## IMPORTANT

HERE IS YOUR REGISTRATION CODE TO ACCESS MCGRAW-HILL PREMIUM CONTENT AND MCGRAW-HILL ONLINE RESOURCES

For key premium online resources you need THIS CODE to gain access. Once the code is entered, you will be able to use the web resources for the length of your course.

Access is provided only if you have purchased a new book.

If the registration code is missing from this book, the registration screen on our website, and within your WebCT or Blackboard course will tell you how to obtain your new code. Your registration code can be used only once to establish access. It is not transferable.

### To gain access to these online resources

1. **USE** your web browser to go to: **[www.mhhe.com/palmer10](http://www.mhhe.com/palmer10)**
2. **CLICK** on "First Time User"
3. **ENTER** the Registration Code printed on the tear-off bookmark on the right
4. After you have entered your registration code, click on "Register"
5. **FOLLOW** the instructions to setup your personal UserID and Password
6. **WRITE** your UserID and Password down for future reference. Keep it in a safe place.

If your course is using WebCT or Blackboard, you'll be able to use this code to access the McGraw-Hill content within your instructor's online course.

To gain access to the McGraw-Hill content in your instructor's WebCT or Blackboard course simply log into the course with the user ID and Password provided by your instructor. Enter the registration code exactly as it appears to the right when prompted by the system. You will only need to use this code the first time you click on McGraw-Hill content.

These instructions are specifically for student access. Instructors are not required to register via the above instructions.

## About the Authors

---

R.R. PALMER was born in Chicago in 1909. After graduating from the University of Chicago he received his Ph.D. from Cornell University in 1934. From 1936 to 1963 he taught at Princeton University, taking leave during World War II to work on historical projects in Washington, D.C. In 1963 he moved to Washington University in St. Louis to serve as dean of arts and sciences but in 1969 resumed his career in teaching and research, this time at Yale. After his retirement in 1977 he lived in Princeton, where he was affiliated with the Institute for Advanced Study, and then in a retirement community in Newtown Pennsylvania. Of the numerous books he wrote, translated, and edited, three of the most important have been his *Catholics and Unbelievers in Eighteenth-Century France* (1939); *Twelve Who Ruled: The Year of the Terror in the French Revolution* (1941, 1989); and his two-volume *Age of the Democratic Revolution* (1959, 1964), the first volume of which won the Bancroft Prize. He served as president of the American Historical Association in 1970, received honorary degrees from universities in the United States and abroad, and was awarded the Antonio Feltrinelli International Prize for History in Rome in 1990. He was a long-time fellow of the American Philosophical Society and of the American Academy of Arts and Sciences. He died in 2002, widely recognized as one of the preeminent historians of his generation.

JOEL COLTON was born in New York City. A graduate of the City College of New York, he served as a military intelligence officer in Europe in World War II, and received his Ph.D. from Columbia University in 1950. Until his retirement in 1989 he served on the faculty of Duke University, chairing the department of history from 1967 to 1974 and chairing the university's academic council from 1971 to 1973. On leave from Duke, he served from 1974 to 1981 with the Rockefeller Foundation in New York as director of its research and fellowship program in the humanities. In 1986 Duke voted him a Distinguished Teaching Award. He has received Guggenheim, Rockefeller Foundation, and National Endowment for the Humanities fellowships. He has served on the editorial boards of the *Journal of Modern History*, *French Historical Studies* and *Historical Abstracts*, and has been co-president of the International Commission on the History of Social Movements and Social Structures. In 1979 he was elected a fellow of the American Academy of Arts and Sciences. His writings include *Compulsory Labor Arbitration in France, 1936–1939* (1951); *Léon Blum: Humanist in Politics* (1966, 1987), for which he received a Mayflower Award; *Twentieth Century* (1968, 1980) in *The Time-Life Great Ages of Man Series*; and numerous contributions to journals, encyclopedias, and collaborative volumes. He served as co-author with Professor Palmer of the second to eighth editions of *A History of the Modern World* and with Professor Kramer of the ninth and the current editions.

LLOYD KRAMER was born in Maryville, Tennessee, and graduated from Maryville College. He received his Ph.D. from Cornell University in 1983. Before entering Cornell, he was a teacher in Hong Kong and he traveled widely in Asia. After completing his graduate studies, he taught at Stanford University and Northwestern University. Since 1986 he has been a member of the faculty at the University of North Carolina, Chapel Hill, where he is currently Dean Smith Distinguished Term Professor and Chair of the History Department. He has received two awards for distinguished undergraduate teaching. His writings include *Threshold of a New World: Intellectuals and the Exile Experience in Paris, 1830–1848* (1988); *Lafayette in Two Worlds: Public Cultures and Personal Identities in an Age of Revolutions* (1996), which won the Gilbert Chinard Prize from the Society for French Historical Studies and the Annibel Jenkins Biography Prize from the American Society for Eighteenth-Century Studies; and *Nationalism: Political Cultures in Europe and America* (1998). He has also co-edited several books, including a collection of essays on historical education in America and *A Companion to Western Historical Thought* (2002). He has been a member of the School of Historical Studies at the Institute for Advanced Study and a Fellow at the National Humanities Center, and he served as president of the Society for French Historical Studies.

## Preface

---

 Dramatic events in the contemporary world—wars, revolutions, terrorist attacks, catastrophic natural disasters, economic crises and the endless stream of daily news—often obscure the long historical processes that have created the societies in which we live and the problems with which we cope. The mass media pay little attention to the broader historical patterns and contexts that give deeper meaning to the swiftly moving events of our era. This new edition of *A History of the Modern World* may be seen as the most recent version of a continuing search for historical perspectives on the complex, often bewildering, events of our age. It thus carries a guiding assumption that the events, cultures, and conflicts of the contemporary world are always evolving out of the long, complex histories of diverse peoples, ideas, institutions, social mores, economic exchanges, and struggles for political power.

These multiple levels of human history have created modern societies and exerted wide influence on people and cultures around the world. This book therefore describes the histories of specific nations and people and emphasizes landmark events such as wars and revolutions, but it also stresses broad historical trends that have developed deep below the most prominent historical events and created what we now call “the modern world.” Our narrative explores the rise of nation-states and the conflicts that have shaped the world over the last several centuries, yet it links such transitions and events to the wider historical influence of the evolving global economy, the development of science and technology, the rise of industry, the significance of religious traditions, the origin and diffusion of new ideas, the changing mores of family and social life, and the complex relations between Western cultures and other cultures around the world.

The term *modern*, as we use it in this book, refers to the historical evolution of societies and cultures that may be said to have had the greatest influence in shaping the modern world—a phase of human history that began to develop about five or six centuries ago and is now evolving more rapidly in more places than ever before. This book makes no claim to be a world history, valuable as such histories may be. By design it focuses primarily on developments in the West until the spread of distinctively modern economic, social, and political institutions in the recent past leads to an increasing global emphasis in the book’s later chapters. Although the narrative stresses the influence of European societies (that is, societies shaped by Europeans or the descendants of Europeans) in the emergence of “modern” institutions and social practices, it also emphasizes the worldwide exchanges, conflicts, and interactions that have contributed to the increasingly global culture of the contemporary era.

### ORGANIZATION OF THE BOOK: CHANGES AND CONTINUITIES

As in the past, the book is organized in chapters that carry the narrative across specific chronological eras, moving steadily toward the present. Yet the clearly defined and numbered sections within each chapter often deal with themes, events, or issues that do not develop in simple chronological order. Each chapter focuses on a specific time frame but

also on themes and problems of continuing historical importance. The chronological organization gives readers a broad historical framework and also provides opportunities for further analysis and discussion of specific historical themes or problems—discussions that can draw, for example, on other materials which can be found on the companion Online Learning Center Web site ([www.mhhe.com/palmer10](http://www.mhhe.com/palmer10)), which now includes an Interactive Glossary.

Although the history of political institutions, revolutions, and international conflicts remains important in this new edition, some details of national and political history have been reduced to expand the discussion of social, cultural, and intellectual history—all of which have been influential in recent historical scholarship. There are sections on the role of women in various historical contexts and eras; descriptions of cultural and intellectual movements from the early modern to the contemporary period; and new analyses of the political, economic, and cultural interactions that have shaped modern global history. Chapters on the Scientific Revolution and the early global economy have been moved in order to show more clearly the chronological relation of notable cultural and economic developments.

In the earlier chapters readers will find discussions of family life during the Renaissance and Reformation; descriptions of literary debates, salon culture, and the evolving public sphere in the Enlightenment; and insights into the cultural dimensions of the French Revolution. Later chapters of the book (in the second volume of the paperback edition) include sections on the emergence of feminism, cultural debates about science and the idea of progress, and discussions of modernist and postmodernist cultural movements.

The chapters on the world since 1945 have been reorganized and divided into new thematic sections. The two longest chapters in the previous edition's narrative of recent historical events have been divided into four new, more concise chapters that will be easier for students and others to read. The new, shorter chapters have a clearer thematic organization, and they convey key patterns in the development of postcolonial societies in Asia, Africa, and the Middle East, as well as the demise of communism in Europe. These reorganized chapters also include new information on recent international confrontations and on the growing globalization of contemporary economic and cultural life. We believe that specific historical information about such developments is the essential starting point for historical analysis, balanced historical insights, and the comprehension of historical change.

Our intention is to help students and other readers understand the complexities of great events such as the religious wars of earlier centuries, the American, French, and Russian Revolutions, the twentieth-century world wars, the spread of democracy and the challenges it has faced, the creation and collapse of the Western-dominated colonial empires, the emergence of new, postcolonial nation-states, and the continuing search for an international order. Readers will also find updated information on current issues such as terrorism, recent upheavals in the Middle East, and the continuing struggle for economic development in the world's poorest countries.

Other revisions have been introduced to make the book even more accessible for a new generation of readers. The visual component has again been extended through the addition of new illustrations, including new images of important works by modern artists such as Pablo Picasso, Berthe Morisot, Jackson Pollock, and Henry Moore. Like other kinds of documents and sources, the images and artwork from past cultures provide important historical information. Knowing how to read and critically evaluate an illustration, painting, or photograph is an essential form of analytical thought and is invaluable for

cross-cultural comparisons. In addition to the many illustrations in each chapter, four-color inserts convey both the artistic creativity and the cultural or social preoccupations of different historical eras. The brief captions that accompany all of the illustrations connect events or issues to the book's narrative.

Other key features of this new edition include newly drawn, easier-to-read maps, presented in sharper color. The wide range of maps and charts shows the changing boundaries, populations, and economies of nations and regions over the years. In addition to the revised maps, new chronological timelines—as suggested by reviewers—have been incorporated into each chapter to give a convenient summary of the notable events and dates in each historical era. The revised, up-to-date entries for the comprehensive Suggestions for Further Reading, long a valued feature of the book, include new listings of useful Web sites as well as the titles of significant new scholarly publications.

The changes in this latest version of *A History of the Modern World* have been introduced to enhance the book's accessibility, but not to replace or weaken the style, content, narrative, and analytical qualities that have appealed to teachers and students over the years. More generally, readers will find that the book in its newest edition expresses again a strong belief in the value of historical knowledge and historical perspectives for anyone who wishes to understand as well as to live in the evolving modern world. It achieves its purpose whenever it helps readers of any age or background gain new perspectives on themselves and their world through the new knowledge or new insights that it may offer.

## SUPPLEMENTS FOR THE INSTRUCTOR

**Instructor's Manual/Test Bank** The first half of this unique manual offers a chapter-by-chapter guide to some of the best documentaries, educational and feature films, videos, and audio recordings to enhance classroom discussion. Brief overviews help instructors select the films best suited to each course topic. The manual also provides instructors with chapter objectives and points for discussion for each chapter, followed by a test bank containing multiple-choice, essay, and identification test questions.

**Computerized Test Bank** This CD-ROM version of the test bank is available for both Macintosh and IBM-compatible computers to allow instructors to customize each test.

**Overhead Transparencies** This set of over 150 overhead color transparencies of maps from the text can be used to illuminate classroom lectures.

**Slide Set** Available through your local McGraw-Hill sales representative, instructors can choose from a list of hundreds of fine art slides to create a customized slide set that will complement the text and enhance classroom lectures.

**Instructor Online Learning Center Web Site ([www.mhhe.com/palmer10](http://www.mhhe.com/palmer10))** At the home page for this text-specific Web site, instructors will find a downloadable version of the Instructor's Manual. Instructors can also create Web-based homework assignments or classroom activities by linking to the Student Online Learning Center and can create an interactive course syllabus using McGraw-Hill's PageOut site.

**PageOut ([www.mhhe.com/pageout](http://www.mhhe.com/pageout))** On the PageOut Web site instructors can create their own course Web sites. PageOut requires no prior knowledge of HTML, no long hours of coding, and no design skills on the instructor's part. Instructors need simply to plug the course information into a template and click on one of the 16 designs. The process takes little time and creates a professionally designed Web site. Powerful features include an interactive course syllabus that lets instructors post content and links, an online grade-

book, lecture notes, bookmarks, and a discussion board where instructors and students can discuss course-related topics.

**Videos** A wide range of videos on classic and contemporary topics in history is available through the Films for the Humanities and Sciences collection. Instructors can illustrate and enhance lectures by selecting from a series of videos correlated to the course. Contact your local McGraw-Hill sales representative for further information.

## SUPPLEMENTS FOR THE STUDENT

**Student Study Guide** Prepared by Joel Colton and Megan McLean, this user-friendly Study Guide helps students process and master important concepts in the text not through rote memorization but by stimulating reflection and interpretation. For each of the 133 sections of the textbook, the Study Guide provides study questions, key discussion sentences, and identification test questions. Each chapter includes general essay questions and general discussion passages. Selected map exercises are also provided. In addition, questions on the numerous illustrations in the text are included in the sections to which they most closely relate and are designed to encourage interpretation and analysis, specifically on the ways in which the illustrations supplement the discussions in the text.

**Student Online Learning Center Web Site ([www.mhhe.com/palmer10](http://www.mhhe.com/palmer10))** New to this Web site and requested by reviewers is an Interactive Glossary, an important learning tool for students that complements the terms and topics highlighted in the margins of the textbook. At this text-specific Web site, students can link to an interactive study guide, including online essay questions, interactive mapping exercises, Internet exercises, interactive chronologies, and links to online primary source documents. Links to trusted history search engines also make the Online Learning Center an ideal place to begin Web-based research.

**PowerWeb** PowerWeb for World History gives students password-protected, course-specific articles with assessments from current research journals and popular press articles, refereed and selected by World History instructors, and especially useful for materials that go beyond the scope of this book.

## ACKNOWLEDGMENTS

We again gratefully acknowledge the help of the many people who have assisted with the production of this book. We owe a special debt to the editors and staff of McGraw-Hill, Inc., which has published this book since its seventh edition. We are grateful also to Alfred A. Knopf, Inc., the earlier publisher of the book, and to Ashbel Green and the Knopf staff for continuing to make it available in a trade edition for the general public. The support and assistance of Lyn Uhl, Monica Eckman, Larry Goldberg, Susan Trentacosti, Marianna Kinigakis, Ayelet Arbel, Nora Agbayani, Janean Utley, Sonia Brown, Louis Swaim, Sean Crowley, and Katherine Bates at McGraw-Hill have been invaluable and essential. We also thank Christine Buese and Deborah Bull for their expert assistance on illustrations and Bethany Keenan for her help in identifying useful Web sites.

We have benefited from the expert advice of reviewers who have offered suggestions for the ways in which a new edition of this book might be revised; and we have absorbed many additional ideas from other colleagues who have used earlier editions of the book in their courses. We mention specifically the following reviewers: Marc Baer, Hope College; Robert Brown, University of North Carolina at Pembroke; Nathanael Greene, Wesleyan

University; L. Edward Hicks, Faulkner University; George Marcopoulos, Tufts University; James McSwain, Tuskegee University; Florene Memegalos, Hunter College; Jenny Nicholas, West High School; David J. Proctor, Tufts University; Sarah Rudell, Wayzata High School; Tamas Ungvari, California State University, Northridge; and Michael Zirinsky, Boise State University. Other colleagues who provided feedback also deserve mention: Joseph J. Colistra, LaSalle College High School; Michael Corey, Lincoln Way High School; Virginia Mancini, Pleasantville High School; Henry A. Ploegstra, St. Mark's School of Texas; and Michael Stoll, Hinsdale South High School. None of these individuals are in any way responsible for the book's shortcomings, but all have contributed to its strengths. We wish also to acknowledge the exceptional support and contributions of our colleagues and our families.

Finally, we note with a sense of deep loss that our colleague and co-author Robert R. Palmer (who always published as R. R. Palmer) died in 2002 after a long career of outstanding accomplishments. His superb contributions to the study of the French Revolution and of eighteenth- and early nineteenth-century history on both sides of the Atlantic have deservedly received wide recognition. His far-reaching intellect, searching acuity, historical insights, and broad-gauged interests marked this work from its beginning, and he remains the guiding influence and inspiration behind this book. The scholarly collaboration that has long characterized *A History of the Modern World* meanwhile continues and takes on new forms in this new edition, for which the most recent co-author has assumed the major responsibility.

# Geography and History

---

 History is the experience of human beings in time, but that experience takes place also in geographic space. Geography describes and maps the earth, but it also studies the changing interactions between human beings and the environments in which they live.

The universe, of which our planet earth and our solar system form but a small part, is now thought to be at least 12 billion years old. Most scientists believe the earth is about 4.6 billion years old. Yet the entire history (and prehistory) of humankind goes back only 3.5 to 5 million years, or perhaps only 2 million years, depending on how humans are defined. What we call history—the recorded cultures and actions of human beings—began with the invention of early forms of writing only about 5,500 years ago.

Oceans and continents have moved about over time, changing in size, shape, and location. The continents as we know them took on their distinctive forms less than 100 million years ago. Dinosaurs, which became extinct some 60 million years before the first humans even emerged, could walk from North America to Europe (as we now call these continents) on solid land in a warm climate. It is only a few thousand years since the end of the most recent glacial age. That Ice Age, which began about 2 million years ago and reached its coldest point only 20,000 years ago, was caused by a slight shift in the earth's orbit around the sun. Water froze into ice 1–2 inches thick and covered the northern parts of the planet (in North America as far south as present-day Chicago and in Europe across large parts of the British Isles and the nearby mainland). The melting of this ice produced the coastlines, offshore islands, inland seas, straits, bays, and harbors that we know today, as well as some of the large river systems and lakes. The process of change in the earth's surface continues. Niagara Falls, on the border between the United States and Canada, has been receding because the ongoing cascade of water erodes the underlying rock. The ocean's tides and human construction erode our shorelines as well, and many scientists believe current patterns of global warming may eventually change the oceans and coasts in much of the world.

Oceans presently cover more than two-thirds of the earth's surface, and many large land areas in the remaining third are poorly suited for habitation by human beings or most other animal and plant organisms. One-tenth of the land remains under ice, as in Antarctica and Greenland; much is tundra; much is desert, as in the Sahara; and much land lies along the windswept ridges of high mountains. Like the oceans, these regions have been important in human history, often acting as barriers to movement and settlement. Human history has therefore evolved in relatively small, scattered sections of the earth's total surface.

Researchers have found persuasive material evidence to show that human beings originated in Africa. Humans belonging to the species *Homo erectus*, the Latin term used by anthropologists and others to denote the upright, walking predecessors of modern humans, seem to have migrated from Africa about 1.8 million years ago, perhaps because of environmental pressures or perhaps because of simple curiosity. Our own species *Homo sapiens*, the Latin term connoting increased cognitive and judgmental abilities, emerged no more than about 100,000 years ago. When humans went beyond merely utilitarian accomplishments and demonstrated aesthetic and artistic interests as well as advanced toolmaking (about 35,000 years ago),

---

---

*Ice Age*

---

---

*Origins of human beings*

we refer to them as the subspecies *Homo sapiens sapiens*. They were the remaining survivors of a very complex human family tree.

The great Ice Age lowered the seas by hundreds of feet and froze huge quantities of water. The English Channel became dry. Land bridges opened up between Siberia and North America over what we now call the Bering Strait. Hunters seeking game walked from one continent to the other. When the glaciers melted, forests sprang up, and many of the open areas in which humans had hunted disappeared, providing added motivation for movement.

Our human ancestors spread eventually to every continent except Antarctica. In doing so, human groups became isolated from each other for millennia, separated by oceans, deserts, or mountains. Wherever they wandered, they evolved slightly over time, developing superficial physical differences that modern cultures have defined as the characteristics of various racial groups. But “race” is a cultural idea rather than a mark of biologically significant differences. All human beings belong to the *Homo sapiens* species, all derive from the same biological ancestry, and all are mutually fertile. Only a very few human genes are responsible for physical differences such as skin pigmentation, in comparison to the vast number of genes that are shared by all members of the human species.

Race: a cultural  
concept

The basic anatomy and genetic makeup of modern humans has not changed over the last 100,000 years. Geographic separation accounts for the emergence over shorter time periods of distinctive cultures, which can be seen, for example, in the different historical and cultural development of the pre-Columbian Americas, Africa, China, India, the Middle East, and

Geography and  
culture

Europe. On a still smaller time scale, geographic separation also explains differences in languages and dialects.

Geographic distances and diversity of climate have also produced differences in flora and fauna, and hence in the plants and animals upon which humans are dependent. Wheat became the most usual cereal in the Middle East and Europe, millet and rice in East Asia, sorghum in tropical Africa, maize in pre-Columbian America. The horse, first domesticated in north-central Asia about 4,500 years ago, was for centuries a mainstay of Europe and Asia for muscle power, transportation, and fighting. The somewhat less versatile camel was adopted later and more slowly in the Middle East, and the Americans long had no beasts of burden except the llama. Such differences did not begin to diminish until early modern travelers crossed the oceans, taking plants and animals with them and bringing others back to environments where they had never lived before.

Although much remains obscure about the origins of life, and new discoveries and calculations are always displacing older hypotheses, paleontologists studying plant and animal fossils (including human ones) have used techniques such as radiocarbon dating to transform our knowledge of the earth and of the earliest human beings. In geography, aerial and satellite photography and computer technology have enabled us to refine older conceptions of continents and oceans. And astrophysicists are now studying vast amounts of new data about the universe, which have been sent to them from powerful telescopes mounted on unmanned spaceships.

Cartography, the art and science of mapmaking, has evolved rapidly, but we tend to forget how our maps often remain conventional and even parochial. It was Europeans and descendants of Europeans who designed our most commonly used maps, which are oriented North-South and West-East from fixed points in their horizons, and which therefore reflect their own European cultural assumptions. Similar biases can be found in the maps of other

cultures too. The Chinese for centuries defined and visualized their country as the “Middle Kingdom.” In the early modern centuries maps drawn in India typically represented South Asia as forming the major part of the world. One such map depicted the European continent as a few marginal areas labeled England, France, and “other hat-wearing islands.”

Changing conceptualizations of the globe continue in our day. A map drawn and published in contemporary Australia, demonstrating the Australian perspective from “down under,” shows South Africa at the top of the map and Capetown at the very tip, the large expanse of contemporary African nations in the middle, and the various European countries crowded at the bottom, the latter appearing quite insignificant. The European-invented term “Middle East” has been called into question, and this region of the world is perhaps better designated as Western Asia. Even our traditional concept of Europe as one of the seven continents (Africa, Asia, Europe, North America, South America, Australia, and Antarctica) is now questioned. Why, for example, should the Indian peninsula be a “subcontinent” when it roughly matches the size and exceeds the population and diversity of the European “continent” (at least that part of the “continent” that lies west of the former Soviet Union)? Europe itself is, of course, actually a peninsula, in a way that the other continents are not. Some geographers ask us to consider it more properly as part of Asia, the western part of a great “Eurasian landmass.” Defined in these terms, Europe becomes more of a cultural conception, arising out of perceived differences from Asia and Africa, than a continent in a strictly geographical sense.

### *Europe's Influence on Modern History*

However we define its place on the globe, Europe has undoubtedly shaped much of modern world history—partly because of its overseas expansion, partly because of what it borrowed from other parts of the world, and partly because of its decisive economic and cultural influence on the emergence of an increasingly global civilization. Europe is of course only one of many important cultural spheres in human history. Its economy, political systems, religious traditions, and social institutions are not the sole historical path to modernity; indeed, people in other regions of the world have often challenged or rejected European forms of “modernization” as they have built their own modern societies. Yet even the critique or rejection of European institutions has usually required historical analysis of Europe’s development and role in the world. Much of the modern global economy, for example, emerged in the international trade that Europe’s imperial powers controlled and expanded after the sixteenth century. European political ideas, science, philosophy, cultural mores, and people also spread widely across the world, contributing to both the constructive and destructive patterns of modern political, social, and cultural life. Ideas and people have meanwhile flowed constantly into Europe from other parts of the world, so that European societies remain a vital center for cross-cultural exchanges and conflicts.

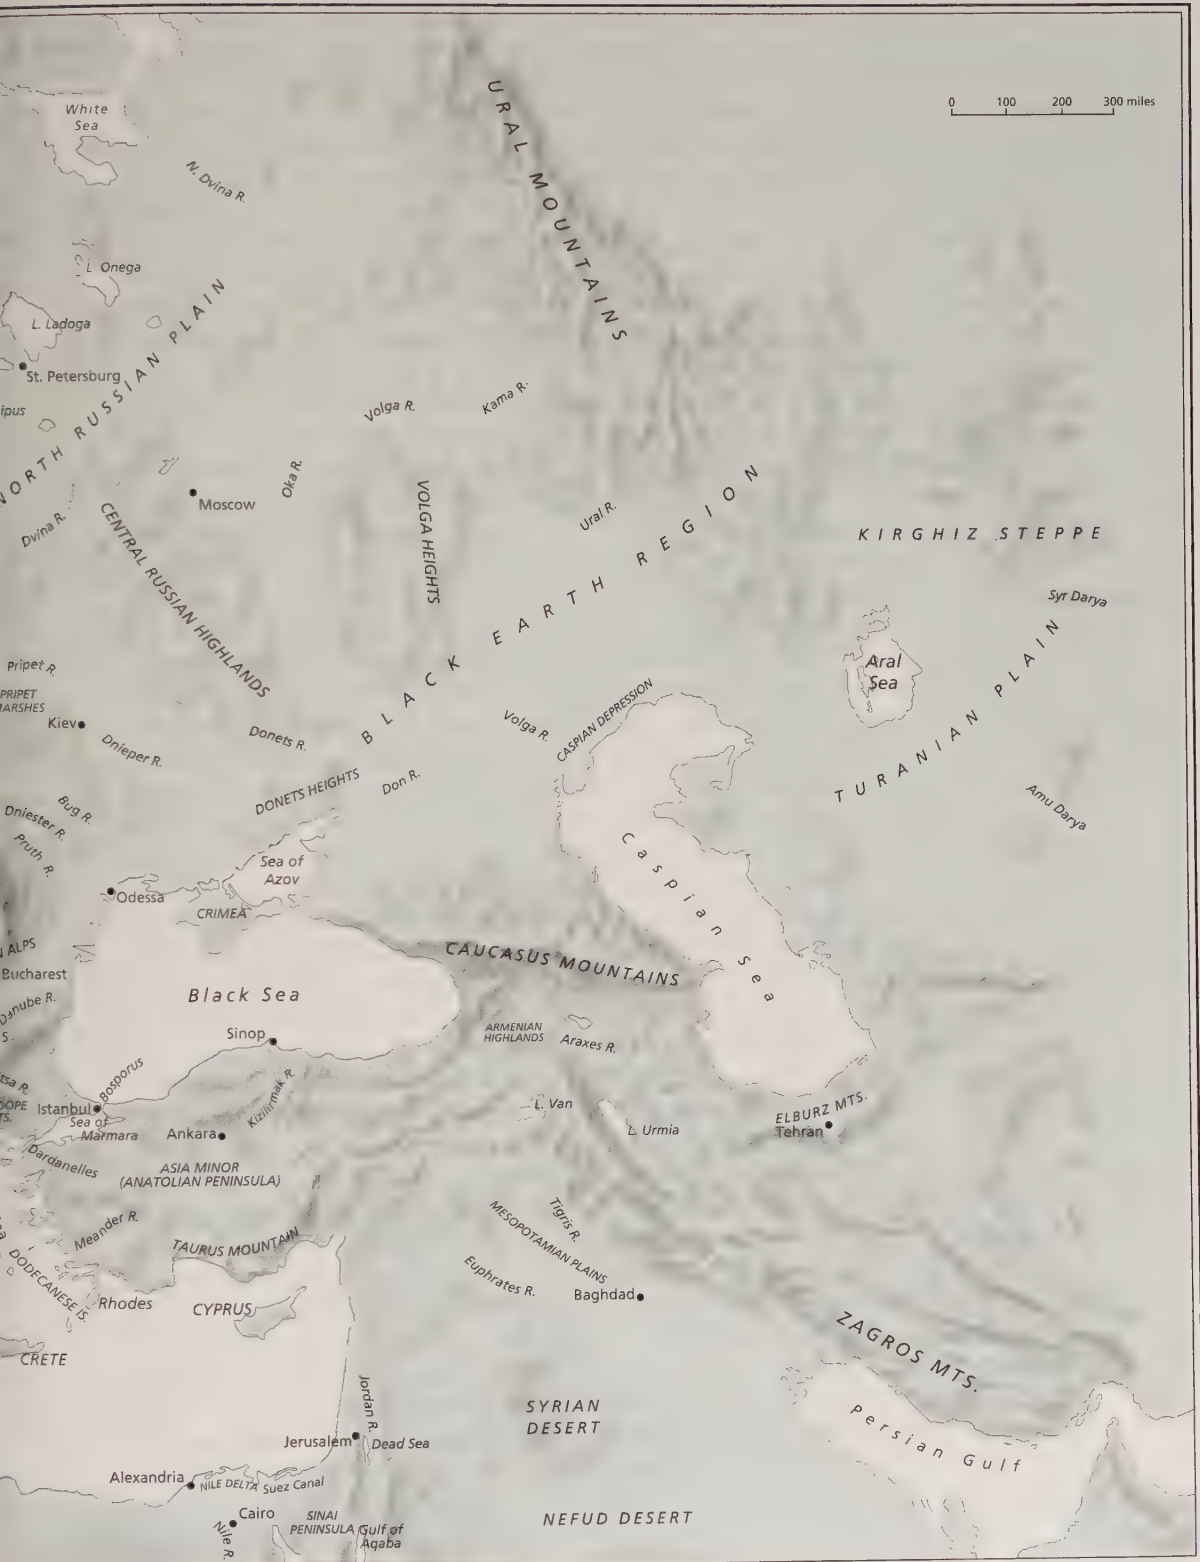

---

*Europe and history*

It is possible to narrate a “history of the modern world” from widely diverging perspectives and with an emphasis on quite different historical themes. This book, however, begins with the recognition that Europe developed and promoted many of the distinctive “modern” ideas and institutions that have now evolved in various forms throughout the contemporary world. Historical understanding of modernity must therefore include a comprehensive analysis of Europe—though an accurate history of the modern world must also insist that Europe represents only one of the diverse, complex cultures that continue to shape modern global history.

Europe exemplifies the perennial interactions between human activity and the natural environment, and the study of its historical evolution should begin with some attention to its geography. The accompanying topographical map shows the main physical features of Europe and its surrounding geographical space. This topography has remained virtually unchanged over historic time, despite the constant political and cultural transformations in European societies. Europe is not large. Even with European Russia, it contains hardly more than 6 percent of the earth's land surface, occupying about the same area as the United States mainland plus Alaska. It is only a little larger than Australia. It is physically separated from Africa by the Mediterranean Sea, although the Mediterranean historically has been as much a passageway as a barrier. A truer barrier emerged when the Sahara Desert dried up only a few thousand years ago, which suggests why northern Africa has often been as connected to southern Europe, or culturally to the Middle East, as to sub-Saharan Africa. The physical separation of Europe from Asia is even less clear. The conventional boundary has been the Ural Mountains in Russia, but they are a low and wide chain that does not stretch far enough to make an adequate boundary. The Russians themselves do not recognize any official distinction between European and Asian Russia.

---

*The Mediterranean  
Sea*

Europe is indeed one of several peninsulas jutting off from Asia, like the Arabian and Indian peninsulas. But there are differences. For one thing, the Mediterranean Sea is unique among the world's bodies of water. Closed in by the Strait of Gibraltar, which is only 8 miles wide, it is more shielded than other seas from the open ocean and is protected from the most violent ocean storms. Though over 2,000 miles long, it is subdivided by islands and peninsulas into lesser seas with identities of their own, such as the Aegean and the Adriatic, and it provides access also to the Black Sea. Because it is possible to travel great distances without being far from land, navigation developed on the Mediterranean from early times and one of the first civilizations appeared on the island of Crete. It is possible also to cross between Europe and Asia at the Bosphorus and between Europe and Africa at Gibraltar. Populations became mixed by migration, and various historic empires—the Carthaginian, Roman, Byzantine, Arabic, Spanish, Venetian, and Ottoman—have effectively used the Mediterranean to govern their component parts. After the Suez Canal was built in the nineteenth century, the Mediterranean became an important segment in the “lifeline of empire” for the British Empire in its heyday.

---

*Mountains*

In southern Europe, north of the Mediterranean and running for its whole length, is a series of mountains, produced over the geological ages by the pushing of the gigantic mass of Africa against the small Eurasian peninsula. The Pyrenees close off Spain from the north, as the Alps do Italy; the Balkan Mountains are difficult to penetrate. The only place where one can travel at water level from the Mediterranean to the north is by the valley of the Rhone River, so that France is the only country that belongs both to the Mediterranean and northern Europe. North of the mountains is a great plain extending from western France all the way into Russia and on into Asia, passing south of the Urals. If one were to draw a straight line from Amsterdam east through what is called the Caspian Gate, north of the Caspian Sea, as far as western China, one would never in traveling these 3,500 miles be higher than 2,000 feet above sea level. This plain has at various times opened Europe to Mongol and other invasions, enabled the Russians to move east and create a huge empire, and made Poland a troubled battleground.

---

*Rivers*

The European rivers are worth particular attention. Most are navigable, and they also give access to the sea. With their valleys, they provided areas

where intensive local development could take place. Thus the most important older cities of Europe are on rivers—London on the Thames, Paris on the Seine, Vienna and Budapest on the Danube, Warsaw on the Vistula. In northern Europe it was often possible to move goods from one river to another, and then in the eighteenth century to connect them by canals. The importance of water is shown again by the location of Copenhagen, Stockholm, and St. Petersburg on the Baltic and of Amsterdam and Lisbon, which grew rapidly after Europeans began traversing the Atlantic Ocean.

There are important geographical conditions such as climate that a topographical map cannot show. Climate depends on latitude, ocean currents, and winds that bring or withhold rainfall. Europe lies as far north as the northern United States and southern Canada, but the parts of Europe near the sea have less extreme temperatures than the corresponding northerly regions of North America. The Mediterranean countries have more sunshine and less severe winters than either northern Europe or the northern United States. Everywhere the winters are cold enough to suppress infectious pathogens and pests and keep out certain diseases that afflict warmer countries. The warm summers with their growing seasons have produced an annual cycle of agriculture, and rainfall has been adequate but not excessive. Europe is the only continent that has no actual desert. It is also for the most part a region of fertile soil. In short, since the end of the Ice Age, or since humans learned to survive winters, Europe has been one of the most favored places on the globe for human habitation.

---

---

*Climate*

If we say that climate and the environment not only set limits but also provide opportunities for what human beings can do, then there is no such thing as geographical determinism. Geography is not destiny. What happens depends on the application of knowledge and abilities in any particular time and place and in any particular culture. What constitutes a natural resource varies with the state of technology and the possibilities of economic exchange. Even the disadvantages of distance can be overcome by developing new means of transportation. The oceans that long divided human beings became a highway for the Portuguese, Spanish, Dutch, French, and English, and later for others. Chinese and Arab sailors also used the oceans for trade across Asia and East Africa. For most of human history, however, neither persons, information, nor commands could travel much more than 30 miles a day. Localism prevailed, and large-scale commercial or governmental organizations were hard to create and maintain. Like most other regions of the world, therefore, Europe was long made up of small local units, pockets of territory each with its own customs, way of life, and manner of speech, largely unknown to or ignorant of others, and looking inward upon itself. A “foreigner” might come from a thousand miles away, or from only ten.

---

---

*Geographical determinism*

Agriculture, like commerce and industry, depends on human invention and decision making. The state of agriculture obviously depends on natural conditions, but it has also depended historically on the invention of the plow, the planting of appropriate crops, the rotation of fields to prevent soil exhaustion, and the availability of livestock from which manure could be obtained as fertilizer. It benefits from stability and is affected by demographic changes. If population grows, new and less fertile or more distant areas must be brought under cultivation. Nor can agriculture be improved without the building of roads and a division of labor between town and country, in which agrarian workers produce surpluses for those not engaged in agriculture. And for agriculture, as for other productive enterprises, elementary security is essential. Farming cannot proceed, nor food be stored over the winter, unless the men and women who work the fields can be protected from attack.

---

---

*Agriculture*

The maps in the present volume cannot show in detail all of the waterways, mountains, and geographical barriers that have helped to shape the course of human history, but they do point to the role of geography in the evolution of political and economic power, or what has become known as geopolitics. Human beings have always developed their institutions and cultures through a complex relation with the natural world, and maps remind us that all human activities take place in geographical space. Readers can also use their imaginations and the scale of maps to convert space into time, remembering that until the invention of the railroad both people and news traveled far more slowly than today. At a rate of 30 miles a day it would take three weeks to travel from London to Venice, and at least six weeks for an exchange of letters. Communication to places outside Europe took even longer. In our own day, when we travel at supersonic speeds and measure electronic communication in nanoseconds, or one-billionth of a second, the barriers of geographic space have virtually disappeared. Yet human beings remain profoundly dependent on their natural environments, and human history remains firmly embedded in the geography of the planet earth.

# THE RISE OF EUROPE

1. Ancient Times: Greece, Rome, and Christianity
2. The Early Middle Ages: The Formation of Europe
3. The High Middle Ages: Secular Civilization
4. The High Middle Ages: The Church

*It may seem strange for a history of the modern world to begin with the European Middle Ages, for Europe is not the world and the Middle Ages were not modern. But much of what is now meant by “modern” made its first appearance in Europe, and to understand both modern Europe and the wider modern world it is necessary to reach fairly far back in time.*

Over the centuries between roughly 1500 and 1900, Europe created the most powerful combination of political, military, economic, technological, and scientific apparatus that the world had ever

seen. In doing so, Europe radically transformed itself, and also profoundly affected other societies and cultures in America, Africa, and Asia—sometimes destroying them, sometimes stimulating or enlivening them, and always presenting them with problems of resistance or adaptation. This European ascendancy became apparent about 300 years ago. It reached its zenith with the European colonial empires at the beginning of the twentieth century. Since then, the position of Europe has relatively declined, partly because of conflicts within Europe itself, but mainly because the apparatus which had made Europe so dominant can now be found in other countries. Some, like the United States, are in many ways cultural and political offshoots of Europe. Others have very different and ancient backgrounds. But whatever their backgrounds, and willingly or not, all peoples in the contemporary world have been caught up in processes of “modernization” or “development,” which usually turns out to mean acquiring or adapting some of the technical skills and powers first exhibited by Europeans.

There is thus in our time a kind of global modern civilization which overlies or penetrates the diverse, regional cultures of the world. This civilization is an interlocking global system, in that conditions on one side of the globe have repercussions on the other. Communications are almost instantaneous and news travels everywhere. If the air is polluted in one country, neighboring countries are affected; if oil ceases to flow from the Middle East, the life of Europe, North America, and Japan may become very difficult. The modern world depends on elaborate means of transportation; on science, industry, and machines:

on new sources of energy to meet insatiable demands; on scientific medicine, public hygiene, and methods of raising food. States and nations fight wars by advanced methods, and negotiate or maintain peace by diplomacy. There is an earth-encompassing network of finance and trade, loans and debts, investments and bank accounts, with resulting fluctuations in monetary exchanges and balances of payments. Some 190 very unequal and dis-united members compose the United Nations and represent every region of the world, but the very concept of the nation, as represented in that body, is derived largely from Europe.

In most modern countries there have been pressures for increased democracy, and all modern governments, democratic or not, seek to arouse the energies and support of their populations. In a modern society old customs loosen, and ancestral religions are often questioned or transformed. There are usually demands for individual liberation, and an expectation of a higher standard of living. Modern societies typically move toward more equality between sexes and races, between adherents of different religions, or between different parts of the same country; and most modern governments try to reduce the gap between very high and low incomes. Movements for social change may be slow and gradual, or revolutionary and catastrophic, but movement of some kind is universal.

Such are a few of the historical trends of modernity. New “modernizing” forms of technology, culture, or economic organization now emerge in many different regions of the world, but most of the early patterns of modernity appeared first in Europe or in the extension of European societies (including the United States). The present book thus deals mainly with the historical growth of European societies and civilization, with increasing attention in later chapters to the earth as a whole. Antimodern movements and protests have also been part of modern world history. When they occur in Asia or Africa, they are often called anti-Western, as if to show that Europe and the “West” have been at the heart of the problem. Even those movements that most vigorously challenge Western social and cultural systems must confront the institutions, ideas, and legacies of modern European history.

If “modern” refers especially to a certain complicated way of living, it has also another sense, meaning merely what is recent or current. As a time span the word “modern” is purely relative. It depends on what we are talking about. A modern kitchen may be as much as 5 years old, modern physics is about 100 years old, modern science over 300, the modern European languages about 1,000. Modern civilization, the current civilization in which we are living, and which is always changing, is in one sense a product of the last two centuries, but in other senses it is much older. Roughly speaking, it may be said that modern times began in Europe about 1500. Modern times were preceded by a period of 1,000 years called the Middle Ages, which set in about A.D. 500, and which were in turn preceded by about another 1,000 years of classical Greek and Roman civilization. Before that reached the long histories of Egypt and Mesopotamia, and, further east, of the Indus Valley and China. All times prior to the European Middle Ages are commonly called “ancient.” But the whole framework—ancient, medieval, and modern—is largely a matter of words and convention, whose meaning developed mainly with reference to Europe. We shall begin our history with a running start, and slow down the pace, surveying the scene more fully in proportion as the times grow more “modern.”

## 1. ANCIENT TIMES: GREECE, ROME, AND CHRISTIANITY

Europeans were by no means the pioneers of human civilization. Half of recorded history had passed before anyone in Europe could read or write. The priests of Egypt began to

keep written records between 4000 and 3000 B.C., but 2,000 years later the poems of Homer were still being circulated in the Greek city-states by word of mouth. Shortly after 3000 B.C., while the pharaohs were building the pyramids, Europeans were laboriously setting up the huge, unwrought stones called megaliths, of which Stonehenge is the best-known example. In a word, until after 2000 B.C., Europe was in the Neolithic or New Stone Age. This was in truth a great age in human history, the age in which human beings learned to make and use sharp tools, weave cloth, build living quarters, domesticate animals, plant seeds, harvest crops, and sense the returning cycles of the months and years. But the Middle East—Egypt, the Euphrates and Tigris valley, the island of Crete, and the shores of the Aegean Sea (which belonged more to Asia than to Europe)—had reached its Neolithic Age 2,000 years before Europe. By about 4000 B.C. the Middle East was already moving into the Bronze Age.

After about 2000 B.C., in the dim, dark continent that Europe then was, great changes began that are now difficult to trace. Europeans, too, learned how to smelt and forge metals, with the **Bronze Age** setting in about 2000 B.C. and the **Iron Age** about 1000 B.C. There was also a steady infusion of new peoples into Europe. They spoke languages related to languages now spoken in India and Iran, to which similar peoples migrated at about the same time. All these languages (whose interconnection was not known until the nineteenth century) are now referred to as **Indo-European**, and the people who spoke them became the ancestors both of the classical Greeks and Romans and of the Europeans of modern times. All European languages today are Indo-European with the exceptions of Basque, which is thought to be a survival from before the Indo-European invasion, and of Finnish and Hungarian, which were brought into Europe from Asia some centuries later. It was these invading Indo-Europeans who diffused over Europe the kind of speech from which the Latin, Greek, Germanic, Slavic, Celtic, and Baltic languages were later derived.

---

---

Indo-Europeans

### *The Greek World*

The first Indo-Europeans to emerge into the clear light of history, in what is now Europe, were the Greeks. They filtered down through the **Balkan peninsula** to the shores of the Aegean Sea about 1900 B.C., **undermining the older Cretan civilization** and occupying most of what has since been called Greece by 1300 B.C. Beginning about 1150 B.C., other Greek-speaking tribes invaded from the north in successive waves. The newcomers included many restless, rough, and warlike tribes, and their coming ushered in several centuries of chaos and unrest before a gradual stabilization and revival began in the ninth century. The *Iliad* and the *Odyssey*, written down about 800 B.C., but composed and recited much earlier, probably refer to wars between the Greeks and other centers of civilization, of which one was at Troy in Asia Minor. The siege of Troy is thought to have occurred about 1200 B.C.

---

---

Greek accomplishments

The ancient Greeks proved to be an exceptionally gifted people, achieving supreme heights in thought and letters. They absorbed the knowledge of earlier eastern cultures, the mathematical lore of the ancient Chaldeans, and the arts and crafts that they found in Asia Minor and on voyages to Egypt. They added immediately to everything that they learned. It was the Greeks of the fifth and fourth centuries B.C. who formulated what the Western world long meant by the beautiful, and who first speculated on political freedom.

**The Parthenon, constructed in ancient Athens during the fifth century B.C. to honor the goddess Athena, gave architectural form to the Greek respect for balance, order, and symmetry.** (Scala/Art Resource, NY)

As they settled down, the Greeks formed tiny **city-states**, all independent and often at war with one another, each only a few miles across, and typically including a coastal city and its adjoining farmlands. **Athens, Corinth, and Sparta** were such city-states. Many were democratic, which meant that all male citizens could congregate in the marketplace to elect officials and discuss their public business. They were not democratic in a modern sense in that slaves, resident noncitizens (called “metics”), and women were excluded from political life.

Politics was turbulent in the small Greek states. Democracy alternated with aristocracy, oligarchy, despotism, and tyranny. From this rich fund of experience was born systematic political science as set forth in the unwritten speculations of **Socrates** and in the *Republic* of Plato and the *Politics* of Aristotle in the fourth century B.C. The Greeks also were the first to write history as a subject distinct from myth and legend. **Herodotus**, “the Father of History,” traveled throughout the Greek world and far beyond, ferreting out all he could learn of the past; and **Thucydides**, in his account of the wars between Athens and Sparta, presented history as a guide to enlightened citizenship and constructive statecraft.

---

*The classical virtues*

Perhaps because they were a restless and vehement people, the Greeks came to prize the “classical” virtues, which they were the first to define and which would have great influence in the subsequent history of European societies. For them, the ideal lay in moderation, or a golden mean. They valued order, balance, symmetry, clarity, and control. Their statues of idealized males revealed their conception of what humans ought to be—noble creatures, dignified, poised, unterrified by life or death, masters of themselves and their feelings. Their architecture, as in the **Parthenon**, made use of exactly measured angles and rows of columns. The classical “order,” or set of

carefully wrought pillars placed in a straight line at specified intervals, represented the firm impress of human reason on the brute materials of nature. The same sense of form was thrown over the torrent of human words. Written language became contrived, carefully planned, organized for effect. The epic poem, the lyric, the drama, the oration, along with history and the philosophical dialogue, each with its own rules and principles of composition, became the “forms” within which, in Western civilization, writers long expressed their thoughts.

Reflecting on the world about them, Greek philosophers concluded that something more fundamental existed beyond the world of appearances, that true reality was not what met the eye. With other peoples, and with the Greeks themselves in earlier times, this same realization had led to the formation of myths, dealing with invisible but mighty beings known as gods and with faraway places on the tops of mountains, beneath the earth, or in a world that followed death. Greek thinkers set to criticizing the web of myth. They looked for rational or natural explanations behind the variety and confusion that they saw. Some, observing human sickness, said that disease was not a demonic possession, but a natural sequence of conditions in the body, which could be identified, understood, and even treated in a natural way. Others, turning to physical nature, said that all matter was in reality composed of a very few things—made up of atoms or elements—which they usually designated as fire, water, earth, and air. Some said that change was a kind of illusion, all basic reality being uniform; some, that only change was real, and that the world was in flux. Some, like Pythagoras, found the enduring reality in “number,” or mathematics. The Greeks, in short, laid the foundations for science. Studying also the way in which the mind worked, or ought to work, if it was to reach truthful conclusions, they developed the science of logic. The great codifier of Greek thought on almost all subjects in the classical period was Aristotle, who lived in Athens from 384 to 322 B.C.

---

*Spread of Greek civilization*

Greek influence spread widely and rapidly. Hardly were some of the city-states founded when their people, crowded within their narrow bounds, sent off some of their number with equipment and provisions to establish colonies. In this way Greek cities were very early established in south Italy, in Sicily, and even in the western Mediterranean, where Marseilles was founded about 600 B.C. Later the Greek city-states, unable to unite, succumbed to conquest by Philip of Macedon, who came from the relatively crude northern part of the Greek world, and whose son, Alexander the Great (356–323 B.C.), led a phenomenal, conquering march into Asia, across Persia, and on as far as India itself. Alexander’s empire did not hold together, but Greek civilization, after having penetrated the western Mediterranean, now began to influence the ancient peoples of Egypt and the Middle East. Greek thought, Greek art, and the Greek language spread far and wide, drawing at the same time on the knowledge and creativity of other ancient cultures. The most famous “Greeks” after the fourth century B.C. and on into the early centuries of the Christian era usually did not come from Greece but from the Hellenized Middle East, and especially from Alexandria in Egypt. Among these later Greeks were the great summarizers or writers of encyclopedias in which ancient science was passed on to later generations—Strabo in geography, Galen in medicine, Ptolemy in astronomy. All three lived in the first and second centuries A.D.

### *The Roman World*

In 146 B.C. the Greeks of Greece were conquered by a new people, the Romans, who kept their own Latin language but rapidly absorbed what they could of the intellectual and artistic culture of the Greeks. Over a period of two or three centuries they assembled an empire

**The Forum was the vital center of Roman public life and a symbol of imperial power. Rome's distinctive sense of grandeur and social order can still be discerned in the Forum's ruins, which are pictured here with the famous coliseum in the background.**

(Royalty-Free/CORBIS)

in which the whole world of ancient civilization (west of Persia) was included. Egypt, Greece, Asia Minor, Syria all became Roman provinces, but in them the Romans had hardly any deep influence except in a political sense. In the West—in what are now Tunisia, Algeria, Morocco, Spain, Portugal, France, Switzerland, Belgium, and England—the Romans, though ruthless in their methods of conquest, in the long run acted as civilizing agents, transmitting to these hitherto isolated countries the age-old achievements of the East and the more recent culture of Greece and of Rome itself. So thorough was the Romanization that in the West Latin even became the commonly spoken language. It was later displaced by Arabic in Africa but survives to this day, transformed by time, in the Romance languages of France, Italy, Spain, Portugal, and Romania.

---

#### *The Roman Empire*

In the Roman Empire, which lasted with many vicissitudes from about 31 B.C. to the latter part of the fifth century A.D., virtually the entire civilized world of the ancient West was politically united and enjoyed generations of internal peace. Rome was the center, around which in all directions lay the “circle of lands,” the *orbis terrarum*, the known world—that is, as known in the West, for the Han Empire at the same time in China (202 B.C. to A.D. 220) was also a highly organized cultural and political entity. The Roman Empire consisted essentially of the coasts of the Mediterranean Sea, which provided the great artery of transport and communication, and from which no part of the empire, except northern Gaul (France), Britain, and the Rhineland, was more than a couple of hundred miles away. Civilization among the elites in this vast empire was remarkably uniform; there were no distinct nationalities, and the most significant cultural difference was that east of Italy the predominant language was Greek;

in Italy and west of it, Latin. Cities grew up everywhere, engaged in a busy commercial life, exchanged ideas with one another, and, like the cities in other ancient cultures, relied on the labor of slaves. There were always more cities in the East, where most of the manufacturing crafts and the densest population were still concentrated, but they sprang up now in the West—indeed, most of the older cities of France, Spain, England, and western and southern Germany boast of some kind of origin under the Romans.

The distinctive aptitude of the Romans lay in organization, administration, government, and law. Never before had armies been so systematically formed, maintained over such long periods, dispatched at a word of command over such distances, or maneuvered so effectively on the field of battle. Never had so many peoples been governed from a single center. The Romans had at first possessed self-governing and republican institutions, but they lost them in the process of conquest, and the governing talents which they displayed in the days of the empire were of an authoritarian character—talents, not for self-government, but for managing, coordinating, and ruling the manifold and scattered parts of one enormous system. Locally, cities and city-states enjoyed a good deal of autonomy. But above them all rose a pyramid of imperial officials and provincial governors, culminating in the emperor at the top. The empire kept peace, the *pax Romana*, and even provided a certain justice for its many peoples. Lawyers worked on the body of principles known ever afterward as Roman law.

---

*The pax Romana*

Roman judges had somehow to settle disputes between persons of different regions, with conflicting local customs, for example, two merchants of Spain and Egypt. The Roman law came therefore to hold that no custom is necessarily right, that there is a higher or universal law by which fair decisions may be made, and that this higher, universal, or “natural” law, or “law of nature,” will be understandable or acceptable to everyone, since it arises from human nature and reason. Here the lawyers drew on Greek philosophy for support. They held also that law derives its force from being enacted by a proper authority (not merely from custom, usage, or former legal cases); this authority to make law they called *majestas*, or sovereign power, and they attributed it to the emperor. Thus the Romans emancipated the idea of law from mere custom on the one hand and mere caprice on the other; they regarded it as something to be formed by enlightened intelligence, consistent with reason and the nature of things; and they associated it with the solemn action of official power. It must be added that Roman law favored the state, or the public interest as seen by the government, rather than the interests or liberties of individual persons, and it generally provided men with more legal privileges than women. These principles, together with more specific ideas on such matters as property, debt, marriage, and wills were in later centuries to have a great effect in Europe.

### *The Coming of Christianity*

The thousand years during which Greco-Roman civilization arose and flourished were notable in another way even more momentous for all later human history. It was in this period that the great world religions came into being. Within the time bracket 800 B.C.—A.D. 700 the lives of Confucius and Buddha, of the major Jewish prophets, and of Muhammad are all included. At the very midpoint (probably about 4 B.C.), in Palestine in the Roman Empire, a man named Jesus was born, believed by his followers to be the Son of God. Like Jesus, the first Christians were Jews; but both under the impulse of its own doctrine, which held that all people were alike in spirit, and under the strong leadership of Paul, a man of Jewish birth, Roman citizenship, and Greek culture, Christianity began to

make converts. The new religion gradually fused the monotheism of Judaism and its ethical teachings with various themes in Greek philosophy, creating a new synthesis of Judeo-Greek thought that would shape much of the later history of ideas in Western cultures. Christianity gained adherents across most of the Roman Empire, and there were certainly a few Christians in Rome by the middle of the first century. Both Paul and the elder apostle, Peter, according to church tradition, died as martyrs at Rome in the time of the Emperor Nero about A.D. 67.<sup>1</sup>

---

*Emergence and spread  
of Christianity*

The Christian teaching spread at first among the poor, the people at the bottom of society, those whom Greek glories and Roman splendors had passed over or enslaved, and who had the least to delight in or to hope for in the existing world. Women were also drawn to the new religion, perhaps in part because early Christianity offered them more autonomy and more opportunities for leadership than they found in the traditional patriarchal order of Roman law and families. Gradually Christian ideas reached the upper classes; a few classically educated and well-to-do people became Christians; in the second century Christian bishops and writers were at work publicly in various parts of the empire. In the third century the Roman government, with the empire falling into turmoil, and blaming the social troubles on the Christians, subjected them to wholesale persecution. In the fourth century (possibly in A.D. 312) the Emperor Constantine accepted Christianity. By the fifth century the entire Roman world was formally Christian; no other religion was officially tolerated; and the deepest thinkers were Christians who combined Christian beliefs with the now thousand-year-old tradition of Greco-Roman thought, philosophy, and social institutions.

It is impossible to exaggerate the importance of the coming of Christianity. It brought with it, for one thing, an altogether new sense of human life. Where the Greeks had demonstrated the powers of the mind, the Christians explored the soul, and they taught that in the sight of God all souls were equal, that every human life was sacrosanct and inviolate, and that all worldly distinctions of greatness, beauty, and brilliancy were in the last analysis superficial. Where the Greeks had identified the beautiful and the good, had thought ugliness to be bad, and had shrunk from disease as an imperfection and from everything misshapen as horrible

---

*Christian beliefs*

and repulsive, the Christians resolutely saw a spiritual beauty even in the plainest or most unpleasant exterior and sought out the diseased, the crippled, and the mutilated to give them help. Love, for the ancients, was never quite distinguished from Venus; for the Christians, who held that God was love, it took on deep overtones of sacrifice and compassion. Suffering itself was in a way divine, since God had also suffered on the Cross in human form. A new dignity was thus found for suffering that the world could not cure. At the same time the Christians worked to relieve suffering as none had worked before. They protested against the massacre of prisoners of war, against the mistreatment and degradation of slaves, against the sending of gladiators to kill each other in the arena for another's pleasure. In place of the Greek and pagan self-satisfaction with human accomplishments they taught humility in the face of an almighty Providence, and in place of proud distinctions between high and low, slave and free, civilized and barbarian, they held that all men and women were alike because all were children of the same God.

---

<sup>1</sup>The terms B.C. (Before Christ) and A.D. (Annō Domini) are generally used now with little attention to their religious origin. With so many creeds and faiths in the modern world employing this system of calculating dates, readers will increasingly encounter the substitute usage B.C.E. (Before the Common Era) and C.E. (Common Era).

On an intellectual level Christianity also marked a revolution. It was Christianity, not rational philosophy, that dispelled the swarm of greater and lesser gods and goddesses; the blood sacrifices and self-immolation; or the frantic resort to magic, fortune-telling, and divination. The Christians taught that there was only one God. The pagan conception of local, tribal, or national gods disappeared. For all the world there was only one plan of Salvation and one Providence, and all human beings took their origin from one source. The idea of the world as one thing, a "universe," was thus affirmed with a new depth of meaning. The very intolerance of Christianity (which was new to the ancient world) came from this sense of human unity, in which it was thought that all people should have, and deserved to have, the one true and saving religion.

The Christians were often denounced and persecuted for their political ideas. The Roman Empire was a world state; there was no other state but it; no living human being except the emperor was sovereign; no one anywhere on earth was his equal. Between gods and human beings, in the pagan view, there was moreover no clear distinction. Some gods behaved very humanly, and some human creatures were more like gods than others. The emperor was held to be veritably a god. A cult of Caesar was established, regarded as necessary to maintain the state, which was the world itself. All this the Christians firmly refused to accept. It was because they would not worship Caesar that the Roman officials regarded them as social incendiaries who must be persecuted and stamped out.

---

---

Persecution

The Christian doctrine on this point went back to the saying gathered from Jesus, that one should render to Caesar the things that were Caesar's, and to God those that were God's. The same dualism was presented more systematically by St. Augustine about A.D. 420 in his *City of God*. Few books have been more influential in shaping the later development of Western civilization.

The "world," the world of Caesar, in the time of St. Augustine, was going to ruin. Rome itself was plundered in 410 by heathen barbarians. Augustine wrote the *City of God* with this event obsessing his imagination. He wrote to show that though the material world could perish there was yet another world that was more enduring and more important.

---

---

St. Augustine

There were, he said, really two "cities," the earthly and the heavenly, the temporal and the eternal, the city of man and the City of God. The earthly city was the domain of state and empire, of political authority and political obedience. It was a good thing, as part of God's providential scheme for human life, but it had no inherently divine character of its own. The emperor was human. The state was not absolute; it could be judged, criticized, or corrected from sources outside itself. It was, for all its majesty and splendor, really subordinate in some way to a higher and spiritual power. This power lay in the City of God. By the City of God Augustine meant many things, and readers found all sorts of meanings in later ages. The heavenly city might mean heaven itself, the abode of God and of blessed spirits enjoying life after death. It might mean certain elect spirits of this world, the good people as opposed to the bad. It might, more theoretically, be a system of ideal values or ideal justice, as opposed to the crude approximations of the actual world.

In any case, with this Christian dualism the Western world escaped from what is called Caesaropapism, a political system in which one person holds the powers of ruler and of pontiff. Instead, the spiritual power and the political power were held to be separate and independent. In later times popes and kings often quarreled with each other; the clergy often struggled for political power, and governments have often attempted to dictate what people should believe, or

---

---

Caesaropapism

**St. Augustine’s wisdom and influence on Christian theology were honored throughout the Middle Ages; he appears here in a medieval illustration, dispensing truths from a celestial throne.**  
(Scala/Art Resource, NY)

love, or hope for. But speaking in general of European history neither side has ever won out, and in the sharp distinction between the spiritual and the temporal has lain the germ of many liberties in later societies. At the same time the idea that no ruler, no government, and no institution is too mighty to rise above moral criticism eventually opened the way to a dynamic and progressive way of living in the West.

## 2. THE EARLY MIDDLE AGES: THE FORMATION OF EUROPE

There was really no Europe in ancient times. In the Roman Empire we may see a Mediterranean world, or even a West and an East in the Latin- and Greek-speaking portions. But

the West included parts of Africa as well as of Europe, and Europe as we know it was divided by the Rhine-Danube frontier, south and west of which lay the civilized provinces of the empire, and north and east the “barbarians” of whom the Roman world knew almost nothing. To the Romans “Africa” meant Tunisia-Algeria; “Asia” meant the Asia Minor peninsula; and the word “Europe,” since it meant little, was scarcely used by them at all. It was in the half-millennium from the fifth to the tenth centuries that Europe as such for the first time emerged with its peoples brought together in a life of their own, clearly set off from Asia or Africa and beginning to create a culture that would become “Western.”

### *The Disintegration of the Roman Empire*

The Roman Empire began to fall apart, especially in the West, and the Christianizing of the empire did nothing to impede its decline. The Emperor Constantine, who in embracing Christianity undoubtedly hoped to strengthen the imperial system, also took one other significant step. In A.D. 330 he founded a new capital at the old Greek city of Byzantium, which he renamed Constantinople. (It is now Istanbul.) Thereafter the Roman Empire had two capitals, Rome and Constantinople, and was administered in two halves. Increasingly the center of gravity moved eastward, as if returning to the more ancient centers in the Middle East, as if the experiment of civilizing the West were to be given up as a failure.

---

---

*Founding of  
Constantinople*

Throughout its long life the empire had been surrounded on almost all sides by people whom the Romans called “barbarians”—wild Celts in Wales and Scotland, Germans in the heart of Europe, Persians or Parthians in the East (“barbarian” only in the ancient sense of speaking neither Greek nor Latin), and, in the southeast, the Arabs. These barbarians, always with the exception of Persia, had never been brought within the pale of ancient Greek or Roman civilization. Somewhat like the Chinese, who about 200 B.C. built several walls to solve the same problem, the Romans simply drew a line beyond which they themselves rarely ventured and would not allow the barbarians to pass. Nevertheless outsiders filtered into the empire. As early as the third century A.D. emperors and generals recruited bands of them to serve in the Roman armies. Their service over, they would receive farmlands, settle down, marry, and mingle with the population. By the fourth and fifth centuries a good many such individuals were even reaching high positions of state.

At the same time, in the West, for reasons that are not fully understood, the activity of the Roman cities began to falter, commerce began to decay, local governments became paralyzed, taxes became more ruinous, and free farmers were bound to the soil. The army seated and unseated emperors. Rival generals fought with each other. Gradually the West fell into decrepitude, and the old line between the Roman provinces and the barbarian world made less and less difference.

---

---

*Decline in the West*

After some centuries of relative stability, the barbarians themselves, pressed by more distant peoples from Asia, rather suddenly began to move. Sometimes they first sought peaceable access to the empire, attracted by the warmer Mediterranean climate, or desiring to share in the advantages of Roman civilization. More often, Germanic tribes moved swiftly and by force, plundering, fighting, and killing as they went. In 476 a barbarian chieftain deposed the last Roman emperor in the West. Sometimes in the general upheaval peoples from Asia rapidly intermixed with other populations in the old Roman Empire. The most famous of these invaders were the Huns, who cut through central Europe and France about 450 under their

---

---

*Barbarian invasions*

leader Attila, the “scourge of God”—and then disappeared. Nor were these invasions all. Two centuries later new irruptions burst upon the Greco-Roman world from the southeast, where hitherto outlying peoples poured in from the Arabian deserts. The Arabs, aroused by the new faith of Islam (Muhammad died in 632), fell as conquerors upon Syria, Mesopotamia, and Persia; occupied Egypt about 640 and the old Roman Africa about 700; and in 711 reached Spain.

Beneath these blows the old unity of the Greco-Roman or Mediterranean world was broken. The “circle of lands” divided into three segments. Three types of civilization now confronted each other across the inland sea.

### *The Byzantine World, the Arabic World, and the West about 700*

---

#### *Byzantine Empire*

The Eastern Roman, Later Roman, Greek, or Byzantine Empire (all names for the same empire) with its capital at Constantinople, and now including only the Asia Minor peninsula, the Balkan peninsula, and parts of Italy, made up one segment of the circle of lands. It represented the most direct continuation of the ancient civilizations of the Middle East. It was Christian in religion and Greek in culture and language. Its people felt themselves to be the truest heirs both of early Christianity and of earlier cultures in Greece. Art and architecture, trades and crafts, commerce and navigation, thought and writing, government and law, while not so creative or flexible as in the classical age, were still carried on actively in the eastern empire, on much the same level as in the closing centuries of ancient times. For all Christians, and for heathen barbarians in Europe, the emperor of the East stood out as the world’s supreme ruler, and Constantinople as the world’s preeminent and almost fabulous city.

---

#### *Arabic world*

The second segment of the Mediterranean world was the Arabic and Islamic. It became the most dynamic culture in the lands of the old Roman Empire, reaching from the neighborhood of the Pyrenees through Spain and all North Africa into Arabia, Syria, and the East. Arabic was its language; it became, and still remains, the common speech from Morocco to the Persian Gulf. Islam was its religion, and it looked to the prophet Muhammad (c. 570–632) and the Qur’an (or Koran) for its religious truths. Muhammad had spent his early adult years as a merchant in Mecca on the Arabian peninsula, but he began to have a series of intense religious revelations when he was about 40 years old. These revelations led Muhammad to a devout and uncompromising monotheism, which stressed the great power of God—or Allah in Arabic—and the human duty to adhere to God’s will. Muhammad saw himself as a prophet in the Jewish and Christian tradition, but he soon came to define his revelations and teachings as the beginning of a new religion. The messages that came to Muhammad through revelation were written down in the sacred book of Islam, the Qur’an, which was organized into 114 chapters (called *suras*). Emphasizing submission to God, the importance of prayer, and an ethical obligation to help others, the Qur’an provided directions for the affairs of daily life as well as a powerful, poetic vision of the grandeur of God.

Muhammad’s revelations attracted little early support in Mecca. Indeed, the hostility there forced him to move north in 622 to the city of Medina. This famous flight (the *Hegira*) brought him to a more receptive community, where his teachings quickly gained numerous adherents and from where the first Muslims set out to spread the new faith across all of Arabia, including Mecca. Muhammad died in 632, but the new religion con-

The sixth-century emperor Justinian built the great Hagia Sophia to display his commitment to the Christian religion and the power of his capital city, Constantinople. The church became a mosque after the Byzantine Empire fell to Muslim invaders in the fifteenth century, but it remains the most famous achievement of Byzantine architecture.

(Hirmer Fotoarchiv)

tinued to expand rapidly in all directions. Leadership passed to a series of caliphs who were initially relatives of Muhammad himself. As Muslims conquered new territories and won new converts throughout the Middle East and North Africa, the lands of Islam came under the control of these caliphs. All Muslims were included in the caliphate. The ruling caliph exercised both spiritual and political authority, and he was regarded as the true religious and military successor of Muhammad himself.

Conflicts and lasting divisions nevertheless developed during the era of the third Caliph, Uthman—one of the sons-in-law of Muhammad and a leader of the Umayyad family. Supporters of Ali, a rival leader and also a son-in-law of Muhammad, killed Uthman in 656, and Ali came to power as the fourth caliph. This violence did not resolve the conflict, however, and Ali himself was soon murdered. Ali's followers refused to accept the legitimacy of the Umayyad family, which now regained control of the caliphate. A minority faction, called Shiites, continued to honor Ali and to claim that all true leaders of Islam must descend from him. Although most Muslims supported the Umayyad caliphs, the Shiite minority remained a permanent presence within Islam, sustaining the memory of Ali and challenging the religious legitimacy of the dominant Sunnis (a term that emerged later). Meanwhile, the Umayyad dynasty set up its capital in Damascus, and some members of the family eventually extended their power as far west as Spain.

The Arabic world, like the Byzantine, built upon the heritage of the Greco-Romans. In religion, the early Muslims regarded themselves as successors to the Jewish and Christian traditions. They considered the line of Jewish prophets since Abraham to be spokesmen of the true God, and they put Jesus in this line. But they added that Muhammad was the last and greatest of the prophets, that the Qur'an set forth a revelation replacing that of the Jewish Bible, that the Christian New Testament was mistaken because Christ was not divine, and that the Christian belief in a Trinity was erroneous because there was in the

strictest sense only One True God. To the Muslim Arabs, therefore, all Christians were dangerous or misguided infidels.

In mundane matters, the Arabs speedily took over the civilization of the lands they conquered. In the caliphate, as in the Byzantine Empire, the civilization of the ancient world went its way without serious interruption. Huge buildings and magnificent palaces were constructed; ships plied the Mediterranean; Arab merchants ventured over the deserts and traversed the Indian Ocean; holy or learned men corresponded over thousands of miles. The government developed efficient systems to collect taxes, enforce the laws, and keep the provinces in order. In the sciences the Arabs not only learned from but also went beyond the Greeks. They translated Greek scientific literature: we know some of it today only through these medieval Arabic versions. Arab geographers had a wider knowledge of the world than anyone had possessed up to their time. Arab mathematicians developed algebra so far beyond the Greeks as almost to be its creator (“algebra” is an Arabic word), and in introducing the “Arabic” numerals (through their contacts with India) they made arithmetic, which in Roman numerals had been formidably difficult into something that every schoolchild can be taught.

---

#### *Latin Christendom*

The third segment of the ancient Greco-Roman world was Latin Christendom, which about A.D. 700 did not look very promising. It was what was left over from the other two—what the Byzantines were unable to hold and the Arabs were unable to conquer. It included only Italy (shared in part with the Byzantines), France, Belgium, the Rhineland, and Britain. Barbarian kings were doing their best to rule small kingdoms, but in truth all government had fallen to pieces. Usually the invading barbarians remained a minority, eventually to be absorbed. Only in England, and in the region immediately west of the Rhine, did the Germanic element supersede the older Celtic and Latin. But the presence of violent invaders, armed and fierce amid peasants and city dwellers reduced to passivity by Roman rule, together with the disintegration of Roman institutions that had gone on even before the invasions, left this region in chaos.

The Western barbarians, as noted, were Germanic; and the Germanic influence became a distinctive contribution to the making of Europe. Some Germans were Christian by the fourth century, but most were still heathen when they burst into the Roman Empire. Their languages had not been written down, but they possessed an intricate folklore and religion in which fighting and heroic valor were much esteemed. Though now in a migratory phase, they were an agricultural people who knew how to work iron, and they had a rudimentary knowledge of the crafts of the Romans. They were organized in small tribes and had a strong sense of tribal kinship, which (as with many similar peoples) dominated their ideas of leadership and law. They enjoyed more freedom in their affairs than did the citizens of the Roman Empire. Many of the tribes were roughly self-governing in that all free men, those entitled to bear arms, met in open fields to hold council; and often the tribe

---

#### *Germanic customs*

itself elected its leader or king. They had a strong sense of loyalty to persons, of fealty to the acknowledged king or chief; but they had no sense of loyalty to large or general institutions. They had no sense of the state—of any distant, impersonal, and continuing source of law and rule. Law they regarded as the inflexible custom of each tribe. In the absence of abstract jurisprudence or trained judges, they settled disputes by rough and ready methods. In the ordeal, for example, a person who obstinately floated when thrown into water was adjudged guilty. In trial by battle, the winner of a kind of ritualistic duel was regarded as innocent. The gods, it was thought, would not allow wrong to prevail.

The Germans who overran the old Roman provinces found it difficult to maintain any political organization at more than a local level. Security and civil order all but disappeared. Peasant communities were at the mercy of wandering bands of habitual fighters. Fighters often captured peasant villages, took them under their protection, guarded them from further marauders, and lived off their produce. Sometimes the same great fighting man came to possess many such villages, moving with his retinue of horsemen from one village to another to support himself throughout the year. Thus originated a new distinction between lord and servant, noble and commoner, martial and menial class. Life became local and self-sufficient. People ate, wore, used, and dwelled in only what they themselves and their neighbors could produce. In contrast to the economies of the Byzantine and Islamic worlds, Western trade died down, the cities became depopulated, money went out of circulation, and almost nothing was bought or sold. The Roman roads fell into neglect; people often used them as quarries for ready-cut building blocks for their own crude purposes. The West not only broke up into localized villages but also ceased to have habitual exchanges across the Mediterranean. It lost contact with the eastern centers from which its former civilization had always been drawn. From roughly A.D. 500 on, Europe fell into what some later historians would call the “Dark Ages.”

### *The Church and the Rise of the Papacy*

Only one organized institution maintained a tie with ancient civilization. Only one institution, reaching over the whole West, could receive news or dispatch its agents over the whole area. This institution was the Christian church. Its framework still stood; its network of bishoprics, as built up in late Roman times, remained intact except in places such as England, where the barbarian conquest was complete.

In addition, a new type of religious institution spread rapidly with the **growth of monasteries**. The serious and the sensitive, both men and women (though not together, to be sure), rejected the savagery about them and retired into communities of their own. Usually they were left unmolested by rough neighbors who held them in religious awe. In a world of violence they formed islands of quiet, peace, and contemplation. Their prayers, it was believed, were of use to all the world, and their example might at the least arouse pangs of shame in more worldly people. The monastic houses generally adopted the rule of St. Benedict (c. 480–543) and were governed by an abbot. Dedicated to the same ideals, they formed unifying filaments throughout the chaos of the Latin West.

---

*Growth of  
monasteries*

Bishops, abbots, and monks looked with veneration to Rome as the spot where St. Peter, the first apostle, had been martyred. The bishop of Rome corresponded with other bishops, sent out missionaries, gave advice on doctrine when he could, and attempted to keep in mind the situation throughout the Latin world as a whole. Moreover, with no emperor any longer in Rome, the bishop took over the government and public affairs of the city. Thus the bishop of Rome, while claiming a primacy over all Christians, was not dominated by any secular power. In the East the great church functionaries, the patriarchs, fell under the influence of the emperor who continued to rule at Constantinople. A tradition of Caesaropapism grew up in the East; but in the West the independence of the bishop of Rome now confirmed in practice a principle always maintained by the great churchmen of the West—the independence of the spiritual power from the political or temporal.

The growing authority of the popes was fortified by various arguments. St. Peter, it was held, had imparted the spiritual authority given to him by Christ himself to the Roman bishops who were his successors. This doctrine of the “Petrine supremacy” was based on two verses in the Bible (Matthew xvi, 18–19), according to which Christ designated Peter as the head of the church, giving him the “power of the keys” to open and close the doors of eternal salvation. As for the pope’s temporal rule in Rome, it was affirmed that the Emperor Constantine had endowed the bishop with the government of the city. This “Donation of Constantine” was accepted as historical fact from the eighth century to the fifteenth, when it was proved to be a forgery.

---

---

*Papal authority*

It was the church that incorporated the barbarians into a higher way of life, and when barbarians embraced a more civilized way of living, it was the church that they entered. As early as about A.D. 340, the church sent out Ulfilas to convert the Goths; his translation of the Bible represents the first writing down of any Germanic language. About 496 the king of the Franks, Clovis, was converted to Christianity. A hundred years later, in 597, the king of Kent in southeast England yielded to the persuasions of Augustine of Canterbury, a missionary dispatched from Rome, and the Christianization of the Anglo-Saxons gradually followed. Missionaries from Ireland also, to which Christians of the Roman Empire had fled before the heathen barbarians, now returned to both Britain and the Continent to spread the gospel. By A.D. 700, after three centuries of turmoil, the borders of Christianity in the West were again roughly what they had been in late Roman times. Then in 711, as we have seen, the Arabs entered Spain. They crossed the Pyrenees and raced toward central Europe, but were stopped by a Christian and Frankish army in 732 at Tours on the river Loire. Islam was turned back into Spain, thereby allowing the people of Western Europe to expand their emerging Latin Christian culture.

---

---

*Conversion of the  
barbarians*

### *The Empire of Charlemagne, 800–814*

Among the Franks, in what is now northern France and the German Rhineland, there had arisen a line of capable rulers of whom the greatest was Charlemagne. The Frankish kings made it their policy to cooperate with the pope. The pope needed a protector against depredations by his barbarian neighbors and against the political claims of the Byzantine Empire upon the city of Rome. The Frankish kings, in return for protection thus offered, won papal support to their side. This made it easier for them to control their own bishops, who were more often seen on horseback than in the episcopal chair, and was of use in pacifying their own domains and in wars of conquest against the heathen. In the year 800, in Rome, the pope crowned Charlemagne as emperor of the West. Frankish king and Roman

### THE MEDITERRANEAN WORLD about A.D. 400, 800, and 1250

Greco-Roman civilization, centered about the Mediterranean, was officially Christian and politically unified under the Roman Empire in A.D. 400 but broke apart into three segments in the early Middle Ages. Each segment developed its own type of life. Each segment also expanded beyond the limits of the ancient Mediterranean culture. By 1250 Latin Christendom reached to the Baltic and beyond. Greek Christendom penetrated north of the Black Sea to include the Russians. The Muslim world spread into inner Asia and Africa. In 1250, and until 1492, the Muslims, or Moors, still held the southern tip of Spain. Jews lived in varying numbers in each of the three segments.

**This image of a monastery in a medieval Spanish manuscript shows how the early monks became known for their learning as well as their religious contemplation and disciplined labor.**

bishop both believed that if only the Roman Empire could be restored peace and order might once more reign. Church and empire, religion and the state, were to be as two mighty swords employed in the same holy cause.

---

#### *Charlemagne*

Charlemagne crossed the Pyrenees and won back the northeastern corner of Spain to Christian rule. He overthrew and subordinated the barbarian kings who had set themselves up in northern Italy. He sent forces down the Danube, penetrated into Bohemia, and proceeded against some of the still heathen Germans (the Saxons) who lived along the river Elbe, and whom he either massacred or converted to Christianity. All these regions he brought within his new empire. Except for England and Ireland, which remained outside, the borders of his empire were coextensive with those of the Latin Christian world.

Once more, to a degree, the peoples of Western Europe were united under an empire. But a momentous change had occurred. Its capital did not lie in the ancient world of the Mediterranean. Its capital was now in northern Europe at Aix-la-Chapelle, or Aachen, near the mouth of the Rhine. Its ruler, Charlemagne, was a German of an ethnic group which had remained outside ancient civilization. Its people were Germans, French, and Italians, or, more precisely, the ancestors from whom these nationalities were to emerge. In the Greco-Roman world the north had always been at best provincial. Now the north became a center in its own right. Charlemagne dispatched embassies to the Byzantine emperor at Constantinople and to Harun al-Rashid, the great Muslim caliph at Baghdad. In intellectual matters, too, the north now became a capital. Centuries of violence and confusion had virtually destroyed education and systematic learning, even for the most powerful families in Europe. Charlemagne himself, though he understood Latin, could barely read and never learned to write. He used his

---

#### *Revival of learning*

authority, however, to revive the all but forgotten ancient learning and to spread education at least among the clergy. To his palace school came scholars from England, Germany, France, Italy, Spain. They wrote and spoke in Latin, the only Western language in which complicated ideas could at the time be expressed. Disintegrating ancient manuscripts were copied and recopied to assure a more abundant supply for study—always by hand, but in a more rapid script than had before been used. This so-called “Carolingian minuscule,” evolved into the small letters of the modern Western alphabet, only the capital letters being Roman. Meanwhile, Charlemagne sought to foster commerce by creating a new and more reliable coinage, which was based on silver, the gold coins of the Roman Empire having long since vanished.

### *Ninth-Century Invasions; Europe by 1000*

In Charlemagne’s empire we first see the shape of Europe as a unit of society and culture distinct from the Mediterranean world of antiquity. The empire did not last. New waves of invaders assailed Western Christendom in the ninth century. The Magyars (called in Latin “Hungarians”) terrified various parts of Europe until they settled down on the middle Danube about the year 900. New Germanic tribes uprooted themselves, coming this time from Scandinavia, and variously known as Norse, Vikings, or Danes. Bursting out in all directions, they reached Kiev in Russia in 864, discovered Iceland in 874, and even touched America in 1000. In the Christian world they assaulted the coasts and pushed up the rivers but settled in considerable numbers only in the Danelaw in England and in Normandy in France. Meanwhile the Arabs raided the shores of France and Italy and occupied Sicily. Nowhere was the power of government strong enough to ward off such attacks. Everywhere the harassed local population found its own means of defense or, that failing, was slaughtered, robbed, or carried off into slavery.

---

*Second wave of  
invaders*

Gradually the second wave of invaders was incorporated as the first had been, by the same process of conversion to Christianity. By the year 1000 this process was nearly complete. In 1001 the pope sent a golden crown to the Magyars to crown St. Stephen as their first king, thus bringing Hungary within the orbit of the Latin West. Poland, Bohemia, and the Scandinavian homelands of the Norse were Christianized during the same era. In older Christian countries, such as France, the last remote and isolated rustics—the “heathen” who lived in the “heath”—were finally ferreted out by missionaries and brought within the Christian fold. In Christian countries Christianity now permeated every corner, and the historic peoples of western Europe had come together within the spreading religious and cultural system of the Latin church.

Meanwhile West and East continued to drift apart. The refusal of Greek patriarchs at Constantinople to recognize the claims to primacy of the bishop of Rome, whom they regarded as a kind of Western barbarian, and the refusal of the Roman pontiff to acknowledge the political pretensions of the Byzantine Empire, led to the Great Schism of East and West. This schism, after developing for three centuries, became definite in 1054. It divided the Christian world into the Latin or Roman Catholic and the Greek Orthodox churches. It was from Constantinople that Christianity reached the peoples of Russia. The Russians, like the Balkan peoples, remained out of contact with most of Europe during the centuries when spiritual and intellectual contacts were carried through the clergy. They believed, indeed, that the Latin West was evil, heretical, and unholy. The Latin West, at the same time, by the schism, cut

---

*“Great Schism of East  
and West”*

one, more of its ties with antiquity and emerged more clearly as an independent center of its own civilization.

---

### *Emerging Europe*

By the year 1000, or soon thereafter, the entity that we call Europe had come into existence. From the turbulence that followed the collapse of the Greco-Roman civilization had issued the peoples and the countries that would evolve into modern Europe. A kingdom of France had emerged, adjoining the great ill-defined bulk of Germany to the east. There were small Christian kingdoms in northern Spain and a number of city-states in the Italian peninsula. In the north there were now a kingdom of England and a kingdom of Scotland; Denmark, Norway, and Sweden had also taken form. In the east rose the three great kingdoms of Poland, Bohemia, and Hungary, the first two predominantly Slavic, Hungary predominantly Magyar, but all were Latin and Catholic in culture and religion, and Western in orientation. The east Slavs, or Russians, and the Slavs and other peoples of the Balkan peninsula also formed kingdoms of their own. Their languages and religion were diverging from the cultures of Western Europe. Christianized by Byzantine missionaries, they were Greek and Orthodox in culture and religion, and oriented toward Constantinople.

The civilization of Western Europeans in the year 1000 was still not much to boast of in the more polished circles of Byzantium or Baghdad. It might still seem that the West would suffer more than the East from their separation. But the West began at this time to experience new social and economic activity, ushering in the European civilization of the High Middle Ages.

## 3. THE HIGH MIDDLE AGES: SECULAR CIVILIZATION

### *Agriculture and the Feudal System after 1000*

Some historical periods are so dynamic that a person who lives to a mature age can remember sweeping changes that have come in one's own lifetime. Such a time began in Europe in the eleventh century. People could see new towns rise and grow before their eyes. They could observe new undertakings in commerce or government. Most of the cities that Europe was to know before the modern industrial era sprang up between about 1050 and 1200. The population of western Europe, which had been sparse even in Roman days, and which was even sparser after 500, suddenly began to grow denser about the year 1000, and it expanded steadily for two or three hundred years. The people of the High Middle Ages did not develop the conception of progress because their minds were set upon timeless values and personal salvation in another world, but the period was nevertheless one of rapid progress in nonreligious or "secular" matters. Much was created that remained fundamental far into modern times.

---

### *Agriculture and population growth*

The new era was made possible by the process of growth in population which went along with agricultural changes. After the Norse and Magyar inroads had stopped, Europe was spared the assaults of other invaders. There came to be more security of life and limb. Farmers could plant with more confidence that they would reap, and people could build houses with the expectation of passing them on to their children. Hence there was more planting and building. Sometime before the year 1000 a heavier plow was invented, which cut a deeper furrow. Better methods of harnessing horses had been found than the ancients had ever known. The Romans had continued simply to throw a yoke over a horse's neck, so that the animal in pulling a weight easily choked. Europeans, before the year 1000, began to use a

horse collar that rested on the animal's shoulders. The single horse could pull a greater load, or several horses could now for the first time be hitched in tandem. The amount of available animal power was thus multiplied, at a time when animals were the main source of power other than human muscle. Windmills, unknown to the ancients, were developed in the Low Countries about this time. They too offered a new source of power. Thus at the very beginning of a specifically "European" history, one may detect characteristics of subsequent European civilization—a search for technological invention, a quest for new sources of energy.

With such labor-saving devices people continued to work very hard, but they obtained more results by their efforts. Probably the use of such inventions, together with the influence of the Christian clergy, accounts for the gradual disappearance of slavery from Europe and its replacement by the less-abject and less-degrading status of serfdom. It is true that medieval Christians, when they could, continued to enslave whites as they were later to do with blacks. Usually such slaves were captives in war, taken from tribes not yet converted to Christianity, and sometimes exported as a form of merchandise to the Byzantine and Muslim worlds. As the successive European peoples became Christianized, the supply of slaves dried up. Medieval Christians did not enslave each other, nor was slavery essential to any important form of production.

Not only did population increase, and work become more productive, but also groups of people became less isolated from one another. Communications improved. The roads remained poor or nonexistent, but bridges were built across European rivers, and settlers filled in the wildernesses that had formerly separated the inhabited areas. Trees were felled, land was cleared, and the rural population clustered in village communities. The "nucleated" village gave more security, more contact between families, and readier access to the blacksmith or the priest. It also made possible a communally organized agriculture.

Better ways of using land were introduced in the "three-field" system, which spread to almost every region where cereal crops were the staple. In this "system" the peasant village divided its arable fields into three parts. In a given year one part was sown with one crop, such as wheat; a second part with another, such as barley; and the third was left to lie fallow. The three parts were rotated from year to year. Thus soil exhaustion was avoided at a time when fertilizers were unknown. Formerly, half or less of the available fields had been cultivated at any one time. With the three-field system two-thirds of the land came into annual use. This change, reinforced by better plowing and more effective employment of animals, led to a huge increase in the supply of food.

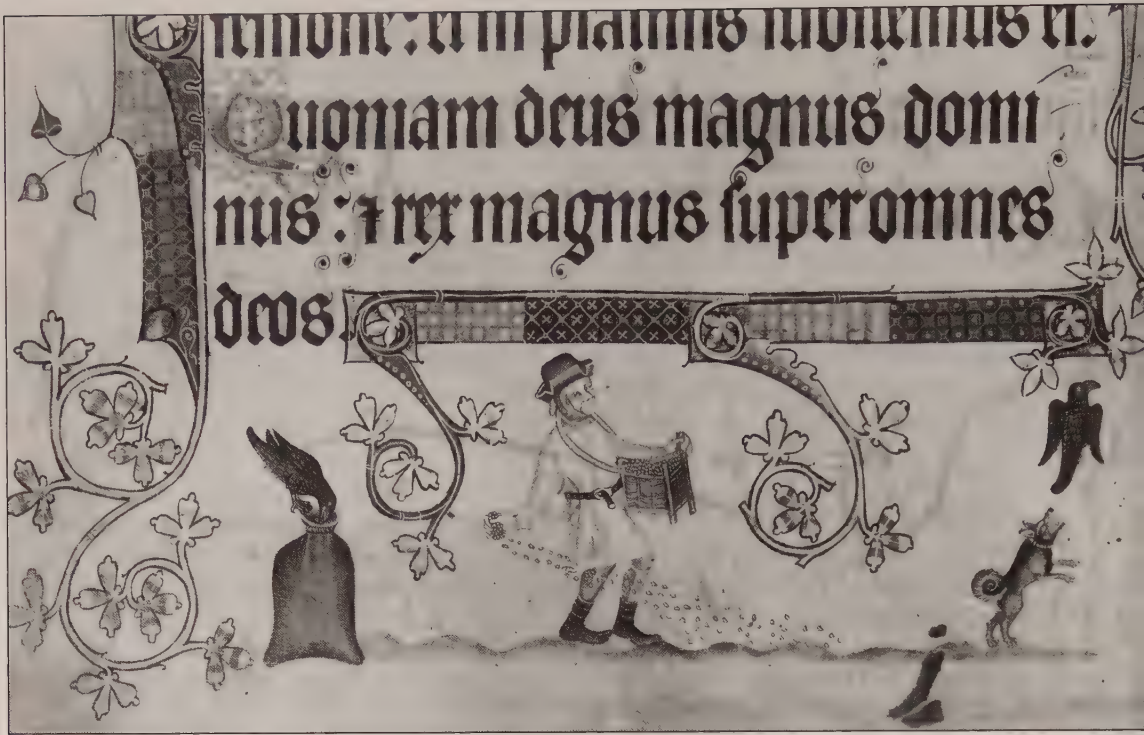

---

*Three-field system*

The peace and personal security necessary to agriculture were also advanced, in the absence of effective public authority, by the growth of institutions that we know as "feudalism." Feudalism was intricate and diverse, but in essence it was a means of carrying on some kind of government on a local basis where no organized state existed. After the collapse of Charlemagne's empire the real authority fell into the hands of persons who were most often called "counts." The count was the most important man of a region covering a few hundred square miles. To build up his own position, and strengthen himself for war against other counts, he tried to keep the peace and maintain control over the lesser lords in his county, those whose possessions extended over a few hundred or a few thousand acres. These lesser lords accepted or were forced to accept his protection. They became his vassals, and he became their "lord." The lord and vassal relation was one of reciprocal duties.

---

*Feudalism*

**Most people in the Middle Ages worked in the fields, coping like the peasant in this late medieval illustration with the seasons, soil, seeds, and animals that shaped agricultural life.**  
(The British Library)

The lord protected the vassal and assured him justice and firm tenure of his land. If two vassals of the same lord disputed the possession of the same village, the lord decided the case, sitting in council (or “court”) with all his vassals assembled and judging according to the common memory or customary law of the district. If a vassal died young, leaving only small children, the lord took the family under his “wardship” or guardianship, guaranteeing that the rightful heirs would inherit in due time. Correspondingly the vassal agreed to serve the lord as a fighting man for a certain number of days in the year. The vassal also owed it to the lord to attend and advise him, to sit in his court in the judging of disputes. Usually he owed no money or material payment; but if the lord had to be ransomed from captivity, or when his children married, the vassal paid a fee. The vassal also paid a fee on inheriting an estate, and the income of estates under wardship went to the lord. Thus the lord collected sporadic revenues with which to finance his somewhat primitive government.

This feudal scheme gradually spread across northern Europe. Lords at the level of counts became in turn the vassals of dukes. In the year 987 the great lords of France chose Hugh Capet as their king and became his vassals. The kings of France enjoyed little real power for another 200 years, but the descendants of Hugh occupied their throne for eight centuries, until the French Revolution. Similarly the magnates of Germany elected a king in 911; in 962 the German king was crowned emperor, as Charlemagne had been before him;

---

Capetian kings

thus originated the Holy Roman Empire, of which much will be heard in the following chapters.

England in these formative centuries did not choose a king by election. England was conquered in 1066 by the Duke of Normandy, William. The Normans (the Norse reshaped by a century of Christian and French influences) imposed upon England a centralized and efficient type of feudalism which they had developed in Normandy. In England, from an early date, the king and his officials therefore had considerable power, which led to more civil peace and personal security than on the Continent. Within the framework of a strong monarchy self-governing institutions could eventually develop with a minimum of disorder.

---

---

*The Normans in  
England*

The notable feature of feudalism was its mutual or reciprocal character. In this it differed from the old Roman imperial principle, by which the emperor had been a majestic and all-powerful sovereign. Under feudalism no one was sovereign. King and people, lord and vassal, were joined in a kind of contract. Each owed something to the other. If one defaulted, the obligation ceased. If a vassal refused his due services, the king had the right to enforce compliance. If the king violated the rights of the vassal, the vassals could join together against him. The king was supposed to act with the advice of the vassals, who formed his council or court. If the vassals believed the king to be exceeding his lawful powers, they could impose terms upon him. Although feudalism was always a hierarchical system of lords and vassals, its mutual or contractual character contributed to later European ideas of constitutional government.

Feudalism applied in the strict sense only to the military or noble class. Below the feudal world lay the vast mass of the peasantry. In the village, the lowliest vassal of a higher noble was lord over his own subjects. The village, with its people and surrounding farmlands, constituted a "manor," the estate of a lord. In the eleventh century most people of the manor were serfs. They were "bound to the soil" in that they could not leave the manor without the lord's permission. Few wanted to leave anyway, at a time when the world beyond the village was unknown and dangerous, and filled at best only with other similar manors. The lord, for his part, could not expropriate the villagers or drive them away. He owed them protection and the administration of justice. They in turn worked his fields and gave him part of the produce of their own. No money changed hands, because there was virtually no money in circulation. The manorial system was the agricultural base on which a ruling class was supported. It supported also the clergy, for the church held much land in the form of manors. It gave the protection from physical violence and the framework of communal living without which the peasants could not grow crops or tend livestock.

---

---

*The manor and serfs*

With the rise of agricultural productivity, lords and even a few peasants could produce a surplus, which they might sell if only they could find a market. The country was able to produce enough food for a town population to live on. And since population grew with the increase of the food supply, a surplus of population also began to exist. Restless spirits among the peasants now wanted to get away from the manor. And many went off to the new towns.

### *The Rise of Towns and Commerce*

We have seen how the ancient cities had decayed. In the ninth and tenth centuries, with few exceptions, there were none left in western Europe. Here and there one would find a cluster of population around the headquarters of a bishop, a great count, or a king. But

there were no commercial centers. There was no merchant class. The simple crafts—weaving, metalworking, harness making—were carried on locally on the manors. Rarely, an itinerant trader might appear with such semiprecious goods as he could carry for long distances on donkeys—Eastern silks, or a few spices for the wealthy. Among these early traders Jews were often important, because Judaism, part of the Byzantine and Arabic worlds as well as the Western, offered one of the few channels of communication among the different Mediterranean cultures.

---

*Long-distance trade*

Long-distance trading was the first to develop. The city of Venice was founded about 570 when refugees fled from invaders and settled in its islands. The Venetians, as time went on, brought Eastern goods up the Adriatic and sold them to traders coming down from central Europe. In Flanders in the north, in what is now Belgium, manufacturers of woolen cloth emerged. Flemish woolens were of a unique quality, owing to peculiarities of the atmosphere and the skill of the weavers. They could not be duplicated elsewhere. Nor could Eastern goods be procured except through the Venetians—or the Genoese or Pisans. Such goods could not possibly be produced locally, yet they were in demand wherever they became known. Merchants traveled in increasing numbers to sell them. Money came back into more general circulation; where it came from is not quite clear, since there was little mining of gold or silver until the end of the Middle Ages. Merchants began to establish permanent headquarters, settling within the deserted walls of ghostly Roman towns or near the seat of a lord or ecclesiastic, whose numerous retainers might become customers. Craftsmen moved from the overpopulated manors to these same growing centers, where they might produce wares that the lords or merchants would wish to buy. The process, once started, tended to snowball: the more people settled in such an agglomeration, the more they needed food brought to them from the country; and the more craftsmen left the villages, the more the country people, lords and serfs, had to obtain clothing and simple tools and utensils from the towns. Hence a busy local trade developed also.

---

*Growth of towns*

By 1100, or not long thereafter, such centers existed all over Europe, from the Baltic to Italy, from England as far east as Bohemia. Usually there was one about every 20 or 30 miles. The smallest towns had only a few hundred inhabitants; the larger ones had two or three thousand, or sometimes more. Each carried on a local exchange with its immediate countryside and purveyed goods of more distant origin to local consumers. But their importance was by no means merely economic. What made them “towns” in the full sense of the word was their acquisition of political rights.

The merchants and craftsmen who lived in the towns did not wish to remain, like the country people, subject to neighboring feudal lords. At worst, the feudal lords regarded merchants as a convenient source of ready money; they might hold them up on the road, plunder their mule trains, collect tolls at river crossings, or extort cash by offering “protection.” At best, the most well-meaning feudal lord could not supervise the affairs of merchants, for the feudal and customary law knew nothing of commercial problems. The traders in the course of their business developed a “law merchant” of their own, having to do with money and moneychanging, debt and bankruptcy, contracts, invoices, and bills of lading. They wished to have their own means of apprehending thieves, runaway debtors, or sellers of fraudulent goods. They strove, therefore, to get recognition for their own law, their own courts, their own judges and magistrates. They wished, too, to govern their towns themselves and to avoid payment of fees or taxes to nearby nobles.

Everywhere in Latin Christendom, along about 1100, the new towns struggled to free themselves from the encircling feudalism and to set themselves up as self-governing little

republics. Where the towns were largest and closest together—along the highly urbanized arteries of the trade routes, in north Italy, on the upper Danube and Rhine rivers, in Flanders, or on the Baltic coast—they emancipated themselves the most fully. Venice, Genoa, Pisa, Florence, Milan became virtually independent city-states, each governing a substantial tract of its surrounding country. In Flanders also, towns like Bruges and Ghent dominated their localities. Along the upper Danube, the Rhine, the North Sea, the Baltic, many towns became imperial free cities within the Holy Roman Empire, each a kind of small republic owing allegiance to no one except the distant and usually ineffectual emperor. Nuremberg, Frankfurt, Augsburg, Strasbourg, Hamburg, and Lübeck were free cities of this kind. In France and England, where the towns in the twelfth century were somewhat less powerful, they obtained less independence but received charters of liberties from the king. By these charters they were assured the right to have their own town governments and officials, their own courts and law, and to pay their own kind of taxes to the king in lieu of ordinary feudal obligations.

Often towns formed leagues or urban federations, joining forces to repress banditry or piracy or to deal with ambitious monarchs or predatory nobles. The most famous such league was the Hanse; it was formed mainly of German towns, fought wars under its own banner, and dominated the commerce of the North Sea and the Baltic until after 1300. Similar tendencies of the towns to form political leagues, or to act independently in war and diplomacy, were suppressed by the kings in England, France, and Spain.

The fact that Italy, Germany, and the Netherlands were commercially more advanced than the Atlantic countries in the Middle Ages, and so had a more intensive town life, was to be one cause (out of many) preventing political unification in the early modern era. Not until 1860 or 1870 were nationwide states created in this region. In the west, where more of a balance was kept between town and country, the towns were absorbed into nationwide monarchies that were arising under the kings. This early difference between central and western Europe would later shape much of Europe's history in modern times.

The liberties won by the towns were corporate liberties. Each town was a collective entity. The people in towns did not possess individual rights, but only the rights which followed from being a resident of a particular town. Among these were personal liberty; no townsman could be a serf, and fugitive serfs who lived over a year in a town were generally deemed to be free. But townspeople did not seek individual liberty in the modern sense. The world was still too unsettled for the individual to act alone. The citizens wanted to join together in a compact body and to protect themselves by all sorts of regulations and controls. The most obvious evidence of this communal solidarity was the wall within which most towns were enclosed. The citizens in time of trouble looked to their own defense. As the towns grew, they built new walls farther out. Today, in Paris or Cologne, one may still see remains of different walls in use from the tenth to the thirteenth centuries.

---

*Corporate liberties*

Economic solidarity was of more day-to-day importance. The towns required neighboring peasants to sell foodstuffs only in the town marketplace. They thus protected their food supply against competition from other towns. Or they forbade the practice of certain trades in the country; this was to oblige peasants to make purchases in town and to protect the jobs and livelihood of the town craftsmen. They put up tariffs and tolls on the goods of other towns brought within their own walls. Or they levied special fees on merchants from outside who did business in the town. In Italy and Germany they often coined their own money; and the typical town fixed the rates at which various moneys should be exchanged. The medieval towns, in short, at the time of their greatest liberty, followed in a local way

**The crafts and trade in medieval towns were dominated by the guilds, whose symbols conveyed the meaning of their work. The sheep on this emblem represents the wool guild in Florence.**

(Alinari/Art Resource, NY)

the same policies of protectionism and exclusiveness which national governments were often to follow in modern times.

#### *Guilds*

Within each town merchants and craftsmen formed associations called “guilds,” whose “masters” supervised the affairs of a specific trade or craft. Merchants formed a merchant guild. Stonemasons, carpenters, barbers, dyers, goldsmiths, coppersmiths, weavers, hatters, tailors, shoemakers, grocers, and apothecaries formed craft guilds of their own. The guilds served a public purpose. They provided that work should be done by reliable and experienced persons, thereby protecting people from the pitfalls of shoddy garments, clumsy barbers, poisonous drugs, or defective and poorly built houses. They also provided a means of vocational education and marked out a career for young men. Women also worked in many trades and could belong to guilds; they were particularly numerous in certain guilds of the clothing trades. Women were nevertheless excluded from some of the guilds’ social activities, and they were not granted the political privileges that men received as they moved up through the ranks of the guild hierarchy. Typically a boy became an apprentice to some master, learned the trade, and lived with and was supported by the master’s family for a term of years, such as seven. Then he became a journeyman, a qualified and recognized worker, who might work for any master at a stated wage. Most workers remained journeymen throughout their lives, especially in the later Middle Ages. The guild system enabled some workers to improve their social position, however; and a lucky young man might eventually become a master, open his own shop, hire journeymen, and take apprentices. So long as the towns were growing, a boy had some chance to become a master; but as early as 1300 many guilds were becoming frozen, and the masters were increasingly chary of admitting new persons to their own status. Although widows often continued to work in the trades or artisanal crafts of their husbands, women almost never became masters. From the beginning, in any case, it was an important function of the guilds to protect their own members. The masters, assembled together, preserved their reputation by regulating the quality of their product. They divided work among themselves and fixed the terms of apprenticeship, the wages to be paid to journeymen, and the prices at which their goods

must be sold. Or they took collective steps to meet or keep out the competition of the same trade in nearby towns.

Whether among individuals within the town itself, or as between town and country, or between town and town, the spirit of the medieval economy was to prevent competition. Risk, adventure, and speculation were not wanted. Almost no one thought it proper to work for monetary profit. The few who did, big merchants trading over large areas, met with suspicion and disapproval wherever they went.

The towns tried in many ways to subject the peasants' interests to their own but nevertheless had an emancipating influence on the country. A rustic by settling in town might escape from serfdom. But the town influence was more widespread and far out of proportion to the relatively small number of people who could become town dwellers. The growth of towns increased the demand for food. Lords began to clear new lands. All western Europe set about developing a kind of internal frontier. Formerly villages had been separated by dark tracts of roadless woods, in which wolves roamed freely, shadowed by the gnomes, elves, and fairies of popular folklore. Now pioneers with axes cleared farmlands and built villages. The lords who usually supervised such operations (since their serfs were not slaves, and could not be moved at will) offered freer terms to entice peasants to settle on the new lands. It was less easy for the lord of an old village to hold his people in serfdom when in an adjacent village, within a few hours' walk, the people were free.

The peasants, moreover, were now able to obtain a little money by selling produce in town. The lords wanted money because the towns were producing more articles which money could buy. It became common for peasants to obtain personal freedom, holding their own lands, in return for an annual money payment to the lord for an indefinite period into the future. As early as the twelfth century serfdom began to disappear in northern France and southern England, and by the fifteenth century it had disappeared from most of western Europe. The peasant could now, in law, move freely about. But the manorial organization remained; the peasant owed dues and fees to the lord and was still under his legal jurisdiction.

---

---

*Towns and the decline  
of serfdom*

### *The Growth of Monarchies and Government Institutions*

Meanwhile the kings were busy, each trying to build his kingdom into an organized monarchy that would outlast his life. Monarchy became hereditary; the king inherited his position like any other feudal lord or possessor of an estate. Inheritance of the crown made for peace and order, for elections under conditions of the time were usually turbulent and disputed, and where the older Germanic principle of elective monarchy remained alive, as in the Holy Roman Empire, there was periodic commotion. The kings sent out executive officers to supervise their interests throughout their kingdoms. The kings of England, adopting an old Anglo-Saxon practice, had a sheriff in each of the 40 shires; the kings of France created similar officers who were called bailiffs. The kings likewise instituted royal courts, under royal justices, to decide property disputes and repress crime. This assertion of legal jurisdiction, together with the military might necessary to enforce judgments upon obstinate nobles, became a main pillar of the royal power. In England especially, and in lesser degree elsewhere, the kings required local inhabitants to assist royal judges in the discovery of relevant facts in particular cases. They put them on oath to declare what they knew of events in their own neighborhood. It is from this enforced association of private persons with royal officers that the jury developed.

---

---

*Changes in  
monarchical rule*

---

Taxation

The kings needed money to pay for their governmental machinery or to carry on war with other kings. Taxation, as known in the Roman Empire, was quite unknown to the Germanic and feudal tradition. In the feudal scheme each person was responsible only for the customary fees which arose on stated occasions. The king, like other lords, was supposed to live on his own income—on the revenue of manors that he owned himself, the proceeds of estates temporarily under his wardship, or the occasional fees paid to him by his vassals. No king, even for the best of reasons, could simply decree a new tax and collect it. At the same time, as the use of money became more common, the kings had to assure themselves of a money income. As the towns grew up, with a new kind of wealth and a new source of money income, they agreed to make stipulated payments in return for their royal charters.

The royal demands for money and the claims to exercise legal jurisdiction were regarded as innovations. They were constantly growing and sometimes were a source of abuse. They met with frequent resistance in all countries. A famous case historically (though somewhat commonplace in its own day) was that of Magna Carta in England in 1215, when a group of English lords and high churchmen, joined by representatives of the city of London, required King John to confirm and guarantee their historic liberties.

The king, as has been said, like any lord, was supposed to act in council or “court” with his vassals. The royal council became the egg out of which departments of government were hatched—such as the royal judiciary, exchequer, and military command. From it also was hatched the institution of parliaments. The kings had always, in a way, held great parleys or “talks” (the Latin *parliamentum* meant simply a “talking”) with their chief retainers. In the twelfth and thirteenth centuries the growth of towns added a new element to European life. To the lords and bishops was now added a burgher class, which, if of far inferior dignity, was too stubborn, free-spirited, and well furnished with money to be overlooked. When representatives of the towns began to be summoned to the king’s great “talks,” along with lords and clergy, parliaments may be said to have come into being.

Parliaments, in this sense, sprouted all over Europe in the thirteenth century. Nothing shows better the similarity of institutions in Latin Christendom, or the inadequacy of tracing the history of any one country by itself. The new assemblies were called *cortes* in Spain, diets in Germany, Estates General or provincial estates in France, parliaments in the British Isles. Usually they are referred to generically as “estates,” the word “parliament” being reserved for Britain, but in origin they were all essentially the same.

The kings called these assemblies as a means of publicizing and strengthening the royal rule. They found it more convenient to explain their policies, or to ask for money, to a large gathering brought together for that purpose than to have a hundred officials make local explanations and strike local bargains in a hundred different places. The kings did not recognize, nor did the assemblies claim, any right of the parliament to dictate to the king and his government. But usually the king invited the parliament to state grievances; his action upon them was the beginning of parliamentary legislation.

The parliaments were considered to represent not the “nation” nor “people” nor yet the individual citizen, but the “estates of the realm,” the great collective interests of the country. The first and highest estate was the clergy; the second was the landed or noble class; to these older ruling groups were added, as a “third estate,” the burghers of the chartered towns. Quite commonly these three types of people sat separately as three distinct chambers. But the pattern varied from country to country. In England, Poland, and Hungary the clergy as a whole

---

Origins of  
parliaments

---

The three estates

ceased to be represented; only the bishops came, sitting with lay magnates in an upper house. Eventually the burghers dropped out in Poland, Bohemia, and Hungary, leaving the landed aristocracy in triumph in eastern Europe. In Castile and Württemberg, on the other hand, the noble estate eventually refused to attend parliament, leaving the townspeople and clergy in the assemblies. In some countries—in Scandinavia, Switzerland, and in the French Estates General—even peasants were allowed to have delegates.

In England the Parliament developed eventually in a distinctive way. After a long period of uncertainty there came to be two houses, known as the Lords and the Commons. The Lords, as in Hungary or Poland, included both great prelates and lay magnates. The House of Commons developed features not found on the Continent. Lesser landholders, the people who elsewhere counted as small nobles, sat in the same House of Commons with representatives of the towns. The Commons was made up of “knights and burgesses,” or gentry and townsmen together, a fact which greatly added to its strength, for the middle class of the towns long remained too weak to act alone. The mingling of classes in England, the willingness of townsmen to follow the leadership of the gentry, and of the gentry to respect the interests of townsmen, helped to root representative institutions in England more deeply than in other countries during the medieval era. Moreover, England was a small country in the Middle Ages. There were no provincial or local parliamentary bodies (as in France, the Holy Roman Empire, or Poland) which might jealously cut into the powers of the central body or with which the king could make local arrangements without violating the principle of representative government. And finally, as a reason for the strength of Parliament in England, the elected members of the House of Commons very early obtained the power to *commit* their constituents. If they voted a tax, those who elected them had to pay it. The king, in order to get matters decided, insisted that the votes be binding. Constituents were not allowed to repudiate the vote of their deputies, nor to punish or harass them when they came home, as often happened in other countries. Parliament thus exercised power as well as rights.

---

*England's Parliament*

In summary, the three centuries of the High Middle Ages laid foundations both for order and for freedom. Slavery was defunct and serfdom was expiring. Politically, the multitude of free chartered towns, the growth of juries in some places, and the rise of parliaments everywhere provided means by which peoples could take some part in their governments. The ancient civilizations had never created a free political unit larger than the city-state. The Greeks had never carried democracy beyond the confines within which people could meet in person, nor had the Romans devised means by which, in a large state, the governed could share any responsibilities with an official bureaucracy. The ancients had never developed the idea of representative government, or of government by duly elected and authorized representatives acting at a distance from home. The idea is by no means as obvious or simple as it looks. It first appeared in the medieval monarchies of the West, and, after much subsequent development, it would become a fundamental principle for political systems in most of the modern world.

#### 4. THE HIGH MIDDLE AGES: THE CHURCH

So far in our account of the High Middle Ages we have told the story of Hamlet without speaking of the Prince of Denmark, for we have left aside the church, except, indeed, when some mention of it could not be avoided. In the real life of the time the church was omnipresent. Religion permeated political and social life. In feudalism the mutual duties of lord and vassal were confirmed by religious oaths, and bishops and abbots, as holders of

lands, became feudal personages themselves. In the monarchies, the king was crowned by the chief churchman of his kingdom, adjured to rule with justice and piety, and anointed with holy oils. In the towns, guilds served as lay religious brotherhoods; each guild chose a patron saint and marched in the streets on holy days. For amusement the townspeople watched religious dramas, the morality and miracle plays in which religious themes were enacted. The rising town, if it harbored a bishop, took especial care to erect a new cathedral. Years of effort and of religious fervor produced the Gothic cathedrals which still stand as the best-known memorials of medieval civilization.

### *The Development of the Medieval Church and Papacy*

If, however, we turn back to the tenth century, the troubled years before 1000, we find the church in as dubious a condition as everything else. It was fragmented and localized. Every bishop went his own way. Though the clergy was the only literate class, many of the clergy themselves could not read and write.

---

#### *The church in crisis*

Christian belief was mixed with the old pagan magic and superstition, and most Christians knew nothing about the theology that had shaped the traditions of the Catholic church. The monasteries were in decay. Priests often lived in a concubinage that was generally condoned. It was customary for them to marry, so that they had recognized children, to whom they intrigued to pass on their churchly position. Powerful laymen often dominated their ecclesiastical neighbors, with the big lords appointing the bishops and the little ones appointing the parish priests. When people thought about Rome at all, they sensed a vague respect for something legendary and far away; but the bishop of Rome, or pope, had no influence and was treated in unseemly fashion by nobles in his own city.

The Roman Catholic church is in fact unrecognizable in the jumble of the tenth century. So far at least as human effort was concerned, it was virtually created in the eleventh century along with the other institutions of the High Middle Ages.

---

#### *Reform efforts*

The impulse to reform came from many quarters. Sometimes a secular ruler undertook to correct conditions in his own domains. For this purpose he asserted a strict control over his clergy. In 962 the Holy Roman Empire was proclaimed. This Empire, like the Carolingian and Roman empires which it was supposed to continue, was in theory coterminous with Latin Christendom itself and endowed with a special mission to preserve and extend the Christian faith. Neither in France nor in England (nor, when they became Christian states, in Spain, Hungary, Poland, or Scandinavia) was this claim of the Holy Roman Empire ever acknowledged. But the Empire did for a time embrace Italy as well as Germany. The first emperors, in the tenth and eleventh centuries, denouncing the conditions of the church in Rome, strove to make the pope their appointee.

At the same time a reform movement arose from spiritual sources. Serious Christians took matters into their own hands. They founded a new monastery at Cluny in France, which soon had many affiliated houses. It was their purpose to purify monastic life and to set a higher Christian ideal to which all clergy and laity might aspire. To rid themselves of immediate local pressures, the greed, narrowness, ignorance, family ambition, and self-satisfied inertia that were the main causes of corruption, the Cluniacs refused to recognize any authority except that of Rome itself. Thus, at the very time when conditions in Rome were at their worst, Christians throughout Europe built up the prestige of Rome, of the idea of Rome, as a means to raise all Latin Christendom from its depths.

## CHRONOLOGY OF NOTABLE EVENTS, 500 B.C.—A.D. 1300

---

500–300 B.C.	Creative era of Classical Greek Civilization: Plato, Aristotle
46 B.C.	Roman Republic conquers Greece
45–31 B.C.	Roman Republic evolves into the Roman Empire
c. A.D. 26–29	Jesus is active in Palestine; beginnings of Christianity
306–337	Roman Emperor Constantine: toleration of Christianity
c. 420	St. Augustine writes <i>City of God</i>
476	End of Roman Empire in the West
450–750	Roman Catholic Church gains converts and influence in Western Europe
610–632	Prophet Muhammad teaches the new religion of Islam
635–750	Islam spreads across Middle East, North Africa, and Spain
800	Coronation of Emperor Charlemagne; the Carolingian Empire
1000–1200	Improvements in European agriculture and rise of towns
1054	Schism of Roman Catholic Church and Orthodox Eastern Church
1095–1099	First Christian Crusade in Palestine
1100–1200	Arabic and Greek science enters European Culture
1147–1221	Second-Fifth Christian Crusades
1198–1216	Pope Innocent III: height of Medieval Papacy
1100–1300	Development of Universities and Scholasticism
1267–1273	Thomas Aquinas writes the <i>Summa Theologica</i>

---

As for the popes in Rome, those who preserved any independence of judgment or respect for their own office, it was their general plan to free themselves from the Roman mobs and aristocrats without falling into dependence upon the Holy Roman Emperor. In 1059 Pope Nicholas II issued a decree providing that future popes should be elected by the cardinals. The cardinals, at that time, were the priests of churches in the city of Rome or bishops of neighboring dioceses. By entrusting the choice of future popes to them, Pope Nicholas hoped to exclude all influence from outside the clergy itself. Popes have been elected by cardinals ever since, though not always without influence from outside.

One of the first popes so elected was Gregory VII, known also as Hildebrand, a dynamic and strong-willed man who was pope from 1073 to 1085. He had been in touch with the Cluniac reformers, and dreamed of a reformed and reinvigorated Europe under the universal guidance of the Roman pontiff. Gregory believed that the church should stand apart from worldly society, that it should judge and guide all human actions, and that a pope had the supreme power to judge and punish kings and emperors if he deemed them sinful. His ideal was not a “world state,” but its spiritual counterpart, a world church officered by a single-minded and disciplined clergy, centralized under a single authority. He began by insisting that the clergy free itself of worldly involvements. He required married priests to put aside their wives and families.

---

Gregory VII

Celibacy of the clergy, never generally established in the Greek Orthodox church, and later rejected by Protestants in the West, became the rule for the Roman Catholic priesthood. Gregory insisted also that no ecclesiastic might receive office through appointment by a layman. In his view only clergy might institute or influence clergy, for the clergy must be independent and self-contained.

Gregory soon faced a battle with that other aspirant to universal supremacy and a sacred mission, the Holy Roman Emperor, who at this time was Henry IV. In Germany the bishops and abbots possessed a great deal of the land, which they held and governed under the emperor as feudal magnates in their own right. To the emperor it was vitally important to have his own men, as reliable vassals, in these great positions. Hence in Germany “lay investiture” had become very common. “Lay investiture” meant the practice by which a layman, the emperor, conferred upon the new bishop the signs of his spiritual authority, the ring and the staff. Gregory prohibited lay investiture. He supported the German bishops and nobles when they rebelled against Henry, but the emperor remained obstinate. Gregory then excommunicated him, that is, outlawed him from Christian society by forbidding any priest to give him the sacraments. Henry, baffled, sought out the pope at Canossa in Italy to do penance. “To go to Canossa” in later times became a byword for submission to the will of Rome.

---

#### *Lay investiture*

In 1122, after both original contenders had died, a compromise on the matter of lay investiture was effected by which bishops recognized the emperor as their feudal head but looked to Rome for spiritual authority. But the struggle between popes and emperors went on unabated. The magnates of Germany, lay lords as well as bishops, often allied with the pope to preserve their own feudal liberties from the emperor. The emperor in Germany was never able to consolidate his domains as did the kings in England and France. The unwillingness of lords and churchmen (and of towns also, as we have seen) to let the emperors build up an effective government left its mark permanently upon Europe in two ways. It contributed to the centralization of Latin Christendom under Rome, while it blocked the development of a more unified monarchical state in central Europe.

---

#### *Innocent III*

The height of the medieval papacy came with Innocent III, whose pontificate lasted from 1198 to 1216. Innocent virtually realized Gregory’s dream of a unified Christian world. He intervened in politics everywhere. He was recognized as a supreme arbiter. At his word, a king of France took a wife, a king of England accepted an unwanted archbishop, a king of León put aside the cousin whom he had married, and a claimant to the crown of Hungary deferred to his rival. The kings of England, Aragon, and Portugal acknowledged him as feudal overlord within their realms. Huge revenues now flowed to Rome from all over Latin Christendom, and an enormous bureaucracy worked there to dispatch the voluminous business of the papal court. As kings struggled to repress civil rebellion, so Innocent and his successors struggled to repress heresy, which, defined as doctrine at variance with that of the church at large, was becoming alarmingly common among the Albigensians of southern France.

In 1215 Innocent called a great church council, the greatest since antiquity, attended by 500 bishops and even by the patriarchs of Constantinople and Jerusalem. The council labored at the perplexing task of keeping the clergy from worldly temptations. By forbidding priests to officiate at ordeals or trials by battle, it virtually ended these survivals of barbarism. It attempted to regularize belief in the supernatural by controlling the superstitious traffic in relics. It declared the sacraments to be the channel of God’s saving grace

and defined them authoritatively.<sup>2</sup> In the chief sacrament, the Eucharist or Mass, it promulgated the dogma of transubstantiation, which held that, in the Mass, the priest converts the substance of bread and wine into the substance of Christ's body and blood. Except for heretics, who were suppressed, the reforms and doctrines of Innocent's council were accepted with satisfaction throughout Latin Europe.

### *Intellectual Life: The Universities, Scholasticism*

Under the auspices of the church, as rising governments gave more civil security, and as the economy of town and country became able to support people devoted to a life of thought, the intellectual horizon of Europeans began to open. The twelfth and thirteenth centuries saw the founding of the first universities. These originated in the natural and spontaneous coming together of teachers and students which had never wholly disappeared even in the most chaotic era of the early Middle Ages. By 1200 there was a center of medical studies at Salerno in south Italy, of legal studies at Bologna in north Italy, of theological studies at Paris. Oxford was founded about 1200 by a secession of disgruntled students and professors from Paris; Cambridge, shortly thereafter. By 1300 there were a dozen such universities in Latin Europe; by 1500 there were almost a hundred.

---

*The founding of  
universities*

As the early agglomerations of traders developed into organized towns and guilds, so the informal concourses of students and teachers developed into organized institutions of learning, receiving the sharp corporate stamp that was characteristic of the High Middle Ages. It was in having this corporate identity that medieval universities resemble our own and differed from the schools of Athens or Alexandria in ancient times. A university, the University of Paris, for example, was a body of individuals, young and old, interested in learning and endowed by law with a communal name and existence. It possessed definite liberties under some kind of charter, regulated its own affairs through its own officials, and kept its own order among its often boisterous population. It gave, and even advertised, courses and lectures, and it decided collectively which professors were the best qualified to teach. It might consist of distinct schools or "faculties"—the combination of theology, law, and medicine, as at Paris, was the most usual. It held examinations and awarded degrees, whose meaning and value were recognized throughout the Latin West. The degree, which originated as a license to teach, admitted its holder to certain honors or privileges in the same way that members of other guilds were authorized to practice a specific craft. With such degrees, professors might readily move from one university to another. Students moved easily also because all universities used the Latin language and offered a similar curriculum. The university, moreover, though typically beginning in poverty, was a corporate body capable of holding property; and the benefactions of pious donors often built up substantial endowments in lands and manors. So organized, free from outside control, and enjoying an income from property, the university lived on as a permanent institution, through good times and bad.

---

<sup>2</sup>A sacrament is understood to be the outward sign of an inward grace. In Catholic doctrine the sacraments were and are seven in number: baptism, confirmation, penance, the Eucharist, extreme unction, marriage, and holy orders. Except for baptism, a sacrament may be administered only by a priest. A dogma is the common belief of the church, in which all the faithful share and must share so long as they are members of the church. Dogmas are regarded as implicitly the same in all ages; they cannot be invented or developed, but may from time to time be clarified, defined, promulgated, or proclaimed.

---

---

Theology

The queen of the sciences was theology, the intellectual study of religion. Many in Europe, by the eleventh century, were beginning to reflect upon their beliefs. They continued to believe in God but could no longer believe with unthinking acceptance. It was accepted as a fact, for example, that the Son of God had been incarnated as a man in Jesus Christ. But in the eleventh century an Italian named Anselm, who became archbishop of Canterbury, wrote a treatise called *Cur Deus Homo?*—"Why Did God Become Man?"—giving reasoned explanations to show why God had taken human form to save sinful human beings. Anselm argued that reason strongly supported the Christian faith in God. Soon afterward Abelard, who taught at Paris, wrote his *Sic et Non*—"Yes and No" or "Pro and Con"—a collection of inconsistent statements made by St. Augustine and other Fathers of the Church. Abelard's purpose was to apply logic to the inherited mass of patristic writings, show wherein the truth of Christian doctrine really lay, and so make the faith consistent with reason and reflection.

---

---

Arabic and Greek learning

Meanwhile, in the twelfth century a great stream of new knowledge poured into Europe, bringing about a veritable intellectual revolution. It was derived from the Arabs, with whom Christians were in contact in Sicily and Spain. The Arabs, as has been seen, had taken over the ancient Greek science, translated Greek writings into Arabic, and in many ways added further refinements of their own. Bilingual Christians (assisted by numerous learned Jews who traveled readily between the Christian and Muslim worlds) translated these works into Latin. Above all, they translated Aristotle, the great codifier of Greek knowledge who had lived and written in the fourth century B.C. The Europeans, drawing on the commentaries of Muslim scholars such as Averroës (1126–1198), were overwhelmed by this sudden disclosure of an undreamed universe of knowledge. Aristotle became The Philosopher, the unparalleled authority on all branches of knowledge other than religious.

The great problem for Europeans was how to digest the gigantic bulk of Aristotle, or, in more general terms, how to assimilate or reconcile the body of Greek and Arabic learning to the Christian faith. The universities, with their "scholastic" philosophers or "schoolmen," performed this function. Most eminent of scholastics was Thomas Aquinas (1225–1274), the Angelic Doctor, known also to his own contemporaries as the Dumb Ox from the slow deliberation of his speech. His chief work, appropriately called the *Summa Theologica*, was a survey of all knowledge.

---

---

Thomas Aquinas

The chief accomplishment of Thomas Aquinas was his demonstration that faith and reason could not be in conflict. By reason he meant a severely logical method, with exact definition of words and concepts, deducing step by step what follows and must follow if certain premises are accepted. His philosophy is classified as a form of moderate "realism," a term whose medieval meaning differed from its common usage today. For medieval philosophers "realism" meant that the general idea is more "real" than the particular—that "man" or "woman" is more real than this or that man or woman, that "law" as such is more real and binding than this or that particular law. He derived his philosophy from what he took to be the nature of God, of law, of reason, of human life, and of beings in general. Thomas taught a hierarchic view of the universe and of society, of which God was the apex. All things and all people were subordinated to God in a descending order, each bound to fulfill the role set by its own place and nature. It was the emphasis on the superior reality of abstractions that enabled people in the Middle Ages to believe steadfastly in the church while freely

### THE MEETING OF ST. ANTHONY AND ST. PAUL

by Sassetta (Italian, 1392–1450)

This picture conveys the abstractness of medieval thought. There is no attempt to portray the figures as unique individuals; they are typical saints with the halos designating sacred persons. St. Anthony appears in three places—walking alone, converting a centaur, and embracing St. Paul. The forest and hills represent the idea of trees or mounds of earth, but there is no physical specificity in these representations of nature.

(Workshop of Sassetta & Sassetta, *The Meeting of St. Anthony and St. Paul*, Samuel H. Kress Collection, © 2000 Board of Trustees, National Gallery of Art, Washington, D.C.)

**THOMAS AQUINAS**

by Fra Bartelemo (Italian, 1472–1517)

**Thomas Aquinas combined Aristotelian knowledge with Christian faith in his scholastic theology, thus gaining permanent respect (and sainthood) from the Catholic Church and artistic recognition from painters such as Fra Bartelemo.**

(Nicolo Orsi Battaglini/Art Resource, NY)

attacking individual churchmen, to have faith in the papacy while denouncing the popes as scoundrels—or to accept without difficulty the mystery of transubstantiation, which declared that what admittedly looked and tasted like bread and wine was, in real inner substance, the body of Christ.

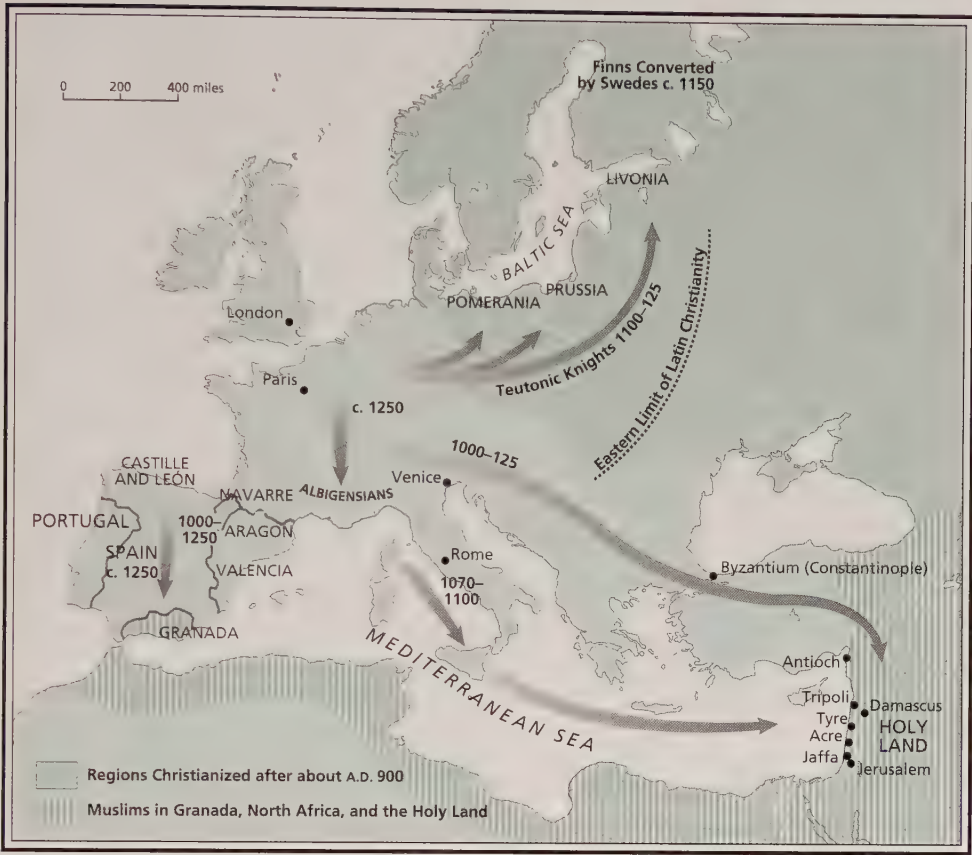

---

*Scholasticism*

The scholastic philosophy, as perfected by Thomas Aquinas, was not very favorable to the growth of natural science, because its emphasis on an inner reality drew attention away from the actual details and behavior of concrete things. On the other hand, the scholastic philosophy laid foundations on which later European thought was to be reared. It habituated Europeans to great exactness, to careful distinctions, even to the splitting of hairs. It called for disciplined thinking. And it made the world safe for reason. If any historical generalization may be made safely, it may be said that any society that believes reason to threaten its foundations will suppress reason. In Thomas's time, there were some who said that Aristotle and the Arabs were infidels, dangerous influences that must be silenced. Any reasoning about the faith, they warned, was a form of weakness. Thomas's doctrine that faith could not be endangered by reason gave a freedom to thinkers to go on thinking.

*The Crusades, New Invasions, Europe by 1300*

Meanwhile, the West was beginning to expand. Europe in the eleventh century launched a military offensive against Islam. All Latin Christendom went on the Crusades. War itself was subordinated to the purposes of religion.

### CRUSADING ACTIVITY, 1100–1250

Medieval Christendom expanded geographically until about 1250. Darker regions are those christianized shortly before and after 1000. Arrows indicate organized military-religious expeditions, which by 1250 had recovered most of Spain from Muslim control, but had failed to do so in the Holy Land. Dates are rounded and very rough.

The most ambitious, best remembered, and least successful of such expeditions were the Crusades to win back the Holy Land. The First Crusade was preached in 1095 by Pope Urban II, who hoped thereby to advance the peace of God by draining off bellicose nobles to fight the infidels and to build up the pope's leadership in Europe. Crusades to the Holy Land, with varying success, and sometimes departing woefully from their religious aims, went on intermittently for 200 years. It was the growth of Italian shipping in the Mediterranean, the rise of more orderly feudal monarchies, the increasing sense of a Europe-wide common purpose that made possible the assembly and transport of considerable forces over a great distance. But the motivation for such Crusades, especially in the beginning, came mostly from a wave of religious fervor that brought nobles and commoners alike into the Crusader armies. This fervor contributed to brutal, deadly attacks on Jewish communities within Europe as well as to the extraordinary violence against entire Muslim populations in cities such as Antioch and Jerusalem. At the same time, however, the Crusades

*Crusades to the Holy Land*

gave Europeans a new awareness of the world beyond their own local realms of religion and small-town economies. Historians have argued that the Crusaders' contacts with Arab societies in the Middle East stimulated subsequent European economic development and a new cultural identity among "Western" peoples. Although this argument points to important consequences of the Crusades, it is also true that the campaigns against Islam grew out of Europe's own growing political and military strength. For a century the Latin Christians occupied parts of Palestine and Syria. But military defeats forced them to withdraw in the thirteenth century, and the Muslims remained in possession.

---

#### Other crusades

Other crusades (for such they were) had more lasting results. A party of Normans won Sicily from the Arabs about 1100. Iberian Christians, descending from the mountains of northern Spain, carried on a *reconquista* of two centuries against the Moors. By 1250 they had staked out the Christian kingdoms of Portugal, León, Castile, Aragon, and Valencia, leaving the Muslims only Granada in the extreme south, which was conquered much later, in 1492. In southern France, an Albigensian crusade in the thirteenth century put down the heretics, those born in the Christian faith but erring from the reigning interpretations of it. Crusading expeditions were also launched against a few remaining "heathen" populations in northeastern Europe. The Teutonic Order, a military-religious society of knights founded originally to fight in the Holy Land, transferred its operations to the north. Christianity was brought by the sword to primitive Prussia and the east Baltic regions.

About the year 1250 there developed a new threat of invasion from Asia. As the Huns had burst out of Asia in the fifth century, and the Magyars in the ninth, so now the Tartars appeared in the thirteenth century, to be followed in the fourteenth by the Ottoman Turks. We shall see how the Turks long continued to press upon central Europe. But, on the whole, by the thirteenth century, Europe was capable of resistance. Always until then it had been vulnerable as an outlying, backward, thinly populated protuberance from the Eurasian land mass. It had lain open in the remote past to wandering Indo-Europeans, then to Roman imperial conquerors, to Germanic barbarians, to Huns, Magyars, and, in part, the Arabs. All these were gradually assimilated by the Roman church, the Latin language, the common institutions of feudalism, monarchy, a free town life, parliamentary assemblies, and scholastic learning. An increasingly connected and coherent culture ran from England to Sicily and from Portugal to Poland.

---

#### The "rise of Europe"

By 1300 the "rise of Europe" was an accomplished fact. The third of the three segments into which the Greco-Roman world had divided, the one which in A.D. 700 had been the most isolated and fragmented, now some 600 years later had a civilization of its own. It was still only one among the several great cultures of the world, such as the Islamic, Byzantine, Indian, and Chinese. It enjoyed no preeminence. The Chinese empire, for example, in the thirteenth century, had cities whose population reached into millions. It had an affluent merchant class, great textile manufacturers, and an iron industry that produced over 100,000 tons a year. The arts and sciences were assiduously pursued. Government was centralized and complex; it issued paper money and employed a civil service recruited by competitive examinations. Books on religious, technical, and agricultural subjects, including whole multivolume encyclopedias, were printed in enormous numbers, even though the lack of an alphabet and the thousands of Chinese characters made it difficult for literacy to become widely spread. The Venetian Marco Polo was dazzled by the China that he lived in from 1275 to 1292.

Europeans took pride in their crusading armies, represented here in a medieval image of the conquest of Antioch in 1098 during the First Crusade.

(Art Resource, NY)

Many have asked why China did not generate, as Europe did in these centuries, the forces that ultimately led to the modern scientific and industrial world. One answer is suggested by the fact that it was Europeans such as Marco Polo who went to China, not Chinese who went to Europe. It was the Chinese who invented printing, but it was Europe that was revolutionized by printed books. The Chinese knew of gunpowder, but the Europeans developed more effective guns. Chinese merchant vessels also traded with India but did not pursue the advantage. In the fifteenth century, over the years 1405 to 1433, a Ming emperor launched a large-scale series of long-range naval expeditions, seven in all, headed by his admiral Cheng Ho. The expeditions sailed to ports in Southeast Asia, India, the Persian Gulf, and East Africa, exchanging gifts in transactions that recognized the emperor's power and prestige. But the emperor and his advisers ultimately terminated the entire venture. China turned its back on overseas commercial opportunities and turned inward to the protection and expansion of its land frontiers. Never again (until the recent past) did it embark on similar expeditions or send its ships to distant, unknown seas. It was the Europeans who pursued the development of trade in India and also crossed the Atlantic to discover America. Somehow Europe became more enterprising and restless, perhaps because

in Europe there was no all-embracing empire as in China, but kings, lords, and towns that competed with each other. With religion and the church kept distinct from the state, the questions of what one should do with one's life were less dependent on the political powers than in China. Europe was disorderly and full of conflict—rivalries and wars between kings, quarrels between kings and their barons, disputes between church and state, clashes between lords and their peasant workers. Much of this conflict was destructive, yet there was also a kind of freedom in such disorder and a dynamism which promoted change.

---

*European civilization  
in 1300*

European civilization in 1300 was by no means a “modern” society, yet the ancient and medieval cultures on European lands had created institutions and traditions that remained influential even in the most recent eras of modern world history. By 1300 people in Europe had developed separate (at times contending) institutions of church and state to control a growing population, economic institutions to promote urban commerce and long-distance trade, judicial and parliamentary councils to codify or revise the law, and universities to teach or redefine their intellectual traditions. These traditions included a pervasive, enduring faith in Christianity, but the ancient Christian beliefs were challenged, revised, and extended by other ancient traditions of rhetoric, philosophy, and rational inquiry—all of which contributed to the emergence of what is now called early modern history.

# Chapter 2

## THE UPHEAVAL IN WESTERN CHRISTENDOM, 1300–1560

5. Disasters of the Fourteenth Century
6. The Renaissance in Italy
7. The Renaissance outside Italy
8. The New Monarchies
9. The Protestant Reformation
10. Catholicism Reformed and Reorganized

 *In the transition from traditional to more modern forms of society all the old civilizations have had to reexamine their religious base. Today we can observe this process at work everywhere: the Chinese reconsider the age-old teachings of Confucius, the Muslims enter into wider activities than those known to the Qur'an, and the peoples of India are rapidly expanding an economy in which historic Hindu practices no longer form the dominant pattern. People in modern societies do not necessarily reject their ancestral religion. In fact, they may strongly reaffirm it, but they usually try also to adapt it to modern economic and political conditions and to make room for new and non-*

religious interests. The process of developing a variety of activities outside the sphere of religion is called “secularization.”

Latin Christendom was the first of the world's major religious cultures to become “secularized.” In the very long run it was those aspects of European civilization that were least associated with Christianity, such as natural science and industrial technology, or military and economic power, that the non-European world proved to be most willing to adopt. If in our own time there has come to be such a thing as a global civilization, it is because all the world's great traditional cultures have been increasingly secularized. This secularization of human cultures, although often challenged by popular religious movements in the contemporary world, remains one of the decisive trends in modern world history, and it is a trend that began to appear in Europe at the end of the Middle Ages.

The Europe which had become both expansive and more prosperous by the thirteenth century soon entered upon a series of disasters. The Mongols after about 1240 held Russia in subjugation for 200 years. The Ottoman Turks, who had originated in central Asia, penetrated the Byzantine Empire, crushed the medieval Serbian kingdom at the battle of Kosovo in 1389, and spread over the Balkans. They took Constantinople itself in 1453. Eastern Christianity continued to exist, but under alien political domination. Latin Christianity,

reaching from Poland and Hungary to the Atlantic, remained independent but was beset with troubles. The authority of the papacy and of the Roman Catholic church was called into question. Eventually the Protestant churches emerged, and the religious unity of medieval civilization disappeared. Yet new forces also asserted themselves alongside or outside the religious tradition. Government, law, philosophy, science, the arts, material and economic activities were pursued with less regard for Christian values. Power, order, beauty, wealth, knowledge, and control of nature were regarded as desirable in themselves.

In this mixture of decline and revival, of religious revolution and secularization, medieval Christendom evolved into the social, political, and cultural world of early modern Europe.

## 5. DISASTERS OF THE FOURTEENTH CENTURY

### *The Black Death and Its Consequences*

During the fourteenth century, and quite abruptly, almost half the population of Europe was wiped out. Although it is impossible to know exactly how many people lived in medieval Europe, the total population probably fell from roughly 70 million in 1300 to about 45 million in 1400. Some died in sporadic local famines that began to appear after 1300. The great killer, however, was the plague, or Black Death, which first struck Europe in 1348. The precise medical cause of the plague is still debated. Most modern historians believe that the disease was carried by rats, but this theory may not explain how the contagion moved so quickly across Europe or why so many humans became vulnerable to a bacillus that normally lives in rodents. Despite the uncertainty about its physiological origins, historians agree that the plague had decisive effects on European social life. Since the plague returned at irregular and unpredictable intervals, and killed off the young as well as the old, it disrupted marriage and family life and made it impossible for many years for Europe to regain the former level of population. In some places whole villages disappeared. Cultivated fields were abandoned for want of able-bodied men and women to work them. The towns were especially vulnerable, because the contagion spread quickly through populations crowded within town walls. Trade and exchange were obstructed; prices, wages, and incomes moved erratically; famine made its victims more susceptible to disease; and deaths from the plague contributed to famine. The living were preoccupied with the burial of the dead and with fears for their own future.

There were immediate social and political repercussions. In some cases, survivors benefited because the scarcity of labor led to higher wages. On the other hand, in the general disorganization, and with landowners and urban employers decimated also, many of the poor could find no work or took to vagabondage and begging. The upper classes, acting through governments, attempted to control wages and prices. Rebelions of workers broke out in various towns, especially in Flanders, and there were massive insurrections of peasants in many parts of Europe. In France these were called “jacqueries” (from “Jacques,” a nickname for a peasant), of which the first was in 1358. In England a similar large-scale uprising in 1381 came to be known as Wat Tyler’s rebellion. Sometimes the spokesmen for these movements went beyond their immediate grievances to raise broader social questions about why some should be rich and others poor. Governments and the upper classes replied to this menace with ferocious repression. The peasants generally returned to their

---

*The Black Death*

---

*Revolts and repression*

usual labors. Yet something was gained for the rural workers, at least in the long run, as underlying economic and demographic forces continued to assert themselves. The landowners, or feudal class, in order to get the work done on their manors and assure their own incomes, had to offer more favorable terms. These included, for example, the giving of lifetime tenures to peasant families, in return for fixed payment of sums of money. Over the years many of these peasant holdings became hereditary and the value of money decreased, so that payment of a shilling, for example, which in 1400 represented a significant amount, became much less burdensome for the rural worker by 1600. In effect, a class of small peasant property owners began to emerge in much of Europe.

The kings also, who had been building up their position against the church and the feudal lords since the eleventh century, found their problems complicated by the disasters of the fourteenth. They still had their governments to maintain, and their ambitions to satisfy, even if death removed large fractions of their subjects. They even had to increase their incomes, as it became usual for kings to employ royal armies of foot soldiers against the recurring possibility of feudal resistance. Various means of increasing the royal spending power were devised. Currency was debased; that is, the king ordered a given weight of gold or silver to represent a larger number of monetary units. Thus he temporarily had more money, but the result was inflation and higher prices, that is, the declining value of money already mentioned. New taxes were introduced. About 1300 the kings of both England and France undertook to tax the clergy of their respective kingdoms, in both of which the clergy were substantial owners of land. The kings made increasing demands as well on great noble landholders and urban merchants. These demands were resisted, or made subject to bargains by the representative bodies whose origin was described in the last chapter, so that the fourteenth century, and still more the fifteenth, has been called the “golden age” of the medieval parliaments.

In 1337 the **Hundred Years' War** began between England and France. The battles all took place in France, which was internally divided, some parts, like Aquitaine, having long belonged to the English crown. France was ravaged by marauding bands of English soldiers and their French adherents, until French forces began to achieve military victories under the inspired leadership of **Joan of Arc**, the young woman whom the English burned at the stake in Rouen in 1431 after she was convicted by the church of heresy and witchcraft. In England the effects of the long and intermittent war were less divisive. As English soldiers with their longbows defeated the mounted French knights, a kind of early patriotism arose in England. Parliament widened its powers as the kings needed money for their campaigns. But the great English barons also became more unruly. They deposed Richard II in 1399, then quarreled among themselves, in a confusion punctuated by invasion from Scotland and revolt in Wales. Disorder became worse in the fifteenth century. Dukes and earls and their followers formed private armies and fought with each other; they defied the royal law courts and intimidated juries, used Parliament and government for their own purposes, and exploited their peasants. From about 1450 until 1485 England was beset by upper-class turmoil that came to be called the Wars of the Roses, because the opposing noble factions adopted red and white roses as their symbols.

War*

### *Troubles of the Medieval Church*

Meanwhile similar calamities afflicted the church. In 1300, the church of the High Middle Ages, centralized in the papacy, stood at its zenith. But the church was weakened by its

**This graph shows the growth of Europe’s population after 1200, the catastrophic impact of the Black Death in the fourteenth century, and the revival of the European population after the early 1400s.**

very successes. It faced the danger that besets every successful institution—a form of government or a university, to choose modern examples—the danger of believing that the institution exists for the benefit of those who conduct its affairs. The papacy, being at the top, was the most liable to this danger. It became “corrupt,” set in its ways, out of touch with public opinion, and controlled by a self-perpetuating bureaucracy. It was unable to reform itself, and unwilling to let anyone else reform it.

Both Edward I of England and Philip the Fair of France, in the 1290s, assessed taxes on the landed estates belonging to the great abbeys, bishoprics, and other components of the church. The pope, Boniface VIII, prohibited the taxation of clergy by the civil ruler. In the ensuing altercation, in 1302, he issued the famous bull, *Unam Sanctam*, the most extreme of all assertions of papal supremacy, which declared that outside the Roman church there was no salvation, and that “every human creature” was “subject to the Roman pontiff.”<sup>1</sup> The French king sent soldiers to arrest Boniface, who soon died. French influence in the College of Cardinals brought about the election of a pope who was expected to be subservient to

Philip, and who took up his residence, with his court and officials, at Avignon on the lower Rhone river, on what were then the borders of France. Thus began the “**Babylonian Captivity**” of the church. The rest of Europe regarded the **popes at Avignon** throughout the century as tools of France. The papacy lost much of its prestige as a universal institution.

*The “Babylonian Captivity”*

<sup>1</sup>Bulls, so-called from the Latin word for their seal, are known by their first one or two Latin words, which in this case mean “one holy (church);” a “bull,” while the most solemn form of papal edict, does not as such embody a dogma; and it is not Catholic practice today to affirm this policy of Boniface VIII.

Attempts to correct the situation made matters worse. In 1378 the College of Cardinals, torn by French and anti-French factions within it, elected two popes. Both were equally legitimate, being chosen by cardinals, but one lived at Rome, one at Avignon, and neither would resign. The French and their supporters recognized the Avignon pope; England and most of Germany, the Roman. For forty years both lines were perpetuated. There were now two papacies, estranged by the Great Schism of the West.

---

*The Great Schism*

Never had the papacy been so externally magnificent as in the days of the Captivity and the Schism. The papal court at Avignon surpassed the courts of kings in splendor. The papal officialdom grew in numbers, ignoring the deeper problems while busily transacting each day's business. Papal revenues mounted, and new papal taxes were devised, for example, the "annates," by which every bishop or abbot in Christendom had to transmit to Rome most of the first year's income of his office. In the continuing movement of funds from all over Europe to the papal court, from the thirteenth century on, a new class of international bankers rose and prospered.

But the papacy, never so sumptuous, had never since the tenth century rested on such shaky foundations. People pay willingly for institutions in which they believe, and admire magnificence in leaders whom they respect. But before 1378, with the pope submissive to France, and after 1378, with two popes and two papacies to support, there was growing complaint at the extravagance and worldliness of papal rule. It must be remembered that all this happened in a Europe traumatized by the plague, and with a declining number of people expected to bear increasing financial burdens. The most pious Christians were the most shocked. They recognized the vital necessity of obtaining God's grace, but with two churches under two popes, each claiming to hold the keys of Peter, how could they be certain that their church gave true salvation? In a society that was still primarily a religious community, this sense of religious insecurity was a source of uneasiness and dread.

The old moorings were weakened, the wrath of God seemed to be raining upon the earth, and no one had the slightest notion of how the world was going to turn out. Symptoms of mass neurosis appeared. Some people sought refuge in a hectic merriment or luxury and self-indulgence. Others became preoccupied with grisly subjects. Some frantically performed the Dance of Death in the cemeteries, while others furtively celebrated the Black Mass, parodying religion in a mad desire to appease the devil. The Order of Flagellants grew up; its members went through the streets, two by two, beating each other with chains and whips. Religious anxieties and fearful religious rumors contributed also to waves of anti-Jewish violence, murder, and expulsion that spread across parts of France and Germany in the fourteenth century. And it was at this time that people first became obsessed with the fear of witches, a delusion that would ultimately cause thousands of persons (often older women) to be tortured and executed over the following three centuries.

---

*Responses to crisis*

Disaffection with the church, or the thought that it might not be the true or the only way to salvation, spread in all ranks of society. It was not only kings who disputed the claims of the clergy but also obscure parish priests, close to the distress of ordinary people, who began to doubt the powers of their ecclesiastical superiors. One of these humble clerics was William Langland, who in his *Piers Plowman*, in the 1360s, contrasted the sufferings of the honest poor with the hypocrisy and corruption in high places. Such unsettling ideas spread very widely; in England those who held them were known as Lollards. Since the actual poor left no records, it is hard to say exactly what they thought, but some of their ideas were probably

---

*Lollards and Hussites*

Extreme expressions of religious anxiety appeared in the later Middle Ages among the flagellants who wandered through towns beating themselves to appease the wrath of God. They are portrayed here in a later sixteenth-century engraving of their processions.

(Giraudon/Art Resource, NY)

expressed by John Wyclif, who taught at Oxford. About 1380, Wyclif was saying that the true church could do without elaborate possessions, and even that an organized church might not be necessary for salvation, since ordinary, devout persons could do without priests and obtain salvation by reading the Bible, which he translated into English. Similar ideas appeared in Bohemia in central Europe, with John Huss as their spokesman. Here they became a national movement, for the Hussites were both a religious party and at the same time a Slavic or Czech party protesting against the supremacy of the Germans who lived in Bohemia. The Hussite wars ravaged central Europe for decades in the fifteenth century. The ideas of the Lollards and of Huss and Wyclif were branded as heresy, or unacceptable deviations from the true doctrine of the church.

Influential and established persons did not yet turn to heresy, and still less to witchcraft or flagellation. Their answer to the needs of the day was to assemble a great Europe-wide or general council of the church, in which reforms could be pressed by the whole body of Christians upon the reluctant and rival popes.

### *The Conciliar Movement*

In 1409 such a church council met at Pisa. All parts of the Latin West were represented. The council declared both reigning popes deposed and obtained the due election of another, but since the first two refused to resign there were now three. In 1414 an even

greater and more fully attended council met at Constance. Its aims were three: to end the now threefold schism, to extirpate heresy, and to reform the church “in head and members,” or from top to bottom. Not much was accomplished in reform. To discourage heresy, John Huss was interrogated, condemned, and burned at the stake. The schism was ended. All three popes were at last persuaded or compelled to withdraw, and another, Martin V, was elected. The unity of the church, under the papacy, was at last restored.

The majority of the Council of Constance wished to make general councils part of the permanent apparatus of the church for all time in the future. Martin V, however, soon reaffirmed the prerogatives of the papal office, dissolved the Council of Constance, and repudiated its decrees. The next 30 years saw a continuing contest of wills between successive popes and successive councils.

In this battle for jurisdiction few reforms could be adopted, and fewer still could be enforced. Increasingly the life of the church was corrupted by money. No one believed in bribery, but everyone knew that many high churchmen (like many high civil officials of the day) could be bribed. To buy or sell a church office was a crime in the canon law known as “simony,” but it was a crime which in the fifteenth century could not be suppressed. For churchmen to live with mistresses was considered understandable, if unseemly; the standards of laymen in such matters were not high; but for a bishop or other ecclesiastic to give lucrative church positions to his own children (or other relatives) was the abuse known as nepotism, and it, too, could not be eradicated. To sell divine grace for money, all agreed, was not only wrong but also impossible. But in 1300 Boniface VIII had given encouragement to the practice of “indulgences.” A person, if properly confessed, absolved, and truly repentant, might, by obtaining an indulgence, be spared certain of the temporal punishments of purgatory. One usually obtained such an indulgence in return for a donation of money. The practice proved to be a fatally easy method of fund raising, despite complaints against the sale of indulgences simply for money.

Gradually the popes prevailed over the councils. The conciliar movement was greatly weakened for Christendom as a whole when the powerful French element secured its aims by a local national arrangement. In the Pragmatic Sanction of Bourges, in 1438, the Gallican (or French) church affirmed the supremacy of councils over popes, declared its administrative independence from the Holy See, suppressed the payment of annates to Rome, and forbade papal intervention in the appointment of French prelates. The papacy thus lost influence in France, but the popes remained preeminent in Europe as a whole. In 1449, with the dissolution of the Council of Basel, the conciliar movement came to an end. In 1450 a great Jubilee was held to celebrate the papal triumph.

The papacy, its prestige and freedom of action thus secured, now passed into the hands of a series of cultivated gentlemen, men of the world, men of “modern” outlook in tune with their times—the famous popes of the Renaissance. Some, like Nicholas V (1447–1455) or Pius II (1458–1464), were accomplished scholars and connoisseurs of books. Some were like Innocent VIII (1484–1492), a pleasant man who was the first pope to dine in public with ladies. Alexander VI (1492–1503), of the Spanish Borgia family, exploited his office for the benefit of his relatives, trying to make his son Cesare Borgia the ruler of all Italy, while his daughter, Lucretia Borgia, became duchess of Ferrara and gathered literary men and artists at her famous Renaissance court. Alexander VI’s successor, Julius II (1503–1513), was a capable general, and Leo X (1513–1521) was a superb patron of architects and painters. But we must now describe the Italian Renaissance, in which worthies of this kind were elevated to the Holy See.

## 6. THE RENAISSANCE IN ITALY

In Italy in the fifteenth century, and especially at Florence, we observe not merely a decay of medieval certainties but the appearance of a new and invigorating attitude toward the world. The Renaissance, a French word meaning “rebirth,” first received its name from those who thought of the Middle Ages as a dark time from which the human spirit had to be awakened. It was called a rebirth in the belief that people now, after a long interruption, had taken up and resumed a civilization like that of the Greco-Romans. Medieval people had thought of the times of Aristotle or Cicero as not sharply distinct from their own. In the Renaissance, with a new historical sense, arose the conception of “modern” and “ancient” times, separated by a long period with a different lifestyle and appropriately called the Middle Ages.

The basic institutions of Europe, the distinctive languages and national cultures, the great frameworks of collective action in law, government, and economic production—all originated in the Middle Ages. But the Renaissance marked a new era in thought and feeling, by which Europe and its institutions were in the long run to be transformed. The origins of modern natural science can be traced more to the medieval universities than to the Renaissance thinkers. But it was in the Italy of the Quattrocento (as Italians call the fifteenth century) that other fields of thought and expression were first cultivated. The Italian influence in other countries, in these respects, remained very strong for at least 200 years. It pertained to high culture, and hence to a limited number of persons, but extended over the whole area represented

---

*The Italian influence*

by literature and the arts—literature meaning all kinds of writing and the arts including all products of human skill. The effects of the Italian Renaissance, though much modified with the passage of time, were evident in the books and art galleries of Europe and America, and in the architecture of their cities, even after the revolution of “modern” art in the early twentieth century. They involved the whole area of culture which was neither theological nor scientific but concerned with moral and civic questions about what human beings ought to be or ought to do, with the answers reflected in matters of taste, style, propriety, decorum, personal character, and education. In particular, it was in Renaissance Italy that an almost purely secular attitude first appeared, in which life was no longer seen by leading thinkers as a brief preparation for the hereafter.

### *The Italian Cities and the New Conception of Life*

The towns of Italy, so long as trade converged in the Mediterranean, were the biggest and most bustling of all the towns that rose in Europe in the Middle Ages. The crafts of Italy included many refined trades such as those of the goldsmith or stonemason, which were so zealously pursued that artisanship turned into art, and a delight in the beautiful became common among all classes. Merchants made fortunes in commerce: they lent their money to popes or princes and so made further fortunes as bankers. They bought the wares of the craftsmen-artists. They rejoiced, not so much in money or the making of money, as in the beautiful things and psychological satisfactions that money could buy; and if they forgot the things that money could not buy, this is only to say again that their outlook was becoming more “secular.”

---

*The Italian city-states*

The towns were independent city-states. There was no king to build up a government for Italy as a whole, and for several generations the popes were either absent at Avignon or engaged in disputes arising from the Great Schism, so that the influence of Rome was unimportant. The merchant oli-

The wealthiest persons in Italian towns were often bankers who made money from the kind of financial exchange that appears in this fifteenth-century illustration.

(Scala/Art Resource, NY)

garchies, each in its own city, enjoyed an unhampered stage on which to pursue interests other than those of business. In some, as at Milan, they succumbed to or worked with a local prince or despot. In others, as at Florence, Venice, and Genoa, they continued to govern themselves as republics. They had the experience of contending for public office, of suppressing popular revolt or winning popular favor, of producing works of public munificence, of making alliances, hiring armies, outwitting rivals, and conducting affairs of state. In short, Italy offered an environment in which many facets of human personality could be developed.

All this was most especially true in Florence, the chief city of Tuscany, which had grown wealthy in the later Middle Ages from the production of woolens. In the fifteenth century it had a population of about 60,000, which made it only moderately large as Italian cities went. Yet, like ancient Athens, Florence produced an extraordinary sequence of gifted individuals. From the years of Dante, Petrarch, and Boccaccio, who all died before 1375, to those of Machiavelli, who lived until 1527, an amazing number of the leading figures of the Italian Renaissance were Florentines. Like Athens also, Florence lost its republican liberty as well as its creative powers. Its history can be summarized in that of the Medici family. The founder of the family fortunes was Giovanni (1360–1429), a merchant and banker of Florence. His son, Cosimo de' Medici (1389–1464), allying himself with the popular element against some of the leading families of the republic, soon became unofficial ruler himself.

---

*The Medici family*

**Two wool merchants display their goods and bags of wool. This illustration, which is from a 1492 book on arithmetic, shows the use of both Arabic and Roman numerals.**

(Biblioteca Riccardiana, Florence)

Cosimo's grandson, Lorenzo the Magnificent (1449–1492), also used his great wealth to govern but is chiefly remembered as a poet, connoisseur, and lavish benefactor of art and learning. In the next century Tuscany became a grand duchy, of which the Medici were hereditary grand dukes until the family died out in 1737. Thus established, they furnished numerous cardinals and two popes to the church, and two Medici women became queens of France.

*A secular conception of life*

What arose in Italy, in these surroundings, was no less than a new secular conception of life. It seemed very doubtful whether a quiet, cloistered, or celibate life was on a higher plane than an active gregarious life, or family life, or even a life of promiscuity and adventure. It was hard to believe that clergy were any better than laity or that life led to a stern divine judgment in the end. That human will and intelligence might prove misleading seemed a gloomy doctrine. The belief that human beings were frail creatures, in need of God's grace and salvation, though perhaps said with the lips, seemed to evoke less feeling in the heart. Instead, what captivated the Italians of the Renaissance was a sense of the vast range of human powers.

Formerly, the ideal behavior had been seen in renunciation, in a certain disdain for the concerns of this world. Now a life of involvement was also prized. Formerly, poverty had been greatly respected, at least in Christian doctrine. Now there was more praise for a proper enjoyment of wealth. Medieval Europeans had admired a life of contemplation, or meditative withdrawal. Now the humanist Leonardo Bruni could write, in 1433, "The whole glory of man lies in activity." Often, to be sure, the two attitudes existed in the same person. Sometimes they divided different groups within the same city. As always, the old persisted along with the new. The result might be psychological stress and civil conflict.

*Individualism*

The new esteem for human activity took both a social and an individualistic turn. In cities maintaining their republican forms, as at Florence in the early fifteenth century, a new civic consciousness or sense of public duty was expressed. For this purpose the writings of Cicero and other

This procession is part of a fresco that Benozzo Gozzoli executed in 1469 for a Medici chapel. Although its title refers to the three kings on their way to Bethlehem, it actually represents important personages in fifteenth-century Florence. Cosimo de' Medici is on a white horse, followed by a throng of supporters.

(Scala/Art Resource, NY)

ancients were found to be highly relevant, since they provided an ethics independent of the Christian and medieval tradition. There was also a kind of cult of the great individual, hardly known to the ancients, and one which gave little attention to collective responsibility. Renaissance individualism emphasized the outstanding attainments of extraordinary men (women, by contrast, were usually expected to pursue the ordinary tasks of domestic life). The great man shaped his own destiny in a world governed by fortune. He had *virtù*, the quality of being a man (*vir*, “man”), and although a few women might also exhibit *virtù*, it was a quality which in the society of the day was more to be expected in the most aggressive adult males. It meant the successful demonstration of human powers. A man of *virtù*, in the arts, in war, or in statecraft, was a man who knew what he was doing, who, from resources within himself, made the best use of his opportunities, hewing his way through the world and excelling in all that he did. For the arts, such a spirit is preserved in the autobiography of Benvenuto Cellini.

The growing preoccupation with things human can be traced in new forms of painting, sculpture, and architecture that arose in Italy at this time. These arts likewise reflected

**Lorenzo de' Medici, known as the Magnificent, examines a model for a villa that was built for him about 1480 on the outskirts of Florence.**

(Scala/Art Resource, NY)

an increasing this-worldliness, a **new sense of reality** and a **new sense of space**, of a kind different from that of the Middle Ages, and which was to underlie much European thought until the early twentieth century. Space was no longer indeterminate, unknowable, or divine; it was a zone occupied by physical human beings, or one in which human beings might at least imagine themselves moving about. Reality meant visible and tangible persons or objects in this space, “objective” in the sense that they looked or felt the same to all normal persons who perceived them. It was a function of the arts to convey this reality, however idealized or suffused by the artist’s individual feeling, in such a way that observers could recognize in the image the identity of the subject portrayed.

**Architecture reflected the new tendencies.** Though the **Gothic** cathedral at Milan was built as late as 1386, at Florence and elsewhere architects preferred to adapt **Greco-Roman** principles of design, such as symmetrical arrangements of doors and windows, the classical column, the arch and the dome. More public buildings of a nonreligious character were built, and more substantial town houses were put up by wealthy merchants, in styles meant to represent grandeur, or civic importance, or availability and convenience for human use. Gardens and terraces were added to many such buildings.

**Sculpture**, confined in the Middle Ages to the niches and portals of cathedrals, now **emerged as an independent and free-standing art**. Its favored subjects were **human beings**, now presented so that the viewer could walk around the object and see it from all directions. The difference from the religious figures carved on medieval churches was very great.

Like the architects, the sculptors in parting from the immediate past found much in the Greek and Roman tradition that was modern and useful to their purpose. They produced portrait busts of eminent contemporaries, or figures of great leaders, sometimes on horse-

back, or statues depicting characters from Greco-Roman history and mythology. The use of the nude, in mythological or allegorical subjects, likewise showed a conception of humanity that was more in keeping with the Greek than with the Christian tradition.

Painting was less influenced by the ancients, since the little of ancient painting that had survived was unknown during the Renaissance. The invention of painting in oils opened new pathways for the art. Merchants, ecclesiastics, and princes provided a mounting demand. In subject matter painting remained conservative, dealing most often with religious themes. It was the conception and presentation that were new. The new feeling for space became evident. With the discovery of the mathematics of perspective, space was presented in exact relation to the beholder's eye. The viewer, in a sense, entered into the world of the painting. A three-dimensional effect was achieved, with careful representation of distance through variation of size, and techniques of shading or chiaroscuro added to the illusion of physical volume. Human figures were often placed in a setting of painted architecture, or against a background of landscape or scenery, showing castles or hills, which though supposedly far away yet framed the composition with a knowable boundary. In such a painting everything was localized in place and time; a part of the real world was caught and put in the picture. The idea was not to suggest eternity, as in earlier religious painting, nor yet to express private fantasy or the workings of the unconscious, as in much "modern" art, but to present a familiar theme in an understandable setting, often with a narrative content, that is, by the telling of a story.

Painters were able also, like the sculptors, by a close study of human anatomy, to show people in distinctive and living attitudes. Faces took on more expression as artists sought to depict individual personalities. Painting became less symbolic, less an intimation of general or abstract truths, more a portrayal of concrete realities as they met the eye. In the portrait by Bellini of a *condottiere* the reader can see how a strong, real, and vivid personality looks out from the canvas. Similarly, the great religious paintings were peopled with human beings. In Leonardo da Vinci's *Last Supper* Christ and his disciples are seen as a group of men each with his own characteristics. Raphael's Madonnas seem to be young Italian women, and in the mighty figures of Michelangelo the attributes of humanity invade heaven itself.

### *Humanism: The Birth of "Literature"*

The literary movement in Renaissance Italy is called humanism because of the rising interest in humane letters, *litterae humaniores*. There had indeed been much writing in the later Middle Ages. Much of it had been of a technical character, as in theology, philosophy, or law; some of it had been meant to convey information, as in chronicles, histories, and descriptions of the physical world. Great hymns had been composed, lively student songs had been sung at the universities, plays had been performed in cathedrals, the old legends of King Arthur and Roland had been written down, and occasionally a monk would try his hand at a long narrative poem. Yet a new kind of literature and literary culture began to appear in the fourteenth and fifteenth centuries in Italy. A new class of writers looked upon literature as their main life's work, wrote for each other and for a somewhat larger public, and used writing to deal with general questions, or to examine their own states of mind, or to resolve their own difficulties, or used words to achieve artistic effects, or simply to please and amuse their readers. Almost all of the writers were men, but a few women also entered the new literary culture of the era. The writings of Christine de Pisan, for example, helped

to spread humanist themes in France during the early fifteenth century (her family had moved to France from Italy) and also demonstrated that women could participate in the debates of European intellectual life.

---

#### *Humanists and Latin*

The Italian humanists, like their predecessors, wrote a good deal in Latin. They differed from earlier literate persons in that they were not, for the most part, members of the clergy. They complained that Latin had become monkish, barbaric, and “scholastic,” a jargon of the schools and universities, and they greatly preferred the classic style of a Cicero or a Livy. Medieval Latin was a vigorous living language that used words in new senses, many of which have passed into English and the Romance languages as perfectly normal expressions. Yet in the ancient writers the humanists found qualities that medieval writing did not have. They discovered a new range of interests, a new sensibility, discussion of political and civic questions, a world presented without the overarching framework of religious belief. In addition, the Greeks and Romans unquestionably had style—a sense of form, a taste for the elegant and the epigrammatic. They had often also written for practical ends, in dialogues, orations, or treatises that were designed for purposes of persuasion.

If the humanists therefore made a cult of antiquity, it was because they saw kindred spirits in ancient cultures. They sensed a relevancy for their own time. The classical influence, never wholly absent in the Middle Ages, now reentered as a main force in the higher civilization of Europe. The humanists polished their Latin, and increasingly they learned

Greek. They searched assiduously for classical texts hitherto unknown. Many were found; they had of course been copied and preserved by the monks of preceding times.

But while a special dignity attached to writing in Latin, known throughout Europe, most of the humanists wrote in Italian also. Or rather, they used the mode of speech current in Florence. This had also been the language of Dante in the *Divine Comedy*. To this vast poem the humanists now added many writings in Florentine or Tuscan prose. The result was that Florentine became the standard form of modern Italian. It was the first time that a European vernacular—that is, the common spoken tongue as opposed to Latin—became thus standardized amid the variety of its dialects and adapted in structure and vocabulary to the more complex requirements of a written language. French and English soon followed, and most of the other European languages somewhat later.

---

The vernacular

The Florentine exile, Francesco Petrarca, or Petrarch, has been called the first man of letters. The son of a merchant, he spent his life in travel throughout France and Italy. Trained for the law, and an ordained clergyman, he became a somewhat rootless critic of these two esteemed professions, which he denounced for their "scholasticism." He lived in the generation after Dante, dying in 1374, and he anticipated the more fully developed humanism that was to come. His voluminous writings show the complex, contradictory attitudes of early Renaissance thought. Attracted by life, love, beauty, travel, and connections with people of importance in church and state, he could also spurn all these things as ephemeral and deceptive. He loved Cicero for his common sense and his commitment to political liberty; indeed, he discovered a manuscript of Cicero's letters in 1345. He loved St. Augustine for his otherworldly vision of the City of God. But in Cicero's writings he also found a deep religious concern, and in St. Augustine he esteemed the active man who had been a bishop, a writer heavily engaged in the controversies of his time, and one who taught that for true Christians the world is not evil.

---

Petrarch

Petrarch wrote sonnets in Italian, an epic in Latin, an introspective study of himself, and a great many letters which he clearly meant to be literary productions. He aspired to literary fame. In all this we see a new kind of writer, who uses language not merely as a practical tool but as a medium of more subtle expression, to commune with himself, to convey moods of discouragement or satisfaction, to clarify doubts, to improve his own understanding of the choices and options that life affords. With Petrarch, in short, literature became a kind of calling, and also a consideration of moral philosophy, still related but no longer subordinate to religion. It was moral philosophy in the widest sense, raising questions of how human beings should adjust to the world, what a good life could be or ought to be, or where the genuine and ultimate rewards of living were to be found.

Petrarch was an indication of things to come. Boccaccio, his contemporary and also a Florentine, wrote the *Decameron* in Italian, a series of tales designed both to entertain and to impart a certain wisdom about human character and behavior. They were followed by the main group of humanists, far more numerous but less well remembered. Men of letters began to take part in public life, to gather students and found schools, to serve as secretaries to governing bodies or princes, and even to occupy office themselves. Thus the humanist Coluccio Salutati became chancellor of Florence in 1375. During the following decades Florence was threatened by the expansive ambitions of Milan, where the princely despotism of the Visconti family had established itself. Against such dangers a new and intense civic consciousness asserted itself. Salutati, in addition to the usual duties of chancellor, served the state with his pen, glorifying Florentine liberty and identifying it with the liberties of ancient republican Rome before they were undermined by the Caesars. He was succeeded as chancellor

---

The humanists

The three men in this painting were Florentine humanists around 1490. They appear in a larger work that the artist Domenico Ghirlandaio painted for a chapel. Ghirlandaio followed the typical Renaissance practice of using religious stories or events to convey secular subjects and ideas.

(Alinari/Art Resource, NY)

by two other humanists, Bruni and Poggio. Bruni wrote a history of Florence which marked a new achievement in historical writing, when compared with the annals and chronicles of the Middle Ages. He saw the past as clearly past, different from but relevant to the present; and he introduced a new division of historical periods. On the model of such ancient writers as Livy, he adopted a flowing narrative form. And he used history for a practical political purpose, to show that Florence had a long tradition of liberty and possessed values and attainments worth fighting for against menacing neighbors. History took on a utility that it had had for the Greeks and Romans and was to retain in the future in Europe and eventually in other parts of the world: the function of heightening a sentiment, not yet of nationalism, but of collective civic consciousness or group identity. It was meant to arouse its readers to a life of commitment and participation.

All this literary activity was of a scholarly type, in which authors broadened their understanding as much by reading as by personal experience of the world. And scholarly activity, the habit of attending closely to what a page really said, had consequences that went beyond either pure literature or local patriotism. A new critical attitude developed. Bruni, in his history, showed a new sense of the need for authentic sources. Lorenzo Valla became one of the founders of textual criticism. Studying the Latin language historically, he observed that its characteristic words and expressions varied from one time to another.

He put this knowledge to the service of the king of Naples in a dispute with the pope. Valla showed, by analysis of the language used in the document, that the Donation of Constantine, on which the papacy then based its temporal claims, could not have been written in Constantine's time in the fourth century, and so was a forgery. Such scholarship helped establish modern methods for assessing the truth of written texts, and it contributed also to humanist optimism about the range and utility of human knowledge. Pico della Mirandola

and others looked for aspects of truth not revealed in the Christian scriptures. In 1486, the enthusiastic and very learned Pico, for example, claimed at the age of 23 that he could summarize all human knowledge in 900 theses, which he had drawn from “the Chaldaic, Arabic, Hebrew, Grecian, Egyptian, and Latin sages.”

### *Schooling, Manners, and Family Life*

While Italian humanism thus contributed much to literature and scholarship, to classical learning, and to the formation of modern national languages, it also had tangible and lasting effects in education. Here its impact persisted in all regions of European civilization down to the present. The medieval universities were essentially places for professional training in theology, medicine, and law. Except in England this continued to be their primary function. What came to be known as secondary education, the preparation of young men either for the universities or for “life,” owes more to the Renaissance. The organized education of women came much later; some girls learned to read at home or in one of the few female primary schools, but young women were excluded from humanist academies and Renaissance universities.

Medieval schooling had been chaotic and repetitious. Youngsters of all ages sat together with a teacher, each absorbing from the confusion whatever could be understood of Latin rules and vocabulary. The Renaissance launched the idea of putting different age groups or levels of accomplishment into separate classes, in separate rooms, each with its own teacher, with periodic promotion of the pupil from one level to the next. Latin remained the principal subject, with Greek now added. But many new purposes were seen in the study of Latin.

It was intended to give skill in the use of language, including the pupil’s native tongue. Rhetoric was the art of using language to influence others. It heightened communication. Knowledge alone was not enough, said the historian and chancellor Bruni, who also wrote a short work on education—“to make effectual use of what we know we must add the power of expression.” Nor was Latin merely the necessary professional tool for the priest, the physician, the lawyer, or the government servant. The student learned Latin (and Greek) in order to read the ancient writings—epics, lyrics, orations, letters, histories, dialogues, and philosophical treatises—and it was assumed that such writings offered practical lessons for the educated elites of every generation. Readers therefore learned how to find relevant historical models or failures in the rise and decline of the Roman republic and the troubles of the Greek city-states. The classics were meant also to have a moral impact, to produce a balanced personality, and to form character. Not everyone could be important or gifted, said the humanist Vittorino, but we all face a life of “social duty” and are responsible for our “personal influence” on others. These aims became permanent themes in the educational systems that trained the young men of early modern Europe.

Young people were trained also for a more civilized deportment in everyday social living. Personal style in the upper classes became somewhat more studied. Hitherto Europeans had generally acted like big children; they spat, belched, and blew their noses without inhibition, snatched at food with their fingers, bawled at each other when aroused, or sulked when their feelings were offended. It was Italians of the Renaissance who first taught more polite habits. Books of etiquette began to appear, of which the most successful was Castiglione’s *Book of the Courtier* (1528). The “courtier” was ancestor to the “gentleman”; “courtesy” was originally the kind of behavior suited to princely courts.

---

Renaissance  
education

This painting by the Italian artist Lavinia Fontana (1552–1614) portrays an appreciation for the generations and social roles that constituted late Renaissance family life. The people are arranged by age and gender, thus suggesting a different identity and destiny for each person and each group.

(Scala/Art Resource, NY)

#### The “courtier”

The “courtier,” according to Castiglione, should be a man of good birth but is chiefly the product of training. His education in youth, and his efforts in mature years, should be directed toward mixing agreeably in the company of his equals. His clothes should be neat, his movements graceful, his approach to other people perfectly poised. He must converse with facility, be proficient in sports and arms, and know how to dance and appreciate music. He should know Latin and Greek. With literary and other subjects he should show a certain familiarity but never become too engrossed. For the well-bred man speaks with “a certain carelessness, to hide his art, and show that what he says or does comes from him without effort or deliberation.” Pedantry and heaviness must yield to an air of effortless superiority, so that even if the “courtier” knows or does something seriously, he must treat it lightly as one of many accomplishments. At its best, the code taught a consideration for the feelings of others and incorporated some of the moral ideas of the humanists, aiming at a creditable life in active society. Castiglione’s book was translated into numerous languages, and a hundred editions were printed before 1600.

Castiglione’s ideal court also included women, whose civilizing influence was supposed to encourage the good manners, polite conversation, and cultural graces that rough-

edged men might otherwise ignore. Expressing views of men and women that shaped much of Renaissance culture, Castiglione expected men to cultivate a “robust and sturdy manliness,” which would be balanced in court society by the “soft and delicate tenderness” of women. Such distinctions suggested also the gender divisions in Renaissance families and households, including those that were far removed from the courts of princes.

The marriages that created Renaissance households grew out of careful negotiations in which the families of prospective brides and grooms sought to enhance their respective social positions. In Florence, for example, parents typically arranged for their daughters to be married by age 18 to older men whose economic or political connections would be advantageous to the young woman’s own family. Florentine husbands, who had usually reached age 30 before their first marriage, were well advanced in trades or professions before they established their new households, which depended also on the dowries that they received through their marriage contracts. The different ages of husbands and wives reinforced the gender divisions in Renaissance families: men pursued their public careers with their professional peers while their much younger wives raised children in the home. The high mortality rates in Renaissance cities, however, meant that women often outlived their older husbands, and, as young widows were forced to raise the children and manage the household. The young men who attended the new Renaissance schools therefore came from families in which mothers usually provided the most important training during their early years. Renaissance education and manners, as taught in the new schools and academies of the era, thus developed within the distinctive patterns of family life in the Italian cities.

Renaissance  
marriages

### *Politics and the Italian Renaissance*

The Italian Renaissance, for all its accomplishments, produced no institution or great idea by which masses of people living in society could be held together. Indeed, the greatest of Europe’s institutions, the Roman church, in which Europeans had lived for centuries, and without which they did not see how they could live at all, fell into neglect under the Renaissance popes. Nor did Italy develop any effective political institutions. Florence during the fifteenth century passed from a high-spirited republicanism to acceptance of one-man rule. Throughout the peninsula the merchants, bankers, connoisseurs, and courtly classes who controlled the city-states could not fight for themselves, nor arouse their citizens to fight for them. They therefore hired professional fighting men, *condottieri*, private leaders of armed bands, who contracted with the various city-states to carry on warfare and often raised their price or changed sides during hostilities. Italian politics became a tangled web, a labyrinth of subterfuge and conspiracy, a platform on which powerful individuals might exhibit their *virtù*. “Italian cunning” became a byword throughout Europe. Dictators rose and fell. The Medici became dukes in Florence, the Sforza in Milan, while in Venice and Genoa, where the republics survived, narrow oligarchies held tight control. These states, along with the states of the church, jockeyed about like pugilists in a ring, held within an intricate, shifting, and purely local balance of power.

Italy was the despair of its patriots, or of such few as remained. One of these was Niccolò Machiavelli, who, in *The Prince* (1513), wrote the most lasting work of the Italian Renaissance. He dreamed of the day when the citizens of his native Florence, or indeed of all Italy, should behave like early Romans—show virility in their politics, fight in citizen armies for patriotic causes, and uphold their

Machiavelli

The governing council in Florence deliberates on going to war against Pisa during a brief period of republican revival after the Medici were expelled in 1494. A nemesis, or omen of failure and retribution, floats over the councilors' heads and represents the challenge of making political decisions in a Renaissance Italian state.

(Alinari/Art Resource, NY)

dignity before Europe. It was outside Italy, in kings Ferdinand of Aragon, Louis XI of France, and Henry VII of England, that Machiavelli was obliged to find his heroes. He admired them because they knew how to exercise power and how to build strong states. In *The Prince* he produced a handbook of statecraft which he hoped Italy might find useful. He produced also the first purely secular treatise on politics.

Medieval writings on politics, those of Thomas Aquinas or Marsiglio of Padua, for example, had always talked of God's will for the government of people, with such accompanying matters as justice and right, or divine and natural law. All this Machiavelli put aside. He "emancipated" politics from theology and moral philosophy. He undertook to describe simply what rulers actually did. What really happens, said Machiavelli, is that effective rulers and governments act only in their own political interest. They keep faith or break it, observe treaties or repudiate them, are merciful or ruthless, forthright or sly, peaceable or aggressive, according to their estimates of their political needs. Machiavelli was prepared to admit that such behavior was bad; he only insisted that it was in this way, however regrettably, that successful rulers behaved. He was thought unduly cynical even in an age that lacked political delicacy. He had nevertheless diagnosed the new era with considerable insight. It was an age when politics was in fact breaking off from religion, with the building up of states and state authority emerging as goals that required no other justification.

But the most successful states of the time, as Machiavelli saw, were not in Italy. They were what history knows as the New Monarchies, and they owed their strength to something more than princely craft, for they enjoyed a measure of loyalty from the people they governed. The city-states in Renaissance Italy failed to sustain even this limited sense of loyalty between governments and their people. Italian politics became an affair of individual or elite *virtù*; and, as outsiders began to realize, the people of Italy lost interest in both the politics and the wars of their own city-states.

So Italy, the sunny land of balmy Mediterranean skies, rich in the busy life of its cities, its moneyed wealth, its gorgeous works of art, became vulnerable to the depredations of less easygoing peoples, from Spain and the north, who possessed institutions in which men could act together in large numbers. In a new age of rising national monarchies the city-states of Italy were too small to compete. In 1494 a French army crossed the Alps. Italy became a bone of contention between France and Spain. In 1527 a horde of undisciplined Spanish and German mercenaries, joined by footloose Italians, fell upon Rome itself. Never, not even from the barbarian Goths of the fifth century, had Rome experienced anything so horrible and degrading. The city was sacked, thousands were killed, soldiers milled about in an orgy of rape and loot, the pope was imprisoned, and cardinals were mockingly paraded through the streets facing backward on the backs of mules.

---

*Italian vulnerability*

After the sack of Rome the Italian Renaissance faded away. Politically, for over three hundred years, Italy remained divided, the passive object of the ambitions of outside powers. Meanwhile its culture permeated the rest of Europe.

## 7. THE RENAISSANCE OUTSIDE ITALY

Outside Italy people were much less conscious of any sudden break with the Middle Ages. Developments north of the Alps, and in Spain, were more an outgrowth of what had gone before. There was indeed a Renaissance in the Italian sense. In some of the innovations in painting the Flemish masters preceded those of Italy. In the north also, as in Italy, writers

favored a revival of classical Latin, but the modern written languages also began to develop.

The northern Renaissance was more a blend of the old and the new. In it, above all, the religious element was stronger than in Italy. The most important northern humanists were writers like Thomas More in England and Erasmus in Holland. The French humanism that produced the earthy François Rabelais also produced the austere John Calvin.

### *Religious Scholarship and Science*

#### *Christian humanists*

Historians like to distinguish between the “pagan” humanism of Italy and the Christian humanism of the north. In the north, Christian humanists studied the Hebrew and Greek texts of the Bible and read the Church Fathers, both Latin and Greek, in order to deepen their understanding of Christianity and to restore its moral vitality. Among people without pretense to humanistic learning, religion also remained a force. Medieval intellectual interests persisted. This is apparent from the continuing foundation of universities. The humanists generally regarded universities as centers of a pedantic, monkish, and “scholastic” learning. Concentrating upon theology, or upon medicine and law, the universities gave little encouragement to experimental science and still less to purely literary studies. In Italy in the fifteenth century no new universities were established. But in Spain, in France, in Scotland, in Scandinavia, and above all in Germany, new universities continued to develop. Between 1386 and 1506 no less than 14 universities were established in Germany. At one of the newest, Wittenberg, founded in 1502, Martin Luther was to launch the Protestant Reformation.

Germany at this time, on the eve of the great religious upheaval, and before the shift of the principal commercial arteries from central Europe to the Atlantic seaboard, was a main center of European life. Politically, the German-speaking world was an ill-defined and ill-organized region, composed of many diverse parts, from which the Netherlands and Switzerland were not yet differentiated. Economically, nevertheless, western and southern Germany enjoyed a lead over most of Western Europe; the towns traded busily, and German banking families, like the famous Fugger, controlled more capital than any others in Europe. Technical inventiveness was alive; mining was developing; and it was in the Rhineland, at Mainz, that Gutenberg, about 1450, produced the first European books printed with movable type. In painting, the western fringe of the Germanic world produced the Flemish masters, and south Germany gave birth to Albrecht Dürer and the Holbeins.

Intellectually, Germany shared in the Latin culture of Europe, a fact often obscured by the Latin names that German authors used in the early modern era. Regiomontanus (the Latin name of Johann Müller) laid the foundations during his short lifetime (1436–1476) for a mathematical conception of the universe. He was probably the most influential scientific worker of the fifteenth century, especially since Leonardo da Vinci’s scientific labors remained unknown. Nicholas of Cusa (1401?–1464), a Rhinelander, was a churchman whose mystical philosophy entered into the later development of mathematics and science. From such a background of mathematical interests came Copernicus (Niklas Kop-

#### *German contributions to early modern science*

pernick, 1473–1543), who believed that the earth moved about the sun; he was indeed a Pole, but he originated in the mixed German-Polish region of East Prussia. Fortified by the same mathematical interests, Europe’s best-known cartographers were also Germans, such as Behaim and Schöner, whose world maps represented the most advanced geographical knowledge of the time. Paracelsus (Latin for Hohenheim) undertook to revolutionize med-

icine at the University of Basel. His wild prophecies made him a mixture of scientist and charlatan; but, in truth, science was not yet clearly distinguished from the occult, with which it shared the idea of control over natural forces. A similar figure, remembered in literature and the arts, was the celebrated Dr. Faustus. In real life, Faust, or Faustus, was perhaps a learned German of the first part of the sixteenth century. He was rumored to have sold his soul to the devil in return for knowledge and power. The Faust story was dramatized in England as early as 1593 by Christopher Marlowe, and, much later, by Goethe in German poetry. In the legend of Faust later generations were to see a symbol of the inordinate ambitions of modern people.

The idea of human powers to understand and control physical nature, as developed most especially north of the Alps, corresponded in many ways to the more purely Italian and humanistic idea of the infinite richness of human personality. Together, they constituted the new Renaissance spirit, for both emphasized the emancipation of humanity's limitless potentialities. The two ideas constantly interacted; in fact, most of the scientific workers just mentioned—Regiomontanus, Nicholas of Cusa, Copernicus—spent many years in Italy, receiving the stimulus of Italian thought.

### *Mysticism and Lay Religion*

In the north a genuine religious impulse, in addition to religious humanistic scholarship, also remained alive. Where in Italy the religious sense, if not extinct, seemed to pass into a joyous and public cult in which God was glorified by works of art, in the north it took on a more mystical and soberly moral tone. Germany in the fourteenth century produced a series of mystics. The mystic tendencies of Nicholas of Cusa have been mentioned. More typical mystics were Meister Eckhart (d. 1327) and Thomas à Kempis (d. 1471), author of the *Imitation of Christ*. The essence of mysticism lay in the belief, or experience, that the individual soul could in perfect solitude commune directly with God. The mystic had no need of reason, nor of words, nor of joining with other people in open worship, nor of the sacraments administered by the priests—nor even of the church. The mystics did not rebel against the church; they accepted its pattern of salvation; but at bottom they offered, to those who could follow, a deeper religion in which the church as a social institution had no place. All social institutions, in fact, were transcended in mysticism by the individual soul, and on this doctrine, both profound and socially disruptive, Martin Luther was later to draw.

---

*Mysticism and the individual soul*

For the church, it was significant also that religion was felt deeply outside the clergy. Persons stirred by religion, who in the Middle Ages would have taken holy orders, now frequently remained laymen. In the past the church had often needed reform. But in the past, in the bad times of the tenth century, for example, the clergy had found reformers within their own ranks. The church had thus been repeatedly reformed and renewed without revolution. Now, in the fifteenth and early sixteenth centuries an ominous line seemed to be increasingly drawn: between the clergy as an established interest, inert and set in its ways, merely living, and living well, off the church; and groups of people outside the clergy—religious laypersons, religiously inclined humanists and writers, impatient and headstrong rulers—who were more influential than ever before and more critical of ecclesiastical abuses.

Lay religion was especially active in the Netherlands. A lay preacher, Gerard Groote, attracted followers by his sermons on spiritual regeneration. In 1374 he founded a religious sisterhood, which was followed by establishments for religiously minded men. They

---

*The Sisters and  
Brothers of the  
Common Life*

Roman Catholic.

called themselves, respectively, the Sisters and the Brothers of the Common Life, and they eventually received papal approval. They lived communally, but not as monks and nuns, for they took no vows, wore ordinary clothing, and were free to leave at will. They worked at relieving the poor and in teaching. The schools of the Brothers, since some of them came to

have as many as a thousand boys, were the first to be organized in separate classes, each with its own room and its own teacher, according to the pupil's age or level of advancement. The Sisters maintained similar though less elaborate schools for girls. Reading and writing were of course taught, but the emphasis was on a Christian ideal of character and conduct, to instill such qualities as humility, tolerance, reverence, love of one's neighbor, and the conscientious performance of duty. This Modern Devotion, as it was called, spread widely in the Netherlands and adjoining parts of Germany.

