during his escape to France. Brighton developed rapidly from the mid-18th cent., when Dr Richard Russell recommended its health-giving air. It was patronized by Fanny \*Burney, Samuel \*Johnson (1770), and from 1784 by George, prince of Wales, five years before George III favoured Weymouth as a resort. Brighton's original classical Royal Pavilion, built by Henry Holland (1784), was redeveloped by \*Nash in oriental style with an Indian exterior and Chinese interior (1817). Queen Victoria sold the building to the town. Charles \*Dickens was a frequent visitor. The population in the 1990s was over 150,000. WMM

**Brigit, St** (c.450–c.525). Patron saint of Ireland, with \*Columba and \*Patrick. Born in Faughart (Co. Louth), she took the veil in her youth, having evaded marriage by disfiguring her face. Her monastery of Cill-Dara (Kildare), founded c.470, developed as a centre of learning and spirituality. Her school of art was renowned for illuminated manuscripts, notably the Book of Kildare, which disappeared three centuries ago. A remarkable woman, head of a group of nunneries, influential in church affairs, her great compassion was accompanied by practical measures to relieve the needy. Numerous miracles are attributed to her. Often identified with the Virgin Mary and known as 'the Mary of the Gael' in Ireland, her popularity spread abroad through Irish missionary monks. AM

**Brihuega, battle of**, 1710. Under pressure from a revitalized Franco-Spanish army of 12,000 troops under the command of the duc de Vendôme, an English force of 4,000 men commanded by Lord \*Stanhope was forced to retreat from Madrid into Catalonia. Caught at Brihuega on 9 December, Stanhope's troops stood firm until their powder ran out, after which they organized a bayonet charge against the superior enemy surrounding them. Reduced to less than 500 men, Stanhope had no choice but to surrender. The victory cost the French and Spanish about 1,500 casualties. JLP

**Brindley, James** (1716–72). Brindley, an engineer, was born in Derbyshire and set up as millwright at Leek in Staffordshire. In 1759 he was put in charge of the duke of \*Bridgewater's canal between his coal pits at Worsley and Manchester. Brindley subsequently supervised the building of a number of canals, including the Liverpool to Manchester, opened in 1767; the Trent and Mersey, 140 miles long and involving a 2,880-yard tunnel at Harecastle; and the Staffordshire and Worcester. 'The great Mr. Brindley', wrote an observer in 1767, 'is as plain a looking man as one of the boors of the Peak, or one of his own carters, but when he speaks, all ears listen.' Hard-working and inventive, Brindley was largely self-taught and barely literate: 'midlin louk' was his laconic account of an early attempt to improve a steam-engine. JAC

**Bristol.** A city at the junction of the rivers Avon and Frome, just inland from the Severn estuary. It is not recorded before c.1020, but by 1066 was a flourishing port, shipping slaves to Ireland. The Normans built there one of the key strategic castles of England, and Earl \*Robert of Gloucester (1107–47) made it his power base in supporting his half-sister \*Matilda in the civil wars from 1138. The original centre lay between the two rivers, just inside Gloucestershire, but the Redcliffe area south of the Avon (and in Somerset) quickly became an important suburb. By 1216 Bristol was influential enough to have an elected mayor, and by c.1240 enterprising enough to divert the river Frome to make a better harbour. Trade until the 15th cent. was chiefly with Ireland, Gascony, and the Iberian peninsula, with Bordeaux wines the main imports. By 1377 Bristol ranked in the poll tax as the largest provincial town after York; its importance was recognized in 1373 when the king took it out of Gloucestershire and Somerset and made it a county corporate; later its status was further enhanced when it became a cathedral city (1542) and when its traders were incorporated as the Society of Merchant Venturers (1552). Bristol suffered severely in the Civil War of 1642–6, but enjoyed a golden age in the late 17th and 18th cents. as the largest and wealthiest English town after London. Its wealth by then came chiefly from transatlantic trade (especially in slaves) and its associated new industries (sugar and tobacco). By 1800, however, it was overtaken in importance by Liverpool, Manchester, and Birmingham, and in 1831 it was the scene of serious riots during the passage of the first Reform Bill. More positively, in the 1830s and 1840s I. K. \*Brunel helped to make Bristol an important terminus for railways and for Atlantic steamships, and from 1868 new docks at Avonmouth helped the city recover

prosperity. In the 20th cent. it developed into a large and thriving conurbation. DMP

**Bristol, diocese of.** The see, founded in 1542 by Henry VIII, is now roughly coterminous with the city of Bristol, but at first included all Dorset, taken from the \*Salisbury diocese. It incurred Archbishop \*Laud's displeasure in the 17th cent. for its puritan ethos and lax discipline. As one of the poorest dioceses, from which bishops wanted rapid preferment, Bristol proved a useful tool for 18th-cent. managers of political patronage. Its poverty, and the need to create the Ripon and Manchester dioceses without increasing the total bench of bishops, led to its brief union with the \*Gloucester diocese in 1836. Dorset returned to Salisbury, though Bristol retained a number of north Wiltshire parishes. Rising population made this merger clearly undesirable, and the bishopric had its independence restored by an Act of 1884. The first 32 women priests of the Church of England were ordained here in 1994. The cathedral is the former St Augustine's abbey, dissolved at the Reformation and rededicated to the Holy Trinity. The 13th-cent. choir remains, and there is a fine Norman chapter house. WMM

**Bristol, St Mary, Redcliffe.** 'The most famous, absolute and goodliest parish church in England', declared Queen Elizabeth I. The church, of cathedralesque proportions, stone-vaulted throughout, is a monument to the piety of the inhabitants of Redcliffe, a wealthy suburb of Bristol. Its foundation goes back certainly to 1158 and possibly earlier, but the building that stands today is Gothic. The transepts and nave, completed by c.1376, are attributed to William Canynges the Elder, merchant, six times mayor and MP for the city. The east end was rebuilt by William Canynges the Younger, his grandson, also mayor and MP, who, after his wife's death, took holy orders and became dean of the college at Westbury-on-Trym. In the south transept are two effigies of William, one as a merchant with his wife, the other as a priest. At some time between c.1200 and c.1320 the church became the focus of a popular cult of the Virgin, which centred round an image housed in the north porch. This explains the curious double form of the porch. The inner porch of c.1200 housed the image: the outer porch of c.1320 was built around it to serve as a vestibule to the cult area and to the church as a whole. The spire was part of the original design but completed only in 1872. The young poet Chatterton worshipped in the church and is buried outside. LR

**Bristol riots, 1831.** The rejection of \*Grey's second Reform Bill by the House of Lords was greeted by widespread demonstrations and rioting. Bristol had a reputation for disorder and the riots there were as much against an oligarchical corporation as against the Lords' action. The flash-point was a visit on 29 October by the recorder, Sir Charles Wetherell, an outspoken opponent of the bill, to open the assizes. Troops had been drafted in but were badly handled and obliged to withdraw. The Mansion House, Customs House, Bishop's palace, and half of Queen Square were then attacked and looted. After two days, more troops cleared the streets, with twelve killed and 100 arrested.

Thirty-one persons were condemned to death and five eventually executed. The commander of the dragoons was court-martialled, and shot himself. Though the disorders added greatly to political tension, it is not clear that they affected the final outcome. JAC

**Britain, Battle of, 1940.** On 18 June 1940 \*Churchill declared 'the Battle of France is over; I expect that the Battle of Britain is about to begin'. On 2 July Hitler reluctantly ordered planning for the invasion of England, preferring a peaceful acceptance by the British of German dominance in continental Europe. The Churchill government, supported by most public opinion, chose to fight on and challenge Hitler who knew, Churchill declared, 'that he will have to break us in this island or lose the war'. The German army had ample resources to conquer the UK. Could they be landed, and, if landed, supplied when the Royal Navy had overwhelming superiority? The German navy thought they could not, even if the Luftwaffe could beat the RAF and then attack British warships. Certainly, the invasion was impossible without German air supremacy. The battle was a German attempt to destroy RAF Fighter Command and so win air superiority over the Channel and south-east England.

The single-seat aircraft in the decisive encounters were evenly matched. The Messerschmidt 109E was as fast as the British Spitfire and faster than the Hurricane; the British types were more manoeuvrable. The British fought over their own air space with a chain of radar stations, supplemented by observers who reported approaching aircraft to sector headquarters, from which fighter squadrons were directed at the enemy by radio. The German bombers began by attacking shipping from mid-July to mid-August. The plan was to force the RAF to attack German fighter escorts. On 13 August, 'Eagle Day', the Germans began the main battle, attacking airfields and aircraft factories. The British came closest to defeat in late August and early September. The Germans made repeated attacks on airfields in the south-east and put out of action many sector control posts. British losses in aircraft and pilots began to exceed replacements. The Germans exaggerated their success and thought the RAF beaten: throughout the Second World War air crews constantly believed they had destroyed more hostile aircraft than post-war evidence confirmed. On 7 and 9 September heavy attacks hit London; the Germans lost 84 aircraft. Evidently the RAF was not defeated and Hitler postponed the decision to invade. On 15 September a renewed attack on London gave the RAF another success: 60 German aircraft and only 26 British were lost. On 17 September Hitler again postponed the invasion and on 12 October it was abandoned.

The Battle of Britain helped, especially since British successes were overstated, to reinforce British support for Churchill's decision to continue the war. The battle encouraged Roosevelt's decision to assist Britain to fight on. In 1941 it forced Hitler to attack the USSR without first solving the problem of the British and American threat. The Battle of Britain was a highly visible contest between small numbers in summer skies. The British lost fewer than 800 aircraft, the Germans nearly 1,400. It was a fierce, limited struggle. Fewer

than 3,000 British air crew took part, of whom 507 were killed and about the same number seriously wounded. Churchill was correct: 'Never in the field of human conflict was so much owed by so many to so few.' RACP

**Britannia**, the Roman name for the British Isles revived by \*Camden (1586), has become the poetic name for Britain. Personified as a seated female figure, adapting a 2nd-cent. Roman design, she appeared emblematically (modelled by Frances Stewart, later duchess of Richmond) on Charles II's 1667 peace of \*Breda medal and copper coinage (1672); the 'union' shield resting alongside bore the crosses of St George and St Andrew. The spear was replaced by a trident (1797) after naval triumphs to represent her ruling the waves. She became helmeted (1825), before appearing on the silver groat (1836), and continues on today's 50p piece. ASH

**British Academy.** In response to a resolve for a world-wide Association of Scientific and Literary Academies (Wiesbaden, 1899), the British Academy was established in 1901 to promote 'Historical, Philosophical and Philological Studies'. It soon received a royal charter, but many years passed before it affected the humanities' world as the \*Royal Society did science. Despite endowments for periodical lectures, published in annual *Proceedings*, it contented itself with achieved eminence rather than new ideas and rising scholars; no government support came until 1924, nor permanent quarters (Burlington Gardens) until 1927, and Beatrice \*Webb, the first elected woman fellow (1932), found it 'a funny little body of elderly and aged men'. By the mid-1940s it was moribund, choked by age, complacent, and out of touch, but under Sir Charles Webster (president, 1950–4) and Mortimer Wheeler (secretary), efficiency and scope slowly broadened: by 1970 it had active research committees, funds to support and encourage younger scholars, an improved government grant, new premises in Burlington House, foreign exchanges, and domestic partnerships. More recent reorganization (language and literature; history and archaeology; philosophy, law, and social sciences) has been accompanied by schemes for the support of advanced scholarship in the humanities and social sciences. ASH

**British and Foreign School Society.** The society stemmed from the work of Joseph \*Lancaster, a pioneer of English elementary education, who established a school and a training institution at Borough Road, Southwark, in 1798. With the promise of £100 p.a. from George III, Lancaster formed 'The Society for Promoting the Royal British or Lancasterian System for the Education of the Poor' in 1808, later changed to the British and Foreign School Society. The main object was to enable poor children to read the Bible. The schools were not confined to any one denomination, in the words of the Royal Charter 'all sects and parties sinking their differences in the provision of the best educational means, and using them in the common school on equal terms'. Nevertheless, the Anglicans soon established their own \*National Schools Society. The training institution at Borough Road was moved to Isleworth (Middx.) in 1890, retaining the name of Borough Road Training College. Almost 4,000 British schools were established by the Society.

Many became board schools after 1870 and either closed or transferred to local education authorities after the 1902 Education Act. PG

### **British Association for the Advancement of Science.**

This peripatetic body, founded in 1831, with an open membership, has been very important in promoting public awareness of science. The \*Royal Society was London-based and like a gentleman's club; the \*Royal Institution, where Humphry \*Davy and then Michael \*Faraday lectured, fashionable and expensive. In Germany, with then no single capital city, meetings were organized each year in a different city: and this became the model for Great Britain and Ireland. Provincial pride and fear of scientific decline were important factors; the first meeting was in York, then came Oxford and Cambridge (where the word *scientist* was coined), and then commercial and industrial cities: by 1914 there had also been meetings in Montreal, Cape Town, and Melbourne. Cities competed to attract meetings, often opening museums or mechanics' institutes; famous debates took place there; and women were, rather grudgingly, admitted. The proceedings were widely reported, and subsequently published; research grants were awarded; and office-holding became an important part of a scientist's career. DK

**British Broadcasting Corporation (BBC).** Britain's key media organization, which oversaw the introduction of \*radio (1922) and \*television (1936), and set standards of broadcasting admired throughout the world. Founded in 1922 as the British Broadcasting Company, funded by a licence fee under government auspices, it became a corporation with a royal charter five years later. From the start it was a monopoly organization designed to regulate the British airwaves, to avoid what was seen as the 'chaos' of free enterprise broadcasting in the USA. Whether this strictly regulated 'public service' approach to broadcasting—symbolized by the BBC's nickname 'Auntie'—has proved conservative and paternalistic or a safeguard against shoddy commercialism is a continuing subject of debate.

The tone for the BBC was set by its founder, John \*Reith, managing director of the company 1922–6, and director-general of the corporation 1927–38. His Scottish Presbyterian values ensured that the BBC fulfilled its remit to inform, educate, and entertain, and observe due impartiality in politics, news, and current affairs. The BBC's reputation for news coverage was made in 1926, when the \*General Strike halted other forms of news production; and received international recognition during the Second World War, when the overseas broadcasting service (established 1932) and foreign-language section (1938) came into their own.

To ensure its impartiality, the early BBC was banned from dealing with controversial issues, and even when the ban was removed by the government in 1928, the BBC trod so carefully that many felt it did a totally inadequate job of dealing with the domestic and international crises of the 1930s. Only certain maverick producers in the devolved regional services, such as Olive Shapley in the north-west, dared to feature the experiences of the unemployed on air.

The BBC introduced more varied fare to supplement its Home Service during the war, with a forces programme of light music (to become the Light Programme in 1945) and a Third Programme of high art and classical music. This pattern remained until the 1960s saw it reshaped into Radios 1, 2, 3, and 4 (with the addition of Radio 5 in the 1990s) and the start of BBC Local Radio in 1967. In television, BBC broadcasting became popular with its post-war relaunch, with innovations such as schools educational TV from 1952, and a second channel, BBC2, from 1962.

Though technically independent of government control, with its own—government-appointed—board of governors, the BBC has been subject to varying degrees of political pressure at times of crisis such as Suez, the Falklands War, the Ulster crisis, and has reacted with varying degrees of independence or compliance.

In general the BBC has tried to steer a middle course, reflecting the spirit of the times—thus being noted for its liberal and progressive approach in the 1960s under Director-General Hugh Greene; while from the 1980s, it has had to adapt to the free market values of Thatcherite Conservatism under Michael Checkland and John Birt. In the era of cable, satellite, and interactive media, the BBC's privileged status as a publicly funded body is increasingly questioned. DJA

**British empire.** At its apogee, around 1920, the British empire was the greatest—the biggest, at any rate—ever known. It was reputed to cover a quarter of the world's land area, and a fifth of its population. Most of that, however, was of recent provenance. Like all mighty oaks, this one had a tiny origin. A medieval English proto-empire can be dimly made out, in 12th–13th-cent. Ireland and Gascony. Most historians date the beginnings of the empire proper, however, from Tudor times. It grew out of the great seafaring voyages of that age. Britain was a little behind the Spanish and Portuguese, so initially her empire did not compare with theirs. They took the plums. Britain had to make do with North America and the Caribbean, which were not so obviously valuable. The first British colony was Virginia, which was settled in 1585, but not for long. A ship returning four years later found that the colonists had disappeared. In 1607 the colony was re-established, and this time survived. Other places were also colonized, especially some Caribbean islands, and more of the North American coast. Trading posts were established in India. These became the two main focuses of British imperial dominion for the next two centuries.

It was mainly a commercial empire, run by chartered monopoly \*companies, and defended by the Royal \*Navy. Britain made sure its benefits accrued to her exclusively, by a series of \*Navigation Acts passed in the mid-17th cent. to prevent the colonies dealing with anyone else. That was to cause trouble later on. Meanwhile, however, the empire expanded steadily, partly through the extension of British trade, and partly as a result of wars with other colonial powers. The \*Seven Years War, for example, saw Britain take control of much of India (1756–7). That marked the peak of what later came to be called the 'first' British empire, which came to an end with the rebellion of the thirteen

American colonies, originally against Britain's trading restrictions, in 1776.

The loss of America (except Canada) threatened to mark the beginning of the end of the British empire as a whole. That was because the idea of *exclusive* trading colonies was coming under attack on other fronts. Adam \*Smith, for example, taught that they undermined the 'wealth of nations', rather than promoting it. In the early 19th cent. most liberals believed that empires were things of the past. For years historians followed them in assuming that the early and mid-19th cent. was one of the British empire's low points. In fact, however, it continued to expand. Even while America was being lost, Captain \*Cook was sniffing out new imperial possibilities in the antipodes. The first colony there, \*New South Wales, was established in 1788. \*Sierra Leone in west Africa was established as a home for freed slaves at around the same time. Other gains—\*Trinidad, \*Malta, \*Gibraltar, the \*Cape of Good Hope—were made as a result of the French Revolutionary wars. Later came \*Tasmania, \*Singapore, \*Burma, Western Australia, \*New Zealand, \*Aden, \*Hong Kong, \*Natal . . . a full list would be tedious, but would also illustrate the continuity of Britain's imperial history at this time. Most of this expansion was due to the requirements of Britain's ever-expanding trade. By the 1880s, when the conventional view used to be that the empire picked up again, the bulk of it was already in place.

The difference about the 1880s was that Britons thereafter became infused with a conscious mood of \*imperialism. They sought empire deliberately, instead of merely accepting its growth in what the imperialist J. R. Seeley called 'a fit of absence of mind'. That may have had some effect on this phase of its expansion, though it has to be said that much of it took place under non-imperialists, like \*Gladstone. It was he who took control of \*Egypt in 1882, for example, though strictly—perhaps to save his anti-imperialist face—this was never called a colony. That sparked off the Scramble for \*Africa, which added much of the eastern and southern part of the continent to Britain's collection. The culmination of this phase was the second \*Boer War (1899–1902). The only substantial additions to the British empire after this were the \*'mandated' territories—ex-German and Ottoman possessions, including much of the Middle East—which were allocated to it in the wake of the \*First World War. They too were not meant to be 'colonies', though most people at the time regarded them as such.

This was the empire's zenith. It was huge. In 1901 an imperial census reckoned its total population was 398,401,404, but even that may have been an underestimate, as it apparently never occurred to the heads of households in some colonies that the British wanted them to count their women too. It had a presence in every habitable continent, giving rise to the boast that 'the sun never set' on it: though one subversive joke suggested that this was only because 'God doesn't trust the Brits in the dark'. Most Britons felt it was beneficial: 'the greatest secular agency for good that the world has seen', according to Lord \*Rosebery, though there were other opinions, voiced by J. A. \*Hobson. The wonder was that so small a country as Britain, at the very

## British Empire

edge of Europe, was able to exercise so wide a sway. How was it done?

The simple answer to that is: 'with difficulty'. Britain's empire would have been far too much for her, if she really had tried to dominate it. She succeeded in holding it mainly by being flexible, and persuading others to take much of the strain. In the 'white' dominions these were the European settlers, who were given effective self-government from early on in the 19th cent., in exchange for which they agreed to look after their 'natives' themselves. That often meant exploiting, enslaving, and even extirpating them, while the Colonial Office in London looked on helplessly. Elsewhere local governors utilized divisions amongst natives cleverly, or adopted a policy of preserving native social and power structures, so as to keep disruption to a minimum. This, however, diluted Britain's real control. Collaborators needed to be appeased. Later they proved less willing, especially as Britain's prosperity and strength came to look more vulnerable. That, in the end, was what brought the empire down, in the aftermath of the \*Second World War, when the process of \*decolonization began.

The empire left legacies on both sides. For the ex-colonies it brought stability for a while, though sometimes only by bottling up natural conflicts that were bound to erupt later. It helped the spread of capitalism, Christianity, parliamentary institutions, English as a *lingua franca*, and (most beneficially) cricket. Afterwards it conferred automatic membership of a new club, the \*Commonwealth of Nations, of which most ex-colonies availed themselves. So far as Britain is concerned, the balance sheet is controversial. She may not have profited as much as she thought from the empire. It can be argued that it held her back industrially; for example, by boosting the \*public schools, whose paternalist ethos was necessary to furnish its governors, but disastrous for the entrepreneurial spirit. Its collapse was felt as a loss, however, economically and emotionally. Many of the country's problems in the second half of the 20th cent. were undoubtedly aggravated by her difficulty in coming to terms with its disappearance. On the other hand it provided the later British film industry, while it lasted, with some splendid locations and plots. BJP

Lloyd, T., *The British Empire, 1558–1983* (Oxford, 1984); Porter, B., *The Lion's Share: A Short History of British Imperialism 1850–1983* (1985).

**British Empire, Order of the.** This was the first democratic or meritocratic order and, significantly, was established in June 1917 in the darkest days of the First World War. Though far less aristocratic than previous orders, it was nevertheless divided into five sections—the Knights Grand Cross, the Knights Commander, Commanders, Officers, and Members. Associated with the order was the British Empire Medal. Of equal significance was that a large number of women were, for the first time, admitted to honours. The prelate of the Order is the bishop of London, the dean is the dean of St Paul's, and the chapel of the order is in the crypt of St Paul's. *Punch* complained that decorations were given in handfuls and that to remain undecorated was a distinction in its own right. JAC

**British Guiana.** See GUYANA.

**British Honduras.** See BELIZE.

**British Museum and Library.** Founded in 1753 to house three historic collections (Cotton, Harley, Sloane) of books, manuscripts, and curiosities acquired by the nation, the museum was funded by public lottery and established in Montagu House, Bloomsbury, 'for public use to all Posterity'. Created in the era of the *Encyclopédistes*, it amassed appropriately, acquiring *inter alia* the Royal library (1757), the Rosetta Stone, George III's library (1823), and the \*Elgin marbles, to become a centre for both scholarship and tourism through its extensive coverage of world cultures. The British Library was established by statute (1973) as the national centre for reference, and is a copyright deposit library. The museum has outgrown its original home since opening in 1759, but removal of the library in 1998 to the new, much-criticized building at St Pancras enabled the great court, surrounding the reading room, to be roofed over in a bold and imaginative reconstruction. ASH

**British Somaliland.** Former British protectorate near the mouth of the Red Sea. In 1884, during the 19th-cent. partition of Africa by European powers, Britain declared a protectorate over the part of Somali territory lying strategically opposite its important naval base in \*Aden. The country's natural resources were poor and development was hampered by a rebellion against British administration in the north from 1899 to 1920. In the Second World War British troops occupied the neighbouring Somali territory, previously controlled by Italy, and in 1960 the two former dependencies were united to create the independent state of Somalia. KI

**British Union of Fascists.** The BUF was founded in 1932 between Sir Oswald \*Mosley's New Party and various small British fascist groups. The BUF was partly funded by Mussolini and given valuable publicity in the papers of Lord Rothermere (\*Harmsworth). The fascist salute was adopted and Black House established in Chelsea as an organizational and social centre. The Blackshirts, a paramilitary organization, were formed in self-defence against attacks from militant Jewish youths and communists.

However, the crisis in British society, which Mosley expected to capitalize on, failed to materialize in the 1930s. The factors which fed fascism on the continent—chronic unemployment, the threat of communism, and national grievances—were not as extreme in Britain. The BUF failed to create a nation-wide, mass movement. It suffered a setback after the Olympia meeting in June 1934 when unnecessarily strong action was taken by the Blackshirts to silence hecklers. Its link with political violence and its increasingly anti-Semitic stance alienated moderate opinion, including Rothermere.

When on 4 October 1936 1,900 fascist marchers were turned back by 100,000 opponents at the 'Battle of Cable Street' in the East End of London, the government feared for public order and decided to take action. The Public Order Act (1936) prohibited political uniforms and gave the police powers to ban marches.

Many BUF members were interned in 1940 but in reality the movement had always been marginal and was never a threat to the stability of government. RAS

**Britons.** The peoples living in Britain during the Roman occupation. The name, which the people of Britain seem to have given themselves, first appears in the account of the voyages of the Greek explorer Pytheas of Marseilles in the late 4th cent. bc. The Greek form of the name is *Prettani* (or *Pritani*) and this form was used by later Greek writers such as Polybius (2nd cent. bc), Diodorus, and Strabo (1st cent. bc). Strabo, however, writing after Caesar's expeditions, also used the form *Brettani*, and Latin authors such as Catullus and Caesar wrote of the *Brittani* from the first. From the name of the people came the name of the Roman province, *Britannia*. The meaning of the name is uncertain, but is thought to be something like 'the tattooed people'. Tattooing, however, barely figured amongst the descriptions of the Britons provided by ancient authors. Only Herodian (3rd cent. ad) wrote of tattoos of patterns and animals on the naked bodies of the Britons, and he referred specifically only to the people of the most northern regions. Caesar claimed far more widespread use of the blue dye woad, but this was used over the whole body and not for painting or tattooing patterns.

In general, Roman authors presented a rather dismal picture of the Britons, as barbarians who wore skins or went naked, practised a form of polygamy, and lived a simple and frugal life. Strabo, who claimed he had seen British youths in Rome, described them as relatively tall, but bow-legged and graceless. But Caesar recognized that not all Britons were the same, identifying those around the south-east coast as more civilized and of different stock from the people of the interior. Tacitus, whose father-in-law *\*Agricola* had campaigned widely in Britain in the mid-1st cent. ad, also observed that the Britons varied widely in physical type, and specifically compared the red-haired, heavily built *\*Caledonii* to the swarthy, curly-haired *\*Silures* of south Wales.

It is clear, from the writings of Strabo and Caesar, that, even before the invasion, the Britons in the south-east corner of the island were becoming socially and politically sophisticated and acquiring a taste for things Roman. They were using gold and bronze coins, and exporting raw materials (gold, silver, and iron) along with grain and hides. In exchange, they received manufactured goods such as bronze- and silverware and fine pottery, together with amphorae full of wine. These products are found mainly at a limited number of major tribal centres like *Camulodunum* (*\*Colchester*) and *\*Verulamium* (St Albans) and in a small number of adjacent burials. They were acquired mainly by tribal élites from whom came the chieftains, and increasingly the kings, who wielded power in Britain at the time of the Roman invasion.

To some extent, therefore, political and social developments in the century before the Claudian invasion of ad 43 paved the way for the sort of political system and settlement that conquest by Rome brought with it. Nucleated settlements which acted as centres of administration for large

tribal territories were known to both the invaders and the natives. Equally, both Romans and Britons were used to a society in which ultimate power was in the hands of a single individual, supported by, and who in return patronized, an élite class.

The Romans developed a system of provincial administration which perpetuated, at least initially, the existing tribal framework. Thus in Britain they created, between ad 70 and ad 120, about fifteen self-governing tribal authorities (*civitates*), each with elected magistrates and council and each based on a major town. The first such grants of local self-government were in areas which had shown the most political sophistication before the invasion—Kent, Essex, Hertfordshire, and Buckinghamshire, where the *civitates* of the *\*Cantiaci*, the *\*Trinovantes*, and the *\*Catuvellauni* were established. Other *civitates* were added later, and there is little doubt that the first magistrates and councillors in these authorities were drawn from the old tribal élites. Nor should we be surprised that they reacted in the same way as other native élites have reacted throughout history, by attempting to emulate the life-style of their conquerors. By ad 80, according to Tacitus, the Britons were widely adopting Roman fashion in housing, clothing, language, and diet. Houses with mosaics, plastered walls and ceilings, under-floor heating, and their own bath-suites were built in town and country alike. Roman shoes and sandals were made and worn, and although there is little evidence to support Tacitus' claim that the toga was to be seen everywhere in Britain, fragments of imported silk and tombstones showing natives in Roman-style clothes testify to the fashionable aspirations of some Britons. The same tombstones, inscribed in Latin, together with private messages varying from a simple word or two scratched on a pot to a full letter written on a waxed tablet reveal the spread of Latin. Along with wine, a variety of amphorae demonstrate that olive oil, fish-sauce, and other exotic foodstuffs were imported by the shipload from the Mediterranean. These developments spawned others, as the demand for both manufactured and imported products created a growing class of craftsmen and middle-men. Accumulating wealth, and other routes to social advancement such as the army, provided opportunities for social mobility which extended the franchise and the opportunity for public service and positions of power and influence to families previously excluded from them. 'And so the Britons were slowly introduced to the luxuries that make vice agreeable', wrote Tacitus.

Just how widespread was the adoption of a Romanized life-style is hotly debated. It is reasonable to claim that all those living in towns were to some extent exposed to a way of life unknown before the Roman occupation, and certainly the families who built and lived in 'villas' in the country were displaying their adoption of a Romanized life-style. But there were probably less than a hundred towns in Roman Britain, mostly very small, and with a total population unlikely to have much exceeded 200,000 people. The villas, even if we assume 3,000 of them (three times the number of probable examples currently known), would add little to this total, since the greatest part of a villa estate's population would be the agricultural labour force and ser-

vants. If we compare this to recent estimates of the total population of Roman Britain, at around 2–3 million, we can see that the Romanized element of the population was very much in the minority.

What is more difficult to assess is the extent to which the lives of the agrarian population were significantly changed by the Roman occupation. Even in rural settlements which show few signs of Romanized architecture, imported pottery and glass, coins, Roman-style jewellery, and occasional Latin graffiti are found. There were some changes in agricultural practice too, with new agricultural implements and crops, new methods of land management, and an increasing emphasis on cash-crops and farming for profit. But these changes, not surprisingly, are best attested in those areas where villas were most prolific—roughly in the area south and east of the \*Fosse Way. Outside this area, the clearest signs of Romanization are often found in the civilian settlements that grew up to serve the soldiers in the garrison forts of the north and west. By providing for the needs of the troops, by intermarriage, and by social intercourse, the native Britons of these areas were introduced to a Roman way of life different perhaps from that of the towns in the south-east but equally quite different from anything they had known before the conquest.

It would be easy to make much of this and claim that the life of the British was totally transformed by the Roman conquest and occupation. But this would be to go too far. For a minority, changes in life-style, and even in attitudes, were dramatic, but for the vast majority of the population, the impression is that much of life went on as before.

Alcock, L., *Economy, Society and Warfare among the Britons and Saxons* (Cardiff, 1987); Cunliffe, B. W., *Iron Age Communities in Britain* (3rd edn. New York, 1991); Laing, L. R., *Celtic Britain and Ireland, AD 200–800: The Myth of the Dark Ages* (New York, 1990).

**Britten, Benjamin** (1913–76). The most distinguished English composer of his generation, Britten showed original talent from an early age. Educated at the \*Royal College of Music (London), he was impatient with the parochialism of much English musical life, though his roots were firmly in East Anglia, where he had his home for 30 years. In 1945 Britten's opera *Peter Grimes* was premièred in London. Its impact was remarkable: Britten had written an opera which quickly established itself in the international repertoire and which combined a distinctively modern style with the ability to appeal to the general musical public. Thereafter Britten's prolific output demonstrated his fluency in writing for the human voice and his capacity to match musical subtlety with psychological insight. A brilliant pianist, Britten's commitment to musical performance was reflected in the foundation of the Aldeburgh Festival in 1948. He was created a life peer in 1976.

JWD

**Brixworth** church in Northamptonshire is the most impressive church to survive from Anglo-Saxon England. Built from reused brick and tile pillaged from Roman Leicester, its earliest parts probably date to the 8th cent. At the core is a spacious nave flanked by a series of side-chapels, now known only from excavations, which were entered

through great archways. To the east was a square choir and apsed sanctuary surrounded by an external ring-crypt. To the west, chambers flanked a two-storey porch. In the late Anglo-Saxon period the nave walls were raised and a stair turret added to the porch.

RNB

'**broad-bottom administration**' was the facetious name given to the coalition formed in December 1744, at the expense of \*Carteret and \*Pulteney. Henry \*Pelham, his brother \*Newcastle and Lord \*Hardwicke were joined by \*Chesterfield, George Lyttelton, Gower, \*Bedford, Hinde Cotton, and \*Dodington. The Pelhams promised to bring in William \*Pitt as soon as George II's dislike could be overcome. Hardwicke told the king that there was not one man left in the Commons 'capable of leading or conducting an opposition'. The coalition represented a significant development in the rehabilitation of the \*Tories and the reunification of the \*Whigs. The opportunities given by the nickname to cartoonists were not overlooked.

JAC

**broad church** is a term applied from the late 1840s to Anglicans who were neither \*evangelicals nor \*tractarians, and became common currency after W. J. Conybeare's *Edinburgh Review* article on 'Church Parties' (1853). It embraced prominent churchmen who, influenced by Thomas \*Arnold and \*Coleridge, worked to restate catholic doctrines and reposition the national church, unafraid of contemporary scholarship. With F. D. \*Maurice (1805–72) as their representative divine, F. W. Robertson of Brighton (1816–53) their preacher, \*Jowett of Balliol (1817–93) their academic, and Dean Stanley of Westminster (1815–81) their ecclesiastic, they were influential, even dominant, in their church by 1900 and attractive to many nonconformists, especially \*congregationalists.

CB

**Brontë family.** In 1820, the Irish-born Patrick Brontë brought his Cornish wife and their six young children to Haworth parsonage on the bleak Yorkshire moors, near Bradford. After the deaths of Mrs Brontë and the two eldest girls (possibly hastened by time at a clergy daughters' school), the children were cared for by an aunt but thrown very much on their own resources, creating imaginary worlds and writing. After erratic schooling, then brief teaching or governess posts, Charlotte, Emily, and Anne returned to Haworth to care for their father; anxiety over their irresponsible debt-laden brother Branwell, for whom there had been great hopes, deepened as he became addicted to alcohol and opium, and all struggled against ill-health. Charlotte's discovery of some of Emily's poems led to publication of *Poems by Currer, Ellis, and Acton Bell* (pseudonyms corresponding to their initials), which, if selling poorly, nevertheless encouraged them towards novels. Charlotte (*Jane Eyre*, 1847; *Shirley*, 1849; *Villette*, 1853, based on her time in Brussels) became a literary celebrity, but Emily's *Wuthering Heights* (1848) was too innovative and passionate for many tastes; Anne (*Agnes Grey*, 1847; *Tenant of Wildfell Hall*, 1848) might have been overpowered by her more brilliant sisters, but continues to be quietly appreciated. Although Branwell's debts were discharged, he died in 1848, to be followed shortly by Emily, then Anne the following

summer. Charlotte eventually married her father's curate (1854), but died soon after, similarly from tuberculosis. ASH

**Brooke, Sir Basil, 1st Lord Brookeborough** (1880–1974). Prime minister of Northern Ireland 1943–63 and indelibly associated with the comment 'a Protestant Parliament and a Protestant State'. Descended from Ulster plantation landowners, Brooke came late to politics after a military career. He was behind the establishment of the Ulster Special Constabulary, minister of agriculture 1933–40, and the most active of Sir James \*Craig's administration. Minister of commerce 1940–3, his criticism of the ineffective response to wartime emergency led to his assuming premiership. He was an intransigent opponent of any concessions to catholic minority and conservative in economic affairs while premier. During the tumultuous years following his retirement, he was an outdated and all-too-easily ridiculed man. MAH

**Brooke, Sir James** (1803–68). Brooke, 'the White Raja of Sarawak', was born at Benares, educated in England, and recruited to the Madras army in 1819. Wounded in the first \*Burmese War (1824–6), he resigned his commission in 1830. Inheriting a fortune five years later, he became an explorer in south-east Asia. In 1841, while recuperating at Singapore, he heard that his friend, the raja of Sarawak, was facing a major rebellion but that no official relief expedition was planned. He rushed to the raja's aid and helped to crush the rebellion. As a reward, and after the death of the raja, he was offered the rajadom by its overlord, the sultan of \*Brunei. He accepted and established a dynasty. He cleared the region of pirates and established the Borneo Company to promote development. He was recognized by the USA as the ruler of an independent state in 1850; and by the British in 1864. DAW

**Brooks's**, one of the most famous of London clubs, began life in Pall Mall in 1764 as Almack's, its proprietor William McCall wisely reversing his name to avoid anti-Scottish prejudice. In 1778 it moved to new premises in St James's Street built by Henry Holland and changed its name to Brooks's. It was noted for high gambling and Whig politics. In its possession are fine busts of \*Fox and \*Pitt by \*Nollekens. JAC

**Brougham, Henry Peter, 1st Baron Brougham and Vaux** (1778–1868). A member of a minor gentry family in Westmorland, educated at Edinburgh University, Brougham was one of the most eminent lawyers and intellectuals of his time, renowned for the breadth of his interests. He helped to found the \**Edinburgh Review* and his contributions made it the leading political journal of the day. He qualified for the English bar in 1802 and entered the House of Commons in 1810. He was a brilliant if too frequent speaker, supporting the liberal wing of the Whig Party and espousing the causes of anti-slavery, popular education, and legal reform. He played a leading part in forming the Society for the Diffusion of Useful Knowledge in 1825 and in founding the University of London in 1828, both established on utilitarian and secular principles.

Brougham was mistrusted by his party leaders who considered his support of Queen \*Caroline, whose adviser he

became in 1819–20, to be motivated by desire for personal advancement. His support of popular causes, particularly anti-slavery, gained him election as MP for Yorkshire in 1830, though he had no property in the county, and when the Whigs came to power he expected high office. He reluctantly accepted the post of lord chancellor with a peerage because it meant giving up the House of Commons and a lucrative income at the bar. He carried through a series of important legal reforms but repeated disagreements with his colleagues led \*Melbourne not to reappoint him in 1834. He never returned to office and became markedly eccentric in later life. EAS

**Brown, George** (1914–85). Brown was one of the Labour Party's most colourful characters, becoming deputy leader (1960–70) and foreign secretary (1966–8). He entered Parliament in 1945 and occupied several minor government positions under \*Attlee. Defeated by Harold \*Wilson for the leadership of the party in 1963, he was both first secretary of state and secretary of state for economic affairs in Wilson's first government (1964–6). He lost his seat at the general election of 1970 and was made Lord George-Brown the same year. Notorious for his drinking and his social gaffes, he acquired a certain personal popularity. But in office he proved an outstanding failure, helping to discredit the concept of detailed economic management. His eventual resignation in 1968 confirmed his political irrelevance. AS

**Brown, (James) Gordon** (b. 1951). Politician. Born in Kirkcaldy, son of a Church of Scotland minister, Brown attended Edinburgh University, where he read history. Damage to an eye in a sporting accident did not prevent a vigorous political career and he was rector of the university 1972–5. Elected to the Westminster Parliament in 1983 for Dunfermline East, he formed a close understanding with Tony \*Blair and was one of the architects of 'New Labour'. His aim, when appointed \*chancellor of the Exchequer in 1997, was to eradicate Labour's reputation for shaky financial management, and he dwelt constantly upon the need for prudence. One of his earliest actions was to hand over responsibility for setting interest rates to the Bank of England. Reappointed chancellor in 2001, Brown would presumably be a strong candidate for the prime ministership should Blair decide to stand down. JAC

**Brown, Lancelot** (1715/16–83). English landscape designer, generally known as 'Capability' because of his references to the 'capabilities' of the places about which he was consulted. Born in Northumberland, he worked first for Sir William Loraine at Kirkharle but by 1741 had moved south to Stowe. Brown took a prominent part in the evolution of the Stowe landscape for which \*Gibbs and \*Kent were providing buildings. Soon Brown established his own distinctive landscape style with its clumps, belts, bridges, irregular lakes, and encircling woodland and lawns. Major commissions (sometimes involving the design of buildings) began to come his way, among them Croome Court (from 1750), \*Longleat, Burton Constable, \*Chatsworth (from 1761), and \*Blenheim (from about 1764). In 1764 Brown was ap-

## Browne

pointed master gardener at Hampton Court, a post which carried with it an official residence within the palace grounds, Wilderness House. In 1771 he went into partnership with the younger Henry Holland (1745–1806), later his son-in-law, and together they undertook architectural commissions such as Claremont (1771–4), Cadland (1775–8), and Nuneham (1781–2). On his death in 1783 Brown was buried at Fenstanton in Huntingdonshire, where he had bought the manor in 1767. Horace \*Walpole wrote of him: 'such was the effect of his genius, that when he was the happiest man, he will be least remembered. So closely did he copy nature that his work will be mistaken for it.' PW

**Browne, Robert** (c.1550–1633). An early puritan separatist preacher and pamphleteer, Browne was born in Rutland of a wealthy family. After graduating from Corpus Christi College, Cambridge (1572), where he was under \*Cartwright's influence, he had a spell in London as a schoolmaster and open-air preacher (1572–8) and then in Cambridgeshire. Hostile to any form of church government, he and Robert Harrison established independent congregations, later known as Brownists, in East Anglia. Arrested for heresy (1581), but protected by his kinsman \*Burghley, he emigrated to Middelburg (the Netherlands), where he continued publishing heretical literature. At odds with other puritan exiles, he returned to England (1583), was imprisoned, but, after submitting to the church, became master of Stamford Grammar School (1586–91). Accepting episcopal ordination (1591), he was rector of Achurch (Northants) until his death. A turbulent, unstable character, he is still regarded by many as a founder of \*congregationalism. WMM

**Browne, Sir Thomas** (1605–82). Physician and author. London-born, educated at Oxford, Montpellier, and Padua, Browne received a Leiden MD (1633) before returning to practise near Halifax. He settled in Norwich (1637), was admitted MD Oxon., and in 1643 published the authorized version of his most famous work *Religio medici*, printed without apparent permission the preceding year. Its reflections on the mysteries of God, creation, and man were an immediate success throughout Europe, though papal authorities placed it in the 'Index expurgatorius'. *Pseudodoxia epidemica* (1646) attempted to dispel some popular superstitions, while *Urn Burial* and *The Garden of Cyrus* (1658) reflected antiquarian interests. Despite all-embracing curiosity and encyclopedic knowledge, Browne remained credulous, as illustrated by his involvement in the conviction of two women as witches (1664). He corresponded with \*Evelyn, \*Dugdale, and \*Aubrey, and, ever a royalist, received a knighthood on Charles II's state visit to Norwich in 1671. ASH

**Browning, Robert** (1812–89). Born in Camberwell, son of a clerk in the Bank of England, Browning read widely as a boy in his father's library, greatly admiring \*Keats, \*Shelley, and \*Byron. He spent only two terms at the University of London, but travelled in Russia and Italy. Much of his early work was historically based. *Paracelsus* (1835) was a verse drama about the 16th-cent. physician. *Strafford* (1837), which

\*Macready persuaded him to write, was a lifeless poetic drama; *King Victor and King Charles* was on the unpromising subject of a dynastic dispute in 18th-cent. Piedmont and was never performed; *A Blot on the 'Scutcheon'* (1843) ran for three nights and convinced Browning to abandon the theatre. *Dramatic Lyrics* (1842) included 'My Last Duchess', 'Soliloquy in a Spanish Cloister', and 'The Pied Piper': *Dramatic Romances and Lyrics* (1845) added 'Home Thoughts from Abroad', 'The Lost Leader', and 'How they Brought the Good News from Ghent to Aix'. In 1846 Browning married Elizabeth Barrett, already an established poet, and they lived mainly in Italy until her death in 1861. His greatest success, *The Ring and the Book* (1868–9), took a melodramatic murder story from late 17th-cent. Italy and presented it from different viewpoints. Some of Browning's poems seem inconsequential and others suggest unpleasant feelings not far below the surface. He was overpraised towards the end of his life and is in some danger of being underrated today. JAC

**Bruce, Edward** (d. 1318). Brother of Robert I king of Scots, earl of Carrick from 1313, titular king of Ireland (1315–18). Edward Bruce was an outstanding if savage soldier, but arrogant and over-ambitious. As soon as Robert I took the throne in 1306, Edward became one of his foremost commanders. In 1308 he ravaged Galloway, confining English authority in the area to a few castles, which were gradually reduced until 1313; further campaigns followed, culminating in the siege of Stirling castle which began in 1313. It is likely that a wearisome siege was not quite Edward's idea of war; and he made an agreement with the English commander Philip Mowbray that the castle would surrender if not relieved within a year. This meant that Edward II would have to attempt to relieve it, which displeased Robert I, since his policy was always to avoid a pitched battle and rely on guerrilla tactics. However, battle could not be avoided. At \*Bannockburn (24 June 1314), Edward was in command of the leading brigade. In August 1314, he was among the leaders of a raid into north-east England, which caused widespread damage. In the Parliament of 1315, he was rewarded by being made heir presumptive to the Scottish throne, in the (unlikely) event that Robert I would die without a direct male heir.

It seems that Edward was not satisfied, and felt that, while his brother was king, he could not achieve what he deserved in Scotland. With Robert's full backing, he embarked on an expedition to Ireland. He seems to have landed in Ulster at the end of May 1315, with the support of Ulster nobles, who had close links with Scotland; but then forced them to acknowledge him as king of Ireland, implying an intention to conquer the whole island. He proceeded to the south, ravaging as usual as he went; but did not find the support he expected. By October 1316, he wrote to the Welsh suggesting that he should join them in an attempt to expel the English from Wales, and that he should become prince of Wales as well as king of Ireland! There was so little reality in all this that in 1317, his brother had to come briefly to his aid in Ireland, but with little success. Edward's position as king was impossible to sustain; and in October 1318 he was killed in battle at Faughart, near Dundalk. BW

**Bruce, James** (1730–94). British explorer. Bruce established his claim to fame by revealing to the western world that the Blue Nile had its source in Lake Tana, in Abyssinia (Ethiopia). As British consul in Algiers from 1763 he became interested in the antiquities of north Africa and travelled extensively around the Mediterranean. From Cairo in 1768 he set out to discover the source of the Nile, travelling upstream as far as Aswan. From there he struck eastward to the Red Sea and then inland again to Gondar. Although the country was troubled by political disturbances, he continued his journey to Lake Tana which he reached in November 1770. After a perilous homeward journey he reached England in 1774, only to encounter serious doubts about the validity of his discoveries. His claims were vindicated by later travellers. KI

**Bruce, Marjorie** (d. 1316). Eldest daughter of King Robert I, and joint founder of the royal house of Stewart (Stuart). Born before 1297, she was the only child of her father's first wife Isabel, daughter of Donald, earl of Mar. Her short life was blighted by personal misfortune. She was captured and handed over to Edward I in 1306, spent the next eight years as a prisoner of the English, and shortly after her return to Scotland was killed by a fall from her horse. But in 1315 she had been married to Walter Stewart, and her son Robert Stewart became king of Scots as Robert II in 1371, when her stepbrother David II died childless. KJS

**Bruce, Robert** (1210–95). Known as the 'Competitor'. Leading member of the 13th-cent. Scottish nobility and grandfather of King Robert I. His extensive lands stretched from Middlesex to Aberdeenshire, the most important concentrations lying in Essex, Co. Durham, and south-west Scotland, where he held the great lordship of Annandale, granted to the Bruces (who came originally from Brix in Normandy) by David I. His long career vividly illustrates the comparatively easy-going nature of Anglo-Scottish relations before the Wars of Independence, when a significant number of landowners held prominence on both sides of the border. His transnational interests are reflected in his marriage to Isabel de Clare, daughter of the earl of Gloucester. He also served as sheriff of Cumberland and supported Henry III against Simon de \*Montfort at the battle of \*Lewes. A truly cosmopolitan figure, he went on crusade to the Holy Land (1271–2), and on his return journey granted lands, probably in Annandale, to Clairvaux abbey in Burgundy. Descended through his mother from David I, he was one of the chief claimants or 'competitors' for the vacant Scottish throne in 1291–2, and was bitterly disappointed when Edward I declared in favour of John \*Balliol, though Balliol's case was in fact legally stronger. He did not contest the decision, but the family never abandoned its claims to the kingdom, which were finally realized in 1306. He died at Lochmaben castle in Annandale, and was buried in Guisborough priory (Yorks.), founded by the Bruces in the early 12th cent. KJS

**Bruce, Robert** (d. 1304). Eldest son of Robert \*Bruce (d. 1295) and father of Robert I. His marriage to Marjorie, widow of Adam of Kilconquhar, brought him the earldom

of Carrick in about 1272—a promotion which involved the Bruces in territorial rivalry with their neighbour John \*Balliol, lord of Galloway—and he succeeded to his family's Anglo-Scottish patrimony some 20 years later. Bruce–Balliol rivalry intensified when Robert's father and John Balliol were the main challengers for the Scottish throne in 1291–2. When Balliol was enthroned, Robert refused to recognize him, thereby keeping his family's claims to the Scottish crown alive. He provided his son, the future king, with a power base by assigning Carrick to him, and on the outbreak of the \*Scottish Wars of Independence, his anti-Balliol stance led him to support Edward I. After the English victory at \*Dunbar (27 April 1296), he asked for the Scottish throne—a request to which Edward famously responded: 'Have we nothing else to do but win kingdoms for you?' Despite this rebuff, Robert remained in the English allegiance until his death, when he was buried in Holm Cultram abbey (Cumberland). KJS

**Bruce, Robert I of Scotland.** See ROBERT I.

**Brudenell, James Thomas.** See CARDIGAN, 7TH EARL OF.

**Bruges, treaty of**, 1375. After years of warfare, Charles V of France and Edward III agreed a truce, under papal auspices, and established a conference at Bruges to negotiate a permanent settlement. But after Edward's death in June 1377, fighting was resumed. JAC

**Brummell, George** (1778–1840), known as 'Beau' Brummell. English dandy. Son of Lord North's private secretary, with a reputation for fastidiousness and ready repartee apparent even at Eton, he utilized a generous inheritance to settle in Mayfair and devote himself to becoming an arbiter of fashion, promoting personal cleanliness and refinement in dress through moderation, in contrast to the Macaronis' slovenliness. Supremely self-centred, cold, and arrogant, he was an intimate friend of George, prince of Wales until royal favour was withdrawn in 1811, after which he lost commercial credit but increased gaming. Accumulating debt eventually forced him to retire to Calais (1816), where he received assistance from friends and was briefly consul at Caen (post abolished in 1832). A subsequent slide into poverty was accompanied by two paralytic strokes, until degeneration and imbecility led to admission to an asylum at Caen, where he died. ASH

**Brunanburh, battle of**, 937. Brunanburh was the crowning military achievement of Athelstan's reign, which saw \*Wessex advances into Devon, south Wales, and the north. In 937 a formidable coalition attempted to hold him at bay. Constantine II of Scotland was joined by Owain of Strathclyde and Olaf Guthfrithsson from Dublin (whose father had been driven out of Northumbria by Athelstan). The site of the battle remains uncertain, though if the Dublin fleet did use the Humber, Brough or Aldborough are possibilities. In savage fighting, Athelstan and his brother Edmund prevailed: five young kings, including a son of Constantine, are said to have been killed. The *Anglo-Saxon Chronicle* thought the victory the greatest ever won by the Saxons and broke into sombre verse:

Likewise the English king and the prince,  
 Brothers triumphant in war, together  
 Returned to their home, the land of Wessex.  
 To enjoy the carnage, they left behind  
 The horn-beaked raven with dusky plumage,  
 And the hungry hawk of battle, the dun-coated  
 Eagle, who with white-tipped tail shared  
 The feast with the wolf, grey beast of the forest. JAC

**Brunei** rose as a powerful Islamic sultanate in the 15th cent. When Magellan visited it in 1521, it held sway over most of lowland Borneo and the surrounding archipelago. However, after it was destroyed by a Spanish fleet, it passed into obscurity. In 1888, surrounded by the Brookes' Sarawak and the domains of the British North Borneo Company, it was taken under a British protectorate. From 1906 to 1959, it was administered by the British resident. Rich oil reserves were discovered. The sultan was restored to his government and, in 1963, declined to join the \*Malaysian Federation. DAW

**Brunel, Isambard Kingdom** (1806–59). Engineer. Son of the distinguished émigré Sir Marc, Brunel was scientifically educated in Paris (unusual when the engineering profession was entered through practical pupillage) and consistently applied first principles to problems, making him more admired by subsequent engineers than contemporary shareholders. Sickness incurred at his father's Thames Tunnel (1826–8) led Brunel to convalesce at Bristol, where he gained appointments as engineer of the Clifton bridge (1829–31), the floating harbour (1830–1), and the Great Western Railway (from 1833). Brunel's engineering of the GWR demonstrated his vision and his failings: the commitment to the broad (7-foot) gauge and his own design for bolstering track promised quality and speed, but delivered inflexibility; his vision of the Atlantic crossing from Bristol encapsulated by his first two major ships, *Great Western* (1837) and \**Great Britain* (1843), displayed the temptation to exceed the bounds of commercial technology proven in the outstandingly advanced \**Great Eastern* (1858); his remarkable bridges of brick, timber, and iron; and locomotive failings from which Gooch rescued the line. A driven man, his genius produced the monitor to attack Sebastopol and the prefabricated hospital for Kronstadt, railways in Italy and India, hectored assistants and neglected pupils, and chronic overwork that contributed to early death as his two greatest achievements, the Albert bridge at Saltash and the *Great Eastern*, neared commissioning. JCh

**Brussels, treaty of.** Signed on 17 March 1948 between the United Kingdom, France, Belgium, the Netherlands, and Luxembourg, it set up the Brussels Treaty Organization, also known as \*Western European Union. This purported to be a security pact based on shared cultural heritage of its members and against any revival of German expansionism. There was also an important, veiled motivation. The treaty was intended to demonstrate that west European states were willing to co-operate with each other and therefore make a US commitment to a role in the security of western Europe more acceptable to Congress. The Brussels treaty was therefore a vital step on the road to the formation of \*NATO. CNL

**'Brutus'.** The extraordinary legend that Britain had been 'founded' by Brutus, great-grandson of Aeneas of Troy, haunted men's imagination for centuries. \*Geoffrey of Monmouth, in the 12th cent., related how Brutus, after many adventures, visited England (landing at Totnes), subdued the race of giants who inhabited it, gave his name to it, and founded London as New Troy.

The implausibility of a myth is no great obstacle to its popularity and 'Brutus' ran and ran. Tudor historians deeply resented the suggestion of Polydore Vergil (a foreigner) that the story was not very likely as a slur upon the nation. The myth had important political consequences. First it put heart into the Welsh after centuries of defeat. They could comfort themselves with a heroic past which must foretell a glorious future: William of Newburgh, writing some 40 years after Geoffrey, remarked sourly that the story had only been told to please the Welsh. Secondly, Geoffrey's account of King \*Arthur, a direct descendant of Brutus, told how he had conquered Ireland, Iceland, Orkney, Sweden, Norway, Denmark, Normandy, and had challenged Rome itself. Tudor imperialists seized upon it. John Dee and others improved upon Arthur's conquests by adding America, visited by \*Madog in the 12th cent., and called for a great new British empire. Until deep into the 20th cent. the imperialist vision inspired and helped to bind together the nations of the British Isles. JAC

**Brut y tywysogyon** ('Chronicle of the Princes') is the most valuable narrative source for the history of medieval Wales. Translated from a lost Latin original, three independent versions in Welsh survive from the 14th cent. as continuations of \*Geoffrey of Monmouth's *Historia regum Britanniae*. These versions are in Peniarth 20, Red Book of Hergest, and Cotton, Cleopatra B V, with a continuation in Black Book of Basingwerk; all three have fine modern editions by Thomas Jones. They begin with Cadwaladr Fendigaid whose death (682) was regarded as a key event in the history of Britons and Saxons. They end with the equally crucial death of Llywelyn ap Gruffydd (1282); Peniarth 20 continues to 1332, drawing on other lost annals, and Black Book of Basingwerk has a continuation to 1461 of little value. The Latin original used church and monastic annals from the 8th cent. and, for 900–1100, others kept at St Davids and possibly Llanbadarn Fawr. It was perhaps composed at the Cistercian abbey of Strata Florida (Cardiganshire). Sometimes cryptic, often bloody, the extant versions are also eloquent and rhetorical with moving laments of great kings. Their compilation reflects the strong sense of identity of the Welsh faced with foreign conquest. RAG

**Bryce, James** (1838–1922). Political analyst and Liberal politician. Bryce was from Belfast and educated there and in Glasgow and Oxford universities. In 1863 he won the Arnold history prize with *The Holy Roman Empire*, the first of many works on the character and morphology of states. After a spell as an education commissioner, in 1870 he became professor of Roman law at Oxford, and began the revival of that subject. Bryce was one of a group of Oxford liberal intellectuals who provided the party with a cogent programme of reform, much of it education oriented. He was a keen

mountaineer and travelled widely. In 1877 he published *Transcaucasia and Ararat*, reflecting his interest in the Eastern Question, a subject which preoccupied him for the rest of his life; he became an especial champion of the rights of the Armenians, including their right to nationhood after the disintegration of the Turkish empire in 1918. In 1880 Bryce became a Liberal MP. He was in \*Gladstone's last cabinet of 1892–4, becoming president of the Board of Trade 1894–5. He chaired a royal commission on education in 1895. A home-ruler despite his Ulster protestant background, he was an uneasy Irish secretary 1906–7, when he went to Washington as ambassador (until 1913), a very successful appointment. Bryce's greatest (and still influential) book was *The American Commonwealth* (1888), a practical as well as theoretical analysis, based on interviews and travels. Bryce became Viscount Bryce in 1914. That year he chaired the Bryce commission on war atrocities and was a member of the small group which promoted a \*League of Nations. In 1921 he published *Modern Democracies*, an encomium for a fast-disappearing liberalism. HCGM

**Brycheiniog** was a medieval Welsh kingdom whose dynasty is traditionally said to have begun with Brychan, the son of a 5th-cent. Irish chieftain and the daughter of the king of Garthmadrin in the Vale of Usk. His line ended c.940, when Brycheiniog fell under \*Deheubarth's influence. It was conquered by Bernard of Neufmarché (1093), whose new marcher lordship was known as Brecon (a corruption of Brychan). Brecknock is the English version of Brycheiniog. The lordship was the basis (with Builth lordship) of the new county of Brecon in 1536; it lasted until 1974 when it was incorporated in Co. Powys. Brycheiniog is used as the Welsh version of Breconshire. RAG

**Buchan, Alexander Comyn, earl of** [S] (d. before 14 March 1290). Earl from 1244, and one of the six guardians of the realm from 1286 till his death. In youth, he was involved in many of the turbulent acts of his family, including the ravaging of the lands of the Bissets in 1242, and the violent seizure of the young Alexander III in 1257. During the minority of Alexander III he and his relatives repeatedly clashed with the supporters of Alan Durward in their efforts to control the council, but a compromise was reached in 1258; and thereafter Alexander appears more as a loyal and effective agent of the king. In 1264 he led the punishment of those in the Isles and Caithness who had supported the king of Norway in his campaign of 1263; and became constable of Scotland by 1275. He died just before the crisis of 1290. From being a disturber of order in his youth, he had become a respected elder statesman. BW

**Buchan, John Comyn, earl of** [S] (d. 1308). Buchan's career shows the difficulties faced by prominent Scots who wished to maintain the integrity of their country. Like the rest of his family he was a supporter of John \*Balliol, and hostile to the claims of Edward I. Yet he had at times to compromise, submitting to Edward in 1296 and being sent by him to suppress the rising of Andrew Murray in 1297. Instead, he joined the rising himself, fought at \*Falkirk against Edward, and was a leading figure on the Scottish

side till what seemed to be Edward's final victory in 1304, after which he was prepared to co-operate in Edward's reorganization of Scottish government. We cannot say what he would have done in 1306 but for Bruce's murder of his cousin John \*Comyn of Badenoch, which forced him finally onto the English side. He was routed by Bruce at \*Inverurie in 1308, and his earldom was ravaged. He fled to England where he died soon after. BW

**Buchan, William Comyn, earl of** [S] (d. 1233). Comyn was justiciar [S]. By his first wife he was grandfather of the Red Comyn, and great-grandfather of the Red \*Comyn who was a competitor for the Scottish throne in 1291. His son Walter became earl of Menteith [S] and was one of the leaders of the powerful Comyn interest in the early years of Alexander III. His second marriage was to Margaret, countess of Buchan, in whose right he was recognized as earl. His son Alexander, by his second wife, was also justiciar 1251–5 and 1257–89. In 1200 Comyn was one of the noblemen sent by William the Lion to make friendly overtures to King John and in 1221 he was a witness to the marriage contract between Alexander II and John's daughter \*Joan. He was buried in the Cistercian abbey of Deer (Aberdeenshire), which he had founded. JAC

**Buchan, Alexander Stewart, 1st earl of** [S] (d. c.1406). Lord of Badenoch. The fourth son of Robert II, he was made a justiciar in northern Scotland (1372), in which post he earned his nickname of 'Wolf of Badenoch'. He became earl of Buchan in 1382 as a result of his marriage to Euphemia, countess of Ross. He was associated with bands of caterans, and was sacked from his justiciarship in 1388. Buchan had been extorting large sums from the bishop of Moray since 1370, in return for protection. In 1389 Moray excommunicated him, and from 1390 took protection from the sheriff of Inverness. In 1390, on Robert II's death, Buchan and his caterans burned Forres, and then Elgin burgh and cathedral, in reprisals for Moray's actions. His royal connections saved him from harsh criticism, but his and his bastard son's northern power proved problematic for the crown well into the 15th cent. RJT

**Buchan, John Stewart, 3rd earl of** [S] (d. 1424). A younger son of Robert, duke of Albany, governor of Scotland, who made him earl of Buchan (1406). Albany appointed Buchan chamberlain (1407), in which post he oversaw widespread embezzling of royal funds. In 1419 Buchan travelled to France with 6,000 Scots to fight for the Dauphin Charles (later Charles VII) against the English. They played an important role and won a small victory at \*Baugé in Anjou (1421). Made constable of France, and leader of the French forces, Buchan came close to fighting James I, involved on the English side, at Beaugency (1421). Buchan was killed, with most of his army, at \*Verneuil (1424). This outcome was as welcome to James I as to the English, as it enabled him to turn against Buchan's family, the Albany Stewarts, and their estates, without fear of reprisal. RJT

**Buchanan, George** (1506–82). The most distinguished Scottish humanist of his era, Buchanan was born near

## Buckingham

Killearn in Stirlingshire and educated primarily at Paris, where he quickly gained a reputation as a neo-Latin poet and dramatist of rare distinction. Deeply influenced by Erasmus, his strongly anticlerical views led to frequent brushes with authority culminating in imprisonment by the Portuguese Inquisition. The date of his conversion to protestantism is unknown, but on his return to Scotland in 1561 he was associated both with the court of the catholic Mary Stuart and with the new protestant kirk. Following the queen's deposition in 1567, he emerged as the most influential of Mary's detractors, justifying resistance to tyranny in his elegant dialogue *De jure regni apud Scotos* (1579) and his monumental *Rerum Scotticarum historia* (1582). Both were dedicated to Mary's son James VI, whose education at Buchanan's hands profoundly influenced the king's own belief in his \*divine right to rule. RAM

**Buckingham, John Sheffield, 1st duke of** (1647–1721). Buckingham succeeded as 3rd earl of Mulgrave at the age of 10, served in the army and navy, and was gentleman of the bedchamber to Charles II. He was in favour with James II, who appointed him lord chamberlain. He stayed with James until the end, but accepted William and Mary and was created marquis of Normanby in 1694. Anne, whom he had courted in 1682, made him lord privy seal and promoted him in 1703 to the dukedom made available by the death of the second Villiers duke. Until 1714 he was an influential high Tory, serving on the commission to negotiate union with Scotland, as lord steward 1710–11, and lord president of the council 1711–14. After 1714 his political career was over. He was a poet of some repute, though \*Johnson was disparaging. His house at the end of the Mall, built in 1703, was sold to George III in 1762 and became the nucleus of \*Buckingham palace. JAC

**Buckingham, Edward Stafford, 3rd duke of** (1478–1521). Stafford's great-great-grandfather was killed at \*Shrewsbury in 1403 fighting for Henry IV; his great-grandfather, the 1st duke, died fighting for the Lancastrians at \*Northampton in 1460. His father, a prominent supporter of Richard III, was seized and executed at Salisbury in 1483, when Stafford was 6. He was restored to his title by Henry VII and given the Garter when he was 21. In 1509, at the coronation of Henry VIII, he claimed the right to act as lord high chamberlain. He had royal blood, through Thomas, duke of \*Gloucester, younger son of Edward III, and his mother, Catherine Woodville, sister to Edward IV's queen. Under a suspicious king, this was a dangerous heritage. In addition, his connection by marriages with the Percies, de la Poles, and Howards made him one of the greatest magnates of the day. His life-style was lavish and his behaviour grand. In 1520, an anonymous letter to \*Wolsey accused the duke of treasonable words. He was summoned from Thornbury, placed in the Tower, and executed on 17 May 1521. JAC

**Buckingham, Henry Stafford, 2nd duke of** (1455–83). Buckingham came from a staunchly Lancastrian family. His father was killed at the first battle of \*St Albans, just before he was born: his grandfather (from whom he inherited the title), was killed at \*Northampton when he

was 6. He could expect little favour from the Yorkist establishment. Edward IV's death opened the door. Allying himself with Richard of Gloucester, the two dukes swept to power in the summer of 1483. With Gloucester crowned as Richard III, Buckingham, lavishly rewarded, looked well set. Yet within four months he joined dissident southern gentry in rebellion. Betrayed to the king, he was summarily executed at Salisbury on 2 November. Buckingham's volte-face remains an enigma. He may have been converted to Henry Tudor's cause; he might have judged that he was again joining the winning side; or he might even have had his own fantasies about the crown. His behaviour suggests that Edward IV had correctly judged him to be dangerously untrustworthy. AJP

**Buckingham, George Villiers, 1st duke of** (1592–1628). Buckingham attracted James I's attention by his good looks, and by 1616 had replaced Robert \*Carr as the reigning favourite. Unlike Carr, however, he displayed considerable administrative ability, carrying through a major programme of naval reform after James appointed him lord admiral. The king's repeated affirmations of his dependence upon Buckingham meant that he was blamed for unpopular policies such as the 'Spanish match' (for Prince Charles) of which he was merely the executant. Only in 1623, during his enforced stay in Spain, did he emancipate himself from James's tutelage, and not until Charles became king in 1625 did he have a free hand in making policy. He planned to build up an anti-Spanish alliance, of which France was to be the linchpin, but religion, as always, complicated the situation, for the French protestants of La Rochelle were under attack from their own king and appealed to Charles to save them. Military operations would require massive funding from Parliament, but Buckingham's involvement in dubious practices such as the sale of titles and offices had brought him an unsavoury reputation, and his catholic connections—his mother was a catholic convert and his wife had abandoned catholicism only in order to marry him—further undermined parliamentary trust. Despite all obstacles he sent out expeditions against Cadiz in 1625 and in support of La Rochelle in 1627, but both ended in humiliating defeat. The Commons attempted to impeach him in 1626, and two years later denounced him as the cause of all England's evils. This inspired an army officer, John Felton, to assassinate him at Portsmouth in August 1628. Buckingham was in fact a patriot, dedicated to the king's service and his country's safety, and although his death was welcomed as a deliverance, subsequent events were to show that he was a symptom rather than the cause of malfunctioning in the English polity. RL

**Buckingham, George Villiers, 2nd duke of** (1628–87). Heir to his renowned father the 1st duke (assassinated August 1628), he was brought up with the royal children and, despite frequent provocations, Charles II always felt a fraternal bond with Buckingham. He fought in the Civil War, but his youth recovered his estates for him in 1647. Personally involved in the Scottish invasion on Charles II's behalf in 1651, Buckingham was able to return to England from exile in 1657, when he married a daughter of Sir Thomas \*Fairfax.

Naturally enjoying preferment at the Restoration, lack of managerial capacity combined with pathological irresponsibility rendered Buckingham the least weighty of 'the \*cabal's' members. His public support for the dissenting community, and the personal standing he acquired with Louis XIV, together bear out contemporary estimates of Buckingham's capricious shallowness. Pope's account, in the *Epistle to Bathurst*, of Buckingham's wretched end is a ludicrous exaggeration.

DDA

**Buckingham palace** (London). The official London residence of Her Majesty the Queen. Buckingham House (as it then was) was built in 1702–5 for John Sheffield, 1st duke of \*Buckingham, by the architect William Winde (d. 1722). Its style is classical, essentially that of a country house set in an English park. Buckingham House was bought in 1762 by George III, who had it altered and enlarged by Sir William \*Chambers in 1762–9. In 1825 George IV approached his friend John \*Nash for designs, and in 1825–30 Nash incorporated Buckingham House in Buckingham palace. On Nash's dismissal in 1830 he was replaced by Edward Blore (1787–1879), who had assisted with Abbotsford for Sir Walter \*Scott. Blore completed Nash's work at Buckingham palace, adding an attic on the garden front (1832–7), then converting the south-east conservatory into a chapel (1842–3), and in 1847–50 building the east wing facing the Mall; in 1913 this was refaced by Sir Aston Webb, who also laid out the *rond point* with radiating avenues in front of the palace. Its interiors are sumptuous, and some of the rooms were opened to the public in 1993 to help pay for the rebuilding of parts of \*Windsor castle after the fire in 1992. Apart from the rich décor, the visitor may see examples of works of art from the royal collections, supplemented by the changing exhibitions in the nearby Queen's Gallery, converted in 1962 from the palace chapel.

PW

**Buckinghamshire** has little geographical unity and seems to be an entirely artificial creation. The chalk hills of the Chilterns run across the middle of the county from south-west to north-east. The area to the south drains into the Thames, which forms the southern boundary. North of the Chilterns stretches the vale of Aylesbury, rich clay farming land, and north of that again the valley of the Ouse, looking towards Northampton, Bedford, and the midlands. Communications between north and south have always been poor, and Olney in the north, where William Cowper lived, was in a different world from Stoke Poges in the south, where \*Gray wrote 'Elegy in a Country Churchyard'.

The diffuseness of the shire was increased by the fact that the county town was not Aylesbury, near the middle, but the smaller town of Buckingham in the extreme north-west corner. For centuries there was rivalry between the two and in the 1740s the assizes were moved to Aylesbury and then back again. Tradition looked upon Buckingham as deeply conservative and Aylesbury as radical. But Aylesbury in the Hanoverian period was venal rather than progressive. Most of the numerous Buckinghamshire parliamentary boroughs were under the secure control of the neighbouring gentry families—the Drakes at Amersham, or the Wallers and Pettys at Wycombe. The powerful county families included

the Verneys of Claydon and, when their money ran out, the Grenvilles of Stowe, who had complete command over Buckingham itself.

Pre-Roman Buckinghamshire was in \*Catuvellauni territory, and \*Cunobelinus, grandson of \*Cassivellaunus, is believed to be commemorated in Great and Little Kimble, near \*Chequers. The Roman road \*Watling Street ran across the north-east of the county through Stony Stratford, intersecting with the older \*Icknield Way just east of the county near Dunstable. In the 6th cent. the area was disputed between the Britons and the English, the latter reported by the *Anglo-Saxon Chronicle* to have captured Aylesbury in 571. The region became part of the kingdom of \*Mercia. As a county Buckinghamshire probably developed after \*Edward the Elder, king of Wessex, launched his great advance against the Danes and fortified Buckingham as a frontier outpost in 918. It was first mentioned as a county in 1010 when most of it was overrun by a second Danish advance. In \*Domesday Book, Buckingham was the only town to be separately assessed and appears to have been substantial. It did not maintain its pre-eminence and was overtaken by Aylesbury, Wycombe, Marlow, Chesham, and other towns. \*Leland, in early Tudor times, found Aylesbury a 'fair town' with a celebrated market and the county gaol. Wycombe had parliamentary representation from early on, Buckingham and Aylesbury from the 16th cent., and Wendover, Amersham, and Marlow as late as the 17th cent.

Industrial development also came late to Buckinghamshire. Lace-making gave the county considerable prosperity in the 17th and 18th cents. but declined sharply in the 19th. Slough did not even merit a separate entry in the 1801 census but was included in the parish of Upton. The 19th cent. gave the county a network of railways, which stimulated the growth of Wolverton, Slough, and Wycombe. Proximity to London led to great changes in the 20th cent., the balance of population moving south. Between 1931 and 1951 the rate of growth was third in the whole country, largely due to Wycombe and Slough, which, by 1961, had grown to 50,000 and 80,000, while Buckingham remained at just over 4,000. The development of Milton Keynes in the north-east as a new town promises to restore the balance. By the Local Government Act of 1972 Buckinghamshire lost Slough and Eton in the extreme south to Berkshire. The Banham commission report in 1994 in favour of abolishing the county, save for ceremonial purposes, was not accepted: the county survived, though Milton Keynes was made a unitary authority.

JAC

**budget.** The practice of devising an annual programme for financial legislation has been attributed to William Lowndes, an official in the Treasury throughout the half-century after 1675. The term dates from the 1730s and is derived from the wallet or 'bougette' in which the chancellor of the Exchequer carried his proposals. Early in the 18th cent. the principle was established that funding and expenditure proposals should be the preserve of the House of Commons, and that financial initiatives within the Commons should be the preserve of the Treasury ministers. In the 19th cent. the practice developed by which the annual

## 'Bulge'

budget comprised an assessment of Exchequer income and expenditures for the past financial year, together with estimates of expected spending needs in the forthcoming year and the fiscal steps required to provide for them. Since the Second World War, when economic management has become a more important part of the political process, the budget has become a means of indicating government economic strategies to other economic agencies, a statement of the state of the economy, and a means of political and media manipulation. As the range of economic instruments at the disposal of the state has increased, together with the need to respond far more frequently to changing events, the budget has lost some of its importance. CHL

**'Bulge, battle of the', 1944.** In September 1944 Hitler decided to counter Anglo-American success in France and Belgium by secretly preparing powerful forces, including twelve Panzer divisions, to break through in the Ardennes, cross the Meuse, and retake Antwerp. Allied supplies would be blocked and allied troops north of Antwerp isolated. Selecting a period of bad weather to palliate allied air superiority, the Germans attacked on 16 December 1944. They used their remaining trucks to support rapid advance into a salient; now, however, the British and Americans had superior mobility and contained the initial surprise success gained by the Germans. Moreover, the American defenders held road junctions, notably at Bastogne where 101 Airborne, hurriedly moved there, withstood a six-day siege. At the time, the surprise German attack caused dismay at an unexpected reassertion of enemy strength and, later, doubts about the efficiency of allied intelligence. \*Montgomery reinforced his unpopularity by seeming publicly to criticize American generals. RACP

**Buller, Sir Redvers Henry (1839–1906).** Soldier. Buller was a man of outstanding personal bravery, but his indecisiveness in high command cast a shadow over his later career. He took part in the \*Zulu War (1878–9), winning the Victoria Cross, and in the \*Gordon relief expedition in the Sudan (1884–5). He then climbed the army ladder steadily until refusing the post of commander-in-chief in India, before reluctantly agreeing to command in South Africa in 1899 at the beginning of the second Anglo-Boer War. He then made the unwise decision to divide his force into three columns, he himself commanding one. This resulted in a series of piecemeal defeats and his replacement in overall command by Lord \*Roberts. Buller's subsequent leadership of his own column demonstrated the same qualities of hesitation, and his later public attempt to refute his critics was not well received. KI

**Bunker Hill, battle of, 1775.** After the encounter at \*Lexington in April 1775, General Gage found himself trapped in Boston by the American rebels. The town was dominated by Dorchester heights to the south and the Charlestown peninsula to the north. On 16 June the Americans dug in on Bunker Hill, near Charlestown, and the following day Gage sent 2,000 troops to dislodge them. This they accomplished but at the cost of more than 1,000 killed

and wounded. The British paid tribute to the courage and tenacity which the rebels had shown. JAC

**Bunyan, John (1628–88).** Puritan author. Son of a brazier near Bedford, but mustered in a parliamentary levy and stationed at Newport Pagnell 1644–6, Bunyan resumed his father's trade, then suffered a severe religious crisis initiated by his wife's piety. Subsequently joining a nonconformist group in Bedford under John Gifford, he began to preach (1657). The Restoration revived hostilities against conventicles, so his refusal to give any undertaking not to continue preaching led to imprisonment for most of the next twelve years, until the \*Declaration of Indulgence (1672); the county gaol being less brutal than portrayed by legend, the enforced leisure produced a stream of theological and devotional works. After further brief confinement (1677), he became pastor of the Bedford separatist church, was nicknamed 'Bishop Bunyan' for his zeal in pastoral work and preaching, and continued to write. The vitality of \**Pilgrim's Progress*, written in gaol, made him a household name. ASH

**Burbage, Richard (c.1567–1619).** Actor. Son of an actor/manager, Burbage gained from his lifelong experience of permanent (then a novelty) rather than travelling theatre to become an outstanding actor, esteemed by playwrights and audiences. Talented, versatile, and a leading player in the Chamberlain's Men by 1594, his relationship with \*Shakespeare soon extended beyond that of fellow-players, or script-writer and player, as they shared the enterprise of constructing and running the \*Globe theatre in Southwark, where he mainly performed. Burbage's versatility and ability to get into the skin of a part (as in Richard III) was exploited by \*Jonson and Shakespeare, and led to demand for his services for new productions. Excelling in tragedy (Hamlet, Lear, Othello) despite small stature and some stoutness, he also acted in plays by Kyd, Webster, Beaumont and Fletcher, and was additionally a competent oil-painter. ASH

**Burdett, Sir Francis (1770–1844).** A wealthy, patrician landowner, Burdett was an outstanding example of gentry or Tory-radical leadership of popular radical movements. For 30 years (1807–37) he was MP for the radical borough of Westminster, championing the cause of parliamentary reform and speaking out against corruption and patronage. When he was imprisoned in 1810 for a breach of parliamentary privilege, troops had to be called to disperse the crowds, in a manner reminiscent of \*Wilkes. Burdett provided leadership for the radical reformers during the lean years of the Napoleonic wars; but when the parliamentary reform movement grew after 1816, with strong working-class roots in the industrial districts, his popularity waned. His ideas, like those of his early mentor \*Horne Tooke, were derived from the past, and he justified reform by appeals to antiquity and custom, and the historic 'rights of Englishmen'. JFCH

**Burford, battle of, c.752.** \*Æthelbald of Mercia was defeated by \*Cuthred of Wessex, enabling Wessex temporarily to extend its territories north of the Thames. Henry of Huntingdon gives a very detailed account, some of which may be authentic. On the evidence of place-names, Stenton denied that Beorhford could be Burford in Oxfordshire. Wessex's

gains were wiped out by \*Offa's victory at \*Benson c.777. JAC

**burgages** were forms of tenure. In the royal burghs of Scotland, they were properties held from the crown for rent and with the obligation of performing \*watch and ward. In England, they were properties in certain boroughs held freehold: in parliamentary boroughs they could carry the right to vote, which gave them a value far in excess of their economic worth. Before the \*Great Reform Act of 1832 there were 29 burgage boroughs. Since it was not difficult for patrons to buy up a majority of burgage properties, many burgage boroughs, particularly in Wiltshire and Yorkshire, were soon closed up and saw few elections: Thirsk was not contested between 1673 and 1832. The burgage boroughs had many idiosyncrasies. At Droitwich the properties were dried-up salt-pans; at Downton some of them were at the bottom of a stream into which the property had long since fallen; Old Sarum had only seven voters. In the 18th cent. patrons controlled the voters by issuing snatch-papers—title deeds to the property to be produced at the hustings to prove freehold, but at once taken away for safe keeping. In 1832 thirteen burgage boroughs lost both their seats and another nine lost one seat. See also BOROUGHs. JAC

**Burgh, Hubert de** (c.1175–1243). A younger son from a family of Norfolk gentry, he rose to govern Plantagenet England and marry a sister of a king of Scotland. Hubert entered John's service in the 1190s. His reputation was made by his obstinate defence of the castle of Chinon in Anjou against Philip Augustus in 1205. Appointed seneschal of Poitou in 1212 he held that province against French attack. Recalled to England he was appointed \*justiciar at the height of the \*Magna Carta crisis and remained in that office, with overall responsibility for the administration of England, until 1232. He played a decisive part in the war of 1215–17, first successfully resisting Prince Louis of France's long siege of Dover castle (1216–17), and then commanding the victorious English fleet at the August 1217 battle of \*Sandwich (or Dover) which finally ended Louis's hopes of becoming king of England. From 1219 onwards Hubert was the most influential figure in Henry III's minority government, successfully presenting himself as a moderate and patriotic Englishman opposed to the arbitrary excesses of foreigners such as Fawkes de Breauté and Peter des \*Roches. In 1221 he married, as his third wife, Margaret, sister of Alexander II of Scotland, and four years later was created earl of Kent. In 1232 his lifelong rival for royal favour, Peter des Roches, finally persuaded Henry to dismiss and imprison him. He made a dramatic escape from prison in 1233 and was reconciled to the king next year, but never recovered his former influence. JG

**Burghley, William Cecil, 1st Lord** (1520–98). Cecil, created Lord Burghley in February 1571, was the son of Lincolnshire gentleman Richard Cecil. After education at Grantham and Stamford grammar schools, he matriculated at St John's College, Cambridge, in 1535. He became part of the important humanist circle of Roger \*Ascham, Thomas \*Smith, John \*Cheke, and Walter Haddon. Cecil married

Cheke's daughter Mary in 1541. The same year he entered Gray's Inn. Mary died a year after the birth of their first son Thomas, but Cecil remarried in December 1545. His new wife was Mildred, daughter of the prominent protestant humanist Sir Anthony Cooke; Mildred, like Cecil, was a Greek scholar of some reputation.

His political career gathered pace after the early 1540s. According to Cecil's own chronology of his life, he sat in Parliament in 1543. He was knighted in 1551, and became a member of the Privy Council (and the principal secretary) from 1550 until 1553. He was central to the duke of \*Northumberland's reconstitution of the council. Cecil did not go abroad during the reign of Mary, but offered his diplomatic services in 1554 and 1555; still, he seems to have been a member of a group of crown critics in the Parliament of 1555 and spent the last three years of the reign privately in Wimbledon.

Cecil's public life began again in November 1558, when he started working on the day of Mary Tudor's death to secure a comfortable accession for Elizabeth. Until he was appointed lord treasurer in 1572, Cecil was principal secretary and the queen's private secretary. He was a key link between Elizabeth and her Privy Council: this meant hard administrative work—collecting and analysing information from diplomats, preparing council agendas, and drafting papers for Elizabeth—but it also put him in a position to press his own concerns in council and present them to the queen. Cecil was at the centre of the campaign in 1559–60 to support the protestant lords of the \*Congregation in Scotland. Like his Privy Council colleagues, Cecil wanted Elizabeth to marry and have heirs to settle the English succession; this was the central political issue of the decade because it involved Mary Stuart, her French connections, Scotland, and the competing ideologies of protestantism and catholicism.

Cecil was prepared to experiment with radical solutions to England's political problems. In 1563 he devised a plan for the 'interregnum' government of the Privy Council in the event of Elizabeth's death. He collaborated with Sir Francis \*Walsingham in 1584 to involve Englishmen in a 'bond of association' to take action in the event of Elizabeth's assassination by catholic foreigners; in fact, Cecil had privately worked out the project in 1569. Although the second part of his Elizabethan career—between 1585 and his death in 1598—is generally viewed as more 'conservative', Cecil was still active as a parliamentary patron, co-ordinator of the Privy Council, master of the court of wards (which he had held since 1561), and lord treasurer; on top of this, he held the more 'local' offices of lord-lieutenant and justice of the peace in the eastern counties. He became, in a very real sense, the elder statesman of the Elizabethan regime.

Cecil's reputation is mixed. Some of his earliest biographers and contemporaries—John Clapham, his 'anonymous' biographer, George Whetstone, and Hugh Broughton—emphasized Cecil's anxiety over England's Roman catholic enemies, his political success, and his patronage of learning. \*Macaulay argued that Cecil was purely an administrator, and this assessment stuck. Because Cecil

## burghs

did not flee abroad during the reign of Mary, historians have often assumed that he was not a strong protestant. In fact, he was part of a solid reformed culture at Cambridge; he knew and patronized radicals like Bishop John \*Hooper and an English printer of Calvin in the 1540s and 1560s, John Day. Cecil had a keen sense of providence and a strongly apocalyptic view of the struggle between the protestant and catholic European kingdoms.

Cecil understood Britain and knew its geography intimately; he wrote his own historical account of the imperial nature of the English crown in 1584 or 1585. He also patronized historians and scholars like William \*Camden. Socially, Cecil was determined to acquire the trappings of court, council, and noble status. He owned and built three houses—Cecil House in London; Burghley House in Northamptonshire; and Theobalds in Hertfordshire—and developed estates in Lincolnshire, Rutland, and Northamptonshire. He was interested in works on cosmography and genealogy and, as a political man with a classical education, owned a substantial library of Greek, Latin, and Italian books. SA

Read, C., *Lord Burghley and Queen Elizabeth* (1960).

**burghs**, a variant spelling of boroughs, is the Scottish term for privileged towns. David I is traditionally credited with the first foundations of royal burghs; after 1450, burghs founded by subjects (burghs of barony and burghs of regality) became more numerous. Scottish burghs differed in many respects from English boroughs: they were more uniform in their laws and customs; they had a more unified voice in national politics until 1707; and indeed the royal burghs (generally the most important towns) had their own \*Convention from the 16th cent. Furthermore, four burghs acquired universities between 1411 and 1583, so that until the 19th cent. Scotland had more university towns than England. Since 1707 the differences between English boroughs and Scottish burghs have diminished, but not altogether disappeared. DMP

**Burgoyne, John** (1723–92). Soldier and playwright. Of an impetuous Bedfordshire gentry family, Burgoyne was reputed to be the natural son of Lord Bingley. His career began with a runaway marriage to Lady Charlotte Stanley, daughter of the earl of Derby. The following year Burgoyne joined the army, retired in the 1750s, but rejoined at the start of the Seven Years War, serving with distinction in Portugal. In 1761 he was brought into Parliament for Midhurst, transferring in 1768 to Preston, a noisy open borough where the Stanleys had influence. He was fined £1,000 for violent conduct and was lucky to keep his seat. He spoke often in the House, shone in society, wrote verse and plays, and acquired the nickname 'Gentleman Johnny'. His big chance came with the war against America. The ambitious expedition from Canada down the Hudson valley was his own plan and he was appointed to the command. After a bright start, he was forced to surrender at \*Saratoga in October 1777. He returned to England to clear his name, declared that he was a scapegoat, and became a vocal member of the opposition. When the Rockinghams took office in 1782 he was made commander-in-chief Ireland, resigning in 1784. He

remained an active member of the Commons and in 1786 scored a stage success with *The Heiress*. Horace \*Walpole called him 'General Swagger' and wrote that 'he had a half-understanding, which was worse than none'. JAC

**Burke, Edmund** (1729–97). Whig politician and conservative political philosopher. Burke was born in Ireland to a catholic mother and protestant father. Brought up as a protestant, he was sent to a quaker school and then to Trinity College, Dublin. He studied law in London, but quickly turned his attention to writing. However, Burke's first love was politics and he became a member of Parliament in 1766. He remained an MP for virtually the rest of his life, and became a towering figure in the House of Commons, captivating his audience with spellbinding oratory. Burke had an unrivalled gift for portraying the wider significance of the issues of the day in terms of general principles, and as a result many of his speeches contain disquisitions on political philosophy. Indeed this was the way in which Burke understood the activity of political philosophy—as reflection on the principles which lay behind current political practice. He rejected the radical and utopian thinking of 18th-cent. writers such as Rousseau, who allowed their imaginations to run away with them, regarding them as little less than sacrilegious; for him the political traditions of a mature society were embodiments of the divine will. Moreover, for Burke, politics is the art of the possible; all social arrangements fall short of the ideal, but we should not reject them for that reason, since they may well be the best that are practicable in the circumstances.

Burke has often been accused of inconsistency. His stance on the plight of catholics in Ireland—he deplored their savage treatment by the protestant ascendancy—and of Indians in Bengal—he denounced the barbarisms perpetrated by the East India Company—is contrasted with his rejection of the idea of natural rights advanced by the French revolutionaries, and his defence of customary patterns of government. Similarly, Burke's sympathy for the American colonists chafing at the imposition of taxes by the British government appears to contradict his insistence on the sovereign authority of Parliament. However, if we bear in mind the above organizing ideas of his political philosophy, we can see that there is an underlying coherence in his writing. In his defence of the Irish catholics, the Bengali Indians, and the American colonists, Burke was not arguing that they had natural rights to determine their own destiny, or that the system of imperial authority exercised over them was fundamentally illegitimate. Far from it; what Burke was asserting was that there had been abuse of legitimate (i.e. traditional) authority, and that such abuse must be corrected to prevent a backlash which could lead to the overthrow of that authority. Similarly, we can see consistency in Burke's apparently contradictory endorsement of the 1688/9 Whig revolution in England, yet denunciation of the 1789 revolution in France. In both cases he sought to defend traditional modes of political authority. The Whig revolution in England was a revolution averted, in that it preserved the established Anglican state from an unconstitutional conversion by James II into a Roman catholic polity. By contrast the French

Revolution was a real revolution, perpetrated illegitimately against the wholesome foundations of a 'noble and venerable castle', the traditional and settled French state.

Burke's enduring reputation as a political thinker rests on the claim that he is the founder of conservative ideology. His *\*Reflections on the Revolution in France* (1790) is generally regarded as the epitome of conservatism, defending traditional political cultures. However, he recognized that some change was inevitable—indeed he held that a state without the means of change was without the means of its own conservation. He also strongly affirmed the modern principle of popular government. Although he was no democrat, Burke held that the primary organ of the British constitution was the House of Commons, and that Parliament owed its authority to the approval of the people.

As a practising politician and statesman, Burke also left his mark. His impassioned defence of the formation of political parties as a means of resisting the unconstitutional influence of the crown—he argued that when bad men combine, good men must unite—was an important step in the process of legitimizing party politics in Britain. This is not to say that Burke's endorsement of party loyalty was unconditional. On the contrary, he was himself responsible for splitting the Whig party over the issue of the French Revolution, by refusing to follow *\*Fox's* approval of the revolution, and he has been accused by historians of thereby depriving the Whigs of office for the next 40 years. Moreover, although he only held minor office (that of paymaster-general) for two short spells under Lord *\*Rockingham*, Burke exerted considerable influence on the government. His vehement condemnation of the revolution in France helped to stiffen anti-French policy in Britain. Similarly the sympathetic tone he adopted toward the American colonists contributed towards the *rapprochement* which was eventually reached by the British government. Finally Burke's obsessive pursuit of the impeachment of Warren *\*Hastings* in the House of Lords for his iniquitous rule as governor-general of Bengal, though it failed to secure Hastings's conviction, succeeded in creating an irresistible momentum for the subsequent reform of the East India Company.

Perhaps Burke's epitaph should be that he was an extremist in pursuit of moderation. TSG

Lock, F., *Edmund Burke* (Oxford, 1998).

**Burke and Hare.** Edinburgh's reputation for medical excellence was jeopardized in the 1820s by growing public vigilance against grave-robbing for dissection purposes. Rather than turn resurrectionists, Burke and Hare smothered a sick lodger and sold his body, before murdering a further fifteen vagrants and street folk in 1827–8 for similar gain; encouraged by the easy money forthcoming, they were helped by the anatomist Dr Knox's lack of suspicion at the freshness of the corpses. After the discovery of a body in Burke's bed-straw, Hare turned king's evidence, Knox remained silent, and Burke was hanged and publicly dissected. Their activities hastened the Anatomy Act (1832). ASH

**Burley-on-the-hill**, on open downland 2 miles east of Oakham (Rutland), is one of the most dramatic of 18th-century houses, its size enhanced by sweeping wings with recessed doorways, leading to outlying pavilions. The estate had once belonged to James I's favourite *\*Buckingham*, and was purchased in 1696 by Daniel Finch, earl of *\*Nottingham*, who began building at once to his own design, drawing on his Italian experience. It was completed by 1700, becoming the home of the 'dark, funereal Finches'. The vast courtyard is closed by a magnificent iron gateway, the work of Joshua Lord. Burley commands extensive views over the vale of Catmose. The gardens were reshaped in the 1790s by *\*Repton*, and the church, connected by a corridor to the main house, contains a fine sculpture of Lady Charlotte Finch (d. 1813) by *\*Chantrey*. JAC

**Burlington, Richard Boyle, 3rd earl of Burlington and 4th earl of Cork** (1684–1753). Patron and architect. Following visits to Italy in 1714–19, Burlington determined to restore *\*Palladian* architecture to the prominence it held in England during the time of Inigo *\*Jones*. Burlington's protégé was William *\*Kent*, and together they promoted Palladianism for the next thirty years. Burlington arranged for the publication of Kent's *The Designs of Inigo Jones* (1727) and after 1730 published Palladio's engraved drawings of Roman baths as *Fabbriche antiche disegnatte da Andrea Palladio*. Notable among Burlington's own buildings are the dormitory at Westminster School, London (1722–30, rebuilt 1947), and the Assembly Rooms, York (1731–2, refronted 1828), which is a model of Palladio's Egyptian Hall, based on Vitruvius. Examples of Burlington's collaboration with Kent include *\*Holkham Hall*, Norfolk (about 1734) and Chiswick House, Middlesex (from 1717), a Palladian villa whose garden layout and buildings reflect ideas expressed in Robert Castell's *The Villas of the Ancients, Illustrated* (1729) which was dedicated to Burlington. PW

**Burma** was ruled by the Alaungpaya dynasty from 1752 to 1885. Initially, the dynasty was expansionary, conquering (although failing to hold) Thailand and pressing west towards Arakan and Assam. However, it was severely checked and ultimately defeated by a counter-expansionary drive coming from the British in India. The British conquest of Burma was piecemeal, beginning in 1826 and not reaching completion until 1885. It partly came about as a reaction to deep Burmese hostility and the failures of 'informal empire'. But it also reflected growing economic ambitions. In colonial Burma, valuable resources of oil, tin, and rubber were more fully exploited and commercial rice cultivation was developed. Originally ruled as a province of British India, the country was given its own administration in 1937. Between 1942 and 1945, Burma was overrun by the Japanese—many of the British, famously, 'walking out' to India. After the war, hopes continued in the Colonial Office for a restoration of British dominance. However, an Anti-Fascist People's Freedom League had arisen under the leadership of Aung San to organize large-scale popular resistance to the Japanese. Now it was turned against the British. On 4 January 1948, the Independent Republic of Burma came into existence. DAW

## Burma campaigns

**Burma campaigns** (1941–5). These involved three issues. One commanded American support, the attempt to reopen the land route to nationalist-held China to strengthen resistance to, and prepare for an attack on, Japan. In 1944 the Japanese, by extending their conquests in China, made this strategy futile. The second involved guarding British-controlled India; the third the reconquest of lost British territories, particularly Malaya, rich in rubber and tin. In 1944 General \*Slim defeated a Japanese offensive and in 1945 \*Mountbatten's South-East Asia Command organized the reconquest of Burma followed by operation Zipper, landings in Malaya, shortly after the Japanese surrender. RACP

**Burmese wars.** The British in India fought three wars against the Alaungpaya dynasty (1752–1885), kings of Burma. The first, between 1824 and 1826, was a reaction to Burmese expansion which had reached Assam and was considered to threaten \*Calcutta. Following a victory notable for its heavy casualties, the East India Company annexed Assam, Arakan, and Tenasserim and established a resident at the royal court. The second war in 1852 was provoked by a revolt against interference in Burmese affairs by the resident and led to the annexation of Pegu. The third war, in 1885–6, was a response to the throne's attempts to promote anti-British sentiments and to establish friendly relations with the French in Indo-China. In its wake, the dynasty was displaced, upper Burma was annexed, and the whole of the country was ruled directly as a province of British India. DAW

**Burnell, Robert** (d. 1292). Clerical statesman. One of Edward I's chief advisers, Burnell was born at Acton Burnell in Shropshire, took holy orders, and came under the patronage of Edward when prince, accompanying him on many journeys. He acted as a guardian of the realm when Henry III died in 1272 while Edward was on crusade. On the king's return in 1274 he nominated Burnell chancellor, a post he held for the rest of his life. The following year he was made bishop of Bath and Wells. He took a prominent part in Welsh and Scottish affairs and in legal reform. By the end of his life he was said to have acquired more than 80 manors in nineteen counties. He was reputed to have fathered a number of children and, despite the king's powerful support, was passed over for promotion either to Winchester or to Canterbury. JAC

**Burnet, Gilbert** (1643–1715). Whig bishop and historian. Born in Edinburgh and educated at Aberdeen University, Burnet became professor of divinity at Glasgow at the age of 26. When he moved in the 1670s to London, he was for a time in favour with Charles II, whom he rebuked for 'sinful pleasures', but increasingly was involved with the opposition Whigs, and attended Lord \*Russell on the scaffold in 1683. He then moved to Holland, was in high favour with William of Orange, accompanied him on the expedition of 1688, and wrote the declaration on landing. His reward was the bishopric of Salisbury, which he held for the rest of his life. He was governor of Prince William of Gloucester, who died in 1700. Burnet's best-known historical work is the *History of my Own Time*, published posthumously

and dealing with the Restoration to the treaty of Utrecht. \*Macaulay made great use of it and offered a strong defence of Burnet's character and writings. A more scholarly work was the *History of the Reformation*, which used archival sources (1679) and for which Burnet received the thanks of Parliament. A large, powerful, and confident man, Burnet was a vigorous preacher and a diligent bishop. He was in the thick of controversy all his life, a thorn in the side of the Tories, and lived to see the Hanoverian succession established. JAC

**Burney, Charles** (1726–1814). Musical historian, composer, and organist, Burney was educated in his birthplace Shrewsbury and in Chester. In 1744 he went to London as apprentice to Thomas Arne, the composer of 'Rule Britannia', through whom he met \*Handel. In 1746 Burney was introduced to Fulke Greville, who bought out his apprenticeship, enabling him to continue his studies and develop his career as an organist and composer. He obtained an Oxford doctorate in 1769. Burney travelled widely in Europe, researching his *History of Music*, published between 1776 and 1789. The entertaining account of his travels (1773) established his literary reputation and helped ensure the success of the *History* in the face of competition from a similar work by Sir John Hawkins. His biography, written by his daughter Fanny, incorporating some of his memoirs, was published in 1832. JC

**Burney, Frances** (Fanny) (1752–1840). Novelist and dramatist. Frances was one of the daughters of music historian Charles \*Burney, in whose circle she met Samuel \*Johnson and Edmund \*Burke. A quiet observer of mankind, her first novel, *Evelina*, was published anonymously in 1778 and well received. The second, *Cecilia*, published in 1782, brought her society introductions, which led to a minor appointment at the court of Queen \*Charlotte in 1786. Five years later, to the surprise of her friends and family, she married General d'Arblay, an impoverished French refugee. Between 1802 and 1812 they lived in France, and at the time of Waterloo she was in Brussels.

Fanny Burney edited her father's memoirs, which were published in 1832. Her own *Early Diary* (1768–78), first published in 1889, includes sketches of Johnson, \*Garrick, and Mrs Thrale, and her later diaries, published 1842–6, give interesting insights into the court of George III, which she found dreary. JC

**Burns, John E.** (1858–1943). Trade union organizer and exponent of 'Lib-Labism'. Burns was born in south London. Despite little formal education he became an engineer, and involved himself in the Amalgamated Society of Engineers and more generally in working-class politics in London's dockland. An accomplished orator, he was one of the organizers of the great London dock strike of 1889, which marked a watershed in the development of trade unionism among unskilled manual workers. In 1884 Burns had joined the \*Social Democratic Federation, and acquired a reputation as a socialist militant. But by the 1890s he had broken both with Marxism and with trade unionism, supporting instead the furtherance of working-class interests within

the Liberal Party. Elected as an independent Labour MP for Battersea in 1892, in 1905 he accepted office as president of the Local Government Board in the newly formed Liberal administration. Burns resigned from the government in 1914, apparently in protest against the declaration of war with Germany. He retired from Parliament in 1918. GA

**Burns, Robert** (1759–96). Poet, son of an Ayrshire tenant farmer. Well educated by an enlightened parish schoolmaster, Burns grew up with an appetite for literature which constantly jostled with his love of the vernacular culture of his region and country. His first creative period coincided with his father's death in 1784, his own unsuccessful attempts at farming, and a passionate affair with Jean Armour. It culminated in the publication of the so-called Kilmarnock edition of his *Poems Chiefly in the Scottish Dialect* (1786). This carefully crafted selection of poems, which was designed to show that Scots could be used as a vehicle of polite literature, was a literary sensation and marks the beginning of a Burns cult that has survived and prospered until the present day. It earned Burns the quite unwarranted reputation for being an untaught natural genius and quickly established him as Scotland's national bard, the man whose loyalties to the refined polite conventions of the English neo-classical literary tradition and to the simplicities of vernacular verse seemed to typify the cultural dilemmas of educated and ambitious post-Union Scots. Being lionized in Edinburgh proved an unnerving and complicated experience for Burns, who was on the point of emigrating to Jamaica when marriage, the offer of a farm, and an appointment in the excise in 1789 made him decide to stay in Scotland. The second creative period of his career was marked by his contributions to James Johnson's *The Scots Musical Museum* (1789–1803). These took the form of more than 100 brilliantly and delicately reworked vernacular songs and lyrics which some modern critics think are the ultimate vindication of his claim that he had transformed the literary potential of Scots and, indeed, of vernacular literature generally. He died in poverty in Dumfries in 1796 at the age of 37. NTP

**Burton, Sir Richard** (1821–90). Traveller, Arabist, and great Victorian outsider, Burton joined the Indian army in 1842. In India he learned numerous languages and much obscure lore, not least about Islam. Hence he was credible when he travelled to Mecca disguised as an Arab in 1853. Now famous, he led an expedition to Harar in north-east Africa before being chosen by the Royal Geographical Society to lead their great east African expedition of 1856. Burton discovered Lake Tanganyika in 1858. He was led by increasingly acrimonious arguments with his companion \*Speke to insist for a time that Tanganyika was the source of the Nile. Burton was in fact happier as a traveller than as a strictly scientific explorer and his best monuments are more than 50 books with their masses of cultural information. He had tended to see Africans through the eyes of Arab traders, disliked the missionary approach to Africa, and favoured the racist outlook of the Anthropological Society. Later travels, sometimes as a British consul, took him to the Gold Coast, Mount Cameroon, Dahomey, Brazil, and the American West. He published translations of the *Arabian Nights* and

the *Kama Sutra*. This and other exploits shocked many Victorians, including his wife, who destroyed most of his papers. RB

**Bury St Edmunds and Ipswich, diocese of.** The see, roughly coterminous with Suffolk, was created in 1914 out of the \*Norwich diocese. Suffolk then had its own see for the first time since the \*Dunwich bishopric collapsed under the weight of the Danish invasions, though Hoxne and Bury St Edmunds are reported to have been sees in the 11th cent. St Edmund's abbey, founded by \*Cnut in memory of the East Anglian king martyred by the Danes (868), was from the first richly endowed and, with its 170 manors, ranked amongst the foremost in England. The cathedral at Bury St Edmunds is the former 15th-cent. Perpendicular parish church adjoining the tower of the ruined former Norman abbey. Transepts and central tower were added to the cathedral in the 20th cent.; further extensions were completed in 1990. The bishop's residence is at Ipswich. Suffolk is well known for its many magnificent parish churches. WMM

**Busaco, battle of**, 1810. After making peace with Austria by the treaty of Schönbrunn, Napoleon resolved to drive the English out of Spain and Portugal. Masséna was dispatched with a large force while \*Wellington prepared his defensive line at \*Torres Vedras. On 27 September 1810 Masséna, with considerable numerical superiority, launched an attack at Busaco, 125 miles north-east of Lisbon, but failed to make progress and took heavy losses. Wellington retired to Torres Vedras, from which he counter-attacked the following year. JAC

**buses** are road vehicles carrying passengers by short stages on fixed routes, picking up and setting down by request. The word is an abbreviation of 'omnibus'. They were introduced by Shillibeer to London from Paris in July 1829, carrying 20 passengers drawn by three horses, soon reduced for economy to two-horse traction, with twelve inside and three outside seats. During the 1830s and 1840s buses spread to Manchester, Glasgow, Birmingham, and other major centres. Successive reductions in their taxation 1842–70 raised capacity and reduced fares: the introduction of 'knifeboard' seats on the roof in the 1840s increased capacity to 22; and the double-deck, 'garden seat' horse-bus, which carried 26, proved the limit of its development. Expensive to run, buses were restricted to the middle-class market, and were uneconomic by comparison with trams, which relegated them to a support role in many towns. By contrast, in London where trams were excluded from the city, the bus predominated, and passenger journeys grew fivefold to 300 million, 1860–96.

The motor bus, introduced to Edinburgh in 1898, spread rapidly with more reliable and efficient designs from 1908, transformed the market, raising capacity and reducing fares, and democratized usage. In London passenger journeys reached over 750 million in 1914, near parity with the total for trams and trolleybuses, and had overtaken them by the early 1920s. With the two-horse bus team producing up to 8 tons of manure per annum, motorization was also critical to the cleansing of city streets, and the horse bus

disappeared from London in 1914, and everywhere else during the 1920s. By the late 1930s, there were 50,000 buses on the road, performing around two-thirds of road passenger journeys, and as many passenger miles as the railways.

Organizationally, growth outside London was chaotic before 1930: much bus business was highly competitive, with easy entry, variable standards, and the majority of firms operating pirate or irregular services; in some towns, by contrast, municipal or private operators enjoyed near monopoly. The London General Omnibus Company, a French foundation of 1855, experienced strong competition as motor vehicles were introduced, but re-established monopoly in the London Electric Railways grouping of 1912. Competition returned, from the *Chocolate Express* and around 200 others 1922–4, when it was restrained by Labour's co-ordinating regulation in the aftermath of a bus strike, and unification came with the London Passenger Transport Board in 1933. Elsewhere, the Road Traffic Act of 1930 introduced control and fostered concentration, and by 1939 the majority of services were provided by around 100 municipal operators, and the Tilling/British Electric Traction and Scottish Motor Traction private groups, both with substantial railway involvement. Britain was largely mapped out into regional monopolies or cartels such as Crosville, Ribble, and Southdown, akin to the situation in London, with strong backward linkages to manufacturers like Leyland and AEC.

Bus services were not nationalized directly by the Transport Act of 1947, but the British Transport Commission acquired railway bus interests under it (1948), and Tilling (1948) and Scottish Motor Traction (1949) by purchase. Many independent and municipal undertakings remained, along with the large group of British Electric Traction. Further acquisitions by BTC were debarred by legislation in 1953, when the Thesiger Committee also endorsed existing regulation by licence. Usage began to fall from 1952 in London, and from 1955 outside, as car ownership rose. The Transport Act of 1968 brought full public ownership of an industry half its 1952 peak, declining further to one-third by 1988. Local government reform in 1986 led to the breakup of this regime, and combined with doctrinaire deregulation to open the industry once more, producing in such cities as Glasgow a rainbow traffic jam of buses. By the mid-1990s the industry was less competitive, and was coming to be dominated by new private regional monopolies, as companies such as Stagecoach grew rapidly by acquisition. JCh

**Buss, Frances Mary** (1827–94). A pioneer of higher education for women, Frances Buss started teaching at 14. She entered Queen's College, London, in 1849 and went on to found the North London Collegiate School for Girls the following year. Starting with 35 pupils, a year later it had 135 and a long waiting list. Buss was a fervent supporter of women's suffrage and campaigned to have university examinations opened to girls, giving much help to Emily \*Davies in founding Girton College, Cambridge. Convinced of girls' intellectual equality with boys, she saw education as a means of providing women with careers and financial independence. In 1871 she added the Camden Lower School to the Collegiate. She was closely involved in establishing St

Hilda's Hall, Oxford, as well as lobbying the Schools Commission to regard education for women as part of its remit. A contemporary jingle, attacking Buss and her fellow-campaigner Dorothea Beale, hints at sternness of purpose:

Miss Buss and Miss Beale  
Cupid's darts do not feel.  
How different from us  
Miss Beale and Miss Buss.

PG; SMC

**Bute, John Crichton-Stuart, 3rd marquis of** (1847–1900). Philanthropist and scholar. Bute inherited the title and large estates at the age of 6 months. After education at Harrow and Christ Church, Oxford, he converted to the catholic church. Much of his time was devoted to the development of Cardiff docks and to the family estates in Glamorgan. He was twice mayor of Cardiff and president of the University College. In Scotland, he was a benefactor of Glasgow and St Andrews universities, and took a keen interest in Scottish history, on which he published. From 1892 to 1898 he was rector of St Andrews. A retiring disposition prevented him taking a prominent political role, but he is a good example of a late Victorian nobleman dedicated to university and municipal matters. The *Daily Chronicle* wrote, on his death, that 'there is probably no similar estate in the country where an immense commercial empire has been fostered on one man's property'. JAC

**Bute, John Stuart, 3rd earl of [S]** (1713–92). Prime minister. Bute served as tutor to the prince of Wales from 1755, thereby acquiring a level of influence which gave rise to political controversy after the latter's succession as George III in 1760. Initially holding only a court appointment, Bute rose to become secretary of state in 1761 and then 1st lord of the Treasury in May 1762 until his resignation the following April. Disheartened by the difficulties in implementing the theoretical reign of virtue which had so impressed his royal pupil, Bute gave up the struggle. If he therefore appears a political coward, some mitigating circumstances can be found in the campaign of vilification conducted against him. This offensive was grounded in blatant anti-Scottish prejudice and included the scurrilous accusation of sexual involvement with the king's mother. Political antagonism towards Bute continued after his resignation; and exaggerated fears about his influence (as a 'minister behind the curtain') destabilized the administrations of both \*Grenville and \*Rockingham. The Bute myth provided some understandable consolation for politicians who found themselves excluded from power, but, in the case of the Rockinghamites, it also supplied the starting-point for a broader ideology of opposition to secret influence. The precise date at which Bute ceased to hold any sway over the king cannot be absolutely determined; that his influence was waning towards extinction from as early as 1765 is plausible, not least because the king outgrew his earlier dependence. Bute was by no means an incompetent statesman and his diplomacy leading to the peace of \*Paris of 1763 is now recognized on its merits. Beyond the sphere of politics, he was not only a patron of education, literature, and the fine

arts, but also a keen student of science, with a particular interest in botany. DW

**butler.** The Norman office of chief butler did not develop into one of the great offices of state. The main duty was to supervise the coronation banquets, which were abandoned after the fiasco of 1821. In England the office was hereditary in the earls of Arundel and their successors the dukes of Norfolk. The chief butler of Ireland gave the name to the Butler family, earls and dukes of Ormond. JAC

**Butler, Joseph** (1692–1752). Bishop. Butler attended a dissenting academy in Gloucestershire before conforming to the Church of England and graduating from Oriel College, Oxford. He advanced in his profession under the patronage of Bishop Talbot (of Salisbury and Durham) and Lord Chancellor Talbot, and also gained the favour of Queen Caroline, who commended him to George II on her deathbed. He was appointed bishop of Bristol in 1738, dean of St Paul's in 1740, and bishop of Durham in 1750. His major publications were *Fifteen Sermons* (1726) and *The Analogy of Religion* (1736). His contribution to the deistic controversy stressed the role of conscience in opposition to Hobbesian self-interest. Though Butler's reasoning was greatly admired, for example by \*Gladstone, who spent the last years of his life editing his works, he assumed too readily that conscience always speaks clearly and that it says the same thing in all societies, and his argument that conscience and self-interest necessarily coincide seems facile: 'conscience and self-love, if we understand our true happiness, always lead us the same way.' JAC

**Butler, Josephine** (1828–1906). Campaigner for women. Born in Northumberland, daughter of John Grey, a political agent for the Whigs, she married George Butler, an academic and later dean of Winchester, in 1852. She first took up philanthropic work amongst poor women in Oxford and continued it after moving to Liverpool in 1864. She became president of the North of England Council for the Higher Education of Women (1869–70) and secretary (1869–85) of the Ladies' National Association for the Repeal of the Contagious Diseases Acts, passed in 1866–9 to regulate prostitution in garrison towns and ports. She campaigned against this abuse of women's rights and its double standard of morality until repeal in 1883–6. In 1874 she took up the cause of girls exported for prostitution, and later supported W. T. Stead's National Vigilance Association. She withdrew from public life after the death of her husband in 1890. ER

**Butler, Richard Austen** (1902–82). Born in India and educated at Cambridge, 'Rab' Butler entered Parliament in 1929 as MP for Saffron Walden. As president of the Board of Education he was responsible for the Education Act (1944) which introduced a tripartite secondary system and the '11-plus' examination. During his time as chairman of the Conservative research department, Butler helped to reconcile the Tories to the welfare state, reviving their fortunes in the post-war era. He served in all three of the great offices of state, as chancellor (1951–5), home secretary (1957–62), and foreign secretary (1963–5). He was twice passed over for leadership of the party in favour of \*Macmillan in 1957 and

Douglas-\*Home in 1963. Butler retired from politics in 1965, became a life peer, and accepted the mastership of Trinity College, Cambridge. RAS

**Butler, Samuel** (1612–80). Poet and satirist. Few records of Butler's life survive, but after education at Worcester he served as clerk or secretary to a succession of noble families, gaining easy access to libraries. His commonplace books, however, say much about his ideas and opinions: in many respects a Baconian, with a practical and realistic outlook though temperamentally gloomy unless stimulated by claret, he was deeply conscious of the self-deception, hypocrisy, and folly of mankind. His scepticism found outlet in satire, where even the newly founded \*Royal Society was mocked. Publication of the burlesque \*Hudibras (1662) brought a brief period of fame before he relapsed into comparative obscurity again. Although the legend of his poverty and neglect was probably exaggerated, it was not until 1677 that a royal pension was forthcoming, and he died poor and disappointed. ASH

**Butler, Samuel** (1835–1902). Butler's grandfather was a bishop and his father a canon of Lincoln and he would have followed them into the church had he not developed religious doubts after graduating with a first from St John's College, Cambridge. He then spent five years sheep-farming in New Zealand, partly to escape from his father. Butler had many talents, was a very competent painter and photographer, and wrote music. As a man of letters, he turned to many forms, including scientific exposition, poetry, theological disputation, Greek translation, art, and travel. His first success was a satirical novel *Erewhon* ('Nowhere'), published in 1872, and depicting a country in which illness was a crime and the use of machinery forbidden. His posthumous novel *The Way of all Flesh* (1903) was written over many years and is partly autobiographical. It contained thinly disguised and brutal portraits of his father and grandfather—'could any decrepitude be so awful as childhood in a happy, united god-fearing family?'. That Butler was 'in an odd way dependent on the disapproval of his father' is a perceptive comment. JAC

**Butt, Dame Clara** (1872–1936). English contralto, who studied with Daniel Rootham and at the Royal College of Music with J. H. Blower. Her first major success was as Orpheus in Gluck's opera at the Royal College in 1892, a role she recreated in 1920 at Covent Garden under \*Beecham, the year in which she was made DBE for wartime services to charity. Her career, however, centred on the concert platform, where her tall, imposing figure was matched by a powerful voice with a strident lower register. She was particularly associated with the music of Elgar, singing the première of his *Sea Pictures* (Norwich, 1899), conducted by the composer, in a dress reminiscent of a mermaid. ECr

**Butt, Isaac** (1813–79). Founder of the \*Home Rule movement. At the outset of his political and legal career, Butt was a vigorous defender of an Orange Toryism. Increasingly, however, his unionism and his commitment to property right were tinged with a strong national feeling: this was encouraged by the haphazard nature of government

## Butterfield

action during the years of the Great Famine. Defending the \*Young Irelanders in May 1848, he urged that the detrimental economic consequences of the British connection might be offset through a subordinate parliament in Dublin. Although he sat for Youghal in the House of Commons (1852–65), he languished for a time on the margins of national politics. His defence of the \*Fenian conspirators in 1868 restored his patriotic reputation. His federalist sympathies and broad political appeal were most clearly evident in his Home Government Association (1870): he was returned to Parliament in 1871 as a Home Ruler, representing Limerick. Butt helped to create a national organization for his cause through the Home Rule League (1873), but by the time of his death in 1879 he had been superseded by angrier and more militant lieutenants. AJ

**Butterfield, William** (1814–1900). Architect. Undoubtedly the most original of Victorian Gothic Revival architects, though not to the taste of those who like their buildings restrained. He was greatly influenced by \*Pugin, and his early churches were at least as stylistically correct as the latter's. He then discovered north Italian Gothic, however, which seems to have liberated his spirit. His first characteristic masterpiece is All Saints, Margaret Street, in his native London (1859); his most famous—or notorious—is Keble College, Oxford (1873–6), to which a common reaction is 'Who knitted it?'; and his biggest single building is that part of Melbourne Anglican cathedral (1877–84) which was built before its commissioners lost their nerve and contracted a duller architect to finish it. All are distinguished by their polychromaticism, and by their Anglo-catholic atmosphere; although in fact Butterfield hated ritual, and never worked for the Roman church on principle. Photographs of him make him appear dour, and he lived a monkish kind of life. BJP

**Butterworth, George** (1885–1916). English composer and one of countless examples of the pity and waste of war. Educated at Eton and Trinity College, Oxford, Butterworth was a leading member of a group of musicians, including Cecil Sharp and Ralph \*Vaughan Williams, interested in English \*folk-song. His compositions were few and small scale, but Butterworth developed a distinctive voice, with a full and at times lush orchestration in his idylls *A Shropshire Lad* (1912) and *The Banks of Green Willow* (1913). In his setting for \*Housman's poem 'The lads in their hundreds to Ludlow come in for the fair', Butterworth paid moving tribute to 'the lads who will die in their glory and never be old'. At the outbreak of war in 1914 he joined up, was awarded the MC, and died in action on the Somme on 5 August 1916. Vaughan Williams dedicated to his memory the Second ('London') Symphony. JAC

**Buxton, Thomas Fowell** (1786–1845). Anti-slavery campaigner and quaker philanthropist, Buxton married Hannah Gurney (sister of Elizabeth \*Fry). In 1808 he joined the quaker brewers Truman, Hanbury & Co. (his mother was a Hanbury), which brought him into contact with the London poor of Spitalfields. Elected MP for Weymouth (1818–37) he advocated prison reform and ending the death penalty for

forgery. He was a founder of the \*Anti-Slavery Society in 1823, taking over from \*Wilberforce as its parliamentary spokesman the following year. He carried resolutions in the Commons against slavery in 1824 and 1831, leading to the successful bill for gradual abolition in 1833. In 1836 he moved an inquiry into the apprenticeship system which was being introduced in place of slavery. Following his electoral defeat in 1837, he devoted himself to the ill-fated Niger expedition designed to end slavery in Africa. He was made a baronet in 1840. ER

**Bye plot**, 1603. James VI and I, plagued by plots in Scotland, was confronted by fresh ones as soon as he arrived in his new kingdom. The Bye plot was a hare-brained scheme, hatched by William Watson, a catholic priest, to seize the king at Greenwich and force him to grant a general toleration. It fizzled out, but the subsequent investigations led to the \*Main plot, which brought down Lord Cobham, \*Cecil's brother-in-law, and \*Raleigh. JAC

**Byland, battle of**, 1322. The victory of his supporters at \*Boroughbridge in March 1322 encouraged Edward II to undertake another campaign against the Scots in the summer. After besieging Berwick without success, he retired, pursued by Robert I Bruce. While the king was at Rievaulx abbey, Bruce's men attacked over the hills from Northallerton. They dispersed the royal rearguard at Old Byland, just west of Rievaulx on 14 October, but Edward escaped to York, losing most of his personal possessions. The battle was no more than a skirmish, but a king of England in flight in his own country was mortifying. JAC

**Byng, George, 1st Viscount Torrington** (1664–1733). Byng entered the navy at 14 from a family in straitened circumstances. In 1688, while serving as a lieutenant in \*Dartmouth's fleet, he acted as intermediary with William of Orange and was rewarded with his own command. By 1703 he was rear admiral and was brought into Parliament in 1705 for Plymouth. From 1709 he was a lord of the Admiralty and commanded squadrons frustrating Jacobite invasions in 1708 and 1715. In 1718 he became admiral of the fleet and the same year won a crushing victory over a Spanish force at \*Cape Passaro, though he was assisted by the ineptness of Spanish tactics. He was given his viscounty in 1721 and served as 1st lord of the Admiralty from 1727 until his death. His fourth son was the ill-fated Admiral \*Byng. JAC

**Byng, John** (1704–57). Byng's naval career got off to a flying start. He was a younger son of Viscount Torrington (George \*Byng), the hero of the naval victory over the Spaniards at \*Cape Passaro and 1st lord of the Admiralty 1727–33. He entered the navy at 14, was present at Cape Passaro, and reached rear admiral in 1745. Six years later he was brought into Parliament as a government supporter for Rochester. On the outbreak of war in 1756 he was dispatched to the Mediterranean with a squadron to protect \*Minorca, under threat from the French. He found an enemy force landed on the island and a French fleet cruising outside. Byng's ships engaged the enemy but came off worse and Byng retired to Gibraltar, leaving Minorca to its fate. When it surrendered, the outcry was thunderous. Byng was recalled at once,

court-martialled, and sentenced to death for not doing his utmost to engage, though with a recommendation to mercy. The recommendation was ignored and he was shot on the quarter-deck of the *Monarque* in Portsmouth harbour. Byng died with courage and composure and the memorial at Southill insisted that he had been the victim of political persecution. Voltaire's *Candide*, published in 1759, contained the famous observation that the English liked to shoot an admiral from time to time, *pour encourager les autres*. JAC

**Byrd, William** (c.1543–1623). Britain's leading composer during the Elizabethan and Jacobean periods, Byrd's large, varied output included English anthems and consort songs, Latin motets and masses, and keyboard and instrumental consort music. A pupil of Thomas \*Tallis, he was appointed organist and choirmaster at Lincoln cathedral in 1563. In 1570 he became a gentleman of the Chapel Royal, where he was joint organist with Tallis, with whom he was granted a royal monopoly of music printing. Byrd published three collections setting English texts (1588, 1589, and 1611), yet he wrote few true madrigals, preferring the contrapuntal consort song for solo voice and viols (such as the elegy 'Ye sacred muses', written on Tallis's death in 1585).

