Made in seven types, operated by either motor or gasoline engine drive

Friction Shaft Couplings.

STANDARD FRICTION CLUTCH COUPLINGS—Built upon simple principles of operation and easily manipulated by unskilled mechanics. With this clutch there is absolutely no contact of frictional surface when not engaged.

Information.

When inquiring please furnish particulars regarding horsepower desired with a certain size of clutch. Catalogue "C" will be mailed on request. Information gladly given regarding hoists and clutch pulleys.

CHICAGO PULLEY & SHAFTING CO.

Power Transmitting Machinery

TELEPHONE:
MAIN 1876

40 South Clinton Street
CHICAGO, ILL.

FACTORY, MENOMONEE FALLS, WIS.

Products.

Manufacturers of the "Chicago Line" of POWER TRANSMITTING MACHINERY, which includes:

Roller, Ball and Thrust Bearings.
Pillow, Rigid or Adjustable Blocks.
Take-up and Clamp Boxes.
Wall Brackets.
Beam Clamps.

Safety Set, Solid and Split Collars.

Ball Bearing, Roller Bearing and Babbitted Countershafts.

Flange Plate, Flexible, Friction Clutch, Ribbed Compression, Standard Compression and Spiral and Square Jaw Couplings.

Friction Ball Bearing and Line and Countershaft Clutches.

All Loose (Ball Bearing) Drives.

Wall Box Frames.

Ball Bearing, Roller Bearing and Babbitted Hangers.

Bracket Hangers; Post Hangers.

Ball Bearing Mule Pulley Stands.

Pedestals.

Base and Sole Plates.

Pulleys, including S.K.F. Ball Bearing Loose Pulleys and S.K.F. Ball Bearing Friction Clutch Pulleys.

Transmission Rope.

Shafting.

Belt Tighteners (ball bearing).

Hangers.

The "Chicago Line" hangers are of great strength, generously babbitted and are of pleasing design; have a duplex system of oiling, wick and ring combined. Roller or ball bearing boxes can be furnished when desired.

"CHICAGO LINE" HANGER

Pillow Blocks.

The "Chicago Line" pillow blocks are furnished in rigid or adjustable types with plain bores or the duplex system of oiling. Adjustable pillow block frames can be fitted with ball or roller bearings when desired.

"CHICAGO LINE" PILLOW BLOCK

Couplings.

The "Chicago Line" couplings include the flange plate, compression, ribbed compression, square and spiral jaw as well as other types. The compression types are of the taper sleeve construction that require no keys. Key couplings fitted to shafting when desired.

"CHICAGO LINE" COUPLING

Thrust Bearings.

The "Chicago Line" thrust bearing for real satisfactory and enduring service designed for loads in one direction along the axis of the shaft. Made in all sizes.

"CHICAGO LINE" THRUST BEARINGS

S. K. F. Ball Bearing Loose Pulleys.

Are especially designed for high speed. Simple in construction, accurately machined and will carry a belt at any working load or speed without heating. They are dustproof, clean, noiseless and require but a

S.K.F. BALL BEARING LOOSE PULLEY

small amount of lubricant a few times a year. Can not wear the shaft.

Every plant has loose pulley troubles. Time, lubricants and bearings represent an annual loss that can be conserved.

S. K. F. Ball Bearing Friction Clutch Pulleys.

A friction clutch pulley designed and guaranteed to carry any belt load at any speed without bearing trouble.

ECONOMY IN DIRECT DRIVES—Drive buffing lathes, emery and disk grinders, fans, punch presses, etc., direct from line shaft and save power, belts, lubricant, time and trouble.

S.K.F. BALL BEARING FRICTION CLUTCH PULLEY

S. K. F. Ball Bearing Countershafts.

The CHICAGO PULLEY & SHAFTING Co. are headquarters for all types of countershafts but recommend at all times ball bearing equipment.

A counter with ball bearing friction clutch pulleys and ball bearing hangers will pay for itself in trouble saved in a very little time, as countershaft troubles are numerous where plain babbitted bearings are used.

S.K.F. BALL BEARING COUNTERSHAFT

S. K. F. Ball Bearing All Loose Drive Countershafts.

A special countershaft with stationary shaft. Another way to eliminate countershaft troubles. Note shaft is stationary; it does not revolve. The small driven pulley and the large driving pulley are cast as one, and the additional loose pulley is the idler, as is used in all countershaft drives. All pulleys fitted with S.K.F. ball bearings.

These are ideal drives for grinders, buffing lathes, fans, etc.

S.K.F. BALL BEARING ALL LOOSE DRIVE COUNTERSHAFT

Typical Orders.

Following are a few orders typical of those received daily by the CHICAGO PULLEY & SHAFTING Co., from all sections of the country:

Steger & Sons, Steger, Ill.—

1 38- x 6½- x 2½-in. S.K.F. Ball Bearing Type Friction Clutch Pulley.

1 38½- x 7- x 2½-in. S.K.F. Ball Bearing Type Friction Clutch Pulley.

1 34- x 8- x 2½-in. S.K.F. Ball Bearing Type Friction Clutch Pulley.

1 33- x 6- x 2½-in. S.K.F. Ball Bearing Type Friction Clutch Pulley.

1 21- x 3- x 2½-in. S.K.F. Ball Bearing Type Friction Clutch Pulley.

Aluminum Goods Manufacturing Co., Manitowoc, Wis., October 17, 1919—

50 24- x 4- x 2½-in. Ball Bearing Clutch Pulleys with split mechanism (for spinning lathes).

36 28- x 6- x 2½-in. Ball Bearing Clutch Pulleys with split mechanism (for buffing lathes).

Aluminum Goods Manufacturing Co., Manitowoc, Wis., October 3, 1919—

30 Countershafts, S.K.F. Ball Bearing Type (for No. 4 spinning lathes) 12-in. Shifter Forks.

25 Countershafts, S.K.F. Ball Bearing Type (for No. 5 spinning lathes) 12-in. Shifter Forks.

W. D. Gibson Co., Chicago, Ill.—

1 22- x 8- x 2½-in. S.K.F. Clutch Pulley.

1 36- x 8- x 2½-in. S.K.F. Clutch Pulley.

1 26- x 6- x 2½-in. S.K.F. Clutch Pulley.

1 20- x 6- x 2½-in. S.K.F. Clutch Pulley.

1 18- x 6- x 2½-in. S.K.F. Clutch Pulley.

5 16- x 6- x 2½-in. S.K.F. Clutch Pulley.

The Brunswick-Balke-Collender Co., Chicago, Ill.—

10 S.K.F. Complete Countershafts with 8- by 4½-in. tight and loose pulleys. Drive pulley to be 16 by 4½ in.

Chicago Nut Company, Chicago, Ill.—

14 sets, S.K.F. Countershaft, Loose Pulleys.

14 sets, S.K.F. Loose Pulleys, Hangers and Bearings.

2 S.K.F. Loose Pulleys only.

The Abbot Ball Co., Hartford, Conn.—

12 12- x 4- x 1¾-in. Crowned Dagget S.K.F. Ball Bearing Loose Pulleys, angle flange from 11 to 12 in. diameter.

12 12- x 4- x 1¾-in. Crowned Iron Pulleys.

Sprague Canning Machinery Co., Chicago, Ill.—

100 Ball Bearing Clutches 16- x 3¼- x 1½-in.

Badger Tool Company, Beloit, Wis.—

12 No. 4 S.K.F. Ball Bearing Countershafts

18 No. 6 S.K.F. Ball Bearing Countershafts

6 No. 8 S.K.F. Ball Bearing Countershafts.

CONWAY & COMPANY

Manufacturers of Friction Clutches

CINCINNATI, OHIO

Products.

FRICITION CLUTCHES, including Compression, Expansion, High Speed, C. M. T., and Split Types.

Friction Clutches.

The friction clutch, though many superficial engineers do not know it, is one of the most important machines in the mechanical world. Nor is it a thing that can be thought up the night before and developed the morning after. This company have given themselves entirely to the design, improvement and correction of friction clutches for more than 20 years. The mistakes, shortcomings and experiences that have been encountered would astonish even the most skeptical.

The Conway patent friction clutch is a mechanism, the perfection of which has commanded years of attainment. It is the embodiment of thought and skill. Its original and radical design may not please the eye of the mechanic, who is blinded by his own perverse notion of clutches, but this is principally because these clutches are fully one-half century ahead of the present time.

Conway clutches are made in 3 types, and this extension of their constructive design provides for them adaptability in every field of mechanical service.

Friction clutches are called upon to meet a variety of requirements and conditions. One type of clutch can not possibly do it. These types succeed very satisfactorily. The compression type clutch is subdivided into three styles, the solid, clamp and split.

COMPRESSION CLUTCH PULLEY

Conway clutches are made of the metal most adaptable to conditions.

For excavating machinery, etc., where mechanism is exposed to weather conditions, clutches are made of bronze friction band mounted on cast steel drive plate.

For interior uses and light work these clutches are made of cast iron.

Clutches for all Uses.

CONWAY & COMPANY also build clutches of the expansion, high speed, C. M. T., and split types, which are based on the same fundamental principles shown in the compression clutch above, but differ in design to meet requirements for class of service intended.

Among their many uses are the following: for textile machinery, dough mixers, hammer mills, ice machines, air compressors, rock crushers, mining machinery, bulldozers, clamshell buckets, steam shovels, cranes, hoists, excavators, ditchers, wagon loaders, gas engines, elevators, concrete machinery, conveyors, threshing machines, hay presses, power presses, rolling mills, sugar mills, tractors and machine tools.

Further information will be sent on request.

CLAMP COMPRESSION CLUTCH

THE CORK INSERT COMPANY

166 Federal Street
BOSTON, MASS.

Products.

CORK INSERT PULLEYS: Cast Iron, Paper, Steel, Wood Rim Iron Center, to meet all requirements.

BRAKE FACINGS: Disks for Clutches, Brakes and Slipping Tensions.

Friction Wheels; Cone Clutches; Cork Insert Transmission Belt; Clutch Facings, Disks and Blocks; Friction Washers and other guaranteed Frictional Devices equipped with Cork Inserts for use where great efficiency or uniform tension is necessary.

Advantages.

Cork Insert pulleys are made to any specifications to transmit any power a belt can carry and they are guaranteed to give satisfaction in the places for which they are designed.

They transmit more power than plain pulleys, stop belt slip and maintain efficiency under unfavorable conditions and are not affected by dampness.

They prevent loss from oily belts or dust, and maintain speeds in spite of water, deliver power with slack belts, cut down friction loads and lessen wear on bearings.

They lengthen the life of belts, eliminate use of belt dressing, thus reducing cost of upkeep.

They give uniform speeds, improve quality and quantity of products and save fuel and electric current.

Applications.

Main drives, motors, fans, blowers, air compressors, wood working machinery and all drives where speeds

are high and loads heavy; machine tools, textile and other machinery where output and uniform operation are especially important; pumps, paper mill machinery, dyeing machines, tanning machinery, sugar grinders, stone crushers, cement mill machinery, milling machinery, polishing machinery and all places where conditions are necessarily bad. These are a few typical cases where Cork Inserts are giving the most satisfactory results.

In one form or another, Cork Inserts are adapted to practically every place where it is necessary to obtain the greatest possible frictional efficiency or a uniform tension.

Directions for Ordering.

When ordering Cork Insert pulleys or requesting quotations, give the following information:

Quantity; type of pulley (specify iron, paper, wood rim or steel); solid or split; crown or flat face; diameter; actual width of face; width of belt; bore; length of hub (standard is two-thirds width of face); projection of rim beyond end of hub; width and depth of keyway; number and location of set screws.

If pulley must fit over parts of machine, send sketch or give outside diameter of hub and inside diameter of rim.

Describe drive, stating whether it is from motor, engine or shaft to machine (giving name and size) or shaft; distance between pulley centers; horsepower; speed of driving pulley; whether pulley described is driver or driven; whether drive is horizontal, vertical or diagonal—open, quarter-turn or crossed; if horizontal or diagonal, whether tight side of belt is on top or bottom; and if vertical or diagonal, whether driving pulley is at top or bottom; diameter and face of pulley at other end of drive.

Give material, thickness (single, double or number of ply) and width of belt.

State troublesome conditions, if any.

Co-operative Service.

Transmission problems analyzed, and recommendations for equipment guaranteed to give satisfactory service are made without charge or obligation.

Catalogue illustrating many successful applications and giving detailed reports of tests sent on request.

DODGE ROPE DRIVING EQUIPMENT; SAFETY COLLARS; KEYLESS COMPRESSION COUPLINGS; ADJUSTABLE BALL and SOCKET DROP HANGERS; BEARINGS; FRICTION CLUTCHES; PULLEYS: "INDEPENDENCE" WOOD SPLIT, "STANDARD" SPLIT IRON, IRON CENTER WOOD RIM, ONEIDA, KEYSTONE and NATIONAL STEEL; SPLIT BUSHINGS; CAST IRON GEARING.

Also, Flywheels, Rope Sheaves, Wood Lagging for Rope Wheels, etc.

Engineers.

Through more than 30 years' experience in meeting transmission problems in every line of industry, Dodge engineers are prepared to give most competent service in the selection and arrangement of transmission equipment for maximum efficiency and economy.

Dodge Rope Driving Equipment.

This company is the originator of the American system of rope driving, and is best equipped to give to every important detail of design and manufacture that careful and experienced attention so necessary to insure successful and economical operation. Equipment for English system rope drives is also manufactured by this company. Dodge literature on rope driving is very complete.

Dodge Safety Collars.

Dodge safety collars are made solid and split for all sizes of shafting, and comply with all the legal requirements as to safety by having set screws and bolts protected. Finished and polished on periphery and faced on ends.

Solid Split
DODGE SAFETY COLLARS

Dodge Keyless Compression Couplings.

The design of the Dodge coupling is excellent and its construction so simple that an ordinary workman can erect it as

DODGE KEYLESS COMPRESSION COUPLINGS

DODGE ADJUSTABLE BALL AND SOCKET DROP HANGERS

satisfactorily as a skilled mechanic or millwright. The only care needed is to tighten all bolts gradually and evenly to insure true running.

Dodge Adjustable Ball and Socket Drop Post Hangers and Bearings.

CAPILLARY TYPE—This bearing is mechanically and scientifically correct in every detail.

The Dodge patent capillary oiler is a wooden block, with alternate saw cuts, through which the oil rises by capillary attraction from reservoir to the shaft. The capillary oiler is a non-agitating oiler. There is not the slightest whipping and churning of the oil. Any sediment precipitates to the bottom of the reservoir and only the good clear oil is brought up to the shaft.

The action of the capillary oiler is definite and positive and can be relied upon absolutely. It can not fail.

RING TYPE—In this bearing the well-known method of oiling by rings is employed, in connection with a bearing of the most superior design and finish.

STANDARD TYPE—This plain oiling type of bearing is exceptionally well made for a bearing of this kind, and is relatively inexpensive.

Capillary Type

Ring Type

Standard Type

TYPES OF BEARINGS USED IN DODGE HANGERS

Continued on next page

Dodge Friction Clutches.

These clutches are manufactured also in the form of cut-off couplings. All sizes, to meet all conditions of service.

DODGE FRICTION CLUTCHES

Dodge "Independence" Wood Split Pulleys.

Rim machined inside and out. Pulley is accurately balanced, runs true, grips shaft securely and has greater transmitting efficiency than any metal pulley.

Made in all sizes and carried in large stocks for instant shipment by all branches and by hundreds of leading dealers. Special sizes made and shipped within 24 to 48 hours from receipt of order.

DODGE "INDEPENDENCE" WOOD SPLIT PULLEY

Dodge "Standard" Split Iron Pulley.

Carried in stock. Made with interchangeable metallic bushings.

DODGE "STANDARD" SPLIT IRON PULLEY

Dodge Iron Center Wood Rim Pulley.

For heavy and shock loads, for high and absolute

Split Type—Single Arm

Split Type—Double Arm

DODGE IRON CENTER WOOD RIM PULLEYS

speeds, this pulley is supreme. Rim is machined inside and out. Pulley is carefully balanced and accurately finished in every detail, and is made solid or split.

Split Bushings.

For tight and loose pulleys. Very easily placed upon the shaft with split pulleys, without necessity of taking down shafting or disturbing any equipment.

SPLIT BUSHINGS

Cast in one piece, bored and turned and then split by fracture, the uneven, ragged edges bring the two halves together to a smooth, accurate fit, held in secure position by compression of the pulley hub.

A large reservoir in center holds lubricating oil. Circular and lengthwise gains distribute oil evenly in bearings, returning it to oil chamber when pulley is not in motion. Oil chamber is filled through a convenient spring oiler.

Oneida Steel Split Pulley.

STRENGTH-WITH LIGHT WEIGHT—The lightest belt pulley made—and the strongest. No revolving superfluous pulley weight. Less weight, less friction in shaft journals—and less power loss.

PERFECT OVAL CROWN—Greatest possible belt grip or adhesion. Transmits maximum power at minimum expense of belt pull or tension. Loose belts mean less bearing friction and saving of belts.

OVAL CROWN VS. ANGLE CROWN

STRONG WINDCUTTING ARMS—Securely riveted to broad bearing of special fishplates. Arms set edgewise, offering little resistance to air.

OTHER PULLEYS

Face overhang. No arm support under belt. Belt tension causes vibration here

THE ONEIDA

No face overhang. Two sets of arms to support load either side. Strong, rigid construction

RIVETS THAT CAN NOT SHEAR—Metals first stamped male and female—no lateral or shearing strain on rivets.

NO SET SCREWS OR KEYWAYS—Pulley held to shaft by compression of hub.

No mutilated shafts, or pulleys running out of true.

RIVETS COUNTER-SUNK

DOUBLE ARMS—Oneida pulleys are built "double arm" or "double spider" in sizes beginning at 8-in. face in the smaller sizes, 10-in. and 12-in. face in medium sizes, and 14-in. face in larger sizes.

ONEIDA PULLEY
Showing double arm construction for wide faces

ONEIDA PULLEY
Sizes, 8 to 11 in. inclusive, in diameter. Takes "G" hub, with standard bore of $3\frac{1}{2}$ in.

ONEIDA PULLEY
Sizes, 12 to 20 in. inclusive, in diameter. Takes "G" hub, with standard bore of $3\frac{1}{2}$ in.

ONEIDA PULLEY
Sizes, over 17 in. in diameter. Standard bore $3\frac{1}{2}$ in. for sizes up to 36 in. Over 36 in. take $4\frac{1}{8}$ -in. bore

ONEIDA PULLEY
40x8 in. and larger, auxiliary arms give added strength

Main Drive Oneidas.

Evidence that Oneida design is basically correct is found in the fact that this is the only steel split pulley that is, or can be, successfully built in sizes up to 14 ft. diameter, for main drive purposes. Oneida main drives of 168 in. diameter, with 40-in. face, are driving as high as 750 h. p., with absolute

ONEIDA MAIN DRIVE PULLEY 14 FT. DIAMETER

safety and satisfaction. Several thousands of these mammoth Oneida pulleys are in constant use, under a wide variety of conditions.

National Steel Split Pulley.

Made 3, 4 and 5 in. in diameter. Three-in. pulleys have hubs 3 in. long and standard bore of $1\frac{1}{4}$ in.; 4-in. and 5 in. pulleys have standard bore of $1\frac{1}{8}$ in. and hubs 3 in. long.

Interchangeable metal bushings are furnished for all shaft sizes in sixteenths.

One bushing and the socket wrench are supplied free with each pulley. Each pulley (with wrench) is packed separately in a neat pasteboard box, on which is plainly stenciled the size of the pulley.

NATIONAL STEEL SPLIT PULLEY

Keystone Steel Split Pulleys.

A SUBSTANTIAL, GROOVELESS RIM—Made of $\frac{3}{16}$ -in. or $\frac{1}{4}$ -in. steel (according to diameter) the Keystone rim is solid, rigid, substantial.

It has the strongest, thickest rim of any steel pulley.

It will not break under sudden strain or high speed nor bend or dent in transit or handling.

It has no groove or seam in the center of the face to lessen belt adhesion.

It has no beads or turnover edges to catch and hold dirt, lint, sawdust, flour dust, moisture, etc., which might throw the pulley out of balance. Hence, the Keystone is a clean pulley, particularly desirable wherever steam, moisture or dust abounds.

Because of its extraordinary strength, this substantial rim provides long wear and absence of vibration, as well as ideal power saving belt adhesion.

Because a Keystone has no beads, it is placed in a lathe after being carefully trued and the edges of the rim are faced, assuring a true running, well balanced pulley.

FACING THE EDGES OF A KEYSTONE PULLEY RIM

RIVETS THAT WILL NOT SHEAR—In the Keystone, the metals, through which a rivet passes, are interlocked male and female by countersinking. The "flange" thus formed on the metals takes all the lateral strain. The rivet is called upon merely to hold the metals together. The countersinking of the rim makes rivets come slightly below the face of the rim and therefore not in contact with the belts.

SECTIONAL VIEW SHOWING COUNTERSUNK METALS

STRONG FLEXIBLE HUB—Set screws or keys—that mutilate shafts—are rarely necessary with the Keystone.

THE KEYSTONE HUB
Interwoven hub and arms with malleable iron reinforcing yoke

The hub is made sufficiently flexible to provide positive, permanent compression on the shaft by the mere tightening of the compression bolts.

This construction provides ample strength with sufficient flexibility for positive compression on the shaft.

BORES AND BUSHINGS—By a simple system of cast iron and compressed steel bushings, Keystone steel pulleys can be made to fit from 24 to 48 different sizes of shafting (according to standard bore) by merely changing the bushing. Supplied in all sizes of shafting in multiples of $\frac{1}{16}$ in. from standard bores to small size shafting.

Every bushing is accurately turned and bored and made to fit into the holes in the hubs of pulleys, virtually keying them in place. Keyseating is not required except in extraordinary cases. A complete set of bushings is furnished free with each pulley. Pulleys having bores larger than standard are subject to extra charge. Keyseating bushing at a nominal extra charge.

4-ARM PULLEY
Pulleys of diameters up to 12 in. and narrow widths of face are made with 4-arm, 2-bolt spider. Standard bore, $3\frac{1}{2}$ in. Made double arm for 8-in. face and over

KEYSTONE STEEL PULLEY
Sizes, 17 to 40 in. in diameter

DESIGN OF KEYSTONE STEEL PULLEY
Sizes, 12 to 17 in. in diameter

SMALL SIZE KEYSTONE STEEL PULLEY

Small size Keystone Steel Pulleys beginning with 8-in. face, medium sizes beginning with 12-in. face, and large sizes beginning with 14-in. face, are made with two or more sets of arms. This gives additional strength and lasting qualities.

Hub and arms are interwoven and in the larger sizes a reinforcing yoke of malleable iron is used inside a sheet steel hub casing.

Since steel has twice the structural strength of cast iron, it is obvious that Keystone steel pulleys may be operated with entire safety at speeds that would be impossible to attain with cast iron pulleys.

THE HILL CLUTCH CO.

Power Transmission Machinery

CLEVELAND, OHIO

EASTERN SALES OFFICE: NEW YORK, N. Y., 50 Church Street—Telephone, Cortlandt 8078

Products.

HILL COLLAR OILING BEARINGS; HILL FRICTION CLUTCHES (Smith Type).

Hill Rope Drives, Belt Tighteners, Drop Hangers, Floor Stands, Shafting, Couplings, Cast Iron Pulleys, Rope Sheaves, Gears, Sprockets, Flywheels, Bench Legs, Concrete Inserts, Gray Iron Castings, Special Machinery.

Hill Collar Oiling Bearings.

In the Hill Collar Oiling bearing, instead of depending upon a loose ring or chain for conveying the oil to the journal, a fixed collar is employed, thus providing a positive means of elevating the oil.

SECTIONAL VIEW HILL COLLAR OILING BEARING, CLEVELAND TYPE (Patented)

In the Cleveland Type Hill Collar Oiling bearing, the oil stored in a reservoir in the bottom of the bearing is continuously elevated by a heavy split collar. Metal wipers deflect the oil, which is then distributed along the full length of the journal. Two or three revolutions of the shaft and the bearing is thoroughly lubricated. It is not only in the positive and copious means of oiling that the Collar Oiling bearing excels, for the collar also serves as a thrust collar, and operates in a bath of oil and thrusts against babbitted seats. No outside collars are required, unless the end thrust is extremely severe. All other types of bearings require outside shaft collars, which bear iron against iron with no lubrication.

Hill Collar Oiling bearings are furnished in all forms of ball and socket and rigid mountings.

The Hill Friction Clutch.

SUPERIORITY—THE HILL CLUTCH CO. has unequalled facilities for the design and manufacture of friction clutches. For 36 years Hill power transmission machinery has been acknowledged to lead all others. No other manufacturer has had a wider experience in

the manufacturing of friction clutches, and complete power transmission machinery equipment or a greater knowledge of the varying conditions of operation that must be met.

EFFICIENCY—The advantages of the Smith Type clutch lie in its unequalled mechanical stability, tremendous starting power, ease of adjustment, and removal of wearing parts.

To obtain such rigidity all parts of the toggle mechanism are of steel and forgings, with the single exception of the connecting lever which is of cast iron.

The friction surfaces are wood to iron, which is a combination offering great frictional resistance. The wood shoes are made from the best grade of well seasoned maple. Large shoe area is supplied, and all of the shoe area is equally effective. The frictional resistance is the same at all points. This is due to the heavy cast iron jaws, rigid guides, and the balanced toggle action transmitting the pressure effort of the operator.

FOUR DESIGNS OF HILL SMITH TYPE FRICTION CLUTCH

THE CARLYLE JOHNSON MACHINE CO.

Manufacturers of Friction Clutches and Cut-off Couplings
MANCHESTER, CONN.

Products.

JOHNSON FRICTION CLUTCHES.

Johnson Cut-off Couplings.

Johnson Friction Clutch.

The Johnson clutch is made in both single and double types for light powered drives from $\frac{1}{2}$ to 4 h. p. per 100 r.p.m. Its extremely compact form and the readiness with which it admits of modification gives it a wide range of usefulness in this field. For line shaft or countershaft installations, or for incorporating into machinery, there is no other clutch that is so universally practical.

It has been thoroughly tested and has been found exceptionally efficient for work that falls within its rating.

SINGLE CLUTCH EXTERIOR

Construction and Operation.

The expanding ring principle on which the Johnson design is based involves the smallest possible number of working parts, and allows a powerful compounding of leverage. The ingenious adaptation of this principle in the Johnson clutch makes it easily the simplest, most compact, and most accessible device on the market.

A body fastened to the shaft carries the split friction ring in which are inserted a pair of toggle levers. A curve shaped wedge, which is made part of a sliding shipper sleeve, forces the levers apart, expanding the ring, bringing the outer surface into frictional contact with the inner surface of the friction cup, the hub of which is made to suit requirements. The leverage is so compounded that it requires but little pressure to operate the clutch.

11	4	$3\frac{1}{8}$	$9\frac{1}{8}$	$6\frac{1}{2}$	$10\frac{1}{8}$	$8\frac{1}{2}$	$1\frac{1}{8}$

Diameter of hub H must be at least 1 in. larger than shaft diameter. If a self-oiling bearing, it must be at least $1\frac{1}{4}$ in. larger.

The clutch may be adjusted to any desired tension by means of a single screw which moves two taper blocks set into the levers, and which is easily reached by means of a screwdriver through a hole in the friction cup.

The shipper sleeve is perfectly smooth, without projections of any sort, and entirely covers the working parts so no dirt can get near them.

The clutch hub bearing is ordinarily spiral grooved for lubrication. For high speeds and exceptionally strenuous service, bronze bushings, self-oiling bearings, or oilless wood bearings are supplied, as the case demands.

DOUBLE CLUTCH EXTERIOR

Advantages.

The Johnson clutch is easily adaptable in form to meet any requirements. It may be fitted with standard pulleys, gears, or sprockets, or may be modified to fit all sorts of special installations, where a stock clutch would not apply. Its superiority lies in its ability to operate smoothly and dependably in whatever situation it is placed.

Information Required.

In submitting inquiries all possible information should be supplied regarding the nature of the machinery to be driven, the function of the clutch, and the frequency of operation; the horsepower required, the speed at which the clutch will run, and the provision for lubrication; the space available, the size of shaft and of clutch hub.

Attention to these points will insure quick service.

For more complete information, write for catalogue "H."

JOHNSON FRICTION CLUTCH

THE KINNEY MANUFACTURING CO.

Manufacturers of Friction Clutches and Cut-off Couplings

3529-3541 Washington Street
BOSTON, MASS.

BRANCH OFFICES

NEW YORK, N. Y. PHILADELPHIA, PA. CHICAGO, ILL. KANSAS CITY, MO. SAN FRANCISCO, CAL.

Products.

FRICITION CLUTCH PULLEYS and CUT-OFF COUPLINGS.

For Road Oiling Equipment, see page 128; for Pumps and Strainers, see pages 742-43.

Competitor Clutch (Pulley).

Six sizes, 2 to 13 h. p. per 100 r. p. m. These clutches are extremely simple in construction, practically indestructible, and seldom require adjustment or repairs.

COMPETITOR CLUTCH

The metal to metal friction surfaces, when properly lubricated, engage easily and start the load without grinding, chattering or other noises. Their use eliminates sudden strains on the belting or machinery. When the pulley is idle the inside disk is the only moving part.

They can be used equally well with gear or chain drive.

All sizes are furnished with wick oiled sleeve.

Oiltight Clutch.

Eight sizes 2 to 80 h. p. per 100 r. p. m. The smallest friction clutch made per horsepower. As the case is oiltight it may be filled with oil, which insures thorough lubrication of all working members.

THE OILTIGHT CLUTCH

It is made with single or multiple disks, depending upon the horsepower required for the speed and space available.

Made to order only.

Interchange Clutch (Pulley or Cut-off Coupling).

Four sizes, 6 to 24 h. p. per 100 r. p. m. The construction of the Interchange clutch is similar to the Competitor type except that the friction members are made in four parts, in place of three, having two rings which are interchangeable. With this feature the clutch may be used on either the driving or driven end of the drive. When the clutch is disengaged the inside disk is the only moving member.

When used as a driven clutch the fitted ring is

INTERCHANGE CLUTCH

placed on the disk, with short hub; this will allow the sleeve disk to revolve freely and become the only moving member when clutch is disengaged.

By changing the sleeve disk for a disk with short hub and roller bearing to guide the end of the shaft, the clutch may be used as a cut-off coupling.

Cut-off Coupling (Worrall Type).

Six sizes 65 to 1200 h. p. at 100 r. p. m.; 200 to 2000 h. p. at 300 r. p. m. This clutch has been on the market for a great many years and has demonstrated its superiority over all other clutches for heavy duty.

Power is directly transmitted through the two flanges keyed firmly to the shafts and not through bolts, loose joints or working parts. When disengaged the

CUT-OFF COUPLING

flanges are entirely separated eliminating all friction.

The clutch and shafts are automatically centered when in use by the bevel face disk. This is the only positive method of centering heavy shafts. There is no end thrust upon the shifter or shaft bearings.

MEDART PATENT PULLEY COMPANY

Power Transmission Machinery

GENERAL OFFICES AND WORKS

ST. LOUIS, MO.

ENGINEERING SALES OFFICES: PHILADELPHIA, PA. and CHICAGO, ILL.

OFFICE and WAREHOUSE: 211 Vine Street, CINCINNATI, OHIO

Products.

Specialists, not alone in PULLEYS, but manufacturers of Every Appliance for Use in Connection with the Mechanical Transmission of Power, including TURNED and POLISHED STEEL SHAFTING.

MEDART

TRADE-MARK

Line Shafting Equipment.

Founded 40 years ago, with the Medart patented steel rim pulley as the nucleus, our business has experienced a gradual well planned development in the single field of making complete equipment for the mechanical transmission of power, and in building machinery also for straightening, turning and polishing round bars of steel, bronze, copper, etc. Today the name "Medart" is synonymous with "*everything* in the line shafting equipment" and "the best machinery for straightening and turning round metal bars," particularly of steel.

Although common impression, due to our corporate name perhaps, has been that the name "Medart" means "Specialists in Pulleys alone," the facts are that pulleys—every type: cast iron, wood split, and steel rim—constitute only a small percentage of our production, and we are importantly engaged in the manufacture of turned and polished steel shafting, couplings, collars, hangers, bearings, bearing supports, friction clutches, gearing, rope sheaves, belt tighteners, American and English system rope drives and so on. In fact, we cover the mechanical transmission field, and have fully equipped some of the largest and best known plants that are noted for high efficiency.

Shafting.

That we are the only exclusive manufacturers of a complete line of power transmission machinery which manufactures shafting in our own mill, on a basis permitting us to quote mill prices, is something engineers and buyers should keep in mind when securing proposals covering tentative line shafting installations. Shafting in any considerable overhead equipment comprises a heavy percentage of the total tonnage involved. Hence, we are able to quote very attractively covering all line shafting equipments. It will be to your great advantage

to secure all overhead equipment from one source of supply—at a saving.

"Medart" shafting is produced by the turning and polishing process.

Transmission Appliances.

Our flange couplings are all male and female design. We fit them to shafts under hydraulic pressure and afterwards face off to insure true alignment. Also we offer compression keyed-on, three-part keyless, universal joint and jaw clutch type couplings.

Our line of hangers and bearings and bearing supports includes different types, all heavy and well designed. Hanger frames are of the 4-way adjustment types. Bearings are either ring, collar or wick oiling or fitted with grease cups—adapted for ball and socket or screw adjustment. Pillow blocks of every style, including base plates, wall boxes, floor stands, brackets, etc.

Our V-groove type friction clutch, having an interchangeable sleeve to which may be fitted either a pulley, gear, sprocket or rope sheave, made solid or split construction, is noted for its great strength, matchless frictional power, simplicity and long life in service. Is adapted for conversion to cut-off coupling.

Pulleys.

Our steel rim pulley—light in weight, perfect in balance—is superior to any possible construction of pressed and riveted sheet steel, because stronger, stiffer, and will stay round. Made all sizes up to 16 ft. in diameter and 50-in. face. Our equipment for manufacture of cast iron pulleys, 3 in. to 16 ft. in diameter, is complete from the best foundry conditions and the most modern types moulding machines to the highest efficiency in machine-shop practice. Medart wood split pulleys do the work—and they will last as long as the shafting will last.

Our heavy duty "Hercules" all-steel pulley is matchless. It will withstand successfully more abuse than any other make or construction of pulley. It is built to suit specific conditions, and guaranteed on a money-back basis.

GEARS—It does not matter what is needed in gears—we can build them. We have thousands of patterns, and, besides, the most efficient moulding machines and gear cutting shop equipment.

Send for our General Catalogue and discounts. Let us quote your next specifications.

GEO. W. PYOTT CO.

Manufacturers of Power Transmission Appliances

OFFICE AND WORKS
North Avenue and Noble Street
CHICAGO, ILL.

Products.

CAST IRON SHEAVES; CAST IRON PULLEYS; SPUR, BEVEL and WORM GEARS; FRICTION CLUTCHES; SPROCKET WHEELS; LINE SHAFT HANGERS and ACCESSORIES; PACKAGE ELEVATORS; SPIRAL CONVEYORS; COUNTER-SHAFT BOX END for Conveyor; BELT CONVEYORS.

Cast Iron Sheaves.

The "V" belt drive is designed for noiseless transmission of power with short centers and at high speed. It very effectually supplants the silent chain drive. Prices of complete rope and other drives furnished on application.

DIMENSION DIAGRAM

Line Shaft Hangers.

This company manufactures and keeps in stock a complete line of 4-point adjustable hangers, pillow blocks, wall brackets and floor stands.

Having side as well as vertical adjustment it is much easier to erect and correctly align them than the older types. Where buildings have settled or shrunk, it is only necessary to readjust the set screws, without moving the frame, to relieve the pressure on the bearings caused when the alignment is disturbed.

These frames can also be fitted with Pyott standard ring oiling boxes as shown.

All other types of line shaft and factory equipment are also manufactured.

LINE SHAFT EQUIPMENT OF ALL TYPES

Package and Barrel Elevators.

For conveying barrels, boxes, tierces, bags, kegs

and other bulky packages. All the single arms are fitted with cushion spring braces. Elevator can be built to meet all conditions of operation. Spiral conveying systems furnished complete.

PACKAGE AND BARREL ELEVATOR

ARMS OF PACKAGE CONVEYOR WITH SPRING BRACES

Countershaft Box End for Conveyor.

This device provides a cast iron end box to furnish bearings necessary for the miter gear countershaft, all self-contained.

COUNTERSHAFT BOX END FOR CONVEYOR

Belt Conveying Systems.

All styles and types of belt conveying systems furnished to meet individual requirements.

VALLEY IRON WORKS

Manufacturers of Power Transmission Equipment

WILLIAMSPORT, PA.

NEW YORK, N. Y., 30 Church Street

Products.

A complete line of POWER TRANSMISSION EQUIPMENT.

For Grates, see pages 680-81.

Power Transmission Equipment.

The VALLEY IRON WORKS' line of power transmission equipment embodies the highest development in power transmission.

The line is complete to suit every purpose. All equipment is accurately constructed, materials are of

the highest grade obtainable for the purpose, and inspections and tests are rigid, insuring long life, safety and high efficiency.

Large stocks and exceptional shipping facilities insure prompt deliveries.

The engineering department of this organization is composed of experts in power transmission equipment and their services are at the disposal of those having power transmission problems to solve.

Where ever you order, always specify the "Hercules."

HERCULES HYATT ROLLER BEARING HANGERS AND PILLOW BLOCK

HERCULES DUPLEX OILING HANGERS AND PILLOW BLOCK

HERCULES COLLAR OILING HANGERS AND PILLOW BLOCK

HERCULES CHAPMAN BALL BEARING HANGERS AND PILLOW BLOCK

STANDARD SOLE PLATE
For standard, Universal and Hercules adjustable pillow blocks.
Plain sole plates for wick and ring oiling rigid pillow blocks, also furnished

WEDGE ADJUSTABLE SOLE PLATE
For wick and ring oiling rigid pillow blocks

SQUARE JAW CLUTCH COUPLING
Substantially designed for general service and finished in first class manner.
Spiral jaw clutch couplings also furnished, either right or left hand

UNIVERSAL JOINT COUPLING
Made single and double.
Only practicable in small powers, moderate speeds and where space does not permit other forms of connections

ADJUSTABLE MULE STAND
Adjustable in every direction.
Complete as illustrated with ceiling plate, guy rods, turnbuckles and compression grease cups. Crowned iron pulleys furnished unless otherwise specified.
Stationary mule stands also furnished

DOUBLE BRACE BINDER FRAMES
Complete as illustrated with any rods, turnbuckles and compression grease cups. Crowned iron pulleys furnished unless otherwise specified.
Single brace binder frames also furnished

SOLID SLEEVE COUPLING
For light work only. Finished all over. Has countersunk set-screws

STANDARD CLAMP COUPLING
Complete with bolts and key

STANDARD PLATE COUPLING
Furnished complete with bolts and key

HENDERSHOT COUPLING
Doubly strong, compensates for shaft inequalities, self-aligning, has interlocking internal jaws eliminating strain on connecting bolts and has greater compression area than other couplings

WEDGE ADJUSTABLE FLOOR STAND
Has ample strength, weight and base of area for the respective shaft sizes; is well adapted to heavy duty and high speed service. Carefully made and finished. Furnished with split babbitted bearing boxes

EXTENSION WALL BRACKET
Makes an excellent support for pillow blocks. Horizontal and vertical adjustments are provided

WALL BOX FRAME
Strong and well made. Designed for the Standard, Universal and Hercules adjustable and wick and ring oiling rigid pillow blocks. Provides horizontal and vertical adjustments as well as the removal of pillow block cap

DOUBLE FLANGE SAFETY SET COLLARS
Made solid and split for all sizes of shafting. Comply with all legal requirements as to safety by having setscrews and bolts protected. Faced on ends, accurately bored and reamed

PEDESTAL FLOOR STAND
Furnished with common split babbitted bearings

VERTICAL SHAFT FLOOR BEARING
Ball and socket adjustable. Split bearing and frame

VERTICAL SHAFT STEP BEARING
Adjustable in all directions. Tempered steel button and babbitted bushing, surrounded by oil reservoir of ample capacity. Operates with minimum friction loss

CROWELL FRICTION CUT-OFF COUPLING
Neat, compact and powerful. Rigid and simple in construction, the satisfactory working of our frictions when they are properly put in position and cared for in a proper manner. Every inquiry and order relative to friction clutches should be explicit, stating the speed and the approximate horsepower to be transmitted, also the exact diameter of shaft. When shaft is not furnished by us, a wire template, not less than 1/8 in. in diameter and pointed at each end, should accompany the order. All parts of our friction clutches are interchangeable. They are perfectly balanced and are fitted with square keys and setscrews and may run at any speed

CROWELL FRICTION CLUTCH PULLEY

BEAM CLAMPS
For standard I-beams. Holds hanger absolutely rigid and eliminates oscillating so frequent with more fragile and cheap devices. All fastening bolts furnished

BELT SHIFTER FIXTURE
Complete shifting attachment by means of which any one of the standard Hercules or Universal drop hangers can readily be fitted up as a countershaft hanger with a very simple and desirable belt shifting rig attached

T. B. WOOD'S SONS COMPANY

Power Transmission Machinery

CHAMBERSBURG, PA.

Products.

A complete line of POWER TRANSMISSION EQUIPMENT: Shafting; Belt Clamps; Solid and Split Safety Set Collars; Flanged or Plate Couplings; Flexible Couplings; Double Cone Compression Couplings; Universal Giant Keyless Couplings; Ribbed Compression Couplings; Square and Spiral Jaw Shifting Clutch Couplings; Solid Sleeve Couplings; Universal Joint Couplings; Ball and Socket Line Shaft, Heavy and Extra Heavy Headshaft Hangers of either Plain, Chain or Ring Oiling Type; Cast Iron Wall Brackets; Floor Stands; Peerless or Four Set Screw Hangers; Rigid and Adjustable Pillow Blocks and Post Hangers of Plain, Chain, Wick or Ring Oiling Type; Plain Flat Boxes; Solid Journal Boxes; Vertical and Angle Shaft Bearings; Rigid and Adjustable Step Bearings; Girder Clamps; Belt Shifters; Cast Iron or Steel Arch Wall Frames; Plain and Wedge Adjusting Base Plates; Cast Iron Pulleys; Taper Cone Pulleys; Step Cone Pulleys; Universal Giant Split Pulleys; Guide Pulleys; Clamp Hub Pulleys; Flanged Pulleys; Tight and Loose Pulleys; Web Center Pulleys; Dynamo Pulleys; Friction Clutch Pulleys; Flywheels; Balance Wheels; Engine Pulleys; Cork Insert Pulleys; Stationary and Adjustable Mule Pulley Stands; Single and Double Braced Binder Frames; Belt Tighteners; Horizontal, Vertical, Swinging and Rack and Pinion Types; Universal Giant Friction Clutches and Cut-off Couplings; Premier Friction Clutches for Countershaft Service; Clutch Shifting Mechanisms; Rope Transmission Drives; Rope; Rope Sheaves; Tension Carriages; Quill Drives; Quill Bearings; Fire Wall Sleeves.

Safety Set Collars.

Made either solid or split, bored for all sizes of shafting. Finished all over and fitted with hardened set screws. All screws, bolts and nuts are protected by flanges projecting beyond heads and nuts.

SAFETY SET COLLAR

Couplings.

This line consists of flange or plate couplings, double cone, ribbed and Universal Giant compression couplings, the latter being the coupling that requires no keys; shift-

UNIVERSAL GIANT COMPRESSION COUPLING

ing jaw clutch couplings, either spiral or square jaws, solid sleeve and Universal joint couplings.

Hangers.

Many different types of hangers are included in this line, all of a modern design, possessing unique adjusting and power saving features, fitted with either ring or chain oiling or plain grease cup bearings.

This company is also prepared to equip hangers with closed end bearings and bearings recessed for concealed collars. This line comprises line shaft, heavy and extra heavy headshaft drop hangers, post hangers and bracket hangers, being made in both the ball and socket or the four set screw or Peerless types.

Adjustable girder clamps of a unique design are also made by this company for attaching its hangers to steel girders.

HEADSHAFT HANGER

Pillow Blocks.

From many different patterns, this company is prepared to supply rigid and adjustable pillow blocks suitable for operation under various conditions. This classification comprises plain flat boxes, standard rigid, wick, ring and chain oiling rigid pillow blocks and post boxes, solid journal boxes, ball and socket and four set screw ring oiling adjustable pillow blocks; also plain or wedge

PILLOW BLOCK

adjusting cast iron and steel arch wall frames, base plates, cast iron wall brackets, plain or wedge adjusting ball and socket floor stands and fire wall sleeves.

Cast Iron Pulleys.

This company manufactures and is prepared to furnish cast iron pulleys of every description, all of a correct design, having metal properly distributed. These cast iron pulleys are machine moulded, carefully finished and well balanced.

CAST IRON PULLEY

Universal Giant Friction Clutches.

These clutches are of the disk type, of a consistent design throughout and are made either solid or split, the same type of construction being used for all sizes and all speeds. The clutch is complete within itself either for use as a cut-off coupling or in connection with ordinary pulleys, gears, rope sheaves, sprockets or any regular or special part that it is desired to use as a driving or driven mechanism. The sleeve and body of this clutch being independent, both are held rigidly in lateral position upon mounting and sustain no end thrust whatever when clutch is thrown in or out of engagement. The friction surfaces are protected from dust, dirt and other foreign substances. If desired, clutch may be equipped with special cover to protect mechanism.

All styles of shifting devices can be supplied including fork and lever stands, compound levers, worm geared and single or double spur geared shifter stands.

UNIVERSAL GIANT FRICTION CLUTCH

Belt Tighteners.

Included in this line are belt tighteners made with "A" frames and vertical side frames, all with screw adjustment; in addition, rack and pinion tighteners for horizontal or vertical use, also swinging tighteners. Also, stationary and adjustable mule pulley stands and single and double brace binder frames.

Belt and Clutch Shifting Mechanism.

Belt shifters supplied which may be attached to any of the hangers; and for friction clutches, fork and lever stands, compound levers, worm geared and single or double spur geared shifter stands can be supplied.

Rope Transmission.

Complete installations of either American or English system drives. Rope sheaves with grooves of every description also furnished; tension carriages, track, track hangers, tail rope sheaves and weights.

A corps of competent engineers, with years of experience in designing and installing satisfactory rope driving equipments, is always ready to plan drives to meet conditions as they may exist.

ROPE SHEAVE

Countershafts.

By assembling standard equipment, this company is able to economically produce in a very short time, a line of countershafts that have never been surpassed either as to quality of workmanship and efficiency, or variety of design.

COUNTERSHAFT

HYATT ROLLER BEARING CO.

NEW YORK, N. Y.

DETROIT, MICH.

NEWARK, N. J.

Products.

FLEXIBLE ROLLER BEARINGS.
SHAFT HANGERS.
BEARING BOXES.
PILLOW BLOCKS.
POST HANGERS.

Scope of Use of Hyatt Roller Bearings.

Hyatt roller bearings are used for steel mill cars and roller tables, trolleys, cranes, hoists, machine tools of all kinds, line shafts, concrete machinery, all kinds of trucks and cars, textile machinery, conveyors, automobiles, tractors, mine cars, etc.

Roller Bearings.

These bearings are antifriction bearings that merit the careful consideration of every engineer, because they are designed and constructed according to sound engineering principles.

The chrome-vanadium steel rollers are heat treated to a hardness that successfully resists wear. Assembled in a correctly designed substantial cage, they provide an antifriction unit that is simple to apply and that is dependable and effective. Hyatt roller bearings have been used for years with unvarying success in industrial machinery.

The rapidly growing use of antifriction bearings in all classes of machinery to conserve power, to cut down lubrication and attention costs and to insure dependability of operation, is a matter of especial interest to every engineer.

Eventually antifriction bearings will entirely displace plain friction bearings as succeeding years increase the demand for more economical, more dependable operation of machinery. The gigantic wastes that have existed in our country due to its abundance of fuels

of the shaft and the bearing to stand up under shock loads without permanent deformation.

Line Shaft Roller Bearings.

Hyatt line shaft roller bearings are made for all standard sizes of shafting and, being split, can be slipped into position without removing pulleys, couplings or hangers.

The boxes are filled with oil after which they need not be lubricated for 4 months.

The bearing consists of a series of flexible rollers of chrome-vanadium steel, retained in position by a substantial steel cage. Being hollow and having helical openings throughout their length, the rollers continually cover all bearing surfaces with oil.

Hyatt bearings are sturdily and accurately constructed and give satisfactory service.

Many are still in operation after 25 to 30 years of practical service earning dividends through savings in power, oil and labor.

The widespread need for increased efficiency in production has caused more attention to be paid to the power savings made possible by reducing the friction of moving parts of machinery.

The perfection of anti-friction bearings has eliminated a large percentage of the power waste caused by ordinary friction bearings.

The true rolling motion of Hyatt line shaft roller bearings eliminates at least 50% of the friction that exists in plain babitted bearings, making possible a reduction of 15% of the total power.

By the use of Hyatt line shaft roller bearings present equipments can be increased without enlarging the power plant, or a 15% reduction in the power bill can be effected—a saving of special importance at this time.

HYATT ROLLER BEARING

HYATT LINE SHAFT ROLLER BEARING

and materials are being slowly but surely checked, and antifriction bearings are one of the soundest means of eliminating these wastes.

By reason of the slight flexibility of the roller, Hyatt bearings carry the load on an area. This materially reduces the unit load and enables the surfaces

Hyatt Bearing Boxes, Shaft Hangers and Pillow Blocks.

This company is prepared to furnish bearing boxes, shaft hangers, pillow blocks and post hangers of excellent design and construction, dimensions of which are given on the following page.

Full information sent on request.

G-A BALL THRUST BEARINGS.

Material.

The rings of these bearings are made of the highest grade chrome bearing steel, free (commercially) from such impurities as sulphur and phosphorus; hence, a supreme quality. These rings are hardened by a special process whereby every ring is subjected to the same heat, rendering the metal hard and tough and superior in every way to the results obtained by case hardening. The balls used are of the very highest grade of chrome steel balls, being accurate to within 0.0001 in.

Thrust Washers.

The races of the "C" series bearings are flat. The load carrying capacity of the bearing is, therefore, considerably less than that of thrust bearings with grooved races. The bearings are not recommended for high speed work.

THE NORMA COMPANY OF AMERICA

High Speed Antifriction Bearings and Precision Measuring Instruments

Anable Avenue

LONG ISLAND CITY, N. Y.

Products.

"NORMA" BALL BEARINGS; "NORMA" ROLLER BEARINGS; "NORMA" THRUST BEARINGS; "NORMA" COMBINATION RADIAL and THRUST BEARINGS; "MINIMETER" MEASURING INSTRUMENTS.

"Norma" Ball Bearings.

These are essentially high speed, high duty bearings preëminently adapted to conditions where long service and silent running are sought, under high speed operation. It must be evident that a bearing that will give satisfaction at high speeds will maintain the same high standard of performance at low and moderate speeds.

The silence and speedability of the "Norma" bearing are due to the following distinctive features: open type and separable construction giving instant access without tools to every part for inspection or cleaning, facilitating lubrication, and permitting the independent rigid mounting of both inner and outer races; rigid mounting of both races preventing wear in the housing, with consequent vibration and noise and misalignment; extremely high precision maintained by the use of the "Minimeter"; materials of high quality improved by special treatments; workmanship and inspection of extreme refinement.

Made in both single and double types, in all the internationally standardized sizes.

"Norma" Roller Bearings.

These heavy duty, high efficiency units are preëminently adapted for service where shock, jar, vibration, and wide and sudden load variations will be encountered—service destructive to even the best ball bearing. One exclusive feature of the "Norma" roller bearing is that it has twice the steady load capacity of a ball bearing of the same dimensions, and a temporary overload capacity up to 50% of its own rating. Its unique feature of design is the use of cylindrical rollers between a cylindrical inner race and a convex outer race. It has all the distinctive "Norma" characteristics of design and construction: open, separable type; rigid mounting of both inner and outer races; extremely high precision; speed qualities second only to the "Norma" ball bearing.

Made in all the internationally standardized ball bearing sizes.

"Norma" Thrust Bearings.

In these units "Norma" standards of design and precision have been applied to the making of bearings with maximum efficiency under end thrust—it being

"NORMA"

TRADE-MARK

understood that even the best thrust

bearing can be only a compromise with true antifriction principles. "Norma" thrust bearings have the durability and the speed qualities which come with correct design, superior materials, and unsurpassed precision of dimensions—they are high speed, silent running bearings. They can be furnished in both single and double types, either with or without housings, as conditions require. The housed types have the advantages of being self-contained and preadjusted.

Made in all the internationally standardized thrust bearing sizes.

"Norma" Combination Bearings.

These high duty units afford the complete solution of that difficult problem—handling a combined radial and thrust load with the maximum of efficiency. In essentials they consist of a standard "Norma" radial unit and a standard "Norma" thrust unit united in one housing

that is self-contained and preadjusted to the limit of exactness. Two types are offered: "Norma" combined annular ball and ball thrust bearing, and "Norma" combined roller and ball thrust bearing.

"Minimeter" Measuring Instrument.

This instrument brings to manufacturing on a commercial scale that degree of precision in measurement which otherwise can not be obtained outside the scientific laboratory. It is a device which, measuring to the 1/10,000 part of an inch, entirely eliminates the personal equation of the operator—the feel, the touch. Its use reduces duplicate part production, interchangeable manufacture, to scientific accuracy. It is furnished in a great variety of mountings, for practically every class of internal and external measurement.

Co-operative Service.

The company's Engineering Department is at the service of any one interested in the adoption or application of antifriction bearings for any purpose. This service is maintained and freely rendered in the conviction, based upon experience and observation, that the selection of the proper type of bearing for a specific duty, and its proper mounting, are as important as the quality of the bearing itself, in the effect upon the results accomplished and upon the performance realized.

OLD RELIABLE "SELLS" ROLLER BEARINGS; COMPRESSION COUPLINGS; UNIVERSAL RING OILING HANGERS; SAFETY SET COLLARS; "SELLS" ROLLER or RING OILING BEARINGS; BRACKET HANGERS; PILLOW BLOCKS; COMBINATION OIL or GREASE GUNS; "ROLLERINE", the ball and roller bearing lubricant.

Power Transmission Machinery, Grinders, Shears, Punches, Dies, Sensitive Drill Presses, Foot Presses, Grinding and Polishing Machines, Tumbling Barrels.

Roller Bearings.

"Sells" roller bearings are made single and double roller structure, the single type being adaptable for all ordinary service. The double structure is intended for exceptionally heavy belt pulls, such as are found near most driving pulleys.

The Split Bushing

The Split Collar

The Split Roller Structure

The Split Box

DETAILS OF "SELLS" DOUBLE ROLLER BEARING

CONSTRUCTION—Every feature of the Old Reliable "Sells" is split, making it easy to apply to shafting. There is no other bearing that combines so many advantages for economy in operation as the "Sells." Its high carbon split steel sleeve protects the shaft from all wear. This is firmly clamped in place by split collars. High carbon split steel lining is also used to protect the raceway in the housing from wear.

The split cage separates the rollers, preventing roller-against-roller friction, holding rollers parallel to the shafting, to each other and to the raceway. Friction is obviously eliminated at every point, because the bearing is of the full floating type.

Standard Compression Couplings.

The heaviest and strongest couplings on the market. Perfectly balanced and afford accurate alignment. No projecting parts to catch or tear clothing.

STANDARD COMPRESSION COUPLINGS

Standard Safety Set Collars.

These collars are made in solid and split types. They are absolutely safe, the set screws are sunk—a good safety first feature.

STANDARD SAFETY SET COLLARS

"Rollerine."

"Rollerine" is the ideal lubricant for "Sells" roller bearings, or, in fact, any bearing. No resin oil, wax, talc, soapstone or gum of any sort is used in compounding it. It will not harden or gum.

"Rollerine" comes in quantities from quart cans to barrels.

A sample can of "Rollerine", that will prove all that has been said, will be sent free to anyone who will write for it.

CAN OF "ROLLERINE"

"Sells" Combination Oil and Grease Gun.

Affords the most efficient means of applying "Rollerine" to "Sells" roller bearings. It is also adapted for heavy oils and greases of all kinds.

The "Sells" combination oil and grease gun puts the lubricant where it should go.

"SELLS" COMBINATION OIL AND GREASE GUN

ROYERSFORD PILLOW BLOCK WITH "SELLS" ROLLER OR RING OILING BEARINGS

SKF SELF-ALIGNING, RADIAL and THRUST BALL BEARINGS; SKF SELF-ALIGNING BALL BEARING HANGERS and PILLOW BLOCKS; BALL BEARING LOOSE PULLEY and FRICTION CLUTCHES.

Hess Bright Deep Groove Radial Ball Bearings, Atlas Steel Balls.

Design of Ball Bearings.

SKF ball bearings are made in all international standard sizes and in the three following types:

Radial bearings, designed for use where the load is carried at right angles to the shaft.

Adapter bearings, a modification of the radial bearings, for use where it is not possible to machine the shaft.

Thrust bearings, which take the load in the direction of the axis of the shaft.

Owing to the correct design and extreme care taken in every stage of manufacture of SKF ball bearings, the following features will be noted, the combination of which are only found in these bearings:

(a) Double row of balls, extra carrying capacity and greater safety.

(b) Self-aligning construction is such that there can be no binding strains in the bearings. Uneven loads, or jolts and shocks of hard service can not cramp or wedge the balls. Both rows of balls carry the load.

(c) Superior workmanship and accuracy. The bearings are as free from friction as it is possible to make them.

Accuracy and high finish are essential to the successful operation of any bearing. In SKF ball bearings, these two factors are paramount, and the rigid control and inspection used throughout set a distinct standard in careful manufacture.

ADAPTER TYPE BALL BEARING USED IN SKF HANGERS

CASING AND BEARING MOUNTED ON SHAFT

Construction of SKF Adapter Bearing.

The SKF adapter type bearing has a split tapered sleeve known as an adapter. The bearing has a tapered bore and seats on the adapter. In practice the sleeve is slipped on the shaft, the bearing is placed on it and by tightening a lock nut on the sleeve the bearing is forced

into place and the sleeve is clamped firmly on the shaft.

No moving part touches the shaft. Therefore there can be no wear on the shaft. The bearing and adapter are completely incased in a cast iron housing which is both oiltight and dustproof.

Power Saving with SKF Ball Bearing Hangers.

Exhaustive tests in manufacturing plants have demonstrated that transmission losses due to friction of plain bearings amount to 20% to 40% of total power used in the plant.

The chart illustrates how, by the use of SKF self-aligning ball bearing hangers, 60% of these losses may be avoided.

A long line of shafting was mounted first in ring oiled babbitt hangers and second in SKF self-aligning ball bearing hangers. The shafting was driven by the same motor and run at various speeds and loads.

It will be noted that on a shaft running at 150 r.p.m. under a load of 840 lbs., the use of SKF ball bearing hangers results in a saving of 62% of the power lost by plain bearings. This means a saving of from 12% to 24% of the total cost of power.

CHART ILLUSTRATING PER CENT OF REDUCTION IN POWER LOSS BY SUBSTITUTING SKF BALL BEARINGS FOR PLAIN BEARINGS

Using Smaller Motors.

With SKF ball bearings the starting friction is no greater than the running friction. This is a very important fact, for, as it is not necessary to provide for heavier starting loads, a much smaller motor may be used. Shafts in cast iron, babbitt or bronze bearings frequently become "set" if the shafting equipment is idle for any length of time.

SKF BALL BEARING HANGER

The oil is pressed out of these bearings and it is extremely difficult to start the shaft from rest. Again, when bearings are operating at normal speed, rubbing friction is constantly consuming power at a sacrifice of efficiency.

With SKF ball bearings rolling friction is practically uniform from rest up to very high speed. On this account SKF ball bearing hangers start with a minimum effort and operate at all times with the highest possible efficiency.

Where ball bearing hangers are used, the selection of a motor for shop drives reduces itself to the problem of providing alone for normal machine power consumption, without the necessity of providing for the heavy overload capacity usually required to "start up."

For example: if machines in the shop normally require 250 h.p. to drive, and an additional 50 h.p. is consumed by the line shaft in distributing this power, a saving of 50% of the power required for the line shaft will reduce the total power required by 25 h.p. or $8\frac{1}{3}\%$ of the total. With a motor costing approximately \$9.00 per h.p. there will be an initial saving of approximately \$225.00 in the motor cost.

Other SKF Features.

Aside from these valuable savings, SKF transmission equipment will save 80% of the lubricant needed for plain bearings. 80% in maintenance bills is a conservative estimate of what SKF will save on repairs.

The SKF oiltight housing insures a clean shop, free from dripping oil. Heating is absolutely eliminated, and so fires caused by hot bearings can be permanently avoided.

SKF transmission equipment possesses numerous advantages and one or the other of these will always show their superiority. SKF ball bearings save where others waste; they give service where others give trouble. A trial will convince you of SKF merits better than anything we can say.

SKF Self-aligning Ball Bearing Hangers and Pillow Blocks.

The type of construction employed in SKF hangers and pillow blocks embodies extreme simplicity with great strength. The ball bearings are contained in accurately machined casings which are securely positioned in the hanger or pedestal pillow block frame by a four-point adjustable suspension.

Inasmuch as SKF ball bearings themselves are self-aligning, no pivoted "cradles" or ball and socket supports are required.

The self-aligning feature of SKF ball bearings is of marked value for line shafting. Buildings settle, floors drop and gradually shafting will pull out of line. Misalignment may not be visible to the eye but still be enough to bind the best plain bearing.

SKF ball bearings, on the other hand, prevent such binding. They align themselves with the shaft and operate smoothly and efficiently even when the shaft is not in perfect line. Worn bearings, heating and reballing, so often found where plain bearings are used, are entirely absent in a plant using SKF hangers. The time and expense saved by this feature alone is sufficient to warrant a most careful consideration of SKF.

SKF Ball Bearing Loose Pulleys.

They eliminate trouble and expense; no dripping of oils, noiseless, dustproof, highly balanced, run at any speed, require lubricating only three or four times a year. Every pulley is tested and filled with lubricant enough to last six months, before leaving the factory. Simple to install, place on the shaft and tighten one set screw.

Exploded View

Disassembled
SKF BALL BEARING LOOSE PULLEY

SKF Ball Bearing Friction Clutch Pulleys.

Drive buffing lathes, emery and disk grinders, fans, punch presses, etc., direct from the shaft. The SKF ball bearing friction clutch pulley is simple in construction, easy to install, and requires less space on the shaft than ordinary clutches. Ball bearings are dustproof, and the lubricant chamber needs re-filling but two to four times a year according to conditions. Prices on application.

Manufacturers of Cut Gears

2100 Marshall Boulevard
CHICAGO, ILL.

Products.

CUT GEARS—Spur, Bevel, Miter, Spiral, Helical and Herringbone Gears; Rawhide and Bakelite-Micarta Gears and Pinions; Worms, Worm Wheels and Internal Gears; Ratchets; Heavy Duty Hardened Auto Transmission and Tractor Gears; Ignition Gears; Pump Gears; Magneto Gears; Washing Machine Gears; Sprockets.

Member of the American Gear Manufacturers' Association.

Equipment, Facilities and Co-operative Service.

Modern machinery and efficient methods enable this company to manufacture gears in the most perfect manner and with the least possible delay. Bevel gears are generated to the true involute form on either Bilgram or Gleason bevel gear shapers. Transmission gears are generated principally on Fellows shapers. Spur, helical and spiral gears are generated on a large battery of the finest and most modern gear hobbing machines.

The company has also a large number of single cutter gear machines and thread milling machines. The plant, capital and engineering force afford facilities for prompt action on any special requirements. The engineering staff is at the disposal of all parties, and will gladly advise, recommend or furnish estimates.

Cut Gears.

QUALITY OF MATERIALS—Gears are made from bar steel, drop forgings, cast steel, semisteel, high grade cast iron, brass or bronze. Quality of materials used is the best available. Customers' material specifications are closely followed.

TRANSMISSION GEARS

SPUR GEARS—Cut from the bar, steel forgings, castings, or best grade cast iron, sizes up to 48 in. in diameter. Stub tooth gears, particularly for automobile drives, hardened and ground, give greater strength and are more quiet than ordinary spur gears.

BEVEL GEARS—The supe-

BEVEL GEARS

VARIOUS TYPES OF GEARS

rior running qualities of our bevel gears are well known—hardened and ground gears for tractor, truck and auto drives, transmissions, machine tools, etc., 4 to 1 ratio; diameters up to 20 in.; miter gears up to 16 in.

SPIRAL GEARS—Spiral and helical gears, made from bronze, steel or cast iron, are accurately cut and smooth running; generated to eliminate thick and thin teeth and so as to get perfect involutes.

Supplied in any style for all purposes.

SPIRAL GEARS

HERRINGBONE GEARS—Smooth running. Action is continuous, with no shocks when load is transferred from tooth to tooth; wear and objectionable side thrust are practically eliminated.

Manufactured in any metal up to 20 in. in diameter.

RAWHIDE AND BAKELITE-MICARTA GEARS AND PINIONS—Especially fitted for high speed service where conditions require absence of noise.

Made with brass or steel flanges reaching to top of teeth, all securely riveted or bolted together, protecting and supporting teeth. In most cases the rawhide of the pinion is made slightly wider than the face of the metal gear, which insures a quiet drive as there is no metallic contact.

WORMS AND WORM WHEELS—Worm gear drives are used where great reduction in velocity or great increase in power is desired. The best combination of materials is used, insuring smoothness of action and long life.

INTERNAL GEARS—Manufactured in all pitches up to 4 diametral pitch and 28-in. pitch diameter.

SPROCKETS—All types of roller and silent chain sprockets made for all purposes, and their quality and workmanship correspond with that shown in all Albaugh-Dover gears.

INTERNAL GEARS

FAWCUS MACHINE COMPANY

Manufacturers of Cut Gears and Special Machinery

PITTSBURGH, PA

WORKS
PITTSBURGH, PA.
FORD CITY, PA.

Products and Services.

CUT GEARS, including Herringbone, Spur, Bevel and Worm.

Flexible Couplings, Special Machinery.

This company builds special machinery to order and invites inquiries on any kind or size of gear. Send the problem or specification.

Complete transmissions are designed.

Shop facilities are such that orders can be handled rapidly.

The services of the engineers of this company are available when needed.

Size of Gears and Drives.

Cut herringbone gears, 2 in. to 20 ft. in diameter. Cut special gears, 2 in. to 20 ft. in diameter. Cut bevel gears, 2 to 48 in. in diameter. Cut worm gears, 2 in. to 10 ft. in diameter. Flexible couplings, for shafts 1 to 20 in. in diameter. Enclosed worm gears, 5 h.p. to 25 h.p. Standard enclosed herringbone gear drives, 25 h.p. to 1500 h.p. (Herringbone Gear Booklet on request.) Special enclosed gear drives, 25 h.p. to 15000 h.p.

Turbine reduction gears, 25 h.p. to 3000 h.p.

Uses.

For general mine and mill use wherever power is transmitted, as for steam and electric hoists, motor driven pumps and air compressors, mine machinery, rubber and steel mill drives.

Fawcus herringbone gears can be advantageously used wherever a positive means of transmitting power is required.

Special Features.

Fawcus herringbone gears transmit power more quietly and efficiently than is possible with spur gears.

Gear and pinion teeth are cut in solid blanks on Fawcus patented machines, and each pair is given a thorough running test before shipment.

The accuracy of herringbone gears makes possible their use for high

TRADE-MARK

speeds and for high ratios of speed reduction.

Gears and drives are all designed to suit special conditions for power transmitted and space available.

Workmanship.

There is a vast difference between cut gears and *correctly cut* gears. This difference means less noise, less wear, less friction, less power wasted, less fuel consumed, time and money saved. Rapidity of cutting is of less importance with us than accuracy of cutting.

Guarantee.

Fawcus herringbone gears, when designed by the company's engineers and installed and taken care of in accordance with our directions, are guaranteed to give entirely satisfactory service, and to run quietly, efficiently and without showing undue wear under normal conditions of service.

BEVEL GEARS

FAWCUS HERRINGBONE GEAR DRIVE

FOOTE BROS. GEAR & MACHINE CO.

Manufacturers of Cut Gears

213 North Curtis Street
CHICAGO, ILL.

Products.

IXL Productions as follows:

ALL SPUR GEAR SPEED TRANSFORMERS, WORM GEAR SPEED TRANSFORMERS; SPUR, BEVEL, MITER and SPIRAL GEARS; WORM, INTERNAL, HELICAL and TRACTOR GEARS; TRACTION ENGINE GEARS; HEAVY DUTY HARDENED GEARS; RAWHIDE PINIONS; CLOTH PINIONS; CUT STEEL MACHINE RACKS; SPROCKETS; FOOTE-IXL TRACTOR TRANSMISSIONS.

Special Machinery Built to Order.

Engineering Service.

Foote Engineers are ready and willing to assist in solving any tractor or gear problems. They have indicated worthwhile economies and better methods for many manufacturers. This service is without obligation.

Literature.

Valuable catalogues, and gear data book sent on application; also transmission circulars.

Reducers.

SPUR GEAR TYPE—IXL all spur gear speed transformers are modern in every way, low priced and of highest quality. Insure efficiency, compactness, durability and strength. Built for heavy duty and continuous service. Entirely enclosed, oiltight, dustproof and fool-proof.

Can be used in many places and under conditions where worm gear reducers can not be used. The value is shown where they take the place of gearing and belting, having a reduction of from 5 to 1 up to 100 to 1 or more. Particularly adapted for use in connection with electric power, where they supply a practical and efficient method of reducing the motor speed.

WORM GEAR TYPE—The IXL worm gear speed transformers have been on the market since 1895, during which time they have demonstrated their efficiency and durability. Recent improvements have added greatly to the value. Each transformer is thoroughly tested before it leaves the factory. They are manufactured with a number of different ratios in the same size case. This is accomplished by a change from a single to a double, triple or quadruple thread in the worm, and also by changing the pitch and number of teeth.

LITERATURE—Send for complete data and information regarding the use of Foote spur gear speed reducers.

Miter and Bevel Gears.

With the use of modern machines and methods for generating, planing or cutting by the Gleason and Bilgrim system, IXL miter, angle and bevel gears are cut with the finest accuracy, thus insuring smoothness and quiet running.

Spur Gears.

Cut spur gears all sizes up to 144 in. in diameter, made from high grade steel forgings, castings or the very best grade cast iron.

IXL BEVEL GEARS

IXL SPUR GEAR

SPUR GEAR REDUCER AND APPLICATIONS

WORM GEAR REDUCER AND APPLICATIONS

Worm Gears.

Foote Bros. are equipped to solve problems and furnish worm gear drives of any style and material desired. IXL quality worm gears are manufactured to meet all requirements, using the best combination of materials in each case.

Heavy Duty Hardened Gears.

Every type of heavy duty hardened spur, bevel, spiral gears and all other gears required for all purposes, including tractors, transmissions, differentials, steering, for machine tools, etc.; also for tractor, truck and auto drives, treated by special *heat treatment* process.

These hardened steel gears have four times the actual strength of cast iron gears of equal size.

In any machine, hardened steel gears will take up considerably less space than ordinary cast iron or steel gears giving equal power.

Wearing qualities are 50 to 1 in comparison to soft steel or cast iron gears.

IXL HEAVY DUTY HARDENED GEARS

Spiral Gears.

IXL spiral gears can be supplied in any size for every purpose. Many designers have availed themselves of Foote Bros. service in solving spiral gear problems. Co-operation is gladly given with any who are interested.

Internal Gears.

IXL internal gears are made or cut of every description, either plate back or plain rings. All pitches up to 4-diameter pitch are generated on Fellows gear shaper; 3-diameter pitch and coarser are planed on Gleason's planers.

Herringbone Gears.

IXL double helical or herringbone gears in any metal or any size up to 80 in. in diameter. This form of gear has angular teeth of great strength owing to their special formation, the 2 teeth always having 2 points of contact in the plane of axis, causing them to work smoothly and noiselessly. Especially adapted for hoisting, mining and rolling mill machinery.

IXL HERRINGBONE GEAR

Sprockets.

Block, roller silent or any other style of chain sprockets furnished for any purpose, and made of any material desired, in any quantity. IXL sprockets have proved their value in all branches of industry.

Racks.

This company is prepared to cut finished IXL machine racks from almost any size blank in almost any pitch, and in continuous section of any length that can be conveniently shipped.

Rawhide Pinions.

For high speed drive in connection with metal gears IXL rawhide noiseless pinions insure maximum efficiency, elasticity and durability. IXL rawhide gears and pinions are made up with brass flanges reaching to the top of the teeth, all securely riveted and bolted together, giving protection, support and long life to the teeth. When an extra quiet drive is wanted these pinions can be made with face of rawhide slightly wider than its metal mate, thus avoiding metal contact. This style costs extra and can only be used where there is plenty of space. Thickness of flanges on both styles depends on the pitch, face and diameter.

Cloth Pinions.

Cloth pinions have met with considerable favor, many claiming them superior, in noiseless operation, long life and high tooth strength, to all other non-metallic pinions in vogue. IXL are made of cloth or cotton filler compressed under hydraulic pressure, held by metal flanges. Prices quoted on receipt of specifications.

Foote-IXL Tractor Transmissions.

The only tractor transmission with the power pulley so arranged that it can be used inside or outside of tractor wheels for either internal chain or external drive.

Constructed of best procurable materials. Case is made from high grade semisteel, carefully machined; oilproof and dusttight. Bearing supports are rigid, keeping gears in perfect alignment under severest conditions, allowing transmission of maximum power to bull pinions. Gears are made from high grade steel treated and hardened by special process; are extra heavy, and figured for ample surplus to care for severest strains. Shafts are made of special alloy high carbon steel, allowing for extremely heavy duty without twisting or straining. All bearings are Hyatt roller mounted, doing away with friction throughout the case. Best type of lubrication.

This company was the pioneer in standardizing tractor transmissions.

MODEL D FOOTE-IXL TRACTOR TRANSMISSION

2 speeds and reverse with pair change gears on side of case which can be reversed in position giving 2 lower speed ratios. For bull pinion drive, 30 to 40 h.p. motors.

MODEL B FOOTE-IXL TRACTOR TRANSMISSION—2 speeds and reverse for bull pinion drive, 25 to 30 h.p. motors. Model C is same as the model B, but with 3 speeds and built for 40 to 50 h.p. motors.

MODEL D-U FOOTE-IXL TRACTOR TRANSMISSION—Same gear arrangement as model D with direct axle drive feature. Can be furnished with engine and front axle supporting frames eliminating further framework. For 30 to 40 h.p. A model E-U is made with same features as the D-U for 45 to 60 h.p. motors.

OTHER TRACTOR TRANSMISSIONS—Live axle and hull pinion types for 2-3, 3-4 plow tractors. Full data and specifications furnished on request

ESTABLISHED 1890

W. A. JONES FOUNDRY & MACHINE CO.

Speed Reducers and General Power Transmission Machinery

4403 West Roosevelt Road
CHICAGO, ILL.

BRANCH OFFICE: 30 Church Street, NEW YORK, N. Y.

Products.

SPUR GEAR SPEED REDUCERS; WORM GEAR REDUCERS; CUT GEARS of Cast Iron, Cast Steel, Forged Steel, Bronze, Rawhide and Bakelite; CAST TOOTH GEARS and SPROCKETS; PULLEYS, Solid or Split; LEMLEY FRICTION CLUTCHES; FLANGE COUPLINGS; PILLOW BLOCKS; HANGERS; ELEVATING and CONVEYING MACHINERY.

Rope Sheaves, Flexible Couplings, and General Power Transmission Machinery.

Spur Gear Speed Reducers.

Jones spur gear speed reducers are designed for reducing speeds between electric motors and driven machines or shafts, and are rapidly replacing belts, chains and other forms of drives in many of the largest mills and plants in the country. Jones reducers are simple in construction, positive in operation, occupy small space, and comply with all safety laws.

All gears and pinions are generated from special analysis steel, the involute stub tooth of 20° pressure angle being used throughout. All shafts are ground to size and supported at both ends by liberal bronze bushed bearings. All moving parts operate in a bath of oil, and as no dust, grit or liquids can enter the machines their length of life is almost unlimited. Jones spur gear reducers are designed to handle excessively heavy overloads with a high degree of efficiency—some of the larger units being built for loads in excess of 200 h.p.

REDUCER AND MOTOR ON BASE

SECTIONAL VIEW OF REDUCER

Practically any reduction ratio may be obtained, reductions of 200 to 1 being not unusual.

Speed Reducer Bulletin will be sent on request, and Jones engineers will gladly make an analysis of reduction problems without obligation. Write today.

Worm Gear Reducers.

Jones worm gear reducers are made from the highest grade material, and in a strictly first class manner. All worm gears are accurately hobbed, and the special analysis steel worms are milled in special thread milling machines, which insures a low coefficient of friction and long life.

Prices and information gladly sent on request. Ask now.

WORM GEAR REDUCER AND MOTOR ON BASE

Cut Gears.

Cut gears are furnished in cast iron, cast steel, forged steel, bronze, rawhide or Bakelite, in sizes up to 80 in. in diameter. Every spur, worm or spiral gear is hobbed in the latest types of machines. Gears with involute stub teeth of 20° pressure angle can be supplied at the same prices as for the ordinary tooth form of 14½° angle. Breakdown and rush orders will be given special attention.

Write for prices.

RAWHIDE PINION

CUT SPUR GEAR

Cast Tooth Gears and Sprockets.

A stock of several thousand gear patterns enables the W. A. JONES FOUNDRY & MACHINE CO., in most cases, to save the extra cost of patterns and to render unusually quick service on rush orders.

Ask for catalogue and quantity discounts on spurs, worms, worm gears, bevels and miters.

CAST SPROCKET

CAST MITERS

Lemley Friction Clutches.

Lemley friction clutches are made for both line and countershaft work as well as for gas engines.

These clutches are superior to many other clutches, in that the friction rings can be replaced without removing the clutch from the shaft; adjustment is simple and positive; and the

STYLE B LEMLEY FRICTION CLUTCH WITH SLEEVE

STYLE B LEMLEY FRICTION CLUTCH WITH PULLEY

LEMLEY GAS ENGINE CLUTCH

toggle arrangement operates to throw the clutch both in and out of operation. To eliminate clutch troubles buy the Lemley. Some of the largest manufacturers use them exclusively.

Ask for catalogue L6 or, if interested in gas engine clutches, ask for L7.

Pillow Blocks.

Jones pillow blocks possess a number of features that make them superior to any others now on the market. Made in both plain, and duplex oiling types.

Send for descriptive matter.

STANDARD RIGID PILLOW BLOCK

Couplings.

There is no flange coupling on the market superior to the Jones. They are finished all over, and the hubs are accurately bored to size and key-seated.

Style "A" flexible coupling is one of the best of its kind on the market and will take care of considerable misalignment. Style "B" is the most flexible coupling on the market and is especially adapted for loads of a pulsating nature.

Write for bulletin.

FLANGE COUPLING

DUPLEX OILING PILLOW BLOCK

Pulleys, Solid or Split.

Jones cast iron pulleys are superior to pressed steel or wooden pulleys, as they have no rivets to work loose and they can not warp or shrink.

They have the rims turned and crowned and the hubs bored true with the rims and setscrewed ready to run.

Jones split cast iron pulleys are just as easy to apply as are those of steel or wood and they always run true.

A large stock of standard sizes is on hand, from which immediate shipment can be made.

Write for catalogue and quantity discounts.

CAST IRON PULLEY

Hangers.

Jones universal adjustment shaft hangers are in a class by themselves

Equipped with either our plain babbit bearing or with our Duplex oiling type.

Descriptive matter on request.

UNIVERSAL ADJUSTMENT HANGER

Elevating and Conveying Machinery.

The W. A. JONES FOUNDRY & MACHINE Co. manufactures a complete line of elevating and conveying machinery of all kinds and carry the largest stock of detachable chain and attachments in Chicago. Special machinery built to order.

Send specifications and ask for estimates, which will be furnished without obligation.

Products.

LEATHER BELTING; BELTING ACCESSORIES and LEATHER SPECIALTIES, which include: Lace Leather, Cut Lacing, Belt Cement, Belt Preservative, Hydraulic Leather, Leather Packing, Washers, Disks, Shafting Rings, Automobile, Truck and Motorcycle Belts, Leather Welting, Straps of every description.

Ladew Engineering Service.

The proper application of belting is an engineering problem deserving of skilled counsel and the best experience. More belts are destroyed by abuse than by use—abuse here implying neglect of proper care as well as ill-advised applications. To correct wrong conditions where known, as well as to guard against them in advance where possible, Ladew Engineering Service is maintained. This consists in the advice and assistance of experienced belting engineers who will study any belting problem and give expert advice on its solution. Ladew service is offered free to all belt users seeking the highest belting economy—which means the lowest belting cost per horsepower per year of service.

Distribution.

Branches and distributors in all principal cities of the world carry complete stocks.

"Flintstone" Leather Belting.

Introduced in 1835, and steadily improved ever since, "Flintstone" is pre-eminent the belt for all drives where everything depends upon, and everything is expected from, the power transmission. The care in selection of leather and in methods of manufacture forbids "Flintstone" selling as a cheap belt. But, hundreds of times over, in the decades past, "Flintstone" has proved itself to be the most economical belt—the belt which gives the greatest number of years of service at the lowest cost per year. Or, stated otherwise, "Flintstone" will transmit more power over a longer period at the lowest cost per horsepower per year. The Ladew trade-mark on "Flintstone" is a guarantee of maximum belting service at minimum belting cost.

"FLINTSTONE" BELTING BRAND

"Turtle" Waterproof Leather Belting.

Introduced in 1860, "Turtle" is the original waterproof belt. It is made from center cuts of the best selected hides, tanned and curried by most approved

methods, thoroughly impregnated with a water resistant, water repellent material, and built up with a special waterproof cement. Even under most extreme moisture conditions, the laps or plies will not open up. For all drives where the utmost in service is sought, in the presence of

water, steam, oil or acid fumes, "Turtle" has a record that proves its unsurpassed qualities. The Ladew trade-mark on each "Turtle" belt is a guarantee of Ladew quality which has been a belting standard for over 80 years.

"TURTLE" BELTING BRAND

Special Belts for Special Purposes.

The Ladew line, in addition to the two main brands mentioned above, includes a number of other brands made from sections of the hide not considered suitable for "Flintstone" and "Turtle." These are high grade belts, though never sold as "first grade" belts, capable of splendid service where the conditions are clearly understood, so that the right belt can be supplied for each particular purpose. In many cases a material saving results by the use of these special belts under the advice of Ladew engineers. The house of Ladew also has unequaled facilities for producing, in short order, belts for special or unusual conditions.

Ladew Belting Accessories.

These include lace leather, cut lacing, belt cement and belt preservative—all made to the Ladew standard of quality and embodying a belting experience of more than 80 years. A Ladew leather belt, with joints laced with Ladew lacing or cemented with Ladew belt cement, will give a length and character of service which makes first cost an insignificant consideration.

Ladew Leather Specialties.

Hydraulic leathers, leather packings, leather washers and disks, shafting rings, and other mechanical specialties in leather made by Ladew are manufactured with the idea of service and sold to a trade which measures value by service rendered.

Catalogue.

"Ladew Leathering Belting" is the title of a 108-page book describing Ladew methods, processes, policies and products. It is furnished on request, together with a belting data sheet for the analysis of any belting problem.

Products.

LEATHER BELTING (Flat, Round, Link and Angular); LEATHER LACING; LEATHER FILLET, LEATHER CUPS, WASHERS and PACKING; LEATHER MECHANICAL GOODS; PULLEY LAGGING.

Guarantee.

All products are guaranteed free from defects of material or workmanship and to give satisfaction with proper usage, where adaptability to work to be performed is considered in their selection.

Leather Belting.

CROWN—Belting of first quality made from large hides of carefully selected No. 1 leather, tanned with oak bark by slow process. Mineral tanned or rawhide of same quality for special purposes. All belting short lapped, as stock is taken only from the firm portions of the hide without running into thin shoulder parts. This, besides enabling a short lap, also permits, substantially, uniform thickness of belt. Stretch thoroughly removed by two processes during currying and one after belts are made up. Comes in different weights or thickness for various purposes. Heavy, extra heavy, planer, (very heavy and can be had only in limited way), light and heavy double. Quality of all fully guaranteed.

TRADE-MARK
An indication of quality and
a means of identifying belt

TARPON—Belt is guaranteed not to come apart no matter how badly it may be wet. It is made from regular Crown stock, the leather is thoroughly waterproofed, and it is designed for moist or damp places or where a belt is liable at times to be actually submerged—as in wheel pits. For laundries, dyehouses, paper mills, and for localities of high climatic humidity, it is invaluable. It possesses all the durability and high pulling power of the best leather belts which so far exceed rubber and other textile belts, and is proof against water and moisture in those places where rubber belts used to be indispensable. As leather belts average nearly four times the length of life of rubber belts, the economy of a waterproof leather belt, even at a considerably advanced price over rubber, is manifest.

TRADE-MARK
An indication of quality and
a means of identifying belt

NEVERSLIP—Belting designed for small pulleys and high speed, or wherever a combination of great flexibility and strength is wanted. The belt is made by a special process owned by PAGE BELTING COMPANY, exclusively, and no other belt can combine with a minimum of stretch such adaptability for high speed on small pulleys and for loads which are often variable or heavy. For such conditions, where avoidance of slip is sought this belt is superior to all others.

TRADE-MARK
An indication of quality and
a means of identifying belt

Leather Fillet.

Made from uniform and flexible leather with sharp even edges and cut to form a true circle. Superior to wood.

LEATHER FILLET

NOTE—Upper row of figures shows, in inches, length of straight sides or short sides. Lower row of figures shows length of curved or long side. The curved side shown above is as it is on the pattern, but before fillet is applied to pattern this long side is the straight side and the 2 short sides are the curved sides

Leather Cups, Packings and Washers.

Made from oak or chrome leather. Designed for valves, pumps, joints, oil wells, etc., and for all pressures, hydraulic or pneumatic work, and work in oil, alcohol or glycerine. All kinds of special cut leathers of this nature readily furnished.

HYDRAULIC CUP

FLANGE PACKING

PUMP CUP

U-LEATHERS

Well moulded and accurate in size

Automobile Clutch Leathers.

OAK LEATHER CLUTCH LININGS—Made from a specially prepared oak tanned leather of the very choicest stock and in various thicknesses. For durability and—what is more important—for satisfactory work, they are unsurpassed. Made with square ends or with laps prepared on ends, or made endless with waterproof cement at the factory, as preferred.

CHROME OR MINERAL TANNED LEATHER CLUTCH LININGS—Made from chrome or mineral tanned leather and only recently put on the market. Have a faculty for gripping quickly and easily, and are made from the best part of steer's hide.

Belt Lacing.

Following brands in whole sides, or sides with belly cropped off, or in hand cut, free from holes, hacks or scratches, 100-ft. bunches.

HERCULES RAWHIDE LACING—Extremely strong and durable. Lacing of carefully selected stock.

CROWN TANNED LACING—Choicest of its kind in strength and quality.

Pulley Lagging.

Supplied cut to length and width out of different qualities of stock, to meet any requirements.

MONTREAL and TORONTO: MAIN BELTING COMPANY OF CANADA, LTD.

Products.

LEVIATHAN and ANACONDA BELTING for Power Transmission, Elevating and Conveying; MAIN TROUGHING ROLLERS, Adjustable and Fixed; MAIN FLAT CARRYING ROLLERS.

Special White Food Conveyor Belt; Duck Brand Liquid Dressing; Blaxtick Bar Dressing; Belt Fasteners.

Which Belt to Use and Where.

Neither Leviathan nor Anaconda takes precedence over the other in point of quality. Each belt is made to the highest standards in material and workmanship with the distinct purpose of meeting efficiently specific conditions. To enable the user readily to determine which belt is pre-eminently suited to the position the following is suggested.

LEVIATHAN—Should be used on main, counter and machine drives under all ordinary conditions in general industries such as railroad and machineshops, iron and steel mills, lumber and woodworking plants, brick, stone, slag, cement, sand, and general ore-reducing plants, cotton seed and peanut oil mills.

ANACONDA—Adapted to positions where severe conditions extraneous to the drive itself are encountered, such as:

TRADE-MARK

Water—Paper mills, dye houses, bleacheries, canneries, packing houses, tanneries, etc.

Machine Oil—Automatic machinery, leaky bearings, oil tempering shops, etc.

Hot Atmosphere—Hot air blowers, drying rooms, laundries, etc.

Corrosive Gases—Forge shops, foundries, pyrites roasters, spring manufacturing plants, etc.

Acid Fumes—Chemical plants, sheet mills, tin products and fertilizer plants, smelters, etc.

Steam—Canneries, dye houses, bleacheries, packing houses, laundries, etc.

Slippery Dust—Flour mills, gypsum and talc mills, bronze-powder plants, etc.

LEVIATHAN and ANACONDA in ELEVATING and CONVEYING—Leviathan is adapted to all normal industrial conditions. Anaconda is supplied in such special conditions as handling hot materials, materials of chemical content, grain and slippery dust.

How the Guarantee of the Main Belting Company Protects the User.

Leviathan-Anaconda belts are made in various ply of solid fabric impregnated with special compound; so treated, stretched and aged as to produce a strong, pliable belting, well high indestructible.

36" X 12 PLY BELT LEVIATHAN

One of the large number of Leviathans that have made good with one of the largest stone companies in this country

ANACONDA 20" X 6 PLY

This is an endless Anaconda, 20" x 6 ply, running more than a mile a minute, pulling a 10% overload. It has been running seven months, and has not stretched yet. There are two more just like it in the same powerhouse. One is two years old, the other just installed. As fast as leather belts come off these positions, Anaconda is replacing them

AN INSTALLATION OF THREE LEVIATHANS

A 360' x 8 ply Leviathan to crusher washer belt, 265' x 20" x 6 ply Leviathan to screens, Loading belt, 100' x 24" x 6 ply Leviathan to cars

The MAIN BELTING COMPANY's patented stretching and treating processes produce, in Leviathan and Anaconda, belts of far greater density than any other belts of their type. Because of this extreme density they are unaffected by changes in the humidity of the atmosphere. This density increases their resistance to wear in the same way that compressing an automobile brake lining by a hydraulic press increases its resistance to wear.

The pliability, tensile strength and co-efficient of friction are also enhanced by the treatment.

Excessive stretch, which is the prime fault of ordinary commercial belts, is positively removed by the MAIN BELTING COMPANY's exclusive processes. This is one of the reasons why we alone among the manufacturers of belting make a "Stretch Guarantee."

GUARANTEE AGAINST STRETCH—For every 1% a belt stretches after the first cut, the Main Belting Company will refund 3% of the purchase price. The first cut is excepted merely because it is generally recognized that it is more a matter of taking up slack than taking out stretch.

The guarantee will apply on every belt we recommend—and we do not recommend Leviathan or Anaconda for positions where they do not belong.

Main Belting Conveyor Rollers.

The Style "C" roller illustrated admits of instant adjustment to meet special conditions in any plant. Styles "A" and "E," while not adjustable, are perfectly finished and have the same high conveying qualities as the Style "C" roller.

The Style "C" Main adjustable troughing roller has the following points of advantage, some of which may be found in other equipment, but no other one roller contains them all.

(1) **MAXIMUM ANGLE OF TROUGH** Is 20°—The troughing pulleys are adjustable to 3 positions; 10°, 15° and 20° from horizontal. If the troughing pulleys are put in their lowest position, a belt of much heavier ply may be used than would ordinarily be possible.

Experience shows that the maximum angle at which a belt may be troughed without finally cracking is 20°, and it should be troughed only so much as is necessary to keep the material from spilling. This is why adjustability is so desirable.

The slight gain in the carrying capacity of a belt troughed at 35° over one troughed at 20° is obtained at the price of the premature destruction of the belt, and a belt which is troughed excessively also has a decided tendency to run off the rollers.

(2) **EDGES OF THE TROUGHING AND THE FLAT PULLEYS OVERLAP**—The troughing pulleys overlap the edges of the end pulleys on the center roll. The inside edge of the troughing pulley is considerably under the top line

of the center roll pulleys, and all possibility of the belt coming into contact with the edges of any of the pulleys is absolutely eliminated.

(3) **SELF-ADJUSTING BEARINGS**—The shaft of the flat roller is suspended in dustproof babbitted swivel bearings. The bearings are not rigidly fixed to their supports but are suspended in them and are free to adjust themselves to accommodate any warping of the stringers. Hence the possibility of the shaft binding in the bearings and ceasing to revolve is eliminated. A belt is worn excessively by pulleys which do not turn, as their rims are soon worn away, presenting holes whose knife-like edges cut the belt.

(4) **FLAT ROLL CARRIES THE LOAD**—Maximum support is given to the belt in the center, where the load is carried, by comparatively long central pulley or roll, investigation having conclusively proved that the highest efficiency is attained by having a large portion of the belt width running flat.

(5) **POSITIVE LUBRICATION AT EACH BEARING SURFACE**—Each bearing surface is provided with an individual compression grease cup effecting positive lubrication.

(6) **CORRECT MECHANICAL DETAILS**—Rollers are ample in every respect.

Rims of the troughing pulleys are reinforced, making it impossible for the rim to wear away and leave a sharp edge to cut the belt.

Shafting is $1\frac{3}{8}$ in. in diameter for all sizes.

Pulleys are 6 in. in diameter, with faces lathe-finished absolutely true with bore, making a true running smooth roll that will not wear the surface of the belt nor cause the belt to vibrate excessively.

Grease cups on troughing pulleys are placed well within pulley rim, thus protected from injury. Set screws are all of ample size and easily accessible.

Literature.

For information regarding power transmission problems, see our Book on Power Transmission.

STYLE "C" MAIN TROUGHING ROLLER; STYLE "R" MAIN RETURN ROLLER, ADJUSTABLE TO 10°, 15° AND 20° TROUGH

STYLE "A" MAIN TROUGHING ROLLERS; STYLE "S" MAIN RETURN ROLLER

With 15° trough for 12- to 14-in. belt; 15° or 20° trough for 16- to 18-in. belt; and 20° trough for 20- to 24-in. belts

STYLE "E" MAIN FLAT CARRYING ROLLER; STYLE "R" MAIN RETURN ROLLER

THE RUSSELL MANUFACTURING CO.

Heavy Woven Fabrics
MIDDLETOWN, CONN.

NEW YORK OFFICE, 349 Broadway
CHICAGO OFFICE, 1438 Michigan Avenue

DETROIT OFFICE, 226 Jefferson Avenue, East
ATLANTA OFFICE, 60 South Forsyth Street

Products.

SOLID WOVEN WHITE COTTON BELTING; WATER-PROOF CONVEYOR and TRANSMISSION BELTING; CONE CLUTCH FACINGS, MULTIPLE DISC CLUTCH FACINGS; ASBESTOS LINING for Crane and Heavy Machinery Brakes.

Rusco Asbestos Brake Lining.

Rusco brake lining is manufactured from a special selected long fiber, pure asbestos, solidly interwoven with fine brass wire. This gives Rusco an extraordinary strength and a superior friction surface. The close, uniform weave obtained by the specially constructed looms insures Rusco a solid body, superior in strength and wear resisting qualities.

Rusco brake lining is thoroughly impregnated with a special compound that insures it against the action of oil, water, grease, dirt, and heat, and yet leaves it soft, pliable, and responsive to every demand.

This material having demonstrated its value for automobile brakes is now being made in greater widths and thicknesses for heavy duty, and is giving satisfaction for crane and heavy machinery brakes. Made in any width and thickness required.

RUSCO ASBESTOS BRAKE LINING

Rusco Multiple Disc Clutch Facing.

Rusco multiple disc clutch facings are composed of long fiber asbestos yarn, solidly interwoven with brass wire, and treated with a special compound which produces the highest possible friction surface, and the maximum service in the finished facing. They are compressed to the correct dimensions, and are guaranteed not to vary more than 10/1000 in. in thickness.

Like all Rusco products these clutch facings are built for service.

RUSCO MULTIPLE DISC CLUTCH FACINGS

Rusco Waterproof Conveyor and Transmission Belting.

This belting is made of long fiber cotton, solidly interwoven and impregnated with a special compound which makes it proof against water, oil, and steam, and adds greatly to its wearing qualities.

There are no stitches in this belt to wear and

break, or plies to come apart. The belt is suitable for either conveyor or transmission purposes in industrial plants, and due to its waterproof qualities is particularly well adapted for all outdoor work. This belt is guaranteed to give satisfaction under any reasonable conditions.

RUSCO WATERPROOF BELTING

Russell Solid Woven White Cotton Belting.

Made in all widths and thicknesses of solidly interwoven cotton.

RUSSELL SOLID WOVEN WHITE COTTON BELTING

Rusco Cone Clutch Facing.

Rusco cone clutch facings satisfactorily solve the problem of heat resisting, efficient clutch lining.

Rusco clutch facing is a solidly woven fabric, absolutely uniform in thickness, and thoroughly impregnated with this company's special compound. It is tough and of sufficient elasticity to allow the clutch to easily engage and hold without slipping.

These facings can be furnished made of asbestos or cotton, as preferred. For dry cone clutches cotton facing is recommended. If run in oil the asbestos facing will give the most satisfactory service.

CRESCENT BELT FASTENER COMPANY

381 Fourth Avenue
NEW YORK, N. Y.

BRANCH OFFICES: BIRMINGHAM, ENG. and TORONTO, CAN.

Products.

CRESCENT BELT FASTENERS; CRESCENT PLATES; CRESCENT RIVETS.

Crescent Belt Fasteners.

Crescent Belt Fasteners save labor and time, conserve the strength of the belt, and lengthen its life.

They make good belts give better service.

OUTSIDE OF CRESCENT JOINT SHOWING CRESCENT PLATES AND CRESCENT RIVETS

Uses.

Crescent Belt Fasteners, consisting of Crescent Plates and Crescent Rivets, are used for joining transmission, elevating and conveying belting of every length, width, thickness and material.

Advantages.

Crescent Belt Fasteners sustain the belt's full strength and reinforce it at the joint. None of the belt material is cut away, punched out or weakened. None of the lengthwise power carrying fibers are severed.

A Crescent joint hugs the pulley snug and tight, and insures full, even, continuous transmission of power. This is because the curve of the Crescent Plates conforms the joint to the pulley.

The edges of Crescent Plates are beveled, which allows for the rock of the belt as it leaves the pulleys and affords the correct flexibility to prevent cracking the belt behind the joint.

A properly made Crescent joint never requires attention. There is no expense for supervision or maintenance. A Crescent joint is quickly and easily made with no other tools than a hammer.

Crescent Plates are attached singly or in multiple according to the size of the belt. The service chart on this page shows the sizes of Crescent Plates and Crescent Rivets which should be used to insure the best results for all different conditions of work.

Crescent Belt Fasteners are recommended and regularly installed by many prominent belt manufacturers as the strongest, safest, most durable and economical method for the joining of power transmitting, elevating, and conveying belting of every length, width and thickness. Their effectiveness can be demonstrated in any plant.

For information write to Service Department.

CRESCENT PLATES AND RIVETS FOR ALL KINDS OF BELTING LENGTHS, WIDTHS AND THICKNESSES

Light Work Pulleys 3 in. or larger Belting 3/4 in. to 4 in. wide	For 3/4 and 1 in. of belt width, No. 25 1 1/2 " " " " " 45 2 " " " " " 65 2 1/2 " " " " " 85 3 " " " " " 805	Crescent Short Grip Plate, \$2.88 per gross " " " " " 8.64 " " " " " " " 11.52 " " " " " " " 11.52 " "

" " 11/16 " " " " " 14	" " " " " " 1.10

Note—To determine the quantity of Crescent Rivets needed to attach a given quantity of Crescent Plates, multiply the number of gross of Crescent Plates ordered by the bold face figures of the size number of the Crescent Plate. Example: 3 gross No. 127 Crescent Plates—3x12=36 gross of Crescent Large Shank Rivets required.

High Speed Light Work Pulleys 2 in. or larger	For 3/4 and 1 in. of belt width, No. 20 1 " " " " " 40 1 1/4 " " " " " 44 2 " " " " " 60	Crescent High Speed Plate, \$2.88 per gross " " " " " 5.76 " " " " " " " 5.76 " " " " " " " 8.64 " "
--	---	---

For belting wider than 2 in. use two or more Crescent Plates of the same grip.

High Speed Light Work Pulleys 4 1/2 in. or larger	For 1 1/2 in. of belt width, No. 66 For belting wider than 3 in. use two or more Crescent Plates of this size.	Crescent High Speed Plate, \$8.64 per gross
--	---	---

For attaching all Crescent High Speed Plates use Crescent Small Shank Rivets as follows:

For belting 5/16 in. thick use size No. 5/16 Crescent Small Shank Rivets \$0.50 per gross									
	3/16					6			50
	4/16					7			55
	5/16					8			55
	6/16					9			60
	7/16					10			60

Note—To determine the quantity of Crescent Rivets needed to attach a given quantity of Crescent Plates, multiply the number of gross of Crescent Plates ordered by the bold face figures of the size number of the Crescent Plate. Example: 5 gross No. 44 Crescent Plates—5x4=20 gross of Crescent Small Shank Rivets required.

Extremely Heavy Work Large pulleys Belting up to 72 in. wide	For 3 in. of belt width, No. 1611 4 " " " " " 2211	Crescent Jumbo Plate, \$28.80 per gross 34 56 " "
--	---	--

For attaching Crescent Jumbo Plates use Crescent Jumbo Rivets as follows:

For belting	5/16 in. thick	use size No.	10/16 Crescent Jumbo Rivets	\$1.25 per gross
" "	6/16	" "	" "	" 1.40
" "	7/16	" "	" "	" 1.40
" "	8/16	" "	" "	" 1.55
" "	9/16	" "	" "	" 1.55
" "	10/16	" "	" "	" 1.70
" "	11/16	" "	" "	" 1.70
" "	13/16	" "	" "	" 1.85

Note—To determine the quantity of Crescent Rivets needed to attach a given quantity of Crescent Plates, multiply the number of gross of Crescent Plates ordered by the bold face figures of the size number of the Crescent Plate. Example: 8 gross No. 2211 Crescent Plates—8x22=176 gross of Crescent Jumbo Rivets required.

Crescent Rivet Extractor No. 79, \$1.00 each

Be sure to specify enough Crescent Rivets for attaching the Crescent Plates ordered.

An additional 50% of Crescent Rivets will provide for rejoining when shortening belt. It is well to order to have them handy. Every Crescent Plate and Crescent Rivet is marked with the registered trade-mark, "Crescent." Specify "Crescent Belt Fasteners" by name on all orders.

Products.

MORSE SILENT CHAINS and SPROCKETS for the transmission of power for every purpose.

General Description.

The use of special alloy steels with heat treatment and improved machinery combine to make the most durable and high grade finished drive on the market.

The Morse rocker joint silent chain drive is essentially a steel belt, made of flat links arranged to form teeth on one side of the chain which engage with teeth cut in the sprocket wheels over which it runs.

It is a gear belt, used in place of belting and gearing and is made in varying pitches from $\frac{3}{8}$ in. to 3 in. to transmit from $\frac{1}{4}$ to 5000 h.p.