*Erasmus of Rotterdam*

---

*Erasmus of  
Rotterdam*

In this atmosphere grew up the greatest of all the northern humanists, and indeed the most notable figure of the entire humanist movement, Erasmus of Rotterdam (1466–1536). Like all the humanists, Erasmus chose to write in a “purified” and usually intricate Latin style. He regarded the Middle Ages as benighted, ridiculed the scholastic philosophers, and studied deeply the classical writers of antiquity. He had the strength and the limitations of the pure man of letters. To the hard questions of serious philosophy he was largely indifferent; he feared the unenlightened excitability of the common people, and he was almost wholly unpolitical in his outlook. He rarely thought in terms of worldly power or advantage and made too little allowance for those who did. An exact contemporary to the most worldly Renaissance popes, Erasmus was keenly aware of the need for reform of the clergy. He put his faith in education, enlightened discussion, and gradual moral improvement. He led no burning crusade and counseled against all violence or fanaticism. He prepared new Greek and Latin editions of the New Testament. Urging people to read the New Testament in the vernacular languages, he hoped that a better understanding of Christ's teaching might turn them from their evil ways. In his *Praise of Folly* he satirized all worldly pretensions and ambitions, those of the clergy most emphatically. In his *Handbook of a Christian Knight* he showed how a man might take part in the affairs of the world while remaining a devout Christian, and in his influential treatise *On Civility in Children* he offered guidance for proper behavior in the social situations of daily life. Tolerance, restraint, good manners, scholarly understanding, a love of peace, a critical and reforming zeal, and a reasonable tone from which shouting and bad temper were always excluded—such were the Erasmian virtues.

Erasmus achieved an international eminence such as no one of purely intellectual attainments had ever enjoyed. He corresponded with the great of Europe. He lectured at Cambridge and edited books for a publisher at Basel. The king of Spain named him a councilor, the king of France called him to Paris, and Pope Leo X assisted him when he was in trouble. Theologians found fault with Erasmus's ideas (in which, indeed, the supernatural had little importance), but among the leaders of the church, the popes and prelates, he had many admirers. Erasmus, it must be noted, attacked only the abuses in the church, the ignorance or sloth of the clergy, and the moral or financial corruption of their lives. The essence and principle of the Roman Catholic church he never called into question. Whether the Erasmian spirit, so widely diffused about 1520, would have sufficed to restore the church without the revolutionary impact of Protestantism is one of the many unanswerable questions of history.

## 8. THE NEW MONARCHIES

Meanwhile, in Europe outside Italy, kings were actively building the institutions of the modern state. It was these states, more than any other single factor, that were to determine the course of the religious revolution. Whether a country turned Protestant, remained Catholic, or divided into separate religious communities was to depend very largely upon political considerations.

War, civil war, class war, feudal rebellion, and plain banditry afflicted a good deal of Europe in the middle of the fifteenth century. In this formless violence central governments had become very weak. Various rulers now tried to impose a kind of civil peace. They have been conveniently called the New Monarchs, but they were not really very new because they resumed the interrupted labors of kings in the High Middle Ages. They thus laid foundations for later national, or at least territorial, states.

The New Monarchs offered the institution of monarchy as a guarantee of law and order. Arousing latent sentiments of loyalty to the reigning dynasty, they proclaimed that hereditary monarchy was the legitimate form of public power, which all should accept without turmoil or resistance. They especially enlisted the support of middle-class people in the towns, who were tired of the private wars and marauding habits of the feudal nobles. Townspeople were willing to let parliaments be dominated or even ignored by the king, for parliaments had proved too often to be strongholds of unruly barons, or had merely accentuated class conflict. The king, receiving money in taxes, was able to organize armies with which to control the nobles. The use of the pike and the longbow, which enabled the foot soldier to stand against the horseman, was here of great potential value. The king, if only he could get his monarchy sufficiently organized and his finances into reliable order, could hire large numbers of foot soldiers, who generally came from the growing population of commoners, unlike the knightly horsemen. But to organize his monarchy, the king had to break down the mass of feudal, inherited, customary, or "common" law in which the rights of the feudal classes were entrenched. For this purpose, at least on the Continent, the New Monarch made use of Roman law, which was now actively studied in the universities. He called himself a "sovereign"—it was at this time that kings began to be addressed as "majesty." The king, said the experts in Roman law, incorporated the will and welfare of the people in his own person. He could therefore make law by his own authority, regardless of previous custom or even of historic liberties—and they quoted Latin phrases to argue that "what pleases the prince has the force of law."

### *The New Monarchy in England, France, and Spain*

The New Monarchy came to England with the dynasty of the Tudors (1485–1603), whose first king, Henry VII (1485–1509), after gaining the throne by force, put an end to the civil turbulence of the Wars of the Roses.

---

*The Tudors*

In these wars the great English baronial families had seriously weakened each other, to the great convenience of the king and the bulk of the citizenry. Henry VII passed laws against "livery and maintenance," the practice by which great lords maintained private armies wearing their own livery or insignia, and he used his royal council as a new court to deal with property disputes and infractions of the public peace. It met in a room decorated with stars, whence its name, the Star Chamber. It represented the authority of the king and his council, and it operated without a jury. Later denounced as an instrument of despotism, it was popular enough at first, because it preserved order and rendered substantial justice.

**ERASMUS OF ROTTERDAM**

by Hans Holbein, the Younger (German, 1497–1543)

This portrait was painted in 1523, when Erasmus was 56, and the Lutheran Reformation had begun in Germany. A classic portrayal of humanism at its best, the painting captures the life of thought and emphasizes the only weapon that Erasmus could use—the pen.

(Alinari/Art Resource, NY)

Henry VII, though miserly and unpleasant in person, was accepted as a good ruler. National feeling in England consolidated around the house of Tudor.

---

*The Valois*

In France the New Monarchy was represented by Louis XI (1461–1483), of the Valois line, and his successors. In the five centuries since the first French king had been crowned, the royal domain had steadily expanded from its original small nucleus around Paris through a combination of inheritance, marriage, war, intrigue, and conquest. Louis XI continued to round out the French borders. Internally, he built up a royal army, suppressed brigands, and subdued rebellious nobles. He acquired far greater powers than the English Tudors to raise taxation without parliamentary consent. The French monarchy also enlarged its powers over the clergy. We have seen how, by the Pragmatic Sanction of 1438, the Gallican church had won considerable independence to manage its own administrative affairs. In 1516 King Francis I reached an agreement with Pope Leo X in the Concordat of Bologna, which rescinded the Pragmatic Sanction. The pope henceforth received his “annates,” or money income, from French ecclesiastics, but the king appointed the French bishops and abbots. The fact that, after 1516, the kings of France already controlled their own national clergy was one reason why, in later years, they were never tempted to turn Protestant.

---

*Aragon and Castile*

Strictly speaking, there was no kingdom of Spain. Various Spanish kingdoms had combined into two, Aragon and Castile. To Aragon, which lay along the Mediterranean side of the peninsula, belonged the Balearic Islands, Sardinia, Sicily, and the south Italian kingdom of Naples. To Castile, after 1492, belonged the newly discovered Americas. The two were joined in a personal union by the marriage of Ferdinand of Aragon and Isabella of Castile in 1469. The union was personal only; that is, both kingdoms recognized the two monarchs, but they had no common political, judicial, or administrative institutions. There was little or no Spanish national feeling; indeed, the Catalans in northern Aragon spoke a language quite different from Castilian Spanish. The most significant common feeling throughout

Spain came from the sense of belonging to the Spanish Catholic church. The common memory was that of the Christian crusade against the Moors. The one common institution, whose officials had equal authority and equal access to all the kingdoms, was a church court, the Inquisition. Meanwhile, the *reconquista* was at last completed when the southern tip of Spain, Granada, was conquered from the Moors in 1492. Its annexation added to the heterogeneous character of the Spanish dominions.

In these circumstances the New Monarchy in Spain followed a religious bent. Unification took place around the church. The rulers, though they made efforts at political centralization, worked largely through facilities offered by the church, and the early sense of "Spanishness" was linked to a sense of Catholicity. Formerly the Spanish had been among the most tolerant of Europeans; Christians, Muslims, and Jews had managed to live together. But in the wave of religious excitement that accompanied the conquest of Granada both the Jews and the Moors were expelled. The expulsion of the Jews by a decree of 1492 was actually a sign of former toleration in Spain, for the Jews had been earlier expelled from England in 1290 and from France in 1306. They were not again legally allowed in England until the mid-seventeenth century, nor in France (with great exceptions) until the French Revolution. In Spain, as in the history of many European peoples, the emergence of an early "national" consciousness seemed to produce a feeling against Jews as "outsiders."<sup>2</sup>

All persons in Spain were now supposed to be Christians. In fact, however, Spain was one of the places in Europe where a person's Christianity could not be taken for granted, because many Spanish families had been Jewish or Muslim for centuries and had only accepted Christianity to avoid expulsion. Hence arose a fear of false Christians, of an unassimilated element secretly hostile to the foundations of Spanish life. It was feared that Moriscos (Christians of Moorish background) and Marranos (Christians of Jewish background) retained a clandestine sympathy for the religion of their forebears. Thousands of such persons were brought before the Inquisition, where, as in the civil courts under Roman procedure, torture could be employed to extort confessions. It was thus safest to be profuse in one's external religious devotions because adherence to the Catholic Church became the way of proving oneself to be a good Spaniard.

---

*Fusing the national  
and the Catholic*

The life of Spain carried forward some of the long-existing commitment to a crusade—which had now evolved into a campaign within Spain against Moriscos and Marranos, and a new campaign against the Moors in Africa itself, which the Spanish invaded immediately after the conquest of Granada. The Spanish also extended their religious energies into the Americas, where the Spanish church set about gathering the Indians into the Christian fold. And Spain's strong religious identity would soon contribute to its growing role in the wider political and religious conflicts of sixteenth-century Europe. Spanish history had prepared the country (before Protestantism ever appeared) to become a leading defender of Roman Catholic traditions as well as an advocate for Catholic renewal and internal reforms.

---

<sup>2</sup>The Jews who left Spain (the Sephardic Jews) went to North Africa and the Middle East, and in smaller numbers to the Dutch Netherlands and even to southwestern France (one of the exceptions noted above). Those who left England two centuries earlier generally went to Germany, the great center of Ashkenazic Jewry in the Middle Ages. Driven from Germany in the fourteenth century they concentrated in Poland, which remained the great center of European Jews until the Nazi massacres of the 1940s.

*The Holy Roman Empire and the Habsburg Supremacy*

Ideas of the New Monarchy were at work even in Germany, which is to say, in the Holy Roman Empire. There were three kinds of states in the Empire. There were the princely states—duchies, margraviates, etc.—each a little hereditary dynastic monarchy in itself, such as Saxony, Brandenburg, or Bavaria. There were ecclesiastical states—bishoprics, abbacies, etc.—in which the bishop or abbot, whose rule was of course not hereditary, conducted the government. A large portion of the area of the Empire consisted of these church-states. Third, there were the imperial free cities, some 50 in number; their collective area was not large, but they dominated the commercial and financial life of the country.

The German states, over the centuries, had prevented the emperor from infringing upon their local liberties. They had taken care to keep the emperorship an elective office, so that with each election local liberties could be reaffirmed. After 1356 the right of electing an emperor was vested in seven electors—namely, four of the princely lords, the Count Palatine, Duke of Saxony, Margrave of Brandenburg, and King of Bohemia (the one king in the Empire), and in three ecclesiastical lords, the archbishops of Mainz, Trier, and

Cologne. In 1452 the electors chose the Archduke of Austria to be emperor.

---

*The Habsburgs*

His family name was Habsburg. The Habsburgs, by using the resources of their hereditary possessions in Austria (and later elsewhere) and by delicately balancing and bribing the numerous political forces within Germany, managed to get themselves consistently reelected to the Holy Roman emperorship in every generation, with one exception, from 1452 until 1806. The Habsburg emperors also tried to introduce the centralizing principles of the New Monarchy into an empire that lacked institutions for the exercise of centralized power.

Under Maximilian I (1493–1519) there seemed to be progress in that direction: the Empire was divided into administrative “circles,” and an Imperial Chamber and Council were created, but they were all doomed to failure before the immovable obstacle of states’ rights. Maximilian was also the author of the Habsburg family fortunes through his strategic use of royal marriages, which brought the Habsburgs into control of a vast empire. Maximilian’s grandson, Charles, thus inherited from his four grandparents the lands of Austria, the Netherlands, and part of Burgundy; Castile and Aragon in Spain; the whole of Spanish America; and scattered possessions in Italy and the Mediterranean. In addition, in 1519, Charles was elected Holy Roman Emperor and so became the symbolic head of all Germany.

---

*Charles V*

Charles V of the Empire (he was known as Charles I in Spain) was thus beyond all comparison the most powerful ruler of his day. But still other fortunes awaited the house of Habsburg. The Turks, who had occupied Constantinople in 1453, were at this time pushing through Hungary and menacing central Europe. In 1526 they defeated the Hungarians at the battle of Mohacs. The parliaments of Hungary, and of the adjoining kingdom of Bohemia, hoping to gain allies in the face of the Turkish threat, thereupon elected Charles V’s brother Ferdinand as their king. Ferdinand soon lost much of Hungary to the Turkish Sultan, Sulayman I, but he retained his royal crown and gradually expanded Habsburg influence in central Europe. No royal family since Charlemagne had stood so far above all rivals. Contemporaries cried that Europe was threatened with “universal monarchy,” with a kind of imperial system in which no people could preserve its independence from the Habsburgs.

The reader who wishes to understand the religious revolution, and the consequent emergence of Protestantism must bear in mind the intricate interplay of the factors that have now been outlined: the decline of the church; the growth of secular and humanistic feeling; the spread of lay religion outside the official clergy; the rise of monarchs who

This painting entitled *Interrogation of the Jews*, by an unknown artist in the 1480s, suggests the dangers that non-Christian people faced in late fifteenth-century Spain. Influential, wealthy interrogators questioned the beliefs or behavior of persons whose religion made them “suspicious” and vulnerable to the powerful people who distrusted them.

(Museo de Bellas Artes, Zaragoza, Spain)

wished to control everything in their kingdoms, including the church; the resistance of feudal elements to these same monarchs; the lassitude of the popes and their fear of church councils; the division of Germany; the Turkish entry into central Europe; the zeal of Spain; the preeminence of Charles V; and the fears felt in other countries, especially in France, of absorption by the amazing empire of the Habsburgs.

## 9. THE PROTESTANT REFORMATION

Three streams contributed to the religious upheaval in sixteenth-century Europe. First, among common people, or the laboring poor, who might find their spokesmen among local priests, there was an endemic dissatisfaction with all the grand apparatus of the church, or a belief that its bishops and abbots were part of a wealthy and oppressive ruling class. For such people, religious ideas were mixed with protest against the whole social order. They found expression in the great peasant rebellion in Germany in the 1520s. The sects which emerged from these social groups are known historically as Anabaptists, and the modern Baptists, Mennonites, and Moravian Brothers are among their descendants. Second, and forming a

discontents

### EUROPE, 1526

The main feature of the political map of Europe about 1526 is the predominance of the house of Habsburg. Much of Europe was ruled by the Habsburg Emperor Charles V, who was at the same time King Charles I of Spain. Charles left his possessions in Austria, Hungary, and Bohemia to his brother and those in Spain, the Netherlands, Italy, and America to his son, thereby establishing the Austrian and Spanish branches of the Habsburg dynasty. France was nearly encircled by Habsburg dominions and habitually formed alliances to oppose the Habsburg kings.

group generally more educated and with broader views of the world, were the **middle classes** of various European cities, especially of cities that were almost autonomous little republics, as in Germany, Switzerland, and the Netherlands. They might wish to manage their own religious affairs as they did their other business, **believing that the church hierarchy was too much embedded in a feudal, baronial, and monarchical system with which they had little in common.** The modern churches of Calvinist origin came in large part from this stream. **Third, there were the ruling sovereigns and princes, who had long disputed with the church on matters of property, taxes, legal jurisdiction, and political influence.** All such rulers wanted to be masters in their own territory. **In the end it was the power of such rulers that determined which form of religion should officially prevail.** The Lutheran and Anglican churches were in this tradition, and to some extent the Gallican church, as the French branch of the Roman Catholic church was called. As it turned out, by 1600, the second and third streams had won many successes, but the first was suppressed. Socio-religious radicalism was reduced to an undercurrent in countries where Anglican, Lutheran, Calvinist, or Roman Catholic churches were established during the sixteenth century.

Since **northern Europe became Protestant while the south remained Catholic,** it may look as if the north had broken off in a body from a once solid Roman church. The reality was not so simple. Let us for a moment put aside the term “Protestant,” and think of the adherents of the new religion as religious revolutionaries.<sup>3</sup> Their ideas were revolutionary **because they held, not merely that “abuses” in the church must be corrected, but also that the Roman church itself was wrong in principle.** Even so, there were many who hoped, for years, that old and new ideas of the church might be combined. Many deplored the extremes but gradually in the heat of struggle had to choose one side or the other. The issues became drawn, and each side aspired to destroy its adversary. For over a century the revolutionaries maintained the hope that “popery” would everywhere fall. **For over a century the upholders of the old order worked to annihilate or reconvert “heretics.”** Only slowly did Catholics and Protestants come to accept each other’s existence as an established fact of European society. Though the religious frontier that was to prove permanent appeared as early as 1560, it was not generally accepted until after the Thirty Years’ War, which ended in 1648.

### *Luther and Lutheranism*

The first who successfully defied the older church authorities was **Martin Luther.** He was a monk, and an earnest one, until he was almost 40 years old. A vehement and spiritually uneasy man, with many dark and introspective recesses in his personality, Luther was terrified by the thought of the awful omnipotence of God, distressed by his own littleness, apprehensive of the devil, and suffering from the chronic conviction that he was damned. The means offered by the church to allay such spiritual anguish—the sacraments, prayer, attendance at Mass—gave him no satisfaction. **From a reading and pondering of St. Paul (Romans i, 17)—“the just shall live by faith”—there dawned upon him a new realization and sense of peace.** He developed the doctrine of justification by faith alone. **This held that what “justifies” a person is not what the church knew as “works” (prayer, alms, the sacraments, holy living) but “faith alone,”** an inward bent of spirit given to each soul directly by God. Good works, Luther thought, were the consequence and external evidence of this inner

---

*Luther’s “justification  
by faith”*

<sup>3</sup>The word “Protestant” arose as an incident in the struggle, at first denoting certain Lutherans who drew up a formal protest against an action of the diet of the Empire in 1529. Only very gradually did the various groups of anti-Roman reformers think of themselves as collectively Protestant.

**Martin Luther and his wife Catherine, portrayed here by the artist Lucas Cranach the Elder, represent the acceptance of marriage among the clergy and religious leaders of the new Protestant churches. Catherine had lived in a convent before she married Luther and took on the new tasks of a religious wife in a Protestant minister's household.**

(Scala/Art Resource, NY)

grace, but in no way its cause. People did not “earn” grace by doing good; they did the good because they possessed the grace of God. With this idea Luther for some years lived content. Even years later some high-placed churchmen believed that in Luther’s doctrine of justification by faith there was nothing contrary to the teachings of the Catholic church.

Luther, now a professor at Wittenberg, was brought out of seclusion by an incident of 1517. A friar named Tetzel was traveling through Germany distributing indulgences, authorized by the pope to finance the building of St. Peter’s in Rome. Tetzel claimed that indulgences would free people from some of the punishments of purgatory, and in return for the indulgences the faithful paid certain stipulated sums of money. Luther thought that people were being deluded, that no one could obtain grace in this way, or ease the pains of relatives in purgatory, as was officially claimed. In the usual academic manner of the day, **he posted 95 theses on the door of the castle church at Wittenberg. Reviewing the Catholic sacrament of penance, Luther held in these theses that, after confession, the sinner is freed of sinful burdens not by the priest’s absolution but by inner grace and faith alone.** Increasingly, it seemed that the **priesthood performed no necessary function in the spiritual relation between human beings and God.**

Luther at first appealed to the pope, Leo X, to correct the abuse of indulgences in Germany. When the pope refused action Luther (like many before him) urged the assembly of

a general church council as an authority higher even than the pope. He was obliged, however, to admit in public debate that even the decision of a general council might be mistaken. The Council of Constance, he said, had in fact erred in its condemnation of John Huss. But if neither the pope, nor yet a council, had authority to define true Christian belief, where was such authority to be found? Luther's answer was, in effect: there is no such authority. He held that individuals might read the Bible and freely make their own interpretations according to their own conscience. This idea was as revolutionary for the church as would be the assertion today that neither the Supreme Court nor any other body may authoritatively interpret or enforce the Constitution of the United States, since each citizen may interpret the Constitution in his or her own way.

From his first public appearance Luther won ardent supporters, for there was a good deal of resentment in Germany against Rome. In 1519 and 1520 he rallied public opinion in a series of tracts, setting forth his main beliefs. He declared that the claim of the clergy to be different from the laity was an imposture. He urged people to find Christian truth in the Bible for themselves, and in the Bible only. He denounced the reliance on fasts, pilgrimages, saints, and Masses. He rejected the belief in purgatory. He reduced the seven sacraments to two—baptism and the communion, as he called the Mass. In the latter he repudiated the new and “modern” doctrine of transubstantiation, while affirming that God was still somehow mysteriously present in the bread and wine. He declared that the clergy should marry, upbraided the prelates for their luxury, and demanded that monasticism be eliminated. To drive through such reforms, while depriving the clergy of their pretensions, he called upon the temporal power, the princes of Germany. He thus issued an invitation to the state to assume control over religion, an invitation which, in the days of the New Monarchy, a good many rulers were enthusiastically willing to accept.

---

*Luther's criticisms of  
the Church*

Threatened by a papal bull with excommunication unless he recanted, Luther solemnly and publicly burned the bull. Excommunication followed. To the emperor, Charles V, now fell the duty of apprehending the heretic and repressing the heresy. Luther was summoned to appear before a diet of the Empire, held at Worms in the Rhineland. He declared that he could be convinced only by Scripture or right reason; otherwise “I neither can nor will recant anything, since it is neither right nor safe to act against conscience. God help me! Amen.” He was placed under the ban of the Empire. But the Elector of Saxony and other north German princes took him under their protection. In safe seclusion, he began to translate the Bible into German.

Lutheranism, or at least anti-Romanism, quickly swept over Germany, assuming the proportions of a national upheaval. It became mixed with all sorts of political and social revolution. A league of imperial knights, adopting Lutheranism, attacked their neighbors, the church-states of the Rhineland, hoping by annexations to enlarge their own meager territories. In 1524 the peasants of a large part of Germany revolted. They were stirred by new religious ideas, worked upon by preachers who went beyond Luther in asserting that each individual could readily understand what was right or wrong. Their aims, however, were social and economic; they demanded a regulation of rents and security of common village rights and complained of exorbitant exactions and oppressive rule by their manorial overlords. Luther repudiated all connection with the peasants, called them filthy swine, and urged the princes to suppress them by the sword. The peasants were unmercifully put down, but popular unrest continued to stir the country, expressing itself, in a religious age, in various forms of extreme religious frenzy.

---

*Social revolution*

The radical Anabaptist movement in Münster was severely repressed after the city's former rulers regained control in early 1536. This illustration depicts the public torture and death of John of Leyden, whose punishment served as a vivid warning to other revolutionary Protestants throughout Germany.

(akg-images)

Various religious leaders attracted devout followers, who came to be known collectively as **Anabaptists**. Some said that all the world needed was love, some that Christ would soon come again, some that they were saints and could do no wrong, and some that infant baptism was useless, immersion of full-grown adults being required, as described in the Bible. The roads of Germany were alive with religious radicals, of whom some tens of thousands converged in 1534 on the city of Münster. There they proclaimed the reign of the saints, abolished property, and introduced polygamy as sanctioned in the Old Testament. A Dutch tailor, **John of Leyden**, claimed that authority came to him directly from God. Hemmed in by besieging armies, he ruled Münster by a revolutionary terror. Luther advised his followers to join even with Catholics to repress such a dangerous religious and social menace. After a full year **Münster** fell to the forces of its former rulers. The “saints” were pitilessly rooted out; John of Leyden died in torture.

---

*Luther's reaction*

Luther, horrified at the way in which religious revolution became confused with social revolution, defined his own position more conservatively. He restricted, while never denying, the right of private judgment in matters of conscience, and he made a larger place for an established clergy, Lutheranized, to be sure, but still established as teachers over the laity. Always well disposed to temporal rulers, having called upon the princes to act as religious reformers, he was thrown by the peasant and Anabaptist uprisings into an even closer alliance with them.

Lutheranism became more submissive to the state. Christian liberty, Luther insisted, was an internal freedom, purely spiritual, known only to God. In worldly matters, he said, the good Christian owed obedience to established authority. Lutheranism thus came to view the state with more deference and respect than governments usually received from either Roman Catholicism or the Calvinism which soon arose.

In the revolution that was rocking Germany it was not the uprising of imperial knights, nor that of peasants or tailors and journeymen, that was successful, but the rebellion of the higher orders of the Empire against the emperor. Charles V, as Holy Roman Emperor, was bound to uphold Catholicism because only in a Catholic world did the Holy Empire have any meaning. The states of the Empire, always fearing the loss of local liberty, saw in Charles's efforts to repress Luther a threat to their own freedom. Many imperial free cities, and most of the dynastic states of north Germany, now insisted on adding to their other rights and liberties the right, or liberty, to determine their own religion. The right or power to reform, they said, belonged to member states, not to the Empire itself. They became Lutheran, locally, introducing Lutheran bishops, doctrines, and forms of worship. Where a state turned Lutheran it usually confiscated the church properties within its borders, a process which considerably enriched some of the Lutheran princes and gave them a strong material interest in the success of the Lutheran movement. In most of the church-states, since the Catholic archbishop or bishop was himself the government, Catholicism prevailed. But a few church-states turned Lutheran. A good example of the secularization of a church-state was afforded in East Prussia, just outside the Empire. This territory belonged to the Teutonic Order, a Catholic organization of which the grand commander, an elective official, was at this time Albert of Brandenburg. In 1525 Albert declared for Luther and converted East Prussia into a secular duchy, of which he and his descendants became hereditary dukes.

---

*Political rebellion*

Against the emperor, a group of Lutheran princes and free cities formed the League of Schmalkald. The king of France, Francis I, though a Catholic in good standing, allied with and supported the League. Political interests overrode religious ones. Against the "universal monarchy" of the swollen Habsburgs the French found alliances where they could, allying with the Turks as with the Lutherans, building up a balance of power against their mighty foe. It became the studied policy of Catholic France to maintain the religious division of Germany.

Threatened by French and Turkish armies and challenged by the resistance of German princes within his own empire, Charles appealed to the pope, urging him to assemble a Europe-wide council in which all disputed matters could be considered, the Protestants could be heard, compromises could be effected, and church unity and German unity (such as it was) could be restored. The king of France schemed at Rome to prevent the pope from calling any such council. The kings of both France and England urged national councils instead, in which religious questions could be settled on a national basis. Pope after pope delayed. The papacy feared that a council of all Latin Christendom might get out of control, since Catholics as much as Protestants demanded reform. To the papacy, remembering the Council of Constance, nothing was more upsetting than the thought of a council, not even the Protestants, not even the Turks. So the popes procrastinated, no council met, years passed, and a new generation grew up in Lutheranism. Meanwhile the Schmalkaldic League, allied with France, actually went to war with the emperor in 1546. Germany fell into an anarchy of civil struggle between Catholic and Protestant states, the latter aided by France. The war was ended by the Peace of Augsburg of 1555.

1517	Martin Luther posts his “95 theses”; beginning of Protestant Reformation
1545–1563	Roman Catholic Council meets at Trent; promotes Catholic reforms
1555	Peace of Augsburg recognizes Protestant and Catholic states in Germany

---

*The Peace of  
Augsburg*

The terms set at Augsburg signified a complete victory for the cause of Lutheranism and states’ rights. Each state of the Empire received the liberty to be either Lutheran or Catholic as it chose. No individual freedom of religion was permitted; if a ruler or a free city decided for Lutheranism, then all persons had to be Lutheran. Similarly in Catholic states all had to be Catholic. The Peace of Augsburg provided also, by the so-called Ecclesiastical Reservation, that any Catholic bishop or other churchman who turned Lutheran in the future (or who had turned Lutheran as recently as 1552) should not carry his territory with him, but should turn Lutheran as an individual and move away, leaving his land and its inhabitants Catholic. Since the issues in Germany were still far from stabilized, this proviso was often disregarded in later years.

The Peace of Augsburg was thus, in religion, a great victory for Protestantism, and at the same time, in German politics and constitutional matters, a step in the disintegration of Germany into a mosaic of increasingly separate states. Lutheranism prevailed in the north and in the south in the duchy of Württemberg and various detached islands formed by Lutheranized free cities. Catholicism prevailed in the south (except in Württemberg and certain cities), in the Rhine valley, and in the direct possessions of the house of Habsburg, which in 1555 reached as far north as the Netherlands. The Germans, because of conditions in the Holy Roman Empire, were the one large European people to emerge from the religious conflict almost evenly divided between Catholic and Protestant.

No rights were granted by the Peace of Augsburg to another group of religious revolutionaries which neither Lutherans nor Catholics were willing to tolerate, namely, the followers of John Calvin.

Lutheranism, it must be pointed out, was adopted by the kings of Denmark and Sweden as early as the 1520s. Since Denmark controlled Norway, and Sweden ruled Finland and the eastern Baltic, all Scandinavia and the Baltic regions became, like north Germany, Lutheran. Beyond this area Lutheranism failed to take root. Like Anglicanism in England (to be described shortly), Lutheranism was too closely associated with established states to spread easily as an international movement. The most successful international form of the Protestant movement was Calvinism.

## Calvin and Calvinism

John Calvin was a Frenchman, born Jean Cauvin, who called himself Calvinus in Latin. Born in 1509, he was a full generation younger than Luther. He was trained both as a priest and as a lawyer and had a humanist's knowledge of Latin and Greek, as well as Hebrew. At the age of 24, experiencing a sudden conversion, or fresh insight into the meaning of Christianity, he joined forces with the religious revolutionaries of whom the best known was then Luther. Three years later, in 1536, he published, in the international language, Latin, his *Institutes of the Christian Religion*. Where Luther had aimed much of his writing either at the existing rulers of Germany, or at the German national feeling against Rome, Calvin addressed his *Institutes* to all the world. He seemed to appeal to human reason itself; he wrote in the severe, logical style of the trained lawyer; he dealt firmly, lucidly, and convincingly with the most basic theological issues. In the *Institutes* people in all countries, if dissatisfied with the existing Roman church, could find cogent expression of universal propositions, which they could apply to their own local circumstances as they required.

---

Calvin's Doctrines

With Luther's criticisms of the Roman church, and with most of Luther's fundamental religious ideas, such as justification by faith and not by works, Calvin agreed. In what they retained of the Catholic Mass, the communion or Lord's Supper as they called it, Luther and Calvin developed certain doctrinal differences. Both rejected transubstantiation, but where Luther insisted that God was somehow actually present in the bread and wine used in the service ("consubstantiation"), Calvin and his followers tended more to regard it as a pious act of symbolic or commemorative character.

The chief differences between Calvin and Luther were two. Calvin made far more of the idea of predestination. Both, drawing heavily on St. Augustine, held that human beings could never earn salvation by their own actions, that any grace which anyone possessed came from the free action of God alone. God, being Almighty, knew and willed in advance all things that happened, including the way in which every life would turn out. God thus knew and willed, from all eternity, that some were saved and some were damned. Calvin, a severe critic of human nature, felt that those who had grace were relatively few. They were the "elect," the "godly," the small group chosen without merit of their own, from all eternity, for salvation. People could feel in their own minds that they were among the saved, God's chosen few, if throughout all trials and temptations they persisted in pursuing a saintly life. Thus the idea of predestination, of God's omnipotence, instead of turning to fatalism and resignation, became a challenge to unrelenting effort, a sense of burning conviction, a conviction of being on the side of that Almighty Power which must in the end be everlastingly triumphant. It was the most resolute spirits that were attracted to Calvinism. Calvinists, in all countries, were militant, uncompromising, perfectionist—or Puritan, as they were called first in England and later in America.

---

Predestination

The second way in which Calvinism differed from Lutheranism was in its attitude to society and to the state. Calvinists refused to recognize the subordination of church to state, or the right of any government—king, parliament, or civic magistracy—to lay down laws for religion. On the contrary, they insisted that true Christians, the elect or godly, should Christianize the state. They wished to remake society itself into the image of a religious community. They rejected the institution of bishops (which both the Lutheran and Anglican churches retained) and provided instead that the church should be governed by presbyteries, elected bodies made up of ministers and devout laymen. By thus bringing an element of lay control into church affairs, they broke the monopoly of priestly power and

so promoted secularization. On the other hand, they were the reverse of secular, for they wished to Christianize all society.

---

*Calvin's Geneva*

Calvin, called in by earlier reformers who had driven out their bishop, was able to set up his model Christian community at Geneva in Switzerland. A body of ministers ruled the church; a consistory of ministers and elders ruled the town. The rule was strict; all loose, light, or frivolous living was suppressed; disaffected persons were driven into exile. The form of worship was severe and favored the intellectual rather than the emotional or the aesthetic. The service was devoted largely to long sermons elucidating Christian doctrine, and all appeals to the senses—color, music, incense—were rigidly subdued. The black gown of Geneva replaced brighter clerical vestments. Images, representing the saints, Mary, or Christ, were taken down and destroyed. Candles went the way of incense. Chanting was replaced by the singing of hymns. Instrumental music was frowned upon, and many Calvinists thought even bells to be a survival of “popery.” In all things Calvin undertook to regulate his church by the Bible. Nor was he more willing than Luther to countenance any doctrine more radical than his own. When a Spanish refugee, Michael Servetus, who denied the Trinity, that is, the divinity of Christ, sought asylum at Geneva, Calvin pronounced him a heretic and had him burned at the stake.

---

*The spread of Calvinism*

Reformers of all nationalities flocked to Geneva to see and study a true scriptural community so that they might reproduce it in their own countries. Geneva became the Protestant Rome, the one great international center of Reformed doctrine. Everywhere Calvinists made their teachings heard (even in Spain and Italy in isolated cases), and everywhere, or almost everywhere, little groups which had locally and spontaneously broken with the old church found in Calvin's *Institutes* a reasoned statement of doctrine and a suggested method of organization. Thus Calvinism spread very widely. In Hungary and Bohemia large elements turned Protestant, and usually Calvinist, partly as a way of opposing the Habsburg rule. In Poland there were many Calvinists, along with less-organized Anabaptists and Unitarians, or Socinians, as those who denied the Trinity were then called. Calvinists spread in Germany, where, opposing both Lutheran and Catholic churches as ungodly impositions of worldly power, they were disliked equally by both. In France the Huguenots were Calvinist, as were the Protestants of the Netherlands. John Knox in the 1550s brought Calvinism to Scotland, where Presbyterianism became and remained the established religion. At the same time Calvinism began to penetrate England, from which it was later to reach British America, giving birth to the Presbyterian and Congregationalist churches of the United States.

---

*Calvinism and democracy*

Calvinism was far from democratic in any modern sense. It carried an almost aristocratic outlook, in that those who sensed themselves to be God's chosen few felt free to dictate to the wider population of lost souls. Yet in many ways Calvinism entered into the development of what became democracy. For one thing, Calvinists never venerated the state; they always held that the sphere of the state and of public life was subject to moral judgment. For another, the Calvinist doctrine of the “calling” taught that a person's labor had a religious dignity and that any form of honest work was pleasing in the sight of God. In the conduct of their own affairs Calvinists developed a type of self-government. They formed “covenants” with one another and devised machinery for the election of presbyteries. They refused to believe that authority was transmitted downward through bishops or through kings. They were inclined also to a democratic outlook by the circumstance that in most countries they remained an unofficial minority. Only at Geneva, in the Dutch Netherlands, in Scotland,

This image of John Calvin suggests that his influence among Protestants came from his intellectual rigor as well as his disciplined leadership of the religious reformers in Geneva.

(Snark/Art Resource, NY)

and in New England (and for a few years in England in the seventeenth century) were Calvinists ever able to prescribe the mode of life and religion of a whole country. In England, France, and Germany, Calvinists remained in opposition to the established authorities of church and state and hence were disposed to favor limitations upon established power. In Poland and Hungary many Calvinists were nobles who disliked royal authority.

### *The Reformation in England*

England was peculiar in that its government broke with the Roman church before adopting any Protestant principles. Henry VIII (1509–1547) in fact prided himself on his orthodoxy. When a few obscure persons, about 1520, began to whisper Luther's ideas in England, Henry himself wrote a *Defense of the Seven Sacraments* in refutation, for which a grateful pope conferred upon him the title "Defender of the Faith." But the king had no male heir. Recalling the violent anarchy from which the Tudor dynasty had extricated England, and determined as a New Monarch to build up a durable monarchy, he decided that he must remarry in order to have a son. He therefore requested the pope, Clement VII, to annul his existing marriage to Catherine of Aragon. Popes in the past had obliged monarchs in similar situations. The pope now, however, was embarrassed by the fact that Catherine, who objected, was the aunt of the Emperor Charles V, whom the pope was in no position to offend. Henry, not a patient man, drove matters forward. He appointed a new archbishop of Canterbury, repudiated the Roman connection, secured the annulment of his earlier marriage, and married the youthful Anne Boleyn. The fact that only three years later he put to death the unfortunate Anne, and thereafter in quick succession married four more wives, for a total of six, threw considerable doubt on the original character of his motives.

---

Henry VIII

---

*The Act of  
Supremacy*

Henry acted through Parliament, believing, as he said, that a king was never stronger than when united with representatives of his kingdom. In 1534 Parliament passed the Act of Supremacy, which declared the English king to be the “Protector and Only Supreme Head of the Church and Clergy of England.” All subjects were required, if asked, to take the oath of supremacy acknowledging the religious headship of Henry and rejecting that of the pope. For refusing this oath Sir Thomas More, a statesman and humanist best known as the author of *Utopia*, was executed for treason. He received a somewhat delayed reward four centuries later when the Roman church pronounced him to be a saint. Henry, in the next few years, closed all the monasteries in England, seized the extensive monastic lands, and passed them out to numerous followers. He thus strengthened and reconstituted a landed aristocracy which had been seriously weakened in the Wars of the Roses. The new landed gentry remained firm supporters of the house of Tudor and the English national church, whatever its doctrines.

It was Henry’s intent not to change the doctrines at all. He simply wished to be the supreme head of an English Catholic church. On the one hand, in 1536, he forcibly suppressed a predominantly Catholic rebellion, and, on the other, in 1539, through the Six Articles, required everybody to believe in transubstantiation, the celibacy of the clergy, the need of confession, and a few other test items of Catholic faith and practice. But it proved impossible to maintain this position, for a great many people in England began to favor one or another of the ideas of Continental Reformers, and a small minority were willing to accept the entire Protestant position.

For three decades the government veered about. Henry died in 1547 and was succeeded by his 10-year-old son, Edward VI, the child of his third wife, Jane Seymour. The Protestant party now came to the fore. But Edward died in 1553 and was succeeded by his much older half-sister, Mary, the daughter of Catherine of Aragon and a devout Roman Catholic whose whole life had been embittered by the break with Rome. Mary tried to re-Catholicize England, but she actually made Catholicism more unpopular with the English. In 1554 she married Philip of Spain, who became king of England, though only in name. The English did not like Philip, nor the Spanish, nor the intense Spanish Catholicism that Philip represented. Under Mary, moreover, some three hundred persons were burned at the stake, as heretics, in public mass executions. It was the first (and last) time that such a thing had happened in England, and it set up a wave of horror. In any event, Mary did not live long. She was succeeded in 1558 by Henry’s younger daughter, Elizabeth, the child of Anne Boleyn. Whatever Elizabeth’s real views in religion might be (she concealed them successfully and was rumored to have none), she could not be a Roman Catholic. For Catholics she was illegitimate and so unable to be queen.

---

*The Church of  
England*

Under Elizabeth the English became Protestant, gradually and in their own way. The Church of England took on a form of its own. Organizationally, it resembled a Lutheran church. It was a state church, for its existence and doctrines were determined by the temporal power, in this case the monarch acting through Parliament. All English subjects were obliged to belong to it, and laws were passed against “recusants,” a term used to cover both the Roman Catholics and the more advanced Calvinists who refused to acknowledge it. With the exception of monasteries and certain other church foundations, the Church of England retained the physical possessions, buildings, and internal organization of the medieval church—the bishops and the archbishops, who continued to sit in the House of Lords, the episcopal

### STATE RELIGIONS IN EUROPE ABOUT 1560

This map shows the legally authorized, established churches about 1560, but it does not show the precise distributions of religious communities. Many Catholics lived north of the heavy line, and many Protestants south of it. Most widely dispersed were the Calvinists and the more radical Protestants or Anabaptists. In Germany, under the Holy Roman Empire, each principality and free city chose its own religion; hence, the Germans were the only large European nationality to emerge from the Reformation almost evenly divided between Catholics and Protestants.

Queen Elizabeth I wanted her portraits to convey her power and royal grandeur. This painting from the 1580s, attributed to Nathan Hilliard, uses clothing and jewels to show her wealth and an ornamental ermine to symbolize her royal rank.

(By permission of the Marquess of Salisbury. Photograph: Photographic Survey, Courtauld Institute of Art)

courts with their jurisdiction over marriage and wills, the tithes or church taxes paid by all landowners, the parish structure, the universities of Oxford and Cambridge.

In religious practice, the Church of England was definitely Protestant: English replaced Latin as the language of the liturgy, there was no cult of the saints, and the clergy married, though Elizabeth confessed to some embarrassment at the thought of an archbishop having a wife. In doctrine, it was Elizabeth's policy to make the dogmas broad and ambiguous, so that persons of all shades of belief could be more readily accommodated. The Thirty-nine Articles (1563), composed by a committee of bishops, defined the creed of the Anglican church. In the light of the burning issues of the day many of the articles were evasive, though Protestant in tone. All but one of the Anglican bishops had been newly appointed by Elizabeth at her accession; many had lived in exile among Continental Protestants in the reign of Mary Tudor; and except on the matter of church government through bishops (known as episcopacy) a strong Calvinist impress was set upon Anglican belief in the time of Elizabeth.

The same ecclesiastical settlement was prescribed for Ireland, where English or rather Anglo-Norman conquerors had settled since the twelfth century, shortly after the Norman conquest of England. A replica of the Church of England was now established, called the Church of Ireland, which took over the properties and position of the Roman church. The native Irish, however, remained almost solidly Roman Catholic. As in Hungary or Bohemia people who resented the Habsburgs were likely to turn Protestant rather than share in the ruler's religion, so in Ireland the fact that the ruling English were Protestant only confirmed the Irish in their attachment to the Roman church. The Catholic priests,

deprived of status, income, and church buildings, and often in hiding, became national leaders of a **discontented people**.

### The Consolidation of Protestantism by 1560

*Good summary 91-92*

Neither in England, nor in Germany, nor in international Calvinism were the religious issues regarded as settled in 1560. Nor had the Roman church accepted the new situation. But by 1560 the chief Protestant doctrines had been affirmed, and geographically Protestantism had made many conquests. The institutional unity of Latin Christendom had been broken. A world of separate churches, states, and nations was taking its place.

Protestants differed with one another, yet there was much that all had in common. All rejected the papal authority. None participated in any effective international organization; the ascendancy of Geneva was spiritual only and proved to be temporary. All Protestants rejected the special, sacerdotal, or supernatural character of the priesthood; indeed, the movement was perhaps most fundamentally a revolt against the medieval position of the clergy. Protestants generally called their clergy ministers, not priests. All Protestant clergy could marry. There were no Protestant monks, nuns, or friars. All Protestant churches replaced Latin with the vernacular in religious services—English, French, German, Czech, as the case might be. All Protestants reduced the number of sacraments, usually to two or three; such sacraments as they retained they regarded more as symbols than as actual carriers of divine grace; all believed, in one way or another, in justification by faith. All denied transubstantiation, or the miracle of the Mass. All gave up the obligatory confessional, and with it priestly absolution. All gave up the idea of purgatory as a kind of temporal zone between heaven and hell and hence abandoned the practice of saying prayers and Masses for the dead. It need hardly be added that nothing like indulgences remained. All gave up the cult of the saints and of the Virgin Mary, whose intercession in heaven was no longer expected. All declared that the one true source of Christian belief was the Holy Scripture. And while all established Protestant churches in the sixteenth century insisted on conformity to their own doctrines, allowing no individual freedom, all Protestants still had some small spark of the spirit first ignited by Luther, so that none flatly repudiated the right of private judgment in matters of conscience.

---

---

*What Protestants held in common*

It has sometimes been maintained that one of the motivations in Protestantism was economic—that a new acquisitive, dynamic, capitalistic impulse shook off the restrictions imposed by medieval religion. The fact that Protestant England and Holland soon underwent a rapid capitalistic development gives added credibility to this idea. The alacrity with which Protestant governments confiscated church lands shows a keen material interest; but in truth, both before and after the Reformation, governments confiscated church properties without breaking with the Roman church. That profound economic changes were occurring at the time will become apparent in the following chapter. Yet it seems that economic conditions were far less decisive than religious convictions and political circumstances. Calvinism won followers not only in cities but also in agrarian countries such as Scotland, Poland, and Hungary. Lutheranism spread more successfully in the economically retarded north Germany than in the busy south. The English were for years no more inclined to Protestantism than the French, and in France, while many lords and peasants turned Protestant, Paris and many other towns remained as steadfastly Catholic. It is possible that Protestantism, by casting a glow of religious righteousness over a person's daily business and material prosperity, later contributed to

The ideal Protestant household is represented by an unknown artist in this sixteenth-century Dutch painting of the family of a successful merchant. There are clear divisions between the men, women, and children, but everyone expresses the sobriety and wealth of a prosperous Calvinist community.

(© Rijksmuseum Foundation)

the economic success of Protestant peoples, but it does not seem that the Protestant work ethic or any other economic factors were of any distinctive importance in the first stages of Protestantism.

#### *Protestants and family life*

The new religious movements had a more immediate influence on attitudes about marriage and the family. In contrast to medieval Catholicism, which had praised sexual abstinence and celibacy as key traits of the most exalted religious persons, Protestantism strongly promoted marriage as the ideal social institution for clergy and lay people alike. Parenthood became honorable for even the most pious Protestant leaders. Although women sometimes wrote hymns or preached in the more radical Protestant churches, the model Protestant woman was the conscientious mother in a devout, religious household. The opportunities, even if limited, that some women had found in medieval convents and religious communities disappeared in Protestant societies, which may explain why nuns in Protestant territories were often among the last persons to accept the new religious ideas.

Apart from the new emphasis on marriage, however, Protestants did little to change the role of women in Christian churches or in the wider social order. The pastors in Protestant communities were all men, and though more women may have become literate in order to read the Bible, they became less visible in Protestant rituals as the long venerated female saints vanished from prayers, religious writings, and charitable institutions. Meanwhile, women in the convents of Catholic countries were more strictly cloistered and controlled as Catholicism developed its own powerful movements for reform and reorganization.

## 10. CATHOLICISM REFORMED AND REORGANIZED

The Catholic movement corresponding to the rise of Protestantism is known as the Catholic Reformation or the Counter Reformation, the former term being preferred by Catholics; the latter by Protestants. Both are applicable. On the one hand the Catholic church underwent a genuine reform, which might have worked itself out in one way or another even if the stimulus of revolutionary Protestantism had been absent. On the other hand the character of the reform, the decisions made, and the measures adopted were shaped by the need of responding explicitly to the Protestant challenge; and certainly, also, there was a good deal of purely "counter" activity aimed at the elimination of Protestantism as such.

The demand for reform was as old as the abuses against which it was directed. Characteristically, it had expressed itself in the demand for a general or ecumenical church council. The conciliar movement, defeated by the popes about 1450, showed signs of revival after 1500. The Lutheran upheaval thus provoked new calls for a general council of the church, and we have seen how Charles V, in the interests of German unity, sought to persuade the pope to assemble an adequately empowered council, which might remove some of the abuses in the church and take away the grounds upon which many Germans were turning to Lutheranism. But meanwhile the king of France found reason to favor the pope and to oppose the emperor. The French king, Francis I (1515–1547), could support the pope because he had obtained from the papacy what he wanted, namely, control over the Gallican church, as acquired in the Concordat of Bologna of 1516. And he had reason to oppose Charles V, because Charles V ruled not only in Germany but also in the Netherlands, Spain, and much of Italy, thus encircling France and threatening Europe with what contemporaries called "universal monarchy." Francis I therefore actively encouraged the Protestants of Germany, as a means of maintaining dissension there, and used his influence at Rome against the calling of a council by which the troubles of the Catholic world might be relieved.

---

*The call for reform*

Gradually, in the curia, there arose a party of reforming cardinals who concluded that the need for reform was so urgent that all dangers of a council must be risked. Pope Paul III summoned a council to meet in 1537, but the wars between France and the Empire forced its abandonment. Finally, in 1545, a council assembled and began deliberations. It met at Trent, on the Alpine borders of Germany and Italy. The Council of Trent, which shaped the destiny of modern Catholicism, sat at irregular intervals for almost 20 years. It was not until the Second Vatican Council in the 1960s that some of the main decisions made at Trent were substantially modified.

### *The Council of Trent*

The council was beset by difficulties of a political nature, which seemed to show that under troubled conditions an international council was no longer a suitable means of regulating Catholic affairs. Significantly, it was not well attended. Whereas earlier councils of the church had assembled as many as 500 prelates, the attendance at Trent was never nearly so great; it sometimes fell as low as 20 or 30, and the important decree on "justification," the prime issue raised by Luther, and one on which some good Catholics had until then believed a compromise to be possible, was passed at a session where only 60 prelates were present. Even with the small attendance, the old conciliar issue was raised. A party of bishops believed that the bishops of the Catholic church, when assembled in council from

all parts of the Catholic world, collectively constituted an authority superior to that of the pope. To stave off this “episcopal” movement was one of the chief duties of the cardinal legates deputed by the pope to preside over the sessions.

---

*Preserving papal  
authority*

The popes managed successfully to resist the idea of limiting the papal power. In the end they triumphed, through a final ruling voted by the council, that no act of the council should be valid unless accepted by the Holy See. It is possible that had the conciliar theory won out, the Catholic church might have become as disunited in modern times as the Protestant. It was clear, at Trent, that the various bishops tended to see matters in a national way, in the light of their own problems at home, and to be frequently under strong influence from their respective secular monarchs. In any case, the papal party prevailed, which is to say that the centralizing element, not the national, triumphed. The Council of Trent thus preserved the papacy as a center of unity for the Catholic church and helped prevent the very real threat of its dissolution into state churches. Even so, the council’s success was not immediate, for in every important country the secular rulers at first accepted only what they chose of its work, and only gradually did its influence prevail.

---

*The Council of Trent:  
defining Catholic  
doctrine*

Questions of national politics and of church politics apart, the Council of Trent addressed itself to two kinds of labors—to a statement of Catholic doctrine and to a reform of abuses in the church. When the council began to meet in 1545, the Protestant movement had already gone so far that any reconciliation was probably impossible: Protestants, especially Calvinists, simply did not wish to belong to the church of Rome under any conditions. In any case, the Council of Trent made no concessions.

It declared justification to be by works and faith combined. It enumerated and defined the seven sacraments, which were held to be vehicles of grace independent of the spiritual state of those who received them. The priesthood was declared to be a special estate set apart from the laity by the sacrament of holy orders. The procedures of the confessional and of absolution were clarified. Transubstantiation was reaffirmed. As sources of Catholic faith, the council put Scripture and tradition on an equal footing. It thus rejected the Protestant claim to find true faith in the Bible alone and reasserted the validity of church development since New Testament times. The Vulgate, a translation of the Bible into Latin made by St. Jerome in the fourth century, was declared to be the only version on which authoritative teaching could be based. The right of individuals to believe that their own interpretation of Scripture was more true than that of church authorities (private judgment) was denied. Latin, as against the national languages, was prescribed as the language of religious worship—a requirement abolished by the Second Vatican Council in the 1960s. Celibacy of the clergy was maintained. Monasticism was upheld. The existence of purgatory was reaffirmed. The theory and correct practice of indulgences were restated. The veneration of saints, the cult of the Virgin, and the use of images, relics, and pilgrimages were approved as spiritually useful and pious actions.

It was easier for a council to define doctrines than to reform abuses, since the latter consisted in the rooted habits of people’s lives. The council decreed, however, a drastic reform of the monastic orders. It acted against the abuse of indulgences while upholding the principle. It ruled that bishops should reside habitually in their dioceses, attend more carefully to their proper duties, and exercise more administrative control over clergy in their own dioceses. The abuse by which one man had held numerous church offices at the same time (pluralism) was checked, and steps were taken to assure that church officials

should be competent. To provide an educated clergy, the council ordered that a seminary should be set up in each diocese for the training of priests.

### *The Counter Crusade*

As laws in general have little force unless sustained by opinion, so the reform decrees of the Council of Trent would have remained ineffectual had not a renewed sense of religious seriousness been growing at the same time. Herein lay the inner force of the Catholic Reform. In Italy, as the Renaissance became more undeniably pagan, and as the sack of Rome in 1527 showed the depths of hatred felt even by many Catholics toward the Roman clergy, the voices of moralists began to be heeded. The line of Renaissance popes was succeeded by a line of reforming popes, of whom the first was Paul III (1534–1549). The reforming popes insisted on the primacy of the papal office, but they regarded this office, unlike their predecessors, as a moral and religious force. In many dioceses the bishops began on their own initiative to be stricter. The new Catholic religious sense, more than the Protestant, centered in a reverence for the sacraments and a mystical awe for the church itself as a divine institution. Both men and women founded many new religious orders, of which the Jesuits became the most famous. Others were the Oratorians for men and the Ursulines for women. The new orders dedicated themselves to a variety of educational and philanthropic activities. Missionary fervor for a long time was more characteristic of Catholics than of Protestants. It reached into Asia and the Americas, and in Europe expressed itself as an intense desire for the reconversion of Protestants. It showed itself, too, in missions among the poor, as in the work of St. Vincent de Paul among the human wreckage of Paris, for which the established Protestant churches failed to produce anything comparable. In America, as colonies developed in the sixteenth and seventeenth centuries, the Protestant clergy tended to take the layman's view of the Indians, while Catholic clergy labored to convert and protect them; and the Catholic church generally worked to mitigate the brutal treatment of enslaved Africans, to which the pastors in English and Dutch colonies, perhaps because they were more dependent upon the laity, remained largely indifferent.

---

---

*Catholic religious  
renewal*

We have seen how in Spain, where the Renaissance had never taken much hold, the very life of the country was connected to a kind of ongoing Christian crusade. It was in Spain that much of the new Catholic feeling first developed, and from Spain that much of the missionary spirit first went out. Spanish writers produced the most influential sixteenth-century accounts of Catholic mysticism, including Teresa of Avila's famous descriptions of her encounters with Christ. It was also Spain that produced St. Ignatius Loyola (1491–1556). A soldier in youth, he too, like Luther and Calvin, had a religious "experience" or "conversion," which occurred in 1521, before he had heard of Luther and while Calvin was still a boy. Loyola resolved to become a soldier of the church, a militant crusader for the pope and the Holy See. On this principle he established the Society of Jesus, commonly known as the Jesuits. Authorized by Pope Paul III in 1540, the Jesuits constituted a monastic order of a new type, less attached to the cloister, more directed toward active participation in the affairs of the world. Only men of proven strength of character and intellectual force were admitted. Each Jesuit had to undergo an arduous and even horrifying mystical training, set forth by Loyola in his *Spiritual Exercises*. The order was ruled by an iron discipline, which required each member to see in his immediate superior the infallibility of the Holy Church.

---

---

*The Jesuits*

**St. Ignatius Loyola's religious inspiration is portrayed in this painting by Peter Paul Rubens, whose work often represented the religious and political leaders of Catholic countries.**

(Giraudon/Art Resource)

If, said Loyola, the church teaches to be black what the eye sees as white, the mind must believe it to be black.

For two hundred years the Jesuits were the most famous schoolmasters of Catholic Europe, eventually conducting some 500 schools for boys of the upper and middle classes. In them they taught, besides the faith, the principles of gentlemanly deportment (their teaching of dancing and dramatics became a scandal to more puritanical Catholics), and they carried over the Renaissance and humanist idea of the Latin classics as the main substance of adolescent education. The Jesuits made a specialty of work among the ruling classes. They became confessors to kings and hence involved in political intrigue. In an age when Protestants subordinated an organized church either to the state or to an individual conscience, and when even Catholics frequently thought of the church within a national framework, the Jesuits seemed almost to worship the church itself as a divine institution, the Church Militant and the Church Universal, internationally organized and governed by the Roman pontiff. All full-fledged Jesuits took a special vow of obedience to the pope. Jesuits in the later sessions of the Council of Trent fought obstinately, and successfully, to uphold the position of Rome against that of the national bishops.

By 1560 the Catholic church, renewed by a deepening of its religious life and by an uncompromising restatement of its dogmas and discipline, had devised also the practical

machinery for a counteroffensive against Protestantism. The Jesuits acted as an international missionary force. They recruited members from all countries, including those in which the governments had turned Protestant. English Catholics, for example, trained as Jesuits on the Continent, returned to England to attempt to overthrow the heretic usurper, Elizabeth, seeing in the universal church a higher cause than national independence in religion. Jesuits poured also into the most hotly disputed regions where the religious issue still swayed in the balance—France, Germany, Bohemia, Poland, Hungary. As after every great revolution, many people after an initial burst of Protestantism were inclined to turn back to the old order, especially as the more crying evils within the Catholic church were corrected. The Jesuits reconverted many who thus hesitated.

For the more recalcitrant other machinery was provided. All countries censored books; Protestant authorities labored to keep “papist” works from the eyes of the faithful, and Catholic authorities took the same pains to suppress all knowledge of “heretics.” All bishops, Anglican, Lutheran, and Catholic, regulated reading matter within their dioceses. In the Catholic world, with the trend toward centralization under the pope, a special importance attached to the list published by the bishop of Rome, the papal Index of Prohibited Books. Only with special permission, granted to reliable persons for special study, could Catholics read books listed on the Index, which was not abandoned until the 1960s.

All countries, Protestant and Catholic, also set up judicial and police machinery to enforce conformity to the accepted church. In England, for example, Elizabeth established the High Commission to bring “recusants” into the Church of England. All bishops, Protestant and Catholic, likewise possessed machinery of enforcement in their episcopal courts. But no court made itself so dreaded as the Inquisition. In reality two distinct organizations went under this name, the word itself being simply an old term of the Roman law, signifying a court of inquest or inquiry. One was the Spanish Inquisition, established originally, about 1480, to ferret out Jewish and Muslim survivals in Spain. It was then introduced into all countries ruled by the Spanish crown and employed against Protestantism, particularly in the Spanish Netherlands, which was an important center of Calvinism. The other was the Roman or papal Inquisition, established at Rome in 1542 under a permanent committee of cardinals called the Holy Office; it was in a sense a revival of the famous medieval tribunal established in the thirteenth century for the detection and repression of heresy. Both the Spanish and the Roman Inquisitions employed torture, for heresy was regarded as the supreme crime, and all persons charged with crime could be tortured, in civil as well as ecclesiastical courts, under the existing laws. In the use of torture, as in the imposition of the harshest sentence, burning alive, the Roman Inquisition was less severe than the Spanish. The Roman Inquisition in principle offered a court to protect purity of faith in all parts of the Catholic world. But the national resistance of Catholic countries proved too strong; few Catholics wished the agents of Rome inquiring locally into their opinions; and the Roman Inquisition never functioned for any length of time outside of Italy.

---

*Enforcing religious  
conformity*

In the “machinery” of enforcing religious belief, however, no engine was to be so powerful as the apparatus of state. Where Protestants won control of government, people became Protestant. Where Catholics retained control of governments, Protestants became in time small minorities. And it was in the clash of governments, which is to say in war, for about a century after 1560, that the fate of European religion was worked out. In 1560 the strongest powers of Europe—Spain, France, Austria—were all officially Catholic. The Protestant states were all small or at most middle-sized. The Lutheran states of Germany, like all German states, were individually of little weight. The Scandinavian monarchies were far away. England, the most considerable of Protestant kingdoms, was a country of

only four million people, with an independent and hostile Scotland to the north, and with no sign of colonial empire yet in existence. In the precedence of monarchs, as arranged in the earlier part of the century, the king of England ranked just below the king of Portugal, and next above the king of Sicily. Clearly, had a great combined Catholic crusade ever developed, Protestantism could have been wiped out. Yet such a crusade, partially launched on various fronts by the king of Spain, never succeeded. Religious divisions became a permanent reality in European culture, contributing eventually, like Renaissance humanism and the new European monarchies, to a gradual secularization of modern societies.

## ECONOMIC RENEWAL AND WARS OF RELIGION, 1560–1648

11. The Opening of the Atlantic
12. The Commercial Revolution
13. Changing Social Structures
14. The Wars of Catholic Spain: The Netherlands and England
15. The Disintegration and Reconstruction of France
16. The Thirty Years' War, 1618–1648: The Disintegration of Germany

 It is convenient to think of European history in the period following 1560 as the age of the Wars of Religion, which may be said to have ended with the Peace of Westphalia in 1648. France, England, the Netherlands, and the Holy Roman Empire fell into internal and international struggles in which religion was often the most burning issue, but in which political, constitutional, economic, and social questions were also involved. The time of the long, drawn-out conflicts between Catholics and Protestants was also a time of economic renewal. From the beginning of the sixteenth century European society was transformed by contacts with a newly discovered overseas world, by expanded trade routes, an emergent capitalism, and the formation of new social classes.

This was the era in which the modern global economic system began to develop. The effects of these profound changes, however, were obscured

and delayed by the politico-religious struggles. In the present chapter we must first examine the geographical discoveries, then survey the broad new economic and social developments under way, and finally trace the impact of the religious wars on various parts of Europe. The wars, as we shall see, left Spain and Germany very much weakened, and opened the way for the English, Dutch, and French to profit from the economic changes and play leading roles in the drama of early modern times.

### 11. THE OPENING OF THE ATLANTIC

Always until about 1500 the Atlantic Ocean had been a barrier, an end. About 1500 it became a bridge, a starting place. The consequences were enormous for all concerned. In

Chapter emblem: Detail from Jean Bourdichon (1457–1521), *The Four Estates of Society: Work*, which shows a carpenter working with the tools of his craft. (Giraudon/Art Resource, NY)

general, they were favorable for Europeans but devastating for peoples elsewhere—in America through massive depopulation by diseases such as smallpox brought from Europe, in Africa through the transatlantic slave trade, and ultimately in places as far away as Australia through the destruction of long-existing cultures or languages. Older, celebratory accounts of Europe’s “overseas discoveries” have therefore been widely challenged in recent decades by historians who approach the story of European expansion from the perspective of Native Americans or African Americans. Viewed from these perspectives, Columbus’s first voyage to America in 1492 launched a history of terrible losses rather than a story of heroic European explorations and conquests.

But few would deny that the new, complex association of the Old and New Worlds, as Europeans called them, became a momentous event in human history. The endless migration of people, the worldwide movement of trade, and the disorienting experiences of cross-cultural encounters marked the true beginning of modern global history. Europeans transformed or even destroyed numerous other cultures, but their own culture was also transformed through steadily expanding contacts with other peoples, social traditions, and religions in every part of the world. A new wealthy commercial class grew up in cities along Europe’s Atlantic coast. Naval power became decisive. European populations grew with the adoption of the American potato, and people in Europe became dependent on imported commodities such as sugar and tobacco. European writers took increasing pride in their understanding of the world and in what they regarded as the superiority of their own cultural or religious traditions. There was also much speculation on the diversity of the human races and cultures, which sometimes led to a new kind of race consciousness on the part of Europeans and sometimes to a cultural relativism in which European customs were seen as only one variant of human behavior as a whole. Meanwhile, people in the Americas and Africa struggled to defend their own evolving cultures and institutions as European soldiers, traders, and missionaries entered the various civilizations of an increasingly interconnected transatlantic economic system.

---

Cultural  
transformation and  
destruction

### *The Portuguese in the East*

Europeans had skirted their Atlantic coast since prehistoric times. Vikings had settled in Iceland in the ninth century and had even reached North America soon thereafter. In 1317 Venetians had established the Flanders galleys, commercial flotillas that regularly made the passage between the Adriatic and North seas. In the fifteenth century, improvements in shipbuilding, the rigging of sails, and the adoption of the mariner’s compass made it feasible to sail on the open ocean out of sight of land. When the Portuguese about 1450 settled in the Azores Islands, in the mid-Atlantic, they found steady westerly winds to assure a safe return to Europe. It seemed that the ocean might even lead to Asia.

For centuries Asia had been a source for Europe of many highly valued commodities, partly manufactures in which Europe could not compete, such as silk and cotton fabrics, rugs, jewelry, porcelains, and fine steel, and partly raw or semimanufactured drugs and foodstuffs, such as sugar and, above all, spices. Europeans had never themselves gone to the sources of supply of Eastern goods. Somewhere, east of Suez, barely known to Europeans, was another world of other merchants who moved the wares of China, India, and the East Indies Spice Islands by caravan over land and by boat through the Red Sea or Persian Gulf to the markets of the eastern Mediterranean. Traders of the two worlds met and did business at such thriving centers as Alexandria or Beirut or Constantinople.

### EUROPEAN DISCOVERIES, 1450–1600

Discovery means the bringing of newly found countries within the habitual knowledge or permanent commercial activity of the society from which the discoverer comes. Although sailors and travelers from Asia had long made voyages to distant places and engaged in trade across the Indian Ocean or South Pacific, it was the Europeans who discovered much of the world in the sense indicated here. They did so in the period between 1450 and 1600, using maritime skills and geographical knowledge developed in the Mediterranean and off the Atlantic coast. Dates on the map show the years of first significant European arrival at the points indicated.

In 1498 the Portuguese navigator **Vasco da Gama**, having rounded Africa in the wake of other intrepid explorers, found himself in the midst of the unknown world of Arab commerce. He landed on the **Malabar Coast** (the southwest coast of India), where he found a busy commercial population of heterogeneous religious background. These people knew at least as much about Europe as Europeans did about India (one Jew was able to act as da Gama's interpreter), and they realized that the coming of the Portuguese would disturb their established channels of commerce. Da Gama, playing upon local rivalries, was able to load his ships with the coveted wares, but on his second voyage, in 1502, he came better prepared, bringing a fighting fleet of no less than 21 vessels. A ferocious war broke out between the Portuguese and Arab merchants, the latter supported in one way or another by the Egyptians, the Turks, and even the distant Venetians, all of whom had an interest in maintaining the old routes of trade. **For the Portuguese**, trained like the Spaniards in long wars against the Moors at home, **no atrocities were too horrible to commit against the infidel competitors whom they found at the end of their heroic quest.** Cities were devastated,

ships were burned at their docks, prisoners were butchered, and their dismembered hands, noses, and ears were sent back as derisive trophies. One Brahmin, mutilated in this way, was left alive to bear them to his people. Such, unfortunately, was India's introduction to the West.

In the following years the Portuguese built permanent fortified stations at Goa on the Malabar Coast, at Aden near the mouth of the Red Sea, at Hormuz near the mouth of the Persian Gulf, and in East Africa. In 1509 they reached Malacca, near modern Singapore, from which they passed northward into China itself and eastward to Amboina, the heart of the Spice Islands, just west of New Guinea. Thus an empire was created, the first of Europe's commercial-colonial empires, maintained by superiority of firearms and sea power and with trade alternating with war and plunder. The early European traders were soon followed by bold Jesuits, including St. Francis Xavier, who, by 1550, had baptized thousands of souls in India, Indonesia, and even Japan.

---

Portuguese trading  
empire

By the new route the cost of Eastern goods for Europeans was much reduced, for the old route had involved many transshipments, unloadings, and reloadings, movements by sea and by land, through the hands of many merchants. In 1504 spices could be bought in Lisbon for only a fifth of the price demanded in Venice. The Venetians (who in their desperation even talked of digging a Suez canal) were hopelessly undersold: their trade thereafter was confined to products of the Middle East. As for the Portuguese, never was a commercial monopoly built so fast. The lower prices added enormously to European demand and consumption. Beginning in 1504, only five years after da Gama's first return, an average of 12 ships a year left Lisbon for the East.

### *The Discovery of America*

Meanwhile, the same quest for a route to the East had led to the somewhat disappointing discovery of America. Like most such discoveries, this was no chance hit of an isolated genius. Behaim's globe, constructed in 1492, the very year of Columbus's first voyage, suggested that China could be reached by crossing the Atlantic and thus supported the idea of sailing westward to arrive in the East. Nevertheless, it was Christopher Columbus who had the persistence and daring to undertake the unprecedented westward voyage. Before the invention of sufficiently accurate clocks (in the eighteenth century) mariners had no way of determining longitude, that is, their east-west position, and learned geographers greatly underestimated the probable distance from Europe westward to Asia. When Columbus struck land, he naturally supposed it to be an outlying part of the Indies. The people were soon called Indians, and the islands where Columbus landed, the West Indies.

Columbus had sailed with the backing of Queen Isabella of Castile, and the new lands became part of the composite dominions of the crown of Spain. The Spaniards, hoping to beat the Portuguese to the East (which da Gama had not yet reached), received Columbus's first reports with enthusiasm. For his second voyage they gave him 17 ships, filled with 1,500 workmen and artisans. Columbus himself, until his death in 1506, kept probing about in the Caribbean, baffled and frustrated, still believing he had discovered a route to Asia and hoping to find something that looked like the fabulous East. Others were more willing to accept the new land for what it was. Churchmen, powerful in Spain, regarded it as a new field for crusading and conversion. The government saw it as a source of gold and silver for the royal exchequer. Footloose gentry of warlike habits, left

idle by the end of war with the Moors in Iberia, turned to America to make their fortunes. **The conquistadores fell upon the new lands.** Cortés conquered the Aztecs in Mexico; Pizarro, the Incas in Peru. **They despoiled the native empires.** Mines for precious metals were opened almost immediately. The Indians were put to forced labor, in which many died. **The rapid decline in the Indian population,** the attempts of the church to protect its Indian converts, and the restrictions set by royal authorities on their exploitation **led almost immediately to the importation of African slaves,** of whom, it was estimated, 100,000 had been brought to America by 1560. This massive, forced migration of Africans continued for more than two centuries; indeed, the number of enslaved Africans reaching America, including the two continents and the West Indies, was far greater than the number of Europeans who settled there before 1800.

---

*Conquest begins in the Americas*

Meanwhile, explorers began to feel their way along the vast American continent that barred them from Asia. A Spanish expedition, led by Magellan, found a southwestern passage in 1520, sailed from the Atlantic into the Pacific, crossed the Pacific, discovered the Philippine Islands, and fought its way through hostile Portuguese across the Indian Ocean back to Spain. The globe was thus

---

*Further explorations*

circumnavigated for the first time, and an idea of the true size and interconnection of the oceans was brought back to Europe. Geographical experts immediately incorporated the new knowledge. Europeans still knew little about the vast, newly discovered continents, however, and other explorers sailing for Spain, the Cabots sailing for England, Jacques Cartier for France, began the long and fruitless search for a northwest passage to the Pacific. An English expedition, looking for a northeast passage, discovered the White Sea in 1553. English merchants immediately began to take the ocean route to Russia. Archangel became an ocean port.

For a century it was only the Spanish and Portuguese who followed up the new ocean routes to America and the East. These two peoples, in a treaty of 1494, divided the globe between them by an imaginary north-and-south line that ran from a point in the middle of the North Atlantic Ocean through the north pole and across eastern Asia. Spain claimed all the Americas by this treaty, and Portugal, all rights of trade in Africa, Asia, and the East Indies. But when Brazil was discovered in 1500 by Pedro Cabral, it was found to be far enough east to lie within the Portuguese area, and when the Philippine Islands were discovered by Magellan in 1521, they were claimed to be in the Spanish zone.

In the populous, long-established civilizations of the East the Portuguese were never more than a handful of outsiders who could not impose their language, their religion, or their way of life. It was otherwise in the Americas, where previously unknown diseases such as smallpox decimated the native populations, and where Spanish invaders set about imposing European culture on the weakened and demoralized survivors.

### *The Spanish Empire in America*

In South America, Mexico, and the Caribbean, after the first ferocity of the *conquista*, the Spanish established their own civilization. In Protestant countries, and also in France, as the years went on there arose an extremely unfavorable idea of the Spanish regime in America, where, it was noted, the Inquisition was presently established and the native peoples were reduced to servitude by the conquerors. The Spanish themselves came to dismiss this grim picture as a false legend concocted by their rivals. The true character of the Spanish empire in America is not easy to portray.

The Spanish government (like the home governments of all colonial empires) regarded its empire as existing primarily for the benefit of the mother country. The Indians were put into servitude, to work in mines or in agriculture. They also died in large numbers from infections brought by Europeans to which Europeans over past centuries had developed immunities but against which the native American peoples had no such protection. The same was true farther north in what later became the United States. The Spanish government made efforts to moderate the exploitation of Indian labor. It introduced the *encomienda*, by which Indians were required to work for an owner a certain number of days in the week, while retaining parcels of land on which to work for themselves. How much the royal regulations were enforced on remote *encomiendas* is another question, to which answers vary. Black African slavery became less important in most of Spanish America than it later became in some of the Dutch, French, and English colonies or in Portuguese Brazil. But the white population remained relatively small. Castilian Spaniards looked down on American-born whites, called *Creoles*. Since fewer women than men emigrated from Spain, there arose a large class of *mestizos*, of mixed white and Indian descent.

The *mestizos*, along with many pure Indians, adopted to a considerable degree the Spanish language and the faith of the Spanish church. The Indians, while unfree, had

usually lacked freedom under their own tribal chiefs; they were spared from tribal war; and the rigors of the Inquisition were mild compared with the physical cruelty that many faced under the Aztecs or Incas. The printing press was brought to Mexico in 1544. By the middle of the sixteenth century Spanish America consisted of two great viceroyalties, those of Mexico and Peru, with 22 bishoprics, and with a university in each viceroyalty; the University of Lima was established in 1551, that of Mexico in 1553.

When Harvard College was founded in New England (in 1636), there were five universities on the European model in Spanish America.

*The Potosí  
silver mines*

In 1545 a great discovery was made, the prodigiously rich silver deposits at Potosí in Peru. (It is now in Bolivia.) Almost simultaneously, better methods of extracting silver from the ore by the use of mercury were developed. American production of precious metals shot up suddenly and portentously. For years, after the mid-century, 500,000 pounds of silver and 10,000 pounds of gold flowed annually from America to Spain. The riches of Potosí financed the European projects of the king of Spain. Peruvian ores, Indian labor, and Spanish management combined to make possible the militant, anti-Protestant phase of the Counter Reformation.

Meanwhile, beginning in 1565, the Spanish also established a lucrative trade route between their colonies in Mexico and the Philippines. Large ships called the “Manila Galleons” carried vast cargoes of silver from Acapulco to Manila, where the silver was traded for Chinese luxury goods—spices, porcelain, silks, and ivory—all of which were transported back to Mexico and on to Europe. This valuable trade continued until the early nineteenth century. It carried perhaps a third of all the silver extracted from Spain’s American colonies off to Asia; and it helped to create the first modern global network for commercial exchange, in part because it brought Chinese consumers the only commodity that they wanted to buy from Europeans during this era. Silver from New World mines therefore sustained the whole Asian-American-European trading system and enabled Spain to control much of the burgeoning global market for Chinese products.

The opening of the Atlantic thus reoriented Europe. In an age of oceanic communications Europe became a center from which America, Africa, and Asia could all be reached. In Europe itself, the Atlantic coast enjoyed great advantages over the center. No sooner did the Portuguese begin to bring spices from the East Indies than Antwerp began to flourish as the point of redistribution for northern Europe. But for a century after the Spanish and Portuguese began to build their empires, the northern peoples did not take to the oceans. French corsairs did indeed put out from Bayonne or Saint-Malo, and Dutch prowlers and English “sea dogs” followed at the close of the century, all bent upon plundering the Iberian treasure ships. Still the Spanish and Portuguese kept their monopoly. No organized effort, backed by governments, came from the north until about 1600. For it is by no means geography alone that determines economic development; the English, Dutch, and French could not make use of the opportunities with which the opening of the Atlantic provided them until they had cleared up their domestic troubles and survived the perils and hazards of the Wars of Religion.

## 12. THE COMMERCIAL REVOLUTION

*Population growth*

In the great economic readjustment that was taking place in Europe, the opening of ocean trade routes was important, but it was by no means the only factor. Two others were the growth of population and a long, gradual rise in prices, or a slow inflation.

*Illustrates

rose; in England, for example, they about quadrupled during the sixteenth century. Prices were also pushed upward by the increase in the volume of money. The royal habit of debasing the currency brought a larger amount of money into circulation, since larger numbers of florins, *reals*, or *livres* were obtained from the same amount of bullion. The flow of gold and silver from America also made money more plentiful, but the impact of Peruvian and Mexican mines can easily be exaggerated. Even before the discovery of America, the development of gold and silver mines had augmented the European money supply. Although the expansion of both population and commerce checked the inflationary forces, the long trend of prices was upward. It affected all prices, including rents and other payments that were set in money values, but the price of hired labor, that is, wages, rose the least. The price changes thus had different effects on the well-being of social classes.

Commercial undertakings were favored by the rising prices and growing population. Merchants could count on increasing numbers of customers, new people could enter trade with hope of success, stocks of goods rose in value with the passage of time, and borrowed money could more easily be repaid. Governments benefited also, so far as kings could count on having more taxpayers and more soldiers.

The economic changes in Europe in the early modern period have been called the “Commercial Revolution,” signifying the rise of a capitalistic economy and the transition from a town-centered to a nation-centered economic system. This “revolution” was an exceptionally slow and protracted one; it began at least as early as the fourteenth century and lasted until machine industry began to overshadow commerce in the early nineteenth century.

### *Changes in Commerce and Production*

In the Middle Ages the town and its adjoining country formed an economic unit. Craftsmen, organized in guilds, produced common articles for local use. Peasants and lords sold their agricultural products to the local town, from which they bought what the craftsmen produced. The town protected itself by its own tariffs and regulations. In the workshop the

master both owned his “capital”—his house, workbench, tools, and materials—and acted as a workman himself along with half a dozen journeymen and apprentices. The masters owned a modest capital, but they were hardly capitalists. They produced only upon order, or at least for customers whose tastes and number were known in advance. There was little profit, little risk of loss, and not much innovation.

All this changed with the widening of the trading area, or market. Even in the Middle Ages, as we have seen, there was a certain amount of long-distance trading in articles that could not be produced as well in one place as in another. Gradually more articles came within this category. Where goods were produced to be sold at some time in the future, in faraway places, to persons unknown, the local guildmaster could not manage the operation. He lacked the money (or “capital”) to tie up in stocks of unsold wares; he lacked the knowledge of what distant customers wanted, or where, in what quantities, and at what price people would buy. In this new type of long-distance business, new kinds of entrepreneurs became prominent in European commercial life. They usually started out as merchants working in an extensive market and ended up as bankers. The Italian Medici family has been mentioned as important in Renaissance banking and culture. Equally typical were the German Fuggers.

---

*New entrepreneurs*

The first of this family, Johann Fugger, a small-town weaver, came to Augsburg in 1368. He established a business in a new kind of cloth, called fustian, in which cotton was mixed, and which had certain advantages over the woolens and linens in which people then clothed themselves. He thus enjoyed a more than local market. Gradually the family began to deal also in spices, silks, and other Eastern goods obtained at Venice. They invested their large profits in other enterprises, notably mining. They lent money to the Renaissance popes. They lent Charles V the money which he spent to obtain election as Holy Roman Emperor in 1519. They became bankers to the Habsburgs in both Germany and Spain. Together with other German and Flemish bankers, the Fuggers financed the Portuguese trade with Asia, either by outright loans or by providing in advance, on credit, the cargoes which the Portuguese traded for spices. The wealth of the Fuggers became proverbial and declined only through repeated Habsburg bankruptcies and with the general economic decline that beset Germany in the sixteenth century.

Other dealers in cloth, less spectacular than the first Fugger, broke away from the town-and-guild framework in other ways. England until the fifteenth century was an exporter of raw wool and an importer of finished woolens from Flanders. In the fifteenth century certain English entrepreneurs began to develop the spinning, weaving, and dyeing of wool in England. To avoid the restrictive practices of the towns and guilds they “put out” the work to people in the country, providing them with looms and other equipment for the purpose, of which they generally retained the ownership themselves. This “putting out” or “domestic” system spread very widely outside the guild system, and, by the early modern period, typically depended on a gendered division of labor. Women usually did the work of spinning wool into thread (hence the later English term for an unmarried woman, “spinster”); men usually wove the thread into cloth. In France the cloth dealers of Rouen, feeling the competition of the new silk trade, developed a lighter, cheaper, and more simply made type of woolen cloth. Various guild regulations in Rouen, to protect the workers there, prohibited the manufacture of this cheaper cloth. The Rouen dealers, in 1496, took the industry into the country, installed looms in peasant cottages, and farmed out the work to the peasants.

---

*The “putting out” system*

**STUDY OF TWO BLACK HEADS**

by Rembrandt van Rijn (Dutch, 1606–1669)

One consequence of the new international trade was the transportation of enslaved black Africans to the Americas. Some Africans appeared also in Europe, where their presence contributed to the growing speculation on the diversity of the human races. Rembrandt, though he never traveled more than 20 miles from his native Leyden, painted all types of people who streamed into the Netherlands, including these two men who had to cope with the strange European world into which they had been cast.

(Maurithshuis, The Hague)

## Capital and Labor

The system of rural household industry remained typical of production in many lines (cloth, hardware, etc.) in western Europe until the introduction of factories in the late eighteenth century. It signified a new divergence between capital and labor. On the one hand were the workers, men and women who worked as the employer needed them, received wages for what they did, and had little interest in or knowledge of more than their own task. Living both by agriculture and by cottage industry, they formed an expansible labor force, available when labor was needed, left to live by farming or local charity when times were bad. On the other hand was the manager or entrepreneur (almost always a man) who directed the whole affair. He had no personal acquaintance with the workers. Estimating how much of his product, let us say woolens, he could sell in a national or even international market, he purchased the needed raw materials, passed out wool to be spun by one group of peasants, took the yarn to another group for weaving, collected the cloth and took it still elsewhere to be dyed, paying wages on all sides for services rendered, while retaining ownership of the materials and the equipment and keeping the coordination and management of the whole enterprise in his own head. Much larger business enterprises could be established in this way than within the municipal framework of guild and town. Indeed, the very master weavers of the guilds often sank to the status of subcontractors, hardly different from wage employees, of the great "clothiers" and "drapers" by whom the business was dominated. The latter, with the widening market, became personages of national or even international repute. And, of course, the bigger the business the more of a capital investment it represented.

---

*Divergence between  
capital and labor*

Certain other industries, new or virtually new in the fifteenth and sixteenth centuries, could by their nature never fit into a town-centered system and were capitalistic from the start, in that they required a large initial outlay before any income could be received. One such was mining. Another was printing and the book trade. Books had a national and even international market, being mainly in Latin; and no ordinary craftsman could afford the outlay required for a printing press, for fonts of type, supplies of paper, and stocks of books on hand. Printers therefore borrowed from capitalists or shared with them an interest in business. Shipbuilding was so stimulated by the shift to the oceans as almost to be a new industry, and still another was the manufacture of cannons and muskets. For the latter the chief demand came from the state, from the New Monarchies which were organizing national armies. In the rise of capitalism the needs of the military were in fact fundamentally important. Armies, which started out by requiring thousands of weapons, in the seventeenth century required thousands of uniforms, and in the eighteenth century many new barracks and fortifications. These heavy demands were the first to require mass production. Where governments themselves did not take the initiative, private middlemen stepped in as links to the many small handicraft workers and families who before the industrial age still manufactured the actual product.

---

*New industries*

The new sea route to the East and the discovery of America brought a vast increase in trade not only of luxury items but of bulk commodities like rice, sugar, tea, and other consumer goods. Older commercial activities were transformed by the widening of markets. Spain increasingly drew cereals from Sicily. The Netherlands were fed from Poland; the French wine districts lived on food brought from northern France. With the growth of shipping, the timber, tar, pitch, and other "naval stores" of Russia and the Baltic entered the commercial scene. There was thus an ever-growing movement of heavy staple commodities, in which again only persons controlling large funds of capital could normally take part.

The growing production of cloth in early modern Europe depended on the labor of families in rural cottage industries. Spinning thread became an important economic activity for many women, as Jean Bourdichon (1457–1521) demonstrates in this illustration of a family at work. The man is apparently a skilled woodworker, and the child is gathering wood chips that can be used for cooking food or heating the house. The solid walls and ceiling show that this is a prosperous, hard-working family.

(Giraudon/Art Resource, NY)

---

*New banking  
practices*

Not all capital was invested; some was simply lent to the church, to governments, to impecunious nobles, or, though perhaps this was the least common type of lending in the sixteenth century, to persons engaged in trade and commerce. Bankers and others who lent money expected to receive back, after a time, a larger sum than that of the loan. They expected “interest”; and they sometimes received as much as 30 percent a year. In the Middle Ages the taking of interest had been frowned upon as usury, denounced as avarice, and forbidden in the canon law. It was still frowned upon in the sixteenth century by almost all but the lenders themselves. The Catholic church maintained its prohibitions. The theologians of the University of Paris also ruled against it in 1530. Luther, who hated bankers like the Fuggers, continued to preach against usury. Calvin made allowances, but as late as 1640, in capitalist Holland itself, the stricter Calvinist ministers still denounced lending at interest.

Nothing could stop the practice. Borrowers compounded with lenders to evade prohibitions, and theologians of all churches began to distinguish between “usury” and a “legitimate return.” Gradually, as interest rates fell, as banking became more established, and as loans were made for economically productive uses rather than to sustain ecclesiastics, princes, and nobles in their personal habits, the feeling against a “reasonable” interest died down and interest became an accepted feature of capitalism. The Bank of Amsterdam, for example, attracted depositors because they knew their money was safe, would earn inter-

est, and could be withdrawn at will. Deposits thus flowed into the bank from all countries and enabled it to make low-interest loans that financed new commercial activities.

The net effect of all these developments was a “commercialization of industry.” The dynamic, entrepreneurial persons in commercial life were the merchants. Industry, the actual processes of production, still in an essentially handicraft stage, was subordinate to the buyers and sellers. Producers—spinners, weavers, hatters, metalworkers, gunsmiths, glassworkers—worked to fill the orders of the merchants, and often with capital which the merchants supplied and owned. The entrepreneur who knew where the article could be sold prevailed over the person who simply knew how to produce it. This commercial capitalism remained the typical form of capitalism until after 1800, when, with the introduction of power machinery, it yielded to industrial capitalism, and merchants became dependent on industrialists who owned, understood, and organized the machines.

---

Commercial  
capitalism

### *Mercantilism*

There was still another aspect of the commercial revolution, namely, the various government policies that go historically under the name of “mercantilism.” Rulers, as we have seen, were hard pressed for money and needed more of it as it fell in value. The desire of kings and their advisers to force gold and silver to flow into their own kingdoms was one of the first impulses leading to mercantilist regulation. Gradually this “bullionist” idea was replaced by the more general idea of building up a strong and self-sufficient economy. The means adopted, in either case, was to “set the poor on work,” as they said in England, to turn the country into a hive of industry, to discourage idleness, begging, vagabondage, and unemployment. New crafts and manufactures were introduced, and favors were given to merchants who provided work for “the poor” and who sold the country’s products abroad. It was thought desirable to raise the export of finished goods and reduce the export of unprocessed raw materials, to curtail all imports except of needed raw materials, and thus obtain a “favorable” balance of trade so that other countries would have to pay their debts in bullion. Since all this was done by a royal or nationwide system of regulations, mercantilism became in the economic sphere what the state building of the New Monarchies was in the political, signifying the transition from town to national units of social living.

Mercantilists frowned upon the localistic and conservative outlook of the guilds. In England the guilds ceased to have importance. Parliament, in the time of Elizabeth, did on a national scale what guilds had once done locally when it enacted the Statute of Artificers of 1563, regulating the admission to apprenticeship and level of wages in various trades. In France the royal government maintained the legal existence of the guilds, because they were convenient bodies to tax, but it deprived them of most of their old independence and used them as organizations through which royal control of industry could be enforced. In both countries the government assisted merchants who wished to set up domestic or cottage industry in the country, against the protests of the town guilds, which in their heyday had forbidden rural people to engage in crafts. Governments generally tried to suppress idleness. The famous English Poor Law of 1601 (which remained in effect, with amendments, until 1834) was designed both to force people to work and to relieve absolute destitution.

---

Opposition to guilds

Governments likewise took steps to introduce new industries. The silk industry was brought from Italy to France under royal protection, to the dismay of French woolen and

linen interests. The English government assisted in turning England from a producer of raw wool into a producer of finished woolens, supervising the immigration of skilled Flemish weavers and even fetching from faraway Turkey, about 1582, two youths who understood the more advanced dyeing arts of the Middle East. Generally, under mercantilism, governments fought to steal skilled workers from each other while prohibiting or discouraging the emigration of their own skilled workers, who might take their trade secrets and “mysteries” to foreign parts.

#### National markets

By such means governments helped to create a national market and an industrious nationwide labor supply for their great merchants. Without such government support the great merchants, such as the drapers or clothiers, could never have risen and prospered. The same help was given to merchants operating in foreign markets. Henry VII of England in 1496 negotiated a commercial treaty with Flanders; and in the next century the kings of France signed treaties with the Ottoman Empire by which French merchants obtained privileges in the Middle East. A merchant backed by a national monarchy was in a much stronger position than one backed merely by a city, such as Augsburg or Venice. This backing on a national scale was again given when national governments subsidized exports, paying bounties for goods whose production they wished to encourage, or when they erected tariff barriers against imports to protect their own producers from competition. Thus a national tariff system was superimposed on the old network of provincial and municipal tariffs. These latter were now thought of as “internal tariffs,” and mercantilists usually wished to abolish them to create an area of free trade within the state as a whole. But local interests were so strong that for centuries they were unable to get rid of local tariffs except in England.

In distant parts of the world, or in less accessible regions nearer home, such as the Muslim lands or Russia, it was not possible for individual European merchants to act by merely private initiative. Merchants trading with such countries needed a good deal of capital, they often had to obtain special privileges and protection from native rulers, and they had to arm their ships against Barbary or Malay pirates or against hostile Europeans. Merchants and their respective governments came together to found official companies for the transoceanic trade. In England, soon after the English discovery of the White Sea in 1553, a Russia Company was established. A Turkey Company soon followed. Shortly after 1600 a great many such companies were operating out of England, Holland, and France. The most famous of all were the East India Companies, which the English founded in 1600, the Dutch in 1602, the French not until 1664. Each of these companies was a state-supported organization with special rights. Each was a monopoly in that only merchants who belonged to the company could legally engage in trade in the region for which the company had a charter. Each was expected to find markets for the national manufactures, and most of them were expected to bring home gold or silver. With these companies the northern European peoples began to encroach on the Spanish and Portuguese monopoly in America and the East. With them new commercial-colonial empires were to be launched. But, as has been already observed, before this could happen it was necessary for certain domestic and purely European conflicts and controversies to be settled.

### 13. CHANGING SOCIAL STRUCTURES

Social structure, for present purposes, refers to the composition, functions, and interrelationships of social classes. Because changes in social structure are slow, they are hard to identify with any particular period of time. In general, however, with the effects of the commercial revolution, population growth, and the falling value of money, the classes of

The headquarters of the Dutch East India Company in Bengal in 1665, long before the British gained predominance there. It is wholly walled off from the Indian life around it, with offices, living quarters, and spacious gardens for employees of the company.

Europe, broadly defined, took on forms that were to last until the industrial era of the nineteenth and twentieth centuries. These classes were the landed aristocracy, the peasantry or mass of agricultural workers, the miscellaneous middle classes, and the urban poor.

While all prices rose in the sixteenth century, it was agricultural prices that rose the most. Anyone who had agricultural products to sell was likely to benefit. Among such beneficiaries were peasants who held bits of land in return for payments to a manorial lord set in unchangeable sums of money, in the old values of the fourteenth or even thirteenth century. The price inflation of the sixteenth century enabled such peasants in effect to pay much less to the lord than in the past. Other rural workers, however, either held no land of their own or produced only at a subsistence level with nothing to sell in the market. Such peasants, and hired hands dependent on wages, found their situation worsened. Village life became less egalitarian than it had been in the Middle Ages. In England a class of small freeholders (the “yeomanry”) developed between the landed gentry and the rural poor. On the Continent, at least in France, western Germany, and the Netherlands, some peasants acquired more secure property rights, resembling those of small freeholders in England. But both in England and on the Continent a large class of unpropertied rural workers remained in poverty.

---

*Small freeholders*

Land rents went up as agricultural prices rose, and inflation and population growth drove up rentals for housing in the towns. Owners of real property (that is, land and buildings) were favored by such changes, but within the former class of feudal lords the effects were mixed. If one's great-grandfather had let out land in earlier times in exchange for fixed sums of money, the value of the income received had actually declined. But those who received payments in kind from their tenants, for example, in bushels of wheat or barley, or who managed their estates themselves, could sell their actual agricultural products at current prices and so increase their money income.

### *Social Classes*

The former feudal class, or nobles, thus turned into a more modern kind of aristocracy. If income from their estates declined, they sought service in the king's army or government or appointment to the more prestigious offices in the church. If landed income increased, they were more wealthy. In either case they became more concerned with civilian pursuits and were likely to develop more refined tastes and pay more attention to the education of their children. Like the peasants, the landowning class became more heterogeneous, ranging from the small gentry to the great peers of England and from small or impoverished nobles to the *grands seigneurs* of France. Some led a life of leisure; others were eager to work in the higher reaches of organized government. The most impoverished nobles sometimes had the longest pedigrees. As their social functions changed, and as persons of more recent family background competed for education, government employment, and even military service, there came to be an increasing importance set upon ancestry as a badge of status. Among the upper class, there was more insistence on high birth and distinguished forebears in the seventeenth and eighteenth centuries than there had been before. But many nobles also claimed that they deserved special privileges because they contributed meritorious service to kings or the expanding national governments.

---

*The bourgeoisie*

Below the aristocracy were the "middle classes," or "bourgeoisie." *Bourgeois* was a French word, which, like the English "burgher," originally meant a person living in a chartered town or borough and enjoying its liberties. The bourgeoisie was the whole social class made up of individual bourgeois. In a much later sense of the word, derived from Karl Marx, the term "bourgeoisie" was applied to the class of owners of capital. This Marxist concept of the bourgeoisie must be kept distinct from the meaning of the word in an earlier era. "Bourgeoisie" referred in preindustrial times to the middle levels of society between the aristocracy, which drew its income from land, and the laboring poor, who depended on wages or charity, or who often went hungry. Class lines tended to blur as aristocratic families formed the habit of living in towns and middle-class burghers began to buy land in the country. Some bourgeois thus came to live on landed rents, while some of the gentry and aristocracy, most notably in England, bought shares in the great overseas trading companies or engaged in other forms of business enterprise. Aristocrats possessing large agricultural estates, timberlands, or mines increasingly brought their products to market to be sold at a profit. But even when aristocrat and bourgeois became economically more alike, a consciousness of social difference between them remained.

---

*Middle class growth  
and diversity*

The middle class became more numerous in the sixteenth century, and increasingly so thereafter. It was an indefinite category, since the countries of Europe were very different in the size and importance of their middle classes, in the kinds of persons who belonged to them, and in the types of occupations pur-

sued. Near the top were the urban elites who governed the towns; they might draw their incomes from rural property, from commerce, or from the emoluments of government itself, and they sometimes intermarried with persons of noble status. Especially where the towns were strong or royal government was weak, as in the Netherlands, the German free cities, or north Italy, such urban patriciates formed virtual aristocracies in themselves. But in a larger perspective the families of merchants, bankers, and shipowners were middle-class, as were those of the traditional learned professions, law and medicine. So in general were judges, tax officials, and other employees of governments, except in the highest ranks. In the professions and in government service the younger sons of the aristocracy might be found alongside the offspring of the middle classes, most commonly in England, less so in France, and even less as one moved into Germany or Spain.

The clergy was drawn from all classes; there were poor parish priests, who might be the sons of peasants, and noblemen among the bishops and abbots; but the bulk of the clergy was recruited from middle-class families. In Protestant countries, where the clergy married, their sons and daughters became an important element in the middle class. Members of trade guilds were middle class, though the guilds differed widely in social status, from those of the great wholesale merchants or the goldsmiths, down through the guilds of such humble occupations as the tanners and barrel makers. At the bottom the middle class faded into the world of small retail shopkeepers, innkeepers, owners of workshops in which ordinary articles were manufactured by hand, the lesser skilled tradespeople, and their employees, journeymen, and apprentices.

The mass of the population in all countries was composed of the working poor. These included not only the unskilled wage laborers but the unemployed, unemployable, and paupers, with a large fringe that turned to vagabondage and begging. They were unable to read or write and were often given to irregular habits which distressed both middle-class persons and government officials. The efforts of mercantilist governments to put the poor to work, or make them contribute to the wealth of the country, have already been mentioned. Charitable relief also developed toward the end of the sixteenth century, as shown in the English Poor Law of 1601 and in similar efforts on the Continent. The idea gained ground that begging was a public nuisance and that the poor should be segregated in workhouses or hospices from the rest of society. Most of the poor were of course not recipients of such relief. They were the people who tilled the fields, tended the livestock, dug in the mines, or went to sea as fishermen and common sailors. They also found work in the towns as casual laborers, porters, water carriers, or removers of excrement; or they entered the domestic service of noble and upper middle-class families, whose rising standard of living required a growing number of chambermaids, cooks, washerwomen, footmen, lackeys, coachmen, and stable boys. Domestic service was in fact the most common job for women during the entire period of early modern history, and the pay for such work remained extremely low. Wages rose less than prices in the sixteenth century. The poor, if not positively worse off than in former times, gained the least from the great commercial developments with which economic history is usually concerned. The very growth of social differentiation, the fact that the middle and upper classes made such advances, left the condition of the poor correspondingly worse.

poor*

### *Social Roles of Education and Government*

Education in the latter part of the sixteenth century took on an altogether new importance for the social system. One consequence of the Reformation, in both Protestant and

Catholic countries, was the attempt to put a serious and effective pastor in each parish. This set up a demand for a more educated clergy. The growth of commerce made it necessary to have literate clerks and agents. Governments wanted men from both the noble and middle classes who could cooperate in large organizations, be reliable, understand finance, keep records, and draft proposals. There was also a widespread need for lawyers.

The new demand for education was met by an outburst of philanthropy, which reached a high point in both England and France between about 1580 and 1640. Many endowed scholarships were established. At what would now be called a secondary level, hundreds of “grammar schools” were founded at this time in England. In France the *collèges* combined the work of the English grammar school with what corresponded to the first year or two of university work at Oxford or Cambridge. Of the 167 most important French colleges still existing at the time of the Revolution in 1789, only 36 had been founded in the centuries before 1560, and 92 were established in the years between 1560 and 1650. Provision for girls’ schools was more sporadic, but the Ursuline sisters, for example, founded in Italy in 1535, had established about 350 convents by the year 1700 in Catholic Europe and even in Canada, in most of which the education of girls was a principal occupation of the sisters.

Dutch and Swiss Protestants founded the universities of Leyden and Geneva. New universities, both Protestant and Catholic, appeared in Germany. In Spain the multiplication of universities was phenomenal. Castile, with only 2 universities dating from the Middle Ages, had 20 by the early seventeenth century; Salamanca was enrolling over 5,000 students a year. Five universities also existed in Spanish America by 1600. In England, new colleges were founded at Oxford and Cambridge, and it was especially in these years that some of the Oxford and Cambridge colleges became very wealthy. Annual freshman admissions at Oxford, barely 100 in 1550, rose to over 500 in the 1630s, a figure not exceeded, or even equaled, during the following two hundred years.

The schools, colleges, and universities drew their students from a wide range of social classes. For girls less organized schooling was offered, but an intelligent and lucky boy of poor family had perhaps a better chance for education than at any time in Europe until very recently. In Spain most of the students seem to have been lesser nobles, or “hidalgos,” aspiring to positions in the church or government; but hidalgos were very numerous in Spain, overlapping with what might be called the middle class in other countries. The French colleges, including those operated by the Jesuits, recruited their students very widely, taking in the sons of nobles, merchants, shopkeepers, artisans, and even, more rarely, of peasants. English grammar schools did likewise; it was in later times that a few of them, like Eton and Harrow, became more exclusive Public Schools. As for universities, we have detailed knowledge for Oxford, which recorded the status of its students at matriculation, classifying them as “esquires,” “gentlemen,” “clergy,” and “plebeians.” From 1560 to 1660 about half of the Oxford students were “plebeians,” which in the language of that time could embrace the whole middle class from big merchants down to quite modest levels. It seems certain that Oxford and Cambridge were more widely representative of the English people in 1660 than in 1900.

Social classes were formed not only by economic forces, and not only by education, but also by the action of governments. Government could inhibit economic growth, as in Spain, or promote it, as in England. Kings contributed to the rise of capitalism and a business class by granting

Government and social classes

(Index/Bridgeman Art Library)

monopolies, borrowing from bankers, and issuing charters to trading companies. In many countries, and notably in France, many families owed their middle-class position to the holding of government offices, some of which might become a form of inheritable property. It might also be the action of governments, as much as economic conditions, that defined or promoted distinctions between nobles and commoners, or “privileged” and “unprivileged” classes. Where peasants suffered heavily from royal taxes, it was more from political than from economic causes. The king, by “making” nobles—that is, by conferring titles of nobility on persons who did not inherit them—could raise a few in the middle class to higher status. Tax exemption could be a sign of high social standing. The king was also the fountain of honor, at the top of “society.” The royal court formed the apex of a pyramid of social rank, in which each class looked up to or down upon the others. Those favored with the royal presence disdained the plain country nobility, who sniffed at the middle classes, who patronized or disparaged the hired servants, day laborers, and the poor. Looking upward, people were expected to show deference for their betters.

### *Eastern and Western Europe*

One other remark may be made on social structure. It was in the sixteenth century that important social differences developed between eastern and western Europe. In the west, the changes brought by the commercial revolution were advantageous to the middle class

and to many of the peasantry for whom the old burdens of the manorial system were lightened. In eastern Europe, it was the lords who benefited from rising prices and the growing market for grain and forest products. Here too the institution of the manor existed; but the peasants' land tenures were more precarious than in the west, more dependent on accidents of death or on the wishes of the lord, and the lord worked a larger part of the manor with his own workforce for his own use or profit.

The rise of prices and expansion of Baltic shipping gave the lord the incentive to increase his output. In northeast Germany (where such lords were called Junkers), in Poland, and as time went on in Russia, Bohemia, and Hungary, beginning in the sixteenth century and continuing into the eighteenth, a vast process set in by which the mass of the

peasantry sank into serfdom. It was hastened in many regions by the violence and insecurity engendered by the religious wars. Typically, peasants lost their individual parcels of land or received them back on condition that they render unpaid labor services to the lord. Usually peasants owed three or four days a week of such forced labor (called *robot* in Bohemia and

Serfdom in eastern  
Europe

adjoining territories), remaining free to work during the remainder of the week on their own parcels. Often the number of days of *robot* exacted by the lord was greater, since in eastern Europe, where central monarchy was weak and centralized legal systems were almost unknown, the lord himself was the final court of appeal for his people. His people were in fact his "subjects."

Serfdom in Germany was not called serfdom, but "hereditary subjection." By whatever name they were known throughout eastern Europe, serfs, or hereditary subjects of the manorial lord, could not leave the manor, marry, or learn a trade without the lord's express permission. The lord, drawing on this large reserve of compulsory labor, using most of it for agriculture but teaching some quick-minded youths the various handicrafts that were needed on the estate, worked the land as his own venture, sold the produce, and retained the profit.

Thus, in eastern Europe at the beginning of modern times, the rural masses lost personal freedom and lived in a poverty unknown among the peasants to the west, poor as the latter were. In western Europe there were peasants who were already on the way to becoming small proprietors. They were free people under the law. They could migrate, marry, and learn trades as opportunity offered. Those who held land could defend it in the royal courts and raise crops and take part in the market economy on their own account. They owed the lord no forced labor—or virtually none, for the ten days a year of *corvée* still found in parts of France hardly compared with the almost full-time *robot* of the peasant of eastern Europe.

The landlord in the east, from the sixteenth century onward, was solidly entrenched in his own domain, monarch of all he surveyed, with no troublesome bourgeoisie to annoy him (for towns were few), and with kings and territorial rulers solicitous of his wishes. Travelers from the west were impressed with the wealth of great Polish and Lithuanian magnates, with their palatial homes, private art galleries, well-stocked libraries, collections of jewels, gargantuan dinners, and lavish hospitality. The Junkers of northeast Germany lived more modestly, but enjoyed the same kind of independence and social superiority.

The growing power of wealthy landlords and the weakening position of impoverished peasants would have decisive social and political consequences for the later history of Prussia, Poland, Russia, and the Austrian world. But meanwhile, amidst all the economic growth, social development, and overseas conquests that have been described in the preceding pages, Europe was torn by the destructive ferocity of the Wars of Religion.

## 14. THE WARS OF CATHOLIC SPAIN: THE NETHERLANDS AND ENGLAND

### *The Ambitions of Philip II*

Charles V, having tried in vain for 35 years to preserve religious unity in Germany, abdicated his many crowns and retired to a monastery in 1556, the year after the Peace of Augsburg had given the ruler of each German state the right to choose its own religion. He left Austria, Bohemia, and Hungary (or the small part of it not occupied by the Turks) to his brother Ferdinand, who was soon elected Holy Roman Emperor (see map, p. 78). All his other possessions Charles left to his son Philip, who became Philip II of Spain. The Habsburg dynasty remained thereafter divided into two branches, the Austrian and the Spanish. The two cooperated in European affairs. The Spanish branch for a century was the more important. Philip II (1556–1598) not only possessed the Spanish kingdoms but in 1580 inherited Portugal, so that the whole Iberian peninsula was brought under his rule. He possessed the 17 provinces of the Netherlands and the Free County of Burgundy, which were member states of the Holy Roman Empire, lying on its western border, adjacent to France. Milan in north Italy and Naples in the south belonged to Philip, and since he also held the chief islands, as well as Tunis, he enjoyed a naval ascendancy in the western Mediterranean which was threatened only by the Turks. For five years, until 1558, he was titular king of England, and in 1589, in the name of his daughter, he laid claim to the throne of France. All America belonged to Philip II, and after 1580 all the Portuguese empire as well, so that except for a few nautical daredevils all ships plying the open ocean were the Spanish king's.

Philip II therefore naturally regarded himself as an international figure, and the more so because he combined the organizing methods of a new monarchy with a profound interest in the political and religious issues that were dividing post-Reformation Europe. He saw Spain as a leader of European Catholicism, and he believed that the advance of Spanish power in Europe served the cause of the universal church as well as the interests of his own monarchy and the people of Spain. Yet his attempts to protect and enhance Spanish power in Italy sometimes led to conflicts with the popes, and much of his foreign policy was directed against the Ottoman Empire in a continuing struggle for control of the Mediterranean Sea. European Protestantism was thus only one of Philip's many international concerns.

---

*Philip's goals*

Philip's active participation in Europe's religious wars should therefore be seen as part of his wider military and political campaigns to protect Spanish and Habsburg interests rather than a single-minded crusade for Catholicism. In his personal life, he was serious, devout, and hardworking. He gave the most detailed attention to the management of his far-flung territories. The wealth that flowed to his country from Potosí and other mines in South America enabled Philip to pursue his goals throughout Europe and the Mediterranean. Meanwhile, Spain also entered upon the Golden Age of its early modern culture.

In this period, the *siglo de oro*, running in round dates from 1550 to 1650, Cervantes wrote his *Don Quixote* (in two parts, 1605, 1615) and Lope de Vega wrote his 200 dramas, while El Greco, Murillo, and Velázquez painted their pictures, and the Jesuit Suarez composed works on philosophy and law that were read even in Protestant countries. As Cervantes showed in *Don Quixote*, many Spaniards were highly aware of the enduring tensions between high ideals and the difficult realities of social, political, and religious life. But Catholic traditions and the Catholic Church remained a powerful force in Spanish culture. The church was vitally present at every social level, from the archbishop of Toledo, who ranked above grandees and could address the king as an equal, down to a

host of penniless and mendicant friars, who mixed with the poorest and most disinherited of the people.

---

*The Escorial*

Philip II built himself a new royal residence, the Escorial, which well expressed in solid stone its creator's political and religious determination.

Madrid itself was a new town, merely a government center, far from the worldly distractions of Toledo or Valladolid. But it was 30 miles from Madrid, on the bleak arid plateau of central Castile, overlooked by the jagged Sierra, that Philip chose to erect the Escorial. He built it in honor of St. Lawrence, on whose feast day he had won a battle against the French. The connecting buildings were laid out in the shape of a grill, since, according to martyrologists, St. Lawrence, in the year 258, had been burned alive on a grill over burning coals. Somber and vast, made of blocks of granite meant to last forever, and with its highest spire rising three hundred feet from the ground, the Escorial was designed not only as a palace but as a center for religious life and the efficient management of a vast empire. Working constantly in this somber setting, Philip II dispatched his couriers to Mexico, to Manila, to Vienna, and to Milan. He sent his troops off to Italy and the Netherlands, his diplomats to all the royal courts of Europe, and his spies wherever they were needed—seeking to extend the influence of his powerful state and (when possible) to promote the Catholicism in which he devoutly believed.

The first years of Philip's reign were also the first years of Elizabeth's reign in England, where the religious issue was still in flux; they were years in which Calvinism agitated the Netherlands, and when France, ruled by teenaged boys, fell apart into implacable civil war. Religious loyalties that knew no frontiers overlapped all political boundaries. Everywhere there were people who looked for guidance outside their own countries. Fervent Calvinists in England, France, and the Netherlands felt closer to one another than to their own monarchs or their own neighbors. Fervent Catholics, in all three countries, welcomed the support of international Catholic forces—the Jesuits, the king of Spain, the pope. National unity threatened to dissolve or was not yet formed. The sense of mutual trust between people who lived side by side was eaten away; and people who lived not only in the same country, but in the same town, on the same street, or even in the same house, turned against each other in the name of a higher cause.

---

*The Catholic offensive*

For about five years, beginning in 1567, it seemed that a resurgent Catholicism might prevail. Catholic forces took the offensive on all fronts. In 1567 Philip sent a new and firmer governor general to the Netherlands, the Duke of Alva, with 20,000 Spanish soldiers; the duke proceeded to suppress religious and political dissidents by establishing a Council of Troubles. In 1569 Philip, who was preparing for a new war with the Ottoman Turks, put down a revolt of the Moriscos (converted Muslims) in Spain. In the same year the Catholics of northern England, led by the Duke of Norfolk and sewing the cross of crusaders on their garments, rose in armed rebellion against their heretic queen. In the next year, 1570, the pope excommunicated Elizabeth and absolved her subjects from allegiance to her, so that English Catholics, if they wished, could henceforth in good conscience conspire to overthrow her. In 1571 the Spanish joined with the Venetians and others to win a great naval battle against the Turks, at Lepanto off the coast of Greece. Although this battle was part of the ongoing military struggle for political and economic control of the Mediterranean, some Spanish sailors wove a cross on their sails and portrayed their war with the Ottomans as a new Christian resistance to Islam. In the next year, 1572, the Catholic leaders of France, with the advice of the pope and of Philip II, decided to make an end of the Huguenots, or French Protestants. Over 3,000 were seized and put to death on the eve of

### KING PHILIP II

**This portrait of the Spanish king suggests the highly focused political, religious, and military purpose in this devout Catholic monarch.**

(Alinari/Art Resource, NY)

St. Bartholomew's Day in Paris alone; and this massacre was followed by lesser liquidations throughout the provinces.

But none of these victories proved enduring. The Turks soon recovered from their defeat at Lepanto and built a new fleet. In fact, they took Tunis from Philip two years later. The Moriscos were not assimilated (they would be expelled from Spain in 1609). The English Catholic rebellion was stamped out; 800 persons were put to death by Elizabeth's government. The revolt in the Netherlands remained very much alive, as did the French Huguenots. Twenty years later England was Protestant, the Dutch were winning independence, a Huguenot had become king of France, and the Spanish fleet had gone to ruin in northern waters.

### *The Revolt of the Netherlands*

The Netherlands, or Low Countries, roughly comprised the area of the modern kingdoms of the Netherlands and Belgium and the grand duchy of Luxembourg. They consisted of 17 provinces, which in the fifteenth century, one by one, had been inherited, purchased, or conquered by the dukes of Burgundy, from whom they were inherited by Charles V and his son,

---

*The Netherlands  
provinces*

Philip II. In the mid-sixteenth century neither a Dutch nor a Belgian nationality yet existed. In the northern provinces the people spoke German dialects; in the southern provinces they spoke dialects of French; but neither here, nor elsewhere in Europe, was it felt that language boundaries had anything to do with political borders. The southern provinces had for centuries been busy commercial centers, and we have seen how Antwerp, having once flourished in trade with Venice, now flourished in trade with Lisbon. The northern provinces that were most open to the sea, the counties of Holland and Zeeland, had developed rapidly in the fifteenth century. They had a popular literature of their own, written in their own kind of German, which came to be called Dutch. The wealth of the northern provinces was drawn from deep-sea fishing. Amsterdam was said to be built on herring bones, and the Dutch, when they added trading to fishing, still lived by the sea.

The northern provinces felt no tie with each other and no sense of difference from the southern provinces. Each of the 17 provinces was a small state or country in itself, and each enjoyed typical medieval liberties and privileges. The only common bond of all 17 provinces was simply that beginning with the dukes of Burgundy they had the same ruler; but since they had the same ruler, they were called upon from time to time to send delegates to an estates general, and so developed an embryonic sense of federal collaboration. The feeling of Netherlandish identity was heightened with the accession of Philip II, for Philip, unlike his father, was thought of as foreign, a Spaniard who lived in Spain; and after 1560 Spanish governors general, Spanish officials, and Spanish troops were seen more frequently in the Netherlands. Moreover, since the Netherlands was the crossroads of Europe, with a tradition of earnestness in religion, Protestant ideas took root very early, and after 1560, when the religious wars began in France, a great many French Calvinists fled across the borders. At first, there were probably more Calvinists in the southern provinces than in the northern, more among the people whom we now call Belgians than among those whom we now call Dutch.

The revolt against Philip II was inextricably political and religious at the same time, and it became increasingly an economic struggle as the years went by. It began in 1566, when some 200 nobles of the various provinces founded a league to check the “foreign” or Spanish influence in the Netherlands. The league, to which both Catholic and Protestant nobles belonged, petitioned Philip II not to employ the Spanish Inquisition in the Netherlands. They

---

*Revolt of the  
Netherlands*

feared the trouble it would stir up; they feared it as a foreign court; they feared that in the enforcement of its rulings the liberties of their provinces would be crushed. Philip’s agents in the Netherlands refused the petition. A mass revolt now broke out. Within a week fanatical Calvinists pillaged 400 churches, pulling down images, breaking stained-glass windows, defacing paintings and tapestries, making off with gold chalices, destroying with a fierce contempt the symbols of “popery” — and “idolatry.” The rank and file for these anti-Catholic and anti-Spanish demonstrations consisted chiefly of journeymen wage earners, whose fury was driven by social and economic grievances as well as religious belief. Before such vandalism many of the petitioning nobles recoiled; the Catholics among them, as well as less militant Protestants, unable to control their revolutionary followers, began to look upon the Spanish authorities with less disfavor.

Philip II, appalled at the sacrilege, forthwith sent in the Inquisition, the Duke of Alva, and reinforcements of Spanish troops. Alva’s Council of Troubles, nicknamed the Council of Blood, sentenced some thousands to death, levied new taxes, and confiscated the estates of a number of important nobles. These measures united people of all classes in opposi-

tion. What might have been primarily a class conflict now took on the character of a national opposition. At its head emerged one of the noblemen whose estates had been confiscated, William of Orange (called William the Silent), Philip II's "stadholder" or lieutenant in the County of Holland. Beginning to claim the authority of a sovereign, he authorized ship captains to make war at sea. Fishing crews, "sea dogs," and downright pirates began to raid the small port towns of the Netherlands and France, descending upon them without warning, desecrating the churches, looting, torturing, and killing, in a wild combination of religious rage, political hatred, and lust for booty. The Spanish reciprocated by renewing their confiscations, their inquisitorial tortures, and their burnings and hangings. The Netherlands was torn by anarchy, revolution, and civil war. No lines were clear, either political or religious. But in 1576 the anti-Spanish feeling prevailed over religious difference. Representatives of all 17 provinces, putting aside the religious question, formed a union to drive out the Spanish at any cost.

### *The Involvement of England*

But the Netherlands revolution, though it was a national revolution with political independence as its first aim, was only part of the international politico-religious struggle. All sorts of other interests became involved in it. Queen Elizabeth of England lent aid to the Netherlands, though for many years surreptitiously, not wishing to provoke a war with Spain, in which it was feared that English Catholics might side with the Spaniards. Elizabeth was troubled by having on her hands an unwanted guest, Mary Queen of Scots. Mary had remained a Catholic and had been queen of France until her husband's premature death, and queen of Scotland until driven out by irate Calvinist lords, and who—if the pope, the king of Spain, the Society of Jesus, and many English Catholics were to have their way—would also be queen of England instead of the usurper Elizabeth.<sup>1</sup> Elizabeth under these circumstances kept Mary Stuart imprisoned. Many intrigues were afoot to put Mary on the English throne, some with and some without Mary's knowledge.

---

*England lends support  
to the Dutch*

In 1576 Don Juan, hero of the Spanish naval victory at Lepanto and half-brother of Philip II, became governor general of the embattled Netherlands. He developed a grandiose plan to subdue the Netherlands and then to use that country as a base for an invasion of England. After overthrowing Elizabeth with Spanish troops, he would put Mary Stuart on the throne, marry her himself, and so become king of a re-Catholicized England. Thus the security of Elizabethan and Protestant England was coming to depend on the outcome of fighting in the Netherlands. Elizabeth signed an alliance with the Netherlands patriots.

Don Juan died in 1578 and was succeeded as governor general of the Netherlands by the prince of Parma. A diplomat as well as a soldier, Parma broke the solid front of the 17 provinces by a mixture of force and persuasion. He promised that the historic liberties of the provinces would be respected, and he appealed not only to the more zealous Catholics but also to moderates who were wearying of the struggle and repelled by mob violence and religious vandalism. On this basis he rallied the southernmost provinces to his side. The seven northern provinces, led by Holland and Zeeland, responded by forming the Union of

---

<sup>1</sup>Mary Stuart, a great-granddaughter of Henry VII, was the next lawful heir to the English throne after Elizabeth, since Elizabeth had no children.

### THE LOW COUNTRIES, 1648

This group of towns and provinces, along the lower reaches of the Rhine, Meuse, and Scheldt rivers, originated in the Middle Ages as part of the Holy Roman Empire. The northern or Dutch provinces were recognized as independent of the Empire in 1648. Early in the seventeenth century a political frontier emerged between the “Dutch” and “Belgian” parts, but the word “Belgium” was not used until much later, the southern or Habsburg provinces being called the Spanish Netherlands in the seventeenth century and the Austrian Netherlands in the eighteenth. The large bishopric of Liège remained a separate church-state until the French Revolution. The language frontier, then as now, ran roughly east and west somewhat south of Brussels, with French to the south and Flemish (a form of Dutch, and hence Germanic) to the north of the line.

#### *The Union of Utrecht*

Utrecht in 1579. In 1581 they formally declared their independence from the king of Spain, calling themselves the United Provinces of the Netherlands. Thus originated what was more commonly called the Dutch Republic, or simply “Holland” in view of the predominance of that county among the seven. The great Flemish towns—Antwerp, Ghent, and Bruges—at first sided with the Union.

Where formerly all had been turmoil, a geographical line was now drawn. The south rallying to Philip II now faced a still rebellious north. But neither side accepted any such partition. Parma still fought to reconquer the north, and the Dutch, led by William the Silent, still struggled to clear the Spanish out of all 17 provinces. Meanwhile the two sides fought to capture the intermediate Flemish cities. When Parma moved upon Antwerp, still the leading port of the North Sea, and one from which an invasion of England could best be mounted, Elizabeth at last openly entered the war on the side of the rebels, sending 6,000 English troops to the Netherlands under the Earl of Leicester in 1585.

The vast size of the Spanish naval armada and the English opposition to it are suggested in this illustration by an unknown artist. Both navies had crosses on the flags of their ships, thereby claiming divine support for their cause and indicating the religious and national stakes in this epic conflict.

(National Maritime Museum, London)

England was now clearly emerging as the chief bulwark of Protestantism and of anti-Spanish feeling in northwestern Europe. In England itself, the popular fears of Spain, the popular resentment against Catholic plots revolving about Mary Stuart, and the popular indignation at “foreign” and “outside” meddling in English matters produced an unprecedented sense of national solidarity. The country rallied to Protestantism and to Elizabeth, and even the Catholic minority for the most part disowned the conspiracies against her. The English were now openly and defiantly allied with the Protestant Dutch. Not only were they fighting together in the Netherlands, but both English and Dutch sea raiders also fell upon Spanish shipping, captured the treasure ships, and even pillaged the mainland coast of northern South America. The Dutch were beginning to penetrate East Indian waters. Elizabeth was negotiating with Scotland, with German Calvinists, and with French Huguenots. At the Escorial it was said that the Netherlands could only be rewon by an invasion of England, that the queen of the heretics must be dethroned, that it was cheaper to launch a gigantic attack upon England than to pay the cost of protecting Spanish galleons year after year against the depredations of piratical sea dogs.

England as bulwark  
of Protestantism

Philip II therefore prepared to invade England. The English retorted with vigor. Mary Stuart, after almost 20 years of imprisonment, was executed in 1587; an aroused Parliament, more than Elizabeth herself, demanded her life on the eve of foreign attack. Sir Francis Drake, most spectacular of the sea dogs, sailed into the port of Cádiz and burnt the very ships assembling there to join the Armada. This was jocosely described as singeing the beard of the king of Spain.

The great Armada, the *armada católica*, was ready early in 1588. With crosses on the sails and banners bearing the image of the Holy Virgin, it went forth as to a new Lepanto against the Turks of the north. It consisted of 130 ships, weighing 58,000 tons, carrying 30,000 men and 2,400 pieces of artillery — the most prodigious assemblage of naval power that the world had ever seen. The plan was for the fleet to sail to the Netherlands, from which it was to escort the prince of Parma’s army across the straits to the English coast.

The Spanish Armada

But the Armada never reached the Spanish army. It was met in the English Channel by some 200 English vessels, which encircled the Spanish fleet near Calais. The English

craft—lighter, smaller, and faster, though well furnished with guns—harried the lumbering mass of the Armada, broke up its formations, and attacked its great vessels one by one. It found no refuge at Calais, and English fireships drove it out again to sea. Then arose a great storm, which the English would later call the “Protestant wind.” The storm blew the broken Armada northward around the tip of Scotland, the Orkneys, the Hebrides, and northern Ireland—forbidding coasts which the Spaniards had to skirt without charts or pilots or adequate provisions, and which they strewed with their wreckage and their bones.

### *The Results of the Struggle*

The war for control of the Netherlands went on for several years, even after Philip died in 1598. In the wars with Spain the English had, above all else, assured their national independence. They had acquired an intense national spirit, a love of “this other Eden, demi-paradise,” “this precious stone set in the silver sea,” as Shakespeare wrote; and they had become more solidly Protestant, almost unanimously set against “popery.” With the ruin of the Armada, they were more free to take to the sea; we have seen how the English East India Company was founded in 1600.

In the Netherlands, the battle lines swayed back and forth until 1609. In that year a

Twelve Years’ Truce was agreed to. By this truce the Netherlands were partitioned. The line of partition ran somewhat farther north than it had in Parma’s time, for the Spaniards had retaken Antwerp and other cities in the middle zone. The seven provinces north of the line, those that had formed the Union of Utrecht in 1579, were henceforth known as Dutch. The ten

provinces south of the line were known as the Spanish Netherlands. Protestants in the south either became Catholics or fled to the north, so that the south (the modern Belgium) became solidly Catholic, while the number of Protestants in the north was increased. Even so, the Dutch were not a completely Protestant people, for probably as many as a third of them remained Catholic. Calvinism was the religion of most Dutch burghers and the religion favored by the state; but in the face of an exceptionally large religious minority the Dutch Netherlands adopted a policy of toleration.

---

*Partition of the  
Netherlands*

The southern Netherlands were ruined by almost 40 years of war. The Dutch, moreover, occupied the mouth of the Scheldt River and refused to allow oceangoing vessels to proceed upstream to Antwerp or to Ghent. The Scheldt remained “closed” for two centuries, and the Flemish cities never recovered their old position. Amsterdam became the commercial and financial center of northern Europe; it retained its commercial supremacy for a century and its financial supremacy for two centuries. For the Dutch, as for the English, the weakening of Spanish naval power opened the way to the sea. The Dutch East India Company was organized in 1602. Both Dutch and English began to found overseas colonies. The English settled in Virginia in 1607, the Dutch at New York in 1612.

As for Spain, while it remained the most formidable military power of Europe for another half-century, its political and economic decline had already begun.

At the death of Philip II the monarchy was living from hand to mouth, habitually depending on the next arrival of treasure from the Indies. The productive forces of the country were weakened by inflation, by taxation, by emigration, by depopulation. At Seville, for example, only 400 looms were in operation in 1621, where there had been 16,000 a century earlier. Spain suffered from the very circumstances that made it great. Qualities that developed in the centuries of religious war and in the reliance upon imported gold or silver from America were not those on which a more modern economy and society could easily be built. The long history of campaigns against infidels and heretics had produced an exceptionally large number of minor aristocrats who often saw their class status as a reason to avoid various forms of mundane work. Their relative indifference to the newer, expanding institutions of European commercial activity may have influenced the country as a whole. In any case, many of the ablest Spaniards continued to enter the church, and there were few innovations in Spain’s political and economic life.

---

*The beginnings of  
Spanish decline*

The very unity accomplished under Ferdinand and Isabella threatened to dissolve. After more than a century of the Inquisition people were still afraid of false Christians and crypto-Muslims. The question of the Moriscos rose again in 1608. The Moriscos included some of the best farmers and most skilled artisans in the country. They lived in almost all parts of Spain and were in no sense a “foreign” element, since they were simply the descendants of those Spaniards who, in the Muslim period, which had begun 900 years before, had adopted the Muslim religion and Arabic language and culture. They were now supposedly Christian, but the true and pure Christians accused them of preserving in secret the rites of Islam and of sympathy for the Barbary pirates. They were thought to be clannish, marrying among themselves; and they were so efficient, sober, and hardworking that they outdistanced other Spaniards in competition. In 1609 some 150,000 Moriscos were driven out of Valencia; in 1610 some 64,000 were driven from Aragon; in 1611 an unknown number were expelled from Castile. All were simply put on boats and sent off with what they could carry. Spain, whose total population was rapidly falling in any case, thus lost one of the most socially valuable, if not religiously orthodox, of all its minorities.

---

*The Moriscos*

Nor could the Christian kingdoms hold peaceably together, despite the centralizing projects of the main government minister, the Count of Olivares. Coming to power under King Philip IV in 1621, Olivares sought to curb the independence of the church, increase the king’s revenues, control the aristocracy, and send the Spanish army into both the Netherlands and the religious wars in Germany. His policies provoked strong opposition throughout Spain. In 1640 Portugal, which had been joined to the Spanish crown since 1580 when its own ruling line had run out, reestablished its independence. That same year Catalonia rose in open rebellion. The Catalan war, in which the French streamed across the

Pyrenees to aid the rebels, lasted for almost 20 years. Catalonia was at last reconquered, but it managed to preserve its old privileges and separate identity. Catalan and Castilian viewed each other with increased repugnance. The Spanish kingdoms were almost as disunited, in spirit and in institutions, as in the days of Isabella and Ferdinand. They suffered, too, during the seventeenth century from a line of kings whose mental peculiarities reached the point of positive imbecility. Meanwhile, however, the might of Spain was still to be felt in both Germany and France.

## 15. THE DISINTEGRATION AND RECONSTRUCTION OF FRANCE

Both France and Germany, in the so-called Wars of Religion, fell into an advanced state of decomposition. France was torn apart by almost 40 years of civil war between 1562 and 1598, while Germany entered a long period of civil troubles that culminated in the Thirty Years' War between 1618 and 1648. From this decomposition France recovered in the seventeenth century, but Germany did not.

### *Political and Religious Disunity*

The Wars of Religion in France, despite the religious savagery shown by partisans of both sides, were no more religious than they were political. They were essentially a new form of the old phenomenon of feudal rebellion against a higher central authority. "Feudal," in this postmedieval sense, generally refers not to nobles only, but to all sorts of groups having rights within the state, and so includes towns and provinces, and even craft guilds and courts of law, in addition to the church and the noble class. It remained to be seen whether all these elements could be welded into one body politic.

In France the New Monarchy, resuming the work of medieval kings, had imposed a certain unity on the country. Normally the country acted as a unit in foreign affairs. The king alone made treaties, and in war his subjects all fought on his side, if they fought at all. Internally, the royal centralization was largely administrative; that is, the king and those who worked for him dealt with subordinate bodies of all kinds, while these subordinate bodies remained in existence with their own functions and personnel. France by the ideas of the time was a very large country. It was three times as large as England and five times as populous—roughly 18 million in the sixteenth century. At a time when the traveler could move hardly 30 miles a day, it took three weeks of steady plodding to cross the kingdom. Local influence was therefore very strong. Beneath the platform of royalty there was almost as little substantial unity in France as in the Holy Roman Empire. When the Empire had 300 "states," France had some 300 areas with their own legal systems. Where the Empire had free cities, France had *bonnes villes*, the king's "good towns," each with its stubbornly defended corporate rights. Where the Empire had middle-sized states like Bavaria, France had provinces as great as some European kingdoms—Brittany, Burgundy, Provence, Languedoc—each ruled by the French king, to be sure, but each with its own identity, autonomy, laws, courts, tariffs, taxes, and parliament or provincial estates. To all this diversity, in France as in Germany, was now added diversity of religion. Calvin himself was by birth and upbringing a Frenchman. Calvinism spread in France very rapidly.

Nor was France much attached to a papal or international Catholicism. The French clergy had long struggled for its national or Gallican liberties; the French kings had dealt

---

Centralization vs.  
localism

rudely with popes, ignored the Council of Trent, and allied for political reasons with both the Lutherans and the Turks. Since 1516 the king of France had the right to nominate the French bishops. The fact that both the monarchy and the clergy already felt independent of Rome held them back from the revolutionary solutions of Protestantism. The Protestantism which did spread in France therefore developed without government support and embraced the most radical theological wing of the Reformation, namely Calvinism, which preached at kings, attacked bishops, smashed religious images, and desecrated the churches. Within the main countries that became Protestant—England, north Germany, even the Netherlands—this extreme Protestantism was the doctrine of a minority. In France there was no middle-of-the-road Protestantism, no broad and comfortable Anglicanism, no halfway Lutheranism inspired by governments; and in the long run, as will be seen, the middle of the road was occupied by Catholics.

At first, however, the Huguenots, as the French Calvinists were called, though always a minority, were neither a small group nor modest in their demands. In a class analysis, it is clear that it was chiefly the nobility that was attracted to Protestantism, though of course it does not follow that most French Protestants were nobles, since the nobility was a small class. More than a third, and possibly almost a half, of the French nobility was Protestant in the 1560s or 1570s. Frequently the seigneur, or lord of one or more manors, believed that he should have the right to regulate religion on his own estates, as the princes of Germany decided the religion of their own territories. It thus happened that a lord might defy the local bishop, put a Calvinist minister in his village church, throw out the images, simplify the sacraments, and have the service conducted in French. In this way peasants also became Huguenots. Occasionally peasants turned Huguenot without encouragement by the lord. It was chiefly in southwestern France that Protestantism spread as a general movement affecting whole areas. But in all parts of the country, north as well as south, many towns converted to Protestantism. Usually this meant that the bourgeois oligarchy, into whose hands town government had generally fallen, went over to Calvinism and thereupon banned Catholic services. The journeymen wage earners might follow along; or estranged by class differences arising from within the local economy, they might remain attached to their old priests. In general, the unskilled laboring population probably remained the least touched of all classes by Calvinist doctrine.

---

---

*The Huguenots*

Both Francis I and Henry II opposed the spread of Calvinism—as did Lutheran and Anglican rulers—for Calvinism, a kind of grassroots movement in religion, rising spontaneously among laity and reforming ministers, seemed to threaten not only the powers of monarchy but also the very idea of a nationally established church. The fact that in France the nobility, a traditionally ungovernable class, figured prominently in the movement only made it look the more like political or feudal rebellion. Persecution of Huguenots, with burnings at the stake, began in the 1550s.

---

---

*Opposition to  
Calvinism*

Then in 1559 King Henry II was accidentally killed in a tournament. He left three sons, of whom the eldest in 1559 was only 15. Their mother, Henry's widow, was Catherine de' Medici, an Italian woman who brought to France some of the polish of Renaissance Italy, along with some of its taste for political intrigue, with which she attempted to govern the country for her royal sons. (Their names were Francis II, who died in 1560, Charles IX, who died in 1574, and Henry III, who lasted until 1589.) With no firm hand in control of the monarchy, the country fell apart; and in the ensuing chaos various powerful factions tried to get control of the youthful monarchs for their own purposes. Among these factions

were both Huguenots and Catholics. The Huguenots, under persecution, were too strong a minority to go into hiding. Counting among their number a third or more of the professional warrior class, the nobles, they took naturally and aggressively to arms.

### *The Civil and Religious Wars*

The civil wars in sixteenth-century France were not wars in which one region of a country takes up arms against another, each retaining some apparatus of government, as in the American Civil War or the civil wars of the seventeenth century in England. They were civil wars of the kind fought in the absence of government. Roving bands of armed men, without territorial base or regular means of subsistence, wandered about the country, fighting and plundering, joining or separating from other similar bands, in shifting hosts that were quickly formed or quickly dissolved. The changing economic and social conditions of the era detached many people from their old routines and threw them into a life of adventure. The more prominent leaders could thus easily obtain followers, and at the coming of such cohorts the peasants usually took to the woods, while bourgeois would lock the gates of their cities. Peasants would form protective leagues, like vigilantes; and even small towns maintained diminutive armies.

The Huguenots were led by various personages of rank, such as Admiral de Coligny and Henry of Bourbon, king of Navarre, a small independent kingdom at the foot of the Pyrenees between Spain and France. A pronounced Catholic party arose under the Guise family, headed by the Duke of Guise and the Cardinal of Lorraine. Catherine de' Medici was left in the middle, opposed like all monarchs to Calvinism but unwilling to fall under the domination of the Guises. While the Guises wished to extirpate heresy, they wished even more to govern France. Among the Huguenots some fought for local liberties in religion, while the more ardent spirits hoped to drive "idolatry" and "popery" out of all France, and indeed out of the world itself. Catherine de' Medici for a time tried to play the two parties against each other. But in 1572, fearing the growing influence of Coligny over the king, and taking advantage of a great concourse of leading Huguenots in Paris to celebrate the marriage of Henry of Navarre, she decided to rid herself of the heads of the Huguenot party at a single blow. In the resulting massacre of St. Bartholomew's Day some thousands of Huguenots were dragged from their beds after midnight and unceremoniously murdered. Coligny was killed; Henry of Navarre escaped by temporarily changing his religion.

---

St. Bartholomew's  
Day massacre

This outrage only aroused Huguenot fury and led to a renewal of civil war, with mounting atrocities committed by both sides. The armed bands slaughtered each other and terrorized noncombatants. Both parties hired companies of mercenary soldiers, mainly from Germany. Spanish troops invaded France at the invitation of the Guises. Protestant towns, such as Rouen and La Rochelle, appealed for armed support from Elizabeth of England, reminding her that kings of England had once reigned over their parts of France; but Elizabeth was too preoccupied with her own problems to give more than very sporadic and insignificant assistance. Neither side could subdue the other, and hence there were numerous truces, during which fighting still flared up, since no one had the power to impose peace.

---

The Politiques

Gradually, mainly among the more perfunctory Catholics, but also among moderate Protestants, there developed still another group who thought of themselves as the "politicals" or *politiques*. The *politiques* concluded that too much was being made of religion, that no doctrine was important enough to justify everlasting war, that perhaps after all there might be room for

**The St. Bartholomew's Day Massacre, in which thousands of Protestants were massacred in Paris in 1572, sparked waves of further atrocities by both sides in France's religious wars. As this image of the massacre suggests, it also became an enduring symbol of the brutal conflicts that divided the nation throughout the late sixteenth century.**

(Musée Cantonal de Beaux Arts, Lausanne)

two churches, and that what the country needed above all else was civil order. Theirs was a secular rather than a religious view. They believed that people lived primarily in the state, not in the church. They were willing to overlook the religious ideas of people in different churches if such persons would simply obey the king and go peaceably about their business. To escape anarchy they put their hopes in the institution of monarchy. Henry of Navarre, now again a Protestant, was at heart a *politique*. Another was the political philosopher Jean Bodin (1530–1596), the first thinker to develop the modern theory of sovereignty. He held that in every society there must be one power strong enough to give law to all others, with their consent if possible, without their consent if necessary. Thus from the disorders of the religious wars in France was germinated the idea of royal absolutism and of the sovereign state.

### *The End of the Wars: Reconstruction under Henry IV*

In 1589 both Henry III, the reigning king, and Henry of Guise, the Catholic party chief who was trying to depose him, were assassinated, each by a partisan of the other. The throne now came by legal inheritance to the third of the three Henrys, Henry of Navarre, the Huguenot chieftain. He reigned as Henry IV. Most popular and most amiably remembered of all French kings, except for medieval St. Louis, he was the first of the Bourbon dynasty, which was to last until the French Revolution.

The civil wars did not end with the accession of Henry IV. The Catholic party refused to recognize him, set up a pretender against him, and called in the Spaniards. Henry, the *politique*, sensed that the majority of the French people were still Catholic and that the Huguenots were not only a minority but, after 30 years of civil strife, an increasingly

---

---

*Henry IV accepts  
Catholicism*

unpopular minority. Paris especially, Catholic throughout the wars, refused to admit the heretic king within its gates. Supposedly remarking that “Paris is well worth a Mass,” Henry IV in 1593 abjured the Calvinist faith, and subjected himself to the elaborate processes of papal absolution. Thereupon the *politiques* and less excitable Catholics consented to work with him. The

Huguenots, at first elated that their leader should become king, were now not only outraged by Henry’s abjuration but also alarmed for their own safety. They demanded positive guarantees for their personal security as well as protection of their religious liberty.

---

---

*The Edict of Nantes*

Henry IV in 1598 responded by issuing the Edict of Nantes. The Edict granted to every seigneur, or noble who was also a manorial lord, the right to hold Protestant services in his own household. It allowed Protestantism in towns where it was in fact the prevailing form of worship, and in any case in one town of each *bailliage* (a unit corresponding somewhat to the English shire) throughout the country; but it barred Protestant churches from Catholic episcopal towns and from a zone surrounding and including the city of Paris. It promised that Protestants should enjoy the same civil rights as Catholics, the same chance for public office, and access to the Catholic universities. In certain of the superior law courts it created “mixed chambers” of both Protestants and Catholics—somewhat as if a stated minority representation were to be legally required in United States federal courts today. The Edict also gave Protestants their own means of defense, granting them about 100 fortified towns to be held by Protestant garrisons under Protestant command.

The Huguenot minority, reassured by the Edict of Nantes, became less of a rebellious element within the state. The majority of the French people viewed the Edict with suspicion. The parlements, or supreme law courts, of Paris, Bordeaux, Toulouse, Aix, and Rennes all refused to recognize it as the law of the land. It was the king who forced toleration upon the country. He silenced the parlements and subdued Catholic opposition by doing favors for the Jesuits. France’s chief minority was thus protected by the central government, not by popular wishes. Where in England the Catholic minority had no rights at all, and in Germany the religious question was settled only by cutting the country into small and hostile fragments, in France a compromise was effected, by which the Protestant minority had both individual and territorial rights. A considerable number of French statesmen, generals, and other important persons in the seventeenth century were Protestants.

Henry IV, having appeased the religious controversy, did everything that he could to let the country gradually recover from its decades of civil war. His ideal, as he breezily put it, was a “chicken in the pot” for every Frenchman. He worked also to restore the ruined government, to collect taxes, pay officials, discipline the army, and supervise the administration of justice. Roads and bridges were repaired and new manufactures were introduced under mercantilist principles. Never throughout his reign of 21 years did he summon the

Estates General. A country that had just hacked itself to pieces in civil war was scarcely able to govern itself, and so, under Henry IV, the foundations of the later royal absolutism of the Bourbons were laid down.

---

---

*The foundations of  
absolutism*

Henry IV was assassinated in 1610 by a crazed fanatic who believed him a menace to the Catholic church. Under his widow, Marie de’ Medici, the nobility and upper Catholic clergy again grew restless and forced the summoning of the Estates General, in which so many conflicting and mutually distrustful interests were represented that no program could be adopted. Marie dismissed them in 1615 to the general relief of all concerned. No Estates General of the kingdom as a whole thereafter met

until the French Revolution. National government was to be conducted by and through the king.

### *Cardinal Richelieu*

In the name of Marie de' Medici and her young son, Louis XIII, the control of affairs gradually came into the hands of an ecclesiastic, Cardinal Richelieu. In the preceding generation Richelieu might have been called a *politique*. It was the state, not the church, whose interests he worked to further. He tried to strengthen the state economically by mercantilist edicts. He attempted to draw impoverished gentlemen into trade by allowing them to engage in maritime commerce without loss of noble status. For wholesale merchants, as an incentive, he made it possible to become nobles, in return for payments into the royal exchequer. He founded and supported many commercial companies on the Anglo-Dutch model.

For a time it seemed that civil war might break out again. Nobles still feuded with each other and evaded the royal jurisdiction. Richelieu prohibited private warfare and ordered the destruction of all fortified castles not manned and needed by the king himself. He even prohibited dueling, a custom much favored by the nobles of the day, but regarded by Richelieu as a mere remnant of private war. The Huguenots, too, with their own towns and their own armed forces under the Edict of Nantes, had become something of a state within the state. In 1627 the Duke of Rohan led a Huguenot rebellion, based in the city of La Rochelle, which received military support from the English. Richelieu after a year suppressed the rebellion and in 1629, by the Peace of Alais, amended the Edict of Nantes. For this highly secularized cardinal of the Catholic church it was agreeable for the Protestants to keep their religion but not for them to share in the instruments of political power. The Huguenots lost, in 1629, their fortified cities, their Protestant armies, and all their military and territorial rights, but in their religious and civil rights they were not officially disturbed for another 50 years.

---

*Renewed threat of  
civil war*

The French monarchy no sooner reestablished itself after the civil wars than it began to return to the old foreign policy of Francis I, who had opposed on every front the European supremacy of the house of Habsburg. The Spanish power still encircled France at the Pyrenees, in the Mediterranean, in the Free County of Burgundy (the Franche-Comté), and in Belgium. The Austrian branch had pretensions to supremacy in Germany and all central Europe. Richelieu found his opportunity to assail the Habsburgs in the civil and religious struggles which now began to afflict Germany.

## 16. THE THIRTY YEARS' WAR, 1618–1648: THE DISINTEGRATION OF GERMANY

The Holy Roman Empire extended from France on the west to Poland and Hungary on the east. It included the Czechs of Bohemia and sizable French-speaking populations in what are now Belgium, Lorraine, eastern Burgundy, and western Switzerland; but with these exceptions the Empire was made up of Germans (see maps, pp. 78, 142–143). Language, however, was far less important than religion as the tie which people felt to be basic to a community; and in religion the Empire was almost evenly divided. Where in England, after stabilization set in, Roman Catholics sank to a minority of some 3 percent, and in France the Huguenots fell to not much over 5 percent, in Germany there was no true

minority, and hence no majority, and religion gave no ground for national concentration. Possibly there were more Protestants than Catholics in the Empire in 1600, for not only was Protestantism the state religion in many of the 300 states, but individual Protestants were also numerous in the legally Catholic states of the Austrian Habsburgs. Bohemia had a Protestant majority, rooted in the Czech people. Farther east, outside the Holy Roman Empire, the Hungarian nobles were mainly Protestant, and Transylvania, in the elbow of the Carpathian Mountains, was an active center of Calvinism.

---

*German decline*

In 1500 Germany had led in the life of Europe, but by 1600 it had lost much of its former cultural creativity and leadership. Where both Catholics and Calvinists recognized international affiliations, Lutherans were suspicious of the world outside the Lutheran states of Germany and Scandinavia, and hence suffered from a cultural isolation. The German universities, both Lutheran and Catholic, attracted fewer students than formerly, and their intellectual effort was consumed in combative dogmatics, each side demonstrating the truth of its own ideas. Many of the most deadly, large-scale campaigns against witchcraft took place in the small German states, and more women were burned as witches in Germany than in other countries in Western Europe. The commerce of south Germany and the Rhineland was in decay, both because of the shift of trade to the Atlantic and because the Dutch controlled the mouth of the Rhine in their own interests. German bankers, such as the Fuggers, were of slight importance after 1600. Capital was now being formed in the centers of maritime trade.

*Background of the Thirty Years' War*

The Peace of Augsburg in 1555 had provided that in each state the government could prescribe the religion of its subjects. In general, in the decades following the Peace of Augsburg, the Lutherans made considerable gains, putting Lutheran administrators into the church states, or “secularizing” them and converting them into lay principalities. In addition, Calvinism spread into Germany. Though Calvinists had no rights under the Peace of Augsburg, a number of states became Calvinist. One of these was the Palatinate, important because it was strategically placed across the middle Rhine, and because its ruler, the Elector Palatine, was one of the seven persons who elected the Holy Roman Emperor. In 1608 the Protestant states, urged on by the Elector Palatine, formed a Protestant union to defend their gains. To obtain support, they negotiated with the Dutch, with the English, and with Henry IV of France. In 1609 a league of Catholic German states was organized by Bavaria. It looked for help from Spain.

---

*Lutheran gains*

The Germans were thus falling apart, or rather coming together, into two parties in anticipation of a religious war, and each party solicited foreign assistance against the other. Other issues were also maturing. The Twelve Years' Truce between Spain and the Dutch, signed in 1609, was due to expire in 1621. The Spanish (whose military power was still unaffected by internal decline) were again preparing to crush the Dutch Republic. Since the Dutch insisted on independence, a renewal of the Dutch-Spanish war appeared to be inevitable. The Spanish also wished to consolidate the Habsburg position in central Europe and enhance their access to the Netherlands by gaining control of new territories along the Rhine River and in various Swiss cantons (see map, pp. 142–143).

These Spanish designs in the Rhineland and Switzerland naturally aroused the opposition of France. Moreover, the Austrian branch of the Habsburg family was slowly bestir-

ring itself to eradicate Protestantism in its own domains and to turn the Holy Roman Empire into a more modern type of state. The idea of a strong power in Germany was abhorrent to the French. Through opposition to the Habsburgs, France was again put in the position of chief protector of Protestantism. France was a giant of Europe, five times as populous as England, over ten times as populous as Sweden or the Dutch Republic, incomparably more populous than any single German state. And France after 1600 was at last unified within—at least relatively. As a French writer has observed, speaking of these years, the appearance of the fleur-de-lis upon the Rhine would tumble to the ground the vast projects of the Counter Reformation.

The Thirty Years' War, resulting from all these pressures, was therefore exceedingly complex. It was a German civil war fought over the Catholic-Protestant issue. It was also a German civil war fought over constitutional issues, between the emperor striving to build up the central power of the Empire and the member states struggling to maintain independence. These two civil wars by no means coincided, for Catholic and Protestant states were alike in objecting to imperial control. It was also an international war, between France and the Habsburgs, between Spain and the Dutch, with the kings of Denmark and Sweden and the prince of Transylvania becoming involved, and with all these outsiders finding allies within Germany, on whose soil most of the battles were fought. The wars were further complicated by the fact that many of the generals were soldiers of fortune who aspired to create principalities of their own and who fought or refused to fight to suit their own convenience.

---

*The complexity of the  
Thirty Years' War*

### *The Four Phases of the War*

The fighting began in Bohemia. It is in fact customary to divide the war into four phases, the Bohemian (1618–1625), the Danish (1625–1629), the Swedish (1630–1635), and the Swedish-French (1635–1648).

---

---

*The Bohemian war*

In 1618 the Bohemians, or Czechs, fearing the loss of their Protestant liberties, dealt with two emissaries from the Habsburg Holy Roman Emperor, Matthias (who was also their king), by a method occasionally used in that country—throwing them out of the window. After this “defenestration of Prague” the king-emperor sent troops to restore his authority, whereupon the Bohemians deposed him and elected a new king. In order to obtain Protestant assistance, they chose the Calvinist Elector Palatine, the head of the Protestant Union, who assumed the title of Frederick V. He brought aid to the Bohemians from the Protestant Union, the Dutch, and the prince of Transylvania. The Emperor Ferdinand, Matthias's successor, assisted by money from the pope, by Spanish troops sent from Milan, and by the forces of Catholic Bavaria, managed to overwhelm the Bohemians at the battle of the White Mountain in 1620. Frederick fled, jeered or pitied as the “winter king.” His ancestral domains in the Palatinate were overrun by the Spaniards.

The Habsburgs now set out to reconquer and revolutionize Bohemia. The Emperor Ferdinand got himself elected as king and soon confiscated the estates of almost half the Bohemian nobles. He granted these lands as endowments for Catholic churches and monasteries or as gifts to adventurers of all nationalities who had entered his service and who became the new landed aristocracy of Bohemia.

With Protestant fortunes at a low ebb, and the Protestant Union itself dissolved in 1621, the lead in Protestant affairs was now taken by the king of Denmark, who was also

**The violence of the Thirty Years' War in Germany, depicted here in a vivid illustration by Jacques Callot entitled simply *The Hanging Tree* (1633), produced terror, bitter memories, and political divisions in central Europe that lasted long after the fighting finally ended in 1648.**

(Anne S.K. Brown Military Collection, Brown University Library)

Duke of Holstein, a state of the Holy Roman Empire. With a little aid from the Dutch and English, and with promises from Richelieu, he entered the fray. Against him the Emperor Ferdinand raised another army, or, rather, commissioned Albert of Wallenstein to raise one on his own private initiative. Wallenstein assembled a force of professional fighters, of all nationalities, who lived by pillage rather than by pay. His army was his personal instrument, not the emperor's, and he therefore followed a policy of his own, which was so tortuous and well concealed that the name of Wallenstein has always remained an enigma. Wallenstein and other imperial generals soon defeated the king of Denmark, reached the Baltic coast, and even invaded the Danish peninsula.

The full tide of the Counter Reformation now flowed over Germany. Not only was Catholicism again seeping into the Palatinate, and again flooding Bohemia, but it also rolled northward into the inner recesses of the Lutheran states. By the Edict of Restitution, in 1629, the emperor declared all church territories secularized since 1552 automatically restored to the Catholic church. Some of these territories had been Protestant since the oldest person could remember. Terror swept over Protestant Germany. It seemed that the whole Protestant Reformation, now a century old, might be undone.

French and Swedish  
alarm

Among those to be alarmed were the French and the Swedes. Richelieu, however, was still putting down fractious nobles and Huguenots. He had not yet consolidated France to his satisfaction and believed that France, without fighting itself, could counter the Habsburg ambitions through the use of allies. He sent diplomats to help extricate the king of Sweden from a war with Poland, and he promised him financial assistance, which soon rose to a million livres a

year in return for the maintenance in Germany of 40,000 Swedish troops. The Dutch subsidized the Swedes with some 50,000 florins a month.

The king of Sweden was Gustavus Adolphus, a ruler of superlative ability, who had conciliated all parties in Sweden and had extended Swedish holdings on the east shore of the Baltic. Using Dutch and other military experts, he had created the most modern army of the time, noted for its firm discipline, high courage, and mobile cannon. Himself a religious man, he had his troops march to battle singing Lutheran hymns. He was ideally suited to be the Protestant champion, a role he now willingly took up, landing in Germany in 1630. Richelieu, besides giving financial help, negotiated with the Catholic states of Germany, playing on their fears of imperial centralization and seeking to isolate the emperor, against whom the Swedish war machine was now hurled.

---

---

*Gustavus Adolphus*

The Swedes, with military aid from Saxony, won a number of spectacular victories, at Breitenfeld in 1631 and Lützen in 1632, where, however, Gustavus Adolphus was killed. His chancellor, Oxenstierna, carried on. The Swedish army penetrated into Bohemia and as far south as the Danube. What those in the higher counsels of Sweden were aiming at is not clear. Perhaps they dreamed of a great federal Protestant empire, to include Scandinavia and north Germany, a Lutheran empire confronting a Catholic and Habsburg empire in the south. But the brilliant Swedish victories came to little. Both sides were weakened by disagreement. Wallenstein, who disliked the Spanish influence in Germany, virtually ceased to fight the Swedes and Saxons, with whom he even entered into private talks hoping to create an independent position for himself. He was finally disgraced by the emperor and assassinated by one of his own staff. On the Swedish-Saxon side, the Saxons decided to make a separate peace. Saxony therefore signed with the emperor the Peace of Prague of 1635. The other German Protestant states concurred in it and withdrew their support from the Swedes. The emperor, by largely annulling the Edict of Restitution, allayed Protestant apprehensions. The Swedes were left isolated in Germany. It seemed that the German states were coming together, that the religious wars might be nearing an end. But, in fact, in 1635, the Thirty Years' War was only well begun. Neither France nor Spain wished peace or reconciliation in Germany.

Richelieu renewed his assurances to the Swedes, paid subsidies even to the wealthy Dutch, hired a German princeling, Bernard of Saxe-Weimar, to maintain an army of Germans in the French service, and at last brought Catholic France into open support of the German Protestants.

So the fleur-de-lis finally moved toward the Rhine, though not at first with the success for which the French or Protestants might hope. The Spanish, from their bases in Belgium and Franche-Comté, drove instead deep into France. Champagne and Burgundy were ravaged, and Paris itself was seized with panic. The Spanish also raided the south. The French had a taste of the plunder, murder, burnings, and stealing of cattle by which Germany had been afflicted. But the French soon turned the tables. When Portugal and Catalonia rebelled against Philip IV, France immediately recognized the independence of Portugal under the new royal house of Braganza—as did England, Holland, and Sweden with equal alacrity. French troops streamed over the Pyrenees into Catalonia, spreading the usual devastation. Richelieu even recognized a Catalan republic.

---

---

*European involvement*

In Germany the last or Swedish-French phase of the war was not so much a civil war among Germans as an international struggle on German soil. Few German states now sided with the French and Swedes. A feeling of national resentment against foreign invasion even seemed to develop.

*The Peace of Westphalia, 1648*

Peace talks began in 1644 in Westphalia, at the two towns of Münster and Osnabrück. The German states were crying for peace, for a final religious settlement, and for “reform” of the Holy Roman Empire. France and Sweden insisted that the German states should individually take part in the negotiations, a disintegrating principle that the German princes eagerly welcomed and which the emperor vainly resisted. To Westphalia, therefore, hundreds of diplomats and negotiators now repaired, representing the Empire, its member states, Spain, France, Sweden, the Dutch, the Swiss, the Portuguese, the Venetians, many other Italians, and the pope. There had been no such European congress since the Council of Constance, and the fact that a European assemblage had in 1415 dealt with affairs of the church, and now in the 1640s dealt with affairs of the state, war, and power, was a measure of the secularization that had come over Europe.

---

*Lengthy peace negotiations*

The negotiations dragged on, because the armies were still fighting, and after each battle one side or the other raised its terms. France and Spain refused to make peace with each other at all and in fact remained at war until 1659. But for the Holy Roman Empire a settlement was agreed to, incorporated in 1648 in the two treaties of Münster and Osnabrück, and commonly known as the Peace of Westphalia.

The Peace of Westphalia represented a general checkmate to the Counter Reformation in Germany. It not only renewed the terms of the Peace of Augsburg, granting each German state the right to determine its own religion, but it also added Calvinism to Lutheranism and Catholicism as an acceptable faith. On the controversial issue of church territories secularized after 1552 the Protestants won a complete victory; Catholic claims to the territories were abandoned.

---

*Dissolution of the Holy Roman Empire*

The dissolution of the Holy Roman Empire, which had been advanced by the drawing of internal religious frontiers in the days of Luther, was now confirmed in politics and international law. Borderlands of the Empire fell away. The Dutch and Swiss ceased to belong to it, and both the United Provinces and Swiss cantons (or Helvetic Body) were recognized as sovereign and independent. From the disintegrating western frontier of the Holy Roman Empire the French cut off small pieces, receiving sovereignty over three Lorraine bishoprics, which they had occupied for a century, and certain rights in Alsace which were so confused that they later led to trouble. The king of Sweden received new territories in northern Germany, thus adding to Sweden’s trans-Baltic possessions.

---

*Germany fragmented*

It was in the new constitution of the Empire itself, not in territorial changes, that the greatest victory of the French and their Swedish and Dutch allies was to be found. The German states, over 300 in number, became virtually sovereign. Each received the right to conduct diplomacy and make treaties with foreign powers. The Peace of Westphalia further stipulated that no laws could be made by the Empire, no taxes could be raised, no soldiers could be recruited, no war could be declared or peace terms ratified except with the consent of the imperial estates—the 300-odd princes, ecclesiastics, and free cities in the Reichstag assembled. Since it was well known that agreement on any such matters was impossible, the principle of self-government, or of medieval constitutional liberties, was used to destroy the Empire itself as an effective political entity. While most other European countries were consolidating under royal absolutism, Germany sank back into fragmentation and localism.

The Peace of Westphalia blocked the Counter Reformation, frustrated the Austrian Habsburgs, and forestalled for almost two centuries any movement toward German national unification. Within Europe as a whole, however, it marked the advent in international law of the modern system of sovereign states. The diplomats who assembled at Westphalia represented independent powers which recognized no superior or common tie. No one any longer pretended that Europe had any significant religious or political unity. Statesmen delighted in the absence of any such unity, in which they sensed the menace of “universal monarchy.” Europe was understood to consist of a large number of unconnected sovereignties, free and detached atoms, or states, which acted according to their own laws, following their own political interests, forming and dissolving alliances, exchanging embassies and legations, alternating between war and peace, shifting position with a shifting balance of power.

---

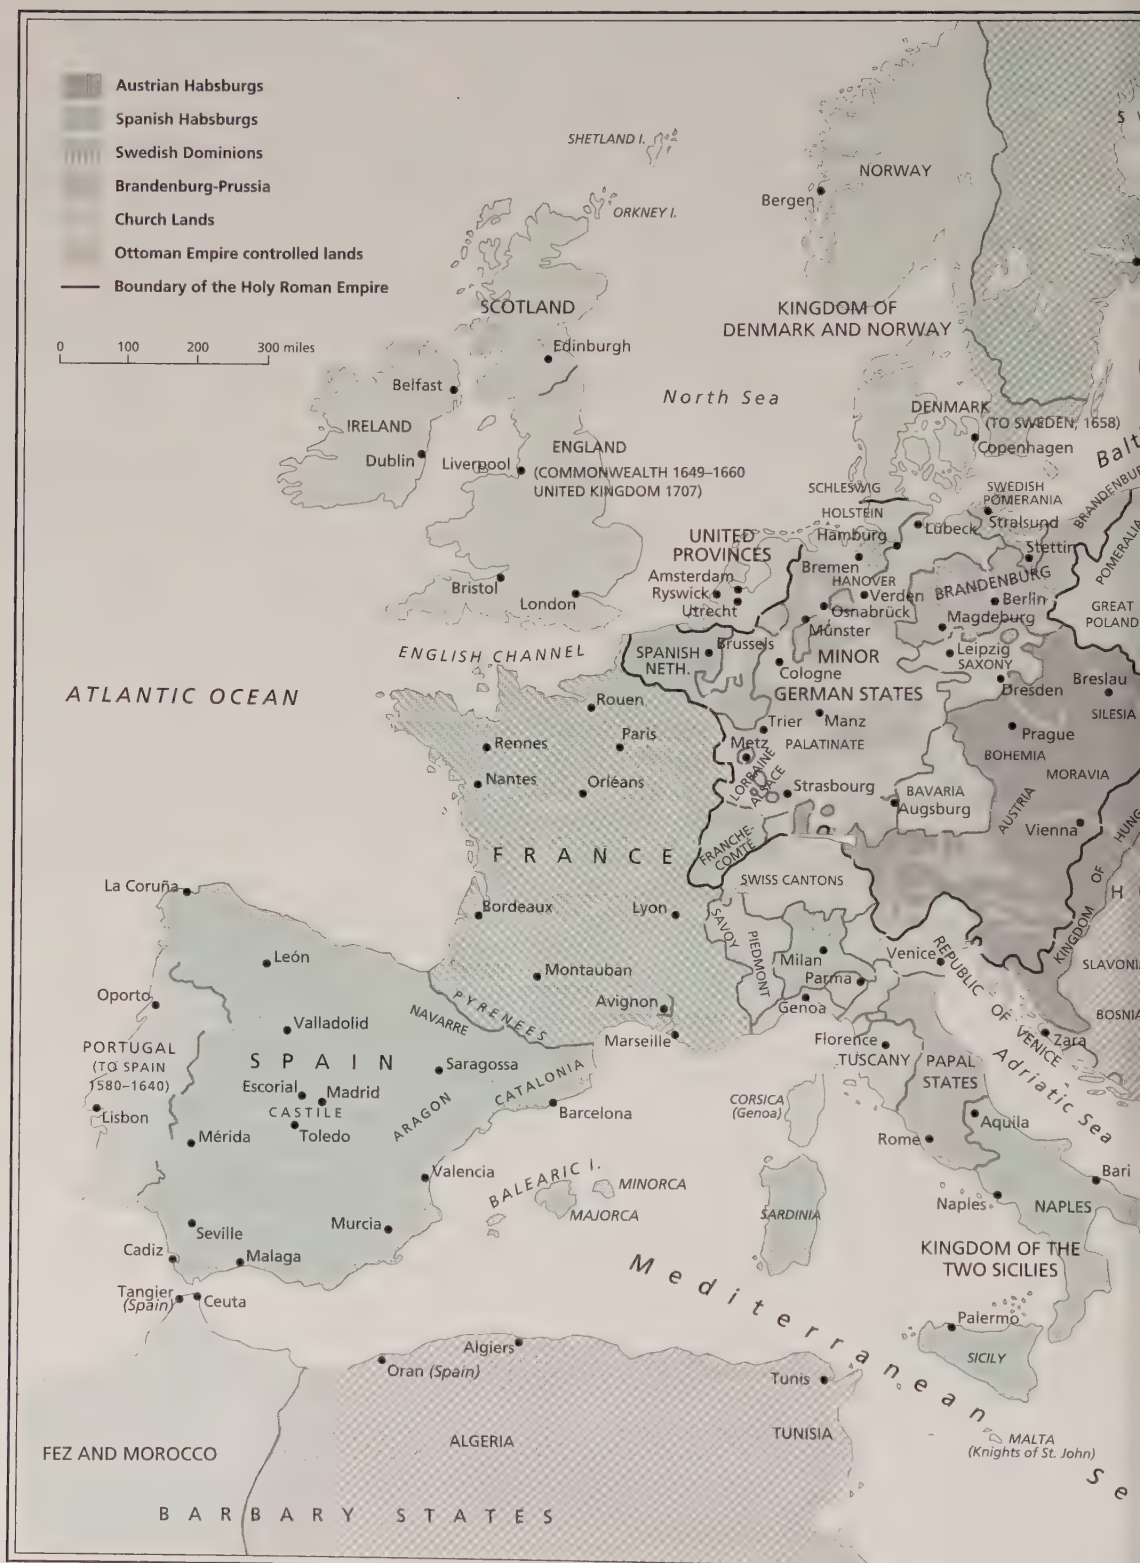

*System of sovereign  
states*

---

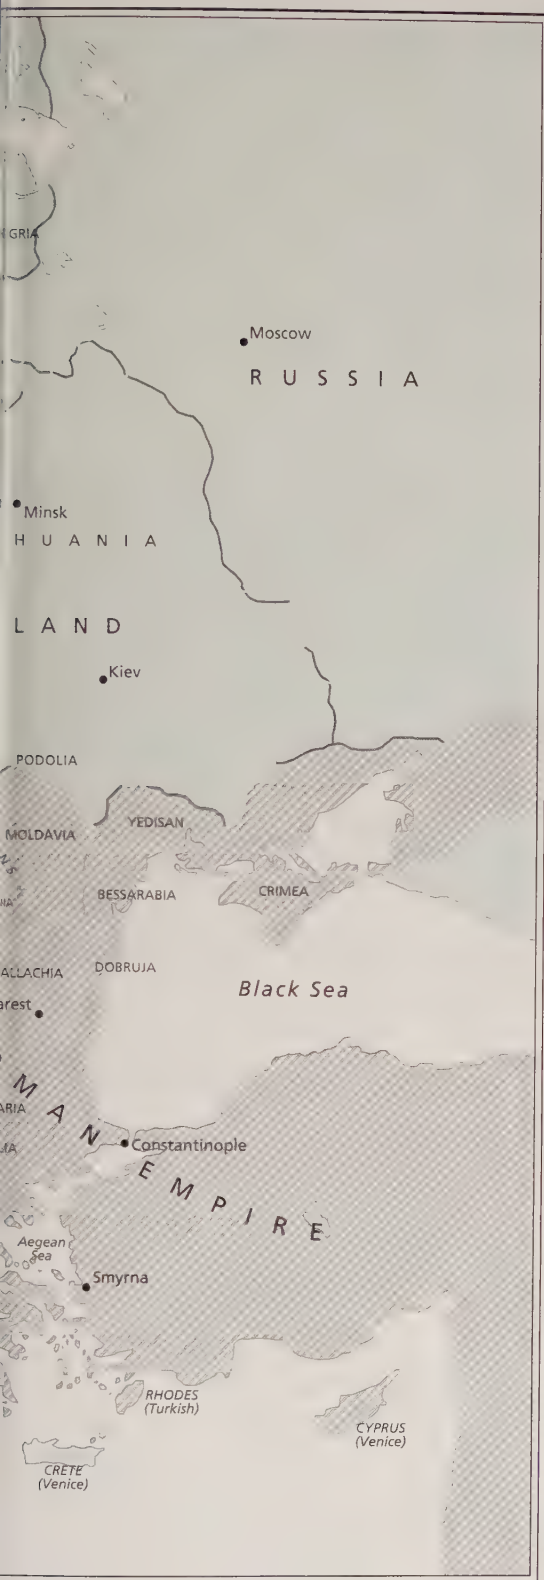

Physically Germany was wrecked by the Thirty Years' War. Cities were sacked by mercenary soldiers with a rapacity that their commanders could not control; or the commanders themselves, drawing no supplies from their home governments, systematically looted whole areas to maintain their armies. Magdeburg was besieged ten times; Leipzig, five. In one woolen town of Bohemia, with a population of 6,000 before the wars, the citizens fled and disappeared, the houses collapsed, and eight years after the peace only 850 persons were found there. The peasants, murdered, put to flight, or tortured by soldiers to reveal their few valuables, ceased to farm; agriculture was ruined; starvation followed, and with it came pestilence. Even revised modern estimates allow that in many extensive parts of Germany as much as a third of the population may have perished. The effects of fire, disease, undernourishment, homelessness, and exposure in the seventeenth century were the more terrible because of the lack of means to combat them. The horrors of modern war for civilians are not wholly different from horrors that men and women have experienced in the past.

Germany as such, physically wrecked and politically cut into small pieces, ceased for a long time to play any significant part in European affairs. A kind of political and cultural vacuum existed in central Europe. On the one hand, the western or Atlantic peoples—French, English, Dutch—began in the seventeenth century to take the lead in European politics, trade, and culture. On the other hand, in eastern Germany, around Berlin and Vienna, new and only half-German centers of power began to form. These themes will be traced in the two following chapters.

With the close of the Thirty Years' War the Wars of Religion came to an end. While religion remained an issue in some later conflicts, it was never again an important cause of conflicts in the political affairs of Europe as a whole. In general, by the close of the seventeenth century, the division between Protestant and Catholic had become stabilized. Neither side any longer expected to make territorial gains at the expense of the other. Both the Protestant and the Catholic reformations were accomplished facts. The political struggle for territory, wealth, and strategic alliances had become secularized in that “reasons of state” now prevailed over religious allegiances in shaping both the foreign policies of governments and the military conflicts of sovereign powers.

### EUROPE, 1648

This map shows the European states at the time of the Peace of Westphalia. A plurality of independent sovereign states was henceforth considered normal. The plurality of religions was also henceforth taken for granted within Europe as a whole, though each state continued to require or favor religious uniformity within its borders. By weakening the Habsburgs and furthering the disintegration of Germany, the Peace of Westphalia opened the way for the political ascendancy of France.

# THE GROWING POWER OF WESTERN EUROPE, 1640–1715

17. The *Grand Monarque* and the Balance of Power
18. The Dutch Republic
19. Britain: The Civil War
20. Britain: The Triumph of Parliament
21. The France of Louis XIV, 1643–1715: The Triumph of Absolutism
22. The Wars of Louis XIV: The Peace of Utrecht, 1713

 If the reader were to take a map of Europe, set a compass on the city of Paris, and draw a circle with a radius of 500 miles, a zone would be marked out from which much of modern “Western” civilization radiated after about 1640. It was within this zone that a secular society, modern natural science, a developed capitalism, the modern state, parliamentary government, democratic ideas, machine industry, and much else either originated or received their first full expression. The extreme western parts of Europe—Ireland, Portugal, and Spain—were somewhat outside the zone in which the most rapid changes occurred. But within it were England, southern Scotland, France, the Low Countries, Switzerland, western and central Germany, and northern Italy. This area, for over two hundred years beginning in the seventeenth century,

was the earth’s principal center of what anthropologists might call cultural diffusion. Although the economy and culture of Western Europe were deeply influenced by the expanding trade and contacts with people outside Europe, the growing power of western European states, trading companies, science, and cultural institutions had a profound and spreading impact on the rest of Europe, the Americas, and ultimately the whole world.

This western European influence grew steadily in the half-century following the Peace of Westphalia. The fading out of the Italian Renaissance, the subsiding of religious wars, the ruin of the Holy Roman Empire, and the decline of Spain all cleared the stage on which the Dutch, English, and French were to be the principal actors. But the Dutch were few in number, and the English during most of the seventeenth century were weakened by domestic discord. It was France that for a time played the most imposing

role. The whole half-century following the Peace of Westphalia is in fact often called the Age of Louis XIV.

## 17. THE GRAND MONARQUE AND THE BALANCE OF POWER

This king of France inherited his throne in 1643 at the age of 5, assumed the personal direction of affairs in 1661 at the age of 23, and reigned for 72 years until his death in 1715. No one else in modern history has held so powerful a position for so long a time. Louis XIV was more than a figurehead. For over half a century, during his whole adult life, he was the actual and working head of the French government. Inheriting the state institutions that Richelieu had developed earlier in the seventeenth century, he made France the strongest country in Europe. Using French money, by bribes or other inducements, he built up a pro-French interest in virtually every country from England to Turkey. His policies and the counterpolicies that others adopted against him set the pace of public events, and his methods of government and administration, war and diplomacy, became a model for other rulers to copy. During this time the French language, French thought and literature, French architecture and landscape gardens, and French styles in clothes, cooking, and etiquette became the accepted standard for Europe. Louis XIV was called by his fascinated admirers Louis the Great, the *Grand Monarque*, and the Sun King.

Internationally, the consuming political question of the last decades of the seventeenth century (at least in western Europe—eastern Europe we reserve for the next chapter) was the fate of the still vast possessions of the Spanish crown. Spain was what Turkey was later called, “the sick man of Europe.” To its social and economic decline was added hereditary physical deterioration of its rulers. In 1665 the Spanish throne was inherited by Charles II, an unfortunate afflicted by many ills of mind and body, impotent, even imbecile, the pitiable product of generations of inbreeding in the Habsburg house. His rule was irresolute and feeble. It was known from the moment of his accession that he could have no children and that the Spanish branch of the Habsburg family would die out with his death. The whole future not only of Spain but also of the Spanish Netherlands, the Spanish holdings in Italy, and all Spanish America was therefore in question. Charles II dragged out his miserable days until 1700, the object of jealousy and outright assault during his lifetime, and precipitating a new European war by his death.

---

---

*The weakness of  
Spain*

Louis XIV, who in his youth married a sister of Charles II, intended to benefit from the debility of his royal brother-in-law. His expansionist policies followed two main lines. One was to push the French borders eastward to the Rhine, annexing the Spanish Netherlands (or Belgium) and the Franche-Comté or Free County of Burgundy, a French-speaking region lying between ducal Burgundy and Switzerland (see maps, pp. 142–143, 147). Such a policy involved the further dismemberment of the Holy Roman Empire. The other line of Louis XIV’s ambitions, increasingly clear as time went on, was his hope of obtaining the entire Spanish inheritance for himself. By combining the resources of France and Spain he would make France supreme in Europe, in America, and on the sea. To promote these ends Louis XIV intrigued with the smaller and middle-sized powers of Europe and also contacted dissidents (i.e., potential allies) in all the countries whose governments opposed him.

---

---

*The ambitions of  
Louis XIV*

### THE EXPANSION OF FRANCE, 1661–1713

The map shows how the foreign policy and wars of King Louis XIV gradually extended France's borders toward the east and northeast, bringing the Franche-Comté and new lands in both Alsace and Lorraine under French control. Louis also gained other territories in the Spanish Netherlands and expanded French holdings in the south along the frontier with Savoy. In addition to the expansion shown here, Louis XIV's other great ambition was to obtain control of Spain and the Spanish Empire in the Americas.

Were Louis XIV to succeed in his aims, he would create the “universal monarchy” dreaded by diplomats, that is to say, a political situation in which one state might subordinate all others to its will. The technique used against universal monarchy was the balance of power. Universal monarchy had formerly been almost achieved by the Austro-Spanish Habsburgs. The Habsburg supremacy had been blocked mainly by a balance of power headed by France, of which the Thirty Years’ War and the Peace of Westphalia were the

outstanding triumphs. Now the danger of universal monarchy came from France, and it was against France that the balance of power was directed.

### *The Idea of the Balance of Power*

#### *Motives for alliances*

The aim of statesmen pursuing policies of balance of power in the seventeenth and eighteenth centuries was generally to preserve their own independence of action to the utmost. Hence the basic rule was to ally against any state threatening domination. If one state seemed to dictate too much, others would shun alliance with it unless they were willing (from ideological sympathy or other reasons) to become its puppets. They would seek alliance with the other weaker states instead. They would thus create a balance or counterweight, or “restore the balance,” against the state whose ascendancy they feared. Another more subtle reason for preferring alliance with the weak rather than with the strong was that in such an alliance the leaders of each state could believe their own contribution to be necessary and valued, and by threatening to withdraw their support could win consideration of their own policies. Indeed, the balance of power may be defined as a system in which each state tends to throw its weight where it is most needed, so that its own importance may be enhanced.

#### *Balance-of-power politics*

The purpose of balance-of-power politics was not to preserve peace but to preserve the sovereignty and independence of the states of Europe, or the “liberties of Europe,” as they were called, against potential aggressors. The system was effective as a means to this end in the seventeenth and eighteenth centuries. Combinations were intricate, and alliances were readily made and unmade to deal with emerging situations. One reason for the effectiveness of the system lay in the great number of states capable of pursuing an independent foreign policy. These included not only the greater and middle-sized states of Austria, Spain, France, England, Holland, Sweden, and Bavaria, but a great number of small independent states, such as Denmark, the German principalities, Portugal after 1640, and Savoy, Venice, Genoa, and Tuscany. States moved easily from one alliance to another or from one side of the balance to another. They were held back by no ideologies or sympathies, especially after the religious wars subsided, but could freely choose or reject allies, aiming only to protect their own independence or enlarge their own interests. Moreover, owing to the military technology of the day, small states might count as important military partners in an alliance. By controlling a strategic location, like the king of Denmark, or by making a contribution of ships or money, like the Dutch Republic, they might add just enough strength to an alliance to balance and overbalance the opposing great power and its allies.

As the ambitions of Louis XIV became bolder, and as the capacity of Spain to resist them withered away, the prevention of universal monarchy under France depended increasingly on combining the states of Europe into a balance of power against him. The balance against Louis XIV was engineered mainly by the Dutch. The most tireless of his enemies, and the one who did more than any other to checkmate him, was the Dutchman William III, the prince of Orange, who in his later years was king of England and Scotland as well.

Let us, after first surveying the Dutch in the seventeenth century, turn to the British Isles, where a momentous conflict occurred between Parliament and king. We shall then examine the French absolute monarchy under Louis XIV and conclude the present chapter with the wars of Louis XIV, particularly the War of the Spanish Succession, in which the resistance to French ambitions ultimately restored the European balance of power.

## 18. THE DUTCH REPUBLIC

### *Dutch Civilization and Government*

The ambassadors of kings, strolling beside a canal at The Hague, might on occasion observe a number of burghers in plain black garments step out of a boat and proceed to make a meal of cheese and herring on the lawn, and they would recognize in these portly figures the provincial delegates of the Estates General of the United Provinces, as the Dutch government was known in the diplomatic language of the day. Though noblemen lived in the country, the Dutch were the most bourgeois of all peoples. They were not the only republicans in Europe, since the Swiss cantons, Venice, Genoa, and even England for a few years were republics, but of all republics the United Provinces was by far the most wealthy, the most flourishing, and the most important in international diplomacy and culture.

The Dutch acquired a nationality of their own in the long struggle against Spain, and with it a pride in their own freedom and independence. In the later phases of the war with Spain, notably during the Thirty Years' War, they were able to rely more on their wealth and diplomacy than on actual fighting, so that during the whole seventeenth century they enjoyed a degree of comfort, and of intellectual, artistic, and commercial achievement unexcelled in Europe. The classic Dutch poets and dramatists wrote at this time, making a literary language of what had formerly been a dialect of Low German. Hugo Grotius produced, in his *Law of War and Peace*, a pioneering treatise on international law. Baruch Spinoza, of a family of refugee Portuguese Jews, quietly turned out works of philosophy, examining the nature of reality, of human conduct, and of church and state. Spinoza made his living by grinding lenses; there were many other lens grinders in Holland; some of them developed the microscope, and some of these, in turn—Leeuwenhoek, Swammerdam, and others—peering through their microscopes and beholding for the first time the world of microscopic life, became founders of modern biological science. The greatest Dutch scientist was Christian Huyghens (1629–1695), who worked mainly in physics and mathematics; he improved the telescope (a Dutch invention), made clocks move with pendulums, discovered the rings of Saturn, and launched the wave theory of light. A less famous writer, Balthasar Bekker, in his *World Bewitched* (1691) delivered a decisive blow against the expiring superstition of witchcraft. Meanwhile, the extraordinarily learned scholar and artist Anna Maria van Schurman (1607–1678) developed an important seventeenth-century argument for the education of women in her influential treatise *The Learned Maid or Whether a Maid May Be Called a Scholar* (1638).

---

#### *Dutch achievements*

But the most eternally fresh of the Dutch creations, suffering from no barrier of time or language, were the superb canvases of the painters. Frans Hals produced bluff portraits of the common people. Jan Vermeer threw a spell of magic and quiet dignity over men, and especially women, of the burgher class, many of whom he portrayed in typical domestic scenes. Rembrandt conveyed the mystery of human consciousness itself. In Rembrandt's *Masters of the Cloth Guild* (see color illustrations following p. 288) we face a group of six men who seem about to speak from the canvas, inclined slightly forward, as intent on their business as judges on the proceedings in a courtroom. Such men conducted the affairs of Holland, in both commerce and government; intelligent and calculating but not cunning, honest but determined to drive a hard bargain; the sober black cloaks, with the clean white collars, set against the carved woodwork and rich table covering of the Cloth Hall, seem to suggest that personal vanity must yield to collective undertakings and that personal simplicity must be maintained in the midst of material opulence. And in

Vermeer's *Geographer* (see p. 153), painted in 1669, there appears not only an immaculately scrubbed and dusted Dutch interior, but something of a symbol of the modern world in its youth—the pale northern sunlight streaming through the window, the globe and the map, the dividers in the scholar's right hand, instrument of science and mathematics, the tapestry flung over the table (or is it an Oriental rug brought from the East?), the head lifted in thought, and eyes resting on an invisible world of fresh discoveries and opening horizons. The same interest in the complexities of human character and the details of household objects appears in Vermeer's *Girl Reading a Letter at an Open Window*, which he painted in the late 1650s (see p. 151), and *The Artist's Studio*, which dates from about 1665 (see color illustrations following p. 288).

Dutch paintings in this era showed certain characteristics of the wider seventeenth-century artistic style that came to be known as **Baroque**. The fascination with lighting, the representation of interior spaces, the use of distinctive colors or subtle hues, and a more naturalistic image of human beings often shaped the distinctive appearance of Baroque paintings. In contrast to most Dutch artists, however, many of the best-known Baroque painters identified with the **Catholic Church or the Counter Reformation**. The Flemish painter **Peter Paul Rubens** was one prominent example of this identification with Catholicism in the Low Countries (see his *Portrait of the Artist with Isabelle Brant*, c. 1610, in the color illustrations following p. 000); but art in the Netherlands tended to portray scenes of everyday life rather than the passion of religious ecstasy.

In religion, after initial disputes, the Dutch Republic adopted toleration. Early in the seventeenth century the **Dutch Calvinists divided**. One group favored a modification of Calvinism, with a toning down of the doctrine of absolute and unconditional predestination. This more moderate Calvinism drew its main support from the comfortable burghers and its doctrines from a theologian of Leyden named Arminius, whose ideas were condemned at an international Calvinist synod in 1618. But beginning in 1632 the Arminians were tolerated. Rights were granted to the large Catholic minority. Jews had long been welcomed in the republic; and Christian sects despised everywhere else, such as the Mennonites, found a refuge in it. Although none of these people had as many political or economic rights as the Calvinists, the resulting mixture stimulated both the intellectual life and the commercial enterprise of the country.

---

#### Religious toleration

---

#### Dutch explorations and settlements

The Dutch as early as 1600 had 10,000 ships, and throughout the seventeenth century they owned most of the shipping of northern Europe. They were the carriers between Spain, France, England, and the Baltic. They also settled in Bordeaux to buy wines, lent money to vintners, and soon owned many vineyards in France itself. They sailed on every sea. They entered the Pacific by way of South America, where they rounded Cape Horn and named it after Hoorn in Holland. Organized in the East India Company of 1602, their merchants increasingly replaced the Portuguese in India and the Far East. In Java, in 1619, they founded the city of Batavia—the Latin name for Holland. (The city is now called Jakarta.)

Not long after 1600 the Dutch reached Japan. But the Japanese, fearing the political consequences of Christian penetration, in 1641 expelled all other Europeans and confined the Dutch to limited operations on an island near Nagasaki. The Dutch remained for over two centuries the sole link of the West with Japan. In 1612 the Dutch founded their first settlement on Manhattan Island, and in 1621 they established a Dutch West India Company to exploit the loosely held riches of Spanish and Portuguese America. They founded colonies at Pernambuco and Bahia in Brazil (lost soon thereafter) and at Caracas, Curaçao, and in Guiana in the Caribbean. In 1652 the Dutch captured the Cape of Good Hope in

**GIRL READING A LETTER AT AN OPEN WINDOW**

by Jan Vermeer (Dutch, 1632–1675)

Vermeer's characteristic interest in the mysteries of human character, the subtle shades of light, and the complex folds of a curtain appear in this painting of a young woman who seems to have received a disconcerting message or perhaps long anticipated news from afar.

(Erich Lessing/Art Resource, NY)

South Africa from the Portuguese. Dutch settlers soon appeared. Moving inland, they occupied the territory of the Khoikhoi and displaced or enslaved the people whose ancestors had lived there for centuries. From these Dutch settlers and from French Huguenots and others have come the modern Afrikaner people, whose language and religion still reflect their mainly Dutch origins.

---

*The Bank of  
Amsterdam*

In 1609 the Dutch founded the Bank of Amsterdam. European money was a chaos; coins were minted not only by great monarchs but also by small states and cities in Germany and Italy, and even by private persons. In addition, under inflationary pressures, kings and others habitually debased their coins by adding more alloy, while leaving the old coins in circulation along with the new. Anyone handling money thus accumulated a miscellany of uncertain value. The Bank of Amsterdam accepted deposits of such mixed money from all persons and from all countries, assessed the gold and silver content, and, at rates of exchange fixed by itself, allowed depositors to withdraw equivalent values in gold florins minted by the Bank of Amsterdam. These were of known and unchanging weight and purity. They thus became an internationally sought money, an international measure of value, acceptable everywhere. Depositors were also allowed to draw checks against their accounts. These conveniences, plus a safety of deposits guaranteed by the Dutch government, attracted capital from all quarters and made possible loans for a wide range of purposes. Amsterdam remained the financial center of Europe until the French Revolution.

Under their republican government the Dutch enjoyed great freedom, but it can hardly be said that their form of government met all the requirements of a state. The seven provinces that sent representatives to the Estates General of the United Provinces were all jealous of their own independence. Each province had, as its executive, an elected stadholder, but there was no stadholder for the United Provinces as a whole. This difficulty was overcome by the fact that most of the various provinces usually elected the head of the house of Orange as stadholder. This family had enjoyed exceptional prestige in the republic since the days of William the Silent and the wars for independence, but the prince of Orange, apart from being stadholder, was simply one of the feudal noblemen of the country. In general, however, the commercial class had more wealth than the older noble families, and affairs were usually managed by the burghers.

Politics in the Dutch Republic was a seesaw between the burghers, pacifistic and absorbed with business, and the princes of Orange, to whom the country owed most of its military security. When foreigners threatened invasion, the power of the stadholder increased. When all was calm, the stadholder could do little. The Peace of Westphalia produced a mood of confidence in the burghers, followed by a constitutional crisis, in the course of which the stadholder William II died, in 1650. No new stadholder was elected for 22 years. The burgher, civilian, and decentralizing tendencies prevailed.

---

*William of Orange*

In 1650, eight days after his father's death, the third William was born in the house of Orange, seemingly fated never to be stadholder and to pass his life as a private nobleman on his own estates. William III grew up to be a grave and reserved young man, small and rather stocky, with thin, compressed lips and a determined spirit. He learned to speak Dutch, German, English, and French with equal facility and to understand Italian, Spanish, and Latin. He observed the requirements of his religion, which was Dutch Calvinism, with sober regularity. He had a strong dislike for everything magnificent or pompous; he lived plainly, hated flattery, and took no pleasure in social conversation. In these respects he was the opposite of his lifelong enemy the Sun King, whom he resembled only in his diligent preoccupation with affairs. In 1677 he married the king of England's niece, Mary Stuart.

### THE GEOGRAPHER

by Jan Vermeer (Dutch, 1632–1675)

The impact on Europe of the opening of the Atlantic may be seen in this painting. For the first time in human history it had become possible to understand with some accuracy the relationships of the oceans and continents throughout the globe. The Dutch built up a large ocean-growing trade, and many of the leading cartographers lived in the Netherlands.

(Städelsches Kunstinstitut, Frankfurt)

*Foreign Affairs: Conflict with the English and French*

Meanwhile matters were not going favorably for the Dutch Republic. In 1651 the revolutionary government then ruling England passed a Navigation Act. This act may be considered the first of a long series of political measures by which the British colonial empire was built up. It was aimed against the Dutch carrying trade. It provided that goods imported into England and its dependencies must be transported on English ships or on ships belonging to the country exporting the goods. Since the Dutch were too small a people to be great producers and exporters themselves, and lived largely by carrying the goods of others, they saw in the new English policy a threat to their economic existence. The Dutch and English soon entered into a series of three wars, running with interruptions from 1652 to 1674 and generally indecisive, though in 1664 the English annexed New Amsterdam and renamed it New York.

---

*Threats by sea and land*

While thus assaulted at sea by the English, the Dutch were menaced on land by the French. Louis XIV made his first aggressive move in 1667, claiming the Spanish Netherlands and Franche-Comté by alleging certain rights of his Spanish wife, and overrunning the Spanish Netherlands with his army. The Dutch, to whom the Spanish Netherlands were a buffer against France, set into motion the mechanism of the balance of power. Dropping temporarily their disputes with the English, they allied with them instead; and since they were able also to secure the adherence of Sweden, the resulting Triple Alliance was sufficient to give pause to Louis XIV, who withdrew from the Spanish Netherlands. But in 1672 Louis XIV again rapidly crossed the Spanish Netherlands, attacked with forces five times as large as the Dutch, and occupied three of the seven Dutch provinces.