Byrd's finest music was inspired by Latin texts. He was regularly listed as a recusant, virtually retiring from the Chapel Royal (where Elizabeth allowed Latin in the services) to live in Essex close to leading members of the catholic nobility. His two books of *Gradualia* (1605, 1607) supply music for the proper of the mass, complementing three masterly settings of the ordinary, whose finely balanced counterpoint matches the best of Palestrina and Lassus. Many of Byrd's Latin motets set penitential texts, treating Jerusalem as a metaphor for catholic England with powerfully expressive music. Joyful exuberance, however, per-

vades works like the madrigalian 'Laudibus in sanctis', as it does his virtuoso keyboard variations. ECr

**Byron, George Gordon, 6th Baron Byron** (1788–1824). Succeeded to the barony and Newstead abbey in 1798. After Harrow and Cambridge he embarked on the grand tour and a life of dissipation which provided material for his verses, in 1812 waking to find himself famous with the publication of the first two cantos of *Childe Harold*. In politics associated with the \*Holland House set, his maiden speech was on the Nottinghamshire frame-breakers' bill, but he left England in 1816 after separating from his wife, heiress Annabella Milbanke. On the continent he befriended \*Shelley, was present at the inception of *Frankenstein*, and published a stream of verse romances refining the features of the 'Byronic hero', a gloomy self-projection of their author, which shocked and fascinated Regency England. Affecting an aristocratic disdain for writers who were 'all inky thumbs', he was a more serious artist than he admitted. Saluted in Italy as 'il poeta della rivoluzione', in 1824 his love of liberty took him to fight in the Greek War for Independence. He died of fever at Missolonghi, his masterpiece *Don Juan* unfinished. Though the obituaries regretted such 'elaborate lampoons', the 20th cent. generally preferred his more satirical vein. JNRS

**Byron, John, 1st Baron Byron** (1599–1652). A royalist commander in the Civil War, Byron was one of seven brothers who fought for the king. He was in action as a cavalry commander at \*Edgehill, \*Roundway Down, the first battle of \*Newbury, and at \*Marston Moor. Defeated at \*Nantwich in January 1644, Byron managed to hold Chester for the king until February 1646. He then retired to Caernarfon castle, which he surrendered in June 1646. The rest of his life was spent in exile. JAC

**cabal.** Word meaning secret clique or conspiracy, given to Charles II's administration of 1671–3 which covered the time of the third \*Anglo-Dutch War, the alliance with Louis XIV, and the suspension of the religious penal laws. The cabal was not a cabinet or unified ministry. The ministers, whose initials formed the word cabal, each had different principles and objectives. Lord \*Clifford, who climbed from being a poor Devonshire squire to become lord treasurer, became a catholic and advocated war to seize Dutch commercial wealth and to make the crown more absolute. \*Arlington, a courtier and careerist, always tried to implement what he interpreted as Charles's wishes. \*Buckingham wanted to become chief minister: he affected popularity and favoured religious toleration. Lord Ashley, advanced to be earl of \*Shaftesbury, also advocated toleration. The cynical \*Lauderdale governed Scotland for Charles. The cabal disintegrated under parliamentary pressure in 1673: Clifford died, Buckingham and Shaftesbury went into opposition. JRJ

**cabinet.** The executive committee of the government, appointed by and answerable to the \*prime minister. It evolved in the later 17th cent. out of the \*Privy Council, which had become too large and too miscellaneous to be efficient. During Anne's reign, the inner group of ministers called themselves the cabinet when the queen was present, the lords of the committee when she was not. In 1710/11 there were 62 cabinet meetings and 106 committee meetings, the attendance at cabinet averaging eleven and at the committee five or six. Two developments of crucial importance were the withdrawal of the monarch from attendance during George I's reign, allowing the first minister to take the chair and impose his views on his colleagues, and the slow growth of the principle of cabinet solidarity.

In the 18th cent., the cabinet was overwhelmingly aristocratic. George \*Grenville in the 1760s had a cabinet of nine, in which he was the only commoner—yet he was the nephew of a viscount and younger brother of an earl. Not until the later 19th cent. did commoners predominate: in 1892 \*Gladstone's cabinet had five peers and twelve commoners. Like most committees, the cabinet has tended to grow, with periodic attempts to prune it, particularly in wartime. The Fox–North coalition in 1783 had seven cabinet members; \*Liverpool in 1812 had thirteen; \*Peel in 1841 had fourteen; \*Salisbury in 1895 had nineteen; \*MacDonald in 1924 had 20, and John \*Major in July 1995 had 23. JAC

In \*Bagehot's words, the cabinet links the legislative part of the state to the executive. Its members are normally drawn from the majority party in the House of Commons, together with some peers: at the same time, they head the executive departments and effectively constitute the leadership of the party. The government as a whole consists of about 100 ministers, ministers of state, junior ministers, and whips: as a body, it never meets. The decisions of the cabinet are the decisions of the government. Its internal disagreements are governed by the hallowed doctrine of collective responsibility, which declares that decisions taken by the cabinet are binding on all its members, and indeed on all members of the government. A minister who disagrees with his cabinet colleagues may express those differences within the cabinet room, but unless he resigns, he may not voice them outside. To the world beyond, the cabinet presents a united front, however harsh the disputes may have been.

The 20th cent. saw the transformation of the 19th-cent. cabinet under the twin impact of war and welfare. The First World War led to the introduction of the cabinet secretariat, one of whose tasks was to minute the decisions of the cabinet. What is remarkable is that the cabinet had for so long been run on the basis of human memory. The exigencies of war meant that the cabinet could no longer work in such a casual way, but the growing functions of the state in economic and social matters would, in any case, have required the development.

The extension of the state's functions imposed a further burden on an institution better suited to the minimal state of the 19th cent. Committees had long been a feature of the cabinet but they were *ad hoc* and temporary. The modern system of permanent standing committees of the cabinet dates effectively from the Second World War. Small committees of ministers, chaired by either the prime minister or a senior member of the government and including ministers not in the cabinet, deal with matters too important, too sensitive, or too broad to be determined within a single department. Over the years the system developed, so that by 1995 there were nineteen cabinet committees or subcommittees. These included the committee on economic and domestic policy, chaired by the prime minister; another on the environment, presided over by the deputy prime minister; and a committee on public expenditure whose chairman was the chancellor of the Exchequer.

These committees have, in effect, become subcabinets. Membership is small and largely consists of those ministers whose departments are most closely concerned. Their brief is to resolve as many issues as possible without going to the full cabinet, and if they cannot reach a decision to refer the question to that body. The powers of cabinet committees are therefore extensive and the principle of collective responsibility applies as forcefully there as to the cabinet itself.

The permanent committees are not the only way in which decisions are taken outside the full cabinet. Quite apart from decisions ministers reach in their departments, decisions may be taken by officially constituted *ad hoc* committees or by the prime minister after consultation with another minister or after discussion with informal groups of ministers. Many decisions going beyond departmental boundaries, or involving questions of general government policy, are taken outside the traditional full cabinet.

The crucial problem of 20th-cent. cabinet government was to adapt an institution which developed in the 19th cent. Though the cabinet has grown in size in absolute terms, a smaller proportion of ministers are appointed to it. Cabinet committees were one response: another solution has been to create super-ministries, e.g. the Department of the Environment, headed by a secretary of state who sits in the cabinet, containing a number of subordinate ministers who, in earlier years, would have been heads of their department and would have had a seat in the cabinet.

The growth of cabinet committees has meant that the cabinet itself no longer has the central importance it once had. 'Cabinet meetings', said Nigel Lawson, former chancellor of the Exchequer, 'are ninety per cent of the time a dignified [rather than an] efficient part of cabinet government.'

Recent discussion has emphasized the increasing power of the prime minister and the declining status of the cabinet. The argument has perhaps been overdone, but there is little doubt that during the 20th cent. the office of prime minister expanded in power, partly at the expense of the cabinet. However, the cabinet remains the ultimate court of appeal within the government. Moreover, it remains, along with Parliament and in certain fields the judiciary, one of the organs which confers legitimacy possessed neither by cabinet committees nor by the prime minister himself. HB

**Cabot, John** (d. 1498) and **Sebastian** (1474–1557). Much obscurity surrounds the lives of the Cabots, father and son, and their precise roles in the discovery of the Americas. But they discovered and defined the north-east American coast as part of a continent and Sebastian set the British on the long and fruitless search for polar passages to the Orient. Genoese born, but working for Venice and Spain, John came to Bristol in 1493 and was inspired by Columbus to try to cross the Atlantic. After one failure, he reached Cape Breton and Newfoundland in the *Matthew* in 1497, thinking initially that he had reached Cathay. He died on an attempted repeat voyage. Sebastian may have been with him in 1497 but certainly attempted the North-West Passage to the Orient in 1508. Possibly he reached the entrance to Hudson's Bay before navigating to a disputed extent south-

wards along the North American coast. With a decline in English interest, Sebastian sailed with a Spanish expedition to the river Plate in 1526–30 and was influential as a cartographer and trainer of pilots. In 1547, he returned to English service, advised on maritime matters, and helped to found the Company of \*Merchant Venturers which, in searching for a North-East Passage, opened up trade with Russia. RB

**Cade, Jack** (d. 1450). Leader of Kentish rebellion. Cade's identity remains a mystery. Military experience is suggested by his capacity to organize, lead, and attempt to discipline the thousands of men from Kent and adjoining counties who began to rise late in May 1450. He adopted the name of John Mortimer, apparently for propaganda purposes: there is no proof that he had any connection with that family or its head, Richard of \*York. Cade harnessed a seemingly spontaneous movement of protest against the incompetence and corruption of Henry VI's government which, divided and demoralized, could not prevent the rebels entering London on 3 July. Here Cade's control of his followers crumbled, the citizens united to expel them, and the rebels were persuaded to accept pardons and disperse. Although himself pardoned (as 'Mortimer'), Cade remained belligerent and was fatally wounded when resisting arrest on 12 July. RLS

**Cadoc, St.** A leading 6th-cent. Welsh scholar. Trained by an Irish monk in Wales, he sought further instruction in Ireland, allegedly under Mochuta, abbot of Lismore, returning to study rhetoric at Llanspyddyd. His principal foundation at Llanccarfan became a centre of religious and literary learning. Cadoc is known for his use of didactic aphorisms (e.g. 'conscience is the eye of God in the soul of man'), possibly reflected in a 17th-cent. collection of early Welsh sayings entitled 'The Wisdom of Cadoc'. An 11th-cent. biographer claims travels and foundations in Scotland, Cornwall, and Brittany. Cadoc's reported martyrdom in Italy is doubted. AM

**Cadwaladr** (d. 664), Welsh king. Son of \*Cadwallon who devastated Northumbria before being killed by King \*Oswald in 634, Cadwaladr himself suffered a serious defeat by the West Saxons at Pinhoe near Exeter in 658. His death in the widespread plague of 664–5 seems to mark the end of British hopes of recovery from the Saxon invasion. Though his deeds are not recorded, he is a significant figure in later prophetic poems, becoming, like King \*Arthur, a semi-mythical hero, one who would rise again and lead his people to victory. The 12th-cent. \*Geoffrey of Monmouth's *Historia regum Britanniae*, which ends with Cadwaladr's death, and his 'Life of Merlin' also popularized such prophecies. Said to be peaceful and pious, Cadwaladr is the dedicatee of a number of churches in Wales, the church of Llangadwaldr in Anglesey claiming him as patron saint and founder. AM

**Cadwaladr** (d. 1172), prince of Gwynedd. Son of \*Gruffydd ap Cynan and younger brother of \*Owain Gwynedd, Cadwaladr played a prominent but tortuous role in 12th-cent. Wales. In 1137 he seized the northern part of Ceredigion but was prevented by the resistance of Cardigan castle from overrunning the south. Next he plunged into the English civil war on the side of the Empress \*Matilda, pos-

## Cadwallon

sibly because of a marriage connection to Ralph, earl of Chester, and was present at \*Lincoln in 1141 when Stephen was captured. He was then involved in serious family quarrels in Wales—first with his brother Owain in 1143 and then with two nephews who attacked his territory of Ceredigion. A fresh quarrel with Owain in 1152 drove him into exile in England until Henry II insisted on his restoration in 1157. Cadwaladr took part in the attempt to subdue \*Rhys ap Gruffydd of Deheubarth, who had thrown off allegiance to Henry II (1159), but joined Owain and the other Welsh princes in resisting Henry's second campaign in Wales, which ended in English withdrawal. Cadwaladr was clearly of consequence but his hold on power was precarious. JAC

**Cadwallon** (d. 634), king of Gwynedd. With his ally \*Penda of Mercia, Cadwallon was responsible for the death of \*Edwin of Northumbria at the battle of \*Heathfield in 633 and for those of his successors Osric of Deira and Eanfrith of Bernicia the following year. In 634 he was himself defeated and slain by Eanfrith's brother \*Oswald at the battle of \*Heavenfield, near Hexham. Not surprisingly Cadwallon gets a consistently bad press in \*Bede's *Ecclesiastical History*, especially for his brutal ravaging within Northumbria. In Welsh poetry he is celebrated as a 'lion of hosts over the Saxons' and his hostility to Northumbria is explained as a reaction to previous attacks on north Wales by the deceitful Edwin. BAEY

**Cadwgan** (Cadogan) (d. 1111), Welsh prince. Cadwgan was one of the sons of Bleddyn ap Cynfyn who ruled Gwynedd and Powys from 1063 to 1075. He began in the 1080s by waging war against \*Rhys ap Tewdwr of Deheubarth, who was killed in 1093 by the Normans. The following year Cadwgan led a great counter-attack against the Norman advance in Wales, in league with \*Gruffydd ap Cynan, king of Gwynedd. A number of castles were seized, much of the Hereford–Gloucester border overrun, and Rufus himself led two expeditions to restore control. In 1102 Cadwgan joined with \*Robert of Bellême, earl of Shrewsbury, in revolt against Henry I but was defeated. The last years of his life were taken up with the activities of his son Owain, who in 1109 abducted Nest, wife of Gerald of Windsor. This led Henry to depose Cadwgan and he was murdered by his nephew's followers while trying to re-establish himself in Powys. JAC

**Cædmon** (d. 680). An elderly uneducated herdsman at the monastery of Whitby who, in a dream, miraculously received the gift of composing vernacular religious poetry. When he awoke, he remembered his song in praise of God the creator and added more verses. Learning of his new-found ability, the abbess \*Hilda took him into the monastic community to receive instruction. He learned about Old Testament history, the Gospels and apostolic teachings, the Last Judgement, heaven, hell, and the judgements of God. According to \*Bede, what he learned he turned into vernacular poems and songs. Only a few lines survive, recorded by Bede in his *Ecclesiastical History*. In an age when few could read or write, much less understand ecclesiastical Latin, Cædmon must have made a valuable contribution to

the propagation of the Scriptures and Christian doctrine. AM

**Cædwalla** (c.659–89), king of Wessex (685–7). A member of the royal kin of Wessex, Cædwalla is first met as an exile in the wild lands (*deserti*) of the Chilterns and the Weald. He made himself king of Wessex and extended his power widely. In particular he conquered the Isle of Wight, exterminating its royal dynasty. In this conquest he was associated with the great bishop \*Wilfrid. Not long after, he abdicated and went to Rome. There he was baptized, died, and was buried in St Peter's with a noble Latin epitaph. Anyone who claims to understand the inwardness of 7th-cent. England should think again about Cædwalla. JCa

**Caen, treaty of**, 1091. On his death-bed in 1087 William the Conqueror gave England to his second son William Rufus, and the duchy of \*Normandy to his first son, \*Robert. But each retained estates and supporters in the other's territories and relations broke down. In 1091 Rufus led an expedition to Normandy, forcing Robert to a treaty at Caen or Rouen. Rufus kept his Normandy possessions, but agreed to help Robert recover lost estates in Cotentin and Maine. Each named the other as successor should there be no children. They joined forces to dispossess their younger brother Henry (later Henry I) in Cotentin but by 1094 were at war with each other again. JAC

**Caerleon** in Gwent was the legionary base of the *legio* (Roman legion) *II Augusta*. It became its permanent headquarters in the mid/late 70s AD, probably under the governor \*Frontinus, subsequent to its postings at Exeter and Gloucester. Excavations at Caerleon have revealed impressive structures such as the military bath-house. Epigraphic and literary evidence connected with Caerleon has provided invaluable insights into the workings of both legion and province. An inscription from Goldcliff, a few miles from the fortress, implies that *II Augusta* was involved in the reclamation of waterlogged land. An inscription on a statue-base from nearby \*Caerwent records that it was set up 'by decree of the council of the *civitas Silurum*' to Tiberius Claudius Paulinus, a legate of *II Augusta* at Caerleon, who went on to become governor. Two Christian martyrs, Aaron and Julius, died at Caerleon during the 3rd-cent. persecutions. ES

**Caernarfon castle** (Gwynedd) was begun in June 1283 during the second Welsh War. In its form Caernarfon is different from any of the other Edwardian castles and, it can be argued, its distinctive features are deliberately symbolic of Edward I's political attitudes and his ambitions in Wales. First, Edward always maintained that his conquest was merely the reassertion of established right. Caernarfon castle incorporates the ancient motte of the castle of Hugh, earl of Chester, built at the end of the 11th cent. during the first Norman penetration into Wales, and thus resumes a lordship symbolized by the earlier fortification. Secondly, national monarchies of the time viewed their own power in imperial terms. Thus lawyers of Philip IV in France insisted that 'the king of France is emperor in his kingdom' and it is certain that Edward shared this interest. Caernarfon's Chris-

tian Roman associations were consciously fostered. The site of Caernarfon is Roman Segontium. In 1283, during building work, a body, thought to be that of \*Magnus Maximus (383–8), alleged father of the Emperor \*Constantine, was discovered and, on Edward's orders, reburied in the new church in the town. The castle, alone among the Welsh castles, was built with polygonal towers and banded masonry, imitating the land walls at Constantinople, believed at that time to be the work of Constantine himself. The king's tower in the castle, seat of government in the principality, was decorated with imperial eagles. Finally, Edward chose the castle to be the birthplace of his son, the future Edward II, but also Edward of Caernarfon and the first English prince of Wales. LR

**Caernarfonshire.** County of north Wales. It was part of the tribal territory of the Celtic Venedotae, later the Welsh kingdom of \*Gwynedd. 'Arfon' is the land over against Môn (\*Anglesey) and the county's name is derived from the Roman fortress *Castrum* (or *Caer*) of Segontium—*Caer yn Arfon*. With the destruction of Gwynedd by Edward I, Arfon, together with the Llŷn peninsula, Eifionydd to the south, and Arllechwedd, the land west of the Conwy river, were joined together by the statute of \*Rhuddlan in 1284 as Caernarfonshire, a county of the principality of Wales. At the Act of \*Union with England in 1536 the county remained, but in 1974 became part of the county of Gwynedd and was divided into three districts, Arfon, Dwyfor (Llŷn), and Aberconwy. In 1996 Môn was detached and Caernarfonshire, Eifionydd, and Aberconwy remain as the new county of Gwynedd.

The county was dominated by the Snowdon massif (Eryri) with the highest peaks in Wales (yr Wyddfa, 3,560 feet), a glaciated terrain of steep mountain slopes, deeply eroded valleys, and lakes. It is one of Wales's national parks. It is predominantly agricultural with sheep-farming as the main enterprise but extensive slate-quarrying and mining in the 18th and 19th cents. have scarred the landscape. There is still some slate production, but tourism, particularly hill-walking and rock-climbing, is a significant element in the economy. Hydroelectric schemes exploit the steep slopes and fast-flowing rivers.

Regarded as the primary mountain fastness of Wales, it has retained Welsh speech. In 1901, 89.6 per cent spoke Welsh with 47.7 being monoglot Welsh. By 1991 the percentage speaking Welsh had fallen to 61.5. In 1991 the total population was 133,338. HC

**Caerphilly castle**, in mid-Glamorgan, a baronial castle begun in 1271 by Gilbert de Clare, earl of \*Gloucester, is 'one of the most remarkable defensive complexes ever completed by an individual [private] patron in the Middle Ages'. This huge castle is an early example of the principle of concentric fortification and heavily defended gatehouse. It is notable for its extensive water defences, a major engineering feat, involving the construction of a fortified dam to hold the waters in place. This aspect of the castle's defence seems to have been influenced by Gilbert's participation in the siege of \*Kenilworth in 1266, in which the mere had played an important part in the successful defence of the castle.

Caerphilly's scale was possible because Gilbert de Clare was very wealthy. Also as lord of Glamorgan he was subject to the law of the march, which meant that he could build a castle without licence from the king. Further he felt threatened by the possibility of Welsh rebellion and unsure of the king's friendship, as after Simon de \*Montfort's rebellion he had promoted the cause of the disinherited, supporters of Simon. The result of particular circumstances, it played no significant part in subsequent Welsh history and on \*Leland's visit 1535–45 was in a ruinous condition. LR

**Caerwent.** Roman town in Gwent and tribal capital of the \*Silures (*Venta Silurum*). Roman occupation in south Wales pivoted around the legionary fortress at Caerleon until the Hadrianic stimulation of AD 121–2. Hadrian clearly considered the area ready for local self-government and formal constitution, and the Roman town of Caerwent was developed. Much of the town has been excavated and a partial plan is known, featuring forum, temple, baths, amphitheatre, and housing. The administration of the tribe and its capital by the town council is specifically attested in an inscription, carved on a pedestal for a statue. ES

**Caesar, Julius.** Roman politician and general. Born in 100 BC of a leading patrician family, Caesar rose to be consul in 59 BC. His provincial command included the Roman province of southern Gaul. In a series of brilliant campaigns from 58 to 54 BC he conquered Gaul as far as the Rhine, earning himself glory, money, and a battle-trained army. Late in the campaigning season of 55 BC he invaded Britain with a small force, but retreated when his fleet was wrecked by storms. The following year he returned with a larger army and defeated the tribes of south-eastern Britain under \*Cassivellaunus, concluding a treaty. For these abortive incursions into a semi-mythical island the Senate voted a longer thanksgiving than for the conquest of Gaul; the expeditions were more for propaganda at home than as a preliminary to conquest. ASEC

**Cairns, Hugh, 1st Earl Cairns** (1819–85). The leading Conservative lawyer of the \*Disraeli era. Of Ulster protestant stock and educated at Belfast Academy and Trinity College, Dublin, Cairns became a successful barrister in London and was Conservative MP for Belfast 1852–66. Solicitor-general and attorney-general to \*Derby, he became lord chancellor under Disraeli, who valued his judgement, in 1868 and 1874–80. A vigorous defender of Conservative and protestant interests, he was party leader in the Lords 1868–70 (some would have preferred him to \*Salisbury even in 1881) and led the peers' opposition to Irish church disestablishment until forced to compromise. An active legal reformer, he worked closely with \*Selborne, his Liberal equivalent. Cairns's evangelical protestantism and firmness over Ireland gave him a wider party appeal than his legal distinction alone would have done. Austere and dour in personality, determined and logical in argument, Cairns, though often troubled by ill-health, was active in evangelical and philanthropic causes and a long-serving Sunday school teacher. BIC

## Caistor by Norwich

**Caistor by Norwich**, Venta Icenorum, was the chief town of the *civitas* of the \*Iceni, which covered present Norfolk and much of Suffolk. The site lies on the river Tas south of modern Norwich in the parish of Caistor St Edmund. There is no known Iron Age antecedent to the Roman site, indeed most significant late Iron Age sites lie in western Norfolk. The town was probably laid out late in the 1st cent. with a street-grid covering some 50 acres. A simple forum and basilica complex and an unpretentious public baths date around the middle of the 2nd cent. Also known are two Romano-Celtic temples, a large house, and evidence for pottery manufacture and glass-working. In the 3rd cent. walls enclosing 33 acres were built. By comparison with other towns of like status, Caistor by Norwich seems a late underdeveloper. This has been attributed to the after-effects of the \*Boudiccan revolt, but it seems unlikely they could have cast a baleful shadow so far on. Its position away from the main centres of the Iceni may be part of the explanation. ASEC

**Calais, possession of.** Calais was in English hands from its capture by Edward III in 1347 to its loss in 1558. It was essentially a 'little bit of England overseas', being represented in the English Parliament from 1536. Soon after its capture, some of the French were expelled and English settlement was deliberately encouraged. Thenceforward, the town's officials, garrison, and merchants were almost exclusively drawn from the homeland. Its strategic significance was as both an outer defence for England and a base for campaigns into France, but it proved a constant drain on English resources. It was heavily defended, often housing 1,000 troops alongside a civilian population of c.5,000. It also played a key role as the staple through which all exported wool had to be directed. As a result, its company of merchants became increasingly powerful in the government and financing of the town. AC

**Calais, treaty of**, 1360. By this treaty, based on terms agreed at \*Brétigny in May, Edward III gained Aquitaine, Poitou, Ponthieu, Guînes, and Calais in full sovereignty, giving up in return his claim to the French throne and to Normandy, Anjou, and Maine, and agreeing to ransom the French king, John II, for 3 million *écus*. The renunciations—by Edward of his French claim and by John II of sovereignty—were never formally made. Thus although the treaty marked a triumph for Edward III, John II's son, Charles V, was able to reopen the war in 1369 on the grounds that its terms had never been fulfilled. AC

**Calcutta** was founded on 24 August 1690 by Job Charnock of the English \*East India Company at the village of Kalikata on the banks of the Hooghly river in \*Bengal. It grew quickly as Bengal displaced \*Madras as the company's leading commercial region. Following Robert \*Clive's victory at the battle of \*Plassey in 1757, a new Fort William was built and came to constitute the centre from which the company's political expansion in India took place. The town attracted a large British community and in 1834 became recognized as the official capital of British India. From the 1870s, a jute industry also developed to complement

Calcutta's already advanced commercial and administrative functions. In 1901 the city had a population of 1 million and was the second largest in the British empire after London. However, in 1912 the capital was removed to \*New Delhi and Calcutta began what has been a long decline. DAW

**Caledonii.** The people of the Scottish Highlands. For a people on the very fringes of the known world, the Caledonians make an appearance in the works of a surprising number of Roman writers including Lucan, Martial, Ptolemy, Dio Cassius, and several lesser authors. Xiphilinus tells us that they were actually a confederation of tribes rather than a single entity, and given the size and broken nature of their territory this is to be expected. Confederation is confirmed by Tacitus, who records that \*Calgacus, who addressed the Caledonians before the battle of Mons Graupius, was 'one of many leaders'. If Dio Cassius is to be believed Calgacus would have been chosen for leadership for his boldness. Dio praised the ability of the Caledonians to endure cold, hunger, and hardship, and recorded that they lived on flocks, game, and fruit. Tacitus, whose father-in-law \*Agricola fought the Caledonians, described them as red-haired and large-limbed, but little else is known of them except that they maintained their independence of the Romans throughout the occupation. They fought against Agricola in the late 1st cent., against \*Septimius Severus in the early 3rd, and are recorded as one of Rome's most persistent enemies in the Verona List of AD 312–14. KB

**calendar reform**, 1751. To remedy the imperfections introduced by Julius Caesar, most of Europe adopted after 1582 the reform proposed by Pope Gregory XIII. Reluctant to follow popish examples, some protestant countries stayed with the old calendar, which became increasingly out of line. The Act 24 Geo. II c. 23 remedied this by eliminating eleven days in September 1752. At the same time, England fell into line with Scotland by starting the year on 1 January instead of 25 March. The protests were less concerned with 'give us back our eleven days' than with the genuine difficulties when contracts or birthdays fell between 2 and 14 September 1752, which disappeared. The 'new style' introduced a new anomaly, still with us, whereby the seventh month, September, became the ninth month. JAC

**Calgacus** is the name given by \*Tacitus to the leader of the Caledonian confederacy at the climactic battle against the Romans under \*Agricola at Mons Graupius in 83/4. Calgacus appears only to give a speech inveighing against the evils of Rome and exhorting his followers to resist as last of the free Britons. It contains the famous epigram 'ubi solitudinem faciunt pacem appellant', 'they create a desert and call it peace'. However, such set-piece speeches are a convention of Graeco-Roman histories; and as such we are hearing the words and thoughts of Tacitus, not Calgacus. ASEC

**Callaghan, James** (b. 1912). Prime minister. Callaghan has the unique record of having held all the highest offices of state: chancellor of the Exchequer (1964–7), home secretary (1967–70), foreign secretary (1974–6), and finally prime minister (1976–9). His background was unassuming and he grew

up in relative poverty after the early death of his father. He left school at 16 to obtain a secure job as a tax officer in the civil service. He joined the union and rose steadily, becoming assistant general secretary of the Inland Revenue Staff Federation in 1936. In the late 1930s he met Harold Laski, the Labour intellectual, who encouraged him to read widely and turned his mind to politics.

In 1945 Callaghan was elected to Parliament as Labour MP for Cardiff South. He quickly established his reputation as an effective debater and in the 1950s became recognized as a Gaitskellite. In 1960 he was defeated in the deputy leadership election by George \*Brown. After Gaitskell's untimely death in 1963 Callaghan stood for leader but came third behind Harold \*Wilson and Brown.

When Labour assumed power in 1964 Callaghan became chancellor of the Exchequer. However, his authority was challenged by the creation of a new Department of Economic Affairs under Brown. Callaghan's term was dogged by speculation against sterling which prompted a series of financial crises resulting in the devaluation of the pound on 17 November 1967. He was unhappy in the post, aware of his own limitations when it came to economic management.

Callaghan moved to the Home Office, where he attempted to deal with the problem of immigration from Commonwealth countries and was responsible for sending British troops into Northern Ireland in August 1969. As the only senior minister with trade union connections, Callaghan thwarted measures put forward by Barbara Castle and Wilson, in 1969, to reform trade union law.

Callaghan's term as foreign secretary coincided with the controversy surrounding Britain's entry into the EEC. The issue had split the Labour Party, Callaghan having criticized the idea of entry without fully opposing it. He set out to renegotiate the terms of entry agreed by the Heath government. Between June 1974 and March 1975 he visited foreign capitals using his union skills as a negotiator to settle details concerning the EEC budget, Common Agricultural Policy, and arrangements for Commonwealth countries. But the changes were largely cosmetic.

In 1976 Wilson announced his resignation and Callaghan beat Michael \*Foot to assume the party leadership and prime ministership. The election was won mainly due to the desire of the party centre-right to stop Foot rather than on Callaghan's own merits. The outlook for Callaghan's term was gloomy from the outset, a fact he recognized. Inflation was rampant and he was aware that the country was not earning the standard of living it enjoyed, the deficit being covered by borrowing. In September 1976, the government was forced to apply to the International Monetary Fund for stand-by credit of £2.3 billion. The government had no effective majority and in 1977 Callaghan had to strike a deal with the Liberals to survive, the price being devolution bills for Scotland and Wales.

During the 'winter of discontent' (1978-9) the country was crippled by strikes as protests against wage restraint, despite the 'social contract' which Labour claimed to have with the unions. In March 1979 the devolution referendum failed. The Labour government lost a vote of no confidence by one vote and the subsequent general election. In October

1980 Callaghan resigned as leader and in 1987 became a life peer. An experienced and capable politician with a conciliatory and pleasant manner, he lacked the vision and decisiveness necessary for leadership.

RAS  
Morgan, K. O., *Callaghan* (Oxford, 1997).

**Calvert, George.** See BALTIMORE, 1ST LORD OF.

**Calvinism**, the creed of Jean Calvin (1509-64), was largely as formulated in his *Institutes*, published 1536. Calvin was greatly influenced by St Augustine in inferring predestination from divine foreknowledge, and he therefore presumed that the elect, chosen for salvation, were known to God from before the creation. Free will was an illusion: 'we call predestination God's eternal decree, by which he determined with himself what he willed to become of each man . . . eternal life is fore-ordained for some, eternal damnation for others . . . it is very wicked merely to investigate the causes of God's will . . . when one asks why God has so done, we must reply, because he has willed it.' [*Institutes*, III. xxi. 5; xxiii. 2.] Church organization followed from that basic premiss, that the chosen of God—the elect—were entitled to no inferior place in worship, but should share government with the ministers. While Luther subordinated church to state, Calvin insisted on the supremacy of the church, with a \*presbyterian form of government. Doctrinally, Calvin shared with Luther belief in the absolute authority of the bible and in justification by faith alone.

Taken into Scotland from Calvin's Geneva in 1559 by John \*Knox, Calvinism became the national creed and was recognized as the established church in 1690. In England it struggled first to influence Anglicanism, then to overthrow it, and was in command from the Civil War to the Restoration. After 1660 it was at first the most powerful of the dissenting sects but lost ground rapidly to the \*baptists and \*congregationalists and in the early 18th cent. was infiltrated by \*socinianism and \*unitarianism. Its theology continued to influence groups within the protestant dissenting churches, particularly the Countess of \*Huntingdon's Connexion and the Welsh Calvinistic Methodists. But the appeal of so austere and harsh a creed faded in an age of enlightenment and humanitarianism, and at the religious census of 1851 the Presbyterian churches had no more than 160 places of worship, while the Huntingdon Connexion had 109, the Welsh Calvinist Methodists 828, the congregationalists more than 3,000, and the \*methodists more than 10,000.

JAC

**Cambridge, George, 2nd duke of** (1819-1904). Cambridge, first cousin to Queen Victoria, was born in Hanover where his father was viceroy. He followed his father into the army, fought in the Crimea, reaching field marshal by 1862. In the 1830s he was considered by some a possible husband for Victoria but in the end married an actress. As commander-in-chief of the army for nearly forty years between 1856 and 1895, Cambridge was known for his resistance to reform, particularly those initiated by \*Cardwell. The equestrian statue in Whitehall was erected in 1907. JAC

**Cambridge, Great St Mary's.** Commonly called the university church, this is a fine very late perpendicular parish

## Cambridge

church on a splendid site between King's Parade and the Market Square. Rebuilding of the original church was begun in the late 15th cent. but was protracted. The west tower, started in 1491, was only half-finished in 1550, completed in 1608, but the proposed spire was never added. Until the Senate House was built in 1730, St Mary's was used for the award of degrees. JAC

**Cambridge, Richard of Conisborough, 1st earl of** (1385–1415). Richard was the younger son of Edmund, duke of \*York, and a grandson of Edward III. With no lands, he depended on Exchequer annuities which were irregularly paid until after his clandestine marriage to Anne Mortimer, sister of Edmund \*Mortimer, earl of March, in 1408. No landed endowment accompanied his creation as earl by Henry V: it was really a courtesy title, recognizing Richard as heir to his childless brother Duke Edward. Apparently unhinged by resentment, Richard devised hare-brained seditious schemes in conversation with the Northumberland knight Thomas Gray of Heton and persuaded himself that Edmund Mortimer shared his motives for rebellion. It remains a mystery how Henry, Lord Scrope of Masham, became entangled in this half-baked conspiracy. Convicted for plotting the deaths of Henry V and his brothers, Cambridge, Scrope, and Gray were beheaded at Southampton. RLS

**Cambridgeshire** is a quiet, thinly populated, agricultural county, pleasantly hilly in the chalk south, flat in the north where it joins the Fens. The river Cam bisects the southern part of the county, flowing north to join the Ouse near Ely. It fell into three sections—the area around Cambridge, with a considerable number of small villages; that part of the Isle of Ely which centred on Ely itself; and a northern part of the isle, around March and Wisbech, which looked more towards Peterborough or up to the Wash, and retained a certain autonomy from Ely. It was a county of small landowners, puritan and nonconformist in sympathy, and politically independent. By the Local Government Act of 1972, Cambridgeshire took over Huntingdonshire and the soke of Peterborough, adding more than 50 per cent to its area.

Cambridge was a Roman settlement, the centre of a network of roads, joining to cross the Cam. Its importance was enhanced by the fact that it became the southern point of a complex pattern of inland navigation, centred on the Ouse, and supported by Roman cuts, as at Reach Lode and Swaffham Lode. It was early colonized by the Angles and a second settlement grew up south of the bridge. In the 7th cent. it was much disputed between the East Angles and the Mercians, and seems to have been devastated, since \*Bede referred to it, late in the century, as 'a small, deserted fortress'.

A development in 673 was the foundation by St \*Æthelthryth of a monastery at Ely, on a small hill rising from the fens. It rapidly prospered and survived sacking by the Danes in 870. Work on the Norman cathedral began in 1083 and it was given cathedral status in 1109. Ely's unique position was responsible for the bishop being granted quasi-\*palatine status. It retained separate judicial and administra-

tive systems and, though the Isle of Ely was made a division of Cambridgeshire in 1836, it was given its own county council in 1888, March becoming the county town. It was once more merged with Cambridgeshire in 1958.

Cambridge town went down before the first Danish onslaught in 870, was liberated by \*Edward the Elder in the early 10th cent., but fell to the Danes once more in 1011. After the Norman Conquest, William I built the castle in 1068 and the town received a charter in 1201. Stourbridge fair on Midsummer common was one of the largest in Europe. The growth of the university in the 13th cent. produced prolonged antagonism between town and gown, and is responsible for that strange mixture of seat of learning and East Anglian market town which characterizes Cambridge today.

The northern parts of the county remained for centuries almost completely cut off by fen and water and developed their own unique way of life. Their inaccessibility made them a natural shelter for refugees, of whom \*Hereward, leader of resistance to the Normans, was the most famous. Proposals for draining the fens were put forward repeatedly. \*Camden wrote laconically in 1586 that the speeches in Parliament on the subject were 'a specious pretence of doing good to the publick'. In the 17th cent. a start was made, and the earl of \*Bedford, through the work of Vermuyden, the Dutch engineer, succeeded in reclaiming vast areas. The results were not always successful, however, since the land dried out, shrank, and was often well below the level of the dikes. For decades to come, great stretches remained lake or quagmire in wet weather.

The fen part of the county, with its vast horizons and lonely windswept fields, has always been an acquired taste. Camden wrote of the 'Fen-men, a sort of people (much like the place) of brutish, uncivilized tempers, envious of all others . . . and usually walking aloft on a sort of stilts'. \*Pepys paid a visit in 1663 to his poor relations living near Wisbech, was plagued by gnats, and did not much enjoy his journey 'over most sad fens, all the way observing the sad life the people of this place do live . . . sometimes rowing from one spot to another, and then wading'. Admiration for Ely cathedral was usually tempered by disgust at the town itself. Celia Fiennes nearly fell off her horse in 1698 and found Ely 'the dirtiest place I ever saw . . . a perfect quagmire, the whole city . . . I had frogs and slow-worms and snails in my room.' More than a hundred years later, things were little better, \*Cobbett finding Ely in 1830 'a miserable little town'. Wisbech was a flourishing port and displayed some elegant buildings, but Pevsner wrote laconically in 1954 that the Fens 'grow much potato, sugar-beet and other root crops, and wheat, but they have never grown much architecture'. In the last decade of the 20th. cent., Cambridge developed rapidly as a scientific and technological centre, the roads leading to it dominated by aggressive and frustrated motorists. JAC

**Cambridge University** dates back to 1209, when, after a serious clash with the townspeople, some of the clerks at Oxford migrated to Cambridge. The first college, on a very modest scale, was Peterhouse, established in 1284 by Hugh

de Balsham, bishop of Ely. Although it modelled itself mainly on the Oxford pattern, with the teachers forming the *studium generale* or corporation, Cambridge did not escape ecclesiastical control from Ely until the 15th cent. Royal patronage led to expansion: Henry VI founded King's College in 1441 and Henry VIII established Trinity College in 1546.

After the Reformation, the poor students largely disappeared, to be replaced by the sons of aristocratic and wealthy families. Many of the leading figures of the Renaissance of learning were associated with Cambridge, including Erasmus, long resident at Queen's College, \*Ascham, and \*Fisher. An Elizabethan statute of 1570 had the effect of making the wealthy constituent colleges more independent of the university. As puritanism flourished in East Anglia, and many of the students were local, Cambridge supported the parliamentary cause in the Civil War, while Oxford was the headquarters of the royalists: these political sympathies died hard and in the 18th cent. Whiggish Cambridge gave a much more enthusiastic welcome to the Hanoverians than did Oxford. Academically, Cambridge was characterized by the growth of science, or natural philosophy as it was called, with \*Newton at Trinity its best-known exponent.

By the middle of the 19th cent. reform was long overdue. Cambridge supported the notion of a royal commission which investigated the two universities from 1850. Two Acts, in 1856 and 1877, did much to break the oligarchical nature of the government of the university. In 1871 Anglican religious exclusiveness was ended. Cambridge's scientific reputation was further enhanced with the opening of the Cavendish Laboratory in 1873, which became famous for its work in experimental physics. Two women's colleges were established at this time, Girton in 1869, Newnham in 1871.

The majority of the heads of colleges are called master. For the first six centuries of its existence, Cambridge, like Oxford, was a seminary, and until 1871 fellows were required to be celibates in holy orders. There are now over 30 colleges. The older foundations date from the Middle Ages, like Corpus Christi College (1352), Pembroke (1357), and Trinity Hall (1390). Several are Tudor, such as Christ's (1505), Trinity, and Emmanuel (1584). Downing was founded in 1800 after a protracted and troublesome legal action over the original bequest by Sir George Downing in 1717. Selwyn and St Edmunds came in the late 19th cent. (1882, 1896). During the 1960s, no fewer than six new colleges came into existence, Churchill (1960), Darwin (1964), Lucy Cavendish (1965), Clare Hall (1966), Fitzwilliam (1966), and Wolfson (1969). Robinson College opened in 1977.

PG

**Cambuskenneth abbey** (Stirling) was one of several \*Augustinian priories founded by David I of Scotland in the 1140s. It was situated close to Stirling castle and belonged to the Arrouaisian congregation. Though like many Scottish communities it suffered from English raids and entered a period of decline in the 14th cent., during which time the Scots Parliament sometimes met here, it later recovered; the abbot was granted episcopal status in 1406, James III was buried here in 1488 and a lavish rebuilding occurred early in the 16th cent. Later it fell under the control of lay

commendators and after the Reformation became a temporal lordship of the Erskine family which had held the commendation since the 1560s, when it had an income of over £3,000. Little now remains but a 14th-cent. detached bell-tower.

BJG

**Camden, battle of**, 1780. In December 1779 \*Clinton took an expedition from New York to South Carolina in the hope of drawing on loyalist support. In May 1780 Charleston was captured with 6,000 rebel prisoners. Clinton then handed over to \*Cornwallis. A counter-thrust by De Kalb and Gates from North Carolina was met at Camden on 16 August. Though Cornwallis was heavily outnumbered, the Americans were routed and De Kalb killed.

JAC

**Camden, Charles Pratt, 1st Earl** (1714–94). Camden joined Middle Temple and was called to the bar in 1738. At first he found it difficult to obtain a brief but eventually found work and established his reputation. In 1757 he became attorney-general under \*Pitt and Whig MP for Downton. In 1761 he was promoted to chief justice of Common Pleas. His most famous case came in 1763 involving \*Wilkes and the libellous \**North Briton*. Camden ruled that \*general warrants were illegal and gained great popularity. He strongly opposed the taxation of the American colonies, declaring the \*Stamp Act unconstitutional. He became lord chancellor in Chatham's second administration and although he opposed the ministry's American policy, retained the great seal until 1770. He remained in opposition until the death of Chatham, but became president of the council in the \*Rockingham administration and retained the post until his death.

RAS

**Camden, John Jeffreys Pratt, 2nd Earl and 1st Marquis** (1759–1840). Statesman. Son of the famous lawyer, Pratt came into Parliament in 1780 and succeeded to the earldom in 1794. After a number of minor offices, he followed \*Fitzwilliam in 1795 as lord-lieutenant of Ireland, holding the post until 1798. The situation in Ireland was extremely tense: Lecky's opinion was that Camden was well intentioned but bewildered, and his lord-lieutenancy ended in the Irish rebellion. In 1799 he was given the Garter. He served in a number of Tory governments, as secretary for war 1804–5 and as lord president of the council 1805–6 and 1807–12. On his retirement he was promoted marquis. From 1780 to 1834 he held the lucrative sinecure of teller of the Exchequer. Canning's private opinion was that, by the end, Camden had become 'useless lumber' in cabinet.

JAC

**Camden, William** (1551–1623). Camden was one of the finest of schoolmaster-historians. Born in London, he was educated at St Paul's and then at Oxford. From 1575 until 1597 he taught at Westminster School, where he became headmaster. From 1597 his position as Clarenceux king-of-arms gave him more time to devote to his passion for history. He produced two major works—*Britannia* (1586), a survey, county by county, of the antiquities of Britain as a successor to \*Leland, and *Annals of Queen Elizabeth* (1615), which established the view of her reign as a *via media*. Camden's work was an example of the new civic history, intended as a handbook for statesmen: he eschewed invented rhet-

## Cameron

orical speeches, made use of state papers obtained through his patron Lord \*Burghley, and wrote beautifully, with piquant and jocular personal touches. Worcestershire perry he dismissed as 'cold and flatulent'; the ruggedness of Northumberland 'seems to have hardened the very carcases of its inhabitants'; Britain is certainly 'the masterpiece of Nature, performed when she was in her best and gayest humour; which she placed as a little world in itself, by the side of the greater, for the diversion of mankind'. He endowed the Camden chair of history in his University of Oxford. JAC

**Cameron, Donald** (1695–1748). Jacobite. Cameron of Lochiel's grandfather had taken part in \*Glencairn's royalist rising in 1652 and fought for the Stuarts at \*Killiecrankie in 1689; his father was out in the '15 and attainted. When Prince Charles Edward landed at Moidart in 1745, Cameron was the first chief to whom he applied. He advised caution, but agreed to lead his clan to Glenfinnan, where it provided the bulk of Charles's small force. Lochiel took part in the march to Derby and was badly wounded at \*Culloden. Though he reached France with the prince in September 1746, he died after a few months in the French service. His brother Archibald, a physician, was out in the '45 with him and was hanged in 1753 when captured on a visit to Scotland. JAC

**Cameron, Richard** (1648–80). Covenanting leader. Born in Falkland in Fife where he was a schoolteacher, Cameron became a presbyterian field preacher in the south-west of Scotland. In 1678–80 he was in Holland, missing the covenanting defeat at \*Bothwell Bridge in June 1679. On his return he joined in issuing the Sanquhar declaration, which denounced Charles II and his brother James and declared them deposed. Tracked down by royal troops, Cameron and his brother were killed at Aird's Moss, near Auchinleck in Ayrshire. His followers, the reformed presbyterians, refused to accept the 1689 church settlement in Scotland. See CAMERONIANS. JAC

**Cameronians.** Known as the 'Society people' until 1690, these covenanters of south-west Scotland followed the extensive field preaching of Richard \*Cameron (1648–80) and Donald Cargill (c.1627–1681). After Cameron was killed in battle and Cargill hanged for publicly defying Charles II with excommunication, the various dissident societies combined to speak against the \*Test Act and to forbid listening to presbyterians who had responded to the \*Declaration of Indulgence (1672). After 1690 they raised the prestigious Cameronian regiment against James. Unlike other leading ministers, Cameronians refused to join the restored presbyterian Church of Scotland which they saw as Erastian, and finally became the free church (1876). WMM

**Cameroon** is an independent republic on the west coast of Africa with a population of 13 million. It attracted Portuguese, Dutch, and British interest but from 1884 until 1916 was under German rule. After the First World War, France administered east Cameroon under a League of Nations \*mandate and Britain south Cameroon. They became independent in 1960 and a plebiscite supported their union. The

capital is Yaoundé and the chief exports are cocoa, coffee, bananas, and cotton. JAC

**Campaign for Nuclear Disarmament (CND).** The largest and most politically orthodox organization associated with the two waves of mass agitation against the British nuclear deterrent and US nuclear bases in Britain during the late 1950s and again in the early 1980s. It was formed in 1958 by establishment intellectuals such as Bertrand \*Russell and J. B. Priestley and urged unilateral British nuclear disarmament. It soon became involved in demonstrations and protests organized by the smaller anarchist-orientated Direct Action Committee. The Easter 1958 march to the Aldermaston nuclear base in Berkshire attracted up to 10,000 supporters and 1959 and 1960 saw the numbers approaching 100,000. The success of a unilateralist motion at the 1960 Labour Party Conference was a high point, but \*Gaitskell managed to reverse the decision in 1961 and the signing of the 1963 Test Ban treaty caused CND to lose momentum.

It re-emerged as a mass movement in the 1980s as a result of the expansion of nuclear weapons systems and a new iciness in American–Soviet relations. It again proved to be a broad church, with strong trade union, youth, Labour, Liberal, Christian, and Green subgroups, though some radical protesters, such as the Greenham Common women's Peace Camp, were not part of CND. By 1982 it had about 100,000 members and drew an estimated 400,000 people to its Hyde Park rally. One consequence of the Labour Party's move to the left was the Gang of Four's decision to defect and set up the \*Social Democratic Party. Further multilateral agreements to control nuclear weapons were both welcome to CND and blunted its cutting edge. Though it did not succeed in its main objective, CND was a remarkable organizational feat and showed more stamina than most political lobbies, even if its main achievement was to damage the Labour Party. CNL

**Campbell, Sir Colin, 1st Baron Clyde** (1792–1863). Campbell was born in Glasgow and entered the army in 1807. He fought in many of the most celebrated campaigns of his era: the Peninsular War (1808–14); the Demerara insurrection (1823); the Opium War (1839–42); the second \*Sikh War (1848–9); and the \*Crimean War (1854), where he commanded a brigade at both \*Alma and \*Balaclava. However, he lacked connections and it took him thirty years to rise from captain to colonel; and another ten to become a general. On the outbreak of the mutiny in 1857, he was appointed commander-in-chief of the Indian army and was principally responsible for putting down the rebellion and relieving the sieges of \*Lucknow and \*Cawnpore. He was knighted in 1849 and made a peer in 1858. He was nicknamed 'Old Khabadar' (Old Careful) in the Indian army for his cautious tactics, most notably at the relief of Lucknow. DAW

**Campbell-Bannerman, Sir Henry** (1836–1908). Prime minister. A genial and popular politician, Campbell-Bannerman none the less acquired a reputation, which still clings to him, as uninspired and unlikely to reach the top in politics.

In fact he proved to be much more shrewd and determined than his apparently more talented rivals in both parties. He managed to hold the Liberal Party together during a difficult, post-Gladstonian period, and led it to its greatest electoral victory in 1906.

A typical Lowland Scot, 'C-B' was educated in Glasgow and at Cambridge, became a partner in the family firm, and married Charlotte Bruce in 1860; the marriage proved to be a long and happy one. As MP for the Stirling Burghs from 1868 C-B showed himself a radical Gladstonian, supporting Scottish disestablishment and \*Irish Home Rule. Indeed, throughout his career he derived strength from his capacity to foster the confidence of radical Liberals for his loyal advocacy of progressive causes including women's suffrage, Labour representation, and Scottish devolution; on hearing of the dissolution of the Russian Duma by the tsar he uttered one of his two memorable remarks: 'La дума est morte; vive la дума.'

However, as a young member C-B spoke infrequently and made little impact as a junior minister in \*Gladstone's 1868 and 1880 governments. In 1884–5 he served briefly as chief secretary for Ireland and reached the cabinet as secretary of state for war prior to the Home Rule crisis in 1886. He retained this post in Gladstone's last administration in 1892 and under \*Rosebery in 1894–5, though by that time he harboured ambitions to become Speaker. Instead he was destined to fill the vacuum left by Gladstone's retirement. Rosebery quit in 1896, and Sir William \*Harcourt resigned as leader in 1898. When both John \*Morley and H. H. \*Asquith declined the poisoned chalice, C-B became leader almost by default.

He was promptly faced with the task of guiding the divided Liberal Party through a period dominated by the \*Boer War when his leadership was challenged by Rosebery and undermined by the \*Liberal Imperialists who supported the government's South African policy. The use of concentration camps by \*Kitchener to quell the Boers provoked C-B's other memorable words: 'When is a war not a war? When it is carried on by methods of barbarism in South Africa.' His prospects were rapidly transformed during 1902–4 as the \*Balfour government wrestled with the consequences of the war and split over tariff reform. As prime minister 1905–8 he successfully bridged the gap between New Liberal policies and Gladstonian traditions. Adopting the role of a firm chairman, he gave free rein to his exceptionally able ministers; Ernest \*Bevin once described Clement \*Attlee as Labour's Campbell-Bannerman. Though some legislation was lost in the House of Lords, important reforms were enacted in connection with trade unions and school meals; old-age pensions were devised by Asquith and the British army reorganized by \*Haldane. By the time of his retirement through ill-health in 1908, C-B had pointed the Liberals towards their next great goal—the reduction of the powers of the Lords. MDP

**Campbell family.** Originating in Argyll, the Campbells first came to prominence under Robert I (1306–29), already aiding the crown against other Highland families. From 1457, led by the Campbell earls of Argyll, they expanded their

power in the south-western Highlands and Islands with royal approval, filling the vacuum left by the forfeiture of the MacDonald lord of the Isles (1493). The family successfully balanced its role in the Highlands with Lowland political aspirations, and branches spread to Breadalbane, Ayrshire, Nairnshire, Fife, and Angus. In the 16th cent. they became indispensable royal proxies in the Highlands for a crown unable to govern directly. Such power eventually produced problems—by the 17th cent. some saw the Campbell clan as little better than those they supplanted. As leaders of the \*covenanters, and strong supporters of the Scottish kirk, they came into conflict with Charles I and James VII. In the 18th cent. the Campbells were once more crown agents, associated with the \*Glencoe massacre (1692), the Act of \*Union (1707), opposition to the Jacobites (1745–6), and the \*Highland clearances. Often criticized, the family's consistent ability over seven centuries made it one of the most successful Scottish dynasties. RJT

**Campden Wonder.** Perhaps the most baffling of all historical mysteries. In August 1660 William Harrison, an elderly rent-collector in the small market town of Chipping Campden, disappeared. When a bloodstained hat was found, it was presumed that he had been murdered. A local youth, John Perry, confessed that he had helped his brother and mother to kill Harrison, and all three were duly hanged. Two years later Harrison reappeared and resumed a placid life. His explanation was that he had been kidnapped, sold as a slave to a Turkish physician near Smyrna, and released as a favour. Why the youth confessed is a matter for abnormal psychology and, though false confessions to murders are not uncommon, confessions to false murders are rather rare. The absurdity of Harrison's story—70-year-old rent-collectors are not normally much sought after for the white slave traffic—suggests that it might be true, since it would not have been difficult to invent a more plausible explanation. One obvious answer, that the whole tale was made up by Sir Thomas Overbury, the local gentleman who first published it in 1676, is contradicted by the fact that Anthony à Wood at Oxford on 6 August 1662 had heard and noted that 'Mr. Harrison, supposed to be murdered two years ago, came out of Turkey to his home in the country.' JAC

**Camperdown, battle of, 1797.** Camperdown is a coastal village in Holland about 10 miles north-west of Alkmaar. Some 10 to 18 miles offshore the Dutch fleet was defeated by a British fleet under the command of Admiral \*Duncan on 11 October 1797. By then the Dutch, as the Batavian Republic, were effectively under the rule of revolutionary France, and their navy had been designated to assist in an invasion of Ireland. In strength there was little to choose between the opponents, and there was a bravery on both sides which recalled the great 17th-cent. encounters. Both Dutch flagships and nine other ships were taken during a 2½-hour action, more than half their force. Duncan's ships sustained heavy damage but none was lost, and the victory was the more notable because Duncan's watch on the Dutch had been earlier hampered by the \*Nore mutiny. DDA

## Campion

**Campion, Edmund** (1540–81). Jesuit martyr. Son of a London bookseller, Campion was enabled to study at Oxford, where, with brilliant prospects as scholar and orator, he was ordained deacon (1568) despite catholic inclinations. Conscience prevailing, he was received at Douai (1573), then sent from Rome by the Jesuits to Bohemia to serve his novitiate, before being reordained in Prague. Part of the Jesuits' 1580 mission to English catholics and carefully non-political, unlike his companion Robert \*Parsons, Campion's 'sweetness of disposition' and eloquent preaching were so successful that the authorities were alerted, especially after *Decem rationes*, denouncing Anglicanism, appeared at St Mary's, Oxford. Captured at Lyford (Berks.) through a servant's treachery, and taken to the Tower, his refusal to recant led to torture on the rack, but he remained steadfast. Trumped-up charges of conspiracy to overthrow the queen, and an unjustly conducted prosecution, brought conviction of treason and hanging at Tyburn. ASH

**Canada.** A self-governing dominion since 1867, much of Canada was earlier colonized by the British and the French. British interest in the area initially focused not on the land but on the sea. Ships leaving the west country probably located the Grand Banks fisheries even before John \*Cabot's explorations of 1497. Despite official discouragement of settlement, \*Newfoundland became *de facto* the first overseas British colony, a status it relinquished later than other parts of what would become Canada.

In 17th- and 18th-cent. usage, the name Canada referred primarily to the St Lawrence lowlands. Here the British involvement is usually dated from \*Wolfe's victory on the Plains of Abraham (1759), but this was not the first British attempt to capture the French colony. In 1629 the Kirke brothers seized the small fort at Quebec. The colony was returned to the French three years later. Subsequent large-scale but unsuccessful attacks took place in 1690 and 1711.

From 1670, through the royally chartered \*Hudson's Bay Company, England claimed sovereignty over Rupert's Land, an area including much of the central plains and northern Canada. The control the Hudson's Bay Company exercised was largely at the sufferance of the native peoples of the area, but the expanding fur trade eventually led the company to set up posts in the far north and on the west coast, establishing British claims to this contested region.

In the long-running 18th-cent. conflict with France, the British definitively acquired Acadia, renamed \*Nova Scotia, in 1713. For some forty years, the British laid few claims to the area. Unable to secure a pledge of allegiance from the Acadian population, British authorities dispossessed and deported them. Nova Scotia was then available for Anglo-American settlement.

With the fall of Quebec in 1759, and the 1763 treaty of \*Paris, British control over the northern half of North America was unrivalled. The attempt to integrate the French, catholic population of the St Lawrence valley into the British empire formed a large part of the political agenda for the next century. A series of constitutions was enacted to address the evolving relationship. The \*Quebec Act (1774)

guaranteed religious freedoms and legal customs, providing greater privileges to the Canadians than catholics enjoyed in Britain. In doing so, it heightened tensions between Britain and its colonies to the south.

When conflict between Britain and its other North American colonies broke out, Nova Scotia, though populated in large part by recent arrivals from Massachusetts, obeyed the military garrison at Halifax. Quebec maintained its allegiance, not necessarily out of love for the British rulers, but for fear of the more radical protestants of the rebel colonies. In the aftermath of the American Revolution, loyalist refugees streamed north to the colonies that had refused to join the rebels.

The arrival of the Anglo-American refugees created new exigencies. Nova Scotia was divided into two colonies, \*New Brunswick and peninsular Nova Scotia. \*Prince Edward Island had already acquired a separate administration from Nova Scotia in 1769, and \*Cape Breton Island enjoyed a separate status as a refuge for loyalists for 40 years. In 1791, Quebec was divided essentially along the Ottawa river to create Upper and Lower Canada. Henceforth, Upper Canada contained primarily an English-speaking population.

The North American colonies were often more of strategic than economic importance to the British. With the fisheries secured, the colonies served two other main purposes. They provided other primary resources, such as wheat, timber, and minerals. Also, they offered a place for British emigrants. Until the 1810s, relatively few made the rough transatlantic voyage to settle in the British North American colonies. But after 1815, Highland Scots and northern Irish flocked to Canada. These huge influxes of population exacerbated tensions between colonial politicians and the mother country and were important factors in the rebellions of 1837–8 in Lower Canada. In turn, these rebellions suggested to the British government that the attempt to integrate the French-Canadian population into the empire had not been successful.

A third constitution, the Union Act, tried to address the problems, uniting the two Canadas, in the hope of swamping the French-speaking population. However, brilliant French-Canadian politicians made alliances with reformist English-speaking colleagues to defeat the attempts. The fourth constitution, the British North America Act of 1867, essentially rejected the assimilationist policy, by separating again Upper and Lower Canada, and joining them with Nova Scotia and New Brunswick, much to the dismay of many people in the latter two colonies. The four provinces received important degrees of autonomy, within a federal system. This constitution, the longest lasting of all the attempts, has proved the most malleable, and despite increasing tensions since the 1960s, the most successful. But Quebec separatism, as demonstrated by the referendum of 1995, remains strong.

With the BNA Act, the name Canada extended to take in the provinces involved. Other provinces and territories were either annexed or joined the federation subsequently: the Northwest Territories through purchase from the Hudson's Bay Company in 1870; Manitoba (1870); British Columbia

(1871); Prince Edward Island (1873); the Arctic Islands (1880), Yukon (1898); Alberta and Saskatchewan (1905); Newfoundland (1949). Canada was a self-governing dominion, the 'eldest daughter' of the empire. Constitutionally equal in status to Britain according to the statute of \*Westminster (1931), until 1949 the final court of appeal remained the Judicial Committee of the Privy Council in London, and until 1982 any amendments to the constitution had to be requested of the Westminster Parliament.

Due to further waves of migration, Canada retained and extended its British character. Between 1902 and 1912 alone, over 1.5 million British emigrants left for Canada. A similarly large proportion of immigrants arrived following the Second World War. In part because of these continuing migrations, cultural and emotional links to Britain in English-speaking Canada remained strong until relatively recently and Canada contributed greatly to the allied war effort in both world wars. However, following the Second World War, Canadian politicians and diplomats have attempted to carve out a separate space in world affairs. For instance, Lester B. Pearson won the Nobel peace prize for negotiating an end to the \*Suez crisis in 1956 despite British consternation at Canada's role in the matter.

By 1994 Canada's population was nearing 30 million. Economically, Canada has at times relied heavily on British markets and investment. Though in slow decline for a long period, since the Second World War trade between Canada and Britain has levelled out at a lower, but not inconsequential, level. As the economic clout of the USA expanded in the 20th cent., so did its influence over Canada. The passage of the Free Trade Agreement in 1989 (and later the North American Free Trade Agreement) recognized and indeed enhanced Canada's continental orientation. CMC

**canal system.** Though the Roman Fossdyke at Lincoln was restored in the 1120s, Britain was late to develop its canal network, being well endowed with improvable rivers and ready access to coastal shipping. Four main phases of river navigation preceded the first canals—1634–8, 1662–5, 1697–1700, and 1719–21—and provided the experience essential to their creation, demonstrating the benefits of enhanced inland water carriage. \*Exeter had been linked to Topsham by a new cut in 1564–6, certainly the first recorded use of the pound lock, the critical technology for inland navigation. By the 1630s, it had been applied on the Lea, the Thames, and Warwickshire Avon.

The first modern development was the Newry canal (opened 1745), which linked Lough Neagh and the Tyrone coalfield with seaborne access to the Dublin market. The first English canal, the Sankey Brook navigation, linked St Helens coal to the river Mersey and \*Liverpool (1757). Its engineer, Henry Berry, had assisted on the Newry canal. While the Sankey was an extensive parallel cut, the duke of \*Bridgewater's canal (1761) was the first to take a route independent of any river and holds traditional place as the

beginning of the 'Canal Age'. When completed in 1767, it linked the duke's pits north-west of Manchester to Runcorn, a 30-mile contour route without locks but with one lengthy aqueduct and a major embankment.

Trunk route development followed from the promotion boom of 1766–72, when most schemes involved James \*Brindley, drawing upon the expertise proven on the Bridgewater. The key links were those of the Grand Trunk canal (1777), which connected the Trent and Mersey, and through the Birmingham canal (1772) connected the midland manufacturing regions with the ports of \*Hull and Liverpool; the Staffordshire and Worcestershire (1772), tying both to the river Severn; the Thames and Severn (1789), the Coventry (1790), and Oxford (1790) canals which completed links from the north-west to London. \*Birmingham, in 1700 the most important manufacturing centre more than 15 miles from water transport, had become the hub of the English canal system. The route from Liverpool to London, around 600 miles by sea, had been cut by 1790 to around 360 by canal, and fell to 290 in 1805 when the Grand Junction canal bypassed the Thames navigation. Lateral trunk routes linked Bristol and London through the Kennet and Avon Canal (1810), and Leeds and Liverpool (1815); the first trans-Pennine crossing was the Rochdale canal (1804); in Scotland, the Forth and Clyde canal (1790) linked Edinburgh and Glasgow, and the Caledonian canal through the Great Glen (1822) cut out the hazardous journey by way of the Pentland Firth. Wales developed a limited canal system for the transport of iron and coal in the valleys from the 1790s. No significant trunk routes were initiated after the Grand Union in 1810, and building was effectively over by 1830, with approximately 4,000 miles completed.

Medium-length hauls of coal and minerals proved the staple traffic of the canal system, and canals cut the cost of carriage by up to two-thirds, releasing the growing urban and industrial economy from critical fuel shortages. For such traffic, the half of the Leeds and Liverpool open by 1777 was rather more significant than the completion of the trunk route as a whole in 1815. From the 1790s the directness of the Grand Junction route was combined with the intensive use of horsepower to provide for the carriage of shop goods and parcels by 'flyboats', thus breaking down regional barriers and allowing for the reduction of inventory costs. Canal carriage was conducted by large specialist firms such as Pickfords, the canal companies themselves sometimes before 1845 in legal disguise, and by smaller companies: unlike railways, no practical monopoly of transport was gained by the canal proprietors.

The canals had creative effects: new towns were established, notably Stourport, Runcorn, Ellesmere Port, and Goole. Birmingham exemplified the impact of canals in making pathways through established towns, and the Leeds and Liverpool coast-to-coast development. They created employment: around 37,000 men and 2,500 women were recorded as canal employees in 1851, less than 1 per cent of the work-force, but a distinct and culturally separate community, containing specialist occupations, such as the 'leggers' who conveyed boats through some tunnels. Canal

## Canning

building engaged many of the greatest engineers of the era—Brindley, \*Smeaton, \*Rennie, and \*Telford for example—and created in the 1790s the financial precursors of the railway in attracting purely investment capital. Many were very profitable, returning dividends in 1825 in excess of 40 per cent, but profit performance was highly polarized, because costs were commonly underestimated, and the average of about 6 per cent left half the 80 companies making no real return.

The system was completed only in the 1820s, and immediately proved inflexible in the face of growing traffic. Mixed gauge development reduced real integration, the bulk of the system being Brindley model narrow (7-foot) canals; inflexible locks, tunnels, pumping capacity, and inclined planes all represented bottle-necks to further expansion. Water shortages limited carriage, and stemmed from the problems of maintaining summit reservoirs in the face of traffic growth, especially where wasteful staircases of locks had been employed, or where routes were insolubly porous. By the mid-1840s, carriers such as Pickfords were rapidly abandoning canals in favour of the railway. Many canals did remain important bulk carriers and the Leeds and Liverpool's trunk carriage peaked after 1870.

Canal usage continued to fall in the First World War, and declined further in the inter-war years, reviving little between 1939 and 1945, and carrying only 5 per cent of all goods conveyed at the peak of the war effort in 1944. Nationalization in 1948 left trends unchanged: although the volume of goods carried on all inland waterways grew until 1953, 36 per cent of the remaining 2,100 miles were seen as redundant in 1955, with a mere 16 per cent, largely rivers, identified for development. By the 1968 Transport Act, around 1,000 miles were identified as 'cruising waterways' and leisure usage has predominated subsequently, with some restoration by preservation groups, notably of the Kennet and Avon and Rochdale canals. **Canning, Charles John, 1st Earl** (1812–62). Canning served as an under-secretary to Robert \*Peel and as postmaster-general to Lord \*Aberdeen before being appointed governor-general of India in 1856. His years in office were dominated by the \*Indian mutiny of 1857. At first, he stood firm against the entreaties of several of his lieutenants to appease the rebels and declare an amnesty. He recalled an army from China and insisted on military reconquest. Afterwards he resisted demands for widespread vengeance and bloodshed, earning the nickname 'Clemency Canning'. His post-mutiny policies centred on reorganizing the army and promoting the loyalty of Indians to Britain. He founded the first Indian universities, passed tenancy legislation, guaranteed the continuity of princely states, and banned interference in Indian religion and custom. Following the abolition of the \*East India Company in 1858, he became the first viceroy of India. Ill-health led him to resign from office in 1862. DAW

**Canning, George** (1770–1827) Prime minister. The most brilliant of the disciples of the younger \*Pitt, Canning was distrusted for much of his career as an intriguer. He also suffered from the fact that his father had died in penury and that his mother had been an actress. Rescued by a wealthy uncle, Canning was educated at Eton and Oxford. Entering the Commons in 1794 he shone as an orator and writer of witty polemical verses, denouncing the French Revolution and supporting the war against France. When \*Portland became prime minister in 1807 Canning was made foreign secretary. His conduct of affairs was bold and energetic. He prevented the Danish fleet from falling into French hands and supported the Spaniards and Portuguese in their struggle against Napoleon. But the failure of the \*Walcheren expedition heightened distrust of Canning and he sought to make \*Castlereagh the scapegoat. The outcome was the famous duel which consigned both men to the back benches. Only in 1818 did Canning return to office as president of the Board of Control and in 1822 he was about to sail for India as governor-general when Castlereagh's suicide led to his appointment as foreign secretary. His success was as dazzling as it was controversial. Always opposed to the \*Congress system, he disengaged from Europe with enthusiasm. By recognizing the independence of the Spanish American colonies, he opened up Latin America for British commerce. He astutely supported the Greeks in their fight for independence while preventing Russia from overwhelming Turkey. But some Tories thought Canning's policy dangerously opportunistic and when he was asked to form a government in 1827 \*Wellington and \*Peel refused to serve under him. Canning's ministry was a coalition of liberal Tories and conservative Whigs. He had long supported \*catholic emancipation and his sensitivity to the public mood might have led him to change his mind on parliamentary reform. But his unexpected death in August 1827 after only three months in office meant that his premiership did not fulfil its promise. JWD

**canon law** was the law of the universal church and from the 4th cent. became a complete legal system, taking much inspiration from the civil (Roman) law. All European countries accepted the authority of canon law and the conflict between church and state in many countries, and in England notably between Henry II and Thomas \*Becket, arose from disputes over the boundaries between canon law and domestic law in such matters as \*advowsons (the right to present to a clergy living), criminous clerks, or other jurisdictional disputes.

In 1066 William I had established a dual system of secular and ecclesiastical courts. In the latter canon law was administered, and they were acknowledged as having authority in all matters spiritual. The jurisdiction of these courts was wide. They dealt with offences against religion and morals, for which clergy and laity alike could be brought before the court and penance imposed, and with matters relating to marriage, legitimacy, and succession to personal property.

Until the Reformation and the reign of Henry VIII the ultimate authority in matters spiritual lay with the papal curia, to which appeal ultimately lay, though there

were many examples of tensions and rivalries between the canon law and the common law courts, e.g. the common law courts would not allow the church courts to deal with questions of title to freehold land, nor to impose fines nor grant damages. The statutes of \*Praemunire were specifically passed to forbid Englishmen to appeal to Rome in cases which were exclusively the concern of the common law.

After Henry VIII's break with Rome, appeal was no longer allowed to the papal curia and was abolished by statute in 1533. After the Reformation, therefore, the English ecclesiastical courts, although much influenced still by canon law, were no longer applying the canon law of the universal church, and a special English ecclesiastical law developed in the tribunals of the Church of England. This tendency was enhanced by the fact that doctors of civil law were increasingly appointed in place of churchmen as judges in the church courts. Ecclesiastical law became part of and subordinate to the common law, though until the 19th cent. the church courts retained jurisdiction over succession in cases of personal property and over questions of family law. MM

**Canterbury** (Roman). Succeeding an important late Iron Age settlement, the *civitas*-capital of Durovernum was laid out on either side of the Great Stour in the later 1st cent., with a rather irregular street-grid. Canterbury had an above-average range of public buildings. The site of a forum/basilica complex is known; adjacent to it was a large temple precinct with associated masonry theatre, and a public baths with portico. All date from the late 1st and early 2nd cents. In the late 3rd cent. walls enclosing 130 acres were constructed. Excavations have shown artisan buildings and larger private houses alongside the public buildings. By the later 4th cent. the town was in decay. The relationship of Roman to Anglo-Saxon Canterbury is vexed; there was activity within the walls for much of the 5th cent., and some of the earliest Anglo-Saxon churches might have late Roman origins. ASEC

(post-Roman) Canterbury re-emerged as the capital of a pagan English kingdom of \*Kent, to which St \*Augustine was sent by Pope Gregory the Great in 597. Gregory intended the new English church to have archbishops at London and York, but a series of historical accidents led to Augustine and his successors remaining at Canterbury. It became one of the larger English walled towns, with a self-governing corporation, but it was dominated until the 1530s by its two great abbeys of Christ Church (the cathedral) and St Augustine's. The many distinguished archbishops included Thomas \*Becket, whose murder in the cathedral in 1170 led to his canonization; when the cathedral was rebuilt after a fire in 1174, it was designed to focus on his tomb, which became one of the great pilgrimage shrines of the West. The city suffered economically from the dissolutions at the Reformation, but revived modestly through silk-weaving introduced by Walloon refugees, and later as a social centre for gentry and clergy. In the Second World War the historic core was heavily bombed, but enough is left for the city to remain a major tourist centre. Pride of

place goes to the cathedral and close, with a rich legacy of surviving and well-documented buildings. DMP

**Canterbury, metropolitan diocese of.** The diocese, comprising east Kent, was founded in 601 at the instigation of Pope Gregory the Great, four years after \*Augustine's arrival in Kent. The boundaries of the diocese itself have changed little, though from 1375 to 1558 Calais fell within it. The number of sees in the Canterbury province, however, has varied from 12 in 735 to 29 today (30 including the modern diocese of Europe). Disestablishment removed the Welsh bishoprics in 1920. Despite Gregory's intention that London should be the metropolitan see after Augustine's death, respect for the latter and the fragility of Christianity in Essex reinforced Canterbury's primatial position. Its early vigour, responsible for \*Paulinus' successful mission to Northumbria in 625, soon declined so much that there was a vacancy in mid-century. In the late 8th-cent. the short-lived metropolitan status of \*Lichfield almost eclipsed Canterbury. Pope Leo's decision to restore the primacy to Canterbury was confirmed by a synod at Clofesho in 803. Since Gregory's blueprint for two provinces of Canterbury and York, left their relationship unclear, York claimed independence from Canterbury. The dispute reached a peak in 1070 when \*Lanfranc demanded obedience from Thomas of York, but following a visit to Rome and a council at Winchester in 1072, Canterbury's precedence, albeit possibly proved with forged evidence, was confirmed. It arose again in 1118 and continued until Innocent VI (1352-62) resolved the question. York was to have metropolitan authority over the north as 'primate of England', Canterbury to have national precedence as 'primate of all England'. Though still retaining his diocesan seat at Canterbury, the archbishop's official residence as primate since c.1185 has been at \*Lambeth palace, suitably close to Westminster and Whitehall. In imperial days all colonial sees looked to Canterbury for oversight. Today, though all Anglican provinces are autonomous, Canterbury is accorded unofficial primacy of honour in the Anglican communion, from Japan to Jerusalem, from the USA and Uganda to Polynesia. Thus the archbishop presides over the Lambeth conference each decade and, as universal leader, has represented worldwide Anglicanism in visits to the pope and at the historic visit of Pope John Paul II to Canterbury in 1982. Increasingly the archbishop has found himself spokesman in the House of Lords not only for Christian communities, but for British adherents of non-Christian faiths. The present cathedral, originally monastic, begun by William of Sens in 1174, is a fine blend of French and English styles. WMM

**Canterbury, quitclaim of,** 1189. Anglo-Scottish treaty. Immediately after Henry II's death, William the Lion petitioned Richard I for full release from the oppressive terms imposed on Scotland by the treaty of \*Falaise. Richard, needing to raise finance for the Third Crusade, accepted William's offer of 10,000 marks (about £6,500), and at Canterbury on 5 December 1189 released him from all allegiance and subjection for the kingdom of Scotland, which remained an independent realm until Edward I's successful revival of English claims of overlordship in 1291-2. KJS

## Canterbury Tales

**Canterbury Tales.** Late 14th-cent. unfinished masterpiece by Chaucer. The General Prologue presents portraits, whose colour and vigour transcend stereotype, of diverse pilgrims congregated at the Tabard inn (Southwark), including a battle-worn Knight, sweetly pretentious Prioress, and emaciated scholar-Clerk. They lighten the journey to Thomas \*Becket's shrine at Canterbury by exchanging twenty-four tales (all but four complete, all but two in rhyming verse), which range from high romance set in ancient Greece (Knight) to low comedy in contemporary England (Miller, Reeve), and from animal fable whimsically laced with erudition (Nun's Priest) to a concluding prose homily (Parson). DCW

**Cantiaci.** A British tribal grouping and *civitas*. The Cantiaci seem to be an artificial creation of the Roman government, for there is no record of either a tribe or federation of this name before the Roman conquest. \*Caesar records the existence of at least four small tribes in Cantium (Kent), but although he gives the names of their kings he does not know the names of the tribes. Nevertheless it was probably these and other small tribes who were brought together in the later 1st cent. AD to form the *civitas* of the Cantiaci. Its territory will have included all of Kent, and the eastern parts of Surrey and Sussex, but Ptolemy's attribution of London to the Cantiaci is clearly in error. The capital of the new *civitas* was established at \*Canterbury, where there had been an important native settlement before the invasion, and was given the name of Durovernum Cantiacorum. KB

**Cape Breton Island** has formed part of \*Nova Scotia since 1820. Named le Royale by the French, who built \*Louisbourg, it was ceded to Britain in 1763. There are French- and Gaelic-speaking communities, coal-mining, and an ailing steel industry. A causeway was built to the mainland in 1955. GM

**Cape Finisterre, battles of, 1747.** The two encounters, in May and October 1747, were very similar in character, since they arose from the Royal Navy's attempt to cut off French communication with its American possessions. In the first, \*Anson annihilated a smaller squadron protecting a convoy. In the second, \*Hawke sank six out of nine warships, though most of the merchantmen managed to escape. JAC

**Cape of Good Hope.** Cape Town was captured by the British from the Dutch in 1795 and formally ceded in 1814. Strained relations between British immigrants and the Dutch settlers (Boers) over slavery and religion led to the Boers' Great Trek in 1835 to re-establish their own territories. The Cape became a crown colony in 1853. The discovery of diamonds (1867) and gold (1886) on Boer land renewed the struggle for political control in southern Africa, leading finally to the \*Boer War (1899–1902). In 1910 the Cape became a province of the Union of South Africa along with the Boer republics of Natal, Transvaal, and the Orange Free State. RAS

**Cape Passaro, battle of, 1718.** Cape Passaro is the extreme southerly cape of Sicily. On 31 July 1718 a British fleet under Sir George \*Byng defeated a Spanish fleet of twice its nu-

merical strength, destroying or capturing 17 Spanish warships. The Spanish fleet was newly built and hardly fit for action, but it was supporting an invasion of Sicily by Philip V to wrest the island from the Emperor Charles VI. Britain was not yet at war with Spain but, in part owing to the 'personal union' with Hanover, was already committed to supporting Charles's ambitions in southern Italy. DDA

**Cape St Vincent, battle of, 1797.** On 14 February 1797, four months after the start of hostilities with Spain and after the British fleet had been forced to evacuate the Mediterranean for the first time in a century, 15 ships under Sir John \*Jervis met the Spanish grand fleet of 27 more heavily gunned ships 25 miles off the south-western cape of Portugal. The Spanish line was disordered and, in a westerly wind, Jervis steered through a wide gap from the north. \*Nelson in *Captain* broke out of the line to prevent the westerly Spaniards rounding the British rear to re-unite with their easterly ships. *Captain*, only later 'nobly supported' by *Excellent* and *Culloden*, was fought to a standstill; Nelson then vaulted with boarding parties first into the *San Nicolas* and then into *San Josef*: his 'patent bridge'. In all, four Spaniards were taken, Nelson's irregularity in leaving the line matching Jervis's expressed resolve upon 'a considerable degree of enterprise'. Jervis was sent to the Lords as Earl St Vincent. DDA

**capitalism.** Since Marx's great work, *Das Kapital*, this term has acquired pejorative overtones indicating criticism rather than approval or even neutral exposition. Capitalism is the name given to the market economy system, which had its roots in earliest history in exchange between communities, but which did not come to full fruition until the restrictive practices of the medieval and mercantilist eras had been gradually eroded. The upsurge in international and intercontinental trade, especially from the 18th cent. onwards, together with the beginnings of modern economic growth in western Europe and North America, was rooted in the operation of competitive markets. During the past two centuries world economic growth has been achieved very largely through the free market system and mainstream economic theory has provided a theoretical justification for it. But it has also been subject to sustained criticism, both in the mild form that its inherent limitations required that its operation should be modified by government intervention and, at the extreme, that its inherent flaws and corruption would ensure its eventual collapse.

The positive case for free market capitalism is based on the liberty of individuals to pursue their objectives subject only to the constraint of law. The state should be involved principally, and some would say exclusively, in providing a legal framework within which property rights and contracts are upheld. Given such a constitutional framework, the most efficient economic system allows markets to operate freely, as individuals buy or sell commodities and services including their own labour. The competitive environment, idealized in perfect competition, represents the most efficient structure. In such a market, all parties are fully informed and are price takers, since no group or individual has sufficient power to control either prices or supplies. Such a structure implies that all participants benefit, so

that the interaction of individuals within the market is mutually advantageous. Competition weeds out costly or inefficient producers and ensures that consumers pay the lowest possible price.

It is, of course, generally recognized that this is not an entirely accurate description of either the modern economy or its precursors. The theoretical tradition supporting the free market system has passed from classical economics to the neo-classical school, which is the current mainstream, and on the more radical right to monetarism, new classical, and Austrian economics. All offer a similar explanation for the divergence between the idealized system outlined above and the reality of human experience. This depends heavily on the concepts of market imperfection and market failure, which suggest that a range of obstacles inhibit the free working of markets. Monopoly power constitutes such an obstacle. Companies with such an advantage can restrict sales or charge high prices at the expense of consumers. The legislation passed in the late 19th cent. in the USA was spurred by the fear of the monopoly power accumulated in the hands of conglomerates like Standard Oil and broke up the trusts into smaller and competitive units. After 1979 the British government sought to break the monopoly of state industries in telephones, gas, and electricity by returning them to the private sector and exposing them to competition. Another type of perceived imperfection has been the interference of government policy. Monetarist theorists like Friedman have explained inflation as the result of weak control of the monetary system by the state. Even the Thatcher administration failed to live up to the strictures of Professor Friedman's policy prescription.

According to this perspective, the market system is totally satisfactory provided various imperfections can be eliminated. But one difficulty lies in the provision of public goods by the state because market failure means they are not adequately supplied by private producers. Examples include transport networks, law and order, welfare benefits, defence, health, and education. The difficulty lies in the fact that payment is indirect, through taxation, rather than in the direct way in which individuals buy themselves a coat or a book. An important market imperfection, as perceived by those on the right, lies in the oversupply of public goods by the vested interests of bureaucrats and politicians, while concealing the true cost to the taxpayer by financing provision through fiscal deficits.

More familiar criticisms have come from those whose vision of capitalism is not of an ideal state marred temporarily by imperfections. The Keynesian tradition, following the work of John Maynard Keynes, makes the basic assumption that the market system needs to be supplemented and managed by the state because it will seldom produce outcomes optimal for society as a whole. Adherents to this tradition believe, for example, that state intervention can reduce unemployment and generate economic growth, both of which claims would be denied by scholars like Friedman. A far more radical view of capitalism is taken by the Marxian tradition. Marx argued that capitalism was based not on complementarity of interest but upon conflict between the classes. Further, he argued, capitalism contained

the seeds of its own destruction through that conflict. As capitalists cut wages to sustain profits in the face of ever more severe competition, they must reduce the capacity of workers to buy their products, leading to a crisis of underconsumption. The acquisition of colonies was one means of postponing eventual collapse by securing new and additional markets. An important 20th-cent. variant of the radical critique was dependency theory. This asserts that the industrialization of the western economies was funded by the expropriation of resources from the Third World, through cheap labour and imperialist control, a further potent manifestation of the inherent corruption within capitalist development. Others have explained the continued failure of the capitalist world to collapse, as predicted by Marx, as a result of artificial demand created by governments in the form of military expenditure. See also SOCIALISM.

Backhouse, R., *A History of Modern Economic Analysis* (Oxford, 1985); Howard, M. C., and King, J. E., *A History of Marxian Economics* (2 vols., 1989, 1992); Mair, D., and Miller, A. G. (eds.), *A Modern Guide to Economic Thought* (Aldershot, 1991).

**capital punishment** was formerly of central importance in all European criminal justice systems. Although the history of capital punishment in Scotland has been little studied, it is clear that hanging was the standard method of executing on both sides of the border. Under English law, decapitation, hanging, drawing, and quartering, or (in the case of women) burning at the stake were reserved for traitors, while some independent jurisdictions, notably Halifax, where a primitive guillotine was in use, had their own methods. But generally, capital punishment meant hanging.

Evidence from burial sites suggests that capital punishment was known in Anglo-Saxon England. Calculating levels of capital punishment for this and the medieval period is impossible, although it seems they were low. This changed drastically in the Tudor period. By Elizabeth's reign large numbers of convicted criminals were executed, a trend which continued after 1603. To take an extreme example, an estimated 150 were hanged annually in the London area in the mid-Jacobean period. Put differently, between a quarter and a fifth of those standing trial for felony in Elizabethan or Jacobean England were executed. Overwhelmingly, they suffered for property offences: of 337 death sentences passed by the main criminal court in Cheshire 1580–1619, 294 (or 87 per cent) were for property offences (mainly theft and burglary), 35 for homicide, and 8 for other offences.

The Elizabethan and Stuart periods also saw an elaboration of rituals at executions, a trend which probably began with treason cases, and a marked contribution from the clergy. The speech made by the convicted person assumed a central importance, taking a stereotyped form in which they confessed their crimes, admitted earlier sins, sought forgiveness from monarch, God, and the spectators, and thus publicly reintegrated themselves into society before dying.

The 18th cent. provides better documentation on ceremonies and crowd reactions at executions. It also experienced a lower level of executions than the early 17th,

## Caracalla

with many convicted persons being reprieved, notably before being transported to the American colonies. A system of selectivity was in operation. The capacity to execute widely was retained but usually those executed were persistent offenders, persons with no influential patrons, perpetrators of unusually atrocious crimes, or offenders convicted at a time when the authorities wanted to make examples.

The early 19th cent. experienced a rapid transition in thinking on punishment. Transportation to Australia or incarceration in one of the new penitentiary prisons became the standard punishment for serious, non-homicidal offenders. By the mid-19th cent. capital punishment was restricted to murderers and, after 1868, was carried out inside prisons rather than in public. The abolition of the death penalty was already being mooted. Debate on this issue surfaced intermittently in the 20th cent., leading to its abolition for all practical purposes in 1965. JAS

**Caracalla.** Roman emperor. The eldest son of the Emperor \*Septimius Severus, his real name was Marcus Aurelius Antoninus, Caracalla being a nickname from his habit of wearing the military cloak. He came to Britain with his father in 208 to take part in the campaign into Scotland, to get him away from the flesh-pots, according to one source. After his father's death at York in 211 he negotiated terms with the tribes of central and southern Scotland and withdrew the troops to the \*Hadrian's Wall area before returning to Rome to substantiate his claim to the throne by murdering his brother. He was assassinated in 218. ASEC

**Caratacus,** British king and opponent of the Roman invasion. Caratacus was one of several sons of the great British king \*Cunobelinus and on his father's death around AD 40 he and his brother Togodumnus appear to have divided the \*Catuvellaunian kingdom between them. Their forces jointly opposed the Roman invasion in AD 43 but Togodumnus died shortly after the battle at the Thames and Caratacus, escaping capture, seems to have fled west. He re-emerged five years later leading the \*Silures of south-east Wales in their initially successful attempts to repel the Roman conquest of their territory. When the Romans planted legionary fortresses at Kingsholm (\*Gloucester) and \*Wroxeter, he withdrew into central Wales and began to organize the \*Ordovices to oppose the Roman advance. In a pitched battle on well-chosen ground, perhaps near Caersws, his forces fought well but lost. He himself escaped and fled to \*Brigantia, but he was betrayed and handed over to the Romans by Queen \*Cartimandua. Taken in chains to Rome, he made a bold and defiant speech before \*Claudius (imaginatively recorded by Tacitus) which won him and his family a pardon. He spent the rest of his life in exile in Rome. KB

**Carausius.** Roman imperial usurper, AD 286–93. In 286 Carausius revolted against official Roman command in advance of disciplinary action by the western *Augustus* (emperor) Maximian. Appointed to command patrols of the English Channel, which was plagued by barbarians, Carausius had exploited the booty profits too successfully

for Maximian's liking, and Maximian sentenced him to death. Carausius declared himself emperor and controlled Britain and north-western Gaul 286–93. In 293 Constantius Chlorus (Maximian's *Caesar* or deputy) made military gains against Carausius in Gaul and captured the great fleet base at Boulogne. Carausius was assassinated by his finance minister \*Allectus. ES

**Carberry Hill, encounter at,** 1567. Mary, queen of Scots' marriage to \*Bothwell in May 1567 provoked widespread protest. They took refuge in Borthwick castle to the south of Edinburgh but were forced to flee. On 15 June at Carberry Hill, east of the city, they were confronted by a superior force. While negotiations continued, Mary's troops began to desert. Bothwell fled north and finished up in life-long captivity in Denmark. Mary was imprisoned in Lochleven castle and, on 24 July, abdicated in favour of her infant son James. JAC

**Carbisdale, battle of,** 1650. Early in 1650 \*Montrose sailed from Bergen to Orkney with a small force. He moved to the mainland without gathering much support and on 27 April was surprised at Carbisdale, on the Kyle of Sutherland, west of Dornoch. His supporters were routed, Montrose captured and hanged in Edinburgh the following month. JAC

**Cardiff.** The capital of Wales located at the mouth of the river Taff. Cardiff was the site of a Roman fort constructed in AD 76, controlling the crossing of the Taff. But little is clear as to its post-Roman history. During the Dark Ages the Celtic St \*Teilo founded his church at Llandaff to the north and there is some slight place-name evidence of Viking presence. But it is with the coming of the Normans that the site was revitalized. Robert \*Fitzhamon set up his castle within the Roman fort. A settlement was established about the castle which became the military and administrative centre of the lordship of Glamorgan, and was protected by stone walls by the beginning of the 14th cent. A charter was granted sometime after 1147. Although large by Welsh standards, later evidence suggests a town of no great significance. Its population, estimated by the Hearth Tax of 1660–70, was some 1,600, and at the first census of 1801, with a population of 1,870, it ranked only 21st amongst Welsh towns.

With the beginning of the iron industry on the northern edge of the coalfield, Cardiff began its rapid growth as the main port, linked to the interior by the Glamorgan canal (1798) and then the Taff Vale railway (1840–1). But from the middle of the century, coal export rose to dominance, reaching 13.5 million tons by 1913. Cardiff was the world's premium coal port and its population rose in parallel with coal. In 1881, when its population was 82,761, it became, and has remained ever since, the largest Welsh town. By 1901 the population was 164,333.

The rise of Cardiff is intimately associated with the successive marquises of Bute, who owned great swathes of urban estate, initially by marriage, subsequently by purchase. The series of docks (Bute West, 1839; Bute East, 1856; Roath Basin, 1808; Roath Dock, 1887; Alexander Dock, 1907) was unique in Britain, since the development

was provided by a single private estate. But financial pressures meant that provision was slow and exclusively for coal export. Cardiff never developed a general trade or a port-based industry.

Even so, its size, twice that of the next largest town, made it dominant in Wales. It became a county borough in 1889, was designated a city in 1905, and slowly acquired a new role as the Welsh metropolis. As the gradual run down of coal-mining led to the decline of the docks, Cardiff emerged as an administrative and financial centre and high-technology industries began to accumulate. Cardiff was transformed into a thriving regional city and, after its designation in 1955 as the capital of Wales, a significant administrative centre.

These changes were accompanied by a physical transformation. In 1897 Cathays Park, an area of some 58 acres, was purchased from the Bute estate and laid out as a civic centre. With local, regional, and national buildings, it is one of the most distinctive of administrative areas in Britain. The gift of Cardiff castle and its surrounding lands by the marquis of Bute in 1947 provided an extensive parkland in the heart of the city.

Internal reorganization has given four large shopping malls within the centre, the St David's centre having a major concert hall, whilst Millennium funds contributed to the national stadium. But perhaps the most significant development is that of Cardiff Bay, where the old docklands are being transformed in a characteristic 'inner harbour' development, which will see a barrage to provide a permanent waterfront and such buildings as a new combined theatre, opera, and museum centre. The population of Cardiff in 1999 was 315,000 (of whom 6.4 per cent spoke Welsh). HC

#### **Cardigan, James Brudenell, 7th earl of (1797–1868).**

Born at Hambledon Manor (Bucks.), as Lord Brudenell he was commissioned in the 8th Hussars in 1824, purchased command of the 15th Hussars in 1832, and was removed for misconduct in 1834. Nothing daunted, in 1836 he purchased command of the 11th Hussars, and in 1837 succeeded to the family title. In 1841 he was tried by the House of Lords for fighting a duel, and acquitted on a technicality. He survived repeated scandals over both his military and private life, marrying twice, first in 1826 the divorcée Elizabeth Johnstone (née Tollemache), from whom he separated in 1846, then in 1858 Adeline de Horsey immediately following his first wife's death. Cardigan's fame and notoriety rest with his command of the light cavalry brigade in the \*Crimean War, particularly the \*'Charge of the Light Brigade' at Balaclava in 1854. He was inspector-general of cavalry 1855–60, and gave his name to the woollen 'Cardigan' jacket popularized by the war. SDB

**Cardiganshire.** A west-coast county of Wales bordering the Irish Sea. In 1974 it became the district of Ceredigion in the county of \*Dyfed, but in 1996 was reconstituted as a county, retaining the name Ceredigion. That name, from which Cardigan is derived, is supposedly after Ceredig, founder of a post-Roman Celtic chieftdom (*gwlad*) and the son of \*Cunedda, a leader of the \*Votadini, who moved or were moved from Strathclyde in the 5th cent. Its territorial extent was confirmed under Norman occupation and, after

its conquest by Edward I in 1277, it was created one of the shires of the principality by the statute of \*Rhuddlan in 1284. At the Act of \*Union with England in 1536 it was retained as a county virtually within its ancient limits and has remained as such to the present, apart from the period 1974–96.

Cardiganshire is the land between the sea and the Plynlimon (Pumlumon) range and between the Teifi and Dyfi rivers. It consists of an interior high plateau (1,700–2,000 feet) falling in a series of lower plateaux, seamed by deeply incised rivers, to the coast. Economically there are three dominant activities, livestock farming, tourism, and education. Two of the institutes of the University of Wales are located in the county at Aberystwyth and Lampeter.

The population, which was 69,000 in 2000, has been growing after 100 years of rural depopulation. Its western location has meant that it has been a bastion of the Welsh language. But although it was spoken by 93 per cent in 1901, with 50.4 monoglot, the proportion had declined to 59.1 per cent in 1991.

Cardiganshire constitutes a parliamentary constituency and, in line with Welsh radicalism, its political representation was predominantly Liberal, but more recently \*Plaid Cymru has taken the seat. HC

**cards, playing.** Of ancient and uncertain origin, but known in Europe by the 1370s, playing cards were probably introduced into England by soldiers returning from the French wars. The early suit signs of coins, clubs, swords, and cups soon gave way to cœurs (hearts, possibly representing the church), carreaux (arrowheads or diamonds, symbolic of vassals/archers), trèfles (clover or clubs, for husbandmen), and piques (lance-points or spades, for knights), which French pattern has since become international; fortune-telling preferred the larger tarot packs, but games of chance generally utilized those with just court and numerical cards. Whilst reflecting changing tastes and outstanding events, colours and characteristics have remained remarkably constant, though now more formalized and sophisticated. An established part of upper-class Christmas festivities by 1484, but castigated by puritans as inventions of the devil, playing cards were so popular by 1628 that the London card-makers formed a company and received a royal charter. Repeated petitions against foreign imports eventually resulted in imposition of duties and establishment of an office for sealing all those of English manufacture and regulating prices; since 1712, the duty mark has decorated the ace of spades, thereby providing date approximation. Political designs have included the \*Rump Parliament, \*Popish plot, Marlborough's victories, reign of Queen Anne (with her \*touching for the evil), South Sea bubble, and caricatures of 1880s figures. Social designs have reflected costume, especially on court cards, and included London cries, lyrics and music for *The Beggar's Opera*, and educational themes. ASH

**Cardwell, Edward (1813–86).** Son of a Liverpool merchant, educated at Winchester and Balliol College, Oxford, Cardwell became a Conservative MP in 1841. Close to the leader \*Peel, he followed the Peelite free traders after the

## Carey

party split of 1846. Elected for Liverpool in 1847, he was defeated in 1852 for supporting repeal of the Navigation Acts. In ministerial posts under \*Aberdeen and \*Palmerston, including colonial secretary, he stood out as an administrative reformer and economizer. \*Gladstone's secretary at war from 1868, he ended flogging in the army and undertook major reforms, prompted partly by a sense of Britain's military weakness. Infantry regiments were given territorial designations and linked to reserves, short service was introduced, and the commander-in-chief's office was brought under clearer ministerial authority. The abolition of purchase of commissions was controversial; when the 1871 Army Regulation Bill was blocked by the Lords, the change was implemented by royal warrant. Cardwell became a viscount on the Liberal defeat in 1874. Strains of prolonged office may have contributed to later insanity. Historians have become sceptical about the military significance of his army reforms. BIC

**Carey, George** (b. 1935). Archbishop of Canterbury. Born and educated in Essex, after national service in the RAF, Carey graduated from the London College of Divinity and King's College, London. He was successively curate in Islington, theological college lecturer, vicar of St Nicholas's, Durham (1975), principal of Trinity College, Bristol (1982), bishop of Bath and Wells (1987), and archbishop (1991). A man of considerable scholarship and missionary flair, his primacy's most notable and controversial achievements have been the ordination of women to the priesthood (1994) and synod's acceptance of the Porvoo declaration establishing intercommunion with continental Lutheran churches (1995). Controversies over homosexuality and church finance remain. Originally an evangelical, he nurtures tolerance within Anglicanism and progress towards unity with Rome and eastern orthodoxy. He continues his predecessors' world-wide quasi-patriarchal role. WMM

**Carey, Henry.** See HUNSDON, 1ST BARON.

**Carham, battle of,** 1018. \*Malcolm II of Scotland with his ally Owain of Strathclyde took advantage of \*Cnut's efforts to establish himself as ruler of England to invade Northumbria and reverse a defeat at Durham in 1006. He inflicted a severe defeat on the Northumbrians at Carham, south-west of Coldstream. Simeon of Durham wrote that 'all the people who dwelt between Tees and Tweed were well-nigh exterminated'. It meant a significant shift in the balance of power in the north, confirming Scotland's hold on Lothian, and helping to establish the Tweed as the border. JAC

**Carisbrooke castle.** A small royal castle near Newport on the Isle of Wight. Occupied by parliamentary forces during the civil wars, the castle and its garrison of twelve soldiers was governed by Colonel Robert Hammond from 1647. Perhaps influenced by a report of Hammond's disenchantment with the parliamentary cause, Charles I fled from Hampton Court to Carisbrooke on 14 November 1647. At the end of December Charles negotiated a secret treaty with the Scots, after which point the garrison was strengthened, and Parliament ordered that the king should be detained in custody. Charles twice attempted but failed to escape from the castle,

though he was let out on parole during the \*Newport treaty of September 1648. Prior to their seizure of power, the army leaders dismissed Hammond. They then transferred Charles from Carisbrooke to Windsor in preparation for his trial and execution. IJG

**Carlile, Richard** (1790–1843). Free thinker and republican publisher. Born in Ashburton (Devon), Carlile moved to London as a journeyman tinplate-maker in 1813 but in 1816 began selling radical newspapers. He took up the ideas of Thomas \*Paine which he published in the 'blasphemous and seditious press', and was imprisoned for blasphemous libel in 1817 and 1819–25. Between 1819 and 1826 he edited the weekly *Republican*, where he expressed views which changed from \*deism to \*atheism. He advocated \*birth control but his Malthusian economics divided him from other popular radical leaders. In 1830 he rented the Blackfriars Rotunda theatre in south London for lectures by the charismatic deist the Revd Robert Taylor, but was imprisoned for seditious libel (1831–3). In the 1830s he preached allegorical Christianity, left his wife for a 'moral marriage' with the feminist Elizabeth Sharpley, and lost much of his influence in the radical movement. ER

**Carlisle, Charles Howard, 1st earl of** (1628–85). Howard's nimble political footwork enabled him to make the awkward transition from ardent Cromwellian to ardent royalist. He was too young when the Civil War started to need a political stance but later gave strong support to \*Cromwell, serving as captain of his bodyguard and fighting with distinction at \*Worcester. His father-in-law, Lord Howard of Escrick, was a member of Cromwell's Council of State and his mother's cousin, Lord Eure, was in Cromwell's 'other house' of peers. Howard was made a viscount by Cromwell in 1657 and also served in the 'other house'. But he kept his options open. After Cromwell's death he supported his son as protector but was accused of complicity in \*Booth's royalist rising in Cheshire in 1659. In 1660, returned to the \*Convention, he changed sides and helped to bring back Charles II. He also moved to Anglicanism, having been catholic, presbyterian, and independent in turn. The new regime forgave old sins. Howard was lord-lieutenant for Cumberland and Westmorland 1660–85, and for Co. Durham 1672–85. In the coronation honours, he was created earl of Carlisle. He served on various diplomatic missions and from 1677 to 1681 was governor of Jamaica. A broadsheet described him, not unfairly, as 'of very complying principles' and \*Burnet wrote charitably that he was 'apt to go forth and backward in public affairs'. JAC

**Carlisle, Charles Howard, 3rd earl of** (1669–1738). Though twice 1st lord of the Treasury, Carlisle's political career was episodic and inconsequential, and his lasting achievement was the building of \*Castle Howard. He entered Parliament as a Whig in 1689 on the family interest at Morpeth, succeeded to the earldom in 1692, and was appointed lord-lieutenant of Cumberland and Westmorland in 1694. William III showed him favour, making him a gentleman of the bedchamber in 1700 and 1st lord of the Treasury in December 1701. But on Anne's succession in

1702, he was dismissed. He was reappointed 1st lord in May 1715 by George I, giving way to Walpole in October. Henceforth he held only minor court office. Increasing gout and his love for Castle Howard made him reluctant to leave Yorkshire: Walpole wrote in 1730 of 'the retired country life which you seem to make your choice'. He was buried in the vast mausoleum at Castle Howard designed by \*Hawksmoor. JAC

**Carlisle, diocese of.** The see, created in 1133, was contemporary with Cumbria until the 19th cent. The region where \*Ninian brought Celtic Christianity in the 4th cent. and which Kentigern secured in 573 came under the bishops of \*Lindisfarne until the Danish invasions obliterated all trace of the see. The diocese was restored with its seat at Carlisle in 1133, following Rufus's annexation of Cumbria (1092). Initially the see had a complex history, for, though ecclesiastically always under the metropolitan jurisdiction of York, it fell politically under the Scottish kings for 21 years (1136–57). In 1856 the see was enlarged to take in northern parts of the Chester diocese. The cathedral, originally founded as an Augustinian priory in 1102, is noted for its fine 14th-cent. curvilinear east window. It suffered severely at the hands of the Scots during the Civil War. WMM

**Carlisle, statute of, 1307.** The activities in 1306 of William Testa, an over-zealous collector of \*Peter's Pence on behalf of Pope Clement V, led to an urgent petition at Edward I's last Parliament at Carlisle. This statute responded by prohibiting payment of Peter's Pence other than was customary and forbidding foreign prelates from raising revenue in England from houses of their order. It constituted a precedent for subsequent anti-papal measures and particularly Henry VIII's legislation in 1533 abolishing payment totally. JAC

**Carlton Club.** Founded in 1832 after the Tories' sharp electoral defeat over the Great Reform Act as a means of rallying the party, of ensuring that supporters registered their right to vote, and of co-ordinating press campaigns. It met first at Carlton House Terrace, then at the Carlton Hotel, and finally at its own premises in Pall Mall, designed by Smirke. Smirke's building was bombed during the Second World War and the club moved to St James's Street. Members are still expected to hold conservative principles. At a meeting in the club on 19 October 1922 the Tories took their decision to withdraw from the \*Lloyd George coalition. JAC

**Carlyle, Thomas (1795–1881).** Historian and man of letters. Born in Ecclefechan, the son of a strict presbyterian stonemason, and educated for the kirk at Edinburgh University, Carlyle showed a particular aptitude for mathematics, and earned a living as a tutor, schoolmaster, and journalist, developing a deep interest in contemporary German literature; his *Life of Schiller* appeared in 1823, his translation of *Wilhelm Meister* in 1824. His marriage to Jane Welsh Carlyle marked the beginning of a long, celebrated, and difficult marriage. By the late 1820s he had become a noted reviewer and commentator on contemporary politics, society, and morals, his collection *Sartor resartus* appearing in 1833–4. He abandoned Edinburgh for London in 1834 and began a

career as a historian and political moralist. His essays on *Chartism* (1839) and *Past and Present* (1843) dramatized the moral demands subjects make on their rulers with remarkable power. His *French Revolution* (1837), his edition of Cromwell's speeches (1845), and his enormous study of Frederick the Great (1858–65) are brilliant imaginative accounts of the moral power of political leadership. By the end of his life Carlyle had become a fashionably unfashionable prophet who refused an honour from Disraeli and preferred burial at Ecclefechan to Westminster abbey. NTP

**Carmarthenshire.** County of south-west Wales. It was part of the early Welsh kingdom of \*Dyfed and later its core—the vale of Towy (Ystrad Tywi)—became the heart of the later kingdom of \*Deheubarth, one of the centres of resistance to Norman occupation. At the Norman conquest, a royal lordship was created about the royal borough of Carmarthen, an indication of its strategic significance. The shire was created at the statute of \*Rhuddlan, by the addition of Ystrad Tywi to the lordship of Carmarthen. At the Act of \*Union with England, other royal lordships and sublordships, including Llandovery (Llanymddyfri), St Clears, Kidwelly (Cydweli), and Newcastle Emlyn, were added to the county. In 1974 Carmarthen became a district in the county of Dyfed, but the old Ystrad Tywi was made into a separate district of Dinefwr and another district was based on Llanelli. In 1996 Carmarthenshire was restored as a county within its traditional bounds. The county is centred on the Tywi valley and the river's source areas in the Black Mountain to the east and the Carmarthen Vans to the north. To the east and west there are separate drainage systems, the Taff (Tâf) to the east and the Gwendraeth, Loughor/Ammann to the west, where the county overlaps on to the anthracite section of the South Wales Coalfield.

The rich valley lowlands constitute the major dairying areas of south Wales. To the east, coal-mining in the 19th and 20th cents. gave rise to extensive village settlement. Llanelli was the main port and steel and tinplate were widely distributed, until rationalized after the Second World War. There is now one integrated plant at Trostre, but other smaller metal-using and engineering industries survive.

Carmarthenshire is a county of rich Welsh tradition. The name, an Anglicization of the Welsh Caerfyrddin, is derived from the Welsh name of Merlin. Welsh is spoken by 58.0 per cent in the district of Carmarthen, although it rises to 66.5 per cent in Dinefwr and falls to 46.5 in Llanelli. The population of the new county was 169,000 in 2000, with almost half in Llanelli. HC

**Carmelites** were originally established as a monastic order in Palestine in the mid-12th cent., claiming descent via early hermits on Mount Carmel from Elijah and the Old Testament prophets. They were given a rule of great asceticism in 1209. Following the decline of the crusading states they returned to Europe in the mid-13th cent. Several communities were established in England c.1242. Shortly afterwards the Carmelites were reorganized as mendicant \*friars (the 'white friars'), perhaps under the influence of the English 'general' of the order, St Simon Stock. They remained especially popular in England, where there were nearly 40

## Carnarvon

friaries at the \*dissolution. In England, as elsewhere, the order was notable for its scholars and theologians, while the 16th-cent. Spanish poet and mystic St John of the Cross was a Carmelite. BJB

**Carnarvon, Henry Molyneux Herbert, 4th earl of** (1831–90). Inheriting the earldom between Eton and Christ Church, Oxford, Carnarvon became a leading advocate of colonial federation, both amongst colonies and between them and the mother country. Colonial secretary under \*Derby and \*Disraeli, he federated the Canadian provinces into a self-governing dominion by the British North America Act (1867) but his similar attempt in southern Africa, including the Boer \*Transvaal, came to grief. Carnarvon, distrustful of democracy, had been one of the cabinet to resign over the Conservatives' Reform Bill in 1867. In 1878, insistent on British neutrality and, as a high churchman sympathetic to Orthodox Christians, he resigned over Disraeli's policy on the Eastern Question. Lord-lieutenant of Ireland under \*Salisbury in 1885, he pursued a policy of conciliation and held secret talks with the nationalist leader \*Parnell, who later claimed \*Home Rule had been discussed. Carnarvon resigned (again) as his policy crumbled, though he opposed Gladstone's \*Irish Home Rule initiative. BIC

**Carnatic wars.** The Carnatic region covers the Eastern Ghats and Coromandel plain in south India and witnessed the initial struggle of the British and French for power in the subcontinent. Rivalry between Chanda Sahib and Mohammed Ali to be nawab of Arcot became entangled with rivalry between the English and French \*East India Companies for trading supremacy. The French backed Chanda Sahib and the English Mohammed Ali. The hostilities, which brought the European War of Austrian Succession and Seven Years War to Asia, lasted with brief respites from 1746 until 1760 and saw the emergence of Robert \*Clive. In 1760, the English won a decisive victory at the battle of \*Wandewash. However, peace did not come to the region for another forty years. English hegemony was challenged by Hyder Ali and Tipu Sultan of Mysore, who received occasional support from France, and south India was not fully secured by the British until Arthur Wellesley's (\*Wellington) victory over Tipu in 1799. DAW

**Carnegie, Andrew** (1835–1919). Philanthropist. Carnegie was born in Dunfermline but brought up in the USA. He made a vast entrepreneurial fortune, mainly in railroads and the iron industry, retiring in 1901 to supervise the 'wide distribution' of his great wealth. He had already begun in 1882 with the gift of a library to Dunfermline and he followed it with endowments to hundreds of libraries in Britain, the USA, and Canada. He also gave generously to the Scottish universities and served as rector at St Andrews, Edinburgh, and Aberdeen. He contributed to the palace of peace at The Hague and was hard hit by the outbreak of the First World War. His autobiography appeared in 1920. JAC

**Caroline of Brandenburg-Anspach** (1683–1737), queen of George II. Daughter of John Frederick, margrave of Brandenburg-Anspach, Caroline was brought up at the

courts of Dresden and Berlin after her father had died when she was 4. In 1705 she married George Augustus, electoral prince of Hanover and, from 1727, king of Great Britain. Her life in England from 1714 was far from tranquil. Her husband was testy and choleric. Relations between him, as prince of Wales, and his father George I were bad, and in turn George and Caroline quarrelled bitterly with their son \*Frederick, prince of Wales: 'there he goes, that wretch, that villain' was one of Caroline's many unflattering references to her first-born. She did not particularly resent her husband's attentions to other women which, at least, kept him occupied. An incomparable account of their domestic life is given in Lord \*Hervey's published memoirs of the court. Her influence over the king, which was considerable, was exercised in favour of Sir Robert \*Walpole, and she acted as regent in 1729, 1732, 1735, and 1736–7 in her husband's absences in Hanover. A woman of intelligence and learning, she was a benefactress of the Queen's College, Oxford. She died in great pain on 20 November 1737 from an undisclosed rupture, her husband characteristically fussing over her death-bed, and was buried in Westminster abbey. SMC

**Caroline of Brunswick** (1768–1821), queen of George IV. Caroline's marriage to her cousin George, prince of Wales, in March 1795 was a spectacular disaster. According to her own testimony, intimacy was confined to the first night, and certainly the couple separated after the birth of their daughter Princess \*Charlotte in January 1796. Thereafter, Caroline spent much time on the continent with a strange entourage, which led to much gossip. A 'delicate investigation' into her conduct in 1806 cleared her of adultery but declared that she had been indiscreet. In 1815 Lady Bessborough, at a ball, found her 'a short, very fat, elderly woman, with an extremely-red face', wearing a white frock cut 'disgustingly low'. When George became king in 1820, Caroline rejected an offer of £50,000 p.a. to stay abroad and returned to England to claim her place as queen. Her cause was taken up by George's not inconsiderable number of enemies and she won a good deal of popular support. A government-sponsored bill to annul the marriage had to be withdrawn. \*Denman, one of her counsel, in a theatrical flourish, begged the Lords to remember that Christ himself had forgiven the woman taken in adultery, laying himself open to a celebrated riposte:

Most gracious Queen, we thee implore  
To go away and sin no more;  
Or, if the effort be too great,  
To go away at any rate.

When Caroline appeared at Westminster abbey in July 1821 at George's coronation, demanding to be let in, she overplayed her hand. She died a fortnight afterwards. SMC

**carols.** The word 'carol' probably derives ultimately from the Greek *choros* via the Italian *carola* meaning a circle-dance. In England from medieval times 'carol' has signified a joyful religious seasonal song, usually sung in the vernacular. In his *English Folk Song*, Cecil Sharp says that it 'stands midway between the hymn and the ballad'. Although over-

whelmingly associated with the Christmas season, it can reflect any religious theme.

Although today the distinction between carols, hymns, and popular Christmas songs has tended to become blurred, the true carol has certain characteristics. It usually gives indirect praise to God, through picturesque references to people, objects, or events which are tangential to the theme. The traditional west country carol 'A Merry Christmas', with its call for 'figgy-pudding' is a good example of this—the joy and fellowship engendered by the yearly commemoration of the incarnation being underlined.

Another characteristic of the true carol is that it is less based upon poetic narrative, than upon imagery and symbolism. In 'The Holly and the Ivy', another traditional carol, the white blossom and red berry stand for Mary and the sacrifice of Christ.