It is in use today for over 3,100,000 h.p., giving positive speed ratios, on short centers, saving construction costs, power, oil and maintenance. The more severe the duty the more need of Morse silent chain, insuring positive, durable 99% efficient service.

MORSE ROCKER JOINT SILENT CHAIN

Design of the Morse Rocker Joint.

The principal difference between the Morse silent chain and all others is in that unseen and all-important part, the joint. The Morse is constructed with this fact in view—the joint bears the burden of service in any chain. Instead of a single pin, as in other joints, two special pins, each held in its respective half, form the joint. No bushing is required.

When the chain is pulled out straight, between sprockets, the flat of seat pin bears against one of the flat faces of rocker pin. As the chain bends in circling each sprocket, the curved side of one pin rolls or rocks against the broad, flat side of the other, eliminating destructive grinding friction entirely.

DETAIL OF MORSE ROCKER JOINT

Speed and Service.

This exclusive "rocker joint" construction enables the Morse to run at a speed far in excess of other chains

because lubricant is not essential to its operation; and after years of service (in nearly every line of industry) it is accepted as the most durable chain on the market.

Material Parts.

"Morse drives" have great mechanical strength and are made with a large factor of safety assuring 100% overloads. They are simple, need little attention, and consist of driving and driven sprockets (solid or split, bored and keyed) and silent chain belt, and are all ready for installing at once. Driven sprockets are usually of cast iron. Driving sprockets of cast iron or steel as service requires.

200 H.P. COMPRESSOR DRIVE, 9TH STREET TERMINAL WAREHOUSE, N. Y. C. LINES, CLEVELAND, OHIO

Advantages.

Morse is accepted as the drive that is positive as gears, flexible as a belt; unaffected by heat, cold, moisture or oil; durable, and gives long life, and is especially desirable for service, in chemical and metallurgical works and in textile, lumber and rubber mills, where dust, gases, acid fumes and steam ruin leather belting.

The satisfactory service and efficiency and world-wide demand and use in the most severe duty of chemical works, smelters, mines, and mills is the evidence of their success.

MORSE SILENT CHAIN DRIVING LARGE LATHE AT WATERTOWN ARSENAL

Morse Engineering Service.

Upon receipt of a general layout, Morse engineers will design the drive to suit special requirements. Engineering service and designs are at the free disposal of clients. Address nearest office for free bulletins applying to every industry.

Products.

CHAMPION ELECTRIC TRAVELING CRANES for all classes of service.

Description.

Champion cranes have been designed to meet every possible requirement in the crane field. Simplicity, accessibility and perfect interchangeability of parts are the predominant features. Even the most severe requirements, usually called for by steel mill crane specifications, are fulfilled, and, at the same time, a machine of high efficiency is produced.

TROLLEY—The side frames consist of two heavy castings connected by a wide, heavy steel girt or separator. This separator, carrying only the hoisting motor and motor electric brake, is fastened to the side frames so as to relieve the bolts of all shearing strains. The component parts are made stiff enough to withstand the heavy shocks and severe strains put upon them by this class of service.

To facilitate occasional repairs and to insure perfect alignment, all fastenings throughout are effected by through bolts with U. S. standard nuts. Bearings are provided with caps fitted with split bronze bushings. All shafts, of forged steel, are located in a horizontal plane and each shaft, with its pinions and gears or hoisting drum, can be lifted individually. Bearings have been proportioned so that they produce comparatively low bearing pressures.

CHAMPION DOUBLE HOOK TROLLEY

The trolley track wheels are of heavy pattern and furnished either of cast iron with chilled ground treads as standard, cast steel or any other alloy cast steel. They are keyed to the axles, revolving in M.C.B. pattern phosphor bronze bearings.

The cable drum, keyed to the drum shaft, is grooved from a solid casting and provided with large guarding

TRADE-MARK

flanges. The grooves are large enough to entirely bury the cable.

The lower block is of the side plate design, the hook forged of steel of special specification and wrought by special process. It swivels on bearings equipped with nickel chrome steel balls.

SIDE AND FRONT VIEWS OF COMPLETE CHAMPION TROLLEY

HOISTING ELEMENTS—All gears in the machine are steel with cut teeth. All pinions are cut from steel forgings. Gears have been designed with wide face and substantial arms, so as to stand overloads caused by sudden starting, stopping and reversing the motor.

A safety lug is provided at each end of the trolley frame 1 in. above the rail, to prevent excessive drop in case of breakage. By placing a wedge under the rail and running the lug against it the weight will be taken on the wedge for ease in removing track wheels.

A differential, flexible band has been adopted, which speedily grips the brake wheel or case when lowering. The advantage of this type is that it applies itself without undue shock, making the operation certain, smooth and noiseless.

BRIDGE—The Champion standard crane bridge, on which the trolley operates, is composed of two box section steel girders mounted and carried on end trucks of cast steel or structural steel with cast steel end brackets.

Gusset plates arrest the tendency of the crane structure to get out of square owing to defects in crane runway, to sudden stopping and starting when the load is close to one end of the crane, or to similar causes.

The bridge motor in a horizontal position is located near the center of the span and attached to the front girder.

The end lengths of the shafts on which the truck pinions are geared are made very short, so that when it becomes necessary to remove the end section in order to replace the pinion, only the short section need be removed. This avoids disturbing the balance of the cross shafting.

A powerful foot brake is provided for stopping the crane on the runway at any point without reversing the bridge motor. The brake wheel is large in diameter and provided with a band lined with asbestos friction material. The brake wheel is located on the bridge motor extension, and operated from the crane operator's cage.

OUTDOOR CHAMPION CRANE INSTALLATION

PLATFORM—The platform, extending from one end of the girders to the other, is provided with a toe-board at least 4 in. high. The platform extends from the outer toe-board angle clear to the web of the girders, so that no machinery parts or tools can fall through any openings to the ground. The bridge motor is mounted in a horizontal position, on heavy structural steel brackets. This design permits adjustments and perfect accessibility to all the motor parts. The motor armature can be moved with facility and landed on the platform. When required, in the case of cranes for heavy steel mill type, the platform will be entirely of steel. In all cases, on commercial or mill type cranes, the platform is provided with a top rail 42 in. from the floor and an intermediate rail 21 in. below this. The vertical posts are located at frequent intervals.

Adaptability.

They can receive any crane hoist motor and motor brake either A. C. or D. C.

LUBRICATION—The trolleys are so constructed as to be adapted to both grease and oil lubrication.

Safety.

To prevent excessive drop in the case of breakage, a safety lug is provided at each end of the trolley. Excessive deflection (due to overload) can not be communicated to the trolley frames by means of the loose load girt, thus precluding the possibility of binding the machinery. The hoist mechanism is provided with an automatic switch, limiting the upper travel of the hook to prevent the damage in case of over hoisting or double

CHAMPION SAFETY LIMIT STOP

blocking. The device or limit contact is actuated by the hook block itself arriving at the predetermined limit. The magnetic switch is normally closed and held in a closed position at the switchboard on the operator's cage. It is opened whenever the circuit is interrupted.

In other words the safety hoist limit operates by "breaking" and not making a circuit. The latter method can not be done with certainty. The trolley is also designed to receive any other form of limit contact in the market. Ready attachment can be made of all standardized safety devices such as truck wheel guards, bumpers, safety pans and also of side platforms to the sides and ends of trolleys for the purpose of securing more perfect accessibility.

Wiring.

All Champion cranes are wired in accordance with the National Board of Fire Underwriters' rules. All wiring is done in flexible steel or rigid conduit with condulets.

Bulletins.

Bulletins describing and illustrating the advantages and superiority of Champion cranes will be sent on request.

CHESAPEAKE IRON WORKS

Traveling Cranes and Steel Structures

BALTIMORE, MD.

Products.

ELECTRIC TRAVELING CRANES.
STEEL BUILDINGS and BRIDGES.
STRUCTURAL STEEL and ORNAMENTAL
IRON WORK.

TRADE-MARK

Chesapeake Electric Traveling Cranes.

They are the most rugged cranes built, and are designed along the most approved lines of modern crane construction.

The trolleys are of the simplest possible construction, and all working parts are extremely heavy, thereby assuring maximum life under the most adverse operating conditions.

Due to the extreme simplicity of design, all parts are accessible for inspection and repair. Each unit can be removed without disturbing any other unit.

TROLLEY—The trolley incorporates, in every respect, those features which make for durability, and incorporates in the simplest manner these essential details:

A rigid "H" frame carries all mechanism, and does not rely on any part of the mechanism for rigidity.

All gears and shafts are extremely heavy. All bearings are bronze bushed.

Gear covers or guards protect all gears.

GIRDERS—The girders, of various types to suit span and other conditions, are of the most efficient design, to counteract the abuse of the most reckless operator.

The bridge drive is of the heavy type, having the driving motor located near the center of the span.

A platform, with angle toe guards and double bar hand rail, extends the entire length of the bridge drive girder.

"SAFETY FIRST" FEATURES—The "safety first" features include many details which are furnished regularly only on Chesapeake cranes.

Switchboard, mounted in steel cabinet with steel door and lock, includes a double pole main switch, contactor, safety plug and independent overload relays for each direct current motor.

Limit switch, which prevents overhoisting, is operated by hook block in conjunction with no-voltage contactor on switchboard, with re-set push button in front of operator.

All gears are enclosed or suitably protected.

Bumper blocks on bridge ends.

Rail sweeps on bridge ends.

Extreme accessibility to all parts for inspection and removal for repairs.

CHESAPEAKE ELECTRIC TRAVELING CRANES IN PLANT OF EASTERN ROLLING MILLS CO., BALTIMORE, MD.
Capacity of each, 25 tons, with 10-ton auxiliary hoist

ALTERNATING CURRENT TYPE TROLLEY—The alternating current type trolley is similar in every respect to the direct current trolley, excepting that the hoisting mechanism is equipped with a mechanical load brake as described.

ALTERNATING CURRENT TYPE TROLLEY

MECHANICAL LOAD BRAKE

DIRECT CURRENT TYPE TROLLEY—Built to meet the most exacting requirements of heavy duty crane service, being extremely heavy in all details, and most accessible in all parts. Lowering of load is controlled by a dynamic braking system and in addition a powerful electric brake is applied to the motor to hold load when current is off.

DIRECT CURRENT TYPE TROLLEY

ELECTRIC BRAKE—Of the iron clad solenoid band type, has holding power equally effective in either direction, in stopping empty hook when hoisting at high speed or in stopping and holding full load when lowering. Brake is always on when current is off and is entirely released when motor is running in either direction.

ELECTRIC BRAKE

MECHANICAL LOAD BRAKE—The Chesapeake load brake, which is of the multiple disk type, is positive in its action, and has ample capacity to sustain the full load, without the use of the electric brake, and will not

allow the load to run down, except when operated by the hoist motor, in the lowering direction.

The load brake, with its gears, is enclosed in an oilproof case, forming a complete self-contained unit. It is simple in design and extremely heavy in all details.

BOTTOM BLOCK—Consists of heavy structural steel housing, the side plates forming a guard for the sheaves

BOTTOM BLOCK

and hoisting rope. Cast iron sheaves machined to suit the hoisting rope are bronze bushed and revolve on a heavy steel shaft which is lubricated through grease receptacles.

Hook is of forged steel and revolves on high grade ball bearings.

Steel Structures.

Specialists in the design, fabrication and erection of steel structures, including office and shop buildings, highway bridges, etc.

A full line of angles, channels and I-beams are always carried in stock.

Inquiries.

Careful attention is paid to all inquiries. Submit structural steel and crane problems to our engineering departments, and a satisfactory solution is assured.

THE CLEVELAND CRANE & ENGINEERING CO.

MAIN OFFICE AND WORKS
WICKLIFFE, OHIO
(NEAR CLEVELAND, OHIO)

NEW YORK OFFICE, 50 Church Street

PITTSBURGH OFFICE, First National Bank Building

Products and Services.

ELECTRIC TRAVELING CRANES.

Hand Power Traveling Cranes; Special Gantry;
Ore and Coal Handling Machinery.

Cranes for different purposes designed and constructed on order.

Cleveland Cranes.

This company manufactures electric cranes in all capacities from 1 ton to 300 tons for either direct or alternating current, and for inside or outside service.

Hand power cranes are also manufactured in capacities from 1 ton to 50 tons.

For crane clearance dimensions see opposite column.

A general description may briefly include the following details of construction:

FACTOR OF SAFETY—At least 6, factor being larger according to conditions.

BRIDGE—Of double or single plate and angle, or a box girder, or a single I-beam or lattice truss type of girder, depending on span, capacity, speed, etc.

BRIDGE TRUCKS—Attached to girders with shoulder construction, which gives a large bearing surface for keeping crane in alignment.

BRIDGE GEARS—All gears and pinions have teeth cut from the solid.

CAB—Of ample size for all electric controlling mechanism, with floor space sufficient for complete operation.

TROLLEY—A casting of I section type, arranged to carry hoist and trolley traveling mechanism.

HOIST DRUM—Finished with right- and left-hand grooves, keeping load equally distributed on both girders.

TRACK WHEELS—For both bridge and trolley, are double flanged, rolled steel, cast iron with chilled tread or cast iron center with high carbon rolled steel tires shrunk on.

LOAD BRAKE—Double friction type, automatic running submerged in oil bath.

ELECTRIC BRAKE—Attached to hoisting motor, automatic, operated by a solenoid, and so connected as to apply instantly when current is interrupted.

FOOT BRAKE—A powerful bridge brake stops bridge when traveling in either direction.

CORNER VIEW STRUCTURAL STEEL M.C.B. END TRUCK

CRANE CAB

FULLY ENCLOSED 2-MOTOR TROLLEY

25 TON, 3 MOTOR HIGH SPEED SKULL CRACKER CRANE, 65 FT. LIFT, INLAND STEEL CO., INDIANA HARBOR, INDIANA
85 ft. 9 in. span

LIMIT SWITCH—Automatic, attached to each hoist, which breaks current when hook is raised above or descends below a predetermined point.

Ruggedness, simplicity and the recognized ideal method of operation are combined in this limit stop. When the limit of travel of bottom block is reached, it operates the limit stop direct and not in connection with something else. To lower, it is only necessary to reverse controller, automatically resetting limit stop. The construction is very simple, no gears, sprockets, traveling nuts, cams, or other moving parts are employed and consequently there is nothing to wear out.

Specific Data Required.

All inquiries for traveling cranes should give the following particulars:

(1) Load: maximum load in net tons to be lifted.

(2) Speed: if special speed for any function is preferred.

(3) Style: type of crane desired.

(4) Clearance dimensions as follows (see illustration):

A—span; B—end clearance; C—distance from top of runway rail to floor; F—overhead clearance; E and D—if there are roof braces interfering with end travel of trolley.

Upon receipt of above information, quotations will be promptly submitted.

Co-operative Service.

In case the styles of cranes shown here do not meet the requirements, the engineering department of this company will gladly submit individual prints and specifications on request.

Products.

NILES ELECTRIC TRAVELING CRANES, TROLLEYS and HOISTS; GRAB BUCKET TROLLEYS and CRANES.

Hand Cranes, Gantry Cranes, Jib Cranes, Wall Cranes; Machine Tools and Steam Hammers.

Electric Traveling Cranes.

The Niles cranes are built to operate continuously, and approved safety devices are incorporated in their design. All parts are accessible for examination or removal, and delays for repairs are reduced to a minimum.

The cage is built of heavy angles and plates and thoroughly braced to eliminate vibration and distortion. It is connected with a platform extending entirely across the crane, affording easy access to the bridge motor, gears and bearings.

The controllers, located in the cage, give perfect regulation and are equipped with liberal wearing parts, ventilated contacts, carbon brushes, powerful magnetic blow-outs—all accessible from the front.

The mechanical load brake is of the double disk type, automatic in action and self-contained; it will not chatter under any condition of service and will not permit the load to run down unless the motor is revolved by power in the lowering direction. The electric brake is of the ironclad solenoid type—safe, powerful and accessible.

The Niles dynamic braking system can be supplied when desired, eliminating the mechanical load brake

and its friction, and at the same time insuring perfect regulation, safety and absolute control of the board.

Bridge girders are made either of box section or I-beam with auxiliary braces, depending upon the capacity and the span. Both types have great lateral rigidity. Standard box section girders are built up of two web plates, four heavy angles and universal mill top and bottom cover plates. I-beam bridge girders are of heavy I-beam section with specially wide flanges.

Standard Crane Trolley.

Framing consists of two double web sides connected by a built-up all-steel girt. Hoisting drum is finished all over and grooves cut right and left hand so as to always lift the load vertically, without twisting. All gears are enclosed in cast iron or steel cases, or carefully guarded.

STANDARD CRANE TROLLEY
With independent auxiliary hoist

STANDARD GRAB BUCKET CRANE TROLLEY

Designed for operation with a 2-rope grab bucket, one rope being attached to the bail of the bucket and the other to the closing mechanism. The entire trolley frame forms a rigid self-contained construction on which the hoisting mechanism is mounted

Directions for Inquiries.

When sending inquiries for cranes, the class of service for which they are to be used should be stated: whether for machinshop, boiler shop, foundry, stone-yard, power plant or whatever the case may be. If crane is for outdoor use, enclosed cage, if desired, should be mentioned. In addition to the above, we should have the following data, in order to properly make up a quotation:

(a) Capacity of crane in tons of 2000 lbs. (b) Span from center to center of runway rails. (c) Either the distance from top of runway rails to ground, or the maximum lift desired.

(d) Distance from top of runway rails to lowest point of roof truss or other obstruction. (e) Distance from center of runway rails to side walls of building. (f) Capacity of auxiliary hoist, if one is required. (g) Voltage and type of current. (If alternating current is to be used, advise number of cycles and the phase.) (h, i, j, k) If building contains wind braces. (l) Size of runway rail.

TRAVELLING CRANES and HOISTS.
For Excavating Machinery, see page 46.

Type "H" Cranes.

In designing the new type "H" crane particular attention has been paid to the installation of proper safeguards for protection of machinery as well as workmen.

Rugged construction, and entirely enclosed gears, none of which are overhung, and the most approved design of all wearing parts, are among the most important points. The following list of important features will give a clear idea of just how the type "H" crane differs from practically all other cranes.

Important Features.

- (1) Accessibility of all parts.
- (2) Each shaft lifting out independently.
- (3) Durability obtained by liberal design.
- (4) No overhung gears or pinions.
- (5) All gears of cast steel.
- (6) All pinions of forged steel.
- (7) All trolley bearings bronze bushed.
- (8) M.C.B. type bearing on both trolley and bridge.
- (9) Through bolts used throughout.
- (10) All gears running submerged in grease and enclosed in oiltight cases, thus insuring constant lubrication, except bridge truck gears which are provided with guards only.
- (11) Drum and running sheaves are not less than thirty times diameter of rope.
- (12) Dynamic braking for direct current cranes.
- (13) Motor and bridge brakes of heavy clamshell type.
- (14) Trolley sides and bridge trucks of box section.

Bridge End Trucks.

Built from structural steel of a box section, at each end is a single casting riveted to both webs which carries the axle bearings, also the end bearings for the cross shaft. Machined lugs on the truck castings against the structural end trucks relieve the rivets almost entirely of vertical shear.

Truck bearings consist of heavy flanged bronze bearings of semi-octagon shape held in place by oil waste boxes of ample size to insure perfect lubrication at all times.

Truck gear is keyed to axle and is located between main bearings. Pinion is located on cross

TYPE "H" CRANE, 15-TON HOIST, 3-TON AUXILIARY, SPAN 47 FT. 10 INS.

American Tool Works, Cincinnati, Ohio

shaft between two bearings, caps of which are joined by a housing which encloses the pinion. Extension of truck gear outside of truck is enclosed in a sheet steel casing.

Bridge Motor.

Located near center of bridge and is attached to either web, or bolted to a structural bracket. Bridge brake is of clamshell type with removable asbestos lined shoe, mounted on armature shaft, and is operated through tension rods by a foot lever in operator's cage.

Motor gears are enclosed in oiltight casing which excludes dust and grit.

Trolley.

This modern enclosed type of trolley was designed to meet the most exacting requirements of crane service, and it is of rugged construction, approved design and very accessible.

TROLLEY DRIVE WITH GEAR CASE OPEN TO SHOW POSITION OF GEARS

TYPE "H" CRANE COMPLETE

Built in sizes ranging from 5 to 75 tons.

All gears are enclosed in oiltight cast iron cases which exclude dust and grit and enable gears to operate

TYPE "H" MILL TROLLEY, 75-TON CAPACITY WITH 15-TON AUXILIARY

Used by The Bethlehem Steel Company

in lubricant bath of oil or soft grease. All cases are provided with large covers that can be easily and quickly removed.

DRUM—Hoisting drum is of cast iron, drum and sheaves are not less than thirty times the diameter of rope, and are of sufficient size to take full run of ropes for specified lift without overlapping.

All shafting is of steel turned and ground at bearings, with forced fit wherever gears, truck wheels, etc., are placed. Each shaft is accessible, lifting out separately with gears mounted on them.

BEARINGS—All bearings are of phosphor bronze, those for the truck axles are flanged semioctagon type and held in place with oil waste boxes of sufficient size to secure ample lubrication.

All other caps are of cast iron, machined to fit between planed lugs on frame. They are supplied with compression grease caps.

BRAKES—Both main and auxiliary hoists are provided with powerful automatic electric brake of clamshell type. In addition to this, dynamic braking is furnished on all direct current cranes, or if alternating current a mechanical load is supplied.

Load brake is of disc type with automatic retaining band; it is located on the trolley side between two bearings which are integral with trolley side.

Motors.

DIRECT CURRENT MOTORS—Designed electrically and mechanically for these cranes only. Have large starting torque, and speeds are lower than those of other crane motors, so that a minimum of time is lost in starting and stopping. Rated on basis of 40° C. rise in 30 minutes, and will withstand 100% overload without undue heating or sparking.

ALTERNATING CURRENT MOTORS—Standard slip ring type, of same excellent design as direct current motors and rated on same temperature basis.

Squirrel cage type of motor is not recommended as speed control is unsatisfactory.

CONTROLLERS—Each motor has its own reversible controller of drum type. This type has proved superior to face plate type.

Limit Switch.

Each hoisting mechanism is provided with a limit switch which interrupts current if bottom block is raised too high. Limit switch is operated directly by the bottom block, and therefore is positive and reliable in action.

Switchboard.

A neat substantial switchboard is mounted in rear of the operator's cage. It consists of slate panels, mounted on an angle iron frame and contains a fused knife switch and fuses for the individual motor circuits.

DRUM TYPE CONTROLLER WITH CRANK

Dynamic Braking.

On direct current cranes dynamic braking has been adopted as standard, the load brake being omitted and the motor being provided with a large capacity clamshell brake fully ample to sustain full load with safety. This system of dynamic braking will therefore give reliable speed control, offer a high degree of safety and eliminate completely all load brake difficulties.

Tests.

Every motor and controller is subjected to a rigid factory test, comprising speed torque, temperature, insulation and high voltage tests, as recommended by the Institute of Electrical Engineers. After crane is completely assembled and wired up it is tested once more, and speeds of different motions are ascertained to insure its coming up to specifications in every respect.

Ordering Information.

The following data will greatly facilitate the work of our engineers in submitting complete specification:

Capacities (in tons of 2000 lbs.): main hoist; auxiliary hoist; auxiliary trolley.

Number of and movements to be operated by electric motors, and what movements to be operated by hand power.

Span, center to center of runway rails.

Weight of runway rails per yard and method of fastening to girders.

Maximum lift from floor line to hook in highest position.

Distance from top of runway rails to lowest point of roof truss.

Distance from center of runway rail to wall or face of column. Dimensions of wind braces if any. Distance from floor line to top of runway rail.

Distance from floor line to top of any obstruction which might interfere with bottom of cage or crane.

Service indoors or out. Intermittent (powerhouse). Moderate (machineshop, foundry, erecting shop). Heavy (steel foundry, mill, magnet, ladle).

Control from cage, floor or pulpit.

Cage located at end of bridge, center of bridge or trolley.

Direct or alternating current. Voltage or cycles and phases.

If magnet is to be used give size and character of material to be handled.

If two or more points of lift are desired, distance center to center should be given, and whether at right angles or parallel with crane bridge.

Gantry crane: single or double leg; single or double cantilever. Distance from top of runway rail to lowest point of bridge. If cantilever type, give distance of center of hook beyond center of runway rail at each end.

ELECTRIC CRANES and HOISTS for every lifting service; DOUBLE MONORAIL TRACK; TROLLEYS; ELECTRIC BACK GEARED WINCHES; CARGO HANDLING WINCHES.

Co-operative Service.

The variety of the Shepard line permits the selection of efficient apparatus specialized to particular needs. This company will be glad to plan, design and help in any way to determine where real savings can be made.

Electric Cranes.

During the 16 years of crane building, no fundamental changes have been made in the original Shepard design which has proved so satisfactory.

This design, when introduced, was entirely unique in its provision for complete dirt exclusion, thorough automatic lubrication and permanence of alignment, secured by locating steel gearing and multiple disc type brakes within cylindrical frames, completely protected, and protecting operators and workmen.

The Shepard line specializes on fully developed cranes of the highest quality in capacities of from 1 to 30 tons. The 1-ton capacity is as complete in

TRADE-MARK

FORM 9 OR DOUBLE HOOK CRANE

Peculiarly fitted to handle tubing, rods and bars in tube mills, rolling mills and pickling departments

SHEPARD ELECTRIC TRAVELING CRANE

Equipped with two Form 6 crane trolleys operating independently; prove flexible and efficient for loading, unloading and storing structural steel

SINGLE I-BEAM WITH FORM 1X HOIST

Shepard single I-beam cranes with latticed outrigger construction combine double girder rigidity with single I-beam lightness. Widely used over foundry and machinshop side floors for capacities of 1 to 5 tons, and for medium and short spans

STANDARD TYPE CRANE TROLLEY

Provides bath lubrication, complete dirt exclusion, and permanent alignment for gearing brakes and motor

3-MOTOR PLATFORM CONTROLLED JIB CRANE WITH FORM 8 HOIST

Provides efficient service under conditions illustrated; assures continuous service irrespective of weather

JIB CRANE WITH FORM 1X HOIST

Front braced type, affords maximum lift with given height of mast. Used to good advantage in locations where traveling cranes can not be employed

every detail as any heavier crane; groups of small units can be handled as profitably as heavy single units.

STYLES—Standard 3-motor cage controlled and double hook traveling cranes; grab bucket, single I-beam, jib, bracket and transfer cranes, and a variety of special types.

FORM 19 HOIST

This type of hoist has two hooks which operate independently. Illustration shows hoist carrying a box of hides, and a section of the runway including a switch and spur track

TOP BRACED BRACKET CRANE WITH FORM 1 HOIST

Provides simple, efficient apparatus for many foundry and machinshop locations and ably assists main crane. For transferring work from one to another, and for jobs which tie up a crane for long periods, this is a most profitable piece of apparatus

GRAB BUCKET MONORAIL HOIST, FORM 19-13

FORM 24 CAGE CONTROLLED HOIST

This type of hoist is adapted to general material handling where heavy monorail service is required. Furnished also with two hooks making it adaptable for handling long flexible loads

FORM 24 HOIST OPERATING ON TRANSFER CRANE

Form 24 hoist used in conjunction with a Shepard transfer crane. This combination is wide in its range of operation and may be worked out to touch any point in or out of the plant

TWO FORM 19-13 MONORAIL HOISTS OPERATING ON TRANSFER CRANES

This type of hoist provides a flexible efficient and labor saving means of unloading, storing and carrying coal into powerhouses

Electric Hoists.

To meet the various handling requirements of more than 70 industries, many types and capacities have been developed during the past 16 years, including 1- and 2-motor floor controlled hoists, and 2-, 3- and 4-motor cage controlled hoists, ranging in capacities from ½ to 10 tons.

Hoists for stationary service, and for electrifying the hoist motion of hand cranes, are built in capacities up to 20 tons.

Thorough automatic lubrication, dirt exclusion, and permanence of alignment, all so necessary in hoisting apparatus, are provided.

The compact construction of Shepard apparatus permits the use of crane gearing and brakes in electric hoists, and back geared motors, providing a great variety of types and wide interchangeability with a minimum number of parts.

Under average conditions, it costs approximately 26¢ per working day to operate a 1-ton hoist.

FORM 23 HOIST WITH GEARED TROLLEY

A special combination of hoisting unit, controller and trolley, which permits maximum lift; cuts in half normal distance from hook in its highest position, to runway beam

Electric Cargo Winches.

The electric cargo winch is a recent development for use on ships and piers. Because of its closed-in

ELECTRIC CARGO WINCH

construction, it is especially desirable for this purpose, and no further waterproofing is necessary. The mechanical features of the Shepard hoist are embodied in this winch which is equipped with the Shepard mechanical load brake.

As shown in the illustration, the pier winches are mounted on wheels so as to make them portable.

These winches can be furnished for both alternating and direct current.

Dimensions and complete information will be furnished on request.

Electric Back Geared Winch.

A compact weatherproof winch, with running parts completely enclosed. Its uses are manifold in and about industrial plants.

Shepard Double Monorail Track.

T-rails may be provided for the hoist to run upon, thus giving a hard steel wearing surface, rather than the soft steel, the kind from which I-beams are made.

The track is attached to the I-beams by means of bolts and spreader castings, which make it unnecessary to drill the beam for the reception of this track. It also permits of using larger area bearings in the trolley wheels, thus insuring greater durability and longer life.

SHEPARD DOUBLE MONORAIL TRACK

ERIE STEEL CONSTRUCTION COMPANY

Manufacturers of Traveling Cranes and Steel Structures

ERIE, PA.

Products.

ERIE ELECTRIC TRAVELING CRANES.

Also Steel Structures of all Descriptions.

Erie Cranes.

A satisfactory crane must be smooth in action and capable of accurate control, designed to facilitate inspection, lubrication and the renewal of worn parts, and liberally proportioned to eliminate unusual stresses and deep deflections and bearing pressures within moderate limits. These considerations govern the design of Erie cranes and skilled workmen build them from carefully selected materials. Erie cranes are simple in operation, accessible for maintenance and durable under most severe service.

All gears are of cast steel and pinions of forged steel, with teeth cut from the solid stock. All gearing, except bridge wheel gears, runs in an oil bath, and is completely enclosed in a dustproof case. The gear covers are provided with easily opened inspection covers, which encourage frequent attention and oiling. All bushings are of high grade bronze. Through bolts are used for all connections and gear covers and bearing caps can be quickly removed. Any shaft, with its gears, can be moved without disturbing any other shaft.

TROLLEY—Of the entirely enclosed type, with gear cases cast integral with the frame. Frames are tied together by structural cross girt of heavy section, and such depth that the alignment does not depend on the shafting. Wheels are of chilled cast iron, ground to a uniform circumference. Drums and sheaves are thirty times the rope diameter, with deep machined grooves to receive the extra flexible plough steel cable. The axle boxes are of the MCB type, with oil waste pockets, and bronze boxes held by double flanges, affording easy means of shimming down to compensate for wear.

Dynamic braking lowering is recommended with direct current motors, because of the improved regulation and control, and the elimination of wear. The mechanical brake used with alternating current motors is of the multiple disk type, and runs in oil, enclosed in one of the gear cases. All hoist motors are equipped with full torque brake. Lower block is of plate construction, with a forged cross bar and hook, swiveling on ball bearings.

BRIDGE—Up to 15-ton cranes of 60-ft. span, a plate and channel box section, rigidly diaphragmed at short

intervals, is standard. The girders are fastened to the end trucks by notched construction. Alignment is preserved by heavy gusset plates connecting the two, fitted through bolts being used in both cases. End trucks are of beam or channel girders, heavily diaphragmed, with plates top and bottom. Wheels are of cast steel, with bronze bushings turning on fixed pins.

ERIE CRANE TROLLEY

BRIDGE DRIVE—The motor is located on horizontal bracket attached at center of one girder. There is one reduction of gearing to the cross shaft, which runs in split bronze bearings carried on horizontal brackets. The driving pinions mesh with gears pressed directly on the hubs of drive wheels. A foot brake operated from the cab acts on a wheel on the armature shaft to control the bridge movement. A platform, with standard hand rail and toe board, extends the full length of the bridge on the drive side. Beneath this is the operator's cab, rigidly braced to prevent vibration.

ELECTRICAL EQUIPMENT—Erie cranes can be equipped with any standard make of crane motor and control equipment. A large stock of direct current motors, controllers, solenoid brakes and limit switches is carried. The switchboard may be furnished with knife switch, fuses and pilot light; or overload relays may be substituted for fuses. Wiring throughout is in conduit. Bridge conductors may be of copper wire, or of soft steel angles or bars. The collectors are of an improved type, preventing arcing, and of low resistance.

INSTALLATION OF AN ERIE CRANE

LANE MANUFACTURING COMPANY

Electric Cranes
MONTPELIER, VT.

Products.

ELECTRIC TRAVELING CRANES.

Also manufacturers of Stone Working Machinery including Radial Polishing Machines, Boom Derricks and equipment for the finishing of granite and other stone.

Wood Working Machinery including Saw Mills, Edgers, Planers, Automatic Novelty Turning Lathes, Universal Saw Benches, Lath, Shingle and Clapboard Machinery, etc.

Distinctive Features of Lane Electric Traveling Cranes.

A notable distinguishing feature of these cranes is the employment of two motors for the three movements. Both motors are the constant speed, non-reversing type which eliminates the use of controllers and complex wiring. Control of all movements, including that of direction by means of a series of friction cones, is mechanical.

LANE ELECTRIC CRANE FOR LONG SPANS, BRIDGE OF STEEL GIRDER, LATTICE BOX TYPE

Other commendable features inherent in Lane electric traveling cranes are the capacity for large overloads and the unhampered control of all movements by the operator. Seated comfortably on the trolley, he always has a clear view over the hook as well as of all the other points below the crane.

Construction and Operation.

Originally, Lane cranes were furnished with timber bridge girders, stayed with steel truss rods fastened to cast iron bridge trucks and having a safety factor of about 7. This construction has the advantage of being exceptionally light for a given capacity. Where desired, we still furnish timber bridge girders of long leaf yellow pine reinforced to give strength and rigidity. The two other types of bridges for Lane cranes are (1) Rolled steel I-beams reinforced with inverted channels riveted to the top flanges when necessary, adapted for short spans. (2) Steel girders of the lattice box section type especially designed for long spans.

MECHANISM OF LANE ELECTRIC CRANE
Showing accessibility and ease of operation

LANE ELECTRIC CRANE FOR SHORT SPACES, ROLLED STEEL I-BEAM BRIDGE

Bridge girders are supported by cast iron end trucks provided with cast iron double flange chilled wheels which have steel axles running in renewable bearings. The trolley is cast iron, designed for rigidity, compactness, accessibility of all parts and is amply reinforced with steel tension rods. The sides are securely joined together by several large steel shafts.

Power for hoist and trolley movements is transmitted by friction cones through steel worms engaging bronze gears running in oil. Worm gear drive is a simple and effective load brake being controlled by convenient hand wheel. Two speeds of the hook are furnished with one part of rope. A luff block is provided with a hook and hinged house sheave so that by running the line through this sheave and attaching the single rope hook to a girt on the underside of the trolley a two-part reaving of the rope is effected, thereby dividing the first two speeds by two and doubling the power, supplying four hoist speeds.

Through the same power cones, the hoist motor operates the trolley motion on the bridge at approximately 100 ft. per minute. The reverse is obtained in the same manner as with the hoist movement. The movements are controlled by hand wheels. There is no complicated wiring system, no large controllers and no hot resistance. Therefore no ability to handle delicate electrical apparatus is required of the operator.

Bridge motor drives a friction disk by transmission through a pair of opposed cones, alternately contacting therewith. Control of bridge travel movement in either direction is effected by shifting the cones by means of a lever connected to a rod running the full length of the bridge convenient to operator's left hand.

Floor control can be furnished at extra cost.

CAPACITY, DIMENSIONS AND SPEED OF LANE ELECTRIC TRAVELING CRANES

Capacity of crane in tons	5	10	20	40
Speed, feet per minute:				
1st hoist full load	10	5	4	3
2nd hoist half load	20	10	8	6
3rd hoist quarter load	40	20	16	12
4th hoist no load	80	40	32	24
Bridge travel full load	250	200	180	170
Trolley travel full load	125	100	100	100
Horsepower of each motor	10	10	15	20
Actual height over all from top of runway rail	5'	5'	5'2"	5'8"
Vertical distance from rail to bearing point of single line hook	even	even	even	6"
Ditto with luff block and double line	17"	17"	28"	38"
End projection of bridge beyond center of rail:				
At gear end	10'8"	10'8"	12'8"	14'8"
At opposite end	9'3"	9'3"	11'3"	13'3"
Gage of trolley, or, center to center bridge girders	4'7"	4'7"	5'3"	5'11"
Diameter "chilled" bridge and trolley truck wheels	15"	15"	16 1/2"	18"
Wheel base of bridge trucks	7'4"	7'4"	8'4"	9'2"

All wheels on bridges and trolleys grooved for 60 lb. A. S. C. E. standard rail. Speeds may be changed to meet requirements. Dimensions may be reduced by employing reversing motor bridge drive when required.

WHITING FOUNDRY EQUIPMENT CO.

Products.

CRANES for every service: Electric Traveling, Gantry, Handpower Traveling, Jib, Pillar and Bracket.

For Foundry Equipment, see pages 1150-51.

Types of Whiting Cranes.

ELECTRIC TRAVELING CRANES—From 1- to 250-ton capacity and for every class of service, inside and outside. Designs are based on over 35 years' engineering and manufacturing experience and cranes can be depended on for safe, reliable operation. Built for practically any span, alternating or direct current; cage or floor control. Trolley may be arranged for handling clamshell bucket or lifting magnet.

Main Features—No overhanging gears. All gears on trolley run in oil in dustproof cases. All gears of steel, cut teeth. Bearings on trolley all bronze bushed. Through bolts used throughout. Wiring in iron conduit. Dependable electric and mechanical brakes. Positive limit switch prevents overtravel of hook. Footwalk with hand rail full length of bridge. All wearing parts readily accessible. Substantial rigid construction throughout.

Data for Quotations—In requesting prices please give the following:

- (1) Capacity in net tons.
- (2) Class of service and whether inside or outside.
- (3) Kind of electric current available.
- (4) Clearance dimensions (refer to diagram

Products.

MONORAIL HOISTS, BUCKET HOISTS and MONORAIL SYSTEMS; ELECTRIC TRAVELING CRANES, Wall, Jib and Gantry.

Special hoisting equipment designed to suit unusual needs.

Advantages.

American electric hoists and cranes are built for the hardest service under the most severe conditions.

The hoisting unit is so constructed that it is readily adaptable to any standard monorail runway or crane, as well as an infinite variety of special mountings and crane combinations with capacities ranging from $\frac{1}{2}$ to 10 tons.

With a wide range of hoisting and traveling speeds there is an economical hoist and crane for every need.

Single I-beam Crane with Floor Control.

The end trucks are of semisteel or steel castings as may be required of I-beam section with U-shape ends, having a bearing on both sides of track wheel. Bearings are fitted with Hyatt rollers with caps so that they are easily removable, and the load is supported equally on the two bearings of each wheel.

Standard Monorail Hoist.

The totally enclosed construction renders the hoist especially adaptable to outside service or in places where the machine is exposed to acid fumes and dust. All gears and pinions are cut from solid bar stock or forgings, heat treated and hardened. Shafting is hardened

and ground at the bearings, which are equipped throughout with standard type Hyatt roller bearings, eliminating friction, and increasing the lift of the hoist many fold. The gear case is filled with transmission grease and provided with inspection covers. This hoist is furnished in 1- or 2-motor for floor operation or remote control, with an operator's cab attached.

3-Motor Bucket Hoist.

Consists of a structural framework with two 4-wheeled supporting trucks mounted at each end and arranged to swivel on ball bearings. The rear or driving truck is arranged to drive through all four wheels.

The hoisting mechanism consists of two standard hoisting units, base mounted on the top of the structural frame. One unit arranged for closing the bucket and the other for hoisting by means of 1 or 2 lines. Capacities, $\frac{3}{4}$ to 2 yds.

3-Motor Traveling Crane.

Equipped throughout with Hyatt bearings running on hardened and ground shafting and wheel axles. Machine totally enclosed, including motors, both A. C. and D. C.

2-MOTOR HOISTING TROLLEY USED ON 3-MOTOR TRAVELING CRANE

STANDARD MONORAIL HOIST

SINGLE I-BEAM CRANE WITH FLOOR CONTROL

3-MOTOR BUCKET HOIST

THE EUCLID CRANE & HOIST CO.

EUCLID, OHIO

Products.

ELECTRIC HOISTS; ELECTRIC MONORAIL TROLLEYS;
ELECTRIC TRAVELING CRANES.

Hand Power Traveling Cranes; Electric Wall and Jib Cranes.

Euclid Hoists.

Designed and built by men who have spent their lives in the study and manufacture of hoisting machinery. The result of their experience is shown in the simplicity, strength and durability of their output.

The use of Euclid electric hoists has become practically universal. Machine and structural shops, foundries, warehouses, railways and all sorts of industrial plants are installing these labor saving devices.

FRAME—A single casting, containing all the shaft bearings, insuring permanent alignment of the shafts, as there are no loose bearings bolted on.

GEARS—Large and substantial, all of steel with machine cut teeth. There are three reductions of gears, all being entirely enclosed with oil bath lubrication.

BEARINGS—Ample size to prevent heating or rapid wear under hardest service. Bushed with renewable phosphor bronze. All hoist shaft bearings are provided with compression grease cups.

BRAKE—Disc type, and so designed that no motor brake is required on the smaller sizes. Pawls or retaining band are not required as the center plate is stationary during hoisting and lowering movements. A patented arrangement of gear and cam plate causes motor gear to drive intermediate gearing direct with brake released while hoisting. No strain on brake. Intermediate pinion acting on cam automatically sets brake immediately, when hoisting movement ceases. The load brake is entirely enclosed and runs in an oil bath.

HOISTING DRUM—Heavy iron casting, machine cut grooves, of sufficient size to take all hoist cable without overwinding.

A LIMIT ATTACHMENT—Of the lever type, furnished on all floor control hoists. Acts on controller, returning to neutral position, or automatically reversing before hook block can run high enough to do any damage.

CONTROLLER—This is the drum type, which has proven most satisfactory for hoist work. Drum is mounted on a square shaft, furnished with renewable phosphor bronze bushings; one in each end of frame. Contact segments are exceptionally large and heavy and reversible; when one end is worn so as not to operate satisfactorily, the other end can be used. These segments are made from pure copper, thoroughly insulated, which eliminates short circuits or grounds.

Fingers consist of heavy rolled brass contact tips secured to flat spring steel strips. Fingers are of the non-stubbing type and are rigidly mounted on an asbestos wood base, giving thorough insulation from the frame.

All controller parts are jugged and interchangeable.

All direct current controllers have a powerful blow-out magnet to prevent injurious arcing when circuit is opened.

With variable speed controllers, resistance made up of individual coils in cartridge form, is furnished. A special high resistance non-corroding wire is used,

wound on heavy, hard asbestos tubes. No inflammable material used in either controller or rheostat.

ADVANTAGES—All Euclid hoist details are strictly interchangeable and are made from the highest grade materials by skilled workmen.

All parts of the machine are accessible.

Substantial *through* bolts in carefully reamed holes are used.

As all parts of standard hoists are carried in stock, shipments are made promptly.

QUOTATION DATA—When writing for quotations, give as complete information as is possible. The following data is essential:

Maximum load and usual working load. Current to be used; if direct, state the voltage; if alternating, the voltage, phase and cycles. Capacity, maximum height of lift. Size of I-beams comprising the monorail track. State whether there are curves, switches, or turntables in the monorail track. Whether single speed or variable speed control of the hoist motor is needed. Style of hoist wanted and service required of same.

Euclid Cranes.

This company also manufactures electric traveling cranes from $\frac{1}{2}$ to 15 tons capacity, in spans not exceeding 70 ft. This line comprises 1-, 2- and 3-motor cranes, single and double girder types and both floor and cab control.

High grade material, sturdy, rugged design, simplicity, accessibility and elimination of all complicated and unnecessary parts are features of Euclid cranes. Crane literature will be mailed on application.

Service and Guarantee.

The purchaser of a Euclid hoist has the assurance that he is buying the most modern type of hoisting equipment, backed by a sound, permanent organization that is in a position to render the service demanded by progressive manufacturers.

THE EUCLID CRANE & HOIST Co. agree to replace without charge f.o.b. their plant at Euclid, Ohio, any part of a Euclid hoist or crane that proves defective in material or workmanship within one year from date of putting machine in operation.

THE YALE & TOWNE MFG. CO.

Manufacturers of Hoisting Equipment, Locks and Hardware

NEW YORK, N. Y.

Products.

CHAIN BLOCKS; ELECTRIC HOISTS; BUILDERS' HARDWARE: PADLOCKS, NIGHT LATCHES, CABINET and TRUNK LOCKS, DOOR CLOSERS, BANK and SAFE LOCKS, POST OFFICE LOCK BOXES.

Yale Chain Blocks.

This company is the largest maker of chain blocks in the world. The line includes the Yale Spur-gear, Screw-gear and differential types, in sizes ranging from ¼ to 20 tons capacity. Absolute safety in operation and ease of handling due to the mechanically sound design, make the Yale Hoists superior. Every Yale Block must pass the final test of 50% overload in long tons before it is shipped.

CHAIN HOIST

Yale Electric Hoists.

In sizes of ½ to 5 tons capacity inclusive, Yale Electric Hoists give 5 to 10 times the speed of hand hoists at small cost. Made for all standard electrical specifications with wire rope suspension for especially heavy service.

ELECTRIC CHAIN HOIST

Yale Builders' Hardware.

Embraces every kind of a lock and nearly every article of hardware required for the equipment of buildings, from a cottage to the highest type of residence and office or public building work.

Yale Padlocks.

Include all grades from the highest to the lowest which are fit for use, in bronze, brass, steel and iron, including padlocks for every purpose.

The cheaper types have from 6 to 36 key changes; medium grades up to 144 changes; the highest grade upwards of 25,000 changes, the difference representing one of its greatest elements of security.

Yale Night Latches.

Embrace a variety to meet all conditions. For entrance doors as added security, or the sole lock on doors of outbuildings, construction houses, closets, etc. Made

in inexpensive
warded construction
with few key
changes up to

the cylinder type with practically unlimited changes, and with the deadlocking device as added security.

NIGHT LATCH

Yale Cabinet and Trunk Locks.

Include a grade and size adapted for every use and locks of special design on motor cars.

For desks, chests, cupboards, lockers, etc., where greatest security is desired, the pin-tumbler lock is to be preferred. The lever tumbler type offers satisfactory security against picking or accidental interchange of keys and is also largely used for similar purposes in cabinet work of all kinds.

CABINET LOCK

Yale Door Closers.

The best known and longest established in the world. The line includes overhead closers of all sizes, single and double acting floor hinges and screen door closers suitable to apply to either right- or left-hand doors without adjustment.

DOOR CLOSER

Yale Bank and Safe Locks.

The oldest makers of bank locks in America and the largest in the world. The line includes time locks, combination and dial locks, safe deposit locks, Sub-Treasury locks and every form of lock used by safe makers and bank vault engineers.

SAFE LOCK

Yale Post Office Lock Boxes.

The original manufacturers of metallic front post office lock boxes for the U. S. Government. Their use has extended to the postal service of nearly all civilized countries, and they are also extensively used in club houses.

POST OFFICE LOCK BOX

Factory Equipment.

Planning for industrial plants can best be accomplished in consultation with this company's experts, whereby the fullest advantages of a Yale master key system can be secured.

Catalogues, etc.

THE YALE & TOWNE MFG. CO. will furnish catalogues, estimates and information to anyone interested in Yale products.

Products.

AMERICAN STEAM ASH CONVEYORS.

Ash Pit Doors, Locomotive Cinder Pit Ejectors, Locomotive Sand Handling Systems, Marine Ash Ejectors, Special Hard Metal Castings.

Scope of Use.

For the economical handling of ashes, combustion ashes, soot, blast furnace dust, coal siftings, etc., from boiler or furnace room to any point desired.

Construction and Operation.

An American Steam Ash Conveyor consists of a heavy pipe line made of hard new pig iron and special patented fittings with removable hard metal wear parts. This pipe line is installed in the boiler house and ash intakes are located at the most convenient points. The installation requires only enough space for a 6-in. or 8-in. pipe line.

Systems are made in units, 4, 6 and 8 in. in diameter. 6-in. diameter and smaller sizes are used for conveying soot from economizers, breechings, combustion chambers of boilers, and coal siftings from stokers.

One man rakes the ashes into an intake conveniently located. He turns a valve, the suction of a steam jet shoots the ashes through a pipe, 100 ft. up if required, 100 to 300 ft. away, to pit, pile, overhead hopper, car, wagon—anywhere desired.

Advantages.

Old and new plants, hand and stoker fired, are easily equipped with American Steam Ash Conveyors. Little space is

required and installation in every condition can be met. Delivery of ashes may be vertically, horizontally, or around corners to any point desired.

The use of an American Steam Ash Conveyor releases from 1 to 6 men to engage in labor more productive to their employer.

Cost.

The first cost is low. Installation is simple, and valuable space is not taken up. The steam consumption is inconsiderable and the stamina of the conveyor is such that repairs or replacements of parts are seldom necessary and entail very little work, which can be quickly and easily done under the direction of the house engineer.

Service.

The great success of American Steam Ash Conveyors is the direct result of scientific experiment and exhaustive tests by the engineers of this corporation. Experts in ash handling give each contract personal attention.

Installations.

1000 American Steam Ash Conveying Systems are in daily use in this country and Canada. One of these plants is located near you, and the address will be furnished to those interested.

THE C. O. BARTLETT & SNOW CO.

Equipment for the Handling and Preparation of Material

MAIN OFFICE AND WORKS
CLEVELAND, OHIO

Products.

ELEVATING and CONVEYING MACHINERY; DRYERS; SKIP HOISTS; CRUSHERS; PULVERIZERS.

Feeders, Screens, Mixers, Sintering Plants, Oil and Grease Extraction Equipment, Garbage Reduction Plants, Paint Making Machinery, Car Hauls, Special Cars.

Elevating and Conveying Machinery.

Bartlett & Snow elevating and conveying machinery

BOILER ROOM OF EASTMAN KODAK CO. EQUIPPED WITH BARTLETT & SNOW CONVEYORS

is well fitted for all conditions which demand economy and dependability.

We build bucket elevators and conveyors, flight conveyors, and apron, belt and screw conveyors.

FLIGHT CONVEYOR

BUCKET ELEVATOR

FOUR ROLL COAL CRUSHER

Dryers.

Bartlett & Snow dryers comprise 13 distinctly different types, each one of which has been developed for the proper and economical drying of a certain class of materials.

Among these 13 types there are direct fired direct heat dryers, direct fired indirect heat dryers, direct fired single pass dryers, direct fired double pass dryers, steam heated dryers and hot air dryers.

STYLE D DRYER, ONE OF THE 13 TYPES

Skip Hoists.

When conditions are severe, and bucket elevators may be subject to excessive wear and to breakdowns, or where lifts are high or capacities large, skip hoists, because of their ruggedness, simplicity, and low power consumption, will be found remarkably economical and dependable.

Power plants, steel mills, sintering plants, mines, and chemical plants can use Bartlett & Snow skip hoists to advantage for elevating coal, coke, ashes, limestone, flue dust, slag, ores, and other gritty material.

INCLINED SKIP HOIST

Coal Crushers.

Bartlett & Snow coal crushers include single-roll crushers, two-roll crushers, and four-roll crushers. Wherever you find Bartlett & Snow coal crushers used, you will also find low crushing costs, uniformly crushed coal, few replacements, and absolutely no breakdowns.

Bartlett & Snow coal crushers are described in Bulletin 42.

Gardner Crusher Pulverizers.

These pulverizers are built for crushing materials of medium hardness. They take relatively little power, most of the crushing being done by the impact of the material against the crusher blocks.

Gardner crusher pulverizers are built in 4 sizes and are fully described in Bulletin 42.

BROWNHOIST PATENT SUSPENDED BIN;
BROWNHOIST COAL AND ASH HANDLING MACHINERY; BROWNHOIST WEIGHING LARRY.

For Locomotive Cranes, see pages 48-49; for Grab Buckets, see pages 64-65.

Brownhoist Patent Suspended Bin.

The Brownhoist patent suspended bin is a concrete bin for storing coal and ashes. It consists of two horizontal steel plate girders supported by upright columns, and from these girders the bin structure is suspended. At intervals of from 3 to 5 ft. steel straps, which are parabolic in shape, are hung from these girders. To the inside of these straps, our patent solid-sheet-steel reinforcement Ferroinclave is bolted, a wooden strip being placed between the Ferroinclave and the straps to prevent corrosion.

When the Ferroinclave is in place, the inside is first coated with concrete, a mixture 1:2:4 of cement,

BROWNHOIST

TRADE-MARK

sand and broken stone, all stone to pass a $\frac{1}{2}$ -in. mesh. The thickness of this lining varies with the span and loading. When this has set, the outside is covered with a mixture 1 to 2 of cement and sand with an addition of a little goat hair.

CAPACITIES—The capacities depend upon the requirements of the customer, but they range from 1 to 15 tons per lin. ft.

ADVANTAGES—This bin lasts a lifetime, as all the steel is protected by the concrete; is fireproof; holds a maximum amount of coal in minimum space; is practically self-emptying; low cost of operation; makes a clean and neat boiler room.

GATES AND SPOUTS—The bin is equipped with Brownhoist gates and spouts. The gates are easily operated from the floor, and are automatically locked when closed and when opened the full width. There are three kinds of spouts: the swinging, the stationary, and the stationary angle—which one to use depends upon requirements of the plant.

VIEW OF BROWNHOIST COAL BIN
SHOWING DISTRIBUTING
SPOUTS

Weighing Larry.

A Brownhoist weighing larry can be put beneath the bin, and it will weigh every pound of coal as it passes to the stokers.

Coal and Ash Handling Machines.

Brownhoist coal and ash handling machines, of various types and designs, consist of the locomotive crane, man trolley, overhead traveling crane, gantry crane, and bridge crane—all used with Brownhoist buckets or tubs.

Estimates, etc.

On receipt of plans and requirements, we will submit estimates on the entire installation in new or old plants. Many views of the bin and machines in use are shown in our catalogue "S."

BELT CONVEYORS for loose materials; PORTABLE and STATIONARY CONVEYORS and ELEVATORS for package freight; VERTICAL TIERING MACHINES for heavy and bulky packages; BOAT, CAR, WAGON and TRUCK LOADERS and UNLOADERS for packed and loose materials.

Scope of Use.

"Brown-Portable" continuous motion machines for the rapid and low-cost handling of packed and loose materials are designed "to fit the job," to handle the general run of sizes and weights of any kind of packed, tied, wrapped, boxed or rolled materials. The "Hand-I-lift" (vertical tiering machine) handles the heavier, bulkier and more irregularly shaped packages; and the belt conveyor practically all forms of loose and bulk materials, such as coal, coke, sand, gravel, crushed stone, loose scrap, broken tile, ashes (not hot), etc.

"Brown Portable" Performance.

Reduces cost of handling from 50% to 80%.

Always ready for use; no expense when not working.

Insurance against scarcity of labor and strikes.

Delivers packages to any height at same cost.

Eliminates danger of breakage of goods in handling.

Does not tire men by over-exertion.

Adjustable in delivery height without cutting off power.

Economizes floor space and increases output of plant.

PORTABLE ELEVATOR
PILING BAGS
No handlers between floor
and top of pile

PORTABLE SECTIONAL CONVEYOR
AND ELEVATOR OPERATING
AS ONE MACHINE
Eliminating truckers and stackers

Few wearing parts; simple in mechanism and operation.

Adaptable to all industries handling packed goods.

Power.

Self-contained, either electricity, gasoline, kerosene, air or steam.

Prices.

THE COLUMBUS CONVEYOR COMPANY

Manufacturers of Unloaders, Elevating and Conveying Machinery
COLUMBUS, OHIO

Products.

RECIPROCATING FEEDERS, and CONTINUOUS BUCKET ELEVATORS.

Loading, Unloading, Elevating and Conveying Machinery.

Services.

This company maintains an Engineering Department which is prepared to inspect plants or jobs and render advantageous recommendations and quotations without any obligation on the part of the prospective buyer.

Full and detailed information will be gladly sent on request.

Saving in Expense.

Owing to the low cost of installation, the "Columbus" system of unloading and conveying is within reach of both small and large plants.

The operation of the "Columbus" unloaders is quick and inexpensive, being able to unload at the rate of 40 to 50 tons per hour at an average expense of 3¢ per ton or less on any loose materials.

"Columbus" Reciprocating Feeder.

CONSTRUCTION—The frame is constructed of heavy steel channel and angles with all parts securely riveted together. The feeder box is of heavy steel plate and angles, and oscillates 9 in. through 2½-in. drop forged crank shaft and 3-in. connecting rod.

POSITION—The feeder is placed directly beneath the railroad rails between ties, and the material is gravitated into same through hopper of railroad car.

SAVING IN WEAR—By its use the load is automatically regulated and the material is fed directly into the continuous bucket elevator, thus eliminating the excessive wear incident to the buckets scooping their load, as well as relieving balance of machinery from much strain.

SIZES—Made in different sizes to accommodate the grade of materials handled and the capacity desired.

COKE BEING FED DIRECTLY INTO BUCKETS OF CONTINUOUS BUCKET ELEVATOR BY THE "COLUMBUS" RECIPROCATING FEEDER

The all-steel service chute gives wider distribution

"COLUMBUS" RECIPROCATING FEEDER

"Columbus" Continuous Bucket Elevator.

FRAME—All-steel construction side frames and cross members of 6-in. 8-lb. channel, securely riveted. Fitted with all necessary take-ups, bearings, idler pulleys, etc.

The jack shaft is equipped with jaw clutch which allows feeder to remain idle, if desired, while elevator is in operation.

Elevators are constructed in standard sections with ample provision for extensions as desired. They can be operated satisfactorily on incline from horizontal 45° to 70°, and can be adapted to almost any condition.

BUCKETS—Made of Armco iron for handling lump or steam coal, as much longer service is insured than if they were made of steel. Size of bucket, as well as the grade of material handled, governs gauge of stock. All buckets are carried by two strands of heavy chain, each link of which has a working test of better than 3000 lbs. Each bucket is bolted to chain through two attachments carrying four bolts each. When steeper incline of elevator is necessary, specially designed buckets are provided.

CONVEYOR—Made in different sizes and any lengths to meet all conditions. All-steel construction used throughout, and built exceptionally strong for long, continuous service.

"COLUMBUS" CONTINUOUS BUCKET ELEVATOR FEEDING INTO ALL-STEEL DRAG CONVEYOR WHICH CONVEYS MATERIAL IN FRONT OF STILL'S FOR THE OIL REFINERY

Products.

GRAVITY ROLLER CONVEYORS, STEEL SPIRAL CHUTES, BELT CONVEYORS, SLAT CONVEYORS; INCLINED and VERTICAL ELEVATORS.

Apron Conveyors, Chain Conveyors, Portable Pilers and Special Conveyors.

Service.

This company places at the disposal of engineers, architects and prospective users, the services of a skilled Engineering Department experienced in all manner of conveying problems. There is no charge for drawings and detailed information covering individual conveyor layouts.

Scope of Use.

Dow conveyors speed up production, eliminate expensive and uncertain labor, and save valuable floor space.

Used by factories, foundries, warehouses, whole-

sale houses, department stores, canning and packing plants, lumber and brickyards—in fact, any place where quantities of materials or merchandise of any description must be handled from one place to another.

Gravity Conveyors.

Furnish the ideal means of handling goods wherever they can be used. A grade of 3% to 5%, depending on the nature of the merchandise, is necessary for the operation of gravity conveyors. They require no power or attention of any kind.

Power Conveyors.

Of all descriptions, usually designed to operate in conjunction with gravity conveyors.

Estimates.

In writing for estimates or other data, state dimensions and weights of largest and smallest packages and send drawing or sketch with dimensions indicating points between which goods must be handled.

ELEVATING and CONVEYING MACHINERY for handling coal, ashes, stone, sand, gravel, ice (natural and manufactured), and bulky materials of all kinds: Coal Handling Machinery, Wagon Loaders, Locomotive Coaling Stations, Ice Elevators, Conveyors and Ice Tools, Apron Conveyors, Warehouse Conveyors.

Also, G-W Pivoted Bucket Carriers, Grain Elevator Machinery, Car Unloaders, Coal Pockets, Bagging Machines for coal and coke, Screens of all kinds, Friction Clutches, Hoists, Icing Station Equipment, Crushed Ice Carts, etc.

Coal Handling Machinery.

DOUBLE RACK AND PINION GATE WITH TILTING CHUTE, AS INSTALLED FOR ROCKAWAY COAL AND ICE CO., BROOKLYN, N. Y.

Locomotive Coaling Stations.

Dependability is the prime factor in locomotive coaling station equipment. As a breakdown means delay and disruption of the schedule, railroads are careful to choose equipment of a dependable make. Railroad engineers have made an exhaustive study of the various makes of equipment in order to secure the maximum of satisfactory service.

The dependability of Gifford-Wood equipment has led to its adoption by the following representative railroads: New York Central; Canadian Pacific; Boston & Albany; Boston & Maine; Rutland; Ottawa & New York; Chicago, West Pullman & Southern.

ELEVATOR CONVEYOR COALING STATION, INSTALLED FOR THE BOSTON & MAINE R. R. AT NASHUA, N. H.

Coal and Ash Handling Machinery.

The illustration at the right shows the ashes elevator and storage tank. The coal car in the background is placed over the track hopper. An apron conveyor delivers from the hopper to a run-around elevator-conveyor, which in turn delivers to storage bunker and stoker spouts.

ASHES ELEVATOR AND STORAGE TANK, FRENCH LICK SPRINGS HOTEL, FRENCH LICK SPRINGS, IND.

Wagon Loaders.

Handle anthracite and bituminous coal, crushed stone, gravel, sand, clinker, lime, coke, ashes, etc.

The machine illustrated is used for broken (egg, stove, and smaller sized) coal. It reduced the loading time to two minutes, and the handling cost from 25c to 4c per ton.

TYPE "B-6" LOADER WITH FEEDER, ELEM COAL CO., NEW YORK, N. Y.

ELKHART, IND.

Products.

COAL and ASH HANDLING MACHINERY.

Engineering Service.

This company maintains an engineering department composed of experts who have had many years' experience in designing coal and ash handling equipment.

Send rough pencil sketch of railroad siding, storage grounds and bins and the engineering department of this company will show exactly what a Godfrey conveyor can do to cut costs.

This service is without obligation on the part of the prospective purchaser.

Adaptability of Godfrey Conveyors.

Godfrey conveyors are adapted for handling all sizes of coal, coke, etc., in an economical and highly efficient manner.

The illustrations show several types, but Godfrey conveyors are equally efficient and adaptable to practically every condition.

They can be successfully installed at any angle or parallel to the railroad siding in heavy cableway or I-beam types, according to conditions.

Coal may be fed into the conveying bucket by gravity through a steel track chute (as illustrated) and then elevated and conveyed to point of dumping. For this method of conveying, a pit is installed. A special pit of this company's design is recommended, which has an opening beneath the rails 6 ft. wide, to take all coal from both sides of side dump cars, as well as hopper bottom cars.

Distinctive Features of Godfrey Conveyors.

ECONOMICAL INSTALLATION AND OPERATION—Godfrey conveyors handle the coal mechanically, thus they greatly reduce labor cost.

Cost of installation is not prohibitive and they effect large savings over other types of conveying systems.

NO BREAKAGE OF FUEL—Godfrey conveyors can

handle all sizes of coal, coke, etc., with practically no breakage or degradation.

This is an exclusive Godfrey feature and saves from 20¢ to 25¢ per ton on this one item alone.

CENTRALIZATION OF CONTROL—Hoist operator controls the entire operation of filling, elevating, conveying, dumping and returning the bucket to the pit for re-loading.

ELIMINATION OF CAR DEMURRAGE—Godfrey conveyors eliminate costly car demurrage due to their speedy and efficient operation.

They will unload and store coal practically as fast as received.

HOISTS—These are of Godfrey special design, constructed so as to handle loads at any practical speed.

They are simple, of rigid construction and are mounted on a base, ready to be attached to power, which may be either electric motor, gasoline engine or steam power.

The "new heart" of the Godfrey conveyor is this company's latest hoist, its "fourteen points" being:

- (1) Extreme ease of operation and perfect control by operator.
- (2) Large hoisting drum driven by raybestos-faced cone clutch.
- (3) Wide reversible traction drum driven in either direction by friction pinions.
- (4) Both drums revolve on heavy stationary steel shaft.
- (5) Heavy coil spring for disengaging hoisting drum clutch.
- (6) Adjustable sleeve for taking up clutch wear.
- (7) Wide raybestos-lined brake bands operated from foot pedals.
- (8) All castings carefully milled in the Godfrey factory.
- (9) All gears machine cut.
- (10) Quietness of operation due to elimination of ratchet brake and chain driven gears.

TYPICAL INSTALLATION OF GODFREY COAL AND ASH CONVEYOR

Operator at hoist controls flow of coal through steel railroad track chute to bucket in pit by means of a double action gate. Bucket is quickly filled and without danger of overflow. By means of the hoist, operator elevates bucket (containing 1 ton) to a point beneath trolley above and is then conveyed along a monorail system of I-beam or heavy cableway to point of dumping. Bucket is dumped automatically, a trip releasing the bi-section bottom by coming in contact with the coal pile, or, where speed is of more importance than breakage of coal, bucket can be tripped from movable trip member overhead, allowing coal to fall from bucket.

- (11) Both hoisting and traction levers at operator's finger tips.
- (12) Compact, yet far heavier and more durable than any other hoist used with the Godfrey conveyor.
- (13) Excess factor of safety in every part.
- (14) Practically "foolproof."

Deliveries.

This company is in a position to make deliveries of its conveyor systems in from 30 to 60 days, and this fact, added to the low cost of installation and operation, has made possible a quick solution of conveyor problems for many industrial and coal handling plants.

The Standardized Steam Conveyor

1400 Broadway
NEW YORK, N. Y.

Product.

GIRTANNER STANDARDIZED STEAM CONVEYOR for removing ashes by the shortest route.

**GIRTANNER
STANDARDIZED
CONVEYOR**
TRADE-MARK

Standardization.

This ash conveyor is the first to be completely standardized. No special pipe lengths are necessary either for installation or subsequent replacement after long service.

Intake Tee.

A special feature of the tee (patents pending) makes it possible to locate the intake at the proper point in front of the boiler without the use of odd pipe lengths. The opening is out of center 3 in., so that by turning the tee end for end it can be brought to the desired position. Should this fail, the cover plate, the opening of which is also out of center, can be reversed, permitting any adjustment within 1 in. at any part of 6 ft.

The intake cover is level with the floor when in place. Inside surface is curved, and concentric with the pipe, eliminating pockets.

Air Intake.

The gross area of the air intake is 100% larger than the pipe, insuring ample supply of air.

An iron grating prevents foreign materials from falling in. This leaves a net area excess of 50% over the pipe area.

Target Box

The box is provided with a detachable hardened back plate, making replacement easy.

A special shelf is cast on the inside bottom of box, enabling ashes to pile up against target plate, and there form an admirable protection against the erosive force of impinging ashes.

This system greatly reduces dust and increases life of back plate.

GIRTANNER STANDARDIZED STEAM CONVEYOR

Liners.

The special carbo-metal liners act as a protection to the pipe, eliminating the necessity for constant replacement of pipes.

These liners are guaranteed to stand 5,000 tons of ash, and usually last for 10,000 tons or more.

All vertical and horizontal liners are respectively interchangeable and are easily replaced through the intake tees or 90° steam units.

Pipe.

All white metal pipe is used throughout, furnished in standard lengths of 18, 24, 30, 36, 48, 60 and 72 in. Special flanging and gasket grooving makes installation a simple matter, and renders the entire system free from any leakage.

90° Steam Units and Wear Section.

This 90° unit furnishes the support of the vertical columns of pipe.

Fitted with 2 upright columns held by bolts in fitting on upper pipe section, being supported on a suitable foundation.

If it becomes necessary to remove the lower sections or the elbow, the riser section is slightly lifted and section removed.

Lower rear door gives access to the steam nozzle at the bottom of the elbow. Nozzle removal can be effected from the inside in a few minutes without disturbing the steam connections in any way. Nozzle is below the level

of the liners, so that it can not be injured by the passing ashes during operation.

Special automatic drain and cleaner are incorporated in design, enabling the nozzle and basin in the pipe to be completely drained before starting up.

Products.

"PATH DIGGING" SELF-FEEDING WAGON LOADERS.

Car Unloaders; Bag Loaders; Portable and Bucket Elevators and Conveyors; Belt Conveyors.

For Contractors' and Coal Dealers' Machinery, see page 61.

Uses.

Wagon loaders are used for loading and unloading trucks and cars quickly. They will dig and elevate coal, ashes, sand, gravel, crushed stone, chemicals, coke, ore, etc., and can also discharge on ground storage adjoining railroad tracks.

Advantages.

The most desirable of all wagon loaders is the famous "Path Digging" loader, patented. In this machine are provided all the automatic features required, thus reducing the number of men otherwise needed to just one, namely, the operator, who can control this machine so that it will give an uninterrupted discharge of 1 cu. yd. of material per minute all day.

The "Path Digging" wagon loader is self-propelling, self-feeding, and self-crowding. In moving about from place to place and digging all kinds of materials, all through means of its own power, it so strongly appeals to most contractors, engineers and coal dealers that after comparison with other wagon loaders the purchase price of the "Path Digging" machine becomes a secondary matter, while the time of delivery takes first consideration.

The patented revolving feeding propellers have made the "Path Digging" wagon loader a huge success.

TRADE-MARK

The blades on this device are so fixed along the wide spreading elevator shaft that when they revolve they force the material from both extremes of the propeller towards the middle point where the buckets fill up. By the same operation the blades cut open a wide pathway to permit the wagon loader wheels to follow automatically in their wake, leaving no material to obstruct the slow, smooth progress of the machine.

The illustrations on this page show why a bucket can not go by without taking its proper load each time.

"PATH DIGGING" WAGON LOADER LOADING 5 CU. YDS. OF GRAVEL IN 5 MINUTES

Operation.

Having been moved under its own power into a position at the foot of some material pile, the operator connects, by means of a clutch, the bucket elevator and the feeding propeller mechanism, and then, when these are in motion, he pushes into mesh a very slow traction gear, which "crowds" the entire loader at a speed of 30 in. per minute against the face of the material pile. After the propellers undermine a pile sufficiently to cause small avalanches, the slow speed drive is thrown out, and comes into use again only when the feeding propeller blades have dug out all material within reach.

Equipment.

Equipped with 10 h. p. gas engine, weight 6800 lbs.; or with 10 h. p. electric motor, weight 5900 lbs. The elevator unit is collapsible. It extends 8 ft. 6 in. from ground to chute, but may be increased if necessary.

Catalogues.

Sent free on application, covering the equipment in which one is interested.

SPIRAL CHUTES; DIVERTING SWITCHES; VERTICAL LIFTS; BELT and CHAIN CONVEYORS.

Gravity Roller Conveyors, Inclined Elevators, Automatic Hoists, Wagon Loaders, etc.

Chutes.

HASLETT PATENTED CONCAVE SPIRAL CHUTES—The patented Haslett concave bottom is designed to control the speed of merchandise so as to prevent damage. The rise of the concave toward the outside balances centrifugal force. The grade of the chute and the centrifugal force decrease with increase of radius. Therefore, when packages tending to travel fast are carried toward the outer rim by centrifugal force, the decreased grade reduces their speed. Packages can not clog in the chute because slow packages losing their centrifugal force are carried by the concave slope

buildings drawings are furnished by which builder can leave properly designed openings in the correct positions.

FLAT BED CHUTES FOR LIGHT MERCHANDISE—This company also builds common flat bed chutes for use in department stores and mail order houses, etc. These can be either of the open outer rim type or cylindrically enclosed type.

These are supported by the central column consisting of standard wrought steel water pipe to which the sheet metal is bolted with cap screws in tapped holes.

SIZES OF STANDARD FLAT BED CHUTES

Diameter	Trough width	Pipe column
3 ft. 4¾ in.	12 in.	4 in. internal
5 ft. 6¾ in.	30 in.	6 in. internal
6 ft. 6¾ in.	36 in.	6 in. internal
7 ft. 8¾ in.	42 in.	8 in. internal

STANDARD CONSTRUCTION HASLETT SPIRAL CHUTE

STYLES—Both styles of chutes can be built in single, double, triple or quadruple blade construction.

EQUIPMENT—Open chutes are furnished with hinged, counterweighted floor traps, and enclosed chutes with vertical sliding fire doors all constructed so as to meet the approval of the National Board of Fire Underwriters.

DIVERTING SWITCHES—In addition to the patented combination fire door and diverting switch, several special types of switches for discharging goods at intermediate floors are built.

Special strength chutes can be built for especially heavy work in all sizes.

nearer the center where the chute is steeper. Successful results are dependent upon proper relationship between trough width, diameter, pitch and concave formation.

FLOOR OPENINGS FOR CHUTES—In completed buildings the floors can be cut and finished, but in new

TYPICAL FLOOR OPENING FOR 7-FT. DIAMETER CHUTE FOR CONCRETE BUILDING

Vertical Lifts, Belt and Chain Conveyors, etc.

These are built to meet requirements. In addition to standard types, special forms for all kinds of warehouse, jobbing and factory needs are designed.

LOWERATOR COMPANY, INC. Manufacturers of Special Conveying Machinery 110-112 West Fortieth Street NEW YORK, N. Y.

Products.

THE LOWERATOR; VERTICAL TRAY ELEVATOR-LOWERATOR.

Gravity Rollers, Roller Spirals, Power and Gravity Inclines, Special Conveying Machinery.

The Lowerator.

This device lowers merchandise from upper floors, by gravity. There is no expense for power, no need of operators. Discharges automatically.

It is built in 5 standard sizes, or specially designed to answer requirements. Articles, packages, barrels, tote-boxes, containers or cases up to 48 by 52 by 72 in. and weighing up to 1500 lbs. each can easily be handled by this machine.

Machine is simple, strong, and fully guaranteed. It operates by means of the loading of trays or carriers attached to endless steel cables passing around upper and lower sheave wheels.

The car spacing is approximately 6 ft., thus affording two cars at each floor at all times.

Speed is regulated and controlled by automatic governor brake. A Lowerator occupies considerably less space than a freight elevator and handles under test four times the volume per hour.

Used in factories, warehouses, wholesale establishments, etc.

VIEW SHOWING INSTALLATION OF THE LOWERATOR

Vertical Tray Elevator-Lowerator.

This is an elaboration of the Lowerator principle wherein the upper terminals are equipped with electric motor for carrying merchandise up as well as down, at the same time in the same shaft.

Goods may be sent from lower floors to any upper floor and automatically discharged. The reverse operation is also provided for. Complete and positive push button control on each floor.

No operator is needed. Requires small space and handles large volume per hour. Small horsepower required as machine is balanced.

Co-operative Service.

The LOWERATOR COMPANY, INC. designs and builds special conveying machinery to meet unusual and difficult conditions. Its Engineers have had years of experience in this particular field, and their services are free to engineers and architects for consultation.

When planning a new building write for detailed drawings of shaft or hatchway. State conditions in client's plant, especially as to floor heights and size of packages to be handled, and a practical and economical solution is assured.

VERTICAL TRAY ELEVATOR-LOWERATOR

ESTABLISHED 1887

HEYL & PATTERSON, INCORPORATED

Contracting Engineers for Elevating and Conveying Equipment

PITTSBURGH, PA.

BRANCH OFFICE: 90 West Street, NEW YORK, N. Y.

Products and Service.

This company maintains an Engineering Organization, Machine Shop, Structural Shop and Field Organization fully equipped for the *design, fabrication and installation* of CONVEYING and ELEVATING EQUIPMENT, and of the STEEL, CONCRETE or WOOD STRUCTURES and BINS required in connection therewith.

In addition to all types of conveyors and elevators, the company builds:

For Dock and Storage Yards.

Man-trolley bridges; rope system bridges; unloading towers; anthracite storage sheds; screening plants; grab buckets; rope haulage systems.

For Wharves and Shipbuilding Yards.

Wharf cranes; portal type cranes; roof cranes; tower cranes; racking cantilever cranes; floating cranes.

For Steel Mills and Powerhouses.

Pulverized fuel equipment; coal and ash handling equipment; coal crushing plants; ore, coal and ash cars; pig iron casting machines; monorail hoists; coal and coke crushers.

For Coal Mines.

Complete tipples; car hauls; revolving dumps; picking tables; Bradford breakers; storage bins; refuse stacking cars; coal washing plants.

PORTAL TYPE WHARF CRANES

COAL DOCK EQUIPMENT

For By-product Coke Ovens.

Coal preparing plants; coke screening and loading plants; car haulage equipment; Bradford breakers; coal and coke crushers; storage equipment.

For Glass Factories.

Batch mixing plants; traveling batch mixers; storage tanks;lehr conveyors; pulverized fuel equipment; telphers.

CARRIERS; CRUSHERS; SWING HAMMER PULVERIZERS and SHREDDERS; LOADERS; ELECTRIC TROLLEY and STORAGE BATTERY LOCOMOTIVES; ELEVATORS; CONVEYORS: Belt, Scraper, Pan and Apron.

Jeffrey Improved Pivoted Bucket Carriers.

(1) Double bushings in chains—glass hard and tough.

(2) Steel cross rods—connect carrier chains at the bucket lips; do not obstruct bucket opening.

(3) High carbon steel side bars—shockproof.

(4) Large roller in chains—hard and tough on the tread and in the bore.

(5) Bore of chain rollers ground to size—too hard to machine.

(6) Overlapping lip buckets—tough malleable iron for coal and ashes; gray steel for cement clinker and hot materials.

Combination cast ends and steel plate.

(7) Hardened steel pivot pins—heat treated to glass hardness.

(8) Pivot blocks in chains—of hard white iron.
(9) Tripping cams on buckets—glass hard and hot riveted to bucket ends.

(10) Traveling and stationary trippers—deep chilled wearing surfaces; easy to operate.

(11) Bucket acme of efficient design—every edge and corner reinforced for long service.

(12) Absolute reliability under all conditions of service. Loaded buckets can not be carried around to filling point without first being dumped. Conveyor safeguarded throughout its entire course against improper action.

Write for Pivoted Bucket Catalogue No. 210-F.

Single Roll Crusher.

This machine is designed for use at the powerhouse, coaling station, and the mine.

It reduces large lump and run-of-mine coal to stoker size in a single operation.

For run-of-mine or hard lump coal this company recommends using the 30x30-in. size as it

JEFFREY SINGLE ROLL CRUSHER

DIAGRAM JEFFREY SINGLE ROLL CRUSHER

has proved the best suited for maximum lumps. (See table at foot of preceding page for sizes.)

Receives coal in any volume direct from a track hopper, grab bucket or mine car without the use of any mechanical device for regulating the feed. Feeder is often used simply to limit the crusher output to the smaller capacity of a receiving conveyor beneath the crusher.

It can be started up under full load and can not be flooded or choked down.

Easily adjusted and has large range for size and capacity.

Consumes but little power. Costs little to install.

Occupies small space in proportion to its capacity.

All joints are machined. Gears are of steel with cut teeth.

Provided with an efficient safety device which protects against shock and accidents. Send for bulletin.

The long teeth do not interfere with the adjusting of the breakerplate up close to the roll when a fine product is required, slots being provided in the breakerplate through which they pass freely and still prevent large pieces of coal getting through without being crushed.

DIGGING AND LOADING HARD ACID PHOSPHATE IN FERTILIZER PLANT WITH JEFFREY TYPE "G" LOADER

Locomotives.

Storage battery locomotives are used extensively in industrial plants and mines. Trolley type locomotives are also built.

JEFFREY STORAGE BATTERY LOCOMOTIVE

Jeffrey Swing Hammer Pulverizer and Shredder.

Of various types and sizes for reducing large quantities of granular and fibrous materials. Complete details on application.

Write for Catalogue No. 147-N.

JEFFREY SWING HAMMER PULVERIZER

Type "G" Loader.

The Jeffrey Type "G" loader is a large wheeled powerfully geared machine, capable of handling, per minute, 1 to 1½ cu. yds. of loose materials, such as crushed stone, sand, gravel, coal, coke, ashes, cinders, acid phosphate, fertilizer, salt, etc. The machine is self-propelling, having two speeds forward and two reverse, the fast speed to carry it from pile to pile and the slow speed suitable for feeding into the material.

The boom is narrower than the buckets, hence it will dig 8 ft. straight back into the pile without meeting an obstruction. The buckets are malleable iron, very heavy and protected by renewable serrated steel digger edge, operating over a large diameter foot wheel, thereby enabling the machine to handle large lumps successfully.

The machine is mounted on three large wheels forming a 3-point support which causes the machine to set solid on any uneven ground, to travel over rough ground, to run over obstacles without harm and to go over moderately soft ground without sinking. The machine will turn short and readily and will sweep the ground in wide circles. The boom is adjustable for depth of cut or to collapse to pass obstructions.

For loading wagons, automobiles, trucks, cars, etc., a swivel chute is supplied. When handling loose materials which are carted, such as, salt, fertilizer, acid phosphate, etc., the machine is fitted with large capacity storage hopper and quick acting clamshell valve for loading wheelbarrows and small carts, thus keeping a string of wheelers busy.

CONSTRUCTION OF THE JEFFREY TYPE "G" LOADER

Standardized Elevators.

Years of close personal contact with the industrial field in the building of conveying and elevating equipments have made it possible to select 40 elevators out of numerous styles for the handling of a wide range of materials—these being known as Jeffrey standard elevators.

Jeffrey standard elevators are made vertical or upon an incline and can be furnished with or without steel casings. Capacities range from 6½ to 80 tons of material per hour with vertical lifts of from 10 to 75 ft. The nature of the materials handled may vary from non- or semi-gritty materials, such as grains and coal, to gritty substances, such as ashes, coke, sand, gravel and stone. The size of the material may vary from dust to 4½-inch cubes. These elevators consist of

endless chains provided with buckets of steel or malleable iron, spaced at short intervals or close together, designated in the table accompanying as centrifugal discharge types and continuous bucket type, respectively.

DELIVERY—These elevators are kept in stock, and by specifying same a much shorter delivery may be obtained than is the case with a special elevator requiring layouts and complete shop details.

PRICES—The home office or any one of the branches is in a position to furnish immediate prices on any of these standard elevators. Just state the number of the elevator and the distance from center of head shaft to center of foot shaft. Catalogue No. 244-D.

Belt Conveyors.

A belt conveyor, where properly installed and operated, forms one of the most flexible and economical type of mechanical handling devices.

The range of materials which the belt conveyor will handle satisfactorily includes nearly all bulk materials, from the lightest of grains to the heaviest of ores, as well as packages of all kinds. It is well adapted to carry fragile materials without undue breakage.

The space occupied by the belt conveyor is small and the power consumption and cost of upkeep are low, making it an ideal conveyor covering a very wide range of application.

Jeffrey belt conveyors are so standardized that the selection of the proper conveyor is very simple.

They have a range of 36 to 1724 tons per hour on any length up to 600 ft. Catalogue No. 175-R.

JEFFREY STANDARD BELT CONVEYOR

Standard Scraper Conveyors.

NO. 1 TYPE SCRAPER CONVEYOR

The smallest standard conveyor of No. 1 type has plain cast iron scrapers 10 by 5 ins. for handling material 3 ins. and under with a maximum capacity of 42 tons of coal per hour, and a maximum length of 150 ft. Four other standard conveyors of this No. 1 type are offered for material up to 5-in. diameter with a maximum capacity of 63 tons of coal per hour and up to 150 ft.

NO. 2 TYPE SCRAPER CONVEYOR

Standard conveyors of No. 2 type or similar to No. 1 type, except the scrapers are larger, made of steel and are equipped with rollers and heavier chains. Capacity of 48 tons per hour for 3½-in. coal up to 70 tons per hour maximum coal of 5 in. and are made up to 200-ft. centers.

NO. 3 TYPE SCRAPER CONVEYOR

Double strand plain chain steel standard conveyors of No. 3 type come in four sizes to handle maximum size coal of 9, 12, 14 and 16 ins. with capacities of 60, 92, 167, 241 tons per hour respectively, and in lengths up to 200 ft.

NO. 4 TYPE SCRAPER CONVEYOR

No. 4 type is made in the same general sizes as the double strand No. 3 type and in most respects is the same, except the various styles of chain are provided with rollers to reduce friction.

Catalogue 257-A.

Standard Apron Conveyors.

Standard wood apron conveyors handle large bulk materials, such as packages, bags, boxes, kegs, barrels, etc.

NO. 1 TYPE APRON CONVEYOR

Type No. 1 conveyors are made up with detachable chains and intended for handling packages up to 100 lbs. and for a distance not in excess of 200 ft.

NO. 2 TYPE APRON CONVEYOR

Type No. 2 is made up with roller chains of malleable iron with plain rollers for the lighter loads, and steel thimble roller chains with either plain or flange rollers for heavy work. They are intended for handling packages weighing from 100 to 1600 lbs. for a maximum distance of 200 ft.

NO. 3 TYPE APRON CONVEYOR

Types 3 and 4 handle small loose material. Particularly adapted for use as apron feeders. They consist of two strands of roller chain, either malleable iron as Type 3 or steel thimble roller chain as Type 4, to which are attached double beaded steel flights with steel ends thus forming a continuous trough or apron. Stand-

NO. 4 TYPE APRON CONVEYOR

ard conveyors have a capacity range of from 56 to 1000 tons per hour. Size of material may vary from dust to 24-in. cubes. These standard conveyors may be obtained in any length up to 100 ft.

SELECTIVE OVERHEAD POWER CONVEYORS.

Light Hand and Electric Power Elevators and Lifts; Electric Cable and Wire Line Cash and Parcel Carriers; Sectional Metallic Receiving and Storage Bins.

Adaptability of Lamson Conveying Systems.

Lamson automatic conveying systems are as varied as industry itself, and are adapted for a wide range of usefulness in nearly every conceivable business.

They carry practically everything that is ordinarily

TRADE-MARK

handled—from papers, currency and the most fragile products to boxes, barrels, tools, castings, machine parts, etc.

No matter what the business is, Lamson conveying systems will *save time and expense*, and enable the organization to perform *more work with less effort*.

Lamson Service.

Specialists employed by this company are constantly solving all kinds of conveying and carrying problems, and their experience and service are at the disposal of those who desire a satisfactory solution of their conveying needs.

Full information covering any problem to which Lamson conveyors may be adapted will be furnished, without obligation.

Telegrams and messages relayed all over the factory by this Lamson tube station

Labor, and the movement of materials, controlled from the central planning department. Lamson pneumatic tubes give practically instantaneous message service to all parts of the plant

This tube service is a quick, mechanical messenger between shop and main office

Papers are kept moving between executives and department heads by Lamson pneumatic tubes

This central desk serves the same purpose as a telephone switchboard. Incoming pneumatic carriers are here relayed by tube to their destinations. The tube system is intercommunicating between all stations

In banks, checks and debit and credit items are kept moving by Lamson pneumatic tubes

LAMSON PNEUMATIC TUBES, THE SWIFT MECHANICAL MESSENGERS OF BUSINESS

These illustrations show how Lamson pneumatic tubes speed up and systematize the transaction of business by carrying letters, requisitions, orders and other papers quickly and surely in the factory, office, bank and business house

Belt and vertical conveyors carrying bags of flour from sewing machine to outgoing freight cars. They do away with the slowness and confusion of porters with trucks

Packing of all kinds of products systematized by Lamson conveyors. Conveyors bringing empty boxes and bars of soap to packers and carrying packed boxes away to nailing machines

Boxes of soap, shown in illustration to the left are conveyed to these nailing machines. Nailed boxes are conveyed to storage or shipment

In textile mills, Lamson conveyors carry bobbins, laps, raw cotton, finished cloth, etc. Lower belt of this 2-way conveyor brings empty silk quilts to filling machines. Upper belt returns filled quilts

Castings and parts carried between machines in the modern machine-shop. Conveyors keep stock in motion between processes and cut down amount of stock that is necessary. They link a battery of machines into one complete unit

Lumber, boards, shooks and other wood products easily carried on Lamson gravity and power conveyors

Tote boxes of small parts carried by gravity or by this chain conveyor

Lamson spiral chutes carry a steady stream of packages vertically downward, quickly and without attention and without damage

Lamson gravity spiral conveyors carry packages downward to shipment and also serve as "live storage." Hundreds of boxes always "stand in line" ready for shipment

A completely equipped shop. Parts and products from every machine are carried on Lamson conveyors to the two main line conveyors, which in turn carry them to the packing and shipping departments

SAVING LABOR'S USELESS STEPS BY LAMSON GRAVITY AND POWER CONVEYORS

These views show how every phase of industrial work is speeded up when Lamson conveyors are used. These conveyors put the handling and carrying on the same footing as the manufacturing processes—on a quantity production basis

THE LOUDEN MACHINERY CO.

Manufacturers of Overhead Carrying Systems

71 Court Street
FAIRFIELD, IOWA

BRANCH OFFICES

ST. PAUL, MINN., 2288 University Avenue ALBANY, N. Y., 1047 Broadway CHICAGO, ILL., 1051 West 35th Street
KANSAS CITY, MO., HARBISON MFG. CO., Tenth and Mulberry Streets

Products.

OVERHEAD CARRYING SYSTEMS for factories, warehouses, machineshops, garages, etc.; COAL CARRIERS; CHAIN HOISTS; TRAVELING CRANES; SWINGING STEEL CRANES.

Advantages of Louden Overhead Systems.

TIME AND LABOR SAVING—The common method of transferring material from place to place in industrial buildings by trucks, carts and wheelbarrows operating on the floor is, aside from cost and many inefficient features, absolutely wasteful of man power.

By installing Louden systems the work is raised to the highest efficiency. The old way required two men to push a truck loaded with 1000 lbs., while with the air route one man can easily shove 2000 lbs. around corners, over switches, and do it in less time. The overhead system requires practically no rehandling.

SPACE SAVING—Valuable floor space is saved. There is no congestion of merchandise in aisles as the steady transportation system insures systematic movement of all material.

MONEY SAVING—The cost of transferring goods is actually reduced 50% to 60%.

Wear and tear on the floor caused by heavy trucking is eliminated, reducing the upkeep expense.

Description of the Louden System.

TRACK AND FITTINGS—The track is of the finest and strongest carbon steel, specially adapted for carrying loads up to 2000 lbs., and can be curved to fit all conditions. The shape is such that all unnecessary friction is eliminated.

TRACK

SWITCHES—When the switch cord is pulled the track is thrown into the desired position, and an automatic safety guard makes it impossible for a car to run off the track. Switch is reversible, right or left, so that several branch tracks can be used on either side of the main track.

3-WAY SWITCH

ADJUSTABLE LINK
TRACK HANGER
Odd inch-lengths up to
61 in.

CARRIERS—Fitted with large roller bearing track wheels and heavy swivel truck castings, which make operation easy and insure ample strength.

DOUBLE TRUCK FACTORY CARRIER

SINGLE TRUCK FACTORY CARRIER

Coal Carrier.

Its roomy tub has the same capacity as 7 large wheelbarrows, and carries its load with absolute safety.

The container will automatically turn upside down, dumping its load at the will of the operator, by simply pushing the trip.

This carrier can be used for carrying ashes, etc. It is equipped with Louden high speed chain hoist and is mechanically right.

LOUDEN COAL CARRIER

High Speed Twin Chain Hoist.

A planetary gear hoist that will raise and lower quickly; is strong, sturdy, and operates easily.

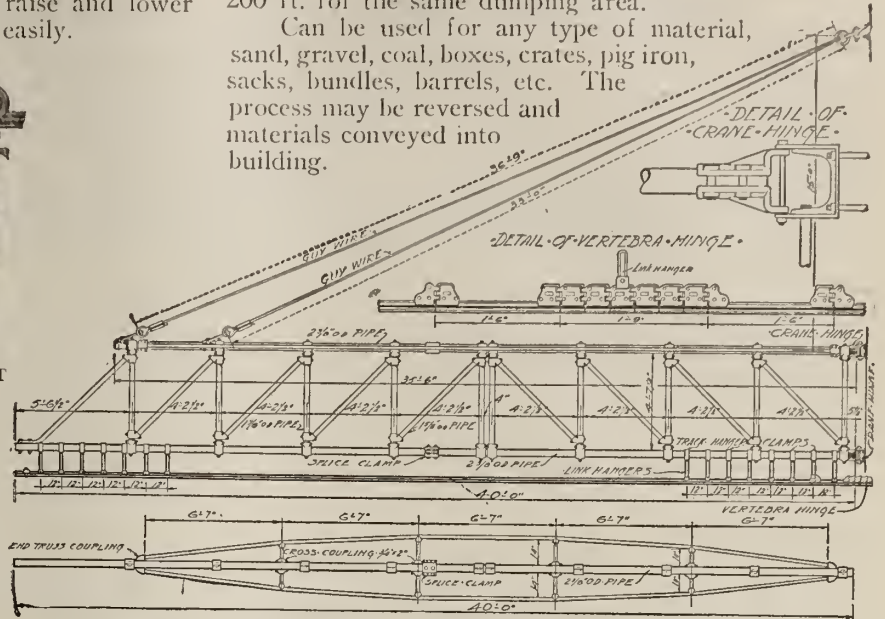

LOUDEN HIGH SPEED TWIN CHAIN HOIST

For lifting and carrying long, cumbersome loads weighing up to 1 ton, this is the ideal hoist to use.

It is also used for carrying long bundles of pipe, timbers, crates, boxes, or in fact, any kind of material or style of load that requires a lift from 2 points.

line out from the building it would have to extend out 200 ft. for the same dumping area.

Can be used for any type of material, sand, gravel, coal, boxes, crates, pig iron, sacks, bundles, barrels, etc. The process may be reversed and materials conveyed into building.

DETAILS OF CONSTRUCTION OF LOUDEN SWINGING STEEL CRANE

OVERHEAD SPACE UTILIZED BY LOUDEN CARRYING SYSTEM AND FLOOR FREE FROM CONGESTION

Six 2-way switches connect main line up with 6 branch tracks. Main track forks into 2 parallel tracks at back.

Louden Swinging Steel Cranes.

Hinged to building above door in line with overhead track and extend out over yard from 12 to 40 ft., according to crane length. No posts or supports are necessary in yard. Afford extremely large dumping area. Consider 40-ft. crane for piling up coal swinging in a semicircle with a radius of 40 ft.; the crane covers an area of over 2500 sq. ft. If track were one straight

Traveling Cranes.

Two main tracks parallel with each other, at any desired distance apart, run the entire length of the room. Operating back and forth on these tracks are trolleys which carry a cross track running at right angles to the two main tracks. This cross track crane carries a trolley and a hoist, making it possible to work from one side of the room to the other. Every foot of space in the room is accessible to the hoist. Overhead support may be ordinary 2 by 12-in. timber or an I-beam. Entire outfit strongly constructed and operates over more floor space than any other device.

TYPICAL INSTALLATION LOUDEN TRAVELING CRANE

Co-operative Service.

The engineering department of this company will cheerfully figure on all conveying requirements. These men come in contact with many different classes of installations, where various kinds of work and material are handled and complicated systems of track arrangements are necessary. As a result of their experience, the department is a clearing house for ideas on this line of work. Send for the complete catalogue, which shows scores of installations for almost every class of conveying work imaginable.

MATHEWS ROLLER SPECIALTIES.

Standard Conveyers.

SINGLE ROLLER CONVEYER UNITS—Light, medium and heavy construction used for handling light, medium and heavy sizes and weights of merchandise packed in boxes, crates, fiber cartons, barrels, kegs, etc., also miscellaneous articles and commodities having one smooth, reasonably hard surface.

DOUBLE ROLLER CONVEYER UNITS—Light, medium and heavy construction, designed for handling boxes, crates, cartons, etc., running to unusually large sizes and heavy weights.

SPECIAL PATENTED FLANGE ROLLER UNITS—Designed for handling brick, hollow tile, cement blocks, and miscellaneous building materials.

SPECIAL PATENTED DOUBLE AND SINGLE ROLLER CONVEYER UNITS—Designed for handling lumber, lath, flooring, siding, dimension stuff, etc.

SPECIAL PATENTED, BALL BEARING WHEEL CONVEYER UNITS—Designed for handling shingles, green brick, cement blocks, tile, etc., on pallets, also light boxes of canned goods of uniform size.

GRAVITY SPIRAL CHUTES—A sheet metal runway built around a metal standpipe or open core, as conditions and requirements may demand. Function is to carry by gravity any kind of package or loose merchandise from upper floors of building to various destinations on lower levels. No positive control of the speed of packages is possible with this type of spiral except such as is exerted by friction produced by contact with bed plates and side guards.

AUXILIARY CONVEYING UNITS AND DEVICES—Consisting of various kinds of switches, counterbalanced hinged sections, deflectors, frogs, stops, etc., all of which are frequently employed in complete factory or warehouse systems to accomplish continuous routing of packages in conformity with an efficient scheme of distribution, or to facilitate the flow of products through a series of processes from one department to another.

ROLLER SPECIALTIES—Consisting of ball bearing steel rollers of various diameters for individual assembly in belt conveyers, and numerous other commercial purposes, lumber dollies, car door rollers, roller trucks, etc.

CURVE UNITS—Standard 90° and 45° curve units are furnished for use in connection with all types of straight roller conveyer units. Curves of any desired angle or radius are also designed to meet special or unusual requirements.

All types of roller conveyers will handle ordinary boxes and other flat, smooth packages, on a grade of 4% or less, depending upon character and weight.

MATHEWS GRAVITY SINGLE ROLLER CONVEYER

AUTOMATIC ELEVATORS—Consisting of straight-lift and inclined types. Designed to operate in connection with gravity roller conveyer, runways permitting installation of complete conveying systems for interdepartment transportation, serving all floors of factories, warehouses, etc. Function of elevators is to receive boxes, crates, cartons, etc., from roller conveyer runways at lower levels and carry same to higher levels, the act of receiving and discharging being accomplished without an attendant.

GRAVITY ROLLER SPIRALS—Practically a continuation of a straight line of gravity roller conveyer units, but so constructed that packages move in a circle of limited diameter while descending from upper to lower levels, the movement being gentle to avoid injury to fragile containers or contents thereof. When desired downward vertical distance has been traveled, the packages are brought out of spiral onto connecting line of portable or permanently placed units of roller conveyer, thence to destination.

ILLUSTRATION—A photographic reproduction of a standard 8-ft. unit of gravity roller conveyer, joined by means of an universal coupling to a standard 90° curve unit. Nearly all types of Mathews roller conveyers are designed for use either portably or installed in permanent locations. Portable units are supplied with universal couplings, making the sections interchangeable. Permanently installed units are supplied with strap couplings, consisting of fish plates and bolts. Curves are reversible, permitting turning of a portable line of carrier in either a right-hand or left-hand direction. Supports of different kinds are furnished, depending upon how the conveyer is to be used.

CROSS-SECTIONAL DIAGRAM OF MATHEWS BALL-BEARING ROLLER

Ball Bearing Roller.

The cross-sectional drawing above clearly indicates the general design and structural details of a Mathews ball bearing roller. Illustration shows the $2\frac{1}{4}$ in. in diameter size. Two larger diameters are made, one $2\frac{1}{2}$ in. and the other $3\frac{1}{4}$ in. These three standard sizes do not differ in general design, but the materials in the two larger sizes are heavier and stronger than those used in the smaller size shown.

The following specifications will indicate the general correlation of the different parts in the complete roller and frame assembly.

General Roller Specifications.

These apply to the $2\frac{1}{4}$ -in., $2\frac{1}{2}$ -in. and $3\frac{1}{4}$ -in. sizes.

No. 1—Frame rail made of bar steel $2\frac{1}{2}$ in. wide by $\frac{1}{4}$ in. thick, slotted on upper edge to receive ends of roller axles.

No. 2—Lock bar made of bar steel $1\frac{1}{2}$ in. wide by $\frac{1}{4}$ in. thick, slotted to fit over ends of axles, holding them in rigid position.

No. 3—"U" brace, made of bar steel $1\frac{1}{2}$ in. wide by $\frac{1}{4}$ in. thick, used to tie frame rails together.

No. 4— $\frac{5}{16}$ in. by $\frac{3}{4}$ in. bolts, used for fastening "U" braces to frame rails.

No. 5— $\frac{5}{16}$ in. by $\frac{3}{4}$ in. bolts, used for fastening lock bar to frame rail.

No. 6—Roller tube, cut from No. 16-gauge cold drawn seamless steel tubing.

No. 7—Roller axle, made of structural steel $\frac{7}{16}$ in. in diameter.

No. 8—Housing made cup-shaped to receive the detachable bearing, of .065-in. dead soft stamping steel.

No. 9—Cone (or sleeve) forming part of ball race, made of cold rolled screw stock, $\frac{3}{4}$ in. in diameter, bored to fit around the axle snugly, but with sufficient play to permit it to revolve slowly when roller rotates under load. Cone is thoroughly case hardened.

No. 10—Flanged steel ring, case hardened, shaped to form inner wall of ball cage, and outer part of ball race; made from .095-in. stamping steel.

No. 11—Retaining washer, case hardened, shaped to form outer wall of ball cage; made from .065-in. stamping steel.

No. 12—Lock ring, designed to bind parts Nos. 10 and 11 together, keeping space in ball cage constantly uniform; made from .035-in. stamping steel.

No. 13—Balls—11 in number, filling the ball race evenly; quality high grade, $\frac{1}{4}$ in. in diameter, made of hardened chrome tool steel.

It will be noted that the assembled detachable bearing is so designed that all parts are positively locked together. When bearing is inserted it is held in position by lock ring (No. 12) coming into contact with housing (No. 8) and by cone (No. 9) fitting against inside surface of frame rail (No. 1). The housing (No. 8) is firmly fastened into ends of roller tube by deep prick punching at three points.

DOUBLE ROLLER CONVEYER STRAIGHT UNIT
Curve units of any desired degree made to fit purchaser's requirements

PATENTED WHEEL CONVEYER STRAIGHT UNIT

Curve units of any desired degree made to fit purchaser's requirements. Construction consists of ball bearing steel wheels, $2\frac{3}{4}$ in. in diameter, $\frac{1}{2}$ in. face, assembled on 3-in. centers, bolted to steel frame rails; standard width, from center to center of wheels, $12\frac{1}{2}$ in. Made any desired width to suit requirements. Suitable for conveying bundles of shingles and boxes of uniform size

Automatic Package Elevators.

The distribution of merchandise packages from lower to upper floors or direct routing of freight from cars to various floors of factory or warehouse is being accomplished efficiently and economically by means of Mathews automatic straight-lift and inclined elevators.

When used in automatic relation to connecting gravity conveyer lines these speedy elevators find their greatest sphere of usefulness and maximum efficiency. Equipped with positive package ejectors, carriage control, safety devices, power discharge stations, etc.