---

*The election of William as stadholder*

A popular clamor now arose among the Dutch for William of Orange, demanding that the young prince, who was 22 years of age, be installed in the old office of stadholder, in which his ancestors had defended them against Spain. He was duly elected stadholder in six provinces. In 1673 these six provinces voted to make the stadholderate hereditary in the house of Orange. William, during his whole “reign” in the Netherlands, attempted to centralize and consolidate his government, put down the feudal liberties of the provinces, and free himself from constitutional checks, moving generally in the direction of absolute monarchy. He was unable, however, to go far in this course, and the United Provinces remained a decentralized patrician republic until 1795.

Meanwhile, to stave off the immediate menace of Louis XIV, William resorted to a new manipulation of the balance of power. He formed an alliance this time with the minor powers of Denmark and Brandenburg (the small German state around Berlin) and with the Austrian and Spanish Habsburgs. Nothing could indicate more clearly the new balance of power precipitated by the rise of France than this coming over of the Dutch to the Habsburg side. This alliance presented a forceful new challenge to Louis XIV and pushed him into negotiations that ended this phase of his expansionist wars. Peace was signed in 1678 (by the treaty of Nimwegen), but only at the expense of Spain and the Holy Roman Empire, from which Louis XIV took the long coveted Franche-Comté, together with another batch of towns in Flanders (see map, p. 147). The Dutch preserved their territory intact.

---

*William comes to the English throne*

In the next ten years came the great windfall of William’s life. In 1689 he became king of England. He was now able to bring the British Isles into his perpetual combinations against France. Since the real impact of France was yet to be felt, and the real bid of Louis XIV for universal monarchy was yet to be

made, and since the English at this time were rapidly gaining in strength, the entrance of England was a decisive addition to the balance formed against French expansion. In this way the constitutional troubles of England, by bringing a determined Dutchman to the English throne, entered into the general stream of European affairs and helped to assure that western Europe and its overseas offshoots should not be dominated totally by France.

## 19. BRITAIN: THE CIVIL WAR

After the defeat of the Spanish Armada and recession of the Spanish threat the English were for a time less closely involved with the affairs of the Continent. They played no significant part in the Thirty Years' War and were almost the only European people west of Poland who were not represented at the Congress of Westphalia. At the time of the Westphalia negotiations in the 1640s they were in fact engaged in a civil war of their own. This English civil war was a milder variant of the Wars of Religion which desolated France, Germany, and the Netherlands. It was fought not between Protestants and Catholics as on the Continent, but between the more extreme or Calvinistic Protestants called Puritans and the more moderate Protestants, who adhered to the established Church of England. As in the wars on the Continent, religious differences were mixed indistinguishably with political and constitutional issues. As the Huguenots represented to some extent feudal rebelliousness against the French monarchy, as German Protestants fought for states' rights against imperial centralization, and the Calvinists of the Netherlands for provincial liberties against the king of Spain, so the Puritans asserted the rights of Parliament against the mounting claims of royalty in England.

The civil war in England took many lives, but was less destructive than most such wars on the Continent; and England escaped the worst horrors of the Wars of Religion. The same was not true of the British Isles as a whole. After 1603 the kingdoms of England and Scotland, while otherwise separate, were ruled by the same king; the kingdom of Ireland remained, as before, a dependency of the English crown. Between England and Presbyterian Scotland there was constant friction, but the worst trouble was between England and Catholic Ireland, which was the scene of religious warfare as savage as that on the Continent.

### *England in the Seventeenth Century*

For the English the seventeenth century was an age of great achievement, during which they made their debut as one of the chief peoples of modern Europe. In 1600 only four or five million persons, in England and Lowland Scotland, spoke the English language. The number did not rise rapidly for another century and a half. But the population began to spread. Religious discontents, reinforced by economic pressures, led to considerable emigration. Twenty thousand Puritans settled in New England between 1630 and 1640, and about the same number went to Barbados and other West India islands during the same years. A third stream, again roughly of the same size, but made up mainly of Scottish Presbyterians, settled in northern Ireland under government auspices, driving away or expropriating the native Celts. English Catholics were allowed by the home government to settle in Maryland. A great many members of the Church of England went to Virginia during and after the mid-century civil war, adding to the small settlement made at Jamestown in 1607. Except for the movement to northern Ireland, called the "plantation of Ulster," these

*English emigration to  
North America*

The English playwright William Shakespeare helped to shape the modern English language as well as much of the later history of English theater and literature. This image of the famous author appeared on an early seventeenth-century edition of his collected works.

(Getty Images)

migrations took place without much attention on the part of the government, through private initiative organized in commercial companies. After the middle of the century the government began deliberately to build an empire. New York was conquered from the Dutch, Jamaica from the Spanish, and Pennsylvania and the Carolinas were established. All the thirteen colonies except Georgia were founded before 1700, but there were at that time still less than half a million people in British North America.

The English also, like the Dutch, French, and Spanish at the time, were creating their national culture. Throughout western Europe the national languages, encroaching upon international Latin on the one hand and local dialects on the other, were becoming adequate vehicles for the expression of thought and feeling. William Shakespeare helped to shape the evolving English language through the enduring influence of his great plays, including the famous tragedies *Hamlet*, *Macbeth*, and *King Lear*—all of which were first performed and published in the early years of the seventeenth century. John Milton published his influential epic poems *Paradise Lost* and *Paradise Regained* later in this same century, after the bitter conflicts of the English Civil War. Shakespeare and Milton projected their mighty conceptions of human experience, aspirations, and tragedy with the imaginative power of both new and old words. The English classical literature, rugged in form but deep in content, vigorous yet subtle in insight, majestic, abundant, and sonorous in expression, was almost the reverse of French classical writing, with its virtues of order, economy, propriety, and graceful precision. Proud of their literary culture and their own great writers, the English could never thereafter quite yield to French standards, nor be dazzled or dumbfounded, as some peoples were, by the cultural glories of the Age of Louis XIV. There were no seventeenth-century painters comparable to those on the Continent, but in music it was the age of Thomas Campion and Henry Purcell, and in architecture the century closed with the great buildings of Christopher Wren.

Economically the English were enterprising and affluent, though in 1600 far outdistanced by the Dutch. They had a larger and more productive

country than the Dutch, and were therefore not as limited to purely mercantile and seafaring occupations. Coal was mined around Newcastle and was increasingly used, but was not yet a leading source of English wealth. The great industry was the growing of sheep and manufacture of woolens, which were the main export. Spinning and weaving were done mostly by workers in the country, under the putting-out system, and organized by merchants according to the methods of commercial capitalism. Since 1553 the English had traded with Russia by way of the White Sea; they were increasingly active in the Baltic and eastern Mediterranean; and with the founding of the East India Company, in 1600, they competed with the Dutch in assaulting the old Portuguese monopoly in India and East Asia. But profitable as such overseas operations were, the main wealth of England was still in the land. The richest men were not merchants but landlords, and the landed aristocracy formed the richest class.

### *Background to the Civil War: Parliament and the Stuart Kings*

In England, as elsewhere in the seventeenth century, the kings clashed with their old medieval representative institutions. In England the old institution, Parliament, won out against the king. But this was not the unique feature in the English development. In Germany the estates of the Holy Roman Empire triumphed against the emperor, and much the same thing, as will be seen, occurred in Poland. But on the Continent the triumph of the old representative institutions generally meant political dissolution or even anarchy. Successful governments were generally those in which kingly powers increased; this was the strong tendency of the time, evident even in the Dutch Republic after 1672 under William of Orange. The unique thing about England was that Parliament, in defeating the king, arrived at a workable form of government. Government remained strong but came under parliamentary control. This determined the character of modern England and launched into the history of Europe and of the world the great movement of liberalism and representative institutions.

The violent struggles that ultimately produced England's new political order emerged from the conflicting ambitions of the Stuart kings and the most powerful social groups in the English Parliament. In 1603, on the death of Queen Elizabeth, the English crown was inherited by the son of Mary Stuart, James VI of Scotland. As a descendant of Henry VII he became king of England also, taking there the title of James I. James was a philosopher of royal absolutism. He had even written a book on the subject, *The True Law of Free Monarchy*. By a "free" monarchy James meant a monarchy free from control by Parliament, churchmen, or laws and customs of the past. It was a monarchy in which the king, as father to his people, looked after their welfare as he saw fit, standing above all parties, private interests, and pressure groups. He even declared that kings drew their authority from God and were responsible to God alone, a doctrine known as the divine right of kings.

Probably any ruler succeeding Elizabeth would have had trouble with Parliament, which had shown signs of restlessness in the last years of her reign but had deferred to her as an aging woman and a national symbol. She had maintained peace within the country and fought off the Spaniards, but these very accomplishments persuaded many people that they could safely bring their grievances into the open. James I was a foreigner, a Scot, who lacked the touch for dealing with the English and who was moreover a royal pedant, the "wisest fool in Christendom," as he was uncharitably called. Not content with the actualities of control, as Elizabeth had been, he read the Parliament tiresome lectures

---

*The Stuarts and  
Parliament*

on the royal rights. He also was in constant need of money. The wars against Spain had left a considerable debt. James was far from economical, and, in any case, in an age of rising prices, he could not live within the fixed and customary revenues of the English crown. These were of medieval character, increasingly quaint under the new national and international conditions.

Neither to James I nor to his son Charles I, who succeeded him in 1625, would Parliament grant adequate revenue, because it distrusted them both. Many members of Parliament were Puritans, whose Calvinist beliefs made them dissatisfied with the organization and doctrine of the Church of England. Elizabeth had tried to hush up religious troubles, but James threatened to “harry the Puritans out of the land,” and Charles supported the Church hierarchy which, under Archbishop Laud, sought to enforce religious conformity. Many members of Parliament were also lawyers, who feared that the common law of England, the historic or customary law, was in danger. They disliked the prerogative courts—the Star Chamber set up by Henry VII to settle disputes without the deliberations of a jury and the High Commission set up by Elizabeth to ensure conformity to the theology of the Church of England. They heard with trepidation the new doctrine that the sovereign king could make laws and decide cases at his own discretion. Last but not least, practically all members of Parliament were property owners. Landowners, supported by the merchants, feared that if the king succeeded in raising taxes on his own authority, their wealth would be insecure. Hence there were strong grounds for resistance.

---

Parliamentary  
resistance

In England the Parliament was so organized as to make resistance effective. There was only one Parliament for the whole country. There were no provincial or local estates, as in the Dutch Republic, Spain, France, Germany, and Poland. Hence all parliamentary opposition was concentrated in one place. In this one and only Parliament, there were only two houses, the House of Lords and the House of Commons. The landed interest dominated in both houses, the noblemen in the Lords and the gentry in the Commons. In the Commons the gentry, who formed the bulk of the aristocracy, mixed with representatives of the merchants and the towns. Indeed the towns frequently chose country gentlemen to represent them. Hence the houses of Parliament did not accentuate, as did the estates on the Continent, the class division within the country.

Nor was the church present in Parliament as a separate force. Before Henry VIII's break with Rome the bishops and abbots together had formed a large majority in the House of Lords. Now there were no abbots left, for there were no monasteries. The House of Lords was now predominantly secular; in the first Parliament of James I there were 82 lay peers and 26 bishops. The great landowners had captured the House of Lords. The smaller landowners of the Commons had been enriched by receiving former monastic lands and had prospered by raising wool. The merchants had likewise grown up under mercantilistic protection. Parliament was strong not only in organization but also in the social interests and wealth that it represented. No king could long govern against its will.

In 1629 king and Parliament came to a deadlock. Charles I attempted to rule without Parliament, which could legally meet only at the royal summons. He intended to give England a good and efficient government. Had he succeeded, the course of English constitutional development would have paralleled that of France. But by certain reforms in Ireland he antagonized the English landlords who had interests in that country. By supporting the leadership and theology of the Church of England he made enemies of the Puritans. By attempting to modernize the navy with funds raised without parliamentary consent (called “ship money”) he alarmed all property owners, who feared that they would be forced to pay for policies they opposed.

The ship-money dispute illustrates the best arguments of both sides. It was the old custom in England for coastal towns to provide ships for the king's service in time of war. More recently, these coastal towns had provided money instead. Charles I wished to maintain a navy in time of peace and to have ship money paid by the country as a whole, including the inland counties. In the old or medieval view it was the function of the towns which were directly affected to maintain a fleet. In the new view, sponsored by the king, the whole nation was the unit on which a navy should be based. The country gentlemen whom Parliament mainly represented, and most of whom lived in inland counties, had less interest in the navy, and in any case were unwilling to pay for it unless they could control the foreign policies for which a navy might be used. The parliamentary class represented the idea, derived from the Middle Ages, that taxes should be authorized by Parliament. The king represented the newer ideas of monarchy that were developing on the Continent, which included a belief in the king's right to collect revenues that were needed by the state. The politically significant classes in England would not accept such ideas. Until the king could govern with the confidence of Parliament, or until Parliament itself was willing, not merely to keep down taxes but to assume the financial responsibilities of government under modern conditions, neither a navy nor any effectual government could be maintained.

---

---

*The ship-money  
dispute*

The Scots were the first to rebel. In 1637 they rioted in Edinburgh against attempts to impose the Church of England's prayer book and episcopal organization in Scotland. Charles, to raise funds to put down the Scottish rebellion, convoked the English Parliament in 1640, for the first time in 11 years. When it proved hostile to him, he dissolved it and called for new elections. The same men were returned. The resulting body, since it sat theoretically for 20 years without new elections, from 1640 to 1660, is known historically as the Long Parliament. Its principal leaders were small or moderately well-to-do landowning gentry. The merchant class, while furnishing no leaders, lent its support.

---

---

*The Long Parliament*

The Long Parliament, far from assisting the king against the Scots, used the Scottish rebellion as a means of pressing its own demands. These were revolutionary from the outset. Parliament insisted that the chief royal advisers be not merely removed but impeached and put to death. It abolished the Star Chamber and the High Commission. The most extreme Calvinist element, the "root and branch" men or "radicals," drove through a bill for the abolition of bishops, revolutionizing the Church of England. In 1642 Parliament and king came to open war: the king drawing followers mainly from the north and west; the Parliament, from the commercially and agriculturally more advanced counties of the south and east (see map, p. 166). A series of bloody battles steadily weakened the king's position, and his army dissolved in 1646. During the war, as the price of support from the Scottish army, Parliament adopted the Solemn League and Covenant. This prescribed that religion in England, Scotland, and Ireland should be made uniform "according to the word of God and the example of the best reformed churches." Thus Presbyterianism became the established legal religion of the three kingdoms.

### *The Emergence of Cromwell*

The parliamentary forces, called Roundheads from the close haircuts favored by Puritans, gained their major military victories with an efficient new army, the New Model Army, and a highly competent commander, Thomas Fairfax. The wars also brought a hitherto unknown gentleman named Oliver Cromwell to the foreground. A devout Protestant, he

organized a new and especially effective regiment in the New Model Army, the Ironsides, in which extreme Protestant exaltation provided the basis for morale, discipline, and the will to fight. By the late 1640s Cromwell had become the most powerful political and military leader of the parliamentary forces. The army, in which a more popular class was represented than in the Parliament, became the center of advanced democratic ideas. Many of the soldiers objected to Presbyterianism as much as to the Church of England. They favored a free toleration for all “godly” forms of religion, with no superior church organization above local groups of like-minded spirits.

Cromwell concluded that the defeated king, Charles I, could not be trusted, that “ungodly” persons of all kinds put their hopes in him (what later ages would call counterrevolution), and that he must be put to death. Since Parliament hesitated, Cromwell with the support of the army moved against Parliament. The Long Parliament, having started in 1640 with some 500 members, had sunk by 1649 to about 150 (for this revolution, like others, was pushed through by a minority); of these

*Pride's Purge*

*Removal of members  
of the Long Parliament*

Cromwell now drove out almost 100, leaving a Rump of 50 or 60. This operation was called Pride's Purge after Colonel Pride who commanded the soldiers by whom Parliament was intimidated; and in subsequent revolutions such excisions have been commonly known as purges, and the residues, sometimes, as rumps. The Rump condemned King Charles for “treason” and sent him to death on the scaffold in 1649.

England, or rather the whole British Isles, was now declared a republic. It was named the Commonwealth. Cromwell tried to govern as best he could. Religious toleration was decreed except for Unitarians and atheists on the one hand, and except for Roman Catholics and the most obstinate supporters of the Church of England on the other. Cromwell had to subdue both Scotland and Ireland by force. In Scotland the execution of the king, violating the ancient national Scottish monarchy of the Stuarts, had swung the country back into the royalist camp. Cromwell crushed the Scots in 1650.

*Religious violence in  
the Commonwealth*

Meanwhile the Protestant and Calvinist fury swept over Ireland. A massacre of newly settled Protestants in Ulster in 1641 had left bitter memories which were now avenged. The Irish garrisons of Drogheda and Wexford were defeated and massacred. Thousands of Catholics were killed; priests were put to the sword, and women and small children were dispatched in cold blood. Where formerly, in the “plantation” of Ulster, a whole Protestant population had been settled in northern Ireland, bodily replacing the native Irish, now Protestant landlords were scattered over the country as a whole, replacing the Catholic landlords and retaining the Catholic peasantry as their tenants. Ireland's native religion and clergy were driven underground, a foreign and detested church was established, and a new and foreign landed aristocracy, originally recruited in large measure from military adventurers, was settled upon the country, in which it ceased to reside as soon as it assured the payment of its rents.

In England itself Cromwell ruled with great difficulty. His regime was more successful in pursuing English interests abroad, for he not only completed the subjugation of Ireland, but in the Navigation Act of 1651, which barred Dutch ships from carrying goods between other countries and England or its colonies, he also opened the English attack on the Dutch maritime supremacy. He further waged a war with Spain in which England acquired Jamaica, thereby enhancing the English commercial position in the Caribbean and launching an English campaign for some of the vast inheritance of the Spanish Habsburgs. But he failed to gain the support of a majority of the English. The Puritan Revolu-

The execution of King Charles I marked the dramatic triumph of the radical, parliamentary forces in 1649, but the king's death—portrayed here in a seventeenth-century engraving—raised unprecedented questions about the proper limits for political authority and religious radicalism in English society.

(The Granger Collection, NY)

tion, like others, produced its extremists. It failed to satisfy the most ardent and could not win over the truly conservative, so that Cromwell found himself reluctantly more autocratic, and more alone.

A party arose called the Levellers, who were in fact what later times would call radical political democrats. They were numerous in the Puritan army, though their chief spokesman, John Lilburne, was a civilian. Appealing to natural rights and to the rights of Englishmen, they asked for a nearly universal manhood suffrage, equality of representation, a written constitution, and subordination of Parliament to a reformed body of voters. They thus anticipated many ideas of the American and French revolutions over a century later. There were others in whom religious and social radicalism were indistinguishably mixed. George Fox, going beyond Calvinism or Presbyterianism, founded the Society of Friends, or "Quakers." The Quakers caused much consternation by insisting that all believers could have new revelations of spiritual truth, by rejecting various social and religious hierarchies, and by allowing or even encouraging women to preach at their meetings. A more ephemeral group, the "Diggers," proceeded to occupy and cultivate common lands, or lands privately owned, in a general repudiation of property. The Fifth Monarchy Men were a millennial group who felt that the end of the world was at hand. They were so called from their belief, as they read the Bible, that history has seen four empires, those of Assyria, Persia, Alexander, and Caesar; and that the existing world was still "Caesar's" but would soon give way to the fifth monarchy, of Christ, in which justice would at last rule.

---

*Religious and social  
radicalism*

Cromwell opposed such movements by which all established persons in society felt threatened. As a regicide and a Puritan, however, he could not turn to the royalists or the former leaders of the Church of England. Unable to agree even with the Rump, he abolished it also in 1653, and thereafter vainly attempted to govern, as Lord Protector, through representative bodies devised by himself and his followers, under a written constitution, the Instrument of Government. Actually, he was driven to place England under military rule, the regime of the “major generals.” These officials, each in his district, repressed malcontents, vagabonds, and “bandits,” closed ale houses, and prohibited cockfighting, in a mixture of moral puritanism and political dictatorship. Cromwell died in 1658; and his son was unable to maintain the Protectorate. Two years later, with all but universal assent, royalty was restored. Charles II, son of the dead Charles I, became king of England and of Scotland.

Cromwell, by beheading a king and keeping his successor off the throne for eleven years, had left a lesson which was not forgotten. Though he favored constitutional and parliamentary government and had granted a measure of religious toleration, he had in fact

ruled as a dictator in behalf of a stern Puritan minority. The English people now began to blot from their memories the fact that they had ever had a real revolution. The fervid dream of a “godly” England was dissipated forever. What was remembered was a nightmare of standing armies and major generals, of grim Puritans and overwrought religious enthusiasts. The English

lower classes ceased to have any political role or consciousness for over a century, except in sporadic rioting over food shortages or outbursts against the dangers of “popery.” Democratic ideas were rejected as “levelling.” They were generally abandoned in England after 1660 or were cherished by obscure individuals and religious radicals who could not make themselves heard. Such ideas, indeed, had a more continuous history in the English colonies in America, where some leaders of the discredited revolution took refuge.

*Legacy of the  
revolution*

## 20. BRITAIN: THE TRIUMPH OF PARLIAMENT

*The Restoration, 1660–1688: The Later Stuarts*

What was restored in 1660 was not only the monarchy, in the person of Charles II, but also the Church of England and the Parliament. Everything, legally, was supposed to be as it had been in 1640. The difference was that Charles II, knowing the fate of his father, was careful not to provoke Parliament to extremes and that the classes represented in Parliament, frightened by the disturbances of the past 20 years, were more warmly loyal to the king than they had been before 1640 and more willing to uphold the established church.

Parliament during the Restoration enacted some far-reaching legislation. It changed the legal basis of land tenure, abolishing certain old feudal payments owed by landholders to the king. The possession of land thus came to resemble private property of modern type, and the landowning

class became more definitely a propertied aristocracy. In place of the feudal dues to the king, which had been automatically payable, Parliament arranged for the king to receive income in the form of taxation, which Parliament could raise or reduce in amount. This gave a new power to Parliament and a new flexibility to government. The aristocracy thus cleared their property of customary restrictions and obligations, and at the same time undertook to support the state by imposing taxes on themselves. The English aristocracy proved more willing than the corresponding classes on the Continent to pay a large share

---

*New legislation*

of the expenses of government. Its reward was that, for a century and a half, it virtually ran the government to the exclusion of everyone else. Landowners in this period directed not only national affairs through Parliament but also local affairs as justices of the peace. The justices, drawn from the gentry of each county, decided small lawsuits, punished misdemeanors, and supervised the parish officials charged with poor relief and care of the roads. The regime of the landlord-justices came to be called the "squirearchy."

Other classes drew less immediate advantage from the Restoration. The Navigation Act of 1651 was renewed and even added to, so that commercial, shipping, and manufacturing interests were well protected. But in other ways the landed classes now in power showed themselves unsympathetic to the business classes of the towns. Many people in the towns were Dissenters, of the element formerly called Puritan and now refusing to accept the restored Church of England. Parliament excluded Dissenters from the town "corporations," or governing bodies, forbade any dissenting clergymen to teach school or come within five miles of an incorporated town, and prohibited all religious meetings, called "conventicles," not held according to the forms and by the authority of the Church of England. The effect was that many middle-class townspeople found it difficult or impossible to follow their preferred religion, to obtain an education for their children, either elementary or advanced (for Oxford and Cambridge were a part of the established church), to take part in local affairs through the town corporations, or to sit in the House of Commons, since the corporations in many cases chose the burgesses who represented the towns. The lowest classes, the very poor, were discouraged by the same laws from following sectarian and visionary preachers. Another enactment fell upon them alone, the Act of Settlement of 1662, which decentralized the administration of the Poor Law, making each parish responsible only for its own paupers. Poor people, who were very numerous, were condemned to remain in the parishes where they lived. A large section of the English population was immobilized.

---

Exclusion of  
Dissenters

But it was not long after the Restoration that Parliament and king were again at odds. The main issue was again religion. Many Protestants throughout Europe at this time were returning voluntarily to Roman Catholicism, a tendency naturally dreaded by the Protestant churches. It was most conspicuously illustrated when the daughter of Gustavus Adolphus himself, Queen Christina of Sweden, to the consternation of the Protestant world, abdicated her throne and was received into the Roman church. In England the national feeling was excitedly anti-Catholic. No measures were more popular than those against "popery"; and the squires in Parliament, stiffly loyal to the Church of England, dreaded papists even more than Dissenters. The king, Charles II, was personally inclined to Catholicism. He admired the magnificent monarchy of Louis XIV, which he would have liked to duplicate, so far as possible, in England. At odds with his Parliament, Charles II made overtures to Louis XIV. The secret treaty of Dover of 1670 was the outcome. Charles thereby agreed to join Louis XIV in his expected war against the Dutch; and Louis agreed to pay the king of England three million livres a year during the war. He hoped also that Charles II would soon find it opportune to rejoin the Roman church.

While these arrangements were unknown in detail in England, it was known that Charles II was well disposed to the French and to Roman Catholicism. England went to war again with the Dutch. The king's brother and heir, James, Duke of York, publicly announced his conversion to Rome. Charles II, in a "declaration of indulgence," announced the nonenforcement of laws against Dissenters. The king declared that he

Among the many religious groups that rose to prominence during the English Revolution, the Quakers became especially notorious for their critique of religious hierarchies and their willingness to let women speak at their meetings. The novelty of the group is suggested in this seventeenth-century French illustration of a woman addressing a Quaker assembly.

(Fotomas Index/Bridgeman Art Library)

#### Charles II and the Test Act

While Charles II favored general toleration, but it was rightly feared that his real aim was to promote Roman Catholicism in England. Parliament retorted in 1673 by passing the Test Act, which required all officeholders to take communion in the Church of England. The Test Act renewed the legislation against Dissenters and also made it impossible for Catholics to serve in the government or in the army and navy. The Test Act remained on the statute books until 1828.

While Charles's pro-French and pro-Catholic policies were extremely unpopular, both among the country gentry who disliked the French from prejudice and the merchants who found them increasingly pressing competitors, the situation might not have come to a head except for the avowed Catholicism and French orientation of Charles's brother James, due to be the next king since Charles had no legitimate children. A strong movement developed in Parliament to exclude James by law from the throne. The exclusionists—and those

generally who were most suspicious of the king, Catholics, and the French—received the nickname of Whigs. The king's supporters were popularly called Tories. The Whigs, while backed by the middle class and merchants of London, drew their main strength from the upper aristocracy, especially certain great noblemen who might expect, if the king's power were weakened, to play a prominent part in ruling the country themselves. The Tories were the party of the lesser aristocracy and gentry, those who were suspicious of the "moneyed interest" of London, and felt a strong loyalty to church and king. These two parties, or at least their names, became permanently established in English public life. But all the Whigs and Tories together, at this time, did not number more than a few thousand persons.

### *The Revolution of 1688*

James II, despite Whig vexation, became king in 1685. He soon antagonized even the Tories, who strongly supported the Church of England. As landowners they appointed most of the parish clergy, who imparted Tory sentiments to the rural population, and from their ranks were drawn the bishops, archdeacons, university functionaries, and other high personnel of the church. The laws keeping Dissenters and Catholics from office had given Anglicans (i.e., members of the Church of England) a monopoly in local and national government and in the army and navy. James II acted as if there were no Test Act, claiming the right to suspend its operation in individual cases, and appointed a good many Catholics to influential and lucrative positions. He offered a program, as his brother had done, of general religious toleration, to allow Protestant Dissenters as well as Roman Catholics to participate in public life.

Such a program, whether frankly meant as a secularizing of politics or indirectly intended as favoritism to Catholics, was repugnant to the Church of England. Seven bishops refused to endorse it. They were prosecuted for disobedience to the king but were acquitted by the jury. James, by these actions, violated the liberties of the established church, threatened the Anglican monopoly of church and state, and aroused the popular terrors of "popery." He was also forced to take the position philosophically set forth by his grandfather James I, that a king of England could make and unmake the law by his own will. The Tories joined the Whigs in opposition. In 1688, a son was born to James II and baptized into the Catholic faith. The prospect now opened up of an indefinite line of Catholic rulers in England. Leading men of both parties thereupon abandoned James II. They offered the throne to his grown daughter Mary, born and brought up a Protestant before her father's conversion to Rome.

---

*Whigs and Tories in opposition to the crown*

Mary was the wife of William of Orange. William, it will be recalled, had spent his adult life blocking the ambitions of the king of France, who likewise had threatened Europe with a "universal monarchy" by absorbing or inheriting the world of Spain. To William III it would be a mere distraction to be husband to a queen of England, or even to be king in his own name, unless England could be brought to serve his own purposes. He was immutably Dutch; his purpose was to save Holland and hence to ruin Louis XIV. His chief interest in England was to bring the English into his balance of power against France. Since the English were generally anti-French, and had chafed under the pro-French tendencies of their kings, William without difficulty reached an understanding with the discontented Whigs and Tories. Protected by a written invitation from prominent Englishmen, he invaded England with a considerable army. James II fled, and William was proclaimed co-ruler with Mary over

*William invades England*

### ENGLAND IN THE SEVENTEENTH CENTURY

The maps show the principal seventeenth-century English towns and the rough division of the country into royalist and parliamentary regions during the English Civil War. King Charles I drew his strongest support from the north and west; Parliament drew its strongest support from the southeast and from London. Similar regional political patterns emerged in later conflicts between the Royalist “Tories” and the Parliamentary “Whigs.” The Whigs were generally supported by the upper aristocracy and the commercial classes of London, who opposed the pro-French, pro-Catholic policies of the Stuart kings Charles II and James II.

England and Scotland. In the next year, 1690, at the Boyne River in Ireland, a motley army of Dutchmen, Germans, Scots, and French Huguenots under William III defeated a French and Irish force led by James II. Thus the constitutional liberties of England were saved and Anglican Protestantism remained the official religion of the English nation. James II fled to France.

Louis XIV of course refused to recognize his inveterate enemy as ruler of England. He maintained James at the French court with all the honors due the English king. It was thereafter one of his principal war aims to restore the Catholic and Stuart dynasty across

the Channel. The English, contrariwise, had added reason to fight the French. A French victory would mean counterrevolution and royal absolutism in England. The whole Revolution of 1688 was at stake in the French wars.

In 1689, Parliament enacted a Bill of Rights, stipulating that no law could be suspended by the king (as the Test Act had been), no taxes could be raised or army maintained except by parliamentary consent, and no subject (however poor) could be arrested and detained without legal process.

---

*Bill of Rights and the  
Toleration Act*

William III accepted these articles as conditions to receiving the crown. Thereafter the relation between king and people was a kind of contract. It was further provided, by the Act of Settlement of 1701, that no Catholic could be king of England; this excluded the descendants of James II, known in the following century as the Pretenders. Parliament also passed the Toleration Act of 1689, which allowed Protestant Dissenters to practice their religion but still excluded them from political life and public service. Since ways of evading these restrictions were soon found, and since even Catholics were not molested unless they supported the Pretenders, there was thereafter no serious trouble over religion in England and Lowland Scotland.

The English Parliament could make no laws for Scotland, and it was to be feared that James II might someday be restored in his northern kingdom. The securing of the parliamentary revolution in England, and of the island's defenses against France, required that the two kingdoms be organically joined. There was little sentiment in Scotland, however, for a merger with the English. The English tempted the Scots with economic advantages. The Scots still had no rights in the English East India Company, nor in the English colonies, nor within the English system of mercantilism and Navigation Acts. They obtained such rights by consenting to a union. In 1707 the United Kingdom of Great Britain was created. The Scots retained their own legal system and established Presbyterian church, but their government and parliament were merged with those of England. The term "British" came into use to refer to both English and Scots.

As for Ireland, it was now feared as a center of Stuart and French intrigue. The Revolution of 1688 marked the climax of a long record of trouble. Ireland had never been simply "conquered" by England, though certain English or rather Anglo-Norman families had carved out estates there since the twelfth century. By the end of the Middle Ages Ireland was organized as a separate kingdom with its own parliament, subordinate to the English crown. During the Reformation the Irish remained Catholic while England turned Protestant, but the monasteries were dissolved in Ireland as in England; and the organized church as such, the established Church of Ireland, with its apparatus of bishoprics, parishes, and tithes, became an Anglican communion in which the mass of native Irish had no interest. Next came the plantation of Ulster, already mentioned, in which a mass of newcomers, mainly Scottish and Presbyterian, settled in the northern part of the island. Then in Cromwell's time, as just seen, English landlords spread through the rest of the country; or rather, a new Anglo-Irish upper class developed, in which English landowning families, residing most often in England, added the income from Irish estates to their miscellaneous revenues.

---

*The Irish threat to the  
Revolution of 1688*

Ireland therefore by the close of the seventeenth century was a very mixed country. Probably two-thirds of its population was Catholic, of generally Celtic ethnic background; perhaps a fifth was Presbyterian, with recent Scottish connections; the small remainder was made up of Anglicans, largely Anglo-Irish of recent or distant origin in England, who controlled most of the land, manned the official church, and were influential in the Irish

parliament. It was essentially a landlord and peasant society, in which the Presbyterian as well as the Catholic mass was overwhelmingly agricultural; towns were small, and the middle class scarcely developed.

After the Revolution of 1688, in which the final overthrow of James II took place at the Boyne River, the English feared Ireland as a source of danger to the postrevolutionary arrangements in England. Resistance of the subjugated Catholics had also to be prevented. English elites who were defending their own liberties at home thus set about destroying the religious, political, and social liberties of Irish Catholics. In addition to the burden of an alien church and absentee landlordism, the Irish were now subjected to a new “penal code.” Catholic clergy were banished, and Catholics were forbidden to vote or to sit in the Irish parliament. Catholic teachers were forbidden to teach, and Catholic parents were forbidden to

*Restrictions for Catholics*

send children overseas to be educated in Catholic schools. No Catholic could take a degree at Trinity College (Dublin University), an Anglican institution. Catholic Irishmen were forbidden to purchase land, to lease it for more than 31 years, to inherit it from a Protestant, or to own a horse worth more than £5. A Catholic whose son turned Protestant found his own property rights limited in his son’s favor. Catholics were forbidden to be attorneys, to serve as constables, or, in most trades, to have more than two apprentices. Some disabilities fell on the Protestant Irish also. Thus Irish shipping was excluded from the British colonies, nor could the Irish import colonial goods except through England. Export of Irish woolens and glass manufactures was prohibited. No import tariff on English manufactures could be levied by the Irish parliament. About all that was left to the Irish, in international trade, was the export of agricultural produce; and the foreign exchange acquired in this way went very largely to pay the rents to absentee landlords.

The purpose of the penal code was in part strategic, to weaken Ireland as a potentially hostile country during a long period of English wars with France. In part it was commercial, to favor English manufactures by removing Irish competition. And in part it was social, to confirm the position of the Anglican interest, or “ascendancy” as it came to be called. Parts of the code were removed piecemeal in the following decades, and a Catholic merchant class grew up in the eighteenth century; but much remained in effect for a long

time, so that, for example, a Catholic could not vote for members of the Irish parliament until 1793, and even then could not be elected to it. **In general, the Irish emerged from the seventeenth century as the most repressed people of western Europe.**

England, immediately after the expulsion of James II, joined William III's coalition against France. To the alliance England brought a highly competent naval force, together with very considerable wealth. William's government, to finance the war, borrowed £1,200,000 from a syndicate of private lenders, who in return for holding government bonds were given the privilege of operating a bank. Thus originated, in 1694, both the Bank of England and the British national debt. Owners of liquid assets, merchants of London and Whig aristocrats with fat rent rolls, having lent their money to the new regime, had a compelling reason to defend it against the French and James II. And having at last a government whose policies they could control, they were willing to entrust it with money in large amounts. The national debt rapidly rose, while the credit of the government held consistently good; and for many years the Continent was astonished at the wealth that the British government could tap at will and the quantities of money that it could pour into the wars of Europe.

---

*Coalition against  
France*

The events of 1688 came to be known to the English as the Glorious Revolution. The Revolution was portrayed as vindicating the principles of parliamentary government, the rule of law, and even the right of rebellion against tyranny (though, as noted above, England's governing classes denied all such rights in Ireland). **The overthrow of James II and the enactment of new parliamentary restrictions on the power of English kings have often been depicted as the climax in the growth of English constitutional self-government.** Political writers like John Locke, shortly after the events, helped to give wide currency to these ideas. There was in truth some justification for these views even though in more recent times some writers have "deglorified" the Revolution of 1688. They point out that it was a class movement, promoted and maintained by the landed aristocracy. The Parliament which boldly asserted itself against the king was at the same time closing itself to large segments of the people. Where in the Middle Ages members of the House of Commons had usually received pay for their services, this custom disappeared in the seventeenth century, so that thereafter only men with independent incomes could sit. After the parliamentary triumph of 1688 this tendency became a matter of law. An act of 1710 required members of the House of Commons to possess private incomes at such a level that only a few thousand persons could legally qualify. This income had to come from the ownership of land. **England from 1688 to 1832 was the best example in modern times of a true aristocracy, that is, of a country in which the men of the aristocratic landowning class not only enjoyed privileges but also conducted the government.** But the landowning interest was then the only class sufficiently wealthy, numerous, educated, and self-conscious to stand on its own feet. The rule of the "gentlemen of England" was within its strict social limits a regime of political liberty.

Revolution*

## 21. THE FRANCE OF LOUIS XIV, 1643–1715: THE TRIUMPH OF ABSOLUTISM

### *French Civilization in the Seventeenth Century*

Having traveled in the outer orbits of the European political system, we come now to its radiant and mighty center, the domain of the Sun King himself, the France against which

the rest of Europe felt obliged to combine because its power threatened the interests of so many other countries—the future of the Spanish possessions, the independence of Holland, the maintenance in England of the parliamentary revolution. The France of Louis XIV owed much of its ascendancy to the quantity and quality of its people. Population was stabilized or possibly even falling in the seventeenth century, the last century in which France was seriously disturbed by famine, pestilence, and peasant rebellion. With 19 million inhabitants in 1700 France was still over three times as populous as England and twice as populous as Spain. Its fertile soil, in an agricultural age, made it a wealthy country, though the wealth was very unevenly distributed.

---

*The contradictions of  
French society*

France was big enough to harbor many contradictions. Millions of its people lived in poverty, yet the number in comfortable or even luxurious circumstances was very large. There were both modest country nobles and cosmopolitan *grands seigneurs*. The middle class included an inordinate number of lawyers, officeholders, and bureaucrats. The country was less commercial than Holland or England, yet in sheer numbers there may have been more merchants in France than in either of the other two countries. Protestants were a declining minority, yet in the mid-seventeenth century there were still more French Huguenots than Dutch Calvinists. It was a self-sufficient country, yet the French in this century began trading in India and Madagascar, founded colonial settlements in Canada, penetrated the Great Lakes and the Mississippi valley, set up plantations in the West Indies, expanded their ancient commerce with the Levant, enlarged their mercantile marine, and for a time had the leading navy of Europe.

The dominance of France meant the dominance not merely of power but of a people whom most Europeans viewed as the forefront of seventeenth-century civilization. They carried over the versatility of the Italy of the Renaissance. In Nicholas Poussin and Claude Lorrain they produced a notable school of painters, their architecture was emulated throughout Europe, and they excelled in military fortification and engineering. Much of their literature, though often written by bourgeois writers, was designed for an aristocratic and courtly audience, which had put aside the uncouth manners of an earlier day and prided itself on the refinement of its tastes and perceptions. Corneille and Racine wrote austere tragedies on the personal conflicts and social relations of human life. Molière, in his comedies, ridiculed bumbling doctors, new-rich bourgeois, and foppish aristocrats, making the word “marquis” almost a joke in the French language. La Fontaine gave the world his animal fables, and La Rochefoucauld, in his witty and sardonic maxims, a nobleman’s candid judgment on human nature. In Descartes the French produced a great mathematician and scientific thinker; in Pascal, a scientist who was also a profound spokesman for Christianity; in Bayle, the father of modern skeptics. It was French thought and the French language, not merely the armies of Louis XIV, which in the seventeenth century were sweeping the European world.

Louis XIV understood that France’s dominant position in Europe required more than large armies and that a flourishing cultural life greatly enhanced the international prestige of even the wealthiest or most powerful sovereign state. He therefore gave generous financial support to his favorite writers and artists, especially those who produced works for his new palace at Versailles. He also brought the arts and sciences into the state’s administrative

---

*Patronage of the arts  
by Louis XIV*

system by establishing royal academies in which various theorists taught the correct principles for art, literature, music, dance, and scientific knowledge. The favored or official aesthetic theory in these academies was called classicism, a theory that emphasized order, harmony, and the artistic achievements of antiquity. Following the example of painters

The French playwright Molière often performed in his own plays, including some that were staged at the court of Louis XIV. He is portrayed here as a character in *The School for Wives*, a popular comedy about conflicts and deceptions in the relations between women and men.

(Giraudon/Art Resource, NY)

such as Poussin, young artists learned to portray scenes from classical Roman history or mythology with harmonious and almost geometric precision. The great literary theorist of the day, Nicolas Boileau, urged writers to emulate the poetic works of ancient writers who had shown how literature addresses the timeless themes of human knowledge rather than the frivolities of daily life. The classicism of French artists and writers thus fit comfortably with the Sun King's appreciation for order, harmony, and hierarchy in every sphere of social, political, and cultural life.

Yet neither the king nor his official academies could control all of France's artistic and intellectual activity. Some literary critics, soon known as the "Moderns," began to argue that modern literature and knowledge had in fact surpassed the achievements of antiquity and that Boileau's academic writers, soon called the "Ancients," deferred much too rigidly to ancient authorities. Meanwhile, other centers of intellectual life emerged outside the royal academies in the new salons of Paris. Developing rapidly in the second half of the seventeenth century, the salons became the unofficial gathering places for Parisian nobles, wealthy professional persons, and creative writers or artists. They were organized by upper-class women who invited people into their homes to discuss philosophy, literature, and art—all of which could be debated without the formal constraints and solemnity of the academies. The salons attracted criticism and even ridicule from some people in the government and academies, partly because

---

---

Salons

they were created by energetic women and partly because they flourished outside the official cultural institutions of the state. But the Parisian salons, like the royal academies, became an enduring, distinctive institution in French cultural life. They also welcomed distinguished foreign visitors, thus contributing to the spread of French ideas and social mores throughout Europe. Parisian-style salons eventually appeared in other European cities, along with French fashion, French manners, and the French language.

### *The Development of Absolutism in France*

This ascendancy of French culture went along with a regime in which political liberties were at a discount. The culture embellished what historians have often called the “absolute monarchy” of Louis XIV, though the king’s power was never as far-reaching as the term “absolutism” suggests. The Sun King had to secure the cooperation of the nobility and other social classes; and his power was constrained in various ways by regional institutions, French legal traditions, and a fragmented system of local economies. France had a tradition of political freedom in the feudal sense. It had the same kind of background of feudal liberties as did the other countries of Europe. It had an Estates General, which had not met since 1615 but was not legally abolished. In some regions Provincial Estates, still

---

#### *The “parlements”*

meeting frequently, retained a measure of self-government and of power over taxation. There were about a dozen bodies known as parlements,<sup>1</sup> which, unlike the English Parliament, had developed as courts of law, each being the supreme court for a certain area of the country. The parlements upheld certain “fundamental laws” which they said the king could not overstep, and they often refused to enforce royal edicts that they declared to be unconstitutional. France, beneath the surface, was almost as diverse as Germany (see map, p. 180). French towns had won charters of acknowledged rights, and many of the great provinces enjoyed liberties written into old agreements with the crown. These local liberties were the main reason for a good deal of institutional complication. There were some 300 “customs” or regional systems of law; it was observed that travelers sometimes changed laws more often than they changed horses. Internal tariffs ran along the old provincial borders. Tolls were levied by manorial lords. The king’s taxes fell less heavily on some regions than on others. Neither coinage nor weights and measures were uniform throughout the country. France was a bundle of territories held together by allegiance to the king.

This older kind of feudal freedom discredited itself in France at the very time when by triumphing in Germany it pulled the Holy Roman Empire to pieces, and when in England it successfully made the transition to a more modern form of political liberty, embodied in the parliamentary though aristocratic state. In France the old medieval or local type of liberty became associated with disorder. It has already been related how after the disorders of the sixteenth-century religious wars people had turned with relief to the monarchy and how Henry IV and then Richelieu had begun to make the monarchy strong. The troubles of the Fronde provided additional incentive for the centralization of political power in France.

---

#### *The Fronde*

The Fronde broke out immediately after the Peace of Westphalia, while Louis XIV was still a child, and was directed against Cardinal Mazarin, who was governing in his name. It was an abortive revolution, led by the same elements, the parlements and the nobility, which were to initiate the great French Revolution in 1789. The parlements, especially the Parlement of Paris, insisted in 1648 on their

---

<sup>1</sup>Spelled *parlements* in French, to distinguish from the English Parliament.

### INSPIRATION OF THE EPIC POET

by Nicolas Poussin (French, 1594–1665)

Poussin's interest in both the themes and forms of classicism appear in this image of a poet who yearns for the honor of a laurel crown as he meditates on the Greek god Apollo (with his lyre) and Calliope, the muse of epic poetry. The painting shows the careful symmetry and balance of much seventeenth-century French art.

(Scala/Art Resource, NY)

right to pronounce certain edicts unconstitutional. Barricades were thrown up and street fighting broke out in Paris. The nobility rebelled, as it had often in the past. Leadership was assumed by certain prominent noblemen who had enough wealth and influence to believe that, if the king's power were contained, they might govern the country themselves. The nobility demanded a calling of the Estates General, expecting to dominate over the bourgeoisie and the clergy in that body. Armed bands of soldiers, unemployed since the Peace of Westphalia and led by nobles, roamed about the country terrorizing the peasants. If the nobles had their way, it was probable that the manorial system would fall on the peasants more heavily, as in eastern Europe, where triumphant lords were at this very time exacting increased labor services from the peasants. Finally the rebellious nobles called in Spanish troops, though France was at war with Spain. By this time the bourgeoisie, together with the parlements, had withdrawn support from the rebellious nobles. The agitation subsided in total failure. Bourgeoisie and aristocracy could not work together; the nobles outraged people throughout France by bringing Spanish soldiers into

their rebellion; and the *frondeurs*, especially after the parlements deserted them, had no systematic or constructive program, aiming only at the overthrow of the unpopular Cardinal Mazarin and at obtaining offices and favors for themselves.

After the Fronde, as after the religious wars, the bourgeoisie and peasantry of France, to protect themselves against the claims of the aristocracy, were in a mood to welcome the exercise of strong power by the kings. And in the young Louis XIV they had a man more than willing to grasp all the power he could get. Louis, at age 23, on Mazarin's death in 1661, announced that he would govern the country himself. He was the third king of the Bourbon line. It was the Bourbon tradition, established by Henry IV and by Richelieu, to draw the teeth from independent aristocrats, and this tradition Louis XIV followed. He was not a man of any transcendent abilities, though he had the capacity, often found among successful executives, of learning a good deal from conversation with experts. His education was not very good, having been made purposely easy; but he had the ability to see and stick to definite lines of policy, and he was extremely methodical and industrious in his daily habits, scrupulously loading himself with administrative business throughout his reign. He was extremely fond of himself and his position of kingship, with an insatiable appetite for admiration and flattery; he loved magnificent display and elaborate etiquette, though to some extent he simply adopted them as instruments of policy rather than as a personal whim.

With the reign of Louis XIV the "state" in its modern form took a long step forward. The state in the abstract has always seemed somewhat theoretical to the English-speaking world. Let us say, for simplicity, that the state represents a fusion of justice and power. A sovereign state possesses, within its territory, a monopoly over the administration of justice and the use of force. Private persons neither pass legal judgments on others nor control private armies of their own. For private and unauthorized persons to do so, in an orderly state, constitutes rebellion. This was in contrast to the older feudal practice, by which feudal lords maintained manorial courts and led their own followers into battle. Against these feudal practices Louis XIV energetically worked, though not with complete success, claiming to possess in his own person, a sovereign ruler, a monopoly over the lawmaking processes and the armed forces of the kingdom. This is the deeper meaning of his reputed boast, *L'état, c'est moi*—"the state is myself." In the France of the seventeenth century, divided by classes and by regions, there was in fact no practical means of consolidating the powers of state except in the shared deference to one individual.

---

*"L'état, c'est moi"*

The state, however, while representing law and order within its borders, has generally stood in a lawless and disorderly relation to other states, since no higher monopoly of law and force has existed. Louis XIV, personifying the French state, had no particular regard for the claims of other states or rulers. He was constantly either at war or prepared for war with his neighbors. The modern state, indeed, was created by the needs of peace at home and war abroad. Machinery of government, as devised by Louis XIV and others, was a means of giving order and security within the territory of the state, and of raising, supporting, and controlling armies for use against other states.

The idea that law and force within a country should be monopolized by the lawful king was the essence of the seventeenth-century doctrine of absolutism. Its principal theorist in the time of Louis XIV was Bishop Bossuet. Bossuet advanced the old Christian teaching that all power comes from God and that all who hold power are responsible to God for the way they use it. He held that kings were God's representatives in the political affairs of earth. Royal power, according to Bossuet, was absolute but not arbitrary: not

arbitrary because it must be reasonable and just, like the will of God which it reflected; absolute in that it was free from dictation by parlements, estates, or other subordinate elements within the country. Law, therefore, was the will of the sovereign king, so long as it conformed to the higher law which was the will of God.

This doctrine, affirming the divine right of kings, was popularly held in France at the time and was taught in the churches. “Absolutism” and “absolute monarchy” became the prevailing concepts of government on much of the European continent in the seventeenth and eighteenth centuries. It must be remembered, however, that these terms referred more to legal theories than to facts. A ruler was “absolute” because he was not legally bound by any other persons or institutions in the country. In reality he became dependent upon a host of advisers and bureaucrats; he often had to compromise with vested interests; and he could be thwarted by the sheer weight of local custom or meet resistance from lawyers, ecclesiastics, nobles, grantees, hereditary officeholders, and miscellaneous dignitaries. And the slow pace of both transportation and communication prevented early modern “absolutist” rulers from controlling their subjects as quickly or as efficiently as governments have controlled their people in modern nation-states.

---

*Absolutism*

### *Government and Administration*

Possibly the most fundamental step taken by Louis XIV was to assure himself of control of the army. Armed forces had formerly been almost a private enterprise. Specialists in fighting, leading their own troops, worked for governments more or less as they chose, either in return for money or to pursue political aims of their own. This was especially common in central Europe, but even in France great noblemen had strong private influence over the troops, and in times of disorder nobles led armed retainers about the country. Colonels were virtually on their own. Provided with a general commission and with funds by some government, they recruited, trained, and equipped their own regiments, and likewise fed and supplied them, often by preying upon bourgeois and peasants in the vicinity. In these circumstances it was often difficult to say on whose side soldiers were fighting. It was hard for governments to set armies into motion and equally hard to make them stop fighting, for commanders fought for their own interests and on their own momentum. War was not a “continuation of policy”; it was not an act of the state; it easily degenerated, as in the Thirty Years’ War, into a kind of aimless and perpetual violence.

---

*War: a state activity*

Louis XIV made war an activity of state. He saw to it that all armed persons in France fought only for him. This produced peace and order in France, while strengthening the fighting power of France against other states. Under the older conditions there was also little integration among different units and arms of the army. Infantry regiments and cavalry went largely their own way, and the artillery was supplied by civilian technicians under contract. Louis XIV created a stronger unity of control, put the artillery organically into the army, systematized the military ranks and grades, and clarified the chain of command, placing himself at the top. The government supervised recruiting, required colonels to prove that they were maintaining the proper number of soldiers, and assumed most of the responsibility for equipping, provisioning, clothing, and housing the troops. Higher officers, thus becoming dependent on the government, could be subjected to discipline. The soldiers were put into uniforms, taught to march in step, and housed in barracks; thus they too became more susceptible to discipline and control.

**LOUIS XIV**

by Hyacinthe Rigaud  
(French, 1659–1743)

**The grandeur of the Sun King is conveyed in this portrait by Rigaud. He uses the king's clothing, stance, and royal emblems to express the power of the French monarchy.**

(Giraudon/Art Resource, NY)

Armed forces became less of a terror to their own people and a more effective weapon in the hands of government. They were employed usually against other governments but sometimes to suppress rebellion at home. Louis XIV also increased the French army in size, raising it from about 100,000 to about 400,000. These changes, both in size and in degree of government control, were made possible by the growth of a large civilian administration, the heads of which under Louis XIV were civilians. They were in effect the first ministers of war, and their assistants, officials, inspectors, and clerks constituted the first organized war ministry.

Louis XIV was not only a vain man, but made it a political principle to overawe the country with his own grandeur. He built himself a whole new city at the old village of Versailles about ten miles from Paris. Where the Escorial in Spain had the atmosphere of a monastery, Versailles was a monument to worldly splendor. Tremendous in size, fitted out with polished mirrors, gleaming chandeliers, and magnificent tapestries, opening on to a formal park with fountains and shaded walks, the palace of Versailles became the marvel of Europe and the envy of lesser kings. It was virtually a public building, much of it used for gov-

ernment offices, with nobles, churchmen, notable bourgeois, and servants milling about on the king's affairs. The more exclusive honors of the château were reserved for the higher aristocrats. The king surrounded his daily routine of rising, eating, and going to bed (known as the *lever*, *dîner*, and *coucher*) with an infinite series of ceremonial acts, so minute and so formalized that there were, for example, six different entries of persons at the *lever*, and a certain gentleman at a specified moment held the right sleeve of the king's nightshirt as he took it off. The most exalted persons thought themselves the greater for thus waiting on so august a being. With such honors, and by more material favors, many great lords were induced to live habitually at court. Here, under the royal eye, they might

---

*The splendor of  
Versailles*

engage in palace intrigue but were kept away from real political mischief. Versailles had a debilitating effect on the French aristocracy.

For most positions in the government, as distinguished from his personal entourage, Louis XIV preferred to use men whose upper-class status was recent. Such men, unlike hereditary nobles, could aspire to no independent political influence of their own. He never called the Estates General, which in any case no one except some of the nobility wanted. Some of the Provincial Estates, because of local and aristocratic pressures, he allowed to remain functioning. He temporarily destroyed the independence of the parlements, commanding them to accept his orders, as Henry IV had commanded them to accept the Edict of Nantes. He developed a strong system of administrative coordination, centering in a number of councils of state, which he attended in person, and in “intendants” who represented these councils throughout the country. Councilors of state and intendants were generally of bourgeois origin or newly ennobled. Each intendant, within his district, embodied all aspects of the royal government—supervising the flow of taxes and recruiting of soldiers, keeping an eye on the local nobility, dealing with towns and guilds, controlling the more or less hereditary officeholders, policing the marketplaces, relieving famine, watching and often participating in the local law courts. A firm and uniform administration was superimposed upon the heterogeneous mass of the old France. In contrast to England, many local questions were handled by agents of the central government, usually honest and often efficient, but essentially bureaucrats constantly instructed by, and referring back to, their superiors at Versailles.

of Louis XIV*

### *Economic and Financial Policies: Colbert*

To support the reorganized and enlarged army, the panoply of Versailles, and the growing civil administration, the king needed a good deal of money. Finance was always the weak spot in the French monarchy. Methods of collecting taxes were costly and inefficient. Direct taxes passed through the hands of many intermediate officials; indirect taxes were collected by private concessionaries called tax farmers, who made a substantial profit. The state always received far less than what the taxpayers actually paid. But the main weakness arose from an old bargain between the French crown and nobility; the king might raise taxes without consent only if he refrained from taxing the nobles. Only the “unprivileged” classes paid direct taxes, and these came almost to mean the peasants only, since many bourgeois in one way or another obtained exemptions. The system was outrageously unjust in throwing a heavy tax burden on the poor and helpless. Louis XIV was willing enough to tax the nobles but was unwilling to fall under their control, and only toward the close of his reign, under extreme stress of war, was he able, for the first time in French history, to impose direct taxes on the aristocratic elements of the population. This was a step toward equality before the law and toward sound public finance, but so many concessions and exemptions were won by nobles and bourgeois that the reform lost much of its value.

---

*Taxation*

Like his predecessors, Louis resorted to all manner of expedients to increase his revenues. He raised the tax rates, always with disappointing results. He devalued the currency. He sold patents of nobility to ambitious bourgeois. He sold government offices, judgeships, and commissions in the army and navy. For both financial and political reasons the king used his sovereign authority to annul the town charters, then sold back reduced rights at a price; this produced a little income but demoralized local government and civic spirit. The need for money arose from the fundamental inability to tax the wealthy. This problem reflected the weakness and limitations of absolutism because the government's

refusal to share its rule with the propertied classes corrupted much of French public life and undermined the political aptitude of the French people.

Louis XIV wished, if only for his own purposes, to make France economically powerful. His great minister Colbert worked for 20 years to do so. Colbert went beyond Richelieu in the application of mercantilism, aiming to make France a self-sufficing economic unit, to expand the export of French goods, and to increase the wealth from which government income was drawn. There was not much that he could do for agriculture, the principal industry of the kingdom, which remained less developed than in England and the Netherlands. But he managed to reduce internal tariffs in a large part of central France, where he set up a tariff union oddly entitled the Five Great Farms (since the remaining tolls were collected by tax farmers); and although vested interests and provincial liberties remained too strong for him to do away with all internal tariffs, the area of the Five Great Farms was in itself one of the largest free-trade areas in Europe, being about the size of England.

---

---

*The Five Great Farms*

For the convenience of business Colbert promulgated a Commercial Code, replacing much of the local customary law with a new model of business practice and regulation. He improved communications by building roads and canals. Working through the guilds, he required the handicraft manufacturers to produce goods of specified kind and quality, believing that foreigners, if assured of quality by the government, would purchase French products. He gave subsidies, tax exemptions, and monopolies to expand the manufacture of silks, tapestries, glassware, and woolens. He helped to found colonies, built up the navy, and established the French East India Company. Export of some goods, notably foodstuffs, was forbidden, for the government wished to keep the populace quiet by holding down the price of bread. Export of other goods, mainly manufactures, was encouraged, partly as a means of bringing money into the country, where it could be funneled into the royal treasury. The growth of the army, and the fact that under Louis XIV the government clothed and equipped the soldiers and hence placed unprecedentedly large orders for uniforms, overcoats, weapons, and ammunition, greatly stimulated the employment of weavers, tailors, and gunsmiths and advanced the commercial capitalism by which such labors were organized. Trade and manufacture thus developed in France under more direct government guidance than in England. They long gave the English an extremely brisk competition. Not until the age of iron and coal did France begin economically to lag.

---

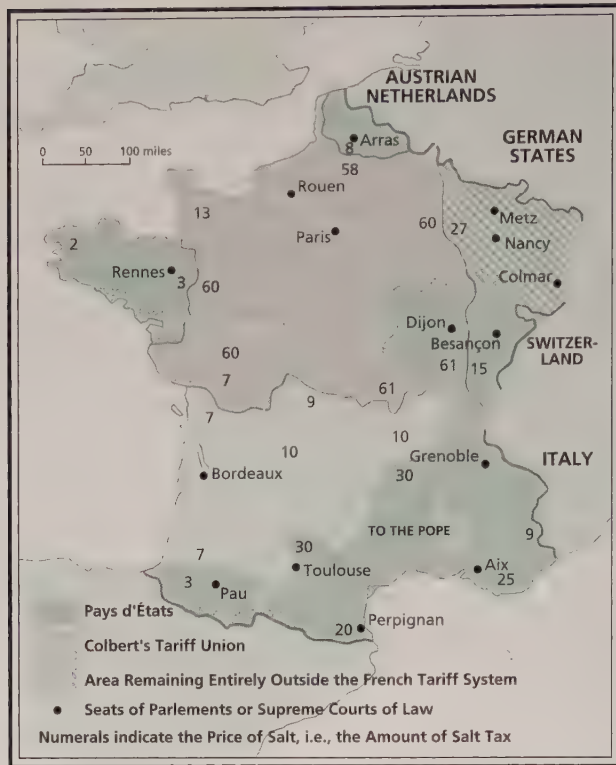

---

*Colbert's Commercial Code*

In general, the system elaborated in the two centuries of Bourbon rule, known in retrospect as the Old Regime, was a society in which groups of many kinds could identify their own special interests with those of the “absolute” monarchy. But it rested on a precarious inconsistency. On the one hand, the royal government, through its intendants and bureaucracy, worked to restrict the privileges of provinces, nobles, and others. On the other hand, it multiplied and protected these and other privileges in its perpetual need for money. The inconsistency was not resolved until the Revolution of 1789, when the principle of equality of rights replaced the regime of privilege.

Thirty thousand workers were employed at one time in the building of the great royal château at Versailles. The seventeenth-century painting (upper) illustrates the complex labor and planning that were required during the process of construction; the lower painting dates from the early eighteenth century, and it shows the activity that surrounded Versailles when the king, government ministers, and nobles were assembled in the vast buildings and gardens. The grandeur and scale of these buildings were designed to symbolize the king's power and to create a sense of awe in the foreign visitors who came to meet Louis XIV or his advisers.

### FRANCE FROM THE LAST YEARS OF LOUIS XIV TO THE REVOLUTION OF 1789

The map gives an idea of the diversity of law and administration before the Revolution. Dark areas are “pays d'états,” provinces in which representative bodies (“estates”) continued to meet. Cities named are the seats of what the French called parlements (see p. 172). The key indicates Colbert's tariff union, the Five Great Farms. The area marked with hatching remained outside the French tariff system entirely; it continued to trade with the states of the Holy Roman Empire (from which it had been annexed) without interference by the French government. Numerals indicate the price of salt, i.e., the varying burden of the salt tax, in various regions. In general, it will be seen that regions farthest from Paris enjoyed the most “privileges” or “liberties,” preserving their legal and judicial identity, Provincial Estates, local tariffs, and a favored position in national taxation.

#### *Religion: The Revocation of the Edict of Nantes, 1685*

The consolidation of France under Louis XIV reached its high point in his policies toward religion. For the Catholics, Louis backed the old claims of the Gallican church to enjoy a certain national independence from Rome. He repressed the movement known as Jansenism, a kind of Calvinism within the Catholic church, which persisted for almost two centuries. Jansenists criticized moral laxity in high places as well as the religious influence of the Jesuits, so there was wide support at Versailles when the king moved against all the main centers of Jansenist theology. But it was the Protestants who suffered most in a new wave of religious persecutions.

France, in the early years of Louis XIV's reign, still allowed more religious toleration than any other large state in Europe. The Huguenots had lost their separate political status

under Richelieu, but they continued to live in relative security, protected by the Edict of Nantes of 1598. From the beginning, however, toleration had been a royal rather than a popular policy, and under Louis XIV the royal policy changed. The fate of Catholics at the hands of a triumphant Parliament in England suggests that the Protestants in France would have been no better off under more popular institutions.

Bending all else to his will, Louis XIV resented the presence of heretics among his subjects. He considered religious unity necessary to the strength and dignity of his rule. He fell under the influence of certain Catholic advisers, who, not content with the attrition by which some Protestants were turning back to Catholicism in any case, wished to hasten the process to the greater glory of themselves. Systematic conversion of Huguenots was begun. Life for Protestant families was gradually made unbearable. Finally they were literally “dragooned,” mounted infantrymen being quartered in Huguenot homes to reinforce the persuasions of missionaries. In 1685 Louis revoked the Edict of Nantes. During the persecutions hundreds of thousands of Protestants left France, migrating to Holland, Germany, and America. Their loss was a severe blow to French economic life, for although Protestants were found in all levels of French society, those of the commercial and industrial classes were the most mobile. With the revocation of the Edict of Nantes France embarked on a century of official intolerance (slowly mitigated in practice), under which Protestants in France were in much the same position as Catholics in the British Isles. The fact that 100 years later, when Protestants were again tolerated, many of them were found to be both commercially prosperous and politically loyal indicates that they fared far better than the Catholic Irish.

---

*Louis XIV seeks  
religious unity*

All things considered, the reign of Louis XIV brought considerable advantages to the French middle and lower classes. His most bitter critics, with the natural exception of Protestants, were disgruntled nobles such as the duke of Saint-Simon, who thought that he showed too many favors to persons of inferior social rank. Since Protestants were an unpopular minority, his repression of them won much approval. Colbert’s system of economic regulation, and perpetuation of the guilds, meant that innovation and private enterprise developed less fully than in England, but France was economically stronger in 1700 than in 1650. Peasants were heavily taxed to pay for Louis XIV’s wars, and they suffered through devastating famines after 1690 (also caused partly by the wars). But they did not sink into the serfdom that was rising in eastern Europe. Compared to later times, France was still a hodgepodge of competing jurisdictions, special privilege, and bureaucratic ineptitude. The king was in truth far from “absolute” but France was nevertheless the best organized of the large monarchies on the Continent. Louis XIV, in turning both high and low into dutiful subjects, ended civil war and even advanced the cause of civil equality. For a long time he was generally popular. What finally turned his people against him in his last years was the strain of his incessant wars.

Louis XIV*

## 22. THE WARS OF LOUIS XIV: THE PEACE OF UTRECHT, 1713

*Before 1700*

From the outset of his reign Louis pursued a vigorous foreign policy. The quarrel between the house of France and the house of Habsburg had gone on for more than a century. When

Louis XIV assumed his personal rule in 1661, Spanish territories still faced France on three sides (northeast, east, and south), but so weakened was Spain that this fact was no longer a menace to France so much as a temptation to French expansion. Louis XIV could count on popular support in France, for the dream of a frontier on the Rhine and the Alps was captivating to Frenchmen. He struck first in 1667 by sending a large army into the Spanish Netherlands. He was blocked, as noted earlier, by the Triple Alliance of the Dutch, the English, and the Swedes. With strength renewed by reforms at home, and in alliance now with Charles II of England, he struck again in 1672 (the “Dutch War”), invading the Dutch provinces on the lower Rhine, and this time raising up against him his great adversary and inveterate enemy, the prince of Orange. William III, bringing the Austrian and Spanish Habsburgs, Brandenburg, and Denmark into alliance with the Dutch Republic, forced Louis to sign the treaty of Nimwegen in 1678. The French gave up their ambitions against Holland but took from Spain the rich province of Franche-Comté, which outflanked Alsace on the south and brought French power to the borders of Switzerland (see map, p. 147).

---

*French incursions into  
the Holy Roman  
Empire*

In the very next year, Louis further infiltrated the dissolving frontier of the Holy Roman Empire, this time in Lorraine and Alsace. By the Peace of Westphalia the French king had rights in this region, but the terms of that treaty were so ambiguous, and the local feudal law so confusing, that claims could be made in contrary directions. French troops thereupon moved in. In 1681 French troops occupied the city of Strasbourg, which, as a free city of the Holy Roman Empire, regarded itself as an independent little republic. A protest went up throughout Germany against this undeclared invasion. But Germany was not a political unity. Since 1648 each German state conducted its own foreign policy, and at this very moment, in 1681, Louis XIV had an ally in the Elector of Brandenburg (forerunner of the kings of Prussia). The diet of the Holy Roman Empire was divided between an anti-French and a pro-French party. The emperor, Leopold I, was distracted by developments in the East. The Hungarians, incited and financed by Louis XIV, were again rebelling against the Habsburgs. They appealed to the Turks, and the Turks in 1683 moved up the Danube and besieged Vienna. Louis XIV, if he did not on this occasion positively assist the Turks, ostentatiously declined to join the proposed crusade against them.

The emperor, with Polish assistance, succeeded in getting the Turkish army out of Austria. Returning to western problems and observing the western border of the Empire crumbling, Franche-Comté already lost, the Spanish Netherlands threatened, and Lorraine and Alsace absorbed bit by bit, the Emperor Leopold gathered the Catholic powers into a combination against the French. The Protestant states at the same time, aroused by the French revocation of the Edict of Nantes in 1685 and by Huguenot émigrés who called down the wrath of God on the perfidious Sun King, began to ally the more readily with William of Orange. Catholic and Protestant enemies of Louis XIV came together in 1686 in the League of Augsburg, which comprised the Holy Roman Emperor, the kings of Spain and of Sweden, the electors of Bavaria, Saxony, and the Palatinate, and the Dutch Republic. In 1686 the king of England was still a protégé of France, but three years later, when William became king in England, that country too joined the League.

---

*The War of the  
League of Augsburg*

The War of the League of Augsburg broke out in 1688. The French armies won battles but could not drive so many enemies from the field. The French navy could not overpower the combined fleets of the Dutch and English. Louis XIV found himself badly strained (it was at this time that he first imposed

direct taxes on the French nobles) and finally made peace at Ryswick in the Netherlands in 1697, leaving matters about where they had been when the war began.

In all the warring and negotiating the question had not been merely the fate of this or that piece of territory, nor even the French thrust to the east, but the eventual disposition of the whole empire of Spain. The Spanish king, Charles II, prematurely senile, momentarily expected to die, yet lived on year after year. He was still alive at the time of the Peace of Ryswick. The greatest diplomatic issue of the day was still unsettled.

### *The War of the Spanish Succession*

The War of the Spanish Succession lasted 11 years, from 1702 to 1713. It was less destructive than the Thirty Years' War, for armies were now supplied in more orderly fashion, subject to more orderly discipline and command, and could be stopped from fighting at the will of their governments. Except for the effects of civil war in Spain and of deadly famines in France, the civilian populations were generally spared from violence and destruction. In this respect the war foreshadowed the typical warfare of the eighteenth century, fought by professional armies rather than by whole peoples. Among wars of the largest scale, the War of the Spanish Succession was the first in which religion counted for little, the first in which commerce and sea power were the principal stakes, and the first in which English money was liberally used in Continental politics. It was also the first that can be called a "world war," because it involved the overseas world together with the leading powers of Europe. Wars within Europe were becoming linked to the global competition for colonies and trade.

The struggle had long been foreseen. The two main aspirants to the Spanish inheritance were the king of France and the Holy Roman Emperor. Each had married a sister of the perpetually moribund Charles II, and each could hope to place a younger member of his family on the throne of Spain. During the last decades of the seventeenth century the powers had made various treaties agreeing to "partition" the Spanish possessions. The idea was, by dividing the Spanish heritage between the two claimants, to preserve the balance of power in Europe. But when Charles II finally died in 1700, it was found that he had made a will, which stipulated that the empire of Spain should be kept intact, that all Spanish territories throughout the world should go to the grandson of Louis XIV, and that if Louis XIV refused to accept in the name of his 17-year-old grandson, the entire inheritance should pass to the son of the Habsburg emperor in Vienna. Louis XIV decided to accept. With Bourbons reigning in Versailles and Madrid, even if the two thrones were never united, French influence would run from Belgium to the Straits of Gibraltar, and from Milan to Mexico and Manila. At Versailles the word went out: "The Pyrenees exist no longer."

Never, at least in almost two centuries, had the political balance within Europe been so threatened. Never had the other states faced such a prospect of relegation to the sidelines. William III acted at once; he gathered the stunned or hesitant diplomats into the last of his coalitions, the Grand Alliance of 1701. He died the next year, before hostilities began, and with Louis XIV at the seeming apex of his grandeur, but he had in fact launched the engine that was to crush the Sun King. The Grand Alliance included England, Holland, and the Austrian emperor, supported by Brandenburg and eventually by Portugal and the Italian duchy of Savoy. Louis XIV could count on Spain, which was generally loyal to the late king's will. Otherwise his only ally was Bavaria, whose rivalry with Austria made it a habitual satellite of France. The Bavarian alliance gave the French armies an advanced position toward Vienna and

---

*"The Pyrenees exist  
no longer"*

---

---

*Threats to political  
balance*

---

maintained that internal division within Germany which was fundamental to the politics of the time, and of a long time to come.

The war was long, mainly because each side no sooner gained a temporary advantage than it raised its demands on the other. The English, though they sent relatively few troops to the Continent, produced in John Churchill, Duke of Marlborough, a preeminent military commander for the Allied forces. The Austrians were led by Prince Eugene of Savoy. The Allies won notable battles at Blenheim in Bavaria (1704), and at Ramillies (1706), Oudenarde (1708), and Malplaquet (1709) in the Spanish Netherlands. The French were routed; Louis XIV asked for peace but would not agree to it because the Allied terms were so enormous. Louis fought to hold the two crowns, to conquer Belgium, to get French merchants into Spanish America, and at the worst in self-defense. After minor successes in 1710 he again insisted on controlling the crown of Spain. The Spanish fought to uphold the will of the deceased king, the unity of the Spanish possessions, and even the integrity of Spain itself—for the English moved in at Gibraltar and made a menacing treaty with Portugal. Meanwhile, the Austrians landed at Barcelona and invaded Catalonia, which (as in 1640) again rose in rebellion, recognizing the Austrian claimant, so that all Spain fell into civil war.<sup>4</sup>

---

*Motives of the  
warring states*

The Austrians fought to keep Spain in the Habsburg family, to crush Bavaria, and to carry Austrian influence across the Alps into Italy. The Dutch fought as always for their security, to keep the French out of Belgium, and to control access to the river Scheldt. The English fought for these same reasons and also to keep the French-supported Catholic Stuarts out of England and preserve the Revolution of 1688. It was to be expected that the Stuarts, if they returned, would ruin the Bank of England and repudiate the national debt. Both maritime powers, England and Holland, fought to keep French merchants out of Spanish America and to advance their own commercial position in America and the Mediterranean. These being the war aims, the Whigs were the implacable war party in England, the vaguely pro-Stuart and anticommercial Tories being quite willing to make peace at an early date. As for the minor allies, Brandenburg and Savoy, their rulers had simply entered the alliance to gain such advantages as might turn up.

### *The Peace of Utrecht*

---

*The partition of  
Spain's holdings*

Peace was finally made at the treaties of Utrecht and Rastadt of 1713 and 1714. The treaty of Utrecht, with its allied instruments, in fact partitioned the world of Spain. But it did not divide it between the two legal claimants only. The British remained at Gibraltar, to the great irritation of the Spaniards, and likewise annexed the island of Minorca. The Duke of Savoy eventually gained the former Spanish island of Sardinia in return for his contribution to the Allied cause. The rest of the Spanish Mediterranean holdings—Milan, Naples, and Sicily—passed to the Austrian Habsburgs, as did the Spanish Netherlands (or Belgium), subsequently referred to as the Austrian Netherlands. In Spain itself, shorn of its European possessions but retaining America, the grandson of Louis XIV was confirmed as king (Philip V of Spain), on the understanding that the French and Spanish thrones should never be inherited by the same person. The Bourbons reigned in Spain, with interruptions, from Philip V to the republican revolution of 1931. French influence was strong in the eighteenth century, for a good many French courtiers, advisers, administrators, and businessmen crossed the Pyrenees with Philip V. They helped somewhat to revive the Spanish

The battle of Blenheim, fought in Bavaria in 1704, was a great victory for the English and the Allied forces that joined to oppose the French in the War of the Spanish Succession. Blenheim brought fame and honors to the British commander, John Churchill, Duke of Marlborough; for the French, it was the first in a series of devastating military defeats that steadily weakened the power of Louis XIV.

(Fotomas Index/Bridgeman Art Library)

monarchy by applying the methods of Louis XIV, and they passed a swelling volume of French manufactures through Seville into Spanish America.

The old objective of William III, to prevent domination by France, was realized at last. The war itself was the main cause of French loss of strength. It produced poverty, misery, and depopulation, and it exposed Louis XIV to severe criticism at home. Recurring famines and tax increases provoked peasant uprisings, which were brutally repressed. Dissatisfaction with the war led also to a revival of aristocratic and parliamentary opposition. By the peace treaties the French abandoned, for the time being, their efforts to conquer Belgium. They ceased to recognize the Stuart pretender as king of Great Britain. They surrendered to the British two of their colonies, Newfoundland and Nova Scotia (called Acadia), and recognized British sovereignty in the disputed American Northwest, known as the Hudson Bay territory. But the French were only checked, not downed. They retained the conquests of Louis XIV in

war for France*

#### PEASANT FAMILY IN A ROOM

by Louis Le Nain (French, 1593–1648)

Although Le Nain portrayed a family in the early half of the seventeenth century, the people in this painting do not differ much from the peasants who later suffered through wars, famines, and tax increases in the last decades of the long reign of Louis XIV.

(Erich Lessing/Art Resource, NY)

Alsace and the Franche-Comté. Their influence was strong in Spain. Their deeper strength and capacity for recovery were soon evident in renewed economic expansion. Their language and civilization continued to spread throughout Europe.

The Dutch received guarantees of their security. They were granted the right to garrison the “Dutch Barrier,” a string of forts in Belgium on the side toward France. But the Dutch, strained by the war and outdistanced by England, never again played a primary role in European political affairs. Two other small states ascended over the diplomatic horizon, Savoy (or Piedmont) and Brandenburg. The rulers of both, for having sided with the victors, were recognized as “kings” by the treaty of Utrecht. Savoy came to be known as “Sardinia,” and Brandenburg as “Prussia.” More is said of Prussia in the next chapter.

---

*Britain becomes a great power*

The greatest winners were the British. Great Britain made its appearance as a great power. Union of England and Scotland had taken place during the war. Based at Gibraltar and Minorca, Britain was now a power in the Mediterranean. Belgium, the “pistol pointed at the heart of England,” was in the innocuous hands of the Austrians. The British added to their American holdings, but far more valuable than Newfoundland and Nova Scotia was the *asiento* extorted from Spain. The *asiento* granted the lucrative privilege (which the French had sought) of providing Spanish America with African slaves. Much of the wealth of Bristol and Liverpool

### THE ATLANTIC WORLD AFTER THE PEACE OF UTRECHT, 1713

The map shows the partitioning of the Spanish empire and the rise of the British. Spain and its American possessions went to the Bourbon Philip V; the European possessions of Spain—the Netherlands, Milan, Naples and Sicily—went to the Austrian Habsburgs. Britain meanwhile was strengthened by the union of England and Scotland, the acquisition of Minorca, Gibraltar, and the commercial privilege of the “asiento” from Spain, and of Newfoundland and Nova Scotia from France.

in the following decades was to be built upon the slave trade. The *asiento*, by permitting one shipload of British goods to be brought each year to Porto Bello in Panama, also provided opportunities for illicit trade in nonhuman cargoes.

The Spanish empire was pried open, and British merchants entered on an era of wholesale smuggling into Spanish America, competing strenuously with the French, who because of their favored position in Spain were usually able to go through more legal channels. Moreover, the British, by defeating France, assured themselves of a line of Protestant kings and of the maintenance of constitutional and parliamentary government. The ratification of the Peace of Utrecht actually marked a further step in the evolution of English constitutional history. The Whigs, who were the main supporters of the war with France, thought the treaty insufficiently favorable to England. The Tories, pledged to peace, had won the House of Commons in 1710, but the Whigs continued to control the House of Lords. Queen Anne, at the request of Tory leaders and in the interests of peace, raised 12 Tory commoners to the peerage in order to create a Tory majority in the Lords and hence to obtain ratification of the treaty. This established itself as a precedent; it became an unwritten article of the British constitution that when the Lords blocked the Commons on an important issue, the monarch could create enough new lords to make a new majority in that House. After 1713, the Lords never again allowed themselves to be swamped by newcomers and thus acceded in all future disputes to the will of the Commons. The landed aristocracy and their merchant allies could now govern as they saw fit. The result was a rapid increase of wealth in England, precipitating within a few generations a veritable Industrial Revolution.

---

Confirmation of the  
European system

Except for the addition of England, the same powers were parties to the treaty of Utrecht in 1713 as to the Peace of Westphalia in 1648, and they now confirmed the system of international relations established by Westphalia. The powers accepted each other as members of the European system; recognized each other as sovereign states connected only by free negotiation, war, and treaty; and adjusted their differences through rather facile exchanges of territory, made in the interests of a balance of power, and without regard to the nationality or presumed wishes of the peoples affected. With Germany still in its “feudal chaos,” Italy divided into minor states or controlled by foreign kings, and Spain subordinated to France, the treaty of Utrecht left France and Great Britain as the two most vigorous imperial powers of Europe. These countries soon became the two principal carriers and exporters of the European civilization that would spread its institutions and ideas throughout the modern world. In the next chapter we look at how the societies of central and eastern Europe, developed along lines of their own, even when they were strongly influenced by the growing power and wealth of the western European states.

# Chapter 5

## THE TRANSFORMATION OF EASTERN EUROPE, 1648–1740

- 23. Three Aging Empires
- 24. The Formation of an Austrian Monarchy
- 25. The Formation of Prussia
- 26. The “Westernizing” of Russia

*In Eastern Europe*, in the century after the Peace of Westphalia of 1648, it became apparent that political systems that failed to become more “modern” might be in danger of going out of existence. In the mid-seventeenth century most parts of Eastern Europe belonged to one or another of three old-fashioned political organizations—the Holy Roman Empire, the Republic of Poland, and the empire of the Ottoman Turks (see maps, pp. 193, 194). All three were loose, decentralized, and increasingly ineffective. They were superseded by

three new and stronger powers—Prussia, Austria, and Russia. These three, by overrunning the intermediate ground of Poland, came to adjoin one another and cover all Eastern Europe except the Balkans. It was in this same period that Russia expanded territorially, adopted some of the technical and administrative apparatus of western Europe, and became an active participant in European affairs.

East and West are of course relative terms. For the Russians Germany and even Poland were “western.” But for Europe as a whole a significant though indefinite social and economic line ran along the Elbe and the Bohemian Mountains to the head of the Adriatic Sea. East of this line towns were fewer than in the West, human labor was less productive, and the middle classes were less strong. Above all, the peasants were governed by their landlords. From the sixteenth to the eighteenth century, in eastern Europe in contrast to what happened in the West, the peasant mass increasingly lost its freedom. The commercial revolution and widening of the market created a strong merchant class in western Europe and tended to turn working people into a legally free and mobile labor force. In eastern Europe these changes strengthened the great landlords who produced for export and who secured their labor force by the institutions of serfdom and “hereditary subjection.” The main social unit was the agricultural estate, which the lord exploited with uncompensated compulsory labor (or *robot*) furnished by his people, who could neither migrate, marry, nor learn a trade except as he permitted, and who, until the eighteenth

Chapter emblem: Russian workers building the new city of St. Petersburg during the reign of Tsar Peter I (1689–1725). (Tass/Sovfoto)

century, had no legal protector or court of appeal other than himself. In the East, therefore, the landlords were exceedingly powerful. They were the only significant political class. And the three new states that grew up—Prussia, Austria, Russia—were alike in being landlord states.

## 23. THREE AGING EMPIRES

In 1648 the whole mainland of Europe from the French border almost to Moscow was occupied by the three large and loosely built structures that have been mentioned—the Holy Roman Empire, the Republic of Poland, and the empire of the Ottoman Turks. The Turkish power reached to about 50 miles from Vienna, and it extended over what is now Romania and over the Tartars on the north shore of the Black Sea. Even so, its European holdings were but a projection from the main mass of the Ottoman Empire in Asia and Africa. Poland extended from roughly 100 miles east of Berlin to a hundred miles west of Moscow and virtually from “sea to sea” in the old phrase of its patriots, from the Baltic around Riga almost to the Black Sea coast. The Holy Roman Empire extended from Poland and Hungary to the North Sea.

These three empires were by no means alike. The Holy Roman Empire bore some of the oldest traditions of Christendom. Poland too had old connections with western Europe and Christian religious institutions. Turkey was a Muslim power, closely connected to the

Islamic civilization of the Middle East and filled with peoples who generally lived outside European cultural traditions (despite a long history of Mediterranean trade and commerce). Yet in some ways the three resembled each other. In all of them central authority had become weak, consisting largely of understandings between a nominal head and outlying dignitaries

or potentates. All lacked efficient systems of administration and government. All were being made obsolete by newer centralizing states of which France was the leading example. All, but especially Poland and Turkey, were made up of diverse ethnic or language groups. The whole immense area was therefore politically weak. It was malleable in the hands of kings or ruling elites who might become a little stronger than their neighbors. We must try to see in what this weakness consisted, and how newer, stronger state forms were created.

---

*Weaknesses of the  
empires*

### *The Holy Roman Empire after 1648*

With the Holy Roman Empire the reader is already familiar. It was an empire, especially after the Peace of Westphalia, with next to no army, revenues, or working organs of a central government. Voltaire called it neither holy, Roman, nor an empire. Created in the Middle Ages, it was Roman in that it was believed to continue the imperial sway of the Rome of antiquity, and it was holy in being the secular counterpart to the spiritual empire of the pope. It had been ruined by the Reformation, which left the Germans divided almost evenly between Protestant and Catholic, with each side thereafter demanding special safeguards against the other. The Empire continued, however, to be universal in principle, having no relation to nationality and theoretically being a form of government suitable to all peoples, although it had never lived up to this theoretical claim and had shown no expansionist tendency since the Middle Ages. In actuality, the Empire was roughly coterminous with the German states and the region of the German language, except that it excluded

after 1648 the Dutch and Swiss, who no longer considered themselves German; and it likewise excluded those Germans who since the fourteenth century had settled along the eastern shores of the Baltic.

Large parts of the Empire had suffered repeatedly from the Thirty Years' War. Yet the war, and the peace terms that followed it, only accentuated a situation that had long been unfavorable. Postwar revival was difficult; the breakup of commercial connections and the wartime losses of savings and capital were hard to overcome. Germany fell increasingly out of step with the economic expansion and cultural changes in western Europe. The burgher class, its ambitions blocked, lost much of its old vitality. No overseas colonies could be founded, for want of strong enough government backing, as was shown when a colonial venture of Brandenburg came to nothing. There was no stock exchange in Germany until one was established at Vienna in 1771, half a century after those of London, Paris, and Amsterdam. Laws, tariffs, tolls, and coinage were more diverse than in France. Even the calendar varied. It varied, indeed, throughout Europe as a whole, since Protestant states long declined to accept the corrected calendar issued by Pope Gregory XIII in 1582; in parts of divided Germany the holidays, the date of the month, and the day of the week changed every few miles. The arts and letters, flourishing in western Europe as never before, were at a low ebb in Germany in the seventeenth century. In science the Germans during and after the Thirty Years' War accomplished less than the English, Dutch, French, or Italians, despite the great mathematician and philosopher Leibniz, one of the great minds of the age. Only in music, as in the work of the Bach family, did the Germans at this time excel. But music was not then much heard beyond the place of its origin. Germany for the rest of the world was a byway in the higher civilization of Europe.

---

---

*Effects of the Thirty  
Years' War*

After the Thirty Years' War each German state had sovereign rights. These "states" numbered some 300 or 2,000, depending on how they were counted. The higher figure included the "knights of the Empire," found in south Germany and the Rhineland. They were persons who acknowledged no overlordship except that of the emperor himself. The knights had tiny estates of their own, averaging not over 100 acres apiece, consisting of a castle and a manor or two, enclosed by the territory of a larger state but not forming a part of it. But even without the knights there were about 300 states capable of some independence of action—free cities, abbots without subjects, archbishops and bishops ruling with temporal power, landgraves, margraves and dukes, and one king, the king of Bohemia.

All these states were intent on preserving what were called the "Germanic liberties." They were gladly assisted by outside powers, notably but not exclusively France. The Germanic liberties meant freedom of the member states from control by emperor or Empire. The rulers of the most important states within the empire elected the emperor (there were nine electors by the end of the seventeenth century), and they always required the successful candidate to accept certain "capitulations," in which he promised to safeguard all the privileges and immunities of the states. The Habsburgs, though consistently elected after 1438, had none of the advantages of hereditary rulers, each having to bargain away in turn any gains made by his predecessor. The elective principle meant that imperial power could not be accumulated and transmitted from one generation to the next. It opened the doors to foreign intrigue, since the electors were willing to consider whichever candidate would promise them most. The French repeatedly supported a rival candidate to the Habsburgs. After 1648 they had supporters in the electoral college, Bavaria and Cologne being the most consistently pro-French. In 1742

---

---

*The "Germanic  
liberties"*

the French obtained the elevation of their Bavarian ally to the imperial throne. The office of emperor became a political football for Germans and non-Germans.

Nor would the German states, after the Thirty Years' War, allow any authority to the imperial diet. The diet possessed the power to raise troops and taxes for the whole Empire, but the power remained unused because the various states feared that any such action would diminish their own authority and independence. Meanwhile, the states which insisted with such obstinacy on their liberties from the Empire gave few liberties to their subjects. The free cities were closed oligarchies, as indeed were most cities in other countries, but in Germany the burgher oligarchs of the free cities were virtually sovereign also. Most of the other states, large or small, developed in the direction of absolutism. Absolutism was checked for Germany as a whole, only to reappear in miniature in hundreds of different places. Each ruler thought himself a little Louis XIV, each court a small Versailles. Subjects became attached by ties of sentiment to their rulers, who almost always lived in the neighborhood and could be readily seen by passers-by. People liked the little courts, the little armies, the gossipy politics, and the familiar officials of their tiny states; and despite all its flaws, the Empire had the merit of holding this conglomeration of states in a lawful relation to one another. It was a kind of miniature league of nations. For a century and a half after the Peace of Westphalia small states existed alongside larger ones, or often totally enclosed within them, without serious fear for their security and without losing their independence.

Yet there were many ambitious rulers in Germany after the Peace of Westphalia. They had won recognition of their sovereignty in 1648. They were busily building absolutist monarchies. They aspired also to extend their dominions and cut a greater figure in the world. There were other ways of doing this than by devouring their smaller neighbors outright. One was by marriage and inheritance. The Empire in this respect was a paradise for fortune hunters; the variety of possible marriages was enormous because of the great number of ruling families. Another outlet for ambition lay in the high politics of the Empire. The Wittelsbach family, which ruled in Bavaria, managed to win an electorate in the Thirty Years' War; they consistently placed members of the family as archbishop of Cologne, and in ecclesiastical posts elsewhere in the Rhineland. With the interest thus built up, they were able to sell their influence to France, which in turn backed them against the Habsburgs. The Guelph family, ruling in Hanover, schemed for years to obtain an electorate, which they finally extorted from the emperor in 1692; in 1714 they inherited the throne of Great Britain with King George I, preferred by the British as Protestants to their Catholic Stuart cousins. The Hohenzollerns, electors of Brandenburg, inherited territories as far apart as the Rhine and the Vistula.

The half-century after the Peace of Westphalia was thus a highly critical period in central Europe. The situation in Germany was fluid. No one could tell which, if any, of the half-dozen chief German states would emerge in the lead. Nothing was crystallized; anything

#### CENTRAL AND EASTERN EUROPE, 1660–1795

This complex area is shown in simplified form on p. 194. The upper panel of the map indicates boundaries as of 1660; the lower panel those of 1795. Both panels show the border between the eastern and western agrarian zones, running from the mouth of the Elbe River into central Germany and down to Trieste. East of this line, from the sixteenth to the eighteenth centuries, the mass of people sank into a kind of serfdom in which they rendered forced labor to their lords on large farms. West of the line the peasants owed little or no forced labor and tilled small farms which they owned or rented. This line marks a somewhat imprecise but significant social boundary that would also have an important influence on the political and economic history of modern Europe.

### AGING EMPIRES AND NEW POWERS

The left panel shows the “three aging empires” which occupied much of central and eastern Europe in the seventeenth century. Though maintaining themselves with growing difficulty under modern conditions, the Polish Republic lasted until 1795, the Holy Roman Empire until 1806, the Ottoman Empire until 1923. Meanwhile, beginning in the seventeenth century, the political leadership in this area was assumed by three states of more modern type, organized around the institutions of monarchy, the standing army, and the professional bureaucracy or civil service—the reorganized Austrian Empire of the Habsburgs, the Hohenzollern kingdom of Prussia, and the Russian Empire of the Romanovs. These are shown in the right panel. All three figured prominently in the affairs of Europe for over 200 years; all perished in the First World War, 1914–1918.

#### *Austria and Prussia*

might happen. Two states definitely came forward after 1700, built by the skill and persistence of their rulers—Austria and Prussia. It is a curious and revealing fact that neither really had a name of its own. They were for a long time known most commonly as “houses”—the house of Austria or Habsburg and the house of Brandenburg or Hohenzollern. Each house put together a certain combination of territories. Each would have been as willing to possess any other combination had the course of events been different. By extension of meaning, one came to be called “Austria,” which for centuries had been simply an archduchy on the upper Danube. The other, “Prussia,” for centuries had meant only a certain stretch of the Baltic coast. To these two states we shall shortly turn.

#### *The Republic of Poland about 1650*

Running almost 1,000 miles eastward from the Holy Roman Empire in the middle of the seventeenth century lay the vast tract of the Republic of Poland, called a republic because its king was elected and because the political classes took pride in their constitutional liberties. Its vast size was one cause of its internal peculiarities. No administrative system could have kept up with the expansion of its frontiers, so that a large degree of freedom had always been left to outlying lords. In addition, the population was heterogeneous.

The Polish state was a far more recent and less substantial creation than the Holy Roman Empire. It was made up of two main parts, Poland proper (the Kingdom of Poland) in the west and the Grand Duchy of Lithuania in the east. They had been joined by a union of their crowns (see maps, pp. 193, 194). Only in the west was there a mass of Polish population. The Duchy of Prussia, a fief of the Polish crown, was peopled mainly by Germans. Further east a Byelorussian and Ukrainian peasantry was subject to a scattering of Polish and Lithuanian landlords. Even in Poland itself the town population was not generally Polish, being largely Germans and Jews. The latter spoke Yiddish, derived from German, and were very numerous because a king of Poland in the later Middle Ages had welcomed Jewish refugees fleeing from anti-Jewish violence in Germany. They lived in separate communities with their own law, language, and religion, forming large islands of Orthodox Jewish life in the Gentile ocean. The Germans too held aloof, resisting assimilation to their less-advanced surroundings. An unsurpassable barrier thus existed between town and country. There was no national middle class. The official and political language was Latin. Roman Catholicism was the leading religion.

---

Poland and  
Lithuania

Poland is interesting as the region in which the landed aristocracy won over all other groups in the country, neither allowing the consolidation of the state on absolutist lines, nor yet creating an effective constitutional or parliamentary government. The Polish aristocracy, or *szlachta*, made up some eight percent of the population, a far higher proportion than the aristocracy of any country of western Europe. On this ground the old Polish kingdom has sometimes been considered, especially by later Polish nationalists, as the possessor of an early form of democracy. The aristocracy were sticklers for their liberties, called the "Polish liberties," which resembled the German liberties in that they consisted largely of a fierce suspicion of central authority and were a perpetual invitation to foreign interference. As in the Holy Roman Empire, the monarchy was elective, and the king upon election had to accept certain contractual agreements, which, like the German "capitulations," prevented the accumulation of authority by the crown. The Poles were too politically divided to accept one of their own number as king, so from 1572 to the extinction of Poland over two centuries later there were only two native Polish kings who reigned for any length of time. One of these kings was the national hero John Sobieski, who led a decisive campaign against the Turks in the 1680s.

As in Germany, the central diet was ineffective and the centers of political action were local. The aristocracy met in 50 or 60 regional diets, turbulent assemblages of warlike gentry, in which the great lords used the lesser lords for their own purposes. The central diet, from which the towns were excluded, was a periodic meeting of emissaries, under binding instructions from the regional diets. It came to be recognized, as one of the liberties of the country, that the central diet could take no action to which any member objected. Any member, by stating his unalterable opposition, could oblige a diet to disband. This was the famous *liberum veto*, the free veto, and to use it to break up a diet was called "exploding" the diet. The first diet was exploded in 1652. Of 55 diets held from that year to 1764, 48 were exploded.

---

Weakness of central  
government

Government became a fiasco. The monopoly of law and force, characteristic of the modern state, failed to develop in Poland. The king of Poland had practically no army, no law courts, no officials, and no income. The nobility paid no taxes. By 1750 the revenues of the king of Poland were about one-thirteenth those of the tsar of Russia and one seventy-fifth those of the king of France. Armed force was in the hands of a dozen or so aristocratic leaders, who also conducted their individual foreign policies, pursuing their own adventures against the Turks, or bringing in Russians, French, or Swedes to help them

against other Poles. The landlords became local monarchs on their manorial estates. The mass of the rural population fell deeper into a serfdom scarcely different from slavery, bound to compulsory labor on estates resembling plantations, with police and disciplinary powers in the hands of the lords and with no outside legal or administrative system to set the limits of exploitation.

The huge expanse comprised under the name of Poland was, in short, a power vacuum; and as more powerful centers developed, notably around Berlin and Moscow, the push against the Polish frontiers became steadily stronger. It was facilitated by the Poles themselves. As early as 1660 the East Prussian fief became independent of the Polish crown. As early as 1667 the Muscovites reconquered Smolensk and Kiev. Already there was confidential talk of partitioning Poland, which, however, was deferred for a century. Much of the history of the modern world would have been different had the Poland of the seventeenth century held together. There would have been no kingdom of Prussia and no Prussian influence in Germany; nor would Russia have become the chief Slavic power or reached so far into central Europe.

---

*Pressures on Poland*

*The Ottoman Empire about 1650*

The Ottoman state, the third of the three empires which together spread over so much of Europe, was larger than either of the others, and in the seventeenth century it was more solidly organized and powerful. In 1529 the Turks had attacked Vienna and seemed about to burst into Germany. To most people in the Christian world the Turks were a mystery as well as a terror. They had formerly been among the rougher of the Muslim peoples, who had migrated from central Asia only a few centuries before and owed most of their higher civilization to the Arabs and the Persians. Their dominions extended, about 1650, from the Hungarian plain and the south Russian steppes as far as Algeria, the upper Nile, and the Persian Gulf. The empire was based to a large degree on military proficiency.

Long before Europe the Turks had a standing army, of which the janissaries were the main striking force. The janissaries were originally recruited from Christian children taken from their families in early childhood, brought up as Muslims, reared in military surroundings, and forbidden to marry; without background or ties, interests, or ambition outside the military organization to which they belonged, they were ideal fighting material in the hands of political leaders. The Turkish forces were long as well equipped as the Christian, being especially strong in heavy artillery. But by the mid-seventeenth century they were falling behind. They had changed little, or for the worse, since the days of Suleiman the Magnificent a century before, whereas in the better-organized Christian states discipline and military administration had been improved, and firearms, land mines, and siegecraft had become more effective.

The Turks cared little about assimilating subject peoples to their language or institutions. Local populations within the empire thus retained most of their cultural traditions and autonomy. Law was religious law derived from the Qur'an. Law courts and judges were hard to distinguish from religious authorities, for there was no separation between religious and secular spheres. The sultan was also the caliph, the commander of the faithful; while on the one hand there was no clergy in the European sense, on the other hand religious influences affected all aspects of life. The Turks, for the most part, applied the Muslim law only to Muslims; and the overall administration of imperial policies was controlled by a powerful government official called the grand vizier.

**COUNT STANISLAS POTOCKI**

by Jacques-Louis David (French, 1748–1825)

This portrait of a well-known eighteenth-century Polish nobleman—painted by David in 1781—expresses the sense of independent grandeur that characterized the Polish aristocracy for several centuries in the early modern era.

(Erich Lessing/Art Resource, NY)

---

*Tolerance of non-  
Muslim subjects*

The Ottoman government left its non-Muslim subjects to settle their own affairs in their own way, not according to nationality, which was generally indistinguishable, but according to religious groupings. The Greek Orthodox church, to which most Christians in the empire belonged, thus became an almost autonomous intermediary between the sultan and a large fraction of its subjects. Armenian Christians and Jews formed other separate bodies. Except in the western Balkans (Albania and Bosnia) there was no general conversion of Christians to Islam during the Turkish rule, although there were many individual cases of Christians turning Muslim to obtain the privileges of the ruling faith. North of the Danube the Christian princes of Transylvania, Wallachia, and Moldavia (later combined into modern Romania) continued to rule over Christian subjects. They were kept in office for that purpose by the sultan, to whom they paid tribute. In general, since their subjects were more profitable to them as Christians, the Turks were not eager to proselytize for Islam.

The Ottoman Empire was therefore a relatively tolerant empire, far more so than the states of Europe. Christians in the Turkish empire fared better than Muslims would have fared in Christendom or than the Moors had in fact fared in Spain. Christians were less disturbed in Turkey than were Protestants in France, after 1685, or Catholics in Ireland. The empire was tolerant because it was composite, an aggregation of peoples, religions, and laws, having no drive, as did the Western states, toward internal unity and complete legal sovereignty. The same tolerance was evident in the attitude toward foreign merchants, who were active throughout most of the empire.

The king of France had had treaty arrangements with Turkey since 1535, and many traders from Marseilles had spread over the port towns of the Middle East. They were exempted by treaty from the laws of the Ottoman Empire and were liable to trial only by their own judges, who though residing in Turkey were appointed by the king of France. They were free to exercise their Roman Catholic religion, and if disputes with Muslims arose, they appeared in special courts where the word of an infidel received equal weight with that of a follower of the prophet. Similar rights in Turkey were obtained by other European states. Thus began "extraterritorial" privileges of the kind obtained by Europeans in later centuries in China and elsewhere, wherever the local laws were regarded as "backward," or hostile to Europeans. To the Turks of the seventeenth century there was nothing exceptional about such arrangements. Only much later, under Western influence, did the Turks come to resent these "capitulations" as impairments of their own sovereignty.

---

*"Extraterritorial"  
privileges*

Yet the Turkish rule was oppressive, and the "terrible Turk" was with reason the nightmare of eastern Europe. Ottoman rule was oppressive to Christians if only because it relegated them to a despised position and because everything they held holy was viewed by the Turks with contempt. But it was oppressive also in that it was often arbitrary and brutal even by the none too sensitive standards of Europeans. It was worse in these respects in the seventeenth century than formerly, for the central authority of the sultans had become corrupt, and the outlying governors, or pashas, had a virtual free hand with their subjects.

Those parts of the Ottoman Empire which adjoined the Christian states were among the least firmly attached to Constantinople. The Tartar Khans of south Russia, like the Christian princes of the Danubian principalities, were simply protégés who paid tribute. Hungary was occupied but was more a battle-field than a province. These regions were disputed by Germans, Poles, and

---

*Disputed regions*

Russians. It seemed in the middle of the seventeenth century as if the grip of the Turks might be relaxing. But a series of capable grand viziers, of the Köprülü family, came to power and retained it contrary to Turkish customs for 50 years. Under them the empire again launched a military campaign to expand into the Habsburg lands in central Europe. By 1663 the janissaries were again mobilizing in Hungary. Tartar horsemen were on the move. Central Europe again felt the old terror. The pope feared that the dreaded enemy might break into Italy. Throughout Germany by the emperor's order special "Turk bells" sounded the alarm. The states of the Empire voted to raise a small imperial army. The Holy Roman Empire thus bestirred itself temporarily against the historic enemy of European Christians. However, it was not under the auspices of the Holy Roman Empire, but by the house of Austria that the Turks were repelled.

## 24. THE FORMATION OF AN AUSTRIAN MONARCHY

### *The Recovery and Growth of Habsburg Power, 1648–1740*

The Austria which appeared by 1700 was actually a new creation, though not as obviously so as the two other rising states in Prussia and Russia. The Austrian Habsburgs had long enjoyed an eminent role. Formerly their position had rested on their headship of the Holy Roman Empire and on their family connection with the wealthy Habsburgs of Spain. In the seventeenth century these two supports collapsed. The hope for an effective Habsburg empire in Germany disappeared in the Thirty Years' War. The connection with Spain lost its value as Spain declined, and it vanished when in 1700 Spain passed to the house of France. The Austrian family in the latter half of the seventeenth century stood at the great turning point of its fortunes. It successfully made a difficult transition, emerging from the husk of the Holy Roman Empire and building an empire of its own. At the same time the Habsburgs continued to be Holy Roman Emperors and remained active in German affairs, using resources drawn from outside Germany to maintain their influence over the German princes. The relation of Austria to the rest of Germany remained a political conundrum down to the twentieth century.

The dominions considered by the house of Austria to be its direct possessions were in three parts. The oldest were the "hereditary provinces"—

---

*Dominions of Austria*

Upper and Lower Austria, with the adjoining Tyrol, Styria, Carinthia, and Carniola. Second, there was the kingdom of Bohemia—Bohemia, Moravia, and Silesia joined under the crown of St. Wenceslas. Third, there was the kingdom of Hungary—Hungary, Transylvania, and Croatia joined under the crown of St. Stephen. Nothing held all these regions together except the fact that the Austrian Habsburg dynasty, in the seventeenth century, reaffirmed its grip upon them all. During the Thirty Years' War the dynasty rooted Protestantism and feudal rebelliousness out of Austria and the hereditary provinces and reconquered and re-Catholicized Bohemia. And in the following decades it conquered Hungary also.

Since 1526 most of Hungary had been occupied by the Turks. For generations the Hungarian plain was a theater of intermittent warfare between the armies of Vienna and Constantinople. The struggle flared up again in 1663, when Turkish armies began to move up the Danube. A mixed force, assembled from the Empire and its various European allies, obliged the Turks in 1664 to accept a 20-year truce. But Louis XIV, who in these years was busily dismembering the western frontier of the Empire, stood to profit greatly from a

diversion on the Danube. He incited the Turks (old allies of France through common hostility to the Habsburgs) to resume their assaults, which they did as the 20-year truce came to a close.

---

*Vienna besieged by  
the Turks*

In 1683 a vast Turkish army reached the city of Vienna and besieged it. The Turks again, as in 1529, peered into the very inner chambers of Europe. The garrison and people of Vienna, greatly outnumbered, held off the besiegers for two months, enough time for a defending force to arrive. Both sides showed the “international” character of the conflict.

The Turkish army included Christians—Romanian and Hungarian—the latter in rebellion against Habsburg rule in Hungary. The anti-Turkish force was composed mainly of Poles, Austrian dynastic troops, and Germans from various states of the Empire. It was financed largely by Pope Innocent XI; it was commanded in the field by the Habsburg general, Duke Charles of Lorraine, who hoped to protect his inheritance from annexation by France; and its higher command was entrusted to John Sobieski, king of Poland. Sobieski contributed greatly to the relief of Vienna, and his bold action represented the last great military effort of the moribund Republic of Poland. When the Turks abandoned the siege, a general anti-Turkish counteroffensive developed. Armed forces of the pope, Poland, Russia, and the republic of Venice joined with the Habsburgs. It was in this war, in fighting between Turks and Venetians, that the Parthenon at Athens, which had survived for 2,000 years but was now used as an ammunition dump by the Turks, was severely damaged.

---

*Prince Eugene of  
Savoy*

The Habsburgs had the good fortune to obtain the services of a man of remarkable talent, Prince Eugene of Savoy. Eugene, like many other servants of the Austrian house, was not Austrian at all; he was in fact French by origin and education but like many aristocrats of the time he was an international personage. More than anyone else he was the founder of the modern Austrian state. Distinguished both as a military administrator and as a commander in the field, he reformed the supply, equipment, training, and command of the Habsburg forces, along lines laid out by Louis XIV; and in 1697 he won the battle of Zenta, driving the Turks out of Hungary. At the Peace of Karlowitz (1699) the Turks yielded most of Hungary, together with Transylvania and Croatia, to the Habsburg house; and the Ottoman Empire was pushed back permanently into Romania and the Balkans.

The Habsburgs were now free to pursue their designs in the west. They entered the War of the Spanish Succession to win the Spanish crown, but they had to content themselves by the treaty of Rastadt in 1714 with the annexation of the old Spanish Netherlands and with Milan and Naples. Prince Eugene, freed now in the west, again turned eastward. Never before or afterward were the Austrians so brilliantly successful. Eugene captured Belgrade and pushed through the Iron Gate into Wallachia. But the Turks were not yet helpless; and by the Peace of Belgrade (1739) a frontier was drawn which on the Austrian side remained unchanged until the twentieth century. The Turks continued to hold Romania and the whole Balkan peninsula except Catholic Croatia, which was incorporated into the Habsburg empire. The Habsburg government, to open a window on the Mediterranean, developed a seaport at Trieste.

### *The Austrian Monarchy by 1740*

Thus the house of Austria, in two or three generations after its humiliation at the Peace of Westphalia, acquired a new empire of considerable proportions. Though installed in Bel-

**The Austrian Habsburgs mobilized a large force of military allies, including Polish troops under King John Sobieski, to repel the Turkish army that besieged Vienna in 1683. This painting by Franz Geffels (1635–c. 1699) portrays the final, decisive clash that forced the Turks to abandon their siege of the city.**

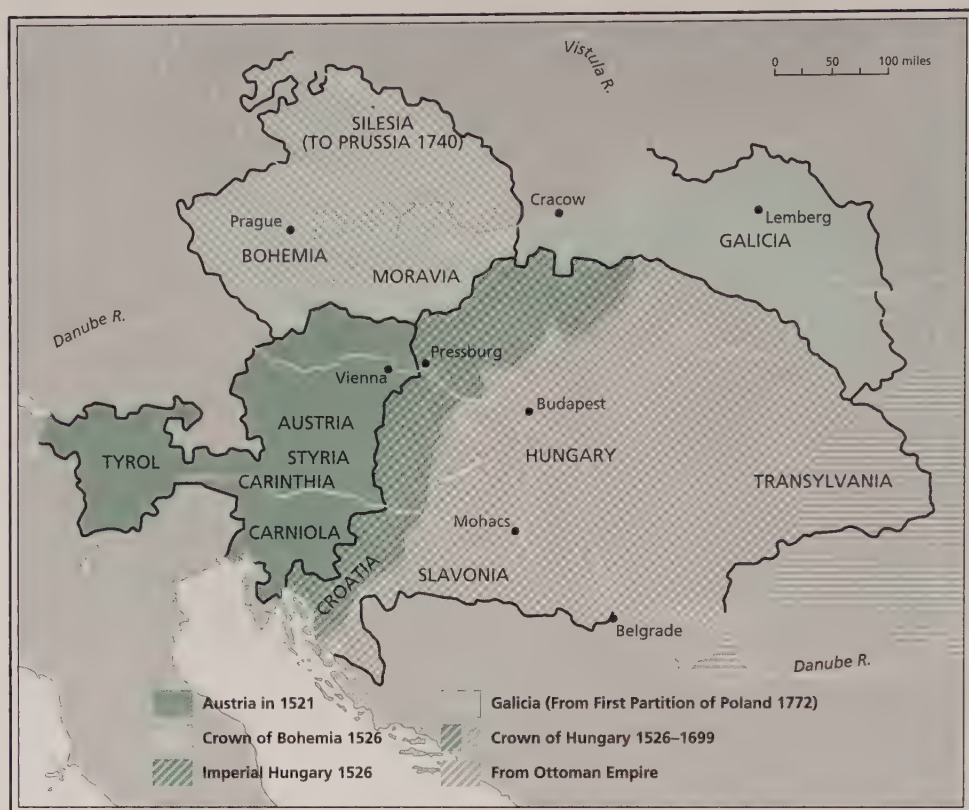

(Erich Lessing/Art Resource, NY (*The Relief of Vienna, 1683* by Franz Geffels (1635/6–c. 1699)))

gium and Italy, it was essentially an empire of the middle Danube, with its headquarters at Vienna in Austria proper, but possessing the sizable kingdoms of Hungary and Bohemia. Though German influence was strong, the empire was international—or nonnational. At the Habsburg court, and in the Habsburg government and army, the names of Czech, Hungarian, Croatian, and Italian noblemen were common. When the nationalist movements swept over Europe in the nineteenth century, the empire was denounced as tyrannical by Hungarians, Croats, Serbs, Romanians, Czechs, Poles, Italians, and even by some Germans, whose national ambitions were blocked by its existence. Later, disillusioned by nationalism in central and eastern Europe, some tended to romanticize unduly the old Habsburg monarchy, noting that it had at least the merit of holding many discordant peoples together.

The empire was from the beginning international, based on a cosmopolitan aristocracy of landowners who felt closer to each other, despite differences of language, than to the laboring masses who worked on their estates. Not for many years, until after 1848, did the Habsburg government really touch these rural masses; it dealt with the landed class and with the relatively few cities, but it left the landlords to control the peasants. The old diets, or assemblies, survived in Bohemia, Hungary, and the Austrian provinces. No diet was created for the empire as a whole. The diets were essentially assemblages of landlords; and though they no longer enjoyed their medieval freedom, they retained powers over taxation and administration and a sense of constitutional liberty against the crown. So long as they

---

*An international  
empire*

### THE GROWTH OF THE AUSTRIAN MONARCHY, 1521–1772

The map shows the main body of the Austrian monarchy as it evolved in the eighteenth century and endured until the collapse of the empire in 1918. There were three main parts: (1) a nucleus, composed of Austria and adjoining duchies, often called the “hereditary provinces”; (2) the lands of the Bohemian crown, which became Habsburg in 1526 and where the Habsburgs reasserted their power during the Thirty Years’ War; and (3) the lands of the Hungarian crown, where at first the Habsburgs held only the segment called Imperial Hungary, the rest remaining Turkish until reconquered by the Habsburgs in 1699. In the first partition of Poland (1772) the Habsburgs annexed Galicia. Silesia was lost to Prussia in 1740.

produced taxes and soldiers as needed, and accepted the wars and foreign policy of the ruling house, no questions were asked at Vienna. Religion was a different matter, however, for the Habsburgs forcefully repressed the Protestantism that had spread widely across both Bohemia and Hungary. Many of the estates of Protestant nobles and rebels were confiscated, giving the Habsburgs valuable lands with which to reward soldiers and supporters from all parts of Europe. An increasingly heterogeneous population of Germans, Croats, and Serbs settled in Habsburg territories, especially in Hungary. Meanwhile, the peasants remained in, or reverted to, serfdom.

Despite the concerted political, religious, and military policies of the Habsburg rulers, the Austrian monarchy remained a collection of territories held together by a personal union. Inhabitants of Austria proper considered their ruler as archduke, Bohemians saw in

him the king of Bohemia; Magyars, the apostolic king of Hungary. Each country retained its own law, diet, and political life, all of which made it difficult or impossible for the Habsburgs to establish laws and institutions that would be accepted in all the territories they ruled. No feeling in the people held these regions together, and even the several aristocracies were joined only by common service to the Habsburgs. For the empire to exist, all crowns had to be inherited by the same person.

After the reconquest of Hungary the king-archduke, Charles VI (1711–1740), devised a form of insurance to guarantee such an undivided succession. This took the form of a document called the Pragmatic Sanction, first issued in 1713. By it every diet in the empire and the various archdukes of the Habsburg family were to agree to regard the Habsburg territories as indivisible and to recognize only the Habsburg line of heirs. The matter became urgent when it developed that Charles would have no male heir. The direct male line of the Austrian Habsburgs, as of the Spanish a few years before, was about to become extinct. But Charles did have a daughter, Maria Theresa, and he gradually won acceptance of the “Pragmatic Sanction” by all parts of his empire and all members of his family. This agreement recognized Maria Theresa’s right to the Habsburg throne and to the inheritance of all Habsburg territories. He then set about having foreign powers guarantee it, knowing that Bavaria, Prussia, or others might well put in claims for this or that part of the inheritance. This process took years, and was accomplished at the cost of many damaging concessions. Charles VI had attempted, for example, to revive Belgium commercially by founding an overseas trading company at Ostend. The British government, before agreeing to guarantee the Pragmatic Sanction, demanded and obtained the renunciation of this commercial project. Finally all powers signed. Charles VI died in 1740, having done all that could be done, by domestic law and international treaty, to assure the continuation of the Austrian empire.

---

*Charles VI and the  
Pragmatic Sanction*

He was scarcely dead when armed “heirs” presented themselves. A great war broke out to partition the Austrian empire, as the Spanish empire had been partitioned shortly before. Bohemia threw off its allegiance. Hungary almost did the same. But these events belong later in the story. At the moment it is enough to know that by 1740 a populous empire of great military strength existed on the Danube.

## 25. THE FORMATION OF PRUSSIA

It was characteristic of the seventeenth century that very small states were able to play an influential part in European affairs, seemingly out of all proportion to their size. The main reason why small states could act as great powers was that armies were small and weapons were simple. Difficulties of supply and communications, the poor condition of the roads, the lack of maps, the absence of general staffs, together with many other administrative and technical difficulties, reduced the number of soldiers who could be successfully managed in a campaign. The battles of the Thirty Years’ War, on the average, were fought by armies of less than 20,000 men. And while Louis XIV, by the last years of his reign, built up a military establishment aggregating some 400,000, the actual field armies in the wars of Louis XIV did not exceed, on the average, 40,000. Armies of this size were well within the reach of smaller powers. If especially well trained, disciplined, and equipped, and if ably commanded, the armies of small powers could defeat those of much larger neighbors. On this fact, fundamentally, the German state of Prussia was to be built.

But Prussia was not the first to exploit the opportunity with spectacular consequences. The first was Sweden.

### *Sweden's Short-Lived Empire*

Sweden almost, but not quite, formed an empire in central and eastern Europe in the seventeenth century. The population of Sweden at the time was not over a million; it was smaller than that of the Dutch Republic. But the Swedes produced a line of extraordinary rulers, ranging from genius in Gustavus Adolphus (1611–1632) through the brilliantly erratic Queen Christina (1632–1654) to the amazing military exploits of Charles XII (1697–1718). The elective Swedish kingship was made hereditary, the royal power freed from control by the estates. Craftsmen and experts were brought from the west, notably Holland; war industries were subsidized by the government; and an army was created with many novel features in weapons, organization, and tactics.

---

*Swedish territorial  
victories*

With this army Gustavus Adolphus crossed the Baltic in the Thirty Years' War, made alliances with Protestant German princes, cut through the Holy Roman Empire, and helped to ward off unification of Germany by the Habsburgs. The Swedish crown, by the Peace of Westphalia, received certain coastal regions of Germany. Subsequently, in a confused series of wars, in which a Polish king claimed to be king of Sweden and a Swedish king claimed to be king of Poland, the Swedes won control of virtually all the shores and cities of the Baltic. Only Denmark at the mouth of that sea and the territories of the house of Brandenburg, which had almost no ports, remained independent. For a time the Baltic was a Swedish lake. The Russians were shut off from it, and the Poles and even the Germans, who lived on its shores, could reach it only on Swedish terms.

---

*Charles XII*

The final Swedish campaign for imperial expansion took place during the meteoric reign of Charles XII. As a young man he found his dominions attacked by Denmark, Poland, and Russia; he won remarkable victories over them but would not make peace; he then led an army back and forth across the East European plain, only to be crushed by the Russians. He fled to Turkey and spent long years as a guest and protégé of the Turks. By 1718 the Swedish sphere had contracted to Sweden itself, except that Finland and reduced holdings in northern Germany remained Swedish for a century more. The Swedes in time proved themselves exceptional among European peoples in not harping on their former greatness. They successfully and peaceably made the transition from the role of a great power to that of a small one.

### *The Territorial Growth of Brandenburg-Prussia*

In the long run it was to be Prussia that dominated this part of Europe. Prussia became famous for its "militarism," which may be said to exist when military needs and military values permeate all other spheres of life. Through its influence on Germany over a period of two centuries it played a momentous part in the modern world. The south coast of the Baltic, where Prussia was to arise, was an unpromising site for the creation of a strong political power. It was an uninviting country, thinly populated, with poor soil and without mineral resources, more backward than Saxony or Bohemia, not to mention the busy centers of south Germany and western Europe. It was a flat open plain, merging imperceptibly into Poland, without prominent physical features or natural frontiers (see maps, pp. 4–5,

193, 194, 208–209). The coastal region directly south from Sweden was known as Pomerania. Inland from it, shut off from the sea, was Brandenburg, centering about Berlin. Brandenburg had been founded in the Middle Ages as a border state, a “mark” or “march” of the Holy Roman Empire, to fight the battles of the empire against the then heathen Slavs. Its ruler, the margrave, was one of the seven princes who, after 1356, elected the Holy Roman Emperor. Hence he was commonly called the Elector of Brandenburg. After 1415 the electors were always of the Hohenzollern family.

All Germany east of the Elbe, including Brandenburg, represented a medieval conquest by the German-speaking peoples—the German *Drang nach Osten*, or drive to the East. From the Elbe to Poland, German conquerors and settlers had replaced the Slavs, eliminating them or absorbing them by intermarriage. Eastward from Brandenburg, and outside the Holy Roman Empire, stretched a region inhabited by Slavic peoples. Next to the east came “Prussia,” which eventually was to give its name to all territories of the Hohenzollern monarchy. This original Prussia formed part of the lands of the Teutonic Knights, a military crusading order which had conquered and Christianized the native peoples in the thirteenth century. Except for its seacoast along the Baltic, the duchy of Prussia was totally enclosed by the Polish kingdom. To the north, along the Baltic, as far as the Gulf of Finland, German minorities lived among Lithuanians, Latvians (or Letts), and Estonians. The towns were German, founded as German commercial colonies in the Middle Ages, and many of the landlords were German also, descendants of the Teutonic Knights, and later known as the “Baltic barons.”

---

---

*Germans expand  
eastward*

Modern Prussia began to appear in the seventeenth century when a number of territories came into the hands of the Hohenzollerns of Brandenburg, who, we have noted, had ruled in Brandenburg since 1415. In 1618 the Elector of Brandenburg inherited the duchy of Prussia. Another important development occurred when the old ruling line in Pomerania expired during the Thirty Years' War. Although the Swedes succeeded in taking the better part of Pomerania, including the city of Stettin, the Elector of Brandenburg received at the Peace of Westphalia eastern Pomerania. Barren, rural, and harborless though it was, it at least had the advantage of connecting Brandenburg with the Baltic. The Hohenzollerns no sooner obtained it than they began to dream of joining it to the duchy of Prussia, a task which required the absorption of an intermediate and predominantly Slavic area, which was part of Poland, a task not accomplished until 1772.

---

---

*Territorial  
acquisitions of the  
Hohenzollerns*

Had the duchy of Prussia and eastern Pomerania been the only acquisitions of the Hohenzollerns, their state would have been oriented almost exclusively toward eastern Europe. But at the Peace of Westphalia they received, in addition to eastern Pomerania, new territories on the west bank of the Elbe. Moreover, through the play of inheritance common in the Holy Roman Empire, the Hohenzollerns had earlier fallen heir, in 1614, to the small state of Cleves on the Rhine at the Dutch border and a few other small territories also in western Germany. These were separated from the main mass around Brandenburg by many intermediate German principalities. But they gave the Hohenzollerns a direct contact with the more advanced regions of western Europe and a base from which larger holdings in the Rhineland were eventually to be built up.

In the seventeenth century, meanwhile, the dominions of the house of Brandenburg were in three disconnected territories. The main one was Brandenburg, with adjoining Pomerania and territories along the Elbe. There was a detached eastern territory in ducal Prussia and another small detached western territory on and near the Rhine. To connect

and unify these three territorial possessions became the long-range policy of the Brandenburg house.

In the midst of the Thirty Years' War, in 1640, a young man of 20, named Frederick William, succeeded to these diverse possessions. Known later as the Great

---

*The Great Elector*

Elector, he was the first of the men who shaped modern Prussia. He had grown up under trying conditions. Brandenburg was one of the parts of Germany to suffer most heavily from the war. Its location made it the

stamping ground of Swedish and Habsburg armies. In 1640, in the 22 years since the beginning of the war, the population of Berlin had fallen from about 14,000 to about 6,000. Hundreds of villages had been wiped out. Wolves roamed over the countryside. Frederick William concluded that in his position, ruling a small and open territory, without natural frontiers or possibility of defense in depth, he must put his main reliance on a competent army. With an effective army, even if small, he could oblige the stronger states to take him into their calculations and so could enter with some hope of advantage into the politics of the balance of power. This long remained the program of the Brandenburgers—to have an army but not to use it, to conserve it with loving and even miserly care, to keep an “army in being,” and to gain their ends by diplomatic maneuver. They did so by siding with France against the Habsburgs, or with Sweden against Poland. They aspired also to the title not merely of margrave or elector, but king. The opportunity came in 1701, when the Habsburg emperor was preparing to enter the War of the Spanish Succession. The emperor requested the elector of Brandenburg, who was then Frederick III, to support him with 8,000 troops. The elector named his price: recognition of himself, by the emperor, as king “in Prussia.” The emperor yielded; the title, at first explicitly limited to the less honorable king *in* Prussia, soon became king *of* Prussia. The elector Frederick III of Brandenburg became King Frederick I of Prussia. Another rent was made in the old fabric of the Holy Roman Empire. There was now a German king above all the other German princes.

### *The Prussian Military State*

The preoccupation of Prussia with its army was unquestionably defensive in origin, arising from the horrors of the Thirty Years' War. But it outlasted its cause and became the settled habit and character of the country. Prussia was not unique in the attention it paid to its armed forces. The unique thing about Prussia was the disproportion between the size of the army and the size of the resources on which the army was based. The government, to maintain the army, had to direct and plan the life of the country for this purpose. Nor was Prussia the originator of the “standing” army, kept active in time of peace and always preparing for war. Most governments imitated Louis XIV in establishing standing armies, not merely to promote foreign ambitions but to keep armed forces out of the hands of nobles and military adventurers and under control by the state.

---

*The Prussian army*

But Prussia was unique in that, more than in any other country, the army developed a life of its own, almost independent of the life of the state. It was older than the Prussian state. In 1657 the Great Elector fought a great battle at Warsaw with soldiers from all parts of his dominions. It was the first time that men from Cleves, Brandenburg, and ducal Prussia had ever done anything together. The army was the first “all Prussian” institution. Institutions of civilian government developed later and largely to meet the needs of the army. And in later generations the army proved more durable than the state. When Prussia collapsed before Napoleon in 1806, the spirit and morale of the Prussian army carried on; and when the Hohenzollern empire finally

**Frederick William, who became known as the Great Elector, governed Prussia for almost 50 years (1640–1688) and set his country on a course toward new power and military influence in central Europe.**

(Foto Marburg/Art Resource, NY)

crashed in 1918, the army still maintained its life and traditions on into the Weimar Republic, which again it survived. Not until the defeat of Adolf Hitler in the Second World War and the establishment of a new republican regime was the army totally subordinated to civilian authority.

In all countries, to some extent, the machinery of the modern state developed as a means of supporting armed forces, but in Prussia the process was exceptionally clear and simple. In Prussia the rulers drew roughly half their income from the crown domain and only about half from taxes. The crown domain, consisting of manors and other productive enterprises owned directly by the ruler as lord, was in effect a kind of government property, for the Prussian rulers used their income almost entirely for state purposes, being personally simple and even Spartan in their habits. The rulers of Prussia, until a century after the accession of the Great Elector, were able to pay the whole cost of their civil government from their own income, the proceeds of the crown domain. But to maintain an army they had to make the domain more productive and also find new income derived from taxes. To develop the domain and account for and transfer the funds, they created a large body of civilian officials. The domain bulked so large that much of the economy of the country was not in private hands but consisted of enterprises owned and administered by the state. For additional income the Great Elector introduced taxes of the kind used in France, such as excise taxes on consumers' goods and a government monopoly on the sale of salt. All taxes, for a century after the accession of the Great Elector, were levied for the use of the army.

---

*Maintaining the  
army*

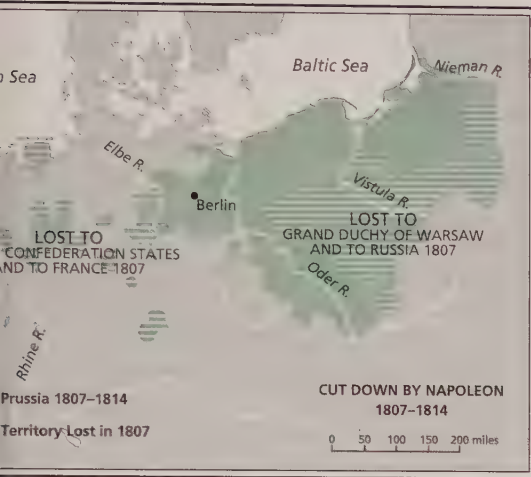

Economic life grew up under government sponsorship, rather than through the enterprise of a venturesome business class. This was because, for a rural country to maintain an organized army, productive and technical skills had to be imported, mainly from the West. The Great Elector in his youth spent a number of years in Holland, where he was impressed by the wealth and prosperity that he saw. After becoming elector he settled Swiss and Frisians in Brandenburg (the Frisians were akin to the Dutch); he welcomed Jews from Poland; and when Louis XIV began to persecute the French Protestants, he provided funds and special officials to assist the immigration of 20,000 Huguenots to Brandenburg. French immigrants for a time formed a sixth of the population of Berlin and were

### THE GROWTH OF PRUSSIA, 1415-1918

The maps shown here, going well beyond the scope of this chapter, give a conspectus of Prussian history from the time when Brandenburg began to expand in the seventeenth century. One may see, by looking at all the panels together, how Prussia was really an east-European state until 1815; its center of gravity shifted westward, in significant degree, only in the nineteenth century. Panel 2 shows the early formation of three unconnected territories; Panel 3, the huge bulk of Silesia relative to the small kingdom that annexed it; Panel 4, the fruits of the partitions of Poland; Panel 5, Napoleon pared Prussia down. The main crisis at the Congress of Vienna, and its resolution, are shown in Panels 6 and 7. Bismarck's enlargement of Prussia appears in Panel 8. The boundaries established by Bismarck remained unchanged until the fall of the monarchy in 1918.

the most advanced commercial element of that comparatively primitive city. The government, as in France under Colbert, initiated and helped to finance various industries; but the importance of such government participation was greater than in France, because the amount of privately owned capital available for investment was incomparably less. Military needs, more than elsewhere, dominated the market for goods, because civilian demand in so poor a country was relatively low; the army, in its requirements for food, uniforms, and weapons became a strong force in shaping the economic growth of the country.

The army had a profound effect also on the social development and class structure of Prussia. The civilian middle class remained submissive, and it became the policy of the rulers to absorb practically the whole landed aristocracy, the Junkers, into military service. They used the army, with conscious purpose, as a means of implementing an "all Prussian" psychology in the landed families of Cleves, Brandenburg, Pomerania, and the former dominions of the Teutonic Knights. The fact that Prussia was a very recent and artificial combination

---

*The army and  
Prussian society*

of territories, so that identification with it was not a natural sentiment, made it all the more necessary to instill loyalty by martial means. Emphasis fell on duty, obedience, service, and sacrifice. That military virtues became characteristic of the whole male Prussian aristocracy was also due, like so much else, to the small size of the population. In France, for example, with perhaps 50,000 male adult nobles, only a small minority served as army officers. In Prussia there were few Junker families that did not have some of their members in uniform.

The Great Elector and his successors, like all absolutist rulers of the era, repressed the estates or parliamentary assemblages in which the landed aristocracy was the main element. To mollify the squires, the rulers promised commissions in the army to men of their class. They promised them also a free hand over their peasants. The Prussian monarchy was largely based on an understanding between the ruler and the landlord gentry—the latter agreed to accept the ruler's government and to serve in his army, in return for holding their own peasants in hereditary subjection. Serfdom spread in Prussia as elsewhere in eastern Europe. In East Prussia the condition of the peasants became as deplorable as in Poland.

The Prussian rulers believed that the Junkers made better army officers because they were brought up in the habit of commanding their own peasants. To preserve the officer class, legislation forbade the sale of “noble” lands, that is, manors, to persons not noble. In France, again by way of contrast, where manorial rights had become simply a form of property, bourgeois and even peasants could legally acquire manors and enjoy a lordly or “seigneurial” income. In Prussia this was not possible; classes were frozen by owning nonexchangeable forms of property. It was thus harder for middle-class persons to enter the aristocracy by setting up as landed gentry. The bourgeois class in any case had little spirit of independence. Few of the old towns of Germany were in Prussia. The Prussian middle class was not wealthy. It was not strong through the possession of private property. The typical middle-class man was an official who worked for the government as an employee of the large crown domain or in an enterprise subsidized by the state. The civil service in Prussia, from the days of the Great Elector, became notable for its honesty and efficiency. But the middle class, more than elsewhere, deferred to the nobles, served the state, and stood in awe of the army.

These peculiar features of Prussia developed especially under Frederick William I, who was king from 1713 to 1740. He was an earthy, uncouth man, who disdained whatever savored of “culture,” to which his father, his grandfather (the Great Elector), and also his son (Frederick the Great) were all strongly attracted. He begrudged every penny not spent on the army. He cut the expense of the royal household by three-fourths. On his coronation journey to Königsberg he spent 2,547 thalers, where his father had spent five million. He ruled the country in a fatherly German way, supervising it like a private estate, prowling the streets of Berlin in an old seedy uniform, and disciplining negligent citizens with blows of his walking stick. He worked all the time and expected everyone else to do likewise.

He loved the army, which all his policies were designed to serve. He was the first Prussian king to appear always in uniform. He rearranged the order of courtly precedence, moving army officers up and civilians down. His love of tall soldiers is famous; he collected a special unit, men between 6 and 7 feet tall, from all over Europe, and indeed the Russian Tsar Peter the Great sent him some from Asia. He devised new forms of discipline and maneuver, founded a cadet corps to train the sons of the Junkers, and invented a new system of recruiting (the canton system, long the most effective in Europe), by which each regiment had a particular district or canton assigned to it as a source of soldiers. He raised

---

*Limited social  
mobility*

---

*Frederick William I*

the size of the army from 40,000 at his accession to 83,000 at his death. During his reign Berlin grew to be a city of 100,000, of whom 20,000 were soldiers, a proportion probably matched in no other city of Europe. He likewise left to his successor (for he fought practically no wars himself) a war chest of 7,000,000 thalers.

With this army and war chest Frederick II, later called the Great, who became king in 1740, startled Europe. Charles VI of Austria had just died. His daughter Maria Theresa entered upon her manifold inheritance. All Europe was hedging on its guarantee of the Pragmatic Sanction. While others waited, Frederick struck. Serving no notice, he moved his forces into Silesia, to which the Hohen-zollerns had an old though doubtful claim. Silesia was a part of the kingdom of Bohemia on the side toward Poland, lying in the upper valley of the Oder River and adjoining Brandenburg on the north. The addition of Silesia to the kingdom of Prussia almost doubled the population and added valuable industries, so that Prussia now, with 6,000,000 people and an army which Frederick raised to 200,000, at last established itself as a great power. It must be added that, judged simply as a human accomplishment, Prussia was a remarkable creation, a state made on a shoestring, a triumph of work and duty.

*The advances of  
Frederick the Great*

## 26. THE "WESTERNIZING" OF RUSSIA

The affairs of central and eastern Europe, from Sweden to Turkey and from Germany to the Caspian Sea, were profoundly interconnected. The underlying theme of the present chapter, it may be recalled, is that this whole great area was fluid, occupied by the weak political bodies of the Holy Roman Empire, Poland, and Turkey, and that in this fluid area three new powers gradually developed—the modern Austrian monarchy, the kingdom of Prussia, and the Russian empire. All, too, in varying degree, became modern eighteenth-century states by borrowing various ideas and administrative systems from the West, though each of these new eastern states also retained its own distinctive political, social, and cultural characteristics.

In the century after 1650 the old tsardom of Muscovy turned into modern Russia. Moving out from the region around Moscow, the Russians not only established themselves across northern Asia, reaching the Bering Sea about 1700, but also entered into closer relations with Europe, undergoing especially in the time of Tsar Peter the Great (1682–1725) a rapid process of Europeanization. To what extent Russia became truly European has always been an open question, disputed both by western Europeans and by Russians themselves. In some ways the Russians have been European from as far back as Europe itself can be said to have existed, that is, from the early Middle Ages. Ancient Russia had been colonized by Vikings, and the Russians had become Christian long before the Swedes, the Lithuanians, or the Finns.

---

*Europeanization*

Yet Russia had not been part of the general development of Europe for a number of reasons. Russia had been converted to the Greek Orthodox branch of Christianity; therefore, the religious and cultural influence of Constantinople, not of Rome, had predominated. Second, the Mongol invasions and conquest about 1240 had kept Russia under Asian domination for about 250 years, until 1480 when a grand duke of Muscovy, Ivan III (1462–1505), was able to throw off the Mongol overlordship and cease payment of tribute. Last, Russian geography, especially the lack of warm-water or ice-free seaports, had made commerce and communication with the West difficult. Russia had therefore not shared in the general European development after about 1100, and the changes that took place in the

**The uniforms of these Prussian soldiers in the era of King Frederick II (1740–1786) represent the status and importance of the military class in Prussian society during the eighteenth century.**  
(akg-images)

seventeenth and eighteenth centuries may accurately be called Europeanization, or at least a wholesale borrowing of the new knowledge and institutions that had developed in the early modern European states. The Europeanizing or westernizing of Russia was by no means a unique thing. It was a step in the expansion of the modern European type of civilization or social organization and hence in the formation of the modern world as we have known it in recent centuries.

*Parallels with  
Prussia*

In some ways the new Russian empire resembled the new kingdom of Prussia. Both took form in the great plain which runs uninterruptedly from the North Sea into inner Asia. Both lacked natural frontiers and grew by addition of territories to an original nucleus. In both countries the state arose primarily as a means of supporting a modern army. In both the government developed autocratically, in conjunction with a landlord class which was impressed into state service and which in turn held the peasantry in serfdom. Neither Russia nor Prussia had a native commercial class of any political importance. In neither country could the modern state and army have been created without the importation of new skills from western Europe. Yet Prussia, with its German connections, its Protestant religion, its universities, and its nearness to the busy commercial artery of the Baltic, was far more “European” than

Russia, and the Europeanization of Russia may perhaps better be compared with the later "westernization" of Japan. In the Russia of 1700, as in the Japan of 1870, the main purpose of the westernizers was to obtain scientific, technical, and military knowledge from the West, in part with a view to strengthening their own countries against penetration or conquest by Europeans. Yet here too the parallel must not be pushed too far. In time, the Russian upper classes intermarried with Europeans, and Russian music and literature became part of the culture of Europe. Russia developed a unique blend of European and non-European traits.

### *Russia before Peter the Great*

The Russians in the seventeenth century, as today, were a medley of peoples distinguished by their language, which was of the Slavic family, of the great Indo-European language group. The Great Russians or Muscovites lived around Moscow. Moving out from that area, they had penetrated the northern forests and had also settled in the southern steppes and along the Volga, where they had assimilated various Asian peoples known as Tartars. After two centuries of expansion, from roughly 1450 to 1650, the Russians had almost but not quite reached the Baltic and the Black seas. The Baltic shore was held by Sweden. The Black Sea coast was still held by Tartar Khans under the protection of Turkey. In the rough borderlands between Tartar and Russia lived the semi-independent cowboy-like Cossacks, largely recruited from migratory Russians. West of Muscovy were the White Russians (or Byelorussians) and southwest of Muscovy the Little Russians (Ruthenians or Ukrainians), both in the seventeenth century under the rule of Poland, which was then the leading Slavic power.

The energies of the Great Russians were directed principally eastward. They conquered the Volga Tartars in the sixteenth century and reached the Ural Mountains, which they immediately crossed. Muscovite pioneers, settlers, and townbuilders streamed along the river systems of Siberia, felling timber and trading in furs as they went. In the 1630s, while the English were building Boston and the Dutch New York, the Russians were establishing towns in the vast Asian stretches of Siberia, reaching to the Pacific itself. A whole string of settlements, remote, small, and isolated—Tomsk and Tobolsk, Irkutsk and Yakutsk—extended for 5,000 miles across northern Asia.

It was toward the vast heartland of central Asia that Muscovy really faced, looking out upon Persia and China across the deserts. The bazaars of Moscow and Astrakhan were frequented by Persians, Afghans, Indians, and Chinese. The Caspian Sea, into which flowed the Volga, the greatest of Russian rivers, was better known than was the Baltic. Europe as sensed from Moscow was in the rear. During most of the seventeenth century even Smolensk and Kiev belonged to Poland. Yet the Russians were not totally shut off from Europe. In 1552, when Ivan the Terrible conquered Kazan from the Tartars, he had a German engineer in his army. In the next year, 1553, Richard Chancellor arrived in Moscow from England by the roundabout way of Archangel on the White Sea. Thereafter trade between England and Muscovy was continuous. The tsars valued Archangel as their only inlet from the West through which military materials could be imported. The English valued it as a means of reaching the wares of Persia.

Russia in the seventeenth century reflected its long estrangement from the culture and social mores that had been developing in Europe. Women of the upper classes were secluded and often wore veils. Men wore beards and skirted garments that seemed exotic to Europeans. Customs were crude, wild drunkenness and revelry alternating with spasms of repentance and religious prostration.

## CHRONOLOGY OF NOTABLE EVENTS, 1640–1740

---

1640–1688	Frederick William, the Great Elector, develops state and military power in Prussia
1663	Ottoman Empire begins new phase of expansion in Central Europe
1667–1671	Stephen Razin leads rebellion of rural population in Russia
1683	Ottoman imperial army is forced to abandon siege of Vienna
1698–1725	Tsar Peter the Great introduces “westernizing” reforms in Russia
1711–1740	Habsburg Charles VI builds the Austrian Empire
1713–1740	Frederick William I expands the army and wealth of the Prussian state

---

Superstition infected the highest classes of church and state. Life counted for little; murder, kidnapping, torture, and elaborate physical cruelty were common. The Russian church supported no such educational or charitable institutions as did the Catholic and Protestant churches of Europe. Churchmen feared the incipient Western influences. “Abhorred of God,” declared a Russian bishop, “is any who loves geometry; it is a spiritual sin.” Even arithmetic was hardly understood in Russia. Arabic numerals were not used, and merchants computed with the abacus. The calendar was dated from the creation of the world. Ability to predict an eclipse seemed a form of magic. Clocks, brought in by Europeans, seemed as wonderful in Russia as they did in China, where they were brought in by Jesuits at about the same time.

Yet this great, non-European Russia, which fronted on inner Asia, was European in some of its fundamental social institutions. It possessed a variant of the manorial and feudal systems. It felt the same wave of constitutional crises that was sweeping over Europe at the same time. Russia had a *duma* or council of retainers and advisers to the tsar, and the rudiments of a national assembly corresponding to meetings of the estates in western Europe. In Russia as in Europe the question was whether power should remain in the hands of these bodies or become concentrated in the hands of the ruler. Ivan the Terrible, who ruled from 1533 to 1584 and was the first grand duke of Muscovy to assume the title of tsar,<sup>1</sup> was a shrewd observer of contemporary events in Poland. He saw the dissolution that was overtaking the Polish state and was determined to avoid it in Muscovy. His ferocity toward those who opposed him made him literally terrible, but though his methods differed from the methods commonly used in Europe, his aims were the aims of his European contemporaries. Not long after his death Russia passed into a period known as the Time of Troubles (1604–1613), during which the Russian nobles elected a series of tsars and demanded certain assurances of their own liberties. But the country was racked by contending factions and a civil war in which the violence resembled the religious wars in France or the Thirty Years’ War in central Europe.

In 1613 a national assembly, hoping to settle the troubles, elected a 17-year-old boy as tsar, or emperor, believing him young enough to have no connection with any of the warring factions. The new boy tsar was Michael Romanov, of a gentry family, related by marriage to the old line of Ivan the

---

*The Romanovs*

<sup>1</sup>The Slavic word *tsar*, like the German *Kaiser*, derives from *Caesar*, a title used as a synonym for *emperor* in the Roman, the Holy Roman, and the Byzantine (or Eastern Roman) empires. The spelling *czar*, also common in English, reveals the etymology and the current English-language pronunciation, *zar*.

Terrible. Thus was established, by vote of the political classes of the day, the Romanov dynasty which ruled in Russia until 1917. The early Romanovs, aware of the fate of elective monarchy in Poland and elsewhere, soon began to repress the representative institutions of Russia and set up as absolute monarchs. Here again, though they were more lawless and violent than any European king, they followed the general pattern of contemporary Europe.

Nor can it be said that the main social development of the seventeenth century in Russia, the sinking of the peasantry into an abyss of helpless serfdom, was exclusively a Russian phenomenon. The same process generally took place in eastern Europe. Serfdom had long been overtaking the older free peasantry of Russia. In Russia, as in the American colonies, land was abundant and labor was scarce. The natural tendency of labor was to migrate over the great Russian plain. In the Time of Troubles, especially, there was a good deal of movement. The landlords, wishing to assure themselves of their labor force, obtained the support of the Romanov tsars.

---

*Serfdom in Russia*

The manor, or what corresponded to it in Russia, came to resemble the slave plantation of the New World. Laws against fugitive serfs were strengthened; lords won the right to recover fugitives up to 15 years after their flight, and finally the time limit was abolished altogether. Peasants came to be so little regarded that a law of 1625 authorized anyone killing another man's peasant simply to give him another peasant in return. Lords exercised police and judicial powers. By a law of 1646 landowners were required to enter the names of all their peasants in government registers; peasants once so entered, together with their descendants, were regarded as attached to the estate on which they were registered. Thus the peasants lost the freedom to move at their own will. For a time they were supposed to have secure tenure of their land; but a law of 1675 allowed the lords to sell peasants without the land, and thus to move peasants like chattels at the will of the owner. This sale of serfs without land, which made their condition more like slavery as then practiced in America, became indeed a distinctive feature of serfdom in Russia, since in Poland, Prussia, Bohemia, and other regions of serfdom, the serf was generally regarded as "bound to the soil," inseparable from the land.

Against the loss of their freedom the rural population of Russia protested as best it could, murdering landlords, fleeing to the Cossacks, taking refuge in a vagrant existence, countered by wholesale government-organized manhunts and by renewed and more stringent legislation. A tremendous uprising was led in 1667 by Stephen Razin, who gathered a host of fugitive serfs, Cossacks, and adventurers, outfitted a fleet on the Caspian Sea, plundered Russian vessels, defeated a Persian squadron, and invaded Persia itself. He then turned back, ascended the Volga, killing and burning as he went and proclaiming a war against landlords, nobles, and priests. Cities opened their gates to him; an army sent against him went over to his side. He was finally captured and put to death in 1671. The consequence of the rebellion, for over a century, was that serfdom was clamped on the country more firmly than ever.

Even from the church the increasingly wretched rural people drew little comfort. The Russian Orthodox church at this time went through a great internal crisis, and ended up as hardly more than a department of the tsardom, useful to the government in instilling a superstitious reverence for Holy Russia. The Russian church had historically looked to the Patriarch of Constantinople as its head. But the conquest of Constantinople by the Turks made the head of the Greek Orthodox church a merely tolerated inferior to the Muslim sultan-caliph, so that the Russians in 1589 set up an independent Russian patriarch of their own. In the following generations the Russian patriarchate first became dependent on, then was abolished by, the tsarist government.

---

*The Russian  
Orthodox church*

**Stephen Razin became an almost mythic figure in Russian popular memory after leading a vast peasant rebellion in the late 1660s. This painting by Wassili Iwanowitsch Surikow (1848–1916) suggests Razin’s later prominence in Russian culture and his symbolic status in modern social and political movements.**

(akg-images (*Stepan Razin*, 1906 by Wassili Iwanowitsch Surikow (1848–1916)))

In the 1650s the Russian patriarch undertook certain church reforms, mainly to correct mistranslations in Russian versions of the Bible and other sacred writings. The changes aroused the horror and indignation of the general body of believers. Superstitiously attached to the mere form of the written word, believing the faith itself to depend on the customary spelling of the name of Jesus, the malcontents saw in the reformers a band of cunning Greek scholars perpetrating the work of Antichrist and the devil. The patriarch and higher church officials forced through the reforms but only with the help of the government and the army. Those who rejected the reforms came to be called Old Believers. More ignorant and fanatical than the established church, agitated by visionary preachers, dividing into innumerable sects, the Old Believers became very numerous, especially among the peasants.

#### Old Believers

Old Believers were active in Stephen Razin’s rebellion and in all the sporadic peasant uprisings that followed. The peasants, already placed by serfdom outside the protection of law, were also estranged from the established religion. A distrust of all organized authority settled over the Russian masses, to whom both church and government seemed mere engines of repression.

But while willing enough to modernize to the extent of correcting mistranslations from the Greek, the church officials resisted the kind of modernization that was coming in from western Europe. They therefore opposed Peter the Great at the end of the century. After 1700 no new patriarch was appointed. Peter put the church under a committee of bishops called the Holy Synod, and to the Synod he attached a civil official called the Procurator of the Holy Synod. The Procurator was not a churchman but head of a government bureau whose task was to see that the church did nothing displeasing to the tsar. Peter thus secularized the church, making himself in effect its head. But while the consequences were more extreme in Russia than elsewhere, it must again be noted that this action of Peter’s fol-

lowed the general pattern of Europe. Secular supervision of religion had become the rule almost everywhere, especially in Protestant countries. Indeed an Englishman of the time thought that Peter the Great, in doing away with the patriarchate and putting the church under his own control, was wisely imitating England, which he had visited in his youth.

### *Peter the Great: Foreign Affairs and Territorial Expansion*

The Russia in which Peter the Great became tsar in 1682 was thus already "European" in some ways and had in any case been in contact with Westerners for over a century. Without Peter, Russia would have developed its European connections more gradually. Peter, by his tempo and methods, made the process a social revolution.

Peter obtained his first knowledge of the West in Moscow itself, where a part of the city known as the German quarter was inhabited by Europeans of various nationalities, whom Peter often visited as a boy. Peter also in his early years mixed with Westerners at Archangel, still Russia's only port, for he was fascinated by the sea and took lessons in navigation on the White Sea from Dutch and English ship captains. Like the Great Elector of Brandenburg, Peter as a young man spent over a year in western Europe, especially Holland and England, where he became profoundly aware of the commercial and technical backwardness of his own country. He had considerable talents as a mechanic and organizer. He labored with his own hands as a ship's carpenter in Amsterdam and talked with political and business leaders on means of introducing Western organization and technology into Russia. He visited workshops, mines, commercial offices, art galleries, hospitals, and forts. Europeans saw him as a barbarian of genius, a giant of a man standing a head above most others, bursting with physical vitality and plying all he met with interminable questions on their manner of working and living. He had neither the refinement nor the pretension of Western monarchs; he mixed easily with workmen and technical people, dressed cheaply and carelessly, loved horseplay and crude practical jokes, and dismayed his hosts by the squalid disorder in which he and his companions left the rooms put at their disposal. A man of acute practical mind, he was as little troubled by appearances as by moral scruples.

---

*Exposure to the West*

Peter on his visit to Europe in 1697–1698 recruited almost 1,000 experts for service in Russia, and many more followed later. He cared nothing for the civilization of Europe except as a means to an end, and this end was to create an army and a state which could stand against those of the West. His aim from the beginning was in part defensive, to ward off the Poles, Swedes, and Turks who had long pushed against Russia; and in part expansionist, to obtain warm-water seaports on the Baltic and Black seas, which would offer year-round access to trade with Europe. For all but two years of his long reign Peter was at war.

---

*Polish threat recedes*

The Poles were a receding threat to Peter's ambitions. A Polish prince had indeed been elected tsar of Muscovy during the Time of Troubles, and for a while the Poles aspired to conquer and Catholicize the Great Russians. But in 1667 the Russians had regained Smolensk and Kiev, and the growing anarchy in Poland made that country no longer a menace, except as the Swedes or others might install themselves in it. The Turks and their Tartar dependencies, though no longer expanding, were still obstinate foes. Peter before going to Europe managed in 1696 to capture Azov at the mouth of the Don, but he was unable to hold any of the Black Sea coast; and he came to recognize the inferiority of the Russian army during these campaigns. The Swedes were the main enemy of Russia. Their army, for its size, was still probably the best in Europe.

The aspirations of Peter the Great are suggested in this formal portrait of a monarch whose clothing and appearance resemble the style of Western European elites in the early eighteenth century.

(Scala/Art Resource, NY)

They controlled the whole eastern shore of the Baltic including the Gulf of Finland. In 1697, the Swedish king having died, Peter entered into an alliance with Poland and Denmark to partition the overseas possessions of the Swedish house.

---

#### *The Swedes*

The new king of Sweden, the youthful Charles XII, was in some ways as crude as Peter (as an adolescent he had sheep driven into his rooms in the palace in order to enjoy the warlike pleasure of killing them), but he proved also to have remarkable aptitude as a general. In 1700, at the battle of Narva, with an army of 8,000 men, he routed Peter's 40,000 Russians. The tsar thus learned another lesson on the need of westernizing his state and army. Fortunately for the Russians Charles XII, instead of immediately pressing his advantage in Russia, spent the following years in furthering Swedish interests in Poland, where he forced the Poles to elect the Swedish candidate as their king. Peter meanwhile, with his imported officers and technicians, reformed the training, discipline, and weapons of the Russian army.

Eventually, Charles XII invaded Russia with a large and well-prepared force. Peter used against him the strategy later used by the Russians against Napoleon and Adolf Hitler; he drew the Swedes into the endless plains, exposing them to the Russian winter, which happened to be an exceptionally severe one, and in 1709, at Poltava in south Russia, he met and overwhelmed the demoralized remainder. The entire Swedish army was destroyed at Poltava, only the king and a few hundred fugitives managing to escape across the Turkish frontier. Peter in the next years conquered Livonia and part of eastern Finland. He landed troops near Stockholm itself. He campaigned in Pomerania almost as far west as the Elbe. Never before had Russian influence reached so deeply into Europe.

The imperial day of Sweden was now over, terminated by Russia. Peter had won for Russia a piece of the Baltic shore and with it warm-water outlets. These significant developments ending the great Northern War (1700–1721) were confirmed in the treaty of Nystadt in 1721.

War is surely not the father of all things, as has been sometimes claimed, but these wars did a good deal to shape imperial Russia. The undisciplined, poorly organized Russian army was transformed into a professional force of the kind maintained by Sweden, France, or Prussia. The elite of the old army had been the *streletsi*, a kind of Moscow guard, composed of nobles and constantly active in politics. A rebellion of the *streletsi* in 1698 had cut short Peter's tour of Europe; he had returned and quelled the mutiny by ferocious use of torture and execution, killing five of the rebels with his own hands. The *streletsi* were liquidated only two years before the great Russian defeat at Narva. Peter then rebuilt the army from the ground up. He employed European officers of many nationalities, paying them half again as much as native Russians of the same grades. He filled his ranks with soldiers supplied by districts on a territorial basis, somewhat as in Prussia. He put the troops into uniforms resembling those of the West and organized them in regiments of standardized composition. He armed them with muskets and artillery of the kind used in Europe and tried to create a service of supply.

---

---

*War and imperial  
Russia*

With this army he not only drove the Swedes back into Sweden but also dominated Russia itself. At the very time of the Swedish invasion large parts of the country were in rebellion, as in the days of Stephen Razin, for the whole middle and lower Volga, together with the Cossacks of the Don and Dnieper, rose against the tsar and rallied behind slogans of class war and hatred of the tsar's foreign experts. Peter crushed these disturbances with the usual ruthlessness. The Russian empire, loose and heterogeneous, was held together by military might.

While the war was still in progress, even before the decisive battle of Poltava, Peter laid the foundations of a wholly new city in territory conquered from the Swedes and inhabited not by Russians but by various Baltic peoples. Peter named it St. Petersburg after himself and his patron saint. From the beginning it was more truly a city than Louis's spectacular creation at Versailles established at almost the same time. Standing at the head of the Gulf of Finland, it was Peter's chief window on the West. Here he established the offices of government, required noblemen to build town houses, and gave favorable terms to foreign merchants and craftsmen to settle. Peter meant to make St. Petersburg a symbol of the new Russia. It was a new city facing toward Europe and drawing the minds of the Russians westward, replacing the old capital, Moscow, which faced toward Asia and was the stronghold of opposition to his westernizing program. St. Petersburg soon became one of the leading cities of northern Europe. It remained the capital of Russia (renamed Petrograd in 1914) until the Revolution of 1917, when Moscow resumed its old role. After the Revolution Petrograd became Leningrad. Its name reverted to St. Petersburg on the eve of the dissolution of the Soviet Union in 1991.

---

---

*The founding of St.  
Petersburg*

### *Internal Changes under Peter the Great*

The new army, the new city, the new and expanding government offices all required money, which in Russia was very scarce. Taxes were imposed on an inconceivable variety of objects—on heads, as poll taxes; on land; on inns, mills, hats, leather, cellars, and coffins; on the right to marry, sell meat, wear a beard, or be an Old Believer. The tax burden fell mainly on the peasants; and to assure the payment of taxes the mobility of

peasants was further restricted, and borderline individuals were classified as peasants in the government records, so that serfdom became both more onerous and more nearly universal. To raise government revenues and to stimulate production Peter adopted the mercantilist policies exemplified by Colbert in France. He encouraged exports, built a fleet on the Baltic, and developed mining, metallurgy, and textiles, which were indispensable to the army. He organized mixed groups of Russians and foreigners into commercial companies, provided them with capital from government funds (little private capital being available), and gave them a labor supply by assigning them the use of serfs in a given locality.

---

*Mercantilism  
encouraged*

Serfdom, in origin mainly an agricultural institution, began to spread in Russia as an industrial institution also. The fact that serf owners obtained the right to sell serfs without land, or to move them from landed estates into mines or towns, made it easier for industry in Russia to develop on the basis of unfree labor. Nor were the employers of serfs, in these government enterprises, free to modify or abandon their projects at will. They too were simply in the tsar's service. The economic system rested largely on impressment of both management and labor, not on private profit and wages as in the increasingly capitalistic West. In this way Peter's efforts to force Russia to a European level of material productivity widened the social differences between Russia and western Europe.

---

*Serfs in industry*

To oversee and operate this system of tax collecting, recruiting, economic controls, serf hunting, and repression of internal rebellion Peter created a new administrative system. The old organs of local self-government wasted away. The duma and the national assembly, decadent anyway in that they could not function without disorder, disappeared. In their place Peter put a "senate" dependent on himself, and 10 territorial areas called "governments," or *gubernii*. The church he ruled through his Procurator of the Holy Synod. At the top of the whole structure was the tsar himself, an absolute ruler and autocrat of all the Russias. Before his death, dissatisfied with his son, he abolished the rule of hereditary succession to the tsardom, claiming the right for each tsar to name his own successor. Transmission of supreme power was thus put outside the domain of law, and in the following century the accession of tsars and tsarinas was marked by strife, conspiracy, and assassination. The whole system of centralized absolutism, while in form resembling that of the West, notably France, was in fact significantly different, for it lacked legal regularity, was handicapped by the poor education of many officials, and was imposed on a turbulent and largely unwilling population. The empire of the Romanovs has been called a state without a people.

---

*New administrative  
system*

Peter sought to assure the success of his reforms by developing what was called "state service," which had been begun by his predecessors. Virtually all landowning and serf-owning aristocrats were required to serve in the army or civil administration. Offices were multiplied to provide places for all. In the state service birth counted for nothing. Peter used men of all classes; Prince Dolgoruky was of the most ancient nobility, Prince Menshikov had been a cook, the tax administrator Kurbatov was an ex-serf, and many others were foreigners of unknown background. Status in Peter's Russia depended not on inherited rank which Peter could not control, but on rank in his state service. "History," wrote a Scot serving in Peter's army, "scarcely affords an example where so many people of low birth have been raised to such dignities as in tsar Peter's reign, or where so many of the highest birth and fortune have been leveled to the lowest ranks of life."

The construction of the city of St. Petersburg became the most important architectural project in Peter the Great's long-term campaign to westernize Russian society. This new city was designed to be a western-looking capital and a new center for commercial contacts with Western Europe; like the construction of the French palace at Versailles, the Russian tsar's architectural goals required the labor of thousands of poor workers and peasants.

(Tass/Sovfoto)

In this respect especially, Peter's program resembled a true social revolution. It created a new governing element in place of the old, almost what in modern terms would be called a party, a body of men working zealously for the new system with a personal interest in its preservation. These men, during Peter's lifetime and after his death, were the bulwarks against an anti-Western reaction, the main agents in making Peter's revolution stick. In time the new families became hereditary themselves. The priority of state service over personal position was abandoned a generation after Peter's death. Offices in the army and government were filled by men of property and birth. After Peter's revolution, as after some others, the new upper class became merged with the old.

---

*Peter's social  
revolution*

Revolutionary also, suggesting the great French Revolution or the Russian Revolution of 1917, were Peter's unconcealed contempt for everything reminiscent of the old Russia and his zeal to reeducate his people in the new ways. He required all gentry to put their sons in school. He sent many abroad to study. He simplified the Russian alphabet. He edited the first newspaper to appear in Russia. He ordered the preparation of the first Russian book of etiquette, teaching his subjects not to spit on the floor, scratch themselves, or gnaw bones at dinner, to mix socially with women, take off their hats, converse pleasantly, and look at people while talking. The beard he took as a symbol of Muscovite backwardness; he forbade it in Russia, and himself shaved a number of men at his court. He forced people to attend evening parties to teach them manners. He had no respect for hereditary

### THE GROWTH OF RUSSIA IN THE WEST

At the accession of Peter the Great in 1682 the Russian empire, expanding from the old grand duchy of Muscovy, had almost reached the Black and Baltic seas. Most of Peter's conquests were in the Baltic region where he pushed back the Swedes and built St. Petersburg. Under Catherine the Great (1762–1796) Russia took part in the three partitions of Poland and also reached the Black Sea. Tsar Alexander I (1801–1825), thanks largely to the Napoleonic wars, was able to acquire still more of Poland and annex Finland and Bessarabia; he also made conquests in the Caucasus. In the nineteenth century the western boundary of Russia remained stabilized, but additional gains were made in the Caucasus. Russia also spread over northern Asia in the seventeenth century, first reaching the Pacific as early as 1630.

aristocracy, torturing or executing the highborn as readily as the peasants. As for religion, we are told that he was a pious man and enjoyed singing in church, but he was contemptuous of ecclesiastical dignity, and in one wild revel paraded publicly with drunken companions clothed in religious vestments and mocking the priests. Like many revolutionists since his time he was aggressively secular.

### *The Results of Peter's Revolution*

Peter's tactics provoked a strong reaction. Some adhered strictly to the old ways; others simply thought that Peter was moving too fast and too indiscriminately toward the new.

Many Russians resented the inescapable presence of foreigners, who often looked down on Russians and who enjoyed special privileges such as the right of free exit from Russia and higher pay for similar employment. One

center around which malcontents rallied was the church. Another was Peter's son Alexis, who declared that when he became tsar he would put a stop to the innovations and restore respect for the customs of old Russia. Peter, after some hesitation, finally put his own son to death. He ruled that each tsar should choose his own successor. He would stop at nothing to remake Russia in his own fashion.

Peter died in 1725, proclaimed "the Great" in his own lifetime by his admiring Senate. Few persons in all history have exerted so strong an individual influence, which indirectly became more far-reaching as the stature of Russia itself grew in later centuries. Though the years after Peter's death were years of turmoil and vacillation, his revolutionary changes held firm against those who would undo them. It is not simply that he Europeanized Russia and conquered a place on the Baltic; these developments might have come about in any case. It is by the methods he used, his impatient forcing of a new culture on Russia, that he set the future character of his empire. His methods fastened autocracy, serfdom, and bureaucracy more firmly upon the country. Yet he was able to reach only the upper classes. Many of these became more Europeanized than he could dream, habitually speaking French and living spiritually in France or in Italy. But as time went on many upper-class Russians, because of their very knowledge of Europe, became impatient of the stolid immovability of the peasants around them, sensed themselves as strangers in their own country, or were troubled by a guilty feeling that their position rested on the degradation and enslavement of human beings. Russian psychology, often mysterious to people in the West, could perhaps be explained in part by the violent paradoxes set up by rapid Europeanization. As for the peasant masses, they remained outside the system, egregiously

*Exclusion of peasants*

exploited, estranged from their rulers and their social superiors, regarded by them as brutes or children, never sharing in any comparable way in their increasingly Europeanized civilization. Much of this worked itself out in the social conflicts of later times. As for Peter's own time, Russia by his efforts came clearly out of its isolation, its vast bulk was now organized to play a part in international affairs, and its history thenceforward was a part of the history of Europe and increasingly of the world. Russia, like Prussia and the Austrian monarchy, was to be counted among the powers of Europe.

The rising influence of these three monarchies depended in part on their ability to acquire modern weaponry, organize more efficient bureaucracies, and bring new forms of European knowledge into their government institutions. By the beginning of the eighteenth century, European science and technologies often gave European states a comparative advantage in their economic, political, and military encounters with other peoples or governments—as the ruling elites in Austria, Prussia, and Russia had learned from their own struggles for power in central Europe. Indeed, the new science would ultimately become one of the most distinctive and significant forces in modern world history. Science helped to transform economic production, military strategies, and traditional cultures as well as imperial conflicts in Europe and around the world. We must therefore look more closely at the ways in which the development of modern scientific thought increasingly influenced the knowledge and control of both nature and human beings.

The Law of Universal Gravitation
  29. New Knowledge of Human Beings and Society
  30. Political Theory:  
The School of Natural Law
- 

*The seventeenth century* has been called the century of genius. One reason is that it was the age when science became “modern.” It was the great age of Galileo and Sir Isaac Newton, whose combined lifetimes spanned the century, with Galileo dying and Newton being born in the same year, 1642. When Galileo was young, those who probed into the secrets of nature still labored largely in the dark, isolated from one another and from the general public, working oftentimes by methods of trial and error, not altogether clear on what they were trying to do, with their thinking still complicated by ideas not nowadays considered scientific. They had never-

theless accomplished a good deal, without which the intellectual revolution of the seventeenth century would not have occurred. But in a way all scientific investigators before Galileo seem to be precursors, patient workers destined never to enter into the world toward which they labored. In 1727, when Newton died, all was changed. Scientists were in continual touch with one another, and science was recognized as one of the principal enterprises of European society. Scientific methods of inquiry had been defined. The store of factual knowledge had become very large. The first modern scientific synthesis, or coherent theory of the physical universe, had been presented by Newton. Scientific knowledge was applied increasingly to navigation, mining, agriculture, and many branches of manufacture. Science and invention were joining hands. Science was accepted as the main force in the advancement of civilization and progress. And science was becoming popularized; many people who were not themselves scientists “believed” in science and attempted to apply scientific habits of thought to diverse problems of social and political life.

The history of science is too complex a story to be told in this book, but there are a few ideas about it which even a book of this kind must attempt to make clear. First, science, purely as a form of thought, is one of

---

Science

the supreme achievements of the human mind, and to have a historical understanding of human intellectual powers one must sense the importance of science, as of philosophy, literature, or the arts. Second, science has increasingly affected practical affairs, entering into the health, wealth, and happiness of humankind. It has changed the size of populations and the use of raw materials, revolutionized methods of production, transport, business, and war, and so helped to relieve some human problems while aggravating others. This is especially true of modern civilization since the seventeenth century. Third, in the modern world ideas have had a way of passing over from science into other domains of thought. Many people today, for example, in their notions of themselves, their neighbors, or the meaning of life, are influenced by ideas which they believe to be those of Freud or Einstein—they talk of repressions or relativity without necessarily knowing much about them. Ideas derived from biology and from Darwin—such as evolution and the struggle for existence—have likewise spread far and wide. Similarly the scientific revolution of the seventeenth century had repercussions far beyond the realm of pure science. It changed ideas of religion and of God and human beings. And it helped to spread certain very deep-seated beliefs, such as that the physical universe is essentially orderly and harmonious, that human reason is capable of understanding and dealing with it, and that human affairs can be conducted by methods of peaceable exchange of ideas and rational discussion. Thus was laid a foundation for belief in free and democratic institutions.

The historical influence of modern science therefore extended far beyond the specific knowledge that transformed the human understanding and use of nature. Scientific methods for establishing truth or defining progress shaped a wide range of modern social institutions, including armies, hospitals, universities, trading companies, government bureaucracies, law courts, and even literary journals. The meaning of the word “modern” became linked to the intellectual prestige of science, and scientific knowledge became the most important intellectual force in the history of the modern world. The purpose of this chapter is to sketch the rise of modern science in the seventeenth century and the emergence of the scientific view of the world and of human affairs. The chapters that follow will describe the increasing application of this new knowledge in the expanding global economy and the influence of scientific thought in eighteenth-century European culture, which is generally known as the Age of Enlightenment.

## 27. PROPHETS OF A SCIENTIFIC CIVILIZATION: BACON AND DESCARTES

### *Science before the Seventeenth Century*

The scientific view became characteristic of elite European society about the middle of the seventeenth century. There had, indeed, been a few in earlier times who caught glimpses of a whole civilization reared upon science. To us today the most famous of these is Leonardo da Vinci (1452–1519), the universal genius of the Italian Renaissance, who had been artist, engineer, and scientific thinker all in one.

---

Leonardo da Vinci

Leonardo, by actual dissection of dead bodies, had obtained an accurate knowledge of human anatomy; he had conceived of the circulation of the blood and the movement of the earth about the sun; and he had drawn designs for submarines and airplanes and speculated on the use of parachutes and poison gases. But Leonardo had not published his scientific ideas. He was known almost exclusively as an artist. His work in science remained outside the stream of scientific thought, without influence on its course.

It was not even known until the discovery of his private notebooks in the twentieth century. **Leonardo** thus figures in the **history of science** as **an isolated genius**, a man of brilliant insights and audacious theories, which died with their author's death, whereas science depends on a transmission of ideas in which investigators build upon one another's discoveries, test one another's experiments, and fill in the gaps in one another's knowledge. **Modern science** evolved as a kind of new cultural system, more dependent on communications and widely shared cultural beliefs than on the brilliance of isolated thinkers. Leonardo's scientific work, remaining unpublished, never entered the cultural institutions in which new scientific knowledge would be produced, challenged, and revised.

A century after the death of Leonardo da Vinci educated Europeans were by no means scientifically minded. Among thoughtful persons many currents were stirring. **On the one hand** there was a great deal of skepticism, a constantly doubting frame of mind, which held that no certain knowledge is possible for human beings at all, that all beliefs are essentially only customs, that some people believe one thing and some another, and that there is no sound way of choosing between them. This attitude was best expressed by the French essayist Michel de Montaigne (1533–1592), whose thought distilled itself into an eternal question, *Que sais-je?* "What do I know?" with the always implied answer, "Nothing." Montaigne's philosophy led to a tolerant, humane, and broad-minded outlook, but as a system of thought it was not otherwise very constructive. **On the other hand**, there was also a tendency to over-believe in mysterious, supernatural powers, arising from the same inability to distinguish between true and false. **There was no accepted line between chemistry and alchemy or between astronomy and astrology; all alike were regarded as ways of penetrating the "secrets" of nature.** The sixteenth century had been a great age of charlatans, such as Nostradamus and Paracelsus, some of whom, notably Paracelsus, mixed magic and valid science in a way hardly understandable to later or modern scientists. As late as the seventeenth century, especially in central Europe where the Thirty Years' War produced chaos and terror, kings and generals kept private astrologers to divine the future.

The two centuries from about 1450 to about 1650 were also the period, **when fear of witches was at its height.** The great campaign against witches thus coincided with Europe's brutal religious wars and with the early development of the new scientific culture among members of Europe's educated elite, but even highly educated persons often believed that witches actually existed. **Witches were blamed for all kinds of natural disasters and personal tragedies—bad harvests, epidemics, the mysterious deaths of children.** Although **most of the persons prosecuted for witchcraft were women**, men were also imprisoned or executed for various crimes of "sorcery." The witchcraft panic lasted longest in Germany and central Europe, probably kept alive by the insecurities engendered by the Thirty Years' War. But **about 20 persons were hanged as witches in Massachusetts as late as 1692,** for the English colonies, as a remote and outlying part of the European world, were among the last to feel some of the intellectual currents originating in Europe. The last known execution for witchcraft took place in 1722 in Scotland.

---

Witchcraft panic

It was by no means clear, in the early part of the seventeenth century, which way Europe was going to develop. It might conceivably have fallen into a kind of political chaos, as India did at about this time. We have seen how much of Europe was racked by chronic and marauding violence, which was ended by the consolidation of the modern state and the conversion of armed bands into organized and disciplined armies. Similarly, in matters of the mind, there was no settled order. Doubt went with superstition,

Women were executed on charges of witchcraft from the later Middle Ages down through the seventeenth century, when a new fear of witches happened to coincide with the early modern scientific revolution. This mid-seventeenth-century English illustration shows a typical pattern of persecution in which several women were put to death at the same time for the alleged crime of “sorcery” or conspiring with “witches.”

(Topham/The Image Works)

indifference with persecution. Science in time provided Europe with a new faith in itself. The rise of science in the seventeenth century possibly saved European civilization from petering out in a long postmedieval afterglow or from wandering off into the diverse paths of a genial skepticism, ineffectual philosophizing, desultory magic, or mad fear of the unknown.

### *Bacon and Descartes*

Two men stand out as prophets of a world reconstructed by science. One was the Englishman Francis Bacon (1561–1626); the other was the Frenchman René Descartes (1596–1650). Both published their most influential books between 1620 and 1640. Both addressed themselves to the problem of knowledge. Both asked themselves how it is possible for human beings to know anything with certainty or to have a reliable, truthful, and usable knowledge of the world of nature. Both shared in the doubts of their day. They branded virtually all beliefs of preceding generations (outside religion) as worthless. Both ridiculed the tendency to put faith in ancient books, to cite the writings of Aristotle or others, on questions having to do with the workings of nature. Both attacked earlier methods of seeking knowledge; they rejected the methods of the “schoolmen” or “scholastics,” the thinkers in the academic tradition of the universities founded in the Middle Ages. On the whole, medieval philosophy had been deductive. That is, its characteristic procedure was to start with definitions and general propositions and then discover what further knowledge could be logically deduced from the definitions thus accepted. Or it proceeded by

affirming the nature of an object to be such-and-such (e.g., that “man is a political animal”) and then described how objects of such a nature do or should behave. These methods, which owed much to Aristotle and other ancient codifiers of human thought, had generally ceased to be fruitful in producing new knowledge of nature. Bacon and Descartes held that the medieval (or Aristotelian) methods were backward. They held that truth is not something that we postulate at the beginning and then explore in all its ramifications, but that it is something which we find at the end, after a long process of investigation, experiment, and intermediate thought.

Bacon and Descartes thus went beyond mere doubt. They offered a constructive program, and though their programs were different, they both became heralds or philosophers of a scientific view. They maintained that there was a true and reliable method of knowledge. And they maintained in addition that once this true method was known and practiced, once the real workings of nature were understood, people would be able to use this knowledge for their own purposes, control nature in their own interests, make undreamed of useful inventions, improve their mechanical arts, and add generally to human wealth and comfort. Bacon and Descartes thus announced the advent of a scientific civilization.

---

Francis Bacon and  
empiricism

Francis Bacon planned a great work in many volumes, to be known as the *Instauratio Magna* or “Great Renewal,” calling for a complete new start in science and civilization. He completed only two parts. One, published in 1620, was the *Novum Organum* or new method of acquiring knowledge. Here he insisted on inductive method. In the inductive method we proceed from the particular to the general, from the concrete to the abstract. For example, in the study of leaves, if we examine millions of actual leaves of all sizes and shapes and if we assemble, observe, and compare them with minute scrutiny, we are using an inductive method in the sense meant by Bacon; if successful, we may arrive at a knowledge, based on observed facts, of the general nature of a leaf as such. If, on the other hand, we begin with a general idea of what we think all leaves are like, that is, all leaves have stems, and then proceed to describe an individual leaf on that basis, we are following the deductive method; we draw logical implications from what we already know, but we learn no more of the nature of a leaf than what we knew or thought we knew at the beginning. Bacon advised his readers to put aside all traditional ideas, to rid themselves of prejudices and preconceptions, to look at the world with fresh eyes, to observe and study the innumerable things that are actually perceived by the senses. Thinkers before Bacon used the inductive method, but he formalized it as a method and became a leading philosopher of empiricism, the founding of knowledge on observation and experience. This philosophy has always proved a useful safeguard against fitting facts into preconceived patterns. It demands that we let the patterns of our thought be shaped by actual facts as we observe them. Scientific knowledge thus links particular facts to general principles and typically combines inductive method with the broader claims of deductive thought.

The other completed part of Bacon’s great work, published in 1623, was called in its English translation *The Advancement of Learning*. Here Bacon developed the same ideas and insisted also that true knowledge was useful knowledge. In *The New Atlantis* (1627), he portrayed a scientific utopia whose inhabitants enjoyed a perfect society through their knowledge and command of nature. The usefulness of knowledge became the other main element in the Baconian tradition. In this view there was no sharp difference between pure science and applied science or between the work of the purely scientific investigators and that of the inventors who in their own way probed into nature and devised instruments or machines for putting natural forces to work. The fact that knowledge could be used for

**RENÉ DESCARTES**

by Frans Hals (1584–1666)

Descartes worked for many years in Amsterdam, where he developed his work in mathematics, described his philosophical methods of systematic doubt, and sat for this famous portrait by Frans Hals.

(Eric Lessing/Art Resource, NY)

practical purposes became a sign or proof that it was true knowledge. For example, the fact that soldiers could aim their cannon and hit their targets more accurately in the seventeenth century became a proof of the theory of ballistics which had been scientifically worked out. Enthusiastic Baconians believed that knowledge was power. True knowledge could be put to work, if not immediately at least in the long run, after more knowledge was discovered. It was useful to mankind, unlike the “delicate learning” of the misguided scholastics. In this coming together of knowledge and power arose the far-reaching modern idea of progress. And in it arose many modern problems, since the power given by scientific knowledge can be used for either good or evil.

But Bacon, though a force in redirecting the European mind, never had much influence on the development of actual science. Kept busy as Lord Chancellor of England and in other government duties, he was not even fully abreast of the most advanced scientific thought of his day. Bacon's greatest weakness was his failure to understand the role of mathematics. Mathematics, dealing with pure abstractions and proceeding deductively from axioms to theorems, was not an empirical or inductive method of thought such as Bacon demanded. Yet science in the seventeenth century went forward most successfully in subjects where mathematics could be applied. Even today the degree to which a subject is truly scientific depends on the degree to which it can be made mathematical. We have pure science where we have formulas and equations, and the scientific method itself is both inductive and deductive.

Descartes was a great mathematician in his own right. He is considered the inventor of coordinate geometry. He showed that by use of coordinates (or graph paper, in simple language) any algebraic formula could be plotted

as a curve in space, and contrariwise that any curve in space, however complex, could be converted into algebraic terms and thus dealt with by methods of calculation. One effect of his general philosophy was to create belief in a vast world of nature that could be reduced to mathematical form.

Descartes set forth his ideas in his *Discourse on Method* in 1637 and in many more technical writings. He advanced the principle of systematic doubt. He began by trying to doubt everything that could reasonably be doubted, thus sweeping away past ideas and clearing the ground for his own “great renewal,” to use Bacon’s phrase. He held that he could not doubt his own existence as a thinking and doubting being (*cogito ergo sum*, “I think, therefore I exist”); he then deduced, by systematic reasoning, the existence of God and much else. He arrived at a philosophy of dualism, the famous “Cartesian dualism,” which held that God has created two kinds of fundamental reality in the universe. One was “thinking substance”—mind, spirit, consciousness, subjective experience. The other was “extended substance”—everything outside the mind and hence objective. Of everything except the mind itself the most fundamental and universal quality was that it occupied a portion of space, minute or vast. Space itself was conceived as infinite and everywhere geometric.

This philosophy had profound and long-lasting effects. For one thing, the seemingly most real elements in human experience, color and sound, joy and grief, seemed somehow to be shadowy and unreal, or at least illusive, with no existence outside the mind itself. But all else was quantitative, measurable, reducible to formulas or equations. Over all else, over the whole universe or half-universe of “extended substance,” the most powerful instrument available to the human understanding, namely, mathematics, reigned supreme. “Give me motion and extension,” said Descartes, “and I will build you the world.”

Descartes also shared Bacon’s belief in useful knowledge and human progress. Instead of the “speculative philosophy of the schools,” he wrote in the *Discourse on Method*, one might discover a “practical philosophy by which, understanding the forces and action of fire, water, air, the stars and heavens and all other bodies that surround us, as distinctly as we understand the mechanical arts of our craftsmen, we can use these forces in the same way for all purposes for which they are appropriate, and so make ourselves the masters and possessors of nature. And this is desirable not only for the invention of innumerable devices by which we may enjoy without trouble the fruits of the earth and the conveniences it affords, but mainly also for the preservation of health, which is undoubtedly the principal good and foundation of all other good things in this life.” Science, in short, opened the way to a better life that philosophy alone could never produce.

## 28. THE ROAD TO NEWTON: THE LAW OF UNIVERSAL GRAVITATION

### *Scientific Advances*

Meanwhile actual scientific discovery was advancing on many fronts. It did not advance on all with equal speed. Some of the sciences were, and long remained, dependent mainly on the collection of specimens. Botany was one of these; Europe’s knowledge of plants expanded enormously with the explorations overseas, and botanical gardens and herb collections in Europe became far more extensive than ever before, bringing important enlargements in the stock of medicinal drugs. Other sciences drew their impetus from intensive and open-minded observation. The Flemish Vesalius, by a book published in 1543, *The Structure of the Human Body*, renewed and modernized the study of anatomy. Formerly anatomists had generally held

---

Botany, anatomy,  
and physiology

that the writings of Galen, dating from the second century A.D., contained an authoritative description of all human muscles and tissues. They had indeed dissected cadavers but had dismissed those not conforming to Galen's description as somehow abnormal or not typical. Vesalius put Galen behind him and based his general description of the human frame on actual bodies as he found them.

In physiology also, dealing with the functioning rather than the structure of living bodies, there was considerable progress. Here the method of laboratory experiment could be profitably used. William Harvey, after years of laboratory work, including the vivisection of animals, published in 1628 a book *On the Movement of the Heart and Blood* which set forth the doctrine of the continual circulation of the blood through arteries and veins. The Italian Malpighi, using the newly invented microscope, confirmed Harvey's findings by the discovery of capillaries in 1661. The Dutch Leeuwenhoek, also by use of the microscope, was the first to see blood corpuscles, spermatozoa, and bacteria, of which he left published drawings. Another seventeenth-century Dutch scientist, Régnier de Graaf, published the first description of the female ovaries, thus challenging Galen's ancient theories of human sexuality and the long-accepted idea that women contributed less than men to the biological processes of reproduction.

---

Astronomy and  
physics

These sciences, and also chemistry, although work in them went forward continually, did not come fully into their own until after 1800. They were long overshadowed by astronomy and physics. Here mathematics could be most fully applied, and mathematics underwent a rapid development in the seventeenth century. Decimals came into use to express fractions, the symbols used in algebra were improved and standardized, and in 1614 logarithms were invented by the Scot John Napier. Coordinate geometry was mapped out by Descartes, the theory of probabilities was developed by Pascal, and calculus was invented simultaneously in England by Newton and in Germany by Leibniz. These advances made it more generally possible to think about nature in purely quantitative terms, to measure with greater precision, and to perform complex and laborious computations. Physics and astronomy were remarkably stimulated, and it was in this field that the most astonishing scientific revolution of the seventeenth century took place.

### *The Scientific Revolution: Copernicus to Galileo*

Ever since the Greek Ptolemy had codified ancient astronomy in the second century A.D., educated Europeans had held a conception of the cosmos which we call Ptolemaic. The

---

The Ptolemaic system

cosmos in this view was a group of concentric spheres, a series of balls within balls each having the same center. The innermost ball was the earth, made up of hard, solid, earthy substance such as people were familiar with underfoot. The other spheres, encompassing the earth in series, were all transparent. They were the "crystalline spheres" made known to us by the poets; their harmony was the "music of the spheres." These spheres all revolved about the earth, each sphere containing, set in it as a jewel, a luminous heavenly body or orb which moved about the earth with the movement of its transparent sphere. Nearest to the earth was the sphere of the moon; then, in turn, the spheres of Mercury and Venus, then the sphere of the sun, then those of the outer planets. Last came the outermost sphere containing all the fixed stars studded in it, all moving majestically about the earth in daily motion, but motionless with respect to each other because they were held firmly in the same sphere. Beyond the sphere of the fixed stars, in general belief, lay the "empyrean," the home of angels and immortal spirits; but this was not a matter of natural science.

### A SCHOLAR HOLDING A THESIS ON BOTANY

by Willem Moreelse (Dutch,  
before 1630–1666)

This scholar may be a new doctor of the University of Utrecht, where the little-known painter Willem Moreelse worked in the seventeenth century. Crowned with the laurel, the successful candidate proudly displays his thesis, on which the Latin words announce “any plant shows the presence of God”—an example of the growing scientific interest in hitherto unknown plants that reached Europe from other parts of the world in this era.

(Toledo Museum of Art. Purchased with funds from the Libbey Endowment. Gift of Edward Drumond Libbey. (1962.70))

Persons standing on the earth and looking up into the sky thus felt themselves to be enclosed by a dome of which their own position was the center. In the blue sky of day they could literally see the crystalline spheres; in the stars at night they could behold the orbs which these spheres carried with them. All revolved about the observer, presumably at no very alarming distance. The celestial bodies were commonly supposed to be of different material and quality from the earth. The earth was of heavy dross; the stars and planets and the sun and moon seemed made of pure and gleaming light, or at least of a bright ethereal substance almost as tenuous as the crystal spheres in which they moved. The cosmos was a hierarchy of ascending perfection. The heavens were purer than the earth.

This system corresponded to actual appearances, and except for scientific knowledge would be highly believable today. It was formulated also in rigorous mathematical terms. Ever since the Greeks, and becoming increasingly intricate in the Middle Ages, a complex geometry had grown up to explain the observed motion of the heavenly bodies. The Ptolemaic system was a mathematical system. And it was for purely mathematical reasons that it first came to be reconsidered. There was a marked revival of mathematical interest at the close of the Middle Ages, in the fourteenth and fifteenth centuries, a renewed concentration on the philosophical traditions of Pythagoras and Plato. In these philosophies could be found the doctrine that numbers might be the final key to the mysteries of nature. With them went a metaphysical belief that simplicity was more likely to be a sign of truth than complexity and that a simpler mathematical formulation was better than a more complicated one.

These ideas motivated Nicholas Copernicus (1473–1543), born in Poland of German and Polish background, who, after study in Italy, wrote his epochal work *On the Revolutions of the Heavenly Orbs*. In this book,

---

Nicholas Copernicus

published in 1543 after his death, he held the sun to be the center of the solar system and of the whole universe; the earth, he argued, was one of the planets revolving in space around it. This view had been entertained by a few isolated thinkers before. Copernicus gave a mathematical demonstration. To him it was a purely mathematical problem. With increasingly detailed knowledge of the actual movement of the heavenly bodies it had become necessary, as the years passed, to make the Ptolemaic system more intricate by the addition of new "cycles" and "epicycles," until, as John Milton expressed it later, the cosmos was

*With Centric and Concentric scribbled o'er,  
Cycle and Epicycle, Orb in Orb.*

Copernicus needed fewer such hypothetical constructions to explain the known movements of the heavenly bodies. The heliocentric or sun-centered theory was mathematically simpler than the geocentric or earth-centered theory hitherto held.

The Copernican doctrine long remained a hypothesis known only to experts. Most astronomers for a time hesitated to accept it, seeing no need, from the evidence yet produced, to make such a radical readjustment of current ideas. Tycho Brahe (1546–1601), the greatest authority on the actual positions and movements of the heavenly bodies in the generations immediately after Copernicus, never accepted the Copernican system in full. But his assistant and follower, Johannes Kepler (1571–1630), building on Tycho's exact observations, not only accepted the Copernican theory but carried it further.

---

*Johannes Kepler*

Kepler, a German, was a kind of mathematical mystic, part-time astrologer, and scientific genius. Copernicus had believed the orbits of the planets about the sun to be perfect circles. Tycho showed that this belief did not fit the observable facts. It was Kepler who discovered that the orbits of the planets were ellipses. The ellipse, like the circle, is an abstract mathematical figure with knowable properties. Kepler demonstrated that the closer a planet is to the sun in its elliptical orbit, the faster it moves; and he showed that the length of time in which the several planets revolve about the sun varies proportionately with their distance from the sun.

It is not possible for most people to understand the mathematics involved, but it is possible to realize the astounding implications of Kepler's laws of planetary motion. Kepler showed that the actual world of stubborn facts, as observed by Tycho, and the purely rational world of mathematical harmony, as surmised by Copernicus, were not really in any contradiction to each other—that they really corresponded exactly. Why they should be did not know; it was the mystery of numbers. He digested an overwhelming amount of hitherto unexplained information into a few brief statements. He showed a cosmic mathematical relationship between space and time. And he described the movement of the planets in explicit formulas, which any competent person could verify at will.

---

*Galileo*

The next scientific step was taken by Galileo (1564–1642). So far the question of what the heavenly bodies were made of had hardly been affected. Indeed, they were not thought of as bodies at all, but rather as orbs. Only the sun and moon had any dimension; stars and planets were only points of light; and the theories of Copernicus and Kepler, like those of Ptolemy, might apply to insubstantial luminous objects in motion. In 1609 Galileo built a telescope. Turning it to the sky, he perceived that the moon had a rough and apparently mountainous surface, as if made of the same kind of material as the earth. Seeing clearly the dark part of the moon in its various phases, and

The Copernican conception of a solar system revolving around the sun was long unknown outside a small circle of experts, and few persons understood the mathematics upon which it was based. But the meaning of the Copernican theories later spread in visual images that depicted the new astronomical view of the sun, earth, and other planets.