Some of the most delightful carols date from the 18th and early 19th cents., when bands of village musicians playing stringed and wind instruments formed the usual accompaniment to church choirs. The surviving part-books from country churches (e.g. Puddletown in Dorset) and the recorded performance of the music by singers and instrumentalists such as the Mellstock Band reveal, in such works as 'Arise and Hail the Joyful Day' and 'Hail Happy Morn', the vitality of this musical tradition, before it was swamped by congregational hymn-singing to organ accompaniment. In recent years the radio and television broadcasting of the service of Nine Lessons and Carols from \*King's College, Cambridge, has done much to heighten awareness of the rich English Christian heritage of both traditional and modern carols. JRG

**Carr, Robert, 1st Viscount Rochester, 1st earl of Somerset** (c.1587–1645). Carr, a royal favourite, began his career as page to James VI of Scotland, whom he accompanied to London in 1603 when James ascended the English throne. By 1607 he was established as the king's favourite, but he only acquired political significance after the death of James's chief minister Robert \*Cecil in 1612, acting as the king's secretary and building up a considerable clientage. His main alliance was with Henry \*Howard, the pro-Spanish and pro-catholic earl of Northampton, and this was reinforced when he fell in love with Northampton's relative Frances Howard. She was the wife of the earl of \*Essex—son of Elizabeth I's favourite—but James, ever indulgent, set up a tribunal which annulled the marriage, and in 1613 Frances married Carr, now earl of Somerset. Meanwhile Carr's former friend and adviser Sir Thomas Overbury, who had opposed the match on political and personal grounds, was removed from the scene when James sent him to the Tower of London, where he died, apparently of natural causes. Only in 1615 did James become aware that in fact Overbury had been poisoned by Frances. Carr and his wife were tried for murder, and although Carr protested his innocence, they were both found guilty. They were saved from execution by James, who issued a pardon, and after a few years' comfortable imprisonment they retired into private life, taking with them the very fine collection of works of art which Carr had acquired. His place as favourite was filled by \*Buckingham. RL

**Carrington, Peter, 6th Baron Carrington** (b. 1919). Carrington is one of the few hereditary peers to hold high office through the modern Conservative Party. After junior ministerial appointments, Carrington served as high commissioner in Australia 1956–9. He rose to prominence as opposition leader in the Lords after 1964 and became defence secretary in 1970. One of \*Heath's closest advisers, he was also party chairman (1972–4) and energy secretary (1974), advising Heath to call an election during the miners' strike of that year. Surprisingly, his career flourished under Margaret \*Thatcher, who found him one of the more congenial Tory grandees. But his appointment as foreign secretary ended in 1982 when he resigned, having failed to foresee the Argentinian invasion of the Falkland Islands. Public reincarnation came as secretary-general of NATO (1984–8) and subsequently as an unsuccessful mediator for the European Community in war-torn Yugoslavia. Endowed with geniality and good humour, Mrs Thatcher described Carrington as a 'jolly Whig'. DJD

**Carroll, Lewis**, pseudonym of Charles Lutwidge Dodgson (1832–98). Author and mathematician. Brought up in a country parsonage, excelling in mathematical and classical studies at Oxford, Dodgson was appointed lecturer in mathematics at Christ Church (1855–81), and ordained deacon (1861) according to the terms of his fellowship endowment; feeling unsuited to parish work, he remained unpriested, hence unmarried. Shyness and a stammer were forgotten in the company of children, whom he amused with stories, puzzles, and riddles; some of these, invented for Dean Liddell's daughters, were recast and immortalized in *Alice's Adventures in Wonderland* (1865) and its sequel *Through the Looking-Glass* (1871), which continue to delight children of all ages. The pseudonym derived from retranslation of the Latin form of his first names (Carolus Ludovicus) reversed. Dodgson, ingenious and extremely methodical, also published mathematical works, verse, and pamphlets on university affairs, all combining logic and humour, and was a fine photographer. ASH

**Carson, Sir Edward** (1854–1935). Carson is still seen as the arch-opponent of \*Irish Home Rule but was a more complex figure than traditionally depicted. Of middle-class southern protestant background, he became a successful lawyer and Unionist politician. In 1893 he moved his political and legal career to London, becoming solicitor-general for both Ireland and Britain and a major figure within the Tory Party. Carson was elected leader of the Unionist Party in 1910, and associated with Ulster resistance to the third Home Rule Bill, as a means of resisting devolution throughout Ireland. Less intransigent in private negotiations on the Ulster crisis than he appeared, he reluctantly accepted the need for partition by 1914. He became a member of the war cabinet and played a significant role in the removal of \*Asquith from office in 1916. Attorney-general 1915–16, and 1st lord of the Admiralty 1917–18, his administrative ability was heavily criticized. Carson took a less central part in Irish Unionist politics after 1918 and resigned the leadership of Ulster Unionists in 1921 before Northern Ireland was established. His denunciation of the Anglo-Irish treaty was more heart-

## Carstares

felt than his welcome of the Northern Irish government. In a characteristically melancholy manner, Carson regarded his career as a failure, whereas Northern Unionists have seen him as iconic. MAH

**Carstares, William** (1649–1715). Ecclesiastical statesman. Carstares was born near Glasgow, the son of a presbyterian minister who took part in the 1666 covenanting rising. After attending Edinburgh University, he lived in Holland, where he was ordained. On his return to Scotland, he was imprisoned by \*Lauderdale 1674–9. When released, he resumed exile on the continent, in touch with \*Shaftesbury and William of Orange. He was again arrested after the \*Rye House plot in 1683 and sent to Scotland, where he was tortured before again being set free. He was then appointed chaplain by William and accompanied him on the 1688 expedition, conducting the thanksgiving service on their safe arrival at Torbay. Carstares became an influential adviser in religious matters and helped to persuade William to opt for a presbyterian settlement in Scotland. His political influence ceased with William's death in 1701 but from 1703 he was rector of the University of Edinburgh. JAC

**Carteret, John, 2nd Baron Carteret, 1st Earl Granville** (1690–1763). Carteret achieved prominence through Baltic diplomacy, 1719–20, and emerged untainted by the \*South Sea bubble crisis to become secretary of state for the southern department in 1721. \*Walpole and \*Townshend's jealousy led to his demotion to the lord-lieutenancy of Ireland in 1724 and dismissal in 1730, whereupon he became a leader of the Whig opposition. Upon Walpole's fall in 1742, Carteret was appointed secretary of state for the northern department. He quickly became George II's favourite minister and developed complex diplomatic schemes to assist Austria, Britain's ally in the War of the Austrian Succession. In the Commons there was outrage at the lack of apparent benefit and cost of Carteret's policies, led by \*Pitt but abetted by the \*Pelham brothers; in November 1744 Granville (as he had become) was forced to resign. After some years of semi-retirement, Granville was persuaded by \*Newcastle in 1751 to become lord president. He acted as an adviser to the king, Pitt, and Newcastle throughout the \*Seven Years War. Though often ill or inebriated, his opinions were much respected by the cabinet. An accomplished classicist, linguist, and wit, Granville's career was restricted by his laziness and an insufficient regard for the power of the Commons. AIL

**Carthusians.** Part of an 11th-cent. revival of Egyptian solitary 'desert life', they were founded as a group of hermits near Grenoble, later La Grande Chartreuse (1084), by Bruno (d. 1101), formerly canon and teacher at Rheims. Their rule was written by Guigo (prior 1110–36), who also founded six other charterhouses in France, all strictly centralized on Chartreuse. A wise combination of the communal and solitary elements of monasticism, Carthusians lived in separate cells with more private than common prayer. As penance for \*Becket's murder, Henry II established the first English house at Witham, Somerset (1178), whose saintly third prior became Bishop \*Hugh of Lincoln. Six more houses

followed (1342–1414), including London (1371) and the largest, Henry V's foundation at Sheen. Never relaxing their austerity, nor ambitious to proliferate, they were noted for their holiness—many distinguished men took vows—and for their powerful mystical tradition, nourished by writings such as *The Cloud of Unknowing*. Carthusian observance uniquely has never changed: *Nunquam reformata quia nunquam deformata*, 'Never reformed, because never deformed'. The quiet holiness of the early 16th-cent. London Charterhouse, a 'desert in the city', contrasting with the 'noisy, restless, ambitious and sordid whirl of the city streets' drew many notables for spiritual direction and even resident retreat. Its last prior, John Houghton, 'a character of rarest strength and beauty', and his monks were all heroically martyred at the \*dissolution. WMM

**Cartimandua**, British queen of the \*Brigantes. Cartimandua is said to have come from a long and distinguished ancestry, and was queen in her own right. She made her first appearance in history when in AD 51 she handed over to the Romans \*Caratacus, the leader of the Welsh resistance. Her treaty relationship with the Romans probably began at this time, providing them with a friendly native state on the northern frontiers of the new province. However both personal and political differences with her consort Venutius led to considerable instability in her kingdom, which was in any case a confederation of tribes spread over most of northern England. Venutius' ambitions were initially thwarted by repeated Roman intervention in support of Cartimandua, but during the civil wars of AD 69 he took his opportunity to seize the kingdom. The queen was rescued by Roman cavalry, but never regained her throne. KB

**cartography.** See MAPS.

**Cartwright, Edmund** (1743–1823). Inventor. A younger brother of John Cartwright, the parliamentary reformer, who also had a taste for inventing, Edmund Cartwright was an Anglican clergyman and from 1779 held the living of Goadby Marwood (Leics.). In 1785 he patented a loom driven by water, which he developed later in a factory near Doncaster. In 1789 he invented a wool-combing machine, which saved labour and caused great agitation among the workers. Cartwright was obliged to abandon his own factory, but his inventions were widely adopted, and in 1809 he was awarded a grant of £10,000 by Parliament. JAC

**Cartwright, Major John** (1740–1824). The 'Father of Reform' was a Lincolnshire squire who devoted the best years of his long life to radical agitation and propaganda. From support of the American colonists, Cartwright moved to a critique of the political system. His most famous book, *Take your Choice* (1776), argued the case for manhood suffrage, secret ballot, annual elections, equal electoral districts, and payment of MPs, by reference to Anglo-Saxon precedent, thus foreshadowing the claims of advanced political reformers until chartist times and beyond. In 1780 he founded the \*Society for Constitutional Information. He welcomed the first stages of the French Revolution, but did not support Paineite radicalism or the London

\*Corresponding Society. For some years after 1805 he was involved in the politics of the radical borough of Westminster, and from 1812 in the \*Hampden Club movement. JFCH

**Cartwright, Thomas** (1535–1603). A leading early presbyterian, Cartwright was born in Hertfordshire and graduated from St John's College, Cambridge. Expelled on Mary's accession, he returned as fellow of Trinity (1562), but disputes over surplices and church government led him to depart for Ireland (1565–7). After his return as Lady Margaret professor of divinity (1569) his advocacy of presbyterian church government brought him into frequent conflict with \*Whitgift, master of Trinity. Deprived of his professorship (1570) and his Trinity fellowship (1571), he emigrated to Geneva. After a brief spell in England (1572), he became (1573) minister to exiled English congregations in Antwerp and Middelburg. Back in England (1585), he continued to preach despite two spells of imprisonment, after which he retired to Guernsey (1592). Intellectually the leading puritan of his day, he refused to associate with the \*Brownists and \*Barrowists. WMM

**Carvetii.** A British tribe and *civitas*. The Carvetii are one of the many smaller tribes that made up the \*Brigantian confederation of northern England. Their name means 'the Deer Men', and their principal deity seems to have been a war-god called Belatucadrus. They occupied the extreme north-west corner of Brigantian territory comprising Cumberland and part of Westmorland. Roman authors make no mention of the Carvetii, but the existence of the *Civitas Carvetiorum* is recorded on two inscriptions—a milestone and a tombstone from Brougham and Old Penrith respectively. The former is important because, dated to AD 258–68, it confirms that the *civitas* was in existence by the middle of the 3rd cent. at the latest. It was possibly created as part of a reorganization of the northern frontier in the early 3rd cent. A capital was established at Carlisle, known to the Romans as Lugalium. KB

**Casablanca conference.** On 14–24 January 1943 \*Churchill and Roosevelt met in Morocco to determine allied strategy. Stalin refused to attend as he was overseeing operations around Stalingrad. The prospect of opening a second front in northern France was discussed but the British considered it premature and instead the invasion of Sicily was planned. It was agreed to increase the bombing of Germany and to give priority to defeating the U-boats in the North Atlantic. It was decided to accept only the unconditional surrender of the axis powers, which ruled out any prospect of a negotiated peace. RAS

**Casement, Sir Roger** (1864–1916). Humanitarian and Irish hero. As British consul in the Congo Free State and then on the Amazon, Casement uncovered European atrocities against natives which stimulated powerful and mainly effective protest campaigns in Britain, and earned him a knighthood in 1911. He then returned to his Irish roots, and collaborated with Britain's German enemies during the \*First World War, for which he was hanged in 1916 after landing from a German submarine near Tralee to help the

\*Easter Rising. In order to mute the predicted Irish-American protest, the British \*secret services surreptitiously circulated private diaries revealing his homosexual proclivities. BJP

**Cashel, archiepiscopal diocese of.** The Irish archbishopric of Cashel (Caisel Muman—stone fort of Munster) was established by the Council of Raithbressail (1111), initially with oversight of the twelve dioceses of Leth Moga (southern half of Ireland), but when the Council of Kells-Mellifont (1152) further restructured Ireland into four provinces, Cashel's authority was reduced to the south-west by the creation of the \*Dublin province for the south-east. \*Patrick is said to have baptized King Aengus here (450) at the famous Rock, fortified in the 4th cent. The Council of Cashel in 1171 reformed Irish canon law. In the 13th–14th cents. its archbishops were still Irish, though the diocesan bishops were equally divided between Irish and Anglo-Norman. Cashel is still a catholic archiepiscopal see, but in 1838 the Anglican see was united with Dublin. Cashel, though still a diocese (also including Waterford and Lismore since 1833), ceased to be an Anglican archbishopric. The 13th-cent. cathedral, now roofless, was restored in 1686, but abandoned in 1749. Cormac's chapel (1127–32), enclosed by the choir and south transept, is reputed to be the most interesting Romanesque church in Ireland. St John Baptist's cathedral is neo-classical (1750–83). WMM

**Cashel, Council of,** 1171. After Henry II's invasion of Ireland and the submission of the princes (1171), he summoned a council of prelates to Cashel under Christian, bishop of Lismore, and the papal legate in the archbishop of Armagh's absence through old age. By reforming Irish canon law, revising the baptismal rite, introducing tithes, and thus removing Irish irregularities, they brought the church into line with the English church and with Rome. Letters they sent to Pope Alexander III were enthusiastically answered, recognizing Henry's new title as lord of Ireland, despite the horror of \*Becket's murder the year before. WMM

**Casket Letters.** The contents of a small silver casket, uncovered in 1567, allegedly incriminating Mary Stuart and her lover \*Bothwell in the murder of her second husband Lord \*Darnley. The papers consist of eight letters from Mary to Bothwell, a sequence of 'sonnets' (totalling 158 lines), and two contracts for the marriage of Mary to Bothwell. The authenticity of the material cannot now be certainly established as the originals vanished in 1584. However, surviving copies suggest that, while not outright forgeries, the material was clumsily doctored by Mary's opponents at the York-Westminster conference in 1568–9. RAM

**Cassivellaunus.** British chief or king. Cassivellaunus is known only from the war diaries of Julius \*Caesar and Dio Cassius' later derivative account of Caesar's invasions of 55 and 54 BC. Nevertheless, he may well have been a key figure in the political development of south-eastern Britain before the Roman conquest. Caesar recounts that before his invasions, Cassivellaunus had been in a continual state of warfare with neighbouring tribes. His territory is described as beginning some 75 miles from the sea, and on the far side

## Castillon

(that is, on the north bank) of the Thames. This places him in the Chilterns and suggests that he may have been the first local chieftain to found a kingdom here which was later to dominate most of south-east England under the tribal name of the \*Catuvellauni. His abilities as a war leader are confirmed by his selection by the British, even those he had recently been fighting, to lead the opposition to Caesar. His subsequent handling of his forces and his use of guerrilla tactics, which prevented Caesar from achieving the total victory he was seeking, suggest a shrewd military mind. The location of his stronghold is uncertain but Wheathamstead near Welwyn is possible. KB

**Castillon, battle of, 1453.** On 17 July 1453, the English lost Gascony, which they had held for 300 years. An Anglo-Gascon attack on a fortified artillery park a mile or two on the right bank of the Dordogne upstream from Castillon was probably launched without knowledge of the strength of its defence. For a short while, despite the hail of shot and ball, the rampart was gained. But the assault was repulsed and the English overrun, \*Shrewsbury, their legendary 65-year-old commander, being killed in the rout. Thus, in a suicidal frontal attack on artillery, not unlike the \*Charge of the Light Brigade, the \*Hundred Years War came to an end. Only \*Calais was left to the English. AJP

**'Castlebar races', 1798.** A small French expedition under Humbert landed at Killala in August 1798 to assist the Irish rebels. On 27 August at Castlebar they engaged militia, stiffened by regulars under General Lake, and routed them. Casualties on the loyalist side would have been heavier had not the militia shown an instinct for self-preservation—hence the mocking name 'Castlebar races'. But Humbert's force was a forlorn hope and surrendered at Ballinamuck a fortnight later. JAC

**Castle Howard, near Malton (Yorks.),** is one of the grandest houses privately built, comparable with \*Chatsworth, which may have influenced its design. It was commissioned by the 3rd earl of \*Carlisle, who began in 1699 to transform what had been the sprawling hamlet and ruined castle of Henderskelfe. The main house was designed by \*Vanbrugh, with the west wing finished in the 1750s to the design of Sir Thomas Robinson of Rokeby, brother-in-law to the 4th earl. The three great features are a superb south front, the imposing dome and entrance hall, and an extensive park, dominated by Vanbrugh's Temple of the Four Winds and \*Hawksmoor's sombre mausoleum. JAC

**Castlereagh, Robert Stewart, Viscount, 2nd marquess of Londonderry (1769–1822).** Castlereagh outgrew his background in Ulster politics and became an advocate of the union between Britain and Ireland, a capable war secretary, and finally a distinguished foreign secretary. Robert Stewart entered the Irish House of Commons at a bye-election for Co. Down in 1790. He had the support of the reformist interest but while he never lost his belief in the necessity for reform in Ireland, he soon felt drawn to the policies of the younger \*Pitt. His kinsman Lord \*Camden encouraged him to look beyond merely Irish perspectives and he was elected to the Westminster Parliament in 1794.

Castlereagh sympathized with reform in France but was unhappy about the decline of the French Revolution into violence. He was anxious about the impact of Jacobin ideas in Ireland through the secret society the \*United Irishmen, and believed Ireland's destiny to be inextricably bound up with that of Britain. He supported the war against France, became prominent in the suppression of the \*Irish rebellion of 1798, though always advocating clemency and reconciliation, and bore the main burden in carrying the Irish Act of \*Union in Dublin. Like Pitt he saw the Union as preliminary to a comprehensive programme of reform. He supported \*catholic emancipation, argued that the tithe should be abolished, and suggested that catholic clergy should be paid by the British crown. Castlereagh resigned with Pitt when George III thwarted the prospect for catholic emancipation. He was, however, prepared to serve in \*Addington's administration from 1802 and in Pitt's second ministry in 1804. On the death of Pitt he left office but became war secretary in the \*Portland ministry. He was an outstanding war minister. He saw the struggle against Napoleon in global terms, appreciated the need for European allies, improved recruitment to the militia and to the army, and organized an expeditionary force for continental intervention if possible. He was also eager to convey to the public the broader principles on which the war was being waged, though he lacked \*Canning's ability to capture the enthusiasm of the public. The \*Peninsular War was supported by Castlereagh from the start and he took the initiative in bringing Wellesley (\*Wellington) forward and in restoring him to command after the death of \*Moore. The failure of the \*Walcheren expedition meant that Castlereagh left the war department as the scapegoat. He had strenuously urged an attack on French bases in the Scheldt, in order to disrupt French invasion plans and support the Austrians by a diversionary tactic. Although he had prepared the expedition with meticulous care, the campaign was bungled. The decision to withdraw was a bitter one, the more so because Canning was eager to ensure that Castlereagh carried the chief responsibility for failure. On learning that he was to be moved from the War Office, Castlereagh believed himself to be the victim of intrigue. The result was the collapse of the Portland ministry and the duel with Canning, which relegated both men to the back benches for several years.

Castlereagh's great opportunity came when he was appointed foreign secretary and leader of the House of Commons on the formation of \*Liverpool's ministry in 1812. He built up the final coalition against Napoleon and his personal diplomacy strengthened allied determination. Although not a brilliant orator, Castlereagh was a successful leader in the Commons, winning the trust of MPs by his patience, courtesy, and understanding. At Vienna he did much to frame the peace settlement. He was committed to regular meetings of the powers in congress not in order to perpetuate the status quo, but to enable peace to be preserved by considered adjustment to inevitable change. He did not believe in collective intervention in the domestic affairs of sovereign states. Castlereagh became alienated from Metternich and by 1820 had dissociated Britain from the \*Holy Alliance,

which he had condemned on its inception as 'a piece of sublime mysticism and nonsense'. Although his distrust of Russian expansion in the Near East drew Castlereagh closer to Metternich over the Greek revolt, he seriously contemplated the recognition of the independence of the Spanish American colonies. In 1822, worn out by overwork and saddened by the failure of the congress system to work as he had hoped, he suffered a nervous breakdown and committed suicide. For many years the tragedy of his death and sustained misrepresentation obscured his greatness as foreign secretary. JWD

Hinde, W., *Castlereagh* (1981).

**castles.** Many man-made structures are called 'castles'; they are very diverse in character and date, ranging from the Iron Age fortification of \*Maiden castle (Dorset), to \*Dover castle, to Eastnor castle (Herefordshire) built as a stately home for the 1st Earl Somers in 1812. Of these only Dover is truly a castle, but the others tell us something about the way castles generally are regarded. Castles are fortifications, some of considerable size and complexity. But unlike Maiden castle, which housed and protected a whole people, they were built by a medieval lord for his own protection. Eastnor was built at a time when medievalism was fashionable, and castles were seen as the suitable residences of the aristocracy, symbols of their hereditary status and right to rule. True castles were also residences; the greatest were palaces of considerable size and luxuriousness. They were also status symbols and centres of government. The donjon or keep of a castle seems to have become a symbol of lordship, which may explain why Ralph, Lord Cromwell, built a tower keep as the centre of his castle at Tattershall in 1434, when towers as parts of the fortification had been superseded. Royal castles, especially those planted by William the Conqueror in the shire towns of England after the Conquest, became centres of royal government. They were county gaols, places where royal courts sat, and where documents, treasure, and weapons were securely held. Baronial castles were the headquarters of estates, where local government and business of the estate was transacted. Finally, all castles were privately owned. Whether the castle was built by the king to control or to protect the kingdom or by one of his barons to subdue his estate, it remained the property of the builder. Royal castles were not built for national defence, did not and still do not belong to the state. The king might require the owner of a castle to maintain it in readiness against an enemy of the kingdom, but the castle remained private property. If a castle was thought relevant to the defence of the realm it could be appropriated for the period of the emergency by the king, but was always returned to its owner. The castle of Norham on the Tweed was the centre of the bishop of Durham's estates in Northumberland. It was built originally at the king's request and later taken several times into the king's hands during the protracted wars against the Scots.

Castles developed first in France, in Anjou, in the 10th cent. The first castles in England were built in Edward the Confessor's reign by his nephew Ralph and his Norman followers, and were strongly resented by the English, as

foreign imports. Lordly residences in late Saxon England appear to have been enclosed with a palisade and a ditch, as excavations at Sulgrave (Northants) and Goltho (Lincs.) have shown, but the defences were slight. Castles were an introduction into England and a direct consequence of the Norman invasion of 1066.

Orderic Vitalis, a Norman historian writing in the 12th cent. about the Norman Conquest, said that the English fought bravely but lost to William because they lacked castles. William secured his first landing in England with a wooden castle, which he brought with him in ready-made sections from Normandy. On entering London, after the battle of Hastings, one of William's first acts was to order the creation of a castle to control the city: the \*Tower of London. His various campaigns to secure the country or to suppress rebellion are notable for castle-building at centres up and down the line of his march.

The castles built immediately after the Conquest, whether by the king or his followers, were generally rapidly constructed of earth and timber, using locally impressed Saxon labour. In form, they were either a fortified enclosure surrounded by a ditch (known as a ringwork) or a motte and bailey, that is an earth mound topped with a fortification and surrounded by a ditch connected to a further lower fortified enclosure. These castles vary considerably in size. This suggests that their owners had differing resources and also that their roles were different. Large castles like \*Windsor, \*Dover, or \*Richmond seem to have been conceived from the first as residences as well as fortresses. The White Tower built by William I to subdue London incorporated two large suites of rooms plus a grand chapel and extensive storage space within the defensive keep. Excavations of the motte at Abinger (Surrey) have shown that the top of the motte had a raised fighting platform or perhaps a look-out tower surrounded by a palisade. All the accommodation, if there was any, must have been in the bailey and suggests that the smaller castles were principally fortresses.

This distinction is important, for it helps to explain the development of castles after the Conquest. During the Conquest all Norman barons, great or small, seem to have built castles; however, the wooden fortresses of the first generation were not very durable and their owners were soon forced to decide whether they should be replaced in stone. Further, the castle's importance in warfare meant that its design was constantly being refined so that to maintain its military efficiency meant a constant outlay. Many smaller landowners seem to have ceased to be castle owners, preferring instead a fortified manor house, which provided security and domestic comfort within their means. Castles became the prerogative of the wealthy baronage and the crown. Thus the castles which are notable monuments today are those which were rebuilt and updated in the 12th cent. and later, with both defensive systems and residential arrangements brought to considerable sophistication. Amongst the most developed examples in Britain are the castles built for Edward I in north Wales, for example, \*Conwy, \*Caernarfon, and \*Harlech. These played a crucial role in the subjugation of the principality, and also

## Cat and Mouse Act

provided palatial accommodation for the king and his officers.

Such castles were extremely expensive to build, and castles constructed in the later Middle Ages, such as \*Bodiam, were consequently smaller, although they retained considerable sophistication. Despite the introduction of gunpowder in that period, castles retained their importance. Late examples, such as \*Raglan (Monmouthshire), were designed to include cannon as part of their defences. Castles were again important in the English Civil War, when large numbers were refortified and held for the king. Several, including \*Corfe, suffered major sieges. In recognition of the part that castles had played in the war, the majority of surviving buildings were deliberately slighted by the victorious parliamentarians. LR

Brown, R. A., *English Castles* (2nd edn. 1976); McNeill, T., *Castles* (1992); Pounds, N. J. G., *The Medieval Castle in England and Wales: A Social and Political History* (Cambridge, 1990); Thompson, M. W., *The Decline of the Castle* (Cambridge, 1987).

**Cat and Mouse Act**, 1913. Exasperated by the tactics of militant suffragettes in going on hunger strike, \*Asquith's government passed the Prisoners' Temporary Discharge for Ill-Health Act, known commonly as the Cat and Mouse Act (3 Geo. V c. 4). Prisoners could be released and subsequently rearrested. McKenna, the home secretary, argued that the suffragettes, by arson and destruction, had 'declared war on society' and that the measure would reduce the disgusting practice of forcible feeding. Keir \*Hardie opposed the bill as futile and unfair and Lord Robert Cecil suggested deportation instead. JAC

**Cateau-Cambrésis, treaty of**, 1559. Mary Tudor's marriage to Philip of Spain dragged her into a disastrous war against France in 1557 in the course of which \*Calais was lost. When Elizabeth succeeded in November 1558, her position was precarious and she was anxious for peace. The treaty was signed on 3 April 1559. The French ceased to support the claims of Mary, queen of Scots (then married to the dauphin) to the English throne, and the English, by implication, gave up hopes of regaining Calais, since the French were to retain it for eight years and then restore it on conditions certain to be broken. JAC

**cathedrals** are the chief churches of a diocese, where the archbishop or bishop has his throne (*cathedra*). The fabric and worship of the church itself is the responsibility of the dean. The oldest dioceses of the Church of England are Canterbury (597), London (604), Rochester (604), York (625), Norwich (631), Lincoln (Lindsey) (634), Durham (Lindisfarne) (635), Lichfield (656), Hereford (676), and Worcester (680). The newest are Birmingham (1905), Southwark (1905), Chelmsford (1914), Bury St Edmunds (1914), Coventry (1918), Bradford (1920), Derby (1927), Guildford (1927), Leicester (1927), and Portsmouth (1927). There are also more than eighty suffragan bishoprics.

Little pre-Norman work remains, though \*Wilfrid's 7th-cent. crypts at Ripon and Hexham survive. Among the more remarkable features of the other cathedrals are the Norman nave at Durham (late 12th cent.), the chapter house at Bristol

(late 12th cent.), the west front at Wells (13th cent.), the carvings at Southwell (late 13th cent.), the spires at Lichfield (early 14th cent.), the cloisters at Gloucester (late 14th cent.), the towers of Lincoln (14th and 15th cent.), and the great dome of St Paul's (late 17th cent.). Modern Anglican cathedrals are at Truro (1880+), Liverpool (1904+), Guildford (1936+), and Coventry (1956–62), this last to the design of Sir Basil \*Spence. \*Westminster Roman catholic cathedral, with its enormous campanile, was built between 1895 and 1903. Two remarkable 20th-cent. catholic cathedrals are at Liverpool, designed by Sir Frederick Gibberd (1962–7), and at Clifton, Bristol (1970–3). [There are separate entries for all the sees of the Church of England, the Church of Ireland, the Church in Wales, and the episcopal Church of Scotland.] JAC

**Catherine of Aragon** (1485–1536), 1st queen of Henry VIII. Catherine was a victim of dynastic politics. The daughter of Ferdinand and Isabella of Spain, she was sent to England in October 1501 to marry Prince \*Arthur, eldest son of Henry VII and one year her junior. The young couple were sent to Ludlow, where Arthur died five months after the marriage. Catherine stayed in England and in 1503 it was arranged that she should marry Arthur's younger brother Henry. Henry VII was in no haste to expedite the matter and for some years Catherine was in an unpleasant position. But on Henry VIII's accession in 1509 he hastened to fulfil the agreement. The marriage was at first affectionate, though not until 1516 was a living child, Princess Mary, born. By 1526, for a mixture of public and private reasons, Henry was thinking of divorce, it having belatedly occurred to him that he had married his brother's wife. From this time forward, the fate of her marriage was out of Catherine's hands, though she continued to protest and refused to enter a nunnery. In July 1531 Henry left her and never saw her again. In 1533 his marriage to \*Anne Boleyn took place and \*Cranmer declared Catherine's marriage invalid. Her later years were spent at Buckden and Kimbolton, comforted by her faith, deprived of her title as queen, forbidden to see her daughter, and in constant fear of poison. She died in January 1536 and was buried in Peterborough abbey. To the end she maintained that her marriage to Arthur had never been consummated and that her marriage to Henry was consequently valid. JAC

**Catherine of Braganza** (1638–1705), queen of Charles II. Daughter of John, king of Portugal, Catherine's marriage to Charles II on 21 May 1662 was regarded by English merchants as 'the most beneficial that ever our nation was engaged in'. Her dowry included Bombay, and Tangier, which was subsequently evacuated. Dark-haired, petite, and amiable, Catherine was badly educated, with little command of languages. She had, however, some charm. Pepys thought her 'mighty pretty' when he saw her hand in hand with the king in 1663 and the following year remarked on her pretty broken English. Tension inevitably arose between her and Charles's mistress Lady Castlemaine. Catherine miscarried several times and had no live children. This, and the growth of anti-catholic feeling, fuelled suggestions of a divorce, but Charles stood by her. After Charles's death in February 1685,

she moved to Somerset House and established a convent, before returning to Portugal after the Glorious Revolution, in March 1692. SMC

**Catherine Howard** (1520–42), 5th queen of Henry VIII. Catherine, the daughter of Lord Edmund Howard and niece of the duke of \*Norfolk, was 19 when Henry became interested in her. The annulment of his marriage to \*Anne of Cleves on 9 July 1540 was followed a fortnight later by his marriage to Catherine. She was tiny, pretty, and vivacious, her sparkle compensating for a lack of education. Henry showered her with gifts but by the end of 1541 he had heard rumours of her adultery, before and after marriage. The illness of his only son Edward, and no sign that she was pregnant, heralded her downfall. Pre-marital affairs with Francis Dereham and her cousin Thomas Culpeper were the basis for a charge of treason, that she had contaminated the royal blood. Members of the Norfolk household were imprisoned, Catherine placed under house arrest at Syon House, and then beheaded on 13 February 1542. She died with notable composure and is reported to have said, 'I die a queen, but would rather have died a wife of Culpeper.' Henry remained in good spirits and began thinking of a sixth marriage or of recalling Anne of Cleves. SMC

**Catherine Parr** (1512–48), 6th queen of Henry VIII. Daughter of Sir Thomas Parr of Kendal, Catherine was well educated with protestant sympathies. She was 31 and had been twice married when she attracted Henry's attention. She is said to have had strong reservations about marrying him—'better mistress than wife'—but the marriage was performed at Hampton Court on 12 July 1543. Her maturity served her well and the marriage was the most adult Henry had experienced. She provided something of a home for the royal family, intervened on behalf of both Mary and Elizabeth, and interested herself in their education. During 1544, while Henry led the invasion of France, Catherine acted as regent and took her duties seriously, adding her initials, KP, to documents. On Henry's death in 1547 she was disappointed not to be made regent for the young Edward VI. She went on to marry the ambitious Thomas \*Seymour, a former admirer, and promoted Baron Seymour of Sudeley. She died on 7 September 1548 shortly after the birth of a daughter. SMC

**Catherine of Valois** (1401–37), queen of Henry V. Youngest daughter of Charles VI of France, Catherine was sent at an early age to a convent. Her marriage to Henry on 2 June 1420, after bitter warfare between France and England, was an affair of state. At the same time, the treaty of \*Troyes was signed, whereby Henry was to become Charles's heir. A son, the later Henry VI, was born in December 1421 at Windsor. Catherine accompanied Henry to Harfleur, where war against the dauphin, Charles, continued, and returned a widow in May 1422 when Henry died of dysentery. Though an affair with Owain \*Tudor resulted in an Act forbidding her to remarry without royal permission, she was already married secretly. The grandson of this marriage took the throne as Henry VII. Catherine died in February 1437, was buried in the Lady Chapel, Westminster abbey, and later

placed alongside Henry V. On his 30th birthday in February 1669, Pepys was shown her corpse, 'and did kiss her mouth'. SMC

**Catholic Apostolic Church.** This millennialist denomination, notable for its liturgy and aristocratic tone, derived from meetings held from 1826 at Albury Park, the Surrey home of the London banker and Tory politician, Henry Drummond (1786–1860). Their intention was to explore the implications of biblical prophecy. Among those attending was Edward \*Irving, minister of Regent Square Scottish Church, London, then at the peak of his wayward genius, but increasingly suspect for his views on the human nature of Christ and further isolated when speaking in tongues broke out among his people in 1831. Excluded from Regent Square in 1832, and from the \*Church of Scotland in 1833, Irving established a congregation in Newman Street. This became the first Holy Catholic Apostolic Church, but Irving was not its leader for, though its adherents were popularly known as 'Irvingites', he was not held to possess apostolic gifts. Liberally supported by Drummond, the new body developed a hierarchy of apostles, prophets, evangelists, and pastors, with deacons to superintend material needs. Its remarkable liturgy drew on Church of Scotland, Anglican, Roman Catholic, and Eastern Orthodox elements, aptly reflected in the architecture of its main London church, Christ the King, Gordon Square (1854), which remains, though unfinished, one of Britain's finest expressions of the gothic revival. Since only apostles could ordain, the Church, which claimed 6,000 members in 30 congregations in 1851, lost its impetus after the last apostle's death in 1901. CB

**Catholic Association**, 1823–9. Daniel \*O'Connell's Catholic Association, founded in Ireland in 1823, was one of the most successful pressure groups of the 19th cent. Its object was to persuade or force the British government to grant \*catholic emancipation, allowing catholics to sit in Parliament. It organized petitions, held monster meetings, collected the 'catholic rent' of a penny a month, and was accused of drilling and intimidation. Attempts to suppress the association in 1825 failed, since it merely reconstituted itself. When O'Connell (unable as a catholic to take the oath) was returned to Parliament at the Co. Clare by-election in July 1828, \*Wellington gave way rather than risk civil war. As a sop to the die-hards, the grant of catholic emancipation was preceded by an Act suppressing the association, but it had already voluntarily dissolved itself, its work done. JAC

**catholic emancipation** was achieved by an Act of Parliament of 1829, enabling Roman catholics in Britain to participate fully in public life by abolishing the \*Test and \*Corporation Acts. It resulted from Daniel \*O'Connell's campaign to liberate the Irish majority from the political and economic domination of the \*Anglo-Irish ascendancy. O'Connell's electoral success in the Co. Clare by-election convinced \*Wellington that, short of a standing army, there was no means of controlling Ireland, other than to accede to the demands of the majority. English catholics

played little part in the campaign. Its effect in resolving the Irish question was only partial, but the impact on British constitutional and religious history was immense. By splitting the Tory Party, with the ultra Tories regarding the actions of Wellington and \*Peel in bringing in the measure as a gross betrayal, it prepared the way for the Whig victory of 1830 and for the decade of reform which followed.

The Act itself (10 Geo. IV c. 7), entitled *An Act for the Relief of His Majesty's Roman Catholic Subjects*, was carried against the strong opposition of the king and passed on 13 April 1829. It made provision for catholics to serve as members of lay corporations and (except catholic clergy) to sit in Parliament. Most crown offices were opened to catholics, save those of lord chancellor, keeper of the great seal, lord-lieutenant of Ireland, and high commissioner of the Church of Scotland. No catholic prelate was to assume a title used by the Church of England, clergy were not to wear clerical dress outside church, and an unenforced ban was placed on religious orders.

The Act overruled the assumption that Britain was *de jure* and *de facto* a protestant nation, though the Act of \*Settlement (1701) forbidding the monarch from being a catholic, or marrying a catholic, remained in force. But Parliament, henceforth open to both protestant and catholic dissenters, was no longer the political forum of the established church. Attempts by such a heterodox body to legislate for the Church of England were greeted with dismay by certain clerics. The unity of church and state, enshrined in the revolution settlement of 1689, had been shattered. JFC

**catholicism.** The word derives from the universality of faith in the Christian church, but since the 16th cent. has referred to the portion of Christianity undivided from allegiance to papal authority and the beliefs and practices of the ancient church. In Britain, allegiance to the papacy and to those theological and doctrinal formulations rejected by reformers in the 16th cent. came to characterize a distinct brand of Christianity, as opposed to the \*protestantism of the Church of England, which emerged from the Elizabethan settlement, and later dissenting groups. Since the 19th cent. parts of the Church of England have argued a case for adopting the term to include themselves, the Roman catholic church, and the orthodox churches as representing the undivided church of ancient times.

Commonly the word is used to delineate the distinctive post-Reformation communities in Britain which rejected the reform of the 16th cent. and the assertion of royal supremacy over the church in England. These catholic or papist communities survived and developed by resistance to legal proscription by \*penal laws, eventually lifted in the late 18th and early 19th cents. That process can be understood in a series of phases, beginning with the period of survival as \*recusant communities during the 17th cent. Up to 1688 and the fall of James II, catholics launched a missionary campaign to retain a foothold and maintain catholic life and worship in the teeth of hostile legislation. The sacramental nature of catholicism meant that the congregations, where they could exist, were dependent on priests who had to be trained in

missionary seminaries in Europe. The first of these was founded by Cardinal William \*Allen at Douai in Flanders and in Rome in the 1570s. The priests, subjected to the law of treason, went in fear of their lives and depended on the protection of lay families, mostly gentry, who risked safety and property to sustain catholic life. Lay and clerical catholics were executed up to the 1680s. The extent to which the penal laws were imposed varied according to the circumstances of the day and to local conditions, and in some areas catholicism flourished unmolested. Parts of Lancashire, the north-east, and the midlands became relatively safe territory, where recusant catholicism predominated. In Ireland, catholics formed the great majority outside Ulster, and in Scotland were strong in the Highlands and Islands.

In these areas it became possible, in the second phase from 1688 to the mid-18th cent., for catholic life to establish its existence, despite the fact that this was the lowest ebb in legal terms. The revolution of 1688 led to another and final wave of penal legislation and to renewed protestant antagonism towards catholicism. But the mood of the early 18th cent. turned against religious persecution and few of the laws were enforced. Almost the only lasting benefit to the catholics from the reign of James II was the appointment of vicars apostolic to govern the catholics in England and Wales (and in Scotland later). This removed the organizational uncertainty from the community and eradicated some of the quarrelsomeness which had characterized an essentially insecure and haphazard operation. By the mid-18th cent., catholic practice was largely tolerated and life for the small congregations, served by travelling missionaries or gentry chaplains, fell into a pattern of quiet independence.

The final defeat of the \*Jacobite cause in 1745 removed the political animus against catholicism, though not until 1829 was the prohibition on catholic MPs lifted. In the 1740s catholics were a negligible fraction of the population of England and Wales—perhaps 1 or 2 per cent—but from that time they entered a new phase of confidence and modest growth. Between about 1745 and the first Catholic Relief Act of 1778, catholics, along with their contemporaries, began to taste the first fruits of economic development. The drift to the towns began and though rural catholicism declined in some areas, urban catholicism in London, the midlands, and parts of the north began to emerge. New congregations, built around the independent self-determination of artisans and skilled craftsmen, grew up. They were able to persuade missionaries to create settled missions, where there was a sufficiently stable population. Chapels and schools, though still technically illegal, began to appear. In these growing towns catholics were left to pursue their trades unmolested and were the basis of the emerging *nouveaux riches*, who were to take English catholicism into its 19th-cent. revival.

Between the Relief Acts of the late 18th cent. and about 1840, these emerging industrial catholics began to take greater responsibility for religious activities. At the same time this often brought them into conflict with the clergy. Tensions over the control and funding of the missionary enterprise had dogged English catholicism since the 16th cent. Clergy and laity had to be interdependent, but by the early 19th cent. both groups were asserting their rights

and dignities. Numbers were increasing rapidly, from around 80,000 at the end of the 18th cent. to nearer 700,000 in the 1851 religious census. This growth was partly endogenous and partly due to massive migration of impoverished Irish catholics. Clerical training had been forced back onto British soil by the French Revolution and clerical numbers, organization, and ecclesiastical authority were increasing. Urban laity wanted at times to behave like the old gentry and were reluctant to relinquish the control over church life which money gave them.

The battle was ultimately resolved largely in favour of the clergy, whose role in an increasingly centralized and authoritarian contemporary catholicism was reinforced by enhanced papal discipline. The restoration of the catholic hierarchy to England and Wales in 1850, as well as resolving issues of control and organization, gave English catholicism a sense of belonging fully to the universal church under papal authority. The task after 1850 was to restore and rebuild English catholicism in the image of European catholicism and to create the churches, schools, society, devotions, and loyalty which built the powerful, close-knit catholic culture characteristic until the middle of the 20th cent. JFC

Bossy, J., *The English Catholic Community, 1570–1850* (1975); Butler, D., *Methodists and Papists: John Wesley and the Catholic Church in the 18th Century* (1994); Norman, E., *The English Catholic Church in the 19th Century* (1984); Quinn, D., *Patronage and Piety: The Politics of English Roman Catholicism 1850–1900* (1993).

**Catholic University of Ireland.** Though from 1793 catholics could take degrees at \*Trinity College, Dublin, few chose to do so, and in 1844 \*Peel proposed the establishment of undenominational colleges at Cork, Belfast, and Galway. The Irish catholic community split in response but the majority condemned them as godless, and the Synod of \*Thurles in 1850 warned catholics not to attend. Archbishop \*Cullen then presided over a committee to set up a catholic university. \*Newman was installed as rector and the lectures he gave in Dublin formed the basis of his *Idea of a University*. The Catholic University opened in 1854 with twenty students but could make little progress without government assistance. It gained some help from the Royal University, set up in 1880 as an examining and funding body, which financed some fellowships. Augustine Birrell, chief secretary in the Liberal administration of 1906, introduced the major reconstruction of 1908, which established the National University, with component colleges at Dublin, Cork, and Galway. Though formally undenominational, it was under catholic control. \*Queen's College, Belfast, was given university status at the same time. JAC

**Cato Street conspiracy.** A plot to murder Lord \*Liverpool's cabinet at dinner at Lord \*Harrowby's house in February 1820 was led by Arthur Thistlewood, a former army officer and a follower of the agrarian communist Thomas \*Spence. It was the culmination of a series of conspiracies to overthrow the government and achieve democratic reform in the period after 1816. The plotters were betrayed by a government spy and arrested as they assembled in a stable in Cato Street. Thistlewood and four fellow-conspirators were executed on May Day, 1820. EAS

**Catterick, battle of**, 6th cent. \*Aneurin's poem \**Gododdin* relates how the North Britons from Edinburgh were defeated at Catterick by the men of \*Bernicia and \*Deira. He attributed their downfall to an immoderate consumption of mead. The battle was probably in the late 6th cent. It has been suggested that there may be confusion with \*Æthelfryth of Bernicia's great victory at \*Degsastan in 603. The battle was an important step in the development of Northumbria as a strong Saxon power. JAC

**Catuvellauni.** A British tribe and *civitas*. The Catuvellauni first appear in Roman records in Dio Cassius' account of the Claudian invasion of AD 43, where they led the opposition to the Roman forces. From the information Dio provides, we can trace the tribal kingdom back at least three generations to a king called Tasciovanus by the coins issued by him and his successor \*Cunobelinus. In fact, it seems likely that the chief called \*Cassivellaunus who had opposed Caesar in 54 BC had already begun to carve out the Catuvellaunan kingdom. The tribal name means 'good in battle', which seems particularly appropriate. By the time of the Claudian invasion, they had not only swallowed up smaller local tribes like the Ancalites, Bibroci, and Cassi but had captured large tracts of territory from the \*Trinovantes and \*Atreabates, and were pressing both the \*Cantiaci and the \*Iceni. The *civitas* which the Romans created in the mid-70s reflects this expansion, with its boundaries including Buckinghamshire, Hertfordshire, and Bedfordshire, much of Northamptonshire and parts of Oxfordshire and Cambridgeshire as well. The *civitas* capital was at \*Verulamium (next to modern St Albans), which had been the original capital of Tasciovanus' kingdom. KB

**Cavalier Parliament**, 1661–79. This Parliament succeeded the \*Convention, which had summoned Charles II back from exile. Though its members were overwhelmingly loyal to the monarchy—well over 100 had fought in the civil wars—they were by no means willing to yield Parliament's rights. The Anglican majority was noticeably less willing to forgive and forget than the king. It began by ordering that the \*covenant be burned by the public hangman, supported a fierce penal code against dissenters, and forced Charles II in 1673 to withdraw his \*Declaration of Indulgence. The unusual length of the Parliament gave opportunities for development of party organization, particularly under \*Danby in the 1670s, even if party as such was still widely condemned and the names of 'court' and 'country' preferred. When Danby lost control in 1678, Charles dissolved the Parliament, but the three which succeeded were Whig-dominated, took up the issue of excluding James, duke of York (later James II), from the succession, and gave even more trouble. JAC

**cavaliers.** Nickname for the royalists who fought for Charles I during the civil wars. Like 'roundhead', 'cavalier' originated as a term of abuse. Stemming from the Spanish word *caballero*, it was meant to connote catholicism, foreignness, and immorality. The word was current by the summer of 1642, and referred to the disorganized and untrustworthy men who had backed the king in the \*Bishops' wars (1639–

40) and the army plots of 1641. Dissolute and turbulent individuals such as George, Lord \*Goring, and ruthless and brutal soldiers of fortune such as Prince \*Rupert, lent some plausibility to this caricature of the king's supporters. Parliamentary propagandists accordingly disseminated an image of the typical cavalier as a rakish individual consumed by the pursuit of illicit pleasure and personal gain, a man devoid of moral principles.

Rather than reject the nickname, the royalists redefined it for their own purposes. They saw themselves as well-born and -bred men who out of loyalty and conscience had chosen to defend their king. They stood for the old English tradition of gentility and valour at arms. Politically they asserted that Charles I, as supreme governor of the church, was God's anointed deputy. To defy him therefore was rebellion against God. Recent research has determined that, rather than being footloose young bachelors, most royalist officers were respectable married gentlemen. What bound them together was the principle of unconditional loyalty to the person of the king, whether or not they agreed with his particular words or actions. Combining contempt for the lower classes with a loathing for rebellion, many of them made enormous material sacrifices for their cause, in addition to hazarding their lives. Apart from a dislike for the Irish, they harboured little antagonism towards Roman Catholics, many of whom supported the king as the lesser of two evils. The statement of Sir Beville Grenville prior to the outbreak of the Civil War sums up the simplicity and the curious pessimism of the royalist creed: 'The [king's] cause must make all those that die in it little inferior to martyrs. And for mine own part I desire to acquire an honest name or an honourable grave.'

IJG

**Cavell, Edith** (1865–1915). The daughter of Frederick Cavell, vicar of Swardeston (Norfolk), Edith Cavell was a governess in Brussels before training as a nurse. In 1907 she returned to Brussels to become matron of the hospital of St Gilles and remained there at the outbreak of war in 1914. She set up escape routes for hundreds of Belgian and allied fugitives and was arrested by the Germans in August 1915. Under repeated interrogations and in solitary confinement, she made full confessions. Court-martialled on 7 October, she was shot on 12 October, dying with dignity and courage. The reaction world-wide to her death was enormous and elevated her to the status of martyr. Her body was later exhumed and reinterred in Norwich cathedral, 5 miles from her childhood home. A memorial was erected to her in St Martin's Place, off Trafalgar Square, London.

SMC

**Cavendish, Lord Frederick** (1836–82). The second son of the 7th duke of Devonshire, Cavendish entered Parliament as a Liberal for the northern division of the West Riding of Yorkshire in 1865. His wife was the niece of Mrs Gladstone and Cavendish became Gladstone's private secretary. He held office as a junior lord of the Treasury in Gladstone's first administration and in 1882, when W. E. \*Forster resigned, was sent to Ireland as chief secretary to replace him. Arriving in Dublin on 6 May he walked in Phoenix Park with T. H. Burke, the under-secretary, and was

attacked and stabbed to death by a gang known as the \*Invincibles. One of their number, James Carey, subsequently turned queen's evidence but was tracked down by his fellow-conspirators while on a vessel bound for South Africa under a false name and shot. Cavendish's murder caused a sensation and a new \*Coercion Act was brought in. He was buried at \*Chatsworth at the top end of Edensor churchyard at a funeral attended by 300 MPs, brought from London by special train, with the duke of Devonshire and Mr Gladstone leading 30,000 mourners. There is an impressive effigy in the church at Edensor and a copy at Cartmel priory. His widow appealed for conciliation, telling Gladstone, 'Uncle William, you did right to send him to Ireland.'

JAC

**Cavendish, Henry** (1731–1810). Cavendish worked on the boundary of physics and chemistry. A nephew of the 3rd duke of Devonshire, and a wealthy man, he studied in Cambridge and in Paris, before living as a recluse in London, though he became an important figure in scientific life. He worked in the new field of pneumatic chemistry, isolating 'inflammable air' (hydrogen) and proving that water was not an element but a compound. Fascinated also by electricity, he made a model of the electric fish (torpedo), and many observations which he never published. He proved by means of a delicate torsion balance that, as \*Newton had said, all particles of matter attract each other (whereas Aristotle had supposed that they were attracted to the centre of the universe), and calculated the mass of the earth. The Cavendish Laboratory in Cambridge was founded in his memory.

DK

**Cavendish, Thomas** (1560–92). An enterprising and accomplished seaman but essentially a pirate, Cavendish helped explore North Carolina in 1585, before becoming the second English sailor to circumnavigate the world in 1586–8 in the ship *Desire*. After a very difficult passage through the Straits of Magellan, he sailed to California, captured a Spanish treasure ship, and returned home via the Moluccas and the Cape of Good Hope. Having lost most of his fortune at court, he tried to repeat his Pacific voyage in 1591 with John \*Davis but failed to get through the Straits and died at sea in the South Atlantic.

RB

**Cavendish, William.** See DEVONSHIRE, 4TH DUKE OF.

**Cawnpore** (Kanpur) was the scene of a bitter struggle during the \*Indian mutiny and became a symbol of the violence of that conflict. Its British garrison, besieged for nineteen days, was obliged to surrender to Nana Sahib who, on hearing of the approach of Sir Henry \*Havelock's relieving army, ordered all prisoners to be killed. Havelock retook the town and his forces wreaked a fearful revenge. However, the garrison he left behind proved unable to hold on and Tatya Tope, Nana Sahib's general, effected a reoccupation. It was not until December 1857 that Sir Colin \*Campbell's army achieved the final reconquest.

DAW

**Caxton, William** (c.1420–c.1492). A prominent merchant from Kent, Caxton established the first successful press in an England slow to adopt metallographic printing with

movable type. Caxton learned printing in Cologne and the Low Countries, producing the first printed book in English—his own translation of *Le Recueil des histoires de Troye*—in Bruges c.1473–4. His press at Westminster, established in 1476, printed nearly 100 volumes, including works by \*Chaucer, \*Gower, \*Lydgate, and \*Malory, and translated writings on chivalry, morality, and religion. Formats varied, but volumes were typically in folio, on paper rather than vellum, in gatherings of four, with text in single columns. Illustrations were monochrome woodcuts. Although Caxton's printed books have been judged 'neither textually accurate nor aesthetically appealing', his impact on English culture is unquestionable. Apart from circulating numerous vernacular texts and taking the technological leap which provided the main means of disseminating information and ideas for the next four centuries, Caxton influenced English prose style and orthography, tending to standardize particular spellings at a time when linguistic upheavals such as the great vowel shift were still under way. DCW

**Ceawlin** (d. c.593), king of the West Saxons (560–91). Ceawlin, who began to reign in 560, fought against the Britons to extend Saxon power. At the battle of \*Dyrham in 577 he is reported to have defeated three kings and to have taken Gloucester, Cirencester, and Bath, thus effectively separating Britons in the south-west from those north of the Bristol channel. In 584 he may have suffered a set-back at \*Fethanleag, possibly near Bicester (Oxon.) for despite taking towns and booty, he is said to have returned home in anger. Ceawlin's final days are not easy to establish. Dissatisfaction may have produced another king or subking, Ceol, in 591, and in 592, after a defeat at Wodnesbeorh (near Alton Priors in the vale of Pewsey), Ceawlin was expelled. He 'perished' the following year. Though the end of his reign was disastrous, he played an important role in Saxon expansion and \*Bede lists him as the second great overlord, or \*bretwalda. AM

**Cecil, Sir Robert** (1563–1612). Jacobean statesman, the younger son, but political heir, of Elizabeth I's chief minister William Cecil (\*Burghley). Small in stature, humpbacked, and physically frail, he devoted himself to the service of the monarchy. Following in his father's footsteps, he entered Parliament in 1584 and quickly established his reputation. Knighted in 1591 and appointed privy counsellor, he was already acting secretary of state, though not formally appointed until 1596. In the last decade of Elizabeth's reign the Cecils' hold on power was challenged by a faction around Elizabeth's young favourite, the earl of \*Essex. Fortunately for the Cecils, Essex overreached himself and was executed. This left Cecil without rival as the queen's chief minister after the death of his father in 1598. Only the prospect of James VI's accession threatened him, for James had been a supporter of Essex, but Cecil neutralized this threat by opening secret communications with the Scottish king. His gamble paid off and he remained in office after James became king of England in 1603. James relied on Cecil, his 'little beagle', for the day-to-day business of government while he was away on frequent hunting expeditions. Cecil sometimes accompanied him, but apart from a love of

hawking did not share the king's passion for the chase, and pressure of work meant he could rarely escape from his desk. While always treating James with deference, Cecil urged him to curtail his extravagance and also to restrain his partiality for Scots advisers and companions. Cecil was a staunch protestant but, like the king, took a relatively tolerant attitude towards catholics. His love of ceremony and of visual splendour—reflected in his pioneer collection of works of art—made him in some respects a precursor of the \*Arminians. Like his royal master, Cecil loved peace, and in 1604 brought the long war with Spain to a close. Because James elevated him to the peerage shortly after his accession, Cecil had to leave the Commons, which made the management of the king's business in Parliament more difficult. In 1608, when he was earl of Salisbury, James appointed him lord treasurer, thereby saddling him with direct responsibility for restoring the royal revenue, eroded by inflation. Cecil's major attempt to refinance the crown, the \*Great Contract, came close to success in 1610, but its eventual collapse diminished his reputation and influence, though he remained the king's principal adviser. However, although not yet 50, his health was in decline, and in 1612 he died. He had inherited the princely mansion called Theobalds which his father constructed, but its situation in good hunting country just north of London made James covet it. Cecil, ever the perfect courtier, therefore exchanged Theobalds for the ruinous palace at \*Hatfield, some miles away, where he built the palatial house in which his descendants still live. RL

**celibacy, clerical.** Clerical celibacy, common since early Christian times, has scant scriptural authority. The Council of Elvira (c.305) forbade all western clergy to marry, a decision later confirmed by popes and western councils. The 11th-cent. Hildebrandine reforms, implemented in England sensitively by \*Lanfranc, sought to eliminate renewed clerical concubinage. Lateran decrees (1123, 1139) reinforced this situation which remains the official catholic line, whereas the eastern church decreed (691) that, though bishops must be celibate, priests and deacons could continue already-established marriages. Clerical marriage was a major issue at the Reformation. Compulsory Anglican celibacy was abolished (1549), though \*Cranmer was already secretly married. Elizabeth initially disapproved of married clergy, even of \*Parker. After the second Vatican Council (1962–5) allowed a married diaconate, Paul VI in *Sacerdotalis caelibatus* resisted strong pressure to end celibacy (1967). Recent catholic reordination of married former Anglican bishops and priests (1995) has complicated the issue. WMM

**céli Dé**, 'clients of God' (often Anglicized as 'culdees'), was the name adopted by reforming ascetics in Ireland in the late 8th and early 9th cents. Based primarily in southern Irish monasteries such as Tallaght and Lismore, they sought to renew the monastic life-style of devotion, prayer, and asceticism. They were also keenly interested in wider structural reform, such as the provision of proper pastoral care.

Diarmait, abbot of \*Iona 814–c.831, was influential on the reformers, who looked to early founders like \*Columba as

## Celtic church

models of monastic behaviour. It may be Diarmait who helped to introduce the *céli Dé* to Scotland, where they were singularly successful. By c.940 there was a *céli Dé* community in St Andrews, where the Scottish king, \*Constantine son of \*Æd, retired into religion as their head. Through charters and church documents of the 11th cent. and later, we know of communities also in Abernethy, Brechin, Dunblane, Iona, probably Dunkeld, and many other monasteries.

The *céli Dé* lived in communities apart from the larger monastic or cathedral setting, in essence a monastery within a monastery. Although the membership of the community would appear to have been partly hereditary (members becoming celibate only later in life, upon entering strict observance), in places such as Kells in Ireland, the *céli Dé* were the observant monastics in an otherwise largely commercial and administrative religious power-centre. In Scotland, they continued to staff monasteries which did not change to continental rules, although many eventually became \*Augustinian canons. Some conflict is observable between newly introduced orders and the entrenched and conservative *céli Dé*, especially in St Andrews. Though tenacious, both communities and terminology gradually became obsolete in the course of the later Middle Ages. TOC

**Celtic church.** This term, which describes the Christian church as it developed in Wales, Ireland, and Scotland, recognizes that church practice in all three countries had many features in common (similar intellectual training, similar ideas on, for instance, pilgrimage and penance, similar styles of church building and art), but should not disguise the fact that there were very real differences between them. In particular, the concept of the territorial episcopal diocese was based on the administrative divisions of the Roman empire, with which Ireland had no formal link, and consequently, although it had its fair share of bishops, the diocesan system had difficulty in taking root there. Although \*Christianity was present in Roman Britain by the early 3rd cent. AD, conversion was a slow and complex affair, and by the time of the Roman withdrawal much of Wales and Scotland was still heathen, and the earliest exact date for the presence of Christians in Ireland is a reference in 431 to Palladius, bishop to 'the Irish who believe in Christ'. While the earliest missionaries may have come from Gaul, Ireland was evangelized largely from Britain, its most famous British missionary being St \*Patrick, whose activity probably dates to the early and mid-5th cent. The diffusion of the cult of Patrick, and the growth in the status of \*Armagh, the ecclesiastical centre most closely associated with him, parallels that of St \*David in south Wales, while the arrival of the Irish saint Colum Cille (\*Columba) in \*Iona, in the territory of \*Dalriada in Scotland, in 563, marked the start of a lengthy period of Irish missionary activity in Britain and the continent. Those monasteries said to have been founded by Colum Cille were held together and administered in the form of a monastic *paruchia*, and while territorial dioceses were being established in Wales and Scotland, in Ireland ecclesiastical power was held largely by the abbatial, and frequently her-

editary, heads of monastic centres, until the great 12th-cent. reform movement saw the establishment of an organized diocesan system along the lines of that operating throughout the Western church. SD

**Celts.** From the 5th cent. BC, Greek ethnographers such as Hecataeus of Miletus and Herodotus described the Celts as one of the major ethnic groups of central and western Europe, locating them inland from Marseilles, or around the headwaters of the Danube. Later Latin and Greek authors equated them with the Galli and Galatae who invaded northern Italy, Greece, and Asia Minor in the 4th and 3rd cents. BC, though Posidonius, writing around 100 BC, contrasted the Celts of Gaul with the less civilized Galatae of central Europe. Caesar, in the opening passage of the *De bello Gallico*, states that only the Gauls of central and southern Gaul called themselves Celts, with Belgae living in the north of Gaul and Aquitani in the south-west; these contrasted with surrounding ethnic groups such as the Germani and Britanni.

Interest was revived in the Celts during the Renaissance, as the earliest named inhabitants of temperate Europe. In 1582 George Buchanan claimed that the former inhabitants of Britain were Celts or Gauls on the basis of similarity in ancient place-names in Gaul and Britain. This linguistic similarity was developed by authors such as Pezron and Llywd in the 17th cent. to define a group of related languages spoken in ancient Gaul, and still surviving in parts of Brittany and Britain, and which they termed 'Celtic'. The term 'Celt' was thus extended to refer to speakers of these languages, or those whose recent ancestors had spoken it—Bretons, Celts, Cornish, Welsh, Irish, Manx, and Scottish.

To identify the ancient Celts, 18th- and 19th-cent. scholars turned to archaeology, describing certain objects and burial rites as 'Celtic'. In 1871 de Mortillet noted the similarity between burials in Champagne and northern Italy, suggesting this was the evidence for the historically documented Gallic invasion of northern Italy in the 4th cent. BC. Kemble and Franks, as early as 1863, had referred to objects from Britain decorated in a distinctive curvilinear art style as 'Celtic'. This art style was also found on the objects fished out at La Tène on Lake Neuchâtel in Switzerland, a site used by Hildebrand in 1874 to define the later Iron Age in central Europe; the cemetery of Hallstatt in Austria represented the earlier phase. Hildebrand considered both periods to be 'Celtic'.

By the late 19th cent. archaeologists had defined a La Tène 'culture', with distinctive artefact types (brooches, swords, etc.), art style, and burial rites, and following the theoretical assumptions of Kossinna and Childe that archaeological cultures could be equated with ancient peoples, the La Tène culture became that of the Celtic peoples, and La Tène art became 'Celtic' art. It was also assumed that there was a close correlation between ethnicity, language, art, and material culture, and by using classical and Irish sources that an ancient 'Celtic' society and 'Celtic' religion could also be defined, and the former distribution of the Celts mapped, using a combination of historical, archaeological, and linguistic (especially place-name) evidence. On

this model, the modern existence of Celtic languages along the Atlantic seaboard implies a 'survival' of Celtic ways, supported further by the La Tène art style and early Christian art in Ireland, and also in descriptions of Irish society. Thus the Irish and the classical sources are often combined to produce a 'timeless' and 'placeless' description of Celtic society and religion.

Scholars such as Powell (1958) and Filip (1962) used archaeology to seek the origin and spread of the La Tène culture. On the evidence of the continuity of burial rites from the preceding Hallstatt period, and of a concentration of richly decorated early La Tène art objects, the centre of origin was identified as northern France—western Germany, more specifically in Champagne, and the hill-ranges of the Hunsrück and Eifel on either side of the river Mosel. From these areas it was claimed the Celts expanded in the 4th and 3rd cents. bc by migrating into southern and western France, Britain, and central Europe, and, as documented by the historical sources, into Italy, Greece, Bulgaria, and Asia Minor. Subsequent revisions of this theory have extended the core area to include southern Germany and Bohemia, and back in time to the late Hallstatt period, to include the rich burials and 'princely residences' such as Asperg, the Heuneburg, and Mont Lassois.

This model has come under increasing criticism. It fails to account for Celtic-speaking groups in Iberia where La Tène objects are rare or unknown; the supposed invasion of Britain in the 4th–3rd cents. bc corresponds with the period when insular–continental contacts were at their lowest; and continuity from the early to the late Iron Age is seen as the norm in virtually all areas where the archaeological record is sufficiently complete (e.g. Britain). The supposed 'expansion' of the Celts is largely a product of the misinterpretation of the archaeological record. Most art objects, ornaments, and weapons are deposited either in graves or in ritual contexts; neither of these are characteristic of the 6th–3rd cents. bc in much of Britain, and, more pertinently, in the areas of Gaul described by Caesar as 'Celtic'. It is therefore not surprising that early La Tène objects are rare or absent from these areas. Attempts to tie in the expansion of the Celts with early archaeological cultures (e.g. the late Bronze Age Urnfield culture) are equally unsatisfactory, and many archaeologists reject the simplistic correlation between language and material culture assumed by traditional approaches.

This fresh, and still disputed, view of the Celts is forcing us to adopt new models for the diffusion and adoption of language, material culture, and art styles, independent of one another. The naming of the language group as 'Celtic' is seen as an arbitrary choice by 17th-cent. scholars—it could have equally been Britannic, Belgic, or Gallic—as the Celts were only one of a number of ethnic groups using these languages. If we accept that there were never any Celts in antiquity in Britain, it follows that terms such as the 'Celtic' church (for the Scottish church of Bede), Celtic art (for early Christian Irish art), or indeed the description of the Welsh, Irish, and Scots as 'Celts' are without historical foundations, and any direct connection between the ancient and modern Celts must be rejected. JRC

Collis, J., *The European Iron Age* (1984); James, S., *Exploring the World of the Celts* (1993); Kruta, V., Frey, O. H., Raftery, B., and Szabo, M. (eds.), *The Celts* (1991); Raftery, B. (ed.), *Celtic Art* (Paris, 1991).

**censorship.** The evolution of censorship has been a series of largely ineffective attempts by the authorities to suppress opinions of which they disapproved. Though they won many temporary victories, over time they were defeated by the growing liberalization of opinion, the difficulty of enforcing controls, and the proliferation of new vehicles of expression—pamphlets, plays, newspapers, film, radio, television, and computers. Before the invention of printing, arrangements for licensing were scarcely needed, though many authors, like Roger \*Bacon and John \*Wyclif, were subsequently taken to task for expressing heretical opinions. In 1529 Henry VIII issued a proclamation deploring the 'pestiferous, cursed and seditious errors' of Martin Luther, prohibiting the sale of books against the catholic religion, and mentioning by name several of \*Tyndale's works. By 1538 it was declared that all books of Scripture needed a licence from the \*Privy Council before publication. In 1557 the Stationers' Company was given the exclusive right of printing. Elizabeth repeated the licensing arrangements in 1559 and in 1586 printing was restricted to London and the two universities. These regulations did not prevent the production of broadsheets and pamphlets, particularly of a puritan bent. Licensing regulations were continued under Charles I, Cromwell, and at the Restoration. The decision in 1695 not to renew the \*Licensing Act freed authors from pre-publication inspection, but they were still liable to prosecution afterwards. In 1719 John Matthews, a Jacobite writer, was hanged for challenging the Hanoverian succession. Newspapers could be attacked by \*general warrants, which authorized the arrest of all concerned with the production or distribution of offending literature. Not until the \*Wilkes case in the 1760s were general warrants declared illegal.

Meanwhile, government had also moved against stage plays. As early as the 1570s the master of the revels had been given the task of licensing plays, but regulation was fitful. \*Walpole, provoked by satirical performances by \*Gay and \*Fielding, sponsored a statute in 1737 giving the lord \*chamberlain power to license theatres and plays. The later 18th cent. saw some relaxation. Another consequence of the Wilkes affair was that, in 1771, Parliament abandoned its efforts to prevent the publication of its debates in the newspapers. During the prosecution of William Woodfall in 1770, the jury insisted on its right to decide whether the passage complained of was libel (and not merely to declare the fact of publication), and this important extension of the right to comment was given statutory authority in Fox's \*Libel Act of 1792.

The current position is extremely complex and changes rapidly, partly because of the number of outlets now available. The lord chamberlain's power to license stage plays was removed in 1968. The Victorian Act of 1857 against obscene publications, under which James \*Joyce's *Ulysses* had been seized in 1923, was modified by an Act of 1959, which

## Census Act

allowed a defence if artistic or literary merit could be proved. The first and most celebrated test of the new legislation was in 1960, when *Lady Chatterley's Lover* was cleared for publication after a parade of distinguished witnesses had testified to its deep moral integrity. Films are categorized under a British Board of Film Censors' code, set up by the industry itself. The home secretary has powers to intervene in BBC radio and television programmes, and the Independent Broadcasting Authority monitors commercial radio and television, though its interventions are infrequent and gentle. To strike an appropriate balance on censorship is far from easy. \*Milton's *Areopagitica* (1644) was a noble statement of the right 'to know, to utter, and to argue freely', but it does not seem likely that he had in mind the tabloid press or video nasties. JAC

**Census Act**, 1800. In 18th-cent. Britain there was much uncertainty about the size of the population and whether it was diminishing in relation to that of France. Sweden, Norway, Denmark, Iceland, and Austria, followed by Holland and Spain, instituted censuses in the course of the century. In 1753 Thomas Potter moved in Parliament for an annual census. His opponents retorted that it would give valuable information to enemies, complained of the affront to British liberty, and forecast widespread resistance. The bill was lost in the Lords. Arthur \*Young proposed a census in a pamphlet of 1771 and an inconclusive debate about the trend rumbled on. The 1800 bill, which carried the day, was introduced by Charles Abbot, a future Speaker, at the suggestion of John Rickman. There was no opposition and the first census of Great Britain was carried out on 10 March 1801. The population of England and Wales was returned as 9.168 million and Scotland as 1.599 million, revealing an upwards trend. Contemporaries were struck by the size of London which, at 1 million, was as big as all the other towns together. Though simple and unsophisticated by later standards, the census was a milestone in the provision of statistical data and has subsequently been held at ten-year intervals. JAC

**Central**. An administrative region of Scotland, created in 1973 from Clackmannanshire, western parts of Perthshire, most of Stirlingshire, and the Bo'ness area of West Lothian. It was divided into three districts—Clackmannan, Falkirk, and Stirling. In April 1996 Central region was abolished, and all local government functions taken over by the previous districts. Parts of the area are mountainous, but most inhabitants live in a string of mainly industrial towns either in the Forth valley or along the line of the Forth–Clyde canal, which itself follows the natural east–west route used by the Romans for the \*Antonine Wall. CML

**Cenwalh** (d. 672), king of Wessex (642–5, 648–72). Cenwalh was driven out by his powerful Mercian neighbours in 645 for repudiating his wife, sister of the Mercian king. He sought refuge at the court of East Anglia, where he was baptized. Returning in 648, he established a kinsman in Berkshire, probably as a bulwark against Mercian aggression. His main successes were against the Britons to the west, gaining victories at Bradford on Avon (652), Peonnan

(658), and Posbury (possibly Pontesbury near Shrewsbury) in 661. Against the Mercians he was less successful and in 661 lost parts of Hampshire and the Isle of Wight to Mercia, which granted them to \*Sussex. Cenwalh's creation of a second episcopal see at \*Winchester, c.660, may have been prompted by the vulnerability of the one at \*Dorchester-on-Thames, though \*Bede claims that he had tired of his Frankish bishop, Agilbert, whose speech he could not understand. After Cenwalh's death, Bede says that Wessex was divided among under-kings for ten years, while the *Anglo-Saxon Chronicle* reports that his queen reigned for a year. AM

**Cenwulf** (d. 821), king of Mercia (796–821). Cenwulf became king after the brief reign of Ecgrith, son of the great \*Offa, doubtless by a coup, for he was only remotely related to his predecessor. He took over Offa's extensive authority in southern England. In 798 he repressed a revolt in Kent, brutally. His authority there was diminished by a long and bitter dispute with Archbishop \*Wulfred of Canterbury, appointed in 805. He fought successful wars in Wales in 816 and 818. Founder, or a major benefactor, of Winchcombe abbey, he was buried there. JCa

**Ceolnoth**, archbishop of Canterbury (833–70), had the difficult task of establishing working relations with the West Saxon kings who had won political control of Kent after many years of Mercian domination. In this he seems to have been largely successful, obtaining grants of land from King \*Egbert and his son \*Æthelwulf and confirmation of the cathedral's control of Kentish minsters which had been disputed in the archiepiscopate of his predecessor \*Wulfred. His period in office saw an intensification of Viking raids and an attack on Canterbury in 850 or 851. By the time of his death in 870 there seems to have been a severe decline in standards of literacy and writing in the Canterbury scriptorium though the reasons for this may be complex and not simply the result of Viking harassment. BAEY

**Ceolwulf** (d. 764), king of Northumbria (729–31, 731–7). Such Anglo-Saxons of his day who can claim immortality, however humbly, owe this to \*Bede. So with Ceolwulf. Bede, in dedicating his *Ecclesiastical History* to 'the most glorious King Ceolwulf', says that he had sent an earlier version to him 'to read and judge'. In the same year (731) Ceolwulf was, an annalist says, 'seized, tonsured [i.e. forced to become a monk] and restored to rule'. Six years later he was deposed for good. He lived long as a monk at \*Lindisfarne and was (later) credited with the introduction of alcohol there. JCa

**ceorl** is one of the terms used in the early (7th- and 9th-cent.) English laws for the lowest class of freeman. Thus in Wessex his blood-price was 200 shillings: that of other free classes was 600 and 1,200. In Kent his relative status was higher. Even the West Saxon ceorl appears as the head of a free peasant household, owing military service, capable of owning slaves, and with significant legal status. At the same time such men could be in a condition of economic dependence. In the later period the term is one of several used for

free peasants, though it occurs in the laws only as meaning 'husband'. An early 11th-cent. tract on status envisages the possibility of such a man's prospering to attain the rights of a thegn. Nevertheless in the 11th cent. the status of free peasants often fell. It is indicative that by 1300 the word was acquiring its modern sense of disparagement. JCa

**ceramics.** Historically ceramics production was widely dispersed, its main branches being brick and tile, pottery and porcelain manufacture. Brick-making was highly localized, wherever suitable clay deposits coincided with a lack of cheap building stone, or where coal, the main fuel used in firing the kilns, was itself cheap. The most primitive form of production was in clamps or piles, covered with earth or turves, and fired with small coal. By the late 18th cent. this was abandoned in favour of fixed kilns, which gradually became larger and more efficient. Continuous methods of firing were introduced during the second half of the 19th cent. Another important product, which played its part in the modernization of agriculture during the 18th and 19th cents., was the field drain. Decorative tile manufacture reached its peak during the Victorian and Edwardian eras.

Also widely manufactured, pottery was an important item of everyday use and of both short- and long-distance trade from prehistoric times, and hence can be an invaluable aid in the dating of archaeological and historic sites. Suitable clay is found in many parts of Britain, but the differences in quality arise from the variability of the raw material. According to material, methods of production, and finish, pottery can be classified in three categories—earthenware, stoneware, and porcelain. The high-domed furnace was introduced from the continent before 1600, but this was replaced in the 18th cent. by a bottle-shaped kiln, of the kind once common in the Potteries of Staffordshire, and still to be seen at the Gladstone Pottery Museum in Stoke-on-Trent or at the Ironbridge Gorge Museum, Telford.

Stoneware was probably the most common variety of pottery still in use in the 18th cent. It was made from a mixture of clay and 20 per cent ground flint, with a salt glaze, and was a typical product of the Staffordshire industry. Porcelain was imitated as a substitute for expensive East India Company imports from China, first pioneered by the Dutch in Delft. After 1740 imitation of Delft-ware was widespread, notably at Lambeth, Bristol, Liverpool, and Glasgow. Around the same time, fine porcelain began to be produced, among other locations, in Chelsea, Derby, and Worcester. Following Meissen and Sèvres products, British potters began to use china clay or kaolin, when in 1768 William Cookworthy, a Plymouth chemist, proved the potential of the kaolin reserves of Cornwall. Due to the availability of local skilled labour and cheap coal, this new industry concentrated on Staffordshire, where one of the best potters was Josiah \*Wedgwood, whose Etruria works and products became world famous.

During the late 18th and early 19th cents. ceramics became one of the leading mass-production industries, though alongside cheap earthenware, high-quality porcelain was

produced by potters like Spode, Minton, and Coalport. These and other famous names in the history of ceramics survive in the modern industry, which has become geographically more concentrated, but still manufactures a diverse range of products. The Arts and Crafts movement of the later 19th and early 20th cents. saw a revival of traditional pottery techniques, emphasizing artistic skill and design as a counter to mass production. ID

**Cerdic, House of.** By the late 9th cent., when the \**Anglo-Saxon Chronicle* was compiled, Cerdic was regarded as the common ancestor of \*Alfred and all previous kings of the West Saxons; however, the reality behind these claims is hard to ascertain. The arrival of Cerdic and his son Cynric is recorded in the *Chronicle* annal for 495, but the entries concerning them are riddled with so many inconsistencies that they cannot be taken as viable historical accounts. Not the least of the problems is that Cerdic is not in origin a Germanic name but Brittonic and may not have been borrowed into Old English until the period c.550–650. The last king who could claim to be a direct descendant in the male line from Cerdic was Edward the Confessor, but Henry I by marrying a great-niece of Edward ensured that subsequent rulers could continue to retain him as an ancestor. BAEY

**Ceylon.** See SRI LANKA.

**Chad** (Ceadda), **St** (d. 673). One of four Northumbrian brothers who were 'famous priests', Chad studied in Ireland and was a disciple of \*Aidan. In 664 he succeeded his brother Cedd as abbot of Lastingham and was nominated to the see of Northumbria (his seat to be at York), by King \*Oswiu, retaliating to his son Alchfrith's nomination of \*Wilfrid. Informed by Archbishop \*Theodore that his consecration (c.665), by Wine and two British bishops, was irregular, he resigned the see. He became (fifth) bishop of the Mercians, the Middle Angles, and the people of Lindsey in 670, his seat at \*Lichfield. As bishop he emulated Aidan, but his scope may have been limited by the earlier work of an active British church. Chad founded a monastery, possibly at Barrow-on-Humber, on land from \*Wulfhere of Mercia. One of his monks, Trumbert, taught \*Bede. The 8th-cent. Gospels of St Chad were probably associated with his shrine. AER

**Chadwick, Edwin** (1800–90). Reformer. John Stuart \*Mill called Chadwick 'one of the organising and contriving minds of the age', and the great moment in his life came in 1829 when he met the aged Jeremy \*Bentham and became his literary secretary. Henceforward, Chadwick was utilitarianism in action. He was born in Manchester, his family moved to London when he was 10, and he became a lawyer. In 1832 he was appointed to the Poor Law Commission and the following year to the commission on children in factories. His influence on both reports was very great and he was appointed secretary to the Poor Law Commission in 1834, a post which brought him savage criticism. Another of his abiding interests was sanitary reform and from 1848 to 1854 he served as a commissioner on the new Board of Health. He was then rather pointedly pensioned off and his public career closed, though he continued to

## Chalgrove Field

campaign, particularly for competitive examinations in the civil service. Chadwick's character made him not only an exemplar but a caricature of utilitarian reform. He was hard-working, rigorous, and determined, but also tactless, unhumorous, impatient, dogmatic, and over-confident. Significantly, he was made to wait for his knighthood until he was 89. JAC

**Chalgrove Field, battle of, 1643.** Prince \*Rupert disrupted \*Essex's advance on Oxford in the summer of 1643 with a series of brilliant sorties. On 17 June he set out with nearly 2,000 men, mainly cavalry, and surprised several parliamentary garrisons, especially that at Chinnor. On the way back the following day, he turned on his pursuers at Chalgrove, between Watlington and Oxford, and inflicted a severe defeat. Fatally wounded in the battle was John \*Hampden, of ship money fame. Shot in the shoulder, he could not reach his home at Great Hampden across the Chilterns but died in an inn at Thame. JAC

**chamber.** The chamber (*camera*) started life as the royal bedchamber, with treasure kept under the bed, and became the financial headquarters of the early Norman monarchy. The main treasure was at first kept in Winchester, as it had been in Anglo-Saxon times. As business grew rapidly in complexity, the office of \*treasurer emerged. Much of the chamber's importance was lost in the reign of Henry III to the \*wardrobe, though it regained influence under Edward II and Edward III. By the Tudor period, the \*Exchequer had taken over most of the chamber's public responsibilities. JAC

**Chamberlain, Sir Austen (1863–1937).** The only 20th-cent. leader of the Conservative Party who failed to rise to the premiership, Chamberlain none the less enjoyed a ministerial career of considerable length and distinction. His rise owed much to the patronage of his father Joseph, but he ultimately emerged in his own right as a politician of standing. Chancellor of the Exchequer under Balfour (1903–5), he strongly supported tariff reform. During the First World War he accepted responsibility for the failure of the Mesopotamian campaign, resigning as secretary of state for India in 1917. But he was soon recalled to high office, returned to the Exchequer, and remained a leading supporter of \*Lloyd George's coalition until its fall in October 1922. He succeeded Bonar \*Law as Conservative leader in 1921 (having withdrawn from the leadership contest ten years earlier in the latter's favour), but lost his chance of the premiership through loyalty to Lloyd George.

As foreign secretary under \*Baldwin (1924–9) he is best remembered for the \*Locarno treaties of 1925, which, despite later misgivings, were hailed at the time as a great step towards European harmony, winning Chamberlain both the Garter and the Nobel peace prize. After a brief spell at the Admiralty, Chamberlain retired to the back benches in 1931, becoming one of very few British politicians who warned of the dangers posed by Hitler's Germany. Stiff and formal in appearance and manner, Chamberlain was often a difficult colleague. But he won respect for his loyalty and sense of

principle. His diaries have been published by the Royal Historical Society. DJD

**Chamberlain, Joseph (1836–1914).** Radical and imperialist. Like many of the most interesting politicians, Chamberlain defies categorization. He made his fortune as a screw manufacturer, which enabled him to retire at the age of 38. He dedicated the rest of his life to politics, first on the Birmingham city council, where he rose to be mayor in 1873–5, and then as a Birmingham MP. He was an advanced social reformer, clearing slums, building houses for the poor, setting up free public libraries and art galleries, and taking the gas, water, and sewage systems of Birmingham into municipal ownership. He also had sharp views on the aristocracy, which he regarded as useless ('they toil not, neither do they spin'), and he talked of making them pay a 'ransom' for their continued enjoyment of their privileges. That offended, as one might expect, Queen Victoria.

He rose to cabinet rank in 1880. But he was not altogether comfortable even on the radical wing of the \*Liberal Party, because of his patriotic views on national issues. These were sorely tested by \*Gladstone's limp policies, as he saw them, on South Africa and Egypt, and caused him to break formally with the Liberal Party over the \*Irish Home Rule issue in 1886. That was curious in some ways, because he was not an out-and-out unionist, and did not seem all that far away from Gladstone's views on Ireland when the crisis came. That led some of his contemporaries to suspect that he was really making a play for the leadership. If that was in his mind, however, he was soon disabused. The new \*Liberal Unionist group he attached himself to never made it up with the rump of the Liberal Party, and eventually allied with the \*Conservatives. It was this camp that provided Chamberlain with his next major platform, as colonial secretary in \*Salisbury's government of 1895.

As colonial secretary Chamberlain proved as radical as he had on the domestic scene, and in many of the same ways: advocating the development by central government, for example, of what he called Britain's 'imperial estates'. He also believed in their extension, particularly in southern Africa, where he was instrumental in trying to bring the Afrikaner republics to heel, first clandestinely (the \*Jameson Raid) and then by helping to provoke the second \*Boer War. That made him the leading imperialist of his time. But he was an unusual one. He sought to extend the empire, but also worried about its over-extension. With this in mind in 1898 he tried to fix a protective alliance with Germany behind Salisbury's back. He also wished to consolidate the colonies, in order to maximize their potential strength. In 1903 he came out publicly in favour of \*imperial preference as a means of achieving this, resigning from the cabinet in order to press it at the next election (1906). The result was to split the Conservative Party (the second great party he had had this effect on), and give the Liberals a landslide victory.

He may have been right. In July 1906, however, he suffered a disabling stroke. Without his energy behind it the tariff reform campaign wilted. He died just before the Great War came to bear out his deepest fears. BJP

Marsh, P. T., *Joseph Chamberlain* (New Haven, 1994).

**chamberlain, lord great.** Originally in charge of the royal chamber and known as the master chamberlain, the office-holder had some financial responsibilities since part of the king's treasure was kept there. Later he lost most of his duties to the \*treasurer and other officers, but retained responsibility for the palace of Westminster, the opening of Parliament, and the introduction of new peers. He also attended the coronation and handed water to the monarch before and after the banquet. From 1133 the office was hereditary in the de Vere family, though with interruptions and vicissitudes, until it passed in 1626 to their cousins the Berties, as Lords Willoughby de Eresby.

The office of lord chamberlain is quite distinct. He has direct charge of the royal household and in 1737 was given the power of licensing plays. This was strengthened by an Act of 1843 and not abolished until 1968. The vice-chamberlain is a deputy to the lord chamberlain. JAC

**Chamberlain, (Arthur) Neville** (1869–1940). Prime minister. Chamberlain was born in Birmingham, a son of Joseph \*Chamberlain by his second wife. Educated at Rugby and Mason College, Birmingham, he seemed destined for a business career, but his election to the city council in 1911 provided an opportunity for him to display his considerable talents as a municipal reformer; in 1915 he became lord mayor of Birmingham and in 1916 he was instrumental in establishing in Birmingham the nation's first—and only—municipal savings bank. His record of conscientious and effective service in local government led to appointments first as a member of the control board established to oversee the liquor trade during the First World War, and then as director-general of national service (1916).

In 1918, at the late age of 49, he determined to enter politics, and was elected as a Conservative MP for Birmingham. Chamberlain had conceived a healthy dislike of \*Lloyd George, but supported the coalition government (1918–22) as being in the national interest. In 1922 his half-brother Austen tried unsuccessfully to persuade the Conservative Party to continue in membership of the coalition; Neville agreed with \*Baldwin and Bonar \*Law that it had outlived its usefulness, and that Lloyd George's political judgement could no longer be trusted. In 1922, clearly marked out for high office, Chamberlain joined Bonar Law's government as postmaster-general, becoming minister of health in 1923, chancellor of the Exchequer 1923–4, and returning to the health portfolio in Baldwin's second government (1924–9).

Chamberlain's years at the Ministry of Health establish his claim to be one of the greatest social reformers in Britain in the 20th cent. It was at his urging that the cabinet agreed to finance a widows', orphans', and old-age pensions bill in 1925. He piloted through the Commons the Rating and Valuation Act of 1925, which gave relief from local rates to agriculture and industry, and he initiated the great Local Government Act of 1929, which abolished the Poor Law Guardians, transferring their powers, and the institutions they administered (including hospitals), to the counties and county boroughs. Meanwhile, he was able to bring about a partnership between private builders and local au-

thorities to build almost 1 million houses for the working classes.

At the general election of 1929 Baldwin's government was voted out of office. Chamberlain agreed to Baldwin's suggestion that he undertake a reorganization of Conservative central office, establishing a research department, but he used this period (1929–31) and this position to work strenuously for the abandonment of free trade, which he correctly viewed as a millstone around the neck of British industry. During Baldwin's absence abroad Chamberlain represented the Conservative Party in the negotiations which led to the formation of the \*National Government. He held office in that administration as chancellor of the Exchequer, until succeeding Baldwin as prime minister in 1937.

Neville Chamberlain's years at the Treasury, coinciding with the depression of the 1930s, were years of challenge: he stood the test. In 1932 he persuaded the cabinet to agree to the abandonment of free trade: a general duty of 10 per cent was placed on almost all imports, but goods originating from within the British empire were exempted. As Chancellor, Chamberlain professed a desire to balance the books: in fact, perhaps more by accident than design, his budgets were frankly inflationary. The first, in 1932, was meant to be orthodox, but was wrongly calculated, and led to an excess of expenditure over revenue of some £32 million; this sum was simply added to the national debt. In 1933 the sinking-fund was suspended: repayment of the national debt was met through borrowing. The war loan was converted from 5 per cent to 3.5 per cent, and bank rate reduced. In 1934 he was able to restore earlier cuts in unemployment pay, and in 1935 to lower income tax. It is true that this policy of financial good housekeeping was blown off course by the need to rearm in the face of the Nazi menace. It is equally true that his budgets assisted economic recovery, and put the nation's finances into a position whereby they were able to meet the early demands of war in 1939. In 1937 he had no hesitation in taxing business profits (the 'National Defence Contribution'), a move which delighted the socialists and caused a short-lived panic on the Stock Exchange.

In May 1937 Baldwin resigned the premiership; Chamberlain's succession was automatic. Almost exactly three years later he resigned in a welter of criticism, triggered by Britain's withdrawal from Norway but largely informed by public disenchantment with his pre-war foreign policy.

Chamberlain's policy towards Nazi Germany is commonly associated with \*'appeasement'. It is as well to remember, therefore, that 'appeasement' of the Nazis was a popular policy in Britain in the 1930s. There was widespread agreement that Germany had been treated badly at Versailles in 1919, that if the principle of national self-determination had any meaning then the Austrian Germans could not be prohibited from joining Germany proper, and that the plight of ethnic Germans incorporated within other states created after the First World War needed attention. Neville Chamberlain believed in the \*League of Nations, and would have joined France in bolstering the League in its efforts to counter the Italian invasion of Abyssinia. When that did not happen he became disenchanted with French

diplomacy, and also unnerved by it. He saw it as his mission to prevent war with Germany and, if that could not be achieved, to postpone hostilities as long as possible in order to give the maximum time for rearmament.

But he had been unable to prevent or curtail Italian intervention in the Spanish Civil War, and Hitler's so-called 'invasion' of Austria caught him off guard. His policy during the Czech crisis (September 1938) was much affected, and undermined, by the unwillingness of the French to fulfil their treaty obligations towards the Czechs. Of course the 3 million Sudeten Germans living in Czechoslovakia were manipulated by the Nazis. None the less, Chamberlain's dramatic airline flight to Berchtesgaden (15 September), to meet Hitler, was tremendously popular at home, and his second visit, to sign the Munich agreement, though certainly paving the way for the Nazi take-over of the Czech state, was at the time widely hailed as a triumph.

In 1939, in relation to the British guarantee of Poland's borders, Chamberlain saw that appeasement was at an end. His honourable intentions were quickly erased from the public mind once Britain and Germany were at war. Chamberlain was then seen as a gullible English gentleman who had been totally outmanoeuvred by a ruthless Führer. He had no stomach for war, and was not a war leader. In May 1940 he resigned to make way for Winston Churchill, and died shortly afterwards. GA

Dilks, D., *Neville Chamberlain* (Cambridge, 1984); Feiling, K. G., *The Life of Neville Chamberlain* (1946); Neville, P., *Neville Chamberlain: A Study in Failure?* (1992).

**Chambers, Ephraim** (c.1680–1740). Encyclopedist, man of letters, and free thinker. Born in Kendal and apprenticed to a well-known map- and globe-maker, the publication of John Harris's *Lexicon technicum* (1704) gave him the idea of constructing an encyclopedia that would be a guide to universal knowledge and would be held together by an elaborate system of cross-referencing and a series of supplements on specialized topics. First published in 1728, subsequently republished in 1738, 1741, 1746, dedicated to the king, Chambers's title indicates the range of his work. *Cyclopaedia: or an universal dictionary of arts and sciences; containing an explanation of the terms and an account of the things signified thereby, in the several arts, both liberal and mechanical: and the several sciences human and divine . . . The whole intended as a course of ancient and modern learning. Extracted from the best authors, dictionaries, memoirs, translations, . . . in several languages.* The French translation of 1743–5 was an important influence on d'Alembert's and Diderot's *Encyclopédie*. NTP

**Chambers, William** (1800–83). Publisher and author born and educated in Peebles and apprenticed to an Edinburgh bookseller. Chambers set up his own bookselling business in 1819 and went into printing, entering the lucrative business of writing and publishing cheap, popular, improving periodicals. With his brother Robert, he made his reputation with *Chambers' Edinburgh Journal*, a 1½-penny weekly begun in 1832. Crammed with entertaining and wholesome stories about Scottish history and biography, often written in vernacular Scots, it soon reached an English market. Chambers published a steady flow of periodicals and en-

cyclopedias for the next four decades, made his fortune, and was an active and influential lord provost of Edinburgh in the 1880s. His interest in civic improvement and conservation left a permanent and wholly beneficent mark on the city's architectural development. He accepted a baronetcy from Gladstone but died before it could be awarded. NTP

**Chambers, Sir William** (1723–96). Architect. Born in Sweden, the son of Scottish parents, Chambers was educated in England, and travelled to the Far East, France, and Italy. On his return, he became architecture tutor to the prince of Wales, later George III, who advanced his career, and for whom he designed a coronation coach still used by the royal family. In 1757 he published *Designs of Chinese Buildings*, and his *Treatise of Civil Architecture* (1759) was long regarded as a standard work. As treasurer of the Royal Academy, his influence led to the development of the architectural profession. The pagoda and orangery at Kew are fine examples of his work, which led to a general interest in Britain in eastern architecture. He was extremely fastidious and correct, even dull, and his designs for Somerset House in London (1775) were criticized for lacking drama. From 1770 he was permitted to use his Swedish knighthood. JC

**champion of England.** The duty of the champion was to present himself in full armour on horseback at the \*coronation banquet in Westminster Hall, to throw down the gauntlet, and challenge anyone who denied the king's title. The office was attached to the manor of Scrivelsby (Lincs.), which belonged in the 12th cent. to the Marmion family, who claimed to have been hereditary champions to the dukes of Normandy. Philip Marmion is said to have acted at the coronation of Edward I in 1274. The manor then passed to the Dymoke family and John Dymoke certainly acted as champion for Richard II. The Dymokes performed at subsequent ceremonies, the last being the coronation of George IV in 1821. William IV decided that the banquet was expensive and unseemly and it has not been held since. There is no record of any challenge being accepted, though it was rumoured that the Jacobites in 1761 might challenge George III. They did not. JAC

**Chanak crisis**, September–October 1922. Turkish nationalists under Mustapha Kemal were unhappy about the loss of territory to Greece under the Sèvres treaty of 1920. They expelled the Greeks from Smyrna by force in August 1922 and threatened to cross the Dardanelles. Britain feared for the security of the Straits. \*Lloyd George reinforced British positions in Chanak, the neutral region on the Asiatic shore of the Dardanelles, thus blocking the Turks. Conflict was averted by an agreement settled on 11 October at Mudania. Eastern Thrace and Adrianople were returned to Turkey in return for recognition of the neutral zones of the Dardanelles. RAS

**Chancellor, Richard** (d. 1556). An explorer who opened up the first English contacts with Russia, Chancellor gained early experience of navigation and seamanship on voyages to the eastern Mediterranean. With the project to open a North-East Passage, he was chosen by \*Willoughby to be pilot-major of the first expedition in 1553 and sailed the

*Edward Bonaventure* into the White Sea. He then travelled overland to Moscow and made a preliminary trade agreement with Ivan IV which inspired backers in England to set up the Muscovy Company (\*Russia Company). Chancellor made a second visit to Moscow in 1555 but was killed when his ship was wrecked off northern Scotland in 1556. However the contacts with Russia and further overland exploration continued. RB

**chancellor of the Exchequer.** This office is held by the head of the \*Treasury. The critical changes were embodied in resolutions passed by the House of Commons in 1706 and 1713 that it would only consider proposals for public expenditure which came from the crown, endowing the executive with the sole authority to instigate financial initiatives. Together these decisions placed the Treasury under control of Parliament with its minister as a politician rather than an administrator. The subsequent growth of public expenditure and taxation, and the enhanced economic responsibilities assumed by government in the 20th cent., greatly increased the importance of the office. CHL

**Chancery, Court of.** The Chancery (*cancellaria*) began life as the royal secretariat during the Norman period. Its task was to draw up royal charters and writs under the authority of the great seal, which was in the possession of the chancellor. The chancellor, in medieval times, was often a bishop and a leading member of the royal council.

By the 14th cent. common law had become the ordinary law of the land administered through courts independent of the crown, staffed by professional lawyers. Yet the king retained the power to administer justice outside the regular system if an aggrieved party could not obtain justice from common law. Petitions were presented to the king in council setting out the details of the case and asking for relief. By the end of the 14th cent. petitions began to be addressed to the chancellor direct and by the end of the 15th cent. he was sitting alone hearing petitions and issuing decrees in his own name.

The rules of common law were bound by tradition and statute. The chancellor was not bound by such rigid procedures. Procedure was simple and informal. The Chancery could sit anywhere, at any time, and once the chancellor felt he had enough information he would arrive at a decision. It was quick and inexpensive justice which especially benefited the poor and the weak. As Lord Ellesmere explained in 1615, 'men's actions are so diverse and infinite that it is impossible to make a general law which may aptly meet with every particular . . . The office of the chancellor is to correct men's consciences for frauds, breaches of trust, wrongs and oppressions of what nature soever they may be, and to soften and mollify the extremity of the law.' Business increased steadily and by the 16th cent. the court was overwhelmed with petitions.

The chancellor's form of justice acquired the name of 'equity'. Equity was not a new concept but the difference was that equity became distinct from common law. At first equity was not seen as a rival to common law, but resentment arose over the growth of Chancery business. In 1616,

clashes over jurisdiction occurred between \*Coke, chief justice of King's Bench, and Chancellor Ellesmere.

After the Reformation, chancellors tended to have a background in law and lost the intuition and common sense of their ecclesiastical predecessors. Equity became bound by precedent and Chancery litigation was expensive and slow, often taking thirty years by the 19th cent. Chancery clerks depended on fees, not a salary, so it was in their interest to prolong proceedings. The backlog of cases grew acute under Chancellor \*Eldon (1801–27), who was too thorough to be efficient. Reform was piecemeal, a vice-chancellor appointed in 1813 and two more in 1842, the clerks were eliminated by 1852, procedure simplified, and a court of appeal established, but they were temporary measures. The 1873 Judicature Acts reduced the Court of Chancery to a division of the new High Court of Justice and judges were empowered to administer both law and equity.

In Ireland a chancellor presided over a separate court of equity which mirrored the development of the English equity system. In Scotland a chancellor existed from the 12th cent. and largely performed the same functions as his English counterpart. However, the chancellor became the chief administrator of law and not of a separate equitable system. Since the Union of 1707 there has been one lord chancellor for Great Britain. RAS

**Chandos, Sir John** (d. 1370). Chandos rose to prominence by military service, being present at the opening campaign of the \*Hundred Years War in 1339, at \*Crécy, and at the sea battle off Winchelsea in 1350. He became one of \*Edward the Black Prince's most trusted friends, serving on the *chevauchée* of 1355 and at \*Poitiers. Following the failure of the campaign of 1359, he was involved in negotiations leading to the treaties of \*Brétigny and \*Calais, but peace with France did not end his military activity. In 1364, leading the army of John IV, duke of Brittany, at the battle of \*Auray, he defeated and killed the rival claimant, Charles de Blois, and captured Bertrand du Guesclin. Three years later, he commanded the right flank at the Black Prince's victory at \*Najerà. When war reopened in 1369, he was seneschal of Poitou. Wounded in an engagement at Lussac on 31 December 1369, he died, unmarried, the following day. AC

**Channel Islands.** All that remains to the monarchy of its once extensive possessions in France, retained when John lost the rest of the duchy of \*Normandy in 1204. They consist of the four larger islands of Jersey, Guernsey, Alderney, and Sark, with a number of smaller islands. A determined attempt by the French in 1781 to capture Jersey was beaten off by the heroic defence of Major Pierson. The population of Jersey in 1991 was 84,000, Guernsey 59,000, Alderney 2,300, and Sark 570. Alderney is no more than 10 miles from the French coast. Jersey, the largest of the islands, is some 10 miles from east to west and 5 from north to south; its capital, St Helier, is on the south coast. The official languages are English and French, with some Norman-French patois still in use. The queen appoints a lieutenant-governor as her representative in the two bailiwicks of Jersey and

## Channel Tunnel

Guernsey. The islands have their own assemblies, legal systems, and currency. Their economy depends greatly upon tourism, but they also export fruit, flowers, and vegetables, and the low rate of income tax makes them a tax haven. During the Second World War, the islands were occupied by German troops and liberated on 9 May 1945. JAC

**Channel Tunnel.** The earliest detailed proposal for a tunnel dates from the peace of \*Amiens in 1802, suggesting two tunnels with horse-drawn vehicles and stabling facilities. Mercifully it was not built. The invention of railways made the project more practical. The London, Chatham, and Dover Company made some exploratory digs and an English Channel Company was formed in 1872. A rival enterprise, sponsored by the South Eastern Company, began operations at Shakespeare Cliff in 1881. But in 1883 both schemes were abandoned, partly for strategic reasons. After the development of an \*entente with France in the 1900s, the argument could be put into reverse. In 1966, the prime ministers of France and Britain pledged themselves to have the tunnel built. Financial difficulties caused the project to languish but a further agreement was signed in 1986. By this time opinion had hardened against a bridge and in favour of a rail tunnel only. Work began in December 1987, the main difficulties being financial rather than technological. The link from each side was established in December 1990 and the tunnelling completed by June 1991. The official opening by President Mitterrand and Queen Elizabeth II was in May 1994. After a series of embarrassing and entertaining mishaps, the first travellers passed through in November 1994. There are two rail tunnels, conveying cars and freight, and a smaller service tunnel. From Waterloo station to Paris is a three-hour run for passengers but the permanent terminal is intended for St Pancras. The tunnel is 31 miles long, second only to the Seikan tunnel in Japan. JAC

**Chantrey, Sir Francis** (1781–1841). English sculptor, born in Yorkshire. Although apprenticed to a woodcarver, Chantrey studied intermittently at the Royal Academy Schools, at first intending to be a portrait painter. About 1804, he decided to concentrate on sculpture and his bust of the radical politician John Horne Tooke (1811) made his reputation. He became, after \*Nollekens, the most successful sculptor of portrait busts in England. His simple and natural sculptures of children, especially *The Sleeping Children* in Lichfield cathedral, were enormously popular, though now may be considered mawkishly sentimental. In 1817 Chantrey became a Royal Academician and he was knighted in 1837. He bequeathed £105,000 to the Royal Academy, the interest to be used to buy 'works of Fine Art of the highest merit executed within the shores of Great Britain'. The purchases, which have often caused controversy, are housed in the Tate Gallery (London). JC

**chantries.** Founded either by individuals, guilds, or corporations, chantries were endowments for offering masses usually near a person's tomb or effigy, for the soul's repose in purgatory. Wealthy men invested heavily; for example, Cardinal \*Beaufort requested 10,000 masses for his soul. Hum-

ble villagers grouped together for an annual obit (memorial mass). Starting in the late 13th cent., with the greatest growth in the 14th, the number fluctuated, but by the Reformation there was a total of about 3,000 chantries. Most cathedrals had up to two dozen (in 1366 St Paul's had 74) and large churches had several. Many 'chantry priests' were employed specifically for this function and, as they had no pastoral duties, founders often provided for the mass-priest to teach in school. Ostensibly to rid the Church of superstitious practice, but incidentally increasing government revenue, chantries were dissolved in 1547. The small chantry chapels, such as Bishop Bubwith's (Wells), Cardinal Beaufort's (Winchester), and Humphrey, duke of \*Gloucester's (St Albans), are 'a series unique in the history of European art'. WMM

**Chaplin, Charles** (1889–1977). Film actor and director. London-born of music-hall performers, with a wretched childhood as the family lost everything, Chaplin learned vaudeville techniques with the Fred Karno Company before being signed by the Keystone Company (Hollywood) in 1913. After an unpropitious start, he gained fame in silent films through portrayal of a baggy-trousered, moustachioed tramp, softening the original character with sentiment and pathos (*The Kid*, *The Gold Rush*, *City Lights*), so charming audiences. His rapid rise was due partly to the emergence of the star system but he contributed creatively if egotistically to cinema art: directing was merely an extension of his power as actor. He made few films after the introduction of sound, but received a special Academy Award in 1972 and was knighted (1975). Chaplin's personal life was frequently stormy, and he left America in 1952 because of political hostility and moral disapproval, to settle permanently in Switzerland. ASH

**chapters and chapter houses.** The chapter house of a monastery, cathedral, or collegiate foundation was second only to the church in importance, and was usually built in close proximity to it. Here the community assembled daily in pre-Reformation times for prayer, for the reading of a chapter in the rule (hence the name), and for the transaction of business. The importance of the chapter house in the life of the community was often reflected in its architectural splendour. Covered with a stone vault, well lit, and entered by an elaborate doorway, there are outstanding examples in England and Wales, including the ruins at \*Rievaulx in Yorkshire and Margam in Glamorgan. At many cathedrals, too, there are fine chapter houses, notably at Wells (Som.), Southwell minster (Notts.), and Bristol cathedral.

Cathedrals which were not monastic foundations, and collegiate churches, were served by secular clergy, the canons or prebendaries, who constituted the caputular body or chapter. Each member of the chapter had his stall in the choir and seat in the chapter house, and initially each had a predetermined period of residence, when he was expected to assist with the conduct of the church's worship. As time passed these duties became increasingly the responsibility of a smaller group of residentiary canons, usually the precentor (responsible for the music and the ordering of the services), the chancellor (responsible for education),

and the treasurer (responsible for the cathedral's fabric, and the vestments and vessels used in worship).

The reforms of the Ecclesiastical Commission in the 19th cent. deprived the prebendaries of their estates, income, and most of their obligations, and, except for the residentiary canons who, with the dean or provost of the cathedral, continue to be responsible for its management and worship, the title of canon or prebendary is now honorary. JRG

**Charge of the Light Brigade**, 1854. During the battle of \*Balaclava (25 October 1854) Lord \*Raglan ordered Lord \*Lucan, his cavalry commander, to advance his forces to stop the Russians removing captured cannon from the Causeway Heights. Confusion among the British commanders led to Lucan mistakenly sending the Light Brigade to attack strong Russian positions at a different location, North valley. About one-third of the 673-strong brigade, commanded by Lord \*Cardigan, became casualties. Thanks partly to \*Tennyson's poem, the action has become a symbol of military stupidity and blindly obedient courage. GDS

**charity schools**. Although the practice of establishing charity schools for the poor by private donors had begun in Elizabethan times, a great increase in numbers occurred towards the end of the 17th cent. The Blue Coat School (Westminster), founded in 1688, educated, clothed, and apprenticed 50 boys. The main object was religious and moral, as well as enabling the poor to earn a livelihood. The \*Society for Promoting Christian Knowledge (SPCK), at its first meeting in 1699, considered how best to establish 'Catechetical Schools' in every parish in London. Children between the ages of 7 and 12 were admitted and wore distinctive uniforms. Teaching was from 7.00 to 11.00 in the morning and 1.00 to 5.00 in the afternoon. Queen Anne took a personal interest and during her reign the schools made rapid advances. However, by 1760 the charity school movement was faltering. This was due to a number of factors, particularly the narrow curriculum offered, incompetent teachers, and the loss of royal patronage, because of suspicions that the schools were breeding-grounds for Jacobite sympathizers. PG

**Charlemont, James Caulfeild, 1st earl of** [I] (1728–99).

Charlemont was a typical member of the \*Anglo-Irish ascendancy, anxious to assert Irish rights against England but even more anxious not to encourage catholic demands. He was the son of an Irish viscount and succeeded to the title and the Ulster estates at the age of 6. He was created earl in 1763, having acted firmly in putting down disturbances in Armagh. Charlemont had literary and antiquarian tastes and, with \*Burke, \*Goldsmith, and \*Johnson, belonged to the Club. Despite nervousness, which prevented him speaking in the Irish House of Lords, he became increasingly interested in politics, and played an important part as organizer, particularly through his contacts with Henry Flood and \*Grattan. His aim, as he expressed it, was to serve Ireland in Ireland and to enhance her constitutional position. In 1768 he gave vigorous support to the \*Octennial Bill, which limited the life of the Irish Parliament and strengthened its position, and in 1775 he brought Grattan

into the Irish House of Commons as member for the family borough of Charlemont. His period of greatest influence was 1780–4 when he commanded the Irish \*Volunteers and he rejoiced in the concessions obtained in 1782. After that, his role was to restrain. He disliked the growing radicalism of the Volunteers and helped to avoid a confrontation in 1783 between the Dublin Convention and the Irish Parliament. He continued as an active member of the Whig opposition in Ireland, helping to frustrate Pitt's commercial propositions in 1785, forming Whig clubs, and opposing the Act of \*Union, which passed soon after his death. JAC

**Charles I** (1600–49), king of England, Scotland, and Ireland (1625–49). Charles was the second son of James VI and Anne of Denmark. Born in Scotland, he moved to England in 1604 after his father ascended the English throne. He developed into a somewhat reserved, scholarly boy, who hero-worshipped his charismatic elder brother Prince \*Henry. Only after Henry was struck down by typhoid in 1612 did Charles, as heir apparent, move centre stage. In 1621 he was a regular attendee at the House of Lords as Parliament considered whether England should intervene on the protestant side in the Thirty Years War. Public opinion favoured this, but James, as a leading protestant ruler, hoped to heal religious divisions by concluding a marriage between Charles and the Infanta Maria, sister of 'the most catholic king' of Spain.

Charles, now 22 and eager to be married, persuaded his father to let him make an incognito romantic journey to Spain. He set off in February 1623, accompanied by the royal favourite, \*Buckingham, who had become a surrogate brother to him. Two weeks of hard riding through France brought them to Madrid, where Charles, after the Spaniards had recovered from the shock of his arrival, received a royal welcome. However, custom forbade him unchaperoned access to the infanta, and when he demonstrated his love by leaping over a garden wall to greet her, she ran away. Frustration, and the growing realization that the infanta was merely a pawn in a power game to keep James from intervening in the war, opened the eyes of Charles and Buckingham to the fact that the expansion of Spanish power threatened England. When they returned home in September, without the infanta, they began constructing an anti-Spanish coalition. The adhesion of France was essential, since protestant states by themselves could never match Spanish power, and Buckingham therefore arranged a marriage between Charles and Louis XIII's sister \*Henrietta Maria.

James remained committed to peace, but was persuaded to call Parliament in 1624. Charles and Buckingham co-operated closely with its leading members in preparing the ground for war, but they only became free to act in March 1625, when the death of James brought Charles to the throne. The new king promptly summoned Parliament, assuming that it would complete what its predecessor had begun, but suspicion of Buckingham, who was associated with corruption and the Hispanophile attitude of James, led the Commons to make only a token grant of money. Charles could not comprehend this suspicion, and took at-

## Charles II

tacks on the favourite personally. When the 1626 Parliament impeached Buckingham, following the failure of an expedition to attack Cadiz, Charles dissolved it. He then levied a \*forced loan to pay for another expedition, this time in support of the French protestants. When this also ended in defeat a further clash with Parliament seemed inevitable. But Charles's acceptance of the \*petition of right in 1628 defused the situation, and Buckingham, the bone of contention, was removed by an assassin's hand in August of that year.

When Parliament reassembled in 1629 Charles expected harmony, but the religious issue came to the fore. Charles was a high churchman and promoted \*Arminians, but members of Parliament were predominantly low church, equating Arminianism with 'popery', which they abhorred. The Commons drew up a resolution against Arminianism, and when Charles tried to prevent its discussion by dissolving Parliament, \*Eliot and his associates held the Speaker down in his chair so that debate could continue. Charles responded to this outrage by imprisoning the offending members and dispensing with Parliament altogether. His personal rule was far from an \*'Eleven Years Tyranny', but Charles's continued patronage of the Arminians—in particular Archbishop \*Laud—outraged public opinion. So also did his resort to non-parliamentary taxation. Nevertheless, the personal rule was not threatened until the débâcle of the \*Bishops' wars, which left Charles with no choice but to summon Parliament. So weak was his position by late 1640 that he had to accept Acts severely curtailing his power. He also had to permit the impeachment and subsequent execution of Laud and his chief minister, \*Strafford. However, by deciding to abandon the Arminians he attracted support from traditional Anglicans, and conservative opinion began rallying round him when Parliament broke with convention by trying to deprive him of control over the army.

Charles had transformed himself into the guardian of the constitution, but in January 1642 he unwisely yielded to pressure from his wife and others who advocated tough measures. After impeaching his principal opponents of treason, he went down to the House of Commons, accompanied by an armed guard, entered the chamber, and demanded their arrest. But, as Charles quickly noted, 'the birds are flown'. His attempted coup had failed and he decided to leave the capital and appeal for support to the country. In August 1642 he raised the royal standard at Nottingham in the midlands, and shortly afterwards established his headquarters at Oxford. During the civil war that ensued, Charles showed qualities of endurance and decisiveness that had hitherto lain dormant. And although he left strategy in the hands of his nephew Prince \*Rupert, he proved a successful commander in the field. But royalist resources were sufficient only for a short war, and Parliament had the longer purse. After his defeat at \*Naseby in June 1645 Charles had no hope of winning, and in May 1646 gave himself up. Yet even in defeat he was still a key figure, for everyone assumed that no blueprint for a post-war constitution could be implemented without his participation. The parliamentary army, which had emerged as a radical political force in its own right, was so concerned that in June 1647 it sent a troop of musketeers

to remove the king from parliamentary guardianship and bring him closer to London. He was held captive in his own palace of Hampton Court until November, when fear for his personal safety drove him to escape and seek refuge in \*Carisbrooke castle on the Isle of Wight.

The political situation was now chaotic, with Parliament, the army, and the Scots all putting proposals to Charles. Confronted by this evidence of disunity among his enemies, Charles took the understandable but risky course of playing them off against each other. All over the country sentiment was flowing, if not in favour of the king, then against those who had overthrown him, and the spring of 1648 saw a series of violent outbreaks called the second civil war. These convinced the army, which ruthlessly suppressed them, that Charles was not to be trusted and that a permanent peace settlement depended on removing him. In December 1648 they 'purged' Parliament of its conservative members, leaving the remaining 'rump' free to set up a high court to try the king. Charles refused to plead, insisting that he was accountable only to God, but although his dignity and fortitude impressed all those present, the outcome was a foregone conclusion. Charles was sentenced to death and beheaded, in front of the Banqueting House in Whitehall, on 30 January 1649.

Charles had many good qualities. He loved the arts, and assembled a collection of paintings among the best in Europe. He loved his wife and children, but above all he loved God. Religion was central to his life, and was intimately involved with his commitment to order and ceremony. But his exalted view of the kingly office, his autocratic tendencies, and his lack of the common touch opened a chasm between him and his subjects which swallowed up the monarchy he struggled to preserve.

RL

Carlton, G., *Charles the First: The Personal Monarch* (1983); Gregg, P., *King Charles I* (1981); Wedgwood, C. V., *The Trial of Charles I* (1964).

**Charles II** (1630–85), king of England, Ireland, and Scotland (acceded 1649, restored 1660–85). Charles received his practical education in 1648–51 when he learnt how to adapt to rapidly changing circumstances, win and discard allies, make use of others, and trust no one. He also fathered his first bastards. He commissioned \*Montrose to raise the Scottish Highlands, but withdrew his support to conclude an agreement with the more powerful \*covenanting party, who defeated and then hanged Montrose (April 1650). Invited to Scotland by \*Argyll, whom Charles executed in 1661, he took the covenant and publicly condemned the religions and policies of his father and mother. At first Argyll's puppet, Charles freed himself by devious manoeuvring, but when \*Cromwell's army advanced he took the gamble of invading England, where few rallied to him. After a disastrous defeat at \*Worcester (September 1651) he made a romantic escape to France. Subsequent royalist plots to restore Charles failed. Foreign assistance proved ineffective: France preferred Cromwell as an ally, leaving Charles to an unhelpful combination with Spain, the weaker power. Divisions among the republican factions brought about his 1660 \*Restoration, which was unconditional. It was old cavaliers

who in 1661–2 imposed conditions by restoring strict Anglican religious uniformity and making Charles abandon his \*Declaration of Indulgence (1662). In his first years Charles was advised by his principal minister, \*Clarendon, to rule within the laws whereas younger ministers urged him to free the crown from constitutional restrictions. After the failure of the \*Anglo-Dutch War of 1665–7 he abandoned Clarendon and initiated a new line of policy.

Charles, his brother James, and the \*cabal ministers concluded treaties with France because it was the strongest European power. Victory in a new Dutch war would be assured. French subsidies and increased revenues from expanded trade (as occurred in 1681–8) would reduce, and might eventually eliminate, dependence on Parliament. War would enable the army to be expanded. Charles, James, and \*Clifford also thought that they could become Catholics and institute religious toleration: in the secret treaty of \*Dover (1670) Louis XIV promised military aid if a rebellion resulted. In the event, unlike the other two, Charles delayed his conversion until his death-bed in 1685. For the first time no parliamentary session occurred in 1672, and had the Dutch War succeeded Charles would have been able to dictate from a position of strength. But stalemate at sea enabled Parliament to make Charles withdraw his Declaration of Indulgence and assent to the \*Test Act barring Catholics from office, forcing James and Clifford to resign. In 1673–4 Dutch propaganda fed MPs' suspicions of Charles's absolutist intentions: they refused to vote money, compelling Charles to desert France and make peace.

Charles also retreated in domestic politics, allowing his new lord treasurer \*Danby to return to upholding the interests of the church, enforcing the penal laws against Catholics and dissenters. Danby was needed to restore royal solvency and manage Parliament, but Charles never liked or trusted him (nor Danby, Charles). The king persisted in trying to maintain a personal connection with Louis XIV and barter English neutrality for subsidies. Danby was alarmed at the increase in French power and wished to balance it by championing William of Orange, furthering this policy by negotiating the marriage of William to James's daughter and heir Mary. Charles allowed the marriage in order to put up the price that Louis would pay for English neutrality, but Louis found it cheaper to bribe the opposition and give them secret papers incriminating Danby. This forced Charles to dismiss Danby and dissolve Parliament. At the same time 'revelations' broke of a \*Popish plot to murder Charles. James's Catholicism, absolutist and French sympathies, and the deciphering of correspondence by an employee, Coleman, made him seem the obvious beneficiary. By sending James into exile Charles raised doubts whether he would steadfastly resist the Whig bill to exclude James from the succession, since he had not protected ministers when they came under attack.

However Charles saw \*exclusion of the rightful heir as changing the monarchy from a hereditary, divinely appointed institution into an elective, limited office that could soon give way to a new commonwealth. He stopped the first Exclusion Bill by dissolving Parliament (July 1679). When Charles fell ill and James returned from exile to de-

fend his right, Charles sent him to rule Scotland, where he could prevent covenanting militants intervening in England (as they had done in 1639–45) to help the Whigs. In 1680 Charles blocked exclusion by encouraging the Lords to reject a second bill, and in March 1681 he dissolved the third Whig Parliament which he had ordered to meet at \*Oxford, to separate the Whigs from their London supporters. No further meetings of Parliament were allowed, Charles being financially secure with a new secret treaty with France giving him subsidies in return for non-intervention in Europe.

The term 'Stuart revenge' does not accurately describe Charles's last years after 1681, apart from renewed prosecutions of dissenters. Charles strengthened the crown by obtaining the surrender or forfeiture of the charters of corporations. He purged Whigs from offices. When evidence surfaced of two separate Whig plots, one by popular activists to murder Charles and James, the other by aristocrats to stage a coup, he relentlessly prosecuted those involved. He used the law against opponents, but he cannot be said to have tried to undermine it or set up royal absolutism. His main interest at the end was politically trivial, to build a new palace near Winchester.

Charles had two constructive achievements to his credit. He successfully resisted intense cavalier pressure in the early 1660s to go back on the Act of Indemnity that was intended to heal the divisions caused by the civil wars. This enabled him later to defend and conserve the rights of the crown without the nation being plunged into the catastrophe of another civil war. Secondly his personal tolerance, ineffective in trying to suspend religious persecution, found full play in his protection of intellectual freedom, although he did little more in science than observe the experiments of the \*Royal Society.

Charles's irregular private life resembled that of his French grandfather Henri IV. It seldom affected politics: the only politically active and influential mistress, the duchess of Portsmouth, worked in the French interest, having been sent by Louis for that purpose. The barren Portuguese queen, \*Catherine, counted for nothing.

JRJ

Hutton, R., *Charles the Second: King of England, Scotland and Ireland* (1989); Jones, J. R., *Charles II, Royal Politician* (1987); Miller, J., *Charles II* (1991).