Handle boxes, barrels, crates, cartons, or any character of container having firm, substantial construction. Straight-lifts are made in three standard sizes. Inclined types are simpler in design and generally employed for two-floor service only.

MATHEWS AUTOMATIC ELEVATOR OPERATING BETWEEN FLOORS

Heavy Duty Roller Conveyers.

It frequently happens that the service required of a gravity roller conveyer is of an unusually severe nature. The packages or commodities may run to extreme sizes and weights, or the installation may be surrounded by conditions which cause rapid deterioration, such as the presence of moisture, steam, acids and salts, usually prevailing in dairies, creameries, ice cream factories, meat and fish packing plants, etc.

The company's engineers made a careful investigation of these adverse conditions and conducted a series of chemical and mechanical experiments covering a period of several months. The Mathews heavy duty roller conveyer is, therefore, a product built upon a thorough knowledge of requirements—not mere theories.

The conveyer is also being applied to the handling of pig iron, billets, forgings, castings, shells, bars, angles, etc.

MATHEWS HEAVY DUTY ROLLER CONVEYER

Gravity Spiral Conveyers.

The adoption of the gravity spiral conveyer as a substitute for platform elevators in handling down-coming merchandise has been almost universal in recent years, especially in large wholesale and retail establishments.

Where packages or products are fragile and liable to injury, a Mathews double roller spiral conveyer (patented) may be substituted for the spiral chute. Roller spirals control the movement of packages, eliminating breakage and damage, also permit accumulating and storing of packages without danger of jamming, or buckling.

The Mathews gravity spiral conveyers are the outcome of correct design and scientific construction applied to high grade material. Made in several standard styles or of special design for inside or outside installation.

MATHEWS GRAVITY SPIRAL CONVEYER

Conveying Systems.

In studying the application of gravity conveyance to factory, wholesale and warehouse use, certain limitations were encountered which resulted in the invention of other correlated conveying devices.

This company now has complete systems for accomplishing continuous transportation of packages between all departments connecting all floors, and with extensions to adjacent building.

By means of automatic straight-lift and inclined elevators, gravity roller spirals, gravity spiral chutes, straight chutes, curves, switches, deflectors and power conveyers, operating in automatic relation to gravity conveyer lines, all objective points can be linked together to conform to special or standardized routing plans, and designed to fit into existing structures without expensive alterations.

MULTIPLE TREAD SPIRAL CHUTE

Gravity Roller Conveyers.

To secure continuous routing, save rehandling, conserve floor space, eliminate waste of time and labor and to speed production and shipping, are the elements which make for efficiency in the handling of merchandise as well as a wide range of raw materials and finished products.

The principle of gravity conveyance has been scientifically developed by Mathews' engineers during 15 years of continuous contact with conveying problems of every description, and today is being successfully applied to the handling of boxes, crates, cartons, barrels, kegs, trays, cans, drums, etc.

The Mathews specialty is roller conveyers, made of light and heavy construction and in single and double roller types. All parts are of high grade steel. Rollers are of cold drawn seamless tubing, fitted with detachable ball bearings and through axles.

MATHEWS GRAVITY ROLLER CONVEYOR DESCRIBING A SHARP CURVE

Patented Lumber Conveyers.

Construction consists of two parallel rows of steel, ball bearing rollers assembled in 12-ft. steel units having three frame rails. The rollers are so arranged that lumber will not run off, although no guard rails are used.

Units are provided with universal couplings the same as the other styles of portable conveyers; boards of any width or length can be sent over these rollers in any desired direction—around corners or through tight places where teams can not go—using a down-grade of only 4%. Curves of 90° and 45° are also furnished, when needed, for proper routing to desired destination.

MATHEWS PATENTED LUMBER CONVEYER

Mathews Gravity Brick Conveyor (Patented).

Another labor saver which has won popularity and a prominent place in plants where clay, concrete and

cement products are made. As a substitute for wheelbarrows this conveyer has been approved and adopted by hundreds of brick makers throughout the country. All of the leading steel and iron mills are using thousands of feet for quick handling of fire brick.

Rollers are steel, with ball bearings, and have flanges at each end which act as guard rails, without creating friction. Units are furnished in straight lengths 4 and 8 ft. long, also 90° and 45° curves, all equipped with universal couplings for portable use. Conveyers are made in standard widths of 8, 10, 12, 14 and 16 in.

MATHEWS GRAVITY BRICK CONVEYER

Building Material Conveyers.

The handling of cement, wall plaster, etc., in sacks is being successfully and economically accomplished by means of the Mathews gravity roller conveyer, and is being used today by many retailers, wholesalers and manufacturers, as well as prominent building contractors.

Units are furnished in straight and curve sections in lengths and weights suitable for portable use, and constructed of high grade steel throughout.

Mathews Service.

Sales and engineering offices are maintained in all the leading cities in charge of experts who are available for consultation on short notice. Branch office services are rendered without cost or obligation, and engineers are urged to make full use of the facilities provided.

In cases where correspondence with the home office is preferable, full details concerning conveying problems should be submitted in first letter, accompanied by pencil sketches or blue prints showing the objective points to be connected by conveyer units, distances, elevations, etc.

State minimum and maximum sizes and weights of boxes, crates, cartons or packages to be handled. In the case of milk cans, pails or other round containers, give diameter, height and weight. If barrels, give diameter of head and bilge, height, weight and whether they are to be conveyed filled or empty. Describe fully the size, shape and weight of any odd or unusual form of package or container. Give accurate distance articles are to be conveyed, and if curves are desired give degree of curves; also state any variation in floor levels on which the carrier line will be supported.

These data are absolutely essential to intelligent consideration of any conveying requirements, and strict compliance with these instructions will enable the company to prepare drawings and proposals without unnecessary loss of time.

NATIONAL CONVEYING EQUIPMENT CORPORATION

TELEPHONE:
ALBANY 67

1752-1772 North Kolmar Avenue
CHICAGO, ILL.

Products.

PORTABLE CONVEYORS, Flight, Belt, Pan; ASH ELEVATORS.

Conveying Equipment of every description.

National Quality, Service and Guarantee.

The design and construction is along correct mechanical lines and affords the maximum strength necessary to withstand long, hard and continuous use. Friction has been reduced wherever possible and the cost of upkeep is practically nil. From the selection of materials to the testing and proving of the finished product, exacting supervision at each point of manufacture insures the high standard of National quality, strength and durability. Each machine is thoroughly tested under power before leaving the shop.

Whenever necessary, the company will supervise the installation of conveyors purchased from them, without charge to the customer. They are equipped to render service in all localities and will back up their guarantee that any equipment purchased from them must give the service rightfully expected of it.

Portable Conveyors; Scope of Use.

Adapted for handling materials such as coal, coke,

sand, gravel, crushed stone, cement, brick, clay, earth, ore, steel turnings, borings, scrap, ashes, clinkers, iron sponge, oxide, chemicals, salt, grain, fertilizer, etc.

May be used for piling or loading direct from hopper car or ground storage; for conveying from car to storage bin or overhead hopper; for conveying from ground storage to boiler room; for conveying direct from car or from ground pile to stokers.

Handled on wheels or overhead trolley.

Operating Cost and Results.

Man power is greatly multiplied by use of National conveyors at an operating cost of approximately 5¢ per hour. They speed up the men by doing the hard work, and, wherever installed, the handling charges invariably decrease.

National conveyors provide an efficient, yet inexpensive means for saving time, labor and money.

Special Conveying Equipment.

This company also build stationary conveyors of every description. Fabricating facilities are adequate and special designs not covered by stock equipment will be submitted.

Plans and estimates furnished.

Type A-1 Steel Flight Conveyor

Constructed of steel throughout. Operates with safety at 45°. Can be provided with slide gates for solid piling. Constructed entirely of steel, the depreciation is very small. Stands the strain and rough usage of coal handling better than any rubber or composition belt possibly could.

Type A-2 Dished Belt Conveyor

Consists of 4-ply 20-in. rubber belt provided with 2½-in. steel cleats. Dished idlers running on hollow shafts packed with grease and equipped with grease cups. Operating angle 30°. Every safeguard is provided to insure long life of the belt. Baffle boards are inbuilt to prevent material falling on underside of belt. Receiving end totally enclosed. Ideally adapted for handling all kinds of abrasive materials.

TWO TYPES OF THE NATIONAL PORTABLE CONVEYOR

Made in lengths of 20, 24, 28, 32, 36, and 40 ft. lengths. Adjustable wheeled frame. Delivers at any height up to 30 ft. Capacity over 60 tons per hour. Handles all size materials up to 20 by 20 in. Constructed along correct mechanical lines, great strength is concentrated where strength is most needed. Has extraordinary balance and is strictly portable. Unequaled for truck or car loading. Combines speed capacity and large operating radius.

TYPE B NATIONAL COMBINATION CONVEYOR

A general purpose conveyor. Meets all classes of railway equipment. Can be handled on wheels or overhead trolley. Unloads hopper bottom, gondola or box cars with equal facility. Stores direct from car to shed or boiler room. Made in lengths of 16, 20, 24, and 28 ft. All steel construction. Depreciation very small. Operating angle 40°. Electric motor or gaso-line engine drive

TYPE B CONVEYOR SUSPENDED FROM TROLLEY

Take off the wheels and set into a car, it follows the coal from one end of car to the other. It is always up against the coal. No trimming, wheeling or piling necessary

TYPE C NATIONAL DISHED BELT CONVEYOR

Handled in same manner as Type B. Made in lengths of 16, 20, 24, and 28 ft. Belt 4-ply rubber, 20 in. wide, provided with steel cleats 2½ in. high. Dished idlers run on hollow shafts equipped with grease cups. Frame, angle steel, riveted at all connections. Receiving end totally enclosed prevents material creeping on underside of belt. Baffle boards inbuilt insures maximum belt protection

SIDE ELEVATION, FLIGHT CONVEYOR

PIG IRON CONVEYOR

SIDE ELEVATION, BELT CONVEYOR

TYPE A-1 NATIONAL PORTABLE CONVEYOR EQUIPPED WITH SLIDE GATES FOR SOLID PILING

Stores 22 tons of coal per lin. ft. Piles 250 tons without moving conveyor

ENCLOSED ASH ELEVATOR

VARIOUS APPLICATIONS OF NATIONAL CONVEYORS

SAMUEL OLSON & CO.

Conveying and Elevating Machinery

TELEPHONE:
ARMITAGE 780, 781

2418-2422 Bloomingdale Avenue
CHICAGO, ILL.

Products.

CONVEYING and ELEVATING MACHINERY for handling materials of every description:

Coal and Ash Handling Elevators and Conveyors, Subveyors, Packing House Conveyors, Ice Handling Machinery, Spiral Chutes, Spiral Fire Escapes, Gravity and Belt Conveyors, Store and Office Service Conveyors, Patented Automatic and Pivoted Tray Elevators, Steel and Wood Apron Conveyors.

Power Transmission Machinery, Flour Blenders and Patented Automatic Proofers for Bakeries.

Conveyors, Spiral Chutes and Elevators.

GRAVITY CONVEYORS AND SPIRAL CHUTES—Gravity conveyors afford an economic medium of distribution of commodities within plants irrespective of their characteristics. Working in conjunction with spiral chutes, an ideal system is placed at the disposal of those whose business necessitates the storing of merchandise on various floors previous to final shipping.

BUCKET ELEVATORS—Can to advantage be efficiently employed in elevating bulk commodities such as sand, gravel, cement, coal, grain, flour, etc.

BELT CONVEYORS — Appropriately designed, they are the logical equipment with which to convey any and all commodities, ranging from coal and ore to the very lightest of packages.

Automatic Elevators.

Olson automatic elevators will prove thoroughly efficient in handling packages, boxes, bags, etc., from the basement or lower floors to any desired upper floors; also for lowering packages, etc., from any floor above to any floor below. In other words, goods may be elevated on the upward moving trays unloading automatically on any desired floor, and other goods simultaneously being lowered on the downward moving trays automatically unloading at any desired floor below.

SECTION OF BUCKET ELEVATOR

AUTOMATIC ELEVATOR

Co-operative Service.

Engineers should use the vast experience of SAMUEL OLSON & Co. in solving intricate handling problems. Previous to making final decision as to any type of conveying machinery, consult this company. Recommendations particularly adapted for exact conditions will be supplied by experts.

PORTION OF A COMPREHENSIVE CONVEYING AND ELEVATING SYSTEM INSTALLED IN PLANT OF AMERICAN CAN CO., MAYWOOD, ILL.

THE PERRINE STORE SERVICE CO.

Pneumatic Tube Systems and Conveying Apparatus

412 South Sixth Street
MINNEAPOLIS, MINN.

Products.

PNEUMATIC TUBE SYSTEMS, POWER SAVING DEVICES, BELT CONVEYORS.

Light Hand and Electric Lifts; Cash and Parcel Carriers.

Pneumatic Tube Systems.

Types—Vacuum—Independent, twin tube line for each substation. Operated by low pressure, positive blower.

Pressure—Combination pressure incoming lines serving 3 to 4 substations each. Pressure outgoing line to each substation. Operated by low pressure, positive blower.

Vacuum Pressure—Vacuum incoming lines serving 3 to 6 substations each. Pressure outgoing line to each substation. Operated by either 1 or 2 low pressure, positive blowers.

Automatic Pressure—Single tube for service in both directions between various stations. Equipped at each end with terminal, which automatically maintains air flow only while carrier is in transit. Operated on 5 lbs. air pressure from special compressor unit or reduced from high pressure air service.

Especially adapted to light traffic.

Foot Power—Single tube, for service in both directions between stations, with foot power operated compressor at each end.

For light service and distances not exceeding 200 ft.

SIZES OF TUBES—2¼-, 3- and 4-in. outside diameter tubing and 3 by 6-in. and 4 by 7-in. oval tubing;

except foot power, which is 2¼- and 3-in. outside diameter tubing only.

Cost—This company can save 15% to 25% on cost of pneumatic tube systems for your requirements. Quotations can be made from the building plans; merely submit plans showing approximate location of stations.

The table below will be of value in approximating the cost of equipment under consideration. (Submit plans for definite quotation.) These costs are based on installations made by THE PERRINE STORE SERVICE CO. at:

Washburn-Crosby Co., Minneapolis, Minn.
U. S. Railroad Consolidated Ticket Office, Minneapolis, Minn.
Powers Mercantile Co., Minneapolis, Minn.
T. S. Martin Co., Sioux City, Iowa
Willys-Overland Co., St. Paul, Minn.

Swift & Co., South St. Paul, Minn.
Swift & Co., Chicago, Ill.
Cleveland Hotel, Cleveland, Ohio
Morris & Co., Chicago, Ill.
Armour & Co., South St. Paul, Minn.

TYPICAL INSTALLATION PERRINE
VACUUM PRESSURE PNEUMATIC
TUBE SYSTEM

TERMINALS PERRINE AUTO-
MATIC PRESSURE PNEU-
MATIC TUBE SYSTEM

Power Saving Devices.

For automatically cutting off air flow through the tubes when the carriers are not in transit. For both vacuum and pressure systems. They are extremely simple in construction and have no electric wiring or auxiliary air connections to get out of order.

Actuated by the presence of the carrier anywhere in the line, they are the only devices on the market which will always maintain air flow until carrier is delivered.

Covered by patents in United States and Canada.

PERRINE POWER
SAVING DEVICES

Belt Conveyors.

Especially designed for handling merchandise in department stores and wholesale houses.

CONSTRUCTION—Both wood and steel framing; semi-oilless bearings; cut rawhide pinion drive; ceiling or floor supports.

SIZES—Width of belt, 12, 18, 24, 30 or 36 in. Larger sizes special to order.

APPROXIMATE COST OF PNEUMATIC TUBE SYSTEMS, INSTALLED

Type of system	Size of tubing, in.	Tubing material	Number of sub-stations	Size of building, ft.	Number of floors served	Average length of line, central to substation, ft.	Maximum horse power required	Industry served	Cost per sub-station	Total cost of system complete 1

"B," 2 unit, 2 vacuum incoming lines and 2 banks selective pressure outgoing lines.

"C," 3 unit, 3 vacuum incoming lines and 3 banks selective pressure outgoing lines.

"F," combination vacuum incoming lines and independent pressure outgoing lines equipped with power saving devices.

"M," automatic pressure, air compressor unit included.

"N," automatic pressure, air compressor unit not included, but pressure reducing valve only.

PORTABLE MACHINERY CO., INC.

Manufacturers of Scoop Conveyors

PASSAIC, N. J.

Product.

SCOOP CONVEYOR, a Portable Belt Conveyor, Wagon Loader, Car Loader and Unloader.

Description.

The Scoop conveyor is a light weight portable belt conveyor, designed to be handled by one man and to assist the hand shoveller in moving materials, such as coal, coke, ashes, sand, crushed stone, gravel and similar materials. It is also used for conveying manufactured products of various kinds, such as packages, boxes, barrels, bags, etc.

Over 2000 scoop conveyors are now in use by contractors, railroads, coal dealers and by manufacturing plants covering almost every conceivable industry.

The Scoop conveyor saves from 6 to 12 men in storing and reclaiming, loading or unloading cars, trucks or wagons. It keeps equipment moving and saves car demurrage.

METHOD OF TRANSPORTING THE SCOOP CONVEYOR

Exclusive Features.

One distinctive feature is the scoop on the feeding end, which can be pushed or completely buried into the material to be conveyed. Thus, instead of lifting the material up by shovelfuls into the feeding hoppers fitted to ordinary portable belt conveyors, it is simply scraped onto the carrying belt and saves 50% of labor in feeding. The scoop also makes it possible to use the Scoop conveyor in unloading hopper bottom cars without providing a track hopper or pit. Besides saving the cost of constructing a track hopper, the Scoop conveyor facilitates unloading of hopper bottom cars at any point along the track.

Another distinctive feature is the construction of the sides or skirt plates. These form a trough, giving a 12-in. belt a carrying capacity equal to a 20-in. trough belt.

SCOOP CONVEYOR

The Scoop conveyor has a wide range of adaptability

TRADE-MARK

Specifications.

SIZES—Built in 6 sizes as follows: 12 in. by 14 ft., 16 in. by 14 ft., 12 in. by 20 ft., 16 in. by 20 ft., 12 in. by 24 ft. and 16 in. by 24 ft. Sizes 12 in. by 14 ft. and 16 in. by 14 ft. are suitable for loading or unloading box cars, small industrial cars or for use in limited space. Sizes 12 in. by 20 ft., 16 in. by 20 ft., 12 in. by 24 ft. and 16 in. by 24 ft. are adapted for loading and unloading trucks or cars and for stacking materials. Size most suitable is governed by height and reach required to meet operating conditions.

MOTOR POWER—Furnished either with or without electric motor or gasoline engine as preferred.

CAPACITY—Both the 12- and 16-in. sizes will carry 1 ton per minute of material weighing 50 lbs. per cu. ft., providing trough is kept even full. Belt on 16-in. size travels at slower speed, because it is intended only for handling larger size pieces than can be safely handled on 12-in. size. For handling material containing cubes measuring over 9 in., 16-in. size is recommended.

SCOOP CONVEYOR IN OPERATION

FEEDING—From storage pile, 1 man can feed 1 ton of material that will pass a 1-in. ring in 1½ minutes, providing storage pile is 8 ft. in height or over. If material is large in size or storage pile is low, it will require several men to feed machine to full capacity.

Guarantee.

The company guarantees that the Scoop conveyor repair costs through wear, including conveying belt renewals, will not be over 1½c. per ton of material handled when conveying coal, coke, ashes, sand, crushed stone or similar material.

Information Required When Making Inquiries.

State operating conditions; kind of material to be handled; power available; where material is received and delivered, etc.

SCOOP CONVEYOR OPERATING IN LIMITED SPACE

ROBINS CONVEYING BELT COMPANY

Manufacturers of Robins Conveying Machinery

13-21 Park Row
NEW YORK, N. Y.

BRANCHES AND AGENCIES

CHICAGO, ILL., Old Colony Building
SALT LAKE CITY, UTAH, Newhouse Building
SAN FRANCISCO, CAL., GRIFFIN Co.

PITTSBURGH, PA., Union Arcade Building
BIRMINGHAM, ALA., C. B. DAVIS & Co.
TORONTO, CAN., GUTTA PERCHA & RUBBER, LTD.

Products and Services.

Manufacturers of CONVEYING MACHINERY.

This company furnishes Belt Conveyors, Unloading Towers, Stock and Reclaiming Bridges, Coal Storage and Reclaiming Systems, Coke Cooling Wharfs, Ore Bedding and Reclaiming Systems, Standard and Adjustable Coal or Coke Crushers, and the auxiliary equipment such as Chutes, Feeders, Screens of various types, etc.

The ROBINS CONVEYING BELT COMPANY is prepared to Design and Install Conveying Machinery to meet any requirement.

Scope of Use.

Robins conveying machinery is handling coal, coke, ashes, ore, limestone, clinker, cement in bulk and in bags, wet concrete, sand, crushed stone, dirt, gypsum, phosphate rock, salt, grain, wood chips and pulp, rubbish, packages of all kinds and many other materials.

Lubrication.

Robins machinery parts are fitted for compression grease cup lubrication to protect the bearings from dust and corrosion. Consequently, troubles resulting from these causes are practically eliminated under the most severe operating conditions.

ROBINS UNLOADING, STOCKING, RECLAIMING AND CONVEYING MACHINERY

LOCOMOTIVE COALING STATION OF THE ERIE R. R. AT CROXTON, N. J.

Belts.

Robins conveyor belts are made in a number of different grades, both of the stepped-ply and straight-ply construction, each grade being designed to give the most economical service under certain operating conditions. If this company believes that none of their brands of belts will give satisfactory service because of unusual conditions, they will manufacture a special grade of belt for the work.

Robins stepped-ply belts have thicker rubber cover in the center than at the edges, thus giving more protection where the abrasion is greatest. A belt of this construction is flexible laterally, allowing it to conform to the shape of the troughing idlers, and causing it to run true even when empty.

ROBINS PATENTED STEPPED-PLY BELT

Handbook.

The Robins "Handbook of Conveyor Practice" will prove of value to engineers who are planning for or designing conveyor installations. It contains a group of useful tables concerning capacities, power requirements, speeds of conveyors and similar matter; also dimensions of conveyor parts, together with general data on conveyor practice. A copy will be gladly sent on request.

R-W "OVER-WAY" TROLLEY and I-BEAM OVERHEAD CARRYING SYSTEMS, LIFT WAREHOUSE DOOR HARDWARE, FIRE DOOR and FIRE SHUTTER FIXTURES.

Manually Operated Cranes; Jib Cranes; Portable Cranes; Yale Hoists; Store Shelves and Ladders; Angle Iron Door Frames; Warehouse Door Hangers; Door Hangers and Track for Sliding Doors of all kinds and weights; Garage Door Outfits; Elevator Door Hangers; Elevator Door Closer and Check; Sliding Partition Door Hardware; Swing Door Closers and Checks; Hardware Specialities.

used for storage purposes. Send detail of overhead construction, so proper brackets will be furnished.

Co-OPERATIVE SERVICE—On receipt of requisite information, detailed drawing of equipment to meet requirements will be submitted for approval.

TROLLEY OVERHEAD ROLLER BEARING SWIVEL CARRIER

Nos. 100-11 and 100-13. For curved track. Made for 4 sizes of track and 6 capacities

TROLLEY OVERHEAD CARRYING TRACK BRACKETS

"Over-Way" Trolley and I-Beam Overhead Carrying Systems.

"Over-Way" conveying equipment constitutes the most efficient labor saving devices manufactured for any size factory or machinshop for handling loads up to 4 tons. The tracks are in a position where they are free from obstruction and always ready for instant use. Factory handling costs are reduced to a minimum, and available floor space increased by hundreds of square feet. Equipment includes overhead tracks, brackets, trolleys, carriers, hangers, switches, cross-overs, turntables and Yale hoists.

ERECTION—To insure proper erection, blue prints are furnished in detail and all material marked to correspond.

INFORMATION REQUIRED—Always send sketch giving correct dimensions and proposed layout of tracks. State weight and size of maximum load, whether for constant or occasional use, and whether track will be

Always specify by number, stating size and weight of I-beam.

Fire Door and Fire Shutter Fixtures.

This line of fire door equipment is the most complete in the United States, and includes all types, as follows: inclined and level track, flat or round, vertical and horizontal sliding doors; swinging doors, single and double. Also fire shutters and trap fire door fixtures.

Fixtures marked with * in table are approved by the Underwriters' Laboratories, Inc. Hardware furnished to meet special requirements.

Corrugated sheet metal fire doors lined with asbestos, approved and labeled under the direction of National Board of Fire Underwriters.

Tin clad fire doors, approved and labeled under the direction of National Board of Fire Underwriters.

For more detailed data, ask for fire door hardware catalogue. Blue prints sent on request.

NO. 102 MONARCH FIRE DOOR FIXTURES
Recommended where headroom exceeds 3 ft.
Two fusible links, one in opening and one near ceiling. Door closes by gravity

DATA, FIRE DOOR FIXTURES

Type of door	Fixture number	Round or flat track	Clearance above top of opening, in.	Clearance required at side of opening	
				Where doors slide or swing, in.	Opposite side, in.
Incline track sliding door	102*	Flat	14†	Width of opening + 22	13½
	201*	Flat	14†	Width of opening + 19	13½
	645*	Round	12†	Width of opening + 18	13½
	646*	Round	12†	Width of opening + 15	13½

	604*	Round	12†	Width of opening + 15	
Single swing doors	206		9	10	3½
	406*		9	11	3½
	606		none	3½	3½
Swing doors in pairs	306		10	10	10
	506*		10	11	11
	706		3½	3½	3½
Side wall required					
				Doors under 300 lbs.	Doors over 300 lbs.
Vertical sliding doors	203	Flat	Height of opening + 19	15 and 21	21 and 28
	603	Round		16 and 22	22 and 29

Adjustable hanger can be furnished with Nos. 102, 201, 204, 303, 645, 646 and 604 fixtures, and requires 3 in. more headroom above top of opening than rigid hangers.

*Approved and labeled under direction of National Board of Fire Underwriters.

†For arched top openings add ¾ in. for each foot of track back of the center of the opening, to the dimension given. For square top opening add ¾ in. for each foot of track back of edge of opening towards which the door slides in closing, to the dimension given.

Lift Warehouse Door Hardware.

KINDS OF DOORS—One-section turnover door with track supporting top of doors; one-section turnover door, top of door supported by cables, suitable for doors not over 8-ft. high; one-section vertical door; two-section vertical door as illustrated; two-section turnover door.

All of these doors are counterbalanced and operated with geared hand chain hoist. Openings should be fitted with steel channel or angle jambs to provide place for attaching hardware.

Used for factories, warehouses, car shops, piers and similar structures having high doorways which require ponderous doors.

VERTICAL SECTIONS OF VARIOUS STYLES OF LIFT WAREHOUSE DOORS

HOW TO ORDER—Furnish width, height, thickness and weight of doors; space between jamb and side walls or nearest obstruction on each side; and space above opening.

TWO-SECTION R.W. LIFT DOOR AT THE UNIVERSAL TRACTOR WORKS, MOLINE, ILL.

SPECIALTY ENGINEERING COMPANY

Manufacturers of Boiler House Equipment and Conveying Machinery

Allegheny and Trenton Avenues
PHILADELPHIA, PA.

Products.

BOILER HOUSE EQUIPMENT for HANDLING COAL and ASH: Skip Hoists, Track Hoppers, Reciprocating Feeders, Coal Crushers, "V" Bucket Conveyors, Flight Conveyors, Bins, Stoker Spouts, and Weighing Larries.

MACHINERY TO CONVEY MATERIALS in Package or in Bulk: Belt Conveyors, Wagon Loaders, Car Unloaders, Barge Unloaders.

COAL POCKETS, ROTARY SCREENS, BAGGING MACHINES and FEEDERS.

Service.

Estimate drawings and specifications are furnished. The experience of Specialty's Engineers is freely given, both in recommending economical methods of handling materials and in selecting the equipment that exactly meets requirements.

Catalogues and bulletins mailed on request.

Shops are equipped to manufacture any work in structural steel or steel plate construction.

Wagon Loaders.

Type No. 15 is shown below. It loads and screens all sizes of anthracite coal. Malleable iron buckets are attached to a double strand of malleable iron and steel chain. Bronze ball and socket bearings prevent lost power. Large steel hopper for screenings. A set of screens furnished with each loader. Motor in dusttight steel casing.

Several types of loaders to suit various conditions are described in Bulletin 4-A.

WAGON LOADER IN ACTION

Belt Conveyors.

Movable belt conveyors are used for rapid loading and unloading of soft coal, hard coal, ash, coke, bricks, sand, stone, dirt, etc. They are made in standard sizes.

Type No. 1, the 18-ft. machine with a 12-in. belt, is the one used to load trucks and for piling coal to a height of 8 ft. Type No. 3, the 20-ft. machine with an 18-in. belt, is used for larger quantities and for coarser materials. Type No. 2 measures 24 ft. from center of foot shaft to center of head shaft. It piles coal 12 ft. high. Belt conveyors are also made 30 ft. and 60 ft. long. Height of machine is adjustable. Steel frame offers maximum efficiency and long service.

See Bulletin 1-B.

THREE MOVABLE BELT CONVEYORS

Coal Pockets.

Coal pocket shown is of structural steel and concrete; 1200-ton capacity. Equipped with "V" bucket conveyors and flight conveyors to carry coal from the concrete track hopper to the overhead bins. The driveways are under the pocket. There are steel gates and

STEEL AND CONCRETE COAL POCKET

screening chutes over the driveways. Coal may be brought to the pocket from a barge. Pockets also built of wood.

Write for Catalogue No. 4.

Car Unloaders.

Car unloaders to fill bins, load wagons and "stock out." Coal is dumped from a car into a steel lined concrete track hopper. This hopper feeds the endless chain

MOTOR DRIVEN CAR UNLOADER

of steel buckets. Coal is conveyed by a two-way chute to wagons or to ground storage. All-steel angle frame. Standard sizes. Operated by motor or gasoline engine.

Package Conveyors.

Illustration shows a section of a bag conveyor. Bags are placed on the loading platform. Arms or brackets attached to a double strand of chain pass through the platform and pick up the bags. The bags are conveyed to a discharging chute at the head of the conveyor. Conveyors made to carry, efficiently and economically, bags, bales, boxes, barrels, etc., from a lower floor to an upper floor. Electrically operated. These conveyors are used in factories and warehouses.

BAG CONVEYOR

Coal Crushers.

Used to reduce bituminous coal to stoker size. Illustrations show the standard sizes usually installed with a reciprocating feeder. The crusher is fitted with compression springs—a safety guard. Heavy bronze bushed bearings.

Coal crushers are described in Bulletin 6.

DIMENSION DRAWINGS OF COAL CRUSHER

CRUSHER DIMENSIONS (INCHES) AND CAPACITIES

28 x 24... " "	50	7 1/2 to 10
28 x 30... " "	60	12
28 x 36... " "	70	15

Screening Outfits.

Screening outfits electrically operated to screen and store coal. An enclosed conveyor with malleable iron chain and buckets carries coal from a concrete steel lined hopper to a steel chute which feeds the screen. The different sized meshes of the inclined rotating screen assort the coal to standard sizes into separate bins. SPECIALTY ENGINEERING COMPANY makes rotary screens 30 in. in diameter and 8 ft. long mounted on angle frame for screening coal, coke, sand, gravel, etc.

SCREENING OUTFIT

Larries.

For automatically weighing coal and keeping an accurate record of the amount of fuel consumed by each boiler. Made in capacities from 1000 to 10,000 lbs. Hand or electric power. A close spacing of gates may be had and little dead coal left in the bunker. The weighing larry is one part of the complete outfits installed in boiler houses by SPECIALTY ENGINEERING COMPANY. Equipments consist of track hoppers, reciprocating feeders, coal crushers, conveyors, bins, and larries.

WEIGHING LARRY

Skip Hoists.

A cheap method of conveying coal, ash, and other bulk material. A steel bucket is automatically hoisted on vertical tracks by means of a steel cable attached to a winding machine. The bucket dumps into a chute which directs material to a bin.

SKIP HOIST INSTALLATION

THE WELLMAN-SEEVER-MORGAN CO.

Apparatus for Handling and Transporting Raw Materials and Finished Products,
Steel Works Equipment, Coke Oven Machinery, Rubber Machinery

CLEVELAND, OHIO

BRANCH OFFICES

NEW YORK, N. Y. PHILADELPHIA, PA. DENVER, COLO. ATLANTA, GA. SAN FRANCISCO, CAL.
WORKS: CLEVELAND AND AKRON, OHIO

Products.

APPARATUS for HAULING and TRANSPORTING which includes:

Coal and Ore Handling Machinery: Unloaders; Traveling Bridges with Grab Buckets; Car Dumpers; Car Haulages; Transfer Cars; Boat Loaders; Bucket Handling Cranes; Revolving Derricks; Excavating Buckets; Weighing Larries.

Special Cranes: Pontoon, Dock Shipbuilding, for Concrete Handling and Steel Plant Service, Special Purpose.

Hoisting and Mining Machinery: Electric or Steam Hoisting Plants; Cages and Skips; Revolving Car Tipples; Akron Chilian Mills; Safety Detaching Hooks.

Hydraulic Turbines: Horizontal or Vertical with spiral or steel plate cylindrical casings, or for open flume settings.

Steel Works Equipment: Hughes Mechanical Gas Producers and Valves; Open Hearth Furnaces and Metal Mixers; Continuous Heating Furnaces; Charging Machines; Charging Boxes; Manipulators; Forter

Valves; Gantry Cranes; Special Cranes for Heavy Work.

Coke Oven Machinery: Coal Levelers; Door Extractors; Coke Quenchers, Pushers, Loaders.

Rubber Machinery: Tire Applying Presses; Rubber Calenders; Mixing and Grinding Mills; Tubing Machines; Vulcanizing Presses; Moulds and Cores; Iron and Steel Castings; Jobbing Work of all kinds.

Port and Terminal Equipment: Machinery for Loading and Unloading Ships; Handling Freight in Sheds, and Fueling Ships.

150-TON ELECTRICALLY OPERATED REVOLVING-TURRET PONTON CRANE, NAVY YARD, NORFOLK, VA.
A duplicate is at the U. S. Navy Yard, Mare Island, Cal.

FRONT VIEW, W-S-M 3-ROLL STANDARD RUBBER CALENDER, BUILT FOR STAR RUBBER CO., AKRON, OHIO

TRAVELING WHEEL BLANK MANIPULATOR, WITH REVOLVING TROLLEY
Capacities from 1000 to 6000 lbs.

ORE BRIDGE PENNSYLVANIA R. R. DOCKS, CLEVELAND, OHIO
Serves dock space 612 ft. deep and carries a 15-ton bucket.
Transfers ore, weighing while handling.
Capacity, 800 tons per hour

W-S-M EXCAVATING BUCKET
Handles iron ore, coal, crushed stone, cinders, sand, gravel, clay, etc.
Capacity, 20 to 360 cu. ft.

McDERMOTT CONTINUOUS TWIN SCOOP LOADER

W-S-M UNLOADER ON DOCKS OF UNITED STATES STEEL CORPORATION, CONNEAUT, OHIO

The fastest single ore handling machine in the world with a maximum unloading capacity of 850 tons per hour. 7 machines in use on this dock

DOUBLE DRUM HOIST, HIGH TYPE

Driven through one reduction of herringbone gears. Fitted with hand operated clutches and post brakes

OPEN HEARTH CHARGING EQUIPMENT, HIGH TYPE

Built to handle loads from 5000 to 12000 lbs.; furnished with any standard type of motor and control equipment

HORIZONTAL, SINGLE DISCHARGE, REACTION TURBINE FOR HIGH HEADS, MOUNT HOOD RAILWAY AND POWER CO., PORTLAND, ORE.

Speed, 514 r.p.m. under head of 320 ft.; develops 6400 h.p. Bronze runner

SWEET'S CATALOGUE

SECTION, HUGHES MECHANICAL GAS PRODUCER

The only machine with the combination of a revolving fuel chamber and ash bed with a reciprocating, water cooled poker.

Will gasify 3000 lbs. of standard bituminous gas coal per hour, gas containing an average of 168 B.t.u. per cu. ft. and with an ash loss of less than 1%

W-S-M COMBINED COKE PUSHER AND COAL LEVELER FOR SEMET-SOLVAY OVENS

Bulletins.

Separate bulletins, each with full information on its particular subject, have been issued and, on request, will be sent to those interested.

STANDARD CONVEYOR COMPANY

FORMERLY MINNESOTA MANUFACTURERS' ASSOCIATION

MAIN OFFICE AND FACTORY
NORTH ST. PAUL, MINN.

Products.

GRAVITY ROLLER CONVEYORS; GRAVITY SPIRAL CHUTES; POWER CONVEYORS; ELEVATORS.

Co-operative Service.

An office with a competent "Gravity Efficiency" force is in every important city and engineers and contractors are invited to make use of this service.

Gravity Roller Conveyors.

Used for the conveying of boxed and cased goods, brick, lumber, pig iron, shells, tubing, and cylindrical shaped objects, and all merchandise having one hard smooth surface.

STANDARD GRAVITY ROLLER CONVEYOR CONVEYING BOXED AND CASED GOODS

STANDARD GRAVITY ROLLER CONVEYOR IN OPERATION IN LARGE AUTOMOBILE PLANT

Large castings and parts of machine products are moved on sections of gravity conveyor to and from various machines for specific operation. Trucking and operator's time waiting for materials entirely eliminated.

Power Conveyors and Elevators.

Consisting of slat conveyors, belt conveyors, and special conveying machinery, including inclined elevators and straight lift automatic elevators.

Spiral Chutes.

For the lowering of general merchandise for de-

partment stores, wholesale grocery houses, wholesale drug houses, and all establishments of two stories or higher.

Standard spiral chutes are constructed on a scientific basis, absolutely controlling the movement of the material being lowered.

A box or case weighing several hundred pounds will lower at practically the same rate of speed as a small package. Standard spiral chutes are furnished with either single, double or triple chuteways surrounding the same center post.

SPIRAL CHUTE LOWERING BAGS OF SEEDS

POWER SLAT INCLINED ELEVATOR

STRAIGHT LIFT AUTOMATIC ELEVATOR

CHAS. K. ERNST SPECIALTY CO.

Manufacturers of Ash Hoisting Specialties

998 East Ferry Street
BUFFALO, N. Y.

Products.

ERNST TELESCOPIC ASH HOISTS; ERNST AUTOMATIC SAFETY-GUARDED SIDEWALK DOORS; COMBINATION TELESCOPIC ASH HOIST and SAFETY-GUARDED SIDEWALK DOOR with DOOR OPERATING MECHANISM; ERNST PERFECTION CELLAR WINDOW ASH ELEVATOR; ERNST SELF-RAISING SIDEWALK ELEVATOR; ELECTRIC MOTOR DRIVEN ELEVATOR.

Also, Ernst Type "A" Light Sidewalk Elevator.

Ernst Combination Telescopic Ash Hoist and Sidewalk Door with Door Operating Mechanism.

The opening, closing and locking of the sidewalk door is automatically taken care of, when the hoist extension arm is moved in a single operation by operator at cellar floor level.

The automatic guard rail completely encloses the open hatchway to avoid danger of the open door when hoist is being used.

The sidewalk door opens towards the building and is made of a one-piece 3 by 2-in. angle iron frame and checkered steel plate, flush with sidewalk. Furnished in 3 ft. square and 4 ft. square sizes.

Makes one of the best appearing doors made.

TELESCOPIC ASH HOIST—Operated entirely by one man from sidewalk level. The opening, closing and locking of sidewalk door is done by same operator from cellar floor level. The hoist is equipped with an automatic gear shifting device and brake to lower empty cans to cellar by brake, ball bearings on main shaft supporting loads, machined cut gears, and steel safety ratchet, automatic clutch pin, steady pin, $\frac{3}{8}$ -in. steel cable, cable grooved drum.

Hoist operates at a speed of 30 ft. per minute. From 4 to 5 ash cans can be hoisted to grade, before operator has to leave the sidewalk. Capacity, 500 lbs.

Door Opening Completely Safety-guarded on 4 Sides

From 4 to 5 ash cans can be hooked on, hoisted, swung and deposited on sidewalk before operator has to leave the sidewalk

Partly Opened

Shows how door is automatically opened or closed in a single operation by operator turning the telescopic crank from cellar floor level

COMBINATION TELESCOPIC ASH HOIST AND SIDEWALK DOOR

Ernst Perfection Cellar Window Ash Elevator.

This handy and compact elevator makes use of any cellar window 28 in. square or larger, to hoist and swing ash cans, etc., directly to the sidewalk, and can be used in any new or old building to advantage. No changes in window frame are necessary.

Six anchor bolts install elevator rigidly in place to cellar floor and concrete, plastered or wood ceiling. Upright installed but 8 in. from wall.

Elevator is constructed entirely of metal, having a 3-in. iron pipe upright; 21-in. diameter iron platform, powerful cranking mechanism directly attached to upright. Hoisting speed 15 to 25 ft. per minute. Platform lowered on cellar floor, requiring no pit.

CELLAR WINDOW ASH ELEVATOR

Elevator with loaded platform hoisted and swung out of cellar window by operator in cellar. Provides a means of access to grade where no outside areaway has been provided

Ernst Self-raising Sidewalk Elevator.

This lift can be used alongside a cellar window as well as through a sidewalk areaway to handle ashes and materials to and from basements. The platform is counterbalanced, eliminating at least one-half of the time and labor ordinarily required to crank elevator.

Lowers loads from 300 to 1000 lbs. by gravity controlled by hand brake and when platform is empty the platform rises automatically to sidewalk level.

Cranking mechanism is directly attached to uprights, taking up no extra room and is of the endless chain type, eliminating replacements of cable and makes elevators always operate the same.

SELF-RAISING SIDEWALK ELEVATOR

Elevator installed at 3-ft. cellar window with 4 ash cans hoisted to grade ready to be removed. Eliminates an outside areaway and requires but one man to operate. Elevator inclined but 2 ft. 5 in. Can be used with or without pit

Electric Motor Driven Elevator.

Operates elevator at speed of 20 ft. per minute while automatic switch and brake automatically stops platform at both floor levels, requiring but one operator. One of the finest, least expensive motor driven elevators made.

GRAVES ELEVATOR CO., INC.

426 Exchange Street
ROCHESTER, N. Y.

NEW YORK OFFICE, 113-117 Cedar Street

Products.

Manufacturers of PASSENGER and FREIGHT ELEVATORS; ELECTRIC TRACTION ELEVATOR MACHINES, for overhead or basement installation.

Graves Electric Traction Elevators.

CONSTRUCTION—In the construction of Graves traction elevators, passenger and freight, the tractive force is exerted directly on the car cables by passing same over a driving sheave, without any attachment thereto. Cables, anchored in car, pass over sheave, then down over an idler, thence down to counterweight where fastening is made.

ADAPTABILITY—Height of car travel bears no relation to size of drive sheave; therefore, the Graves elevators, freight and passenger, are adapted for efficient use in all kinds of buildings, high or low (Fig. 2).

Graves Traction Type Elevator Machines.

CONSTRUCTION—Simple and durable; built compact, to occupy small space; all working parts are accessible for adjustment and oiling; driving sheave shaft is short and bearings are large, giving strength, great rigidity and long life; a phosphor bronze gear is used, with a steel worm cut integral with worm shaft; worm thrust is taken care of on one end of worm shaft, permitting entire thrust bearings to be removed without disturbing balance of machine. Thrusts are S.K.F. Special (Fig. 1). Machines are built in two types and different sizes to suit requirements and service—straight worm geared for passenger and high speed freight service, and compound geared for slow speed freight service.

FIG. 1. DIRECT CONNECTED ELECTRIC WORM GEARED V-GROOVE TRACTION ELEVATOR MACHINE

Equipped with electric brake. For either overhead or basement installation. Mechanically and electrically correct

OPERATION—These machines provide for operation of the elevator quietly on direct or alternating current, either with push button, car switch or hand rope control. Elevator can not travel into overhead work, being prevented by reason of the special design of the traction feature. The service is efficient, with economical operation.

SPECIFICATION DATA FOR ARCHITECTS—Depth of pit and

Passenger Type, Overhead

Freight Type, Basement

FIG. 2. GRAVES TRACTION ELEVATORS

Two-speed, Full Magnet Dynamic Brake, Direct Current

Full Magnet Controller, Alternating Current

FIG. 3. THE GRAVES MAGNET CONTROLLERS

overhead clearance is governed by car speed, and is specified in State requirements. Size of hatch for wood guides is approximately 18 in. wider post-wise and 2 in. wider front to back than car size. Size of hatch for steel guide is approximately 15 in. wider post-wise and 2 in. wider front to back than car size.

Co-operative Service.

Estimates and specifications for complete traction elevators which prospective purchasers propose to install will be furnished on application.

KAESTNER & HECHT COMPANY

Electric Elevator Builders

OFFICES AND WORKS

Harrison, Throop and Congress Streets

CHICAGO, ILL.

BRANCH OFFICES IN LEADING CITIES

Products.

Manufacturers of K & H ELECTRIC ELEVATORS for PASSENGER, FREIGHT or PACKAGE SERVICE, including those types controlled by Operators and also by Automatic Push Buttons.

Electrically Controlled Hydraulic Lifts, Electric Dumbwaiters.

Service.

Each elevator installation is a separate problem in itself. Each K & H product is carefully engineered to

meet the specific requirements of the individual job.

The broadest possible co-operation is offered to engineers, architects and owners in connection with *all vertical lifting problems.*

Reliability.

Aside from the splendid manufacturing facilities, which insure a quality product, the responsibility of this firm is of great importance to those who have to select and maintain elevator equipment.

TRADE-MARK

Hydraulic Elevator Machines.

Hydraulic plunger elevators which can be adapted to meet any requirements are manufactured by this company.

Information Desired for Estimates on Elevator Machines.

The opportunity to co-operate with architects, engineers and owners will be appreciated either in furnishing preliminary plans and specifications or comparative costs of electric and hydraulic equipments.

To avoid delay and to insure intelligent response to inquiries the following information should be furnished:

Travel of car: Distance between bottom and top landings.
Maximum load to be carried. If a freight elevator, materials to be carried. Approximate speed desired.

Size of car required or size of hoistway provided.

Construction of hoistway: Brick, concrete, steel or wood.

Number and size of openings at each floor, and side or sides of hoistway where openings are located.

If electric elevator, state location of space provided for machine: in pent house over hoistway or adjacent to hoistway at lowest landing.

If hydraulic plunger elevator, advise nature of soil: gravel, sand, salt marsh or rock. Give water pressure.

For electric elevators give current available, whether D. C. or A. C. If D. C. state voltage. If A. C. state voltage, phase and cycles.

As there is considerable difference in cost between wood and steel guides, a preference should be designated or a request made for price of each.

Where wooden freight elevator gates are required, state number and type: full automatic or semi-automatic; also if gates are to be single or double bar or slatted.

PAYNE ELECTRIC ELEVATOR CONTROLLER

Payne Patented Hydraulic Ash Hoists.

Designed for use wherever differences in grade necessitate the use of a hoist for the removal of ashes.

REVOLVATOR CO.

334 Garfield Avenue
JERSEY CITY, N. J.

SALES AGENT FOR N. Y. REVOLVING PORTABLE ELEV. CO.

Products.

PORTABLE ELEVATORS (Tiering Machines), Revolvable and Non-revolvable Types, Hand or Electric Power or Combination.

Barrel Racks to meet any situation.

Revolvator.

The Revolvator is a portable elevator for stacking or tiering bales, boxes, barrels, or any other heavy, bulky, or fragile articles.

Advantages.

A Revolvator will increase the storage capacity of a warehouse from 20% to 50%. Materials can be stacked clear to the ceiling, leaving no waste space and making wide aisles unnecessary.

It reduces the labor bill for handling material. Usually two men and a Revolvator can do the work of from four to eight men without one, and can do it more speedily.

Types.

The Revolvator is made in nine models, operated by hand, motor, and combination hand and motor. All are built in both revolvable and non-revolvable types.

HAND OPERATED—An economical machine which will materially reduce the cost of labor wherever lifting, piling, and stacking is being done.

MOTOR OPERATED—For very high piling, for extra heavy loads or especially fast work, the electric motor driven Revolvator is recommended. This machine has all the advantages of the other types, except that it can not be operated by hand or plugged into an ordinary lighting circuit.

These machines are standard up to 1800 lbs. capacity, and can be built to order for greater weights or to meet special conditions.

COMBINATION HAND AND MOTOR OPERATED—Giving a combination machine which may be run by hand or by electricity. The $\frac{1}{2}$ h. p. motor will raise a load of 1800 lbs. at more than three times the speed of the average man operating by hand.

The electric motor attachment used on this machine can be furnished for and installed on any hand operated Revolvator, or any make of tiering machine.

REVOLVABLE TYPE—The exclusive feature of this

Operated by Hand

Operated by Motor

COMBINATION REVOLVATOR

machine is the revolvable base. The whole upper structure including the loading platform may be swung around in any direction, like a turntable, without changing the position of the lower base.

NON-REVOLVABLE TYPE—Some types of piling may be done effectively with a machine of this kind, which is similar in construction to the revolvable type, but is made without the revolvable base feature.

REVOLVABLE TYPE

NON-REVOLVABLE TYPE

Literature and Information.

Literature giving full information on any of these machines will be sent on request.

SMITH ELEVATOR CO., INC.

OFFICE AND WORKS
BUFFALO, N. Y.

Products.

Builders and designers of **ELECTRIC ELEVATOR EQUIPMENT** for Passenger and Freight Service.

Service.

Architects have at their command, through the **SMITH ELEVATOR CO., INC.**, an organization of experts with extensive experience in the planning of passenger, freight and sidewalk elevators.

Various Types of Elevators.

Both passenger and freight elevators of this company's manufacture are of standard types and there is every facility here for perfectly meeting every condition.

Careful study is made of their application and the installations are planned and carried out to exactly meet particular conditions and to perfectly accomplish desired results.

Specialists in Freight Elevators.

This company specializes in freight elevators and has developed an elevator machine for very heavy and severe service which is shown in an illustration on this page.

TRADE-MARK

Typical Installations.

There are 35 elevators of this company's design and installation in the Larkin buildings, including the equipment for the largest terminal warehouse in the world.

The Pierce-Arrow Motor Car plant is equipped with Smith elevators, as is the home of Shredded Wheat and hundreds of other well-known industries including the following:

Armour & Co., Westfield, N. Y.
American Agricultural & Chemical Co., Detroit, Mich.
Buffalo Forge Co., Buffalo, N. Y.
Jacob Dold Packing Co., Buffalo, N. Y.
Detroit Valve & Fitting Co., Detroit, Mich.

Manufacturers of the G&G MODEL D TELESCOPIC CRANE HOIST, ELECTRICALLY OPERATED.

Also, Model A Hand Power Hoist, with Automatic Gear Shifting Brake Device and Silencer; Model B Overhead Crane Hand Power Hoist, with Automatic Gear Shifting Brake Device and Silencer; Model E Hoist operated by Electric Motor mounted on pipe standard; Model C Hoist, electrically operated.

For use with G&G Hoists, this company also manufactures the G&G Automatic Sidewalk Door Opening and Closing Device with Spring Guard Gate and Sidewalk Doors, and G&G Swing Bail Hoisting Cans, G&G Side Handle Cans, G&G Ash Can Trucks, G&G Iron Ladders.

Model D, Overhead Telescopic Crane Hoist.

This hoist is operated by electric power and should be installed where the daily removal of ashes involves a considerable number of cans and where the grade level approaches are constructed so as to permit ash wagons to drive close to hoistway leading to boiler room. Distance between hoistway and wagon can be as great as 36 in. The overhead crane attachment makes it possible to raise a load from the level of the boiler room, to a point over the top of the ash wagon and the ashes dumped directly into the wagon without re-handling the cans at grade level.

Motor.

Hoist has a 1½ h. p. series wound, totally enclosed motor with mechanical load brake, automatic upper and lower limit, and a single speed controller giving one hoisting and one lowering speed. Cast iron base is provided for motor. Equipment includes a non-rotating cable.

The apparatus is dustproof and moistureproof, lubrication being effected throughout by means of grease forced through compression cups.

Speed.

Model D will raise a load of 300 lbs. at an actual speed of 60 ft. per minute. (Maximum load, see "Factor of Safety.") When the can reaches its full height the power is shut off by the automatic upper limit.

Telescopic Feature.

No part of the hoisting apparatus shows above pavement, when not in use.

Factor of Safety.

No part has a factor of safety less than 8, based on the ultimate strength of the material when a load of 300 lbs. is raised.

Gearing has a very high factor of safety of about 30, and all running parts have a factor of safety far beyond what is ordinarily considered necessary. When adjustable wrought iron guy rods from top of hoist to building wall are provided, the factor of safety is 8 when maximum load of 500 lbs. is raised.

Installation.

All necessary clamps and bolts are furnished with each hoist, together with detailed blue print showing how to erect, and set of instructions covering operation. Each hoist is constructed especially for some particular installation.

Size of Opening.

It is strongly recommended that opening at grade level be made 4 by 4 ft. in size.

How to Specify.

Furnish and install where indicated on plans, one G&G Telescopic Overhead Crane Hoist with electric motor, Model D.

G&G Swing Bail Cans should also be specified.

MODEL D, G&G TELESCOPIC HOIST IN OPERATION

MERRICK SCALE MFG. CO.

Designers of Weighing and Conveying Installations

CABLE ADDRESS:
"WEIGHTOM, PASSAIC, N. J."

178 Autumn Street
PASSAIC, N. J.

CODES:
A. B. C., Western Union

Product.

The MERRICK WEIGHTOMETER.

Description.

The Weightometer consists of a pair of weighing levers, L, and a steelyard or beam, B, similar to that of the platform scale, but of special design, so that a short section of the conveyor can be suspended from the weighing levers. The load on this suspended portion, however distributed, is always automatically counterbalanced by the buoyancy of a cylindrical iron float immersed in a mercury bath and suspended from the long end of the weighing beam. This float allows the beam to move from its position, when the conveyor is empty, in exact proportion to the weight of material on the suspended portion of the conveyor at any moment. A mechanical integrator totalizes the movement of the beam, with a factor obtained from the travel of the conveyor by means of suitable gearing from the bend pulley or sprocket wheel. The result obtained from the product of two quantities, one proportional to the weight of the material suspended and the other to the travel, therefore represents accurately the total weight of material moved. This is plainly indicated, by a register, in units and decimals of either a short ton, long ton, metric ton or other desired units.

Applications.

In the past 11 years 400 Weightometers have been installed and are now operating. Materials weighed in domestic and foreign service include coal, coke, hog fuel, stone, gravel, sand, limestone, and iron, silver, zinc, lead, copper, gold, telluride ores and metallic ore concentrates, ammonium sulphate, caliche, copra, cement rock, clinker and finished cement, phosphate rock or pebbles, wood chips, sulphite pulp lumps, fish or fish products, slaughter house tankage, sugar beet cossettes and asbestos rock.

Accuracy.

This company guarantees, when this machine is erected and operated in accordance with instructions, that the accuracy shall be within 1% of the actual weight of material carried over the conveyor at a rate of not less than one-half of the maximum capacity for which the Weightometer is designed. This is not limited to a uniform continuous load, as portions of the conveyor may be loaded to full capacity of the Weightometer with empty portions intervening.

In testing, at least sufficient material must pass over the conveyor to register 5 or more unit figures on the counter.

Guarantee.

This company guarantees to replace by new ones, free of charge, f. o. b. factory, Passaic, N. J., any parts breaking or wearing out from ordinary use within one year's time, providing the defective part or parts be returned with transportation prepaid within a reasonable time after receipt of new part.

VIEW OF WEIGHTOMETER ON BELT CONVEYOR
Front sheet of casing removed

Registration.

Weight to be registered by 5-figure counter in tons of 2000 lbs. and decimals thereof, unless otherwise requested. Registration can be made in other units, as long tons, metric tons, barrels of a certain number of pounds, etc.

Material Furnished.

The Weightometer includes all weighing levers, beam, mercury balance and integrator enclosed in a sheet iron removable casing.

For belt conveyors, all parts for suspending the idlers and driving the integrator with snub pulley from return conveyor belt, are furnished.

For pan conveyors, suspension rods and brackets for suspending the track, and sprocket chain with sprocket to attach to one of the conveyor sprocket shafts, are furnished.

Material Not Furnished.

Uprights and cross members on which the Weightometer is placed.

Magnetic Counters.

One or more magnetic counters, for duplicating the readings of the register on the scale at distant points, can be supplied.

Durability.

Many of these machines have been in practical service for ten years, without appreciable expense for replacements and still maintain their original accuracy.

Essential Features.

The important advantages of the Merrick Weightometer are:

Easy installation; automatic operation; no expense for attendance; durability; simplicity; sheet iron enclosure for all working parts, thereby eliminating exposure to dust and interference by tampering; weighing without interruption of conveyor service, and a high degree of accuracy, whether the load be intermittent or uniform.

RICHARDSON SCALE COMPANY

RICHARDSON AUTOMATIC COAL SCALES.

Description.

The scale is built on the equal beam or weight for weight principle. On either end of an even armed beam, balanced exactly in the center, is suspended a receptacle, one containing standard government test weights, the other coal to be weighed.

When the weigh hopper has received coal equivalent to the weights, a toggle mechanism causes the feed gate to close, and the hopper door to open and the coal discharges through gravity. Each weighing is registered and totaled on a mechanical counter.

An ingenious device known as the Richardson patent gate interlocking gear makes it impossible for the feed gate and discharge door to be open at the same time and coal to pass through unweighed.

This part of the scale is made of bronze, as are all the pins upon which the levers of the scale work. The weigh hopper is lined with or partially made of sheet Tobin bronze. Thus the vital parts of the scale are protected against the moisture content of the coal.

Purposes.

Richardson automatic coal scales serve two important purposes:

(1) Weighing the coal as received and protecting the user from short weights; (2) keeping a record of the coal burned, which, when compared with the weight

of water used, gives a continuous record of evaporative efficiency. Thus preventable losses, due to scale, poor draft, dirty flues, etc., are promptly indicated, and once recognized, can be remedied.

Scope of Use.

Used for weighing coal; also for dust, ores, rock, cement, grain, flour, feeds, sugar, lumpy materials, granular and powdered products of every description; water, oils and other liquids.

Capacity.

100 to 3000 lbs. per discharge or 1 to 150 tons hourly.

Accuracy.

Guaranteed to weigh within $\frac{1}{2}$ of 1% of the true weight.

SCALES.

Also, Gasoline and Oil Engines, Contractor's Hoists, Pumps, Hand and Trailer Trucks, Dump Wagons, Cars, Scrapers, etc.

For Concrete Mixers, see page 100.

General.

"The Standard" line of scales includes practically all types for every purpose, in sizes from the smaller counter graduated so fine as $\frac{1}{16}$ oz. up through the general run of express packages, portable platform, dormant, mine, wagon, motor truck, etc., to railroad track scales of the heaviest capacity and longest platform. This company specializes particularly on the heavier type of scales for steel mills, mines, grain elevators, etc.

Experience.

Over 25 years' experience in manufacturing scales, and the company's location in the geographical center of the industrial field places it in a position to furnish manufacturers with the right scales for every requirement and at prices in line with the grade of scales required.

"THE STANDARD" MOTOR TRUCK SCALE

Scientifically designed and constructed to withstand the heavy strain imposed upon it by the concentration of from 70% to 90% of the motor truck load on its rear axle

AUTOMATIC DIAL SCALE

Constructed entirely of metal and ready to place on foundation upon arrival. Gives instant readings without use of weights. Usually equipped with a tare beam for balancing weight of truck. For use in receiving and shipping rooms and warehouses of industrial and transportation companies

WAGON SCALE

MONITOR ROLLING MILL SCALE

Equipped with short iron pillar and raised platform. Permits weighing of heavy castings, large plates, etc., handled by cranes

MINE OR TIPPLE SCALE

TANK OR HOPPER SCALE

"The Standard" Modern Railroad Track Scale.

These scales are of massive and scientific design assuring durability, accuracy, economical maintenance, avoidance of breakdowns and the consequent delays, and the elimination of losses and possible disputes. Scales are readily accessible for inspection and attention.

Manufactured in capacities up to 300 tons and

RAILROAD TRACK SCALE

lengths of platforms running from 6 ft. up. This company is prepared to furnish a specially heavy type where the scale is called upon to perform particularly heavy duty, or where it is necessary for a locomotive to pass over it. With the lighter pattern, a dead rail is usually provided. A single full capacity beam, graduated from 20 lbs. up to the capacity of the scale, either with or without recording attachment, is usually furnished. Double, triple or special beams are frequently used and the company is prepared to meet all demands.

Catalogue No. 89 will be sent on request. Please specify the type of scale in which interested so that full information can be furnished.

THE BONNOT COMPANY

Pulverized Coal Systems

CANTON, OHIO

Products.

HOLBECK PULVERIZED COAL SYSTEMS.

Bonnot Pulverizers, Rotary Kilns, Dryers and Coolers, and Bonnot Clay Working Machinery.

Holbeck Pulverized Coal Systems.

THE BONNOT COMPANY has passed into the fifth year of the successful manufacture and installation of the Holbeck system. The company can speak with experience and confidence of the good results that can be obtained, but the fact that many of the best known and most successful corporations have adopted the Holbeck system expresses more eloquently the reception accorded it.

The fundamental advantages of the use of pulverized coal are due to the coal particles being so finely divided that they readily mix with oxygen for combustion, thus requiring only the minimum amount of air.

Pulverized coal, when mixed with the proper amount of air, burns without smoke, not unlike gas; either reducing or oxidizing flames being obtainable. The fire is started with a swab of oiled waste; combustion readily taking place in a cold furnace. It can be turned on or off, up or down, to meet the temperature and conditions required.

The Holbeck system saves the labor required for unloading, wheeling and stoking the coal, also about 90% of the labor required for removing the ashes, clinkers and unburned coal. It requires no labor outside of the operators who stop and start the equipment, keep the bearings adjusted and lubricated.

The pulverized coal is delivered automatically as required to the different furnaces. After the coal is pulverized and delivered to the pulverized coal storage bins, the only equipment used is a screw conveyor to feed the coal from the bin, a blower to propel the air, an air indicator to indicate the quantity of air required, and an automatic regulator that works in conjunction with the air indicator to control the speed of the feeder that feeds the pulverized coal into the system.

Holbeck systems have been installed in almost every field of furnace heating, embracing the operation of steam boilers, open hearth, continuous billet heating, ingot heating, forging, malleable iron and cast steel annealing, busheling, fagoting, drop forging, nut, bolt and rivet making, rivet and plate heating, bull-dozer, sheet and pair and tinning, core drying, copper and lead reverberatory furnaces, roasters, rotary kilns, dryers and many other types of furnaces.

In every case, saving has been effected over the fuel previously used.

The perspective illustrated shows the Holbeck system as installed in a large copper smelter where it has been operating for more than two years.

More complete information will be sent to interested parties and the engineers of this company will make estimates on the possible economy of using pulverized coal.

Bonnot Pulverizers, Rotary Kilns, Bonnot Clay Working Machinery, etc.

Complete information and catalogue will be sent on request.

PERSPECTIVE OF HOLBECK PULVERIZED COAL SYSTEM INSTALLED IN LARGE COPPER SMELTER

KEK MANUFACTURING CO.

Manufacturers of Universal Grinding Mills

1372 Clinton Street
BUFFALO, N. Y.

Product.

KEK UNIVERSAL GRINDING MILLS.

Scope of Work.

The Kek Mill will handle any material which is dry and of a nature that will grind or pulverize. It will grind chemicals, colors, paints, minerals, metals, cereals, drugs and fibrous materials, or any other materials of a like nature not included in these general classifications.

A complete laboratory is maintained by this company, where samples of products will be ground and returned with full data as to fineness, capacity, power consumed, etc.

Kek Mill.

The Kek Universal Grinding Mill embodies a new application of the idea of using centrifugal force to aid in grinding and pulverizing materials. As shown below, the Kek is a cylindrically shaped mill, small and compact, the larger size, being 32 in. high by 32 in. in diameter.

FIG. 1. 26-INCH KEK MILL, COMPLETE

The grinding or pulverizing medium consists of two taper dished steel plates, containing short steel pins set in circular rows in the plates (Fig. 2). The top plate with pins facing downward is stationary and bolted to body of the machine; the bottom plate set on a vertical shaft revolves, and pins in each plate run in circular grooves in the opposite plate. Bottom plate is revolved at high speed by a worm and gear arrangement (Fig. 3). The gear ratio between horizontal shaft and vertical shaft is 4 to 1.

In operation the Kek works as follows: material is fed in through the center opening in the top of the mill (Fig. 1), drops onto the bottom disk which is revolving

at a high rate of speed, about 3000 r.p.m., and is whirled by centrifugal force towards the outside of the disk; in passing through the revolving pins it is pulverized to fine powder and is then thrown out through a rectangular mouthpiece at the back of the mill.

By regulating the speed of the drive shaft and also by using pin plates containing different numbers of pins, any degree of fineness up to 300-mesh screening may be obtained. Four sets of pin plates are manufactured for the large 26-in. size Kek, containing 174 pins, 369 pins, 598 pins and 961 pins respectively.

FIG. 2. 13-INCH KEK MILL, SHOWING INTERIOR
Top grinding disk removed

For the small size 13-in. Kek, 2 sets of pin plates are manufactured, containing 273 pins and 369 pins respectively. For fine grinding the larger number of pins are used.

The 26-in. Kek will handle up to two tons an hour and will consume 15 to 25 h.p., depending on the material ground. It weighs 2000 lbs.

The 13-in. Kek will handle up to 1000 lbs. per hour and consume 7 to 10 h.p., depending on the material handled. It weighs 800 lbs.

FIG. 3. DRIVE SHAFTS AND WORM GEAR ARRANGEMENT OF KEK MILL

RAYMOND BROS. IMPACT PULVERIZER CO.

Manufacturers of Grinding, Pulverizing and Air Separating Machinery

OFFICE AND WORKS
1316 North Branch Street
CHICAGO, ILL.

Products.

ROLLER MILLS, AUTOMATIC PULVERIZERS, VACUUM AIR SEPARATORS, for the fine grinding of all dry materials to a powder.

Special Exhaust Fans and Dust Collectors.

Roller Mills.

These are built for capacities of from 1 to 10 tons per hour and for fine or coarse grinding.

They are of the suspended roller type, crushing and pulverizing the material by centrifugal force. The fine material is carried away from the grinding chamber by our air separation principle as fast as it is made, eliminating the clogging effect produced by screen separation. In this way the rolls are always working on coarse material.

Raymond roller mills have been adopted as standard equipment by many large industrial corporations for grinding materials such as coal, coke, gypsum, limestone, phosphate rock, etc., to 100-mesh; and talc, graphite, barytes, caustic lime, lithopone, etc., to 200-mesh and finer.

RAYMOND ROLLER MILL

TYPICAL ROLLER MILL INSTALLATION FOR GRINDING COAL

Automatic Pulverizers.

These, like the roller mills, are equipped with air separation for the production of uniform fine products, but they are of the high speed type and therefore used for softer materials like clay, dry colors, hydrated lime, litharge, etc.

They are built in several sizes and will grind to any fineness by a simple adjustment in the air separator.

They can also be equipped with our special automatic throw-out attachment for separating impurities from such materials as hydrated lime, litharge, etc.

RAYMOND AUTOMATIC PULVERIZER

Special Features and Advantages.

The installation shown is typical of the Raymond system, as in all cases the piping can be arranged to allow placing the collector at almost any point where the material is to be discharged.

This discharge can be made into any convenient storage bin or conveyor and requires no extra power for operation.

In some of these installations the collector is set as high as 100 ft., and at a distance from the mill, eliminating at least one elevator and sometimes a conveyor.

NO SCREENS OR BOLTERS—The mills shown require no screens or bolters to produce the required fineness, as this is obtained automatically by the use of our patented air separators.

These separators after once being adjusted require no attention and produce absolutely uniform fine products containing no lumps or oversizes. They will give any fineness desired by a simple adjustment.

How to Specify.

To properly quote prices and guarantees on the right machinery, it is necessary to have all the information that can be supplied in regard to the proposition.

Always include the material to be ground and the capacity and fineness required. In this connection we would like to have some small mail samples, showing the crude material intended for the mill and the finished product to be duplicated.

If there is no sample of the finished product, kindly advise, in the terms of the Tyler standard screen scale, the fineness required.

E. H. STROUD & COMPANY

ESTABLISHED 1896

Engineers and Manufacturers of Crushing, Pulverizing and Stoking Machinery

928, 930, 932 and 934 Fullerton Avenue
CHICAGO, ILL.

Products.

Machinery for the reduction of all sorts of DRY GRINDABLE MATERIALS, ANIMAL, CHEMICAL, MINERAL and VEGETABLE and some that carry 6% to 8% of MOISTURE. Also POWDERED COAL BURNING EQUIPMENT.

Pioneers.

Pioneers in the art of pulverizing, stoking and burning powdered coal under boilers and some other heating units.

Stroud Powdered Coal Stoker and Burner.

This device receives the powdered coal, draws its own supply of air from the atmosphere, measures the coal and the air as used, mixes them thoroughly, delivers the mixture to the furnace (where it ignites at once) and enables the operator to have complete control of furnace temperatures and to make records from which to duplicate his results at will.

STROUD POWDERED COAL STOKER AND BURNER

ROUGH SKETCH OF A TYPICAL STROUD POWDERED COAL INSTALLATION

We have purposely made an incorrect drawing of the furnace and some other details because we do not

TRADE-MARK

wish to advertise or give away gratis information which has cost us considerable time and money and effort.

Our installation is as simple as that shown, and gives entire satisfaction.

All persons are warned that the ideas embodied in the "Stroud Powdered Coal Stoker and Burner" are well covered by fundamental patents.

SIZES AND CAPACITIES—Sizes and capacities from 15 lbs. to 5000 lbs. of coal per hour per stoker with all the air needed for combustion.

Write for Bulletins No. 103-B and No. 107.

Stroud Air Separation Pulverizers.

The illustration shows a product collector attached to the pulverizer. We build air vent chambers too.

These mills give a finished product direct which, without subsequent sieving, is so uniformly fine that 95% or 98% or all of it, as wanted, will, if tested when dry, pass through a horizontal brass wire cloth testing sieve of the desired mesh, which can be any mesh from say 40x40 down to the most impalpable powders, far finer than a 200x200 mesh.

They are without exception the most efficient pulverizers made.

Dustless in operation.

Difficult to clog.
Easy to clean.

A cool pulverizer for chemicals.

So automatic in feeding and operation that one man can attend to at least half a dozen mills.

Cost of milling is very low.

Ask for Bulletin No. 101-A.

STROUD AIR SEPARATION PULVERIZER

Throw-out-Box-End-Door.

For cleansing materials from imperfect and foreign matter during process of pulverization.

Pulverizers.

RING-ROLL MILLS—For grinding hard, medium or soft material from 2-in. size to from 10-mesh to 100-mesh. Used largely for grinding cement clinker, limestone, ores, granite, trap, phosphate, clay, shale, iron borings, feldspar, etc. Slow speed; durable and accessible. Wearing parts are a ring and 3 rolls, easily and quickly replaced. No clogging, no internal screens, no shields nor scrapers. Large capacity per horsepower and low upkeep.

HINGED HAMMER PULVERIZERS—For reducing salt, clay, shells, fertilizers, chemicals and other soft or fibrous materials to a fineness of from ¼ in. to 20-mesh. A high speed, inexpensive mill having large output with small horsepower.

On sticky materials the gates are often omitted entirely or in part, thus giving the mill a free discharge to prevent clogging; and if separation is required, an outside screen is used, the oversize being returned to the mill for regrinding.

EMERY MILLS—Made in vertical and horizontal types for grinding soft and moderately hard materials such as clay, shale, chalk, falc, salt, coal, facings, colors, lime, manganese, barytes, etc., to a fine powder.

These mills are economical in power and upkeep and are instantly accessible.

Size of feed, ¼ in. and finer; range of output, 20- to 200-mesh.

On ordinary material, they will grind to 100-mesh without screens or separators. Finer than this, bolts, reels, screens or air separators are desirable. Run without vibration on any good floor. Furnished right-

or left-hand discharge with automatic feeder.

Screens.

NEWAYGO SUPERSCREENS—For screening everything screenable from ½ in. to 180-mesh. The Newaygo screening principle embodies: inclined screen surface, adjustable angle to regulate flow, wire stretched taut and automatically held taut to prevent sagging, elastic bridges tapped by hammers which keep screen in constant rapid vibration, thus insuring open meshes and large accurate output. On account of screen inclination, heavy gage wire and large meshes produce fine output, thus wear is reduced to a minimum and clogging is rare. Unit construction. Made in many styles and sizes to suit practically every condition.

Catalogue No. 77.

"OPEN DOOR" TWO UNIT SCREEN

Dry Mixers.

For mixing fertilizer and other dry ingredients in batches from ¼ to 1 ton. Capacities from 4 to 30 tons per hour.

A simple and durable machine that accomplishes a thorough and rapid mixing.

LLOYD COAL BREAKING ROLLS, solid and hollow ground teeth; PARRISH FLEXIBLE ARM SHAKER; KEYSTONE RIVETLESS CONVEYOR and ELEVATOR CHAIN; SIMPLEX JIGS.

Lloyd Coal Breaking Rolls.

The compound gearing of Lloyd's coal breaking rolls is an exclusive feature. The company's long experience warrants the use of slow peripheral speed as "hammer blows" are positively eliminated, thereby creating less pulverization.

The outer surface of the roll bodies of Lloyd's crusher have their surface planed to receive the toothed segments and the roll body takes all the load resulting from the crushing of the coal. The only strain on the bolts is that required to hold the segments on the roll against the peripheral speed. This construction makes the replacing or changing of segments a very easy matter. The arrangement of teeth is such that it is impossible for a lump of coal to get between any two teeth without meeting a cutting or splitting edge. These rolls are also made with Johnson hollow ground teeth; which give a very much greater percentage of prepared sizes. Get the largest possible percentage of domestic sizes by specifying hollow ground teeth on the rolls.

COAL BREAKING ROLL BODY

Size, in.	Tons per hour	Speed, r. p. m.	Horsepower
24 x 28	40 to 60	210	25

SEGMENT OF COAL BREAKING ROLL

Parrish Flexible Arm Shaker.

Experience has fully demonstrated the superiority of shakers over revolving screens for sizing coals. An investigation will demonstrate the superiority of Parrish flexible arm shakers over all other shakers.

In all shakers other than the Parrish the shaker arm is attached to the frame by some sort of pin or bearing. In the Parrish the two are bolted rigidly together, the flexibility of the shaker arm itself allowing sufficient vertical movement for the throw of the eccentric. In comparison, Parrish flexible arm shakers are cheaper to install, lighter, more durable, require less power to operate and give greater capacity for any given size. Parrish shakers subject a breaker to no greater strain than revolving screens and can be safely installed in old

breakers where it would be dangerous to place other types of shakers because of their great weight and the vibration resulting from their use.

FLEXIBLE ARM SHAKER

Keystone Rivetless Steel Conveyor and Elevator Chain.

This chain contains only three parts; the center link, the side links which are alike and interchangeable, and the connecting pin. No bolts or rivets are used and no tools are required for assembling or taking apart. All bending strains have been avoided, the links being in tension and the pins in double shear. The strength of the chain in position is therefore exactly the same as the ultimate strength of the cross-sectional area of the metal. Curves and arches have been avoided in the design so it is impossible for any change to develop in the pitch. Every part of the chain is drop forged from steel having a tensile strength of 85,000 to 95,000 lbs. per sq. in.

Buying new chain for renewals involves an additional expense in the time and labor required to place it in position; a chain, therefore, which can not stretch and which by reason of its enormous strength will not easily break, offers two-fold economy.

MILTRENA BLACKSMITHING COAL.

Pocahontas, New River and Kanawha Gas and Splint Coals.

Physical Characteristics and Peculiar Properties.

Miltrena blacksmithing coal is a superior product of mines of rare deposits controlled by this company. Only in a very few localities on the globe has nature deposited coal that possesses the vital, heat generating qualities that perfect smithing demands. Coal seams designated by geologists as containing such deposits are often lacking in the essential "fusing" quality, making perfect welds impossible.

Miltrena blacksmithing coal contains the lowest percentage of moisture and ash and the highest percentage of fixed carbon and volatile matter which combine to make it the most efficient and therefore most economical coal for smithing. Due to the high fusing or melting temperature of the ash—approximately 3000° Fahr.—and the low percentage of sulphur, this coal is free from clinker or any other heat resisting bodies. Perfect fusing which depends for success chiefly upon a sustained, high temperature is thus assured. By actual test, Miltrena blacksmithing coal contains from 15,000 to 15,500 B.t.u.

Uses.

Its free burning, intense heat generating qualities would suggest many and varied uses for this coal. For all kinds of welding, brazing, heating, lead burning, paint burning and similar classes of work where an intense, sustained, concentrated heat is essential, Miltrena blacksmithing coal is admirably adapted.

Output.

The annual output of coal from mines controlled by this company is 2,000,000 tons. Many thousands of carloads of Miltrena blacksmithing coal distributed to satisfied users from Jacksonville, Fla., to Alaska, many of whom are the largest concerns in their line in the world, establishes beyond doubt the superior quality of this coal.

Tests.

A mineral or chemical product stands or falls according to the results of official tests to which it is subjected.

Two analyses are presented here, made by the United

States Navy, of Miltrena blacksmithing coal taken from cars for cargoes.

FLINN & DREFFEIN COMPANY

Gas and Fuel Engineers

431 South Dearborn Street
CHICAGO, ILL.

Products.

DESIGNERS and BUILDERS of INDUSTRIAL FUEL EQUIPMENT, which includes:

Anthracite Producer Gas Plants.
Bituminous Producer Gas Plants (Raw).
Bituminous Producer Gas Plants (Clean).
Mechanical Gas Producers.
Gas Washing Apparatus.
Tar Extractors.
Raw Producer Gas Burners.
Special Gas Apparatus for making:
Nitrogen, Carbon Monoxide, Carbon Dioxide.

Raw Producer Gas Burner.

These burners can be applied to furnaces using fuel oil, coal or coke with virtually no material alterations. Combustion is complete within the furnaces and there are no objectionable fumes or smoke emitted. Furnaces are readily adapted to raw producer gas burners.

FLINN & DREFFEIN RAW PRODUCER GAS BURNER

For displacing oil, natural gas, coal and coke in a wide range of industrial heating operations

Clean Producer Gas from Bituminous Coal.

The FLINN & DREFFEIN COMPANY is prepared to

FLINN & DREFFEIN BITUMINOUS PRODUCER GAS CLEANING PLANT

For delivering a tar-free cold gas suitable for transmission through standard steel pipe to operations where this fuel can be advantageously applied. Any standard gas producer may be used in connection with FLINN & DREFFEIN gas cleaning equipment

build bituminous producer gas cleaning plants in capacities ranging from 50 lbs. of coal per hour up to the maximum that may be required.

Anthracite Producer Plant.

This type of apparatus is built for soldering tin cans, canning, etc. Also for hardening, tempering, annealing and heat treating of steel.

ANTHRACITE PRODUCER PLANT

Furnishing gas for bright annealing cold rolled steel, sherardizing, japanning and various operations formerly using city gas

Raw Bituminous Producer Gas Plant.

This apparatus is especially suitable for heating reducing kettles, ovens, etc., as well as in all moderate temperature, direct fired furnaces, such as hardening, tempering, annealing and heat treating of steel.

RAW BITUMINOUS PRODUCER GAS PLANT

In combination with a complete burner system for heating asphalt stills

Services.

For more than ten years, the FLINN & DREFFEIN COMPANY has designed and built fuel equipments for industrial and manufacturing purposes, covering the entire range of heating and burner operations, and is in a position to offer only that equipment which is most suitable to the manufacturer's needs. Fuel systems of its design can be seen in successful operation in many leading factories throughout the country.

Information Required.

In the nature of things, nearly every proposition must be specially considered before definite recommendations can be made regarding the apparatus involved. In writing, please describe as fully as possible the requirements, giving kind and quantity of fuel used and nature of heating operations to be performed.

INTERNATIONAL OXYGEN COMPANY

NEWARK, N. J.

Products.

GENERATORS for OXYGEN and HYDROGEN.

Pressure, Regulating and Reducing Valves for high pressure gases; Gas Testing Apparatus and Cylinders; Distilling Apparatus and Hydraulic Testing Apparatus; Oxygen and Hydrogen Gases in cylinders; Welding and Cutting Equipment.

Scope.

The organization takes in the requirements of the entire field of oxygen and hydrogen users. It manufactures unit oxygen and hydrogen generators for any quantity of gas needed.

I. O. C. Type 4—1000 Oxy-hydrogen Generators.

These generators of the unit or single cell type have set a new standard of economy in gas production.

Each generator is complete in itself, making pure oxygen and pure hydrogen at a rate determined by the amperage of the electric current supplied.

Each unit requires floor space of 4 by 40 in., or about the equivalent of a square foot and with necessary pipe connections needs headroom of about 6 ft. This generator per unit of floor space produces normally 3 times the gases made by any other apparatus.

Practically no organic material enters into the construction of the Type 4—1000 generator. There are no parts on the interior of the cell constructed of glass, por-

celain, rubber or paraffin which are readily destructible. I. O. C. cells are indestructible and timeproof.

ELECTRICAL EFFICIENCY—At normal current of 600 amp., each cell, with an electrolyte of caustic soda solution, requires 2.2 volts and has a guaranteed capacity of 4.8 cu. ft. of oxygen and 9.6 cu. ft. of hydrogen per clock hour. The kilowatt hour efficiency is 3.65 cu. ft. of oxygen and 7.3 cu. ft. of hydrogen.

A normal current of 600 amp. is stated, because, at the common current rates, the cell operated at this amperage shows the most economical adjustment between installation cost and operating cost.

Below 600 amp., a slightly higher electrical efficiency is obtained, but the gas output per cell diminishes. Above 600 amp., the electrical efficiency diminishes slightly, while the output per cell increases.

When the demand falls below normal, current can be saved by running the plant on a lower amperage, thus securing the smaller gas output needed at a higher electrical efficiency. As gas requirements increase, a higher amperage can be used and a larger output secured.

It is practical to operate, at a range, from less than 200 amp. to upwards of 1000 amp.—or at a ratio of more than 1 to 5.

PURITY OF GASES—I. O. C. Type 4—1000 generators are guaranteed to produce gases of a minimum purity of 99% for oxygen and 99.5% for hydrogen. Experience, however, shows oxygen averaging 99.7% pure and hydrogen 99.9% pure.

CAPACITIES, I. O. C. TYPE 4—1000 UNIT GENERATOR

No. of cells	Capacity in cu. ft. per 24 hours			
	At 600 amp.		At 1000 amp.	
	Oxygen	Hydrogen	Oxygen	Hydrogen
25	2880	5760	4800	9600
50	5760	11520	9600	19200
75	8640	17280	14400	28800
100	11520	23040	19200	38400
150	17280	34560	28800	57600

BANK OF 15 I.O.C. TYPE 4—1000 OXY-HYDROGEN GENERATORS

I. O. C. Engineering Service.

The company designs, installs, and puts into operation oxy-hydrogen plants complete in every detail—not alone I. O. C. generating apparatus, but also such purchased accessories as motor generators, switchboards and control apparatus, compressors, gas holders, piping systems, and apparatus for utilizing the gases.

Or the company will, in connection with the purchase of its own apparatus, prepare plans for the complete installation and furnish specifications covering all accessories—with a view to safeguarding the purchaser's interests at every point.

MILWAUKEE RELIANCE BOILER WORKS

Manufacturers of Gas Producers

32nd and Hadley Streets
MILWAUKEE, WIS.

Products.

"SHARP-BASSETT" GAS PRODUCERS.

Also, "Reliance" Steel Tanks, Feed Water Heaters, Vertical Boilers.

"Sharp-Bassett" Gas Producer.

The "Sharp-Bassett" improved gas producer, was designed by A. J. Bassett who has had many years of experience in operating, testing and experimenting with different makes of gas producers and gas engines, under actual working conditions; thereby being in position to know the proper design and construction necessary to produce the most economical, reliable and serviceable gas producer.

In designing this gas producer, it was the designer's aim to place a gas producer on the market that would be simple, economical, convenient to operate and absolutely reliable under all working conditions.

The great number of installations which are now in successful operation, throughout the United States and foreign countries, prove beyond a doubt, that this gas producer furnishes fuel for modern gas engines and refined heating operations cheaper than any other method known.

Exhaustive tests, run on a great number of "Sharp-Bassett" improved gas producers in service show that they will deliver 80% of the total heating value of the fuel as fired, in a clean, cool gas, for use in gas engines and heating furnaces.

CROSS SECTION OF "SHARP-BASSETT" IMPROVED STANDARD GAS PRODUCER

Showing method of firing, cleaning and cooling the gas; double shell arrangement; method by which brick lining and grates are installed

"Sharp-Bassett" Combined Steam and Gas Generator.

Designed to meet the demands of power and fuel users who require a quantity of steam and hot water for heating purposes during the winter months, also other heating applications in the manufacturing process of products.

With regular equipment the gas generating efficiency of the "Sharp-Bassett" combined steam and gas generator is the same as the efficiency of the "Sharp-Bassett" improved gas producer.

The steam generating part of the equipment is entirely a recovery process, as through the process of distilling the fuel a certain percentage of the heating value of the fuel is thrown off through radiation, and this is the heat which is used to generate steam, therefore the steam is generated at no cost to the user.

Should the user's steam requirements be larger than the steam thus recovered the volume of steam generated can be increased by simply reducing the thickness of the brick lining, or eliminating the brick lining entirely to obtain the volume of steam required.

The construction of this combined steam and gas generator is of the same general construction as the improved gas producer.

With the improved gas producer the double shell is used as an economizer, vaporizer, and saturator, but with the combined steam and gas generator the double shell is staybolted and in addition has a crown sheet, steam dome, and feed water heater.

CROSS SECTION OF "SHARP-BASSETT" COMBINED STEAM AND GAS PRODUCER

Gas generated by this generator supplies the fuel to a modern gas engine, which in turn supplies the power for this factory, and the steam generated is used throughout the factory for heating purposes

The feed water heater is placed in the gas offtake between the gas generator and the scrubber and recovers the heat which would otherwise enter the scrubber and be carried off by the scrubber water to the sewer.

A scientific test-run made on the "Sharp-Bassett" combined steam and gas generator operating in actual service, showed an over all efficiency of 96%. This being the highest efficiency thus far obtained through any other type of power generating apparatus.

"SHARP-BASSETT" COMBINED STEAM AND GAS GENERATOR

Producer Gas for Power.

Producer gas when used for power is cooled and thoroughly cleaned before being delivered to the engine. The U. S. Government made tests at their plant in St. Louis to determine the commercial value of various fuels and the most perfect system of conversion into power and heat. The producer gas tests made at this time by the government experts proved that power can be developed by the producer gas plant with 1/5 to 1/3 the amount of coal used in modern steam plants. The results of these tests will be found in publication, which can be obtained by application to Bureau of Mines, Washington, D. C.

It is now universally acknowledged that producer gas is the coming power, displacing all other methods, because of its greater economy, and its great saving in labor, repairs and increased longevity of plants; its safety and reduction of fire risk; its cleanliness and elim-

ination of smoke nuisance, which is important, especially in cities. Power can be developed for three-tenths of a cent per horsepower hour, fuel cost, using buckwheat size anthracite coal at \$6.00 per ton. Electricity can be developed for one half cent per kw. hour. Producer gas can be used for power or fuel at less cost than city gas at 20¢ per 1000 cu. ft. or natural gas at 35¢ per 1000 cu. ft.

Producer Gas for Fuel.

Producer gas is used for supplying a fuel gas to replace other fuels with a great many advantages, as well as being very much more economical. The heat or calorific energy of the fuel can be applied in the most direct and economical way. It prevents waste of material and prolongs the life of furnaces. It shortens time of operation, thus increasing production. It produces more uniform and better products. It can readily be applied to almost every form of industry where heat is required. In large plants, centralization of gas producer results in a reduction of labor and increases efficiency over separately fired furnaces. When firing furnaces with producer gas they are under perfect control of the operator and almost any heat can be obtained.

The labor required for firing a gas producer for power or fuel is very small compared to a steam boiler. One man can take care of a large plant and have plenty of time for other duties. He can charge our producer, stoke, inspect and regulate fire, and remove the ash without facing uncomfortable heat. His work is clean. No carelessness or accident can cause an explosion and there is no smoke.

THE SMITH GAS ENGINEERING CO.
Clean Gas Producer Plants
DAYTON, OHIO

FACTORIES: LEXINGTON AND MORaine (NEAR DAYTON), OHIO
SOLE CANADIAN REPRESENTATIVE: THE CANADIAN ALLIS-CHALMERS, LTD., TORONTO

Products.

Designers and builders of GAS PRODUCER PLANTS for power service and industrial heating, including Plants to furnish Gas for Melting, Annealing, Heat Treating and Re-heating Metals and Glass, also for Enameling Ovens and Foundries for Baking and Drying.

Special types of PRODUCERS designed for Anthracite, Bituminous and Lignite Coals; TAR EXTRACTORS; GAS CLEANING PLANTS.

Recording Gas Calorimeter; Gas Valves for hot and cold Gas, Tar Extracts for coke oven or producer gas, etc.

Experience.

THE SMITH GAS ENGINEERING Co. is a pioneer in gas producer work, Smith suction gas producers having been in successful commercial operation since 1902. Over 80,000 h.p. have been installed, ranging in size from 25 to 3,000 h.p. in single units, operating on a wide range of fuels, and furnishing gas for both power and heating. The company numbers among its customers some of the largest and best known manufacturers in the country, who installed Smith producers after thorough and detailed examinations by their own engineers, which showed the remarkable economies to be obtained by their use.

Economy.

The increasing cost and scarcity of fuel of all kinds and high labor costs make it imperative in every industry to utilize both in the most efficient manner. Producer gas is rapidly becoming recognized as the most efficient and desirable agent to use where power or heating operations are necessary. Because it can be generated simply and easily direct from coal, the most widely distributed and cheapest natural fuel, it furnishes, in connection with the gas engine, the cheapest power known. It is easily applied to the heating of furnaces and ovens with marked economy over other fuels, and requires a remarkably small amount of skilled labor in its manufacture and application. These advantages are being daily demonstrated in numerous plants and in widely diversified industries where Smith suction gas producers have replaced other types of apparatus.

RELATIVE OPERATING COSTS—200 H.P. STEAM AND GAS POWER PLANTS

Type of engine	Fuel	Cost per ton	Fuel consumption per b. h. p. hour, lbs.	Total coal, tons	Total fuel cost per year of 3000 hrs.	Relative fuel costs per cent
Simple steam. . . .	Bituminous coal	\$3. 00	8	2400	\$7200. 00	640
Compound steam non-condensing.	Bituminous coal	3. 00	5	1500	4500. 00	400
Compound steam condensing. . . .	Bituminous coal	3. 00	3	900	2700. 00	240
Producer gas. . . .	Anthracite coal	5. 00	1	300	1500. 00	133
Producer gas. . . .	Lignite	2. 50	1. 75	525	1315. 00	117
Producer gas. . . .	Bituminous	3. 00	1. 25	375	1125. 00	100

Type of Plant.

The general arrangement of the complete plant and the method of operation are shown in the diagrammatic cross section. The essential parts are the saturator (B)

75 H.P. TYPE "E" PRODUCER

for supplying a fixed proportion of hot air and steam for the gas making; the generator (E), where the gas making occurs; the scrubber (L), for cleaning the gas; the moisture trap (M) for removing any entrained water from the gas; the necessary piping for connecting the various parts; and auxiliary equipment, gauges, valves, and tools necessary for operation. For furnace work, producers are equipped with positive pressure exhausters.

The operation described is the same for all types of Smith gas producers with the exception of type CF which is of the down-draft type.

Type "E" Producer.

Type "E" producer is designed for anthracite coal only. It is suited to either fuel gas or power service. Producers are of the suction type; but when gas is to be delivered under pressure, the plant is equipped with suitable exhauster and pressure regulator for delivering the gas to the mains without the use of a gas holder.

Type "E" producers are built in 11 sizes ranging from 25 to 300 h. p. For fuel service they will burn from 25 to 400 lbs. of coal per hour. They are guaranteed to deliver 75% of the heating value of the coal in gas of at least 135 B.t.u. per cu. ft. when producer is operating at rated load.

TYPE "E" SUCTION PRODUCER, 300 H. P.
Showing scrubber and saturator complete

Producer is charged and cleaned once in 24 hours when operating on 10-hour service. It is charged every 6 hours when operating continuously. There are no shut-downs for cleaning or charging.

Gas cleaning equipment consists of a steel pipe filled with cast iron, cone shaped baffles. Gas passes up through the baffles counter to the flow of water. This arrangement gives the best cleaning effect, and is very economical in use of water.

Type "E" producers are equipped with flat grates. The larger units have grates with rocking centers operated by a compressed air cylinder. This type of grate keeps the center of the fire clean without hand labor, and prevents loss of fuel when the fire is cleaned.

TYPE "E" SUCTION PRODUCER, 75 H.P.
Note simplicity

Type "EP" Producer.

Type "EP" producer is designed to operate on charcoal or coke, which fuels contain small quantities of tar. This producer is identical with Type "E" machine, except that a mechanical scrubber is added to the gas cleaning equipment.

DIMENSIONS, TYPES "E" AND "EP" PRODUCERS

H. p.	Foundation in ft.		Required minimum height, ft.
	Suction	Pressure	
25	4½ x 4½	4½ x 8½	20
35	5 x 5	5 x 9	20
50	5½ x 5½	5½ x 9½	20
75	6 x 6	6 x 10	20
100	6½ x 6½	6½ x 10½	20
125	7 x 7	7 x 11	22
150	7½ x 7½	7½ x 11½	22
175	8 x 8	8 x 12	22
200	8½ x 8½	8½ x 12½	22
250	9 x 9	9 x 13	22
300	10 x 10	10 x 14	22

Type "BF" Producer.

Type "BF" producer is designed to operate on bituminous coal only. The producer proper is identical with the Type "E" machine. The cleaning equipment consists of the Type "F" tar extractor in addition to usual type of baffle scrubber. Baffle scrubber is used only to cool the gas. Gas is drawn from the scrubber by a positive exhauster and forced through Type "F" tar extractor, which consists essentially of a housing in which is located a diaphragm of glass wool. The tar enters this diaphragm in the form of fog floating in the gas. During its passage through the diaphragm it is agglomerated into large drops which fall out of the gas current, by gravity, into trap provided for that purpose.

Any desired degree of gas cleanness can be secured by use of this equipment. Engines are operated continuously for periods of several months upon gas

SECTION OF SMITH TYPE "F" TAR EXTRACTOR

A SMITH TYPE "F" TAR EXTRACTOR HAVING CAPACITY OF 200,000 CU. FT. OF GAS PER HOUR

Producer gas cleaned by this apparatus can be distributed over a wide area and handled in the same manner as natural or illuminating gas. Gas cleaned by this process can be distributed under high pressure from a central community plant, or to any number of furnaces and engines in a large factory.

cleaned in this way, and no trouble whatever is experienced from accumulation of tar in manifolds or of valves.

Other Types of Producers.

Two other notable types of Smith producers are Type "CF" producer for lignite and Type "G" producer for bituminous coal with mechanical stoking and poking on units of 600 to 3,000 lbs. per hour.

Catalogues and Bulletins.

THE SMITH GAS ENGINEERING Co. will be pleased to mail catalogues and bulletins of any of the equipment illustrated or mentioned above, together with any engineering data desired.

MORGAN CONSTRUCTION CO

GAS PRODUCER DEPARTMENT
WORCESTER, MASS.

Product.

MORGAN PRODUCER-GAS MACHINE.

Description.

The Morgan producer-gas machine converts a larger quantity of coal into gas of the best known quality than is possible with any other type of mechanical gas producer without disturbance of the fuel bed by pokers and without manual labor.

A measuring feeder delivers coal of any size up to 4-in. cubes, direct from the overhead bin on to the fuel bed at frequent intervals, without action on the part of the operator, whose work is confined to regulating the speed to correspond with the demand for gas. The coal is properly spread and the surface continuously leveled by the water cooled bar which floats on the fuel, and permits any practicable variation in height of surface or thickness of fuel bed.

INSTALLATION DIAGRAM OF MORGAN GAS PRODUCER

SECTION OF POKERLESS PRODUCER-GAS MACHINE
Feeder not shown

Ash is removed mechanically at one point into a chute by a spiral shaped plow, held stationary during one complete revolution of the ash pan, and then released automatically; no manual labor.

The development of a closed feeder, operating without manual action, together with the other improvements noted, makes it possible for one man to attend to the gasification of 9 tons of coal per hour.

The fire brick lining has been reduced in thickness around the hottest zone, and is surrounded by a water jacket which keeps the inner surface cool enough to prevent adhesion of clinker.

Operating Results.

One prominent customer took continuous 12-hour samples of the gas day and night for 2 weeks, with the following average results:

AVERAGE ANALYSIS OF 12-HOUR GAS SAMPLES CONTINUING FOR 2 WEEKS

Date	CO ₂	C ₂ H ₄	CO	H ₂	CH ₄	B. t. u. in gas	
						U. S. steel standard	Total at 32° Fahr.
Feb. 2-14, incl., 1914	2.8	0.6	27.4	11.2	3.5	160.5	180.0

Four Morgan producer-gas machines were installed in the above plant to do the work usually requiring 6 mechanical gas producers. During a period of 4 months' test, 3 machines made all the gas required, working at an average rate of over 30 tons of coal per day.

Another customer, operating open hearth furnaces, analyzed an 8-hour continuous sample of the gas practically every day. The average for 5 months was 3.5% CO₂, 28.8 CO, and 182 B. t. u.

Further experimenting gave them the following gasifying capacities and disclosed the fact that the quality of gas does not suffer at these high working rates:

GASIFYING CAPACITY OF PRODUCER-GAS MACHINE

[Date	Net tons coal per day	Operating hours per day	Pounds coal per hour	B. t. u. of gas	
				U. S. steel standard	Total at 32° Fahr.
September 21-22	32.35	23.70	2730	167.0	188.0
September 22-23	36.00	23.05	3120	168.5	190.0
September 23-24	34.15	22.05	3100	165.0	186.0
September 24-25	37.35	22.90	3260	165.5	186.5

Uniformity.

The experience of users is that the gas from these machines is exceptionally uniform in quality. The president of a well-known iron and steel company recently wrote voluntarily:

"The regularity of the product makes it next to natural gas and we are very much pleased with the results."

Installations.

The leading steel companies, in the United States, Great Britain and France, are installing these machines as fast as they can be built. There are 375 in operation, giving results which place them in a class entirely beyond the reach of the ordinary mechanical gas producer. The Bethlehem Steel Co. alone has 46, and the Cambria Steel Co. has recently ordered 51.

A list of important installations furnished on request.

THE ANTHONY COMPANY

Liquid Fuel Engineers

9 Jackson Avenue
LONG ISLAND CITY, N. Y.

Products.

ANTHONY NEBULYTE OIL and OIL GAS BURNERS; ANTHONY NEBULYTE OIL SPRAYS for Water-gas Plants and SPRAYS for all liquids; OIL and GAS BURNING EQUIPMENT for industrial heating systems.

Also Air Washers, Spray Cooling Systems, Paint or Oil Spraying Apparatus, and Sprinklers.

Engineering Service.

THE ANTHONY COMPANY is prepared to redesign present equipment of any kind enabling any one to avail themselves of the advantages of oil or gas fuel.

The engineering staff is also prepared to discuss all heating problems and design special oil or gas fired apparatus for specific needs.

Having designed a great variety of successful industrial heating systems, Anthony engineers have wide experience in this field to place at a client's disposal.

Employment of their services leads to conservation of fuel, speeding up of production, and better quality of treated material.

Application of Fuel Equipment.

Anthony equipment is applicable wherever stills, evaporating pans, dryers, kilns, forges, furnaces or other pieces of apparatus require heat.

Low and high pressure designs to suit every requirement.

Anthony Nebulyte Sprays for Water-gas Plants.

In operation of water-gas plants, Nebulyte sprays give perfect atomization, positive control and uniform distribution of oil.

Anthony Nebulyte Sprays for All Purposes.

Sprays supplied of definite capacity and throw which can be utilized for many purposes, such as: cooling, aerating, atomizing, gasifying, mixing, absorbing gases and vapors, and for all purposes where it is desired to distribute a liquid in finely divided form over a large area, or through a large volume.

HAMMEL OIL BURNING EQUIPMENT CO., INC

FACTORY AND MAIN OFFICE
PROVIDENCE, R.I.

PORTLAND, ME.
BOSTON, MASS.

NEW YORK, N. Y.
JACKSONVILLE, FLA.

PHILADELPHIA, PA.
LOS ANGELES, CAL.

Products.

HAMMEL OIL BURNERS; HAMMEL PATENT OIL BURNING FURNACES; OIL PUMPING SETS.
Also, Hammel Special Designed Oil Burning Furnaces; Hammel Oil Firing Valves; Automatic Pump Governors; Self-cleaning Oil Strainers; Fuel Oil Heaters; Oil Burner Governors and Draft Gages.

Hammel Oil Burners.

The Hammel oil burner is of the inside mixer type and built upon scientific principles. The features which distinguish the Hammel as an ideal oil burner are that, in normal service, it will not carbonize; parts subject to wear, due to grit in oil, can be renewed in five minutes at a cost of a few cents; heavy Mexican oil is burned with perfect results.

Advantages of Hammel Oil Burners.

HIGHER EFFICIENCY—Due to more perfect combustion and better heat distribution.
REDUCED COSTS OF FUEL HANDLING AND MAINTENANCE—No expensive conveying or elevating systems

are necessary. Firing tools and grate bars are eliminated.

INCREASED BOILER CAPACITY—Converting from coal to fuel oil means increased capacity of from 10% to 75%, generally 40% to 60%.

ABSENCE OF SMOKE—Smoke entirely eliminated except for short periods while burners are started up from cold.

HOSKINS MANUFACTURING COMPANY

Electric Furnaces, Pyrometers and Heat Resistant Alloys

Buchanan Street and Lawton Avenue
DETROIT, MICH.

SALES OFFICES

BOSTON, MASS., Tremont Building
PITTSBURGH, PA., Oliver Building

NEW YORK, N. Y., Grand Central Terminal
CHICAGO, ILL., Otis Building

Products.

ELECTRIC HEAT TREATING FURNACES, PYROMETERS and "CHROMEL" HEAT RESISTANT ALLOYS in the form of Wire and Castings.

Electric Furnaces.

The chief advantage of these furnaces is the very close and easy control of the temperature, and the practical elimination of "scale" on the parts being heat treated. They are especially advantageous in the heat treatment of tools and other small metal parts. The furnaces shown here are described in detail in Catalogues 80 and 101-S.

HOSKINS ELECTRIC HEAT TREATING FURNACES

TYPE FB—This furnace is the one shown on the right in the above illustration. Its maximum safe operating temperature is about 2000° Fahr., and its most common use is for the heat treatment of carbon steel parts or for preheating high speed steel. It operates only on alternating current, 110-, 220- or 440-volt line, and requires the use of a transformer. The temperature is controlled by a series of selective switches, shown mounted on the furnace stand. Made in muffle, crucible and tube designs.