(© Trustees of the British Museum)

noting that in every position it only reflected the light of the sun, he concluded that the moon was not itself a luminous object, another indication that it might be made of earth-like substance. He saw spots on the sun, as if the sun were not pure and perfect. He found that the planets had visible breadth when seen in the telescope but that the fixed stars remained only points of light, as if incalculably further away. He discovered also that Jupiter had satellites, moons moving around it like the moon around the earth. These discoveries reassured him of the validity of the Copernican theory, which he had in any case already accepted. They suggested also that the heavenly bodies might be of the same substance as the earth, masses of matter moving in space. Contrariwise, it became easier to think of the earth itself as a kind of heavenly body revolving about the sun. The difference between the earth and the heavens was disappearing. This struck a terrifying blow at all earlier philosophy and theology. Some professors were afraid to look through the telescope, and Galileo was condemned and forced to an ostensible recantation by his church.

Moreover, where Kepler had found mathematical laws describing the movement of planets, Galileo now found mathematical laws describing the movement of bodies on the earth. Formerly it had been thought that some bodies were by nature heavier than others

and that heavier bodies fell to the ground faster than light ones. Galileo in 1591, according to the story, dropped a 10-pound and a 1-pound weight simultaneously from the top of the Leaning Tower of Pisa. The truth of this story has been questioned, but in any case Galileo showed that despite all previous speculation on the subject two bodies of different weights, when allowance was made for differences in air resistance due to differences of size or shape, struck the ground at the same time. His further work in dynamics, or the science of motion of bodies, took many years to accomplish. He had to devise more refined means for measuring small intervals of time, find means of estimating the air resistance, friction, and other impediments which always occur in nature, and conceive of pure or absolute motion, and of force and velocity, in abstract mathematical terms. He made use of a new conception of inertia, in which only change in motion, not the origination of motion, had to be explained. This dispensed with the need of an Unmoved Mover felt in the older philosophy.

### *The Achievement of Newton: The Promise of Science*

It was the supreme achievement of Isaac Newton (1642–1727) to bring Kepler and Galileo together, that is, to show that Kepler's laws of planetary motion and Galileo's laws of terrestrial motion were two aspects of the same laws. Galileo's discovery that moving bodies move uniformly in a straight line unless deflected by a definite force made it necessary to explain why the planets, instead of flying off in straight lines, tend to fall toward the sun, the result being their elliptical orbits—and why the moon, similarly, tends to fall toward the earth. Newton seems early to have suspected that the answer would be related to

---

#### *Universal gravitation*

Galileo's laws of falling bodies—that is, that gravity, or the pull of the earth upon objects on earth, might be a form of a universal gravitation, or a similar pull characterizing all bodies in the solar system. Great technical difficulties stood in the way, but finally, after inventing calculus, and using a new measurement of the size of the earth made by a Frenchman and experiments with circular motion made by the Dutch Huyghens on the pendulum, Newton was able to bring his calculations to fruition, and to publish, in 1687, his *Mathematical Principles of Natural Philosophy*.

This stupendous book showed that all motion that could be timed and measured, whether on the earth or in the solar system, could be described by the same mathematical formulas. All matter moved as if every particle attracted every other particle with a force proportionate to the product of the two masses and inversely proportionate to the square of the distance between them. This “force” was universal gravitation. What it was Newton did not pretend to explain. For 200 years the law stood unshaken, always verified by every new relevant discovery. Only in the past century were its limitations found; it does not hold good in the infinitesimal world of subatomic structure or in the macrocosm of the whole physical universe as now conceived.

It was in Newton's time that the pursuit of natural knowledge became institutionalized. Organized institutions, possessing equipment and funds, were engaged in scientific study, most notably the Royal Society of London, founded in 1662, and the Royal Academy of Sciences in France, founded in 1666. Both originated when earlier and informal groups, usually gentlemen of the landed class, received charters from their governments to pursue scientific interests. Scientific periodicals began to be published. Scientific societies provided the medium for prompt interchange of ideas indispensable to the growth of scientific knowledge. They held meetings, proposed projects for research, and published articles not only on the natural sciences and mathematics, but also on paleography, numismatics,

chronology, legal history, and natural law. The work of the learned had not yet yielded to specialization.

In all these activities the promise of science seemed fulfilled. Even in practical affairs conveniences followed, as anticipated by the Baconians. The tides could now be understood and predicted by the gravitational interplay of earth, moon, and sun. Exact mathematical knowledge of the celestial bodies, together with the invention of more accurate timepieces, was of great help to navigation and mapmaking. Measures of latitude, or of north-south distances on the spherical earth, had been known to the ancient Greeks. But longitude, or east-west distances, could not be measured until the eighteenth century, when it became possible to determine it by use of a chronometer and observation of heavenly bodies at a known time. Merchant ships and naval squadrons could thus operate with more assurance. Places on land could be located and mapped more exactly. Eighteenth-century Europeans were the first human beings to have a fairly accurate idea of the shapes and sizes of all the continents and oceans. Better local and regional maps of places in Europe also became available.

Mathematical advance, including the development of calculus, which allowed an exact treatment of curves and trajectories, reinforced by technical discoveries in the working of metals, led to an increased use of artillery. Armies in 1750 used twice as many cannon per soldier as in 1650. Naval ordnance also improved. These items made armed forces more expensive to maintain, requiring governments to increase their taxes, and hence producing constitutional crises. Improved firearms heightened the advantage of armies over insurrectionists or private fighting bands, thus strengthening the sovereignty of the state. They also gave Europeans the military advantage over other peoples, in America, India, or elsewhere, on which the world ascendancy of Europe was built in the eighteenth century.

The instance of the steam engine may also be cited. Steam power was eventually almost literally to move the world. In 1700 it was only in its earliest stages, but it was in sight on the horizon. A Frenchman, Denis Papin, in 1681 invented a device in which steam moved a piston, but it produced so little power that it was used only in cooking. British scientists turned their minds to it. Robert Boyle, discoverer of "Boyle's Law" on the pressure of gases, studied the problem; scientists, mechanics, and instrument makers collaborated. In 1702 Thomas Newcomen, a man without scientific training but associated with scientists, produced the steam engine known thereafter as Newcomen's engine, from which, as will be seen, James Watt developed the steam engine as we know it. Newcomen's engine was primitive according to later ideas. It burned so much fuel that it could be used only in coal mines. But it was used. Not long after 1700 it was widely employed to pump water from the coal pits. It saved labor, cheapened production, and opened hitherto unusable deposits to exploitation. It was the first application of steam to an economic purpose.

No distinction was yet felt between pure and applied science. The modern sense of the word hardly existed; what we call "science" was called natural philosophy or "useful knowledge." Traveling public lecturers, in explaining the laws of force and motion, showed their application in devices such as pulleys, scales, levers, cogwheels, waterwheels, and pumps. Such lectures were attended, especially in England, by a mixed audience of philosophers, experimenters, inventors, artisans, landed gentlemen who wished to develop their estates, and small businessmen wishing to enlarge their markets. The scientific movement thus opened the way to agricultural and industrial improvements in Great Britain and other places where the new knowledge was brought into economic activities.

Scientific  
improvements

**FOUNDING OF THE ACADEMY OF SCIENCES AND THE OBSERVATORY IN 1666**  
by Henri Testelin (1616–1695)

Testelin was an instructor at the Royal Academy of Painting and a strong defender of the academic traditions in French art. He portrayed King Louis XIV visiting the new Royal Academy of Sciences in this painting, which expresses his respect for both the king and the new scientific knowledge. But Testelin's life also exemplified another side of life in late seventeenth-century France. He was a Protestant who eventually had to give up his academic position and move to the Netherlands to practice his religion.

(Giraudon/Art Resource, NY)

*The Scientific Revolution and the World of Thought*

It was perhaps in the world of thought that the revolution accomplished from Copernicus to Newton was most profound. It has been called the greatest spiritual readjustment that human beings have been required to make. The old heavens were exploded. Humans were no longer the center of creation. The luminaries of the sky no longer shone to light their way or to give them beauty. The sky itself was an illusion, its color a thing in the mind only, for anyone looking upward was really looking only into the darkness of endless space. The old cosmos, comfortably enclosed and ranked in an ascending order of purity, gave way to a new cosmos which seemed to consist of an infinite emptiness through which particles of matter were distributed. Humans were the puny denizens of a material object swinging in space along with other very distant material objects of the same kind. About

the physical universe there was nothing especially Christian, nothing that the God portrayed in the Hebrew or the Christian Bible would be likely to have made. The gap between religion and natural science, always present yet always bridged in the Middle Ages, now opened wider than ever. It was felt with anguish by some in the seventeenth century, notably by the Frenchman Blaise Pascal, a considerable scientist, preeminent mathematician, and deep and troubled Christian believer. He left a record of his state of mind in his *Pensées*, or *Thoughts*, jottings from which he hoped some day to write a great book on the Christian faith. "I am terrified," he said in one of these jottings, "by the eternal silence of these infinite spaces."

But on the whole the reaction was more optimistic. Man might be merely a reed, as Pascal said, but Pascal added, he was "a thinking reed." Human beings might be no longer the physical center of the world. But it was the human mind that had penetrated the world's laws. The Newtonian system, as it became popularized, a process which took about 50 years, led to a great intellectual complacency. Never had confidence in human powers been so high. As the English poet Alexander Pope put it,

---

The Newtonian  
system

*Nature and nature's laws lay hid in night;  
God said, "Let Newton be," and all was light.*

Or, according to another epigram on the subject, there was only one universe to discover, and this universe had been discovered by Newton. Everything seemed possible to human reason. Although Newton and most other scientists continued to believe in the existence of God, the old feeling of dependency on divine powers and judgments lost much of its force or became something to be discussed by clergymen in church on Sunday. Human beings were not really little creatures, wayfarers in a world that was alien, yearning for the reunion with God that would bring peace. They were creatures of great capacity in their own right, living in a world that was understandable and manageable. These ideas contributed greatly to the secularizing of European society, gradually pushing religion and churches to the sidelines of European political power and many of the era's new intellectual debates.

The scientific discoveries also reinforced the old philosophy of natural law. This philosophy, developed by the Greeks and renewed in the Middle Ages, held that the universe is fundamentally orderly and that there is a natural rightness or justice, universally the same for all people and knowable by reason. It was very important in political theory, where it stood out against arbitrariness and the mere claims of power. The laws of nature as discovered by science were somewhat different, but they taught the same lesson, namely, the orderliness and minute regularity of the world. It was reassuring to feel that everywhere throughout an infinite space every particle of matter was quietly attracting every other particle by a force proportionate to the product of the masses and inversely proportionate to the square of the distance. The physical universe laid bare by science—orderly, rational, balanced, smoothly running, without strife or rivalry or contention—became a model on which many thinkers, as time went on, hoped to refashion human society. They hoped to make society also fulfill the rule of law.

In some ways it would be possible to exaggerate the impact of pure science. Scientists themselves did not usually apply their scientific ideas to religion and society. Few suffered the spiritual torment of Pascal. Both Descartes and Newton wrote earnest tracts arguing for the truth of certain religious doctrines. Bacon and Harvey were conservative politically,

Isaac Newton became the famous public symbol of the new scientific knowledge and the new scientific researcher. This portrait by an anonymous artist emphasizes the focused brilliance that made Newton an icon in the expanding institutions of scientific culture and in the wider development of eighteenth-century intellectual life.

(Bettmann/Corbis)

upholders of king against Parliament. The Englishman Joseph Glanvill, in the 1660s, used the Cartesian dualism to demonstrate the probable existence of witches. Descartes, despite his systematic doubt, held that the customs of one's country should usually be accepted without question. Natural science, in the pure sense, was not inherently revolutionary or even upsetting. If Europeans in the seventeenth century began to waver in many old beliefs, it was not only because of the stimulus of pure science but also because of an increasing knowledge and study of humanity itself.

## 29. NEW KNOWLEDGE OF HUMAN BEINGS AND SOCIETY

The discovery and exploration of the world overseas became a decisive new influence on European views of human cultures and the nature of human beings. Europe was already becoming part of the world as a whole and could henceforth understand itself only by comparison with non-European regions. Great reciprocal influences were at work. The influences of European expansion on other parts of the world are easily seen: the Indian societies of America were modified or extinguished; the indigenous societies of Africa were dislocated and many of their members were enslaved and transported; in the long run even the ancient societies of Asia were to be disrupted or undermined. From the beginning the counterinfluence of the rest of the world upon Europe was equally great. It took the form of new medicines, new diseases, new foods, new and exotic manufactures

brought to Europe, and the growth of material wealth in west-European countries, but it also affected European thinking. New questions were raised about the diversity of religious traditions, the history of languages, and the origins of human civilizations. The growing involvement with other cultures undermined the old Europe and its ideas, just as Europe was undermining the old cultures beyond the oceans. Vast new horizons opened before Europeans in the sixteenth and seventeenth centuries. Europeans of this period were the first people to know the globe as a whole, to establish colonial outposts around most of the world, or to realize the variety of the human race and its multifarious manners and customs.

### *The Current of Skepticism*

This realization was very unsettling. The realization of human differences had the effect, in Europe, of breaking what has been called the “cake of custom.” A new sense of the relative nature of social institutions developed. It became harder to believe in any absolute rightness of one’s own ways. Montaigne, already mentioned, expressed the relativist outlook clearly, and nowhere more clearly than in his famous essay on cannibals. The cannibals, he said humorously, did in fact eat human flesh; that was their custom, and they have their customs as we have ours; they would think some of our ways odd or inhuman; peoples differ, and who are we to judge? Travelers’ books spread the same message increasingly through the seventeenth century. As one of them observed (whether or not rightly), in Turkey it was the custom to shave the hair and wear the beard, in Europe to shave the beard and wear the hair; what difference does it really make? That the ways of non-Europeans might be good ways was emphasized by Jesuit missionaries. Writing from the depths of the Mississippi Valley or from China, the Jesuit fathers often dwelt on the natural goodness and mental alertness of the native peoples they encountered, perhaps hoping in this way to gain support in Europe for their missionary labors. People from the American wilderness or from Asia sometimes appeared in Europe itself. In 1684 a delegation of aristocratic Siamese arrived in Paris, followed by another in 1686. The Parisians went through a fad for Siam (now Thailand); they recounted how the king of Siam, when asked by a missionary to turn Christian, replied that divine Providence, had it wished a single religion to prevail in the world, could easily have so arranged it. The philosophical Siamese seemed civilized and wise; they allowed Christians to preach in their own country, whereas it was well known what would happen to a Siamese missionary who undertook to preach in Paris. China also was seen at this time as a civilized center of learning, tolerance, and wise ethical traditions. By 1700 there were even professors of Arabic, at Paris, Oxford, and Utrecht, who said that Islam was a religion to be respected, as good for Muslims as Christianity was for Christians.

---

*Travelers' tales*

Thus was created a strong current of skepticism, holding that all beliefs are relative, varying with time and place. Its greatest spokesman at the end of the century was Pierre Bayle (1647–1706). Bayle was influenced by the scientific discoveries also; not exactly that he understood them, for he was an almost purely literary scholar, but he realized that many popular beliefs were without scientific foundation. Between 1680 and 1682 a number of comets were seen. The one of 1682 was studied by a friend of Newton’s, Edmond Halley, the first man to predict the return of a comet. He identified the comet of 1682 with the one observed in 1302, 1456, 1531, and 1607, and predicted its reappearance in 1757 (it appeared in 1759); it was seen again in 1910 and 1986

---

*Skepticism*

The arrival of ambassadors from Siam at Versailles in 1684 made a vivid impression on a French generation that was fascinated by reports on distant lands and peoples. Although the bowing ambassadors show the requisite respect for the Sun King, their presence in France contributed to the growing speculation on cultural differences and the relativism of cultural customs.

(Musées Versailles, Reunion des Musées Nationaux/Art Resource, NY)

and is still called Halley's Comet. In the 1680s people were talking excitedly about the significance of comets. Some said that comets emitted poisonous exhalations; others, that they were supernatural omens of future events.

Bayle, in his *Thoughts on the Comet*, argued at great length that there was no basis for any such beliefs except human credulity. In 1697 he published his *Historical and Critical Dictionary*, a tremendous repository of miscellaneous lore, conveying the message that what is called truth is often mere opinion, that most people are amazingly gullible, that many things firmly believed are really ridiculous, and that it is very foolish to hold too strongly to one's own views. Bayle's *Dictionary* remained a reservoir on which skeptical writers continued to draw for generations. Bayle himself, having no firm basis in his own mind for settled judgment, mixed skepticism with an impulse to faith. Born a Protestant, he was converted to Rome, then returned to his Calvinist background. In any case his views made for toleration in religion. For Bayle, as for Montaigne, no opinion was worth burning your neighbor for.

### *The New Sense of Evidence*

But in the study of humankind, as in the study of physical nature, Europeans of the seventeenth century were not generally content with skepticism. They were not possessed by a mere negative and doubting mood, important and salutary as such an attitude was. In the subjects collectively called the humanities, as in pure science, they were looking not for disbelief but for understanding. They wanted new means of telling the true from the false, a new method for arriving at some degree of certainty of conviction. And here, too, a kind of scientific view of the world arose, if that term is understood in a general sense. It took the form of a new sense of evidence. Evidence is that which allows one to believe a thing to be true, or at least truer than something else for which the evidence is weaker. And if to believe without evidence is the sign of primitive or irrational thinking, to require evidence before believing is in a way to be scientific, or at least to trust and use the power of human intelligence.

The new sense of evidence, and of the need of evidence, revealed itself in many ways. One of the clearest was in the law. The English law of evidence, for example, began to take on its modern form at the close of the seventeenth century. It was long believed that less evidence should be necessary in arriving at a verdict of guilty in trials for the most atrocious crimes; this was thought necessary to protect society from the more hideous offenses. From the end of the seventeenth century, in English law, the judge lost his power of discretion in deciding what should constitute evidence, and the same rules of evidence were applied in all forms of accusation, the essential question being recognized as always the same—did such-and-such a fact (however outrageous) occur or did it not? After 1650 mere hearsay evidence, long vaguely distrusted, was ruled definitely out of court. After 1696 even persons charged with felony were allowed legal counsel.

---

---

*English law of  
evidence*

The new sense of evidence was probably the main force in putting an end to the delusions of witchcraft. What made witchcraft so credible and so fearsome was that many persons confessed themselves to be witches, admitting to supernatural powers and to evil designs upon their neighbors. Many or most such confessions were extracted under torture. Reformers urged that confessions obtained under torture were not evidence, that people would say anything to escape unbearable pain, so that no such confessions offered the slightest ground for believing in witches. As for the voluntary confessions, and even the boastings of some people of their diabolical powers, it was noted that such statements often came from persons who would today be called hysterical or psychotic. Witches came to be regarded as self-deluded. Their ideas of themselves were no longer accepted as evidence. But it must be added that, except in England, the use of legal torture lasted through most of the eighteenth century in criminal cases in which the judge believed the accused to be guilty.

---

---

*Evidence and  
witchcraft*

### *History and Historical Scholarship*

What are called the historical sciences also developed rapidly at this time. History, like the law, depends on the finding and using of evidence. The historian and the judge must answer the same kind of question—did such-and-such a fact really occur? All knowledge of history, so far as it disengages itself from legend and wishful thinking, rests ultimately on pieces of evidence, written records, and other works created in the past and surviving in some form or other in the present. On this mass of material the vast picture of the past is

### THE GROWTH OF GEOGRAPHICAL KNOWLEDGE

The four maps show the best scientific knowledge at their respective dates. Behaim has no inkling of the existence of America and has filled in the hemisphere opposite to Europe with a mass of islands, representing what he has heard of the East Indies and Japan. He knows pretty well the limits of Africa. Schöner in 1523 fills in America and even distinguishes two American continents. He knows of the Gulf of Mexico but fails to realize the narrowness of the Isthmus of Panama. He knows of the Straits of Magellan (but not Cape Horn) and hopefully fills in a corresponding Northwest Passage in the north. His conception of the Indian Ocean is quite accurate. To Homan, two centuries later, the size and shapes of oceans and continents are well known, but he believes New Guinea joined to Australia and is frankly ignorant of the northwest coast of North America, representing it by a straight line. The Great Lakes and the interior of North America have become known to Europe. D'Anville in 1761 has no island of Tasmania, does not understand that Alaska is a peninsula, and believes the American polar regions to be impassable by sea. Otherwise his map is indistinguishable from one on the same scale today.

built, and without it people would be ignorant of their own antecedents or would have only folktales and oral traditions.

There was much skepticism about history in the seventeenth century. Some said that history was not a form of true knowledge because it was not mathematical. Others said that it was useless because Adam, the perfect man, neither had nor needed any history. Many felt that what passed for history was only a mass of fables. History was distrusted also because historians were often pretentious, claiming to be high-flying men of letters, writing for rhetorical or inspirational appeal or for argumentative reasons, disdaining the hard labor of actual study. History was losing the confidence of thinking people who came to view science as the model for reliable knowledge. How was it possible, they asked, to feel even a modicum of certainty about alleged events that had happened long before any living person had been born?

This doubting attitude itself arose from a stricter sense of evidence, or from a realization that there was really no proof for much of what was said about the past. But scholars set to work to assemble what evidence there was. They hoped to create a new history, one that should contain only reliable statements. Europe was littered with old papers and parchments. Abbeys, manor houses, and royal archives were full of written documents, many of them of unknown age or unknown origin, often written in a handwriting that people could no longer read. Learned and laborious enthusiasts set to work to explore this accumulation. They added so much to the efforts of their predecessors as virtually to create modern critical scholarship and erudition. The French Benedictine monk Jean Mabillon, in 1681, in his book *On Diplomatics* (referring to ancient charters and “diplomas”) established the science of paleography, which deals with the deciphering, reading, dating, and authentication of manuscripts. The Frenchman DuCange in 1678 published a dictionary of medieval Latin which is still used. Others, like the Italian Muratori, spent whole lifetimes exploring archives, collecting, editing, or publishing masses of documents, comparing manuscript copies of the same text and trying to discover what the author had really written, rejecting some as fabrications or forgeries, pronouncing others to be genuine pieces of

New historical  
scholarship

The early modern interest in the preservation and study of historical materials led to a systematic organization of the libraries and sources that careful scholarship would require. This seventeenth-century engraving of a library in Leiden shows the subjects that scholars studied and the tables at which they stood to read the books.

(Corbis)

historical evidence. Others made themselves experts in ancient coins, many of which were far more ancient than the oldest manuscripts; they founded the science of numismatics. Still others, or indeed the same persons, turned to a critical examination of the inscriptions on old buildings and ruins.

Another important but little-known historical “science,” namely, chronology, was greatly stimulated also. Chronology deals with the age of the world and with finding a common denominator between the dating systems of various peoples. Probably it is not natural for the human mind to think in terms of dates at all. For simple or nonhistorically minded people it is enough to know that some things happened “long ago.” In the seventeenth century the new interest in numbers, evident in physical science, turned also to the human past. Archbishop James Usher, an Anglican prelate of Ireland, after much study of the Bible, announced the date of 4004 B.C. as that of the creation of the world. His chronological system was later printed in the margins of the Authorized Version of the English Bible and is still adhered to by some fundamentalists as if part of the Bible itself. But Usher’s system was not accepted by scholars even in his own time. Geographical knowledge was revealing China and its dynasties to Europe; historical knowledge was beginning to discover ancient Egypt. The Chinese and Egyptian records claimed a greater antiquity for their countries than the Old Testament seemed to allow for the human race. There was much erudite conjecture; one scholar about 1700 counted 70 estimates of the age of the world, ranging as high as 170,000 years, a figure which then seemed fantastic and appalling.

The difficulty was not only in the language of the Old Testament. It was in finding the correspondence between the chronological systems of different peoples. A Chinese system of dating by dynasties might be coherent within itself, but how could it be equated with the European system of dating from the birth of Christ, a date as little known to the Chinese as the date of Wu Wang was to Europeans? Even European records presented the same difficulty; the Romans counted by consulships, or from the supposed year of the founding of Rome; many medieval documents told only the year of some obscure ruler’s reign. Only infinite patience, interminable research, and endless calculation could reduce such a jumble to the simple system of modern textbooks. This is of more importance than may be at first thought. A common system of dating is a great aid to thinking of human history as an interconnected whole. An overall conception of the human race is made easier by the dating of all events according to the Christian era. This itself, it may be pointed out, is an arbitrary and conventional scale, since Christ is now thought to have been born not in A.D. 1, but in 4 B.C.

---

*A common system of  
dating*

Common dating was of importance in practical affairs as well as in historical knowledge. Europe was disunited even on the Christian calendar. Protestant and some Orthodox countries followed the old or Julian calendar; Catholic countries, the corrected or Gregorian calendar issued in the sixteenth century under authority of Pope Gregory XIII. The two calendars varied in the seventeenth century by 10 days. Only gradually was the Gregorian calendar accepted, by England in 1752, by Russia in 1918. Most other peoples today, in China, India, the Arabic world, and elsewhere, use or recognize the Gregorian calendar. Without a uniform way of specifying days and years it would be difficult to transact international affairs, hold international conferences, make plans, or pay and receive money; a global system for defining time and dates thus became essential for global economic exchanges and communications. This common dating, easily taken for granted, was a consequence of the predominance of Europe in modern times. It is a sign of growing unity in world civilization.

### *The Questioning of Traditional Beliefs*

The historical sciences provided a foundation on which a knowledge of human activities in the past could be built, and the growing geographical knowledge spread a panorama of human diversity in the present. This new knowledge shared with natural science the view that many traditional ideas were erroneous but that much could be known by a disciplined use of the human mind. The humanities and the sciences were alike in demanding evidence for belief and in trusting to the power of reason. In their impact on the old certainties of European life, the studies of human cultures exerted possibly a greater direct force than those of nature. Pascal, in his attempt to defend the Christian faith, feared the spirit of Montaigne, the mood of skepticism and denial, which he felt himself, more than he feared the findings of mathematical and physical science. And the movement of historical thought, with its insistence on textual criticism, threw doubt on much of the Christian religion, or at least on the sacred history related in the Bible, which was considered to be part and parcel of religion itself.

In 1678 a French priest, Richard Simon, published a pioneering work in Biblical criticism, his *Critical History of the Old Testament*. Although his book was condemned both by the church and by the government of Louis XIV, Richard Simon always felt himself to be orthodox; Catholic faith, he insisted, depended more on church tradition than on the literal statements of the Bible. He simply applied to the Old Testament the methods of textual criticism which others were applying to secular documents. He concluded that the Old Testament, as known, rested on medieval manuscripts, many of which were of unknown or doubtful origin, that monkish copyists had introduced errors and corruptions, and that the books thought to have been written by Moses could not have been written by him, since they contained obvious contradictions and matter clearly inserted after his death. Others went further, questioning not merely the evidence of the Biblical text, but the very possibility of some events that it related. From the scientific idea of the absolute regularity of nature on the one hand, and from a strong sense of human credulity on the other, they denied that miracles had ever occurred and looked upon oracles and prophecies among either the Greeks or the Hebrews with a dubious eye.

and criticism*

---

---

*Baruch Spinoza*

The most profoundly disturbing of all thinkers of the time was Baruch Spinoza (1632–1677), the lens grinder of Amsterdam, a Jew who was excommunicated by his own synagogue and who refused a professorship at the University of Heidelberg, craving only the quiet to think in peace. Spinoza drew on both the scientific and humanistic thought of his day. He arrived at a philosophy holding that God had no existence apart from the world, that everything was itself an aspect of God—a philosophy technically called pantheism but considered by many to be really atheistic. He denied the inspiration of the Bible, disbelieved in miracles and the supernatural, rejected all revelation and revealed religion, Jewish or Christian, and held that few if any governments of the day were really just. He taught a pure, stern, and intellectual ethical code, and one which had few consolations for the average person. His name became a byword for impiety and horrendous unbelief. People were literally afraid to read his works, even when they could find them, which was not often because of the censorship. His influence spread slowly, through the mediation of other writers, contributing to the later development of rationalist philosophy.

More widely read, less abstruse, were the writings of the Englishman John Locke (1632–1704), who summarized many of the intellectual trends of his lifetime and exerted a strong influence for the following hundred years. He combined practical experience and theoretical interests in a philosophy that dwelled on the merits of common sense. Educated in medicine, he kept in touch with the sciences and was acquainted with Newton. He was associated with the great Whig noblemen who were the main authors of the English revolution in 1688. For political reasons he spent several years in the 1680s in the Netherlands, where he became familiar with thought on the Continent. He wrote on many subjects—finance, economics, education, religious policy, political theory, general philosophy—always with an engaging directness and sober air of the sensible man of the world. In his *Letter on Toleration* (1689) he advocated an established church but with toleration of all except Roman Catholics and atheists; these he held to be dangerous to society: the former because of a foreign allegiance; the latter because they lacked a basis of moral responsibility. In his *Reasonableness of Christianity* he argued that Christianity, rightly considered, is after all a reasonable form of religion; this softened the friction between religion and natural knowledge but tended to shut out the supernatural and merge religious feeling into an unruffled common sense.

Locke's deepest book was his *Essay Concerning the Human Understanding* (1690). Here he faced the great problem of the day, the problem of knowledge; he asked if it was possible to know anything with certainty, and how certain knowledge was arrived at. His answer was that true or certain knowledge is derived from experience—from perceptions by the sense organs and reflection of the mind on these perceptions. Locke at the end of the century thus echoes Bacon at the beginning; they became the two great pillars of empirical philosophy, insisting on experience and observation as the source of truth. Locke denied Descartes's doctrine of innate ideas, or inevitable disposition of the human mind to think in certain ways. He held that the mind at birth is a blank tablet or *tabula rasa* and that the social environment shapes what people think or believe. Locke's environmentalist philosophy became fundamental to liberal and reforming thought in later years. It seemed that false ideas or superstitions were the result of bad environment and bad education. It seemed that the evil in human actions was due to bad social institutions and that an improvement in human society would improve human behavior. This philosophy, whether or not wholly true in the final analysis, was largely true with respect to many practical conditions. It gave confidence in the possibility of social progress and turned attention to a

The Dutch, Jewish philosopher Baruch Spinoza (1632–1677), portrayed here in a painting by Samuel Van Hoogstraten, developed a materialist or pantheistic philosophy that provoked strong opposition from many of his contemporaries; but Spinoza became an influential thinker for later writers who expressed skepticism about traditional religious beliefs.

(Bettmann/CORBIS)

sphere in which planned and constructive action was possible, namely, the sphere of government, public policy, and legislation. Here we touch on political theory, to which Locke contributed *Two Treatises of Government* (these works are discussed later in this chapter).

### 30. POLITICAL THEORY: THE SCHOOL OF NATURAL LAW

Political theory can never be strictly scientific. Science deals with what does exist or has existed. It does not tell what ought to exist. To describe what society and government ought to be like, in view of human nature and the capacity to be miserable or contented, is a main purpose of political theory. Political theory is in a sense more practical than science. It is the scientists and scholars who are most content to observe facts as they are. Practical people, and scientists and scholars insofar as they have practical interests, must always ask themselves what ought to be done, what policies ought to be adopted, what measures ought to be taken, what state of affairs ought to be maintained or brought about. Conservatives and radicals, traditionalists and innovators, are alike in this respect. It is impossible in human affairs to escape the word “ought.”

But political theory was affected by the scientific view. The Renaissance Italian, Niccolò Machiavelli (1469–1527), whom we have discussed earlier, had opened the way in this direction. Machiavelli too had his “ought”; he preferred a republican form of government in which citizens felt a patriotic attachment to their state. But in his book *The Prince* he disregarded the question of the best form of government, a favorite question of Christian and scholastic philosophers of the Middle Ages. He separated the study of politics from theology and moral philosophy. He undertook to describe how governments and rulers actually behaved. He observed that successful rulers behaved as if holding or increasing power

---

Niccolò Machiavelli

were their only object, that they regarded all else as means to this end. Princes, said Machiavelli, kept their promises or broke them, told the truth or distorted or colored it, sought popularity or ignored it, advanced public welfare or disrupted it, conciliated their neighbors or destroyed them—depending merely on which course of action seemed the best means of advancing their political interests. All this was bad, said Machiavelli; but that was not the question, for the question was to find out what rulers really did. Drawing his conclusions from the evidence of history, Machiavelli chose to be nonmoral in order to be scientific. To most readers he seemed to be simply immoral. Nor was it possible to draw the line between *The Prince* as a scientific description of fact and *The Prince* as a book of maxims of conduct. In telling how successful rulers obtained their successes, Machiavelli also suggested how rulers *ought* to proceed. And though governments did in fact continue to behave for the most part as Machiavelli said, most people refused to admit that they ought to.

### *Natural Right and Natural Law*

Political theory in the seventeenth century did not embrace the cynicism attributed to Machiavelli. Nor did it fall into the skepticism of those who said that the customs of one's country should be passively accepted or that one form of government was about as good as another. It directly faced the question, What is right? The seventeenth century was the classic age of the philosophy of natural right or of natural law.

"Natural law" and  
"natural right"

The idea of natural law underlies a good deal of modern democratic development, and its decline in the last century has been closely connected with many of the troubles of recent times. It is not easy to say in what the philosophy of natural law essentially consisted. It held that there is, somehow, in the structure of the world, a law that distinguishes right from wrong. It held that right is "natural," not a mere human invention. This right is not determined, for any country, by its heritage, tradition, or customs, nor yet by its actual laws (called "positive" laws) of the kind that are enforced in the law courts. All these may be unfair or unjust. We detect unfairness or injustice in them by comparing them with natural law as we understand it; thus we have a basis for saying that cannibalism is bad or that a law requiring forced labor from orphan children is unjust. Nor is natural law, or the real rightness of something, determined by the authority of any person or people. No king can make right that which is wrong. No people, by its will as a people, can make just that which is unjust. Right and law, in the ultimate sense, exist outside and above all peoples. They are universal, the same for all. No one can make them up to suit themselves. A good king or a just people is a king or people whose actions correspond to the objective standard. But how, if we cannot trust our own positive laws or customs, or our leaders, or even our collective selves, can we know what is naturally right? How do we discover natural law?

The answer, in the natural law philosophy, is that we discover it by reason. Philosophers of natural law said that human beings are rational animals. And they assumed that all human beings have, at least potentially and when better enlightened, the same powers of reason and understanding—Germans or English, Asians, Africans or Europeans. This view favored a cosmopolitan outlook and made international agreement and general world progress seem realizable goals. As time went on, the premises of this philosophy came to be questioned. By the twentieth century it was widely thought that the human mind was not especially rational but was motivated by unconscious drives or urges or instincts and that human cultural differences were so fundamental that people of different nationalities or classes could never expect to see things in the same way. Challenged by such theories of

human irrationality and cultural difference (which could be promoted with much ancient and modern evidence), the older philosophy of a universal natural law lost its hold on many minds.

In the seventeenth and eighteenth centuries, however, it was generally accepted. Some, carrying over the philosophy of the Middle Ages, thought of natural law as an aspect of the law of God. Others, more secular in spirit, held that the natural law stood of itself. These included even some churchmen; a group of theologians, mainly Jesuits, were condemned by the pope in 1690 for holding that universal right and wrong might exist by reason only, whether God existed or not. The idea of natural law and the faith in human reason went side by side, and both were fundamental in the thought of the time. They were to be found everywhere in Europe, in their religious or their secular form.

On the basis of natural law some thinkers tried to create an international law or "law of nations," to bring order into the maze of sovereign territorial states, great and small, that was developing in Europe. Hugo Grotius, in 1625, published the first great book devoted exclusively to this subject, his *Law of War and Peace*.

Samuel Pufendorf followed with his *Law of Nature and of Nations* in 1672. Both held that sovereign states, though bound by no positive law or authority, should work together for the common good, that there was a community of nations as of individuals, and that in the absence of a higher international sovereignty they were all still subordinate to natural reason and justice. Certain concrete doctrines, such as the freedom of the seas or the immunity of ambassadors, were put forward. The principles of international law remained those of natural law. The content came to include specific agreements between governments, certain kinds of admiralty and maritime law, and the terms of treaties such as the treaties of Westphalia, Utrecht, and others. The means of enforcement, to be sure, remained weak or nonexistent in crises.

---

"Law of nations"

### *Hobbes and Locke*

In domestic affairs the philosophy of natural law, though it rather favored constitutionalism, was used to justify both constitutional and absolutist governments. Right itself was held to be in the nature of things, beyond human power to change. But forms of government were held to be means to an end. No philosopher at the time thought the state to have an absolute value in itself. The state had to be "justified," made acceptable to the moral consciousness or to reason. There were, indeed, important competing philosophies. On the side of absolutism was the doctrine of the divine right of kings. On the side of constitutionalism were arguments based on heritage or custom, emphasizing the charters, bulls, or compacts of former times and the historic powers of parliaments and estates. But neither the supernatural argument of the divine right of kings nor the historical argument pointing back to liberties of the Middle Ages was entirely satisfactory in the scientific atmosphere of the seventeenth century. Neither carried complete conviction to the reason or moral sense of the most acute thinkers. Both were reinforced by arguments of natural law. Two Englishmen stand out above all others in this connection. Absolutism was philosophically justified by Thomas Hobbes; constitutionalism, by John Locke.

Hobbes (1588–1679) followed the scientific and mathematical discoveries of his time with more than an amateur interest. In philosophy he held to a materialistic and even atheistic system. In English politics he sided with king against Parliament; he disliked the disorder and violence of the civil war of the 1640s and the unstable conditions of the English republic of the 1650s. He concluded that humans have no capacity for self-government. His opinion of human

---

*Absolutism and  
Thomas Hobbes*

nature was low; he held that people in the “state of nature,” or as imagined to exist without government, were quarrelsome and turbulent, forever locked in a war of all against all. In his famous phrase, life in the state of nature was “solitary, poor, nasty, brutish and short.” From fear of each other, to obtain order and enjoy the advantages of law and right, people came to a kind of agreement or “contract” by which they surrendered their freedom of action into the hands of a ruler. It was necessary for this ruler to have unrestricted or absolute power. Only thus could he maintain order. It was intolerably dangerous, according to Hobbes, for anyone to question the actions of government, for such questioning might reopen the way to chaos. Government must therefore be a kind of Leviathan (the monster mentioned in the Bible, Job 41); and Hobbes in fact used the word *Leviathan* for the title of his principal book, published in 1651, two years after the execution of King Charles I.

By this book Hobbes became the leading secular exponent of absolutism and one of the principal theorists of the unlimited sovereignty of the state. His influence on later thinkers was very great. He accustomed political theorists to the use of purely natural arguments. He quoted freely from the Bible, but the Bible had no influence on his thought. After Hobbes, all advanced political theorists regarded government as a device created by human purpose. It was no longer considered, except popularly and except by professional theologians, as part of God’s divine dispensation to human history. Hobbes also affected later theorists by his arguments for a sovereign authority and, more negatively, by obliging them to refute his idea of an unlimited personal sovereign. But he was never a popular writer. In England the cause which he favored was lost. In those continental countries where royal absolutism prevailed his arguments were received with secret gratification, but his irreligion was too dangerous to make public, and the absolutist argument, on the popular level, remained that of the divine right of kings. In any case Hobbes’s arguments were in some ways insufficient for real monarchs. Hobbes abhorred struggle and violence. He believed that absolutism would produce civil peace, individual security, and a rule of law. He also held that absolute power depended on, or had at least originated in, a free and rational agreement by which people accepted it. An absolute monarchy that flagrantly violated these conditions could with difficulty be justified even by the doctrines of Hobbes. It is in these respects that Hobbes differs from totalitarian theorists of more recent times. For Hobbes, in the final analysis, absolute power was an expedient to promote individual welfare. It was a means necessary to the realization of natural law.

---

John Locke

John Locke (1632–1704), as has been seen, also stood in the main current of scientific thought and discovery. But in his political philosophy he carried over many ideas of the Middle Ages, as formulated in the thirteenth century by St. Thomas Aquinas and kept alive in England by successive thinkers of the Anglican church. Medieval philosophy had never favored an absolute power. With Hobbes, Locke shared the idea that good government is an expedient of human purpose, neither provided by divine Providence nor inherited by a national tradition. He held, too, like Hobbes and the whole school of natural law, that government was based on a kind of contract, or rational and conscious agreement upon which authority was based. In contrast to Hobbes, he sided with Parliament against king in the practical struggles of politics. About 1680, in the course of these disputes, he wrote *Two Treatises of Government*, which, however, were not published until shortly after the parliamentary revolution of 1688–1689.

Locke took a more genial view of human nature than Hobbes. As he showed in his other books, he believed that a moderate religion was a good thing and above all that people could learn from experience and hence could be educated to an enlightened way of life.

in a perfect world...

These ideas favored a belief in self-government. Locke declared (in contradiction to Hobbes) that people in the “state of nature” were reasonable and well disposed, willing to get along with one another though handicapped by the absence of public authority. They likewise had a moral sense, quite independently of government; and they also possessed by nature certain rights, quite apart from the state. These rights were the rights to life, liberty, and property.

Locke placed heavy emphasis on the right of property, by which he usually meant the possession of land. His philosophy can in fact be regarded as an expression of the landed classes of England, who challenged the power of kings by defending the political and social rights of private property. Individuals in the state of nature are not altogether able, according to Locke, to win general respect for their individual natural rights. They cannot by their own efforts protect what is “proper” to them, that is, their property. They agree to set up government to enforce observance of the rights of all. Government is thus created by a contract, but the contract is not unconditional, as claimed by Hobbes. It imposes mutual obligations. The people must be reasonable; only rational beings can be politically free. Liberty is not an anarchy of undisciplined will; it is the freedom to act without compulsion by another. Only rational and responsible creatures can exercise true freedom; but adult human beings, according to Locke, are or can be educated to be rational and responsible. They therefore can and should be free. On government, also, certain conditions and obligations are imposed. If a government breaks the contract, if it threatens the natural rights which it is the sole purpose of government to protect, if, for example, it takes away a man’s property without his consent, then the governed have a right to reconsider what they have done in creating the government and may even in the last extremity rebel against it. The right to resist government, Locke admits, is very dangerous, but it is less dangerous than its opposite, which would lead to the loss of all liberty; and in any case we are talking about reasonable and responsible people.

If Locke’s ideas seem familiar, especially to Americans, it is because of the wide popularizing of his philosophy in the century after his death. Nowhere was his influence greater than in the British colonies. The authors of the American Declaration of Independence and of the Constitution of the United States knew the writings of Locke very thoroughly. Some phrases of the Declaration of Independence echo his very language. In Great Britain also, and in France and elsewhere, in the course of time, Locke’s influence was immense. But it should be noted that his ideas did not always mean the same thing for all people or in all places. Locke did not extend his ideas of human liberty to enslaved Africans, apparently because he viewed slavery as a legitimate form of private property. Locke himself invested in the slave-trading Royal African Company and endorsed the development of slavery in the American colonies. The growing influence of Locke’s political theories may also have contributed indirectly to the emergence of new racist ideas in the eighteenth century. New justifications for slavery became necessary when the political classes of England and America began to believe that human beings possessed natural rights to life, liberty, and property. How could slavery be reconciled with such beliefs? The answer appeared in new forms of racism, which justified the enslavement of Africans by arguing that the African “race” lacked certain rational human traits of the European “race” and that black people could be denied fundamental human rights because they differed from other human beings.

In general, however, Locke’s ideas of natural rights and human liberty were later used to challenge absolutist or repressive institutions, including also the institutions of slavery. What Locke did was to convert an episode in English history into an event of universal

---

Locke’s influence

**JOHN LOCKE**

by John Greenhill (English,  
1642–1676)

**Locke's writings on government and natural rights summarized the arguments against royal power in England and also won adherents wherever political theorists challenged monarchical absolutism.**

(Snark/Art Resource, NY)

political meaning. In England, in 1688, certain great lords, winning the support of the established church, gentry, and merchants, deposed one king and brought in another. On the new king they imposed certain obligations—specified in the Bill of Rights of 1689 and all dealing with legal or technical interpretations of the English constitution. The Revolution of 1688 was a very English affair. England in 1688 was still little known to the rest of Europe. The proceedings in England, so far as known, might seem no different from a rebellion of the magnates of Hungary. Locke, in arguing that Parliament had been right to eject James II, put the whole affair on a level of reason, natural right, and human nature. It thus came to have meaning for people who had no connection with the specific problems of English political history.

---

*Locke on the English  
revolution*

At the same time, Locke made the English revolution a sign of progress rather than reaction. The new and modern form of government in 1690 was royal absolutism, with its professional bureaucracy and corps of paid officials. Almost everywhere there was resistance to the kings, led by landed interests and harking back to earlier freedoms. Such resistance seemed to many Europeans to be feudal and medieval. Locke made the resistance in England, namely, the Revolution of 1688 against James II, into a modern and forward-looking move. He checked the prestige of absolutism. He gave new prestige to constitutional principles. He carried over, in modified form, many ideas from the scholastic philosophers of the Middle Ages, who had generally maintained that kings had only a relative and restricted power and were responsible to their peoples. To these ideas he added the force of the newer scientific view of the world. He did not rest his case on supernatural or providential argu-

ments. He did not say that constitutional government was the will of God. He said that it rested on experience and observation of human nature, on recognition of certain individual rights and especially the right of property, and on the existence of a purely natural law of reason and justice. He was an almost entirely secular thinker, and, as such, he developed ideas that could be drawn into the political and social conflicts of most modern nations.

One must not claim too much for Locke, or for any writer. England was in fact, in 1688, more modern in many ways than other countries in Europe. The Glorious Revolution was in fact not exactly like uprisings of the landed and propertied classes elsewhere. England in the following century did in fact create a form of parliamentary government that was unique. But facts go together with the theories that give them an understandable meaning. Events in England, as explained by Locke, and as seen in other countries and even in England and its colonies through Locke's eyes, launched into the mainstream of modern history the superb tradition of constitutional government, which has been one of the principal themes in the history of the modern world ever since.

By 1700, at the close of the "century of genius," some beliefs that were to become characteristic of modern times had clearly taken form, notably a faith in science, in human reason, in natural human rights, and in progress. The new scientific knowledge was beginning to transform the global economy, the culture of European elites, and the conflicts within or among European empires. Meanwhile, the cultural institutions of modern science were spreading across Europe, and new scientific theories in physics, astronomy, and physiology were challenging both the theology and thought systems of earlier generations. The following period, generally known as the Age of Enlightenment, was to be a time of clarifying and popularizing ideas which the more creative seventeenth century had produced. These ideas were eventually to revolutionize Europe, America, and the world. They were also in subsequent years to be modified, amended, challenged, and even denied. But they are still very much alive today.

# Chapter 7

## THE STRUGGLE FOR WEALTH AND EMPIRE

31. Elite and Popular Cultures
32. The Global Economy of the Eighteenth Century
33. Western Europe after the Peace of Utrecht, 1713–1740
34. The Great War of the Mid-Eighteenth Century: The Peace of Paris, 1763

 In earlier chapters we have seen how western Europe, and especially England and France, by about the year 1700 came to occupy a position of power and influence in Europe as a whole. We have traced the political history of western Europe through the War of the Spanish Succession, terminated in 1713–1714 by the treaties of Utrecht and Rastadt. Affairs of central Europe and Germany have been carried to 1740. In that year a new kingdom of Prussia and a new or renovated Austrian monarchy, each passing into the hands of a new ruler, stood on the eve of a struggle for ascendancy in central Europe. As for eastern Europe, we have observed the Europeanizing and

expansion of the Russian empire.

More important in the long run than these political events, and continuing through the seventeenth and eighteenth centuries, was the cumulative expansion of all forms of knowledge, which we saw in the rapid development of seventeenth-century science and to which we turn again in the next chapter. Equally important was the growing wealth of Europe, or at least of the Atlantic region north of Spain. The new wealth, in the widest sense, meaning conveniences of every kind, resulted partly from the new technical and scientific knowledge, which in turn it helped to produce; and the two together, more wealth and more knowledge, helped to form one of the most far-reaching ideas of modern times, the idea of progress. This idea challenged the traditional deference to ancient authorities and fostered critical inquiry, creative innovations, and remarkable optimism in most spheres of social and intellectual life. Although the world wars and environmental problems of more recent times would eventually provoke widespread anxieties about the historical consequences of new technologies, a belief in progress, even if somewhat chastened, remains a powerful cultural force in all modern societies.

Chapter emblem: Detail from an Indian miniature (c. 1785), showing an Englishwoman and one of her servants in India. (Werner Forman Archive/Art Resource, NY)

The new wealth of Europe was not like the age-old wealth of the great empires in the East, said by Milton to “shower on her kings barbaric pearl and gold.” It consisted of gold, to be sure, but even more of bank deposits and facilities for credit, of more and better devices for mining coal, casting iron, and spinning thread, more productive agriculture, better and more comfortable houses, a wider variety of diet on the table, more and improved sailing ships, warehouses, and docks; more books, more newspapers, more medical instruments, more scientific equipment; greater government revenues, larger armies, and more numerous government employees. In the wealthy European countries, and because of the growing wealth, more people were freed from the necessity of toiling for food, clothing, and shelter, and were enabled to devote themselves to all sorts of specialized callings in government, management, finance, war, teaching, writing, inventing, exploring, and researching, and in producing the amenities rather than the barest necessities of life. These new forms of mechanical production, social organization, and specialized knowledge also began to spread to European colonies around the world, thus contributing to the expanding systems of global trade and to the growing belief in human progress.

### 31. ELITE AND POPULAR CULTURES

The accumulation of wealth and knowledge was not evenly distributed among the various social classes. There had always been differences between rich and poor, with many gradations between the extremes, but at the time we are now considering, as the seventeenth century turned into the eighteenth, there came to be a more obvious distinction between elite and popular cultures. The terms are hard to define. The elite culture was not exactly the culture of the rich and well-to-do, nor was the popular culture limited to the poor and lower economic classes. The word “elite” suggests a minority within a given range of interests; thus there are elites not only of wealth, but of social position and of power; elites of fashion, of patronage and connoisseurship in the arts, and of artists themselves; elites of education, of special training as in medicine and law, and of discovery and accomplishment in technology and the sciences. In general, persons taking part in an elite culture could share at will in the popular culture by attending public amusements or simply by talking familiarly with their servants. But the relation was asymmetric. Those born in popular culture could not easily share in the intellectual or social culture of the elites, at least not without transforming themselves, through education or marriage, which could occur only in exceptional cases.

A main difference was simply one of language. At the popular level people generally used a local form of speech, varying from one place to another, with a distinctive accent, and with words that had become obsolete elsewhere or that might not be understood even a few miles away. In the Middle Ages this variety had been overcome by the use of Latin. Since the invention of printing and the rise of national literatures, and with the spreading influence of schools, of which we have seen that many were founded between 1550 and 1650, there came to be standard forms of English, French, Italian, and other languages,

employed by all educated persons. Grammar and spelling became regularized. Virtually all printing was in a national language when it was not in Latin. Since only a minority were able to get the necessary education, the mass of the people continued to speak as they did before. Their way of talking was now considered a dialect, a peasant language, or what was called *patois* in French

or *Volkssprache* in German. And while it may be true, as some scientific philologists have said, that no form of speech is “better” than another, it is also true that facility in the national language was a sign of elite culture until the spread of universal elementary schooling in the nineteenth century. It gave access to at least certain segments of the elite culture, as it continues to do today, and it enabled educated persons to participate in the elite institutions of government, commerce, and the professions.

The elite culture was transmitted largely by way of books, although acquired also by word of mouth within favored families and social circles. The popular culture was predominantly oral, although also expressed in cheaply printed almanacs, chapbooks, woodcuts, and broadsides. Since it was so largely oral, and left so few written records, popular culture is difficult for historians to reconstruct, although it made up the daily lives, interests, and activities of the great majority in all countries. It must always be remembered that what we read as history, in this as in most other books, is mostly an account of the work of a small minority, either of power-wielders, decision-makers, and innovators whose actions nevertheless affected whole peoples, or of writers and thinkers whose ideas appealed to a limited audience. Persons who were illiterate or barely literate changed their ideas more slowly than the more mobile and more informed members of the elite. Cultural changes initiated by such elites spread slowly, generation after generation, to wider social classes, so that what was characteristic of popular culture at a given moment, such as a belief in magic, had often been common to all classes a century or two before. All people and social classes make history and participate in the processes of historical change, but the new knowledge, education, and wealth in early modern societies also created new forms of social distinctions and new hierarchies of cultural power.

---

*Oral vs. print culture*

The humanism of the Renaissance, being transmitted so largely through books and the study of Greek and Latin, remained limited to the elite culture. The strength of the Protestant Reformation lay in combining the efforts of highly educated persons, such as Luther and Calvin, with the anger, distress, disillusionment, and hopes of many very ordinary people. The new science and the ensuing eighteenth-century Enlightenment emerged in the work of small numbers of experimenters and writers but slowly reshaped the thinking of others. The process of diffusion might be slow and uncertain. Astrology, for example, was in the Middle Ages a branch of scientific inquiry; in the seventeenth century astrologers were still consulted by emperors and kings; then divination by the stars was denounced by both the clergy and secular thinkers as a superstition, and astrology was expelled from astronomy, but horoscopes still appear in American and European newspapers in our own time.

The differences of wealth, if not wholly decisive, were of great importance. Culture in the broader or anthropologist’s sense of the word includes material circumstances of food, drink, and shelter. In some respects the lot of the poor in the seventeenth century was worse than in the Middle Ages. Less meat was eaten in Europe, because as population grew there was less land available for the raising of livestock. With the growth of a market economy many peasants raised wheat, but ate bread made of rye, barley, or oats, or even looked for acorns and roots in times of famine. The consumption of bread by working people in France in the eighteenth century was about a pound per day per person, because little else except cabbages and beans was eaten on ordinary days; after 1750 the use of white bread became more usual. Meanwhile the rich, or the merely affluent, developed more delicate menus prepared by professional cooks, one of whom is said to have committed suicide when his soufflé fell.

---

*Living standards*

---

*Housing conditions*

In the towns the poor lived in crowded and unwholesome buildings, and in the country they lived in dark and shabby cabins where stoves only gradually replaced holes in the roof for the escape of smoke. The poor had no glass in their windows, the middle classes had some, and the rich had glass windows and mirrors in profusion. In humble homes the dishes were wooden bowls, slowly replaced by pewter, while china plates began to appear on the tables of the more well-to-do. Table forks, with one for each diner, originating in Italy, were brought to France in the sixteenth century by Catherine de Medici along with other items of Italian culture, and soon spread among those able to afford them, though Louis XIV still preferred to use his fingers. Silver bowls and pitchers were ancient but became more elaborate and more often seen in upper-class circles. The poor had no furniture, or only a few benches and a mat to sleep on; the middle classes had chairs and beds; the rich not only had substantial furniture but were becoming more conscious of style. Among persons of adequate income it became usual to have houses with specialized rooms, such as separate bedrooms, and a dining room. The prominent and the fashionable fitted out rooms for social receptions and entertainments, called salons in France, with walls of wood paneling, lighted by chandeliers reflected in mirrors, and provided with sofas and armchairs, which the invention of upholstery made more comfortable. The poor, after dark, huddled on chests or on the floor by a single candle.

In the use of beverages the seventeenth century saw progress, if that is the right word. Coffee and tea, along with sugar and tobacco, all imported from overseas, were exotic rarities in 1600, more widely enjoyed in 1700, and available to all but the very destitute by the time of the French Revolution. Coffee shops developed and taverns multiplied. Cheap wines became more plentiful in southern Europe, as did beer in the north. The distillation of alcohol had been developed in the Middle Ages, when brandy, a distilled wine, was used as a medicine; by the seventeenth century it was a familiar drink. Whisky and gin also came into use at about this time. The taverns and coffee shops offered a place for neighborly gatherings for the middling and lower social classes. Drunkenness became a more visible problem in European cities, especially among workers who could not drink in domestic privacy and who were therefore often seen in the streets, as shown by Hogarth's pictures of "Gin Lane" in London about 1750. Arising from all this poverty and disorganization, especially in the large cities, was an increase in out-of-wedlock births and abandonment of children. It was calculated that in Paris in 1780 there were 7,000 abandoned children for 30,000 births, but many of these infants were brought from the country to be deposited in the foundling hospitals of the city, which were overwhelmed.

---

*Religion*

There was much that persons of all classes and cultures shared. Most important, in principle, was religion. The refined and the rude, the learned and the untutored, heard the same sermons in church, were baptized, married, and buried by the same sacraments, often by the same priest, and were subject to religious and moral obligations that transcended the boundaries of social class. Such was most likely to be the case in small communities of unmixed religion or where the lord and lady of the manor attended the same church as the villagers. Where different churches existed in fact, whether or not officially tolerated, religion played less of a role in social cohesion. In England, for example, the Nonconformists, who succeeded the old Puritans after the Stuart Restoration, developed a kind of middle-class culture that was noticeably different from the culture of the Anglican gentry. Rich families in both Protestant and Catholic countries might have their own private chaplains and build chapels of their own. In towns that were big enough for neighborhood diversification some churches

**GIN LANE**

by William Hogarth (English,  
1697–1764)

Hogarth showed both the popularity and dangers of alcohol in the lives of Britain's working classes, as in this illustration of drunkenness in the streets of London.

(Metropolitan Museum of Art, Harris  
Brisbane Dick Fund, 1932)

The popularity of coffee and tea in the eighteenth century made the coffeehouse a popular meeting place in large cities such as London and Paris. The establishment portrayed here attracted a fashionable, wealthy clientele, but many coffeehouses also catered to the lower classes.

(The Metropolitan Museum of Art,  
Harris Brisbane Dick Fund, 1935  
(35.100.31))

became fashionable and others merely popular. In any case some people in the seventeenth century were not very religious at all; these would include those in inaccessible rural areas as well as some of the poorest in the larger towns, who were often uprooted and homeless migrants from an overcrowded countryside. Reforming bishops, especially in France, undertook to ameliorate the situation, so that the seventeenth century was a great age of

internal missionary work, and it may be that in the following century, as skepticism began to pervade the elite culture, the popular culture became more Christianized than it had been in the past.

---

#### Health

Rich and poor were subject to the same diseases, the same dangers of tainted food and polluted water, and the same smells and filth in noisy streets littered with horse droppings, puddles, and garbage. Not of course equally: in the elite culture people called on the service of doctors, who had been trained in the universities, while ordinary sufferers sought out popular healers, who were often women and whose remedies consisted of strange herbs or mysterious potions (women did not become doctors because they could not attend universities); and it made a difference whether one rode through the streets in a coach, as the affluent did, or picked one's way on foot with the common people. Congestion was worst in rapidly growing cities, such as London, Paris, Amsterdam, and Naples, where the differences between wealth and poverty were both more extreme and more shockingly visible. There were recurrent fears of shortage of food, as crop failure or local famine struck this or that region, in which case some starved and some ate less, while those able to do so simply paid higher prices. In some towns charitable organizations developed, often on the initiative of upper-class women, to finance and assist religious sisters in relief of the poor. Hunger and the fear of hunger sometimes produced riots, which however had little political significance except insofar as upper-class people tried to make use of them for their own purposes.

---

#### Politeness, etiquette, entertainment

It was also in less material aspects that the elite and popular cultures increasingly diverged. The upper strata set a new importance on polite manners, in which the French now set the tone, with much bowing, doffing of hats, and exchange of compliments, beside which the manners of ordinary people now seemed uncouth. The etiquette of princely courts became more formal, the court fools and jesters disappeared, and royalty surrounded itself not with rough retainers but with ladies and gentlemen. About 1600 the plays of Shakespeare were staged in public theaters where all classes mixed and enjoyed the same performance, but in the following century it became usual for the upper classes to have private theaters. People of higher social position took to stylish dancing, which their children had to learn from dancing teachers, while plain people continued to cavort more spontaneously in country dances and jigs. For evening parties, the polite world met in salons to engage in the art of cultured conversation, while working people, especially in the country, met in a neighbor's house after the day's labors were over, and there, while the men mended their implements and the women mended the clothes, engaged in local gossip, listened to storytellers, or sat by while someone read aloud from one of the cheaply printed books that were now widely circulated.

Enough of these books have survived, along with popular almanacs, to make it possible to form some ideas of the mental horizons of the nonliterate and inarticulate classes. They were often written by printers or their employees or by others who were in effect intermediaries between the elite and popular cultures and who purposely addressed themselves to what they knew of popular interests. The almanacs purveyed astrological observations, advice on the weather, proverbs, and scraps of what had once been science but was now offered as occult wisdom. Other little books undertook to teach the ABCs or told how to behave in church; how to approach persons of the other sex; how to show respect for superiors; or how to compose a proper letter of love, thanks, or condolence, or have such a letter written by the professional letter writers to whose services illiterate persons resorted. Still others put into print the stories that had long circulated in the oral tradition,

fairy tales, saints' lives, or accounts of outlaws such as Robin Hood. Miracles, prodigies, witches, ogres, angels, and the devil figured prominently in such narratives.

It is a curious fact that where educated persons were now schooled in Greek mythology and admired the heroes of ancient Rome, the plain people were still engrossed by tales of medieval chivalry, knights errant, and holy hermits that had once been told in baronial halls. Memories of the times of King Arthur and Charlemagne lingered in the popular consciousness. There were many long and complex tales of the exploits of Roland and other paladins who had fought for Christianity against the infidels, all set in a world of faraway adventure without definite location in time or place. Saracens, Moors, Turks, and Muslims, and at times Jews, were generally portrayed in such stories as menacing figures.

Belief in witchcraft and magic was to be found in 1600 in all social classes. The witches in *Macbeth* were perfectly believable to Shakespeare's audience. Learned books were still written on these subjects, and indeed it may be that learned writers and the judges in law courts had stirred up more anxiety about witches and magicians than ordinary people would otherwise have felt. By 1700 a great change was evident: witches, magicians, and miscellaneous enchantments were disappearing from the elite culture, but they still figured in the popular mind. Unaffected as yet by either science or doubt, most ordinary people inclined to think that there was something true about magic, which they distinguished as good and bad. Good magic unlocked the "secrets" of nature; popular writings on alchemy told of famous sages of the past who knew how to turn base metals into gold; there were special formulas that added to the efficacy of prayer. Some old women had a secret knowledge of medicinal herbs, in which indeed there might be some pragmatic value but which was blended with the mysterious and the occult. Bad magic was used to cause harm; it taught the black arts; it gave force to curses; it often involved a compact with the devil; it was what made witches so fearsome. By 1700 such ideas were subsiding. Judges no longer believed that such powers existed, and so would no longer preside at witchcraft trials. The same may be said of belief in prophecies and oracles: in the elite culture only those recorded in the Bible retained any credibility, but there was still a popular acceptance of recent prophecies and foretellings of the future.

---

Witchcraft and  
magic

Popular culture continued to express itself also in fairs and carnivals. For men and women who lived limited lives these were exciting events that occurred only at certain times of the year and to which people flocked from miles around. At the fairs one could buy things that local shops and wandering peddlers could not supply. There would be puppet shows, jugglers, and acrobats. There were conjurers who refused to admit like modern magicians that they were using merely natural means. A mountebank was someone who mounted a platform (*banco* in Italian) where he sold questionable remedies for various ills while keeping up a patter of jokes and stories, often accompanied by a clown. Blind singers and traveling musicians entertained the throngs, and for the tougher minded there were cockfights and bear baiting. In such a hubbub itinerant preachers might denounce the vanities of this world or throw doubt on the wisdom of bishops and lawyers.

Carnival went on for several weeks preceding Lent. The word itself, from the Italian *carne vale*, meant "farewell to meat," from which good Christians were to abstain during the 40-day Lenten fast; in France it climaxed in the Mardi Gras ("fat Tuesday"). It persisted in Protestant countries also. It was a time for big eating and heavy drinking and for general merrymaking and foolery. Comical processions marched through the streets. Farces were performed and mock sermons were delivered. Young men showed their strength in tugs-of-war, footraces,

---

Carnival

### A CARNIVAL ON THE FEAST DAY OF SAINT GEORGE

by Pieter Bruegel, the Younger (Flemish, 1564–1638)

Carnivals broke the normal patterns of daily life in towns and villages throughout the early modern era. This painting shows an early seventeenth-century carnival near the Flemish city of Antwerp, but the games, eating, drinking, dancing, and banners were typical of the carnivals in almost every European village during this era.

(Christie's Images/Bridgeman Art Library)

and a rough-and-tumble kind of football. A common theme was what was called in England “the world turned upside down.” Men and women put on each other’s clothing. Horses were made to move backward with the rider facing the tail. Little street dramas showed the servant giving orders to the master, the judge sitting in the stocks, the pupil beating the teacher, or the husband holding the baby while the wife clutched a gun. In general, the carnival was a time for defying custom and ridiculing authority. It is hard to know how much such outbursts were expressions of genuine resentments and how much they were only a form of play. They could, indeed, be both.

In 1600 people of all classes took part in these festive activities. In the following century, as both the Protestant and the Catholic Reformations extended their influences, the clergy undertook to purge such public events of what they considered excesses, and with the growth of the state the civil authorities began to frown on them as incitements to subversion. By 1700 the people of elite culture, the wealthy, the fashionable, and the educated,

were more inclined to stay away or attended only as spectators to be amused at the simple pleasures of the common people. In the eighteenth century, as the various elites took to more formal manners and to neoclassicism in literature and the arts, the gulf between the elite and popular cultures widened. The clergy campaigned against necromancy and tried to restrain the faithful in the matter of pilgrimages and veneration of dubious local saints. As the medical profession developed, the popular healers and venders of nostrums were seen as charlatans and quacks. As scientific and other knowledge increased among educated elites, those who lacked such knowledge appeared to be simply superstitious or ignorant. It may be said both that the elites withdrew from the popular culture and that the people as a whole had not yet been brought into the pale of higher civilization. In any case, class distinctions became sharper than ever. But nothing ever stands still, and before the year 1800 there were persons in the elite culture who were beginning to “rediscover” the people, to collect ballads and fairy tales, and to lay a foundation for what in the nineteenth century was called “folklore.”

## 32. THE GLOBAL ECONOMY OF THE EIGHTEENTH CENTURY

The opening of the Atlantic in the sixteenth century, it will be recalled, had reoriented Europe. In an age of oceanic communications western Europe became a center from which America, Asia, and Africa could all be reached. A global economy had been created. The first to profit from it had been the Portuguese and Spanish, and they retained their monopoly through most of the sixteenth century; but the decline of the Portuguese and Spanish paved the way for the triumph of the British, the French, and the Dutch. In the eighteenth century the outstanding economic development was the expansion of the global economy and the fact that Europe became incomparably wealthier than any other part of the world.

### *Commerce and Industry in the Eighteenth Century*

The increase of wealth was brought about by the methods of commercial capitalism and handicraft industry. Though the Industrial Revolution in England is usually dated from 1760 or 1780, it was not until the nineteenth century that the use of steam engines and power-driven machinery, and the growth of large factories and great manufacturing cities, brought about the conditions of modern industrialism. The economic system of the eighteenth century, while it contained within itself the seeds of later industrialism, represented the flowering of the older merchant capitalism, domestic industry, and mercantilist government policies which had grown up since the sixteenth century.

Most people in the eighteenth century lived in the country. Agriculture was the greatest single industry and source of wealth. Cities remained small. London and Paris, the largest of Europe, each had a population of 600,000 or 700,000, but the next largest cities did not much exceed 200,000, and in all Europe at the time of the French Revolution in 1789 there were only 50 cities with as many as 50,000 people. Urbanization, however, was no sign of economic advancement. Spain, Italy, and even the Balkan peninsula, according to an estimate made in the 1780s, each had more large cities (over 50,000) than did Great Britain. Urbanization did not equate with industry because most industry was carried on in the country, by peasants and part-time agricultural workers who worked for the merchant capitalists of the towns. Thus, while it is true to say that most people still lived in the country, it would be false to say that their lives and labors were devoted to agriculture exclusively. One English estimate, made

---

*Rural industry*

**Most people who were “engaged in manufactures” in eighteenth-century Europe still worked in their own rural homes. This engraving from the early 1780s shows three women at work in an Irish cottage, where they are spinning and winding thread while another woman prepares a meal and watches a child.**

(SSPL/The Image Works)

in 1739, held that there were 4,250,000 persons “engaged in manufactures” in the British Isles, a figure that included women and children and comprised almost half the entire population. These people worked characteristically in their own cottages, employed as wage earners by merchant capitalists under the “domestic” system. Almost half of them were engaged in the weaving and processing of woollens. Others were in the copper, iron, lead, and tin manufactures; others in leather goods; much smaller were the paper, glass, porcelain, silk, and linen trades; and smallest of all, in 1739, was the manufacture of cotton cloth, which accounted for only about 100,000 workers. The list suggests the importance of nonagricultural occupations in the preindustrial age.

England, even with half its population engaged at least part of the time in manufactures, was not yet the unrivaled manufacturing country that it was to become after 1800. England in the eighteenth century produced no more iron than Russia and no more manufactures than France. The population of England was still small; it began to grow rapidly about 1760, but as late as 1800 France was still twice as populous as England and Scotland together. France, though less intensively developed than England, with probably far less than half its people “engaged in manufactures,” nevertheless, because of its greater size, remained the chief industrial center of Europe.

Although foreign and colonial trade grew rapidly in the eighteenth century, it is probable that, in both Great Britain and France, the domestic or internal trade was greater in vol-

ume and occupied more people. Great Britain, with no internal tariffs, with an insignificant guild system, and with no monopolies allowed within the country except to inventors, was the largest area of internal free trade in Europe. France, or at least Colbert's Five Great Farms, offered an almost equal-sized free-trading internal market. A great deal of economic activity was therefore domestic, consisting of exchange between town and town or between region and region. The proportions between domestic and international trade cannot be known. But foreign trade was increasingly important for the largest business enterprises. International trade created the greatest commercial fortunes and the main accumulations of new capital. And it was the foreign trade that led to international rivalry and war.

### *The World Economy: The Dutch, British, and French*

On the international economic scene a great part was still played by the Dutch. After the Peace of Utrecht the Dutch ceased to be a great political power; but their role in commerce, shipping, and finance remained undiminished, or diminished only when compared to the continuing commercial growth of France and Great Britain. They were still the middlemen and common carriers for other peoples. Their freight rates remained the lowest of Europe. They continued to grow rich on imports from the East Indies. To a large extent also, in the eighteenth century, the Dutch lived on their investments. The capital they had accumulated over 200 years they now lent out to French or British or other entrepreneurs. Dutch capital was to be found in every large commercial venture of Europe and was lent to governments far and wide. A third of the capital of the Bank of England in the mid-eighteenth century belonged to Dutch shareholders. The Bank of Amsterdam remained the chief clearinghouse and financial center of Europe. Its supremacy ended only with the invasion of Holland by a French Revolutionary army in 1795.

Trade

The Atlantic trade routes, leading to America, to Africa, and to Asia, attracted the merchants of many nationalities in Europe. A great many East India companies were established—usually to do business in America as well as the East, for the “Indies” at the beginning of the eighteenth century was still a general term for the vast regions overseas. Both the English and the French East India companies were reorganized, with an increased investment of capital, shortly after 1700. A number of others were established—by the Scots, the Swedes, the Danes, the imperial free city of Hamburg, the republic of Venice, Prussia, and the Austrian monarchy. But, with the exception of the Danish company that lasted some 60 years, they all failed after only a few years, either for insufficiency of capital or because they lacked strong diplomatic, military, and naval support. Their failure showed that, in the transoceanic trade, unassisted business enterprise was not enough. Merchants needed strong national backing to succeed in this sphere. Neither free city, nor small kingdom, nor tiny republic, nor the amorphous Austrian empire provided a firm enough base.

---

---

East India companies

It was the British and French who won out in the commercial rivalry of the eighteenth century. Britain and France were alike in having, besides a high level of industrial production at home, governments organized on a national scale and able to protect and advance, under mercantilist principles, the interests of their merchants in distant countries. For both peoples the eighteenth century—or the three-quarters of a century between the end of the War of the Spanish Succession in 1713 and the beginning of the French Revolution in 1789—was an age of spectacular enrichment and commercial expansion.

---

---

Commercial rivalry

Although the trade figures are difficult to arrive at, French foreign and colonial trade may well have grown even more rapidly than the British in the years between the 1720s and the 1780s. In any event, by the 1780s, the two countries were about equal in their total foreign and colonial trade. The British in the 1780s enjoyed proportionately more of the trade with America and Asia; the French, more of the trade with the rest of Europe and the Middle East. The contest for markets played an important part in the colonial and commercial wars between Britain and France all through the eighteenth century and on into the final and climactic struggle, and British triumph, in the time of Napoleon.

### *Asia, America, and Africa in the Global Economy*

In the expanding global economy of the eighteenth century each continent played its special part. The European trade with Asia was subject to an ancient limitation. Asia was almost useless as a market for European manufactures. There was much that Europeans wanted from Asia but almost nothing that Asians wanted from Europe. The peoples of Chinese, Indian, and Malay culture had elaborate civilizations with which they were content; Asian elites in this era lacked the dynamic restlessness of European entrepreneurs, and the masses were so impoverished (more so even than in Europe) that they could buy nothing anyway. Europeans found that they could send little to Asia except gold. The trade of gold from Europe to Asia had gone on since ancient times, and even more gold and silver flowed to east Asia from European colonies in the Americas after the sixteenth century. Accumulating over time, the wealth from this trade became one source of the fabulous treasures of Eastern princes. To finance the swelling demand for Asian products it was necessary for Europeans constantly to replenish their stocks of gold. The British found an important new supply in Africa along the Gulf of Guinea, where one region (the present Ghana) was long called the Gold Coast. The word “guinea” became the name of a gold coin minted in England from 1663 to 1813 and long remained a fashionable way of saying 21 shillings.

---

*Spices and Eastern  
manufactures*

What Europeans sought from Asia was still in part spices—pepper and ginger, cinnamon and cloves—now brought in mainly by the Dutch from their East India islands. But they wanted manufactured goods also. Asia was still in some lines superior to Europe in technical skill. It is enough to mention rugs, chinaware, and cotton cloth. The very names by which cotton fabrics are known in English and other European languages reveal the places from which they were thought to come. “Madras” and “calico” refer to the Indian cities of Madras and Calicut; “muslin,” to the Arabic city of Mosul. “Gingham” comes from a Malay word meaning “striped”; “chintz,” from a Hindustani word meaning “spotted.” Most of the Eastern manufactures were increasingly imitated in the eighteenth century in Europe. Axminster and Aubusson carpets competed with Oriental rugs. In 1709 a German named Boettcher discovered a formula for making a vitreous and translucent substance comparable to the porcelain of China; this European “china,” made at Sèvres, Dresden, and in England, soon competed successfully with the imported original.

Cotton fabrics were never produced in Europe at a price to compete with India until after the introduction of power machinery, which began in England about 1780. Before that date the demand for Indian cotton goods was so heavy that the woolen, linen, and silk interests became alarmed. They could produce nothing like the sheer muslins and bright calico prints which caught the public fancy, and many governments, to protect the jobs and capital involved in the old European textile industries, simply forbade the import of Indian

cottons altogether. But it was a time of many laws and little enforcement, the forbidden fabrics continued to come in, and Daniel Defoe observed in 1708 that, despite the laws, cottons were not only sought as clothing by all classes, but “crept into our houses, our closets and bedchambers; curtains, cushions, chairs and at last beds themselves were nothing but calicoes or Indian stuffs.” Gradually, in the face of tariff protection for “infant industries” in Europe, and the rapid growth of European cotton manufactures, import of cottons and other manufactures from Asia declined. After about 1770 most of the imports of the British East India Company consisted of tea, which was brought from China.

The Americas, including the West Indies, bulked larger than Asia in the eighteenth-century trade of western Europe. The American trade was based mainly on one commodity—sugar. Sugar had long been known in the East, and in the European Middle Ages little bits of it had trickled through to delight the palates of lords and prelates. About 1650 sugar cane was brought in quantities from the East and planted in the West Indies by Europeans. A whole new economic system arose in a few decades. It was based on the “plantation.” A plantation was an economic unit consisting of a considerable tract of land, a sizable investment of capital, often owned by absentees in France or England, and a force of impressed labor, supplied by black workers brought from Africa as slaves. Sugar, produced in quantity with cheap labor at low cost, proved to have an inexhaustible market.

---

*Sugar and the  
plantation system*

The eighteenth century was the golden age, economically speaking, of the West Indies. From its own islands alone, during the 80 years from 1713 to 1792, Great Britain imported a total of £162,000,000 worth of goods, almost all sugar; imports from India and China, in the same 80 years, amounted to only £104,000,000. The little islands of Jamaica, Barbados, St. Kitts, and others, as suppliers of Europe, not only dwarfed the whole mainland of British America but the whole mainland of Asia as well. For France, less well established than Britain on the American mainland and in Asia, the same holds with greater force. The richest of all the sugar colonies, Santo Domingo (now divided between Haiti and the Dominican Republic) belonged to France.

The plantation economy, first established in sugar and later in cotton (after 1800), brought Africa into the foreground. Slaves had been obtained from Black Africa from time immemorial, both by the Roman Empire and by the Muslim world, both of which, however, enslaved blacks and whites indiscriminately. After the European discovery of America, blacks were taken across the Atlantic by the Spanish and Portuguese. Dutch slavetraders also took them to Virginia in 1619, a year before the arrival of the Pilgrim Fathers in Massachusetts. But slavery in the Americas before 1650 may be described as occasional. With the rise of the plantation economy after 1650, and especially after 1700, it became a fundamental economic institution. Slavery now formed the labor supply of a very substantial and heavily capitalized branch of world production. About 610,000 blacks were landed from Africa in the island of Jamaica alone between 1700 and 1786. Total figures are hard to give, but it is certain that, until well after 1800, far more Africans than Europeans made the voyage to the Americas.

---

*Slave trade*

The transatlantic slave trade in the eighteenth century was conducted mainly by English-speaking interests, principally in England but also in New England, followed as closely as they could manage it by the French. Yearly export of merchandise from Great Britain to Africa, used chiefly in exchange for slaves, increased tenfold between 1713 and 1792. As for merchandise coming into Britain from the British West Indies, virtually all produced by slaves, in 1790 it constituted almost a fourth of all British imports. If we add British imports from the American mainland, including what after 1776 became the United

States, the importance of black labor to the British economic system will appear still greater, since a great part of exports from the mainland consisted of agricultural products, such as tobacco and indigo, produced partly by slaves. The rapid growth of trade within the British empire and the phenomenal rise of British capitalism in the eighteenth century were therefore based to a considerable extent on the enslavement of Africans. The town of Liverpool, an insignificant place on the Irish Sea in 1700, built itself up by the slave trade and the trade in slave-produced commodities to a busy transatlantic commercial center, which in turn, as will be seen later, stimulated the “industrial revolution” in Manchester and other neighboring towns.

---

*Slavery and British capitalism*

The west-European merchants, British, French, and Dutch, sold the products of America and Asia to their own peoples and those of central and eastern Europe. Trade with Germany and Italy was fairly stable. With Russia it enormously increased. To cite the British record only, Britain imported 15 times as much goods from Russia in 1790 as in 1700, and sold the Russians 6 times as much. The Russian landlords, as they became Europeanized, desired Western manufactures and the colonial products such as sugar, tobacco, and tea which could be purchased only from western Europeans. They had grain, timber, and naval stores to offer in return. Similarly, landlords of Poland and north Germany, in the seventeenth and eighteenth centuries, found themselves increasingly able to move their agricultural products out through the Baltic and hence increasingly able to buy the products of western Europe, America, and Asia in return. Landlords of eastern Europe thus had an incentive to make their estates more productive. “Big” agriculture spread, developing in eastern Europe a system not unlike the plantation economy of the New World. It had many effects. It contributed, along with political causes, to reducing the bulk of the east-European population to serfdom. It helped to bring western European culture to the upper classes of eastern Europe. And it helped to enrich the cities and merchants of western Europe.

### *The Wealth of Western Europe: Social Consequences*

The wealth which accumulated along the Atlantic seaboard of Europe was, in short, by no means produced by the efforts of western Europeans only. All the world contributed to its formation. The natural resources of the Americas, the gold and people of Africa, the labor of enslaved workers on Caribbean islands, the resources and manufacturing skills of Asia, all alike went into producing the vastly increased volume of goods moving in world commerce. Europeans directed the movement. They supplied capital; they contributed technical and organizing abilities; and it was the demand of Europeans, at home in Europe and as traders abroad, that set increasing numbers of Indians to spinning cotton, Chinese to raising tea, Malays to gathering spices, and Africans to the tending of sugar cane. A few non-Europeans might benefit in the process—Indian or Chinese merchants “subsidized” by the East Indian companies, African chiefs who captured slaves from neighboring tribes and sold them to Europeans. But the profits of the world economy really went to Europe. The new wealth, over and above what was necessary to keep the far-flung and polyglot labor force in being, and to pay other expenses, piled up in Britain, Holland, and France.

---

*Private property*

Here it was owned by private persons. It accumulated within the system of private property and as part of the institutions of private enterprise or private capitalism. Governments were dependent on these private owners of property, for governments, in western Europe, had no important sources of revenue except loans and taxes derived from their peoples. When the owners of

European traders and merchants gained much of their new wealth in the seventeenth and eighteenth centuries from commodities produced on plantations in the Americas and the Caribbean. This plantation economy depended on the labor of enslaved African workers such as the people in this seventeenth century illustration, who are preparing tobacco for export from one of the Caribbean islands.

(Rare Books and Manuscripts Division, New York Public Library, Astor, Lenox and Tilden Foundations)

wealth gave their support, the government was strong and successful, as in England. When they withdrew support, the government collapsed, as it was to collapse in France in the Revolution of 1789.

In a technical sense there were many “capitalists” in western Europe, persons who had a little savings which they used to buy a parcel of land or a loom or entrusted to some other person to invest at interest. And in a general sense the new wealth was widely distributed; the standard of living rose in western Europe in the eighteenth century. Tea, for example, which cost as much as £10 a pound when introduced into England about 1650, was an article of common consumption a hundred years later. But wealth used to produce more wealth, that is, capital, was owned or controlled in significant amounts by relatively few persons. In the eighteenth century some people became unprecedentedly rich (including some who started quite poor, for it was a time of open opportunity); the great intermediate layers of society became noticeably more comfortable; and the people at the bottom, such

as the serfs of eastern Europe, the Irish peasantry, the dispossessed farm workers in England, the poorest peasants and workers of France, were worse off than they had been before. The poor continued to live in hovels. The prosperous created for themselves that pleasant, comfortable world of the eighteenth century that connoisseurs still admire, a world of well-ordered Georgian homes, closely cropped lawns and shrubs, furniture by Chippendale or à la Louis XV, coach-and-four, family portraits, high chandeliers, books bound in morocco, and a staff of servants “below stairs.”

*The merging of  
bourgeois and  
aristocratic wealth*

Families enriched by commerce, and especially the daughters, mixed and intermarried with the old families who owned land. Women thus played an essential economic role in the carefully arranged marriages that both protected and increased the wealth of upper-class families. Landowners needed the capital that could be acquired through marriages with the daughters of wealthy traders; prosperous entrepreneurs sought the landed properties that might come into their families through marriages with women of the old aristocracy. But marriage was only one of the ways in which the old and new wealth of Europe came together. The merchant in England or France no sooner became prosperous than he bought himself a landed estate. In France he might also purchase a government office or patent of nobility. Contrariwise, the landowning gentleman, especially in England, no sooner increased his landed income than he invested the proceeds in commercial enterprise or government bonds. The two forms of property, bourgeois and aristocratic, tended to merge. Until toward the end of the century the various propertied interests worked harmoniously together, and the unpropertied classes, the vast majority, could influence the government only by riot and tumult. The eighteenth century, though an era of rapid commercial expansion, was on the whole an age of considerable social stability in western Europe. It was the upheavals of the French Revolution that would disrupt and transform much of the social and political order in European societies after 1789.

The foregoing might be illustrated from the lives of thousands of men and women. Two examples are enough, one English and one French. They show the working of the world economic system, the rise of the commercial class in western Europe, and the role of that class in the political life of the Western countries.

*Thomas Pitt*

Thomas Pitt, called “Diamond” Pitt, was born in 1653, the son of a parish clergyman in the Church of England. He went to India in 1674. Here he operated as an “interloper,” trading in defiance of the legal monopoly of the East India Company. Returning to England, he was prosecuted by the company and fined £400 but was rich enough to buy the manor of Stratford and with it the borough of Old Sarum, a rotten borough which gave him a seat in the House of Commons without the trouble of an election. He soon returned to India, again as an interloper, where he competed so successfully with the company that it finally took him into its own employment. He traded on his own account, as well as for the company, sent back some new chintzes to England, and defended Madras against the local ruler of the Carnatic, the coastal area around Madras, buying him off with money. In 1702, though his salary was only £300 a year, he purchased a 410-carat uncut diamond for £20,400. He bought it from an Indian merchant who had himself bought it from an English skipper, who in turn had stolen it from the slave who had found it in the mines and who had concealed it in a wound in his leg. Back in Europe, Pitt had his diamond cut at Amsterdam and sold it in 1717 to the regent of France for £135,000. The regent put it in the French crown; it was appraised at the time of the French Revolution at £480,000. “Diamond” Pitt died in 1726. One of his daughters became the Countess of Stanhope and one of his sons became the Earl of Londonderry. Another son became father to the William Pitt who guided Britain through the

**THE DUET**

by Arthur Devis (English,  
1711–1787)

The prosperity of the upper classes in eighteenth-century England supported the culture and comforts that are represented in this painting. Expanding global trade provided a pleasant, comfortable life for increasingly wealthy European elites and a new market for good furniture, fine art, and talented gardeners.

Resource, NY)

Seven Years' War with France and who was raised to the peerage as the Earl of Chatham. After this Pitt the city of Pittsburgh was named, so that a fortune gained in the East gave its name to a frontier settlement in the interior of America. Chatham's younger son, the second William Pitt, became prime minister at 24. The younger Pitt guided Britain through its wars with revolutionary France and Napoleon, until his death in 1806 during the high tide of the Napoleonic empire.

Jean-Joseph Laborde was born in 1724, of a bourgeois family of southern France. He went to work for an uncle who had a business at Bayonne trading with Spain and the East. From the profits he built up vast plantations and slaveholdings in Santo Domingo. His ships brought sugar to Europe and returned with prefabricated building materials, each piece carefully numbered, for his plantations and refineries in the West Indies. He became one of the leading bankers in Paris. His daughter became the Countess de Noailles. He himself received the title of marquis, which he did not use. He bought a number of manors and châteaux near Paris. As a real estate operator he developed that part of Paris, then suburban, now called the Chaussée d'Antin. During the Seven Years' War he was sent by the French government to borrow money in Spain, where he was told that Spain would lend nothing to Louis XV but would gladly lend him personally 20,000,000 reals. In the War of American Independence Laborde raised 12,000,000 livres in gold for the government to help pay the French army and navy, thus contributing to the success of the American Revolution. He acted as investment agent for Voltaire, gave 24,000 livres a year to charity, and subscribed 400,000 livres in 1788 toward building new hospitals in Paris. In July 1789 he helped to finance the insurrection which led to the fall of the Bastille and the Revolution. His son, in June 1789, took the Oath of the Tennis Court, swearing to write a constitution for France. He himself was guillotined in 1794. His children turned to scholarship and the arts.

---

Jean-Joseph Laborde

### 33. WESTERN EUROPE AFTER THE PEACE OF UTRECHT, 1713–1740

The Peace of Utrecht registered the defeat of French ambitions in the wars of Louis XIV. The French move toward “universal monarchy” had been blocked. The European state system had been preserved. Europe was to consist of independent and sovereign states, all legally free and equal, continuously entering or leaving alliances along the principles of the balance of power. The peace settlement of 1713–1714 placed the Bourbon Philip V on the Spanish throne but gave most of Spain’s European possessions, outside Spain itself, to the Austrian Habsburgs (see maps, pp. 187, 313). Great Britain, which had been consolidated during the wars as a combined kingdom of England and Scotland, took Newfoundland, Nova Scotia, and the Hudson Bay region from France and, taking Gibraltar and Minorca from Spain, became a naval power in the Mediterranean. The British also received trading rights in Spanish America, thus enhancing their position as the most dynamic power in the rapidly developing transatlantic economic system.

*Repairing the  
damages of war*

Governments now turned to repairing the damages of war. Spain was somewhat rejuvenated by the French influence under its new Bourbon house. The drift and decadence that had set in under the last Habsburgs were at least halted. The Spanish monarchy was administratively strengthened. Its officials followed the absolutist government of Louis XIV as a model. The estates of the east-Spanish kingdoms, Aragon and Valencia, ceased to meet, going like the Estates General of France into the limbo of obsolete institutions. On the whole the French influence in eighteenth-century Spain was intangible. Nothing was changed in substance, but the old machinery functioned with more precision. Administrators were better trained and took a more constructive attitude toward government work; they became more aware of the world north of the Pyrenees and recovered confidence in their country’s future. They tried also to tighten up the administration of their American empire. More revenue officers and coast guards were introduced in the Caribbean, whose zeal led to repeated clashes with smugglers, mainly British. Friction on the Spanish Main, reinforced by Spanish dislike for British occupation of Gibraltar, kept Spain and Britain in a continual ferment of potential hostility.

The Dutch after Utrecht receded from the political stage, though their alliance was always sought because of the huge shipping and financial resources they controlled. The Swiss also became important in banking and financial circles. The Belgians founded an overseas trading company in 1723 on the authority of their new Austrian ruler; this “Ostend Company” sent out six voyages to China, which were highly profitable, but the commercial jealousy of the Dutch and British obliged the Austrian emperor to withdraw his support, so that the enterprise soon came to an end. The Scots began at about this time to play their remarkable role of energizing business affairs in many countries. Union with England gave them access to the British empire and to the numerous commercial advantages won by the English. John Law, the financial wizard of France, was a Scot, as was William Paterson, one of the chief founders of the Bank of England.

#### *France and Britain after 1713*

Our main attention falls on Britain and France. Though one was the victor and the other the vanquished in the wars that ended in 1713, and though one stood for absolutism and the other for constitutionalism in government, their development in the years after Utrecht

was in some ways surprisingly parallel. In both countries for some years the king was personally ineffective, and in both the various propertied interests therefore gained many advantages. Both enjoyed the commercial expansion described above. Both went through a short period of financial experimentation and frantic speculation in stocks, the bubble bursting in each case in 1720. Each was thereafter governed by a statesman, Cardinal Fleury in France and Robert Walpole in England, whose policy was to keep peace abroad and conciliate all interests at home. Fleury and Walpole held office for about two decades, toward the end of which the two countries again went to war. But the differences are at least as instructive as the parallels.

In France the new king was a child, Louis XV, the great-grandson of Louis XIV, and only five years old when his reign began in 1715. The government was entrusted to a regent, the Duke of Orleans, an elder cousin of the young king. Orleans, lacking the authority of a monarch, had to admit the aristocracy to a greater share of the power that nobles had lost during the long reign of Louis XIV. Most of the nobles had never liked the absolutist policies of Louis XIV, and there was much dissatisfaction with absolutism among all classes, because of the ruin and suffering brought by Louis XIV's wars.

The higher nobles, ousted by Louis XIV, now reappeared in the government. For a time Orleans worked through committees of noblemen, roughly corresponding to ministries, a system lauded by its backers as a revival of political freedom; but the committees proved so incompetent that they were soon abandoned. The old parlements of France, and especially the Parlement of Paris, which Louis XIV had reduced to silence, vigorously reasserted themselves after his death. The parlements were primarily law courts, originally composed of bourgeois judges. But Louis XIV and his predecessors, to raise money, had made the judgeships into offices to be sold; and they attached titles of nobility to increase the price. Hence in the time of the Regency the judges of the parlements had bought or inherited their seats and were almost all nobles. Because they had property rights in their offices, they could not be removed by the king. The Regent conceded much influence to the Parlement of Paris, utilizing it to modify the will of Louis XIV. The parlements broadened their position, claiming the right to assent to legislation and taxes, through refusing to enforce government measures that they considered contrary to the unwritten constitution or fundamental laws of France. They managed to exercise this right, off and on, from the days of the Regency until the great Revolution of 1789. The eighteenth century, for France, was a period of absolutism checked and balanced by organized privileged groups. It was an age of aristocratic resurgence, in which the nobles won back many of the powers that Louis XIV had taken from them.

---

---

*Aristocratic  
resurgence*

In Great Britain the Parliament was very different from the French parlements, and the British aristocracy was more politically competent than the noblesse of France. Parliament proved an effective machine for the conduct of public business. The House of Lords was hereditary, with the large exception of the bishops, who were appointed by the government and made up about a quarter of the active members of the upper house. The House of Commons was not at all representative of the country according to modern ideas. Only the wealthy, or those patronized by the wealthy, could sit in it, and they were chosen by diverse and eccentric methods, in counties and towns, almost without regard to the size or wishes of the population. Some boroughs were owned outright, like the Old Sarum of the Pitt family. But through the machinations of bosses, or purchase of seats, all kinds of interests managed to get representatives into the Commons. Some members spoke for the "landed interest";

---

---

*The English  
Parliament*

others for the “funded interest” (mainly government creditors); others for the “London interest,” the “West India interest,” the “East India interest,” and others. All politically significant groups could expect to have their desires heeded in Parliament, and all therefore were willing to go through parliamentary channels. Parliament was corrupt, slow, and expensive, but it was effective. For Parliament was not only a roughly representative body; it had also acquired, in practice, the power to legislate.

Queen Anne, the last reigning Stuart, died in 1714. She was succeeded by George I, Elector of Hanover, as provided for by Parliament in the Act of Settlement of 1701. George I was the nearest relative of the Stuarts who was also a Protestant. A heavy middle-aged German who spoke no English, he continued to spend much of his time in Germany, and he brought with him to England a retinue of German ministers and mistresses. He was never popular in England, where he was regarded as at best a political convenience. He was in no position to play a strong hand in English public life, and during his reign Parliament gained considerable independence from the crown.

The main problem was still whether the principles of the Revolution of 1688 should be maintained. The agreement which had made that revolution relatively bloodless proved to be temporary. The Whigs, who considered the revolution as their work, long remained a minority made up of a few great landowning noblemen, wealthy London merchants, lesser businesspeople, and nonconformists in religion. The Whigs generally controlled the House of Lords, but the House of Commons was more uncertain; at the time of the Peace of Utrecht its majority was Tory. We have already noted the significance for English constitutional development of the conflict at that time between the prowar Whig majority in the House of Lords and the Tory majority in Commons and how the conflict was resolved to help establish the primacy of the House of Commons.

---

#### *Whigs and Tories*

After 1714 the two parties tended to dissolve, and the terms “Whig” and “Tory” ceased to have much definite meaning. In general the government, and the Anglican bishops who were close to the government, remained “Whig.” Men who were remote from the central government, or suspicious of its activities, formed a kind of country party quite different from the earlier Tories. Gentry and yeomen of the shires and byways were easily aroused against the great noblemen and men of money who led the Whigs. In the established church the lesser clergy were sometimes critical of the Whig bishops. Outside the official church were a group of Anglican clergy who refused the oath of loyalty after 1688 and were called Non-Jurors; they kept alive a shadow church until 1805. In Scotland also, the ancestral home of the Stuarts, many were disaffected with the new regime.

Tories, Non-Jurors, and Scots made up a milieu after 1688 in which what would now be called counterrevolution might develop. Never enthusiastic for the “Whig wars” against France, critical of the mounting national debt which the wars created, distrustful of the business and moneyed interests, they began to look wistfully to the exiled Stuarts. After 1701, when James died in France, the Stuart claims devolved upon his son, who lived until 1766, scheming time and again to make himself king of England. His partisans were known as Jacobites, from *Jacobus*, the Latin for James. They claimed that he had a divine right to the monarchy and regarded him as “James III,” whereas others called him the Pretender. The Jacobites felt that if he would give up his Catholic religion, he should be accepted as Britain’s rightful king.

---

#### *“James III”*

The Whigs could not tolerate a return of the Stuarts. The restoration of “James III” and his divine-right partisans would undo the principles of the Glorious Revolution—limited monarchy, constitutionalism, parliamentary supremacy, the rule of law, the

toleration of dissenting Protestants, in short all that was summarized and defended in the political writings of John Locke. Moreover, those who held stock in the Bank of England or who had lent their money to the government would be ruined, since “James III” would surely repudiate a debt contracted by his foes. The Whigs were bound to support the Hanoverian George I. And George I was bound to look for support in a strange country among the Whigs.

George lacked personal appeal even for his English friends. To his enemies he was ridiculous and repulsive. The successful establishment of his dynasty would ruin the hopes of Tories and Jacobites. In 1715 the Pretender landed in Scotland, gathered followers from the Highlands, and proclaimed a rebellion against George I. Civil war seemed to threaten. But the Jacobite leaders bungled, and many of their followers proved to be undecided. They were willing enough to toast the “king over the water” in protest against the Whigs but not willing in a showdown to see the Stuarts, with all that went with them, again in possession of the crown of England.

---

*Threats of civil war*

The Fifteen, as the revolt came to be called, petered out. But 30 years later came the Forty-five. In 1745, during war with France, the Pretender’s son, “Bonnie Prince Charlie” or the “Young Pretender,” again landed in Scotland and again proclaimed rebellion. This time, though almost no one in England rallied, the uprising was more successful. A Scottish force penetrated to within 80 miles of London and was driven back and crushed with the help of Hanoverian regiments rushed over from Germany. The government set out to destroy Jacobitism in the Scottish Highlands. The social system of the Highlands was wiped out, the clans were broken up, and their lands were forcibly reorganized according to modern notions of property and of landlord and tenant.

The Jacobite uprisings confirmed the old reputation of England in the eyes of Europe, namely, as Voltaire said, that its government was as stormy as the seas that surrounded it. To partisans of monarchy on the Continent they illustrated the weaknesses of parliamentary government. But their ignominious collapse actually strengthened the parliamentary regime in England. They left little permanent mark and soon passed into romantic legend.

### *The “Bubbles”*

Meanwhile, immediately after the Peace of Utrecht, the problem of dealing with a large postwar government debt had to be faced in both England and France. Organized permanent public debt was new at the time. The possibilities and limitations of large-scale banking, paper money, and credit were not clearly seen. In France there was much amazement at the way in which England and Holland, though smaller and less wealthy than France, had been able to maximize their resources through banking and credit and even to finance the alliance which had eclipsed the Sun King. In addition there was much private demand for both lending and borrowing money. Private persons all over western Europe were looking for enterprises in which to invest their savings. And promoters and organizers, anticipating a profit in this or that line of business, were looking for capital with which to work. Out of this whole situation grew the “South Sea bubble” in England and the “Mississippi bubble” in France. Both bubbles broke in 1720, and both had important long-range effects.

A close tie between government finance and private enterprise was usual at the time, under mercantilist ideas of government guidance of trade. In England, for example, a good deal of the government debt was held by companies organized for that purpose. The government would charter a company, strengthen it with a monopoly in a given line of

---

*Ties between  
government and  
private enterprise*

business, and then receive from the company, after the stockholders had bought up the shares, a large sum of cash as a loan. Much of the **British debt**, contracted in the wars from 1689 to 1713, **was held in this way by the Bank of England**, founded in 1694; by **the East India Company**, reorganized in 1708 in such a way as to provide funds for the government; and by the **South Sea Company**, founded in 1711. **The Bank enjoyed a legal monopoly over certain banking operations in London**, the East India Company over trade with the East, the South Sea Company for exploiting the *asiento* and other commercial privileges extorted from Spain. The companies were owned by private investors. Savings drawn from trade and agriculture, put into shares in these companies, became available both for economic reinvestment and for use of the government in defraying the costs of war.

---

#### John Law

In 1716 the Prince Regent of France was attracted to a Scottish financier, John Law, reputedly by Law's remarkable mathematical system in gambling at cards. **Law founded a much-needed French central bank.** In the next year, 1717, he organized a *Compagnie d'Occident*, popularly called the Mississippi Company, which obtained a monopoly of trade with Louisiana, where it founded New Orleans in 1718. This company, under Law's management, soon absorbed the French East India, China, Senegal, and African companies. It now enjoyed a legal monopoly of all French colonial trade. Seeing this trade as a means to solve France's financial problems, the Regent authorized Law to assume the entire government debt. The Mississippi Company received from individuals their certificates of royal indebtedness or "bonds" and gave them shares of company stock in return. It proposed to pay dividends on these shares and to extinguish the debt from profits in the colonial trade and from a monopoly over the collection of all indirect taxes in France. The project carried with it a plan for drastic reform of the whole taxation system, to make taxes both more fair to the taxpayer and more lucrative to the government. Shares in the Mississippi Company were gobbled up by the public. There was a frenzy of speculation, a wild fear of not buying soon enough. Quotations rose to 18,000 livres a share. But the company rested only on unrealized projects. Shareholders began to fear for their money. They began to unload. The market broke sharply. **Many found their life savings gone. Others lost ancestral estates on which they had borrowed in the hope of getting rich.** Those, however, who had owned shares in the company before the rise, and who had resisted the speculative fever, lost nothing by the bursting of inflated prices and later enjoyed a gilt-edged commercial investment.

Much the same thing happened in England, where it was thought by many that Law was about to provide a panacea for France. The South Sea Company, outbidding the Bank of England, took over a large fraction of the public debt by receiving government "bonds" from their owners in return for shares of its stock. The size and speed of profits to be made in Spanish America were greatly exaggerated, and the market value of South Sea shares rose rapidly for a time, reaching £1,050 for a share of £100 par value. Other schemes abounded in the passion for easy money. Promoters organized mining and textile companies, as well as others of more fanciful or bolder design—a company to bring live fish to market in tanks, an insurance company to insure female chastity, a company "for an undertaking which shall in due time be revealed." Shares in such enterprises were snatched at mounting prices. But in September 1720 the South Sea stockholders began to sell, doubting whether operations would pay dividends commensurate to £1,000 a share. They dragged down the whole unstable structure. As in France, many people found that their savings or their inheritances had disappeared.

Indignation in both countries was extreme. Both governments were implicated in the scandal. John Law fled to Brussels. The Regent was discredited; he resigned in 1723, and French affairs were afterward conducted by Cardinal Fleury. In England there was a change of ministers. Robert Walpole, a country gentleman of Whig persuasion who had long sat in the Commons and who had warned against the South Sea scheme from the beginning, became the principal minister to George I.

Britain recovered from the crisis more successfully than France. Law's bank, a useful institution, was dissolved in the reaction against him, and France lacked an adequate banking system during the rest of the century. French investors developed a morbid fear of paper securities and a marked preference for putting their savings into land.

Commercial capitalism and the growth of credit institutions in France were retarded. In England the same fears were felt. Parliament passed the "Bubble Act," forbidding all companies except those specifically chartered by the government to raise capital by the sale of stock. In both countries the development of joint-stock financing along the lines of the modern corporation was slowed down for over a century. Business enterprises continued to be typically owned by individuals and partnerships, which expanded by reinvestment of their own profits and so had another reason to keep profits up and wages down. But in England Walpole managed to save the South Sea Company, the East India Company, and the Bank, all of which were temporarily discredited in the eyes of the public. England continued to perfect its financial machinery.

The credit of the two governments was also shaken by the "bubbles." Much of the French war debt was repudiated in one way or another. Repudiation was in many cases morally justifiable, for many government creditors were unscrupulous war profiteers, but financially it was disastrous, for it discouraged honest people from lending their money to the state. Nor was much accomplished toward reform of the taxes. The nobles continued to evade taxes imposed on them by Louis XIV, John Law's plans for taxation evaporated with the rest of his project, and when in 1726 a finance minister tried to levy a two percent tax on all property, the vested interests, led by the Parlement of Paris, demolished this proposal also. Lacking an adequate revenue, and repudiating its debts, the French monarchy had little credit. The conception of the public or national debt hardly developed in France in the eighteenth century. The debt was considered to be the king's debt, for which no one except a few ministers felt any responsibility. The Bourbon government in fact often borrowed through the church, the Provincial Estates, or the city of Paris, which lenders considered to be better financial risks than the king himself. The government was severely handicapped in its foreign policy and its wars. It could not fully tap the wealth of its own subjects.

In England none of the debt was repudiated. Walpole managed to launch and keep going the system of the sinking fund, by which the government regularly set aside the wherewithal to pay interest and principal on its obligations. The credit of the British government became absolutely firm. The debt was considered a national debt, for which the British people themselves assumed the responsibility. Parliamentary government made this development possible. In France no one could tell what the king or his ministers might do, and hence the French were reluctant to trust them with their money. In England the people who had the money could also, through Parliament, determine the policies of state, decide what the money should be spent for, and levy enough taxes to maintain confidence in the debt. Similarities to France there were; the landowners who controlled the British Parliament, like those who controlled the Parlement of Paris, resisted direct taxation, so that the British government drew two-thirds or more of its revenues from indirect taxes

*The "Bubble Act"*

---

*Credit and the  
National Debt*

**M. BACHELIER, DIRECTOR OF THE LYONS FARMS**  
by Jean-Baptiste Oudry (French, 1686–1755)

The “farms” of which M. Bachelier was a director were the semiprivate syndicates to which the French monarchy delegated or farmed out the collection of its indirect taxes. Tax farmers were generally hated, and many became very rich. Nothing is known of the man in this picture, but with his huge wig, his lace cuffs, and his left hand politely extended, he typifies the ruling elite at the close of the reign of Louis XIV.

(University of Michigan Museum of Art (1968/1.76))

paid by the mass of the population. Yet landowners, even dukes, did pay important amounts of taxes. There were no exemptions by class or rank, as in France. All propertied interests had a stake in the government. The wealth of the country stood behind the national debt. The national credit seemed inexhaustible. This was the supreme trump card of the British in their wars with France from the founding of the Bank of England in 1694 to the fall of Napoleon 120 years later. And it was the political freedom and power of Parliament that gave Britain's government its economic strength.

### *Fleury in France, Walpole in England*

Fleury was 73 years old when he took office in 1726 and 90 when he left it. He was not one to initiate programs for the distant future. Louis XV, as he came of age, proved to be indolent and selfish. Public affairs drifted, while France grew privately more wealthy, especially the commercial and bourgeois classes. Walpole likewise kept out of controversies. His motto was *quieta non movere*, "let sleeping dogs lie." It was to win over the Tory squires to the Hanoverian and Whig regime that Walpole kept down the land taxes; this policy was successful, and Jacobitism quieted down. Walpole supported the Bank, the trading companies, and the financial interests, and they in turn supported him. It was a time of political calm, in which the lower classes were quiet and the upper classes were not quarreling, favorable therefore to the development of parliamentary institutions.

Walpole has been called the first prime minister and the architect of cabinet government, a system in which the prime minister and the ministers who head the cabinet departments are also members of the legislative body. He saw to it, by careful rigging, that a majority in the Commons always supported him. He avoided issues on which his majority might be lost. He thus began to acknowledge the principle of cabinet responsibility to a majority in Parliament, which was to become an important characteristic of cabinet government. And by selecting colleagues who agreed with him, and getting rid of those who did not, he advanced the idea of the cabinet as a body of ministers bound to each other and to the prime minister, obligated to follow the same policies and to stand or fall as a group. Thus Parliament was not only a representative or deliberative body, but also one that developed an effective executive organ, without which neither representative government nor any government could survive.

---

*Cabinet government*

To assure peace and quiet in domestic politics the best means was to avoid raising taxes. And the best way to avoid taxes was to avoid war. Fleury and Walpole both tried to keep at peace. They were not in the long run successful. Fleury was drawn into the War of the Polish Succession in 1733. Walpole kept England out of war until 1739. He always had a war party to contend with, and the most bellicose were those interested in the American trade—the slave trade, the sugar plantations, and the illicit sale of goods in the Spanish empire. The British official figures show that while trade with Europe in the eighteenth century was always less in war than in peace, trade with America always increased during war, except, indeed, during the War of American Independence.

In the 1730s there were constant complaints of indignities suffered by Britons on the Spanish Main. The war party produced a Captain Jenkins, who carried with him a small box containing a withered ear, which he said had been cut from his head by the outrageous Spaniards. Testifying in the House of Commons, where he "commended his soul to God and his cause to his country," he stirred up a commotion which led to war. So in 1739, after 25 years of peace, England plunged with wild enthusiasm into the War of Jenkins's Ear.

“They are ringing the bells now,” said Walpole; “they will soon be wringing their hands.” The war soon merged into a conflict involving Europeans and others in all parts of the world. European wars could no longer be contained within Europe. The global economic and colonial systems that produced the expanding global trade also produced a series of global wars in which the European powers extended their conflicts across all of the distant territories and seas they sought to control.

### 34. THE GREAT WAR OF THE MID-EIGHTEENTH CENTURY: THE PEACE OF PARIS, 1763

The fighting lasted until 1763, with an uneasy interlude between 1748 and 1756. It went by many names. The opening hostilities between England and Spain were called, by the English, the War of Jenkins’s Ear. The struggle on the Continent in the 1740s over the Habsburg inheritance was often known as the War of the Pragmatic Sanction. The Prussians spoke of the three “Silesian” wars. British colonials in America called the fighting of the 1740s King George’s War, or used the term “French and Indian Wars,” for the whole sporadic conflict. Disorganized and nameless struggles at the same time shook the peoples of India. Eventually these wars came to be called the War of the Austrian Succession (for hostilities between 1740 and 1748) and the Seven Years’ War (for the conflicts between 1756 and 1763). The two wars were really one. They involved the same two principal issues: the global duel of Britain and France for colonies, trade, and sea power, and the European duel of Prussia and Austria for territory and military power in central Europe.

#### *Eighteenth-Century Warfare*

Warfare at the time was in a kind of classical phase, which strongly affected the development of events. It was somewhat slow, formal, elaborate, and indecisive. The enlisted ranks of armies and navies were filled with men considered economically useless, picked up by recruiting officers among unwary loungers in taverns or on the wharves. All governments protected their productive population, peasants, mechanics, and bourgeois, preferring to keep them at home, at work, and paying taxes. Soldiers became a class apart, enrolled for long terms, paid wages, professional in their outlook, and highly trained. They lived in barracks or great forts and were dressed in bright uniforms (like the British “red-coats”), which, since camouflage was unnecessary, they wore even in battle. Weapons were not powerful; infantry was predominant and was armed with the smooth-bore musket to which the bayonet could be attached. In war the troops depended on great supply depots built up beforehand, which were practically immovable with the transportation available, so that armies, at least in central and western Europe, rarely operated more than a few days’ march from their bases. Soldiers fought methodically for pay. Generals hesitated to risk their troops, which took years to train and equip and were very expensive. Strategy took the form not of seeking out the enemy’s main force to destroy it in battle but of maneuvering for advantages of position, applying a cumulative and subtle pressure somewhat as in a game of chess.

---

*Little national feeling*

There was little national feeling, or feeling of any kind. The Prussian army recruited half or more of its enlisted personnel outside Prussia; the British army was largely made up of Hanoverian or other German regiments; even the French army had German units incorporated in it. Deserters from one side were enlisted by the other. War was between governments, or between the oligarchies and aristocra-

cies which governments represented, not between whole peoples. It was fought for power, prestige, or calculated practical interests, not for ideologies, moral principles, world conquest, national survival, or ways of life. Popular nationalism had developed farthest in England, where “Rule Britannia” and “God Save the King,” both breathing a low opinion of foreigners, became popular songs during these mid-eighteenth-century wars.

Civilians were little affected, except in India or the American wilderness where European conditions did not prevail. In Europe, a government aspiring to conquer a neighboring province did not wish to ruin or antagonize it beforehand. The fact that the west-European struggle was largely naval kept it well outside civilian experience. Never had war been so harmless, certainly not in the religious wars of earlier times or in the national wars initiated later. This was one reason why governments went to war so lightly. On the other hand governments also withdrew from war much more readily than in later times. Their treasuries might be exhausted, their trained soldiers used up; only practical or rational questions were at stake; there was no war hysteria or pressure of mass opinion; the enemy of today might be the ally of tomorrow. Peace was almost as easy to make as war. Peace treaties were negotiated, not imposed. So the eighteenth century saw a series of wars and treaties and rearrangements of alliances, all arising over much the same issues and with exactly the same powers present at the end as at the beginning.

### *The War of the Austrian Succession, 1740–1748*

The War of the Austrian Succession was started by the king of Prussia: Frederick II, or the “Great,” was a young man of 28 when he became king in 1740. His youth had not been happy; he was temperamentally incompatible with his father. His tastes as a prince had run to playing the flute, corresponding with French authors, and writing prose and verse in the French language. His father, the sober, military-minded Frederick William I, thought him frivolous and effeminate and dealt with him so clumsily that at the age of 18 he tried to escape from the kingdom. Caught and brought back, he was forced to witness the execution, by his father’s order, of the friend and companion who had shared in his attempted flight. Frederick changed as the years passed from a jaunty youth to an aged cynic, equally undeceived by himself, his friends, or his enemies, and seeing no reason to expect much from human nature. Though his greatest reputation was made as a soldier, he retained his literary interests all his life, became a historian of merit, and is perhaps of all modern monarchs the only one who would have a respectable standing if considered only as a writer. An unabashed freethinker, like many others of his day, he considered all religions ridiculous and laughed at the divine right of kings; but he would have no nonsense about the rights of the house of Brandenburg, and he took a solemn view of the majesty of the state.

---

Frederick II

Frederick lost no time in showing a boldness which his father would have surely dreaded. He decided to conquer Silesia, and on December 16, 1740, he invaded that province, a region adjoining Prussia, lying in the upper valley of the Oder, and belonging to the kingdom of Bohemia and hence to the Danubian empire of the Habsburgs (see map, p. 208, panel 3). The Pragmatic Sanction, a general agreement signed by the European powers, including Prussia, had stipulated that all domains of the Austrian Habsburgs should be inherited integrally by the new heiress, Maria Theresa. The issue was between law and force. Frederick in attacking Silesia could invoke nothing better than “reason of state,” the welfare and expansion of the state of which he was ruler.

The young Frederick II of Prussia, who would later be called Frederick the Great, was more interested in music and literature than in the military and political tasks of a monarch—which he nevertheless pursued boldly after becoming king in 1740. This painting by Antoine Pesne portrays the “Crown Prince” in the year before he inherited the Prussian throne.

(Bettmann/CORBIS)

The Pragmatic Sanction was universally disregarded. All turned against Maria Theresa. Bavaria and Saxony put in claims. Spain, still hoping to revise the Peace of Utrecht, saw another chance to win back former Spanish holdings in Italy. The decisive intervention was that of France. It was the fate of France to be torn between ambitions on the European continent and ambitions on the sea and beyond the seas. Economic and commercial advantage might dictate concentration on the impending struggle with Britain. But the French nobles were less interested than the British aristocrats in commercial considerations. They were influential because they furnished practically all the army officers and diplomats. They saw in Austria the traditional enemy, in Europe the traditional field of valor, and in Belgium, which now belonged to the Austrians, the traditional object for annexation to France. Cardinal Fleury, much against his will and judgment, found himself forced into war against the Habsburgs.

---

*Maria Theresa*

Maria Theresa was at this time a **young woman of 23**. She proved to be one of the most capable rulers ever produced by the house of Habsburg. She bore **16 children**, and set a model of conscientious family living at a time of much indifference to such matters among the upper classes. **She was as devout and as earnest as Frederick** of Prussia was irreligious and seemingly flip. She dominated her husband and her grown sons as she did her kingdoms and her duchies. With a good deal of practical sense, she reconstructed her empire without having any doctrinaire program, and she accomplished more in her methodical way than more brilliant contemporaries with more spectacular projects of reform.

Soon after **Frederick invaded Silesia**, she gave birth to her first son, the future emperor Joseph II, in March 1741. She was preoccupied at the same time by the political crisis. Her dominions were assailed by half a dozen outside powers and her two kingdoms of Hungary and Bohemia (both of which had accepted the Pragmatic Sanction) were waiting to see which way their advantage lay. She betook herself to Hungary to be crowned with the

crown of St. Stephen—and to rally support. She made a carefully arranged and dramatic appearance before the Hungarian political elite, implored them to defend her, and swore to uphold the liberties of the Hungarian nobles and the separate constitution of the kingdom of Hungary. All Europe told how the young queen, by raising aloft the infant Joseph, who was to be heir to the throne, at a session of the Hungarian parliament, had thrown the dour Magyars into paroxysms of chivalrous resolve. The story was not quite true, but it is true that she made an eloquent address to the Magyars and that she took her baby with her and proudly exhibited him. The Hungarian magnates pledged their “blood and life” and delivered 100,000 soldiers.

The war, as it worked out in Europe, was reminiscent of the struggles of the time of Louis XIV, or even of the Thirty Years’ War now a century in the past. It was, again, a kind of civil struggle within the Holy Roman Empire, in which a league of German princes banded together against the monarchy of Vienna. This time they included the new kingdom of Prussia. It was, again, a collision of Bourbons and Habsburgs, in which the French pursued their old policy of maintaining division in Germany by supporting the German princes against the Habsburgs. The basic aim of French policy, according to instructions given by the French foreign office to its ambassador in Vienna in 1725, was to keep the Empire divided, preventing the union of German powers into “one and the same body, which would in fact become formidable to all the other powers of Europe.” This time France had Spain on its side. Maria Theresa was supported only by Britain and Holland, which subsidized her financially but had inadequate land forces. The Franco-German-Spanish combination was highly successful. In 1742 Maria Theresa, hard pressed, accepted the proposals of Frederick for a separate peace. She temporarily granted him Silesia, and he temporarily slipped out of the war which he had been the first to enter. The French and Bavarians moved into Bohemia and almost organized a puppet kingdom with the aid of Bohemian nobles. The French obtained the election of their Bavarian satellite as Holy Roman Emperor, Charles VII. In 1745 the French won the battle of Fontenoy in Belgium, the greatest battle of the war; they dominated Belgium, which neither the Dutch nor British were able to defend. In the same year they fomented the Jacobite rebellion in Scotland to weaken or overthrow the British monarch.

---

---

*Parallels with past wars*

But the situation overseas offset the situation in Europe. It was America that tilted the balance. The French fortress of Louisburg on Cape Breton Island was captured by an expedition of New Englanders in conjunction with the British navy. British warships drove French and Spanish shipping from the seas. The French West Indies were blockaded. The French government, in danger of losing the wealth and taxes drawn from the sugar and slave trades, announced its willingness to negotiate.

Peace was made at Aix-la-Chapelle in 1748. It was based on an Anglo-French agreement in which Maria Theresa was obliged to concur. Britain and France arranged their differences by a return to the prewar *status quo*.

---

---

*Peace of Aix-la-Chapelle*

The British returned Louisburg despite the protests of the Americans and relaxed their stranglehold on the Caribbean. The French returned Madras, which they had captured, and gave up their hold on Belgium. The Atlantic powers recognized Frederick’s annexation of Silesia and required Maria Theresa to cede some Italian duchies to a Spanish Bourbon. Belgium was returned to Maria Theresa at the insistence of Britain and the Dutch. She and her ministers were very dissatisfied. They would infinitely have preferred to lose Belgium and keep Silesia. They were required, in the interest of a European or even intercontinental balance of power, to give up Silesia and to hold Belgium for the benefit of the Dutch against the French.

**MARIA THERESA AND HER FAMILY**

by Martin van Meytens (Austrian, 1695–1770)

Maria Theresa had an imposing public image in her dual roles as Queen in the Austrian house of Habsburg and mother in a large household of 16 children. This portrait of the Queen with her husband and many of her children shows her devotion to family life as well as the power she exercised in governing her empire.

(Scala/Art Resource, NY)

The war had been more decisive than the few readjustments of the map seemed to show. It proved the weakness of the French position, straddled as it was between Europe and the overseas world. Maintaining a huge army for use in Europe, the French could not, like Britain, concentrate upon the sea. On the other hand, because they were vulnerable on the sea, they could not hold their gains in Europe or conquer Belgium. The Austrians, though bitter, had reason for satisfaction. The war had been a war to partition the Habsburg

empire. The Habsburg empire still stood. Hungary had thrown in its lot with Vienna, a fact of much subsequent importance. Bohemia was won back. In 1745 Maria Theresa got her husband elected Holy Roman Emperor as Francis I, a position for which, as a woman, she could not qualify. But the loss of Silesia was momentous. Silesia was as populous as the Dutch Republic, heavily German, and industrially the most advanced region east of the Elbe. Prussia by acquiring it doubled its population and more than doubled its resources. Prussia with Silesia was unquestionably a great power. Since Austria was still a great power, there were henceforth two great powers in the vague world known as “Germany,” a situation which came to be known as the German dualism. But the transfer of Silesia, which doubled the number of Germans ruled by the king of Prussia, made the Habsburg empire less German, more Slavic and Hungarian, more Danubian and international. Silesia was the keystone of Germany. Frederick was determined to hold it; Maria Theresa was determined to win it back. A new war was therefore foreseeable in central Europe. As for Britain and France, the peace of Aix-la-Chapelle was clearly only a truce.

The next years passed in a busy diplomacy, leading to what is known as the “reversal of alliances” and Diplomatic Revolution of 1756. The Austrians set themselves to checking the growth of Prussia. Maria Theresa’s foreign minister, Count Kaunitz, perhaps the most artful diplomat of the century, concluded that the rise of Prussia had revolutionized the balance of power. Kaunitz, dramatically reversing traditional policy, proposed an alliance between Austria and France—between the Habsburgs and the Bourbons. He encouraged French aspirations for Belgium in return for French support in the destruction of Prussia. The overtures between Austria and France obliged Britain, Austria’s former ally, to reconsider its position in Europe; the British had Hanover to protect and were favorably impressed by the Prussian army. An alliance of Great Britain and Prussia was concluded in January 1756. Meanwhile Kaunitz consummated his alliance with France. One consequence was to marry the future Louis XVI to one of Maria Theresa’s daughters, Marie Antoinette, the “Austrian woman” of French Revolutionary fame. The Austrian alliance was never popular in France. Some French thought that the ruin of Prussia would only enhance the Austrian control of Germany and so undo the fundamental “Westphalia system.” The French progressive thinkers, known as “philosophes,” believed Austria to be priest-ridden and backward and were for ideological reasons admirers of the freethinking Frederick II. Dissatisfaction with its foreign policy was one reason for the growth of internal opposition to the Bourbon government.

---

*The Diplomatic  
Revolution of 1756*

In any case, when the Seven Years’ War broke out in 1756, though it was a continuation of the preceding war in that Prussia fought Austria, and Britain fought France, the belligerents had all changed partners. Great Britain and Prussia were now allies, as were, more remarkably, the Bourbons and the Habsburgs. In addition, Austria had concluded a treaty with the Russian empire for the annihilation of Prussia.

### *The Seven Years’ War, 1756–1763: In Europe and America*

Although the Seven Years’ War began in America, let us turn first to Europe, where the war was another war of “partition.” As a league of powers had but recently attempted to partition the empire of Maria Theresa, and a generation before had in fact partitioned the empires of Sweden and Spain, so now Austria, Russia, and France set out to partition the newly created kingdom of Prussia. Their aim was to relegate the Hohenzollerns to the territory of Brandenburg. Even with Silesia, Prussia had less than 6,000,000 people; each of its three principal enemies had 20,000,000 or more. But war was less an affair of peoples

Schönbrunn Palace, near Vienna, was the great palace of the Austrian Habsburgs. It was planned to compete with the vast palace of their French Bourbon rivals, but the plan was never completed because Maria Theresa (1740–1780) thought that the building seen here was adequate for her needs.

(Kunsthistorisches Museum, Vienna)

---

*Frederick's military triumphs*

than of states and standing armies, and the Prussian state and Prussian army were the most efficient in Europe. Frederick fought brilliant campaigns, won victories as at Rossbach in 1757, moved rapidly along interior lines, and eluded, surprised, and reattacked the badly coordinated armies opposed to him. He proved himself the great military genius of his day. But genius was scarcely enough. Against three such powers, reinforced by Sweden and the German states, and with no ally except Great Britain (and Hanover) whose aid was almost entirely financial, the kingdom of Prussia by any reasonable estimate had no chance of survival. There were times when Frederick believed all to be lost, yet he went on fighting, and his strength of character in these years of adversity, as much as his ultimate triumph, later made him a hero and symbol for the Germans. His subjects, Junkers and even serfs, advanced in patriotic spirit under pressure. The coalition tended to fall apart. The French lacked enthusiasm; they were fighting Britain, the Austrian alliance was unpopular, and Kaunitz would not plainly promise them Belgium. The Russians found that the more they moved westward the more they alarmed their Austrian allies. Frederick was left to deal only with the implacable Austrians, for whom he was more than a match. By the peace of Hubertusburg in 1763 not only did he lose nothing but he also retained Silesia.

*The Masters of the Cloth Guild*

by **Rembrandt van Rijn** (Dutch, 1606–1669)

This painting was done on commission for the guild of “clothiers” in Amsterdam; these men are the prosperous leaders of the guild.

(Rijksmuseum, Amsterdam)

*Portrait of the Artist with Isabelle Brant*

by **Peter Paul Rubens** (Flemish, 1577–1640)

Isabelle Brant married Rubens about the time he painted this dual portrait, which conveys the affection in an early seventeenth-century marriage.

(Bayerische Staatsgemäldesammlungen. Alte Pinakothek, Munich, Kustdia-Archive ARTOTHEK, D-Peissenberg)

*The Artist's Studio*

by **Jan Vermeer** (Dutch, 1632–1675)

The shadings of light and the textures of cloth are joined with the mysteries of human character in Vermeer's painting of the creative artist and his subject.

(Kunsthistorisches Museum, Vienna)

*Old Woman Cooking Eggs*

by **Diego Velázquez** (Spanish, 1559–1660)

Velázquez was best known for his portraits of people at the Spanish royal court, but he also portrayed the lives and character of the lower classes—as in this painting of an unknown woman preparing food.

(National Galleries of Scotland)

*Self-Portrait*

by **Elisabeth Vigée-Lebrun** (French, 1755–1842)

Vigée-Lebrun boldly represented her creative ambitions, looking directly toward the viewer and claiming her place in the mostly male world of eighteenth-century art.

(Scala/Art Resource, NY)

*Mrs. Philip Thicknesse*

by **Thomas Gainsborough** (English, 1727–1788)

Although eighteenth-century women could not enter politics, their role in the fine arts became a theme in paintings such as Gainsborough's portrait of the fashionable Mrs. Thicknesse.

(Cincinnati Art Museum, Bequest of Mary M. Emery)

***A Woman of the Revolution***

by **Jacques-Louis David** (French, 1748–1825)

David's portrait of a lower-class French woman in 1795 suggests the determination of the women who joined the revolutionary Parisian crowds and clubs during the French Revolution.

(Giraudon/Art Resource, NY)

***The Gleaners***

by **Jean-François Millet** (French, 1814–1875)

Most French women still worked in the countryside during the nineteenth century, as Millet showed in this painting of poor peasants who gleaned the fields for a few stalks of grain.

(Art Resource, NY)

## CHRONOLOGY OF NOTABLE EVENTS, 1619–1763

---

1619	First enslaved Africans arrive in Virginia
1720	The “Mississippi Bubble” in France and “South Sea Bubble” in Britain
1740–1748	War of Austrian Succession in Europe
1740–1780	Queen Maria Theresa rules and expands the Austrian Empire
1740–1786	Frederick II (the Great) rules and expands the kingdom of Prussia
1756–1763	The Seven Years’ War; expansion of British power in India and America

---

---

For the rest, the Seven Years’ War was a phase in the long dispute between France and Great Britain. Its stakes were supremacy in the growing world economy, control of colonies, and command of the sea. The two empires had been left unchanged in 1748 by the peace of Aix-la-Chapelle. Both held possessions in India, in the West Indies, and on the American mainland (see maps, pp. 187, 295). In India both British and French possessed only disconnected commercial establishments on the coast, infinitesimal specks on the giant body of India. Both also traded with China at Canton. Both occupied way stations on the route to Asia—the British in St. Helena and Ascension Island in the south Atlantic, the French in the more valuable islands of Mauritius and Reunion in the Indian Ocean. The French were active also on the coasts of Madagascar. The greatest way station, the Cape of Good Hope, belonged to the Dutch. In the West Indies the British plantations were mainly in Jamaica, Barbados, and some of the Leeward Islands; the French, in Santo Domingo, Guadeloupe, and Martinique. All were supported by the booming slave trade in Africa.

---

---

*British and French  
colonial interests*

On the American mainland the French had more territory and the British had more people. In the British colonies from Georgia to Nova Scotia lived perhaps two million Europeans, predominantly English but with strong infusions of Scots-Irish, Dutch, Germans, French, and Swedes. Philadelphia, with some 40,000 people, was as large as any city in England except London. The colonies in population bulked about a quarter as large as the mother country. But they were provincial, locally minded, and incapable of concerted action. In 1754 the British government called a congress at Albany in New York, hoping that the colonies would assume some collective responsibility for the coming war. The congress adopted an “Albany plan of union” drawn up by Benjamin Franklin, but the colonial legislatures declined to accept it, through fear of losing their separate identity. The colonials were willing, in a politically immature way, to rely on Britain for military action against France.

The French were still in possession of Louisburg on Cape Breton Island, a stronghold established by Louis XIV, located in the Gulf of St. Lawrence. It was designed for naval domination of the north Atlantic and to control access to the St. Lawrence River, the Great Lakes, and the vast region now called the Middle West. Through all this tract of country the French constantly came and went, but there were sizable French settlements only around New Orleans in the south and Quebec in the north. One source of French strength was that the French were more successful than the British in gaining the support of the Indians. This was probably because the French, being few in numbers, did not threaten to expropriate their lands and also because Catholics at this time were incomparably more active than Protestants in Christian missions among non-European peoples.

---

---

*Mercantilist  
regulations*

Both empires, French and British, were held together by mercantilist regulations framed mainly in the interest of the home countries. In some ways the British empire was more liberal than the French; it allowed local self-government and permitted immigration from all parts of Europe. In other ways the British system was stricter. British subjects, for example, were required by the Navigation Acts to use British ships and seamen—English, Scottish, or colonial—whereas the French were freer to use the transport services of other nations. British sugar planters had to ship raw sugar to the home country, there to be refined and sold to Europe, whereas French planters were free to refine their sugar in the islands. The mainland British colonials were forbidden to manufacture ironware and numerous other articles for sale; they were expected to buy such objects from England. Since the British sold little to the West Indies, where the slave population had no income with which to buy, the mainland colonies, though less valued as a source of wealth, were a far more important market for British goods. The colonials, though they had prospered under the restrictive system, were beginning to find much of it irksome at the time of the Seven Years' War, and indeed evaded it when they could.

Fighting was endemic even in the years of peace in Europe. Nova Scotia was a trouble spot. French in population, it had been annexed by Britain at the Peace of Utrecht. Its proximity to Louisburg made it a scene of perpetual agitation. The British government in 1755, foreseeing war with France, bodily removed about 7,000 of the mostly French-speaking inhabitants of Acadia, originally a French colony and part of Nova Scotia. Although they were dispersed throughout Britain's North American colonies, some of these displaced people eventually migrated to Louisiana and preserved a distinctive identity in the French Cajun culture that developed there. But the great disputed area was the Alleghenies. British colonials were beginning to feel their way westward through the mountains. French traders, soldiers, and empire builders were moving eastward toward the same mountains from points on the Mississippi and the Great Lakes. In 1749, at the request of Virginia and London capitalists, the British government chartered a land-exploitation company, the Ohio Company, to operate in territory claimed also by the French. The French built a fort at the point where the Ohio River is formed by the junction of two smaller rivers—Fort Duquesne, later called Pittsburgh. A force of colonials and British regular troops, under General Braddock, started through the wilderness to dislodge the French. It was defeated in July 1755, perhaps through its commander's unwillingness to take advice from the colonial officers, one of whom was George Washington.

A year later France and Britain declared war. The British were brilliantly led by William Pitt, subsequently the Earl of Chatham, a man of wide vision and superb confidence. "I know that I can save the country," he said, "and I know that no one else can." He concentrated British effort on the navy and colonies, while subsidizing Frederick of Prussia to fight in Europe, so that England, as he put it, might win an empire on the plains of Germany. Only the enormous financial credit of the British government made such a policy feasible. In 1758 British forces successfully took Fort Duquesne. Louisburg fell again in the same year. Gaining entry to the St. Lawrence, the British moved upstream to Quebec, and in 1759 a force under General Wolfe, stealthily scaling the heights, appeared by surprise on the Plains of Abraham outside the fortress, forcing the garrison to accept a battle, which the British won. With the fall of Quebec no further French resistance was possible on the American mainland. The British also, with superior naval power, occupied Guadeloupe and Martinique in the Caribbean and the French slave stations in Africa.

*The Seven Years' War, 1756–1763: In India*

Both British and French interests meanwhile profited from disturbed conditions in India. As large as Europe without Russia, India was a congested country of impoverished masses, speaking hundreds of languages and following many religions and subreligions, the two greatest being the Hindu and the Muslim. Waves of invasion through the northwest frontier since the Christian year A.D. 1001 had produced a Muslim empire, whose capital was at Delhi and which for a time held jurisdiction over most of the country. These Muslim emperors were known as Great Moguls. The greatest was Akbar, who ruled from 1556 to 1605, built roads, reformed the taxes, patronized the arts, and attempted to minimize religious differences among his peoples. The Muslim artistic culture flourished for a time after Akbar. One of his successors, Shah Jehan (1628–1658), built the beautiful Taj Mahal near Agra and at Delhi built the delicately carved alabaster palace of the Moguls, in which he placed the Peacock Throne made of solid gold and studded with gems.

But meanwhile there was restlessness among the Hindus. The Sikhs, who had originated in the fifteenth century as a reform movement in Hinduism, went to war with the Mogul emperor in the seventeenth century. They became one of the most ferociously warlike of Indian peoples. Hindu princes in central India meanwhile formed a “Mahratta confederacy” against the Muslim emperor at Delhi. Matters were made worse when Aurungzeb, the last significant Mogul emperor (1658–1707), adopted repressive measures against the Hindus. After Aurungzeb, India fell into political dissolution. Many of the modern princely states originated or became autonomous at this time. Hindu princes rebelled against the Mogul. Muslims, beginning as governors or commanders under the Mogul, set up as rulers in their own right. Thus originated Hyderabad, which included the fabulous diamond mines of Golconda and whose ruler long was called the wealthiest man in the world. Princes and would-be princes fought with each other and with the emperor. New Muslim invaders also poured across the northwest frontier. In 1739 a Persian force occupied Delhi, slaughtered 30,000 people, and departed with the Peacock Throne. Between 1747 and 1761 came a series of forays from Afghanistan, which again resulted in the looting of Delhi and the massacre of thousands.

---

*Religious and  
political upheaval in  
India*

The situation in India resembled, on a larger and more frightful scale, what had happened in Europe in the Holy Roman Empire, where irreconcilable religious differences (of Catholics and Protestants) had also torn the country asunder, ambitious princes and city-states had won a chaotic independence, and foreign armies appeared repeatedly as invaders. India, like central Europe, suffered chronically from war, intrigue, and rival pretensions to territory; and in India, as in the Holy Roman Empire, outsiders and ambitious insiders benefited together.

The instability and violence in the interior had repercussions on the Indian coasts. Here handfuls of Europeans were established in the coastal cities. By the troubles in the interior the Indian authorities along the coasts were reduced, so to speak, to a size and power with which the Europeans could deal. The Europeans—British and French—were agents of their respective East India companies. The companies built forts, maintained soldiers, coined money, and entered into treaties with surrounding Indian powers, under charter of their home governments and with no one to deny them the exercise of such sovereign rights. Agents of the companies, like Indians themselves, ignored or respected the Mogul emperor as suited their own purpose. They were, at first, only one of the many elements in the flux and reflux of Indian affairs. Their presence in India showed the international reach

**The battle of Quebec, depicted here in an English illustration of the British army's surprise approach to the Plains of Abraham, allowed Britain to gain control over most of North America and to increase its power in the expanding, global system of eighteenth-century trade.**

of European companies, the worldwide competition between British and French interests, and the growing importance of India in the global economic system.

*Intentions of the  
British and the  
French*

Neither the British nor the French government, during the Seven Years' War, had any intention of territorial conquest in India, their policy in this respect differing radically from policy toward America. Nor were the two trading companies pushing their agents toward imperialistic political interventions. The company directors in London and Paris disapproved of fantastic schemes to intervene in Indian politics, insisted that their agents should attend to business only, and resented every penny and every sou not spent to bring in commercial profit. But it took a year or more to exchange messages between Europe and India, and company representatives in India, caught up in the Indian vortex and overcome by the chance to make personal fortunes or by dreams of empire, acted very much on their own, committing their home offices without compunction. Involvement in Indian affairs was not exactly new. We have seen how "Diamond" Pitt, in 1702, purchased the goodwill of the local ruler of the Carnatic when he threatened by military force to reduce the English traders at Madras to submission.

The first European to exploit the possibilities of the changing situation in mid-eighteenth-century India was the Frenchman Joseph-François Dupleix, who believed that the funds sent out by the company in Paris to finance the Indian trade were insufficient. His

idea seems to have been not empire-building but to make the company into a local territorial power in order that, from taxes and other political revenues, it might have more capital for its commercial operations. In any case, during the years of peace in Europe after 1748, Dupleix found himself with about 2,000 French troops in the Carnatic. He lent them out to neighboring local rulers in return for territorial concessions. He also began to drill Indian soldiers by European methods, thereby creating the first regiments of “sepoys”—Indian troops who served in the military forces of the European companies. Following a program of backing claimants to various Indian thrones, he built up a clientele of local rulers under obligation to himself. He was very successful, for a few well-armed European troops or sepoy could overcome much larger, poorly armed Indian forces in pitched battle. But he was recalled to France in 1754, after the company became apprehensive of war with Britain and other trouble; and he died in disgrace.

When war came in 1756, British interests in India were advanced chiefly by Robert Clive. He had come to India many years before as a clerk for the East India Company but had shown military talents and an ability to comprehend Indian politics. He had maneuvered, with little success, against Dupleix in the Carnatic in the 1740s. In 1756, on hearing the news of war in Europe, he shifted his attention to Bengal, hoping to drive the French from their trading stations there. The French were favored in Bengal by the local Muslim ruler, Suraja Dowla, who proceeded to anticipate Clive's arrival by expelling the British from Calcutta. Capturing the city, he shut up 146 Englishmen in a small room without windows (soon known in England as the “Black Hole of Calcutta”) and kept them there all night, during which most of them died of suffocation. Clive, soon appearing with a small force of British and sepoy, routed Suraja Dowla at the battle of Plassey in 1757. He put his own puppet on the Bengal throne and extorted huge reparations both for the company and for himself. Returning to England, he was received with mixed feelings; but he was given a new title (Baron Clive of Passy) and appointed the “governor” of Bengal. He strove in India to reduce the almost incredible corruption of company employees there, individuals normal enough but demoralized by irresistible chances for easy riches. Finally he committed suicide in 1774.

---

Robert Clive

It was British sea power, more fundamentally than Clive's tactics, that assured the triumph of British over French ambitions in the East. The British government still had no intention of conquest in India, but it could not see its East India Company forced out by agents of the French company in collaboration with Indian princes. Naval forces were therefore dispatched to the Indian Ocean, and they not only allowed Clive to shift from Madras to Calcutta at will but also gradually cut off the French posts in India from Europe and from each other. By the end of the war all the French establishments in India, as in Africa and America, were at the mercy of the British. The French overseas lay prostrate, and France itself was again detached from the overseas world on which much of its economy rested. In 1761 France made an alliance with Spain, which was alarmed for the safety of its own American empire after the British victories at Quebec and in the Caribbean. But the British also defeated Spain.

### *The Peace Settlement of 1763*

The British armed forces had been spectacularly successful. Yet the peace treaty, signed at Paris in February 1763, five days before the Austro-Prussian peace of Hubertusburg, was by no means unfavorable to the defeated. The French Duke of Choiseul was a

Britain's imperial role in late eighteenth-century India is represented in this Indian miniature of a British officer's wife surrounded by Indian servants. The social hierarchies within the growing empire appear in this scene of domestic order and wealth, which dates from about 1785.

(Werner Forman Archive/Art Resource, NY)

#### *French concessions*

skillful and single-minded negotiator. The British, Pitt having fallen from office in 1761, were represented by a confused group of parliamentary favorites of the new king, George III. **France ceded to Britain all French territory on the North American mainland east of the Mississippi. Canada thereby became British,** and the colonials of the thirteen colonies were relieved of the French presence beyond the Alleghenies. **To Spain, in return for aid in the last days of the war, France ceded all holdings west of the Mississippi and at its mouth. France thereby virtually abandoned the North American continent.** But these almost empty regions were of minor commercial importance, and the French, in return for surrendering them, retained many economically more valuable establishments elsewhere. In the West Indies the British planters, and in England the powerful "West India interest," feared competition from the **French sugar islands** and wanted to exclude them from the protected economic system of

### THE WORLD IN 1763

At the Peace of Paris of 1763 the British overseas empire triumphed over the French. The French ceded their holdings on the North American mainland east of the Mississippi to Britain, those west of the Mississippi to Spain. Britain also took Florida from Spain in 1763, but lost it, returning it to Spain in 1783, at the close of the War of American Independence. The French retained their sugar islands in the West Indies and their trading stations in India; they were stopped from empire-building but did not greatly suffer commercially from the Seven Years' War. The British proceeded to build their empire in India.

the British empire. France therefore received back Guadeloupe and Martinique, as well as most of its slave stations in Africa. In India, the French remained in possession of their commercial installations—offices, warehouses, and docks—at Pondicherry and other towns. They were forbidden to erect fortifications or pursue political ambitions among Indian princes—a practice which neither the French nor the British government had hitherto much favored in any case.

The treaties of Paris and Hubertusburg, closing the prolonged war of the mid-century, made the year 1763 a memorable turning point. Prussia was to remain a major power, which meant that the dualism of Germany would continue. Austria and Prussia eyed each other as rivals. Frederick's aggression of 1740 was legalized and even given a new moral status in Prussia by the heroic defense that had proved necessary to retain the plunder.

Frederick himself, from 1763 until his death in 1786, was a man of peace, philosophical and even benign. But the German crucible had boiled, and out of it had come a Prussia even more disposed by its escape from annihilation to glorify its army as the steel framework of its life.

The Anglo-French settlement was far-reaching and rather curious. Although the British won decisive victories everywhere in the global war, it resulted in no commercial calamity for France. French trade with America and the East grew as rapidly after the Seven Years' War as before it, and in 1785 was double what it had been in 1755. For England the war opened up new commercial channels. British trade with America and the East probably tripled between 1755 and 1785. But the outstanding British gains were imperial and strategic. The European balance of power was preserved, the French had been kept out of Belgium, British subjects in North America seemed secure, and Britain had again vindicated its command of the sea. British sea power implied, in turn, that British sea-borne commerce was safe in peace or war, while the seaborne commerce for the French, or of any others, depended ultimately on the political requirements of the British. But the French still had a few cards to play and were to play them in the American and French revolutions.

For America and India the peace of 1763 was decisive in pushing the peoples of these two vast territories toward closer connections with the political and commercial institutions of the British empire. America north of Mexico was to become part of an English-speaking world. In India the British government was drawn increasingly into a policy of territorial occupation; a British "paramount power" eventually emerged in place of the empire of the Moguls. British political rule in India stimulated and protected British business there, until in the greatest days of British prosperity India was one of the main pillars of the British economic system, and the road to India became in a real sense the lifeline of the British empire. But in 1763 this state of affairs was still in the future and was to be reached by many intermediate steps.

# THE AGE OF ENLIGHTENMENT

35. The Philosophes—  
and Others
36. Enlightened Despotism:  
France, Austria, Prussia
37. Enlightened Despotism:  
Russia
38. The Partitions of Poland
39. New Stirrings: The British  
Reform Movement
40. The American Revolution

*The eighteenth century*, or at least the years of that century preceding the French Revolution of 1789, is commonly known in European history as the Age of Enlightenment, and though that name raises some difficulties, still there is no other that describes so many features of the time so well. People strongly felt that theirs was an enlightened age, and it is from their own evaluation of themselves that our term Age of Enlightenment is derived. Everywhere there was a feeling that Europeans had at last emerged from a long twilight. The past was generally regarded as a time of barbarism and darkness. The sense of progress was all but universal among the educated classes. It was the belief both of the forward-looking thinkers and

writers known as the philosophes and of the forward-looking monarchs, the “enlightened despots,” together with their ministers and officials.

The leading ideas of the Enlightenment—optimistic beliefs in the historical advance of reason, science, education, social reform, tolerance, and enlightened government—have been constant themes in the modern world. The Enlightenment, in short, remains a dynamic tradition in cultural and political life. Intellectual debates since the eighteenth century have almost always returned, explicitly or implicitly, to questions about the validity and legacy of Enlightenment conceptions of truth, knowledge, and progress. The Enlightenment has often been challenged or condemned by influential cultural movements (for example, romanticism, postmodernism, religious revivals) and by modern political ideologies (for example, fascism, ethnic nationalisms). Yet the vehemence of its modern critics confirms the Enlightenment’s exceptional, enduring importance in the cultures and politics of modern societies.

Eighteenth-century critiques of existing regimes and cultural traditions drew increasingly on the ideas of the Enlightenment; indeed, such ideas were contributing by

the end of the century to explosive political revolutions in America and Europe. In later centuries, Enlightenment ideas continued to generate opposition to unpopular governments or dominant cultural ideologies or hierarchical social systems, but the Enlightenment was also condemned in many cultures. For its advocates and critics alike, however, the “Age of Enlightenment” has always represented a decisive historical moment or force in the development of “modernity.”

## 35. THE PHILOSOPHES—AND OTHERS

### *The Spirit of Progress and Improvement*

The spirit of the eighteenth-century Enlightenment was drawn from the scientific and intellectual revolution of the seventeenth century. The Enlightenment carried over and popularized the ideas of Bacon and Descartes, of Bayle and Spinoza, and, above all, of Locke and Newton. It carried over the philosophy of natural law and of natural right. There had never been an age in which Europeans were so skeptical toward tradition, so confident in the powers of human reason and of science, so firmly convinced of the regularity and harmony of nature, and so deeply imbued with the sense of civilization’s advance and progress.

#### *Faith in progress*

The idea of progress has often been described as the dominant or characteristic idea of European civilization in the modern era, or since the late seventeenth century. It is a belief, a kind of nonreligious faith, that the conditions of human life become better as time goes on, that in general each generation is better off than its predecessors and will contribute by its labor to an even better life for generations to come, and that in the long run all humankind will share in the same advance. All the elements of this belief had been present by 1700. It was after 1700, however, that the idea of progress became explicit. In the seventeenth century it had shown itself in a more rudimentary way in the sporadic intellectual dispute in England and France known as the quarrel of Ancients and Moderns (which, as noted earlier, also became part of the challenge to official theorists in Louis XIV’s academies). The Ancients held that the works of the Greeks and Romans had never been surpassed. The Moderns, pointing to science, art, literature, and invention, declared that their own time was the best, that it was natural for people of their time to do better than the ancients because they came later and built upon their predecessors’ achievements. The quarrel was never exactly settled, but a great many people in 1700 were Moderns.

Far-reaching also was the faith of the age in the natural faculties of the human mind. Extreme skepticism, but not a skeptical outlook, was rejected. Nor were the educated, after 1700, likely to be superstitious, terrified by the unknown, or addicted to magic. The witchcraft mania abruptly died. Indeed all sense of the supernatural became dim for many Europeans. “Modern” people not only ceased to fear the devil but also to fear God. They thought of God less as a Father than as a First Cause of the physical universe. There was less sense of a personal God, or of the inscrutable imminence of divine Providence, or of the human need for saving grace. God was less the God of Love than the inconceivably intelligent Being who had made the amazing universe now discovered by human reason. The great symbol of the Christian God was the Cross, on which a divine being had suffered in human form. The symbol which occurred to people of scientific view was the Watchmaker. The intricacies of the physical universe were compared to the intricacies of

a watch, and it was argued that just as a watch could not exist without a watchmaker, so the universe as discovered by Newton could not exist without a God who created it and set it moving by its mathematical laws. It was almighty intelligence that was thought divine.

Of course not everyone was primarily moved by such ideas. The first half of the eighteenth century was in fact also a time of continuing religious fervor. Isaac Watts wrote many hymns that are still familiar in English-speaking churches; the great church music of J. S. Bach was composed mainly in the 1720s; Handel's oratorio, *The Messiah*, was first performed in 1741; and it was at about this time that congregations first sang the *Adeste fideles* ("O Come, All Ye Faithful"), originally Catholic in inspiration but soon adopted by Protestants also. The Lutherans of Germany were stirred by the movement known as Pietism, which stressed the inner spiritual experience of ordinary persons as distinct from the doctrines taught and debated in theological faculties. The quest for an "inner light," or illumination of the soul rather than of the reason, was somewhat contrary to the main thrust of the Age of Enlightenment, and a religious urge for improvement of the individual rather than of social institutions was hardly central to the ideas of the age, but such ideas were by no means merely conservative, for they were in general highly critical of the existing order.

---

*Religious fervor and  
Pietism*

Within the Church of England John Wesley, while a student at Oxford, joined a group of like-minded young men for prayer and meditation. They engaged in good works to relieve the sufferings of prisoners and the poor, to whom they distributed food and clothing, while also teaching them how to read. Going outside the restrictive system of parishes, Wesley and others took to "itinerant" preaching, often to immense crowds in open fields. Wesley is said to have traveled 250,000 miles within Great Britain over a period of 50 years. He and George Whitfield, who shared his views, preached also in the English American colonies, where they helped to arouse the Great Awakening of the 1740s. Such movements had a democratizing effect in stressing individual worth and spiritual consciousness independently of the established religious authorities. Indeed, the spokesmen for older churches dismissed such movements as "enthusiasm," which was then a word of reproach. By the time he died in 1791, Wesley had about half a million followers in what were called Methodist societies. Wesley himself tried to keep them within the Church of England, but separate Methodist churches were already founded in England and the United States.

---

*John Wesley and  
Methodism*

In a way these expressions of religious feeling reflected differences between the popular and elite cultures that have already been described. While some of the elite joined in the new movements, it was on the whole the least comfortable classes who did so. The official churches, Anglican, Lutheran, Catholic, did not wish to be disturbed by religious revivalism. Bishops were cultivated gentlemen of the age. But the most vehement intellectual leaders pushed all churches aside.

The science and new learning in this "age of reason" did not end the popular interest in magic or mystification. A Swiss pastor, J. C. Lavater, attracted attention with his supposed science of "physiognomy," by which a person's character could be read in the play of the facial features. An Austrian physician, F. A. Mesmer, created a stir in Paris by arranging séances where people were touched by a wand, or sat in tubs, to receive "animal magnetism" in the hope of curing various ills. His "mesmerism" was an early stage in the discovery of hypnosis, but it is significant that a committee of the Royal Academy of Sciences, after investigation, concluded that Mesmer's own theories to explain these strange phenomena were without foundation.

*Individualism*

---

*Freemasonry*

More in the mainstream was **Freemasonry**, which took form in England and soon spread to the Continent. The Masons were generally persons who held typical Enlightenment views, well disposed toward reason, progress, toleration, and humane reforms, and respectful toward God as architect of the universe; but they met secretly in lodges, in an atmosphere of mysterious rituals and occult knowledge. People of all walks of life, nobles, clergy, and middle classes, belonged to the lodges (a few also allowed women to join). Freemasonry thus had the effect of bringing persons of different social classes together, somewhat harmlessly for self-improvement and the improvement of others. It aroused suspicion, however, because of its secrecy; and a small deviant offshoot, the Illuminati of south Germany, was considered so dangerous that the Bavarian government suppressed it in 1786. There were later some who insisted that the French Revolution had been caused by a conspiracy of Illuminati, philosophes, and other clandestine plotters, but this idea was never any more than the belief of a few frightened conservative critics. The word *Illuminati* meant “the enlightened ones,” but the notion of secrecy was foreign to the Enlightenment, which relied above all else on publicity and the reading public.

*The Philosophes*

*Philosophe* is simply French for philosopher, but to be “philosophical” in the eighteenth century meant to approach any subject in a critical and inquiring spirit. The French word is used in English to denote a group of writers who were not philosophers in the sense of treating ultimate questions of knowledge or existence. They were social or literary critics, popularizers, and publicists. Most philosophes were men, but many women also participated in Enlightenment culture. The French writer Emilie du Châtelet, for example, translated Newton and explained the significance of the new theories in her scientific essays. Though often learned, the philosophes wrote to gain attention, and it was through the philosophes that the ideas of the Enlightenment spread. Formerly authors had generally been persons of leisure, or talented protégés of aristocratic or royal patrons, or professors or clerics supported by the income from religious foundations. In the Age of Enlightenment a great many were freelancers, grub-streeters, or journalists. They wrote for “the public.”

---

*The reading public*

The reading public had greatly expanded; by the 1780s in France, literacy rates had risen to 47 percent among men and 27 percent among women. The educated middle class, commercial and professional, was much larger than ever before. Women readers formed a growing audience for novels and literary journals, country gentlemen sought new scientific advice on agriculture, and even noblemen wished to keep informed. Newspapers and magazines multiplied, and people who could not read them at home could read them in coffeehouses or in reading rooms organized for that purpose. There was a great demand also for dictionaries, encyclopedias, and surveys of all fields of knowledge. The new readers wanted matters made interesting and clear. They appreciated wit and lightness of touch. From such a public, literature itself greatly benefited.

The style of the eighteenth century became admirably fluent, clear, and exact, neither ponderous on the one hand nor frothy on the other. And from writings of this kind the readers benefited also, from the interior of Europe to the America of Benjamin Franklin. People began to talk of “public opinion” as a kind of critical tribunal that judged the significance of new books and established or destroyed the reputations of ambitious

authors. This new public opinion, the French writer Malesherbes explained, was an independent social force “that all powers respect, that appreciates all talents, that pronounces on all people of merit.” Critical reviews of literature, art, and music provoked debates in newspapers, journals, and coffeehouses, all of which contributed to an expanding public sphere beyond the personal world of private households and outside the official world of government institutions. The bourgeois middle class was becoming not only educated but also thoughtful and critical. But the movement was not a class movement only.

There was another way in which writings of the day were affected by social conditions. They were all written under censorship. The theory of censorship was to protect people from harmful ideas as they were protected from shoddy merchandise or dishonest weights and measures. In England the censorship was so mild as to have little effect. Other countries, such as Spain, had a powerful censorship. France, the center of the Enlightenment, had both a complicated censorship and a large reading and writing public. The church, the Parlement of Paris, the royal officials, and the printers’ guilds all had a hand in the censoring of books. French censorship, however, was loosely administered, and after 1750 writers were little disturbed by it. It cannot be compared to censorship in some countries in the twentieth century. Yet in one way it had an unfavorable effect on French thought and letters. It discouraged writers from openly or explicitly addressing concrete public questions. Legally forbidden to criticize church or state, they threw their criticisms on an abstract level. Barred from attacking matters in particular, they tended to attack matters in general. Or they talked of the customs of the Persians and the Iroquois but not the French. Their works became full of double meanings, sly digs, innuendoes, and jokes by which authors, if questioned, could declare that they did not mean what all the world knew they did mean. As for readers, they developed a taste for forbidden books, which were always easy enough to obtain through illicit channels and foreign booksellers.

---

Censorship

Paris was the heart of the movement. Here, in the town houses of the well-to-do, literary and social celebrities gathered for literate conversation. It might occasionally happen that a notable philosophe was also wealthy; such was the case of Helvétius, who not only wrote books *On the Mind* and *On Man* but also gave grand entertainments at which such matters were discussed. Mainly, however, this mingling of people and ideas went on in salons conducted by women who became famous as hostesses, or salonnières, and who played a crucial mediating role in what came to be called the “Republic of Letters.” Madame de Geoffrin, for example, for a period of 25 years beginning about 1750, organized conversations of artists and writers at dinner, sometimes helped them financially, and introduced them to persons of influence in high society or in government. She welcomed visiting foreigners also, such as Horace Walpole and David Hume from England and young Stanislas Poniatowski before he became king of Poland. Since other women held similar salons, philosophes and other writers had frequent opportunity to meet and exchange ideas.

---

Paris: the heart of the Enlightenment

Salons became well-organized meeting places at which authors introduced new works to critical readers, salonnières read letters from travelers or distant correspondents, and lively conversation spread the reputations of aspiring philosophes. The leading salonnières gave careful attention to the intellectual themes and social continuities of their salons. Suzanne Necker, whose salon met on Friday afternoons during the 1770s and 1780s, prepared for her weekly conversations by listing in her journal the ideas and books that she wanted to discuss. Julie de Lespinasse provided opportunities for almost constant discussion at her Parisian home, where she received visitors every evening of the week for 12

years. “Her great art,” wrote one admirer, “was to show to advantage the minds of others, and she enjoyed doing that more than revealing her own.” Salons and salonnières promoted the ideals of a cosmopolitan Republic of Letters in which talent and creativity counted for more than noble lineage; and though women lost much of their cultural influence after the 1780s, some salons of this kind survived the Revolution. In 1795, after the Terror, the widows of two eminent philosophes, Helvétius and Condorcet, opened or reopened their salons in Paris for people of moderate republican or liberal sentiments. Sophie Condorcet became a writer herself and a translator of Adam Smith. Her salon remained a center of liberal opposition during the years of Napoleon. More short-lived was the salon of the even more famous Germaine de Staël, who also wrote widely read books and who, among her many other ideas, deplored the subordination of women that the Revolution had done little to change. In these post-Revolutionary salons much of the French liberalism of the nineteenth century was born.

---

Diderot's  
Encyclopédie

In Paris also, in the mid-eighteenth century, the most serious of all philosophe enterprises, the *Encyclopédie*, was published in 17 large volumes and completed over the years 1751 to 1772. Edited by Denis Diderot, it was a great compendium of scientific, technical, and historical knowledge, carrying a strong undertone of criticism of existing society and institutions and epitomizing the skeptical, rational, and scientific spirit of the age. It was not the first encyclopedia, but it was the first to have a distinguished list of contributors or to be conceived as a positive force for social progress. Virtually all the French philosophes contributed—Voltaire, Montesquieu, Rousseau, d’Alembert (who assisted in the editing), Buffon, Turgot, Quesnay, and many others, all sometimes collectively called the Encyclopedists. Although edited in Paris, the *Encyclopédie* became very widely known and read. About 25,000 multivolumed sets were sold before the Revolution, about half of them outside France, since French had become an international language understood by educated persons all over Europe. Within France itself the *Encyclopédie* was read in all parts of the country and in the most influential ranks of society. At Besançon, for example, a city of about 28,000 inhabitants, 137 sets were sold to local residents, of whom 15 were members of the clergy, 53 were of the nobility, and 69 were lawyers, doctors, merchants, government officials, or others of what was called the Third Estate. The privileged groups of whom the Encyclopedists were the most critical, that is, the clergy and the nobility, read it or at least purchased it far out of proportion to their numbers in the population as a whole.

Men and women who considered themselves philosophes, or close to the philosophes in spirit, were found all over Europe. Frederick the Great was an eminent philosophe; not only was he the friend of Voltaire and host to a circle of literary and scientific men at Potsdam, but he also wrote epigrams, satires, dissertations, and histories, as well as works on military science; and he had a gift of wit, a sharp tongue, and a certain impishness toward the traditional and the pompous. Catherine the Great, empress of Russia, was also a philosophe for much the same reason. Maria Theresa, of Austria, was not a philosophe; she was too religious and too little concerned with general ideas. Her son Joseph, on the other hand, as we shall see, proved to be virtually a philosophe enthroned. In England Bishop Warburton was considered by some of his friends as a philosophe; he held that the Church of England of his day, as a social institution, was exactly what pure reason would have invented. The Scottish skeptical philosopher David Hume counted as a philosophe, as did Edward Gibbon, who shocked the pious by his attacks on Christianity in his famous *Decline and Fall of the Roman Empire*. Dr. Samuel Johnson was not a philosophe, though he was best known for a typical eighteenth-century project—the compilation of a new dictionary of the English language. Johnson worried over the supernatural, adhered to the

The salon of Madame de Geoffrin, depicted here by the artist Lemonnier, became one of the best-known meeting places for writers and artists in mid-eighteenth-century Paris. This imagined scene of an author reading from his work was painted early in the following century, but it shows the cultural reputation of famous salons and salonnières.

(Réunion des Musées Nationaux/Art Resource, NY)

established church, deflated pretentious authors, and even declared that Voltaire and Rousseau were evil men who should be sent “to the plantations.” There were also Italian and German philosophes, like the Marquis di Beccaria, who sought to humanize the criminal law, or Baron Grimm, who sent a literary newsletter from Paris to his many subscribers.

### *Montesquieu, Voltaire, and Rousseau*

Most famous of all philosophes were the French trio, Montesquieu (1689–1755), Voltaire (1694–1778), and Rousseau (1712–1778). They differed vehemently with each other. All were hailed as literary geniuses in their own day. All turned from pure literature to works of political commentary and social analysis. All thought that the existing state of society could be improved.

**Montesquieu**, twice a baron, was a landed aristocrat, a seigneur or manorial lord of southern France. He inherited from his uncle a seat in the Parlement of Bordeaux and sat actively in that parlement after the death of Louis XIV. He was part of the noble resurgence that began about 1715 and continued on through the eighteenth century. Although he shared many of the ideas in the stream of aristocratic and antiabsolutist thought, he went beyond a mere self-centered class philosophy. In his great work, *The Spirit of*

**This portrait of Voltaire (c. 1736) by Maurice-Quentin de La Tour suggests the playful, ironic style that made his works accessible and popular, even when he was attacking religious persecutions or the suppression of controversial ideas.**

---

Montesquieu's *The Spirit of Laws*

*Laws*, published in 1748, he developed two principal ideas. One was that forms of government varied according to climate and circumstances, for example, that despotism was suited only to large empires in hot climates, and that democracy would work only in small city-states. His other great doctrine, aimed against royal absolutism in France (which he called “despotism”), was the separation and balance of powers. In France he believed that power should be divided between the king and a great many “intermediate bodies”—parlements, provincial estates, organized nobility, chartered towns, and even the church. His position as a judge in parlement, a provincial, and a nobleman gave him good reasons to favor the first three, and his work in Bordeaux helped him to recognize the importance of the bourgeoisie in French towns; as for the church, he observed that, while he took no stock in its teachings, he thought it useful as a barrier to undue centralization of government. He greatly admired the English constitution as he understood it, believing that England carried over, more successfully than any other country, the feudal liberties of the early Middle Ages. He thought that in England the necessary separation and balance of powers was obtained by an ingenious mixture of monarchy, aristocracy, and democracy (king, lords, and commons) and by a separation of the functions of the executive, legislature, and judiciary. This doctrine had a wide influence and was well known to the Americans who in 1787 wrote the Constitution of the United States. Montesquieu's own philosophe friends thought him too conservative and even tried to dissuade him from publishing his ideas. He was, indeed, technically a reactionary, favoring a scheme of things that antedated Louis XIV, and he was unusual among contemporaries in his admiration of the “barbarous” Middle Ages.

---

Voltaire

Voltaire was born in 1694 into a comfortable bourgeois family and christened François-Marie Arouet; “Voltaire,” an invented name, is simply the most famous of all pen names. Until he was over 40 he was known only as a clever writer of epigrams, tragedies in verse, and an epic. Thereafter he turned increasingly to philosophical and public questions. His strength throughout lay in the facility of

his pen. He is the easiest of all great writers to read. He was always trenchant, logical, and incisive, sometimes scurrilous; mocking and sarcastic when he wished, equally a master of deft irony and of withering ridicule. However serious in his purpose, he achieved it by getting his readers to laugh.

In his youth Voltaire spent 11 months in the Bastille for what was considered to be impertinence to the Regent, who, however, in the next year rewarded him with a pension for one of his dramas. He was again arrested after a fracas with a nobleman, the Chevalier de Rohan. He remained an incorrigible bourgeois, while never deeply objecting to the aristocracy on principle. Through his admirer Mme. de Pompadour (another bourgeois, though the king's favorite) he became a gentleman of the bedchamber and royal historian to Louis XV. These functions he fulfilled *in absentia*, when at all, for Paris and Versailles were too unsafe for him. He was the personal friend of Frederick the Great, in whose household he lived for about two years at Potsdam. The two finally quarreled, for no stage was big enough to hold two such prima donnas for long. Voltaire made a fortune from his writings, pensions, speculations, and practical business sense. In his later years he purchased a manor at Ferney near the Swiss frontier. Here he became, as he said, the "hotel keeper of Europe," receiving the streams of distinguished admirers, favor hunters, and distressed persons who came to seek him out. He died at Paris in 1778, at the age of 84, by far the most famous man of letters in Europe. His collected writings fill over 70 volumes.

Voltaire was mainly interested in the freedom of thought. Like Montesquieu, he was an admirer of England. He spent three years in that country, where, in 1727, he witnessed the state funeral accorded to Sir Isaac Newton and his burial in Westminster Abbey. Voltaire's *Philosophical Letters on the English* (1733) and *Elements of the Philosophy of Newton* (1738) not only brought England increasingly before the consciousness of the rest of Europe but also popularized the new scientific ideas—the inductive philosophy of Bacon, the physics of Newton, and the psychology of Locke, whose doctrine that all true ideas arose from sense experience undercut the authority of religious belief. What Voltaire mainly admired in England was its religious liberty, its tolerance for diverse ideas and scientific inquiry, its relative freedom of the press, and its respect for men of letters like himself. Political liberty concerned him much less than it did Montesquieu. Louis XIV, a villain for Montesquieu and the neoaristocratic school, was a hero for Voltaire, who wrote a laudatory *Age of Louis XIV* (1751) praising the Sun King for the splendor of art and literature in his reign. Voltaire likewise continued to esteem Frederick the Great, though he quarreled with him personally. Frederick was in fact almost his ideal of the enlightened ruler, a man who sponsored the arts and sciences, recognized no religious authority, and granted toleration to all creeds, welcoming Protestants and Catholics on equal terms if only they would be socially useful.

After about 1740 Voltaire became more definitely the crusader, preaching the cause of religious toleration. He fought to clear the memory of Jean Calas, a Protestant put to death on the charge of murdering a son to prevent his conversion to Rome. He wrote also to exonerate a youth named La Barre, who had been executed for defiling a wayside cross. *Écrasez l'infâme!* became the famous Voltairean war cry—"crush the infamous thing!" The *infâme* for him was bigotry, intolerance, and superstition and behind these the power of an organized clergy. He assaulted not only the Catholic church but the whole traditional Christian view of the world as well. He argued for "natural religion" and "natural morality," holding that belief in God and the difference between good and evil arose from reason itself. This doctrine had in fact long been taught by the Catholic church. But Voltaire insisted that no supernatural revelation in addition to reason was desirable or necessary; belief in a special supernatural revelation, he argued, made people intolerant, stupid, and cruel.

Voltaire was also the first to present a purely secular conception of world history. In his *Essai sur les mœurs*, or “Universal History,” he began with ancient China and surveyed the great civilizations in turn. Earlier writers of world history had put human events within a Christian framework. Following the Bible, they began with the Creation, proceeded to the Fall, recounted the rise of Israel, and so on. Voltaire put Judeo-Christian history within a much broader world history and placed religious thought in a sociological framework. He represented Christianity and all other organized religions as social phenomena or mere human inventions. Spinoza had said as much; Voltaire spread these ideas through Europe.

---

Voltaire on politics

In matters of politics and self-government Voltaire was neither a liberal nor a democrat. His opinion of the human race was about as low as his friend Frederick's. If only a government was enlightened, he did not care how powerful it was. By an enlightened government he meant one that fought against sloth and stupidity, kept the clergy in a subordinate place, allowed freedom of thought and religion, and advanced the cause of material and technical progress. He had no developed political theory, but his ideal for large civilized countries approached that of enlightened or rational despotism. Believing that only a few could be enlightened, he thought that these few, a king and his advisers, should have the power to carry out their program against all opposition. To overcome ignorance, credulity, and priestcraft it was necessary for the state to be strong. What Voltaire most desired was liberty for the enlightened, or for people like himself.

---

Jean-Jacques  
Rousseau

Jean-Jacques Rousseau was very different. Born in Geneva in 1712, he was a Swiss, a Protestant, and almost of lower-class origin. He never felt at ease in France or in Paris society. Neglected as a child, a runaway at 16, he lived for years by odd jobs, such as copying music, and not until the age of 40 did he have any success as a writer. He was always the little man, the outsider. In addition, his personal relations with women were difficult and unstable; he finally settled down with an uneducated woman named Thérèse Levasseur and with her mother, who kept interfering in his affairs. By Thérèse he had five children, whom he deposited at an orphanage. He had no social status, no money; and no sense of money; and after he became famous he lived largely by the generosity of his friends. He was pathetically and painfully maladjusted. He came to feel that he could trust no one, that those who tried to befriend him were deriding or betraying him behind his back. He condemned the cultural influence of French women, criticizing especially their prominent role in Parisian salons (“they do not know anything, although they judge everything”). He suffered from what would now be termed psychological complexes; possibly he was paranoid. He talked endlessly of his own virtue and innocence and complained bitterly that he was misunderstood.

But unbalanced though he was, he was possibly the most profound writer of the age and was certainly the most permanently influential. Rousseau felt, from his own experience, that in society as it existed a good person could not be happy. He therefore attacked society, declaring that it was artificial and corrupt. He even attacked reason, calling it a false guide when followed alone. He felt doubts on all the progress which gave satisfaction to his contemporaries. In two “discourses,” one on the *Arts and Sciences* (1750), the other on the *Origin of Inequality Among Men* (1753), he argued that civilization was the source of much evil and that life in a “state of nature,” were it only possible, would be much better. As

---

Rousseau's  
“discourses”

Voltaire said, when Rousseau sent him a copy of his second discourse (Voltaire who relished civilization in every form), it made him “feel like going on all fours.” To Rousseau

the best traits of human character, such as kindness, unselfishness, honesty, and true understanding, were products of nature. Deep below reason, he sensed the presence of feeling. He delighted in the warmth of sympathy, the quick flash of intuition, the clear message of conscience. He was religious by temperament, for though he believed in no church, no clergy, and no revelation, he had a respect for the Bible, a reverent awe toward the cosmos, a love of solitary meditation, and a belief in a God who was not merely a “first cause” but also a God of love and beauty. Rousseau thus made it easier for serious-minded people to slip away from orthodoxy and all forms of churchly discipline. He was feared by the churches as the most dangerous of all “infidels” and was condemned both in Catholic France and at Protestant Geneva.

In general, in most of his books, Rousseau, unlike so many of his contemporaries, gave the impression that impulse is more reliable than considered judgment, spontaneous feeling more to be trusted than critical thought. Mystical insights were for him more truthful than rational or clear ideas. He became the “man of feeling,” the “child of nature,” the forerunner of the coming age of romanticism, and an important source of all modern emphasis on the nonrational and the subconscious. He thus became an early, influential critic of the Enlightenment, even as he resembled other philosophes in his desire to change the existing social order.

In the *Social Contract* (1762) Rousseau seemed to contradict much of his famous sentiment for nature. In this book he held, somewhat like Hobbes, that the “state of nature” was a brutish condition without law or morality. In other works he had held that human evil was due to the evils of society. He now held that good people could be produced only by an improved society. Earlier thinkers, such as John Locke, for example, had thought of the “contract” as an agreement between a ruler and a people. Rousseau thought of it as an agreement among the people themselves. It was a social, not merely a political, contract. Organized civil society, that is, the community, rested upon it. The social contract was an understanding by which all individuals surrendered their natural liberty to each other, fused their individual wills into a combined General Will, and agreed to accept the rulings of this General Will as final. This General Will was the sovereign; and true sovereign power, rightly understood, was “absolute,” “sacred,” and “inviolable.” Government was secondary; kings, officials, or elected representatives were only delegates of a sovereign people. Rousseau devoted many difficult and abstruse pages to explaining how the *real* General Will could be known. It was not necessarily determined by vote of a majority. “What generalizes the will,” he said, “is not the number of voices but the common interest that unites them.” He said little of the mechanism of government and had no admiration for parliamentary institutions. He was concerned with something deeper. Maladjusted outsider that he was, he craved a commonwealth in which every person could feel that he or she belonged. He wished a state in which all persons had a sense of membership and participation.

---

*The Social Contract*

By these ideas Rousseau made himself the prophet of both democracy and nationalism. Indeed, in his *Considerations on Poland*, written at the request of Poles who were fighting against the partitions of their nation's territories by foreign powers, Rousseau applied the ideas of the *Social Contract* in more concrete form and became the first systematic theorist of a conscious and calculated nationalism. In writing the *Social Contract* he had in mind a small city-state like his native Geneva. But what he did, in effect, was to generalize and make applicable to large territories the psychology of small city republics—the sense of membership, of community and fellowship, of responsible citizenship and intimate participation in public affairs—in short, of common will. All modern

states, democratic or undemocratic, strive to impart this sense of moral solidarity to their peoples. Whereas in democratic states the General Will can in some way be identified with the sovereignty of the people, in dictatorships it becomes possible for individuals (or parties) to arrogate to themselves the right to serve as spokesmen and interpreters of the General Will. Both totalitarians and democrats have regarded Rousseau as one of their prophets.

Rousseau's influence on his contemporaries was spread also by his other writings and especially his novels, *Émile* (1762) and the *Nouvelle Héloïse* (1760). The novels were widely read in all literate classes of society, especially by women, who made a kind of cult of Jean-Jacques. He was a literary master, able to evoke shades of thought and feeling that few writers had touched before, and by his literary writings he spread in the highest circles a new respect for the common person, a love of common things, an impulse of human pity and compassion, a sense of artifice and superficiality in aristocratic life. Women took to nursing their own babies, as Rousseau said they should. Men began describing the delicacy of their sentiments. Tears became the fashion. The queen, Marie Antoinette, built herself a village in the gardens at Versailles, where she pretended to be a simple milkmaid. In all this there was much that was ridiculous or shallow. Yet it was the wellspring of modern humanitarianism, the force leading to a new sense of human equality. Rousseau estranged the French upper classes from their own mode of life. He made many of them lose faith in their own superiority. That was his main direct contribution to the French Revolution.

### Political Economists

---

#### Physiocrats

In France, somewhat apart from the philosophes, were the Physiocrats, whom their critics called "economists," a word originally thought to be mildly insulting. Many of the Physiocrats, unlike the philosophes, were close to the government as administrators or advisers. Quesnay was physician to Louis XV, Turgot was an experienced official who became minister to Louis XVI, and Dupont de Nemours, an associate of Turgot's, became the founder of the industrial family of the Du Ponts in the United States. Such men concerned themselves with fiscal and tax reform and with measures to increase the national wealth of France. They opposed guild regulations and price controls as impediments to the production and circulation of goods, and so were the first to use the term *laissez-faire* ("let them do as they see fit") as a principle of economic activity. They favored strong government, however, relying on it to overcome traditional obstacles and to provide inducements for the establishment of new industries.

Economics, or what was long called political economy, arose from these activities of the Physiocrats, from the somewhat similar work of "cameralists" in the German states, and from the collection and analysis of quantitative data, that is, the birth of statistics. Economic thinking flourished especially in Great Britain, and notably in Scotland, where Adam Smith's *Wealth of Nations* appeared in 1776. By 1800 the *Wealth of Nations* had been translated into every west-European language except Portuguese.

---

#### Adam Smith

Adam Smith's purpose, like that of the French Physiocrats, was to increase the national wealth by the reduction of barriers that hindered its growth. He undercut the premises of what we have called "the struggle for wealth and empire" in Chapter 7, since he argued that to build up a nation's wealth it was unnecessary to have an empire. He attacked most of the program of mercantilism that had obtained since the sixteenth century, and he expected that Britain's American colonies would soon become independent without loss to British trade. Where others

1713–1784)

Some hints of the complexities of Rousseau's personality and thought appear in this portrait by a Scottish artist who admired the famous writers of the French Enlightenment.

(Giraudon/Art Resource, NY)

looked to planning by an enlightened government, Adam Smith preferred to limit the functions of government to defense, internal security, and the provision of reasonable laws and fair law courts by which private differences could be adjudicated. For innovation and enterprise he counted more on private persons than on the state. He became the philosopher of the free market, the prophet of free trade. If there was a shortage of a given commodity, its price would rise and so stimulate producers to produce more, while also attracting new persons into that line of production. If there was an excess, if more was produced than purchasers would buy, both capital and labor would withdraw and gradually move into another area where demand was stronger. Demand would increase with lower prices, which depended on lower costs, which in turn depended on the specialization of labor. His most famous example was that of the pin factory of his time, where each of a dozen workers engaged in only one part of the process of manufacture, so that together they produced far more pins than if each worker produced whole pins; the price of pins then fell, and more pins could be used by more people. The same principle held in international trade; some countries or climates could produce an article more cheaply than others, so that if each specialized and then exchanged with the others, all would have more. Each nation could use its comparative advantage in certain spheres of production or trade to compensate for economic weaknesses in other spheres and also to increase its national wealth.

The motivation for all such production and exchange was to be the self-interest of the participants. As he said, we rely for our meat not on the goodwill of the butcher but on his concern for his own income. To those who might object that this was a system of selfishness Adam Smith would reply (being a professor of moral philosophy at the University of

Glasgow) that it was at least **realistic**, describing how people really behaved, and that it was morally justified since it ultimately produced a **maximum both of freedom and of abundance**. The mutual interaction of the enlightened self-interest of millions of persons would in the end, as if by an "invisible hand," he said, result in the highest welfare of all. Among problems that Smith minimized, or accepted as lesser evils, were the insecurity of individuals and the dangers of excessive dependence of a whole country on imports of essentials, such as food; and if the **visible hand of government** continued to regulate the price of bread, it should not be for economic reasons, but to prevent rioting and maintain social peace.

### Main Currents of Enlightenment Thought

It is clear that the currents of thought in France and Europe were divergent and inconsistent. There was a general belief in progress, reason, science, and civilization. Rousseau had his doubts and praised the imagined conditions in a precivilized state of nature. Montesquieu thought the church useful but did not believe in religion; Rousseau believed in religion but saw no need for any church. Montesquieu was concerned about practical political liberty; Voltaire would surrender political liberty in return for guarantees of intellectual freedom; Rousseau wanted emancipation from the restraints of society and sought the freedom that consists in merging with nature and with one's fellows. **Most philosophes were closest to Voltaire. They favored more tolerance for intellectual differences and more equality in European societies.** It was not a very far-reaching equality, but it meant **equality of rights for persons of different religions, a reduction of privileges enjoyed by nobles but not by commoners, greater equality of status in law courts and in the payment of taxes, and more opportunity for middle-class persons to rise to positions of social or political importance.**

France was the **main center of the Enlightenment**. French philosophes traveled all over Europe. Frederick II and Catherine II invited French thinkers to their courts. French was the language of the academies of St. Petersburg and Berlin. Frederick wrote his philosophical works in the French language. The upper classes of Europe shared a uniform cosmopolitan culture, and this culture was predominantly French. **But Britain was important also.** Hitherto somewhat on the fringes of the European consciousness, Britain now moved closer to the center. Montesquieu and Voltaire may be said to have "discovered" Britain for Europe. Through them the ideas of Bacon, Newton, and Locke, and the whole theory of British liberty and parliamentary government became matters for general discussion and comment. We have seen, too, how Adam Smith's *Wealth of Nations* was soon translated into many languages.

**The main agency of progress was thought to be the state.** Whether in the form of limited monarchy on the British model favored by Montesquieu, or of enlightened despotism preferred by Voltaire, or of the idealized republican commonwealth portrayed by Rousseau, **the rightly ordered government was considered the best guarantee of social welfare.** Even the **political economists** needed the state to shake people out of the habits of ages, sweep away a mass of local regulation, preserve law and order and the enforcement of contracts, and so assure the existence of a free market. But if **they relied on the state,** they were not nationalists in any later sense of the word. As "universalists," they believed in the unity of humankind under a natural law of right and reason and thus **they carried over the classical and Christian outlook in a secular way.** They supposed that all peoples would participate eventually in

Summary of beliefs of philosophers  
3 main

the same progress. No nation was thought to have a peculiar message. French ideas enjoyed a wide currency, but no one thought of them as peculiarly French, arising from a French "national character." It was simply thought that the French at the time were in the vanguard of civilized thinking. Such was the idea of Condorcet, one of the later philosophes, a leading spokesman of the Enlightenment who became an active figure in the French Revolution, and also one of its victims, and who in 1794, while in hiding from the guillotine, wrote the great testament to the Enlightenment, his *Sketch of the Progress of the Human Mind*.

## 36. ENLIGHTENED DESPOTISM: FRANCE, AUSTRIA, PRUSSIA

### *The Meaning of Enlightened Despotism*

Enlightened despotism is hard to define, because it grew out of earlier forms of absolutism that Louis XIV and Peter the Great had established in France and Russia. Characteristically, the enlightened despots drained marshes, built roads and bridges, codified the laws, repressed provincial autonomy and localism, curtailed the independence of church and nobles, and developed a trained and salaried officialdom. All these things had been done by kings before. Enlightened despots differed from their "unenlightened" predecessors mainly in attitude and tempo. They said little of a divine right to the throne. They might even not emphasize hereditary or dynastic family rights. They justified their authority on grounds of usefulness to society, calling themselves, as Frederick the Great did, the "first servant of the state."

---

*The secular outlook*

Enlightened despotism was secular; it claimed no mandate from heaven and recognized no special responsibility to God or church. The typical enlightened despot consequently favored toleration in religion, and this was an important new emphasis after about 1740; but here again there was precedent in the older absolutism, for the rulers of Prussia had been inclined toward toleration before Frederick, and even the French Bourbons had recognized a degree of religious liberty for almost a century following the Edict of Nantes in 1598. The secular outlook of the enlightened governments is again seen in the common front they adopted against the Jesuits. High papalists, affirming the authority of a universal church in Rome and asserting themselves in other ways as the strongest religious order in the Catholic world, the Jesuits were distasteful to the enlightened monarchs. In the 1760s the order was banned in almost all Catholic countries. In 1773 the pope was persuaded to dissolve the Society of Jesus entirely. Governments in France, Austria, Spain, Portugal, and Naples confiscated Jesuit property and took over the Jesuit schools. Not until 1814 was the order reconstituted.

Enlightened despotism was also rational and reformist. The typical monarch set out to reconstruct the state by the use of reason. Sharing the widespread eighteenth-century view of the past as benighted, the new monarchs were impatient of custom and of all that was imbedded in custom or claimed as a heritage from the past, such as systems of customary law and the rights and privileges of church, nobles, towns, guilds, provinces, assemblies of estates, or, in France, the judicial bodies called parlements. The complex of such institutions was disparagingly referred to as "feudalism." Monarchs had long struggled against feudalism in this sense, but in the past they had usually compromised. The enlightened despot was less willing to compromise, and herein lay the difference in tempo. The new monarchs acted abruptly, desiring quicker results.

---

The roots of  
enlightened despotism

Enlightened despotism, in short, was an acceleration of the old centralizing institution of monarchy, which now put aside its quasi-sacred mantle and undertook to justify itself in the cold light of reason and secular usefulness. In theory even the dynastic claim was awkward, for it rested on inheritance from the past. Under enlightened despotism the idea of the state itself was changing, from the older notion of an estate belonging by a kind of sanctified property right to its ruler, to a newer notion of an abstract and impersonal authority exercised by public officers, of whom the king was simply the highest.

The trend to enlightened despotism after 1740 owed a great deal to writers and philosophes, but it arose also out of a very practical situation, namely, the great war of the mid-eighteenth century. War, in modern history, has usually led to concentration and rationalizing of government power, and the wars of 1740–1748 and 1756–1763 were no exception. Under their impact even governments where the rulers were not considered by philosophes to be enlightened, notably those of Louis XV and Maria Theresa, and even the government of Great Britain, which was certainly not despotic, embarked on programs that all bear features in common. They attempted to augment their revenues, devise new taxes, tax persons or regions hitherto more or less tax-exempt, limit the autonomy of outlying political bodies, and centralize and renovate their respective political systems. The workings of enlightened despotism might be seen in many states, but the new policies had the most far-reaching influence in the larger Continental countries—France and Austria, Prussia and Russia—and in the rather different, yet not wholly different, course of events in the British empire.

### *The Failure of Enlightened Despotism in France*

It was in France that enlightened despotism had the least success. Louis XV, who had inherited the throne as a child in 1715 and lived until 1774, though by no means stupid, was indifferent to most serious questions, absorbed in the daily rounds at Versailles, disinclined to make trouble for people with whom he had personal contact, and interested in government only by fits and starts. His reputed remark, *après moi le déluge*, whether or not he really said it, sufficiently characterizes his personal attitude to conditions in France. Yet the French government was not unenlightened, and many capable officials carried on its affairs all through the century. These officials generally knew what the basic trouble was. Most of the practical difficulties of the French monarchy could be traced to its methods of raising revenue. It derived some income from the sale of offices and privileges, which had the perverse effect of building up vested interests in the existing system. Of actual taxes the most important was the *taille*, a kind of land tax, generally paid only by peasants. Nobles were exempt from it on principle, and officeholders and bourgeois, for one reason or another, were generally

---

Tax collection

### EUROPE, 1740

Boundaries are as of 1740. There were now three Bourbon monarchies (France, Spain, and the Two Sicilies), while the Austrian monarchy possessed most of what is now Belgium, and in Italy the duchy of Milan and grand duchy of Tuscany, where the Medici family had recently died out. Prussia expanded by acquiring Silesia in the war of the 1740s. The first partition of Poland in 1772 enlarged Prussia, Austria, and Russia. France acquired Lorraine in 1766 and Corsica in 1768. Otherwise there were no changes until the Revolutionary-Napoleonic wars of 1792–1814.

exempt also. In addition, the church, which owned between five and ten percent of the land of the country, insisted that its property was not taxable by the state; it granted to the king a periodic “free gift” which, though sizable, was less than the government might expect from direct taxation. The consequence of the tax exemptions was that, although France itself was wealthy and prosperous, the government was chronically poor, because the social classes which enjoyed most of the wealth and prosperity did not pay taxes corresponding to their incomes.

Louis XIV, under pressure of war, had tried to tax everybody alike by creating new levies—the capitation or poll tax and the *dixième* or tenth, both of which were assessed in proportion to income; but these taxes had been widely evaded. A similar effort was made in 1726, but it too had failed. The propertied classes resisted taxation because they thought it degrading. France had succumbed to the appalling principle that to pay direct taxes was the sure mark of inferior status. Nobles, churchmen, and bourgeois also resisted taxation because they were kept out of policymaking functions of government and so had no sense of political responsibility or control.

In the 1740s, under pressure of heavy war costs, a new tax was introduced, the *vingtième* or twentieth, which imposed a five percent tax on income from all forms of property and was to be paid irrespective of class status, provincial liberties, or previous exemptions of any kind. In practice, the *vingtième* amounted to less than five percent and fell only upon land, but it was paid by nobles and bourgeois alike and lasted until the Revolution. During the Seven Years’ War the government tried to increase it, without success. A clamor arose from the Parlement of Paris, the provincial parlements, the estates of Brittany, and the church. All these were now stronger than in the days of Louis XIV, and they could now cite Montesquieu to justify their opposition to the crown. The parlements ruled the tax increase to be incompatible with the laws of France, that is, unconstitutional; and the *pays d’états*, or provinces having assemblies of estates, declared that their historic liberties were being violated. After several years of wrangling, Louis XV decided to push the matter no further.

But after the Seven Years’ War, burdened with war debts, the government sought to win effective central control by eliminating the parlements as a political force. In 1768 Louis XV called to the chancellorship a man named Maupeou, who simply abrogated the old parlements and set up new ones in their place. Maupeou had the sympathy of Voltaire and most of the philosophes. In the “Maupeou parlements” the judges had no property rights in their seats but became salaried officials appointed by the crown with assurances of secure tenure; and they were forbidden to reject government edicts or to pass on their constitutionality, being confined to purely judicial functions. Maupeou proposed to make the laws and judicial procedure more uniform throughout the whole country. Meanwhile, with the old parlements out of the way, another attempt was made to tax the privileged and exempted groups.

---

The “Maupeou parlements”

---

Louis XVI

But Louis XV died in 1774. His grandson and successor, Louis XVI, though more conscientious than his grandfather and possessed by a genuine desire to govern well, resembled Louis XV in that he lacked sustained will power and could not bear to offend the people who could get to see him personally. In any case he was only 20 in 1774. The kingdom resounded with outcries against Maupeou and his colleagues as minions of despotism and with demands for the immediate restoration of the old Parlement of Paris and the others. Louis XVI, fearful of beginning his reign as a “despot,” therefore recalled the old parlements and abolished those of Maupeou. The abortive Mau-

peou parlements represented the farthest step taken by enlightened despotism in France. It was arbitrary, high-handed, and despotic for Louis XV to destroy the old parlements; but it was certainly "enlightened" in the sense then connoted by the word, for the old parlements were strongholds of aristocracy and privilege and had for decades blocked programs of reform.