**Charles, prince of Wales** (b. 1948). Born during the reign of George VI, Prince Charles was 3 when his mother succeeded to the throne as Queen Elizabeth II. He was sent to Cheam School, Gordonstoun, Geelong Grammar School in Australia, Trinity College, Cambridge (where he took a degree in history), and University College, Aberystwyth, where he studied Welsh. Created prince of Wales in 1958, he was invested in \*Caernarfon castle in 1969. He then entered the armed forces and pursued a vigorous training programme—flying a supersonic jet, qualifying as a helicopter pilot, catapulting from the deck of *Ark Royal* in a Buccaneer, training in minesweepers and submarines, and commanding a mine-hunter. His private pleasures included not only painting, music, and acting, but surfing, sailing, skiing, fishing, shooting, riding, and playing polo to international standard. His reward for these strenuous activities

## Charles

was to be increasingly portrayed in newspapers as a 'crank', 'a young twerp', and a 'wimp', who admitted talking to flowers and showed an interest in alternative medicine. Protest groups soon latched on to the fact that demonstrations, preferably violent, on a princely visit gained them publicity, and he was threatened with boycotts, hunger-strikes, air-fresheners, and bombs. His public utterances on matters like the environment, modern architecture, and the preservation of natural resources, on which he feels strongly, were greeted with indignation by interested groups. He is anxious to modernize the monarchy but not all of his suggestions have been well received. In 1994 he remarked that he would like to be defender of all faiths, and not merely that of the Church of England—which, as some newspaper correspondents tartly observed, sounded as if it did not matter what one believed provided one believed something. In 1981 the prince married Lady \*Diana Spencer in St Paul's cathedral: the Clay Cross council in Derbyshire announced it would call a Republican Day (subsequently cancelled), and a Yorkshire councillor resolved to go on hunger-strike in protest at the cost of the ceremony. Two sons, Prince \*William and Prince Henry, were born in 1982 and 1984, but disharmony in the marriage was increasingly the subject of comment, and the royal couple separated in 1992 and divorced in 1996. After Princess Diana was killed in a car crash the following year, speculation at once began whether the prince would remarry. When, as a 14-year-old schoolboy at Gordonstoun the prince ordered a glass of cherry brandy at a Stornoway hotel, the ensuing sensation must have afforded him a glimpse that life might not be tranquil. JAC

**Charles, Thomas** (1755–1814). Welsh revivalist. Born in Carmarthenshire and educated at Jesus College, Oxford, Charles took holy orders in 1778. His sympathies were with the Calvinistic methodists and from a chapel in Bala he began building up an evangelical circle. In 1803 he established a press at Bala which produced catechisms and religious magazines in Welsh and he prepared for the British and Foreign Bible Society an edition of the Bible in Welsh. Charles fought off accusations of Jacobinism and democratic tendencies in *The Welsh Methodists Vindicated* (1802). In 1811 the ordaining of lay preachers led to a breach with the church which Charles, with reluctance, accepted. JAC

**Charleston, battle of**, 1780. In 1779 the British decided to concentrate on the southern states in America in order to encourage the loyalists. \*Clinton took a strong expedition from New York to Georgia and moved north to besiege Charleston, the largest town in the south. After a close investment and heavy fighting, the defenders surrendered on 12 May 1780. Clinton took 6,000 prisoners and many guns. But the political response was disappointing. JAC

**Charlotte Augusta, Princess** (1796–1817). The daughter of George, prince of Wales, and Caroline of Brunswick, Charlotte bore the brunt of the hatred between her parents, who separated shortly after her birth. Much of her childhood was spent with little access to the outside world, though, largely through the efforts of her aunt, the duchess

of Württemberg, she received a rounded education. In December 1813 she was betrothed to William, prince of Orange, but broke off the engagement, not wishing to move to Holland. Her stubbornness even managed momentarily to unite her warring parents, her father dismissing her entire household and her mother refusing to receive her. At length she was given lodgings at Windsor, but visitors were forbidden and letters had to be smuggled in. When, in 1816, Leopold of Saxe-Coburg proposed, Charlotte readily accepted and the marriage took place on 2 May at Carlton House (London). Charlotte died giving birth to a stillborn child on 5 November 1817: her accoucheur, Sir Richard Croft, shot himself. SMC

**Charlotte of Mecklenburg-Strelitz** (1744–1818), queen of George III. Though Charlotte was chosen unseen from lists of German princesses in 1761, her marriage to George III proved a great success. She was considered by many to be rather dull and distinctly plain, but George was devoted to her and their routine domestic life set a pattern for the future. She had little interest in political matters and was rarely accused of trying to influence her husband. Her fifteen children took up a great deal of her time and energy, but she was interested in music and literature. She cared for her husband during his long slide into insanity, though terrified by his occasional outbursts of violence. She predeceased him and was buried in November 1818 in St George's Chapel, Windsor. SMC

**charters** are grants of privilege. They are of fundamental importance to students of medieval legal, constitutional, and municipal history. They can also be used to establish where the king or lord was at a certain time, and they give some indication of his chief ministers from the frequency names appear as witnesses. But they need to be used with great caution since spurious charters are by no means uncommon, interpolations were frequently made, and contemporary phrases can be difficult to render precisely. Indeed, a number of learned controversies have turned on the exact meaning of charter terms. The oldest charters appear to be grants made to the Church in Kent during the reign of \*Æthelbert in the 600s and were modelled on private Roman documents. Grants of land to individuals became common and the phrase 'bookland' indicated an estate held by charter. Next came charters to towns or cities, giving them the right to hold markets or fairs, to collect tolls, or to elect their own officials. William the Conqueror issued a charter to London, Norwich received one from Stephen, York from Richard I, Bristol from Henry III. Charters as regular instruments of royal policy seem to have been introduced into Scotland from 1095 during the reign of Edgar, who had close connections with the Anglo-Norman court of William Rufus. The 'coronation charters' of Henry I, Stephen, and Henry II were rather different in character and more like political manifestos, since they promised good government in accordance with the traditional laws of the realm. Though the promises were not always kept, the charters implied some limitation on royal authority and paved the way for \*Magna Carta in 1215, itself constantly confirmed. Later came charters to guilds and to trading

companies. The \*Merchant Venturers, having obtained concessions from continental rulers, had their privileges confirmed by Edward III; the Royal College of Physicians of London was incorporated by Henry VIII in 1518; the \*East India Company was granted its charter by Elizabeth in 1600. The sanctity of charters was regarded as the very bedrock of property. Consequently the campaigns by Charles II and James II after 1681 to call in the charters of parliamentary boroughs and remodel them roused fierce opposition. When the Fox–North coalition in 1783 introduced a bill to reform the East India Company, the opposition had much success with the argument that this was a gross and daring violation of the constitution. In the 19th and 20th cents. charters were granted, under the supervision of the Privy Council, to universities and educational bodies. JAC

**chartism** (1837–54) was the first attempt to build an independent political party representing the interests of the labouring and unprivileged sections of the nation. For many of its followers chartism was basically ‘a knife and fork question’. Yet its programme was a series of political demands. The link between economic ills and political representation was constantly elaborated in chartist pamphlets and oratory.

The chartists were so named because they formulated their demands in a six-point charter: universal (manhood) suffrage, annual parliaments, vote by (secret) ballot, abolition of property qualifications for MPs, payment of MPs, and equal electoral districts. The object was to make the charter the law of the land by legal, constitutional means if possible, or by force if necessary—or by a mixture of both: ‘peaceably if we can, forcibly if we must.’ Great efforts were made to collect support for a petition to the House of Commons on behalf of the charter, but on each occasion the House rejected its demands. Alternative methods were therefore advocated. There were plans for making the central body of chartist delegates, the national convention, a people’s parliament which would bypass Westminster; a general strike (‘national holiday’) was attempted in August 1839; and local riots, and perhaps an abortive insurrection (the \*Newport rising) in November 1839, showed that ‘physical force’ might not be ruled out.

In its origins chartism was an umbrella movement which drew together many strands of radical grievance. In London and the provinces Working Men’s Associations were formed in 1837, building on the remains of earlier radical reform organizations. In Birmingham, the movement at first was closely allied with middle-class radicals and currency reformers. In Leeds, \*Owenite socialists combined with middle-class radicals and physical-force militants to launch the Leeds Working Men’s Association. In other towns of the West Riding and the industrial North local movements and grievances (including the 1834 New Poor Law) provided a basis for chartism, which was thus not so much a national movement as a series of local and regional movements, loosely federated. This posed a problem of concerted action which was never solved. Attempts to build a national organization repeatedly fell apart; and the most effective link be-

tween chartists was the widely read chartist newspaper the *Northern Star*.

The geography of chartism reflected the national economic and social structure. Wherever there was a substantial number of skilled artisans, especially shoemakers, printers, tailors, and cabinet-makers, a chartist organization on the lines of the Working Men’s Associations was to be expected, with an emphasis on self-help, independence, and propaganda for universal suffrage. Such was the movement in London or Birmingham. But in areas where there were substantial numbers of distressed handloom weavers or framework-knitters (as in Lancashire, the West Riding, and the midlands) chartism assumed a fiercer visage and adopted a more strident tone, expressed in mass demonstrations and torchlight meetings on the moors.

Just as the local variations of chartism were related to the structure of the economy, so the chronology of the movement reflected the cycle of booms and slumps between 1836 and 1851. The first climax of chartism came in the winter of 1839 during a severe trade depression. In 1842 a second peak of chartist activity was reached, arising out of mass unemployment in the northern towns. The last great flare-up of chartism came in 1848, following a winter of economic recession and inspired by revolutions on the continent. In periods of relative prosperity (1843–7 and after 1848) chartism lost its mass support. It then became a movement promoting education, temperance, municipal reforms, and settlement on the land—while never losing faith that universal suffrage would some day, somehow, be won. After 1848, as a curious epilogue, a group of chartists tried to steer the movement towards socialism and the international working-class movement of \*Marx and \*Engels.

Though the chartists failed at the time to achieve their six points, they were, with the exception of annual parliaments, realized later. JFCH

Ward, J. T., *Chartism* (1973).

**Chatham naval base.** Henry VIII developed Deptford and Woolwich as naval bases and dockyards but in 1550 it was decided to develop Gillingham Water or Chatham, on the Medway, 20 miles nearer to the North Sea. During the Dutch wars of the 17th cent., Chatham became the major naval base. In 1667, in a surprise raid, De Ruyter burst through the boom at Sheerness, wreaked havoc on the ships at harbour, and towed away the *Royal Charles*. The dockyard closed in the 1980s. JAC

**Chatsworth House** (Derbys.). Country seat of the Cavendishes, dukes of Devonshire. The Elizabethan house, begun by Sir William Cavendish in 1552 and completed by his widow Bess of Hardwick (Lady \*Shrewsbury) was replaced by the present building which has south and east fronts by William Talman (1687–96) and a north front by Thomas Archer (1704–7). Later architects at Chatsworth include James Paine, John Carr, and Sir Jeffry Wyattville, whose alterations and additions between 1820 and 1841 encompassed the library, the north wing and tower, and estate buildings. Chatsworth has painted ceilings by Verrio, Thornhill, and Laguerre, furniture by William \*Kent, sculp-

ture by Cibber and Canova, and paintings by Rembrandt, Frans Hals, \*Van Dyck, Tintoretto, and \*Lely. Of more recent date, there are sculptures by Angela Conner and paintings by \*Landseer, \*Sargent, and Lucien Freud. Among the contents of the library are major collections of drawings by Palladio and Rubens. The formal parterres at Chatsworth were designed by George London and Henry Wise, whilst the cascade by Grillet, a pupil of Le Nôtre, has a classical temple at its top by Thomas Archer (1702). From 1761 Capability \*Brown made major changes in the grounds, incorporating new planting and a bridge by Paine (1760–4), and alterations to the course of the river Derwent. During the 19th cent. the 6th duke of Devonshire and his gardener Sir Joseph Paxton devised a system of cascades, fountains, and pools, culminating in the Emperor Fountain of 1843. They planted rare trees and specimen shrubs, and introduced rocks, buildings, and statuary to punctuate the landscape. The site of the conservatory (1836–40) by Paxton and Decimus Burton—which anticipated Paxton’s design for the \*Crystal Palace—is now covered by a maze. PW

**Chaucer, Geoffrey** (c.1343–1400). Chaucer’s enduring fame reflects the range and quality of his poetry and prose, but also the accessibility of his midlands-based London English compared with that of works such as the north-western *Pearl* and *Sir Gawain and the Green Knight*. His impact on the English language and its poetics through the absorption of French words, ideas, and forms is considerable, as is his influence on writers from Hoccleve, \*Lydgate, and the ‘Scottish Chaucerians’ onwards.

Born into a family of prosperous vintners, Chaucer served as page then esquire to various aristocratic households, including that of Richard II (1377–99). His wife Philippa Roet, with whom he probably had two sons, Lewis and Thomas, was also in royal service. Chaucer’s specific assignments included fighting in the \*Hundred Years War c.1359, undertaking trade and diplomatic missions to Italy and France, and acting as customs controller at the port of London and clerk of works at Westminster and elsewhere.

Chaucer’s life experience doubtless contributed to his ‘most wonderful, comprehensive nature’ (Dryden), while his situation on the periphery of aristocratic circles perhaps underlies his self-presentation as ‘an elvyssh man’, a bystander at life’s games of power and love. How closely the professional and artistic lives interlocked is unclear. A courtly audience seems implied, for instance, by *The Book of the Duchess*, probably a consolation for \*John of Gaunt at the death of his duchess Blanche c.1369, while the ballade ‘Lack of Steadfastness’ offers advice to the king; yet no records exist of commissions or payments for poetry. Fellow poets and intellectuals such as ‘moral \*Gower’ and ‘philosophical Strode’, saluted at the close of *Troilus and Criseyde*, must have been a valued part of Chaucer’s readership.

Like other gifted contemporaries, Chaucer made an art of breathing new life into established conventions, and despite an increasing independence from sources, many of his late, masterly \**Canterbury Tales* are modified translations of existing works. His sources and models include the allegorical love-vision *Le Roman de la Rose*, and works by Machaut,

Froissart, Dante, Petrarch, Boccaccio, Ovid, Virgil, and Boethius.

Apart from the brilliant five-part tragedy *Troilus and Criseyde*, the poems are mainly small to medium scale, while in the broken ending of *The House of Fame* we perhaps see Chaucer losing his direction in an ambitious experimental project. Solemnity rarely goes unpunctured, yet Chaucer is also ‘the noble philosophical poet of love’ (Usk), preoccupied with questions about love, true nobility, and the Boethian opposition between false (worldly) felicity and true (spiritual) felicity. Notable, especially compared with the stiff rhetoric and unambiguous didacticism of much medieval literature, is Chaucer’s ability not only to impersonate other voices (from the coy hen falcon in *The Parliament of Fowls* to the blustering Host in the *Canterbury Tales*), but also to articulate different world-views with apparent impartiality. This permits a fascinating range of interpretation for many individual poems (reflected in the abundant secondary literature), and occasions ongoing debates about the advancedness or otherwise of Chaucer’s views on such issues as love, marriage, war, and the church. The only direct mention of 14th-cent. events is the jocular reference in the *Nun’s Priest’s Tale* to Jakke Straw, a leader of the 1381 \*Peasants’ Revolt, but the contemporary problems of religious charlatanry and the misuse of money and power are treated in the *Canterbury Tales* with pervasive irony. DCW

**Chaumont, treaty of**, 1814. Even after Napoleon’s defeat at Leipzig in 1813 he remained dangerous, and Castlereagh, Britain’s foreign secretary, was concerned lest he succeed in breaking the fifth coalition and signing a separate peace with one of the eastern powers. In March 1814 Castlereagh negotiated the treaty whereby Britain, Russia, Prussia, and Austria agreed to put 150,000 men each in the field until victory was achieved, and to guarantee Europe against French aggression for twenty years. The treaty was subsequently renewed. JAC

**Chedworth**. A large Romano-British villa in the Cotswolds 7 miles north-east of \* Cirencester. Originating as simple, free-standing buildings in the early part of the 2nd cent., in the early 4th cent. it developed into an extensive complex. The excavated (and displayed) area comprised, at the south-western, uphill end, a court divided from the rest of the villa by a wall with gatehouse. On three sides this court was enclosed by buildings, including two sets of baths and many rooms floored with mosaic. Nearby lay a *nymphaeum* enclosing a spring. The north-western range was prolonged into a row of rooms. The outer court remains unexcavated. Nearby was a probable temple. This and other features of the design have led to the suggestion that rather than a villa, Chedworth may have been part of a sacred complex. ASEC

**Cheke, Sir John** (1514–57). Cambridge-born protestant Greek scholar, educator, and man of affairs, Cheke was fellow of St John’s College from 1529. As regius professor 1540–51, he was supported by his friends Sir Thomas \*Smith and Roger \*Ascham in introducing the new ‘Erasmian’ pronunciation of Greek, against the vice-chancellor’s ban. Under Henry VIII, Cheke was tutor to Prince Edward who, as

Edward VI, gave him land, a knighthood, and the provostship of King's College, Cambridge; he was also member of Parliament, clerk to the council, and secretary of state. A supporter of Lady Jane \*Grey, he was imprisoned for treason under Mary 1533–4 but allowed to migrate to Basle, whence he travelled in Italy and taught at Strasbourg before being enticed to Brussels by Mary's agents in 1556 and again imprisoned in London. Securing release by renouncing his religion, he died soon after. Cheke's edition of two sermons by St John Chrysostom, with his Latin translation, was the first text to be printed in England in Greek type (1543). His strongly nationalist feelings in favour of the English language are evident in his gospel translations and his preface to Hoby's translation of Castiglione's *Courtier* (1561). JBT

**Chelmsford, diocese of.** The present see, created in 1914, is coterminous with Essex. In 604 \*Augustine consecrated \*Mellitus bishop of London to convert the East Saxons, but success was short-lived. In c.650 \*Oswiu, king of Northumbria, sent Cedd as Celtic bishop of the East Saxons with two centres, at Tilbury and Ythancaestir near Bradwell. The Essex see was independent until 675, when Bishop Eorcenwald moved to London. After that Essex remained within the London diocese until the 19th cent., though Simon \*Sudbury, bishop of London (1362–75), resided in Essex, where he was better known. In 1845 Essex was removed from the overpopulated London diocese and united with \*Rochester, only to be transferred again to the new see of \*St Albans in 1877. With the creation of the see of Chelmsford in 1914, Essex again had a bishop of its own. The cathedral is the former 15th-cent. parish church with 19th-cent. additions. WMM

**Chelsea hospital** (London) was founded by Charles II for veteran soldiers. The pensioners wear an 18th-cent. uniform and celebrate the founder on Oak Apple Day (29 May). The buildings were by Christopher \*Wren and the foundation stone was laid on 17 February 1682. The duke of \*Wellington lay in state at the hospital in 1852, when several people died in the crush to pay respects. The Chelsea Flower Show is held annually in the gardens. JAC

**Cheltenham Gold Cup.** The most important steeplechase in England at level weights. The National Hunt Meeting at Cheltenham is held in mid-March and the Gold Cup is the main event, run over 3 miles, 2 furlongs, and 76 yards. First run in 1924, the most notable winner has been Golden Miller, winning five times in succession 1932–6. RAS

**chemical industry.** Chemicals have formed part of the industrial activity of Britain for centuries although the extraction of usable materials or their manufacture only came to be systematically related to scientific principles from the end of the 18th cent. Chemical processes were used in brewing and distillation of alcoholic drinks, in preparing medicines, making concrete, glass, and pottery, making soap, and in cleaning, bleaching, and dyeing textiles. By the later 15th cent. the manufacture of gunpowder had stimulated investigations of the properties of substances for use in warfare or in economic activities.

The period called the \*industrial revolution in Britain saw the systematic exploitation of raw materials for use in the expanding economy. For example, town gas was made during the process of coking coal and it was used from 1808 at Soho in Birmingham to light the factory of Boulton and Watt. Within 20 years a number of gaslight companies were supplying many large towns. The by-products of coke and other chemicals, which began as waste, became of increasing importance as knowledge of their potential in other industries grew. Another example was the development of the lead chamber process which increased supplies of sulphuric acid, a necessity for many of the new industries.

Many heavy industries, such as iron, produced as byproducts inorganic chemicals which, with further processing, found markets. Amongst these were agricultural fertilizers such as basic slag and essential components of products such as washing powders. Output of raw materials such as common salt became of increasing importance and firms led by Lever Brothers formed the Salt Union which lasted for some years, dominating its supply in the late 19th cent. Research and development in these fields of chemical manufacture were undertaken by Brunner and Mond. Their United Alkali Company merged with the explosives company Nobel Industries and the British Dyestuffs Corporation in 1926 to form Imperial Chemical Industries.

Applications of research in organic chemistry during the 19th cent. enabled the development of firms making solvents, synthetic dyes, and new materials. The most important of these were developments from combinations of cellulose which made possible a wide range of new products including parkesine (the first commercial plastic), photographic film, and viscose rayon.

During the 20th cent. the demands for new chemicals continued in order to reduce imports and to cut costs. Thus rayon was invented and marketed as artificial silk. Courtaulds sold this cheaper fibre which was used for clothing and furnishing fabrics. Similarly Lever Brothers and the Dutch company of Jurgens combined in 1929 to form Unilever, whose core businesses had depended on making soap, margarine, and cattle feed, but which then produced pharmaceuticals and food chemicals. Developments in long-chain polymer chemistry during the middle decades of the 20th cent. gave rise to many products: polythene, nylon, and terylene. The raw materials for these products derived from coal or crude oil. Major international oil companies became closely involved in chemical manufacturing and often undertook research to tailor-make some product for special uses such as materials for aircraft tyres.

The most modern chemical industries are those concerned with biochemistry, microbiology, and particularly pharmaceutical research. Associated with household names such as Boots, Fisons, Glaxo, and ICI and Zenaca, they all demand heavy research and development investment. IJEK

**Chepstow castle** on the banks of the river Wye was one of the southernmost of the line of castles dominating the border with Wales. It was started immediately after the Norman Conquest by William \*Fitzosbern, earl of Hereford,

## Chequers

and added to by Walter de Clare and Richard de Clare, earl of \*Pembroke ('Strongbow'), extending along the length of the river cliff. Later the castle passed to the Beauforts, who also owned \*Raglan, nearby. During the first civil war, Chepstow was held for the king and surrendered after a brief siege in 1645: it was again besieged in the second civil war in 1648. After the Restoration, it was used as a prison: Henry Marten, the regicide, was confined there and gave his name to Marten's Tower. JAC

**Chequers**, in the Chilterns near Wendover (Bucks.), was given in 1917 by Lord Lee of Fareham as a country residence for the prime minister. It was first used by \*Lloyd George in 1921. Lee, a Conservative MP first elected in 1900, was an admirer of Lloyd George, served as director-general of food production in 1917, and moved to agriculture in 1919 and to the Admiralty in 1921. He was given a barony in 1918 and left office when the coalition broke up in 1922. The house has a Tudor core, with Victorian additions and substantial remodelling by Lee 1909–12. Among its more remarkable features is a fine collection of paintings including Constables, Reynolds, Van Loos, and Raeburns. JAC

**Cheriton, battle of**, 1644. After \*Roundway Down. \*Hopton and \*Waller continued their private struggle in Wessex, manoeuvring for possession of Winchester. On 29 March they met at Cheriton, Waller with 10,000 men, Hopton with 6,000. The royalist cavalry suffered heavily when caught in deep rutted lanes and Hopton was obliged to retreat, first to Alresford, then to Winchester. The battle is sometimes known as Alresford. JAC

**Cheshire**, a lowland county in north-western England, resembles a hammock slung between the south-west Pennines (east) and Flint–Denbighshire uplands (west); the southerly morainic barrier is crossed by the midland gap, now followed by road, rail, and canal. These barriers halted the early flood of Anglo-Saxon invaders to fertile meadowlands and ancient woodlands. The Romans had established a legionary fortress at Deva (\*Chester), as a base for advances into Wales and west Brigantia, but place-names reflect subsequent traces of early Celtic church influence and Scandinavian invasions (Irish-Norse into Wirral, Danes into east). Initially part of \*Mercia and 'shired' (=sheared) in the 10th cent., the county boundaries conformed to roughly their present extent by the 12th cent. \*Palatinate from 1237 when the earldom passed to the crown, though sparsely inhabited, Cheshire was not rich in castles despite its border position; large country houses, characteristically half-timbered, were its greater glory. Of crucial importance during the Civil War because of its strategic position, the county saw much fighting. The royalist defeat at \*Nantwich in 1644, followed by the surrender of Chester after siege in February 1646, effectively ended Charles I's hopes of help from Ireland.

Long known for its salt and famous for its cheese since the Middle Ages, Cheshire remained only moderately important agriculturally until specialization encouraged expansion of its dairying. The south and centre of the county have remained agricultural. Equal balance between rural and urban

populations was affected by the revolutionary changes of the industrial period, with the extension of manufacturing industries and improving transport. Under the influence of the expanding cotton industry, Stockport (important for the manufacture of textile machinery) and other towns in north-east Cheshire grew rapidly; Birkenhead then developed around Cammell Laird's shipyard. As population quadrupled during the 19th cent., canals took coal and agricultural products to the labour forces, and salt all over England; railway networks radiating from Crewe and Chester were augmented by that growing around Manchester and a tunnel under the river Mersey, linking Birkenhead with Liverpool (1886). The emergence of the chemical industries, concentrated on Northwich (salt), Runcorn, and Port Sunlight (soap), lessened the dependence on textiles. Population has continued to increase, since much of northern Cheshire has become an overspill or dormitory area for nearby Lancashire urban centres. The county, once called 'the seedplot of Gentility', nevertheless remains determined to maintain its distinctions. ASH

**chess**. The origins of chess have been much discussed but remain obscure, since it developed over time. It seems to have begun in India or China about the 6th cent. AD and to have been adopted in Persia, where it was known as *shatranj*. It spread to the west through the Arabs and the Vikings, and a Viking ivory chess set, discovered in the Hebrides in 1831, has been dated to the 12th cent. One of the earliest books to be issued by \*Caxton (c.1481) was *Game and Playe of the Chesse*, a translation from a French translation of a Latin work. The medieval game was slow and was speeded up in the 16th cent. by giving the queen and bishop greater powers. Since then a reasonably standard game has developed, though with local variations. The game is controlled, with some difficulty, by the World Chess Federation, founded in 1924, which formulates rules, awards grandmasterships and masterships, and organizes the world championship. JAC

**Chester** (Roman), known to the Romans as Deva, was founded in the 70s as a legionary fortress, originally for *legio II Adiutrix*. From the 80s it became the long-term base of *legio XX Valeria Victrix*. Originally constructed in timber, it was rebuilt in stone c.100 and was larger than normal at 60 acres. Parts of the northern and eastern defences continued in use down to the English Civil War. Excavation within the fortress is restricted by later buildings, but it seems to have contained the usual complement of buildings, and an unexplained and elaborate complex known as the 'Elliptical Building'. Outside the south-eastern angle of the defences lay an amphitheatre, and traces of riverside works have been found to the west in the area of the Roodee. In the later Roman period the intensity of occupation declined, though was probably still military. ASEC

(post-Roman). After the Norman invasion of 1066, William quickly marched north to subdue the rebellious native population, particularly the Welsh; the castle was commenced and an hereditary earldom created, but this title reverted to the crown in 1237. Although Chester prospered

as an administrative centre, the port was no longer viable by 1600 because of silting.

Granted a royal charter in 1506, Chester was severely affected by the Civil War since city and county supported opposing factions. Besieged 1644–6, the city was Charles's last important outlet to the sea and the nearest port for Ireland; he is said to have watched his army's defeat at \*Rowton Heath in September 1645 from the medieval walls before escaping into Wales, leaving the city to starve. By mid-18th cent., it had recovered into quiet country-town prosperity, remaining untroubled by later industrial unrest. The continuous, rambling first-floor arcades of the medieval rows are unique, but many of the black-and-white half-timbered restorations are Victorian. ASH

**Chester, battle of**, c.616. \*Æthelfryth of Northumbria defeated the Britons of Powys, killing their leader, Selyf. According to \*Bede, the battle was preceded by a massacre of monks from Bangor-is-y-Coed (near Wrexham), who were praying for a British victory. Bede regarded this as just retribution for their refusal to accept \*Augustine's invitation to adopt the Roman rites. The Saxon victory was part of a westwards expansion which ultimately drove a wedge between the Britons of Strathclyde and those of Wales, and represented an important step in the growth of Northumbrian power. JAC

**Chester, diocese of**. Chester was one of the seats of the Mercian bishops, though the bishopric was variously styled as Chester, Coventry, or (later) Coventry and Lichfield. In 1075 it was removed from Lichfield to Chester by Bishop Peter, but his successor, Robert de Limesey, moved it to Coventry (1102). After the \*dissolution of the monasteries, the see was refounded by Henry VIII (1541), and comprised the archdeaconries of Chester and Richmond (taken from York), covering a huge area of the north-west of England. Initially in the province of Canterbury, it was transferred to York the following year. The church of the former Benedictine abbey of St Werburgh, transformed in 1092 from a church of secular canons, became the new cathedral, rededicated to Christ and the Blessed Virgin Mary.

The see was much reduced in the 19th cent. The Yorkshire portion went to the new see of Ripon (1836), Lancashire north of the Ribble to the new Manchester diocese (1847), and Cumberland, Westmorland, and Lakeland Lancashire transferred to Carlisle (1856). The few Welsh parishes went to St Asaph, and Liverpool, a new archdeaconry, gained diocesan independence in 1880. ASH

**Chesterfield, battle of**, 1266. Despite Simon de \*Montfort's death at \*Evesham in 1265, the earl of Derby and other barons continued their resistance to Henry III. On 15 May 1266 they were defeated at Chesterfield and Derby was captured. Some of the survivors then took refuge in the fens of Ely, where they were suppressed by Henry's son Edward in 1267. JAC

**Chesterfield, Philip Dormer Stanhope, 4th earl of** (1694–1773). Politician and diplomat. Chesterfield owed his entrée into politics in 1714 to his kinsman James \*Stanhope. He was elected an MP in 1715 and joined the household of

the prince of Wales, the future George II. Inheriting his father's earldom in 1726, he served as ambassador to The Hague, 1728–32, but soon after his return joined the opposition to \*Walpole. After Walpole's fall he made his peace in 1745 with the 'old corps' Whigs, led by the \*Pelhams, and accepted office as lord-lieutenant of Ireland. He became one of the inner circle of ministers responsible for national policy, and in 1746 was appointed secretary of state (northern department), but his peace aims were frequently upstaged by the bellicosity of his senior colleague \*Newcastle, and in 1748 he resigned. Chesterfield's *Letters to his Son*, famously described by \*Johnson as exhibiting 'the morals of a whore and the manners of a dancing master', were published by his widow the year after his death. AAH

**Chester-le-Street, diocese of**. Created in 883, when the monks of \*Lindisfarne, evicted in 875, settled here on the south bank of the Tyne with \*Cuthbert's relics. The cult of the saint made it the centre of wealth and power in the north-east until the see was moved to \*Durham in 995. WMM

**Chesterton, Gilbert Keith** (1874–1936). Chesterton and his friend Hilaire Belloc (1870–1953), with whom he collaborated, were the best-known catholic writers of Edwardian England—\*Shaw dubbed them 'Chesterbelloc'—though Chesterton did not join the catholic church until 1922. Busy journalists, they engaged in public controversy, particularly with Shaw, \*Kipling, and \*Wells. Chesterton's best works are probably *The Napoleon of Notting Hill* (1904), *The Club of Queer Trades* (1905) ('Major Brown, Major Brown, where does the jackal dwell?'), and *The Man who was Thursday* (1908), though his most popular books were the Father Brown detective stories from 1911. Chesterton's 'cheese and good ale' stance grows tedious at times, and the deep nostalgia which he shared with Belloc is perhaps best captured in the latter's poem 'Ha'nacker Mill'. JAC

**Chevy Chase, battle of**. See OTTERBURN.

**Chichele, Henry** (c.1362–1443). Archbishop of Canterbury. The son and brother of prominent London merchants, Chichele was an original fellow of New College, Oxford. As a doctor of civil law, he practised in church courts and diocesan administration. From 1406 he was in royal service as an ambassador, earning the bishopric of St Davids, a place in the council, and in 1414 promotion to Canterbury from Henry V. He never held a political office but was an assiduous member of royal councils for most of his life. He founded a collegiate church at his birthplace, Higham Ferrers (Northants), in 1422, and in 1438 the college of All Souls, Oxford, for 40 fellows praying for the souls of Henry V and other English casualties in the French war, while studying arts and law, but not theology. RLS

**Chichester** (Roman). The *civitas*-capital of the \*Reg(i)ni; its Roman name was Noviomagus. Lying within the area of the possible late Iron Age *oppidum* defined by the Chichester entrenchments, after a brief military occupation the Roman town developed early. This can be ascribed to the

## Chichester

influence of the pro-Roman king \*Cogidubnus, mentioned on two exceptionally early Roman inscriptions from the town, one referring to a temple of Neptune and Minerva (location unknown). Otherwise, the development of the town seems to have been unexceptional. The main baths were in the north-western quadrant, the amphitheatre outside the south-eastern walls were constructed in the 3rd/4th cents. Remains of a number of later Roman houses, some with mosaics, have been located. The town seems to have been in decline in the later 4th cent. ASEC

**Chichester, Arthur, 1st Baron** [I] (1563–1625). Lord deputy of Ireland. Chichester came from a Devon family, his mother being a Courtenay of Powderham. After serving against the Armada and taking part in the expedition against Cadiz in 1596, he went to Ireland and was appointed governor of Carrickfergus. In 1604 he was made lord deputy in succession to \*Mountjoy and held the post for a remarkable eleven years, retiring in 1615. In 1613 he was made an Irish baron. There were two prominent features of his administration—to weaken the loyalty of the native Irish to their chiefs, which resulted in the \*Flight of the Earls in 1607, and to encourage Scottish and English immigration to Ulster, where he acquired large estates. The moderation which has been perceived in his policy towards the Catholics may have been more fatigue than principle, for he shared the current English contempt for the native Irish and believed their conversion to be essential, and his cautious approach to settlement was prudential rather than fundamental. JAC

**Chichester, diocese of.** The diocese was created by the transfer of the see from \*Selsey under the terms of the Council of London (1075), and is roughly coterminous with Sussex. Among its bishops were Hilary (1147–69), who was at variance with Becket as Henry II's chancellor over Battle abbey (1157), and later refused total obedience to Becket as archbishop in his quarrel with the king. Later bishops include Ralph Neville (1224–44), chancellor of England, Richard de Wyche (1244–53), noted for his learning and sanctity and canonized in 1262, Reginald \*Pecock (1450–9), theological writer and controversialist, deprived of his see, and Lancelot \*Andrewes (1605–9), as a scholar and preacher one of the principal influences on Anglican theological development. Bishop George \*Bell (1929–58) was a strong opponent of saturation bombing in the Second World War, a stance which is said to have cost him preferment to Canterbury in 1944. The cathedral, built between c.1091 and 1305, is Norman in origin, but was largely rebuilt between 1191 and 1210 in a style reminiscent of Canterbury. WMM

**Chichester-Clark, James, Lord Moyola** (b. 1923). Prime minister of Northern Ireland. Chichester-Clark, like his predecessor Terence \*O'Neill, was from a landed background. He was Unionist chief whip in the Stormont Parliament (1963–6), leader of the House of Commons (1966–7), and minister of agriculture (1967–9). He deftly united support among both the allies and opponents of the prime minister, O'Neill, when he resigned from the cabinet in April 1969 in opposition to the new local government franchise: he succeeded O'Neill on 1 May. In August 1969 British troops were

introduced into Northern Ireland, a development which weakened the authority of the Stormont government. The emergence of the more militant Provisional IRA in early 1971 forced Chichester-Clark to demand a new security initiative from London; and when this was not forthcoming, he resigned (20 March), taking a life peerage. An affable but unimaginative figure, Chichester-Clark was disorientated by high-handed British government action and by the rapid escalation of violence. Terence O'Neill observed that for the 22 months of his premiership Chichester-Clark bore a permanent expression of worry. AJ

**Child, Sir Josiah, baronet** (c.1630–99). Child made his money virtualising the navy and lived at Portsmouth before developing a great estate at Wanstead in Essex. He sat in Parliament for Petersfield in 1658, Downton 1673, and Ludlow 1685. His baronetcy was awarded in 1678. From 1677 he was a director of the \*East India Company, governor 1681–3 and 1686–8, and deputy governor 1684–6 and 1688–90. His brother John was governor of Bombay. Child's *Discourse on Trade* in 1668 praised the Dutch and argued for a low rate of interest to stimulate trade and manufactures. He disagreed with the commonly held view that high wages made England uncompetitive, maintaining that they were, in themselves, signs of prosperity. His prodigious wealth attracted much envy. \*Evelyn described him as 'sordidly avaricious' and dismissed Wanstead, with its lakes and walnut trees, as 'a cursed and barren spot, as commonly these overgrown and suddenly moneyed men for the most part seat themselves'. Child's daughter married into the nobility, and his son Richard was made an Irish earl in 1731 as Tylney of Castlemaine. JAC

**childbirth.** Before the early 18th cent., childbirth was a social rather than medical event, prominently controlled by women and ritualistic. In late pregnancy, the expectant mother issued invitations to close female friends and relatives, known as 'gossips' (from 'god-siblings'), who were summoned by the husband on commencement of labour. The birth itself was supervised by the midwife (or 'grace-wife'), for which she was paid with a gift or 'grace'. The bedroom became a lying-in chamber, enclosed physically and symbolically (keyholes blocked, daylight excluded, use of candles), where the gossips prepared a special warmed drink, sweetened and spiced, known as the caudle. The actual birth depended on the midwife's method for swift, safe delivery, but once the 'navel-string' was tied and cut, the infant was swaddled, then shown to the mother. Although she had been brought to bed and completed her 'crying out', she was still 'in the straw' (alluding to early bed-fillings) and would remain so for a full month. Initially confined to bed in the darkened room, 'up-sitting' was an important social occasion, when female visitors might drink the caudle; she then continued room-bound though not bed-bound, before moving around the house, though not outdoors. The rite of churching (originally purification, later just thanksgiving), unenforced but very popular, symbolically marked the end of lying-in. Men were excluded from the delivery, unless a surgeon was summoned to remove a dead foetus, using hooks, in the minority of difficult births. Since

they were only called in as a last resort, medical knowledge of the birth mechanism and placental role was scant.

The Chamberlen family, Huguenot immigrants, were not the only male midwives in 17th-cent. London but were the most notable, though as their claimed special expertise remained a family secret for four generations (*ante* 1620–c.1730), their impact was limited. Their skills in delivering a living child by the head were instrumental rather than manual—forceps, vectis (=lever), fillet (=pliable noose)—but the disclosure of forceps was only coincidental with the rise of man-midwifery, not its cause. Replacing gossips with male pupils, William Smellie initiated large-scale teaching of midwifery in 1740s London and greatly enlarged experience of both normal labour and difficult births. Lying-in funds for poor mothers preceded establishment of lying-in hospitals and lying-in charities. Obstetric knowledge exploded, London supplanted Paris through its published treatises, and, by the end of the century, obstetrics had become firmly established within orthodox medical practice. But medical reform in the first half of the 19th cent. was accompanied by hardening of occupational boundaries and professional rivalry, and obstetrics became side-lined. Midwives, unregistered and generally untrained, still undertook the majority of deliveries in villages and large manufacturing towns, but lying-in hospitals were so bedevilled by epidemics of puerperal fever that poor women were more safely delivered in slums by these untrained women, despite Dickens's portrayal of Sairey Gamp as the epitome of disreputability.

By the end of the 19th cent. maternal mortality rates were causing public concern, but the introduction of antisepsis only impacted on the lying-in hospitals, and levels continued high until 1935. Maternal mortality was sensitive to standards of care, but although midwives could be monitored after the Midwives Act (1902), the newly created College of Obstetricians and Gynaecologists (1929) was more concerned with its own status than with general maternal care. Use of forceps and anaesthesia for normal deliveries had grown steadily from the 1870s, but surgical intervention may have sustained mortality rates until the introduction of sulphonamides (1936), then penicillin, which slashed deaths from puerperal fever. The 1936 Midwives Act, Second World War, and introduction of the National Health Service (1948) led to improvements in maternity services, and hospitals were increasingly used for normal as well as high-risk deliveries. By the 1980s, almost all births were hospitalized. Maternal and perinatal deaths are now rare, but the intense medicalization of childbirth is under challenge: women's expectations have changed, and dispute between doctors, midwives, and mothers has spread to within the medical profession itself. ASH

**Childers, Robert Erskine** (1870–1922). Childers was a prim civil servant with a taste for high adventure. He was born in London and educated at Haileybury and Trinity College, Cambridge. His father, a distinguished oriental scholar, died when he was 6, and Childers was brought up by his mother, whose family came from Glendalough in the Wicklow Mountains. From 1895 to 1910 Childers was a clerk in the

House of Commons. At the outbreak of the Boer War he volunteered and wrote two books on his experiences. In 1903 he achieved a sensational success with a brilliant novel, *The Riddle of the Sands*, about two yachtsmen who stumbled on German preparations, in the shelter of the Frisian Islands, for a barge-invasion of England: it touched public anxiety and sold copiously. From 1910 Childers became more involved in the Irish nationalist cause and in 1914 ran a quantity of arms to Howth in his yacht *Asgard*. During the Great War he worked as an intelligence officer and took part in the air raid on Zeppelin bases at Cuxhaven in November 1914—his old stamping-ground. He was secretary to the Irish delegation in 1921 but joined \*de Valera in 1922 in opposition to the treaty and was shot by the new government of the Irish Free State. He died with composure, shaking hands with the firing squad. His son Erskine was president of Eire from 1973 to 1975. JAC

**children.** The proportion of children in British society has varied over time with little accurate documentation until censuses began in 1801. At that time, the proportion of children under 15 years was estimated to have been one-third of the total, increasing to almost 40 per cent by the mid-19th cent. By 1991 the proportion of children had decreased to about a quarter of the total population. These changes in relative proportions do not necessarily reflect differences in absolute numbers but are influenced by variations in life expectancy as well as birth rates. The numbers of children born in any family depended upon factors such as age at marriage, and the nutrition and health of parents, particularly the mother. Although many children were born, infant mortality rates were high until the major improvements in health care in the last quarter of the 19th cent. During the 18th and 19th cents. it was not uncommon for parents with a favourite or family Christian name to give it to several of their children in an attempt to guarantee its presence in the next generation. Official statistics indicate that the number of children per family varied little between social classes until the 1870s, when more reliable contraception was taken up by the better-off. The use of contraception to limit family size appears to have been associated with changing attitudes to women as well as the cost of the education of children in the rapidly expanding economy of Britain in the 19th cent. Access to contraception spread to all levels of society during the 20th cent., particularly after the introduction of the female contraceptive pill in the 1960s, which accelerated the decline in the birth rate and increased the proportion of childless couples. The numbers of children born have fallen below the rate needed to replace the population. Paradoxically, as the birth rate declined there was also a great deal of medical effort to understand and counter infertility.

Attitudes to children have varied over time, with gender, social status, and values about childhood shaping adult views and thus the children's experiences. The concept of childhood drawn from the old Roman catholic doctrine of original sin required that children be saved from the devil by a sound inculcation of Christian values beginning with the sacrament of baptism. Even very small children were ex-

pected to understand as though adult. The image of a child was not of innocence but of an imp, a little devil, likely to commit sin unless corrected. This concept continued after the Reformation when it was assumed that the young were likely to be corrupted by worldly ways and that a moral way of life could be attained only by strict, even forcible, guidance. It was accepted that all children at every level of society needed religious education whether formally in church or informally at home. Formal education and training for adult life assumed differing destinies for boys and for girls and for differing levels in society. The care of children was normally the task of parents and the immediate family, but, amongst the wealthy, care was the responsibility of special servants, such as nursemaids or 'nannies'. In the later Middle Ages, the sons of the aristocracy were sent as pages into another noble household at about the age of 12 years. Later, children of the upper classes were educated at home by a resident tutor or governess while the middle classes sent their sons away from home to boarding schools. The education of children in modern times has been characterized by its increasing formality and length.

A dramatic challenge to accepted ideas about childhood emerged in the 18th cent., expressed at its most controversial in *Émile* by J. J. Rousseau. The English edition appeared in 1763, a year after its first publication in French. Rousseau argued that children were born innocent and would continue so unless corrupted by adults. Although this remained a minority view for many years, it helped to modify some severity towards children. In addition, this new view of children stimulated the development of special toys and pastimes to help them learn. A major innovation, led by the publisher John Newberry in the later 18th cent., was literature specifically designed for child readers. This period also saw the establishment of Sunday schools for children's religious education.

The enjoyment of leisure in the ways suggested in the debates about childhood was completely outside the experience of most children. In rural areas, children of the less well-off had always performed household and other tasks. This pattern was continued in urban and industrial areas with children as young as 3 years being employed in textiles, mines, and other occupations. Charles \*Kingsley's account of the London chimney sweeps in *The Water Babies*, and many of \*Dickens's novels, drew attention in fiction to the reality of life for many children. During the 19th cent. there was increasing involvement of the state to protect children by controlling working practices and, eventually, to finance and regulate full-time education. State intervention continued in the 20th cent., raising the age at which children might leave compulsory full-time education and giving access to a range of educational opportunities including those at university level. Parallel developments occurred in the punishment of juvenile offenders by the state. In 1846 young offenders were separated from adults and sent to industrial schools, the precursors of borstal institutions, for treatment and rehabilitation. In 1908 the Children's Act established special courts to deal with child offenders, a system which continued for the rest of the 20th cent.

Children are both the newest members of society and its future. The history of British attitudes to children has demonstrated their importance in maintaining property and family position. At the highest levels of society, children were used to enhance the political and social strength of their families. At other levels they were educated and trained to contribute to the family's status and resources. Children at all levels were recognized as a cost during their time of dependency but as having the potential to repay their family line as adults.

IJEK

Aries, P., *Centuries of Childhood* (1962); Walvin, J., *A Child's World: A Social History of English Childhood* (1982).

**Chillingworth, William** (1602–44). Theological controversialist. Born in Oxford, he was educated at Trinity College, where he became fellow. The Jesuits persuaded him, though \*Laud's godson, to join the Roman church, but a brief spell of study in Douai (1630–1) caused him to leave catholic certainties for \*Falkland's liberal group at Great Tew. Here he wrote his main work *The Religion of Protestants, a Safe Way of Salvation* (1637), supporting the right of free enquiry and denying any church monopoly of the truth. Taking Anglican orders (1638), he became chancellor of Salisbury (1638), but in the Civil War, while serving as a royalist army chaplain, he was captured at Arundel. Already in poor health, he died at Chichester. Ahead of his time, his rationalism and toleration, suspected by Romanists and puritans alike, were to be valued in later years.

WMM

**Chiltern hundreds.** Members of Parliament cannot resign directly and must therefore, if they wish to retire before a general election, apply for an office of profit under the crown, which disqualifies them. By convention this is the stewardship of the Chiltern hundreds. The stewardships of the manor of Northstead, of East Hendred, and of Kempholme have also been used.

JAC

**Chimney Sweeps Act, 1875.** The plight of small boys sent up to clean chimneys had been raised as early as the 1760s by Jonas \*Hanway, who characteristically composed several pamphlets. Legislation to ensure decent treatment was largely ineffective, though an Act of 1788 specified that they should attend church on Sundays. Lord \*Shaftesbury took up the matter towards the end of his life, drawing attention to two recent cases—the death of a 7-year-old boy in Co. Durham and a 14-year-old in Cambridgeshire. The 1875 Act (38 & 39 Vic. c. 70) laid down that chimney sweeps should be registered by the police and certificates withheld if they disregarded safety.

JAC

**China, relations with.** Direct British trading contacts with China began in 1637, and were soon followed by a considerable artistic and cultural interest in the world's longest-established civilization. Difficulties in finding suitable exports to China, coupled with the problem of dealing with an empire which acknowledged no equals in the world, led to the first \*China (Opium) War in 1839–42. A British victory was rewarded with many privileges in five 'treaty' ports (a number later much increased), and by the acquisition of \*Hong Kong. Further differences precipitated the second China War when the Chinese were finally forced (1860) to

conform to western ideas of diplomatic practice. The British thereafter had no wish to see China weakened further since they already enjoyed the lion's share of trade and investment. Competition for trade and concessions increased in the 1890s, and Britain participated in an international force to raise the siege of the legations in Peking by the \*Boxers (1900). In the 1920s and 1930s Chinese nationalism was strong enough to persuade the Foreign Office to start the renegotiation of the unequal treaties. On the other hand, from 1931 Britain was unable to assist China against growing Japanese pressure, while victory in 1945 temporarily made the USA the leading outside power in Chinese affairs. Britain, unlike the USA, recognized the new communist regime which came to power in China in 1949, and tried to moderate American policy towards Peking during and after the \*Korean War (1950–3). China insisted on the return of Hong Kong when the lease expired in 1997, and firmly opposed British efforts in 1993–4 to extend democracy in the colony. CJB

**China wars**, 1839–42 and 1856–60. Otherwise known as the 'Opium wars', these were as much about clashes of imperial interests as the specific issue of opium, which was grown in British India and was one of the few commodities that China was prepared to trade. In 1839 the imperial Chinese government attempted to block the trade, seizing all opium held in the main trading port of Canton. The resulting war was an unequal conflict, with the Chinese having no answer to British fire-power, particularly from two East India Company gunboats with 32-pounder guns. The treaty of \*Nanking gave Britain \*Hong Kong and access to five other 'treaty ports' including Canton and Shanghai. China then collapsed into a brutal civil war known as the Tai Ping rebellion (1850–64), caught between a decadent government and religious fanaticism, in which about 20 million people died. Other powers took advantage of this, and in 1857 British and French forces occupied Canton. Although repulsed at the Taku Forts in June 1859, the Anglo-French force captured them next year, and founded the naval base at Port Arthur (modern Luda). After the convention of Peking had ceded Kowloon to Britain, in a notorious incident the Imperial Summer Palace at Peking was destroyed in reprisal for Chinese barbarities. Redvers \*Buller, a famous participant in the war, refused to wear his campaign medal, believing the war to be immoral. See also ARROW WAR. SDB

**Chippendale, Thomas** (1718–79). Cabinet-maker and designer, the son of a Yorkshire joiner, he set up business in London about the 1750s. Employing varied styles and adapting to changing fashions, Chippendale designed an extensive range of furniture, carpets, wallpapers, and brassware, from the elaborate yet delicate for the homes of gentry, to the simple and unpretentious for their servants' quarters. In 1754 he published *The Gentleman and Cabinet-Maker's Director* which influenced style in Europe and America. Both Catherine the Great and Louis XVI had copies of the book. Chippendale's designs are in many distinguished houses, including Badminton, Harewood, and Alnwick castle. Probably his best work was after 1770, when he worked with Robert \*Adam, a notoriously fastidious architect. Not

highly regarded by his contemporaries and successors—\*Sheraton said his designs were 'wholly antiquated and laid aside'—Chippendale's name has come to typify 18th-century mahogany furniture. JC

**Chippenham, battle of**, 878. \*Alfred's Wessex forces were encamped at Chippenham in north Wiltshire on 6 January 878 when they were routed by a surprise attack from a Danish army at Gloucester, led by \*Guthrum. Alfred was forced into hiding in the marshes of Somerset. JAC

**Chippenham, treaty of**. See WEDMORE.

**chivalry**. The French precursor of this term, *chevalerie*, indicates that this code of behaviour, to which the noble and gentle classes subscribed throughout the Middle Ages and beyond, derived initially from the special status and function of the mounted warrior. Developments in warfare c.800–1100 elevated this type of soldier in both a military and social context. The training was long, the costs of equipment high; the need for considered behaviour in the field and the praise attached to worthy actions spilled over into life in general. Thus was generated a moral, religious, and social code, which over the centuries became more closely defined and controlled through the conduct of \*tournaments, laws of war, orders of chivalry, and \*heraldry. The church, too, was keen to encourage the proper conduct of the warrior élite, and the crusades helped to shape 'the distinctive Christian strand in chivalry', even if its origins must still be sought in a secular context. Much of the early evidence derives from literary sources, such as the *chansons de geste*. Historians of chivalry debate whether art and literature reflected realities of life or were intended to shape them. This is particularly relevant in the English context where Edward III's plans for a chivalric order, finally bearing fruit in the \*Garter (c.1348), were much influenced by contemporary perceptions of the \*Arthurian romance tradition. Although chivalry was to some degree institutionalized in the later Middle Ages through the military orders and through the writing of treatises, it remained a nebulous yet all-embracing concept. It was important in creating a social bond between the crown, nobility, and gentry, and in generating the code of behaviour expected of a gentleman, demanding personal honour, generosity, loyalty, and courage. Thus it survived well beyond the era of the mounted knight. AC

**choirs**. A term used for groups of singers performing together, usually in parts with more than one singer per part. English usage often makes a distinction between 'choir', a small group of trained, often professional, and frequently ecclesiastical singers, and a larger, generally amateur and secular 'chorus'. Choruses in opera-houses, however, are traditionally professional.

The earliest recorded uses of choral singing are for Christian worship, in particular the unison singing of plainchant. Medieval monastic choirs often numbered over 50, while cathedrals, collegiate churches, and household chapels supported similar-sized choirs of men and boys. Convents, naturally, employed women's voices. Contrast was provided by alternating choral chant with passages sung by soloists.

These sections were later set polyphonically and by the 15th cent. were assigned to a small choir, generally in four or five parts. By the mid-16th cent. London's Chapel Royal numbered around 32 men and 12 boys. The post-Reformation choir was usually split into two antiphonal groups: cantoris on the precentor's side and decani opposite on the dean's side.

During the Commonwealth (1649–60) choirs were disbanded, although at the Restoration Charles II conscripted the best choirboys throughout the country (including \*Purcell) for his new Chapel Royal. Short choruses were an important element in the masque and Restoration stage works, and it was on this tradition that \*Handel built his new genre, the English oratorio. Here the chorus (usually sung by around 24 singers including the soloists) often played an important dramatic role, as in the many double choruses of *Israel in Egypt* (1739). The 1784 Handel celebrations at Westminster abbey, with nearly 300 singers and almost as many instrumentalists, began a tradition of gargantuan performances that continued in the Handel festivals, using thousands of performers, inaugurated at London's Crystal Palace in 1857.

The 19th cent. saw the growth of countless amateur choral societies throughout Britain, now including female voices (except for male-voice choirs cultivated especially in Wales). Revivals of favourites by Handel (especially \*Messiah), Haydn, and, later, Bach were balanced by new commissions such as Mendelssohn's *Elijah* for the Birmingham Festival (1846). Evangelical movements formed choirs to sing hymns and gospel songs, and John Curwen's educational tonic sol-fa method opened up whole repertoires to singers unable to read conventional notation.

Some choirs, like the various Bach choirs around the country, concentrate on the music of a particular composer. During the last few decades, consorts of solo voices have specialized in early repertoires such as madrigals, while small expert groups like the Monteverdi and Taverner choirs have adopted 'authentic' forces in an attempt to recreate earlier performing styles. See also THREE CHOIRS FESTIVAL.

ECr

**cholera**, an acute diarrhoeal disease transmitted by faecal contamination of water supplies and food, and long endemic in India, escaped from Bengal in 1817 to initiate the first of several world-wide pandemics. Asiatic cholera eventually appeared in England in October 1831 in the north-east port of Sunderland, supposedly imported from Hamburg; its presence was initially denied by those with mercantile interests, but it soon arose in Newcastle, Edinburgh, and London, before reaching France and then hurdling the Atlantic. Spreading capriciously, it caused some 31,000 estimated deaths in England and Scotland, and a further 20,000 in Ireland. A second outbreak commencing in London in 1848 was even more serious, despite a stream of regulations and recommendations, and affected all sections of the population rather than the 'destitute and reckless class' as before, with some 65,000 deaths in England, Wales, and Scotland and 30,000 in Ireland. The last two major outbreaks of 1853–4 and 1866 were milder. Mid-century attitudes of

practical concern held by an enlightened minority (such as John Snow, who famously removed the handle of the Broad Street pump in 1854) spurred some sanitary reform, but there is disagreement amongst modern commentators about the impact of cholera on political, administrative, or social history. Despite its shock value, it was surpassed by tuberculosis and the fevers as a cause of death and debility, but local government reorganization facilitated progress in public health, and few cases occurred in Britain after 1893.

ASH

**Christadelphians.** A Christian sect founded by John Thomas (New York, c.1848), but with adherents in Britain. Originally called Thomasites, the name Christadelphian ('Brother of Christ') was adopted during the American Civil War to justify objection to military service. Rejecting ministers and churches, and with no overall organization, the core belief is millennialist, with Christ expected to return and rule from Jerusalem; the Bible is regarded as infallible, the doctrine of the trinity is rejected, baptism is seen as valid only by immersion, and the unconverted will not be raised from the dead.

ASH

**Christianity**, derived from Judaism to become the dominant religion of western Europe and the driving force behind its civilization, has underpinned much of Britain's cultural and artistic heritage for fourteen centuries. There is little evidence of widespread Christianity before the 4th cent., though it was probably introduced earlier by eastern traders along with Mithraism and Isis-worship, popular with the army and fortress-towns: archaeological evidence of a cryptogram has been found at Cirencester (2nd–3rd cents.), chi-rho signs elsewhere, and the first British martyr was \*Alban. Urban Christianity was sufficiently vibrant to send three bishops (London, York, Colchester) to the Council of Arles (314); the little church at Silchester (c.360), wall-paintings at Lullingstone (Kent), and a Christian mosaic at Hinton St Mary (Dorset) further testify to its vigour. \*Paganism, despite a brief revival 360–80, was in decline as the century ended, when historical figures such as \*Ninian and \*Patrick began to emerge and Christianity was becoming the religion not merely of towns and upper classes but of rural estates. On the arrival of Anglo-Saxon invaders with their gods Woden and Thor, British Christianity was virtually extinguished except for the western Celtic fringes relatively untouched by Romanization or Saxon conquest. \*Monasticism (withdrawal from the world) had reached the Celts at a formative stage in their Christianity, and monks rather than bishops led the church. Patrick (c.390–461) evangelized Ireland, Ninian (c.360–c.432) the Picts of Galloway, and Kentigern (d. 612) Strathclyde; Illtud (d. c.540) and \*David (c.530–c.589) worked in Wales, but had little wish to convert the pagan settlers, though they sent missions to the continent; \*Columba settled in \*Iona (c.563), whence \*Aidan brought Christianity to \*Lindisfarne (635). The great legacies of the Celtic church are illuminated manuscripts such as the Books of \*Kells and Durrow, and the \*Lindisfarne Gospels. When Roman missionaries under \*Augustine arrived in Kent (597), divergences between the two strands arising from differences in organization and de-

tails such as the date of Easter and style of monkish tonsure led to clashes unresolved until the Synod of \*Whitby (664), when Roman customs prevailed. Conversion had sometimes been slow, though helped when a ruler embraced the new faith (\*Æthelbert of Kent, \*Edwin of Northumbria), but a brief golden age followed statesman-archbishop \*Theodore's reorganization of scattered dioceses, which produced scholars such as \*Bede, missionaries like \*Boniface of Crediton, and growth in the church's status and prestige. Monasteries were not only centres of religion and education but functioned as law-courts, while large investments were made in buildings representing the church (stone replacing wood, built in 'the Roman style'); secular Anglo-Saxon and Christian cultural traditions began to fuse in both poetry and visual arts (metalwork, manuscripts, carvings). Attacks from \*Viking raiders during the 9th cent., seen by churchmen as apocalyptic, destroyed religious houses and shifted power and wealth into secular hands, but did not totally destroy the church.

For two centuries after about 1050, when most of western Europe was formally Christian, sustained attempts were made to apply gospel principles and canon law to society generally, through Gregorian reform, clergy discipline, and then modification of lay life. The Norman Conquest, which joined England politically and ecclesiastically with Europe's main states, away from Scandinavia, led to a revival of religious life. \*Edward the Confessor had already rebuilt the abbey church at \*Westminster, but ecclesiastical administration was reorganized, cathedrals commenced, and the cathedral school at Oxford grew into a university. Monasticism again flourished, but with changed structure: diverging from the original \*Benedictines were \*Cluniacs, \*Cistercians, and \*Augustinians, while \*Hospitallers and \*Templars were founded for service of Holy Land pilgrims; friars in the west, unlike monks, lived in rather than withdrawn from the world, the \*Franciscans among the destitute, the \*Dominicans as teachers, preachers, and scholars. Monasteries were not only repositories of learning but, through the concept of loving one's neighbour, cared for the sick (though the soul remained pre-eminent over the body). A redemptive religion centred on Christ's mediation with God, one of Christianity's attractions in a time of poverty, illness, and the ever-present consideration of early death was its promise of an afterlife with justice or consolation; chantries, schools, and hospitals were frequently founded on earth to buy grace in heaven. Since the prospect of punishment was more dramatic than that of bland paradise—art and literature reveal vividly imaginative interpretations of hell—the threat of eternal damnation was used to enforce a prescription of ethics and attitudes suitable for differing social ranks. High days and holy days punctuated the seasons' calendar, marriage laws for the laity contributed to a form of social welfare, while a knight's fidelity to his lord and protection of the needy was echoed in the adoption of a new position of prayer (kneeling with hands together) resembling feudal homage. At the same time, depictions of Christ in majesty yielded to images of his crucifixion, to encourage devotion. By the 15th cent. explorers, merchants, and colonizers had started to spread Christianity beyond Europe, a

process that continued throughout the ensuing centuries. Empire-building not only involved colonization and growth of trade, but active and purposeful extension of religion; the cross followed the flag, sometimes vice versa. Nevertheless, with late 20th-cent. decolonization, Christianity, far from dying in these newly independent territories, became even more vigorous, especially in Africa.

The principal sacraments (or 'mysteries') recognized by all Christians, except \*quakers, are the eucharist and baptism. The eucharist or mass is the central act of most public worship as the re-presentation (*sic*) of Christ's last supper, death, and resurrection, symbolically feeding the faithful. Baptism is an initiation rite in which the use of water is an outward sign of death to the old self, washing, and fresh life; originally for converted adults, it is now usually administered to infants. Other sacraments, not universally acknowledged, are confirmation, marriage, ordination, confession, and anointing of the sick. Hymn-singing, preaching, reading of Scripture, and prayer form significant parts of worship. The Bible is an important primary written source for most Christians, taken literally by some, but regarded as no more than a history book, with all associated imperfections, by others. The greatest challenges to Christianity have been the doctrinal upheavals that led to the \*Reformation (and the English church's rupture from Rome) and \*secularism. The Census Report on Religious Worship (1851–3) caused alarm by its revelation that nearly 40 per cent of the population were unwilling or unable to attend a place of worship. While Christianity remains Britain's established religion at the start of the 21st cent., the challenge from secularism has grown, compounded by disillusion with organized religion, the increasing ethnic mix from immigrants with their own beliefs and practices, and a feeling that spirituality is lacking in a materialistic world. Appeals for improvement in moral values repeatedly call for a return to 'Christian' ethics. WMM; ASH

**Christian socialism.** See SOCIALISM, CHRISTIAN.

**Christmas.** Literally Christ-Mass, the liturgical commemoration of the birth of Christ. There is evidence of its observance on 25 December at Rome by the early 4th cent., and this date has remained the focus of the commemoration in the western, catholic, tradition ever since. There is no evidence to support the theory, which was seemingly first advanced by St Hippolytus (c. AD 170–c.236), that this was the actual birth-date of Christ. The choice was rather dictated by already well-established pagan celebrations on that day. In antiquity it was the winter solstice, celebrated as the birthday of both Sol Invictus and Mithras. In the Julian calendar, the solstice had fallen on 6 January, but because of its inaccuracy the date 'moved' back to 25 December. The other principal feast of the Incarnation, the Epiphany, which has the pre-eminence among orthodox Christians, is still celebrated on the old solstice, 6 January. Many of the features of modern Christmas, such as Christmas trees, cards, and boxes, are Victorian rather than earlier. JRG

**Church Army.** Founded in 1882 by the Revd Wilson Carlile, a 35-year-old Church of England curate in Kensing-

## church commissioners

ton, its organization was consciously modelled on that of the \*Salvation Army, even to the use of the military title of 'captain' for its officers. Like Booth's Salvation Army, Carlile's Church Army was dedicated to evangelism and social and moral welfare work among the poor and disadvantaged. A predominantly lay organization, including men and women, in recent years some members have been accepted for ordination. Carlile remained closely involved with the Church Army for sixty years, until his death in 1942. JRG

**church commissioners.** See ECCLESIASTICAL COMMISSIONERS.

**churches.** See ABBEYS; CATHEDRALS; PARISH CHURCHES.

**Churchill, Lord Randolph** (1849–95). An MP from 1874, Churchill was secretary to his father, the 7th duke of Marlborough, then lord-lieutenant of Ireland. After the Conservative defeat of 1880 he led a small ginger group known as the \*Fourth Party undermining the party leadership of \*Northcote. Contemptuous of the passivity and 'respectability' of the 'Old Gang', Churchill exploited the discontents of the neglected provincial associations in the National Union and claimed to speak for a 'Tory Democracy' derived from \*Disraeli: 'Trust the people.' Audacious in language and style, compulsively self-publicizing, Churchill was a young man in a hurry, perhaps knowing that syphilis would shorten his career. His deal with \*Salisbury in 1884, abandoning the National Union in return for admittance into the collective leadership, ended Northcote's chances of the premiership. Secretary for India in Salisbury's 1885 government, Churchill had Burma annexed. Though he flirted with Parnell's nationalists and pursued conciliation in Ireland, once \*Gladstone had proposed \*Home Rule Churchill hoisted unionist colours: 'Ulster will fight and Ulster will be right.' Chancellor of the Exchequer and leader of the Commons in 1886, he soon became impatient with cabinet colleagues and, seeking tactical alliance with \*Chamberlain's wing of the Liberal Unionists, he began to challenge Salisbury's leadership. When Churchill, frustrated over cutting the services estimates, offered a tactical resignation, Salisbury called his bluff and accepted. Though he said he had 'forgotten \*Goschen' (who took the Exchequer), rather he had underestimated the desire of those who mattered to rid themselves of a disruptive presence. Harassed by health and financial worries, Churchill never recovered politically. His marriage to New York heiress Jennie Jerome appeared, at least in public, to be a glamorous success. The biography published in 1908 by his son Winston, then a Liberal, celebrated Randolph as the frustrated hero of a democratic and radical Toryism: later historians have seen consistency in little but driving ambition. BIC

**Churchill, Sir Winston Leonard Spencer** (1874–1965). Britain's greatest prime minister, saviour of his country, inspiring orator, and winner of the Nobel prize for literature; Churchill was born at Blenheim palace in 1874, the elder son of Lord Randolph \*Churchill and grandson of the 7th duke of Marlborough. His mother was the American heiress Jennie Jerome. Educated at Harrow and Sandhurst, he served

with the 4th Hussars in Cuba, Malakand, Tirah, and Sudan (1895–8) and rode in the lancers' charge at \*Omdurman. Between 1899 and 1900 he was a war correspondent in South Africa, where he was captured by the Boers but escaped. He enjoyed wars and was the first prime minister since the duke of \*Wellington to have fought in battle. He saw active service in the trenches for a few months in 1916 and during the Second World War, when London was being bombed, confessed that he 'loved the bangs'. After 1945 his martial spirit was held against him and ill-founded accusations of war-mongering were made.

In 1900 he entered the House of Commons as a Conservative but crossed the floor within four years to join the Liberals on the issue of free trade. Returned as a Liberal at the next election, he gained his first ministerial experience under \*Campbell-Bannerman as under-secretary for the colonies. \*Asquith brought him into the cabinet at the age of 33 as president of the Board of Trade (1908) and moved him to the Home Office before he had reached the age of 35 (1910). By now Churchill had married Clementine Hozier (1908)—to whom he proposed four times before he won acceptance. She provided him with a stable emotional base for the rest of his life. Meanwhile, along with \*Lloyd George, he played a major part in laying the foundations of the \*welfare state by establishing labour exchanges and social insurance. His tenure of the Home Office, on the other hand, is remembered for the myth that he sent troops to Wales to crush the striking miners of Tonypandy (1910) and for his appearance at the siege of Sidney Street (1911).

In 1911 he became 1st lord of the Admiralty and a historical figure of significance for the first time. Completing the work of the recently retired Admiral \*Fisher, he replaced dreadnoughts with super-dreadnoughts, established a naval air service, and began the conversion of the fleet from coal to oil. In the words of historian M. D. R. Foot, 'the outbreak of war in 1914 found much the world's strongest fleet fully mobilised at its war stations, and able to exercise an international impact, which, over four and a quarter years proved decisive. It was as much Fisher's achievement as Churchill's, but neither could have achieved as much as he did without the other.'

Having the fleet ready was one of Churchill's contributions to the British war effort between 1914 and 1918. Another was the part he played in the development of the tank. However, he was remembered most of all for conceiving the 1915 Dardanelles campaign, designed to shorten the war by removing Turkey and allowing the western allies to link up with Russia. Approved by the war cabinet and given the half-hearted support of Fisher (who had been recalled in 1914 but who in Churchill's own words 'went mad' the following year), the attack on Gallipoli failed due to naval delays and the lack of troops to effect a surprise landing. In its wake, Asquith was forced to form a coalition with the Conservatives, who loathed Churchill as a renegade, and had him transferred to become chancellor of the duchy of Lancaster. Lacking any influence over the course of the war, Churchill resigned and took command of a battalion of the Royal Scots Fusiliers in France. A few months later he was recalled by Lloyd George to become minister of munitions,

although his influence on events remained minimal. Between 1918 and 1920 he was secretary of state for war and air, in which capacity he was responsible for running down the planned post-war Royal Air Force from 154 squadrons to 24, with only two for home defence. He was also responsible for ensuring that demobilization proceeded peacefully, a task which he fulfilled successfully. His attempts, on the other hand, to persuade his colleagues to overthrow the Bolsheviks in Russia were unsuccessful. Intervention did take place—to prevent allied stores falling into German hands—but Churchill had to organize the withdrawal of British troops. His true instincts, however, became well known and played their part in building up his image as an arch-enemy of the organized working class. The Tonypandy myth, plus his role during the 1926 \*General Strike, helped consolidate this reputation.

In 1921 he became colonial secretary and made a treaty with the \*Irish Free State. He also negotiated a peace settlement with the Arabs, advised by T. E. \*Lawrence. Although he opposed Lloyd George's policy towards the Turks, he gave his prime minister vociferous support over the \*Chanak crisis of 1922. When the coalition fell a few months later, he was defeated in the 1922 election and began work on his history of the First World War, the first volume of which was published in 1923 (it was completed in 1931). A friend quipped: 'Winston has written an enormous book about himself and called it *The World Crisis*.'

Returning to the Commons in October 1924, he was offered the chancellorship of the Exchequer by \*Baldwin and rejoined the Conservative Party. In 1925 he put Great Britain back on the gold standard, unfortunately at the pre-war parity of £1 = \$1, which was of little help to British exporters. Three years later he introduced the 'ten-year rule', whereby the service estimates would be prepared on the assumption that no war was likely for the next ten years. Meanwhile, he was only prevented from running down the navy as he had already run down the RAF by the threatened resignation of the entire Board of Admiralty. Even so, much of the grand fleet he had controlled before 1914 was broken up. In the General Strike of 1926, he took overall command of the government newspaper the *British Gazette*. This reinforced the hostility of organized labour towards him, but in fact he was not as bellicose against the miners as people assumed. Churchill's star, however, was set to wane. With the fall of Baldwin's government in 1929, he was out of office for the next ten years.

Churchill himself turned the 1930s into his wilderness years by choosing to wander in the political desert. His attacks on constitutional progress in India, inspired by a romantic vision of the India of his youth, and his defence of Edward VIII found little response among a British public used to the idea of independent dominions and determined not to have an American divorcee as queen at any price. Nor was Churchill able to capture the public imagination as the ideological foe of fascism. He admired Mussolini and sympathized with Franco during the Spanish Civil War. Finally, on the great economic questions of the day—unemployment, protection, recovery—he had little to say,

unlike Lloyd George, who in the words of A. J. P. Taylor 'produced a rich stock of creative ideas'.

In the 1930s, however, Churchill did take up the cause of resistance to Nazi Germany. There were many obstacles to this and British governments were all too well aware of them: pacifist sentiment after the First World War; belief in the \*League of Nations; sympathy for Germany's desire to rewrite the treaty of Versailles; not least, fear of the bomber. The Treasury in particular opposed rearmament, also with good cause: America's refusal to provide loans; war debts from the First World War; fear of inflation and the crowding-out of civilian investment; difficulties with management and labour if the economy had to be directed; a possible taxpayers' revolt; the lack of sufficient gold and foreign currency reserves to import both food and raw materials in wartime. After a year of war, Britain, it predicted, would be bankrupt. The chiefs of staff, for their part, advised that it would be impossible to fight a war on three fronts simultaneously against Germany, Italy, and Japan around the globe. Britain would simply lose. The Foreign Office, finally, asked just who our allies were going to be. America was neutral, the dominions unpredictable, and even if the Soviets could be brought in, an alliance with them might push Franco into the arms of the axis and close off the Mediterranean. The appeasers, therefore, had a good case. Churchill, on the other hand, was a sort of appeaser too. He did not believe that war was inevitable and knew that Hitler wanted Britain as an ally. However, he believed that a grand alliance against the dictator would make him moderate his plans, at which stage his grievances could be considered. If not, perhaps he could be overthrown before it came to war. But if Germany would not see reason, then war it would be. He envisaged that war, however, as one in which Britain would make her contribution with sea and air power. He thought a continental army a mistake.

When war came, Churchill returned to the Admiralty, although he acted as if he were already prime minister. Almost immediately he became involved in a madcap scheme to send an expeditionary force to Norway, ostensibly to help save Finland from the Russians, but in practice to cut off Swedish iron ore from the Germans. The lack of air cover, however, meant that the whole campaign was a disaster. Ironically, \*Chamberlain was blamed and Churchill became prime minister at the head of a national government.

As leader, Churchill was a mixture of ruthlessness and impetuosity. Concerned to do everything possible to win the war, in practice he had few means of doing so. Still, he did what he could, which meant the bombing offensive, plus the Mediterranean campaign. Determined to have action, he prodded and sacked his generals and made many mistakes—sinking the French fleet at Oran, invading Greece, defending Crete, neglecting the Far East. Yet his position as prime minister was secure, since he had become in the summer of 1940 the spirit of British resistance incarnate, defying the Nazis with speeches of supreme eloquence that reflected the emotional mood of the nation precisely. His real hope of victory depended on the entry of the USA, and when that happened, Churchill persuaded the Americans both to make Europe the primary theatre of the war

## Church in Wales

and to participate in the north African campaign. When Hitler attacked Stalin, he immediately offered aid to the Soviets, his only war aim being the destruction of Nazi Germany. Towards the end of the war, in October 1944, aware of US plans to send their troops home once the war was over, he signed the Percentages agreement with Stalin, dividing the Balkans into spheres of influence and saving Greece from communism.

As war leader, Churchill had little time for the home front. Nor was he much interested in post-war planning. When the *\*Beveridge Report* was published in 1942, he doubted whether a bankrupt Britain would be able to afford the welfare state which it envisaged. In any case, he had left domestic affairs to *\*Attlee* and his Labour colleagues, which proved a mistake. For it was to them that the electorate turned in July 1945 once victory had been secured over Germany. Churchill was still adored and respected, but the voters guessed that he was not the man for post-war reconstruction. As leader of the Conservative Party and of the opposition, on the other hand, he was more politically secure than he had ever been before in peacetime. His voice continued to be heard in international affairs and, just as he had warned against the rising threat from Hitler, he now warned against the 'iron curtain' which was descending over Europe. He also spoke out in favour of a united Europe, although he never meant that Britain should be part of it.

In 1951 he returned as prime minister. He was now 77 years old, had suffered two strokes, and would suffer two more. Yet his government was highly successful. *\*Eden* shone as foreign secretary, *\*Macmillan* built a record number of council houses, and nothing was done to undermine the welfare state, inherited from Labour. Churchill attempted to arrange a summit conference with the Soviets after the death of Stalin in 1953, but Eisenhower would hear none of it. He in turn rejected Eisenhower's request the following year to involve the British in Vietnam to save the French. In April 1955 he agreed to retire as prime minister, completing a career without equal among democratic politicians. He was Father of the House of Commons when he gave up his seat in 1964 and died the following year. Churchill was given a state funeral, and buried in Bladon churchyard on the Blenheim estate. No attempts to revise or belittle his reputation have yet proved successful. AS

Gilbert, M., *Churchill: A Life* (New York, 1991); Sked, A., and Cook, C., *Post-War Britain: A Political History, 1945–1992* (Harmondsworth, 1993).

**Church in Wales.** The Church in Wales as an autonomous province within the Anglican Communion came into being in 1920, when, on 31 March, the Act of 1914 disestablishing the Church of England in the principality came into force. The four ancient Welsh dioceses of Bangor, St Asaph, St David's, and Llandaff became a self-governing church, with the bishop of St Asaph, Alfred George Edwards, as the first archbishop of Wales. The 1914 Act, among other provisions, deprived the Welsh bishops of their seats in the House of Lords, and abolished private patronage. All endowments given to the church before 1662 were taken from it. Since 1920 there has been no established church

in Wales; legally, all denominations have equal status. The Anglican church in Wales elects its own bishops, and manages its own affairs through an elected governing body of clergy and laity, and a representative body in which its property, including church buildings, is vested. The Disestablishment Act had been vehemently opposed by many—but not all—Anglicans in Wales, but was supported by the majority of free churchmen. JRG

**Church Missionary Society.** Founded in 1799 for missions in Africa and the East, the society became the Church of England's first effective body for such work despite far earlier establishment of the *\*Society for Promoting Christian Knowledge* and the *\*Society for the Propagation of the Gospel*. Consistently evangelical in its theology, it pioneered extensively throughout the world and continues to sponsor Bible translations. ASH

**Church of England.** Though, as an Erastian institution, the Church of England dates only from the 16th cent., *\*Christianity* in these islands originated with merchants, administrators, and soldiers in 2nd- and 3rd-cent. Roman Britain. *\*Alban* was martyred in the 3rd century and three British bishops were present at the Council of Arles (314), but the 5th-cent. Anglo-Saxon invasions virtually obliterated all trace of Christian presence, leaving a remnant in Wales whence Ireland and southern Scotland were converted. The present English church dates from the reintroduction of this Celtic Christianity into Northumbria by *\*Aidan* (635) and Roman Christianity into Kent by *\*Augustine* (597). After the union of these two streams at the Synod of *\*Whitby* (664), *\*Theodore* of Tarsus, archbishop of Canterbury, restructured the church to form the basis of the medieval ecclesiastical system. Though medieval kings exercised considerable authority over the church, it was the break with Rome (1534) which fully established royal supremacy, from which date the established Church of England (*Ecclesia Anglicana*) can be said to exist. The Act of *\*Supremacy* (1534) declared Henry VIII to be 'the only supreme head of the Church' in place of the pope, which Elizabeth's Act (1559) moderated to the less offensive 'Supreme Governor'.

Apart from this the church remained legally and administratively much the same. The church courts and their penalties, diocesan administrative systems, the authority of bishops and archdeacons all continued. The non-monastic cathedrals—those of the old foundation—survived as before with the same legal standing and statutes. Only those which since Anglo-Saxon times had been monastic were perforce given revised constitutions. Ecclesiastical law remained as before. Though now under royal control the *\*convocations* of Canterbury and York survived. Even crown appointments to bishoprics and cathedral deaneries showed little change, for royal nomination by *congé d'élire* and letters dimissory had been the norm until the late Middle Ages; even then 'the royal will was the final factor'. The church after Henry VIII was thoroughly Erastian, its officials little more than agents of the crown. Indeed post-Restoration clergy were also agents of royalist propaganda, parsons thundering from their pulpits the doctrines of *\*divine right*, *\*non-resistance*,

and passive obedience. Every church building had to display the royal coat of arms on the chancel arch in place of the rood. All licensed Anglican clergy and ordinands still take the loyal oath and licensed clergy have the right to administer marriage recognized by civil law without a civil registrar's presence. Though the last prelate holding senior political office was John \*Robinson, bishop of London (1713–23), 18th-cent. episcopal appointments were a powerful means of government patronage, for the 26 bishops in the House of Lords, though sometimes breaking free, normally supported the government. More recently Archbishops \*Tait and \*Davidson in particular had substantial political influence, the latter, for instance, in the passage of the Parliament Act (1911). Though today there are 43 diocesan bishops, only 26 sit in the Lords where they try to represent the multi-cultural spiritual and ethical dimension of national life.

Though Henry VIII made virtually no theological or liturgical break with the past, there was under Edward VI a considerable influx of continental reform and liturgical innovation from Bucer, Zwingli, and Calvin. After a brief reversion to papal catholicism under Mary, the church moved towards a comprehensive settlement under Elizabeth. Enshrined in the Acts of \*Supremacy and \*Uniformity, the \*Book of Common Prayer and the \*Thirty-Nine Articles, this attempted to reconcile the diverse shades of English opinion. Provided citizens fulfilled the royal injunction to weekly church attendance, there was to be no test as to conscience, 'no windows into men's souls'. Episcopacy and royal supremacy marked the boundaries—presbyterianism and adherence to Rome were unacceptable. Most accepted, but minorities existed, some still adhering to Rome, others, though not yet schismatic, to presbyterianism or more extreme protestant views. Elizabeth and her first archbishop, Matthew \*Parker, used strict liturgical uniformity to mask theological differences between catholic and Calvinistic wings within the church. After the heyday of the sects in the \*Interregnum (1649–60), compromise became impossible. Moderate presbyterians' offer of limited episcopacy fell on deaf Anglican ears; instead, the Restoration settlement refused to recognize those already ordained non-episcopally, and demanded tests. A thousand incumbents were ejected—and thus became \*nonconformists. From that time the church ceased to be the church of the whole nation.

Nevertheless a distinctive Anglican theology had already sprung up. The writings of John \*Jewel (*Apologia Ecclesiae Anglicanae*, 1562) and Richard \*Hooker (*Of the Laws of Ecclesiastical Polity*, 1593–7) demonstrated that *Ecclesia Anglicana*, in attempting a return to the early church before its infection with medieval accretions, was both 'catholic and reformed', appealing to the Scriptures, the early fathers, and reason. Seventeenth-cent. Caroline divines including Lancelot \*Andrewes, John Cosin, George \*Herbert, Jeremy \*Taylor, and Nicholas Ferrar, through their personal sanctity, scholarship, and poetry, built on this foundation. The Prayer Book and the King James Bible became part of English culture.

After 1689 church life remained turbulent but settled down from 1714. Eighteenth-cent. ecclesiastics' reputation

for idleness and rationalist indifference is undeserved. Modern research reveals that bishops and clergy were far more committed to their charges than hitherto supposed. Nor were they mere political hacks. Nevertheless liturgically the church was deadening. Medieval ecclesiastical corruption did not prevent the mysterious action of the medieval mass from touching the hearts of the humblest of men. Eighteenth-cent. Prayer Book liturgy and weighty preaching was another matter—too cerebral and unsuited to a mainly illiterate, uneducated people, about whose absence from, or misbehaviour in, church we often read in church court records. The preaching of the \*Wesley brothers thus fell on ready ears, but it was to the church's shame that these two devoted Anglican priests, both high churchmen, and their followers were rejected. Enthusiasm was dangerous, leading to fanaticism.

Though there is evidence of both evangelical and Caroline high-church strands in the 18th cent., the full \*evangelical revival spilled over into the 19th cent. and, with the \*tractarian movement, invigorated church life. Evangelicalism following in the Wesley tradition produced many of note, clergy like Fletcher, Newton, and \*Simeon and leading laymen such as \*Wilberforce and \*Shaftesbury. Tractarianism, led by \*Keble, \*Newman, and \*Pusey, initially traced Anglicanism's traditions back to Augustine, but developed later into a powerful movement to restore fully the church's catholic wing. By 1900, in the shape of \*Anglo-catholicism, it became increasingly ritualistic and caught the imagination and the hearts of the newly developed urban working class.

As the British empire spread throughout the world by commerce and the sword in the 18th and 19th cents., the church followed—or in some cases with its missionaries led the way. Two overseas dioceses in 1800 increased to 72 in 1882, and to 450 dioceses (in 28 provinces) in the 1990s. The *Ecclesia Anglicana* from having been merely the church of the English people became a world-wide communion of many nations and tongues. The archbishop of Canterbury, as St Augustine's successor, was not just 'Primate of all England' but came to hold a universal primacy of honour, 'a presidency of maturity and affection', though without authority. To provide cohesion and consensus, initially over the \*Colenso affair, the first Lambeth conference with 67 bishops met in 1867, to be followed at \*Tait's inspiration by the second in 1878. Tait and his successors kept increasingly frequent contact with the overseas churches. The archbishop still presides at the Lambeth conference each decade, and continuity is provided since 1968 by the Anglican Consultative Council and primates' meetings. \*Davidson was the first archbishop to visit the Church abroad—in Canada and the USA (1904). It is now part of the archbishop's quasi-patriarchal role to visit provinces world-wide. Commonly held Anglican principles are enshrined in the so-called Lambeth Quadrilateral (1888)—the Scriptures, the creeds, the historic episcopate and threefold ministry, and the sacraments.

Twentieth-cent. liturgical scholarship deeply affected all Christian denominations; Anglicanism is no exception. Recent liturgical modifications have meant that, with each

## Church of Ireland

Anglican province making its own modifications, the 1662 Prayer Book is no longer the global cohesive symbol. After England's attempt to produce a revised prayer book (1928) was foiled by Parliament, the Synod 50 years later introduced an *Alternative Service Book* 1980, providing services in modern English, embodying the fruit of liturgical study. Though worship is now closer to that of the early church and to modern practice in other denominations, the new forms have lost linguistic beauty, regarded by some as essential for true worship.

Because all religious orders were disbanded at the Reformation, there were no monasteries, convents, or friaries until the restoration of the catholic hierarchy in the 19th cent., except for Nicholas Ferrar's short-lived 17th-cent. Little Gidding community, but the \*Oxford movement spawned several Anglican religious orders in the monastic tradition, such as the Cowley Fathers (SSJE), Mirfield, and Kelham, while the Society of St Francis, founded in the 1920s, follows the Franciscan tradition, working in the Third World and in British inner cities.

Twentieth-cent. developments included women's ordination to the diaconate and the priesthood (in England 1987 and 1994), making the Anglican church the first episcopal church to take this step. Ecumenism, so much a part of 20th-cent. church life, has extended to dialogue with non-Christian faiths, which are now prominent in the English scene.

Though its regular practising members are fewer than the catholics, the *Ecclesia Anglicana* with its unique liturgical, musical, and architectural heritage is still the church of the nation. Through its parish system all citizens have a church building and the ministry of a parish priest. All citizens in a real sense belong, whatever their threshold of belief, and whether or not they are practising members. Today with regular church-going at 7 per cent (Church of England 2.4 per cent, in all UK 2.9 per cent), but with 70 per cent believing in God, the ubiquitous church building in village or city, together with mosque, synagogue, and temple, is sacramental, a vital outward and visible sign of the spiritual dimension of man's existence. Quite by chance in its creation as a 'catholic and reformed' national church, the Church of England happens to be pivotal between Roman catholic and eastern orthodox churches on the one hand and protestant reformed churches on the other. Its diversity under a cloak of uniformity, though apparently a weakness, is also its greatest strength, recognizing as it does disparate, but equally valid, paths to God, hints of which appear as early as New Testament times.

WMM

**Church of Ireland.** Building on 4th-cent. traces, \*Patrick evangelized Ireland (c.432) and developed a distinctively Celtic Christianity, but with the partial Anglo-Norman conquest of Ireland the church again joined mainstream western Christendom. Though Henry VIII established the Church of Ireland after his Irish break with Rome (1536), the Reformation was less popular than in England. Despite parliamentary suppression of the monasteries (1537), they continued in Gaelic areas, friars pursued their ministry, and Jesuits arrived (c.1545). Elizabeth's Irish Parliament (1560),

after hastily, but reluctantly, passing Irish Acts of Supremacy and Uniformity, was as hastily dissolved. The Reformation largely failed. Gaelic, which most Irishmen spoke, was forbidden in worship and the established church was inextricably associated with the colonizing offices of state. After 1580 missionary priests poured in, but Anglo-Scottish colonization of Ulster (c.1610) made it the bastion of protestantism, \*Ussher's 104 Irish Articles (1615) were Calvinistic in ethos and \*Cromwell further antagonized Irish opinion by confiscating catholic land and allowing protestants economic predominance. Despite the spirituality of some, such as Jeremy \*Taylor, the established church was increasingly associated with colonization, unpopular, and lacking vibrant spirituality. William III's promise of toleration (1691) was a dead letter until 1791. After the Anglican archbishoprics were reduced to two and bishoprics by eight (1833), the church, always predominantly evangelical, was disestablished (1869). Today with two archbishoprics and twelve dioceses, it has a total membership (1990) of 437,000 (340,000 in the North and 97,000 in the Republic).

WMM

**Church of Scotland.** The church claims continuity from \*Ninian and \*Columba. Although the Scottish Reformation's first impact was \*Lutheran, the return of John \*Knox from Geneva in 1559 led to the Church's reconstruction on \*presbyterian lines, a process not completed until 1690. In between kirk and crown battled as to whether Scotland's ecclesiastical system should be presbyterian or \*episcopalian. Presbyterianism was advanced by the first \*General Assembly (1560), the first presbytery (Edinburgh 1581), agreed by the monarch (1586) and ratified by Parliament (1642). Its popular status was affirmed by the National Covenant (1638), the \*Solemn League and Covenant (1643), and the \*Westminster Assembly (1643–52). Episcopalianism was advanced by the Stuart monarchs' steady preference, the imposition of the Prayer Book (1637), and the restoration of episcopacy (1660). The conflict was intensified by the assassination of Archbishop \*Sharp of St Andrews (1679), and resolved by the revolution of 1688: all ministers must subscribe to the Westminster confession. In the 18th cent. the now dominant church was weakened by secession; and the growth of two parties, one favouring the rights of patronage in ministerial settlements, the other favouring congregational rights, led to the \*Disruption of 1843, and the formation of the \*Free Church. Thereafter a pattern of reunion developed, although each one also resulted in a remnant. The secession and relief churches formed the United Presbyterian Church in 1847; the United Presbyterian and Free Churches became the United Free Church in 1900. At the same time patronage was abolished (1874), there was a significant liturgical revival, and the Church of Scotland Act (1921), which explicitly declared the church's spiritual freedom, paved the way for union with the United Free Church (1929), in the context of an establishment purged of what had fuelled earlier secessions. The General Assembly was now equally composed of ministers and elders, and women were admitted to both eldership (1966) and ministry (1968). If the church's membership accounted for under a

quarter of the adult population by the 1990s, its cultural impact on the nation remained profound. CB

**churchwardens** are representatives of the parish meeting or the vestry, generally assisted by sidesmen. From the 12th to the middle of the 16th cents. churchwardens were primarily responsible for providing and maintaining all that was necessary for public worship in their parish church or chapel. A subsidiary duty was that of presentment to the ecclesiastical courts of moral misdemeanours of the laity and clergy of the parish. From the mid-16th to the 19th cents. churchwardens were also civil officials with duties as various as providing arms for soldiers, poor relief, and vermin control. Until 1571 churchwardens were elected by the whole parish, and after that time it was usual for the parish to elect one warden and the minister the other. Their accounts, which were presented annually to the parish meeting, are a major source of information about parish life. LR

**cinema** was the most influential mass medium in the first half of the 20th cent. In world terms, British cinema has never been regarded highly, constantly overshadowed by Hollywood, and with only the occasional international breakthrough, such as producer Alexander Korda in the 1930s, Ealing films in the 1950s, and the James Bond films in the 1960s.

Only in non-fiction has British cinema been a world-leader, with John Grierson pioneering the documentary film with *Drifters* (1929) and his subsequent work with the Empire Marketing Board and GPO Film Unit. Though hailed as a major contributor to the art of cinema, Grierson's reputation has been dented by recent criticisms of the documentary movement's paternalistic, middle-class ideology—with the honourable exception of Humphrey Jennings, whose portraits of Britons at peace and war (*Spare Time*, *Listen to Britain*) have been elevated to classic status.

Recent research has unearthed a more authentic British people's cinema in the workers' film movement, a network of proletarian film groups documenting the struggles of the inter-war years under the influence of Soviet revolutionary cinema. Most recent work on British cinema history has moved away from attempting to champion British films in world terms, or from elevating directors to a pantheon of 'auteurs'. Only a few directors, such as Alfred Hitchcock, Anthony Asquith, David Lean, Carol Reed, Michael Powell, and American Joseph Losey, could lay claim to a 'personal artistic vision' within British cinema.

Instead research has concentrated on Britain's previously unexplored mainstream commercial fiction cinema, looking at popular genre films such as horror, war, and comedy (the *Carry On* and *Doctor* series); at the industry, studios, and financial organizations which produced and distributed them; at institutions such as the British Board of Film Censors which influenced them; at the stars who acted in them; and at the mass audiences who enjoyed them—a complete map of the social, cultural, political, and ideological contours of British cinema as a whole.

Studies of the most popular stars of the 1930s, Gracie Fields and George Formby, reveal their films as aspects of ideological struggle for the consent of the working class,

with a vision of imaginary national unity 'magically' resolving the problems of the depression. The role of cinema in constructing a united nation is even more explicitly revealed in the films of the Second World War, under the more obvious propaganda influence of the Ministry of Information.

Cinema of the late 1940s and early 1950s reveals, most famously, Ealing films projecting Britain and the British character in the new era of austerity and Labour-Conservative welfare consensus; less obviously, Gainsborough's 'women's pictures' (*The Wicked Lady*) show deep-rooted male fears of women's wartime liberation.

Similar psychoanalytic critical methods applied to Hammer horror films of the 1950s reveal social fears and repressed sexuality translated into fictional vampire narratives. James Bond films of the 1960s incorporate themes of male sexual doubts, Cold War conflict, and Britain's declining imperial power in the creation of a mythical spy superhero. A more obvious reflection of changing British social attitudes to sex, race, class, rebellion, and youth is evident from the 'New Wave' films of the late 1950s and early 1960s (*A Taste of Honey*), and the 'Swinging London' films of the mid-1960s (*Alfie*). The dramatic decline in cinema attendance during the 1960s, following the spread of television, was halted in the 1990s and considerable recovery effected. Nevertheless, the towns of Britain are littered with old cinemas, now serving as supermarkets, warehouses, or bingo halls. See FILM INDUSTRY. DJA

**Cinque Ports.** A maritime confederation in Kent and Sussex, and the nearest England ever came to having an urban federation of the continental kind. Their privileges from the crown, in return for naval service, go back at least to the 12th cent., and they remained a formidable maritime power until Tudor times. The original 'Five Ports'—Hastings, New Romney, Hythe, Dover, and Sandwich—were later joined by Rye and Winchelsea, and other lesser ports were included as 'limbs' or members. Most of their special jurisdiction was abolished in 1855, but the office of lord warden remains a distinguished honour in the gift of the sovereign. DMP

**Cintra, convention of,** 1808. Concluded on 30 August after a British victory over the French at \*Vimeiro early in the Peninsular War. Though it was in Britain's interest to conclude a treaty, the terms negotiated by Sir Hew Dalrymple, commander of the British forces, were ridiculous. All French troops, equipment, and loot were to be transported back to France in British ships and no guarantee was exacted to prevent them returning to Spain. The news of the treaty caused uproar in London and led to an official inquiry, which relieved Dalrymple of his command. RAS

**Cirencester.** *Civitas-capital* of the \*Dobunni, Corinium grew to be one of the most considerable towns of Roman Britain. Probably replacing the late Iron Age *oppidum* at Bagendon 3 miles to the north, the town developed on the site of two successive forts on \*Fosse Way. The large, early 2nd-cent. forum/basilica complex lay at the centre of the town beside a large enclosure, possibly religious. On the western side of the town was an earth and timber amphitheatre.

## Cistercians

theatre and a possible theatre lay at the northern end of the town. In the later 2nd cent. defences were constructed enclosing 240 acres, appreciably more than the built-up area of the street-grid. Originally these consisted of stone gates linked by earthwork, in the 3rd/4th cents. the latter fronted by a stone wall. A 4th-cent. inscription mentioning a *Rector* (governor) of Britannia Prima, one of the four late Roman provinces of Britain, suggests that Cirencester may have been a provincial capital. The town had a number of large houses of the 2nd to 4th cents. Many contained fine mosaics such as the 2nd-cent. examples from under modern Dyer Street. In the 4th cent. Cirencester may have been the base for a 'school' or *officina* of mosaicists serving the Cotswold region. Though there is no evidence for occupation after c.400, Cirencester is one of three former Roman towns mentioned in the *Anglo-Saxon Chronicle* entry for 577. ASEC

**Cistercians** (or 'white' monks) were a monastic order established in 1098 by Robert of Molesme at Cîteaux (Burgundy) in reaction to the perceived laxity of contemporary \*Benedictine monasticism. Their constitutions aimed at a literal observance of the Benedictine rule, and included the rejection of many types of revenue, including the possession of churches and manorial dues. Their estates were organized in self-contained 'granges' staffed by lay brothers ('conversi') who, while not monks, followed a rule and wore a distinctive habit. Early Cistercians owed much to contemporary eremitical practice and their administration, codified as the 'Carta caritatis' ('Charter of Love') during the abbacy of the Englishman Stephen Harding, by 1119, provided a clear command and disciplinary structure, articulated through annual visitations of daughter- by mother-communities. After initial difficulties the Cistercians enjoyed phenomenal success, particularly during the life of St Bernard, who entered Cîteaux in 1112 and was abbot of its daughter house of Clairvaux from 1115 till his death in 1153. By then c.300 abbeys had been founded across Europe (and in the crusading states), and though attempts were made in 1152 to limit new foundations there were c.530 houses by 1200. Thereafter the tide slackened and, though the Cistercians continued to influence other monastic groups, benefactions declined.

In England and Wales the first abbey was founded at Waverley (Surrey) in 1128, followed shortly afterwards by \*Tintern and \*Rievaulx. By 1152 there were about 40, as well as communities in Scotland (such as \*Melrose) and Ireland. Moreover, there were several nunneries following Cistercian customs, as well as thirteen abbeys of the order of Savigny which were taken over by Cîteaux in 1147. In the later Middle Ages Cistercian influence declined, though there were a few new, urban foundations (e.g. at Oxford and London). Their economy underwent drastic changes following the \*Black Death. BJG

**Ciudad Rodrigo, battle of**, 1812. The fortress of Ciudad Rodrigo was a strategic stronghold near the Portuguese-Spanish border held by a French garrison of roughly 2,500 men. In early 1812, \*Wellington with 35,000 men marched through snow and laid siege to it. By 14 January the artillery

and engineers had breached the walls in two places. On the morning of 19 January a fierce assault was launched and after heavy fighting the fortress was taken by storm. The British lost some 900 men killed and wounded including Generals Craufurd and Mackinnon. However, Wellington captured 153 heavy guns and gained a vital frontier gateway into Spain. RAS

**civil law.** The term has two meanings:

1. It is used as synonymous with Roman law, or with the Roman law tradition, which was accepted in most countries of Europe. The classical Roman law was the universal law and legal system of the Roman empire. With the fall of the Roman empire, the Roman or civil law which survived was heavily influenced by custom. Thus Roman law came to have two aspects—the pure classical Roman law and the bastardized Roman customary law which applied in the many barbarian and post-barbarian societies of western Europe. The codes of Roman law which most influenced western Europe were the code of Theodosius, and Justinian's *Corpus juris civilis*. These codes were much studied in the universities of Europe—especially in Italy where the first European law school was established in the 12th cent., at Bologna, the home of Irnerius, Azo, and Vacarius, who travelled from Bologna to Oxford and who influenced \*Bracton. In the 13th cent. Accursius and Bartolus and his followers, as a reaction to the sophistication of the glossators, emphasized the practicalities of custom and conflict of laws. A further revival of Roman law took place in the 16th cent. in the University of Bourges under Cujas (1522–90) as part of the Renaissance and the revival of pure classical learning.

English law was undoubtedly influenced by civil law, though it never 'received' or adopted Roman law. There was little evidence of survival of Roman law from the Roman occupation of Britain, but the Norman Conquest brought England close to continental traditions, especially through the influence of \*canon law. Further, \*Lanfranc, William's first archbishop of Canterbury, had taught in the law school at Pavia before founding the school at Bec and coming to England. \*Anselm and \*Theobald, two more archbishops, were also from Bec and strongly versed in civil law and canon law.

The author of \*Glanvill clearly had a sound grounding in Roman law, though the book makes it clear that English law is by no means the same. \*Bracton is commonly acknowledged to be heavily influenced by Roman law, though it has been disputed whether he was deeply imbued with Roman law ideas or merely using Roman principles to construct a synthesis of the emerging English common law. The great movement known as the Reception, under which many countries in Europe adopted the Roman civil law, passed England by, and although civilian ideas and procedures affected English law through the conciliar courts, including the courts of \*Chancery and \*Admiralty, and although later lawyers looked to Bracton and Britton for guidance and inspiration, civil law was never a serious threat to the common law in England. However, both through the canon law and through the interest of common law judges in civil law from time to time, Romanist ideas have been an undoubted

if minor influence on the substantive law of England and Wales.

2. The other meaning of civil law is as distinct from criminal—i.e. the law relating to the adjustment of legal disputes between individuals, as distinct from those matters where the state takes responsibility for dealing with conduct which is against the interests of society and which is therefore pursued and punished by that society. The common law was mainly civil law since the work of the courts of common law was primarily the development of the writ system to enable individuals to litigate in the king's courts.

MM

**civil list.** The civil list is the grant made by Parliament for the monarch's personal support and for that of the household, and has frequently proved controversial. It was started in the reign of William and Mary and fixed at £700,000 p.a., out of which the monarchs had to pay pensions and salaries. \*Walpole's desire to retain office in 1727 led to George II receiving an extremely generous settlement, since his income rose as trade increased. George III, young and inexperienced in 1760, agreed to a fixed sum of £800,000 p.a.—a 'most disastrous step', according to his biographer, since the growth of the royal family soon eroded the value of the grant and made repeated and embarrassing applications to Parliament necessary. The influence of the crown diminished accordingly. Although in later reigns pensions were dealt with separately, the civil list continued to provoke criticism. Victoria, a secluded widow for many years after Albert's death in 1861, spent very little and was repaid with a pamphlet entitled *What does she do with it?* It was presumed that vast savings were being transferred to the private purse. Edward VII and George V were given a basic £470,000 p.a. but post-war inflation in the 1960s brought the issue to the surface again in the reign of Elizabeth II. A select committee in 1971 recommended that any savings should return to the public purse and that there should be regular reviews of the civil list award. In the 1980s and 1990s there were persistent complaints that too many members of the royal family were supported at the taxpayers' expense.

JAC

**civil service.** Despite repeated campaigns to reduce numbers, the civil service remains one of the great growth areas of modern Britain. In the 17th cent. the civil service—i.e. persons directly employed by the government—was tiny. The royal household, it is true, numbered some 2,000 persons, but that included 210 Yeomen of the Guard, 55 gentlemen pensioners, together with cooks and porters, who were not civil servants in the modern sense. The two secretaries of state had a staff of about fifteen—four clerks of the signet, a French and a Latin secretary, a German translator, and between four and eight junior clerks. There was no career structure, posts were filled by patronage, and remuneration was by fees rather than salary. When the two secretaries of state were divided into foreign and home in 1782, the Home Office began with two under-secretaries, a chief clerk, ten other clerks, and some domestic staff. The Rockinghams began, and Pitt continued, a campaign of economical reform, and sinecures were snipped away, but the persistent

warfare from 1793 led to further increases in numbers, particularly in the revenue and in naval administration.

The growth of the civil service in the 19th cent. was steady and moderate and hardly kept pace with the rise in population. In 1815 there were 25,000 civil servants; 39,000 by 1851; 54,000 by 1871; and 79,000 by 1891. Some reforms were introduced piecemeal by departments. In the Treasury, North had launched the concept of promotion by merit (1776), Shelburne had inaugurated fixed salaries (1782), and in 1805 an assistant secretary was appointed, the forerunner of the permanent secretary. A comprehensive review waited for the Northcote–Trevelyan Report of 1854, which recommended a division of labour between graduate policy-makers and humble administrators; entry by competitive examination; transfer between departments; and promotion by merit based on assessment. The proposals were implemented piecemeal, though a Civil Service Commission, to supervise recruitment, was set up at once in 1855.

The vast expansion of the civil service in the 20th cent. is not easy to calculate, since definitions are troublesome and one commentator has referred to the 'statistical conjuring tricks'—e.g. recategorizing thousands of civil servants—to give the impression that numbers are falling. The biggest growth has been in welfare and education services, beginning in the first decade of the century. By 1939 the numbers had risen to 387,000 and by 1979 to 730,000. These developments were accompanied by further reports. \*Haldane in 1918 was concerned that senior civil servants had little time to think, though the proposals were modest. Plowden in 1961 complained that the Treasury had no adequate system for forecasting or controlling expenditure—a rather worrying observation—and the Fulton Committee in 1968 deplored the survival of the cult of the amateur gentleman, the generalist, and called for the expert or specialist: 'the cult is obsolete at all levels.' One consequence was the establishment of a Civil Service College in 1970 to conduct research and training.

Among other criticisms, it has often been suggested that the senior civil servants really run things and can frustrate the plans of all but the most determined of ministers—a view reinforced by the popular television series *Yes, Minister*. Generalization in so wide and imprecise an area is hard, but an equally cogent view is that the upper civil service has been too subservient to party whims and ideologies—what is sometimes known as the 'grovel factor'. Neutrality of the civil service is a concept readily conceded, but practice is more difficult, and the line between warning and frustrating, concurring and encouraging, is not easy to establish.

Though the public image of the civil servant may remain a pin-striped bowler-hatted Whitehall mandarin, most civil servants work outside London and half of them are women. Of the non-industrial civil service, the large employers are the Ministry of Defence, the Department of Social Security, the Board of Inland Revenue, the Department of Education and Employment, the Department of the Environment, the Home Office, and Customs and Excise.

JAC

**civil wars, 1642–51.** Armed conflict between king and Parliament, which also involved invasions of Ireland and Scot-

## civil wars

land by parliamentary armies. The early Stuart monarchy was hobbled in two critical respects. Without a standing army or paid bureaucracy, it lacked the power to coerce its subjects. Without adequate income from legal sources (including parliamentary taxation) it lacked financial power. James I and Charles I attempted to augment their income by raising customs duties, levying forced loans, exploiting feudal fiscal privileges, and inventing a new form of non-parliamentary taxation—ship money. Although Parliament was, if anything, growing weaker during the decades prior to 1640, unparliamentary taxation, arbitrary arrest, and other Stuart high-handedness caused resentment and alienation among large segments of the nobility, gentry, lawyers, and merchants who comprised the political nation. A significant minority of these classes had imbibed puritan and common law doctrines that stiffened their defiance towards the absolutist pretensions of the king.

In 1629 Charles I dismissed Parliament, resolving never to call another. He might have succeeded but for the problem of the multiple kingdoms. During the 1630s he decided to bring Scottish religious practice into conformity with English by abolishing presbyterian worship and substituting an Anglican service. The Scots revolted, and Charles's two attempts to subdue them—the \*Bishops' wars of 1639 and 1640—were abject failures. Tax revenues dried up and his soldiers deserted in droves. At the insistence of the nobility he summoned Parliament. Once convened, the Commons refused him the taxes he desperately needed, voting assistance to the Scots instead. They then set about dismantling the apparatus of prerogative government, abolishing ship money, the courts of \*Star Chamber, \*High Commission, \*Wards, and others; passing a Triennial Act, depriving church courts of their punitive powers, and attainting Charles's chief minister \*Strafford. Charles ratified these changes, but with such ill grace that many doubted whether he would keep his word. Trust became a critical issue upon the outbreak of rebellion in Ireland in the autumn of 1641. As lord-lieutenant of Ireland, Strafford had ruled with a heavy hand. His absence, added to Charles's failure to guarantee the catholic inhabitants security of tenure on their estates, and fear of the resurgent strength of puritanism in the English Parliament, combined to ignite an uprising in Ulster which rapidly spread. Exaggerated reports of atrocities perpetrated against the protestant settlers in Ireland inflamed English opinion. It was universally accepted that an army should be mustered to crush the rebellion, but there was no agreement about entrusting the king with the command. Charles's attempt to arrest five of the parliamentary ring-leaders whom he suspected of plotting to impeach the queen, together with the rumour that he had actually authorized the Ulster catholics to rise in rebellion, contributed to the deepening distrust of him. Parliament's demand for control of the sword, and Charles's refusal, was the immediate cause of the outbreak of armed conflict in the autumn of 1642.

Mistrust of the king was compounded by fear that he could not be counted on to defend England against the threat of international catholicism. Far from being a protestant champion, Charles was regarded by many as a crypto-

papist. Thus legal and constitutional arguments about taxation, the rights of Parliament, and the extent of royal power were inflamed by religious panic. Religion more than any other single factor brought thousands of men to rally to the standard of either king or Parliament, to risk their lives, and to 'sheathe their swords in [their countrymen's] bowels'.

If the civil wars were in one sense Europe's last wars of religion, they were also in their early phase a baronial conflict. The armies on both sides were led by aristocrats, and in the king's view it was the nobility, particularly \*Essex, 'the chief rebel', who had instigated the Civil War.

Despite its control of the midlands, the east, and the south-east including London, as well as its capture of the navy, there was nothing inevitable about Parliament's victory. Charles almost overthrew his foes at \*Edgehill (October 1642), while in 1643 there were a number of royalist victories and a drawn battle between the king's and Essex's armies at \*Newbury (September 1643). For all the efforts of John \*Pym to hold together the parliamentary coalition and to finance the war with new excise and assessment taxes, parliamentary fortunes reached their nadir in that year. Popular demand for an end to the war became increasingly insistent.

What turned the tide against Charles I was again the reality of multiple kingdoms. In return for a promise to uphold presbyterian church government and impose it in England, the Scots came to Parliament's aid with an army of 20,000. This bargain was sealed in the \*Solemn League and Covenant of 1643, and the Scots army entered England early in 1644. The joint armies dealt a crushing blow to the king's forces under Prince \*Rupert and the earl of Newcastle at \*Marston Moor, near York (July 1644). However, this victory was almost frittered away by Essex when he allowed his army to become trapped by Charles at \*Lostwithiel in Cornwall (September 1644). Completely disenchanted with the aristocratic leadership of Parliament's armies, the win-the-war faction under Sir Henry \*Vane and Oliver \*Cromwell grasped the nettle, by purging the armies of their noble and parliamentary leadership, and creating the \*New Model Army out of the remains of the armies of Essex, \*Manchester, and \*Waller. Led by Sir Thomas \*Fairfax, and knit together by constant pay and religious indoctrination, this new army quickly put the royalist forces to flight at \*Naseby (June 1645), \*Langport (July 1645), and Bristol (September 1645). By May 1646 most royalists had surrendered and Charles had handed himself over to the Scots.

Refusing to accept the verdict of the battlefield, Charles dragged out peace negotiations with Parliament. Meanwhile, Denzil \*Holles and Sir Philip Stapleton, the political heirs of Essex, who had died in September 1646, moved to disband the New Model with only a fraction of its arrears of pay. The consequence was an army revolt, the seizure of the king at Holdenby, and the invasion of London. Charles attempted to exploit the rift between army and Parliament and redoubled his efforts to persuade the Scots to assist him. At the same time Fairfax, Cromwell, and \*Ireton struggled to control the \*Levellers who were striving to seize political control of the army in order to implement their programme

of democracy, religious and economic liberty, and decentralization.

Early in 1648 royalist risings erupted in Kent, Essex, Wales, and the navy in anticipation of a Scottish intervention on behalf of the king. But the Scots were late, and the New Model Army had no difficulty crushing the revolts one by one. When the duke of \*Hamilton crossed the border in July with a small army, he attracted little support, so that Cromwell had no trouble destroying his forces between \*Preston and Uttoxeter (August 1648). Everywhere triumphant in battle, the army found to its chagrin that Parliament was still intent on negotiating peace with the king. To prevent such an outcome it occupied London, purged the House of Commons of those who favoured negotiation, and engineered the trial and execution of the king. Once the \*Rump Parliament had abolished monarchy and the House of Lords, it launched invasions of Ireland (1649) and Scotland (1650). In spite of Cromwellian ruthlessness at \*Drogheda and Wexford, Ireland took three years to subjugate. The Scots were devastated at \*Dunbar, east of Edinburgh (September 1650), but continued to resist, to the point of invading England a year later under Charles II. His forces scattered at \*Worcester (September 1651), the hapless king fled to the continent where he sojourned until disunity within the army and a generalized fear of quakers and other radicals paved the way for a bloodless restoration of monarchy. Although the king, lords, and Church of England were brought back in 1660, prerogative government was not. The constitutional changes of 1641 were preserved, while the legacy of the civil wars in radical thought, religious liberty, and parliamentary domination of the state re-emerged in the \* 'Glorious' Revolution of 1688–9.

IJC

Gentles, I., *The New Model Army in England, Ireland and Scotland, 1645–1653* (Oxford, 1992); Kenyon, J., *The Civil Wars of England* (1988); Morrill, J., *The Nature of the English Revolution* (Harlow, 1993); Russell, C., *The Causes of the English Civil War* (Oxford, 1990).

**Claim of Right, 1689.** The Scottish equivalent of the English Bill of Rights, declaring that James VII had been deposed and that no Roman catholic could succeed to the throne of Scotland. But it also declared prelaty to be a great grievance and prepared the way for a presbyterian church settlement. On these terms the crown of Scotland was offered to William and Mary.

JAC

**clans.** The Gaelic word *clann* means primarily children, but was also used synonymously with *cinel tuath* or *fine* to describe a family group of four generations from a common male ancestor. Clans are referred to in the reign of David I (1124–53) in the *Book of Deer*, where there are references to the toiseachs of the Clans Morgan and Canan. A toiseach was a royal official, so in these cases the post must have become hereditary. Mackintoshes are *Clann an Toiseach*, literally 'the toiseach's children'. In the Celtic church ecclesiastical positions could become hereditary, which is why Clan Macnab are in Gaelic *Clan an Abba* 'the children of the abbot'.

Clans Canan and Morgan did not survive. Nor did the two clans Chattan and Kay, who settled a dispute by sending 30

men each to fight at Perth before Robert III in 1397. Continual flux, constant rise and fall seems to have been typical of Scottish clans. Nevertheless, one can argue that the classic clans of the Highlands, and the much smaller border clans, were usually formed from a merging of feudal jurisdictions with kinship ties (real or imagined). Scottish feudalism, unlike Irish feudalism, became assimilated early into the Gaelic tradition. Most Highland clans were in origin Gaelic communities onto which feudal structures were grafted. Some of these communities in the west had originally been Norse. Especially in the province of \*Moray, there were also feudal groups which adopted clanship. Such were the Frasers, Chisholms, Grants, and Rosses, as also the Inneses, Gordons, Stewarts, Sinclairs, and the Clan Menzies.

From feudalism a clan chief gained the concept of absolute ownership of land, and the system of succession by primogeniture. Female heirs, or wardship by a superior of a male minor, could threaten the tribal identity which was the other side of the clan coin. Control of the marriage of a female heiress by the cadet branches of the chiefly house, and the office of tutor or guardian within the clan, were partial answers. Kinship was largely bogus for the bulk of a clan, who only began to use surnames very late. Cadets of the chief, holding estates in tack or lease on generous terms, in exchange for military service, were the core of a clan and their multiplication its usual mode of expansion.

After the forfeiture of the lordship of the \*Isles in 1493 broke the Clan Donald into smaller MacDonald clans, three great imperialist clans dominated Highland history, due to the support of the crown, whose agents they were. These were the Gordons in the north-east, the Mackenzies in the northern Highlands and Hebrides, and Clan Campbell in the west. Scots-speaking border clans like the Scotts, Nixons, and Maxwells became obsolete after the regal union of 1603 removed their defence function. Highland clans became deeply distrusted after a century of bloody intervention in Lowland politics between 1644 and 1746. After the last \*Jacobite rebellion legislation effectively destroyed them as military, jurisdictional, and cultural units. Market economics and clearances completed the job in the 19th cent.

BPL

**Clapham sect.** An influential evangelical network whose activity in the early 19th cent. found a base in Clapham, where ten of them are commemorated in the parish church. Often attributed to Sydney \*Smith, the name was popularized and perhaps coined by Sir James \*Stephen in the \**Edinburgh Review* (1844). The banker Henry Thornton (1760–1815) and his family provided the Clapham core but the 'sect's' dominant figure, their kinsman William \*Wilberforce, also lived there (1797–1808), as did Zachary Macaulay (1768–1838) from 1803 to 1819, Lord Teignmouth (1751–1834) from 1802 to 1818, and John Venn (1759–1813), Clapham's rector from 1797. The original group, ranging from Granville \*Sharp, the oldest, to Thomas \*Clarkson, the last survivor, provided some 60 years of public service. Their commercial, legal, and administrative experience took them naturally into Parliament where their humanitarian concerns introduced an unusual but ineradicable note at a

## Clapperton

time when such reforms were regarded as business for individual members rather than government. Their greatest victories were the abolition of the \*slave trade (1807) and of slavery itself in the British empire (1833), but their influence was decisive in promoting Christian missions in India and west Africa and in supporting such bodies as the Tract (1799) and \*Bible (1804) societies at home. Mostly Anglican and significantly Tory, their links with Whigs and dissenters confirm their importance as midwives of \*humanitarian reform. CB

**Clapperton, Hugh** (1788–1827). Scottish explorer of west Africa, Clapperton revealed the Fulani empire and tried to solve the problem of the Niger's course and termination. After an adventurous early career in the Royal Navy, Clapperton was retired on half-pay when in 1822 W. Oudney invited him and Denham to join an official expedition from Tripoli across the Sahara to the middle Niger region. Clapperton alone visited Kano and Sokoto in the newly created Fulani empire of Uthman dan Fodio and his son Mohamed Bello in 1824. On his return to Britain, the colonial secretary asked him immediately to go back to Sokoto to make treaties. With \*Lander, he penetrated from the Guinea coast in the south, but Bello's disputes with neighbouring Bornu hampered Clapperton, who died of dysentery in April 1827 without solving the Niger problem. But three years later Lander showed that the Niger terminated in the Gulf of Guinea. RB

**Clare, Gilbert de** (d. 1230). See GLOUCESTER, 4TH EARL OF.

**Clare, Gilbert de** (1243–95). See GLOUCESTER, 6TH EARL OF.

**Clare, Gilbert de** (d. 1314). See GLOUCESTER, 7TH EARL OF.

**Clare, Richard de** (d. 1176). See PEMBROKE, EARL OF.

**Clare, Richard de** (d. 1262). See GLOUCESTER, 5TH EARL OF.

**Clarence, Albert Victor Christian Edward, duke of** (1864–92). Clarence was the first son of Edward, prince of Wales, and grandson of Queen Victoria. From the beginning, his health caused anxiety and he seems to have been congenitally handicapped: at the age of 5 he was described as 'languid and listless'. At 13 he went to Dartmouth Naval College and was then sent on a long world cruise with his brother George. He spent some time at Trinity College, Cambridge, though one tutor described his faculties as 'abnormally dormant' and another remarked that 'he hardly knows the meaning of the words *to read*'. The university obliged with an honorary degree. He was next placed in the army where the commander-in-chief reported that even elementary drill movements were beyond him. Known in the family as 'Eddie', he remained indolent and wayward and what vigour he did possess was devoted to sexual encounters of various kinds. 'His education and future', wrote his father in 1890, 'has been a matter of considerable anxiety to us and the difficulty of rousing him is very great.' Desperate remedies were suggested—even longer cruises or matrimony. In 1891 Princess \*Mary of Teck, his cousin, accepted him, but he died of pneumonia at Sandringham on 14 January 1892, a month before the

wedding. In due course his younger brother married his fiancée and succeeded as George V. The more lurid stories connected him with the Ripper murders. JAC

**Clarence, George, 1st duke of** (1449–78). Reputed to have been drowned in a butt of malmsey, Clarence was the younger brother of Edward IV. As an impressionable youth he was enticed by a promise of the crown to support \*Warwick the Kingmaker (whose daughter Isabel he married) against his brother. In the event Henry VI was restored and in 1471 Clarence abandoned Warwick to help Edward IV recover the throne. In the early 1470s he was high in Edward's favour, lavishly rewarded with half of the Warwick inheritance. But his truculence (he quarrelled with Richard of Gloucester over the division of the spoils), incompetence, and insubordination exasperated the king. Arrested in 1477, and condemned for treason in a show trial before his peers, he was executed secretly in the Tower, by means never officially revealed. AJP

**Clarence, Thomas, 1st duke of** (1388–1421). The second son of Henry IV, Thomas was lieutenant of Ireland from 1401 to 1413, and was there, with guardians, until 1403, and again, more actively, in 1408–9. He also served in the Welsh war and at sea. He became more prominent when his father recovered control of government from Prince Henry (later Henry V): he was created duke and given command of the abortive expedition to support the Orléanist faction in France. Under Henry V, he took part in the Agincourt campaign and in the conquest of Normandy, sometimes in charge of successful detached operations. Clarence was lieutenant for the king's absence in England. Raiding Maine, he advanced with his cavalry ahead of the main army to attack a reported Franco-Scottish force at \*Baugé, where he was killed. He had no legitimate heir. RLS

**Clarendon, Assize of.** An assize (set of instructions for the king's judges) issued on Henry II's orders from his palace at Clarendon in 1166. It required grand juries to name ('present') accused or suspected criminals in their area so that the sheriff could then have them arrested and brought for trial before royal judges in the county courts. Gaols were to be built in every county where they did not already exist. The assize is generally regarded as an important step in the development of common law machinery for the public prosecution of crime and of the integration of county courts into a national court system. JG

**Clarendon, constitutions of.** A written statement of Henry II's view of his customary rights over the English church. It was issued at a council held at the palace of Clarendon in January 1164 in an attempt to clarify and settle the issues at stake in the king's quarrel with \*Becket. He required the bishops to promise to obey these customs in good faith, but since some of the constitutions, including one perceived as undermining \*benefit of clergy, seemed to threaten the liberty of the church and in consequence were soon condemned by Pope Alexander III, the only outcome was to escalate the dispute. JG

**Clarendon, Edward Hyde, 1st earl of** (1609–74). Constitutionalism and the rule of law provided the guiding principles of Clarendon's life. In the first session of the \*Long Parliament, 1640–1, he led the attack on Charles I's prerogative courts, but in the second he perceived John \*Pym's radical policies as an equal threat to constitutional liberties and religious order. He co-authored Charles's declarations, joining him at York in May 1642. In 1643 as privy counsellor and chancellor of the Exchequer he persuaded Charles to convoke a parliament of royalist peers and MPs at Oxford to offset the absolutist advice of courtiers and soldiers. Similarly as adviser to the exiled Charles II he counselled him not to owe his restoration to Scottish, French, or Spanish intervention purchased by the abandonment of the Church of England.