DATA, TYPE FB MUFFLE FURNACE

Type and number	Chamber dimensions			Full load, kw.
	Width	Height	Length	
FB-202	4 1/2"	3"	9"	2.75
FB-204	7 3/8"	5"	12 1/2"	6.00
FB-205	12"	5"	12 1/2"	8.00
FB-206	12"	8"	19"	12.50
FB-207	12"	8"	26"	15.00
FB-208	12"	8"	33"	20.00

FB-202 requires the use of a rheostat, but the other sizes, FB-204 to FB-208 inclusive, do not.

TYPE FC—The Type FC furnace is the one shown at the left in the above illustration. In the muffle design, it produces temperatures up to 2500° Cent. and is designed primarily for the heat treatment of high speed steel. It operates on alternating current only and requires a transformer. The resistor material is a series

of carbon strips, and by controlling the pressure of these plates against each other, the temperature can be very closely regulated.

DATA, TYPE FC MUFFLE FURNACE

Type and number	Chamber dimensions			Full load, kw.
	Width	Height	Length	
FC-204	6 1/2"	5"	12"	15.0
206	12"	8"	18"	30.0

Indicating and Recording Pyrometers.

The main feature of Hoskins pyrometers is the fact that the user can make his own thermo-couples. The advantages of this are understood when it is realized that this is practically the only part of the pyrometer equipment requiring renewal. Complete details about this feature and the instruments themselves are given in Catalogue 3-S.

Hoskins pyrometers of the indicating type, high resistance design, are provided with both milli-volt and temperature scales, supplied in ranges of 1000°, 1500°, 2000° and 2500° Fahr., and the equivalent Centigrade scales.

The Recording pyrometer illustrated here makes a single 12- or 24-hour continuous temperature record. It records every 30 seconds, a metal point being pressed against a carbon sheet at the back of a translucent chart, thus making a series of dots. No ink is used.

Hoskins multiple recording pyrometer, not illustrated here, will make any number of temperature records from 1 to 10. Supplied in ranges of 1000°, 2000° and 2500° Fahr. The record appears very distinctly as a series of red inked dots on a green chart.

INDICATING PYROMETER, TYPE HE

PORTABLE PYROMETER, TYPE HA

RECORDING PYROMETER, TYPE HR

"Chromel" Castings.

"Chromel" is a pure nickel-chromium alloy that resists oxidation better than any other known commercial metal used for high-temperature work. Tell us the problem.

AMERICAN GAS FURNACE CO.

Specialists in the Use of Gas for Mechanical Heating Processes

24 John Street
NEW YORK, N. Y.

Products and Services.

AMERICAN OIL GAS MACHINES; GAS BLAST FURNACES; HEATING MACHINES; BLOWPIPE BURNERS; AUTOMATIC HEAT CONTROLLERS; CARBON GAS GENERATORS; CARBONIZING MACHINES; PRESSURE BLOWERS; COMPLETE EQUIPMENT for MECHANICAL HEATING PROCESSES, using Gas as Fuel.

GAS ENGINEERS.

Scope of Use.

These products are applicable to all heat treating processes requiring precision.

Gas as Fuel.

After an experience of over 35 years in utilizing gas in mechanical heating processes in heating operations, we find no fuel possesses so high a degree of efficiency. A positive air blast inducts the gas which is injected into combustion chamber—a properly proportioned mixture of both, under absolute control.

Gas has been proved the best and also the cheapest fuel, when measured by net results.

American Oil Gas Machine.

Converts naphtha into gas, without by-products. No waste. By reason of its purity, it is the best fuel gas known for heating metals, and is delivered under a constant and uniform pressure and is equal to standard city gas. The machine generates gas automatically in quantities as consumed up to its capacity. Machine delivered complete; requires no gasometer or storage tank.

SIZES—Made in 3 regular sizes, converting from 5 to 25 gals. of naphtha per hour into a perfect fuel gas.

Automatic Heat Controller.

Gas blast furnaces operated with this heat controller will not vary more than 5° Fahr. from any temperature to which instrument is set.

Controller consists of 2 parts: (1) pyrometer arranged so that dial pointer movement indicates and controls temperature; (2) pneumatic valve attached to furnace, operated

COMPLETE INSTRUMENT, OR HEAT CONTROLLER, CONNECTED TO OVEN FURNACE

by same air pressure supplied to furnace for combustion and admitting both gas and air in correct proportion to maintain heat wanted, thus effecting a considerable saving of gas, as well as maintenance cost, and assuring uniform results.

A Case Hardening Plant.

In case hardening, the first operation is to carbonize exterior of work so that it can be hardened; second, the hardening process. Plant consists, therefore, of a carbonizing machine and reheating machine or furnace, placed according to available space, and quenching tank.

NEW PROCESS CARBONIZING—By this new process of carbonizing the surface of wrought iron or low carbon steel is converted into high carbon steel to any practical depth required for case hardening the exterior uniformly and leaving a soft core.

NEW PROCESS CARBONIZING PLANT
One of many plants now in daily operation

In this machine the work is packed in gaseous instead of solid carbon. With this process, city or natural gas can be used as the carbonizing agent.

The machine is built in different sizes and when necessary proper fixtures can be supplied for holding the work firmly in the retort while rotating, to prevent it from becoming marred or bruised. Quotations on request. State conditions and requirements fully.

QUENCHING BATH MACHINE—An automatic quenching bath furnished for small work not requiring reheating, but quenched direct from retort on completion of carbonizing process.

CARBONIZING PROCESS—Work contained in the evenly heated, slowly revolving cylindrical retort is constantly and uniformly exposed to a carbon-charged atmosphere under pressure, and absorption of carbon begins as soon as work is sufficiently heated to attract it without the use of old style solid carbons or packing in boxes.

Gas Furnaces and Heating Machines.

GAS BLAST FORGES—Will develop required heat in a few minutes. Used in machineries for tool dressing and forging, *drop forging*, etc.

Types—Bench forges, for forging and tempering small tools or small pieces of metal; tool room forges; gas forges, for drop forgings, for heating blanks of various lengths, for hardening large lathe tools, for forging cutlery, for special work of many varieties, etc.; rod heaters; forges, and babbitt melters.

OVEN FURNACES—For annealing and hardening; die hardening furnaces; case hardening furnaces.

CYLINDRICAL FURNACES—For annealing, hardening and carbonizing.

Types—Round annealers, for wire and light stock coiled; circular, for heating large rims, rings, disks, dies and other circular steel blocks; for hardening rolls, shafts, long blades, etc. Made in various sizes.

TEMPERING MACHINES
—For drawing temper *after hardening*.

Types—Oil tempering, designed to heat oil or tallow not exceeding 600° Fahr., and to control temperature so as to draw any desired temper required in dies, cutters, punches, knives, shear blades, and other cutting tools; air tempering, used to draw "spring temper" and for all work which must show a temper color—air being injected into heating chamber and heated to any required degree, then forced into working space under positive pressure. Where temperature exceeds 600° Fahr., hot air coloring and tempering machines made in various sizes to meet different requirements are recommended; also recommended for "*carbonia*" (or gun-metal) finish.

MELTING FURNACES
For crucibles and cast iron pots.

Types—Regular crucible, for melting gold, silver, copper, brass, nickel, also test melts of iron and steel.

SOFT METAL FURNACES, WITH CAST IRON POTS AND VATS—For melting babbitt, aluminum, zinc, britannia, type metal, etc.; also *cyanide and lead hardening furnaces*.

SOLDERING FURNACES
—For soldering brass tubing; also, soldering furnaces for many other purposes.

ADJUSTABLE TIRE HEATERS—For expanding tires for shrinking same on wheels; readily adjustable to different sizes.

MUFFLE FURNACES—For enameling and assaying. Muffles necessary only when work is such that products of combustion must be excluded from heating chamber containing the work, or when air draught through heating space is required. Muffles not necessary for metal

work. Muffle enclosed by a fire-clay chamber. Burners project into combustion chamber horizontally from opposite sides and force flame into space surrounding muffle, causing its equal distribution.

ASSAY CUPELLING FURNACES—For assaying, cupelling and scorifying—built on plan of our other muffle furnaces, with air draught through muffle.

ANNEALING FURNACES—For bars, rods, strips and pipe. Made to order, of any desired size.

BRAZING TABLES AND FURNACES—Convenient forges for brazing joints in various positions. Blow-pipes pivoted and hinged so as to be easily adjusted to any desired angle or height. Rim brazing furnace, for brazing tires, rims and similar work.

GAS BLAST RADIATORS—For japanning or enameling ovens. Illustration shows what this company supplies for japanning ovens, core ovens, drying kilns or heating of any enclosed cubic space which may be specified; radiator used exclusively for work which does not emit fumes or gases liable to be ignited from open burners. Positive pressure of air is necessary. Enclosed burner for indirect heating also manufactured.

GAS BLAST RADIATOR NO. 3

HEATING MACHINES—Furnaces provided with carrier devices for automatic transmission of work through uniformly heated space, for hardening, annealing, brazing and tempering uniform size work in quantities.

Kind of Work Treated—Lock washers, bolts, springs, pens, cups, cones, ball bearings, etc., for hardening or annealing. Pencil ends, ferules, grease cups, cartridge shells, etc., for annealing.

POSITIVE PRESSURE BLOWERS—Made in 7 different sizes. An air blast under an average pressure of 1 lb. to the sq. in. is indispensable for the operation of all American furnaces and heating appliances. Proper blast can best be applied by this type of blower.

OTHER FURNACES AND HEATING MACHINES—The AMERICAN GAS FURNACE CO. manufactures many other kinds of appliances to meet special requirements. Full particulars on application.

FUEL—All appliances can be used with natural, artificial or naphtha gas. Kind of gas must be specified when ordering.

WHEN ORDERING—State fully all conditions and requirements.

HEATING MACHINE NO. 51
For tempering and coloring steelworkCONTINUOUS HEATING MACHINE
For hardening and annealing, work passing through a uniformly heated retort. Discharges automatically. Made in various sizesLEAD HARDENING FURNACE
For hardening or tempering in lead

POSITIVE PRESSURE BLOWER

PARKS-CRAMER COMPANY

General Agents for the Merrill Process of Industrial Heating
1102 Old South Building
BOSTON, MASS.

WORKS: FITCHBURG, MASS., AND CHARLOTTE, N. C.

Products.

MERRILL PROCESS OF INDUSTRIAL HEATING. (Patented Jan. 1, 1918, Sept. 3, 1918, and other patents pending and applied for.)

For Air Conditioning Equipment, see pages 1010-11.

Merrill Process.

This is an apparatus for supplying heat at high temperatures for industrial processes, and conforms to certain general requirements which may be briefly stated as follows:

The temperature range of the heating medium exceeds that of the material being heated, to insure a rapid transfer of heat. In other words, there is ample thermic head.

The apparatus is safe and durable. Damage from excessive pressure and danger from explosions or fire hazard have been avoided.

The temperature and the rate of heat transfer are under quick and positive control at all times.

A special, non-explosive fluid, mechanically circulated, passes through a scientifically constructed heat absorber. Thence it is delivered through pipes to the apparatus to be heated—jacketed kettles, oven coils, stills, tanks, etc. After delivering a certain predetermined portion of its heat, the circulating fluid returns through the pump to the absorber for re-heating. The entire system is under a slight static pressure from an expansion tank, open to the atmosphere. The only added pressure, rarely exceeding 5 lbs., is that required to maintain circulation against internal frictional resistance.

The absorber and fuel supply may be located at any reasonable distance from the manufacturing apparatus—completely isolated in a fireproof room if the product is inflammable. All fire risk is thus avoided. There is no explosion hazard from the circulating fluid.

The circulating fluid is of the first importance. A special mineral fluid free from carbon is used; also free from inflammable distillate or vapor pressure. Its copyrighted name is Meprolene. It has a safe working temperature of 600° Fahr. With dry saturated steam, a pressure of 232 lbs. per sq. in. is reached at only 400° Fahr. Superheating may carry this temperature higher, but is of little use for industrial heating on account of its low specific heat and its inefficiency due to the loss of the latent heat of vaporization.

Meprolene will stand most severe flash and fire tests. It withstands high temperatures for indefinite periods. It does not carbonize, distill or "crack." It is made especially for the Merrill Process and is sold only for it.

Absorber.

Peculiar requirements for transferring heat, not found in other engineering construction, necessitated long experimenting and careful design. The absorber coil rests on a Dutch oven furnace especially designed for

the type of fuel used. Expansion strains and radiation losses are amply provided for. Insulated clean-out doors provide proper accessibility. The low pressure fuel oil burners prolong the life of furnace linings.

The absorber coil is a series of tube elements expanded into nested return elbow units. Compact in construction, efficient in distribution of heating surface, easy of examination and repair.

A 600,000 B.T.U. PER HOUR ABSORBER COIL

Circulating Plant.

Proper design of the circulating plant is of vital importance. The pump must circulate, without pulsation, a material which when cold is extremely viscous, and when hot is more fluid than water and more difficult to confine. Ample safety devices are installed to protect all parts of the system against unintelligent operation.

Applications.

The Merrill Process began in the asphalt-using industries five years ago. Its early apparatus, relating to road construction, is still in use. The system as now developed, however, is applicable to the following industries:

Chemical plants, rubber works, asphalt melting and coating plants, melting and refining works, oven heating, japanning plants, paper coating mills, canning factories, shoe shops, plants using hot calender rolls or presses, varnish, paint and shellac works.

Each case is a separate engineering problem. On request, preliminary data sheets will be furnished, from which tentative estimates may often be submitted. These must invariably be checked later by a personal inspection of local conditions before a definite contract price can be quoted. Parks-Cramer engineers are always available for consultation.

Installations require specially trained mechanics, hence must invariably be made by the construction force of this company.

TYPICAL MERRILL PROCESS SYSTEM CONNECTED TO A LARGE JACKETED KETTLE

BAYLEY MANUFACTURING CO.

Builders of Heating, Ventilating and Drying Apparatus

732-748 Greenbush Street
MILWAUKEE, WIS.

Products.

PLEXIFORM FANS; PRESSURE BLOWERS, FANS for Forced and Induced Draft; CHINOOK HEATERS; STEAM ENGINES; LEATHER DRIERS; ALFALFA DRIERS; SHAVINGS EXHAUST FANS.

Also Steam Traps and Blast Gates.

Plexiform Fans.

The Plexiform fan is of a design that makes for great strength in construction, lightness and efficiency. Its characteristics and distinguishing features are:

The maximum air from the minimum of housing.

Large and practically unobstructed inlet and outlet openings.

Free and noiseless delivery of air, without the use of arbitrary cut-offs.

A type of construction adapted for handling high temperature as well as low temperature gases, and for double width, double inlet fans as well as single width, single inlet fans.

BLAST WHEEL FOR PLEXIFORM FAN

PLEXIFORM FAN

Suitable for practically all applications where maximum of air (at low or medium pressures) is desired, and especially where space conditions limit and where horsepower expenditure is a prime factor.

It is used generally as a component part of indirect systems of heating and ventilating for schools, churches, theaters, hospitals, penal institutions, industrial buildings; for forced and induced draft applications; for drying; for ventilating purposes, and for the handling of dust laden air, etc.

Shavings Exhaust Fans.

Type "B" shavings exhaust fans for handling refuse from saw-mills, planing mills, cotton gins, wood-working establishments of all kinds.

TYPE "B" FAN

TYPE "B" BLAST WHEEL

Type "B" shavings exhaust fan is designed to reach its highest efficiency at a medium speed. Peculiar, in that its blast wheel is of the multiple bladed type and that its construction permits of repair.

Chinook Heaters.

A staggered tube, indirect heater, built without the use of return bends, elbows, nipples or left-hand threads. The circulation is accomplished by the use of a pipe within a pipe. The Chinook heater is not subjected to the ravages of unequal expansion and contraction, as each tube is independent of any other.

It is used principally in connection with the Plexiform fan for heating and ventilating public buildings, and for drying. It is also used as indirect radiation independent of fans, for cooling water and for condensing exhaust steam.

It is shipped set up or knocked down, depending on size and installation conditions.

CHINOOK HEATER

Steam Engines.

Vertical and horizontal steam engines for high and low pressures, built for direct connection to fans and generators, and for belt connections.

Leather Driers.

Both loft and tunnel systems for drying wet stock, and tunnel systems for re-drying finished leather.

Alfalfa Driers.

A continuous tunnel system for curing alfalfa directly from the mower and delivering the cured hay to the grinder. Also adapted for the drying of hemp, clover, hops, etc.

VERTICAL ENGINE

Products.

Manufacturers of AIR WASHERS; HEATING, VENTILATING, PURIFYING, COOLING, HUMIDIFYING, DEHUMIDIFYING and DRYING EQUIPMENT; "SIROCCO" FANS; MECHANICAL DRAFT and BLAST APPARATUS; FANS and BLOWERS for all purposes; VERTICAL SELF-OILING ENGINES; TILTING STEAM TRAPS ("DETROIT" SYSTEMS); DRY KILNS for Timber Products.

Fans and Blowers.

The AMERICAN BLOWER COMPANY's lines of fans and blowers include a type of machine to meet every air handling problem, from a small office fan to a complete ventilating or heating system for the largest factories and public buildings. The superiority of these fans is proved by their adoption in the world's largest plants.

"ABC" fans are adapted to heating, ventilating, exhausting, purifying, cooling, humidifying, dehumidifying and drying equipment in office, public, educational and industrial buildings.

"Sirocco" Fans.

"Sirocco" fans in all sizes are regularly constructed with full housings; larger fans are built, however, with seven-eighths housings. Housings being small for any given capacity, it is usually possible to use full housed fans.

Full housed fans, up to and including No. 6, are adjustable as to discharge, it being possible with the same fan to change the discharge to any direction desired and to shift the pulley from one side of the fan to the other. This can not be done with the seven-eighths housed fans, each fan being constructed to meet the requirements of individual installation. If desirable, double discharge fans can be furnished.

SINGLE INLET AMERICAN "SIROCCO" FAN

Full housed. Left hand. Top horizontal discharge, inlet side

Single inlet fans are constructed with either overhung wheel or pulley, as conditions require. Double inlet fans can not be built with overhung wheels.

"Sirocco" fans may be engine, motor or turbine driven, either direct connected or by belt.

Pressure Blowers and Exhausters.

PRESSURE BLOWERS—Blowers of this type are especially designed and constructed for delivering air at high pressures.

They are built in standard sizes, which are suitable for all purposes for pressures up to 16 ozs. per sq. in.; and special blowers are built to give a pressure up to 24 ozs. per sq. in. The speeds at which the standard blowers operate are generally too high to permit of driving by direct connected motors, but special blowers are built for such requirements.

SPECIAL TYPE P BLOWER WITH D. C. MOTOR

Pressure blowers are particularly adapted for supplying the air blast for cupolas and forges; for blowing heating and melting furnaces for plates, billets, rivets, etc., using either oil, gas, coal or coke for fuel; for furnishing air for cooling the moulds in glass plants; blowing scale from dies and forging hammers; glass blowing, and kindred applications.

EXHAUSTERS—Designed and built especially to withstand strains of high pressure duty, such as in pneumatic systems, metal mine and tunnel ventilation, gas exhausting, etc.

Cast Iron Blowers and Exhausters.

Installed as exhausters, these fans are especially adapted to handling gritty dust, such as comes from emery wheels, tumbling barrels, rattlers, etc., which quickly cuts into and destroys sheet steel. The sandy

exterior of cast iron, however, gives a certain amount of protection.

They are also adapted to the removal of smoke from forge fires, steam from cooking vats or kettles, in dye works, breweries, packing houses or rubber factories; blowing coal dust or powdered coal into rotary kilns or other furnaces; ventilating toilet rooms in public buildings; in fact, they are adapted to any work within their capacity.

As blowers, they are particularly adapted for furnishing the blast for heating plates, rivets, etc., in furnaces burning coal or coke; for blowing of forge fires; for supplying draft to steam boilers; and for use in connection with mechanical stokers.

Disc Ventilating Fans.

Adapted to ventilation of all types of buildings, for removal of smoke, noxious fumes and gases, steam and dust; to heating and drying in connection with heating apparatus, either furnaces or steam coils. Also more economical and effective than aspirating coils frequently employed to assist draft in ventilating shafts or eduction flues in large public buildings.

TYPE D FAN WITH STANDARD BASE AND PULLEY

Ventura Disc Ventilating Fans.

Ventura disc ventilating fans handle large volumes of air freely, or against pressures, up to 1-in. water gauge. They have 10 broad blades riveted to a large central disc, which absolutely prevents a back flow of air through the center when working against pressure.

VENTURA FAN—WALL TYPE, MOTOR DRIVEN
Pulley outfits can also be furnished

For ventilating rooms and buildings; for ventilating small mines or at any mine where a disc fan (engine or motor driven) can be used, with capacities of 650 to 100,000 cu. ft. per minute, resistance not exceeding 1-in. water gauge.

Mechanical Draft.

"Sirocco" multiblade fans have met with unprecedented success in this class of work. Many of the largest and speediest warships afloat are equipped with "Sirocco" fans to supply draft.

Two of the largest power plant boilers in the world are supplied with draft from "Sirocco" fans. For very high speed high pressure work, reinforced "Sirocco" wheels are available.

ADVANTAGES—The advantages that can be derived from the use of artificial draft are many, though largely dependent upon one another. Being so interwoven, to enlarge upon each one separately apparently involves repetition, yet the distinctive features are present and very evident. The points of superiority of mechanical draft produced by centrifugal fans as compared with chimney draft are as follows:

Lower first cost; smaller operating expense; cheaper fuel; increased and improved combustion; smaller boiler plant; more thorough utilization of waste gases; absolute independence of atmospheric conditions; better regulation; economy of space; smoke prevention; greater adaptability.

INDUCED DRAFT—A few of the important advantages of induced draft over forced draft are as follows:

Draft Not Shut Off While Firing—It is never necessary to shut off the draft when firing, as there is no pressure in the combustion chamber to force scorching gases and dust out of the firing doors when they are opened. The ash pit can be cleaned at any time without shutting off draft.

Boiler Room Ventilated—Air drawn into furnaces from boiler room is replaced by fresh outside air. Forced draft has a tendency to force smoke and ill-smelling gases through crevices in boiler setting. No injurious gases can escape, as all crevices are under a suction.

Cleaner Boiler Flues—Boiler flues can be kept cleaner, as there is less lifting effect at fire and consequently ashes and dirt are not carried in suspension and deposited in places where velocity of gases is lowered, to same extent as is the case with forced draft.

"SIROCCO" TURBINE DRIVEN BLOWERS
Supplying forced draft for two 2365 h.p. boilers, the largest in the world

Boilers Uninjured—Liability of boilers being injured is reduced to a minimum with induced draft, being no greater than with natural draft.

FORCED DRAFT—Whenever the greater portion of resistance offered by a boiler system to the flow of air is encountered at the furnace, it is advisable to use forced draft. This is particularly the case when hollow blast grates or underfeed stokers are used, as under these circumstances, if an induced draft fan were employed, the high suction which would have to be maintained throughout the entire system would result in excessive leakage.

Air Purifiers or Washers.

All the improvements made in air washers for the past 18 or 20 years are embodied in the "Sirocco" purifier. The nozzles are adjustable, and can be flushed while in operation without affecting the cleansing effect of the machine. The scrubbing and eliminator surfaces are arranged so as to create low resistance through the purifier; hence, low operating cost.

They are built in sizes with capacities of 3,500 to 300,000 cu. ft. of air per minute.

"SIROCCO" PURIFIER

One of the eight recently installed by the Ford Motor Company

Humidifying Systems.

The contract department of this company is prepared to undertake the work of installing complete systems for humidifying textile mills, bakeries, rubber drying, or similar work requiring accurate and automatic control of the atmospheric conditions in manufacturing processes.

Cooling, Dehumidifying or Temperature Drying Systems.

The AMERICAN BLOWER COMPANY is prepared to furnish complete installations on a guarantee of results for low temperature drying or other cooling work including refrigerating equipment. Some of the largest and most successful work of this kind in the country has been done by the company and includes match drying rooms, cheese storage houses, capsule drying systems, film drying, chocolate dipping and coating processes in biscuit plants, fermentation rooms, drying materials susceptible to injury at high temperatures.

"ABC" Unit Heater.

This compact, portable apparatus provides an ideal method for heating factories of all kinds, particularly small or medium sized buildings. One or more units can be placed in a room where heat is most desirable. As extensions to the plant are made, additional units can be installed. The fan is driven by a motor, turbine or a pulley.

"ABC" UNIT HEATER

"ABC" Heaters.

"ABC" pipe coil heaters are admirably adapted for heating and ventilating factories and all occupied buildings requiring a large volume of air freshly warmed by steam or hot water. "ABC" heaters are also well adapted for drying and cooling purposes.

The capacity of "ABC" heaters is extremely flexible, as they are made in sizes up to 40 pipes wide, and from 2 ft. to 12 ft. high.

"ABC" PIPE COIL HEATERS ON FACTORY HEATING SYSTEM

Vertical Steam Engines.

"ABC" vertical enclosed self-oiling steam engines are built in 3 types, with or without automatic speed control:

Type "A" single cylinder up to 60 h. p.

Type "E" double cylinder up to 120 h. p.

Type "X" cross compound up to 120 h. p.

"ABC" engines are adaptable for direct connection to centrifugal pumps, electric generators, stokers, fans and blowers.

With variable speed attachment they are successfully used to drive paper mill machinery.

They operate without noise or vibration. Oil is not forced, but flows by gravity, each bearing surface being individually supplied with its proper proportion.

"ABC" engines have run continuously from 6 months to 1 year, without adding new oil to original supply or making an adjustment.

TYPE X ENGINE—VERTICAL

Showing arrangement of interior lubricating mechanism

"ABC" TYPE A ENGINES DRIVING CENTRIFUGAL PUMPS
Used for barometric condenser service

"Detroit" Systems for Handling Condensation.

Designed to automatically return condensation directly to boiler without loss of heat units. To meet various conditions, these systems are manufactured and used as required according to the following types:

(1) Single system, used when steam pressure at receiving tank is sufficient to raise water to return trap above boiler. (2) Double system, used when steam pressure on return lines is insufficient to raise water to trap above boiler, as in exhaust steam heating. (3) Combination system, used when a wide variation in steam pressure exists, as exhaust in daytime and live steam at night. (4) Metering system, used when feed water is to be measured. (5) Boiler feed system, used to feed boiler

in place of a boiler feed pump. (6) Vacuum system, a double trap installation, used when desirable that vacuum, or lower trap, receives condensation by its vacuum and lifts it to return trap on top of boiler. (7) Lifting or pumping systems, used for raising water from one level to another. (8) Systems for handling condensation in low pressure heating installations.

DETROIT RETURN TRAP
No working parts inside the tank

THE "DETROIT" DOUBLE SYSTEM

Method of connecting up "Detroit" return traps for double trap system. Arrow indicates direction of flow of condensation

Special Drying Systems.

"ABC" dryers can be designed to meet the requirements of almost every material. "ABC" engineers have designed successful systems for drying such material as glue, enamel on metal surfaces, cereals, leather, salt, soap, pottery, varnish, cloth, asbestos, ginger, starch, tobacco, paper, cocoa, sugar, powders, etc.

Dry Kilns for Timber Products.

Built in 2 types: Forced circulation (with fan); natural circulation (without fan). For drying all kinds of woods and wood products.

"ABC" kilns are equipped with the new and improved *straight pipe* heating coils. "ABC" kilns produce a first class product, free from checks, stains, and other imperfections. "ABC" kilns dry uniformly, eliminating the possibility of case hardening. Controllable under all outside weather conditions.

Engineering Service.

If those parties considering the installation of ventilating or heating systems will communicate with the Engineering Department of this company, as to their plans along these lines, this department will suggest the kind of equipment best fitted for the plans which they have in mind. The company's sales engineers are located at points shown on page 964, or information may be secured direct from the Engineering Department at the home office.

BUCKEYE BLOWER COMPANY

Manufacturers of Ventilating Apparatus

COLUMBUS, OHIO

Products.

BUCKEYE DISC FANS.

BUCKEYE MULTIBLADE
FANS.

Adaptability.

Buckeye fans are eminently suited for mechanical ventilation, forced or induced draft, mine ventilation, dry kiln where hot blast is used, waste heat installations, any mechanical system operated in limited space and for service as exhausters.

Notable Advantages.

BUCKEYE DISC FAN—To successfully overcome a moderate amount of resistance usually encountered in mines, industrial plants, etc., all sizes of Buckeye disc fans are built with 12 blades so assembled and secured as to overlap one another. This construction enables the Buckeye fan to maintain a higher pressure than ordinary disc fans, and therefore renders it more suitable for this class of service.

Type A

Type B
BUCKEYE FANS

BUCKEYE MULTIBLADE FANS—The large, unrestricted openings in comparison to the size of the wheel, peculiar to this type of fan, permits large volumes of air to be handled with moderate velocities and minimum power consumption.

Buckeye fan wheels are carefully balanced before shipment on a special knife edge balancing apparatus, so that they remain in any desired position when supported on this balance. This insures smooth, quiet running at either high or low speed while delivering maximum volume of air for power consumed.

For a given amount of air the diameter of multi-blade wheel is smaller than in any other type. Thus to maintain the same tip speed, more revolutions per minute are required. This allows the use of a higher speed motor or engine, thus making, in some cases, a great saving in cost.

TRADE-MARK

BUCKEYE REVERSIBLE MULTIBLADE FANS

Buckeye Disc Fans.

These fans were carefully designed for continuous and efficient service. They are heavy duty fans substantially built of the highest quality of materials, and are rigidly assembled and finished in a workmanlike manner. They will successfully withstand the severe service to which industrial ventilating fans are subjected.

The fan hub is a single casting, accurately bored for the shaft and carefully machined for receiving the blades which are hot riveted to two parallel flanges provided around the hub. A large cast iron disc is used as a companion member to the hub, to which the various blade braces are hot riveted. The hub and disc are each secured to the shaft by a common key but with separate set screws.

This large center hub provides the strongest possible method of rigidly mounting the 12 fan blades. It also effectively prevents any backflow through the center where the linear velocity of the fan wheel becomes too low to create a high static pressure. Each blade is made of heavy gauge steel, overlapping the one next to it, and is riveted to both sides of the center hub. Each blade is further braced to an extra supporting disc mounted behind the hub.

BUCKEYE DISC FAN BLADES
Showing rigid bracing

The fan wheel is keyed to a shaft of the finest quality of cold rolled carbon steel.

The casing of blue annealed sheet steel completely encircles the fan wheel, making the fan a self-contained unit. All casings are stiffened with two angle flanges, which, together with ring oiling bearings, etc., are standard with all Buckeye disc fans.

The smaller sizes of Buckeye disc fan (type A) are supported in the casing by extra heavy wrought iron tubes, cast into a central yoke which houses the bearing. These fans are ready to install in a brick or other solid masonry partition wall, or are more usually furnished with heavy cast iron bases, making them independent of the wall for support.

The 6-, 7- and 8-ft. sizes are made with pillow blocks mounted on cast iron pedestals which are bolted to a flat base (type B). This base also supports the casing. The 9-, 10- and 12-ft. sizes are generally mounted on a concrete pedestal.

All wheels are carefully balanced before shipping, and run smooth and quiet at high speeds, delivering a maximum volume of air for the power consumed.

36-IN. DISC FAN, HYATT BEARINGS

TYPE C DISC FAN, DIRECT CONNECTED TO MOTOR

Buckeye Multiblade Fans.

The correct design, expert construction and high grade of materials used combine to make this fan an efficient ventilating agent.

The bearings which this company manufactures for all Buckeye fans are of the ring oiling, self-aligning, babbitted type. The oil reservoir is unusually large, and is equipped with a sight level oil cup. Where desired, water jacket, babbitted bearings or roller bearings may be had at a slight increase in cost.

Housings are made of best grade blue steel sheets rigidly braced and stiffened with angle iron.

BUCKEYE MULTIBLADE FAN WHEEL

FLOOR STAND AND SHAFT BEARING

Shafts are of the highest grade turned steel, properly ground and accurately machined to sizes required.

The peculiar design of the Buckeye multiblade fan wheel insures a saving of approximately 30% in power over the old, large type wheel. The blades are all formed in dies, thus insuring exact uniformity in curvature and pitch which are essential for the high percentage of efficiency that this wheel develops.

Buckeye multiblade fans are regularly built in size 5 and larger, with overhung pulley. The bearings are rigidly supported on the sides of the fan housing. If desired, these fans can be furnished with bearings independent of the housing and supported upon heavy cast iron floor pedestals.

Size 4 and smaller are built with overhung wheel. The casting and bearings are supported upon a rigid, cast iron pedestal and are so arranged that the casting may be removed from the pedestal and replaced to comply with any hand or discharge.

Buckeye fans are usually furnished for belt drive, but can be furnished for rope, chain or gear drive as desired.

Direct connected Buckeye multiblade fans can be furnished for any available power, and in any required size or type. They can be constructed to fit any special conditions and arranged for either single or double inlet, and single or double discharge, as desired. They can be used for either blowing or exhausting.

Double inlet fans are more efficient than single inlet, and should be used wherever possible.

BUCKEYE MULTIBLADE FAN DIRECT CONNECTED TO MOTOR

Information Required When Ordering.

In order to furnish dependable data on fan installation that will absolutely comply with client's conditions and requirements, the following information is necessary:

- (1) The volume of air that fan is to deliver.
- (2) The resistance, or static pressure, that it will operate against.
- (3) The restrictions in regard to the speed of fan or power, if any.
- (4) Any restrictions as to power consumption.
- (5) Any restrictions as to space for fan or power, such as height, width, or length of floor space available for the apparatus.
- (6) Type of motive power to be used.

Services and Facilities.

Buckeye fans are designed and built by expert mechanics in modern shops equipped with the latest improved machinery.

The location of the shops near 16 steam lines and 8 interurban lines assures prompt shipments.

The company maintains a special engineering department, which is prepared to co-operate with mining engineers, superintendents and operators in the solution of difficult ventilation problems in their application to industry.

This service is at the disposal of clients, and does not entail any obligation whatever.

BUFFALO FORGE COMPANY

Heating, Ventilating, Forges, Mechanical Draft Equipment; Punches and Shears
BUFFALO, N. Y.

BRANCH OFFICES IN PRINCIPAL CITIES

Products.

HEATING and VENTILATING EQUIPMENT:

Heaters
Centrifugal Fans
Exhaust Fans
Blowers
Disk Fans

FORGES

MACHINE TOOLS:

Bar Cutters
Punches and Shears
Drill Presses

Buffalo Steel Pressure Blowers.

For supplying blast to forge fires, cupolas and furnaces where pressures from 4 to 14 oz. are required.

They have a solid cast iron peripheral shell which absolutely prevents leakage.

Removable cast iron side plates make the blast wheel and shaft easily accessible.

BUFFALO STEEL PRESSURE BLOWER
Bottom horizontal discharge

B Volume Blowers and Exhausters.

These blowers and exhausters are used for pressures up to 6 oz. For removing fumes or gases, in connection with dust and refuse removal, in organ blowing, in forge and furnace blowing and all similar work they are supreme.

B VOLUME BLOWER

Buffalo Heating System.

The Buffalo heating system consists of three elements: the heater, the fan, and a system of distributing ducts.

BUFFALO HEATERS—The heater is in sections, each consisting of four rows of vertical 1-in. pipe screwed into a cast iron base. The coils are tightly enclosed on top and sides by a sheet steel casing through which the fan draws air.

BUFFALO FANS—The fan is a Buffalo conoidal or planoidal of size selected for the particular service required in each case.

DUCTS—The ducts distributing the warm air are usually of sheet metal, overhead, but may be incorporated into the building construction or be placed underground.

ADVANTAGES—The advantages of the Buffalo fan system of heating lies both in its flexibility of operation and economy. Equipped with direct radiation a building heats up slowly and with no uniformity. This is especially true of a high building, where the chimney

action draws all the warm air up under the roof and allows the heat to escape through the roof.

A fan system with the proper amount of reserve can heat a building quickly, and the arrangement of the duct outlets throws the warm air down into the working area.

The chief points of the Buffalo system may be summarized as follows:

- (1) Perfect ventilation regardless of exterior conditions.
- (2) Uniform and proper distribution of heat.
- (3) High efficiency of heating surface (3 to 5 times that of direct radiation).
- (4) Greatest economy in operation.
- (5) Utilization of exhaust steam.
- (6) Prevention of drafts by production of a plenum.
- (7) Independent regulation of heating and ventilating effects.
- (8) Great flexibility in operation to suit varying conditions, affording maximum economy.
- (9) Ease of control, which prevents overheating.
- (10) Great compactness, affording an economy of space and reducing the cost of steam connections.

- (11) Perfect drainage, making less repairs necessary and giving a lower rate of deterioration than with direct radiation.
- (12) Lower cost of installation.
- (13) The entire apparatus is easily portable and is, therefore, a permanent asset.

Catalogue No. 401 and others.

Buffalo Slow Speed High Efficiency Mill Exhausters.

These machines are designed especially for conveying and removing shavings, sawdust, grain, cotton, dust, bark, etc. They are built to withstand hard continuous service and are reversible for any direction of discharge.

Catalogue No. 410.

NIAGARA CONOIDAL WHEEL

THREE-QUARTER HOUSING, NIAGARA CONOIDAL FAN

STANDARD EXHAUSTER

SLOW SPEED HIGH EFFICIENCY EXHAUSTER

Buffalo Electric Disk Fans.

Produce the greatest results at lowest cost in cooling workshops, loft buildings, restaurants, kitchens and for carrying off smoke and fumes when no ducts are needed. Their operation is noiseless and no attention, except occasional oiling, is required.

DISK FAN (SMALL SIZE)

DISK FAN (LARGE SIZE)

Buffalo Combination "Armor Plate" Punches and Shears.

These machines are built up of plates of steel with a tensile strength of 75,000 lbs. per sq. in. Since this is more than seven times as strong as cast iron, it makes possible a large capacity machine of light weight. They are built up in various styles to meet individual requirements.

Catalogue PS gives complete data.

Buffalo No. 10 Bar Cutter.

This machine weighs 300 lbs. and is especially favored by contractors for construction work on buildings because of its portability. It is built up of two steel plates (tensile strength 75,000 lbs.), bolted and riveted together. All working parts enclosed. Stripper on side prevents metal binding and roller prevents dulling of knives.

Buffalo Open Throat Angle Shears.

Buffalo open throat angle shear is a compact machine. Its big feature is the open throat, which permits entering the material from the front of the machine instead of inserting through the sides.

NO. 10 CONTRACTOR'S BAR CUTTER

NO. 4-B COMBINATION PUNCH AND SHEARS

NO. 2. OPEN THROAT ANGLE SHEAR AND TEE CUTTER

Forges.

Buffalo rivet forges for rivet heating on structural work are light, compact and strong and will stand a large amount of rough handling.

Blacksmith forges of both the portable and stationary types and for every conceivable purpose make selection of this type of equipment a simple matter.

Catalogues Nos. 100 and 108 give detailed information on all sizes.

NO. 210 RIVET FORGE
Largest capacity, quickest heat, easiest operation

BUFFALO NO. 332-H STEEL CONTRACTORS FORGE
Equipped with Buffalo No. 200 Silent Blower and "Vulcan" Tuyere

Buffalo Drills.

Buffalo drills are designed in a large variety of styles and sizes to meet every conceivable need.

Catalogue No. 210 gives complete data on other styles.

STEAM and ELECTRIC TURBO UNDER-GRATE BLOWERS for boilers and furnaces; VOLUME BLOWERS and EXHAUSTERS for gas producers and industrial uses; PRES-SURE BLOWERS for oil burning systems; STEAM POWER TURBINES.

regulating valve, thus giving automatic control. This feature also maintains a steady steam pressure. Peak loads are easy to overcome, as the blower will rapidly increase the rate of combustion, making the work much easier for the fireman.

Carling Turbo Undergrate Blower.

Supplies the necessary air volume and pressure for successfully burning the lowest grades of fuel, effecting savings of 10% to 30%. All the heat value can be obtained from screenings, culm, coke breeze, lignite and similar grades. Exhaust steam from turbine is mixed with air from fan, cutting down clinker formation. With high grade bituminous coal, better combustion is obtained than is possible with chimney draft and 100% to 200% more steam can be obtained, as the blower produces desired draft independent of chimney and weather conditions.

One or more blowers may be operated from one

Built in standard sizes with normal capacities from 50 to 500 b. h. p. for continuous operation at 100% above rating. Usual steam consumption of this type of blower is from 1% to 2%.

CONSTRUCTION—Design is substantial and construction is heavy. Turbine rotor and fan are larger in diameter than is found in usual practice. Ball bearings are the only parts in metallic contact and subject to wear. These may be quickly replaced with Carling patent construction at slight expense. Fan and turbine are designed as a unit, mounted on one common shaft. Lubrication is practically automatic and is the only point of attention necessary in operation. Three nozzles are supplied on the turbine with valves which may be regulated for increasing or decreasing speed and air pressure. Turbine rotor is made of bronze and buckets of cupro nickel, eliminating corrosion. Fan wheel is of the propeller type, cast in one piece of aluminum bronze. Fan casing is made on the Venturi principal, giving an easy flow of air at highest efficiency. Operation is very quiet, as turbine is enclosed and fan housing has been especially designed to eliminate air noise through the wheel. Blade spacing in all rotors is 110 or more per inch of diameter. Blades have been especially designed for this work in accordance with the latest practice, giving a maximum of steam economy. Construction of turbo unit as a whole is superior for durability and each machine is guaranteed against defects for one year.

INSTALLATION—The Carling undergrate blower is easy to install, as it is shipped all set up, ready to run. Usually set in side wall of boiler or may be placed in front center wall or at rear of boiler with a duct extending through the bridge wall. When set in front center wall with Carling air ducts and dampers, 2 boilers may be operated from 1 blower. Cost of installation is low and can be made by almost any one in a few hours.

Carling Volume Fans.

Designed for delivering large volumes of air at pressures ranging from 1/4 to 6 oz. Supplied either as blowers or exhausters. This type of fan has a wide range of industrial uses, being especially adapted for gas producers and furnaces, small stokers, installations, low pressure oil systems, conveying materials, etc.

Standard arrangement is right-hand bottom horizontal. Standard construction is with fan casing of cast iron and fan wheel of steel plate, all parts painted with acid resisting paint. Removable side plates on fan casing give quick access for inspection. Fan wheel is mounted direct on one common shaft with the turbine, eliminating couplings and belt troubles. Speed may be varied by regulating valves. Only 2 bearings need be oiled and practically no attention is required. Unit may be placed in any position on account of perfect balance.

Carling Pressure Blower.

Of the same general construction as the volume fan.

It does not deliver as much air, but has a pressure range up to 1 lb. and is used mostly on oil burning systems, forge fires and other requirements for high pressures.

Carling Steam Power Turbine.

Especially designed to meet the demand for small steam turbines. Built in sizes from 1 to 50 h. p.; speed ranges from 1200 to 5000 r. p. m., with 12-, 16-, 20-, and 24-in. single or double stage rotors, with or without constant speed governor. For ordinary conditions, two 12A turbines will develop up to 8 h. p.; 16A up to 15 h. p.; 20A up to 30 h. p. and 24B up to 50 h. p. Carling reduction gears supplied for various speed ratios. All parts interchangeable.

Rotors are of bronze and buckets of cupro nickel, designed for highest steam economy. Shaft is of heavy section, mounted on 2 ball bearings, the latter held in place by the Carling patent method, so that they may be replaced quickly at little expense.

Carling turbines can be supplied with coupling for direct connection to pumps, generators, blower fans and similar drives; supplied with a pulley for belt connection or made to operate in a vertical position. Special designs built for particular requirements.

Briefly the advantages of the Carling turbine are: high efficiency for power developed; great economy in the use of oil; only 2 bearings to lubricate; freedom from repairs; no reciprocating parts; even drive rotation; exhaust steam contains no oil; can be placed in any position; no special foundations required; perfect balance; requires little space and practically no attention.

Products.

HEATING and VENTILATING APPARATUS; FANS, BLOWERS, EXHAUSTERS, AIR WASHERS, PIPE COIL HEATERS; STEAM ENGINES.

Clarage Special Bearings.

If a fan or blower is to give the very best of service the bearings must be faultless. In any centrifugal machine the point of greatest wear occurs in the bearing.

Clarage special bearings are protected against wear. Felt washers are provided at each end of the bearing case, fitting snugly around the shaft. The felt washers prevent the entrance of dirt and grit into the bearing and thereby save the inner sleeves from injury. Clarage bearings are self-oiling, and self-aligning in all planes.

These superior bearings are now furnished on all Clarage fans and blowers. The best fan bearings made.

CLARAGE FAN BEARING
OPEN FOR INSPECTION

Multiblade Fans.

The Clarage multiblade fans are guaranteed to be equal, if not superior, to any fans built for handling large volumes of air against comparatively low pressures.

For heating or ventilating installations in public building, factory, mine or tunnel, these fans are especially suitable. The unusually high efficiency obtained, quietness of operation, small space required and adjustable features of the design, are all points in which they have been found superior to other types. Every wheel is guaranteed to be amply strong for working against static pressures even as high as 5-in. water gage.

For convenience in specifying, these fans are numbered according to the approximate diameter of the wheel in feet: No. 1, 1-ft. wheel; No. 2½, 2½-ft. wheel, etc. Sizes up to and including the No. 10.

Full-housed fans, up to and including the No. 3 size, are built with cast iron side plates, and, therefore, adjustable and reversible for hand and discharge; 16 different directions of discharge can be obtained with one fan.

CLARAGE MULTIBLADE
FAN WITH OVERHUNG
WHEEL

This arrangement leaves inlet unobstructed

Multiblade fans are built in full-housed and ¾-housed arrangements.

Single width fans are furnished with either overhung wheel or with overhung pulley. Double width fans can not be built with wheel overhung.

Clarage multiblade fans can be motor, engine or turbine driven, either by belt or direct connected.

Pipe Coil Heaters.

Clarage pipe coil heaters consist of a cast iron base, which forms a steam reservoir on one side of the partition wall and condensation reservoir on the other, and 1-in. pipes rising in pairs connected at the top with elbows and a short nipple.

These heaters are well adapted for heating all types of buildings requiring large volumes of warm air. They can be used with success in drying and evaporating installations.

CLARAGE PIPE COIL HEATER

Vento Heaters and Air Washers.

In connection with Clarage fans this company is prepared to furnish cast iron vento heaters and air washers or any accessories necessary or desirable for a complete heating and ventilating unit.

Steel Plate Fans and Blowers.

Especially designed and constructed for furnishing mechanical draft, either as forced or induced draft fans; built unusually heavy to stand the strain of continuous operation. They are also adaptable for heating and ventilating, exhausting fumes and gases or in any installation, where large volumes of air are handled at low pressures or at pressures 3- to 6-in. water gage.

Built in either full-housed or ¾-housed arrangements and with any angle of discharge. Fans are regularly constructed either single or double inlet. The single inlet fans are required where it is not desirable to draw the air or gases over the pulley, motor or engine. Sizes Nos. 25 to 300.

CLARAGE STEEL PLATE FAN FOR
FORCED DRAFT

Driven by Clarage steam engine

The sizes No. 80 and smaller are reversible and adjustable for 16 different directions of discharge.

Steel plate fans can be motor, engine or turbine driven, by belt or direct connected.

Standard Exhaust Fans.

Clarage standard "SP" exhaust fans are built heavier and more rugged than most exhaust fans. These fans are used for elevating and conveying sawdust, shavings and blocks as encountered in the lumber mills; dust and lint from polishing and emery wheels; cotton, wool or grain; smoke vapors or air alone. They are particularly suitable, however, where the heavy materials pass through the fan and where strength and rigidity of construction are necessary to withstand the wear and tear of such service.

Sizes Nos. 25 to 160. Fans in sizes No. 80 and smaller are reversible and adjustable for 16 different directions of discharge. Belt or direct motor driven.

Style "C" exhausters are furnished with high efficiency, multiblade wheels which run at lower speeds and save power. Used for exhausting and conveying, in installations where the materials do not pass directly through the fan. Built in sizes Nos. 30 to 60, reversible and adjustable for 16 different directions of discharge. Belt or direct motor driven.

Cast Iron Fans.

In almost every manufacturing plant Clarage Type C.I. fans can be used to advantage; either as single inlet exhaust fans or as double inlet blowers. Four sizes, Nos. 5, 6, 7, and 9, the number indicating the diameter in inches of the inlet or outlet. Built reversible and adjustable in every way.

For handling explosive or poisonous gases cast iron fans are built airtight; furnished with flanged connections for inlet and outlet.

CLARAGE STANDARD "SP" EXHAUST FAN

CLARAGE STYLE "C" EXHAUST FAN
Multiblade wheel partly removed from housing

CLARAGE CAST IRON FAN, INLET SIDE

Pressure Blowers.

Clarage style "C" pressure blowers are suited for operation at comparatively high speeds and against pressures up to 12-oz. water gage. Furnished with multiblade wheels, with peculiarly shaped blades, these fans are exceedingly efficient. Adaptable for furnishing air under pressure to oil burning furnaces, foundry cupolas and forges. Built in sizes No. 30 to 60. Reversible and adjustable for 16 different directions of discharge. Belt or direct motor driven.

Special pressure blowers are designed for operation against high pressures (8 to 30 oz.) and for direct connection to standard speed electric motors. Bearings are supported independently of housing, thus eliminating vibration. Each fan is built for the duty specified, with any angle of discharge. First cost is about one-third cost of rotary blower for the same duty; the maintenance cost is negligible, and satisfactory performance is guaranteed.

CLARAGE STYLE "C" BLOWER ARRANGED FOR BELT DRIVE

CLARAGE SPECIAL PRESSURE BLOWER

Vertical Self-oiling Steam Engines.

Clarage steam engines are fully enclosed. Adaptable for direct connection to fans, blowers, pumps, motor generators, etc. Engines are built in 4 classes to operate on different steam pressures from 10 to 250 lbs., capable of developing up to 40 horsepower.

Clarage Service.

The Engineering Department of the CLARAGE FAN COMPANY has compiled elaborate data covering capacities, etc., for every Clarage product. The department will gladly co-operate with engineers in supplying this information, and by recommending, without obligation, the proper Clarage Equipment to use.

selection. One can not afford *not* to take advantage of this company's wide experience, as this experience, more than mere calculations, will solve all blower problems.

Write for data sheet and send the necessary data so that conditions can be studied from every angle and a report will be furnished with this company's recommendations.

Coppus Turbo Blowers, (Type C).

Built with either single- or double-stage impulse turbine, entirely enclosed, on the same shaft with a propeller fan.

Coppus construction insures quiet operation and high economy at the most efficient fan speeds. Turbine is provided with convenient hand valves for individual nozzle control. The steam chamber is small, yet of ample cross section to prevent condensation.

The life of the machine depends largely upon the life of its bearings, and the life of the bearings is largely determined by their lubrication. It is very essential to give a great deal of attention to proper lubrication of the bearings on turbo undergrate blowers on account of the severe conditions under which they operate. The Coppus lubricating system is designed to take care of these exacting requirements. It is absolutely dustproof, requires little attention, can not get out of order with ordinary neglect and abuse, and no matter if any oil is used up, a constant oil level will be maintained in the upper chamber of the motor bushing.

The Coppus turbo blower is the only blower in which the fan does not overhang the bearing and in which the exhaust steam is discharged into the fan casing when desired, where it mixes thoroughly with the air. All stuffing boxes have been eliminated.

It delivers more air, size for size, at any specified pressures and uses 25% to 75% less steam than any other turbo blower made. This claim can be proved by comparative tests.

Special attention has been given to the fan casing in order to insure the highest efficiency. The casing hugs the fan and is expanded immediately beyond, relieving the choking effect on the air by the casing, greatly eliminating friction and preventing the formation of eddy currents. This feature (Patent No. 1,308,982) has gone through all the tribunals of the United States Patent Office, during 4 years of interference proceedings and this company has been awarded priority of invention of the expanded casing to the exclusion of all others.

For low steam consumption, high air delivery, simplicity of operation, low cost of upkeep and reliability, the Coppus turbo blower has proved a generally accepted leader.

How to Choose the Size Blower Best Adapted to Any Boiler.

This company's advice is, do not try ; let the Coppus engineers do it. This will save considerable time and will avoid trouble and disappointment. It is not only a question of blower capacity, but the conditions under which the blower must operate that enter largely into its

CROWELL MANUFACTURING COMPANY

Pressure Blowers, Rotary Air Compressors and Vacuum Pumps

296-298 Taaffe Place
BROOKLYN, N. Y.

Products.

Sole manufacturers, under patents, of POSITIVE PRESSURE BLOWERS or ROTARY AIR PUMPS, for use with Gas or Oil, in connection with Furnaces, Blowpipes, Burners, etc.; ROTARY AIR COMPRESSORS or VACUUM PUMPS, for use in connection with all Laboratory Work, Chemical and Steam Heating Plants, Vacuums, etc. Air Receivers.

Positive Pressure Blowers.

Adapted for all purposes requiring air under pressure of 1 to 8 lbs. per sq. in., or any degree of vacuum not exceeding 20 ins.

Construction, same in both types, consisting of an internal drum and shaft carrying sliding blades or pistons operating in close contact with cylinder walls, giving simple positive action under lowest speeds. No springs, gears, valves, or unbalanced parts, and pressure not dependent upon high speeds or centrifugal force.

Products.

Manufacturers of MECHANICAL HOT BLAST HEATERS (patented).

M. & L. Unit Heaters for Steam; Air Dryers, Air Conditioning Systems.

Designers and constructors of Power Plants complete, Heating and Ventilating Systems, Air Conditioning Systems, Dryers, Sheet Metal Work and Light Structural Work of all descriptions.

Engineering Services.

The Engineering Organization is well equipped for both the entire design of Power Plant Work complete, and the Contracting Department has every facility and wide experience in the handling of all Power and Piping jobs of any size in any part of the country.

Correspondence is invited on their engineering and designing services or for estimates on their own or engineers' plans of any size, anywhere.

References to work which this organization has completed in various parts of the country will be furnished on request to interested engineers or owners.

Wide experience as consultants with engineers on work in our line has saved many thousands of dollars to owners. Two examples of this are the combination power plant and heating system of the Saginaw Products Division of the General Motors Company, Saginaw, Mich.; and the Peerless Foundry Co., Cincinnati, Ohio, on the mechanical hot blast heaters; both of which plants were specified by Frank D. Chase, Inc.

Adaptability of Mechanical Hot Blast Heater.

Designed for heating, ventilating and air conditioning of foundries, machinesthops, warehouses, mills, factories, manufacturing plants, industrial buildings, sheet metal plants, pattern shops, garages, etc.

This company will co-operate with engineers in specifying these heaters properly.

Description and Advantages.

The heater consists essentially of a large cast iron stove with a series of heat chambers enclosed in sheet metal casing. The castings are of high grade gray iron and the casings of best grade galvanized iron.

The efficiency of these furnaces is at least five times as great as any form of steam or hot water heating. This is obtained by the direct application of the air to the heated surfaces, whereby losses incident to conversion and transmission through pipes or ducts are eliminated.

The circulation is indicated by the arrows in the illustration. By this system of heating the natural circulation of air is given impetus through the use of a multivane fan. Thus by forced circulation a large volume of warm air is obtained, instead of a small volume of hot, burnt air as where natural circulation exclusively is depended upon.

MECHANICAL HOT BLAST HEATER
Patented

The heating or radiating surface is greatly increased by means of radiating fins on the fire pot, combustion chamber and radiator tubes. These fins being staggered, the air is frequently broken up during its passage through the various heating chambers.

The warm air produced by heater absorbs and condenses steam and gas arising from foundry moulds, thus leaving the building clear of these objectionable elements.

Heat capacities range from 100,000 cu. ft. to 500,000 cu. ft. with one unit.

Fuels.

The fuels used—domestic coke, foundry coke, bituminous and anthracite coal, lignite, fuel oil, natural and artificial gas.

Cost.

The initial cost will not exceed one-third that of any other form of heating, and in many cases has run as low as one-eighth the cost of high grade steam or hot water plants.

Operating Cost.

FUEL EXPENSE—The fuel consumption is from one-half to one-fourth that of any other form of heating, due to the scientific construction of the radiating surfaces.

LABOR EXPENSE—A licensed engineer or fireman is not needed to operate the heater, nor any skilled help. It can be operated with common labor.

Manufacturers of a complete line of ELECTRIC PROPELLER and DISC FANS, direct connected; EXHAUST FANS; HEATING and VENTILATING FANS; AUTOMATIC LOUVERS and SHUTTERS; POWER ROOF VENTILATORS; UNIVERSAL MULTIBLADE BLOWERS and EXHAUSTERS, direct connected and belted; MOTORS for driving fans and blowers; ILGAIR UNIT HEATERS.

Steel Plate Fans, Ready-to-run Ventilating Sets; Mechanical Draft Apparatus; Fans and Blowers for drying; Humidifiers.

Ilg Self-cooled Propeller Fans.

SELF-COOLED MOTOR—The illustrations below show the Ilg patented self-cooled feature. Experience has proved that open motors can not be used on propeller fans, because dirt and grease are drawn into motor. If fully enclosed motor is used, the motor efficiency is decreased, due to overheating. If partially covered motor is used, the suction eventually draws dirt and grease through the enclosing covers.

Furnished with direct connected motor for any cur-

Ilg Power Roof Ventilators.

There are many types of buildings where roof ventilation provides the only practical means of exhausting foul air. Heretofore the custom has been to use natural gravity ventilators operated solely by the velocity and direction of the wind, therefore unreliable and spasmodic in effect.

With the Ilg power roof ventilator there is a constant suction, created by the Ilg self-cooled motor fan, which is enclosed in the penthouse. The action of the fan draws off the foul air, thereby making room for fresh air as provided by the natural laws of ventilation.

TWO 36-IN. ILG POWER ROOF VENTILATORS INSTALLED ON ROOF AND DIRECTLY CONNECTED TO HOODS OVER FURNACES, IN PLANT OF AMALGAMATED METALS CO., CHICAGO, ILL.

One-story factories, laundries, foundries, etc., are economically ventilated by locating Ilg power roof ventilators directly over spots where ventilation is most needed. Fresh air through windows gives complete circulation.

Ilg Volume Blowers.

TYPE "V"—These blowers have all the features of the larger Universal blowers. They are intended to be used where small volumes of air at low pressures are required and where quiet running is a feature. These machines are universal in discharge and drive.

Type "V" blowers are suitable for the ventilation of

small offices, dark rooms, toilet rooms, picture booths, telephone booths, staterooms on boats, private yachts, residence kitchens.

TYPE "P"—The Ilg direct connected electric volume blowers are applicable for exhausting dust and fumes from laboratories and polishing rooms; removal of steam and heavy vapors from cooking vats in dye houses, breweries, canning factories, etc.

Ilg Universal Multiblade Blowers.

The construction of Ilg blowers and exhausters is a distinct departure from methods heretofore employed. Motor is machined circular and held in cast iron ring bolted to cast iron bowl. Bowl is in turn bolted to cast iron side of blower. On the inlet side, a cast iron inlet flange is bolted to cast iron side. The two cast iron sides of blower are exactly alike, with holes drilled alike; consequently bowl and inlet flange can be interchanged, giving change of drive.

Legs are bolted to cast iron sides, and can be put on in any position, giving any angle of discharge. Wheel is mounted directly on motor shaft and, as motor is pushed up against bowl, the hub of wheel is very close to motor bearing, giving small overhang.

TYPICAL INSTALLATION, ILG UNIVERSAL BLOWER FOR BLAST USE

TWO 50-IN. DIRECT CONNECTED 3-PHASE ILG UNIVERSAL BLOWERS EXHAUSTING FUMES AT PLANT OF BUDD MANUFACTURING CO., PHILADELPHIA, PA.

ILG BELTED BLOWERS—Have cast iron sides with interchangeable bowl and inlet flange.

Pulley and wheel are overhung on shaft, supported in two bearings in cast iron bracket.

One nameplate—Ilg—covers the unit for customers' protection.

CATALOGUE—Write for condensed catalogue showing complete details on blowers.

Literature showing specific application of Ilg fans and blowers, for drying, cooling, oxygen supply, heating and ventilating, will also be mailed.

Ilgair Unit Heaters.

In the production of the Ilgair unit heater the ILG ELECTRIC VENTILATING CO. has originated a new engineering principle, affording an effective and economical means of heating which complies with all the scientific laws of air circulation.

The Ilgair unit heater is a cabinet, open at both ends, in which is housed an ordinary 2-stack radiator and an Ilg self-cooled motor propeller fan. This cabinet acts as a heating chamber for the air which is drawn in over the heated coils on the intake side at low velocity (about 1000 ft. per minute) and discharged in volume at high velocity (about 2500 ft. per minute).

Each unit constitutes a separate heater, and both the volume and distribution of the heat is controlled at its source. This unit system speeds up the heating, increases distribution and makes possible the heating of any particular section of the building without operating the entire system.

No ducts or high speed machinery are required. Instead of having to create and distribute the heat from one limited source of supply, the Ilgair unit heater system provides for a multiple of units depending upon the floor area.

No other heating system affords such flexibility of application. It is a simple matter to rearrange the placing of any one or more units, and if the building is remodeled or enlarged it merely means replacing or installing additional units.

Ilgair unit heaters can be used in summer as cooling outfits and streams of air can be blown in any direction. This is an important feature in plants having processes that give off heat. Unit can also be placed against side walls and connected with outside air to furnish ventilation.

CO-OPERATIVE SERVICE—Layouts furnished as required. Write for further information.

Products.

Manufacturers of FANS, BLOWERS, HEATERS and AIR WASHERS for Heating, Ventilating, Purifying, Cooling, Humidifying, Dehumidifying; FORCED and INDUCED DRAFT, COMMERCIAL DRYING and BLAST EQUIPMENT.

Squirrel Cage Multiblade Fans.

For heating, ventilating, drying and mechanical draft the squirrel cage fan will meet every requirement, except for moving material. Built in all sizes from 6-in. diameter wheels and up.

Steel Plate Blowers and Exhausters.

Adapted for same purposes as the squirrel cage type fan. Can be designed for moving materials.

Massachusetts Propeller and Disc Fans.

For moving large volumes of air under low pressures. Built for pulley drive or direct connection to motors or engine. Built in all sizes from 12-in. diameter and up, for horizontal or vertical shaft.

Cone Fans.

Designed for installations where the conditions will not permit the usual housing.

Planing Mill Exhausters.

Steel plate shell sufficiently thick to withstand abrasive action of material handled. No exposed bearings. Any discharge.

Portable Service Sets.

Standard sizes. Right- or left-hand discharge. Belt or direct drive.

Pipe Coil Heaters.

For hot water and steam. Adapted for high and low pressure work. Made in return bend and miter types.

Air Washers.

For purifying, cooling, humidifying and dehumidifying air for industrial and commercial purposes. Made in all sizes.

Drying and Cooling Systems.

Dry kilns and cooling and ventilating systems designed and equipped to meet any requirements.

BAETZ PATENT FAN HEATER UNITS; SKINNER PATENT DIRECT FIRED FAN BLAST HEATER UNITS.
Skinner Patent System Fan Blast Dryer Outfits.

Baetz Patent Air Heater.

For steam, either exhaust or high or low pressure, 6 sizes and 4 types are made, as shown in Fig. 1, with fan wheels of steel plate or multi-blade construction for either motor, line shaft, steam engine, gas or gasoline engine drive. These units are built to occupy the least possible floor space and range from 4 sq. ft. to 36 sq. ft. The fan is made double inlet and is located near the floor directly under a closely nested pipe coil, made in two sections to permit easy removal and give a free air passage through same. The fan exhausts the cooler air on the floor and discharges same up through the coil and out into the room at low velocity through the large diameter directing elbow outlet. If desired, more than one elbow may be installed for special cases. In drying work, one or more sheet metal ducts can be carried from heater outlets for distribution to several drying chambers. The fan wheel is mounted on a polished steel shaft, supported by two large ring-oiling, self-aligning bearings, bolted firmly in place on shelves cast rigidly in each inlet plate casting. Standard outfits consist of all parts as illustrated in Fig. 1, except motor, motor belt and elbow outlet. Headers are threaded for screwed fittings, but will be furnished with standard companion flanges on request.

Uses—Heating and ventilating all types of factories, industrial plants, garages, machine and railroad shops.

Drying of all kinds of materials, including fruits, vegetables, candy, etc.

Steam vapor removal from packing plants, paper mill machine and beater rooms to prevent precipitation.

ADVANTAGES—No sheet metal ducts are required. No foundation required other than good floor construction carrying 175 lbs. In mild weather sufficient heat

will be obtained by natural stack effect heating without running the fan; in normal freezing weather medium fan speed and in coldest weather maximum fan speed, thus requiring smallest possible horsepower and steam consumption, while giving greatest possible flexibility of operation. All units are portable, also self-contained and can be connected with factory labor. The steam coils are good for any steam pressure from atmospheric to 125 lbs.

Any vacuum valves, traps, or steam accessories can be applied in the same way as with any steam coil.

City or well water can be circulated through the coils, which will give a greater cooling effect, also lower the relative humidity depending on the circulating water temperature.

If the units are not required for use in the summer, they can be stored in another part of the plant, thus giving more floor space for manufacturing during this period; but continued use in summer is recommended, owing to proved value in summer cooling and ventilation.

GUARANTEE—All workmanship and materials guaranteed one year from date of shipment. This company also guarantees any inside average temperature, if given complete data on building and building construction, amount and kind of steam available.

LITERATURE—For steam systems write for following literature:

Descriptive pamphlet No. 50.

List and addresses of users, No. 80.

Catalogue No. 101, giving full description.

Direct Fired Type.

For plants having no available steam, this type illustrated in Fig. 2 is furnished. All internal heating construction made of heavy cast iron with deep cup shaped joints filled with special oxide cement. Fan construction and other parts same as for steam coil type (Fig. 1).

Standard units consist of complete outfit as shown (Fig. 2), with the exception of motor, motor belt, directing elbow and smoke pipe, but collar connections for smoke pipe and air directing elbows are also furnished. Send for descriptive pamphlet No. 60.

FIG. 1. TYPES OC, NC, OCS AND NCS BAETZ FAN HEATER

THE SPENCER TURBINE CO.

Manufacturers of Turbine Blowers and Exhausters
HARTFORD, CONN.

SALES REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products.

TURBINE BLOWERS and EXHAUSTERS: Spencer Turbo-compressors, Spencer Vacuum Cleaners, Spencer Organ Blowing Apparatus (the Orgoblo).

Turbo-compressors.

Spencer turbo-compressors are built to meet the needs of modern industrial conditions frequently requiring continuous operation for many days where absolute dependability is most essential. They are built for service and combine simplicity and practicability with sturdy and rugged construction.

CONSTRUCTION—The Spencer plate steel, double wall, reinforced construction gives a maximum of strength with a minimum of weight.

FOUNDATION—As the motor and compressor form one compact and integral unit no special foundation is required.

BEARINGS—Consist of 2 motor bearings and 1 ball thrust bearing designed with a liberal factor of safety.

MOTORS—Of the highest grade, standard type. Spencer turbo-compressors are furnished equipped with 60-cycle alternating current or direct current motors of any standard voltage.

OPERATION—Spencer turbo-compressors operate at 1750 r. p. m., generally considered by electrical engineers to be the most efficient and practical motor speed, and this one feature has obtained for them rapidly increasing recognition and preference over others.

SPECIAL FEATURES—(1) A slow speed, low velocity wide clearance multistage turbine.

(2) Retains its efficiency permanently; no contacts or even close clearances, hence no chance for wear.

(3) Direct connected, self-contained unit, avoids necessity for belts, gears or chains, with their resultant losses and noises.

MOTOR END SPENCER TURBO-COMPRESSOR

(4) Constant pressure, with no pulsations nor surging, even when operated idle or under partial loads.

(5) Current consumption inherently decreases in proportion to reduction of volume of air used, eliminating all auxiliary governors.

PRESSURES—The Spencer line of turbo-compressors for 1-lb., 1½-lb. and 2-lb. pressures meets a wide demand for an efficient equipment of the “slow-speed” turbine type to use in supplying air for oil and gas burning furnaces, foundry cupolas, etc.

Spencer Vacuum Cleaners.

Turbine, or multistage fan type exhausters, of the wide clearance, constant potential, low velocity type. Motors direct connected; no belts or gears. No water or sewer connections required.

Current consumption varies in direct proportion to work being done, through inherent self-governing characteristics of turbine.

Simplicity of design, and high grade construction insures low maintenance cost.

Turbine, with extremely wide clearances, and absolutely no close fitting parts, is ideal type of exhauster for handling dirt-laden air. No cloth bags or screens.

Entire system designed to produce correct air stream conditions, to do universal vacuum cleaning with uniform efficiency, speed and thoroughness.

Superiority of cleaning implements and accessories universally acknowledged. All floor tools provided with completely controllable swivel, enabling the operator to reach the dirt with ease and rapidity.

SIZES AND TYPES—Spencer cleaners are manufactured in sizes suitable for all buildings, from smallest residences, to largest skyscrapers, hotels, factories, and business buildings.

Particularly adapted for school buildings. Central plants installed for cleaning entire group of college or similar buildings.

SERVICE—The engineering department is glad to co-operate with engineers or architects in laying out piping systems, drawing specifications or submitting recommendations regarding any vacuum cleaning problems.

REFERENCES—The finest examples of all kinds of buildings throughout the country are equipped with Spencer systems.

Carefully prepared, giving full technical information usually required. Contains 960 pages of invaluable information covering heating and ventilating. Price \$10.00.

Publications.

The Sturtevant line is so varied, that a comprehensive presentation in one publication is undesirable. This company, has, therefore, issued a special bulletin on each particular line covering the mechanical details.

Engineering Service.

As each installation is unique, it is usually necessary that an engineer analyse the conditions before making recommendations.

The engineering staff of the B. F. STURTEVANT COMPANY has been trained to analyse all conditions and to properly apply the company's apparatus accordingly.

Consult this department, which is at the disposal of architects and others without obligation.

Sweet's Catalogue.

The following pages, devoted to a partial list of the Sturtevant line, are intended to assist engineers and architects in making specifications on the main points of Sturtevant equipment.

If more information is desired, consult the nearest sales office.

Types of Sturtevant Fans and Their Uses.

CENTRIFUGAL FANS—Multivane Fans (Design 3)—For supplying fresh air under pressure and for removing foul air. They are usually installed in connection with piping or duct work. Piping may be applied to inlet or outlet, or both.

PROPELLER FANS—Sturtevant Propeller Fan—For exhausting foul air from rooms or similar enclosed spaces. They can not be used efficiently against static pressures greater than $\frac{1}{8}$ or $\frac{3}{16}$ in. and therefore will not operate to advantage with long piping or ducts. They are usually installed in a wall, window or ceiling.

DISC FANS—Sturtevant Disc Fans—For the same classes of service as propeller fans, except that they work efficiently against static pressures as high as $\frac{1}{4}$ or $\frac{3}{8}$ in. and are used with slightly reduced efficiency for pressures up to $\frac{1}{2}$ in.

Choice of Size of Fan.

AIR CHANGES—The tables herein give the volume of air per minute delivered by each fan.

Where a fan must run noiselessly, as in sleeping rooms, low speed fans are recommended. If a fan is so placed that a slight noise is not objectionable, it can run at a higher speed and a larger volume of air handled by the same fan.

In making a choice of fan, the air changes for various types of rooms must be first considered. These changes are shown in the following table:

AIR CHANGES FOR VARIOUS TYPES OF ROOMS

Kind of Room	Number of minutes in which air should be changed completely
Office	8 to 12
Toilet	5 " 7
Kitchens	3 " 5
Lodge room	5 " 7
Theater	8 " 15
Paper mill machine room	8 " 12
Foundry	12 " 18
Cotton mill and machineries	15 " 20
Assembly hall	10 " 15
Smoking room	2 " 4

NOTE—Owing to the wide variation in the ratio of the number of occupants to the size of the room, calculations for offices, schoolrooms, theaters, and assembly halls made according to the above figures should be checked on a basis of air supply per occupant, as crowded rooms may require more air than would be afforded by the above air changes. Good practice recommends 30 cu. ft. per minute for each occupant of an office, or schoolroom, and 20 cu. ft. for theaters and assembly halls. To be on the safe side, the larger fan determined by these methods should be used.

CALCULATION OF STATIC PRESSURES—The resistance of heating systems in inches of water, or static pressure

RESISTANCE OF HEATING SYSTEMS IN INCHES OF WATER OR STATIC PRESSURE AGAINST WHICH FAN MUST WORK

Details of Systems	Static resistance in inches of water—air at 60°
Ordinary resistance for public building ventilation without heaters. Systems well proportioned	$\frac{1}{4}$ in.
Maximum resistance for public building ventilation with complex systems and without heaters. Minimum resistance for public building heating without air washers	$\frac{1}{2}$ in.
Ordinary resistance for public building heating systems, theaters, without air washers. Minimum resistance for public building heating systems with air washers	$\frac{3}{4}$ in.
Ordinary resistance for public building heating systems with air washers	$\frac{7}{8}$ in.
Maximum resistance for public building heating systems with air washers. Minimum resistance for factory heating systems	1 in.
Ordinary resistance for factory and roundhouse heating systems	$1\frac{1}{4}$ in.
Maximum resistance for factory and roundhouse heating systems	$1\frac{1}{2}$ in.

In the above, the term "public buildings" includes schools, theaters, office buildings, hotels, etc. The resistance above is the maintained resistance of the system, that is, the sum of the static pressures on both the inlet and outlet sides of the fan.

sure against which the fan must work, is next considered. The resistance shown in table is the maintained resistance of the system, that is, the sum of the static pressures on both the inlet and outlet sides of the fans.

As propeller fans operate wide open or against no resistance, static pressures are disregarded. In the selection of disc and multivane fans, static pressure is taken into consideration.

Sturtevant Multivane Fans (Design 3).

The most efficient commercial fans on the market. Service tests under the most trying conditions have proved conclusively that they will deliver a given amount of air at a given pressure at an expenditure of considerably less power than other types.

They occupy small space and their light weight permits them to be suspended from ceilings or supported by structural iron work.

The great rigidity of their construction makes them very durable and they may be depended upon for long service, with minimum repairs.

The compactness of these fans is of great value, as they may be placed in positions impossible for other types.

Made in overhung wheel, overhung pulley, full housed and seven-eighths housed types, for direct connection to motors, steam turbines, and high speed engines.

**STURTEVANT OVERHUNG WHEEL MULTIVANE FAN (DESIGN 3)****STURTEVANT ELECTRIC MULTIVANE FAN, FULL HOUSED, OVERHUNG WHEEL****STURTEVANT SINGLE WIDTH MULTIVANE FAN, FULL HOUSING, DIRECT CONNECTED TO STURTEVANT VS-7 ENGINE****WHEEL FOR LARGE SIZE MULTIVANE FANS**
Showing double spider and third annular ring**WHEEL FOR MEDIUM SIZE MULTIVANE FANS**

How to Specify Multivane Fans.

GENERAL—Furnish a Multivane Fan that shall be made (single or double) inlet, (single or double) width, (right or left) and, discharge and have (full or seven-eighths) housing.

Wheels shall be not less than in. diameter.

Outlet shall be in. by in.; diameter of the inlet shall be in., total height of the fan housing shall be in.; width in direction of shaft in., and length transverse to shaft in.

Fan shall have a capacity of cu. ft. per minute against a resistance of in. water gage either at the inlet or at the outlet (or at both, taking the sum) and shall operate at approximately r.p.m., requiring approximately b.h.p.

HOUSING—Housing shall be of spiral form constructed of steel plate strongly braced, bolted and riveted to a rigid frame of angle iron.

Side plates and round-about sheet shall be made of No. 11-gage for fans above 45 in. high. The smaller sizes shall have these parts made of No. 14-gage plate.

Outlet shall be rectangular in shape and consist of angle irons bolted to the housing and arranged for connection to a discharge duct.

Inlet shall be of cone shape and so constructed as to allow the wheel to be taken out through the opening caused by the removal of the cone. In the single inlet fan the side opposite the inlet shall be closed by a dished plate bolted to the side of the housing.

Cut-off piece shall be made of a sheet bent 180° upon itself and having the two ends bolted to the spiral sheet, thus leaving no edges of metal which can in any way be acted upon by the air issuing from the outlet so as to produce vibration, and therefore, noise at this point.

VOLUMES AND PRESSURES OF DESIGN 3 SINGLE INLET MULTIVANE FANS

(Table is greatly condensed, but gives a general idea of size fan necessary.)

Volumes and horsepower shown are correct for fans discharging air at 65° Fahr., and density .075 lb. per cu. ft. against continuously maintained resistance

Sturtevant Propeller Fans.

Developed for all conceivable exhaust conditions—for operation in rooms filled with steam, gases, smoke, etc., and are usually installed in a wall, window, or ceiling.

Their advantages are: freedom from noise, great mechanical strength and satisfactory service. Motors are amply large for the work required.

These fans are not designed for operation against static pressure, thus they are not applied in connection with piping systems or ducts.

STURTEVANT ELECTRIC PROPELLER FAN WITH ENCLOSED BI-POLAR MOTOR

STURTEVANT PULLEY PROPELLER FAN

How to Specify Propeller Fans.

There shall be furnished an ... in. propeller fan. Total length of the fan in the direction of the shaft shall be ... in. and the total over all diameter, ... in. Fan shall have a capacity of ... cu. ft. per minute and shall operate at approximately ... r.p.m., requiring approximately ... b.h.p.

Thimble shall be made of cast iron in sizes up to and including 42 in. and of steel plate in larger sizes. There shall be bolted to the flange of the thimble three arms to support the motor and the fan wheel, which latter shall be overhung on the extended motor shaft.

Motor shall be built to operate on current volts, cycles, phase.

Volumes and horsepowers are for fans operating wide open, in other words, against no resistance.
D. C. fans furnished with regulating rheostats for 50% reduction in speed by armature control.
Motors are of the enclosed type described on page 1001

Sturtevant Disc Fans (Design 2).

Used for exhausting or supplying large volumes of air against low resistance—where the resistance encountered is more than that against which a propeller fan will efficiently operate, and where the resistance is less than that for which centrifugal fans are adapted. Designed to stand on the floor, but can be easily installed in wall or window, as in the case of a propeller fan.

STURTEVANT DISC FAN (DESIGN 2)

How to Specify Disc Fans.

There shall be furnished a disc fan having a capacity of ... cu. ft. per minute against a resistance of in. water gage and shall operate at approximately r.p.m., requiring approximately ... b.h.p. Wheel shall have 12 floats, firmly riveted to the hub. To give additional strength, sizes 42 in. and larger shall have each float braced with supports extending from a special ring on the hub to a point near the outer end of the float. Casing shall consist of steel plate of No. ... gage, suitably supported with angle irons on both inlet and outlet sides. Removable feet shall be bolted to the fan casing.

Volumes and horsepowers shown are correct for fans discharging air at 65° Fahr., and density .075 lb. per cu. ft. against continuously maintained resistance.																			
Alternating current fans for other frequencies and direct current fans for other speeds, volumes and pressures can be furnished.																			
Motors are of the enclosed type described on page 1001																			

Sturtevant Steel Pressure Blowers.

Designed for all purposes where pressures up to 16 oz. per sq. in. are to be maintained and for forcing air for long distances.

These blowers may be driven by belts from a line shaft or from engine, motor or turbine, or may be driven direct connected to an electric motor, steam engine or steam turbine.

See description of Sturtevant engines, turbines, and motors on page 1001.

Sturtevant steel pressure blowers are used for supplying air blast to cupolas, forges, and to oil, gas and pulverized fuel burners.

They are also used for blowing scale from hammers, furnishing air blast for ventilating and cooling, and draft for coke and coal fires.

Under usual operating conditions, 500 cu. ft. of air per minute are required per ton capacity of cupola. The pressure ranges with the size of the cupola from 12 to 28 in. (7 in. to 16 oz.).

For forge blowing, it is usual to allow from 40 to 60 cu. ft. of air per minute for each sq. in. of tuyere area. The pressure required at the forge averages about 7 in. of water. In small forges, it sometimes drops as low as 4 in. and in large forges it may go as high as 10 or 12 in.

Standard arrangement is bottom horizontal discharge with pulley on the right hand side, as one faces blower outlet. Other hands and discharges can be supplied if required. Steel pressure blowers are also furnished direct connected to electric motors and steam turbines.

The following capacity table is much condensed, but gives a general idea of the size fan required for various conditions.

Wheels are accurately balanced and run smoothly when driven at high-est speeds.

Journal bearings are of unusual length, which makes possible sustained operation for long periods.

Each bearing is cast in a single piece and lined with Sturtevant white metal, which is carefully bored and of great length with efficient oiling features. These bearings are practically non-heating and of great durability.

Sturtevant Monogram Fans, Blowers and Exhausters.

The range of service of these units is midway between Sturtevant multivane fans and Sturtevant steel pressure blowers previously described.

The Monogram is distinctly a volume fan, handling air in greatly increased volume over the higher pressure types, while operating at lower pressures.

They will efficiently deliver large volumes of air at pressures of from 3 to 10 in. of water, but can be used for pressures as low as 1 or 2 in. and as high as 14 in.

Especially adapted for ventilating, for exhausting chemical fumes, for use with hot blast heater units, for drying systems and for supplying blast to forges and furnaces. In addition to these uses, the smaller sizes find a broad field of service in industrial work, being very largely adopted for dust collecting.

These units may be driven by belts from line shaft or from engine, motor or turbine, or may be driven direct connected to electric motor, steam engine or steam turbine.

See description of Sturtevant engines, turbines, and motors on page 1001.

Casing is of cast iron, cast in 2 sections and bolted together. Blast wheel is of the side plate type for all ordinary applications, but special wheels can be fitted to meet varying conditions. Bearings are ample in size, thoroughly lubricated and lined with Sturtevant white metal.

Monogram fans are built either as blowers or ex-hausters, and are regularly built with bottom horizontal discharge in all sizes and with up-blast discharge in sizes 3 to 10 inclusive. They can be built with down-blast or horizontal discharge as desired.

Monogram blowers are regularly built right hand, but can be built left hand if de-sired. Monogram exhausters are regu-larly built both hands.

Blowers may be equipped with adjustable bed with telescopic outlet. Sizes 4 to 10 are the only sizes regularly fitted with adjustable beds, but other sizes can be so fit-ted, if desired. Exhausters are not used with adjust-able beds.

Sturtevant High Pressure Blowers.

Designed for delivering air or gas at pressure of from 1 to 5 lbs. per sq. in.

They are of the rotary or positive type and are especially adapted for furnishing blasts for cupolas, gas and oil burner furnaces, cement kilns, annealing and smelting furnaces, steel converters, puddling furnaces, forges using either coal, oil or gas, for agitating and aerating liquids, for cooling processes and for all work requiring blasts up to 5 lbs. per sq. in. Used as exhausters, they create the necessary vacuum for pneumatic conveying service, for the manufacture of coal gas and for many other applications.

One of the principal advantages of this design of blower is that the pulsations so common in many types of positive blowers are almost unnoticeable in the Sturtevant high pressure blower. This is especially valuable when the blower is to be used in the manufacture of gas or in producing blasts for use in gas or oil furnaces.

On either side of casing is an opening flanged and fitted for standard gas pipe fittings.

As the casing is symmetrical, rotors may be operated in either direction, and the openings in the casing are thereby used either as a discharge or inlet, depending upon the direction of rotation of the rotors.

The rotors never come in contact, and so ample is the clearance between the 2 rotors and between the rotors and casing that it is practically impossible to cause them to come in contact.

No internal lubrication is necessary, entirely eliminating the tendency present in some positive blowers to force the oil used in their internal lubrication through the pipes, causing trouble in many classes of work.

High grade construction and materials, accurate workmanship and simplicity of design makes this blower capable of continuous operation for long periods with little attention.

Sturtevant Slow Speed Planing Mill Exhausters (Design 2).

These exhausters are the latest type of convertible, slow speed, low power exhausters for planing mill work, being especially adapted for collecting and conveying shavings, sawdust, dust and all material that may be conveyed in a current of air.

Sturtevant planing mill exhausters will convey more material at a smaller expenditure of power than those of any other manufacture.

They are designed according to correct principles and embody the results of over 50 years' experience in the manufacture of fans.

They are exceptionally sturdy in appearance, rugged in construction and meet the demand for fans which can readily be changed to either hand or to any direction of discharge.

The cone on the pulley side of the housing and the inlet ring are of cast iron, secured to the side sheets by tap bolts threaded into annular steel rings on the inside of the housing side sheet and riveted to it. This construction clamps the side sheet securely to the supporting castings besides facilitating the interchangeability of discharge.

The roundabout corner angles are on the inside of the housing and bolted to roundabout sheet so that the bolts are readily accessible.

The blast wheel has eighteen arms made of steel tees cast in a solid iron hub. A steel back plate is used to stiffen the blades. This construction together with careful balancing of the parts insures a strong wheel free from objectionable vibrations.

The bearings are self-adjustable and self-lubricating, having a large oil reservoir with brush feed, and are lined with Sturtevant white metal, hammered in. In fact, these bearings are the same pattern which this company has found satisfactory for so many years in their standard steel plate planing mill exhausters.

The long experience of the Sturtevant engineers makes them particularly competent to design and install the most efficient conveying and dust collecting systems to meet all requirements.

Sturtevant Heating System.

In the Sturtevant system of heating, air is forced by a fan across steam coils and is then conveyed through ducts to all parts of the building to be heated. This arrangement is usually known as the fan or hot blast system.

AIR WASHING—Where air washing is required, the Sturtevant air washer can be installed in the Sturtevant heating system as shown on page 999.

ADVANTAGES OF THE FAN SYSTEM OF HEATING—The chief advantage of the fan system of heating over steam pipe or radiator systems is its lower cost.

Other advantages are: greater flexibility; more readily controlled and regulated; less trouble to maintain; ventilates as well as heats; much less radiating surface required; humidity can be controlled; no undesirable steam piping to disfigure building.

ADAPTABILITY TO AVAILABLE SPACE—A distinctive advantage of Sturtevant heaters is that they can be installed in floor space of any dimensions and with ceiling of any height. The total lineal feet of 1-in. pipe necessary to heat any building can readily be arranged in a heater of dimensions that will be suitable for the room in question.

Types of Sturtevant Heaters and Their Uses.

LONDON HEATER—Used where it is desired to have perfect control over the temperature of hot air supplied, regardless of outside weather conditions. Adapted to public building work, schools, etc. Individually controlled valves are provided for every section.

RETURN BEND HEATER—This type provides for individual control of sections. It may be used for the same service as the other types, the chief difference being that it has a larger free area, and sections with greater surface are built in this type than in the other types.

MITRE TYPE HEATER—Provides for individual control of sections, and either steam or hot water may be used.

Very satisfactory for all conditions of service and, on account of its superior construction, is the most expensive Sturtevant heater made.

Arrangements on Hot Blast Apparatus.

Sturtevant heaters may be installed in either "draw-through" or "blow-through" arrangement, depending upon the conditions of service.

In the former, air is drawn through the hot coils, passes through the fan and is forced through the distributing ducts. This is the usual arrangement where air of one temperature is required and is generally adopted in shop and factory heating.

Where air is required at more than one temperature, a "blow-through" rig is necessary. In this arrangement, air enters the fan first and is then blown through the heater. Dampers and a by-pass in the heater casing are so arranged that some or all of the air from the fan may be diverted around the heater and through a cold air duct (see illustration following).

A "draw-through" rig usually requires less space than a "blow-through" of the same capacity. The "draw-through" arrangement is shown in the air washer section on page 999.

Where one section is not large enough, double width, 2-way and 3-way heaters are installed.

BLOW-THROUGH HEATER WITH BY-PASS AND MIXING DAMPERS

In some outfits, by-pass is above the coils

Piping and Bases of Sturtevant Heater Sections.

PIPING—All Sturtevant heater sections are made of an extra heavy 1-in. piping spaced on $2\frac{1}{8}$ - or $2\frac{3}{4}$ -in. centers.

BASES—The bases of the London and Mitre type sections are of cast iron, amply strong to withstand severe service. Being corrugated on the sides, the bases fit easily into one another and save floor space. The Sturtevant is the only heater made with a corrugated base.

The ends of the corrugated bases are so made that where a double width section is needed, 2 sections can be placed end to end and no extra space is left between the pipes of the 2 sections.

Two-way Heater Three-way Heater
SHOWING ARRANGEMENTS WHICH GIVE GREATER FREE AREA THAN CAN BE SECURED BY USING SINGLE WIDTH OR DOUBLE WIDTH HEATERS

BASE OF LONDON HEATER

Hole in head accommodates through-bolt for binding sections together

BASE OF RETURN BEND HEATER

A, air vent; B, bleeder

DRIP BASE OF MITRE TYPE HEATER

Supply base is identical except that large tapping is in the back

The base of the return bend heater is of cast iron but is not corrugated. Each section is an individual unit and has supply and drip connections valved independently of the other sections.

SIZES—With the exception of the return bend heater, all bases for 1-in. pipe are made in 2 widths: 2 rows and 4 rows of pipes.

The half-width sections are generally used in connection with a number of 4-row sections, making an intermediate depth possible.

Length of bases will be found on page 996.

London Type Heaters.

These heaters are made with a steam supply in the top portion of the base that extends beyond the steel plate jacket that incloses the heater. The drip is tapped into the end of the extended portion of the base. With this arrangement each 2-row or 4-row section can be individually controlled.

The extended portion of the base permits tapping a supply connection large enough to permit the use of low pressure or exhaust steam without restricting the flow or causing the drop in pressure.

The drip is taken from a drainage pocket in the bottom of the section, thus complete drainage is assured.

The pipes are placed $2\frac{1}{8}$ in. apart, making a section with the free area about 5.5% of the heating surface.

How to Specify London Type Heaters.

There shall be furnished a pipe coil heater of the type, having lineal ft. of in. pipe and sq. ft. of free area. Heater shall be composed of 4-row sections and 2-row sections. All sections shall have a nominal length of ft., and nominal height of pipes shall be ft. in.

A sheet steel casing of No. gage shall be furnished, and this shall be suitably braced and stiffened.

Return Bend Heaters.

The pipes in the return bend heaters are spaced $2\frac{3}{4}$ in. apart as compared to $2\frac{1}{8}$ in. spacing in the other Sturtevant heaters. This wider spacing results in a greater proportion of free area to total area, so that with the same air velocity and steam temperature a greater number of rows of pipes is required to result in the same temperature rise as in the other Sturtevant heaters. But with the same amount of heating surface, with air under given conditions and steam of given temperature, the same temperature rise in air will result in all Sturtevant heaters. The number of rows of pipes must not be confused with the amount of heating surface, as for equivalent size sections of the same number of rows there is less heating surface in the return bend type as compared to the other types.

The base of this heater is divided by a vertical partition, which separates the supply side from the drip side. As condensation takes place in the supply side as well as in the drip side, a separate drip connection called a bleeder is provided. And for best results, the bleeder connections should be led to a trap separated from the main return trap.

Each pair of vertical pipes is joined at the top with a malleable return-bend fitting. This construction is of superior design, inasmuch as it results in two less joints at the top of the pipe as compared to the method of joining the pipe by two separate elbows and a short nipple.

For sizes, dimensions, temperature rise curves, heating surfaces, free area, and designing notes, see pages 994-98.

How to Specify Return Bend Heaters.

There shall be furnished a pipe coil heater of the type, having lineal ft. of in. (1 or $1\frac{1}{4}$ in.) pipe and sq. ft. of free area. Heater shall be composed of 4-row sections and 2-row sections. All sections shall have a nominal length of ft., and nominal height of pipes shall be ft. in.

A sheet steel casing of No. gage shall be furnished, and this shall be suitably braced and stiffened.

Mitre Type Heaters.

In this type, there are 2 bases to each section. Vertical and horizontal pipes form a mitre. The steam (or hot water) is admitted to the vertical base and the water of condensation is drained from the horizontal base.

Mitre sections may be used with hot water as a heating medium because the flow of water is downward, due to the drop in temperature of the water.

When it is not advisable to depend on gravity circulation, a pump may be used to force the water through the coils.

The relative lengths of vertical and horizontal pipes vary greatly, and depend on the floor space and headroom available. If horizontal pipes are longer than 10 ft., a sheet steel diaphragm is used in the center of the pipes to keep them properly spaced and to prevent sagging.

Each Mitre section is controlled by individual supply and drip valves.

For sizes, dimensions, temperature rise curves, heating surfaces, free areas and designing notes, see pages 994-98.

How to Specify Mitre Type Heaters.

There shall be furnished a pipe coil heater of the type, having lineal ft. of in. (1 or $1\frac{1}{4}$ in.) pipe and sq. ft. of free area. Heater shall be composed of 4-row sections and 2-row sections. All sections shall have a nominal length of ft., and nominal height of pipes shall be ft. in.

A sheet steel casing of No. gage shall be furnished, and this shall be suitably braced and stiffened.

TEMPERATURE RISE CURVES

With given initial and final air temperatures, air velocity and steam pressure, first find the number of rows to give final temperature directly from chart. Next find the number of rows to heat air from minus 40 to actual initial temperature; the difference between these numbers will give the number of rows required. Given the number of rows, to find final temperature, first find number of rows to heat from minus 40 to initial temperature, and add to this the number of rows given, then find actual initial temperature with this number of rows

*Dimension "A" is length of air space.
**"Single" means that heater consists of a single section. §"Double" means that heater is of double width, having 2 sections placed back-to-back.
Dotted lines at left of casing show location of additional headers and piping for double group heaters.

Data for Design and Calculation of Sturtevant Heat- ing Systems.

HEAT LOSSES—The reduction of temperature within buildings is due to (1) transmission of heat through roof, windows, walls, doors, floors, etc.; (2) direct leakage of hot air through cracks, open spaces, etc.

The material, thickness and method of construction of the walls, also exposure and relative amount of glass, determine the rapidity of heat loss.

Transmission Losses—To calculate the heat loss by transmission, it is customary to use the coefficients given in the table at the foot of this column. For example, when outside temperature is 20° and inside temperature is 70°, an 8-in. brick wall of 700 sq. ft. will have a heat loss by transmission of $458 \times (70^\circ - 20^\circ) \times 700 = 16,030$ B.t.u.

Leakage Losses—In the average building, the leakage loss amounts to one air change per hour; that is, in a building of 200,000 cu. ft. content, the leakage is 200,000 cu. ft. per hour. This varies with different types of buildings and with the grade of construction; thus this figure must be used with judgment and the designer must know from experience whether or not the building is better or worse than the average, and make allowance accordingly.

It should also be noted that in large buildings the air change is less frequent than in smaller buildings of the same construction, as the ratio of the wall space to the total cubic contents is considerably less. The leakage loss must be taken into consideration in buildings where ventilation is not provided, that is, where the fan draws its supply of air from the

rooms. If, however, the fan uses fresh air from the outside, no such allowance is necessary, as this is included in the heat required to warm the air used for ventilation.

Calculation of Heat Losses by Transmission—Assume an industrial building under the following conditions, and calculate heat loss by transmission in this building as shown in table below:

TABULATION OF HEAT LOSSES BY TRANSMISSION

SIZE OF BUILDING—100 by 200 by 50 ft.
MATERIAL—Brick and glass, the former averaging 20 in. thick.
EXPOSURE—Ends of building facing North and South.
ROOF—Flat, having 2-in. plank covered with 5-ply tar and gravel roofing. No exposure factor due to its flatness.
WINDOW OPENINGS—Front, 40% of total area; back, 30% of total area; 2 ends, each 35% of total area.
DOOR OPENINGS—Front and back, 100 sq. ft. each; ends, 200 sq. ft. each.
SKYLIGHT—20 by 100 ft.
BASEMENT—Unheated, entirely below ground level and with minimum temperature of 30°.
FLOORING—Double flooring used on first floor, forming basement ceiling.
LOWEST ENCOUNTERED OUTSIDE TEMPERATURE—20°.
AVERAGE INSIDE TEMPERATURE—70°.

Wall	Material and area	Loss in B.t.u. per hour, no allowance for exposure	Total loss, including allowance for exposure
East wall 10,000 sq. ft. Exposure factor 15%	20 in. brick = 5,900 sq. ft. Single window = 4,000 sq. ft. Doors (35% glass) = 100 sq. ft.	$5,900 \times 50^\circ \times .23 = 67,800$ $4,000 \times 50^\circ \times 1.215 = 243,000$ $100 \times 50^\circ \times .57^* = 2,850$ Total 313,650	$313,650 \times 1.15 = 360,000$
West wall 10,000 sq. ft. Exposure factor 25%	Same as east wall	Same as east wall	$313,650 \times 1.25 = 392,000$
North wall 5,000 sq. ft. Exposure factor 35%	20-in. brick = 3,050 sq. ft. Single window = 1,750 sq. ft. Doors (35% glass) = 200 sq. ft.	$3,050 \times 50^\circ \times .23 = 35,100$ $1,750 \times 50^\circ \times 1.215 = 106,000$ $200 \times 50^\circ \times .57 = 5,700$ Total 146,800	$146,800 \times 1.35 = 199,200$
South wall 5,000 sq. ft. Exposure factor 5%	Same as north wall	Same as north wall	$146,800 \times 1.05 = 153,500$
Roof 20,000 sq. ft. No exposure factor due to flat roof	5-ply tar and gravel roof on 2-in. plank = 17,000 sq. ft. Single skylight 20 x 150 = 3,000 sq. ft.	$17,000 \times 50^\circ \times .3 = 255,000$ $3,000 \times 50^\circ \times 1.215 = 182,000$ Total 437,000	= 437,000
Floor 20,000 sq. ft. Assume basement temperature 30° Total loss by	Double floor = 20,000 sq. ft. transmission.....	$20,000 \times 40^\circ \times .31 = 248,000$	= 248,000 = 1,788,700

B.T.U. TRANSMITTED THROUGH MATERIALS PER SQUARE FOOT OF EXPOSED SURFACE PER DEGREE DIFFERENCE OF TEMPERATURE BETWEEN INSIDE AND OUTSIDE AIR

Material	Coefficient	Material	Coefficient
Brick wall		Double floor with lath and plaster ceiling beneath	.18
4 in. thick	.66	Double floor without lath and plaster ceiling beneath	.31
8 in. thick	.46	Dirt floor—no covering	.23
12 in. thick	.32	Wood floor on dirt	.14
16 in. thick	.26	Galvanized iron siding	1.21
20 in. thick	.23	"Book Tile" roof	.80
24 in. thick	.19	Slate roof	.80
Concrete or stone		2-in. plank	.40
12 in. thick	.49	8-in. brick wall lined with 4-in. hollow terra cotta blocks—plastered inside	.22
16 in. thick	.43	12-in. brick wall lined with 4-in. hollow terra cotta blocks—plastered inside	.18
20 in. thick	.38	16-in. brick wall lined with 4-in. hollow terra cotta blocks—plastered inside	.16
24 in. thick	.35	4-in. terra cotta roof—plastered	.42
Single window or skylight†	1.215	8-in. terra cotta roof—plastered	.26
Double window or skylight† (independent sashes)	.57	12-in. terra cotta roof—plastered	.20
Door (close fitting and not often open)†	.57	5-ply tar and gravel roof on 4-in. re-enforced concrete slab	.64
Door, average (same as glass)	1.215		
Hy-Rib construction	1.0		
5-ply tar and gravel roofing on 3-in. plank	.30		
Frame walls, clapboard, paper, studding and plaster	.31		
Single wooden floor 1-in. thick with lath and plaster ceiling beneath	.27		

†In all cases measure the full opening for glass area or door area. To the values calculated from the constants as given above, add for north exposure 35%, south exposure 5%, east exposure 15%, west exposure 25%.

If the point of the compass is not known, 20% is added for each side instead of the above factors. If the roof is flat, or sloped only slightly, nothing is added for roof exposure.

If, however, it is quite steep, there is necessarily an increased heat loss due to exposure, and the factors above should be used for the roof as well. For a sawtooth roof, figure the two surfaces independently, using exposure factors in the same way as for walls.

†The 50° is the difference between inside temperature and lowest encountered outside temperature.

*In most cases doors are figured the same as glass.

Calculation of Heat Losses by Leakage—To the heat losses by transmission must be added the heat losses by leakage.

Assume the leakage in the building described above to be greater than average and equal to $1\frac{1}{2}$ air changes per hour.

This building has a total content of 1,000,000 cu. ft., the air leakage is $1\frac{1}{2}$ by 1,000,000 or 1,500,000 cu. ft. per hour, and this amount of air must be taken in at 20° and heated to 70° to replace the warm air lost by leakage.

The heat required to raise this air from 20° to 70° is found from the formula:

$$\text{B.t.u.} = \frac{\text{Cubic contents} \times \text{air changes} \times \text{temperature rise}}{55.2^*}$$

$$= \frac{1,000,000 \times 1\frac{1}{2} \times 50}{55.2} = 1,360,000 \text{ B.t.u. per hour}$$

These figures represent the heat loss due to leakage.

*1 B.t.u. will raise 55.2 cu. ft. of air 1° in temperature under standard conditions or will raise 1 cu. ft. 55.2° Fahr. In commercial work, either 55 or 56 is used in the above formula.

Total Heat Losses—The total heat losses for the building described above are 3,040,000 B.t.u. This amount of heat must be transmitted to the air supplied to the building.

RECOMMENDED VELOCITIES THROUGH HEATERS—In an industrial installation, the apparatus is designed to supply the necessary heat with as slight cost as possible; whereas in public building work, noise must be considered.

This latter is often the controlling factor and greatly affects the velocities used.

See following table for recommended velocities.

RECOMMENDED VELOCITIES THROUGH HEATERS

Number of 4-row sections deep	Public buildings, schools, office buildings, etc., velocity in ft. per min.	Factories, shops and industrial buildings, velocity in ft. per min.
1 to 3	1200	1500*
4 to 6	1000	1200
7 or more	800†	1200

*In factory work, velocities through the heater sometimes run as high as 1800, but this is done only under unusual conditions or where space limitations preclude the possibility of a heater of adequate size. It should be noted that high velocities greatly increase the power required to drive the fan and militate against an efficient system.

†Under special conditions, the velocities in public building work may run as low as 600 ft. per min. In drying work, where very high temperatures are sometimes necessary, extremely low velocities—even 300 ft. per min.—and deep heaters are installed.

DESIGN OF DISTRIBUTING SYSTEM—Piping—A well designed piping system should be laid out on a basis of equal friction loss per foot, and the following table is calculated on this basis. With this table it is possible to figure the sizes of pipe necessary when two or more pipes meet, or when a main splits into two or more branches.

*EQUALIZATION OF PIPES

*This table gives the number of pipes of smaller size equal to one larger pipe. Thus one 10-in. pipe has the same air carrying capacity as 20.3 3-in. pipes for equal friction loss per lineal foot of pipe.

Size of Main Ducts and Velocities—In factory work, the air velocity in the main duct varies from 1500 to 2500 ft. per minute and averages about 2000 ft. This velocity decreases gradually until the air reaches the risers. In public building work, the velocities in main duct range from 1000 to 1500 ft. and average about 1200 ft. The velocities in any connection leading to a riser must be intermediate between that leaving the fan and that existing in the riser.