Louis XVI, in recalling the old parlements in 1774, began his reign by pacifying the privileged classes. At the same time he appointed a reforming ministry. At its head was Turgot, a philosophe and a Physiocrat and a widely experienced government administrator. Turgot undertook to suppress the guilds and their privileged municipal monopolies in their several trades. He allowed greater freedom to the internal commerce in grain. He planned to abolish the royal *corvée* (a requirement that certain peasants labor on the roads a few days each year), replacing it by a money tax which would fall on all classes. He began to review the whole system of taxation and in religious matters was known even to favor the legal toleration of Protestants. The Parlement of Paris, supported by the Provincial Estates and the church, vociferously opposed him, and in 1776 he resigned. Louis XVI, by recalling the parlements, had made reform impossible. In 1778 France again went to war with Britain. The same cycle was repeated: war costs, debt, deficit, new projects of taxation, resistance from the parlements and other semiautonomous bodies. In the 1780s the clash led to revolution.

#### *Austria: The Reforms of Maria Theresa (1740–1780) and of Joseph II (1780–1790)*

For Maria Theresa the European war of the 1740s proved the extraordinary flimsiness of her empire and the Austrian monarchy. Her subjects did not show much inclination to remain united under her rule, even when threatened by invading armies. The empire was only a loose bundle of territories without common purpose or common will. The Pragmatic Sanction devised by Charles VI, it should be recalled, had been meant not only to guarantee the Habsburg inheritance against foreign attack but also to secure the assent of the several parts of the empire to remain united under the Habsburg dynasty.

The war of the 1740s led to internal consolidation. The reign of Maria Theresa set the course of all later development of the Austrian empire and hence of the many peoples who lived within its borders. She was aided by a notable team of ministers, whose origin illustrated the nonnational character of the Habsburg system. Her most trusted adviser in foreign relations, the astute Kaunitz, was a Moravian; her main assistants in domestic affairs were a Silesian and a Bohemian-Czech. They worked smoothly with the German archduchess-queen and with German officials in Vienna. Their aim was to prevent dissolution of the monarchy by enlarging and guaranteeing the flow of taxes and soldiers. This involved breaking the local control of territorial nobles in their diets. Hungary, profoundly separatist, was left alone. But the Bohemian and Austrian provinces were welded together, and a unified state bureaucracy took the place of local self-government. Officials (following the form of mercantilist doctrine called "cameralism" in central Europe) planned to augment the economic strength of the empire by increasing production. They checked the local guild monopolies; suppressed brigandage on the roads; and in 1775 created a tariff union of Bohemia, Moravia, and the Austrian duchies. This region became the largest area of free trade on the European continent, since even France was still divided by internal tariffs. Bohemia, industrially the most advanced part of the empire, benefited substantially; one of its cotton manufacturing plants, at the end of Maria Theresa's reign, employed 4,000 persons.

---

*Internal consolidation  
of the empire*

The restoration of the traditional parlements at the beginning of the reign of Louis XVI was an important political victory for the privileged classes in French society, whose power had been challenged by the Maupeou ministry in the early 1770s. This illustration of the young king at the first session of the restored Parlement of Paris (he occupies the elevated seat on the upper left side of the assembly) offers an early example of his lifelong tendency to align himself with older elites and to oppose reformers who wanted to reduce the power or privileges of the old nobility. The caption lists the royal officials and dignitaries who accompanied the king at this meeting of the Parlement in November 1774.

(Bibliothèque Nationale de France, Paris)

The great social fact, both in the Habsburg lands and in all eastern Europe, was the **serfdom** into which the rural masses had progressively fallen during the past 200 years. Serfdom meant that the peasant belonged more to the landlord than to the state. **The serf owed labor to the lord**, often unspecified in amount or kind. The tendency, so long as the landlords ruled locally through their diets, was for the serf to do six days a week of forced labor on the lord's land. **Maria Theresa**, from humane motives and also from a desire to control the manpower from which her armies were recruited, **launched a systematic attack on the institutions of**

serfdom, which meant also an attack on the landed aristocracy of the empire. With the diets reduced in power, the protests of the nobles were less effective; still, the whole agricultural labor system of her territories was involved, and Maria Theresa proceeded with caution. Laws were passed against abuse of peasants by lords or their overseers. Other laws regularized the labor obligations, requiring that they be publicly registered and usually limiting them to three days a week. The laws were often evaded. But the peasant was to some extent freed from arbitrary exactions of the lord. Maria Theresa accomplished more to alleviate serfdom than any other ruler of the eighteenth century in eastern Europe, with the single exception of her own son, Joseph II.

---

*Attacks on serfdom*

The great archduchess-queen died in 1780, having reigned for 40 years. Her son, who had been co-regent with his mother since 1765, had little patience with her methods. Maria Theresa, though steady enough in aim, had always been content with partial measures. Instead of advertising her purposes by philosophical pronouncements, she disguised or understated them, never carrying matters to the point of arousing an unmanageable reaction or of uniting against her the vested interests that she undermined. She watched and waited. Joseph II was more impatient. Though he thought the French philosophes frivolous, and Frederick of Prussia a mere clever cynic, he was himself a pure representative of the Age of Enlightenment, and it is in his brief reign of 10 years that the character and the limitations of enlightened despotism can best be seen. He was a solemn, earnest, good man, who sensed the misery and hopelessness of the lowest classes. He believed existing conditions to be bad, and he would not regulate or improve them; he would end them. Right and reason, in his mind, lay with the views which he himself adopted; upholders of the old order were self-seeking or mistaken and to yield to them would be to compromise with evil.

---

*Joseph II: the  
"revolutionary  
emperor"*

"The state," said Joseph, anticipating the later Philosophical Radicals in England, meant "the greatest good for the greatest number." He acted accordingly. His 10 years of rule passed in a quick succession of decrees. Maria Theresa had regulated serfdom. Joseph abolished it. His mother had collected taxes from nobles as well as peasants, though not equally. Joseph decreed absolute equality of taxation. He insisted on equal punishment for equal crimes whatever the class status of the offender; an aristocratic army officer, who had stolen 97,000 gulden, was exhibited in the pillory, and Count Podstacky, a forger, was made to sweep the streets of Vienna chained to common convicts. At the same time many legal punishments were made less physically cruel. Joseph granted complete liberty of the press. He ordered toleration of all religions, except for a few popular sects that he thought too ignorant to allow. He granted equal civil rights to the Jews, and equal duties, making Jews liable, for the first time in Europe, to service in the army. He even created Jewish nobles, an amazing phenomenon to those of aristocratic "blood."

Joseph clashed openly and rudely with the pope. He demanded increased powers in the appointment and supervision of Catholic bishops, and he suppressed a good many monasteries, using their property to finance secular hospitals in Vienna, and thus laying the foundations of Viennese excellence as a medical center. He attempted also to develop the empire economically and built up the port of Trieste, where he even established an East India Company, which soon failed for obvious reasons—neither capital nor naval support being forthcoming from central Europe. His attempts to reach the sea commercially through Belgium, like those of his grandfather at the time of the Ostend Company, were blocked by Dutch and British interests.

To force through his program Joseph had to centralize his state, like earlier rulers, except that he went further. Regional diets and aristocratic self-government fared even

worse than under his mother. Where she had always sagaciously let Hungary go its own way, he applied most of his measures to Hungary also—what was right must be right everywhere. His ideal was a perfectly uniform and rational empire, with all irregularities smoothed out as if under a steamroller. He thought it reasonable to have a single language for administration and naturally chose German; this led to a program of Germanizing the Czechs, Poles, Magyars, and others, which in turn aroused their nationalistic resistance. Using the German language, and pushing the emperor's program against regional and class opposition, was a hard-pressed, constantly growing, and increasingly disciplined body of officials. Bureaucracy became recognizably modern, with training courses, promotion schedules, retirement pensions, efficiency reports, and visits by inspectors. The clergy likewise were employed as representatives of the state to explain new laws to their parishioners and teach due respect for the government. To watch over the whole structure Joseph created a secret police, whose agents, soliciting the confidential aid of spies and informers, reported on the performance of government employees or on the ideas and actions of nobles, clergy, or others from whom trouble might be expected. The police state, so infamous to the liberal world, was first systematically built up under Joseph as an instrument of enlightenment and reform.

Joseph II, the “revolutionary emperor,” anticipated much that was done in France by the Revolution and under Napoleon. He could not abide “feudalism” or “medievalism”; he personally detested the nobility and the church. But few of his reforms proved lasting. He died prematurely in 1790, at the age of 49, disillusioned and broken-hearted. Joseph was a revolutionist without a party. He failed because he could not be everywhere and do everything himself, and because he was opposed by the most powerful social groups in his empire. His reign demonstrated the limitations of a merely despotic enlightenment. It showed that a legally absolute ruler could not really do as he pleased. It suggested that drastic and abrupt reform could perhaps come only with a true revolution, on a wave of public opinion, and under the leadership of persons who shared in a coherent body of ideas.

---

*Limitations of  
Joseph's reforms*

Joseph was succeeded by his brother Leopold, one of the ablest rulers of the century, who for many years as grand duke of Tuscany had given that country the best government known in Italy for generations. Now, in 1790, Leopold was plagued by outcries from his sister, Marie Antoinette, caught in the toils of a real revolution in France. He refused to interfere in French affairs; in any case, he was busy dealing with the uproar left by Joseph. He abrogated most of Joseph's edicts, but he did not yield entirely. The nobles did not win back full powers in their diets. The peasants were not wholly consigned to the old serfdom; Joseph's efforts to provide them with land and to rid them of forced labor had to be given up, but they remained legally free to migrate, marry, or choose an occupation at will. Leopold died in 1792 and was followed by his son Francis II. Under Francis the aristocratic and clerical reaction gathered strength, terrified by the memory of Joseph II and by the spectacle of revolutionary France, with which Austria went to war soon after Leopold's death.

### *Prussia under Frederick the Great (1740–1786)*

In Prussia, Frederick the Great continued to reign for 23 years after the close of the Seven Years' War in 1763. “Old Fritz,” as he was called, spent the time peaceably, writing memoirs and histories, rehabilitating his shattered country, promoting agriculture and industry, replenishing his treasury, drilling his army, and assimilating his huge conquest of Silesia,

and, after 1772, the Polish lands which fell to him in the first partition of Poland. Frederick's fame as one of the most eminent of enlightened despots rests, however, not so much on his actual innovations as on his own intellectual gifts, which were considerable, and on the admiring publicity which he received from such literary friends as Voltaire. "My chief occupation," he wrote to Voltaire, "is to fight ignorance and prejudices in this country. . . . I must enlighten my people, cultivate their manners and morals, and make them as happy as human beings can be, or as happy as the means at my disposal permit." He did not conceive that sweeping changes were necessary to happiness in Prussia. The country was docile, for its Lutheran church had long been subordinate to the state, its relatively few burghers were largely dependents of the crown, and the independence of the Junker landlords, as expressed in provincial diets, had been curtailed by Frederick's predecessors. Frederick simplified and codified the many laws of the kingdom and made the law courts cheaper, more expeditious, and more honest. He kept up a wholesome and energetic tone in his civil service. He protected religious freedom, and he decreed, though he did not achieve, a modicum of elementary education for all children of all classes. Prussia under Frederick was attractive enough for some 300,000 immigrants to seek it out.

But society remained stratified in a way hardly known in western Europe. Nobles, peasants, and burghers lived side by side in a kind of segregation. Each group paid different taxes and owed different duties to the state, and no person could buy property of the type owned by one of the other two groups. Property was legally classified, as well as persons; there was little movement from one group to another. These policies served a specific military purpose. They preserved a distinct peasant class from which to draw soldiers and a distinct aristocratic class from which to draw officers. The peasants, except in the western extremities of the kingdom, were serfs holding patches of land on precarious terms with obligations to labor on the estates of the lords. They were likewise considered the lord's "hereditary subjects" and were not free to leave the lord's estate, to marry, or to learn a trade except with his permission. Frederick in his early years considered steps to relieve the burden of serfdom. He did relieve it on his own manors, those belonging to the Prussian crown domain, which comprised a quarter of the area of the kingdom. But he did nothing for serfs belonging to the private landlords or Junkers. No king of Prussia could antagonize the Junker class which commanded the army. On the other hand, even in Prussia, the existence of a monarchical state was of some advantage for the common person; the serf in Prussia was not so badly off as in adjoining areas—Poland, Livonia, Mecklenburg, or Swedish Pomerania—where the will of the landlords was the law of the land, and which therefore have been called Junker republics. In these countries cases came to light in which owners sold their serfs as movable property or gambled or gave them away, breaking up families in the process, as Russian landlords might do with their serfs or American plantation owners with their slaves. Such abuses were unknown in Prussia.

---

*Social stratification  
in Prussia*

Frederick's system was centralized not merely at Potsdam but in his own head. He himself attended to all business and made all important decisions. None of his ministers or generals ever achieved an independent reputation. As he said of his army, "no one reasons, everyone executes"—that is, no one reasoned except the king himself. Or again, as Frederick put it, if Newton had had to consult with Descartes he would never have discovered the law of universal gravitation. To have to take into account other people's ideas, or to entrust responsibilities to people less capable than himself, seemed to Frederick wasteful and anarchic. He died in 1786, after ruling 46 years and having trained no successors. Twenty years later Prussia was all but destroyed by Napoleon. It was not surprising that Napoleon

should defeat Prussia, but Europe was amazed, in 1806, to see Prussia collapse totally and abruptly. It was then concluded in Prussia and elsewhere that government by a mastermind working in lofty and isolated superiority did not offer a viable form of state under modern conditions.

### 37. ENLIGHTENED DESPOTISM: RUSSIA

The Russian empire has long been out of sight in the preceding pages. There are reasons for its absence, for it played no part in the intellectual revolution of the seventeenth century, and its role in the struggle for wealth and empire, which reached a climax in the Seven Years' War, was somewhat incidental. In the Age of Enlightenment the role of Russia was passive. No Russian thinker was known to western Europe, but western European thinkers were well known in Russia. The French-dominated cosmopolitan culture of the

---

*Russia absorbs  
French culture*

European upper classes spread to the upper classes of Russia. The Russian court and aristocracy took over French as their common conversational language. With French (German was also known, and sometimes English, for the Russian aristocrats were remarkable linguists) all the ideas boiling up in western Europe streamed into Russia. The Enlightenment, if it did not

affect Russia profoundly, affected it significantly. It continued the westernization so forcibly pushed forward by Peter and carried further the estrangement of the Russian upper classes from their own people and their own native scene.

#### *Russia after Peter the Great*

Peter the Great died in 1725. To secure his revolution he had decreed that each tsar should name his successor, but he himself had named none and had put to death his own son Alexis to prevent social reaction. Peter's long reign was therefore followed by a period of political instability. Rival factions at court—a German party and a native Russian party—struggled for control over successive tsars, tsarinas, and short-lived governments until a palace revolution in 1741 brought to the throne Peter the Great's daughter, Elizabeth, who managed to hold power until her death 21 years later. In her reign the military power of Russia expanded, and she entered into European diplomacy and joined in the Seven Years' War against Prussia, fearing that the continued growth of Prussia would endanger the new Russian position on the Baltic. Her nephew, Peter III, was almost immediately dethroned, and probably assassinated, by a group acting in the name of his young wife Catherine. The victorious coterie gave it out that Peter III had been almost a half-wit, who at the age of 24 still played with paper soldiers. Catherine was proclaimed the Empress Catherine II and is called "the Great." She enjoyed a long reign from 1762 to 1796, during which she acquired a somewhat exaggerated reputation as an enlightened despot.

The names of the tsars and tsarinas between Peter I and Catherine II are of slight importance, but their violent and rapid sequence tells a story. With no principle of succession, dynastic or other, the empire fell into a lawless struggle of parties, in which plots against rulers while living alternated with palace revolutions upon their death. In all the confusion an underlying issue was always how the westernizing reform program of Peter would turn out. To most people in western Europe Russia still seemed alien or even barbaric.

#### *Catherine the Great (1762–1796): Domestic Program*

Catherine the Great was a German woman of a small princely house of the Holy Roman Empire. She had gone to Russia at the age of 15 to be married. She had immediately culti-

vated the goodwill of the Russians, learned the language, and embraced the Orthodox church. Early in her married life, **disgusted with her husband, she foresaw the chance of becoming empress herself.** Like the other prominent woman ruler of this era in Europe, Maria Theresa, she approached political issues with a strong practical sense and great energy (though she did not share Maria Theresa's devotion to family life). Catherine's intellectual powers were as remarkable as her physical vigor; even after becoming empress she often got up at five in the morning, lit her own fire, and turned to her books, making a digest, for example, of Blackstone's *Commentaries on the Laws of England*, published in 1765. She corresponded with Voltaire and invited Diderot, editor of the *Encyclopédie*, to visit her at St. Petersburg, where, she reported, he thumped her so hard on the knee in the energy of his conversation that she had to put a table between them. She bought Diderot's library, allowing him to keep it during his lifetime, and in other ways won renown by her benefactions to the philosophes, whom she regarded as useful press agents for Russia.

When she first came to power, **she publicized an intention to introduce certain enlightened reforms.** She **summoned** a great consultative assembly, called a **Legislative Commission**, which met in the summer of 1767. From its numerous proposals Catherine obtained a good deal of information on conditions in the country and concluded, from the profuse loyalty exhibited by the deputies, that though a usurper and a foreigner she possessed a strong hold upon Russia. **The reforms which she subsequently enacted** consisted in a **measure of legal codification, restrictions on the use of torture, and a certain support of religious toleration, though she would not allow Old Believers to build their own chapels.** Such innovations were enough to raise an admiring chorus from the philosophes, who saw in her, as they saw retrospectively in Peter the Great, **the standard-bearer of an enlightened civilization among a backward people.**

---

*Catherine's reforms*

Whatever ideas Catherine may conceivably have had at first, as a thoughtful and progressive young woman, on the fundamental subject of reforming serfdom in Russia, did not last long after she became empress and dissolved with the great peasant insurrection of 1773, known as Pugachev's rebellion. The condition of the Russian serfs was deteriorating. Serf owners were increasingly selling them apart from the land, breaking up families, using them in mines or manufactures, disciplining and punishing them at will, or exiling them to Siberia. **The serf population was restless, worked upon by Old Believers** and cherishing distorted popular memories of the mighty hero, Stephen Razin, who a century before had led an uprising against the landlords. Class antagonism, though latent, was profound, nor was it made less when the rough muzhik, in some places, heard the lord and his family talking French so as not to be understood by the servants or saw them wearing European clothes, reading European books, and adopting the manners of a foreign way of life.

In 1773 a **Don Cossack, Emelian Pugachev, a former soldier, appeared at the head of an insurrection in the Urals.** Following an old Russian custom, **he announced himself as the true tsar, Peter III (Catherine's deceased husband),** now returned after long travels in Egypt and the Holy Land. He surrounded himself with his own imperial family, courtiers, and even a secretary of state. He issued an imperial manifesto proclaiming the end of serfdom and of taxes and military conscription. Tens of hundreds of thousands, in the Urals and Volga regions, Tartars, Kirghiz, Cossacks, agricultural serfs, servile workers in the Ural mines, fishermen in the rivers and in the Caspian Sea, flocked to Pugachev's banner. The great host surged through eastern Russia, burning and pillaging, killing priests and landlords. The upper classes in Moscow were terrified; 100,000 serfs lived in the city as domestic servants or industrial workers and their

*Pugachev's rebellion*

**CATHERINE THE GREAT**

by Alexander Roslin (Swedish,  
1718–1793)

Catherine's forceful character and slightly whimsical smile are represented in this portrait, which was painted shortly after the powerful tsarina suppressed the great peasant rebellion of 1773–1774.

(Giraudon/Art Resource, NY)

sympathies went out to Pugachev and his militant supporters. Armies sent against him were at first unsuccessful. But famine along the Volga in 1774 dispersed the rebels. Pugachev, betrayed by some of his own followers, was brought to Moscow in an iron cage. Catherine forbade the use of torture at his trial, but he was executed by the drawing and quartering of his body, a punishment, it should perhaps be noted, used at the time in western Europe in cases of flagrant treason.

Pugachev's rebellion was the most violent peasant uprising in the history of Russia, and the most formidable mass upheaval in Europe in the century before 1789. Catherine replied to it by repression. She conceded more powers to the landlords. The nobles shook off the last vestiges of the compulsory state service to which Peter had bound them. The peasants were henceforth the only bound or unfree class. As in Prussia, the state came more than ever to rest on an understanding between ruler and gentry, by which the gentry accepted the monarchy, with its laws, officials, army, and foreign policy, and received from it, in return, the assurance of full authority over the rural masses. Government reached down through the aristocracy and the scattered towns, but it stopped short at the manor; there the lord took over and was himself a kind of government in his own person. Under these conditions the number of serfs increased, and the load on each became heavier. Catherine's reign saw the culmination of Russian serfdom, which now ceased to differ in any important respect from the chattel slavery to which blacks were subject in the Americas. One might read in the Moscow *Gazette* such advertisements as the following: "For sale, two plump coachmen; two girls 18 and 15 years, quick at manual work. Two

Emelian Pugachev, leader of the most violent, widespread peasant uprising in Russian history, was held in an iron cage before his trial and execution for treason.

barbers; one, 21, knows how to read and write and play a musical instrument; the other can do ladies' and gentlemen's hair."

### *Catherine the Great: Foreign Affairs*

Territorially Catherine was one of the main builders of modern Russia. When she became tsarina in 1762, the empire reached to the Pacific and into central Asia, and it touched upon the Gulf of Riga and the Gulf of Finland on the Baltic, but westward from Moscow one could go only 200 miles before reaching Poland, and no one standing on Russian soil could see the waters of the Black Sea (see map, pp. 222–223). **Russia was separated from central Europe by a wide band of loosely organized domains**, extending from the Baltic to the Black Sea and the Mediterranean and nominally belonging to the Polish and Turkish states. **Poland was an old enemy**, which had once threatened Muscovy, and in both Poland and the Ottoman Empire there were many **Greek Orthodox Christians with whom Russians felt an ideological tie**. In western Europe the disposal of the whole Polish-Turkish tract, which stretched through Asia Minor, Syria, and Palestine into Egypt, came to be called the Eastern Question. Though the name went out of use after 1900, the question of who would control these lands remained a contentious issue in the modern history of both Europe and the Middle East.

**Catherine's supreme plan was to penetrate the entire area**, Polish and Turkish alike. In a war with Turkey in 1772 she developed her "Greek project," in which "Greeks," that is, members of the Greek Orthodox Church, would replace Muslims as the dominant element throughout the Middle East. **She defeated the Turks in the war**, but was herself checked by **the diplomatic pressures of the European**

---

*Territorial expansion*

balance of power. The result was the first partition of Poland—a seizure of land and people in which the monarchs of Prussia, Russia, and Austria began to divide up Polish territory between them. Frederick took Pomerelia, which he renamed West Prussia; Catherine took parts of Byelorussia; Maria Theresa, Galicia. Frederick digested his portion with relish, realizing an old dream of the Brandenburg house; Catherine swallowed hers with somewhat less appetite, since she had satisfactorily controlled the whole of Poland before; to Maria Theresa the dish was distasteful, and even shocking, but she could not see her neighbors go ahead without her, and she shared in the feast by suppressing her moral scruples. “She wept,” said Frederick cynically, “but she kept on taking.” Catherine, in 1774, signed a peace treaty with the defeated Turks at Kuchuk Kainarji on the Danube. The sultan ceded his rights over the Tartar principalities on the north coast of the Black Sea, where the Russians soon founded the seaport of Odessa.

Catherine had only delayed, not altered, her plans with respect to Turkey. She decided to neutralize the opposition of Austria. She invited Joseph II to visit her in Russia, and the two sovereigns proceeded together on a tour of her newly won Black Sea provinces. Her long-time adviser and lover, Grigory Potemkin, accompanied Catherine on this tour, which included visits to numerous towns and fortresses that Potemkin had established in the Crimea. Although the Russians had actually made significant progress in developing the region, Potemkin’s enemies claimed that the new towns were nothing but a facade—thus creating the famous phrase “Potemkin villages” to mean bogus evidence of a nonexistent prosperity. At Kherson Catherine and Joseph II passed through a gate marked “The Road to Byzantium.” “What I want is Silesia,” said Joseph II, but the tsarina induced him to join in a war of conquest against Turkey.

This war with Turkey was interrupted by the French Revolution. Both governments reduced their commitments in the Balkans to await developments in western Europe. It became Catherine’s policy to incite Austria and Prussia into a war with revolutionary France, in the name of monarchy and civilization, in order that she might have a free hand in the Polish-Turkish sphere. Meanwhile she contributed to killing off the nationalist and reforming movement among the Poles. In 1793 she arranged with Prussia for the second partition, and in 1795, with both Prussia and Austria, for the third. She was the only ruler who lived to take part in all three partitions of Poland (which are described later in this chapter).

---

*Catherine’s reign  
evaluated*

Her protestations of enlightenment tempt one to an ironic judgment of her career. Her foreign policy was purely expansionist and unscrupulous, and the net effect of her domestic policy, aside from a few reforms of detail, was to favor the half-Europeanized aristocracy and to extend serfdom among the people. In her defense it may be observed that unscrupulous expansion was the accepted practice of the time, and that, domestically, probably no ruler could have corrected the social evils from which Russia suffered. If there was to be a Russian empire, it had to be with the consent of the serf-owning gentry, which was the only politically significant class. As Catherine observed to Diderot on the subject of reforms: “You write only on paper, but I have to write on human skin, which is incomparably more irritable and ticklish.” She had reason to know how easily tsars and tsarinas could be unseated and even murdered and that the danger of overthrow came not from the peasants but from cliques of army officers and landlords.

Yet she remained attuned to the West. She never thought that the peculiar institutions of Russia should become a model for others. She continued to recognize the standards of the Enlightenment. In her later years she gave careful attention to her favorite grandson,

Alexander, closely supervising his education, which she planned on the Western model. She gave him as a tutor the Swiss philosophe La Harpe, who filled his mind with humane and liberal sentiments on the duties of princes. Trained by Catherine as a kind of ideal ruler, Alexander I was destined to cut a wide circle in the affairs of Europe, to help defeat Napoleon Bonaparte, preach peace and freedom, and suffer from the same internal cultural divisions and frustrations by which educated Russians seemed characteristically to be afflicted.

### *The Limitations of Enlightened Despotism*

Enlightened despotism, seen in retrospect, foreshadowed an age of revolution and even signified a preliminary effort to revolutionize society by authoritative action from above. People were told by their own governments that reforms were needed, that many privileges, special liberties, or tax exemptions were bad, that the past was a source of confusion, injustice, or inefficiency in the present. The state rose up as more completely sovereign, whether acting frankly in its own interest or claiming to act in the interest of its people. All old and established rights were brought into question—rights of kingdoms and provinces, orders and classes, legal bodies and corporate groups. Enlightened despotism overrode or exterminated the Society of Jesus, the Parlement of Paris, the autonomy of Bohemia, and the independence of Poland. Customary and common law was pushed aside by authoritative legal codes. Governments, by opposing the special powers of the church and the feudal interests, tended to make all persons into uniform and equal subjects. To this extent enlightened despotism favored equality before the law. But it could go only a certain distance in this direction. The king was after all a hereditary aristocrat himself, and no government can be revolutionary to the point of breaking up its own foundations.

Even before the French Revolution enlightened despotism had run its course. Everywhere the “despots,” for reasons of politics if not of principle, had reached a point beyond which they could not go. In France Louis XVI had appeased the privileged classes; in the Austrian empire Joseph’s failure to appease them threw them into open revolt; in Prussia and in Russia the brilliant reigns of Frederick and Catherine wound up in an aggravation of landlordism for the mass of the people. Almost everywhere there was an aristocratic and even feudal revival. Religion also was renewing itself in many ways. Many were again saying that kingship was in a sense divine, and a new alliance was forming between “the throne and the altar.” The French Revolution, by terrifying the old vested interests, was to accelerate and embitter a reaction which had already begun. Monarchy in Europe, ever since the Middle Ages, had generally been a centralizing but progressive institution that set itself against the feudal and ecclesiastical powers. Enlightened despotism was the culmination of the historic institution of monarchy. After the enlightened despots, and after the French Revolution, monarchy became on the whole nostalgic and backward-looking, supported most ardently by the churches and aristocracies that it had once tried to subdue and least of all by those who felt in themselves the surge of the future.

## 38. THE PARTITIONS OF POLAND

The fate of eighteenth-century Poland has been mentioned as a consequence of the growing power of the newer Central European monarchies, but the partitions of Polish territories also illustrate the assumptions and practices of the so-called “enlightened despots.” Apart from

the still somewhat non-European state of Russia, Poland in the eighteenth century was by far the largest state in Europe. It reached at the beginning of the century from the Baltic almost to the Black Sea and extended eastward for 800 miles across the north-European plain. But it was the classic example, along with the Holy Roman Empire, of an older political structure which failed to develop modern organs of government (see maps, pp. 193, 194). It fell into ever deeper anarchy and confusion. Without army, revenues, or administration and internally divided among parties forever at cross-purposes, the country was a perpetual theater for foreign diplomatic maneuvering and was finally absorbed by its growing neighbors.

The Polish kings were chosen in elections that became an object of regular international interference. A movement for reform therefore began to gather strength after the 1730s, and Polish patriots sought to do away with the *liberum veto* and other elements in the constitution that made government impossible. The reformers were repeatedly frustrated, however, by the influence of Catherine the Great and other foreign rulers who preferred a Poland in which they could intervene at will. Catherine's candidate for the Polish throne, Stanislas Poniatowski, won an election in 1763, thereby giving her new influence over Poland's domestic affairs. She

---

*Interference in Polish elections*

declared herself protector of the Polish liberties. It was to the Russian advantage to maintain the existing state of affairs in Poland rather than to divide the country with neighbors who might exclude Russian influence from their own spheres. The Prussian government, which was eager to join the old duchy of Prussia with its other territories in the east, developed a greater interest in dividing Poland as a means to enhance its own strategic position.

The opportunity for Prussia presented itself in 1772, when Russia's war with Turkey destabilized the situation in eastern Europe. The Russian victories in this war were so overwhelming that both Austrians and Prussians feared an enduring Russian disruption of the balance of power. The Prussians therefore came forward with a proposal. It was a proposal to prevent an Austro-Russian war and to preserve the balance in Eastern Europe by leaving the Ottoman Empire more or less intact, but to have all three European powers annex territory from Poland instead. The proposition was accepted by all three parties.

Poland was thus sacrificed. By the first partition in 1772, its outer territories were cut away. Russia took an eastern slice around the city of Vitebsk. Austria took a southern slice, the region known as Galicia. Prussia realized its territorial ambitions by taking the Pomerelian borderland in West Prussia and creating a solid Prussian block from the Elbe to the borders of Lithuania (see map, p. 208, panel 4). The partition sobered the Poles, who renewed their efforts at a national revival, hoping to create an effective sovereignty which could secure the country against outsiders. But the Polish movement lacked deep popular strength, for it was confined mainly to nobles, whose conflicts had brought the country to ruin. The mass of the serf population and the numerous Jews did not much care at this time whether they were governed by Poles, Russians, or Germans.

Nevertheless, beginning in 1788, a reform party gathered strength. One of its members was King Stanislas Poniatowski himself, who had begun his reign as a protégé of the Russian empress. The reformers produced a new constitution in 1791. It made the Polish kingship hereditary, thus strengthening the executive government, and it reduced the powers of the great magnates while giving political rights to many burghers in the towns. By this time, however, the governments of eastern Europe were afraid of the French Revolution, which they saw as an outbreak of "Jacobinism." Denouncing the Polish reformers as Jacobins, Catherine the Great said she would "fight Jacobinism and beat it in Poland." In collusion with a few disgruntled Polish noblemen she sent an army into Poland and destroyed the constitution of 1791. In agreement with Prussia she then carried out the Second Partition in 1793. In 1794 Thaddeus Kosciuszko led a more revolutionary political

movement, which included even a proposed abolition of serfdom. Although it received no aid from the revolutionaries then governing France, it was crushed in the general European counterrevolution when Russian and Prussian armies again invaded Poland, defeated Kosciusko, and in a Third Partition in 1795 divided what remained of the country among themselves and Austria. Poland as a political entity ceased to exist.

Many advanced thinkers of the day praised the partitions of Poland as a triumph of enlightened rulers, putting an end to an old nuisance. The three partitioning powers justified their conduct on various grounds and even took pride in it as an enlightened diplomatic achievement by which war was prevented among them. It was argued also that the partitions of Poland put an end to an old cause of international rivalry and war, replacing anarchy with more stable governments in a large area of eastern Europe. It is a fact that Poland had been scarcely more independent before the partitions than after. It is to be noted also, though nationalist arguments were not used at the time, that on national grounds the Poles themselves had no claim to large parts of the old Poland. The regions taken by Russia were inhabited overwhelmingly by Byelorussians and Ukrainians, among whom the Poles were mainly a landlord class. Russia, even after the third partition, reached only to the true ethnic border of Poland. But later, after the fall of Napoleon, by general international agreement, the Russian sphere was extended deep into the territory inhabited by Poles.

---

*Debate over the  
partitions*

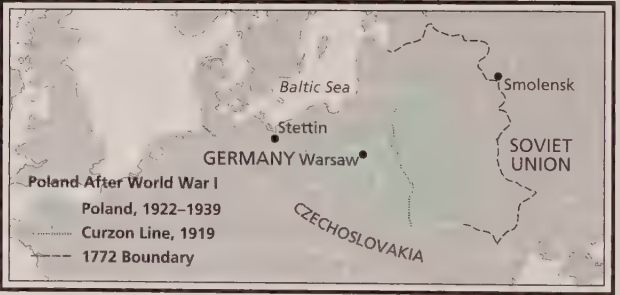

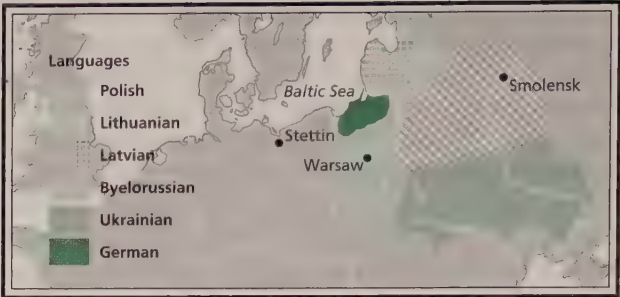

The partitions of Poland, however extenuated, were nevertheless a great shock to the old system of Europe. Edmund Burke, in England, prophetically saw in the first partition the crumbling of the old international order. His diagnosis was a shrewd one. The principle of the balance of power had been historically invoked to preserve the independence of European states and to secure weak or small ones against universal monarchy. It was now used to destroy the independence of a weak but ancient kingdom. Poland was not the first European kingdom to be "partitioned," but it was the first to be partitioned without war and the first to disappear totally. That Poland was partitioned without war, a source of great satisfaction to the partitioning powers, was still a very unsettling fact. It was alarming for a huge state to vanish simply by cold diplomatic calculation. It seemed that no established rights were safe even in peacetime. The partitions of Poland showed that in a world where great powers had arisen in control of a modern state apparatus it was dangerous not to be strong. They suggested that any area failing to develop a sovereign state capable of keeping out foreign infiltration, and so situated as to be within the reach of the great powers of Europe, was unlikely to retain its independence. In this way the history of eighteenth-century Poland anticipated, for example, the partitions of Africa a century later, when Africa too, lacking strong governments, was almost totally divided, without war, among half a dozen states of Europe.

Moreover the partitions of Poland, while maintaining a balance of power in eastern Europe, profoundly changed the balance of Europe as a whole. The disappearance of Poland was a blow to France, which had long used Poland, as it had used Hungary and Turkey, as an outpost of French influence in eastern Europe. The three Eastern powers expanded their territory, while France enjoyed henceforth no permanent growth. Eastern Europe bulked larger than ever before in the affairs of Europe. Prussia, Russia, and the Austrian empire became contiguous. Although they had drawn somewhat differently on western European methods of statecraft and military organization to build their power, they had a common interest and objective in eastern Europe, the repression of Polish resistance to their rule. Polish resistance, dating from before the partitions and continuing thereafter, was the earliest example of modern revolutionary nationalism in Europe.

The independence of Poland, and of other submerged nationalities, later became a popular cause in western Europe, while the three great monarchies of eastern Europe were

**POLAND SINCE THE  
EIGHTEENTH CENTURY**

The top panel shows, in simplified form, the ethnic composition of the area included in the Poland of 1772. In addition to languages shown, Yiddish was spoken by the large scattered Jewish population. The line set in 1795 as the western boundary of Russia persists through later changes. It reappears as the eastern border of Napoleon's Grand Duchy and of Congress Poland. After the First World War the victorious Allies contemplated much this same line as Poland's eastern frontier (the dotted line in the fourth panel, known as the Curzon Line); but the Poles in 1920–1921 conquered territory farther east. After the Second World War the Russians pushed the Poles back to the same basic line, but compensated Poland with territory taken from Germany, as far west as the river Oder and its tributary, the Neisse. The position of Warsaw in each panel shows how Poland has been shoved westward.

drawn together in common opposition to national liberation; this fact, plus the fact that the eastern monarchies were primarily landlord states, accentuated the political and social division of Europe in the nineteenth century between a western Europe that inclined to be liberal and an eastern Europe that inclined to be reactionary. The first great assault on the older social order and political system in eighteenth-century Europe, however, came from the "enlightened despots" who destroyed the kingdom of Poland.

### 39. NEW STIRRINGS: THE BRITISH REFORM MOVEMENT

It was not only by monarchs and their ministers that the older privileged, feudal, and ecclesiastical interests were threatened. Beginning about 1760 they were challenged also in more popular quarters. Growing out of the Enlightenment, and out of the failure of governments to cope with grave social and fiscal problems, a new era of revolutionary disturbance was about to open. It was marked above all by the great French Revolution of 1789, but the American Revolution of 1776 was also of international importance. In Great Britain, too, the long-drawn-out movement for parliamentary reform that began in the 1760s was in effect revolutionary in character, though nonviolent, since it questioned the foundations of traditional English government and society. In addition, in the last third of the eighteenth century, there was revolutionary agitation in Switzerland, Belgium, and Holland, in Ireland, Poland, Hungary, Italy, and in lesser degree elsewhere. After 1800 revolutionary ferment was increasingly evident in Germany, Spain, and Latin America. This general wave of revolution may be said not to have ended until after the revolutions of 1848.

#### *Onset of an Age of "Democratic Revolution"*

For the whole period the term "Atlantic Revolution" has sometimes been used, since countries on both sides of the Atlantic were affected. It has been called also an age of "Democratic Revolution," since in all the diversity of these upheavals, from the American Revolution to those of 1848, certain principles of the modern democratic society were in one way or another affirmed. In this view, the particular revolutions, attempted revolutions, or basic reform movements are seen as aspects of one great revolutionary wave by which virtually the whole area of Western civilization was transformed. There is also another view of this revolutionary age, namely, that each country presented a special case, which can be misunderstood if specific national events are described only as part of a vague general international turmoil. Thus the American Revolution, it is argued, was essentially a movement for independence, conservative in its objectives, and entirely different from the French Revolution, in which a thorough renovation of all society and ideas was contemplated; and both were utterly different from what happened in England, where there was no revolution at all. It need only be stressed here, however, that the American revolutionaries, the French Jacobins, the United Irish, the Dutch Patriots, and similar groups, though differing from each other, shared much in common that can only be characterized as revolutionary and as contributing to a revolutionary age.

It is important to see in what ways the movement that began about 1760 was and was not "democratic." It did not generally demand universal suffrage, though a handful of persons in England did so as early as the 1770s and some of the American states practiced an almost universal male suffrage after 1776, as did the more militant French revolutionaries

---

*"Age of Democratic  
Revolution"*

in 1792. It did not aim at a welfare state, nor question the right of property, though there were signs pointing in these directions in the extreme wing of the French Revolution. It was not especially directed against monarchy as such. The quarrel of the Americans was primarily with the British Parliament, not the king; the French proclaimed a republic by default in 1792, three years after their revolution began; the revolutionary Poles after 1788 tried to strengthen their king's position, not weaken it; and revolutionary groups could come into action where no monarchy existed at all, as in the Dutch provinces before the French Revolution, and the Swiss cantons, the Venetian Republic, or again in Holland, under French influence after 1795. Indeed the first revolutionary outbreak of the period occurred in 1768 at Geneva, a very nonmonarchical small city-republic, ruled by a close-knit circle of hereditary patricians. Royal power, where it existed, became the victim of revolutionaries only where it was used to support various privileged social groups.

---

*Liberty and equality*

The revolutionary movement announced itself everywhere as a demand for "liberty and equality." It favored declarations of rights and explicit written constitutions. It proclaimed the sovereignty of the people, or "nation," and it formulated the idea of national citizenship. In this context the "people" were essentially classless; it was a legal term, signifying not government but the community over which public authority was exercised and from which government itself was in principle derived. To say that citizens were equal meant originally that there was no difference between noble and commoner. To say that the people were sovereign meant that neither the king, nor the British Parliament, nor any group of nobles, patricians, regents, or other elite possessed power of government in their own right; that all public officers were removable and exercised a delegated authority within limits defined by the constitution. There must be no "magistrate" above the people, no self-perpetuation or cooptation in office, no rank derived from birth and acknowledged in the law. Social distinctions, as the French said in their Declaration of Rights of 1789, were to be based only "on common utility." Elites of talent or function there might be, but none of birth, privilege, or estate. "Aristocracy" in every form must be shunned. In representative bodies, there could be no special representation for special groups; representatives should be elected by frequent elections, not indeed by universal suffrage, but by a body of voters, however defined, in which each voter should count for one in a system of equal representation. Representation by numbers, with majority rule, replaced the older idea of representation of social classes, privileged towns, or other corporate groups.

In short, everything associated with absolutism, feudalism, or inherited right (except the right of property) was repudiated. Likewise rejected was any connection between religion and citizenship, or civil rights. The Democratic Revolution undermined the special position of the Catholic church in France, the Anglican in England and Ireland, and the Dutch Reformed in the United Provinces. This was also the great period of what has been called Jewish "emancipation," which gave Jews political and social rights that had been denied to them throughout the Middle Ages and early modern era. The whole idea that government, or any human authority, was somehow willed by God and protected by religion faded away. A general liberty of opinion on all subjects was countenanced, in the belief that it was necessary to progress. Here again the secularism of the Enlightenment was carried from science and philosophy into many of the new political and cultural institutions that emerged during this era of revolutionary change.

On the whole, the Democratic Revolution was a middle-class movement, and indeed the term "bourgeois revolution" was later invented to describe it. Many of its leaders in Europe were in fact nobles who were willing to forgo the historic privileges of nobility; and many of its supporters were of the poorer classes, especially in the great French Revo-

lution. But the middle classes were the great beneficiaries, and it was a kind of middle-class or bourgeois society that emerged. Persons of noble ancestry continued to exist after the storm was over, but the world of noble values was gone; and they either took part in various activities on much the same terms as others or retreated into exclusive drawing rooms to enjoy their aristocratic distinctions in private. The main drive of the working classes was still to come.

### *The English-Speaking Countries: Parliament and Reform*

If the American Revolution was the first act of a larger drama, it must be understood also in connection with the broader British world of which the American colonies formed a part. **The British Empire in the middle of the century was decentralized and composite.** Thirty-one governments were directly subordinate to Westminster, ranging from the separate kingdom of Ireland through all the crown and charter colonies to the various political establishments maintained in the East by the East India Company. The whole empire, with about **15,000,000 people of all colors in 1750, was less populous than France or the Austrian monarchy.** The whole tract of the American mainland from Georgia to Nova Scotia compared in the number of its white population with Ireland or Scotland—or with Brittany or Bohemia—a figure of about 2,000,000 being roughly applicable in each case.

Britain had its own way of passing through the Age of Enlightenment. There was general contentment with the arrangements that followed the English Revolution of 1688—it has often been remarked that nothing is so conservative as a successful revolution. British thought generally lacked the asperity of thought on the Continent. The writers who most resembled French philosophes, such as the Scottish philosopher David Hume and the English historian Edward Gibbon, were moderate in their political ideas. The prevailing mood, however, was one of complacency, a self-satisfaction in the glories of the unwritten **British constitution** by which **Englishmen enjoyed liberties unknown on the Continent.**

In Britain, **Parliament** was as supreme as the monarchs in most Continental countries. **It had the power,** as one facetious journalist put it, to do all things except change a man into a woman. The British Parliament was indeed more sovereign than any European ruler, since less that could be called feudalism remained in England than on the Continent. **Nor was there any “despotism” in England,** enlightened or otherwise. The young George III, who inherited the throne in 1760, did feel himself to be a “patriot king.” He did wish to heighten the influence of the crown and to overcome the factionalism of parties. But it was through Parliament that he had to work. He had to descend into the political arena himself, buy up or otherwise control votes in the Commons, grant pensions and favors, and make promises and deals with other parliamentary politicians. What he did in effect was to create a new faction, the **“king’s friends.”** This faction was in power during the ministry of Lord North from 1770 to 1782. It is worth noting that all factions were factions of Whigs, that the Tory party was practically defunct, that Britain did not yet have a two-party system, and that the word “Tory,” as it came to be used by American revolutionaries, was little more than a term of abuse.

While Parliament was supreme, and constitutional questions apparently settled, there were nevertheless numerous undercurrents of discontent. These were expressed, since **the press was freer** in England than elsewhere, in many books and pamphlets which were read in the American colonies and helped to form the psychology of the American Revolution. There was, for example, a school of Anglo-Irish Protestant writers who argued that since Ireland was in

---

*The monarchy in Great Britain*

---

*English discontent*

any case a separate kingdom, with its own parliament, it ought to be less dependent on the central government at Westminster. The possibility of a similar separate state remaining within the British Empire, was one of the alternatives considered by Americans before they settled on independence. In England there was the considerable body of Dissenters, or Protestants not accepting the Church of England, who had enjoyed religious toleration since 1689 but continued to labor (until 1828) under various forms of political exclusion. They overlapped with two other amorphous groups, a small number of “commonwealthmen” and a larger and growing number of parliamentary reformers. The commonwealthmen, increasingly eccentric and largely ignored, looked back nostalgically to the Puritan Revolution and the republican era of Oliver Cromwell. They kept alive memories of the Levellers and ideals of equality, well mixed with a pseudo-history of a simple Anglo-Saxon England that had been crushed by the despotism of the Norman Conquest. They had less influence in England than in the American colonies and especially New England, whose origins were closely connected to the Puritan Revolution. The parliamentary reformers were a more diverse and influential group. They were condemned in the eighteenth century to repeated frustration; not until the First Reform Bill of 1832 did they begin to accomplish their goals.

---

*Parliamentary  
politics*

The very power of Parliament meant that political leaders had to take strong measures to assure its votes. These measures were generally denounced by their critics as “corruption,” on the grounds that Parliament, whether or not truly representative, should at least be free. Control of Parliament, and especially of the House of Commons, was assured by various devices, such as patronage or the giving of government jobs (called “places”), or awarding contracts, or having infrequent general elections (every seven years after 1716); or the fact that in many constituencies there were no real elections at all. The distribution of seats in the Commons bore no relation to numbers of inhabitants. A town having the right to send members to Parliament was called a “borough,” but no new borough was created after 1688 (or until 1832). Thus localities that had been important in the medieval or Tudor periods were represented, but towns that had grown up recently, such as Manchester and Birmingham, were not. A few boroughs were populous and democratic, but many had few inhabitants or none, so that influential “borough mongers” decided who should represent them in Parliament.

---

*The reform movement*

The reform movement began in England before the American Revolution, with which it was closely associated. Since complaints were diverse, it attracted people of different kinds. The first agitation centered about John Wilkes, a journalist and member of Parliament who vehemently attacked the policies of King George III. He was vindicated when the courts pronounced the arrest of his publisher illegal, but the king’s supporters expelled him from the House of Commons. Wilkes became a political hero, however, and was later reelected three times to the House, which refused to seat him. A whirl of protests, public meetings, and petitions supported him against the exclusionary actions of Parliament. His followers in 1769 founded the Supporters of the Bill of Rights, the first of many societies dedicated to parliamentary reform. His case raised the question of whether the House of Commons should be dependent on the electorate and on the propriety of mass agitation “out of doors” on political questions. It was in this connection, also, that debates in Parliament for the first time came to be reported in the London press. Parliament stood on the eve of a long transition, by which it was to be converted from a select body meeting in private to a modern representative institution answerable to the public and its constituents. Wilkes himself finally

**THE HON. MRS. GRAHAM**

by Thomas Gainsborough (English, 1727–1788)

High social status is very evident in this portrayal of a young English gentlewoman. The wealth of her social class is apparent in the brooch, the plumes, the silks, bows and ruffles, and in the strings of pearls. Her delicate hands and the classical colonnade suggest a life of leisure and cultural importance. This is the way that English aristocrats of the eighteenth century liked to imagine themselves and to be portrayed for posterity.

(National Galleries of Scotland)

regained his parliamentary seat in 1774 and soon introduced the first of many reform bills, none of which passed for over half a century.

Meanwhile, the important **Whig leaders**, who had previously **managed Parliament** by **manipulating elections** in lightly populated boroughs, began to sense “corruption” in such methods after control passed to George III and his “friends.” Their most eloquent spokesman was Edmund Burke. Other reformers called for **more frequent elections**, “**annual parliaments**,” a **wider and more equal or even universal male suffrage**, with dissolution of some boroughs in which no one was really represented. **Burke favored none of these things; in fact he came strenuously to oppose them.** A founder of philosophical conservatism, he was yet in his way a reformer. **He was more concerned that the House of Commons should be independent and responsible than that it should be mathematically representative. He thought that the landowning interest should govern.** But he pleaded for a strong sense of party in opposition to royal encroachments, and **he argued that members of Parliament should follow their own best judgment of the country’s interests, bound neither by the king on the one hand nor by their own constituents on the other. Like other reformers, he objected to “placemen,” or jobholders dependent on their ministerial patrons, and he objected to the use made, for political purposes, of a bewildering array of pensions, sinecures, honorific appointments, and ornamental offices, ranks, and titles. In his Economical Reform of 1782, which curtailed crown patronage, he got many of these abolished:**

---

Edmund Burke

The reform movement, though ineffectual, remained strong. Even William Pitt, as prime minister in the 1780s, gave it his sponsorship. It took on new strength at the time of the French Revolution, spreading then to more popular levels, as members of the skilled artisan class responded to events in France by demanding a more adequate “representation of the people” in England. They then had upper-class support from Charles James Fox and a minority of the Whigs. But conservatism, satisfaction with the British constitution, patriotism engendered by a new round of French wars, and reaction against the French Revolution all raised an impassable barrier. Reform was delayed for another generation.

After the American Revolution, which in a way was a civil struggle within the English-speaking world, the **English reformers generally blamed the trouble with America on King George III. This was less than fair, since Parliament on the American question was never dragooned by the king.** The most ardent reformers later argued that **if Parliament had been truly representative of the British people, the Americans would not have been driven to independence.** This seems unlikely. In any case, reformers of various kinds, from Wilkes to Burke, were sympathetic to the complaints of the American colonials after 1763. There was much busy correspondence across the Atlantic. Wilkes was a hero in Boston as well as London. Burke pleaded for conciliation with the colonies in a famous speech of 1775. His very insistence on the powers and dignity of Parliament, however, made it hard for him to find a workable solution; and after the colonies became independent, he showed no interest in the political ideas of the new American states. It was the more radical reformers in England, as in Scotland and Ireland, who most consistently favored the Americans, both before and after independence. They of course had no power. **On the American side, for a decade before independence, the increasingly discontented colonials, reading English books and pamphlets and reports of speeches, heard George III denounced for despotism and Parliament accused of incorrigible corruption.** All this seemed to confirm what Americans had long been reading anyway in the works of English Dissenters or old commonwealthmen, now on the fringes of English society but sure of a receptive audience in the American colonies. The result was to make Americans suspicious

Edmund Burke's insistence on the political and social value of inherited traditions made him a key figure in the emergence of modern conservatism. Although he favored an independent Parliament in Britain, he wrote a famous critique of the revolution that abolished traditional royal prerogatives in France. He appears here in an engraving from the 1770s, after a painting by Sir Joshua Reynolds.

(Getty Images)

of all actions by the British government, to sense tyranny everywhere, to magnify such things as the Stamp Act into a kind of plot against American liberties.

The real drift in England in the eighteenth century, however, despite the chronic criticism of Parliament, was for Parliament to extend its powers in a general centralization of the empire. The British government faced somewhat the same problems as governments on the Continent. All had to deal with the issues raised by the great war of the mid-century, in its two phases of the Austrian Succession and Seven Years' War. Everywhere the solution adopted by governments was to increase their own central power. We have seen how the French government, in attempting to tap new sources of revenue, tried to encroach on the liberties of Brittany and other provinces and to subordinate the bodies which in France were called parlements. We have likewise seen how the Habsburg government, also in an effort to raise more taxes, repressed local self-government in the empire and consolidated power in a more centralized bureaucracy. The same tendency showed itself in the British system. The Habsburg revocation of a constitutional charter in Bohemia in 1749 had its parallel in the revocation of the charter of Massachusetts in 1774. The disputes of the French king with the estates of Brittany or Languedoc had their parallel in the disputes of the British Parliament with the provincial assemblies of Virginia or New York.

---

*British centralization*

### *Scotland, Ireland, India*

The British also faced problems nearer home. Scotland proved a source of weakness in the War of the Austrian Succession. The Lowlanders were loyal enough, but the Highlanders revolted with French assistance in the Jacobite rising of 1745 and by invading England threatened to attack the British government in the rear as it was locked in the struggle with France. The Highlands had never really been under any government, even under the old Scottish monarchy before

## CHRONOLOGY OF NOTABLE EVENTS, 1733–1795

---

1733	Voltaire publishes <i>Philosophical Letters on the English</i>
1741	Montesquieu publishes <i>The Spirit of Laws</i>
1751–1772	Publication of the <i>Encyclopedia</i> in Paris
1753	Jean-Jacques Rousseau publishes <i>Origin of Inequality Among Men</i>
1762	Rousseau publishes <i>The Social Contract</i> and <i>Émile</i>
1762–1796	Tsarina Catherine the Great reigns as “enlightened despot” in Russia
1769	Emergence of Reform Movement in British Parliament
1772	Prussia, Austria, and Russia impose the First Partition of Poland
1773	Emelian Pugachev leads a rebellion of the lower classes in Russia
1774–1792	King Louis XVI reigns in France
1776	Adam Smith publishes <i>The Wealth of Nations</i>
1776–1783	Revolutionary War achieves American independence from Britain
1780–1790	Emperor Joseph II introduces “enlightened” reforms in Austria
1784	Britain creates the India Office to manage British interests in India
1787	Written Constitution establishes new government in the United States
1793, 1795	Second and Third Partitions of Poland destroy the Polish state

---

the union of 1707 with England. Men in the Highlands looked to their chiefs, the heads of the clans, to tell them whom and when to fight. The chiefs had hereditary jurisdiction, often including powers of life and death, over their clans. A few leaders could throw the whole region to the Stuarts or the French. The British government, after 1745, proceeded to make its sovereignty effective in the Highlands. Troops were quartered there for years. Roads were pushed across the moors and through the glens. Law courts enforced the law of the Scottish Lowlands. Revenue officers collected funds for the treasury of Great Britain. The chiefs lost their old quasi-feudal jurisdiction. The old system of land tenure was broken up, and the holding of land from clannish chiefs was ended. Fighting Highlanders were incorporated into newly formed Highland regiments of the British army, under the usual discipline imposed by the modern state on its fighting forces. For 30 years the Scots were forbidden to wear the kilt or play the bagpipes.

---

### The British in Ireland

In Ireland the process of centralization worked itself out more slowly. How Ireland was subjected after the battle of the Boyne has already been described. It was a French army that had landed in Ireland, supported James II, and been defeated in 1690. The new English constitutional arrangements, the Hanoverian succession, the Protestant ascendancy, the church and the land settlement in Ireland, together with the prosperity of British commerce, were all secured by the subordination of the smaller island. The native or Catholic Irish remained generally pro-French. The Presbyterian Irish disliked both the French and popery, but they were alienated from England also; many in fact emigrated to America in the generation before the American Revolution. Ireland remained quiet in the mid-century wars. When the trouble began between the

British Parliament and the American colonies, the Presbyterian Irish generally took the American side. They were greatly stirred by the example of American independence. Thousands formed themselves into Volunteer Companies; they wore uniforms, armed, and drilled; they demanded both internal reform of the Irish parliament (which was even less representative than the British) and greater autonomy for the Irish parliament as against the central government at Westminster.

Faced with these demands, and fearing a French invasion of Ireland during the War of American Independence, the British government made concessions. It allowed an increase of power to the Irish parliament at Dublin. But from the English parliament Catholics were still excluded. In the next war between France and Great Britain, which began in 1793, many Irish felt a warm sympathy for the French Revolution. Catholics and Presbyterians, at last combining, formed a network of United Irish societies throughout the whole island. They sought French aid, and the French barely failed to land a sizable army. Even without French military support, the United Irish rose in 1798 to drive out the English and establish an independent republic. The British, suppressing the rebellion, now turned to centralization. The separate kingdom of Ireland, and the Irish parliament, ceased to exist. The Irish were thereafter represented in the imperial Parliament at Westminster. These provisions were incorporated in the Act of Union of 1801, creating the United Kingdom of Great Britain and Ireland, which lasted until 1922.

---

#### *Intervention in India*

British establishments in India also felt the hand of Parliament increasingly upon them. At the close of the Seven Years' War the various British posts in and around Bombay, Madras, and Calcutta were unconnected with each other and subordinate only to the board of directors of the East India Company in London. Company employees interfered at will in the wars and politics of the Indian states and enriched themselves by such means as they could, not excluding graft, trickery, intimidation, rapine, and extortion. In 1773 the ministry of Lord North passed a Regulating Act, of which the main purpose was to regulate the British subjects in India, whom no Indian government could control. The company was left with its trading activities, but its political activities were brought under parliamentary supervision. The act gathered all the British establishments under a single governor general, set up a new supreme court with British judges at Calcutta, and required the company to submit its correspondence on political matters for review by the ministers of His Majesty's Government. Warren Hastings became the first British governor general in India. He was so high-handed with some of the Indian princes, and made so many enemies among jealous English residents in Bengal, that he was denounced at home, impeached, and subjected to a trial which dragged on for seven years in the House of Lords. He was finally acquitted. After Clive, whose interventions had rapidly expanded British power there during the 1750s, Hastings was the main author of British supremacy in India. Meanwhile, in 1784 an India office was created in the British ministry at home. The governor general henceforth ruled the growing British sphere in India almost as an absolute monarch but only as the agent of the ministry and Parliament of Great Britain.

Thus the trend in the British world was to centralization. Despite the flutter of royalism under George III, it was to a centralization of all British territories under the authority of Parliament. What was happening in empire affairs, as in domestic politics in England, was a continuing application of the principles of 1689. The parliamentary sovereignty established in 1689 was now, after the middle of the eighteenth century, being applied to regions where it had heretofore had little effect. And it was against the authority of the British Parliament that the Americans primarily rebelled.

## 40. THE AMERICAN REVOLUTION

*Background to the Revolution*

The behavior of the Americans in the Seven Years' War, as viewed by the British government, left much to be desired. The several colonial legislatures rejected the Albany Plan of Union drafted by Franklin and commended to them by British officials. During the war it was the British regular army and navy, financed by taxes and loans in Great Britain, that drove the French out of America. The war effort of the Anglo-Americans was desultory at best. After the defeat of the French the colonials had still to reckon with the Indians of the interior, who preferred French rule to that of their new British and British-colonial masters. Many tribes joined in an uprising led by Pontiac, a western chief, and they carried their attacks on colonial and British outposts as far eastward as the Pennsylvania and Virginia frontiers. Again, the colonials proved unable to deal with a problem vital to their own future, and peace was brought about by officials and army units taking their orders from Great Britain.

The British government tried to make the colonials pay a larger share toward the expenses of the empire. The colonials had hitherto paid only local taxes. They were liable to customs duties, of which the proceeds went in principle to Great Britain; but these duties were levied to enforce the Acts of Trade and Navigation and to direct the flow of commerce, not to raise revenue; and they were seldom paid, because the Acts of Trade and Navigation were persistently ignored. American merchants, for example, commonly imported sugar from the French West Indies, contrary to law, and even shipped in return the iron wares which it was against the law for Americans to manufacture for export. The colonials in practice paid only such taxes as were approved by their own local legislature for local purposes. The Americans in effect enjoyed a degree of tax exemption within the empire, and it was against this form of provincial privilege that Parliament began to move.

By the Revenue Act of 1764 (the "Sugar" Act), the British ministry, while reducing and liberalizing the customs duties payable in America, entered upon a program of actual and systematic collection. In the following year the ministry attempted to extend to British subjects in America a tax peaceably accepted by those in Great Britain and commonplace in most of Europe. This imposed on all uses of paper, as in newspapers and commercial and legal documents, the payment of a fee that was certified by the affixing of a stamp. The Stamp Act aroused violent and concerted resistance in the colonies, especially among the businessmen, lawyers, and editors who were the most articulate class. It therefore was repealed in 1766. In 1767 Parliament, clumsily casting about to find a tax acceptable to the Americans, hit upon the "Townshend duties," which taxed colonial imports of paper, paint, lead, and tea. Another outcry went up, and the Townshend duties were repealed, except the one on tea, which was kept as a token of the sovereign power of Parliament to tax all persons in the empire.

The colonials had proved stubborn, the government pliable but lacking in constructive ideas. The Americans argued that Parliament had no authority to tax them because they were not represented in it. The British replied that Parliament represented America as much as it represented Great Britain. If Philadelphia sent no actually elected deputies to the Commons, so this argument ran, neither did Manchester in England. Both places enjoyed a kind of "virtual representation," since members of the Commons did not merely speak for local constituencies but made themselves responsible for imperial interests as a whole. To this

---

new taxes*

---

*Debate over  
representation*

many Americans retorted that if Manchester was not “really” represented it ought to be, which was of course also the belief of the English reformers. Meanwhile the strictly Anglo-American question subsided after the repeal of the Stamp Act and the Townshend program. There had been no clarification of principle on either side. But in practice the Americans had resisted significant taxation, and Parliament had refrained from making any drastic use of its sovereign power.

The calm was shattered in 1773 by an event which proved, to the more dissatisfied Americans, the disadvantages of belonging to a global economic system in which the main policies were made on the other side of the ocean. The East India Company was in difficulties. It had a great surplus of Chinese tea, and in any case it wanted new commercial privileges in return for the political privileges which it was losing in India by the Regulating Act of 1773. In the past the company had been required to sell its wares at public auction in London; other merchants had handled distribution from that point on. Now, in 1773, Parliament granted the company the exclusive right to sell tea through its own agents in America to American local dealers. Tea was a large item of business in the commercial capitalism of the time. The colonial consumer might pay less for it, but the intermediary American merchant would be shut out. The company’s tea was boycotted in all American ports. In Boston, to prevent its forcible landing, a party of disguised men invaded the tea ships and dumped the chests into the harbor. To this act of vandalism the British government replied by measures far out of proportion to the offense. It “closed” the port of Boston, thus threatening the city with economic ruin. It virtually rescinded the charter of Massachusetts, forbidding certain local elections and the holding of town meetings.

---

*The Boston Tea Party*

And at the same time, in 1774, apparently by coincidence, Parliament enacted the Quebec Act. The wisest piece of British legislation in these troubled years, the Quebec Act provided a government for the newly conquered Canadian French, granting them security in their French civil law and Catholic religion and laying foundations for the British Empire that was to come. But the act defined the boundaries of Quebec somewhat as the French themselves would have defined them, including in them all territory north of the Ohio River—the present states of Wisconsin, Michigan, Illinois, Indiana, and Ohio. In the view of British legislators these boundaries were perfectly reasonable, since the few Europeans in the area were French, and since, in the age before canals or railways, the obvious means of reaching the whole region was by way of the St. Lawrence valley and the Lakes. But to the Americans the Quebec Act was a pro-French and pro-Catholic outrage, and at a time when the powers of juries and assemblies in the old colonies were threatened, it was disquieting that the Quebec Act made no mention of such representative institutions for the new northern province. It was lumped with the closing of an American port and the destruction of the Massachusetts government as one of the “Intolerable Acts” to be resisted.

---

*The Quebec Act*

And indeed the implications of parliamentary sovereignty and centralized planning were now apparent. It was no longer merely an affair of taxation. A government that had to take account of the East India Company, the French Canadians, and the British taxpayers, even if more prudent and enlightened than Lord North’s ministry of 1774, could not possibly at the same time have satisfied the Americans of the thirteen seaboard colonies. These Americans, since 1763 no longer afraid of the French empire, were less inclined to forgo their own interests in order to remain under British protection or control. British policies had aroused antagonism in the coastal towns and in the backwoods, among wealthy land speculators and poor squatter frontiersmen, among merchants and the workers who depended on the business of merchants. The freedom of Americans to determine their own

**MRS. ISAAC SMITH**

by John Singleton Copley (American, then English, 1737–1815)

The wife of a Boston merchant, Mrs. Smith represents the bourgeois family background of many leaders in the American and French revolutions. In general, it was a background of substance, comfort, and hard work. Mrs. Smith's costume and surroundings (though less elegant than those portrayed in the painting of Mrs. Graham on p. 333) suggest her high station in New England society. Copley disliked the rising revolutionary agitation in America and emigrated permanently to England in 1774.

(Yale University Art Gallery, Gift of Maitland Fuller Griggs, B.A. 1869, LHD 1938 (1941.74), (detail))

political life was in question. Yet there were few in 1774, or even later, prepared to face the thought of independence.

### *The War of American Independence*

After the "Intolerable Acts," self-authorized groups met in the several colonies and sent delegates to a "continental congress" in Philadelphia. This body adopted a boycott of British goods, to be enforced on unwilling Americans by local organizers of resistance. Fighting began in the next year, 1775, when the British commander at Boston sent a detachment to seize unauthorized stores of weapons at Concord. On the way, at Lexington, in a brush between soldiers and partisans, or "minute-men," someone fired the "shot heard round the world." The Second Continental Congress, meeting a few weeks later, proceeded to raise an American army, appointed George Washington as the commanding general of its troops, dispatched an expedition to force Quebec into the revolutionary union, and entered into overtures with Bourbon France.

---

*The "shot heard  
round the world"*

The Congress was still reluctant to repudiate the tie with Britain. But passions grew fierce in consequence of the fighting. Radicals convinced moderates that the choice now lay between independence and enslavement. It appeared that the French, naturally uninterested in a reconciliation of British subjects, would give help if the avowed aim of American rebels was to dismember the British Empire. In January 1776 Thomas Paine, in his pamphlet *Common Sense*, made his debut as a kind of international revolutionary; he was to figure in the French Revolution and to work for revolution in England. He had come from England less than two years before, and he detested English society for its injustices. Eloquent and vitriolic, *Common Sense* identified the independence of the American colonies with the cause of liberty for all humankind. It pitted freedom against tyranny in the person of "the royal brute of Great Britain." It was "repugnant to reason," said Paine, "to suppose that this Continent can long remain subject to any external power. . . . There is something absurd in supposing a Continent to be perpetually governed by an island." *Common Sense* was read everywhere in the colonies, and its slashing arguments unquestionably spread a sense of proud isolation from the Old World. Such ideas also gained wide support in the Continental Congress, where Thomas Jefferson and other members of a special committee began drafting a theoretical and historical justification for America's separation from Britain. Like Paine, the authors linked their specific grievances to broad Enlightenment claims for universal human rights, thus giving the widest possible significance to the armed rebellion of some sparsely settled colonies in Britain's far-flung eighteenth-century empire. On July 4, 1776, the Congress adopted the Declaration of Independence, by which the United States assumed its separate and equal station among the powers of the earth.

The War of American Independence thereupon turned into another European struggle for empire. For two years more the French government remained ostensibly noninterventionist but meanwhile poured munitions into the colonies through an especially rigged-up commercial concern. Nine-tenths of the arms used by the Americans at the battle of Saratoga came from France. After the American victory in this battle the French government concluded, in 1778, that the insurgents were a good political risk, recognized them, signed an alliance with them, and declared war on Great Britain. Spain soon followed, hoping to drive the British from Gibraltar and deciding that its overseas empire was more threatened by a restoration of British

---

*Role of the European  
powers*

supremacy in North America than by the disturbing example of an independent American republic. The Dutch were drawn into hostilities through their trade with the Americans, which flowed mostly by way of the Dutch West Indies. Other powers—Russia, Sweden, Denmark, Prussia, Portugal, and Turkey—irked at British employment of blockade and sea power in time of war, formed an “Armed Neutrality” to protect their commerce from dictation by the British fleet. The French, in a brief revival of their own sea power, landed an expeditionary force of 6,000 men in Rhode Island. The Americans suffered from the internal differences inseparable from all revolutions and were in any case still unable to govern themselves to any effect, meeting with the old difficulties in raising both troops and money. It was therefore the participation of regiments of the French army, in conjunction with squadrons of the French fleet, that made possible the defeat of the armed forces of the British Empire and so persuaded the British government to recognize the independence of the United States. By the peace treaty of 1783, though the British were still in possession of New York and Savannah and though the governments befriending the Americans would just as soon have confined them east of the mountains, the new republic obtained territory as far west as the Mississippi. Canada remained British. It received an English-speaking population by the settlement of over 60,000 refugee Americans who remained loyal to Great Britain.

### *Significance of the Revolution*

The upheaval in America was a revolution as well as a war of independence. The cry for liberty against Great Britain raised echoes within the colonies themselves. The Declaration of Independence was more than an announcement of secession from the empire; it was a justification of rebellion against established authority. Curiously, although the American quarrel had been with the Parliament, the Declaration arraigned no one but the king. One reason was that the Congress, not recognizing the authority of Parliament, could separate from Great Britain only by a denunciation of the British crown; another reason was that the cry of “tyrant” made a more popular and flaming issue. Boldly voicing the natural right philosophy of the age, the Declaration held as “self-evident”—that is, as evident to all reasonable people—that “all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are life, liberty, and the pursuit of happiness.” These electrifying words leaped inward into America and outward to the world.

---

*The Declaration of Independence*

In the new states democratic equality made many advances. It was subject, however, to a great limitation, in that it long applied only to white males of European origin. It was more than a century before women received the vote. American Indians were relatively few in number, but the black population at the time of the Revolution comprised about a fifth of

---

*Equality advances and limitations*

the whole. Many American whites of the revolutionary generation were indeed troubled by the institution of slavery. It was abolished outright in Massachusetts, and all states north of Maryland took steps toward its gradual extinction. But application of the principles of liberty and equality without regard to race or gender went far beyond the political and cultural assumptions of even the most enlightened white Americans at the time. In the South, all censuses from 1790 to 1850 showed a third of the population to be slaves. In the North, free blacks found that in fact, and often in law, they were debarred from voting, from adequate schooling, and from the widening opportunities in which white Americans saw the essence of their national life and their superiority to Europe.

Brief, violent clashes in Massachusetts in April 1775 launched the long military struggle of the American Revolution. This picture shows the local militia exchanging fire in the village of Lexington with a detachment of the British army that had been sent from Boston to search for arms that American rebels were collecting in the area.

(Photo from the collection of the Lexington, Massachusetts, Historical Society)

For the white male population the Revolution had a democratizing effect in many ways. Lawyers, landowners, and businessmen who led the movement against England needed the support of numbers and to obtain it were willing to make promises and concessions to the lower classes. Or the popular elements, workmen and mechanics, farmers and frontiersmen, often dissidents in religion, extorted concessions by force or threats. There was a good deal of violence, as in all revolutions; **the new states confiscated property from the counterrevolutionaries, called Tories,** some of whom were tarred and feathered by infuriated mobs. The dissolution of the old

---

*Democratization*

colonial governments threw open all political questions. In some states more men became qualified to vote. In some, governors and senators were now popularly elected, in addition to the lower houses of the legislatures as in colonial times. The **principle** was adopted, still unknown to the parliamentary bodies of Europe, **that each member of a legislative assembly should represent about the same number of citizens**. Primogeniture and entail, which landed families aspiring to an aristocratic mode of life sometimes favored, went down before the demands of democrats and small property owners. Tithes were done away with, and the established churches—Anglican in the South, Congregationalist in New England—lost their privileged position in varying degree. But the Revolution was not socially as profound as the revolution soon to come in France, or as the revolution in Russia in 1917. Property changed hands, but the law of property was modified only in detail. There had been no such thing in British America as a native nobleman or even a bishop; clergy and aristocracy had been incomparably less ingrained in American than in European society, and the rebellion against them was less devastating in its effect.

The main importance of the American Revolution remained political and even constitutional in a strict sense. The American leaders were themselves part of the Age of Enlightenment, sharing fully in its humane and secular spirit. But probably the **only non-British thinker by whom they were influenced was Montesquieu**, and Montesquieu owed his popularity to his philosophizing upon English institutions. The Americans drew heavily on the writings of John Locke, but their cast of mind went back before Locke to the English Puritan movement of the first half of the seventeenth century. Their thought was formed not only by Locke's ideas of human nature and government, but, as already noted, by the dissenting literature and the neorepublican writings that had never quite died out in England. The realities of life for five generations in America had sharpened the old insistence upon personal liberty and equality. When the dispute with Britain came to a head, the Americans found themselves arguing both for the historic and chartered rights of the English and for the timeless and universal rights of man, both of which were held up as barriers against the inroads of parliamentary sovereignty. **The Americans came to believe, more than any other people, that government should possess limited powers and operate only within the terms of a fixed and written constitutional document.**

All 13 of the new states lost no time in providing themselves with written constitutions (in Connecticut and Rhode Island merely the old charters reaffirmed), all of which enshrined virtually the same principles. All followed the thought stated in the great Declaration, that it was to protect **"unalienable" rights that governments were instituted among men and that whenever government became destructive to this end the people had a right to "institute new government" for their safety and happiness.** All the constitutions undertook to limit government by a separation of executive, legislative, and judicial powers. Most appended a bill of rights, stating the natural rights of the citizens and the actions which no government might justly take. None of the constitutions were as yet fully democratic; even the most liberal gave some advantage in public affairs to the owners of property.

Federalism, or the allocation of power between central and outlying governments, went along with the idea of written constitutions as a principal offering of the Americans to the world. Like constitutionalism, federalism developed in the atmosphere of protest against a centralized sovereign power. It was a hard idea for Americans to work out, since the new states carried over the old separatism which had so distracted the British. **Until 1789 the states remained banded together in the**

PHILADELPHIA PRINTED.

And sold by W. and T. BRADFORD. C1776

*Wrote by one Thomas Paine  
in the year 1776.*

Thomas Paine (1737–1809) lived in England until he arrived in Philadelphia in 1774. He published his *Common Sense* anonymously two years later, after the armed conflict had begun. Widely read, it helped persuade Americans to fight for complete independence from Britain.

(Library of Congress)

Articles of Confederation. The United States was a union of 13 independent republics. Disadvantages in this scheme becoming apparent, a constitutional convention met at Philadelphia in 1787 and drew up the constitution which is today the world's oldest written instrument of government still in operation. In it the United States was conceived not merely as a league of states but as a union in which individuals were citizens of the United States of America for some purposes and of their particular states for others. Persons, not states, composed the federal republic, and the laws of the United States fell not merely on the states but on the people.

The consequences of the American Revolution can hardly be overstated. By overburdening the French treasury, the American war became a direct cause of the French Revolution. Beyond that, it ushered in the age of predominantly liberal or democratic revolution which lasted through the European revolutions of 1848. The American doctrine, like most thought in the Age of Enlightenment, was expressed in universal terms of "man" and

“nature.” All peoples regardless of their own history could apply it to themselves, because, as Alexander Hamilton once put it in his youth, “the sacred rights of man are not to be rummaged for among old parchments or musty records. They are written, as with a sun-beam, in the whole volume of human nature, by the hand of Divinity itself, and can never be erased or obscured by mortal power.” **The Americans, in freeing themselves, had done what all peoples ought to do.**

---

*Significance of  
American Revolution*

The revolt in America offered a dramatic judgment on the old colonial system, convincing some, in England and elsewhere, that the empires for which they had long been struggling were hardly worth acquiring, since colonies in time, in the words of Turgot, fell away from the mother country “like ripe fruit.” The idea spread, since trade between Britain and America continued to prosper, that one could do business with a country without exerting political influence or control, and this idea became fundamental to the coming movement of economic liberalism and free trade. By coincidence, the book that became the gospel of the free trade movement, Adam Smith’s *Wealth of Nations*, was published in England in the year 1776. **The American example was pointed to by other peoples wishing to throw off colonial status—first by the Latin Americans, then by the peoples of the older British dominions, and, finally, in the twentieth century, by those of Asia and Africa also.** In Europe, the **American example encouraged the type of nationalism in which subjugated nations aspire to be free.** And at home the Revolution did much to determine the spirit and method by which the new nation spread across the North American continent and the ideas by which the United States, when it became a leading power a century and a half later, would explain and justify its national actions in the modern world.

More immediately, the American example was not lost on the many Europeans who sojourned in the new states during and after the war. Of these the Marquis de Lafayette was the most famous, but there were many others: Thomas Paine, who returned to Europe in 1787; the future French revolutionist Brissot; the future Polish national leader Kosciusko; **the future marshals of Napoleon**, Jourdan and Berthier; the future reformer of the Prussian army Gneisenau. Contrariwise various Americans went to Europe, notably the aging Benjamin Franklin, **who in the 1780s was incredibly lionized in the fashionable and literary world of Paris.**

---

*Vindication of  
Enlightenment ideas*

**The establishment of the United States was taken in Europe to prove that many ideas of the Enlightenment were practicable.** Rationalists declared that here was a people, free of past errors and superstitions, who showed how enlightened beings could plan their affairs. Rousseauists saw in America **the very paradise of natural equality, unspoiled innocence, and patriotic virtue.** But nothing so much impressed Europeans, and especially the French, as the spectacle of the Americans meeting in solemn conclave to draft their state constitutions. These, along with the Declaration of Independence, were translated and published in 1778 by a French nobleman, the Duke de la Rochefoucauld. They were endlessly and excitedly discussed. Constitutionalism, federalism, and limited government were not new ideas in Europe. They came out of the Middle Ages and were currently set forth in many quarters, for example, in Hungary, the Holy Roman Empire, and the Parlement of Paris. But in their prevailing form, and even in the philosophy of Montesquieu, they were associated with feudalism and aristocracy. The American Revolution made such ideas progressive. The American influence, added to the force of developments in Europe, made the thought of the later Enlightenment more democratic. **The United States replaced England as the model country of advanced thinkers.** On the Continent there was less passive trust in

### DECLARATION OF INDEPENDENCE

by John Trumbull (American, 1756–1843)

Trumbull's painting shows the committee that presented America's Declaration of Independence to the Continental Congress in 1776. Although Franklin and Adams are standing with the committee, Thomas Jefferson is presenting the document. Trumbull met often with Jefferson in Paris when he was at work on this painting in the late 1780s, and the picture conveys a Jeffersonian view of the event it portrays.

(Yale University Art Gallery, Trumbull Collection (1832.3))

the enlightened despotism of the official state. Confidence in self-government was aroused.

The American constitutions seemed a demonstration of the social contract. They offered a picture of men in a "state of nature," having cast off their old government, deliberately sitting down to contrive a new one, weighing and judging each branch of government on its merits, assigning due powers to legislature, executive, and judiciary, declaring that all government was created by the people and in possession of a merely delegated authority, and listing specifically the inalienable human rights—inalienable in that they could not conceivably be taken away, since all persons possessed them even if denied them

by force. And these rights were the very same rights that many Europeans wanted secured for themselves—freedom of religion, freedom of press, freedom of assembly, freedom from arbitrary arrest at the discretion of officials. And they were all based on the rigorous principle of equality before the law. The American example crystallized and made tangible the ideas that were strongly blowing in Europe, and the American example was one reason why the French, in 1789, began their revolution with a declaration of human rights and with the drafting of a written constitution.

And more deeply still, America became a kind of mirage or ideal vision for Europe, land of open opportunity and of new beginnings, free from the load of history and of the past, wistfully addressed by Goethe:

*America, thou hast it better  
Than has our Continent, the old one.*

It is evident that this was only part of the picture. The United States, as its later history was to show, bore a heavy load of inherited burdens and unsolved problems, especially slavery and pervasive racial discrimination. But in a general way, until new revolutionary and radical social movements set in a century later, America stood as a kind of utopian opportunity for common people, not only for the millions who emigrated to it but for other millions who stayed at home, who often wished that their own countries might become more like it, and many of whom might even agree with Abraham Lincoln in calling it the last best hope of earth.

# THE FRENCH REVOLUTION

41. Backgrounds
42. The Revolution and the Reorganization of France
43. The Revolution and Europe: The War and the "Second" Revolution, 1792
44. The Emergency Republic, 1792–1795: The Terror
45. The Constitutional Republic: The Directory, 1795–1799
46. The Authoritarian Republic: The Consulate, 1799–1804

 In 1789 France fell into revolution, and the world has never since been the same. The French Revolution was by far the most momentous upheaval of the whole revolutionary age. It replaced the “old regime” with “modern society,” and at its extreme phase it became very radical, so much so that later revolutionary movements often looked back to it as a predecessor. The ideas of the French Revolution, spreading far beyond France itself, decisively influenced the subsequent development of political parties and ideological conflicts throughout much of Europe and elsewhere; indeed, the Revolution still provokes highly charged debates about the characteristics or consequences of social reform, political radicalism, and revolutionary violence. At the time, in the age of the Democratic or Atlantic Revolution from the 1760s to 1848, the role of France was decisive. Even the Americans, without French military intervention,

would hardly have won such a clear settlement from England or been so free to set up the new states and new constitutions that have just been described. And while revolutionary disturbances in Ireland and Poland, or among the Dutch, Italians, and others, were by no means caused by the French example, it was the presence or absence of French aid that usually determined whatever successes they achieved.

The French Revolution, unlike the Russian or Chinese revolutions of the twentieth century, occurred in what was in many ways the most advanced country of the day. France was the center of the intellectual movement of the Enlightenment. French science then led the world. French books were read everywhere, and the newspapers and political journals that became very numerous after 1789 carried a message that hardly needed translation.

French was a kind of international spoken language in the educated and aristocratic circles of many countries. France was also, potentially before 1789 and actually after 1793, the most powerful country in Europe. It may have been the wealthiest, though not per capita. With a population of 24,000,000 the French were the most numerous of all European peoples under a single government. Even Russia was hardly more populous until after the partitions of Poland. The Germans were divided, the subjects of the Habsburgs were of diverse nationalities, and the English and Scots together numbered only 10,000,000. Paris, though smaller than London, was over twice as large as Vienna or Amsterdam. French exports to Europe were larger than those of Great Britain. It is said that half the goldpieces circulating in Europe were French. Europeans in the eighteenth century were in the habit of taking ideas from France; they were therefore, depending on their social position, the more excited, encouraged, alarmed, or horrified when revolution broke out in that country.

## 41. BACKGROUNDS

### *The Old Regime: The Three Estates*

Some remarks have already been made about the Old Regime, as the prerevolutionary society came to be called after it disappeared, and about the failure of enlightened despotism in France to alter it in any fundamental way. The essential fact about the Old Regime was that it was still legally aristocratic and in some ways feudal. Everyone belonged legally to an “estate” or “order” of society. The First Estate was the clergy, the Second Estate was the nobility, and the Third Estate included everyone else—from the wealthiest business and professional classes to the poorest peasantry and city workers. These categories were important in that the individual’s legal rights and personal prestige depended on the category to which he or she belonged. Politically, they were obsolescent; not since 1614 had the estates assembled in an Estates General of the whole kingdom, though in some provinces they had continued to meet as provincial bodies. Socially, they were obsolescent also, for the threefold division no longer corresponded to the real distribution of interest, influence, property, or productive activity among the French people.

---

#### *The church*

Conditions in the church and the position of the clergy have in the past been much exaggerated as a cause of the French Revolution. The church in France levied a tithe on all agricultural products, but so did the church in England; the French bishops often played a part in government affairs, but so did bishops in England through the House of Lords. The French bishoprics of 1789 were in reality no wealthier than those of the Church of England were found to be when investigated 40 years later. In actual numbers, in the secular atmosphere of the Age of Enlightenment, the clergy, especially the monastic orders, had greatly declined, so that by 1789 there were probably not more than 100,000 Catholic clergy of all types in the entire population. But if the importance of the clergy has been overemphasized, still it must be said that the church was deeply involved in the prevailing social system. For one thing, church bodies—bishoprics, abbeys, convents, schools, and other religious foundations—owned between 5 and 10 percent of the land of the country, which meant that collectively the church was the greatest of all landowners. Moreover, the income from church properties, like all income, was divided very unequally, and much of it found its way into the hands of the aristocratic occupants of the higher ecclesiastical offices.

This image of French peasants shows how farmers prepared their fields and planted seeds during the 1760s, when the picture was published in a French book. The agrarian system shaped property rights and social hierarchies as well as the supply of food in French cities—all of which created resentments or fears that contributed to the coming of the French Revolution.

(Ann Ronan Picture Library/HIP/  
The Image Works)

The noble order, which in 1789 comprised about 400,000 persons, including women and children, had enjoyed a great resurgence since the death of Louis XIV in 1715. Distinguished government service, higher church offices, army, parlements, and most other public and semipublic honors were almost monopolized by the nobility in the time of Louis XVI, who, it will be recalled, had mounted the throne in 1774. Repeatedly, through parlements, Provincial Estates, or the assembly of the clergy dominated by the noble bishops, the aristocracy had blocked royal plans for taxation and shown a desire to control the policies of state. At the same time the bourgeoisie, or upper crust of the Third Estate, had never been so influential. Although the “bourgeoisie” was an amorphous social category (indeed, some historians argue that “bourgeois” refers to a class that never had a real social identity), the number of French merchants, lawyers, and other professional groups clearly grew over the course of the eighteenth century. The fivefold increase of French foreign trade between 1713 and 1789 suggests the growth of the merchant class and of the legal and governmental classes associated with it. As members of the bourgeoisie became stronger, more widely read, and more self-confident, they resented the distinctions enjoyed by the nobles. Some of these were financial: nobles were exempt on principle from the most important direct tax, the *taille*, whereas bourgeois obtained exemption with more effort; but so many bourgeois enjoyed tax privileges that purely monetary self-interest was not

---

*The nobility*

primary in their psychology. The bourgeois resented the nobleman for his superiority and his arrogance. What had formerly been customary respect was now felt as humiliation. And they felt that they were being shut out from office and honors and that the nobles were seeking more power in government as a class. The Revolution thus began in the social and political collision of two moving objects, a rising aristocracy and a rising bourgeoisie.

---

#### *The Third Estate*

The common people, below the commercial and professional families in the Third Estate, were probably as well off as in most countries. But they were not well off compared with the upper classes. Wage earners had by no means shared in the wave of business prosperity. Between the 1730s and the 1780s the prices of consumers' goods rose about 65 percent, whereas wages rose only 22 percent. Persons dependent on wages were therefore badly pinched, but they were less numerous than today, for in the country there were many small farmers and in the towns many small craftsmen who made a living not by wages but by selling the product of their own labor at market prices. Yet in both town and country there was a significant wage-earning population, which was to play a decisive part in the Revolution.

#### *The Agrarian System of the Old Regime*

Over four-fifths of the people were rural. The agrarian system had developed so that there was no serfdom in France as it was known in eastern Europe. The peasant owed no labor to the lord—except a few token services in some cases. The peasants worked for themselves, either on their own land or on rented land; or they worked as sharecroppers (*métayers*); or they hired themselves out to the lord or to another peasant.

---

#### *Survival of feudal privileges*

The manor, however, still retained certain surviving features of the feudal age. The noble owner of a manor enjoyed “hunting rights,” or the privilege of keeping game preserves and of hunting on his own and the peasants' land. He usually had a monopoly over the village mill, bakeshop, or wine press, for the use of which he collected fees called *banalités*. He possessed certain vestigial powers of jurisdiction in the manorial court and certain local police powers, from which fees and fines were collected. These seigneurial privileges were of course the survivals of a day when the local manor had been a unit of government and the noble had performed the functions of government, an age that had long passed with the development of the centralized modern state.

There was another special feature to the property system of the Old Regime. Every owner of a manor (there were some bourgeois and even wealthy peasants who had purchased manors) possessed what was called a right of “*eminent property*” with respect to all land located in the manorial village. This meant that lesser landowners within the manor “owned” their land in that they could freely buy, sell, lease, and inherit or bequeath it; but they owed to the owner of the manor, in recognition of his “*eminent property*” rights, certain rents, payable annually, as well as transfer fees that were payable whenever the land changed owners by sale or death. Subject to these “*eminent property*” rights, landownership was fairly widespread. Peasants directly owned about two-fifths of the soil of the country; bourgeois, a little under a fifth. The nobility owned perhaps a little over a fifth and the church owned somewhat under a tenth, the remainder being crown lands, wastelands, or commons. Finally, all property rights were subject also to certain “collective” rights by

which villagers might cut firewood, run their pigs in the commons, or pasture cattle on land belonging to other owners after the crops were in, which they could easily do because there were usually no fences or enclosures.

All this may seem rather complex, but it is important to realize that property is a changing institution. Even today, in industrialized countries, a high proportion of all property is in land, including natural resources in and below the soil. In the eighteenth century property meant land even more than it does today. The bourgeois class, whose wealth was so largely in ships, merchandise, or commercial paper, also invested heavily in land, and in 1789 they owned almost as much land in France as the nobility and more than the church. The Revolution was to revolutionize the law of property by freeing the private ownership of land from all the indirect encumbrances described—manorial fees, “eminent property” rights, communal village agricultural practices, and church tithes. It also was to abolish other older forms of property, such as property in public office or in masterships in the guilds, which had worked to the advantage mainly of closed and privileged groups. In final effect the Revolution defined and established the institutions of private property in the modern sense and therefore mostly benefited the landowning peasants and the bourgeoisie.

The peasants not only owned two-fifths of the soil but also worked almost all of it on their own initiative and risk. In effect, the land owned by the nobility, the church, the bourgeoisie, and the crown was divided up and leased to peasants in small parcels. France was already a country of small farmers. There was no “big agriculture” as in England, eastern Europe, or the plantations of America. The manorial lord performed no economic function. He lived (there were of course exceptions) not by managing an estate and selling his own crops and cattle but by receiving innumerable dues and fees. During the eighteenth century, in connection with the general aristocratic resurgence, there took place a phenomenon often called the “feudal reaction.” Manorial lords, faced with rising living costs and acquiring higher living standards because of the general material progress, collected their dues more rigorously or revived old ones that had fallen into disuse. Leases and sharecropping arrangements also became less favorable to the peasants. The farmers, like the wage earners, were under a steadily increasing pressure. At the same time the peasants resented the “feudal dues” more than ever because they regarded themselves as in many cases the real owners of the land and viewed the lord as a gentleman of the neighborhood who for no reason enjoyed a special income and a status different from their own. The trouble was that much of the property system no longer bore any relation to real economic usefulness or activity.

---

The “feudal reaction”

The political unity of France, achieved over the centuries by the monarchy, was likewise a fundamental prerequisite, and even a cause, of the Revolution. Whatever social conditions might have existed, they could give rise to nationwide public opinion, nationwide agitation, nationwide policies, and nationwide legislation only in a country already politically unified as a nation. These conditions were lacking in central Europe. In France a centralized French state existed. Reformers did not have to create it but only capture and remodel it. The French in the eighteenth century already had the sense of membership in a political entity called France. The Revolution saw a tremendous stirring of this sense of membership and of fraternity, turning it into a passion for citizenship, civic rights, voting powers, and the use of the state and its sovereignty for the public advantage. At the very outbreak of the Revolution people saluted each other as *citoyen* or *citoyenne* and shouted *vive la nation!*

*Political Culture and Public Opinion after 1770**The Revolution and the Enlightenment*

The social and economic resentments that existed among ambitious people in French cities and among peasants in the French countryside could finally explode in a revolutionary upheaval because eighteenth-century writers had created a culture that encouraged political and social criticism. Educated persons in the Third Estate could draw on Enlightenment conceptions of reason, natural rights, and historical progress to complain about the irrationality of ancient privileges or the injustice of noble prerogatives. Enlightenment thought provided a language in which people could now describe their dissatisfactions with the obstacles that stymied professional or economic ambitions.

It has been argued that the famous works of the French philosophes led directly to the revolutionary events of 1789; it was the “fault” of Voltaire, critics explained; it was the “fault” of Rousseau. Many who supported the Revolution also made such claims for its intellectual origins, so that the history of the French Revolution has always been linked in complex ways with the legacy of the Enlightenment. Yet most historians now argue that the connections between the philosophes and the Revolution were by no means as direct as people once imagined. The philosophes themselves favored enlightened social reforms, but they were not revolutionaries and, except perhaps for Rousseau, they rarely promoted the political rights of the lower classes. Their most important publications, including the famous *Encyclopédie*, often attracted more readers among the nobility than among the middle classes. Political theory was far less popular than novels or social satires; there was an enormous audience for Rousseau’s *Nouvelle Héloïse*, for example, but few persons read the *Social Contract*. The notion that great Enlightenment writers “caused” the French Revolution is therefore an inadequate explanation for what happened (much as claims that bourgeois economic interests “caused” the Revolution are also inadequate). It is nevertheless true that the Enlightenment contributed widely to new forms of criticism, public debate, and “public opinion,” most of which challenged the traditional authority of the French king and nobles.

*Critical spirit*

The last two decades of the Old Regime were filled with intense political controversy as the monarchy sought unsuccessfully to suppress the traditional French parlements, as successive ministries sought to raise new revenues, as French journals reported on the new American state constitutions, and as pamphleteers increasingly attacked the officials and courtiers at Versailles. The critical spirit that had developed in salons, coffeehouses, and literary arguments spread rapidly into a developing public sphere of political debate. The new political pamphlets were scarcely concerned with the subtle nuances of political theory; in fact, many consisted of little more than scandalous rumors of sexual misconduct or financial corruption in the affairs of the royal family and government ministries. Stories of corruption in high places stripped away the once sacred image of the monarchy, the church, and the social hierarchy. At the same time, the reading public developed an interest in scandalous legal cases that pitted members of the aristocracy against aggrieved persons of the Third Estate or that revealed immorality and decadence among ancient noble families. Lawyers could publish their legal briefs without securing the approval of government censors, and, using this freedom, they bolstered their legal arguments with appeals to popular sentiment or natural rights. The injustice of inherited privilege thus became a recurring theme in the scandalous stories of social and personal disputes that French lawyers carried from French courtrooms to the tribunal of “public opinion.”

By 1789, in France, educated persons in all social classes were coming to believe what Voltaire had said after the famous Calas Affair in the 1760s: “Opinion governs the

world." Campaigns to influence public opinion became a powerful political force in French society during the last decades of the Old Regime, and most such campaigns appealed for public support in the name of reason, rights, or justice. In these ways, the critical thought of Enlightenment culture entered into bitter political conflicts that led finally and unexpectedly to the Revolution.

## 42. THE REVOLUTION AND THE REORGANIZATION OF FRANCE

### *The Financial Crisis*

The Revolution was precipitated by a financial collapse of the government. What overburdened the government was by no means the costly magnificence of the court of Versailles. Only five percent of public expenditures in 1788 was devoted to the upkeep of the entire royal establishment. What overburdened all governments was war costs, both current upkeep of armies and navies and the burden of public debt, which in all countries was due almost totally to the war costs of the past. In 1788 the French government devoted about a quarter of its annual expenditure to maintenance of the armed forces and about half to the payment of its debts. British expenditures showed almost the same distribution. The French debt stood at almost four billion livres. It had been greatly swollen by the War of American Independence. Yet it was only half as great as the national debt of Great Britain, and less than a fifth as heavy per capita. It was less than the debt of the Dutch Republic. It was apparently no greater than the debt left by Louis XIV three-quarters of a century before. At that time the debt had been lightened by repudiation. No responsible French official in the 1780s even considered repudiation, a sure sign of the progress in the interim of the well-to-do classes, who were the main government creditors.

Yet the debt could not be carried, for the simple reason that revenues fell short of necessary expenditures. This in turn was not due to national poverty but to the tax exemptions and tax evasions of privileged elements and to complications in the fiscal system, or lack of system, by which much of what taxpayers paid never came into the hands of the Treasury. We have already described how the most important tax, the *taille*, was generally paid only by the peasants—the nobles being exempt by virtue of their class privilege, and office holders and bourgeois obtaining exemption in various ways. The church too insisted that its property was not taxable by the state; and its periodic “free gift” to the king, though substantial, was less than might have been obtained from direct taxation of the church’s land. Thus, although the country itself was prosperous, the government treasury was empty. The social classes which enjoyed most of the wealth of the country did not pay taxes corresponding to their income—and, even worse, they resisted taxation as a sign of inferior status.

A long series of responsible persons—Louis XIV himself, John Law, Maupeou, Turgot—had seen the need for taxing the privileged classes. Jacques Necker, a Swiss banker made director of the finances in 1777 by Louis XVI, made moves in the same direction and, like his predecessors, was dismissed. His successor, Calonne, as the crisis mounted, came to even more revolutionary conclusions. In 1786 he produced a program in which enlightened despotism was tempered by a modest resort to representative institutions. He proposed, in place of the *taille*, a general tax to fall on all landowners without exemption.

a refusal  
by any  
to pay  
debt

Nobles  
evade taxes  
Problems of taxation  
Country was not  
poor

a lightening of indirect taxes and abolition of internal tariffs to stimulate economic production, and a confiscation of some properties of the church. He also sought to give the propertied elements a greater interest in the government by proposing the establishment of provincial assemblies in which all landowners should be represented without regard to estate or order.

Calonne's program, if carried out, might have solved the fiscal problem and averted the Revolution. But it struck not only at privileges in taxation—noble, provincial, and others—but also at the threefold hierarchic organization of society. Knowing from experience that the Parlement of Paris would never accept it, Calonne in 1787 convened an “assembly of notables,” hoping to win its endorsement of his ideas. The notables insisted on concessions in return, for they wished to share in control of the government. A deadlock followed; the king dismissed Calonne and appointed as his successor Loménie de Brienne, the exceedingly worldly-wise archbishop of Toulouse. Brienne tried to push the same program through the Parlement of Paris. The Parlement rejected it, declaring that only the three estates of the realm, assembled in an Estates General, had authority to consent to new taxes. Brienne and Louis XVI at first refused, believing that the Estates General, if convened, would be dominated by the nobility. Like Maupeou and Louis XV, Brienne and Louis XVI tried to break the parlements, replacing them with a modernized judicial system in which the law courts should have no influence over policy. This led to a veritable revolt of the nobles. All the parlements and Provincial Estates resisted; army officers refused to serve; the intendants hesitated to act; and noblemen began to organize political clubs and committees of correspondence. With his government brought to a standstill and unable to borrow money or collect taxes, Louis XVI on July 5, 1788, promised to call the Estates General for the following May. The various classes were invited to elect representatives and also to draw up lists of their grievances.

---

Resistance of the nobles

### *From Estates General to National Assembly*

Since no Estates General had met in over a century and a half, the king asked for proposals on how such an assembly should be organized under modern conditions. This led to an outburst of public discussion, which soon expanded far beyond all previous campaigns to influence public opinion. Hundreds of political pamphlets appeared, many of them demanding a change in the old system by which the three estates sat in separate chambers, each chamber voting as a unit. This voting system was widely criticized because it meant, in practice, that the chamber of the Third Estate was always outnumbered. But in September 1788 the Parlement of Paris, restored to its functions, ruled that the Estates General should meet and vote as in 1614, in three separate orders.

---

The aims of the nobility

The nobility, through the Parlement, thus revealed its aim. It had forced the summoning of the Estates General, and in this way the French nobility initiated the Revolution. The Revolution began as another victory in the aristocratic resurgence against the absolutism of the king. The nobles actually had a liberal program: they demanded constitutional government, guarantees of personal liberty for all, freedom of speech and press, freedom from arbitrary arrest and confinement. Many now were even prepared to give up special privileges in taxation; this might have worked itself out in time. But in return they hoped to become the preponderant political element in the state. It was their idea not merely to have the Estates General meet in 1789 but for France to be henceforth governed through the Estates General, a supreme

body in three chambers—one for nobles, one for a clergy in which the higher officers were also nobles, and one for the Third Estate.

This was precisely what the Third Estate wished to avoid. Lawyers, bankers, business owners, government creditors, shopkeepers, artisans, working people, and peasants had no desire to be governed by lords temporal and spiritual. Their hopes of a new era, formed by the philosophy of the Enlightenment, stirred by the revolution in America, rose to the utmost excitement when “good king Louis” called the Estates General. The ruling of the Parlement of Paris in September 1788 came to them as a slap in the face—an unprovoked class insult. The whole Third Estate turned on the nobility with detestation and distrust. The Abbé Sieyès in January 1789 launched his famous pamphlet *What Is the Third Estate?*, declaring that the nobility was a useless caste which could be abolished without loss, that the Third Estate was the one necessary element of society, that it was identical with the nation, and that the nation was absolutely and unqualifiedly sovereign. Through Sieyès the ideas of Rousseau’s *Social Contract* entered the thought of the Revolution. At the same time, even before the Estates General actually met, and not from the books of philosophes so much as from actual events and conditions, nobles and commoners viewed each other with fear and suspicion. The Third Estate, which had at first supported the nobles against the “despotism” of the king’s ministers, now ascribed to the former the worst possible motives. Bourgeois critics vehemently rejected the political program and ambitions of the nobility. Class antagonism poisoned the Revolution at the outset, made peaceful reform impossible, and threw many bourgeois without delay into a radical and destructive mood.

---

The Third Estate  
reacts

The Estates General met as planned in May 1789 at Versailles. The Third Estate, most of whose representatives were lawyers, would not accept the division of the orders into three separate chambers. It insisted that deputies of all three orders should sit as a single house and vote as individuals; this procedure would be of advantage to the Third Estate, since the king had granted it as many deputies as the other two orders combined. For six weeks a deadlock was maintained. On June 13 a few priests, leaving the chamber of the First Estate, came over and sat with the Third. They were greeted with jubilation. On June 17 the Third Estate declared itself the “National Assembly.” Louis XVI, under pressure from the nobles, closed the hall in which it met. The members found a neighboring indoor tennis court and there, milling about in a babel of confusion and apprehension, swore and signed the Oath of the Tennis Court on June 20, 1789, affirming that wherever they foregathered the National Assembly was in existence and that they would not disband until they had drafted a constitution. This was a revolutionary step, for it assumed virtually sovereign power for a body that had no legal authority. The king ordered members of the three estates to sit in their separate houses. He now somewhat tardily presented a reforming program of his own, too late to win the confidence of the disaffected and in any case continuing the organization of French society in legal classes. The self-entitled National Assembly refused to back down. The king faltered, failed to enforce his commands promptly, and allowed the Assembly to remain in being. In the following days, at the end of June, he summoned about 18,000 soldiers to Versailles.

What had happened was that the king of France, in the dispute raging between nobles and commoners, chose the nobles. It was traditional in France for the king to oppose feudalism. For centuries the French monarchy had drawn strength from the bourgeoisie. All through the eighteenth century the royal ministers had carried on the struggle against the privileged interests. Only a year before Louis XVI had been almost at war with his rebellious aristocracy. In 1789 he failed to assert himself. He lost control

OUVERTURE DES ÉTATS GÉNÉRAUX  
(D'après C. Monet.)

Convoked for the first time in 175 years, the Estates General met in a large hall at Versailles in May 1789. This picture shows Louis XVI seated on his throne, with deputies of the clergy seated on his right, those of the nobility on his left, and those of the Third Estate facing him at the other end of the hall.

(Culver Pictures)

over the Estates General, exerted no leadership, offered no program until it was too late, and provided no symbol behind which parties could rally. He failed to make use of the profound loyalty to himself felt by the bourgeoisie and common people, who yearned for nothing so much as a king who would stand up for them, as in days of yore, against an aristocracy of birth and status. He tried instead, at first, to compromise and postpone a crisis; then he found himself in the position of having issued orders which the Third Estate boldly defied; and in this embarrassing predicament he yielded to his wife Marie Antoinette, to his brothers, and to the court nobles with whom he lived and who told him that his dignity and authority were outraged and undermined. At the end of June Louis XVI undoubtedly intended to dissolve the Estates General by military force. But what the Third Estate most feared was not a return to the old theoretically absolute monarchy. It was a future in which the aristocracy should control the government of the country. There was now no going back; the revolt of the Third Estate had allied Louis XVI with the nobles, and the Third Estate now feared the nobles more than ever, believing with good reason that they now had the king in their hands.

Failure of royal  
leadership

### *The Lower Classes in Action*

The country meanwhile was falling into dissolution. The lower classes, below the bourgeoisie, were out of hand. For them too the convocation of the Estates General had seemed to herald a new era. The grievances of ages, and those which existed equally in other countries than France, rose to the surface. Short-run conditions were bad. The harvest of 1788 had been poor; the price of bread, by July 1789, was higher than at any time since the death of Louis XIV. The year 1789 was also one of depression; the rapid growth of trade since the American war had suddenly halted, so that wages fell and unemployment spread while scarcity drove food prices up. The government, paralyzed at the center, could not take such measures of relief as were customary under the Old Regime. The masses were everywhere restless. Labor trouble broke out; in April a riot of workers devastated a wallpaper factory in Paris. In the rural districts there was much disorder. Peasants declared that they would pay no more manorial dues and were refusing to pay taxes. In the best of times the countryside was troubled by vagrants, beggars, and smugglers who flourished along the many tariff frontiers. Now the business depression reduced the income of honest peasants who engaged in weaving or other domestic industries in their homes; unemployment and indigence spread in the country; people were uprooted; and the result was to raise the number of vagrants to terrifying proportions. It was believed, since nothing was too bad to believe of the aristocrats (though it was not true), that they were secretly recruiting these "brigands" for their own purposes to intimidate the Third Estate. The economic and social crises thus became acutely political.

The towns were afraid of being swamped by beggars and desperadoes. This was true even of Paris, the largest city in Europe except London. The Parisians were also alarmed by the concentration of troops about Versailles. They began to arm in self-defense. All classes of the Third Estate took part. Crowds began to look for weapons in arsenals and public buildings. On July 14 they came to the Bastille, a stronghold built in the Middle Ages to overawe the city, like the Tower of London in England. It was used as a place of detention for persons with enough influence to escape the common jails but was otherwise in normal times considered harmless; in fact there had been talk, some years before, of tearing it down to make room for a public park. Now, in the general turbulence, the governor had placed cannon in the embrasures. The crowd requested him to remove his cannon and to furnish them with arms. He refused. Through a series of misunderstandings, reinforced by the vehemence of a few firebrands, the crowd turned into a mob, which assaulted the fortress and which, when helped by a handful of trained soldiers and five artillery pieces, persuaded the governor to surrender. The mob, enraged by the death of 98 of its members, streamed in and murdered six soldiers of the garrison in cold blood. The governor was murdered while under escort to the Town Hall. A few other officials met the same fate. Their heads were cut off, stuck on the ends of pikes, and paraded about the city. While all this happened, the regular army units on the outskirts of Paris did not stir; their reliability was open to question and the authorities were in any case unaccustomed to firing on the people.

*The storming of the Bastille*

The capture of the Bastille, though not so intended, had the effect of saving the Assembly at Versailles. The king, not knowing what to do, accepted the new situation in Paris. He recognized a citizens' committee, which had formed there, as the new municipal government. He sent away the troops that he had summoned and commanded the royalists among nobles and clergy to join in the National Assembly. In Paris and other cities a

### THE TENNIS COURT OATH

by Jacques-Louis David (French, 1748–1825)

This famous picture portrays the momentous decision by members of the Third Estate to continue meeting as the National Assembly of France until they had written a new constitution. The deputies swore their oath at an indoor tennis court because the king had closed the hall in which they had been holding their sessions.

(Giraudon/Art Resource, NY)

bourgeois or national guard was established to keep order. The Assembly appointed the Marquis de Lafayette “the hero of two worlds,” to command the guard in Paris. For insignia he combined the colors of the city of Paris, red and blue, with the white of the house of Bourbon. The French tricolor, emblem of the Revolution, thus originated in a fusion of old and new.

The Great Fear of  
1789

In the rural districts matters went from bad to worse. Vague insecurity rose to the proportions of panic in the Great Fear of 1789 which spread over the country late in July in the wake of travelers, postal couriers, and others. The cry was relayed from point to point that “the brigands were coming.” Peasants, armed to protect their homes and crops and gathered together and working upon each other’s feelings, turned their attention to the manor houses, burning them in some cases and in others simply destroying the manorial archives in which fees and dues were recorded. The Great Fear became part of a general agrarian insurrection in which peasants, far from being motivated by wild alarms, knew perfectly well what they were doing. They intended to destroy the manorial regime by force.

## *The Initial Reforms of the National Assembly*

The Assembly at Versailles could restore order only by meeting the demands of the peasants. To wipe out all manorial payments would deprive the landed aristocracy of much of its income. Many bourgeois also owned manors. There was therefore much perplexity. A small group of deputies prepared a surprise move in the Assembly, choosing an evening session from which many would be absent. Hence came the “night of August 4.” A few liberal noblemen, by prearrangement, arose and surrendered their hunting rights, their *banalités*, their rights in manorial courts, and feudal and seigneurial privileges generally. What was left of serfdom and all personal servitude was declared ended. Tithes were abolished. Other deputies repudiated the special privileges of their provinces. All personal tax privileges were given up. On the main matter, the dues arising from “*eminent property*” in the manors, a compromise was adopted. These dues were all abolished but compensation was to be paid by the peasants to the former owners. The compensation was in most cases never paid. Eventually, in 1793, in the radical phase of the Revolution, the provision for compensation was repealed. In the end French peasant landowners rid themselves of their manorial obligations without cost to themselves. This was in contrast to what later happened in most other countries, where peasants, when liberated from manorial obligations, either lost part of their land or were burdened with installment payments lasting many years.

In a decree summarizing the resolutions of August 4 the Assembly declared flatly that “feudalism is abolished.” With legal privilege replaced by legal equality, it proceeded to map the principles of the new order. On August 26, 1789, it issued the Declaration of the Rights of Man and Citizen.

The Declaration of 1789 was meant to affirm the principles of the new state, which were essentially the rule of law, equal individual citizenship, and collective sovereignty of the people. “Men are born and remain,” declared Article I, “free and equal in rights.” Man’s natural rights were held to be “liberty, property, security, and resistance to oppression.” Freedom of thought and religion was guaranteed; no one might be arrested or punished except by process of law; all persons were declared eligible for any public office for which they met the requirements. Liberty was defined as the freedom to do anything not injurious to others, which in turn was to be determined only by law. Law must fall equally upon all persons. Law was the expression of the general will, to be made by all citizens or their representatives. The only sovereign was the nation itself, and all public officials and armed forces acted only in its name. Taxes might be raised only by common consent, all public servants were accountable for their conduct in office, and the powers of government were to be separated among different branches. Finally, the state might for public purposes, and under law, confiscate the property of private persons, but only with fair compensation. The Declaration, printed in thousands of leaflets, pamphlets, and books, read aloud in public places, or framed and hung on walls, became the catechism of the Revolution in France. When translated into other languages it soon carried the same message to all of Europe. Thomas Paine’s book *The Rights of Man*, published in 1791 to defend the French Revolution, gave the phrase a powerful impact in English.

---

*The Declaration of  
the Rights of Man  
and Citizen*

The “rights of man” had become a motto or watchword for potentially revolutionary ideas well before 1789. The thinkers of the Enlightenment had used it, and during the American Revolution even Alexander Hamilton had spoken of “the sacred rights of man” with enthusiasm. “Man” in this sense was meant to apply abstractly, regardless of nationality, race, or sex. In French as in English the word “man” was used to designate all human beings, and the Declaration of 1789 was not intended to refer to males alone. In German,

The capture of the Bastille—the prison-fortress that became a symbol of Old Regime repression—marked the dramatic entry of the Parisian crowd into the rapidly evolving Revolution. Violence in the streets of Paris in July 1789 saved the National Assembly from the king’s intention to dissolve it.

(Bibliothèque Nationale de France, Paris)

for example, where a distinction is made between *Mensch* as a human being and *Mann* as an adult male, the “rights of man” was always translated as *Menschenrechte*. Similarly the word “citizen” in its general sense applied to women, as is shown by the frequency of the feminine *citoyenne* during the Revolution, in which a great many women were very active. But when it came to the exercise of specific legal rights the Revolutionaries went no farther than contemporary opinion. Thus they assigned the right to vote and hold office only to men, and in most matters of property, family law, and education it was the boys and men, who benefited most. Very few persons at the time argued for legal equality between the sexes.

The Rights of  
Woman

One of them, however, was Olympe de Gouges, a woman who had gained prominence as a writer for the theater and who in 1791 published *The Rights of Woman*. Following the official Declaration in each of its 17 articles, she applied them to women explicitly in each case, and she asserted also, in addition, the right of women to divorce under certain conditions, to the control of property in marriage, and for equal access with men to higher education and to civilian careers and public employment. Mary Wollstonecraft in England published a similar *Vindication of the Rights of Woman* in 1792. In France some of the secondary figures in the Revolution, and

some of the teachers in boys' schools, thought that women should have greater opportunities at least in education. And there were in fact a few reforms that improved the social rights of women. The revolutionary government redefined marriage as a civil contract and legalized divorce in 1792, thereby enabling women to leave abusive or unhappy marriages (until divorce was banned again in 1816). Inheritance laws were also changed in ways that gave women the legal right to equal inheritance of their family's property.

But among the leaders of the Revolution, only Condorcet argued for legal equality of the sexes. Intent on political change, the Revolutionaries thought that politics, government, law, and war were a masculine business, for which only boys and young men needed to be educated or prepared. The Revolution generally reduced or restricted the cultural and political influence that some women had exercised in the elite circles of Old Regime society. The new political order, as most revolutionaries defined it, was to develop through "manly" opposition to the "feminine" corruptions of the Old Regime court and social hierarchies. "Women are disposed . . . to an over-excitation which would be deadly in public affairs," one revolutionary deputy argued in a typical justification for excluding women from government institutions. Such assumptions led to restrictions on the rights of women to petition or gather in political meetings; finally, in 1793, the revolutionary government closed all women's political clubs.

Shortly after adoption of the Declaration of the Rights of Man the Revolutionary leadership fell apart. In September 1789 the Assembly began the actual planning of the new government. Some wanted a strong veto power for the king and a legislative body in two houses, as in England. Others, the "patriots," wanted only a delaying veto for the king and a legislative body of one chamber. Here again, it was suspicion of the aristocracy that proved decisive. The "patriots" were afraid that an upper chamber would bring back the nobility as a collective force, and they were afraid to make the king constitutionally strong by giving him a full veto, because they believed him to be in sympathy with the nobles. He was, at the moment, hesitating to accept both the August 4th decrees and the Declaration of Rights. His brother, the Count of Artois, followed by many aristocrats, had already emigrated to foreign parts and, along with these other émigrés, was preparing to agitate against the Revolution with all the governments of Europe. The patriot party would concede nothing; the more conservative party could gain nothing. The debate was interrupted again, as in July, by insurrection and violence. On October 4, a crowd of market women and revolutionary militants, followed by the revolutionary Paris national guard, took the road from Paris to Versailles. Besieging and invading the château, they obliged Louis XVI to take up his residence in Paris, where he could be watched. The National Assembly also shifted itself to Paris, where it too soon fell under the influence of radical elements in the city. The champions of a one-chamber legislative body and of a suspensive veto for the king won out.

The more conservative revolutionaries, if such they may be called, disillusioned at seeing constitutional questions settled by mobs, began to drop out of the Assembly. Men who on June 20 had bravely sworn the Oath of the Tennis Court now felt that the Revolution was falling into unworthy hands. Some even emigrated, forming a second wave of émigrés that would have nothing to do with the first. The counterrevolution gathered strength.

But those who wanted still to go forward, and they were many, began to organize in clubs. Most important of all was the Society of Friends of the Constitution, called the Jacobin club for short, since it met in an old Jacobin monastery in Paris. The dues were at first so high that only substantial bourgeois belonged; the dues were later lowered but never enough to include persons of the poorest classes, who therefore formed clubs of their own. The most advanced members of the Assembly were Jacobins, who used the club as a caucus in which to discuss their policies and

lay their plans. They remained a middle-class group even during the later and more radical phase of the Revolution. Madame Rosalie Jullien, for example, who was as dedicated a revolutionary as her husband and son, attended a meeting of the Paris Jacobin club on August 5, 1792. Tell your friends in the provinces, she wrote to her husband, that these Jacobins are “the flower of the Paris bourgeoisie, to judge by the fancy jackets they wear. There were also two or three hundred women present, dressed as if for the theater, who made an impression by their proud attitude and forceful speech.”

### *Constitutional Changes*

In the two years from October 1789 to September 1791 the National Assembly (or the Constituent Assembly, as it had come to be called because it was preparing a constitution) continued its work of simultaneously governing the country, devising a written constitution, and destroying in detail the institutions of the Old Regime. The Assembly soon discarded most of the political and legal institutions that had governed French affairs for centuries—the old monarchical ministries, the organization of government bureaus, the taxes, the property in office, the titles of nobility, the parlements, the hundreds of regional systems of law, the internal tariffs, the provinces, and the urban municipalities. Contemporaries, like Edmund Burke, were appalled at the thoroughness with which the French seemed determined to eradicate their national institutions. Why, asked Burke, should the French fanatics cut to pieces the living body of Normandy or Provence? The truth is that the provinces, like everything else, formed part of the whole system of special privilege and unequal rights. All had to disappear if the hope of equal citizenship under national sovereignty was to be attained. In place of the provinces the Constituent Assembly divided France into 83 equal “departments.” In place of the old towns, with their quaint old magistrates, it introduced a uniform municipal organization, all towns henceforth having the same form of government, varying only according to size. All local officials, even prosecuting attorneys and tax collectors, were elected locally. Administratively the country was decentralized in reaction against the bureaucracy of the Old Regime. No one outside Paris now really acted for the central government, and local communities enforced the national legislation, or declined to enforce it, as they chose. This proved ruinous when the war came, and although the “departments” created by the Constituent Assembly still exist, it became traditional in France after the Revolution, as it was before, to keep local officials under strong control by ministers in Paris.

Under the constitution that was prepared, sometimes called the Constitution of 1791 because it went into effect at that date, the sovereign power of the nation was to be exercised by a unicameral elected assembly called the Legislative Assembly. The king was given only a suspensive veto power by which legislation desired by the Assembly could be postponed. In general, the executive branch, that is, king and ministers, was kept weak, partly in reaction against “ministerial despotism,” partly from a well-founded distrust of Louis XVI.

In June 1791 Louis attempted to escape from the kingdom, join with émigré noblemen, and seek help from foreign powers. He left behind him a written message in which he explicitly repudiated the Revolution. Arrested at Varennes in eastern France, he was brought back to Paris and forced to accept his status as a constitutional monarch. The hostile attitude of Louis XVI greatly disoriented the Revolution, for it made impossible the creation of a strong executive power and left the country to be ruled by a debating society which under revolutionary conditions contained more than the usual number of hotheads.

Not all this machinery of state was democratic. As noted above, women did not receive the right to vote or hold public office; and in the granting of political rights to men

The three men at an anvil are a noble, a cleric, and a commoner hammering out a new constitution together. At the beginning of the Revolution, most people expected the three estates to fraternize in the redefined French nation.

(Bibliothèque Nationale de France, Paris)

the abstract principles of the great Declaration were **seriously modified for practical reasons**. Since most **people were illiterate, it was thought that they could have no reasonable political views**. Since the small man was often a domestic servant or shop assistant, it was assumed that in politics he would merely follow the views of his employer. **The Constituent Assembly therefore distinguished in the new constitution between “active” and “passive” citizens**. Both had the same civil rights, but **only active citizens had the right to vote**. These active citizens chose “electors” on the basis of one elector for every hundred active citizens. The electors convened in the chief town of their new “department” and there chose deputies to the national legislature as well as certain local officials. **Males over 25 years of age, and wealthy enough to pay a small direct tax, qualified as “active” citizens; well over half the adult male population could so qualify.** Of these, men paying a somewhat higher tax qualified as “electors”; even so, almost half the adult males qualified for this role. In practice, what limited the number of **available electors** was that, to function as such, **a man had to have enough education, interest, and leisure to attend an electoral assembly at a distance from home and remain in attendance for several days**. In any case, only about 50,000 persons served as electors in 1790–1791 because a proportion of one for every hundred active citizens yielded that figure.

### *Economic and Cultural Policies*

**Economic policies favored the middle rather than the lowest classes.** The public debt had precipitated the Revolution, but the revolutionary leaders, even the most extreme Jacobins, never disowned the debt of the Old Regime. The reason is that the bourgeois class, on the whole, were the people to whom the money was owed. To secure the debt, and to pay current expenses of government, since tax collections had become very sporadic, the Constituent Assembly as early as November 1789 resorted to a device by no means new in Europe, though never before used on so extensive a scale. **It confiscated all the property of the church.** Against this property, **it issued negotiable instruments**

gov't issued

## Assignats

called *assignats*, first regarded as bonds and issued only in large denominations, later regarded as currency and issued in small bills. Holders of *assignats* could use them, or any money, to buy parcels of the former church lands. None of the confiscated land was given away; all was in fact sold, since the interest of the government was fiscal rather than social. The peasants, even when they had the money, could not easily buy land because the lands were sold at distant auctions or in large undivided blocks. The peasants were disgruntled, though they did acquire a good deal of the former church lands through middlemen. Peasant landowners were likewise expected, until 1793, to pay compensation for many of their old manorial fees. And the landless peasants were aroused when the government, with its modern ideas, encouraged the dividing up of the village commons and extinction of various collective village rights in the interest of individual private property.

The revolutionary leadership favored free economic individualism. It had had enough, under the Old Regime, of government regulation over the sale or quality of goods and of privileged companies and other economic monopolies. Reforming economic thought at the time in France and in Britain, where Adam Smith had published his epoch-making *Wealth of Nations* in 1776, held that organized special interests were bad for society and that all prices and wages should be determined by free arrangement between the individuals concerned. The more prominent leaders of the French Revolution believed firmly in this freedom from control. The Constituent Assembly thus abolished the guilds, which were mainly monopolistic organizations of small businessmen or master craftsmen, interested in keeping up prices and averse to new machinery or new methods.

There was also in France what we would now call an organized labor movement. Since the masterships in the guilds were practically hereditary (as a form of property and privilege), the journeymen had formed their own associations, or trade unions, called *compagnonnages*, outside the guilds. Many trades were so organized—the carpenters, plasterers, paper workers, hatters, saddlers, cutlers, nail makers, carters, tanners, locksmiths, and glassworkers. Some were organized nationally; some, only locally. All these journeymen's unions had been illegal under the Old Regime, but they had flourished nevertheless. They collected dues and maintained officers. They often dealt collectively with the guild masters or other employers, requiring the payment of a stipulated wage or change of working conditions. Sometimes they even imposed closed shops. Organized strikes were quite common. The labor troubles of 1789 continued on into the Revolution. Business fell off in the

## Banning labor organizations

atmosphere of disorder. In 1791 there was another wave of strikes. The Assembly, in the Le Chapelier law of that year, renewed the old prohibitions of the *compagnonnages*. The same law restated the abolition of the guilds and forbade the organization of special economic interests of any kind. All trades, it declared, were free for all to enter. All persons, without belonging to any organization, had the right to work at any occupation or business they might choose. All wages were to be settled privately by the worker and his or her employer. This was not at all what the workers, at that time or any other, really wanted. Nevertheless the provisions of the Le Chapelier law remained a part of French law for three-quarters of a century. The embryonic trade unions continued to exist secretly, though with more difficulty than under the hit-and-miss law enforcement of the Old Regime.

Meanwhile, revolutionary activists set about transforming the symbols, rituals, dress, and holidays of Old Regime society. Seeking to break from the hierarchies and privileges of the past, they developed a new political culture that would be symbolized by a new flag.

The revolutionary government used paper money to finance its policies. The notes were called *assignats* because they were assigned to, or secured by, real estate confiscated during the Revolution, mostly from the church. Inflation rose rapidly after 1794, so that even notes with denominations as high as 10,000 livres, as shown in this picture, became worthless. The assignats were therefore abolished, and a new, more stable French currency came into use in 1796. (Bibliothèque Nationale de France, Paris)

new forms of democratic language, new clothing, new festivals, and new public monuments. The art and imagery of the traditional monarchy and church rapidly disappeared from public life. Great festivals of national unity were organized, beginning with the famous “Festival of the Federation,” which brought together a vast crowd in Paris to mark the first anniversary of the assault on the Bastille (July 14, 1790), to celebrate the new liberties of the French people and to begin creating rituals for what would eventually become the French national holiday.

---

*A revolutionary political culture*

Supporters of the Revolution planted “liberty trees” in towns throughout France, and they began to wear “liberty caps” and tricolor cockades to show their political allegiances. Later revolutionary governments encouraged new artwork in which the nation came to be represented by a female symbol of liberty, Marianne. Statues of Marianne offered alternatives to traditional Catholic icons of the Virgin Mary and gave illiterate persons new visual images by which they could understand that national sovereignty and liberty had replaced the king and church at the symbolic center of French political life. A profusion of revolutionary plays, novels, and songs conveyed the same message. By promoting the new political ideas and symbols in every sphere of daily life, the French Revolution created a new national identity and “nationalized” the French people through the use of cultural rituals that would later become common in other national movements of the modern world.

### *The Quarrel with the Church*

Most fatefully of all, the Constituent Assembly quarreled with the Catholic church. The confiscation of church properties naturally came as a shock to the clergy. The village priests, whose support had made possible the revolt of the Third Estate, now found that the very buildings in which they worshipped with their parishioners on Sunday belonged to the “nation.” The loss of income-producing properties undercut the religious orders and

ruined the schools, in which thousands of boys had received free education before the Revolution. Yet it was not on the question of material wealth that the church and the Revolution came to blows. Members of the Constituent Assembly took the view of the church that the great monarchies had taken before them. The idea of separation of church and state was far from their minds. They regarded the church as a form of public authority and as such subordinate to the sovereign power. They frankly argued that the poor needed religion if they were to respect the property of the more wealthy. In any case, having deprived the church of its own income, they had to provide for its maintenance. For the schools many generous and democratic projects of state-sponsored education were drawn up,

though under the troubled conditions of the time little was accomplished. For the clergy the new program was mapped out in the Civil Constitution of the Clergy of 1790.

*The Civil  
Constitution of the  
Clergy*

This document went far toward setting up a French national church. Under its provisions the parish priests and bishops were elected, the latter by the same 50,000 electors who chose other important officials. Protestants, Jews, and agnostics could legally take part in the elections, purely on the ground of citizenship and property qualifications. Archbishoprics were abolished, and all the borders of existing bishoprics were redrawn. The number of dioceses was reduced from over 130 to 83, so that one would be coterminous with each department. Bishops were allowed merely to notify the pope of their elevation; they were forbidden to acknowledge any papal authority on their assumption of office, and no papal letter or decree was to be published or enforced in France except with government permission. All clergy received salaries from the state; the average income of bishops was somewhat reduced and that of parish clergymen was raised. Sinecures, plural holdings, and other abuses by which the church had supported noble families were done away with. The Constituent Assembly (independently of the Civil Constitution) also prohibited the taking of religious vows and dissolved all monastic houses.

Some of all this was not in principle alarmingly new, since before the Revolution the civil authority of the king had designated the French bishops and passed judgement on the admission of papal documents into France. French bishops, in the old spirit of the "Gallican liberties," were traditionally jealous of papal power in France. Many were now willing to accept something like the Civil Constitution if allowed to produce it on their own authority. The Assembly refused to concede so much jurisdiction to the Gallican church and applied instead to the pope, hoping to force its plans upon the French clergy by invoking the authority of the Vatican. But the Vatican pronounced the Civil Constitution a wanton usurpation of power over the Catholic church. Unfortunately, the pope also went further, condemning the whole Revolution and all its works. The Constituent Assembly retorted by requiring all French clergy to swear an oath of loyalty to the constitution, including the Civil Constitution of the Clergy. Half took the oath and half refused it, the latter half including all but seven of the bishops. One of the seven willing to accept the new arrangements was Talleyrand, soon to be famous as foreign minister of numerous French governments.

There were now two churches in France, one clandestine, the other official, one maintained by voluntary offerings or by funds smuggled in from abroad, the other financed and sponsored by the government. The former, comprising the nonjuring, unsworn, or "refractory" clergy, turned violently counterrevolutionary. To protect themselves from the Revolution they insisted, with an emphasis quite new in France, on the universal religious supremacy of the Roman pontiff. They denounced the "constitutional" clergy as schismatics who spurned the pope and as mere careerists willing to hold jobs on the government's

The revolutionaries created rituals and symbols to celebrate the new nation they were trying to establish. The great festival of the Federation in Paris on July 14, 1790, assembled the king, the National Guard, and a huge crowd in a symbolic expression of the national unity and national liberties that the new political institutions were supposed to protect.

(Giraudon/Art Resource, NY)

terms. The constitutional clergy, those taking the oath and upholding the Civil Constitution, considered themselves to be patriots and defenders of the rights of man; and they insisted that the Gallican church had always enjoyed a degree of liberty from Rome. The Catholic laity were terrified and puzzled. Many were sufficiently attached to the Revolution to prefer the constitutional clergy but to do so meant to defy the pope, and Catholics who persisted in defying the pope were on the whole those least zealous in their religion. The constitutional clergy therefore stood on shaky foundations. Many of their followers, under stress of the times, eventually turned against Christianity itself.

"Constitutional" and  
"refractory" clergy

Good Catholics tended to favor the "refractory" clergy. The outstanding example was the king himself. He personally used the services of refractory priests, and thus gave a new reason for the revolutionaries to distrust him. Whatever chance there was that Louis XVI might go along with the Revolution was exploded, for he concluded that he could do so only by endangering his immortal soul. Former aristocrats also naturally preferred the refractory clergy. They now put aside the Voltairean levities of the Age of Enlightenment, and the "best people" began to exhibit a new piety in religious matters. The peasants, who found little in the Revolution to interest them after their own insurrection of 1789 and the consequent abolition of the manorial regime, also favored the old-fashioned or refractory clergy. Much the same was true of the urban working-class families, in which both men and women might shout against priests and yet want to be sure that their marriages were valid and their children were properly baptized. The Constituent Assembly, and its successors, could never finally decide what to do. Sometimes they shut their eyes at the intrigues of refractory clergy, in which case the constitutional clergy then became fearful. Sometimes they hunted out and persecuted the refractories, in that case they only stirred up religious fanaticism.

✗ The Civil Constitution of the Clergy has been called the greatest tactical blunder of the Revolution. Certainly its consequences were unfortunate in the extreme, and they spread to much of Europe. In the nineteenth century the church was to be officially anti-democratic and antiliberal; and democrats and liberals in most cases became outspokenly

anticlerical. The main beneficiary was the papacy. The French church, which had clung for ages to its Gallican liberties, was thrown by the Revolution into the arms of the pope. Even Napoleon, when he healed the schism a decade later, acknowledged powers in the papacy that had never been acknowledged by the French kings. These were steps in the process, leading through the proclamation of papal infallibility in 1870, by which the affairs of the modern Catholic church became increasingly centralized at the Vatican.

With the proclamation of the constitution in September 1791, the Constituent Assembly disbanded. Before dissolving, it ruled that none of its members might sit in the forthcoming Legislative Assembly. This body was therefore made up of men who still wished to make their mark in the Revolution. The new regime went into effect in October 1791. It was a constitutional monarchy in which a unicameral Legislative Assembly confronted a king unconverted to the new order. Designed as the permanent solution to France's problems, it was to collapse in 10 months, in August 1792, as a result of popular insurrection four months after France became involved in war. A group of Jacobins, known as Girondins, for a time became the left or advanced party of the Revolution and in the Legislative Assembly led France into war.

### 43. THE REVOLUTION AND EUROPE: THE WAR AND THE "SECOND" REVOLUTION, 1792

#### *The International Impact of the Revolution*

The European governments were long reluctant to become involved with France. They were under considerable pressure. On the one hand, pro-French and pro-revolutionary groups appeared immediately in many quarters. The doctrines of the French Revolution, as of the American, were highly exportable: they took the form of a universal philosophy, proclaiming the rights of man regardless of time or place, race or nation. Moreover, depending on what one was looking for, one might see in the first disturbances in France a revolt of either the nobility, the bourgeoisie, the common people, or the entire nation. In Poland those who were trying to reorganize the country against further partition hailed the French example. The Hungarian landlords pointed to it in their reaction against Joseph II. In England, for a time, those who controlled Parliament complacently believed that the French were attempting to imitate them.

*Inspiration of the  
Revolution*

But it was the excluded classes of European society who were most inspired. The hard-pressed Silesian weavers were said to hope that "the French would come." Strikes broke out at Hamburg, and peasants rebelled elsewhere. One English diplomat found that even the Prussian army had "a strong taint of democracy among officers and men." In Belgium, where the privileged elements were already in revolt against the Austrian emperor, a second revolt broke out, inspired by events in France and aimed at the privileged elements. In England the newly developing "radicals," men like Thomas Paine and Dr. Richard Price, who wished a thorough overhauling of Parliament and the established church, entered into correspondence with the Assembly in Paris. Business leaders of importance, including Watt and Boulton, the pioneers of the steam engine, were likewise pro-French since they had no representation in the House of Commons. The Irish too were excited and presently revolted. Everywhere the young were aroused, the young Hegel in Germany or in England the young Wordsworth, who later recalled the sense of a new era that had captivated so many spirits in 1789:

*Bliss was it in that dawn to be alive,  
But to be young was very heaven!*

On the other hand the anti-Revolutionary movement gathered strength. Edmund Burke, frightened by the French proclivities of English radicals, published as early as 1790 his *Reflections on the Revolution in France*. For France, he predicted anarchy and dictatorship. For England, he sternly advised the English to accept a slow adaptation of their own English liberties. For all the world, he denounced a political philosophy that rested on abstract principles of right and wrong, declaring that every people must be shaped by its own national circumstances, national history, and national character. He drew an eloquent reply and a defense of France from Thomas Paine in the *Rights of Man*. Burke soon began to preach the necessity of war, urging a kind of ideological struggle against French barbarism and violence. His *Reflections* was translated and widely read, becoming in the long run an influential work in the emergence of modern conservative thought. In the short run it fell on willing ears: The king of Sweden, Gustavus III, offered to lead a monarchist crusade. In Russia Empress Catherine was appalled; she forbade further translations of her erstwhile friend Voltaire, she called the French "vile riffraff" and "brutish cannibals," and she packed off to Siberia a Russian named Radischev, who in his *Voyage from St. Petersburg to Moscow* pointed out the evils of serfdom. The terrors were heightened by plaintive messages from Louis XVI and Marie Antoinette and by the émigrés who kept bursting out of France, led as early as July 1789 by the king's own brother, the Count of Artois. The émigrés, who at first were nobles, settled in various parts of Europe and began using their international aristocratic connections. They preached a kind of holy war against the evils of revolution. They bemoaned the sad plight of the king, but what they most wanted was to get back their manorial incomes and other rights. Extremists among the émigrés even hinted that Louis XVI himself was a dangerous revolutionary and much preferred his brother, the unyielding Count of Artois.

Anti-Revolutionary  
sentiment

In short, Europe was soon split by a division that overran all frontiers. The same was true of America also. In the United States the rising party of Jefferson was branded as Jacobin and pro-French, that of Hamilton as aristocratic and pro-British, while in colonial Latin America there was new interest in ideas of independence, and the Venezuelan Miranda became a general in the French army. In all countries of the European world, though least of all in eastern and southern Europe, there were revolutionary or pro-French elements that were feared by their own governments. In all countries, including France, there were implacable enemies of the French Revolution. In all countries were people whose loyalties or sympathies lay abroad. There had been no such situation since the Protestant Reformation, nor was there anything like it again until after the Russian Revolution of the twentieth century.

### *The Coming of the War, April 1792*

Yet the European governments were slow to move. Catherine had no intention of becoming involved in western Europe. She only wished to involve her neighbors. William Pitt, the British prime minister, resisted the war cries of Burke. Pitt had tried and failed to carry a plan for reform of Parliament and was now concentrating on a policy of orderly finance and systematic economy. His domestic program would be ruined by war. He insisted that the internal affairs of France were of no concern to the British government. The key position was occupied by the Habsburg emperor, Leopold II, brother to the French queen.

Leopold at first answered Marie Antoinette's pleas for help by telling her to adjust herself to conditions in France. He resisted the furious demands of the émigrés, whom he understood perfectly, having inherited from Joseph II a fractious aristocracy himself.

Still, the new French government was a disturbing phenomenon. It openly encouraged malcontents all over Europe. It showed a tendency to settle international affairs by unilateral action. For example, it annexed Avignon at the request of local revolutionaries but without the consent of its historic sovereign, the pope. Or again, in Alsace there had been much overlapping jurisdiction between France and Germany ever since the Peace of Westphalia in 1648 (see maps, pp. 142–143, 180, 313). The Constituent Assembly abolished feudalism and manorial dues in Alsace as elsewhere in France. To German princes who had feudal rights in Alsace the Assembly offered compensation, but it did not ask their consent. Moreover, after the arrest of Louis XVI at Varennes, after his attempted flight in June 1791, it became impossible to deny that the French king and queen were prisoners of the revolutionaries.

The Declaration of  
Pillnitz

In August Leopold met with the king of Prussia at Pillnitz in Saxony. The resulting Declaration of Pillnitz rested on a famous *if*: Leopold would take military steps to restore order in France if all the other powers would join him. Knowing the attitude of Pitt, he believed that this could never materialize. His aim was mainly to rid himself of the French émigrés, but the émigrés perversely received the Declaration with delight. They used it as an open threat to their enemies in France, announcing that they would soon return alongside the forces of civilized Europe to punish the guilty and right the wrongs that had been done to them.

In France the upholders of the Revolution were alarmed. They were ignorant of what Leopold really meant and took the dire menaces of the émigrés at their face value. The Declaration of Pillnitz, far from cowing the French, enraged them against all the crowned heads of Europe. It gave a political advantage to the then dominant faction of Jacobins, known to history as the Girondins. These included the philosophe Condorcet, the humanitarian lawyer Brissot, and the civil servant Roland and his more famous wife, Madame Roland, whose house became a kind of headquarters of the group. They attracted many foreigners also, such as Thomas Paine and the German Anacharsis Cloots, the "representative of the human race." In December 1791 a deputation of English radicals, led by James Watt, son of the inventor of the steam engine, received a wild ovation at the Paris Jacobin club.

The Girondins became the party of international revolution. They declared that the Revolution could never be secure in France until it spread to the world. In their view, once war had come, the peoples of states at war with France would not support their own governments. There was reason for this belief, since revolutionary elements antedating the French Revolution already existed in both the

France goes to war

Dutch and the Austrian Netherlands, and to a lesser degree in parts of Switzerland, Poland, and elsewhere. Some Girondins therefore contemplated a war in which French armies should enter neighboring countries, unite with local revolutionaries, overthrow the established governments, and set up a federation of republics. War was also favored by a very different group, led by Lafayette, which wished to curb the Revolution by holding it at the line of constitutional monarchy. This group mistakenly believed that war might restore the much damaged popularity of Louis XVI, unite the country under the new government, and make it possible to put down the continuing Jacobin agitation. As the war spirit boiled up in France, the Emperor Leopold II died. He was succeeded by Francis II, a man much more inclined than Leopold to yield to the clamors of the old aristocracy. Francis resumed negotiations with Prussia. In France all who dreaded a return of

the Old Regime listened more readily to the Girondins. Among the Jacobins as a whole, only a few, generally a handful of radical democrats, opposed the war. On April 20, 1792, without serious opposition, the Assembly declared war on "the king of Hungary and Bohemia," that is, the Austrian monarchy.

### *The "Second" Revolution: August 10, 1792*

The war intensified the existing unrest and dissatisfaction of the unpropertied classes. Both peasants and urban workers felt that the Constituent and the Legislative Assembly had served the propertied interests and had done little for them. Peasants were dissatisfied with the inadequate measures taken to facilitate land distribution; workers felt especially the pinch of soaring prices, which by 1792 had greatly risen. Gold had been taken out of the country by the émigrés; paper money, the *assignats*, was almost the sole currency, and the future of the government was so uncertain that it steadily lost value. Peasants concealed their food products rather than sell them for depreciating paper. Actual scarcity combined with the falling value of money to drive up the cost of living. The lowest income groups suffered the most. But dissatisfied though they were, when the war began they were threatened with a return of the émigrés and a vindictive restoration of the Old Regime, which at least for the peasants would be the worst of all possible eventualities. The working classes—peasants, artisans, mechanics, shopkeepers, wage workers—rallied to the Revolution but not to the revolutionary government in power. The Legislative Assembly and the constitutional monarchy lacked the confidence of large elements of the population.

In addition, the war at first went very unfavorably for the French. Prussia joined immediately with Austria, and by the summer of 1792 the two powers were on the point of invading France. They issued a proclamation to the French people, the Brunswick Manifesto of July 25 declaring that if any harm befell the French king and queen the Austro-Prussian forces, upon their arrival in Paris, would exact the most severe retribution from the inhabitants of that city. Such menaces, compounding the military emergency, only played into the hands of the most violent activists. Masses of the French people, roused and guided by bourgeois Jacobin leaders, notably Robespierre, Danton, and the vitriolic journalist Marat, burst out in a passion of patriotic excitement. They turned against the king because he was identified with powers at war with France and also because, in France itself, those who still supported him were using the monarchy as defense against the lower classes. Republicanism in France was partly a rather sudden historical accident, in that France was at war under a king who could not be trusted, and partly a kind of popular lower-class movement, in which, however, many bourgeois revolutionaries shared.

Feeling ran high during the summer of 1792. Recruits streamed into Paris from all quarters on their way to the frontiers. One detachment, from Marseilles, brought with them a new marching song, known ever since as the *Marseillaise*, a fierce call to war upon tyranny. The transient provincials stirred up the agitation in Paris. On August 10, 1792, the working-class quarters of the city rose in revolt, supported by the recruits from Marseilles and elsewhere. They stormed the Tuileries against resistance by the Swiss Guard, many of whom were massacred, and seized and imprisoned the king and the royal family. A revolutionary municipal government, or "Commune," was set up in Paris. Usurping the powers of the Legislative Assembly, it forced the abrogation of the constitution and the election, by universal male suffrage, of a Constitutional Convention that was to govern France and prepare a new and more democratic constitution. The very word Convention was used in

---

*Agitation and  
violence in Paris*

recollection of the American Constitutional Convention in 1787. Meanwhile hysteria, anarchy, and terror reigned in Paris; mobs of insurrectionary volunteers, declaring that they would not fight enemies on the frontiers until they had disposed of enemies in Paris, dragged about 1,100 persons—refractory priests and other counterrevolutionaries—from the prisons of the city and killed them after drumhead trials, in brutal executions known as the “September massacres.”

For nearly three years, since October 1789, there had been an abatement of popular violence. Now the coming of the war and the dissatisfaction of the lower classes with the course of events so far had led to new explosions. The insurrection of August 10, 1792, the “second” French Revolution, initiated the most advanced phase of the Revolution.

#### 44. THE EMERGENCY REPUBLIC, 1792–1795: THE TERROR

##### *The National Convention*

The National Convention met on September 20, 1792; it was to sit for three years. It immediately proclaimed the Year One of the French Republic. The disorganized French armies, also on September 20, won a great moral victory in the “cannonade of Valmy,” a battle that was hardly more than an artillery duel, but which induced the Prussian commander to give up his march on Paris. The French soon occupied Belgium (the Austrian Netherlands), the Savoy region near the Swiss-Italian border (which belonged to the king of Sardinia who had joined with the Austrians), and Mainz and other cities on the German Left Bank of the Rhine. Revolutionary sympathizers in these places appealed for French aid. The National Convention decreed assistance to “all peoples wishing to recover their liberty.” It also ordered that French generals, in the occupied areas, should dissolve the old governments; confiscate government and church property; abolish tithes, hunting rights, and seigneurial dues; and set up provisional administrations. Thus revolution spread in the wake of the successful French armies.

*Spread of the  
Revolution*

The British and Dutch now prepared to resist. Pitt, still insisting that the French might have any domestic regime that they chose, declared that Great Britain could not tolerate the French occupation of Belgium. The British and Dutch began conversations with Prussia and Austria, and the French declared war on them on February 1, 1793. Within a few weeks the Republic had annexed Savoy and Nice, as well as Belgium, and had much of the German Rhineland under its military government (see map, p. 388). Meanwhile, in eastern Europe, while denouncing the rapacity of the French savages, the rulers of Russia and Prussia, as we have seen, came to an arrangement of their own, each appropriating a portion of Poland in the second partition in January 1793. The Austrians, excluded from the second partition, became anxious about their interests in eastern Europe. The infant French Republic, now at war with all Europe, was saved by the weakness of the Coalition, for Britain and Holland had no land forces of consequence and Prussia and Austria were too jealous of each other, and too preoccupied with Poland, to commit the bulk of their armies against France.

In the Convention all the leaders were Jacobins, but the Jacobins were again splitting. The Girondins were no longer the most advanced revolutionary group as they had been in the Legislative Assembly. Beside the Girondins appeared a new group, whose members preferred to sit in the highest seats in the hall, and therefore were dubbed the “Mountain” in the political lan-

*The Jacobins split*

guage of the day. The leading Girondins came from the great provincial cities; the leading Montagnards, though mostly of provincial birth, represented Paris and owed most of their political strength to the radical and popular elements in that city.

These popular revolutionists, outside the Convention, proudly called themselves "sans-culottes" since they wore the workingman's long trousers, not the knee breeches or *culottes* of the middle and upper classes. They were the working class of a preindustrial age, shopkeepers and shop assistants, skilled artisans in various trades, including some who were owners of small manufacturing or handicraft enterprises. For two years their militancy and their activism pressed the Revolution forward. They demanded an equality that should be meaningful for people like themselves, they called for a mighty effort against foreign powers that presumed to intervene in the French Revolution, and they denounced the now deposed king and queen (correctly enough) for collusion with the Austrian enemy. The sans-culottes feared that the Convention might be too moderate. They favored direct democracy in their neighborhood clubs and assemblies, together with a mass rising if necessary against the Convention itself. The Girondins in the Convention began to dismiss these popular militants as anarchists. The group known as the Mountain was more willing to work with them, so long at least as the emergency lasted.

The Convention put Louis XVI on trial for treason in December 1792.

On January 15 it unanimously pronounced him guilty, but on the next day, out of 721 deputies present, only 361 voted for immediate execution, a majority of one. Louis XVI died on the guillotine forthwith. The 361 deputies were henceforth branded for life as regicides; never could they allow, in safety to themselves, a restoration of the Bourbon monarchy in France. The other 360 deputies were not similarly compromised; their rivals called them Girondins, "moder-  
atists," counterrevolutionaries. All who still wanted more from the Revolution, or who feared that the slightest wavering would bring the Allies and the émigrés into France, now looked to the Mountain wing of the Jacobins.

The execution of the king

### *Background to the Terror*

In April 1793 the most prominent French general, Dumouriez, who had won the victories in Belgium five months before, defected to Austria. The Allied armies now drove the French from Belgium and again threatened to invade France. Counterrevolutionaries in France exulted. From the revolutionaries went up the cry, "We are betrayed!" Prices continued to rise, the currency fell, food was harder to obtain, and the working classes were increasingly restless. The sans-culottes demanded price controls, currency controls, rationing, legislation against the hoarding of food, and requisitioning to enforce the circulation of goods. They denounced bourgeois traders as profiteers and exploiters of the people. While the Girondins resisted, the Mountain went along with the sans-culottes, partly from sympathy with their ideas, partly to win mass support for the war, and partly as a maneuver against the Girondins. On May 31, 1793, the Commune of Paris, under pressure from the sans-culottes assembled a host of demonstrators and insurrectionists who invaded the Convention and forced the arrest of the Girondin leaders. Other Girondins fled to the provinces, including Condorcet, who, while in hiding, and before his death, found occasion to write his famous book on the *Progress of the Human Mind*.

The Mountain now ruled in the Convention, but the Convention itself ruled very little. Not only were the foreign armies and the émigrés at the gates bent on destroying the Convention as a band of regicides and social incendiaries, but the authority of the Convention

A wave of popular violence in Paris in 1792 led to the fall of the monarchy and the proclamation of a new French republic. Angry crowds pulled down the symbols of the old regime, including this statue of Louis XIV.

(Stock Montage, Inc.)

was also widely repudiated in France itself. In the west, in the Vendée, the peasants had revolted against military conscription; they were worked upon by refractory priests, British agents, and royalist emissaries of the Count of Artois. The great provincial cities, Lyons, Bordeaux, Marseilles, and others, had also rebelled, especially after the fugitive Girondins reached them. These “federalist” rebels demanded a more “federal” or decentralized republic. Like the Vendéans, with whom they had no connection, they objected to the ascendancy of Paris, having been accustomed to more regional independence under the Old Regime. These rebellions became counterrevolutionary, since all sorts of foreigners, royalists, émigrés, and clericals streamed in to assist them.

The Convention had to defend itself against extremists of the Left as well. To the genuine mass action of the sans-culottes were now added the voices of even more excited militants called *enragés*. Various organizers, enthusiasts, agitators, and neighborhood politicians declared that parlia-

under attack

mentary methods were useless. Generally they were men outside the Convention—and also women, for women were particularly sensitive to the crisis of food shortage and soaring prices, and an organization of Revolutionary Republican Women helped to mobilize the sans-culottes in 1793 (until the suppression of women's political clubs). All such activists worked through units of local government in Paris and elsewhere as well as in thousands of "popular societies" and provincial clubs throughout the whole country. They also formed "revolutionary armies," semimilitary bands that scoured the rural areas for food, searched the barns of peasants, denounced suspects, and preached revolution.

As for the Convention, while it cannot be said ever to have had any commanding leaders, the program it followed for about a year was on the whole that of Maximilien Robespierre, himself a Jacobin but not one to go along forever with popular revolution or anarchy. Robespierre is one of the most argued about and least understood figures in history. Persons accustomed to stable conditions dismiss him with a shudder as a bloodthirsty fanatic, dictator, and demagogue. Others have considered him an idealist, a visionary, and an ardent patriot whose goals and ideals were at least avowedly democratic. All agree on his personal honesty and integrity and on his revolutionary zeal. He was by origin a lawyer from northern France, educated with the aid of scholarships in Paris. He had been elected in 1789 to sit for the Third Estate in the Estates General, and in the ensuing Constituent Assembly played a minor role, though calling attention to himself by his views against capital punishment and in favor of universal suffrage. During the time of the Legislative Assembly, in 1791–1792, he continued to agitate for democracy and vainly pleaded against the declaration of war. In the Convention, elected in September 1792, he sat for a Paris constituency. He became a prominent member of the Mountain and welcomed the purge of the Girondins. He had always kept free of the bribery and graft in which some others became involved and for this reason was known as the Incorruptible. He was a great believer in the importance of "virtue," a term that the philosophes had used in a specialized way. Both Montesquieu and Rousseau, for example, had held that republics depended upon "virtue," or unselfish public spirit and civic zeal, to which was added, under Rousseauist influence, a somewhat sentimentalized idea of personal uprightness and purity of life. Robespierre was determined, in 1793 and 1794, to bring about a democratic republic made up of good, virtuous, and honest citizens.

---

Robespierre

### *The Program of the Convention, 1793–1794: The Terror*

The program of the Convention, which Robespierre helped to form, was to repress anarchy, civil strife, and counterrevolution at home and to win the war by a great national mobilization of the country's people and resources. It would prepare a democratic constitution and initiate legislation for the lower classes, but it would not yield to the Paris Commune and other agencies of direct revolutionary action. To conduct the government, the Convention granted wide powers to a Committee of Public Safety, a group of 12 members of the Convention who were reelected every month. Robespierre was an influential member; others were the youthful St. Just, the militant lawyer Couthon, and the army officer Carnot, "organizer of victory."

To repress the "counterrevolution," the Convention and the Committee of Public Safety set up what is popularly known as the "Reign of Terror." Revolutionary courts were instituted as an alternative to the lynch law of the September massacres. A Committee of General Security was created as a kind of supreme political police. Designed to protect the Revolutionary Republic from its internal enemies, the Terror struck at those who were in league against the Republic and

---

The "Reign of Terror"

at those who were merely suspected of hostile activities. Its victims ranged from Marie Antoinette and other royalists to the former revolutionary colleagues of the Mountain, the Girondin leaders; and before the year 1793–1794 was over, some of the old Jacobins of the Mountain who had helped inaugurate the program also went to the guillotine.

Many thousands of people died in France at the height of the Revolution. Most deaths were in places in open revolt against the Convention, as in the Vendée in western France. Some resulted from acts of private vengeance. But if the Terror is understood to mean the official program of the government, which at one time decreed “terror the order of the day,” the number who died in it was not large by the brutal standards of the twentieth century, in which dictatorial governments attempted to wipe out not only their political opponents but whole social classes or ethnic groups. About 40,000 persons perished in the Terror thus defined, and many others were temporarily imprisoned. About 8 percent of the victims of the “official” Terror were nobles, but nobles as a class were not molested unless suspected of political agitation; 14 percent of the victims were classifiable as bourgeois, mainly of the rebellious southern cities; 6 percent were clergy, while no less than 70 percent were of the peasant and laboring classes. A democratic republic, founded on the Declaration of the

Victims of the  
“Terror”

Rights of Man, was in principle to follow the Terror once the war and the emergency were over, but meanwhile, the Terror was inhuman at best and in some places atrocious, as at Nantes where 2,000 persons were loaded on barges and deliberately drowned. The Terror left long memories in France and created much of the enduring antipathy to the Revolution and to republicanism.

The Committee of  
Public Safety

Power rests with a large body of the people. To conduct the government in the midst of the war emergency the Committee of Public Safety operated as a joint dictatorship and war cabinet. It prepared and guided legislation through the Convention. It gained control over the “representatives on mission,” who were members of the Convention on duty with the armies and in the insurgent areas of France. It

established the *Bulletin des lois*, so that all persons might know what laws they were supposed to enforce or to obey. It centralized the administration, converting the swarm of locally elected officials left over from the Constituent Assembly (who were royalists in some places, wild extremists, in others) into centrally appointed “national agents” named by the Committee of Public Safety.

To win the war the Committee proclaimed the *levée en masse*, calling on all able-bodied men to rally to the colors. It recruited scientists to work on armaments and munitions. The most prominent French scientists of the day, including Lagrange and Lamarck, worked for or were protected by the government of the Terror, though one, Lavoisier, “father of modern chemistry,” was guillotined in 1794 because he had been involved in tax farming before 1789. For military reasons also the Committee instituted economic controls, which at the same time met the demands of the *enragés* and other working-class spokesmen. The value of the *assignats* ceased to fall during the year of the Terror. Thus the government protected both its own purchasing power and that of the masses. It did so by controlling the export of gold, by confiscating specie and foreign currency from French citizens, to whom it paid assignats in return, and by legislation against hoarding or the withholding of goods from the market. Food and supplies for the armies, and for civilians in the towns, were raised and allocated by a system of requisitions, centralized in a Subsistence Commission under the Committee of Public Safety. A “general maximum” set ceilings for prices and wages. It helped to check inflation during the crisis, but it did not work very well; the Committee believed, in principle, in a free market economy and lacked the technical and administrative machinery to enforce thorough controls. By 1794

it was giving freer rein to private enterprise and to the peasants to encourage production. It tried also to hold down wages and in that respect lost the adherence of many working-class leaders.

In June 1793 the Committee produced, and the Convention adopted, a republican constitution which provided for universal male suffrage. But the new constitution was suspended indefinitely, and the government was declared “revolutionary until the peace,” “revolutionary” meaning extraconstitutional or of an emergency character. In other ways the Committee showed intentions of legislating on behalf of the lower economic classes. The price controls and other economic regulations answered the demands of the sans-culottes. The last of the manorial regime was done away with; the peasants were relieved of having to pay compensation for the obligations that had been abolished at the opening of the Revolution. The Committee busied itself also with social services and measures of public improvement. It issued pamphlets to teach farmers to improve their crops, selected promising youths to receive instruction in useful trades, opened a military school for boys of all classes, even the humblest, and certainly intended to introduce universal elementary education.

It was also at this time, in 1794, that the National Convention decreed the abolition of slavery in the French colonies, meaning chiefly Saint-Domingue, the modern Haiti, the richest of all the sugar islands in the Caribbean. Free blacks in the colonies had already received civic rights earlier in the Revolution. The black slaves had in fact already liberated themselves in a massive rebellion in 1791. They had produced a leader in Toussaint L'Ouverture, born a slave, who after the French abolished slavery served as a general in the French army against the Spanish and British who had ambitions in Haiti. Amid the ensuing political and military conflicts Toussaint became France's governor-general in Haiti, but his new government soon broke away from all French control. Under pressure from the slave-owning and commercial interests (and the European demand for sugar) the government of Napoleon in 1802 reestablished slavery in the French colonies, sent troops to reassert French authority in Haiti, captured Toussaint, and took him to France, where he died in prison. Unable in any case to defeat the armed rebellion of the black population, most of the French army sent out in this operation perished of yellow fever. Haitian leaders, in 1804, established an independent Republic of Haiti. An unexpected consequence of the French defeat in Haiti was that Napoleon sold the remaining French possessions on the North American mainland (“Louisiana”) to the United States in 1803. Slavery was not effectively abolished in the French colonies until 1848.

---

*Slavery abolished in  
French colonies*

At the climax of the Revolution, in 1793–1794, the Committee of Public Safety was determined to concentrate revolutionary initiative in itself. It had no patience with unauthorized revolutionary violence. With a democratic program of its own, it disapproved of the turbulent democracy of popular clubs and local assemblies. In the fall of 1793, at the time of its prohibition of revolutionary women's organizations, the Committee arrested the leading *enragés*. Extreme revolutionary demands were expressed by Jacques Hébert, a journalist and officer of the Paris Commune. Robespierre called such people “ultra revolutionaries.” They were a large and indefinable group and included many members of the Convention. They indiscriminately denounced merchants and bourgeoisie. They were the party of extreme Terror; an Hébertist brought about the drownings at Nantes. Believing all religion to be counterrevolutionary, they launched the movement of Dechristianization and strongly supported the creation of a new republican calendar. The Convention adopted this calendar as part of its campaign to strengthen popular allegiance to the republic and to establish a new national organization of daily life that would replace the Christian cycle of Sundays, saints' days, and holidays such as Christmas and Easter. The new calendar thus

counted years from the founding of the French Republic, divided each year into new months of 30 days each, and even abolished the week, which it replaced with the 10-day *décade*.<sup>1</sup>

The Revolution and  
religion

Dechristianization also contributed to the development of the cult of reason, which sprang up all over France at the end of 1793. In Paris the bishop resigned his office, declaring that he had been deluded; and the Commune put on ceremonies in the cathedral of Notre Dame, in which Reason was impersonated by an actress who was the wife of one of the city officials. But Dechristianization was severely frowned upon by Robespierre. He believed that it would alienate the masses from the Republic and ruin such sympathy as was still felt for the Revolution abroad. The Committee of Public Safety, therefore, ordered the toleration of peaceable Catholics, and in June 1794 Robespierre introduced the cult of the Supreme Being, a deistic natural religion, in which the Republic was declared to recognize the existence of God and the immortality of the soul. Robespierre hoped that both Catholics and agnostic anticlericals could become reconciled on this ground. But Catholics were now beyond reconciliation, and the freethinkers, appealing to the tradition of Voltaire, regarded Robespierre as a reactionary mystery monger and were instrumental in bringing about his fall.

Meanwhile the Committee proceeded relentlessly against the Hébertists, whose main champions it sent to the guillotine in March 1794. The paramilitary "revolutionary armies" were suppressed. The extreme Terrorists were recalled from the provinces. The revolutionary Paris Commune was destroyed. Robespierre filled the municipal offices of Paris with his own appointees. This Robespierist commune disapproved of strikes and tried to hold down wages, on the plea of military necessity; it failed to win over the ex-Hébertists and working-class leaders, who became disillusioned with the Revolution and dismissed it as a bourgeois movement. Probably to prevent just such a conclusion, and to avoid the appearance of deviation to the Right, Robespierre and the Committee, after liquidating the left-wing Hébertists, also liquidated certain right-wing members of the Mountain who were known as Dantonists. Danton and his followers were accused of financial dishonesty and of dealing with counterrevolutionaries; the charges contained some truth but were not the main reason for the executions.

By the spring of 1794 the French Republic possessed an army of 800,000 men, the largest ever raised up to that time by a European power. It was a national army representing a people in arms, commanded by officers who had been promoted rapidly on grounds of merit and composed of troops who felt themselves to be citizens fighting for their own cause. Its intense political-mindedness made it the more formidable and contrasted strongly with the indifference of the opposing troops, some of whom were in fact serfs and none of whom had any sense of membership in their own political systems. The Allied governments, each pursuing its own ends and still distracted by their ambitions in Poland, where the third partition was impending, could not combine their forces against France. In June 1794 the French won the battle of Fleurus in Belgium. The Republican hosts again streamed into the Low Countries; in six months their cavalry rode into Amsterdam on the ice. A revolutionary Batavian Republic soon replaced the old Dutch provinces. The opposite occurred at this time

Revolutionary  
military pictures

<sup>1</sup>Though not adopted until October 1793, the revolutionary calendar dated the Year I of the French Republic from September 22, 1792. The names of the months, in order and corresponding to the seasons of the year, were Vendémiaire, Brumaire, Frimaire (autumn); Nivôse, Pluviôse, Ventôse (winter); Germinal, Floréal, Prairial (spring); Messidor, Thermidor, Fructidor (summer).

The French army won a great victory at the battle of Fleurus in June 1794, thus opening the way for republican troops to enter the Low Countries and easing the external threats that had pushed the Revolution toward internal repression and the Terror. This picture shows how the French used a balloon to observe enemy forces during the battle, but the results must have been disappointing, since balloons were not thereafter used by either side.

(Picture Collection, The New York Public Library, Astor, Lenox and Tilden Foundations)

in eastern Europe, where Russian and Prussian armies stamped out the attempted revolution that Kosciuszko led in Poland. All Polish lands and people were finally merged into the east-European empires in 1795.

Military success made the French less willing to put up with the dictatorial rule and economic regimentation of the Terror. Robespierre and the Committee of Public Safety had antagonized all significant parties. The working-class radicals of Paris would no longer support him, and after the death of Danton the National Convention was afraid of its own ruling committee. A group in the Convention obtained the “outlawing” of Robespierre on 9 Thermidor (July 27, 1794); he was guillotined with some of his associates on the following day. Many who turned against Robespierre believed they were pushing the Revolution farther forward, as

---

*Fall of Robespierre*

The guillotine was used during the most radical phase of the Revolution to execute persons judged to be enemies of the republic. First adopted as a more humane way of inflicting capital punishment, it became a permanent symbol of revolutionary violence and it claimed victims from every part of the Revolution itself. This picture illustrates the execution of Robespierre and four others who were denounced as conspirators against liberty and sent to the guillotine in July 1794.

(Bettmann/Corbis)

in destroying the Girondins the year before. Others thought, or said, that they were stopping a dictator and a tyrant. All agreed, to absolve themselves, in heaping all blame upon Robespierre. The idea that Robespierre was an ogre originated more with his former colleagues than with conservatives of the time.

### *The Thermidorian Reaction*

The fall of Robespierre stunned the country, but its effects manifested themselves during the following months as the 'Thermidorian reaction.' The Terror subsided. The Convention reduced the powers of the Committee of Public Safety, and it closed the Jacobin club. Price controls and other regulations were removed. Inflation resumed its course, prices again rose, and the disoriented and leaderless working classes suffered more than

ever. Sporadic uprisings broke out, of which the greatest was the insurrection of Prairial in the Year III (May 1795), when a mob all but dispersed the Convention by force. Troops were called to Paris for the first time since 1789. Insurrectionists in the working-class quarters threw up barricades in the streets. The army prevailed without much bloodshed, but the Convention arrested, imprisoned, or deported 10,000 of the insurgents. A few organizers were guillotined. The affair of Prairial gave a foretaste of modern social revolution.

The triumphant element consisted mostly of the bourgeois class which had guided the Revolution since the Constituent Assembly and had not been really unseated even during the Terror. It was not mainly a bourgeoisie of modern capitalists, eager to make a financial profit by developing new factories or machinery. The political victors after Thermidor were "bourgeois" in an older social sense, those who had not been noble or aristocratic before 1789 yet had held a secure position under the Old Regime, many of them lawyers or officeholders and often drawing income from the ownership of land. To them were now added new elements produced by the Revolution itself, parvenus and nouveaux riches, who had made money by wartime government contracts or had profited by inflation or by buying up former church lands at bargain prices. Such people, often joined by former aristocrats, and in reaction against Robespierist virtue, set an extravagant and ostentatious style of living that gave a bad name to the new order. They also unleashed a "white terror" in which many ex-Jacobins were simply murdered.

---

*Politics and society  
after Thermidor*

But the Thermidorians, disreputable though a few of them were, had not lost faith in the Revolution. Democracy they associated with red terror and mob rule, but they still believed in individual legal rights and in a written constitution. Conditions were rather adverse, for the country was still unsettled, and although the Convention made a separate peace with Spain and Prussia, France still remained at war with Great Britain and the Habsburg empire. But the men of the Convention were determined to make another attempt at constitutional government. They set aside the democratic constitution written in 1793 (and never used) and produced the Constitution of the Year III, which went into effect at the end of 1795.

## 45. THE CONSTITUTIONAL REPUBLIC: THE DIRECTORY, 1795–1799

### *The Weakness of the Directory*

The first formally constituted French Republic, known as the Directory, lasted only four years. Its weakness was that it rested on an extremely narrow social base and that it presupposed certain military conquests. The new constitution applied not only to France but also to Belgium, which was now regarded as incorporated constitutionally into France, though the Habsburgs had not yet ceded these "Austrian Netherlands," nor had the British yielded in their refusal to accept French occupation. The constitution of 1795 thus committed the republic to a program of successful expansion. At the same time it restricted the politically active class. It gave almost all adult males the vote, but they voted only for "electors." Persons chosen as electors were usually men of some means, able to give their time and willing to take part in public life; this in effect meant men of the upper middle class, since the old aristocracy was disaffected. The electors chose all important department officials and also the members of the national Legislative Assembly, which this time was divided

---

*The constitution of  
1795*

into two chambers. The lower chamber was called the Council of Five Hundred; the upper, composed of 250 members, the Council of Ancients—"ancients" being those over 40. The chambers chose the executive, which was called the Directory (from which the whole regime took its name) and was made up of five Directors.

The government was thus constitutionally in the hands of substantial property owners, rural and urban, but its real base was narrower still. In the reaction after Thermidor many people began to consider restoring the monarchy. The Convention, to protect its own members, had ruled that two-thirds of the men initially elected to the Council of Five Hundred and Council of Ancients must be ex-members of the Convention. This interference with the freedom of the elections provoked serious disturbances in Paris, instigated mainly by royalists. The Convention, having now accustomed itself to using the army, instructed a young general named Bonaparte, who happened to be in Paris, to put down the royalist mob. He did so with a "whiff of grapeshot." The constitutional republic thus made itself dependent on military protection at the outset.

The regime had enemies to both Right and Left. On the Right, undisguised royalists agitated in Paris and even in the two councils; and they were in continuous touch with the late king's brother, the Count of Provence, whom they regarded as Louis XVIII (Louis XVI's son, who died in prison, was counted as Louis XVII). Louis XVIII had installed himself at Verona in Italy, where he headed a propaganda agency financed largely by British money. The worst obstacle to the resurgence of royalism in France was Louis XVIII himself. In 1795, on assuming the title, he had issued a Declaration of Verona; in which he announced his intention to restore the Old Regime and punish all involved in the Revolution back to 1789. It has been said, correctly enough in this connection, that the Bourbons "learned nothing and forgot nothing." Had Louis XVIII offered in 1795 what he offered in 1814, it is quite conceivable that his partisans in France might have brought about his restoration and terminated the war. As it was, the bulk of the French adhered not exactly to the republic as set up in 1795, but more negatively to any system that would shut out the Bourbons and privileged nobility, prevent a reimposition of the manorial system, and secure the new landowners, peasant and bourgeois, in the possession of the church properties which they had purchased.

The Left was made up of persons from various levels of society who still favored the more democratic ideas expressed earlier in the Revolution. Some of them thought that the fall of Robespierre had been a great misfortune. A tiny group of extremists formed the Conspiracy of Equals, organized in 1796 by "Gracchus" Babeuf. His intention was to overthrow the Directory and replace it with a dictatorial government which he called "democratic," in which private property would be abolished and equality would be decreed. For these ideas, and for his activist program, he has been regarded as a political precursor to modern communism. The Directory repressed the Conspiracy of Equals without difficulty and guillotined Babeuf and one other. Meanwhile it did nothing to relieve the distress of the lower classes, who showed little inclination to follow Babeuf even though they suffered from the ravages of scarcity and inflation.

### *The Political Crisis of 1797*

In March 1797 occurred the first really free election ever held in France under republican auspices. The successful candidates were for the most part constitutional monarchists or at least vaguely royalist. A change of the balance within the Five Hundred and the Ancients, in favor of royalism, seemed to be impending. This was precisely what most of the repub-

licans of 1793, including the regicides, could not endure, even though they had to violate the constitution to prevent it. Nor was it endurable, for other reasons, to General Napoleon Bonaparte.

Bonaparte had been born in 1769 into the minor nobility of Corsica, shortly after the annexation of Corsica to France. He had studied in French military schools and been commissioned in the Bourbon army but would never have reached high rank under the conditions of the Old Regime. In 1793 he was a fervent young Jacobin officer, who had been useful in driving the British from Toulon and who was consequently made a brigadier general by the government of the Terror. In 1795, as noted, he rendered service to the Convention by breaking up a demonstration of royalists. In 1796 he received command of an army, with which, in two brilliant campaigns, he crossed the Alps and drove the Austrians from north Italy. Like other generals he soon became independent from the government in Paris, which was financially too harassed to pay his troops or to supply him. He lived by local requisitions in Italy, became self-supporting, and in fact made the civilian government in Paris dependent on him.

---

*Napoleon Bonaparte*

He developed a foreign policy of his own. Many Italians had become dissatisfied with their old governments, so that the arrival of the French republican armies threw north Italy into a turmoil. The Venetian cities revolted against Venice, Bologna against the pope, Milan against Austria, and in Piedmont the Savoy monarchy was threatened by uprisings of its own subjects. Combining with some of these revolutionaries, while rejecting others, Bonaparte established a "Cisalpine" Republic in the Po valley, modeled on the French system, with Milan as its capital. Where the Directory, on the whole, had originally meant to return Milan to the Austrians in compensation for Austrian recognition of the French conquest of Belgium, Bonaparte insisted that France hold its position in both Belgium and Italy. He therefore needed expansionist republicans in the government in Paris and was perturbed by the royalist victories in the elections of 1797.

The Austrians negotiated with Bonaparte because they had been beaten by him in battle. The British also, in conferences with the French at Lille, discussed peace in 1796 and 1797. The war had gone badly for England; a party of Whigs led by Charles James Fox had always openly disapproved it, and the pro-French and republican radicals were so active that the government suspended habeas corpus in 1794, and thereafter imprisoned political agitators at its discretion. Crops were bad and bread was scarce and costly. England too suffered from inflation, for Pitt at first financed the war by extensive loans, and a good deal of gold was shipped to the Continent to finance the Allied armies. In February 1797 the Bank of England suspended gold payments to private citizens. Famine threatened, the populace was restless, and there were even mutinies in the fleet. Ireland was in rebellion; the French came close to landing a republican army there, and it could be supposed that the next attempt might be more successful. The Austrians, Britain's only remaining ally, had been routed by Bonaparte, and at the moment the British could subsidize them no further. The British had every reason to make peace.

---

*Prospects for peace*

Prospects for peace therefore seemed good in the summer of 1797, but, as always, it would be peace upon certain conditions. It was the royalists in France that were the peace party, since a restored king could easily return the conquests of the republic and would in any case abandon the new republics in Holland and the Po valley. The republicans in the French government could make peace with difficulty, if at all. They were constitutionally bound to retain Belgium. They were losing control of their own generals. Nor could the supreme question be evaded: Was peace dear enough to purchase by a return of the Old Regime, such as Louis XVIII had himself promised?

---

## CHRONOLOGY OF NOTABLE EVENTS, 1789–1804

---

May 1789	Estates General convenes at Versailles
June 1789	The Third Estate declares itself to be the National Assembly
July 1789	Crowd assaults and captures the Bastille fortress in Paris
August 1789	National Assembly issues “Declaration of the Rights of Man and Citizen” and abolishes “feudal privileges”
September 1791	New French Constitution establishes a constitutional monarchy
April 1791	France declares war on Austria and Prussia
September 1792	New National Convention meets in Paris; France becomes a republic
January 1793	King Louis XVI is executed in Paris
1793–1794	The Radical Revolution and the “Reign of Terror”
July 1794	Robespierre and his Jacobin allies are executed
1795–1799	Republic called “the Directory” governs France and sends armies to spread revolutionary republicanism in Europe
November 1799	Napoleon Bonaparte seizes power in a coup d’état
1799–1804	Napoleon is “First Consul” in French government called the Consulate; laws are codified in Napoleonic Code
1801	Napoleon’s Concordat with the Roman Catholic Church
1804	France becomes an empire under Emperor Napoleon I

---

---

### *The coup d’état of Fructidor*

The coup d’état of Fructidor (September 4, 1797) resolved all these many issues. It was the turning point of the constitutional republic and was decisive for all Europe. The Directory asked for help from Bonaparte, who sent one of his generals, Augereau, to Paris. While Augereau stood by with a force of soldiers, the councils annulled most of the elections of the preceding spring. On the whole, it was the old republicans of the Convention who secured themselves in power. Their justification was that they were defending the revolution, keeping out Louis XVIII and the Old Regime. But to do so they had violated their own constitution and quashed the first free election ever held in a constitutional French republic. And they had become more than ever dependent on the army.

After the coup d’état the “Fructidorian” government broke off negotiations with England. With Austria it signed the treaty of Campo Formio on October 17, 1797, incorporating Bonaparte’s ideas. By the new treaty Austria recognized the French annexation of Belgium (the former Austrian Netherlands), the French right to incorporate the Left Bank of the Rhine, and the French-dominated Cisalpine Republic in Italy. In return, Bonaparte allowed the Austrians to annex Venice and most of mainland Venetia.

---

### *Revolutionary republicanism spreads*

In the following months, under French auspices, revolutionary republicanism spread rapidly through much of Italy, creating new republics with classical names. The old patrician republic of Genoa turned into a Ligurian Republic on the French model. At Rome the pope was deposed from his

temporal power and a Roman Republic was established. In southern Italy a Neapolitan Republic, also called Parthenopean, was set up. In Switzerland at the same time, Swiss reformers cooperated with the French to create a new Helvetic Republic.

The Left Bank of the Rhine, in the atomistic Holy Roman Empire, was occupied by a great many German princes who now had to vacate. The treaty of Campo Formio provided that they be compensated by church territories in Germany east of the Rhine and that France have a hand in the redistribution. The German princes turned greedy eyes on the German bishops and abbots, and the almost 1,000-year-old empire, hardly more than a solemn form since the Peace of Westphalia, sank to the level of a land rush or real estate speculation, while France became involved in the territorial reconstruction of Germany.

### *The Coup d'État of 1799: Bonaparte*

After Fructidor the idea of maintaining the republic as a free or constitutional government was given up. There were more uprisings, more quashed elections, more purgings both to Left and Right. The Directory turned into an ineffective dictatorship. It repudiated most of the assignats and the debt but failed to restore financial confidence or stability. Guerrilla activity flared up again in the Vendée and other parts of western France. The religious schism became more acute; the Directory had to take severe measures toward the refractory clergy.

Meanwhile Bonaparte waited for the situation to ripen. Returning from Italy a conquering hero, he was assigned to command the army in training to invade England. He concluded that invasion was premature and decided to strike indirectly at England, by threatening India in a spectacular invasion of Egypt. In 1798, outwitting the British fleet, he landed a French army at the mouth of the Nile. Egypt was part of the Ottoman Empire, and the French occupation of it alarmed the Russians, who had their own designs on the Middle East. The Austrians objected to the French rearrangement of Germany. A year and a half after the treaty of Campo Formio, Austria, Russia, and Great Britain formed an alliance known as the Second Coalition. The French Republic was again involved in a general war. And the war went unfavorably, for in August 1798 the British fleet had cut off the French army in Egypt by winning the battle of the Nile (or Aboukir), and in 1799 Russian forces, under Marshal Suvorov, were operating as far west as Switzerland and north Italy, where the Cisalpine Republic went down in ruin.

General Bonaparte's opportunity had now come. He left his army in Egypt and, slipping through the British fleet, reappeared unexpectedly in France. He found that certain civilian leaders in the Directory were planning a change. They included Sieyès, of whom little had been heard since he wrote *What Is the Third Estate?* in 1789, but who had sat in the Convention and voted for the death of Louis XVI. Sieyès' formula was now "confidence from below, authority from above"—what he now wanted of the people was acquiescence, and of the government, power to act. This group was looking about for a general, and their choice fell on the sensational young Bonaparte, who was still only 30. Dictatorship by an army officer was repugnant to most republicans of the Five Hundred and the Ancients. Bonaparte, Sieyès, and their followers resorted to force, executing the coup d'état of Brumaire (November 9, 1799), in which armed soldiers drove the legislators from the chambers. They proclaimed a new form of the republic, which Bonaparte entitled the Consulate. It was headed by three consuls, with Bonaparte as the First Consul.

---

*The Directory turns to Bonaparte*

### THE FRENCH REPUBLIC AND ITS SATELLITES, 1798–1799

By 1799 the French Republic had annexed Belgium (the Austrian Netherlands) and the small German bishoprics and principalities west of the Rhine, and had created, with the aid of native sympathizers, a string of lesser revolutionary republics in the Dutch Netherlands, Switzerland, and most of Italy. With the treaty of Campo Formio between France and Austria in 1797, the Holy Roman Empire began to disintegrate, for the German princes of the Left Bank of the Rhine, who were dispossessed when their territories went to France, began to be compensated with territory of the church-states of the Holy Roman Empire. These developments were carried further by Napoleon (see map, p. 430).

## 46. THE AUTHORITARIAN REPUBLIC: THE CONSULATE, 1799–1804

The next chapter takes up the affairs of Europe as a whole in the time of Napoleon Bonaparte, the purpose at present being only to tell how he closed, in a way, the Revolution in France.

It happened that the French Republic, in falling into the hands of a general, fell also to a man of such remarkable talents as are often denominated genius. Bonaparte was a short man who would never have looked impressive in civilian clothing. His manners were rather coarse; he lost his temper, cheated at cards, and pinched people by the ear in a kind of formidable play—he was no “gentleman.” A child of the Enlightenment and the Revolution, he was entirely emancipated not only from customary ideas but from moral scruples as well. He regarded the world as a flux to be formed by his own mind. He had an exalted belief in his own destinies, which became more mystical and exaggerated as the years went on. He claimed to follow his “star.” His ideas of the good and the beautiful were rather blunt, but he was a man of extraordinary intellectual capacity, which impressed all with whom he came in contact. “Never speak unless you know you are the ablest man in the room,” he once advised his stepson, on making him viceroy of Italy, a maxim which, if he followed it himself, still allowed him to do most of the talking. His interests ran to solid subjects, history, law, military science, public administration. His mind was tenacious and perfectly orderly; he once declared that it was like a chest of drawers, which he could open or close at will, forgetting any subject when its drawer was closed and finding it ready with all necessary detail when its drawer was opened. He had all the masterful qualities associated with leadership; he could dazzle and captivate those who had any inclination to follow him at all. Some of the most humane men of the day, including Goethe and Beethoven in Germany, and Lazare Carnot among the former revolutionary leaders, at first looked on him with high approval. He inspired confidence by his crisp speech, rapid decisions, and quick grasp of complex problems when they were newly presented to him. He was, or seemed, just what many people in France were looking for after ten years of upheaval.

---

*Napoleon's genius*

Under the Consulate France reverted to a form of enlightened despotism, and Bonaparte may be thought of as the last and most eminent of the enlightened despots. Despotic the new regime undoubtedly was from the start. Self-government through elected bodies was ruthlessly pushed aside. Bonaparte delighted in affirming the sovereignty of the people; but to his mind the people were a sovereign, like Voltaire's God, who somehow created the world but never thereafter interfered in it. He clearly saw that a government's authority was greater when it was held to represent the entire nation. In the weeks after Brumaire he assured himself of a popular mandate by devising a written constitution and submitting it to a general referendum or “plebiscite.” The voters could take it—or nothing. They took it by a majority officially reported as 3,011,007 to 1,562.

---

*Bonaparte as First Consul*

The new constitution set up a make-believe of parliamentary institutions. It provided for universal male suffrage, but the citizens merely chose “notables”; men on the lists of notables were then appointed by the government itself to public position. The notables had no powers of their own. They were merely available for appointment to office. They might sit in a Legislative Body, where they could neither initiate nor discuss legislation but only mutely reject or enact it. There was

also a **Tribunate** which discussed public policies but had no enacting powers. There was a **Conservative Senate**, which had rights of appointment of notables to office ("patronage" in American terms) and in which numerous storm-tossed regicides found a haven. **The main agency in the new government was the Council of State**, imitated from the Old Regime; it prepared the significant legislation, often under the presidency of the First Consul himself, who always gave the impression that he understood everything. **The First Consul made all the decisions and ran the state.** The regime did not openly represent anybody, and that was its strength, for it provoked the less opposition. In any case, the political machinery just described fell rapidly into disuse.

**Bonaparte entrenched himself also by promising and obtaining peace.** The military problem at the close of 1799 was much simplified by the attitude of the **Russians**, who in effect **withdrew from the war with France.** In the Italian theater Bonaparte had to deal only with the Austrians, whom he again defeated, by again crossing the Alps, at the battle of Marengo in June 1800. In February 1801 the **Austrians signed the treaty of Lunéville**, in which the terms of **Campo Formio** were confirmed. A year later, in March 1802, **peace was made even with Britain.**

Peace was made also at home. **Bonaparte kept internal order, partly by a secret political police but more especially through a powerful and centralized administrative machine in which a "prefect," under direct orders of the minister of the interior, ruled firmly over each of the regional departments created by the Constituent Assembly.** The new government put down the guerrillas in the west. Its laws and taxes were imposed on Brittany and the Vendée. **Peasants there were no longer terrorized by marauding partisans.** A new peace settled down on the factions left by the Revolution. **Bonaparte offered a general amnesty and invited back to France, with a few exceptions, exiles of all stripes, from the first aristocratic émigrés to the refugees and deportees of the republican coups d'état.** Requiring only that they work for him and stop quarreling with each other, he picked reasonable men from all camps. **His Second Consul was Cambacérès, a regicide of the Terror; his Third Consul was Lebrun, who had been Maupéou's colleague in the days of Louis XV. Fouché emerged as minister of police; he had been an Hébertist and extreme terrorist in 1793 and had done as much as anyone to bring about the fall of Robespierre.** Before 1789 he had been an obscure bourgeois professor of physics. **Talleyrand appeared as minister of foreign affairs; he had spent the Terror in safe seclusion in the United States, and his principles, if he had any, were those of constitutional monarchy.** Before 1789 he had been a bishop, and he descended from an old and famous aristocratic lineage—no one who had not known the Old Regime, he once said, could realize how pleasant it had been. Men of this kind were now willing, for a few years beginning in 1800, to forget the past and work in common toward the future.

**Disturbers of the new order the First Consul ruthlessly put down. Indeed, he concocted alarms to make himself more welcome as a pillar of order.** On Christmas Eve, 1800, on the way to the opera, he was nearly killed by a bomb, or "infernal machine," as people then called such bombs. It had been set by royalists, but Bonaparte represented it as the work of Jacobin conspiracy, being most afraid at the moment of some of the old republicans; and over 100 former Jacobins were deported. **Contrariwise, in 1804, he greatly exaggerated certain royalist plots against him, invaded the independent state of Baden, and there arrested the Duke of Enghien, who was related to the Bourbons.** Though he knew Enghien to be innocent, he had him shot. **His purpose now was to please the old Jacobins by staining his own hands with Bourbon blood; Fouché and the regicides concluded that they were secure so long as Bonaparte was in power.**

*Controlling the  
revolutions  
war nature.*

After repeatedly winning battles against all the powers of Europe, Napoleon developed even more grandiose ideas of himself and the imperial power of France. This painting was completed in 1806 by Jacques-Louis David, the aging revolutionary whose work had once portrayed the Tennis Court Oath and the faces of common people in Paris. Here he presents an idealized image of Napoleon as a young republican hero who crossed the Alps in 1800 to win the battle of Marengo.

(Giraudon/Art Resource, NY)

### *The Settlement with the Church, Other Reforms*

For all but the most convinced royalists and republicans, reconciliation was made easier by the establishment of peace with the church. Bonaparte himself was a pure eighteenth-century rationalist. He regarded religion as a convenience. He advertised himself as a Muslim in Egypt, as a Catholic in France, and as a freethinker among the professors at the Institute in Paris. But a Catholic revival was in full swing and he saw its importance. The refractory clergy were the spiritual force animating all forms of counter-revolution. "Fifty émigré bishops, paid by England," he once said, "lead the French clergy today. Their influence must be destroyed. For this we need the authority of the pope." Ignoring the horrified outcries of the old Jacobins, in 1801 he signed a concordat with the Vatican.

Concordat with the  
Vatican

Both parties gained from the settlement. The autonomy of the prerevolutionary Gallican church came to an end. The pope received the right to depose French bishops, since before the schism could be healed both constitutional and refractory bishops had to be obliged to resign. The constitutional or pro-revolutionary clergy came under the discipline of the Holy See. Publicity of Catholic worship, in such forms as processions in the streets, was again allowed. Church seminaries were again permitted. But Bonaparte and the heirs of the Revolution gained even more. The pope, by signing the concordat, virtually recognized the Republic. The Vatican agreed to raise no question over the former tithes and the former church lands. The new owners of former church properties thus obtained clear titles. Nor was there any further question of Avignon, an enclave within France, formerly papal, annexed to France in 1791. Nor were the papal negotiators able to undermine religious toleration; all that Bonaparte would concede was a

clause that was purely factual, and hence harmless, stating that Catholicism was the religion of the majority of the French people. The clergy, in compensation for loss of their tithes and property, were assured of receiving salaries from the state. But Bonaparte, to dispel the notion of an established church, put Protestant ministers of all denominations on the state payroll also. He thus checkmated the Vatican on important points. At the same time, simply by signing an agreement with Rome, he disarmed the counterrevolution. It could no longer be said that the Republic was godless. Good relations did not, indeed, last very long, for Bonaparte and the papacy were soon at odds. But the terms of the concordat proved lasting.

With peace and order established, the constructive work of the Consulate turned to the fields of law and administration. The First Consul and his advisers combined what they conceived to be the best of the Revolution and of the Old Regime. The modern state took on clearer form. It was the reverse of everything feudal. All public authority was concentrated

---

#### Consulate reforms

in officially employed agents of government, no person was held to be under any legal authority except that of the state, and the authority of government fell on all persons alike. There were no more estates, legal classes, privileges, local liberties, hereditary offices, guilds, or manors. Judges, officials, and army officers received specified salaries. Neither military commissions nor civil offices could be bought and sold. Citizens were to rise in government service according to their abilities rather than their wealth or privileged birth.

---

#### "Careers open to talent"

This was the doctrine of "careers open to talent"; it was what the bourgeoisie had wanted before the Revolution, and a few persons of quite humble birth profited also. For sons of the old aristocracy, it meant that pedigree was not enough; they must also show individual capacity to obtain employment. Qualification came to depend increasingly on education, and the secondary and higher schools were reorganized in these years, with a view to preparing young men for government service and the learned professions. Scholarships were provided, but it was mainly the upper middle class that benefited. Education, in fact, in France and in Europe generally, came to be an important determinant of social standing, with one system for those who could spend a dozen or more years at school, and another for those who were to enter the workforce at the age of 12 or 14. Meanwhile, French intellectual life was strictly regulated and censored. When a few professors at the National Institute began to question certain government policies, for example, Bonaparte suppressed both their writings and the section of the Institute in which they worked; and when the liberal critic Germaine de Staël published books that displeased the First Consul, she was sent off to exile in Switzerland. Creative, critical intellectual debate thus became impossible in France during these years, though Bonaparte satisfied many of the popular demands for education and professional advancement.