In 1660 he became earl and lord chancellor. He did not think it proper to act as a prime minister, but his pregnant daughter \*Anne's marriage to James, duke of York, provoked charges that he dominated the royal family. Nor would he engage in systematic parliamentary management. He opposed all governmental innovations and the second \*Anglo-Dutch War, and lost control over junior ministers who combined against him when the war ended in failure. Charles cynically abandoned him, encouraging his impeachment. Clarendon fled to France, where he completed his monumental *History of the Rebellion*. [JR]

**Clarendon, Henry Hyde, 2nd earl of** (1638–1709). Clarendon was the son of the lord chancellor and historian, and brother of Anne Hyde, mother of Queen Mary and Queen Anne. He was returned to Parliament in 1661 and succeeded to the earldom in 1674. From 1662 he was in the service of Queen \*Catherine, Charles II's Portuguese wife, as private secretary, lord chamberlain, and treasurer. On the accession of his brother-in-law James II in 1685, Clarendon and his younger brother \*Rochester were given high office. From 1685 to 1687 Clarendon held the privy seal and was lord-lieutenant of Ireland. But his time in Dublin was difficult. As a protestant he was increasingly anxious at James's headlong catholicizing policy and as lord-lieutenant he was overshadowed by \*Tyrconnel, a zealous catholic and commander-in-chief. In January 1687 both brothers were dismissed. At the revolution, his son Lord Cornbury was one of the first to join William, and Clarendon followed a fortnight later. Nevertheless he refused to take the oaths of allegiance to the new monarchs and had two spells in the Tower in 1690 and 1691 under suspicion of Jacobitism. The remainder of his life was spent in retirement. [JAC]

**Clarendon, George Villiers, 4th earl of** (1800–70). Whig politician. Clarendon served under such diverse leaders as \*Aberdeen, \*Palmerston, \*Russell, and \*Gladstone (1853–8, 1865–6, and 1868–70). The Tory leader, \*Derby, twice offered him a place in government. A good linguist, he was an acknowledged expert on foreign affairs. Bismarck, with a touch of heavy Prussian humour, suggested in 1870 that had Clarendon lived longer he might have averted the Franco-Prussian War. Clarendon had learned the skills of diplomacy and politics as minister in Madrid during the Carlist wars and later as lord-lieutenant in Ireland (1847–

52). As foreign secretary in 1853 he had the misfortune during the run-up to the \*Crimean War to be in a divided cabinet. Clarendon's biggest opportunity to distinguish himself occurred during the Congress of \*Paris in 1856 when he resisted the more extreme demands of Palmerston in London. He also publicized ideas on friendly mediation before states resorted to war. If he perhaps missed an opportunity to discourage the Hohenzollern candidature which precipitated the Franco-Prussian War, he was far from inactive in the search for a peaceful settlement. [CJB]

**Clarendon code.** The title given, inaccurately, to the statutes passed after the Restoration re-establishing the Church of England under government by bishops and compelling the nation to conform. They embodied the principles, interests, and vindictiveness of the cavalier majority in Parliament rather than the judgement of Lord \*Clarendon, Charles II's chief minister. The \*Uniformity Act (1662) required clergy to have episcopal ordination and use only the Book of Common Prayer. Some 1,000 were ejected for refusing. The \*Conventicle Act (1664) penalized all religious meetings outside the church. The \*Five Mile Act (1665) banned dissenting ministers from corporate towns. In 1672 Charles tried to suspend these statutes by issuing a \*Declaration of Indulgence. [JR]

**Clarendon palace.** Two miles east of Salisbury, the palace began in William the Conqueror's time as a hunting-lodge, but was converted by Henry II into a major royal residence. In 1164 when the constitutions of \*Clarendon were promulgated, fourteen bishops were in attendance. The palace was still in use in the 15th cent., but thereafter was neglected. Only a wall remains today, amid undergrowth. [JAC]

**Clarkson, Thomas** (1760–1846). Anti-slavery campaigner. Born in Wisbech (Cambs.), son of a schoolmaster, Clarkson was educated at St Paul's School and St John's College, Cambridge, where he became concerned about slavery. In 1787 he helped found a committee for the suppression of the slave trade and lectured on behalf of the parliamentary campaign for abolition until his health collapsed in 1794. He resumed lecturing in 1805 until the ending of the trade in the British empire in 1807. In 1818 he took the case for international abolition to the Congress of Aix-la-Chapelle. With William \*Wilberforce he was a vice-president of the \*Anti-Slavery Society (founded 1823), and after the act was carried in 1833 for the gradual abolition of slavery in the British empire, he retained his concern for wider abolition and appeared on the platform at the 1840 international Anti-Slavery Convention in London. [ER]

**class** is about power. The history of social class is about the way in which men and women gained and used power over others, in matters of government and the state, in ideas, culture, and education, but above all in the relationships of production and consumption. The concept of social class has been and is used by historians in their struggle to understand the experience, social relationships, and social conflicts of past and present.

By the 1960s, historians had established the major outlines of this story. Sometime in the late 18th–early 19th cent., the

## Classicianus

way in which the British people began to think about their own society and the way in which the major conflicts and relationships of that society developed began to change. Eighteenth-cent. society was a hierarchy of ranks and orders held together by relationships of deference and patronage, although the sense of a bi-polar division of rich and poor, rulers and ruled, aristocracy and people might inform debates on poverty, consumption, and the nature of the constitution. The new relationships and consciousness of class were associated with economic change, with the dominance of capitalist property relationships, with the intensity of competition in commerce, and, above all, with the reorganization of work through the division of labour and new machine-based, often steam-driven, technologies. Early conflicts were associated with trade unionism and the new technologies. The 1830s and 1840s were decades of intense conflict associated with constitutional change. There were key periods of industrial conflict in the 1880s and the quarter-century before 1926.

Social class was used to explain a wide variety of other changes and relationships. The demographic transition to low birth rates and low death rates was linked to middle-class experience in the second half of the 19th cent. and then filtered down to skilled and then unskilled working-class people. The voting patterns and political behaviour of the 20th cent. and the rise of the modern Labour and Tory Parties were related to middle- and working-class interests. Class was related to privilege in housing and education, to habits of dress, food consumption, and speech.

Behind this interpretation lay a series of assumptions. British writing was dominated by a three-class model, loosely related to the three factors of production identified by \*Ricardo in 1817. The aristocracy were rent takers, the middle class were profit takers, and the working class wage earners. A rigid Marxist presentation assuming an increasingly divisive conflict between capital and labour was rare, but the notion of a potential conflict derived from relationships to the means of production and the stabilization of this conflict in the 1850s and 1860s was central to the story. Explicit references to the ideas of Max Weber are even rarer, but his assumptions provide valuable guidance. Class was related to market position and hence involved privileges of education as well as property. Class was related to status which involved recognition by others in social status or 'social honour'.

This story has been questioned. Eighteenth-cent. historians have identified a 'middling sort' not least in patterns of consumption. The re-examination of the political events of the 1830s and 1840s, especially the language of those contests, yields little evidence of self-aware conflict groups based upon economic relationships. The closer study of work revealed a lack of homogeneity of experience within the major social classes. Divisions within classes, of gender, party, religion, region, ethnicity, were seen as providing identities more dominant than class itself.

Social class has lost its privileged position in the narrative of British social history, but it remains a crucial means of explaining the conflicts and inequalities that arose and arise from the relationships of production and consumption, not

least because, in the last 200 years, the language of class has been used in covert and overt ways by the people of Britain.

See also SOCIAL HISTORY.

RJM

**Classicianus.** Procurator (chief financial administrator) of Britain AD 60–I. His origins and early career are unknown. His name suggests Gallic antecedents, like those of his wife, who was from Trier. He became procurator of Britain in the aftermath of the \*Boudiccan revolt and was instrumental in having the victorious governor \*Suetonius Paullinus recalled before the latter's military policies could do further fiscal damage. Much of what we know of Classicianus derives from the tombstone erected by his wife, parts of which were reused in late Roman towers added to the walls of London; clearly he died in office. ASEC

**Classis Britannica** was the name of the Roman fleet which policed the Channel. It does not appear in the evidence before the early 2nd cent., though fleets were used in the Claudian invasion and by \*Agricola. Commanded by a procurator, its main base was at Boulogne, with an important installation at Dover. Bricks and tiles stamped CL BR (and variants) are widely distributed in present-day Kent and East Sussex, many associated with Wealden iron-working sites, which seem to have been under direct military exploitation. We have no direct evidence for the *Classis Britannica* after the early 3rd cent. ASEC

**Claudius.** Roman emperor AD 41–54. Because of his physical infirmities, Claudius had been denied the normal career of a Roman aristocrat. After the assassination of Caligula, the middle-aged Claudius was unexpectedly proclaimed emperor by the army. To reward the army and prove his martial prowess, Claudius decided to resume the work of his ancestor Julius \*Caesar with an invasion of Britain in 43. Though the invasion force was commanded by \*Aulus Plautius, the emperor himself came to Britain for the formal entry into Camulodunum (\*Colchester). Having spent sixteen days in the new province, Claudius returned to Rome, where he celebrated a triumph. Claudius awarded the title *Britannicus* to his son, and the invasion was the most famous event of his reign. A large temple dedicated to him was constructed in Colchester. ASEC

**Cleland, William** (c.1661–89). Cleland joined the covenanting rising of 1679 and fought at \*Drumclog and \*Bothwell Bridge. In 1685 he took part in \*Argyll's rising and at the revolution of 1688 gave allegiance to William III. On 21 August 1689 a small force led by Cleland was cut off by Jacobites at \*Dunkeld, but drove off their assailants. Cleland was killed during the battle. JAC

**clerk register** (Scotland). First seen in 1286 (as clerk of the rolls), the office entailed custodianship of the records of crown charters, the Exchequer, and Parliament. The clerk register initially wrote the records himself, but by the mid-16th cent. he was a director of record-keeping. From 1532 the clerk register was an advocate, present at Parliament, Privy Council, and session as both a record keeper and judge. From 1689 the office was a well-paid political appointment, but after the \*Union (1707), and the end of a separate Par-

liament and Privy Council, the job gradually declined into a sinecure.

RJT

**Cleveland** was one of the new non-metropolitan counties created by the English local government reforms of 1972. It straddled the ancient border of the river Tees between Yorkshire and Co. Durham, which had become increasingly obsolete due to the industrialization of the Tees estuary. Middlesbrough and Stockton had been united in Teesside county borough (1968–74), and the town of Hartlepool, and the Yorkshire districts immediately adjacent to Middlesbrough, were added to form Cleveland county. Many people in these areas failed to identify with it and in 1996, following the recommendations of the Banham commission, the county was abolished: Hartlepool, Middlesbrough, Stockton, and Redcar and Cleveland then became unitary authorities.

CNL

**Clifford, Thomas Clifford, 1st Baron** (1630–73). Clifford was a Devon gentleman of modest means determined to make a mark after the Restoration. Elected in 1660 for the local borough of Totnes, he spoke frequently and in December 1660 was appointed a gentleman of the privy chamber. At that stage he belonged to Lord \*Arlington's group. Bitterly opposed to the Dutch, he urged the second war in 1664 and volunteered for several naval actions. In 1666 he became comptroller of the household, held the post of treasurer 1668–72, and 1672–3 was lord high treasurer with a peerage. But as a member of the inner cabinet or \*cabal, his judgement seems less good than his spirit. He advocated and signed the secret treaty of \*Dover with Louis XIV, which involved Charles II in great embarrassment; suggested the stop on the Exchequer, a short-term expedient of doubtful wisdom; and pushed hard for a third Dutch War. But when the \*Test Act, against which he argued, passed in 1673, he resigned all offices as an avowed catholic. He took his leave of John Evelyn, a close friend, with considerable solemnity, and a few weeks later was dead, it was rumoured by hanging himself.

JAC

**Clinton, Sir Henry** (1730–95). Clinton was a grandson of the 6th earl of Lincoln, son of an admiral, and related to the dukes of Newcastle. He joined the army in 1745, fought in Canada during the War of Austrian Succession, and in Germany during the Seven Years War. By 1772 he was a major-general, acquired credit at \*Bunker Hill, and was appointed second in command in America under \*Howe. In 1778, after \*Burgoyne's surrender at \*Saratoga, he became commander-in-chief. In 1780 he scored a major victory at \*Charleston, when 6,000 rebels surrendered with 300 guns, but outright victory eluded him and, like most generals, he called for reinforcements. He was allowed to resign in 1782 after the surrender of \*Cornwallis at \*Yorktown and was subsequently involved in acrimonious controversy. He has been severely criticized as peevish, neurotic, rising only to mediocrity, but it was not an easy war to win.

JAC

**Clitherow, St Margaret** (1556–86). Catholic martyr. Daughter of a sheriff of York and a butcher's wife, she became a catholic (1574). She was tried at York for harbouring Jesuits and priests and hearing mass in her house. To save

her children from giving evidence she refused to plead, was condemned and pressed to death. Her sons studied at Rheims and Rome for the priesthood and her daughter became a nun at Louvain. A fine example of recusant courage and the brutality of the age, she was canonized in 1970.

WMM

**Clive, Robert** (1725–74). Soldier-statesman who helped to secure British control over India. Born in Shropshire, he was sent to Madras to join the \*East India Company in 1743. Eight years later, when war broke out between Britain and France in India, he volunteered for military service and, against all the odds, seized and held the city of Arcot. In 1756 he moved to Bengal, where a dispute between the British and the French-supported Siraj-ud-Daula had led to the loss of Calcutta, where surviving Europeans had been incarcerated in the notorious \*'Black Hole'. Clive organized a small force of European and Indian soldiers to retake the city in January 1757, but it soon became apparent that Siraj was still a major threat. Clive marched inland with no more than 3,200 troops to face Siraj's army of 50,000 at \*Plassey on the Bhagirathi river. The battle was fought in a rainstorm on 23 June 1757; for the loss of only 23 men, Clive routed the enemy.

By now the undisputed master of Bengal, Clive returned to England in 1760, where he was raised to the Irish peerage as Baron Clive of Plassey (1762). He returned to India in 1765 as governor of Bengal, where he introduced a series of reforms to company administration. Corruption remained, however, and in 1772 he was forced to defend himself before Parliament. Although exonerated, the trial affected his health and, on 22 November 1774, he committed suicide.

JLP

**Clodius Albinus**. Governor of Roman Britain 192–7 and claimant to the imperial throne. Probably from Hadrumetum (now Sousse) in north Africa, Albinus' career before his appointment to Britain is lost, nor do we know anything of his activities as governor. He came to prominence after the assassination of Commodus on 31 December 192, when he put himself forward as a successor. His chief rival was \*Septimius Severus supported by the garrison of Pannonia Superior and the Senate. At first relations were outwardly cordial and Severus accorded Albinus the title of Caesar (junior partner). But in 195 Albinus crossed to Gaul, where the large army of Britain proclaimed him Augustus. After initial successes in 196 including the capture of Lugdunum (Lyons), he was defeated and killed by Severus outside that city on 19 February 197.

ASEC

**Clogher** (Clochar mac nDaimine), **diocese of**. The Irish see of Clogher in the province of \*Armagh was established by the Council of Raithbressail (1111). At Kells-Mellifont (1152) its territory was increased, though for a spell (1135–92) the see was transferred to Louth until the Anglo-Normans settled there. There were usually Irish, not Anglo-Norman, bishops until the 16th cent. Since the Reformation there have been both catholic and Anglican bishops of Clogher, though the Anglican diocese was vacant (1571–1604), and for a spell (1850–86) united with the Armagh

## Clontarf

diocese. There are cathedrals at Clogher and Enniskillen. WMM

**Clontarf, battle of**, 1014. \*Brian Boru claimed the high kingship of Ireland, though resisted by Leinster and by the Norse kingdom of Dublin. After an inconclusive campaign in 1013, the Norse were reinforced from Orkney and the Isle of Man. On 23 April 1014 just outside Dublin, battle was joined. Brian Boru was too old to fight and his troops, largely from Munster, were led by his son Murchad. The Norsemen were led by Sihtric, king of Dublin. Though the Norse were defeated, Brian Boru, inadequately guarded, was killed and the victory was not followed up. JAC

**cloth industry.** See WOOLLEN INDUSTRY.

**club-men.** Not all Englishmen were keen to fight in the Civil War and by 1644 the depredations and extortions of each army had become unbearable. Groups of country folk, particularly in the royalist south and west, began to band together against troops from either side. Armed mainly with clubs, scythes, and spades, they were still formidable, and local commanders tried to enlist their help and turn their animosities against the other side. The Wiltshire club-men were hostile to Parliament, while their neighbours in Somerset were hostile to the king. \*Cromwell had to deal with 2,000 of them on Hambledon Hill near Shaftesbury: his cavalry dispersed them with some loss of life, but he wrote to \*Fairfax for permission to send the 'poor silly creatures' home. \*Rupert tried to instil better discipline in the border counties in 1645, and it was in part to reduce looting and appease the club-men that Parliament strove to pay the \*New Model Army regularly. JAC

**clubs.** The decades after the Restoration saw a proliferation of clubs and societies in London and the main provincial cities, many of them meeting in taverns or coffee-houses. They were prompted by greater prosperity, growth in the size of towns, and a marked increase in the membership of the professions. Contemporaries attached much importance to clubs as instruments of civility: one writer in 1739 remarked that though many clubs were run by 'the meanest and rudest of the citizens', they maintained 'the best order and decorum'. Though the most famous club, to which \*Johnson, \*Burke, and \*Gibbon belonged, was literary, the majority were dining clubs, or political or gambling clubs. The Cocoa Tree Chocolate House, in Anne's reign, was a haunt of Tories and Jacobites; Read's Coffee House in Fleet Street was the home of Whigs. Sixty years later, Almack's and \*Brooks's were famous gambling clubs. The 19th-cent. gentlemen's clubs were likely to have their own premises, not too far from the House of Commons, and to be run, not by a proprietor, but by a committee of members. The Athenaeum (1824), founded by J. W. \*Croker, was literary; the \*Carlton (1832) was established to restore the fortunes of the Tory Party after its shattering election defeat; the \*Reform Club (1836) was a Whig and radical riposte to the Carlton's success. The heyday of the gentlemen's club was late Victorian and Edwardian England, with clubs offering overnight accommodation and libraries as well as good dining facilities. Trollope's old lawyer Abel Wharton, in *The*

*Prime Minister*, 'twice a week, on Wednesdays and Saturdays, dined at that old law club, the Eldon, and played whist after dinner till twelve o'clock'. At the other end of the social scale were highly successful working men's clubs, where the drink was beer and the entertainment a local comedian, sing-song, or dominoes. JAC

**Cluniacs** were \*Benedictine monks from the monastery of Cluny (Burgundy) founded by William, duke of Aquitaine, in 909. Cluny was a centre of reformed observance, laying great stress on the rule, the liturgy, and freedom from lay (and, indeed, episcopal) control. Under the leadership of its early abbots, especially Odo (927–42), Odilo (994–1048), and Hugh (1049–1109), Cluny enjoyed considerable prosperity, and exercised a wide influence on monastic reform elsewhere in Europe, while an increasing number of monasteries were taken under Cluniac control, or adopted Cluniac observances. The order was extremely centralized, Cluny's abbot possessed autocratic powers within the order, and other Cluniac foundations or 'prieories' were subordinate to Cluny, where their monks made profession. The Cluniacs were closely involved with the papal reform movement of the late 11th cent. and Pope Urban II (1088–99) was himself a Cluniac. Under Hugh's abbacy, Cluny reached the height of its prestige as a spiritual and cultural centre, famous for its music and rebuilt abbey church, which, when consecrated in 1131–2, was perhaps the grandest in western Europe.

The first English Cluniac priory was founded by William de Warenne in 1077 near his castle at Lewes. His, the largest community, was joined by some 30 more, most being founded in the late 11th and 12th cents. Though initially subject to Cluny's authority and hence regarded as 'alien priories' and liable to sequestration during the Anglo-French wars, most purchased national identity as 'denizens'. BJG

**Clwyd.** A Welsh county created under the Local Government Act of 1972 and extant from 1974 to 1996. It was made up of the former counties of \*Denbighshire and \*Flintshire minus a north–south strip along the Conwy valley, allocated to \*Gwynedd, but with the Edeyrnion rural district in the south-west, transferred from \*Merioneth. The counties which emerged in 1972 from a long period of consultation were the result of attempts to balance historical tradition, minimum population to support services (usually taken as 250,000), and reasonable distances for internal administration. Clwyd was a compromise on all three bases. It had little in the way of common historical identity, although there was some common industrial inheritance, since it included the whole of the North Wales Coalfield. An earlier proposal had suggested amalgamation with Gwynedd. Another notion was amalgamation in \*Powys. But while such schemes gave appropriate populations, they would have given unwieldy counties with severe communication problems. Clwyd, therefore, with a name of no historic significance, but derived from the river, was a compromise which gave an element of administrative identity to north-east Wales.

The county was divided into six districts: Colwyn; Rhuddlan; Delyn; Alyn and Deeside; Glyndŵr; and Wrexham Maelor. Its population was 390,200 in 1981 and 402,927 (1981 base) in 1991. In 1996 it was divided into three new

unitary authorities, Denbighshire (91,000), Flintshire (144,000), and Wrexham (123,000), whilst Colwyn on the western border of Clwyd was joined with Aberconwy in Aberconwy and Colwyn (109,000). HC

**Cnut** (d. 1035), king of England (1016–35). Cnut, the younger son of the Danish king \*Sweyn Forkbeard, came to prominence campaigning in England by the side of his father, 1013–14. Sweyn forced King \*Æthelred into exile and received the submission of all England but died in February 1014. His son then took his army back to Denmark after an act of savage brutality when he mutilated his hostages before putting them ashore at Sandwich. He returned in September 1015 and after hard battles with Æthelred's son \*Edmund Ironside (d. Nov. 1016) conquered England. For close on 20 years this Danish prince, quickly recognized as legitimate successor to the Christian kingship of England, gave the kingdom substantial peace and prosperity. At a great assembly at Oxford in 1018 he promised to adhere to the laws of King \*Edgar, a promise reiterated in a letter sent to all the shire courts in 1019/20 in which he stated his intention to be a gracious lord and to support the rights of the church and just secular law. In 1019 he succeeded his elder brother as king of Denmark, and he also, after one major set-back at the hands of Olaf Haraldson (St Olaf) and the Swedes in 1026, gained mastery of Norway in 1028. Incongruously, Cnut attempted to govern Norway through the virtual regency of his English wife, Ælfgifu of Northampton, and their young son Sweyn (d. 1036), an experiment which ended in miserable failure in 1035, the year of Cnut's own death. Whether Cnut could have repaired the damage had he lived is a moot point: but the Norwegian fiasco is a reminder of the fragile nature of Cnut's so-called Scandinavian empire. England and to a lesser extent Denmark constituted the solid base of his political power. In England itself continuity is the main theme. There were occasional outbursts of ferocity, notably in the opening years of the reign, including the murder of the treacherous ealdorman Eadric Streona in 1017. Cnut made, primarily for political reasons, a Christian marriage to Æthelred's widow \*Emma of Normandy, although continuing to consort with and recognize Ælfgifu of Northampton, and relied heavily on many of Æthelred's principal advisers, notably \*Wulfstan, archbishop of York and bishop of Worcester (1002–23). Wulfstan was chiefly responsible for the framing of Cnut's law codes, the first of which dealt with ecclesiastical matters and the second, longer and more elaborate, with secular affairs. These codes proved the chief vehicles for the transmission of knowledge of Anglo-Saxon law deep into the Norman period. Local government continued to operate in shires, hundreds, and wapentakes, essential for the judicial and financial health of the local communities and of the monarchy. Cnut exploited to the full the wealth of a basically prosperous England. There were some major exactions recorded in the *Anglo-Saxon Chronicle*, £10,500 from London alone in 1018 to help pay off the victorious Danish fleet and £72,000 from the whole of England: but it was the regular exaction of geld from the country that provided the king with the means to set up stable government and to preserve

internal peace. The sophisticated coinage that Cnut had inherited from his predecessors continued to be struck to a high and consistent standard. His piety was much more than skin deep and on an impressive visit to Rome in 1027 to attend the coronation of the Emperor Conrad—in itself a symptom of his prestige and confidence—Cnut took the opportunity to negotiate favourable terms for English traders and pilgrims *en route*. Prompted in part by his needs for reliable subordinates who would exercise more than traditional authority when the king was abroad, he deliberately built up the regional powers of some great men to whom was accorded the title of eorl, a step that has been interpreted, probably falsely, as potentially harmful to the integrity of the late Old English monarchy. In Cnut's day they, especially \*Godwine, earl of Wessex, were kept firmly under royal discipline, serving a useful purpose as regional commanders. The reputation of Cnut suffered in one respect from sheer biological accident. He died relatively young (one later authority says at the age of 37) in 1035. His two sons \*Harold Harefoot (by Ælfgifu) and \*Harthacnut (by Emma) contended for the succession to England and to Denmark, and both died in their early twenties, Harold in 1040, Harthacnut in 1042. His other two children by Ælfgifu, Sweyn, much entangled in Norwegian politics, and Gunnhild, married to the future emperor Henry III, also died young in 1036 and 1038 respectively. The return of the ancient dynasty to England in the person of \*Edward the Confessor (1042–66) left Cnut with no great apologist among English historical writers. The *Anglo-Saxon Chronicle* has comparatively little to say about him, and indeed his wife Emma, who lived on until 1052, has a better personal historical press. There can be no doubt, however, that Cnut's contribution to the institutional and economic life of England was considerable, and that medieval Scandinavian historians and chroniclers were well justified in referring to him as 'Cnut the Great'. HL

Lawson, M. K., *Cnut* (1993).

**Coalbrookdale** in Shropshire was the site of the great development of the iron industry by the Darby family, using local raw materials and the river Severn for transport. The valley also produced steam-engines in the early 18th cent. and at the end of the century the Coalport china factory was established. The museum complex based on \*Ironbridge is one of the finest in the country. JAC

**coal industry.** This has the longest continuously recorded history of any British industry, beginning with monastic and manorial documents of the 13th cent. Pits were small, shallow, or outcrops, capital investment was minuscule, drainage was an insignificant problem, and markets were generally local. However, by the 14th cent. a water-borne export trade from the Forth and Tyne had developed. Expansion occurred in the 16th and 17th cents. as a consequence of the growth of markets. By 1690 coal output was approaching 3 million tons, with Northumberland and Durham accounting for 45 per cent of production.

Growth in output resulted from greater investment by landowners with coal on their estates. Supply was partly affected by the Reformation and secularization of ecclesias-

tical land. New owners exploited coal reserves more actively and sought markets within and beyond their localities. Where land was leased for mining, leases were often longer, encouraging investment and entrepreneurship. Mining methods improved considerably, and coal-mining was a major stimulus of invention, especially in the use of water-wheels to drive drainage pumps. Ultimately, between 1698 and 1705 the problem of drainage led to steam pumps devised by Thomas \*Savery and Thomas \*Newcomen. Demand from London accounted for the dominance of the seasale mines of the Great Northern Coalfield; domestic consumers were very important, but the industries of London—smiths, glass-makers, owners of sugarhouses, brick and tile kilns, breweries and distilleries—should not be ignored. A range of industries from lime-burning to dyeing encouraged landsale and seasale, the former operating close to the pit-head, thereby offsetting transport costs.

Demand for coal escalated in the 18th cent. as the iron and metal industries altered their methods of production. Smelting by coke, achieved by Abraham \*Darby I in 1709, spread rapidly after 1760. In the late 18th cent. the Cranage brothers, Peter Onions, and Henry \*Cort applied coke to the puddling process in producing bar iron. New industries, notably gas, chemicals, the railways, and steam-power installations, also widened demand. Domestic consumers increased in number as urbanization proceeded. By 1800 output exceeded 11 million tons and in 1854 approached 65 million tons. It has been estimated that annual gross capital formation increased nearly sixfold between these years from over £480,000 to over £2.5 million. Technical and commercial constraints on growth were removed in this period. The steam-engine solved the problem of mine drainage; ventilation was improved in deeper pits by the sinking of air shafts; George \*Stephenson's and Humphry \*Davy's safety lamps began the improvement in underground lighting and mining safety, although gases remained a hazard; a labour-intensive industry which used ponies underground, as well as women and children in coal haulage, mining gained from the wire rope, the cage, and the rotary steam-engine, all features of substantial collieries by 1855. Cheaper transport was achieved by river improvement, canals, and railways. One per cent of national income in 1800, the coal industry accounted for about 6 per cent by 1900. Coal represented 5 per cent of the total value of exports up to the 1870s and by the early 20th cent. about 10 per cent. The industry was Britain's major male employer by 1914, when output reached 287.4 million tons, the highest figure ever attained.

After the war (1914–18) coal went into structural decline, encountering massive labour problems and declining productivity, interrupted only by the Second World War (1939–45) and its immediate aftermath. Nationalized in 1947, the industry was extensively modernized at great public cost. Demand fell as alternative fuels gained ground. High-costing pits closed after 1959, and declining productivity was reversed. The number of collieries fell from 901 in 1951 to 438 in 1967, a process hastened in the 1970s and 1980s; one consequence was a substantial fall in the mining labour force. Despite a growing emphasis on open-cast working and new mechanized mines, such as the Selby com-

plex, in an abortive attempt to compete with foreign imports, the industry continued its decline in the 1990s, returning to private ownership in 1994–5. By 1997 there were only 20 large deep mines still in operation. JB

**Cobbett, William** (1763–1835). Radical journalist whose *\*Political Register* (1802–35) was the most influential radical paper of its time. Week after week Cobbett thundered against the political system ('Old Corruption') and championed the cause of labouring people, particularly the agricultural workers. His radicalism, blended with traditionalism, was individualistic, untheoretical, and non-revolutionary. He was, wrote \*Hazlitt, 'a kind of 4th estate in the politics of the country'. Born and raised on a Surrey farm, Cobbett enlisted in 1784, served in Nova Scotia, and was promoted serjeant-major. On returning to England in 1791 he tried unsuccessfully to expose financial corruption in the regiment, and as a consequence had to flee to France and then to America. In Philadelphia (1792–9) Cobbett patriotically defended Great Britain, and when he returned to England in 1800 was welcomed as a Tory supporter. However, he soon became disenchanted with what he called 'The System' and from 1806 demanded parliamentary reform. Sentenced in 1810 to two years in Newgate gaol for seditious libel, Cobbett was henceforth regarded as a dangerous radical; and when habeas corpus was suspended in 1817 he deemed it prudent to flee to America. On his return home in 1819 he resumed farming and also wrote some of his finest pieces, published as *Rural Rides*. He was MP for Oldham in the reformed Parliament of 1833. JFCH

**Cobden, Richard** (1804–65). A British radical politician, Cobden was devoted to free trade and international peace, and hostile to aristocratic rule. After the successful campaign for the incorporation of Manchester, he joined the \*Anti-Corn Law League. Dissatisfied with propaganda campaigns, early in 1841 he persuaded the league to fight a by-election. Although this was lost, by forcing a moderate Whig to withdraw the League had shown that it could affect election results. Cobden became MP for Southport in 1841 and proved a competent speaker both in and out of Parliament. His speaking style was simple and straightforward. In the aftermath of the Conservative victory in 1841, Cobden contemplated militant action, but eventually decided on exploiting all legitimate opportunities, both electorally and in the propaganda war. He was largely responsible for the League's increasing prominence. In 1846 he received from \*Peel an exaggerated tribute as the man primarily responsible for repeal of the Corn Laws. Thereafter, Cobden remained a prominent reformer, but opposition to the \*Crimean War and \*Palmerston's popular foreign policy reduced his influence. In 1859–60 he negotiated an important commercial treaty with France. He died too early to take a place in the leadership of the emerging \*Liberal Party. NMCC

**Cochrane, Thomas, 10th earl of Dundonald** [S] (1775–1860). Cochrane had a long and colourful life. The family was impoverished and he had to make his own way in the world. In 1793 he joined the navy, in which his uncle was

serving. During 1800–1 he commanded the *Speedy*, preying upon Spanish shipping, and captured a frigate three times the size of his own ship. Next he took up politics, was returned to Parliament in 1806 for Honiton, and then Westminster as partner to Sir Francis \*Burdett. They formed a radical pair, urging parliamentary reform. In 1809 he was given charge of a fireship attack on a French squadron in Aix roads, quarrelled with Gambier, his superior officer, had him court-martialled, and lost. In 1814 Cochrane was involved in a Stock Exchange fraud, sentenced to a year in prison, stripped of his honours, and expelled from Parliament. His radical Westminster constituents returned him again, but he failed to become a second Wilkes. In 1818, abandoning Parliament, he left for South America, where Spain's colonies were in rebellion, and performed deeds of heroism on behalf of Chile, Peru, and Brazil. After that he commanded for the Greeks against the Turks without notable success. Returning to England, he succeeded as earl in 1831 and was given a free pardon in 1832. He was employed once more 1848–51 as commander-in-chief West Indies and promoted admiral. Cochrane was a vigorous and brave leader of men, but a bad subordinate and was never entrusted with supreme command. An uncomfortable national hero, he was buried in Westminster abbey. JAC

**Cockburn, Henry** (1779–1854). Scottish advocate, judge, and diarist, whose *Memorials of his Time* (1856) remains one of the most vivid and attractive accounts of Scottish politics and Edinburgh society and culture in what Cockburn called 'the last purely Scotch age'. A well-connected Whig who spent his whole life in Edinburgh, a successful and talented criminal advocate, Cockburn was a founder member of the \**Edinburgh Review*. He became solicitor-general for Scotland in 1830, drafted the Scottish Reform Act, and was promoted to the Scottish bench in 1834. Cockburn's generous and unaffected prose did not make him a particularly trenchant Edinburgh reviewer or Whig pamphleteer. It did make him a diarist of near genius. His *Memorials* are his greatest work. His *Journals* which cover 1832–54 are less successful. His strongly topographical *Circuit Journeys*, written while he was a circuit judge, is a neglected masterpiece. In his later years he became a notable and ardent conservationist. NTP

**cock-fighting.** A ferocious blood-sport, probably introduced by the Romans, in which intensively trained gamecocks with metal or bone spurs slipped over their natural ones were set to fight, usually to the death, on a stage in a circular pit. Mains (matches) were variously structured, with rules, the rowdy spectacles generally accompanied by heavy betting. A medieval Shrovetide schoolboy sport, and survivor of bans which claimed it interfered with archery practice, it flourished across all social classes and was a favourite pastime of royalty and the upper classes; numerous place-names involving the word 'cock' attest to the ease with which an arena could be set up. Forbidden briefly by the Commonwealth, its resurgence in Restoration England was typified by Charles II's own enthusiasm. The best cocks were valuable, and paintings frequently commissioned. County competition first showed itself in this sport, usually

as three-day events and often associated with race meetings; Ireland quickly followed the English example. Opposition grew in the early 19th cent., but not all towns acquiesced readily; although banned in 1835 and 1849, it persisted in coal-mining areas, and still occurs secretly. ASH

**Codrington, Sir Edward** (1770–1851). Codrington was of the Gloucestershire family of baronets and entered the navy in 1783. He served with distinction at the \*Glorious First of June in 1794 and was given his first command later that year. At \*Trafalgar he captained the *Orion*. At the end of the war he was knighted and was promoted vice-admiral in 1825. In 1827 he was given a difficult command in the eastern Mediterranean, where the Greeks were in rebellion against the Turks. His squadron, with Russian and French contingents, was intended to enforce an armistice but on 20 October an accidental clash with a Turkish fleet led to the Turks' annihilation in \*Navarino Bay, on the south-west of the Morea. The British government, while praising Codrington, explained the battle as an 'untoward event'. The sequel became acrimonious and Codrington's orders appear vague. He was promoted admiral of the blue in 1837 and commanded the Channel fleet from 1839 to 1842. JAC

**coercion bills**, under various names, were a sombre obligato to Anglo-Irish relations throughout much of the 19th cent. Sometimes produced by threat of revolution or actual insurrection, or by widespread agrarian disorder, they also balanced measures of concession to improve their chance of getting through the Westminster Parliament. \*Habeas corpus was not introduced in Ireland until 1781, most lords-lieutenant arguing that the country was not sufficiently settled, and it was suspended at frequent intervals thereafter. \*Peel as chief secretary responded to agrarian violence in 1814 with an Insurrection Act, which suspended trials by jury in troubled areas and allowed a curfew and the recruitment of special constables. \*Grey's ministry in 1833 replied to the disorders of the 'tithe war' and the murders by the 'whitefeet' with a coercion act which allowed the lord-lieutenant to ban public meetings and to proclaim martial law in disaffected areas: 'we coerce as do Metternich and the pope', \*Palmerston wrote, 'but then we redress grievances, as they do not'. \*Gladstone's first land reform in 1871 was accompanied by a Peace Preservation Act, which extended the powers of the lord-lieutenant to order search and arrest and made disturbed areas pay for the extra policing. His second land reform in 1881, at the height of the \*Irish Land League agitation, was accompanied by another coercion act widening powers of arrest and detention, and strengthened after the murder of Lord Frederick \*Cavendish. \*Balfour, chief secretary 1887–91, declared coercion and concession his twin policy—'relentless as Cromwell in enforcing obedience . . . radical in redressing grievances'. His \*Congested districts relief scheme was matched by a new Crime Act. The protracted opposition to coercive measures by \*Parnell and his colleagues led to parliamentary devices like the closure to prevent business being brought to a standstill. JAC

## coffee-houses

**coffee-houses.** Coffee, tea, and chocolate became available through the \*East India Company (founded 1600) and the first coffee-houses, as alternatives to taverns or ale-houses, appeared in Oxford (1650) and London (1652). They developed as centres for the exchange and distribution of domestic and foreign news, intelligence, and gossip in the days of unorganized delivery of letters and news-sheets. Concentrated in London mainly around the Royal Exchange, they rapidly became part of the daily life of the city, the business day often beginning and ending there. Frequented by stockbrokers, trading and livery companies, insurance schemes (spurred by the fire of 1666) were initiated, 'bubble' schemes hatched, and ships' passages announced there. The government of Charles II was soon alarmed at small groups of men meeting in private rooms and made a half-hearted attempt to ban them in 1675. Initially they worked in conjunction with the Post Office for the delivery of letters, but by 1700 the well-organized arrangements of the coffee-men (especially with the ship masters) were costing the Post Office much revenue: subsequent acts to curb the practice were ineffective, since postal administration remained unsavoury and inefficient. The coffee-men vied with each other to provide the broadest variety of intelligence, setting up individual arrangements with news publishers.

The class and type of customer varied according to locality, trade, and fashion. They soon became political headquarters, the Cocoa-Tree a famous Tory haunt, Ozinda's for Jacobites, and the Smyrna and St James's coffee-houses for Whigs. They were also used for educational purposes, lodge meetings, assignations, planning robberies, and occasionally for selling slaves, and attracted quacks, prostitutes, and press-gangs. With a growing population, rebuilding, improving communications, and more efficient public services, they were beginning to outlive their usefulness by 1830. As the original antagonism of the vintners had been replaced by acquisitiveness, the remaining coffee-houses reverted easily to taverns or wine-houses, or developed into clubs. ASH

**Coggan, Donald** (1909–2000). Archbishop of Canterbury. Coggan was born in London of a west country family and ultimately Welsh stock. He had a distinguished academic career at Cambridge and at Manchester University, where he taught Semitic languages and literature prior to ordination in 1934. After a brief curacy he returned to academic life, first in Canada, and then, after 1944, in London, where he transformed the moribund theological college of St John's Hall, Highbury, into the thriving London College of Divinity. A first-class scholar and administrator, steeped in the evangelical tradition, Coggan's merits were recognized in 1956 with appointment as bishop of Bradford, and in 1961 as archbishop of York. His translation at the age of 65 to Canterbury came as a surprise to many, but perceptions of him as a stop-gap or caretaker primate quickly faded. Before retirement in 1980 he proved an enthusiastic ecumenist and a prophetic leader, whilst giving the Church of England a period of stability. He was made a life peer, dying at the age of 90. JRG

**Cogidubnus**, British king of the \*Regni (Regnenses). The ancestry of Cogidubnus is obscure. It is possible that he was a prince of the \*Atreabates, for his kingdom during the early years of the Roman occupation included the southern part of the old Atrebatian kingdom. Tacitus records that he was a loyal friend of Rome, and this is confirmed by his forenames—Tiberius Claudius—which reflect Claudius' grant of Roman citizenship to the king. He appears to have been installed in a newly created kingdom by the Romans at the time of the invasion, and to have provided them with a safe base at \*Fishbourne on Chichester harbour for their campaign in south-west England. The palace which was built over the site of the Roman camp is likely to have been erected by Cogidubnus, although he may not have lived to see it completed in the late 70s. KB

**coins and currency** may be viewed from different angles—as symbols of monarchical or national authority; as art-forms reflecting the culture of a period and the influences at work; or as an economic weapon, control of which was essential for financial stability. For centuries coins were hammered out by hand and the quality of individual coins and the output of different mints varied considerably. Debased or worn coinage was bad for trade: in 1695 William Stout, a Lancaster shopkeeper, complained that 'the old silver coin of this nation continued to be more and more diminished, which made great distraction in trade'. If the intrinsic value of coins was more than their formal exchange value, they were hoarded or melted down; if markedly less, there was reluctance to accept them.

The king's coinage was one of the most visible manifestations of royal authority. The number of mints was carefully controlled and permission to subjects to strike coins granted sparingly: it was an indication of the weakness of government during Stephen's reign that so many magnates began to mint coins. Counterfeiting or clipping the coinage was regarded as a heinous crime. In 1350 Edward III declared counterfeiting to be high treason and Henry V extended treason to clipping or defacing. As late as 1742 gilding shillings to pass as guineas was made treason. Nor were these idle threats. Phoebe Harris was burned before 20,000 people in 1786 and Christian Murphy in 1789. It was an act of clemency in 1790 when Parliament substituted hanging and not until 1832 was the death sentence abolished.

At the time of Caesar's invasion in 55 BC coins were circulating in southern England. They were largely imitations of Gaulish coins, themselves imitations of Greek staters. Tasciovanus, king of the \*Catuvellauni, minted gold, silver, and copper coins (c.20 BC), and his son \*Cunobelinus had coins circulating in the Colchester area: the \*Iceni and the \*Coritani also had their own currency. After AD 43 the Romans substituted their own imperial coinage but by c. AD 430 the import and use of coins seems to have ended.

The peoples who penetrated the Roman empire—Vandals, Visigoths, Lombards, Franks, Angles, and Saxons—soon began to issue their own currency. At first the coins imitated Roman specimens, often without understanding the originals, but later kings substituted their own

names and images. In England, gold thrymsas and silver sceats appeared around AD 600, minted mainly at Canterbury and London. The earliest coins to be struck by an identifiable king came from the short-lived \*Peada of Mercia (656). King \*Ecgrith of Northumbria had his name on coins soon after (670–85), and Northumbrian coins showed some artistic originality, with a recurrent griffin or dragon. In the 750s, Pepin assumed the kingship of the Franks and introduced a completely new silver coinage, using the Latin term 'denarius'. When this was borrowed by the English, they used the name penny but retained the symbol *d.*: twelve denarii made one solidus, and 20 solidi one pound or libra, giving the term *£.s.d.*, which survived until decimalization in 1971. Within a few years \*Offa of Mercia was issuing his own silver pennies, which were the main form of currency for the next 600 years. Offa's coinage was produced largely at Canterbury, by named moneyers, was more plentiful than before, and of higher artistic merit. Two subsequent advances were \*Aethelstan's claim on his coins to be 'Rex Totius Britanniae' from 927, his insistence on one coinage, and the extension of his mints to Exeter, Shrewsbury, Chester, and York. \*Edgar carried out a great reform of the coinage (c.973), with a system for calling in worn coins for reissue and a large increase in the number of mints.

There was little alteration in the design of the silver penny in the two centuries following the Norman Conquest. Richard and John not only kept the basic design but retained the name of their predecessor Henry II on their coins. A continuing problem was that of change. With only one denomination, pennies were cut to provide halves and quarters. The \*Anglo-Saxon Chronicle reported in 1124 that a man who took a pound of pennies (240) to market might find only twelve accepted. Henry I resolved on drastic action the following year, summoned nearly 100 moneyers to Winchester, and mutilated many of them for shoddy work. The coinage was at its worst during the civil war of Stephen's reign, when rival coins circulated, many of them crude. Henry III in 1257 introduced a new gold coin worth 20 silver pennies, but it was undervalued and therefore melted down: after three years he was obliged to abandon it.

The later Middle Ages saw a great increase in trade. Edward I carried out a grand recoinage in 1279–80, minting new coins, silver halfpennies and farthings, to remove the need to cut, and a fourpence groat, which was not at first successful. Quality was improved, a mint master appointed, and the London mint moved to the Tower. The innovation of Edward III's reign was the introduction in 1344 of gold coins—a florin (6 shillings), half-florin, and quarter-florin. They were augmented by nobles (80 silver pennies), half- and quarter-nobles. Representations became more interesting. The half-florin had a rather benign leopard (which gave the coin its popular name): the noble had an elaborate scene of Edward III, sword drawn, in a two-castled ship, perhaps commemorating his naval victory at \*Sluys in 1340. The noble was replaced during the reign of Edward IV by a coin of the same value, a noble-angel, which had a representation of the archangel Michael. It was accompanied by a ryal (from French *royaux*), valued at 10 shillings and with a large Yorkist rose—hence its popular name, rose-noble.

Tudor coinage was marked by three features—fluctuations in the value of the currency; the introduction of a great number of new coins; and the appearance of lifelike representations of the monarchs. Despite the political upheavals of the previous decades, Henry VII inherited a stable currency and bequeathed a strong position to his successor. But Henry VIII's systematic debasement of the currency from 1526 onwards drove up prices. Elizabeth brought the situation under control with some difficulty, admitting that her recoinage of 1560 was 'bitter medicine'. The new coins included a magnificent golden sovereign by Henry VII in 1489 and a half-sovereign; a gold Crown of the Rose at 5 shillings by Henry VIII and a half-crown which settled down later as a silver coin and ran until the 20th cent.; and a George noble in 1526 on which the patron saint made his first appearance. Edward VI introduced a treble sovereign, sixpence, and threepence; Mary a half-groat; and Elizabeth a rather strange silver  $1\frac{1}{2}d.$  and  $\frac{3}{4}d.$  to facilitate change. Henry VII's silver shilling carried a good likeness of the king, known as the testoon (from French *tête*). Henceforth the national coinage carried some remarkable portraits—Henry VIII aged on a Bristol groat (1544–7); Edward VI's silver shilling (1550–3); Philip and Mary's sixpence (1554–8); an imperious Elizabeth gold pound (1561–82); a stylish Charles I shilling (1638–9), and a saturnine Charles II crown (1663).

James I celebrated the union of his two kingdoms in 1604 with a gold crown called 'unite' or 'unit', bearing the title 'King of Great Britain' and the legend 'I will make them one people.' But a more important development of his reign was the introduction of copper coinage. Lord Harington in 1613 was given a patent to produce copper farthings, known colloquially as Haringtons, with an intermediate status between coins and tokens.

Charles I had a keen interest in art and before 1642 his coinage was of a high standard. The Civil War produced some desperate expedients, particularly 'siege-money', made out of any metal to hand and cut into strange shapes. The Commonwealth issued its own coinage, with inscriptions in English: one legend 'God with us' prompted cavaliers to the obvious retort that 'the Commonwealth was on one side and God on the other'. Good likenesses of Cromwell were produced but never issued.

As soon as he returned from his travels in 1660, Charles II tackled the question of the currency. The following year he ordered all coins to be mechanically produced and called in the Commonwealth issues. An innovation was the use of Guinea gold from Africa, which settled at 21 shillings and was called a guinea. The need for small change remained a problem and thousands of tradesmen's tokens circulated. To meet this, Charles introduced copper halfpennies and farthings in 1672: on the new coins, \*Britannia made her appearance for the first time. But one further step, in 1684, to bring in tin coins proved disastrous, since the metal oxidized rapidly.

Charles was also king of Scotland and of Ireland. The Scottish coinage dated from David I's reign in the early 12th cent. But the number of coins struck was small. There were mints only at Edinburgh, Berwick, and

Roxburgh, and what circulation there was came from England. The Scottish coinage had much in common with the English, partly through direct imitation, partly because each copied continental, and especially French, designs. But Scottish coins had their own peculiarities. Their international standing was undermined in the 15th and 16th cents. by persistent debasement. In 1423 the English government forbade the circulation of Scottish coins and at the union of the crowns in 1603 the Scottish pound was fixed at only one-twelfth that of the English. The falling value of the Scottish currency derived in part from the practice of mixing silver with alloy to produce the base metal billon. One result was that Scotland had less trouble about small change than England. James I introduced a billon penny and halfpenny; James III followed with a billon plack (from French *plaque*) valued at first at threepence and later at sixpence, a half-plack, and a copper farthing (1466); in James V's reign the bawbee (1544) and half-bawbee were issued, and in Mary's the hardhead was issued to help 'the common people' buy bread, drink, flesh, and fish. The billon coinage was discontinued after 1603, but twopence pieces in copper called hardheads, bodles, or turners continued to be issued until the Act of Union.

The earliest known Irish coins were minted by Sihtric Olafsson in the Viking kingdom of Dublin after 990 and were copies of English silver pennies. The circulation was probably very limited. No regular coinage was issued until after the Norman Conquest when John introduced coins stamped with a harp. There were no gold coins and, as in Scotland, silver was heavily alloyed. By the reign of Edward IV there were mints at Dublin, Waterford, Wexford, Cork, Drogheda, Limerick, and Trim, though the English government would not permit a national currency. In the Tudor period the Irish coinage suffered great debasement, as did the Scots and English, fuelling inflation and damaging trade. In 1689 James II issued a bronze currency known as 'gun-money' which, after his defeat at the Boyne, was bought in at metal value—less than 3 per cent of its face value. The fury caused by \*Wood's halfpence in 1723 had less to do with the coins, which were of respectable quality, than the state of Anglo-Irish relations.

In Wales, no coins were struck until after the Norman invasion. Coin hoards have been found in Wales dating to the 9th, 10th, and 11th cents., but the coins were foreign, mainly English, Viking, or Arabic. \*Hywel Dda's silver penny (c.940) was minted at Chester, copied an English coin, and may have been a presentation piece. Subsequent Welsh rulers do not seem to have produced their own coins and what circulated were English, though there were mints at Cardiff and Rhuddlan.

One persistent problem was the weight of coins and the hazard of transporting large quantities. Individual merchants and financiers had long issued personal bills of exchange, from which developed the cheque and the banknote—at first for special named customers, then for general use. The earliest extant cheque, dated 1659, is preserved in the Institute of Banking Library and is for £400. On 29 February 1668 \*Pepys recorded sending his father a goldsmith's note for £600. Paper credit expanded rapidly

and by the end of the 17th cent. it was calculated that England and Wales had £11.6 million circulating as coins, but tallies, banknotes, and bills worth £15 million. The Bank of England began issuing large-denomination printed notes in 1725 with, in effect, the credit of the government behind them. Nevertheless, many people preferred their local banks. Banknotes are still issued on the authority of the Bank of England and contain the comforting message from the chief cashier 'I promise to pay the bearer on demand the sum of . . . pounds'. Scotland retains its own banknotes which also circulate in the north of England.

At the time of the great recoinage of 1696 bimetalism was still the basis of the British currency, silver and gold providing the mainstay. Later in the 18th cent. declining production of silver made it excessively expensive and the currency went over to gold almost completely. When in turn gold became in short supply during the Revolutionary wars, the government declared banknotes to be legal tender. There was continuing difficulty about small change. Some of George III's copper coins ('cartwheels') were too heavy to be practicable since they were intended to contain their own value in copper. The result was that the country was again flooded with token coins.

Reorganization of the currency after the Napoleonic wars became a major political question and it was decided to go to one standard—gold. Silver tokens were prohibited in 1813 and copper tokens in 1818. The gold standard was retained, with increasing difficulty, until the economic crisis of 1931.

Four developments in the 20th cent. may be noted. Substantial inflation, particularly after the Second World War, caused several coins to be abandoned as their purchasing power dwindled: the farthing, beloved of haberdashers, was withdrawn in 1960, and the halfpenny, which survived decimalization in 1971, succumbed in 1984. Secondly, in 1971 the whole coinage was decimalized in preparation for Britain's entry into the EEC. Decimalization had been advocated as early as 1849 when the florin had been introduced as one-tenth of a pound. Thirdly, there was fierce debate in the 1990s whether Britain should join a European currency and, if so, what inscriptions the coins should bear. Fourthly, the spread of credit cards and electronic banking meant that coinage played a smaller part in financial transactions than in the past, heralding the day when money would be carried only for sundry purchases like sweets and newspapers.

Davies, G., *A History of Money: From Ancient Times to the Present Day* (Cardiff, 1994); Feavearyear, A., *The Pound Sterling: A History of English Money* (2nd edn. Oxford, 1963); Oman, C., *The Coinage of England* (Oxford, 1931); Sutherland, C. H. V., *English Coinage 600–1900* (1973).

**Coke, Sir Edward** (1552–1634). Lawyer, judge, and parliamentary figure. Coke was called to the bar in 1578 and quickly gained a considerable reputation. In 1592 he became recorder of London and later that year solicitor-general. In 1593 the queen appointed him Speaker of the House of Commons and then attorney-general. Coke conducted a number of famous prosecutions for the crown, with unfeeling harshness, including the trials of \*Essex (1601), Sir Walter \*Raleigh (1603), and the Gunpowder plot conspirators (1605). In 1606

he became chief justice of Common Pleas. Coke held that the royal prerogative was defined by law and could not be arbitrarily extended, a fact which brought him frequently into conflict with the crown. In 1613 he was transferred to the King's Bench, a post with more prestige but less influence. Then in 1616 Coke was removed from office altogether on the charge that in his decisions he had introduced several things in derogation of the royal prerogative. In 1621 Coke re-entered Parliament where he opposed monopolies and denounced interference with the liberties of Parliament. His last major political act was his role in drafting the *\*Petition of Right* in 1628.

RAS

**Coke, Thomas William, 1st earl of Leicester** (1754–1842). 'Coke of Norfolk' was an assertively Whig MP for Norfolk for over 50 years; there were two short intervals, when political excitement overwhelmed his local influence as a large landowner. He is remembered as an agricultural improver. Especially on the sandy soils of north-western Norfolk, new crop rotations raised production: turnips (winter food for sheep) preceded grain, followed by sown grass (summer food for sheep) leading again to grain; sheep fertilized for wheat and barley. Publicity for Coke's work and his agricultural shows ('sheep shearings'), where tenants mingled with prominent radicals and Whigs, has caused neglect of the agricultural improvements of his great-uncle Thomas Coke (1697–1759), Viscount Lovell (1728) and earl of Leicester (1744), who followed earlier aristocratic fashions, collected humanistic manuscripts and Roman and Italian art, and patronized architecture, building *\*Holkham Hall*. He profited from Walpolean Whig connections in government; Coke of Norfolk's popularity among his tenantry enabled him, by contrast, vigorously to oppose governmental influence.

RACP

**Colchester.** First 'capital' of Roman Britain. Camulodunum was the site of the most important late Iron Age *oppidum* of southern Britain, seat of *\*Cunobelinus* (Cymbeline). After its surrender in AD 43 a legionary fortress was planted, succeeded in 49 by a *colonia* of retired legionaries living in the former barracks. A temple to the deified Claudius was under construction when the entire town was burned to the ground in the first fury of the revolt of *\*Boudicca*. Town and temple were reconstructed, the latter being one of the few in Britain in the fully Roman style. It was the seat of the imperial cult and *concilium provinciae* (provincial council) for all Britain, and associated with a theatre. Walls to demonstrate the status of the *colonia* were constructed early in the 2nd cent. The town developed as a prosperous regional seat, its houses sheltering a fine collection of late 2nd-cent. mosaics. In the 4th cent. the density of occupation declined, though a rare example of a Roman-period church has been found outside the south walls. Medieval legend claimed for the town Helena, mother of the Emperor *\*Constantine I*, as a daughter of Old King Coel.

ASEC

**Cold War.** The antagonism between the USA and USSR lasting from the late 1940s until the late 1980s, 'cold' because it was waged through diplomatic and ideological means ra-

ther than force. Britain was allied to the USA. Britain's role in the emergence of the Cold War is controversial. One view is that war-ravaged Britain was marginal to the development of frosty American–Soviet relations, and that her encouragement of a permanent US military presence in Europe was largely related to fears of German revival. Cultural differences and the repressive nature of the Soviet regime would, in any case, have made lasting co-operation between the USSR, Britain, and the USA impossible. But others attach blame to Britain. Rather than seeking a 'third force Europe' or acting as a bridge between the USA and USSR, *\*Attlee's* foreign secretary Ernest *\*Bevin* (aided by *\*Churchill* whose 1946 'iron curtain' speech had a great impact in America) pursued a policy of fanning the flames of anti-Soviet paranoia in Washington in order to obtain US financial aid and military presence in Europe, this giving Britain the resources to attempt to sustain her empire. The Cold War came to an end with the collapse of Soviet power, largely as a result of its intervention in Afghanistan, and its progress towards democracy.

CNL

**Coldstream Guards.** The regiment is one of the oldest in the British army having been raised by *\*Cromwell* for General *\*Monck* in 1650. Their name derives from their march south in 1660 from Coldstream, on the Scottish border, to London where Monck helped to restore the monarchy.

RAS

**Colenso, John** (1814–83). Bishop of *\*Natal*. A Cornishman, Colenso was educated at St John's College, Cambridge, where he became mathematics fellow (1842–6). Originally an evangelical, he became, partly under F. D. *\*Maurice's* influence, a naïve radical. As first bishop of Natal (from 1853), his over-simplistic *Commentary on the Epistle to the Romans* (1861) and *Pentateuch* (1862–70) dismayed Liberals and played into Conservative hands. Bishop Gray of Cape Town, his metropolitan, deposed him (1863). When the Privy Council annulled his deposition (1865), Colenso was warmly welcomed back. Gray nevertheless publicly excommunicated him (1866) and appointed a successor. Colenso continued his successful Zulu ministry, creating a schism that lasted until 1911. He publicly supported the Zulus before and after their resounding victory over British troops at *\*Isandhlwana* (1879). He wrote a Zulu grammar, an English–Zulu dictionary, and a Zulu translation of the New Testament. His support of Cetewayo and the Zulus was worthier than his unwise sortie into theology.

WMM

**Coleridge, Samuel Taylor** (1772–1834). Poet and polymath whose collaboration with *\*Wordsworth* laid the foundations for English Romanticism. Their *Lyrical Ballads* (1798) opened with his 'Rime of the Ancient Mariner' and, although relations became strained, Coleridge's initial contribution cannot be gainsaid. Dogged by ill-health and self-doubt, his poetic career was brief and littered with unfulfilled projects: the incomplete 'Christabel'; 'Kubla Khan' famously interrupted by 'a person from Porlock'. As literary critic, if not the originator of the philosophical method he aspired to in *Biographia literaria* (1817), he gives a subtler account of language and morality than his predecessors. The charge of

plagiarism from Schlegel, Schelling, and the German Idealists cannot be dismissed by his airy confidence that 'Truth is a divine ventriloquist', but there is a continuity in his thought from before his visit to Germany in 1798, when Immanuel Kant was still 'utterly unintelligible'. Though no friend to \*Pitt's ministry, his 'baby trumpet of sedition' was already muted, and the political journalism of the *Watchman* (1796) and the *Friend* (1809) depended on 'placing the questions of the day in a moral point of view'. His last substantial work, *On the Constitution of Church and State* (1830), finds him staunchly defending them as 'two poles of the same magnet'. JNRS

**Colet, John** (1467–1519). Colet, cleric and educator, was born in London as the eldest child of Sir Henry Colet, mercer and twice mayor of the city, and his wife Christian Knyvet. After schooling in London, he probably attended Cambridge University before travelling to Paris and Orléans, and to Italy. He was in Rome in 1493, and perhaps in Florence: certainly he read intensively the Florentine Platonists Marsilio Ficino and Pico della Mirandola. About 1496 Colet began to teach in Oxford, gaining a reputation for his exposition of the meaning and application to life of the Pauline Epistles as well as studying the Neoplatonist Pseudo-Dionysius and the Genesis account of creation. Colet's piety and eloquence impressed Erasmus from their first meeting in 1499; he was later Erasmus' patron and helper. As dean of St Paul's from 1505 to his death of the sweating sickness in 1519, Colet refounded and endowed St Paul's School (1509). Erasmus advised him on its curriculum and in his *On the Basis of Study* (1511) characterized its Christian-humanist orientation; he also wrote for it pious, grammatical, and rhetorical handbooks. Colet's austerity and high-mindedness led him into conflict with his cathedral clergy. A forthright disputant, and powerful preacher to court and convocation, he was also from 1516—before Thomas \*More—a member of the king's council. His works remained in manuscript almost completely until they were edited in the 19th cent. JBT

**College of Arms.** Established in 1484 by Richard III to bring order into the approval of heraldic designs. Garter king-of-arms has precedence though his concerns are mainly with his order. Clarenceux king-of-arms looks after the area south of the Trent, Norroys king-of-arms the area north and Ulster. There are also six heralds and four pursuivants, under the overall control of the earl marshal. Scottish heraldry is the responsibility of the Lyon Office under Lord Lyon king-of-arms, assisted by three heralds and three pursuivants. The office of Lord Lyon descends from that of Sennachie, bard to the ancient Celtic kings of Scotland. JAC

**Collingwood, Cuthbert, 1st Baron** (1750–1810). The Newcastle upon Tyne-born Collingwood had no influence behind him, unlike \*Nelson, when he joined the navy in 1761; and again, unlike Nelson, with whom he was on terms of close friendship, Collingwood only obtained a captaincy when he was 30. The friends were strongly contrasted in temperament and physique, and Collingwood's reserve, which in fact concealed strong sensitivities, was very differ-

ent from Nelson's transparent quality. A common devotion to the service excluded rancour when Collingwood succeeded Nelson in no fewer than three of their earliest commands in the Caribbean; and a shared experience cemented an association which continued through correspondence during their years ashore 1786–93. In dauntless courage Collingwood was unquestionably Nelson's equal, but a natural stoicism assisted Collingwood to more balanced judgements. Present at the \*'Glorious First of June' battle 1794, and, pre-eminently, at \*Cape St Vincent in February 1797, Collingwood ruefully accepted not being within Nelson's command which resulted in victory at the \*Nile; and admiral rank only came in February 1799. At \*Trafalgar Collingwood commanded the lee division in *Royal Sovereign*, devastatingly opening the action at midday, the most resplendent hour of his life, and taking command of the fleet on Nelson's death at 4.30 p.m. Raised to the peerage, the overworked Collingwood died at sea in March 1810, but was buried close to Nelson in St Paul's. DDA

**Collins, Michael** (1890–1922). Collins is the best-known 20th-cent. Irish revolutionary leader, a template for guerrillas, and has been very romanticized. From a west Cork farming background, he moved to London at 15, and was active among exiled nationalists. He played a background role in Dublin during the \*Easter Rising. After internment, through an agency of \*Irish Republican Brotherhood, Collins became the key figure in the reorganized Irish Volunteers/\*Irish Republican Army. As director of IRA intelligence, he infiltrated all agencies of British rule in Ireland. Against his will, he was a negotiator at the Anglo-Irish conference of October–December 1921, revealing his pragmatism by signing the \*Anglo-Irish treaty. As chairman of provisional government January–June 1922, Collins uneasily presided over the establishment of the new state while striving to appease anti-treaty former colleagues. British insistence on the treaty terms led to his ordering the Dublin Four Courts attack in June 1922, beginning the civil war. While visiting pro-treaty troops as commander-in-chief and searching for a basis for peace, he was killed in a west Cork ambush on 22 August 1922. Rumour and speculation have since run riot on the circumstances of his death. Lately debate has centred on what Collins might have contributed to Ireland had he lived. Undoubtedly the pro-treaty side lost its most charismatic figure and the Northern Ireland government its most fervent opponent. MAH

**Collins, (William) Wilkie** (1824–89). Novelist. Collins, usually regarded as the pioneer of the detective story, was born in London, son of a painter. He began in the law, but took up writing professionally after publishing a biography of his father in 1848, and becoming a close friend of Charles \*Dickens, to whose magazine *Household Words* he contributed. His first big success was *The Woman in White* (1860), and he repeated it with *The Moonstone* (1868). He has been identified as an exponent of 'the novel of sensation', appealing to a less sophisticated readership with lurid plots of dark secrets, dastardly scoundrels, drugs, and insanity. Collins was unmarried but did not want for female comfort.

A splendid portrait by his friend \*Millais (1850) is in the National Portrait Gallery. JAC

**Colonial Office.** The changes in the status and structure of the Colonial Office mirror the vicissitudes of the British empire. For most of the 17th cent., while the American colonies were being established, there was no coordinating body at Westminster. The Privy Council exercised what supervision there was through a series of committees or councils, but distance and the chartered status of most of the colonies made control fitful. Not until 1696 was a Board of Trade and Plantations established under a president, working through the Privy Council. By 1768 the state of the American colonies was causing concern and a third secretaryship was created for the colonies, usually known as the American secretary. By 1782, with the rebellious colonies almost gone, both the third secretaryship and the Board of Trade were abolished, though the latter was revived in 1786. Colonial affairs went to the home secretary. In 1794, when the \*Portland Whigs joined \*Pitt, a third secretaryship was re-established under Henry \*Dundas, with responsibility for war and the colonies. Indian affairs meanwhile fell to the Board of Control, set up in 1784. These rather makeshift arrangements sufficed until 1854, by which time the second British empire was growing, and a fourth secretary of state with special responsibility for the colonies was created. This was a powerful cabinet post, especially when held by men of the calibre of \*Granville (1868–70, 1886) or Joseph \*Chamberlain (1895–1903). A further reorganization took place in 1925 when a new Dominions Office was created with its own secretary of state. The extraordinarily rapid decolonization in the 1960s left the Colonial Office with few territories to administer. The secretaryship was abolished in 1966 and the Colonial Office merged with the Commonwealth Relations Office. They were both integrated into the Foreign Office in October 1968. JAC

**Colquhoun, Patrick** (1745–1820). Born in Dundee, his career was almost entirely in business, although he became lord provost of Glasgow (1782–3) and city magistrate in London (1792–1818). He is best known for his *Wealth, Power and Resources of the British Empire* (1814). In this he provided estimates of national income; this was an influence upon socialist writers since Colquhoun claimed that unproductive labour, estimated as 20 per cent of the labour force, received over 30 per cent of the output. As a social reformer he was concerned with poor relief and with policing in London. He believed that poverty could be removed by better standards of education. His pamphlet *New and Appropriate System of Education for the Labouring People* (1806) was extremely influential at that time. JRP

**Columba, St** (d. 597). Founder, in 565, of the monastery of \*Iona, which contributed to conversion in Northumbria, Mercia, and Pictland. Born between 519 and 522 into the Cenél Conaill of Donegal branch of the northern royal Uí Néill, Columba had founded Derry in the 550s and possibly Durrow and Kells before his condemnation at the Synod of Teltown (Co. Meath), for involvement in the battle of Cúl Drebene (561), prompted him to be pilgrim-exile in the

southern part of \*Dalriada, where King Conall gave him Iona (574). Columba's major concern was the pastoral needs of Dalriada, but his visits to King Bridei facilitated 7th-cent. foundations in east Pictland. Revered in his foundations and their offshoots, including \*Lindisfarne, he was belittled by \*Wilfrid in debate at \*Whitby (664). This perhaps prompted Abbot Cumméne the White to compose a (lost) biography, used by \*Adomnán. Columba may have instigated the royal conference of Drumceat (Druim Cett) (575) which considered constitutional relations of the people of Irish Dalriada, with their king in Scotland, and with the Uí Néill high king. His political eminence may explain why he was regarded as one whose prayers gained victory for favoured kings, including \*Oswald. His crozier and a psalter associated with him were, later, taken into battle. His relics were translated c.849, to \*Dunkeld (Perthshire) in Pictland, and to Kells. AER

**Columbanus, St** (c.543–615). Born in Leinster (Ireland), Columbanus entered religious life as a young man. Fired with missionary zeal, he left the monastery at Bangor c.590 with twelve companions. His request to settle in the wastelands of Burgundy granted, he established monastic centres at Annegray, Luxeuil, and Fontaines. He greatly influenced the spread of monasticism in Gaul, attracting many followers. But adhering to Celtic traditions such as the dating of Easter, he provoked Frankish bishops whose authority he would not recognize, and whilst accepting the primacy of the papal see, he refused to conform with Roman practices. Driven out of Burgundy in 610 by Queen Brunhilde for criticizing her grandson's immorality, Columbanus worked briefly near Bregenz before settling in Lombardy, founding his great monastic centre at Bobbio, where he died. His rule reveals an extremely severe discipline and detailed penal code. AM

**Combination Acts, 1799–1800.** These Acts were directed against trade unions (combinations of workmen) when the government feared unrest and even revolution. Combinations were in fact already illegal under both common law and statute; the Acts were intended to simplify and speed up prosecution by summary trial. The Acts failed to crush the unions, consisting mainly of skilled artisans, but did force them to operate circumspectly or secretly. Repeal of the Acts came in 1824–5 after a campaign master-minded by \*Place and presented by Joseph \*Hume, and was followed by an immediate upsurge in trade union activity. JFCH

**comics** form the branch of the press and periodicals industry generally seen as providing children's entertainment. In their early days though, in the 18th and 19th cents., comics were very much an adult affair, often at the cutting edge of political reform struggles. Early examples include the satirical caricatures of \*Hogarth, \*Gillray, \*Rowlandson, and \*Cruikshank, often gathered together in 'strips' (with Rowlandson's Dr Syntax becoming one of the first cartoon heroes), or published in monthly magazines, such as the *Comick Magazine* (1796).

## 'commercial revolution'

Influenced by European publications, broadsheet or tabloid 'picture sheets' appeared through the 19th cent., such as the *Glasgow Looking Glass* (1825); with the most famous satirical magazine *\*Punch* starting in 1841, and its later rival *Judy* (1867) launching the most popular Victorian cartoon character Ally Sloper.

The standard 'comic' format was pioneered by James Henderson's *Funny Folks* (1874), an eight-page black-and-white tabloid weekly mixing text and pictures and selling for 1 penny. This format was exploited by Alfred *\*Harmsworth*, whose turn of the century Amalgamated Press revolution included the launch of the most successful of all comics, the half penny *Comic Cuts* (1890), with the perennially popular Weary Willie and Tired Tim. As part of the 'half penny boom', more comics offered sections for children, leading to a pre-First World War 'golden age' with comics like the *Rainbow*, and popular characters like Tiger Tim and the Bruin Boys. 'Twopenny coloureds' tended to be favoured by middle-class parents, while 'Penny Blacks' were the choice of the working-class reader. A famous entrant to the comic market in the 1930s was Dundee's D. C. Thomson, with the *Beano* and the *Dandy* gaining lasting popularity, while Amalgamated Press's *Film Fun* (1920), and *Mickey Mouse Weekly* (1930) showed the early influence of the cinema.

The comics industry was revolutionized from the 1930s and 1940s with the popularity of American 'comic books', especially Action Comics' superheroes such as Batman. A post-war 'moral panic' over some of the more lurid horror imports led to a temporary ban on US products, and a resurgence of the wholesome British tradition in *Eagle* (1950) and *Lion* (1952). The main phenomenon of the 1980s was the return of the 'adult' comic, with the success of the broad comedy of *Viz*, and the politically and ideologically complex world of 2000 A.D. and *Judge Dredd*, reminding the public that comics were not just for kids. DJA

'commercial revolution'. This preceded major industrialization by two centuries and encompassed great upsurges in overseas trade with many consequences, not least the expansion of Britain's fleet. Essentially an English phenomenon, later the Scots were also heavily engaged. Trade experienced three long periods of growth, separated by virtual stagnation. Between 1475 and 1550 existing markets for English broadcloths and other woollens grew rapidly, because the importing regions became more prosperous and had greater purchasing power. In the second period, 1630–89, two general circumstances aided expansion. South European markets, previously the domain of Spanish and Italian industry, were won by the English and the Dutch in competition with one another. The second general circumstance was the rise of virtually new trades because cheaper English re-exports of sugar, tobacco, and calicoes created fresh markets. The third period, 1730–60, was linked to the growth of American and West Indian populations, production, and purchasing power, but also continued the advance of re-exports.

In the first period English woollen cloth exports were the bulwark of overseas trade, the wool trade declining sharply

in the decade after 1510. In a period of inflation the quantity of cloth exported more than doubled by 1550; London gained at the expense of provincial ports, as trade with Antwerp grew and was controlled by the Company of *\*Merchant Venturers*. Interruptions to the Antwerp trade caused by wars gradually brought this phase of growth to a halt, although English merchants trading with Hamburg accessed central European markets via the Elbe. Another change after 1580, the revival of some provincial ports, also resulted from the collapse of the Antwerp entrepôt trade.

The second expansion in the 17th cent. can be largely attributed to the growth of exports to southern Europe. Demand suddenly increased in Spain and was then supplemented from Portugal and Italy. The northern trade declined in relative importance, and by 1700 accounted for only half of English cloth exports compared with nine-tenths in the early 17th cent. Light cloths or 'New Draperies' were attractive to these markets and increasingly beat Dutch competition, as English labour costs provided a cardinal advantage to these manufactures. Trade with Iberia also reached the Spanish and Portuguese colonies and thus the market was enlarged. The English cloth industry responded rapidly to changes in fashion and produced a greater variety of light cloths and textile mixtures. A substantial trade in salted and dried cod from the Grand Banks of Newfoundland was an additional source of exports to catholic Europe.

Several new imports in the period 1500–1750 provided exceptional profit margins and an incentive to exploration and mercantile enterprise. In the 16th cent. the chief imports were luxuries, especially French wine, but in the following century Spain and Portugal became important suppliers. Apart from wine, most imports were manufactures, bought in the Netherlands but produced in many parts of Europe. The gradual growth of British industry reduced the dependence on foreign manufactures in the 17th cent. One exception was European linens until the Scots and the Irish, protected by the *\*Navigation Laws* and a rising tariff wall, learned to copy and outdo continental producers during the 18th cent. Trade with the Baltic, mainly conducted in the 16th and early 17th cents. via the Netherlands, became more direct, first because of the activities of the *\*Eastland Company* (1579) and secondly because its profitability encouraged interlopers. In years of bad harvests Baltic corn was a standby, but after 1650 new raw materials were much more important. Amounts of timber, potash, tar, pitch, flax, and hemp increased as the navy and merchant marine grew, and Swedish iron also became important after 1650. From the Mediterranean came not only more wine but also wool, oil, raisins, figs and oranges, Italian silks, and Levant goods, including raw silk, mohair, cotton, and dyestuffs.

Trade with countries beyond Europe, insignificant before the Civil War, grew rapidly by 1700 when America and Asia accounted for a third of England's imports, and re-exports for nearly a third of all exports. The discoveries that Virginia could grow tobacco plants imported from Trinidad and that Brazilian sugar cane would flourish in the West Indies were fundamental to the later development of the Atlantic economy and of the triangular trade with Africa. The *\*East India*

Company (1600) began trading principally in pepper and then in cotton cloth; both tapped markets in Britain and Europe. Trade in slaves, sugar, coffee, tobacco, pepper, and oriental cottons underpinned the third great era of expansion in the 18th cent. before industrialization had proceeded far, America and the West Indies being much the most buoyant trading partners. Liverpool, Bristol, and Glasgow benefited most from these developments.

The Atlantic trade was controlled by merchant partnerships. If journeys were long or large capitals were required, the company form of organization was preferable. Once trade was established—even when companies claimed trading monopolies—the return to trading by partnerships was general. The \*Russia Company (1555), the \*Levant Company (1581), and the \*Royal Africa Company (1672) all succumbed to this pattern; only the \*Hudson's Bay Company (1670) retained control over its territory. The East India Company also survived and was much the most important in terms of trade and capital employed, but there were abortive attempts to displace it after 1698. In the 18th cent. it was markedly on the defensive, a highly profitable anachronism.

The 'commercial revolution' was important for its effects upon the British economy and the British state. It was buttressed by protective mercantilism, especially by the navigation laws; its result was the accumulation of capital from foreign trade and ultimately lower rates of interest than might have prevailed without this expansion. Foreign produce brought profits to distributors involved in inland trade. Merchant investment in land was probably more important than capital flows to industry, but the growth of London was exceptional in Europe. Pressure for domestic improvement was a major consequence of Britain's growing affluence, as her industries became increasingly attached to the international economy. JB

**Committee of Articles** (Lords of the Articles). A steering committee of the Scottish Parliament, dating back to the 15th cent. It prepared business and drafted legislation, each estate having equal representation. The royal government had strong influence over the committee and Parliament was given little opportunity for debate or dissent. In 1640 the committee was abolished, restored in 1660, and finally dismantled in 1690 after the \*Glorious Revolution. JAC

**Commius** was a Gallic noble who allied himself with Julius \*Caesar and was rewarded with the kingship of the Gallic \*Atrebatas. In 55 BC he was sent by Caesar to win over British tribes prior to the invasion, but was taken prisoner. Released at the end of the 55 BC invasion, he participated in the 54 BC invasion and was intermediary when \*Cassivellaunus sued for terms. In 52 BC he sided with the revolt of Vercingetorix in Gaul, and on his defeat fled to Britain founding a new dynasty of the Atrebatas in the Berkshire/north Hampshire area. ASEC

**common law.** The origins of the common law lay in the justice of the king, exercised through his \*curia regis, rather than the customary law exercised in the old communal

courts of shire and hundred, or the feudal law exercised by the lord in relation to his own vassals, free and unfree. In the reign of Henry I the justice of the king in his curia was sometimes invoked in favour of a subject, though justice was usually to be sought in the communal or feudal courts.

As overlord of all subjects, the king had a residual right to give justice to all, and as feudal lord of the tenants-in-chief he had the right and the duty to sit in his curia regis to hear their disputes, or to deal with matters relating to their feudal duties. Until the reign of Henry II, royal justice was available to subjects who were not tenants-in-chief only in exceptional cases, since the proper court for matters relating to land or tenure was the court of one's lord and other matters were the province of the court of shire or hundred. However, in the reign of Henry II, access to the king's justice was extended by the enactment of a principle that 'no man need answer for his freehold land without the king's writ being obtained'. As a result, the writ of right patent would issue to the lord ordering him to hear the case between his free tenants; where there was a dispute between tenants-in-chief, the alternative 'praecipe' form of the writ of right would be issued, ordering the defendant to return the disputed land or to appear before the king's justices to explain his refusal. Further, through the development of the Grand \*Assize and the petty assizes, disputants over land would have their case tried by an inquest of neighbours who gave a verdict on oath before the royal justices. As these royal writs and particularly the petty assizes became popular with litigants, so they increasingly sought the justice of the king's courts rather than the local or feudal courts, which slowly declined. This decline was caused by a number of factors, legal, social, and economic, but the influence of royal justice and the effectiveness of its procedures (e.g. petty assizes, trial by jury) led inexorably to the decline of rival systems of justice and the triumph of the king's justice or, as it came to be known, the common law.

The king's justice was dispensed by the itinerant justices of the curia regis and gradually the principles and procedures of the king's law grew from their practice, drawing on the customs of different areas of the country. When the courts of Common Pleas, King's Bench, and Exchequer developed as separate entities, the law they applied was the common law. By the time of Edward I there was in existence a 'common law'—the law administered in the king's courts throughout the land and therefore 'common' to the whole kingdom.

The term 'common law' came to be used of the English legal system and, generally, to describe a system where the law is built up through the decisions of the courts. Hence it is used to describe the legal systems of former colonies such as the majority of the USA and the member countries of the Commonwealth, which share the common law tradition. The term is also used to describe those rules and principles of law which are based upon the decisions of the courts as distinct from the rules and remedies which were applied in the Court of Chancery. Finally the term is used to describe rules of law which have been established by the courts as against laws which are formally enacted by Parliament (statute law). See also CIVIL LAW. MM

## Common Market

**Common Market.** See EUROPEAN ECONOMIC COMMUNITY.

**Common Pleas, Court of.** One of the three courts of common law. The Court of Common Pleas was an offshoot of the \*curia regis, the court which followed the king on his travels around the country. The insistence of \*Magna Carta led to a court being established in one place, clause 17 stating that 'Common Pleas shall not follow the king but be heard in some fixed place'. The court was based at Westminster Hall and decided controversies concerning civil cases between the king's subjects, cases involving claims to land, trespass, and debt. It kept its own records known as the *de Banco* rolls and in 1272 was given its own chief justice. In the Middle Ages it was the busiest of the common law courts and the most lucrative for the judges and early members of the legal profession who practised there. Over the centuries this position declined as other courts encroached on its jurisdiction and poached its cases. In the Judicature Act of 1873 the Court of Common Pleas along with the courts of Queen's Bench and Exchequer all became divisions of the High Court of Justice. Ultimately, they were all merged into the Queen's Bench Division in 1880. RAS

**Commons, House of.** From modest beginnings, the House of Commons has progressed until it shares effective sovereignty with the prime minister. Commoners were summoned to Parliament at first less for their advice than for their consent to taxation. Knights of the shire were first called to Parliament in 1254 and in Simon de \*Montfort's Parliament of 1265 they were joined by representatives from certain boroughs and cities. They were not necessarily summoned to every parliament at first, and might be dismissed before the Parliament ended, or held back for separate discussions. Early usage was extremely fluid, with committees and groups joining for plenary sessions. From the early 14th cent. the Commons began to meet as a separate house, usually in the chapter house of the abbey of Westminster. The knights stayed with the citizens rather than joining the baronage, with whom they had much in common, adding great weight to the Commons house. The lesser clergy, who had been represented in some of the early parliaments, dropped out after 1340 and used \*convocation, making it easier for the Commons to cohere as a body.

The Commons soon began to act as a channel for receiving petitions and took the lead in legislating to remove grievances. Their chief weapon was control of taxation and as early as 1395 the formula was in use that the grant was made 'by the Commons with the advice and assent of the Lords'. The principle of elective representation stood them in good stead in relation to both the crown and the Lords. At an early stage members took refuge in the reply that they must consult their constituents. The crown could and did intervene in elections and could create new parliamentary boroughs but its influence over the Lords was even more direct by the creation of peers. During the 18th and 19th cents. the House of Commons, through the prime minister, seized this prerogative and used it to bring the Lords to heel.

The use of Parliament by the Tudors to regulate the succession to the throne and to reform the church enhanced the

standing of that body. Two further developments helped to confirm the Commons' identity. In 1547 they were granted St Stephen's chapel as their meeting place and stayed there until the great fire of 1834. At the same time, the House began a formal record of its own proceedings, the *Journals of the House of Commons*.

The result of the great struggles of the 17th cent. was to increase the power of the Commons at the expense of the Lords. Indeed, when the Commons in 1649 galloped out of control, Lords and monarchy were abolished as 'dangerous and useless'. Though the pendulum swung back after 1660, the strengthened position of Parliament after 1688 helped the Commons, particularly by limiting the power of the crown to govern without Parliament or to retain a complaisant Parliament. This helped to neutralize the advantage that lords had, that they could lobby the monarch through the court and their privilege of direct audience. In addition the Commons reasserted its sole right to decide matters of taxation. Though the House of Lords retained considerable influence, the balance was further affected by the extensions of the franchise from 1832 onwards, which increased the Commons' claim to speak for the nation, and by a slow loss of faith in the hereditary principle. JAC

The starting-point of any discussion of the modern House of Commons is two related features—the near dominance of the executive and the ever-present power of the political parties. Romantic parliamentarianism looks back to a golden age in the mid-19th cent. that probably never was—the age of the private member.

Among the functions of the House of Commons, that of legislation would be given pride of place. But legislation bears the stamp of the executive, especially of the bureaucracy, rather than that of the Commons. Most important bills are introduced by the government of the day, which reflects both the privileges accorded in fact, if not always in name, to the government in the procedures of the House, and the quasi-monopoly of knowledge enjoyed by the executive. Popular criticism of the modern role of the House of Commons focuses on the alleged rigour of party control over the backbenchers, exercised through the whips, and tends to overlook the advantage the executive would have, even if the House were composed of 659 genuinely independent members.

Note first the long-standing rule that increases in taxation and expenditure can be imposed only on the proposal of the crown. Any private member who sponsors a bill that would increase public expenditure must either obtain the backing of the government or impose the new duties on local councils. More recent procedural changes allocate most of the time of the House to the government, an arrangement which rests ultimately on the government's control of its majority. Private members are allotted ten days a year for the discussion of their bills and the privilege of being awarded a day is decided by ballot. If a member's bill is controversial, there will be an attempt to 'talk it out'. If, at the end of the allotted time, the member seeks to move the closure, he faces two hurdles. The Speaker may think that the measure has not been adequately debated and may refuse to accept the motion: if a motion is accepted, it

may not be passed by the numbers required—a majority, with at least 100 members voting in that majority. Lacking the organization of the whips' office, the backbencher may simply not be able to ensure the attendance of 100 supporters; and if it passes this test but faces obstruction in standing committee, he will not, as the government can, be able to propose and carry a guillotine motion to limit the time spent debating his bill.

A second element of the strength of the executive in and over the House of Commons lies in its near monopoly of knowledge. Ministers are backed by an experienced and informed department: the backbencher has only his personal resources. Moreover, the way in which the House of Commons deals with legislation deprives it of the information it might have to counter the accumulated wisdom of the department. The principle of the bill is debated by the whole House, normally at second or third reading, but the detail of the bill is discussed in standing committee. These standing committees are neither permanent in composition nor specialist in subject-matter. Members may indeed have knowledge derived in their personal capacity but they do not through their work on bills develop a corpus of information to match that available to ministers. In the 1960s, the House made fitful attempts to form specialized select committees to inquire into particular areas of government activity, and these arrangements were extended, systematized, and made permanent in 1979. Service on these select committees certainly makes for more informed backbenchers. But the select committees do not themselves examine legislation: this remains the province of the transient and unspecialized standing committees.

The third feature is party loyalty and party organization. Virtually every member (bar the Speaker) is elected as the candidate of a party, and members most of the time vote in the House with their party. The cohesion of parties in the division lobbies of the House dates from the 1890s and reached its peak in the 1950s. Since 1966 there has been a perceptible decline in party cohesion, but conformity rather than rebellion remains the most prominent feature of backbench life.

Many explanations have been offered for the strength of party cohesion in the British Parliament. The whips have the task of mobilizing their party's backbenchers: popular mythology ascribes to them powers beyond their reach. The whips cannot in themselves deny reselection to a dissident member, though withdrawal of the whip, itself rare, can rouse difficulties with the member's constituency association. In both parties the hope of office, and in the Conservative Party the thirst for honours, may prompt the potential rebel back into line, bearing out the truth of Napoleon's observation that 'men are governed by baubles'. Members, most of the time, follow the party line, in voting if not in debate. But such behaviour usually poses no strain on a member's conscience. Most of the time the House is debating humdrum questions on which many members are uninformed. When the division-bell rings, members stream into the House, many having heard not a word of the debate, and ask the whips, 'Which is our lobby?' Sanctions, threats, and rewards become important on the great dra-

matic issues. But most of the time the House is not witnessing drama, but an ill-attended tedious ritual of claim and counter-claim.

Nevertheless, ministers do sometimes give way to disquiet voiced on the floor of the House; more often, they yield to the importunities of their backbenchers expressed through party committees or behind-the-scenes deputations. When the government has a narrow majority, the discontents of small groups of backbenchers will be listened to even more attentively.

The government then is the dominant force in the legislation passed by the House. But in exercising these and other powers it is accountable to the House. Traditionally this accountability was exercised most obviously through question time, but the value of question time is greatly exaggerated. The Blair government of 1997 curtailed it to one period per week, usually devoted to 'sound-bites' between the prime minister and the leader of the Opposition. The ordinary process of debate is another way in which members can highlight blunders, abuse of power, or mismanagement. But members may well be inhibited from embarrassing a minister of their own party by the delight it affords their opponents. The sanction against ministerial, or indeed departmental, incompetence is supposed to be that ministers who fail to convince the House of their competence and integrity will be obliged to resign, but the doctrine of individual ministerial responsibility is more myth than reality.

Today, the select committees, with all their limitations, are becoming the chief means by which ministers are made accountable to the House. Even though they do not debate legislation, they enable the House to scrutinize the work of the departments, and the publicity given to their reports is a salutary check upon ministerial evasion and bureaucratic complacency.

HB

**Commonwealth.** The Commonwealth took its origins from a vote by the \*Rump Parliament on 4 January 1649, four weeks after \*Pride's Purge, 'That the people are, under God, the original of all just power', and that they, the Commons, possessed supreme authority as the people's representatives. Two days later they set up the High Court of Justice which tried and sentenced Charles I. The abolition of the monarchy and the House of Lords followed, and another brief Act on 19 May formally declared England to be a Commonwealth. From February, executive authority was vested in a \*Council of State, accountable to the Rump, elected annually by it, and drawn mainly from its own members. The army's general council of officers adopted and presented a written constitution called an \*Agreement of the People (the second such), after modifying parts of it; it provided for biennial single-chamber parliaments, elected on a broad franchise by radically reformed constituencies. But the \*Levellers, who were part-authors of the agreement and resented the officers' tampering with it, wrecked any chances of its acceptance by denouncing the Commonwealth as a new tyranny and raising a serious mutiny in the army. In face of this and other threats, including Scotland's proclamation of King Charles II, the Rump shelved the agreement and forgot its promises of early elec-

## Commonwealth of Nations

tions. Enlarged by many newly readmitted members who had held aloof from the act of regicide, it settled into a more prolonged and conservative regime than the army had ever envisaged. It fought shy of reforms that might add to the Commonwealth's already disturbing unpopularity and restricted religious toleration with a Blasphemy Act, though it repealed the laws which compelled attendance at parish worship.

The Commonwealth expanded to include Scotland and Ireland after the army's conquest of those countries. Its foreign policy became expansive too, and the \*Navigation Act of 1651, which challenged Dutch domination of the carrying trade, was one factor that led it into war with the United Provinces in 1652. This dismayed \*Cromwell, whose ideal was a united protestant interest in Europe. The Rump's materialist outlook and evident aversion to 'a godly reformation' brought it under increasing pressure from the army during 1652 to make way for a successor. Eventually it did introduce a bill for a new parliament to meet in November 1653, but its contents (which do not survive) left the army unsatisfied, and Cromwell in a rage expelled the Rump on 20 April. The brief experiment of a nominated assembly (\*'Barebone's Parliament', July–December 1653) ended in its own abdication, and on 16 December the Commonwealth gave way to the Cromwellian \*Protectorate.

It was briefly restored in May 1659, after a coup by the army against Richard \*Cromwell, but renewed quarrels between the officers and the Rumpers soon exposed the political bankruptcy of both. Republicanism had struck few roots in England, and General \*Monck was enthusiastically acclaimed when he opened the way to the Restoration by readmitting the members 'secluded' in Pride's Purge on 21 February 1660. AHW

**Commonwealth of Nations.** The husk of the old \*British empire, an accidental by-product of history. The only thing its member states apart from Britain have in common is that they were once her colonies, though Mozambique, not a former colony, was admitted in 1995 as a special case. Not all her ex-colonies are members: the future USA for example liberated themselves before the idea was thought of; some colonies, like \*Burma and \*British Somaliland, declined to join from the beginning; and the \*Irish Free State, \*South Africa, and \*Pakistan were once members but later (in 1949, 1961, and 1972 respectively) left. Nevertheless the present Commonwealth comprises Britain and most of her old empire: around 54 states, scattered over all the inhabited continents, with a population estimated (in 1994) at 1.4 billion.

The term 'commonwealth', in this context, dates from the turn of the century, and grew out of the realization that already several of Britain's older-established colonies were self-governing in all essential respects. To call them 'colonies', or collectively an 'empire', appeared to under-value their real independence, and the new word was felt by some to express better the form the empire would take: a union or federation of equal nation states, united for the common good of the whole. An important catalyst for this transformation was the \*First World War. This had the dual effect of reminding the \*dominions of their continued sub-

jugation to Britain in some ways—when George V committed the whole empire to the war it was without formal consultation with them—while at the same time emphasizing their importance and sense of individual national identity. By the time the next world war came around, each dominion was allowed to decide for itself whether it would join in. (Canada, Australia, and New Zealand were generous with their contributions; South Africa, many of whose whites felt more affinity with the Nazis, less so.) This development was not to everyone's liking, however. Enthusiasts for the 'commonwealth ideal' had generally envisaged the dominions taking an equal share in the formulation of policies that would then be common to them all. Instead it took an entirely different turn, and came to mean that they would have equal rights to separate policies of their own.

This privilege was established in the early 1920s, after disputes within the Commonwealth over the Washington naval conference of 1921–2 and the \*Chanak affair in 1922. In 1923 Canada became the first dominion to conclude a treaty with a foreign power (the Halibut Fish treaty) without reference to Britain; and the pattern for the future—of independent partnership—was set. It was formalized by an important pronouncement of the 1926 imperial conference, defining dominion status; and by the 1931 statute of \*Westminster, which confirmed the dominions' legislative autonomy. For the moment this only applied to colonies of European settlement (the full list at that time was Canada, Newfoundland, Australia, New Zealand, Eire, and South Africa), and not to the 'non-white' colonies. That changed in 1947, when the newly independent nation of India was admitted to the Commonwealth. That established the character of the 'multiracial' Commonwealth as it exists today.

As \*decolonization progressed, the other ex-colonies followed. Most old imperialists regarded this process with pride. Some of them indeed saw the new Commonwealth as the culmination of the empire, the goal to which its evolution had been directed for a hundred years or more. In a way it was, for there had always been a strong tradition of what was called 'trusteeship' in British imperial thought. It was also widely hoped that the Commonwealth might prove to be a powerful political and economic force in the world, all the more powerful for being free, and so revive Britain's flagging 'great power' status and role. Labour ministers were prone to this as well as Conservatives. For this reason the Commonwealth has been criticized for seducing Britain away from her continental neighbours, during the years when western Europe was evolving an alternative supra-national structure of its own.

The idea that the Commonwealth could be a kind of empire-substitute, however, was soon shattered. The newest members regarded their hard-won national independence jealously, and were unwilling to co-operate together merely to give Britain a further lease of international life. There were sharp clashes between members, arising from past memories that were hard to eradicate, conflicting economic interests, and differences of principle, especially over the issue of apartheid, which forced South Africa to leave in 1961. (It rejoined in 1994.) Widely dispersed as they were,

and differentiated in almost every possible way, it would have been remarkable if the member states had easily and naturally cohered. So the Commonwealth became much less than the united 'third force' in the world that the imperial optimists had envisaged; something quite different, though still worthy of respect.

As it stands now, it is totally unlike any other international organization of states that has existed before. It has a secretariat, and a secretary-general (set up in 1965), but little else in common. It has no power, no united policy, no common principles, and no shared institutions. There used to be a common citizenship, with Britain allowing unrestricted entry to all Commonwealth citizens, but her Immigration Act of 1962 put an end to that. Most member states are parliamentary democracies, but not all. Most have retained English legal forms, but not all. Most play cricket, but not all. The single constitutional feature common to all member states is that they acknowledge the British monarch as symbolic head of the Commonwealth, but fewer than half recognize her or him as the head of their own states. It was once thought of as an economic unit, a potential free (or preferential) trade area, but that was never convincing, and collapsed when Britain joined the \*European Economic Community in 1973. Another blow was the raising of British college fees for overseas students in 1979. The interchange of bright young people had been a valuable way of fostering Commonwealth solidarity. That was no longer felt to be a priority, however, in the narrowly utilitarian climate which prevailed at that time.

Nevertheless the Commonwealth still serves a purpose, as a forum for informal discussion and co-operation between nations of widely disparate cultures and material conditions. That function is served by a host of specialist Commonwealth institutions (the Commonwealth Institute in London, the Commonwealth Parliamentary Association, the Association of Commonwealth Universities, the Commonwealth of Learning, and so on); and by biennial conferences of Commonwealth heads of government. The ideal it represents still flickers, albeit fitfully. Only time will tell whether the Commonwealth is a mere footnote to history, or the beginning of a new chapter.

BJP

Mansergh, P. N. S., *The Commonwealth Experience* (1969); Miller, J. D. B., *The Commonwealth in the World* (1965).

**Common Wealth Party.** Formed in 1942, Common Wealth was a merger of a movement Forward March, formed by the Liberal MP Sir Richard Acland, and the 1941 Committee of the playwright J. B. Priestley. An idealistic, socialist party, its membership was heavily middle class. Its two main themes were common ownership and vital democracy. The major parties had an electoral truce during the war. This gave a great fillip to Common Wealth, which won Conservative seats at Skipton and Eddisbury: it also supported an independent candidate who won easily in West Derbyshire. The party's application to Labour to affiliate was rejected, but it won another sweeping victory in April 1945 at Chelmsford, a safe Conservative seat.

Once the electoral truce was over, Common Wealth suffered the fate of most new parties in Britain. At the general

election it held only Chelmsford, where Labour did not run a candidate. After the election, Acland called upon the party to dissolve and for its members to enrol with Labour as individuals. The success of Common Wealth, though fragile, foreshadowed the Labour victory of 1945. HB

**Communist Party of Great Britain.** During the First World War the \*Social Democratic Federation changed its name to the British Socialist Party, remaining affiliated to the \*Labour Party. The success of the Bolshevik revolution produced a realignment of the left and the Communist Party was founded in 1920. Its purely tactical request to the Labour Party for affiliation was rejected, but it gained two MPs in 1922, one of them under Labour colours. Such strength as the new party had was largely in south Wales and industrialized Scotland. The *Daily Worker* was started in 1930 but absorbed much of the energy of the party in trying to keep it going. Modest success came in 1935 when Harry Pollitt polled 38 per cent of the vote in East Rhondda and Willie Gallacher won the West Fife seat. The party pursued a grimly Stalinist line and the outbreak of the Second World War produced vigorous intellectual gymnastics. The anti-fascist conflict to be won at all costs in September 1939 became an 'unjust and imperialist' war a month later when Stalin, now in alliance with Hitler, made it clear that his British comrades had made a false diagnosis. The German attack on the Soviet Union in 1941 produced another reappraisal and the Communist Party had some success, by association, in 1942. But no great breakthrough followed, and though the party returned two MPs in 1945, 12 of its 21 candidates lost their deposits. Worse was to follow when the development of the Cold War and the growing evidence of Stalin's tyranny forced it onto the defensive. At the general election of 1950, it put up 100 candidates, lost both its seats, and forfeited 97 deposits. The collapse of the Soviet Union in 1989 forced another reappraisal. One group resolved to change its name to the Democratic Left: their opponents retained the old name. But at the general election of 1997 the five Communist candidates polled one-eighth of the collective vote of the Monster Raving Loony Party. JAC

**commutation** was the change from meeting feudal obligations in labour or in kind to cash payments. It had obvious advantages for the lord, since serf labour was often grudging and unenthusiastic and hired labour did not need the same army of organizers: the serf or tenant knew more precisely what his obligations were and could plan his time. Boon work at harvest time was slowest to be commuted since there was bound to be a temporary shortage of labour then. The rate at which commutation took place varied from manor to manor and from region to region, according to local supply and demand of labour, nor was there a regular and steady progress towards a moneyed economy. But a process which began in the 12th cent. accelerated in the 14th, and was almost completed by the 16th cent. JAC

**companies, trading.** Trading companies monopolized overseas trade, made great fortunes, and played a part in the history of imperialism. The state supported their power and the companies made the state rich. The most important

## compositions of delinquency

early English example was the Merchants of the \*Staple which ran the wool trade from the 12th to 14th cents. It was followed, at the end of the 15th cent., by the \*Merchant Venturers of London, monopolists of the expanding cloth industry's overseas trade. An Act of Parliament (1497) and a charter from Henry VII (1505) recognized the company's monopoly authority.

In the last quarter of the 16th cent. English overseas trade boomed and piracy was rampant. Company ships armed to fight pirates also defeated trading rivals and monopolized foreign trade. The French, Spanish, Russian, Barbary, Levant, and Eastland (Baltic) companies all date from this time. However the development of an effective navy at the end of the 17th cent. put an end to the need for monopoly trading in Europe; only those companies that went across the world still needed to protect themselves.

In the later 18th cent. trading companies became involved in imperialism: in Bengal, the \*East India Company (royal charter, 1600) administered taxes and justice and the \*Africa Company aided the growth of imperialism in Nigeria, east Africa, and Rhodesia. WMM

**compositions of delinquency** was the term used by Parliament in the Civil War to describe the confiscation of property to be imposed on royalists wishing to compound or come to terms. They balanced between the need to raise revenue and the political desire to attract deserters from the royalist cause. An ordinance in March 1643 sequestered all property but in August one-fifth of the income was to be returned for the upkeep of wife and children. In January 1644 royalists were allowed to compound on the basis of two years' purchase of their estate, though they had first to take the covenant and swear never again to take up arms against Parliament. By the autumn of 1644 one royalist reported that 3,000 had compounded and 'daily more go'. JAC

**comprehension.** The Elizabethan religious settlement attempted to comprehend all from catholic to Calvinist under cover of liturgical uniformity, royal supremacy, episcopacy, and the Thirty-Nine Articles. Excepting recusants, this was largely successful until after the \*Interregnum, the sectarians' heyday. By failing to achieve comprehension through modified episcopacy, the \*Savoy conference of 1661 ended in schism—the exclusion of 936 non-episcopalians from their livings. Further attempts to include sectaries within the church through comprehension bills (1668, 1678, 1689) failed, for most bishops, including \*Sheldon and \*Sancroft, stood by the \*Clarendon code. It was, for Tories, unthinkable to have a national church with sectaries outside. Despite the loss of 18th-cent. methodists, later archbishops have prevented further schism by retaining within tighter boundaries evangelicals, liberals, Anglo-catholics, and, more recently, opponents of women's ordination. Plurality of belief within defined limits of creeds, episcopacy, Scripture, and sacraments is a hallmark of Anglicanism. WMM

**Compton, Henry** (1632–1713). Bishop of London. Royalist son of the earl of Northampton, Compton had a spell in the new Horse Guards (from 1661), before graduating from

Queen's College, Oxford (1666). Following ordination he was successively canon of Christ Church (1669–74), and bishop of Oxford (1674–5) and of London (1675–1713), where he was also responsible for the education of Princesses Mary and Anne, James's protestant daughters. Dedicated to national stability, he viewed sectarian turbulence and Romanism as equally dangerous. James II suspended him (1685). He was one of seven inviting William to England (1688) and in the crisis he appeared at Oxford in full military attire. Restored to his see, he briefly acted as primate, crowning William and Mary (April 1689), during \*Sancroft's suspension, though soon afterwards the Canterbury chapter appointed \*Tillotson to act instead. Essentially moderate, he was neither a dedicated Whig like \*Tenison and \*Burnet, nor a fervent Jacobite, like his friend \*Atterbury. WMM

**compurgation** or law-wager was an Anglo-Saxon defence against an accusation by bringing a number of persons to testify to one's innocence as character witnesses. The laws of King \*Ine laid down rules for the status of the compurgators and the number needed to answer to particular charges. The compurgators were not strictly witnesses nor jurymen, and the number varied, though was commonly twelve. The practice gradually fell into disuse after the Norman Conquest, though it survived for centuries in matters of debt. Clearly it contributed an element to the jury system which replaced it. JAC

**computing and information technology.** Computing science developed as an aid to mathematics. John \*Napier, the discoverer of logarithms, described in 1617 a calculating machine made of ivory rods ('Napier's bones') which, he explained, would have helped the laborious calculations that 'ought to have been accomplished by many computers'. Pascal in France developed an arithmetical machine in the 1640s, which Leibniz improved upon, and Sir Samuel Morland, once \*Pepys's tutor at Magdalene College, Cambridge, invented not only a speaking trumpet, writing-machine, and water-pump, but a calculating device: 'very pretty, but not very useful' was Pepys's laconic verdict. Charles \*Babbage is rightly regarded as the immediate pioneer of computers, but the limitations of his work should not be ignored. His 'difference engine' was never completed (in *The Decline of Science* (1830) he blamed this on inadequate government funding—a cry that has been heard since) and his machine was purely mechanical, whereas modern computers depended upon electronic developments. But his later 'analytical engine', which Babbage admitted was no more than a 'shadowy vision', would have been not merely a calculator, using punched cards, but would have included a storage facility and a print-out. The Scheutze father and son in Sweden produced a commercially viable tabulating machine in the 1850s, one of which was used by the British registrar-general. In America, Hollerith, working on census returns, developed a machine using electric current and capable of analysing returns at speed. His Tabulating Machine Company (1896) was the forerunner of International Business Machines (IBM), which dominated the computer market for many years.

By the end of the 19th cent. the use of computers for purely statistical purposes was well established. Their introduction to a wider public came essentially after the Second World War. At Bletchley Park, a high-powered British team succeeded in cracking the German Enigma code, with the assistance of Colossus, specially designed to analyse German messages at speed and identify correlations. Early main-frame computers were enormous monsters. IBM's Automatic Sequence Controlled Calculator (ASCC, 1944) was 51 feet long and weighed 5 tons. Not until the invention of the microchip (integrated circuit), which evolved in the late 1950s out of work on semiconductors and transistors, did the possibility of personal computers arrive, changing access to computing out of all recognition and liberating users from the domination of experts. Digital Equipment Corporation introduced its PDP-8 microcomputer in 1963 and was followed by a host of competitors. Even so, the first acquaintance of ordinary people with the new technology was likely to have been with pocket calculators ('ready reckoners'), which led to a debate on whether they should be used in schools and universities and what effect they would have on mental arithmetic. But by the 1980s computers, long established in offices, turned up in stores, municipal administration, and libraries, and increasingly in spare bedrooms and basements. Babbage had been convinced that his work demonstrated the argument from design and that the world operated as a great calculating-machine, programmed by God. But, as with many discoveries, the excessive claims of pioneers and salesmen have become more sober. Computer manuals discuss chaos theory, expensive Ariane rockets blow up on launch (1996), and it is worth remembering that Babbage lost a great deal of money trying to invent an infallible scheme for winning on horses.

JAC

**Comyn, John** (d. 1303), known as the 'Red Comyn'. A guardian (regent) of Scotland during the effective interregnum between Alexander III's death (1286) and John Balliol's accession (1292). Sometimes wrongly called the 'Black Comyn' by historians, he was in fact known to contemporaries as the 'Red Comyn', a title usually taken by the head of his family, the most influential baronial dynasty in 13th-cent. Scotland. He held the great Highland lordships of Badenoch and Lochaber, and estates in many other parts of Scotland. He helped to negotiate the treaty of \*Birgham and subsequently supported Balliol, his brother-in-law, as king of Scots. He submitted to Edward I in 1296, but had joined William \*Wallace by December 1297.

KJS

**Comyn, John** (d. 1306), known as the 'Red Comyn'. Son and heir of John \*Comyn, he was a leading Scottish patriot, despite appearances to the contrary—not least his murder by Robert Bruce, the future king. A devoted supporter of his uncle King John Balliol, he remained steadfastly loyal after Balliol's enforced abdication, and served from 1298 as a guardian or regent of Scotland in Balliol's name. Though he had established himself as the most powerful political figure in Scotland, he was unable to halt Edward I's massive campaign against the Scots in 1304, when he and other Scottish leaders had to submit. John's murder by Bruce and his

companions in the Franciscan church, Dumfries, has been variously interpreted. Most likely, it was provoked by his refusal to desert Balliol and support Bruce's bid for the throne.

KJS

**Confederation of British Industry** (CBI). The CBI emerged in 1965 from a group of older employers' organizations, the Federation of British Industries, the British Employers' Confederation, and the National Association of British Manufacturers, and like its predecessors aimed to influence economic decisions taken by governments. A subscription organization with a permanent staff, its origins in 1916 were relatively modest, but by 1939 the Federation of Business had a membership of about 2,900 firms and 180 trade associations, successfully lobbying the chancellor of the Exchequer. Governments in the 1960s and 1970s saw it as a partner with the \*Trades Union Congress in attempting to impose prices and incomes policies. In the period since 1980 its quarterly forecasts for the British economy and its sectoral surveys have been an important element in testing the effects of fiscal and monetary policy. It is the most powerful lobbying group on behalf of employers.

JB

**Congested Districts Board** (Ireland). The board was set up in 1891 by \*Balfour when chief secretary for Ireland as the positive side of his policy of firmness and reform—to kill \*Home Rule by kindness, it was suggested. The objective was to alleviate the dire poverty of the west of Ireland by providing funds for land purchase, building bridges and light railways, improving drainage, and sponsoring industries. Its resources were strengthened by George Wyndham in 1903. Before it was replaced in 1923, the board achieved much, but it did not kill Home Rule.

JAC

**Congregation, Lords of**, 1557. A group of Scottish nobles who, in a 'Common Band' dated 3 December, pledged their lives to maintain, set forward, and establish the reformed religion in Scotland. Signed by the earls of Argyll, Glencairn, and \*Morton, Lord Lorne, and Erskine of Dun, this 'Common Band', or covenant, was a protestant response to the increasing domination of Scotland by France during the regency of \*Mary of Guise, and the maintenance of catholicism as the established religion. More significantly, this protestant manifesto signalled the emergence of the Lords of the Congregation as an organized political force in Scotland.

PER

**congregationalists** were one of the main protestant dissenting sects. Since they believed strongly in the autonomy of each congregation, they were also known as independents or separatists. Their ideas, based on the priesthood of all believers, were developed by Robert \*Browne and Henry \*Barrow, and were \*Calvinist in tone. The first congregations were established in the late 16th cent. and increased rapidly during the Civil War period, particularly in the parliamentary army and under the protection of \*Cromwell, himself an independent. They made little progress in the 18th cent., but another great expansion took place in the early 19th cent. and at the time of the religious census of 1851 they were said to have 3,244 churches in England and

## Congress system

Wales—more than the \*baptists though less than a third of the \*methodists. They were vigorous supporters of the \*London Missionary Society (1796) and the \*British and Foreign School Society (1807). The Congregational Union, formed in 1831, was necessarily a loose federation: in 1966 it was reorganized as the Congregational Church and in 1972 joined with the Presbyterian Church of England to form the United Reformed Church. JAC

**Congress system.** Formally set up by article VI of the \*Quadruple Alliance, signed with the second treaty of \*Paris (20 November 1815). It had been foreshadowed in the treaty of \*Chaumont of March 1815, when the principal allies in the last coalition against Napoleon—Austria, Great Britain, Prussia, and Russia—resolved to remain united after the war to safeguard the peace settlements. Congresses met four times, at Aix-la-Chapelle (1818), Troppau (1820), Laibach (1821), and Verona (1822). The Aix-la-Chapelle meeting was harmonious. The allied army of occupation in France was to be withdrawn and France admitted to the union. Britain and France did not send representatives to the Troppau meeting, which had been called by the tsar to consider revolutionary outbreaks in Spain and Italy. The three eastern powers signed the Troppau declaration, asserting their right to intervene against revolutions. The British foreign secretary, Lord \*Castlereagh, strongly resisted this interpretation in his State Paper of May 1820. The Troppau meeting was adjourned to Laibach but little was settled. The last congress, at Verona, discussed mainly Spain. Britain had to acquiesce in French intervention there. The congress system broke down because of the divergent aims of its members, the eastern powers wishing to use it to 'police' Europe, Britain insisting that it was intended only to secure the peace settlement and should not intervene in the domestic affairs of other countries. But it foreshadowed the peacekeeping efforts of the \*League of Nations and the \*United Nations in the 20th cent. MEC

**Congreve, William** (1670–1729). English poet and playwright. Educated at Kilkenny School and Trinity College, Dublin, at the same time as Jonathan \*Swift, Congreve quickly gave up law for literature. After *Incognita* (1691)—a prose fiction more notable for its preface than its plot—Congreve found his *métier* in witty comedy, establishing his reputation with *The Old Batchelour* (1693), *The Double Dealer* (1693), and *Love for Love* (1695). Distinctive for their less ambiguous morality, epitomized by the love-match between Millamant and Mirabell which resolves *The Way of the World* (1700), Congreve's plays marked a significant development from earlier Restoration comedies. Disappointed by the reception of this last play, however, Congreve gave up writing for the stage, and the rest of his slim output was mostly poetic. Comfortably off as the holder of various government positions, but in poor health, Congreve was friendly with most of the literati of his day, regardless of party. JAD

**Connacht** (Connaught), taking its name from the mythical Irish figure, Conn of the Hundred Battles, was, by the 8th cent., dominated by the Uí Briúin dynasty, their ruling seg-

ment at the time of the Anglo-Norman invasion being the powerful O'Connor line, whose ecclesiastical capital at \*Tuam was established as an archdiocese in 1152. Their hegemony was threatened by Anglo-Norman colonization in the 13th cent., led by the de Burgh family, but when the last member of the direct line of the de Burghs was killed in 1333, power in Connacht was shared between their cadet lines (generally known as Burkes) and several lines of the O'Connors and other Irish dynasties. The establishment of the presidency of Connacht in 1570 and the shiring of the province thereafter led to piecemeal plantation, while in the aftermath of the rebellion of \*1641 surviving catholic landholders throughout Ireland were transported there, a process summed up in the aphorism ascribed to \*Cromwell 'To hell or Connacht!' It played a significant part in the \*1798 rebellion, witnessing the landing of the French General Humbert at Killala and a briefly successful campaign, and Connacht was also the scene of much activity in the Land Wars of the late 19th cent., most memorably in the incident involving the land-agent Captain \*Boycott which added the latter word to the English language. SD

**Connolly, James** (1868–1916). Author and union leader, Connolly was the most important Irish socialist in an intellectual and organizational sense. Though unsuccessful in an attempt to reconcile socialism and nationalism, he remains a great influence in Ireland and Scotland. Born in Edinburgh, Connolly joined the British army. Self-educated, he became a socialist organizer in Belfast and Dublin, founding the Irish Socialist Republican Party 1896 and 'the Workers' Republic' 1898. From 1902 to 1910 he was in the USA, where he set up the Irish Socialist Federation and published the *Harp*. Returning to Ireland in 1910, he organized the Irish Transport and General Workers' Union with James \*Larkin and led the strike following a lock-out in 1913. Badly wounded in the \*Easter Rising, he was executed strapped to a chair. Irish republican socialism has never recovered from his loss and has struggled to explain his blood-sacrifice. He published *Erin's Hope* (1897), *Labour in Irish History and Labour, Nationality and Religion* (1910), and *The Reconquest of Ireland* (1915). MAH

**Conrad, Joseph** (1857–1924). Writer. Conrad was born in the Ukraine, son of a revolutionary who was sent into internal exile. His mother died when he was 7, his father when he was 12. He went to sea, first visiting England in 1878 and becoming a British citizen in 1886. Though he never spoke English fluently, he wrote in it, publishing *Almayer's Folly* in 1895. It was followed rapidly by *An Outcast of the Islands* (1896), *The Nigger of the 'Narcissus'* (1897), *Lord Jim* (1900), and *Nostromo* (1904). Conrad published prolifically, making money on *Chance* (1914). He gained great recognition and declined a knighthood in his last year. Conrad drew on his own experiences at sea to write adventures with an important moral dimension. In *Lord Jim*, based upon a real episode, Jim, chief mate of the *Patna*, 'eaten up with rust', abandons ship unnecessarily, is disgraced, and redeems himself by sacrificing his life. 'Heart of Darkness' (1902), a long short story, based on Conrad's time in the Congo, is, among other things, a sharp critique of imperialism. JAC

**conscription.** In 1914 Britain was the only great power which relied upon volunteers to man its army. This tradition was continued until January 1916, by when nearly 2.5 million men had volunteered to join \*Kitchener's New Armies. But by the summer of 1915 the flow of volunteers was failing to keep pace with the anticipated rate of casualties. Between June 1915 and May 1916 the \*Asquith coalition government was convulsed by the conscription debate. Anti-conscriptionists argued that if more men were taken for the army, industry would have too little labour and Britain would be bankrupted before the army won the war. Pro-conscriptionists retorted that without conscription there would be no military victory. Asquith compromised. In January 1916 legislation was passed conscripting single men, followed in May by a second Act conscripting married men. By the end of the war nearly 2.3 million men had been conscripted, and without their efforts the British army would have collapsed long before the armistice. In 1939, conscription was introduced at once. DF

**Conservative Party.** The less reformist of the (normally) two main parties in British politics. It has a longer history than any other political party, perhaps anywhere, with an institutional continuity under that name from the early 1830s, though it drew upon older traditions including a church and king \*Toryism. (In common currency 'Tory' has often been interchangeable with 'Conservative'.) The matrix of 19th-cent. Conservatism lay in the younger \*Pitt's government, a cause given wider appeal and by its resistance to the \*Jacobinism of revolutionary France. Constitutional and societal conservatism united the old \*court party (largely placemen under Treasury patronage) and most of the country gentlemen in the Commons. A long near-monopoly of government ended only in 1830 when issues like \*catholic emancipation and parliamentary reform broke up old solidarities. The loss of office and Treasury patronage (itself in decline) forced the organization of an independent party from a position of opposition. The Reform Bill struggle of 1831-2, though a defeat, was a crucible of party development and the newly named Conservative Party set itself to limit further damage to established institutions. The \*Carlton Club, founded in 1832 and moved to Pall Mall in 1835, symbolized this development. \*Wellington and \*Peel were the recognized leaders, though the latter's \*'Tamworth manifesto' of December 1834, a statement of political strategy, was not a party document.

The party operated within the framework of the parliamentary constitution and its organization helped to fill the gap left by the decline of the crown's influence in the 'making' of a House of Commons. It was in competition with the rival Whig Party, which, with its radical allies, developed into the \*Liberal Party. The disintegration of the Liberals in the early 20th cent. meant the Conservatives' main challenge came from the trade union-based Labour Party mobilizing the working-class vote. That change also involved a shift in the dominant issues. The Victorian Conservative Party was identified with the defence of the constitution and the causes and interests associated with it: the monarchy and House of Lords, the established churches, the

Union with Ireland, landownership, property rights and inheritance, a limited franchise. Always associated, particularly at the parliamentary level, with wealth and privilege, it also reflected vertical divisions in society: church against chapel, land and agriculture against industry, the countryside against the larger towns. From around the Great War these traditional causes were largely superseded by socio-economic issues, a change assisted by the Irish settlement, the Bolshevik revolution, and economic depression. The main threats identified by the party were now trade unionism, egalitarianism, redistributive welfare, socialism, and Bolshevism. The Conservatives became more a party of business (companies and entrepreneurs took over its main financing) and more clearly the party of middle-class interests. Its leaders now came to be drawn from the business and professional classes rather than the landed and titled. The 1951 general election's overwhelmingly Conservative middle-class vote represented a peak of class-based voting. At the same time nearly a third of the enfranchised working classes has usually supported the Conservatives for reasons of patriotic identity, resentment of immigrant groups, hostility to catholics or dissenters, or just a sense of economic interest.

The party's history has a pronounced periodization. After the long dominance of constitutional loyalism down to 1830, the Conservatives spent most of the period 1830-86 in opposition. Only two general elections, 1841 and 1874, were won. Franchise extensions and advancing urbanization and industrialization handicapped the party and its 1846 split over the \*Corn Laws left long-term damage. It then benefited from the comparable Liberal split over \*Irish Home Rule in 1886 and was maintained in office by the \*Liberal Unionists for most of the next 20 years. (The two parties merged as the Conservative and Unionist Party in 1912.) Though hit by the Parliament Act removing the absolute veto of the Conservative-dominated House of Lords in 1911 and by the progress of Home Rule, the Conservatives gained from the Great War, which brought them back into government and divided the Liberals again. Faced with three-party politics and the first Labour governments in the 1920s, the Conservatives, who gained most of the disintegrating Liberal vote, established themselves as the dominant party, despite the impact of economic depression, and controlled the \*National Government coalition from 1931. The Second World War undermined this position: it brought Labour into government and to the management of the 'home front', and the 1945 general election was lost decisively by the Conservatives. The 1945-51 Labour government established a 'post-war consensus' around a mixed economy, the welfare state, and a commitment to full employment. Conservative governments from 1951 to 1964 were founded on acceptance of this legacy as well as upon rising living standards and Cold War diplomacy. What was left of the colonial empire was liquidated, a process now seen even by most Conservatives as a legitimate application of democratic self-government. The party had come to terms with full democracy (except in its own internal structures where hierarchy and the notion of 'leadership' continued to appeal). With the breakdown of this domestic consensus

## consistory courts

by the 1970s under pressure of rising inflation, labour disputes, increasing unemployment, and declining economic competitiveness, the party turned (perhaps returned) sharply towards the free-market economics represented by the \*Thatcher government of 1979–90. This tenure of office and four successive general election victories were assisted by divisions within the Labour Party and the opposition generally. Though the 20th cent. stood more than the 19th as 'the Conservative century', Conservative dominance of government owed much to the fragmentation of the political left.