Knowing the volume of air handled and assuming the velocity, the cross-sectional area of the main ducts is secured from the formula:

Cubic feet of air passing through ducts per minute

Area= Velocity in feet per minute

Velocities in Vertical Flues—In public buildings, the usual velocities in risers leading to registers are from 400 to 800 ft. per minute. The larger the riser, the greater is the allowable velocity. The figures in the accompanying table will serve as a rough guide.

Velocities Through Registers—In public buildings, the factors of noise and drafts render it advisable to restrict velocities through net clear area of registers to not more than 500 ft. per minute; 325 and 500 ft. are usually considered the limiting values. The desirable velocity depends on the type of room and the location of the register, also the larger the register the higher is the velocity that it is safe to use. In most cases, an approximate velocity is assumed, and from this the size of the register is figured. This size may not conform to standard size registers, and the nearest should therefore be chosen. The range of velocities allows a considerable leeway, so that a register can be chosen to suit the structural requirements of the building. Floor registers are not recommended; but if used, velocities of from 175 to 275 ft. per minute should be adopted.

VELOCITIES THROUGH REGISTERS

Cu. ft. per min. of air supplied to room	Under 500	525 to 950	1000 to 1800	1850 to 2500
Velocity through net area of registers, ft. per min.	325 to 375	375 to 410	410 to 450	450 to 500

TO FIND SIZE OF MAIN STEAM CONNECTION AND RETURN PIPE—Determine the total amount of heat units necessary per hour to raise the air volume under consideration from its initial temperature entering the heater to its final temperature leaving the heater from the number of heat units required; find the number of pounds of steam necessary to supply the required amount of heat by dividing the heat units by latent heat of evaporation per pound of steam at the steam pressure used. The resulting figure will be the pounds of steam required and condensed per hour.

By consulting the table below, the proper size steam and drip main can be chosen with the pounds of steam known with gauge pressures of 0, 5 and 80 lbs.

For other steam pressures, interpolation with sufficient accuracy can be made to determine the size mains required.

SIZES OF STEAM PIPES FOR STURTEVANT HEATERS IN INCHES

Lbs. steam condensed per hour	Steam Pressure						Lbs. steam condensed per hour	Steam Pressure					
	0 lbs.		5 lbs.		80 lbs.			0 lbs.		5 lbs.		80 lbs.

Sturtevant Air Washers.

TYPES—There are three standardized types of Sturtevant air washers:

Type H—An efficient apparatus designed for all general work in washing, purifying and humidifying. This is the type recommended.

Type C—For more severe service than Type H, and will give the maximum cooling that is possible with re-circulated water; that is, it cools to practically the wet bulb temperature. This type is of similar design to Type H, but has an additional group of nozzles and a spray chamber 2 ft. longer.

Type S—Suited for all average air washing requirements in simple ventilating systems. Recommended where low cost is the primary consideration.

STURTEVANT TYPE H AIR WASHER

STURTEVANT TYPE C AIR WASHER WITH SIDE AND BAFFLES REMOVED

Note auxiliary spray pipe and method of attaching risers at top

Sturtevant Type H Air Washer.

Adapted for a very wide range of work. In comparison with competitive apparatus, it has the following advantages:

Tank constructed of No. 14-gage iron, thus it is heavier than that of most other makes. Has more than twice the strainer area of any other washer made and has ten times the area of some. Strainer area is hundreds of times greater than area of pump suction. No washer has its strainer designed for such easy removal for cleaning.

No other washer has as many spray nozzles for a given capacity. In the Sturtevant, there is one nozzle for every 325 cu. ft. of air, exclusive of the auxiliary nozzles washing the eliminators.

No other washer is furnished with trap in overflow. No other washer supplies as much as 5 gals. of water per minute for each foot of width of the eliminator plates for auxiliary washing.

No other washer is furnished with louvers where air enters. These louvers, or diffuser plates, eliminate eddy currents and prevent mist getting outside the spray chamber.

CLEANING EFFICIENCY—Sturtevant air washers have a guaranteed cleaning efficiency of 98%.

Type H will increase the relative humidity of the air and will cool 85% of the wet bulb temperature. Type C will cool to 100% of the wet bulb depression.

SIDE ELEVATION OF STURTEVANT TYPE H AIR WASHER

Dimensions B and D are given in third and fourth columns of table on following page. If pump is placed as indicated above, the additional width required for the pump and piping is as follows:

Pump discharge, in..... 1½ 2 2½ 3 4 5
Minimum additional width, ft. and in.... 2-6 3-0 3-6 4-0 4-6 5-0

The size of pump necessary for any size of air washer is given in column 5 of table on following page.

TYPICAL STURTEVANT HEATING, VENTILATING AND AIR CONDITIONING SYSTEM

How to Specify Air Washers.

GENERAL—There shall be furnished a by size air washer. Width of the washer shall be ft. in. by a height ft. in. The length of the washer in direction of flow of air shall be 7 ft.

The air washer shall have a capacity of cu. ft. of air per minute at a velocity of ft. per minute.

TANK—The tank shall be constructed of galvanized steel firmly braced and riveted to a rigid frame of galvanized angle irons. The plates of the tank shall be of No. 14-gage, the angle irons shall be $1\frac{1}{2}$ by $\frac{3}{8}$ in., and shall be spaced not more than 3 ft. apart. The top framing angles are to be punched 5 in. on centers for $\frac{3}{8}$ -in. bolts, to secure the casing of the spray chamber to the tank. All rivet heads and seams shall be soldered over to make the tank watertight. The tank shall be fitted with a conical shaped overflow and trap which shall carry away the surplus water. The trap shall be provided, to prevent the admission of sewer gas from the drain to the spray chamber.

CASING—The casing of the washer shall be made of No. 18 galvanized steel thoroughly braced with $1\frac{1}{2}$ by $1\frac{1}{2}$ by $\frac{3}{8}$ -in. galvanized angle irons, spaced not more than 3 ft. on centers. The seams and rivet heads are to be soldered so as to make the casing watertight. The casing shall be fitted with an 18 by 30-in. hinged door for access to spray chamber. This door shall consist of a rigid cast iron frame fitted with 3 glass panels. The door shall be hung on heavy hinges and shall clamp against a heavy rubber gasket inserted in the frame that carries the door. To make the door watertight, it shall be provided with 6 latches operating with a cam motion. The frame shall be arranged to collect any water that may drip from the door, and return same to tank, should the door be left unclamped.

ELIMINATORS—There shall be provided eliminator plates to remove the entrained moisture from the air after it has passed through the spray chamber. These eliminators shall be of the horizontal cut-lip type, arranged in tiers of not more than 5-ft. widths. The plates shall be not lighter than No. 22-gage steel and shall be galvanized after they have been cut and formed to shape. The plates are to be so arranged that a large part of the surface will become a washing surface for the removal of dust that impinges upon them. The eliminators shall consist of one group in the direction of the flow of air and be so arranged that the passageway between two plates shall be continuous.

SPRAY DEVICE—The spray device shall consist of a horizontal header placed across the bottom of the spray chamber and fitted with vertical risers so placed as to bring the spray nozzles, secured to the risers, in a plane parallel to and at a distance of 48 in. in front of the eliminators. The upper ends of the risers shall be capped with a special cap that will permit fastening to a galvanized angle iron across the top of the spray chamber, thus holding the risers securely in line. There shall be not less than one atomizing nozzle for each 325 cu. ft. of air washed per

minute. The nozzles shall be constructed entirely of bronze and shall have large waterways to prevent clogging of the nozzles by sediment carried in the water. The nozzle openings shall be not less than $\frac{3}{8}$ in. in diameter, and shall discharge not more than $1\frac{1}{4}$ gal. per minute with 19-lb. pressure per sq. in. All piping and fittings shall be heavily galvanized. For washers of 8 ft. height and under, 1-in. risers shall be used; for washers over 8 ft. in height, $1\frac{1}{4}$ -in. risers shall be used.

In addition to the atomizing nozzles, there shall be furnished a spray pipe across the top of the spray chamber adjacent to the eliminator plates. These nozzles shall be of the rain-spray type, shall be placed 6 in. on centers and shall have capacity to wash each foot of width of the eliminators with not less than 5 gal. of water per minute.

STRAINER—The straining device shall consist of a compartment extending the full width of the tank and shall be fitted with fine mesh copper wire screens arranged for easy removal for cleaning. There shall be 2 sq. ft. of strainer area for each foot in width of the tank. The top of the compartment shall be closed with hinged doors to prevent dirt washed from the air falling into it.

DIFFUSER PLATES—Across the front of the spray chamber shall be placed a series of louverlike diffuser plates to eliminate eddy currents and to prevent back splash of the spray washer. The washer shall be so designed that when the fan is not in operation, the spray water will be entirely retained within the spray chamber when the pump is running.

PUMP AND MOTOR—For re-circulating the spray water, there shall be furnished centrifugal pump of the double suction, split casing type. The pump to be furnished with a bronze impeller, bronze covered steel shaft and bronze bushings. The bearings shall be of the ring oiling type. Heavy cast iron base shall be furnished, upon which to mount the pump and motor. An oil groove shall extend completely around the cast iron base. The pump will be driven by the motor through an insulated flexible coupling.

The motor shall be of ... horsepower, capacity at ... r.p.m., and designed to operate on current of the following characteristics:

ACCESSORIES—Where necessary, a suitable starter will be furnished with the motor. A 5-in. diameter pressure gage, with white dial and black figures reading to 30 lbs., shall be furnished with the washer. A bronze float for maintaining constant water level in the tank will be furnished with the washer. The casing shall be fitted with a waterproof marine type fixture ready to receive the electric bulb to be furnished by others.

NOTE—Pipe connections will be fitted to the washers for connecting the pump suction and discharge to the strainer compartment and to the spray headers, respectively. The contractor is to furnish between the washer and pump, galvanized piping in accordance with the washer manufacturer's drawings.

Sturtevant Steam Engines.

Vertical engines, VS-7 and VS-8 types, are furnished for use as independent engines and for driving fans, blowers, exhausters and generators direct connected.

They are of the simple, single valve type and may be operated as automatic or throttling engines.

These two types differ only in their oiling arrangements. The VS-7 type has a gravity system and the VS-8 has forced lubrication.

Sturtevant Steam Turbines.

Simple and durable construction makes the Sturtevant steam turbine a reliable source of power for driving fans, blowers, centrifugal pumps and electric generators.

Type 6 is of the single stage, multi-velocity type, and its operation is such as to give high efficiency

and permit of moderate rotative speeds. Hand valves are used for shutting off the nozzles, and the speed is regulated by a centrifugal throttling governor placed on the end of the shaft.

Internal lubrication is unnecessary, therefore the exhaust steam is free from oil.

STURTEVANT STEAM TURBINE, TYPE 6

Sturtevant Electric Motors.

TYPE D—Type D motors are designed primarily for use as a general purpose motor. The field frame is of cast iron. All sizes are provided with commutating poles. Sizes 100 to 103, inclusive, have 2 poles; sizes 1 to 9, inclusive, have 4 poles. They can be arranged for either floor, wall or ceiling mounting.

TYPE C—Type C motors are designed to meet the demand for a slow speed motor for direct connection to fan apparatus and the like.

The smaller sizes are of the end shield type, and the larger are all of the pedestal type

They are built in standard voltages and in capacities from 1 to 800 h.p.

OTHER TYPES—Type TF turbo motor for direct connection to high speed centrifugal fan and centrifugal pumps. Built in sizes 5 to 100 h.p.; speeds up to 4,000 r.p.m.

Type MP-4 built in larger sizes up to 125 h.p. at medium speeds.

Sturtevant Generating Sets.

VS-7 AND VS-8 STEAM ENGINE SETS—Compact and self-contained units especially adapted for isolated power plants and for auxiliaries in large plants.

Generators are of the 8-pole type, capable of carrying a 50% overload momentarily without shifting brushes and without destructive sparking and a 25% overload for 2 hours without sparking or undue heating.

Both types are identical, except that the VS-7 has gravity lubrication and the VS-8 has forced lubrication.

Speed regulation is within 1½%, making the sets particularly desirable for lighting purposes.

TURBO GENERATING SETS—These sets make desirable power and lighting units. When mounted on cast iron subbase, their compactness recommends them where space is an important item to be considered. Absence of vibration due to perfect balance makes a foundation other than a subbase unnecessary.

Absence of oil in the exhaust steam makes it possible to utilize the exhaust in the heating system. An efficient regulating device makes it possible to maintain a constant voltage and impossible for the turbine to overspeed. Individual nozzle shut-off valves are a source of great steam economy when operating under fractional loads.

Sturtevant steam turbines (described on preceding page) can be furnished separately and can be directly connected to standard makes of electric generators.

Sturtevant Gear Transmissions.

Built primarily for turbo blower outfits. Their chief duty is to enable both turbine and blower to run at their most efficient speed, resulting in the remarkable saving in power and lower steam consumption.

Gears have double helical (herringbone) stub teeth, giving maximum strength and perfect rolling contact without end thrust. They are accurately cut and do not require filing, fitting or running in. Tooth pres-

STURTEVANT GEAR TRANSMISSION

DATA, GEAR TRANSMISSIONS

Pitch	Ratio (Max.)	Centers, in.	Weights		
			4-in. face	6-in. face	8-in. face
8	8.08	8½	1200	1300	1400
to 10	12.33	12½	1600	1700	1800

5	4.66	8½	1600
to 7	7.34	12½	2000
7	10.00	16½	2400

sure is very light, consequently the life of the gears is unusually long.

Quiet operation is secured by means of fine pitch and wide face. Bearings are long and shafts large, giving minimum bearing pressure.

Complete transmission, including gears, oil pump and bearings is contained in lower casing. Upper casing serves as a cover to keep oil in and dust out. Small door in upper casing permits inspection while in operation.

Sturtevant Turbo Undergrate Blowers.

Compact, self-contained units designed to secure the advantages of mechanical forced draft without the expense of the larger systems.

They consist of a specially designed built-up propeller fan, with rolled aluminum blades securely riveted into a bronze hub and mounted upon the shaft of a Sturtevant steam turbine. The rotor is a solid forging of the best open hearth steel, with buckets milled into the rim. Nozzles and reversing buckets consist of one solid bronze casting, reversing buckets being milled in the solid metal.

Bearings are bronze sleeves lubricated by ring oilers, which are continually supplied with oil from a reservoir with capacity large enough to make frequent filling unnecessary. Bearing casing and supporting arm are cast integrally with the turbine casings, making an exceptionally rigid unit.

Sturtevant Fuel Economizers.

Sturtevant fuel economizers effect large fuel savings, increase the capacity of boilers, prolong their life, purify the feed water and reduce the smoke nuisance. When used in connection with the Sturtevant system of mechanical draft, increased savings may be secured through the burning of the cheapest grades of fuel.

The construction of the Sturtevant economizer is extremely simple.

Consult the Sturtevant engineers for a satisfactory solution of economizer problems.

Sturtevant Drying Systems.

The drying department of this company is in a position to provide drying equipment for various kinds of industrial work. The experts comprising this department have an intimate knowledge of the materials most generally requiring drying, and their services are at the disposal of those desiring to install systems for drying paper, brick and clay products, leather, varnish, paint, fish, fruits, chemical powders, milk, malt, glue, lumber, etc.

All drying requirements and conditions are known by the Sturtevant engineers and can be obtained precisely by Sturtevant dryers. Submit dryer problems to this company for a satisfactory solution.

L. J. WING MFG. CO.

Air Handling and Power Plant Equipment

354-360 West 13th Street

NEW YORK, N. Y.

Products.

WING TURBINE and ELECTRIC BLOWERS for mechanical draft; "WING-SCRUPLEX" and "DISC" FANS for ventilation; "WYDAWAKE" DAMPER REGULATORS. "WING-SCRUPLEX" UNIT HEATERS; "HYPRESS" PRESSURE BLOWERS and VACUUM PUMPS, SMALL STEAM TURBINES.

Wing Turbine Blower.

CAPACITIES—Wing turbine blowers are made in sizes from 12 to 25 in. Volume capacities range up to 17,000 to 20,000 cu. ft. per minute, depending upon the pressure. Static pressures range up to 5 in.

WING PROPELLER TYPE TURBINE BLOWER

APPLICATIONS—Wing turbine blowers were originally designed for forced draft in hand fired boilers; but with their improvement and development, their use has been extended to stoker installations. For drying and ventilating, too, they have proved exceptionally fitted, for by the simple addition of a heater, turning the exhaust of the turbine into the heating coils, this propeller type blower becomes a complete drying unit. Such a unit takes up only a *fraction* of the space occupied by a centrifugal blower.

WING CENTRIFUGAL TURBINE BLOWER

For such applications as require higher pressure than that given by an open type or propeller fan, the Wing centrifugal turbine blower is built. This small, simple outfit possesses the advantage of greatly smaller upkeep than the engine driven type. The whole outfit takes up little space and delivers high volumes of air against high static pressures.

Wing "Wydawake" Damper Regulator.

The "Wydawake" damper regulator is sensitive and accurate in operation. Consists of only 3 principal parts. Used to operate both dampers and blower valves.

Wing "Hypress" Pressure Blowers and Vacuum Pumps.

"Hypress" blowers are efficient and absolutely positive in operation, built up of only four parts. "Hypress" blowers put up pressures to 10 lbs.

The "Wing-Scruplex" Fan.

The remarkable record made by this fan is due to its highly efficient operation against resistances offered by ductwork, etc. This fan delivers its air straight forward, in a column of practically the same diameter as the fan itself, and at practically uniform velocity over its entire area; thereby eliminating eddy current losses.

The propeller is a solid aluminum casting in the smaller sizes and of pressed steel in the larger sizes. Motors are fully enclosed and dustproof. Made in all sizes, 12 in. to 12 ft. in diameter, and are built for either motor or pulley drive.

"WING-SCRUPLEX" FAN

The "Wing-Scruplex" Exhauster.

This unit combines all the advantages of the "Scruplex" fan with certain advantages of the enclosed or steel plate fan. The motor of the "Scruplex" exhauster is entirely outside the current of air or vapor being handled by the fan. The motor thereby keeps clean and is easy of access. The unit is of small dimensions, capable of exhausting very large volumes of air.

"WING-SCRUPLEX" EXHAUSTER

The "Wing-Scruplex" Unit Heater.

This unit is a combination of the "Scruplex" fan and a heater. The apparatus is so arranged as to direct the heated air downward to assure a warm layer of air at the floor level and, at the same time, to keep the air in a room circulating. Several units may be used in one room, each placed where the heat is most needed. Ideal for large open shops, foundries, steel mills, etc.

Wing Steam Turbine.

For driving centrifugal pumps, etc., requiring up to 25 h. p. Wing turbines are simple, compact, economical driving units, low in cost.

CARRIER AIR CONDITIONING COMPANY OF AMERICA

BUFFALO, N. Y.

Products.

AIR WASHERS.

Humidifiers, Dehumidifiers, Generator Coolers.

Carrier Air Washers.

Air washers insure pure, clean air by removing all dust with a finely divided water spray. Operated in connection with heating installations a lower temperature may be used, because of the increase in comfort due to proper humidity.

INTERIOR VIEW OF CARRIER AIR WASHER

Carrier Air Washers consist of three important elements: first, the Spray System; second, the Eliminators; and third, the Dew-point Control. Each of these is of extreme importance in insuring the proper control of a perfect heating system.

Carrier Spray System.

A fine spray is essential for the intimate intermingling of the water and the air. The Carrier Spray Nozzle is very simple and highly effective. The atomizing effect does not depend upon the size of the nozzle opening, but upon the interior design of the nozzle itself; hence, large openings can be used, which positively prevent clogging. With water pressure as low as 15 lbs. an extremely fine spray is produced.

AIR WASHER SPRAY IN OPERATION

SPRAY NOZZLE

Eliminators.

The eliminators of the Carrier Air Washer consist of a series of zigzag, vertical, continuous surfaces, against which the moisture laden air is thrown in its passage through the washer. The free moisture and dirt adhere to the plates and is washed into the settling tank by the continuous spray from the flooding nozzles.

PART OF CASING REMOVED SHOWING ELIMINATORS IN POSITION

FIVE PAILS OF DIRT WASHED FROM AIR DURING ONE WEEK'S OPERATION OF AIR WASHER

Dew-point Control.

The Carrier Dew-point control insures the delivery of air into buildings with just the proper amount of moisture, without variation, during the heating season.

ATMOSPHERIC CONDITIONING CORPORATION

Specialists in Air Conditioning Equipment

443 Chestnut Street
PHILADELPHIA, PA.

Products.

EQUIPMENT for Maintaining Artificial Atmospheric Conditions in Industrial Plants; HUMIDIFYING, DEHUMIDIFYING, DRYING, COOLING APPARATUS and AIR CONDITIONING APPARATUS for Generator and Transformer Ventilation.

Webster Air Conditioning Apparatus for Generator and Transformer Ventilation.

The construction of the Webster air conditioning apparatus for cleansing and cooling the air for turbo-generator and transformer ventilation is arranged to permit the air to pass through a spray chamber in which water is finely atomized, producing an extremely intimate contact between the air and the water.

Under certain conditions and in some localities, the prime object in installing such an apparatus is for the removal of dust, dirt, oily particles and foreign matter generally from the air, the thought of cooling being secondary.

For use in such cases the Webster Type "G-W" apparatus will fully meet the requirements; the length of apparatus, quantity of water circulated and cost of installation will be somewhat less than that for the Webster Type "G-C" equipment, which is designed to secure the greatest cooling effect possible with recirculated water, reducing the temperature of the air passing to the entering wet bulb temperature.

The Webster apparatus includes as its initial feature a spray chamber containing a series of Webster spiral mist nozzles for atomizing the spray water.

These nozzles are arranged uniformly over the entire spray chamber, there being but one group in the "G-W"

type of apparatus, the quantity of water handled being sufficient to remove 98% of all foreign matter contained in the entering air, and capable of cooling this air 70% of the wet bulb depression.

In the Webster Type "G-C" apparatus the spray chamber piping consists of two banks of sprays, one discharging the water in the direction of the air flow, the other discharging against the air flow. This construction insures a very intimate contact between the air and water, resulting in the air being reduced to the saturation point, at the same time giving a 98% cleansing effect.

The Type "G-W" (400 series) is 7 ft. long, while the Type "G-C" (500 series) is 9 ft. long and each is made in various dimensions and capacities to meet any local space condition.

THE WEBSTER SPIRAL MIST NOZZLE (PATENTED)

zation of spray water at a pressure of 17 lbs. per sq. in. The mist nozzles are made entirely of brass and have a discharge orifice of $\frac{3}{16}$ in. in diameter. The large water opening makes the mist nozzle practically non-cloggable.

ELIMINATOR—For eliminating the free moisture from the air after it has been subjected to the sprays, a series of vertical baffles are provided and may be constructed of galvanized steel, ingot iron or copper as desired. The front and rear sections of the eliminator are staggered so that the air streams will be split in passing through the same. The construction of the eliminators is such that all entrained moisture is removed from the air being discharged to generator or transformer.

SECTIONAL VIEW OF USUAL FORM OF WEBSTER ELIMINATOR

TANK—It extends under the entire apparatus and is provided with the necessary flanges for fresh water, overflow, drain, suction connections, etc. The tank is usually made 15 in. in depth, which allows ample space for the collection of dust, dirt and foreign matter removed from the entering air. The tank should be cleaned and flushed out daily.

STRAINER—The strainer furnished for sheet metal tank is of the double brass box type with hinged lid and a removable inner basket having a free area 15 times that of the pump suction. The entire strainer is removable for cleansing and inspection. For concrete tanks, the strainer furnished is of the cylindrical type having the same free area through the inner basket.

DOUBLE CYLINDRICAL BRASS STRAINER

DOUBLE BOX BRASS STRAINER

CENTRIFUGAL PUMP—Of the double suction type having horizontally split shell which allows access to the interior parts of the pump without disturbing the pipe connections. The pump is provided with flexible coupling direct connected to motor, both mounted on cast iron base.

DOUBLE SUCTION CENTRIFUGAL PUMP DIRECT CONNECTED TO ELECTRIC MOTOR

APPLICATION—Each installation must be designed for the particular space available and conditions encountered.

Maintenance of Artificial Atmospheric Conditions.

Special apparatus for maintaining artificial atmospheric conditions in industrial plants, where humidifying, dehumidifying, cooling, drying, etc., are involved, is the chief product of the company. The company's engineers are constantly engaged in the investigation of conditions and the design of apparatus for correcting troubles in plants where atmospheric control is essential.

The nature of the problem influences the type and construction of each equipment, which may require apparatus using recirculated water in the simpler forms or may make the use of deep well water necessary. This type of apparatus may be of either the single or double stage type, the latter especially desirable where the quantity of well water is limited.

Where greater cooling effect is necessary and the results to be secured warrant this expense, apparatus can be furnished in connection with which refrigerating equipment is provided.

The Webster system of automatic humidity control makes possible the regulation of temperature within 1° Fahr. either way and the control of the relative humidity within 2% of the point for which it is set.

The company's engineers are available at all times for investigation of conditions and consultation regarding the adaptability of Webster apparatus.

No contract ever undertaken where just the results the buyer wishes can not be accomplished.

Products and Services.

CONSULTATION, DESIGNS, CONSTRUCTION, EQUIPMENT and INSTALLATION, complete or in part, of plants for the purpose of Humidifying, Dehumidifying, Cooling, Air Washing, Automatic Temperature and Humidity Regulation.

Experience and Co-operative Service.

More than a thousand Carrier installations are manufacturing more than 400,000,000 lbs. of made-to-order weather every working day; in more than 200 distinctly different American industries, all the way from chewing gum to aeroplanes.

Carrier service is founded upon the experience gained in serving this remarkable clientele.

Wherever weather—dry, moist, hot or cold—affects the process or the labor, Carrier apparatus, designed and installed by Carrier engineers, can be efficiently employed to manufacture the kind of weather required.

Manufactured weather is improving efficiency, standardizing routine, increasing production, and making "Every day a good day" in all of the following industries, besides many others (space permits the mention of only one firm name, selected at random, in each industry).

Literature.

Any of the following publications will be gladly furnished on request:

"Weather, and The Story Of How It Is Manufactured," a 64-page bound book telling, non-technically, the fairy story of manufactured weather.

W. L. FLEISHER & CO., INC.

Consulting and Contracting Industrial Engineers for Air Conditioning and Drying

31 Union Square West
NEW YORK, N. Y.

Sales inquiries direct to home office, or the 22 branch offices of the B. F. Sturtevant Co., in principal cities of the United States

Products.

AIR CONDITIONING SYSTEMS: Humidifying, Dehumidifying, Heating, Ventilating.

DRYERS for SOLIDS: Tray, Tunnel, Progressive.

DRYERS for LIQUIDS: Spray type.

Service.

W. L. FLEISHER & Co., INC., employs a staff of chemical and mechanical engineers solely for the purpose of working on problems which arise in the preparation and use of materials such as:

Chemicals	Paints	Wool	Fruits
Drugs	Soaps	Fibers	Milk
Dyes	Silk	Lumber	Meats
Varnishes	Cotton	Leather	Candy

Laboratories, equipped with experimental and model humidifiers, dehumidifiers, washers for the clim-

Air Conditioning.

The humidifying, dehumidifying, heating and cooling systems installed by W. L. FLEISHER & Co., INC., maintain constant atmospheric conditions inside the factory by means of patented devices. They insure an uninterrupted production in spite of adverse winter or summer weather.

Installations are made only after exhaustive tests both in the laboratory and at the factory, and are guaranteed to "deliver the climate" ideal for the specific purpose.

This company carries the problem through from preliminary investigation to the completed installation and turns the equipment over in operating condition with guarantees demonstrated.

They offer the ideal combination—Fleisher Service and Sturtevant Apparatus.

Dryers for Solids.

Like the air conditioning systems, the dryers of this company are built to fit the particular problem, and no recommendation is made until after scientific experiments have determined the proper solution.

Building made-to-order equipments enables W. L. FLEISHER & Co., INC., to furnish tray, tunnel, or progressive types of highest mechanical and thermal efficiency, each fitted to the particular problem.

Results are guaranteed.

Dryers for Liquids.

The spray dryers of this company are of the continuous operating type, delivering the product in powder or granulated form. They are inherently simple, fireproof, economical to operate, require no skilled attendance and do not affect the most delicate products.

The spray dryers not only offer their inherent advantages, but their use usually eliminates from the manufacturing process many troublesome and expensive steps, such as filtering, cake drying, grinding and screening.

A commercial scale laboratory is at the service of prospective purchasers for making tests of factory size.

AIR CONDITIONING IN A CANDY FACTORY

ination of dust and gases, shelf dryers and spray dryers, are at the service of engineers and contractors.

This company handles each problem from preliminary laboratory work through design to complete installation of the system as an individual problem. Standard apparatus used, any part of which can be easily renewed.

AIR CONDITIONING EQUIPMENTS; TURBO-HUMIDIFYING SYSTEM; TURBO OIL SPRAYER; AIR WASHERS; HUMIDIFIERS; COOLERS; AUTOMATIC HUMIDITY AND TEMPERATURE REGULATORS; HYGROMETERS; PSYCHROMETERS; DIAPHRAGM VALVES; COMPRESSED AIR CLEANING DEVICES.

For the Merrill Process of Industrial Heating, see page 962.

Air Conditioning Equipments.

The requirements of the various industries being so different, it early developed that no one particular system could meet all possible conditions; and, to properly meet the general demands, it became necessary to develop a number of types of equipment, and the matter now merely resolves itself into what system is best adapted to the particular problem presented.

Sometimes it is merely desirable to humidify, sometimes to air-wash or to heat, but more frequently to combine either two or more of these features in the same plant and at the same time to automatically control both the temperature and humidity.

With these requirements in mind, the following types of air conditioning equipment have been developed, which by themselves, or in combination with each other, meet most completely the individual requirements of all forms of industry.

(A) Central station outfits for ventilating, cooling, heating, air cleansing, humidifying, or dehumidifying.

(B) Fan driven air conditioners, both of the inside and of the wall ventilating type.

(C) Improved accessible spray humidifiers.

(D) Forced draft multiple bank atomizers.

(E) Humidity and temperature control equipment.

(F) Recording and indicating apparatus: valves, accessories, etc.

Diaphragm Humidity and Temperature Regulator.

The essential features of this instrument are the metal diaphragms, which contain a highly volatile fluid, expanding and contracting with changes in temperature.

These movements are positive, and of such magnitude that they can be used without multiplication to open and close valves, and thereby produce a most simple and effective machine for this purpose.

In this machine the spray method of maintaining the wet bulb temperature without rags or wicks is used, and this part of the device needs no attention.

DIAPHRAGM HUMIDITY AND TEMPERATURE REGULATOR

Copper Fan Air Conditioners.

This air conditioner produces, with approximately the same power expenditure, enormously increased results, both in air handling and water evaporative capacity.

It is the only really successful fan humidifier made. The only one that does not blow out drops of water, and that has an instantly accessible interior, with perforated copper pan strainer, and a fan motor removable without bothering with bolts or screws.

To take the fan off, merely lift it off. It can not fall off, as it is secured in a heavy iron ring while in a running position.

The design of inside cover is such that the spray is discharged in a flat horizontal plane, and not drawn back into fan at the top, resulting in local circulation and wet spots around each head.

"HIGH DUTY" COPPER FAN AIR CONDITIONER

CENTRAL STATION EQUIPPED WITH DOUBLE FAN

The smooth outside surface presents no unusual humps to be filled with floating lint, and its size is small compared with its evaporative and air handling capacity.

Ventilating Fan Air Conditioners.

This type of equipment lends itself admirably to ventilating purposes, and is usually arranged with a thimble in the pilaster, or a direct duct connection to the transom on either side, so that part or all of the air drawn through the fan can be brought from out of doors.

This head will handle 60,000 cu. ft. of air per hour, and in warm weather reduces it to the wet bulb temperature; while in winter, if hot water is used, as is ordinarily the case, warm tempered air is introduced.

VENTILATING FAN AIR CONDITIONER

Turbo-humidifying System.

The Turbo-humidifying system imparts additional humidity or moisture to the air in factories or other buildings.

Air under pressure is supplied through a main pipe to the several branch lines in which the heads are located. Parallel with these branch air lines are water lines. These are run dead level.

Water is supplied through a covered, float controlled tank. This tank is equipped with overflow pipe, draw-off pipe, filter, etc., and is covered to keep out dust and lint. The supply tank is a special one, but is about the size of that furnished with any complete toilet room set.

One of the tanks will supply from 60 to 70 heads, but in large rooms the best practice is to divide the system into 2, 3 or 4 separate sections. Tanks may be located in toilet rooms, or other convenient, accessible places. The water line, controlled by overflow pipe is located 1½ in. below the center line of the head.

It is absolutely impossible for water to overflow from the heads on floors, machinery, stock, etc., for when the air is shut off there is no power to lift the water up to and into the head; when the water is shut off the air has no water to lift, hence no damage either way.

TURBO-HUMIDIFIER HEAD—Air is supplied at the required pressure at the orifice, A; passes through the tangential orifices in the bushing, B-B; produces a vacuum at the end of the water nozzle, E, and by so doing, draws water through the tube, D.

The centrifugal motion imparted to the air by the turbo principle actually pulverizes the water in the chamber, C, before it is delivered to the atmosphere. The importance of this centrifugal action is noted, since it spreads the vapor and distributes it before condensation can occur.

DETAIL OF PIPING AND INSTALLATION OF TURBO HEAD

CROSS SECTION OF TURBO HEAD

The water inlet to the head is connected to the riser nipple, C-1, in the water branch pipe by means of a non-corrosive, flexible, metallic tube, C-4, which being provided with union connections, B-2, C-6, makes all parts readily accessible and adjustments easy. Two unions, one vertical and the other horizontal, make it possible to point the jet in any direction.

The turbo valve or cock, D-1, is so located that any head may be shut down without interfering with the others. Simply shutting off the air shuts down the head.

Compressed Air Cleaning.

The next most profitable use of compressed air from the Turbo-humidifier system applies directly to the manufacturing departments through its utilization in cleaning the mill and its machinery.

A hose specially designed for this service and a special cleaning nozzle with operating lever is supplied.

The use of compressed air is the easiest and most economical method of cleaning mill machinery. Write for complete details of this service.

Turbo Oil Sprayer.

The Turbo sprayer was designed to meet special spraying problems where a penetrating spray is necessary. Perhaps its most frequent application is the conditioning of wool, worsted, cotton and jute.

The capacity of the sprayers will vary with the quality of the wool and the percentages of raw wool or waste stock which are being treated. The needle valves which control the supply to each sprayer are adjustable for very close regulation.

The fluid is delivered through a small fluid tip and is atomized by the Turbo principle.

Various sizes of fluid tips and air nozzles supplied and interchanged to produce the desired quality of spray and distribution for particular conditions.

The positive rotary impeller type pump is particularly well adapted for this purpose. Extremely durable under all conditions. Special strainers, installed in fluid supply tank, are used to protect pumps from foreign matter.

Inquiries for equipments for special purposes will receive the prompt attention of Parks-Cramer engineers.

Manufacturers of AIR WASHERS, BIMULTI FANS, STEEL PLATE FANS, ROOF FAN VENTILATORS.

Blowers, Exhaust Fans, Dust Collectors, and Mushroom Ventilators.

Services.

With engineering data unusually complete, we stand ready at all times to assist engineers in the study of their problems. What may seem a complicated problem may be reduced to a simple proposition through the experience of the HERSH & BROTHER engineering department.

Do not hesitate to ask for information.

Bi-cal-ky Air Washer.

This machine is designed for cleansing and cooling air by passing it through a mist-filled chamber. A series of spray heads placed in a vertical plane across the chamber produce the mist.

The construction and mechanical manipulation of this air washer is such that the mist from the spray heads remains intact while flushing. This is of the greatest importance for the reason that it offers no weak spot in the mist sheets during the flushing operations to permit of any foreign matter passing through the air washer.

AUTOMATIC FLUSHING—A rigid shaft is placed across the air washer above the sump. This runs freely and is rotated by means of buckets filled with falling waste water from the spray heads. Cams are arranged on this shaft, under each vertical row of spray heads, so as to operate a series of tee iron rods connected with the different rows of heads. When released

BICAL-KY AIR WASHER

by the cams these rods fall and produce a hammer blow on the center rods of the spray heads, causing a rush of water through the nozzles, which dislodges any dirt that may have accumulated in hindrance to a perfect mist spray. The cams are set so as to drop one tee at a time, which in turn flushes this vertical row of spray heads.

Planing Mill Exhaust Fan.

This type is constructed especially for shaving exhaust systems in planing mills. The patented wheel construction gives unusual strength and prevents racking.

The absence of rivets on the face of the blade insures an unusually long life to the wheel as the rivets otherwise are worn by the abrasive action of the material handled. The construction of the wheel also permits the handling of long, stringy materials without clogging. This type is also constructed as a double fan.

Bimulti Type Fan.

The Bimulti fan is particularly designed for use in heating and ventilating systems in public and industrial buildings, where large volumes of air are to be handled at comparatively low pressures. The patented wheel construction is unique among fans combining as it does the desirable features of the older steel plate fan with the large capacity, efficient and quiet operation of the multiblade type.

BIMULTI FAN WHEEL

The unusual strength and ruggedness of construction are readily apparent from an examination of the blades running at a tangent from the central hub of the wheel. These blades are formed of two heavy bent plates riveted together at the center to form bracing angles on the back of the blade and are so placed with reference to the hub as to give the greatest strength in the direction of rotation.

Write for catalogue giving capacity tables, horsepower and characteristic curves.

Steel Plate Type Fan.

The particular advantage of this type is its adaptability for all purposes. The pressure characteristics adapt it particularly to forced and induced suction of pressure systems where the pressure involved is greater than $1\frac{1}{2}$ to 2 oz. Under such conditions this type is preferable to the Bimulti.

The efficiency of the wheel is not affected by high pressures as is the case to a certain extent in the multiblade wheel.

Manufacturers of ICE MAKING and REFRIGERATING PLANTS, for every purpose from 1-ton capacity upwards, and suitable for connection to any kind of power.

Drop Forged Steel Ammonia Fittings, for high pressure work.

Ice Plant Supplies, for every purpose.

Cold Drinking Water Plants, for large industrial institutions.

Chemical Reclamation Plants, for reclaiming benzol and other volatile liquids in gaseous form for re-use; Chemical Precipitating Plants, where certain soluble chemicals are precipitated into solids at low temperatures.

Oil Cooling Systems, for use in connection with large steel heat treating plants or any other purpose.

Roll Cooling Systems, for the rubber industry.

Large Water Cooling Systems, where the temperature is brought down lower than it can be done by cooling towers, or spray ponds.

Gas Condensers, atmospheric, double pipe, submerged and tube types; Solution and Gas Coolers, in styles best adapted to the particular use.

Insulating Material, for every condition.

Heat Exchangers, in all styles: atmospheric, double pipe, submerged, shell and tube.

Pipe Work and Fittings, for every use and pressure.

Arctic Pownall Raw Water System (The Ultimate Plant).

This is the most efficient and up to date ice making plant built in the world. It will produce better ice at less cost than any other.

POWER COST—The current consumption runs from 40 to 55 kw. hours per ton of ice produced, and the current usually costs from $\frac{3}{4}\phi$ to $1\frac{1}{4}\phi$ per kw. hour.

This covers everything, including lights and pumping of water.

LABOR—Less than one-half as many men on a shift as required by other type of plant. Only one man required on the tank.

OVERHEAD EXPENSE—Greatly reduced. Insurance is lower. Less chance for fire. Depreciation and repairs greatly reduced on account of modern construction.

UPKEEP—Very little, as the wear on motor drive is practically nothing.

CALCIUM LOSS—Virtually eliminated.

The Arctic Junior Line.

Made in sizes from 1 to 25 tons daily refrigerating capacity and can be driven by any kind of power. It is simple and sturdy, requiring a minimum of attention as it is of the splash oiling type.

All points of wear are fitted with replaceable bushings.

Particularly suited to hotels, apartment houses, small water cooling plants, commissary departments, meat markets and dairies.

Can be fitted to operate automatically.

Co-operative Service.

THE ARCTIC ICE MACHINE COMPANY specializes in adapting refrigeration to industrial requirements.

The experience of this organization is at the command of all customers. If in doubt as to the requirements, this company will investigate and guarantee results, advising the most efficient method of removing heat or transferring it from one substance to another.

Products.

Manufacturers of complete AUTOMATICALLY CONTROLLED AMMONIA COMPRESSION REFRIGERATING and ICE MAKING PLANTS, including Compressors, Condensers, Coils, Piping and Traps, and Automatic Controlling and Safety Devices for Refrigerating Plants.

Advantages and Scope of Utility.

Chief among the numberless and varied uses of refrigerating and ice making plants are their advantageous application to industrial needs. Automatic refrigerating equipment, designed for large industrial establishments, is eminently adapted for drinking water, in factory, restaurants and commissary departments. It is also extensively utilized in special mechanical processes such as tempering and solidifying work.

An Automatic plant can be located anywhere in a building without reference to the location of the engine room. It will cool from 10 to 15 refrigerators at different temperatures on the one direct expansion system.

Brine installations are handled with equal facility where conditions warrant that type of plant.

Automatic Refrigerating Plants.

These plants (fully patented) are designed to provide mechanical refrigeration without the necessity of an operating engineer. Automatic devices absolutely control starting and stopping of machine as temperature in boxes rises above, or falls below, predetermined points, and also control feed of ammonia to expansion coils, and feed of water to condenser. Safety devices immediately stop plant in case of trouble with water or electric power service.

Compressors.

They are of the vertical 2-cylinder, single acting, enclosed type; built to accurate dimensions with parts interchangeable. They are provided with patent "safety heads," preventing danger to cylinder heads from non-gaseous substances getting into cylinder. Cylinders and pistons are especially designed to prevent objectionable oil pumping into expansion piping. Single units have from $\frac{1}{2}$ ton to 32 tons refrigerating capacity per 24 hours. The construction is particularly rugged, and all parts are thoroughly tested. Fitting and assembling carefully done by skilled mechanics insure dependable service and longevity.

AMMONIA COMPRESSOR

Automatic Control.

The control equipment is mechanically correct and of rugged construction, therefore thoroughly dependable. It includes a specially designed switchboard, which has automatic safety devices that shut the machine down and cut off all power in the event of trouble in the electric service, preventing danger of damage to motor.

Thermostat.

The thermostat automatically controls the starting and stopping of the machine so as to maintain any desired temperature within a degree or two of a predetermined point, preventing consumption of power except when the temperature requires it. As it is used with the Automatic electric control panel, there is no arcing or pitting of the contact points.

Automatic Expansion Valve.

Automatically controls the feed of ammonia to the expansion coils, thus maintaining the most economical pressure for the expansion of the liquid ammonia in the coils. It is easily adjusted, and functions perfectly.

Automatic Water Regulator.

Automatically controls the flow of water to the condenser, and automatically adjusts the water use to the requirements of the plant. The action of the water valve is powerful and positive, and water waste is eliminated.

Automatic High Pressure Safety Cut-off.

This device automatically stops the machine should the head pressure approach the danger point, due to failure of water supply or any other cause. It puts the plant in operation again when the cause of the high pressure is eliminated.

Condensers.

These are of the double pipe type, with water and ammonia flowing in opposite directions. Atmospheric condensers are used where conditions make them more desirable.

Coils.

Coils are continuously welded, or with screwed or flanged return bends, whichever type is best adapted to the specific installation. All screwed joints are thoroughly "sweated" and tested under high pressure.

Repair Parts.

All parts of Automatic plants are subjected to rigid tests and are interchangeable. A complete stock is always carried, insuring prompt shipment.

Co-operative Services.

The engineering department of this company will gladly co-operate with engineers and architects in the solution of special problems affecting mechanical refrigeration. This service, including preparation of drawings and data, is at the disposal of clients and entails no obligation.

Products and Services.

REFRIGERATING and ICE MAKING MACHINERY which includes: Absorption Refrigerating Machinery, Compression Refrigerating Machinery using Worthington Feather Valve Compressors, Ice Making Plants, Ammonia Economizers, Paraffin Wax Machinery, consisting of Distillate Chilling Machines, Hydraulic Filter Presses, Pumping Equipment, Sweating Pans, Steam and Aqua Ammonia Pumps, Brine Coolers, Gland and Ammonia Fittings, etc.

We are prepared to design, furnish and install complete Ice Making, Refrigerating, and Paraffin Wax Plants.

Advantages of Absorption Refrigerating Machines.

(1) Can run by exhaust steam. (2) No heavy moving parts. (3) Noiseless. (4) No heavy foundations. (5) Very little attention required. (6) Adapted for any floor space or headroom. (7) Most economical, with low cost of maintenance.

Types of Absorption Machines.

The type of machine is determined by local conditions. These are, first, the atmospheric type, which is adapted to warm or muddy water; second, double pipe type, which is used in engine rooms where water conditions are favorable, and, on account of having straight pipes, is very accessible for repairs and cleaning; third, shell and coil type, adapted for water which is not corrosive.

Ice Making.

Central stations, gas plants and steam users with a source of exhaust steam can operate a Carbondale ice machine to advantage. If a complete plant is desired with boiler equipment, the evaporator system is recommended and the fuel consumption is guaranteed.

Refrigeration.

Where exhaust steam machines are not wanted for ice making purposes, but for refrigerating uses alone, in hotels, clubs, department stores, hospitals, offices, etc., the condensed steam from the generator is trapped to a hot well and then used for boiler feed.

In connection with a large refrigerating machine installation, an ammonia economizer is recommended. This has two functions: First, it serves as a reducing still for strengthening the charge of an absorption machine by the distillation of strong aqua ammonia, while the machine is in operation; second, it is used as a purge absorber to reduce the ammonia loss incidental to purging the main absorber of air and foul gases.

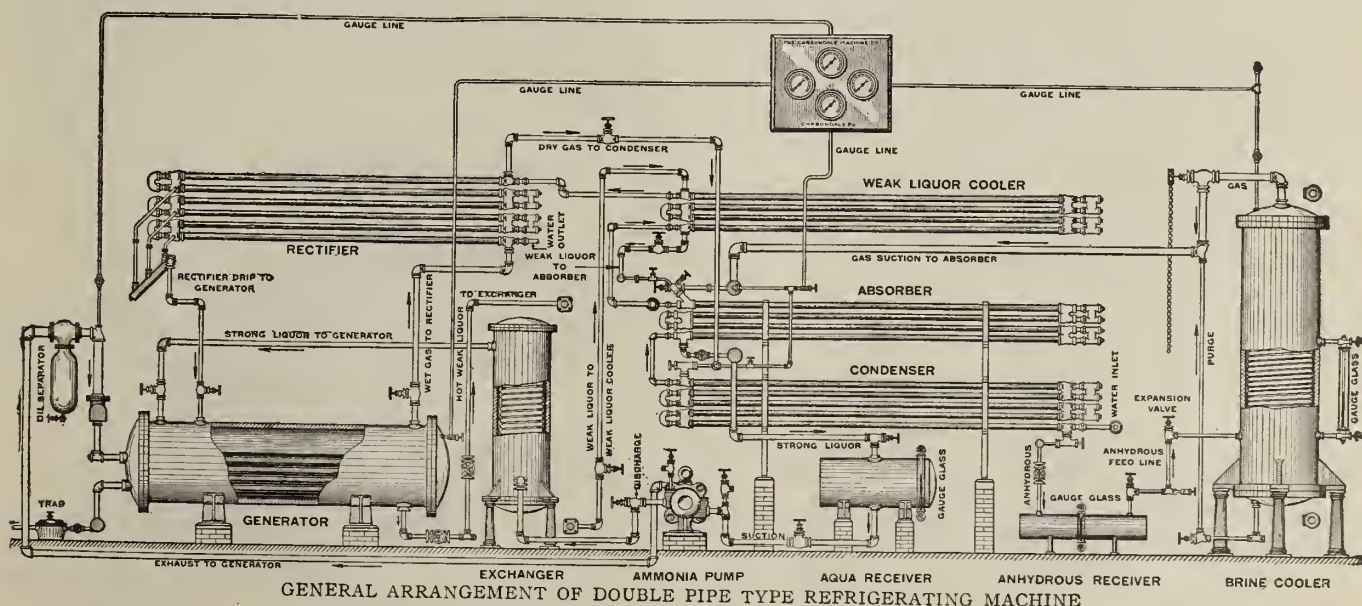

Paraffin Wax Plants.

All apparatus in connection with paraffin wax plants can be designed and supplied by this company. The absorption machine is used on account of adaptability for low temperatures. Plans and specifications furnished to cover desired equipment. Patented wax distillate chilling machines used for both medium cold test neutral oils and zero cold test oils.

Many successful installations can be referred to, or shown.

Installation.

Machines are designed for the service required. All installations carefully planned, with a view of giving operator best economy possible. Special attention given to water connections; when water is under pressure, outlet water can be used for other purposes within building. Particular attention directed to brine circulation. Estimates and preliminary drawings furnished. Catalogue sent upon request. Existing refrigerating and ice making plants remodeled.

CONTINENTAL MACHINERY COMPANY

Manufacturers of Refrigerating Machines

1101 Security Building, 189 West Madison Street
CHICAGO, ILL.

PHILADELPHIA, PA. BRANCH OFFICES DETROIT, MICH.
ST. LOUIS, MO. BALTIMORE, MD. MINNEAPOLIS, MINN.

Products.

"CONTINENTAL" REFRIGERATION: Raw Water Ice Plants, and Accessories, including Ammonia Fittings, Compressors, Refrigerating Equipment.

Scope of Use.

Abatoirs, meat markets, poultry freezing, dairy plants, creameries, marine refrigeration, fur cold storage, skating rinks, drying, confectioners, air conditioning, oil refining, hotels, restaurants, fruit storage, hospitals and morgues, mining operations, mushroom growing, bottling plants, steel tempering, fruit precooling, fish freezing.

"Continental" Ammonia Compressors.

The "Continental" ammonia compressors, following automobile and gas engine design that has proved so satisfactory, are of the multiple cylinder type, being made with 1, 2 and 3 cylinders. Standard sizes range from 1½ to 50 tons refrigerating capacity. For any plant within this range the company can furnish a machine with just the right capacity, neither too small nor too large.

SAFETY HEAD—In case a charge of liquid has been drawn into the cylinders, the safety head opens as well as the discharge valve; thus effectively clearing the cylinders of liquid with no danger to the cylinder heads proper. *Safety is the "Continental" way.*

CLEARANCE—Due to the adjustment for clearance in the crosshead, the "Continental" compressor, with the safety head and single acting construction, is run with less clearance than any other machine now made with *maximum volumetric efficiency* as a result.

VALVES—The valves are flat discs of vanadium steel, light, quick acting, noiseless, absolutely tight and safe. The valves can not fall into the cylinder and wreck the machine. The valve seats are of hardened steel, and with the vanadium discs, enduring, permanent and always dependable.

BEARINGS—All bearing bushings are die cast and can be adjusted to take up wear or easily replaced. Every bearing is so carefully fitted that a "Continental" is absolutely noiseless in operation.

CRANK SHAFT—The crank shafts are steel forgings very liberally proportioned, giving ample strength and insuring continuous service.

LUBRICATION—The lubricating system on a "Continental" compressor is ideal. All parts run in a bath of oil, reducing friction losses to the absolute minimum and increasing the life of parts to a maximum. Even the space around the spring in stuffing box is kept constantly filled with oil by the force feed lubricator. The oil in crank case surrounds the working parts there.

ACCESSIBILITY—Ammonia does not surround the working parts of a "Continental," so they are always

"CONTINENTAL" SELF-CONTAINED "HIGH SIDE"

easily accessible for inspection or adjustment. Is it not reasonable to assume that a machine constructed thus, will receive better care and last longer than one so built that the owner must pump out ammonia, break several gastight joints, and then work with hands and face exposed to burning ammonia fumes? To inspect the cylinder, piston and valves it is only necessary to take off the cylinder head. There are no pipe connections or water heads to be taken down first.

Engineering Service.

On the CONTINENTAL MACHINERY COMPANY's staff are engineers with years of refrigeration experience.

The service of these specialists is available without charge. Acquaint this staff with the conditions and complete information, with cost of plant installed, will be furnished.

"CONTINENTAL" TWO-CYLINDER COMPRESSOR

ESTABLISHED 1880

HENRY VOGT MACHINE CO.

Manufacturers of Ice and Refrigerating Machinery

LOUISVILLE, KY.

Products.

ICE and REFRIGERATING MACHINERY, EXHAUST STEAM AMMONIA GENERATORS, AQUA AMMONIA PUMPS, and DROP FORGED VALVES and FITTINGS.

Oil Refinery Equipment, Paraffin Wax Presses, Distillate Wax Chilling Machines for cold test oils, Steam and Crude Stills, Filter Presses, Agitators, Condenser Boxes, Welded Vessels.

For Boilers and Boiler Casings, see page 660.

Refrigeration.

Thirty-nine years of effort in the design and construction of the Vogt absorption machine has brought forth the present economical and efficient exhaust steam unit. By an exhaust steam unit is meant a refrigerating machine capable of developing its rated capacity through the use of steam that has already performed useful work.

A further economy is effected by combining the exhaust steam refrigerating machine with any mill, light or power plant, the refrigeration or ice so produced being a by-product. When it is understood that the operation of such a machine is possible without the introduction of any complicated parts, our correctness of design is thoroughly established.

The workmanship and materials used in the Vogt machines are the very best; the Vogt drop forged valves and fittings being one of the superior features.

Vogt Exhaust Steam Ammonia Generator (Patented).

Designed to operate on lowest possible steam pressure.

The shell and heads are made of semisteel, this metal being the most durable in contact with hot ammonia.

The coil is made of straight extra heavy wrought iron pipe, and each pipe is closed at one end. The steam is delivered through an inside pipe at the closed end and travels only one time the length of the generator. This

VOGT EXHAUST STEAM AMMONIA GENERATOR (PATENTED)

SWEET'S CATALOGUE

eliminates the friction and enables operation at minimum pressure.

Other special features are: *no* return bends; *no* bent pipes; *no* exposed heating surface; *no* stuffing boxes on steam coils; *no* threaded joints inside of shell.

Vogt Aqua Ammonia Pump.

The Vogt aqua ammonia pump is designed to handle strong aqua ammonia. The steam cylinder is equipped with balanced piston type valve, governed by an auxiliary valve that is mechanically operated. The steam consumption is considerably low for this type pump, and the speed is automatically controlled at any desired number of strokes by means of a Mason regulator. The ammonia cylinder is provided with an extra long stuffing box and water chamber.

The ammonia piston rod is made of special steel and connected with coupling to the steam piston rod so it can be easily removed when necessary.

The pump is mounted on a heavy base.

VOGT AQUA AMMONIA PUMP

Drop Forged Valves and Fittings.

The purchase of low grade valves and fittings is false economy. The one consideration that should govern the choice of valves and fittings is their permanent value—not their first cost factor. The purchaser, who overlooks this wide difference between value and price, overlooks the inevitable losses through leaks and breakage which are invariably in excess of the money originally saved.

Vogt forged valves and fittings are in daily service, frequently subjected to intense pressures which no other fitting but a Vogt could withstand. They are especially adapted for high pressures of air, steam, gas, ammonia, water and oil. For the manufacture of chemicals, of explosives, of hydraulic equipment; for the factory, the mill and the mine, these fittings are no experiment—they are a daily necessity.

With a record of excellent service and a guarantee of satisfaction, Vogt forged valves and fittings are a logical selection—there can be no reason for not specifying them.

DROP FORGED VALVE AND FITTINGS

Products.

VILTER ICE MAKING and REFRIGERATING MACHINERY; AMMONIA COMPRESSORS; PATENTED IMPROVED LOW TEMPERATURE COMPRESSION SYSTEM; POPPET VALVE ENGINES; ROLLING MILL CORLISS ENGINES.

Vilter Duplex Ammonia Compressor.

A duplex steam driven unit, with horizontal double acting ammonia compressors and direct connected to cross compound Corliss engine. Compressor equipped with multiple valve heads, giving maximum area. Stuffing box of the double packed type, with oil seal and pressure release.

VILTER DUPLEX DOUBLE ACTING CROSS COMPOUND MACHINE

Vilter Single Ammonia Compressors.

This type also built with the Vilter poppet valve high pressure steam cylinder, for high steam pressures and superheat. The duplex type is built in sizes from 125 to 800 tons daily refrigerating capacity.

A single heavy duty steam driven unit, direct connected to tandem compound Corliss engine. The design is wonderfully free from complication, and the construction is such as will insure long life, satisfactory service and freedom from trouble. The heavy duty frame is

COMPRESSOR DIRECT CONNECTED TO VILTER TANDEM COMPOUND HEAVY DUTY CORLISS ENGINE

designed on straight line principles, of massive construction. The tandem compound engine driven type is built in sizes from 50 to 375 tons daily refrigerating capacity.

Compressor Arrangement for Belt Drive.

The belt driven machines are furnished in either single or duplex units, and either belt wheels or wheels grooved for rope can be supplied. These units may be driven by any kind of power, such as electric motor, gas or oil engines, etc. Single units are built in sizes from 7½ to 400 tons daily refrigerating capacity; duplex units, in sizes from 15 to 800 tons daily refrigerating capacity.

ROPE DRIVEN DUPLEX COMPRESSOR ROLLING MILL FRAMES

Rolling Mill Type Compressor.

The rolling mill frame machine is built along very heavy lines for all conditions of service. It is used with only slight modifications in all sizes of compressors. Its very appearance gives assurance and proof of its strength and reliability. All parts of the base rest upon the foundation, thus giving a uniform distribution of the load and insuring maximum stability and rigidity.

ROLLING MILL TYPE COMPRESSOR

Vilter Horizontal High Speed Ammonia Compressor.

Vilter horizontal high speed ammonia compressors are simple in design, rugged in appearance and in the character of service they give. They are specially designed for direct connection to the newest types of high speed prime movers, and particularly adapted for direct connection to synchronous motors—a method of drive which is proving so highly economical and efficient.

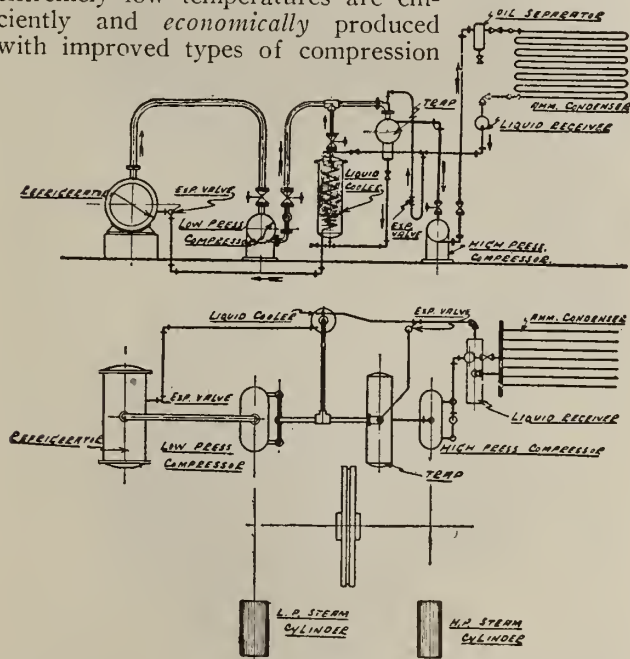

VILTER HORIZONTAL HIGH SPEED AMMONIA COMPRESSOR

Vilter Twin Cylinder Ammonia Compressor.

A vertical compressor, specially designed for users of comparatively small quantities of refrigeration. The design unites the base, main bearing and crank case in a single massive casting, cylindrical sections being used throughout, giving simplicity, symmetry and strength, with a very low center of gravity and perfect alignment. Made in sizes from 1 to 20 tons daily refrigerating capacity.

VILTER VERTICAL AMMONIA COMPRESSOR
Small capacity**Vilter Low Temperature Compression System.**

A system manufactured under D. I. Davis patents; extremely low temperatures are efficiently and economically produced with improved types of compression

DIAGRAMMATICAL ARRANGEMENT OF LOW TEMPERATURE SYSTEM

Showing plan and elevation of the low temperature compression system

SWEET'S CATALOGUE

refrigerating machinery superior to the standard compression machine—the latter costs more and its operation is accompanied with several disadvantageous results.

These economic, detrimental features are overcome in this system by the following methods:

(1) Multistage compression, which increases volumetric efficiency and reduces the power required for operating the compressors.

(2) Cooling the liquid before entering the low temperature refrigerator, thus reducing amount of gas handled by low pressure compressor and the power per ton of refrigeration—because the work of cooling is handled by one high pressure cylinder.

(3) Proper traps, etc.

Vilter Tandem Compound Poppet Valve Engine.

Vilter tandem compound engine with poppet high pressure and Corliss low pressure cylinder direct connected to rolling mill compressor frame. The most economical combination known, using high pressure superheated steam.

The latest design of Vilter poppet valve engine embodies the very latest developments to accomplish low steam consumption and simple operation.

VILTER TANDEM COMPOUND ENGINE
Having poppet valve high pressure and Corliss low pressure cylinders, direct connected to rolling mill type compressor**Vilter Rolling Mill Type Simple Corliss Engine.**

The rolling mill frame Corliss engine is of exceptionally massive construction throughout; and is adapted to any class of service from the steady belted load to direct connected electrical service, in which the engine is subjected to heavy and extremely variable loads.

It is built for high steam pressures, and high rotative speeds, and may be used with superheated steam up to 100° Fahr. superheat. The valve gear is of the high speed type, and all valves are double ported. Built in all sizes, either simple, tandem, compound or cross compound.

ICE MAKING and REFRIGERATING MACHINERY which includes Compression Refrigerating Machines (Ammonia and Carbon Dioxide), Absorption Refrigerating Machines, Ice Making Plants, Refrigerating Plants, Ammonia Valves, Ammonia Fittings, Ammonia Condensers, Brine Coolers, Aqua Ammonia Pumps, Ice Cans, and all parts needed to equip a complete ice making or refrigerating plant.

Description.

We make, in our own factory, all the machinery and apparatus used in ice making and for general refrigeration, both compression and absorption systems.

Sizes.

The enclosed machine is built in sizes from $\frac{1}{4}$ ton refrigerating capacity upward; the vertical single acting machines from 20 to 600 tons; the horizontal double acting machines from 10 to 600 tons—either belt or steam driven type. Absorption plants of any capacity required by the trade.

Application.

York machines can be used wherever ice making or refrigeration is required, the style of machine being determined, to a great extent, by local conditions.

The enclosed machine is particularly adapted for residences, apartment houses, small hotels, creameries, ice cream factories, etc.

Valves and Fittings.

York ammonia valves and fittings are guaranteed to give satisfaction under all usual working pressures.

Service.

All our agencies carry in stock a complete line of ammonia valves and fittings; also a line of enclosed machines.

What a service department is to the owner of an automobile, the York Sales Organization is to the user of ice making and refrigerating machinery.

Both *quality* and *service* can be secured by patronizing the York Organization.

ARMSTRONG CORK & INSULATION COMPANY

126 Twenty-fourth Street
PITTSBURGH, PA.

BRANCHES IN ALL THE LARGE CITIES

Products and Services.

NONPAREIL HIGH PRESSURE COVERING for high pressure and superheated steam lines, boilers, etc.; NONPAREIL INSULATING BRICK for furnaces, ovens, kilns, boiler settings, etc.; NONPAREIL CORK COVERING for brine, ammonia and ice water lines and tanks.

CONTRACTORS for heat and cold insulation.

Nonpareil Corkboard Insulation for cold storage plants.

Nonpareil High Pressure Covering.

Nonpareil High Pressure Covering is made of diatomaceous earth (kieselguhr) and a small quantity of asbestos fiber for a binder. Diatomaceous earth is practically pure silica, being composed of the skeletons of microscopic plants that grew in the sea ages ago. It is estimated that there are 39 billion of these shells to the cubic inch, each one hollow and filled with air, and it is this large amount of entrapped air which gives Nonpareil High Pressure Covering its remarkable heat insulating value.

ADVANTAGES—Compared with other coverings, Nonpareil High Pressure Covering is not only a better nonconductor of heat, but will withstand much higher temperatures without calcining or disintegrating. It is particularly well-suited, therefore, for the insulation of superheated steam lines, enameling and japanning ovens, and other places where relatively high temperatures are encountered. Moreover, it will bear repeated wetting and drying without injury, and for this reason is an ideal form of covering for underground steam lines and those which come in contact with excessive moisture.

SERVICE DETAILS—Nonpareil High Pressure Covering is made in sectional and block form of various thicknesses, and is also supplied as plastic cement.

LITERATURE—Full information regarding Nonpareil High Pressure Covering is given in an 84-page bound book, which, together with samples of the material, will be cheerfully sent on request.

Nonpareil Insulating Brick.

Nonpareil Insulating Brick are also composed principally of diatomaceous earth (kieselguhr), and here again the remarkable heat insulating properties of this material are utilized to excellent advantage. For many years there has existed a real need for an insulation that could be used for reducing the amount of heat lost by conduction and radiation from boiler settings, steam drums, furnaces, ovens, hot blast mains, etc., and Nonpareil Insulating Brick meet these requirements more

nearly than any other form of insulation yet put on the market.

ADVANTAGES—Not only are Nonpareil Insulating Brick excellent nonconductors of heat, ten times more efficient than fire brick and common brick, but they also have structural strength and the ability to withstand relatively high temperatures. Their convenient brick form makes them easy to install in walls and arches where the courses of Nonpareil Brick may be bonded with fire brick or common brick.

INSULATING A BOILER SETTING WITH NONPAREIL INSULATING BRICK

The Nonpareil Brick are placed between the inner courses of fire brick and the outer course of common brick

SERVICE DETAILS—The standard, straight Nonpareil Insulating Brick are nominally 9 by 4½ by 2½ ins. and weigh about 1½ lbs. each. Various other shapes for arches, circles, etc., are carried in stock. For the purchaser's protection each brick is stamped with the trade mark "Nonpareil."

FURTHER INFORMATION—Literature, prices, full size sample brick, and complete information will be furnished on request.

Nonpareil Cork Covering.

Nonpareil Cork Covering, due to its composition, is the only satisfactory material for the insulation of cold pipe lines carrying drinking water, brine, ammonia, etc. It is made entirely of pure granulated cork, compressed and baked in moulds to fit the different sizes of pipe and various fittings in ordinary use.

NONPAREIL CORK COVERING

LITERATURE—The 48-page book, *Drinking Water Systems*, will be of great value to anyone interested in the supplying of properly cooled drinking water in mills, factories, office buildings, etc., while the 64-page book, *Nonpareil Cork Covering*, covers the application of the material in its various other fields. Either or both of these books, together with samples, will be sent on request.

BANNER ROCK PRODUCTS CO.

Manufacturers of Cold Storage and Heat Insulation

ALEXANDRIA, IND.

Products and Services.

ROCK CORK; ROCK CORK STUCCO SHEATHING;
ROCK CORK LATH; ROCK WOOL QUILT.

Contractors for application of our products in all kinds of cold storage installations, or, with the insulation, a competent superintendent to direct application.

Rock Cork.

DESCRIPTION—A board made of rock wool, bound with waterproofing crude paraffin binder, and in volume 88% air cells. Formed in slabs 16 by 36 in., and $\frac{1}{2}$, 1, $1\frac{1}{2}$, 2 and 3 in. thick. Can be applied to brick or concrete walls in portland cement mortar and to lumber surfaces in asphalt insulating cement. Permanent walls and partitions are constructed by erecting 2 layers in portland cement mortar, and plastering both sides. Portland cement plaster adheres tenaciously to Rock Cork. Rock Cork is non-inflammable, being a mass of minute air cells, having walls of indestructible mineral.

ROCK CORK STUCCO SHEATHING—Made from Rock Cork composition $\frac{1}{2}$ in. thick, for application on exterior walls of dwellings or buildings receiving stucco finish. On brick, tile or concrete walls, apply in portland cement mortar. On lumber walls, nail with 3d nails and tin or galvanized caps, allowing 3 nails per sq. ft. Cover with 2-in. chicken netting or other wire fabric. Apply stucco finish direct in 2 coats, following usual compositions. Rock Cork stucco sheathing $\frac{1}{2}$ in. thick insulates a building from heat and cold equivalent to 8 in. brick veneer, and protects from moisture and sound. Use 1, $1\frac{1}{2}$ or 2 in. thickness of suitable widths of Rock Cork in connection with stucco sheathing, for raised panels, pilasters, vertical or horizontal borders, and water tables.

ROCK CORK LATH—A painted metal lath embedded in Rock Cork composition $\frac{1}{2}$ in. thick, made in 4-ft. lengths, 18 in. wide. Can be nailed to interior or exterior studs on 16- or 12-in. centers, and receive plaster or stucco finish for partition construction for outside stucco

finish. Resists heat, cold and moisture. Sound resistance is increased and weight of partition is but 60% of solid construction when granulated Rock Cork mixed with plaster composition is used. For hospitals, hotels and apartment houses.

ROOF INSULATION—For 1-in. thickness, use 16- by 36-in. sheets. This thickness conducts about one-half as much as two $\frac{7}{8}$ -in. boards with paper between. 1-in. Rock Cork weighs $1\frac{1}{4}$ lbs. per sq. ft.

FLOOR AND PARTITION DEADENING—Lay Rock Cork on floors, or granulated Rock Cork between strips. Apply to tile, brick or metal lath partitions in portland cement mortar, and plaster. Partitions for any purpose that have great sound resistance can be constructed as indicated above.

INSULATING EFFICIENCY—Many tests by different observers and by different methods place Rock Cork as one of the most efficient insulating materials known. Proof against water, fire and decay. The test of time, for 11 years, demonstrates its permanency. It is backed by a record of successful service in many leading cold storage warehouses, packing plants, ice storage rooms, ice cream plants, creameries, etc.

Rock Cork is acknowledged to give more insulating efficiency per dollar expended than any other material or composition known.

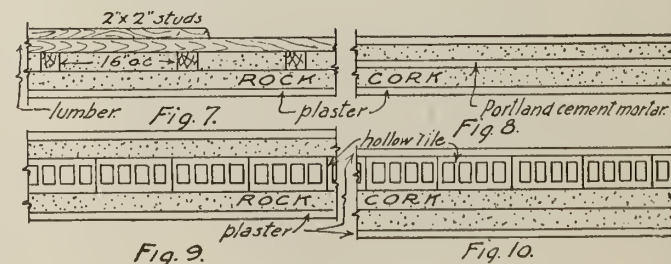

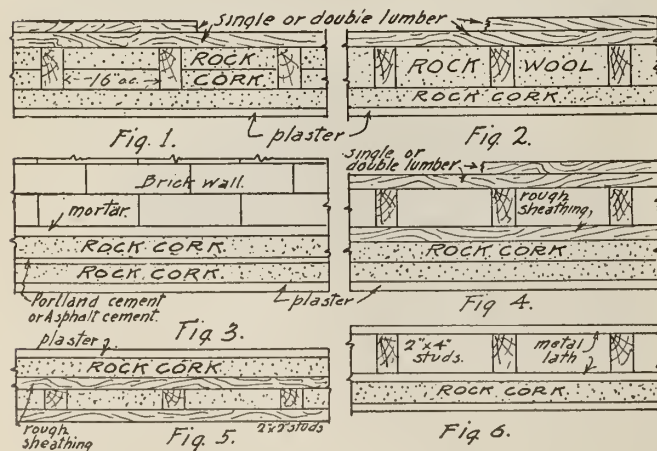

Rock Wool Quilt.

A flexible insulation for high temperatures, on boilers, furnaces, tanks. $1\frac{1}{2}$ - or 2-in. thickness. 3 by 8 ft. stock size. Other sizes made to order. Can be finished, if desired, after installation, with any plaster composition.

References.

Rock Cork has been installed in 32 states and in Mexico. Below some of our oldest installations:

Grocers' Ice & Cold Storage Co., Louisville, Ky.
Geo. D. Mansfield Co., Milwaukee, Wis.
Milwaukee-Waukesha Brewing Co., Milwaukee, Wis.
Syracuse Cold Storage Co., Syracuse, N. Y.
Cincinnati Abattoir Co., Cincinnati, Ohio
Burge Machine Works, Chicago, Ill.

Products.

SIL-O-CEL BRICK, BLOCKS, POWDER and CEMENTS, for the Insulation of all types of High Temperature Equipments where permanent and lasting insulation is required. Also used in Cold Storage Work; for Fireproofing and Sound Deadening.

CELCOTE, an Elastic Adhesive Cement especially prepared to Prevent the Infiltration or Air through the boiler, furnace or kiln walls, also used as Weatherproofing Coat for Sil-O-Cel Insulation.

Filter-Cel, a Porous Inert Material in powdered form, especially prepared to facilitate filtration.

Celite High Temperature Cements—Mixtures of ceramic materials scientifically compounded for laying, patching and coating firebrick linings of boilers and furnaces.

Sil-O-Cel.

GENERAL DESCRIPTION—Sil-O-Cel is a light weight highly silicious insulating material produced in the form of brick, blocks, powder and cements. Its heat conductivity factor is one-tenth that of ordinary fire brick, and it will withstand temperatures that completely destroy other forms of insulation.

Sil-O-Cel is used chiefly as an insulating backing for the refractory lining of all types of high temperature equipment and is sufficiently refractory, however, so that it will not fuse, shrink or decompose when placed against highly heated fire brick.

BOILER AND FURNACE INSULATION—To prevent the great heat loss from boiler and furnace settings due to conduction, radiation and convection. It is necessary to incorporate in the setting between the fire brick lining and the outer wall a material of high insulating value. Sil-O-Cel serves this purpose, due to the fact that it is not affected by the high temperatures encountered in work of this character.

The use of Sil-O-Cel Brick 4 in. thick in the walls, and from 2½ to 4½ in. of Sil-O-Cel Powder over the tops and drums of boilers will stop heat waste, save fuel, prevent cracks which cause air leakage and insure better working conditions in the boiler room.

STEEL PLANT INSULATION—Proper insulation of iron and steel

TRADE-MARK

plant equipment will increase the output of the furnace and prolong the life of the equipment. Hot blast stoves are insulated by packing from 3 to 5 in. of Sil-O-Cel Powder between the fire brick lining and the outer shell. Vibration of heat will not cause it to settle or shrink, and it protects the steel shell from strains caused by temperature changes. If preferred 2½ or 5 in. of Sil-O-Cel Brick may be used as an alternate.

Crowns of stoves require 2½ in. of Sil-O-Cel Brick laid directly over the fire brick.

Bustle pipes and mains are effectively insulated by placing 2½ or 4½ in. of Sil-O-Cel Brick between the refractory lining and shell.

Hot metal cars, ladles and mixers are best insulated with Sil-O-Cel C-3 cement especially prepared for this type of equipment.

INSULATION OF OIL STILLS—Sil-O-Cel insulation, when applied to oil stills and still settings, actually increases the capacity of the stills by saving heat which is ordinarily lost and making it productive. Both Sil-O-Cel Brick and Insulating Ce-

OIL STILLS INSULATED WITH SIL-O-CEL INSULATING BRICK

ment are recommended for still work, the insulation varying from 2½ to 4½ in. in thickness.

Proper insulation will insure a greater output from stills, more uniform internal temperature, more accurate temperature control and greater efficiency.

SIL-O-CEL INSULATING CEMENTS—These cements make a most effective insulation for irregular heated surfaces where it is impracticable to use Sil-O-Cel Insulating Brick or Powder. Supplied in three forms and are preferably applied in three coats: First, a sticking coat, second: the insulating coat, third: a hard finish coat.

VARIOUS USES—Sil-O-Cel Insulating Products will prevent heat loss and increase the output of heated equipment. Sil-O-Cel Insulation saves fuel, better working conditions and insures more accurate control of temperature. It is applicable to:

Annealing furnaces	Enameling ovens	Waste heat boilers
Annealing pits	Furnace doors	Japanning ovens
Bakers' ovens	Gas generators	Kilns
Boiler settings	Gas producers	Marine boilers
Breechings	Heat treating equipment	Malleable furnaces
Bustle pipes	High temperature flues	Metal mixers
Coke ovens	Hot blast stoves	Oil stills
Core ovens	Hot blast mains	Pipe covering
Dryers	Hot metal cars	Regenerators
Dust catchers		Soaking pits
Electric furnaces		Tanks and vats

INFORMATION—Bulletins containing engineering data on any of the above types of equipment will be sent on request. Detailed information on any specific insulating problem will be furnished by this company's Engineering Department.

Service.

Johns-Manville power plant, roofing and building materials are backed by the responsibility of the H. W. JOHNS-MANVILLE Co. which assures the engineer better service, better value and greater satisfaction, because of the long, economical service these materials afford. Full details, specifications and drawings will be gladly furnished by the engineering service department of the nearest branch office.

Johns-Manville engineers will be glad to confer on any problems of insulation of boilers, hot and cold pipe systems (inside, outside or underground); packing of rods and pistons; waterproofing, or the use of radiator or steam traps.

Johns-Manville Underground System of Pipe Insulation.

The underground method of distribution of steam and hot water is the most desirable, convenient and economical, provided the system installed meets three important qualifications:

(1) Its efficiency must be equal to, or greater than, that attained with properly insulated pipes running indoors. (2) Its insulating value must not depreciate more rapidly than the pipe itself. (3) Its cost per year, based on its saving of heat and its great durability, must be less than the cost of others.

The Johns-Manville Underground System of Pipe Insulation provides a permanent, efficient and economical means of placing underground, and insulating, pipes conveying steam or hot water.

Johns-Manville Pipe and Boiler Insulation.

One of the most important results of the development of asbestos by Johns-Manville has been the saving

of heat through insulation. Johns-Manville have developed materials, built on asbestos as a base, that retard the escape of heat from boilers, furnaces, pipes and flues. Twenty-five years' specialization, directed by the highest engineering talent, has enabled Johns-Manville to develop and produce insulations of exceptional efficiency and durability under every service condition.

Asbesto-Sponge, for example—a remarkable felt which combines the insulating value of sponge with the heat resistance and endurance of asbestos—ranks first in efficiency among commercial steam pipe insulations; or 85% Magnesia or Asbestocel, Zero, Anti-Sweat or Brine and Ammonia Insulations. Whatever the needs, they can be met efficiently with one of the Johns-Manville insulations tabulated below:

Service	Type of Insulation	Insulation Recommended
Steam pipes, all pressures	Sectional	Asbesto-Sponge Felted; 85% Magnesia
Medium and low pressure steam pipes	Sectional	Asbestocel
Low pressure steam and hot water pipes	Sectional	Asbestocel
Anti-freezing	Built-up and sectional	Built-up Hair Felt; Zero
Brine and ammonia pipes	Built-up and sectional	Brine and Ammonia; Anti-Sweat
Cold water pipes	Built-up and sectional	Anti-Sweat or Built-up
Boiler insulation	Sheet and block, and cement	Asbesto-Sponge; Asbestocel; 85% Magnesia; Cements, Nos. 302, 400, 85% Magnesia
Stack and flues	Sheet and block	Vitrobestos

The efficiency of the Johns-Manville system is at least 90% when installed according to the Johns-Manville specifications, and by them or under their supervision. This efficiency is maintained for a long period of time on account of the character of the materials used in the construction of this system.

Johns-Manville Packings.

Johns-Manville packing design provides for economy by reducing friction and preventing steam losses. By designing for service, Johns-Manville have reduced friction and wear of rods and packings at no sacrifice of steamtightness.

Engineers have found that instead of having to repack several times a season, a set of Johns-Manville sea rings often last several seasons, because the heavy wear on packings, wear of the rod, and loss of power

through friction, so common with other forms of packings, have been reduced to a minimum. Economical service is afforded by Universal piston packing, Service sheet, Kearsarge gaskets, Vulcabeston pump valves and by all the Johns-Manville line.

Johns-Manville Refractory Cements.

Johns-Manville high temperature cements are composed of highly refractory minerals, which, when thoroughly mixed with water to the consistency of mortar or grout, are especially adapted for use as a bond between, or coating of, fire brick for withstanding the action of flame and severe temperatures.

The three cements used for general plant conditions are Nos. 31, 26 and 32. Cements No. 31 and No. 26 are used for bonding, while No. 32 is used as a coating to protect the exposed face of the brick.

These cements are designed to resist high temperatures without fusing or melting, and to provide for continual expansion and contraction of fire settings without disintegrating. Their use in place of fire clay and other mixtures with lower fusing points will greatly increase the life of boiler and other fire brick settings.

Johns-Manville Electrical Materials.

The "Noark" line of electrical protective devices is complete. It comprises: cartridge enclosed fuses, renewable and non-renewable, cutout bases, main line and branch fuse and switch boxes, primary distribution fuse boxes, underground junction and distribution boxes, service meter protective devices, exteriorly operated switch boxes, all-safe switches, and a complete line of accessories.

This entire line is the result of many years conscientious effort to produce the best and most dependable electrical protective devices. The satisfactory service they render wherever used is positive evidence that this effort has been successful, and furnishes obvious proof of Johns-Manville responsibility.

Johns-Manville Steam Traps.

This trap is adapted to power plant requirements and is generally used in sizes with connections from $\frac{3}{4}$ to 2 in. inclusive. It permits the free discharge of water without loss of steam. The action is direct—that is, operation depends upon the movement of the water flowing into it, rather than the temperature or the pressure of the steam.

There is just one moving part—a ball, which is held against the discharge bushing by unbalanced pressure and rises when water flows into the chamber. Whenever the water level rises to a certain point above the discharge orifice, the buoyant force of the water rolls the ball up and exposes part of the discharge orifice, allowing free escape of water and air. As the water level lowers, the ball settles back and closes the discharge orifice, and the water seal which is maintained prevents steam leakage; operation is continuous, for it discharges as the water is received.

Johns-Manville Radiator Traps.

This device permits the free discharge of water and air from the radiator without loss of steam, whether the system operates by gravity or vacuum, and is similar to the Johns-Manville steam trap in construction and principle.

Johns-Manville Asbestos Roofings.

Asbestos rock fiber, a fireproof, timeproof and weatherproof mineral is the base of all Johns-Manville

asbestos roofings which are made in a variety of forms for every roofing need.

Johns-Manville Standard and "Colorblende" asbestos shingles. Made of asbestos fiber and portland cement united under hydraulic pressure. Furnished in various sizes and shapes, in four colors and two thicknesses, $\frac{1}{4}$ in. and $\frac{1}{8}$ in.

Johns-Manville asbestos ready-to-lay roofings for sloping roofs. Made of asphalt impregnated sheets of asbestos felt cemented together with natural base asphalts. Furnished in three or four plies, in sheets or rolls, ready-to-lay.

Johns-Manville asbestos built-up roofing for flat surfaces. Sheets of asphalt impregnated asbestos felts built up on the roof deck with hot asphalt, in the required thickness, by Johns-Manville workmen.

Johns-Manville corrugated asbestos roofing for skeleton frame buildings. Made of asphalt impregnated sheets of asbestos felt with a reinforcing center sheet of metal.

These roofings are approved by the Underwriters' Laboratories, Inc., take base rates of insurance and are backed by Johns-Manville service and responsibility. This company's engineering service department will be glad to confer and submit detailed specifications and estimates.

Johns-Manville Asphalt Mastic Flooring.

This flooring is in the nature of an asphaltic concrete and consists of a binder, or cement, made up of a combination of natural asphalts and a well graded mineral aggregate of torpedo gravel, crushed stone and sand, with particles ranging in size from those passing a $\frac{3}{8}$ in. mesh screen down to those which pass a 200-mesh screen.

Johns-Manville Mastic can be laid in any consistency between extreme hardness and softness and, while always dense, possesses a certain amount of resiliency. Does not cause foot soreness and fatigue like concrete and other non-yielding floor surfaces; and where employees of machine shops, factories, and other industries are compelled to stand while at work, it adds greatly to their comfort and efficiency. Furthermore being damp-proof, it is a protection against ailments common to dampness.

This is essentially a floor that is "made to fit"; therefore, each installation should be treated as an individual problem and a specification written to meet the exact requirements. A brief description of conditions sent to any of our Branch Engineering Departments will bring immediate response.

Johns-Manville Asbestos Wood.

A fireproof building material made of asbestos fiber and portland cement. Recommended for use as a fire barrier in factories, foundries, warehouses, machine-shops and wherever a fireproof building material is required, in any of the following forms:

Smoke breechings, roofing, sheathing, window casings, moldings, cabinets, tank linings, ceilings, floorings, battens, boxes and receptacles, fire doors and partitions. It is also impervious to the action of most commercial chemicals.

It has a gray surface which requires no painting, but it can be painted, varnished or grained in imitation of slate, marble or any hardwood.

Can be fastened with nails or screws and does not warp, distort, chip or weaken in service. Comparatively light in weight and has a modulus of rupture of 3500 lbs. per sq. in. under transverse loads.

Approved by the Underwriters' Laboratories, Inc.

MAGNESIA ASSOCIATION OF AMERICA

EXECUTIVE COMMITTEE

WILLIAM A. MACAN, CHAIRMAN

GEORGE D. CRABBS, The Philip Carey Co., Cincinnati, Ohio
ALVIN M. EHRET, Ehret Magnesia Mfg. Co., Valley Forge, Pa.

J. R. SWIFT, The Franklin Mfg. Co., Franklin, Pa.
R. V. MATTISON, JR., Keasbey & Mattison Co., Ambler, Pa.

Manufacturers of "85% Magnesia" Insulation for Power and Heating Systems

Products.

85% CARBONATE of MAGNESIA NON-HEAT-CONDUCTING COVERINGS for power, heating and ventilating systems, including 85% MAGNESIA SECTIONAL PIPE COVERING, MAGNESIA BLOCKS and MAGNESIA PLASTIC.

85% Magnesia for Pipe and Boiler Covering.

85% Magnesia is an inorganic, inert mineral composition, composed of 85% of commercially pure carbonate of magnesia, with which is incorporated sufficient mineral fiber to act as a binder, thus giving the necessary structural strength.

In substance, 85% Magnesia consists of myriads of microscopic crystalline cells, each one holding enmeshed an infinitesimal particle of *dead air*—the only accepted scientific principle of perfect heat insulation.

Application.

85% Magnesia is manufactured in the form of half sections, for pipes up to 10 in. in diameter; segments for larger sized pipes and curved surfaces; blocks for boilers and flat surfaces; and plastic (or fibrous powder) for irregular surfaces, filling of joints, etc.

Efficiency and Durability.

The efficiency of 85% Magnesia is equal to a saving of from 75% to 97% of the total heat wasted by bare pipes, the percentage varying somewhat with the temperature and thickness. (For the correct thickness for maximum saving at all pressures and temperatures, see Table No. 1.)

Many cases are on record where 85% Magnesia coverings have been in continual use for upwards of a quarter century, without any loss of efficiency. In many instances they have outlasted the metal pipes and boilers they protected, and have been removed in perfect condition and applied on the new work installed to replace the old.

General Service Experience.

The insulation value of 85% Magnesia coverings is attested by the records of over 30 years' experience in the U. S. Navy, the leading steamship lines, railroads, locomotive builders, power and heating plants and the largest hotels, public buildings, skyscrapers and other large structures in America and elsewhere.

Magnesia Association Specifications.

For 85% Magnesia non-heat-conducting coverings for power and heating systems.

NON-HEAT-CONDUCTING MATERIAL—Non-heat-conducting covering material for all heated surfaces shall be 85% Magnesia covering, consisting of hydrated carbonate of magnesia, manufactured according to the standard formula ($4 \text{ MgCO}_3 \cdot \text{MgO}_2 \cdot \text{H}_2\text{O}$), and asbestos fiber. The mixture shall contain in combination not less than 95% of said magnesia and fiber, of which at least 85% of the whole shall be said magnesia.

85% MAGNESIA COVERED STEAM PIPES, CINCINNATI & COLUMBUS TRACTION CO., COLUMBUS, OHIO

FORM OF COVERINGS—Non-heat-conducting covering materials shall be furnished in the forms and dimensions specified in Table No. 2 of this specification. Pipes shall be covered with molded sections or segments. Boilers, heaters, and similar surfaces shall be covered with blocks and plastic cement. Flanges, fittings, and similar surfaces shall be covered with blocks and plastic cement, or plastic cement only.

THICKNESS OF COVERING—The thickness of non-heat-conducting coverings shall be in accordance with the following table, except as otherwise specified:

	Thickness
Superheated steam pipes:—	
Sizes up to 4 in.	**double standard
Sizes 4 in. and larger	
3 in. (double layer) and ½ in. Magnesia cement	
High pressure saturated steam pipes:—	
Sizes up to 4 in.	2 in.
Sizes 4 in. and larger	**double standard
High pressure saturated steam flanges.	2 in.
High pressure drips.	2 in.
Feed water pipes.	*standard
Heating system pipes.	*standard
Superheated steam flanges (removable)	2 in.
Feed water flanges.	1 in.
Low pressure heating flanges.	1 in.
Boiler tops.	2½ in. blocks and ½ in. Magnesia cement
Ends of boiler drums.	2½ in. blocks and ½ in. Magnesia cement
Feed water heater.	1½ in. blocks and ½ in. Magnesia cement

Note to Specification Writer—The thicknesses specified above represent good practice for average conditions: (i.e., coal \$4.00 per ton, 150 lbs. steam pressure, 150° Fahr. superheat). For scientifically correct thicknesses to meet any special condition see tables No. 2 and No. 3.

*See table No. 1, column 2.

**See table No. 1, column 8.

WORKMANSHIP—Workmen employed in the application of coverings shall be skilled pipe coverers.

STEAM AND HOT WATER PIPING—Single Thickness Covering—All single thickness pipe coverings shall be carefully applied so that seams and butt joints are tight. Coverings shall be finished with canvas jacket pasted on, and black japanned bands on 18-in. centers.

(Where pipe is so located that the coverings may be damaged, or where a particularly fine finish is desired, there should be applied, over the standard canvas jacket, sheathing paper, followed by an extra 8-oz. canvas jacket sewed on in the manner specified under Double Thickness Covering.)

Double Thickness Covering—All double thickness covering shall be applied by the broken joint method. The first layer of sectional or segmental covering shall be securely wired in place with No. 18 annealed iron wire; the second layer shall be ap-

plied so as to break both butt and lateral joints, and be secured in place by No. 18 annealed iron wire, not less than three separate loops to the section. Any cracks on the surface between the sections or segments shall be carefully filled with 85% Magnesia Plastic.

All double thickness covering shall be finished with an 8-oz. canvas jacket, neatly applied over heavy sheathing paper and well sewed on, approximately three stitches to the inch.

Fittings—Pipe fittings, including flanged fittings, shall be covered with 85% Magnesia Blocks and Plastic, or all 85% Magnesia Plastic, to a thickness not less than the covering on the pipes. The finishing coat shall be smoothly troweled, and finished with a canvas jacket to match the sectional covering.

Flanges—All high pressure steam flanges, except flanges on fittings, shall be covered with 85% Magnesia Blocks and Plastic, or all Plastic, made up on framework of 1/2-in. mesh iron wire netting, in two sections, so as to be easily removable and replaceable. Flange covers shall be finished with a canvas jacket to match the sectional covering. Low pressure steam and hot water flange covers shall be built up solid.

The covering on pipes at flange bolts shall be cut back and neatly beveled to allow sufficient space for the removal of the bolts without injury to the covering.

EXHAUST PIPING—Exhaust piping and exhaust mains, 10 in. and smaller, shall be covered with standard thick 85% Magnesia Sectional Covering (see table 1, column 2), finished with canvas jacket pasted on, and black japanned bands on 18-in. centers.

Exhaust piping and exhaust mains, 12 in. and larger, shall be covered with 85% Magnesia Plastic, or Blocks and Plastic, not less than 1 1/2 in. thick, finished with a coat of hard finish cement.

(Where exhaust piping is so located that the covering may be damaged, or where a particularly fine finish is desired, there should be applied, over the standard canvas jacket, sheathing paper, followed by an extra 8-oz. canvas jacket, sewed on in the manner specified under Double Thickness Covering.)

Fittings—Fittings (including flanges) on exhaust lines and mains shall be covered with Magnesia Plastic, or Blocks and Plastic, applied to the same thickness as the sectional covering, and finished with a canvas jacket to match the sectional covering.

BOILERS—**Boiler Tops**—All exposed boiler tops, or tops of drums, shall be covered with 85% Magnesia Blocks, finished with 1/2 in. of Magnesia Plastic and a coat of hard finish cement.

The covering shall be extended over the top surface of the brick setting on either side of, and in between, the boiler tops and drums, and over top of combustion chamber.

Ends of Drums—The ends of boiler drums, both heads and rings, shall be covered with 85% Magnesia Blocks and Plastic, or all Plastic, of thickness required, securely wired in place, as previously described, followed with a smooth finishing coat and covered with a canvas jacket to match the sectional covering. The covering of drum ends shall be beveled around manholes.

Boiler Walls—The side brick walls of boiler settings shall be thoroughly sealed against air infiltration by means of 2 coats of heavy paint made up of tar and asbestos; over this shall be applied 1 3/4-in. thickness of 85% Magnesia Plastic Cement, followed by a final 1/4-in. thick coat of hard finish cement.

The 85% Magnesia Plastic Cement shall be reinforced by means of 2-in. hexagonal wire mesh placed at a distance of from 1 in. to 1 1/2 in. from the brick wall and fastened thereto by means of No. 16 gauge iron tie wires, which shall be either embedded in the brickwork or fastened to expansion bolts embedded in the brickwork on 18-in. centers.

The covering shall be neatly beveled about all openings, and for a distance of 4 ft. from the boiler room floor it shall be protected by some form of sheet metal casing, which shall be provided by the sheet iron contractor.

SMOKE BREECHING—On connections from boiler to main smokestack, including portions running to economizer, there shall be applied, first, 1/2-in. mesh black iron wire cloth with 3/4-in. V-iron attached, to form air space, and fastened directly to the iron.

Block and Plastic material shall follow, as specified for boiler tops.

DUCTS AND STACKS—All hot and temperate air and cold air ducts and flues, and all exposed surfaces of fan casings, tempering coils, etc., shall be covered with 85% Magnesia Blocks, 1 in. in thickness, firmly secured with No. 18 galvanized iron wire, with all block joints pointed up with 85% Magnesia Plastic, and the edges of all exposed ducts protected with a light metal formed to an "L".

All said insulation (except that concealed in walls, ceilings, etc.) shall be finished in sheathing paper and an 8-oz. canvas jacket, well stretched, and neatly sewed, not less than three stitches to the inch.

HEATERS, RECEIVERS, RETURN TANKS, TRAPS, ETC.—All heaters, receivers, return tanks, traps, etc., shall be covered with 85% Magnesia Blocks and Plastic. (The steam or water temperature should govern the thickness of coverings specified, and in every case the thickness of the covering should correspond to the thickness of the pipe covering where similar conditions of heat and steam temperature are found.)

EXPPOSED COVERINGS—All pipes running outdoors or exposed to extremely low temperatures, whether steam or heating mains, shall be covered with 1 in. greater thickness than previously specified, and applied as provided under specification for steam piping, but finished with three-ply waterproof roofing (in place of canvas), applied with lapped joints and secured with No. 16 copper wire, spaced not over 8 in. on centers.

PAINTING—Such painting as is required by the engineer or architect is to be included in the general painting contract.

On interior insulation, the canvas jacket shall be thoroughly sized and painted two coats of standard lead and oil paint, of such colors as may be selected by the supervising engineer.

Explanation of Tables and Curves.

The thicknesses given in these tables and curves are the proper thickness for the maximum net saving for each condition. They are based on a period of service of 8,760 hours per year.

Where pipes are cold part of the year, multiply the cost of coal by the number of hours per year the pipes are hot and divide by 8,760; use the value obtained instead of the actual coal cost. 20% of the list cost has been allowed as the cost of application, and 13% of the total cost for the annual fixed charges (6% interest, 5% depreciation, 2% miscellaneous). The value of the heat losses used in calculating the net savings is based on a series of experiments, covering a period of three years, made for the MAGNESIA ASSOCIATION OF AMERICA by the Mellon Institute of Industrial Research of the University of Pittsburgh.

The tables below and on following page are for use in plants where costs are not accurately known. They are based on average conditions. In transforming the steam cost to coal cost, it has been assumed that 75% of the cost of steam is coal cost, that 1 lb. of coal will evaporate 7 lbs. of water, and that each pound of steam contains 1,000 B.t.u. above the feed water temperature.

TABLE NO. 1—THICKNESS OF "85% MAGNESIA" FOR MAXIMUM NET SAVING

S=Standard Thickness; DS=Double Standard Thickness (See Table No. 2)

N.B.—These tables, with the curves accompanying, are based on the latest determination of fact, arrived at by the Mellon Institute of Industrial Research, Pittsburgh, Pa.

The curves following are for use in plants where heat costs, steam temperatures, etc., are accurately known. They are applicable to all heated surfaces, since they are based on the temperature of the surface and the value of the heat in dollars per million B. t. u.

STANDARD BLOCK SIZES
6 in. x 36 in. 3 in. x 18 in.

How to Use These Tables and Curves.

Determine the following factors in connection with the heated surfaces to be covered: cost of coal, steam pressure and size of pipes.

Select the table most nearly corresponding to the cost of coal, and the column in the table nearest to the condition of steam pressure or temperature. The thick-nesses in this column are the proper thicknesses for the pipe sizes given at the left.

EXAMPLE—Cost of coal \$3.75, steam pressure 150 lbs., size of pipe 12 in. Select the \$4.00 per ton table, and the column headed, "Steam 100-200 lbs." Run down this column to the 12-in. line and find that Double Standard is the proper thickness for maximum net saving.

Special Note to Architects and Engineers.

Occasionally when an architect or engineer is writing his specifications, he finds that brevity is so necessary that he can not enter fullest details. When such is the case on the subject of non-conducting pipe cover-ings, the use of the following abbreviated Magnesia As-sociation Specification will amply insure application of correct insulation :

"NON-CONDUCTING COVERING—All exposed boiler surfaces, all pipes, fittings, or appurtenances carrying steam, hot water or hot gases, where radiation would cause condensation or drop in temperature, or result in loss of B. t. u. which could be utilized, shall be thor-oughly insulated as specified in Magnesia Association Specification for 85% Carbonate of Magnesia Non-conducting Coverings."

Copies of Specification.

Copies of the Magnesia Association Specification, herein referred to, will be mailed to architects and engi-neers on request addressed to any of the members of the MAGNESIA ASSOCIATION OF AMERICA.

Should any insulating condition arise in practise not fully covered in this Specification, please send details of problem to one of the members of the MAGNESIA ASSO-CIATION OF AMERICA, and it will have expert considera-tion and prompt reply.

Handbook.

A practical handbook, "Defend your Steam," deal-ing fully with the manufacture, uses and application of 85% Magnesia coverings and with the theory and practise of heat insulation, and will be sent free on request.

NORRISTOWN MAGNESIA & ASBESTOS CO.

Pipe and Boiler Coverings and Asbestos Products

MAIN OFFICE

NORRISTOWN, PA.

BRANCH OFFICE: 23 Lewis Wharf, BOSTON, MASS.

FACTORIES: NORRISTOWN, PA., DOYLESTOWN, PA., and PLEASANT MILLS, N. J.

Products.

MAGNESIA ASBESTOS PIPE and BOILER COVERINGS, Exposed, Overhead and Underground.

Also, Asbestos Paper and Board, Cloth and Wick Packing, Sheet Packing and Gaskets, and Cements.

Note to Engineers and Architects.

This company has been in the active manufacture of pipe and boiler coverings, and heat and cold insulation materials for the past 20 years. There are so many different conditions which govern in every heat or cold insulation equipment that it is scientifically and physically impossible to recommend one or two styles of covering only.

This company manufactures eleven distinct types of covering and many variations of these particular types for varying or special conditions. They are not trying to push the sale of any particular one.

There is a covering for every condition from the highest steam pressure to the coldest water line, and for varying outside conditions, together with the conditions to be met to comply with the requirements of any installation in question, as to whether ultimate efficiency with high first cost or a lower first cost with a sacrifice of the highest point of efficiency are desired.

Trade-mark.

All of the products manufactured by NORRISTOWN MAGNESIA & ASBESTOS Co. are made under the brand name of "Diamond N." The resources of the company are behind the "Diamond N" trade-mark, and it is their desire to consult with and advise in accordance with their past experience on any such problems as may arise with architects and engineers or those desiring to use these products.

"Ideal" Covering.

Under general conditions, "Ideal" covering is recommended for highest steam pressure, and where highest efficiency is desired. It is a relatively high first cost covering, being made up of a center core of magnesia asbestos, enclosed in an outside jacket of wool felt, which allows it to be applied "broken joint" method, thereby increasing the efficiency of the covering as a whole. The jacket also affords an excellent protection to the center core against mechanical injury, where the covering is liable to be subjected to rough han-

TRADE-MARK

dling, vibration, knocks and bruises, etc., as in a boiler room, or where the pipe is located near the floor or within easy reach.

In a number of comparative tests between this and other "Diamond N" coverings, as well as standard coverings of other manufacturers, "Ideal" has never been surpassed in point of efficiency.

Asbestos Magnesia Covering.

This is the center core of asbestos magnesia which is used in making up the "Ideal" covering, with the wool felt jacket omitted. The efficiency is not quite so high as the "Ideal" covering, and the first cost is lower. It will not calcine under any working temperature. A perfectly white covering producing a very good appearance in an engine room, when erected.

Wool Felt Covering.

Made up of layers of wool felt paper. Good efficiency. Used mostly for hot water and cold water lines. It is asbestos lined for hot water lines, very durable and comparatively low in first cost.

Air Cell Covering.

Made of corrugated asbestos paper. An exceedingly light weight covering having fairly good efficiency, and very low first cost. Made in 2-, 3- and 4-ply, for ordinary low steam pressures, and 6- and 8-ply for steam pressures up to 125 lbs.

Frostproof Covering.

A wool felt jacket with hair felt ½ in. to 1 in. thick in the center. An exceedingly good covering to prevent freezing of water lines.

Indent Covering.

Made up of consecutive layers of asbestos paper, indented. Will stand the highest temperature, and is exceedingly durable. Very good efficiency. Can be used in the most severe cases of vibration, or where mechanical injury is to be avoided, even to the point of train pipe and locomotive insulation.

Ric-wiL Covering.

For underground work there is no covering on the market at the present time, which can compare with Ric-wiL underground pipe covering as a permanent, efficient and thoroughly mechanical job.

It consists of a terra cotta tile, heavily glazed, longitudinally split pipe, with the insulation integral with the tile. The pipe line is placed in the center of the insulation, supported on roller bearings, the whole tile supported on a base constructed so as to form a drain to carry away the surface water, and keep the tile line dry. Absolutely permanent construction.

Inquiries.

The above coverings are but a few of the eleven standard coverings which this company makes. Inquiries are solicited for any conditions of service.

"IDEAL" COVERING

For high pressure work and for pipelines exposed to weather when waterproofed

UNION FIBRE CO., INC.

Manufacturers of Insulating Materials

WINONA, MINN.

BRANCH FACTORY: YORKTOWN, IND.
AGENTS IN EVERY LARGE CITY

Products.

INSULATING MATERIALS: LINOFELT; FIBROFELT; WATERPROOF LITH; UNION LITH PIPE COVERING; UNION ROCK WOOL.

Engineering Data and Service.