Another deep demand of the French people, deeper than the demand for the vote, was for more reason, order, and economy in public finance and taxation. The Consulate gave these also. There were no tax exemptions because of birth, status, or special arrangement. Everyone was supposed to pay, so that no disgrace attached to payment, and there was less evasion. In principle these changes had been introduced in 1789; after 1799 they began to work. For the first time in ten years the government really collected the taxes that it levied and so could rationally plan its financial affairs. Order was introduced also into expenditure, and accounting methods were improved. There was no longer a haphazard assortment of different "funds" on which various officials drew independently and confidentially as

they needed money, but a concentration of financial management in the treasury and even in a kind of budget. The revolutionary uncertainties over the value of money were also ended. Because the Directory had shouldered the odium of repudiating the paper money and government debt, the Consulate was able to establish a sound currency and public credit. To assist in government financing, one of the banks of the Old Regime was revived and established as the Bank of France.

Like all enlightened despots, Bonaparte codified the laws, and of all law codes since the Romans the Napoleonic codes are the most famous. To the 300 legal systems of the Old Regime and the mass of royal ordinances were now added the thousands of laws enacted but seldom implemented by the revolutionary assemblies. Five codes emerged—the Civil Code (often called simply the Code Napoleon), the codes of civil and of criminal procedure, and the commercial and penal codes. The codes made France legally and judicially uniform. They assured legal equality: all French citizens had the same civil rights. They formulated the new law of property and set forth the law of contracts, debts, leases, stock companies, and similar matters in such a way as to create the legal framework for an economy of private enterprise. They repeated the ban of all previous regimes on organized labor unions and were severe with individual workers, their word not being acceptable in court against that of the employer—a significant departure from equality before the law. The criminal code was somewhat freer in giving the government the means to detect crime than in granting the individual the means of defense against legal charges. As for the family, the codes recognized civil marriage and divorce but left the wife with very restricted powers over property and the father with extensive authority over minor children; the legal system codified a paternalistic view of all family relations. The codes reflected much of French life under the Old Regime. They also set the character of France as it has been ever since, socially bourgeois, legally egalitarian, and administratively bureaucratic.

---

*The Napoleonic  
Codes*

In France, with the Consulate, the Revolution was over. If its highest hopes had not been accomplished, the worst evils of the Old Regime had at least been cured. The beneficiaries of the Revolution felt secure. Even former aristocrats were rallying. The working-class movement, repeatedly frustrated under all the revolutionary regimes, now vanished from the political scene to reappear as socialism 30 years later. What the Third Estate had most wanted in 1789 was now both codified and enforced, with the exception of parliamentary government, which after ten years of turmoil many people were temporarily willing to forgo. Moreover, in 1802, the French Republic was at peace with the papacy, Great Britain, and all Continental powers. It reached to the Rhine and had dependent republics in Holland and Italy. So popular was the First Consul that in 1802, by another plebiscite, he had himself elected consul for life. A new constitution, in 1804, again ratified by plebiscite, declared that “the government of the republic is entrusted to an emperor.” The Consulate became the Empire, and Bonaparte emerged as Napoleon I, Emperor of the French.

---

*From Consulate to  
Empire*

But France, no longer revolutionary at home, was revolutionary outside its borders. Napoleon became a terror to the patricians of Europe. They called him the “Jacobin.” And the France which he ruled, and used as his arsenal, was an incomparably formidable state. Even before the Revolution it had been the most populous in Europe, perhaps the most wealthy, in the front rank of scientific enterprise and intellectual leadership. Now all the old barriers of privilege, tax exemption, localism, and caste exclusiveness had disappeared. The new France could tap the wealth of its citizens and put able men into positions without inquiring into their origins. Every private, boasted Napoleon, carried a marshal’s

bâton in his knapsack. The French looked with disdain on their caste-ridden adversaries. The principle of civic equality proved not only to have the appeal of justice, but also to be politically useful, and the resources of France were hurled against Europe with a force which for many years nothing could check.

## NAPOLEONIC EUROPE

47. The Formation of the French Imperial System
48. The Grand Empire: Spread of the Revolution
49. The Continental System: Britain and Europe
50. The National Movements: Germany
51. The Overthrow of Napoleon: The Congress of Vienna

 *The repercussions* of the French Revolution had been felt throughout Europe since the fall of the Bastille, and even more definitely after the outbreak of war in 1792 and the ensuing victories of the republican armies. They became even more evident after the republican General Bonaparte turned into Napoleon I, Emperor of the French, King of Italy, and Protector of the Confederation of the Rhine. Napoleon surpassed all previous European rulers in imposing a broad political unity on the European continent. Although his imperial power collapsed in less than fifteen years, his military campaigns and political ascendancy transformed both international relations in Europe and the internal development of the various European peoples. The French impact on other nations,

though based on military success, represented more than mere forcible subjugation. Innovations of a kind made in France by revolution were brought to other countries by administrative decree. There were for several years Germans, Italians, Dutch, and Poles who worked with the French emperor to introduce the changes that he demanded, and which they themselves often desired. In Prussia it was resistance to Napoleon that gave the incentive to internal reorganization and fostered the emergence of a new German nationalism. Whether by collaboration or resistance, Europe was transformed.

It is convenient to think of the fighting from 1792 to 1814 as a “world war,” as indeed it was, affecting not only all of Europe but also places as far away as Latin America, where the wars of independence began, or the interior of North America, where the United States purchased Louisiana in 1803 and attempted a conquest of Canada in the War of 1812. But it is important to realize that this world war was actually a series of wars, most of them quite short and distinct. Only Great Britain remained continually at war with France, except for about a year of peace in 1802–1803. Never were the four

great European powers, Britain, Austria, Russia, and Prussia, simultaneously in the field against France until 1813.

The history of the Napoleonic period would be much simpler if the European governments had fought merely to protect themselves against the aggressive French. Each, however, in its way, was as dynamic and expansive as Napoleon himself. For some generations Great Britain had been building a commercial empire, Russia had been pushing upon Poland and Turkey, and Prussia had been consolidating its territories and striving for leadership in north Germany. Austria was less aggressive, but the Austrians were not without their own dreams of ascendancy in Germany, the Balkans, and the Adriatic. None of these ambitions ceased during the Napoleonic years. Governments, in pursuit of their own aims, were quite as willing to ally with Napoleon as to fight him. Only gradually, and under repeated provocation, did they conclude that their main interest was to dispose of the French emperor entirely.

## 47. THE FORMATION OF THE FRENCH IMPERIAL SYSTEM

### *The Dissolution of the First and Second Coalitions, 1792–1802*

The conflicting purposes of the powers had been apparent from almost the beginning of the French Revolution. Leopold of Austria, in issuing the Declaration of Pillnitz in 1791, had believed a general European coalition against France to be impossible. When war began in 1792, the Austrians and Prussians kept their main forces in eastern Europe, more afraid of each other and of Russia, in the matter of Poland, than of the French revolutionary republic. Indeed, the main accomplishment of the First Coalition was the partition of Poland and the dissolution of the Polish state.

*The First Coalition  
disintegrates*

In 1795 the French broke up the coalition. The British withdrew their army from the Continent. Prussia and Spain each made a separate peace with France. Indeed, Bourbon Spain—acting for reasons of strategic self-interest that ignored all ideology or principle—formed an alliance with the French republic that had guillotined Louis XVI and kept Louis XVIII from his monarchic rights. Spain simply reverted to the eighteenth-century pattern in allying with France because of hostility to Great Britain, whose possession of Gibraltar, naval influence in the Mediterranean, and attitude toward the Spanish empire were disquieting to the Spanish government. When Austria signed the peace of Campo Formio in 1797, the First Coalition was totally dissipated, only British naval forces remaining engaged with the French.

The Second Coalition of 1799 fared no better. After the British fleet defeated the French at the battle of the Nile, cutting off the French army in Egypt, the Russians saw their ambitions in the Mediterranean blocked mainly by the British and withdrew Suvorov's army from western Europe. Austria's acceptance of the peace of Lunéville in 1801 dissolved the Second Coalition, and in 1802 Great Britain signed the peace of Amiens. For the only time between 1792 and 1814 no European power was at war with another.

### *Peace Interim, 1802–1803*

Never had a peace been so advantageous to France as the peace of 1802. But Bonaparte gave it no chance. He used peace as he did war to advance his interests. He dispatched a

sizable army to Haiti, ostensibly to suppress Toussaint L'Ouverture and the Haitian military campaign to establish an independent republic. But he also sent this army with the further thought (since Louisiana had been ceded back by Spain to France in 1800) of reviving the French colonial empire in America. He reorganized the Cisalpine Republic into an "Italian" Republic with himself as president. He reorganized the Helvetic Republic, making himself "mediator" of the Confederation of Switzerland. He reorganized Germany; that is to say, he and his agents closely watched the rearrangement of territory which the Germans themselves had been carrying out since 1797.

By the treaty of Campo Formio, it will be recalled, German princes of the Left Bank of the Rhine, expropriated by the annexation of their dominions to the French Republic, were to receive new territories on the Right Bank. The result was a scramble called by patriotic German historians the "shame of the princes." The German rulers, far from opposing Bonaparte or upholding any national interests, competed desperately for the absorption of German territory, each bribing and fawning upon the French (Talleyrand made over 10,000,000 francs in the process) to win French support against other Germans. The Holy Roman Empire was fatally mauled by the Germans themselves. Most of its ecclesiastical principalities and 45 out of its 51 free cities disappeared, annexed by their larger neighbors. The number of states in the Holy Empire was greatly reduced, but Prussia, Bavaria, Württemberg, and Baden consolidated and enlarged themselves. These arrangements were ratified in February 1803 by the diet of the Empire. The enlarged German states now depended on Bonaparte for the maintenance of their new position.

---

The "shame of the  
princes"

### *Formation of the Third Coalition in 1805*

Britain and France went to war again in 1803. Bonaparte, his communications with America menaced by the British navy, and his army in Haiti decimated by disease and by the military campaigns of the Haitian independence movement, suspended his ideas for recreating an American empire and sold Louisiana to the United States. Great Britain began to seek allies for a Third Coalition. In May 1804 Napoleon pronounced himself Emperor of the French to ensure the hereditary permanency of his system, though at the time he had no heir. Francis II of Austria, seeing the Holy Roman Empire in ruins, promulgated the Austrian Empire in August 1804. He thus advanced the long process of integrating the Danubian monarchy. In 1805 Austria signed an alliance with Great Britain. The Third Coalition was completed by the accession of the Russian Tsar Alexander I, who, after Napoleon himself, was to become the most considerable figure on the European stage.

---

Tsar Alexander I

Alexander was the grandson of Catherine the Great, educated by her to be a kind of enlightened despot on the eighteenth-century model. The Swiss tutor of his boyhood, La Harpe, later turned up as a pro-French revolutionary in the Helvetic Republic of 1798. Alexander became tsar in 1801, at the age of 24, through a palace revolution which implicated him in the murder of his father Paul. He still corresponded with La Harpe, and he surrounded himself with a circle of liberal and zealous young men of various nationalities, of whom the most prominent was a Polish youth, Czartoryski. Alexander regarded the still recent partitions of Poland as a crime. He wished to restore the unity of Poland with himself as a constitutional king. In Germany many who had first warmed to the French Revolution, but had been disillusioned, began to hail the new liberal tsar as the protector of Germany and hope of the future. Alexander conceived of himself as a rival to Napoleon in

Toussaint L'Ouverture, pictured here with a sword and documents to symbolize his independence, led the political and military movement that created a new Republic of Haiti. Although Toussaint himself was captured and sent to a prison in France (where he died in 1803), the French defeat in Haiti made Napoleon abandon his plans for an American empire and sell Louisiana to the United States.

(Library of Congress)

guiding the destinies of Europe in an age of change. Moralistic and self-righteous, he puzzled and disturbed the statesmen of Europe, who generally saw, behind his humane and republican utterances, either an enthroned leader of all the “Jacobins” of Europe or the familiar specter of Russian aggrandizement.

Yet Alexander, more than his contemporaries, formed a conception of international collective security and the indivisibility of peace. He was shocked when Napoleon in 1804, in order to seize the duke of Enghien, rudely violated the sovereignty of Baden. He declared that the issue in Europe was clearly between law and force—between an international society in which the rights of each member were secured by international agreement and organization and a society in which all trembled before the rule of cynicism and conquest embodied in the French usurper.

Alexander was therefore ready to enter a Third Coalition with Great Britain. Picturing himself as a future arbiter of central Europe, and with secret designs on the Ottoman Empire and the Mediterranean, he signed a treaty with England in April 1805. The British agreed to pay Russia £1,250,000 for each 100,000 soldiers that the Russians raised.

### *The Third Coalition, 1805–1807: The Peace of Tilsit*

Napoleon meanwhile, since the resumption of hostilities in 1803, had been making preparations to invade England. He concentrated large forces on the Channel coast, together

with thousands of boats and barges in which he gave the troops amphibious training in embarkation and debarkation. He reasoned that if his own fleet could divert or cripple the British fleet for a few days he could place enough soldiers on the defenseless island to force its capitulation. The British, sensing mortal danger, lined their coasts with lookouts and signal beacons and set to drilling a home guard. Their main defense was twofold: the Austro-Russian armies and the British fleet under Lord Nelson. The Russian and Austrian armies moved westward in the summer of 1805. In August Napoleon relieved the pressure upon England, shifting seven army corps from the Channel to the upper Danube. On October 15 he surrounded an Austrian force of 50,000 men at Ulm in Bavaria, forcing it to surrender without resistance. On October 21 Lord Nelson, off Cape Trafalgar on the Spanish coast, caught and annihilated the main body of the combined fleets of France and Spain.

The battle of Trafalgar established the supremacy of the British navy for over a century—but only on the proviso that Napoleon be prevented from controlling the bulk of Europe, which would furnish an ample base for eventual construction of a greater navy than the British. And to control Europe was precisely what Napoleon proceeded to do. Moving east from Ulm he came upon the Russian and Austrian armies in Moravia, where on December 2 he won the great victory of Austerlitz. The broken Russian army withdrew into Poland, and Austria made peace. By the treaty of Pressburg Napoleon took Venetia from the Austrians, to whom he had given it in 1797, and annexed it to his kingdom of Italy (the former Cisalpine and Italian Republic), which now included a good deal of Italy north of Rome. Venice and Trieste soon resounded with the hammers of shipwrights rebuilding the Napoleonic fleet. In Germany, early in 1806, the French emperor raised Bavaria and Württemberg to the stature of kingdoms and Baden to a grand duchy. The Holy Roman Empire was finally, formally, and irrevocably dissolved. In its place Napoleon began to gather his German client states into a new kind of Germanic federation, the Confederation of the Rhine, of which he made himself the “protector.”

*British victory at  
Trafalgar*

Prussia, at peace with France for ten years, had declined to join the Third Coalition. But as Napoleon's program for controlling Germany became clear after Austerlitz, the war party in Prussia became irresistible, and the Prussian government, outwitted and distraught, went to war with the French unaided and alone. The French smashed the famous Prussian army at the battles of Jena and Auerstädt in October 1806. The French cavalry galloped all over north Germany unopposed. The Prussian king and his government took refuge in the east, at Königsberg, where the tsar and the re-forming Russian army might protect them. But the terrible Corsican pursued the Russians also. Marching through western Poland and into East Prussia, he met the Russian army first at the sanguinary but indecisive battle of Eylau and then defeated it on June 14, 1807, at Friedland. Alexander I was unwilling to retreat into Russia. He was unsure of his own resources; if the country were invaded, there might be a revolt of the nobles or even of the serfs—for people still remembered the great serf rebellion of the 1770s. Alexander feared also merely playing the game of the British. He put aside his war aims of 1804 and signified his willingness to negotiate with Napoleon. The Third Coalition had gone the way of the two before it.

*The Third Coalition  
collapses*

The Emperor of the French and the Autocrat of All the Russias met privately on a raft in the Niemen River, not far from the border between Prussia and Russia, the very easternmost frontier of civilized Europe, as the triumphant Napoleon gleefully imagined it. The hapless Prussian king, Frederick William III, paced nervously on the bank. Bonaparte turned all his charm upon Alexander, denouncing England as the author of all the

troubles of Europe and captivating him by flights of Latin imagination, in which he set before Alexander a boundless destiny as Emperor of the East, intimating that Russia's future lay toward Turkey, Persia, Afghanistan, and India. The result of their conversations was the treaty of Tilsit of July 1807, in many ways the high point of Napoleon's success. The French and Russian empires became allies, mainly against Great Britain. Ostensibly this alliance lasted for five years. Alexander accepted Napoleon as a kind of Emperor of the West. As for Prussia, Napoleon continued to occupy Berlin with his troops, and he took away all Prussian territories west of the Elbe, combining them with others taken from Hanover to make a new kingdom of Westphalia, which became part of his Confederation of the Rhine.

---

*The Treaty of Tilsit*

*The Continental System and the War in Spain*

Hardly had the "peace of the continent" been reestablished on the foundation of a Franco-Russian alliance when Napoleon began to have serious trouble. He was bent on subduing the British who, secure on their island, seemed beyond his reach. Since the French naval disaster at Trafalgar, there was no possibility of invading England in the foreseeable future. Napoleon therefore turned to economic warfare. He would fight sea power with land power, using his political control of the Continent to shut out British goods and shipping from all European ports.

---

*Economic warfare*

He would destroy the British trade in exports to Europe, both exports of British products and the profitable British reexport of goods from America and Asia. Thereby, he hoped, he would ruin British commercial firms and cause a violent business depression, marked by overloaded warehouses, unemployment, runs on the banks, a fall of the currency, rising prices, and revolutionary agitation. The British government, which would simultaneously be losing revenues from its customs duties, would thus find itself unable to carry the enormous national debt, or to borrow additional funds from its subjects, or to continue its financial subsidies to the military powers of Europe. At Berlin, in 1806, after the battle of Jena, Napoleon issued the Berlin Decree, forbidding the importation of British goods into any part of Europe allied with or dependent on himself. He in that way formally established the Continental System.

To make the Continental System effective Napoleon believed that it must extend to all continental Europe without exception. By the treaty of Tilsit, in 1807, he required both Russia and Prussia to adhere to it. They agreed to exclude all British goods; in fact, in the following months Russia, Prussia, and Austria all declared war on Great Britain. Napoleon then ordered two neutral states, Denmark and Portugal, to adhere. Denmark was an important entrepôt for all central Europe, and the British, fearing Danish compliance, dispatched a fleet to Copenhagen, bombarded the city for four days, and took captive the Danish fleet. The outraged Danes allied with Napoleon and joined the Continental System. Portugal, long a satellite of Britain, refused compliance; Napoleon invaded it. To control the whole European coastline from St. Petersburg around to Trieste he now had only to control the ports of Spain. By a series of deceptions he got both the Bourbon Charles IV and his son Ferdinand to abdicate the Spanish throne. He made his brother Joseph king of Spain in 1808 and reinforced him with a large French army.

He thus involved himself in an entanglement from which he never escaped. The Spanish regarded the Napoleonic soldiers as godless villains who desecrated churches. Fierce guerrillas took the field. Cruelties of one side were answered by atrocities of the

This meeting between Napoleon and Russia's Alexander I on the Niemen River produced an alliance and the Continental System. The new system was aimed against the British, but Alexander soon disliked the restrictions on Anglo-Russian commerce. His withdrawal from the Continental System provoked Napoleon's disastrous invasion of Russia in 1812.

(Rare Book Collection, University of North Carolina–Chapel Hill (Hoyt IC-187))

other. The British sent an expeditionary force of their small regular army, eventually under the Duke of Wellington, to sustain the Spanish guerrillas; the resulting Peninsular War dragged on for five years. But from the beginning the affair went badly for Napoleon. In July 1808 a French general, for the first time since the Revolution, surrendered an army corps, without fighting, by the capitulation at Baylen. In August another French force surrendered to the British army in Portugal. And these events raised hopes in the rest of Europe. An anti-French movement swept over Germany. It was felt strongly in Austria, where the Habsburg government, undaunted by three defeats and hoping to lead a general German national resistance, prepared for a fourth time since 1792 to go to war with France.

---

*The Peninsular War  
in Spain*

*The Austrian War of Liberation, 1809*

Napoleon summoned a general congress which met at Erfurt in Saxony in September 1808. His main purpose was to talk with his ally of a year, Alexander, but he assembled numerous dependent monarchs as well, by whose presence he hoped to overawe the tsar. He even had Talma, the leading actor of the day, play in the theater of Erfurt before "a parterre of kings." Alexander was unimpressed. He was hurt in a sensitive spot because Napoleon, a few months before, had made moves to re-create a Polish state, setting up what was called the Grand Duchy of Warsaw. He had found Napoleon unwilling, despite the grandiose language of Tilsit, really to support his expansion into the Balkans. In addition, Alexander was taken aside by Talleyrand, Napoleon's foreign minister. Talleyrand had concluded that Napoleon was overreaching himself and said so confidentially to the tsar, advising him to wait. Talleyrand thus betrayed the man whom he ostensibly served and prepared a safe place for

---

Talleyrand

himself in the event of Napoleon's fall; but he acted also as an aristocrat of the prenationalistic Old Regime, seeing his own country as only one part of the whole of Europe, believing a balance among the several parts to be necessary and holding that peace would be possible only when the exaggerated reach of French power would be reduced. For France and Russia, the two strongest states, to combine against all other states was contrary to all principles of the older diplomacy.

Austria proclaimed a war of liberation in April 1809. Napoleon advanced rapidly along the familiar route to Vienna. The German princes, indebted to the French, declined to join in a general German war against him. Alexander stood watchfully on the sidelines. Napoleon won the battle of Wagram in July. In October Austria made peace. The short war of 1809 was over. The Danubian monarchy, by no means as fragile as it seemed, survived a fourth defeat at the hands of the French without internal revolution or disloyalty to the Habsburg house. From it, in punishment, Napoleon took considerable portions of its territory. Part of Austrian Poland was used to enlarge Napoleon's Grand Duchy of Warsaw, and parts of Dalmatia, Slovenia, and Croatia, on the south, were erected into a new creation which Napoleon called the Illyrian Provinces (see map, p. 407).

*Napoleon at His Peak, 1809–1811*

---

Metternich

The next two years saw the Napoleonic empire at its peak. In Austria after the defeat of 1809 the conduct of foreign affairs fell to Clemens von Metternich, who was to remain the Austrian foreign minister for 40 years. He was a German from west of the Rhine, whose ancestral territories had been annexed to the French Republic, but he had entered the Austrian service and even married the granddaughter of Kaunitz, the old model of diplomatic savoir-faire, of which Metternich now became a model himself. Austria had been repeatedly humiliated and even partitioned by Napoleon, most of all in the treaty of 1809. But Metternich was not a man to conduct diplomacy by grudges. Believing that Russia was the really permanent problem for a state situated in the Danube valley, Metternich thought it wise to renew good relations with France. He was quite willing to go along with Napoleon, whom he knew personally, having been Austrian ambassador to Paris before the short war of 1809.

The French emperor, who in 1809 was exactly 40, was increasingly concerned by the fact that he was childless. He had made an empire which he pronounced hereditary. Yet he had no heir. Between him and his wife Josephine whom he had married in youth, and who

THE THIRD OF MAY 1808 *Goya (Spanish)*  
by Francisco de Goya (Spanish, 1746–1808)

Facing steadfast resistance to their military occupation of Spain, the French army committed atrocities such as the brutal scene that Goya portrayed in this image of the Peninsular War.

(Erich Lessing/Art Resource, NY)

*imperialism / expansionism*

*guerrilla → little war (people's war) → just standing up to invasion*

was six years his senior, there had long since ceased to be affection or even fidelity on either side. **He divorced her in 1809**, though since she had two children by a first husband she naturally protested that **Napoleon's childlessness was not her fault**. He intended to marry a younger woman who might bear him offspring. He intended also to make a spectacular marriage, to extort for himself, a self-made Corsican army officer, the highest and most exclusive recognition that aristocratic Europe could bestow. He debated between Habsburgs and Romanovs, between an archduchess and a grand duchess. Tactful inquiries at St. Petersburg concerning the availability of Alexander's sister were tactfully rebuffed; the tsar intimated that his mother would never allow it. The Russian alliance again showed its limitations. **Napoleon was thrown into the arms of Metternich—and of Marie Louise, the 18-year-old daughter of the Austrian emperor and niece of another "Austrian woman," Marie Antoinette. They were married in 1810. In a year she bore him a son, whom he entitled the King of Rome.**

Napoleon assumed ever more pompous airs of imperial majesty. He was now, by marriage, the nephew of Louis XVI. He showed more consideration to French noblemen of the Old Regime—only they, he said, knew really how to serve. He surrounded himself with a newly made hereditary Napoleonic nobility, hoping that the new families, as time went on, would bind their own fortunes to the house of Bonaparte. The marshals became dukes and princes; Talleyrand became the Prince of Benevento; and the bourgeois Fouché, an Hébertist radical in 1793 and more latterly a police official, was now solemnly addressed as the Duke of Otranto. In foreign affairs also the cycle had been run. With one significant exception, all the powers of the successive coalitions were allied with the French, and the Son of the Revolution now gravely referred to the emperor of Austria as “my father.”

## 48. THE GRAND EMPIRE: SPREAD OF THE REVOLUTION

### *The Organization of the Napoleonic Empire*

*The empire at its  
height*

Territorially Napoleon's influence enjoyed its farthest reach in 1810 and 1811, when it included the entire European mainland except the Balkan peninsula. The Napoleonic domain was in two parts. Its core was the French empire; then came thick layers of dependent states, which together with France comprised the Grand Empire. In addition, to the north and east were the “allied states” under their traditional governments—the three great powers, Prussia, Austria, and Russia, and also Denmark and Sweden. The allied states were at war with Great Britain, though not engaged in positive hostilities; their populations were supposed to do without British goods under the Continental System, but otherwise Napoleon had no direct lawful influence upon their internal affairs.

The French empire, as successor to the French Republic, included Belgium and the Left Bank of the Rhine. In addition, by 1810, it had developed two appendages which on a map looked like tentacles outstretched from it (see the map on p. 407). When he proclaimed France an empire and turned its dependent republics into kingdoms, Napoleon had set up his brother Louis as king of Holland; but Louis had shown such a tendency to ingratiate himself with the Dutch, and such a willingness to let Dutch businessmen trade secretly with the British, that Napoleon dethroned him and incorporated Holland into the French empire. In his endless war upon British goods he found it useful to exert more direct control over the ports of Bremen, Hamburg, Lübeck, Genoa, and Leghorn; he therefore annexed directly to the French empire the German coast as far as the western Baltic, and the Italian coast far enough to include Rome, which he desired for its imperial rather than its commercial value. Harking back to traditions as old as Charlemagne, he considered Rome the second city of his empire and entitled his son the “King of Rome.” When Pope Pius VII protested, Napoleon took him prisoner and interned him in France. The whole French empire, from Lübeck to Rome, was governed directly by departmental prefects who reported to Paris, and the 83 departments of France, created by the Constituent Assembly, had risen in 1810 to 130.

The dependent states, forming with France the Grand Empire, were of different kinds. The Swiss federation remained republican in form. The Illyrian Provinces, which included Trieste and the Dalmatian coast, were administered in their brief two years almost like departments of France. In Poland, since the Russians objected to a revived kingdom of Poland, Napoleon called his creation the Grand Duchy of Warsaw. Among the most important of the dependent states in the Grand Empire were the German states organized into the

**Confederation of the Rhine.** Too modestly named, the Confederation included all Germany between what the French annexed on the west and what Prussia and Austria retained on the east. It was a league of all the German princes in this region who were regarded as sovereign and who now numbered only about 20, the most important being the four newly made kings of Saxony, Bavaria, Württemberg, and Westphalia. Westphalia was an entirely new and synthetic state, made up of **Hanoverian and Prussian territories** and of various small parts of the old Germany. **Its king was Napoleon's youngest brother, Jerome.**

Napoleon liked to use his family as a means of rule. **The Corsican clan became the Bonaparte dynasty.** His brother Joseph from 1804 to 1808 **functioned as king of Naples** and after 1808 as **king of Spain.** Louis Bonaparte was for six years **king of Holland;** Jerome was king of Westphalia. **Sister Caroline became queen of Naples** after brother Joseph's transfer to Spain; for Napoleon, running out of brothers (having quarreled with his remaining brother, Lucien), gave the throne of Naples to his brother-in-law, Joachim Murat, a cavalry officer who was Caroline's husband. **In the "Kingdom of Italy,"** which in 1810 included Lombardy, Venetia, and most of the former papal states, **Napoleon himself retained the title of king,** but set up his stepson, Eugène Beauharnais (Josephine's son) as viceroy. **The mother of the Bonapartes, Letitia, who had brought up all these children under very different circumstances in Corsica, was suitably installed at the imperial court as Madame Mère.** According to legend she kept repeating to herself, "If only it lasts!"; **she outlived Napoleon by 15 years.**

### *Napoleon and the Spread of the Revolution*

**In all the states of the Grand Empire the same course of events tended to repeat itself.** First came the stage of military conquest and occupation by French troops. Then came the establishment of a native satellite government with the support of local persons who were willing to collaborate with the French and who helped in the drafting of a constitution specifying the powers of the new government and regularizing its relationships with France. In some areas these two stages had been accomplished under the republican governments before Napoleon came to power. In some regions no more than these two stages really occurred, notably in Spain and the Grand Duchy of Warsaw.

---

*Stages of French occupation*

**The third stage of French influence was one of sweeping internal reform and reorganization, modeled on Bonaparte's program for France and hence derivatively on the French Revolution.** Belgium and the German territories west of the Rhine underwent this stage most thoroughly, since they were annexed directly to France for 20 years. Italy and the main bulk of Germany west of Prussia and Austria also experienced the third stage.

**Napoleon considered himself a great reformer and man of the Enlightenment.** He called his system "liberal," and though the word to him meant almost the reverse of what it meant later to liberals, he was possibly the first to use it in a political sense. **He believed also in "constitutions";** not that he favored representative assemblies or limited government, but **he wanted government to be rationally "constituted,"** that is, deliberately mapped out and planned, not merely inherited from the jumble of the past. Man on horseback though he was, he believed firmly in **the rule of law.** He insisted with the zeal of conviction on transplanting his **Civil Code** to the dependent states. **He assumed that this code was based on the very nature of justice and human relationships, and he believed that it must therefore be applicable to all countries with no more than minor adaptation.** The idea that a country's laws must mirror its peculiar

---

*Napoleon as reformer*

national character and history was foreign to his mind, for he carried over the rationalist and universalist outlook of the Age of Enlightenment. He thought that people everywhere wanted, and deserved, much the same thing. As he wrote to his brother Jerome, on making him king of Westphalia, "the peoples of Germany, as of France, Italy and Spain, want equality and liberal ideas. For some years now I have been managing the affairs of Europe, and I am convinced that the crowing of the privileged classes was everywhere disliked. Be a constitutional king."

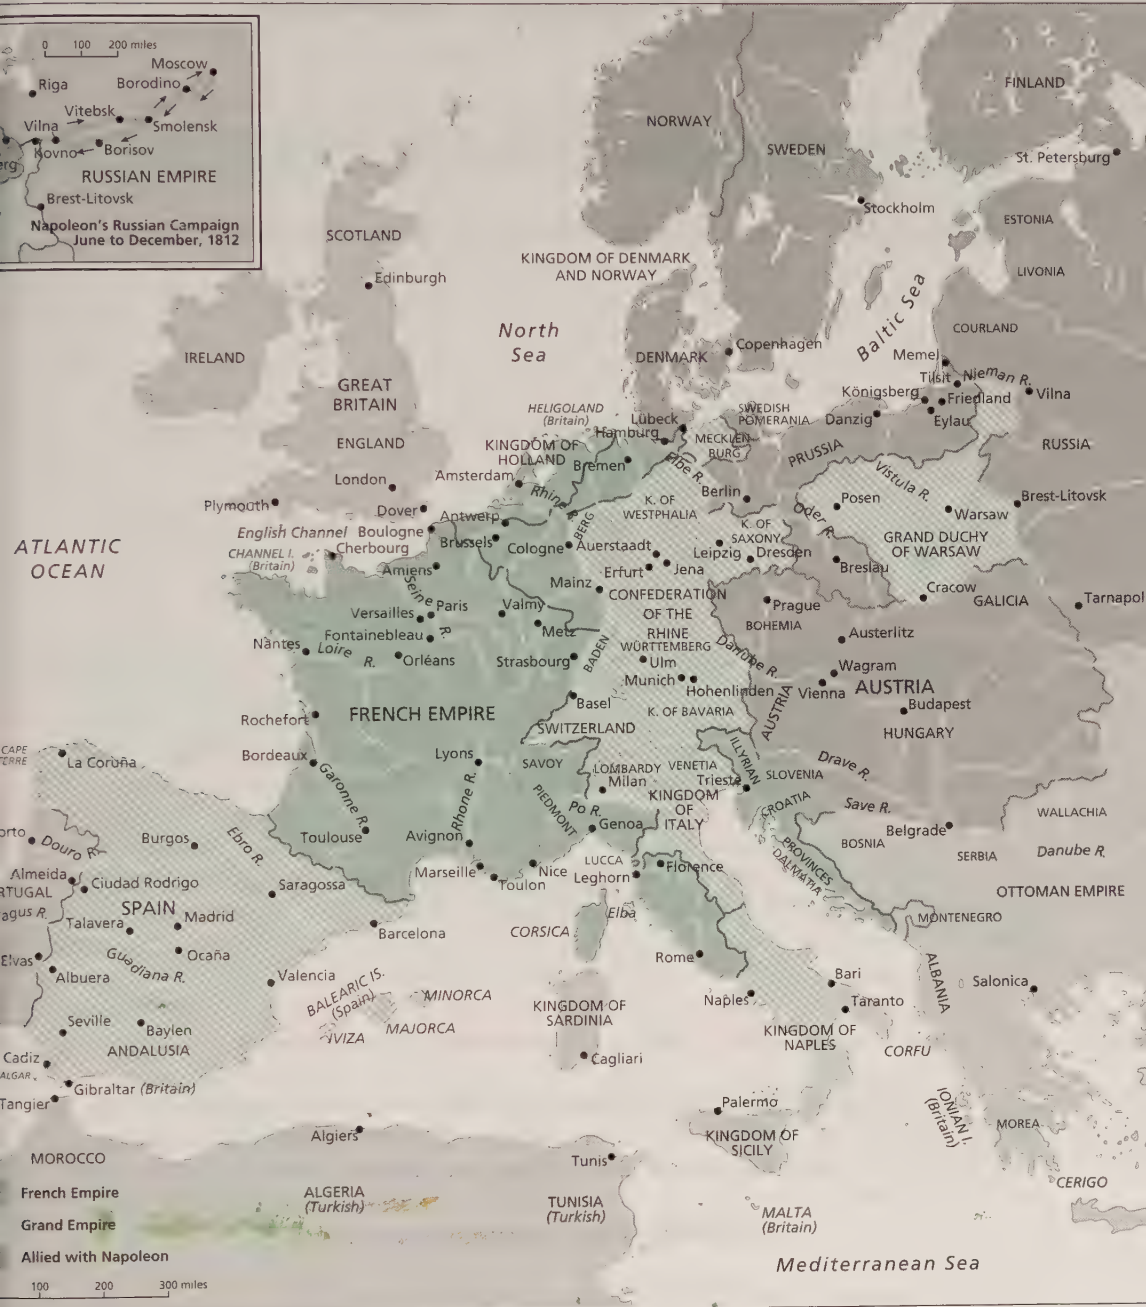

The same plan of reform was initiated, with some variation, in all the dependent states from Spain to Poland and from the mouth of the Elbe to the Straits of Messina. The reforms were directed, in a word, against everything feudal. They established the legal equality of individual persons and gave governments more complete authority over their individual subjects. Legal classes were wiped out, as in France in 1789; the theory of a society made up of "estates of the realm" gave way to the theory of a society made up of legally equal individuals. The nobility lost its privileges in taxation, officeholding, and military command. Careers were "opened to talent."

The manorial system, bulwark of the old aristocracy, was virtually liquidated. Lords lost all legal jurisdiction over their peasants; peasants became subjects of the state, personally free to move, migrate, or marry, and able to bring suit in the courts of law. The manorial fees, along with tithes, were generally abolished, as in France in 1789. In France the peasants escaped from these burdens without having to pay compensation, in part because they had themselves risen in rebellion in 1789 and in part because France passed through a radical popular revolution in 1793. In other parts of the Grand Empire, however, the peasants were committed to payment of indemnities, and the former feudal class continued to receive income from its abolished rights. Only in Belgium and the Rhineland, incorporated into France under the republic, did the manorial regime disappear without compensation as in France, leaving a numerous entrenched class of small landowning farmers. East of the Rhine Napoleon had to compromise with the aristocracy that he assailed. In Poland, the only country in the Grand Empire where a thoroughgoing serfdom had prevailed, the peasants received legal freedom during the French occupation; but the Polish landlords remained economically unharmed, since they owned all the land. Napoleon had to conciliate them, for there was no other effective class in Poland to which he could look for support. In general, outside of France, the assault upon feudal traditions was not socially as revolutionary as it had been in France. The lord was gone, but the landlord remained.

Everywhere in the Grand Empire the church lost its position as a public authority alongside the state. Church courts were abolished or restricted; the Inquisition was outlawed in Spain. Tithes were done away with, church property was confiscated, and monastic orders were dissolved or severely regulated. Toleration became the law; Catholics, Protestants, Jews, and unbelievers received the same civil rights. The state was to be based not on the idea of religious community but on the idea of territorial residence. With the nobility, or on

### NAPOLEONIC EUROPE, 1810

Napoleon extended the sphere of French power well beyond the earlier expansion of the French Republic. By 1810 he dominated the whole continent except Portugal and the Balkan peninsula. Russia, Prussia, and Austria had been forced into alliance with him, and he had made his brothers kings of Spain, Holland, and Westphalia; his brother-in-law king of Naples; and his stepson viceroy of Italy. The old Holy Roman Empire disappeared into other states, including Napoleon's Confederation of the Rhine. In Poland, Napoleon undid the partitions of the 1770s by setting up the Grand Duchy of Warsaw.

economic matters, Napoleon would compromise; but he would not compromise with the Catholic clergy on the principle of a secular state. Even in Spain he insisted on these fundamentals of his system, a sure indication that he was not motivated by expediency only, since it was largely his antireligious program that provoked the Spanish populace to rebellion.

Guilds were generally abolished or reduced to empty forms, and the individual's right to work was generally proclaimed. Peasants, gaining legal freedom, might learn and enter any trade they chose. The old town oligarchies and bourgeois patriciates were broken up. Towns and provinces lost their antique liberties and came under general legislation. Internal tariffs were removed, and free trade within state frontiers was encouraged. Some countries shifted to a decimal system of money; and the heterogeneous weights and measures which had originated in the Middle Ages, and of which the Anglo-American bushels, yards, ounces, and pints are living survivals, yielded to the Cartesian regularities of the metric system. Ancient and diverse legal systems gave way to the Napoleonic codes. Law courts were separated from the administration. Hereditary office and the sale of office were done away with. Officials received salaries large enough to shield them from the temptations of corruption. Kings were put on civil lists, with their personal expenses separated from those of the government. Taxes and finances were modernized. The common tax became a land tax, paid by every landowner; and governments knew how much land each owner really possessed, for they developed systematic methods of appraisal and assessment. Tax farming was replaced by direct collection. New methods of accounting and of collecting statistics were introduced.

In general, in all countries of the Grand Empire, some of the main principles of the French Revolution were introduced under Napoleon, with the notable exception that there was no self-government through elected legislative bodies. In all countries Napoleon found numerous natives willing to support him, mainly among people in the commercial and professional classes, who were generally aware of Enlightenment writers, often anticlerical, desirous of more equal-

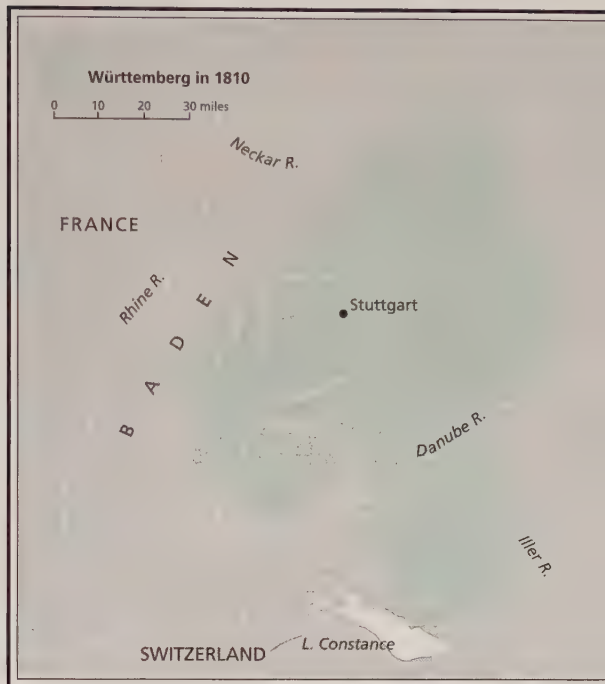

---

*Support for Napoleon*

ity with the nobility, and eager to break down the old localisms that interfered with trade and the exchange of ideas. He found supporters also among many progressive nobles and, in the Confederation of the Rhine, among the German rulers. His program appealed to some people everywhere and in all parts of the Grand Empire was executed mainly by local leaders. Repression went with it, though hardly on the same scale as the repressions of later dictatorships. There were no vast internment camps, and Fouché's police were engaged more in spying and submitting reports than in the brutalizing of the disaffected. The execution of a single Bavarian bookseller, named Palm, became a famous outrage.

In short, there was at first a good deal of pro-Napoleonic feeling in the Grand Empire. The French influence (outside Belgium and the Rhineland) struck deepest in north Italy, where there were no native monarchist traditions and where the old Italian city-states had produced a strong and often anticlerical burgher class. In south Germany also the French influence was profound. The French system had the least appeal in Spain, where Catholic royalist sentiment produced a kind of counterrevolutionary movement of independence. Nor did it appeal to agrarian eastern Europe, the land of lord and serf. Yet even in Prussia, as will be seen, the state was remodeled along French lines. In Russia, during the Tilsit alliance, Alexander gave his backing to a pro-French reforming minister, Speranski. The Napoleonic influence was pervasive because it carried over the older movement of enlightened despotism and seemed to confer the advantages of the French Revolution without the violence and the disorder. Napoleon, it seemed to Goethe, "was the expression of all that was reasonable, legitimate and European in the revolutionary movement."

But the Napoleonic reforms were also weapons of war. All the dependent states were required by Napoleon to supply him with money and soldiers. Germans, Dutch, Belgians,

### NAPOLEONIC GERMANY

In the panel at the left are shown, by shading, territories of the Duchy of Württemberg in 1800. Note how Württemberg had "islands" of territory unconnected with its main mass, and "holes" or enclaves formed by smaller states enclosed within the mass of Württemberg. Note, too, how Württemberg, itself only 50 miles wide, was surrounded by a mosaic of tiny jurisdictions—free cities, counties, duchies, principalities, abbacies, commanderies, bishoprics, archbishoprics, etc.—all "independent" within the Holy Roman Empire. The right-hand panel shows the Kingdom of Württemberg as consolidated and enlarged in the time of Napoleon. Similar consolidations all over Germany greatly reduced the number of states and added to the efficiency of law and government.

Italians, Poles, and even Spaniards fought in his armies. In addition, the dependent states defrayed much of the cost of the French army, most of which was stationed outside France. This meant that taxes in France could remain low, to the general satisfaction of the propertied interests that had issued from the Revolution.

## 49. THE CONTINENTAL SYSTEM: BRITAIN AND EUROPE

Beyond the tributary states of the Grand Empire lay the countries nominally independent, joined under Napoleon in the Continental System. Napoleon thought of his allies as at best subordinate partners in a common project. The great project was to crush Great Britain, and it was for this purpose that the Continental System had been established. But the crushing of Britain became in Napoleon's mind a means to a further end, the unification and mastery of all of Europe. This in turn, had he achieved it, would doubtless have merely opened the way to further conquests.

Germaine de Staël was an influential leader of the liberal opposition to Napoleon's repressive cultural policies. She was forced to live in exile in Switzerland, but both her Swiss home and her writings provided crucial support for Napoleon's critics.

(Ken Welsh/Bridgeman Art Library)

#### Continental unity

At the point where he stood in 1807 or 1810 the unification of continental Europe seemed a not impossible objective. He cast about for an ideology to inspire both his Grand Empire and his allies. He held out the cosmopolitan doctrines of the eighteenth century, spoke endlessly of the enlightenment of the age, and urged all peoples to work with him against the medievalism, ignorance, and obscurantism by which they were surrounded. Although he disliked and even suppressed the creative work of writers such as his vehement critic Germaine de Staël, Napoleon encouraged innovative scientific research and rewarded the scientists who pursued it. He viewed science as the essential, rational foundation of modern knowledge. And while appealing to ideas of modernity or progress he dwelt also on the grandeur of Roman times. The Roman inspiration appeared in the arts of the day and in the architecture that expressed Napoleon's conception of imperial glory. The massive "empire" furniture, the heroic canvases of David, the church of the Madeleine in Paris (resembling a classical temple and converted to a Temple of Glory); and the Arch of Triumph in the same city (begun in 1806) all evoked the atmosphere of far-spreading majesty in which Napoleon would have liked the peoples of Europe to live. In addition, to arouse an all-European feeling, Napoleon worked upon the latent hostility to Great Britain. The British, in winning out in the eighteenth-century struggle for wealth and empire, had made themselves disliked in many quarters. There was the natural jealousy felt toward the successful, and resentment against the high-handedness by which success had been won and maintained. Such feelings were present among almost all Europeans. It was believed that the British

were really using their sea power to win a larger permanent share of the world's seaborne commerce for themselves. Nor, in truth, was this belief mistaken.

### *British Blockade and Napoleon's Continental System*

The British, in the Revolutionary and Napoleonic wars, when they declared France and its allies in a state of blockade, did not expect either to starve them or to deprive them of necessary materials of war. Western Europe was still self-sufficient in food, and armaments were to a large extent produced locally from simple materials like iron, copper, and saltpeter. Europe required almost nothing indispensable from overseas. The chief aim of the British blockade was not, therefore, to keep imports out of enemy countries; it was to keep the trade in such imports out of enemy hands. It was to kill off enemy commerce and shipping, in the short run to weaken the war-making powers of the enemy government by undermining its revenues and its navy and in the long run to weaken the enemy's position in the markets of the world. Economic warfare was trade warfare. The British were willing enough to have British goods pass through to the enemy either by smuggling or by the mediation of neutrals.

---

*Anti-British  
sentiments*

As early as 1793 the French republicans had denounced England as the "modern Carthage," a ruthless mercantile and profit-seeking power which aspired to enslave Europe to its financial and commercial system. With the wars, the British in fact obtained a monopoly over the shipment of overseas commodities into Europe. At the same time, being relatively advanced in the new techniques of industrial production, they could produce cotton cloth and certain other articles, by power machinery, more cheaply than other peoples of Europe and so threatened to monopolize the European market for such manufactured goods. There was much feeling in Europe against the modern Carthage, especially among the bourgeois and commercial classes who were in competition with it. The upper classes were perhaps less hostile, not caring where the goods that they consumed had originated, but aristocracies and governments were susceptible to the argument that Britain was a money power, a "nation of shopkeepers" as Napoleon put it, which fought its wars with pounds sterling instead of blood and was always in search of dupes in Europe.

It was on all these feelings that Napoleon played, reiterating time and again that England was the real enemy of all Europe, and that Europe would never be prosperous or independent until relieved of the incubus of British "monopoly." To prevent the flow of goods into Britain was no more the purpose of the Continental System than to prevent the flow of goods into France was the purpose of the British blockade. The purpose of each was to destroy the enemy's commerce, credit, and public revenues by the destruction of its exports—and also to build up markets for oneself.

To destroy British exports Napoleon prohibited, by the Berlin Decree of 1806, the importation of British goods into the continent of Europe. Counted as British, if of British or British colonial origin, were goods brought to Europe in neutral ships as the property of neutrals. The British, in response, ruled by an "order in council" of November 1807 that neutrals might enter Napoleonic ports only if they first stopped in Great Britain, where the regulations were such as to encourage their loading with British goods. The British thus tried to move their exports into enemy territory through neutral channels, which was precisely what Napoleon intended to prevent. He announced, by the Milan Decree of December 1807, that any neutral vessel that had stopped at a British port, or submitted to search by a British warship at sea, would be confiscated upon its appearance in a Continental harbor.

---

*Trade warfare*

With all Europe at war, virtually the only major trading neutral nation was the United States, which could now trade with neither England nor Europe except by violating the regulations of one belligerent or the other. It would thus become liable to reprisals, and hence to involvement in war. President Jefferson, to avoid war, attempted a self-imposed policy of commercial isolation which proved so ruinous to American foreign trade that the United States government took steps to renew trade relations with whichever belligerent first removed its controls over neutral commerce. Napoleon offered to do so, on condition that the United States would defend itself against the enforcement of British controls. At the same time an expansionist party among the Americans, ambitious to annex Canada, considered that with the British army engaged in Spain the time was ripe to complete the War of Independence by driving Britain from the North American mainland. The result was the Anglo-American War of 1812, which had few results, except to demonstrate the distressing inefficiency of military institutions in the new republic.

---

*The War of 1812*

But the Continental System was more than a device for destroying the export trade of Great Britain. It was also a scheme for developing the economy of continental Europe, around France as its main center. The Continental System, if successful, would replace the national economies with an integrated economy for the Continent as a whole. It would create the framework for a European civilization. And it would ruin the British sea power and commercial monopoly; for a unified Europe, Napoleon thought, would itself soon take to the sea.

### *The Failure of the Continental System*

But the Continental System failed; it was worse than a failure, for it caused widespread antagonism to the Napoleonic regime. The dream of a united Europe, under French rule, was not sufficiently attractive to inspire the necessary sacrifice—even a sacrifice more of comforts than of necessities. As Napoleon impatiently said, one would suppose that the destinies of Europe turned upon a barrel of sugar. It was true, as he and his propagandists insisted, that Britain monopolized the sale of sugar, tobacco, and other overseas goods, but people preferred to deal clandestinely with the British rather than go without them. The charms of America destroyed the Continental System.

British manufactures were somewhat easier than colonial goods to replace. Raw cotton was brought by land from the Middle East through the Balkans, and the cotton manufacturers of France, Saxony, Switzerland, and north Italy were stimulated by the relief from British competition. There was a great expansion of Danish woolens and German hardware. The cultivation of sugar beets, to replace cane sugar, spread in France, central Europe, Holland, and even Russia. Thus infant industries and investments were built up which, after Napoleon's fall, clamored for tariff protection. In general, the European industrial interests were well disposed toward the Continental System.

---

*Consequences of the  
Continental System*

Yet they could never adequately replace the British in supplying the market. One obstacle was transportation. Much trading between parts of the Continent had always been by sea; this coastal traffic was now blocked by the British. Land routes were increasingly used, even in the faraway Balkans and Illyrian Provinces, through which raw cotton was brought; and improved roads were built through the Simplon and Mont Cenis passes in the Alps. No less than 17,000 wheeled vehicles crossed the Mont Cenis pass in 1810. But land transport, at best, was no substitute for the sea. Without railroads, introduced some 30 years later, a purely Continental modern economy was impossible to maintain.

Construction on the Arch of Triumph began in 1806, but it was not completed until 1836. It became a monument of French nationalism, symbolizing both the Republic and the Empire. The continuous band of bas reliefs above the curve of the arch represented 172 battles since Valmy in 1792.

(Culver Pictures)

Another obstacle was tariffs. The idea of a Continental tariff union was put forward by some of his subordinates, but Napoleon never adopted it. The dependent states remained insistent on their ostensible sovereignty. Each had widened its trading area by demolishing former internal tariffs, but each kept a tariff against the others. The kingdoms of Italy and Naples enjoyed no free trade with each other nor did the German states of the Confederation of the Rhine. France remained protectionist; and when Napoleon annexed Holland and parts of Italy to France, he kept them outside the French customs. At the same time Napoleon forbade the satellite states to raise high tariffs against France. France was his base, and he meant to favor French industry, which was much crippled by its loss of its Middle Eastern and American markets.

Shippers, shipbuilders, and dealers in overseas goods, a powerful element of the older bourgeoisie, were ruined by the Continental System. The French ports were idle and their populations were distressed and disgruntled. The same problems befell all ports of Europe where the blockade was strictly enforced; at Trieste, total annual tonnage fell from 208,000 in 1807 to 60,000 in 1812. Eastern Europe was especially hard hit. In the West there was the stimulus to new manufactures. Eastern Europe, long dependent on western Europe for manufactured goods, could no longer obtain them from England legally, nor from France, Germany, or Bohemia because of the difficulties of land transport and the British control of the Baltic.

---

*Economic stagnation*

Napoleon used architecture to show that Paris was the capital of modern Europe and that his empire replicated the imperial grandeur of ancient Rome. He built the multicolumned Madeleine to be a temple of glory, but after his fall from power it became a church.

(Bettmann/Corbis)

Nor could the landowners of Prussia, Poland, and Russia market their produce. The aristocracy of eastern Europe, which was the principal spending and importing class, had additional reason to dislike the French and to sympathize with the British.

As a war measure against Britain the Continental System also failed. British trade with Europe was significantly reduced, but the loss was made up elsewhere because of British control of the sea. Exports to Latin America rose from £300,000 in 1805 to £6,300,000 in 1809. Here again the existence of the overseas world frustrated the Continental System. Despite the System, export of British cotton goods, rising on a continuous tide of the rapidly developing Industrial Revolution, more than doubled in four years from 1805 to 1809. And while part of the increase was due to mere inflation and rising prices, it is estimated that the annual income of the British people more than doubled in the Revolutionary and Napoleonic wars, growing from £140,000,000 in 1792 to £335,000,000 in 1814.

## 50. THE NATIONAL MOVEMENTS: GERMANY

### *The Resistance to Napoleon: Nationalism*

From the beginning, as far back as 1792, the French met with resistance as well as collaboration in the countries they occupied. There was resentment when the invading armies

plundered and laid requisitions upon the occupied countries, which were required to pay tribute in men and money, and whose policies were dictated by French residents or ambassadors. The Continental System was also resented because it was used for the benefit of French manufacturers. Europeans began to feel that Napoleon was employing them merely as tools against England. And in all countries, including France itself, people grew tired of the peace that was no peace, the wars and rumors of war, the conscription and the taxes, the loss of lives and local liberties, the aloof bureaucratic government, and the obviously growing and insatiable appetite of Napoleon for power and self-exaltation. Movements of protest and independence showed themselves even within the Napoleonic structure. We have seen how the dependent states protected themselves by tariffs. Even the emperor's proconsuls tried to root themselves in local opinion, as when Louis Bonaparte, king of Holland, tried to defend Dutch interests against Napoleon's demands, or when Murat, king of Naples, appealed to Italian sentiment to secure his own throne.

Nationalism developed as a movement of resistance against the forcible internationalism of the Napoleonic empire. Since the international system was essentially French, the nationalistic movements were anti-French; and since Napoleon was an autocrat, they were antiautocratic. The nationalism of the period was a mixture of the conservative and the liberal. Some nationalists, predominantly conservative, insisted on the value of their own peculiar institutions, customs, folkways, and historical development, which they feared might be obliterated under the French and Napoleonic system. Others, or indeed the same persons, insisted on more self-determination, more participation in government, more representative institutions, more freedom for the individual against the bureaucratic interference of the state. Both conservatism and liberalism rose up against Napoleon, destroyed him, outlasted him, and shaped the history of the following generations.

---

Anti-French  
nationalism

Nationalism was thus very complex and appeared in different countries in different ways. In England the profound solidarity of the country exhibited itself; all classes rallied and stood shoulder to shoulder against "Boney"; and ideas of reforming Parliament or tampering with historic English liberties were resolutely put aside. It is possible that the Napoleonic wars helped England through a very difficult social crisis, for the Industrial Revolution was causing dislocation, misery, unemployment, and even revolutionary agitation among a small minority, all of which were eclipsed by the patriotic need for resistance to Bonaparte. In Spain, nationalism took the form of implacable resistance to the French armies that desolated the land. Some Spanish nationalists were liberal; a bourgeois group at Cádiz, rebelling against the French regime, proclaimed the Spanish constitution of 1812, modeled on the French constitution of 1791. But Spanish nationalism drew its greatest strength from sentiments that were counterrevolutionary, aiming to restore the clergy and the Bourbons. In Italy the Napoleonic regime was better liked and national feeling was less anti-French than in Spain. Bourgeois of the Italian cities generally prized the efficiency and enlightenment of French methods and often shared in the anticlericalism of the French Revolution. The French regime, which lasted in Italy from 1796 to 1814, broke the habit of loyalty to the various duchies, oligarchic republics, papal states, and foreign dynasties by which Italy had long been ruled. Napoleon never unified Italy, but he consolidated it into only three parts, and the French influence brought the notion of a politically united Italy within the bounds of reasonable aspiration. With the Poles, Napoleon positively encouraged national feeling. He repeatedly told them that they might win a restored and united Poland by faithfully fighting in his cause. A few Polish nationalists, like the aging patriot Kosciuszko, never trusted Napoleon, and some others, like Czartoryski, looked rather to the Russian tsar for a restoration of the Polish kingdom; but in general the

Poles, for their own national reasons, were exceptionally devoted to the emperor of the French and lamented his passing.

### *The Movement of Thought in Napoleonic Germany*

The national  
movement in  
Germany

By far the most momentous new national movement developed in Germany. The Germans rebelled not only against the Napoleonic rule but also against the century-old ascendancy of French civilization. They rebelled not only against the French armies but also against much of the philosophy of the Age of Enlightenment. The years of the French Revolution and Napoleon were for Germany the years of great cultural efflorescence, the years of Beethoven, Goethe, and Schiller, of Herder, Kant, Fichte, Hegel, Schleiermacher, and many others. German ideas fell in with all the ferment of the new cultural movement known as "romanticism," which was everywhere challenging the "dry abstractions" of the Age of Reason and shaping the new themes of literature, music, art, and historical research. Germany became the most "romantic" of all countries, and German influence spread throughout Europe. In the nineteenth century the Germans came to be widely regarded as intellectual leaders, somewhat as the French had been in the century before. And most of the distinctive features of German thought were somehow connected with nationalism in a broad sense.

Formerly, especially in the century following the Peace of Westphalia, the Germans had been the least nationally minded of all the larger European peoples. They prided themselves on their world citizenship or cosmopolitan outlook. Looking out from the tiny states in which they lived, they were conscious of Europe, conscious of other countries, but hardly conscious of Germany. The Holy Roman Empire was neither a forceful political power nor the public embodiment of a well-defined national culture. The German world had no tangible frontiers; the area of German speech simply faded out into Alsace or the Austrian Netherlands, or into Poland, Bohemia, or the upper Balkans. That "Germany" ever did, thought, or hoped anything never crossed the German mind. The upper classes, becoming contemptuous of much that was German, took over French fashions, dress, etiquette, manners, ideas, and language, regarding them as an international norm of civilized living. Frederick the Great hired French tax collectors and wrote his own books in French.

About 1780 signs of a change set in. Even Frederick, in his later years, predicted a golden age of German literature, proudly declaring that Germans could do what other nations had done. In 1784 appeared a book by J. G. Herder called *Ideas on the Philosophy of the History of Mankind*. Herder was an earnest soul, a Protestant pastor and theologian who thought the French somewhat frivolous. He concluded that imitation of foreign ways made people

shallow and artificial. He declared that German ways were indeed different from French but not for that reason the less worthy of respect. All true culture or civilization, he held, must arise from native roots. It must arise also from the life of the common people, the *Volk*, not from the cosmopolitan and artificial life of the upper classes. Each people, he thought, meaning by a people a

group sharing the same language, had its own attitudes, spirit, or genius. A sound civilization must express a national character or *Volksgeist*. And the character of each people was special to itself. Herder did not believe the nations to be in conflict: quite the contrary, he simply insisted that they were different. He did not believe German culture to be the best; many other peoples, notably the Slavs, later found his ideas applicable to their own needs. His philosophy of history was very different from that of Voltaire and the philosophes, who had

Herder's cultural  
nationalism

*National Character: Volksgeist*

Herder  
Father Jol.  
J. G. Fichet

Nationalism  
developed  
during  
the 19th  
century

Nationalism grew rapidly in all the European countries that resisted Napoleon's expansionist military policies. This image of Britannia "blowing up the Corsican Bottle Conjuror" expressed British national pride during this era. The bottle's label says "British spirits, composed of True Liberty, Courage, Loyalty and Religion."

(Rare Book Collection, University of North Carolina-Chapel Hill  
(Hoyt 11-192))

British  
Pride

Beginning of  
British  
Pride

expected all people to progress along the same path of reason and enlightenment toward a similar civilization. Herder thought that all peoples should develop their own genius in their own way, each slowly unfolding with the inevitability of plantlike growth, avoiding sudden change or distortion by outside influence, and all ultimately reflecting, in their endless diversity, the infinite richness of humanity and of God.

The idea of the *Volksgeist* was reinforced from other and non-German sources and soon passed to other countries in the general movement of romantic thought. Like much else in romanticism, it emphasized genius or intuition rather than reason. It stressed the differences rather than the similarity of mankind. It broke down that sense of human similarity or universality which had been characteristic of the Age of Enlightenment, and which revealed itself in French and American doctrines of the rights of man, or again in the law codes of Napoleon. In the past it had been usually thought that what was good was good for all peoples. Good poetry was poetry written according to certain classical principles or "rules" of composition, which were the same for all writers from the Greeks on down. Now, according to Herder and to romantics in all countries, good poetry was poetry that expressed an inner genius, either an individual genius or the genius of a people—there were no more rigid, classical "rules." Good and just laws, according to the older philosophy of natural law, somehow corresponded to a standard of justice that was the same for all people. But now, according to Herder and the romantic school of jurisprudence, good laws were those that reflected local conditions or national idiosyncrasies. Here again there were no "rules," except possibly the rule that each nation should follow its own path.

Herder's philosophy set forth a cultural nationalism, without a political message. The Germans had long been a nonpolitical people. In the microscopic states of the Holy Roman Empire they had had no significant political questions to think about; in the more sizable ones they had been excluded from public affairs. The French Revolution made the Germans acutely conscious of the state. It showed what a people could do with a state, once they took it over and used it for their own purposes. For one thing, the French had raised themselves to the dignity of citizenship; they had become free individuals, responsible for themselves, taking part in the affairs of their country. For another, because they had a unified state which included all French people, and one in which a whole nation surged with a new sense of freedom, they were able to rise above all the other nations of Europe. Many in Germany were beginning to feel humiliation at the paternalism of their governments. The futilities of the Holy Roman Empire, which had made Germany for centuries the battlefield of Europe, now filled them with shame and indignation. They saw with disgust how their German princes, forever squabbling with each other for control over German subjects, disgraced themselves before the French to promote their own interests. The national awakening in Germany, which set in strongly after 1800, was therefore directed not only against Napoleon and the French but also against the German rulers and many of the half-Frenchified German upper classes. It was democratic in that it stressed the superior virtue of the common people.

Germans became fascinated by the idea of political and national greatness, precisely because they had neither. A great national German state, expressing the deep moral will and distinctive culture of the German people, seemed to them the solution to all their problems. It would give moral dignity to the individual German, solve the vexatious question of the selfish petty princes, protect the deep German *Volksgeist* from violation, and secure the Germans from subjection to outside powers. The nationalist philosophy remained somewhat vague, because in practice there was little that one could do. "Father" Jahn organized a kind of youth movement, had his young men do calisthenics for the Fatherland and led them on open-air expeditions into the country, where they made fun of aristocrats in French costume. He taught them to be suspicious of foreigners, Jews, and internationalists, and indeed of everything that might corrupt the purity of the German *Volk*. Most Germans thought him too extreme. Others collected wonderful stories of the rich medieval German past. There was an anonymous anti-French work, *Germany in Its Deep Humiliation*, for selling which the publisher Palm was put to death. Others founded the Moral and Scientific Union, generally known as the *Tugendbund* or league of virtue or manliness, whose members, by developing their own moral character, were to contribute to the future of Germany.

---

Fichte and the  
German national  
spirit

The career of J. G. Fichte illustrates the course of German thought in these years. Fichte was a moral and metaphysical philosopher, a professor at the University of Jena. His doctrine that the inner spirit of the individual creates its own moral universe was much admired in many countries. In America, for example, it entered into the transcendental philosophy of Ralph Waldo Emerson. Fichte at first was practically without national feeling. He enthusiastically approved of the French Revolution, as did many other German intellectuals at the time. In 1793, with the Revolution at its height, Fichte published a laudatory tract on the French Republic. He saw it as an emancipation of the human spirit, a step upward in the elevation of human dignity and moral stature. He accepted the idea of the Terror, that of "forcing men to be free," and he shared Rousseau's conception of the state as the embodiment of the sovereign will of a people. He came to see the state as the

means of human salvation. In 1800, in his *Closed Commercial State*, he sketched a kind of totalitarian system in which the state planned and operated the whole economy of the country, shutting itself off from the rest of the world in order that, at home, it might freely develop the character of its own citizens. When the French conquered Germany Fichte became intensely and self-consciously German. He took over the idea of the *Volksgeist*: not only did the individual spirit create its own moral universe, but the spirit of a people created a kind of moral universe as well, manifested in its language, history, arts, folkways, customs, institutions, and ideas.

At Berlin, in 1808, Fichte delivered a series of *Addresses to the German Nation*, declaring that there was an ineradicable German spirit, a primordial and immutable national character, more noble than that of other peoples (thus going beyond Herder), to be kept pure at all costs from all outside influence, either international or French. The German spirit, he held, had always been profoundly different from that of France and western Europe: it had never yet really been heard from but would be some day. The French army commander then occupying the city thought the lectures too academic to be worth suppression. They attracted only small audiences; but his published lectures provided an enduring philosophical argument for German nationalism, and many Germans later regarded him as a national hero.

### *Reforms in Prussia*

Politically, the revolt against the French led to major transformations in Prussia and the Prussian state. After the death of Frederick the Great in 1786 Prussia had fallen into a period of satisfied inertia, such as is likely to follow upon rapid growth or spectacular success. Then in 1806, at Jena-Auerstädt, the kingdom collapsed in a single battle. Its western and most of its Polish territories were taken away. It was relegated by Napoleon to its old holdings east of the Elbe River. Even here the French remained in occupation, for Napoleon stationed his Ninth Corps in Berlin. But in the eyes of German nationalists Prussia had a moral advantage. Of all the German states it was the least compromised by collaboration with the French. Toward Prussia, as toward a haven, German patriots therefore made their way. Prussia, east of the Elbe, formerly the least German of German lands, became the center of an all-German movement for national freedom. The years after Jena contributed to the "Prussianizing" of Germany; but it is to be observed that neither Fichte nor Hegel, Gneisenau nor Scharnhorst, Stein nor Hardenberg, all rebuilders of Prussia, was a native Prussian.

---

*The reform movement  
in Prussia*

The main problem for Prussia was military, since Napoleon could be overthrown only by military force. And as always in Prussia, the requirements of the army shaped the form taken by the state. The problem was conceived to be one of morale and personnel. The old Prussia of Frederick, which had fallen ingloriously, had been mechanical, arbitrary, soulless. Its people had lacked the sense of membership in the state, and in the army its soldiers had held no hope of promotion and felt no patriotism or spirit. To produce this spirit was the aim of the army reformers Scharnhorst and Gneisenau. Gneisenau, a Saxon, had served in one of the British "Hessian" regiments in the War of American Independence, during which he had observed the military value of patriotic feeling in the American soldiers. He was a close observer also of the consequences of the French Revolution, which, he said, had "set in action the national energy of the entire French people, putting the different classes on an equal social and fiscal basis." If Prussia was to strengthen itself against France, or indeed to avoid revolution in the long run in Prussia

## CHRONOLOGY OF NOTABLE EVENTS, 1799–1815

---

1799–1801	Second Coalition (Austria, Russia, Britain) wages war with France
1803	Napoleon's army is defeated in Haiti and France sells Louisiana to the United States
1805–1807	Third Coalition (Austria, Russia, Britain) wages war with France
1806	Napoleon defeats Prussian armies and occupies Berlin
1806–1825	Latin American countries pursue successful campaigns for national independence from Spain and Portugal
1807	Treaty of Tilsit creates French-Russian alliance; Napoleon proclaims "Continental System" to exclude trade with Britain
1808–1814	Peninsular War leads to French defeats in Spain
1810	Napoleon marries Marie Louise, daughter of Austrian Emperor
1812	Napoleon's "Grand Army" invades Russia and is destroyed in winter retreat
1813	French army loses decisive battle of Leipzig in Germany
1814	Abdication of Napoleon and restoration of Bourbon Monarchy in France
1814–1815	Congress of Vienna reorganizes the political order in Europe
1815	Napoleon returns to power for "100 Days"; final defeat at the battle of Waterloo

---

itself, it must find a means to inspire a similar feeling of equal participation in its own people and to allow capable individuals to fill important positions in the army and government without regard to their social status.

The reconstruction of the state, prerequisite to the reconstruction of the army, was initiated by Baron Stein and continued by his successor, Hardenberg. Like Metternich, Stein came from western Germany, and he was long hostile to what he considered a barely civilized Prussia, but he finally turned to the Prussian state as the best hope to lead Germany as a whole into the future. Deeply committed to the philosophy of Kant and Fichte, he dwelt on the concepts of duty, service, moral character, and responsibility. He thought that the common people must be awakened to moral life and raised from a brutalized servility to the level of self-determination and membership in the community. This, he believed, required an equality more of duties than of rights.

Under Stein the old caste structure of Prussia became somewhat less rigid. Property became interchangeable between social classes, and soldiers of all classes could now serve as officers in the army. The burghers, to develop a sense of citizenship and participation in the state, were given extensive freedom of self-government in the cities; the municipal systems of Prussia, and later of Germany, became a model for much of Europe in the following century.

Stein's most famous work was the "abolition of serfdom." It was naturally impossible, since the whole reform program was aimed at strengthening Prussia for a war of liberation against the French, to antagonize the Junkers who commanded the army. Stein's ordinance of 1807 abolished serfdom only in that it abolished the "hereditary subjection" of peasants to their manorial lords. It gave peasants the right to move and migrate, marry, and take up trades without the lord's approval. If, however, they remained on the land, they were still

subject to all the old services of forced labor in the fields of the lord. Peasants enjoying small tenures of their own continued to be liable for the old dues and fees. By an edict of 1810, they might convert their tenure into private property, getting rid of the manorial obligations, but only on condition that one-third of the land held should become the private property of the lord. In the following decades many such conversions took place; as a result, the estates of the Junkers grew considerably larger. The reforms in Prussia somewhat reduced the old patriarchal powers of the lords and gave legal status and freedom of movement to the mass of the population, thus laying the foundation for a modern state and modern economy. But the peasants tended to become mere hired agricultural laborers and the position of the Junkers was heightened, not reduced. Prussia avoided the Revolution. Stein himself, because Napoleon feared him, was obliged to go into exile in 1808, but his reforms endured.

## 51. THE OVERTHROW OF NAPOLEON: THE CONGRESS OF VIENNA

The situation at the close of 1811 may be summarized as follows. Napoleon had the mainland of Europe in his grip. Russia and Turkey were at war on the Danube, but otherwise there was no war except in Spain, where four years of fighting remained inconclusive. The Continental System was working badly. Britain was hurt by it only in that, without it, British exports to Europe would have risen rapidly in these years. Well launched in the economic growth of the Industrial Revolution, Britain was amassing a vast store of national wealth that could be used to assist European governments financially against Napoleon. The peoples of Europe were growing restless, dreaming increasingly of national freedom. In Germany especially, many awaited the opportunity to rise in a war of independence. But Napoleon could be overthrown only by the destruction of his army, over which neither British wealth nor British sea power, nor the European patriots and nationalists, nor the Prussian nor the Austrian armed forces were able to prevail. All eyes turned to Russia. Alexander I had long been dissatisfied with his French alliance. He had obtained from it nothing but the annexation of Finland in 1809. He received no assistance from France in his war with Turkey; he saw Napoleon marry into the Austrian house; he had to tolerate the existence of a French-oriented Poland at his very door. The articulate classes in Russia, namely, the landowners and serf owners, loudly denounced the French alliance and demanded a resumption of open trade relations with England. An international clientele of émigrés and anti-Bonapartists, including Baron Stein, also gradually congregated at St. Petersburg, where they poured into the tsar's ears the welcome message that Europe looked to him for its salvation.

*Europe in 1811*

### *The Russian Campaign and the War of Liberation*

On December 31, 1810, Russia formally withdrew from the Continental System. Anglo-Russian commercial relations were resumed. Napoleon resolved to crush the tsar. He concentrated the Grand Army in eastern Germany and Poland, a vast force of 700,000 men, the largest ever assembled up to that time for a single military operation. It was an all-European host. Hardly more than a third was French; another third was German, from German regions annexed to France, from the states of the Confederation of the Rhine, and with token forces from Prussia and Austria; and the remaining third was drawn from all other nationalities of the Grand Empire, including 90,000 Poles.

Napoleon at first hoped to meet the Russians in Poland or Prussia. This time, however, they decided to fight on their own ground, and they needed in any case to delay until their forces on the lower Danube could be recalled. In June 1812 Napoleon led the Grand Army into Russia.

He intended a short, sharp war, such as most of his wars had been in the past, and carried with him only three weeks' supplies. But from the beginning everything went wrong. It was Napoleon's principle to force a decisive battle; but the Russian army simply melted away. It was his principle to live on the country, so as to reduce the need for supply trains; but the Russians destroyed as they retreated, and in any case, in Russia, even in the summer, it was hard to find sustenance for so many men and horses. Finally, not far from Moscow, Napoleon was able to join battle with the main Russian force at Borodino. Here again everything miscarried. It was his principle always to outnumber the enemy at the decisive spot, but the Grand Army had left so many detachments along its line of march that at Borodino the Russians outnumbered it. It was Napoleon's principle to concentrate his artillery, but here he scattered it instead. His principle was to throw in his last reserves at the critical moment, but at Borodino, so far from home, he refused the risk of ordering the Old Guard into action; Napoleon won the battle, at a cost of 30,000 men, as against 50,000 lost by the Russians; but the Russian army was able to withdraw in good order.

On September 14, 1812, the French emperor entered Moscow. Almost immediately the city broke into flames. Napoleon found himself camping in a ruin, with troops strewn along a long line all the way back to Poland, and with a hostile army maneuvering near at hand. Baffled, he tried to negotiate with Alexander, who refused all overtures. After five weeks, not knowing what to do and fearful of remaining isolated in Moscow over the winter, Napoleon ordered a retreat. Prevented by the Russians from taking a more southerly route, the Grand Army retired by the same way it had come, but it could no longer live off the land. The cold weather set in early and was unusually severe. For a century after 1812 the retreat from Moscow remained the last word in military horror. Men froze and starved, horses slipped and died, vehicles could not be moved, and equipment was abandoned. Discipline broke down toward the end; the army dissolved into a horde of individual fugitives, speaking a babel of languages, harassed by bands of Russian irregulars, picking their way on foot over ice and snow, most of the time in the dark, for the nights are long in these latitudes in December. Of 611,000 who entered Russia 400,000 died of battle casualties, starvation, and exposure, and 100,000 were taken prisoner. The Grand Army no longer existed.

---

*The retreat from  
Moscow*

Now at last all the anti-Napoleon forces rushed together. The Russians pushed westward into central Europe. The Prussian and Austrian governments, which in 1812 had half-heartedly supplied troops for the invasion of Russia, switched over in 1813 and joined the tsar. Throughout Germany, the patriots, often half-trained boys, marched off in the War of Liberation, though it was the professional armies of the German states that made the difference. Anti-French riots broke out in Italy. In Spain Wellington at last pushed rapidly forward; in June 1813 he crossed the Pyrenees into France. The British government, in three years from 1813 to 1815, poured £32,000,000 as subsidies into Europe, more than half of all the funds granted during the 22 years of the wars. An incongruous alliance of British capitalism and east-European agrarian feudalism, of the British navy and the Russian army, of Spanish clericalism and German nationalism, of divine-right monarchies and newly aroused democrats and liberals, combined at last to bring the Man of Destiny to the ground.

Napoleon, who had left his army in Russia in December 1812 and rushed across Europe to Paris by sleigh and coach in the remarkable time of 13 days, raised a new army in France in the early months of 1813. But it was untrained and unsteady, and he himself had lost some of his genius for command. His new army was smashed in October at the battle of Leipzig, known to the Germans as the Battle of the Nations, the greatest battle in number of men engaged ever fought until the twentieth century. The allies drove Napoleon back upon France. But the closer they came to defeating him the more they began to fear and distrust each other.

---

*The "Battle of the Nations"*

---

### *The Restoration of the Bourbons*

The coalition already showed signs of splitting. Should the allies, together or singly, negotiate with Napoleon? How strong should the France of the future be? What should be its new frontiers? What form of government should it have? There was no agreement on these questions. Alexander wanted to dethrone Napoleon and dictate peace in Paris, in dramatic retribution for the destruction of Moscow. He had a scheme for giving the French throne to Bernadotte, a former French marshal, now crown prince of Sweden, who as king of France would depend on Russian support. Metternich preferred to keep Napoleon or his son as French emperor, after clearing the French out of central Europe; for a Bonaparte dynasty in a reduced France would be dependent on Austria. The Prussian counsels were divided. The British, with an eye to one of their main strategic concerns, declared that the French must get out of Belgium and that Napoleon must go; they held that the French might then choose their own government but believed a restoration of the Bourbons to be the best solution. The three Continental monarchies had no concern for the Bourbons; and both Alexander and Metternich, if they could make France dependent respectively on themselves, were willing to see it remain strong to the extent of including Belgium.

The British foreign minister, Viscount Castlereagh, arrived on the Continent for consultations in January 1814. He held a number of strong cards. For one thing, Napoleon continued to fight, and the allies therefore continued to ask for British financial aid. Castlereagh skillfully used the promise of British subsidies to win acceptance of the British war aims, which included France's expulsion from Belgium. In addition, he found a common ground for agreement with Metternich, both Britain and Austria fearing the domination of Europe by Russia. Castlereagh's first great problem was to hold the alliance together, for without Continental allies the British could not defeat France. He succeeded, on March 9, 1814, in getting Russia, Prussia, Austria, and Great Britain to sign the treaty of Chaumont. Each power bound itself for 20 years to a Quadruple Alliance against France, and each agreed to provide 150,000 soldiers to enforce such peace terms as might be arrived at. For the first time since 1792 a solid coalition of the four great powers now existed against France. Three weeks later the allies entered Paris, and on April 4 Napoleon abdicated at Fontainebleau.

---

*The Quadruple Alliance*

---

He was forced to this step by lack of support in France itself. Twenty years before, in 1793 and 1794, France had fought off the combined powers of Europe—minus Russia. It could not and would not do so in 1814. The country cried for peace. Even the imperial marshals advised the emperor's abdication. But what was to follow him? For over 25 years the French had had one regime after another. Now they were divided. Some wanted a republic; other wished to retain the empire under Napoleon's infant son; still others desired

The French army's retreat from Russia in 1812 shattered Napoleon's image of military invincibility and brought the anti-Napoleonic forces together for a decisive victory in the following year. This French painting portrays the misery that gave the retreat of 1812 its lasting reputation for military horror.

a constitutional monarchy; and there were even those who longed for the old regime. Talleyrand stepped into the breach. The "legitimate" king, he said, Louis XVIII, was the man who would provoke the least factionalism and opposition. The powers, likewise, had by this time concluded in favor of the Bourbons. A Bourbon king would be peaceable, under no impulse to win back the conquests of the republic and empire. He would also, as the native and rightful king of France, need no foreign support to bolster him, so that the control of France would not arise as an issue to divide the victorious powers.

The Bourbon dynasty was thus restored. Louis XVIII, ignored and disregarded for a whole generation, both by most people in France and by the governments of Europe, returned to the throne of his brother and his fathers. He issued a "constitutional charter," partly at the insistence of the liberal tsar and partly because, having actually learned from his long exile, he sought the support of influential people in France. The charter of 1814 made no concession to the principle of popular or national sovereignty. It was represented as the gracious

The Bourbons restored

gift of a theoretically absolute king. But in practice it granted what most of the French wanted. It promised legal equality, eligibility of all to public office without regard to class, and a parliamentary government in two chambers. It recognized the Napoleonic law codes, the Napoleonic settlement with the church, and the redistribution of property effected during the Revolution. It carried over the abolition of all feudal privileges and manorial rights. It confined the vote, to be sure, to a very few large landowners; but for the time being, except for a few irreconcilables, France settled down to enjoy the blessings of a chastened revolution—and peace.

### *The Settlement before the Vienna Congress*

It was with the government of the restored Bourbons that the powers, on May 30, 1814, signed a treaty. This document, the “first” Treaty of Paris, confined France to its boundaries of 1792, those obtaining before the wars. The allied statesmen disregarded cries for vengeance and punishment, imposed no indemnity or reparations, and even allowed the works of art gathered from Europe during the wars to remain in Paris. It was not the desire of the victors to handicap the new French government on which they placed their hopes. Napoleon meanwhile was exiled to the island of Elba on the Italian coast.

To deal with other questions, the powers had agreed, before signing the Alliance of Chaumont, to hold an international congress at Vienna after defeating Napoleon. The recession of the French flood left the future of much of Europe fluid and uncertain. Both Russia and Great Britain, however, before consenting to a general conference, specified certain matters that they would decide for themselves as not susceptible to international consideration. The Russians refused to discuss Turkey and the Balkans; they retained Bessarabia as the prize of their recent war with the Turks. They also kept Finland, as an autonomous constitutional grand duchy, as well as certain conquests in the Caucasus almost unknown to Europe, namely Georgia and Azerbaijan. The British refused any discussion of the freedom of the seas. They also barred all colonial and overseas questions. The British government simply announced which of its colonial and insular conquests it would keep and which it would return. The revolts in Latin America were left to run their course.

In Europe, the British remained in possession of Malta, the Ionian Islands, and Heligoland; in America, they kept St. Lucia, Trinidad, and Tobago in the West Indies. Of former French possessions, the British kept the island of Mauritius in the Indian Ocean. Of former Dutch territories, they kept the Cape of Good Hope and Ceylon, but returned the Netherlands Indies. During the Revolutionary and Napoleonic wars in Europe the British had also made extensive conquests in India, bringing much of the Deccan and the upper Ganges valley under their rule. The British emerged, in 1814, as the controlling power in both India and the Indian Ocean.

---

*British supremacy*

Indeed, of all the colonial empires founded by Europeans in the sixteenth and seventeenth centuries, only the British now remained as a growing and dynamic system. The old French, Spanish, and Portuguese empires were reduced to mere scraps of their former selves; the Dutch still held vast establishments in the East Indies, but all the intermediate positions—the Cape, Ceylon, Mauritius, Singapore—were now British. Nor, in 1814, did any people except the British have a significant navy. With Napoleon and the Continental System defeated, with the Industrial Revolution bringing power machinery to the manufacturers of England, with no rival left in the contest for overseas dominion, and with a virtual monopoly of naval power, whose use they studiously kept free from international regulation, the British embarked on their century of world leadership, which may be said to have lasted from 1814 to 1914.

*The Congress of Vienna, 1814–1815*

The Congress of Vienna assembled in September 1814. Never had such a brilliant gathering been seen. All the states of Europe sent representatives; and many defunct states, such as the formerly sovereign princes and ecclesiastics of the late Holy Roman Empire, sent lobbyists to urge their restoration. But procedure was so arranged that all important matters were decided by the four triumphant Great Powers. Indeed it was at the Congress of Vienna that the terms great and small powers entered clearly into the diplomatic vocabulary. Europe was at peace, a treaty having been signed with the late enemy, but France was represented at the Congress, by none other than Talleyrand, now minister to Louis XVIII. Castlereagh, Metternich, and Alexander spoke for their respective countries; Prussia was represented by Hardenberg. The Prussians hoped, as always, to enlarge the kingdom of Prussia. Alexander was a question mark, but it could be surmised that he wanted Poland, that he favored constitutional governments in Europe, and that he sought some kind of international system of collective security. Castlereagh and Metternich, with support from Talleyrand, were most especially concerned to produce a balance of power on the Continent. Aristocrats of the Old Regime, they applied eighteenth-century diplomatic principles to the existing problem. They by no means desired to restore the territorial boundaries obtaining before the wars. They did desire, as they put it, to restore the “liberties of Europe,” meaning the freedom of European states from domination by a single power; and it was hoped that a proper balance of power would also produce a lasting peace.

The chief menace to peace, and most likely claimant for the domination of Europe, naturally seemed to be the late troublemaker, France. The Congress of Vienna, without much disagreement, erected a barrier of strong states along the French eastern frontier. The historic Dutch Republic, extinct since 1795, was revived as the kingdom of the Netherlands, with the

---

*Containing France*

house of Orange as a hereditary monarchy; to it was added Belgium, the old Austrian Netherlands with which Austria had long been willing to part. It was hoped that the combined Dutch-Belgian kingdom would be strong enough to discourage the perennial French drive into the Low Countries. On the south, the kingdom of Sardinia (or Piedmont) was restored and strengthened by the incorporation of Genoa. Behind the Netherlands and Piedmont, and further to discourage a renewal of French pressure upon Germany and Italy, two great powers were installed. Almost all the German left bank of the Rhine was ceded to Prussia, which was to be, in Castlereagh's words, a kind of “bridge” spanning central Europe, a bulwark against both France in the West and Russia in the East. In Italy, again as a kind of secondary barrier against France, the Austrians were firmly installed. They not only took back Tuscany and the Milanese, which they had held before 1796, but also annexed the extinct republic of Venice. The Austrian empire now included a Lombardo-Venetian kingdom in north Italy, which lasted for almost half a century. In the rest of Italy the Congress recognized the restoration of the pope in the papal states and of former rulers in the smaller duchies; but it did not insist on a restoration of the Bourbons in the kingdom of Naples. There Napoleon's brother-in-law Murat, with support from Metternich, managed for a time to retain his throne. The Bourbon and Braganza rulers restored themselves in Spain and Portugal, respectively, and were recognized by the Congress.

---

*Germany remains divided*

As for Germany, the Congress made no attempt to put together again the Humpty Dumpty of the Holy Roman Empire. The French and Napoleonic reorganization of Germany was substantially confirmed, and the kings of Bavaria, Württemberg, and Saxony kept the royal crowns that Napoleon had bestowed on them. The king of England, George III, was now recognized as

The Congress of Vienna combined complex diplomatic negotiations with the cultural elegance of traditional elites. This picture shows the social status of the diplomats who sought to establish peace and order in Europe after 25 years of revolution and warfare.

king, not “elector,” of Hanover. The German states, 39 in number, including Prussia and Austria, were joined in a loose confederation in which the members remained virtually sovereign. The Congress ignored the yearnings of German nationalists for a great unified Fatherland; Metternich especially feared nationalistic agitation; and in any case the nationalists themselves had no practical answer to concrete questions, such as the government and frontiers that a united Germany should have.

### *The Polish-Saxon Question*

The question of Poland, reopened by the fall of Napoleon’s Grand Duchy of Warsaw, brought the Congress almost to disaster. Alexander still insisted on undoing the crime of the partitions, which to his mind meant reconstituting the Polish kingdom with himself as constitutional king, in a merely personal union with the Russian empire. To reunite Poland required that Austria and Prussia surrender their respective segments of the old Poland, most of which they had lost to Napoleon. The Prussians were willing, with the proviso, which Alexander supported, that Prussia receive instead the whole of the kingdom of Saxony, which was considered available because the king of Saxony had been the last German ruler to abandon Napoleon. The issue presented itself as the Polish-Saxon question, with

Russia and Prussia standing together to demand all Poland for Russia and all Saxony for Prussia.

Such a prospect horrified Metternich. For Prussia to absorb Saxony would raise Prussia prodigiously in the eyes of all Germans, and it would greatly lengthen the common frontier between Prussia and the Austrian Empire. Furthermore, for Alexander to become king of all Poland, and incidentally the protector of an extended Prussia, would incalculably augment the influence of Russia in the affairs of Europe. Metternich found that

Castlereagh shared these views. To Castlereagh it seemed that the main problem at Vienna was to restrain Russia. The British had not fought the French emperor only to have Europe fall to the Russian tsar. For months the Polish-Saxon question was debated, Metternich and Castlereagh exploring every device of argument to dissuade the Russo-Prussian combination from

its expansionist designs.

Finally they accepted the proffered assistance of Talleyrand, who shrewdly used the rift between the victors to bring France back into the diplomatic circle as a power in its own right. On January 3, 1815, Castlereagh, Metternich, and Talleyrand signed a secret treaty, pledging themselves to go to war if necessary against Russia and Prussia. So, in the very midst of the peace conference, war again reared its head.

No sooner had news of the secret treaty leaked out than Alexander offered to compromise. In his complicated nature he was, among other things, a man of peace, and he agreed to content himself with a reduced Polish kingdom. The Congress therefore created a new

Poland (called "Congress Poland," which lasted for 15 years); Alexander became its king, and he gave it a constitution. It comprised much the same area as Napoleon's Grand Duchy, representing in effect a transfer of this region from French to Russian control. It reached 250 miles farther west

into Europe than had the Russian segment of the third partition of 1795. Some Poles still remained in Prussia and some remained in the Austrian Empire; Poland was not reunited. With the tsar thus content, Prussia too had to back down. It received about two-fifths of Saxony, the rest remaining to the Saxon king. The addition of both Saxon and Rhineland territories brought the Prussian monarchy into the most advanced parts of Germany. The net effect of the peace settlement, and of the Napoleonic wars, in this connection, was to shift the center of gravity of both Russia and Prussia farther west—Russia almost to the Oder River and Prussia to the borders of France (see maps, pp. 208–209, 222–223).

With the solution of the Polish-Saxon question the main political work of the Congress was completed, and various committees of the Congress set to work to draft the Final Act. But at this point the whole settlement was unexpectedly brought into jeopardy.

### *The Hundred Days and Their Aftermath*

Napoleon escaped from Elba, landed in France on March 1, 1815, and again proclaimed the empire. In the year since the return of the Bourbons discontent had been spreading in France. Louis XVIII proved to be a sensible man, but a swarm of unreasonable and vindictive émigrés had come back with him. Reaction and a "white terror" were raging through the country. Adherents of the Revolution rallied to the emperor on his dramatic reappearance. Napoleon reached Paris, took over the government and army, and headed for Belgium. He would, if he could, disperse the pompous assemblage at Vienna. To the victors of the year before, and to most of Europe, it seemed that the Revolution was again stirring, that the old horror of toppling thrones and recurring warfare might not after all be ended. The opposing forces met in Belgium at Waterloo, where the Duke of Wellington, commanding

---

Diplomatic  
maneuvers

---

"Congress Poland"

an allied force, won a great victory. Napoleon again abdicated and was again exiled, this time to distant St. Helena in the south Atlantic. A new peace treaty was made with France, the "second" Treaty of Paris. It was more severe than the first, since the French seemed to have shown themselves incorrigible and unrepentant. The new treaty imposed minor changes of the frontiers, an indemnity of 700,000,000 francs, and an army of occupation.

The effect of the Hundred Days, as the episode following Napoleon's return from Elba is called, was to renew the dread of revolution, war, and aggression. Britain, Russia, Austria, and Prussia, after being almost at war with each other in January, again joined forces to get rid of the apparition from Elba, and in November 1815 they solemnly reconfirmed the Quadruple Alliance of Chaumont, adding a provision that no Bonaparte should ever govern France. They agreed also to hold future congresses to review the political situation and enforce the peace. No change was made in the arrangements agreed to at Vienna, except that Murat, who fought for Napoleon during the Hundred Days, was captured and shot, and an extremely unenlightened Bourbon monarchy was restored in Naples. In addition to the Quadruple Alliance of the Great Powers, bound specifically to enforce or amend the terms of the peace treaty by international action, Alexander devised a vaguer scheme which he called the Holy Alliance. Long attracted to the idea of an international order, appalled by the return of Napoleon, and influenced at the moment by the pious Baroness von Krüdener, the tsar proposed, for all monarchs to sign, a statement by which they promised to uphold Christian principles of charity and peace. All signed except the pope, the sultan of the Ottoman Empire, and the prince regent of Great Britain. The Holy Alliance, probably sincerely meant by Alexander as a condemnation of violence, and at first not taken seriously by the others who signed it and who thought it absurd to mix Christianity with politics, soon came to signify, in the minds of liberals, a kind of unholy alliance of monarchies against liberty and progress.

---

*Alliances against  
Napoleon*

The Peace of Vienna, including generally the Treaty of Vienna itself, the treaties of Paris, and the British and colonial settlement, was the most far-reaching diplomatic agreement between the Peace of Westphalia of 1648 and the Peace of Paris, which closed the First World War in 1919. It had its strong points and its weak ones. It produced a minimum of resentment in France; the late enemy accepted the new arrangements. It ended almost two centuries of European conflicts over the control of colonial territories in Asia and the Americas; for 60 or 70 years no colonial empire seriously challenged the British. Two other causes of friction in the eighteenth century—the control of Poland and the Austro-Prussian dualism in Germany—were smoothed over for 50 years. With past issues the peace of 1815 dealt rather effectively; with future issues, not unnaturally, it was less successful. The Vienna treaty was not illiberal in its day; it was by no means entirely reactionary, for the Congress showed little desire to restore the state of affairs in existence before the wars. The reaction that gathered strength after 1815 was not written into the treaty itself.

---

*The Peace of Vienna*

But the treaty gave no satisfaction to nationalists and democrats. It was a disappointment even to many liberals, especially in Germany. The transfer of peoples from government to government without consultation of their wishes opened the way under nineteenth-century conditions to a good deal of subsequent trouble. The peacemakers were in fact hostile both to nationalism and to democracy, the potent forces of the coming age; they regarded them, with reason, as leading to revolution and war. The problem to which they addressed themselves was to restore the balance of power, the "liberties of Europe," and to make a lasting peace. In this they were successful. They restored the European state system, a system in which a number of sovereign and independent states existed without

fear of conquest or domination. And the peace they made, though some details broke down in 1830 and others in 1848, on the whole subsisted for half a century; and not for a full century, not until 1914, was there a war in Europe that lasted longer than a few months or in which all the great powers were involved.

The Peace of Vienna thus brought to a close the great political and military upheavals that had spread across Europe in the wake of the French Revolution. Yet even the most conservative diplomats at Vienna recognized that the revolutionary events and legacy would not simply vanish from European culture or history; indeed the Holy Alliance and the vigilance of the conservative European states after 1815 showed how deeply the French Revolution had affected all of Europe and those places outside Europe where revolutionary ideas had become popular and influential. The Latin American struggle for independence from Spain, for example, continued to draw on the new conceptions of national sovereignty and continued to spread across the New World while diplomats in Vienna were working to restore stability and order in Europe.

*Legacy of the  
Revolution*

The French Revolution and the Napoleonic empire had demonstrated how a new, more open system of social and professional advancement enabled a nation to exercise power more effectively than any of the traditional, monarchical states. The revolutionary regimes had introduced new methods for mobilizing national economic resources, military forces, and large populations, all of which would reappear in the national mobilizations of other modern states. The Revolution and Napoleon, in short, gave the modern world new models of political organization and authoritarian rule. At the same time, however, the famous revolutionary events also helped to spread new conceptions of human rights, political participation, democratic government, and economic organization that would remain powerful cultural ideals throughout much of the modern world; and the popular ideology of nationalism, which developed among both supporters and opponents of the French Revolution and Napoleon, rapidly became one of the most pervasive political and cultural forces in modern world history.

All of these ideas helped to produce and reshape the characteristic institutions of modern societies. They continued to attract fervent supporters after the Congress of Vienna and after all other attempts to defend or revive the old order. The French Revolution and the Napoleonic wars, for all their turmoil and terrible destructive violence, created a lasting political and cultural legacy that has influenced modern nations almost everywhere, down to our own time.

## EUROPE, 1815

Boundaries are those set by the Congress of Vienna. France was reduced to the borders it had in 1789. Prussia was firmly installed on both banks of the Rhine, but South Germany remained as reorganized by Napoleon. Poland was again partitioned, with a larger share than in 1795 going to Russia—which also acquired Finland and Bessarabia. The Austrians added Venetia to what they had held before 1796. The union of the Dutch and Belgian Netherlands lasted only until 1831, when the kingdom of Belgium was established. Otherwise, the boundaries of 1815 lasted until the Italian war of 1859, which led to the unification of Italy.

## INDUSTRIES, IDEAS, AND THE STRUGGLE FOR REFORM, 1815–1848

52. The Industrial Revolution in Britain
53. The Advent of the "Isms"
54. The Dike and the Flood: Domestic
55. The Dike and the Flood: International
56. The Breakthrough of Liberalism in the West: Revolutions of 1830–1832
57. Triumph of the West European Bourgeoisie

*In the period* of some 30 years preceding 1815 two "revolutions" had been taking place. One was the upheaval associated with the French Revolution and the Napoleonic empire. Basically, it was mainly **political**, having to do with the organization of government, public power and authority, public finance, taxation, administration, law, individual rights, and the legal position of social classes. The other "revolution," a revolution in a more metaphorical sense, was primarily **economic**, having to do with the production of wealth, the techniques of manufacture, the exploitation of natural resources, the development of new technologies, the formation of capital, and the distribution of products to consumers. The political and the economic revolutions in these years went on somewhat independently of each

other. **Until 1815 the political revolution affected mainly the Continent, while the economic revolution was most active in England.** The Continent, while renewing itself politically, remained economically less advanced than England. **England, transformed economically, remained conservative in other respects.** Hence it has been possible to deal with the political significance of the French Revolution and its Napoleonic sequel without much discussion of **the Industrial Revolution, as the economic changes then occurring in England are always called.**

It may be (the matter is arguable) that the Industrial Revolution was more important than the French Revolution or any other. In a telescopic view of world history the two biggest changes experienced by the human race in the past 10,000 years may have been the agricultural or Neolithic revolution, which, beginning about 8000 B.C., ushered in the first civilizations, and **the Industrial Revolution, which ushered in the modern global civilization of the last two centuries.** However that may be, it proves on closer examination that

---

*Political and  
economic factors*

the economic and the political, the Industrial Revolution (or industrialization) and the other institutions of a society, cannot be kept apart in the historical study of modern times. The Industrial Revolution occurred first in England, becoming evident about 1780, because of certain political characteristics of English society, because earlier commercial and naval successes had expanded England's access to world markets, and because English life offered rewards to the individual for a spirit of risk-taking and innovation. Nor can the effects of political and economic revolution, in England or elsewhere, be kept apart for the years after 1815.

With the defeat of Napoleon and signing of the peace treaty at Vienna in 1815, it seemed that the French Revolution was at last over. European conservatism had triumphed; since it restored European monarchies and frankly opposed the new "French ideas," it can appropriately be called "reaction." But the processes of industrialization, as they accelerated in England and spread to the Continent, worked against the politically conservative settlement. Industrialization greatly enlarged both the business and wage-earning classes, and made it harder for monarchs and landed aristocrats to maintain their control over public power. Industrial development in the nineteenth century was often called "progress," and economic progress proved stronger than political reaction.

Industrial society arose in England, Western Europe, and the United States in the nineteenth century, within the system known as capitalism. In the twentieth century, after the Russian Revolution in 1917, industrial societies were created in which capitalism was vehemently rejected. Industrialism and capitalism are therefore by no means the same. Yet all industrial societies use capital, which is defined as wealth that is not consumed but is used to produce more wealth, or future wealth. An automobile is a consumer's good; the automobile factory is the capital. What distinguishes a capitalist from a noncapitalist society is not the existence of capital but the ways in which the capital is controlled. The distinctions sometimes become blurred. In one form of society the control of capital is through private ownership, or institutions of private property, by which capital is owned by individuals, families, or corporations that are in turn owned by shareholders—in any case not by the state. In such societies, though ownership may be widespread, most capital is controlled by relatively few people, responding to market forces. In the other form of society productive capital in principle belongs to the public and is in effect owned and controlled by the state or its agencies; such societies usually call themselves socialist, because the first socialists rejected the principle of private ownership of the means of production, that is, of capital. In these societies the control of capital, or decisions on saving, investment, and production, are also in the hands of relatively few under some form of central plan.

---

*Industrialism versus  
capitalism*

In Europe the institutions of secure private property had developed gradually since the Middle Ages, and much that happened in the French Revolution was designed to protect property from the demands of the state. Possession of property was held to be the basis of personal independence and political liberty, and the expectation of keeping future profits inspired, in some, a willingness to commit their capital to new and uncertain ventures. It made possible an entrepreneurial spirit. There had been a commercial capitalism in Europe at least since the sixteenth century. Industrialization in Europe was therefore capitalist. Countries outside the West-European orbit, and industrializing later, faced a different problem. A country in which little capital had accumulated from the trade and agriculture of previous generations, and which had few owners of capital or enterprising individuals, could hardly industrialize by European methods. If it lacked the European background, in which various political, social, legal, and organizational features were as important as the

economic, it would have to achieve industrialization by a combination of other methods. This usually meant that innovation, planning, decision making, control, and even domination rested largely with the state.

In the short run, within a few years, the Industrial Revolution in Western Europe favored the liberal, modernizing principles and legal rights proclaimed in the French Revolution. In the middle run, or in half a century, it made Europe overwhelmingly more powerful than other parts of the world, leading to a worldwide European ascendancy in the form of imperialism. In the still longer run, by the twentieth century, it provoked a retaliation, in which other countries tried hastily to industrialize in self-protection, or to improve the condition of their peoples, hoping to catch up with Western economies and nation-states while loudly denouncing the West as imperialist and capitalist. Of these newer industrial societies the Soviet Union, until its dissolution in 1991, and the People's Republic of China, from 1949 into the twenty-first century, would be the most prominent.

## 52. THE INDUSTRIAL REVOLUTION IN BRITAIN

On the whole, from the beginning of history until about 1800, the work of the world was done with hand tools. Since then it has been increasingly done by machines. Before about 1800 power was supplied by human or animal muscle, reinforced by levers or pulleys, and supplemented by the force of running water or moving air. Since then power has been supplied by the human manipulation of forms of energy found in steam, electricity, the combustion of gases, and most recently within the atom. The process of shifting from hand tools to power machinery is what is meant by the Industrial Revolution. Its beginning cannot be dated exactly. It grew gradually out of the technical practices of earlier times. It is still going on, for in some countries industrialization has barely begun, and even in the most highly developed it is still making advances. But the first country to be profoundly affected by industrialization was Great Britain, where its effects became manifest in the half-century following 1780.

It seems likely, despite the emphasis placed on revolutionary upheavals by historians, that people are habitually quite conservative. Working people do not put off their old way of life, move to strange and overcrowded towns, or enter the deadly rounds of mine and factory except under strong incentive. Well-to-do people, living in comfort on assured incomes, do not readily risk their wealth in new and untried ventures. The shifting to modern machine production requires in any country a certain mobility of people and of wealth. Such mobility may be produced by state pressure, as in the twentieth-century industrialization of the Soviet Union or the People's Republic of China. In eighteenth-century England a high degree of social mobility developed from a long historical process of social change.

### *The Agricultural Revolution in Britain*

The English Revolution of 1688, confirming the ascendancy of Parliament over the king, meant in economic terms the ascendancy of the more well-to-do property-owning classes. Among these the landowners were by far the most important, though they counted the great London merchants among their allies. For a century and a half, from 1688 to 1832, the British government was substantially in the hands of these landowners—the “squirearchy” or “gentlemen of England.” The result was a thorough transformation of farming, an Agricultural Revolution without which the Industrial Revolution could not have occurred.

---

**Agricultural  
experimentation**

---

Many landowners, seeking to increase their money incomes, began experimenting with improved methods of cultivation and stock raising. They made more use of fertilizers such as animal manure; they introduced new implements such as the drill seeder and horse-hoe; they brought in new crops, such as turnips, and a more scientific system of crop rotation; they attempted to breed larger sheep and fatter cattle. An improving landlord, to introduce such changes successfully, needed full control over his land. He saw only a barrier to progress in the old village system of open fields, common lands, and semicollective methods of cultivation. Improvement also required an investment of capital, which was impossible so long as the soil was tilled by numerous poor and custom-bound small farmers.

---

**The enclosure acts**

---

The old common rights of the villagers were part of the English common law. Only an act of Parliament could modify or extinguish them. It was the great landowners who controlled Parliament, which therefore passed hundreds of “enclosure acts,” authorizing the enclosure, by fences, walls, or hedges, of the old common lands and unfenced open fields. Land thus came under a strict regime of private ownership and individual management. At the same time small owners sold out or were excluded in various ways, the more easily since the larger owners had so much local authority as justices of the peace. Ownership of land in England, more than anywhere else in central or western Europe, became concentrated in the hands of a relatively small class of wealthy landlords, who leased it out in large blocks to a relatively small class of substantial farmers. This development, though in progress throughout the eighteenth century, reached its height during the Napoleonic wars.

One result was greatly to raise the productivity of land and of farm labor. Fatter cattle yielded more meat; more assiduous cultivation yielded more cereals. The food supply of England was increased, while a smaller percentage of the population was needed to produce it. Labor was thus released for other pursuits. The greater number of the English country people became wage earners, working for the farmers and landlords, or spinning or weaving in their cottages for merchants in the towns. English working men and women were therefore dependent on daily wages long before the coming of the factory and the machine. Working people became mobile; they would go where the jobs were, or where the wages were slightly higher. They also became available for new kinds of work because fewer of them were needed on the land to produce food. Such conditions hardly obtained except in Great Britain. On the Continent agricultural methods were less productive, and the rural workers were more established on the soil, whether by institutions of serfdom as in eastern Europe or by the possession of property or firm leaseholds as in France.

*Industrialism in Britain: Incentives and Inventions*

Meanwhile, as the Agricultural Revolution ran its course in the eighteenth century and into the nineteenth, the British had conquered a colonial empire, staked out markets all over the Americas and Europe, built up a huge mercantile marine, and won command of the sea. The British merchant could sell more, if only more could be produced. He had the customers, he had the ships, and moreover he could obtain the capital with which to finance new ideas. The profit motive prompted the search for more rapid methods of production. The old English staple export, woollen cloth, could be marketed indefinitely if only more could be woven. The possibilities in cotton cloth were enormous. The taste of Europeans for cottons had been already formed by imports from Asia. Using hand methods, Europeans could not produce cotton cloth in competition with the East. But the market was

The construction of cotton mills led to a rapid increase in the production of textiles and brought large numbers of workers together in new cities. This illustration of an English cotton mill in the early 1830s shows the technology of industrialization and the women workers who moved from older cottage industries into the new factories. *Mass production / Division of Labor*  
(Mary Evans Picture Library/The Image Works) *"alienated labor"*

endless if cotton could be spun, woven, and printed with less labor, that is, by machines. Capital was available, mobile, and fluid because of the rise of banking, credit, and stock companies. Funds could be shifted from one enterprise to another. Wealthy landowners and merchants could divert some of their profits to industry. If an invention proved a total loss, as sometimes happened, or if it required years of development before producing any income, the investment could still be afforded. Only a country already wealthy from commerce and agriculture could have been the first to initiate the machine age. England was such a country.

These conditions induced a series of successful inventions in the textile industry. In 1733 a man named John Kay invented the fly shuttle, by which only one person instead of two was needed to weave cloth on a loom. The resulting increase in the output of weaving set up a strong demand for yarn. This was met in the 1760s by the invention of the spinning jenny, a kind of mechanized spinning wheel that enabled workers to increase their production of yarn. The new shuttles and jennies were first operated by hand and used by domestic workers in their homes. But in 1769 Richard Arkwright patented the water frame, a device for the multiple spinning of many threads. At first it was operated by water power, but in the 1780s Arkwright introduced the steam engine to drive his spinning

---

*Inventions in the  
textile industry*

machinery. Requiring a considerable installation of heavy equipment, he gathered his engines, frames, and workers into large and usually dismal buildings, called mills by the English, or factories in subsequent American usage. **Mechanical spinning** now for a time overwhelmed the hand weavers with yarn. This led to the development of the power loom, which became economically practicable shortly after 1800. **Weaving as well as spinning therefore took place increasingly in factories.** These improvements in the finishing process put a heavy strain on the production of raw cotton. An ingenious Connecticut inventor, Eli Whitney, while employed as a children's tutor on a Georgia plantation in 1793, produced a **cotton gin**, which by speeding up the removal of seeds greatly increased the output of cotton. The gin soon spread through the American South, where the almost decaying plantation economy was abruptly revived, becoming an adjunct to the Industrial Revolution in England. British imports of raw cotton multiplied fivefold in the 30 years following 1790. **In value of manufactures, cotton cloth rose from ninth to first place among British industries in the same years.** By 1820 it made up almost half of all British exports.

---

#### *The steam engine*

The steam engine, applied to the cotton mills in the 1780s, **had for a century been going through a development of its own.** Scientific and technical experiments with steam pressures had been fairly common in the seventeenth century, but what gave the economic impetus to invention was the gradual dwindling of Europe's primeval stocks of timber. The wood shortage became acute in England about 1700, so that it was more difficult to obtain the charcoal needed in smelting iron, and smelters turned increasingly to coal. Deeper coal shafts could not be sunk until someone devised better methods of pumping out water. About 1702 Thomas Newcomen built the first economically significant steam engine, which was soon widely used to drive pumps in the coal mines. However, it consumed so much fuel in proportion to power delivered that it could generally be used only in the coal fields themselves. In 1763 James Watt, a technician at the University of Glasgow, began to make improvements on Newcomen's engine. He formed a business partnership with Matthew Boulton. Boulton, originally a manufacturer of toys, buttons, and shoe buckles, provided the funds to finance Watt's rather costly experiments, handmade equipment, and slowly germinating ideas. **By the 1780s the firm of Boulton and Watt was eminently successful, manufacturing steam engines both for British use and for the export trade.**

---

#### *Transportation*

At first, until further refinements and greater precision could be obtained in the working of iron, the engines were so cumbersome that they could be used as stationary engines only, as in the new spinning mills of Arkwright and others. **Soon after 1800 the steam engine was successfully used to propel river boats,** notably on the Hudson River in 1807, by Robert Fulton, who employed an imported Boulton and Watt engine. **Experiments with steam power for land transportation began at the same time.** Just as Newcomen's engine had been put to practical uses in the coal fields of England a century before, so now **it was in the coal fields that Watt's engine first became a locomotive.** Well before 1800 the mines had taken to using railways, on which wagons with flanged wheels, drawn by horses, carried coal to canals or to the sea. **In the 1820s steam engines were successfully placed on moving vehicles.** The first fully satisfactory locomotive was George Stephenson's *Rocket*, which in 1829, on the newly built Liverpool and Manchester Railway, not only reached an impressive speed of 16 miles per hour but met more important safety tests as well. **By the 1840s the era of railroad construction was under way in both Europe and the United States.**

The Industrial Revolution in Great Britain in its early phase, down to 1830 or 1840, took place principally in the manufacture of textiles, with accompanying developments in the exploitation of iron and coal. The early factories were principally textile factories, and

indeed mainly cotton mills; for cotton was an entirely new industry to Europe and hence easily mechanized, whereas the long established woolen trade, in which both employers and workers hesitated to abandon their customary ways, was mechanized more slowly. The suddenness of the change must not be exaggerated. It is often said that the Industrial Revolution was not a revolution at all. As late as the 1830s only a small fraction of the British working people were employed in factories. But the factory and the factory system were even then regarded as the coming mode of production, destined to grow and expand and symbolize the irresistible march of progress.

### *Some Social Consequences of Industrialism in Britain*

The Britain that emerged fundamentally unscathed and in fact strengthened from the wars with Napoleon was no longer the "merrie England" of days of yore. The island was becoming crowded with people, as was the lesser island of Ireland. The combined population of Great Britain and Ireland tripled in the century from 1750 to 1850, rising from about 10 million in 1750 to about 30 million in 1850. The growth was distributed very unevenly. Formerly, in England, most people had lived in the south. But the coal and iron, and hence the steam power, lay in the Midlands and the north. Here whole new cities rose seemingly out of nowhere. In 1785 it was estimated that in England and Scotland, outside of London, there were only three cities with more than 50,000 people. Seventy years later, the span of one lifetime, there were 31 British cities of this size.

Preeminent among them was Manchester in Lancashire, the first and most famous of the new industrial cities. Manchester, before the coming of the cotton mills, was a rather large market town. Though very ancient, it had not been significant enough to be recognized as a borough for representation in Parliament. Locally it was organized as a manor. Not until 1845 did the inhabitants extinguish the manorial rights, buying them out at that time from the last lord. In population Manchester grew from 25,000 in 1772 to 455,000 in 1851. But until 1835 there was no regular procedure in England for the incorporation of cities. Urban organization was more backward than in Prussia or France. Unless inherited from the Middle Ages, a city had no legal existence. It lacked proper officials and adequate tax-raising and lawmaking powers. It was therefore difficult for Manchester and the other new factory towns to deal with problems of rapid urbanization, such as provision for police protection, water and sewers, or the disposal of garbage.

---

*Manchester*

The new urban agglomerations were drab places, blackened with the heavy soot of the early coal age, settling alike on the mills and the workers' quarters, which were dark at best, for the climate of the Midlands is not sunny. Housing for workers was hastily built, closely packed, and always in short supply, as in all rapidly growing communities. Entire families lived in single rooms, and family life tended to disintegrate. A police officer in Glasgow observed that there were whole blocks of tenements in the city, each swarming with a thousand ragged children who had first names only, usually nicknames—like animals, as he put it.

The distressing feature of the new factories was that for the most part they required unskilled labor only. Skilled workers found themselves degraded in status. Hand weavers and spinners, thrown out of work by the new machines, either languished in a misery that was the deepest of that of any class in the Industrial Revolution or else went off to a factory to find a job. The factories paid good wages by the standards for unskilled labor at the time. But these standards were very low, too low to allow a man to support his wife and children. This had generally

---

*Unskilled labor*

*Violating the moral guidance wheels of nature* The invention of the steam locomotive and railways contributed decisively to early nineteenth-century industrialization. These primitive trains, about 1840, are running on wooden rails with “guidance wheels” at a strange angle to keep them on the track. (Time Life Pictures/Getty Images) *Effects of Industrial Rev.*

*Pollution* been true for unskilled labor in England and elsewhere, under earlier economic systems also. In the new factories the work was so mechanical that children as young as six years old were often preferred. Women, too, worked for less and were often more adept at handling a bobbin, which brought many women spinners from the older, displaced “cottage industries” into the new industrial working class.

Hours in the factories were long, 14 a day or occasionally more; and though such hours were familiar to persons who had worked on farms, or at domestic industry in rural households, they became more tedious and oppressive in the more regimented conditions that were necessary in the mills. Holidays were few, except for the unwelcome leisure of unemployment, which was a common scourge, because the short-run ups and downs of

### BRITAIN BEFORE AND AFTER THE INDUSTRIAL REVOLUTION

In 1700 England, Scotland, and Wales had only one city with a population of more than 100,000. In 1911 they had nearly 30, most of which were located in the industrialized Midlands (the area within the small rectangle).

business were very erratic. A day without work produced nothing to live on, but even where the daily wage was relatively attractive, the worker's real income was chronically insufficient. Workers in the factories, as in the mines, were almost entirely unorganized. They were a mass of recently assembled humanity without traditions or common ties. They bargained individually with their employers who, usually small business people themselves, faced ferocious competition with others. The employers were often in debt for the equipment in their own factories, or they were determined to save money in order to purchase more, and so held their wages bill to the lowest possible figure.

The factory owners, the new "cotton lords," were the first industrial capitalists. They were often self-made men, who owed their position to their own intelligence, persistence, and foresight. They lived in comfort without ostentation or luxury, saving from each year's income to build up their factories and their machines. Hard-working themselves, they thought that landed gentlemen were usually idlers and that the poor tended to be lazy. They were usually honest, in a hard and exacting way; they would make money by any means the law allowed, but not beyond it. They were neither brutal nor knowingly hard-hearted. They gave to charitable and philanthropic causes. They believed that they did the poor a favor by furnishing them with work and by seeing to it that they worked diligently and productively. Most of them disapproved of public regulation of their business, though a few, driven by competition to expedients that they did not like, such as the employment of small children, would have accepted some regulation that fell on all competitors equally. It was a cotton magnate, the

---

*The cotton lords*

elder Robert Peel, who in 1802 pushed the first Factory Act through Parliament. This act purported to regulate the conditions in which pauper children were employed in the textile mills, but it was a dead letter from the beginning, since it provided no adequate body of factory inspectors. The English at this time, alone among the leading European peoples, had no class of trained, paid, and professional government administrators; nor did they yet want such a class, preferring self-government and local initiative. To have inspectors for one's affairs smacked of Continental bureaucracy. The fact that the older methods of economic regulation were obsolescent, actually unsuited to the new age, had the effect of discrediting the idea of regulation itself. The new industrialists wanted to be left alone. They considered it unnatural to interfere with business and believed that, if allowed to follow their own judgment, they would assure the future prosperity and progress of the country.

### *Classical Economics: "Laissez-Faire"*

The industrialists were strengthened in these beliefs by the emerging science of political economy. In 1776 Adam Smith published his epochal *Wealth of Nations*, which criticized the older mercantilism, with its regulatory and monopolistic practices, and urged, though with moderation, that certain "natural laws" of production and exchange be allowed to work freely in economic markets. Smith was followed by Thomas R. Malthus, David Ricardo, and the so-called Manchester School. Their doctrine was dubbed (by its opponents) *laissez-faire* and in its elaborated form is still called classical economics. It held, basically, that there is a world of economic relationships autonomous and separable from government or politics. It is the world of the free market and is regulated within itself by

certain "natural laws," such as the law of supply and demand. All persons should follow their own enlightened self-interest; all know their own interests better than anyone else; and the sum total of individual interests will add up to the general welfare and liberty of all. Government should do as little as possible; it should confine itself to preserving security of life and

Self-interest and free  
trade

property, providing reasonable laws and reliable courts, thus ensuring the discharge of private contracts, debts, and obligations. Not only business but education, charity, and personal matters generally should be left to private initiative. There should be no tariffs; free trade should reign everywhere, for the economic system is worldwide, unaffected by political barriers or national differences. As for workers, according to classical economists before about 1850, they should not expect to make more than a bare minimum living; an "iron law of wages," they argued, shows that as soon as workers receive more than a subsistence wage they breed more children, who eat up the excess, so that they reduce themselves, and the working class generally, again to a subsistence level. Workers, if discontented, should see the folly of changing the system, for this *is* the system, the natural system—there is no other. Political economy as taught in grim Manchester was not without reason called the "dismal science."

Working people's  
experiences

For working people in England the Industrial Revolution was a hard experience. It should be remembered, however, that neither low wages, nor the 14-hour day, nor the labor of women and children, nor the ravages of unemployment were anything new. All had existed for centuries, in England and western Europe, as agricultural and commercial capitalism replaced the more self-sufficient economies of the Middle Ages. The factory towns were in some ways better places than the rural slums from which many of their people came. Factory routine was psychologically deadening, but the textile mills were not always worse than the domestic

sweatshops in which manufacturing processes had previously been carried on. The concentration of working people in city and factory opened the way to improvement in their condition. It made their misery apparent; philanthropic sentiment gradually arose among the more fortunate. Gathered in cities, workers obtained more knowledge of the world. Mingling and talking together, they developed a sense of solidarity, class interest, and common political aims; and in time they became organized, establishing labor unions by which to obtain a larger share of the national income.

Britain after the fall of Napoleon became the workshop of the world. Though factories using steam power sprang up in France, Belgium, New England, and elsewhere, it was really not until after 1870 that Great Britain faced major industrial competition from abroad. The British had a virtual monopoly in textiles and machine tools. The English Midlands and Scottish Lowlands shipped cotton thread and steam engines to all the world. British capital was exported to all countries, there to call new enterprises into being. London became the world's clearinghouse and financial center. Progressive people in other lands looked to Britain as their model, hoping to learn from its advanced industrial methods, and to imitate its parliamentary political system.

### 53. THE ADVENT OF THE "ISMS"

The combined forces of industrialization and of the French Revolution led after 1815 to a proliferation of new doctrines and movements, most of which contributed to a general European revolution in 1848. As for the 33 years from 1815 to 1848, there is no better way of grasping their long-run meaning than to reflect on the number of enduring "isms" that arose at that time.

So far as is known the word "liberalism" first appeared in the English language in 1819, "radicalism" in 1820, "socialism" in 1832, "conservatism" in 1835. The 1830s first saw "individualism," "constitutionalism," "humanitarianism," "feminism," and "monarchism." "Nationalism" and "communism" date from the 1840s. Not until the 1850s did the English-speaking world use the word "capitalism" (French *capitalisme* is much older); and not until even later had it heard of "Marxism," though the doctrines of Marx grew out of and reflected the troubled times of the 1840s.

The rapid coinage of new "isms" does not in every case mean that the ideas they conveyed were new. Many of them had their origin in the Enlightenment, if not before. People had loved liberty before talking of liberalism and been conservative without defining their ideas as conservatism. The appearance of so many "isms" shows rather that people were making their ideas more systematic. To the "philosophy" of the Enlightenment were now added an intense activism and partisanship generated during the French Revolution. People were obliged to reconsider and analyze society as a whole. The social sciences were taking form. An "ism" (excluding such words as "hypnotism" or "favoritism") may be defined as the conscious espousal of a doctrine in competition with other doctrines. Without the "isms" created in the 30-odd years after the peace of Vienna it is impossible to understand or even talk about the history of the world since that event, so that a brief characterization of some of the most important is in order.

#### *Romanticism*

One of the "isms" was not political. It was called "romanticism," a word first used in English in the 1840s to describe a movement then half a century old. Romanticism was primarily a theory of literature and the arts. Its great exponents included William Wordsworth,

THE INDUSTRIAL REVOLUTION IN BRITAIN (AS SHOWN BY SOURCES OF INCOME)

British national income grew about eightfold in the nineteenth century. Income derived from agriculture, forestry, and the like remained about the same, but the income from these activities sank from one-third to one-sixteenth of all income. By 1851 half the national income came from manufacturing, trade, and transportation, and by 1901 three-quarters came from these sources. The category “income from abroad” refers to interest and dividends on loans and investments outside Great Britain, which grew rapidly after the 1850s.

Lord Byron, Percy Bysshe Shelley, and Mary Wollstonecraft Shelley in England; Victor Hugo, René Chateaubriand, and George Sand in France; and Friedrich von Schiller, Friedrich Schlegel, and many others in Germany. As a theory of art it raised basic questions on the nature of significant truth, on the importance of various human faculties, on the relation of thought and feeling, on the meaning of the past and of time itself. Romanticism rejected the emphasis on classical rules and rational order that had shaped aesthetic theory during much of the eighteenth century. Romantics celebrated the idiosyncratic visions of creative individuals rather than the symmetries of classical art and literature. They helped produce the modern image of defiant artistic rebels. Representing a new way of sensing all human experience, romanticism affected much thinking on social and public questions.

Possibly the most fundamental romantic attitude was a love of the unclassifiable—of moods or impressions, scenes or stories, sights or sounds or things concretely experienced, personal idiosyncrasies or peculiar customs which the intellect could never classify, box up, explain away, or reduce to an abstract generalization. The romantics, characteristically, insisted on the value of feeling as well as of reason. They were aware of the importance of the subconscious. They were likely to suspect a perfectly lucid idea as somehow superficial. They loved the mysterious, the unknown, the half-seen figures on the far horizon. Hence romanticism contributed to a new interest in strange and distant societies and in strange and distant historical epochs. Where the philosophes of the Enlightenment had deplored the Middle Ages as a time of intellectual error, the romantic generation looked back upon them with respect and even nostalgia, finding in them a fascination, a colorfulness, or a spiritual depth which they missed in their own time. The "Gothic," which rationalists thought barbarous, had a strong appeal for romantics. A Gothic Revival emerged in the arts, of which one example was the British Parliament buildings, built in the 1830s.

---

*Love of the  
unclassifiable*

In medieval art and institutions, as in the art and institutions of every age and people, the romantics saw the expression of an inner genius. The idea of original or creative genius was in fact another of the most fundamental romantic beliefs. A genius was a dynamic spirit that no rules could hem in, one that no analysis or classification could ever fully explain. Genius, it was thought, made its own rules and laws. The genius might be that of the individual person, such as the artist, writer, or Napoleonic mover of the world. It might be the genius or spirit of an age. Or it might be the genius of a people or nation, the *Volksgeist* of Herder, an inherent national character making each people grow in its own distinctive way, which could be known only by a study of its history; romanticism thus merged in many places with new forms of nationalism. Here again romanticism gave a new impetus to study of the past. Politically, romantics could be found in all camps, conservative, liberal, and radical, but the emphasis on individual creativity led most romantics toward a critical view of rigid social and cultural hierarchies. Romanticism thus added cultural and emotional passions to the more political "isms" that evolved rapidly after 1815.

*Creative genius*

### *Classical Liberalism*

The first Liberals, calling themselves by that name (though Napoleon used that word for his own system), arose in Spain among opponents of the Napoleonic occupation. The word passed to France, where it denoted opposition to royalism after the restoration of the Bourbons in 1814 and where it gained intellectual influence through the work of liberal writers such as Benjamin Constant. In England, many Whigs became increasingly liberal, as did even a few Tories. Liberal political theorists also had influence in England, most notably in the writings of John Stuart Mill, and a new Liberal Party became an important force in British politics during the 1850s. Nineteenth-century, or "classical," liberalism varied from country to country, but it showed many basic similarities, including an emphasis on the rights and liberties that individuals should possess in every well-ordered, modern society.

Liberals were generally persons of the business and professional classes, together with enterprising landowners wishing to improve their estates. They believed in what was modern, enlightened, efficient, reasonable, and fair. They had confidence in the human capacity for self-government and self-control. They set a high value on parliamentary or representative government,

working through reasonable discussion and legislation, with responsible ministries and an impartial and law-abiding administration. They demanded full publicity for all actions of government, and to ensure such publicity they insisted on freedom of the press and free rights of assembly. **All these political advantages they thought most likely to be realized under a good constitutional monarchy.** Outside England they favored explicit written constitutions. They were not democrats; they generally opposed giving every man the vote, fearing the excesses of mob rule or of irrational political action. **Only as the nineteenth century progressed did liberals gradually and reluctantly come to accept the idea of universal male suffrage.** Many continued to oppose female suffrage, though some liberals such as John Stuart Mill argued that women should have the same voting rights as men. **Liberals**

subscribed to the doctrines of the "rights of man" as set forth in the American and French revolutions, but with a clear emphasis on the right of property, and in their economic views they typically followed the British Manchester School or the French economist J. B. Say. They favored *laissez-faire*, were suspicious of the ability of government to regulate business, wanted to get rid of the guild system where it still existed, and disapproved of attempts on the part of the new industrial laborers to organize unions.

Internationally they advocated freedom of trade, to be accomplished by the lowering or abolition of tariffs, so that all countries might exchange their products easily with each other and with industrial England. In this way, they thought, each country would produce what it was most fitted for, and so best increase its wealth and standards of living. From the growth of wealth, production, invention, and scientific progress they believed that the general progress of humanity would ensue. They generally frowned upon the established churches and landed aristocracies as obstacles to advancement. They believed in the spread of tolerance and education. They were also profoundly civilian in attitude, disliking wars, conquerors, army officers, standing armies, and military expenditures. They wanted orderly change by processes of legislation. They shrank before the idea of revolution. Liberals on the Continent usually admired Great Britain.

### *Radicalism, Republicanism, Socialism*

**Radicalism**, at least as a word, originated in England, where about 1820 the Philosophical Radicals proudly applied the term to themselves. These Radicals in the 1820s included not only the few working-class leaders who were beginning to emerge but also many of the new industrial capitalists, who were still unrepresented in Parliament. They took up where such English "Jacobins" as Thomas Paine had left off a generation earlier, before the long crisis of the French wars had discredited all radicalism as pro-French; and they wanted to extend many of the liberal arguments for individual rights to much wider segments of the population.

The Philosophical Radicals were a good deal like the rationalist French philosophes before the Revolution. They were followers of an elderly sage, Jeremy Bentham, who in prolific writings from 1776 to 1832 undertook to reform the English criminal and civil law, church, Parliament, and constitution. The English Radicals professed to deduce the right form of institutions from the fundamental traits of human nature and psychology. They impatiently waved aside all arguments based on history, usage, or custom. They went to the roots of things. ("Radical" is from the Latin word for "root.") They wanted a total reconstruction of laws, courts, prisons, poor relief, municipal organization, rotten boroughs, and fox-hunting clergy. Their demand for the reform of Parliament was vehement and insistent. They detested the Church of England, the peerage, and the squirearchy. Many radicals would just as soon abolish royalty also; not until the long reign of Queen Victoria (1837–1901) did the British monarchy become undeniably popular in all quarters. Above all, radicalism was democratic; it demanded a vote for every adult Englishman. After the Reform Bill of 1832 the industrial capitalists generally turned into liberals, but the working-class leaders remained radical democrats, as will be seen.

---

*Demands for radical reforms*

On the Continent radicalism was represented by militant republicanism. The years of the First French Republic, which to liberals and conservatives signified horrors associated with the Reign of Terror, were for the republicans years of hope and progress, cut short by forces of reaction. Republicans were a minority even in France; elsewhere, as in Italy and Germany, they were fewer still,

---

*Republican ideals*

though they existed. Mostly the republicans were drawn from intelligentsia such as students and writers, from working-class leaders protesting social injustice, and from elderly veterans, or the descendants of veterans, to whom the Republic of '93, with its wars and its glory, was a living thing. Because of police repression, republicans often joined together in secret societies. They looked with equanimity on the prospect of further revolutionary upheaval, by which they felt that the cause of liberty, equality, and fraternity would be advanced. Strong believers in political equality, they were democrats demanding universal male suffrage. They favored parliamentary government but were much less primarily concerned with its successful operation than were the liberals. Most republicans were bitterly anticlerical. Remembering the internecine struggle between the church and the republic during the French Revolution, and still facing the political influence of the Catholic clergy (for republicanism was most common in Catholic countries), they regarded the Catholic church as the implacable enemy of reason and liberty. Opposed to monarchy of any kind, even to constitutional monarchy, intensely hostile to church and aristocracy, conscious heirs of the great French Revolution, organized in national and international secret societies, not averse to overthrowing existing regimes by force, the more militant republicans were considered by most other people, including the liberals, to be little better than anarchists.

---

*Socialist views*

Republicanism shaded off into socialism. Socialists generally shared the political attitudes of republicanism but added other views besides. The early socialists, those before the Revolution of 1848, were of many kinds, but all had certain ideas in common. All of them regarded the existing economic system as aimless, chaotic, and outrageously unjust. All thought it improper for owners of wealth to have so much economic power—to give or deny work to the worker, to set wages and hours in their own interests, to guide all the labors of society in the interests of private profit. All therefore questioned the value of private enterprise, favoring some degree of communal ownership of productive assets—banks, factories, machines, land, and transportation. All disliked competition as a governing economic or social principle and set forth principles of harmony, cooperation or association instead. All flatly and absolutely rejected the laissez-faire of the liberals and the political economists. Where the latter thought mainly of increasing production, without much concern over distribution, the early socialists thought mainly of a fairer or more equal distribution of income among all useful members of society. They believed that beyond the civil and legal equality brought by the French Revolution a further step toward social and economic equality had yet to be taken.

One of the first socialists was also one of the first cotton lords, Robert Owen (1771–1858) of Manchester and the Scottish Lowlands. Appalled at the condition of the millhands, he created a kind of model community for his own employees, paying high wages, reducing hours, sternly correcting vice and drunkenness, building schools and housing and company stores for the cheap sale of workers' necessities. From such paternalistic capitalism in his early years he passed on to a long lifetime spent in crusading for social reforms, in which he was somewhat handicapped, not only by the opposition of industrialists, but also by his unpopular radicalism in matters of religion.

Most of the early socialists were French, spurred onward by the sense of an uncompleted revolution. One was a nobleman, the Count de Saint-Simon (1760–1825), who had fought in the War of American Independence, accepted the French Revolution, and in his later years wrote many books on social problems. He and his followers, who called themselves not socialists

but Saint-Simonians, were among the first clear exponents of a planned society. They advocated the public ownership of industrial equipment and other capital, with control vested in the hands of great captains of industry or social engineers, who should plan vast projects like the digging of a canal at Suez, and in general coordinate the labor and resources of society to productive ends. Of a different type was Charles Fourier (1772–1837), a somewhat doctrinaire thinker who subjected all social institutions to a sweeping condemnation. His positive program took the form of proposing that society be organized in small units which he termed “phalansteries.” Each of these he conceived to contain 1,620 persons, each doing the work suited to his or her natural inclination. Among the practical French no phalanstery was ever successfully organized. A number were established in the United States, still the land of Europe’s utopian dream; the best known, since it was operated by literary people, was the Brook Farm “movement” in Massachusetts, which ran through a troubled existence of five years from 1842 to 1847. Robert Owen also, in 1825, had founded an experimental colony in America, at New Harmony, Indiana, on the then remote and unspoiled banks of the Wabash; it, too, lasted only about five years. Such schemes, as their critics pointed out, presupposed the withdrawal of select spirits to live by themselves and really had little to say about the problems of society as a whole in an industrial age.

Politically the most significant form of socialism before 1848 was the movement stirring among the working classes of France, a compound of revolutionary republicanism and socialism. The politically minded Paris workers had been republican since 1792. For them the Revolution, in the 1820s, 1830s, 1840s, was not finished but only momentarily interrupted.

---

*The French working  
classes*

Reduced to political impotence, discriminated against in the law courts, obliged to carry identity papers signed by their employers, and goaded by the pressures of industrialization as new factories spread across France, they developed a deep hostility to the owning classes of the bourgeoisie. They found a spokesman in the Paris journalist Louis Blanc, editor of the *Revue de progrès* and author of the *Organization of Work* (1839), one of the most constructive of the early socialist writings. He proposed a system of “social workshops,” or state-supported manufacturing centers, in which the workers should labor by and for themselves without the intervention of private capitalists. Of this kind of socialism we shall hear more.

As for “communism,” it was at this time an uncertain synonym for socialism. A small group of German revolutionaries, mainly exiles in France, took the name for themselves in the 1840s. They would have been historically forgotten had they not included Karl Marx and Friedrich Engels among their members. Marx and Engels consciously used the word in 1848 to differentiate their variety of socialism from that of such utopians as Saint-Simon, Fourier, and Owen. But the word *communism* went out of general use after 1848, to be revived after the Russian Revolution of 1917, at which time it received a somewhat new meaning.

### *Feminism*

Feminism emerged as a new political and cultural movement in the early nineteenth century, though the term itself did not appear until some women in France began to refer to themselves as “feminists” during the 1830s. There were several strands of feminism, as there were several strands of all significant “isms,” but most feminists shared various ideas with liberals, radicals, or socialists. Feminism sought to expand the rights of women in

both public and private life. Drawing on the legacy of the French Revolution and its conceptions of human rights, feminists argued that the “rights of man” existed also for women (much as republicans and socialists claimed that such rights must also exist for poor people and workers). Some feminists, extending the arguments of Mary Wollstonecraft’s influential book, *A Vindication of the Rights of Women* (1792), worked mainly to secure new voting and civil rights for women. Other feminists, though they might also support the quest for voting rights, worked mainly to reform the laws that regulated family life or to advance the rights of women in education, cultural life, and the economy. Both of these tendencies in early nineteenth-century feminism drew on Enlightenment ideas about human rights, reform, education, and progress, so that feminism resembled republicanism, radicalism, and socialism in its links to eighteenth-century predecessors, including French writers such as Condorcet and Olympe de Gouges.

---

#### Egalitarian feminism

The writers and activists who sought new political rights for women tended to be “egalitarian” feminists; that is, they stressed the ways in which women and men shared the use of reason and universal human rights.

Despite the obvious connection to themes of the French Revolution, the campaign for women’s political rights developed more rapidly in early nineteenth-century England and America. These national differences may have reflected the fact that voting rights generally became more widespread in England and America in the decades before 1848; or the different feminisms may have developed because French republicanism had become hostile to female political activities during the later stages of the French Revolution, and because the Napoleonic Code had given French women a subordinate position in the patriarchal legal system that regulated family relations. In any case, French feminists in the nineteenth century tended to focus on the social, cultural, or legal rights of women rather than on campaigns to win the vote.

---

#### English feminists

The first nineteenth-century advocates for women’s rights in England were Philosophical Radicals and followers of the socialist leader Robert Owen. The socialists Anne Wheeler and William Thompson, for example, published an important statement of the new feminist themes in their *Appeal on Behalf of Women* (1825), which traced the inferior status of women to flaws in the economic system. Similar arguments appeared also in the writings of Owen himself and in the publications of his feminist friend, the Scottish writer Frances Wright. But the most influential English argument for women’s political rights emerged in the works of the liberal writers Harriet Taylor and John Stuart Mill, who worked together as close intellectual partners for more than 20 years (they ultimately married after the death of her husband). Beginning in the 1830s, Taylor and Mill produced important works on the social, legal, and political inequalities that women faced in even the most advanced modern societies. Their collaboration led finally to Mill’s famous book, *The Subjection of Women* (1869), in which Mill referred to the decisive influence of Taylor’s ideas, though she had died before its publication. Mill built his case for women’s political and social rights on the claim that women were inherently equal to men (hence entitled to the same rights) and on the utilitarian argument that society could only benefit from the increased participation of women in public life. Translated into all the major European languages, his book had much subsequent influence on feminist campaigns for the political and legal rights of women in other nations as well as in England. Meanwhile, American women launched their own campaign for voting rights at a convention in Seneca Falls, New York, where leaders such as Elizabeth Cady Stanton declared, in 1848, that women were entitled to vote because they were “created equal” with men.

Feminists also entered public life on the Continent during the 1830s and 1840s, especially in France. Socialists such as Saint-Simon and Fourier gave critical attention to the history of the family, thereby encouraging their followers to develop a social analysis of traditional restrictions on the rights of women. Women activists in the Saint-Simonian groups of the 1830s established journals whose titles asserted new feminist identities: *The Free Woman* and *The New Woman*. A new generation of women writers also began to extend the earlier work of Germaine de Staël, who had argued that "it is useful to society's enlightenment and happiness that women should carefully develop their intelligence and their reason." All feminists advocated better education for young women, reforms in property and divorce laws to enhance women's independence, and the right of women to participate in public debates. Many feminists in France, however, moved away from the egalitarian arguments for women's rights by stressing certain differences between men and women. The special responsibilities of motherhood, for example, gave women a distinctive, essential task in educating the rising generation, but only well-educated, competent women could raise intelligent, well-educated children. Feminists thus strongly supported the creation of new schools for girls and began seeking women's access to higher education (public secondary schools for girls were not established in France until the 1880s).

In addition to the campaigns for education and legal reforms, many feminists became writers in order to describe the social lives of women or to assert their claims for a place in public life. The travel writings of Flora Tristan, for instance, examined the social constraints that women faced in both South America and Europe. Another French writer of Tristan's generation, George Sand, became the most influential literary woman of the 1840s. Her many novels and essays often portrayed independent women, but her own life was almost as famous and controversial as her books. Critics mocked her for wearing male clothing, smoking cigars, and living with men outside marriage; yet Sand also won the admiring support of readers throughout Europe, many of whom saw her as a model for new forms of female cultural and political expression. She therefore became a famous symbol for both supporters and enemies of the new feminism; indeed, the term "George Sandism" was used to condemn women whose behavior seemed radical or unconventional. Such hostility indicates how feminism had become one of the postrevolutionary "isms," though the political campaign for women's voting rights and other legal reforms would not achieve its main objectives until the twentieth century.

### *Nationalism: Western Europe*

Nationalism first arose in many places as part of the general reaction against the international Napoleonic system, but it also drew its strength from specific cultural and political traditions in each country. It was the most pervasive and the least crystallized of the new "isms," in part because it usually overlapped with various forms of romanticism, republicanism, or liberalism. In western Europe—Britain, France, or Spain—where national unity already existed, nationalism was not a doctrine for nation-building so much as a set of political and cultural beliefs, easily aroused when national interests were questioned but normally taken for granted. Elsewhere—in Italy, Germany, Poland, the Austrian and Turkish empires—where peoples of the same nationality were politically divided or subject to foreign rule, nationalism was becoming a deliberate and conscious program for political action. It was undoubtedly the example of the West, of Great Britain and France, successful and flourishing because they were unified nations, that stimulated the ambitions of

The Saint-Simonian movement in France produced early feminist publications and also helped to launch a new social analysis of the restrictions on women's rights. This engraving by the artist Malreuve in 1832 suggests the unconventional behavior of the Saint-Simonian feminists; the woman is wearing a dress short for its time and standing beside a document that says simply "Doctrine of St. Simon. The Free Woman?"

(Bibliothèque Nationale de France, Paris)

other peoples to become unified nations too. The period after 1815 was in Germany a time of rising agitation over the national question; in Italy, of the Risorgimento or “resurgence”; in eastern Europe, of the Slavic Revival.

The movement was led by intellectuals, who often found it necessary to instill in their compatriots the very idea of nationality itself. They seized upon Herder’s conception of the *Volksgeist*, or national spirit, applying its emphasis on national differences to their own people. Usually they began with a cultural nationalism, holding that each people had a language, history, world view, and culture of its own, which must be preserved and perfected. They then usually passed on to a political nationalism, holding that to preserve this national culture, and to ensure liberty and justice for its individual members, each nation should create for itself a sovereign state. Governing authorities, they held, should be of the same nationality and language as those they governed; and all persons of the same national language should be encompassed within the same state.

Since such ideas could not be fully realized without the overthrow of every government in Europe east of France, thoroughgoing nationalism was inherently revolutionary. Outspoken nationalists were therefore persecuted by the authorities, which drove them everywhere into secret nationalist societies. The Carbonari, organized in Italy in the time of Napoleon, was the best known, but there

Volksgeist

Secret societies

This caricature of George Sand, which appeared in a lithograph by Alcide Lorentz in 1842, mocks the famous author for her apparently "masculine" actions. Dressed in pants, holding a cigarette, and surrounded by her writings and political concerns, Sand is ridiculed in both the image and in a sarcastic caption—which alludes to her claim that genius "has no sex."

(Bibliothèque Nationale de France, Paris)

rise of feminism = product of industrial revolution & reconstruction ~~of~~ family unit.

were many others—like the *Veri Italiani*, the Apophasimenes, and the Sublime and Perfect Masters. In some regions Masonic lodges might serve the same purpose. In many of the societies nationalism was mixed with liberalism, socialism, or revolutionary republicanism in an undifferentiated way. Members were initiated by a complex ritual intended to impress upon them the dire consequences of betraying the society's secrets. They used special grips and passwords and adopted revolutionary names to conceal their identity and baffle the police. They were usually so organized that the ordinary member knew the identity of only a few others, and never of the higher-ups, so that those arrested could reveal nothing important. The societies kept busy, circulating forbidden literature and generally maintaining a revolutionary ferment. Conservatives dreaded them, but they were not really dangerous to any government that enjoyed the support of its people.

Best known of the nationalist philosophers in western Europe was the Italian Joseph Mazzini (1805–1872), who spent most of his adult life in exile in France and England. In his youth he joined the Carbonari, but in 1831 he founded a society of his own, called Young Italy, and he edited and smuggled into Italy copies of a journal of the same name. Young Italy was soon imitated by other societies of similar aim, such as Young Germany. In 1834 Mazzini tried unsuccessfully to bring about an uprising against the kingdom of Sardinia, which he viewed as a key obstacle to the unification of Italy. Undeterred by the total failure of this plan, he continued to organize, to conspire, and to write. For Mazzini nationality and revolution were a holy cause in which the most generous and humane qualities were to find expression. He was a moral philosopher, as may be judged from the title of his most widely read book, *The Duties of Man*, in which he placed duty to the nation intermediate between duty to family and to God.

---

Mazzini

To the Germans, divided and frustrated, nationality became almost an obsession. It affected everything from folklore to metaphysics. *Grimm's Fairy Tales*, for example, was first published in 1812. It was the work of the two Grimm brothers, founders of the modern science of comparative linguistics, who traveled about Germany to study the popular dialects and in doing so collected the folktales that for generations had been current among the common people. They hoped in this way to find the ancient, native, indigenous “spirit” of Germany, deep and unspoiled in the bosom of the *Volk*. The same preoccupation with nationhood revealed itself in the philosophy of Hegel (1770–1831), possibly the most extraordinary of all nineteenth-century thinkers.

To Hegel, witnessing the spectacle of the Napoleonic years, it was evident that for a people to enjoy freedom, order, or dignity it must possess a potent and independent state.

---

*Hegel's philosophy*

The state, for him, became the institutional embodiment of reason and liberty—the “march of God through the world,” as he put it, meaning not an expansion in space through vulgar conquest, but a march through time and through the processes of history. Hegel conceived of reality itself as a process of endless change, a development having an inner logic and necessary sequence of its own. He thus broke with the more static and mechanical philosophy of the eighteenth century, with its fixed categories of unchangeable right and wrong. He became a philosopher of history, in which he saw the unfolding of a “Universal Spirit” or “Idea” across time, and he linked this evolving Spirit in complex ways to reason and freedom. He held that change came about through a historical “dialectic,” or irresistible tendency of the Universal Spirit and the human mind to move forward by the creation of opposites. A given state of affairs (the *thesis*) would in this view inevitably produce the conception of an opposite state of affairs (the *antithesis*), which would be followed by a reconciliation and fusion of the two (the *synthesis*). This new synthesis became the starting point for a new “thesis” in the next stage of dialectical change. Thus, for example, the very disunity of Germany, by producing the opposing idea of unity, would ultimately lead toward the creation of a more unified German state.

The Hegelian dialectic was soon to be appropriated by Karl Marx to new uses, but meanwhile Hegel's philosophy, with other currents in Germany, made the study of history more philosophically meaningful than it had ever been before. History, the study of time process, seemed to be the very key with which to unlock the true significance of the world; it could show the unfolding of the Universal Spirit in specific times and places. Historical studies were stimulated, and the German universities became centers of historical learning, attracting scholars from many countries. Most eminent of the German historians was Leopold von Ranke (1795–1886), founder of the “scientific” school of historical writing. Ranke, too, though intellectually scrupulous to the last degree, owed much of his incentive to his national feeling. His first youthful work was a study of the *Latin and Teutonic Peoples*; and one of his main ideas, throughout his long life, was that Europe owed its unique greatness to the coexistence and interplay of several distinct nations, which had always resisted the attempts of any one nation to control the whole. By the latter Ranke really meant France—the France of Louis XIV and Napoleon. The Germans, said Ranke in 1830, had a mission from God to develop a culture and a political system entirely different from those of the French. They were destined to “create the pure German state corresponding to the genius of the nation.” Whether Western constitutional, parliamentary, and individualist principles were suited to the national character of Germany seemed to Ranke very doubtful.

---

*List's economics*

In economics Friedrich List, in his *National System of Political Economy* (1840), held that political economy as taught in England was suited

### LANGUAGES OF EUROPE

National movements in modern Europe often referred to the distinctive languages of various national groups, but there are only three main European language families: Germanic, Latin, and Slav. The map shows language areas in the early twentieth century. It does not show the overlap of adjoining languages, bilingual areas, or the existence of small language “pockets” such as Turkish in the Balkans, Greek in Asia Minor, Yiddish in Poland, or German in scattered parts of eastern Europe. In the extreme northwest is the “Celtic fringe,” to which the Breton, Welsh, and Gaelic languages were pushed back in the early Middle Ages. For the area within the diamond-shaped zone no map on this scale can give a realistic idea of the overlapping languages. During the Second World War and its aftermath, however, many language pockets in eastern Europe were wiped out through exchange, transportation, or destruction of peoples.

only to England. It was not an abstract truth but a body of ideas developed in a certain historical stage in a certain country. List thus became a founder of the historical or institutional school of economics. The doctrine of free trade, he said, was designed to make England the world’s industrial center by keeping other countries in the status of suppliers of raw material and food. But any country, he held, if it was to be civilized and develop its own national culture, must have cities, factories, industries, and capital of its own. It must therefore put up high tariffs (at least temporarily, in theory) for protection. List, it should be remarked, had developed his ideas during a sojourn in the United States, where Henry Clay’s “American system” was in fact a national system of political economy.

### *Nationalism: Eastern Europe*

In eastern Europe the Poles and the Magyars had long been active political nationalists, the Poles wishing to undo the partitions of Polish territories and reestablish their Polish state,

the Magyars insisting on autonomy for their kingdom of Hungary within the Habsburg empire. But for the most part nationalism in eastern Europe long remained more cultural than political. Centuries of development had tended to submerge the Czechs, Slovaks, Ruthenians, Romanians, Serbs, Croats, Slovenes—and even the Poles and Magyars in lesser degree. Their upper classes spoke German or French and looked to Vienna or to Paris for their ideas. The native languages had remained peasant languages, barely known outside the isolated peasant cultures in which they were spoken. It seemed that many of these languages would disappear.

---

*Preservation of  
historic cultures*

But early in the nineteenth century the new national patriots began to demand the preservation of their historic cultures. They collected folktales and ballads; they studied the languages, composing grammars and dictionaries, often for the first time; and they took to writing books in their mother tongues. They urged their own educated classes to give up foreign ways.

They wrote histories showing the famous exploits of their several peoples in the Middle Ages. A new nationalism stirred the Magyars; in 1837 a national Hungarian theater was established at Budapest. In what was to become Romania a former Transylvanian peasant youth named George Lazar began as early as 1816 to teach at Bucharest. He lectured in Romanian (to the surprise of the upper classes, who preferred Greek), telling how Romania had a distinguished history back to the Roman emperor Trajan. As for the Greeks, they entertained visions of restoring the medieval Greek empire (known to Westerners as the Byzantine Empire) in which persons of Greek language or Greek Orthodox religion should become the predominant people of the Balkans.

---

*The Slavic Revival*

The most far-reaching of the East European movements was the Slavic Revival. The Slavs included the Russians, Poles, Ukrainians, Byelorussians, and Ruthenians; the Czechs and Slovaks; and the South Slavs, consisting of the Slovenes, Croats, Serbs, and Bulgars. All branches of the Slavs began to develop new nationalisms. In 1814 the Serb Vuk Karajich published a grammar of his native tongue and a collection of *Popular Songs and Epics of the Serbs*; he worked out a Serbian alphabet, translated the New Testament, and declared that the dialect spoken in the city of Ragusa (now Dubrovnik) should become the literary language of all South Slavs. In 1836 the Czech historian Francis Palacky published the first volume of his *History of Bohemia*, designed to give the Czechs a new pride in their national past. He first wrote his book in German, the common reading language of educated Czechs. But he soon recast it into Czech, significantly reentitling it a *History of the Czech People*. Among Poles the poet and revolutionary Adam Mickiewicz must be mentioned. Arrested by the Russians in 1823 for membership in a secret society, he was later allowed by the tsarist government to pass into western Europe. From 1840 to 1844 he taught Slavic literature at the Collège de France, using his lecture platform as a rostrum to deliver eloquent pleas for the liberation of all peoples and overthrow of autocracy. He wrote epic poems on Polish historical themes and continued to be active among the revolutionary Polish exiles settled in France.

---

*Russian Slavophilism*

Russia itself, which Poles and Czechs regarded as backward, was slower to develop a pronounced national sense. Under Tsar Alexander I a Western or European orientation prevailed, but in Alexander's last years and after his death in 1825 the doctrines of Slavophilism began to spread. Russian Slavophilism, or the idea that Russia possessed a way of life of its own, different from and not to be corrupted by that of Europe, became a Russian affirmation of the fundamental idea of the *Volksgeist*. Such views in Russia were at least as old as the opposition to the reforms of Peter the Great. In the nationalistic nineteenth century they crystallized

more systematically into an “ism,” and they tended to merge into Pan-Slavism, which made substantially the same assertions for the Slavic peoples as a whole. But Pan-Slavism, before 1848, was no more than embryonic.

### *Other “Isms”*

Romanticism, liberalism, radical republicanism, socialism, feminism, and nationalism were the political and cultural forces driving many of the new European political and cultural conflicts in the era between 1815 and 1848. Of other “isms” less need be said. Conservatism remained strong. Politically, on the Continent, conservatism upheld the institutions of absolute monarchy, aristocracy, and church and opposed the constitutional and representative government sought by liberals. As a political philosophy, conservatism built upon the ideas of Edmund Burke, who had held that every people must change its institutions by gradual adaptation and that no people could suddenly realize in the present any freedoms not already well prepared for in the past. This doctrine lacked appeal for those to whom the past had been a series of misfortunes, but it gained support among others who sought to define and defend long-evolving social or political traditions. Conservatism sometimes passed into nationalism, since it stressed the firmness and continuity of national character. But nationalists at this time were more often liberals or republicans. Monarchism was conservative and even reactionary. Gone was the enlightened despotism of the previous century, when kings had boldly irritated their nobles and defied their churches. After the thunders of the French Revolution aristocracy and monarchy huddled together, and their new watchword was to maintain “the throne and the altar.”

---

---

*Conservatism*

Deeper than other “isms,” a feeling shared in varying ways by people of all parties, was the profound current of humanitarianism. It consisted in a heightened concern about the cruelty inflicted upon others. Here the thought of the Age of Enlightenment suffered no reversal. Torture was gone, and even conservative monarchical governments showed no inclination to restore it. Conditions in prisons, hospitals, insane asylums, and orphanages improved. People became determined to change the miserable social position of pauper children, chimney sweeps, women in the mines, and enslaved people in the Americas. Russian serf owners and American slave owners began to show psychological signs of moral doubt. To degrade human beings, use them as work animals, torture them, confine them unjustly, hold them as hostages for others, tear apart their families, and punish their relatives were increasingly regarded by Europeans as foreign to true civilization. The Christian sense of the inviolability of the human person was now again, in a more secular, mundane way, beginning to relieve the sufferings of humanity.

*Humanitarianism*

## 54. THE DIKE AND THE FLOOD: DOMESTIC

It is now time to look more specifically at the most influential political reactions and reform movements that emerged after the European peace settlement of 1814–1815. The governments that defeated Napoleon wanted to assure themselves above all else that the disturbances of the past 25 years would not be renewed. In France the restored Bourbon king, Louis XVIII, aspired to keep his throne for himself and his successors. In Great Britain the Tory governing class hoped to preserve the old England that they had so valiantly saved from the clutches of Bonaparte. In Germany, Austria, Italy, and central Europe the chief aim of Metternich, who for another 33 years remained the dominant political figure in these

regions, was to maintain a system in which the prestige of the Habsburg dynasty should be supreme. The aims of the tsar, Alexander, were less clear. He was feared by representatives of the other powers as a dreamer, a self-chosen world savior, a man who said he wanted to bring Christianity into politics, a crowned Jacobin, and even a liberal. It became one of Metternich's chief hopes to convert Alexander to conservatism.

The arrangements made by the victorious powers were in some ways moderate, at least when the provocations they had undergone in the Napoleonic wars are considered. Partly by the tsar's insistence written constitutions existed after 1814 in France and in Russian or "Congress" Poland. Some of the rulers of south German states allowed a measure of representative government. Even the king of Prussia promised a representative assembly for his kingdom, though the promise was not kept. But it was difficult to maintain any kind of stability. The forces of the political right, the privileged classes (or in France the former privileged classes) denounced all signs of liberalism as dangerous concessions to revolution. Those of the political left—liberals, nationalists, republicans—regarded the newly installed regimes as hopelessly reactionary and inadequate. Statesmen were jittery on the subject of revolution. They therefore met every sign of agitation with attempts at repression, which, though they might drive agitation temporarily underground, really only made it worse by creating additional grievances. A vicious circle was set endlessly revolving.

### *Reaction after 1815: France, Poland*

In France Louis XVIII began his reign in 1814 with an amnesty to the regicides of 1793. But the regicides, like all republicans, found the France of 1814 an uncomfortable place to live in, exposed as they were to the unofficial vengeance of counterrevolutionaries, and in

1815 most of them rallied to Napoleon when he returned from Elba. This exasperated the royalist counterrevolutionaries beyond all measure. A brutal "white terror" broke out. Upper-class youths murdered Bonapartists and republicans; Catholic mobs seized and killed Protestants at Marseilles and

---

The "white terror"

Toulouse. The Chamber of Deputies chosen in 1815 (by the tiny electorate of 100,000 well-to-do landowners) proved to be more reactionary and royalist than the king. The king himself could not control the mounting frenzy of reaction, which he was sensible enough to realize would only infuriate the revolutionary element still further, as in fact happened. In 1820 a fanatical workingman assassinated the king's nephew, the Duke de Berry. Those who said that all partisans of the French Revolution were criminal extremists seemed to be justified. The reaction deepened, until in 1824 Louis XVIII died and was succeeded by his brother Charles X. Not only was Charles X the father of the recently murdered Duke de Berry, but for over 30 years he had also been the acknowledged leader of implacable counterrevolution. As the Count of Artois, youngest brother of Louis XVI, he had been among the first to emigrate in 1789. He was the favorite Bourbon among the most obstinate ex-seigneurs, nobles, and churchmen. Regarding himself as hereditary absolute monarch by the grace of God, he had himself crowned at Reims with all the romantic pomp of ages past, and proceeded to stamp out not only revolutionary republicanism but liberalism and constitutionalism as well.

In Poland, it will be recalled, the Vienna settlement created a constitutional kingdom, with the Russian tsar Alexander as king, joined in merely personal union with the Russian empire. The new machinery did not work very well. The Polish constitution provided for an elected diet, a wide suffrage by the standards of the day, the Napoleonic civil code, freedom of press and religion, and exclusive use of the Polish language. But the Poles discovered that Alexander, though favoring liberty, did not like to have anyone disagree with

him. They could make little use of their much touted freedom in any actual legislation. The elected diet could not get along with the viceroy, who was a Russian. In Russia the serf-owning aristocracy viewed Alexander's idea of a constitutional kingdom in Poland with a jaundiced eye. They wanted no experimentation with liberty on the very borders of Russia.

The Poles themselves played into the hands of their enemies. For the Poles were nationalist at least as much as they were liberal. They were dissatisfied with the boundaries accorded to Congress Poland, and they dreamed of the vast kingdom that had existed before the First Partition in 1772. At the University of Vilna professors and students began to join secret societies. Some members of these societies were revolutionaries who wanted to drive out Alexander, reunite with Prussian and Austrian Poland, and reconstitute an independent Polish state. It was in the discovery and breaking up of one such society that Adam Mickiewicz was arrested in 1823. Reaction and repression now struck the University of Vilna.

*Polish ambitions*

### *Reaction after 1815: The German States, Britain*

In Germany those who had felt national stirrings during the Wars of Liberation were disillusioned by the peace treaty, which maintained the several German principalities about as Napoleon had left them and purposely united them only in a loose federation, or Bund. National ideas were most common in the numerous universities, where students and professors were more susceptible than most people to the doctrines of an eternal Volksgeist and a far-flung Deutschum. National ideas tended to glorify the German common people and thus carried with them a kind of democratic opposition to aristocrats, princes, and kings. Students in many of the universities in 1815 formed college clubs, called collectively the Burschenschaft, which, as centers of serious political discussion, were to replace the older clubs devoted to drinking and dueling. The Burschenschaft, a kind of German youth movement, held a nationwide congress at Wartburg in 1817. Students listened to rousing speeches by patriotic professors, marched about in "Teutonic" costume, and burned a few reactionary books. This undergraduate performance was no immediate threat to any established state, but the nervous governments took alarm. In 1819 a theology student assassinated the German writer Kotzebue, known as an informer in the service of the tsar. The assassin received hundreds of letters of congratulation, and at Nassau the head of the local government barely escaped the same fate at the hands of a pharmacy student.

Metternich now chose to intervene. He had no authority in Germany except in that Austria was a member of the Germanic federation. He regarded all these manifestations of German national spirit, or of any demand for a more solidly unified Germany, as a threat to the favorable position of the Austrian Empire and to the whole balance of Europe. He called a conference of the principal German states at Carlsbad in Bohemia; the frightened conferees adopted certain resolutions, proposed by Metternich, which were soon enacted by the diet of the Bund. These Carlsbad Decrees (1819) dissolved the Burschenschaft and the equally nationalistic gymnastic clubs (some of whose members thereupon joined secret societies). They provided for government officials to be placed in the universities and for censors to control the contents of books and the periodical and newspaper press. The Carlsbad Decrees remained in force for many years, and they imposed an effective check on the growth of liberal and nationalist ideas in Germany.

---

*Metternich intervenes*

Nor did Great Britain escape the dreary rounds of agitation and repression. As elsewhere, radicalism produced reaction and vice versa. Britain after Waterloo was a country devoted to its old traditions but also afflicted by the

---

*Economic crisis spurs radicalism*

German students celebrated their conception of German nationhood at a festival in 1817. Gathering near a castle at Wartburg where Martin Luther had once lived, they commemorated the beginning of the Protestant Reformation in 1517 and also burned books that were deemed hostile to German liberty.

(akg-images)

most advanced social problems of a rapidly developing industrial economy. In 1815, at the close of the wars, the landed classes feared an inrush of imported agricultural products and consequent collapse of farm prices and rentals. The landowning gentry who controlled Parliament enacted a new Corn Law, raising the protective tariff to the point where import of grain became impossible unless prices were very high. Landlords and their farmers benefited, but wage earners and industrial workers found the price of breadstuffs soaring out of reach. At the same time there was a postwar depression in industry. Wages fell and many were thrown out of work. These conditions naturally contributed to the spread of political radicalism, which looked first of all to a drastic reform of the House of Commons in order that thereafter a radical program of social and economic legislation might be enacted.

A riot broke out in London in December 1816. In the following February the Prince Regent was attacked in his carriage. The government suspended habeas corpus and employed *agents provocateurs* to obtain evidence against the agitators. Industrialists of Manchester and the new factory towns, determined to force through the reform of parliamentary representation, took the chance offered by the distress of the working classes to organize mass meetings of protest. At Birmingham a crowd elected a mock member of Parliament. At sprawling Manchester 80,000 people staged an enormous demonstration at St. Peter's Fields in 1819; they demanded universal male suffrage, annual election of the House of Commons, and the repeal of the Corn Laws. Although perfectly orderly they were fired upon by soldiers; 11 persons were killed and about 400 were wounded, including 113 women. Radicals called this episode the Peterloo massacre in derisive comparison with the battle of Waterloo.

---

*The Peterloo massacre*

The frightened government thanked the soldiers for their brave upholding of the social order. Parliament rushed through the Six Acts (1819), which out-

lawed "seditious and blasphemous" literature, put a heavy stamp tax on newspapers, authorized the search of private houses for arms, and rigidly restricted the right of public meeting. A group of revolutionaries thereupon plotted to assassinate the whole cabinet at a dinner; they were caught in Cato Street in London in 1820—whence the name "Cato Street Conspiracy." Five of them were hanged. Meanwhile, for publishing the writings of Thomas Paine, Richard Carlisle spent seven years in prison.

"Our example," wrote the Duke of Wellington to a Continental correspondent in 1819, "will be of value in France and Germany, and it is to be hoped that the world will escape from the general revolution with which we all seem to be threatened."

In summary, the various European governments promoted reactionary policies everywhere they could reach in the years following the peace of 1815. The reaction was due only in part to memories of the French Revolution. It was due even more to the living fear of revolution in the present. This fear, though exaggerated, was no mere hallucination. Sensing the rising flood, the established interests desperately built dikes against it in every country. The same is true of international politics at the time.

## 55. THE DIKE AND THE FLOOD: INTERNATIONAL

At the Congress of Vienna in 1814–1815 the powers agreed to hold meetings in the future to enforce the treaty and take up new issues as they arose. A number of congresses of the Great Powers resulted, which are of significance as an experimental step toward international regulation of the affairs of Europe. The congresses resembled, in a tentative and partial way, the League of Nations that arose after the First World War of 1914–1918, or the United Nations that followed after the war of 1939–1945. The powers had also, in 1815, in alarm after the return of Napoleon, subscribed to Alexander I's Holy Alliance, which became the popular term for the collaboration of the European states in the congresses. The Holy Alliance, on the face of it a statement of Christian purpose and international concord, gradually became an alliance for the suppression of revolutionary and even liberal activity, following in that respect the trend of the governments which made it up.

### *The Congress of Aix-la-Chapelle, 1818*

The first general postwar assemblage of the powers took place at the congress of Aix-la-Chapelle (or Aachen) in 1818. The principal item on the agenda was to withdraw the allied army of occupation from France. The French argued that Louis XVIII would never be popular in France so long as he was supported by a foreign army. The other powers, since they all desired the French to forget the past and accept the Bourbons, withdrew their military forces without disagreement. They arranged also to have private bankers take over the French reparations debt (the 700 million francs imposed by the second Treaty of Paris); the bankers paid the allied governments, and the French in due time paid the bankers.

Tsar Alexander was still the most advanced internationalist of the day. He suggested at Aix-la-Chapelle a kind of permanent European union and even proposed the maintenance of international military forces to safeguard recognized states against changes by violence. Governments if thus reassured against revolution, he argued, would more willingly grant constitutional and liberal reforms. But the others demurred, especially the British foreign minister Lord Castlereagh. The British declared themselves willing to make international commitments against specified contingencies, such as a revival of aggression on the part of

---

Alexander's  
internationalism

The “Peterloo Massacre” of 1819 was condemned in this caricature by the English artist George Cruikshank. A peaceable crowd gathered in St. Peter’s Fields, Manchester, to demand political reforms and repeal of the Corn Laws (which placed high tariffs on imported grains), but a militia of part-time soldiers opened fire on the protesters, causing numerous casualties. The British government responded by commending the soldiers and passing new restrictions on public meetings.

(Getty Images) *pro-labor*

France. But they would assume no obligations to act upon indefinite and unforeseeable future events. They reserved the **right of independent judgment** in foreign policy.

Concretely, the congress addressed itself to the **problems of the Atlantic slave trade** and of the recurring **nuisance of the Barbary pirates**. It was unanimously agreed that both **should be suppressed**. To suppress them required **naval forces, which only the British possessed in adequate amount**, and it meant also that naval captains must be authorized to stop and search vessels at sea. The **continental states**, always touchy on the subject of British sea power, **refused to countenance any such uses of the British fleet**. They **feared for the freedom of the seas**. As for the British, they would not even discuss placing British warships in an international naval pool or putting British squadrons under the authority of an international body. **Nothing therefore was done**; the slave trade continued, booming illic-

itly with the endless demand for cotton; and the Barbary pirates were not disposed of until the French occupied and annexed Algeria some years later. The growth of international institutions was blocked by the separate interests of the sovereign states.

### *Revolution in Southern Europe: The Congress of Troppau, 1820*

Scarcely had the Congress of Aix-la-Chapelle disbanded when revolutionary agitation came to a crisis in southern Europe. It was not that revolutionary or liberal sentiment was stronger here than in the north, but rather that the governments in question, those of **Spain, Naples, and the Ottoman Empire**, were inefficient, flimsy, and corrupt. Many of the revolutionaries were hardly more than middle-class liberals; indeed, the Spaniards, as we have noted, were the first to use the word "liberal" in this modern political sense. **Many of them had at first accepted the Napoleonic occupation of Spain as a progressive development but had then turned against it and proclaimed a new constitution in 1812, modeled on the French revolutionary constitution of 1789–1791. After Napoleon's final defeat they attempted to force the restored Bourbon kings of Spain and Naples to adopt this constitution of 1812.**

---

*Revolution in Spain  
and Naples*

In 1820 the **governments of both Spain and Naples collapsed with remarkable ease before the demonstrations of revolutionaries.** The kings of both countries reluctantly **took oaths to the Spanish constitution of 1812.** But **Metternich** saw the insurrections as the first symptoms of a **revolutionary seizure against which Europe should be quarantined.** It was a fact that revolutionary agitation was international, easily leaping across frontiers, because of the operations of secret societies and of political exiles and because in any case the same ideas had been aroused in all countries by the French Revolution. **Metternich considered Italy in particular to be within the legitimate sphere of influence of the Austrian Empire.** He therefore called a meeting of the Great Powers at Troppau in the Austrian-controlled region in Silesia, hoping to use the authority of an **international congress to put down the revolution in Naples.** The governments of **Great Britain and France**, not eager to play Austria's game, **sent only observers** to the congress. **Metternich's main problem was, as usual, Alexander.** What would be the attitude of the liberal tsar, the friend and patron of constitutions, toward the idea of a constitutional monarchy in Naples? At an inn in Troppau Metternich and Alexander met alone, and there held a momentous interview over the teacups. Metternich reviewed the horrors of revolutionism, the unwisdom of granting any concessions lest revolutionaries be encouraged. **Alexander was already somewhat disillusioned by the ungrateful feelings of the Poles, and the upheaval in Naples posed a new threat to his view of royal authority.** He had always believed that **constitutions should be granted by legitimate sovereigns, not extorted from them by revolutionaries, as had happened in Naples. He allowed himself to be persuaded by Metternich.** He declared that he had always been wrong and that Metternich had always been right; and he **announced himself ready to follow Metternich's political judgment.**

Thus fortified, Metternich drew up a document, the protocol of Troppau, for consideration and acceptance by the five Great Powers. It held that **all recognized European states should be protected by collective international action, in the interests of general peace and stability, from internal changes brought about by force.** It was a statement of collective security against revolution. **Neither France nor Great Britain accepted it.** Castlereagh wrote to Metternich that if Austria felt its interests to be threatened in Naples it should intervene in its own name only. The British Tories did not object to the repression of the Neapolitan revolution, but they rejected the principle of a binding international collaboration.

Metternich could get only Russia and Prussia to endorse his protocol, in addition to Austria. These three, acting as the Congress of Troppau, authorized Metternich to dispatch an Austrian army into Naples. He did so; the Neapolitan revolutionaries were arrested or put to flight; the incompetent and brutal Ferdinand I was restored as “absolute” king; the demon of revolution was seemingly exorcised. But the Congress of Troppau, ostensibly a Europewide international body, had in effect functioned as an antirevolutionary alliance of Austria, Russia, and Prussia. A gap opened between the three Eastern autocracies and the two Western powers—even when the latter consisted of Tories and Bourbons.

*A gap opens between  
East and West*

### *Spain and the Near East: The Congress of Verona, 1822*

Thousands of revolutionaries and liberals fled from the terror raging in Italy. Many went to Spain, now dreaded by conservatives as the main seat of revolutionary infection. The Middle East also seemed about to ignite in conflagration. Alexander Ypsilanti, a Greek who had spent his adult life in the military service of Russia, in 1821 led a band of armed followers from Russia into Romania (then still a part of Turkey), hoping that all Greeks and pro-Greeks in the Turkish empire would join him. He expected Russian support, since Russia had long wanted to use Greek Christians in a campaign to weaken the Turkish empire. The possibility of a Turkish empire converted into a “Greek” empire and dependent on Russia was naturally unpleasant to Metternich. To deal with all these matters an international congress met at Verona in 1822.

Alexander, in shifting from liberal to reactionary views, had not changed his belief in the need for concerted international action. Had pure power politics determined his decisions, he would doubtless have favored Ypsilanti’s Grecophile revolution. But he stood by the principle of international solidarity against revolutionary violence. He refused to support Ypsilanti, who found less enthusiasm for Greek culture among the Romanians and Balkan peoples than he had expected and was soon defeated by the Turks. As for intervention to repress the uprising in Greece itself, the question did not arise since the Turkish government proved quite able for a time to handle the matter without assistance.

---

*Ypsilanti refused  
support*

The question of the revolution in Spain was settled by foreign intervention. The Bourbon regime in France had no taste for a Spain in which revolutionaries, republicans, political exiles, and members of secret societies might be harbored. The French government proposed to the Congress of Verona that it be authorized to dispatch an army across the Pyrenees. The Congress welcomed the offer, and despite many dire predictions of ruin, arising from memories of Napoleon’s disaster, a French army of 200,000 men moved into Spain in 1823. The campaign proved to be a military promenade through a cheering country. Spanish liberals, constitutionalists, or revolutionaries were a helpless minority. The mass of the people saw the invasion as a deliverance from Masons, Carbonari, and heretics and shouted with satisfaction at the restoration of church and king. Ferdinand VII, unscrupulous and narrow-minded, repudiated his constitutional oath and let the most reactionary Spaniards have their way. The revolutionaries were savagely persecuted, exiled, or jailed.

---

*The French invade  
Spain*

### *Latin American Independence*

The Napoleonic wars and later political disturbances in Europe had their repercussions in all parts of America. While Great Britain was engaged against Napoleon, the United States fought its inconclusive War of 1812 against the former mother country, and a few years

later, after minor military operations, obtained the cession of Florida from Spain. During these same years, new movements for national independence emerged in Latin America and used the turmoil in Europe as an opportunity to break free from the weakening Portuguese and Spanish empires. The Portuguese royal family, to escape Napoleon, had taken refuge in its Brazilian empire, but when the dynasty was restored at Lisbon, one of its members refused to leave Brazil, which remained as an "empire" independent of Portugal; in 1889 the imperial regime gave way to a new Brazilian republic.

Spanish America reached over the enormous area from San Francisco to Buenos Aires. Here, too, the thought of the Enlightenment, the news of the American and French revolutions, the Napoleonic occupation of Spain, and the restoration in 1814 of the Bourbon Ferdinand VII to the Spanish throne all had their effects. The British had been commercially active in Spanish America for over a century, and during the Napoleonic wars they had increased their exports to it twenty-fold. There were thus business interests in Spanish America that resisted

---

*Motives for revolt*

any return to the old Spanish imperial system of trade controls. More fundamental was the political and social resentment that Creoles felt for the peninsulars. The Creoles were the white population of Spanish descent born in America, and they found their ambitions blocked by the peninsulars who were sent out from Spain to occupy the highest offices in the empire. In many places most of the people were native Indians or mestizos of mixed Spanish and Indian origin, often living in depressed economic conditions and far from the capital cities. The movement for independence in most of Latin America therefore lacked the more widespread popular character that it had developed in the British colonies that became the United States. It was mainly led by Creoles who were active in municipal governments in the towns. At times, the movement for independence recruited some very conservative elements among large landowners and high churchmen. But the important leaders, such as Simón Bolívar and José de San Martín, were men who had spent years in Europe and preferred the new constitutional principles but were in the end frustrated in their aspirations for their own country. The dissensions that long continued to afflict Spanish America were all present within the independence movement itself.

Because of its vast extent, over 6,000 miles interrupted by mountain barriers, there could be less unity in the liberation of Spanish America than had been possible, however difficult, in the North American rebellion against England. There could be no Continental Congress such as had met in Philadelphia in 1774. Revolts took place separately within the great vice-royalties: New Spain (Mexico), New Granada (Colombia and Venezuela), Peru (including Ecuador and most of Bolivia and Chile), and La Plata (Argentina, with claims over what are now Uruguay and Paraguay).

The first revolts were against Joseph Bonaparte after Napoleon made him king of Spain in 1808. The rebels proclaimed their loyalty to the deposed Ferdinand VII, who, however, when restored in 1814, refused to make any concessions to American demands, so that revolutionary sentiment turned against him also. There followed a series of disconnected struggles between those fighting for independence (with or without much internal change) and combinations of officials, army officers, landowners, and churchmen who remained loyal to the Spanish crown. Bolívar became the liberator of Venezuela and Colombia. San Martín became the liberator of Argentina and Chile, and both combined in the liberation of Peru. In Mexico, by way of exception, there was a true mass rising of Indians and mestizos, which was put down by the middle- and upper-class leaders. This conservative repression of a more popular revolutionary movement led to a long period of turmoil in the newly independent Mexican state, but Mexico was by no means the only postcolonial society that faced such problems. All Spanish America was troubled by disputes over boundaries, regional

Simón Bolívar (1783–1830) was known as “The Liberator” for his leadership of the South American revolutionary movements. He had lived in Europe, where he was strongly influenced by the political ideas of the French Revolution. Although his revolutionary campaigns secured the independence of several new nations, Bolívar’s attempts to establish stable, constitutional governments were generally stymied during the 1820s.

(Getty Images)

conflicts and attempted conquests and secessions, so that it was only later in the nineteenth century that the map of South and Central America took form as we know it today.

In addition to these complex conflicts among themselves, the emerging Latin American nations remained vulnerable to the imperial interventions of outside powers. Let us return to the congress of European powers meeting in Verona in 1822. At the very time when a French army suppressed the revolution in Spain, the revolutionaries in Spanish America were declaring their independence. At Verona, Tsar Alexander urged the Congress to mediate between Spain and its colonies. This was a euphemistic way of suggesting

military intervention in Spanish America, following the principle of repressing revolutions that had been announced at Troppau. The British objected. Even the Tory government favored revolutions that might break up the Spanish empire into independent states, with which free trade treaties might be negotiated. Without at least benevolent neutrality from the British fleet no armed force could sail to America. The Spanish Americans therefore maintained their independence, thanks in part to the use made by the British of their sea power on this occasion.

---

*British favor Spanish  
American  
independence*

The new republics also received strong moral support from the United States. In December 1823 President James Monroe, in a message to Congress, announced the “Monroe Doctrine.” It stated that attempts by European powers to return parts of America to colonial status would be viewed as an unfriendly act by the United States. The British foreign minister George Canning

---

*The Monroe Doctrine*

(who had just succeeded Castlereagh) had at first proposed a joint statement by Great Britain and the United States against the East European powers on the Spanish-American question. President Monroe, at the advice of his secretary of state, John Quincy Adams, decided instead to make a unilateral statement in the form of a message to Congress. They intended to aim their "doctrine" at Great Britain as well as the Continental states, since the British, with their command of the sea, were in fact the only power that could actually threaten the independence of American states at this time. Canning, having no such threats in mind, and concerned more with the Congress of Verona, accepted the line taken by the United States. Indeed, he declared with a flourish that he had "called the New World into existence to redress the balance of the Old." The Monroe Doctrine, at its inception, was a kind of counterblast to the Metternich doctrine of the protocol of Troppau. Where the latter announced the principle of intervention against revolution, the Monroe Doctrine announced that revolutions in America, if they resulted in regimes recognized by the United States, were outside the pale of attention of European powers. In any case, the efficacy of the Monroe Doctrine long depended on the tacit cooperation of the British fleet.

Over 300 years of European colonial empires in America now came to an end, with few exceptions, in the half-century following the United States declaration of independence. One exception was Canada, where membership in the British empire was voluntary, at least for the English-speaking inhabitants, and where both the English and French Canadians resisted threats of annexation by the United States. The other exceptions were in the West Indies, where Haiti was independent; the smaller islands remained British, French, or Dutch; and the large islands of Cuba and Puerto Rico remained Spanish until the Spanish-American War of 1898.

### *The End of the Congress System*

After the Congress of Verona no more such meetings were held. The attempt at a formal international regulation of European affairs was given up. In the broadest retrospect, the congresses failed to make progress toward an international order because, especially after Alexander's conversion to Metternich's conservatism, they came to stand for nothing except preservation of the status quo. They made no attempt at accommodation with the new forces that were shaping Europe. It was not the policy of the congresses to forestall revolution by demanding that governments institute reforms. They simply repressed or punished all revolutionary agitation. They propped up governments that could not stand on their own feet.

In any case the congresses never succeeded in subordinating the separate interests of the Great Powers. Perhaps Alexander's repudiation of Ypsilanti was a sacrifice of Russian advantage to international principle; but when the Austrian government intervened to crush the revolution in Naples, and when the French government crushed the revolution in Spain, though in both cases they acted with an international mandate, each was really promoting what it conceived to be its own interests. The interest of Great Britain was to pull away from the system entirely. As defined by Castlereagh and by Canning after him, it was to stand aloof from permanent international commitments, to preserve a free exercise of sea power and foreign policy, and to take a benevolent view toward revolution in other countries. Since France eventually pulled away also, the Holy Alliance ceased to be even ostensibly a European system and became no more than a counterrevolutionary league of the three East European autocracies. The cause of liberalism in Europe was thus advanced by the collapse of this highly

conservative international system. At the same time the collapse of this system opened the way to the **uncontrolled nationalism of the sovereign states**. “Things are getting back to a wholesome state again,” wrote George Canning in 1822. “Every nation for itself and God for us all!”

*Russia: The Decembrist Revolt, 1825*

Alexander I, “the man who defeated Napoleon,” the ruler who had led his armies from Moscow to Paris, who had frightened the diplomats by the Russian shadow that he threw over the Continent, and who yet in his way had been the great pillar of constitutional liberalism and international order, died in 1825. **His death was the signal for revolution in Russia. Officers of the Russian army, during the campaigns of 1812–1815 in Europe, had become acquainted with many unsettling ideas. Secret societies were formed even in the Russian officer corps; their members held all sorts of conflicting ideas, some wanting a constitutional tsardom in Russia, some demanding a republic, some even dreaming of an emancipation of the serfs.** When Alexander died it was for a time uncertain which of his two brothers, Constantine or Nicholas, should succeed him. The restless coteries in the army **preferred Constantine**, who was thought to be more favorable to innovations in the state. In December 1825 they proclaimed Constantine at St. Petersburg, having their soldiers shout “Constantine and Constitution!” The soldiers, it is said, thought that Constitution was Constantine’s wife.

Constantine and  
Nicholas

But the fact was that **Constantine had already renounced his claims in favor of Nicholas**, who was the rightful heir. The uprising, known as the Decembrist revolt, was soon put down. **Five of the mutinous officers were hanged; many others were condemned to forced labor or interned in Siberia.** The Decembrist revolt was the first manifestation of the modern revolutionary movement in Russia—of a revolutionary movement inspired by an ideological program, as distinguished from the elemental mass upheavals of Pugachev or Stephen Razin in earlier times. **But the immediate effect of the Decembrist revolt was to clamp repression upon Russia more firmly. Nicholas I (1825–1855) maintained an unconditional and despotic autocracy.**

Ten years after the defeat of Napoleon the new forces issuing from the French Revolution seemed to be routed, and reaction, repression, and political immobility seemed to prevail everywhere in Europe. The dike—a massive dike—seemed to be containing the flood.

## 56. THE BREAKTHROUGH OF LIBERALISM IN THE WEST: REVOLUTIONS OF 1830–1832

The reactionary dike broke in 1830, and in western Europe the stream thereafter never stopped. The seepage, indeed, had already begun. By 1825 **Spanish America was independent.** The British and the French had pulled away from the congress system. The Greek nationalist movement against the Turks had broken out in the early 1820s.

With the defeat of Ypsilanti in 1821 the Greek nationalists turned somewhat away from the idea of a neo-Greek empire and more toward the idea of **independence for Greece proper**, the islands and peninsulas where Greek was the predominant language. Tsar Nicholas was more willing than Alexander to assist this movement. The governments of Great Britain and France were not inclined to let Russia stand as the only champion of Balkan peoples. Moreover, liberals in the West thought of the embattled Greeks as ancient Athenians fighting the modern oriental despotism of the Turkish empire.

The result was a joint Anglo-French-Russian naval intervention, which destroyed the Turkish fleet at Navarino Bay in 1827. Russia again, as often in the past, sent armies into the Balkans. A Russo-Turkish war and a great Middle Eastern crisis followed, in the course of which the rival powers agreed in 1829 to recognize Greece as an independent kingdom. The Balkan states of Serbia, Wallachia, and Moldavia were also recognized as autonomous principalities within the badly shaken Ottoman Empire (see map p. 649). From the same crisis Egypt emerged as an autonomous region under Mehemet Ali. Egypt in time became a center of Arabic nationalism, which reduced Ottoman power in the south just as Balkan nationalism did in the north.

*France, 1824–1830: The July Revolution, 1830*

It was in 1830, and first of all in France, that the wall of reaction really collapsed. Charles X became king in 1824. In the next year the legislative chambers voted an indemnity, in the form of perpetual annuities totaling 30 million francs a year, to those who as émigrés thirty-odd years before had had their property confiscated by the revolutionary state. Catholic clergy began to take over classrooms in the schools. A law pronounced the death penalty for sacrilege committed in church buildings. But the France of the restored Bourbons was still a free country, and against these apparent efforts to revive the Old Regime a strong opposition developed in the newspapers and in the chambers. In March 1830 the Chamber of Deputies, in which the bankers Laffitte and Casimier-Périer led the “leftist” opposition, passed a vote of no confidence in the government. The king, as was his legal right, dissolved the Chamber and called for new elections. The elections repudiated the king’s policies. He replied on July 26, 1830, with four ordinances issued on his own authority. One dissolved the newly elected Chamber before it had ever met; another imposed censorship on the press; the third so amended the suffrage as to reduce the voting power of bankers, merchants, and industrialists and to concentrate it in the hands of the old-fashioned aristocracy; the fourth called for an election on the new basis.

These July Ordinances produced on the very next day the July Revolution. The upper bourgeois class was of course desperate at being thus brazenly ousted from political life. But it was the republicans—the nucleus of revolutionary workers, students, and intelligentsia in Paris—who actually moved. For three days, from July 27 to 29, barricades were erected in the city, behind which a swarming populace defied the army and the police. Most of the army refused to fire. Charles X, in no mood to be made captive by a revolution like his long-dead brother Louis XVI, precipitately abdicated and headed for England.

---

*Charles X abdicates*

Some of the leaders wished to proclaim a democratic republic. Working people hoped for better conditions of employment. The political liberals, supported by bankers, industrialists, various journalists, and intellectuals, had other aims. They had been satisfied in general with the constitutional charter of 1814; it was only to the policies and personnel of the government that they had objected, and they wished now to continue with constitutional monarchy, somewhat liberalized, and with a king whom they could trust. A solution to the deadlock was found by Lafayette, the aging hero of the American and the French revolutions, who became commander of the reorganized National Guard and a popular symbol of national unity. Lafayette produced the Duke of Orleans on the balcony of the Paris Hôtel de Ville, embraced him before a great concourse of people, and offered him as the answer to France’s need. The duke was a collateral relative of the Bourbons; he had also, as a young man, served in the republican army of 1792. The militant republicans accepted him, willing to see what would develop; and the Chamber of Deputies on August 7 offered him

the throne, on condition that he observe faithfully the constitutional charter of 1814. He reigned, until 1848, under the title of Louis Philippe.

---

*The July Monarchy*

The regime of Louis Philippe, called the Orléanist, bourgeois, or July Monarchy, was viewed very differently by different groups in France and in Europe. To the other states of Europe and to the clergy and legitimists within France, it seemed shockingly revolutionary. The new king owed his throne to an insurrection, to a bargain made with republicans, and to promises made to the Chamber of Deputies. He called himself not king of France but king of the French, and he flew the tricolor flag of the Revolution in place of the Bourbon lily. The tricolor produced an effect on the established classes not unlike that of the hammer and sickle after the Russian Revolution. He cultivated a popular manner, wore sober dark clothing (the ancestor of the modern business suit), and carried an umbrella. Though in private he worked stubbornly to maintain his royal position, in public he adhered scrupulously to the constitution.

The constitution remained substantially what it had been in 1814. The main political change was one of tone; there would be no more absolutism, with its notion that constitutional guarantees could be abrogated by a reigning prince. Legally the main change was that the Chamber of Peers ceased to be hereditary, to the chagrin of the old nobility, and that the Chamber of Deputies was to be elected by a somewhat enlarged body of voters. Where before 1830 there had been 100,000 voters, there were now about 200,000. The right to vote was still based on the ownership of a considerable quantity of real estate. About one-thirtieth of the adult male population (the top thirtieth in the possession of real property) now elected the Chamber of Deputies. The beneficiaries of the new system were the upper bourgeoisie—the bankers, merchants, and industrialists. The big property owners constituted the *pays légal*, the “legal country,” and to them the July Monarchy was the consummation and stopping place of political progress. To others, and especially to the radical democrats, it proved as the years passed to be a disillusionment and an annoyance.

### *Revolutions of 1830: Belgium and Poland*

The immediate effect of the three-day Paris revolution of 1830 was to set off a series of similar explosions throughout Europe, most notably in Belgium and Poland. These in turn, coming after the collapse of the Bourbons in France, brought the whole peace settlement of 1815 into jeopardy. It will be recalled that the Congress of Vienna had joined Belgium with the Dutch Netherlands to create a strong buffer state against a resurgent France and had also done what it could to prevent direct pressure of Russian power upon central Europe by way of Poland. Both these arrangements were now undone.

---

*The benefits of the Dutch-Belgian union*

The Dutch-Belgium union proved economically beneficial, for Belgian industry complemented the commercial and shipping activity of the Dutch, but politically it worked poorly, especially since the Dutch king had absolutist and centralizing ideas. The Belgians, though they had never been independent, had always stood stiffly for their local liberties under former Austrian rulers (and Spanish before them); now they did the same against the Dutch. The Catholic Belgians disliked Dutch Protestantism; those Belgians who spoke French (the Walloons) objected to regulations requiring the use of Dutch. About a month after the July Revolution in Paris disturbances broke out in Brussels. The leaders asked only for local Belgian self-government, but when the king took arms against them, they went on to proclaim independence. A national assembly met and drafted a constitution.