Conservative victory in 1992 was very much a mixed blessing. The majority was small, the party badly split on Europe, and John \*Major struggled to impose his authority, at one point standing for re-election as party leader. The party was also increasingly handicapped by its weak appeal in Scotland and Wales, where in 1997 it did not win a single seat, and by its breach with the Ulster Unionists, who at one time had been staunch allies. More and more it resembled an English National Party. After a series of allegations of 'sleaze', its defeat in 1997 was not unexpected, but its poor showing in 2001, despite the exertions of William \*Hague, was a bitter blow. The new leader took up once more the task of redefining and marketing conservatism.

The Conservative Party has never had a clear ideological identity. Social paternalism, *laissez-faire*, state corporatism, religiosity and materialism, free trade and protectionism have all had their influence, though major division and damage have only rarely arisen from the tensions. Loyalties to the constitution and its symbols, social order, and patriotism have substituted for ideological coherence. Conservative political practice has generally been pragmatic, geared to the needs of electoral success and office-holding. The long history of the party adds also to the blurring of ideological identity. The political right has never needed to recreate itself in Britain as in many continental countries. The Conservative Party's continuity reflects that of the state and nation which have not suffered conquest, major defeat, or social revolution. It also reflects the nature of economic and social development in Britain. The extent of social well-being among a large middle class and even sections of the working classes has facilitated the Conservative practice of defending great property through an alliance with small property.

**consistory courts.** After the Norman Conquest, separate ecclesiastical courts were set up to deal with pleas 'which belonged to the government of souls'. The consistory court was the court of a bishop for his diocese and was the normal forum for deciding serious cases of defamation and matters relating to wills of personal property. Where the consistory court found the defendant guilty of defamation it could impose penance. The church courts were not allowed to impose fines and where they required the defendant to pay back money as restitution they incurred the hostility of

the common law courts and were subject to prohibition. The consistory court was normally presided over by the chancellor, a layman, and appeal lay from its decision to the court of the archbishop. MM

**constable.** One of the great medieval offices of state, derived from *comes stabuli*, count of the stables. The first lord high constable was a supporter of the Empress \*Matilda, who made him earl of Hereford. It then passed to the Bohuns, on to \*Thomas of Woodstock, and to his descendant Edward, duke of \*Buckingham, executed by Henry VIII in 1521. It had acquired responsibility for the mobilization of the army, for the enforcement of martial law, and for adjudication on matters of chivalry. After Buckingham's death, the office was granted temporarily to noblemen so that they could act at coronations: the duke of \*Wellington was lord high constable at three successive coronations in 1821, 1831, and 1838. Scottish constables commanded the army and from the time of Robert I the office became hereditary in the Hay family, earls of Erroll, who take precedence of all other Scottish subjects. JAC

**Constable, Archibald** (1774–1827). Publisher. Son of the earl of Kellie's land steward and apprenticed to Peter Hill, an Edinburgh bookseller, Constable soon established himself independently. Drawing on London and Scottish contacts, he ventured into publishing with theological and political pamphlets, before becoming proprietor of the *Scots Magazine* (1801) and then publisher of the prestigious \**Edinburgh Review* (1802), which brought him into prominence. His liberality with authors confounded rivals. In 1805–8 and 1814–26 he published most of Sir Walter \*Scott's works, and owned \**Encyclopaedia Britannica* for a decade, introducing extended 'dissertations' as supplements. Dreams of a revolution in bookselling by offering easily affordable fiction to the 'millions' were ambushed by huge debts and bankruptcy (1826) from heady speculativeness; the firm's collapse (together with Ballantyne's) so rocked the publishing industry that ambition and innovation were stifled for years. Constable's efforts to recover lacked heart, and he soon succumbed to ill-health. ASH

**Constable, John** (1776–1837). Landscape painter, born at East Bergholt (Suffolk), the son of a miller. At first intended for the church, then to follow his father, eventually Constable was allowed to go to London to study at the Royal Academy Schools. Encouraged by Benjamin \*West, Constable concentrated on studying nature and rarely painted outside the genre of landscape: 'my art is to be found under every hedge.' Initially, he worked in the manner of \*Gainsborough, but slowly developed his own style of conveying nature and humble subjects so as to appear spontaneous and without what he called 'fal-de-lal or fiddle-de-dee'. This gained him little recognition at home but a growing reputation in France where his *Hay Wain* (1821) influenced the modern school of landscape painters. In 1819 he became ARA, but a further ten years elapsed before he was elected a full academician. Today he is recognized with Turner as the major English landscape painter of the 19th cent. JC

**Constans.** Roman emperor. One of the three sons of \*Constantine the Great amongst whom the empire was divided after Constantine's death in 337, Constans was awarded the central part of the empire including Italy. In 340 he invaded the possessions of his brother Constantine II in the West, defeating and killing him. Constans had to visit Britain in winter 342–3; the reasons for this risky crossing are unknown. Constans was in his turn overthrown in 350 by a cabal of Gallic nobles, who replaced him with an army commander in Britain, \*Magnentius, who had Constans hunted down and killed. ASEC

**Constantin, son of Fergus** (d. 820), king of Picts (from 790) and of Scottish \*Dalriada (from 811). Constantín was the first king to rule by right over both Picts and Scottish Gaels. After defeating a rival in 789, he reigned first as king of the Picts, only in 811 taking the kingship of Dalriada, which his father had held 778–81. His power base was the central Pictish territory of \*Fortriu, and his dominance there is reflected in the recently discovered inscription on the Dupplin Cross (5 miles south-west of Perth), which bears his name set amidst the iconography of Christian kingship. The religious dimension of his reign is further demonstrated by his foundation of the monastery of \*Dunkeld (c.818), by the presence of his name in the Durham *Liber vitae* (entered after that of Charlemagne), and by his commemoration as a saint in Irish martyrologies and a Scottish litany. He stands at the head of a short-lived Pictish dynasty, his brother, son, and nephew reigning in turn. TOC

**Constantine** (c.274–337), first Christian Roman emperor (306–37), known as 'the Great'. Born at Naissus (now Nis), Constantine was the son of \*Constantius I by Helena. In 305 Constantius succeeded as *Augustus* (senior emperor) of the West. Constantine fled from the court of Galerius, eastern *Augustus*, in time to be at his father's death-bed at York in 306. He was illegally proclaimed *Augustus* by the army there. In 312 he invaded Italy and defeated Maxentius near Rome, apparently after a Christian vision. By 324 Constantine was sole *Augustus*. He was an energetic general and recast the Roman army. He also continued the administrative and fiscal reforms of Diocletian. Constantine promoted Christianity financially, legally, and theologically, being baptized on his death-bed in 337. He probably revisited Britain in 312 and 314, taking the title *Britannicus* in 315, and an edict of 319 is addressed to the *Vicarius* of the Britains, Pacatianus. ASEC

**Constantine III** (d. 411). Usurper, proclaimed emperor by Roman troops in Britain. At the beginning of the 5th cent. AD Roman Britain was not heavily defended, \*Stilicho having withdrawn troops in 401–2 to help defend Italy against German invaders. This attack on Italy and the overrunning of Gaul by Germanic tribes left Britain as an isolated and relatively untroubled area from which came three successive attempts to usurp power. In AD 406 Marcus seized power in Britain, but after a few months was replaced by the equally short-lived Gratian. The new usurper, Constantine III, was more effective, managing to take substantial territories in Gaul and Spain, and enjoying some moderate successes

against the Germans. Eventually he was defeated by the forces of the western emperor Honorius: in 411 he was besieged at Arles, captured, and executed. ES

**Constantine I** (d. 877), 'king of the Picts' (862–76), anachronistically regarded as third king of Scotland. Son of \*Kenneth I, he succeeded his uncle Donald I. Only for the second time in Pictish history had a family retained the kingship without a break beyond one generation. Constantine's ancestry in the male line was Gaelic, like most Pictish kings in the 9th cent. His career was chiefly consumed in a desperate struggle for survival against Scandinavian incursions. In 866 the Norwegian king of Dublin devastated Pictland (probably concentrating on Perthshire), and in 870–1 returned and took away many, including Picts, as slaves. In 875 Halfdan the Danish king of York inflicted a crushing defeat on Constantine at \*Dollar (9 miles east of Stirling), driving him back to the Highlands. Constantine was killed two years later by the Danes at 'Inverdufata' (unidentified). The only record of Constantine as an aggressor beyond his kingdom was as sponsor of the assassination of Arthgal, king of \*Strathclyde, in 872. DEB

**Constantine II** (d. 952), king of 'Scotland' (900–940/5). He retired to become abbot of the \**céli Dé* ('Clients of God') at St Andrews. His father was \*Æd (d. 878). Constantine II laid the foundations of the kingdom of Scotland. His victory over the Danes at Strathearn in 904 represented a turning-point in its struggle against Scandinavian aggression, and after another victory at (probably) Corbridge (18 miles west of Newcastle) in 918 he initiated a policy of *rapprochement* with the Danes, cemented with the marriage of his daughter to the Danish king Guthfrith. This was designed to support Danish York in its struggle for survival against kings of Wessex. The kings of Wessex began to threaten Scotland itself when \*Athelstan invaded as far as Dunnottar (14 miles south of Aberdeen) in 934, and in 937 an invasion of England mounted by Constantine and the Danes from Dublin led by Guthfrith's son \*Olaf ended in disaster at the battle of \*Brunanburh, in which Constantine lost a son. Despite consorting with heathens, Constantine evidently had a genuine concern for the church, setting new standards of religious life and clerical freedom in an agreement proclaimed at Scone with Cellach, chief bishop of the Scots, in 905/6. Constantine probably established St Andrews as the seat of the chief bishop of his kingdom. DEB

**Constantine III** (d. 997), king of 'Scotland' (from 995). He reigned for only a year and a half following the assassination of \*Kenneth II. He was a son of King \*Cuilén, and the last of the descendants of King \*Æd (d. 878) to hold the kingship. He was killed by \*Kenneth III, a member of the rival branch of the royal dynasty, at 'Rathinveramon' (literally the 'fort on the mouth of the river Almond') which is unidentified, but probably near Scone, north of Perth. He is known from late medieval histories as Constantine the Bald. DEB

**Constantius I** (Constantius Chlorus), *Caesar* (deputy emperor) and then *Augustus* (emperor) of the western Roman empire (AD 292–306). In 293 Constantius wrested power from the usurper \*Carausius. Constantius' successes

## constitution

included taking Boulogne, home of the Channel fleet. Carausius was assassinated by \*Allectus who in turn usurped imperial power. Constantius' forces attacked Allectus in Britain; Allectus was killed and Constantius made a triumphal entry into London. In AD 305–6 Constantius, then co-emperor with Maximian, conducted a campaign in northern Britain. His son \*Constantine joined him, and was declared emperor when Constantius died at York. ES

**constitution.** A constitution is a body of rules, formal or informal, which regulates the government of a state, or, indeed, a private association. It is concerned essentially not with 'What is to be done?' but 'How?' The procedures to be followed when taking decisions form the constitution. The distribution of power between the various organs of government, the limits of governmental authority, the methods of appointing or electing those who govern—these are the staple of a constitution.

The existence of a constitution implies that there are some restraints upon those who govern. If decisions, for instance, depend upon the whim of an absolute monarch, or the fancy of a dictator, it is hard to speak of a constitution. Constitutions are about procedures, and arbitrary power, by its very arbitrariness, is not hedged around by prescribed procedures. Most states, and many private associations, have written constitutions—a code of written rules binding those who govern, together with any amendments which have been made in accordance with the procedures laid down in the constitution. Thus the US constitution is the document accepted in 1787, together with the 27 amendments passed subsequently. Such a document, or collection of documents, is called the written or, more aptly, the formal constitution.

A contrast is sometimes made between written and unwritten constitutions. Britain, it is said, has an unwritten constitution. But the distinction is overdrawn. Britain is unusual in that there is no single document which can be called the formal constitution. The constitution in Britain is scattered through hundreds of Acts of Parliament and judicial rulings. There are, of course, many statutes that form part of the formal constitution in Britain: the \*Bill of Rights of 1689 which limited royal power; the Act of \*Settlement of 1701 which regulated the succession to the throne; the Representation of the People Acts from 1832 to the present day, which progressively widened the right to vote and regulated the conditions under which the right could be exercised. These statutes have not, however, been brought together in one legal document; the formal constitution of Britain, like truth, has to be collected and put together limb by limb.

But the description of Britain as having an unwritten constitution usually focuses on another attribute—the importance of conventions. Some of Britain's most important constitutional rules are constitutional *conventions*—rules which are generally observed but have no legal force. There is a convention that monarchs act on the advice of their ministers: there is no direct legal compulsion on them to act on ministerial advice, but they invariably do. By convention, a government clearly defeated on a vote of confi-

dence in the House of Commons either resigns or holds a general election. The most powerful organ in the constitution, the cabinet, is barely known to the law. Its composition, its time of meeting, its powers, are all regulated by convention and usage, not by law.

Conventions are rules which have evolved over decades of constitutional practice. They have grown up and are obeyed because people find them useful. It is as though opposing players in a game had reached informal understandings about what was to be considered 'foul play' without bothering to write them down in the rule book. Conventions play a most important part in British political life, but it is quite wrong to regard them as a unique feature of British politics. Conventions develop in both states and private clubs. They figure conspicuously in the constitutional practice of the USA, which has the oldest surviving written constitution in the world. The growth of conventions, for example, has changed the choice of the American president from the indirect election provided for by the framers of the constitution to direct election by the people.

The constitution, especially the formal part, is often regarded as having a superior status to ordinary law; indeed, it is often seen as a fundamental law, a framework from which particular acts of legislation or executive decisions draw their legitimacy. It is held that it must be set apart from ordinary law and venerated as such, and be protected by change from chance majorities or the whims of a faction dominant for the time being. Many constitutions therefore specify that the constitution can be changed only by a special procedure. The constitution may lay down that an amendment must be passed by a special majority in the legislature, or must be approved by both houses of the legislature, or by the people in a referendum. Such measures emphasize the special status of the constitution and affirm that constitutional change can come about only through the deliberate and considered will of the people or their representatives. Such constitutions are called *rigid*; constitutions which can be changed in the same way as any ordinary mundane law are called *flexible*. Britain has a highly flexible constitution: that of the USA is highly rigid.

It is easy to assume that a constitutional state, one where the governors are themselves bound by rules, must also be democratic, but the assumption is false. A constitutional state is wholly compatible with a restricted franchise or oligarchic government. It is not the source of power which makes a state constitutional or otherwise, but the degree to which the various organs of the state check and control the use of arbitrary power. It is arbitrariness, not, say, traditional kingship, which is the opposite of constitutionalism.

Lastly, while it is true that a constitution may help to shape the political habits of a people, the converse is more likely to hold good. The world is littered with the parchment of dead constitutions—legal frameworks so remote from the experience of the peoples they sought to guide, so hostile to the most powerful interests in the land, that they collapsed at the first breath of challenge. HB

**constitutional history** once held a dominant and still holds a respectable position in historical output. The tri-

umph of a reformed British Parliament in the 19th cent., and the desire to recommend parliamentary government to other nations as a guarantee of liberal stability, encouraged interest in its origins, in the evolution of the constitution, and in the Stuart period as its testing time. Two remarkable historians helped to establish the subject. In the preface to *Select Charters and Other Illustrations of English Constitutional History* (1866), William \*Stubbs wrote that he aimed to examine 'a distinct growth from a well-defined germ to full maturity'. He followed it with *The Constitutional History of England in its Origin and Development* (1873–8). S. R. Gardiner's contribution was *Constitutional Documents of the Puritan Revolution* (1889), and a sober and detailed *History of England from James I* (1863–), which reached sixteen volumes and 1656 before death intervened in 1902. One by-product of their initiative was the cult of documents. Volume after volume followed, and though the process was rather dull, the teaching sometimes mechanical, and the documents often divorced from their wider contexts, it was defended as systematic consultation of the evidence. The 20th cent. was less in awe of Parliament and a counter-attack developed. R. G. Usher, an American historian, launched a sharp attack on Gardiner's historical method in 1915. After the First World War, Herbert Butterfield and L. B. Namier, though differing on much else, agreed that the previous approach had been Whiggish and teleological. Interest in constitutional history waned as Britain's world position declined, in much the same way as imperial history dropped out of favour, and it suffered from competition from new forms of history, administrative, social, and economic. Though much work on constitutional history continued to be done, the emphasis was more on everyday working than on constitutional theory. The *History of Parliament*, which recommenced publication in 1964, eschewed documentary commentary or political narrative in favour of biographies of MPs and sketches of their constituencies. JAC

**construction industry.** The largest structures of the medieval and early modern periods were monasteries, churches, cathedrals, castles, and town walls. \*York, with its 13th-cent. motte and bailey castle, known as Clifford's Tower, the massive minster (the largest Gothic church in England, 13th–15th cent.), and complete city walls, provides a classic composite. The city boundaries at the height of the pre-Reformation period contained 40 churches, 9 chapels, 4 monasteries, 4 friaries, 16 hospitals, and 9 guildhalls for the various trades.

Most of these were built of stone, while dwellings and other functional buildings like farmsteads or mills, depending on local materials, were of timber, clay, or brick. Roofing materials were thatch, turf, timber, tiles, slates, and lead. While there were many local styles, construction, especially in stone, was everywhere dependent on the mason's skill, hence the traditional importance and high status of the trade.

The most important 16th- and 17th-cent. buildings were town and country houses for the nobility and gentry, and public buildings, such as churches and town halls. In 1514 Cardinal \*Wolsey began to build the largest house in Eng-

land, \*Hampton Court, further extended by Henry VIII. More typical, though still on a grand scale, was \*Hardwick Hall (Derbys.), begun in 1591 by Elizabeth, countess of \*Shrewsbury. Considering its size it was constructed incredibly quickly, being finished and occupied by 1597. Nearer the close of this period, and following the Great Fire of 1666, \*St Paul's cathedral, designed by \*Wren, was begun in 1673.

During the 18th cent. rising population and sustained economic prosperity generated greatly increased activity in construction. The urban building boom of the Georgian era is best appreciated in the splendid architecture of \*Edinburgh, \*Bath, \*Stamford, and \*Dublin, but can be seen in many other towns and villages. In the countryside the modernization of agriculture led to the construction of new farm houses and buildings, walls, roads, and ditches. Quarrying, both for stone and slate, and brick and tile manufacture, expanded rapidly to meet demand.

The \*industrial revolution of the later 18th and early 19th cents. required major construction projects and a more functional architecture. The new factory buildings, such as the cotton-spinning mills still to be seen at Cromford, Styal, and New Lanark, were often large scale, and increased in size and complexity as industry expanded in centres like \*Manchester and \*Glasgow. The transport revolution, which accompanied industrialization, also engendered major canal, railway, bridge, and harbour building projects. The \*Iron Bridge over the Severn at \*Coalbrookdale (1777–9) was the first to use that great sinew of the industrial age in its construction. It was also put to good effect by Victorian engineers in the \*Crystal Palace (1851) and the great train sheds at major railway stations like Waverley (Edinburgh), Temple Meads (Bristol), and St Pancras (London). Subsequently, in the late 19th and early 20th cents., steel and concrete were extensively used in construction, the largest engineering structures, apart from buildings, being bridges, motorways, tunnels, and gas and oil rigs.

The construction industry has always been an important barometer of the economy, seen, for example, in the building boom which coincided with the era of late 19th-cent. prosperity, more modestly in parts of Britain during the recovery of the 1930s, and during the years of reconstruction following the \*Second World War. ID

**Conventicles Act**, 1664. This Act (16 Car. II c. 4) was one of the fiercest provisions of the \*Clarendon code, which aimed at restoring Anglican supremacy after the Restoration. It forbade attendance at any meeting of more than five persons for religious purposes other than Church of England ceremonies, and was accompanied by a battery of fines, imprisonment, and transportation. It was strongly imposed at first but later ignored. In 1668 it was allowed to expire, replaced by a less severe act in 1670 (22 Car. II c. 1), and replaced by the \*Toleration Act of 1689. JAC

**Convention of Estates**, 1689. The flight of James VII in 1688 made it impossible to summon a legal Scottish Parliament. It was therefore decided to fall back upon a Convention of Estates, which had often been summoned in emergencies, and which met on 14 March 1689 in Edinburgh. By the \*Claim of Right it declared that James VII had been

## Convention of royal burghs

deposed and the \*Articles of Grievances took the opportunity to protest against the organization of business by the \*Lords of the Articles. In June the Convention declared itself a parliament. JAC

**Convention of royal burghs.** Meetings of the royal burghs in Scotland went back to the 14th cent. and in 1487 a statute authorized annual sessions. The conventions were in addition to the representation of the burghs in the Scottish Parliament and, after 1707, the British Parliament. The same commissioners often served in both bodies and the taxation distribution agreed by the burghs was usually confirmed by the Scottish Parliament. The conventions also had considerable political influence. They continued after the Act of \*Union but in 1975, following the local government reorganization, the body was changed into a convention of local authorities. JAC

**Convention Parliaments.** The constitutional crisis of the 17th cent. produced two occasions when there were legal impediments to the summoning of a lawful parliament. The first was at the Restoration. On 25 April 1660, a month after the \*Long Parliament had dissolved itself, a convention assembled and declared that the government should be in king, lords, and commons. Its first act was to declare itself a genuine parliament, 'notwithstanding any defect or default whatsoever'. It remained in existence until December 1660, establishing the terms of the Restoration, save for the church settlement, which was left to its successor. A similar procedure was adopted in 1689 after James II's flight meant that the calling of a lawful parliament was impossible. The Assembly which gathered at Westminster on 22 January was a parliament in all but name, and its first act, using the exact words of the 1660 measure, was to declare itself a parliament. By the \*Declaration of Rights, later turned into the \*Bill of Rights, it laid down the main features of the revolutionary settlement, accepted by William and Mary. In Scotland a \*Convention of Estates was summoned in 1689 for the same purpose. JAC

**conversion of England.** See CHRISTIANITY.

**convocations of Canterbury and York.** These provincial assemblies, originally of bishops, date from Archbishop \*Theodore (668–90), though York's, smaller and historically less significant, only developed separately c.733. Representatives (proctors) of cathedrals, monasteries, and parochial clergy attended later (13th cent.). Initially sitting together, bishops and lower clergy split into upper and lower houses (15th cent.). The archbishop presided over the whole convocation; the lower house, when sitting separately, was chaired by its elected prolocutor, its channel of communication to the bishops. Though kings watched warily, convocations normally legislated by canons, until compelled by Henry VIII to limit their powers drastically (Acts of \*Submission 1532/1534). Despite Edward I's abortive attempts to prevent them, the clergy taxed themselves through convocations until 1664, after which the crown had less need to summon them. Acrimonious altercations between the Whiggish upper and Tory lower house of the Canterbury convocation (1689 and 1700–17)—reflecting con-

temporary political and ecclesiastical divisions—led the crown to suspend both convocations. They met only formally until the \*evangelical and \*tractarian revivals inspired them to resume discussion (1852 and 1861). Still exclusively clerical assemblies, the two convocations have existed alongside elected lay houses since 1885. The two sat jointly from 1904, a situation legalized as the Church Assembly (1920) which in turn gave way to the General Synod (1970). Though its 'last smile' lives on in the Synod's houses of bishops and clergy, convocation's loose federalism—and thus diocesan 'near-autonomy'—has given way to synodical centralism. WMM

**Conway, treaty of.** See ABERCONWY.

**Conwy castle** (Gwynedd), near Bangor, was begun in 1283 and was substantially complete by 1287. The castle is similar to Caernarfon and like it was planned from the first with an adjoining walled town. The work involved the uprooting of the abbey of Aberconwy, the principal Cistercian abbey in Wales, to a new site at Maenan, 8 miles further up the river. The unfinished abbey church was taken over and completed as the parish church of the new town, which it still is. It was here that Richard II received Henry Percy, earl of \*Northumberland, as Henry Bolingbroke's ambassador, and accepted assurances of safe conduct which proved to be false. During the Civil War the castle was repaired, supplied, and garrisoned, at his own expense, for the king by John \*Williams, archbishop of York, a Conwy-born man. Parliamentary forces besieged the castle, which was eventually surrendered by Williams to prevent his native town from being destroyed. For the next five years it was kept on a war footing by Parliament before being slighted in 1655. LR

**Cook, James** (1718–79). Usually referred to as Captain Cook, he was arguably the greatest ever maritime explorer. Though not a great innovative scientist, he had 'the genius of the matter of fact' and a 'controlled imagination'. He established much of the basic geography of Australasia and the Pacific region, disposed of the myth of the southern continent, and, perhaps largely by accident, learned how to keep his men free of scurvy. Not by accident, he used Harrison's chronometer and lunar distances to calculate longitudes accurately. A brilliant hydrographical surveyor and navigator, he was also a great seaman and leader, behaving sensibly and honourably equally towards scientists like \*Banks accompanying his expeditions, towards his crews, or the non-Europeans he encountered.

Cook was born in Yorkshire and apprenticed to a Whitby shipowner when he developed his 'passionately professional' approach to managing ships and their crews as well as learning navigation. In 1755 he entered the Royal Navy. Soon, his charts helped General \*Wolfe up the St Lawrence and he also surveyed Newfoundland's coasts. Recognized as an expert navigator, he was chosen leader of the expedition in the *Endeavour* which took scientists to Tahiti to observe the transit of Venus between earth and sun in 1769. He also sought the reputed southern continent, circumnavigated the New Zealand islands, and explored the whole eastern

coast of Australia. The results of this 1768–71 voyage added more reliable information about the Pacific than ever before. In the *Resolution* in 1772–5, Cook finally disproved the southern continent by sailing round Antarctica but also discovered Tonga and the New Hebrides. A third major expedition in 1776–9 was to the North Pacific to find the end of the North-West Passage. Of course he did not, though he sailed through the Bering Strait, but he did discover the Hawaiian Islands, where on a second visit he lost his life in a fracas with some natives over a stolen boat. RB

**Cooper, Samuel** (1609–72). English miniaturist who enjoyed a European reputation. He was active before, during, and after the English Civil War and Commonwealth and his patrons included \*Cromwell and Charles II, \*Milton and \*Monck. Cooper regarded the miniature as a painting, not a piece of the jeweller's art; with his use of light and shade, combined with superb draughtsmanship, he broke away from his predecessors, especially \*Hilliard. The diarist John \*Evelyn described Cooper as 'the prince of limners' and \*Pepys commissioned a miniature of his wife. The Royal Collection has several excellent examples of Cooper's work. There are also examples in London at the Victoria and Albert Museum and the National Portrait Gallery, in Cambridge, and at the Hague. JC

**Co-operative movement.** The Co-operative movement is often identified solely with retailing, and its foundation ascribed to the '\*Rochdale Pioneers' who set up the first store to pay dividends to members on the basis of how much they had purchased from the society. It actually originated in the ideas of Robert \*Owen, the visionary factory owner and social thinker of \*New Lanark. During the 1820s and 1830s many groups of people started on the road to creating an alternative society based on mutual assistance rather than competitive individualism, the 'New Moral World' whose superiority, once established through the working of communities in which labour was the unit of currency, would drive out the irrationality of capitalism. The first step on the road to community-building was to set up a shop, whose surpluses could then be applied to manufacturing and ultimately farming; but most of the early co-operative societies fell at this first hurdle. The Rochdale Pioneers system rendered Co-operation attractive to those who sought to save as they spent, and brought the movement into line with prevailing social values. After the Pioneers began in 1844 the movement spread rapidly, supplying unadulterated food-stuffs at accessible prices and making a distinctive virtue of refusing credit. Co-operation was especially popular in the textile towns of Lancashire and west Yorkshire in the mid-Victorian years, later gaining a strong following in Scotland and colonizing the midlands and south. Membership had reached saturation point in some industrial towns by the turn of the century, and middle-class recruitment began in earnest in the inter-war years. Societies were locally based, but the Co-operative Wholesale Society co-ordinated purchasing and then manufacturing for the whole movement from 1863. Although most members came to view the dividend as the most important aspect, the Co-op never lost its idealism completely, providing classes and libraries, support-

ing strikes, and (through its Women's Guild) offering political confidence and empowerment to working-class women. The societies were democratically run and in 1918 a Co-operative Party was set up, which ran in harness with the Labour Party. The Co-op also diversified its retail services, went into banking and home loans, and built houses for its members. It sustained its strength into the mid-20th cent., despite campaigns against it by private traders, and came to hold a dominant position in retailing, which it gradually lost in the changing climate of the 1950s onwards. Societies amalgamated, local identities were lost, the dividend itself was abandoned, and the Co-op seemed to many to have lost its way. Attempts are still being made to adapt it to modern circumstances without losing its distinctive identity, but the struggle is an uphill one. JKW

**Coote, Sir Eyre** (1726–83). Coote was born at Limerick and joined the army during the Jacobite uprising of 1745. His most distinguished service came in India where he fought under Robert \*Clive at the battle of \*Plassey in 1757. On 22 January 1760 he commanded at \*Wandewash when the French threat to southern India was extirpated. He then went on to capture Pondicherry, the French capital in India, in 1761. Posted to \*Calcutta, he rapidly quarrelled with members of the Bengal Council and left for England in 1762. In 1769 he returned as commander-in-chief of the Bengal army but soon resigned again for the same reason. In 1779, he came back once more as C.-in-C. under Warren \*Hastings and led the army in the second Mysore War. But he was defeated by Hyder Ali, the Mysore sultan, at Porto Nuovo in 1781. Coote died at Madras in 1783. DAW

**Copenhagen, battle of,** 1801. This encounter with the Danish fleet was fought on 2 April in the narrow 3-mile-long King's Channel, of varying depth, which bounded the eastern defences of the Danish capital. These consisted of the formidable Trekroner fort, flanked to the north by 5 moored warships and to the south by a redoubtable line of 7 unmastered warships and 10 floating batteries, all moored, heavily gunned and manned. The British under Sir Hyde Parker with \*Nelson as his second had 15 ships supported by a variety of assault craft and 600 soldiers. Following a daring navigation aided by a southerly wind the British attacked in line and broke the Danish defence, Danes and British each sustaining over 1,000 men killed. Nelson 'turned his blind eye' to Parker's premature signal to withdraw. The victory was as much a blow at Russia, leading the offensive 'Northern League', Nelson showing all his chivalry in subsequent armistice negotiations with the Danes. DDA

**copyhold.** Rack rents, or leasehold rents, in which the tenant pays an economic rent to the landlord, only became common across the country in the later 19th cent. Until then large parts of England, particularly in the north and west, but also in Norfolk, the home of the agricultural revolution, had a variety of arrangements offering more (or less) security to the tenant. These included copyhold, customaryhold, lifeleasehold, three-life, and 99-year leases, which gave the tenant virtual rights of ownership in return for a small annual rent, and occasional 'fines', payable usu-

## copyright

ally on the death of the owner before the property could be transferred to his family. Copyhold literally meant 'by copy of the court roll', in other words by an agreement entered into the court rolls of the manor, and therefore approved by both landlord and tenant. These forms of tenure relieved the landlord of the responsibility of looking after the land, but were generally held not to have improved the quality of farming. By the 19th cent. the traditional rents were so out of line with real values that landlords sought to convert them to rack rents. However, copyhold was only abolished in 1926. JVB

**copyright** is the ownership of and right of control over the means of reproducing works of literature, art, drama, film, sound, and computer technology. Until the 18th cent. authors had little protection against pirate publication of their works. An important step forward, and the basis of modern legislation, was a statute of 1709 'to encourage learned men' (8 Anne c. 19) by granting the author sole right of publication for fourteen years, with the possibility of a further extension of another fourteen years. Publishers were required to submit nine copies of each work to be lodged in the royal library, the libraries of Oxford and Cambridge Universities, Sion College, London, the four Scottish universities, and the Faculty of Advocates in Edinburgh. The length of copyright was extended in 1814, 1842, and 1911 and comparable legislation brought in to protect plays, music, and engravings. Copyright now lasts 70 years after the death of an author. Under the terms of the Public Lending Rights scheme, introduced in 1983, authors can receive royalties on the use of their books in libraries in Britain and in several other European countries. JC

**Coram, Thomas** (1668–1751). Coram, a successful sea-captain, was an active philanthropist in the Walpole period, supporting the foundation of the colony of Georgia in America as a haven for debtors. Concerned at the plight of tiny children abandoned in the streets of London, he was the driving force behind the establishment of the Foundling hospital in 1739. \*Hogarth, who painted a fine portrait of Coram, gave his support and \*Handel conducted performances of *Messiah* to raise funds. In later life, Coram himself ran into financial difficulties and was assisted by a public subscription. He was buried in the chapel of his hospital and a statue raised outside. Though the hospital was demolished in 1928, the entrance lodges still stand in front of Coram's Fields, largely given over to children's playgrounds. JAC

**Corbeil, treaty of**, 1326. On 26 April 1326 Robert I Bruce and Charles IV of France agreed to a treaty of mutual aid against the English. This was an early step in the formation of the \*Auld Alliance between Scotland and France. JAC

**Corbridge**. Coriostopitum was a major Roman military base and important town in the valley of the Tyne. The first base, dating to the campaigns of \*Agricola (c.80), lay at Red House. Subsequently the base was moved three-quarters of a mile east to where the east–west road (the Stanegate) met the north–south road (Dere Street), just north of the Tyne bridge. A succession of forts was con-

structed through the late 1st and first half of the 2nd cents., one yielding two sets of Roman hoop armour, *lorica segmentata*. From the mid-2nd cent., the fort was abandoned and the military presence became a supply and works depot contained in two compounds at the centre of what was now largely a defended civil town. Inscriptions attest the continuing military importance of Corbridge whenever the Romans campaigned northwards. From c.200 dated an unfinished, large, square courtyard building in fine masonry at the centre of the town. Possibly a civil forum or a storehouse, similar continental buildings were markets for cross-border trade. The town consisted of buildings suggesting commercial activity tied to the military and the local populace, with little trace of high-status occupants. ASEC

**Corfe castle** (Dorset) stands on an isolated hill along the spine of the Isle of Purbeck, between Wareham and Swanage, guarding the routeways into Purbeck. Corfe was perhaps the site of an Anglo-Saxon royal residence and the place at which King \*Edward, later known as 'the Martyr', was murdered by his stepmother Ælfthryth in 978. The castle was one of the first ordered to be built by William I after the battle of \*Hastings and remained in royal hands until it was sold by Elizabeth I in 1572. Corfe, in the royal forest and warren of Purbeck, was a favourite residence of both King John and Henry III who spent large sums of money on the defences and on extensive domestic accommodation, the remains of which are known as the 'Gloriette'. During the Civil War the castle was held for the king, although most of Dorset was controlled by Parliament, and successfully withstood a siege in 1643, the defence being directed by Lady Bankes, wife of the owner. A second siege in 1646 ended when the attackers were secretly admitted to the castle. In recognition of her bravery Lady Bankes was allowed to retain the keys and seals of the castle, although the defences were systematically slighted. LR

**Coritani**. A British tribe and *civitas*. There has been much debate about the name of this tribe, and some believe it was called the Corieltauvi. There is no good reason, however, to discard the spelling provided by the geographer Ptolemy, who recorded them as the Coritani. It occupied the territory between the rivers Welland and Humber, fringed on the west by the southern Pennines. To judge from their pre-invasion coinage, which often bears two names, it is possible that the leadership of the tribe was split between two kings or chiefs. If so, one might suggest that they ruled from the two major Iron Age centres known in the tribal territory at Old Sleaford and Leicester. The impression of the tribe at the time of the Roman conquest is that it was not yet united into a single powerful kingdom. This may explain the rapid Roman advance through their territory, culminating in the foundation of a legionary fortress at \*Lincoln c. AD 60. The pacified tribe were awarded local self-government as a *civitas* a decade or two later, with \*Leicester, known as Ratae Coritanorum, as its administrative centre. KB

**Cork** (Corcach már Muman), **diocese of**. The Irish see of Cork was established in the province of \*Cashel at the Council of Raithbressail (1111). St Finbar had founded a mon-

astery in the 7th cent. Originally a Norse settlement, later colonized by the Anglo-Normans, it usually had English bishops from the 13th/14th cents. By the 1190s its cathedral had a secular chapter on the continental pattern. As part of a policy of Anglicization to establish sees in royal cities and so subordinate the Irish to English rule, Cork was eventually merged with Irish Cloyne (1411). This catholic diocese remained together until 1747, when Cork became separate again. Similarly the Anglican diocese of Cork has at times been held with Cloyne and Ross. There are cathedrals at all three sites.

WMM

**Corn Laws.** First passed in 1815, these were always a controversial measure of agricultural protection. Britain's fast-growing population was making the country a food importer rather than exporter as before. The French wars had forced up domestic prices and encouraged agricultural investment, so there was fear of a post-war collapse of prices. Despite protests in some cities, Parliament passed a Corn Law that prohibited the importation of wheat until the domestic price reached 80 shillings a quarter. (Other cereals had similar provisions.) The 1820s still suffered agricultural depression despite a high ceiling for corn prices in years of poor harvests. In 1828 a sliding scale was introduced, which meant that duties would reduce as prices rose and vice versa. Despite this trend to easier importation, the Corn Laws soon came under fierce attack from the \*Anti-Corn Law League centred in the Lancashire cotton industry, which blamed recurrent industrial depressions on agricultural protection. It was also attacked as a system and symbol of aristocratic privilege. Under pressure the Whig government proposed to move to a fixed duty in 1841 but lost the election to the largely protectionist Conservatives. \*Peel, alarmed by the industrial crisis of 1842 and fearing the conjunction of high food prices with league agitation and mass unemployment, concluded that political stability required a sacrifice of the Corn Laws. Using the Irish potato famine of 1845 as an excuse, he proposed total repeal. This betrayal of party commitments and the landed interest produced a revolt of Conservative backbenchers and the farmers, led by the Central Agricultural Protection Society. Though Peel carried repeal of the Corn Laws in 1846 with full effect from 1849, he split his party into a free-trading minority and a protectionist majority. Only in 1852 did the latter abandon the idea of protection. Other free-trade measures followed and Corn Law repeal came to be seen as symbolizing the triumph of liberal and free-trading ideas. The main effect of repeal was delayed until the 1870s when cheap transatlantic grain flooded in and produced both sharp falls in food prices and acute agricultural depression. The United Kingdom was unusual among advanced countries in abandoning agricultural protection.

BIC

**Cornovii.** British tribe and *civitas*. The Cornovii are a surprisingly obscure tribe, given that they lay well within the boundaries of the Roman province and their *civitas*-capital was one of the largest towns in Britain. They share their tribal name—which means 'the people of the horn'—with a Scottish tribe, but there is no reason to think they shared a common ancestry. Before the Roman invasion they issued

no coinage and we know the names of none of their kings or chieftains. Equally there is no distinctive 'Cornovian' material culture by which to recognize them. Thus, the territory which we believe they occupied is effectively demarcated by the areas occupied by surrounding tribes rather than by any internal evidence from the Cornovii themselves. This suggests the *civitas* encompassed the modern counties of Shropshire, Staffordshire, and Cheshire. More or less at the heart of this territory lay the *civitas*-capital of Viriconium (\*Wroxeter), which may have replaced, and borrowed the name of, the nearby Iron Age hill-fort on the Wrekin. It was from Wroxeter that an inscription was recovered which confirmed the existence of the *Civitas Cornoviorum*, previously known only from the writings of the Alexandrian geographer Ptolemy.

KB

**Cornwall.** The oldest of English duchies (from 1337, though first a Norman earldom c.1140) has dimensions other than its peninsularity: the bulk of the course of the south-flowing Tamar forms the county boundary with Devon (some 45 miles), and but for the hills in which it rises could be canalized with the Marsland stream to render Cornwall an island. As the distant part of '*civitas* \*Dumnonia' the Romans may not have colonized Cornwall (any more than later Germanic invaders), but they monopolized its tin production as they did more precious metals elsewhere; and there is some evidence for a road system, including a link between Padstow and \*Exeter (Isca). For Cornish people England is entered by crossing the Tamar, and in the Civil War, redoubtably though Cornish levies defended the crown within the county, they could not be brought to do so further east. Cornwall has a place in western prehistory at least as far back as the 3rd millennium BC, and in the 5th–6th cents. AD a church coloured by Irish and eastern Mediterranean practice; in later centuries it had a role not only in trade but in pilgrimage routes to southern Europe. Penzance is equidistant between Loch Foyle in Ulster and the Gironde; more intimately, perhaps, between Waterford and Quimper in Brittany. In the 5th cent. AD Brittany received an immigration from Dumnonia (Britons), and the disused Cornish language may still be studied in Breton schools. The Isles of \*Scilly, 'a drowned landscape' integral to Cornwall's prehistory, lie on the same longitude as Ardnamurchan Point in Argyll and Cadiz; and, by extension, Cornwall has had its share in the evolution of the Atlantic world. The Falmouth mail service developed a proud record on its American run 1688–1850, and in the 19th cent. Cornish miners worked, and died, in the mines of South America and South Africa; in 1901 Marconi, in Newfoundland, received the first transatlantic radio transmission from Poldhu near the Lizard. Back home, it had taken all Brunel's genius to bridge the Tamar at Saltash 1857–9, and so bring the railway, and a holiday industry, to Cornwall.

Cornwall's geology is predominantly granite and slate, the latter used for walls as well as roofs, but china clay, around St Austell, is its one extractive industry today. In antiquity tin from Cornwall's streams, increasingly deep-mined by the later 16th cent., was the region's life-blood. As ingots the metal was exported far and wide, but the

earliest traders appear to have used the two north coast havens, St Ives-Hayle and the Camel estuary, rather than those on the south coast towards which most of the tin-bearing streams flowed: while the western shores of Falmouth's estuary have rendered up hoards of Roman coins (in payment?), no place in Britain is so overwhelmingly rich in the remains of 5th–6th-cent. Mediterranean pottery (import containers?) as is Tintagel, on present evidence the prime entrepôt for this epoch. Few, if any, British sites have more romance and mystery than this inhospitable headland: its history prior to the cliff-hanging castle built there by Earl \*Richard of Cornwall in the 1230s is at best elusive, and associations with 'King \*Arthur' are solely attributable to the chronicler \*Geoffrey of Monmouth, writing a century earlier. Not a vestige of corroborative evidence has surfaced since his time. More prosaically, at the time of \*Domesday Book (1086), in which neither Tintagel nor tin receive mention, Cornwall was evidently underpopulated on the scale of one man per 160 acres. In 1346, however, Fowey was able to send over 40 ships to aid Edward III at Calais; in Armada year (1588) the port had only one ship in Queen Elizabeth's service, though Cornwall had become one of the most populous of southern counties. Its present-day population is some 480,000, much the most concentrated urban area being Redruth–Camborne. Truro (18,000) only became a centre in the early 19th cent., its cathedral, built 1890–1910, marking Cornwall as a diocese independent of Exeter for the first time in a millennium.

Domesday Book may confirm that Anglo-Saxon Cornwall was underdeveloped, but the special status of the tin-miners may have been established before the Conquest. When, in 1201, King John granted them their first charter confirming exceptional legal autonomies, in the Court of the \*Stannaries, agriculture in Cornwall, which had once been exiguous, needed to give way to the territorial requirements of the tin-streamers; with the dukedom's establishment in 1336 their rights came under royal wardenship, though the court itself was only formally wound up in the mid-19th cent. By the 16th cent. the leading county families, Rashleighs, Eliots, Godolphins, formed closely knit groupings to which the Tudor monarchs were ready to respond by granting enfranchisement to some fifteen additional boroughs, including Bossiney and Penryn, famed respectively for their slate and granite quarries. The measure of their political evanescence, however, may be gauged by the \*Great Reform Act of 1832 which disfranchised almost all of them, a quarter of the total number (56) which were then abolished in England and Wales. But great houses, Lanhydrock, Cotehele, Trerice, still attest to no mean aristocratic pride. By the end of the 18th cent. Cornishmen of a different stamp emerged: John Opie, the precocious portraitist and art theoretician, Richard Trevithick, wrestler and inventor of high-pressure steam traction, Humphry \*Davy, perfecter of the miner's safety lamp. In the 19th cent. Robert Hunt became professor of London's School of Mines, a fellow of the Royal Society, and a stalwart supporter of the Royal Institution of Cornwall (1818) and the Polytechnic Society of Falmouth (1833). Such bodies sustained self-awareness in a county which, 150 years before,

had been favoured with the first large-scale map of any English county. Today, though the pilchard no longer thrives along their coasts and their deep mines are derelict, the Cornish retain their cultural richness. Britain and the wider world would be poorer without their artists and potters, their cream, and Mr Lemon Hart's rum. DDA

**Cornwall, duchy of.** From the Norman Conquest onwards, Cornwall has had close links with the crown. William the Conqueror gave large estates there to his half-brother Robert; Reynold, an illegitimate son of Henry I, was created earl of Cornwall in 1141; John's second son \*Richard was earl of Cornwall, but his line became extinct by 1300. In 1337 Edward III created his son, \*Edward the Black Prince, duke of Cornwall—the first English dukedom. Henceforward the duchy belonged to the prince of Wales, reverting to the crown when there was no prince—for example, during much of the Tudor period. It was administered from Lostwithiel. It is a private estate, provides the prince of Wales with most of his income, and has property outside Cornwall. The lord warden of the stannaries, appointed by the duke, presides over the Council of the Duchy, and the duke appoints the sheriff of Cornwall. The great influence of the duchy may explain why there have been few great aristocratic families in Cornwall. The duke had considerable electoral influence before 1832, when Cornwall was full of parliamentary boroughs, which was the basis for the opposition interest built up by \*Frederick, prince of Wales, against Sir Robert Walpole. The duchy owns 130,000 acres in some 23 counties, together with a number of shops, offices, and houses. The annual income from the duchy was estimated in 1996 as £4.5 million, but since 1993 the prince of Wales has paid standard income tax. JAC

**Cornwallis, Charles, 1st Marquis Cornwallis** (1738–1805). Soldier and administrator. Cornwallis served during the American War of Independence and from 1780 commanded the British forces in South Carolina. Though an able general, he was cut off at \*Yorktown by American forces and the French fleet. He was forced to surrender on 19 October 1781 thus ending the war. In 1786–93 Cornwallis acted as governor-general and commander of the army in Bengal. He introduced the permanent settlement, concerning landownership, and judicial and revenue reforms. He also gained victory over Tipu Sahib of Mysore at the battle of Arikeri (13 May 1791) and concluded settlements with other native powers. In 1798 Cornwallis left for Ireland as lord-lieutenant and succeeded in subduing the \*Irish Rebellion. He presided over the Act of \*Union (1800) but resigned a year later after the government's refusal to grant catholic emancipation. Cornwallis died on 5 October 1805 at Ghazipur shortly after resuming his former post in India. RAS

**coronations.** Though the monarch succeeds automatically on the death of his predecessor, the coronation is a public avowal of his new position. Indeed, earlier tradition held that he was not really king until he had been crowned. Consequently, coronations followed accessions very swiftly,

particularly if there were rival candidates, allowing little time for elaborate preparations. Harold II was crowned on the very day of Edward the Confessor's burial and Henry I only three days after his brother William Rufus' death in 1100. The ceremony was, essentially, religious—a dedication to God's service. But the political opportunities were soon apparent. Monarchs wished for a widespread demonstration of their acceptance, especially by the most eminent in the land, with the chance to remind their subjects of the need for obedience: subjects found in the ceremony a chance to remind monarchs of their own rights. Hence, the evolution of the ceremony registers the ebb and flow of political power. It is also a remarkable example of the way in which new features can be grafted onto old stems.

The English ceremonial which developed was more religious and more elaborate than that in Scotland or Ireland. The first recorded instance in England of a ceremony reflects both its nature and its limitations. In 787 Ecgrith, son of \*Offa of Mercia, was publicly anointed to ensure his succession: in the event he survived for only six months before he was overthrown by a cousin, \*Cenwulf. The coronation of \*Edgar at Bath in 973 suggests the development of considerable ritual, much of it borrowed from Frankish sources. A ring, sword, and sceptre were delivered as tokens of authority and the anthem 'Zadok the Priest' chanted. \*Æthelred, his second son, was crowned at Kingston upon Thames in 978 where the subsequent order of service seems to have been established. \*Edward the Confessor was crowned at Winchester in 1043, but all later coronations have taken place at Westminster.

The central features of the ceremony have remained largely unchanged though there have been many alterations in the regalia and the oath. The monarch is first presented, usually by the archbishop of Canterbury; takes a series of oaths; is anointed with holy oil; is crowned, receives the regalia, and accepts homage. A preliminary walk to the abbey was abandoned by Charles I in 1625 and a subsequent banquet in Westminster Hall dropped by William IV in 1831, partly as an economy measure, partly because his brother's banquet in 1821 had ended in unseemly behaviour.

Most of the ancient regalia of the crown was sold off after the execution of Charles I. The spoon and ampulla, in the shape of a golden eagle, survived. The ampulla was believed to contain holy oil, said to have been given by the Virgin Mary to Thomas \*Becket and rediscovered in time to assist Henry IV at his coronation in 1399. For good measure the same monarch, who needed all the support he could get, was preceded by four swords, while his predecessors had been content with three. The rest of the regalia now consists of replicas fashioned in 1660 for Charles II, or later additions. A copy of the crown believed to have been worn by Edward the Confessor was made at the Restoration, and a lighter crown produced for Victoria in 1838. The coronation chair was made for Edward I, again on the pattern of Edward the Confessor's, and until 1996 included the stone of \*Scone, brought back from Scotland in 1296. Two swords of state were made in 1660, one of which subsequently went missing; a third was made in 1678. The sword of offering was made in 1821. The spurs dated from Henry IV and had to be

replaced. Bracelets have made sporadic appearances. The ring was a personal piece of the monarch. Charles I's fell into the hands of the Stuarts in exile, was returned in the 19th cent., and is now in Edinburgh castle. An orb was introduced in the 15th cent. to reinforce the monarch's imperial claims to the throne of France. A bible was added to the ceremony in 1689. Of the ritual, the 'vivat' by Westminster boys dates from 1625 and \*Handel's setting of 'Zadok the Priest' has been used since 1727.

Politically, the alterations to the oath are instructive. The original oaths were fervent but vague, and augmented by the coronation charters. Mistrust of Edward II led in 1308 to a new oath being added, to maintain the laws as chosen by his subjects. Henry VIII wished to modify this and it was much diluted for the coronation of Edward VI. Tampering with the oath in the interests of the royal prerogative was one of the charges against Archbishop \*Laud in 1644. After the experience of James II's reign, the oath for William and Mary was intended to bolt the door against catholicism and despotism, obliging the monarchs to observe 'the statutes in parliament agreed on' and to maintain 'the Protestant reformed religion established by law'. A further significant change had the monarch replying 'I solemnly promise' instead of 'I grant.' When George III and George IV pleaded their coronation oaths against catholic emancipation, it was by no means a specious argument or political ploy: George III wrote that the coronation statute was 'understood to bind the crown' not to consent to the repeal of the existing laws for the defence of the protestant religion. Elizabeth II's oath in 1953 included a promise to govern in accordance with the 'respective laws and customs' of the Commonwealth countries over which she reigned.

In practice coronation ceremonies have frequently had difficulty in living up to the solemnity of the occasion. William the Conqueror's coronation was marred by a massacre of his new Saxon subjects, whose shouts of acclamation were mistaken by nervous Norman guards as the signal for a rising. The pageantry of the royal \*champion has often caused problems. In 1377 Richard II's champion appeared at the abbey during mass and had to be told to go away. In 1685 James II's champion fell flat on his face, which suggests that it was just as well that the challenge was not taken up. Lord Talbot, in 1761, who accompanied the champion as lord high steward, had trained his horse to back away from the royal presence, but, to the delight of the onlookers, the animal insisted on entering backwards as well. For George IV's coronation, the horse was prudently borrowed from Astley's circus, where he would be used to noisy crowds. After this, the role of the champion was much reduced. In 1559 Elizabeth I complained that the holy oil was greasy and smelled unpleasant. In 1727 Queen \*Caroline had to borrow jewels since George I had given the rest to his mistress. A special hazard at the coronation of George IV was the arrival, in the middle of the ceremony, of his estranged wife, demanding to be let in. Victoria's own account tells of the pain she suffered when the archbishop pushed the ring on her wrong finger, and George VI's account of 1937 was that the archbishop juggled so much with the crown that he never did find out if it was on the right way.

## Coronel

The coronation of Scottish monarchs remained much simpler. Until the 13th cent. it was a ceremony of inauguration, usually at Scone, involving the elevation on a stone or chair. Alexander II's aspirations for a crown and anointing met with papal disapproval. Each was granted in 1329 to Robert I by a papal bull and used in 1331 at the coronation of David II. But later ceremony was restrained by the fact that so many Scottish monarchs succeeded as infants or children and could not sustain a demanding role: James III, for example, was inaugurated at Kelso, aged 8, a week after James II's death outside Floors castle in 1460. Charles I's belated Scottish coronation in 1633 added to his difficulties when he insisted on an unpopular Anglican service. The last Scottish coronation, that of Charles II in 1651, was a hasty business in the midst of adversity: Charles was required to swear to the covenant, and anointing was dropped as a superstitious and popish practice. JAC

Cannon, J. A., and Griffiths, R., *The Oxford Illustrated History of the Monarchy* (Oxford, 1988); Rose, T., *The Coronation Ceremony of the Kings and Queens of England and the Crown Jewels* (1992); Schramm, P. E., *A History of the English Coronation* (Oxford, 1937).

**Coronel, battle of**, 1914. At the outbreak of the First World War, the German Pacific squadron, commanded by Admiral von Spee, steamed across the Pacific with the intention of rounding Cape Horn and returning to Germany. On 1 November 1914 von Spee was intercepted by a British squadron commanded by Rear-Admiral Sir Christopher Craddock off Coronel on the Chilean coast. The Germans had more modern vessels armed with heavier guns and within an hour they had sunk most of Craddock's ships and resumed their voyage. They were themselves sunk at the battle of the \*Falkland Islands in December. DF

**coroner.** The coroner was an official appointed by the king to 'keep' or enrol the pleas of the crown for the county and thus to safeguard the rights of the crown (especially in relation to criminal law). The office was first referred to in 1194 though it probably existed before that time. Under the Norman and Angevin kings the pleas of the crown were noted by the sheriff and any fines due to the king from these offences were collected by him. The coroner was appointed to keep a check on the sheriff so that he did not defraud the crown of its rightful profits of criminal justice. In \*Magna Carta the power of the sheriff was further diminished in that he was no longer to hold the pleas of the crown. In addition to keeping the pleas of the crown, the coroner held an inquiry or 'inquest' into certain matters which were of special interest to the king. These included inquiries into the cause of sudden and unexplained death, treasure trove wrecks, and finding of sturgeon as belonging to the crown. The coroner still has an important role, holding inquests in cases of sudden or unexplained death. MM

**Corporation Act**, 1661. This statute (13 Car. II c. 1) was the first part of the '\*Clarendon code' and set out to reassert Anglican supremacy after the Restoration. Persons holding municipal office were obliged to qualify by taking communion with the Church of England. Many nonconformists felt able to do so and the Act did not prevent most dissenters

from holding office. It was tightened up by the Act against \*Occasional Conformity in 1711 but relaxed during the Walpole period by periodic Acts of indemnity. It remained a bone of contention throughout the 18th cent. and was not repealed until 1828. JAC

**corporations.** A large number of economic activities are so complex or costly that they can only be undertaken by the combination of many individuals. It is not surprising, therefore, that all economic systems have been characterized by the development of large institutions such as the state or the firm. Early forms of large-scale undertakings were found in the trading \*companies whose business took them to the Baltic or Mediterranean. Major companies, trading ever further afield, were granted monopoly rights by the crown. The most famous was the \*East India Company, chartered in 1600 for a single voyage, subsequently renewed, and eventually established as a continuous operation in 1657. Such joint-stock companies, as the name suggests, brought together the capital, and sometimes the labour, of many partners. By 1617 the East India Company had 36 ships and 934 stockholders. These large organizations, the precursors of modern corporations, proliferated with royal charters granted to the \*Bank of England in 1694 and, early in the following century, to the \*South Sea Company, the \*Royal Exchange Company, and the London Assurance. The government took an opportunity in granting charters to secure promises of loans from the beneficiaries. The appearance of the new stock brought opportunities for speculative gain and there was considerable trading in the shares of the companies which increased the value of their stock. This practice was stimulated by the fact that transactions could be conducted on the basis of a partial down-payment, often as little as 5 per cent. These developments mark the beginnings both of a financial market in company shares and of the emergence of large business organizations, whose need for resources was so great that it lay beyond the wealth of the partners and had to draw on a wider pool of funds through the financial institutions. CHL

**corresponding societies.** The initial welcome to the French Revolution in Britain came largely from middle-class and dissenting groups, but its ideas soon gained wider popularity through the spread of Paineite radicalism, disseminated especially by corresponding societies. In 1792 the most famous of all the radical societies of the period—the London Corresponding Society—was founded by Thomas Hardy, a Scottish shoemaker, with the intention of corresponding with provincial radicals in Manchester, Sheffield, Norwich, and elsewhere to promote the cause of parliamentary reform. Unlike other radical reform movements of the 1790s, the corresponding societies were composed mainly of artisans and tradesmen. These 'English Jacobins' were organized in 'divisions' which met regularly in different public houses for discussion, lectures, and fellowship. In 1793–4, as an alternative to petitioning for parliamentary reform, the reformers took up \*Paine's suggestion of electing delegates to a national convention on the French model. The government, thoroughly alarmed, arrested the leaders and clamped down heavily

on the LCS. By 1797 the corresponding societies had collapsed or been driven underground. They marked the emergence of an articulate political voice from the unenfranchised. At their peak in 1797 there were perhaps over 100 societies, with a nominal membership of 10,000. JFCH

**Corrichie, battle of**, 1562. When Mary, queen of Scots, returned from France as a widow in 1561, great influence was wielded by her half-brother Lord James Stuart, illegitimate son of James V. He pursued a pro-English and pro-protestant policy. Early in 1562 he was made earl of \*Moray, which was also claimed by the 4th earl of \*Huntly, a leader of the catholics. Huntly was forced into rebellion and then defeated and captured by Lord James on 28 October at Corrichie, west of Aberdeen. Huntly died that night, being 'gross, corpulent, short of breath'. JAC

**Corrupt Practices Act**, 1883. Electoral corruption continued to flourish after the Reform Act of 1832 and was not eradicated either by the Corrupt Practices Act of 1854, or by \*secret ballot in 1872. The general election of 1880 produced a number of cases of flagrant treating or bribery. The 1883 Act (46 & 47 Vic. c. 51) strengthened the previous Act, which had called for the publication of candidates' expenses, by laying down the limits of electoral expenditure. Corruption was not eliminated but the growing size of the electorate and the disfranchisement of many small boroughs reduced it. Even so, a royal commission reported that at Worcester in 1906 there were 500 voters, 'mainly of the needy and loafing class', who were 'prepared to sell their votes for drink or money'. JAC

**Cort, Henry** (1740–1800). Cort was born at Lancaster, son of a mason. He became an agent to the navy in the 1760s and his interest in the production of iron developed after the Russians had raised their prices. By 1784 he was able to patent an invention for 'puddling' iron to make it malleable. With Adam Jellicoe he entered into large naval contracts, but Jellicoe's death in 1789 revealed fraud, which brought Cort down. During the last years of his life, he existed on a small pension. During his lifetime, the production of iron in Britain rose from some 30,000 tons to well over 200,000 tons. JAC

**Corunna, battle of**, 1809. In October 1808 the British, under Sir John \*Moore, pushed into northern Spain to ease the pressure on the Spanish army and draw the French from Madrid. Outnumbered and inadequately supplied, they were soon in danger of being cut off. Moore skilfully retreated through the Galician mountains towards the coast, over 250 miles in harsh winter conditions, closely pursued by the French under Marshal Soult. At Corunna on 16 January 1809 Soult attacked with 20,000 men. Moore with 15,000 men uniformly repulsed the French, allowing the British to evacuate safely by sea, but Moore himself was fatally wounded. RAS

**Cosgrave, W. T.** (1880–1965). President of Executive Council 1922–32, Cosgrave is the least remembered and least colourful of leading politicians of the Irish revolutionary era.

He had considerable experience in Dublin corporation before becoming a Sinn Féin MP in 1917, and minister of local government in the Dáil administration of 1919–21. His vote enabled the \*Anglo-Irish treaty to be accepted by the Dáil cabinet in December 1921. In August 1922, the darkest hour of the civil war, he replaced Michael \*Collins as leader of the Free State and provided much-needed stability. Cosgrave governed along conservative social and economic lines and his party, Cumann na nGaedheal, then Fine Gael, showed no capacity for winning popular nation-wide support. In 1932, defeated by \*de Valera and Fianna Fáil, he became an ineffective political figure, finally resigning the leadership in 1943. His son Liam, Taoiseach 1973–7, shared many of his father's unheroic characteristics. MAH

**Cotman, John Sell** (1782–1842). Architect, draughtsman, landscape and water-colour painter. The son of a prosperous silk-mercantile in Norwich, he was intended for his father's business, but preferring art, went to London to study in 1798. He exhibited at the Royal Academy 1800–6, before returning to Norwich in 1807 to open a school for drawing and design. He joined the Norwich Society of Artists, becoming president in 1811. In 1834, on the recommendation of \*Turner, he became professor of drawing at King's College, London. His later years were clouded by ill-health and depression. His original painting style was not popular, but he is now seen as one of the most original and versatile English artists of the first half of the 19th cent., with the water-colour *Greta Bridge* (1805) probably his masterpiece. JC

**Cottenham, Charles Christopher Pepys, 1st earl of** (1781–1851). Pepys's grandfather was William Dowdeswell, a pillar of the \*Rockingham party in the 1770s, and his father, a master in Chancery, was created a baronet in 1801. After Harrow and Trinity College, Cambridge, Pepys practised law and was brought into Parliament in 1831 on the \*Fitzwilliam interest. He succeeded John Campbell as solicitor-general in February 1834, became master of the rolls in September 1834, and was 1st commissioner of the great seal in 1835 when \*Melbourne declined to reappoint \*Brougham to the lord chancellorship. Pepys was promoted lord chancellor in 1836 and was given a barony, serving until the Whigs went out of office in 1841. On their return in 1846 he resumed the lord chancellorship, resigning in 1850, when he was raised to the earldom. An uncle, Sir Lucas Pepys, was a distinguished physician and a younger brother was a bishop. Cottenham was regarded as sensible and hard-working, but he was not a good speaker, often in poor health, and reserved himself largely for legal matters. JAC

**Cottington, Francis, 1st Baron Cottington** (c.1579–1652). Cottington was a Somerset gentleman who became a leading minister before the Civil War. He was first employed by James I in Spanish matters, knew the country well, and spoke the language. In 1622 he became secretary to Charles, prince of Wales, was given a baronetcy in 1623, and brought into Parliament. A shadow fell over his progress when he quarrelled with \*Buckingham, but after the duke's murder Cottington forged ahead. In 1629 he became chancellor of the Exchequer and held the post until 1642. He was

## cotton industry

rewarded in 1631 for negotiating peace with Spain with a barony. As master of the Court of \*Wards from 1635 he screwed up the income at the cost of much irritation. As soon as the royal government began to falter, Cottington was a marked man and began to divest himself of his offices. When war broke out he joined the king at Oxford, acted as lord high treasurer, and on the surrender in 1646 went into exile. He died a catholic in Spain in June 1652. \*Clarendon described him as a good-humoured and entertaining schemer—'he left behind a greater esteem of his parts than love of his person'. JAC

**cotton industry.** Cotton manufacture was introduced to Britain from the Netherlands in the 16th cent. and was established in a number of areas by 1750, including Lancashire, East Anglia, and the west of Scotland. Mixtures of cotton and linen were particularly in demand, and London was the most important market for these fustians. London bills of exchange were an important element in trading capital, but requirements for fixed capital were modest until the advent of the factory, and met generally from profits. Pure cotton goods were very expensive but highly fashionable and were imported from India by the \*East India Company. These oriental products were commonly imitated in cheaper cotton mixtures. Before the industry started to move into factories, an experienced labour force and commercial networks had been created, and in some places concentration of production in large workshops without significant changes in technology had already begun.

Shortly after 1700 the silk industry fathered the water-powered factory, and this organization was transferred to the cotton industry by Richard \*Arkwright in the late 1760s. Increasing demand and interruptions to the supply of Indian goods, provoked by wars, encouraged the mechanization of spinning with the introduction of the jenny, water frame, and mule, then improvement of preparation machinery, especially carding, and finally weaving with the power loom. Power was provided at first by horse capstans, windmills, and water-wheels, but James \*Watt's rotary steam-engine encouraged location near cheap coal supplies in towns, and the industry tended to concentrate in Lancashire and the west of Scotland. Hand-spinning rapidly declined in the late 18th cent. Hand-loom weaving survived much longer, but growing immiseration was the lot of its practitioners by the 1840s.

Cotton created many opportunities for social and economic mobility. On the supply side the most important feature was the emergence of the southern states of America as the world's leading producer; Liverpool soon after 1800 became the most important port for the cotton trade and superseded London. The rise of Liverpool and the growth of machine-making firms in Oldham and Manchester gave Lancashire cardinal cost advantages. Thus Manchester became the main centre for the cotton trade and manufacture in the 19th cent.

One must not exaggerate the importance of cotton to the British economy. Research suggests that it probably never accounted for more than 8 to 10 per cent of national income. Yet the cotton industry had a wide influence. For instance, it

pointed the way for other textile industries; it stimulated civil and mechanical engineering, aided the development of the chemical industry, and was significant in the growth of wholesale and retail trade.

The industry slowly came under pressure in foreign markets because of the rise of competition and the transfer of technology to other countries. Competitive disadvantages were compounded by the hardness of sterling before 1914 and the omnipresence of tariff barriers. Yet Britain was dominant in world cotton markets till 1914. The industry had structural weaknesses which were exposed in the period 1919–39: an inability or slowness to adopt the latest technology; undue specialization rather than integration combining spinning, weaving, finishing, and the clothing trades; a refusal to acknowledge the weaknesses of \*laissez-faire when faced with economic discrimination; a low wage/low productivity strategy which bedevilled industrial relations; and the rise of man-made fibres, beginning with rayon (artificial silk).

The fall in exports in the inter-war years represented not only the success of competitors and the deficiencies of Britain's industry, but also the problems besetting the world economy. Acceptance of the need for tariffs and the rationalization of the industry was rapid after 1929, with state intervention reducing capacity under a Spindles Board (1936) and the Cotton Industry (Reorganization) Act (1939), which established a cartel under the Cotton Board. After 1951 decline was swift and would have been worse without high levels of protection. Yet the progress of artificial fibres and cheap imports, often from the Commonwealth, could not be gainsaid. The state managed further contraction under the Cotton Industry Act (1959), only large integrated multinational firms surviving by 1990. The epic success of the 'industrial revolution' became a horror story from the 1920s. JB

**Council, Great.** See GREAT COUNCIL.

**Council for Wales in the Marches.** Edward IV had large estates as earl of March in the Welsh border and in the 1470s established a council at Shrewsbury under the nominal authority of the infant prince of Wales. Henry VII, Welsh by birth, followed the example. After a period in abeyance, the council seems to have been revived by Thomas \*Cromwell. The Act of Union with Wales in 1536 brought the whole area under closer royal supervision and a statute of 1543 established a council with wide authority in Wales and in the border counties of Shropshire, Herefordshire, Worcestershire, and Gloucestershire. Much of its business was judicial and petitioners were saved a long and expensive journey to London. Unlike the \*Council of the North, the Council in Wales was not abolished by the \*Long Parliament, though the English border counties were removed from its remit. Reconstituted in 1660, the council never regained its former importance and was abolished in 1689 by 1 Wm. & Mar. c. 27 on the grounds that the ordinary law courts were quite capable of providing justice. JAC

**Council of State, 1649–60.** After the execution of Charles I and the abolition of the monarchy, the \*Rump Parliament in

February 1649 gave executive power to a Council of State of 41 members. It contained three peers, a number of lawyers including \*Bradshaw, and senior army officers such as \*Cromwell, \*Fairfax, and \*Skippon. Cromwell dissolved the council in 1653 immediately after he had dismissed the Rump and appointed an interim Council of State in April. When Cromwell became lord protector in December 1653 he was given a council of 21 under the \*Instrument of Government. Though it had less power than its predecessor, it was far from negligible and Cromwell complained that he was in toils. In the \*Humble Petition and Advice, adopted in 1657, it was referred to as the Privy Council. When the Rump was recalled in 1659, another Council of State was appointed, but it was swept away at the Restoration. Charles II held a meeting of a much truncated Privy Council at Canterbury as soon as he landed in 1660. JAC

**Council of the North.** The chief arm of government in the turbulent northern shires of Yorkshire, Durham, Cumberland, Westmorland, and Northumberland in the Tudor and early Stuart period. It was responsible for law and order and had wide jurisdiction. As duke of Gloucester in Edward IV's reign, Richard III had shared power in the north with the earl of \*Northumberland. Having seized the crown in 1483, he appointed Northumberland warden of the marches but created a separate council at York under his nephew and heir, the earl of \*Lincoln. Henry VIII allowed the council to lapse but revived it in 1525 under the nominal control of his natural son Henry \*FitzRoy. In 1530 it was made a royal council and after the \*Pilgrimage of Grace in 1536, which the council had failed to prevent, it was reorganized once more. Its importance in Elizabeth I's reign is indicated by the fact that, after the dangerous rising of the \*northern earls in 1569, the presidency was held by Lord \*Huntingdon, the queen's cousin, from 1572 until 1595, and by Lord Burghley, elder brother of Sir Robert \*Cecil, from 1599 until 1603. In 1628 Charles I appointed \*Strafford to be president. He retained the office while he was lord deputy in Ireland but in 1641 was attainted and executed. The council was abolished by the \*Long Parliament shortly afterwards. It was not revived at the Restoration, though Charles II considered doing so in 1664. From the dissolution of the monasteries to its abolition, the council met in the King's Manor at York, the residence of the lord president. JAC

**counties.** The county (otherwise the shire) was the main unit of provincial government in England from before the Norman Conquest until modern times. \*Domesday Book (1086) describes 32 shires. Five of these were subdivisions of the former kingdom of Wessex. Of these, Hampshire already existed in 757; the others may be as old. Five shires derive from former kingdoms absorbed into the dominions of the house of Wessex (Kent, Sussex, Essex, and East Anglia (divided into Norfolk and Suffolk)). The shires of the midlands were nearly all created in the 10th cent. The only later additions to the system were Westmorland, Cumberland, Lancashire, Durham, Northumberland, and the anomalous Rutland. The Domesday shires had, to a remarkable extent, the boundaries which they were to retain for many centuries. By 1066 each shire (sometimes pairs of shires) had an

official, the \*sheriff, responsible for the royal lands and the exercise of aspects of royal authority. The \*county court, meeting twice annually, was a principal forum for justice both civil and criminal.

After the Norman Conquest the principal changes were the construction of shire castles as cores of local authority and a great increase in the frequency with which the shire courts met. Although the importance of these courts diminished in the later Middle Ages, the most important new judicial authorities, the \*justices of the peace, were organized on a shire basis. The justices acquired many powers as time went on; their \*quarter sessions were the principal organs of local government until the establishment of \*county councils by the Local Government Act of 1888. This Act divided some historic shires for governmental purposes. Their historic boundaries had been modestly rationalized by earlier legislation.

The only major innovation in shire government in the centuries before 1888 (setting on one side the events of the Civil War and Interregnum) was the creation of the office of \*lord-lieutenant in 1549. His function was to command the shire levies. From their very earliest days a predominant function of the shires had been military. Shire associations of regular regiments (which sometimes had a long history going back to the Militia Act of 1757) were made standard and universal by an act of 1881. This was an expression of the greater shire-consciousness of the later 19th cent., found also in the associations of archaeological societies, cricket clubs, and agricultural societies. An Act of 1972 brought major changes in county organization. Some historic shires were merged and new ones without historic antecedents created. Further changes were made in 1996. JCa

**country houses.** The country house was the focal point and symbol of the ascendancy of the gentry and aristocracy in the period between the Glorious Revolution and the First World War. It no longer had military significance. It was not a castle, did not need moats or peel towers, and had no fortifications, unless the owner in the late 18th cent. had a taste for mock Gothic and battlements. It was large enough to accommodate the family and its dependants, and the bevy of servants who supported them. Ideally it could give hospitality to a considerable number of guests since it often served as a political headquarters. It stood in its own park, with a lodge and a drive, partly to give privacy, partly to impress or even overawe visitors. The minimum requirements were a large dining room, good stables, and a reception room: the larger houses ran to long galleries, libraries, orangeries, and lakes. Follies and eye-catchers were optional extras.

Country house does not seem the right term for Tudor residences. The great palaces—\*Hatfield, \*Longleat, Burghley, \*Hardwick—were rather too grand: 'prodigy houses' has been suggested. Many of the rest were modest, often in the middle of a medieval village, squalid rather than picturesque. The fields surrounding the villages were still, for the most part, communally cultivated on a strip system, giving the house little space of its own. One of the objects of \*enclosures in the 18th cent. was often to round off a

## County Councils Act

park, eliminate an irritating intrusion, or divert a footpath. Until 1693, the main road from Deptford to Woolwich ran right through the middle of the Queen's House at \*Greenwich.

Most of the land released by the \*dissolution of the monasteries in the 1540s found its way into the hands of the gentry and nobility and many of the estates were future country houses, betraying their origins as Woburn abbey (Beds.), Newbattle abbey (Lothian), or Hitchin priory (Herts.). The great building period followed the Restoration in 1660 and particularly the Glorious Revolution in 1688. Good examples of the modest 17th-cent. manor house are Washington Old Hall, south of Newcastle upon Tyne, and Woolbridge Manor (Dorset), where Thomas \*Hardy made Tess spend her unlucky honeymoon. On a grander scale are Capheaton, Northumberland (1668), Milton, Oxfordshire (1670), and Uppark, Sussex (1685–90). With \*Chatsworth, Derbyshire (1687), \*Castle Howard, Yorkshire (1699), Stowe, Buckinghamshire (1720), and \*Mellerstain, Borders (1725) we are moving towards palaces.

The style of life within the walls depended greatly on the wealth and interests of the owner. After 1688, Parliament met annually, usually in November, and members were not keen to stay in London long after Easter. The country house season was the summer and early autumn. Leading politicians held conclaves—Lord \*Temple had a 'grand congress' at Stowe in October 1783 to concert opposition to Fox's \*India Bill; county members cultivated their neighbours and freeholders with dinners, balls, and races, the lesser gentry took advantage of the light evenings to visit within a radius of 10 miles or so. Though the vision, particularly for the old, was a country retreat, there were many, especially among the young, who were bored in the country and pined for the London season. The comfort of the house depended greatly on the quality of its servants. Augustus Hervey at Stowe in 1765 'never saw so large a house so well conducted . . . servants all attention and respect'. But Horace \*Walpole at Houghton, much neglected, in 1773 found three old servants drunk before breakfast. The problem of finding reliable and cheap servants became acute in the later 19th cent. and was one of the factors undermining the country-house way of life.

The mid-18th cent. was an age of improvement. A large number of country houses were rebuilt in classical style and much money spent on embellishing parks. At Kedleston, Milton, Chippenham (Cambs.), Nuneham Courtenay, and Wimpole, whole villages were removed to give greater privacy. Visiting the new seats and inspecting the improvements became a favourite pastime and housekeepers turned the honest penny by showing tourists round when the family was not in residence. The internal arrangements were remodelled to give much greater privacy and comfort than had existed in the semi-communal house of medieval times, with its great hall. Water closets began to be installed in the late 17th cent. though progress was slow.

Though the 18th cent. was the heyday of the country house, more were built in the 19th cent. than ever before. \*Disraeli, who surprisingly became leader of the Tory Party, had no country house of his own and had to borrow money

from the Bentincks to buy Hughenden Manor in Buckinghamshire. Sir William \*Armstrong, the north-eastern armaments king, built himself an extraordinary country retreat at Cragside in the Northumbrian hills, where elegance gave way to comfort. The Rothschild family covered the vale of Aylesbury with large and ornate country houses—Aston Clinton (1840), Mentmore (1852–4), Tring (1873), Ascott (1874), Waddesdon (1880), and Halton (1884). The spread of the railway network made visiting country houses, particularly for the weekend, easier than ever before.

The decline in the later 19th cent. had a variety of causes. Country gentlemen no longer dominated politics, at Westminster or in the shire, and the country house lost its *raison d'être* as a political centre. The agricultural depression after the 1870s struck the landed interest hard and for decades land ceased to be an attractive investment. The cost of running households and estates escalated just as \*death duties and discriminatory taxes were beginning to bite. Though many country houses survive, others have been transformed into hideous parodies of former greatness, and serve as conference centres, reform homes, cult headquarters, and even fun-fairs and amusement parks. JAC

**County Councils Act, 1888.** The \*Municipal Corporations Act of 1835 had given elected corporations to the large towns. Rural administration remained in the hands of the justices of the peace, though the smaller towns had their own local institutions. The 1884 Reform Act, which extended the parliamentary vote to many people in the shires, made the situation anomalous. In the Act of 1888, Lord Salisbury's government created 62 county councils in England and Wales, some of the larger shires being subdivided. Sixty-one towns of over 50,000 inhabitants were given county borough status and London was given its own county council. The franchise was similar to that in the boroughs. Unmarried women could vote for the new councils but not serve on them—a position not remedied until 1907. To the counties' responsibilities for highways, and a share in the police, were soon added powers for education. In England there was great continuity of personnel, many JPs being elected, and several lords-lieutenant becoming chairmen. But in Wales there was a much greater change and nonconformist liberals swept the board at the expense of the gentry. The equivalent Scottish Act was passed in 1889. JAC

**county courts.** The shire or county courts were the most important of the communal courts which governed all aspects of local life in Anglo-Saxon and Norman England. Each shire held a monthly court or assembly where all local business, legislative, administrative, or judicial, was conducted. The shire court gradually declined with the growth of the common law courts from the \*curia regis and with the development of Parliament in the 13th cent., though it remained important as the court in which the itinerant justices sat and as the assembly in which the representatives of the shire to Parliament were chosen. By the 19th cent. there was no legal forum available to the would-be civil litigant whose means were small, hence the gibe that the English courts were open to all 'like the Ritz Hotel'. In

1846, to meet this criticism, the County Courts Act set up a network of new 'county courts' within each area, not necessarily synonymous with the county in which they sat. These courts became and remain civil courts of limited jurisdiction.

MM

**Courcy, John de** (d. 1219). Conqueror of Ulster. De Courcy's parentage is unknown, though he probably came from Somerset. He is said to have visited Ireland in 1171 with Henry II, who promised him Ulster if he could acquire it. Returning in 1176 with a small but well-organized force, he moved north from Dublin and succeeded in gaining the lands east of the Bann. He established a castle and base at Carrickfergus, built other strong points, and strengthened his position in 1180 by a marriage to Affreca, daughter of Gottred, king of Man. From 1185 to 1190 he was justiciar in Ireland. But he had great difficulty in holding his conquests, both against the native Irish and against Hugh de Lacey, a rival Norman colonizer, who was created earl of Ulster by King John in 1205.

JAC

**court.** The institution known as the court has changed its meaning over the centuries. In early medieval times, the court, or household, was the centre of government. The chamberlain and butler performed their personal services for the king but also acted as advisers in broader questions. The monarch, with counsellors and great officers in attendance, would do business, receive petitions, and dispense justice. The king's journeys around the shires enabled some of his subjects to visit him locally, but must have inhibited the social side of court life, since it would not have been easy to accommodate large numbers of unexpected guests: Henry II's movements were notoriously unpredictable. As public business increased, various functions were delegated: much administration was left to the council, and justice to the specialized law courts. But as long as political power remained with the monarch, the division between public and private, government and ceremony, could never be absolute. It has been suggested that, as a result of the 'Tudor revolution in government', the court from the 1530s took on a purely ceremonial role. That is premature. All through the Tudor and early Stuart period, careers could be made or broken at court—\*Wolsey, \*Leicester, \*Essex, \*Rochester, \*Buckingham. The more routine aspects of government may have been hived off, but the crucial decisions still rested with the monarch and his immediate advisers. But after the Glorious Revolution, as power drained away to Parliament and the cabinet, the importance of the court began to diminish. Charles II's court had been lively, with obliging ladies founding aristocratic families, but money had started to run out. Monarchs also shared with many noblemen the preference for a less public and more domestic home life. By George II's reign, court life was routine and placid, save for a few grand occasions. To some extent this was fortuitous. William III was taciturn, Anne shy, George I inhibited by language difficulties; George II's temper made his receptions distinctly unpredictable, and George III's tastes ran to domestic bliss. Nor could the court any longer afford the patronage that had made Charles I a connoisseur of the arts. Monarchs still wielded considerable influence but in direct

consultation with ministers in private or in correspondence rather than through the court. The Edwardian court in the 1900s saw a brief social revival, partly because of the novelty of a visible monarch after Victoria's protracted seclusion, partly because Edward VII enjoyed company. But it was an Indian summer and went down in the trenches of 1917. After the Great War, society did not really recover. There were still people to whom it mattered to be received at court. But to almost all subjects in the late 20th cent. the court meant nothing, politically or socially. Though *The Times* continued dutifully to print a court circular, it is doubtful whether it was as much read as the sports page.

JAC

**court and country party.** Names employed for government and opposition in the late 17th and early 18th cents. The term 'country party' had obvious advantages. It was much broader than Tory or church party and avoided the divisive names of Whig and Tory at a time when many were combining to overthrow \*Walpole. It hinted at massive support in the nation at large: 'court and country', wrote one pamphleteer in 1742, 'distinguish the friends and enemies of the people.' It called to mind a golden past when squire and countryman had lived in harmony before the new moneyed interest bore everything down. 'Court', on the other hand, suggested a clique subservient to the monarch, wallowing in patronage and corruption. The basic country programme was a reduction in the number of placemen in Parliament and repeal of the \*Septennial Act to bring about more frequent elections and return power to the people. The court party retorted that the country party members were either secret Jacobites or self-seeking careerists, making trouble for their own ends. The court's counter-accusation was strengthened by the fact that so little was done when the opposition took over, particularly in 1742 on the fall of Walpole: the only Place Act was insignificant and the Septennial Act was not repealed. The attitudes and arguments, though not the names, repeated themselves in the 1770s when the \*Rockinghams were in protracted opposition to Lord North's administration, prescribed \*economical reform, and deplored the excessive influence of the crown.

JAC

**Courtenay, Edward, 11th earl of Devon** (1526–56). Courtenay spent more than half of his life in the Tower. He was son of Henry \*Courtenay, marquis of Exeter, and a great-grandson of Edward IV. When Courtenay was 12, he and his parents were sent to the Tower. His father was accused of treason against Henry VIII and executed. Edward Courtenay was attainted in 1539 and not released until Mary succeeded in 1553. His mother was a confidante of the queen and Courtenay had got to know \*Gardiner, bishop of Winchester, while they were in the Tower. He was received with great favour, restored to the earldom, and made KB. Handsome, catholic, and of royal blood, he was talked of as a possible husband for Mary. The suggestion was not preposterous: in similar circumstances \*Darnley won the throne of Scotland twelve years later. But Mary heard reports of debauchery and turned to Philip of Spain. Courtenay then transferred his hopes to Princess Elizabeth and was implicated in \*Wyatt's rising in 1554. He was sent

## Courtenay

back to the Tower, released in 1555, but died the following year abroad. JAC

**Courtenay, Henry, 10th earl of Devon** (c.1498–1539). Courtenay succeeded his father as earl of Devon in 1511. He was a grandson of Edward IV through his mother and a cousin of Henry VIII. For a time he prospered greatly. Henry gave him the Garter in 1521 and four years later created him marquis of Exeter. He gained from the \*dissolution of the monasteries and built up a powerful position in the west country. In 1536 he took part in suppressing the \*Pilgrimage of Grace. But his second wife was a catholic and on close terms with Princess Mary and Courtenay himself was at odds with Thomas \*Cromwell. His closeness to the throne roused Henry's suspicions and in 1538 he was accused of treason. A flimsy case was constructed against him on the basis of a few loose remarks and he was executed on Tower Hill in January 1539. The Russells succeeded to his position as the leading Devon family. JAC

**Courtenay, William** (c.1342–96). Archbishop of Canterbury. Courtenay's aristocratic connections carried him rapidly up the ladder of preferment. Of the noble Devon family, he graduated in law at Oxford and was chancellor in 1367. In 1370, at the age of 28 or thereabouts, he became bishop of Hereford, transferring to London in 1375. His tenure there saw the \*Peasants' Revolt, in which Simon \*Sudbury, the archbishop of Canterbury, was murdered. Courtenay replaced him and for a short while held the great seal as chancellor. He opened Parliament with a sermon in English. Hostile to \*Wyclif and \*John of Gaunt's faction, Courtenay helped to force Wyclif into retirement at Lutterworth. His relations with the young king, Richard II, were turbulent. In 1385 they quarrelled violently when Courtenay attempted to rebuke him for his wild way of life, yet the archbishop supported the statute of \*Praemunire (1393), which curbed papal authority. JAC

**Court of Session.** In the 15th cent. the general jurisdiction of the Scottish royal council was delegated to a committee. In 1532, partly at papal suggestion, James V established a Court of Session, or College of Justice. There were to be fifteen members, 'cunning and wise men', half of whom, including the president, were to be clerics. After the Reformation, the clerical numbers were reduced and the last clerical judge, Archbishop Burnet of Glasgow, served 1664 to 1668. The arrangements were confirmed by the Act of \*Union, though the number of justices has been increased to deal with the growth of litigation. The court sits at Parliament House in Edinburgh and there is no appeal in criminal matters to the House of Lords at Westminster. The justices are accorded the courtesy title Lord, though they do not sit in the House of Lords, and the title is not hereditary. JAC

**courts leet** were originally held as a form of franchise by the lord of the manor. Unlike the seigneurial (feudal) courts, the jurisdiction of the leet did not belong to the lord by right but had to be granted to him by the king. However such a grant entitled the lord to hold the hundred court, dealing with all minor criminal matters within the district, and to

receive the fines paid to the court. This passing of hundred courts into private hands was widespread and although Edward I by his 'quo warranto' inquiry clamped down on the holders of franchises, he eventually allowed a lord to hold the court if he could show a specific grant from the crown or that he had held the court from the date of the accession of Richard I (1189). Courts leet declined with the advent of the \*justices of the peace but many remained and some became the kernel of a new local government for the growing boroughs which incorporated an existing manor. Courts leet were sometimes combined in one gathering with the court customary (the 'halmote' or 'hallmoot'), presided over by the lord's steward or bailiff. MM

**courts martial.** Strictly these are courts administering military law, i.e. the special legal rules applicable to members of the armed forces and ancillary personnel. However, the term has also been used to describe courts administering 'martial law'. As early as the Wars of the Roses, powers were exercised by military commanders to try and to punish offenders in areas of conflict. Special courts under such proclamations tried and punished those who transgressed against the orders of the military authority. Proclamations of martial law, issued in times of constitutional struggle, were described as illegal in the \*Petition of right in 1628. In so far as there is any such principle as 'martial law', it can only be that necessity may on occasion be a defence to a breach of the law, and the necessity of keeping order and peace may on rare occasions justify conduct which is otherwise unlawful. Trial must still take place in the usual courts after the event. MM

**covenanters.** As supporters of the Scottish National Covenant (1638) they sought to preserve \*presbyterianism in Scotland and oppose royal interference, in particular imposition of the 'Laudian' Prayer Book (1637). After defeating Charles I in the \*Bishops' wars (1639–40), they forced him to accept presbyterianism in Scotland. The New Model Army's sectarianism thwarted their attempt by the \*Solemn League and Covenant with Parliament (1643) to impose it on England. Though after Charles I's execution Charles II signed the covenant (1650), \*Cromwell's victorious army forced the Scots unwillingly to tolerate sectarianism. Revival of Scottish episcopacy (1662) was unpopular and short-lived; presbyterianism was restored (1690). WMM

**Covent Garden** (London). Anxious to restore his dilapidated estate (land belonging to the convent, or abbey, of Westminster prior to the \*dissolution of the monasteries), the 4th earl of Bedford secured a building licence and commissioned Inigo \*Jones as architect. Influenced by study in Italy, Jones created a piazza surrounded by St Paul's church and three terraces of tall houses with arcades looking inwards (completed by 1639), the unfamiliar design meeting a mixed reception. The houses became highly sought after, until western developments and the expansion of the fruit, flower and vegetable market (established 1670) made them less fashionable. Shops and coffee-houses proliferated, and its first theatre (now the Royal Opera House) opened in 1732. The area became increasingly unruly and seedy, despite at-

tempted control by the estate authorities and considerable rebuilding. It was eventually sold by the 11th duke (1918), and the market moved to Nine Elms (1974). ASH

**Coventry.** Cathedral city in Warwickshire. It developed around an important priory, founded in 1043 by Earl \*Leofric and Countess Godgifu ('Lady \*Godiva' of Coventry folklore). From 1102 to 1539 the priory church had cathedral status, and in the 14th cent. the city rose spectacularly through cloth-manufacturing to become the fourth largest English town. It declined equally spectacularly in the 16th cent., but found renewed industrial prosperity from the 18th cent., and in 1918 became a cathedral city once more. It was heavily bombed in the Second World War, but retains more historic buildings than is often appreciated, including the 14th-cent. St Mary's Hall. DMP

**Coventry, diocese of.** The modern see, created in 1918, is roughly coterminous with Warwickshire. In Anglo-Saxon and early Norman times the Mercian church had been centred on \*Lichfield, then on \*Chester, and eventually, after 1102, on Coventry abbey, though the administrative centre remained at Lichfield. Bishops were known as 'bishops of Coventry' until 1228, after which the title 'Coventry and Lichfield' was usual. With the removal of the see's north-western section to form the Chester diocese in 1541 and Coventry abbey's dissolution, Lichfield's administrative importance was acknowledged by the reversal of the title to 'Lichfield and Coventry'. In 1836 Coventry and its neighbourhood were put under \*Worcester, but the massive increase in population in the midlands necessitated the foundation of the \*Birmingham diocese in 1905 and Coventry in 1918. St Michael's parish church served as the cathedral, until it was destroyed by bombing in 1940 and retained as a roofless ruin, which is now neatly juxtaposed with the new cathedral, designed by Basil \*Spence, the whole being a symbol of death and resurrection. The cathedral's interior is dominated by the great tapestry of *Christ in Glory* by Graham \*Sutherland. The twinning of Coventry with Dresden is a powerful symbol of the desire for renewal after destruction, for both dioceses lost their cathedrals in the Second World War. WMM

**Coventry, Thomas Coventry, 1st Baron** (1578–1640). Coventry was born at Croome d'Abitot in Worcestershire, the son of a judge, and had a rapid rise to legal eminence. By 1616 he was recorder of London, in 1617–21 solicitor-general, and attorney-general 1621–5. From 1625 until his death he was lord keeper and then lord chancellor, receiving his peerage in 1628. He followed the line of royal policy but argued a moderate case and was inclined to reserve himself for legal questions. He advised Charles I to agree to the \*Petition of right and defended the imposition of \*ship money in general terms. Said to be morose in private, in public he was courteous and civil and Clarendon credited him with 'a strange power of making himself believed'. He died just before the opening of the \*Short Parliament in 1640 'in a season most opportune and in which a wise man would have prayed to have finished his course'. Two of his sons had important political careers in Charles II's reign. JAC

**Coverdale, Miles** (1488–1568). Augustinian friar turned secular priest, popular preacher, and early reformer, Coverdale spent most of the time between 1528 and 1548 in exile, producing the first complete translation of the Bible into English, whilst abroad, in 1535. Prior to this, he may have worked with William \*Tyndale, upon whose New Testament translation he relied. Five years earlier, Henry VIII deemed an English translation unnecessary, but Thomas \*Cromwell obtained royal approval for publication of Coverdale's Bible in England, which encouraged John Rogers's Matthew Bible in 1537. Meanwhile, Cromwell initiated an official translation for use in every parish church, entrusting the revision to Coverdale. The 'Great Bible' was published in 1539. Coverdale was appointed bishop of Exeter in Edward VI's reign, deprived, but escaped persecution under Mary Tudor. Christian III of Denmark's intercession enabled him to go abroad again until the more favourable climate of Elizabeth's reign. But he was not restored to his diocese, presumably because his views were too radical. AM

**Cowes regatta.** Cowes week is held early in August and is the climax of the yachting season. Cowes castle, built by Henry VIII, has been the headquarters of the Royal Yacht Squadron, founded 1815, since 1856. East and West Cowes lie on either side of the estuary of the river Medina in the north of the Isle of Wight. JAC

**Cowper, William, 1st Earl Cowper** (1664–1724). Politician and lawyer. Called to the bar in 1688, Cowper proved a brilliant lawyer, an attainment which he brought to the Commons in 1695. Despite being a court Whig, he kept a cautious distance from the \*Junto. He was appointed lord keeper in 1705, becoming a peer in 1706, and lord chancellor in 1707. In these offices he brought about an improvement of Chancery procedure, and as a true Whig member of the \*Godolphin ministry instigated a mass removal of Tories from the magistracy. In 1710 he presided over the trial of Dr \*Sacheverell, and later that year resigned with his party. Reappointed lord chancellor by George I in 1714, he promoted the \*Riot and \*Septennial Acts. By 1718, however, he was voting increasingly with the Tories, disgusted by the power-lust of some of his colleagues, and resigned a month after receiving an earldom. He continued to lead the opposition in the Lords until his death in 1724. AAH

**Crabbe, George** (1754–1832). Born in Aldeburgh (Suffolk), Crabbe began training as a doctor before taking holy orders. But his love was poetry and, moving to London, he was fortunate enough to be taken up by \*Burke, \*Johnson, and the Manners family. His poem *The Village* (1783) is a gloomy description of poverty and toil, intended as a contrast to \*Goldsmith's idealized *Deserted Village*:

Here joyless roam a wild amphibious race  
With sullen woe displayed in every face.

It brought Crabbe considerable reputation and much clerical preferment. His other major work was *The Borough* (1810), which described his home town, and included the story of Peter Grimes, a sadistic fisherman, used by Benja-

## Craftsman

min \*Britten. Crabbe's heroic couplets looked back to Pope, but his realism linked him to Wordsworth, and it was unusual to regard the annals of the poor as of much poetic interest. \*Hazlitt, while admitting that Crabbe was 'one of the most popular and admired of our living authors', complained of the monotony of Crabbe's response—'he has no delight beyond the walls of a workhouse'. JAC

**Craftsman, The: or, The Countryman's Journal.** Best-selling newspaper which, from 5 December 1726, spearheaded the opposition to Sir Robert \*Walpole. Backed by \*Bolingbroke and William \*Pulteney, and edited by Nicholas Amhurst under the pseudonym 'Caleb D'Anvers of Gray's-Inn, Esq.', the paper's avowed aim was to expose political craft. 'Country' rhetoric was employed in the attempt to create a political platform strong enough to accommodate the opinions of Tories and dissident Whigs. Bolingbroke was himself a principal contributor, his *Dissertations on Parties and Remarks on the History of England* both being reprinted from a series of essays originally published in *The Craftsman*. JAD

**Craig, James, 1st Viscount Craigavon** (1871–1940). First prime minister of Northern Ireland. Craig, the son of a millionaire whiskey distiller, was elected as Unionist MP for East Down in 1906. With \*Carson he led the Ulster Unionist resistance to the third \*Home Rule Bill, using his administrative skill and extensive social connections to organize a mass movement: Carson was the charismatic front-man, Craig the tireless manager. He held junior ministerial office as parliamentary secretary to the Ministry of Pensions (1919–20) and as financial secretary at the Admiralty (1920–1): he influenced the Government of \*Ireland Act, successfully pressing for a six-county partition scheme. Despite his standing at Westminster, he accepted the premiership of the newly created Northern Ireland in 1921, holding office until his death in 1940. He saw off the IRA challenge to the partition settlement (1921–2), but was unable to address the intractable sectarian and economic problems of the new state. However, Craig had both political imagination and managerial skill. In his later years he was ailing and apparently disengaged from the Northern Irish political scene: the limited powers devolved on \*Stormont offered little scope to this once resourceful minister. AJ

**Cranfield, Lionel, 1st earl of Middlesex** (1575–1645). Cranfield, of relatively humble origins, competent and industrious, became lord treasurer under James I. He was a successful \*Merchant Venturer and when in 1613 he was appointed surveyor-general of the customs, it was a case of poacher turned gamekeeper. In 1614 he became a member of Parliament, and attached himself to the royal favourite, George Villiers, later duke of \*Buckingham. Under this patronage, Cranfield was appointed to various royal offices, which he performed with great efficiency. In 1621, when he became lord treasurer, he found that reform was needed in 'every particular'. As James I's expenditures exceeded his income, Cranfield made spending cuts, and courtiers lost their pensions and allowances. This was the beginning, though set-back followed, of 'Treasury control'. Cranfield

soon fell, brought down by Buckingham, his former patron, and the enemies he had made in the king's service. He was impeached, found guilty of maladministration and corruption, deprived of his offices, fined, and briefly imprisoned in the Tower. He was pardoned in 1625, and for the rest of his life lived in retirement. MW

**Cranmer, Thomas** (1489–1556). Archbishop of Canterbury. Cranmer played a greater role than any other single churchman in shaping the Church of England, and above all its liturgy. However, his diffidence in theological controversy has denied him the status of a founding reformer. He was born to a gentry family in Nottinghamshire and studied at Jesus College, Cambridge, where he became a fellow and took orders, becoming a DD in 1526. He rose to sudden prominence in 1529 on the strength of his suggestion that the universities of Europe be asked to provide opinions on the legitimacy of Henry VIII's first marriage. On an embassy to Germany in 1532 he met and married the niece of the Lutheran church leader of Nuremberg, Andreas Osiander, whom he later brought secretly back to England. When Archbishop William \*Warham died in August of that year Cranmer was proposed as his successor; despite the stalled divorce negotiations Clement VII provided the papal documents for his consecration early in 1533. Cranmer then presided over the court which annulled Henry and \*Catherine's marriage. He was also used, later on, to decree the nullity of Henry's marriage to \*Anne Boleyn and to celebrate, and end, the marriage to \*Anne of Cleves.

During c.1535–8 it is hard to separate Cranmer's role from that of Thomas \*Cromwell, or from some other bishops such as Hugh \*Latimer, in the shaping of religious policy and documents such as the 'Bishops' Book' of 1537. He was clearly opposed to the Act of \*Six Articles in 1539 (which forced him to send his wife away) but, unlike Latimer, did not resign his see in protest. After Cromwell's death he emerged as one of the leading reform-minded privy counsellors. Henry VIII's constant support ensured his survival in the 'Prebendaries' plot' against him at Canterbury in 1543, and gave him the authority to promote his own *English Litany* and *King's Prayer* while suppressing more conservative liturgical projects.

On the accession of Edward VI, Cranmer issued definitively protestant works, above all the first \**Book of Homilies*, a set of official model sermons, which were to be amplified and reissued under Elizabeth. In contrast, his first version of the \**Book of Common Prayer* of 1549 was painfully conservative, to the glee of catholic opponents and the embarrassment of Cranmer's allies. It nevertheless provoked the western rebellion of that year. In 1549 Cranmer welcomed a galaxy of German and Italian protestant stars into England as a refuge from Charles V's campaign against Lutheranism. They helped guide Cranmer into formulating his most explicitly anti-catholic liturgical document, the second version of the *Book of Common Prayer* (1552) and the *Forty-Two Articles of Religion* (1553), the basis for the *Prayer Book* of 1559 and the \**Thirty-Nine Articles* of 1563 respectively.

Cranmer, like most leading figures in Edward's reign, acquiesced uneasily in the device to divert the succession

to Jane \*Grey, but offered no resistance to Mary I's accession despite her known catholicism. He and other protestant bishops regarded her coming as a divine test or punishment, and disobeyed passively. An attainer for treason was set aside in favour of a show-disputation at Oxford in April 1554, in which Cranmer defended himself less vigorously than Nicholas \*Ridley. He was kept in prison and eventually persuaded to sign recantations in which he accepted key catholic doctrines. He later withdrew these and was burned for heresy on 21 March 1556.

Cranmer's defining quality seems not to have been timidity (the theme of some accusations by historians) but a curiously biddable humility, intense loyalty to the crown, and a preference for very gradual change. The last two might in other circumstances have made a good Lutheran, but the first was most unusual for any 16th-cent. churchman. He wrote relatively little and ranks much less highly as a theologian than many of those he received in England in 1549–53. However, his exceptional gift for framing a poetic liturgical language, which combined the Latinate with the everyday, created a Prayer Book which was appreciated more and more in the centuries which followed. EC

**Crashaw, Richard** (c.1612–49). Poet. Despite his preacher father's puritan zealotry, Crashaw was drawn increasingly to high Anglicanism, aided by education at strongly Anglo-catholic Peterhouse, Cambridge (fellowship, 1635), preaching at the adjoining Little St Mary's (where he embraced Marianism), and friendship with Nicholas Ferrar, founder of the community at Little Gidding. Fleeing Peterhouse (1643) because of iconoclastic puritans, he made his way to Paris, where, fully converted to catholicism, he was rescued from poverty by fellow-poet Cowley, who had become cipher-secretary to \*Henrietta Maria in France. The queen's intercessions to Rome led merely to the office of attendant to Cardinal Palotta, before a minor cathedral post at Loreto, where he soon died. Remembered for religious rather than secular verse (*Steps to the Temple*, 1646), Crashaw was never more than a minor poet despite his richness of language, but his ecstatic mysticism and unrestrained imagery have been acclaimed as the height of \*baroque in English poetry. ASH

**Cravant, battle of**, 1423. In the summer of 1423, the earl of \*Salisbury with his Burgundian allies marched to relieve Cravant on the river Yonne in France, gateway to Dijon and Burgundy. The besiegers, led by \*Buchan, constable of France, were caught on 1 August between the garrison, making a sortie, and Salisbury's men, and badly defeated. The victory represented a recovery after the death of \*Clarence at \*Baugé and the death in 1422 of Henry V while campaigning. JAC

**Crécy, battle of**, 1346. The first great English land victory of the \*Hundred Years War was the high point of a campaign which began with the sack of Caen, and ended with the successful siege of Calais. Edward III landed unexpectedly in Normandy, and was forced by the French strategy of destroying bridges across the Seine to march almost up to Paris. He was able to repair the bridge at Poissy; challenges to meet the French in open battle yielded no results, and the

English army marched northwards. The Somme was crossed at Blanche-Taque, and at Crécy in Ponthieu (département Somme) the English prepared for battle. Edward drew up his force on 26 August with knights and men-at-arms dismounted, flanked by archers. The French first sent forward Genoese mercenary crossbowmen, whose weapons, their bowstrings slackened by a shower of rain, proved no match for the English longbows. Cannon, used for the first time in a major battle, helped to terrify the French. The French cavalry charged through their own retreating crossbowmen. The English archers brought down many of the French horses; the dismounted men-at-arms stood firm. Edward III commanded his men from the height of a nearby windmill; his son the Black Prince, in the forefront of the fighting, provided charismatic leadership. The final stages of the battle witnessed moments of pointless chivalric heroism from the French, notably when the blind king of Bohemia was led into the mêlée, his knights bound to him by ropes. All were slain. At the close, the English horses were brought forward, those who were still capable mounted, and the battle turned into a rout. After the victory, Edward laid siege to Calais, which surrendered in August 1347, giving the English a vital line of communication to the continent, which they kept for more than 200 years. MCP

**Crediton, diocese of**. Carved out of the \*Sherborne bishopric in 909, it initially covered all Devon and Cornwall, though from 931 to 1027 \*St Germans was the separate see for Cornwall. In 1050 Leofric moved the bishopric to \*Exeter, in obedience to Leo IX's command for sees to be in larger towns. Crediton was the birthplace of \*Boniface (680), the missionary to Frisia and Germany. WMM

**cricket**. As with most games, cricket was played in a primitive form many years before rules were drawn up, and some of the most enjoyable cricket is still played in back lanes with a dustbin as wicket. There are suggestions that shepherds in the Sussex weald played some form of the game in forest clearings, presumably with stones, a stick, and a tree stump. Among the games condemned by Edward III for distracting men from archery practice was club-ball. Cricket is not mentioned in James I's *Book of Sports* (1617) but was certainly well developed before the end of the century. An eleven-a-side match for 50 guineas was played in Sussex in 1697 and in 1709 Kent played Surrey at Dartford. Bowling was underarm and the bat was a heavy curved club. In 1744 there was an attempt to formulate agreed rules and the same year an All England XI played the men of Kent at the Artillery Ground, Finsbury. The patronage of the nobility helped to make the game fashionable. \*Frederick, prince of Wales, was a keen cricketer in the 1740s and the duke of Dorset in the 1770s, being a member of the Hambledon Club which played on Broadhalfpenny Down (Hants), outside the Bat and Ball Inn, and a patron of the White Conduit Club, which played at Islington Fields. A meeting at the Star and Garter in 1774 drew up new rules, with 22-yard pitches, 4-ball overs, stumping, and no-balling: 'the wicket-keeper should not by any noise incommode the striker.' In 1785 the White Conduits played Kent for 1,000 guineas, winning by 306 after Kent's

second innings had collapsed for 28. In 1787 Thomas Lord opened his new ground at Marylebone and in 1788 the Marylebone Cricket Club issued revised rules, prohibiting any attempt to impede a fielder while making a catch. The club moved to its present ground in 1814.

The most important change in the rules in the 19th cent. was the introduction of overarm bowling in 1864 after some vehement controversies. The Gentlemen v. Players match was first held in 1806 and was annual after 1819; Oxford v. Cambridge dates from 1827. By 1864 enough cricket was being played for John Wisden, himself a celebrated bowler (who took all ten wickets playing in 1850 for North v. South), to launch his *Cricketers' Almanack*. The first test match was played at Melbourne in 1877, when Australia won, and when they won again at the Oval in 1882 (England needing 85 in the second innings were all out for 77, Spofforth taking 7–44), the *Sporting Times* declared that the ashes of English cricket would be taken to Australia. Though county teams competed from early days, the county championship did not start until 1889, and was dominated in its early years by Nottinghamshire, Surrey, Yorkshire, and Lancashire. Gloucestershire, for whom the great W. G. Grace played, had been strong in the 1870s. Grace, probably the best known of all Victorian figures, gave cricket a national following. When he first turned out at 16 for the Gentlemen in 1865 they had lost their last 17 matches to the Players: subsequently they won 35 out of 39. Grace played until well over 50 and took ten wickets on two occasions, in 1873 and 1886—on the second occasion scoring a century as well.

The two main developments of 20th-cent. cricket were the spread of international competition, as the West Indies, India, Pakistan, Sri Lanka, and others came in to join England, Australia, New Zealand, and South Africa, and the introduction after the Second World War of limited-over cricket at the highest level. Limited-over cricket was not quite the innovation sometimes suggested, since village, club, and northern league cricket had always been played on that basis. It was made necessary because gate money could no longer support the traditional county championship in the face of alternative leisure attractions. With limited-over cricket came sponsorship—the Gillette Cup in 1963, the John Player League in 1969, the Benson and Hedges Cup in 1972. It is not difficult to deplore negative bowling, six-hitting flails, complex rules, and often predictable finishes, but cricket has always had its bizarre side. Married women and maidens played at Bury in Sussex in 1793; one-legged Greenwich pensioners v. one-armed Greenwich pensioners in 1796; teetotallers v. whiskey-drinkers at Ballinasloe in 1840; and cricket on the ice at Cambridge in 1870. Disagreeable developments of more recent years have been the intrusiveness of crowd behaviour and the revelation that heavy betting has led to widespread corruption.

**crime** is a subject which has, from the 1960s, attracted considerable attention from historians. It is, however, a topic which is fraught with difficulties. A key one is that of defining crime. In any period a variety of forms of behaviour

have been criminalized (for example, the prosecution of Roman catholic recusants in the Elizabethan and Stuart periods), or categorized as deviant. There has also been a tension between social historians studying crime and more traditional legal historians, while it has never proved easy to separate the history of crime from the history of the institutions which attempted to deal with it, and upon whose records students of the subject are largely dependent. Despite these difficulties, considerable work has been carried out on crime in England (the subject has not attracted much attention among historians of Scotland).

Anglo-Saxon law codes suggest a restitutive system, essentially a regulation of the feud. Post-Conquest England experienced a growing criminal justice system, the reign of Henry II (1154–89) providing the most durable elements. Interpreting the level and nature of medieval crime is difficult. There were criminal gangs who at times indulged in outright banditry, but criminal prosecutions in the 14th cent. suggest a more modern criminality in some areas, with theft as the most prominent offence. Certainly, although rates of homicide were high in the Middle Ages, the paradigm of a long-term shift from a 'feudal' criminality characterized by violence to a 'modern' criminality based on property crime remains unproven.

Record survival permits more systematic work from the 1550s, which has centred mainly on the study of felony (a category which includes serious offences such as homicide, burglary, theft, rape, and arson). Prosecution of these offences (especially property offences) reached peaks, according to region, in the late 1590s (a period of bad harvests) and the 1620s, a decade which experienced severe social and economic problems. When the running of criminal courts was resumed after the civil wars, however, levels of prosecuted felonies were low, and remained so until the mid-18th cent., when a resumption of population growth and the economic dislocation which attended the arrival of the industrial revolution caused them to rise.

During the early 19th cent. levels of crime rose alarmingly. Mass demobilization of soldiers and sailors after 1815 caused a crime wave, as had happened at the end of every war in the 18th cent., and this continued as industrialization and urbanization burgeoned. It was in the early 19th cent. that crime was identified as a social problem in the modern sense. The period saw the origins of criminology as a discipline, the introduction of national crime statistics, the emergence of such concepts as juvenile delinquency, and of professional police forces and prison as the standard punishment for serious offenders. With the emergence of some level of economic stability, and especially of improved living standards among the working classes, levels of prosecution dropped slightly in the late Victorian and Edwardian periods. From the 1950s, however, levels of prosecution increased, and continued to do so alarmingly over recent decades.

JAS

**Crimean War, 1853–6.** Known to contemporaries as 'the Russian War', this arose from long-term Russian ambitions to expand westward and southward, resisted by Britain as a matter of policy. The immediate cause was a petty struggle

between Russia and France over rights in Ottoman Turkey. This produced an ultimatum from Russia to Turkey in March 1853, followed by Russian occupation of the Ottoman Danubian provinces (modern Romania) and a naval victory over Turkey at Sinope on 27 November. Britain and France (later joined by Sardinia as well as Turkey) issued their own ultimatum on 27 March 1854.

The Black Sea theatre dominated contemporary perspectives of the war. Britain supplied a field army of about 28,000, which, with a French contingent of equal size, landed in May 1854 at Varna to defend it against Russian forces crossing the Danube. When this threat failed to materialize, the allied armies were transferred to the Crimean peninsula, landing north of the main Russian naval base of Sebastopol on 14 September. Their first victory, at the \*Alma six days later, enabled them to continue south around Sebastopol from the landward side to Balaclava, so establishing a partial siege of the base.

Through the autumn the Russians tried to break the siege of Sebastopol, the two major attacks being at \*Balaclava in October and \*Inkerman in November. After surviving a bad winter, for which they were not equipped, the allies launched naval expeditions against the smaller Russian bases of Kerch at the eastern end of the Crimea in May and Kinburn (near Odessa) in October 1855. Meanwhile, the Russians made one final attempt to relieve Sebastopol in August at the Tchernaya (in which the British were hardly involved). Repeated British and French attacks on Sebastopol finally led to the base becoming untenable and the Russians abandoned it in October.

Modern historical study pays at least as much attention to the purely naval campaign fought in the Baltic as to the Crimean theatre. The end of the war came about not through the fall of Sebastopol but through the British victory in August 1855 in destroying by bombardment the Russian dockyard at Sweaborg (outside modern Helsinki). Together with Kinburn, this demonstrated the vulnerability of Russian naval bases to British ships, a threat made explicit that winter with the building of the 'Great Armament', a floating siege train of over 360 vessels intended to capture the main Russian naval base in the Baltic at Cronstadt. Rather than face the loss of Cronstadt as well as Sebastopol, the Russians agreed to moderate allied peace terms in the treaty of \*Paris of 30 March 1856, with the Black Sea declared neutral and the Danube an open waterway.

The result of the Crimean War has been much debated. By pursuing a realistic limited aim the Allies held Russia in check for a generation, rather than destroying themselves by marching on Moscow. Equally, although British performance in the Crimea was a contemporary byword for incompetence, it is recognized that the army did not perform much worse than at the start of the Napoleonic wars, was as much a victim of government parsimony as of its own faults, and that by the winter of 1855 most of its problems were solved. SDB

**criminal law.** In Anglo-Saxon and Norman England, there was no distinction between criminal and civil law. Violence, or the causing of damage or harm to another's person or

property, was subject to savage penalties if the offender was caught red-handed, but other cases, including homicide, were dealt with by a system of compensation whereby, according to a tariff, wrongs were recompensed by money payments. Where the offence was serious, in addition to the bot (compensation for injury) or \*wergeld (payment to the kin of a murdered person), a payment (the wite) was made to the king.

Certain offences which were especially serious were the 'pleas of the crown', declared by the Anglo-Saxon kings to affect the king's interests especially, such as a breach of the king's peace. The Normans adopted these notions and extended the pleas of the crown, as well as introducing the concept of felony. These pleas came to be dealt with by the king's own justice—i.e. by the king or his justices.

In the Assizes of \*Clarendon and \*Northampton (1166 and 1176), Henry II introduced a system of presentment, under which twelve men of each hundred were to present to the justices of the \*curia regis those suspected of serious crime (pleas of the crown). Some see this as the beginning of a true 'criminal law', since it acknowledged that it is the role of government in the person of the king to ensure that crime is dealt with. Those presented might then be put to the ordeal to ascertain their guilt or innocence. When the clergy were forbidden to participate in ordeals by the Lateran Council of the church in 1215, the justices turned to the verdict of a jury to decide guilt or innocence. Presentment soon superseded the appeal of felony as the principal means of bringing criminals to justice.

Lesser offences were presented to the sheriff at the periodic session of the \*hundred court (held four times a year), which was known as the 'sheriff's tourn'. Where the lord of the manor held a \*court leet, the jurisdiction of the hundred was exercised in that court, and the fines collected were payable to the lord. Later, after the introduction of the \*justices of the peace, and especially after their jurisdiction was extended in 1361, lesser offences were tried by the JPs in \*petty sessions or \*quarter sessions.

The pleas of the crown became the basis of the English criminal law, which was administered in the sheriff's tourn and the court leet, and later in the courts held by the JPs (for minor crimes), and at quarter sessions, and before the judges of \*assize, where serious cases were heard with a jury. This system of criminal justice remained until the 19th cent. and was little changed until the 1971 Courts Act. In 1971 the assizes were abolished, as were quarter sessions. Serious criminal cases (indictable offences) are now tried in the crown court with a jury. Less serious cases (summary) are dealt with by magistrates sitting without a jury, or by a stipendiary magistrate. The ancient classification of crimes into treasons, felonies, or misdemeanours was abolished in 1967, and the law now divides crimes into indictable or summary (for purposes of trial) and into arrestable and non-arrestable.

The 18th and 19th cents. saw the introduction of large numbers of capital offences, partly in response to fear of revolution among the ruling élite. The so-called 'bloody code' imposed savage penalties for many offences and, even when transportation was introduced as an alternative

## Cripps

to the death penalty, punishments remained severe. The severity of the penal system was modified by the use of fictions, especially the undervaluing of goods stolen at less than a pound; by the use of benefit of clergy to enable a defendant who had been found guilty to evade the death penalty; by the reluctance of juries to convict; and by the very widespread use of the power of pardon. Gradually, under the influence of reformers such as \*Bentham, \*Romilly, \*Mackintosh, and \*Peel, the ferocity of the penal code was mitigated.

Appeals against conviction could only be to the Court for Crown Cases Reserved, set up in 1848, and it was not until 1907 that a proper system of criminal appeals was introduced with the creation of the Court of Criminal Appeal. In 1966 the Court of Appeal was divided into the criminal and civil divisions, and there is a right of appeal to that court from the crown court. MM

**Cripps, Sir Stafford** (1889–1952). Cripps was a successful barrister before he was appointed Labour solicitor-general in 1930. Along with \*Lansbury and \*Attlee, he became the most important Labour MP to survive the 1931 electoral débâcle. The economic crisis converted Cripps to socialism and he took the leadership of the Socialist League. His energetic advocacy of first the 'Unity Campaign' and later the 'Popular Front' made Cripps prominent but earned him expulsion from the Labour Party in 1939.

During the war, Cripps rose to the fore after the success of his ambassadorship to Russia, although the failure of his subsequent mission to India—perhaps a deliberate ploy by \*Churchill to discredit him—checked his advance. In 1945 Attlee appointed Cripps president of the Board of Trade (1945–7) and then chancellor of the Exchequer (1947–50). These jobs he carried out with his characteristic emphasis on self-sacrifice and austerity. His powers of persuasion and sheer moral authority enabled him to arrange a voluntary wage freeze with the unions and a hold on dividends, which was maintained for two years. His dedication and rigorous working schedule forced his resignation in 1950, and he died soon after. LHM

**Crofters' Act**, 1886. Crofts are smallholdings, particularly found in the Highlands and Islands of Scotland. Clearances in the 18th cent. had pushed numbers of tenants into crofts near the sea, where kelping and fishing eked out a meagre existence. In 1883 \*Gladstone, under pressure from the \*Highland Land League, appointed a commission under Lord Napier to investigate and report. The Act of 1886 (49 & 50 Vic. c. 29) established fair rents, security of tenure, and compensation for improvements. It also set up a Crofters' Commission, with power to fix rents. A further Act of 1976 made it easier for crofters to buy their holdings outright. JAC

**Croker, John Wilson** (1780–1857). An Irish lawyer, educated at Trinity College, Dublin, Croker had two separate though related careers as politician and as man of letters. He entered Parliament in 1806 and was taken up by \*Canning, becoming a strong Tory supporter, though sympathetic to both \*catholic emancipation and a measure of

\*parliamentary reform. He was on close terms with both \*Peel and \*Wellington. In 1809 he helped to found the \*Quarterly Review, in which most of his essays appeared. \*Perceval appointed him secretary to the Admiralty in 1809, a well-paid post which he held for 22 years, never quitting his office 'without a kind of uneasiness like a truant boy'. Despite a residual stammer, he was a sharp and effective debater. But his brilliant upwards progress faltered after 1820 when his only child, a 3-year-old son, died. He went out with the Tories in 1830 and played a prominent part in opposing the Whig Reform Act. \*Greville, who did not like him, called a 2½-hour speech in reply to \*Macaulay in September 1831 'very fine'. But after the passage of the bill, he gave up his seat, to his friends' bewilderment, partly in despair, partly because he was tired and ill. The rest of his life he devoted to his literary work, though staying on close terms with Peel until his conversion over the Corn Laws, which Croker thought had 'ruined the character of public men'. In an age of brutal reviewing, there remains a contrast between Croker's public image as sarcastic and arrogant, and the affection felt for him by his friends and family. Greville wrote at his death: 'While Macaulay is thus ascending to the House of Peers, his old enemy and rival Croker has descended to his grave, very noiselessly and almost without observation, for he had been for some time so withdrawn from the world that he was nearly forgotten. He had lived to see all his predictions of ruin and disaster to the country completely falsified.' JAC

**Cromarty, George Mackenzie, 1st earl of** [S] (1630–1714). Mackenzie succeeded his father as baronet in 1654 and joined the royalist rising in Scotland the same year. In 1661–4 he was a lord of Session as Lord Tarbat and, after a period out of favour, lord justice general [S] 1678–80 and again 1705–10, lord clerk register [S] 1681–9 and 1692–5. A competent administrator, he was a vigorous supporter of James VII and II, who created him Viscount Tarbat [S] in 1685, but came to terms with William. During Anne's reign, he was secretary of state [S] 1702–5, was advanced to the earldom of Cromarty [S] 1702, and used his influence in favour of the Union. He subsequently served as a representative peer. His grandson, the 3rd earl, was sentenced to death in 1746 for his part in the '45, but pardoned. JAC

**Crome, John** (1768–1821). Landscape painter, born in Norwich where he spent almost all his life. The son of an inn-keeper, Crome had little education and was apprenticed early to a coach- and sign-writer, spending his leisure sketching from nature. He supplemented his income by giving drawing lessons, and became the drawing master at the local grammar school in 1801. In 1803 he helped found the Norwich Society of Artists where he exhibited regularly and of which he became president in 1808. In the company of other British artists, he visited Paris in 1814, to see artworks acquired by Napoleon. Greatly influenced by the Dutch style, and the Romantic concept of landscape, Crome, together with \*Cotman, is considered the major artist of the Norwich School. He is well represented at Norwich Castle Museum and in the Tate and National Galleries, London. JC

**Crompton, Samuel** (1753–1827). Inventor. One of the men who revolutionized the Lancashire textiles industry, Crompton was born near Bolton. His 'spinning mule', invented in 1779, improved upon \*Hargreaves's jenny. It was a cross between the jenny and \*Arkwright's water frame and produced yarn of high quality, particularly suited to muslins. Like many inventors, Crompton made little out of his discovery and his business ventures failed. He was however given a public grant of £5,000 in 1812. JAC

**Cromwell, Henry** (1628–74). Oliver's fourth son. Captain of horse at 19, he rose to command his own cavalry regiment in his father's expeditionary force to Ireland in 1650. He stayed on there, returning to sit for Ireland in \*Barebone's Parliament. On becoming protector, Oliver sent him back there to investigate the loyalty of the army, whose commander he became. Charles Fleetwood, the lord deputy, returned home, and Henry inherited his authority, though not until 1657 his title. His rule was bedevilled by constant friction with a well-entrenched 'anabaptist' faction, which his thin-skinned, slightly paranoid nature made him too prickly in handling. But he showed real ability in a very difficult task, and gave every support in 1658–9 to his brother Richard \*Cromwell, who promoted him to lord-lieutenant and governor-general. Thanks to his fairness to Irish royalists, which \*Ormond and \*Clarendon attested, he survived the \*Restoration to live quietly in Cambridgeshire until his early death. AHW

**Cromwell, Oliver** (1599–1658). General and Lord Protector. Despite all that has been written about him, it is still difficult to appreciate the unique character of Cromwell's career, and the impact that it made on his contemporaries. No private person until then had taken power to rule a great European kingdom, no subject had taken it upon himself to sit in judgement on his lawful sovereign, condemn him with the formality of a lawful process, and publicly execute him as a criminal. In a country governed by custom, precedent, and the common law, Cromwell completely changed the ancient frame of government, reforming Parliament and imposing a written constitution. By conquest he incorporated the separate kingdoms of Scotland and Ireland into a single commonwealth with England. He remains the only British statesman whose entire career depended on the control and use of military power. Yet his achievement proved to be totally ephemeral. He left no political heirs or legacy. Two centuries were to elapse before his reputation recovered. The New England which his friends created across the Atlantic, and to which he once thought of emigrating, was to flourish: the new regenerate England he tried to create collapsed and vanished completely.