In every large city we maintain offices, in charge of expert insulation men, capable of analyzing any problem and suggesting proper treatment. Full data as to requirements for any condition, together with complete estimates on materials, or workmanship, freely furnished. The practical experience of twenty years in handling the most difficult problems in insulation, condensation, machine vibration, acoustic correction, etc., is at the service of customers.

Linofelt.

A heat resisting quilt for sheathing buildings. Prevents passage of heat or sound through walls, floors, or ceilings. Chemically treated flax fiber, immune from decay, firmly stitched between layers of tough, Kraft paper, or of waterproof paper, muslin or burlap, as may be required. Uniform in thickness and quality, germ-proof and verminproof, and the most efficient heat and sound insulation on the market. From $\frac{1}{4}$ to 1 in. thick, in various widths and lengths. Special types for acoustic work, fireproof construction, etc.

Fibrofelt.

A light, self-sustaining, flexible insulating felt, in board form, from selected straw fiber. Odorless, sanitary, germproof and verminproof. Easily cut and applied like lumber. Especially adapted for prevention of roof condensation. Deadens sound and vibration in factory machinery.

Waterproof Lith.

A standard insulating block for refrigerating plants, cold storages, packing houses, creameries, ice storages, etc., composed of selected flax fiber and annealed rock wool. This wool, comprising 40% of Lith, contains 8% stone fiber and 92% entrapped air. Flax fiber adds insulating efficiency and necessary tensile strength not found in other wool blocks, or other cold storage insulation. Thicknesses are from $\frac{1}{2}$ to 3 in.; blocks 18 in. wide by 4 ft. long. Heat transmission, per inch thickness, per degree difference in temperature, per day, is 6.60 B.t.u's.

Union Lith Pipe Covering.

For ice water, brine, and refrigeration pipe and fittings, moulded to exact form from same material as Lith. Made in three thicknesses: Regular Brine, $2\frac{1}{2}$

in. thick, for zero to 25° Fahr.; Heavy Brine, $3\frac{1}{2}$ in. thick, for below zero service; Ice Water, $1\frac{3}{4}$ in. thick, for cold liquids between 25 and 50° Fahr. Unusually efficient, extensively used.

Union Rock Wool.

Blown from virgin rock by exclusive patented annealing process, it is the most durable and efficient wool obtainable. Recent infringement prosecutions prove its superiority. Furnished in bags, 50 lbs. each, in carloads or less, f.o.b. Yorktown, Ind. Wool packs in service to 14 lbs. per cu. ft. Excellent insulation, and especially adapted for filtration of chemicals, acids, etc.

Economy of Insulation.

A half-inch thickness of any of our products, used to prevent escape of heat through walls, roofs, etc., will easily save one-third its cost *every* year, in fuel alone, and maintain uniform temperatures. In cold storage service, its cost is only a fraction of the cost of the refrigeration it eliminates. For sound absorption, acoustic correction, etc., our products rank highest in every test, and compared with former methods, are absurdly inexpensive. A proper application under heavy, vibrating machinery adds years to the life of both buildings and machines.

Elimination of Roof Condensation.

In the coldest climate, under extreme conditions, one-inch thickness of Fibrofelt, applied in hot asphalt on concrete roofs, will absolutely prevent condensation, which for years has been so destructive. Hundreds of applications prove it. Any ordinary form of roofing can be used over the insulation, in the ordinary manner. Such treatment, by retaining interior heat, prevents roof concrete from attaining cold temperature at which condensation takes place, thus removing its cause.

Refrigerator Insulation.

Practically all efficient household refrigerators, fully 60% of the refrigerator cars in the country, and a very large percentage of the cold storage plants, packing houses, etc., in all parts of the country, are, and have been using our specially adapted products for years, with unqualified success. During the past year 82% of our shipments were to former customers, proving their satisfaction.

Estimates, Etc.

Complete data and estimates for any requirements freely furnished on request, together with personal service of any of the engineering forces.

CHEMICAL TOILET CORPORATION

Sanitary Indoor Closets for Unsewered Buildings

SYRACUSE, N. Y.

Products.

- PERFECTION INDOOR CHEMICAL CLOSETS.
- PERFECTION SEPTIC DISPOSAL SYSTEMS.
- PERFECTION CHEMICAL for Purifying Sewage.
- PERFECTION SOLVENT for Clogged Pipes.
- PERFECTION CESSPOOL SOLVENT.

Perfection Chemical Closet.

No water or sewer required. Designed for use in unsewered buildings; wherever folks live or work.

Chemical disposal of sewage provides safety, cleanliness, convenience; improves working conditions, and promotes contentment.

Approved by health, educational and industrial authorities for use wherever sewers and water are not available; destroys bacteria; prevents contagion.

Easily installed in any building. Tanks are set in ground or hung from floor. Cared for by emptying through drainage pipes to seepage pool and putting in new charge of Perfection Chemical once about every 4 to 6 months for average home; same for mills when one system is provided for each 12 to 15 employees.

Multiple Systems.

Any number of bowls may be joined for ventilation or drainage. Blue print suggestions furnished on application.

Perfection Septic Disposal Systems.

Septic tanks for use in connection with water flush systems where sewers are not laid. Also septic vault closets for use as an outdoor closet without water connections. Catalogue on request.

Perfection Chemical.

In 25-lb. cans; full charge for purifying 125 gals. of sewage. Destroys bacteria, liquefies and purifies sewage. No infectious disease or water pollution.

SINGLE BOWL INSTALLATION

AN INSTALLATION WITH TWO BOWLS

Specifications of Perfection Chemical System.

Storage tank of No. 14 gauge Toncan metal, 128 gals.; 12-in. drop tube connection; 16-in. manhole opening to provide access to drain valve. Tanks are protected against corrosion and guaranteed for long term service.

Drain valve closes and opens by rod connection. Pressure closing, no threads.

Simple spiral agitator or mixer is hand operated at side of bowl. No attachments or bearings inside of tank.

VITREOUS CHINA BOWL—Oak or mahogany anti-split seat. Metal drop tube connection to tank, 30-in. stock length or as required.

VENTILATION—4-in. white enameled ventilation for inside use, galvanized for outside, with roof fittings as required.

Perfection Solvent.

Drain pipe size for cleaning out any organic stoppage. 2-lb. size cleans out ordinary stoppage. Frequent use prevents trouble.

Perfection Cesspool Solvent.

Purifies and opens cesspools. Periodical use prevents trouble. Comes in 25-lb. cans.

KAUSTINE COMPANY, INC.

Sanitation Engineers and
Manufacturers of Waterless Toilet Equipment (Chemical)

BUFFALO, N. Y.

CHARLOTTE, N. C.

GREENVILLE, S. C.

TORONTO, CANADA

Products.

CHEMICAL WATERLESS TOILETS and VENTILATING URINALS for use where sewers and water supply are not available.

Also Enameled Iron Septic Tanks.

Adaptability and Uses.

The Kaustine waterless toilet, made and sold by the above company, is expressly intended for use in districts where sewers and water supply are not available. It is suited to, and largely in use in, schools, factories, railroad shops and stations, halls, churches, fair grounds and resorts, rural homes and cottages. It is installed singly or in batteries up to any number of units.

Features of the System.

Chemical sterilization and liquefaction, ventilation and aeration, and agitation are the main features of the Kaustine system.

SINGLE SEAT KAUSTINE SYSTEM

The Chemical Kaustine.

Kaustine (furnished exclusively by KAUSTINE COMPANY, INC.) is a flaked green crystal, prepared for use by dissolving in water. It accomplishes three distinct results:

- (1) Softens and disintegrates the sewage solids and toilet paper.
- (2) It destroys all germ life. It eliminates the odors of organic matter.
- (3) It changes the vegetable and animal matter to a pure chemical state and prevents putrefaction and decomposition, rendering the contents of the tank into preserved purity—a state from which these contents may be converted into a fertilizer or disposed of by a very simple method.

Sizes and Capacities.

The following table shows various sizes and capacities of tanks and number of bowls or individual urinals they are supposed to accommodate. Each tank is designated by a number, which should always be used in specifying when ordering.

STANDARD TANK TABLE

Number	Diameter, in.	Length, in.	Capacity, U. S. gals.	Number bowls intended	Lbs. Kaustine required
T-125	27	50	125	1	26
T-200	27	80	200	1	45
T-250	27	100	250	2	52
T-375	32	108	375	3	78
T-500	32	144	500	4	104
T-625	32	180	625	5	130
T-750	32	216	750	6	156

NOTE—T-200 tank is intended for use with 1 bowl, or 1 bowl and 1 individual urinal. There are conditions where it can be used to advantage.

Toilet and Ventilating Urinal Specifications.

CLOSET BOWL—Vitreous china, equipped with oak seat, hinges and fittings.

CHEMICAL TANK—Of No. 14-gauge Armco ingot iron, electro-welded, well made and durable. Form cylindrical.

VENTILATING SYSTEM—Pipes of Armco iron, enameled or galvanized to suit surroundings. Equipped with vent cap, roof safe and all necessary connections.

Installation Plans and Estimates.

The company supplies, through its Engineering Department, plans and estimates without charge. Inquiries are solicited from architects and builders for details and particulars regarding plans for installation.

The seats are installed same as water closets, requiring, however, proper ventilating facilities and location for tank. Tanks may be buried, or held by supports or suspended from ceiling. Must be directly under closet bowl.

FIG. 17, ONE BOWL; FIG. 18, ONE BOWL AND ONE URINAL; FIG. 19, TWO BOWLS AND ONE URINAL

BETZ BROS., INC.

Manufacturers of Steel Toilet Partitions

Woolworth Building
NEW YORK, N. Y.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Product.

"STEELBILT" SANITARY TOILET PARTITIONS.

Partitions.

Our partitions are durable and strong, because they are made of steel with all parts electrically or oxy-acetylene welded. They are practically indestructible. They are sanitary, because non-absorbent, and also because all surfaces where dust or dirt might collect have been eliminated. In appearance they are neat and clean.

Partitions are made of heavy gage patent level steel, with stiles, rails and panels electrically welded together forming a unit. The post is formed with a lug at each end; the bottom lug fits into a cast base which fastens to the floor, the top fits into a cast cap, both of which allow for vertical adjustment (to correct unevenness of floor). The rear end of the partition fits over and is bolted to a tee shape member, which is fastened to the wall with expansion bolts, and is arranged for vertical and lateral adjustments to meet variable wall conditions.

Doors.

Stiles and rails are heavy gage drawn steel and are mitered and oxy-acetylene welded at corners, being electrically welded to panel. Joints are ground down to a smooth surface.

Caps and Bases.

Castings for caps and bases are neatly fitted. Caps are made to receive 1-in. diameter pipe, which passes through same and serves as bracing for partitions. The base is made of a special composition non-corrosive metal and is fastened to floor through center in a concealed manner with expansion bolts.

INSTALLATION "STEELBILT" TOILET PARTITIONS

SWEET'S CATALOGUE

BETZ
Steelbilt
TRADE MARK
TOILET PARTITIONS

Hardware.

The hardware furnished consists of special universal pivot hinge, 2 rubber bumpers, 1 door pull and 1 latch for each compartment.

Finish.

We furnish our partitions with 1 prime coat applied, or either one of the standard finishes such as olive green or gray enamel. Finish coats are baked on. All of the hardware, including cast caps and bases, are always finished the same as the partition proper. Our standard olive green enamel finish is recommended where service and durability is a special requirement. Other colors furnished if required.

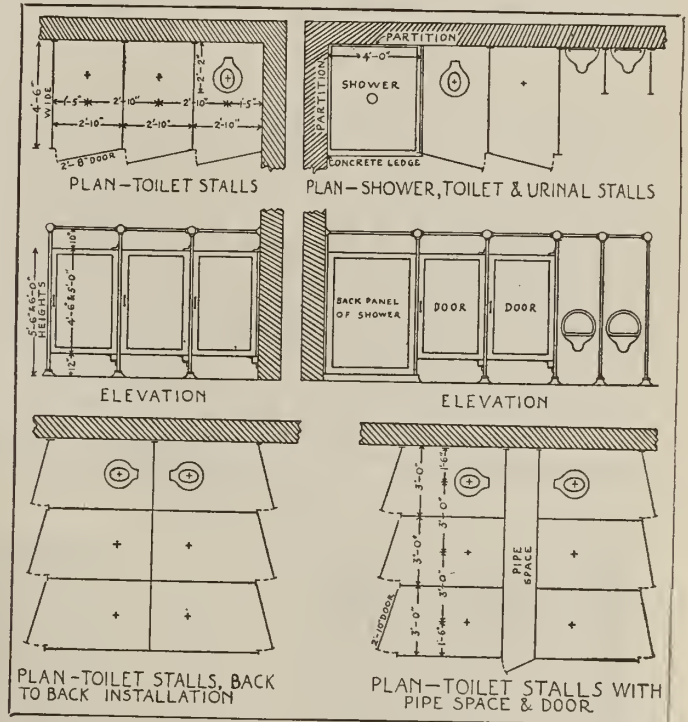

Erection.

Partitions and doors are delivered ready for erection. We will erect the partitions or they can be erected by customer's mechanic. They are easily erected and do not require specially trained men.

Cost.

Our "Steelbilt" partitions cost less than slate.

For prices and further information write Dept. "C." On application we will refer inquirers to our nearest representative.

Manufacturers of CARPENTER'S "SANYMETAL" PARTITIONS and DOORS for toilet rooms, dressing rooms, shower baths, urinals, etc.

"SANYMETAL" DIVIDING PARTITIONS for offices and factories.

"SANYMETAL" GRAVITY ROLLER BEARING HINGES for all toilet doors.

Carpenter's "Sanymetal" Partitions and Doors.

Carpenter's "Sanymetal" consists of two essential units—a partition with an integral supporting post, and a door. For the partition, a heavy gauge, cold rolled steel sheet is electrically welded to a hollow steel vertical post, and fitted top, bottom and rear with rigid steel mouldings—all electrically welded into one complete whole. The door, of similar construction, is fitted with special spring or gravity roller bearing hinges, rubber bumpers, and pull. These two units, with necessary castings for base and caps, and pipe rails for top finish, constitute Carpenter's "Sanymetal" sections.

FINISH—Partitions and doors present an impervious hard enameled surface. Standard finish is olive green. Other colors furnished are Brewster green and gray. Sections can be supplied with a filler and primer coat and finished by the painter after the work is set. White enamel is best furnished in this way.

For showers and urinals a lead coated special steel is used, finished, like the partitions, with baked enamel.

ERECTION—Quotations will be given on "Sanymetal" either erected, or f. o. b., the work. The erection of "Sanymetal" is a simple matter. After work has been laid out, base castings are set. Into these the hollow vertical posts are set. A set screw in the castings makes the partition adjustable to uneven floors. The rear of the panel has a moulding electrically welded to it and mitered to the top moulding. This is bolted into a U-channel, which snugly fits the back moulding of the partitions.

This U-channel is first fastened to the wall, and allows the partition to be adjusted to uneven walls. With the required number of sections erected, the drawn steel tubing is run through the top castings and fastened to the walls, forming a solid brace to hold the partition.

Sanymetal
TOILET PARTITIONS
TRADE MARK REGISTERED

"Sanymetal" Steel Interior Dividing Partitions.

Sectional dividing partitions for offices and factories consist of a hollow metal post, a well built lower panel, and a glass

section above.

Flexible construction for any room dimensions. Can be installed with wire or metal ceilings. Top panels may be glass, metal or wire mesh. Partitions finished the same on both sides.

"Sanymetal" Gravity Roller Bearing Hinges.

Gravity roller bearing hinges for double and single acting doors of wood or steel made to fit "Sanymetal," slate, marble or wood partitions.

Hinge consists of five parts only. Upper hinge is a heavy casting with pivot carried in socket. Lower hinge is of similar design, the weight of the door being carried by a wheel rolling on a double inclined cam. Hinge can be used for either right- or left-hand door, and can be made for any thickness of material. The cam is reversible, one side making a double acting hinge, reverse side making an inswing hinge to hold door open when not in use. Cam is adjustable to make doors in pairs swing even, or to allow single doors to stand open 6 in. or more.

FINISH—The hinge is made in malleable iron or brass, with a black japanned or nickelplated finish.

"SANYMETAL" DIVIDING PARTITIONS

"SANYMETAL" COMBINATION SHOWING URINALS AND DOUBLE AND SINGLE DOOR TOILETS

THE HUGHES-KEENAN CO.

Manufacturers of Toilet Partitions
MANSFIELD, OHIO

Products.

Manufacturers of "HYGEA" TOILET PARTITIONS.

Ornamental Iron Work and "S & L" Pressed Steel Stairs.

Construction.

The "Hygea" construction consists of formed steel tubular posts, extending from the floor to a height of 6 ft. 6 in. (on standard partition, see details.) The backs of the posts are arranged to connect to the steel panel and form a mould or stile for that portion of the panel connecting to it. The panel is made with the upper and lower mould and a special channel and stile at the building wall, making a joint between wall and panel which is secure and also neat, adjustable and non-dirt-collecting.

The "Hygea" Wall Connection.

A channel-shaped member is provided with two flanges, slightly curved inward at the ends. These flanges stand at an angle, slightly more than 90° to the web which is bolted to the wall. These flanges are separated to a width which is slightly larger than the inside of the stile or wall moulding of the panel.

In connecting these members, it is necessary only to press the wall stile over this channel-shaped wall connection which holds the partition in place. To avoid any

possibility of shifting, through bolts are also inserted which make a rigid connection and allow for a variation in the alignment of the wall.

"Hygea" Toilet Doors.

These doors are formed with a single panel, having same patented top and bottom rails and side stiles as partition panels (see details).

Patented Mould and Panel Securing Device.

Another feature of the "Hygea" partition is this combination mould and panel securing device. The object of this is to eliminate any rivets, screws or objectionable edges of metal on the exposed surfaces of the panels. It also insures a panel which is free from waves or buckles.

Patented Gravity Hinge.

The pleasing and practical feature of THE HUGHES-KEENAN Co.'s patented gravity hinge is that it *requires no adjustments*. It is built for the purpose it serves—to allow the door to swing freely, smoothly and noiselessly and to stand slightly ajar when not engaged. No indicating lock is needed.

Installation.

Complete installations furnished and erected if desired. The "Hygea" toilet partition is a complete, sanitary installation.

WEISTEEL COMPARTMENTS for Toilets and Shower and Dressing Rooms.

Weisteel Compartments.

Weisteel compartments have made good in steel mills, munition plants, packing plants, railway buildings, and schoolhouses where sanitary equipment of this kind is put to the hardest test.

Many of the largest industrial institutions, railway systems and school boards incorporate Weisteel compartments in their standard specifications and use them in all buildings.

Design.

Every sanitary requirement has been fully taken care of. All unnecessary joints have been eliminated; all parts are so shaped that water will not stand upon them and there are no projecting screw or bolt heads to catch dust or dirt.

Erection.

The erection of these compartments is so simple

WEISTEEL

TRADE-MARK

that any handy man with ordinary tools can do the work quickly. Only three bolts are required to erect the ordinary toilet compartment, and there is no drilling or fitting. Wall connections allow for variation in walls and permit setting of partitions out 1 in. from the wall where desired. Foot casting allows for adjusting height of front post to care for any variation in finished floors, and is fastened to the floor by concealed screw within the casting.

Units.

Weisteel compartments are built in special stock units for toilets, to suit almost every condition and can be shipped immediately from stock. Compartments are also built to suit all special conditions and for showers and dressing rooms. For toilets requiring utility or working space at the rear, space is enclosed completely with steel backs, ends and tops.

Engineers' Specifications.

PARTITIONS—Partitions with front and rear posts built in one unit of No. 16-gauge steel sheet, and con-

WALL FASTENING

PHANTOM VIEW OF FOOT CASTING

sist of three members only, top and bottom rail of partition being formed from the partition sheet which is interlocked into the hollow metal posts at front and rear and securely welded into place. Partitions can finish any distance up from the floor or on the floor if desired.

DOORS—Door stiles and rails are formed of No. 22-gauge steel having panels of No. 16-gauge steel. Miters of stiles and rails are interlocked, countersunk and finished flush.

CASTINGS—Malleable iron castings are furnished at the top and bottom of front post, at wall to receive head rail, and at top and bottom of rear post to form wall fastening. Safety set screws having no projection are provided for fastening head rail into top post castings and wall flanges.

HARDWARE—All hardware with the exception of pivot butts is steel dead black finish and consists of specially designed spring pivot butts, single acting with yoke attachment; 3½-in. two-prong coat and hat hook; cast bumper stop with rubber filler at both top and bottom of door; 4-in. cast bar pulls, and a heavy slide bolt latch.

WOOD DOORS—Wood doors may be used instead of steel when desired; in which case, the standard hardware equipment is furnished with the necessary screws for attaching to wood.

HEAD RAIL—Rectangular tubing 1¼ by 1⅞-in. No. 16-gauge steel.

FINISH—All parts finished in either a prime coat of special grey metal filler and primer or hard baked on enamel of either olive green or battleship grey. All finish sprayed on under 40 lbs. pressure.

STOCK UNITS OF WEISTEEL COMPARTMENTS

Note—Series 1 and 2 are batteries of compartments where wall forms the end at right or left. Series 3 is a battery of compartments entirely between walls and where both ends are formed by walls. Series 4 is a battery of compartments having no walls at ends. In series 1, 2, 3 and 4 any number of compartments can be had in one battery. Series 5, 6, 7 and 8 are made in single compartments as shown.

DOORS—Width of doors in series 5, 6, 7 and 8 are 2 ft. 0 in. in all cases as shown. Width of all other doors in every case 2 in. less than dimension "A"; except in series 1, 2 and 3, where doors in end stalls are 3 in. less than dimension "A."

Swing of doors may be reversed where desired. Any of the above stock units can be had without doors where desired

Units without doors in Series 1, 2, 3 and 4 are also made in the following sizes for dimension "B": 2'-6", 3'-0" and 3'-6". Any stock unit can be made in special units with provision for utility or working spaces. Urinal partitions, also shower and dressing compartments, with or without doors, can be furnished in special units of any desired size.

THE CENTRAL BRASS MANUFACTURING CO.

Drinking Fountains, Valves, Faucets

CLEVELAND, OHIO

Products.

"QUICKCOOL" REFRIGERATING DRINKING FOUNTAIN.

"CENTRAL" GLOBE AND ANGLE VALVES.

SWIVEL DISC GLOBE VALVES.

QUICK-PRESSION FAUCETS for Sinks, Lavatories, etc.

Also, Gate Valves (2 in. only).

"Quickcool" Drinking Fountain.

(Trade-mark and patent applied for).

Has protected angle jet, giving absolute protection against mouth secretions and germ-laden dust. Serves equally well as a tumbler filler. Holds a 75-lb. cake of ice or over 100 lbs. of cracked ice.

Central Globe Valves.

Designed primarily for water, but suitable and guaranteed for steam up to 85 pounds. Globe valves $\frac{3}{8}$ in. to 1 in. Angle valves $\frac{3}{8}$ in. to $\frac{3}{4}$ in.

Swivel Disc Globe Valves.

A Jenkins type valve, guaranteed for steam up to 150 lbs. This valve made only in globe, $\frac{1}{2}$ in. to 2 in., screw end only.

Guarantee.

The products of THE CENTRAL BRASS MANUFACTURING Co. are absolutely guaranteed against defects in material and workmanship.

Catalogue.

Engineers and architects are invited to ask for catalogue "J" giving detailed descriptions.

Deliveries.

While we can not maintain a constant stock of everything in our line, a point is made to give preferred attention to orders for specified goods.

JOHN SIMMONS CO.

Plumbing Supplies

GENERAL OFFICES
102-110 Centre Street
NEW YORK, N. Y.

PLUMBING WAREHOUSE, Bush Terminal, BROOKLYN, N. Y.

Products.

PLUMBING EQUIPMENT for Factory Installation.

Also, Cocks: Brass and Iron, for steam, water, gas, air, ammonia and acid; Ball, Basin and Hydrant.
For Pipe and Fittings, see page 404.

RANGE OF SOLID PORCELAIN URINALS

Urinal is glazed all over, and is fitted with nickelplated strainer for lead or iron pipe connection, nickelplated spreader, and nickelplated flush valve, the combination making the most sanitary outfit procurable. 18, 24 or 28 in. wide.

FACTORY LAVATORY OUTFIT WITH SPECIAL DOUBLE COMPRESSION FAUCETS WITH GOOSENECK AND SPRAY

Equipment for Factory Installation.

The efficiency of the employee is governed in large measure by his surroundings. Light, cheery quarters, with plenty of fresh air, have produced amazing returns in added output. The plumbing equipment is meeting with the careful consideration of many of the foremost manufacturing concerns. They realize that proper plumbing facilities lead to cleanliness, and cleanliness to better health for their workers.

Closet Combinations.

There are many different styles of closet combinations for use in factory installation. For this kind of work a heavy "Giant" bowl with integral seat, and nickelplated flush valve with brass oscillating handle is recommended.

REFERENCES—This company has completed contracts for this kind of equipment with the following concerns:

De La Vergne Machine Works
Downey Shipbuilding Corp.
E. I. du Pont de Nemours & Co.
Essex Foundry
Ford Instrument Company
General Chemical Company
West Virginia Pulp & Paper Co.

RANGE OF SOLID PORCELAIN "IDEAL" FACTORY LAVATORY BASINS WITH INTEGRAL SOAP HOLDERS

Basins are furnished either back to back or for wall support. Each basin measures 18 by 21 in. Inside measurement 15 by 17 by 6½ in. Range is supported on "Universal" cast iron floor brackets, and equipped with pipe supports, supply pipes for hot and cold water and Fuller or compression bibbs

Inquiries.

JOHN SIMMONS Co. has specialized in installations of this kind, and invites inquiries.

GLAUBER BRASS MFG. CO.

Finest Brass Goods Made for Plumbing, Gas and Water Works

GENERAL OFFICES AND WORKS
CLEVELAND, OHIO

Products.

FAUCETS and COCKS of every type, as used in plumbing, water and gas installations, the items of particular interest to the industrial trade being LAVATORY and WASH SINK FIXTURES, SANITARY DRINKING FOUNTAINS and BUBBLERS, SHOWER MIXING VALVES and SHOWER BATHS.

Metal.

All Glauber products are made from a rich bronze metal containing 86% copper, 6% tin, 4% zinc and 4% lead, a formula which has been adopted almost without any changes by the water departments of ten of the leading cities in the United States, whose engineers agree with us that only rich red metal can withstand the ravages of time.

Guarantee.

All goods made by GLAUBER BRASS MFG. CO. are sold under an absolute *five-year guarantee*, fully insuring the customer against loss and annoyance inevitably encountered in the use of inferior goods.

Shower Mixing Valves and Shower Baths.

Glauber mixing valves are unique in that they are the only ones operating on a two-way cam principle.

Ours was originally the "Paragon" valve, of which the company purchased the patent. The opening and closing of the ports is positive.

Other mixers are built on the piston valve principle, no provision being made to take care of expansion other than a loose fit. This permits seepage, resulting in faulty control of temperatures and in frequent scaldings.

Glauber mixing valves are of such perfect mechanical construction that they can be successfully used to make hot water out of steam and cold water when equipped with steam packings. This is of interest to many industrial concerns, where steam lines already installed may be utilized, saving the installation of a hot water system.

The Practicool Drinking Fountain.

A splendid means of serving employees with cool water, even during the hottest months. The fountain holds a 75-lb. cake of ice, which will last about 3 days under normal conditions. Besides being equipped with a Glauber sanitary bubbler, it is also equipped with the Coolerator, a galvanized cast iron water chamber holding 3 times as much water as a 40-ft. coil of $\frac{3}{8}$ -in. lead pipe and will therefore effect a 20% reduction. For instance, it is sufficient to reduce 40 gals. of 70° water to 50°. The fountain is durably constructed, being made of heavy iron with a galvanized iron ice chamber. Granulated cork is used for insulation. Being connected with waste and supply pipes, it requires no attention. The model illustrated is the No. 1 Practicool fountain. We also manufacture 3 other types. Write for information and prices.

ROUGHING-IN DIMENSIONS OF THE PRACTICOOL DRINKING FOUNTAIN

"PRACTICOOL" NO. 2 DRINKING FOUNTAIN

Sanitary Drinking Fountains.

The common fault with drinking fountains in general is that they do not prevent contact between users' lips and the jet. This fault is not found in Glauber drinking fountains and, in addition, the jet is of such design that it throws a slightly palpitating bubble, automatically cleansing the bowl every time the bubbler is used.

THE PRINCETON BUBBLER

THE GIRARD BUBBLER

PRACTICO PEDESTAL DRINKING FOUNTAIN

PRACTICO NO. 2 PEDESTAL DRINKING FOUNTAIN

Lavatory and Wash Sink Fixtures.

Attention is called to the fact that all these fixtures illustrated embody the modern and sanitary idea of *washing in running water*. The use of chain and plug or any other type of waste is dispensed with—a beehive

strainer being used instead, to compel the men to wash in running water. In this way the lavatories are kept clean and the men are not using the water more than once.

THE STEARNS

Nu-Rapid (quick compression) combination lavatory fitting with Salinas gooseneck spout. Fits any lavatory except those drilled for Standing or Ideal waste. Connections between valves and spout are lead pipe, providing ready adjustability of centers—anything from 8 to 12 in. Regular finish nickelplated

Elevation

Side View

THE SAXON

Compression combination fixture for installation on wall above lavatory or trough or on sink back. Connection between valves and spout embodies our "lock-jaw" fittings, which combine the adjustability of slip joints with the rigidity of threaded connections. Inlets tapped female, 1/2-in. iron pipe. Loose cast brass wall flanges are furnished with each fixture

THE OVERLAND

Nu-Rapid (quick compression) combination lavatory fitting with "Carnegie" gooseneck and cast brass "No-Spread" rose spray. Fits any lavatory except those drilled for Standing or Ideal waste. Connections between valves and spout are lead pipe, providing ready adjustment of valve centers, 8 to 10 in. Exposed parts finished brass, nickelplated; parts below lavatory slab, rough brass, nickelplated, unless otherwise ordered

THE BRISCOE

Compression combination fixture with "Carnegie" gooseneck and cast brass "No-Spread" rose spray, for installation on wall above lavatory or trough or on sink back. Connections between valves and spout embody our "lock-jaw" fittings, which combine the adjustability of slip joints with the rigidity of threaded connections. Inlets tapped female, 1/2-in. iron pipe. Loose cast brass wall flanges are furnished with each fixture

THE JORDAN—FRONT VIEW

Nu-Rapid (quick compression) combination fixture for wash sinks. Has "Carnegie" gooseneck and cast brass "No-Spread" rose spray; has "blendo" adjustable shanks, centers variable from 3 3/8 to 10 in. Shanks tapped 1/2-in. iron pipe. Nickelplated, unless ordered in finished brass

THE KISSEL

Beehive strainer for lavatories, sinks and troughs. Its purpose is to prevent filling the bowl with water, compelling the men to wash in running water—the sanitary way. Nickelplated, unless ordered in finished brass

THE CHANDLER

Nu-Rapid (quick compression) fixture for wash sinks. Has cast brass "No-Spread" rose spray, delivering cold, warm or hot water. Has union couplings with straight tail-pieces threaded 1/2-in. iron pipe. Nickelplated, unless ordered in finished brass

THE TEMPER-FLO

Nu-Rapid (quick compression) combination fixture for wash sinks. Delivers cold, warm or hot water. Has union couplings with tail-pieces threaded 1/2-in. iron pipe. Nickelplated, unless ordered in finished brass

Products.

JOSAM DOUBLE DRAINAGE DRAINS for Shower Stalls, Floor, Roof and Garage; DRAIN and TRAP COMBINATIONS; DOUBLE ECCENTRIC UNIONS; DOUBLE ECCENTRIC CONCRETE INSERTS and SOCKETS.

Specially designed Cast Iron and Brass Drains, Refrigerator Drains.

Advantages of Josam Double Drainage Drains.

Double drainage drains prevent leakages to ceiling below at points of contact between the metal and floor or roof. Economy in installation. Absolutely trouble-proof. Once installed no further attention is necessary.

Materials.

All numbers made in cast iron, black or galvanized finish; and all brass, plain or nickelplate finish.

Josam Double Drainage Drain and Trap Combination.

200A SERIES—

Heavy cast iron body with adjustable brass strainer to suit floor thickness variations. Regular finish black japan. Galvanized extra. Also furnished in all brass.

Strainers for porcelain shower receptors furnished.

DETAILS, 200A SERIES DRAIN AND TRAP

2003A, SPECIAL SHALLOW TYPE—

Same construction as 200A, but designed for shallow installation. This number comes fitted

with flashing ring and bolts to clamp and holds flashing permanently. Also nickelplated brass strainer and adjustable collar.

Josam Double Drainage Drain for Shower and Urinals.

300 SERIES—Without trap, for shower stalls. The body is of cast iron and strainer nickelplated brass.

DETAILS, 300 SERIES DRAIN

This number can be installed in connection with independent trap to suit construction. Can furnish either flat, convex or concave nickelplated strainers. Adjustable to variations in floor thickness.

FOAMITE FIREFOAM COMPANY

Manufacturers of Chemical Fire Extinguishers

CABLE ADDRESS:
"FOAMITE, NEW YORK"

200 Fifth Avenue
NEW YORK, N. Y.

Products.

FIRE PROTECTION SYSTEMS; PORTABLE FIRE ENGINES; FIRE EXTINGUISHERS.

Engineering Service.

The Engineering Department of the FOAMITE FIREFOAM COMPANY is at the disposal of engineers, architects and corporations, for the solution of their fire protection problems. We will gladly submit designs for complete fire protection systems for oil refineries, manufacturing plants, factories and mills. Where the fire risk is great and obviously outside the range of ordinary fire protection apparatus, correspondence is specially solicited.

Foamite Firefoam Method of Extinguishing Fires.

The principle of Foamite Firefoam is based on the well-known fact that carbonic acid gas is the most deadly enemy of fire. In applying this gas the problem is to prevent its being blown away from the fire by the

generated high pressure, is eight times the capacity of the container. Foamite Firefoam is not dangerous or harmful in any way. It does not soak in or damage like water.

Efficiency.

The efficiency of Firefoam leaves nothing to be desired. In many instances it has extinguished fires within a few minutes, in gasoline and oil tanks up to 55,000-barrel capacity and 114-ft. diameter. It is the standard form of fire protection in many of the large oil companies throughout the United States. Oil and gasoline fires are especially mentioned because apparatus which will put out such fires on a large scale can easily extinguish fires of a less dangerous character.

Apparatus.

The portable engines are made standard in 40-, 250-, 500-, and 800-gal. sizes. Special engines are built of the non-portable type, in any capacity up to 12,000 gals. and larger.

FIERCE FIRE IN PIT (11 by 13 ft.) AT COKE PLANT
Tar, benzol and gasoline burning. Foamite Firefoam engine just starting

FIRE SHOWN OPPOSITE COMPLETELY EXTINGUISHED
Firefoam coats the burning walls and floats on the burning inflammables in the bottom of the pit, completely extinguishing the fire and making refashing impossible

wind or draft created by the fire, and to retain it as a blanket on the burning surface, thus cutting off the air and quickly smothering the fire.

Foamite Firefoam solves this problem completely by holding the carbonic acid gas in the form of a blanket of foam that coats all burning substances and fireproofs them, thus rendering re-ignition difficult. It is very light and floats on all burning inflammable liquids, quickly smothering flames which would merely be spread by water and ordinary chemical extinguishers. The blanket of foam keeps down fumes and smoke; it also insulates and fireproofs, thus preventing the spread of fire. In these two respects, coating and floating, Foamite Firefoam is unique and is vastly superior to any other type of fire extinguishing material. Furthermore, Foamite Firefoam has great capacity, as the quantity formed and discharged from the apparatus, at self-

Products.

Manufacturers of DEVICES for AUTOMATIC SPRINKLER SYSTEMS:

Automatic Systems: Dry Pipe and Wet Pipe.

Outside Systems: Cornice, Roof and Window.

Standpipe Systems: Yard Hydrants, Tanks and Mains.

DRY PIPE VALVES, ALARM CHECK VALVES.

Heating Department: One- and Two-gravity (steam) Systems, Gravity Hot Water Systems, Forced Hot Water Systems, Vacuum Systems, also Power Piping Equipment.

Information and Approval.

The National Fire Protection Association, in 1903, adopted resolutions which provided that automatic sprinklers should be installed by recognized automatic sprinkler companies and that they should not be sold to be erected by those not experienced in the installation of automatic sprinkler equipment, unless the sprinkler company furnishing the devices guaranteed such installation to comply with the National Board of Fire Underwriters' rules.

The GLOBE AUTOMATIC SPRINKLER Co. guarantees its own installation; and all the devices installed are fully approved by the Underwriters' Laboratories, Inc., and all insurance bureaus in the United States and Canada.

Globe Automatic Sprinklers.

Sprinklers are simple automatic valves consisting of a bronze frame, bronze upper and lower levers, a bronze die stamped fusible link, a bronze die stamped fixed water distributor, a bronze die stamped valve and a die stamped copper gasket.

Frame is provided with a turned seat. Between this seat and valve is placed the copper gasket, which insures a tight, leakless joint when sprinkler is not in operation. Valve is held closed by a pair of levers, at out end of which is placed a link, made to fuse at different temperatures.

Special Features—Model C.

(1) Perfected tilting bar construction, insuring a

TRADE-MARK

perfect mechanical carrying of load and removing all strains from fusible metal. (2) High factor of safety due to tilting bar construction. (3)

Positive and uniform fusing due to removal of strain from solder, enabling it to function freely and instantly. (4) Dependability of operation assured through positive and instant separation of link plates, caused by tilting bar. (5) Use of die stamped parts wherever possible, insuring uniformity of manufacture, extreme and uniform strength, and maximum resistance to corrosion.

Globe Dry Pipe Valves.

Designed for use in automatic sprinkler systems wherever it is not possible to keep piping filled with water at all times—due to absence of (or insufficient) heating facilities; or, when sprinklers are placed in cold storage vaults, open driveways, loading platforms, etc. It is simply constructed and reliable in operation. Any air pressure exceeding 12 lbs. will prevent valve from opening, regardless of water pressure in ordinary system. For technical details of application, construction, connections, and installation, write for special folder describing Globe dry pipe valves.

Globe Alarm Check Valves—Model E.

Used in connection with wet pipe sprinkler systems in buildings of every character for giving an immediate alarm upon opening of a Globe sprinkler. It is simple, reliable and positive in action; all parts readily accessible. Complete equipment consists of an alarm check valve, a retarding or variable pressure chamber, water motor for mechanical alarm, and a circuit closer for electrical alarm.

Co-operative Service.

Engineers, architects and contractors are invited and urged to avail themselves of the facilities the GLOBE AUTOMATIC SPRINKLER Co. extends through its numerous offices to consult with its engineers, from the inception of plans to the end, that good and economical engineering may distinguish the completed structure.

SECTION OF MODEL C SPRINKLER HEAD
Made in 4 fusing temperatures, 165°, 212°, 280°, 360°

Products.

ARC LAMPS and MAZDA STREET LIGHTING EQUIPMENTS; SWITCHBOARDS; SWITCHBOARD INSTRUMENTS; CIRCUIT BREAKERS; LIGHTNING ARRESTERS; FEEDER REGULATORS.

MOTORS, DIRECT CURRENT, SQUIRREL CAGE and SLIP RING ALTERNATING CURRENT; MILL MOTORS; CRANE and HOIST MOTORS; ELEVATOR MOTORS; SYNCHRONOUS MOTORS; WESTINGHOUSE CONTROLLERS.

Mazda Lamp Fixtures and Arc Lamps.

A complete line of "Luxsolite" fixtures for high candlepower Mazda lamps; street hoods for low candlepower Mazda lamps, suitably arranged with diffusing globes, or Holophane refractors, for any service. Also ornamental posts, brackets, cut-out pulleys, mast arms and other specialties forming a complete line of equipment for any locality.

Modern high efficiency arc lamps for all kinds of circuits are available for any service. Series regulators and safety coils to meet all requirements are regularly furnished.

LUXSOLITE FIXTURE WITH REFLECTOR AND SKIRTED REFRACTOR

Switchboards.

Westinghouse switchboards, by use of 7-in. meters and remote-control oil breakers, require a minimum of floor space. Front of board is entirely symmetrical; all indicating meters match perfectly in appearance. A complete line of standard panels is listed for prompt shipment.

TYPE JD SWITCHBOARD PANEL

Switchboard Instruments.

Westinghouse instruments comprise the only complete line of 7-in. A.C. instruments with 14 1/4-in. scales, on the market, and have full, open, glass fronts; corresponding D.C. instruments have scales that are equal to any 9-in. instruments previously used. Three of these 7-in. instruments can be mounted horizontally on a 24-in. panel, and two on a 16-in. panel.

7-IN. INSTRUMENT

Circuit Breakers.

TYPE CA CARBON CIRCUIT BREAKERS—Designed particularly for the severe current and interrupting conditions met with in operating low voltage direct and

TRADE-MARK

alternating current systems; made for both manual and electrical operation.

TYPE CD CARBON CIRCUIT BREAKERS—May be used for motor starting control of industrial circuits, and for control of feeder circuits. They are supplied for voltage up to 750, and for capacities up to 300 amperes.

TYPE F OIL CIRCUIT BREAKERS—Comprise a complete line of moderate capacity non-automatic and automatic, manually and electrically operated breakers.

For indoor service the breakers are made in panel mounting, remote-control wall mounting and pipe mounting forms, and for outdoor service in pole and subway mounting forms.

TYPE F-3 OIL CIRCUIT BREAKER

Indoor, electrically operated, wall mounting, automatic, three-pole, single throw, 500 amperes, 13,200-volts

Lightning Arresters.

Westinghouse electrolytic arresters have been developed for maximum results and have the greatest freedom of discharge and protective effect possible in the present state of the art.

The Westinghouse impulse gap, when used with electrolytic arresters in place of the plain sphere gap, selects high frequency or steep wave front static impulses and discharges them at a much higher voltage than the normal frequency discharge voltage of the gap, thus adding greatly to the protective value of this form of arrester.

A complete line of arresters and choke coils for all classes of service is provided.

ELECTROLYTIC ARRESTER

Feeder Voltage Regulators.

These regulators permit maintenance of uniform voltage at center of distribution of each feeder of an alternating current transmission system, by independently compensating the voltage drop. In the induction type practically an infinite number of steps of regulation are offered. Maintenance expense is low.

Made for all classes of service, and for circuits of any commercial size, voltage or frequency. For automatic motor operation, the regulator is operated by a motor and electric brake controlled through a set of relays and a line drop compensator.

INDUCTION FEEDER REGULATOR

Westinghouse Electric Motors.

Westinghouse electric motors can be supplied for every service and for operation on every commercial circuit. Some of the different types are listed below, complete information on motors for any service in any industry can be obtained on request at our nearest office.

MOTOR APPLICATIONS

INDUSTRY	TYPE	LEAFLETS
Brick and clay plants	CS, and CW	CS3072
Cement plants	CS, CW	2321, 3860, 3553, CS3073
Chemical plants	CS, CW	2321, 3860
Coal mines	CS, SK	2321, 2359
Contractors	CS, SK, CI, CW	2321, 2359, 3687, 3860
Electric shovels	CS, CW, SK	2321, 3860, 2359, 3710
Electrochemical	CS, CW, SK	1160, 3820, 2359-A
Flour mills	CS, CW	2321, 3860
Hoists	CW, CI, K	3860, 3687
Industrial locomotives		3723
Laundries	CS	2321, 3725
Leather	CS, CW	2321, 3860
Metal mines	CS, SK	2321, 2359
Metal working	SK and CS	2359, 2321, CS3042
Paper mills	CS, CW, SK	2321, 2359, 3505, 3506 3507, 3508
Printing plants	SK, CW	2359, 3792, CS3185
Pumping plants	CS, CW, SK	2321, 3860, 2359, CS3082
Refrigerating	E, G	1150, 2409-A
Rubber	CS, CW, SK	2321, 3860, 3693
Smelters	MC, MA, CS, CW	1101, 2383, 2321, 3860
Steam railroads	CS, SK, Arc Welding	2321, 2359, 3668, CS3042
Steel mills	MC, CS, CW, SK	2361, 2383, 2321, 3860, 2359
Woodworking	CS, CW	2321, 3860

MILL MOTORS—For steel mills and other severe services where varying speed is required, the type MC motor for direct current, and the type MA for alternating current are used. They have steel frames, massive shafts, very large bearings, fireproof insulation and other features that insure reliability. Commutating poles in type MC motors insure sparkless commutation.

Capacities, type MC motors, 5 to 250 h. p.; type MA motors 5 to 162 h. p. for 25 cycles.

MILL MOTOR
Direct and alternating current

DIRECT CURRENT MOTORS—Type SK motors are for general service in all industrial applications using direct current and are supplied for either constant or adjustable speed service. Especially adapted for driving machine tools. They are supplied either open, semienclosed or totally enclosed, according to the conditions under which they must operate.

Capacities 1½ to 250 h. p., 115, 230 and 550 volts.

DIRECT CURRENT MOTOR

ALTERNATING CURRENT WOUND ROTOR MOTORS—Types CW and CI motors for polyphase circuits are for constant or varying speed service where the starting conditions are severe, and the starting current must be kept low. They are built along the same mechanical lines as the type CS motors, but have different rotors. For intermittent service, such as hoists, cranes, etc., use the

CI motor, and for continuous service use the CW motor. Capacities from ½ to 650 h.p.

ALTERNATING CURRENT SQUIRREL CAGE MOTORS—Type CS motors for polyphase circuits are for general constant speed service in practically all industries.

Capacities with type CSA motors ¼ to 650 h. p.

SQUIRREL CAGE MOTOR

ELEVATOR MOTORS—Specially designed for elevator service. They have high starting torque and ample overload capacity and are very quiet in operation. Built in several different classes to suit different classes of elevator service for both alternating and direct current.

ELEVATOR MOTOR

SMALL POWER MOTORS—Made in sizes from 1/20 to 3 h. p. for operation on all commercial direct and alternating current lighting circuits, to drive any small machine that requires a small amount of power.

CRANE AND HOIST MOTORS—For severe intermittent service when high starting torque is required; type K motors for direct current, 2 to 52 h. p.; type CI, 1½ to 300 h. p.

DIRECT CURRENT CRANE MOTOR

SYNCHRONOUS MOTORS—Westinghouse synchronous motors, either belted, coupled or engine-type for compressor drive, operate at any power factor. Different types for different requirements. They are an ideal drive for ammonia compressors, because they are right in speeds and rugged yet simple in construction. Their application causes better voltage regulation, improved line conditions, higher operating efficiency with lower maintenance costs.

TYPE G SYNCHRONOUS MOTOR
WITH PEDESTAL BEARINGS

Westinghouse Controllers.

Westinghouse controllers can be supplied for every kind of service, hand or automatic operation. Long experience in the manufacture of motors and their application to machines in all industries has enabled us to build controllers fitted for the service they are to perform for both direct and alternating current motors. They are characterized by strength, simplicity and compactness of construction, as well as ease of installation and operation. All wearing parts can be easily and economically renewed.

Products.

The products of the GENERAL ELECTRIC COMPANY comprise practically every kind of Apparatus and Machinery used in the Generation, Transmission, Distribution and Use of Electrical Energy. Complete index of products and bulletins on page 1051.

TRADE-MARK
Guarantee of Excellence on
Goods Electrical

Engineering Service.

The factory, engineers, laboratory and equipment of the GENERAL ELECTRIC COMPANY are at the disposal of all engineers in authority or responsible for the design, erection or operation of manufacturing or engineering equipment.

At each district office a specialist of this company is at the service of such persons wishing authoritative advice on all electrical matters. Catalogues, special bulletins and prices are readily obtained at the nearest branch office.

Unified Responsibility.

It is entirely practicable for the engineer to standardize with G-E equipment throughout. By this procedure, all parts inter-relate and much time as well as capital investment in spare parts can be saved. The added advantage of having all electrical equipment built by one company, ready for immediate installation and operation, is obvious.

Guarantee.

The name "General Electric" on any electrical device is a guarantee of quality, backed by over a quarter century's experience in the generation, transmission, distribution and application of electricity. Its thousands of products in use in all parts of the world have established the G-E trade-mark as the modern guarantee of excellence on goods electrical. As commercial installations have been made in almost every section of the country, prospective purchasers can be referred to appliances in active service.

General.

It is a well recognized fact that a knowledge of the

many functions wherein electricity enters into modern engineering practice is essential to every engineer and to every official in charge of manufacturing operations. Most manufacturing plants maintain their own engineering departments, but only the largest of them have engineers devoting their attention exclusively to electrical problems.

The purpose of these pages is to show in a broad way the scope of utility of electrical equipment as applied to the generation, transmission, conversion, distribution and utilization of electricity; also to point out the various decisions relative to electrical equipment that the average industrial engineer or official may be called upon to make, and to show how the GENERAL ELECTRIC COMPANY may co-operate therein, by furnishing engineering service, as well as equipment.

Every factory, either at its inception or as a state in its development, may be required to decide upon:

- (a) The type of generating and current converting apparatus.
- (b) The kind of switchboard, switches, circuit breakers and measuring instruments. If decision (a) is necessary, this decision will also have to be made. Even in case of purchase of power, it would be necessary to make decision (b).
- (c) The type and size of transformers, lightning arresters, electrical conductors, and other electrical transmission apparatus.
- (d) The kind and size of electrical conductors.
- (e) Motors and control for particular applications.
- (f) The type of wiring specialties.
- (g) Electrical equipment for battery charging, arc welding, industrial heating, material handling, etc.
- (h) The various requirements for lighting, including lamps.

It is manifestly impossible to display all the products manufactured by the GENERAL ELECTRIC COMPANY, but descriptions and illustrations of typical apparatus are given, together with concrete suggestions that may aid in reaching a decision on the points tabulated.

Curtis Steam Turbines.

Hand in hand with high pressure steam, the use of the superheater, and condensers for high degrees of vacuum, comes the steam turbine.

Its advantages have long been recognized, and, as a result, practically all the electric power produced by large steam stations is generated by turbines.

The Curtis steam turbine, as manufactured by the GENERAL ELECTRIC COMPANY, is distinguished by its low cost of operation and reliable service.

Electric power must first of all be cheaply generated, and secondly, must be dependable, as breakdowns, during working hours, seriously cripple production, thereby increasing production costs.

Curtis turbines are usually constructed with the first stage wheel carrying 2 rows of revolving buckets, followed by several stages, each containing a single row. The very small sizes are built with one or more stages, each with 2 or 3 rows of revolving buckets.

No internal lubrication is necessary, and since the oil is circulated through the bearings in a closed system, the cost of oil is very small.

A protective emergency governor is supplied with

300 KW., 3600 R.P.M., ALTERNATING CURRENT CURTIS STEAM TURBINE

each turbine. When the turbines drive generators or other apparatus requiring close speed regulation, a separate and sensitive governor controls the speed of the machine. These governors are simple in design and have nothing about them to give trouble.

The exhaust steam from the turbine is free from oil and may be used for heating the boiler feed water, or for heating the building, or for other low pressure industrial purposes.

Curtis turbines give the maximum of power with a minimum of floor space and head room.

They are built in sizes of 500 watts upward for direct current generators, and from 100 kw. upward for alternating current generators; also for low and mixed pressures.

The prime requisites, characteristic of Curtis turbines, may be sub-divided as follows:

ECONOMY—(1) High initial efficiency maintained in service.

(2) High steam economy over wide range of load.

(3) Ability to effectively utilize extreme steam conditions, i.e., high pressure, superheat, and vacuum.

(4) Low cost of supplies, repairs and maintenance.

RELIABILITY—(1) Simple mechanical construction.

(2) Short shaft: disc type wheels.

(3) Proper proportion of turbine and generator to each other.

(4) Absence of distortion, due to sudden change in internal temperatures.

Bulletins 42201A, 42010, 62010 to 62013.

LOW AND MIXED PRESSURE TURBINES—The low pressure turbine is designed to take exhaust steam from engines, pumps, air compressors, hoists, etc., and convert it into useful power.

The mixed pressure, in addition, will carry all or any portion of its rated load on high pressure steam.

Low and mixed pressure turbines are of the same general construction as the high pressure machines and embody all the well-known advantages of the Curtis type of turbine.

TURBINE GENERATOR HEADLIGHT SETS—To meet the rigid requirements of steam locomotive headlight service, a turbine generator set has been designed especially to supply power for the headlight and cab lights, although its use may be extended also to other applications including steam shovels, derricks, wrecking cranes, oil well drilling outfits, launches and tugboats.

This set consists of a single-stage Curtis turbine direct-connected to a compound-wound generator governed on the steam end by a self-contained pressure regulating valve, and controlled electrically by a stationary magnetic brake coil and rotating copper disc which maintains practically constant voltage under different loads.

For locomotive headlight service the set is made in a 500 watt, 32 volt capacity for operation on 125-, 225-lb. boiler pressure.

For industrial applications the set is made in a 500-watt, 110-volt capacity for operation on 70 to 170 lbs. boiler pressure.

Parts are interchangeable so that sets of either voltage can be furnished to operate on either range of boiler pressure when requested.

Bulletin 42014A.

TYPE CY-32-B 3600 R.P.M. HEADLIGHT TURBINE GENERATOR

500-watt 32-volt 125 to 225 lbs. steam pressure.
500-watt 110-volt 70 to 170 lbs. steam pressure

Steam Engine Generating Sets.

Made for small plants, and for lighting construction operations in isolated places, requiring 75 kw. or less.

These sets have the great advantage of being manufactured completely at one factory, insuring perfect fit, uniformity of finish, and a thorough test of the combined unit before shipment is made.

Used extensively for both power and lighting service.

Bulletin 42300.

SINGLE CYLINDER, FORCED LUBRICATION ENGINE, WITH D. C. GENERATOR

Water Wheel Driven Generators.

The GENERAL ELECTRIC COMPANY is producing units ranging in capacity from 37½ kv-a. to 32,500 kv-a.

Both horizontal and vertical types are individually designed to meet most efficiently the various requirements imposed by the supply of water available for any given development and the operating conditions involved in either constant or fluctuating hydraulic heads.

In addition to water wheel driven generators, the GENERAL ELECTRIC COMPANY manufactures all classes of electrical apparatus necessary for the complete equipment of hydro-electric stations, and the service of the company's engineers are always at the disposal of prospective customers to assist in selecting apparatus which will insure safety and reliability in operation and the most efficient utilization of the water power.

3500-VOLT VERTICAL SHAFT WATER WHEEL DRIVEN GENERATOR

WASHINGTON WATER POWER CO., LONG LAKE DEVELOPMENT ON THE SPOKANE RIVER

TWO 17,400-KV-A., 200 R.P.M., 4000-VOLT GENERATORS INSTALLED IN LONG LAKE POWER STATION

Ultimate installation will consist of 4 units of this capacity. These generators have a capacity of 19,500 kv-a. with forced ventilation

More than 3,000,000 kv-a. G-E wheel generators are in successful operation.

Bulletin 40600.

Belt Driven Generators.

The GENERAL ELECTRIC COMPANY manufactures belt driven D.C. generators in capacities from a fraction of a horsepower to 300 kw. capacity in standard voltages. A.C. generators are designed for various frequencies, voltages and phases, from 7½ to 550 kw.

TYPE RC GENERATOR WITH SLIDING BASE AND PULLEY

Detailed information covering these generators will be found in bulletins 40400B, 40019, 40021.

Motor Generator Sets.

The GENERAL ELECTRIC COMPANY has developed a large number of motor-generator sets including a wide range of sizes and types adapted to different purposes.

Motor-generator sets may be divided into three general classes: those made up of D.C. machines, those made up of A.C. machines, and those made up of both A.C. and D.C. machines.

The first class includes the balancer, battery-charging, booster, and the electrolytic sets. The second class, made up of A.C. machines, is known as frequency converters, which tie in between separate power systems with different frequencies. The third class, made up of both A.C. and D.C. machines, includes battery-charging, exciter, lighting, railway and power sets. This class is perhaps the most important and certainly the largest of the three.

A.C. is almost universal, but for some applications D.C. is still preferable. Practically all street cars are driven by D.C. motors; some of the newest and most up-to-date railroad electrification work is D.C. For power work, where variable speed is required, D.C. is now generally installed, and for electrolytic and battery-charging D.C. is absolutely necessary. With the great majority of power being generated and distributed as A.C., there is required a motor-generator set, a synchronous converter, or some form of rectifier.

300-KV-A WATER WHEEL GENERATOR VIRGINIA COTTON MILLS

Small size motor-generator sets up to 100 kw. are generally driven by induction motors; while larger sets are driven by synchronous motors. The synchronous motor has the advantages of power-factor correction and constant speed, while at same time it is cheaper to build.

Motors may be wound for any standard voltage up to 13,200, although in all but very large sizes it is probably more economical to step down the voltages to 6,600 or less through transformers.

For induction motors, Type M slip ring motors with external resistances are recommended above 750 kw.; for smaller sizes, Type K squirrel cage motors are generally used.

D.C. generators of standard sets range in size from 1/20 to 2000 kw. 600-volt machines of the railway type.

All new motor-generator sets, except those for railway and mine hoist work, are rated according to the latest A. I. E. E. rules; that is, machines are rated to give maximum output continuously without exceeding 50° C. No overload rating is given.

Bulletin 42552A.

Frequency Converter Sets.

These sets are primarily designed to change from one cycle condition to another; for example, a small town laid out for 25-cycle operation is absorbed by a large transmission company which operates on a 60-cycle basis.

Excitation is a complicated subject and no fixed rule can be laid down. Stations containing 3 or more units are usually provided with a motor-generator set and a spare, either of which is capable of furnishing the excitation for the whole station. This arrangement is economical.

If sets are not running in parallel and are subject to widely diverging loads, automatic voltage control is impossible with the single exciter system.

With a direct-connected exciter for each set the flexibility of the control is greatly increased, and there is a possibility of automatic voltage control for each set. See exciter on end of shaft in illustration of frequency converter.

Bulletin 42552A.

FREQUENCY CONVERTER WITH DIRECT-CONNECTED EXCITER

Boosters.

Booster sets are for use in railway stations to raise the potential of the feeders extending to distant points of the system; for storage battery charging and regulation; for station excitation systems; and in connection with the Edison 3-wire lighting system. The design of the various sets is closely dependent upon their application.

Booster sets are constructed in either series or shunt wound types and may be arranged for either automatic or hand regulation, depending on nature of service required.

Where there are a number of lighting feeders con-

nected and run at full load for only a short time each day, it will generally be economical to install boosters rather than to invest in additional feeder copper.

Bulletin 42552A.

SHUNT WOUND BOOSTER DIRECT-CONNECTED TO MOTOR

Balancer Sets.

A balancer set is a form of D.C. compensator. It consists of two D.C. machines connected in series across the line, either machine acting as a generator or motor depending on whether its side of the line is the more heavily or the more lightly loaded. By compounding the machine it is possible to equalize the voltages on both sides within 2%, even under conditions of maximum unbalancing.

These machines are rated by amperes carried in the neutral and not by the per cent. of unbalancing or kw. capacity of machines. Standard sizes range from 28 to 4000 amps.

In practice it is customary to connect a balancer to the line without fuses, as it has been found more advantageous to run the risk of damaging the balancer set rather than lose the neutral of the system.

Bulletin 42552A.

BALANCER SET

Synchronous Converters.

G-E synchronous converters are well known through their extensive use by railroads, electric light and power plants, large industrial projects and electrochemical operations in all sections of the country.

The commutating pole synchronous converter introduced by the GENERAL ELECTRIC COMPANY has been so successful in operation that it is now practically a standard design for all the larger sizes. These machines in the smaller sizes are especially suitable where substation equipment is subjected to infrequent peak loads.

The momentary overload capacity of the small commutating pole machines, 3 times normal load, allows the selection of substation units with less regard to the limitations imposed by occasional peaks. In the larger machines for city railways, the use of commutating poles has made it possible to build standard converters with

better commutating characteristics, lighter weight, and decreased cost.

For low-voltage industrial and electrolytic work, the regulating pole or booster type of synchronous converter is recommended.

SYNCHRONOUS CONVERTER WITH REVOLVING ARMATURE BOOSTER

For industrial service it is often desirable to transform a small amount of power from alternating to direct current; in which case Type TC 25- to 100-kw. capacity, 115- or 250-volt unit may be specified.

Bulletin 42500.

Portable Substations.

Most electric roads have certain sections on which it is necessary to handle heavy traffic occasionally, or on which traffic can be normally handled by one machine. In either case, economy in operation may be obtained and the cost of equipment reduced by the use of a portable synchronous converter substation, which can be easily transported and put in operation at any point where additional power is necessary. Its use in some cases may save the cost of a spare unit in several substations.

The GENERAL ELECTRIC COMPANY has in successful operation many of these portable substations, consisting of synchronous converter, transformers, switchboard and accessories arranged ready for operation in a specially built car.

Bulletin 42500.

500 KW. PORTABLE SUBSTATION. 60000 VOLTS A.C.; 1200 VOLTS D.C.

Synchronous Condensers.

Synchronous condensers consist of standard TB belt-driven alternators with squirrel cage windings. This winding increases starting torque, so that machine may be started from starting compensator or from starting taps on transformers. It is the most effective anti-hunting device on the market and will keep motor in step, if possible to operate a synchronous motor on system.

The machines may be operated as synchronous condensers at ratings of 30, 45, 60, 90, 120, 180 and 240 kv-a. at 240, 480, 600, 1150 or 2300 volts, 60 cycles, 2- or 3-phase, with a temperature rise not exceeding 50° C. on armature or field.

Bulletin 40400B.

BELT DRIVEN ALTERNATOR WITH D.C. EXCITER

Static Condensers.

The GENERAL ELECTRIC COMPANY has recently developed and perfected a static condenser designed primarily for improvement of power factor. The advantages of static condenser equipment over synchronous apparatus are most pronounced for capacities of 500 kv-a. and less, although in several cases they are more economical at 1000 kv-a. or higher ratings. Other advantages are: comparatively low cost in the smaller sizes; extremely low losses; practically no attendance, and long life due to absence of moving parts.

Static condenser equipments for 2300-volt service consist of a number of condenser units—a reactor for damping out the higher harmonics in voltage wave, a discharge resistance for draining condenser charge when disconnected from line, and an oil circuit-breaker for control of the equipment.

For 220, 440, and 550-volt service, an auto-transformer is provided, which steps the voltage to 1200 for condensers, to provide for most economical use of active material.

Static condensers have been standardized for circuits ranging in frequency from 40 to 125 cycles, in voltage from 220 to 2300, and in capacities from 30 to 300 kv-a., although they can be supplied for other voltages and capacities whenever necessary.

3-PHASE, 60-CYCLE 350-KV-A. GE STATIC CONDENSER

A recent installation of a 3-phase, 350 kv-a. static condenser has effected an increase in power factor of .65 to .85, enabling generating equipment to carry 24% greater load, reducing excitation requirements 20% and improving voltage regulation, eliminating necessity for new generator, boiler and auxiliary capacity.

Bulletin 49714B.

Voltage Regulators.

GENERATOR VOLTAGE REGULATORS—Designed to control A. C. or D. C. stations having a capacity as high as 200,000 kw. These regulators are intended for switch-board use, but certain types can be mounted on pedestals.

Type TD, Form G

Type CD, Form A and Regulating Counter EMF Motor

D. C. GENERATOR VOLTAGE REGULATORS

A comparatively new D. C. voltage regulator has been designed for the control of D. C. generators, 35 kw. and above supplying lighting and mixed power and lighting service. The voltage is held constant by a coil which controls contacts operating in the field of the small motor mounted on the back of the regulator panel. The motor armature generates a counter EMF opposing the field of the generator being controlled, the amount depending on the action of the regulator contacts. A magnetic brake on the motor keeps the motor speed within proper limits.

The principal advantages of a steady voltage: more economical lamps may be used; fewer lamp renewals; saving in energy; no loss of revenue; reduction of number of switchboard attendants.

Bulletin 45500A.

**A. C. GENERATOR VOLTAGE REGULATORS**
For bracket, panel and pedestal mounting

FEEDER VOLTAGE REGULATORS—Voltage on each feeder may be maintained constantly at normal by installing an induction voltage regulator in each feeder. These regulators are designed for the control of single-phase or polyphase circuits of any standard voltage, frequency or current capacity. Supplied for hand or motor (remote) control. Motor operated regulators made automatic by addition of certain auxiliaries.

Principal Advantages: Improved service; savings in installation costs; line drop can be correctly compensated for under all conditions of load.

Adapted for outdoor use by addition of covers to protect auxiliary apparatus as illustrated. A panel may be furnished for auxiliaries, making installation a compact unit.

Bulletin 45402.

The GENERAL ELECTRIC COMPANY has developed regulators suitable for pole mounting at or near center of load. This type can be used advantageously for regu-

lating voltage of a feeder taken from a transmission or power system and supplying a small village or community.

The same conditions prevail on a long feeder from which power is taken at a number of points along its length. Although all regulators for outdoor service are of the induction type, 2 designs have been developed: Type PIRS, a self-contained design for the control of single-phase feeders of 25 kv-a. or less and Type IRS, a modification of the standard station design for the control of either single-phase or polyphase feeders of over 25 kv-a.

Standardized rating of PIRS Type, 2.3 kv-a., 60-cycle, 2300-volt primary, 230-volt secondary, 10-amp., single-phase, oil-cooled automatic.

Bulletin 45505.

For Indoor Service

For Outdoor Service

Pole Type

FEEDER VOLTAGE REGULATORS**Lever Switches.**

For D. C. circuits the use of lever switches is general—as a circuit breaking device within certain capacities, as a starting device (in connection with starting resistances) for motors or synchronous converters, and as a disconnecting device in series with circuit breakers.

For A. C. circuits their use is not quite so general as a circuit breaking device; oil circuit breakers being recommended for large capacities and for circuits above 440 volts. Extensively used as disconnecting devices for isolating oil current breakers and other apparatus.

All G-E lever switches are constructed to withstand severe and constant usage and meet all the requirements of the National Board of Fire Underwriters. The ratings are based on maximum current which the device will carry continuously without causing a temperature rise of more than 28° C.

Switches are made either single or double-throw, 1, 2, 3 or 4-pole and with straight or spade handle.

Air brake switches of other designs are also available, such as control switches for use with electrically operated apparatus, switches of different types for transferring or disconnecting instruments, coils, plug switches for constant current lighting circuits, and electrically operated switches for various purposes.

Air Circuit Breakers.

The GENERAL ELECTRIC COMPANY has been manufacturing many types of air circuit breakers for over 20 years. The satisfactory operation given in all kinds of railway, industrial and building service is an indication of the quality and excellent design of the G-E air circuit breaker. The advantage of purchasing G-E air circuit breakers, which come mounted on switchboard ready for immediate operation, is obvious.

For direct current systems the use of air circuit breakers is universal as an automatic device for taking care of abnormal conditions on machine or feeder circuits. These conditions may be overload or short circuit, underload, under voltage, over voltage, reverse current, or unbalanced voltage in 3-wire systems. Some of these are taken care of directly by breaker as a self-contained device, and some by use of auxiliaries acting to trip breaker either mechanically or electrically. By means of a shunt trip or under voltage release, the breaker may also be actuated by operation of some other device, such as limit switches, relays, speed limiting devices on machines, and push button control. In addition, breakers are used occasionally as non-automatic breaking devices by omission of overload parts.

For alternating current systems above 440 volts, air circuit breakers are only rarely employed, since the oil circuit breaker covers the larger part of this field. The conditions most commonly taken care of are overload and under voltage. These same conditions as well as reverse power, reverse phase, and various other abnormal disturbances can be taken care of by means of alternating current relays used in connection with the tripping mechanism of the breaker.

The hand operated air circuit breaker is type most commonly used. By use of remote control breakers the station wiring can very often be laid out to better advantage, resulting in a large saving of cable. For such conditions electrically operated breakers are available.

Self-contained solenoid operated breakers up to 3500 amps., alternating current and 4000 amps. direct current are listed below. For breakers above these capacities refer to the General Office for information.

All G-E air circuit breakers are approved and listed by the Underwriters' Laboratories, Inc., and will carry full rated loads continuously with a temperature rise not in excess of 30° C.

‡ Can be made non-automatic by omission of overload parts.

Oil Circuit Breakers.

A wide and thorough knowledge of conditions, and years of experience in designing and building oil circuit breakers, which fulfil every requirement in long-continued service, have enabled the GENERAL ELECTRIC COMPANY to place on the market complete and comprehensive lines of oil circuit breakers to meet a great variety of conditions. These lines comprise breakers for service on potentials up to 155,000 volts and above, and in current capacities up to 5,000 amperes. They are liberally designed and strong in construction, and combine every essential of reliability and satisfactory operation.

Oil circuit breakers are either hand or solenoid

operated. A few hand operated breakers are non-automatic only, all others can be obtained for both automatic and non-automatic service. Solenoid operated breakers can be equipped with standard coils for tripping at 125, 250 or 600 volts D. C. Coils for tripping at other voltages can be furnished on request. Oil circuit breakers can be equipped with circuit opening and circuit closing auxiliary switches for electrically interlocking, for indicating or for controlling an auxiliary circuit; bell alarm switches; under-voltage release for tripping breakers; relays for every purpose.

Parts are accurately constructed in order to insure perfect adaptability to any like breaker, or to any similar function of the same breaker.

Type FK35

Recommended for use up to 7,500 volts on systems where breakers of moderate capacity—400 to 800 amp.—are required. Bulletin 47445

Type FK32

Recommended for use up to 15,000 volts on systems of moderate capacity where service is severe. Bulletin 47450

OIL CIRCUIT BREAKERS FOR GENERAL USE ON LOW VOLTAGE SYSTEMS

These breakers are of standard unit construction, each unit consisting of oil tank, cover insulators, studs and contacts. Thus a single, double, 3- or 4-pole breaker is made up respectively of 1, 2, 3 or 4 standard units plus frame, breaker mechanism and either manual or solenoid-operating mechanism.

Each standard unit is suspended from frame of the oil circuit breaker by attaching the oil tank to under surface of frame. Each oil tank is held in position by hook bolts.

Ratings are based on the maximum current breakers will carry continuously without overheating

Type FP10

This type with 2-coil overload trip is designed for starting and controlling 25-, 40- and 60-cycle induction motors of 25 h.p. or less, up to 600 volts, but not above 50 amps. for automatic or non-automatic service.

Made 3- and 4-pole, single throw, quick make-and-break as follows:

Non-automatic; with 2-coil, series overload, inverse time trip, with undervoltage instantaneous trip; with inverse time overload trip and undervoltage instantaneous trip for 4-pole breaker only (this breaker can be adapted for 3-pole service); with time delay overload protective plugs and undervoltage release (3-pole only). Bulletin 47419A

Type FK20

Designed for starting and controlling induction motors in industrial applications, especially in some branches such as textile and flour mills, coal mines, in the pumping and refining of oil, etc., where inflammable dust or gases are present.

Built automatic and non-automatic for 2-, 3- and 4-wire systems, single throw, up to 2,500 volts and 300 amps. The trip coils can be operated at 25% overload without exceeding the temperature limits prescribed by American Institute of Electrical Engineers. Bulletin 47433A

OIL CIRCUIT BREAKERS FOR USE IN FEEDER OR MOTOR CIRCUITS

Type FH

MOTOR OPERATED BREAKER, MODERATE CAPACITY

This type, very generally used in central stations, is an unusually reliable A. C. circuit breaking device. Designed for use up to 70,000 volts and as high as 4,000 amps. Motor operated, and made also in removable truck form so that the entire breaker on any pole may be removed for inspection or adjustments. Bulletin 47495

Type FK25

OIL CIRCUIT BREAKER, FOR HIGH CURRENT CAPACITY

Designed for use on low voltage, high ampere capacity A. C. circuits. Built for 600 volts; 3,000, 4,000 and 5,000 amps.; 3-pole, single throw. Bulletin 47471

Type FK36

LARGE CAPACITY HIGH VOLTAGE BREAKER

For ratings from 15,000 to 155,000 volts and above; 3-pole, single-throw. This breaker is made in three types for different interrupting capacities at any voltage. The FK36 is designed for indoor use; FK36 for outdoor use. Bulletin 47478

Switchboards.

The GENERAL ELECTRIC COMPANY offers a complete line of switchboards for all systems of electrical distribution. It has divided switchboards into three broad classes as follows: "Standard Unit Panels," "Modified Standard Unit Panels" and "Special Panels."

THE STANDARD UNIT PANEL—This has been developed, classified and listed to meet certain conditions which have been found to occur repeatedly in connection with control and distribution of electric power. It has not been developed for voltage above 1500 direct current or 3500 alternating current, although later it will be extended beyond these limits.

It is advisable whenever possible to use standard unit panels, for they are less expensive than the other classes, requiring less time to build and ship, though quality and workmanship are the same.

Standard unit panels may be ordered simply by one or more catalogue numbers, taken from the GENERAL ELECTRIC COMPANY's switchboard bulletins. Each bulletin is complete in itself and covers panels in a distinct class. They are shown in outline and the equipment is specified in every detail necessary to enable one to select just what is needed.

These panels are so designed that they can be assembled in different combinations, to form a complete switchboard having a neat, uniform appearance, both front and back, all parts on the back being easily accessible. All equipments on these boards are made by a single company, thus centralizing responsibility for behavior of the entire switchboard.

THE MODIFIED STANDARD UNIT PANEL—Of same general design, construction and appearance as standard unit panel, but recommended to meet requirements which are either modifications of conditions covered by standard unit panel or are in voltage or capacity beyond its scope.

THE SPECIAL PANEL—This is constructed to meet unusual conditions of voltage, capacity, control, architecture, etc.; the Panama Lock control boards serve as an extreme example.

CO-OPERATIVE SERVICE—Industrial and consulting engineers are invited to confer with switchboard specialists stationed in the principal branch offices of the company. Sketches, detailed drawings and specifications of any such special boards, or the adaptation of standard unit panels will be cheerfully and quickly furnished on request.

Bulletin 47001.

D. C. Switchboards, Small Capacity Plants.

D. C. 2-WIRE GENERATOR AND FEEDER PANELS—These panels are particularly adapted to use where it seems necessary to keep initial expense as low as possible, as in small manufacturing plants and office buildings. Furnished with or without separate generator switches.

Panels without generator switches made for both floor and wall mounting.

Feeder circuits on a single panel up to 6 and protected by fuses or circuit breakers.

TYPICAL STANDARD UNIT BOARD FOR 2 GENERATORS AND 7 FEEDERS

125- and 250-volt D. C. standard unit small plant switchboards, wall or floor mounted on supports 64 or 76 in. high. For 2-wire general power and lighting service.

Bulletin 47050A.

D. C. SINGLE POLARITY MINING PANELS—Particularly adapted for use in small mining plants where mining locomotives are operated in accordance with the usual railway practice.

As the *negative is grounded*, the circuit breaker is connected between negative brush and series field of machine to protect the machine in case of grounds, either internal or between the machine and bus. The series field of an incoming machine may be connected in multiple with those of the running machines and the voltage adjusted before closing main switch, which insures correct polarity of incoming machine and the least disturbance in paralleling.

Generator panels are 250/275-volt up to 330 kw. or 550/575-volt up to 368 kw.

Feeder panels are single and double circuit up to 1200 amps. per circuit.

Bulletin 4877.

D. C. 3-WIRE GENERATOR AND FEEDER PANEL—Designed especially for Edison 3-wire service in small plants; the generator is protected from grounds or short circuits across lines or between neutral and outside lines by a double pole, double coil, overload circuit breaker.

Panels are suitable for operation on ungrounded or grounded circuits, and subpanels can be furnished for additional feeder circuits or to take care of break down service.

Ammeters are furnished for both sides of generator armature circuit, so that balancing of system is easily determined.

125/250-volt D. C. standard unit 3-wire combination generator and feeder panels up to 100 kw. 76 in. high for 2- or 4-feeder circuits and 90 in. high for 6-feeder.

Bulletin A-4189.

STANDARD UNIT 3-WIRE GENERATOR AND FEEDER PANEL

D. C. Switchboards, Large Capacity Plants.

DIRECT CURRENT EXCITER PANELS—Used with and line up with any G-E alternating current panels 90 in. high.

STANDARD UNIT SWITCHBOARD WITH D. C. EXCITER PANELS

Various alternatives in instrument equipment are available, and panels can be used with or without

generator voltage regulators and with shunt or compound exciters operating alone or in multiple. When panels are to be used with exciters that are units of motor generator sets, such panels are equipped with reverse current circuit breakers, which open only when there is danger of the generator motoring from the exciter bus. 125-volt D. C. standard unit double polarity exciter panels. Single or double circuit, with or without voltmeter and with or without fuses.

Bulletin A-4036.

POWER STATION SWITCHBOARD—These panels are used with one set of busbars to which all generators are connected by single throw lever switches and circuit breakers. When generators are run in parallel, equalizer switches mounted on pedestals near the machines are used.

D. C. STANDARD UNIT DOUBLE POLARITY 2-WIRE LARGE POWER STATION SWITCHBOARD

Feeder panels are available with either circuit breaker or fuse protection and with 1 double pole or 2 single pole lever switches per circuit. Feeder panels are furnished with or without ammeters, and on 125- and 250-volts panels can be furnished with small capacity circuits up to 12.

Panels may be furnished for grounded or ungrounded systems. Generator panels up to 6000 amps., feeder panels up to 4000 amps., 125 and 250 volts—1200 amps., 600 volts.

Bulletin 47070.

STANDARD UNIT PANEL FOR EDISON 3-WIRE SYSTEM—Especially designed for Edison 3-wire service; special provision is made for trouble arising between either of outside lines or between neutral and outside. Each generator panel contains a double pole, double coil, overload circuit breaker; and equipment is so arranged that series fields can be established in the proper direction before a generator is thrown on bus. Panels are suitable for operation on ungrounded or grounded 3-wire circuits.

125/250-volt D. C. standard unit 3-wire generator and 2- or 3-wire feeder switchboards. Generator panels up to 200 kw. and feeder panels up to 1200 amps.

Bulletin 47070 contains considerable information on the proper control equipment for 3-wire generators.

PANELS FOR RAILROAD SERVICE—These standard switchboard units provide for the control of direct current machines and circuits which actually furnish current to the trolley wire or third rail on railway systems that operate with a grounded negative return. All panels are suitable for either main station or substation installation. Equipments for the alternating current side of synchronous converters and for other alternating current railway apparatus are

STANDARD UNIT, 1200-VOLT PANEL WITH WATT-HOUR METER FOR 2 SYNCHRONOUS CONVERTERS IN SERIES

available, together with auxiliary direct current panels, such as exciter panels.

Standard unit panels for railway service can be obtained as listed below:

600- to 1500-volt D. C. switchboard panels, single polarity, 3-section, 90 or 99 ins. high.

Panels, designed to line up together, are listed to control:

Generators and Converters—

100 to 2400 kw. on 600-volt systems.

100 to 1000 kw. on 1200- and 1200/600-volt systems.

125 to 1200 kw. on 1500- and 1500/750-volt systems.

Feeders—

2000 amps., maximum on 600-volt systems.

1200 amps., maximum on 600-volt systems with series boosters.

1200 amps., maximum on 1200-, 1200/600-, 1500- and 1500/750-volt systems.

Generator and converter panels are all arranged for parallel operation of machines at like voltage.

Bulletin 47010.

A. C. Switchboards, Small Capacity Plants.

A. C. GENERATOR AND FEEDER PANELS—Used mostly in small alternating current plants where there is likelihood of later extensions.

As units can be added at any time they constitute a flexible arrangement. Panels can be used for generators operating independently or in parallel. Also each generator can be connected separately to its own exciter or exciter can be run in parallel. Generator voltage regulators can be used. Panels are used with one set of busbars, to which all generators and feeders are connected by means of single throw lever switches or circuit breakers.

Both separate and combination generator and feeder panels. Generator panels, up to 200 kw. 240 volts, 400 kw. 480 volts. Feeder panels, 2 to 9 circuits with fuses, 2 to 6 circuits with circuit breakers.

Bulletin 47131.

These panels (Fig. B) are intended for use in small alternating current plants where ultimate capacity will not exceed 1500 kv-a. The panels are quite similar to those mentioned above, but oil circuit breakers are used instead of lever switches and circuit breakers. Oil circuit breakers for generators are non-automatic, and for feeders are automatic with two overload coils.

The oil circuit breakers are in all cases arranged for mounting on backs of panels. Sufficient range in capacity and arrangement of circuits is available to take care of conditions in average industrial plant.

Both separate and combination generator and feeder panels.

FIG. A. ALTERNATING CURRENT STANDARD UNIT PANELS, 240-480 VOLTS

FIG. B. ALTERNATING CURRENT STANDARD UNIT PANELS, 480-600 VOLTS

Generator panels up to 5000 kw. 480 volts, 680 kw. 500 volts. Feeder panels up to 800 amps. Bulletin 47133.

STANDARD A. C. PANELS—Intended for general power and lighting service in small industrial and municipal plants up to 1500 kv-a. Separate generator and feeder panels are furnished for parallel operation and can be used with or without a generator voltage regulator.

All instruments listed with panels are secondary and are operated from current and potential transformers included with the panels.

Both separate and combined generator and feeder panels. 1150- and 2300-volt alternating current standard unit switchboard. Generator panels up to 640 kw., at 2300 volts, feeder panels up to 200 amps.

Watt-hour meter equipment can be furnished. Bulletin 47135A.

SERIES ARC AND INCANDESCENT PANELS—For controlling constant current transformers in plants of any size. Made in 1150 and 2300 volts. For installation near the constant current transformers, which they control.

Switch equipment consists of safe and convenient plug switches and tubular expulsion fuse combined in single unit. On panels where secondary voltage is greater than 2300, ammeters are connected in series with circuit and are provided with insulating covers and with insulating bushings for ammeter studs where they extend through panel. Panels are available provided with watt-hour meter subbases used as a check upon the general meters in the station.

STANDARD UNIT A. C. PANELS

STANDARD UNIT SERIES ARC AND SERIES INCANDESCENT PANEL

A. C. Switchboards, Large Capacity Plants.

INDUCTION MOTOR STARTING PANELS—These panels are not intended to line up with other panels in a switchboard.

Panels for squirrel cage motors, where the compensators do not have self-contained oil circuit breakers, are provided with a combination of oil circuit breakers so interlocked that incorrect sequence of operation in starting a motor is impossible. Panels with low voltage release attachments are available. These are often particularly desirable where large numbers of motors are installed in isolated or unattended locations and all on one system. On panels for squirrel cage motors without compensators, compensator core and coils are furnished.

Bulletin 47140.

For starting and controlling squirrel cage, external resistance or internal resistance 3-phase induction motors up to approximately 4000 h. p.

2200-VOLT ALTERNATING CURRENT STANDARD UNIT PANEL

A. C. SWITCHBOARD PANELS WITH OIL CIRCUIT BREAKERS—For use similar to that described above, and can be used for higher voltages because of the use of oil circuit breakers. The generator panels have non-automatic oil circuit breakers, and feeder panels are furnished with 1- or 2-coil, automatic, series oil circuit breakers for use with current transformers. Panels are particularly adapted to low voltage plants where generators and feeders are of large capacity.

Bulletin 47163.

Still other panels for similar service have the oil circuit breakers mounted on pipe framework remote from panel. Thus oil circuit breakers can be used for higher ampere and rupturing capacity.

Bulletin 47164.

Safety First Panels.

Marked progress has been made in developing means which will prevent accidental contact with oil circuit breakers while alive, and this development has also increased the efficiency of operation by giving greater ease of inspection, adjustment, and replacement. The method is to enclose and interlock the oil circuit breakers, with their necessary auxiliary apparatus, in a housing so that: (1) Access cannot be had to them while alive; (2) They can be swung out or drawn out from the housing when dead.

The Truck Type Panels are especially adapted to group mounting and make a most desirable switchboard from the standpoint of safety to life, the elimination of fire risk and continuity of service.

"SAFETY FIRST" TRUCK TYPE PANEL

"SAFETY FIRST" SWING-OUT PANEL

Each complete unit consists of two elements—the truck or movable element carrying the panel, oil circuit breaker and instrument transformers; and the stationary or housing element enclosing the truck (when it is in an operative position), the buses and the terminal of the incoming and outgoing cables. All current carrying parts are completely enclosed when alive; and when withdrawn for inspection or repairs, the wiring and apparatus on the truck are accessible from all sides and electrically dead.

Bulletin 47100.

The Safety Enclosed Swing-Out Panel has a circuit breaker enclosed in a steel housing and so interlocked with the housing that the panel can be swung out only when the breaker is in the "off" position and the disconnecting device is therefore carrying no current. The interlock also prevents the panel from being swung back into the operating position when the breaker is in the "on" position.

Bulletin 67105.

Switchboard Instruments.

The GENERAL ELECTRIC COMPANY has developed and perfected a complete line of indicating and recording instruments for all classes of work. These are of

such mechanical excellence that they have become the standard for highest grade instruments.

For further information relative to any of the following instruments, see bulletins on the subject.

ROUND PATTERN VOLTMETERS AND AMMETERS—For use on D. C. circuits. Wide opening in cover together with large needle, facilitates reading the indications. Equipped with zero adjusting device. Cases are cast iron and dustproof. Constructed on the well known D'Arsonval principle. Type D ammeters ranging from 80 to 3000 amperes are furnished with external shunt.

Bulletin 46017.

Round pattern voltmeters and ammeters for use on A. C. circuits, although primarily for A. C. work, can also be used on D. C. Neat and pleasing in design. Operate on the Thomson inclined coil principle and with the wide scale opening, wide needle and legible scale can be easily read from a distance.

Bulletin Y-492.

HORIZONTAL EDGEWISE VOLTMETERS, AMMETERS AND WATTMETERS—G-E horizontal edgewise instruments are exceedingly accurate and may be relied upon to give long and satisfactory service. Instruments are of uniform size, presenting a pleasing appearance when installed. Primarily designed for A. C. service, but can be used on D. C. voltmeters and ammeters constructed on the well known Thomson inclined coil and D'Arsonval principles; watt-meters on the direct reading dynamometer principle. Made for back connection only, in dull black finish.

Bulletin 46016.

FREQUENCY AND POWER FACTOR INDICATORS—Horizontal edgewise instruments with same style of case as the voltmeters, ammeters and wattmeters. The type H Frequency Indicator shows on direct reading scale the cycles per second of any A. C. system. Adjustable for characteristics of circuits on which installed. Standard instruments wound for 100 to 125-volt circuits only; up to and including 650 volts if desired.

Power factor indicator shows on direct reading scale the power factor, lagging or leading, of balanced 3-wire 2-phase, 3-wire 3-phase or 4-wire 2-phase systems. Furnished for any potential up to and including 650 volts.

Bulletin 46016.

SYNCHRONISM INDICATORS—For synchronizing 2 or more A. C. machines. Can be furnished with swinging brackets and lamps for mounting on side of panel or pivoted brackets and lamps for mounting at top of panel. Bulletin 46015.

TYPE CR CURVE DRAWING VOLTMETERS AND AMMETERS—Portable and switchboard types have high torque, give accurate results and clear, unblotted records. Furnished for front or back connection. Voltmeters can be furnished with extra tap on resistance for use on both A. C. and D. C.

Capacities of ammeters, up to and including 200 amp.; voltmeters, up to and including 750 volts A. C. or D. C.

Bulletin 46021.

AMMETER

THOMSON D. C. ASTATIC WATTHOUR METERS—Especially designed for switchboard use. Made in back connected form only, and enclosed in rectangular glass case. Covers are removable from the front.

Armatures and damping magnets are astatically arranged, thus minimizing the effect of stray fields. Damping magnets are enclosed in a laminated iron shield, thereby protecting them from the effects of short circuits. Meter is provided with spherical armature and field coils, gravity control brushes and small commutator; and is of dull black finish. Write for additional information.

Bulletin 66351.

ASTATIC WATT-
HOUR METER

Portable Instruments.

TYPE DP2 PORTABLE VOLTMETERS AND AMMETERS—Designed for secondary standards and general testing purposes on D. C. Constructed on the well-known D'Arsonval principle. DP2 ammeters are self-contained up to and including 30 amp.; higher capacities furnished with 200 millivolt portable shunts. Contained in polished mahogany case.

Bulletin 46013, Section 100A.

TYPE P3 PORTABLE VOLTMETERS, AMMETERS AND WATTMETERS—Extremely accurate for laboratory and general testing purposes. Voltmeters and Wattmeters made on the dynamometer principle, ammeters on the Thomson inclined coil principle. Designed for A. C. but can be used on D. C. by taking reverse readings. Magnetically damped and protected from stray fields.

Bulletin 46013, Section 100A.

TYPE CP PORTABLE CURVE DRAWING VOLTMETERS, AMMETERS AND WATTMETERS—For motor testing and other work where desirable to make periodic or temporary arrangements for testing.

MENT

G-E Flow Meters.

G-E flow meters provide a means of accurately measuring the flow of steam, water, air, gas, oil, etc. through pipes and closed conduits. Flow meters can be furnished in the following types:

High pressure up to 300 lbs. gauge:

- Type F recording
- Type F-2 recording, integrating
- Type F-3 indicating, recording
- Type F-4 indicating, recording, integrating
- Type F-5 indicating

Low Pressure up to 65 lbs. absolute

- Type F-6 recording
- Type F-7 recording, integrating
- Type F-8 indicating, recording
- Type F-9 indicating, recording, integrating
- Type F-10 indicating

Type T Portable testing meter, high or low pressure furnished with carrying case.

Bulletin 46501-C.

INDICATING, RECORD-
ING, INTEGRATING
FLOW METER

Wires and Cables.

The GENERAL ELECTRIC COMPANY manufactures wires and armored cables suitable for use under various conditions.

All wires and cables are tested before shipment. A pressure test of at least twice the working pressure is applied. After the pressure test, an insulation test is made with a 250-volt battery and delicate reflecting galvanometer.

RUBBER INSULATED—Three types of rubber insulation have been standardized:

"Red Core" is a high class insulation used primarily on wires for house wiring, and is superior to the requirements of the National Board of Fire Underwriters.

"Tricoat" insulation was designed for those desiring a very high grade wire, somewhat better than "Red Core," but less expensive than the "30 Per Cent Hevea."

"30 Per Cent Hevea" insulation meets the 1907 Specifications of the Rubber Covered Wire Engineers' Association and is the best rubber compound for absolutely high grade work. The core may be white or black, as desired.

BRAIDED WIRE—All wires and cables with N. E. C. rubber insulation, No. 8 B. & S. and smaller carry a single braid, while No. 6 B. & S. and larger are regularly made with either 2 braids, or 1 tape and 1 braid; and in accordance with Underwriters' requirements, are equal to double braid and suitable for conduit work. If 1 tape and 2 braids are required, orders must so specify, and extra charge for extra braid will be made.

N. E. Code, "Red Core," braided, twin wire is finished with talc, which insures ease in pulling wire into conduits; no extra charge made for this feature. All the braided, rubber covered wires may be finished in this way, if desired, without additional cost.

These rubber covered braided wires and cables are distinguished by 1 red and 1 black thread woven parallel in braid.

WEATHERPROOF AND SLOW BURNING WIRES AND CABLES—Standard weatherproof wires and cables are manufactured strictly in accordance with the requirements of the National Board of Fire Underwriters, with 3 braids placed directly over the copper core, thoroughly impregnated with a black, weatherproofing compound, and then polished to remove all superfluous compound and give a smooth exterior finish. Double braid weatherproof wire furnished on order.

When the number of braids is not specified, wire

with 3 braids, commonly called triple braid, is always furnished; if double braid is required, requisitions or requests for quotations should so state. A stock of triple braid wire is carried.

Slow burning wires and cables are similar to the triple braid weatherproof in construction except that the impregnating material is a white, flameproof compound.

BAND STEEL ARMORED CABLES—The conductors are double taped with mild band steel between two wraps of asphalted jute. Our standard practice is to apply these steel tapings in the same direction, the outer tape covering the joints of the inner. However, if required, the steel tapes may be applied in reverse directions without additional cost, but we do not recommend this construction. A final wrap of asphalted jute protects the armor from corrosion. These cables are especially adapted for mine use, subways and tunnels; on bridges, generally in iron pipe; and overhead through city streets.

This cable is also furnished lead encased suitable for direct burial in earth without conduit. It can be applied to any voltage up to 25000 volts. Its principal uses are ornamental lighting systems for parks, residential districts and small towns.

STEEL WIRE ARMORED CABLES—Similar in construction to band steel armored, except that one layer of wire is used between the jute wrappings instead of band steel. The cable is designed so that the armor will carry the weight of the cable, if necessary to install in a vertical position.

Armored cables without lead may be used in dry mines and subways where cable is subjected to mechanical injury. By lead encasing under the armor this type of cable becomes the standard for submarine work or for use in wet mines. This cable is also adaptable for direct burial in the soil.

ASPHALTED JUTE CABLES—Depending upon conditions, these consist of leaded or unleaded cables covered with jute coverings and asphalt compound. Such cables are recommended for use in mines, when not exposed to mechanical injury, in wet ducts and for direct burial in the soil, where a tile or board laid over it will give sufficient mechanical protection.

CABLE CONNECTING DEVICES—A standard line of cable connecting devices of reliability and convenience is also manufactured. It includes copper cable connectors, end bells, cast iron coupling boxes, junction boxes and fuse boxes.

Detailed information is given in bulletin 49302.

Lightning Arresters.

Protection against lightning is required to preserve continuity of service. The GENERAL ELECTRIC COMPANY manufactures lightning arresters and choke coils for the protection of all kinds of service. The most commonly used types and their service are given below.

ALUMINUM ARRESTERS—For the protection of important generating and transforming A. C. apparatus of large stations of any voltage. On account of high speed of discharge and enormous discharge capacity, capable of quickly and thoroughly relieving lines of dangerous surges. Construction is clearly shown by accompanying illustrations and in general consists of stacks of aluminum cells between lines and ground. Stack is built up of aluminum cones supported on treated wooden rods and separated from each other by treated fiber washers.

CROSS SECTION OF ALUMINUM LIGHTNING ARRESTER 35,000 VOLT 3-PHASE ARRESTER FOR OUTDOOR SERVICE

Cell electrolyte partially fills spaces between cones and is in contact with part of surface of the upper and lower cone. Stack of cones is placed in steel tank which is filled with oil for cooling and insulation. A circular insulating barrier concentric with cone stack is hung within tank to increase the insulation between stack and wall of tank and to augment oil circulation. Stacks are connected to line through high-speed gaps, set to discharge without permitting the apparatus to be subjected to dangerously high potential. Gaps for all arresters above 7500 volts are sphere gaps arranged so that they may be readily opened for disconnecting or closed for charging. All gaps are equipped with charging resistances and charging contacts. Each arrester is equipped with transfer switch for changing connections between ground stacks and one of line stacks in order that all stacks may be equally charged. Gaps and transfer switch are mounted on pipe framework, all parts of which are thoroughly weatherproofed by galvanizing or sherardizing.

Several types are made ranging from 1,000 volts up to 155,000 volts.

Bulletin 45601A.

MAGNETIC BLOW-OUT AND D. C. ALUMINUM ARRESTER—For the protection of electric railway equipments from damage by lightning and the consequent repair expenses, interruption of service, and loss of traffic, the GENERAL ELECTRIC COMPANY offers two types of arresters—the magnetic blow-out and the aluminum arrester. The type to use depends upon the conditions to be met.

For average conditions, the magnetic blow-out type

MAGNETIC BLOW-OUT ARRESTER

D. C. ALUMINUM ARRESTER

of arrester will give the desired protection when placed on the cars and along the line at intervals of at least four per mile. Where lightning disturbances are especially severe so that the problem of lightning protection becomes of vital importance, the selection of the aluminum arrester is advisable.

Aluminum arresters are built to withstand the rigors of service on railway cars. They combine the advantages of a condenser and the safety valve effect of the aluminum cell. Having no gap in series, the aluminum arrester operates upon the slightest rise in potential.

Bulletin 44712.

GRADED SHUNT RESISTANCE MULTIGAP ARRESTER—Suitable for indoor or outdoor installation on circuits up to 15,000 volts. Should be installed in stations and substations, on feeders at receiving points for the protection of motor and transformers, and on lines for the protection of power and lighting transformers.

Essential feature is a row of metal cylinders, spaced with small air gap between them and connected between line and ground. Cylinders act as condensers and this gives arrester sensitiveness, causing it to discharge at much lower voltage than would an arrester having only a single gap of length equal to sum of small gaps to insure extinguishing of arc which follows discharge.

Bulletin 45603A.

COMPRESSION CHAMBER MULTIGAP ARRESTER—For the protection of power and lighting distribution pole transformers. Designed to meet the demands for an arrester which would give good protection and at such a cost that it could be placed at the terminals of even the smallest transformers.

This arrester is efficient because the multigap principle of design is carried out to the highest degree. Its construction and the materials used are such that the arrester is not only light and compact but also waterproof and fireproof, features which make inspection unnecessary. As long as the arrester is intact it is in operating condition.

Bulletin 45603A.

VACUUM TUBE ARRESTERS—For railway signal, police and fire alarm circuits.

Bulletin 45600A.

HORN GAP ARRESTERS—For series arc and incandescent circuits.

Bulletin 45602.

CHOKE COILS—For use with lightning arresters on A. C. circuits, described in Bulletin 45606.

CHOKE COIL FOR 15,000-VOLT CIRCUITS

Transformers.

G-E transformers embody features which have

Their use is recommended where restrictions are imposed upon oil filled transformers, indoor service only.

AIR-COOLED TRANSFORMER WITH RADIATORS

WATER-COOLED TRANSFORMER

made them preferred by the great central stations of this country.

Reliability has always been the first consideration and the many thousands of kv-a. capacity now in service have proved their ability to operate continuously with minimum losses and maximum factor of safety.

G-E transformers may be broadly divided into two

TYPE H TRANSFORMER FOR POLE MOUNTING

3-PHASE AIR BLAST TRANSFORMER

classes—oil insulated and air blast. The latter are limited to use with potentials not exceeding 25,000 volts, while the former may be used for any voltage.

Information concerning the use of transformers should be requested from the nearest G-E district office.

OIL INSULATED TRANSFORMERS—For indoor or outdoor service. Divided into two general types:

Self-cooled—Uses circular coil construction throughout, and known as Type H. May be obtained for any voltage and capacity.

Transformers of this type are placed in steel tanks generally with corrugated sides electrically welded or cast to the base and top rim. In large sizes external radiators are used to increase the cooling surface.

Water-cooled—Built in any size and for any voltage. Construction similar to the self-cooled Type H transformers. All welded steel plate tanks are used. Cooling is effected by the circulation of water through cooling coils in contact with the hot oil.

AIR BLAST TRANSFORMERS—Shell type construction, either in single phase or three phase units for all frequencies.

THE LARGEST SELF-COOLED TRANSFORMER IN AMERICA

Single-phase, 25-cycle, 8000 kv-a. The development of the separable radiator and the all-welded steel plate tank has made possible self-cooled transformers of this size

THE LARGEST WATER-COOLED TRANSFORMER IN AMERICA

3-phase auto transformer having an output of 50,000 kv-a.

This type is cooled by forcing a current of air through ducts provided between the coils and between sectionalized portions of the core. Mechanical parts are substantial and few in number.

CONSTANT CURRENT TRANSFORMERS—For information on transformers for street lighting see page 1084.

LARGE OUTDOOR SUBSTATION WITH WATER-COOLED TRANSFORMERS

Current Limiting Reactors.

The GENERAL ELECTRIC COMPANY manufactures current limiting reactors which can be applied to all classes of service where it is desired to control short circuits or limit the current, as in generator-leads, bus bars, tie and feeder circuits, etc.

The necessity for reactors is due to the abnormal conditions which may occur in a system as the result of short circuits, either 3-phase or single-phase. Energy liberated under these conditions may be of such a magnitude as to exceed the safe rupturing capacity of oil switches and also the mechanical strength of generators, transformers, bus bars, etc.

A further use of reactors is to give greater continuity of service by limiting the larger part of the short circuit disturbances to the section of the system in which it originates.

Construction details of this device are given in Bulletin 45300.

3-PHASE REACTOR

Small Transformers and Auto Transformers.

Type M miniature air-cooled transformers meet the demand for low voltage transformers for capacities of 500 volts and under; 15 to 5000 watts, 60 cycles, 11 to 3000 watts, 25 cycles.

They give perfect satisfaction in the following applications: electric welding, speed variations of motors, railway signal lighting, 2- to 3-phase transformation; operation of small low-voltage motors from high-voltage circuits, insulating lighting from power circuits, telephone circuits before rectification; loom stop mechanism.

By substituting these transformers for batteries or magneto generators, no maintenance or replacement charges, due to wear, are incurred, less space is required and cleanliness and reliability are assured.

Bulletin 45105.

Portable Instrument Transformers.

Made in 3 general types:

CURRENT TRANSFORMERS—Type P2—Standard ratings are 50, 100 and 200 amps. primary with 5 amps. secondary, also 25, 50 and 100 amps. primary with 5 amps. secondary.

Type R2—Designed for 1000-amp. turns at full load rating. Standard transformer has 5-amp. secondary winding, giving a ratio with one primary turn passing through the core of 1000:5. Bulletin 46030.

CABLE TESTING TRANSFORMERS—Made in 125 and 250-amp. capacity. Bulletin 46030.

POTENTIAL TRANSFORMERS—Type E4—50 and 200-watt capacity.

Type E6—25-watt capacity and lighter in weight than Type E4. Bulletin 46030.

HEAVY DUTY BELL RINGING TRANSFORMERS—Made in 50- and 100-watt sizes for operating signal systems requiring considerable power. Designed and classed as air-cooled transformers for 300 volts or less and subject to code installation requirements accordingly. Equipped for 3-phase bell-circuit voltages.

Pyrotip Electric Burner.

The most modern method of burning terminals in place on storage batteries, removing old connections, cutting off or building up posts, or in fact almost any form of soldering work, is to do it electrically—by the electric welding process. The GENERAL ELECTRIC COMPANY has recently developed a lead burning transformer to meet this need.

This transformer is designed to be connected to the ordinary 110-volt A. C. lamp socket, a 10 ft. cord with plug being provided for this purpose. This attaching cord is protected by a special rubber covering against hard wear, dirt and acid.

Connection to transformer itself is made by means of a plug and socket connection, so that this plug can be used in place of the snap-switch in the lamp socket for turning on and off.

Two separate rubber covered terminal leads are used to convey the low voltage heat producing current to the parts of the battery to be welded (see illustration). The lead having the "Big Brute" clip is for fastening to the battery plates or posts which are to be worked on. The other lead has at its end a carbon holder which is arranged with a heavily insulated handle so that the operator's hand is guarded from the heat. The carbon holder takes any ordinary arc welding carbon, this carbon forming the second terminal.

When the pointed arc welding carbon is brought into contact with the lead, the pointed end of the carbon becomes so intensely hot that it melts over a restricted area quicker than with a pointed gas flame. The welding or operation is carried out by a sort of puddling process, the carbon terminal being manipulated to flow the lead where it is needed.