### LIBERTY LEADING THE PEOPLE

by Eugène Delacroix (French, 1798–1863)

Delacroix, a founder of the romantic school in nineteenth-century French art, painted this picture soon after the July Revolution in Paris in 1830. It well illustrates the idealistic conception of revolution that prevailed among revolutionaries before 1848. Revolution is shown as a noble and moral act on behalf of the abstract ideals of liberty. The figures express determination and courage but show no sign of hatred or even anger. They are not a class; they are the people, affirming the rights of man. Liberty, holding the tricolor aloft, is a composed and even rational goddess.

(Giraudon/Art Resource, NY)

Nicholas of Russia wished to send troops to stamp out the Belgian uprising. But he could not get his forces safely through Poland. In Poland, too, in 1830, a revolution broke out. The Polish nationalists saw in the fall of the French Bourbons a timely moment for them to strike. They objected also to the appearance of Russian troops bound presumably to suppress freedom in western Europe. One incident led to another, until in January 1831 the Polish diet proclaimed the dethronement of the Polish king (i.e., Nicholas), who thereupon sent in a large army. The Poles, outnumbered and divided among themselves, could put up no successful resistance. They obtained no support from the West. The British government was unsettled by agitation at home. The French government, newly installed under Louis Philippe, had no wish to appear disturbingly revolutionary, and in any case feared the Polish agents who

---

*Revolution in Poland*

sought its backing as international firebrands and republicans. The Polish revolution was therefore crushed. Congress Poland disappeared; its constitution was abrogated, and it was merged into the Russian empire. Thousands of Poles settled in western Europe, where they became familiar figures in republican circles. In Poland the engines of repression rolled. The tsar's government exiled some thousands to Siberia, began to Russify the Eastern Border, and closed the universities of Warsaw and Vilna. Since it was too late for the tsar any longer to contemplate intervention in Belgium, it may be said that the sacrifice of the Poles contributed to the success of the West European revolution of 1830, as it had to that of the French Revolution of 1789–1795.

It was true enough, as Nicholas maintained, that an independent Belgium presented great international problems. Belgium for 20 years before 1815 had been part of France. A few Belgians now favored reunion with it, and in France the republican left, which regarded the Vienna treaty as an insult to the French nation, saw an opportunity to win back this first and dearest conquest of the First Republic. In 1831, by a small majority, the Belgian national assembly elected as their king the son of Louis Philippe, who, however, not wishing trouble with the British, forbade his son to accept it. The Belgians thereupon elected Leopold of Saxe-Coburg, a German princeling who had married into the British royal family and became a British subject. He was in fact the uncle of a 12-year-old girl who was to be Queen Victoria. The British negotiated with Talleyrand, sent over by the French government (it was his last public service); and the result was a treaty of 1831 (confirmed in 1839) setting up Belgium as a perpetually neutral state, incapable of forming alliances and guaranteed against invasion by all five of the Great Powers. The aim intended by the Treaty of Vienna, to prevent the annexation of Belgium to France, was thus again realized in a new way. Internally Belgium presently settled down to a stable parliamentary system, somewhat more democratic than the July Monarchy in France but fundamentally offering the same type of bourgeois and liberal rule.

### *Reform in Great Britain*

The three-day Paris revolution of 1830 had direct repercussions across the Channel. The quick results following on working-class insurrection gave radical leaders in England the idea that threats of violence might be useful. On the other hand, the ease and speed with which the French bourgeoisie gained the upper hand reassured the British middle classes, who concluded that they might unsparingly embarrass the government without courting a mass upheaval.

---

#### *The Tory regime*

The Tory regime in England had in fact already begun to loosen up. A group of new Tory leaders came forward in the 1820s, notably George Canning, the foreign minister, and Robert Peel, son of one of the first cotton manufacturers. This group was sensitive to the needs of British business and to the liberal doctrines of free trade. They reduced tariffs and liberalized the old Navigation Acts, permitting British colonies to trade with countries other than Britain. The Liberal Tories also undermined the legal position of the Church of England, forwarding the conception of a secular state, though such was hardly their purpose. They repealed the old laws (which dated from the seventeenth century) forbidding dissenting Protestants to hold public office except through a legal fiction by which they pretended to be Anglicans. They even allowed the Test Act of 1673 to be repealed and Catholic Emancipation to be adopted. Catholics in Great Britain and Ireland received the same rights as others. Capital punishment was abolished for about a hundred offenses. A professional police force was introduced in place of the old-

fashioned and ineffectual local constables. (It is after Robert Peel that London policemen came to be called “bobbies.”) The new police were expected to handle protest meetings, angry crowds, or occasional riots without having to call for military assistance.

There were two things that the Liberal Tories could not do. They could not question the Corn Laws, and they could not reform the House of Commons. By the Corn Laws, which set the tariff on imported grain, a tariff raised to new heights in 1815, the gentlemen of England protected their rent rolls; and by the existing structure of the House of Commons they governed the country, expecting the working class and the business interests to look to them as natural leaders.

Never in 500 years of its history had the Commons been so unrepresentative. No new borough had been created since the Revolution of 1688. The boroughs, or urban centers having the right to elect members of Parliament, were heavily concentrated in southern England. Although the Industrial Revolution was shifting population noticeably to the north, the new factory towns were not represented in Parliament. In a few boroughs real elections took place, but in some of them it was the town corporation, and in others the owners of certain pieces of real estate, that had the right to name members of Parliament. Each borough was different, carrying over the local liberties of the Middle Ages. Many boroughs were entirely dominated by influential persons called borough-mongers by their critics. As for the rural districts, the “forty-shilling freeholders” chose two members of Parliament for each county, in a convivial assembly much influenced by the gentry. It was estimated about 1820 that fewer than 500 men, most of them members of the House of Lords, really selected a majority of the House of Commons.

---

*Problems of  
representation*

Some two dozen bills to reform the House of Commons had been introduced in the half-century preceding 1830. They had all failed to pass. In 1830, after the Paris revolution, the issue was again raised by the minority party, the Whigs. The Tory prime minister, the Duke of Wellington, the victor of Waterloo and a most extreme conservative, so immoderately defended the existing system that he lost the confidence even of some of his own followers. The existing methods of election in England, he declared, were more perfect than any that human intelligence could contrive at a single stroke. After this outburst a Whig ministry took over the government. It introduced a reform bill. The House of Commons rejected it. The Whig ministry thereupon resigned. The Tories, fearing popular violence, refused to take the responsibility for forming a cabinet. The Whigs resumed office and again introduced their reform bill. This time it passed the Commons but failed in the House of Lords. An angry roar went up over the country. Crowds milled in the London streets, rioters for several days were in control at Bristol, the jail at Derby was sacked, and Nottingham castle was burned. Only the passage of the reform bill, it seemed, could prevent an actual revolution. Using this argument, the Whigs got the king to promise to create enough new peers to change the majority in the House of Lords. The Lords yielded rather than be swamped, and in April 1832 the bill became law.

---

*The Reform Bill of  
1832*

The Reform Bill of 1832 was a very English measure. It adapted the English or medieval system rather than following the new ideas of the French Revolution. On the Continent, constitutional political systems in countries such as France rested on the idea that each representative should represent roughly the same number of voters and that voters should qualify to vote by a flat uniform qualification, usually the payment of a stated amount of property taxes. The British held to the idea that members of the House of Commons represented boroughs and counties, in general without regard to size of population (with exceptions). In other words, no attempt

was made to create equal electoral districts, and the vote was still distributed in the reformed boroughs and counties on the basis of economic status, reliability, and permanence. The total effect on the size of the electorate was to raise the number of voters in the British Isles from about 500,000 to about 813,000. Some persons actually lost their votes, namely, the poorer elements in the handful of old boroughs which had been fairly democratic, like the borough of Westminster in greater London.

The most important change was not the increased size of the electorate but its redistribution by region and by class. The Reform Bill reallocated the seats in the House of Commons. Fifty-six of the smallest older boroughs were abolished, their inhabitants thereafter voting as residents of their counties. Thirty other small boroughs kept the right to send only one burgess to Parliament instead of the historic two. The 143 seats thus made available were given to the new industrial towns, where the middle classes now gained the right to vote—factory owners and businessmen and their principal employees, doctors, lawyers, brokers, merchants, and newspaper people, relatives and connections of the well-to-do.

---

*The ambiguous  
impact of reform*

The Reform Bill of 1832 was more sweeping than the Whigs would have favored except for their fear of revolution. It was more conservative than the democratic radicals would have accepted, except for their belief that the suffrage might be widened in the future. Whether Great Britain in 1830 was in danger of any real revolution can never be known. A distressed mass of workers was led by an irate manufacturing class that was unwilling to tolerate any longer its exclusion from political life, yet neither the workers nor the industrialists turned toward violence and revolution. The reason probably lies first of all in the existence of the historic institution of Parliament, which, erratic though it was before the Reform Bill, provided the means by which social changes could be legally accomplished and continued, in principle, to enjoy universal respect. Conservatives, driven to the wall, would yield; they could allow a revision of the suffrage because they could expect to remain themselves in public life. Radicals, using enough violence to scare the established interest, did not thereafter face a blank wall; they could expect, once the breach was made, to carry some day a further democratization of Parliament and with it their social and economic program by orderly legislation.

### *Britain after 1832*

But the Reform Bill of 1832 was in its way a revolution. The new business interests, created by industrialization, took their place alongside the old aristocracy in the governing elite of the country. The aristocratic Whigs who had carried the Reform Bill gradually merged with formerly radical industrialists and with a few Liberal Tories to form the Liberal party. The main body of the Tories, joined by a few old Whigs and even a few former radicals, gradually turned into the Conservative party. The two parties alternated in power at short intervals from 1832 to the First World War, this being the classic period in Great Britain of the Liberal-Conservative two-party system.

---

*Liberals and  
Conservatives*

In 1833 slavery was abolished in the British Empire. In 1834 a new Poor Law was adopted. In 1835 the Municipal Corporations Act, second only to the Reform Bill in basic importance, modernized the local government of English cities; it broke up the old local oligarchies and brought in uniform electoral and administrative machinery, enabling city dwellers to grapple more effectively with the problems of

## CHRONOLOGY OF NOTABLE EVENTS, 1780–1869

---

1780s	Mechanical spinning of cotton spreads across England
1792	Mary Wollstonecraft publishes <i>A Vindication of the Rights of Women</i>
1807	Robert Fulton uses the steam engine to propel river boats
1819	“Peterloo Massacre” suppresses protesting English workers in Manchester
1819	Metternich’s “Carlsbad Decrees” suppress the German nationalist movement
1820	Congress of Troppau calls for international action against all revolutions
1823	Monroe Doctrine opposes European intervention in Latin America
1825	Decembrist Revolt of military officers is put down in Russia
1829	Steam locomotive is tested safely in England
1830	July Revolution in France forces abdication of Charles X; Louis-Philippe becomes king
1831	Russia suppresses national movement in Poland
1832	Reform Bill widens British suffrage; alters representation in Parliament
1839	Louis Blanc’s <i>Organization of Work</i> promotes new socialist ideas
1846	Repeal of Corn Laws marks ascendancy of British industrial interests
1869	John Stuart Mill argues for women’s rights in <i>The Subjection of Women</i>

---

---

urban life. In 1836 the House of Commons allowed the newspapers to report how its members voted—a long step toward publicity of government proceedings was thus taken. Meanwhile an ecclesiastical commission reviewed the affairs of the Church of England; financial and administrative irregularities were corrected, together with the grosser inequalities between the income of upper and lower clergy, all of which had made the church formerly a kind of closed preserve for the landed gentry.

The Tories, thus assaulted in their immemorial strongholds of local government and the established church, carried a counteroffensive into the strongholds of the new liberal manufacturing class, namely, the factories and the mines. Tories became champions of the industrial workers. Landed gentlemen, of whom the most famous was Lord Ashley, later seventh Earl of Shaftesbury, took the lead in publicizing the social evils of a rapid and even ruthless industrialization. They received some support from a few humanitarian industrialists; indeed, the early legislation tended to follow practices already established by the best or strongest business firms. A Factory Act of 1833 forbade the labor of children less than nine years old in the textile mills. It was the first effective piece of legislation on the subject because it provided for paid inspectors and procedures for enforcement. An act of 1842 initiated significant regulation in the coal mines; the employment underground of women and girls, and of boys under ten, was forbidden.

---

*The Tory  
counteroffensive*

The greatest victory of the working classes came in 1847 with the Ten Hours Act, which limited the labor of women and children in all industrial establishments to ten hours a day. Thereafter men commonly worked only ten hours also, since the work of men, women, and young people was too closely coordinated for the men to work alone. The

Liberal John Bright, Quaker and cotton magnate, called the Ten Hours Act “a delusion practiced on the working classes.” To regulate the hours of labor was contrary to the accepted principles of *laissez-faire*, economic law, the free market, freedom of trade, and individual liberty for employer and worker. Yet the Ten Hours Act stood, and British industry continued to prosper.

---

*The Anti-Corn Law  
League*

Gathering their strength, the Whig-liberal-radical combination established in 1838 an Anti-Corn Law League. Wage earners objected to the Corn Laws because the tariff on grain imports kept up the price of food. Industrial employers objected to them because, in keeping up food prices, they also kept up wages and the cost of industrial production in England, thus working to England's disadvantage in the export trade. Defenders of the Corn Laws argued that protection of agriculture was necessary to maintain the natural landowning aristocracy of the country, but they also sometimes used more widely framed economic arguments, affirming that Britain should preserve an economic balance between industry and farming and avoid becoming too exclusively dependent on imported food. The issue became a straight contest between the industrialists, acting with working-class support, and the aristocratic and predominantly Tory landowning interest. The Anti-Corn Law League, whose headquarters were at Manchester, operated like a modern political party. It had plenty of money, supplied by large donations from manufacturers and small ones from laboring people. It sent lecturers on tour, agitated in the newspapers, and issued a stream of polemical pamphlets and educational books. It held political teas, torchlight processions, and open-air mass meetings. The pressure proved irresistible and received a final impetus from a famine in Ireland. It was a Tory government, headed by Sir Robert Peel, which in 1846 yielded before so vociferous a demand.

The repeal of the Corn Laws in 1846 stands as a symbol of the change that had come over England. It reaffirmed the revolutionary consequences of the Reform Bill of 1832. Industry was now a governing element in the country. Free trade was henceforth the rule. Great Britain, in return for the export of manufacturers, became deliberately dependent on imports for its very life. It was committed henceforth to an international and even worldwide economic system. The first to undergo the Industrial Revolution, possessing mechanical power and methods of mass production, the British could produce yarn and cloth, machine tools and railroad equipment, more efficiently and more cheaply than any other people. In Britain, the early industrial workshop of the world, people would pour increasingly into mine, factory, and city; live by selling manufactures, coal, shipping, and financial services to the other peoples of the earth; and obtain raw cotton, rare ores, meat, cereals, and thousands of lesser but still vital necessities from the rest of the earth in exchange. The welfare of Britain depended on the maintenance of a freely exchanging worldwide economic system and, as always, on the British navy's control of the sea.

## 57. TRIUMPH OF THE WEST EUROPEAN BOURGEOISIE

In general, the decades following 1830 may be thought of as a kind of golden age of the West-European bourgeoisie, or what in English would be called the upper middle class. In the older meaning, in French, a *bourgeois* had been someone who was not of the nobility but enjoyed an income from business, a profession, or the ownership of property. After the French Revolution, and even more after 1830, the word took on new meanings, not all of

them consistent. Artists, literary people, and old-line aristocrats might disdain the bourgeois as a person of uncultivated tastes, supposedly interested only in making money. From another point of view, shared by social theorists and working-class leaders, the bourgeois was someone who could hire the labor of other people for business enterprises, recreational activities, or household service. In a word, the bourgeois was the employer. In any case, the bourgeoisie and the aristocracy tended to become more alike in the nineteenth century in their daily pursuits and style of life, and to draw income from the possession of income-producing property or capital. The bourgeoisie, formerly identified in contrast to the nobility, was now identified in contrast to the working class, that is, those whose whole income depended on daily labor in shops, offices, farms, or factories.

The reigning liberal doctrine was the "stake in society" theory; those who govern should have something to lose. In the France of the July Monarchy (1830–1848), only about one adult male in 30 had the vote. In the Britain of the first Reform Bill (1832–1867), one man in eight could vote for a member of the House of Commons. In France only the most well-to-do were enfranchised; in Britain, virtually the whole middle class, which, however, long supported members of the aristocracy for the highest public positions. In Britain the continuation of the Tory landed interest in politics somewhat blunted the edge of capitalist and managerial rule, resulting in the passage of significant legislation for the protection of industrial labor. In France the aristocratic landed interest, weaker and less public spirited than in England, lost much of its influence by the Revolution of 1830, and less was done to relieve the condition of labor.

---

"Stake in society"  
theory

The bourgeois age left its mark on Europe in many ways. For one thing, western Europe continued to accumulate capital and build up its industrial plant. National income was constantly rising, but a relatively small share went to the laboring class and a relatively large share went to owners of capital. This meant that less was spent on consumers' goods—housing, clothing, food, recreation—and that more was saved and available for reinvestment. New stock companies were constantly formed, and the law of corporations was amended, allowing for the extension of corporate enterprise to new fields. The factory system spread from Britain to the Continent and within Britain from the textile industry to other lines of production. The output of iron, a good index to economic advancement in this phase of industrialism, rose about 300 percent in Great Britain between 1830 and 1848 and about 65 percent in France between 1830 and 1845. (All the German states combined, at the latter date, produced about a tenth as much iron as Great Britain and less than half as much as France.) Railroad building began in earnest after 1840. In 1840 Samuel Cunard put four steamships into regular transatlantic service. Much capital was exported; as early as 1839 an American estimated that Europeans (mainly British) owned \$200,000,000 worth of stocks in American companies. Such investments financed the purchase of British and other goods and helped to rivet together a world economic system, in which western Europe and especially England took the lead, with other regions remaining in a somewhat subordinate status.

### *The Frustration and Challenge of Labor*

The bourgeois age had the effect also of estranging the world of labor. The state in Britain and France was as near as it has ever been to what Karl Marx was soon to call it—a committee of the bourgeois class. Already in France people spoke worriedly of the

*prolétaires*, those at the bottom of society, who had nothing to lose. Republicans in France, radical democrats in Britain, felt cheated and imposed upon in the 1830s and 1840s. They had in each country forced through a virtual revolution by their insurrections and demonstrations and then in each country had been left without the vote. Some lost interest in representative institutions. Excluded from government, they were tempted to seek political ends through extragovernmental, which is to say revolutionary or utopian, channels. Social and economic reforms seemed to the average worker far more important, as a final aim, than mere governmental innovations. Workers were told by respected economists that they could not hope to change the system in their own favor. They were tempted, therefore, to destroy the system, to replace it utterly with some new system conceived mainly in the minds of thinkers. They were told by the Manchester School, and by its equivalent in France, that the income of labor was set by ineluctable natural laws, that it was best and indeed necessary for wages to remain low, and that the way to rise in the world was to get out of the laboring class altogether, by becoming the owner of a profitable business and leaving working people about where they were.

The reigning doctrine emphasized the conception of a labor market. The worker sold labor; the employer bought it. The price of labor, or wage, was to be agreed upon by the two individual parties. The price would naturally fluctuate according to changes in supply and demand. When a great deal of a certain kind of labor was required, the wage would go up until new persons moved into the market offering more labor of this type, with the result that something like the old wage would again be established. When no labor was needed, none should be hired, and persons who could not sell labor might then subsist for a time by poor relief.

---

*The labor market*

The new Poor Law of 1834 was especially repugnant to the British working class. It corrected crying evils of the old poor laws that had left millions of people in habitual poverty but did nothing constructive to relieve productive workers suffering from occasional or cyclical unemployment. The new law followed the stern precepts of the dismal science; its main principle was to safeguard the labor market by making relief more unpleasant than any job. It granted relief only to persons willing to enter a workhouse, or poorhouse; and in these establishments the sexes were segregated and life was in other ways made noticeably less attractive than in the outside world. The workers considered the new law an abomination. They called the workhouses "bastilles." They resented the whole conception of a labor market, in which labor was to be bought and sold (or remain unsold) like any other commodity. The fluctuating, cyclical labor market contributed to the social instability of working-class families and may also have created new tensions between women and men. Court records from early nineteenth-century England suggest that violent family disputes became more common when women earned significant portions of the working family's household income or found work more readily than their unemployed husbands; such situations challenged the traditional relations in English family life, though women almost always received lower wages than men.

---

*The Poor Law of  
1834*

In the long run it would be the increase in productivity that would improve the condition of the workers. Meanwhile the friends of the working class offered two means of escape. One was to improve the position of labor in the market. This led to the formation of labor unions for control of the labor supply and collective bargaining with employers. Such unions, illegal in France, were barely legal in Great Britain after 1825, though it was still illegal in both countries to strike. The other means of escape was to repudiate the

whole idea of a market economy and of the capitalist system. It was to conceive of a system in which goods were to be produced for use, not for sale; and in which working people should be compensated according to need, not according to the requirements of an employer. This was the basis of most forms of nineteenth-century socialism.

### *Socialism and Chartism*

Socialism spread rapidly among the working classes after 1830. In France it blended with revolutionary republicanism. There was a revival of interest in the great Revolution and the democratic Republic of 1793. Cheap reprints of the writings of Robespierre began to circulate in the working-class quarters of Paris. Robespierre was now seen as a people's hero. The socialist Louis Blanc, for example, who in 1839 published his *Organization of Work* recommending the formation of "social workshops," also wrote a long history of the French Revolution, in which he pointed out the egalitarian ideals that had inspired the National Convention in 1793. In Britain, as befitted the different background of the country, socialistic ideas blended in with the movement for further parliamentary reform. This was advanced by the working-class group known as the Chartists, from the People's Charter which they drafted in 1838.

Chartism was far more of a mass movement than the French socialism of the day. Only a few Chartists were clearly socialists in their own minds. But all were anticapitalistic. All could agree that the first step toward social reform must be to win working-class representation in Parliament. The Charter of 1838 consisted of six points. It demanded (1) the annual election of the House of Commons by (2) universal suffrage for all adult males, through (3) a secret ballot and (4) equal electoral districts; and it called for (5) the abolition of property qualifications for membership in the House of Commons, which perpetuated the old idea that Parliament should be composed of gentlemen of independent income, and urged instead (6) the payment of salaries to the elected members of Parliament, in order that people of small means might serve. A convention composed of delegates sent by labor unions, mass meetings, and radical societies all over the country met in London in 1839. Convention was an ominous word, with French revolutionary and even terrorist overtones; some members of this British convention regarded it as the body really representing the people and favored armed violence and a general strike, while others stood only for moral pressure upon Parliament.

A petition bearing over a million signatures, urging acceptance of the Charter, was submitted to the House of Commons. The violent and revolutionary wing, or "physical force" Chartists, precipitated a wave of riots which were effectively quelled by the authorities. In 1842 the petition was again submitted. This time, according to the best estimate, it was signed by 3,317,702 persons. Since the entire population of Great Britain was about 19 million, it is clear that the Charter, whatever the exact number of signatures, commanded the explicit adherence of half the adult males of the country. The House of Commons nevertheless rejected the petition by 287 votes to 49. It was feared that political democracy would threaten property rights and the whole economic system as they then existed. The Chartist movement gradually died down in the face of firm opposition by the government and the business classes and was weakened by mutual fears and disagreements among its own supporters. It had not been entirely fruitless; for without popular agitation and the publicizing of working-class grievances, the Mines Act of 1842 and the Ten Hours Act of

---

---

*Petitions and the defeat of the Chartists*

The newly organized London police await the arrival of a Chartist procession in the 1840s. The British government introduced a more disciplined police force to avoid incidents such as the Peterloo Massacre and to manage the mass demonstrations of groups such as the Chartists, who campaigned (unsuccessfully) for more democratic electoral laws.

(Getty Images)

1847 might not have been enacted. These measures in turn alleviated the distress of industrial workers and kept alive a degree of confidence in the future of the economic system. Chartism revived briefly in 1848, as will be seen in the next chapter; but in general, in the 1840s, British working people turned from political agitation to the forming and strengthening of labor unions by which they could deal directly with employers without having to appeal to the government. Not until 1867 was the suffrage extended in Great Britain, and it took about 80 years to realize the full program of the Charter of 1838, except for the annual election of Parliament, for which there soon ceased to be any demand.

It is not easy to summarize the history of Europe between 1815 and 1848. Among all the forces set free by the French and Industrial revolutions—liberalism, conservatism, nationalism, republicanism, socialism, feminism, democracy—no stabilization had been achieved. No international system had been created; Europe had instead fallen increasingly into two political camps, which represented both geographical and ideological divisions in nineteenth-century European societies. In general, the political ideas of classical liberalism advanced most rapidly in the nations of western Europe, whereas eastern Europe was mostly dominated by three autocratic monarchies. Western Europe generally adhered more closely to the principles of nationality; governments in central and eastern

Europe still opposed them. The countries of northwestern Europe were growing collectively richer, more industrialized, more liberal, more bourgeois. Middle-class people in Germany, central Europe, and Italy (as well as in Spain and Portugal) did not usually enjoy the dignities and emoluments that they enjoyed in Great Britain or France. But the industrializing societies in northwestern Europe had not solved their social problem; their whole material civilization rested upon a restless and sorely tried working class. **Everywhere there was repression, in varying degree, and everywhere apprehension, more in some places than in others; but there was also hope, confidence in the progress of an industrial and scientific society, and faith in the unfinished liberal program of the rights of individuals.** The result was the general Revolution of 1848.

## REVOLUTIONS AND THE REIMPOSITION OF ORDER, 1848–1870

58. Paris: The Specter of Social Revolution in the West
59. Vienna: The Nationalist Revolutions in Central Europe and Italy
60. Frankfurt and Berlin: The Question of a Liberal Germany
61. The New European “Isms”: Realism, Positivism, Marxism
62. Bonapartism: The Second French Empire, 1852–1870

*Fears haunting* the established classes of Europe for 30 years came true in 1848. Governments collapsed all over the Continent. Remembered horrors appeared again, as in a recurring dream, in much the same sequence as after 1789 only at a much faster rate of speed. Revolutionaries milled in the streets, kings fled, republics were declared, and within four years there was another Napoleon. Soon thereafter came a series of short wars.

Never before or since has Europe seen so truly universal an upheaval as in 1848. While the French Revolution of 1789 and the Russian Revolution of 1917 both had immediate international repercussions, in each of these cases a single country took the lead. In 1848 the revolutionary movements broke out spontaneously from Copenhagen to Palermo and from Paris to Budapest. Contemporaries

sometimes attributed the universality of the phenomenon to the machinations of secret societies, and it is true that the faint beginnings of an international revolutionary movement existed before 1848; but the fact is that revolutionary plotters had little influence upon what actually happened, and the nearly simultaneous fall of governments is quite understandable from other causes. Many people in Europe sought substantially the same goals—constitutional government, the independence and unification of national groups, an end to serfdom and manorial restraints where they still existed. With some variation, there was a common body of ideas among politically conscious elements of all countries. Some of the powers that the new forces had to combat were themselves international, notably the Catholic church and the far-spreading influence of the Habsburgs, so that resistance to them arose independently in many places. In any case, only the Russian

empire and Great Britain escaped the European revolutionary contagion of 1848, and the British received a very bad scare.

But the Revolutions of 1848, though they shook the whole Continent, lacked enduring political and social strength. They failed almost as rapidly as they succeeded. Their main consequence, at least in the short run, was to strengthen the more conservative forces that viewed all revolution with alarm. Revolutionary ideals succumbed to military repression. To some extent the governments of the 1850s and 1860s, while hostile to revolution, satisfied some of the aims of 1848, notably in national unification and constitutional government with limited representation, but they did so in a mood of calculated realism that firmly reasserted their own authority. The repressed Revolutions of 1848 left a legacy of class fears and class conflict, in which prophets of a new society also became more realistic, as when Karl Marx, branding earlier forms of socialism as “utopian,” offered his own views as hard-headed and “scientific.” New “isms” arose in response to the evolving nineteenth-century political and cultural order, but power also remained firmly with the institutions and national ideologies of the various European states and their centralizing governments.

## 58. PARIS: THE SPECTER OF SOCIAL REVOLUTION IN THE WEST

The July Monarchy in France was a platform of boards built over a volcano. Under it burned the repressed fires of the republicanism put down in 1830, which since 1830 had become steadily more socialistic.

Politics in the July Monarchy became increasingly separated from the changing social classes in French society. So few interests were represented in the Chamber of Deputies that the most basic social or political issues were seldom debated. Even most of the bourgeois class had no representation. Graft and corruption were more common than they should have been, as economic expansion favored stock swindles and fraud by business promoters and politicians in combination. A strong movement set in to give the vote to more people. Radicals wanted universal male suffrage and a republic, but liberals asked only for a broadening of voting rights within the existing constitutional monarchy. The king, Louis Philippe, and his prime minister, Guizot, instead of allying with the liberals against the radicals, resolutely and obtusely opposed any change whatsoever.

### *The “February” Revolution in France*

Reformers, against the king’s expressed wishes, planned a great banquet in Paris for February 22, 1848, to be accompanied by demonstrations in the streets. The government on February 21 forbade all such meetings. That night barricades were built in the working-class quarters. Paving blocks, building stones, or large pieces of furniture were thrown together across the narrow streets and intersections of the old city, constituting a maze within which insurgents prepared to resist the authorities. The government called out the National Guard, which refused to move. The king now promised electoral reform, but republican firebrands took charge of the working-class elements, who demonstrated outside the house of Guizot. Someone shot at the guards placed around the house; the guards replied, killing 20 persons. The republican organizers put some of the corpses on a torch-lit cart and paraded them through the city, which, armed and barricaded, soon began to erupt

in an enormous riot. On February 24 Louis Philippe, like Charles X before him, abdicated and made for England. The February Revolution of 1848, like the July Revolution of 1830, had unseated a monarch in three days.

The constitutional reformers hoped to carry on with Louis Philippe's young grandson as king, but the republicans, now aroused and armed, poured into the Chamber of Deputies and forced the proclamation of the Republic. Republican leaders set up a provisional government of 10 men, pending election by all France of a Constituent Assembly that would write the new constitution for the second French Republic. Seven of the 10 were "political" republicans, the most notable being the poet Lamartine. Three were "social" republicans, the most notable being Louis Blanc. A huge crowd of workers appeared before the Hôtel de Ville, or city hall, demanding that France adopt the new socialist emblem—the red flag. They were dissuaded by the eloquence of Lamartine, and the tricolor remained the republican standard.

---

*Proclamation of the  
Republic*

Louis Blanc urged the Provisional Government to push through a bold economic and social program without delay. But since the "social" republicans were in a minority in the Provisional Government (though probably not among Paris republicans generally), Louis Blanc's ideas were very much watered down in the application. He wanted a Ministry of Progress to organize a network of "social workshops," the state-supported and collectivist manufacturing establishments that he had projected in his writings. The new government, however, would only create a more limited Labor Commission and a system of shops significantly entitled "national" rather than "social." The National Workshops, as they are always called in English (though "workshop" suggests something more insignificant than Louis Blanc had in mind), were established as a political concession to the "social" republicans, but no significant work was ever assigned them for fear of competition with private enterprise and dislocation of the economic system. Indeed, the man placed in charge of them admitted that his purpose was to prove the fallacies of socialism. Meanwhile the Labor Commission was unable to win public acceptance for the ten-hour day, which the British Parliament had enacted the year before. One action of the Provisional Government, however, had permanent effect: the final abolition of slavery in the French colonies.

---

*Louis Blanc*

The National Workshops became in practice only an extensive project in unemployment relief. Women were excluded from the workshops, but men of all trades, skilled and unskilled, were set to work digging on the roads and fortifications outside Paris. They were paid two francs a day. The number of legitimate unemployed increased rapidly, for 1847 had been a year of depression and the revolution prevented the return of business confidence. Other needy persons also presented themselves for remuneration, and soon there were too many men for the amount of work made available. From 25,000 enrolled in the workshops by the middle of March, the number climbed to 120,000 by mid-June, by which time there were also in Paris another 50,000 whom the bulging workshops could no longer accommodate. In June there were probably almost 200,000 essentially idle but able-bodied men in a city of about a million people.

---

*The National  
Workshops*

The Constituent Assembly, elected in April by universal male suffrage throughout France, met on May 4. It immediately replaced the Provisional Government with a temporary executive board of its own. The main body of France, a land of provincial bourgeois and peasant landowners, was not socialist in the least. The temporary executive board,

There was in Paris a well-established tradition of revolutionary agitation, so that a conflict between political activists and the police in February 1848 could lead quickly toward the well-known patterns of radical political upheaval: crowds and barricades in the streets, publications calling for revolutionary change, and emotional responses to popular national symbols such as the tricolor flag. This nineteenth-century illustration depicts part of the Parisian crowd that marched on the Tuileries, forcing King Louis-Philippe to abdicate power and leave the country.

(Snark/Art Resource, NY)

chosen by the Constituent Assembly in May, included no “social” republicans. All five of its members were known as outspoken enemies of Louis Blanc; the socialists could no longer expect even the grudging concessions that they had earlier obtained.

The battle lines were now drawn after only three months of revolution, somewhat as they had been drawn in 1792 after three years. Paris again stood for revolutionary actions in which the rest of the country was not prepared to share. Revolutionary leaders in Paris, in 1848 as in 1792, were unwilling to accept the processes of majority rule or slow parliamentary deliberation. But the crisis in 1848 was more acute than in 1792. A larger proportion of the population were wage earners. Under a system of predominantly merchant capitalism, in which machine industry and factory concentration were only just emerging, the workers were tormented by the same evils as the more industrialized working classes of England. Hours were if anything longer, and pay was less, in France than in Great Britain; insecurity and unemployment were at least as great; and the belief that a capitalist

economy held no future for the laborer was the same. In addition, where the English worker shrank from an actual assault on Parliament, the French worker saw nothing very sacrilegious in the violation of elected assemblies. Too many regimes in France since 1789, including those preferred by the comfortable classes, had been based on insurrectionary violence for the French workers to feel much compunction over using it for their own ends.

### *The "June Days" of 1848*

On the one hand stood the nationally elected Constituent Assembly. On the other, the National Workshops had mobilized in Paris the most distressed elements of the working class. Tens of thousands had been brought together where they could talk, read journals, listen to speeches, and concert common action. Agitators and organizers naturally made use of the opportunity thus presented to them. Men in the workshops began to feel desperate, to sense that the social republic was slipping from them perhaps forever. On May 15 they attacked the Constituent Assembly, drove its members out of the hall, declared it dissolved, and set up a new provisional government of their own. They announced that a social revolution must follow the purely political revolution of February. But the National Guard, a kind of civilian militia, turned against the insurgents and restored the Constituent Assembly. The Assembly, to root out socialism, now prepared to get rid of the National Workshops. It offered those enrolled in them the alternatives of enlistment in the army, transfer to provincial workshops, or expulsion from Paris by force. The whole laboring class in the city began to resist. The government proclaimed martial law, the civilian executive board resigned, and all power was given to General Cavaignac and the regular army.

---

*Paris on the verge of revolution*

---

There followed the "Bloody June Days"—June 24 to 26, 1848—three days during which a terrifying class war raged in Paris. Over 20,000 men from the workshops took to arms, and they were joined by thousands of men and women from the working-class districts of the city. Half or more of Paris became a labyrinth of barricades defended by determined men and equally resolute women. Military methods of the time made it possible for civilians to shoot it out openly with soldiers in the narrow streets; small arms were the main weapons, and armies still lacked the military advantage of armored vehicles. The soldiers found it a difficult operation, but after three days the outcome was in doubt no longer. Ten thousand persons had been killed or wounded. Eleven thousand insurgents were taken prisoner. The Assembly, refusing all clemency, decreed their immediate deportation to the colonies.

---

*Class war*

---

The June Days sent a shudder throughout France and Europe. Whether the battle in Paris had been a true class struggle, how large a portion of the laboring class had really participated (it was large in any case), how much they had fought for permanent objectives, and how much over the temporary issue of the workshops—all these were secondary questions. It was widely understood that a class war had in fact broken out. Militant workers were confirmed in a hatred of the bourgeois class and in a belief that capitalism ultimately survived by shooting working-class men and women in the streets. People above the laboring class were thrown into a panic. They were sure that they had narrowly escaped a ghastly upheaval. The very ground of civilized living seemed to have quaked. After June 1848, wrote a Frenchwoman of the time, society was "a prey to a feeling of terror incomparable to anything since the invasion of Rome by the barbarians."

---

*The revival of  
Chartist agitation*

Nor were the signs in England much more reassuring. There the Chartist agitation for electoral reforms was revived by the February Revolution in Paris. “France is a Republic!” cried the Chartist Ernest Jones; the Chartist petition was again circulated and was soon said to have six million signatures. Another Chartist convention met, considered by its leaders to be the forerunner of a Constituent Assembly as in France. The violent minority was the most active; it began to gather arms and to drill. The old Duke of Wellington swore in 70,000 special constables to uphold the social order. Clashes occurred at Liverpool and elsewhere; in London the revolutionary committee laid plans for systematic arson and organized men to break up the pavements for barricades. Meanwhile the petition, weighing 584 pounds, was carried in three cabs to the House of Commons, which estimated that it contained “only” two million signatures and again summarily rejected it. The revolutionary menace passed. One of the secret organizers in London proved to be a government spy; he revealed the whole plan at the critical moment, and the revolutionary committee was arrested on the day set for insurrection. Most Chartists had in any case refused to support the militants, but the truculent minority of radical workers and journalists had a deeper sense of envenomed class consciousness. The word “proletarian” was imported from France. “Every proletarian,” wrote the Chartist editor of *Red Revolution*, “who does not see and feel that he belongs to an enslaved and degraded class is a fool.”

The specter of social revolution thus hung over western Europe in the summer of 1848, though in all probability there could have been no successful socialist revolution at the time. But the specter was there, and it spread a sinking fear among all who had something to lose. This fear shaped the whole subsequent course of the Second Republic in France and of the revolutionary movements that had by this time begun in other countries as well.

*The Emergence of Louis Napoleon Bonaparte*

In France, after the June Days, the Constituent Assembly (with General Cavaignac as a virtual dictator) set about drafting a republican constitution. It was decided, in view of the disturbances just passed, to create a strong executive power in the hands of a president to be elected by universal male suffrage. It was decided also to have this president elected immediately, even before the rest of the constitution was finished. Four candidates presented themselves: Lamartine, Cavaignac, Ledru-Rollin—and Louis Napoleon Bonaparte. The poet Lamartine stood for a somewhat vaguely moral and idealistic republic; Cavaignac, for a republic of disciplined order; Ledru-Rollin, for somewhat chastened social ideas. What Bonaparte stood for was not so clear. He was, however, elected by an avalanche of votes in December 1848, receiving over 5,400,000, compared to only 1,500,000 for Cavaignac, 370,000 for Ledru-Rollin, and a mere 18,000 for Lamartine.

---

*Bonaparte's  
background*

Thus entered upon the European stage the second Napoleon. Born in 1808, Louis Napoleon Bonaparte was the nephew of the great Napoleon. His father, Louis Bonaparte, was at the time of his birth the king of Holland. When Napoleon's own son died in 1832, Louis Napoleon assumed the headship of the Bonaparte family. He resolved to restore the glories of the empire. With a handful of followers he tried to seize power at Strasbourg in 1836 and at Boulogne in 1840, leading what the following century would know as *Putsches*. Both failed ridiculously. Sentenced to life imprisonment in the fortress of Ham, he had escaped from it as recently as 1846 by

simply walking off the grounds dressed as a stonemason. He professed advanced social and political ideas, and he wrote two books. *Napoleonic Ideas* claimed that his famous uncle had been misunderstood and checkmated by reactionary forces; his other book, *Extinction of Poverty*, was a somewhat anticapitalist tract like so many others of its time. But he was no friend of "anarchists," and in the spring of 1848, while still a refugee in England, he enrolled as one of Wellington's special constables to oppose the Chartist agitation. He soon returned to France. Compromised neither by the June Days nor by their repression, he was supposed to be a friend of the common people and at the same time a believer in order; and his name was Napoleon Bonaparte.

For 20 years a groundswell had been stirring the popular mind. It is known as the Napoleonic Legend. Peasants put up pictures of the emperor in their cottages, fondly imagining that it had been Napoleon who gave them the free ownership of their land. The completion of the Arch of Triumph in 1836 drove home the memory of imperial glories, and in 1840 the remains of the emperor were brought from St. Helena and majestically interred at the Invalides on the banks of the Seine. All this happened in a country where, with government in the hands of a few, most people had little political experience or political sense except what they had gained in revolution. When millions were suddenly, for the first time in their lives, asked to vote for a president in 1848, the name of Bonaparte was the only one they had ever heard of. "How should I not vote for this gentleman," said an old peasant, "I whose nose was frozen at Moscow?"

---

*President by popular  
mandate*

So Prince Louis Napoleon became president of the Second Republic, by an overwhelming popular mandate, in which an army officer was his only even faintly successful rival. He soon saw the way the wind was blowing. The Constituent Assembly dissolved itself in May 1849 and was replaced by the Legislative Assembly. Although this new legislative body was established under the provisions of the new republican constitution and was elected by universal male suffrage, it was a strange assembly for a republic. Five hundred of the Second Republic's newly elected deputies, or two-thirds, were really monarchists, but they were divided into irreconcilable factions—the Legitimists, who favored the line of Charles X, and the Orléanists, who favored that of Louis Philippe. One-third of the deputies called themselves republicans. Of these, in turn, about 180 were socialists of one kind or another; and only about 70 were political or old-fashioned republicans to whom the main issue was the form of government rather than the form of society itself.

The president and the Assembly at first combined to conjure away the specter of socialism with which republicanism itself was now clearly associated. An abortive insurrection of June 1849 provided the chance. The Assembly, backed by the president, ousted 33 socialist deputies, suppressed public meetings, and imposed controls on the press. In 1850 it went so far as to rescind universal male suffrage, taking the vote away from about a third of the electorate—naturally the poorest and hence most socialistic third. The Falloux Law of 1850 put the schools at all levels of the education system under supervision of the Catholic clergy; for, as M. Falloux said in the Assembly, "lay teachers have made the principles of social revolution popular in the most distant villages," and it was necessary "to rally around religion to strengthen the foundations of society against those who want to divide up property." The French Republic, now actually an anti-republican government, likewise intervened forcefully against the revolutionary republic that Mazzini had established in the city of Rome. French military forces were sent to Rome to protect the pope; they remained there 20 years.

---

*Antirepublican  
government*

To the conservatives Bonaparte knew that he was virtually indispensable. They were so sharply divided between two sets of monarchists—Legitimist and Orléanist—that each would accept any antisocialist regime rather than yield to the other. Bonaparte's problem was to win over the radicals. He did so by urging in 1851 the restoration of universal suffrage, which he had himself helped repeal in 1850. He now posed as the people's friend, the one man in public life who trusted the common man. He let it be thought that greedy plutocrats controlled the Assembly and hoodwinked France. He put his lieutenants in as ministers of war and of the interior, thus controlling the army, the bureaucracy, and the police. On December 2, 1851, the anniversary of his uncle's famous victory at the battle of Austerlitz, he sprang his coup d'état. Placards appeared all over Paris. They declared the Assembly dissolved and the vote for every adult Frenchman reinstated. When members of the Assembly tried to meet, they were attacked, dispersed, or arrested by the soldiers. The country did not submit without fighting. One hundred and fifty persons were killed in Paris, and throughout France probably 100,000 were put under arrest. But on December 20 the voters elected Louis Napoleon president for a term of 10 years, by a vote officially stated as 7,439,216 to 646,737. A year later the new Bonaparte proclaimed the empire, with himself as Emperor of the French. Remembering Napoleon's son, who had died, he called himself Napoleon III.

How the empire functioned will be seen below. Not only was the Second Republic dead. The republic as republicans understood it, an egalitarian, anticlerical regime with socialist or at least antibourgeois tendencies, had been dead since June 1848. Feeble anyway, it was killed by its reputation for radicalism. Liberalism and constitutionalism were dead also, at least in the political institutions by which the new Napoleon now governed France. Republicans and monarchists were all pushed aside, and for the first time since 1815 France ceased to have any significant parliamentary life.

parliamentary  
government*

## 59. VIENNA: THE NATIONALIST REVOLUTIONS IN CENTRAL EUROPE AND ITALY

### *The Austrian Empire in 1848*

The Austrian Empire of the Habsburgs, with its capital at Vienna, was in 1848 the most populous European state except Russia. Its peoples, living principally in the three major geographical divisions of the empire (Austria, Bohemia, and Hungary) were of about a dozen recognizably different nationalities or language groups—Germans, Czechs, Magyars, Poles, Ruthenians, Slovaks, Serbs, Croats, Slovenes, Dalmatians, Romanians, and Italians (see map, p. 455). In some parts of the empire the nationalities lived in solid blocks, but in many regions two or more were interlaced together, the language changing from village to village, or even from house to house, in a way quite unknown in western Europe.

Germans were the most numerous national group. They occupied all of Austria proper and considerable parts of Bohemia and were scattered also in small pockets throughout Hungary. The Czechs occupied Bohemia and the adjoining Moravia. The Magyars were the dominant group in the historic kingdom of Hungary, which contained a mixture of nationalities with a considerable number of Slavic peoples. Two of the most advanced parts of Italy

---

*The diversity of the  
empire*

also belonged to the empire—Venetia, with its capital at Venice, and Lombardy, whose chief city was Milan.

The Czechs, Poles, Ruthenians, Slovaks, Serbs, Croats, Slovenes, and Dalmatians in the empire were all Slavs; that is, their languages were all related to one another and to the several forms of Russian. Neither the Magyars nor the Romanians were Slavs. The Magyars, as national sentiment grew, prided themselves on the uniqueness of their language in Europe, and the Romanians prided themselves on their linguistic affiliations with the Latin peoples of the West. Romanians, Magyars, and Germans formed a thick belt separating the South Slavs from those of the north. The peoples of the empire represented every cultural level known to Europe. Vienna, where the Waltz King Johann Strauss was reigning, recognized no peer except Paris itself. Milan was a great center of trade. Bohemia had long had an important textile industry, which was beginning to be mechanized in the 1840s; but 200 miles to the south a Croatian intellectual remarked, about the same time, that the first steam engine he ever saw was in a picture printed on a cotton handkerchief imported from Manchester.

Thus the empire ruled from Vienna included, according to political frontiers established 70 years later, in 1918, all of Austria, Hungary, and Czechoslovakia, with adjoining portions of Poland, Romania, Yugoslavia, and Italy. But the political authority of Vienna reached far beyond the borders of the empire. Austria since 1815 had been the most influential member of the German confederation, for Prussia in these years was content to look with deference upon the Habsburgs. The influence of Vienna was felt throughout Germany in many ways, as in the enactment and enforcement of Metternich's repressive Carlsbad Decrees described in the last chapter. It reached also through the length of Italy. Lombardy and Venetia were part of the Austrian Empire. Tuscany, ostensibly independent, was governed by a Habsburg grand duke. The kingdom of Naples or the Two Sicilies, comprising all Italy south of Rome, was virtually a protectorate of Vienna. The papal states looked politically to Vienna for leadership, at least until 1846, when the College of Cardinals elected a liberal-minded pope, Pius IX—the one contingency upon which Metternich confessed he had failed to reckon. In all Italy there was only one state ruled by a native Italian dynasty and attempting any consistent independence of policy—the kingdom of Sardinia (called also Savoy or Piedmont) tucked away in the northwest corner around Turin. Italy, said Metternich blandly, was only a “geographical expression,” a mere regional name. He might have said the same of Poland, or even of Germany, though Germany was tenuously joined in the Bund, or loose confederation, of 1815.

---

*Vienna's authority  
and leadership*

These peoples since the turn of the century had all felt the flutters of the *Volksgeist*, persistent stirrings of a cultural nationalism; and among Germans, Italians, Poles, and Hungarians a good deal of political agitation and liberal reformism had been at work. Metternich, in Vienna, had discouraged such manifestations for over 30 years, ominously predicting that if allowed to break out they would produce the *bellum omnium contra omnes*—“the war of all against all.” As a prophet he was not wholly mistaken, but if it is the business of statesmanship not merely to prophesy events but to control them, it cannot be said that the regime of Metternich was very successful. The whole nationalities question was evaded. The fundamental problem of the century, the bringing of peoples into some kind of mutual relationship with their governments—the problem of which nationalism, liberalism, constitutionalism, and democracy were diverse aspects—remained unconsidered by the responsible authorities of central Europe. Metternich believed that a reigning house, with an official bureaucracy, should rule benevolently over peoples with

whom it need have no connection and who need have no connection with each other. Such ideas could be found everywhere among the governing elites in eighteenth-century Europe. They dated from before the French Revolution, and they were best suited to the agricultural, locally oriented societies that by 1848 were giving way to cities, cultural nationalisms, and new commercial institutions.

### *The March Days*

In March 1848 most of the political institutions in central Europe collapsed with incredible swiftness. At that time the diet of Hungary had been sitting for some months, considering constitutional reforms and, as usual, debating further means of keeping German influence out of Hungary. Then came news of the February Revolution in Paris. The radical party in the Hungarian diet was aroused. Its leader, Louis Kossuth, on March 3 made an impassioned speech on the virtues of liberty. This speech was immediately printed in German and read in Vienna, where restlessness was also heightened by the news from Paris. On March 13 workers and students rose in insurrection in Vienna, erected barricades, fought off soldiers, and invaded the imperial palace. So flabbergasted and terrified was the government that Metternich, to the amazement of Europe, resigned and fled in disguise to England.

---

#### *Metternich's fall*

The fall of Metternich proved that the Vienna government was completely disoriented. Revolution swept through the empire and through all Italy and Germany. On March 15 rioting began in Berlin; the king of Prussia promised a constitution. The lesser German governments collapsed in sequence. On the last day of March a pre-Parliament met to arrange the calling of an all-German national assembly. In Hungary, aroused by Kossuth's national party, the diet on March 15 enacted the March Laws, by which Hungary sought complete constitutional separatism within the empire, while still recognizing the Habsburg house. The harassed Emperor Ferdinand a few days later granted substantially the same status to Bohemia. At Milan between March 18 and 22 the populace drove out the Austrian garrison. Venice proclaimed itself an independent republic. Tuscany drove out its grand duke and also established a republic. Charles Albert was king of Sardinia, a kingdom also called Piedmont because its capital Turin and much of its territory apart from the island of Sardinia lay in northwest Italy at the foot of the Alps. Stimulated by events in Paris, Charles Albert had granted a constitution to his small country. He now declared war on Austria on March 23 and invaded Lombardy-Venetia, hoping to bring that area under his house of Savoy. Italian troops streamed up from Tuscany, from Naples (where revolution had broken out as early as January), and even from the papal states (the new pope being in some sympathy with national and liberal aims) to join in an all-Italian war against the seemingly helpless Austrian government.

Thus in the brief span of these phenomenal March Days in 1848 the whole political structure based on Vienna went to pieces. The Austrian Empire had fallen into its main components, Prussia had yielded to revolutionaries, all Germany was preparing to unify itself, and war raged in Italy. Everywhere constitutions had been widely promised by stupefied governments, constitutional assemblies were meeting, and independent or autonomous nations struggled into existence. Patriots everywhere demanded liberal government and national freedom—written constitutions, representative assemblies, responsible ministries, a more or less extended suffrage, restrictions upon police action, jury trial, civil liberty, freedom of press and assembly. And where it still existed—in Prussia, Gali-

The Revolution of 1848 spread rapidly across the European continent, provoking an uprising in Vienna by mid-March. Workers, students, and even soldiers joined together to erect barricades and resist the king's loyal troops. This nineteenth-century image of the Viennese crowd, however, suggests the tensions within a movement that rallied behind a banner for "King, Freedom, and Fatherland."

(Snark/Art Resource, NY)

cia, Bohemia, Hungary—serfdom was abolished and the peasant masses became legally free from control by their local lords.

### *The Turning of the Tide after June*

The revolution, as in France, surged forward until the month of June and then began to ebb. For its steady reflux there are many reasons. The old governments had been stunned in the March Days, but not really broken. They merely awaited the opportunity to take back promises extorted by force. The pressure originally imposed by the revolutionaries could not be sustained. The revolutionary leaders lacked a strong social base. Middle-class, bourgeois, property-owning, and commercial interests were nowhere nearly as highly developed as in western Europe. The revolutionary leaders were to a large extent writers, editors, professors, and students—intellectuals rather than the representatives of powerful social and economic interests. In Vienna, Milan, and a few other cities the working class was numerous and socialist ideas were fairly common, but the workers were not as literate, organized, or politically conscious as in Paris or Great Britain. They were strong enough, however, to disquiet the middle classes; and especially after the specter of social revolution rose over western Europe, the middle-class and lower-class revolutionaries began to be afraid of each other. The liberated nationalities also began to disagree. The peasants, once emancipated, had no further interest in revolution. Nor were the peasants at this time conscious of nationality; nationalism was primarily a doctrine of the educated

### EUROPEAN REVOLUTIONS, 1848

The map shows cities in which notable revolutionary upheavals occurred during 1848. Although opponents of the revolutionary agitation suspected an international conspiracy, the revolutions erupted more or less spontaneously as urban populations took to the streets with demands for constitutional government, national independence, or new civil rights. It should be noted that the revolutions of 1848 took place mainly in central and eastern Europe—a pattern that suggests the spreading influence of ideas that had appeared earlier in the American and French revolutions. But the failure of these revolutions led to a resurgence of conservatism and delayed or prevented the development of liberal, constitutional governments in most of central and eastern Europe.

middle classes or of the aristocratic landowning classes in Poland and Hungary. Since the old internationally minded aristocracy furnished the bulk of officers in the armies, and the peasants the bulk of the soldiers, the armies remained almost immune to nationalist aspirations. This attitude of the armies was decisive.

The tide first turned in Prague. The all-German national assembly met at Frankfurt in May. Representatives from Bohemia had been invited to come to Frankfurt, since many Germans had always lived in Bohemia and since Bohemia formed part of the confederation of 1815 as it had of the Holy Roman Empire before it. Many of the Germans in Bohemia, the Sudeten Germans, were attracted to the Frankfurt Assembly, but the idea of belonging to a national German state, a Germany based on the principle that the inhabitants embodied a German nationality, did not appeal to the Czechs in Bohemia. They refused to go to the all-German congress at Frankfurt. Instead, they called an all-Slav congress of their own. At Prague, in June 1848, this first Pan-Slav assembly met. Most of the delegates were from Slav communities within the Austrian Empire, but a few came from the Balkans and non-Austrian Poland.

The spirit of the Prague congress was that of the Slavic Revival described in the last chapter; the Czech historian Palacky was in fact one of its most active figures. The congress was profoundly anti-German, since the essence of the Slavic Revival was resistance to Germanization. But it was not profoundly anti-Austrian or anti-Habsburg. A few extremists, indeed, maintained that Slavdom should be the basis of political regeneration, and that the world therefore had no place for an Austrian Empire. But the great majority at the Prague congress were Austroslavs who held that the many Slavic peoples, pressed on two sides by the Russians and Germans, needed the Austrian Empire as a political frame within which to develop their own national life. It demanded that the Slavic peoples be admitted as equals with the other nationalities in the Austrian Empire, enjoying local autonomy and constitutional guarantees.

### *Victories of the Counterrevolution, June–December, 1848*

But the Emperor Ferdinand, and the advisers on whom he chose to rely, would have nothing to do with the liberal national movements or with the restrictions they wanted to impose upon the powers of the state. All therefore were to be resisted. The first victory of the old government came at Prague. In that city a Czech insurrection broke out on June 12, at the time when the Slav congress was sitting, and the conflict was made worse by local animosities between Czechs and Germans. Windischgrätz, the local army commander, bombarded and subdued the city, thereby reasserting Habsburg military control. The Slav congress dispersed.

The next victory of the counterrevolution came in north Italy in the following month. Only Lombardy-Venetia, of all parts of the empire, had declared independence from the Habsburgs during the upheavals of March. The diminutive kingdom of Sardinia had lent support and had declared war on Austria. Italians from all over the peninsula had flocked in to fight; and until after the June Days in Paris it even seemed possible that republican France might intervene to befriend fellow revolutionaries as in 1796. But in France no radical or expansionist revolution succeeded. The Italians were left to themselves. Radetsky, the Austrian commander in Italy, overwhelmingly defeated the king of Sardinia at Custoza on July 25. The Sardinian king, Charles Albert, retreated into his own country. Lombardy and Venetia were restored with savage vengeance to the Austrian Empire.

---

---

*The Italians defeated*

The third victory of the counterrevolution came in September and October. The Hungarian radical party of Louis Kossuth was liberal and even democratic in many of its principles, but it was a Magyar nationalist party above all else. Triumphant in the March Days, it completely shook off the German connection. It moved the capital from Pressburg near the Austrian border to Budapest in the center of Hungary. It changed the official language of Hungary from Latin to Magyar. Less than half the people of Hungary were Magyars, and Magyar is a difficult language, quite alien to the Indo-European tongues of Europe. It soon became clear that one must be a Magyar to benefit from the new liberal constitution and that the Magyars intended to repress the national ambitions of all others with whom they shared the country. Slovaks, Romanians, Germans, Serbs, and Croats violently resisted, each group determined to keep its national identity unimpaired. The Croats, who had enjoyed certain liberties before the Magyar revolution, took the lead under Count Jellachich, the “ban,” or provincial governor, of Croatia. In September Jellachich raised a civil war in Hungary, leading a force of Serbo-Croatians, supported by the whole non-Magyar half of the population. Half of Hungary, alarmed by Magyar nationalism, now

---

---

*Magyar nationalism*

looked to the Habsburgs and the empire to protect them. Emperor Ferdinand made Jellachich his military commander against the Magyars. Hungary dissolved into the war of all against all.

At Vienna the more clear-sighted revolutionaries, who had led the March rising, now saw that Jellachich's army, if successful against the Magyars, would soon be turned against them. They therefore rose in a second mass insurrection in October 1848. The emperor fled; never had the Viennese revolution gone so far. But it was already too late. The Austrian military leader Windischgrätz brought his intact forces down from Bohemia.

He besieged Vienna for five days and forced its surrender on October 31.

---

Vienna recaptured

With the recapture of Vienna the upholders of the old order took heart. Counterrevolutionary leaders—large estate holders, Catholic clergy, high-ranking army men—decided to clear the way by getting rid of the Emperor Ferdinand, considering that promises made in March by Ferdinand might be more easily repudiated by his successor. Ferdinand abdicated and on December 2, 1848, was succeeded by Francis Joseph, a boy of 18, destined to live until 1916 and to end his reign in a crisis even more shattering than that in which he began it.

### *Final Outburst and Repression, 1849*

For a time in the first part of 1849 the revolution in many places seemed to blaze more fiercely than ever. Republican riots broke out in parts of Germany. In Rome someone assassinated the reforming minister of Pius IX. The pope fled from the city, and a radical Roman Republic was proclaimed under three Triumvirs, one of whom was Mazzini, who hastened from England to take part in the republican upheaval. In north Italy Charles Albert of Sardinia again invaded Lombardy. In Hungary, after the revived Habsburg authorities repudiated the new Magyar constitution, the Magyars, led by the inflamed Kossuth, went on to declare absolute independence. But all these manifestations proved short-lived. German republicanism flickered out. A French army drove Mazzini and his republican allies from Rome, thereby restoring Pope Pius IX to his traditional powers. The Sardinian king was again defeated by an Austrian army, but in Hungary the Magyars put up a terrific resistance, which Austria's imperial army and the anti-Magyar native irregulars could not overcome. The Habsburg authorities now renewed the procedures of the Holy Alliance. The new Emperor Francis Joseph invited the Tsar Nicholas to intervene. In August 1849 over 100,000 Russian troops poured over the mountains into Hungary, defeated the Magyars, and laid the prostrate country at the feet of the court of Vienna.

The nationalist upheaval of 1848 in central Europe and Italy was now over. The Habsburgs had reasserted their imperial authority over Czech nationalists in Prague, Magyars in Hungary, Italian patriots in north Italy, and liberal revolutionists in Vienna itself. Reaction, or antirevolutionism, became the order of the day. Pius IX, the "liberal pope" of 1846, returned to the papal throne and rejected all of his earlier liberal ideas. The breach between liberalism and Roman Catholicism, which had opened wide in the first French Revolution, was made a yawning chasm by the revolutionary violence of Mazzini's Roman Republic and by the measures taken to repress it. Pius IX now reiterated the anathemas of his predecessors. He codified them in 1864 in the *Syllabus of Errors*, which warned all Catholics, on the authority of the Vatican, against everything that went under the names of liberalism, progress, and modern civilization. As for the nationalists in Italy, many were disillusioned.

---

Antirevolutionism

Joseph Mazzini (1805–1872) led the short-lived Republic in Rome during the Italian upheavals of 1849, but his new regime was soon suppressed by foreign powers and he retreated to the life of an exile in England. Although Mazzini's Romantic nationalism lost favor in Italy after about 1850, his writings and political activities gave him a prominent place in the intellectual life of London, where this photograph was taken in the early 1860s.

(The Granger Collection, New York)

sioned with the firecracker methods of romantic republicans and were inclined to conclude that Italy would be liberated from Austrian influence only by an old-fashioned war between established powers.

In the Austrian Empire, under Prince Schwarzenberg, the emperor's chief minister, the main policy was now to oppose all forms of popular self-expression with a more candid reliance on military force. Constitutionalism was to be rooted out, as well as all forms of nationalism—Slavism, Magyarism, Italianism, and also Germanism, which would draw the Austrian Germans away from the Habsburg empire to the great kindred body of the German people. The regime came to be called the Bach system, after Alexander Bach, the minister of the interior. Under it, the government was rigidly centralized. Hungary lost the separate rights it had held before 1848.

---

*The Bach system*

The ideal was to create a perfectly solid and unitary political system. Bach insisted on maintaining the emancipation of the peasants, which had converted the mass of the people from subjects of their landlords into subjects of the state. He drove through a reform of the legal system and law courts, created a free trading area of the whole empire with only a common external tariff, and subsidized and encouraged the building of highways and railroads. The aim, as in France at the same time under Louis Napoleon, was to make people forget liberty in an overwhelming demonstration of administrative efficiency and material progress. But some, at that time, would not forget. A liberal said of the Bach system that it consisted of "a standing army of soldiers, a sitting army of officials, a kneeling army of priests, and a creeping army of informers."

## 60. FRANKFURT AND BERLIN: THE QUESTION OF A LIBERAL GERMANY

### *The German States*

Meanwhile, from May 1848 to May 1849, the Frankfurt Assembly was sitting at the historic city on the Main. It was attempting to bring a unified German state into being, one which should also be liberal and constitutional, assuring civil rights to its citizens and possessing a government responsive to popular will as manifested in free elections and open parliamentary debate. The mid-nineteenth-century failure to produce a democratic Germany became one of the overshadowing facts of modern times.

The convocation of the Frankfurt Assembly was made possible by the collapse of the existing German governments in the March Days of 1848. These governments, the 39 states recognized after the Congress of Vienna, enjoyed their political independence and formed the main obstacles in the way of unification. The German states

---

Obstacles to  
unification

resisted the surrender of sovereignty to a united Germany just as national states in later eras were to resist the surrender of sovereignty to a United Nations. In another way the German world was a miniature of the wider political world. It consisted of both great and small powers. Its great powers were Prussia and Austria. Austria was the miscellaneous empire described earlier. Prussia after 1815 included the Rhineland, the central regions around Berlin, West Prussia and Posen (acquired in the partitions of Poland), and historic East Prussia. The former Polish areas were inhabited by a mixture of Germans and Poles. Neither of these great powers could submit to the other or allow the other to dominate its lesser German neighbors.

---

German dualism

This German “dualism,” or polarity between Berlin and Vienna, had become somewhat less intense under the common menace of the Napoleonic empire. The whole German question had lain dormant so far as the governments were concerned, nor did it agitate the old aristocracies. In Prussia the Junkers, the owners of great landed estates east of the Elbe, were singularly indifferent to the all-German dream. Their political feeling was not German but Prussian. They were satisfied with their dominant position in Prussia and could expect only to lose by absorption into Germany as a whole, for in Germany west of the Elbe the small peasant holding was the basis of society, and there was no landowning element corresponding to the Junkers. The rest of Germany looked upon Prussia as somewhat uncouth and eastern; but this feeling, too, had diminished in the time of Napoleon, when patriots from all over Germany enlisted in the Prussian service.

### *Berlin: Failure of the Revolution in Prussia*

Prussia was illiberal but not backward. Frederick William III repeatedly evaded his promise to grant a modern constitution. His successor, Frederick William IV, who inherited the throne in 1840 and from whom much was at first expected by liberals, was equally determined not to share his authority with his subjects. At the same time the government, administratively speaking, was efficient, progressive, and fair. The universities and elementary school system surpassed those of western Europe. Literacy was higher than in England or France. The government followed in mercantilist traditions of evoking, planning, and supporting economic life. In 1818 it initiated a tariff union, at first with tiny states (or enclaves) wholly enclosed within Prussia. This tariff union, or Zollverein, was extended in the following decades to include almost all Germany.

On March 15, 1848, the rioting and street fighting that we have noted broke out in Berlin. For a time it seemed as if the army would master the situation. But the erratically conscientious king, Frederick William IV, called off the soldiers and allowed his subjects to elect the first all-Prussian legislative assembly. Thus though the army remained intact, and its Junker officers remained unconvinced, revolution proceeded superficially on its way. The new Prussian Assembly proved surprisingly radical, since it was dominated by anti-Junker lower-class extremists from East Prussia. These men were supporting Polish revolutionaries and exiles who sought the restoration of Polish freedom. Their main belief was that the fortress of reaction was tsarist Russia—that the whole structure of Junkerdom, landlordism, serf-owning, and repression of national freedom depended ultimately on the armed might of the tsarist empire. (The subsequent intervention of Russia in Hungary indicated the truth of their diagnosis.) Prussian radicals, like many elsewhere, hoped to smash the old Holy Alliance by raising an all-German or even European revolutionary war against Russia, to precipitate which they supported the claims of the Poles.

---

*Radical assemblies*

Meanwhile the radical-dominated Berlin Assembly granted local self-government to the Poles of West Prussia and Posen. But in those areas Germans and Slavs had long lived side by side. The Germans in Posen now refused to respect the authority of Polish officials. Prussian army units stationed in Posen supported the German element. As early as April 1848, a month after the “revolution,” the army crushed the new pro-Polish institutions set up in Posen by the Berlin Assembly. It was clear where the only real power lay. By the end of 1848, in Prussia as in Austria, the revolution was over. The king again changed his mind; and the old authorities, acting through the army, were again in control.

### *The Frankfurt Assembly*

Meanwhile a similar story was enacted on the larger stage of Germany as a whole. The disabling of the old governments left a power vacuum. A self-appointed committee convoked a preliminary parliament, which in turn arranged for the election of an all-German assembly. Bypassing the existing sovereignties, voters throughout Germany sent delegates to Frankfurt to create a federated superstate. The strength and weakness of the resulting Frankfurt Assembly originated in the manner in which it was elected. The Assembly represented the moral sentiment of people at large, the liberal and national aspirations of many Germans. It stood for an idea. Politically it represented nothing. The delegates had no power to issue orders or expect compliance. Superficially resembling the National Assembly which met in France in 1789, the German National Assembly at Frankfurt was really in a very different position. There was no preexisting national structure for it to work with. There was no all-German army or civil service for the Assembly to take over. The Frankfurt Assembly, having no power of its own, became dependent on the power of the very sovereign states that it was attempting to supersede.

The Assembly met in May 1848. Its members with a handful of exceptions were not at all revolutionary. They were overwhelmingly professional people—professors, judges, lawyers, government administrators, clergy both Protestant and Catholic, and prominent businessmen. They wanted a liberal, self-governing, federally unified, and “democratic” though not egalitarian Germany. Their outlook was earnest, peaceable, and legalistic; they hoped to succeed by persuasion. Violence was abhorrent to them. The example of the June Days in Paris, and the Chartist agitation in Great Britain, coinciding with the early weeks of the Frankfurt Assembly, increased the dread of that body for radicalism and republicanism in Germany. The fate of Germany (and hence of Europe) lay in the fact that this German

revolution came at a time when social revolutionaries had already begun to declare war on the bourgeoisie and the bourgeoisie was already afraid of the lower classes. It was the worker or artisan, not the professor or respectable merchant, who in unsettled times had actually seized firearms and shouted revolutionary utterances in the streets. Without lower-

---

*An untimely  
revolution*

class insurrection not even middle-class revolutions have been successful. The combination effected in France between 1789 and 1794, an unwilling and divergent combination of bourgeois and lower-class revolutionaries, could not be effected in Germany in 1848. One form of revolutionary power—controlled popular turbulence—the Germans of the Frankfurt

Assembly would not or could not use. Quite the contrary: when radical riots broke out in Frankfurt itself in September 1848, the Assembly undertook to repress them. Having no force of its own, it appealed to the Prussian army. The Prussian army put down the riots, and thereafter the Assembly met under its protection.

But the most troublesome question facing the Frankfurt Assembly was not social but national. What, after all, was this “Germany” which so far existed only in

---

*Questions of territory*

the mind? The assembly at Frankfurt, eager to create a real Germany, naturally could not propose a German state that would be smaller than the shadow Germany that they so much deplored. Most members of the

Assembly were therefore Great Germans; they thought that the Germany for which they were writing a constitution should include the Austrian lands, except Hungary. This would mean that the federal crown must be offered to the Habsburgs. Others, at first a minority, were Little Germans; they thought that Austria should be excluded and that the new Germany should comprise the smaller states and the entire kingdom of Prussia. In that case the king of Prussia would become the federal emperor.

The desire of the Frankfurt Assembly to retain non-German peoples in the new Germany, at a time when these peoples also were feeling national ambitions, was another reason

---

*Dependence on  
Austrian and  
Prussian armies*

for its fatal dependency upon the Austrian and Prussian armies. The Frankfurt Assembly applauded when Windischgrätz broke the Czech revolution and when Prussian forces put down the Poles in Posen. On this matter the National Assembly at Frankfurt and the Prussian Assembly at Berlin did not agree. The men of Frankfurt, thinking the Prussian revolutionary assembly was too radical and pro-Polish, in effect supported the Prussian army

and the Junkers against the Berlin revolution, without which the Frankfurt Assembly itself could never have existed. The Assembly, in short, turned against the revolutionary movement in Berlin and lost its earlier base of popular support. When radical riots later broke out against the Junkers, the tsar, and the Frankfurt Assembly itself, the Assembly acknowledged its weak and vulnerable position by calling in Prussian forces for its own protection.

### *The Failure of the Frankfurt Assembly*

By the end of 1848 the debacle was approaching. The nationalists had checkmated each other. Everywhere in central Europe, from Denmark to Naples and from the Rhineland to Romania, the awakening nationalities had failed to respect each other's aspirations, had delighted in each other's defeats, and by quarreling with each other had hastened the return of the old absolutist and nonnational order. At Berlin and at Vienna the counterrevolution, backed by the army, was in the saddle. At this very time, in December, the Frankfurt Assembly at last issued a Declaration of the Rights of the German People. It was a humane and high-minded document, announcing numerous individual rights, civil liber-

The Frankfurt Assembly that convened in May 1848 (as depicted in this nineteenth-century illustration) consisted mostly of professional people who feared the working classes almost as much as or more than they feared the political powers of kings and Prussian aristocrats. The members of the Assembly wrote a constitution and sought to create a constitutional monarchy for all Germany outside Austria. But the Prussian king would not accept this kind of constitutional appointment to royal power and the Frankfurt Assembly's national, democratic aspirations were destroyed when the Assembly was dissolved in 1849.

(akg-images)

ties, and constitutional guarantees, much along the line of the French and American declarations of the eighteenth century, but with one significant difference—the French and Americans spoke of the rights of man, while even the liberal Germans spoke of the rights of Germans. In April 1849 the Frankfurt Assembly completed its constitution. It was now clear that Austria must be excluded, for the simple reason that the restored Habsburg government refused to come in. The Little Germans in the Assembly therefore had their way. The hereditary headship of a new German empire, a constitutional and federal union

of German states minus Austria, was now offered to Frederick William IV, the king of Prussia.

Frederick William was tempted. The Prussian army officers and East Elbian landlords were not. They had no wish to lose Prussia in Germany. The king himself had his scruples. If he took the proffered crown, he would still have to impose himself by force on the lesser states, which the Frankfurt Assembly did not represent and could not bind and which were in fact still the actual powers in the country. He could also expect trouble with Austria. He did not want war. Nor was it proper for an heir to the Hohenzollerns to accept a throne circumscribed with constitutional limitations and representing the revolutionary conception of the sovereignty of the people. Declaring that he could not “pick up a crown from the gutter,” he turned it down. It would have to be offered freely by his equals, the sovereign princes of Germany.

---

*Frederick William  
tempted*

Thus all the work of the Frankfurt Assembly went for nothing. Most members of the Assembly, having never dreamed of using violence in the first place, concluded that they were beaten and went home. A handful of extremists remained at Frankfurt, promulgated the constitution on their own authority, urged revolutionary outbreaks, and called for elections.

---

*The failure of liberal  
nationalism*

Riots broke out in various places. The Prussian army put them down—in Saxony, in Bavaria, in Baden. The same army drove the rump Assembly out of Frankfurt, and that was the end of it.

In summary, liberal nationalism failed to produce a unified constitutional German state in 1848, and a less liberal kind of nationalism soon replaced it. The weakness and failures of German liberalism in 1848–1849 in the long run contributed to a complex estrangement between Germany and western Europe. The failed revolutions of 1848 also pushed thousands of disappointed German liberals and revolutionaries toward the United States, where the stream of liberal immigrants came to be known as the “forty-eighters.”

In Prussia itself the ingenious monarch undertook to placate everybody by issuing a constitution of his own, one that should be peculiarly Prussian. It remained in effect from 1850 to 1918. The Constitution established a single parliament for all the miscellaneous regions of Prussia and divided the parliament into two chambers. The lower chamber was elected by universal male suffrage, but the system of elections in effect divided the population into three estates—the wealthy, the less wealthy, and the general run of the people. Those few big taxpayers who together contributed a third of the tax returns chose a third of the members of district electoral colleges, which in turn chose deputies to the Prussian lower house. In this way one large property owner had as much voting power as hundreds of working people. Large property in Prussia in 1850 still meant mainly the landed estates of the East Elbian Junkers, but as time went on, it came to include industrial property in the Rhineland also. The Junkers likewise were not harmed by the final liquidation of serfdom. They increased the acreage of their holdings, and the former servile agricultural workers turned into free wage earners economically dependent on the great landowners.

---

*The Prussian  
Constitution of 1850* 

For 1850 the Prussian constitution was fairly progressive. If the mass of the people could elect very few deputies under the indirect system described, the mass of the British people, until 1867 or even 1884, could elect no deputies to Parliament at all. But the Prussian constitution remained in force until 1918. By the close of the nineteenth century, with democratic advances making their appearance elsewhere, the electoral system in Prussia came to be reactionary and illiberal, giving the great landowners and industrialists an unusual position of special privilege within the state.

---

## CHRONOLOGY OF NOTABLE EVENTS, 1848–1857

---

January 1848	Marx and Engels publish the <i>Communist Manifesto</i>
February 1848	Revolution in Paris; proclamation of the Second French Republic
March 1848	Revolutions in Vienna, Berlin, Bohemia, and Hungary; Metternich flees from Vienna to England
March 1848	Italians rise against Austrian rule in northern Italy
March–April 1848	Prussian Legislative Assembly meets in Berlin
May 1848	All-German Frankfurt Assembly convenes to draft constitution for a unified German state
June 1848	Thousands die in worker-army clashes in Paris
June–December 1848	Counterrevolutionary forces regain control of Austrian empire: Bohemia, northern Italy, Hungary, Vienna
December 1848	Louis Napoleon Bonaparte is elected president of French Republic; Francis Joseph becomes emperor of Austrian empire
April 1849	King Frederick William IV of Prussia rejects Frankfurt Assembly's constitution and offer of hereditary rule in a federal German state; Frankfurt Assembly is dissolved
1852	Louis Napoleon Bonaparte becomes "Emperor Napoleon III" and establishes Second French Empire
1853–1870	Baron Haussmann supervises the modern rebuilding of Paris
1857	Gustave Flaubert publishes <i>Madame Bovary</i>

---

### 61. THE NEW EUROPEAN "ISMS": REALISM, POSITIVISM, MARXISM

The revolutions of 1848 failed not only in Germany but also in Hungary, Italy, and France. The "springtime of peoples," as it was called, was followed by chilling blasts of winter. The dreams of half a century, visions of a humane nationalism, aspirations for liberalism without violence, ideals of a peaceful and democratic republican commonwealth, were all exploded. **Everywhere the cry had been for constitutional government**, but only in a few small states—Denmark, Holland, Belgium, Switzerland, Piedmont—was constitutional liberty more firmly secured by the revolutions of 1848. **Everywhere the cry had been for the freedom of nations, to unify national groups or rid them of foreign rule**; but nowhere was national liberty more advanced in 1850 than it had been two years before. France obtained universal male suffrage in 1848 and kept it permanently thereafter (except for a brief reversion to a restricted suffrage in 1850–1851), but it did not obtain democracy; it obtained a kind of popular dictatorship under Louis Napoleon Bonaparte. **One accomplishment, however, was real enough. The peasantry was emancipated in the German states and the Austrian Empire. Serfdom and manorial restraints were abolished, nor were they reimposed after the failure of the revolutions.** This was the most fundamental accomplishment of the whole movement. The peasant masses of central Europe were thereafter free to move about, find new jobs, enter a labor market, take part in a money economy, receive and spend

---

*New freedoms for  
peasants*

wages, migrate to growing cities—or even go to the United States. But the peasants, once freed, showed little concern for constitutional or bourgeois ideas. Peasant emancipation, in fact, strengthened the forces of political counterrevolution.

The most immediate and far-reaching consequence of the 1848 revolutions, or of their failure, was a new kind of intellectual and political realism. Idealism and romanticism were discredited in European culture and politics. Revolutionaries became less optimistic; conservatives, more willing to exercise repression. It was now a point of pride to be realistic, emancipated from illusions, willing to face facts as they were. The future, it was thought, would be determined by present realities rather than by imaginings of what ought to be. Industrialization went forward, with England still far in the lead, but now spreading across the Continent and initiating the momentous transformation of Germany. The 1850s were a period of rising prices and wages, thanks in part to the gold rush in California. There was more prosperity than in the 1840s; the propertied classes felt secure, and spokesmen for labor turned from theories of society to the organizing of viable unions, especially in the skilled trades.

### *Materialism, Realism, Positivism*

In basic philosophy the new intellectual themes appeared as materialism, holding that everything mental, spiritual, or ideal was an outgrowth of physical or physiological forces. In literature and the arts it was called realism. Writers and painters broke away from romanticism, which they said colored things out of all relation to the real facts. They attempted to describe and reproduce life as they found it, without intimation of a better or nobler world. The French writer Gustave Flaubert, for example, wrote meticulous descriptions of a provincial woman's tedious, unhappy marriage in his famous novel *Madame Bovary* (1857), a book that both mocked the illusions of romantic literature and showed the new artistic desire for a precise, unsentimental literary language. More people came to trust science, not merely for an understanding of nature but for insights into the true meaning of human life and social relations. In religion the movement was toward skepticism, renewing skeptical trends of the eighteenth century, which had been somewhat interrupted during the intervening period of romanticism. It was variously held, not by all but by many, that religion was unscientific and hence not to be taken seriously; or that it was a mere historical growth among peoples in certain stages of development and hence irrelevant to modern civilization; or that one ought to go to church and lead a decent life, without taking the priest or clergyman too seriously, because religion was necessary to preserve the social order against radicalism and anarchy. To this idea the radical counterpart was of course that religion was a bourgeois invention to delude the people.

“Positivism” was another term used to describe the new attitude. It originated with the French philosopher Auguste Comte, who had begun to publish his numerous volumes on *Positive Philosophy* as long ago as 1830 and was still writing in the 1850s. He saw human history as a series of three

stages, the theological, the metaphysical, and the scientific. The French revolutions of 1789 and 1848 suffered, in his view, from an excess of metaphysical abstractions, empty words, and unverifiable high-flying principles. Those who worked for the improvement of society must adopt a strictly scientific outlook, and Comte produced an elaborate classification of the sciences, of which the highest would be the science of society, for which he coined the word “sociology.” This new science would build upon observation of actual “positive” facts to develop broad scientific laws of social progress. Comte himself, and his

closest disciples, envisaged a final scientific Religion of Humanity, which, stripped of archaic theological and metaphysical concerns, would serve as the basis for a better world of the future. More generally, however, positivism came to mean an insistence on verifiable facts, an avoidance of wishful thinking, a questioning of all assumptions, and a dislike of unprovable generalizations. Positivism in a broad sense, both in its demand for observation of facts and testing of ideas, and in its aspiration to be humanly useful, contributed to the growth of the social sciences as a branch of learning.

In politics the new emphasis on realism came to be known by the German term *Realpolitik*. This simply meant a "politics of reality." In domestic affairs it meant that people should give up utopian dreams, such as had caused the debacle of 1848, and content themselves with the blessings of an orderly, honest, hard-working government. For radicals it meant that people should stop imagining that the new society would result from goodness or the love of justice and that social reformers must resort to the methods of politics—power and calculation. In international affairs *Realpolitik* meant that governments should not be guided by ideology, or by any system of "natural" enemies or "natural" allies, or by any desire to defend or promote any particular view of the world; but that they should follow their own practical or strategic interests, meet facts and situations as they arose, make any alliances that seemed useful, disregard ethical theories and scruples, and use any practical means to achieve their ends. The same persons who before 1848 had been not ashamed to express pacifist and cosmopolitan hopes now dismissed such ideas as a little softheaded. War, which governments since the overthrow of Napoleon had successfully tried to prevent, was accepted in the 1850s as a strategic option that was sometimes needed to achieve a political purpose. It was not especially glorious; it was not an end in itself; it was simply one of the tools of realistic statesmanship. *Realpolitik* was by no means confined to Germany, despite its German name and despite the fact that the famous German chancellor Bismarck became its most famous practitioner. Two other tough-minded thinkers, each in his own way, were Karl Marx and Louis Napoleon Bonaparte.

*Realpolitik*

### *Early Marxism*

Karl Marx and Friedrich Engels were among the disappointed revolutionaries of 1848. Marx (1818–1883) was the son of a lawyer in the Prussian Rhineland. He studied law and philosophy at several German universities and received a doctoral degree in 1841. Unable to find an academic job, Marx associated with radical German intellectuals, began writing for left-wing journals, and soon moved to Paris with other Germans who wanted to produce philosophical publications in the historic birthplace of modern revolutions. Engels (1820–1893), the son of a well-to-do German textile manufacturer, was sent as a young man to Manchester in England where his father owned a factory, to learn the business and then manage it. Marx and Engels met in Paris in 1844. There they began a collaboration in thinking and writing that lasted for 40 years.

In 1847 they joined the Communist League, a tiny secret group of revolutionaries, mainly Germans in exile in the more liberal cities of Western Europe. The word "communist" then had only a vague and uncertain meaning, and the League, as Engels later recalled, was at first "not actually much more than the German branch of the French secret societies." It agitated like other societies during the revolutions of 1848 and issued a set of "Demands of the Communist Party in Germany," which urged a unified indivisible German republic; democratic suffrage;

LIST HERE

### A BURIAL AT ORNANS

by Gustave Courbet (French, 1819–1877)

A new “realism” emerged in many spheres of European culture after the failure of the revolutions in 1848. The artist Courbet in fact began to use the term “realism” in this period to describe his work, which frequently depicted ordinary people and peasants on monumental canvasses. Paintings such as this portrayal of a funeral in the French countryside disturbed many nineteenth-century critics because Courbet painted images of the lower classes and also because he refused to romanticize his subjects or to portray common people in sentimental poses.

(Giraudon/Art Resource, NY)

universal free education; arming of the people; a progressive income tax; limitations upon inheritance; state ownership of banks, railroads, canals, mines, and the like; and a degree of large-scale, scientific, collectivized agriculture. It was such obscurely voiced radicalism that alarmed the Frankfurt Assembly. **With the triumph of counterrevolution in Germany the Communist League was crushed.**

It was for this League that Marx and Engels wrote their *Communist Manifesto*, which was published in January 1848. But there was as yet no Marxism, and Marxism played no role in the revolutions of 1848. As a historical force Marxism set in during the 1870s. Meanwhile, with the failure of the revolutions, Engels returned to his factory at Manchester. Marx also settled in England, spending the rest of his life in London, where, after long labors in the library of the British Museum, he finally produced his huge work called *Capital*, of which the first volume was published in German in 1867. The final two volumes were edited by Engels and published after Marx’s death.

### Sources and Content of Marxism

Marxism may be said to have had three sources or to have merged three national streams of early nineteenth-century European history: German philosophy, French revolutionism, and the British Industrial Revolution. As a student in Germany, and for a while thereafter, Marx mingled with a group known as **Young Hegelians**, who were actually critics of Hegel in that they expected the

Workers in Manchester came to be known as some of the most impoverished in the new industrial age, partly because writers such as Friedrich Engels focused on the city in their critiques of the capitalist economy. This image of a demoralized worker was published in Elizabeth Gaskell's novel *Mary Barton* (1848), a popular work that portrayed the miseries of the heroine's unhappy working-class father in Manchester.

(Lebrecht/The Image Works)

course of history to lead to a free and democratic society, instead of to the existing Prussian state as Hegel had maintained. They joined with liberals in resisting the repressive measures that prevailed in Germany after the defeat of Napoleon. Like democrats and republicans, they believed that the promise of the French Revolution had not yet been fulfilled, since social and economic equality should follow the civil and legal equality already won. In keeping with the general movement of romanticism, they hoped for a more personal emancipation from the trammels of society, government, and religion.

In the mid 1840s, elaborating on Hegel, Marx developed the idea of the alienation of labor, a social experience and state of mind produced when human beings in the historic process of mechanization become estranged from the objects on which they work. This alienation, as Marx described it, was a distinctive feature of modern capitalist societies. The economic system of wage labor and private ownership of the means of production kept workers from identifying with or benefiting from the products of their labor. In fact, Marx argued, the wealth (or capital) that workers produced was regularly used against them in the social and political institutions of capitalist societies. It followed that true freedom would become possible only when private property in capital goods was abolished. Some of the early writings in which these ideas were worked out in the 1840s were not published until a century later. They then led to a reconsideration of Marxism, in which the early Marx was seen more as a social analyst and critical historian than as a revolutionary.

---

Engels and British  
industrialism

But they had little impact on the growth of Marxism as a program for revolutionary socialism in the nineteenth century.

Engels, engaged in the Manchester cotton industry, possessed a personal knowledge of the new industrial and factory system in England. He was in touch with some of the most radical Chartists, though he had no confidence in Chartism as a constructive movement. In 1844 he published a revealing book, *The Condition of the Working Classes in England*. He drew from his observations much the same conclusions that Marx drew from philosophical analysis and historical study. The depressed condition of labor was an actual fact. It was a fact that labor received a relatively small portion of the national income and that much of the product of society was being reinvested in capital goods, which belonged as private property to private persons. Government and parliamentary institutions, also as a matter of fact, were in the hands of the well-to-do in both Great Britain and France. Religion was commonly viewed as necessary for keeping the lower classes in order, but such views did not encourage the kinds of reform movements that religious groups had often led in other centuries and in other cultures. The churches at the time actually took little interest in problems of the workers. The family, as an institution, was indeed disintegrating among laboring people in the cities, through exploitation of women and children and the overcrowding in inadequate and unsanitary living quarters.

Much of this was seized upon and dramatized in the *Communist Manifesto* as a summons to revolution. The outbreak of revolution in France in February, and its rapid spread to other countries, naturally confirmed Marx and Engels in their beliefs. They interpreted the actual class war that shook Paris in the June Days as a manifestation of a universal class struggle, in which the workers or proletariat would rise against the owners of capital, the bourgeoisie.

---

The Communist  
Manifesto

As a call to action, the *Communist Manifesto* was meant to be inflammatory. It went beyond facts to denunciation and exhortation. It said that workers were deprived of the wealth they had themselves created. It called the state a committee of the bourgeoisie for the exploitation of the people. Religion was a drug to keep the worker quietly dreaming upon imaginary heavenly rewards. The women and children in working-class families had been brutalized by the bourgeoisie, and many women were forced into prostitution. It seemed to Marx and Engels that uprooted workers should be loyal to nothing—except their own class. Even country had become meaningless. The proletariat had no country. Workers everywhere had the same problems and faced everywhere the same enemy. Therefore “let the ruling classes tremble at a communist revolution. The proletarians have nothing to lose but their chains. They have a world to win. Workingmen of all countries, unite!” So closed the *Manifesto*.

But Marx was no mere revolutionary schemer like the “revolution-makers,” as he later scornfully called them. His mature thought was a system for producing revolution, but it showed how revolution would necessarily come by operation of vast historical forces.

---

British political  
economy

It was from English sources that Marx developed much of his economic theory, as expounded at length in *Capital*. From British political economy he adopted the subsistence theory of wages, or Iron Law (which orthodox economists presently abandoned since wages did in fact begin to rise). It held that the average worker could never obtain more than a minimum living standard—of which the corollary, for those who wished to draw it, was that the existing economic system held out no better future for the laboring class as a class. Marx likewise took over from orthodox economists the labor theory of value, holding that

the value of any human-made object depended ultimately on the amount of labor put into it—capital being regarded as the stored up labor of former times. Orthodox economists, it must be said, soon discarded the theory that economic value is produced by the input of labor alone. Marx, from the labor theory, developed his doctrine of surplus value, which, to simplify, meant in effect that workers were being robbed. They received in wages only a fraction of the value of the products which their labor produced. The difference was expropriated by the bourgeois capitalists—the private owners of the factories and the machines. And because workers never received in wages the equivalent of what they produced, capitalism was constantly menaced by overproduction, the accumulation of goods that people could not afford to buy. Hence it ran repeatedly into crises and depressions and was obliged also to be constantly expanding in search of new markets. It was the depression of 1847, according to Marx, that had precipitated the revolutions of 1848; and with every such depression during the rest of his lifetime Marx hoped that the day of the great social revolution was drawing nearer.

What brought all these observations together in a unified and compelling doctrine was the philosophy of dialectical materialism. By dialectic, Marx meant what the German philosopher Hegel had meant, that all things are in movement and in evolution and that all change comes through the clash of antagonistic elements. The word itself, coming from the Greek, meant originally a way of arriving at a higher conclusion through a series of propositions, as in a logical argument. The implications of the dialectic, for both Hegel and Marx, were that all history, and indeed all reality, is a process of development through time, a single and meaningful unfolding of events in a clear historical direction; that every event happens for good and sufficient reasons; and that history—though not exactly predetermined—is always shaped by impersonal forces and deep structural changes rather than by individuals or chance events.

---

---

*Dialectical  
materialism*

Marx differed from Hegel in one vital respect. Whereas Hegel emphasized the primacy of ideas in social change, Marx gave emphasis to the primacy of material conditions, or the relations of production, which included technology, inventions, natural resources, and property systems. These material realities create the social world in which people live. It is the relations of production that determine what kind of religions, philosophies, governments, laws, and moral values are accepted. To believe that ideas precede and generate actualities was, according to Marx, the error of Hegel. Hegel had thought, for example, that the mind conceives the idea of freedom, which it then realizes in the Greek city-state, in Christianity, in the French Revolution, and in the kingdom of Prussia. Not at all, according to Marx: the idea of freedom, or any other idea, is generated by the actual economic and social conditions. Conditions are the roots; ideas, the trees. Hegel had held the ideas to be the roots and the resulting actual conditions to be the trees. Or as Marx and Engels said, they found Hegel standing on his head and set him on his feet again.

---

---

*Historical  
development*

In the picture of historical development offered by Marx material conditions, or the relations of production, give rise to economic classes. Agrarian conditions produce a landholding or feudal class, but with changes in trade routes, money, and productive techniques a new commercial or bourgeois class arises. Each class, feudal and bourgeois, develops an ideology suited to its needs. Prevailing religions, governments, laws, and morals reflect the outlook of these classes. The two classes inevitably clash. Bourgeois revolutions against feudal interests break out—in England in 1642, in France in 1789, in Germany in 1848, though the bourgeois revolution in Germany proved abortive.

**Karl Marx as he appeared near the end of his life. By the time he sat for this photograph in the early 1880s, he had been living in London for about 30 years, but he had developed many of his social and historical theories while living on the European continent in the political, economic, and revolutionary context of the 1840s.**

(Getty Images)

Meanwhile, as the bourgeois class develops, it inevitably calls another class into being, its dialectical antithesis, the proletariat. The bourgeois is defined as the private owner of capital, the proletarian as the wage worker who possesses nothing but his or her own hands. The more a country becomes bourgeois, the more it becomes proletarian. The more production is concentrated in factories, the more the revolutionary laboring class is built up. Under competitive conditions the bourgeois tend to devour and absorb each other; ownership of the factories, mines, machines, and railroads (capital) becomes concentrated into very few hands. Others sink into the proletariat. In the end the proletarianized mass simply takes over from the remaining bourgeois. It “expropriates the expropriators,” and abolishes private property in the means of production.

The social revolution is thus accomplished. Marx assumed that this revolution would create a classless society, because class arises from economic differences which will disappear. The state and religion, being outgrowths of bourgeois interests, also disappear. For a time, until all vestiges of bourgeois interests have been rooted out, or until the danger of counterrevolution against socialism has been overcome, there will be a “dictatorship of the proletariat.” After that the state will “wither away,” since there is no longer an exploiting class to require it.

---

*Class war between  
bourgeois and  
proletariat*

Meanwhile the call is to war. Bourgeois and proletarian are locked in a universal struggle, which means that workers and labor unions must be kept in a belligerent and revolutionary mood. They must never forget that the employer is their class enemy and that government, law, morality, and religion are merely so much artillery directed against them. Morals are

"bourgeois morals," law is "bourgeois law," government is an instrument of class power, and religion is a form of psychological warfare, a means of providing "opium" for the masses. Workers must not let themselves be fooled; they must learn how to detect the class interest underlying the most exalted institutions and beliefs. In this form of military intelligence, ferreting out the ways of the enemy, they will be helped by intellectuals especially trained in explaining it to them.

Like all fighting forces, the workers need a disciplined solidarity. Individuals must lose themselves in the whole—in their class. It is a betrayal of their class for workers to rise above the proletariat, to "improve themselves," as the bourgeois says. It is dangerous for labor unions merely to obtain better wages or hours by negotiation with employers, for by such little gains the war itself may be forgotten. It is likewise dangerous, and even treasonous, for workers to put faith in democratic machinery or "social legislation," for the state, an engine of repression, can never be made into an instrument of welfare. Law simply expresses the will of the stronger class; "right" and "justice" are thin emanations of class interest. We must hold, wrote Marx in 1875, to "the realistic outlook which has cost so much effort to instill into the party, but which has now taken root in it"; and we must not let this outlook be perverted "by means of ideological nonsense about 'right' and other trash common among the democrats and French Socialists."

---

---

*Worker solidarity*

### *The Appeal of Marxism: Its Strength and Weaknesses*

The original Marxism was a hard doctrine, with both advantages and handicaps in the winning of adherents. One of its advantages was its claim to be scientific. Marx classified earlier and rival forms of socialism as utopian: they rested on moral indignation, and their formula for reforming society was for human beings to become more just, or for the upper classes to be converted to sympathy for the lower. His own doctrine, Marx insisted, had nothing to do with ethical ideas; it was purely scientific, resting upon the study of actual facts and real processes, and it showed that socialism would be not a miraculous reversal but a historical continuation of what was already taking place. He also considered it utopian and unscientific to describe the future socialist society in any detail. It would be classless, with neither bourgeois nor proletarian; but to lay any specific plans would be idle dreaming. Let the revolution come, and socialism would take care of itself.

Marxism was a strong compound of the scientific, the historical, the metaphysical, and the apocalyptic. But some elements of Marxism stood in the way of its natural propagation. The working people of Europe were not really in the frame of mind of an army in battle. They hesitated to subordinate all else to the distant prospect of a class revolution. They were not exclusively class-people, nor did they behave as such. They still held to religious beliefs or to a political faith in natural rights that could not portray morality as simply a class weapon or right and justice as "trash." Increasingly, they had national loyalties to country. Only with great difficulty could they associate themselves emotionally with a world proletariat in an unrelenting struggle against their own neighbors.

---

---

*Conflicting working-class values*

The cure for the revolutionism of 1848 proved in time to be the admission of the laboring classes to a fuller membership in society. Wages generally rose after 1850, labor unions were organized, and by 1870 in the principal European countries the workingman very generally had gained the right to vote. Through their unions, workers were often able to get better wages and working conditions by direct pressure upon employers. Having the vote, they gradually formed working-class parties, and as they proceeded to act through

the state, they had less inclination to destroy it. Marx's dismissive term for these maneuvers was "opportunism," but such political campaigns gained increasing support among workers, most of whom wanted to better themselves by dealing with employers and by obtaining social reforms through existing government institutions rather than by waging class war. From Marxism the working class absorbed much, including a watchful hostility to employers and a sense of working-class solidarity; but on the whole, as Marxism spread at the close of the nineteenth century, it ceased to be really revolutionary. Had the old Europe not gone to pieces in the twentieth-century wars, and had Marxism not been revived by Lenin and transplanted to Russia, it is probable that Marx's ideas would have been domesticated into the general body of European thought and that much less would have been said about them in later years in Europe or elsewhere.

---

Opportunism

## 62. BONAPARTISM: THE SECOND FRENCH EMPIRE, 1852–1870

The new "realism" in European culture after 1848 extended also to the exercise of post-revolutionary political power. We have seen how Louis Napoleon Bonaparte, elected president of the French republic in 1848, soon made himself Emperor of the French with the title of Napoleon III. Those willing to fight for the parliamentary and liberal institutions which he crushed were silenced. He became chief of state and then Emperor (in 1852) on a wave of popular acclaim.

### *Political Institutions of the Second Empire*

Napoleon III, like Napoleon I, came to power because of the fear of radicalism in a discredited republic. Otherwise he bore little resemblance to his famous uncle. He was not a professional soldier or a great organizer. When he became president of the republic at the age of 40 he had been an adventurer and a conspirator, but he undoubtedly felt more concern than Napoleon I for the plight of the working classes. Where Napoleon I had been disdainful of public opinion, his nephew recognized it as an opportunity, not a nuisance. Though journalists and intellectuals generally distrusted him, he drew some of them to his side; he tried to placate the Catholic interests; and he appealed to the masses by giving them the vote (however useless), by promises of prosperity, and by pageantry. He understood perfectly that a single leader exerts more magnetism than an elected assembly. And he knew that a Europe still shuddering over the June Days was hoping desperately for order in France.

---

Modern progress

He gloried in modern progress. Toward the changes coming over Europe the monarchs of the old school usually showed an attitude of timidity and doubt if not positive opposition. Napoleon III boldly offered himself as the strong leader in a brave new world. Like his uncle, he announced that he embodied the sovereignty of the people. He said that he had found a solution to the problem of mass democracy. In all the other great Continental states and in Great Britain, in 1852, universal suffrage was thought to be incompatible with intelligent government and economic prosperity. Napoleon III claimed to put them together. Like Marx and other "realists" after 1848 he held that elected parliamentary bodies, far from representing an abstract "people," only accentuated class divisions within a country. He declared that the regime of the restored Bourbons and the July Monarchy had been dominated by special interests; that the Republic of 1848 had first been violent and anarchic

and then had fallen into the hands of a distrustful assembly that robbed the laboring man of his vote; and that France would find in the empire the permanent, popular, and modern system for which it had been vainly searching since 1789. He affirmed that he stood above classes and would govern equally in the interests of all. In any case, like many other political leaders after 1848, he held that forms of government were less important, than economic and social realities.

The political institutions of the Second Empire were therefore authoritarian, modeled on those of the Consulate of the first Bonaparte. There was a Council of State, composed of experts who drafted legislation and advised on technical matters. There was also an appointive Senate and a Legislative Body, which was elected by universal male suffrage in carefully managed elections. But the Legislative Body had no real power to make laws, set the budget, or control the army. Parliamentary life was reduced almost to absolute zero.

---

Authoritarian  
political institutions

To captivate public attention and glorify the Napoleonic name the new emperor set up a sumptuous court at the Tuileries. Baked in the ambition to marry into one of the great dynasties, Napoleon III chose as his empress a young Spanish noblewoman, Eugénie, who was destined to outlive the empire by 50 years, dying in 1920. It was said to be a love match—a sure sign of popularized royalty. The court life of the empire was brilliant and showy beyond anything known at the time in St. Petersburg or Vienna. The note of pageantry was further struck in the embellishment of the city of Paris. Baron Haussmann, one of the most creative of city planners, gave Paris much of the appearance that it has today. He built roomy railway stations with broad approaches, and he constructed a system of boulevards and public squares offering long vistas ending in fine buildings or monuments, as at the Place de l'Opéra. He also modernized the sewers and the water supply. The building program, like the expensive court, had the additional advantage of stimulating business and employment. And the cutting of wide avenues through the crooked streets and congested old houses would permit easier military operations against insurrectionists entrenched behind barricades, should the events of 1848 ever be repeated.

### *Economic Developments under the Empire*

It was as a great social engineer that Napoleon III preferred to be known. In his youth he had tried to read the riddle of modern industrialism, and now, as emperor, he found some of his main backers in former Saint-Simonians, who called him their “socialist emperor.” Saint-Simon, it may be recalled, had been among the first to conceive of a centrally planned industrial system. But the Saint-Simonians of the 1850s shared in the new sense of being realistic, and their most signal triumph was the invention of investment banking, by which they hoped to guide economic growth through the concentration of financial resources. They founded a novel kind of banking institution, the *Crédit Mobilier*, which raised funds by selling its shares to the public, and with the funds thus obtained bought stock in such new industrial enterprises as it wished to develop. France entered a new phase of rapid economic development—a distinctive French version of the Industrial Revolution.

The times were exceedingly favorable for expansion, for the discovery of gold in California in 1849, and in Australia soon afterward, together with the newly organized credit facilities, brought a substantial increase in the European money supply, which had a mildly inflationary effect. The steady rise of prices and all money values encouraged company promotion and investment of capital. Railway mileage, increasing everywhere in the Western world, increased in France from 3,000 to 16,000 kilometers in the 1850s. The demand for rolling stock, iron rails,

---

Expansion

auxiliary equipment, and building materials for stations and freight houses kept the mines and factories busy. The railway network was rationalized, 55 small lines in France being merged into six big regional trunks. Iron steamboats replaced wooden sailing ships. Between 1859 and 1869 a French company built the Suez Canal, which it continued to own for almost a century, though the British government after 1875 was the principal stockholder.<sup>9</sup>

Large corporations made their appearance, in railroads and banking first of all. In 1863 the law granted the right of “limited liability,” by which a stockholder could not lose more than the par value of the stock, however insolvent or debt-burdened the corporation might become. This encouraged investment by persons of small means, and by capitalists large and small in enterprises of which they knew very little; thus the wealth and savings of the country were more effectively mobilized and put to work. Stocks and shares became more numerous and diversified. The Stock Exchange boomed. Financiers—those whose business was to handle money, credit, and securities—assumed a new eminence in the capitalistic world. A good many people became very rich, richer perhaps than anyone had ever been in France before.

The emperor aspired also to do something for the working class, within the limits of the existing system. Jobs were plentiful and wages were good, by the ideas of the day, at least until the temporary depression of 1857. The emperor had a plan, as did some of the Saint-Simonians, for organizing forces of workers in military fashion and setting them to

clear and develop uncultivated land. Not much was done in this direction.

More was accomplished in the humanitarian relief of suffering. Hospitals and asylums were established, and free medicines were distributed. The outlines of a social-welfare state began somewhat vaguely to appear. Meanwhile the workers were building up unions. All combinations of workers

had been prohibited during the French Revolution, a prohibition that was deemed to be still in force until the ambiguous legal position of labor unions began to change. In 1864 it even became legal for organized workers to go on strike. Large labor units, or unions, and large business units, or corporations, were thus legalized at the same time. Napoleon III hardly did enough for labor to rank as a working-class hero, but he did enough to be suspected as “socialistic” by many middle-class people of the day.

Later authoritarian regimes, bent like the Second Empire on a program of economic development, were usually highly protectionist, unwilling to face open competition with the rest of the world. Napoleon III believed in freedom of international trade. He had a project for a tariff union with Belgium, which some Belgians also supported. Belgium was already well industrialized, and a Franco-Belgium union, especially since Belgium had the coal that France lacked, would have formed a trading area of very great strength. But the plan was blocked by private interests in both countries and strongly opposed by both Great Britain and the German Zollverein. The emperor then turned to an all-around reduction of import duties. Since the repeal of the Corn Laws in 1846 the free traders

were in power in England. They were eager to abolish trade barriers between Britain and France. Napoleon III, overriding unusual opposition in his Legislative Body, concluded a free trade treaty with Great Britain in 1860. He set aside 40 million francs of government funds to assist French manufacturers in making adjustments to British competition; but

this sum was never spent in full, which suggests that French industry was generally able to compete successfully with the more intensively mechanized industry of Britain. The Anglo-French treaty was accompanied by lesser trade agreements with other countries.

Free trade treaty with  
Britain

Napoleon III's ambitious plan to rebuild the city of Paris became one of the great urban projects of modern times. Organized by the strong-willed Baron Haussmann, the systematic, controversial reconstruction of Parisian streets, parks, buildings, sewers, and monuments transformed the city and produced an aesthetic grandeur that has drawn visitors ever since. This photograph shows some of the construction workers and the tools they used to build the new streets.

(Giraudon/Art Resource, New York)

It looked, in the 1860s, as if Europe might actually be about to enter the promised land of freedom of trade.

### *Internal Difficulties and War*

But by 1860 the empire was running into trouble. It took a few years to overcome the depression of 1857. By his free trade policy the emperor made enemies among certain industrialists. The Catholics objected to his intervention in Italy, where he briefly joined an anti-Austrian military campaign in 1859. After 1860 opposition mounted. The emperor granted more leeway to the Legislative Body. The 1860s are called the decade of the Liberal Empire—all such terms being relative. How the empire would have fared had purely internal causes been left free scope we shall never know. Louis Napoleon actually ruined himself by war. His empire evaporated on the battlefield in 1870. But he was at war long before that.

"The empire means peace," he had assured his audiences in 1852: *l'Empire, c'est la paix*. But war is after all a supreme form of pageantry (or was then); France was the strongest country in Europe, and the emperor's name was Napoleon. Less than a year and a half after the proclamation of the empire France was at war with a European state for the first time since Waterloo. The enemy was

---

"The Empire means peace"

Russia, and the war was the Crimean War. Napoleon III did not alone instigate the Crimean War. Many forces in Europe after 1848 made for war; but Napoleon III was one of these forces. In 1859 the new Napoleon was fighting in Italy, from 1862 to 1867 in Mexico, and in 1870 in France itself, in a war with Prussia which he could easily have avoided. These wars form part of the story of the following chapter.

It is enough to say here that in 1870 the Second Empire went the way of the First, into the limbo of governments tried and discarded by the French. It had lasted 18 years, exactly as long as the July Monarchy, and longer than any other regime known in France, up to that time, since the fall of the Bastille. Not until the twentieth century, when dictators sprouted all over Europe, did people begin to recognize that Louis Napoleon had been an omen of the future rather than a bizarre reincarnation of the past.

# THE GLOBAL CONSOLIDATION OF LARGE NATION- STATES, 1859–1871

63. Backgrounds: The Idea of the Nation-State
64. Cavour and the Italian War of 1859: The Unification of Italy
65. The Founding of a German Empire and the Dual Monarchy of Austria-Hungary
66. Liberalization in Tsarist Russia: Alexander II
67. The United States: The American Civil War
68. The Dominion of Canada, 1867
69. Japan and the West

 The rise of nineteenth-century nationalism and the quest for unified national governments led to a remarkable consolidation of nation-states during the 12 years after 1859. Notable political unifications and reforms in this period included the formation of a new German empire, a unified kingdom of Italy, the Dual Monarchy of Austria-Hungary, and the introduction of drastic internal changes in tsarist Russia; the triumph of central authority after a civil war in the United States; the creation of an independent, united Dominion of Canada; and the emergence of a modernizing government and economy in the empire of Japan. All these disparate events reflected profound changes brought by the railroad, steamship, and telegraph. The communication of ideas, exchange of goods, and movement of people over wide areas became more frequent and easier than ever before. New technologies and the rapid development of new industries strengthened the political power of nation-states, which gained increasing influence in the evolving social and economic life of all modern societies.

## 63. BACKGROUNDS: THE IDEA OF THE NATION-STATE

Before 1860 there were two prominent nation-states in Europe—Great Britain and France. Spain, united on the map, was internally so miscellaneous as to belong to a different category. Portugal, Switzerland, the Netherlands, and the Scandinavian countries

Chapter emblem: Detail from a photograph of Giuseppe Garibaldi, a leader of the Italian movement for national unification in the early 1860s. (Getty Images)

were nation-states, but small and peripheral. The characteristic political organizations were small states comprising fragments of a nation, such as were strewn across the middle of Europe—Hanover, Baden, Sardinia, Tuscany, or the Two Sicilies—and large sprawling empires made up of all sorts of peoples, distantly ruled from above by dynasties and bureaucracies, such as the Romanov, Habsburg, and Ottoman domains. Except for recent developments in the Americas the same mixture of small nonnational states and of large nonnational empires was to be found in most of the rest of the world.

Since 1860 or 1870 a nation-state system has prevailed. The consolidation of large nations became a model for other peoples large and small. In time, in the following century, other large groups of people undertook to establish nation-states in India, Pakistan, Indonesia, Iran, and Nigeria. Small and middle-sized populations increasingly thought of themselves as nations, entitled to their own sovereignty and independence. Some of these sovereignties that emerged after 1945 comprise fewer people than a small modern city.

---

#### Unity and disunity

The idea of the nation-state has served both to bring people together into larger units and to break them apart into smaller ones. In the nineteenth century, outside the disintegrating Ottoman Empire, from which Greece, Serbia, Bulgaria, and Romania became independent, and in which an Arab

national movement also began to stir, the national idea served mainly to create larger units in place of small ones. The map of Europe from 1871 to 1918 was the simplest it has ever been before or since (see map, pp. 538–539).

This book has already had much to say about the idea of the nation-state and the movement of nationalism. Earlier chapters have described the ferment of national ideas and movements stirred up by the French Revolution and by the Napoleonic domination of Europe, the nationalist agitation and repression of the years after 1815, and the frustration and failure of patriotic aspirations in Germany, Italy, and central Europe in the Revolution of 1848. For many in the nineteenth century, nationalism, the winning of national unity and independence and the creation of the nation-state, became a kind of secular faith. For

most devout nationalists, the nation represented higher truths as well as collective and personal aspirations for a better future life.

---

#### Characteristics of nation-states

A nation-state may be thought of as one in which supreme political authority somehow rests upon and represents the will and feeling of its inhabitants. There must be a people, not merely a swarm of human beings.

The people must basically will and feel something in common. They must sense that they belong—that they are members of a community, participating somehow in a common social and cultural life, that the government is their government, and that outsiders are “foreign.” The outsiders or foreigners are usually (though not always) those who speak a different language. The nation is usually (though not always) composed of persons sharing the same speech. A nation may also possess a belief in common descent or racial origin (however mistaken), or a sense of a common history (sometimes imagined), a common future, a common religion, a common geographical home, or a common external menace. Nations take form in many ways. But all are alike in feeling or imagining themselves to be communities, permanent communities in which individual persons, together with their children and their children’s children, are committed to a collective destiny on earth.

In the nineteenth century governments found that they could not effectively rule or develop the full powers of state except by enlisting this sense of membership and support among their subjects. The consolidation of large nation-states had two distinguishable phases. Territorially, it meant the union of preexisting smaller states. Morally and psychologically it meant the cre-

---

#### Consolidation and constitutionalism

ation of new ties between government and governed, the admission of new segments of the population to political life, through the creation or extension of liberal and representative institutions. This process of national integration and institution-building was repeated in widely disparate cultures, including Japan, tsarist Russia, and the frontier societies of North America. Although there was considerable variation in the real power of the new political institutions and in the extent of self-government actually realized, parliaments were set up for the new Italy, the new Germany, the new Japan, the new Canada; and the movement in Russia was in the same direction. In Europe, some of the aims which the revolutionists of 1848 had failed to achieve were now brought about by the established authorities.

They were brought about, however, only through a series of wars. To create an all-German or an all-Italian state, as the revolutions of 1848 had already shown, it was necessary to break the power of Austria, render Russia at least temporarily ineffective, and overthrow or intimidate those German and Italian governments which refused to surrender their sovereignty. In the United States, to maintain national unity as understood by President Lincoln, it was necessary to repress the movement for Southern independence by force of arms. For almost 40 years after 1815 there had been no war between established powers of Europe. Then in 1854 came the Crimean War; in 1859, the Italian War; in 1864, the Danish War; in 1866, the Austro-Prussian War; and in 1870, the Franco-Prussian War. Concurrently the Civil War raged in the United States. After 1871, for 43 years there was again no war between the major European powers.

### *The Crimean War, 1854–1856*

Before moving on to the first of the national consolidation movements, the Italian, we must examine the Crimean War which, though seemingly remote and unconnected, helped to make possible the success of the European national movements. Its chief significance for Europe is that it seriously weakened both Austria and Russia, the two powers most bent on preserving the peace settlement of 1815 and on preventing national changes. It was also the first war covered by newspaper correspondents, and the first in which women, led by Florence Nightingale, established their position as army nurses.

The pressure of Russia upon Turkey was an old story. Every generation saw its Russo-Turkish war. In the last Russo-Turkish war, to go back no further, that of 1828–1829, Tsar Nicholas I protected the independence newly won by Greece and annexed the left bank of the mouth of the Danube. Now, in 1853, Nicholas again made demands upon the still large but decaying Ottoman Empire, moving in on the two Danubian principalities, Wallachia and Moldavia (later to be known as Romania), with military forces (see map, p. 649). The dispute this time ostensibly involved the protection of Christians in the Ottoman Empire, including the foreign Christians at Jerusalem and in Palestine. Over these Christians the French also claimed a certain protective jurisdiction. The French had for centuries been the principal Western people in the Middle East. They had often furnished money and advisers to the sultan, they carried on a huge volume of trade, they staffed and financed Christian missions, and they were continually talking of building a Suez canal. Napoleon III thus had his own aspirations in the eastern Mediterranean, and he encouraged the Turkish government to resist Russian claims to protect Christians within Turkey. War between Russia and Turkey broke out late in 1853. In 1854 France joined the side of the Turks, as did Great Britain, whose settled policy was to uphold Turkey and the Middle East against penetration by Russia. The two

---

*Russian pressure*

Western powers were soon joined by a small ally, the kingdom of Sardinia, better known because of its Italian mainland territory and seat of government as Piedmont. Sardinia had no visible interest in the issues in the Middle East, but it entered the war as a means to influence the Italian question.

The British fleet successfully blockaded Russia in both its Baltic and Black Sea outlets. French and British armies invaded Russia itself, landing in the Crimean peninsula, to which all the important fighting was confined. The Austrian Empire had its own reasons not to want Russia to conquer the Balkans and Constantinople, or to see Britain and France master the situation alone; Austria therefore, though not yet recovered from the upheaval of 1848–1849, mobilized its armed forces at a great effort to itself and occupied Wallachia and Moldavia, which the Russians evacuated under this threat of attack by a new enemy. Tsar Nicholas died in 1855, and his successor, Alexander II, sued for peace.

*Peace in 1856*

A congress of all the great powers made peace at Paris in 1856. By the treaty the powers pledged themselves jointly to maintain the “integrity of the Ottoman Empire.” The Russian tide ebbed a little. Russia ceded the left bank of the mouth of the Danube to Moldavia and gave up its claim to the special protection of Christians in the

The Crimean War weakened the international position of Austria and Russia, but its most enduring effect on nations such as Britain may have come in the ways that wars were described in the popular press and in the new role of women nurses. Florence Nightingale arrived in the Crimea with 36 nurses and was at first opposed by army doctors. She is pictured here in one of the hospitals where she began to create the new military and social identity of the female nurse.

(Getty Images)

Turkish empire. Moldavia and Wallachia (united as Romania in 1858), together with Serbia, were recognized as self-governing principalities under protection of the European powers. At the Congress of Paris European diplomacy seemed to be achieving a more harmonious international system.

But trouble was in the making. Napoleon III needed glory. The Italians wanted some kind of unified Italy. The Prussians, who had done nothing in the Crimean War and were only tardily invited to the Congress of Paris, feared that their status as a great power might be slipping away. Napoleon III, the Italian nationalists, and the Prussians all stood to gain by change. Change in central Europe and Italy meant a tearing up of the Treaty of Vienna of 1815, long guarded by Metternich and unsuccessfully challenged by the revolutionaries of 1848. Now, after the Crimean War, the forces opposing change were very weak. It was the Russian and Austrian empires that had stood firmly for the status quo. But these two powers, which had most seriously attempted to uphold the Vienna settlement, could do so no longer. The first proof came in Italy.

## 64. CAVOUR AND THE ITALIAN WAR OF 1859: THE UNIFICATION OF ITALY

### *Italian Nationalism: The Program of Cavour*

In Italy there had long been about a dozen sizable states, together with a few very small ones. Several of them had dissolved in the Italian movements that accompanied the wars of the French Revolution. All had been reorganized, first by Napoleon and then by the Congress of Vienna. The governments of these states were generally content with their separate independence. But the governments were remote from their peoples.

There was a widespread disgust in Italy with the existing authorities, and a growing desire for a liberal national state in which all Italy might be embodied and which might resurrect the Italian grandeur of ancient times and of the Renaissance. This sentiment, the dream of an Italian Risorgimento, or resurgence, had become very heated at the time of the French Revolution and Napoleon, and had then been transformed by the writings of Mazzini into an intensely moral campaign for Italian national unity. Mazzini had seen his hopes for a unified republican Italy elevated for a brief moment and then blasted in the general debacle of 1848. In the stormy events of 1848 the papacy vehemently rejected the radical romantic republicanism of Mazzini, Garibaldi, and other firebrands; and the pope could no longer be expected to support the cause of Italian nationalism. The same events had shown that Austria could not be ousted from the Italian peninsula without the aid of an outside power.

---

*Italian Risorgimento*

These lessons were not lost on the prime minister of Piedmont, which was ruled since 1848 as a constitutional monarchy and was now under King Victor Emmanuel. This prime minister after 1852 was Camillo di Cavour, one of the shrewdest political tacticians of that or any age. Cavour was a liberal of Western type. He tried to make the state a model of progress, efficiency, and fair government that other Italians would admire. He worked hard to plant constitutional and parliamentary practices. He favored the building of railroads and docks, the improvement of agriculture, and emancipation of trade. He followed a strongly anticlerical policy, cutting down the number of religious holidays, limiting the right of church bodies to own real estate, abolishing the church courts—all without negotiation with the Holy See. A liberal and constitutional monarchist, a wealthy landowner in

Cavour's "politics of reality"

his own right, he had no sympathy for the revolutionary, romantic, and republican nationalism of Mazzini.

Cavour shared in that new realism described in the last chapter. He did not approve of romantic republicans but was willing to work with them surreptitiously. He did not idealize war but was willing to make war to unify Italy under the house of Savoy. With unruffled calculation he took Piedmont into the Crimean War, sending troops to Russia in the hope of winning a place at the peace table and raising the Italian question at the Congress of Paris. It was evident to him that against one great power one must pit another and that the only way to get Austria out of Italy was to use the French army. He therefore developed a master plan to provoke war with Austria, after having assured himself of French military support.

It was not difficult to persuade Napoleon III to collaborate. The Bonapartes looked upon Italy as their ancestral country, and Napoleon III, in his adventurous youth, had traveled in conspiratorial Italian circles and even participated in an Italian insurrection in 1831. Now, as emperor, in his role of apostle of modernity, he entertained a "doctrine of nationalities" which held the consolidation of nations to be a forward step at the existing stage of history. To fight reactionary Austria for the freedom of Italy would also mollify liberal opinion in France, which in other ways Napoleon was engaged in suppressing. The last note in persuasion was furnished by an Italian republican named Orsini, who in 1858, finding the French emperor too slow to make up his mind, attempted to assassinate him with a bomb. Napoleon III reached a secret agreement with Cavour. In April 1859, Cavour tricked Austria into a declaration of war. The French army poured over the Alps.

There were two battles, Magenta and Solferino, both won by the French and Piedmontese. But Napoleon III was now in a quandary. In Italy, with the defeat of the Austrians, revolutionary agitation broke out all over the peninsula, as it had a decade before—and the French emperor was no patron of popular revolution. The revolutionaries overthrew or denounced the existing governments and clamored for annexation to Piedmont. In France, as elsewhere, the Catholics, fearful that the pope's temporal power would be lost, upbraided the emperor for his godless and unnecessary war. The French position was indeed odd, for while the bulk of the French army fought Austria in the north, a detachment of it was still stationed in Rome, sent there in 1849 to protect the pope against Italian republicanism. Napoleon III, in July 1859, at the height of his victories, stupefied Cavour. He made a separate peace with the Austrians.

Franco-Austrian agreement

The Franco-Austrian agreement gave Lombardy to Piedmont but left Venetia within the Austrian Empire. It offered a compromise solution to the Italian question, in the form of a federal union of the existing Italian governments, to be presided over by the pope. This was not what Cavour or the Piedmontese or the more fiery Italian patriots wanted. Revolution continued to spread across the northern Italian states. Tuscany, Modena, Parma, and Romagna drove out their old rulers. They were annexed to Piedmont, after plebiscites or general elections in these regions had shown an overwhelming popular favor for this step. Since Romagna belonged to the papal states, the pope excommunicated the organizers of the new Italy. Undeterred, representatives of all north Italy except Venetia met at the Piedmontese capital of Turin in 1860 in the first parliament of the enlarged kingdom. The British government hailed these events with enthusiasm, and Napoleon III also recognized the expanded Piedmontese state, in return for the transfer to France of Nice and Savoy, where plebiscites disclosed enormous majorities for annexation to France.

### *The Completion of Italian Unity*

There were now, in 1860, a north Italian kingdom, the papal states in the middle, and the kingdom of the Two Sicilies, ruled by a Bourbon king in Naples and still standing in the south. The latter was being undermined by revolutionary agitation, as often in the past. A Piedmontese republican, Giuseppe Garibaldi, brought matters to a head. Somewhat like Lafayette, Garibaldi was a "hero of two worlds," who had fought for the independence of Uruguay, lived in the United States, and been one of the Triumvirs in the short-lived Roman Republic of 1849. He now organized a group of about 1,150 personal followers—Garibaldi's Thousand, or the Red Shirts—for an armed expedition to the south. Cavour, unable openly to favor such action against a neighboring state, connived at Garibaldi's preparations and departure. Garibaldi landed in Sicily and soon crossed to the mainland. Revolutionists hastened to join him, and the government of the Two Sicilies, backward and corrupt, commanding little loyalty from its population, collapsed before this picturesque intrusion.

Garibaldi now prepared to push from Naples up to Rome. Here, of course, he would meet not only the pope but also the French army, and the international scandal would reverberate throughout the globe. Cavour decided that so extreme a step must be averted, but that Garibaldi's successes must at the same time be used. Garibaldi, though not all his followers, was now ready to accept a monarchy as the best solution to the problem of Italian unification. The chief of the Red Shirts, the one-time foe of kings, consented to ride in an open carriage with Victor Emmanuel through the streets of Naples amid cheering thousands. Plebiscites held in the Two Sicilies showed an almost unanimous willingness to join with Piedmont. In the remainder of the papal states, except for Rome and its environs, plebiscites were held also, with the same result. A parliament representing all Italy except Rome and Venetia met in 1861, and the Kingdom of Italy was formally proclaimed, with Victor Emmanuel II as king "by grace of God and the will of the nation." Venetia was added in 1866, as a reward for Italian aid to Prussia in a war against Austria. Rome was annexed in 1870 after the withdrawal of French troops in the Franco-Prussian War of 1870.

---

Garibaldi's  
compromise

So Italy was "made," as the phrase of the time expressed it. It had been made by the high-minded cultural nationalism of Mazzini, the audacity of Garibaldi, and the cold policy of Cavour. In the end, however, the Italians also achieved national unification through insurrections, armed violence, and the endorsement of popular votes.

### *Persistent Problems after Unification*

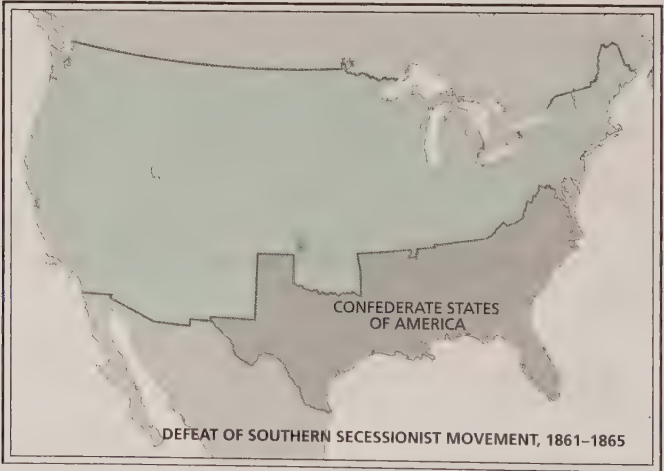

Very little was settled or ended by unification. Even territorially, the more pronounced nationalists refused to believe that Italian unity was completed. They looked beyond to regions of mixed population where Italians were numerous or preponderant—to the Trentino, to Trieste, to certain Dalmatian islands, or to Nice and Savoy. They saw in these regions an *Italia irredenta*, "an unredeemed Italy," awaiting in its turn the day of incorporation. Irredentism even passed into the English language as a word signifying a vociferous demand, on nationalist grounds, for annexation of regions beyond one's own frontiers.

The occupation of Rome in 1870 by the Italian government opened the rift between church and state still wider. The pope, deprived of territories the papacy had held for a thousand years, renewed his condemnations and chose to remain in lifelong seclusion in the Vatican. His successors followed the same policy until 1929. Hence good Italian patriots were bound to be anticlerical, and good Catholics were bound to look upon the Italian state with unfriendly eyes.

---

Occupation of Rome

This photograph of Giuseppe Garibaldi suggests the confident, charismatic personal style that enabled him to lead a spirited group of Italian nationalists or “Red Shirts” into southern Italy, to form an alliance with King Victor Emmanuel of Piedmont, and to help establish a unified Italian nation-state.

(Getty Images)

The regional differences between northern and southern Italy did not disappear with unification. The north looked upon the agrarian south—the land of priest, landlord, and impoverished peasant—as disgracefully backward.

The new Italy was parliamentary but not democratic. At first the vote was only given to some 600,000 persons out of more than 20 million. Not until 1913 was the suffrage significantly broadened. Meanwhile parliamentary life, confined to a few, was somewhat isolated from the mass of the population and frequently corrupt. But the dream of ages was realized. Italy was one. The period that seemed so shameful to patriots, the long centuries that had elapsed since the Renaissance, were now terminated in the glories of a successful Risorgimento.

## 65. THE FOUNDING OF A GERMAN EMPIRE AND THE DUAL MONARCHY OF AUSTRIA-HUNGARY

To play upon the divisions among the Germans, keeping them in rivalry with each other and dependent upon outside powers, had been the policy of France ever since the Reformation and of Russia since it began to take part in the affairs of Europe. To keep the Germanic world divided was in fact a kind of negative prerequisite to the development of modern history as we know it, for without it the economic and cultural leadership of Europe would hardly have become concentrated along the Atlantic seaboard; nor would a great military empire have arisen in Russia and spread along the Baltic and into Poland.

Gradually, as we have seen, the Germans became dissatisfied with their position. They became nationalistic during and after the Napoleonic wars. Many German thinkers held

### NATION BUILDING, 1859–1867

In the eight years after 1859 Italy was unified (except for the city of Rome, annexed in 1870), the Habsburg government tried to solve its nationalities problem by creating the Dual Monarchy of Austria-Hungary, the United States affirmed its unity by defeating a Southern secessionist movement, and the Dominion of Canada was formed to include all of British North America (dates show the accession of provinces) except Newfoundland and Labrador, which were added in 1949.

that Germany was different from the West, destined someday to work out a peculiarly German way of life and political system of its own. To the Slavs the Germans felt immeasurably superior. German philosophy, as shown most clearly in Hegel, took on a certain characteristic tone. It tended to criticize modern individualism and to skip lightly over liberal conceptions of individual liberty; it also tended to glorify group loyalties, the nation, and the state. It emphasized the progressive evolution of history, which in the thought of Hegel, and after him Marx, became a vast impersonal force almost independent of human beings. History was said to ordain, require, condemn, justify, or excuse. What one did not like could be dismissed as a mere historical phase, opening into a quite different and more attractive future. What one wanted, in the present or future, could be described as historically necessary and bound to come.

### *The German States after 1848*

In 1848 a series of revolutions had unseated the several governments of Germany. At the Frankfurt Assembly a group composed essentially of private citizens tried to organize a united Germany by constitutional methods. They failed because they had no power. Hence after 1848 the Germans began to think in terms of power, developing a somewhat excessive admiration for *die Macht*. The men of Frankfurt failed also, perhaps, because they were insufficiently revolutionary. The Germans were still attached emotionally to their several states. What happened in Italy, a revolutionary destruction of all the old governments except that of Piedmont, could not readily happen in Germany.

After the failure of the 1848 revolution German nationalists and liberals were confused. By 1850 the old states were restored—Austria and Prussia, the kingdoms of Hanover, Saxony, Bavaria, and Württemberg, together with about 30 other states ranging in size down to the free cities of Hamburg and Frankfurt. The loose confederation of 1815, linking all these states together, was restored also (see map, p. 530). But within this frame-

work great economic and social changes were occurring. Between 1850 and 1870 the output of both coal and iron in Germany multiplied sixfold. In 1850 Germany produced less iron than France; in 1870, more. Germany was rapidly gaining economic unity and overcoming the economic and

social lag which had separated Germans from the fast-developing industrial and global commerce in northwestern Europe. The German cities were growing, bound together by railroad and telegraph, requiring larger supporting areas on which to live. Industrial capitalists and industrial workers were becoming more numerous. With the advantages of unity more obvious than ever, with the ideals of 1848 badly compromised, with a strong philosophical respect for the state and for power, and with a habit of accepting the successful event as the “judgment of history,” the Germans were ripe for what happened. They did not unify themselves by their own exertions. They fell into the arms of Prussia.

---

Advantages of unity

### *Prussia in the 1860s: Bismarck*

Prussia had always been the smallest and most precarious of the great powers. Ruined by Napoleon, it had risen again. It owed its international influence and internal character to its army. Actually it had fought rather fewer wars than other great powers, but its army enabled Prussia to expand by conquest or diplomacy. The taking of Silesia in 1740 by force, the acquisition of parts of Poland in the partitions of the 1770s and 1790s, and the addition of the Rhineland in 1815 by diplomatic or international agreement were the highlights of Prussian growth. After 1850 those who controlled the destinies of Prussia were apprehensive. Their state had been shaken by revolution. In the Crimean War and at the

Congress of Paris they were hardly more than spectators. It seemed as if the hard-won and still relatively recent position of Prussia might be waning.

Since 1815 the population of Prussia had grown from 11 to 18 million, but the size of the army had not changed. Merely to enforce existing principles of conscription would therefore almost double the army. But this would require increased financial appropriations. After 1850 Prussia had a parliament. It was a parliament, to be sure, dominated by men of wealth; but some of the wealthy Prussians, notably the industrialists of the Rhineland, were liberals who wished the parliament to have control over government policies. These men did not like professional armies and considered the Prussian Junkers, from whom the officer corps was recruited, as their main rivals in the state. The parliament refused the necessary appropriations. The king at this juncture, in 1862, appointed a new chief minister, Otto von Bismarck.

---

Parliamentary  
politics

Bismarck was a Junker from old Brandenburg east of the Elbe. He cultivated the gruff manner of an honest country squire, though he was in fact an accomplished man of the world. Intellectually he was far superior to the rather unsophisticated landlord class from which he sprang and for which he often felt an impatient contempt. He shared in many Junker ideas. He advocated, and even felt, a kind of stout Protestant piety. Although he cared for the world's opinion, it never deterred him in his actions; criticism and denunciation left him untouched. He was in fact obstinate. He was not a nationalist. He did not look upon all Germany as his Fatherland. He was a Prussian. His social affinities, as with the Junkers generally, lay to the East with corresponding landowning elements of the Baltic provinces and Russia. Western Europe, including the bulk of Germany, he neither understood nor trusted; it seemed to him revolutionary, free-thinking, and materialistic. Parliamentary bodies he considered ignorant and irresponsible as organs of government. Individual liberty seemed to him disorderly selfishness. Liberalism, democracy, socialism were repugnant to him. He preferred to stress duty, service, order, and the fear of God. The idea of forming a new German union developed only gradually in his mind and then as an adjunct to the strengthening of Prussia.

---

Bismarck

Bismarck thus had his predilections and even his principles. But no principle bound him; no ideology seemed to him an end in itself. He became the classic practitioner of *Realpolitik*. First he made wars; then he insisted upon peace. Enmities and alliances were to him only matters of passing convenience. The enemy of today might be the friend of tomorrow. Far from planning out a long train of events, then following it step by step to a grand consummation, he seems to have been practical and opportunistic, taking advantage of situations as they emerged and prepared to act in any one of several directions as events might suggest.

In 1862, as minister-president, it was his job, or duty, to thwart the liberals in the Prussian parliament. For four years, from 1862 to 1866, Bismarck waged this constitutional struggle. The parliament refused to vote the proposed taxes. The government collected them anyway. The taxpayers paid them without protest—it was the orderly thing to do, and the collectors represented public authority. The limitations of Prussian liberalism, the docility of the population, the respect for officialdom, the belief that the king and his ministers were wiser than the elected deputies—all clearly revealed themselves in this triumph of military policy over the theory of government by consent. The army was enlarged, reorganized, retrained, and reequipped. Bismarck fended off the showers of abuse from the liberal majority in the chamber. The liberals declared that the government's policy was flagrantly unconstitutional. The constitution, said Bismarck, could not have been meant to

Constitutional  
struggle

Otto von Bismarck's pragmatic use of power and his successful campaign to create a unified German nation-state made him the most successful practitioner of *Realpolitik* in late nineteenth-century Europe. This photograph suggests the talent for well-focused observation that enabled Bismarck to see clearly what was at stake in the many political and diplomatic conflicts of his generation.

(Getty Images)

undermine the state. The government, said the liberals, was itself undermining Prussia, for the rest of Germany hoped to find in Prussia, as Italy had found in Piedmont, a model of political freedom. What the Germans admired in Prussia, replied Bismarck coldly, was not its liberalism but its power. He declared that the Prussian boundaries as set in 1815 were unsound, that Prussia must be prepared to seize favorable opportunities for further growth. And he added one of his most memorable utterances: "Not by speeches and majority votes are the great questions of the day decided—that was the great error of 1848 and 1849—but by blood and iron."

#### *Bismarck's Wars: The Creation of the North German Confederation, 1867*

A favorable opportunity was not long in presenting itself. The Danes, engaged in a process of national consolidation of their own, wished to make the duchy of Schleswig an integral part of Denmark. The population of Schleswig was part Dane and part German. The diet of the German confederation, unwilling to see Germans thus annexed outright to Denmark, called for an all-German war upon the Danes. Bismarck had no desire to support or strengthen the existing German confederation. He wanted not an all-German war but a Prussian war. To disguise his aims he acted jointly with Austria, a fellow member of the German confederation. In 1864 Prussia and Austria together went to war with Denmark, which they soon defeated. It was Bismarck's intention to annex both Schleswig and the duchy of Holstein to Prussia, gaining whatever other advantages might present themselves from future trouble with Austria. He arranged a provisional occupation of Schleswig by Prussia and of Holstein by Austria. Disputes soon arose over rights of passage, the keeping of internal order, and other problems with which occupying forces are commonly afflicted. While pretending to try to regulate these disputes he allowed them to ripen.

He now proceeded to discredit and isolate Austria. The British government was at the time following a policy of nonintervention in the affairs of the Continent. The Russian empire was in no position for action; it was divided internally by a reform program then at its height; it was in a mood of hostility to Austria, because of events of the Crimean War, and well disposed toward Prussia and Bismarck, because Bismarck in 1863 took care to support it against an uprising of the Poles. To win over the new kingdom of Italy Bismarck held out the lure of Venetia. As for France, Napoleon III was embarrassed by domestic discontents and his army was committed to adventures in Mexico. In addition, Bismarck charmed him at a confidential interview at Biarritz, where vague oral intimations of French

expansion were exchanged, and the two men seemed to agree to a needed modernization of the map of Europe. To weaken Austria within Germany, Bismarck presented himself as a democrat. He proposed a reform of the German confederation, recommending that it have a popular chamber elected by universal male suffrage. He calculated that the mass of the German people were wedded neither to the well-to-do capitalistic liberals, nor to the existing government structures of the German states, nor to the house of Habsburg. He would use "democracy" to undermine all established interests that stood in his way.

---

*Bismarck as democrat*

Meanwhile the occupying powers continued to quarrel over Schleswig-Holstein. Austria finally raised the matter formally in the German federal diet, one of whose functions was to prevent war between its members. Bismarck declared that the diet had no authority, accused the Austrians of aggression, and ordered the Prussian army to enter Holstein. The Austrians called for federal sanctions in the form of an all-German force to be sent against Prussia. The result was that Prussia, in 1866, was at war not only with Austria but also with most of the other German states. The Prussian army soon proved its superiority. Trained to an unprecedented precision, equipped with the new needle-gun, by which the infantryman could deliver five rounds a minute, brought into the zone of combat by an imaginative strategy that made use of the new railroads, and skillfully commanded, the Prussian army overwhelmed the Austrians and defeated the other German states soon thereafter. The Austro-Prussian, or Seven Weeks' War, was amazing in its brevity. Bismarck hastened to make peace before the other European powers could realize what had happened.

---

*Seven Weeks' War*

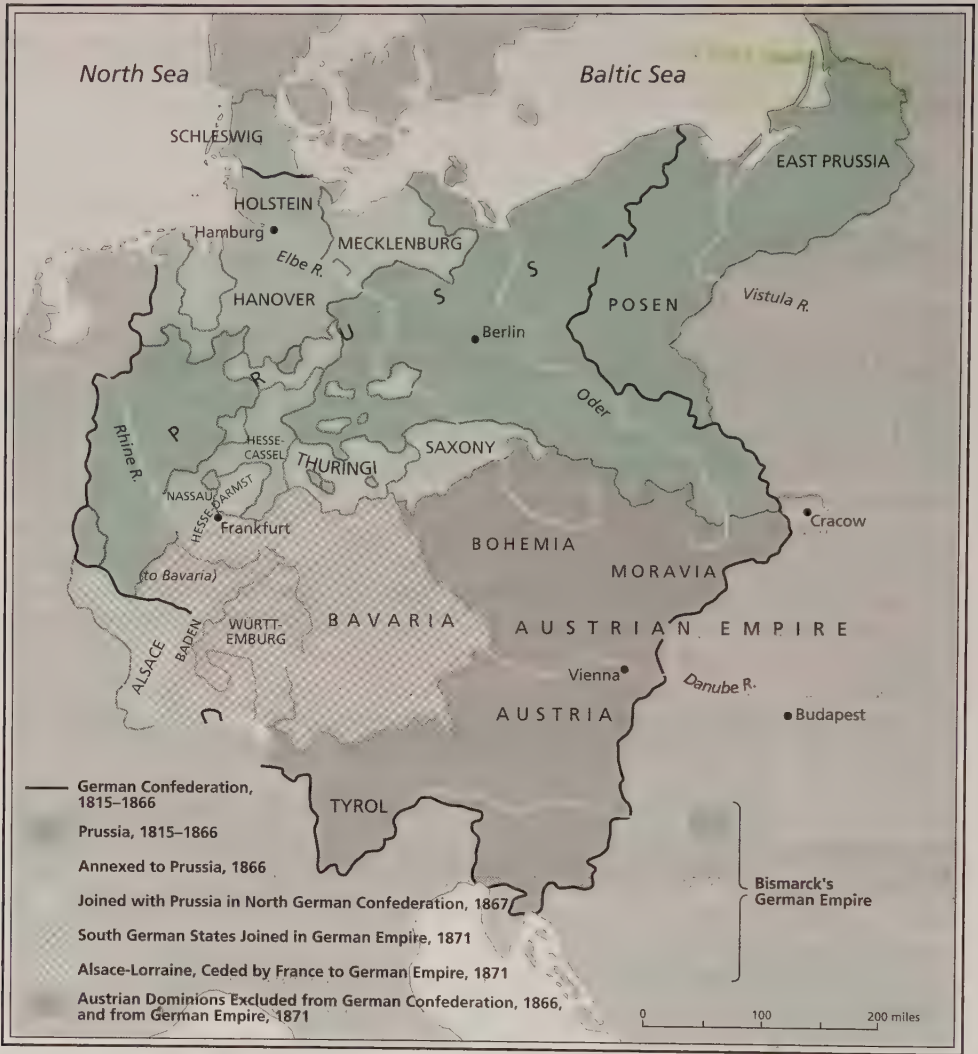

Prussia annexed outright, together with Schleswig-Holstein, the whole kingdom of Hanover, the duchies of Nassau and Hesse-Cassel, and the free city of Frankfurt. Here the old governments simply disappeared before the axe of the "red reactionary." The German federal union disappeared likewise. In its place, in 1867, Bismarck organized a North German Confederation, in which the newly enlarged Prussia joined with 21 other states, all of which combined it greatly outweighed. The German states south of the river Main—Austria, Bavaria, Baden, Württemberg, and Hesse-Darmstadt—remained outside the new organization, with no kind of union among themselves. Meanwhile the kingdom of Italy annexed Venetia.

For the North German Confederation Bismarck produced a constitution. The new structure, though a federal one, was much stronger than the now defunct Confederation of 1815. The king of Prussia became its hereditary head. Ministers were responsible to him. There was a parliament with two chambers. The upper chamber, as in the United States, represented the states as such, though not equally. The lower chamber, or Reichstag, was deemed to represent the people and was elected by universal male suffrage. Such flirting with democracy seemed madness to both conservative Junker and liberal bourgeois. It was indeed a bold step, for only France at the time exemplified universal suffrage in Europe on a large scale, and in the France of Napoleon III neither old-fashioned conservatives nor genuine liberals could take much satisfaction. As for Great Britain, where voting rights were extended in this same year, 1867, they were still given to fewer than half the adult male population. Bismarck sensed in the "masses" an ally of strong government against private interests. He negotiated even with the socialists, who had arisen with the industrialization of the past decade, and who, in Germany at this time, were mainly followers of Ferdinand Lassalle. The Lassallean socialists, unlike the Marxian, believed it possible to improve working-class conditions through the action of existing governments. To the great annoyance of Marx, then in England (his *Capital* first appeared in 1867), the bulk

*A new constitution*

### THE GERMAN QUESTION, 1815–1871

From 1815 to 1866 there were 39 German states joined in the German Confederation (the largest states are shown here). The movement to create a unified Germany gave rise in this era to opposing nationalist groups: the Great Germans, who favored an all-German union that would include Austria; and the Little Germans, who were willing to exclude Austria and its empire from a new German nation-state. Bismarck was a Little German but a Great Prussian. He (1) enlarged Prussia by conquest in 1866; (2) joined Mecklenburg, Saxony, and other regions with Prussia in the North German Confederation of 1867; and (3) combined this Confederation with Bavaria, Württemberg, and other southern states to form the German Empire in 1871. He also (4) conquered Alsace-Lorraine from France and (5) excluded Austria from the new German empire. These boundaries remained unchanged until 1918.

of the German socialists reached an understanding with Bismarck. In return for a democratic suffrage they agreed to accept the North German Confederation. Bismarck, for his part, by making use of democratic and socialist sentiment, won popular approval for his emerging empire.

### *The Franco-Prussian War*

It was clear that the situation was not yet stable. The small south German states were left floating in empty space; they would sooner or later have to gravitate into some orbit or other, whether Austrian, Prussian, or French. In France there were angry criticisms of Napoleon III's foreign policy. French intervention in Mexico had proved a fiasco. A united Italy had been allowed to rise on France's borders. And now, contrary to all principles of French national interest observed by French governments for hundreds of years, a strong and independent power was being allowed to spread over virtually the whole of Germany. Everywhere people began to feel that war was inevitable between France and Prussia. Bismarck played on the fears of France felt in the south German states. South Germany, though in former times often a willing satellite of France, was now sufficiently nationalistic to consider such subservience to a foreign people disgraceful. To Bismarck it seemed that a war between Prussia and France would frighten the small south German states into a union with Prussia, leaving only Austria outside—which was what he wanted. To Napoleon III, or at least to some of his advisers, it seemed that such a war, if successful, would restore public approval of the Bonapartist empire. In this inflammable situation the responsible persons of neither country worked for peace.

Meanwhile, in a totally unexpected chain of events, a revolution in Spain had driven the reigning queen into exile, and a Spanish provisional government invited Prince Leopold of Hohenzollern, the king of Prussia's cousin, to be constitutional king of Spain. To entrench the Prussian royal house in Spain would naturally be distasteful to France. Three times the Hohenzollern family refused the Spanish offer. Bismarck, who could not control such family decisions but who foresaw the possibility of a usable incident, deviously persuaded the Spanish to issue the invitation still a fourth time. On July 2, 1870, Paris heard that Prince Leopold had accepted. The French ambassador to Prussia, Benedetti, at the direction of his government, met the king of Prussia at the bathing resort of Ems, where he formally demanded that Prince Leopold's acceptance be withdrawn. It was withdrawn on July 12. The French seemed to have their way. Bismarck was disappointed.

---

*France thwarts new  
Spanish king*

The French government went still further. It instructed Benedetti to approach the king again at Ems and demand that at no time in the future would any Hohenzollern ever become a candidate for the Spanish throne. The king politely declined any such commitment and telegraphed a full report of the conversation to Bismarck at Berlin. Bismarck, receiving the telegram, which became famous as the "Ems dispatch," saw a new opportunity, as he put it, to wave a red flag before the Gallic bull. He condensed the Ems telegram for publication, so reducing and abridging it that it seemed to newspaper readers as if a curt exchange had occurred at Ems, in which the Prussians believed that their king had been insulted and the French believed that their ambassador had been snubbed. In both countries the war party demanded satisfaction. On July 19, 1870, on these trivial grounds, and with the ostensible issue of the Spanish throne already settled, the irresponsible and decaying government of Napoleon III declared war on Prussia.

The French suffered a crushing defeat at Sedan in northeastern France during the brief Franco-Prussian War in 1870. Napoleon III was captured along with much of his army. French civilians fled from both the battle and advancing Prussian troops, as can be seen in this German engraving of terrified people crossing a dangerous, crowded bridge.

(The Art Archive/Musée Carnavalet Paris/Dagli Orti)

#### *A short war*

Again the war was short. Again Bismarck had taken care to isolate his enemy in advance. The British generally felt France to be in the wrong.

They had been alarmed by French operations in Mexico, which suggested an ambition to re-create a French American empire. The Italians had long been awaiting the chance to seize Rome; they did so in 1870, when the French withdrew their troops from Rome for use against Prussia. The Russians had been awaiting the chance to upset a clause of the Peace of 1856 that forbade them to keep naval vessels in the Black Sea. They did so in 1870.

The War of 1870, like the others of the time, failed to become a general European struggle. Prussia was supported by the south German states. France had no allies. The French army proved to be technically backward compared with the Prussian. War began on July 19; on September 2, after the battle of Sedan, the principal French army surrendered to the Germans. Napoleon III was himself taken prisoner. On September 4 an insurrection in Paris proclaimed the Third Republic. The Prussian and German forces moved into France and laid siege to the capital. Though the French armies dissolved, Paris refused to capitulate. For four months it was surrounded and besieged.

*The German Empire, 1871*

With their guns encircling Paris, the German rulers or their representatives assembled at Versailles. The château and gardens of Versailles, since Louis XVI's unceremonious departure in October 1789, had been little more than a vacant monument to a society long since dead. Here, in the most sumptuous room of the palace, the resplendent Hall of Mirrors, where the Sun King had once received the deferential approaches of German princes, Bismarck on January 18, 1871, arranged for the German Empire to be proclaimed. The king of Prussia received the hereditary title of German emperor. The other German rulers (excepting, to be sure, the ruler of Austria, and those whom Bismarck had himself dethroned) accepted his imperial authority. Ten days later the people of Paris, shivering, hungry, and helpless, opened their gates to the enemy. France had no government with which Bismarck could make peace. It was not at all clear what kind of government the country wanted.

Bismarck insisted on the election of a Constituent Assembly by universal suffrage. He demanded that France pay the German Empire a war indemnity of five billion gold francs (then an enormous and unprecedented sum) and cede to it the border region of Alsace and most of Lorraine.

---

*Bismarck's demands*

Though the Alsatians spoke German, most of them felt themselves to be French, having shared in the general history of France since the seventeenth century. There was strong local protest at the transfer to Germany, and the French never reconciled themselves to this cold-blooded amputation of their frontier. The peace dictated by Bismarck was embodied in the treaty of Frankfurt of May 10, 1871. Thereafter, as will be seen, the French Constituent Assembly gradually proceeded to construct the Third Republic.

The consolidation of Germany transformed the face of Europe. It reversed the dictum not only of the Peace of Vienna but even of the Peace of Westphalia. The German Empire, no sooner born, was the strongest state on the continent of Europe. Rapidly industrialized after 1870, it became more potent still. Bismarck had astutely exploited the conflicting ambitions of other European states and used three short wars to bring about a German unification that most European governments had long sought at all costs to prevent. He outwitted everybody in turn, including the Germans. The united all-German state that issued from the nationalist movement was a Germany conquered by Prussia. Within the new empire Prussia directly controlled about two-thirds of the whole imperial territory. Before such unanswerable success the Prussian liberals capitulated, and the Prussian parliament passed an indemnity act; the gist of it was that Bismarck admitted to a certain high-handedness during the constitutional struggle but that the parliament legalized the disputed tax collections *ex post facto*, agreeing to forgive and forget, in view of the victory over Austria and its consequences. Thus liberalism withered away before nationalism.

---

*The strength of the German state*

The German Empire received substantially the constitution of the North German Confederation. It was a federation of monarchies, each based in theory on divine or hereditary right. At the same time, in the Reichstag elected by universal male suffrage, the empire rested on a kind of mass appeal and was in a sense democratic. Yet the country's ministers were responsible to the emperor and not to the elected chamber. Moreover, it was the rulers who joined the empire, not the peoples. There were no popular plebiscites as in Italy. Each state kept its own laws, government, and constitution. The people of Prussia, for example, remained for Prussian affairs under the rather illiberal constitution of 1850 with its three-class system of voting; in affairs of the Reich, or empire, however, they enjoyed an equal vote by universal suffrage. The emperor, who was also the king of Prussia, had

The new German Empire was officially proclaimed in January 1871 at the historic French palace in Versailles. King Wilhelm of Prussia became the German Emperor. This picture shows how Bismarck assembled his military officers and representatives from all of the constituent German states in the famous “Hall of Mirrors”—a symbolic site of past French grandeur that made the German celebration all the more humiliating for the French.

(Bismarck Museum/Bildarchiv Preussischer Kulturbesitz/Art Resource, NY)

legal control over the foreign and military policy of the empire. The German Empire in effect served as a mechanism to magnify the role of Prussia, the Prussian army, and the East Elbian Prussian aristocracy in world affairs.

### *The Habsburg Empire after 1848*

Bismarck united Germany, but he also divided it, for he left about a sixth of the Germans outside his German Empire. These Germans of Austria and Bohemia had now to work out a common future with the dozen other nationalities in the Danubian domain. The

clumsiness of the old Habsburg multinational empire is clear enough, but more impressive is its astonishing capacity to live and to survive. Having survived repeated attempts to dismember it during the eighteenth century,

the Napoleonic wars, and the revolutions of 1848, the empire held together until the cataclysm of the First World War. But the events of the 1850s and 1860s greatly altered its character.

The essential question, in a nationalist age, was how the Habsburg government would react to the problems raised by national self-expression. By Habsburg, in this period, one means primarily Francis Joseph, who as emperor from 1848 to 1916 reigned even longer than his famous contemporary, Queen Victoria. Francis Joseph, like many others, could never shake off his own tradition. His thoughts turned on his house and on its rights. Buffeted unmercifully by the waves of change and by central European nationalisms, he cordially disliked everything liberal, progressive, or modern. Personally, Francis Joseph was incapable of enlarged views, ambitious projects, bold decisions, or persevering action. And he lived in a pompous dream world, surrounded in the imperial court by great noblemen, high churchmen, and bespangled personages of the army.

Yet the government was not idle; it was, if anything, too fertile in devising new deals and new dispensations. Various expedients were tried after 1849, but none was tried long enough to see if it would work. For several years the ruling idea was centralization—to govern the empire through the German language and with German efficiency, maintaining the abolition of serfdom as accomplished in 1848 (and which required a strong official control over the landlords if it was to work in practice) and favoring the building of railroads and other forms of material progress. This Germanic and bureaucratic centralization was distasteful to the non-German nationalities, and especially to the Magyars. It is important to say Magyars, not Hungarians, because the Magyars composed less than half of the very mixed population within the then existing borders of Hungary. Nevertheless the Magyars, as the strongest of the non-German groups, and hence the most able to maintain a political system of their own, felt the Germanic influence as most oppressive.

---

Germanic  
centralization

### *The Compromise of 1867*

In 1867 a compromise was worked out between the Germans of Austria-Bohemia and the Magyars of Hungary. It worked to the common disadvantage of the Slavs, who were viewed as a backward, less civilized people by both the Germans and the Magyars. The compromise created a Dual Monarchy, of a kind unparalleled in Europe. West of the river Leith was the Empire of Austria; east of it was the Kingdom of Hungary. The two were now judged exactly equal. Each had its own constitution and its own parliament, to which in each country the governing ministry was henceforth to be responsible. The administrative language of Austria would be German; of Hungary, Magyar. Neither state might intervene in the other's affairs. The two were joined by the fact that the same Habsburg ruler should always be emperor in Austria and king in Hungary. Yet the union was not personal only; for, though there was no common parliament, delegates of the two parliaments were to meet together alternately in Vienna and Budapest, and there was to be a common ministry for finance, foreign affairs, and war. To this common ministry of Austria-Hungary both Austrians and Hungarians were to be appointed.

---

A dual monarchy

Both Austria and Hungary under the Dual Monarchy were in form constitutional parliamentary states, although the principle of ministerial responsibility was not consistently honored. Neither was democratic. In Austria, after much juggling with voting

Hungary and Austria formed a political union under a Dual Monarchy and common government ministries after 1867, but most of the population continued to live a traditional agrarian life. This painting by the Hungarian artist Miklos Barabas, *The Arrival of the Bride* (1856), portrays one of the enduring rituals of rural societies, which were often romanticized in nineteenth-century nationalism.

(Magyar Nemzeti Galeria, Budapest, Hungary/Bridgeman Art Library (*The Arrival of the Bride*, 1856 by Miklos Barabas, 1810–98))

systems, a true universal male suffrage was instituted in 1907. In Hungary, when the First World War came in 1914, still only a quarter of the adult male population had the vote. Socially, the great reform of 1848, the abolition of serfdom, was not allowed to lead on to upsetting conclusions. The owners of great landed estates, especially in Hungary (but also in parts of the Austrian Empire) remained the unquestionably dominant class. They were surrounded by landless peasants, an agrarian proletariat, composed partly of lower classes of their own nationality and partly of entire peasant peoples, like the Slovaks and Serbs, who had no educated or wealthy class of their own. National and social questions therefore came together. For some nationalities, especially the Magyars, not only a national but also a social and economic ascendancy was at stake. Landlordism became the basic social issue. A landowning class, educated and civilized, faced a depressed peasant mass that was generally left out of the advancing civilization of the day.

National and social  
questions

## 66. LIBERALIZATION IN TSARIST RUSSIA: ALEXANDER II

*Tsarist Russia after 1856*

For Russia also the Crimean War set off a series of changes. The ungainly empire, an “enormous village” as it has been called, stretching from Poland to the Pacific, had proved unable to repel a localized attack by France and Great Britain, into which neither of the Western powers had put anything like its full resources. Alexander II (1855–1881), who became tsar during the war, was no liberal by nature or conviction. But he saw that something drastic must be done. The prestige of western Europe was at its height. There the most successful and even enviable nations were to be found. The reforms in Russia therefore followed, at some distance, the European model.

Imperial Russia was a political organization very difficult to describe. Its own subjects did not know what to make of it. Some, called Westernizers in the mid-nineteenth century, believed Russia destined to become more like Europe. Others, the Slavophiles, believed Russia to be entrusted with a special destiny of its own, which imitation of Europe would only weaken or pervert.

That Russia differed from Europe at least in degree was doubted by nobody. The leading institution was the autocracy of the tsar. This was not exactly the absolutism known in the West. In Russia certain very old European conceptions were missing, such as the idea that spiritual authority is independent of even the mightiest prince or the old feudal idea of reciprocal duties between king and subject. The notion that people have certain rights or claims for justice at the hands of power, which no one in Europe had ever expressly repudiated, was in Russia a somewhat doctrinaire importation from the West. The tsardom did not rule by law; it ran the country by ukase, police action, and the army. The tsars, since Peter and before, had built up their state very largely by importing European technical methods and technical experts, often against strong objection by native Russians of all classes, upon whom the new methods were, when necessary, simply forced. More than any state in Europe, the Russian empire was a machine superimposed upon its people without organic connection—bureaucracy pure and simple. But as the contacts with Europe were joined, many Russians acquired European ideas in which the autocracy was not interested—ideas of liberty and fraternity, of a just and classless society, of individual personality enriched by humane culture and moral freedom. Many people with such sentiments found themselves chronically critical of the government and of Russia itself. The government, massive though it seemed, was afraid of such people. Any idea arising outside official circles seemed pernicious, and the press and the universities were as a rule severely censored.

---

*Autocracy of the tsar*

A second fundamental institution, which had grown up with the tsardom, was legalized bondage or serfdom. The bulk of the population were serfs dependent upon masters. Russian serfdom was more onerous than the serfdom that existed in east-central Europe until 1848. It resembled the slavery of the Americas in that serfs were “owned”; they could be bought and sold and used in occupations other than agriculture. Some serfs worked the soil, rendering unpaid labor service to the gentry. Others could be used by their owners in factories or mines or rented out for such purposes. Others were more independent, working as artisans or mechanics, and even traveling about or residing in the cities, but from their earnings they had to remit certain fees to the lord or return home when he called them. The owners had a certain paternalistic responsibility for their serfs, and in the villages the gentry constituted a kind of personal local government. The law, as in the American South, did little or nothing to interfere

---

*The severity of  
Russian serfdom*

### EUROPE, 1871

This map shows the existence of the newly unified German Empire and a unified Kingdom of Italy. The German domain was enlarged by the incorporation of Schleswig (in the neck of the Danish peninsula) and the annexation from France of Alsace and parts of Lorraine (the regions around Strassburg and Metz on the map). From 1871 to 1914, Europe had fewer separate states than at any other time in its history. There were no further changes in national borders during this period except for the voluntary separation of Norway and Sweden in 1905 and various realignments in south-eastern Europe as the Ottoman Empire withdrew from the Balkans.

between gentry and servile mass, so that the serfs' day-to-day fortunes depended on the personality or economic circumstances of their owners.

By the mid-nineteenth century most Russians agreed that serfdom must some day end. Serfdom was in any case ceasing to be profitable; some two-thirds of all the privately owned serfs (that is, those not belonging to the tsar or state) were mortgaged as security for loans at the time of Alexander II's accession. Increasingly serfdom was recognized as a bad system of labor relations, making the muzhiks into illiterate and stolid drudges, without incentive, initiative, self-respect, or pride of workmanship, and also very poor soldiers for the army.

---

Western ideas and  
education

Educated Russians, full of Western ideas, were estranged from the government, from the Orthodox church, which was an arm of the tsar, and from the common people of their own country. They felt ill at ease in a nation of uneducated peasants and a pang of guilt at the virtual slavery on which their own position rested. Hence arose another distinctive feature of nineteenth-century Russian life, the intelligentsia. In Russia it was thought so exciting to be educated, to have ideas, to subscribe to magazines, or engage in critical conversation that the intelligentsia sensed themselves as a class apart. They were made up of students, university graduates, and persons who had a good deal of leisure to read. Such people, while not very free to think, were more free to think than to do almost anything else. The Russian intelligentsia tended to sweeping and all-embracing philosophies. They believed that intellectuals should play a large role in society. They formed an exaggerated idea of how thinkers could direct the course of historical change. Their characteristic attitude was one of opposition. Some, overwhelmed by the mammoth immobility of the tsardom and of serfdom, turned to revolutionary and even terroristic philosophies. This only made the bureaucrats more anxious and fearful, and the government more fitfully repressive.

### *The Emancipation Act of 1861 and Other Reforms*

Alexander II, on becoming tsar in 1855, attempted to enlist the support of the liberals among the intelligentsia by implementing a whole series of significant reforms. He gave permission to travel outside Russia, eased the controls on the universities, and allowed the censorship to go relatively unenforced. Newspapers and journals were founded, and those written by Russian revolutionaries abroad, like the *Polar Star* of Alexander Herzen in London, penetrated more freely into the country. The result was a great outburst of public opinion, which was agreed at least on one point, the necessity of emancipating the peasants. This was in principle hardly a party question. Alexander's father, Nicholas I, had been a noted reactionary, who abhorred Western liberalism and organized a system of secret political police until then unparalleled in Europe for its arbitrary and inquisitorial methods. Yet Nicholas I had taken serious measures to alleviate serfdom. Alexander II, basically conservative on Russian affairs, proceeded to set up a special branch of the government to study the question. The government did not wish to throw the whole labor system and economy of the country into chaos, nor to ruin the gentry class without which it could not govern at all. After many discussions, proposals, and memoranda, an imperial ukase of 1861 declared serfdom abolished and the peasants free.

By this great decree the peasants became legally free in the Western sense. They were henceforth subjects of the government, not subjects of their owners. It was hoped that they would be stirred by a new sense of human dignity. As one enthusiastic official put it shortly after emancipation: "The people are erect and transformed; the look, the walk, the speech, everything is changed." The gentry lost their old quasi-manorial jurisdiction over the vil-

lages. They could no longer exact forced and unpaid labor or receive fees arising from servitude.

It is important to realize what the Act of Emancipation did and did not do. Roughly (with great differences from region to region) it allocated about half the cultivated land to the gentry and half to the former serfs. The latter had to pay redemption money for the land they received and for the fees which the gentry lost. The Russian aristocracy was far from weakened; in place of a kind of human property largely mortgaged anyway, they now had clear possession of some half the land, they received the redemption money, and they were rid of obligations to the peasants.

---

---

*Land allocation*

The peasants, on the other hand, now owned some half the arable land in their own right—a considerable amount by the standards of almost any European country. They did not, however, possess it according to the principles of private property or independent farming that had become prevalent in Europe. The peasant land, when redeemed, became the collective property of the ancient peasant village assembly, or *mir*. The village, as a unit, was responsible to the government for payment of the redemption and for collection of the necessary sums from its individual members. The village assembly, in default of collection, might require forced labor from the defaulter or a member of his family; and it could prevent peasants from moving away from the village, lest those remaining bear the whole burden of payment. It could (as in the past) assign and reassign certain lands to its members for tillage and otherwise supervise cultivation as a joint concern. To keep the village community intact, the government presently forbade the selling or mortgaging of land to persons outside the village. This tended to preserve the peasant society but also to discourage the investment of outside capital, with which equipment might be purchased, and so to retard agricultural improvement and the growth of wealth.

Not all peasants within the village unit were equal. As in France before the Revolution, some had the right to work more land than others. Some were only day laborers. Others had rights of inheritance in the soil (for not all land was subject to reassignment by the commune) or rented additional parcels of land belonging to the gentry. These lands they worked by hiring other peasants for wages. None of the Russian peasants, however, after the emancipation, possessed full individual freedom of action. In their movements and obligations, as in their thoughts, they were restricted by their villages as they had once been restricted by their lords.

---

---

*Inequality among peasants*

Alexander II proceeded to overhaul and westernize the legal system of the country. With the disappearance of the lord's jurisdiction over his peasants a new system of local courts was needed in any case, but the opportunity was taken to reform the courts from bottom to top. The arbitrariness of authority and defenselessness of the subject were the inveterate evils. They were greatly mitigated by the edict of 1864. Trials were made public, and private persons received the right to be represented in court by lawyers of their own choosing. All class distinctions in judicial matters were abolished, although in practice peasants continued to be subject to harsh disadvantages. A clear sequence of lower and higher courts was established. Requirements were laid down for the professional training of judges, who henceforth received stated salaries and were protected from administrative pressure. A system of juries on the English model was introduced.

While thus attempting to establish a rule of law, the tsar also moved in the direction of allowing self-government. He hoped to win over the liberals and to shoulder the upper and middle classes with some degree of public responsibility. He created, again by an edict of 1864, a system of provincial

---

---

*A system of self-government*

The emancipation of the peasants in Russia transformed the legal status of the former serfs and opened opportunities for the development of more prosperous peasant communities. There was still much poverty in the Russian countryside after 1861, but the people who are drinking and playing music outside this rural Russian house seem to be part of the prospering post-emancipation peasant class.

(Library of Congress)

and district councils called zemstvos. Elected by various elements, including the peasants, the zemstvos gradually went into operation and took up matters of education, medical relief, public welfare, food supply, and road maintenance in their localities. Their great value was in developing civic sentiment among those who took part in them. Many liberals urged a representative body for all Russia, a Zemsky Sobor or Duma, which, however, Alexander II refused to concede. After 1864 his policy became more cautious. A rebellion in Poland in 1863 inclined him to take advice from those who favored repression. He began to mollify the vested interests that had been disgruntled by the reforms and to whittle down some of the concessions already granted. But the essence of the reforms remained unaffected.

### *Revolutionism in Russia*

The autocrat who thus undertook to liberalize Russia barely escaped assassination in 1866, had five shots fired at him in 1873, missed death by half an hour in 1880 when his imperial dining room was dynamited, and in 1881 was to be killed by a bomb. The revolutionaries were not pleased with the reforms, which if successful would merely strengthen the existing order. Dissatisfied intelligentsia in the 1860s began to call themselves "nihilists": they believed in "nothing"—except science—and took a cynical view of the reforming tsar and his zemstvos. The peasants, saddled with heavy redemption payments, remained basically unsatisfied, and intellectuals toured the villages fanning this discontent. Revolutionaries developed a mystic conception of the revolutionary role of the Russian masses. Socialists, after the failure of socialism in Europe in the Revolution of 1848, came in many cases to believe, as Alexander Herzen wrote, that the true future of socialism lay in Russia, because of the very weakness of capitalism in Russia and the existence of a kind of collectivism already established in the village assemblies or communes.

More radical than Herzen were the anarchist Bakunin and his disciple Nechaiev. In their *People's Justice* these two called for terrorism not only against tsarist officials but against liberals also. As they wrote in the *Catechism of a Revolutionist*, the true revolutionary "is devoured by one purpose, one thought, one passion—the revolution. . . . He has severed every link with the social order and with the entire civilized world. . . . Everything which promotes the success of the revolution is moral, everything which hinders it is immoral." Terrorism (which in that time generally meant assassination) was rejected by many of the revolutionaries, especially by those who in the 1870s took up the scientific socialism of Karl Marx. To Marx it did not seem that frantic violence would advance an inevitable social process. But other groups, recognizing the inspiration of men like Bakunin and Nechaiev, organized secret terrorist societies. One of these, the People's Will, determined to assassinate the tsar. In an autocratic state, they held, there was no other road to justice and freedom.

---

Bakunin and  
anarchism

Alexander II, alarmed by this underground menace, which of course did not escape the attention of the police, again turned for support to the liberals. The liberals, who were themselves threatened by the revolutionaries, had become estranged from the government by its failure to follow through with the reforms of the early 1860s. Now, in 1880, to rally support, the tsar again relaxed the autocratic system. He abolished the dreaded secret police set up by his father, allowed the press to discuss most political subjects freely, and encouraged the zemstvos to do the same. Further to associate representatives of the public with the government, he proposed, not exactly a parliament, but two nationally elected commissions to sit with the council of state. He signed the edict to this effect on March 13, 1881, and on the same day was assassinated, not by a demented

individual acting wildly and alone, but by the joint efforts of the highly trained members of the terrorist society, the People's Will.

Alexander III, upon his father's death, abandoned the project for elected commissions and during his whole reign, from 1881 to 1894, reverted to a program of brutal resistance to liberals and revolutionaries alike. The new regime established by peasant emancipation, judicial reform, and the zemstvos was nevertheless allowed to continue. How Russia finally received a parliament in 1905 is explained below in the chapter on the Russian Revolution. At present it is enough to have seen how even tsarist Russia, under Alexander II, shared in a liberal movement that was then at its height. The abolition of serfdom, putting both aristocrat and peasant more fully into a money economy, opened the way for capitalist development within the empire. And between the two confining walls of autocracy and revolutionism—equally hard and unyielding—European ideas of law, liberty, and humanity began to spread in a tentative way.

and revolutionism*

## 67. THE UNITED STATES: THE AMERICAN CIVIL WAR

The history of Europe, long interconnected with that of the rest of the world, by the early twentieth century became merged with it entirely. Similarly the development of non-European regions, long a collection of separate stories, was to fuse into a single worldwide theme, to which later chapters of this book are largely devoted. It is no great leap at this point to pass to a treatment of areas outside Europe, some of which underwent in the 1860s the same process of national consolidation, or attempted consolidation, already traced in Italy and Germany, Austria, Hungary, and the Russian empire. In particular, foundations were laid for two new powerful nation-states like those of Europe—the United States of America and the Empire of Japan. The huge Dominion of Canada was also established.

### *Growth of the United States*

As in the time of the American Revolution and Napoleon, the history of the United States in the nineteenth century resembled the evolving history of the European world, to which it was closely connected. The most basic fact, besides territorial expansion, was rapid growth. This was so obvious as to lead a French observer in the 1830s, Alexis de Tocqueville, to make a famous prediction: that within a century the United States would have 100 million people and would, along with Russia, be one of the two leading powers of the world. By 1860, with 31 million, the United States was almost as populous as France and more so than Great Britain.

---

*Immigration*

The growth in numbers was due to a prolific birth rate, but also to the arrival of immigrants, who became prolific in their turn. The immigrants in this era—except for an uncounted, because illegal, importation of slaves—came almost entirely from Europe, and before 1860 almost entirely from Great Britain, Ireland, and Germany. The immigrants did not desire to surrender their native ways. Some brought skills that the new country greatly needed, but immigration also presented a true social problem, obliging peoples to live together without common traditions. On the whole, it appears that most older Americans accepted the immigrants and the reshaping of their country rather calmly, with antiforeign movements occasionally surfacing but then quickly subsiding. Few concessions were made to the immigrant populations. English was the language of the public schools, the police, law courts, local government, and public notices and announcements. Usually the immigrant had to know some

English to hold a job. On the other hand no one was exactly forced to become “Americanized”—the new arrivals were free to maintain churches, newspapers, and social gatherings in their own tongues. The fact that the English, Scots, and Irish already spoke English, and that the Germans readily learned it, alleviated the language issue. The immigrants did not constitute minorities in the European sense. They were more than willing to embrace American national attitudes as formed in the eighteenth century—the national traditions of republicanism and self-government, of individual liberty, free enterprise, and unbounded opportunity for self-improvement. They also accepted the optimistic American creed—which preached that the future would be better than either the present or the past. The old America impressed itself on the new, being somewhat impressed itself in the process. In this sense a new nationality was steadily consolidated.

### *The Estrangement of North and South*

But at the same time the nation was falling to pieces. North and South became completely estranged. The Industrial Revolution had contrary effects on the two regions. It turned the South into an economic associate of Great Britain. The South became the world’s chief producer of raw cotton for the Lancashire mills. The Southerners, living by the export of a cash crop and producing virtually no manufactures, wished to purchase manufactured goods as cheaply as possible. Hence they favored free trade, especially with Great Britain. In the North, the Industrial Revolution led to the building of factories. Northern factory owners, usually backed by their workers, demanded protection from the inflow of British goods, with which no other country at the time could easily compete. The North therefore favored a high tariff, which the South declared to be ruinous.

More fundamental was the difference in the status of labor. As the demand for raw cotton reached unprecedented magnitudes the South fell more deeply under the great hereditary social problem of the Americas—the slave and plantation system. In the nineteenth century slavery increasingly revolted the moral conscience of thoughtful people on both sides of the Atlantic. It was abolished in the British colonies in 1833, in the French colonies in 1848, and in the Spanish American republics at different dates in the first half of the century. Similarly, serfdom was abolished in the Habsburg possessions in 1848 and in Russia in 1861. The American South could not, and after about 1830 no longer even wished to, free itself of the system. The South was the Cotton Kingdom whose “peculiar institution” controlled the unfree labor of blacks. Whites were hurt by the system as well as blacks. Few free workers could prosper alongside a mass of subservient and virtually uncompensated labor. The incoming Europeans settled overwhelmingly in the North, the South remaining more purely “Anglo-Saxon”—except that in its most densely peopled areas some half of the people were of African descent.

---

*Slave labor and the  
plantation system*

In the movement westward, common in North and South, the pressure in the South came mainly from planters wishing to establish new plantations and in the North from persons hoping to set up small farms and from businessmen bent on founding new towns, building railroads, and creating markets. As once France and Great Britain had fought for control beyond the Alleghenies, so now North and South fought for control beyond the Mississippi. In 1846 the United States made war upon Mexico by methods that anticipated the aggressive tactics that Bismarck would soon use to expand the territories of Prussia. The North widely denounced the war as an act of Southern aggression but was willing enough to take the ensuing territorial conquests, which comprised the region from Texas to the Pacific.

The first new state created in this region, California, prohibited slavery. Since 1820 the United States had held together precariously by the Missouri Compromise, under which new states, as set up in the West, were admitted to the Union in pairs, one slave and one free, so that a rough equality was maintained in the Senate and in the presidential electoral vote.

---

*The compromise of  
1850*

With the creation of California this balance of power was upset in favor of the North, so that in return, by the “compromise of 1850,” the North agreed to enforce the laws on runaway slaves to the satisfaction of the South. But the new strictness toward fugitive slaves ran against mounting anti-slavery sentiment in the North. Attempts to arrest blacks in free states and return them to slavery aroused abolitionist anger to a higher pitch. The abolitionists, a branch of the humanitarian movement then sweeping the European world, and somewhat resembling the radical democrats who came forward in Europe in 1848, demanded the immediate and total elimination of slavery, without concession, compromise, or compensation for the property interests of the slave owners. Abolitionists denounced the Union itself as the unholy accomplice in a social abomination.

By 1860 a sense of sectionalism had developed in the South not different in principle from the nationalism felt by many peoples in Europe. In their proud insistence on states’ rights and constitutional liberties, their aristocratic and warlike codes of ethics, their demand for independence from outside influence and for freedom in ruling their own subject people, the Southern white elites can be compared to the Magyars of the Austrian Empire. They now wondered whether their way of life could be safely maintained within the Union which they had helped to create. They viewed Northerners as outsiders, unsympathetic, foreign, hostile, and the South as potentially an independent and distinct nation. They were aware that within the Union they were increasingly a minority; for where in 1790 North and South had been approximately equal, by 1860 the North had outrun the South in population, mainly because of the stream of migration from Europe. The incipient nationalism of the South resembled the nationalist sentiments of a small nation struggling against a great empire. In the North, nationalism favored maintaining the whole existing territory of the United States. Northerners by 1860, with a few exceptions, refused to admit that any state of the Union could withdraw, or secede, for any reason.

In 1860 the new Republican party elected Abraham Lincoln president. It advanced a program of free Western lands for small farmers, a higher tariff, transcontinental railroad building, and economic and capitalistic development on a national scale. The new party’s radical wing, to which Lincoln himself did not belong, was vehemently abolitionist and anti-Southern in sentiment. Southern leaders, after the election of Lincoln, brought about the formal withdrawal of their states from the United States of America and the creation of the Confederate States of America reaching from Virginia to Texas. Lincoln ordered the armed forces to defend the territory of the United States, and the resulting Civil War, or war of Southern independence, lasting four years and involving battles as great as those of Napoleon, was the most harrowing struggle of the nineteenth century with the exception of the Tai-ping rebellion in China, which lasted from 1853 to 1864.

---

*Lincoln and the  
secession of the South*

European governments, while never recognizing the Confederacy, were partial to the South. The United States stood for principles still considered revolutionary in Europe, so that while the European working classes generally favored the North, the upper classes were willing enough to see the North American republic end in collapse and failure. In addition, Great Britain and France saw in the breakup of the United States the same advantages that they had formerly seen in the breakup of the Spanish empire. In the Confederate States the British, and the French to a lesser degree, expected to find another free trade

country, supplying western Europe with raw materials and buying its manufactures; in short, they saw not a competitor like the North, but a complementary partner to the industry of the Old World. It was likewise during the American Civil War that a French army sent by Napoleon III invaded Mexico to create a puppet empire under an Austrian archduke. Thus the only serious attempt to ignore the Monroe Doctrine, violate the independence of Latin America, and revive European colonialism in the Americas occurred at the time when the United States was in dissolution.

But the North won the war and the Union was upheld. The power and influence of the United States continued to grow, and people in the Americas reaffirmed their independence from the Old World. The Mexicans rid themselves of their unwanted European emperor. Tsar Alexander II sold Alaska to the United States. The war ended the idea of the Union as a confederation of member states from which members might withdraw at will. In its place triumphed the idea that the United States was a national state, composed not of member states but of a unitary people irrevocably bound together. This doctrine was written explicitly into the Fourteenth Amendment to the Constitution, which pronounced all Americans to be citizens not only of their several states but of the United States and forbade any state to “deprive any person of life, liberty or property without due process of law”—“due process” to be determined by authority of the national government. The new force of central authority was felt first of all in the South. President Lincoln, using his war powers, issued the Emancipation Proclamation in 1863, abolishing slavery in areas engaged in hostilities against the United States. The Thirteenth Amendment in 1865 abolished slavery everywhere in the country. No compensation was paid to the slave owners, who were therefore financially ruined. The abolitionist campaign for the human rights of black Americans prevailed over the historic American deference to the rights of property.

---

*The Union upheld*

### *After the Civil War: Reconstruction, Industrial Growth*

The assassination of Lincoln in 1865 by a fanatical Southern patriot strengthened those radical Republicans who said that the South must be drastically reformed. With the old Southern upper class completely ruined, Northerners of many types poured into the defeated country. Some came to represent the federal government, some to dabble in local politics, some to make money, and a great many out of democratic and humanitarian impulses to teach the distressed ex-slaves the elements of reading and writing or of useful trades. Blacks in the South voted, sat in legislatures, and occupied public office. This period, called Reconstruction, may be compared to the most advanced phase of the French Revolution in that “radical republicans” undertook to press liberty and equality upon a recalcitrant country, under conditions of emergency rule and under the auspices of a highly centralized national government with a mobilized army. The Southern whites strenuously objected. Some of the Northern radicals discredited themselves and most gradually lost their zeal. Reconstruction was abandoned in the 1870s, and, by what Europeans would call a counterrevolution, the Southern whites and even members of the old planter class gradually regained control.

The Northern business interests—financiers, bankers, company promoters, railway builders, manufacturers—expanded greatly with the wartime demand for munitions and military provisioning. They received protection by the Morrill tariff of 1861. In the next year, partly as a war measure, the Union Pacific Railroad was incorporated, and in 1869, at a remote spot in Utah, the last spike was driven in the first railroad to span the American continent. The

The victories of Union armies during the American Civil War preserved the unity of the United States and also gave the national government the power to abolish slavery. This illustration from a French journal in 1863 provides a European image of newly freed people celebrating President Lincoln's Emancipation Proclamation and leaving the places where they had been enslaved. Lincoln's proclamation is posted on the side of the coach.

Homestead Act, providing farms to settlers on easy conditions, and the granting of public lands to certain colleges (ever since called land-grant colleges), largely for the promotion of agricultural sciences, encouraged the push of the eastern population into the West. Vast tracts of land were given by the government to subsidize railway building. With the destruction of the Southern slaveholders, who before the war had counterbalanced the rising industrialists, it was now industry and finance that dominated national politics in the increasingly centralized United States. The Fourteenth Amendment, for many years, was mainly interpreted not to protect the civil rights of individual persons but the property rights of business corporations against restrictive legislation by the states. The shift of

political power from the states to the federal government accompanied and protected the shift of economic enterprise from local businesses to far-flung and continent-embracing corporations. As in France under Napoleon III, there was a good deal of corruption, fraud, speculation, and dishonestly or rapaciously acquired wealth; but industry boomed, the cities grew, and the American mass market was created. On Fifth Avenue in New York, and in other Northern cities, rose the pretentious and gaudy mansions of the excessively rich.

In short, the American Civil War, which might have reduced English-speaking America to a scramble of jealously competing minor republics, resulted instead in the economic and political consolidation of a large nation-state, liberal and democratic in its political principles, and committed enthusiastically to private enterprise in its economic system.

## 68. THE DOMINION OF CANADA, 1867

North of the United States, at the time of the Civil War, lay a number of British provinces unconnected with one another and each in varying degree dependent on Great Britain. The European population in this vast territory had originated in three great streams. One part was French, settled in the St. Lawrence valley since the seventeenth century. A second part was made up of descendants of United Empire Loyalists, old seaboard colonists who, remaining faithful to Britain, had fled from the United States during the American Revolution. They were numerous in the Maritime Provinces and in Upper Canada, as Ontario was then called (see map, p. 524). A third part consisted of recent immigrants from Great Britain, men and women of the working classes who had left the home country to improve their lives in America.

The French firmly resisted assimilation to the English-speaking world around them. Their statute of freedom was the Quebec Act of 1774, which had been denounced as "intolerable" by the aroused inhabitants of the thirteen colonies, but which put the French civil law, French language, and French Catholic church under the protection of the British Crown. The French looked with apprehension upon the stream of immigrants, English-speaking and Protestant, which began to flow into Canada about 1780 and thereafter never stopped. There was constant irritation between the two nationalities.

---

*French resistance to  
assimilation*

The British government tried various expedients. In 1791 it created two provinces in the St. Lawrence and Great Lakes region—a Lower Canada to remain French, and an Upper Canada to be English. They received the same form of government as that enjoyed by the thirteen colonies before their break from the empire. Each colony, that is, had a locally elected assembly with certain powers of taxation and lawmaking, subject to veto by the British authorities, as represented either by the governor or by the London government itself. For many years there was no objection to these arrangements. The War of 1812, in which the United States embarked on the conquest of Canada, aroused a national sentiment among both French and English in that country, together with a willingness to depend politically upon Great Britain for military security. But the internal political differences continued. In Lower Canada the French feared the English-speaking minority. In Upper Canada the old aristocracy of United Empire Loyalists, who had carved the province from the wilderness, hesitated to share control with the new immigrants from Great Britain. Between the provinces there were grievances also, since Lower Canada stood in the way of Upper Canada's outlet to the sea. In 1837 a superficial rebellion broke out in both provinces. It was put down virtually without bloodshed.

---

*Upper and Lower  
Canada*

### Lord Durham's Report

In Great Britain at this time the reforming Whigs were busily renovating many ancient English institutions. Some of them had definite views on the administration of colonies. In general, they held that it was not necessary to control a region politically to trade with it. This was an aspect of the free trade doctrine, separating economics from politics, business from power. The Whig reformers were rather indifferent to empire, unconcerned with military, naval, or strategic considerations. A few even thought it natural for colonies, when mature, to drop away entirely from the mother country. Whigs, liberals, and radicals all wished to economize on military expenditure, to relieve British taxpayers by cutting down British garrisons overseas.

After the Canadian insurrection of 1837 the Whig government sent out the Earl of Durham as governor. Durham, one of the framers of the parliamentary Reform Bill of 1832, published his views on Canadian affairs in 1839. Durham's Report was long regarded as one of the classic documents in the rise of the British Commonwealth of Nations. He held that in the long run French separatist feeling in Canada should disappear and all Canadians should be brought to feel a common citizenship and national character.

He therefore called for the reuniting of the two Canadas into one province. To consolidate this province he proposed an intensive development of railways and canals. In political matters he urged the granting of virtual self-government for Canada and the introduction of the British system of "responsible government," in which the prime minister and cabinet should

be responsible to and under the control of the elected assembly in the province, the governor becoming a kind of legal and ceremonial figure like the sovereign in Great Britain.

Most of Durham's Report was accepted immediately. Upper and Lower Canada were combined into one province, with the machinery of self-government, in 1840. The British army was withdrawn. The Canadians undertook to maintain their own military establishment, still regarded as necessary, since the era of the famous undefended frontier between Canada and the United States had not yet dawned. The principle of responsible government was established in the late 1840s, the governors of Canada allowing the elected assembly to adopt policies and appoint or remove ministers as it chose. Responsible government, still confined to internal matters, worked satisfactorily from the beginning. But one feature of the new plan, the union of the two Canadas, began to produce friction as the

English-speaking immigration continued. The French were afraid of being outnumbered in their own country. Many Canadians therefore turned to the idea of a federation, in which the French and English areas might each conduct their own local affairs, while remaining joined for larger purposes in a central government.

### Founding of the Dominion of Canada

Federalism in Canada was thus partly a decentralizing idea, aimed at satisfying the French element by returning to a division into two provinces, and in part a plan for a new centralization or unification, because it contemplated bringing all the provinces of British North America into union with the St. Lawrence and Great Lakes region, to which alone the term Canada had hitherto been applied. While the people of British North America discussed federation, the Civil War was tearing apart the United States. In the face of this example, the Canadians formed a strong union in which all powers were to rest in the central government except those specifically assigned to the provinces. The federal constitution, drafted in

---

*Call for reuniting the provinces*

---

*The appeal of a federation*

The Dominion of Canada united English and French provinces under a federal constitution. The French-Canadian Prime Minister Wilfred Laurier, pictured here toward the end of his long political career in the early twentieth century, helped extend the union of the English and French populations from a constitutional document into the daily affairs of a modern national government.

(Getty Images)

Canada by Canadians, was passed by the British Parliament in 1867 as the British North America Act, which constitutionally established the Dominion of Canada. The eastern maritime provinces (Nova Scotia, New Brunswick, and Prince Edward Island) joined Quebec and Ontario in the Dominion, and the new political arrangements facilitated Canada's rapid westward expansion to the Pacific coast. In 1982 the British North America Act was replaced by a new agreement, which explicitly recognized the sovereign independence of Canada and its power to frame a constitution for itself. By the 1980s, however, the French speakers of Quebec had become more determined to defend the autonomy of their own province and culture, so it was again necessary to recognize a special status for Quebec. The western provinces had also grown and become more protective of their interests. The relationship between the central and provincial governments, along with bilingualism, or the equal recognition of the French and English languages, has never been completely resolved.

By the legislation of 1867 the new dominion received a common federal parliament, in which a ministry responsible to the majority in parliament governed according to British principles of "responsible," or cabinet, government. The new Canadian government was generally controlled by the Conservative Party, but the Liberal Party eventually came to a long term of power (1896–1911) under the leadership of an energetic French Canadian named Wilfred Laurier, whose political prominence showed the increasing collaboration between the French and English populations. The Dominion of Canada, though at first not large in population, possessed from the beginning a significance beyond the mere number of its people. It was the first example of successful devolution, or granting of political liberty, within one of the European colonial empires. It embodied principles which Edmund Burke and Benjamin Franklin had vainly recommended a century before to keep the thirteen colonies loyal to Great Britain. The dominion after 1867 moved forward from independence in internal matters to independence in such external affairs as tariffs, diplomacy, and the decisions of war and peace. It thus pioneered in the development of "dominion status," working out precedents later applied in Australia (1901), New Zealand (1907), the

Pioneering dominion  
status

Union of South Africa (1910), and in the 1920s, temporarily, in Ireland. By the middle of the twentieth century the same idea, or what may be called the Canadian idea, was also applied to the worldwide process of decolonization as it affected non-European peoples, notably in India, Pakistan, Sri Lanka, and the former British colonies in Africa, until all these peoples chose to become republics, though still loosely and voluntarily joined together and to Great Britain in a Commonwealth of Nations.