A provincial gentleman of modest means, Cromwell first became prominent in the second session of the \*Long Parliament (1641–2). When the abortive Army plot of royalist officers apparently showed that Charles I intended to renege on his acceptance of the constitutional safeguards enacted in the first session, and a catholic rebellion broke out in Ireland, Cromwell urged Parliament to assume control of both the army destined for Ireland and the home militia. He soon became identified with what has been termed the war party.

He believed that the military defeat of the king's forces must precede negotiations for a settlement, whereas a more numerous 'peace party' advocated a defensive strategy while a compromise was negotiated, even if the royal forces continued offensive operations. A 'middle party' also hesitated before becoming committed to all-out war against their sovereign. Cromwell also had to overcome obstruction at the local level from the county committees preoccupied with the defence of their region, making a general offensive strategy impossible. He made the forces maintained by the \*Eastern Association the most formidable of the parliamentary armies, but his practice of commissioning men of determination and ability, regardless of their social status and religious positions, provoked hostility. Cromwell's men contributed decisively to the victory at \*Marston Moor (July 1644), but his political associates had to publicize his role to counter their opponents' attribution of the victory to Parliament's Scottish allies.

Cromwell deplored the failure to follow up this victory effectively, and used it to oust irresolute leaders. He denounced his own neighbour and superior officer, Lord \*Manchester, and helped pass the \*self-denying ordinance. This barred peers and MPs, with exceptions of whom Cromwell was one, from commands and set up a central army, the \*New Model, of which he became second in command. This made short work of the royalists. At \*Naseby, Cromwell annihilated Charles's field army (June 1645). But once the war became concerned with mopping up royalist fortresses and islands, with Charles I in Scottish hands, a majority of peers and MPs worked to bring the army under direct parliamentary control. They allowed army pay to fall into arrears. Soldiers were refused indemnity to cover war-time actions. The reconquest of Ireland was not to be entrusted to the New Model. Instead its regiments were to be disbanded, the soldiers re-enlisted in new units commanded by a new set of officers nominated by Parliament. A new established church on presbyterian lines would mean restricted toleration for the independents and other sects who were strongly represented in the army. Cromwell shared his men's resentment. He emerged as the chief military politician, eclipsing his superior, Lord \*Fairfax. Cromwell took the lead, first in representing army grievances, but soon in a wider sense claiming to speak and act as the embodiment of the 'cause' for which it had fought the war. In June 1647 Cornet Joyce took Charles into the custody of the army. Marching on London the army forced the Commons to send away the most conspicuously anti-army MPs. In July it issued the \*Heads of the Proposals, a manifesto for a new constitutional settlement, which it discussed with Charles, whose responses were characteristically ambiguous. The manifesto did not go far enough to satisfy the more radical officers and men. Influenced by \*Leveller ideas, the radicals published an \*Agreement of the People: this was discussed in the \*Putney debates of the army council, a body representing all ranks and units which Cromwell had accepted as a sounding-board for opinions (October–November).

During this period of rapid and frequent change Cromwell developed the techniques which enabled him to keep control over the army for the rest of his life. Historians have

condemned him for failing to manage Parliament effectively, but most have overlooked his skill and success in managing the army, manipulating patronage—promotions, appointments, secondments, and dismissals—and using intimidation or persuasion according to circumstances. He could not depend on politicized radicals obeying orders. He had to break up networks of officers that could develop into challenges to his authority, he had to balance the factions—ambitious opportunists (like \*Lambert), religious fanatics (\*Harrison), professionals (\*Monck, Montagu). He learned that neglect of the interests and grievances of ordinary soldiers led to their politicization. Above all he knew that army unity must be maintained—and it was disunity among the officers that brought down the Commonwealth in 1659–60 after Cromwell's death.

In November 1647 Cromwell personally suppressed a potentially infective Leveller-inspired mutiny in a single regiment. Early in 1648 royalist risings broke out in Wales, Kent, and Essex and a Scottish army invaded on Charles's behalf. Cromwell and Fairfax reacted with great speed, annihilating enemy forces. It was clear that Charles had planned these risings at a time when he was negotiating with both Parliament and the army, and trying to widen the breach between them. Despite this a majority in Parliament still wished to continue negotiating with him, whereas opinion in the army now accepted that as a 'man of blood' he had to be punished. Cromwell clearly inspired the action that followed although he personally stayed in the background. Colonel Pride, backed up by armed soldiers, prevented MPs who were unacceptable to the army from entering the Commons. Many were arrested; the purged House that subsequently worked with the army was known as the \*Rump. In similar fashion Cromwell did not himself decide that Charles should be put on trial but his was the guiding spirit that led the small group of army officers and their parliamentary associates to make and implement the decision. By killing the king the regicides made any future compromise impossible; they committed treason and their lives were forfeit. Cromwell's body was to be exhumed in 1660 and hung from a gallows in a macabre form of legal retribution—with obvious psychopathic overtones. It also made Cromwell and the regime outcasts in Europe. The survival of each successive form of republican government depended on the physical power of the army, and of the navy in preventing foreign intervention.

In 1649–51 Cromwell was almost continuously on campaign away from Westminster. His militarily successful Irish campaign of 1649–50 has been universally condemned for its ruthlessness, especially for the massacres at \*Drogheda and Wexford, and the planned ethnic cleansing of three Irish provinces. Cromwell's methods actually represented a direct revival of those used in Elizabeth's Irish wars and he saw them as a reprisal for atrocities committed by the Irish rebels in 1641. In 1650–1 he was engaged in war against the Scots who crowned Charles II king of Scotland. Cromwell defeated them at \*Dunbar and finally \*Worcester in successive Septembers, 1650 and 1651. Then in May 1652 the Rump became involved in war against the Dutch. These wars delayed half-hearted attempts to draft a definitive constitu-

tional settlement, and necessitated heavy taxation and expenditure, of which many MPs and officials took corrupt advantage. Absorbed by routine work of government the Rump lost sight of the cause which to Cromwell remained paramount.

Cromwell's second major coup, his ejection of the Rump by force on 20 April 1653, opened the way for an experiment to create a form of government that would be in accord with what he took to be God's will. He and the army council named a constituent body to draft a godly constitution, \*Barebone's or the 'Nominated' Parliament. This reflected the influence on Cromwell of the religious radicals, the 'fanatics' or \*Fifth Monarchy men. He saw them as fellow-seekers for God's truth who believed that all public as well as private life should be governed by God's providential dispensation. By contrast Cromwell never sympathized with the Levellers because their principles and interests were secular and their leaders mainly deists or atheists. The fanatics in Barebone's Parliament disappointed Cromwell by wanting the abolition of tithe and universities, seeing a salaried and learned ministry as unnecessary. After moderates dissolved the 'Parliament' Cromwell infuriated the fanatics further, and interest groups associated with the Rump, by ending the Dutch War, giving the defeated enemy lenient terms (March 1654). After Barebone's Parliament came a written constitution, the \*Instrument of Government (December 1653), introducing a form of government based on a balance of power and duties between a reformed single-chamber parliament elected by a new representative system, an elected council, and the executive, Lord Protector Cromwell. But this constitution was to be superseded in 1657 by the \*Humble Petition and Advice which established an upper house in Parliament and empowered the lord protector to designate his successor. Neither constitution gave the impression of a governmental system built to last. This explains Cromwell's reluctant refusal in 1657 to assume the familiar title of king.

In the short term Cromwellian government worked, at a price. He maintained army discipline and unity but he could not eradicate all potential radical activists. Parliaments were called, but known opponents had to be kept out of the 1656 Commons. Quakers as well as Catholics and Prayer Book Anglicans were excluded from toleration. The costs of maintaining the army, aggravated by a Spanish war that began in 1655, produced an accumulation of debt that would have ended in an insoluble crisis, the army demanding pay and resisting disbandment, the nation unable or unwilling to provide it. But the greatest change brought about by the institutionalization of the Protectorate was the erosion of the 'cause' which Cromwell embodied, the establishment of a form of government in which the godly, not a monarch, wielded power and guided (or compelled) the nation into ways laid down by God. Previous rulers—even Elizabeth—had failed to undertake and complete all the tasks required of a godly prince. Cromwell's missionary cause was to create a godly nation, but by 1658 few still shared his zeal. His court at Whitehall was full of civilian careerists, the army of mercenaries, ambitious officers, and political radicals biding their time. And the nation generally wanted no more

than order, stability, lower taxes, and fewer soldiers, things that the exiled Stuarts could promise, as none of Cromwell's successors could.

**Cromwell, Richard** (1626–1712). Lord Protector (1658–9). Son of Oliver \*Cromwell, he held no important position until 1657. Under the \*Heads of the Proposals, the 1656 constitution, Oliver could nominate his successor and probably did so days before he died on 3 September 1658. Despite inexperience, Richard initially provided stability, settling army discontent and calling a Parliament elected on the traditional constituencies, which contained a majority ready to work with him. His eventual failure was caused principally by intractable problems which he inherited. Accumulated debt of £2,500,000 and economic depression worsened by the Spanish War that damaged trade could not be tackled because the main cause of an annual deficit of £300,000 was expenditure on the army and navy. Richard's ability to get practical co-operation from Parliament was frustrated by a determined and brilliantly led republican minority who wanted the return of the Rump. Even more fatal was the revival of radical political activism in the army. In April 1659 Richard tried to use Parliament to gain control over the military: this drove the generals into the radical camp and they forced him to dissolve Parliament, so forfeiting civilian support. Richard was never deposed; his authority was no longer recognized. Thereafter he lived privately, in exile from 1660 to 1680.

**Cromwell, Thomas** (c.1485–1540). Thomas Cromwell was the second of the great ministers to whom Henry VIII gave much trust and an imposing array of offices; he was the one most personally associated with the programme which made Henry VIII supreme head of the church in England.

**1. Early career.** Thomas Cromwell was born c.1485, the son of a Putney cloth-worker. In his early life he followed the French campaigns in Italy, and somehow acquired a broad education including some knowledge of business and law. He sat in the 1523 Parliament and entered the service of Thomas \*Wolsey, assisting in the dissolutions of religious houses used to endow Wolsey's college and school. Though he stayed with Wolsey longer than most after his disgrace, he escaped the wreck to join a group of intellectuals and administrators, including Edward Foxe, Thomas \*Audley, and Richard Rich, who were working on plans for Henry VIII to escape from the impasse in his divorce negotiations.

Cromwell became master of the king's jewel house in 1532 and principal royal secretary in 1534. Though he was thereafter to accumulate other offices including chancellor of the Exchequer, master of the rolls, lord privy seal, and great chamberlain, it was on his role as royal secretary, to which he gave unprecedented political importance, that his power rested. Thanks to the survival of vast amounts of his personal papers, seized before his attainder in 1540, his extensive contacts across the entire Tudor state can be documented.

**2. Cromwell and the royal supremacy, 1532–1536.** It is not certain exactly what role Cromwell played in the birth of Henry VIII's campaign for supremacy over the church. The arguments used to justify this campaign antedated Cromwell's rise to influence. Nevertheless, it seems likely that Cromwell drew the strands together, eliminated the more obviously implausible proofs, and recognized that parliamentary statute—hitherto used only for issues where church affairs bordered on secular concerns—offered the most public and authoritative way to announce and embody the new changes. Cromwell is thought to have been responsible for drafting the Supplication of the Commons against the Ordinaries in 1532. This parliamentary petition resurrected the protests against church courts originally made in 1529 in the attack on Wolsey; it was used to secure the \*submission of the clergy, which finally subjected canon law to secular review. Cromwell certainly took charge of the drafting of the Act in Restraint of \*Appeals to Rome (1533) and the Act of \*Supremacy (1534).

Parliamentary statute was only one of several means Cromwell found to secure consent to the supremacy. Using Berthelet, the royal printer, he saw to the publication of a sheaf of propaganda tracts, written by a range of intellectual clients and allies in both English and Latin, which justified the royal proceedings to readers of every level of education. Just as important was Cromwell's meticulous and ruthless treatment of high-profile opponents of the policy. The long examinations of Sir Thomas \*More, and his eventual trial and conviction for treasonably refusing the oath of supremacy, testify to Cromwell's anxiety to be seen to observe the forms of law; this trait can also be seen in his efforts to secure convictions of those implicated in the \*Pilgrimage of Grace of 1536.

**3. Cromwell and the Reformation.** For all his ruthlessness, Cromwell gave away a hostage to fortune by his efforts to propel Henrician religious policy in a moderately protestant direction. As royal vicegerent in spirituals from 1535 Cromwell was responsible for the Ten Articles of 1536 and the royal injunctions of 1536 and 1538, which systematically attacked catholic teaching on works-righteousness, the cult of saints, offerings for the dead, holy relics and shrines, and religious festivals. On a wider front, Cromwell patronized ideas for social reform, especially improvements to poor relief and economic welfare schemes, similar to those being promoted in Europe at the same time. Though largely unsuccessful in the 1530s, these projects anticipated parts of the successful Tudor Poor Law reforms of the 1570s.

**4. Cromwell and faction, 1536–1540.** Thomas Cromwell never enjoyed the sort of ascendancy in Henry VIII's councils held by Cardinal Wolsey. The last four years of his life were a constant struggle to overcome rivals. Using parliamentary Acts of attainder he secured the judicial killing successively of \*Anne Boleyn and her household (1536), and the Courtenay and Pole families (1538). By this period Cromwell was seeking an alliance with pro-protestant princes in Germany who belonged to neither the French nor the Habsburg allegiance. In 1540 he brought about

## Cropredy Bridge

the disastrous marriage of Henry and \*Anne of Cleves in pursuit of this policy. He had even intervened to protect preachers at Calais who were almost certainly pushing a harder protestant line than royal policy allowed. In self-defence he tried to accuse the lord deputy of Calais (who knew of his dealings there) of treason. Political and religious enemies led by the duke of \*Norfolk and Bishop Stephen \*Gardiner momentarily gained the king's ear and convinced Henry that Cromwell was not only a traitor but an ultra-protestant 'sacramentarian' heretic; he was condemned untried by the weapon of parliamentary attainder which he had himself used so often, and executed on 28 July 1540.

**5. Assessment.** Thomas Cromwell presents the paradox of a statesman of great breadth of vision, who pursued his goals with a degree of judicial brutality only previously seen in times of civil war. Many of his policies display pragmatic calculations of factional advantage as much as, or more than, political principle. His creation of the courts of revenue now looks more like wasteful inflation of his own patronage than modern 'bureaucratic' innovation. The \*Privy Council was conjured up to throw a smoke-screen over the Cromwell clique's role in government in 1536, rather than to create an efficient executive committee of the crown. Yet after the bloody backbiting of the 1530s was over, many of his achievements were rediscovered and adopted to become part of the foundations of early modern government. EC

Beckingsale, B. W., *Thomas Cromwell* (1978).

**Cropredy Bridge, battle of, 1644.** While waiting for news of \*Rupert's attempt to relieve York, Charles I's southern army clashed with \*Waller at Cropredy bridge, on the Cherwell near Banbury, on 29 June. Waller, seeing the royalist army strung out on the march, hoped to punch a hole between van and rear by taking Cropredy bridge. In turn, he found himself facing a battle on two fronts, when the royalist van turned, and he was fortunate to extricate himself with the loss of some light guns. Though little more than a cavalry skirmish, Cropredy sustained royalist morale until the news from \*Marston Moor came through. JAC

**croquet** may have originated in France, since most of the terms are French in origin, and seems to have been played in England in the 16th cent. Like many games, it became standardized in the Victorian period and an English tournament was organized at Evesham in 1867. Three years later a conference laid down rules, though these have been substantially modified. Simple versions are played in many private gardens, with unexpected hazards, but the national game is administered by the Croquet Association at the Hurlingham Club. JAC

**Crotoy, battle of, 1347.** In 1346 Edward III laid siege to \*Calais with a naval blockade. On 25 June 1347 a French fleet of some 40 vessels bringing relief was scattered at Crotoy, at the mouth of the Somme to the south. Calais surrendered on 3 August and remained in English hands for more than 200 years. JAC

**Crowley, Sir Ambrose** (1658–1713). Crowley was a remarkable industrial magnate. He came from a quaker family of Worcestershire and his ancestors were blacksmiths, moving up into iron production. Crowley was apprenticed in London and settled there, buying a large house at Greenwich. He built up an enormous iron enterprise, first establishing a foundry at Sunderland, where coal was cheap, transport to London quick, and the Tyneside shipbuilders needed nails. In 1691 he transferred his business to Winlaton, west of Newcastle, and later developed the lower Derwent valley. He was knighted in 1707 while sheriff of London and at his death had just been elected to Parliament for Andover. One daughter married Sir John Hind Cotton, 3rd baronet, of Cambridgeshire, and another Lord St John of Bletsoe. JAC

**crown.** See MONARCHY.

**Cruikshank, George** (1792–1878). Caricaturist and book illustrator. Born in London of Scottish parents, apprentice and assistant in his father's print factory, Cruikshank rapidly became \*Gillray's successor as leading political caricaturist, but from about 1824 turned to book illustration as humorous artist and social commentator. Immensely productive, incorporating witty anthropomorphism, near-surrealism, and Celtic treatment of the supernatural, he worked with \*Thackeray, Ainsworth, and \*Dickens, counteracting the strong continental influence upon book illustration and enabling an English school to emerge. But as Regency exuberance yielded to Victorian gentility, his style did not move with public taste, and he began to outlive his popularity. Sprightly and convivial, he espoused total abstinence (1847) as zealously as he had formerly imbibed, to the embarrassment of friends, and lectured indefatigably for both \*temperance and Volunteer movements. Despite an active career of 72 years, with little diminution of powers, he struggled to survive. ASH

**crusades.** The main crusades were (1) 1095–9 summoned by Pope Urban II; (2) 1145–8 by Eugenius III; (3) 1188–92 by Gregory VIII; (4) 1198–1204 by Innocent III. Subsequent crusades included the 'Children's Crusade' of 1212, in which the English were not involved. The crusades constituted the most popular mass movement of the later Middle Ages. They may be defined as a species of holy war, authorized by the pope and proclaimed in the name of Christ; a just war, that is a justifiable reaction to aggression towards Christian people or territory, their participants enjoying a set of privileges offered by the pope and enshrined in canon law. Such a definition, crucially, did not require a crusader to fulfil his vow in the Holy Land, nor did it postulate Muslims as the target. Crusades came to be deployed against a variety of opponents and in a number of crusading theatres at different times—against Moors in Spain, Mongols in eastern Europe, pagan Slavs in north-eastern Europe, heretics in Bosnia and in southern France, and a variety of papal political opponents within western Europe.

Many of these applications were controversial at the time and remain so today. The same is true of the very notion of crusade, from the time that Pope Urban II made his call to

what we now know as the First Crusade at the Council of Clermont in November 1095. In protestant Britain, not surprisingly, the crusade was harshly judged for centuries. For Thomas Fuller, a 17th-cent. royalist Anglican, as for the 16th-cent. martyrologist John \*Foxe, the 'holy war' was fatally tainted by catholicism, while the notion of savage fanaticism was effectively developed by Edward \*Gibbon in the 18th cent., in a general attack on the lamentable consequences of religious frenzy. This train of thought was famously stated by David \*Hume in his condemnation of crusade: 'the most signal and durable monument to human folly that has yet appeared in any age or nation.' This tradition is still alive, found, for example, in the summing-up by Runciman, whose massive work ends in a ringing denunciation: 'the Holy War itself was nothing more than a long act of intolerance in the name of God, which is the sin against the Holy Ghost.'

Such a tradition has militated against serious consideration of the significance of the crusades in and for British history. Allowance must also be made for that narrowly insular outlook of many 19th- and early 20th-cent. historians. Apart from the deeds of Richard I, incongruously a source of English national pride as Richard was not English, nor even Anglo-Norman, the limited English role in the crusading movement was scarcely conducive to extensive historical study. What is more, the very wisdom of English involvement was questionable, especially that of kings. Were the crusades not a terrible distraction, deflecting the king from his primary concerns at home, and resulting in Richard I's case in disastrous consequences for his subjects as well as himself? It followed that the crusades could be seen as a deplorable squandering of resources that could have been more usefully employed in England or to England's advantage.

Times and attitudes have changed. One recent trend has been a move towards thorough investigation of the impact of the crusades upon the societies in which they were preached, and it is now apparent that the crusade affected vast areas of life. It is in these effects, on what might be termed the home front of the crusading movement, that the crusades exerted a most profound influence. The heyday of crusading was in the 12th and 13th cents., at least so far as English participation is concerned, but as an institution and as a real force in English life the crusade only finally withered and died in the later 16th cent., as a result of the reordering of values during the Reformation. Every king of England between 1154 and 1327 took the cross, though only one, Richard I, fulfilled it in person. Many of their subjects continued the tradition into the 16th cent.

**Crystal Palace.** Designed by Sir Joseph Paxton to house the \*Great Exhibition in Hyde Park in 1851. It was itself the greatest success of the Exhibition. Paxton based it upon the lily house he had built at \*Chatsworth for the duke of

Devonshire—a vast glass conservatory, dubbed the Crystal Palace by \*Punch. It was more than three times the length of St Paul's and included 294,000 panes of glass. The astronomer-royal declared that it could not stand, but it survived the 'Hallelujah' chorus at the opening ceremony, several gales, the excitement caused by a lady in bloomers, and the deafening cheers for the duke of \*Wellington. Victoria took Paxton's progress from gardener's boy as an example of the social mobility possible. In 1852 the building was removed to Sydenham, where it was destroyed by fire in November 1936. JAC

**Cubitt, Thomas** (1788-1855). Builder. Son of a Norfolk carpenter removed to London, Cubitt set up as master carpenter but abandoned traditional practices of subcontracting by employing his own tradesmen, ensuring their continuous employment and considerate for their welfare. After the London Institution (1815) he moved into speculative building, progressing from Highbury villas to Bloomsbury and Belgravia. Active during one of London's great eras of development, and described as 'the Emperor of the building Trade', he appeared before select committees concerned with 'Metropolitan Improvements', advised in town-planning and house-building, was concerned with sewage and smoke nuisance, Battersea Park and the embankment, but was never officially honoured. Cubitt's business acumen and benevolent autocracy led to great wealth, but he was generous to his family and employees; according to Queen Victoria (for whom he altered \*Osborne and built the east wing of \*Buckingham palace), 'a better, kinder-hearted man never breathed'. ASH

**Cuilén** (d. 971), king of 'Scotland' (from 966). Son of \*Indulf, Cuilén became king following Dub's death fighting the men of Moray. He had challenged Dub unsuccessfully in 965, but had been defeated in battle at Duncrub (7 miles west of Perth). He was killed by Rhydderch son of King Dyfnwal of Strathclyde in a battle fought in Lothian. It is alleged that he had carried off Rhydderch's daughter. Cuilén had a Danish nickname, *Hringr* (ring-giver). This, his father's Danish name, and a brother called Olaf suggest that his family were particularly receptive to Scandinavian influence, and may be linked with the 'hog-back' grave-slabs characteristic of Danish north England found in Fife and Perthshire, perhaps indicating Danish immigration at this time. DEB

**Cullen, Paul** (1803-78). Archbishop of Dublin, first Irish cardinal (1866). Cullen was born in Kildare, and educated in Ireland and Rome. During his long residence there (1820-49) he was student, and successively vice-rector and rector, of the Irish College and of Propaganda College. He became successively archbishop of Armagh (1849) and primate (1849-78) and archbishop of Dublin (1852). Because political revolution in Rome (1848) made him detest \*Fenians and extremists, he prohibited his clergy from participation in politics (1853). A supporter of the crown and constitution, he preferred 'Irishization', advancing Irish to responsible places by constitutional means. He helped found the \*Catholic University (1854) and held the first national synod for 200 years (1850). Of immense influence in Ireland

## Culloden

and Rome, he was close to Pius IX. He gave the Irish church its characteristically ultramontane tone. WMM

**Culloden, battle of**, 1746. Fought on Wednesday 16 April about 5 miles south-east of the Highland capital of Inverness. The retreating Jacobites occupied Inverness in February 1746. An attempted night attack on the advancing army of the duke of \*Cumberland failed on 15 April, and Charles \*Stuart decided to offer battle on the bare boggy Drumossie Moor above Culloden House, despite the view of Lord George \*Murray that less suitable ground for Highlanders was difficult to find. The Jacobites could assemble only 5,000 men. Cumberland had 9,000 men including many Scots. Unlike Charles, he had a good, well-served field artillery.

Cumberland's field guns decimated the Jacobite ranks for 20 minutes. Charles, in command for the first time, fatally delayed the order to charge. Lord George launched the Jacobite right and centre, but gallantry could not match discipline, canister shot from the guns, musketry, and ultimately the bayonet's superior reach to the broadsword. The Macdonalds on the Jacobite left rightly pulled back at first in good order, pursued by cavalry. Retreat became rout. BPL

**Cumberland** consisted of the western part of the Lake District, a surrounding coastal plain, narrow towards the south, broadening towards the north, and two outlying areas, a hilly district to the east towards Alston, and fertile lands north of \*Hadrian's Wall towards the Scottish border. The northern part is drained by the Eden, running through Carlisle, and its tributaries the Caldew and the Petteril, running north from Penrith; the Derwent flows from Derwentwater and Bassenthwaite through Cockermouth to Workington; and the southern parts are drained by the Uddon. The great slab of hills in the east is drained by the south Tyne and the Tees, the water finishing in the North Sea. The boundary with Scotland was the river Liddel; with Westmorland the Eamont, flowing out of Ullswater; and with Lancashire, the Uddon. Carlisle grew as a bridge over the Eden, where an important east-west route from Newcastle towards Ireland intersected with two major north-south routes, an ancient road through Tebay, and an old route from Yorkshire across Stainmore via Scotch Corner, Brough, and Appleby.

Cumberland was one of the last shires to take shape and for centuries was disputed between England and Scotland. In Caesar's time it was in the territory of the \*Brigantes, but that was a loose confederation and the local tribe were the \*Carvetii, inhabiting the Solway region. The Romans were interested in the area for strategic and economic reasons. In the end, their boundary with the Scots settled along the line of Hadrian's Wall, which entered Cumbria at Gilsland and ran to Bowes-on-Solway. Carlisle (Luguvalium) was a major Roman town, protected by a fort at Stanwix, and there were important forts at Hardknott (the worst posting in Roman Britain), and at Maryport, Penrith, Netherby, and Bewcastle. Ravenglass, where the Mite, Irt, and Esk meet, was a superb natural harbour until it silted up. The local mineral resources were also exploited—silver and lead from the Alston region, copper, coal, and iron elsewhere. After the Roman

period, the orientation of the region was towards Scotland and Ireland rather than the south. It was a meeting-place of peoples and cultures. The basic stratum was Welsh or British, and the name, Cumberland, means the land of the Cumbri—the Welsh. But the Saxons penetrated across from Yorkshire and from Northumbria and later there were settlers from Ireland and the Isle of Man, who left Norse place-names—Aspatiria, Cleator, Ennerdale, and Borrowdale. Carlisle is a case in point, since the Latinized form Luguvalium commemorates a Celtic god; Bede tells us that the Saxons called it Luel; later came the Celtic prefix *caer*, a city; and the Normans added a silent *s* making Carlisle. Roman and Celtic Christianity competed here. St \*Ninian's mission at Whithorn was only the other side of Solway Firth and St Kentigern certainly evangelized in the 6th cent. from Strathclyde, judging by the number of churches dedicated to him. After \*Æthelfryth's victory at \*Degaстан in 603, the region fell under Saxon rule and became part of \*Northumbria. The Synod of \*Whitby in 664 decided in favour of Roman Christianity and in 685 \*Ecgrif gave Carlisle and district to St \*Cuthbert as part of the endowment for the diocese of \*Lindisfarne. Bede records how St Herbert left his island in the middle of Derwentwater to meet Cuthbert. \*Bewcastle cross also testifies to Northumbrian influence since it commemorates Aldfrith, who ruled 686–705.

But it was hard for any power to keep a firm grip on the area and as Northumbrian influence waned, that of Wessex rose. In 926 \*Athelstan, king of Wessex, met the kings of Strathclyde and Scotland at Eamont bridge to dictate terms, and reasserted his authority in 937 with a crushing victory at \*Brunanburh. But Wessex control of so distant a territory can only have been fitful and the fact that Athelstan's successor, \*Edmund ravaged the region in 945 suggests that Dunmail of Strathclyde had regained it. He is probably commemorated in Dunmail raise between Windermere and Keswick. Edmund is said to have ceded the region to Malcolm, king of the Scots, though both the nature of the contract and the extent of the region remain obscure. The arrangement does not seem to have lasted long for in 1000 \*Æthelred was once more harrying the region, suggesting that he had lost control, probably to the Norse, since his fleet also attacked the Isle of Man.

By this time the term Cumbria was coming into use. The Normans did not at first occupy the area and neither Cumberland nor Westmorland was included in the \*Domesday survey in 1086. But in 1092 William Rufus brought a large force there and began building the castle at Carlisle. In 1133 Henry I established Carlisle as a bishopric. The territory was still regarded as the district of Carlisle rather than as a shire and the Scots had by no means abandoned their claims. David I of Scotland took advantage of the confusion of Stephen's reign to occupy the area and died at Carlisle in 1153. Henry II reconquered it in 1157 and though William the Lion and Alexander II of Scotland made efforts to recapture it, it stayed part of England. Westmorland was hived off to form a separate county and Alston in the east added to Cumberland, though it remained in the diocese of Durham. By the end of the 13th cent. Cumberland,

like the other counties, sent two knights of the shire to Parliament.

Though Cumberland was now firmly attached to England, it remained a border county, liable to incursions great and small. The tide of war rolled backwards and forwards. The Scots besieged Carlisle in 1296; Robert I Bruce did homage in the cathedral in 1297; and Edward I died at Burgh campaigning against the Scots in 1307. The region was repeatedly ravaged in the 14th cent. During the Civil War, in 1644–5, Carlisle stood a siege from the Scots who destroyed much of the cathedral. The last serious fighting on English soil occurred in the county during Prince Charles \*Stuart's retreat in 1745, when he left a forlorn hope in Carlisle castle. Even in times of peace, the many peel towers were invaluable refuges against reivers and raiders.

Although not a large town, Carlisle dominated the county. Penrith had military importance because of the junction of two major routes, and the market towns of Brampton, Wigton, Cockermouth, and Keswick had local significance. Travellers avoided the area if they could. Celia Fiennes in 1698 described 'villages of sad little huts . . . I took them at first sight for barns to fodder cattle in.' But the character of the county began to change with the industrial revolution, which created an urban fringe to west Cumberland, and the revolution in taste, which brought visitors in search of Romantic scenery of lakes and hills. Local landowners were vigorous in exploiting mineral resources and opening up ports. The Lowthers sponsored Whitehaven, which exported coal to Dublin, the Curwens did the same for Workington. Copper and iron were also mined on an increasing scale. The chief beneficiary or victim of Romanticism was perhaps Keswick, on the shore of Derwentwater, which changed from a small market town into a fashionable Victorian resort and thence into a tourist trap.

By the local government reorganization of 1972 Cumberland was united with Westmorland and the Furness district of Lancashire to form Cumbria. The M6 tears through the county, through Ingelwood Forest—the forest of the English settlers—and at Sellafield on the coast the lights of a nuclear power station twinkle.

JAC

**Cumberland, Ernest Augustus, duke of** (1771–1851). Ernest Augustus, the fifth son of George III, had an eventful life. At 15 he was sent to the University of Göttingen in Hanover and in 1790 was commissioned in the Hanoverian army. A brave cavalry commander, he was severely wounded in 1794, losing one eye. Later he transferred to the British army, finishing as field marshal. In 1799 he was created duke of Cumberland, took his seat in the Lords, and spoke frequently as a protestant Tory. In 1810 he survived a frenzied attack by his valet, though scandal insisted that Cumberland had been the aggressor. In the crisis of 1828–32, Cumberland became the spokesman for those opposed to the repeal of the \*Test and Corporation Acts, \*catholic emancipation, which he denounced as 'outrageous', and the \*Reform Bill. With the death of his elder brother the duke of \*York in 1827, he became heir presumptive to the Hanoverian throne, since his niece Prin-

cess Victoria could not inherit it. On becoming king of \*Hanover in 1837, he at once cancelled the liberal constitution granted in 1833 by his brother William IV, substituting a more limited one three years later. The Hanoverians, delighted to have a resident monarch once more, admired him greatly and he survived the year of revolution in 1848 without difficulty. Politically, his instincts were those of a cavalry officer—to ride straight at the enemy—and his statue in Hanover is very properly an equestrian one.

JAC

**Cumberland, William Augustus, 1st duke of** (1721–65).

Cumberland was the second surviving son of the prince of Wales, later George II. Made duke of Cumberland in 1726, he was promoted lieutenant-general in 1744, after fighting at \*Dettingen. In 1745 he was proclaimed captain-general of the British army. Shortly afterwards, Marshal Saxe repulsed his attempt to relieve Tournay at \*Fontenoy. Recalled in October to deal with the \*Jacobite rebellion, he finally crushed it at \*Culloden in April 1746. His devastation of the central Highlands was ruthless, but provoked by a refusal to accept terms.

His Anglo-Dutch army back in Flanders was usually outnumbered by that of Saxe, and ill-provided. Mere competence could not bring victory. After the peace of 1748, his stress on disciplinary measures in the army made him unpopular. At the start of the \*Seven Years War, he virtually ran the British war effort but was destroyed by defeat against superior French armies in Hanover. The convention of \*Kloster-Zeven, which he signed with the French, was repudiated. He retired from the army, but remained a powerful political influence into the early years of George III. Obese and unmarried, he died unexpectedly of a clot on the brain.

BPL

**Cumbria.** The new county of Cumbria was established by the Local Government Act of 1972, which joined the traditional counties of Cumberland and Westmorland, and added that section of north Lancashire to the south of the Lake District, and Sedbergh and Dentdale, taken from the west riding. It includes the whole of the Lake District and is bisected by the London–Glasgow railway and the M6. The county town is Carlisle.

JAC

**Cum universi**, 1192. The papal bull *Cum universi*, issued by Celestine III, confirmed the independence of the Scottish church, declared by the bull \**Super anxietatibus* of 1176, resisting in particular claims of the archbishop of York. It was repeated by Pope Innocent III in 1200 and by Honorius in 1218. The Scottish church was said to be 'subject to the apostolic see, as a special daughter, with no intermediary'.

JAC

**Cunedda.** Leader of the \*Votadini tribe of southern Scotland in the late Roman period. Cunedda and the Votadini migrated from southern Scotland to north Wales, as part of the military and social upheavals of this turbulent period, in either the late 4th or the early 5th cent. However it must be remembered that the meagre historical accounts of late Roman Britain are sometimes no more than traditions recorded at a later date. This is particularly so in the case of Cunedda, and the tradition surrounding him has been

## Cunningham

described as 'folklore'. The contention that the British leader \*Vortigern arranged the migration of the Votadini in order to strengthen north Wales against the Irish, thus establishing the royal house of \*Gwynedd, must be treated with caution. ES

**Cunningham, Andrew, 1st Viscount Cunningham** (1883–1963). Sailor. Entering the navy in 1897 as a cadet, Cunningham spent the First World War as captain of the destroyer *Scorpion*. The outbreak of the Second World War found him an acting Admiral as commander-in-chief Mediterranean. This became a post of supreme importance when Italy entered the war in 1940 and an extraordinary situation developed with British convoys moving east–west from Suez to Gibraltar and Italian convoys crossing north–south *en route* for Libya. In November 1940 an air attack on the harbour of \*Taranto forced the Italian fleet to withdraw northwards and in March 1941, in a night attack, Cunningham won a decisive victory over an Italian force off Cape \*Matapan. He remained in his Mediterranean command during the allied landings in north Africa and Sicily, and in 1943 was appointed 1st sea lord and chief of the naval staff. In 1945 he was given a barony and advanced to viscount the following year. JAC

**Cunobelinus** succeeded Tasciovanus as king of the \*Catuvellauni around AD 5. His coins identify him as the son of Tasciovanus, but whether this was by birth, adoption, or simply political style is uncertain. What is clear is that he continued Tasciovanus' vigorous expansion of the Catuvellaunian kingdom at the expense of neighbouring tribes. By AD 10 he had overrun the kingdom of the \*Trinovantes and had moved his own capital from \*Verulamium (St Albans) to Camulodunum (\*Colchester), from where he now issued most of his coinage. South of the Thames he encroached on the territory of the \*Cantiaci, and to the south-west the \*Atrebatas, whilst to the north and the north-east he pushed into the fringes of the \*Coritanian and \*Icenian kingdoms. He became the most powerful monarch in Britain and the Roman historian Suetonius described him as 'Britannorum rex'—king of the Britons. He reigned for more than 35 years, dying only a year or two before the Claudian invasion of AD 43. He sired at least three sons, one of whom, Adminius, he banished for unknown reasons around AD 35. His other known sons, Togodumnus and \*Caratacus, succeeded him and shared the kingdom between them. Whether, like them, Cunobelinus would have provided Claudius with a pretext for invasion by the expulsion of a Roman ally—Verica of the Atrebatas—is open to debate. KB

**curia regis.** See GREAT COUNCIL.

**Curragh mutiny.** In March 1914 57 officers of the 3rd Cavalry Brigade, stationed at Curragh near Dublin, informed the commander-in-chief that they would accept dismissal rather than undertake operations against Ulstermen to impose the Irish Home Rule Bill. They succeeded in obtaining a written assurance from the chief of staff that they would not be expected to do this. RAS

**Curzon, George Nathaniel, 1st Marquis Curzon** (1859–1925). Curzon became an authority on the East through travelling extensively in the 1880s, and a passionate advocate of British imperial power. His main contribution to that came when he was sent to India as viceroy in 1899, where he worked hard to further the interests—as he saw them—of both Britain and the natives, and in some splendour. He also quarrelled with his army commander, Lord \*Kitchener; and with most of the population of Bengal by partitioning the province in 1905. His resignation later that year was accompanied by bitterness, and followed by a period of exclusion from public life, under an unsympathetic Liberal government, until the \*First World War resurrected his career in 1916. After the war he was foreign secretary (1919–24), but again quarrelsome; and was disappointed at not becoming prime minister in 1923. His earldom came in 1911, the marquise in 1921. He had a reputation for arrogance and inflexibility, which some attributed to a painful spinal condition which required him to wear a corset for most of his life. BJP

**customs and excise.** Monarchs and governments have traditionally levied customs and excise duties, but they became more important as the expense of government increased, particularly during the 17th cent. Customs duty or tariff is an impost on goods crossing a frontier, its purpose being either to raise revenue or to protect home industries. Customs duties, however, were sometimes imposed to supplement or make more effective internal excise duties. Excise, Dr \*Johnson's 'hateful tax', has traditionally been levied on a wide variety of home-produced raw materials and manufactures, notably alcoholic drinks, but also including at various times such items as coal, salt, paper, and glass.

Historically, customs and excise duties have both been objects of popular resistance. \*Ship money, for example, was only one of several imposts introduced by Charles I which caused widespread resentment prior to the civil wars. Later, the 1707 \*Union of England and Scotland, though highly contentious, embodied a customs union with equalization of duty on designated items, including an enhanced malt tax, which caused riots in Scotland. With enhanced duties on wines and spirits, \*smuggling became widespread during the 18th and early 19th cents., partly because effective policing was impossible and partly because it was socially approved. In 1733 \*Walpole was nearly brought down by the \*Excise crisis. In the North American colonies, imposition of customs duties on such items as newspapers and Indian tea, though amounting to less than 1 per cent of average colonial income, contributed to the outbreak of war against the British.

By the late 18th cent. the customs and excise, though still stretched by smuggling and evasion, had become increasingly efficient. Adam \*Smith, author of *The \*Wealth of Nations*, was a commissioner of customs in Scotland, while the poet Robert \*Burns served as an exciseman at Dumfries. In the 19th cent., growing belief in \*free trade persuaded governments to reduce customs duties where possible, but increasing international competition towards the end of the century produced a call for protective tariffs which, articu-

lated by Joseph \*Chamberlain, split the Conservative Party in 1903. Protectionist arguments made progress after the \*First World War, but one of the objects of the \*European Economic Community, after the \*Second World War, was to reduce customs duties between member states. ID

**custos rotulorum.** The officer charged in the 14th cent. with keeping the records of the county sessions, though the name did not come into use until the 15th cent. He was always a justice of the quorum and appointed the clerk of the peace. Later the office became identified with the \*lord-lieutenancy, though they had separate functions. JAC

**Cuthbert, St** (d. 687). Known, from two near contemporaries, an anonymous biographer at \*Lindisfarne and \*Bede, who wrote three accounts, as a man who conversed with angels, struggled against demons, had prophetic vision, and mortified his flesh. Probably of aristocratic Anglo-Saxon origin, and born in Northumbria c.635, Cuthbert was prompted by a vision of the soul of \*Aidan to enter the monastery at Melrose, where he trained under Boisil. With Abbot Eata, he entered Alchfrith of Deira's new monastery at Ripon (late 650s), but returned after refusing to accept Roman practices. Cuthbert became prior in 664 and undertook teaching tours in Northumbria. He also visited Pictish Christians, with whom he was apparently on friendly terms. After the Synod of \*Whitby (664), Eata removed to Lindisfarne. Cuthbert followed and became prior, but had some difficulties managing the monks. He retreated to Farne Island (c.676) but was, reluctantly, made bishop of part of Northumbria under Archbishop \*Theodore (685). His seat was at Lindisfarne. He retired in 686, in failing health, and died in 687, on Farne. In 698, in promotion of his cult, his remains, buried at Lindisfarne, were exhumed and enshrined, in which process they were found to be incorrupt, and for which the Lindisfarne Gospels may have been produced. Near the royal seat at Bamburgh, Lindisfarne enjoyed royal patronage and prospered and the cult of Cuthbert became a political force. Tenth-cent. West Saxon kings' patronage of Cuthbert in the north, and promotion of his cult in the south, were, partly, attempts to unify their realm and legitimize their authority. Legitimization is the motive behind the tale of Cuthbert promising Alfred, in a vision, rule of all Britain for himself and his descendants, in the *Historia de Sancto Cuthberto*. This was written mainly in the mid-10th cent., at \*Chester-le-Street, Scandinavian pressure having caused the community to move. In 995 it reached Durham, where a new shrine was established in 1104. Here Cuthbert attracted many pilgrims, gained a reputation for misogyny, and was perceived as champion of the community. His repose suffered from Henry VIII's commissioners, and again in 1827, when his grave was reopened, likewise in an atmosphere of religious tensions, and some of his relics were dispersed. His 698 decorated coffin survives, in fragments, now displayed with his pectoral cross and some Anglo-Saxon gifts to his shrine in the cathedral.

Cuthbert was no stranger to politics. We see him discussing the royal succession with Abbess Ælfflæd of Whitby (684), as adviser to King \*Ecgrith, and to his widow Iurminburg (685). Becoming bishop involved opposition

to \*Wilfrid who claimed all Northumbria. His retirement may have discreetly anticipated Wilfrid's forthcoming return. Cuthbert's promotion as saint, and his historiography, are, in part, episodes in the long-running dispute between two parties, each emphasizing its positive contribution to Northumbrian Christianity and its adherence to Roman practice. There is for example a propagandist element in the depiction of St Peter on Cuthbert's coffin.

This makes it hard to discover what Cuthbert was really like and really stood for. His training, some episodes in his career, his asceticism, and some of his miracles (often involving animals and birds) suggest his values were in the Irish tradition, ascetic and contemplative. But his cross suggests that as bishop he cut a more magnificent figure than this might imply. Both biographers give some continental dimension to his traits, behaviour, and values. In Bede's pages Cuthbert harmoniously combines both traditions, as a Northumbrian St Benedict (of Nursia) and embodiment of the episcopal virtues expounded by Pope Gregory I: an exemplar for Bede's contemporaries. AER

**Cuthred** (d. 756), king of Wessex (c.740–56). When Cuthred succeeded, King \*Æthelbald of Mercia dominated the southern English kingdoms. In 743 the two kings are recorded as combining against the Welsh, whom Cuthred was fighting again some ten years later. In 750 Cuthred successfully put down the rebellion of Æthelhun, a 'presumptuous ealdorman', who apparently went on to fight for his king in 752, when Cuthred defeated Æthelbald at \*Burford, the site of which is uncertain. This victory apparently brought independence to Wessex for a while, but it seems to have reverted to Mercian dependency soon after Cuthred's death in 756. AM

**Cutty Sark.** The last and most famous full-rigged tea clipper, launched in 1869 from Dumbarton (the figurehead's 'cutty sark'=short chemise). Steamers using the recently opened Suez canal proved too competitive, but she plied the Australian wool trade until 1895. Now restored and riggered, she lies at Greenwich. ASH

**cycling.** A primitive wheeled cycle was exhibited at Paris in 1791 but had to be pushed with the feet, as were the hobby-horses of the 1810s. In the 1860s a front-wheel-drive machine was manufactured—the bone-shaker—and in subsequent decades the front wheel became larger until the penny-farthing had developed. By 1882 speeds of 20 m.p.h. had been attained. The Rover safety model, built at Coventry from 1885, had a rear-wheel chain drive and from 1888 pneumatic tyres could be fitted. Women were able to ride the new models and the industry was established as a major employer in the midlands, turning out 750 bicycles p.a. by the 1890s. Cycle races began early and special tracks were built in the 1880s. The National Cyclists' Union was founded in 1878 and the Cyclists' Touring Club the same year. Time trials began in 1895 and a national championship was introduced in the 1930s. Road racing in Britain was subject to restrictions and did not develop as on the continent. But a Tour of Britain was started in 1951 and became the annual Milk Race. Meanwhile, ordinary cyclists, driven off the road

## Cynegils

by aggressive motorists, took to the pavements, leaving pedestrians to fend for themselves. JAC

**Cynegils** (d. 643), king of the West Saxons (c.611–643). Cynegils extended his frontier by defeating the Britons at Beandun, probably Bindon, east Devon, but suffered setbacks. In 626, the failed assassination of the Northumbrian king \*Edwin, organized by Cynegils's son Cwichelm, was followed by a vengeful attack in which five Wessex princes were killed. The thrust of expansion was slowed by conflict with expanding Mercian neighbours, and although it is recorded that the battle of Cirencester in 628 was followed by an agreement, it seems likely that Wessex lost lands gained in 577, in the lower Severn valley, to \*Penda of Mercia. In 635, sponsored by the powerful Northumbrian king Oswald, Cynegils was baptized by the recently arrived missionary Birinus. He became the first Christian king of Wessex and Birinus was established in an episcopal see at \*Dorchester-on-Thames. AM

**Cynewulf** (d. 786), king of Wessex (757–86). Cynewulf deposed his predecessor, Sigeberht. In 757 he attended the Mercian court, witnessing one of \*Æthelbald's last charters, suggesting that Wessex was again a Mercian dependency. He witnessed another charter there in 772, but otherwise there seems no evidence of subjection to \*Offa. But he appears to have lost lands to Offa after defeat at \*Benson (c.777). The *Anglo-Saxon Chronicle* account of his death reads like a heroic saga. After a long reign, during which he 'frequently fought great battles against the Welsh', he was attacked and killed by Cyneheard, the deposed Sigeberht's brother, when visiting his mistress. His few at-

tendants fought to the death, refusing freedom under Cyneheard. The next day, Cynewulf's remaining force confronted his killer. Loyal to their lord they refused offers of money and land to accept Cyneheard's succession, slaying him and his followers. AM

**Cyprus** is the third largest island in the Mediterranean with Turkey and Syria its nearest neighbours. The major agricultural area, the Mesaörian plain, separates the Kyrenia range in the north and the Troodos mountains in the south. The economy of the island is based upon agriculture, manufacturing, and tourism. From AD 647, following occupation by both Roman and Byzantine empires, Cyprus was Arab for 500 years, then an independent Frankish kingdom for about 300 years, before falling briefly into Egyptian hands until 1489, when it was occupied by the Venetians. In 1571 it was conquered by the Ottoman Turks. In 1878 administration of the island was taken over by Britain as a forward naval base to support Turkey against Russia, but on the outbreak of war with Turkey in 1914 it was annexed. Pressure for independence or union with Greece ('Enosis') developed after the Second World War and in the 1950s EOKA began a guerrilla campaign. Independence was declared in 1960 with Greek Cypriot Archbishop Makarios as president and a Turkish Cypriot, Dr Küçük, as his deputy. Immediate difficulties arose between Greeks and Turks and a UN peace-keeping force arrived in 1964. In 1974 an EOKA coup to replace Makarios prompted a Turkish invasion and the occupation of northern Cyprus. Despite occasional negotiations, the two communities remain implacably apart. JC

**Dafydd ap Gruffydd** (d. 1283), prince of Wales (1282–3). The third son of Gruffydd ap Llywelyn of Gwynedd, he was the last prince of Wales. Ambitious, treacherous, and disloyal to his elder brother \*Llywelyn, he allowed himself to be manipulated by English kings. Quarrelling with Llywelyn, he did homage to Henry III (1253); after his defeat by Llywelyn at the battle of Bryn Derwin (June 1255), they were reconciled though their relationship was not easy. In 1263 he joined Henry III, though when Llywelyn was recognized as prince of Wales (1267) Dafydd was restored to land and position and swore fealty to Llywelyn. In 1274 he and Powys's princes plotted Llywelyn's death, after which he fled to Edward I. After Llywelyn's defeat (1277), Dafydd was given substantial lands in north-east Wales and England, and married the king's relative, Elizabeth Ferrers. Dissatisfied with this treatment, he attacked Hawarden (21 March 1282) and Llywelyn was drawn into the war. After Llywelyn's death (December), Dafydd held out in Dolbadarn castle and styled himself prince of Wales. He was betrayed by Welshmen, tried at Shrewsbury, and executed for treason (3 October 1283). RAG

**Dafydd ap Llywelyn** (c.1208–46), prince of Gwynedd (1240–6). The only son of \*Llywelyn ab Iorwerth, prince of Gwynedd, and Joan, daughter of King John, he was declared heir to his father's principality. This was recognized by Henry III (1220) and the pope (1222), and Welsh nobles swore fealty to him (1226, 1238); he did homage to Henry III (1229). Dafydd's marriage to Isabella, daughter of William de \*Braose, incorporated Builth into Llywelyn's domain. Dafydd's elevation alienated his illegitimate elder brother Gruffydd, and tension grew as their father aged; in 1239 Dafydd deprived Gruffydd of some lands and imprisoned him. When Llywelyn died (1240), Henry III determined to curb Dafydd's ambitions. At Gloucester (15 May) he was knighted by the king, who received his homage; but Llywelyn's acquisitions outside Gwynedd were withheld and the homage of other Welsh nobles was reserved to the king. These humiliating terms were imposed on Dafydd in agreements at Gwerneigron and London (29 August and 24 October 1241), whilst Gruffydd was handed over to Henry III, who exploited him against Dafydd. After Gruffydd died (1 March 1244) while trying to escape from the Tower of London, Dafydd resolved to resist the king: he gained support from Welsh nobles, sought endorsement from the pope,

wrote to the king of France, styled himself prince of Wales, and resumed his father's policy of creating a modern, feudal principality. Henry III launched an expedition against him (1245), but it was Dafydd's sudden death at Aber (25 February 1246) that halted his ambitions. He was buried in Aberconwy abbey. He had no heir and Gruffydd's sons claimed Gwynedd; for the moment, however, the crown's triumph was complete, as the treaty of \*Woodstock (30 April 1247) illustrated. RAG

**Dáil Éireann** is the Lower House of the Parliament of Eire, the upper house being the Senate. Its first meeting in the Mansion House at Dublin was in January 1919 after \*Sinn Féin had won 73 seats at the general election, boycotted the Westminster Parliament, and proclaimed themselves the Parliament of the Irish Republic. There are 166 members elected by proportional representation on a five-year basis. The prime minister is the Taoiseach. JAC

**Daily Telegraph.** This newspaper has come to embody the ideology of conservative, middle-class, middle England in popular perception. Its origins were far from this, being a pioneer of 'popular' journalism in 1855, in the wake of the repeal of press taxes, with its selling price of 2 pence later dropping to 1 penny. By 1888, its sales of 300,000 had left *The Times's* 60,000 far behind. But a decline around the turn of the century was halted only with its purchase by press magnate Lord Camrose, who reshaped it successfully in its middle-class mould and laid the foundations for its unrivalled reputation for wide and authoritative news coverage. DJA

**Dalhousie, James Andrew Broun Ramsay, 1st Marquis and 10th Earl** (1812–60). Born at Dalhousie castle, Scotland, he was the son of a commander-in-chief of the Indian army. Politically he was a Peelite and, after serving at the Board of Trade from 1843–5, was appointed governor-general of India in 1848. His period in office was distinguished by its aggressive westernization, which contributed to the \*Indian mutiny of 1857. He extended the boundaries of British India, annexing the Punjab (1849) and Pegu in Burma (1852) and declaring a doctrine of 'lapse' to acquire princely states which failed to produce heirs. He centralized authority within the \*East India Company state, providing it with a modern system of record-keeping, reporting, and decision-making. He promoted the building of roads, railways, and ports, the extension of western education, and the

## Dalriada

development of colonial commerce. He resigned exhausted in 1856, the victim of overwork and ill-health. DAW

**Dalriada, kingdom of.** Dalriada, or Dal Riata, started as an Irish kingdom on the coast of Antrim, but migrated to the west coast of Scotland in the 5th cent., settling Kintyre and Argyll. This brought it into contact with the kingdom of the \*Picts to the north-east and \*Strathclyde to the south-east. There were three kindreds of Dalriada, based on Islay, Lorn, and Kintyre, the last, the Cenél nGabráin, being predominant at first. \*Ædan of Dalriada, consecrated by St \*Columba in the later 6th cent., clearly had wide ambitions, raiding in Orkney and Man, and waging war against Picts and Northumbrians. An attack on the Northumbrians c.603 ended in severe defeat for Ædan at \*Degaстан, joyously reported by \*Bede. This, and a further defeat for Ædan's grandson at Strathcarron at the hands of the Strathclyde Britons (c.642), weakened the kingdom and led to internal dissensions. Pictish influence increased and the Dalriadan fortress at Dunadd was taken by them c.736. Norse pressure to the west in the early 9th cent. might have squeezed Dalriada, but the reverse seems to have happened. The line of advance was apparently perceived as eastwards and in 843 \*Kenneth MacAlpin, king of Dalriada, took over Pictland and moved the centre of his combined kingdom to \*Dunkeld in Perthshire. Dalriada henceforth merged into the kingdom of \*Alba, the nucleus for the later kingdom of Scotland, which took its name from the Latin designation of the Dalriadans, *Scotti*. JAC

**Dalrymple, James, 1st Viscount Stair** [S] (1619–95). Scottish lawyer and statesman. Born in Ayrshire, Dalrymple was a presbyterian. He was knighted at the Restoration and appointed a lord of Session. By 1681 he was in disfavour, lost his offices, and retired to Holland. He was accused of complicity in plots against Charles II and indicted for treason in 1685. He accompanied William of Orange on his expedition in 1688, was restored as president of the Court of Session, and promoted to the peerage in 1690. In 1681 he published *Institution of the Law of Scotland*, and was regarded by Macaulay as 'the greatest jurist that his country had produced'. JAC

**Dalrymple, John, 1st earl of Stair** [S] (1648–1707). Lawyer and statesman. Like his father, Dalrymple was in disfavour during the early 1680s and twice imprisoned in Edinburgh castle. But in 1687 James VII appointed him king's advocate [S] and the following year lord justice clerk [S] and a lord of Session. Nevertheless he gave strong support to William of Orange and was reappointed king's advocate 1689–92. From 1690 he was also secretary of state in Scotland. He succeeded his father as 2nd viscount in 1695 but was obliged to resign his offices for his role in authorizing the massacre of \*Glencoe. Anne restored him to favour, promoted him to the earldom of Stair in 1703, and he took an active part in bringing about the Union, dying soon after an intervention in debate. His prominent political role attracted the extremes of praise and blame: Burnet wrote that he 'made a better companion than statesman'. JAC

**Dalrymple, John, 2nd earl of Stair** [S] (1673–1747). Diplomat and soldier. Dalrymple succeeded as 2nd earl at the age of 34 in 1707, having pursued a successful career in the army. He served as a Scottish representative peer 1707–8, 1715–34, and 1744–7, and was given the Thistle in 1710. In 1714–20 he was ambassador in France, where he played an important role in watching the Jacobites and in consolidating the understanding with the Regent d'Orléans. His opposition to Walpole's \*Excise scheme in 1733 led to his dismissal from his offices and only after Walpole's fall in 1742 was he restored to favour. In 1742 he served as ambassador at The Hague, was promoted field marshal, and in 1742–3 was commander-in-chief in Flanders, resigning in dudgeon. Walpole's brother Horace thought Stair 'insufferably proud and haughty' and Lord \*Hervey described him as of 'a very warm, prompt temper'. JAC

**Dalton, John** (1766–1844). Chemist, atomist, quaker, and Manchester intellectual, Dalton's first interests were in meteorology and in colour blindness: being colour blind himself, he made the first scientific study of the phenomenon. From 1794 he worked at the Manchester Literary and Philosophical Society, taking private pupils to augment his income. In 1803–4 he lectured at the \*Royal Institution in London, and met Humphry \*Davy; but metropolitan life did not attract him. He wondered why the atmosphere was not a sandwich, with the densest gas at the bottom, and began thinking about the nature of the particles of matter. He concluded that each chemical element has distinct atoms, and began to work out structures of compounds, using simplicity rules. His was the first testable atomic theory, transforming chemistry in subsequent years. DK

**dame schools.** Before the \*Education Act of 1870, many young children were taught by unqualified women in their own homes. The dame schools, which were often in the country, were privately supported and fees were charged. The curriculum was narrow and concentrated on reading and writing. Dame schools acquired a bad reputation yet Samuel \*Johnson remembered Dame Anne Oliver, a shoe-maker's widow who also sold gingerbread, with affection. PG

**Damnonii.** A tribe of central Scotland. This Scottish tribe may well have been called the Dumnonii, but the spelling used by Ptolemy is retained here. There is no known connection between them and their namesakes of south-west England. They are known only from Ptolemy's *Geography*, and their location must be determined by the settlements that he attributes to them. These include Colania, Coria, and Alauna which are thought to be identifiable as the Roman forts at Camelon, Barochan Hill, and Ardoch, although only the latter is certain. If these identifications are correct, they place the tribe firmly in the central Lowlands. KB

**Dampier, William** (1652–1715). Dampier was a seaman whose experiences in the \*Anglo-Dutch War of 1674 set him off on his career as a pirate in the West Indies. In 1679 he crossed the Isthmus of Darien to plunder Spain's South American possessions. He returned in 1683 via Cape Horn and then sailed on across the Pacific eventually

reaching Australia before returning to Britain. He now showed talent as a writer whose *New Voyage round the World* of 1697 rekindled British interest in the Pacific. The Admiralty hired him to return in a half-rotten ship. He reached the west coast of Australia and in 1700 discovered the islands of New Ireland and New Britain. He was half-way home when the ship finally foundered. Dampier returned to a buccaneering life, including marooning and later rescuing Alexander Selkirk (\*'Robinson Crusoe') on Juan Fernández and another circumnavigation of the world. Despite further publications, Dampier died in poverty and bitterness before the large sums of prize money due to him had been paid.

RB

**Danby, Thomas Osborne, 1st earl of, marquis of Carmarthen, and duke of Leeds** (1632–1712). The first minister to construct and manage working majorities in both Houses of Parliament. He did not come from a leading family and at first acted as lieutenant to the 2nd duke of \*Buckingham. Appointed lord treasurer in 1673 as a stop-gap to restore royal finances after the collapse of the \*cabal he secured himself in office by reversing previous unpopular policies. He made Charles II realize that without money the \*Anglo-Dutch War must be abandoned. He rallied the bishops and clergy, out of royal favour since 1663, renewing prosecutions of Catholics and dissenters. Danby used patronage to win followers, especially in Parliament and county offices, and installed relations and associates in key positions. He defeated all attempts by \*Shaftesbury's country opposition to force the dissolution of Parliament or his dismissal. But Charles retained rivals in court offices and operated a secret alternative policy of co-operation with France. Danby negotiated the marriage of the later William III and Mary II but failed to commit Charles to war against France. By releasing incriminating papers to MPs, Louis XIV drove Danby from office. Under impeachment he was confined in the Tower from 1679 to 1684. During the \*Glorious Revolution, Danby seized York and Hull for William. Lord president of the council (1689), he resumed his activities as a political manager and fixer, becoming identified as the leading Tory. But the exposure of his corrupt practices in 1695 ended his active career.

JRJ

**dance**, spontaneous or choreographed, may take a wide variety of forms and serve many functions. As the early Christian church's attitude was ambivalent, many old ritual dances (such as those associated with maypoles) became disguised through new names and contexts, evolving into social dance or absorbed into later theatrical spectacle. The emergence of noble and peasant classes further contributed to the development of social dance: chivalric culture encouraged stately movement, accompanied by instruments such as lutes, while boisterous, rustic figure-dances were accompanied by singing. France's lead in court dance yielded to Renaissance Italy's developments, and the upper classes of early Tudor England were soon familiar with these fashionable new forms; pageants meanwhile developed into \*masques, which could range from simple dances with masks to elaborate entertainments with songs and speech. A new liveliness (typified by the jig) then emerged, encour-

aged by Elizabeth I, and dancing schools so flourished as to prompt ambassadorial comment about 'the dancing English'. Puritan disapproval failed to suppress the popularity of dance, and John Playford's *The English Dancing Master* (1651), which ran to 18 editions in 80 years, eventually included 900 choral dances of rustic origins.

After 1700, \*ballet (formalized by the French) became increasingly confined to highly trained specialists, on stage rather than floor, while former open-air choral dances moved indoors, executed by all classes, and seen as contributing to general education and manners. Jane \*Austen fully appreciated the role of assemblies and balls in the marriage-market. David Dale's view of dancing—'most favourable for [workers'] spirits, and a strong source of attachment to the works' (1812)—was adopted by \*Owen at \*New Lanark, where drill, team dancing, and community singing were utilized to control incipient lawlessness. Public ballrooms multiplied in the 19th cent., when the waltz gained international popularity, despite some moral disapproval of such paired dancing. The 20th cent. saw renewed interest in folk dance (morris dancing, now considered a survival from a primitive religious cult; Cecil Sharpe's collections) and search for new forms. England became arbiter of taste for these novelties, Victor Sylvester's *Modern Ballroom Dancing* (1928) a handbook for the dancing world, and dance competitions emerged. The advent of radio, gramophone, then electronics, expanded recreational dancing everywhere, from Scottish reels to jazz-based dances without physical contact, rock 'n' roll, disco, and break-dancing. Ballet meantime had generally dissociated itself from \*opera, and begun to experiment with choreography. Theatrical dance continues to flourish and influence ice-skating, women's gymnastics, and synchronized swimming.

ASH

**Danegeld**. The term is often applied to tribute payments made to the \*Vikings in the reign of \*Æthelred II (978–1016); these payments are known as *gafol* in the \*Anglo-Saxon Chronicle. In 1012 Æthelred introduced an annual land tax, levied throughout the country, to pay for a Scandinavian force led by Thorkell the Tall which he had recruited to fight for him. The levy was continued by \*Cnut and his sons to pay for their own standing forces and was only abolished by \*Edward the Confessor in 1051. It was this tax which Norman administrative documents called 'Danegeld', though the Anglo-Saxons knew it as *heregeld* ('army tax').

BAEY

**Danelaw**. When during the 10th cent. the \*Viking settlers of eastern England recognized the authority of the English kings, they were allowed to follow their traditional laws. By the 11th cent. the term 'Danelaw' was being used to indicate the area in which customary law was influenced by Danish practice, defined in 12th-cent. documents as all of eastern England between the Thames and the Tees.

BAEY

**Darby, Abraham** (1677–1717). The founder of the great Shropshire iron industry, using local supplies of coal and iron. He was born in Worcestershire of a quaker family, apprenticed in Birmingham, and set up as a brass founder in Bristol. In 1708 he patented a process for casting cheap iron pots in sand and the following year leased a furnace in

## Darcy

\*Coalbrookdale. Two successive Abraham Darbys developed the business and in 1779 the \*Iron Bridge at Broseley advertised the company to the world. JAC

**Darcy, Thomas Darcy, 1st Baron** (c.1467–1537). The Darcy estates were in Yorkshire and Thomas Darcy was descended from the lords Darcy of Knaith (Lincs.). Useful in the reign of Henry VII in the north, Darcy was created a peer in 1504 and given the Garter at the accession of Henry VIII in 1509. But he became increasingly disillusioned with Henry's religious policy, disliked the \*dissolution of the monasteries, and began plotting with the imperial ambassador. In the rising of the \*Pilgrimage of Grace for the old religion, he played an equivocal role and was accused of treason in surrendering Pontefract castle to the rebels. His explanations that he was trying to steer the rising were brushed aside and he was beheaded on Tower Hill in June 1537. His son was restored to the title in the reign of Edward VI. JAC

**Dardanelles campaign.** See GALLIPOLI.

**Darien venture.** Previous Scottish attempts to establish colonies had been small scale, but the Company of Scotland, established in 1695, had grand ideas. It aimed at raising £400,000—perhaps half the capital in Scotland. 'They came in shoals,' wrote an eye-witness: £50,000 was raised on the first day, the remainder in five months. Five ships were equipped, 1,200 men enrolled, and the expedition sailed in July 1698. The destination was a secret even from the captains until they opened their orders on the voyage. The directors had chosen Darien, on the isthmus of Panama, to be called Caledonia. After a difficult voyage of three months, the ships reached Darien, found some friendly Indians, and began building New Edinburgh. But what appeared at first sight an earthly paradise was in reality a fever-ridden swamp. Nor was there much demand for the cargo of wigs and woollen goods which they had brought. On 22 June 1699 the colonists evacuated. A second expedition left the Clyde in August 1699, reached Caledonia, and found deserted huts and hundreds of graves. After four months they surrendered to a Spanish force and were allowed to depart; very few saw Scotland again. The disaster for a small country was shattering. William III, anxious not to be embroiled with Spain at a difficult moment, had warned his subjects not to assist the enterprise. The Scots could therefore blame the English for their misfortunes. In 1705 when an English captain, Thomas Green of the *Worcester*, put in at Leith, he was arrested, falsely accused of piracy, and hanged at the instigation of a howling mob. Paradoxically, the worsening relations between the two countries hastened the \*Union of 1707. JAC

**'Dark Ages'.** A term employed in the 17th and 18th cents. to indicate the intellectual darkness which was believed to have descended on Europe with the ending of the Roman empire until new light was provided by the \*Renaissance. Since the achievements of the Middle Ages have come to be properly recognized the term has been in retreat, but it still has a stronghold in what should be more appropriately described as the early Middle Ages (c.400–c.1000). In the field of British

history it is sometimes applied just to the 5th and 6th cents., which many historians would prefer to designate as sub- or post-Roman. BAEY

**Darling, Grace** (1815–42). One of nine children, Grace Horsley Darling was born on 24 November 1815 at Bamburgh (Northd.). From 1826 her father was lighthouse-keeper of the Longstone Light on the Farne Islands. Although Grace led a secluded existence, receiving little formal education, she was a keen observer of sea-life. By 19 she was resigned to her life on the islands, assisting her father and providing companionship to her mother. She became a national heroine when, with her father, she rescued nine passengers from the steamship *Forfarshire* on its way from Hull to Dundee, when it struck rocks during gales on 7 September 1838. Grace, shy by nature, found the glare of publicity unwelcome. Nevertheless, Grace Darling memorabilia and romanticized depictions of the event were churned out. She continued to live with her parents until her death, from tuberculosis, on 20 October 1842. A Grace Darling memorial and museum are at Bamburgh. SMC

**Darnley, Henry Stewart, Lord** (1545–67). The son of Matthew Stewart, 4th earl of Lennox, and grandson of \*Margaret Tudor, Darnley's place in the English succession was second only to that of Mary Stuart. His father was forfeited for treason in 1544 and Darnley born and brought up in England. In 1564, however, Mary restored Lennox and the arrival of Darnley in Scotland the following year was swiftly followed by their marriage by catholic rite on 29 July 1565. The marriage incensed Elizabeth but provoked in Scotland only a minor rebellion of disaffected protestant nobles, led by \*Moray, which she declined to support and which rapidly fizzled out. Within months, stability was restored, Mary was pregnant, and the Stuart dynasty's future seemed assured. But Darnley's good looks, while initially captivating Mary, masked a meretricious personality and his relations with the queen soon soured. Mary's refusal to grant him the crown matrimonial drove him to ally with the disaffected nobles who had opposed the marriage and who carefully implicated him in the \*Rizzio murder of March 1566, a protestant demonstration against the prospect of a catholic royal succession which achieved very little. The future James VI was born on 19 June and baptized a catholic on 17 December. The rift between Mary and Darnley, briefly healed following the Rizzio affair, now widened beyond repair. Darnley pointedly missed his son's lavish baptismal celebrations and the political isolation resulting from his betrayal of his fellow Rizzio conspirators was compounded by Mary's increasing dependence on \*Bothwell. It remains unclear who murdered Darnley at Kirk o' Field, Edinburgh, on 10 February 1567, or whether Mary was party to the deed. Her precipitate marriage to Bothwell, however, handed the Lennox Stewarts a gift-wrapped opportunity to gild Darnley's memory at Mary's expense. RAM

**Dartmouth, George Legge, 1st Baron** (1648–91). Legge fought in the second \*Anglo-Dutch War, held naval commands in the third Anglo-Dutch War, and had also started to accumulate military and high civil posts, due to his intimate

relationship with the duke of York. Created Lord Dartmouth in 1682, he evacuated Tangier in 1683–4. Facing the threat of a Dutch invasion in 1688, James II made this ultimate loyalist commander-in-chief of the navy. Adverse winds made it impossible for him to prevent invasion, and his fleet was rife with disaffection. Dartmouth was appalled by James's determination to send the heir to the throne to France. After James's flight, Dartmouth recognized William of Orange *de facto*. James deserted him, not he James. Committed to the Tower on suspicion of treason in 1691, he died there unexpectedly. No man was less likely to facilitate a French invasion. BPL

**Dartmouth, William Legge, 2nd earl of** (1731–1801). William Legge was the grandson of the 1st earl, a moderate Hanoverian Tory. Succeeding in 1750, he entered politics after doing the grand tour with Frederick \*North, the future prime minister and his half-brother. Dartmouth served as president of the Board of Trade in the Rockingham ministry of 1765–6. In North's administration he was secretary of state for the colonies and president of the Board of Trade from 1772, lord privy seal from 1775. A deeply devout man, with methodist sympathies, he was known irreverently as 'the psalm singer'. Dartmouth College in Hanover (New Hampshire), chartered in 1769, was named after him. Unhappy with coercion of the American colonies, he supported conciliation proposals in the approach to the American Revolution but by 1776 was convinced that force was the only remedy left. American propaganda painted him as unbalanced and remote from reality. He resigned with North in 1782 and left politics after 1783. BPL

**darts** evolved from throwing spears or shooting arrows. Hand arrows were a useful weapon, known as 'dartes', and this was one of the few games that medieval and early modern governments did not feel obliged to prohibit. It is possible that the modern dartboard developed from the cross-section of a tree trunk, brought indoors for practice. There were of course many local variations, including the use of blowpipes. The standard clock-face became established in the late 19th cent., and paper flights to fit the darts were patented in 1898. In 1908 a court action at Leeds held that darts was a game of skill rather than chance and could therefore be played in pubs, without offending the laws against gambling. In the 20th cent., two world wars (with much killing of time) followed by the spread of television helped to popularize the game, which has been controlled in Britain by the National Darts Association since 1953. NJB

**Darwin, Charles** (1809–82). Darwin made evolution scientifically respectable. Intended for medicine, he took courses at Edinburgh, but dropped out unable to bear surgery. He went on to Christ's College, Cambridge, took a pass degree, and became a clergyman, reading W. \*Paley with pleasure. There J. S. Henslow and Adam Sedgwick directed his enthusiasm for nature into serious science and in 1831 he was offered a place as companion to the captain on HMS *Beagle* surveying Cape Horn. This was the kind of opportunity that Joseph \*Banks had enjoyed; and on the five-year voyage round the world, Darwin became a great descriptive scien-

tist and collector. Thinking about nature's diversity, and reading T. R. \*Malthus, he hit upon the idea of natural selection when he got home.

Animals and plants produced more young than could survive: those better adapted to their surroundings would be 'selected' by nature as the stock-breeder selected the woolliest or meatiest sheep, and their offspring would diverge, inheriting characteristics. Unlike earlier theories, his grandfather's or J. B. Lamarck's, this did not involve progressive development in accordance with a plan or law; it was open-ended. Darwin spent over 20 years collecting and marshalling evidence before publishing the *\*Origin of Species* in 1859. Meanwhile, he had married his cousin Emma Wedgwood, and settled in a remote corner of Kent; his health was poor, and he led a reclusive life, writing the standard work on barnacles. Despite furious controversy, his theory prevailed, and by the end of his life he was universally recognized. DK

**David I** (c.1085–1153), king of Scots (1124–53). An outstanding monarch who 'became a legend in his own lifetime', he was the youngest son of \*Malcolm Canmore and Queen (later St) \*Margaret, and succeeded his brother \*Alexander I. His early career brought him firmly within the English orbit: he was educated at Henry I's court and became earl of Huntingdon in 1113 through his marriage to \*Matilda, a great-niece of William the Conqueror. But, once king, he asserted his independence as a sovereign ruler, and drew on his experience of the Anglo-Norman world to bring the Scots kingdom within the mainstream of European development, though recent studies also highlight how far he depended on the strengths and practices of his Celtic inheritance. The 'Davidian revolution' involved the settlement in Scotland of Anglo-Norman nobles, who established powerful local lordships defended with castles and supplied knights to the king's army. The monarchy was also strengthened by the restructuring of law and administration along Anglo-Norman lines, and by an extensive programme of church reform. Thus David created or revived several bishoprics and personally founded ten major monasteries, especially for Cistercian monks (Melrose, Newbattle, Kinloss) and Augustinian canons (Jedburgh, Holyrood, Cambuskenneth). He also developed the economic basis of the kingdom by founding burghs (notably Berwick, Edinburgh, and Aberdeen) and by introducing the first Scottish \*coinage.

In all these respects, 'Normanization' followed a very different path from that taken in the rest of the 'Celtic fringe', where both Wales and Ireland experienced Anglo-Norman conquests. In Scotland, by contrast, David's predecessors had already established a sufficiently powerful and unitary monarchy to ensure that change operated on behalf of Scottish interests, not against them. Quintessentially, however, David was as much a conventional Celtic ruler as a new-style 'feudal' monarch. Though he acted decisively to crush the rebellion of the mormaer (provincial ruler) of Moray in 1130, he preferred to work with traditional power structures wherever practicable. He continued to use the ancient centres of royal authority; loyal native lords kept their lands and their prominence as members of the governing élite alongside the Anglo-Norman incomers (all the earls

## David II

and most of the bishops were native Scots); the existing pattern of administrative offices coexisted with the sheriffs, justiciars, and other new officers; the taxation system remained based on the old levies of cain and conveth ('tribute and hospitality'); and customary methods of military recruitment retained fundamental importance. So, while change was a leading motif, David's reign also exhibited considerable degrees of continuity; indeed, the key to his greatness as a state-builder was the ability to integrate old and new. His Scottish power base was confined largely to the Lowlands; but the reality of growing royal might was firmly demonstrated when he led vast armies (including 200 knights, but mainly comprising native troops from many parts of Scotland) in wars of territorial conquest against the embattled King Stephen, and from 1141 he ruled the 'English' north to the rivers Ribble and Tees as an integral part of an enlarged Scoto-Northumbrian realm. His successes as a war leader help to explain why his modernizing policies were not more strenuously challenged by Celtic lords outside the royal circle. Anglo-Norman adventurers flocked to his court in increasing numbers; and control of the rich silver-mines near Carlisle gave a major boost to the Scottish economy. But in 1152 David's only surviving son Henry predeceased him. When David himself died, he was therefore succeeded not by a mature and experienced heir, but by a boy-king, his grandson Malcolm IV; and in 1157, at Henry II's insistence, the Scots were obliged to withdraw from the north. Yet by 1153 the traditional kingdom of Scots was well on the way to becoming a self-confident, European-style state, and David's reign was arguably the most formative period in medieval Scottish history. KJS

**David II** (1324–71), king of Scots (1329–71). He succeeded to the throne at the age of 5; and within three years his realm was invaded by Edward \*Balliol and Edward III of England. With his young wife \*Joan, sister of Edward III, he had to take refuge in France, his kingdom at times on the point of collapse. Not until 1341 was he able to return; and in 1346 he was captured at the battle of \*Neville's Cross, near Durham, and spent eleven years in captivity before his release in 1357. As a prisoner, his chief object was to obtain his release. To this end, he was prepared to abandon the steward's right of succession, but not to accept a union with England. He would contemplate the possible succession of \*John of Gaunt, a younger son of Edward III, who was not Edward's heir. This proposal, however, was rejected by the Scottish Parliament. In 1357, David was released in return for a large ransom; and proposals for a peace in 1363, on the basis of the succession of Edward III if David had no direct heir, were again rejected, very possibly with the approval of David himself.

After his return to Scotland in 1357, David's government proved efficient. He was able to impose heavy taxation to meet the cost of his ransom; yet royal finances were probably in a better state at the end of his reign than at any other time in the century. He dealt firmly with a baronial revolt in 1363 and with opposition from individual barons. He reacted strongly to disobedience by certain Highland nobles, provoked by increased taxation and an act of revocation of 1367,

which bore heavily upon them. As a ruler he was evidently stronger than any of his successors before James I.

His main weakness lay in his personal affairs. His first wife seems to have abandoned him after 1357, returning to England where she died in 1362. David above all required an heir. By 1363 he had formed an attachment to \*Margaret Logie, whom he married in that year. When no heir was forthcoming by 1370, he divorced her and was planning to marry Agnes Dunbar, when he himself died unexpectedly, early in 1371.

David has been accused of lack of patriotism, but there seems little basis for this. Throughout, he tried to maintain the integrity of his kingdom, with success in what were often difficult circumstances. BW

**David** (Dewi), **St** (d. c.601). Bishop of Menevia (St Davids), and patron saint of Wales. All accounts of him are based on the c.1090 biography by Rhygyfarch (Ricemarch) which is fanciful and appears to be propaganda to bolster the primacy of St Davids. According to the legend David's birth was predicted by St \*Patrick while travelling in the area of Menevia. David was born in Ceredigion to St Non, a nun who had been ravished by Sant (David's father), and there is a tenuous connection to the \*Cunedda family. He was educated at Vebus Rubus (Henfynyw, in Cardigan), was later ordained, became a pupil of Paulinus (possibly St Paul of Leon), and is reputed to have worked miracles. Afterwards he travelled through Wales preaching and founding monasteries. He finally settled at Mynyw (St Davids) and began a life of intense austerity. After a pilgrimage to the Holy Land, David attended the Synod of Brefi, where the \*Pelagian heresy was condemned and after which, due to his eloquence and holiness, he was elected primate of the Cambrian church with his see at Mynyw. This story is fraught with invention but his cult was well established by the 11th cent. and at least 60 churches were dedicated to him by 1200. David was canonized in 1120 by Pope Calixtus. SMD

**Davidson, Randall** (1848–1930). Archbishop of Canterbury. Born a Scottish presbyterian in Edinburgh and educated at Trinity College, Oxford, Davidson was successively chaplain to Archbishops \*Tait (1877) and \*Benson, dean of Windsor (1883), bishop of Rochester (1891) and Winchester (1895), and archbishop (1903–28). An ecclesiastical policy-maker for over 50 years (1877–1928), he was close confidant of two archbishops (1877–95) and an intimate of Queen Victoria, whose death he attended. As a national leader during 25 years of phenomenal change, he gave the primacy substantial prestige. Frequently plagued by ill-health, conciliatory rather than dynamic, Davidson displayed skill and courage with problems domestic, colonial, and international. The first modern archbishop to visit combatant troops at the front (1916), the first to visit America (1904), he was also a keen House of Lords man where his support assisted the passage of the Parliament Bill (1911). Sometimes insufficiently outspoken, he nevertheless courageously opposed the death sentence for Roger \*Casement, condemned the \*Black and Tans, was even-handed in the \*General Strike, supported the \*League of Nations, and prevented the patriarch's expulsion from Constantinople. Ecclesiastic-

ally he constantly worked to conciliate differing viewpoints. Though the Enabling Act (1919) gave the church some self-government, he resigned after Prayer Book revision failed to gain parliamentary approval. WMM

**Davies, (Edward) Clement** (1884–1962). Liberal leader. Born in Montgomery and educated at Trinity College, Cambridge, Davies began as a successful lawyer, but was returned to Parliament as a Liberal in 1929 for his native county, holding the seat for the rest of his life. In the 1930s he belonged to the Liberal National group which supported the government, and at the outbreak of the Second World War strongly urged a wider coalition. He played some part in the overthrow of \*Chamberlain's government in 1940. In 1945 he became leader of the Liberal Party when Sir Archibald \*Sinclair failed to retain his seat, and in 1951 was offered a cabinet post by \*Churchill. His colleagues, anxious to preserve Liberal independence, persuaded him to refuse. Respected and convivial, 'Clem' was scarcely the man to rejuvenate the party in the nadir of its fortunes, though he did reunite the two wings. But from twelve MPs in 1945 their numbers dropped to six in 1950. After the 1955 general election he was gently eased out of the leadership and replaced by Jo \*Grimond. JAC

**Davies, Emily** (1830–1921). Born in Southampton, brought up in Gateshead where her father had a parish, Emily Davies began by helping Elizabeth Garrett \*Anderson to obtain her medical training. In 1862 she joined a committee to lobby for access to university examinations for women and then moved on to help organize a women's college. This opened at Hitchin in 1869 with five students and transferred to Girton, just outside Cambridge, in 1873, with fifteen. Davies served as mistress from 1873 until 1875 and as honorary secretary from 1867 to 1904. She was also a strong advocate of women's suffrage and organized J. S. \*Mill's petition to Parliament in 1866. 'Small and plain . . . her face unrevealing between smooth bands of mouse-coloured hair' was a contemporary assessment: 'all at once friendly and formidable' a later comment. JAC

**Davies, Sir John** (1569–1626). Lawyer and poet. Davies was born in Wiltshire, sent to Queen's College, Oxford, and became a lawyer. In 1597 he was elected to Parliament for Shaftesbury. Appointed solicitor-general in Ireland in 1603 through the patronage of the earl of Devonshire, Davies was knighted and spent much of his life in Ireland, serving as attorney-general from 1606 and as speaker of the Irish House of Commons in 1613. His letters and reports on conditions in Ireland are of great value. He returned to England in 1619 and was appointed chief justice of King's Bench in 1626, but died before he could take up office. His best-known poem, *Nosce teipsum* (1599), dealt with the immortality of the soul, was admired by James I, and was quoted approvingly by \*Coleridge in *Biographia literaria*. Davies's wife claimed the gift of prophecy and, predicting his death, irritatingly adopted mourning in advance of the event. JAC

**Davies, Richard** (c.1501–81). Bishop and scholar. Davies was born in north Wales and educated at New Inn Hall, Oxford. He held livings in Buckinghamshire but, as a re-

former, took refuge in Geneva during Mary's reign. At the accession of Elizabeth, Davies was made bishop of St Asaph (1560) and moved in 1561 to St Davids. He was on close terms with both Archbishop \*Parker and \*Cecil, advising them on Welsh matters. Davies collaborated closely with William \*Salesbury in producing the Welsh translation of the New Testament in 1567, parts of which he contributed. But a quarrel between them seems to have left the Old Testament to be translated by William \*Morgan. JAC

**Davis, John** (c.1550–1605). One of the long line of English navigators who sought the North-West Passage, he obtained some sort of backing from \*Walsingham for three expeditions in 1585–7. Following \*Frobisher's example, he sailed south and west of Greenland, but then penetrated much further north to about 73° in the strait that bears his name. His men played football with Inuit (Eskimos). Later in his life, Davis sailed to the Magellan Straits, fought the Spanish Armada, and died in a skirmish in the East Indies. He continued to believe that a North-West Passage could be found, expounding the view in books of 1584 and 1595. RB

**Davitt, Michael** (1846–1906). Irish nationalist. Born in the famine period, evicted at the age of 5, Davitt lost his right arm in an accident in a Lancashire cotton-mill when he was 12. He joined the \*Fenians and in 1870 was sentenced to fifteen years in gaol for treason-felony. Released after seven years, he persuaded \*Parnell of the potential in a land reform agitation. In October 1879 he formed the \*Irish Land League, with Parnell as president. He took a hostile line to Parnell after the divorce scandal and was returned to Parliament in 1895. Though his early belief in violence moderated, Davitt alienated many supporters by his anticlerical views and his collectivist attitude towards land. JAC

**Davy, Sir Humphry** (1778–1829). Cornish chemist and applied scientist. Davy's apprenticeship to an apothecary was interrupted through his meeting with James \*Watt's son Gregory, and he was invited to Bristol to a clinic where oxygen and other gases were given to those with tuberculosis. He met S. T. \*Coleridge, and with him discovered the properties of laughing gas. In 1801 he was appointed to the \*Royal Institution in London, where his eloquence made his lectures fashionable, and where in 1806–7 he proved that chemical affinity is electrical, winning a prize from Napoleon's *Institut*. After marrying a wealthy widow, Jane Apreece, in 1813, he set out for France to collect it, accompanied by his new assistant, Michael \*Faraday. On his return in 1815, his help was sought in controlling mine explosions; beginning with laboratory investigation, he came up with the lamp that bears his name. This was a new route to technological innovation. His lamp made him the obvious candidate to succeed Sir Joseph \*Banks as president of the \*Royal Society in 1820; but his reign was unhappy in a decade of tension between tradition and reform. DK

**D-Day**, 6 June 1944, and the following days, were decisive in the war on Germany. British and American troops, in roughly equal numbers, including Canadians in the British total, established themselves on the Normandy coast; Rommel, commanding the German side, could not concentrate

sufficiently powerful forces to dislodge them. D-Day, though cloudy and windy, justified Eisenhower's decision, as supreme commander, to accept, at the last minute, a comparatively hopeful weather forecast. \*Montgomery, in command of ground forces, dispatched five infantry divisions, to five separate beaches, plus three airborne divisions, landing over 150,000 men on the first day. The landings were supported by more than 100 warships, with 4-inch or larger guns, bombarding coastal defences. On one American beach, Omaha, against a good-quality German division and well-prepared German defensive works, casualties were high. The British and American air forces virtually stopped German movement of troops or supplies by day and made impossible a co-ordinated German counter-attack. Allied air forces contributed decisively to the 1st US Army break-out which led to the liberation of France and Belgium in August and September 1944. RACP

**deacon.** The rank in the Christian ministry below that of bishop and priest or presbyter. The order has its New Testament warrant from Acts 6, the commissioning of Stephen and others to serve the poor, and in 1 Timothy 3, as ministers serving with presbyters. Today the diaconate, open to men and women, has become little more than a preparatory step to priesthood. JRG

**dean.** The title is most commonly associated with the priest who presides over the life and work of a cathedral. Originally it evolved from the Latin 'decem' (ten) as descriptive of one who had authority over, or the supervision of, a group of ten others. Where a cathedral or collegiate church (e.g. Westminster abbey or St George's, Windsor) had a chapter of canons or prebendaries, the dean was *primus inter pares*, and rarely had (or has) authority to act apart from the caputular body over which he presided. The statutes governing most English cathedrals give the dean and chapter together a considerable degree of independence from episcopal control. The title 'dean' is also held—as 'rural dean'—by a beneficed clergyman in a part-time capacity. The rural dean is appointed by the bishop to act as a channel of communication between himself and the clergy of the parishes which make up his deanery. The office is an ancient one, revived in the 18th and 19th cents. by pastorally minded bishops. In universities, deans are normally chairmen of faculties. JRG

**death duties.** Death is considered to be a 'taxable event'. The taxation of inheritance (on the acquisition of property from a person who has died) provided a source of government revenue in Roman times. A death tax was introduced in Britain in 1694 but the modern framework dates from 1779–80. Since 1894, when Sir William Harcourt introduced a new system in the teeth of fierce opposition, death duties have mainly been in the form of estate duties (on property left at death), although for a period from 1975 they were replaced by capital transfer tax which applied to transfers of property at any time, including death. Death duties differ from property taxation in that there is only one assessment. Normally some portion or types of assets or bequests are exempt from taxation. It is for this reason that death duties tend to be relatively complicated and seldom either provide

a good source of revenue or bring about significant wealth redistribution. KJB

**Declaration of Independence, 1776.** Conflict in America was well advanced when Congress on 4 July 1776 adopted the Declaration of Independence. Primarily the work of Thomas Jefferson in a five-man committee, a principal objective was to facilitate an understanding with France. The celebrated 'self-evident truths' of life, liberty and the pursuit of happiness were followed by a fierce denunciation of George III—a 27-point indictment, insisting that he was 'a tyrant unfit to be the ruler of a free people'. The drafters understood that hatred is more easily called forth if it can be personified, and though it was doubtful history, it was very effective propaganda. The list of grievances would have been longer had Congress not prudently deleted the accusation that George had vetoed attempts to abolish slavery, 'this execrable commerce'. The declaration concluded that 'all political connection between them and the state of Great Britain is, and ought to be, totally dissolved.' JAC

**Declaration of Rights, 1689.** In February 1689, the \*Convention drew up a Declaration of Rights, which it presented to William and Mary in the Banqueting Hall at Whitehall. It related the misdeeds of James II, begged William and Mary to accept the throne, and laid down an oath of allegiance. William accepted on their behalf and they were proclaimed king and queen. The declaration was given statutory form in the \*Bill of Rights in December 1689, which added that no papist, or person married to a papist, could sit on the throne of England. See GLORIOUS REVOLUTION. JAC

**Declarations of Indulgence.** Charles II disliked the penal laws against protestant and catholic dissenters and in 1672, using his \*suspending power, issued a Declaration of Indulgence. The House of Commons protested vehemently: 'we humbly conceive that Your Majesty has been very much misinformed, since no such power was ever claimed or exercised by any of Your Majesty's predecessors.' Faced with a war with the Dutch, Charles climbed down and withdrew it. Learning nothing from the experience of his brother, James II issued another declaration in 1687, repeated it in 1688, and compounded matters with a foolish preface declaring, 'we cannot but heartily wish, as it will easily be believed, that all the people of our dominions were members of the Catholic Church.' He next prosecuted seven bishops for petitioning against the declaration. Several of the judges cast great doubt on the validity of the suspending power and the bishops were acquitted amid widespread rejoicing. The same day the 'immortal seven' (six noblemen and \*Compton, bishop of London) sent to William of Orange to rescue them. JAC

**Declaratory Act, 1766.** This asserted parliamentary sovereignty against the claims of the American assemblies, although in other writings it was made clear that Parliament would not try to tax Americans. It was designed to win the consent of king, Lords, and Commons to the modification, or repeal, of the \*Stamp Act. RCS

**decolonization.** As with many historical processes, the term 'decolonization' was improvised *ex post facto* to indicate a transformation which was not always perceived at the time. Decolonization certainly does not denote the simple loss of authority over an overseas possession—the ending of British rule over the thirteen American colonies in 1783 was not, for example, an act of decolonization, any more than was the loss of Calais in 1558. The origins of British decolonization as an exercise in the devolution of constitutional authority may be found in the transition during which responsible government was granted to self-governing settler colonies in the Canadas, Australasia, and southern Africa from the 1840s onwards. But just as responsible government in the 19th cent. was not an enemy to empire, so later policies feeding into decolonization in the 20th cent. were by no means intended as an abrupt abandonment of British preponderance.

There was certainly no decolonization, as such, between the two world wars. Rather, conditions alerted British policy-makers to the wisdom of making alien domination less blatant and, as Lord \*Milner put it in his report on Egypt in 1920, to the need to make appearances more acceptable to the indigenous population while retaining imperial reality. The formal empire experiment with the method of dyarchy, especially in India following the 1919 Government of India Act, whereby some branches of public affairs were reserved for the imperial government while others were to be gradually devolved into the hands of elected representatives, reflected the same spirit.

The Second World War may have ultimately proved the prime cause of the disappearance of the British empire, but it cannot be said to have led at the time to any coherent vision of decolonization—if anything the reverse. Although Prime Minister \*Churchill joined in the \*Atlantic charter (August 1941) which affirmed the right of peoples to determine the governments under which they lived, his subsequent statement that he 'had not become His Majesty's Chief Minister to preside over the liquidation of the British Empire' is just as well known. Some possessions—principally \*Malaya and \*Burma after December 1941—were overrun, but planning for their reconquest got under way immediately. The British government formally recognized in Parliament during July 1943 a responsibility 'to guide Colonial people along the road to self-government, within the framework of the British Empire', but self-government was not decolonization, and the goal was made contingent on conceptions of social and economic improvements which were clearly decades, perhaps centuries, away.

It was in south Asia after 1945 that decolonization in its characteristic British formulation as the 'transfer of power'—for which phrase there is no French equivalent—took shape. During the events leading up to the independence of \*India and \*Pakistan (August 1947) the Labour government's essential requirements were that British prestige should not be impaired, that the process should take place on an agreed basis, and that no important political, strategic, or economic interest of the United Kingdom should be harmed. Lord Louis \*Mountbatten, as the last viceroy, showed how along the way new friends could be

made out of old adversaries, as with Jawaharlal \*Nehru and his Congress Party, even if it was at the cost of colder relations with such traditional allies as Ali \*Jinnah's Muslim League. It was convenient for all concerned in 1947 that the position of the crown remained at first untouched, though in 1949 the expressed wishes of India and Pakistan to become republics were accommodated within a multiracial \*Commonwealth, of which the British monarch became head. Meanwhile Burma's statehood (January 1948) outside the Commonwealth, and \*Ceylon's independence including a treaty guaranteeing Britain's strategic presence (February 1948), constituted the two poles of British decolonization on the margins of the subcontinent.

The transition in south Asia, however, did not necessarily set precedents for other parts of the British empire. No British colonial territory became independent during the peacetime premiership of Churchill (October 1951–April 1955). In some cases, most notoriously that of \*Cyprus (July 1954), it was stated in Parliament that the principle of self-determination could *never* be applied. Although subsequently \*Sudan became the first country in British Africa to attain statehood (January 1956), it did so as part of the unravelling of the old Anglo-Egyptian Condominium, not as symptomatic of a wider shift of colonial policy. Both the Gold Coast (January 1957), renamed \*Ghana, and Malaya (August 1957) acquired independence having met certain political and financial requirements, though whether the same tests would be applied to other territories remained uncertain.

The second main phase of British decolonization came with the 'acceleration' of colonial policy in Africa following the re-election of Harold \*Macmillan's Conservative government in October 1959, and especially his speech before the South African Parliament on 3 February 1960, warning of the 'winds of change'. Macmillan's colonial secretary, Iain Macleod, later claimed that this acceleration was governed by the stark alternative of bloodshed. This was justification for a policy which had more complex causes at a variety of levels. \*Nigeria became independent during 1960, Tanganyika (\*Tanzania) and \*Sierra Leone in 1961, \*Uganda in 1962, \*Kenya and \*Zanzibar in 1963, \*Zambia and \*Malawi in 1964, the \*Gambia in 1965, \*Lesotho in 1966, and \*Swaziland in 1968. These complicated arrangements were often negotiated at 'Lancaster House conferences' in London which replicated, in narrower compass, the ideal inaugurated in India of a constitutional and amicable separation in which Britain itself seemingly played the leading role. More or less simultaneously the British Caribbean provided a footnote to African decolonization, \*Jamaica and \*Trinidad opting in August 1962 for independence apart from the ill-fated West Indian Federation, and other Caribbean territories following at intervals. The emergence of the Republic of Cyprus (August 1960), although highly idiosyncratic in the limitations on its external sovereignty, had already signified that smallness was no longer a constraint on the application of self-determination.

If British governments ever pursued a distinct policy of decolonization, it was in the Afro-Caribbean world between 1960 and roughly 1966. The lack of alternatives meant that any controversies between, or within, the main British

## Decorated style

political parties remained limited. More polemic surrounded the scuttle from \*Aden (November 1967) and the abandonment of contractual obligations to Gulf rulers—this was the real 'swansong of empire'. Thereafter the process of bringing down the curtain on Britain's imperial history was largely a matter of coping with cases which were *sui generis*. The category of 'Associated State' was invented to meet the needs of the poorer and least viable West Indian islands. By far the most complicated and dangerous 'unfinished business' of decolonization in the later 1960s and 1970s was \*Rhodesia, where a white settler rebellion was not quelled and the territory brought back into the mainstream of legitimate independence-making till the emergence of Zimbabwe in April 1980. The final phases of the Rhodesian story showed that it had become the proper acknowledgement of the forms of the transfer of power which mattered more to Britain than anything else. Perhaps, if the Galtieri regime in Argentina had understood this point, the status of the \*Falkland Islands might not have remained so rigidly frozen in the image of the British population in the wake of the war of 1982.

Since it is the writing of the final page in any historical experience which fixes the record in perpetuity, during the prolonged run-up to the last great British decolonization, that in \*Hong Kong (30 June 1997), the preoccupation of the British government and its representative, Governor Patten, was to establish beyond dispute the commitment to democracy and the welfare of the local population, which Britain's rulers have always contended lay at the basis of their colonial mission overseas. The speech before the joint British Houses of Parliament by the greatest living 'freedom-fighter', President Nelson Mandela of South Africa, on 5 July 1996, in which he legitimized Britain's moral statecraft abroad from the ending of colonial slavery through to the granting of African 'freedom' by Harold Macmillan, testified to the final triumph of the British version of decolonization.

A., *Eclipse of Empire* (Cambridge, 1991); Porter, A. N., and Stockwell, A. J., *British Imperial Policy and Decolonization, 1938–64* (2 vols., 1987).

**Decorated style.** See GOTHIC ARCHITECTURE.

**Dee, John** (1527–1608). Mathematician and astrologer. Dee was born in London, attended St John's College, Cambridge, and, taking holy orders, was a founding fellow of the new Trinity College. He spent much time on the continent, collecting rare books, studying mathematics, astronomy, and cartography, and lectured at Paris on Euclid. He returned to England in 1551, but was under a cloud in Mary's reign, imprisoned on charges of treason and heresy. Elizabeth was more receptive to Dee's appeals, but though she promised patronage, his reputation as a magician seems to have handicapped him. Dee moved into alchemy and then into an attempt to communicate with angels. Not until 1596 did he get much recognition, when he was made warden of Christ's College, Manchester, a post which proved acrimonious, and from which he retired in 1605. He appealed in vain to James I

to allow him to clear himself of the imputation of sorcery, and died in poverty. His curious diaries were published, edited by Edward Fenton, in 1998. John \*Aubrey, a distant relative, wrote that Dee was 'a very handsome man, with a long beard as white as milke . . . he wore a gowne like an artist's gowne, with hanging sleeves . . . the children dreaded him because he was accounted a conjurer'. See also MAGIC; ALCHEMY. JAC

**Deerhurst.** St Mary's priory church at Deerhurst near the Severn in Gloucestershire has a history extending back to the early Anglo-Saxon period, some of its masonry dating from c.700. A monastery existed there before 804 when Æthelric granted land to Deerhurst, making it the chief monastery of the kingdom of the \*Hwicce. In addition to a fine Saxon tower, there is a 'tub-font', used for centuries as a farm trough, a remarkable double-headed window from the 9th cent., and several impressive sculptures. Odda's chapel nearby dates from 1056 and was the kitchen of a farmhouse until the late 19th cent. SMD

**De facto Act,** 1495. The name is misleading since the statute, 11 Hen. VII c. 1, does not appear, contrary to much commentary, to distinguish between kings *de facto* and kings *de jure*. Henry VII, victorious at \*Bosworth, faced a series of challenges to his throne. To buttress his position, this statute declared that a person performing his duty to the king could be 'in no wise convict of high treason' and that any subsequent legislation to the contrary would be null and void. Whether an Act which could be repealed by a future Parliament gave comfort to anyone may be doubted. Perpetual edicts have often had a short life. JAC

**Defence, Ministry of.** In 1950 there were secretaries of state for war and for air and a 1st lord of the Admiralty. But the exigencies of modern warfare, which demanded ever closer liaison between the armed forces, coupled with severe financial difficulties, which made three separate services appear extravagant, suggested a single command. On taking office in 1940 Winston \*Churchill had assumed the title of minister of defence and chaired the defence committee of the cabinet, though there was no corresponding department. This arrangement was continued by his successor Clement \*Attlee, but in 1947 a minister of defence was appointed to co-ordinate activities and allocate resources. In 1964 the policy was taken to its logical conclusion and a single Ministry of Defence created, with a secretary of state at its head. JAC

**Defenders** were Irish catholics who banded together to combat the protestant \*Peep o' Day Boys. They began to organize in the 1780s and in the 1790s merged with the \*United Irishmen. There were frequent clashes between defenders and the protestants, numerous murders, arming, and drilling: in one encounter at Ballina in 1794 about 70 persons are said to have been killed. The spread of catholic disaffection culminated in the \*Irish rising of 1798. JAC

**Defoe, Daniel** (c.1660–1731). Prolific English writer. Educated at Charles Morton's dissenting academy, Defoe was pardoned for fighting for \*Monmouth, and gaoled

for bankruptcy in 1692, before becoming William III's unofficial apologist in the best-selling *True-Born Englishman* (1701). Imprisoned and pilloried for seditious libel for his satire on high-church bigotry, *The Shortest Way with the Dissenters* (1702), Defoe was recruited as a propagandist and intelligence agent by Robert \*Harley, writing the seminal propaganda journal the *Review* (1704–13), and reporting on the passage of the Act of \*Union (1707) through the Scottish Parliament. Re-employed by Harley in 1710, Defoe wrote government propaganda until 1714. Having finally made his peace with the Whigs, Defoe published *\*Robinson Crusoe* (1719), the first of the series of fictional autobiographies, including *A Journal of the Plague Year* (1722), *Moll Flanders* (1722), and *Roxana* (1724), for which he has been confusingly labelled the first English novelist. Crucially significant as sources for early-18th-cent. British society, works like *A Tour thro' the Whole Island of Great Britain* (1724–6) have been intensively quarried by historians. Still hounded by creditors, Defoe, fittingly, died near his birthplace close by the real-life \*Grub Street. JAD

**Degeangli.** Indigenous British tribe of the Iron Age and Roman periods whose territory covered much of northern Wales. They were the northern neighbours of the \*Ordovices. Responding to the tribal uprisings instigated by the British chief \*Caratacus, the governor P. \*Ostorius Scapula attacked the Ordovices and Silures and crushed the first Icenian revolt of AD 47; he then marched north-westwards into lowland Cheshire and on into the territory of the Degeangli. The Degeangli were cut off from the powerful \*Brigantes of Yorkshire and subdued. The tribe was incorporated into the province of *Britannia* and became a *civitas* (tribal administrative district). ES

**Degsastan, battle of,** 603. This was apparently a very severe defeat for \*Ædan, king of \*Dalriada, at the hands of \*Æthelfrith of Northumbria. The site of the battle is usually taken to be at Dawston Rigg, near Saughtree in Liddesdale. \*Bede, writing some 130 years afterwards, declared that 'almost all his army was cut to pieces' and that 'no Irish king in Britain' had dared to make war on the English since. JAC

**De heretico comburendo,** 1401. This statute, 2 Hen. IV c. 15, was directed against the \*lollards, 'a certain new sect', who were causing dissension 'under the cover of dissembled holiness'. It threatened them with the stake 'in some conspicuous place'. Strong action against the heresy was pushed by Archbishop \*Arundel (1399–1414) and by the new king, Henry IV. The immediate cause was prosecutions against William Sawtre and John Purvey. The church was alarmed at increasing criticism of clerical wealth and the new regime was concerned that heresy might take a political turn. But the statute was not followed up by any sustained campaign to eradicate lollardism. JAC

**Deheubarth** ('the south part'), one of Wales's larger medieval kingdoms. Formed during the reign of \*Hywel Dda (died 949/50) by combining, through marriage, \*Seisyllwg and \*Dyfed, it covered the west and south-west of Wales and sometimes extended into \*Brycheiniog. Hywel's line ended

with \*Rhys ap Tewdwr's death (1093) in the early years of Norman advances. The Welsh victory near Cardigan (1136) enabled his son \*Gruffydd to recover part of the kingdom; but the invaders were never expelled completely from the south (Dyfed), even by \*Rhys ap Gruffydd, the Lord Rhys (d. 1197), under whom Deheubarth was one of the three great kingdoms of 12th-cent. Wales. Its capital, Dinefwr, acquired legendary status, and Rhys's achievements enhanced Deheubarth's traditional significance. It disintegrated after his death, and the princes of \*Gwynedd extended their influence over northern Deheubarth until it was replaced (1277–87) by Edward I's new counties of Cardigan and Carmarthen; the marcher lordships of Pembrokehire and south Carmarthenshire continued to occupy the southern portion. The descendants of Deheubarth's rulers declined into obscurity. The name and concept of Deheubarth has not been revived, unlike Dyfed and Ceredigion. RAG

**Deira, kingdom of.** Anglo-Saxon kingdom lying north of the Humber and south of the Tees. The origins are obscure, but the name is British and may imply Anglo-Saxon takeover of a British territory. The Deiran dynasty appears well established by the end of the 6th cent. when Ælle was ruling. After his death \*Æthelfrith of \*Bernicia conquered the province in 604 and expelled Ælle's son \*Edwin. Edwin returned in 616 and after killing Æthelfrith ruled both Bernicia and Deira himself. Through his marriage with a Kentish princess, he caused the province to be officially converted to Christianity in 626–7, and \*Paulinus from the Gregorian mission in Canterbury was appointed the first bishop of York. After the death of Edwin the royal house was increasingly under threat from its Bernician neighbours. The last member of the Deiran royal house to rule was Oswin (644–51) who was murdered by Oswiu of Bernicia who ruthlessly hunted down males of the royal house. Females fared rather better and the monastery of Whitby under a succession of Deiran princess-abbesses was a major ecclesiastical centre. During the reign of \*Ecgrith (670–85) Deira was fully integrated with Bernicia to form the kingdom of \*Northumbria. BAEY

**deism.** A term derived from Latin *deus*, meaning belief in a Supreme Being and used to describe the system of natural religion first developed in the late 17th and 18th cents. The classical exposition of deism was John Toland's *Christianity not Mysterious* (1696), which argued against revelation and the supernatural. Deists asserted the supremacy of reason and denied the validity of miracles, prophecy, and a literal, fundamentalist interpretation of the Bible. They usually coupled this religious unorthodoxy with political radicalism and were condemned as 'infidels' and dangerous subversives. \*Paine's *Age of Reason* (1794) spread deism to radical working men, reinforced in the 1820s by Richard \*Carlyle's publications. In the 1830s and 1840s popular deism was represented by Robert \*Owen and the Owenites; and the Owenite legacy was inherited by the secularist movement, led by G. J. \*Holyoake and Charles \*Bradlaugh. The term deism was not much used after the 18th cent., and those who adopted its tenets in the 19th cent. were known as free thinkers or believers in rational religion. When Victorian

## Delius

liberals felt that they could no longer accept the teachings of Christianity or the institutions of the church, but were nevertheless reluctant to deny the existence of God altogether, they became in effect deists. But deism never had the influence in Britain that it had in France and Germany. JFCH

**Delius, Frederick** (1862–1934). Composer. Born in Bradford (Yorks.) of German descent, Delius spent most of his life abroad. As a young man he worked in Florida and for many years was domiciled in France, yet his music often evokes a sense of the English landscape. He rejected traditional formalism and as a disciple of Nietzsche believed that the artist's primary duty was to fulfil himself in life and art. His greatest music depicts the beauties of nature and the transience of human life with poetic imagination and a mastery of orchestration. His most popular pieces are short and idyllic, such as *On Hearing the First Cuckoo in Spring* or *Brigg Fair*, but in *Appalachia* and *A Mass of Life* he wrote superbly on a large scale. In his final years he was blind and paralysed but was able to continue composing through the devoted assistance of Eric Fenby, his musical amanuensis. JWD

**demesne** was a legal term to describe land and property worked for the direct benefit of the owner. During the Middle Ages the importance of such holdings varied: at times it was more valuable for owners to work the land themselves, whilst at others it was more profitable to rent the land to tenants. When demand for agricultural produce was high and profits good, demesnes expanded. For example, during the 13th cent., when a growing population made ever-increasing demands for agricultural produce, many landlords reserved the best land for themselves. In areas such as the Somerset levels, Pevensy marshes by the coasts of Kent and east Sussex, and the Fens in East Anglia, landowners undertook schemes to drain wet lands to increase the available fertile arable, since good yields and the low costs of working the land justified the capital investment in digging ditches and erecting flood defences. When the costs of production rose, as after the repeated visits of plague during the 14th cent., many magnates leased demesnes to tenants for cash rent, keeping the demesne next to residences to meet the immediate needs of the household.

IJEK

**Demetae.** Indigenous British tribe of the Iron Age and Roman periods whose territory covered Pembrokeshire and much of Carmarthenshire in south-west Wales. The Demetae appear not to have been intensively garrisoned by the Roman army, except along their eastern border, which may have been to protect them from their hostile neighbours the \*Silures. The tribe was incorporated into the province of Britannia and became a *civitas*. The *civitas*-capital has been identified as Carmarthen (Moridunum Demetarum), dating from c. AD 75. ES

**democracy.** In Britain, the transition from oligarchy to democracy was piecemeal. The civil wars and Glorious Revolution of the 17th cent. confirmed the supremacy of Parliament, but an unreformed electoral system restricted effective participation to a small minority. What public opin-

ion existed could be expressed only spasmodically, by riots or petitioning. The proliferation of newspapers in the 18th cent. and the publication of parliamentary debates after 1770 widened the scope of opinion, but not until the \*Great Reform Act of 1832 was the system itself substantially modified, with the introduction of a standard franchise, and the grant of representation to great towns like Manchester, Sheffield, Birmingham, Leeds, and Wolverhampton. Further extensions of the franchise in 1867 and 1884 gave most adult males the vote (though excluding many lodgers), \*secret ballot in 1872 reduced the influence of the gentry, and the \*Corrupt Practices Act of 1883 curtailed bribery. Two further reforms of 1918 and 1928 gave the vote to women, and the voting age was reduced to 18 by an Act of 1969.

Democracy affords voters the opportunity to change their government, but the extent to which the opinions of ordinary people are effective in other matters remains a subject of debate, and it is arguable that specific interest groups, or lobbies, carry more weight than the casting of a vote (often for a losing candidate) once every four or five years. There was concern that the proportion of people voting at the general election of 2001 was low, suggesting somewhat desultory interest, and the proposal for proportional representation was once more urged as a means of making every vote of significance. In local government, where the influence of the individual might be expected to be greatest, the effect has been reduced by powerful strides towards centralized decision-making, and the domination of many councils by one party. For many people the main experience of democracy in action is being overruled while taking part in some local protest. Participatory democracy, accepted in principle by almost everybody, is not easy to practise in a large country, where issues are many and complex. On a larger scale, there is a tension between the move towards \*devolution, to make government seem less remote, and the desire of some to see more decisions taken by the \*European Community, which has the reverse effect. JAC

**Democratic Unionist Party (DUP).** Formed in 1971 to challenge the declining position of the \*Ulster Unionist Party and represent traditional loyalist working-class opinion. Its platform is a mixture of uncompromising, traditional unionism and social and economic populism. Massively dominated by its leader Ian \*Paisley, its support extends far beyond the free presbyterian church. The party has always been suspicious of peace initiatives. It rejected the \*Anglo-Irish agreement of 1985, and though it took part in the Northern Ireland Assembly from 1998 it refused to work with \*Sinn Féin ministers. The refusal of the \*IRA to begin decommissioning its arms polarized opinion in Ulster and at the general election of 2001 the DUP strengthened its position against the Ulster Unionists, gaining five seats against six. MAH/JAC

**Denain, battle of, 1712.** Marshal Villars, leading a French army of 24,000 troops, many of them heavy infantry, surprised an Anglo-Dutch force of about 10,000 men under the earl of Albemarle close to Denain on 24 July. Allied reinforcements under Prince Eugene tried to come to Albemarle's assistance but could not cross the Scheldt

river. Pressed by superior numbers, less than 4,000 of Albemarle's men escaped; five allied generals were captured or killed and over 4,000 soldiers taken prisoner. The French suffered about 2,000 casualties. JLP

**Denbighshire.** A county of north-east Wales created in 1536 at the Act of \*Union with England. Its core was Perffeddwlad, east of the Conwy river, once the Welsh kingdoms of Rhufoniog and Rhos, together with Dyffryn Clwyd. These, after the Norman conquest, constituted the lordships of Denbigh and Ruthin, and to them were added a series of smaller lordships carved out of the northern lands of the Welsh kingdom of \*Powys, including St Asaph, Bromfield and Yale, Chirk, and Hope.

Thus constituted, the shire included very varied terrain. At its heart was the vale of Clwyd, but to the east it extended across the Denbigh moors and Mynydd Hiraethog to the Conwy valley. To the south it pushed across the Dee valley to the Berwyn Mountains (Moel Sych, 2,317 feet), whilst eastward it included the Wrexham area to the English border, detaching a section of Flintshire. In 1974 it became part of the county of \*Clwyd and the former county was divided into three districts—Colwyn, Glyndŵr, and Wrexham Maelor. In 1996 it was reconstituted as a county, but without Wrexham which became a county in its own right.

Denbighshire's economy was based mainly on agriculture and tourism. Its south-eastern extension prior to 1996 covered the southern part of the North Wales Coalfield. Although mining has ceased, the area is characterized by industrial village settlement and there is a legacy from the past in modern engineering and electronic industries.

Denbighshire straddles north-east Wales from the English border to the Conwy valley. Accordingly it had a characteristic range of Welsh speaking, from 9.9 per cent in Marford and Hoseley to 74.8 per cent in Llangernyw. HC

**Denman, Thomas, 1st Baron Denman** (1779–1854). Lawyer. Son of a doctor, Denman was sent to Eton and to St John's College, Cambridge. His sympathies were Whig/radical and he defended \*Cochrane (1814) and Jeremy Brandreth (1816). In 1818 he entered Parliament for Wareham, transferring to Nottingham in 1820. He was appointed solicitor-general to Queen \*Caroline and acquired great popularity in her defence, though his style was considered florid. When the whigs took office in 1830 Denman became attorney-general and took a prominent part in defending the Reform Bill. In 1832 he was appointed chief justice of King's Bench and was given a barony in 1834. In *Stockdale v. Hansard* (1837) he maintained that parliamentary privilege could not cover libel, though the decision ultimately went the other way. Much of his later work was concerned with the abolition of the slave trade. Not a profound lawyer, Denman's reputation was as a reformer. JAC

**Denmark, relations with.** England became part of a Scandinavian empire under Danish kings (\*Cnut and his sons) between 1019 and 1042. Although over the next 500 years England's main political and military activities moved elsewhere, trade with the Baltic (especially in naval stores from the 16th cent.) guaranteed interest in Denmark and its Nor-

wegian kingdom at the entrance to the Baltic. In 1801 Danish participation in a league of armed neutrality against the rigorous search for contraband by the Royal Navy unleashed a fierce response with \*Nelson triumphing at the battle of \*Copenhagen. Six years later the British carried out a pre-emptive strike, fearful that Danish naval power was about to fall under the control of Napoleon. At the end of the Napoleonic wars Britain was involved in the transfer of Norway from Denmark to Sweden. In 1848–52 Britain helped to find a peaceful solution to a disputed succession to the duchies of Schleswig and Holstein in favour of continuing Danish rule. But in 1863–4 \*Palmerston was unable to avert a war in which Prussia (assisted by Austria) defeated the Danes. This episode strengthened those in Britain who favoured a lower profile in European affairs. Despite some disputes over fishing rights, relations between the two countries in modern times have been cordial, and they share a cautious attitude towards the \*European Community. CJB

**Denning, Alfred, Lord** (1899–1999). From a simple background, Denning obtained a place at Magdalen College, Oxford. After a period of service in France during 1917–18, he gained a first in mathematics but returned to Cambridge as the Eldon scholar and gained a first in law. In 1944 he was appointed a High Court judge and gradually worked his way up through the judicial ranking. In 1962 Denning became master of the rolls. He extended the limits of judicial lawmaking as he attempted to free the Court of Appeal from its obligation to follow its own decisions. His dissenting judgments brought many clashes with the House of Lords. Denning became a household name after \*Macmillan asked him to conduct an inquiry into the Profumo affair. Often controversial, Denning was acknowledged as perhaps the greatest judge of his age. He retired in 1982, at the age of 83, and wrote many books. RAS

**dentistry, development of.** Practical dental treatment in medieval and early modern Britain was generally restricted to cleaning and extracting teeth, and applying dressings or prescribing mouthwashes to relieve pain. Cleaning by scraping or application of acids was carried out by barbers, who were also legally permitted to extract teeth. Extractions were the due of tooth-drawers, an independent trade group since at least the end of the 13th cent., but were undertaken also by surgeons, blacksmiths, and itinerants at markets and fairs. The emergence of restorative dentistry in mid-17th-cent. London was enhanced by the arrival of skilled immigrant surgeons from the continent and the early stirrings of consumerism, although contemporary satirists saw the provision of artificial teeth as no more than cosmetic vanity. As anatomical and technical knowledge slowly improved throughout the 18th cent., gold or lead fillings appeared, while artificial teeth became increasingly sophisticated, though affordable only by the wealthy. 'Operators for the teeth' gave way to 'dentists', who began to seek business not only in London but in provincial towns. By the mid-19th cent., dentistry was developing into a profession, with scientific journals and professional societies, then qualifications and a register (1878), though still under the control of the General Medical Council. Apprenticeship

## Derby

and informal parental or casual training were superseded by dental schools which had developed out of earlier dental dispensaries and hospitals. The profession was closed by the Dentists Act of 1921, but did not become independent of the GMC until 1957. The inclusion of dental treatment within the \*National Health Service (1948) generated an unforeseen demand for treatment, but also revealed a shortfall in practitioners, services, and standards. Expansion of dental schools and reduction in caries rates after the advent of fluoridation have since improved the nation's dental health, but many practitioners have recently returned to independent practice, and the future of the NHS dental service has become questionable. ASH

**Derby.** Described by Disraeli as 'the Blue Riband of the Turf', the Derby is the top event in the flat season's racing calendar. First run on 4 May 1780, the race is named after its founder, the 12th earl of Derby. It is a race for 3-year-olds, run on Epsom downs over 1 mile 4 furlongs. Traditionally run on the first Wednesday in June, from 1995 it moved to Saturday for commercial reasons. RAS

**Derby, diocese of.** The see, roughly coterminous with Derbyshire, was created in 1927 out of the diocese of \*Southwell, where the ecclesiastical union in 1884 of Nottinghamshire and Derbyshire, formerly in the Lincoln and Lichfield dioceses, had not been a success. The cathedral is the former parish church, built in the classical style (1723–5), though the tower is 15th cent. and the reredos dates from 1965. WMM

**Derby, Thomas Stanley, 1st earl of.** See STANLEY, THOMAS.

**Derby, Edward Stanley, 14th earl of** (1799–1869). The longest-serving of Conservative leaders. Heir to an ancient title and vast properties (the main estates were in south Lancashire around the family seat Knowsley), Stanley, after Eton and Christ Church, Oxford, was a Whig MP by 1822. After minor office under \*Canning, he served in \*Grey's cabinet and negotiated with Tory 'waverers' over the Reform Bill. As chief secretary for Ireland he introduced the Irish Church Temporalities Bill and a measure for popular education and as colonial secretary the abolition of colonial slavery, all in 1833. Alienated by \*O'Connell and his Irish and by his Whig rival \*Russell, Stanley, often spoken of as a future Whig leader, led the resigners from the cabinet in 1834 (the \*Derby Dilly) and briefly commanded a following of over 20 MPs, though he declined to join a coalition under \*Peel later that year. Over the next few years he and most of his followers moved into the Conservative Party. Colonial secretary in Peel's government of 1841, he had won considerable standing with his party's backbenchers by the time he opted for a peerage and moved to the Lords in 1844. \*Lytton saw him as 'frank, haughty, rash, the Rupert of debate'. In 1845 Stanley was the only cabinet minister to hold out against Peel's policy of Corn Law repeal and left the government. He resented surrender to the \*Anti-Corn Law League (active in his own territory of Lancashire), any weakening of the aristocratic position and of the interests of land, and also the breaking of party commitments on protection.