Some advantages are: repair work in remote corners easily done, as the heat is always at the point of the carbon; device is readily portable, weighing approximately 25 lbs.; joints do not have to be cleaned, as the dirt and slag automatically rise to the surface of the molten lead and surfaces are joined while cleansed; when properly used, there is no glare to injure operator's eyes, as he looks down on the cool end of the carbon in such a way that the bright point where the carbon touches the lead is hidden from view; there is no danger from electric shock because of the efficient insulation.

On the basis of 10 cents per kilowatt hour, it costs about 8 cents per hour for current when the device is operating steadily. The instant the carbon point is removed from the work, the current consumption practically ceases, as the device then takes only $4\frac{1}{2}$ watts from the line.

Bulletin B3549.

SHOWING USE OF PYROTIP ELECTRIC BURNER IN REPAIRING STORAGE BATTERY

Battery Charging Equipment.

The GENERAL ELECTRIC COMPANY is prepared to furnish charging equipment for all classes of service.

INDIVIDUAL VEHICLE BATTERY CHARGING M-G SETS—The individual vehicle charging sets can be furnished for the charging of either lead or Edison vehicle batteries. They can be furnished for service on various frequencies, either single phase or polyphase circuits of standard voltages, and in suitable capacities for charging lead batteries of 44 cells and under, or Edison batteries of 60 cells and under.

CHARGING SET IN OPERATION

The selection of the proper set for any particular charging work depends upon the make of battery and type of cell, as well as the frequency, voltage and number of phases of the A. C. supply.

Bulletin 62558A.

CHARGING OUTFITS FOR LARGE GARAGES—The problems for selecting battery charging outfits for large garages present conditions so diversified in character that it is best to take each case up individually with the Supply Dept. of the GENERAL ELECTRIC COMPANY.

Bulletin 62557.

MOTOR GENERATOR STARTING AND LIGHTING BATTERY CHARGING OUTFITS—The motor generator charging outfits illustrated are for charging automobile starting and lighting batteries. They consist of a small, compact 4 bearing motor-generator set on which is mounted a small steel switchboard completely equipped.

MOTOR GENERATOR SET

These outfits are furnished in capacities of 250, 500 and 750 watts, giving a range of sizes, the smallest of which will charge any combination of one to four 6-volt batteries and the largest any combination of three to twelve 6-volt batteries.

Larger sets wound for 37½ volts, 20, 30, 50, 75 and 100 amperes, in 3 bearing construction with common base are also available.

Bulletin B3432A.

STANDARD MERCURY ARC RECTIFIER BATTERY CHARGING SETS—For charging automobile, signal or telephone batteries. Made in 3 standard sizes of 10, 30 and 50 amperes capacity, and in D. C. voltages ranging from 10 to 100 when operated at 110 volts A. C., and from 20 to 175 when operated from 220 volts A. C. Suitable for circuits of 60 cycles or more. Special rectifiers furnished for higher D. C. voltages than

SINGLE PHASE
MERCURY ARC
RECTIFIER

the foregoing from 220-volts A. C. and up to a maximum of 350 volts D. C. in capacities up to and including 50 amperes. Special rectifiers can be furnished for operation on 25, 30 or 40 cycles.

Bulletin 43950.

TUNGAR BATTERY CHARGERS—Another charging device for garage or service station use is the Tungar rectifier, operating on the principle of the emission of small particles of negative electricity from an incandescent filament in a bulb filled with inert gas.

This charger is simple in construction, light in weight, is self-starting, and requires no expert attendance. Its first cost and operating expense are very low. The smaller sizes connect with any A. C. lamp socket.

There are four sizes:

6-amp. 75-volt Size—Will charge any combination of 3, 4, 5, 6 up to 30 cells, at 6 or 7 amps. or less from A. C. Particularly adapted to the needs of garages and service stations.

Bulletin B3487.

5-amp. 30-volt Size—Will charge from one to four 3-cell batteries at 5 amp. rate or less. Particularly adapted for automobile dealers.

Bulletin B3529.

5-amp. 7.5-volt Size—Will charge one 3 cell battery at 5 amp. or a 6 cell battery at 3 amp. or 9 cells at 1.5 amp. Suitable for the private garage.

Bulletin B3532.

2-amp. 7.5-volt Size—Will charge 3 cells at 2 amps., 6 cells at about 1 amp. and 8 cells at about 0.75 amp. Suitable for charging small batteries.

Bulletin B3532.

SWITCHBOARD FOR CONTROLLING GENERATOR AND SIX
CHARGING CIRCUITS

Arc Welding Apparatus.

The use of welding apparatus in foundries, steel mills, ship yards and repair shops, is rapidly increasing, due to the economies effected, and this company has developed a complete line of electric arc welding equipment

to meet all requirements. The principal advantages of the electric arc process is in concentration of heat (reducing expansion and contraction of metal worked upon) and high temperature.

Two methods are employed—metallic and carbon electrode. In the former method, the metal of electrode is added to the weld, producing greater strength and smoother appearance. This is the only method which will deposit metal successfully on overhead surfaces. The carbon electrode method used for building up metal, plugging holes in castings, welding and joining parts where strength and appearance are not so essential or where surface is to be planed off. Greater speed can be attained with carbon electrodes because of greater current capacity. The method of operation is similar to soldering process. The carbon electrode method is also used for cutting and melting away metal.

In some cases the tensile strength of metal in a weld may be as high as 55,000 to 60,000 lbs. A safe figure is 40,000 lbs. where work is done by experienced welders.

Approximate power input required for various systems ranges from 5 to 15 kw. or kv-a.

Principal types: Constant energy, self-excited generator; constant energy balancer sets; constant potential generator with auxiliary equipment; A. C. welder. All except constant potential type are primarily single-operator equipments suitable for bare metallic electrode welding only. Constant potential type may be used as a single operator equipment for either carbon or metallic

200 AMP. SELF-EXCITED WELDING GENERATOR
Constant energy type

ARC WELDING GENERATOR SET
Constant potential type

electrode welding or a number of operators may work from one machine. This type also permits use of carbon electrode for cutting.

Each outfit consists of following apparatus:

Constant energy, self-excited generator arranged for belt drive or direct connected to A. C. or D. C. motor, or engine, the maximum motor voltage being 550.

Constant energy balancer sets of 150 amperes capacity are suitable only when 110 to 125 volts D. C. is available. If circuit has positive side grounded, it is entirely satisfactory. If not, special precaution must be taken.

Constant potential generators can be direct connected to D. C. motor, A. C. motor or gas, oil or steam engines.

The GENERAL ELECTRIC COMPANY has developed

also an automatic welder which can be operated from any of the above D. C. welding generators.

A. C. welders may be used on 60-cycle circuits of 220, 440 or 550 volts maximum. The welder is single-phase, but where several are in use on a polyphase system, they may be distributed among the phases to partially balance the load.

Standard capacities of G-E arc welding outfits range from 150 to 1250 amps. Portable outfits are made in 3 sizes, 200, 300 and 400 amps.; stationary outfits in 9 sizes, 150, 200, 300, 400, 500, 600, 800, 1000 and 1250 amps. Outfits of 300 to 400 amps. portable can be arranged for 2 operators by adding an auxiliary switchboard panel, as in case of all stationary outfits.

Current requirements vary with thickness of the metal to be welded. Maximum for metallic electrode welding is about 200 amps. Where several operators are working from one set under average conditions, it is safe to figure on 125 to 150 amps. per operator, taking advantage of intermittent nature of operation. For light work this value will be reduced.

With carbon electrode, light work can be welded with 150 to 250 amps. Medium welding with carbon electrode requires 250 to 350 amps. and heavy welding 350 to 500 amps. The capacity of a set used for cutting depends upon speed required. 300 amps. will cut light metal, but currents up to 1000 amps. are desirable for metal 2 in. thick or heavier. Cutting speed may be estimated on basis of $\frac{1}{2}$ sq. in. cross-section per minute per 100 amps. For heavy sections this figure is somewhat high and for thin sections low.

Bulletin 48932A.

CONTROL PANEL
WITH WELDING
CIRCUIT CONTROL

PORTABLE ARC WELDING OUTFIT

Industrial Heating Equipment.

The GENERAL ELECTRIC COMPANY has developed a very extensive line of industrial heating apparatus which is being successfully applied in many different processes requiring heat. The following are some of the numerous operations which have been improved by the adoption of electric heating with automatic temperature control:

Annealing copper, brass and carbon and nickel steels.

Baking japan, enamel, foundry cores, grinding wheels, insulation and furnace lining.

Drying chemicals, paints and varnishes, acid-washed metals, brake lining, crucibles and steel wire.

Drawing temper of carbon, nickel and high-speed steels.

Hardening carbon and nickel steels.

Heating rivets, glue, oils and compounds.

Melting brass, copper, aluminum, non-ferrous metals, lead and tin alloys, pitch, paraffin and compounds.

Vulcanizing tires.

Electrically Heated Ovens.

Nearly all industrial plants use ovens for some heat treating process. The principal problem is to secure the most efficient application of heat that will give the required quality of product.

Electrically heated ovens are economical, they permit close control of temperature, even distribution of heat and insure a uniform product and high quality of finish, results which cannot be attained in the same degree with other means of heating. Electric ovens are clean and easy to operate, and they reduce fire hazard materially.

G-E electrically heated ovens of several types are in commercial use.

Send for Bulletin 48021A.

BATTERY OF 15 ELECTRICALLY HEATED OVENS

Industrial Oven Heating Equipment.

Three types of heaters are made—wall, floor, and the universal for either floor or wall mounting. The heater consists of metallic resistor material carried on suitable insulation and assembled in steel frames for convenience in installing. Each heater is made up of units which consist of flat resistance ribbon wound on insulating blocks. The blocks are made of a compound which retains its insulating qualities at the temperature to which subjected and will not crack or break.

These heaters are furnished in capacities from 1.3 kw. to 12.3 kw. for voltage up to 600 volts. Temperature range extends to 950° Fahr. in the oven.

Bulletin 48709.

OVEN HEATER UNIT FOR WALL MOUNTING

Oven Control Panels.

The three-phase automatic control panel consists of a slate base containing a double pole switch, with fuses for operating the contactor, a three pole contactor which opens and closes the heater circuit, three main fuses for protecting the heater circuit, and a pilot lamp, which lights when the current is on. The automatic control panel contains a reversing relay in the control circuit which is operated by the thermostat in the oven. The hand control panels are made up in the same way except that the reversing relay in the control circuit is omitted.

Panels for D. C. or single-phase, A. C. automatic control, are the same as three-phase panels except that the contactors are double pole. These panels can also be furnished for hand control by omitting the reversing relay in the control circuit for operating thermostat in the oven.

In cases where it is desired at times to operate the

oven at a lower temperature than ordinarily used or at less than normal load the control panel is provided with a series parallel switch for single-phase A-C. or D-C. circuits and with a "Y" delta switch for A-C. three-phase

CONTROL PANELS FOR DRYING OVENS

circuits which is placed in the heater circuit and by means of this switch the energy input can be reduced respectively to one-quarter or one-third of the normal input. This enables the operator to cut down the maximum demand at such times and reduces the current which is thrown on and off as the temperature in the oven falls or rises.

BRASS MELTING FURNACE WITH CONTROL PANEL AND TRANSFORMER

G-E Electric Furnace.

The principal characteristics of this electric furnace for melting non-ferrous metals and alloys are:

Temperature of heat generating source controllable at will.

Heat generated is of the "soaking" type, uniformly distributed, and any workable temperature gradient may be maintained, between charge and heat source.

The charge is heated from all sides.

Bath is shallow and large surfaces exposed to receive heat by conduction as well as radiation.

Has normally a reducing atmosphere, which may readily be made neutral or oxidizing.

Automatic control of power permits one man to operate several furnaces.

Furnace atmosphere free from contaminating gases.

Dead atmosphere exists in furnace normally as there is practically no circulation of air through furnace.

Temperature controllable, prevents formation of slag cinders. Hence metal may be readily recovered without crushing operation.

Furnace may be "forced," i.e., heat may be fed to metal as fast as latter will absorb it, and a high rate of melting results, with many of the advantages and none of the disadvantages met in fuel-fired furnaces.

Electric Heat Treating Furnace.

For heat treating processes in the manufacturing industries requiring temperatures from 900° Fahr. to 1800° Fahr., chief among which are hardening, drawing and annealing of carbon steels, drawing high speed steels, annealing brass and copper, and baking vitreous enamels, the GENERAL ELECTRIC COMPANY has developed a type of electric heating unit which is adapted to either horizontal furnaces or vertical cylindrical furnaces. In conjunction with this design of heating unit, there has been developed an automatic temperature recording and controlling system.

ELECTRIC RESISTANCE FURNACE AND CONTROL

Some of the advantages of electric heat treating furnaces constructed and equipped with heating units and temperature control system are: automatic control of the temperature giving minimum temperature variation in the furnace; maximum rate of heating the charge; maximum efficiency in heat treating and elimination of scale due to oxidation.

Heat treating problems should be referred to the Industrial Heating Specialists located in our nearest office.

Muffle Furnace.

The Electric Muffle Furnace meets the demand for a convenient, economical and durable furnace for temperatures up to about 1550° Fahr. For heat treating carbon steel, baking vitreous enamel, experimental purposes, etc., this furnace is very economical.

Electric Sherardizing Machines.

Metal to be rendered non-corrosive is sherardized by being electrically heated in the presence of zinc. In order to secure the best results and obtain uniformity as well as durability of coating it is necessary to have unvarying quality of zinc dust and to maintain a certain correlation between the composition of this dust and the sherardizing temperature. Electric heat is ideal for this purpose as the temperature can be maintained with absolute certainty. Articles so coated may be bent, swaged or

otherwise deformed, at ordinary room temperature, without injury to the coating.

Bulletin 48926 gives other points regarding this process.

Oil Tempering Baths.

The oil tempering bath for tempering carbon steels is safe, efficient and easy to operate. It is made in different sizes, heats up very quickly and can be held at any temperature.

Bulletin 69700.

Electric Rivet Heater.

Industrial progress has created a demand for an efficient, portable and self-contained rivet heater. The objections to the old heating methods with the attendant expense of handling fuels or the installation and maintenance of piping together with the problem of disposing of waste gases, cinders and dust, are eliminated in the flexible G-E Electric Rivet Heater in all classes of work.

The standard sizes of G-E Electric Rivet Heaters are 5 kw., 2-jaw for rivets up to 1/2 in., and 15 kw., 2-jaw for rivets up to 1 1/4 in. These heaters are intended to supply the maximum requirements of one gang of riveters.

Bulletin 69701.

ELECTRIC RIVET HEATER

Electric Soldering Iron.

The Electric Soldering Iron is efficient and convenient. For light or intermittent work it is one of the most useful of the electrically heated devices for industrial purposes.

The soldering irons manufactured by the GENERAL ELECTRIC COMPANY have been on the market for a number of years and have given general satisfaction. Made in various sizes.

Bulletin B3514.

ELECTRIC SOLDERING IRON

SOLDERING IRON FURNACE

Electric Muffle Furnace for Soldering Irons.

For light and intermittent service, the self-contained electric soldering iron is very satisfactory, but for moderate and heavy duty work it is frequently desirable to use the ordinary soldering copper which must be heated in a furnace or open flame. Appreciating that fuel-fired furnaces have many disadvantages such as noxious fumes, excessive heat, a high fire risk, etc., an electrically-heated two-compartment muffle furnace for this purpose has been developed.

The furnace consists of two special steel alloy muffles wound with nichrome wire on insulators made of a compound which retains its electrical resistance at high temperatures.

The 110-volt furnace, by means of a 3-way switch, provides three heats.

MUFFLE TYPE HEAT TREATING FURNACE

ELECTRICALLY HEATED SHERARDIZING MACHINE

The 220-volt furnaces can be operated only on one heat as both the muffles are in series.

Bulletin 69702.

Generally speaking, the 1500-watt furnace is suitable for irons up to 2½ lb. in weight per muffle. For heavier irons, the 2000-watt furnace should be used.

Cartridge Heating Units.

For concentrated or localized heating, the cartridge unit provides a more efficient method of heating than gas or steam.

The G-E cartridge unit can be furnished for operation on any commercial voltages from 100 to 250 volts.

These units are now being used extensively in shoe manufacturing and cigarette and paper box machinery, and for heating glue pots, soldering irons, small boilers, etc.

Metal Melting Pots.

The GENERAL ELECTRIC COMPANY has developed a new electrically operated device for melting lead, babbitt, and similar metals, called the Self-Regulating Metal Melter. The automatic regulation which is the principal feature of this new melting pot, has been obtained by making the heating element of wire with a positive temperature coefficient. That is, when the temperature of the heating element rises, its resistance rises proportionately and limits the current. When cold metal is put into the container it is melted quickly by the initial rise of current after which the current automatically decreases to a value just sufficient to keep the metal molten.

30 LB. ELECTRIC METAL MELTER

Electric Glue Pots.

Electric glue pots are being widely and successfully used in wood shops, binderies, etc. The water-jacketed type is recommended where glue is used intermittently as it permits the use of a high starting heat to melt the glue quickly.

The jacketless type for continuous service automatically maintains the correct working temperature and operates on about one-half the current required for the average jacketed pot.

Bulletin 69100.

WATER JACKETED ELECTRIC GLUE POT

Industrial Kettles.

The GENERAL ELECTRIC COMPANY is prepared to furnish heating equipment for kettles and tanks for heating various substances; such as oil, paraffin, solutions, compounds, etc., where the purchaser provides the tank and foundation and installs the heating equipment.

When requesting prices submit complete requirements.

Arc Furnace Equipment.

The GENERAL ELECTRIC COMPANY can supply all the electrical equipment needed in connection with any type of electrical arc furnace.

The company is constantly developing new types of equipment necessitated by the rapid advance going on in the utilization of electrical heat in industrial operations.

Designers of furnaces for reduction of ores, for production of abrasives, production of ferro-alloys, steel, electrolysis of fused salts, fused silica products, carbon bisulphide, calcium carbide, fixation of atmospheric nitro-

gen, and a multitude of other electrothermic developments, will find the GENERAL ELECTRIC COMPANY's experience in this line of value.

The equipment includes such specialties as automatic electrode regulators, motor-operated multiple-pole switches for controlling power supplied to the furnaces, voltage regulating devices, special transformers, such as

ELECTRIC FURNACE TRANSFORMER

the multi-tap transformers used in connection with graphite furnaces, which permit periodical change of voltage, special reactances for steel furnaces, etc.

The design of a proper electric furnace for an industrial chemical operation is a problem in electrical engineering as much as in chemistry or metallurgy. The furnace specialists of the GENERAL ELECTRIC COMPANY

HAND AND AUTOMATIC PANELS FOR ELECTRODE CONTROL

will co-operate with you with regard to the proper design of your furnaces from the electrical engineering point of view, advising as to all the latest improvements in regulating devices, transformers, etc., and as to the best utilization of the sources of energy at your disposal.

Bulletin 48710A.

ELECTRODE MOTOR

TILTING MOTOR

Motors and Control.

The GENERAL ELECTRIC COMPANY has developed a complete line of motors suitable for every kind of service.

A few of the many types made by the company are described herein. For further information, consult the nearest office or send for bulletins referred to.

Reliable and efficient starting and controlling apparatus has also been developed for the successful operation of motor installations. Control devices recommended for the various motors are listed on the following pages together with brief descriptions. For further information our bulletins should be consulted.

A. C. Brush Shifting Motors.

BTS ALTERNATING CURRENT MOTORS—Give an infinite number of speeds and high efficiency at all of them. Speed changes, starting and stopping, are obtained in a simple manner by merely shifting the brushes.

Motors have been developed in 60 cycles from 10 to 100 h.p. inclusive. Slow speed 25-cycle motors can be furnished for 100, 125 and 150 h.p.

ALTERNATING CURRENT BRUSH SHIFTING MOTOR

Control for BTS Motor—CR6055 brush shifting controller gives a variation of 50% below synchronous speed or any intermediate speed by shifting brushes.

Movement of controller handle, to which is attached a chain for moving brush rigging, also opens and closes the line circuit as required and can reverse direction of motor.

TYPE BSS BRUSH SHIFTING MOTOR—Single-phase, varying speed brush shifting motors are furnished in sizes $\frac{1}{4}$ to $7\frac{1}{2}$ h.p., 1200 to 1800 r.p.m., 60 cycles. Voltages, interchangeable on 110 or 220-volt circuits. Type BSS is suitable for constant torque, belt or chain drive (fans and blowers, printing presses, refrigerators and laundry machinery, etc.), and will permit 50% speed reduction against full load or three-quarters load torque.

Has the following leading characteristics:

Quick acceleration (2 to 5 seconds from start), no tendency to spark. Entirely automatic in action, no in-

SINGLE PHASE BRUSH SHIFTING MOTOR

ternal clutches or starting devices. Power factor, full load 90 to 99%, no load 80%. Efficiency high at all loads. Overload capacity, 50% momentarily. Starting torque; will start and accelerate loads having two and one-half times full load torque.

Bulletin 61401.

Control for BSS Motor—Same as for BTS Motor, described above.

A. C. Hoist Variable Speed Motor.

MTC alternating current, 3-phase motors give a maximum torque for a given weight and are very strong mechanically.

A. C. VARIABLE SPEED HOIST MOTOR

They are used for hoists and similar service of an intermittent nature where the limiting feature depends upon the frequent starting and accelerating torque required. These motors are regularly furnished with open frames and taper shafts on each end for gear and solenoid brake. MTC motors are furnished in standard capacities of 1 to 300 h.p.; 60, 40 and 25 cycles. MQC and IQC designate 2-phase motors and cover same range as MTC and ITC motors.

CONTROL FOR ABOVE MOTORS—CR 3202 drum type controllers are regularly recommended for capacities up to 112 h.p.

Drum controllers are rated in current capacities owing to the wide range of secondary currents of slip ring motors of same horsepower. The CR 3221, CR 3223 and CR 3232 resistors ordinarily furnished with this control, consist of cast grid resistance units mounted in frames, and may be bolted together to form a single unit if desired.

Bulletins 68200B and 68205.

For motors of larger capacity, the magnetic type of control is used. Information obtained by addressing the nearest office.

DRUM CONTROLLER

A. C. Variable Speed Motor.

Form MT motors with phase wound rotors and external resistance are adapted for service requiring frequent starting under load, or starting of loads with high inertia. High starting torque is obtained with a comparatively small amount of current from the line.

FORM MT VARIABLE SPEED INDUCTION MOTOR

Standard rating, 60 and 25 cycles up to 200 h.p. Special rating to 6000 h.p.

High speed Form MT induction motors, ranging from 75 to 350 h.p., 1800 r.p.m. for direct connection can be furnished.

CONTROL FOR MT MOTOR—CR 1023 rheostats control the secondary circuit of Form MT or slip ring induction motors during the starting period, Bulletin 68331. They are intended for light service only, and where severe service is required, CR 3202 and CR 3204 drum type controllers with resistance are recommended. Both types of drum controllers are similar to control described for ITC motors.

Bulletins 68200B and 68205.

For automatic control of constant speed Form MT or slip ring motors, CR 2351 self-starters are advised. These starters are designed for use with motors driving pumps, air compressors, etc., where it is desired to automatically start and stop motor in order to control fluid level or pressure.

Bulletin 68406A.

Accessories for remote control can be supplied, such as CR 2931 float switch, Bulletin 68501; CR 2922 pressure governor, Bulletin 68411; CR 2925 pressure switch.

Bulletin 68502A. **SPEED REGULATOR AND AUTOMATIC SELF-STARTER**

Where it is desired to regulate speed of slip ring induction motors, CR 1260 and CR 1261 rheostats, Bulletin 68333, are available for the smaller sizes of motors. They are capable of reducing the speed 50% from normal at full load torque. For motors above 10 h.p., CR 3202 drum controller with resistance is recommended.

Bulletin 68200B.

See description under control of ITC motor.

For automatic control of variable speed motor, information will be furnished on request.

A. C. Constant Speed Motors.

TYPE RI—Constant speed, single-phase, induction motors furnished in sizes $\frac{1}{4}$ to 15 h. p. Frequencies, 25, 40 or 60 cycles. Voltages interchangeable for 110 or 220-volt circuit.

Bulletins 41507A, 61200.

Reversing service, Type RI motors furnished in sizes $\frac{1}{4}$ to 5 h.p. Standard RI non-reversible motors may be made reversible with reduced rating by simply adding 4 leads and re-setting brush yoke.

Reversible RI motors are especially useful for application to elevators, small cranes and hoists, laundry machinery, etc.

Have the following leading characteristics:

Quick acceleration (2 to 5 seconds from start), no tendency to spark. Entirely automatic in action, no internal clutches or starting devices. Power factor, full load, 90 to 99%; no load, 80%. Efficiency high at all loads. Overload capacity, 50% momentarily. Starting torque: will start and accelerate loads having two and one-half times full load torque.

Bulletin 61508.

TYPE RI SINGLE PHASE INDUCTION MOTOR

Control for Type RI Motors—Constant speed Type RI motors can be thrown directly on the line without injury to the motor. However, in sizes above 5 h.p. the use of a starting rheostat is usually recommended. The CR 1025 (built for all sizes of RI motors) will reduce starting current to approximately one-half normal. Bulletin 68328.

The following control devices are also available for Type RI motors:

CR 1038 totally enclosed knife switch for motors, 220-volt, 3 h.p. and smaller; 110-volt, $1\frac{1}{2}$ h.p. or smaller.

The C R 1038 switch is a quick make-and-break single throw switch and is provided with time limit protective plugs which guard the motor against overload. Accidental closure impossible—a push opens and a pull closes the switch. The switch is limited in capacity to 3 h.p., 110 volts, and 5 h.p., 220, 440 and 550 volts.

Bulletin 68305B.

The FP 3 and FP 6 oil circuit breakers are designed for starting and controlling induction motors of 25 h.p. or less at 600 volts or with normal current ratings not greater than 50 amps. at voltages less than 600.

Arranged for either open or conduit wiring.

Can be opened or closed by hand or mounted out of reach of operator and be operated from a distance by a shipper rod. Cannot be left in partly opened or closed position and contacts cannot be jarred open by vibration. Bulletin A4113.

See page on oil circuit breakers for references to other types for controlling induction motors.

TYPE KT MOTORS—Polyphase induction motor—Riveted or skeleton frames—Range $\frac{1}{4}$ to 750 h.p. Standard ratings: 110 volts, $\frac{1}{4}$ to 15 h.p.; 220 volts, $\frac{1}{4}$ to 100 h.p.; 440 and 550 volts, $\frac{1}{4}$ to 750 h.p. and 2200 volts, 20 to 750 h.p. Adaptable for driving all classes of machines requiring constant speed.

Bulletins 41302A, 61505B and 61300A.

High speed Type KT induction motors ranging from $\frac{3}{4}$ h.p., 3600 r.p.m. to 300 h.p., 1800 r.p.m. for direct connection can be furnished. These motors are especially adapted for driving centrifugal pumps or for similar service.

Type KT multispeed induction motors are wound for 60-cycle 3-phase service only. Standard voltages 220-440 and 550. These motors may be furnished up to 12

h.p. at four constant speeds—1800, 1200, 900, 600 r.p.m. Constant horsepower motors are suitable for machine tools, etc., and constant torque motors for operating fans, blowers, printing presses, etc.

TYPE KT CONSTANT SPEED INDUCTION MOTOR

Control for KT Motor—Many of the smaller sizes of squirrel cage induction motors can be thrown directly

Continued on next page

on line, and for such purposes motor starting switches CR 1038 and CR 1031 are recommended.

CR 1031 switch (4-pole, double throw) is provided with a low voltage release and time limit overload relays. Recommended for use with motors up to $7\frac{1}{2}$ h.p. on standard voltages.

Bulletin 48302A.

Both types of switches combine all the necessary features for protecting the operator.

CR 1034 compensators are recommended for type KT or squirrel cage induction motors. They are provided with inductive windings arranged with suitable taps. The switch is immersed in a tank of oil. Each compensator is equipped with low voltage release. In addition, fuses or overload relays can be furnished. The CR 1034 is ruggedly constructed, all parts being enclosed, protecting them from mechanical injury.

Bulletin 68304.

For remote or automatic control of Form KT or squirrel cage induction motors, CR 2361 automatic compensators are recommended. These compensators are particularly adapted for use with motors driving centrifugal and reciprocating pumps, air compressors, fans, blowers, punch presses, belt conveyors, shears, line shafting, woodworking machinery, etc., when automatic starting and stopping is required. Low voltage release is an inherent feature and overload relays can be furnished if desired.

Bulletin 68404.

The CR 7052 automatic starting compensator is designed for safe control of squirrel cage induction motors. Safe operation has been obtained by completely enclosing all live parts in a metal case with provision for padlock. Safety to the motor is assured through automatic acceleration and by effective overload and under voltage protection.

The enclosing case is hung from a detachable conduit box which is installed first and used as a pull box. Conduit may be run directly to this box from above, below, or either side.

The CR 7006 Enclosed Magnetic Switch for starting small alternating current motors is light in weight and can be readily mounted where convenient. Protection is afforded against excessive motor endangering overloads by inverse time element relays. The operation of these relays is such that during short peak overloads the motor will not be shut down.

When operated by push buttons, operators are protected against unexpected starting of motors. When operated by float switches or pressure governors, motors restart immediately upon return of power—if switch is closed.

Bulletin 68415A.

Accessories for remote control can be supplied, such as CR 2931 float switch, Bulletin 68501; CR 2922 pressure governor, Bulletin 68411; CR 2925 pressure switch, Bulletin 68502A.

CR 1034 COMPENSATOR FOR INDUCTION MOTORS

CR 7052 AUTOMATIC COMPENSATOR

CR 7006 MAGNETIC STARTING SWITCH

A. C. Constant and Variable Speed Mine Type Induction Motors.

TYPE HI MOTORS—Specially designed for mining service. They have high starting effort and large capacity for severe overloads. End shields can be removed without disturbing back shaft. Built in standard sizes from 5 to 75 h.p., 3-phase, 60 cycles, 220, 440 and 550 volts, with or without back gearing.

Control for HI Motor—CR 1034 compensator for ordinary starting of HI Form K squirrel cage motors is recommended and is described under control for Type HI motor.

Bulletin 68304.

CR 3202 drum controller is adaptable for starting HI Form M slip ring induction motors.

Bulletin 68200B.

Described under control for polyphase Form ITC induction motor.

INDUCTION MOTOR FOR MINE SERVICE

SYNCHRONOUS MOTORS—While the synchronous motor may be applied to most any industrial service, its greatest value is obtained when used on circuits with a need for power factor correction, indicated as follows:

(1) When the power factor is low and greater generator, transformer or feeder capacity is required.

(2) When power is purchased at a rate which is now, or shortly may be, dependent upon the power factor of the load.

(3) When the voltage regulation is poor on account of an existing induction motor load and production falls off in consequence.

(4) When continuity of operation is imperative and dirty operating conditions make a small motor air gap inadvisable.

The GENERAL ELECTRIC COMPANY has designed complete lines of synchronous motors covering a wide range of speeds and capacities which are in extensive use throughout many industries driving rolls, compressors, pumps, grinders, crushers, blowers, fans, conveyors, etc.

Bulletin 41309. Our engineers will be pleased to supply additional information on request.

A. C. and D. C. Mill Type Constant Speed Motors.

MI and MD mill type motors, for severe steel mill service, require special designs. In addition to cranes

MILL TYPE MOTOR AND SOLENOID BRAKE

and reversing auxiliary machinery in steel plants, mill type motors can be applied with advantage as follows: Ore and coal bridges and unloaders; charging machines

of all types—for example, gas works, coke pushers, levelers, etc.; heavy duty fabricating shop and erecting shop cranes; high grade factory cranes, electric shovels, dipper dredges, capstans, gates, valves, etc.; on canal locks, draw and lift bridges; small heavy duty hoists.

Mill type motors furnished totally enclosed in sizes from 3 to 150 h.p. for 25-cycle, 220 and 440 volts A. C. and 230 and 550 volts D. C. Open type motors furnished from 25 to 150 h.p. A. C. and 6 to 200 h.p. D. C. for continuous duty.

CONTROL FOR MILL TYPE MOTORS—Drum controller CR 3202, described under control for MTC motors, is recommended for general application for controlling the type MI motor.

Bulletin 68200B.

MD Motor Control—CR 3100 drum controllers provide either for non-reversing or full reverse rheostatic control of series or compound wound MD motors. Dustproof covers protect moving and live parts from dust, dirt and accidental contact by operator.

Bulletin 68202.

CR 9510 solenoid brake for either MI or MD motors is arranged for mounting either on floor or motor and possesses all the features demanded by modern practice. These brakes are self-contained, automatic or self-adjusting, and are designed to withstand the most severe service. Solenoid Brake.

Bulletins 48900 and 68010A.

D. C. Constant Speed Motor.

The Type RC motor may be classed as the universal D. C. motor. Furnished for constant speed, shunt wound for conditions requiring close speed regulation, compound wound for conditions demanding heavy starting torque or where violent power fluctuations occur, series wound where load either possesses fixed values or may be made subject to automatic or manual control.

CONSTANT SPEED D. C. MOTOR, SEMI-ENCLOSED

All RC motors are shipped for floor installation. Readily arranged for wall or ceiling suspension.

Bulletins 41013, 61014.

CONTROL FOR RC MOTORS—CR 1000 dial type rheostat is recommended for ordinary starting service of RC motors, Bulletin 68332. Where the service is more severe, CR 3100 drum controller should be used. Bulletin 68202.

STARTING RHEOSTAT AND CURRENT LIMITING SELF-STARTER

SWEET'S CATALOGUE

tin 68202. Drum controller can be supplied for reversing or non-reversing service.

Where it is desired to start motor automatically or from remote points, there are several types of self-starters that can be used. Counter EMF self-starters, such as CR 2301-2-3-5-6, automatically close the line circuit through starting resistance, then automatically short circuit the resistance after the counter EMF has reached a predetermined value, Bulletin 68409. The current limiting type of self-starter—CR 2201-2-3-4-6—closes the line circuit through starting resistance, then automatically cuts out each step as the current falls to a predetermined value, Bulletin 68410. Accessories can be supplied, such as CR 2931 float switch, Bulletin 68501; CR 2922 pressure governor, Bulletin 68411; CR 2925 pressure switch.

Bulletin 68502A.

D. C. Crane and Hoist Variable Speed Motor.

CO 1800 CRANE AND HOIST MOTORS—CO 1800 crane and hoist motors are designed for intermittent service requiring a maximum torque motor of ample overload capacity, enclosed, reversible and series wound. Suitable for floor, wall or ceiling mounting. End shields, feet and shaft extensions same on both ends. Furnished with or without back gear. Top half of frame can be lifted off without disturbing back gearing. Shaft can be removed without disturbing windings or commutator. All parts arranged to facilitate repair and permit easy inspection.

Sizes range from 2 h.p. to 65 h.p., 115 and 230 volts, and to 50 h.p., 550 volts. Electric brakes of half or full torque capacity can be supplied to insure a quick, sure stop.

Bulletin 68100A.

Control for CO 1800 Motors—CR 3100 Drum Controller and CR 9510 Solenoid Brake. Described for control of MD Mill Type Motors.

D. C. Adjustable Speed Motor.

RF ADJUSTABLE SPEED MOTOR—RF adjustable speed, commutating pole motors have been designed for machine tool and similar service where wide variation and adjustment of speed independent of load is required. Built with removable shaft, split back end shield and bearings which facilitate repairs and changes. Conduit terminal bases protect connections and operator.

Bulletins 41021A and 48029.

TYPE RF ADJUSTABLE SPEED D. C. MOTOR

Continued on next page

Made in sizes from 2 to 50 h.p., 230, and 550 volts. Speed adjustment by field 2 to 1, 3 to 1 or 4 to 1.

Type RA motors in sizes from $\frac{1}{2}$ to $1\frac{1}{2}$ h.p., 115 and 230 volts. Speed adjustment 2 to 1 or 3 to 1.

Control for RF Motor—CR 1200 dial speed regulator is recommended for light service. This regulator contains starting resistance which will allow a 2 to 1, 3 to 1 or 4 to 1 speed variation by weakening shunt field of motor. Bulletins 48320 and 68336.

SPEED CONTROLLING RHEOSTAT

Where service is severe, the CR 3105 drum type controller is recommended. On smaller sizes both armature and field resistance are mounted on back of controller; while on larger sizes field resistance only is mounted on back of controller, and the armature resistance being mounted as a separate unit. In case under voltage or overload protection is required, CR 3170 panel is recommended.

Bulletin 68204.

Fractional Horsepower Motors.

The GENERAL ELECTRIC COMPANY has studied extensively the problem of electric motor application to small tools, etc., and out of its familiarity thus gained, is in a position to help other manufacturers who have small tool power application problems.

Type SA, SD, SDA, RSA, RKT and RKQ. Fractional horsepower motors rating from $1/200$ to $3/4$ h.p. inclusive are available.

Alternating current Type SA and direct current Type SD motors are, for corresponding ratings, mechanically interchangeable.

Type SDA line are series wound motors, and the A. C. and D. C. motors of corresponding ratings, being built in the same frames, are therefore mechanically interchangeable.

The Type SA and RSA are constant speed, single-phase motors, and can be furnished for standard frequencies.

Types RKT and RKQ are polyphase, constant speed motors, and can be furnished for standard frequencies.

All types with the exception of the Type SDA mo-

Type SD

Type RSA

FRACTIONAL HORSEPOWER MOTORS

tors can be furnished with back gearing equipment for slow speed service.

Control for fractional horsepower motors may be either push button, lever switch or rheostat.

Bulletins 61509 to 61512.

Following is a partial checking list of applications of fractional horsepower motors. These applications may in themselves not solve all problems but may suggest a means whereby they can be solved.

Air compressors	Weighing machines
Bag filling machines	Winding machines
Fans, blowers and exhausters	Centrifuges
Boiler tube cleaners	Screwdrivers
Conveyors	Vibrators
Drill presses	Boring machines
Portable drills	Drying drums
Flow surfacers	Valve operation
Buffers, grinders and polishers	Nailing machines
Lathe drive	Pipe cutters
Machine tools	Planers
Oscillators	Punch presses
Riveting machines	Shears
Saw setters or trimmers	Stone dressers
Spinning machines	Saws: hack, band, circular and jig
Automatic switches	Pumps: oil, water, gasoline, vacuum, etc.

Some of these applications are illustrated below. The devices are not manufactured by the GENERAL ELECTRIC COMPANY but show uses for which the small G-E motor is admirably adapted.

Die Filing Machine

Bench Planer

Air Compressor

Lectroflator

Portable Riveter

Rotary Oil Pump

Bench Riveter

Automatic Heat Regulator

Portable Electric Drill

Disk Grinding Machine

Water Wheel Governor

Water Pump

Power Saw

Automatic Buffing and Polishing Machine

A FEW APPLICATIONS OF G-E FRACTIONAL HORSEPOWER MOTORS

Fort Wayne Electric Rock Drills.

These drills are in extensive use in tunneling and mining operations.

They are of the rotary hammer type operated by a fully enclosed splashproof electric motor (A. C. or D. C., single-phase excepted), which can be removed and replaced in 1 minute. Motors are designed for 50% overload and can be mounted on drill so that an A. C. motor may be instantly substituted for a D. C. motor and vice versa.

Any desired speed can be obtained by means of a belt tightener.

These drills strike 1700 blows per minute, each blow having maximum cutting effect. They will cut holes up to 12 ft. deep, finishing at 1½ in. diameter, and can be handled by 2 men.

Power consumption is 1½ to 2 h.p. as compared to 12 to 18 h.p. for air drills of equal capacity.

Drill steel can be changed without the use of wrenches or other tools.

Drills can be mounted on tripod, column, shaft bar, gadder post or quarry bar.

FORT WAYNE ROCK DRILL

Motor Driven Exhaust Fan Outfits.

G-E exhaust fan outfits are self-contained units, adapted for ventilating shops, factories, office buildings, etc., or for use in dye houses, laundries, paper mills and other industrial establishments where it is desirable to remove steam, moist air, dust, smoke and odors, or to exhaust noxious gases and fumes which attend certain processes of manufacture.

These outfits may be usefully employed to dry cloth, paper, wool, tobacco, asbestos, bricks, clay and many other articles of merchandise.

Made in disk and propeller types for both A. C. and D. C. standard voltages, ranging in sizes from 12½ to 48 inches, capacities from 750 to 25,900 cu. ft. of air per minute.

Bulletin 41801.

PROPELLER FAN

VENTURA DISK FAN

Fabroil Gears.

Fabroil gears are superior to other non-metallic gears by virtue of a measure of elasticity which allows meshing teeth to come to a good bearing across the full width of face, and absorbs shock of rapid variation of torque.

Because of their noiseless operation, long life and high tooth strength, Fabroil gears are applicable to lathes, planers, traveling cranes, drill presses, shears, punches, etc.; shafts of back-gear motors which drive machine tools; drive of spinning frames in silk, worsted, carpet and similar mills; heavy machinery of paper and pulp mills; intricate mechanism of printing plants; automobile and other gas engine ignition drives; timing gear-trains.

While in some instances they run with success at 4000 ft. per minute, maximum speed should be kept at 2000 ft. per minute, for all general applications.

ADVANTAGES—Strong as the best cast iron.

Not liable to damage from contact with oil.

Unaffected by atmospheric changes and neither shrink nor swell in extreme dryness or dampness.

Absolutely vermin-proof.

Elasticity of tooth sufficient to absorb shocks.

Long life.

Run equally well against cast iron, steel or bronze.

Can be run in cold or hot oil baths.

Bulletin 48703A.

FINISHED FABROIL GEAR

Portable Air Compressors.

The small G-E reciprocating compressors, such as are used to supply air brakes on electric street cars, are particularly applicable for blowing out machinery in industrial plants.

These compressors are built with either induction motors or D. C. motors of any commercial frequency or voltage.

The motor and compressor are so designed and built as to form one unit.

The compressors have 2 horizontal cylinders, single action, single stage, geared between cranks by herring-bone gear.

The lubrication of all bearings is entirely automatic and abundant, being carried up by the gear to distributing panels which supply all bearings.

Electrical design of the motors is best suited to the purpose, because it is not limited by the gear centers. No separate gear case is required, as all gearing is contained in the compressor frame.

G-E compressors are furnished either as portable sets or as stationary equipments complete with automatic pressure governor, reservoir, line switch and fuses and pressure gage.

For blowing out electrical apparatus or knitting machinery and the like, either machines of 15 or 25 cu. ft. displacement per minute are used at pressures of 50 or 60 lbs. per sq. in.

Bulletin 48610.

PORTABLE AIR COMPRESSOR

Centrifugal Blowers.

G-E centrifugal blowers or compressors are designed for large volumes and low pressures such as are required for the following classes of service: oil and gas burning furnaces, foundry cupola blowing, pneumatic mail and cash conveying systems, pneumatic coal and ash conveying systems, agitation of liquids, sewage treating plants, blowing water gas generators, etc.

STANDARD SINGLE-STAGE CENTRIFUGAL BLOWER DRIVEN BY DIRECT CONNECTED INDUCTION MOTOR

These blowers are similar in design to the well-known centrifugal pump. They may be driven by D. C. motors with auxiliary apparatus for starting and controlling speeds, 60-cycle induction motors for constant speed service or by Curtis steam turbines. Blower and driver are direct-connected, the complete unit requiring at most 3 bearings and usually only 2 bearings.

The G-E centrifugal blower differs from the ordinary fan blower in that it is provided with discharge or diffusion vanes which convert the otherwise lost energy of velocity into pressure energy, resulting in high overall efficiency. Blower is completely housed.

G-E centrifugal blowers will deliver practically constant pressure over a wide range of loads. The internal clearance is very large, thus there is no rubbing and no internal lubrication is required. Dimensions are small, thus minimum floor space is required. These blowers may be fitted with a constant volume governor which is simple in action, positive, accurate and safeguards machinery in case of breakdown.

Bulletins 48601, 48609, 42801.

STANDARD SINGLE-STAGE BLOWERS—Induction motor and D. C. motor driven, are furnished for varying speeds and pressures. Capacities of 350 to 10200 cu. ft. per min. Curtis steam turbine driven blowers are arranged for steam pressures of 80 lbs. per sq. in. and up, condensing or non-condensing. For varying speeds and pressures. Capacities of 600 to 10200 cu. ft. per min.

LARGE MULTISTAGE CENTRIFUGAL BLOWERS—Driven by Curtis Steam Turbines or 60-cycle induction motors. Capacities of 3000 to 55,000 cu. ft. per min.

SMALL MULTISTAGE CENTRIFUGAL BLOWERS—Developed in three types to meet the demand for blowers of smaller volume capacity than the single-stage sets.

Electric Locomotives.

The GENERAL ELECTRIC COMPANY builds electric locomotives for moving all classes of rolling stock. A separate engineering organization is maintained for this class of work. The largest type for heavy freight service built by this company is a 280-ton locomotive.

A modern high speed gearless passenger locomotive weighing 265 tons is described in Bulletin 44102.

The GENERAL ELECTRIC COMPANY's standard type of 25-ton electric locomotive is designed to meet the service conditions where trains of medium weight have to be hauled over tracks which do not include excessive grades. Its weight may vary anywhere between 22 and 35 tons, according to the service requirements.

35-TON ELECTRIC SWITCHING LOCOMOTIVE

This type of locomotive has been extensively used as a switching unit in large industrial plants and for switching service in the terminals of interurban roads. The design is such as to give maximum economy in materials of construction and at the same time maximum strength and rigidity. In general the equipment comprises four 40 to 75 h.p. motors.

Almost every interurban road will find an electric locomotive a useful adjunct to its regular equipment. Two advantages are to be obtained by reserving a separate unit of this kind to switch freight at terminals and to haul trains. The regular motor cars are released from this class of duty and, secondly; the equipment of the locomotive, being specially designed for freight service, is capable of performing it in a more satisfactory and economical manner.

Industrial Electric Locomotives.

The electric locomotive is admirably adapted to fulfill the transportation requirements of all industries and possesses many advantages over steam locomotives, animal haulage, hand trucks, etc. Its advantages are:

Consumes power only when in actual operation. Can be operated by one man of ordinary intelligence. Ready for use at all times. Has large momentary overload capacity. Possesses an easy and perfect system of control. Has comparatively few wearing parts and consequently low maintenance cost. Requires attention only when actually in use. Can be run inside a building and in other localities where smoke and fire risk of a steam locomotive would forbid its use. The inter-factory transportation of large manufacturing plants that consist of buildings scattered over considerable areas, can be most satisfactorily and eco-

4-TON NARROW GAGE STORAGE BATTERY LOCOMOTIVE

nomically handled by small electric locomotives. It is equally well adapted for service in brickyards, stone quarries, cement plants, etc., in getting ore from mines to stamp mills, hauling log trains to saw mill, in large public works and in tunnel driving.

TYPE—Single truck with 2 motors, varying in weight from 2 to 25 tons. Built for gages from 18 to 56½ in. Fitted with motor equipments designed for operation on 250- and 500-volt D. C. circuits.

Bulletin 4936A.

Mine Locomotives.

G-E electric mine locomotives have been in active service for many years, which is proof of their rugged construction and of their ability to stand up under the most trying conditions.

The two-motor locomotive is recognized as the standard type for mine work. Sparkless commutation is assured by the use of special motor construction. Although this locomotive has long wheel base, it is easy on track. Weighs 20 tons, and will develop maximum drawbar pull of 12,000 lbs.

20-TON ELECTRIC MINE LOCOMOTIVE

Gathering locomotives for use for short haulages between the working face and entry of mines where the seam is thin. The locomotive is operated by simply hitching the cable to entry trolley, throwing in motor switch and operating locomotive forward and backward without danger of overrunning or kinking the cable. The reel of the motor is driven by a small vertical motor.

Storage Battery Locomotives.

Adapted for short distance hauls at low speeds handling material in and about factory buildings. By providing the elevators with tracks they can be effectively used to distribute material on different floors.

STORAGE BATTERY LOCOMOTIVE

Can be safely used in locations where sparks would involve danger.

Bulletins 64250 to 64257.

Line Material.

The GENERAL ELECTRIC COMPANY has developed a complete line of material used in the construction of overhead trolley systems and track return for electric railways in every service. This includes pole brackets,

suspensions and ears of many types, strain and feeder insulators, splicing sleeves, trolley frogs and crossings, section switches and insulators, turn buckles, rail bonds, bonding tools, etc. Special forms of these devices have been developed to meet the special conditions of mines and other industrial properties.

These devices have been designed to meet every possible condition and have been thoroughly tested. Sherardizing is the standard finish and protection for all iron and steel parts of G-E line devices. Japan finish can be furnished for use where devices are subject to the deteriorating effects of acids.

FORM N TROLLEY FROG WITH RENEWABLE PAN

CLAMPING EAR

TROLLEY FROGS—Furnished for any angle of divergence and in various forms suitable to meet all conditions. For mine work, the Type N is recommended on account of its low first cost and low cost of repairing. The worn-out pan can be easily replaced by loosening the two clamping bolts.

SECTION INSULATORS—The combined section insulator and automatic section switch, although designed especially for mine tramways, may be used to advantage in surface work.

The hand operated section insulator will permit several locomotives to enter the protected zone at one time. The switch, being located at the side of the insulator block, moves parallel to the track and is therefore easily operated from the moving locomotive. The runways are made of composition metal and overlap so that the current is not interrupted. The runway and switch contacts are easily renewable.

HAND OPERATED SECTION INSULATOR, BOTTOM VIEW

ADJUSTABLE CROSSINGS—These crossings manufactured by the GENERAL ELECTRIC COMPANY can be adjusted to any angle between 30° and 90°.

RAIL BONDS—Owing to the many types and the variation in dimensions of rails and joint plates in common use, a great variety of forms of bonds has been developed. Occasionally exceptional cases arise requiring some modification of one of the standard forms in order that the best results may be obtained. The GENERAL ELECTRIC COMPANY will gladly submit recommendations showing how best to meet any bonding conditions and its Engineering Department is always at the service of customers to give advice.

FORM G ADJUSTABLE CROSSING (UNINSULATED)

FORM II MINING SUSPENSION

Bulletins 44004A and 44005A will give detailed information regarding railway line material.

Wiring Devices.

Only a few of the G-E wiring devices are shown here.

For information on our complete line, send for G-E Specialties Catalogue Y1270.

Threaded Catch Sockets.

The G-E Threaded Catch Socket can not pull apart under many times the strain to which it will be subjected in service.

Its strength and rigidity are unequalled by any other design of metal lamp socket.

Lugs on the cap fit into the body of the shell, preventing twisting; and a threaded ring holds the two parts of the shell firmly together.

This improved design costs no more than the ordinary types. It is made in key, keyless and pull styles; also in the locking type both key and keyless. It is *not* designed for use in fixture husks.

SHELL OF
THREADED
CATCH SOCKET

Locking Sockets.

These afford a positive protection to lamps installed in public or semipublic places. They also prevent the theft of current through the surreptitious use of high wattage lamps and current consuming devices.

The principle of design is correct. When the key is removed the screw shell of the socket swivels freely, preventing injury either to the lamp base or socket if an attempt be made to remove the lamp without the use of the key. G-E locking sockets can be furnished in the following types: Key, keyless and pull, metal shell and porcelain, with all the usual styles of caps and bases.

SHELL OF LOCK-
ING SOCKET

To install a lamp, the key is inserted in a horizontal position. The key should then be turned to a vertical position and pressed until it engages one of the notches in the fiber ring at the top of the screw shell. This holds the screw shell stationary while the lamp is being screwed in and firmly seated. When key is removed, the lamp and screw shell will swivel freely. The peculiar shape of the key prevents the substitution of a pin, nail or similar device.

Porcelain Sockets.

Where climatic conditions or peculiar surroundings

Keyless Sockets, $\frac{1}{8}$ -inch Cap Key Socket, Pendent Cap
PORCELAIN SOCKETS

are likely to corrode metal shell sockets, porcelain sockets should be used. They are anti-corrosive, and are especially adapted for chemical laboratories, bathrooms, cellars, laundries, storage plants, etc.

They are made N.E.C. standard in key, keyless and pull chain types.

Key and pull chain, 250 watts, 250 volts.

Keyless, 660 watts, 250 volts.

Metal Shell Sockets.

These sockets are standard and dependable. They are made in the usual key, keyless, push button and pull chain styles, and in the locking type, either key, keyless or pull.

Key for Lock-
ing Sockets Multi-catch
Locking Socket Fluted Catch, Lock-
ing Key Socket Multi-catch
Keyless Socket
METAL SHELL SOCKETS

Multi-catch, pull and key, 250 watts, 250 volts.
Keyless, fluted catch and push button, 660 watts, 250 volts.

Weatherproof Sockets.

For outdoor installations or where sockets are exposed to unusual dampness or other corrosive influence, G-E weatherproof sockets should be used.

Made N. E. C. standard and will take standard weatherproof shade holders.

Made in 660 watts, 250 volts.

Porcelain Socket Socket with Wires In-
side of Pipe
WEATHERPROOF SOCKETS

Lamp Receptacles.

G-E metal shell receptacles are made sturdy, and electrically perfect, in key, keyless and pull; and in the same styles locking type, N. E. C. standard.

There are dozens of designs for every conceivable purpose.

Fluted Catch Locking
Receptacle

Pull Metal Shell Recep-
tacle, Angle Base

METAL SHELL LAMP RECEPTACLES

Moulding and Cleat Receptacles.

A neat appearing and thoroughly efficient G-E receptacle for moulding and cleat work. Made in all standard ratings in a large variety of types and sizes. Furnished key, keyless, locking and pull chain.

Key, Metal Shell Receptacle, One-way Base

Fluted Catch Key Receptacle for Cleat Wiring

MOULDING AND CLEAT RECEPTACLES

Ceiling Receptacles.

Like all other G-E fittings, these receptacles are substantially built and electrically perfect. Made N. E. C. standard, in keyless and pull chain types.

KEYLESS METAL SHELL CEILING RECEPTACLE
For use with 3/4 and 4-inch Outlet Boxes

Porcelain Cleat Receptacles.

For good appearance, utility and dependability, these receptacles are unique. The mechanism is protected from dampness and dust. Made N. E. C. standard in key, and keyless type, solid and removable base.

Cleat Receptacle

Keyless Cleat Receptacle, Removable Base

Key Cleat Receptacle, Removable Base

PORCELAIN CLEAT RECEPTACLES

Porcelain Moulding and Conduit Box Receptacles.

A sturdy, neat-appearing porcelain receptacle, designed for National metal moulding, with 1-way or 2-way bases.

Made in key, and keyless types.

The conduit box receptacles are made to fit 3 1/4-in. and 4-in. conduit boxes.

Key, 250 watts, 250 volts.

Keyless, 660 watts, 250 volts.

Key Moulding Receptacle, Removable Base

Keyless Receptacle for 4-inch Conduit Box

Key Receptacle for 3/4 inch Conduit Box

PORCELAIN MOULDING RECEPTACLES

"Standard" Separable Receptacles.

The G-E line includes this convenient type of receptacle, for use with portable electrical conveniences now so increasingly popular in household, commercial and industrial installations. Made for long wear. Adaptable to cleat, moulding and conduit work.

Cleat Receptacle

Receptacle for Conduit Boxes

Receptacle with Base for "Paiste" Taplets

Receptacle with Condulet Base

Receptacle for Concealed Work

Receptacle for Moulding Work

STANDARD SEPARABLE RECEPTACLES

"Standard" G-E Flush Receptacles.

G-E "Standard" type, 660 watts, 250 volts, is recommended for general use.

Any "Standard" plug will fit any "Standard" receptacle.

The double outlet type takes the same box as the single outlet receptacle.

These receptacles take the same outlet boxes as flush push button switches.

Dimensions of porcelain, center to center of supporting screw holes:

Length	Width	Depth	Outside	Inside
2 5/8 in.	1 5/8 in.	1 3/8 in.	3 3/8 in.	2 13/16 in.

CAP

"STANDARD" FLUSH RECEPTACLE, SINGLE OUTLET

Heavy Duty Receptacles, 25 Amperes.

An extra heavy duty receptacle for use on heating circuits, etc.

Dimensions of porcelain, center to center of supporting screw holes:

Length	Width	Depth	Outside	Inside
2 1/2 in.	1 3/4 in.	1 3/8 in.	3 3/8 in.	2 13/16 in.

Ceiling Rosettes.

On open wire installations and

Geco Rosette, Cleat

Geco Rosette, Moulding

Standard Rosette, Concealed Work

PORCELAIN CEILING ROSETTES

concealed work the ceiling rosette is the important connecting device between pendant lamps and the circuit. G-E ceiling rosettes are made in all types and sizes. Furnished with or without fuses.

Pull Switches.

A necessary convenience where lights are inaccessible or remote from point of control. Ruggedly built and electrically perfect. Made for cleat, moulding and conduit work, and furnished with 1- or 2-way bases, with short chain and 10 ft. of cord.

Pull Switch Rosette, Conduit Base

Pull Switch Rosette, Side Outlet, Large Concealed Base, Porcelain Flange

Pull Switch Rosette, Side Outlet, Cleat Base

Side Outlet Pull Switch, Small Porcelain Base. Furnished also with Bottom Outlet

PULL SWITCHES

Pendent Switches.

The advantages of this type switch are obvious. They permit the convenient control of lights without running wires along the ceiling or down the side walls.

Pendent Switch, 1/8-inch Cap

Pendent Cap, Pendent Switch

Porcelain Pendent Switch

PENDENT SWITCHES

Snap Switches.

Admirably adapted for open wiring in attics, garages, cellars, barns, storehouses and in all installations demanding a low cost, yet thoroughly dependable switch.

Made with porcelain base and some types in all porcelain.

Made in all standard ratings, in a great variety of types and sizes and may be had in indicating or non-indicating forms. Porcelain switches are recommended for use in places subject to moisture, acid fumes or other corroding influences. Made for cleat, moulding and conduit work. Furnished single, 2-, 3-, and 4-way.

CEILING SNAP SWITCH, CONCEALED BASE

Single Pole Snap Switch for Condulets

PORCELAIN SNAP SWITCHES

Door Switches.

These switches are of the flush type to be installed in door frames.

They are operated by opening and closing the door.

Recommended to control lights in closets, refrigerators, etc.

Furnished single pole, 6 amperes; in 2 types—to close circuit when door is open and to close circuit when door is closed.

Flush plate furnished with switch.

Dimensions of porcelain, center to center of supporting screw holes:

Length.	Width.	Depth.	Outside.	Inside.
3 1/8 in.	1 in.	1 1/8 in.	2 1/8 in.	2 1/8 in.

AUTOMATIC DOOR SWITCH

Plug Cut-outs.

Made with porcelain base, single, double and triple pole, two or three wire. Furnished in 30- and 60-ampere capacities.

Plug Cut-out Single-pole

Combined Switch and Plug Cut-out

Plug Cut-out Double-pole

PLUG CUT-OUTS

Fuses.

Where maximum protection under all operating conditions is desired, the use of N. E. C. S. fuses is strongly recommended.

Where it is considered desirable on account of frequent blow-outs to use fuses of the renewable type—G-E renewable enclosed fuses are offered with the assurance that they embody all the best features of this type of fuse.

FUSE PLUG New type

KNIFE FUSE

Floodlighting Projectors.

This company provides a line of projectors to meet all special requirements.

G-E projectors have been successfully used in lighting the following: arsenals, building fronts, chimneys, docks, freight unloading, grain elevators, manufactur-

ing plant exteriors, patrol duty, quarries, water tanks, theater fronts, railroad yards, etc.

FORM L-1—For lighting an object at 150 ft. or more; beam divergence 8° to 14° ; with medium-angle reflector, beam divergence 12° to 20° , suitable for objects at 75 to 200 ft.

FORM L-3—Beam divergence 50° , for objects at 25 to 75 ft. or more; similar to L-1 but provided with special silvered and copper-backed heat-resisting reflector.

FORM L-11—Meets the demand for a small flood-lighting unit mounted close to object.

FORM L-15—Designed for large areas, lighting shipyards, construction work, etc. Beam divergence 20° to 30° . This projector is equipped with focusing mechanism to regulate divergence of beam.

CONSTRUCTION WORK ILLUMINATED BY FLOOD LIGHTING PROJECTORS

Headlights.

For electric railways, both traction service and mining locomotives, and also for steam roads. Either arc or incandescent types can be furnished.

Bulletins A4061 and 43800.

Searchlights.

Searchlights are suitable for night work in mines, railroads, marine and construction work.

The GENERAL ELECTRIC COMPANY makes 2 types: an 18-in. incandescent lamp, 1000-watt, 110-volt searchlight and the arc lamp type, in sizes 9, 13, 18 and 24 in. Larger projectors of 30, 36, 48 and 60 in. in diameter are manufactured and can be supplied.

Projectors arranged for hand and pilot house control are regularly kept in stock for immediate shipment; and for shaft, rope and electrical control can be provided when desired.

Bulletin 43856A.

ELECTRICALLY CON-
TROLLED SEARCHLIGHT

Blue Printing Lamp.

Economical blue printing and photographic work requires an intense light containing an excess of violet, ultra-violet or actinic rays.

The GENERAL ELECTRIC COMPANY manufactures a special enclosed-carbon arc lamp meeting these requirements. These are adjusted for 20 amps. at 110 volts A. C., 15 amps. at 220 volts A. C. and 10 amps. at 220 volts D. C. All are equipped with heat-resisting globes.

D. C. LAMPS—Form 12, 10 amps. 1100 watts; Form 6, 6 amps. 1320 watts; Form 20, 15 amps. 1650 watts; Form 14, 10 amps. 220 watts.

A. C. LAMPS—Form 6, 10 amps. 770 watts; Form 6, 6 amps. 950 watts; Form 14, 20 amps. 1600 watts; Form 14, 15 amps. 2300 watts. It is desirable to use an arc lamp having a high current adjustment.

Bulletin B-3293.

BLUE
PRINTING
LAMP

Constant Current Transformers.

The GENERAL ELECTRIC COMPANY builds a complete line of constant current transformers in capacities from 1 to 80 kw., inclusive. These may be supplied for any commercial voltage, frequency and current. Two types are manufactured: one for station use and the other for pole mounting for outdoor service.

Bulletins 65109 and 65110.

The Company manufactures also series luminous rectifier outfits for operating series magnetite arc lamps.

Bulletin 43253 and 43900.

OUTDOOR TYPE AND STATION
TYPE CONSTANT CURRENT
TRANSFORMERS

Novalux Units.

Novalux pendent and ornamental units are designed for use with the efficient Mazda "C" lamp. The pendent type is particularly suited for the economical illumination of streets, large interiors and exteriors, and the different light directing equipments produce such a variety of illuminating characteristics that a selection can be made to meet any individual requirement.

The ornamental units in addition to lighting the

EDISON MAZDA LAMPS.

Lamps of Known Quality.

Into every Edison MAZDA lamp is built the cumulative results of 40 years' experience in the manufacture of over one billion lamps. Each Edison MAZDA lamp is backed by MAZDA Service, the world wide scientific service of the Research Laboratories of the General Electric Company, to certain lamp manufacturers maintaining the MAZDA standard of quality.

New Era in Lighting.

It is indeed fortunate that the economical and reliable Edison MAZDA lamp is available, for all commercial interests are beginning to realize the tremendous importance of proper artificial illumination. We are at the beginning of a new era of lighting.

In the *industrial plant*, for example, manufacturers are realizing that with high intensity lighting of the proper quality as to diffusion and color, tremendous increases in production are possible. Carefully conducted and authentic tests have indicated that this statement is no mere theory, but is carried out in practice.

A slight expenditure over what has been made in the past for lighting will make available greater production; a most important question under the present economic conditions. With proper lighting in the industrial plant, safety is enhanced and far more comfortable working conditions produced. Much higher intensities than employed in the past are coming into use, and in planning the wiring for the industrial plants, due consideration must be taken of the additional demand for lighting likely to be encountered.

In connection with increased intensities of illumination special precaution must be taken to avoid glare. A reflector is a very important factor in this consideration, and the leading reflector manufacturers of America have standardized on new designs affording better eye protection than heretofore, and are marketing these under the name of RLM (Reflector and Lamp Manufacturers) standard reflectors.

The RLM standard reflectors are built to certain specifications as regards angle of cut-off (for proper eye protection), quality of enamel, workmanship, etc. Every designing engineer should be thoroughly posted on these new types of reflecting equipment.

To obtain higher intensity illumination larger lamps must be employed, and with the increase in size of lamp, special precautions must be taken to diffuse the light coming from the lamp itself.

A new finish of the lower end of the lamp bulb, known as *bowl enameling* has been developed. This resembles bowl frosting, but is applied by an entirely new process, which produces a pure white diffusing surface of considerably lower brilliancy than the older

style of diffusing bulb. It is especially serviceable with the RLM dome reflectors and similar equipment.

In order to obtain some idea of the present lighting conditions, a little instrument known as the *Foot-candle Meter* is now available at a very low cost. This is in reality a portable photometer, very simple in design and operation. An inexperienced man, with the aid of this instrument, can readily obtain reasonably accurate figures on the intensity of illumination. This instrument is a very important factor in improving lighting conditions. The designing engineer and architect should certainly have one of these available, to obtain records of the results which will form a basis of future design.

In the *office* there is now far more appreciation of the economic advantages of increased illumination properly diffused. Many new types of commercial lighting units and semidirect equipments are now standard. It is well in planning the layout of office buildings to be liberal in wiring capacity and in the spacing of outlets to take care of future requirements.

The *merchants* have become awakened to the possibilities in the way of increased sales and better working conditions through proper artificial illumination. The Foot-candle Meter gives them an instrument for checking the lighting, and it is useful throughout the various departments in determining the relation between light and sales.

In planning the lighting for the *show window* another instance is seen of the desirability of adequate wiring capacity. Within the last year a considerable number of high grade stores have employed colored mediums for modifying the light from show window lamps. Extremely artistic and pleasing effects are possible through the use of colored illumination in the show windows. This practice is spreading throughout the country. Instead of all window displays being illuminated in a standard manner with unmodified light, each picture erected by the display man will be painted with light.

In *residences* and other fields of *decorative lighting* a wider use will be made of tinted illumination. Pleasing touches of color throughout the home or decorative interior add wonderfully to the effect of the illumination. The MAZDA lamp is of such a character that its light can be readily modified by the application of color screens or mediums of various sorts.

Service Available.

The EDISON LAMP WORKS is desirous of securing the best practical application of its product and welcomes the opportunity of co-operating with engineers, architects and others responsible for lighting designs.

The publications of this company are designed to give up-to-date information on lamps, illumination and various appliances, and are obtainable on request.

SPRAGUE ELECTRIC HOISTS and MONORAILS.

Also, Motors, Generators, Electric Dynamometers, Switchboards, Panelboards, Industrial and Portable Ozonators, Exhaust Fan Outfits, Electric Fans, Steel Armored Cable, Flexible Steel Conduit, Galvanized Rigid Conduit, Enameled Rigid Conduit Outlet Boxes, Armored Hose, Electric Freight Handling Machinery, Theatrical Devices.

Co-operative Service.

The SPRAGUE ELECTRIC WORKS of General Electric Company are prepared to furnish, through recognized trade channels, a complete line of apparatus and supplies for the electrical equipment of buildings, and offer the services of a specialized department to architects, consulting engineers, electrical contractors, plumbing contractors, heating and ventilating contractors, supply houses, and manufacturers of motor driven machinery used in the equipment for buildings.

General.

The SPRAGUE ELECTRIC WORKS for many years have manufactured a complete line of electric hoists and cranes in capacities from $\frac{1}{4}$ to 6 tons. They are designed to satisfy the demand for efficient lifting and carrying devices to fill the gap between the hand chain block and the large traveling cranes. The hoists and cranes are admirably suited for all industrial operations requiring the transportation of any class of material.

The hoists here described can all be equipped with cage for operator.

Complete information concerning any equipment described here will be gladly furnished on request to the nearest branch office.

S-1 Hoist.

This hoist is entirely enclosed and protected from dust and moisture. It is built both for direct current and polyphase alternating current circuits. Any one of a number of controllers and trolley carriages may be used in connection with it, so that a great variety of applications is possible. It is built for loads of $\frac{1}{2}$ and 1 ton.

S-1 HOIST

This design is suitable for use out of doors, without additional protection.

The load brake with which this hoist is equipped in addition to the regular service brake, prevents excessive acceleration of the load in lowering.

Direct current machines may be equipped with a special controller to produce the slow speeds necessary for foundry service, or with ordinary rheostatic controller for moderate speed regulation.

For lifting small castings and forgings in a machinshop, an electric hoist with a plain or hand geared trolley is vastly superior to other methods. Also used for handling heavy stock, such as castings, bales and cases, which require some means of quick and economical handling.

S-1 MONORAIL HOIST WITH OPEN TRAILING CAGE

S-2 and S-3 Hoists.

For loads of 2, 3, 4 or 6 tons. Both hoists are similar in design, the S-2 hoist having a maximum capacity of 8000 lbs., and the S-3 hoist a capacity of 12,000 lbs.

Motor is geared to drum through a triple reduction spur gearing, the gears being of cast steel, and pinions of steel forgings. The motor, gears, controller and resistance are entirely enclosed, and are protected from dust and moisture. Hoist can be used out of doors without being provided with housing or other protection.

S-2 and S-3 hoists can be supplied with any style of standard trolley carriage, either plain, hand geared or motor driven, with rigid or swivel trucks. They can also be furnished with separate controllers and magnetic brakes.

TYPE S-2 AND S-3 MONORAIL HOIST

W-1 and W-2 Hoists.

For loads of 1, 2, 3, 4 and 6 tons. Both hoists are similar in design, the W-1 built in capacities of from 2000 to 4000 lbs. and the W-2 in capacities of from 3000 to 12,000 lbs. They are worm geared, and can be attached to any style of standard trolley carriage, either plain, hand geared or motor driven. They can also be furnished with remote controllers and magnetic brakes.

Supplied with a traveling rope guide, designed to keep rope in drum grooves, regardless of side pull.

The gears are entirely enclosed, run in grease, and the machines are weatherproof. They can be used for hoisting work of any description within the limit of their capacity, and are especially applicable to foundry work and for use in exposed situations.

Vertical Electric Winch.

The entire mechanism is enclosed in the cast iron base, insuring complete protection from the elements or rough handling, but all parts are easily accessible for inspection by raising hinged covers on sides.

The motor is direct or alternating current, and is geared to winch head through a triple reduction gearing. The gears are steel castings, and pinions steel forgings, all teeth being cut from solid. All bearings are of best bearing bronze and are lubricated with grease by compression cups.

Built in capacities of from 2000 lbs. pull at 150 ft. per minute, to 12,000 lbs. pull at 25 ft. per minute. For pulling loads horizontally, a single speed cylinder type controller is used, which is operated by a foot lever. If the load has to be hauled up a grade, a rheostatic controller and a holding pawl are furnished, the latter for holding the load in case current is interrupted.

VERTICAL ELECTRIC WINCH

GB-7 GRAB BUCKET MONORAIL HOIST WITH ENCLOSED CAGE

D-11 SPUR GEARED WINDING DRUM

Built in capacities from 1000 to 8000 lbs. pull, at speed of 100 ft. per minute. Motor is direct or alternating current, geared to drum through triple reduction gearing

IVANHOE-REGENT WORKS

OF GENERAL ELECTRIC COMPANY

Manufacturers of Ivanhoe Metal Reflectors

5716 Euclid Avenue
CLEVELAND, OHIO

Products.

Manufacturers of IVANHOE METAL REFLECTORS; REFLECTO-CAP DIFFUSERS and FITTINGS for Industrial Plants.

Types of Reflectors.

Based upon wide experience in industrial lighting, the Ivanhoe line has been redesigned—the manufacturer standardizing on four essential types with an addition of a few special service reflectors.

Each type, scientifically designed, is made to produce certain characteristic results which can be applied to any class of industry.

These different types are shown on the following pages and the characteristic distribution of light is shown for each.

Finishes of Reflectors.

Ivanhoe reflectors are made of open hearth drawn steel with 3 standard finishes: porcelain enamel, aluminum, and paint enamel.

PORCELAIN ENAMEL—This finish is applied to the inside of the reflectors in 3 coats. The first is a binding coat, and it is covered by 2 coats of white porcelain enamel. The outside of the reflectors is treated with the same binding coat, and covered with 1 application of dark green porcelain enamel.

ALUMINUM—The aluminum finish is applied in 5 coats, 3 to the inside, and 2 to the outside. The final inside coat is transparent and washable, and the finishing coat on the outside is green paint. The metal form is thoroughly cleaned before the aluminum is applied, and the various coats are baked on separately. The finished reflector is well protected against rust; and although the reflecting surface does not collect dirt readily, it is easily cleaned by washing with a pure soap lather, or with a solution of 4 parts of warm water to 1 part ammonia.

PAINT ENAMEL—The inside of the reflector is covered with a binding coat, and 2 coats of glossy white paint enamel. A glossy green paint enamel is applied to the outer surface, and baked on to insure a tough and durable finish. The color is permanent.

Holders.

Ivanhoe reflectors are made with 3 distinct types of extension to conform to different systems of wiring and installing. These are the B-heel extension, the extension equipped with the D holder, and the R extension.

B-HEEL TYPE—The B-heel is the name applied to the fitter at the top of one type of extension. It

B-HEEL TYPE

TRADE-MARK

provides a convenient and practical method of attaching the reflector to a separable holder.

The B-heel is $2\frac{1}{4}$ ins. for medium base lamps and $3\frac{1}{4}$ ins. for reflectors used with mogul base lamps. B-heels of $2\frac{1}{4}$ ins. fit the standard form "O" holders or holders Nos. 902, 822, 824 or 884. B-heels of $3\frac{1}{4}$ ins. fit holders Nos. 622, 672 or 705.

D TYPE—A second type of extension is furnished with a brass clip ring reinforced by the D clamp strap, or holder, for attaching directly to brass shell sockets.

R TYPE—The R extension gives its reflectors the name of "solid top." This extension contains a porcelain socket which is held in place by a lock nut at the top of the extension. The socket is designed to fit a $\frac{1}{2}$ -in. conduit. Besides providing for easy wiring, all R type reflectors are weatherproof.

D REFLECTOR ON SOCKET
To hang a D reflector on a socket, loosen screw, snap socket in ring, and tighten screw

WIRING TYPE R REFLECTORS
Loosen lock nut at top of extension and raise reflector on pipe

RLM Standard Dome Reflectors.

For all sizes of Mazda C lamps. These reflectors are made in accordance with the specifications and design of the reflectors standardized by the Reflector and Lamp Manufacturers and therefore bear their standard designation RLM.

Recommended as the highest standard of the distributing type.

They are porcelain enameled, green outside and white inside.

For uniform illumination they should be spaced not to exceed one and two-thirds times their height above the work.

In ordering, the Ivanhoe number should be given.

METHOD OF WIRING HOLDER
Cover of holder raised on pipe in order to wire holder and clamp it to B-heel

Holders for Medium and Mogul Base Lamps and Reflectors.

No. 822 is a porcelain socket holder, tapped at the top for 1/2-in. conduit. It is attached to the B-heel type by means of 3 clamps, which are locked into place by a ring.

No. 824 is No. 822 with top casting fitted to take a weatherproof green porcelain enameled canopy.

No. 884 is a green porcelain enameled set screw holder containing porcelain socket.

No. 902 is a steel holder finished in green paint and can be used with any 2 1/4-in. B-heel reflector with either porcelain or composition socket.

No. 622 is a porcelain socket holder, tapped at the top for 1/2-in. conduit. It is attached to the B-heel by means of 3 clamps, which are locked into place by a ring.

No. 672 is No. 622 with top casting fitted to take a weatherproof green porcelain enameled canopy.

No. 705 is a green porcelain enameled set screw holder contain-

List price, each	\$0.19	1.20	1.85	1.60

Ivanhoe Glass-top Reflector.

Metal part of reflector is one compact piece, the form and heel being connected by substantial legs rigidly welded at each end. RLM standard dome type or typical bowl type.

The glass section is of good quality, light density, diffusing opal, firmly held by clips. Light transmitted by glass top is not large in comparison with that in other directions, but is sufficient to brighten the ceiling.

Characteristic distribution, BEDD-200-G.T.

IVANHOE GLASS-TOP DOME TYPE REFLECTOR

Reflecto-Cap Diffuser.

The Ivanhoe Reflecto-Cap Diffuser for 75-, 100-, 150-, 200- and 300-watt Mazda C lamps provides glareless illumination. It is particularly adapted to fine machine work, jewelry manufacturing, printing, cabinet work, pattern making, various operations in the textile industries, and fine finishing operations, as on furniture, pianos and automobiles. The unit is so constructed as to cut out all direct light from the lamp so that glaring reflections from bright surfaces are practically eliminated.

It consists of 3 parts: a green porcelain enameled set screw holder containing the socket, a porcelain enameled reflector, green on the outside and white inside, and a silvered cap, highly polished inside, which fits snugly over the bottom of the Mazda C lamp. The units should

be so installed that the space between them does not exceed one and one-half times their height above the work. Caps that have been in service for a long time may be refinished at 30¢ list each.

Ivanhoe-Regent Opal Lamp Caps.

The Ivanhoe-Regent opal lamp cap is made of Genco glass, which combines splendid diffusion with low absorption. This cap improves the illumination by hiding the filament and cutting down glare. It is designed particularly for use with reflectors, both glass and steel, which do not give sufficient eye protection.

Ohms per 1000 ft. at 25° C. = 10787 ÷ c. m.

Pounds per 1000 ft. = 0.0030875 × c. m.

Special stranding supplied to order.

Copper Rods.

Round copper rods made in following diameters:

1/4, 5/16, 3/8, 1/2, 9/16, 5/8, 7/8, 1 and 1 1/4 in.

Flat copper rods made in sizes up to 3 in. wide and 1/4 in. thick.

"From Mine to Finished Product."

In 1918 the mills of the ANACONDA COPPER MINING Co., at Great Falls, Mont., were completed for the manufacture of copper rods, wires and cables, so that the consumer is now served direct. The products of the rolling mill are the first of their kind to be manufactured west of the Mississippi.

Hard Drawn Copper Wire.

RESISTIVITY SPECIFICATION (ADOPTED BY A.S.T.M., 1915)—Electric resistivity shall be determined upon fair samples by resistance measurements at a temperature of 20° C. (68° Fahr.).

The wire shall not exceed the following limits:

For diameters 0.460 in. to 0.325 in., 900.77 lb. per mile-ohm at 20° C.

For diameters 0.324 in. to 0.040 in., 910.15 lb. per mile-ohm at 20° C.

900.77 lb. per mile-ohm is equal to:

0.15775 ohms per meter-gram

1.7745 microhms per centimeter-cube

0.69863 microhms per inch-cube

10.674 ohms per mil-foot

910.15 lb. per mile-ohm is equal to:

0.15940 ohms per meter-gram

1.7930 microhms per centimeter-cube

0.70590 microhms per inch-cube

10.785 ohms per mil-foot

Medium Hard Wire.

RESISTIVITY SPECIFICATION (ADOPTED BY A.S.T.M., 1915)—Electric resistivity shall be determined upon fair samples by resistance measurements at a temperature of 20° C. (68° Fahr.).

The wire shall not exceed the following limits:

For diameters 0.460 in. to 0.325 in., 896.15 lb. per mile-ohm at 20° C.

For diameters 0.324 in. to 0.040 in., 905.44 lb. per mile-ohm at 20° C.

896.15 lb. per mile-ohm is equal to:

0.15694 ohms per meter-gram

1.7654 microhms per centimeter-cube

0.69504 microhms per inch-cube

10.619 ohms per mil-foot

905.44 lb. per mile-ohm is equal to:

0.15857 ohms per meter-gram

1.7837 microhms per centimeter-cube

0.70224 microhms per inch-cube

10.729 ohms per mil-foot

Soft or Annealed Copper Wire.

RESISTIVITY SPECIFICATION (ADOPTED BY A.S.T.M., 1915)—Electric resistivity shall be determined upon fair samples by resistance measurements at a temperature of 20° C. (68° Fahr.), and it shall not exceed 891.58 lbs. per mile-ohm.

891.58 lbs. per mile-ohm is equal to:

0.15614 ohms per meter-gram

1.7564 microhms per centimeter-cube

0.6915 microhms per inch-cube

10.565 ohms per mil-foot

Facilities.

Reinforcing the extensive factory equipment, there are well equipped chemical, physical and electrical laboratories, wherein the problems incident to the solution of every difficulty encountered are handled by thoroughly reliable experts and up-to-date methods. All steel and copper used are rolled and drawn in our mills and under our supervision throughout every operation.

All raw materials are tested and inspected before being used, the manufacturing processes are constantly checked, and finally the finished material is subjected to an exhaustive series of tests that determine beyond question whether or not it is of proper quality. With such facilities we are enabled to manufacture electrical conductors of all kinds to the severest specifications, and to give to the users of our product a standard of quality that is unexcelled.

Bare Wires and Cables—Copper, Iron or Steel.

Copper wire for all purposes in any required shape or size; for telephone and telegraph, high voltage long distance transmission, and industrial purposes in general. Copper cables of all capacities and degrees of flexibility, hard drawn or annealed, bare or insulated. Galvanized iron and steel wire is also made in all shapes and sizes, bare or insulated, and for all purposes; telephone and telegraph wires, armor wires, strand and wire rope of all kinds.

COPPER TROLLEY WIRE
 —Generally made of hard drawn copper in three shapes: round, grooved and figure 8, the latter form not being extensively used.

EXTRA FLEXIBLE CABLES—Made up of a large number of small copper wires, and are for flexible connectors, commutator brushes, third rail shoes and similar purposes.

Made both concentric and rope lay.

RAIL BONDS—Made of any desired type, capacity or length to meet any requirements. All standard types of terminal stud bonds are made, from which any particular style of bond can be selected for any given set of track conditions. These bonds are distinguished by accurate workmanship, superior grade of material and simplicity of design, insuring lasting and economical service.

EXTRA GALVANIZED W. & M. TELEPHONE and TELEGRAPH WIRE—There are three standard grades, all made from the very best materials by improved processes: "extra best best" (E. B. B.), "best best" (B. B.), and "steel."

While these grades differ in physical characteristics, there is no difference in the standard as regards galvanizing.

PROPERTIES OF GALVANIZED TELEPHONE AND TELEGRAPH WIRES
Based on Standard Specifications

EXTRA GALVANIZED BOND WIRE—For signal bonding on steam roads. Extra B. B. extra galvanized telephone wire is nearly always used for this purpose. Cut and straightened to lengths at small extra charge. Usually 3 to 5 ft. long, of any gage number desired.

EXTRA GALVANIZED STEEL SIGNAL WIRE—Used as

connection from lever or other pulling device to semaphore signal operated mechanically. The two sizes in common use are Nos. 8 and 9 B. W. G., with breaking strength of 2350 lbs. and 1900 lbs. respectively.

STANDARD STEEL STRAND—Galvanized or extra galvanized. Used chiefly for guying poles and smokestacks, supporting trolley wire, and operating railroad signals.

For fuller data, see our Wire Rope Catalogue in this volume.

STANDARD STEEL STRAND
7 steel wires twisted into single strand
GALVANIZED OR EXTRA GALVANIZED

1	160	2,800	1 1/8	13	300

EXTRA GALVANIZED SPECIAL STRANDS—Three special grades which meet all requirements for durability, strength, toughness and light weight: Extra galvanized Siemens-Martin strand, extra galvanized high strength (crucible steel) strand, and extra galvanized extra high strength (plow steel) strand. All three grades are composed of 7 wires each, and have very heavy coating of galvanizing, insuring long life.

Besides these three standard grades, we are in position to make strands to the most exacting specifications.

For fuller data, see our Wire Rope Catalogue in this volume.

Catenary Method of Supporting Trolley Wire—These three special grades of extra galvanized special strands are also used in the catenary method of supporting trolley wire.

Long Spans in High Tension Current Transmission Line—Where necessary to cross over rivers, lakes and bays with power transmission lines, the current may be conducted through an extra galvanized strand of one of the three special grades of steel previously described, of such size and strength as will show a safety factor of at least 5.

An entire power transmission line of very high

potential could be economically constructed with extra galvanized Siemens-Martin strand, reducing the number of supporting towers which are often the cause of energy loss and trouble.

ARMATURE BINDING WIRE—Tinned steel armature wire is manufactured in four grades: A, B, C1 and C2, which vary in tensile strength.

Grade A—Used to bind armatures of small motors and dynamos.

Grade B—Commercial grade. Used on motors and dynamos of ordinary commercial size and speed.

Grade C1—Made of high grade piano wire and used where great strength is required.

Grade C2—Used when very high tensile strength is required, as on motors and dynamos of unusual size and high speed.

POLE STEPS—For use of electric light, street railway and telephone companies. Have our regular spike and button heads, each step carefully threaded with screw thread. Special shapes or lengths to order.

DATA, POLE STEPS					
Size, in.	Weight per 100 pole steps, lbs.		Size, in.	Weight per 100 pole steps, lbs.	
	Plain	Galvanized		Plain	Galvanized

10 x 5/8	85	88	10½ x 7/8	71	74
10½ x 5/8	89	93	9 x 1½	51	54

A keg of pole steps weighs about 200 lbs.

Magnet Wire.

All magnet wire is thoroughly annealed by processes which insure uniform and extreme softness, high-

est conductivity and ease of handling. Before cover is applied all wire is carefully inspected for size, uniformity of dimensions, freedom from scale and all surface imperfections.

Large quantities of the ordinary commercial sizes of cotton covered magnet wire are produced, as well as fine and special work, silk and cotton. Magnet wire is covered with single, double or triple cotton or silk, asbestos, cotton and paper.

PAPER COVERED MAGNET WIRE—The space required by paper insulation is less than half that required for a double cotton covering, thus allowing more ampere turns in a given space. Very best grade of manila rope paper is used, containing no particles of iron or wood pulp and no trace of alkali or acid.

PAPER COVERED MAGNET WIRE

SPECIAL MAGNET WIRE—Special wire made for any unusual purpose, including the following: Round duplex magnet wire in which both conductors, bare or insulated, are laid parallel and covered with 1, 2 or 3 coverings of silk or cotton. Magnet wire also furnished with stranded conductor, if desired. Tinned magnet wire supplied in any shape.

Annunciator and Office Wire.

ANNUNCIATOR WIRE—Commercially pure, soft copper wire from No. 14 to No. 22 B. & S. is used. This is insulated with specially prepared paraffin wax compound. The outside wrap is made of any color or combination of colors, the most common being bright and fast red or blue with white. Put up in spools weighing about 7 lbs. net.

“Black Core” or “Dampproof” Annunciator Wire—Finished in colors as above, shipped on spools of about 7 lbs. net. Made with the inside wind saturated with our weatherproof compound. This permits its use in damp places. Outside wind of cotton, which is made in colors, is saturated with special paraffin wax compound, and finished so as to present a smooth and highly polished surface that will not catch dust.

OFFICE WIRE—Standard grade consists of copper conductor from No. 14 to No. 20 B. & S., insulated with 1 wind and 1 braid of cotton, both applied tight and even and saturated with special paraffin wax compound. The outer braid is given high polish and is made in any color, or combination of colors, specified. Standard colors are red and white or blue and white. The wire is put up in coils of about 20 lbs. Used largely by telephone and telegraph companies for inside wiring, extending from the instruments to the junction where they connect with outside wires and cables as they enter building. Also used as high grade bell and annunciator wire.

14	3314	56	18	3318	115
16	3316	80	20	3320	154

“Black Core” or “Dampproof” Office Wire—Has 2 inside cotton winds applied in opposite directions which are thoroughly impregnated with black weatherproof compound. The outside braid is finished same as regular office wire. Used where higher grade of insulation is required. Packed same as regular office wire.

SPECIAL ANNUNCIATOR AND OFFICE WIRE—Special kinds furnished as specified. Also conductors of other than standard sizes, either solid or stranded. Untinned copper wire is used in the regular product, but tinned wire will be furnished if required.

MULTIPLE CONDUCTORS—Any of these insulated wires can be supplied, 2 in parallel or twisted in pairs, in 3-conductor cables or in cables having any number of conductors. Same can be covered with 1 or more braids or with tape and braid and finished in any manner specified.

Weatherproof and Slow Burning Wires and Cables.

These have moderate degree of insulation and are less expensive than rubber insulated conductors. Double and triple braid. Reliance weatherproof wire meets every requirement for outdoor service, while Reliance slow burning wire is superior for indoor uses.

Wires and cables are made in strict accordance with all requirements of the National Board of Fire Underwriters, sizes varying from No. 20 B. & S. to the largest feeder cables used. Sizes No. 4/0 B. & S. and smaller are usually made of solid wires, while larger sizes have stranded conductors.

Unless hard drawn copper be specified, wires of purest grade of annealed copper, uniform in softness and having minimum conductivity of 98% Matthiessen's standard, will be used.

RELIANCE WEATHERPROOF INSULATION—For use outdoors where moisture is certain and where fireproof qualities are not necessary; also where, on account of small separation, bare wires would be liable to swing into contact with each other or with other low tension cables.

The wires are first covered by 2 or 3 closely and evenly woven braids of strong fibrous material, which is then completely saturated with weatherproof insulating compound. After drying thoroughly, the wire receives dressing of mineral wax, when the surface is thoroughly burnished and polished, reducing to a minimum trouble from sleet and ice.

The insulation will withstand all ordinary climatic conditions.

RELIANCE, SLOW BURNING WIRES AND CABLES—Have insulation that will not carry flame. Especially useful in hot, dry places, and where wires are brought together, as on the back of a large switchboard or in a

wire tower. Each insulating braid completely saturated with white slow burning compound, and outside thoroughly slicked down and given a hard, smooth, white surface.

*Size and number of wires in strands same as in weatherproof cables

RELIANCE SLOW BURNING CABLE
Stranded copper conductor, 3 white braids

SPECIAL WEATHERPROOF AND SLOW BURNING WIRES—A combined insulation of black weatherproof and white slow burning coverings is often required. The wires may have a single coating of each kind of 3 coatings, 2 of slow burning and 1 of weatherproof, or conversely. When weatherproof covering is inside, the conductor is known as "white finish weatherproof," and when flameproof covering is inside, it is called "black finish slow burning." Outside surfaces are finished smooth and hard. The white finish weatherproof wire only is approved by National Electrical Code.

Any of these weatherproof or slow burning wires furnished twisted into pairs, or formed into cables having any number of conductors, the conductors so formed being incased in 1 or more finished braids or with tape.

Americore Lamp Cord and Reinforced Cord, National Electrical Code Standard.

The lamp cord shown on following page is used in short lengths for exposed wiring in offices and residences to connect the concealed wiring with drop lights, brackets and portables.

LAMP CORD OF ALL KINDS AND SIZES

Also used for automobile lighting, trouble lamps, spot light and many other purposes where a short flexible conductor is desired.

TWISTED LAMP CORD

SPECIFICATIONS—The following data is an extract from the National Board of Underwriters' Specifications dated 1911, and covers our Americore (new code) lamp cord and portable cord.

Type C, for Pendant Lamps—In this class is included all flexible cord, which, under usual conditions, hangs freely in the air and not likely to be moved sufficiently to come in contact with surrounding objects. Pendant lamps provided with long cords, so that they can be carried about or hung over nails or on machinery, etc., are not included in this class, even though they are usually allowed to hang freely. Each conductor must have an approved braided covering so put on and sealed in place that when cut it will not fray out.

This type is insulated with $\frac{3}{64}$ -in. rubber on sizes 8 to 14 and $\frac{1}{32}$ on 16 to 22.

Type C. W. P. for Pendant Lamps—Same as above, except must have saturated braid and $\frac{3}{64}$ -in. rubber. For use in damp places.

Type P. O., for Pendant Lamps—Parallel cord—each conductor type C, two such conductors laid parallel and covered with one silk or cotton braid.

Type P., for Portables—Flexible cord for portable use, except in offices, dwellings or similar places where cord is not liable to rough usage and where good appearance is an essential feature, must meet all the requirements for flexible cord for pendants, and in addition must have a tough braided cover over the whole. There must also be an extra layer of rubber between the outer cover and the flexible cord. All sizes (except No. 14 and larger) are insulated with $\frac{1}{32}$ -in. rubber; No. 14 and larger have $\frac{3}{64}$ -in. rubber.

PORTABLE CORD

Type P. W. P., for Portables in Damp Places—(Same as type P except must be furnished with a saturated braid.) For use in damp places, the insulation must be $\frac{3}{64}$ -in. thick on sizes No. 14 and larger, and $\frac{1}{32}$ -in. on sizes No. 16 and smaller, and the cord must have an outer covering saturated with a moistureproof preservative compound thoroughly slicked down, or must have a filler of approved material instead of an extra layer of rubber, and have two outer braids saturated with a moistureproof compound with an exterior surface thoroughly slicked down.

Type P. S., for Portables in Dwellings, Offices, etc.—In offices, dwellings or similar places where cords are not liable to rough usage and where good appearance is essential, flexible cord for portable use must meet all of the requirements for flexible or for pendant lamps, both as to construction and thickness of insulation, and in addition must have a tough braided cover over the whole; or providing there is an extra layer of rubber between the flexible cord and the outer cover, the insulation proper on each stranded conductor of cord may be $\frac{1}{64}$ in. in thickness instead of as required for pendant cords.

Note: This cord has only $\frac{1}{64}$ -in. rubber on each conductor, sizes 16 and 18, approved by underwriters. The supplementary insulation is same as on other portable cords.

CONSTRUCTION OF CORD FOR PORTABLES—Made with regular National Electrical Code cotton covered lamp cord, over which is placed a supplementary insulation of vulcanized rubber. This is then covered with one strong braid of cotton, thoroughly saturated with a preservative compound, waxed and polished.

Reinforced portable cord is sometimes called for with the outside braid of dry, glazed cotton, either black or colored, and sometimes with a colored silk braid. Such cords take the same lists and are the same as our Reinforced portable cord.

Show window cord and cord for portables are the same as Reinforced portable cord. Orders should specify the kind of braid desired, i. e., whether weather-proof, dry cotton or silk, and the color.

1909 Code: This grade, also known as grade A, is insulated with $\frac{1}{32}$ -in. thickness of rubber, and was formerly the National Code Standard.

Commercial: Known as "old code," or grade C, is insulated with $\frac{1}{64}$ -in. thickness of rubber.

Both these grades are still in demand and can be furnished upon request in lamp cord or portable cord constructions.

The braiding can be either dry cotton or silk in any color or weatherproof saturated cotton.

Americore Brewery, Packing House and Canvasite Cords.

BREWERY CORD (TYPE C. B., CLASS A)—Each conductor is lamp cord strand, cotton wound, insulated with Americore rubber and covered with a weatherproof braid; 2 such conductors twisted together (no braid over all).

BREWERY CORD

List number	Construction of conductor	Thickness of rubber insulation, in.	Size, B. & S. gage	Weight per 1000 ft., lbs.

BORDER LIGHT CABLES (TYPE B)—Same construction as theater and stage cable, but have not jute fillers, and may have more than 3 conductors.

Elevator Lighting and Control Cable.

Type E construction, 2 or more conductors, no smaller than No. 14 B. & S. for lighting, nor No. 16 B. & S. for control cables, insulated with code thickness of rubber and covered with a dry soft cotton braid; conductors twisted together and covered with a supplementary belt of rubber and 1 weatherproof braid, or with no supplementary belt and 3 weatherproof braids.

Automobile Cables.

We are manufacturing a large number of different styles of lighting, ignition and starting cables in various sizes of conductors; insulated with rubber or cambric or a combination of both, braided or armored over all.

These cables can be furnished in single or multiple conductors.

B-5. BRAIDED PRIMARY SINGLE LIGHTING CABLE; ENLARGED

RS-2-W. DUPLEX PRIMARY AND LIGHTING CABLE

Rubber Covered Copper Telephone Wire.

SPECIFICATIONS—The following are considered standard by the larger telephone companies:

No. 14 B. & S. Twisted Pair "Outside Distribution Wire"—Each conductor hard drawn tinned copper wire, insulated to a diameter of $\frac{5}{32}$ in. over rubber and covered with cotton braid, saturated with black weatherproof compound, wax finish, one conductor having a raised tracer to distinguish it from the other.

NO. 14 B. & S. TWISTED PAIR "OUTSIDE DISTRIBUTION WIRE"

No. 18 B. & S. Twisted Pair "Bridle Wire"—Each conductor soft drawn tinned copper wire, insulated to a diameter of $\frac{7}{64}$ in. over rubber and covered with cotton braid, saturated with black weatherproof compound, wax finish, 1 conductor having a raised tracer to distinguish it from the other.

NO. 18 B. & S. TWISTED PAIR "BRIDLE WIRE"

No. 19 B. & S. Single Conductor Twisted Pair and Triple Conductor "Inside" or "Substation" Wire—Conductors soft drawn tinned copper insulated to a diameter of $\frac{5}{32}$ in. over rubber, covered with single hard glazed cotton braid. Single conductors are braided with plain colored cotton, while in the twisted pair 1 conductor contains a differently colored tracer thread, and in triple conductor 2 of the 3 wires contain different colors or different design of tracer threads, thus making no two of conductor braids alike. Sometimes a differently colored cotton braid is used, 1 for each conductor, for purposes of distinction.

NO. 19 B. & S. SINGLE CONDUCTOR TWISTED PAIR, AND TRIPLE CONDUCTOR "INSIDE" OR "SUBSTATION" WIRE

"Pot Head" Wires, Plain Telephone Conductors—Furnished in the smaller sizes, Nos. 18, 19, 20 or 22 B. & S., either single conductor or twisted pair. Soft tinned copper conductors insulated to a diameter of $\frac{5}{32}$ in. over rubber without any outer braid or protection. In case of twisted pairs, 1 conductor is sometimes made of a differently colored rubber than the other to discriminate between them.

TELEPHONE CABLES—Made to include any number of single conductors or twisted pairs of telephone wires either plain or braided, bunched together or laid up concentrically, with a tape or cotton braid or other fibrous covering over all. Frequently incased in lead sheath, or armored. These cables vary greatly in construction and are furnished to buyers' requirements and specifications.

struction and are furnished to buyers' requirements and specifications.

RUBBER COVERED IRON TELEPHONE WIRE, SINGLE CONDUCTOR—These conductors are generally No. 12 or 14 B. W. G. galvanized iron wire insulated with code thickness of vulcanized rubber, either single or double cotton braid, weatherproof, saturated and wax polished.

RUBBER COVERED IRON TELEPHONE WIRE, SINGLE CONDUCTOR

Size, B. W. G.	Thickness rubber, in.	SINGLE BRAID		DOUBLE BRAID	
		List number	Weight per 1000 ft., lbs.	List number	Weight per 1000 ft., lbs.
12	$\frac{3}{8}$	1512	100	1512A	140
14	$\frac{3}{8}$	1514	75	1514A	100

When furnished in twisted pairs, 1 conductor contains a raised tracer thread to distinguish it from the other conductor.

OTHER STYLES OF TELEPHONE WIRE—*Spider Wire*—The accepted interpretation of this term is synonymous with "bridle wire," except that it is used singly instead of in pairs. Braids and finish are the same.

Drop Wire—No. 14 B. & S. twisted pair, $\frac{5}{32}$ in. over insulation, with black saturated weatherproof braid, and raised marker in 1 conductor. Hard drawn copper. This service involves the drop from the pole terminal to the house bracket. No. 16 B. & S. insulated to $\frac{4}{32}$ in. is extensively used, but on account of the severe service to which this type of wire is put, necessitating great resistance to climatic conditions, No. 14 B. & S. is considered the standard, because of increased tensile strength.

Jumper Wire—This is often confused with spider and "bridle wire" in outside construction, but by the more general acceptance of the term, it applies to the wire used for cross connecting service on the main distributing frame. It is usually a No. 20 or No. 22 B. & S. wire insulated to $\frac{3}{32}$ in. with flameproof braids; if twisted pair, 1 is red and 1 is white.

Americore Rubber Covered Wires and Cables.

These wires and cables as used for general purposes must possess three essentials: the conductor, the wall of rubber insulation and the braid, tape and braid or other form of protection. The conductor consists of uniformly soft annealed commercially pure copper wire. It may be used in the solid form up to size 1/0 American wire gage (B. & S.), or in special cases even to 4/0, or in the stranded form. All conductors are thoroughly and evenly coated with tin to protect the copper from any injurious effect from the sulphur in the rubber insulation.

KINDS OF RUBBER INSULATION—We make two standard grades of rubber compound for rubber covered conductors: Americore compound, meeting the code requirements; and Amerite, a high grade 30% compound. In addition, wire is insulated to any specifications covering particular requirements, such as 20% or 40% rubber compounds. We also make a high grade compound for lead incased rubber covered cables.

AMERICORE RUBBER—This rubber has all the desirable qualities of a new code wire. It is a high grade compound, meeting all National Electrical Code requirements and can be recommended for all service conditions in which the working pressure is 7000 volts or under.

AMERITE RUBBER—This brand contains only the best grade of pure Para rubber, and is used for high voltage circuits. This makes an unsurpassed dielectric for all high voltages and for exacting service conditions; it has great strength and elasticity, high insulation qualities and long life.

Every wire insulated with our standard compounds has a distinguishing woolen *tracer thread* placed lengthwise of the conductor between the rubber and the braid. In Americore this tracer thread is uncolored and in Amerite it is crimson.

Americore Twin Rubber Covered Wire and Cable.

SPECIFICATIONS—Tinned annealed copper wires or strands of highest conductivity, each conductor insulated with code thickness of high grade vulcanized rubber, protected by saturated braid; 2 such finished conductors laid parallel and covered with heavy cotton braid over all, saturated in black weatherproof compound. Special finish for conduit work.

Underwriters' rules permit use of above in sizes No. 14 and larger. No. 6 and larger shipped on reels containing 100-ft. lengths; smaller sizes shipped in coils containing 500-ft. lengths.

Industrial Plant Wiring.

While factory wiring does not often have to be concealed, nor to be so neatly installed as in a residence, its installation is not on this account as simple as it seems.

TWO REQUIREMENTS—The primary requirement of factory wiring is to serve as the reliable means of furnishing energy to motors, lamps, heating devices, etc. Power is one of the chief requisites in modern manufacturing; having provided a reliable source of electric power, the wiring for distributing it about the plant must be at least as dependable. The second requirement of the wiring is that it must be safe and free from fire or accident hazards because of the large number of employes that may be at work in the plant and of whom only very few know much about electricity and how to guard against shock or fire from its use. It is in order to provide safety from these hazards that the rules governing factory wiring in the national and local electrical codes have steadily been made more stringent.

TWO PRINCIPAL SYSTEMS—There are two principal wiring systems used in factory buildings: (1) open wiring, in which the insulated wires are supported on porcelain knobs or cleats and are not enclosed in any protection except where exposed to probable injury, and (2) conduit wiring in which the wires are run in metal ducts that are either exposed on ceilings, walls or columns, or concealed in walls and floors, or partly exposed and partly concealed. Conduit wiring is obviously more expensive, but much safer and more reliable because wires are completely protected from mechanical injury, from accumulations of dust, etc. Because of its superior safety, conduit wiring is insisted on for factory buildings in the largest cities and is coming more and more into use everywhere.