More immediately, in America, the founding of the dominion, a solid band of self-governing territory stretching from ocean to ocean, stabilized the relations between British North America and the United States. The United States regarded its northern borders as final. The withdrawal of British control from Canadian affairs also furthered the long-developing conception of an American continent entirely free from European political influence.

## 69. JAPAN AND THE WEST

The Japanese, when they allowed the Westerners to discover them, were a highly civilized people living in a complex society. They had many large cities, they enjoyed the contemplation of natural scenery, they went to the theater, and they read novels. With their stylized manners, their fans and their wooden temples, their lacquer work and their painting on screens, their tiny rice fields and their curious and ineffectual firearms, they seemed to Europeans to be the very acme of everything quaint. This European view of traditional Japan is immortalized in *The Mikado* of Gilbert and Sullivan, first performed in 1885. Not long thereafter the idea of Japanese quaintness, like the idea of the Germans as an impractical people given mainly to music and metaphysics, had to be revised. The Europeans, in “opening” Japan, opened up more than they knew.

In 1853, the American Commodore Perry forced his way with a fleet of naval vessels into Yedo Bay, insisted upon landing, and demanded of the Japanese government that it engage in commercial relations with the United States and other Western powers. In the next year the Japanese began to comply, and in 1867 an internal revolution took place, of which the most conspicuous consequence was a rapid modernizing of Japanese life and institutions. But if it looked as if the country had been “opened” by Westerners, actually Japan had exploded from within.

### *Background: Two Centuries of Isolation, 1640–1854*

For over two centuries Japan had followed a program of self-imposed isolation. No Japanese was allowed to leave the islands or even to build a ship large enough to navigate the high seas. No foreigner, except for handfuls of Dutch and Chinese, was allowed to enter. Japan remained a sealed book to the West. The contrary is not quite so true, for the Japanese knew rather more about Europe than Europeans did about Japan. The Japanese policy of systematic exclusions was not merely based upon ignorance. Initially, at least, it was based on experience.

The first Europeans — three Portuguese in a Chinese junk — are thought to have arrived in Japan in 1542. For about a century thereafter there was considerable coming and going.

The Japanese showed a strong desire to trade with the foreigners, from whom they obtained clocks and maps, learned about printing and ship-building, and took over the use of tobacco and potatoes. Thousands also adopted the Christian religion as preached to them by Spanish and Por-

## CHRONOLOGY OF NOTABLE EVENTS, 1853–1871

---

1853	American Commodore Perry arrives in Yedo (Tokyo) Bay, “opening” Japan to foreign commercial exchanges
1854–1856	France and Britain join with Turkey to defeat Russia in the Crimean War
1861	Italians establish the unified Kingdom of Italy
1861	Tsar Alexander II abolishes serfdom in Russia
1861–1865	Civil War in the United States; federal union is upheld and slavery is abolished
1867	Austria and Hungary join together in “Dual Monarchy” under the Habsburg ruler Francis Joseph
1867	Creation of the independent Dominion of Canada
1868	New Japanese emperor Mutsuhito begins the Meiji era; Japan enters process of rapid economic and political change
1870	Prussia defeats France in brief war; Napoleon III abdicates and Parisians proclaim a Third French Republic
1871	King Wilhelm of Prussia becomes emperor in newly established German Empire

---

tuguese Jesuits. Japanese traveled to the Dutch Indies and even to Europe. The Japanese in fact proved more receptive to European ideas than other Asian peoples. But shortly after 1600 the government began to drive Christianity underground; in 1624 it expelled the Spaniards, in 1639 it expelled the Portuguese, and in 1640 it expelled all Europeans except for a few Dutch merchants who were allowed to remain at Nagasaki under strict control. From 1640 to 1854 these few Dutch at Nagasaki were the only channel of communication with the West.

The reasons for self-seclusion, as for its abandonment later, arose from the course of political events in Japan. The history of Japan showed some similarities to that of Europe. In Japan, as in Europe, a period of feudal warfare was followed by a period of government absolutism, during which civil peace was kept by a bureaucracy, an obsolescent warrior class was maintained as a privileged element in society, and a commercial class of native merchants grew wealthier, stronger, and more insistent upon its position.

When the first Europeans arrived, the islands were still torn by the wars and rivalries of the numerous clans into which the Japanese were organized. Gradually one clan, the Tokugawa, gained control, taking over the office of “shogun.” The shogun was a kind of military head who governed in the name of the emperor, and the hereditary Tokugawa shogunate, founded in 1603, lasted until 1867. The early Tokugawa shoguns concluded from a good deal of evidence that the Europeans in Japan, both merchants and missionaries, were engaging in feudal or interclan politics and even aspiring to dominate Japan by helping Christian or pro-European Japanese to get into power. The first three Tokugawa shoguns, to establish their own dynasty, to pacify and stabilize the country, and to keep Japan free from European penetration, undertook to eliminate Christianity and adopted the rigid policy of non-intercourse with the rest of the world.

---

*The Tokugawa shoguns*

Under the Tokugawa Japan enjoyed peace, a long peace, for the first time in centuries. The Tokugawa shoguns completed the detachment of the emperor from politics, building him up as a divine and legendary being, too august and too remote for the hurly-burly of

the world. The emperor remained shut in at Kyoto on a modest allowance furnished by the shoguns. The shoguns established their own court and government at Yedo (later called Tokyo); and as Louis XIV brought nobles to Versailles, or Peter the Great forced his uncouth lords to build town houses in St. Petersburg, so the shoguns required the great feudal chieftains and their men-at-arms to reside at least part of the year in Yedo.

---

*Military dictatorship*

The shoguns administered the country through a kind of military bureaucracy or dictatorship. This formidable instrument of state watched over the great lords (called daimyo), who, however, retained a good deal of feudal authority over their subjects in the regions most distant from Yedo.

The great lords and their armed retainers (the samurai), having no further fighting to occupy them, turned into a landed aristocracy which spent a good deal of its time in Yedo and other cities. As a leisure class, they developed new tastes and standards of living and hence needed more income, which they obtained by squeezing the peasants, and which they spent by buying from the merchants.

---

*Class divisions*

The merchant class greatly expanded by catering to the government and the gentry. Japan in the seventeenth century developed a money economy. Many lords fell seriously into debt to the merchants. Many samurai, like lesser nobles in France, Spain, or Poland at the time, were almost ridiculously impoverished, hard-pressed to keep up appearances, with nothing except social status to distinguish them from commoners. The law, as in Europe under the Old Regime, drew a sharp line between classes. Nobles, merchants, and peasants were subject to different taxes and were differently punished for different offenses. What was a crime for a commoner would be excusable for a samurai; or what in a samurai would be a punishable breach of honor would be accepted in a commoner. The samurai had the right to carry two swords as a mark of class and could in theory cut down an impudent commoner without arousing further inquiry. In practice the shoguns repressed violence of this kind, but there was much less development of law and justice than in the European monarchies of the Old Regime. Economically the merchants and artisans prospered. By 1723 Yedo was a city with 500,000 people; by 1800 with over 1,000,000, it was larger than London or Paris, and 20 times as large as the largest city in the United States. After 1800 some merchants were able to purchase the rank of samurai for money. The old class lines were beginning to blur.

---

*Secularization and Shinto*

Though deliberately secluded, the economic and social life of Japan was thus by no means static. The same is true of its intellectual life. Buddhism, the historic religion, lost its hold on many people during the Tokugawa period, so that Japan in its way underwent, like the West, a secularization of ideas. As a code of personal conduct there was a new emphasis on Bushido, the “way of the warrior,” a kind of nonreligious moral teaching which exalted the samurai virtues of honor and loyalty. With the decline of Buddhism went also a revival of the cult of Shinto, the “way of the gods,” the ancient indigenous religion of Japan, which held, among much else, that the emperor was veritably the Son of Heaven. There was much activity in the study and writing of history, arousing, as in Europe, an acute interest in the national past. History, like Shinto, led to a feeling that shoguns were usurpers and that the emperor, obscurely relegated to Kyoto, was the true representative of everything highest and most lasting in the life of Japan.

Meanwhile, through the crack left open at Nagasaki, Western ideas trickled in. The shogun Yoshimune in the mid-eighteenth century permitted the importation of Occidental books, except those relating to Christianity. A few Japanese learned Dutch and began to decipher Dutch books on anatomy, surgery, astronomy, and other subjects. In 1745 a

Dutch-Japanese dictionary was completed. For European manufactures also—watches, glassware, velvets, woolens, telescopes, barometers—there came to be an eager demand, satisfied as much as possible by the methodical Dutch. Nor were the Japanese wholly uninformed about politics in the West. While the most assiduous Westerner could learn nothing of the internal affairs of Japan, an educated Japanese could, if he wished, arrive at some idea of the French Revolution, or know who was president of the United States.

### *The Opening of Japan*

When Perry sailed into Yedo Bay in 1853, he therefore had many potential allies within Japan. There were nobles, heavily in debt, unable to draw more income from agriculture, willing to embark upon foreign trade and to exploit their property by introducing new enterprises. There were penurious samurai, with no future in the old system, ready and willing to enter upon new careers as army officers or civil officials. There were merchants hoping to add to their business by dealing in Western goods. There were scholars eager to learn more of Western science and medicine. There were patriots fearful that Japan was becoming defenseless against Western guns. Spiritually the country was already adrift from its moorings, already set toward a course of national self-assertion, restlessly susceptible to hazily understood new ideas. Under such pressures, and from downright fear of a bombardment of Yedo by the Americans, which if it would not subdue Japan would at least ruin the declining prestige of the shogunate, the shogun Iesada in 1854 signed a commercial treaty with the United States. Similar treaties were soon signed with the Europeans.

In the following years were sown the seeds of much later misunderstanding between Japan and the West. The Europeans and Americans tended to be trigger-happy in the discharge of naval ordnance against less well-armed peoples. The Japanese, a proud and elaborately civilized nation, soon found that Western people considered them backward. They quickly found, for example, as soon as they learned more of the West by reading and travel, that the treaties they signed in the 1850s were not treaties between equals as understood in the West. These first treaties provided that Japan should maintain a low tariff on imports and not change it except with the consent of the foreign powers. To give outsiders a voice in determining tariff policy was not the custom among sovereign states of the West. The early treaties also provided for extraterritoriality. This meant that Europeans and Americans residing in Japan were not subject to Japanese law but remained under the jurisdiction of their respective homelands as represented by consular officials. Such extraterritorial provisions had long been established in Turkey and were currently taking root in China. Europeans insisted upon them in countries where European principles of property, debt, or security of life and person did not prevail. At the same time, of course, no European state ever permitted a foreign power to exercise jurisdiction within its borders. Extraterritoriality was a mark of inferiority, as the Japanese soon discovered.

---

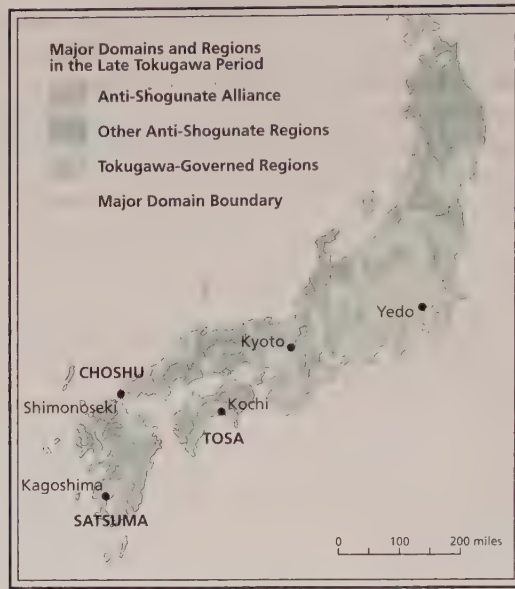

*The seeds of conflict*

A strong antiforeign reaction developed after 1854. It was at first led by certain nobles of the western islands, the lords of Choshu and Satsuma, who had never been fully subordinated to the shogun at Yedo, and who now dreamed of overturning the Tokugawa shogunate and leading a national revival with the emperor as its rallying point. Their first idea was to check Western penetration (as two and a half centuries before) by driving the Westerners out. But in 1862 some Englishmen unintentionally violated a small point of Japanese etiquette. One of them was killed. The

*Antiforeign reaction*

### JAPAN IN THE LATE TOKUGAWA PERIOD

The Tokugawa regime lasted from 1603 to 1867. The map shows the divisions and power rivalries within Japan around the time that Western nations began to enter the region in the mid-nineteenth century. The Tokugawa shogunate controlled the territory around Yedo (later called Tokyo), but independent nobles in Choshu, Satsuma, and other parts of the country controlled large areas that the shogun at Yedo could not bring under his authority. As the Western powers entered Japan after 1854, a strong demand for reforms emerged in Choshu and Satsuma, leading to the overthrow of the Tokugawa shogun in 1867, the establishment of a new national (“Meiji”) government, and the rapid development of a new industrial economy.

British government demanded punishment for the offending Japanese, who were followers of the lord of Satsuma. The shogun proved unable to arrange this, and the British navy thereupon bombarded the capital of Satsuma. In the same year the lord of Choshu, who commanded the straits of Shimonoseki with some ancient artillery, ordered it to fire on passing vessels. The British, French, Dutch, and United States governments immediately protested, and, when the embarrassed shogun proved unable to discipline Choshu, they dispatched an allied naval force to Shimonoseki. The forts and shipping of Choshu were destroyed, and an indemnity of \$3,000,000 was imposed. These incidents were remembered in Japan long after they were forgotten in Europe and the United States. It was likewise remembered that the Western powers, discovering that the shogun was not the supreme ruler of the country, sent a naval expedition to Kyoto itself and required the emperor to confirm the treaties signed by the shogun and to reduce import duties, under threat of naval bombardment.

### *The Meiji Era (1868–1912): The Modernization of Japan*

The lords of Choshu and Satsuma now concluded that the only way to deal with the West was to adopt the military and technical equipment of the West itself. They would save Japan for the Japanese by learning the secrets of modern Western power. First they forced

the resignation of the shogun, whose prestige had long been undermined anyway and who had now discredited himself first by signing undesirable treaties with the West and then failing to protect the country from outrage. The last shogun abdicated in 1867. The reformers declared the emperor restored to his full authority. It was their intention to use the imperial throne to consolidate and fortify Japan for its new position in the world. In 1868 a new emperor inherited the throne; his name was Mutsuhito; according to Japanese custom a name was given to his reign also, which was called Meiji ("enlightened peace"). The Meiji era (1868–1912) was the first great era of modernization in Japan.

Japan turned into a modern nation-state. Feudalism was abolished, most of the great lords voluntarily surrendering into the emperor's hands their control over samurai and common people. "We abolish the clans and convert them into prefectures," declared one imperial decree. The legal system was reorganized and equality before the law was introduced, in the sense that all persons became subject to the same rules regardless of class. In part with the hope of getting rid of extraterritoriality, the reformers recast the criminal law along Western lines, deleting the bizarre and cruel punishments which Europeans considered barbaric. A new army was established, modeled mainly on the Prussian. The samurai in 1871 lost his historic right to carry two swords; he now served as an army officer, not as the retainer of a clannish chief. A navy, modeled on the British, followed somewhat later. Control of money and currency passed to the central government, and a national currency with decimal units was adopted. A national postal service began to function, and above all the government developed a national school system, which soon brought a high rate of literacy to Japan. Buddhism was discouraged, and the property of Buddhist monasteries was confiscated. Shinto was the cult favored by the government. Shinto gave a religious tincture to national sentiment and led to a renewed veneration of the imperial family.

---

*A modern nation-state*

In 1889 a constitution was promulgated. It confirmed the civil liberties then common in the West and provided for a parliament in two chambers, but it stressed also the supreme and eternal authority of the emperor, to whom the ministers were legally responsible. In practice, in the new Japan, the emperor never actively governed. He remained aloof, as in the past; and political leaders, never fully responsible to the parliament, tended to govern freely in what they conceived to be the interests of the state.

Industrial and financial modernization went along with and even preceded the political revolution. In 1858 the first steamship was purchased from the Dutch. In 1859 Japan placed its first foreign loan, borrowing five million yen by a bond issue floated in England. In 1869 the first telegraph connected Yokohama and Tokyo. The first railroad, between the same two cities, was completed in 1872. In 1870 appeared the first spinning machinery. Foreign trade, almost literally zero in 1854, was valued at \$200 million a year by the end of the century. The population rose from 33 million in 1872 to 46 million in 1902. The island empire, like Great Britain, became dependent on exports and imports to sustain its dense population at the level of living to which it aspired.

---

*Industrial and financial modernization*

The modernization of Japanese society still stands as the most remarkable transformation ever undergone by any people in so short a time. It recalls the "westernizing" of Russia under Peter over a century before, though conducted somewhat less brutally, more rapidly, and with a wider consent among the population. For Japan, as formerly for Russia, the motive was in large measure defense against Western penetration, together with an admiration for Western statecraft and an ambition to become an international power. The new government institutions helped to produce a more unified nation-state of the type then

Distinctive characteristics of Japan's new industrial economy appear in this illustration of a silk reeling factory by the artist Ichiyosai. Working in a Western-style brick building under the supervision of factory foremen, women produce silk within the structures of a modern industrial system, but they continue to wear Japanese clothing (in contrast to the visitors in the left foreground), thereby expressing the cultural mixtures of an older society and a new economic order.

(Laurie Platt Winfrey, Inc.)

developing throughout Europe and the Americas. What the Japanese wanted from the West was primarily science, technology, and organization. They were content enough with the innermost substance of their culture, their moral ideas, their family life, their arts and amusements, their religious conceptions, though even in these they showed an uncommon adaptability. Essentially it was to protect their internal substance, their Japanese culture, that they took over the external apparatus of modern Western civilization. This apparatus—science, technology, machinery, arms, political and legal organization—was the part of Western civilization for which other peoples generally felt a need, which they hoped to adopt without losing their own cultural and spiritual independence, and which therefore, though sometimes rather scornfully dismissed as materialistic, became the common ground for the interdependent worldwide civilization that emerged at the close of the nineteenth century.

In brief, the world between 1850 and 1870, revolutionized economically by the railroad and steamship, was revolutionized politically by the formation and expansion of large, consolidated nation-states. These states at the time all embodied certain liberal and constitutional principles, or at least the machinery of parliamentary and representative government. But the whole earth had also become an arena in which certain nations or powers sought to promote their economic and political interests. The Great Powers in 1871 were Great Britain, Germany, France, Austria-Hungary, and Russia. Britain had produced a daughter nation in Canada. Whether Italy was to be called a Great Power was not yet clear. No one knew what Japan would do. All agreed that the United States would one day play a large role in international affairs, but the time was not yet.

# EUROPEAN CIVILIZATION, 1871–1914: ECONOMY AND POLITICS

- 
- 70. The Modern "Civilized World"
  - 71. Basic Demography: The Increase of the Europeans
  - 72. The World Economy of the Nineteenth Century
  - 73. The Advance of Democracy: Third French Republic, United Kingdom, German Empire
- 

*Half a century* elapsed between the period of national consolidation described in the last chapter and the outbreak of the First World War in 1914. In this half-century European civilization achieved its greatest power in global politics, developed its leading role in the global economy, and also exerted its maximum influence upon peoples outside Europe.

For Europe and the European world the years 1871 to 1914 were marked by hitherto unparalleled material and industrial growth; international peace; domestic stability; the advance of constitutional, representative, and democratic government; and continued faith in science, reason, and progress. But in these very years, in politics, economics, philosophy, and the arts, there were also new trends

operating to undermine the liberal premises and tenets of this European civilization. Meanwhile, a new wave of European imperialism spread across Africa and Asia, creating new colonial empires, new global economic connections, and new international and cultural conflicts. All of these developments contributed to and reflected the European ascendancy before 1914, and all produced a legacy that has decisively influenced the modern world down to our own time.

For purposes of historical analysis, we must separate this complex era into different thematic strands. This chapter therefore examines economic and political trends in Europe after 1871, the next describes European social and cultural movements in this era, and the following one discusses the worldwide impact of European imperialism. By 1914, the institutions and ideas of modern European civilization were spreading across most of the world, but these same institutions and ideas were also facing new critical challenges from within Europe and from people on other continents who resented the European domination of their economies, governments, and cultures.

## 70. THE MODERN "CIVILIZED WORLD"

### *Materialistic and Nonmaterialistic Ideals*

With the extension of the nation-state system Europe was politically more divided than ever. Its unity lay in the sharing by almost all Europeans of a similar way of life and outlook, which existed also in such "European" countries as the United States, Canada, Australia, and New Zealand. Europe and its offshoots constituted what Europeans and North Americans called the "civilized world" or the "West." Other regions—mostly in Asia, Africa, and Latin America—were described by Europeans as "backward." Europeans and other Westerners were extremely conscious and inordinately proud of their civilization in the half-century before 1914. They believed it to be the well-deserved outcome of centuries of progress. Believing themselves to be the most advanced branch of mankind in the most important areas of human endeavor, they assumed that all peoples should respect the same social ideals—that so far as they were unwilling or unable to adopt them, they were "backward," and that so far as they did adopt them, they became "civilized" in their turn.

Such ideas shaped the ideology and practice of imperialism, which entered a dynamic new phase in the late nineteenth century.

---

*The ideal of civilization*

The ideals of European or "Western" civilization were in part materialistic. If Europeans and Westerners considered their civilization to be better in 1900 than in 1800, or better than the ways of non-Western peoples at the same time, it was because they generally had a higher standard of living,

ate and dressed more adequately, slept in softer beds, and had more satisfactory sanitary facilities. It was because they possessed ocean liners, railroads, and streetcars and after about 1880, telephones and electric lights. But the ideal of civilization was by no means exclusively materialistic. Knowledge as such, correct or truthful knowledge, was held to be a civilized attainment—scientific knowledge of nature, in place of superstition or demonology; geographical knowledge, by which civilized people were aware of the earth as a whole with its general contours and diverse inhabitants. The ideal was also profoundly moral, derived from Christianity, but now secularized and detached from religion. An Englishman, Isaac Taylor, in his *Ultimate Civilization*, published in 1860, defined this moral ideal by listing the contrasting "relics of barbarism" which he thought were due to disappear—"Polygamy, Infanticide, Legalized Prostitution, Capricious Divorce, Sanguinary and Immoral Games, Infliction of Torture, Caste and Slavery." Several of these had been unknown to the approved customs of Europe at least since the coming of Christianity (though prostitution was more or less tolerated in almost all European societies). Torture went out of use about 1800, even in the illiberal European states; and legalized caste and slavery were gradually abolished by Western countries in the course of the nineteenth century. But there were few non-Western peoples, in 1860, among whom two or three of Taylor's "relics" could not be found.

---

*Indices of advancement*

There are certain other indices, more purely quantitative, worked out by sociologists to show the level of advancement of a given society. One of these is the death rate, or number of persons per thousand of population who

die each year. In England, France, and Sweden the "true" death rate (or death rate regardless of the proportion of infants and old people, who are most susceptible to death) is known to have fallen from about 25 (per 1,000 per year) before 1850, to 19 in 1914 and 18 in the 1930s. Indeed, before the Second World War, it stood seemingly stabilized at about 18 in all countries of northwestern Europe, the United States, and the British dominions.

Death rates in countries not "modern" usually run over 40 even in favorable times. A closely related index is infant mortality, which fell rapidly after 1870 in all countries affected by medical science. Thus a woman under more modern conditions had to go through pregnancy and childbirth less often to produce the same number of surviving children. Another index is life expectancy, or the age that a person has an even chance of attaining. In England life expectancy at birth rose from 40 years in the 1840s to 59 in 1933 and to 78 at the beginning of the twenty-first century. In India in 1931 it was less than 27 years. It had risen to about 62 in 2001. Still another index is the literacy rate, or proportion of persons above a certain age (such as ten) able to read and write. In northwestern Europe by 1900 the literacy rate approached 100, whereas in some countries of the world it had still not risen very far above zero. A further basic index is the productivity of labor, or amount produced by one worker in a given expenditure of time. This is difficult to compute, especially for earlier periods for which statistical data are lacking. In the 1930s, however, the productivity of a farmer in Denmark was over ten times that of a farmer in Albania. All northwestern Europe was above the European average in this respect with the exception of Ireland, whereas Ireland, Spain, Portugal, Italy and all eastern Europe were below it.

The essence of civilized living doubtless is in the intangibles, in the way in which people use their minds and in the attitudes they form toward others or toward the conditions and planning of their own lives. The intangibles, however, are not always agreed upon by persons of different cultures or ideologies. On the quantitative criteria there is less disagreement; all, with few exceptions, wish to lower the death rate, raise the literacy rate, and increase the productivity of human exertion. Whatever we might say about the intangible qualities of a civilized society, if we apply quantitative or sociological indices alone, we can say that for about four decades after 1870 Europe was in fact (and not merely in the opinion of Europeans) the center of a modern civilization that was expanding rapidly around the world.

### *The "Zones" of Civilization*

Or rather, a certain region of Europe was the center. For there were really two Europes, an inner zone and an outer. A Frenchman writing in the 1920s describing the two Europes that had risen since 1870, called the inner zone the "Europe of steam," and bounded it by an imaginary line joining Glasgow, Stockholm, Danzig, Trieste, Florence, and Barcelona. It included not only Great Britain but Belgium, Germany, France, northern Italy, and the western portions of the Austrian Empire. Virtually all heavy European industry was located in this zone. Here the railway network was thickest. Here the wealth of Europe was concentrated, in the form both of a high living standard and of accumulations of capital. Here likewise were almost all the laboratories and scientific activity of Europe. Here, in the same zone, lay the strength of constitutional and parliamentary government and of liberal, humanitarian, socialist, and reformist movements of many kinds. In this zone the death rate was low, life expectancy was high, conditions of health and sanitation were at their best, literacy was almost universal, productivity of labor was impressive. To the same zone, for practical purposes, belonged certain regions of European settlement overseas, especially the post-Civil War United States.

The outer zone included most of Ireland, most of the Iberian and Italian peninsulas, and all Europe east of what was then Germany, Bohemia, and Austria proper. The outer zone was agricultural, though the productivity of agriculture, per farm worker or per acre, was far less than in the inner zone. The people were poorer, more illiterate, and more likely to die young. The wealthy were landlords, often absentees.

---

*The outer zone*

### TRAIN IN THE SNOW

by Claude Monet (French, 1840–1926)

Trains became one of the new symbols of modernity during the nineteenth century, but few artists saw them as appropriate subjects for paintings. Monet and other Impressionists, however, wanted to apply their artistic techniques to the familiar objects of everyday life, including the iron shapes of a passing locomotive. In this typical Impressionist rendering of modern technology, the solid mass of the train melts into the play of light and the indeterminate grays of a dull winter day.

(Giraudon/Art Resource, NY)

The outer zone lived increasingly after 1870 by selling grain, livestock, wool, or lumber to the more industrialized inner zone but was too poor to purchase many manufactured products in return. To obtain capital it borrowed in London or Paris. Its social and political philosophies were characteristically imported from Germany and the West. It borrowed engineers and technicians from the first zone to build its bridges and install its telegraph systems and sent its youth to universities in the first zone to study medicine or other professions. Many areas of European settlement overseas, for example in Latin America and the agrarian parts of the United States, may also be thought of at that time as belonging to this outer zone.

Beyond the European world lay a third zone, the immense reaches of Asia and Africa, all viewed as “backward” by the standards or cultural assumptions of Europe, with the exception of modernizing Japan, and destined for the most part to become heavily dependent upon or colonized by Europe in the half-century after 1870. Much of the world’s history since 1870 could be written as the story of relations among these three zones; but it is necessary in all human matters to guard against formulas that are too simple. And there are always changes as well as continuities in the histories of all human societies.

## 71. BASIC DEMOGRAPHY: THE INCREASE OF THE EUROPEANS

### *European and World Population Growth since 1650*

All continents except Africa gained enormously in population in the three centuries following 1650, but it was Europe that grew the most. There is little doubt that the proportion of Europeans in the world’s total, including those of European origin in other continents, reached its maximum for all time between 1850 and the Second World War. Estimates are given in the table on page 566, beginning with 1650.

The causes of the rise in population after 1650 cannot be positively known. Some of them obviously operated in Asia as well as Europe. In Europe the organized sovereign states, as established in the seventeenth century, put an end to a long period of civil wars, stopping the chronic violence and marauding, with the accompanying insecurity of agriculture and family life, which were more deadly than wars fought between governments. Similarly, the Tokugawa kept peace in Japan, and the Manchu or Qing dynasty (1644–1912) brought a long period of order in China. The British rule in India and the Dutch in Java, by curbing famine and violence, allowed populations to grow very rapidly. All such factors, which allowed more people to remain alive longer, also favored the stability of families and the birth and raising of children. Death rates could fall and birth rates could rise from similar causes. The great exception to the swelling rise of population was Africa, where the slave trade removed over 10 million people (and what would have been an even larger number of their descendants) in three or four centuries, and where slave raiding led to the disruption of African cultures. In the Americas the native Indians were devastated by diseases brought from Europe to which at first they had no immunity.

---

*Causes of  
demographic growth*

---

In Europe, sooner than elsewhere, other causes of growth were at work beyond the maintenance of civil peace. They included liberation from certain endemic afflictions, beginning with the subsiding of bubonic plague in the seventeenth century and the use of vaccination against smallpox in the eighteenth. Agricultural improvement produced more food, notably in England about 1750. The improvement of transportation by road, canal, and railroad made localized famine a thing of the past, since food could be moved into areas of temporary shortage. With the Industrial Revolution larger populations could subsist in Europe by importing food from overseas. In the cities of Europe and North America, by 1900, the supply of pure drinking water and facilities for the disposal of garbage and sewage were better than in the past.

---

*Improved living  
conditions*

---

Hence population grew for several generations more substantially in Europe and its offshoots than elsewhere. Approximate percentages are given in the table. Asia, by these estimates, increased less than threefold between 1650 and 1900, but Europe increased fourfold, and the total number of Europeans, including the descendants of those who

World Total	100.0	100.0	100.0	100.0	100.0	100.0

\*This table is designed to show only the numbers and proportion of people living in predominantly "European" cultures (that is, descended from societies with European languages and traditions) and "non-European" cultures over the modern period. It reveals the rapid increase in the proportion of "Europeans" in this sense from 1750 to 1900, and a steady decline in the "European" proportion during the twentieth century. The table is subject to serious reservations. The population of the former Soviet Union is divided between Europe and Asia, but millions of Russian "Europeans" have long lived in the Asian parts of the former U.S.S.R. It must also be remembered that the population of the United States consists of Africans and Asians as well as Europeans, that the people in Latin American countries now generally speak a European language and differ widely in their racial composition, and that there are well over four million persons of European origin in southern Africa. In short, the table has nothing to do with race, for there are many whites who do not live in "European" cultural zones and many "nonwhite" people in the Americas and elsewhere (including Europe) who participate fully in institutions and languages derived from Europe.

Source: For 1650 to 1900, A. N. Carr-Sanders, *World Population* (Oxford: Oxford University Press, 1936); for 1750, 1850, and 1900, John D. Durand, "The Modern Expansion of World Population," in *Proceedings of the American Philosophical Society*, vol. 111 (1967); and for 1950 and 2000, *United Nations Demographic Yearbook and World Population Prospects* (United Nations: New York, 1989) and *The New York Times 2001 Almanac* (New York, 2000).

migrated to other continents, multiplied fivefold. The ascendancy of European civilization in the two and a half centuries after 1650 was due in some measure to demographic growth. But while in 1900 the proportion of "Europeans" in all continents was approaching a third of the human race, after 1900 this proportion began to fall. By the beginning of the twenty-first century it could be projected that "Europeans" would constitute only a tenth of the human beings on the planet in the year 2100.

## Stabilization of European Population

The stabilization and relative decline of the European population followed from a fall in the birth rate. As early as 1830 the birth rate began noticeably to drop in France, with the result that France, long the most populous European state, was surpassed in population by Germany about 1870, by the British Isles about 1895, and by Italy about 1930. France, once thought to be decadent for this reason, was in fact only the leading country in a population cycle through which the European countries seemed to pass. The birth rate, which had fallen below 30 per hundred in France in the 1830s, fell to that level in Sweden in the 1880s; in England in the 1890s; and in Germany and the Netherlands between 1900 and 1910. After the Second World War there was a temporary rise, but by 2000 the birth rate was less than 15 per 1,000 in Europe and North America, hardly sufficient to maintain existing population levels. In much of the rest of the world it was still well over 25 or even 30.

The reduced birth rate is not a mere dry statistical item, nor does it affect populations merely in the mass. It is one of the indices of modern civilization, first appearing in that inner European zone in which the other indices were also highest, and thence spreading outward in a kind of wave. Concretely, a low birth rate in the nineteenth century meant that families averaged from two to four children, where in former times, families might consist of ten children or even more. The low birth rate reflects the small family system, and few institutions were more fundamental to modern life. The principal means used to hold down the birth rate, or to limit the family, is the practice of contraception. But the true causes or reasons why parents wish to limit their families were deeply embedded in the codes of modernizing societies.

Historical demographers have detected a "European family pattern" as far back as the seventeenth century. It was a pattern in which, in comparison to other societies, Europeans married later, and a larger number never married at all. Late marriage shortened the number of years during which a woman bore children and enabled young people to acquire skills or accumulate savings (as in tools and household goods) before setting up new families. The effect was less explosive population growth, and less-extreme poverty, than in other parts of the world. Evidence indicating the use of various forms of contraception can be found in the eighteenth century among the upper classes, by study of the number and spacing of their children. The practice seems to have spread to other social classes during the French Revolution. The Code Napoleon that followed required that inheritances be divided among all sons and daughters. The French peasants, many of them owners of land, began to limit themselves to two or three children in order that all children (by inheritance, marriage, and dowries) might remain in as high an economic and social position as their parents. It was thus the quest for economic security and higher living standards that led to the reduced birth rate in France and subsequently in other parts of Europe.

---

*A European family pattern*

In the great cities of the nineteenth century, in which standards of life for the working classes often collapsed, the effect might at first be a proliferation of offspring. But life in the city, under crowded conditions of housing, also set a premium on the small family. There were many activities in the city that people with many children could only with difficulty enjoy. After about 1880 child labor became much less frequent among the working classes. When children ceased to earn part of the family income, parents tended to have fewer of them. About the same time governments in the advanced countries began to require universal compulsory schooling. The number of years spent in education, and hence in economic dependency

---

*Life in the city*

upon parents, grew longer and longer until it became common even for young adults to be still engaged in study. Each child represented many years of expense for its parents. The ever rising idea of what it was necessary to do for one's children and the desire of parents to give them every possible advantage in a competitive world were probably the most basic causes of voluntary limitation of the family. Hardly less basic was the desire to lighten the burdens upon mothers. The small family system, together with the decline of infant mortality, since they combined to free women from the interminable bearing and tending of infants, probably did more than anything else to improve the position of women in modern societies. Freed at least in part from the traditional cycles of pregnancy and child care, middle-class women were eventually able to pursue advanced education, new professions, and new kinds of social or political activities. The use of contraception also spread widely among the working class during the early twentieth century; demographic research in England, for example, suggests that almost 70 percent of working-class couples were using contraception by the 1930s (compared to fewer than 20 percent in 1900).

The effects of the small family system upon total population became manifest only slowly. More people lived on into the middle and older age groups, and the fall of the birth rate was gradual, so that in all the leading countries total numbers continued to rise, except in France, which hardly grew between 1900 and 1945. The persistent note was one of superabundant increase. In five generations, between 1800 and 1950, some 200 million "Europeans" grew into 700 million "Europeans" around the globe. Since productivity increased even more rapidly, the standard of living for most of these "Europeans" rose in spite of the increase of numbers, and there was no general problem of overpopulation.

### *Growth of Cities and Urban Life*

Where did so many people go? Some stayed in the rural areas where most people had always lived. Rural populations in the inner zone became more dense, turning to the more intensive agriculture of truck gardening or dairy farming, leaving products like wool and cereal grains to be raised elsewhere and then imported. But it is estimated that of every seven persons added to the western European population only one stayed on the land. Of the other six, one left Europe altogether and five went to the growing cities.

The nineteenth-century city was mostly the child of the railroad, for with the railroads it became possible for the first time to concentrate manufacturing in large towns, to which bulky goods such as foods and fuel could now be moved in great volume. The growth of cities between 1850 and 1914 was phenomenal. In England two-thirds of the people lived in places of 20,000 or less in 1830; in 1914 two-thirds lived in places of 20,000 or more. Germany, the historic land of archaic towns carried over from the Middle Ages, rivaled England after 1870 in modern industrial urbanization. Whereas in 1840 only London and Paris had a million people, the same could be said by 1914 of Berlin, Vienna, St. Petersburg, and Moscow; and outside Europe, of cities such as New York, Chicago, Philadelphia, Rio de Janeiro, Buenos Aires, Calcutta, Tokyo, and Osaka. Some places, like the English Midlands and the Ruhr valley in Germany, became a mass of contiguous smaller cities, vast urban agglomerations divided only by municipal lines.

---

#### *Impact of urban life*

The great city set the tone of modern society. City life was impersonal and anonymous; people were uprooted, less tied to home or church than in the country. They lacked the country person's feeling of deference for aristocratic families. They lacked the sense of self-help characteristic of older rural communities. It was in the city that the daily newspaper press, which spread rapidly in the wake of

The evolving demographic pattern in nineteenth-century European bourgeois families may be seen in this portrait of a Victorian-era English family sitting in their garden. The declining number of children eventually gave women more time and freedom for diverse activities because they were less tied to long cycles of pregnancies and childrearing.

(Getty Images)

the telegraph after 1850, found its most habitual readers. The so-called yellow or sensational press appeared about 1900. Articulate public opinion was formed in the cities, and city people were on the whole disrespectful of tradition, receptive to new ideas, having in many cases deliberately altered their own lives by moving from the country or from smaller towns. It is hardly surprising that the new conditions of urban life fostered the spread of socialism among the industrial masses in European cities. Some of the more blatant nationalism that arose after 1870 was also stimulated by city life, for people felt increasingly detached from all institutions except the state. At the same time city life, by its greater facilities for schooling, reading, and discussion, made for a more alert and informed public opinion of an enlightened kind.

*Migration from Europe, 1850–1940*

*The Atlantic Migration*

During the same period in which cities were growing, almost 60 million people left Europe altogether, of whom possibly a fifth sooner or later returned. The Atlantic Migration—aptly so called, because all crossed the ocean except those who moved from European to Asian Russia—towers above all others in magnitude, and possibly also in significance, for it was by this means that earlier colonial offshoots of Europe were transformed into new societies that carried the very strong influence of European political, social, religious, and cultural traditions. All parts of Europe contributed to the migration, as shown in the table below, which comprises the years from 1850 to 1940. Before 1850 the mass movement had scarcely begun, though by that time over a million immigrants had entered the United States since the close of the Napoleonic wars. After 1940 the character of intercontinental migration was greatly transformed. In recent decades, since the Second World War, there have been large migrations into Europe from Africa, the Middle East, and Asia, and into the Americas from places outside Europe. But in the century before 1940 the migration of European peoples was a key force in the dissemination of European institutions and cultures.

It is hard to give satisfactory figures for emigration from Europe. In the statistical sources the English, Scots, Welsh, and Irish are mixed, and until the First World War, that is until 1914, the Poles, Czechs, other Slavic peoples, Hungarians, East European Jews, and others were not counted as such but were included among emigrants from the Russian, Austro-Hungarian, and German empires. Millions of Jews, Irish, Poles, and many thousands of others are therefore invisible in the figures, which also include several million Russians who moved from European to Asian parts of Russia. It must be remembered also that some intercontinental migration did not involve Europeans. For a

EMIGRATION FROM EUROPE, 1850–1940		
From:	British Isles	18,300,000

few years after 1850 black slaves were still brought illegally to the United States and Brazil. Workers went from India to the West Indies and South Africa, and many Chinese settled in the United States and southeast Asia. With these reservations, the table on this page shows the pattern of European emigration in the 90 years preceding the Second World War.

The British and Irish went to the British dominions and the United States. The Italians divided between the United States and Latin America. Spaniards settled overwhelmingly in the Spanish American republics, and the Portuguese settled in Brazil. The Germans moved overwhelmingly to the United States, though some went to Argentina and Brazil. The extraordinary preponderance of the United States is apparent. At the same time, it should be noted that almost half of the European migration went to other countries around the world. The new countries received the following influxes of people:

The exodus from Europe was due to a remarkable and temporary juxtaposition of causes. One fundamental cause, or precondition, was that before 1914 the new countries welcomed immigration. Hands were wanted to farm the land, build houses, dig in the mines. This was least true of Australia and New Zealand, which preferred to limit themselves to English-speaking settlers and which also pioneered as social democracies, becoming models even before 1900 of legislation to protect the working classes. One result was that no inrush of outsiders to compete for jobs at low wages was desired. A similar combination of national preferences and labor protectionism led to laws restricting immigration in the United States in 1921 and 1924. Thereafter immigrants could enter only under quotas, and the quotas were lowest for eastern and southern Europe, the areas from which most emigration had been coming.

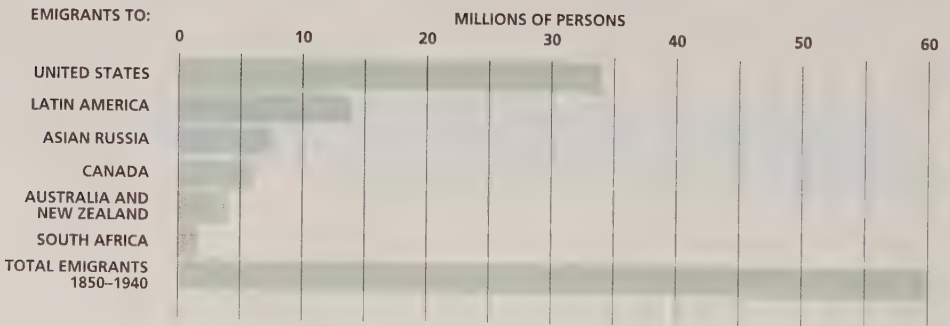

In Europe there were many conditions propelling emigrants outward. Physically, the steamship made it easier and cheaper to cross the sea, and the railroad helped people to get to the ports as well as to distribute themselves after landing in the new countries. Economically, people in the mass could for the first time afford a long journey. People migrated to improve their material circumstances; but some high points in the wave of emigration coincided with high points in the business cycle in Europe, when jobs in Europe were

---

---

*Causes of the exodus*

**MIGRATION FROM EUROPE, 1850–1940**

About 60 million people left Europe in the century preceding the Second World War, distributing themselves as shown in the diagram above. (See figures on p. 571.) About half went to the United States, but the migration of European peoples also built up “European” societies in other regions of the world. These overseas “European” societies produced food and raw materials for Europe and borrowed capital or bought manufactured goods from Europe, thus helping to support European economic development and to expand the modern worldwide economic system.

The mass migration of people is one of the distinctive social patterns of the modern world. This Italian woman and her children, who arrived in New York about 1900, were part of a vast emigration out of Europe that affected societies and economies on every continent.

(Snark/Art Resource, NY)

plentiful and wages were at their highest. Of the opposite case, of actual flight from economic ruin or starvation, the emigration from Ireland after 1846 is the best example. In the “great potato famine” of 1845–1849 nearly 1 million Irish died of starvation and disease, and more than 1.5 million emigrated to the United States in the next few years. After the revolutions of 1848 a certain number of Europeans left Europe for political reasons, and, later on, to avoid compulsory military service. The best example of flight from segregation and discrimination, and from direct persecution in government-encouraged pogroms, is that of the Jews of Russia and Russian Poland, of whom a million and a half moved to the United States in the 15 years preceding the First World War.

But perhaps most basic in the whole European exodus was the underlying liberalism of the age. Never before (nor since) had people been legally so free to move. Old laws requiring skilled workmen to stay in their own countries were repealed, as in England in 1824. The old semicommunal agricultural villages, with collective rights and obligations, holding individuals to their native groups, fell into disuse except in Russia. The disappearance of serfdom allowed the peasants of eastern Europe to change residences without obtaining a lord’s permission. Governments permitted their subjects to emigrate, to take with them their savings of shillings, marks, kronen, or lire, and to change nationality by becoming naturalized in their new homes. The rise of liberty in Europe, as well as the hope of enjoying it in America, made possible the great emigration. For so huge a mass movement the most remarkable fact is that it took place by private initiative and at private expense. Individuals, families, and small local groups (to borrow the metaphor of one authority) detached themselves atom by atom from the mass of Europe, crossed the seas on their own, and reattached themselves atom by atom to the accumulating mass of the New World. The

---

*Freedom of movement*

mass migrations of the late nineteenth century thus launched a worldwide movement of people that continues to the present day, grows in importance, and remains one of the most characteristic social patterns of the modern world.

## 72. THE WORLD ECONOMY OF THE NINETEENTH CENTURY

How did the swelling population of Europeans manage to feed itself? How, in fact, did it not merely feed itself but enjoy an incomparably higher standard of living in 1900 than in 1800? By science, industry, transportation, communications, and the expansion of global trading systems. And by organization—in business, finance, and labor.

### *The “New Industrial Revolution”*

The Industrial Revolution and the global economy entered upon a new phase. The use of steam power, the growth of the textile and metallurgical industries, and the advent of the railroad had characterized the early part of the century. Now, after 1870, new sources of power were tapped, the already mechanized industries expanded, new industries appeared, and industry spread geographically.

The steam engine itself was refined and improved. By 1914 it still predominated over other power machinery, but electricity with its incomparable advantages came into use. The invention of the internal combustion (or gasoline) engine and the diesel engine gave the world automobiles, airplanes, and submarines in the two decades before 1914; the advent of the automotive and aviation industries made oil one of the most coveted of natural resources. In the new chemical industries industrial research laboratories were replacing the individual inventor. Chemists discovered new fertilizers, and from coal tar alone produced a bewildering array of new products ranging from artificial food flavors to high explosives. With explosives the first great tunnels were built, the Mount Cenis in 1873, the Simplon in 1906—both in the Alps; and great new canals, the Suez in 1869, the Kiel in 1895, the Panama in 1914. Chemistry made possible the production of synthetic fabrics like rayon, which revolutionized the textile industry. Electricity transformed all indoor and outdoor lighting. There was a communications revolution too. The telephone appeared in the 1870s. Marconi brought the continents closer together, successfully transmitting wireless signals across the Atlantic in 1901. The moving picture and the radio modestly presented themselves before 1914. Medicine ran the alphabetical gamut from anesthetics to X-rays; yellow fever was overcome. Vastly improved processes for refining iron ore made possible a great expansion in the production of steel, the key product of the new industrial age; aluminum and other metal alloys were also produced through new industrial processes. Railroad mileage multiplied; the European network, including the Russian, increased from 140,000 miles in 1890 to 213,000 in 1914.

In the new phase of the Industrial Revolution machine industry spread geographically from Britain and Belgium, the only truly industrial countries in 1870, to France, Italy, Russia, Japan, and, most markedly, to Germany and the United States. In Europe industrial production was concentrated in the “inner zone.” Three powers alone—Britain, Germany, and France—accounted in 1914 for more than seven-tenths of all European manufactures and produced over four-fifths of all European coal, steel, and machinery. Of the major European powers Germany was now forging ahead. To use steel alone as a criterion, in 1871 Germany was producing

---

*Industrial advances*

---

*The industrial powers*

annually three-fifths as much steel as Britain; by 1900 it was producing more, and by 1914 it was producing twice as much as Britain—but only half as much as the new industrial giant, the United States. By 1914 American steel output was greater than that of Germany, Britain, and France combined. Britain, the pioneer in mechanization, was being outstripped in both the Old World and the New. The three European powers increased their industrial production by about 50 percent in the two decades before 1914, but the United States had a far higher annual growth rate from 1870 to 1913, 4.3 percent as compared to the next leading powers, Germany with 2.9 percent, Britain with 2.2 percent, and France with 1.6 percent. By 1914 the United States had moved ahead of Europe in the mechanization of agriculture, in manufactures, and in coal and steel production, in which it was producing over two-fifths of the world's output. The Americans were pioneering also in assembly-line, conveyor-belt techniques for the mass production of automobiles and all kinds of consumer goods.

### *Free Trade and the European "Balance of Payments"*

It was Britain in the mid-nineteenth century, then the workshop of the world, that had inaugurated the movement toward free trade. It will be recalled that in 1846, by the repeal of the Corn Laws, the British embarked upon a systematic free trade policy, deliberately choosing to become dependent upon overseas imports for their food. France adopted free trade in 1860. Other countries soon followed. It is true that by 1880 there was a movement back to protective tariffs except in Britain, Holland, and Belgium. But the tariffs were impediments rather than barriers, and until 1914 the characteristic of the economic system was the extreme mobility of goods across political frontiers. Politically, Europe was more than ever nationalistic; but economic activity, under generally liberal conditions in which business was supposed to be free from the political state, remained predominantly international and globe-encircling.

Broadly speaking, the great economic accomplishment of Europe before 1914 was to create a system by which the huge imports used by industrial Europe could be acquired and paid for. All European countries except Russia, Austria-Hungary, and the Balkan states imported more than they exported. It was the British again who led in this direction. Britain had been a predominantly importing country since the close of the eighteenth century. Despite the expanding export of cotton manufactures and other products of the Industrial Revolution, Britain consumed more goods from abroad than it sent out. Industrialization and urbanization in the nineteenth century confirmed the same situation. Between 1800 and 1900 the value of British exports multiplied eightfold, but the value of imports into Great Britain multiplied tenfold, and in the decade before 1914 the British had an import surplus of about three-quarters of a billion dollars a year. Great Britain and the industrial countries of Europe together (roughly Europe's "inner zone"), at the beginning of the twentieth century, were drawing in an import surplus, measured in dollars, of almost \$2 billion every year (the dollar then representing far more goods than it came to represent later). The imports into Europe's inner zone consisted of raw materials for its industries and of food and amenities for its people.

How were the imports paid for? How did Europe enjoy a favorable "balance of payments" despite an unfavorable balance of trade in commodities? Export of European manufactures paid for most imports, but not all. It was the so-called invisible exports that made up the difference, that is, shipping and insurance services rendered to foreigners, and interest on money lent out or invested,

---

*Imports versus exports*

---

*Invisible exports*

The Bessemer steel-making process enhanced the production of steel and rapidly became an important component of industrial expansion during the later decades of the nineteenth century. Its importance for Britain is suggested by this illustration of the future King Edward VII and his wife, who are observing the new methods of steel production from box seats at a factory in Sheffield in 1875.

(Getty Images)

all bringing in foreign exchange. Shipping and insurance were important. An Argentine merchant in Buenos Aires, to ship hides to Germany, might employ a British vessel; he would pay the freight charges in Argentine pesos, which might be credited to the account of the British shipowner in an Argentine bank; the British shipowner would sell the pesos to someone, in England or elsewhere in Europe, who needed them to buy Argentine meat. The far-flung British merchant marine thus earned a considerable amount of the food and raw materials needed by Britain. To insure themselves against risks of every conceivable kind people all over the world turned to Lloyds of London. With the profits drawn from selling insurance the British could buy what they wished. Governments or business enterprises borrowed money in Europe, mainly in England; the interest payments, putting foreign currencies into European and British hands, constituted another invisible export by which large quantities of imports could be financed. But the lending of money to foreigners is only part of a larger phenomenon, the export of capital.

### *The Export of European Capital*

The migration of millions of Europeans had the effect of creating new societies, basically European in character, which both purchased manufactures from Europe and produced the food, wool, cotton, and minerals that Europe needed. It could not have had this effect if

### CLASSIC LANDSCAPE

by Charles Sheeler (American, 1883–1965)

This landscape depicts an American plant of the Ford Motor Company in 1931, but it also symbolizes what has been called the Second Industrial Revolution. In this phase of industrialization, electricity, the internal combustion engine, and the automobile were especially important, and industry spread far beyond its early centers in Britain and western Europe. The picture is “classic” in its clear delineation, its array of familiar mathematical forms, and the universality of its message. The plant seems rational and precise, but there are no human beings. It is as if the machine had a life of its own and could do without human hands.

(Collection of Mr. and Mrs. Barney A. Ebsworth, Photograph © 2000 Board of Trustees, National Gallery of Art, Washington, 1931 (2000.39.2))

Europe had exported people only, especially people of such small means as most emigrants were. Europe also exported the capital that enabled the new settlers to develop productive economies.

The export of capital meant that an older and wealthier country, instead of using its whole annual income to raise its own standard of living, or to add to its own capital by expanding or improving its houses, factories, machinery, mines, and transportation, diverted some of its income to expanding or improving the houses, factories, machinery,

mines, and transportation of foreign countries. It meant that British, French, Dutch, Belgian, Swiss, and eventually German investors bought the stocks of foreign business enterprises and the bonds of foreign businesses and governments; or they organized companies of their own to operate in foreign countries; or their banks granted loans to banks in New York or Tokyo, which then lent the funds to local users.

---

*Capital accumulation*

Capital arose in Europe to some extent from the savings of quite small people, especially in France, where peasants and modest bourgeois families were notably thrifty. But most capital accumulated from savings by the well-to-do. The owners of a business concern, for example, instead of spending the concern's income by paying higher wages, took a portion of it in profits or dividends, and instead of spending all this on their own living, reinvested part of it in domestic or foreign enterprises. The gap between rich and poor was thus one cause of the rapid accumulation of capital, though the accumulation of capital, in the nineteenth century, produced in turn a steady rise of living standards for the working classes. In a sense, however, the common people of western Europe, by forgoing the better housing, diet, education, or pleasures that a more democratic or consumer-oriented society might have planned for them, made possible the export of capital and hence the financing and building up of other regions of the world.

The British were the chief exporters of capital, followed at some distance by the French, and at the close of the century by the Germans. As early as the 1840s half the annual increase of wealth in Great Britain was going into foreign investments. By 1914 the British had \$20 billion in foreign investments, the French had about \$8.7 billion, and the Germans had about \$6 billion. A quarter of all the wealth owned by the inhabitants of Great Britain consisted in 1914 of holdings outside the country. Almost a sixth of the French national wealth lay in investments outside France. All three countries had given hostages to fortune, and fortune proved unkind, for in the First World War the British lost about a quarter of their foreign investments, the French lost about a third, and the Germans lost all.

---

*The recipients of European capital*

These huge sums, pouring out from Europe's inner zone for a century before 1914, at first went mainly to finance the Americas and the less affluent regions of Europe. European capital was also invested in Asia and Africa, especially after the rapid expansion of Europe's colonial empires in the 1890s. No country except Great Britain completely built its railways with its own resources. In the United States the railway system was built very largely with capital obtained from England. In central and eastern Europe British companies often constructed the first railways, then sold out to native operating companies or to governments which subsequently ran them. In the Argentine Republic the British not merely financed and built the railways, but long continued to operate and own them. In addition, up to 1914 the British sold about 75 million tons of coal a year to South America to keep the railways going, not to mention items for replacement and upkeep of equipment. Docks, warehouses, mines, plantations, processing and manufacturing establishments all over the world were similarly built up with capital drawn from Europe. European capital also helped emigrants in the new countries to develop public services and institutions that required major financial investments. In the United States, for example, state and local governments very commonly sold their bonds in Europe to build roads, pave streets, or construct school systems for the westward-moving population. A few of these American bonds proved a partial or total loss to European investors. On the whole, by 1914, the United States had paid back a good deal of its indebtedness. Even so, in 1914, Americans

still owed about \$4 billion to Europeans—a sum three times as large as the national debt of the United States at the time.

### *An International Money System: The Gold Standard*

The international economy rested upon an international money system, based in turn upon the almost universal acceptance of the gold standard. England had adopted the gold standard in 1821, when the pound sterling was legally defined as the equivalent of 113 grains of fine gold. Western Europe and the United States adopted an exclusively gold standard in the 1870s. A person holding any “civilized” money—pounds, francs, dollars, marks, and the like—could turn it into gold at will, and a person holding gold could turn it into any money. The currencies were like so many different languages all expressing the same thing. All had substantially the same value, and until 1914 the exchange rates between currencies remained highly stable. It was assumed that no modern industrial country’s currency ever “fell”; such things might happen in Turkey or China, or in the French Revolution, but not in the world of modern progress and civilized affairs.

The important currencies were all freely exchangeable. A French merchant selling silks to a German, and hence receiving German marks, could turn the marks into francs, pounds sterling, or dollars. That is, he was not obliged to buy from Germany or spend his money in Germany but could use the proceeds of his German sale to buy French, British, or American goods or services as he chose. Trade was multilateral. A country needing imports from another country, such as American cotton, did not have to sell to that country to obtain them; it could sell its own goods anywhere and then import according to its needs.

---

*Currency exchange*

It was the acceptance of the gold standard, and the fact that all important countries possessed a sufficient share of gold to support their currencies, that made possible so fluid an interchange. At the same time the gold standard had less wholesome effects. It was hard on countries that lacked gold. And it produced a gradual fall of prices, especially between 1870 and 1900, because (until the gold discoveries in South Africa, Australia, and Alaska in the 1890s) the world’s production of gold lagged behind the expanding production of industrial and agricultural goods. Persistently declining prices were a hardship to those who habitually worked with borrowed money—many farmers, many businessmen, and debtor nations as a whole. A famous speech of William Jennings Bryan in the United States in 1896, declaring that mankind should not be crucified “upon this cross of gold,” expressed a common, worldwide anger about a financial system that worked against the interests of indebted persons and indebted nations. But falling prices were an advantage to the wage-earning class, which generally improved its position in these years, and also to the wealthy, the owners and lenders of capital, the bankers and financiers, who so long as prices were falling were repaid in money of more value than that which they had lent.

---

*Effects of the gold standard*

The center of the global economic and financial system was London.

---

*London at the center*

The London banks prospered in consequence of the defeat of Napoleon, the older financial centers in Amsterdam having been ruined in the Revolutionary and Napoleonic wars. It may be recalled also that the victors in 1815 imposed upon France an indemnity of 700 million francs, which in 1818 was taken over by a syndicate of private bankers; the London banks played a leading part in this affair and so developed their connections with many government treasuries. In the Crimean War of 1854–1856,

with England at war with Russia, the London banks floated loans for the Russian government—so independent were business and politics at the time. The early adoption of the gold standard in England meant that many people, British and foreign, kept their funds in the form of sterling on deposit in London, where quantities of available capital therefore accumulated. London became the apex of a financial pyramid which had the world for its base. It was the main center for the exchange of currencies, the clearing-house of the world's debts, the depository from which all the world borrowed, the banker's bank, as well as the world's shipping center and the headquarters of many international corporations.

### *A World Market: Unity, Competition—and Insecurity*

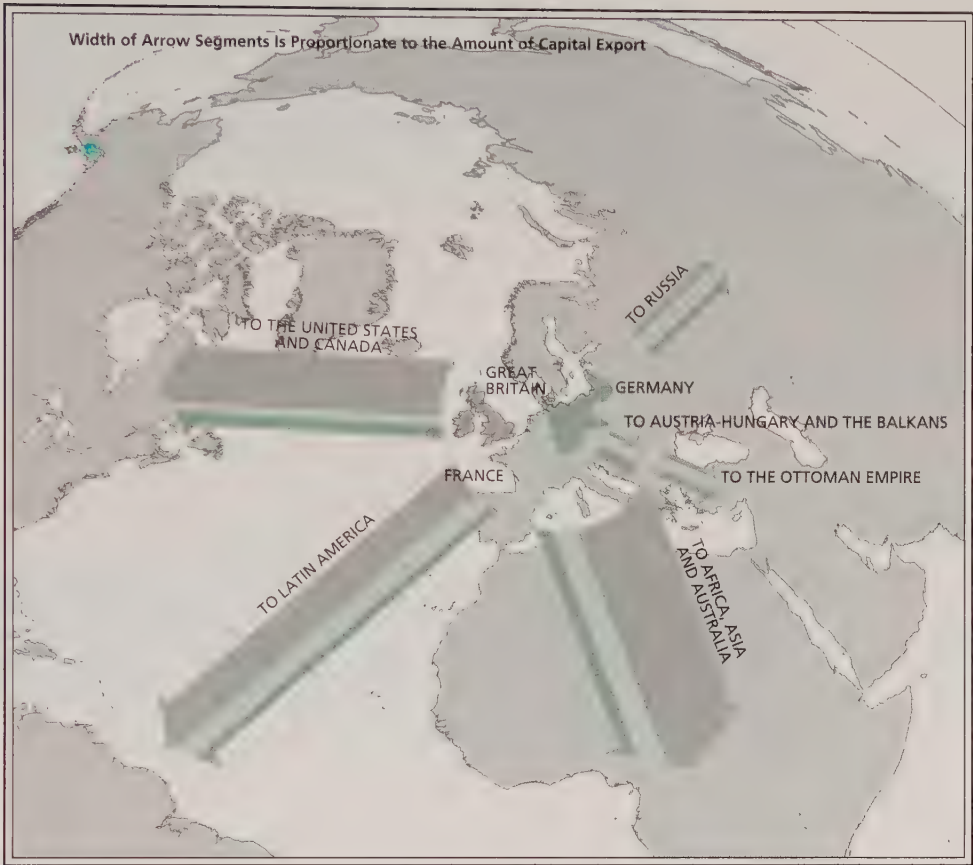

Never had the earth been so unified economically, with each region playing specific roles in a global specialization. Western Europe, and in 1870 mainly Great Britain, was the world's industrial workshop. Other parts of the earth supplied its many needs. An English economist marveled in 1866 that Britain now had its granaries in Chicago and Odessa, its forests in Canada and the Baltic, its sheep farms in Australia, and its gold and silver mines in California and Peru, while drinking tea brought from China and coffee from East Indian plantations. The same could have been said of most of Europe's inner zone by the time of the First World War.

---

*A true global market*

A true global market had been created. Goods, services, commodities, money, capital, people moved back and forth almost without regard to national boundaries. Articles were bought and sold at uniform world prices. Dealers in wheat, for example, followed prices in Minneapolis, Liverpool, Buenos Aires, and Danzig as reported by telegraph and cable from day to day. They bought where it was cheapest, and sold where it was dearest. In this way the world's wheat supply was distributed roughly according to need or ability to pay. The worker of Milan, if the Italian crop was poor and prices were high, was fed from another source. On the other hand, the Italian wheat grower would in this case feel the pinch of world competition. The world market, while it organized the world into a unified economic system, at the same time brought distant regions into competition for the first time. The producers of goods and commodities—whether entrepreneur, factory employee, farmer, or coffee planter—had no secure outlet for their products, as had generally been true in the past. They were in competition not only with persons across the street or down the road but also with other producers throughout the world. It was this worldwide system of production and consumption that established the modern economic foundation for what is now called “globalization.”

The creation of an integrated world market, the financing and building up of countries outside of Europe, and the consequent feeding and support of Europe's increasing population were the great triumphs of the nineteenth-century system of unregulated capitalism. The system was intricate, with thousands and even millions of individuals and business firms supplying each other's wants without central planning. But it was extremely precarious, and the position of most people in this network of global economic exchanges was exceedingly vulnerable. Region competed against region and person against person. A fall of grain prices in the American Middle West, besides ruining a few speculators, might oblige German or Argentine wheat growers to sell at a price at which they could not live. Factory owners might be driven out of business if competitors successfully undersold them or if a new commodity made their own product obsolete. The workers, hired only when needed by an employer, faced unemployment when business slackened or when jobs disappeared because of labor-saving inventions.

### EXPORT OF EUROPEAN CAPITAL TO 1914

In 1914 the British, French, and Germans held upwards of \$30 billion in foreign and colonial loans and investments, distributed as shown on the map. Dutch investments, especially in the West Indies, together with Swiss, Belgian, and Scandinavian holdings, would add several billion dollars more. Proceeds from such investments helped Europeans to pay for the excess of their imports over exports. British capital predominated in the overseas world, while the less-developed regions of eastern Europe and the Middle East were financed mainly from Germany and France. Much of the investment shown here was lost or expended in the First World War.

---

*Cycles of boom and depression*

The system went through cycles of boom and depression, the most notable example of the latter being the “long depression” that set in about 1873 and lasted to about 1893. The new global economy depended on expansion and on credit; but sometimes people could not pay their debts, so that credit collapsed; and sometimes expansion failed to keep pace with expectations, and anticipated profits proved to be losses. To combat the essential insecurity of private capitalism, all manner of devices were resorted to. Against competition from other countries governments established protective tariffs; business enterprises entered into acquisitions and mergers, sometimes approaching monopolies. For the working classes governments adopted social insurance measures as protection against accidents, illness, and unemployment. Labor meanwhile turned increasingly to its own trade unions and socialist parties. All this signaled the gradual decline in the years after 1880 of nineteenth-century unregulated, laissez-faire capitalism.

*Changes in Organization: Big Business*

A great change came over capitalism itself about 1880 or 1890. Formerly characterized by a large number of small units, small businesses run by individuals, partnerships, or small companies, it was increasingly characterized by large and impersonal corporations. The attractions of the “limited liability” corporation as a form of business organization and as a means of encouraging investment arose from laws enacted by most countries in the nineteenth century that limited the individual investor’s personal loss in the event of a bankruptcy to the amount of his or her shares of stock in the enterprise. The corporation, in its modern form

---

*The “limited liability” corporation*

appearing first with the railroads, became the usual form of organization for industry and commerce. As machinery grew more complicated, only a large pool of capital could finance it. And as corporations grew in size and number, relying on the sale of stock and the issue of bonds, the influence of banking and financial circles was enhanced. Financiers, using not so much their own money as the savings of others, had a new power to create or to destroy, to stimulate, discourage, or combine corporate enterprises in various industries. Industrial capitalism brought finance capitalism with it.

Corporate organization made it possible to concentrate diverse economic processes under unified management. In retail commerce, large department stores appeared after about 1870 in the United States and France, selling all kinds of goods that were formerly sold only in small shops and establishing a fixed price for each piece of merchandise. In industry, steel offers a good example. Steel became in any case a big business when heavy blast furnaces were introduced. It was not safe for the steel business, or for the blast furnaces, to rely for iron and coal on independent producers. The steel works therefore began to operate mines of their own or to buy out or otherwise reduce coal and iron mines to subsidiary status. Some, to assure their markets, began to produce not merely steel but steel manufactures as well—steel ships, railway equipment, naval and military ordnance. Thus entire processes from mining to finished product became concentrated in a “vertical” integration.

---

*Vertical integration*

“Horizontal” integration meant that concerns at the same level combined with each other to reduce competition and to protect themselves against fluctuations in prices and markets. Some fixed prices, some agreed to restrict production, and some divided up markets among themselves. They were called trusts in the United States; cartels, in Europe. They were common in the steel industry and in many other new industries at the close of the century, such as chemicals, aluminum, and oil. It was in the United

The new world market strongly encouraged the development of export industries and commodity production in agrarian societies that mainly produced food in earlier times. During the decades before 1914, the colonized areas of Asia, Africa, and the Americas rapidly increased their production of commodities such as tea, coffee, sugar, and cocoa, most of which flowed into the more industrialized, capitalist economies of Europe and North America. These workers in India collected tea for export and thus participated, though with low wages, in a global trading system that transformed agriculture and daily life in almost every part of the world. (The Art Archive)

"Captains" of  
industry, "titans" of  
finance

States that such big business developed furthest, headed by "captains" of industry and "titans" of finance. Andrew Carnegie, by origin a poor Scottish immigrant boy, produced more steel than all England; in 1901 he sold out to an even more colossal organization, the United States Steel Corporation, formed by the financier J. P. Morgan. It was in the United States, too, that concern over monopoly and the power of big business in general was felt most strongly; antitrust legislation, beginning with the Sherman Act of 1890, was enacted but never with any substantial effect.

Many of the new combinations were beneficial in making the ups and downs of business less erratic, and so providing more stable prices and more continuous and secure employment. Generally they reduced the costs of production; but whether the savings went into higher profits, higher wages, or lower prices depended on numerous factors. Some trusts were greedier than others or were confronted with only weakly organized or unorganized labor. In any case, for good or ill, decisions rested with management and finance. A new kind of private power had arisen, which its critics like to call "feudal." Since no economic system had ever been so centralized up to that time, never in fact had so few people exercised so much economic power over so many. The middle class, with the rise of great corporations, came typically to consist of salaried employees; the salaried person might spend a lifetime with the same company, and feel toward it, in its disputes with labor or government, a loyalty not unlike that of a lord's retainer in feudal times. The laboring class was less amenable; labor attempted to organize unions capable of dealing with increasingly gigantic employers. It also after about 1880 played an increasingly decisive role in the politics of all advanced nations.

### 73. THE ADVANCE OF DEMOCRACY: THIRD FRENCH REPUBLIC, UNITED KINGDOM, GERMAN EMPIRE

In the years from 1815 to 1870 European political life had been marked by liberal agitation for constitutional government, representative assemblies, responsible ministries, and guarantees of individual liberties. In the years from 1871 to 1914 the most notable political development was the democratic extension of the vote to working class men—the adoption of universal male suffrage, which in turn meant for the first time the creation of mass political parties and the need for political leaders to appeal to a wide electorate. Although there was growing agitation for voting rights for women in the decades before 1914, that reform would not be achieved until after the First World War. The extension of male suffrage and democratization often took place in a continuing monarchical and aristocratic framework, but almost everywhere in Europe by 1914 some machinery of democratic self-government was being introduced. In addition, to counter the growing strength of socialism after 1871, and for humanitarian reasons, governments were also assuming responsibility for the social and economic problems arising from industrialism. The welfare state in its modern form was taking shape.

#### *France: The Establishment of the Third Republic*

In France the democratic republic was not easily established, and its troubled early years left deep cleavages within the country. It will be recalled that in September 1870, when the empire of Napoleon III revealed its helplessness in the Franco-Prussian War,

The Bon Marché department store in Paris became a well-known example of the new, large stores that began to displace smaller shops and independent merchants. The new era is evident in this late nineteenth-century illustration of the store's vast expanse, proliferation of merchandise, and affluent shoppers. Department stores provided a safe meeting place for women as well as lower prices for the many new products of the industrial era.

(Picture Collection, The New York Public Library, Astor, Lenox and Tilden Foundations)

insurrectionaries in Paris, as in 1792 and 1848, again proclaimed the Republic. A provisional government of national defense sought desperately to continue the war, but the cause was hopeless. By January 1871, a bitter siege of Paris came to an end and an armistice was signed. Bismarck, insisting that only a properly constituted government could make peace, permitted the election, by universal male suffrage, of a National Assembly which was to consider his peace terms and draft a constitution for the new French state. When the elections were held in February, it was found, as in 1848 (and, indeed, 1797), that republicanism was so distrusted by the French people as a whole, and most especially in the provinces and rural areas, that a free election brought monarchist elements into power. Republicanism was still thought to be violent—bellicose in its foreign policy, turbulent in its political workings, unfriendly to the church, and socialistic or at least egalitarian in its views of property and private wealth. The new Assembly contained only about 200 republicans out of more than 600 deputies.

But the Paris republicans, who had defended France when Napoleon III failed to do so, who for four months had been besieged, starved, and frozen by the Germans, and who still refused to make peace on the harsh terms imposed by Bismarck and about to be accepted by the Assembly, refused to recognize the latter's authority. A civil war broke out between the National Assembly, now sitting at Versailles, and the city of Paris, where a revolutionary municipal council or "Commune" was set up. Paris, so lately attacked by German soldiers, was now attacked by French.

---

#### *The Paris Commune*

The Paris Commune, which lasted from March to May 1871, seemed to be another explosion of social revolution. Actually, it was in essence a revival of the Jacobinism of 1793. It was fiercely patriotic and republican; anti-German; opposed to wealthy bourgeois, aristocrats, and clergy; in favor of government controls of prices, wages, and working conditions, but still not socialist in any sweeping or systematic way. Among its leaders, however, there were a few of the new international revolutionary socialists who saw in a Jacobin or democratic republic a step toward their new order. Marx in England, and others elsewhere, hopefully read into the Commune the impending doom of the bourgeoisie. This was precisely what more conservative elements feared. To many of the French middle and peasant class, and to people like them all over Europe, it seemed that the Communards were wild and savage destroyers of nineteenth-century civilization. The fighting in Paris was atrocious beyond anything known in any preceding French revolution. The Communards, in final desperation, burned a number of public buildings and put to death the archbishop of Paris, whom they held as a hostage. The armed forces of the National Assembly, when finally triumphant, were determined to root out the inveterate revolutionism of Paris. Some 330,000 persons were denounced, 38,000 were arrested, 20,000 were put to death, and 7,500 were deported to New Caledonia. The Third Republic was born in an atmosphere of class hate and social terror.

The form of government for the new regime still had to be established. The monarchist majority in the Assembly was itself evenly divided between those who favored a restoration of the Bourbon family and those who favored the Orléanist. The monarchists thus checkmated each other and, in effect, opened the way toward a new French republic. Meanwhile, after extended discussion of various constitutional projects, the Assembly adopted in 1875 not a constitution, but certain constitutive laws. By a margin of one vote, a resolution indirectly amounting to the establishment of a republic was passed. The new laws provided for a president, a parliament in two chambers, and a council of ministers, or cabinet, headed by a premier. The two legislative bodies were to emerge from different electoral processes: the Senate was to be elected by a complicated and indirect system of election, the Chamber of Deputies, by universal, direct, male suffrage.

Within two years, in 1877, the role of the president, the ministers, and the parliament was further clarified as a result of an unsuccessful attempt by an early president, Marshal MacMahon, to dismiss a premier of whom he did not approve but who had the backing of the Chamber. MacMahon proceeded to dissolve the Chamber and to hold new elections, but the example of Napoleon III's transformation of the Second Republic into an authoritarian regime was still fresh. The elections vindicated the principle of parliamentary primacy and of the responsibility of the premier and his cabinet to the legislature, a responsibility which meant generally but not exclusively to the lower house. The true executive in republican France for a long time was not the president, who became a ceremonial figure, but the premier and the cabinet, themselves held strictly to account by a majority of the legislature. Unfortunately, that majority, in a parliament where a dozen or so parties were represented, was always difficult to form and could be created only by unstable, temporary, shifting party alliances, coalitions, or blocs. No president, and indeed no premier, could henceforth dissolve the Chamber in order to hold new elections and consult the country as could be done in Britain. Actually, under the Third Republic the substantial machinery of state—ministries, prefectures, law courts, police, army, bureaucracy, all under highly centralized control—was carried over virtually untouched as in all upheavals since the time of Napoleon I. France in the nineteenth century, although volatile in appearance, in effect underwent less extensive governmental reorganization than any other leading country in Europe.

Parliamentary  
primacy

### *Troubles of the Third French Republic*

Yet the Third Republic was precarious. The government had changed so often since 1789 that all forms of government seemed to be transitory. Questions that in other countries were questions about specific government policies or party programs became in France fundamental questions of "regime"—monarchy versus republic. Many people, especially those influenced by the upper classes, the Catholic clergy, and the professional army officers, continued to harbor a positive aversion to the republic. On the other hand, the unmerciful and vindictive repression of the Commune made many middle-class people sympathetic to the republicans. Many turned republican simply because no other form of government established itself or because it was the form of government that divided the country the least. As republicanism took in wider elements of society, it became less revolutionary and less fearsome. In 1879, for the first time, republicans won control of both houses of the government. In the 1880s their radicalism hardly went further than the founding of a democratic and compulsory school system at government expense and the passage of anticlerical legislation intended to curb church influence in education.

For over a quarter of a century, however, republican energies had to be expended in defense of republican institutions in order to ensure the survival of the regime. An initial crisis arose in 1886–1889, when General Boulanger gathered around him an incongruous following that included not only Bonapartists, monarchists, and aristocrats but also extreme radical republicans who wished a war of revenge against Germany and workers disgruntled over their unhappy lot. Boulanger became a popular figure and seemed for a moment about to seize power. But the menace collapsed in a comical failure as the general lost heart at the crucial hour and fled into exile. Meanwhile, in the 1880s and 1890s scandals and revelations of corruption in high republican circles provided ammunition for the antirepublicans. Moreover, the hope that unsympathetic French Catholics would "rally" to the republic, as urged by French prelates and by Pope Leo XIII in 1892, was shattered by

This barricade and its defenders suggest the revolutionary fervor of the Paris Commune, which controlled the French capital in the spring of 1871. The Commune was in many respects a revival of revolutionary Jacobinism rather than a precursor of social revolution, but it provoked intense fear and brutal repression from more conservative forces in French society. Revolutionary images of Parisian radicals in the streets—as seen in this photograph—made the Paris Commune a symbol of political idealism and martyrdom for many socialists and a symbol of dreadful social dangers for the middle and upper classes.

#### *The Dreyfus Affair*

the Dreyfus Affair, which in the late 1890s rocked the country and attracted wide attention outside France as well.

In 1894 a French military court found Captain Alfred Dreyfus, a Jewish army officer, guilty of treason for leaking secret military documents to the German embassy in Paris. Dreyfus was deported to life imprisonment at Devil's Island, but evidence accumulated to show his innocence and to indicate the guilt of another officer, Major Esterhazy, an adventurer known to be riddled with gambling debts. But the army refused to reopen the case, unwilling to admit it had erred: a staff officer, Major Henry, even forged documents to confirm Dreyfus's guilt. Meanwhile anti-Semites, royalists, traditionalists, militarists, and most of the "best" people fought the reopening of the case, deeming it unpatriotic to shake the nation's confidence in the army and wishing also to disgrace the republican regime. The partisans of Dreyfus stubbornly upheld him, both because they believed in justice and because they wished to discredit their antirepublican

This photograph of Alfred Dreyfus shows the French army captain after he was found guilty of treason in 1894. Stripped of his army rank and deported to prison on an island near French Guiana, his unjust conviction sparked bitter debates in France, a surge of anti-Semitism, and protracted legal campaigns that ultimately led to his complete exoneration and return to the French army.

(Getty Images)

adversaries. The country was deeply split into political and cultural factions that defended or attacked republicanism with arguments that repeated the bitter ideological conflicts of every French revolution since 1789. Finally, following a passionate pro-Dreyfus campaign by writers such as Emile Zola, Dreyfus was pardoned by the French president in 1899 and granted complete legal exoneration in 1906. In the aftermath of the affair, leftist republicans and socialists held power in the Chamber of Deputies and revenged themselves by blocking the promotions of antirepublican officers and by anticlerical legislation. In 1905, in a series of laic laws, they “separated” church and state, unilaterally ending the close relationship established under Napoleon’s concordat a century earlier. All ties between church and state were severed, priests and bishops were no longer to be paid by the state, church property was taken over (“even the chandeliers”) by the government, and Catholic laymen were to administer each parish. The Pope retaliated by excommunicating all deputies who had voted for these measures. Gradually compromises were worked out; some provisions were made less stringent, and tensions, if they did not disappear, at least eased.

### *The Strength and Weakness of the Republic*

The Third Republic, when the First World War came in 1914, had lasted over twice as long as any French regime since 1789. Born unwanted and accidentally, though it still had opponents, it now commanded the loyalty of the overwhelming mass of the French people. What it had done, since 1871, was to domesticate democratic republicanism in Europe. Republicanism, one of the most

---

*Domesticating  
republicanism*

militant of revolutionary movements down to 1870, had been shown in France to be compatible with order, law, parliamentary government, economic prosperity, and a mutual tolerance between classes, to the extent at least that they no longer butchered each other in the streets. Industrial workers were in many ways less well off than in England or Germany, but there were fewer of them; and for most people France in these years was a pleasant country, where painters, writers, scholars, and scientists flourished, where bankers, bourgeois and well-established farmers could freely pursue their economic interests, a country living comfortably and unhurriedly on the savings of generations, and one in which, in close-knit family groups, average men and women could plan securely for their own and their children's future.

But the comforts and values of bourgeois France were not those that would equip it for leadership in the modern age of technology and industrial power. Though substantial economic progress was made, the country lagged behind Germany in industrial development; the French entrepreneur showed little inclination to take the business risks needed for industrial growth. Politically, the fragmentation of political parties, itself a democratic reflection of a divided public opinion, and the distrust for historic reasons of a strong executive power led to the rise and fall of numerous short-lived ministries—no fewer than 50 in the years between 1871 and 1914. Ministerial instability was to be a chronic problem of the Third Republic both before and after 1914; continuity of government policy was, however, generally maintained because of stability in certain key ministries and because of the permanent civil service.

French labor remained a steady source of discontent. Although French workers benefited from some labor legislation in the two decades after 1890, they continued to feel frustrated at the failure to establish a “social republic.” Socialist representation in the Chamber grew, strengthening the antiroyalist factions in the French government. How-

ever, the most important single party of the republic, the Radicals, or Radical Socialists, were in actuality radical republicans—patriotic, anticlerical spokesmen for the small shopkeepers and the lesser propertied interests; they drew the line at the advanced social legislation that labor expected from them, and on occasion their leaders even took positive

steps to prevent unionization and to suppress strikes. Since some of these Radicals had started out as socialists, the distrust of French workers for all politicians and even for political processes was intensified. But the difficulties of the republic went deeper. The political energies of the republican statesmen had gone into liquidating the past, into curbing the political strength of the monarchists, the church, and the army; by the turn of the century, even before these older issues were fully resolved, the republic was compelled to meet the challenge of labor and to face other domestic and international pressures that were to try it sorely. The Third Republic was to weather the crisis of the First World War but not that of the Second.

*The Radical  
Socialists*

### *The British Constitutional Monarchy*

The British constitutional monarchy in the half-century before 1914 was the great exemplar of reasonable, orderly, and peaceable self-government through parliamentary methods. For over 60 years, spanning two-thirds of the nineteenth century, Victoria reigned (1837–1901) and gave her name to a distinguished era of material progress, literary accomplishment, and political stability. The two great parties, Liberal and Conservative, the heirs roughly of the Whigs and Tories, took form in the 1850s, the former producing its

great leader in William E. Gladstone; the latter, a series of leaders of whom the most colorful was Benjamin Disraeli.

The advance toward an egalitarian political democracy in Britain was more cautious and slower than in France. The Reform Bill of 1832 had granted the vote to about an eighth of the adult male population. The democratic Chartist agitation of the 1830s and 1840s attracted wide popular support but failed to produce further reforms in the electoral system. In 1867, however, in response to continued demand for a wider suffrage, the Second Reform Bill was passed. Conservatives as well as Liberals outdoing one another in an effort to satisfy the country and to win new political strength for their own party. The bill, adopted under Disraeli's Conservative ministry, extended the suffrage from about 1 million eligible voters to about 2 million, or over a third of the adult males in the United Kingdom, reaching down far enough to include most workers in the cities. Disraeli's colleague Lord Derby called it a "leap in the dark." In 1884, under Liberal auspices, the suffrage was again broadened, this time in the rural areas, adding some 2 million additional voters and enfranchising over three-fourths of all adult males in the country. Not until 1918 did Great Britain adopt universal male suffrage, as generally understood; and at that time the long campaign for women's political rights gained at least a partial victory when women over the age of 30 received the right to vote.

---

*The extension of  
suffrage*

The leadership of the country at the turn of the century was still in the hands of men of the upper and wealthier classes. Until 1911 the government paid no salaries to members of the House of Commons, who therefore, in both great parties, were usually gentlemen with private incomes, possessing the same family background and education. An attitude of sportsmanship and good feeling was characteristic of British politics. The two parties alternated in power at regular intervals, each indulgent toward the other, carrying over and developing rather than reversing the policies of its predecessor in office. Both parties sought support where they could find it, the Liberals leaning somewhat more on the industrial and commercial interests; the Conservatives on the landed aristocracy; both sought and succeeded in winning their share of the new working-class vote.

The Liberals were usually the more willing to pioneer, the first of the four ministries of Gladstone being especially notable in this respect. Gladstone in this first ministry (1868–1874) developed the principle of state-supported public education under the Forster Education Act of 1870, introduced the secret ballot, formally legalized labor unions, promoted competitive examinations for civil service posts, reorganized the upper judiciary, eliminated the purchase and sale of commissions in the army (a form of property in office), and by abolishing religious tests enabled persons who were not members of the Church of England to graduate from Oxford and Cambridge. The Conservative party, less sensitive to pressure from business interests for a laissez-faire policy in economic matters, and continuing the tradition of early Tory reformers, took the initiative in further labor legislation. Under Disraeli's second ministry (1874–1880), the existing acts regulating public sanitation and conditions in mines and factories were extended and codified, safety measures were enacted to protect sailors, and the first attempt to regulate housing conditions for the poorer classes was initiated. But the Liberals, it must be added, sought to protect the workers' interests too. In Gladstone's second ministry (1880–1885), for example, workers were assured of compensation for injuries not of their own responsibility, and Gladstone later campaigned to reduce labor hours and to extend employers' liability in accidents.

*Liberals and  
Conservatives*

*British Political Changes after 1900*

---

*Rise of British labor*

---

At the turn of the century important changes were discernible on the British political scene. Labor emerged as an independent political force, the Labour party itself being organized shortly after 1900. The rise of labor had a deep impact upon the Liberal party and indeed upon liberalism itself.

With many persons insisting that protective measures be taken to counteract the poor health, low income, and economic insecurity of British workers, the Liberals abandoned their traditional position of laissez-faire and sponsored a policy of government intervention and social legislation in behalf of working people. The Liberals, though they acted in part for humanitarian reasons, were aware that with the emergence of the Labour party workers who customarily had voted for them might readily transfer their allegiance.

The Liberals, in control of the government from 1906 to 1916, with Herbert Asquith as prime minister and David Lloyd George as chancellor of the exchequer during most of this time, put through a spectacular program of social welfare. Sickness, accident, and old-age insurance, and a degree of unemployment insurance were adopted, and a moderate minimum wage law was enacted. Labor exchanges, or employment bureaus, were established throughout the country. Restrictions on strikes and other trade union activities were removed. To meet the costs of the new program as well as of other government expenditures, Lloyd George's budget of 1909 called for progressive income and inheritance taxes: wealthier taxpayers would be taxed at progressively higher rates. He was in effect advancing the then novel idea of using taxation to modify the social extremes of wealth and poverty. It was a "war budget," he said, intended "to wage war against poverty." Its fiscal measures were directed primarily at the landed aristocracy, and it aroused great opposition, especially in the House of Lords, where the contest over the budget led to a further constitutional curtailment of the power of the upper house. The Parliament Act of 1911 deprived the Lords of all veto power in money matters and of all but a two-year delaying veto on action of the Commons on other legislation. At this time, too, the government voted to pay salaries to members of the House of Commons, making it possible for workers and others without independent incomes to take seats in Parliament.

*A war against poverty*

---

---

*State intervention*

---

The Liberal party was embracing a program of positive state intervention in social and economic matters that the older liberalism, nurtured on the doctrines of laissez-faire and the Manchester School, would not have accepted. With the Liberals actively seeking the support of labor and altering much in their traditional program, the Conservatives in the twentieth century tended to become the party of industry as well as of landed wealth and to replace the Liberals as the champions of economic liberalism and laissez-faire. In the next generation, after the First World War, the Conservatives were to remain one of the two major parties of the country; the Liberals were to be far outstripped by the Labour party.

Meanwhile, despite its gains, labor was not pacified. Real wages showed a tendency to fall after 1900, and great coal and railway strikes broke out in 1911 and 1912. The British capacity to survive crises without violence, while still conspicuous, was being strained. An even more serious threat came from Ireland.

*The Irish Question*

Britain suffered from one of the most bitter minorities conflicts in Europe—what the British called the Irish question. After 1801 Britain was known as the United Kingdom of

### SUNDAY AFTERNOON ON THE ISLAND OF LA GRANDE JATTE

by Georges Seurat (French, 1859–1891)

This picture of sunny calm, painted in 1886, conveys the well-being that many Europeans enjoyed in the late nineteenth century. The people portrayed here seem to live in a peaceable world that is far removed from a later age of speed and mechanical amusements. Technically, this is one of the most remarkable pictures ever painted. The artist created it without the use of lines by filling the canvas with thousands of minute dots of the primary colors, which blur and mix in the eye to produce the forms, hues, light, and shadows of nature.

(George Seurat, French, 1859–1891, *A Sunday on La Grande Jatte*—1884, 1884–1886, oil on canvas, 207.6 × 308 cm., photograph © 2001, The Art Institute of Chicago, 1926.224 (E28490))

Great Britain and Ireland, Ireland having been incorporated into the United Kingdom as a defensive measure against pro-French sympathies in Ireland during the wars of the French Revolution. The Irish representatives who sat in Parliament were generally obstructionist in their tactics. The Irish had many substantial grievances, among which two were conspicuous. The Irish peasants were defenseless against their landlords, far more so, for example, than the French peasants before 1789; and the Irish people, though predominantly Catholic, were obliged to pay tithes to the established Church of Ireland

Real wages for British workers tended to fall in first decade of the twentieth century, causing hardships for people such as these coal miners in Wales. Miners joined in strikes throughout Britain after 1910, contributing to economic and political crises that altered the older doctrines and policies of *laissez-faire* liberalism.

(an Anglican sister church to the Church of England), which also owned a good deal of the land.

Gladstone, in his first ministry, disestablished the Church of Ireland. He also initiated measures to protect the Irish farm tenant. By 1900, under Conservative auspices, Irish tenants were being assisted by the British government to buy out their landlords—often English or Anglicized and absentee Irish landowners. The Irish also wanted home rule, or a parliament of their own. Gladstone, in trying to give it to them in 1886, split his Liberal party, part of which went along with the Conservatives in opposing a political division of the British Isles. Home rule was finally granted to Ireland in 1914. But the Ulstermen, Protestants of northern Ireland, objected vehemently to inclusion in an autonomous Ireland, in which they would be outnumbered by the Catholics of the south. The latter, however, insisted with equal vehemence on the inclusion of Ulster, not wishing to see a political division of Ireland.

The Ulstermen, backed by British Conservatives, started arming and drilling to resist the act of Parliament that authorized home rule. Great Britain, in 1914, was about to see a civil war on its own doorstep. It suffered from something like the insoluble nationalist disputes that afflicted Austria-Hungary. During the First World War home rule was sus-

pended. After considerable violence on both sides Catholic Ireland (which for a time called itself Eire) received dominion status in 1922, but eventually dissolved all ties with Britain and became the Republic of Ireland. Northern Ireland remained in the United Kingdom and was dominated by Protestants, so that its Catholic minority continued to be an alienated, discontented population within the British state. The "Irish question" remained an unresolved issue, generating bitter resentments and violent conflicts during all of the twentieth century and beyond.

### *Bismarck and the German Empire, 1871–1890*

The German Empire, as put together by Bismarck in 1871 with William I, king of Prussia, as Kaiser, was a federation of monarchies, a union of 25 German states, in which the weight of monarchical Prussia, the Prussian army, and the Prussian landed aristocracy was preponderant. It developed neither the strong constitutionalism of England nor the democratic equality that was characteristic of France. To win popular support for his projects, Bismarck exploited existing democratic and socialist sentiment and provided that members of the Reichstag, the lower chamber, be elected by universal male suffrage. Remaining chancellor of the united empire for some 20 years, from 1871 to 1890, he usually tried to have a majority in the Reichstag on his side, but he recognized no dependence on a majority in principle, holding to the doctrine that it was the emperor and his chancellor who were to govern the country. Moreover, in practice, the legislative powers of the lower house were severely restricted, and the upper chamber, representing the princes and not the people, and favored by the government, tended to be more important. Despite the nature of the empire, the Prussian conservatives, the East Elbian Junker landlords, were at first by no means enthusiastic over Bismarck's unified Germany. They opposed his democratic concessions and were left horrified when in 1872 he undertook to abolish what was left of their manorial jurisdiction over their peasants.

Bismarck in the 1870s therefore leaned not on the Conservatives but on the National Liberals. With their aid he put through a number of economic and legal measures designed to consolidate the unity of the new empire. Bismarck's first serious conflict developed with the Catholic church. At the very time that he was bent on subordinating all groups within the state to the sovereign power of the new empire, the church had spoken out. In 1864 in the *Syllabus of Errors*, it denounced the encroachment of all governments on educational and church affairs; in 1870 the new dogma of papal infallibility made it incumbent on Catholics to accept unreservedly the pope's pronouncements in matters of faith and morals. To many, the implication was that the new empire could not count on the undivided loyalty of its Catholic citizens. To defend Catholic interests and those of the south German states where Catholicism predominated, Catholic elements had organized the strong Center party, which now upheld the church pronouncements. In 1871 Bismarck launched the *Kulturkampf*, or "battle for modern civilization." The Liberals joined in eagerly. Like nineteenth-century liberals elsewhere (Gladstone's campaign against Anglican privilege and the French laic laws have just been mentioned), they were strongly anticlerical and disapproved of the influence of organized churches in public and private life. Laws were put through imposing restrictions upon Catholic worship and education, the Jesuits were expelled, and many Catholic bishops throughout Germany were arrested or went into exile. But Bismarck gradually concluded that the anti-Catholic legislation was fruitless, that he had overestimated the danger to the state of

## CHRONOLOGY OF NOTABLE EVENTS, 1850–1914

---

1850–1940	About 60 million people migrate from Europe
1869	Opening of Suez Canal in Egypt facilitates global trade
1870s	Western Europe and United States adopt the “gold standard” for global currency exchanges
1871	The revolutionary Paris Commune is violently suppressed in France
1890	Kaiser William II dismisses Bismarck and begins to shape policies of the German Empire
1894–1899	Dreyfus Affair bitterly divides republican and antirepublican factions in France
c. 1900	European population reaches its highest percentage of world population
1906–1916	Liberal government in Britain introduces broad program of social welfare
1914	Opening of Panama Canal facilitates global trade in the Americas

---

organized Catholicism, and that he needed the support of the Center party for other parts of his program. Meanwhile, the country’s rapid and spectacular industrial expansion had stimulated the growth of the German working class, and to Bismarck’s alarm, socialism was spreading.

The German Social Democratic party had been founded in 1875 by a fusion of Marxian socialists and the reformist followers of Ferdinand Lassalle on an essentially moderate program which Marx had denounced. But even a moderate socialism was mistrusted by Bismarck. He shared in the European horror at the recent Paris Commune, he feared socialism as anarchy, and he knew that socialism was in any case republican, which made it a potentially revolutionary movement in an empire of monarchies. Two radical attempts on the emperor’s life (in neither case by Social Democrats) provided him with all the excuse he needed. In 1878, having already made peace with the

Catholics, he set out to eradicate socialism. Antisocialist laws from 1878 to 1890 prohibited socialist meetings and socialist newspapers. For 12 years socialism was driven underground. But repression was not his only weapon; he turned also to another tactic. Bismarck sought to persuade the workers to place their faith in him and the German Empire rather than in

Marx and the prophets of socialism. To that end, in the 1880s, he initiated an extensive program of social legislation. Workers were insured by the state against sickness, accident, and incapacity in old age. “Our democratic friends,” said Bismarck, “will pipe in vain when the people see princes concerned with their well-being.” In social insurance imperial Germany was, from whatever motives, years ahead of more democratic England, France, and the United States.

Bismarck failed to kill socialism. The number of socialists elected to the Reichstag was greater in 1890 than in 1878. It seems, however, that Bismarck by the later 1880s was more apprehensive than ever of social revolution that would destroy his empire and contemplated some kind of coup d’état in which the Reichstag would be throttled. He never reached this point because in 1890, at the age of 75, he was obliged by the new emperor, William II, to retire.

*Repression of  
socialism*

*The German Empire after 1890: William II*

William I died in 1888 and was succeeded by his son Frederick III, who had been married for many years to Victoria, the eldest daughter of England's Queen Victoria. Incurably ill of cancer, he died some three months after his accession. Frederick's son, William II, the last king of Prussia and the last German Kaiser, began his reign (1888–1918) as a young man of 29, full of startling ideas about his personal power and privileges, somewhat in contrast to his father. He was also uncomfortable in the presence of an elder statesman who had made the German Empire, who had been his grandfather's aide and adviser, and whom he regarded partly with veneration and partly as an old fogey. William soon quarreled with Bismarck over continuation of the antisocialist laws and over matters of foreign affairs. When Bismarck forbade his ministers to meet with the emperor on policy matters unless he was present, William resolved that he, and not Bismarck, would rule the empire, and in 1890 he ordered Bismarck to resign, "dropping the pilot," in the celebrated phrase. Under the four chancellors who succeeded Bismarck, it was William who dominated policy.

---

---

 William II

After 1890 Germany embarked upon what was termed a "new course."

In foreign affairs this meant a more aggressive and ambitious colonial, naval, and diplomatic policy. In domestic affairs it meant a more conciliatory attitude toward the laboring class. The antisocialist laws were dropped,

---

---

 A "new course"

and the system of social security legislation was enlarged and codified. But no expansion of parliamentary democracy seemed possible. William II believed in the divinely ordained prerogatives of the house of Hohenzollern, and the empire still rested on the power of the federated princes, the Junkers, the army, and the new industrial magnates. But the Social Democrats, the Progressive party, and other democratic forces were growing in strength. They demanded, for Prussia, a reform of the illiberal constitution of 1850, and for the Reich, real control over the federal chancellor by the majority party in the Reichstag. In the election of 1912 the Social Democrats reached a new high by polling four and a quarter million votes, about one-third of the total, and by electing 110 members to the Reichstag, in which they now formed the largest single party; yet they were excluded from the highest posts of government. Even had war not come in 1914, it is clear that the imperial Germany created by Bismarck, and now ruled by William II, was moving toward a constitutional crisis in which political democracy would be the issue.

*Developments Elsewhere, General Observations*

Of political developments in other European states before 1914, something has already been said in the preceding chapter. Italy had become a constitutional monarchy in the 1860s and completed its unification by the forceful seizure of Rome in 1870. Despite parliamentary reforms, Italian political life in substance was characterized by unstable majorities and by opportunistic maneuvering and manipulation by moderate liberal political leaders who maintained themselves in office for long periods of time by shuffling and reshuffling political coalitions. The liberal leaders were anticlerical, and the quarrel with the papacy over the seizure of the papal territories remained unsettled. The popes refused to recognize the Italian kingdom and forbade Catholics to participate in its affairs or even to vote in elections. Catholics voted nonetheless and in 1907 bishops in each diocese were permitted to relax the ban, as they increasingly did.

---

 Political scene in Italy

Kaiser William II's decision to remove Bismarck from his powerful position in Germany's government was widely described as "dropping the pilot" of the German Empire. This theme was conveyed by the British cartoonist John Tenniel, who portrayed William expelling Bismarck from the ship of state in this famous illustration for the British magazine *Punch*.

(Getty Images)

Industry had begun to make an appearance in the northern cities like Milan. More as a matter of expediency than out of any democratic impulse, the government moved to extend the franchise to the working classes. The narrow suffrage of 1861 was broadened, first in 1882, and then in 1912, when the new reform increased the number of eligible voters from 3 to 8 million, or virtually universal male suffrage. Because of illiteracy and political inertia not all of the newly enfranchised hastened to exercise their voting privilege. The social problem remained serious, too, despite some modest labor legislation. Poverty and illiteracy, especially in the agrarian south, were widespread, and radical unrest appeared in the industrial cities. The first manifestations of an antiparliamentary ideology, chauvinistic nationalism, and explosive irrationalism appeared in the writings and political activism of literary men such as Gabriele d'Annunzio and Filippo Marinetti, the latter publishing in 1909 the manifesto of a violently nihilistic movement he called "futurism." The machinery of political democracy was established in Italy, but there could be no assurance about the evolution of a stable Italian parliamentary democracy.

In the Dual Monarchy of Austria-Hungary, created by the political compromise of 1867, Austria and Hungary were each in form constitutional parliamentary states. In theory, the Emperor-King Francis Joseph

ruled through ministries responsible to the legislature in each state. However, in the important sphere of matters affecting the empire as a whole, such as foreign affairs and military questions, there was little parliamentary restraint on the emperor. Here he had virtually final authority; moreover, in all matters he still had broad powers to govern by decree, which he exercised. **As in Germany**, the tide of socialism was held back both by repressive laws and by social insurance and benevolent legislation. The most serious problem in the empire remained not socialism but agitation by the various subject nationalities, the Czechs and other Slavic peoples. Political democracy took a different course in Austria than in Hungary. In the former, partly as an effort to placate nationalist sentiment, universal male suffrage was introduced in 1907. In the latter it was bitterly and successfully resisted by the Magyars, who saw in it a weapon that could be employed by the Slavs to contest and destroy the Magyar preponderance. Austria itself, despite the democratic suffrage, was ruled very much like the German Empire, with the legislature able to debate and criticize but not control policy.

Of other countries it can be said that the political forms of democracy showed signs of advancing everywhere. Universal male suffrage was adopted in Switzerland in 1874, in Belgium in 1893, in the Netherlands in 1896, and in the next few years in Norway and Sweden (Norway was peacefully separated in 1905 from Sweden). In southern Europe, besides Italy, universal male suffrage was introduced in Spain, Greece, Bulgaria, Serbia, and, after the revolt of 1908, in Turkey. Even tsarist Russia, after the Revolution of 1905, received a Duma, or national parliament, elected on a wide franchise but on an indirect and undemocratic class basis and with narrow powers. **Among states west of the Russian empire, only Hungary and Romania had a highly restricted suffrage on the eve of the First World War.** The vote for women progressed more slowly. Women voted before 1914 only in certain western states of the United States, in Australia, New Zealand, Finland, and Norway. **Not until after the First World War did female suffrage begin to make significant advances, and women did not gain the right to vote in France and Italy until after the Second World War.**

---

---

*Democratic advances*

The progress of representative and democratic institutions did not mean an end to the rule of monarchs, landed aristocrats, and other minority interests. For one thing, with the exception of France and Switzerland, Europe remained monarchical. **Second, despite the growing importance of parliaments, parliamentary control over political life was far from guaranteed; emperors and kings still ruled through their chancellors and prime ministers.** Of the major world powers it was mainly in the United States (at least for white males), Britain, and France that democratic and popular control was something of a reality. But the **extension of the suffrage**, by the relaxation of property qualifications, had a dynamic of its own and was altering the framework of politics everywhere; mass political parties, including socialist parties and confessional, or religious-oriented, parties were replacing the older narrow oligarchic political organizations, and support now had to be sought on a wider electoral basis. In almost all Europe, and in many of the outlying areas peopled by European descendants, democracy was advancing, even within the older framework. By 1871, most European nations, with the notable exception of Russia, had already won written constitutions, guarantees of personal freedom, parliamentary and representative institutions, and limitations on absolutism; in the years between 1871 and 1914 the most significant new political factor was the advance of male suffrage.

---

---

*Expansion of the suffrage*

The growing populations and economies of European nations thus created a social stability in which political institutions gradually became more democratic and more

responsive to public opinion. Wealth and resources flowed into Europe from all parts of the world, so that the middle classes and even workers had more comforts and material goods than ever before—and more opportunities to participate in the political institutions of their various nations. Europe's dominant role in the global economy, the massive migration of European people, and the military power of European nation-states gave European civilization its extraordinary world influence in the decades after 1871.

During these same years, however, the growing power of industrial corporations and capitalist financial institutions as well as the traditional power of older European social hierarchies and cultural attitudes also provoked opposition, which appeared in popular political movements, as in socialism, and in criticisms of imperialism. The critics eventually influenced many people outside Europe, gaining a following wherever European economic and cultural institutions had appeared. European criticisms of Western capitalism, traditions, and ideas became another aspect of Europe's global influence at the end of the nineteenth century.

# EUROPEAN CIVILIZATION, 1871–1914: SOCIETY AND CULTURE

- 
- 74. The Advance of Democracy: Socialism, Labor Unions, and Feminism
  - 75. Science, Philosophy, the Arts, and Religion
  - 76. The Waning of Classical Liberalism
- 

*The belief in progress* has been at the center of modern thought since the Scientific Revolution of the seventeenth century. Although some romantic poets, conservatives, and socialists questioned the consequences of modern technologies and industry, most people in the nineteenth century assumed that progress was both inevitable and beneficial. Liberals were especially optimistic about progressive developments in all the main spheres of modern life: scientific knowledge, technological inventions, economic expansion, constitutional government, and protection for fundamental

human rights. But the liberals were by no means alone in seeing the late nineteenth-century European ascendancy as the historical confirmation of human progress.

There were also many Europeans, however, who believed that whole groups of human beings were denied the benefits of modern civilization, that workers were not receiving their rightful share of modern wealth, or that women were not entering their rightful place in modern political life. The popular new political movements in these decades were therefore convinced that they were on the side of progress, and in fact they were often able to gain new rights or benefits for the groups they represented.

Meanwhile, science itself continued to produce advances in both the theoretical understanding of nature and the technological inventions that were transforming modern societies. Yet it was also at this time that various thinkers began to question the certitudes of scientific knowledge and to stress the limits of human reason, thus challenging many of the cultural assumptions that sustained the popular belief in human progress. These new trends in European intellectual life before 1914 began to erode some of the confidence in the progressive evolution of human history (at least among certain philosophers or artists) and to undermine the optimism of classical liberalism. The idea of progress remained a powerful theme in all modern cultures, but by the early twentieth century the limits and

consequences of progress were also becoming subjects for historical reflection, artistic representation, and cultural debate.

## 74. THE ADVANCE OF DEMOCRACY: SOCIALISM, LABOR UNIONS, AND FEMINISM

The artisan and laboring classes had always been suspicious of “bourgeois” liberalism’s optimistic view of free competition, unrestrained private enterprise, the Manchester School, laissez-faire, the laws of supply and demand, the free market for goods and labor, and the idea of an economy independent of states and governments. These were the ideas of middle-class liberals, not of radical democrats. Popular leaders had opposed them in the French Revolution in 1793. The English Chartists had been outspokenly anticapitalistic, and on the Continent the ideas of socialism had been spreading. In 1848 there was a strong movement among the working classes for a “social” republic, and, though the social revolution failed in 1848, the force of it was enough to terrify the possessing classes and shape the philosophy of Karl Marx. With the advent of the ballot, workers pressed for social legislation and used their political power to gain a greater measure of social democracy.

---

*Opponents of  
liberalism*

But in addition, before and after obtaining the ballot, working people resorted to other devices for the improvement of their position. Against the owners of capital, who controlled the giving of jobs, there were two principal lines of action. One was to abolish the capitalists; the other, to bargain with them. The former led to radical forms of socialism; the latter, to the formation of labor unions. Socialism, in logic, meant the extinction of the private employer as such, or at least to the dissolution of the larger capitalist corporations. Trade unionism, in logic, meant that the workers had every reason to keep their employers prospering in business in order that bargaining with them might produce better economic results. The working-class movement thus contained an internal contradiction which was never completely resolved.

---

*Workers and  
intellectuals*

Middle-class and educated people who took up the workers’ cause, the “intellectuals” of the movement—Karl Marx, Friedrich Engels, Louis Blanc, Ferdinand Lassalle, and thousands of less famous names—tended more to socialism than to unionism. They thought of society as a whole, they saw the economy as a complex social system, they thought of the future in long-run terms, and their time scale allowed generously for whole historical epochs to come and go. The actual workers, put to work at an early age, barely educated if at all, with the waking hours of their adult lives spent on manual jobs, were inclined to keep their attention more on unionism than on socialism. To earn a shilling more every week beginning next week, to be spared the nervous strain and physical danger of constant exposure to unprotected machinery, to have 15 minutes more every day for lunch, were likely to seem more tangible and important than far-reaching but distant plans for a reconstructed society. The worker looked on the intellectual as an outsider, however welcome; the intellectual looked on the worker as shortsighted and timid, however much in need of help.

After the failures of 1848 the socialist and trade union movements diverged for a generation. The 1850s, compared with the hungry ‘40s, were a time of full employment, rising wages, and increasing prosperity for all classes. Workers set to organizing unions, socialist thinkers to perfecting their doctrines.

### *The Trade Union Movement and Rise of British Labor*

Organizations of wage workers, or labor unions in the modern sense (as distinguished from medieval craft guilds), had long maintained a shadowy and sporadic existence. But they had always been extralegal, frowned upon or actually prohibited by governments. French revolutionaries in the Le Chapelier Act of 1791 and British Tories in the Combination Act of 1799 had been as one in forbidding workers to unite. It was the rise of “bourgeois” liberalism, so insensitive to the worker in most ways, that first gave legal freedom to labor unions. The British unions received a tacit recognition from the Liberal Tories in 1825 and explicit recognition from Gladstone’s Liberal ministry in 1871. French unions were recognized by Napoleon III in 1864, then restrained in the reaction caused by the Commune, then fully legalized in 1884. In Germany Bismarck negotiated with labor leaders to find support against the vested interests that stood in his way.

The prosperity of the 1850s favored the formation of unions, for workers can always organize most easily when employers are most in need of their services. The craft union—or union of skilled workers in the same trade, such as carpenters—was at first the typical organization. It was most fully developed in England, where a “new model” unionism was introduced by the Amalgamated Society of Engineers (i.e., machinists) in 1851. It was the policy of the “new model” union officials to take the unions out of politics, to forget the semisocialism of the Chartists, to abandon Robert Owen’s grandiose idea of “one big union” for all workers, and to concentrate on advancing the interests of each separate trade. The new leaders proposed to be reasonable with employers, avoid strikes, accumulate union funds, and build up their membership. In this they were successful; the unions took root; and the two governing parties in England, reassured by the unexpected moderation of working-class representatives, combined to give the town worker the vote in 1867.

---

*“New model”  
unionism*

In the 1880s, and especially with the great London dock strike of 1889, which closed the port of London for the first time since the French Revolution, unions of unskilled workers began to form. Industrial unionism, or the joining in one union of all workers in one industry, such as coal or transportation, regardless of the skill or job of the individual worker, began to take shape at the same time. In some cases the older skilled unionists joined with unskilled laborers who worked beside them. By 1900 there were about 2,000,000 union members in Great Britain, compared with only 850,000 in Germany and 250,000 in France.

It was largely because British workers were so far advanced in trade unionism, and so successful in forcing collective bargaining upon their employers, that they were much slower than their Continental counterparts in forming a workers’ political party. By the 1880s, when avowed socialists were already sitting in French, Belgian, and German parliaments, the only corresponding persons in Britain were a half-dozen “Lib-Labs,” as they were called, laboring men elected on the Liberal ticket. The British Labour party was formed at the turn of the century by the joint efforts of trade union officials and middle-class intellectuals. Where on the Continent the labor unions were often led, and even brought into being, by the socialist political parties, in Britain it was the labor unions that brought into being, and subsequently led, the Labour party. The influence of British labor unions made the Labour party less socialistic than working-class parties on the Continent. Its origin and rapid growth were due in large measure to a desire to defend the unions as established and respectable institutions.

---

*The British Labour  
party*

A steady rise in the membership of labor unions transformed political life in all industrialized societies. This illustration of British miners voting to strike was published in an Italian newspaper, but it depicts the kind of worker activism that became common in most European nations and in other parts of the modern world by the early twentieth century.

(The Art Archive/Domenica del Corriere/Dagli Orti(A))

*The Taff Vale decision*

The unions were threatened in their very existence by a ruling of the British courts in 1901, the Taff Vale decision, which held a union financially responsible for business losses incurred by an employer during a strike. The shortest and most orderly strike, by exhausting a union's funds, might ruin the union. Opposition to the Taff Vale decision unified the unions and all other existing labor and socialist organizations and precipitated the formation of the modern Labour party. In the election of 1906 the new Labour party sent 29 members to Parliament, which thereupon overruled the Taff Vale decision by new legislation. The social legislation put through Parliament by the Liberal party government in the next few years, in good part under pressure from labor, has been described in the last chapter.

### *European Socialism after 1850*

As for socialism, which had so frightened the middle and upper classes in 1848, it seemed in the 1850s to go into abeyance. Karl Marx, after issuing the *Communist Manifesto* with Engels in 1848, and agitating as a journalist in the German revolution of that year, withdrew to the secure haven offered by England, where, after years of painstaking research, he published the first volume of his *Capital* in 1867. This work, of which the succeeding two volumes were published after his death, gave body, substance, and argument to the principles announced earlier in the *Communist Manifesto*. Marx, during more than 30 years in London, scarcely mixed with the labor leaders then building up the English

unions. Hardly known to the English, he associated mainly with political exiles and temporary visitors of numerous nationalities. The first volume of *Capital* was not even published in English until 1886.

In 1864 there took place in London the first meeting of the International Working Men's Association, commonly known as the First International. It was sponsored by a heterogeneous group, including the secretary of the British carpenters' union, Robert Applegarth; the aging Italian revolutionary, Mazzini; and Karl Marx. With the union officials absorbed in union business, leadership in the Association gradually passed to Marx, who used it as a means of publicizing the ideas about to appear in his *Capital*. At subsequent annual congresses, at Geneva, Lausanne, Brussels, and Basel, Marx built up his position. He made the Mazzinians unwelcome, and he denounced the German Lassalleans for their willingness to cooperate with Bismarck, arguing that it was not the business of socialists to cooperate with the state but to seize it. His sharpest struggle was with the Russian Bakunin. Drawing on his experience in tsarist Russia, Bakunin viewed the state as the cause of the worker's afflictions; he was hence an "anarchist," holding that the state should be attacked and abolished. To Marx anarchism was abhorrent; the correct doctrine was that the state—tsarist or bourgeois—was a product of economic conditions and a weapon of the propertied interests, so that the true target for revolutionary action must be not the state but the capitalist economic system. Marx drove Bakunin from the International in 1872.

---

---

*The First  
International*

Meanwhile members of the First International watched with great excitement the Paris Commune of 1871, which they hoped might be the opening act of a European working-class upheaval. Members of the International infiltrated the Commune, and the connection between the two, though rather incidental, was one reason why the French Provisional Government repressed the Commune with such terrified ferocity. But the Commune actually destroyed the First International. The Commune had been bloody and violent, an armed rebellion against the democratically elected National Assembly of France. Marx praised it as a stage in the international class war. He even saw in it a foretaste of what he was coming to call the "dictatorship of the proletariat." He thus frightened away many possible followers. Certainly British trade unionists, sober and steady individuals, could have nothing to do with such doings or such doctrines. The First International faded out of existence after 1872.

---

---

*The Paris Commune*

But in 1875, at the Gotha conference, Marxian and Lassallean socialists united to found the German Social Democratic party, whose remarkable growth thereafter, against Bismarck's attempts to stop it, has already been noted. About 1880 socialist parties sprouted in many countries. In Belgium, highly industrialized, a Belgian Socialist party appeared in 1879. In the industrial regions of France some workers were attracted to Jules Guesde, a self-taught worker, former Communard, and now a rigid Marxist, who held it impossible to emancipate the working class by compromise of any sort; others followed Paul Brousse, who thought it possible for workers to arrive at socialism through parliamentary methods; still others supported Jean Jaurès, who eloquently linked social reform to the French revolutionary tradition and the defense of republican institutions. Not until 1905 did the socialist groups in France form a unified Socialist party. In England, in 1881, H. M. Hyndman founded a Social Democratic Federation on the German model and with a Marxist program; it never had more than a handful of members. In 1883 two Russian exiles in Switzerland, Plekhanov and Axelrod, recent converts to Marxism, founded the Russian Social Democratic party, from which the communism of the following century was eventually to be derived. The socialist parties

*The Second  
International*

all came together to establish an international league in 1889, known as the Second International, which thereafter met every three years and lasted until 1914.

*Revisionist and Revolutionary Socialism, 1880–1914*

The new socialist parties of the 1880s were all Marxist in inspiration. Marx died in 1883. Marxism or “scientific socialism,” by the force of its social analysis, the mass of Marx’s writings over 40 years, and an attitude of unyielding hostility to competing socialist doctrines, had become the only widely current form of systematic socialism. Strongest in Germany and France, Marxism was relatively unsuccessful in Italy and Spain, where the working class, less industrialized anyway, more illiterate, unable to place its hopes in the ballot, and habituated to insurrectionism in the manner of Garibaldi, turned more frequently to the anarchism preached by Bakunin.

Nor was Marxism at all successful in England; workers stood by their trade unions, and middle-class critics of capitalism followed the Fabian Society, established in 1883. The Fabians (so called from the ancient Roman general Fabius Cunctator, the “delayer,” or strategist of gradual methods) were very English and very un-Marxist. George Bernard Shaw, H. G. Wells, and Sidney and Beatrice Webb were among early members of the Society. For them socialism was the social and economic counterpart to political democracy, as well as its inevitable outcome. They held that no class conflict was necessary or even existed, that gradual and reasonable and conciliatory measures would in due time bring about a socialist state, and that improvement of local government, or municipal ownership of such things as waterworks and electric lighting, were steps toward this consummation. The Fabians, like the trade union officials, were content with small and immediate satisfactions. They joined with the unions to form the Labour party. At the same time, by patient and detailed research into economic realities, they provided a mass of practical information on which a legislative program could be based.

*Fabian socialism in  
England*

The Marxist or Social Democratic parties on the Continent grew rapidly. Marxism turned into a less revolutionary “parliamentary socialism” — except indeed for the Russian Social Democratic party, since Russia had no parliamentary government. The growth of socialist parties meant that true workers, and not merely intellectuals, were voting for socialist candidates for the Reichstag, Chamber of Deputies, or whatever the lower house of parliament might be called; and this in turn meant that the moderating influence of labor unions within the parties was increased. The workers and their union officials might in theory consider themselves locked in an enormous struggle with capital; but in practice their aim was to gain more for themselves out of their employers’ business. They might believe in the internationalism of the workers’ interests; but in practice, acting through the parliaments of national states, they would work for orderly legislation benefiting the workers of their own country only — social insurance, factory regulation, minimum wages, or maximum hours.

*Parliamentary  
socialism on the  
Continent*

By the close of the nineteenth century it was becoming apparent that Marx’s prediction of growing worker impoverishment (based initially on conditions of the 1840s) had not come true, at least not yet; the bourgeois was getting richer, but the proletariat was not getting poorer. Real wages — or what the wage earner’s income would actually buy, even allowing for the losses due to unemployment — are estimated to have risen about 50 percent in the industrialized countries between 1870 and 1900. The increase was due to the

greater productivity of labor through mechanization, the growth of the world economy, the accumulation of capital wealth, and the gradual fall in prices of food and other items that the workers had to buy.

Marxism began in the 1890s to undergo a movement of revisionism, led in France by Jean Jaurès, Socialist leader in the Chamber of Deputies, and in Germany by Eduard Bernstein, Social Democratic member of the Reichstag and author in 1898 of *Evolutionary Socialism*, an important tract setting forth the new views. The revisionists held that the class conflict might not be absolutely inevitable, that capitalism might be gradually transformed in the workers' interest, and that now that the workers had not only the vote but also a political party of their own, they could obtain their ends through democratic channels, without revolution and without any dictatorship of the proletariat. Most socialists or social democrats followed the revisionists. Repeatedly, but in vain, the Second International had to warn its component socialist parties against collaboration with the bourgeoisie.

---

---

*The revisionists*

This tendency to "opportunism" among Marxists drove the really revolutionary spirits into new directions. Thus there arose revolutionary syndicalism, of which the main intellectual exponent was a Frenchman, Georges Sorel. "Syndicalism" is simply the French word for trade unionism (*syndicat*, a union), and the idea was that the workers' unions might themselves become the supreme authoritative institutions in society, replacing not only property and the market economy, but also government itself. The means to this end was to be a stupendous general strike, in which all workers in all industries would simultaneously stop work, thus paralyzing society and forcing acceptance of their will. Syndicalism made most headway where the unions were weakest, as in Italy, Spain, and France, since here the unions had the least to lose and were most in need of sensational doctrines to attract members. Its strongest base was in the French General Confederation of Labor, founded in 1895.

---

---

*Syndicalism*

Among orthodox Marxists there was also a revival of Marxist fundamentals in protest against revisionism. In Germany Karl Kautsky arraigned the revisionists as compromisers who betrayed Marxism for petty-bourgeois ends. In 1904 he and other rigorists prevailed upon the Second International to condemn the political behavior of the French socialist Alexandre Millerand, who in 1899 had accepted a ministerial post in a French cabinet. Socialists might use parliaments as a forum, the International ruled, but socialists who entered the government itself were unpardonably identifying themselves with the enemy bourgeois state. Not until the First World War did socialists henceforth join the cabinet of any European country. In the Russian Social Democratic party the issue of revisionism came to a head in 1903 at a party congress held in London—for the most prominent Russian Marxists were mainly exiles. Here a group led by the committed revolutionist V. I. Lenin demanded that revisionism be stamped out. Lenin won a majority, at the moment at least, and hence the uncompromising Marxists were called Bolsheviks (from the Russian word for majority), while the revisionist Russian Marxists, those willing to work with bourgeois liberals and democrats, were subsequently known as Mensheviks or the "minority" group. But in 1903 the Russian Marxists were considered unimportant.

---

---

*Orthodoxy vs.  
Revisionism*

In general, in Europe's inner zone, by the turn of the century, most people who called themselves Marxists were no longer actively revolutionary. As revolutionary republicanism had quieted down in the Third French Republic, so revolutionary Marxism seemed to have quieted down into the milder doctrines of social democracy. What would have happened except for the coming of war in

---

---

*Marxism transformed*

1914 cannot be known; possibly social revolutionism would have revived, since real wages no longer generally rose between 1900 and 1914, and considerable restlessness developed in labor circles, punctuated by great strikes. But in 1914 the working class as a whole was in no revolutionary mood. Workers still sought a greater measure of social justice, but the social agitation so feared or hoped for in 1848 had subsided. There seem to have been three principal reasons. Capitalism had worked well enough to raise the workers' living standard above what they could remember of their parents' or grandparents'; workers had gained the right to vote, so they expected to benefit from new public policies rather than from the overthrow of their governments; and they had created political parties and increasingly powerful labor unions, all of which protected their interests and helped them acquire a larger share of the national income.

### *Feminism, 1880–1914*

The campaign for women's rights also became more international and better organized during the same decades that the new workers' parties were spreading across Europe. Women received less pay than men for the work they performed in the new industrial economy, and in most places they still faced numerous restrictions on their rights to own property, participate in political meetings, vote in elections, and attend universities. The movement for women's rights therefore continued to promote the kind of reforms that feminists had been advocating since the early nineteenth century, including more access to education and the right to vote. Women's groups on the Continent tended to emphasize legal and social reforms rather than voting rights, whereas British and American feminists gave more attention to the campaign for women's suffrage. But activists in all industrialized societies were increasingly drawn to national and international organizations, in part because such groups created useful networks for spreading information and political ideas. American women such as Susan B. Anthony and Elizabeth Cady Stanton joined with European feminists to establish an International Council of Women in 1888, and the growing demand for women's rights crossed the borders of all modern nations.

Although some feminists worked to make birth control available to more women or to improve the conditions of women workers, the quest for voting rights attracted the most public attention, especially in the United States and Britain. New organizations such as the National American Woman Suffrage Association and, in Britain, the Women's Social and Political Union sponsored petitions, mass meetings, and protests that demanded equal voting

---

*Suffragettes seek the  
vote*

rights in both local and national elections. The suffrage movement in Britain became especially militant after the British Parliament rejected every legislative proposal to grant women the vote—a pattern of official opposition that had become a recurring theme in British politics since the 1860s. Frustrated by the stubborn resistance of male politicians, the energetic leader of the Women's Social and Political Union, Emmeline Pankhurst, led a radical wing of the suffrage movement in a campaign of violent protests in the years before 1914. Pankhurst's supporters and allies disrupted sessions of Parliament, broke store windows, destroyed mailboxes, and damaged government buildings to protest the exclusion of women from British elections and political institutions. When arrested, the “suffragettes” went on hunger strikes, to which the police responded by painful forcible feedings.

Pankhurst and other suffragettes were widely ridiculed in the British press and Parliament, but their campaign attracted growing support during the First World War (when the

The British campaign for women's voting rights often mobilized women for marches in the streets, public demonstrations, and confrontations with government officials. The protestors at this march in 1913 were following a woman who had been arrested at an early suffragist demonstration, and the presence of the police is an example of the close government surveillance that was part of every such event.

(Getty Images)

militant protests were suspended), and, as noted earlier, British women over the age of 30 finally received the right to vote in 1918. Women also gained the right to vote in Germany, the United States, and other Western nations in the early years of this postwar era. The campaign for voting rights was only one component of modern feminism, however; and the movement to enhance women's rights in the economy, legal system, family, and education would develop new themes and new political strategies throughout the twentieth century.

## 75. SCIENCE, PHILOSOPHY, THE ARTS, AND RELIGION

Faith in the powers of natural science has been characteristic of modern society for over three centuries, but never was there a time when this faith spread to so many people or was held so firmly and with so few mental reservations as in the half-century preceding the First World War. Science lay at the bottom of the whole movement of industrialization; and if science gained wide popularity after about 1870, in that persons ignorant of science came to look upon it as an oracle of wisdom, it was because it manifested itself to

everybody in the new wonders of daily life. Hardly had the world's more industrialized regions digested the railroad, the steamship, and the telegraph when a whole series of new inventions began to appear. In the 30 years following 1875 the number of patents tripled in the United States, quadrupled in Germany, and multiplied in all modern countries. The scientific and technical advance was as completely international (though confined mainly to the "inner zone") as any movement the world has ever seen. Never had the rush of scientific invention been so fundamentally useful, so helpful to the constructive labors and serious problems of mankind.

---

*Changing conceptions  
in science*

In more basic scientific thinking important changes set in about 1860 or 1870. Up to that time, generally speaking, the underlying ideas had been those set forth by Isaac Newton almost two centuries before. The law of universal gravitation reigned unquestioned, and with it, hardly less so, the geometry of Euclid and a physics that was basically mechanics. The ultimate nature of the universe was thought to be regular, orderly, predictable, and harmonious; it was also timeless, in that the passage of ages brought no change or development. By the end of the epoch considered here, that is, by 1914, the old conceptions had begun to yield on every side.

### *The Impact of Evolution*

---

*Charles Darwin*

In impact upon general thinking the greatest change came in the new emphasis upon biology and the life sciences. Here the great symbolic date is the publication by Charles Darwin of the *Origin of Species* in 1859. Evolution, after Darwin, became the most influential intellectual theme of the era. Evolutionary philosophies, holding that the way to understand anything was to understand its development, were not new in 1859. Hegel had introduced the evolutionary conception into metaphysics; and he and Marx, into historical theories of human society. The idea of progress, taken over from the Age of Enlightenment, was a kind of evolutionary philosophy; and the great activity in historical studies, under romantic and nationalist auspices, had made people think of human affairs in terms of a time process. In the world of nature, the rise of geology after 1800 had opened the way to evolutionary ideas, and venturesome biologists had allowed themselves to speculate on an evolutionary development of living forms. What Darwin did was to stamp evolution with the seal of science, marshaling the evidence for it and offering an explanation of how it worked. In 1871, in *The Descent of Man*, he applied the same hypotheses to human beings.

By evolution, Darwin meant that species are mutable; that no species is created to remain unchanged once and for all; and that all species of living organisms, plant and animal, microscopic or elephantine in dimensions, living or extinct, have developed by successive small changes from other species that went before them. An important corollary was that all life was interrelated and subject to the same laws. Another corollary was that the whole history of living things on earth, generally held by scientists in Darwin's time to be many millions of years, was a unified history unfolding continuously in a single complex process of evolution.

Darwin thought that species changed, not by any intelligent or purposeful activity in the organism, but essentially by a kind of chance. Individual organisms, through the play of heredity, inherited slightly different characteristics, some more useful than others in food getting, fighting, or mating; and the organisms that had the most useful characteristics tended to survive, so that their characteristics were passed on to offspring, until the whole

Charles Darwin's *Origin of Species* (1859) set forth scientific arguments for the biological evolution of living organisms and provoked cultural debates far beyond the academic sphere of natural scientists. Darwin is portrayed here as an ageing, somewhat detached scientific expert whose grandfatherly appearance scarcely suggests the intellectual revolution that he launched through his research and writings.

(Library of Congress)

species gradually changed. Certain phrases, not all of them invented by Darwin, summed up the theory. There was a “struggle for existence” resulting in the “survival of the fittest” through “natural selection” of the “most favored races”—races meaning not human races but the strains within a species. The struggle for existence referred to the fact that in nature more individuals were born in each species than could live out a normal life span; the “fittest” were those individual specimens of a species having the most useful characteristics, such as fleetness in deer or ferocity in tigers; “natural” selection meant that the fittest survived without purpose in themselves or in a Creator; the “favored races” were the strains within a species having good survival powers.

Darwin's ideas precipitated a great outcry. Scientists rushed to defend and churchmen to attack him. The biologist T. H. Huxley became the chief spokesman for Darwin—“Darwin's bulldog.” He debated with, among others, the bishop of Oxford. Darwin was denounced, with less than fairness, for saying that human beings came from monkeys. It was feared that all grounds of human dignity, morality, and religion would collapse. Darwin himself remained complacent on this score. Under civilized conditions, he said, the social and cooperative virtues were useful characteristics assisting in survival, so that “we may expect that virtuous habits will grow stronger, becoming perhaps fixed by inheritance.” Much of the outburst against Darwin was somewhat trivial, nor were those who attacked him generally noted for spiritual insight; yet they were not mistaken in sensing a profound danger.

That Darwinism said nothing of God, Providence, creative (or intelligent) design, or salvation was not surprising; no science ever did. That evolution did not square with the first chapter of Genesis was disturbing but not fatal; much of the Old Testament was already regarded as symbolic, at least outside fundamentalist circles. Even the idea that

*“Survival of the fittest”*

Changing views of  
nature

humans and animals were of one piece was not ruinous; the animal side of human nature had not escaped the notice of theologians. The novel and upsetting effect of evolutionary biology was to change the conception of nature. Nature was no longer a harmony; it was a scene of struggle, “nature red in tooth and claw.” Elimination of the weak was natural, and it might even be considered good insofar as it contributed to evolutionary development. Such conceptions of what was good or beneficial for evolutionary progress profoundly challenged traditional religious ideas about morality and virtue. There were no fixed species or perfected forms, but only an unending flux. Change was everlasting; and everything seemed relative to time, place, and environment. There were no norms of good and bad; a good organism was one that survived where others perished; adaptation replaced virtue; outside it there was nothing “right.” The test was, in short, success; the “fit” were the successful; and here Darwinism merged with the new realism, or *Realpolitik*, and other social doctrines which were appearing in Europe at the same time from other causes.

Social Darwinism

Such at least were the implications if one generalized from science, carrying over scientific findings into human affairs, and the prestige of science was so great that this is precisely what many people wished to do. With the popularization of biological evolution, a school known as Social Darwinists actively applied the ideas of the struggle for existence and survival of the fittest to human society. Social Darwinists were found all over Europe and the United States. Their doctrines were put to various political and cultural uses, to show that some peoples were naturally superior to others, such as whites to blacks, or Nordics to Latins, or Germans to Slavs (or vice versa), or non-Jews to Jews; or that the upper and middle classes, comfortable and contented, deserved these blessings because they had proved themselves “fitter” than the shiftless poor; or that big business in the nature of things had to take over smaller concerns; or that some states, such as the British or German Empires, were bound to rise, or that war was morally a fine thing, proving the virility and survival value of those who fought.

### *Genetics, Anthropology, and Psychology*

Gregor Mendel

Meanwhile Gregor Mendel (1822–1884), an Austrian monk patiently experimenting with the cross-pollination of garden peas in his Augustinian monastery, arrived at an explanation of how heredity operates and how hybridization can take place. Unlike Darwin, his findings, published in 1866, were ignored until 1900, when they were rediscovered and became the basis for the new science of genetics. Mendel’s ideas foreshadowed the amazing breakthroughs in the scientific study of heredity and control over genetic materials in the second half of the twentieth century and in our own day.

Anthropologists began to study the physical and cultural characteristics of all branches of humankind. Physical anthropologists became interested in the several human “races,” some of which they considered might be “favored” in the Darwinian sense, that is, superior in inheritance and survival value. Some European scientists and intellectuals in this era argued that the whites were the most competent race, and among the whites the Nordics, or Germans and Anglo-Saxons. The public became more race conscious than Europeans had ever been before. On the other hand the cultural anthropologists, surveying all manner of primitive or complex societies with scientific disinterest, seemed sometimes to teach a more deflating doctrine. Scientifically, it seemed, no culture or society was “bet-

ter” than any other, all being adaptations to an environment, or merely a matter of custom—of the *mores*, as people said in careful distinction from “morals.” The effect was again a kind of relativism or skepticism—a negation of values, a belief that right and wrong were matters of social convention, psychological conditioning, mere opinion, or point of view. We are describing, let it be emphasized, not the history of science itself but the effects of science upon European civilization at the time.

The impact of anthropology was felt keenly in religion too. Sir James Frazer (1854–1941) in his multivolumed *The Golden Bough* could demonstrate that some of the most sacred practices, rites, and ideas of Christianity were not unique but could be found among numerous premodern societies and that, moreover, only the thinnest of lines divided magic from religion. Anthropology, like Darwinian evolution, undermined traditional religious beliefs.

---

---

*Anthropology and religion*

Psychology, as a science of human behavior, led to thoroughly upsetting implications about the very nature of human freedom and rationality. It was launched in the 1870s as a natural science by the German physiologist Wilhelm Wundt (1832–1920), who developed various new experimental techniques. The Russian Ivan Pavlov (1849–1936) conducted a famous series of experiments in which he “conditioned” dogs to salivate automatically at the ringing of a bell once they had become accustomed over a period of time to associate the sound with the serving of their food. Pavlov’s observations were important. They implied that a great part of animal behavior, and presumably human behavior, could be explained on the basis of conditioned responses. In the case of human beings these are responses which humans make automatically by virtue of their earlier environment and training and not through choice or conscious reasoning.

Most significant of all the developments in the study of human behavior was the work of Sigmund Freud (1856–1939) and those influenced by him. Freud, a Viennese physician, founded psychoanalysis at the turn of the century. He came to believe that certain forms of emotional disturbance like hysteria were traceable to earlier forgotten episodes of patients’ lives. After first trying various techniques such as hypnosis, which he soon abandoned, he employed free association, or free recall. If patients could be helped to bring these suppressed experiences into conscious recall, the symptoms of illness would often disappear.

---

---

*Sigmund Freud*

From these beginnings Freud and his followers explored the role that the unconscious played in all human behavior, he himself stressing the sexual drive. In one of his most famous books, *The Interpretation of Dreams* (1900), he stressed dreams as a key to understanding the unconscious; elsewhere he related his findings to religion, war, education, art, and literature. Freud and Freudian ideas had great influence on the social and behavioral sciences, and a good deal of the Freudian vocabulary later entered into everyday modern language and popular culture. In its deepest significance psychoanalysis, by revealing the wide areas of human behavior outside conscious control, suggested that human beings were not essentially rational creatures at all. Although Freud identified with the scientific traditions of the Enlightenment, his theory of the unconscious called into question the classical liberal and Enlightenment assumptions about how reasonable, free persons developed, explained, and acted upon their individual interests or beliefs.

### *The New Physics*

The revolution in biology of the nineteenth century, together with the developments in psychology and anthropology, were soon to be matched and surpassed by the revolution in physics. In the late 1890s physics was on the threshold of a revolutionary transformation.

Sigmund Freud's description of the unconscious mind reshaped modern conceptions of human psychology and influenced the arts, literature, and social theories as well as the medical treatment of mental illnesses. As this photograph suggests, however, the "revolutionary" Dr. Freud was also a typical member of his own cultural milieu—the professional class in early twentieth-century Vienna.

(Culver Pictures, Inc.)

Like Newtonian mechanics in the seventeenth century and Darwinian evolution in the nineteenth, the new physics represented one of the great scientific revolutions of all time. There was no single work comparable to Newton's *Principia* or Darwin's *Origin of Species* unless Albert Einstein's theory of relativity, propounded in a series of scientific papers in 1905 and 1916, might be considered as such. Instead there were a series of discoveries and findings, partly mathematical and then increasingly empirical, that threw new light on the nature of matter and energy. In Newtonian physics the atom, the basic unit of all matter, which the Greeks had hypothesized in ancient times, was like a hard, solid, unstructured billiard ball, permanent and unchanging; and matter and energy were separate and distinct.

---

Einstein's theory of  
relativity

But a series of discoveries from 1896 on profoundly altered this view. In 1896 the French scientist Antoine Henri Becquerel discovered radioactivity, observing that uranium emitted particles or rays of energy. In the years immediately following, from the observations and discoveries of the French scientists Pierre and Marie Curie and the Englishmen J. J. Thomson and Lord Rutherford, there emerged the notion that atoms were not simple but complex and, moreover, that various radioactive atoms were by nature unstable, releasing energy as they disintegrated. The German physicist Max Planck demonstrated in 1900 that energy was emitted or absorbed in specific and discrete units or bundles, each called a quantum; moreover, energy was not emitted smoothly and continuously as previously thought, nor was it as distinguishable from matter as once supposed. In 1913, the Danish physicist Niels Bohr postulated an atom consisting of a nucleus of protons surrounded by electrically charged units, called electrons, rotating around the nucleus, each in its orbit, like a minuscule solar system.

With radioactivity scientists were returning to an idea long rejected, the favored view of the alchemists, that matter was transmutable; in a way undreamed of even by the alchemists, it was convertible into energy. This the German-born Jewish scientific genius Albert Einstein (1879–1955) expressed in a famous formula  $E = mc^2$ . From his theory of relativity emerged also the profoundly

---

$$E = mc^2$$

The new theories that emerged in physics after 1900 transformed earlier Newtonian science and gave the young Albert Einstein an international reputation. This picture shows Einstein standing next to his personal books and papers in the 1920s, several years before he moved to the United States to escape the intolerance and repression in Nazi Germany.

(Getty Images)

revolutionary notion that time, space, and motion were not absolute in character but were relative to the observer and the observer's own movement in space. In later years, in 1929 and in 1954, Einstein brought together into one common set of laws, as Newton formerly had done, a unified field theory, an explanation of gravitation, electromagnetism, and subatomic behavior. Difficult as it was for even the serious-minded to grasp, and a great deal was still the subject of scientific controversy, it modified much that had been taken for granted since Newton. The Newtonian world was being replaced by a four-dimensional world, a kind of space-time continuum; and in mathematics, non-Euclidian geometries were being developed.

It turned out, too, that neither cause and effect nor time and space nor Newton's law of universal gravitation meant very much in the subatomic world nor indeed in the cosmos when objects moved with the speed of light. It was impossible, as the German scientist Werner Heisenberg demonstrated a little later, in 1927, by his principle of uncertainty, or indeterminacy, to ascertain simultaneously both the position and the velocity of the individual electron. On these foundations established before the First World War there developed the new science of nuclear physics and the tapping of the atom's energy. The atom and its world of subatomic particles were discovered to be even more complex than conceived of before 1914.

### *Trends in Philosophy and the Arts*

Although some writers and artists resembled earlier Romantic thinkers in criticizing Enlightenment ideas or modern science, most European intellectuals in this period viewed science as the model for all forms of knowledge. They were drawn to positivism or to the belief that scientific methods provided the only "positive" knowledge of the world. Anything unknowable to science must therefore remain unknowable forever—a doctrine called agnosticism, or the acknowledgment of ignorance. Herbert Spencer (1820–1903) in England and Ernst Haeckel (1834–1919) in Germany were widely read popularizers of agnosticism; both also pictured a universe governed by Darwinian evolution. For Spencer especially, all philosophy could be unified, organized, and coordinated through the doctrine of evolution; this

---

*Agnosticism*

doctrine he applied not only to all living things but also to sociology, government, and economics as well. The evolution of society, he felt, was toward the increasing freedom of the individual, the role of governments being merely to maintain freedom and justice; they were not to interfere with natural social and economic processes, nor to coddle the weak and unfit. Yet, like Darwin himself, Spencer believed that altruism, charity, and goodwill as individual ethical virtues were themselves useful and laudable products of evolutionary development.

These latter views were not shared by another of the serious writers of the age, also much influenced by evolutionary ideas, the German philosopher Friedrich Nietzsche (1844–1900). Drawing upon many intellectual currents of the century, Nietzsche was an unsystematic, radical thinker to whom it is easy to do less than justice. It is evident, however, that he held a low opinion of

---

Friedrich Nietzsche

modern, democratic societies. From a background of evolutionary thinking he developed the concept of a Superman, a new kind of noble being who would create new ethical values and philosophical truths that would enable him to dominate and dazzle the multitude. Qualities of humility, patience, helpfulness, hope, and love, in short the specifically Christian virtues, Nietzsche described as a slave morality concocted by the weak to disarm the strong. Qualities of courage, love of danger, intellectual excellence, and beauty of character he prized more highly. Indeed he argued that all humans, even philosophers, were driven more by their instincts and a “will to power” than by reason or rational thought. His critique of religion revived and revised some forms of classical paganism. Nietzsche was neither much read nor much respected by his contemporaries, many of whom considered him unbalanced or even insane; but he nevertheless expressed with unshrinking frankness many implications of the new evolutionary ideas. And his critique of reason and rationality had wide influence among anti-Enlightenment thinkers both before and after the First World War.

As in the sciences and philosophy, so in works of creative imagination—literature, drama and the fine arts—the changes at the dawn of the twentieth century ushered in the contemporary age. Some writers, like Emile Zola in France or Henrik Ibsen in Scandinavia, turned to the portrayal of social problems, producing a realistic literature that dealt with industrial strife, strikes, prostitution, divorce, or insanity. New psychological theories appeared in fictional portraits of troubled characters and irrational human behavior. The new novels and plays were indeed often truer to life than the older forms of European literature. But some literary movements—for example, the symbolist poets in France—were experimenting with language in works that moved modern writing far away from the literal representation of social realities. In a sense the arts followed the intellectual developments of the age, reflecting, as they do today, diverse attitudes of relativism, irrationalism, social determinism, linguistic ambiguity, and interest in the operations of the unconscious mind. On the other hand, never had artist and society been so far apart. The painter Paul Gauguin, an extreme case, fled to the South Seas, abandoned his family and modern European life, and reveled in the stark violence of tropical colors (see Gauguin’s painting *Ia Orana Maria* in the color insert following p. 792). Others became absorbed in technicalities or mere capricious self-expression. Art at its extreme fringe became almost incomprehensible and the average person seemed deprived of a visual means (as old as the cave paintings of the Stone Age) of perceiving and enjoying the world.

The artistic movement known as Impressionism did not sever all links between painting and the external world, however, and the Impressionists became perhaps the most influential artists in late nineteenth-century Europe. Rising to prominence in the 1870s and 1880s, painters such as Claude Monet, Pierre-Auguste Renoir, Camille Pissaro, Berthe

A distinctive fascination with light can be seen in most Impressionist works, as in Claude Monet's paintings of the cathedral at Rouen. This view of the cathedral in the evening light was one of a series that Monet painted in the 1890s, when he portrayed the different appearances and colors of objects in various shades of light over the course of a single day.

(The Art Archive/Musée d'Orsay  
Paris/Dagli Orti (*Rouen Cathedral*,  
brown harmony, effect of evening,  
1894 by Claude Monet (1840–1926))

Morisot, and Mary Cassatt rejected traditional styles of academic painting in France and turned instead to the representation of everyday life and the colorful play of light in the natural world. In contrast to earlier painters who had worked in studios and depicted scenes from mythology, classical history, or exotic cultures, the Impressionists preferred to paint outdoors and to portray the streets or buildings of modern France, the daily activities of ordinary people, or the pleasures of a modern café. Monet was especially adept at representing the same object in various shades of light (see, for example, the *Rouen Cathedral* at the top of this page, but all Impressionists used light and color rather than classical lines or themes to convey their “impressions” of the modern world. Most Impressionist painters were French and most were men, though women such as Morisot and the American-born Cassatt also produced innovative works, often portraying women in the different phases of their lives (see Morisot’s *Little Girl Reading* on p. 618 and Cassatt’s *The Boating Party* in the color insert following p. 792; another famous Impressionist painting, Renoir’s *Le Moulin de La Galette* is also in this color insert).

Impressionism gradually gained international influence and became the aesthetic starting point for other artists, usually called Post-Impressionists, who portrayed people and objects in novel and increasingly abstract forms and surprising colors. The works of

The French painter Berthe Morisot was one of the first women to adopt the methods and perspectives of Impressionist art. This painting, *Little Girl Reading* (1888), exemplifies the movement's characteristic concern with light and color, but the portrait of a young girl was typical of Morisot's particular interest in representing the experiences and memories of women.

(Museum of Fine Arts, St. Petersburg, FL. Museum purchase in memory of Margaret Acheson Stuart 1981.2 (*Lecture (Reading)*, 1888 By Berthe Morisot (French, 1841–1895)))

Paul Cézanne are influential examples of the “post-impressionist” art that pushed steadily beyond Impressionism in a continuing attempt to represent the artist’s distinctive personal vision of human experience (see Cézanne’s *Self-Portrait with Beret* in the color insert following p. 792). By the early twentieth century, artists such as Pablo Picasso, Georges Braque, and Vasily Kandinsky were painting “Cubist” or “Abstract Expressionist” works that represented natural objects and the human body in highly abstract forms and splashes of color, most of which bore little or no resemblance to what scientists might have called objective reality (see Picasso’s *Les Femmes d’Alger* on p. 619; Braque’s *Composition with the Ace of Clubs* and Kandinsky’s *Panel for Edwin R. Campbell No. 1*, 1914 are both in the color insert following p. 792).

After the First World War, and on into the present, the same trends of subjectivism in the arts attracted a wider, less-skeptical audience. People read books without punctuation (or with peculiar punctuation); listened to music called atonal, composed for effects of discord and dissonance; and studied intently abstract or “nonobjective” paintings and sculpture to which the artists themselves often refused to give titles. Increasingly remote from modern industrial society, artists and their art exemplified the specialization of the modern

Pablo Picasso's representations of the human body in paintings such as this disorienting collective portrait, *Les Femmes d'Alger* (1907), became the best-known works of early "Cubism." The Cubist painters portrayed objects from multiple perspectives and used abstract shapes or unexpected colors to convey the subjective visions of the artist rather than a realistic image of the external world.

world. Artists were no longer speaking for society or creating art for common use or enjoyment but were specialists plying their trade and pursuing their own concerns—like other specialists whose work was often incomprehensible to outsiders.

### *The Churches and the Modern Age*

Religion, too, was displaced. It was now a long time since almost everyone had looked to religion for guidance. But religion was more threatened after 1860 or 1870 than ever in the past, because never before had science, or philosophies drawing upon science, addressed themselves so directly to the nature of life and of human existence. Never before had so many of the fundamental premises of traditional religion been questioned or denied. Darwinian evolution challenged the value of Christian ethics as well as the traditional picture of Creation, and anthropologists questioned the uniqueness of the most sacred Christian tenets. There developed also the "higher" criticism of the Bible, an effort to apply to the Scriptures the techniques of scholarship long applied to secular documents, to incorporate archeological discoveries, and to reconstruct a naturalistic, historical account of ancient religious times. This form of critical, textual analysis, going back at least to the seventeenth century, now took on significant proportions and was applied both to the Old Testament and the New. In the case of the Old Testament the patient scrutiny of style and language cast doubt on the validity of certain prophecies; and in the New the inconsistencies of the several Gospel sources were demonstrated by a new generation of scholars and critics. The German theologian David Friedrich Strauss (1808–1874), one such critical scholar, was the author of a widely discussed *Life of Jesus*, in which many miraculous and supernatural episodes were reverently but firmly explained away as myth. The sensitive French historian and man of letters Ernest Renan (1823–1892) in a somewhat similar vein wrote on Jesus and the origins of

*Threats to religion*

Christianity and on the life of ancient Israel, giving secular explanations for the oldest religious stories and beliefs. Moreover, the whole tenor of the time, its absorption in material progress, kept people away from church; and the wholesale uprooting, the movement from country to city, often broke religious ties.

---

Challenges to  
Protestantism

The Protestant churches were less successful than the Catholic in protecting their membership from the disintegrating effects of the age. Church attendance among Protestants became increasingly casual, and the doctrines set forth in sermons seemed increasingly remote. Protestants traditionally trusted their own private judgment and regarded their clergy as their own agents, not as authoritative teachers placed above them. Protestants also had always set special emphasis on the Bible as the source of religious belief; and as doubts accumulated on the literal truth of Biblical narratives there seemed no other authoritative source on which to rely.

Protestants tended to divide between modernists and fundamentalists. The fundamentalists, as they were called in the United States, in an effort to defend the literal word of Scripture, were often obliged to deny the most indubitable findings of science. The modernists were willing enough to accept science and to interpret much of the Bible as allegory, but only with difficulty could they recapture a strong sense of spirituality or urgent feeling of Christian truth. Most Protestant churches were slow to face the social problems and wholesale injustices produced by the economic system, though a group of “Christian socialists” had emerged by the early twentieth century in some Protestant denominations. Because both education and the care for orphans, sick, and mentally disturbed persons generally passed to the state, Protestant groups had less to do in the relief of suffering and the upbringing of the young. Protestantism, to the regret of many Protestants, became increasingly a customary observance by people whose minds were elsewhere. Not until after the First World War could a strong Protestant revival be discerned, with a reaffirmation of basic doctrines by theologians such as Karl Barth, and an ecumenical movement on the part of divergent Protestant churches to combine.

---

Catholicism resists

The Roman Catholic church proved more resistant to the trends of the age. We have seen how Pope Pius IX (1846–1878), after being driven from Rome by republicans in 1848, gave up his inclinations to liberalism. In 1864, in the *Syllabus of Errors*, he denounced as erroneous a long list of widely current ideas, including the faith in rationalism and science, and he vigorously denied that the head of the church “should reconcile and align himself with progress, liberalism, and modern civilization.” The *Syllabus* was a warning to Catholics, not a matter of dogma incumbent upon them to believe. In dogma, the Immaculate Conception of the Virgin Mary was announced as dogmatic truth in 1854; a century later, in 1950, the bodily assumption of Mary into heaven was proclaimed. Thus the Catholic church reaffirmed in a skeptical age, and against Christian modernists, its faith in the supernatural and miraculous.

Pius IX also convened a general church council, which met at the Vatican in 1870. It was the first such council since the Council of Trent some 300 years before. The Vatican Council proclaimed the dogma of papal infallibility, which holds that the pope, when speaking *ex cathedra* on matters of faith and morals, speaks with a final and supernatural authority that no Catholic may question or reject. The Vatican Council, and the acceptance of papal infallibility by Catholics, was the climax of centuries of development within the church. In brief, as the world grew more national, Catholicism became more international. As state sovereignty and secularism grew, Catholic clergy looked increasingly to the spiritual powers of Rome for protection against alien forces. Much in the past 300 years had

made Catholics distrustful of their own governments or of non-Catholics in their midst—the Protestantism and the state churches of the sixteenth century, the Jansenist movement of the seventeenth, the anticlericalism of enlightened despotism in the eighteenth, the hostility to the church shown by the French Revolution, and by liberalism, republicanism, and socialism in the nineteenth century. By 1870 the net effect was to throw Catholics into the arms of the Holy See. Ultramontanism, the unconditional acceptance of papal jurisdiction, prevailed over the old Gallican and other national tendencies that had long existed within the Catholic church.

In 1870, while the 600 prelates of the Vatican Council were sitting, the new Italian state unceremoniously entered and annexed the city of Rome. The pope's temporal power thus disappeared. It is now widely agreed that with the loss of local temporal interests the spiritual hold of the papacy on Catholics throughout the world was ultimately enhanced. The popes long refused, however, to recognize the loss of Rome; and each pope in turn, from 1870 to 1929, adopted a policy of self-imprisonment in the Vatican grounds. By the Lateran treaty of 1929 the papacy finally recognized the Italian state, and Italy conceded the existence of a Vatican City about a square mile in area, as an independent state not legally within Italy at all. The papacy thus gained the independence from national or secular authority deemed necessary by Catholics to the performance of its role.

---

---

Vatican City

Pius IX's successor, Leo XIII (1878–1903), carried on the counteroffensive against irreligion and instituted a revival of medieval philosophy as represented by Thomas Aquinas. But Leo XIII is chiefly remembered for formulating Catholic social doctrine, especially in the encyclical *Rerum Novarum* ("of modern things") of 1891, to which subsequent pontiffs have adhered, and from which various movements of Catholic socialism are derived. *Rerum Novarum* upheld private property as a natural right, within the limits of justice; but it found fault with capitalism for the poverty, insecurity, and even degradation in which many of the laboring classes were left. It declared that much in socialism was Christian in principle; but it criticized socialism insofar as (like Marxism) it was materialistic and antireligious. The pope therefore recommended that Catholics, if they wished, form socialist parties of their own and that Catholic workers form labor unions under Catholic auspices.

---

---

*Rerum Novarum*

As for Judaism, the Jews were a small minority, but their condition had always been a kind of barometer reflecting changes in the atmosphere of tolerance as a whole. In the nineteenth century the basic trend was toward emancipation and assimilation. Science and secularism had the same dissolving effect upon Orthodox Judaism as upon traditional Christianity. Reform Judaism grew up as the Jewish counterpart to modernism in other faiths. Secular Jews moved away from worship altogether. In society at large, the prevalence of liberalism allowed them to act as citizens and to enter business or the professions like everybody else, freed from old legal discriminations that had been imposed on them for centuries.

---

---

Jewish emancipation

Toward the end of the century two important new tendencies began to challenge or counter earlier trends that were leading to the assimilation of Jewish communities and individuals. One, a cultural and political nationalism, originated with Jews themselves, some of whom feared an assimilation that would lead to a loss of Jewish identity and perhaps even the disappearance of Judaism itself. The other counter-tendency, or barrier to assimilation, was the rise of a virulent new anti-Semitism, noticeable in many quarters by 1900. Racist theories, dislike for Jewish competitors in business and the professions, socialist scorn for

---

---

The rise of anti-Semitism

This is a photograph of the Jewish journalist Theodor Herzl (1860–1904), who responded to anti-Semitic ideologies in central Europe and the anti-Semitism of the Dreyfus Affair in France by launching a new Zionist movement in late nineteenth-century Europe. Herzl organized the first international Zionist congress and called for the creation of a new Jewish state in Palestine, which was at this time part of the Ottoman Empire and occupied by a predominantly Arab population.

(Zionist Archives and Library)

Jewish capitalists like the Rothschilds, upper-class fears of Jewish revolutionists and Marxists, together with a growth of ethnic nationalism, which held that France should be purely French and Latin, Germany purely German and Nordic, or Russia purely Russian and Slav, all combined to raise an anti-Semitic hue and cry. In Russia there were fierce pogroms, or massacres of Jews. In France the Dreyfus case, which dragged on from 1894 to 1906, revealed unsuspected depths of anti-Semitic fury. Many Jews were forced by such hostility into a new sense of Jewish identity. The Hungarian-born Jewish journalist Theodor Herzl was one. Appalled by the turbulence of the Dreyfus affair in civilized France, which he observed firsthand as a reporter for a Vienna newspaper, he founded modern, or political, Zionism when he organized the first international Zionist congress at Basel in 1897. Zionists hoped to establish a Jewish state in Palestine, in which Jews from all the world might find refuge, although there had been no independent Jewish state there since ancient times.

Many Jews, wishing civic assimilation yet despairing of obtaining it, began to sympathize with the Jewish nationalist movement, looking to Zionism and a Jewish renaissance as a way to maintain their own dignity. Others insisted that Judaism was a religious faith, not a nationality by itself; that Jews and non-Jews within the same country shared in exactly the same nationality, citizenship, and political or social outlook. On the integration of Jews into the larger community the traditions of the Enlightenment, the American and French revolutions, the empire of Napoleon I, and the liberalism of the nineteenth century all agreed.

## 76. THE WANING OF CLASSICAL LIBERALISM

The net effect of the political, economic, and intellectual trends described above was twofold. There was a continued advance of much that was basic to classical liberalism and at the same time a weakening of the grounds on which liberalism had firmly rested ever since the seventeenth and eighteenth centuries. A third effect might be noted too. Even where the essentials of liberalism persisted, in program and doctrine it underwent impor-

The English political writer John Stuart Mill, who appears here in a photograph from the early 1850s, was one of the most influential advocates of classical liberalism. By the last years of his career, however, he had also become a prominent supporter of political rights for women and of social reforms that broke with some of the individualism in classical liberal theory.

(Getty Images)

tant changes; liberalism persisted but the classical type of liberalism was in eclipse.

---

*Liberalism changed*

Classical liberalism, the liberalism in its heyday in the nineteenth century, went back at least as far as John Locke in the seventeenth century and the philosophes of the eighteenth. It found its highest nineteenth-century expression in political philosophers such as John Stuart Mill and in the outlook of political leaders such as William Gladstone. Classical liberalism had as its deepest principle the liberty of the individual. Man, or each specimen of humankind according to liberals, was or could become a freestanding being. "Man" meant for them any member of the human race, *homo sapiens*, though in practice, except for a few like Mill, they were usually thinking of adult males. The very principle of liberalism, however, with its stress on the autonomy of the individual, also contributed to the growing movement for women's rights.

The individual, in this view, was not simply formed by race, class, church, nation, or state but was ultimately independent of all such collective identities. Individuals did not hold their ideas because they belonged to particular ethnic or social groups. They were viewed as autonomous persons who were capable of the free use of reason or of thinking matters out independently, apart from their own interests, prejudices, or unconscious drives. And, since this was the nature of rational human behavior, people of different interests could reasonably and profitably discuss their differences, make compromises, and reach solutions by peaceable agreement. It was because they thought all persons potentially reasonable that liberals favored education. They opposed all imposition of force upon the individual, from physical torture to mental indoctrination.

---

*The rational individual*

In religion, liberals thought each individual should adopt any faith or no faith as he or she chose and that churches and clergy should play little or no part in public affairs. In politics, they thought that governments should be constitutional and limited in power, with

individuals governing themselves through their chosen representatives, with issues discussed and decided by the use of intelligence, both by the voters in election campaigns and by elected deputies in parliamentary debate. The will of a majority, or larger number of individuals, was taken as decisive, with the understanding that the minority might become a majority in its turn as individuals changed opinions. At first distrustful of democracy, fearing the excesses of popular rule, and eager to limit political power and the suffrage to the propertied classes, in the course of the nineteenth century liberals had accepted the democratic principle of universal male suffrage, if not yet the vote for women. In economics, liberals thought of the whole world as peopled by individuals doing business with one another—buying and selling, borrowing and lending, hiring and firing—without interference from governments and without regard to religion or politics, both of which were thought to impose superficial differences upon the underlying uniformity of mankind. The practical consequences of liberalism were toleration, constitutionalism, laissez-faire, free trade, and an international economic system. It was thought that all peoples would progress to these same ends, though the era's pervasive racism and the attitudes of imperialism blocked the actual application of liberal principles to the non-European peoples who lived under European rule in old and new colonial empires.

There never was a time, even in one country, when all liberal ideas were simultaneously triumphant. Pure liberalism, like most other cultural and political ideologies, has never existed except as a doctrine. Advancing in one way, liberalism would be blocked or reversed in another. On the whole, Europe before 1914 was predominantly liberal. But signs of the wane of liberalism set in clearly about 1880; some, like the changing conceptions of human behavior and the new interest in the irrational, have already been mentioned.

### *The Decline of Nineteenth-Century Liberalism: Economic Trends*

The free economy produced many hardships. Workers tossed by the ups and downs of a labor market and producers caught in the uncertainties of a world commodity market clamored for protection against exposure. A severe depression in 1873 sent prices and wages into collapse, and the economy did not fully recover until 1893. European farmers, both small French farm owners and big Junker landlords of East Germany, demanded tariff protection; they could not compete with the American Middle West or the steppes of South Russia, both of which after 1870 poured their cereals at low prices into Europe. The revival of tariffs and decline of free trade, very marked in Europe about 1880, thus began with the protection of agricultural interests. Industry soon demanded the same favors. In Germany the Junkers and the rising Rhineland industrialists joined forces in 1879 to extort a tariff from Bismarck. The French in 1892 adopted a high tariff to shelter both manufacturing and agricultural interests. The United States, rapidly industrializing, also adopted protective tariffs beginning in the 1860s, the earliest of all.

The Industrial Revolution was now definitely at work in countries other than Great Britain. There was an increasing resistance to buying manufactures from England, selling only raw materials and foodstuffs in return. Everywhere there was a revival of the arguments of the German economist Friedrich List, who a half-century before, in his *National System of Political Economy* (1840), had branded free trade as a system mainly advantageous to the British and declared that no country could become strong, independent, or even fully civilized if it remained an agrarian supplier of unfinished goods. With Germany, the United States, and Japan manufacturing for export, a nationalist competition for world markets set in, contributing also to

## CHRONOLOGY OF NOTABLE EVENTS, 1859–1920

---

1859	Charles Darwin publishes <i>Origin of Species</i> ; “evolution” becomes a key theme in modern intellectual life
1880s–1890s	Claude Monet portrays the nuances of light and color in Impressionist paintings such as <i>Rouen Cathedral</i>
1889	European socialist parties establish the Second International
1897	Theodor Herzl organizes the first international Zionist congress
1900	Sigmund Freud develops his theory of the unconscious mind in <i>The Interpretation of Dreams</i>
1905	Albert Einstein introduces the theory of relativity in physics
1907	Pablo Picasso advances his new Cubist style of painting in works such as <i>Les Femmes d'Alger</i>
1918–1920	Women gain the right to vote in Britain, Germany, and the United States

---

---

the drive for colonies and the new imperialism described in the next chapter. The new imperialism itself was another sign of the waning of liberalism, which had been largely indifferent to colonies.

In all these respects the division between politics and economics, postulated by liberals, began to fade. A kind of neomercantilism arose, recalling the attempts of governments in the seventeenth and eighteenth centuries to subordinate economic activity to political ends. A better term is economic nationalism, which became noticeable by 1900. Nations struggled to strengthen themselves by tariffs, by trade competition and by internal regulation, without regard to the effect upon other nations. Workers and business entrepreneurs were now very much affected in purely economic matters by the nation to which they belonged and by the government or laws under which they lived.

---

*Economic nationalism*

It was of course to protect themselves against insecurity and abuse as individuals that workers formed labor unions. It was likewise to protect themselves against the uncertainties of uncontrolled markets that business interests began to merge; to concentrate in large corporations; or to form monopolies, trusts, or cartels. The rise of big business and organized labor undermined the theory and practice of individual competition to which classical liberalism had been attached. Organized labor, socialist parties, universal male suffrage, and a sensitivity to social distress all obliged political leaders to intervene increasingly in economic matters. Factory codes became more detailed and better enforced. Social insurance, initiated by Bismarck, spread to other countries. Governments regulated the purity of foods and drugs. The social service state developed, a state assuming responsibility for the social and economic welfare of the mass of its own subjects. The “new” liberalism, that of the Liberals in England of the David Lloyd George era, of the Republican President Theodore Roosevelt and the Democratic President Woodrow Wilson in the United States, accepted the enlarged role of the government in social and economic matters. Both Roosevelt and Wilson, and others, sought also to reestablish economic competition by government action against monopolies and trusts. The new liberals were generally

---

*The “new” liberalism  
and the welfare state*

more favorably disposed toward workers and the disadvantaged classes than toward business; the improvement of the workers' lot would vindicate the old humanitarian concern of liberalism with the dignity and worth of the individual person. The welfare state with an enlarged role for government, remote as it was from classical liberalism, was the direction taken by the new liberals. Advocates of the older or classical liberalism, however, often opposed the growing power of governments and centralized authority and were apprehensive for individual liberties.

### *Intellectual and Other Currents*

#### *Challenges to Liberalism*

Liberalism, both old and new, was undermined also by many developments in the field of thought described earlier in this chapter—Darwinian evolution, the new psychology, trends in philosophy and the arts. Paradoxically, this great age of science found that the human being was not a rational animal. Darwinian theory implied that the human species was merely a highly evolved organism whose faculties were merely adaptations to an environment. Psychology seemed to teach that what was called reason was often only rationalization, or a finding of alleged “reasons” to justify material wants or emotional and unconscious needs, and that conscious reflection dominated only a narrow part of human behavior. Ideas themselves were said to be the products of cultural conditioning or of social power. There were English ideas or Anglo-Saxon ideas, or bourgeois or progressive or reactionary ideas. In politics, some believed that parties or nations with conflicting interests could never reasonably agree on a program common to both, since neither could ever get beyond the limitations of its own outlook. It became common to dismiss the arguments of an adversary without further thought and without any expectation that thought could overcome difficulties. This insidious “anti-intellectualism” was destructive to liberal principles. If, because of prior conditioning, it was impossible to change one's mind, then there was no hope of settling matters by persuasion.

From the view that the human being was not essentially a rational creature, which in itself was only a scientific attempt at a better understanding of human behavior, it was but a short step deliberately to reject reason and to emphasize and cultivate the irrational; to stress the will, intuition, impulse, and emotion; and to place a new value on violence and conflict. A philosophy of “realism,” a kind of unreasoning faith in the constructive value of struggle and a tough-minded rejection of ideas and ideals, spread. It was not new. Marxism, since the 1840s, had taught that class war, latent or open, was the motivating force of history. Now Nietzsche rejected the ordinary ethical virtues in favor of personal courage and daring; and the Social Darwinists glorified the successful and the dominant in all phases of human activity as the most “fit” in a perpetual struggle for existence. Other thinkers embraced a frank irrationalism. Georges Sorel, the philosopher of syndicalism, in his *Reflections on Violence* in 1908, declared that violence was good irrespective of the end accomplished and that workers should believe in the “myth” of a future general strike, with its attendant debacle of bourgeois civilization, even though it was known to be only a “myth.” The function of thought, in this philosophy of the social myth, was to keep people agitated and excited and ready for action, not to achieve any correspondence with rational or objective truth. Such ideas passed into the fascism and other activist movements of the twentieth century.

Thus, the end of the nineteenth century, the greatest age of peace in Europe's history, abounded in philosophies glorifying struggle. People who had never heard a shot fired in anger solemnly announced that world history moved forward by violence and antagonism. They said not merely that struggle existed (which would have been a purely factual state-

These miners, who were on strike at a coal mine in northern France in 1906, represent the militancy of the early twentieth-century European labor movement. Demanding better wages, better working conditions, and a greater role in public life, labor became an important force in the political cultures of all major European states during this era.

(Roger-Viollet)

ment) but that struggle was a positive good through which progress was to be accomplished. The popularity of struggle was due not only to the intellectuals but also in part to actual historical events. People remembered that before 1871 certain weighty questions had been settled by force, that the movements of social revolution in 1848 and in the Paris Commune of 1871 had been put down by the military, and that the unity of Italy and Germany, as well as of the United States, had been confirmed by war. In addition, after 1871, all continental European states maintained large standing armies, the largest ever maintained until then in time of peace.

In economic and political matters, even in England, the homeland of classical liberalism, there were numerous signs between 1900 and 1914 that the older liberalism was on

---

*The popularity of  
struggle*

the wane. Joseph Chamberlain led a movement to return to tariff protection (to repeal, so to speak, the repeal of the Corn Laws); it failed at the time, but was strong enough to disorient the Conservative party in 1906. The Liberal party abandoned its traditional laissez-faire policy in sponsoring the labor legislation of the years following 1906. The new Labour party required its members in Parliament to vote as directed by the party, thus initiating a system of party solidarity, eventually copied by others, that hardened the lines of opposition, denied that individuals should freely change sides, and hence reduced the practical significance of parliamentary discussion. The Irish nationalists had long used unparliamentary methods; in 1914, when Parliament at last enacted Irish home rule, the anti-Irish and conservative interests prepared to resist parliamentary action by force. The English suffragettes, despairing of ever getting the men to listen to reason, resorted to the amazingly “un-English,” violent political actions noted earlier. And in 1911 and 1912 great railway and coal strikes disclosed the sheer power of organized labor.

---

*The persistence of  
liberalism*

Still, it is the persistence of liberalism rather than its wane that should be emphasized at the close of two chapters on European history in the half-century before 1914. Tariffs existed, but goods still circulated freely in world trade. Nationalism was heightened, but there was nothing like totalitarianism. Racist ideas were in the air, but they still had little political importance within Europe itself. Anti-Semitism was sometimes vocal; but all governments except the Russian protected the rights of Jews, and the years from 1848 to 1914 were in fact the great period of Jewish integration into general society. The laissez-faire state was disappearing, but social legislation continued the humanitarian strain that had always been an essential part of liberalism. A few advanced revolutionaries preached social catastrophism, but social democrats and working people were overwhelmingly revisionist, loyal to parliamentary procedures and to their existing states. Doctrinaires exalted the grim beauty of war, but all governments down to 1914 tried to prevent war among the great powers. And despite the skepticism of some radical philosophers, artists, and intellectuals, there was still a supreme popular faith in progress.

# EUROPE'S WORLD SUPREMACY, 1871–1914

77. Imperialism: Its Nature and Causes
78. The Americas
79. The Dissolution of the Ottoman Empire
80. The Partition of Africa
81. Imperialism in Asia: The Dutch, the British, and the Russians
82. Imperialism in Asia: China and the West
83. The Russo-Japanese War and Its Consequences

*The economic, political, and cultural institutions and ideas of modern European civilization, as described in the last two chapters, spread steadily across most of the world after about 1870. The large European nation-states, which were now equipped with the overwhelming new powers of science and industry, gained empires for themselves throughout the globe. The history of Europe—as of Asia, Africa, and the Americas—became more closely involved than ever before in the history of the world.*

For a while the most active of the imperialist nation-states were located in Europe, and the 40 years preceding the First World War were the years of Europe's world supremacy. With the rise of the United States the term "Western" came into use, signifying European in an expanded sense. The modernization of Japan made the term "Western" inappropriate in some ways, as did other later devel-

opments. By the mid-twentieth century it was customary to speak of "developed" parts of the world, in comparison with which others were seen as "less developed" or "developing." There even came to be a "Third World," with no specific geographic identity of its own, but which came to mean the developing countries in the later decades of the twentieth century. These terms represented efforts to deal with the same basic reality, namely, a bifurcation between modern and traditional societies, rich countries and poor ones, or between the powerful and the weak.

For the first time in human history, by 1900, it was possible to speak of a world civilization. Although retaining important differences in languages, culture, and social practices, all countries were drawn into a world economy and a world market. The attributes of political and economic modernity were much the same everywhere—modern science,

*The Third World*

modern weapons of warfare, machine industry, fast communications, industrial organization, efficient taxation and law enforcement, and modern public health, sanitation, and medicine.

But not all peoples participated in this global evolution on equal terms. It was the Europeans, or “Westerners,” who reaped the greatest rewards. Elsewhere, tribal societies and massive old civilizations alike began to come apart, reacting to the pressures of modern economic and social changes. Scientific ideas changed ways of thinking everywhere, as they had in Europe. In India, China, or Africa local industries often suffered, and many people found it harder than ever to subsist even at a low level. The building of railways in China, for example, threw boatmen, carters, and innkeepers out of work. In India, the hand spinners and weavers of cotton could not compete in their own villages with the machine-made products of Lancashire. In parts of Africa, tribal groups that had lived by owning herds of cattle, moving from place to place to obtain grazing lands, found white farmers or plantation or mine owners occupying their country and were often forced by the white man’s law to give up their migratory habits. Peoples of all races began to produce for export—rubber, raw cotton, jute, petroleum, tin, gold—and hence were exposed to the rise and fall of world prices. A depression tended to become a world depression, dragging all down alike.

---

### Imperialism

Imperialism, or the colonialism of the late nineteenth century, may be briefly defined as the government of one people by another. As a specific form of political control, European imperialism proved to be transitory, weakening and disappearing in this form after the Second World War. But the economic and cultural aspects of the colonial systems continued to influence “post-colonial” societies after they regained their political independence. Imperialism and empire-building were a phase in the worldwide spread of the industrial and scientific civilization which had originated in Europe’s “inner zone.” That it was not the last phase became clear as the twentieth century unfolded. The subordinated peoples, forcibly introduced to the West by imperialism, came to sense a need for modernizing and industrializing their own countries and for the aid of Western science, technology, and capital; but they wished to get rid of imperialists, govern themselves, and control the conditions under which modernization and borrowing should take place. In opposition to European empires, subject peoples began to assert ideas learned from Europe—ideas of liberty and democracy, and of an anticapitalism that passed easily into socialism. Many such ideas were derived from the French and American revolutions, or from Marxism, or from the whole modern history of Europe itself; but these ideas were transformed or challenged as they entered into the political and cultural traditions of other civilizations.

The present chapter deals only with the imperialist phase of this global transformation. By one of the ironies of history, the imperialist rivalries of the European powers, while representing Europe’s world supremacy, also contributed to the disaster of the First World War, and so to the collapse of such supremacy as Europe had enjoyed.

## 77. IMPERIALISM: ITS NATURE AND CAUSES

European civilization had always shown a tendency to expand. In the Middle Ages Latin Christendom spread by conquest and conversion to include the whole area from Spain to Finland. Then came the age of overseas discoveries and the founding of colonial empires, whose struggles filled the seventeenth and eighteenth centuries and whose most far-reaching consequence was the gradual “Europeanization” of the Americas. At the same time European

culture spread among the upper classes of Russia. The defeat of Napoleon left only one of the old colonial empires standing in any strength, namely, the British. For 60 years after 1815 there were no significant colonial rivalries. In many circles there was an indifference to overseas empire. Under principles of free trade, it was thought unnecessary to exercise political influence in areas in which one did business. During these years, however, the French took control of Algeria, the British strengthened their Indian empire, the Dutch developed Java and the neighboring islands more intensively, and the Western powers “opened” Japan and began to penetrate China. But these developments did not lead to overt imperial conflicts among Europeans, and there was no systematic imperial program, doctrine, or “ism.”

Rather suddenly, about 1870 or 1880, colonial questions came again to the fore. In the short space of two decades, by 1900, the advanced industrial countries partitioned most of the earth among themselves. A world map by 1900 showed their possessions in some nine or ten colors.

### *The New Imperialism*

The new imperialism differed both economically and politically from the colonialism of earlier times. The older empires had been maritime and mercantile. European traders in India, Java, or Canton had simply purchased the wares brought to them by local merchants as produced by local methods. They operated on a kind of cash-and-carry basis. European governments had had no territorial ambitions beyond the protection of way stations and trading centers. To these generalizations America, the Philippines, and Australia had been exceptions. They had neither native states which Europeans respected, nor native industries in which Europeans were interested. Europeans therefore developed territorial claims and invested capital and brought in their own methods of production and management, especially in the then booming sugar islands of the West Indies.

---

*New imperialism  
versus old colonialism*

Under the new imperialism Europeans were by no means content simply to purchase what local merchants provided. They wanted goods of a kind or in a quantity that preindustrial handicraft methods could not supply. They moved into the so-called “backward” countries more thoroughly. They invested capital in them, setting up mines, plantations, docks, warehouses, factories, refineries, railroads, river steamships, and banks. They built offices, homes, hotels, clubs, and cool mountain resorts for European officials and visitors. Taking over the productive life of the country, they transformed large elements of the local population into the wage employees of foreign owners and so introduced the class problems of industrial Europe in a form accentuated by racial differences. Or they lent money to non-European rulers—the khedive of Egypt, the shah of Persia, the emperor of China—to enable them to hold up their tottering thrones or simply to live with more pleasure and magnificence than they could from their usual revenues. Europeans thus developed a huge financial stake in governments and economic enterprises outside the West.

To secure these investments, and for other reasons, in contrast to what had happened under the older colonialism, the Europeans now aspired to political and territorial domination. Some areas became outright colonies, directly governed by European states and their appointed government officials. Others became protectorates: here the native chief, sultan, bey, rajah, or prince was maintained and guaranteed against internal upheaval or external conquest. A European “resident” or “commissioner” usually told him what to do. In other regions, as in China or Persia, where no single European state could make good its claims against the

territorial domination*

European access to colonial territories in the period of the “new imperialism” often depended on the construction of new railroads, which carried both people and goods into and out of the interior districts of the European colonies. This picture portrays the arrival of a locomotive that a team of elephants pulled into central India when a new railroad track was built in the region of Indore.

(Picture Collection, The New York Public Library, Astor, Lenox and Tilden Foundations)

others, they arranged to divide the country into “spheres of influence,” each European power having advisory privileges and investment and trade opportunities within its own sphere. The sphere of influence was the vaguest of all forms of imperial control; supposedly, it left the country independent.

An enormous differential opened up, about 1875, between the power of European and non-European states. Queen Elizabeth had dealt with the Great Mogul of the Indian subcontinent with genuine respect, at least in part because his revenues in the early seventeenth century were some 20 times greater than those of the English monarchy. Even Napoleon had pretended to regard the shah of Persia as an equal. Then came the Industrial Revolution in Europe, iron and steel ships, heavier naval guns, and more accurate rifles. Democratic and nationalist movements produced large and unified European peoples, united in the service and financial support of their governments. Seemingly endless wealth, with modern administration, allowed European governments to tax, borrow, and spend without apparent limit. The modern nation-states loomed as enormous power complexes without precedent in the world’s history. At the same time it so happened that all the principal non-European empires were in decay. They were receiving a minimum of support from their own subjects. As in the eighteenth century when the disintegration of the Mogul empire had enabled the British to take over India, so in the nineteenth century the political weakness and vulnerabilities of the sultan of Turkey, the sultan of Zanzibar,

the shah of Persia, the emperor of China, and the shogun of Japan made European intervention remarkably easy. Only the Japanese were able to revolutionize their government in time to ward off imperialist penetration. Even the Japanese, however, were restricted by early treaties that controlled their tariff policies until after 1900.

So great was the difference in the sheer mechanics of power that usually a mere show of force allowed the Europeans to impose their will. A garrison of only 75,000 troops long held India for the British. Numerous sporadic little wars were constantly fought—Afghan wars, Burmese wars, Zulu wars—which passed unnoticed by Europeans in the home country and were no more like a true national war or national military mobilization than the operations of the United States army against the Indians of the western plains. The Spanish-American War of 1898 and the Boer War of 1899 were also wars of colonial type, fought between entirely unequal parties. Often a show of naval strength was enough. It was the classic age of the punitive bombardment. We have seen how the American Commodore Perry threatened to bombard Tokyo in 1854. In 1856 the British consul at Canton, to punish acts of violence against Europeans, called upon the local British admiral to bombard that Chinese city. In 1863 the British bombarded Satsuma, and in 1864 an allied force including Americans bombarded Choshu—precipitating revolution in Japan. Similarly, Alexandria was bombarded in 1882 and Zanzibar in 1896. The usual consequence was that the local ruler signed a treaty, reorganized the government, or accepted a European (usually British) adviser.

their will*

### *Incentives and Motives*

Behind the aggressiveness lay many pressures. The Europeans could not maintain for themselves the style of life to which they had become accustomed except by bringing the rest of the world within their orbit. But many other needs felt in Europe drove people into distant, unknown places. Catholic and Protestant groups sent growing numbers of missionaries to remote regions, where they sometimes got into trouble with the local people and where some missionaries were even killed. Public opinion in the home countries, soon learning of such events by ocean cable, might clamor for political action to suppress such outbreaks of anti-Christian violence. Similarly, scientists required geographical expeditions for their observations and discoveries. Wealthy persons traveled more, now that travel was so easy; they hunted tigers or elephants, or simply went to see the sights. It seemed only reasonable at the close of the nineteenth century that all Europeans wherever they might choose to go should enjoy the personal security and the orderly legal procedures that European governments sought to provide for the Western people who visited or lived in their overseas empires.

Economically, European life required material goods, many of which only tropical regions could supply. Even the working classes now drank tea or coffee every day. After the American Civil War Europe relied for its cotton increasingly on Africa and the East. Rubber and petroleum became staple needs. The lowly jute, which grew only in India, was used to make burlap, twine, carpets, and the millions of jute bags employed in commerce. The lordly coconut tree had innumerable common uses, which led to its intensive cultivation in the Dutch Indies. Various parts of it could be eaten, or manufactured into bags, brushes, cables, rope, sails, or doormats or converted into coconut oil, which in turn went into the making of candles, soap, margarine, and many other products.

Europe's overseas colonies gave European travelers new places to visit and new forms of "exotic" adventure that developed within the social and legal hierarchies of imperial political systems. The Englishwomen depicted here are going into an Asian forest for a picnic, accompanied by servants who carry their food and handle their horses and by escorts whose pith helmets symbolize the heyday of the British Empire.

Industrial countries also attempted to sell their own products, and one of the reasons given by imperialists, in support of imperialism, was the urgent necessity of finding new markets. The industrialization of Germany, the United States, Japan, and other countries, after about 1870, meant that they competed with each other and with Great Britain for foreign trade. The slowly declining price level after 1873 meant that a business firm had to sell more goods to turn over the same amount of money. Competition was more intense. The advanced industrial countries, as we have seen, raised tariffs to keep out each other's products. It was therefore argued that each industrialized nation must develop a colonial empire, an area of "sheltered markets," as the phrase went in England, in which the home country would supply manufactured goods in return for raw materials. The idea was to create a large self-sufficient trading unit, embracing various climates and types of resources, protected if necessary from outside competition by tariffs, guaranteeing a market for all its members and wealth and prosperity for the home country. This phase of imperialism is often called *neomercantilism*, since it revived in substance the mercantilism, or national economic systems, of the sixteenth to the eighteenth centuries.

Purely financial considerations also characterized the new imperialism. Money invested in the so-called “backward” countries by the close of the nineteenth century brought a higher rate of return than if invested in the more industrialized ones. For this there were many reasons, including the cheap labor of non-European regions, the heavy and unsatisfied demand for non-European products, and the greater risk of losses in half-unknown areas where European ideas of law and order did not prevail. By 1900 western Europe and the northeastern United States were equipped with their basic industrial apparatus. Their railway networks and first factories were built. Opportunities for investment in these countries became stabilized. At the same time, these countries themselves accumulated capital seeking an outlet. In the mid-century most exported capital was British-owned. By the close of the century more French, German, American, Dutch, Belgian, and Swiss investors were investing or lending outside their own borders. In 1850, most exported capital went to build up Europe, the United States, Canada, Australia, or Argentina. By 1900 more of it was going to undeveloped regions in other parts of the world. This capital was the property of individual small savers or of large banking combinations. Investors preferred “civilized” political control over the parts of Asia, Africa, or Latin America in which their railroads, mines, plantations, government loans, or other investments were situated. Hence the profit motive, or desire to invest “surplus” capital, promoted imperialism.

---

*The profit motive*

This analysis was put forward by critics like the English socialist J. A. Hobson, who wrote an influential book on imperialism in 1903, and later by Lenin, in his *Imperialism, the Highest Stage of World Capitalism*, written in 1916. They ascribed imperialism primarily to the accumulation of surplus capital and condemned it on socialist grounds. Hobson argued that a change in the domestic economy would remove the main motive for imperialism: if more of the national income went to workers as wages, and less of it to capitalists as interest and dividends, or if wealthy people were more heavily taxed and the money used for social welfare, there would be no surplus of capital and no real imperialism. Since the working class, if this were done, would also have more purchasing power, it would be less necessary to look endlessly for new markets outside the country. But the surplus capital explanation of imperialism was not entirely convincing. That investors and exporters were instrumental in the rise of imperialism was of course very true. That imperialism arose essentially from the capitalists’ pressure to invest abroad was more doubtful. Perhaps even more basic was Europe’s need for imports—only by enormous imports could Europe sustain its dense population, complex industry, and high standard of living. It was the demand for such imports—cotton, cocoa, coffee, copper, and the like drawn from the colonies—that made investment in the colonies financially profitable. Moreover, non-Europeans themselves often asked for the capital, glad though the European lenders were to lend it at high rates. In 1890 this might mean merely that a shah or sultan wanted to build himself a new palace, but the need of non-Europeans for Western capital was basic, nor was it to decline in later times. Lastly, the imperialism of some countries, notably Russia and Italy, which had little capital and few modern-type capitalists of their own, could not reasonably be attributed to pressure for lucrative foreign investments.

---

*Socialist critics*

For the British, however, the capitalistic incentive was of great importance. We have seen how the British, in 1914, had \$20 billion invested outside Great Britain, a quarter of all their wealth. About half, or \$10 billion, was invested in the British Empire. Only a tenth of French foreign investments was in French colonies. French investment in the colonial world in general, however, including Egypt, Suez, South Africa, and Asia in addition to the

French colonies, amounted to about a fifth of all French foreign investments. Only an infinitesimal fraction of German foreign investment in 1914 was in German colonies, which were of slight value. A fifth of German foreign investments, however, was placed in Africa, Asia, and the Ottoman Empire. These sums are enough to suggest the pressures upon the European governments to assert political influence in Africa, Turkey, or China.

---

*Foreign economic  
interests in Russia*

In addition, French investors (including small bourgeois and even affluent peasants) had in 1914 a huge stake in the Russian empire. Russia, an imperial power with respect to adjoining countries in the Balkans and Asia, occupied an almost semicolonial status with respect to western Europe. The tsardom until its demise in 1917, not unlike the Ottoman sultanate or the Qing dynasty in China, was kept going by foreign loans, predominantly French. The French in 1914 had lent over \$2 billion to Russia, more than to all colonial regions combined. For these huge outlays the motivation was at least as much political as economic. The French government urged French banks to buy Russian bonds. The aim was not merely to make a profit for bankers and small investors but to build up and hold together a military ally against Germany.

---

*Joseph Chamberlain*

Politics went along with economics in the whole process of imperialist expansion. National security, both political and economic, was as important an aim as the accumulation of private wealth. So, too, was the growing concern in many quarters over the economic security and welfare of the working classes. The ideas of the British statesman Joseph Chamberlain (1836–1914) illustrated how these motives entered into imperialist thinking.

Chamberlain, father of Neville Chamberlain, who was to be prime minister of Britain in the years just prior to the Second World War, began as a Birmingham manufacturer, the type of man who a generation before would have been a staunch free trader and upholder of laissez-faire. Discarding the old individualism, he came to believe that the community should and could take better care of its members and that the British community (or empire) could advance the welfare of Britons. As mayor of Birmingham he introduced a kind of municipal socialism, including public ownership of utilities. As colonial secretary from 1895 to 1903, he preached Britain's need for "a great self-sustaining and self-protecting empire" in an age of rising international competition—a worldwide British trading area, developed by British capital, which would give a secure source of raw materials and food, markets for exports, and a steady level of profits, wages, and employment.

Chamberlain saw with misgivings the tendencies toward independence in Canada, New Zealand, and the Australian Commonwealth. For these dominions he favored complete self-government, but he hoped that, once assured of virtual independence, they would reknit their ties with each other and with Great Britain. Britain and its dominions, in Chamberlain's view, should pool their resources not only for military defense but also for economic well-being. The dominions had already levied tariffs against British manufacturers in order to build up their own. Chamberlain urged the dominions to charge a lower duty on British wares than on the same wares coming from foreign countries. In return, he even proposed that Great Britain adopt a protective tariff, so that it might then favor Canadian or Australian goods by offering them a lower rate. His plan was to bind the empire together by economic bonds, making it a kind of tariff union, or system of "imperial preference." Since Britain imported mainly meat and cereals from the dominions, Chamberlain was obliged to recommend a tariff even upon these products—to "tax the people's food," repudiating the very ark of the covenant of Free Trade upon which the British economy had rested for half a century. The proposal was rejected. Chamberlain died in 1914, his goal unaccomplished. But after the First World War the British Empire,

or Commonwealth of Nations, followed closely the proposals he had mapped out.

Whether the economic welfare and security of the European working classes was advanced by imperialism is still debated. It is probable that the worker in western Europe did gain economic benefits from imperialism. Socially conservative imperialists were joined in this belief by thinkers of the extreme Left. Marx himself, followed by Lenin, thought that the European worker obtained higher real wages through the inflow of low-priced colonial goods. To Marxists this was unfortunate, for it gave European workers a vested interest in imperialism, made the European proletariat "opportunistic" (i.e., unrevolutionary), and blocked the formation of a true international world proletariat of all races.

---

*Working classes and imperialism*

Another imperialist argument much heard at the time held that European countries must acquire colonies to which surplus population could migrate without altogether abandoning the native land. It seemed unfortunate, for example, that so many Germans or Italians emigrating to the United States should be lost to the fatherland. This argument was purely specious. No European country after 1870 acquired any colony to which European families in any numbers wished to move. The millions who were still leaving Europe persisted in heading for the Americas, where in the circumstances no European colony could be founded.

The competitive nature of the European state system introduced other almost exclusively political features. The European states had to guard their security against each other. They had to keep some kind of balance among themselves, in the overseas world as in Europe. Hence, as in the scramble for Africa, one government often hurriedly annexed territory simply for fear that another might do so first. Or again, colonies came to have an intangible but momentous value in symbolism and prestige. To have colonies was a normal criterion of greatness. It was the sign of having arrived as a Great Power. Britain and France had had colonies for centuries. Therefore the new powers formed in the 1860s—Germany, Italy, Japan, and in a sense the United States—came to believe they had to have colonies also.

*Diplomacy and imperialism*

### *Imperialism as Crusade*

Imperialism arose from the commercial, industrial, financial, scientific, political, journalistic, intellectual, religious, and humanitarian impulses of Europe compounded together. It was an outthrust of modern Western civilization, and its advocates claimed that it would bring civilization and enlightenment to those who still sat in darkness. Faith in "modern civilization" had become a kind of substitute religion. Imperialism was its crusade.