He saw it as an issue of honour and integrity. Though his efforts to stop repeal failed, he became leader of the protectionist rump of the divided party in July 1846. He attempted to reunite the Conservatives (he resumed the old party name in 1848) and the Peelites, largely unsuccessfully, but he was also cautious about abandoning protection without due cause. He defended the Navigation Acts in 1849 and finally dropped protection only after the election defeat of 1852. By 1849 Stanley had appointed \*Disraeli as his subordinate leader in the Commons.

Derby (he inherited the earldom in 1851) was prime minister of three governments (1852, 1858–9, and 1866–8) and twice, in 1851 and 1855, declined to form an administration. Throughout that period the Conservatives remained a minority party in the Commons. In the second ministry Derby attempted a measure of parliamentary reform and displayed a more progressive stance than previously. After the defeat of 1859 he decided to prop up \*Palmerston's moderate Liberal government against radical challenges and settled for opposition. He declined to overthrow the government over Schleswig-Holstein in 1864 despite his own caution in foreign policy and doubts about Palmerstonian interventionism. Derby, who voiced concern about the impact of railway developments on working-class housing in London, became chairman of the Lancashire relief fund during the cotton famine and contributed significantly to the success of the period's greatest voluntary relief effort. In 1866 after Palmerston's death the Conservatives overturned Russell's Liberal government over parliamentary reform and Derby became premier again. He determined to pre-empt any further Liberal measure by passing a reform measure of his own; the second Reform Act (he called it 'a leap in the dark') was his initiative, though handled and modified by Disraeli in the Commons. Derby was the only man to have served in the reform cabinets of both 1832 and 1867. He retired because of ill-health in 1868, Disraeli succeeding as premier, but he made a dramatic though unavailing attempt to stop Irish church \*disestablishment passing the Lords in 1869. Chancellor of Oxford University since 1852, he had always upheld established churches; his relations with Roman catholicism, particularly in Ireland, had often been uneasy.

A politician of flair and dash and, when roused by the occasion, an impressive parliamentary speaker, Derby never realized the early promise of his career. A great aristocratic figure—shooting and the turf (until he sold his stud in 1863) were among his passions and he was an accomplished classical scholar—he mixed great political talents with a frequent disdain for the drudgery and frustrations of ordinary political life. The restabilizer of Conservative politics after the damage done by Peel, he recognized the importance of party and of reciprocal loyalty between leaders and followers. No ideologue but a pragmatist capable of moving with 'the Spirit of the Age', he also looked to hold the line against destructive change and mixed caution with boldness; like Palmerston he was among the balance-holders of early Victorian politics. Disarmingly (sometimes disconcertingly) open in manner, especially in sporting contexts, he was also acutely aware of his social standing, and aristo-

cratic stiffness handicapped his dealings with middle-class politicians, including the 'fourth estate' of the press and the extra-parliamentary party organization. Resplendent as a political grandee, he was representative of a high point of aristocratic parliamentarianism before later developments undermined it. BIC

**Derby, Edward Stanley, 15th earl of** (1826–93). Educated at Rugby and Trinity College, Cambridge, and an MP from 1848, Stanley was closer to \*Disraeli than was his own father in the 1850s, and a more centrist figure than the elder Derby had become. An uneasy Conservative, sometimes sought by the Whigs or seen as a possible coalitionist, he was also a potential Conservative leader and might have displaced Disraeli but for his poor relations with the party's church interest. He was colonial and Indian secretary in 1858–9 and foreign secretary in 1866–8 and, after inheriting the earldom in 1869, again from 1874. During the Eastern Question crisis he conducted an independent and non-interventionist (some said pro-Russian) policy and, having fallen out with Disraeli, resigned in 1878. In 1880 his support for the Liberals was a factor of some electoral significance in Lancashire. As colonial secretary under \*Gladstone from 1882 he was disinclined to a 'forward policy'. In 1886 he broke with Gladstone over \*Home Rule and led the \*Liberal Unionists in the Lords until 1891. A cool and sceptical politician, though of progressive views, Derby was immune to most of the enthusiasms of his day. He was a notable political diarist. BIC

**Derby, James Stanley, 7th earl of** (1607–51). Derby was lord-lieutenant of Lancashire, lord of the \*Isle of Man, an enormously wealthy landowner, and a leading royalist peer during the \*civil wars. In 1642 he raised over 6,000 men in the county for the king. Despite his energetic efforts, however, his army was broken, he quarrelled with his subordinates, and by June 1643 was driven out of his county. He spent most of the next seven years on the Isle of Man, a royalist stronghold, emerging in 1644 to fight at \*Marston Moor. His seat at Lathom House was defended against parliamentary siege by his French wife. In 1650 he declared for Charles II and brought a small contingent to the mainland, but was defeated at Wigan Lane (25 August 1651). Having failed to raise Lancashire and Cheshire, he fought at \*Worcester (September 1651), was captured, tried by court martial, and condemned to death. He was beheaded at Bolton, a town which he had stormed and sacked in 1644, killing 1,600 civilians. An indifferent military commander, Derby was heavy-handed and conceited. But he acquitted himself courageously on the scaffold, where he was compelled to wait several hours before being executed. IJG

**Derby Dilly.** \*O'Connell's belittling phrase for the moderate Whigs who, led by four cabinet ministers including Edward Stanley, heir to the \*Derby earldom, seceded from the reformers in 1834 and began a restructuring of parties. William IV's hopes for a Dilly/Conservative coalition were dashed, but most of the defectors had become Conservatives by 1841. Dilly was slang for a diligence or rapid stage-coach. BIC

**Derbyshire** is a heart-shaped county in the heart of England, traditionally bordering Leicestershire, Staffordshire, Nottinghamshire, Yorkshire, and Cheshire, but stopping a few miles short of Lancashire and Warwickshire. It has been little altered by boundary changes, but since 1974 borders Greater Manchester.

The Romans, chiefly interested in the county for its lead and the springs at Buxton, established a number of forts and roads. Christianity came with the first religious house in Mercia built at \*Repton in 656 (where the Saxon crypt survives), but thereafter Danish invasions placed Derbyshire in the front line of battle until 1013, when \*Sweyn conquered the whole country.

Throughout the medieval period Derbyshire remained sparsely populated, but numerous market charters were granted and there is a reference to coal-mining near Ilkeston in 1285. The county suffered grievously from the plague, the final outbreak occurring famously in 1665 when six-sevenths of the population of Eyam died. The Civil War saw Derby occupied by parliamentarians in 1643 and, with the north and west of the county royalist in sentiment, a number of small battles followed, including skirmishes at Hartington and Wirksworth (1643). However, Derbyshire's chief importance to the Stuarts came in 1745, when the young pretender and his army occupied Derby before retreating to Scotland. By the 17th cent., the Cavendishes had established themselves as the premier family, mostly due to Bess of Hardwick (countess of \*Shrewsbury) (1520–1608); they owned 14 per cent of Derbyshire at one stage, controlled one of the county's two MPs, built the magnificent \*Chatsworth House (1687–1707), and in 1756–7 William Cavendish, 4th duke of \*Devonshire, was prime minister.

In addition to the building of great country houses, such as Kedleston and Calke abbey, the 18th cent. saw the development of cotton-mills in Derbyshire (notably by \*Arkwright at Cromford, 1771), impressive growth in coal-mining and iron production around Bolsover and Chesterfield, and framework-knitting at Belper, Ilkeston, and Heanor in the east. Though canal-building did occur in the county, it concentrated on the rivers Derwent and Trent (in the south) and to the north of Chesterfield only; more effective in improving communications were the turnpike roads (the first opened in 1725). It was, however, the railways that profoundly changed Derbyshire and, by the mid-19th cent., Derby had become the railway centre of the midlands, hastening the urbanization of the east of the county. Today, although coal has ceased to be of economic significance to Derbyshire, quarrying (especially limestone) is still important, as are textiles and engineering, most famously at \*Rolls Royce's aero-engine factory in Derby. In addition, with most of north-west Derbyshire in the Peak District (Britain's first national park), the county attracts vast numbers of visitors, making leisure and tourism major Derbyshire concerns.

Derby is by far the largest town in the county, with 235,000 inhabitants in 1999, but Derby diocese was only created in 1927 (though the cathedral was founded in the 10th cent.), its city status was conferred as late as 1977, and, culturally, Derby has suffered from its proximity to larger Nottingham. Additionally, the city's southern location

## Dermot MacMurrough

reinforces the county's diffuse nature, with the north-east looking to Chesterfield and beyond that to Sheffield, and the north-west looking to Manchester. Furthermore, north Derbyshire is millstone grit and limestone country, with stone walls, sheep farms, and bleak moors, whereas in the south there are hedged dairy and arable farms on clay, sandstone, and alluvium.

The county's administrative headquarters are at Matlock, a fine spa town second only to Buxton, its first bath built in 1698, and its dramatic cliffs drawing visitors ever since. But it was Buxton, in the west of Derbyshire and England's highest market town, that prospered most from its hot waters; its sumptuous Crescent, built by the Cavendishes 1780–6, is said to have cost £120,000 and the town retains a sense of Georgian elegance. Also in the rural west, to the south, lie Bake-well and Ashbourne, both granted charters in the 1250s and boasting magnificent parish churches. In Ashbourne, an ancient Shrovetide football game is still played along attractive Georgian streets, and local villages, notably Tissington, dress their wells with flowers annually.

In the east and north, where iron, cotton, and coal dominated the economy, and where much of Derbyshire's industry is still based, runs the M1 motorway, past Ilkeston and Alfreton. Above them is Chesterfield, with its celebrated twisted spire atop an exceptional Gothic church, and Dronfield, which has almost merged with Sheffield. The north-west tip of Derbyshire is the least populated part and contains the Ladybower reservoir, opened in 1945; its largest town, Glossop, retains the appearance of a Victorian mill town, but has a number of attractive 17th-cent. gabled houses.

After the Banham commission report in 1995, Derbyshire retained its county status, with the city of Derby becoming a unitary authority. ALL

**Dermot MacMurrough** (c.1110–71), king of Leinster. Dermot is said to have succeeded his father as king while in his teens and to have been large, violent, and voluble. He plunged at once into fierce fighting but in 1166 was forced into exile and begged Henry II to assist him, promising homage in return. Henry gave him permission to recruit helpers and he was joined in Ireland in 1170 by Richard de \*Clare, 'Strongbow'. Together they recaptured Dublin, and Strongbow married Dermot's daughter Eva (Aoife). Dermot died the following year and five months later Henry himself led an expedition which laid the foundation for the Anglo-Norman acquisition of Dublin and the \*Pale. JAC

**Derry, diocese of.** Derry had been a bishopric from 1254 and was continued after the Reformation as a diocese of the Church of Ireland. Among the more remarkable bishops was Frederick Hervey (1768–1803), who succeeded as earl of Bristol in 1779 and played a prominent part in the agitation for parliamentary reform in the 1780s. He was followed by two other noble bishops, sons of Viscount Northland and Baron Ponsonby, who held the see until 1853. The bishopric of Raphoe to the West was joined to Derry in 1834. The medieval cathedral was destroyed by an explosion in 1566. The new cathedral, dedicated to St Columba, was built between

1628 and 1633 and extensively remodelled in Victorian times. The spire was damaged in the siege of 1689; a replacement in 1776 proved too heavy; the third spire, added in 1822, survives. St Eugene's Roman catholic cathedral was completed in 1873 and a spire added in 1903. JAC

**deserted villages** can be found throughout the British Isles for a variety of reasons. Settlements have been abandoned because their locations proved to be unviable, because populations moved from rural to urban areas, or because a landowner deliberately cleared village sites for a purpose such as sheep pasture.

Villages became deserted in almost every century, although their abandonment has not always been well documented. For example, a great deal is known about those of medieval England through the work of archaeologists and historians of the Deserted Medieval Villages Group which has found and examined sites in great detail. One of the earliest areas to receive the group's attention was Leicestershire, where it was shown that villages were deserted largely because of depopulation caused by the plague. As population declined villagers could no longer maintain isolated communities. A similar process seemed to have occurred at Wharram Percy on the Yorkshire wolds where the population declined to such an extent that its owners initiated the abandonment of the village and its land became grazing for sheep.

An important contemporary account of the use of land was the survey by commissioners in 1517, who gave accounts of the 'pulling down of towns' to create pastures. A similar awareness of such melancholy consequences occurred in the works of Oliver \*Goldsmith, in the 18th cent., and the Revd George \*Crabbe in the early 19th cent., each of whom wrote on the theme.

One of the most dramatic examples of the enforced abandonment of villages was the 'Highland clearances' of the early 19th cent. when landowners removed people to provide pasture and land for hunting and shooting. Protests were made by the evicted people and in popular songs and poems.

One of the most unusual cases of enforced desertion of a village occurred on Salisbury Plain during the Second World War when the government relocated the entire population of Imber in order to provide for military training, including practice in street fighting. IJEK

**Despenser, Henry** (c.1343–1406). Bishop of Norwich (1370–1406). The younger son of a peer, Despenser studied civil law at Oxford. He became bishop in 1370 after serving in a papal war in Italy. In 1381, he was the first magnate to resort to arms against the rebellious commons, rescuing fenland abbeys from their tenants, restoring order in Cambridge and Norwich, and routing an assembly at North Walsham, Norfolk; he had ringleaders hanged. Parliament decided to send an expedition to support Flemish towns in revolt against their pro-French count in 1383, adopting the pretext that this was a crusade against adherents of a schismatic pope. Despenser was given command of this operation, doomed from the start because the towns had already been defeated. On his return, he was impeached for incompetence and his bishopric sequestrated, until 1385. In 1400 his

loyalty to Henry IV was suspect, but he avoided open implication in treason. RLS

**Despenser, Hugh, 1st earl of Winchester** (1261–1326). Despenser's father had been a leading member of the baronial opposition to Henry III, acted as \*justiciar, and was killed with de \*Montfort at \*Evesham. A coming man under Edward I, Despenser was an ardent supporter of Edward II and his closest companion after the death of \*Gaveston. He fought in the defeat at \*Bannockburn. He and his son received many estates and incurred great unpopularity. In 1321 Edward was forced to exile him, but the death of his great enemy \*Thomas of Lancaster at \*Boroughbridge the following year seemed to have secured his position, and Edward created him earl of Winchester. But he was speedily overthrown in 1326. Edward's queen \*Isabella led an invasion from France, and Despenser was captured at Bristol and executed. His son was taken a few days later with the king and hanged at Hereford. The king himself was deposed two months later. JAC

**Dettingen, battle of**, 1743. Britain entered the War of the \*Austrian Succession on the side of Maria Theresa and placed an army in the field in Germany under John \*Dalrymple, Lord Stair. In June 1743 it was trapped on the river Main near Hanau by a superior French force under Noailles. It succeeded in fighting its way to safety on the 27th mainly because of the musket fire of the infantry. George II led his troops into battle, sword in hand, with remarkable courage. This, the last time a British king fought in person, was a reminder of the original role of the monarch as battle-leader. JAC

**Deusdedit**, archbishop of Canterbury (655–64), was the sixth man to hold that office and the first Englishman to be appointed; his predecessors were all members of the missions dispatched from Rome by Pope Gregory the Great. He was a West Saxon whose English name seems to have been Frithuwine, but nothing else is known of his early history. Nor is anything recorded of his achievements as archbishop, though we do know that he died on 14 July 664 in the great plague of that year. BAEY

**de Valera, Eamon** (1882–1975). The dominant figure in Irish politics for over 40 years despite, or perhaps because of, his aloof, ascetic personality. De Valera was born in New York, reared in Co. Limerick, and was originally a mathematics teacher. He came to advanced nationalism through the Irish Language Movement and Volunteers. His rise to leadership was due to his being the last surviving commandant of the \*Easter Rising. Following release from internment in early 1917, he led a broad-based Sinn Féin coalition, and master-minded the move towards a moderate self-determination policy which successfully challenged the Irish Parliamentary Party. Arrested May 1918, de Valera escaped from Lincoln gaol in February 1919, and became president of the Dáil. He spent most of the Anglo-Irish War seeking recognition of the Irish Republic and financial backing in the USA. After the truce in July 1921, de Valera became chief negotiator in Dáil ranks but controversially absented himself from the peace conference, October–December. Opposing the

\*Anglo-Irish treaty, he advanced external association as an alternative. He strove to avoid the drift to civil war but was rendered impotent by the force of military opposition to the treaty. Marginalized during the civil war, he recovered the leadership amongst republicans after the conflict, aided by being imprisoned until 1924. Splitting from Sinn Féin and the IRA and their Dáil abstentionist policy, he formed Fianna Fáil Party, entering the Dáil in 1927. After winning the 1932 election he followed a treaty reform policy, abolishing the oath of allegiance to the British crown and ceasing payment of land annuities to Britain. The constitution of 1937 epitomized his social and cultural conservatism. De Valera followed popular neutrality policy in the \*Second World War, despite intense British and American opposition. Defeated in elections 1948 and 1954, but Taoiseach again 1951–4 and 1957–9, he withdrew to the presidency 1959–73. By the 1960s his policies appeared anachronistic in a rapidly evolving modern European state, leading to an increasingly unsympathetic portrayal of his career. J. J. Lee commented that de Valera would have made a leader beyond compare in the pre-industrial world. De Valera himself said: 'I was meant to be a dyed-in-the-wool Tory or even a Bishop, rather than the leader of a Revolution.' MAH

**devolution.** Though the usage of the term in this sense dates from the late 19th cent., the concept is much older. It represents an attempt to defuse discontent by bringing decision-making closer to the governed. Even in a highly centralized state some powers will be delegated to towns and provinces. Many countries—e.g. the USA and Germany—have federal constitutions with considerable powers exercised by states or *Länder*. But in a devolved system, the central government retains ultimate authority. The Westminster Parliament, which devolved powers to Northern Ireland at Stormont in 1921, took them back in 1972, and restored them in 1998. The federal government in the USA could not suspend or abolish a state like New York or Florida, and state rights are jealously guarded.

In Britain, devolution was first raised in relation to \*Irish Home Rule, which led, as some had predicted, to the total independence of Eire. Devolutionary policies were adopted in the 1990s, towards Northern Ireland, Wales, and Scotland, which, after referenda, were granted an Assembly, a National Assembly, and in Scotland a Parliament.

The exact degree of delegation is, of course, likely to prove a bone of contention, especially the fund-raising powers, particularly if the devolved area, for political or national reasons, is at odds with the central government. Scottish devolution was complicated by the 'West Lothian' question (named after its MP Tam Dalyell), who pointed out that while Scottish MPs at Westminster could still debate and vote on English issues, English MPs were debarred from debating certain Scottish issues. Devolution also means accepting that different regions may well adopt different policies and have different benefits, and is less likely to appeal to deprived areas which look for support from their wealthier neighbours and complain that they are left to their own resources. Some of the English regions, particularly in the north-west and north-east, objected that, more remote from

Westminster, they were at a disadvantage in lobbying for help, and there was some support for the creation of English regional assemblies. It remains to be seen whether devolution will promote or retard the breakup of the United Kingdom. JAC

Bogdanor, V., *Devolution in the United Kingdom* (1999).

**Devon** was the third largest of the old counties. Having two sea-coasts, it was orientated in different directions. The northern shore along the Bristol channel runs from east of Lynton to south of Hartland Point: the south shore, along the English channel, runs from east of Seaton, via Exmouth and Torbay, to the Tamar, west of Plymouth. The southern parts are drained by the Tamar, the Dart, the Exe, the Culm, the Otter, and the Axe; the north eastern parts by the Torridge and the Taw, flowing into Barnstaple Bay. The boundary with Cornwall in the west is the Tamar, while the eastern boundary with Somerset is largely the line of hills forming the watershed of the Exe and the Otter. Dartmoor in the south, Exmoor in the north, and the Blackdowns in the east are the highest points, but much of the county is hilly, with deep valleys.

The name first appears in the *Anglo-Saxon Chronicle* in 851 as *Defensascir*, which appears to be derived from the \**Dumnonii*, the Celtic tribe inhabiting the area. In Roman times, \**Exeter* (Isca Dumnoniorum) was an important base and port. The \**Fosse Way* ran through what is now the south-east of the shire, meeting the Roman road from Dorchester to Exeter.

In post-Roman times, the British kingdom of \**Dumnonia* embraced both Devon and Cornwall: it survived, perhaps in shrunken form, at least until the early 8th cent., since \**Aldhelm* in 705 addressed a letter to its king, *Geraint*. The eastern part of the region had fallen to the Saxons after \**Cenwalh's* victory at \**Penselwood* in 658 and much of the western part by the end of the century. It then formed part of the kingdom of \**Wessex*. \**Ine* established a bishopric for the area at \**Sherborne* in 705, moved to \**Crediton* in 909, and to Exeter itself in 1050. With exposed coast-lines and many creeks, the area was vulnerable to Danish raids and suffered heavily in the 870s and again in 1003, when the monastery at Exeter was destroyed. By the 11th cent. it had taken shape as a shire. In the \**Domesday survey* of 1086 Exeter was by far the largest town and the only other boroughs mentioned were Totnes, Barnstaple, and Lydford. By the 12th cent. the building of the present cathedral had begun and Exeter was large enough to have problems of water supply.

Though Exeter was the county town and of national importance, it did not dominate in so large a shire as other county towns did. Consequently, Devon developed as a county of seaports—Barnstaple, Bideford, Brixham—and of market towns of largely local significance, Okehampton, Tavistock, Tiverton, Torrington, Newton Abbot, Honiton, and Ashburton. Until the growth of the cloth industry in the later Middle Ages, it was wholly dependent upon agriculture and fishing, with a little mining. \**Plymouth* developed as a naval base as vessels grew larger and its superb harbour was more needed, replacing Plympton. Charles II built the cita-

del and William III established the royal dockyard in 1692. Celia Fiennes, who visited the county in 1699, found the hills hard going: 'rarely can you see houses unless you are just descending to them, they always are placed in holes, as it were . . . the lanes full of stones and dirt for the most part.' She was amazed at the bustle of activity in the serge trade at Exeter and for 20 miles round, and at Plymouth left good descriptions of the new dockyard and the first Eddystone lighthouse. Twenty years later, another visitor, \**Defoe*, was ecstatic, finding the shire 'so full of great towns, and those towns so full of people so universally employed in trade and manufactures, that not only it cannot be equalled in England, but perhaps not in Europe'.

The reputation of the county was for unintelligible speech, turbulence, and independence. In 1549 there was a formidable rising on behalf of the old religion and Exeter was threatened. Later, protestant dissent made much progress. During the Civil War there was heavy fighting. Exeter was held for the king but Plymouth, a fiercely puritan town, resisted throughout the war and proved a thorn in the royalists' side. The county gave some support in 1685 to \**Monmouth*, who landed at Lyme, and more in 1688 to William of Orange, who came ashore at Brixham in November. There were few great families, though the Edgcombcs owned Mount Edgcombe at Plymouth, the Courtenays held Powderham near Exeter, and the Russells gained influence after their acquisition of the estates of Tavistock abbey at the \**dissolution* of the monasteries. The great size of the county made electioneering difficult and was an incentive to avoid contests: in the 100 years from the Glorious Revolution to 1790, there was only one by-election contest, in 1712.

Improvements in roads and the coming of the railway made Devon less inaccessible: Brunel's lines reached Exeter in 1844 and Plymouth in 1848. Exeter grew from 17,000 in 1801 to 47,000 by the end of the century but was surpassed by Plymouth, 16,000 in 1801 and more than 100,000 in 1901. Even more remarkable was the growth of the resorts as the habit of seaside holidays caught on. Ilfracombe, on the north coast, rose from a small town in 1801 to well over 8,000 by 1901: Torquay, a hamlet of only 800 at the beginning of the century, was a town of 33,000 by 1901, and the new borough of Torbay had a population of 124,000 in 2002 against 111,000 in Exeter. Distance from London has given the county some protection, though both Exeter and Plymouth suffered badly from bombing during the \**Second World War*. After the Banham commission report on local government in 1994 Devon retained its county status, with Plymouth and Torbay as unitary authorities. JAC

**Devonshire, Spencer Compton Cavendish, 8th duke of, marquis of Hartington** (1833–1908). Heir to the Cavendish family's dukedom and a Palmerstonian Whig, Hartington was an MP at 24 and a cabinet minister at 34. Elected Liberal leader in the Commons after \**Gladstone's* retirement in 1875, he was undermined by the latter's political come-back and, when offered the premiership after the Liberal victory of 1880, recommended Gladstone instead. Firm for the Union (the Cavendishes were great Irish landowners and Hartington's brother, Lord Frederick

\*Cavendish, had been assassinated by Irish nationalists in 1882), he broke with Gladstone over \*Home Rule in 1886 and, as the leader of the \*Liberal Unionists with some 78 MPs, maintained \*Salisbury's Conservatives in power until 1892, twice declining the premiership himself. In 1895 Devonshire, as he had become, joined Salisbury in a unionist coalition and served as lord president. In 1904 he resigned from \*Balfour's government in protest at Joseph \*Chamberlain's campaign for imperial preference and argued for continued free trade. Combining a high aristocratic life-style (including devotion to the turf) with moderate Liberal views, Hartington represented the balance point of late Victorian politics. His support for Salisbury's governments helped to restabilize national politics. What a lengthy Hartington leadership would have meant for the Liberal party and politics generally rests with surmise. BIC

**Devonshire, William Cavendish, 1st duke of** (1641–1707). Devonshire was one of many noblemen who backed the right horse in 1688 and prospered exceedingly, founding one of the great Revolution families. A shrewd marriage to Bess of Hardwick in the 16th cent. gave the Cavendishes prominence in Derbyshire and they obtained a barony in 1605 and an earldom in 1618. William Cavendish was a page at Charles II's coronation, saw naval service, and served as MP for Derby 1661–81, succeeding as 4th earl in 1684. A zealous Whig and keen supporter of \*exclusion, he was one of the seven who invited William of Orange over in 1688 and took up arms at Derby. In the new reign, he was at once made lord steward, a knight of the Garter, and, in 1694, a duke. His monumental inscription at Derby, which he wrote himself, praised him as the enemy of tyrants. A gambler, sportsman, gallant, he was turbulent but reputed a good classical scholar. He began the building of \*Chatsworth in 1687. 'Of a nice honour in everything but the paying of his tradesmen,' was \*Burnet's comment. JAC

**Devonshire, William Cavendish, 4th duke of** (1720–64). Cavendish came from a highly political Whig family. He entered Parliament at the age of 21 for Derbyshire, when his father was lord-lieutenant of Ireland, and supported the \*Pelhams. In 1751 he was called up to the Lords in his father's barony as Lord Cavendish and succeeded as duke in 1755. After serving as master of the horse 1751–5, he was made lord-lieutenant of Ireland. In the crisis of 1756, conciliatory and trusted, he was given the Garter and became 1st lord of the Treasury with \*Pitt as the driving force. When Pitt was obliged to come to terms with \*Newcastle, Devonshire was moved to be lord chamberlain 1757–62. In the new reign he and his Whig colleagues resented the ascendancy of \*Bute. After Newcastle resigned, Devonshire refused to attend councils and in November 1762 was dismissed by George III and his name removed from the Privy Council. Newcastle was scandalized at such treatment of a Whig grandee. Devonshire's early death, caused by a brain tumour, robbed the Whigs of a future leader. JAC

**Devoy, John** (1842–1928). Irish nationalist. Devoy was born in Kildare and joined the \*Fenians as a young man. His task was to foster disaffection in the British army and he was

arrested in 1862. Released in 1871 on condition of exile, he spent the rest of his life in America, where he organized the Clan na Gael as a fund-raising group, affiliated to the \*Irish Republican Brotherhood. In 1878 he initiated the 'new departure', a proposal for a *rapprochement* between the Fenians and \*Parnell's parliamentarians, but it was rejected by the IRB the following year. In 1915 Devoy supported \*Casement's mission to Germany to obtain arms, assuring the Germans that Casement had his 'fullest confidence'. After Casement's arrest, Devoy distanced himself. JAC

**dialects** are popularly defined as regional varieties of a language though, for the linguist, the term also embraces differences which signal social and occupational status.

Place-names and a few runic inscriptions indicate that dialectal varieties of English existed before the 8th cent. Such variation presumably owed much to the differing sources of the Anglo-Saxon settlers, but equally must have been encouraged by the emergence of political and economic groupings within Britain itself. The fuller records of the 8th and 9th cents. show the existence of four major dialects (Northumbrian, Mercian, West Saxon, and Kentish) though our knowledge of them is largely limited to the practices of certain scriptoria. By the later 10th cent. a form based on West Saxon had acquired the status of a standard written language, used alike by scribes at such centres as Winchester, Canterbury, and York, whose own spoken forms differed widely from each other. The adoption of this standard reflected the political and ecclesiastical power of Wessex and the early literary exploitation of the West Saxon dialect by \*Alfred.

After the Norman Conquest the grip of this standard written language was broken by the new social order and for the next four centuries all English dialects seem to have had similar status. Increasingly, however, in the 14th cent. writers show themselves sensitive to the fact that language variety was an obstacle to widespread understanding and transmission of their work; Chaucer's envoi to *Troilus and Criseyde* provides one well-known expression of such concerns. But already within Chaucer's period a new written standard was emerging which was based upon the language of London, itself now dominated by the dialectal preferences of the southern and eastern midlands where lay much of the country's wealth. The introduction of printing at the end of the 15th cent. helped further to standardize and spread the use of this form. It was one variety of the language of London also which, from the 15th cent. onwards, acquired the status of a standard spoken language. In this case it was essentially the language of the court but, until the 19th cent., its acquisition depended largely on familiarity with certain circles in the capital; thereafter, through the influence of the public schools, reformed universities, and finally the \*British Broadcasting Corporation, it was widely diffused on a basis which was purely social and non-localized. See also ENGLISH LANGUAGE. RNB

**Dialogus de Scaccario.** The *Dialogue of the Exchequer* is the earliest administrative handbook in English history and a prime source for historians of royal finance. Written in the 1170s it gives an account of Exchequer practice in the

## Diamond Jubilee

form of a dialogue between pupil and master. Its main concern is with the procedures followed when sheriffs brought their accounts to be audited at the Court of the Upper Exchequer. Its author, Richard \*FitzNigel (c.1130–98), was, like his father Nigel, bishop of Ely, a long-serving treasurer of the Exchequer, rewarded in 1189 by being made bishop of London. JG

**Diamond Jubilee**, 1897. By 1897 Victoria had surpassed George III as the longest reigning British monarch. The celebrations were restricted by her age and infirmities and the centre-piece, on 22 June, was a short service outside St Paul's, while the queen sat in an open carriage. The emphasis was on the empire—partly to recognize its spectacular growth, partly to avoid the anxiety and expense of entertaining the crowned heads of Europe. A special stand was reserved for survivors of the \*Charge of the Light Brigade, 43 years before. The crowds were particularly impressed by the Indian cavalry. 'The cheering was quite deafening,' wrote the queen, 'I was much moved and gratified.'

JAC

**Diana, princess of Wales** (1961–97). Lady Diana Spencer was the third daughter of the 8th Earl Spencer of Althorp (Northants), by Frances, youngest daughter of the 4th Baron Fermoy. Her father had been equerry to George VI 1950–2 and to Queen Elizabeth 1952–4. Lady Diana was educated at Riddlesworth Hall. Her marriage to Charles, prince of Wales, in 1981 attracted enormous public interest. Her two sons, \*William and Henry, were born in 1982 and 1984. Soon afterwards there were rumours that the princess was unhappy and in 1992 it was announced that she and Prince Charles were to separate. Divorce followed in 1996. Admiration for the princess's extensive work for many charities was dented when she announced abruptly that she was dropping her patronage of 100 of them. Princess Diana was the subject and sometimes the victim of massive press coverage, but her attitude towards it often appeared ambivalent. She was killed in a car crash in Paris in 1997 and, after an impressive and moving funeral, was buried on an island in the lake at Althorp. JAC

**Dickens, Charles John Huffam** (1812–70). Novelist, born at Portsea, Portsmouth, where his father was serving as a clerk in the navy pay office. His father's transfers to Chatham and ultimately to London were to influence the settings of his work. A fictionalized Chatham, its neighbouring city of Rochester, and the landscapes around them figure prominently in *Pickwick Papers*, *Great Expectations*, and in the unfinished *The Mystery of Edwin Drood*. It was, however, London which became the main focus of Dickens's work as a novelist, journalist, and essayist. It figures as an often confusing, polyphonic and exhilarating setting for the earlier fiction, but, from *Bleak House* (1852–3) onwards, London seems to assume a new darkness, mystery, and drabness. Dickens is the quintessential urban artist, able to transform the multivalency of Victorian city life into a new and flexible kind of fiction. His contemporary success was to some degree assured by his skilful exploitation of monthly-part publication: from 1850 until 1859 he edited *Household Words*. He

used his popularity with readers to campaign in his novels for the reform of British institutions (e.g. the 1834 Poor Law, the prison system, the civil service, the law) which he saw as working against the public good. Thanks to the influence of \*Carlyle his two historical novels, *Barnaby Rudge* (1841) and *A Tale of Two Cities* (1859), the first set at the time of the Gordon riots and the second during the French Revolution, suggest that social upheaval is a consequence of injustice rooted in historical conditions. In his *American Notes* (1842) he gave a vivid account of his visit to the USA, which offended many Americans. His disillusion with aspects of American life is also reflected in *Martin Chuzzlewit* (1843–4). ALS

**Dictionary of National Biography**. The brainchild of the publisher George Smith. The work began in 1882 with Sir Leslie Stephen as editor and the last volume appeared in 1900. Supplements and updates have followed and Oxford University Press have commissioned a new edition. The original contributors included Sidney Lee, C. H. Firth, S. R. Gardiner, Hastings Rashdall, Creighton, Tout, Tait, Round, and Pollard. Though many entries have been overtaken by time and the advance of knowledge, the *DNB* remains an invaluable tool of scholarship. JAC

**Dieppe assault**, 1942. On 19 August 1942 a raiding force of the 2nd Canadian Division and three British commando units carried out a daylight reconnaissance mission against the German defences at the French port of Dieppe. After a fierce nine-hour battle the force was withdrawn, having sustained 3,670 casualties out of the 7,000-strong force. The costly operation suggested that, in a full-scale invasion, the advantages of a preliminary bombardment would greatly outweigh the possibility of surprise, and that it would be unwise to try to seize a major port. The role of Lord \*Mountbatten, chief of combined operations, has been subjected to strong criticism. RAS

**Digby, George, 2nd earl of Bristol** (1612–77). Digby was a leading opponent of \*Strafford but changed sides during his impeachment. He fought at \*Edgehill and was appointed secretary of state by the king in 1643. He was a hard-liner, insisting on a dictated peace. \*Clarendon thought him ingratiating, but part of his appeal to Charles I was an unquenchable optimism: even after \*Marston Moor in 1644 he wrote that 'His Majesty's affairs are in the best posture that they have been at any time since these unhappy wars.' He took over command in the north from \*Rupert in 1645, too late to demonstrate whether he had real military talent. Clarendon disliked him and described him as handsome, vain, and unstable. Digby reciprocated the dislike and spent much time after the Restoration in pursuing a vendetta against Clarendon. JAC

**Diggers**. Small communistic groups, active in 1649–50, sometimes calling themselves True Levellers. Their prophet Gerrard \*Winstanley taught that God made the earth to be a common treasury; property and man's subjection to man were results of the Fall. The religious foundations of their beliefs range them nearer to contemporary millenarians than to modern Marxists or Maoists. But unlike the \*Fifth Monarchists they eschewed the use of force; their aim was

not to dispossess landlords, robbers of their fellow-creatures though they were, but merely to assert the people's right to common land, and to lands recently confiscated by the Commonwealth. A pioneering group began digging the commons on St George's Hill (Surrey), in April 1649. The \*Council of State ordered General \*Fairfax to disperse them, but it was angry locals who finally destroyed their cabins and crops. They moved on to Cobham, but suffered the same fate. Some evidence survives of nine other short-lived Digger colonies, mainly in the home counties and midlands. AHW

**Dilke, Sir Charles** (1843–1911). Liberal politician. Dilke is supposed to have ruined his chance of becoming prime minister by his involvement as co-respondent in a famous divorce case (*Crawford v. Crawford*) in 1885–6; but he probably would not have made it anyway. Before this happened he was better known as a radical, a close ally of Joseph \*Chamberlain, an early propagandist for the \*British empire (through his *Greater Britain*, published in 1868), and one of the most boring speakers in the House of Commons. His highest government post was as president of the Local Government Board in \*Gladstone's second ministry. After the scandal he was turfed out by his constituency (Chelsea), but found another one shortly afterwards (the Forest of Dean), and devoted the rest of his time in Parliament to championing (boringly) the interests of exploited colonial peoples. BJP

**Dillon, John** (1851–1927). Irish nationalist. Dillon's father, a lawyer, had been active in the 1848 rising and subsequently served in Parliament. Dillon was born at Blackrock (Co. Dublin) and educated at the \*Catholic University. He took a degree in medicine and entered politics as a supporter of John \*Mitchel in 1875. In 1880 he was returned to Parliament and served until 1918. He took a prominent part in the \*Irish Land League campaign and was gaoled for a year until the \*Kilmainham treaty. In 1888 he served another prison sentence and a third in 1891. After the Parnell split he joined the anti-Parnell group, becoming leader when Justin \*McCarthy resigned in 1896. Four years later he gave way to \*Redmond as leader of the reunited party and represented it at the Buckingham palace conference in 1914. On the death of Redmond in February 1918 Dillon took over the parliamentary leadership, but lost his seat at the general election in December 1918 to \*de Valera. He was a man of striking appearance and considerable eloquence. JAC

**diplomatic history** was likely to rank higher in prestige in the late 19th cent. when Britain was still a major world power and while entry to the Foreign Office remained an ambition for many undergraduates at Oxford and Cambridge. It had the advantage as a subject for study that it looked at evidence from different points of view, demanded some knowledge of languages, and raised interesting problems of causation and contingency. Governments also encouraged the study of diplomatic history by preserving and then making available diplomatic archives, and often subsidizing publication in order to justify policy. Among

the leading exponents in Britain of diplomatic history were G. P. Gooch (1873–1968), Charles Webster (1886–1961), author of *The Congress of Vienna* (1919) and a study of Castle-reagh (1931), and H. V. Temperley (1879–1939), who produced a celebrated study of Canning (1905) and collaborated with Gooch to edit *British documents on the origin of the war 1898–1914* (11 vols., 1926–38). Its weakness was that it was often taught in isolation from the rest of history as a self-contained study. Its post-1945 decline was in part a consequence of competition from other aspects of the subject, and in part that many found it unsatisfying—'the record of what one clerk said to another clerk', in G. M. Young's comment. The collapse of language teaching in schools also made it difficult to do more than study selected (and pre-packaged?) documents in translation. Though diplomatic history remains an important branch of historical study it seems unlikely to regain its former prominence. JAC

**Disestablishment.** The 19th cent. saw the questioning of the right and propriety of a church which represented only a minority of Christian believers to be the established church, its clergy supported and maintained by law by parishioners who did not sympathize with or belong to it.

The Irish church, with its two Anglican provinces of Armagh and Dublin, was the first to be disestablished. For some years an alliance of Irish nationalists and Roman Catholics had campaigned for the removal of the privileged position of the minority Anglican church, and in 1868 this cause was espoused by \*Gladstone. As prime minister in 1869 he introduced a parliamentary bill to disestablish the Church of Ireland, and although strongly opposed by some—including Queen Victoria—it passed into law.

In Wales similar cultural nationalism, allied less with Roman Catholicism than with nonconformity (which in the mid-19th cent. held the allegiance of almost 80 per cent of worshippers), produced a similar campaign. The growth of the Liberal Party and the widening of the franchise encouraged the movement, and after 1891 Liberals became formally committed to it. Several parliamentary bills from 1870 onwards either failed or were withdrawn, until one was passed in 1914. The First World War delayed its implementation, but the Act came into force in 1920.

The 1869 Irish disestablishment left the Church of Ireland a shadow of its former self, particularly in the overwhelmingly Catholic rural areas—a fact to which the numerous derelict Anglican church buildings still dotting the landscape bear eloquent witness—though it remained strong in some towns and cities. In Wales the long delay saw a different outcome. By 1920 nonconformity was losing its dominant place in Welsh life, and the Church in Wales was able to maintain its widespread presence throughout the principalities. JRG

**dispensing power** was the prerogative or discretion claimed by the monarch of exempting from the operation of statutes in particular cases. It was exercised by medieval and Tudor monarchs but became a bone of contention in the 17th cent. The \*Long Parliament, in its \*Nineteen Propositions, accused Charles I of making excessive use of it. Charles II employed it to assist Catholics who had helped his

escape after the battle of \*Worcester. James II used it to exempt catholic army officers from the \*Test Act and, in a collusive action, *Godden v. Hales*, the judges found for the king. After James had fled in 1688, the \*Bill of Rights abolished the \*suspending power outright and the dispensing power 'as it hath been assumed and exercised of late'. It caused little further trouble. JAC

**Disraeli, Benjamin, 1st earl of Beaconsfield** (1804–81). Conservative statesman, novelist, and exotic. Of a Christianized Jewish upper middle-class family (his father a distinguished man of letters), Disraeli led an early life that handicapped the political career for which he came to yearn. Egotistical, raffish, self-publicizing, he combined recklessness in financial and sexual matters with a talent for scrambling up available lifelines. Helped by his patron \*Lyndhurst, Disraeli, despite radical flirtations, was a Conservative MP from 1837. Desperate for office, he lacked standing and was ignored by Peel in 1841. More notice was gained by his novels, which he wrote partly for money (debt long remained a problem) but which also developed, eclectically rather than consistently, social and political ideas then current. *Coningsby* (1844) explored the nature of aristocratic party politics and *Sybil* (1845), a 'condition of England' novel, deplored the gulf between the 'Two Nations' of rich and poor: *Tancred* (1847) completed the trilogy. Disraeli had belonged to the otherwise aristocratic \*Young England group of political romantics and his growing hostility to \*Peel, signalled in the novels, expressed itself in the House over \*Maynooth and the \*Corn Laws in 1845–6. Though the Conservative revolt and split required the weight of Stanley and \*Bentinck, Disraeli's coruscating mockery of Peel gave him prominence for the first time. Nearly all the Conservative office-holders having followed Peel, the shortage of talent, particularly after Bentinck's death, on the protectionist front bench made Disraeli indispensable and by 1849 Stanley (the future earl of \*Derby) had resigned himself to having this improbable figure as his subordinate leader in the Commons, a position held until Derby himself retired in 1868. Initially a handicap to his party in that his position made reunion with the Peelites harder, Disraeli gained in experience and weight through the long service; he also benefited from the discipline brought by his marriage in 1839 to the wealthy and older Mary Anne, widow of a Conservative MP and determined on political eminence for her new husband. Never a protectionist on principle (his case against Peel had been his contempt for party commitments and loyalty), Disraeli had to be restrained by Derby in his wish to jettison protectionism swiftly (it was abandoned after the 1852 defeat) and in some of his subsequent and wilder flights of political creativity. Hungry for office, he deplored Derby's rejections of opportunities in 1851 and 1855; he was also reader to cultivate the press than Derby was and briefly sustained a newspaper of his own. His biography *Lord George Bentinck* (1852) repaid a considerable personal debt; the Bentincks also provided the money to set Disraeli up as a country gentleman at Hughenden in Buckinghamshire.

Disraeli served as chancellor of the Exchequer (a somewhat improbable role) and leader of the Commons in the

three Derby minority ministries of 1852, 1858–9, and 1866–8, though a major triumph came only in 1867 when his skilful and cynically ruthless handling of the details of the government's Reform Bill divided the Liberals and enabled the Conservatives to cling to office long enough to pass a measure. Scarcely 'democratic' in intention, it at least minimized the damage a Liberal measure would have done to Conservative interests. Disraeli succeeded Derby as premier in 1868 ('I have climbed to the top of the greasy pole') and, in opposition after electoral defeat, survived party discontent, helped by the self-doubt of the younger \*Derby for the leadership. At this stage he took some interest in party organization and established central office in 1870. By 1872, when he made major speeches at Manchester and Crystal Palace proclaiming a supposedly distinctive Conservative philosophy, \*Gladstone's Liberal government was disintegrating and the tide was flowing the Conservative way. The election victory of 1874, the party's first since 1841, owed more to Gladstone than Disraeli, but it gave the latter and his followers the prolonged period of office they sought. Disraeli's platform in 1874—stability and quiet at home and the patriotic assertion of national interests abroad—was pure \*Palmerston and a mirror image of what Gladstonian government had apparently provided. Much of Disraeli's policy in his final decade was geared to attracting disenchanted Palmerstonians over from the Liberal side.

Disraeli's name rests mainly upon his ministry of 1874–80. Its social legislation was mainly the work of Richard Cross at the Home Office and had no obvious link with the social theorizing of the premier's Young England past or even with vague references to social reform in the 1872 speeches, though it may have had an element of response to the extent of working-class (and largely anti-Irish) Toryism now evident in Lancashire. Only the trade union legislation of 1875, on which Disraeli backed Cross against cabinet hostility, went markedly beyond what any government might have passed. This phase was over by the time an ageing Disraeli moved to the Lords as earl of Beaconsfield in 1876. More significant than domestic policy was his forwardness in foreign and colonial matters. Disraeli seized the chance to buy a controlling interest in the Suez canal, he sent the flamboyant \*Lytton to India as viceroy, and his 1876 \*Royal Titles Act proclaimed Victoria empress of India. Over the Eastern Question, the struggle between Russia and Turkey in the Balkans, an equally dramatic confrontation developed between Beaconsfield and the former Liberal leader Gladstone (their mutual antipathy was long established); after much hesitation and at the expense of cabinet resignations, including the foreign secretary Derby, the government decided to intervene to sustain Turkey and found backing in outbreaks of popular patriotism (\*'jingoism') in some cities. Beaconsfield's reward was a personal triumph at the Congress of \*Berlin, a Balkan settlement that suited Britain ('Peace with Honour'), and the cession of \*Cyprus by Turkey. But colonial wars in Afghanistan and southern Africa went less well and gave Gladstone the chance to attack 'Beaconsfieldism' in his \*Midlothian campaigns. A new nationalist mood in Ireland and economic (including severe agricultural) depression also contributed, alongside Tory

divisions, to the heavy electoral defeat of 1880, which put Gladstone back in office. Though not retiring as party leader, Disraeli was depressed by developments, including the Liberals' Irish land legislation, and his death in 1881 came at a low ebb of party fortunes and morale.

Soon Randolph \*Churchill and the \*Primrose League were active in cultivating a mythology of Disraelian 'Tory Democracy' and his name was on the way to its 20th-cent. status as a codeword for a leftish and social reforming Conservatism. In fact the substance of Disraeli's politics was far more orthodox than later romance suggested: a matter of upholding the 'aristocratic constitution', the monarchy (his closeness to Victoria, something he exploited politically, helped to draw her back into public life), the Union with Ireland, property rights, and social stability. His foreign policy in the 1870s certainly took Palmerstonism to the point of riskiness and he helped to claim the patriotic and imperial identity for the Conservative Party, though Gladstone made his task easier. In religious matters he upheld established churches as much as he could and had a protestant bent which found both Roman catholicism and Puseyite ritualism within the Church of England distasteful; he backed the 1874 Public Worship Regulation Act to penalize ritualism. But none of this matched the exoticism in rhetoric, wit, and phrase-making that Disraeli brought to politics; he was far more interesting as a political performer than in underlying intentions. What distinguished him most perhaps was his immense stamina and dedication over a long career in party leadership, his great loyalty to the Conservative Party, and his unquenchable thirst for office, power, and patronage. He was a great *arriviste*. BIC

Blake, R., *Disraeli* (1966); Coleman, B., *Conservatism and the Conservative Party in Nineteenth-Century Britain* (1988); Weintraub, S., *Disraeli* (1993).

**Disruption** (1843). On 18 May 1843, a majority of the \*Church of Scotland's \*General Assembly left St Andrew's church, Edinburgh, for Tanfield Hall, Canonmills, to hold the \*Free Church of Scotland's first assembly, under the presidency of Thomas Chalmers (1780–1847). Thus culminated ten years' conflict between those who asserted their church's spiritual independence and those who accepted its apparent subordination to the civil power. The conflict, which focused on whether a minister could be forced on an unwilling congregation, was precipitated by the House of Lords' ruling in the Auchterarder case (1838–9) confirming statute law's supremacy over ecclesiastical courts. Consequently 474 out of 1,203 ministers seceded from the established church, accompanied by a proportionate number of members. CB

**dissent** (nonconformity). Though dissenting sects could trace some of their doctrines to well before the Reformation, for example to the \*lollards, pre-Reformation heterodoxy is usually termed schism or heresy. The term dissent is reserved for those who did not conform to the Church of England and, though this included catholics, it is usually confined to protestant groups. Long before the Civil War there were many puritans but most of them remained in the church, hoping to reform it from within. Elizabeth's Act of

\*Uniformity of 1559, augmented by royal injunctions to kneel, bow, and wear surplices, did not produce a mass exodus (apart from Mary's bishops) such as accompanied the Act of \*Uniformity of 1662 after the Restoration. Thomas \*Cartwright (1535–1603), described by John Strype as 'the head and most learned of that sect of dissenters then called puritans', remained shakily within the church all his days, and ended his life as master of the Leicester hospital at Warwick. Robert \*Browne (c.1550–c.1633), described as 'the earliest separatist from the Church of England' and certainly with no fondness for bishops, nevertheless held an Anglican living for the last 40 years of his life.

The seed time for nonconformity was the Civil War. By 1644 Archbishop \*Laud was in the Tower, episcopacy abolished, the \*Solemn League and Covenant imposed, and the \*Book of Common Prayer declared illegal. Perhaps as many as 3,000 Anglican clergy lost their livings and had the \*presbyterian form of church government survived, as it ultimately did in Scotland, the Anglicans would have finished up as dissenters. The confused situation gave dissenting sects the opportunity to establish themselves. The independents or \*congregationalists dissented from the dissenters, disliking the rigour of presbyterian rule and demanding toleration; the \*baptists, who had broken away from the Brownists in the early 17th cent., split between the general baptists and the particular baptists, who were closer to \*calvinism; George \*Fox felt in 1643 the call which led to the foundation of the 'Children of Light', later known as \*quakers; Ludowick \*Muggleton, who disliked the quakers, organized his own distinctively negative sect in the 1650s; Thomas \*Harrison looked for the imminent establishment of Christ's \*Fifth Monarchy and the triumph of the saints.

In the declaration of \*Breda (April 1660) Charles II offered 'a liberty to tender consciences' in religious matters and the presbyterians at least, powerful in the \*Convention that had recalled the king, hoped for an acceptable settlement. They were disappointed. The \*Cavalier Parliament, elected in March 1661 to replace the Convention, was much less inclined to forgive and forget: many of its members had suffered imprisonment and sequestration at the hands of the sectaries. The \*Savoy conference between twelve bishops and twelve puritans broke down without agreement, and the preface to the revised Anglican Prayer Book condemned 'men of factious, peevish and perverse spirits' who would not accept it. A new Act of Uniformity (1662) led to some 1,000 puritan clergy leaving their livings. The \*'Clarendon code' waged war against the nonconformists, forbidding them civic office, prohibiting religious gatherings or conventicles of more than five persons, and demanding that ejected ministers should not live within 5 miles of their former parishes. The \*Test Act of 1673 barred dissenters, protestant and catholic, from public office, including membership of Parliament.

The reigns of Charles II and James II were difficult for the dissenters, fierce bursts of persecution alternating with efforts to woo them. The two royal \*Declarations of Indulgence (1672, 1687), designed to improve the position of the catholics, placed many dissenters in a dilemma—whether to oppose any concessions to the papists, whom they hated, or

to make use of the opportunity. Some, like \*Penn the quaker, who had suffered imprisonment for his views, believed the assurances of James II: the majority heeded the warning from \*Halifax that 'you are therefore to be hugged now only that you may be the better squeezed at another time'.

After the Glorious Revolution, the \*Toleration Act of 1689 was intended to 'exempt their Majesties' protestant subjects, dissenting from the Church of England, from the penalty of certain laws'. While not conceding civil or public rights, or waiving the obligation to pay tithes to the Church of England, it granted freedom of worship, provided that dissenters took a simple oath of allegiance. An echo of the days when they had been regarded as fanatics and malignants was clause 6 which forbade them to lock, bolt, or bar the doors of any chapel. Quakers, unwilling on principle to take oaths, were allowed a 'declaration of fidelity'. At the same time a new schism arose when 400 Anglican clergy decided that they could not swear to the new regime and formed the \*non-juring church. The dissenting groups settled down at last to a period of consolidation, though the election of a strongly high-church and Tory Parliament in 1710 produced more hostile legislation in the Act against \*Occasional Conformity (1711) and the \*Schism Act (1714), both repealed by the subsequent Whig administration. The repeal of the Schism Act allowed the spread of \*dissenting academies, whose excellence made up for the exclusion of dissenters from Oxford and Cambridge. At the same time, the acceptance after 1688 of an avowedly presbyterian church order in Scotland, confirmed by the Act of \*Union in 1707, was proof that the Church of England no longer had an official monopoly in the British Isles.

Under these comparatively relaxed conditions, the dissenting groups might have been expected to flourish. In practice toleration proved more damaging than persecution. Though exact figures are scarcely possible there is little doubt that dissenters, who had numbered some 300,000 or 5 per cent of the population of England in 1700, lost members in the next 40 years. Some of the more prosperous dissenters conformed for social or political reasons, but the dissenters also suffered from internal convulsions. The 'Happy Union' of congregationalists and baptists formed in 1691 lasted only four years before dissolving amid reciprocal recriminations. A rift in the 1690s among the American quakers spread to Britain when George Keith was expelled for accusing Penn of deistic views, and finished up as an Anglican minister. In 1719 the Salters' Hall controversy revealed the inroads made into presbyterian doctrine by \*socinian or \*unitarian beliefs. Isaac Watts, the hymn writer and an independent moving towards unitarianism, was afraid that dissent might be found 'nowhere but in books', while Philip Doddridge, a leading presbyterian, feared in 1730 'the echo of our own voices'.

The development of the \*methodist movement from the 1730s onwards led to a vast increase in dissent, though during \*Wesley's lifetime his followers remained in the Anglican church. By the 1770s the dissenters had arrested their decline and were growing more confident, fortified by the success of

nonconformity in America. This led many of them to oppose the American war, bringing them renewed unpopularity. A motion to repeal the Test and Corporation Acts in 1787 received little more support in Parliament than in 1736, and was defeated by 176-98: the prime minister William \*Pitt observed that 'there is a natural desire in sectaries to extend the influence of their religion; the dissenters were never backward in this.' The support of many dissenters for the French Revolution in its early stages kindled fresh bitterness and \*Priestley's house in \*Birmingham was burned in 1791 in church and king riots. In 1828, the long wars safely over, repeal of the Test and Corporation Acts went through with surprising ease. Though nonconformists retained substantial grievances, especially over marriage and tithes, they had at least achieved formal civil equality.

It transpired that they had achieved a good deal more. The early years of the 19th cent. witnessed a remarkable upsurge in support for dissent. 'Old Dissent', particularly in the form of presbyterianism and quakerism, showed little vitality, but 'New Dissent' made many converts. The methodists pointed the way to other sects, and the \*evangelicalism of the age embraced dissent, with the congregationalists and the baptists to the fore in foreign missions and the quakers in the anti-slavery movement. The Anglicans were comparatively slow to respond to the rapidly developing urban growth and lost ground. At the time of Wesley's death in 1791 the methodists numbered some 56,000: by 1836 there were 360,000 in the different methodist churches. Congregationalist membership increased from some 20,000 in 1760 to 127,000 by 1838, baptists from 11,000 to 100,000. Organization and liaison improved. The baptists formed a union in 1831, the congregationalists, ever jealous of their autonomy, a looser confederation in 1832.

The effect of these changes was a transformation of the religious scene recorded by the religious census of 1851. Despite some imperfections as a statistical record, the general position was clear. Two things amazed the Victorians. First the census showed that 5½ million people who might have attended church on 30 March—nearly 40 per cent of those eligible—had not done so. This figure, which would have seemed highly satisfactory to churches in the early 21st cent., shocked people in 1851. Secondly, it revealed that Anglican attenders scarcely outnumbered the dissenting sects—3,773,000 against 3,487,000, of whom methodists were 1,463,000, independents 793,000, baptists 587,000, catholics 305,000, unitarians 37,000, and quakers 18,000. Indeed, in the heated exchanges that followed publication of the report, dissenters pointed out that since many of their members attended two or three services, dissenting attendances were higher than Anglican. Dissenters were in a comfortable majority in many northern industrial towns like Sheffield, Leeds, and Bradford, and formed a great majority in Wales.

Anglicans braced themselves for another attack on the established position of the church. Tithes went in 1868; the Irish \*church was disestablished in 1869; the Welsh church in 1920. But the Church of England held out until the tide of religious belief was clearly ebbing. Meanwhile the influence of dissent was all-pervasive. The \*Municipal Corporations Act of 1835, which set up elected councils in

the large towns, had brought hundreds of dissenters into local government. In Leeds, where the old corporation had been Anglican dominated, the *Mercury* reported that only 20 of the 51 new councillors were churchmen and in the next twelve years only 2 of the mayors were not dissenters; in Leicester, of 56 aldermen and councillors, 40 were dissenters, 16 Anglicans. The nonconformist conscience, urged on in the 1830s and 1840s by Jabez Bunting, a Methodist, in the 1850s and 1860s by Charles Spurgeon, a Baptist, and in the 1880s and 1890s by Hugh Price Hughes, another Methodist, was a powerful political force, as Charles \*Dilke and \*Parnell discovered. The influence of dissent may be seen most clearly in the \*Liberal Party. The Whigs had always expected to obtain most of the dissenting vote, but the Liberals relied upon it, and many of their leaders appealed directly to it. \*Bright and W. E. \*Forster were Quakers, Joseph \*Chamberlain a Unitarian, \*Asquith from a Congregationalist family, \*Lloyd George from a Baptist home. The Parliament of 1905, which gave the Liberals their biggest majority ever, contained over 180 Protestant dissenters, most of them on the Liberal benches. But both dissent and the Liberal Party were poised for eclipse. The removal of many of their grievances by the Liberals persuaded some dissenters to move to the political right, while the new \*Labour Party offered alternative accommodation to those who remained radical.

Dissent itself was also in decline. From 1918 onwards there was a marked falling-off in membership of both the Church of England and the dissenting denominations. This seems to have been caused less by the spread of avowed atheism or agnosticism than by competition from other sources of leisure-time activity, together with a growing dislike of authority in any form. Religious bodies held on with some success to existing members but did less well at recruiting from new generations. There was a dramatic decline in attendance at \*Sunday schools, once a mainstay of recruitment, but by 1990 down to 10 per cent of their 1900 numbers. There was increasing difficulty in recruiting clergy. The Church of England had 20,000 clerics in 1900, 10,000 by 1984; the Methodists, with 4,700 ministers in 1950, had 2,500 by 1993. In Scotland, there were 3,600 Presbyterian ministers in 1900, less than 1,500 in 1990. At the same time, the general population was continuing to grow. Estimates of church and chapel attendance in 1989 suggested that fewer than 10 per cent of the English population attended on any regular basis. The churches responded in a variety of ways—by merging parishes, by abandoning unwanted churches, by institutional amalgamations, and by ordaining women ministers and priests. In 1972 the Presbyterian church of England merged with most of the Congregational unions to create the United Reform Church, but the decline in membership was not arrested. There were of course other churches whose membership increased notably in the decades after the Second World War—Pentecostal churches, Afro-Caribbean churches, Muslim, Hindu, Sikh, and Orthodox churches—but their increase was largely due to immigration and they did not look back to the nonconformity of the 17th and 18th cents. Though religious issues still surfaced in public life, politics was largely secularized. Except in Northern Ireland,

there is little positive correlation between religious views and voting behaviour. Many church leaders in the 19th cent., especially in the ranks of dissent, advised their members that it was their duty to take a full part in political questions, but in the early 21st cent. clerics who speak out are likely to be told that religion and politics should not mix.

**dissenting academies.** The Act of \*Uniformity (1662) excluded dissenting ministers from their posts. Many, out of necessity, became teachers or tutors. Dissenting academies were particularly popular in Devon, Lancashire, London, and Wales, some of the most distinguished being at Tewkesbury, Northampton, and Warrington. They were much used by nonconformists who could not take the oaths at Oxford or Cambridge. Girls' as well as boys' schools were provided and commercial schools for the sons of city merchants set up. The curriculum, at first classically based, developed in the 18th cent. into a utilitarian one. Intellectual freedom was demonstrated by the emphasis on scientific subjects, taught by renowned experts such as Joseph \*Priestley.

PG

**dissolution of the monasteries** of England and Wales occurred between 1536 and 1540. Profoundly controversial to contemporaries, this was an unparalleled secular spoliation of ecclesiastical property. By the 16th cent. most English monasteries were in decline. Numbers of religious were falling; the economy of the majority had been seriously disturbed by changes consequent upon 14th-cent. crises; few new communities were being founded, though there were exceptions such as Syon and Sheen; spiritual and literary life were generally insipid, and few new benefactions were being attracted from lay patrons. However, very few houses had been forced into 'liquidation' through religious or economic failure prior to the 1530s, and those that had, disappeared largely because they were 'alien priories', i.e. subject to monasteries in France and hence potentially disloyal. Their property was usually passed to another monastery or, as happened at Cardinal \*Wolsey's foundation of Cardinal College (later Christ Church, Oxford), used to finance educational establishments. Nor is there much evidence that lay society was hostile to the monasteries: indeed, following their dissolution there was considerable support for them, notably expressed in the \*Pilgrimage of Grace (1536) in Lincolnshire and Yorkshire.

But the monasteries remained wealthy communities, and hence tempting to Henry VIII and his chief adviser Thomas \*Cromwell. The full-scale valuation of ecclesiastical income, the *Valor ecclesiasticus* (1535), had revealed the extent of monastic revenues. The desire to appropriate these potently combined with the king's continuing onslaught on the ecclesiastical establishment. Royal visitations revealed

## distrain of knighthood

convenient scandals and in 1536 all monasteries with an annual income of less than £200 were suppressed. This was followed by the gradual dissolution of individual larger houses and in 1539 all surviving greater monasteries were dissolved. Comparatively few monks raised more than token resistance, those most likely to object having in most cases already been executed for refusing to take the oath of supremacy. Monks were given annual pensions; a number became secular priests. Ex-nuns were more harshly treated and were not permitted to marry till the reign of Edward VI.

Monastic lands, administered through the Court of Augmentations, largely fell into the hands of the aristocracy and gentry, though some were used to endow new bishoprics; buildings were looted for their materials, though some churches were adapted to parochial use; the great artistic treasures accumulated over centuries were destroyed or dispersed. BJG

**distrain of knighthood.** The post-Conquest military obligations attached to knighthood were not necessarily welcome and increasingly avoided. In theory landowners of a certain status were required to present themselves at coronations to be knighted. Henry III began campaigns to oblige freeholders with estates worth £20 p.a. to take up knighthoods, issuing writs of distrain. At this stage, the motive was primarily military but later monarchs were more interested in the revenue they could raise by allowing subjects to compound or pay fines. By Tudor times the estate value had been raised to £40 p.a., but distrains were little used. Charles I, in his search for extra-parliamentary revenue, ordered the records of the Tower to be inspected to discover devices, and from 1630 began distraining, allowing the victims to compound at less than the cost of a fine. Considerable revenue was raised and even more considerable animosity. When the \*Long Parliament met, John \*Selden in 1641 carried an Act declaring distrains unlawful and Charles was obliged to give his assent. At the Restoration knight service was abolished. JAC

**divine right of kings.** It was taken for granted in early modern Europe that monarchs derived their authority from God, but the French wars of religion in the late 16th cent. produced a passionate debate about the limitations, if any, upon royal power. James VI of Scotland, the protestant son of a catholic mother, took part in this as he defended his own authority against the claims of both \*presbyterians and \*Jesuits. But his insistence that kings were gods in their own right, above the law in theory (though rarely in practice), alarmed his English subjects after 1603, who enjoyed political liberties and property rights embodied in the common law and protected by Parliament. James never, in fact, threatened these, but the less flexible Charles I overrode property rights through prerogative taxation, and political liberties by ruling without Parliament. The divine right of kings apparently died with him but was resuscitated during the later Stuart period. Only after the \*Glorious Revolution did it become irrelevant. RL

**divorce.** Since the Roman catholic church has never recognized divorce, it was not available in Britain until after the

\*Reformation. Henry VIII was technically never divorced—his marriages to \*Catherine of Aragon and \*Anne of Cleves were annulled—and thereafter England moved very cautiously indeed. Separation from bed and board was permissible in certain circumstances but without the right to remarry. But after Parliament in 1670 had passed an Act to allow Lord Roos to remarry after the notorious adultery of his wife, a loophole was opened. The number of divorces remained very small. The Church of England retained the ecclesiastical courts from the previous era and the case for ending a marriage had to satisfy canon law. Once the church courts had agreed that the marriage should end, only a private Act of Parliament could give effect to property settlements and issues of succession. Such Acts were expensive, faced a real possibility of failing to pass, and exposed the details of personal family relationships to public knowledge.

With the costs of a private Act so high, it is likely that many unhappy marriages endured or that informal and undocumented separations took place. The wish to divorce appeared to be present at all social levels. For example, there are references in the 16th cent. and later to the curiosity of 'wife sales' amongst the poor, an illegal practice fictionalized in Thomas \*Hardy's *The Mayor of Casterbridge*.

Divorce, although still expensive, became more generally accessible with the Matrimonial Causes Act of 1857, which applied to England and Wales. This Act incorporated the recommendations of the Campbell Commission, which had investigated the law relating to marriage. The Act established a Court for Divorce and Matrimonial Causes and allowed divorce on specified grounds. A husband could divorce on the grounds of adultery by a wife, but a wife had to prove that her husband had committed adultery aggravated by desertion, cruelty, incest, rape, sodomy, or bestiality before she could divorce. For those who could not afford to go to the new court, escape from the effects of a violent marriage or desertion was provided by an Act of 1878 which gave magistrates' courts power to recognize formal separation. But by 1913 there were still very few divorces—only 577 in England and Wales.

After the Reformation the situation in Scotland developed differently. Husbands and wives had equal access to divorce and procedures for rescinding a marriage could be initiated in the sheriff court by resident Scots. In the mid-19th cent. the costs of such a divorce were between £20 and £30.

Equality between the sexes was recognized by the Divorce Act of 1923, which made the grounds for divorce the same for both spouses. As a consequence, the number of divorces increased, although remaining relatively small. A major change towards lowering the cost of legal proceedings was incorporated into the Divorce Act of 1937, which also added habitual drunkenness and insanity to the grounds for divorce. Again the number of divorces increased and rose even higher after the Second World War, when those seeking divorce could apply for financial help under the legal aid scheme of 1948.

Until the Divorce Act of 1971 two features characterized divorce proceedings: the guilt of one partner had to be proved, and both partners had to agree to pursuing a divorce. The 1971 Act allowed divorce on the grounds of the

irredeemable breakdown of the marriage, and the initiation of divorce proceedings by one partner even against the opposition of the other. The Act also sought to safeguard the welfare of any children of the divorcing couple.

After 1971 the number of divorces rose sharply and continuously so that, by the 1990s, it was estimated that one marriage in three would end in divorce. The Marriage Act of 1996 sought to distinguish between the end of marriages of short duration and those of greater length. The former could be ended very rapidly with few long-term obligations between the partners. The legislation attempted to provide the latter with greater long-term protection in respect of property including resources such as pensions. IJEK

**Dobunni.** A British tribe and *civitas*. The Dobunni were centred on Gloucestershire, with their pre-Roman capital probably in the fortified settlement at Bagendon. Either by conquest or by the unification and incorporation of smaller tribal groupings, they established by AD 43 a kingdom which seems to have included all of Gloucestershire, most of Somerset, and parts of Herefordshire, Worcestershire, Oxfordshire, and Wiltshire. Their inscribed coinage, however, suggests that their territory was divided, peacefully or otherwise, into two kingdoms each with its own ruler. Trade relations were established with the kingdom of the \*Catuvellauni to the east but \*Cunobelinus' ambitious plans for expansion may have resulted in some encroachment on Dobunnian territory around AD 40. In any event, according to the Greek historian Dio Cassius, early in the Claudian invasion in AD 43, a part of the Dobunni deserted the British cause and came to terms with the Roman invaders. Subsequently, around AD 70, the tribe were granted *civitas* status and the developing town of \*Cirencester (Corinium) became their capital. It grew to be one of the largest towns in Roman Britain, and when Britannia was divided into four provinces early in the 4th cent., Cirencester was chosen as the capital of Britannia Prima. KB

**docks and ports.** Points of transshipment for goods and passengers at the coast or on inland waterways. Up to c.1700, Britain's ports had been largely natural coastal or riverside sites, sometimes with quays and wharfs for lading, and beaching vessels at low tide. In the busiest ports, such as London or Newcastle upon Tyne, where larger vessels were unable to tie up at the quay, smaller lighters were used as intermediaries to carry goods from ship to shore.

The growth of trade from the 16th cent. increased pressures on these natural harbours and stimulated new investment. This created the first wet docks, entered by lock and adding large areas of water to natural harbours, at Rotherhithe (1700) and \*Liverpool (1701 and 1715). Development between 1770 and 1830 was remarkable: in 1775, the only commercial docks were in Liverpool, with 14 acres of water; by 1830, there were 397 acres in all, with 42 per cent in London, and the remainder concentrated into Liverpool, \*Bristol, \*Hull, Grimsby, and Goole. Liverpool was the leading handler of traffic, with 2.5 million tons in 1830, but nationally in 1841 three-fifths of tonnage was still handled without docks.

The coming of the coastal paddle-steamer in the 1830s forced dock rebuilding, and after 1870 the screw-propelled, triple-expansion powered steamship continued the process. Oceanic passenger traffic trebled between 1870 and 1913, as did the volume of goods shipped. From the 1870s, the growth in the scale of ships and their traffic forced the development of deep-water facilities, which led to the rise of \*Southampton from the coming of the railway in the 1840s, and as a liner port from the 1890s; \*Cardiff, as the 'coal metropolis', its sole credential as capital of Wales from mid-century; and brought \*Manchester, after the building of its ship canal (1894), to fourth port in Britain by 1913, by value of goods traded. Heavy investment on Clydeside brought \*Glasgow to fifth place.

Britain's loss of shipping supremacy after 1918 reduced the volume of goods handled, and foreign penetration of coastal tramp shipping favoured the revival of small and cheap ports. Shipping technology had significant effects after the Second World War: containerization began at Larne in 1954, and generalized during the 1960s; the shift of trade back towards Europe stimulated the east coast ports; and roll-on/roll-off ferries and hovercraft services developed from the later 1960s. Air travel virtually extinguished the liner ports by 1970, and port and dock employment, which exceeded 120,000 in 1911, fell consistently, collapsing from the 1960s. The full impact of the Channel Tunnel on UK ports has yet to be felt. JCh

**Doctors' Commons** was the popular name for the labyrinthine complex of law courts just south of St Paul's, London, from 1565 until 1858. The courts of civil law dealt with matrimonial and slander cases, the ecclesiastical courts with clerical discipline, and the Court of Admiralty with maritime disputes. For good measure, marriage licences could also be obtained there. The lawyers who practised there were required to have doctorates in law from Oxford or Cambridge. \*Dickens was a clerk there in the early 1830s and made use of his experiences in *Sketches by Boz*, *Pickwick Papers*, *Our Mutual Friend*, and *David Copperfield*. JAC

**Dodington, George Bubb, 1st Baron Melcombe Regis** (1691–1762). Famous to posterity as the archetypal place-hunter, Dodington, though not heroic, was a politician of some note and a patron of the arts. It was customary to sneer at his ancestry, but he was quite well connected. Born George Bubb, he was related to the Temple family, which eventually inherited his enormous mansion at Eastbury, Dorset (and pulled it down), and his father and grandfather had been MPs. Dodington was sent to Winchester and Exeter College, Oxford, entered Parliament in 1715, and remained in the Commons until made a peer in 1761. He inherited large estates and a considerable electoral influence in 1720 from an uncle, George Dodington, another MP, whose name he took. \*Walpole made him a lord of Treasury 1724–40, but he then went over to \*Frederick, prince of Wales, who promised to make him a great man in the new reign. Henry \*Pelham bought him back in 1744 as treasurer of the navy but he rejoined the prince in opposition in 1749. The prince's early death in 1751 left him stranded. When George III came to the throne, Dodington was too

## Doe

old and too fat for active service, but got his peerage: 'his coronet seems only calculated to adorn his tomb', wrote Horace Mann, and he was proved right. Dodington's diary, a valuable source, was left to a cousin, whose nephew published it in 1784 with disparaging comments. Dodington summarized his philosophy at the end of his life in his delightful poem 'Shorten Sail':

Strive thy little bark to steer  
With the tide, but near the shore.

JAC

**Doe, John.** One of the fictitious characters introduced in a procedure known as ejectment. The writs and remedies available to holders of title in freehold land were not available to leaseholders (i.e. those whose interest in land was limited to a fixed term), who were thus at a disadvantage if they were dispossessed. Through the writ of trespass the common law courts provided leasehold tenants with a remedy, which at first consisted merely of damages against the dispossessor, but later enabled them to recover possession of the leasehold land against the wrongdoer. This remedy, being quick and effective, was attractive to freeholders and, in order to avail themselves of it, they created a fictitious lease involving imaginary characters named John Doe, Richard Roe, and William Stiles. Using this fiction, the two parties to a dispute involving title to freehold land would use ejectment to determine which party had the better right to it.

MM

**Dogger Bank, battle of the, 1915.** The Germans created their high seas fleet as an expression of Germany's great power status and as a political lever to force concessions from Britain. It was not designed to win a war, and faced by a numerically superior enemy, the German admirals had no intention of obliging the British by seeking a naval action until they had reduced the Grand Fleet's numerical superiority by attrition. The battle of the Dogger Bank was fought in the North Sea on 24 January 1915. A raiding force of German battle-cruisers was intercepted and pounded by \*Beatty's battle-cruiser squadron. The action only convinced the German Admiralty that they were right to pursue a cautious strategy.

DF

**Dollar, battle of, c.875.** The battle, east of Alloa, Scotland, was a crushing defeat for \*Constantine I of Alba by the Norsemen, led by Halfdan of York. The whole northern part of Scotland was conceded to the invaders. Though the chronology is very doubtful, the reality of serious warfare is clear.

JAC

**Domesday Book** was the result of the great survey commissioned by William the Conqueror at Gloucester at Christmas 1085. The main manuscript, so-called Great Domesday, written by a single scribe, contains the final version of the surveys of all English counties south of the rivers Ribble and Tees, with the exception of Norfolk, Suffolk, and Essex. These three counties make up Little Domesday, a more detailed, unedited draft text which, for reasons which remain unknown, was not reduced to the final Great Domesday form. Domesday Book's name, given to it in the generations immediately after the survey, shows that it

was a source of awe and wonder. During the Middle Ages it continued to be consulted on numerous legal and tenurial matters. It is a fundamental source for all types of historical enquiry and is of importance for geographers, lawyers, and linguists. It is primarily a record of landholders, both in 1086 and in the time of Edward the Confessor, and of the manors and other estates which they held. The detail given for each estate usually consists of geld assessment, numbers of peasantry, ploughs, ploughlands, and some categories of livestock, and estimated value in King Edward's day, in 1086, and sometimes at an intermediate point. Information is often (but not consistently) given about whether title to a particular manor was in dispute and about churches, mills, and woodland. Major towns were supposed to be entered at the start of each county survey, but some important ones, such as London and Winchester, were omitted. The survey's purpose and the method of its compilation are subjects of debate. The current emphasis is on a financial purpose, since it seems to be primarily concerned with resources and assessments. However, its value as a register of title must not be overlooked, even if the disputes which it records were often not resolved. It is clear from chronicle references that the preliminary results were brought to William, perhaps by 1 August 1086 in preparation for the famous \*Salisbury Oath, and certainly before he left for Normandy in the autumn. The production of the final Great Domesday text, however, took much longer and was probably not concluded until early 1088. Sets of commissioners toured the kingdom and heard evidence from juries representing shire and hundred courts. The kingdom was divided into circuits, of which there were probably seven. The basic order in which the material was to be set out was predetermined. The most complex modern discussions concern the methods by which this material was collected. While it is clear that some was in existence before the survey was made, the emphasis in recent discussion is on an intense editing process at local level, involving documents of various kinds and the participation of the local representatives. Computer-based studies of Domesday Book's contents are starting to yield impressive results on all kinds of subjects, but the complexities of its terminology and its statistics still baffle investigators. DB

**domestic service** refers to paid employment as servants in the households of others. The number of such servants depended upon the size of the household and its income. In all periods of history both men and women sought such employment. However, fewer men than women became servants after 1780, when a tax was imposed on all adult male indoor servants. Initially the tax was designed to encourage men into the armed forces or paid work in the expanding non-domestic labour market. Once established it made male domestic workers expensive, so that the typical domestic servant was female.

Domestic service was the most important type of employment for women until after the start of the First World War in 1914, when women took on the jobs of men who joined the services. Simultaneously, many households reduced the number of domestic servants because their incomes were reduced by wartime inflation.

In upper-class households there was often a hierarchy of servants 'below stairs', ranging from the butler to kitchen skivvies. Frequently these servants remained with the household for many years, some holding positions of intimacy and trust. Amongst the lower middle class only a 'maid of all work' was employed, who often endured very long hours and little prestige. Her lot was superior only to the 'daily' helping with the 'rough work'.

After 1918 domestic service never regained its former importance in private households; since 1945, work similar to that of the domestic servant has taken place in public contexts, through employment as cleaners and caterers in hospitals, nursing homes, schools, and universities. The increase in women working outside the home in the early 21st cent. is revivifying domestic service, which is now additionally provided through entrepreneurial small businesses. IJEK

Horn, P., *The Rise and Fall of the Victorian Servant* (1975); Waterson, M., *The Servant's Hall* (1980).

**domestic system.** The organization of production by entrepreneurs not in a specialized workplace, but in the homes of workers. The method began in the Middle Ages when almost all manufacturing was carried out within the home whether in town or country. However, when markets grew rapidly, some production was concentrated in factories. For some products, such as many varieties of textiles, gloves, boots, and shoes, the system of subcontracting remained appropriate. Hand-loom and knitting-machines, such as the Griswold used for stocking- and glove-making, were typical of those installed in workers' homes. In some districts, such as the east midlands, new houses were erected during the 18th cent. with space to accommodate the knitting frames. The spacious room at the top of the house had large windows to capture the maximum daylight for operating the frames accurately.

The domestic or putting-out system had many advantages for the master or capitalist manufacturer. The work often required little training. Workers were paid only for their output, and employers did not have to bear the cost of lighting and heating, nor provide space for the machines which were used. In addition, employers responded to variations in demand by increasing or decreasing the amount of work subcontracted. Most workers paid rents for the machines, whether or not they were in use, and stored in their cottages raw materials or components. The masters employed 'bagmen' to distribute raw materials and to collect finished items. The payments for work done depended on the quality of the product and disputes often arose between agents and workers.

The decline of the domestic system was a consequence of the \*industrial revolution. Growth in mass markets, combined with the development of textile machines, gave dominance to factory production of cloth, knitwear, and lace. The domestic system continued in the trades where there were specialized markets or where there were constant changes in the demand for decorative accessories and trimmings for the fashion industry. The pattern also continued in areas such as tailoring, paperbox-making, and even chain-making.

During the 20th cent. the domestic system or home working survived, usually associated with low-paid work by women. These workers, isolated in their homes, rarely joined trade unions or organized to obtain adequate pay and conditions. The Trade Boards Act of 1909 was designed to cover the 'sweated industries' of the domestic system and established panels, drawn from employers and employees, to determine minimum rates of pay. However, this law provided no effective means of enforcing the statutory wage rates. It was abolished by the Wages Act of 1986.

Home working continues during the early 21st cent. in a wide range of contexts, from the making of exclusive high-fashion knitwear from expensive fibres for the fashion industry to new developments in telesales and networking from home through computers. IJEK

**Dominica** is the most northerly of the Windward Islands in the eastern Caribbean. It has been an independent state within the Commonwealth since 1978. Sighted and named by Columbus in 1493, it was disputed in the 18th cent. between France and Britain, changed hands repeatedly, and was finally held by the British when they beat off a French attack in 1805. The economy relies heavily upon bananas, cocoa, and coconuts, but has been severely affected by hurricanes. JAC

**Dominicans** (or 'black' or 'preaching' \*friars) were a mendicant order founded by a Spanish \*Augustinian and preacher, St Dominic, to combat the Albigensian heresy in southern France. The order was confirmed by Pope Innocent III in 1215, and its rule, largely based on the Augustinian rule, codified by 1221. Though following ideals of corporate poverty, the order was dedicated to educational activity and quickly established itself at the forefront of intellectual life—Thomas Aquinas was a Dominican—and friaries were found in virtually every university town in the medieval West. Like the \*Franciscans there were also strictly enclosed communities of contemplative nuns. Its rule, with its system of representational government under the authority of the master-general, is famous for its organizational sophistication, and partly accounts for its success and appeal both to the ecclesiastical hierarchy, especially the papacy, which used it for administrative, as well as evangelizing, duties, and to the laity.

The Dominicans first settled in England in Oxford and London in 1221 and by their \*dissolution in 1538–9 there were over 50 English friaries, constituting the English province, and divided into the four disciplinary 'visitations' of London, Oxford, Cambridge, and York. BJG

**dominion status** was the term chosen to describe the position of the self-governing member states of the inter-war \*Commonwealth. They were to be regarded, proclaimed the 1926 imperial conference, as 'autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, although united by a common allegiance to the Crown and *freely* associated as members of the British Commonwealth of Nations' (italics added). That was necessary to their self-respect. After 1947, however, when India

## Donald I

entered the club, even that was felt to be inadequate, and the word 'dominion' was quietly dropped, as implying—despite Britain's disavowals—a certain subordination to her. BJP

**Donald I** (d. 862), 'king of the Picts' (858–62) anachronistically regarded as second king of Scotland. Brother of \*Kenneth I, whom he succeeded on the latter's death of a tumour. Little is known of Donald's reign (which may have been untypically peaceful) except that he presided over an assembly of the Gaels at the royal centre of Forteviot (5 miles south of Perth). He died (probably) at 'Rathinveramon'—probably a fort near Scone. He is not known to have had any children, and was succeeded by his nephew \*Constantine I—only the second occasion when a family had retained the kingship for more than a generation. DEB

**Donald II** (d. 900), king of 'Scotland' (889–900). Donald is the first king in contemporary record to be referred to as '*ri Alban*', 'king of Scotland'. 'Scotland' in this period, however, was only the eastern region north of the Forth. Donald was son of \*Constantine I. His family had lost power between 878 and 889, but succeeded in monopolizing the kingship thereafter for 145 years, from Donald's accession to \*Malcolm II's death in 1034. Donald's reign, like his father's, was plagued by Scandinavian incursions. He had more success than his father and managed to defeat a Danish force on some unidentified islands. It is likely, however, that he was killed by Scandinavians at Dunnottar (14 miles south of Aberdeen). According to a debatable source he was buried on Iona. DEB

**Donald III** (d. c.1100), king of Scotland (1093–4, 1094–7), known as Donald Bane. He seized the kingship on the death of his brother, \*Malcolm III. The children of Malcolm and his English wife, St \*Margaret, fled into exile, and Donald expelled Malcolm's English followers who he feared would support them. His first rival, however, was \*Duncan II, Malcolm's eldest son by his Orcadian wife Ingibjorg. Duncan had been dubbed knight by William II of England in 1087, and with William's military intervention he dislodged Donald from the kingship in 1094. Duncan was soon defeated, forced to dismiss his Anglo-Norman backers, and before the end of the year was killed in battle and Donald restored to the throne. This time Donald was supported by Malcolm and Margaret's son Edmund whom he probably recognized as his heir. In 1097 William II gave military backing to another of Malcolm and Margaret's sons, \*Edgar. Donald was defeated and he and Edmund incarcerated. In 1099 he was blinded by Edgar and died (perhaps as a result). He was buried at Dunkeld, but later reburied on Iona. DEB

**Donne, John** (1572–1631). Metaphysical poet and churchman. Of catholic stock, his education at Oxford and Lincoln's Inn was directed towards a future state office. Having been a volunteer on the 1596 Cadiz expedition, he became secretary to Sir Thomas Egerton, but marriage to Anne More without parental consent (1601) led to dismissal and a long period of unemployment. By then he had written much of his passionate, witty poetry and begun to reject catholicism. Even as an Anglican, though, his deep, personal religious struggle continued, but since James I refused to

appoint him to any position outside the church, he was eventually ordained (1615); preferment was then rapid and he became famous for his powerful and eloquent sermons. Despite uncertain health, he was installed as dean of \*St Paul's cathedral (1621), where he was conscientious in his duties and subsequently buried. ASH

**Dorchester** (Dorset). *Civitas*-capital of the \*Durotriges. Lying near the Iron Age hill-fort of \*Maiden castle, Durnovaria may have succeeded a base of *legio II Augusta*. A large bath-house lay in the south-eastern part of the town and the amphitheatre lay to the south, reusing the site of a Neolithic henge monument, Maumbury Rings. Earthen defences enclosing an area of c.75 acres constructed in the late 2nd cent. were refurbished in stone in the 3rd. Of the 3rd and 4th cents. were well-appointed houses and the large western cemetery at Poundbury, which may have been Christian. ASEC

**Dorchester-on-Thames, diocese of.** First created in c.635 as the see of Birinus for Wessex, it was transferred to \*Winchester c.663. A Mercian bishopric existed here twice, 675–85, and again following \*Leicester's retreat from the 8th-cent. Danish invasions. As the Danelaw was reconquered, Dorchester extended its authority to the Humber; c.1072 the see was moved to \*Lincoln. WMM

**Dorset** is one of the oldest and most beautiful shires. But it has been so immortalized in the novels of Thomas \*Hardy that to many people it is better known in fiction than in fact—the land of Tess and of Gabriel Oak, of Giles Winterborne and Marty South, of Eustacia Vye, the reddleman, and Michael Henchard—trapped in time, where Mrs Yeobright sits dying on Egdon Heath and the effigy of Henchard swirls round and round the weir-pond outside Casterbridge.

It is not easy to see much geographical unity. The county is largely the basin of the river Frome, which flows through Dorchester and Wareham into Poole harbour, and of the Stour and its tributaries, flowing from Sturminster in the north through Wimborne to Christchurch. For centuries it was the quietest of rural counties, with small market towns like Shaftesbury, Beaminster, and Blandford, and quiet harbours like Wareham, Lyme, and Bridport. The balance of the county was transformed from 1850 onwards by the sudden growth of the coastal towns. In 1801, no town in the shire had above 5,000 people; Poole had 4,800, Weymouth 3,600, Sherborne 3,200, Bridport 3,100, and Shaftesbury, Blandford, and Dorchester were all well under 3,000. But by 1931, when Dorchester had reached 10,000, Poole had grown to 57,000 and Weymouth 22,000. The boundary changes of 1972 reinforced this shift by bringing in Bournemouth and Christchurch from west Hampshire. Bournemouth's growth was amazing. In 1841 it boasted 26 dwellings. But after the coming of the railway in 1870, it gained county borough status by 1895, was well over 100,000 by 1931, and 159,000 by 1991. Since by 1991 Poole had grown to 135,000, nearly half of the county's population was tucked into the south-east corner.

At the time of the Roman invasion in AD 43 the local tribe was the \*Durotriges. Their fortress of \*Maiden castle was

stormed by \*Vespasian's second legion, and nearby \*Dorchester developed as the Roman town of Durnovaria. In Saxon times it was soon recognized as a distinct area. \*Sherborne was established as a bishopric as early as 705, and remained one until 1075 when it was removed to Old Sarum.

The region formed part of the kingdom of \*Wessex: Brithric was buried at Wareham c.802 and Edward the Martyr at Shaftesbury in 979. In the 9th cent. Dorset was repeatedly attacked by the Danes. The *Anglo-Saxon Chronicle* records an encounter in 837 between the men of Dorset and the Danes at Portland and another in 845 when they joined with the men of Somerset to engage the Danes at the mouth of the Parrett. Wareham was taken by the Danes in 876 and Sherborne, Dorchester, and Shaftesbury devastated by \*Sweyn in 1002.

By this time Dorset was a recognized county. The \*Domesday survey of 1086 identified four boroughs—Shaftesbury, Dorchester, Wareham, and Bridport—the latter having difficulty in sustaining its position because of the vulnerability of its sea defences. Much of the county was owned by the great monastery of Sherborne and by the nunnery at Shaftesbury, reputedly founded by \*Alfred.

In the later Middle Ages and Tudor period, the coastal towns suffered greatly from French and Spanish reprisals and from Algerine pirates. The seashore inhabitants gained some recompense by resorting to wrecking, a tradition which lasted well into the 19th cent., and by their own privateering and smuggling. Wareham gradually silted up, losing its prosperity to Poole, which flourished on mackerel, oysters, and the Newfoundland fish trade. Bridport manufactured hempen ropes. The demand for Portland stone increased vastly from the 17th cent. onwards, the \*Banqueting Hall, \*St Paul's, and \*Greenwich palace made of it: as late as 1927, the 87-year-old Thomas Hardy enjoyed watching goods trains carrying stone clattering through Dorchester. Purbeck marble, exported through Swanage, was also much in demand. Inland, cloth manufactures flourished—silk at Sherborne, lace at Blandford, linen at Gillingham, baize at Sturminster. But the mainstay of the county was the sheep on the chalk downs around Dorchester and the cattle in the vale of Blackmoor to the north.

Like most counties, Dorset was divided by the Civil War. Dorchester, Lyme, and Poole were parliamentary strongholds, Sherborne and Corfe castles royalist bastions. The county's position between the parliamentary east and the royalist west, and easy communications with France, made it strategically important. After the royalist victory at \*Roundway Down in 1643 much of the shire fell to the king and Lyme, in 1644, survived a royalist siege. In the last years of the war, \*club-men were active, and confrontations took place at Sturminster in June 1645 and in August with Cromwell near Shaftesbury.

After 1731 one fortunate result of a disastrous fire at Blandford was a complete rebuilding, making it one of the most charming Georgian towns in the country. Another rebuilding was at Milton Abbas, where Joseph Damer pulled down the old village and employed Capability \*Brown to build a new model village. The county remained remote and

little known. Visits by George III helped to encourage Weymouth as a resort. In 1796 an Act was passed authorizing a 49-mile canal linking the Stour with the Kennet and Avon but, unsurprisingly, it was never completed. Apart from Bournemouth, not then in the county, the railways did not make much impact, though the Somerset and Dorset passed into folklore as the old Slow-and-Dirty, and the Pines Express, which ran from Bournemouth to Manchester via Bath, Green Park, had a strong claim to be the slowest express ever.

The 20th cent. produced a vast urban build-up between Poole and Bournemouth and a diversification of industry—an atomic energy station on Wynfrith Heath, oil drilling off the coast. The hinterland remains largely unspoiled and boasts villages like Sixpenny Handley, Ryme Intrinica, Okeford Fitzpaine, Toller Porcorum, and Hazelbury Bryan. The recommendation of the Banham commission in 1994 was to retain the county for ceremonial purposes only. Nevertheless, it has retained its full status, with Bournemouth and Poole established as unitary authorities.

JAC

### **Dorset, Henry Grey, 3rd marquis of, duke of Suffolk**

(1517–54). Dorset succeeded his father at the age of 13, and was lord high constable at the coronation of Edward VI and a knight of the Garter. In 1551 he was made duke of Suffolk. His second wife was the eldest daughter of \*Mary Tudor by Charles Brandon, duke of \*Suffolk, and he was the father of Lady Jane \*Grey. A zealous protestant, he became a close ally of the duke of \*Northumberland. He declared his daughter queen on the death of Edward, recanted, and was lucky to save his life. But the following year he was implicated in \*Wyatt's rising against Mary's Spanish marriage, was discovered hiding in a hollow tree on one of his Warwickshire estates, and executed. His widow married a ginger-haired groom sixteen years her junior soon after the duke's execution.

JAC

### **Dorset, Thomas Sackville, 1st earl of (c.1536–1608).**

Thomas Sackville was the son of Sir Richard Sackville, under-treasurer at the Exchequer 1559–66, a wealthy lawyer and administrator, who was \*Anne Boleyn's first cousin. A member of the Inner Temple, Sackville was returned to Parliament in 1558 when he was just of age. His interests at that time were literary rather than political. In 1559 he wrote the introduction to *A Mirror for Magistrates* and, with Thomas Norton, was author in 1561 of the tragedy *Gorboduc*, put on at the Inner Temple. In 1567, soon after his father's death, he was made Baron Buckhurst. He served Elizabeth in a number of ambassadorial posts, was given the Garter in 1589, and from 1599 to his death was lord treasurer. James I advanced him in 1604 to the earldom of Dorset. He died at the council table in April 1608. He was granted the reversion of the estate of Knole in Kent, though he did not gain possession until much later, and in the last years of his life began rebuilding the medieval house.

JAC

**Douglas, Sir Archibald** (c.1296–1333). Regent of Scotland. Archibald Douglas was younger brother of Sir James \*Douglas, the staunch supporter of Robert Bruce. After Bruce's

death they stood by his young son, David II. In December 1332 at Annan, Archibald Douglas routed Edward \*Balliol, who had claimed the Scottish throne, and in March 1333 he was appointed regent or guardian, after Sir Andrew \*Moray had been captured. Edward III of England then besieged Berwick and Douglas marched to relieve it. In July 1333 at \*Halidon Hill, the English were victorious and Douglas killed. JAC

**Douglas, Archibald Douglas, 3rd earl of [S]** (d. 1400), known as 'the Grim'. Douglas rose to prominence as a supporter of David II in a period when the steward and the 1st earl of Douglas were in rebellion (1363). David made him constable of Edinburgh castle (1361), warden of the west marches (1364), and lord of Galloway (1369). He bought the earldom of Wigtown (1372), received Bothwell by marriage, and inherited the earldom of Douglas (1388), creating the Douglas power that dominated Scotland until 1455. He was praised by contemporary chroniclers, particularly for endowment of collegiate churches at Lincluden and Bothwell. From 1399 he supported Robert III's heir, the duke of Rothesay, as governor of Scotland, his death significantly weakening the duke's position. Furthermore, by buying his daughter's marriage to Rothesay (1400), he antagonized the earl of Dunbar, whose daughter was already espoused to the duke. Dunbar persuaded Henry IV to invade in retaliation. RJT

**Douglas, Archibald Douglas, 4th earl of [S], lord of Galloway and Annandale, duke of Touraine** (c.1372–1424). Son and heir of Archibald 'the Grim', 3rd earl of Douglas [S], and later nicknamed 'the Tyneman' (the Loser), perhaps because of his participation in so many battles on the losing side (\*Homildon, 1402; \*Shrewsbury, 1403; \*Verneuil, 1424), in the process losing his liberty, various parts of his anatomy, and ultimately his life. Earl Archibald was none the less a magnate of immense power and influence, the dominating force in southern Scotland and one of the triumvirate (with \*Albany and Mar) who controlled the country during the captivity of James I.

Latterly Douglas supported the cause of Charles VII of France against the English, and was thus prudently absent from Scotland on James I's return there in the spring of 1424. Created lieutenant-general of the French army and duke of Touraine, Douglas was killed in battle against John, duke of \*Bedford's forces at Verneuil in Perche (August 1424).

NATM

**Douglas, Archibald Douglas, 5th earl of [S]** (c.1390–1439). Elder son of Archibald, 4th earl of Douglas, and Margaret Stewart, daughter of Robert III. The future 5th earl took a leading part in Scottish military assistance to France from 1419. As earl of Wigtown, he joined John Stewart, earl of \*Buchan [S], in leading Scottish expeditionary forces of 1419 and 1421; in March 1421 Buchan and Wigtown won the spectacular victory of \*Baugé in Anjou, killing Henry V's brother Thomas, duke of \*Clarence.

Succeeding his father as earl of Douglas following \*Verneuil (1424), Archibald had to walk the political tightrope of defending Douglas family interests while maintain-

ing reasonable relations with James I. Despite a brief imprisonment in Lochleven castle (1431), he was broadly successful. Following the king's assassination in February 1437, Douglas was appointed lieutenant-general to lend respectability to the shaky new government. However, he died of plague at Restalrig near Edinburgh. NATM

**Douglas, Gavin** (c.1475–1522). Scottish poet and ecclesiastical politician. A younger son of the 5th earl of \*Angus, from an early age Douglas pursued an ambitious ecclesiastical career. His failure to secure the archbishopric of St Andrews was only partially compensated for by his appointment as bishop of Dunkeld in 1516, but as uncle of the 6th earl of \*Angus he played a prominent role in Anglo-Scottish affairs following his nephew's marriage to James IV's widow \*Margaret Tudor in 1514. His deep but largely unprofitable involvement in political intrigue led to his death (apparently from plague) in English exile, and also prevented him from developing further his considerable poetic gifts. One of the great 'makars' of Renaissance Scotland, Douglas's early work *The Palice of Honour* (1501) was followed by his *Eneados* (1513), a remarkable Scots verse rendering of Virgil's *Aeneid* which is his most enduring memorial. RAM

**Douglas, Sir James** (d. 1330). One of the most successful leaders in the Scottish Wars of Independence. In 1306, Douglas rallied immediately to Robert Bruce. His forte was the daring surprise attack. Early in 1307, he wiped out the English garrison of his family's castle at Douglas; probably in August 1308 he helped Bruce gain his victory at the pass of Brander by climbing the slopes of Ben Cruachan to attack the enemy unexpectedly in the rear. In 1314, he recovered Roxburgh by a night attack; led one of the brigades at \*Bannockburn; and repeatedly thereafter raided into England. His final service was to carry Bruce's heart in a campaign against the Muslims in Spain, in which he himself was killed, though the heart was recovered and brought back to Scotland. The rewards which he received from Bruce during his life established his family as one of the most powerful in Scotland. BW

**Douglas, James Douglas, 2nd earl of [S]** (c.1358–88). Son of William, the 1st earl, whom he succeeded in 1384. To secure his loyalty to the new Stewart dynasty, he was given an annuity of 100 marks, Robert II's fourth daughter Isabella as a wife, and £500 Scots, following his father's brief claim to the throne (1371). Douglas was one of several Scottish earls who took advantage of the expiry of truce, and the domestic troubles of Richard II, to invade England (1388), initially across the Solway Firth to Cockermouth, and later in a smaller invasion in the east. This force eventually met with Henry (Hotspur) \*Percy at \*Otterburn (August 1388). In the ensuing battle Percy was captured, the English defeated, but Douglas killed. He was commemorated as 'doughty Douglas' in the ballad 'Chevy Chase'. He lacked a legitimate heir, which eventually split the family into 'Black' and 'Red' branches. RJT

**Douglas, James Douglas of Balvenie, 7th earl of [S]** (c.1373–1443), known as 'the Gross'. Second son of Archibald 'the Grim', 3rd earl of Douglas. An able and ruthless man,

Balvenie built—or greatly extended—the ‘robber baron’ castle of Abercorn near Linlithgow and extorted large sums from the burgh customars during the English captivity of James I. Despite this, Balvenie became a trusted counsellor of the adult James I (1424–37).

Following James’s murder, Balvenie was given the earldom of Avandale [S] (November 1437), probably the gift of his nephew, the lieutenant-general. The latter’s unexpected death in 1439 was followed by the execution of his sons—probably with Avandale’s connivance, as he was justice-general—following the \*‘Black Dinner’ in 1440. Avandale then succeeded, in terms of the Douglas entail of 1342, as 7th earl of Douglas, reunited the vast Douglas estates by marrying his eldest son William to the Galloway heiress Margaret, and died at Abercorn in 1443. NATM

**Douglas, James Douglas, 9th earl of** [S] (d. 1491). Second son of James ‘the Gross’, 7th earl of \*Douglas. With two companions, James took part in a tournament against three Burgundian champions before James II at Stirling in 1449, and lost. The remainder of his life was one long rearguard action. Succeeding as 9th (and last) earl on his elder brother William, 8th earl of \*Douglas’s murder by James II (1452), James withdrew his allegiance from the king, then negotiated for a settlement (bond of manrent, 1453), finally fleeing to England before his forfeiture in 1455. As part of the Scottish ‘fifth column’ in England, Earl James hoped to be restored to his estates with English military aid. With the forfeited duke of \*Albany, Douglas finally returned to Scotland, far too late, only to be captured at Lochmaben (1484), and die at Lindores (1491). He had no children by his marriage to Margaret, ‘Fair Maid’ of Galloway. NATM

**Douglas, William Douglas, 8th earl of** [S] (c.1425–52). Eldest son of James ‘the Gross’, 7th earl of \*Douglas. Knighted while still an infant (1430), together with the royal child who would eventually kill him, he grew up to become by far the most powerful magnate in Scotland. Lieutenant-general for the young James II from 1444, and married to the Galloway heiress Margaret, Douglas and his brothers James (who succeeded him), Archibald (earl of Moray), Hugh (earl of Ormond), and John, Lord Balvenie, defeated all opposition and dominated Scottish politics between 1444 and 1452.

During William’s absence abroad, cutting a fine figure in Rome during Jubilee Year 1450, the adult James II plundered the Douglas lands of Wigtown and Selkirk. A hollow reconciliation between king and earl followed in 1451, but the following year a bond between Douglas, Crawford, and Ross provided the excuse for the earl’s murder, by James II in person, at Stirling castle. NATM

**Douglas cause.** On the death of the 1st duke of Douglas in 1761, the estates were disputed on behalf of his cousin, the duke of Hamilton, aged 5, and Archibald Stewart, claiming to be a nephew, aged 13. In 1767 the Court of Session decided against the nephew but in 1769 the House of Lords reversed the verdict. Stewart changed his name to Douglas and was given a barony in 1790. Since Douglas’s mother would have

been 51 at the time of his birth, the Lords’ verdict was received with some surprise. JAC

**Dover, treaty of**, 1364. This agreement between Edward III and Louis de Mâle, count of Flanders, on 19 October 1364, was intended to lead to the marriage of Edward’s fourth son, Edmund, with the count’s daughter, Margaret, who stood to inherit not only Flanders but also the counties of Nevers, Rethel, Burgundy, and Artois, and the duchies of Limburg and Brabant. As Edward proposed to settle on his son Calais, Guînes, and Ponthieu, the marriage would have led to English dominance on the northern and eastern fringes of France. Charles V of France thus put pressure on Pope Urban V not to allow a dispensation for the marriage, and was able to negotiate instead Margaret’s marriage to his own son Philip. AC

**Dover, treaty of**, 1670. Louis XIV’s attack upon the Dutch in 1667 had been halted by the \*Triple Alliance of Holland, Sweden, and England. To prepare for a decisive victory, Louis needed to smash the alliance and in 1669 began negotiations with Charles II. The treaty of May 1670, signed by Charles’s sister Henrietta-Anne, pledged the two powers to a joint attack on the Dutch and not to make a separate peace. A secret clause committed Charles to declaring himself a catholic and Louis to providing him with an army if disaffection followed. When, in 1674, Charles assured Parliament that there were no secret clauses in the treaty, it was observed that his hand shook. Suspicions of his sincerity were an important factor in allegations of a \*Popish plot in 1678. JAC

**Dover castle** is the gateway to England. Dover was one of the harbours of the \*Saxon Shore and the base for the Roman fleet, \**Classis Britannica*. Its Roman lighthouse probably dates from the 1st cent. AD. There was certainly some Saxon fortification there but the present castle was started in the reign of Henry II and ready for use in 1185. Its most remarkable feature is that the large keep is itself protected by further curtain walls. It was one of the last rectangular keeps to be built before castle design moved on to polygonal or circular towers. The keep is similar to that at Newcastle upon Tyne, finished a few years earlier, and by the same master builder, Maurice the Engineer. In 1216 it was held by Hubert de \*Burgh for King John against several weeks’ siege by Louis, dauphin of France. Its subsequent history was surprisingly peaceful and the heavy fortifications added during the Revolutionary and Napoleonic wars were never called upon. The lord warden of the Cinque ports is also constable of Dover castle. JAC

**Dowding, Hugh, 1st Baron Dowding** (1882–1970). Air chief marshal. Dowding was born in Dumfriesshire and went to Winchester. He joined the army, served in India, and just before the First World War qualified as an RFC pilot. He finished the war as brigadier-general and transferred to the new RAF. In 1936 he was made commander-in-chief of Fighter Command and though due to retire in 1939 was asked to continue. He thus held a crucial post during the Second World War. In May 1940, in a powerfully argued memo, he begged that no more fighter planes be

## Dowland

sent to France, and he was in personal control all through the Battle of \*Britain which followed. He was replaced in November 1940, after the German invasion threat had been defeated, and was given a barony in 1943. 'Stuff' Dowding was austere and could be difficult. But the men under his direct command won one of the vital battles of the war. Churchill called his decision to hold seven squadrons in reserve 'an example of genius in the art of war' and in his victory broadcast of May 1945 paid a special tribute to Dowding. JAC

**Dowland, John** (c.1563–1626). English composer and the leading lutenist of his age. At the age of 17 Dowland travelled in the service of the ambassador Sir Henry Cobham to Paris, where he became a catholic. In 1594–7 he visited Germany and Italy, becoming court lutenist to King Christian IV of Denmark in 1598. Nevertheless Dowland was bitterly disappointed at his failure to achieve an English court position. This eventually came in 1612, but he remained disaffected, his typically Elizabethan tendency to melancholy colouring his most characteristic music, such as the lute-song 'Flow my tears', based on the famous 'Lachrimae' pavan that also appeared in versions for solo lute and for viol consort. Dowland made the lute-song his own, moving from the dance-orientated pieces of *The First Booke of Songes or Ayres* (1597) to the Italianate declamation of 'Sorrow stay' (Book II, 1600) and the deep introspection of 'In darkness let me dwell' (*A Musically Banquet*, 1610). ECR

**Down** was one of the six counties of Northern Ireland before the local government reorganization of 1973. Its boundary to the north is the Lagan; to the south, with the Irish Republic, Carlingford Lough; and across to Armagh in the west, with the Newry canal as boundary. The Mountains of Mourne are in the south-west corner. There was a diocese of Down from the early 12th cent., with the headquarters at Downpatrick, where the cathedral dates from 1790. The chief town is Newry, close to the border, and the seat of the Roman catholic bishopric of Dromore. The land is good grazing, there is fishing from the coast, and Bangor is a seaside resort. The catholic population is largely in the south of the county and at the general election of 2001 the Social Democratic and Labour Party took Down South and Newry and Armagh: Unionist parties took Strangford and Down North. JAC

**Down** (Dún Lethglaisse), **diocese of**. The Irish bishopric of Down was listed at the Councils of Raithbressail (1111) and Kells-Mellifont (1152) as a diocese in the province of \*Armagh. It was united with Connor in 1453. Whereas most of medieval Ulster was Gaelic, Co. Down was English. Since the Reformation both the Catholic and Anglican sees have been known as 'Down and Connor'. In the Anglican church, however, Dromore was united with it (1842). With the separation of Connor (1944), the Anglican see is now known as 'Down and Dromore'. There are cathedrals at both locations. WMM

**Downing Street** was built by Sir George Downing in the 1680s as a speculation. The site had once been part of \*Whitehall palace. Only three of the original houses remain,

on the north side—no. 10 used by the prime minister, no. 11 by the chancellor, and no. 12 by the whips. The south side is taken up by Sir George Gilbert \*Scott's government offices, built in the 1860s. Behind the modest façade of no. 10 is another large house, fronting the Horse Guards and connected. Sir Robert \*Walpole accepted it from George II in 1732 for the prime minister of the day. Its nearness to Parliament was an important consideration. The internal arrangements include work by \*Kent, Taylor, and \*Soane and are dominated by the staircase, with its collection of engravings and photographs of prime ministers. The cabinet room was redesigned in 1781–3. JAC

**Downs, battle of the**, 1652. A clash on 18 May which helped to precipitate the first Anglo-Dutch War. Robert \*Blake with a force of fifteen vessels was attacked by a superior fleet under Martin Tromp. The encounter was not decisive but the Dutch lost two ships. JAC

**Downs, battle of the**, 1666. A heavy naval engagement on 11–14 June during the second \*Anglo-Dutch War, sometimes known as the Four Days' fight or the Goodwin's fight. Albemarle (\*Monck), with a fleet of some 56 vessels, left the Downs and off the North Foreland encountered a large Dutch fleet under de Ruyter, Cornelis Tromp, and de Witt. \*Rupert brought up reserves on the fourth day enabling Albemarle to retire into the Thames estuary but the English losses were heavier, and included the *Royal Prince*, a 92-gun, which ran aground. Both sides suffered severely, but \*Pepys wrote 'I do find great reason to think that we are beaten in every respect and that we are the losers.' JAC

**Doyle, Sir Arthur Conan** (1859–1930). Author. Educated at Edinburgh University, Doyle qualified as a doctor but gave up medicine for writing. He published his first novel, *A Study in Scarlet*, in 1887, which introduced the detective Sherlock Holmes. In 1891 Doyle began to write short stories under the title 'The Adventures of Sherlock Holmes' for the *Strand Magazine*. Doyle's intellectual detective was famous for his powers of analytical reasoning and became associated with his dressing-gown, pipe, violin, and cocaine syringe. His eccentricity was in contrast to the sober nature of his faithful friend Dr Watson, who narrated the stories. In 1893 Doyle killed off Holmes, but such was the public outcry that he eventually resurrected him in 1903. Doyle wrote many other novels of general and historical interest. He was an avid imperialist, serving as a physician during the \*Boer War (1899–1902). In later years he was absorbed by the subject of spiritualism. RAS

**Drake, Sir Francis** (c.1543–96). In legend and perhaps in reality, Drake was the greatest of the Elizabethan 'sea-dogs'. A skilled seaman and naval tactician, an inspiring leader of men, he was, nevertheless, capable of greed, disloyalty, injustice towards associates, and poor judgement as a naval strategist. His career was a key part of the process by which England emerged as an oceanic power. Though of yeoman stock, Drake became closely associated with a predatory and aggressive ruling aristocracy ready to sanction piracy and privateering against the French, Portuguese, and above

all, the Spanish. The contests with the latter also had a religious edge as Drake was a determined protestant. Yet the Spaniards who knew El Draque admired him.

Originally from Devon, Drake learned seamanship apprenticed on a coastal bark plying from the Thames, but in the 1560s joined a kinsman, \*Hawkins, on ventures to Spain and then to west Africa and the Caribbean, procuring and selling slaves in the face of Portuguese and Spanish hostility. By 1569, Drake was in command of a ship. Details of his life are obscure, but he made at least three piratical expeditions to the Caribbean, with that in 1572 capturing 30 tons of silver, part of the Spanish treasure annually brought across the Isthmus of Panama. After an Irish venture, in 1577 Drake embarked on a circumnavigation of the globe financed by the queen and other great people. This was at once further plundering of the Spanish—now on the western coast of the Americas—a search for the Pacific end of the North-West Passage, and an attempt to reach the spice islands by going west. Drake's expedition was the second to circuit the globe and also led to his claiming California for Elizabeth. Just where Drake landed in California and whether a plaque which came to notice in 1937 was actually the one he left there in 1579 remain in dispute. On the return of the 70-foot-long *Golden Hind* in 1580, Drake, rich and famous, was knighted, while England, it has been said, began to think globally.

There followed further raids on Spain and, most notably, assaults on key Spanish positions around the Caribbean in 1585–6 and Cadiz in 1587. These actions, combined with the defeat of the Spanish Armada in 1588 with Drake second in command, ended Spain's unquestioned supremacy at sea, though they did *not* break Spain's naval power. Nor was Drake's role in the defeat of the Armada the key one.

In 1589, Drake led an expedition against Lisbon before settling to active involvement in the life of Plymouth, including becoming its MP. He was encouraged to resume a privateering career in 1595 since Elizabeth's policy favoured predation on Spain as a means of increasing England's stake in world trade. But the attacks in the West Indies failed and Drake died at sea. This disaster was soon forgotten as the legend was elaborated in subsequent years and centuries.

**drama.** See THEATRE.

**dreadnought** is the name given to a type of battleship introduced into the principal navies after the experiences of the Russo-Japanese War. The chief innovations were higher speed and a main armament of heavy guns of uniform calibre. The first to enter service was HMS *Dreadnought* in December 1906, although other 'dreadnoughts', including the American *Michigan*, had been designed earlier. Although innovative design kept *Dreadnought's* increases in size and cost moderate, by 1914 'super-dreadnoughts' incorporated further increases in size, armour, and armament, which played a major rôle in the international naval rivalry of the early 20th cent.

NMcC

**dress** may meet practical needs such as protection against climate and labour hazards, but it has also been a powerful

tool in the maintenance of hierarchy through its reflection of status, and has served to distinguish occupation and faith as well as rank. It additionally mirrors fashion and permits expression of personal taste. Sumptuous clothes are usually worn by the more privileged classes, to enforce authority, flaunt wealth, or merely dissociate themselves from menial labour: medieval and Tudor monarchs could not wear too many jewels or precious metals; outer clothing was slashed or looped to show underlying layers of expensive fabric; impractical footwear and incapacitating sleeves were signs of leisure, if not symbols of dignity. Sumptuary laws may have been framed to protect home industries by bans on foreign imports (clothes, cloth, wool) and internal trade controls, but they considerably enhanced, then maintained, class distinctions. Because of 'the outrageous and excessive apparel of divers peoples against their estate and degree', dress for servants, handicraftsmen and yeomen, esquires and gentlemen, merchants and burgesses, knights, clerks, and ploughmen was firmly regulated in 1363 via quality of cloth and permitted embellishment. Such distinctions were perpetuated in clauses forbidding velvet caps to any below the degree of knight (8 Eliz. c. 11) or demanding the Sunday wearing of woollen 'statute' caps (13 Eliz. c. 19) by all save the nobility, clergy, and London company wardens. Dress, according to Lord \*Chesterfield in 1745, was a very foolish thing, 'yet it is a very foolish thing for a man not to be well dressed, according to his rank and way of life'.

In some instances, practicality and symbolic authority merged. The periwig, adopted from French fashion after the Restoration, not only concealed baldness or reduced head-lice (since the natural hair was close-cropped or shaved) but was worn to enhance dignity. Gain in size and artificiality meant that the heavy full-bottomed wig could only be worn on formal or special occasions, or by gentlemen of leisure. Modified for general use, wigs spread slowly throughout the country despite the hazards of inflammability, contagion, moralist attack, and poor durability, but generally decreased in size through the 18th cent. until their demise. Legal wigs, however, as part of traditional professional costume, are only today being slowly abandoned. Combined practicality and authority may also be seen in doctors' white coats and policemen's helmets.

If practical considerations dictated much of working dress, particularly when it remained relatively simple, occupational distinction came through attachment of appropriate emblems (threaded needle, weaver's shuttle), cap or arm badges, apron colour, or the heraldic crest/colours of the family served, while company liveries symbolized competence in a particular skill. Custom grew out of utility, then persisted, partly to prevent workers absconding from their employers, but also from the wearers' desire to maintain their group's recognized trademark. This may be seen today in corporate uniforms (airlines, hotels), identification badges, shoulder-tabs, and arm-bands; regimental and old school ties are merely rose-tinted nostalgia for lost fraternalism. Variations within uniform can denote distinctions of rank, most readily observed within the armed forces.

A prevailing style of dress has become known as being 'in fashion', but fashion has been described as a tyrannically

## Drogheda

democratic force, enforcing conformity to current social or moral conventions. Attack has come from moralists (frequently men rather than women), medical critics concerned about distorted torsos or incipient pneumonia, politicians and economists, aesthetic critics, animal lovers (against fur and feathers), and caricaturists, but with little long-term effect. Individuals have challenged fashion through aggressive nonconformity—Miss Chudleigh, later countess of Bristol, appeared virtually naked as Iphigenia at a 1749 ball—only to find the shock of the new fading because of growing familiarity, and the focus of attention shifting to another part of the body. Fashionable style moved downwards quite quickly. If Thackeray's duchess of Fitzbattleaxe was emulated by Lady Croesus, then Mrs Broadcloth must follow suit; if her, then also Mrs Seedy, her landlady Miss Letsam, and finally Suky the maid. This might produce vulgarization, but it also spurred the duchess to modifications to restore her lead in fashion. Sumptuary laws had long disappeared (1643 saw the last enactment), and class distinctions had been further blurred by the growing custom for the mistress to give her cast-offs to the lady's maid—such well-dressed servants puzzled many foreign visitors whose own countries still enforced sartorial regulations.

Fashion has frequently reflected overseas influences, despite war or trade restrictions: returning crusaders introduced silks and damasks, emphasis on Germanic puffs and slashes yielded to Spanish *bombast* (padding) and rigid outline as that country's power advanced in the 16th cent., puritan dress had similarities with its Dutch equivalent, and French influence on taste generally was enormous after the Restoration and for most of the 18th cent. The bloomer costume, adopted by some early female emancipators, originated in mid-19th-cent. America, and in the 20th cent., Parisian couture-houses led the way, even if designs were watered down for high-street shops, and the growing trend towards informality and casual wear has lessened their importance. American influence may be seen in the proliferation of baseball caps, for young and old, and jeans for the former.