SELECTION OF SYSTEM—Selection of the wiring system depends on nature of the building construction and on character of the manufacturing process carried on. In general, it may be said that the less expensive open wiring system may be used in any factory building where no special effort at fireproofing has been made and in which no hazardous materials or processes are used and, further, where wires may be so arranged that they will not be readily distributed. If building is of substantially fireproof construction, open wiring is entirely out of place because every feature of the wiring also should be practically fireproof. If so-called mill construction is used, open wiring may be used with slow burning insulation on wires. Conduit wiring may be used in almost any type of building; but is especially desirable in concrete or other fireproof buildings. In factories or mills where explosive or other hazardous materials are being handled conduit wiring is absolutely essential. Examples are flour mills, grain elevators, powder plants, certain chemical works, oil works, many textile mills, etc.

ECONOMY PRECAUTIONS—Several precautions should be observed in laying out the system in order to promote economy in first cost of installation and in making future additions; this is especially important in concealed conduit systems. Circuits should be run as direct and as free of bends as possible. All wires for a circuit should be run in the same conduit, especially if alternating current is used. Distribution, junction, cut-out and switch boxes or cabinets should be of ample size to accommodate additional feeders and branch circuits that it may be anticipated to add later, even if these are not installed for some time. This may be easily done by having these boxes of ample size, and provided with blank knockouts to permit ready addition of other

feeders or branches without interfering with existing service. If such provision is neglected, troublesome interference, delay and much extra expense may be involved when the additional circuits are needed. In the case of concealed conduit in a concrete building it pays to install ample conduit runs for any possible future demands because of the obvious cost and trouble to put in extra conduit unless the latter is exposed. Wire may be pulled into such extra conduit whenever needed.

SEPARATE FEEDERS FOR LIGHTING AND POWER—Separate feeders should always be installed for lighting and power. The first reason for this is that starting and stopping of motors causes serious fluctuation of the circuit voltage; large changes of load also produce such fluctuations, which are very noticeable in the light emitted by lamps. Flickering light is very annoying to the eye and may produce errors or accidents. The second reason is that motor circuits are more often overloaded or short circuited, and therefore interrupted by blowing of fuses, than lighting circuits. Any combination of lighting and power circuits on the same feeder is therefore liable to cause troublesome cutting off of the light that might lead to confusion, accidents or even panic, if many, or if easily terrified women employes were involved in a large shop.

ILLUMINATION REQUIREMENTS MUST BE DETERMINED—In laying out lighting circuits, the illumination requirements of different rooms must first be known. These depend on the kind of work done, size and light absorbing conditions of the room and on the nature of the lighting equipment selected. On account of these variables, power consumption for lighting ranges from 0.5 to 2.5 watts per sq. ft. in different departments of different plants. For any chosen lighting intensity and related conditions it is possible to find the corresponding unit watt consumption. Assume it to be 1.2 watts per sq. ft. the floor area in square feet multiplied by 1.2 will then give total wattage to be provided for the room in question. Not more than 660 watts is allowed on any ordinary lighting circuit. From these facts it is possible to lay out the requisite circuits, arrangement of which in a large room should usually permit switching on the lamps in rows parallel to the windows, so those farthest from the windows may be turned on first.

The following table shows capacity of different sizes of wires as lighting feeders. The second column gives capacity of the wire in amperes, the third column gives it in watts based on 220 volts between the outer wires. The last six columns give number of 25-, 40-, 50-, 60-, 75- and 100-watt lamps, respectively, that can be supplied by the particular size of wire. The neutral wire is not taken into account, serving chiefly as a means for overcoming unbalance. These capacities have nothing to do with the branch circuits, which are normally limited to 660 watts.

INDEPENDENT SYSTEM FOR EMERGENCY LIGHTING—Since failure of light at a critical time, as at the outbreak of a fire, might easily contribute to serious loss of life in a factory with many employes, because of the great difficulty in finding exits in a dark, smoke filled room, a number of communities require installation of an independent system for emergency lighting. This is an excellent provision in any medium size or large plant. Such a system should have separate circuits and be fed from a source separate from that normally supplying the lighting. If the plant has its own powerhouse, emergency lighting should be fed from a central station or other external source. If the plant uses central station supply, a separate service should furnish emergency lighting. This lighting should include all exit

and stairway lights and enough special lights on each large floor to permit finding the way to the nearest exit.

LAYING OUT POWER CIRCUITS—Laying out power circuits where there are many motors and of different sizes is often a difficult problem. Since the power load is almost invariably many times greater than the lighting load in a factory, even greater care in laying out the power feeders and branch circuits is necessary than for the layout of the lighting, because not only would there be a waste in first cost of unnecessary length of heavy cable or wire but also in needless power loss in over-coming resistance.

Rules for finding the size of wire to run to any motor are quite well known and many tables have been published both for direct current and alternating current motors. It is usual to allow not only for efficiency of motor, but also for at least 10% over full load current because the starting current, though usually of brief duration, is frequently three times the full load current. Obviously, if motor is started at short intervals, or if it is subjected to frequent overloads, wire size has to be larger, else overheating of conductors would ensue. The kind of service motor is to render, type of motor and its rating must be taken into account in determining wire size.

There are conflicting rules and opinions about sizes of mains supplying more than one motor. Insurance inspectors are inclined to require a heavier size of main than many municipal or central station inspectors. Among the former a common rule is to have the main provide for 110% of full load for largest motor plus full load for the other motors of the group. Other inspectors are inclined to allow for the demand factor of motor group; this usually permits of smaller wire size and is legitimate, provided the prospective demand factor is definitely known and remains so after installation. On account of the uncertainty of this it is better to be on the safe side and provide mains of ample size to prevent overheating, which is not only dangerous, but represents needless power loss and reduced voltage and speed for the motors.

In some large plants motor mains are run on the ceiling to a junction box, from which branch circuits are dropped to individual motors. This is economical of wire, but requires fuses in the junction box, which is here located in a relatively inaccessible place, so that blowing of a fuse may represent much delay before

motor can be put back in service. It is preferable to run the mains as risers to distributing boxes or panels on wall or columns where fuses may be quickly replaced.

STARTING DEVICE—For all but small motors over a minimum that depends on the type of motor, kind of service it performs and source of supply, it is necessary to provide a starting rheostat, compensator or other starting device to permit motor to come up to speed gradually without drawing an excessive starting current. This starter should be placed as convenient to the control point as possible; if it is at some distance from a large motor, an automatic remote control system may save considerable heavy wiring. The starting device must have an automatic no-voltage release to prevent possible burnout of the motor if power is suddenly restored while motor switch and circuit is closed. Stopping of motor should preferably be by opening the main switch, which may be done by remote control from several stations about the driven machine.

INSTALLATION OF OPEN WIRING SYSTEM—Installation of an open wiring system is relatively simple. The wires must have either a rubber, slow burning, or slow burning weatherproof insulation; rubber covered wires smaller than No. 6 may have a single outer braid, but No. 6 or larger must have a double braid. In very moist rooms rubber insulation is required. In places where there are corrosive vapors, insulation may be either rubber or weatherproof; in the latter case a coating of shellac or varnish is sometimes applied over the wires after they have been put up. In all cases, wires must be properly supported and spaced. Where exposed to mechanical injury they must be protected by conduit, running boards of guard strips.

INSTALLATION OF CONDUIT WIRING SYSTEM—Installation of conduit wiring is not very difficult when done by a skilled wireman. Rubber covered wiring is used almost exclusively, unless temperature of room is quite high when slow burning insulation is required. In places where there is liability for condensation inside the conduits due to changes of temperature, as in cold storage or refrigerating rooms, conduit must be well drained or open wiring with suitable guard strips where necessary must be used. The growing use of conduit systems in industrial plants is causing electricians quite generally to gain the requisite experience and skill needed for its proper installation. Its almost universal use in the future is therefore to be expected.

Americore Car Cables.

This cable is used for both power and light circuits in electric cars and motor lead cables. It differs from the other rubber insulated conductors already described, in having a layer of fine cotton or paper wound on the conductor underneath the rubber which is easily removed and which leaves the conductor clean for jointing.

SPECIFICATIONS—Consist of tinned annealed copper strand of highest conductivity, over which is placed a wind of fine cotton or paper and a code thickness of vulcanized rubber insulation. This is protected by a closely woven cotton braid, thoroughly saturated with black weatherproof compound and finished smooth.

AMERICORE CAR CABLE
National Electrical Code Standard

Stranded tinned conductor, rubber insulation, single braid, black finish
For low potential, 0-600 volts

Americore Fireproof Cables.

This wire is placed before the public at the suggestion of many superintendents of electric light companies who are using it for wiring their stations. It is fireproof in the sense that the braid will not ignite or carry flame.

SPECIFICATIONS—Tinned annealed copper strand of highest conductivity, insulated with required thickness of high grade vulcanized rubber, protected with 2 smooth, closely woven strong heavy cotton braids, each of which is thoroughly saturated in white flameproof compound, smoothly finished.

AMERICORE FIREPROOF CABLE

Flat Steel Taped Park or Suburban Cables.

These are either rubber, cambric or paper insulated. This type of cable is becoming standard for lighting purposes in parks and boulevards, suburban ornamental lighting, private estates, service laterals and pole connections, and in places where installation is difficult or impossible owing to the absence of ducts. It is installed by being laid in trenches 15 to 30 ins. deep (depending on

locations), and sufficient in width to permit cables being laid at this depth. This style of cable is not only economical and easy to install, but really makes a safe and reliable substitute for the more expensive conduit system.

Steel taped cables carry their own protection. Being lead covered, they are waterproof. A serving of saturated jute is placed over the lead covering and two steel tapes of suitable width are laid spirally in the same direction with an additional serving of saturated 2-ply jute on the outside. The cable is then drawn through a bath of hot preservative compound and compressed, giving it a smooth and hard finish. Note illustrations:

SINGLE CONDUCTOR

Stranded copper conductor, insulation, tape, lead, jute, first steel tape, second steel tape with jute over all

TWIN CONDUCTORS

Solid copper conductors both covered with insulation, taped separately, covered with lead over all, then jute, first steel tape, second steel tape and jute over all

THREE CONDUCTORS

Each conductor solid copper, insulated, taped; 3 such conductors twisted together, jute filled to make round and covered over all with tape, lead, jute, first steel tape, second steel tape and jute over all

The jute and steel armoring protect the cable against mechanical injury and thus permit of its being laid in the trenches, which are afterwards filled with sand and gravel. However, it is desirable to give such cables an additional protection, by putting a layer of sand beneath and over the cable as it is laid in the trench, tamping the sand tightly around the cable, and putting in place a covering of brick or plank before the trench is filled up with gravel. Such extra precaution protects the cable from damage from picks, etc., in case of future excavations.

These cables are usually shipped from the factory in long lengths on reels which, when received at destination, are mounted on a shaft with 2 wheels or on a truck alongside of trench and, as the reel is being pulled forward, the cable is unwound and laid into the open trench, thus avoiding the necessity of making many joints. Where joints are required, the same method is followed as in all other lead covered cables and, in addition to this, a split cast iron joint box (straightaway or branch—details covering jointing material on application) is put over the lead sleeve and protects it against injury.

Cables of this kind can be constructed with any desired number or size of conductors. Each conductor is insulated with a suitable thickness of rubber, cambric, or paper, to meet any standard commercial working voltage.

For low working potentials, the practice of using lead sleeves, solder wiped, can be eliminated, as the joint can be made within the split cast iron joint box, which, after the completion of the joint, is filled with hot insulating compound and, after cooling, makes the joint absolutely waterproof.

All our steel taped cables are subjected to a factory test equal to two and one-half times the working voltage, also high insulation resistance guaranteed.

STANDARD SHIPPING LENGTHS OF CABLES AND OUTSIDE DIAMETERS

Outside diam., in.75	1.00	1.25	1.50	1.75	2.00	2.25 and over
Length, ft.	2000	1750	1500	1200	1000	800	700

INQUIRIES—We make such a great variety of electric light and power cables, they are made in so many different sizes and with so many different thicknesses of insulation and finished in so many different ways that it would be impracticable to attempt to tabulate them all. This class of our product is making an enviable record and is well and favorably known in all parts of the country.

Inquiries containing full information are solicited. If desired, can furnish competent men to make installations at a reasonable charge.

Americore and Globe Mining and Machine Cables.

Specifications—Consist of 2 flexible strands of tinned annealed copper of highest conductivity, each of which is insulated with code thickness of vulcanized rubber and protected with a braid of cotton saturated with weatherproof compound. The 2 finished cables are then placed side by side and covered with 2 or 3 strong cotton braids, thoroughly saturated in weatherproof compound.

MINING MACHINE CABLE
For low potential, 0-600 volts

Size, B. & S.	Number wires in strand	Thickness of rubber, in.	Weight per 1000 ft., 2-braid, lbs.	Weight per 1000 ft., 3-braid, lbs.	List number			Shipped on reel number

While this cable is commonly used in sizes from 2 to 10 B. & S., other sizes will be made to specifications. Hard spun cotton cord braids will be substituted for the regular cotton braid at a slightly advanced price, when same is required for extra hard usage.

AMERICORE CONCENTRIC MINING MACHINE CABLE—Specification A—Inner conductor is composed of 49 (7x7) tinned copper wires, insulated with rubber; this is finished with a tape or a braid; around this are placed tinned copper wires to equal in area the central conductor. A belt of rubber (code thickness) is then applied, and the whole finished with 3 braids or a tape and 2 braids—black finish.

Specification B—Same as A, without the outside belt of rubber.

Amerite High Grade 30% and Special Rubber Insulated Wires and Cables.

For station wiring, arc light and signal service, street railroad feeders and high voltage power transmission lines.

Rubber covered wires and cables made to the most exacting specifications; in any size or finish and for all services and voltages.

Insulated with rubber compounds containing only highest grades of Para rubber and other necessary preservative ingredients. The exact composition of rubber compound used and thickness of rubber insulation in every case determined by working voltage and by nature of service.

Conductors furnished solid, stranded or extra flexible as ordered, annealed and heavily tinned.

SIGNAL WIRES AND CABLES—Made to meet, in every respect, the rigid specifications of the Railway Signal Association. Insulated with 30% Para rubber or higher grade, as required by leading railroads.

These signal wires and cables may consist of single rubber covered conductors or of any number of such conductors stranded into a cable.

Solid Conductor, Insulated and Braided

Twin Wires, Insulated and Braided

Armored Torpedo Cable
SIGNAL WIRES AND CABLES

Electric Light and Power Cables, Lead Incased or Armored.

These are made in all types, aerial, underground and submarine. Made to the most rigid specifications, in any quantity, size or length, for any voltage, and finished for any service, single or multiple conductor or concentric laid.

Only the very best of materials enter into the construction of these cables.

AMERICORE LEAD INCASED CABLE
Stranded tinned copper conductor, rubber insulated, taped and lead incased

AMERICORE LEAD INCASED CABLE
Solid or stranded tinned copper conductor, rubber insulated, taped and lead incased

RUBBER INSULATED, LEAD COVERED CABLES—We make a specialty of heavy rubber cables, lead sheathed, armored, or lead incased and armored, for all services and voltages, and finished in any style.

These are made to meet the most exacting requirements, such as those specified for government and for railway signal service, underground, submarine, or aerial.

While taped and braided rubber wires and cables are used for inside and submarine service with entire satisfaction without any lead sheathing, experience has demonstrated the advisability of enclosing the cable in a sheath whenever it is to be used in conduits for underground work, or where it would be exposed to acids, gases, extreme temperature changes, or other destructive agencies.

AMERICORE LEAD INCASED CABLE
4-conductor, stranded, rubber, tape, jute and lead

Any number of rubber insulated conductors can be stranded into a core or cable, the interstices between the conductors usually being rounded out with jute fillers. In this condition the cable is ready for the application of the tape and lead sheath, or as sometimes required, a supplementary belt of rubber insulation, and then the tape and sheath or other protection.

All copper conductors are annealed thoroughly and heavily and evenly tinned, and have a guaranteed conductivity of 98% or better.

Rubber insulated cables may be finished in any one of the following ways, as may be specified:

Taped and leaded.

Taped, leaded and braided, weatherproof, soapstone or flameproof finish.

Taped, leaded and juted.

Taped, leaded, juted and armored.

Taped, leaded, juted, armored and juted.

Taped, juted and armored.

Taped, juted, armored and juted.

A tracer thread is always laid underneath the tape.

Cables may be taped and braided instead of taped, and in each case 1, 2 or 3 reverse layers of jute can be used.

Other combinations are sometimes required which can be made as specified.

Paper Insulated Lead Sheathed Cables.

Used for electric light and power purposes. Made with single and multiple conductor, and to the most exacting specifications.

Narrow and very thin strips of pure manila paper are wound spirally about the conductor in sufficient number of layers for required dielectric strength. After paper covering is applied to single conductor, or core of conductors in the form of a belt, every trace of air and moisture is removed from cable by special processes, and while in this condition the core is thoroughly saturated and all interstices completely filled with hot insulating compounds.

TWIN LEAD INCASED PAPER CABLE

PAPER INSULATED AND LEAD COVERED CABLE

Cable is then put through a hydraulic press and covered with closely fitting lead sheathing so as to exclude all air and moisture and retain insulating compound. A tracer thread is placed lengthwise of all cables underneath the sheath.

Paper cables are generally cheaper and have lower electrostatic capacity than rubber or varnished cambric cables. Insulation is strong and uniform in quality, and except when frozen solid, is quite flexible.

Paper cables can be worked safely at higher temperature than can other kinds, and experience has demonstrated that their useful life is practically determined by the integrity of the sheathing. For this reason thickness of lead sheath should in general be greater than for corresponding sizes of rubber or cambric cables, by $\frac{1}{64}$ in. or $\frac{2}{64}$ in. Paper is less liable than rubber to deterioration from excessive electrostatic strains.

In short, paper insulated cable when properly constructed and sheathed can be recommended as one of the best for most conditions.

3-CONDUCTOR PAPER INSULATED LEAD INCASED CABLE

4/0 3-conductor, 37 wires each; diameter of each copper conductor, .53 in.; thickness of paper over each conductor, $\frac{5}{32}$ in.; thickness of supplementary paper, $\frac{9}{32}$ in.; thickness of lead, $\frac{1}{8}$ in.; diameter over lead, 2.281 ins.

NO. 6 B. & S. SOLID, 3-CONDUCTOR, PAPER INSULATED, LEAD INCASED CABLE

Varnished Cambric Cables.

A single conductor varnished cambric cable is made by winding tapes of thin varnished cotton or muslin cloth spirally about the conductor in a sufficient number of smooth, tightly drawn layers to make the required thickness of dielectric.

The cotton fabric is saturated with several applications of special non-hardening insulating varnish. The dielectric strength of this material is very high, as a single thickness of cotton well treated with this special varnish will withstand a stress of from 8,000 to 12,000 volts for 5 seconds, depending upon the number of coats of varnish.

The varnish prevents the tape from unwrapping when the cable is cut, and permits adjoining layers of varnished cambric to slide upon each other, thus insuring a concentric condition when the cable is bent. This compound of varnish prevents capillary absorption of moisture between the layers of tape, seals any possible skips in films and precludes air spaces.

In multiple conductor cables, it is usual to place a portion of the required thickness of insulation in the form of a belt about the core of conductors, as in the case with paper cables.

This class of cables is in general more flexible than paper cables, more impervious to moisture, reasonable in cost, and can be used in dry places such as for station wiring without lead sheathing.

When no sheathing is required the cable is protected by a cotton braid, or with an asbestos braid for fire protection. These braids are saturated in weather-proof compounds or in slow burning compounds, as may be required.

These cables are made in any quantity, of any size or type and for any voltage or service condition, to the most rigid specifications.

Inquiries containing full information as to working conditions are solicited and prices will be quoted on application.

3-CONDUCTOR VARNISHED CAMBRIC LEAD CABLE

This class of material furnished to the most exacting specifications. Full information as to the purpose for which the cable is to be used, location, depth of water and working conditions should accompany requests for prices.

Installation of Underground Cables.

This company will furnish, install and guarantee its underground cables for almost any class of service. Rubber covered telephone or telegraph cables, electric light and power cables, single or multiple conductors insulated with rubber, paper or varnished cambric, made to carry current for any service at any pressure within practical working limits.

We maintain a fully equipped cable department, supervised by experienced and able engineers and manned by competent cable workmen, which has for many years and with marked success attended to all matters pertaining to underground and submarine cable installations.

Through this department, we are at all times prepared to install cables, to make estimates or to advise customers regarding specifications, costs of installations and so on, or to furnish competent supervisors for installations made by the customer himself.

Submarine Cables.

Large quantities of submarine cables of every class are manufactured and installed for street railways, telegraph and telephone companies and electric light and power plants. These are used for crossing rivers, bays, ponds or lakes.

2-CONDUCTOR TWIN SUBMARINE CABLE, LEAD INCASED, JUTE SEWED AND ARMORED

SUBMARINE CABLE
Multiple conductor rubber insulated signal cable

SUBMARINE CABLE FOR TRANSMITTING POWER AT 25,000 VOLTS

3-conductor, 2/0 cable, 19 wires in each strand; rubber insulation $\frac{19}{32}$ in. thick and taped. 3 conductors laid up with jute fillers and taped all over. Covered with 3 jute servings in reverse layers. 35 galvanized iron armor wires, each .25 in. in diameter. Outside diameter of cable, 3.41 ins. This particular cable, 7000 ft. long, has been in service under the St. Lawrence River for one year. A similar cable has been in service three years. Both are giving entire satisfaction.

CROUSE-HINDS COMPANY

Manufacturers of Electrical Appliances

SYRACUSE, N. Y.

BRANCH OFFICES

NEW YORK, N. Y., 30 Church Street

BOSTON, MASS., 201 Devonshire Street

CHICAGO, ILL., 417 South Dearborn Street

Products.

Manufacturers of ELECTRICAL APPLIANCES:

Panels; Distributing Boards; Panelboard Cabinets, Steel and Wood; Knife Switches; Iron Clad Safety First Switches; Condulets (Conduit Outlets); Condulet Covers and Fittings, including Receptacles (Plug and Lamp) and Cord and Fixture Rosettes.

Also, Flood Light Projectors, Voltmeter, Ammeter and End Cell Battery Switches; Receptacles for conduit boxes, moulding, cleat and temporary installations, as well as Heavy Duty Attachment Plug Receptacles, Plugs and Guy Anchors.

Panels.

Crouse-Hinds standard line of panelboards includes types for cartridge or plug fuses only in branches and, also, for either style of fuses in connection with knife, flush rotary or double push button switches; also dead front (safety first), metering and residence panels.

Special panels are designed for uncommon conditions and this service is free to customers. This company prides itself both on excellence of products and promptness of delivery.

Panelboard Cabinets.

Boxes and trim are of the same high excellence as the panelboards. Each steel box is formed from one piece of No. 10-gage sheet metal, although lighter gage metal is allowed.

Switches.

All current carrying parts of Crouse-Hinds switches are of hard drawn copper, 98% conductivity, with a current density rating of 1000 amperes per sq. in. of sectional area. Sliding contacts are rated at 75 amperes per sq. in. Blades are ground in contact. Parts can not work loose.

Condulets.

Condulets (conduit outlets) are made in hundreds of types and sizes, from single branch pull boxes for $\frac{3}{8}$ -in. conduit, to the massive, fused, surface entrance fitting (type FF) for 4-in. conduit. In fact, there is a condulet for every need. They are made of the best grade, gray cast iron and are designed to secure the maximum strength. They have threaded hubs to receive conduit, are well proportioned, and are no larger than their purpose demands.

Catalogues.

Crouse-Hinds catalogues, giving complete illustrations, descriptions and listings, will be mailed free, on request, to any address.

SAFETY SWITCHES; DEAD FRONT PANELBOARDS and CABINETS; SWITCHBOARDS.

Knife Switches, Push and Snap Switches, Cutouts, Rosettes and various wiring devices.

"Circle T" "Safety" Switches.

This is the name under which our knife switches in externally operated boxes are classified.

Exposed knife switches present a great danger from inexperienced handling.

A switch in an ordinary iron or steel box is safe as long as box is closed, but should be opened only by an experienced person.

Externally operated switches can be opened and closed by any one; and when so constructed that the box can never be opened on a live closed switch, it is possible for any one to renew fuses without danger.

[TRADE-MARK]

EXTERNALLY OPERATED ENTRANCE SWITCH
Box closed

With 100% Safety Shield

Box Open

"CIRCLE T" "SAFETY SERVICE" EXTERNALLY OPERATED ENTRANCE SWITCH

"Circle T" Dead Front Panelboards and Cabinets.

Designed and produced to permit the unrestricted use of circuit switches without the possibility of the operator coming in contact with any of the live parts of the panel.

They meet the safety requirements of the United States Bureau of Standards, the Underwriters' Laboratories, Inc., and the Workmen's Compensation Laws of the various states.

TYPES OF DEAD FRONT PANELS—*Heavy Duty Type*—C T for N.E.C. cartridge fuses; P T for plug fuses—both with 30-ampere tumbler switches.

Light Duty Type—C P for N.E.C. cartridge fuses; P P for plug fuses—both with 20-ampere push button switches.

SAFETY CABINETS FOR DEAD FRONT PANELS—Cabinets are so designed that no live parts are exposed, and so that they can be opened and operated by the most inexperienced person without danger to the person or the service.

They are equipped with double doors (a door within a door).

(a) The smaller door is secured by a catch and can be opened at will. It covers the switches only, and when open no live parts are exposed. This door may be omitted when so specified without reducing the safety value of the cabinet.

(b) The larger door is equipped with a combination lock and catch, and covers the branches and main switch or main fuses. This door may be opened only by an authorized person of experience for inspection or renewal of fuses.

(c) Single doors with spring catch are used to cover the entire panel of both types with plug fuses in branches where there are lugs only in mains, in which case a sectional plate covers these lugs and no live parts are exposed.

Cabinets are made either flush or surface type as hereinafter described.

USES—*Heavy Duty Types, C T and P T*—For use particularly in factories or elsewhere where glue pots, soldering irons or other electric heating devices are used in the processes of manufacture, or where unreliable or unskilled help are employed, and in stores, stockrooms, etc., using large wattage type C lamps.

TYPE OF "CIRCLE T" DEAD FRONT PANELBOARDS AND CABINETS FOR LIGHT DUTY REQUIREMENTS

Branch switches are 30-ampere, 125-volt, 2-pole or 3-pole tumbler type switch, quick make and quick break (moulded handle indicates type). These switches are the latest development in meeting the demand of enduring ruggedness under severe use.

They are positive and reliable in action.

Steel supporting frames and the steel parts are nickelplated. The fuses are so placed that when the switch is open the fuses are dead.

The base of the panels is natural black electrical slate, free from metallic veins.

Light Duty Types, C P and P P—These types are particularly adaptable for residential work, for churches, apartment houses, department stores and factories where the heavier types are not required.

Because of its narrow width (11 in. or 17 in. complete with cabinet) it can be installed in many locations otherwise impracticable for a panelboard, such as pilasters supporting columns and elsewhere, where the space is convenient, but limited.

Type P T

Type C P

TYPES OF "CIRCLE T" DEAD FRONT PANELBOARDS AND CABINETS FOR HEAVY DUTY REQUIREMENTS

TUMBLER SWITCH

Used on Types C T and P T "Circle T" dead front panels

DESCRIPTION, TYPES P P AND C P—Type P P—(Plug fuses and push switches) is distinctly a sectional panel being built up of double branch units made of cold moulded, fireproof, impregnated insulation (Transit), with a much higher electrical resistance than marble or slate, and the unit base is grooved in the rear for bus and circuit bars. The individual units are mounted on a backing $\frac{1}{4}$ in. thick, of the same material which is also non-absorptive.

PUSH BUTTON SWITCH

Used on Type C P and P P "Circle T" dead front panels

Type C P—(Enclosed fuses and push switches) has a base of 1-in. natural black electrical slate and is not a sectional panel.

The switches and the fuse receptacles on both of these types are mounted upon the front, and may be removed (in type C P the switches only are removable) from the front for repairs or replacements.

Branch switches are 20-ampere, double-pole, push button type with a short push, designed especially for panelboard use.

OFFICIAL APPROVAL—All "Circle T" panels and cabinets are examined and labeled under direction of the Underwriters' Laboratories, Inc.

Switchboards.

Owing to the great diversity of design in switchboard construction, it is impracticable to present comprehensive data on the subject, further than the statement that this company is thoroughly equipped to design, build and erect any kind of switchboard desired for either direct or alternating current.

An efficient engineering department is maintained and the factory equipment is of the best.

Knife switches used are our regular type "A." Any make of indicating instruments, circuit breakers and oil switches can be supplied.

When drawings of switchboards are requested with quotations, they are charged for at actual cost and this charge is credited if the order is later placed with this company.

Publications.

Knife Switches, "Safety" Switches and Wiring Devices are listed in Catalogue 12.

Panelboards, Cabinets and Switchboard Accessories are listed in Bulletins 1, 2 and 3.

These will be gladly furnished by the home office or branch office upon application.

"BULL DOG" SYSTEM of MOTOR CONTROL.

"BULL DOG" KNIFE SWITCHES, SWITCHBOARDS, PANELBOARDS and CABINETS; "BULL DOG SUPER-SAFETY" APPARATUS.

THE SWITCH WITH POWERFUL JAWS

TRADE-MARK

"Bull Dog" System of Motor Control.

This system of motor control is particularly adapted for large industrial plants having a number of induction motors of capacities varying from 5 to 50 h. p., which may be controlled from one central point. The system is adaptable for use under various conditions, and accomplishes the following results:

(a) Reduces the maximum demand in current, because the number of motors that can be started up at one time is limited.

(b) The use of fuses is unnecessary throughout the system.

(c) Induction motors ranging from 5 to 50 h. p. may be started from one central point without the use of individual compensators for motors.

(d) Any of the motors may be individually tested and proper readings made without interfering with the wiring installation or shutting down the motor.

(e) No live metal parts are accessible from the front of the board, which feature appeals particularly to plants that are in step with the "Safety-First" movement.

(f) Full protection is provided for the motors.

(g) Any motor may be shut down from any or several locations as desired, by merely pushing a button.

(h) Only authorized or experienced persons can start the motors.

(i) Materially reduces the cost of large motor installations, and particularly reduces the cost of maintenance, which is usually required where compensators are used.

The system may also be provided with a lock-out, which is an additional "Safety-First" feature, that does not permit the starting of the motor until this lock-out button is released.

This "Motor Control System" is a switchboard or a group of boards similar to the cut shown above, consisting of double throw oil circuit breakers, which were particularly designed for this system, with a starting bus and running bus; special automatic compensator coils are provided in connection with the starting bus. A switch is first thrown in the starting position and then thrown on the running bus.

INDORSEMENTS—This system is not new, but has been in use for the past 10 years in the following plants: Dodge Bros., Detroit, Mich.; Ford Motor Plant, Canada; Chevrolet Motor Company, Flint, Mich.; Studebaker Corporation, South Bend, Ind.; General Motors Corporation, Saginaw, Mich.; Timken-Detroit Axle Co., Detroit, Mich. and other manufacturing plants throughout the country.

CO-OPERATIVE SERVICE—Detailed information will be given to engineers who are interested in this system.

The MUTUAL ELECTRIC & MACHINE CO. will gladly co-operate in the determination of the adaptability of this system for particular requirements.

"BULL DOG" MOTOR CONTROL SYSTEM INSTALLED IN A GOVERNMENT SHELL PLANT

Double unit; each unit arranged for 18 motors. The system is particularly adaptable for controlling from 10 to 30 motors to the unit

"Bull Dog" Switches.

"Bull Dog" switches are made of pure copper, 98% conductivity, milled and sweated type. "Multiple" (two or more) blades are used with each pole of the switch larger than 200 amperes.

Round studs are regularly furnished on all back connected switches, 30 to 2000 amperes, respectively. "Laminated" busbar studs are used on switches of larger capacity.

RANGE OF "BULL DOG" SWITCHES

Capacity, amperes	30, 60, 100, 200, 300, 400, 600, 800, 1,000, 1,200, 1,500, 2,000, 2,500, 3,000, 4,000, 5,000, 6,000, 8,000, 10,000
Voltage*	A.C.
	30, 125, 250, 440, 500, 600
D.C.	250, 600
No. of poles	Single, double, triple, four, five, six
Throw	Single or double
Fuse	With or without fuse holders
Connection	Front or back connected

* Switches of higher voltages are designed primarily for that installation.

"Dead Face" or "Super-Safety" Switchboards.

"Dead Face" switchboards are furnished for theaters, office buildings and industrial plants. There are no live metal parts on the face of the switchboards.

Switches are interlocking, and may be arranged so that a master shaft lever can operate the switches in groups.

"Dead Face" switches are double break type. Switches and fuses are dead when open.

"Bull Dog" Panelboards and Cabinets.

"Bull Dog" panelboards and cabinets are manufactured in all types to meet all conditions.

Mains may be 2, 3 or 4 wires, according to the system, with lugs only, fuse holders only, no fuse switch, or switch and fuse holders.

ELECTRIC MOTORS.

Electric Dynamos, Alternators, Lighting Plants, Starters, etc.

For Oil Engines, see page 699; for Centrifugal, Steam and Power Pumps, see page 737.

Solid Metal Rotor "Cage" Winding.

Used on all Fairbanks-Morse squirrel cage motors over 3 h.p. One piece of solid metal without joints, eliminating repairs occasioned by loose screws and rivets or resoldering joints. This is the original, jointless rotor winding, and insures maximum conductivity.

SOLID METAL ROTOR "CAGE" WINDING

Type "H" Squirrel "Cage" Ball Bearing Motor.

For alternating current. Ball bearings mean less friction, higher efficiency, proved reliability. Type "H" motors have grease lubrication, bearings are dustproof; no oil slop.

Bulletin 210.

TYPE "H" SQUIRREL "CAGE" BALL BEARING MOTOR

Type "B" Squirrel "Cage" Induc- tion Motor.

For alternating current. Big sturdy ring oiling bearings with interchangeable phosphor bronze sleeves.

Bulletin 202.

TYPE "B" SQUIRREL "CAGE" INDUCTION MOTOR

Type "KPV" Internal Starter Motor.

For alternating current. Especially adapted for remote control. Close a switch to start, open to stop. Switch may be located anywhere. Takes little starting current. May be used where squirrel "cage" motors would impair the lighting service.

Bulletin 210.

TYPE "KPV" INTERNAL STARTER MOTOR

Type "BV" Slip Ring or Wound Rotor Motor.

For use where speed control is desired, or high starting torque with small starting current. For alternating current.

Bulletin 29.

TYPE "BV" SLIP RING OR WOUND ROTOR MOTOR

Type "CP" Ring Oiling Sleeve Bearing Motor.

For direct current. Commutating pole or interpole type. Either constant speed or adjustable speed for machine tools.

Bulletin 27.

TYPE "CP" RING OILING SLEEVE BEARING MOTOR

Type "CPB" Ball Bearing Motor.

For direct current. Similar to the "CP" motor except that it has ball bearings. The grease packed ball bearings require little attention.

Bulletin 31.

TYPE "CPB" BALL BEARING MOTOR

"Y" OIL ENGINES

Furnished with either alternators or generators make most economical power plants for small cities or towns

ELECTRICAL EQUIPMENT: Motors for all purposes, Alternating Current and Direct Current Generators, Motor Generator and Turbo Generator Sets, Transformers, Synchronous Converters, Frequency Changers, Balancers, Boosters, Synchronous Condensers, Switchboards.

PRIME MOVERS: Steam Turbines; Steam, Gas and Oil Engines; Hydraulic Turbines.

INDUSTRIAL MACHINERY: Portable and Stationary Air Compressors, Crushing and Cement Machinery, Mining Machinery, Power Transmission Machinery, Flour Mill Machinery, Saw Mill Machinery, Rolling Mill Machinery, Timber Treating and Preserving Machinery, Sugar Machinery, Agricultural Machinery, Pumping Engines, Hydraulic Machinery, Steam and Electric Hoists, etc.

For Centrifugal Pumps, see pages 718-719.

Squirrel Cage Induction Motors.

Type "AN" are standard polyphase alternating current motors for constant speed service. They are of very rugged construction and therefore adapted to severe service conditions. The field frames are of the substantial box type, the shafts large and rigid, while the bearings, which are of liberal size, are provided with dust guards. Moisture-proof coils are used. Standard ratings are $\frac{1}{2}$ h. p. and larger.

SQUIRREL CAGE
INDUCTION MOTOR

Slip Ring Induction Motors.

Type "ANY" are polyphase alternating current motors for use where the starting conditions are severe, where the starting current must be kept low, and for varying speed requirements. Standard ratings, 5 h. p. and larger.

Alternating Current Synchronous Motors and Condensers.

Synchronous motors are especially suited for driving generators, large air compressors, pumps, line shafts and other constant speed apparatus where the starting conditions are not severe.

The corrective effect which they exert on the power system makes them particularly desirable for alternating

TRADE-MARK

systems where the power factor is low. Built for ratings of 50 h. p. and larger.

Direct Current Motors.

The new type "E" motors incorporate the latest and best features of direct current engineering practice; among which are the following:

Ratings and speeds corresponding to those of induction motors, a complete line of constant and adjustable speed ratings, rugged cast steel yokes, commutating poles, insuring sparkless commutation, dustproof bearings, windings treated to resist oil and moisture, thorough ventilation, conduit terminal boxes on all motors, standard enclosing covers, all parts easily accessible.

For ratings of 150 h. p. and larger, Type "HC" motors are built for constant or adjustable speed service. Having commutating poles and with pedestal bearings mounted on a substantial base, they are particularly rugged and adapted for heavy duty.

DIRECT CURRENT MOTOR,
TYPE "E"

Alternating and Direct Current Generators.

Allis-Chalmers generators are built in a number of forms and for ratings and speeds adapted to the various types of prime movers.

For belting or coupling, the smaller generators are of the self-contained bracket bearing type; while larger machines have pedestal bearings. Other complete lines are those for reciprocating engines, vertical and horizontal machines for hydraulic turbines and high speed steam turbine units.

Allis-Chalmers generating units can be furnished complete with any type of prime mover. This gives the purchaser the important advantage of a complete installation with undivided responsibility.

2000 KW. DIRECT
CURRENT ENGINE
DRIVEN UNIT

Synchronous or Rotary Converters.

Standard synchronous converters or "rotaries" for industrial or mining service deliver 250 or 275 volts direct current when operating from the alternating current supply system. They are built for ratings of 100 kw. and larger, in the commutating pole type, and for 60-cycle and 25-cycle systems.

Railway "rotaries" are supplied for voltages up to 1500 volts direct current.

200 KW. INDUSTRIAL SYNCHRONOUS CONVERTER

Motor Generator Sets.

For transforming from alternating to direct current, standard sets are built for ratings of 2 kw. and larger. Ratings of 50 kw. and larger may be provided with synchronous motors suitable not only for driving the direct current generator, but for correcting the power factor of the alternating current system.

Sets operating from direct to alternating current, frequency changing sets, balancers, boosters and many other sets are built for particular service conditions.

Some of the largest sets in service are those built by the ALLIS-CHALMERS MANUFACTURING COMPANY.

1500 KW. MOTOR GENERATOR SET

Transformers.

Distributing transformers are built for high and low tension power or lighting distribution. Standard ratings, up to 200 kv-a. are furnished in all commercial voltages.

Allis-Chalmers power transformers are built for voltages up to the highest in transmission service, and are used on many of the largest transmission and distributing systems of the country. Information furnished on application.

THREE 4000 KVA, 150,000-VOLT TRANSFORMERS, OUTDOOR INSTALLATION

Stationary and Portable Air Compressors.

These compressors are extensively used for garage or industrial purposes. They are entirely automatic in operation, maintaining the air pressure practically constant at all times. Portable or stationary equipment are built in capacities from 11 to 150 cu. ft. for belt drive or in the motor driven type.

PORTABLE AIR COMPRESSOR

Steam Turbines.

Allis-Chalmers steam turbine and alternator units, condensing, non-condensing, mixed pressure and low pressure types, built in sizes from 200 kw. up.

Allis-Chalmers steam turbines are of the horizontal reaction type, highly efficient, simple in design, accessible for inspection and built for continuous service.

Full information will be furnished on application to the nearest district office.

SOL-LUX INDUSTRIAL LIGHTING REFLECTORS and FIXTURES; HOLDER-SOCKET-REFLECTORS; HOLDER-SOCKETS; REFLECTO-CAP DIFFUSERS; VAPORPROOF FIXTURES; AUTOMATIC CUT-OUT HANGERS for Multiple Circuits; PROTECTIVE LIGHTING FIXTURES; "UNIVERSAL" FLOOD LIGHTING PROJECTORS; ORNAMENTAL STREET LIGHTING STANDARDS and BRACKETS; PENDENT STREET LIGHTING UNITS; STREET HOODS; SWITCHBOARDS; PANEL-BOARDS and CABINETS; CUT-OUT BOXES.

Also, Plugs and Receptacles, Terminals and Connectors.

Engineering Service.

The Engineering Service Department will assist in making plans and estimates. Complete designs will be submitted when drawings and sketches are supplied with the following information: (1) Class of work to be performed in each building or department. (2) Dimensions of rooms, height of ceilings, location of windows, girders, shafting, etc. (3) Location of machinery, work benches, etc. (4) Color of walls. (5) Whether conduit or open wiring is to be installed.

Value of Good Industrial Lighting.

Cost of illumination is paid for if it saves 3 minutes daily of each man's time, or $\frac{1}{2}$ of 1% of wages and supervision. Yet good illumination, on an average, saves 30 minutes daily per man. It also gives other returns, including increased production for the same labor costs and overhead, reduction of spoilage and seconds, decrease in the number of accidents, less eye strain, and more cheerful and sanitary conditions for employees.

Elimination of Glare.

Glare causes eye strain, accidents, spoilage of materials and decreased production. Use reflectors which shield the lamp filament from the direct line of vision. In buildings where high mounting heights are possible, bowl type reflectors may be used. Where ceilings are low, units for general illumination should be installed as close as possible to the ceiling. The R L M standard dome type reflector is the latest and most efficient design available for general illumination in factories. Cutter holder-sockets possess a particular advantage for the latter purpose, because they allow lamps and reflectors to be installed directly to the conduit or outlet box. For localized lighting, bowl type reflectors are the most satisfactory.

Both direct and reflected glare may be reduced by the use of opal glass bowls with R L M standard dome type reflectors.

Write for complete details of units designed particularly for this purpose.

Keep Reflectors and Lamps Clean.

Reliable tests show that, on an average, the loss

SOLOLUX

TRADE-MARK

of light amounts to nearly 50% when reflectors are not kept clean. Automatic cut-out hangers should be used for this purpose. See following page.

Holder-socket-reflectors.

"Easy to wire. Guaranteed weatherproof." Holder-socket-reflectors are combinations of Cutter "easy-to-wire" holder-sockets and the standard types of high efficiency one-piece porcelain enameled steel reflectors—dome, bowl and angle.

They are designed primarily for economy and labor conservation. The holder-socket saves 75% of the time ordinarily required to install lighting fixtures of these types.

Holder-socket-reflectors are interchangeable. Reflectors of different types may be substituted at any time, and reflectors for medium base and mogul base lamps may be interchanged respectively with medium screw and mogul screw sockets.

Approved construction. Cutter holder-sockets are approved by the National Board of Fire Underwriters.

METHODS OF ATTACHMENT—Holder-socket-reflectors may be used in any type of installation and for either interior or exterior lighting purposes. They may be suspended:

(1) On $\frac{1}{2}$ -in. or $\frac{3}{4}$ -in. conduit. (2) Directly from the outlet box or conduit. (3) On chain or cord by using suspension eyes. (4) On reinforced drop cord by using porcelain bushings.

*Furnished with porcelain bushing for reinforced drop cord suspension, when so ordered, without additional charge.

Cutter Holder-sockets.

Combination holders for standard heel reflectors and sockets for mazda lamps approved by National Board of Fire Underwriters. They permit of the greatest flexibility in light distribution.

Holder-sockets are made with cap for attachment to 1/2-in. and 3/4-in. conduit stems, with cover for attachment directly to outlet boxes and condulets, and with porcelain bushing for reinforced drop cord suspension. Holders are made for both 2 1/4-in. and 3 1/4-in. standard heel reflectors.

HOLDER-SOCKET WITH PORCELAIN BUSHING FOR REINFORCED DROP CORD SUSPENSION

METHOD OF WIRING HOLDER-SOCKET FOR ATTACHMENT TO CONDUIT

Standard Heel Reflectors.

Different types of reflectors with same size heel may be used with same holder, permitting change in light distribution without disturbing the wiring. Reflectors easily removed for cleaning. The 2 1/2-in. heel supplied on reflectors for 200-watt lamps and smaller, 3 1/4-in. heel on reflectors for 300-watt lamps and larger. Standard heel reflectors used with holder-sockets recommended for outlet box, conduit, and reinforced drop cord installations.

R L M Standard Dome Type

Standard Bowl Type

STANDARD HEEL REFLECTORS

Reflecto-Cap Diffuser.

This diffuser constitutes an important unit of the Cutter complete line of industrial lighting reflectors. Direct glare is eliminated by silverplated cap which covers lower part of bulb of the lamp. This cap conceals the filament and directs the rays to large reflector above, which distributes them uniformly over the working plane.

Where illumination of high intensity is required for detailed and accurate workmanship, or where materials with polished or oily surfaces offer special danger from reflected glare, the Reflecto-cap diffuser should be installed.

Sol-lux Vaporproof Fixtures.

"Safety first" units of highest class designed for plants where explosive gases and dust accumulating in the standard types of industrial lighting fixtures would cause explosions and fires, and where moisture and smoke fumes would hasten corrosion of exposed metal parts.

Each fixture uses a Cutter holder-socket. Special gaskets are used in all joints to make the fixtures tight. Fixtures may be used with or without lamp guards. Write for price list.

SOL-LUX VAPOR-PROOF FIXTURES WITH PEAR SHAPE GLOBE AND GUARD

Automatic Cut-out Hanger for Multiple Circuits.

Cutter automatic cut-out hangers facilitate cleaning reflectors without use of ladders, thus saving much time and expense with absolute protection against accidental short circuits or contact with live wires.

This hanger may be used with angle type reflectors and other fixtures requiring a fixed location. The position of the lower switch is always the same with respect to the upper part of the pulley.

Universal suspension clamp, furnished with this device, may be used for fastening the hanger to ceiling, or on cable, or on pipe bracket of 3/4-in. to 1 1/4-in. bore. With this hanger use Cutter Mid-get changeable pulley and 3/8-in. or 1/4-in. weatherproof cord or 1/4-in. galvanized ebony wire rope.

WESTERN ELECTRIC PORTABLE UTILITY LIGHTS.

Also, equipment for every electrical need, including all classes of Lighting, Power and Telephone Appliances and Wiring Materials; Motors; Generators; Switchboards; Fans; Sunbeam Mazda Lamps; Intercommunicating Telephones; Washing Machines; Vacuum Sweepers; Heat Regulators and other Electrical Household Appliances; Wire and Cable.

Portable Utility Lights.

The Western Electric portable utility light fully meets the demands for night illumination at close range within restricted area where the light is to be located at distances not greater than 100 to 125 ft. from the object to be illuminated.

It has a hammered-glass reflector which is spring-suspended in a one-piece cast iron housing. This housing is closed by a wire glass front fitted into a cast iron ring, forming a door hinged at the bottom. This door is operated by a hand latch.

Its rugged construction enables it to withstand rough usage and its wire glass front will not shatter.

Its light weight—30 lbs.—and a properly balanced handle make the light readily portable. It can be mounted on either vertical or flat surface.

SCOPE OF USE—This Western Electric portable utility light making use as it does, of a 200-watt Mazda C lamp is an exceptionally economical light for close range work.

Since most construction work requires close range lighting, this light is particularly suitable for contractors' needs. It is the light to use on loading platforms, excavation work, emergency repair work, illumination of monuments and for protection of supplies.

Flood Lamps.

The Western Electric-Davis larger flood lamps meet the requirements for lamps that will produce "electric daylight" at night, with a soft, enveloping and glareless, yet penetrating, light. An idea of their illuminating power may be gained from the fact that one lamp placed 60 ft. above ground will illuminate over 10,000 sq. ft.

The Western Electric-Davis flood lamp finds its application in all industrial plants where night work is necessary, indoors or outdoors; in protecting public works, central stations, bridges, etc.; in lighting railroad yards, terminals, transfer yards, etc.; facilitating exca-

Western Electric
TRADE-MARK

vating and building work; in lighting the above ground workings of mines; and in illuminating buildings, statues, beaches and playgrounds.

TYPES—There are two types, the portable and the bracket.

The portable lamps, complete with base and standard, weigh only 45 lbs. and are 3¼ ft. high. For outside work, they are usually mounted on tops of buildings for the best distribution of light over a maximum area. For interior use, they are mounted close to the ceiling. A set makes an ideal emergency lighting equipment.

The bracket type embodies the same lighting head as the portable. The difference is in the method of mounting, the bracket making it possible to affix the lamps to poles or trees.

No permanent wiring is needed.

WESTINGHOUSE MAZDA LAMPS in every style and size, for all lighting requirements.

Quality.

For thirty-nine years, lamps labeled "Westinghouse" have stood for the highest attainment in the art of lamp manufacture, so that the name has come to be recognized as a guarantee of quality on incandescent lamps.

Made in four modern, completely equipped factories, *Westinghouse Mazda* lamps embody all the latest developments and improvements. Uniform quality and absolute dependability are the characteristics which have established for them an unusual record for satisfactory service.

Sizes, Voltages, etc.

Westinghouse Mazda lamps are made in every required size for every conceivable lighting service.

REGULAR MULTIPLE BURNING LAMPS—In sizes from 10 to 500 watts for standard voltage ranges. Straight side and round bulbs.

MAZDA C (GAS-FILLED) LAMPS—In sizes from 75 to 1000 watts for standard voltage ranges. Pear shape bulbs.

SERIES BURNING LAMPS—60 to 1000 c.p. in standard ampere ranges for street lighting. Straight side and pear shape bulbs.

SIGN LAMPS MULTIPLE BURNING—11 to 12½, 55 to 65, and 110 to 125 volts. Straight side bulbs.

SERIES BURNING ELECTRIC RAILWAY LAMPS—Five in series on voltage ranges 525 to 650. Straight side bulbs.

MULTIPLE BURNING TRAIN LIGHTING LAMPS—30 to 34 and 60 to 65 volts, round bulbs. Also locomotive headlight lamps, round bulbs.

STEREOPTICON LAMPS—Round bulbs.

SHOWCASE LAMPS—Tubular bulbs.

COMPENSATOR LAMPS—Straight side bulbs.

FLOOD LIGHTING LAMPS—Round bulbs.

WHITELITE ELECTRIC COMPANY

Manufacturers of Incandescent Gas-filled Lamps

368-370 Broome Street
NEW YORK, N. Y.

Product.

WHITELITE INCANDESCENT GAS-FILLED LAMPS.

The WHITELITE ELECTRIC COMPANY makes nothing but lamps, and none but gas-filled lamps. The Whitelite plant has been the first in the United States to concentrate upon gas-filled lamps, from the day that form of illumination became a scientific actuality.

TRADE-MARK

Distinctive Features.

Untiring research, as specialists in gas-filled lamps, added to the numerous patents of the General Electric Company, under which Whitelite lamps are manufactured, have made it possible for the WHITELITE ELECTRIC COMPANY to produce a lamp of high efficiency and extreme durability. The Whitelite lamp is essentially a lamp of quality. Nothing goes into the make-up of the Whitelite lamp but what is highest in material and workmanship.

Facilities.

The Whitelite factories being situated in New York, with its great waterways and railroad lines, customers may count upon prompt shippings.

Sizes, Shapes and Voltage.

The Whitelite lamp, clear, frosted, or Daylite blue, is uniformly pear shaped, and comes in sizes from 40 to 1000 watts, in all voltages.

Prices.

Price list and other detailed information will be sent on application. Discounts can be quoted only where indication is given as to extent of turn-over in gas-filled lamps.

WITHERBEE STORAGE BATTERY CO., INC.

ESTABLISHED 1903

FACTORY AND OFFICES
643-655 West 43rd Street
NEW YORK, N. Y.

Products.

STARTING, LIGHTING and IGNITION BATTERIES for Automobiles and Motor Trucks.

TRADE-MARK

Description.

"Witherbee" Batteries are of correct size, shape and capacity for every make and model of car, and for starting and lighting systems of any manufacture in general use.

Modern, carefully constructed batteries, they all possess high starting ability, and deliver the highest current required, without damage. The plates are specially processed and durably constructed to prevent buckling; only the finest rubber goes into the jars, and the cases are of acid-proofed hardwood.

Recognized standards since 1903.

Equipment and Types.

All "Witherbee" Batteries will be furnished with terminals suitable for the particular make and model of vehicle for which they are ordered, as specified and used by the manufacturer of that car. Special terminals and terminal leads of unusual length will be furnished at extra cost.

The tables shown herewith cover the principal replacement sizes in general use.

Literature.

Illustrated catalogue and replacement bulletin with prices sent on request.

ECONOMY FUSE & MFG. CO.

Manufacturers of Approved Renewable Cartridge Fuses and Non-renewable Indicating Fuses

2707-2721 Greenview Avenue
CHICAGO, ILL.

BRANCH OFFICES IN PRINCIPAL CITIES

Complete Stock Carried by All Leading Jobbers and Dealers

Products.

ECONOMY APPROVED RENEWABLE CARTRIDGE FUSES.
"ARKLESS" NON-RENEWABLE INDICATING FUSES.

Economy "Approved in all Capacities" Renewable Fuses.

The first "approved in all capacities" renewable fuse using inexpensive bare renewal links for restoring a blown fuse to its original efficiency.

Economy fuses are made in two general types (ferrule and knife blade) with a full line of capacity ranges for all commercial voltages. This is the first line of fuses approved in all capacities by the Underwriters' Laboratories, established and maintained by the National Board of Fire Underwriters, employing an inexpensive bare link for restoring a blown fuse to its original efficiency.

The fusible elements are of the "drop out" renewal link type, accurately rated and of definite design. Every part of an Economy fuse is built on the "safety first" principle, which means that the design is right from an electrical standpoint, and that material entering into the construction of the completed fuse is the best that money can buy.

IMPROVED ECONOMY RENEWABLE FUSE—Study the renewable link feature. See the two narrow bridges of metal holding the "drop out" features in place. In operations on short circuits, these two bridges fuse. The entire fuse metal does not volatilize, only the two narrow bridges. This very greatly decreases the danger factor due to the tremendous pressure generated when an entire strip of fusible metal is instantly converted into gases. No powdered filler to deteriorate or solidify. Only the fuse metal is destroyed; the fuse itself is ready for years of service. See the new winged washer which makes it simple and easy for any one to replace the "drop out" renewal link in a few minutes.

ECONOMY FUSE SAVINGS—There is 80% of fuse maintenance cost saved yearly, as compared to the cost of securing adequate protection by the use of non-renewable "one-time" fuses.

ECONOMY FUSE USERS—Users include industrial plants, large corpora-

tions, light and power companies, arms and munition plants, powder mills, mining and smelting companies, department and large stores, publishing companies, flour mills, food product plants, hotels, theaters, public buildings, steamships, wireless stations ashore and afloat, and various departments of the United States Government.

WHY ECONOMY APPROVED RENEWABLE FUSES ARE USED—Because Economy fuses cut yearly fuse costs 80% and furnish proper protection under all conditions of service. Unlike "one-time" fuses, which are discarded after operation, Economy fuses are used over and over again to obtain complete protection against the fire and accident hazards of overloads, short circuits, and the effects of lightning discharges on electrical circuits.

"DROP-OUT" RENEWAL LINK—It is the heart of an Economy fuse. It instantly restores a blown Economy fuse to its original efficiency at the absolute minimum of cost.

A stock of "drop-out" links, always on hand, represents only a small investment.

"Drop Out" Renewal Link and Winged Washer
ECONOMY KNIFE BLADE TYPE FUSE DISSEMBLED

SAFETY—The use of economy fuses in establishments where the fire hazard is great (powder factories, arms and munition plants, chemical works, flour mills, submarines, battleships, etc.), and where "safety first" is the highest consideration (department stores, hospitals, schools, hotels, theaters, institutions, ships, railway cars, etc.), is the proof of their safety in use.

"Arkless" Non-renewable Indicating Fuses.

We are also sole manufacturers of "Arkless," the non-renewable fuse with the "100% guaranteed indicator." For use on circuits not subject to frequent overloads.

Samples.

Any capacities sent on request, provided they are to be used for comparison and tests. Ask for Catalogue 51 when ordering samples.

Product.

NATIONAL RENEWABLE FUSES for the protection of electrical circuits.

Approval.

National renewable fuses are approved by the Underwriters' Laboratories, Inc., their report E-4199, December 1, 1919.

The National renewable fuse is the only renewable fuse that is approved by the Associated Factory Mutual Fire Insurance Companies.

The National renewable fuse is also approved by the Mutual Fire Prevention Bureau of the Millers' Mutual Fire Insurance Companies.

The National renewable fuse is the only renewable fuse having all the three above approvals. Neither of the above mentioned mutuals have approved the naked element type of renewable fuse; they specify a powder packed element.

Description of National Renewable Fuses.

The fuse consists of an inner cartridge containing the fuse element and smothering powder, and an outer fiber cartridge of suitable contacts and a permanent metallic indicator which is part of the element, for identifying the capacity of the renewable element used, without opening the outer cartridge.

The knife blade fuses and elements are both provided with gas vents in the ends to allow the gases to escape on short circuits.

The ferrule on the ferrule type is staked, and on the knife blade type is riveted to the fiber casing, and not screwed on the threaded fiber.

Distinctive Features.

(1) Only one element of the proper size and rating can be used at a time.

(2) Powder packed element confines and smothers the fierce heat of the arc when the fuse blows, and also protects and increases the life of the outer casing or holder.

(3) The indestructible metallic tell-tale indicator tells the amperage rating at a glance.

(4) Simplicity—easy to reload.

Economy.

Wherever the National renewable fuse is used, a big saving is effected. First, because the renewable cartridge costs but a small part of the cost of the old style one-time fuse; and second, because its initial cost and maintenance expense are less than most renewable fuses.

Indorsement.

The National renewable fuse is indorsed and used extensively by prominent industrial plants throughout the country.

Sizes.

Manufactured in 250 and 600 volts, up to and including 600 amperes.

Bulletin.

A copy of "Correct Fuse Ratings for Motor Circuits" will be sent on request.

FERRULE TYPE NATIONAL RENEWABLE FUSE

Only 3 parts; other ferrule type renewable fuses have 6 or more parts

KNIFE BLADE TYPE NATIONAL RENEWABLE FUSE

Only 5 parts; other knife blade type renewable fuses have 9 or more parts

THE MONSON MAINE SLATE CO.

112 Water Street
BOSTON, MASS.

QUARRIES AND MILL
MONSON, MAINE

Products.

MONSON MAINE UNFADING BLACK SLATE.

Facilities.

THE MONSON MAINE SLATE CO. owns and operates the largest slate mills in the United States, which are equipped with the most modern machinery, are complete in every detail, and are operated by a corps of skilled workmen who have been trained by many years' experience in this line.

These facilities, together with its exceptionally fine railroad connections, enable this company to make prompt shipments to any point in the United States.

Adaptability of Monson Maine Unfading Black Slate.

The physical and chemical properties of this slate especially adapt it for electrical work of all kinds. It is furnished cut to the purchaser's specifications.

It is also adapted for roofing, sinks, urinals, tiles, chimney tops, slabs, counter tops, garden borders and walks, headstones, grave linings and covers, grave vaults, vestibule floors, greenhouse shelves, baseboards, wainscoting, refrigerator shelves, register frames, billiard table tops, blackboards, etc.

Electrical Qualifications of Monson Maine Slate.

The following distinctive features are embodied in Monson Maine unfading black slate:

It is the best non-conductor of any slate quarried and, because of its insulating qualities, is especially adapted for electrical work of all kinds. It is jet black, uniform in color and absolutely non-fading, therefore it requires no preparation to make various units match.

Its natural finish permits scratches to be eradicated. It is uniform in substance and can be easily planed, drilled and turned like wood or metal. It has greater tensile strength than any other slate and far greater than marble. It meets the most exacting tests, and in appearance and durability, it has no superior.

It is absolutely acidproof, weatherproof, non-porous and is not subject to discoloration.

Monson Maine Roofing Slate.

Slate roofs which are known to have been in continuous service for more than 150 years, are still in good condition, a proof of their marked superiority over other types of roofing.

Due to its great durability and its non-fading and weatherproof qualities, Monson Maine slate is ideal for roofing.

Slate tiles and roof slates in any size with edges sawn and holes drilled and countersunk, will be furnished in accordance with purchaser's specifications.

GRADES—Selected No. 1—No slate to be less than full $\frac{3}{16}$ in. thick. All corners cut square and full and both surfaces smooth and level.

Extra No. 2—One surface smooth, all corners cut square and full, but thickness varies.

Chemical Properties.

The following is an extract from a report of test made on Monson Maine black slate by the Massachusetts Institute of Technology, Boston, Mass., on Jan. 1, 1891.

Loss of ignition and organic matter...	3.88%
Silica	56.42%
Alumina	24.14%
Protoxide of iron.....	4.46%
Lime52%
Magnesia	2.28%
Potash	5.53%
Soda	3.15%

Physical Properties.

The figures given below show the comparative crushing strength of Monson Maine black slate and other slates, stones, etc., obtained through tests made by eminent authorities. These tests were made on 1-in. cubes.

NAME OF STONE	CRUSHING STRENGTH	AUTHORITY
Monson Maine black slate	34,680 lbs.	Jerome Sondericks
Vermont slate	29,270 lbs.	Prof. W. O. Crosby
Fairhaven slate	12,870 lbs.	F. R. Hutton
Sandstone	8,633 lbs.	Franklin
Blue stone	13,096 lbs.	Hutton
Granite	17,342 lbs.	Gilmore
Vermont marble	8,375 lbs.	U. S. Navy
Italian marble	10,173 lbs.	Gilmore
Limestone	9,996 lbs.	Gilmore

Specifications.

To insure installation of the best slate that can be procured and to prevent substitution of other slate, specifications should call for Monson Maine Unfading Black Slate as quarried and manufactured by THE MONSON MAINE SLATE CO., Boston, Mass.

Samples.

Samples of Monson Maine unfading black slate will be sent to prospective users on request.

Service.

This company maintains a service department which is at the disposal of prospective purchasers, without obligation, for the submission of estimates and general information concerning the company's products.

References.

The superiority of Monson slate is recognized by all the leading electrical concerns in the United States. A few of the users of this slate are listed below:

General Electric Co., Western Electric Co., Westinghouse Electric & Mfg. Co., Pennsylvania Railroad, Philadelphia Rapid Transit Co., Interborough Rapid Transit Co., Boston Elevated Railway Co., Edison Co., Ford Motor Co., Willys-Overland Co., Buick Motor Co., International Harvester Co., U. Products.

Manufacturers of INTER-COMMUNICATING TELEPHONE SYSTEMS, TELEPHONE APPARATUS, TELEPHONE CABLES and SUPPLIES.

Inter-communicating Telephone System No. 1.

Selective ringing, selective talking, *with 6-, 12-, 22- and 32-station capacity*; cost of a switchboard system and an operator's salary are saved; each telephone station may select, ring and talk with any of the other stations *without interference with remaining stations which may be using system simultaneously*.

ADAPTABILITY—For offices, factories, public buildings, large residences, etc., where simultaneous conversations are necessary.

SERVICE—Three kinds: (1) For communication between a certain group of local stations. (2 and 3) This local service with additional service to and from city or town telephone system of either the "central energy" or local battery type, by means of one or more exchange trunk lines. One station on local system designated as the answering station.

Telephone exchange may be of two styles: (a) "central energy" type, with which answering station handles and transfers *incoming calls only*—outgoing calls being controlled from each local station; (b) "generator call" type, where both incoming and outgoing calls are conducted through the answering station.

STANDARD EQUIPMENT—All telephone apparatus and accessories, including desk, wall and combination telephones, long distance transmitters and receivers, 3-position type switching key mechanism, key boxes, extension bells and other trunk line equipments, cables, terminal boxes, mounting standards, bell ringing transformers, batteries, etc. Each part is of the same high quality as used in regular city exchange systems.

OPERATION—*To Establish Connection*—Press 1 button once only; same button is used for selecting and ringing desired telephone. Push button switching keys have 3 operating positions—normal, talking and ringing; pushing button all the way down closes a circuit which *causes bell of distant telephone to ring*; button being released, it snaps back half way to *talking position*, completing talking circuit with the telephone called; receiver is then removed and conversation may begin.

Switching keys interlock by means of a tumbler plate so that, when any call is made, any key button *still remaining in talking position* is restored to normal position when any other key button is pressed.

To Answer a Call—Connection is made with party calling by pressing the white "home" button and by taking receiver from hook; "home" button is restored automatically when next call is made on system.

Telephones for System No. 1.

No. 905, for use at regular stations, consists of two pieces—a No. 989 desk stand and either a No. 8R, 9R, 10R or 11R key box. For answering stations, see table.

Key boxes contain switching key, vibrating ringer, impedance coil and line and battery terminals; directory spaces opposite each key button for inserting names of stations; removable covers for testing and inspection.

CABLING OF SYSTEM—Cables contain all wires (Nos. 18 and 22 B & S gauge copper) necessary for operation of system; full metallic circuit wiring between all stations; and any pair of wires are identified by their coloring, making installation work easy. Each wire is tinned and insulated with servings of silk and cotton in opposite directions. Splices or junctions in cable should be made with the terminal boxes (for all sizes of cable).

Types of Cables—(1) Braided sheath type, recommended for interior use. (2) Leaded type, for all outdoor use or places subject to excessive moisture or corrosive fumes, dampness, etc.

CABLE

Inter-communicating Telephone System No. 2.

Service is equivalent to No. 1 System with these exceptions:

- (1) It transmits one conversation only at a time; and
- (2) it is not arranged for connections with a public service telephone exchange.

Any or all stations may be called in rapid succession. Wiring arranged for local service between all stations.

ADAPTABILITY—Used for small size local service systems such as small commercial establishments, factories, clubs and residences. The circuits are simple and do not require the 3-position switching key.

SIZES—Instruments and accessories furnished in 2 standard sizes: for 6 and 11 stations.

INSTALLATION AND OPERATION—Further details will be mailed on application.

No. 1122-B WALL TELEPHONE FOR SYSTEM NO. 2
Mounting space, 5 3/4" by 9 in.

Inter-communicating Telephone System No. 3.

A central station system for communication between one master station and a number of outlying stations as in schools, small hotels and public institutions. Arrangement provides for talking and ringing between master station and all outlying stations over a 3-wire circuit—2 common talking circuit wires and an individual signalling wire to each station. Outlying stations can not call each other direct, but must first call the master station, which in turn calls desired station. All calls, therefore, are checked. One conversation only can be maintained at a time.

EQUIPMENT—Master station is equipped with both wall and desk telephones similar to those illustrated on preceding page; outlying stations are fitted with desk, wall and combination telephones, impedance coil (for regulating supply of current to transmitters of the various telephones) and all accessories.

SIZES—Instruments and accessories are furnished in 4 sizes: for 5, 10, 20 and 30 stations. A complete system need not be installed at the beginning—additional stations can be provided at any time, if master station capacity is of sufficient size.

No. 965 WALL TELEPHONE FOR SYSTEMS NO. 3 AND NO. 4
Mounting space, 5 3/4" by 7 3/4" in.

Inter-communicating Telephone System No. 4.

For communication between any 2 points not farther than 1,500 ft. apart. An ideal equipment for a private line between 2 offices, 2 departments in a factory, and for house to garage lines, etc.

EQUIPMENT—System No. 4 is equipped with wall, desk and combination telephones and other necessary accessories.

Prices and Further Information.

On receipt of full particulars, estimates and detailed information, with catalogues, bulletins, etc., will be mailed without delay.

References.

Extensive lists of satisfied users of this company's inter-communicating telephone systems will be forwarded to interested inquirers on application.

THE SCREW MACHINE PRODUCTS CORPORATION

Manufacturers of Select-O-Phone, Automatic Interior Telephone
and Calling System

PROVIDENCE, R. I.

Products.

The SELECT-O-PHONE SYSTEM, a combined Automatic Interior Telephone and a General, or Factory, Calling Service.

Standard Desk Type Select-O-Phone.

The standard desk instrument is finished in dull black, with heavily nickered fittings, and is practically identical in size and appearance with the usual desk telephone for exchange service, but contains the numbered dial with which connections are obtained without a switchboard operator.

STANDARD
DESK TYPE
SELECT-O-PHONE

Description.

The Select-O-Phone automatic telephone service consists of an automatic switchboard and telephone instruments. It has an ultimate capacity of 33 direct lines and 2 extensions for each line. All of these are intercommunicating with each other.

Advantages.

SIMPLICITY—The Select-O-Phone requires no expensive and complicated cable arrangements or terminal boxes. Wiring for its operation is very simple and inexpensive, and stations already installed may be moved easily. This simplicity also facilitates the addition of new instruments to the system.

FLEXIBILITY—The Select-O-Phone is built throughout on the unit plan. One of the chief objects kept continually in mind during its development was to design a system that would be flexible; one, the first cost of which would not be prohibitive to the user who required a small number of stations, but at the same time a system that could be added to as requirements demand.

Special Features.

- Requires no operator.
- Gives a service of 24 hours.
- Gives connection in 4 seconds.
- Secret conversation.
- Speeds up city telephone service by relieving overburdened switchboard.
- No cut-offs during conversations.
- Conference of 3 or more on the same wire—all remaining at their post of duty.
- Executive control for special messages of the chief.

General Calling Service.

The general calling service, when combined with the Select-O-Phone automatic telephone service, provides a means of instantly locating and verbally connecting with a desired person anywhere in the plant. They step to the nearest Select-O-Phone station, answer the call and proceed on their way without loss of time.

It is not necessarily a part of the Select-O-Phone system, but the many advantages it offers makes it a valuable adjunct, especially for factories and large institutions. Its omission in no way interferes with the telephone service, as rendered by the Select-O-Phone, and it need not be installed unless desired. Provision is made in every system for its addition at any time.

Automatic Switchboard.

TYPE M-33—The cabinets are made of selected, well-seasoned hardwood, finished in dull black, size 28½ by 20½ by 8 in.

They are designed to mount on wall and the glass front cover is removable. They are handsome pieces of furniture, harmonizing with any office and occupying a very small space.

TYPE M-33 AUTOMATIC SWITCHBOARD

Type M-33 switchboards are always furnished with the "busy" unit and fully wired for mounting the general call relay and additional racks as needed.

TYPE M-11—A smaller switchboard of a similar design is made to meet the demands of those requiring an ultimate capacity of only 11 lines.

Service.

This company maintains an engineering department which is always at the service of its customers, and will gladly furnish any information desired.

Hydraulic Straightening Presses.

These machines are carefully designed along the lines of advanced engineering practice and are constructed of high grade material throughout.

The bed is made of two extra heavy steel I-beams supported by two heavily flanged cast legs. Adjustable V-block centers are provided for the support of shaft.

HYDRAULIC STRAIGHTENING PRESS

Made in capacities of 35, 50, 65 and 125 tons for straightening 3-in. to 6-in. bars and shafts, including No. 191 crank shaft press designed especially for crank shaft straightening.

Press is built for accumulator drive; belt drive from

line shaft; and direct motor drive as a self-contained removable unit.

Hydro-pneumatic Quick Operating Presses.

Manufactured in capacities of 10, 15, 20, 30 and 40 tons for light straightening, broaching, forcing and assembly operations.

Hydraulic Presses.

Designed for vulcanizing and forming in rubber manufacture; leather and coin embossing; metal and plastic material forming presses.

Hydraulic Arbor Presses.

For industrial and railroad shop work, made in capacities of 35, 60 and 100 tons.

Hydraulic Broaching Presses.

For use in accumulator or belt driven types.

Hydraulic Forcing and Assembly Presses.

Horizontal style, quick operating types, for rear axle housing and brake drum work.

FORCING AND ASSEMBLY PRESS

Hydraulic Accumulators.

Made in four types and a wide range of capacities for various requirements.

Hydraulic High Duty Pumps.

These pumps are manufactured in horizontal and vertical types and in capacities of 2½ to 20 gals.

Pipe and Fittings for Hydraulic Lines.

Consist of flanges, pipe and pipe bends, valves, etc., including "Metalwood" quick operating type valve; alleviators and intensifiers.

HYDRAULIC VALVE

Drop Forged Steel Hydraulic Fittings.

Ells, tees, stop and check valves, flange unions, couplings, bushings, etc.

Bulletins.

Furnished on application.

BRANCH OFFICES

BIRMINGHAM, ALA.

Products.

HYDRAULIC MACHINERY and POWER TOOLS:

Gate Shears; Angle Shears; Multiple Punches; Forcing Presses; Drawing Presses; Flanging Presses; Plate Planers; Tile and Die Presses; Bending Rolls; Push Benches; Pull Benches; Riveters; Plate Bending Presses; Wheel Presses; Jogging Presses; Stamping

and Drawing Presses; Heater Presses; Forging Presses; Intensifiers; Dishing Presses; Washer Presses; Accumulators; Bending and Straightening Machines; Punching and Shearing Presses; Powder Presses; Flue Welders; Locomotive Repair Machinery; Scrap Reclaiming Equipment; Shipyard Machinery.

WASHER PRESS

May be equipped to feed washer stock in band or bars.
May also be arranged for belt or motor drive

BENDING ROLLS

Made in many sizes, varying in capacity from rolling of small sheets up to large ship plates, which are at times as long as 34 ft.

General construction consists of 3 rolls, arranged in a pyramidal setting. Two bottom rolls driven by suitable gear trains and electric motor, while top roll is an idler arranged for vertical adjustment through suitable screw down mechanism, which is generally driven by independent electric motor.

On all but large ship rolls, top roll is provided with an extension for balancing weight of roll; while outer bearing, which is removable, can be dropped for the purpose of taking out completed shells. This roll can also be thrown out of parallel in a vertical plane with 2 lower rolls for handling conical sections.

Housings and gear bearings mounted on continuous cast iron bed plate, which in turn is set on suitable concrete foundation

ACCUMULATOR

60-in. ram, 20-ft. stroke, 2940 gals., 600 lbs. per sq. in.
Furnished either moving cylinder or moving ram type of any capacity or pressure

HORIZONTAL DRAWING PRESS

300-ton press having a stroke of 14 ft.

Arranged with double die-bed; 1 die-bed arranged in front of resistance platen and another arranged back of resistance platen, so that for short draws, only sufficient stroke is utilized to finish the material, thus economizing on pressure water

VERTICAL PRESS AND INTENSIFIER

1500-ton hydraulic forging press complete with intensifier.

Low pressure admitted to main cylinder through check valve and tee by operating main valve. This brings moving platen down to ram and fills high pressure intensifier cylinder. Maximum capacity obtained by operating 3-way valve on low pressure intensifier cylinder. Raising intensifier ram admits intensified pressure water through check valve into main cylinder of press

600-TON MOTOR DRIVEN WHEEL PRESS

Motor driven inclined type. Pump body of forged steel. Mounted on heavy cast iron base plate. Equipped with axle bushing and stop plate. Capacities from 100 to 600 tons

FLANGING PRESS

4-column 350-ton press adapted for general use in car and boiler shops for flanging steel shapes.

Platens made of open hearth steel casting with tee slots planed from solid, or of special close grained cast iron.

This company has built presses of this design with clearances from 4 by 6 ft. to 12 by 14 ft. between columns, and up to 2500 tons capacity. All presses equipped with operating valves and piping between valve and press

Plate Planers.

For edge planing, plates are clamped down to bed of machine either by hand, hydraulic or pneumatic jacks. Jacks are mounted on a structural steel girder, which is connected to bed plate through housings at each end of machine. Carriage is equipped with 2 tools, 1 for planing in each direction. Travel of carriage is obtained through means of a long bronze nut fastened to underside of it, and a screw which is supported in a half-round groove running the full length of the bed.

At the end of the machine are tight and loose driving pulleys which operate the screw through a single reduction of cut gears. Driving belts are shifted by hand or automatically from the carriage which operates adjustable dogs on belt shifter shaft.

For ordinary belt drive, pulleys are belted to an overhead countershaft. The most common type of drive is the belted motor type, in which motor is mounted directly above reversing pulleys on a structural stand. Direct connected reversing type motor can also be used, and in this case is usually under manual control of operator who travels with the carriage.

Made to take plates in lengths from 16 to 40 ft.

All planers are made with overhung housing, so that plates longer than the travel of the carriage can be handled by re-setting.

Gate Shears.

Made in various sizes, from those having blades 2 ft. in length up to 16 ft., with different depths of throats in housings from 12 to 60 ins.

Usually built of 2 main housings; lower beam for supporting shear blocks and plunger which carries upper shear knives and suitable distance braces between the 2 housings.

Operation of the ram is controlled by the jaw clutch and foot treadle.

The machine is usually triple geared to direct connected motor.

Automatic clamping beams in front of the shear knives hold plate in position while the cut is made.

Solenoid or magnetic clamp can also be furnished in the table which holds the work.

Plunger guides are lined with bronze taper gibs, which are used to take up the wear.

**JOGGING PRESS**

Capacities, 350 and 500 tons. For use in offsetting plates, beams and bulb angles.

Equipped with 1 vertical and 1 horizontal ram.

Gap to center of vertical ram 33 ins. Table 5 ft. 3 ins. by 4 ft. 8 ins. Vertical clearance between highest position of moving platen and table 3 ft. 9 ins.

**PORTABLE RIVETER**

100-ton special riveter with 15-in. gap and 7-in. stroke. Distance from center of removable forged steel riveter horn to face of top die, 3 ft. Stroke of ram, 7 ins. Designed of all cast steel and provided with adjustable hanger

**HEATER PRESS**

Capacity, 1000 tons. Ram, 30 ins. diameter; 3000 lbs. pressure. Full stroke of ram, 14 ft. Inside diameter of shell, 4 ft. 8 ins.

**STAMPING AND DRAWING PRESS**

4-column type having 2 moving platens. Designed with capacities from 100 to 1000 tons. Working pressure, 1500 lbs.

Two standard bronze body 3-way valves furnished with this press.

Small stripper cylinder, single or double-acting type, can be arranged in center of bottom of platen if desired

**200-TON SECTIONAL FLANGING PRESS**

Furnished complete with operating valves. Designed for 1500 lbs. pressure. Equipped with 2 vertical rams, 1 horizontal ram and 1 supplementary ram.

Housing of semi-steel. Cylinders of steel castings cast separately. Rams of special close grained cast iron mixture

**STATIONARY RIVETER**

Single power. All rams outside packed, stuffing boxes easily accessible. Pull-back operated by constant pressure, while main ram is controlled by standard piston type 3-way operating valve.

Built in capacities from 15 to 60 tons with gaps from 6 ins. to 12 ft. 6 ins.

Standard opening between stakes 24 ins.

Triple and six power. Solid, split stake type. Capacities up to 200 tons with gaps to 25 ft.

**PUSH BENCH WITH EXTENSION DIE BED**

Used for reducing pipes by pushing over a mandrel. Also used for drawing cups and cartridge cases.

Special device for stripping tubes from mandrel is arranged at end of front head.

Operated by standard 4-way operating valve.

Presses built with cylinders ranging from 5 ins. in diameter up to 26 ins. for 1500 lbs. working pressure, with strokes of from 18 ins. to 26 ft.

Hydraulic draw benches for tube mills also built

**VERTICAL PLATE BENDING PRESS**

Vertical opening, 12 ft. 4 ins. Stroke of bending beam, 6 ins. Operates with 1000 lbs. line pressure.

To get maximum capacity of 1000 tons in horizontal direction, a hydraulic intensifier is provided, which will intensify pressure water in press cylinder and give a stroke of approximately 1 in.

Can also be arranged with flexible top member so as to facilitate bending of shells to complete circle

THE WATSON-STILLMAN CO.

MAIN SALES OFFICE

50 Church Street

NEW YORK, N. Y. -

CHICAGO OFFICE, McCormick Building

WORKS: ALDENE, UNION CO., N. J.

Products.

HYDRAULIC JACKS; HYDRAULIC SHEARS; IRON and WIRE ROPE SHEARS; CONCRETE TESTING PRESSES; PAXTITE LEATHER PACKINGS.

Benders, Tunneling Shields and Equipment, Heating and Chilling Presses, Forcing Presses and Special Machinery.

Universal Hydraulic Jack.

This jack is designed to fill the requirements of a universal purpose jack for work where the old style jacks have not filled the requirements. In its construction, no detail has been omitted which is necessary to render it capable of handling the work for which it is designed.

On account of the form of this jack it is easy to handle; and being made entirely of steel renders it light in weight.

It has a horizontal head which enables the jack to work at any angle from vertical to horizontal, and when laid flat upon the side the ram will push out its entire lifting length. To the bottom of the head is attached a cylinder, which passes over the outside for the purpose of excluding sand and dirt, from between the ram and cylinder, which would cut them and disable the tool as in case of some other styles of jacks.

It is provided with a large round steel bottom which gives it a firm foundation.

An independent claw can be used when a low lift is required, and removed when the jack is used for other purposes, thus relieving the tool of the additional weight.

This jack will be found durable, plain in construction, and reliable in service; and on account of its special design, will facilitate the handling of heavy equipment, bridges, etc.

These jacks are built in capacities to 60 tons.

Independent Pump Hydraulic Jack.

This jack will work where any other can be used, and it will work where conditions make the use of other jacks impossible. Being connected to its pump by a flexible copper pipe 8 or 12 ft. long, the jack can be placed in recesses out of reach of the operator or in

locations where another jack would be dangerous. The pump can be set at a distance determined by the length of the pipe, with a safe and firm footing for the operator.

Since the jack is merely a plain cylinder and ram, it has a maximum raise with a minimum over all height; and the pump being a separate unit, the weight is distributed, making the outfit more portable.

The pump shown coupled to the jack is our standard single plunger type. It is simple and serviceable and all parts are accessible for repair and lubrication.

The reservoir is cast iron, the pump body of bronze and the plunger of hardened tool steel. The reservoir capacity is ample for the total displacement of the jack with which it is furnished.

A double plunger pump, which provides two pressures and two speeds, will be furnished if desired.

This pump is particularly valuable when rapidity of operation is important.

Any type of hand or power driven pump can be used in connection with these jacks.

The flexible connection between the pump and the jack is a $\frac{1}{4}$ -in. annealed copper pipe, 8 ft. long, tested to 10,000 lbs. per sq. in.

Outside Pump Hydraulic Jack.

The outside pump hydraulic jack, vertical type, is built with double plunger pump. The features of these jacks are the simplicity of design, accessibility of working parts, and large bases.

Compactness is not attained at the expense of simplicity, or lightness at the expense of strength; they are made to work.

They are used extensively by contractors, builders, dry dock and wrecking companies for underpinning and foundation work, in machineries, and for hauling out oil well pipes. These are built in capacities from 60 to 200 tons and lifts of 9, 12 and 18 in.

UNIVERSAL HYDRAULIC JACK

INDEPENDENT PUMP HYDRAULIC JACK

HYDRAULIC JACK WITH DOUBLE PLUNGER PUMP

Outside Pump Hydraulic Jack, Horizontal Type.

This is another type of the outside pump jack. It is used in horizontal pressing; for pushing crank pins; for moving bridges, boilers, machinery, etc. The ram is pulled back by a rack and pinion device.

Single or double plunger pumps can be supplied with this jack at no additional cost.

The capacities of standard sizes are 60 to 200 tons, with 12-in. movement.

OUTSIDE PUMP HYDRAULIC JACK, HORIZONTAL TYPE

Horizontal Claw Hydraulic Jack.

The horizontal claw hydraulic jack is a very handy tool.

It will push horizontally its entire lifting stroke, and is so constructed that grit or dirt can not get between cylinder and ram.

It is built in capacities from 4 to 40 tons and 12-in. to 18-in. movements.

HORIZONTAL CLAW HYDRAULIC JACK

Hydraulic Shear for Cutting Reinforcing Bars, etc.

This shear is especially adapted for cutting reinforcing bars, flats, rounds, ovals or very high carbon or tough material. The cutting blades are square and so designed as to give 8 available cutting edges before resharpening. It is portable and can be operated by one man. Tool shown is No. 3 size with a 4½-in. ram, exerting a pressure of 75 tons, and will cut material up to 1¼-in. square.

IRON AND WIRE ROPE SHEAR

HYDRAULIC SHEAR
For cutting steel reinforcing bars**Flat and Round Bar Iron and Wire Rope Shear.**

This lever shear is adaptable for cutting flat iron, round iron or wire rope, by merely changing the shear blades. Its construction is powerful throughout; and considering its weight and size, its capacity is high. They are made in a number of sizes and capacities.

Hydraulic Testing Press.

This press was designed originally for making compression tests on specimen blocks of concrete, etc. Its handy size makes it adaptable to many uses in laboratory or machinshop, such as press fitting small parts, and for an unlimited number of uses in bending, straightening, etc. It is only 27 in. high, but is capable of a maximum pressure of 30 tons. Other sizes on demand.

TESTING PRESS

Pax-tite Packings.

Pax-tite packings are guaranteed to outlast under similar conditions of service any competitive packings on the market. As large users of packings in our own line of hydraulic machinery, we have been able to prove this claim.

Pax-tite packings are made from the best leather obtainable, prepared by a special process which gives them every quality necessary to the successful operation of hydraulic machinery.

They are made in all standard sizes. Special designs and sizes can be built to specifications.

PAX-TITE LEATHER PACKINGS

ALBERENE STONE COMPANY

Manufacturers of Laboratory Equipment

223 East 23rd Street
NEW YORK, N. Y.

NEWARK, N. J., Prudential Building

PITTSBURGH, PA.

CHICAGO, ILL., 214-222 N. Clinton St.
PHILADELPHIA, PA., Pennsylvania Building

Products.

LABORATORY FIXTURES: Table Tops, Backs, Shelves, Supports, Sinks, Hood Bases, Superstructure for Hoods, Tanks and Gutters.

Flooring, Window Sills, Steam Baths, Sand Baths, Flues, Strainers and Linings for Smelting Furnaces.

TRADE-MARK

Sinks, gutters and tanks are made up with a tongued and grooved joint, similar to that shown in illustration, which renders these fixtures perfectly watertight. By the use of proper cement, long service can be secured.

SLIP TONGUE JOINT

Fume Hoods.

The non-absorbent quality of ALBERENE STONE together with its density renders it a splendid resistant to the action of fumes and makes possible a permanent superstructure with practically no maintenance charge.

Installation.

The ALBERENE STONE COMPANY assumes responsibility for the delivery of the material to the building and its erection in position on foundations to be provided by this company, or by the owners or other contractors. The company is, therefore, in a position to complete the interior equipment of a laboratory consisting of table tops, shelving, sinks, gutters and hoods, excluding plumbing connections and fittings, but including pipe frame supports or cabinet work where required.

FUME HOOD, TABLE TOP, BACK, REAGENT SHELF, AND SINK OF ALBERENE STONE

General.

ALBERENE STONE is the trade-name applied exclusively to the output of the quarries of the ALBERENE STONE COMPANY and serves both as an identification and a guarantee of quality and service. ALBERENE STONE is a natural quarried stone, gray in color, close grained, non-porous and of uniform density and hardness. The non-absorbent quality of ALBERENE STONE renders it acid and alkali resistant for table tops, sinks, gutters, and shelving for laboratory use. Acids and alkali have very slight action upon the stone. Samples furnished for test prior to installation.

Fixtures.

Table tops for industrial and research laboratories of ALBERENE STONE are proving most satisfactory. The construction is similar to that shown in the accompanying illustrations. The slip tongue joint makes possible the erection of table tops of any length required, with joints that are almost imperceptible.

TONGUED, GROOVED AND BOLTED JOINT

ALBERENE TABLE TOP, SHELF, SUPPORTS, FLOORING AND BASE

Co-operation and Responsibility.

Based on over 30 years' experience the ALBERENE STONE COMPANY will gladly furnish information concerning equipment and prepare details.

The ALBERENE STONE COMPANY guarantees its products against defective material and workmanship.

AMERICAN PROCESS COMPANY

Manufacturers of Drying, Pressing and Cooking Machinery

68 William Street
NEW YORK, N. Y.

Products.

DRYERS; PRESSES; DIGESTERS and COOKERS.

Scope of Use.

The dryers manufactured by AMERICAN PROCESS COMPANY will handle any kind of animal, vegetable and mineral materials, organic or inorganic matter, solid or liquid. They are operated either by direct heat or steam heated air. Continuous screw presses of different construction, used for separating any solid matter from its liquid, can be adapted for slaughter house tankage (residuum of fats) as well as for pressing fish and reclaimed rubber. Digesters and cookers to meet any and all conditions.

American Process Machinery.

Distinguishing features of AMERICAN PROCESS COMPANY's machinery are its automatic, continuous and uniform action.

ADVANTAGES—(1) Product is uniform; (2) labor is reduced to a minimum; (3) wear and tear of starting, stopping and reversing or otherwise changing the load are eliminated, thus prolonging life of machine far beyond that of similar types; (4) economy in fuel consumption, heat being applied direct; (5) saving in power and increase in capacity by continuous action.

SAND, ORE AND FERTILIZER DRYER

Direct heat rotary dryer, with gear ring. Materials and gases travel in same direction. Wet material and furnace gases enter shell together at higher end. Wet material falls to bottom of shell, is caught by an interior shelf, elevated to almost highest point of rotation, and then falls again through furnace gases. This operation, with highest temperature in contact with wettest material, continues until dried material is discharged through lower end of dryer. Erection of dryer with furnace can be performed by any competent mechanic.

DRYER CAPACITIES AND DIMENSIONS

No.	Capacity (lbs.) sand, ore, etc., per hour, when 5% moisture	Capacity (lbs.) of fertilizer, etc., when 50% moisture	Horse-power	Shipping weight, lbs.	Floor space
C II	10,000	1,000	5-8	10,000	27' 6"x6'x6' 6"
C III	20,000	2,000	8-12	12,000	32' 6"x6'x6' 7"
C IV	30,000	3,000	10-15	15,000	37' 6"x6'x6' 7"
C V	40,000	5,000	15-20	28,000	42' 6"x9'x8' 9"
C VI	50,000	8,000	20-25	30,000	50' 6"x9'x9'

Counter current dryers and brick lined roasters are also manufactured.

STEAM HEATED AIR DRYER

For drying borax, baking powder, nitrate of ammonia, etc.

Automatic Continuous Screw Press.

This press is self-contained and of continuous screw type, consisting of a horizontal tapered screw, built up on a hollow perforated shaft and arranged to allow admission of steam, if desired. Screw fits closely inside of a similarly tapered slatted curb, and rotates. Material, forced into conveyor portion of screw, then into curb, must move towards small end of press as screw turns. Size of discharge opening is regulated. Drainage is both internal and external. To regulate supply of material, a patent feeder is furnished.

CONTINUOUS SCREW PRESS

For pressing fish, slaughter house tankage (residuum of fats, etc.), reclaimed rubber, etc. Material fed in at one end and discharged at the other; liquids forced out between slats, into drainage holes of shaft, thence to a tank. Built in all sizes

Automatic Continuous Digester and Cooker.

Direct steam, self-contained type and operated continuously. A screw conveyor (inside a cylindrical shell) rotates, cuts up, digests and thoroughly agitates material and carries it forward. Steam admitted through perforations in hollow shaft of conveyor. Note forced rotary feed at admission end. Liquid and solid matter are discharged together, thence to a tank. Drainage tank can be built at small expense.

AUTOMATIC CONTINUOUS DIGESTER AND COOKER

Feed, digester proper and discharge all driven by sprockets and chain belting. Very little vibration, and digester can be erected in upper stories of building. Built in all sizes

Co-operative Services.

Complete drawings and directions are always furnished for the erection and operation of dryers and, generally, no outside assistance is required. Recommendations made and, if desired, an engineer will be placed in charge of the installation.

THE BIGGS BOILER WORKS COMPANY

Vulcanizers and Devulcanizers

East Market Street and Case Avenue
AKRON, OHIO

Products.

VULCANIZERS and DEVULCANIZERS having the "SIMPLEX" BOLTLESS QUICK CLOSING DOOR.

For Tanks, see page 617.

"Simplex" Boltless Quick Closing Vulcanizer Door.

Made throughout of high grade cast steel, accurately machined and is entirely self-contained. Overhead chain blocks, counterweights or trolleys are eliminated, and parts subject to wear are extremely heavy. It will operate satisfactorily when attached to vertical or horizontal vulcanizers, or similar equipment. Door is tight when used at specified operating pressure *without using fastening bolts* of any description.

Even the larger sizes can be opened or closed in 30 seconds without using any mechanical leverage other than short bar inserted in lugs provided. Practically no upkeep.

The design and construction of the "Simplex" has been accepted by the insurance companies, and will be accepted by them for insurance. Certificate of inspection furnished, if desired.

THE BIGGS BOILER WORKS COMPANY guarantees the "Simplex" to do all that is claimed for it. Workmanship and material guaranteed for one year.

"SIMPLEX" BOLTLESS HEAD ON A STANDARD HORIZONTAL VULCANIZER

Jacketed Vulcanizers.

Used very largely for special work where a dry heat is desired, and steam is not permitted to come in contact with material to be treated. These vulcanizers are rigidly constructed. On sizes larger than 42 in. in diameter, the entire collapsing strain of inner shell is thrown on to the staybolts. Steam jacket extends around entire shell and rear head, and in standard practice the front head is not jacketed. If necessary, this can be done.

If it is desired to carry a steam pressure on inner chamber as well as jacket, this can be accomplished. Working pressure, however, to which each chamber will be subjected, or number of inches of vacuum to be pulled, should be given.

Furnished in all sizes and for all pressures.

Vulcanizers for Insulated Wire.

This company furnishes single shell and jacketed vulcanizers for vulcanizing insulated wire.

Equipment illustrated is so arranged that reel revolves continually during vulcanization. Provided with shaft and gear to facilitate unwinding wire. Made in all diameters and for any working pressure.

Reels, car and gearing are usually special. Vulcanizers may be furnished with inside track only, customer furnishing reels and cars. Also furnished with any special type of inside car or similar device for special work.

VULCANIZER FOR INSULATED WIRE

Jacketed Rotary Devulcanizers.

With the jacketed rotary devulcanizer, material to be devulcanized is placed in inner chamber containing the liquid, steam is admitted to jacket, and the entire devulcanizer is revolved continuously, and agitation assisted by stationary angles.

Machines are ordinarily constructed for 125 to 150 lbs. steam working pressure on the jacket, which should produce a temperature of approximately 350° to 365° Fahr. Made in all sizes and for any pressure. Furnished with inspection certificate issued by the insurance companies, which will be accepted by them for insurance.

This company also furnishes stationary horizontal or vertical devulcanizers, having a central shaft containing paddles, which do the agitating.

ROTARY DEVULCANIZER

Experience.

The experience of this company, together with special equipment and facilities, places them in position to furnish specially designed vulcanizers and devulcanizers at attractive prices.

DRYERS.

Advantages of Buckeye Dryers.

Seven types—a dryer for every purpose.
Capacity, fuel economy, thoroughness in construction, economy in operation and maintenance.

Tires, rollers, gears and all wearing parts made of steel.

Types.

Type "A" is best adapted to drying materials which carry a very high percentage of moisture, such as sewage sludge, liquid manure, garbage, packing house tankage above 40% moisture, etc.

TYPE "A" DRYER

Type "B" machine is best adapted to drying materials carrying from 10% to 40% moisture, such as pressed tankage, pressed blood stock feeds, coal, waste from canning factories, gypsum, etc.

TYPE "B" DRYER

Type "C" is of the indirect heat type in which the products of combustion do not come into contact with the materials being dried. This machine is suitable for drying materials containing from 10% to 40% of moisture, where for any reason it is desired to prevent the products of combustion from coming into contact with the materials being dried, such as sensitive chemicals, high grade salt, etc.

TYPE "C" DRYER

Type "D" is a direct heat dryer, the interior of which is divided into various compartments, through

which the material is distributed while being dried. It is best adapted to drying pulp from beet sugar factories, potatoes for making potato flour, etc.

TYPE "D" DRYER

Type "E" is a plain shell dryer with a set of steam coils incased in a metal housing for heating the air before it enters the dryer, and is suitable for drying sensitive chemicals, sugar, etc., which can not be subjected to high temperature.

TYPE "E" DRYER

Type "F" is a dryer carrying the steam coils in the shell or drum of the dryer, and is suitable for drying certain materials which can not be subjected to high temperatures.

TYPE "F" DRYER

Type "G" is a plain shell dryer suitable for use in drying rough, coarse materials, such as rock ores, sand, gravel, etc., which can not be injured by overheating.

TYPE "G" DRYER

Some Users of Buckeye Dryers.

Morris & Co.; Wilson & Co.; Morton Salt Co.; Carey Salt Co.; Colonial Salt Co.; Pennsylvania Salt Mfg. Co.; Goodyear Tire & Rubber Co.; Milwaukee, Wis. and Houston, Tex. Sewage Plants.

During the year 1919, 51% of the business consisted of repeat orders from large concerns, who, after trying out many machines, adopted Buckeye dryers.

Sugar Machinery Department.

This department is under the supervision of a specialist who has had many years of experience in designing, constructing and operating sugar machinery and entire sugar manufacturing plants for producing brown, white and refined sugars in the cane and beet sugar fields. Facilities enable us to manufacture, assemble and test machinery of any weight and size capable of rail or water transportation.

Research Laboratories.

Complete working units of various chemical apparatus and each type of evaporator and vacuum dryer are contained in this company's research laboratories. An opportunity is afforded to make practical working tests without charge or obligation, provided materials are furnished and transportation paid. The various laboratories are as follows:

Organic and Inorganic Chemical Laboratories.

Demonstrating and Testing Laboratory for vacuum drying, evaporating and various chemical operations.

Metallurgical Laboratory.

Physical Testing Laboratory.

Qualified experts are in charge of these laboratories, and customers are invited to make liberal use of them.

Engineering and Consultation.

Supplementing the services of our regular engineering staff, the benefit of consultation with specialists occupying the foremost position in their respective fields is offered. Among the fields thus covered are the following:

Organic chemicals. Heavy chemicals, acids, and high explosives.

Caustic soda, potash, and other alkalis.

Vacuum drying. Evaporating.

Sugar plants and complete sugar refineries.

"Buflovak" Vacuum Drying Apparatus.

"Buflovak" vacuum dryers are especially noted for efficiency and economy in drying a wide range of materials, including liquids, semiliquids and solids. The production of a uniform quality of dry material at low cost is always assured when using "Buflovak" dryers, because of the quick drying time, low operating cost, and the absolute control of the temperature at which the drying is done. The low temperatures at which materials can be handled in these dryers permit with absolute safety the drying of many materials that would otherwise be injured, or dried only at prohibitive cost. The drying is done very rapidly, and materials can be dried in a few hours that would otherwise require days and weeks.

"Buflovak" dryers are built for all materials and to suit any capacity desired.

Vacuum Drum Dryer.

The ideal apparatus for drying liquids containing solids, such as tanning, dyewood, and other extracts, pharmaceuticals, milk, glue, acids, chemicals, colors, liquid food products, etc.

While the vacuum drum dryer has in theory been considered the ideal apparatus for drying liquids, satisfactory commercial results were not attained until the development of the "Buflovak" vacuum drum dryer, containing our patented devices and methods for the applying of the liquid to the drum.

The economical and satisfactory performance of these dryers in a wide range of industries is an assurance of their successful operation in any plant.

Built in sizes to meet any capacity.

"BUFLOVAK" VACUUM DRUM DRYER

Vacuum Rotary Dryers.

Used for drying materials that permit agitation or mixing while being dried.

The interior contains a revolving heating tube, with mixing arms and paddles attached. The outer jacketed shell and the inner revolving tube are made of lap-welded steel tubing, which allows the paddles to be set close to the shell, thereby obtaining a higher efficiency than in the ordinary steel plate construction.

Built in many sizes.

"BUFLOVAK" VACUUM ROTARY DRYER

Vacuum Shelf Dryers.

For drying materials that can be handled in pans or trays. In this, as in all "Buflovak" dryers, the most expensive and sensitive materials may be dried without injury or danger of overheating, because the temperature is always under absolute control.

Built in sizes to meet any capacity.

"BUFLOVAK" VACUUM SHELF DRYER

Impregnating Apparatus.

For drying various materials and impregnating them with insulating, waterproofing, fireproofing, coloring and other compounds. Used for insulating electric coils, cables, transformers, etc.; impregnating wood with stain or color for producing imitations of other woods; impregnating any material with paraffin, creosote, oils, colors, waterproofing compounds and other liquids.

"BUFLOVAK" VACUUM DRYING AND IMPREGNATING APPARATUS

"Buflovak" Dry Vacuum Pumps.

The success achieved in "Buflovak" vacuum apparatus is partly due to the efficiency of "Buflovak" dry vacuum pumps, which are noted for their high vacuum, durability and low power consumption.

Built in various sizes—single-stage or two-stage, steam, belt or motor driven.

"BUFLOVAK" DRY VACUUM PUMP

Horizontal Tube Evaporators.

Used for common solutions which are to be distilled or concentrated to a higher density without the separation of salts, and which have no tendency to foam or produce scale.

An important feature of the horizontal type is the possibility of increasing the capacity by simply adding another cylindrical shell and providing longer tubes. This avoids the necessity of installing entirely new equipment.

The shells are made in one piece up to 12 ft. long, thereby reducing to a minimum the number of joints and the chances of leakage.

Front View

Plan and Elevation

"BUFLOVAK" HORIZONTAL TUBE EVAPORATOR

Rapid Circulation Evaporator, Vertical Type.

This type is especially suitable for the concentration of thin liquids of foamy nature, and organic solutions which should not be exposed to the heat for any length of time. This type is especially noted for its high capacity, which is accounted for by the climbing film of liquor that covers the upper part of the tubes. The density of the liquor is under perfect control, which is not the case with other evaporators of the climbing film type. The evaporator occupies very little floor space, and the erection and operation are extremely simple.

"BUFLOVAK" VERTICAL TYPE RAPID CIRCULATION EVAPORATOR

Rapid Circulation Evaporator, Inclined Type.

For concentrating and distilling (without salt separation) common solutions which have a tendency to foam or produce scale. Especially adapted for delicate or foamy liquors. Furnished in a wide range of sizes in single effect, or multiple effects, of many units. Where a large heating surface is required, each unit can be constructed with two steam chests bolted to a single vapor body, as shown in the drawing of the duplex type, which also shows the general arrangement of the vapor body, steam chest and tubes.

"BUFLOVAK" INCLINED TYPE RAPID CIRCULATION EVAPORATOR

In the rapid circulating evaporator the amount of liquor in circulation is very small and the possibility of foaming is reduced to a minimum, as the liquor level is always kept rather low and the foam is broken up in the upper part of the tube where film evaporation takes place.

"BUFLOVAK" DUPLEX TYPE RAPID CIRCULATION EVAPORATOR

Vertical Tube Evaporator.

This type is used mainly for liquors with soluble salts which precipitate during concentration. The construction is very simple, making the apparatus easy to operate and maintain. The steam chest is of the floating type and forms a separate unit, which allows a better circulation of the steam and liquor than is possible with the old style of evaporator where the steam chest was an integral part of the body.

Built in 12 standard sizes, with heating surface running from 300 to 2440 sq. ft. The salt filters are furnished in 5 standard sizes, having a net capacity of from 300 to 5000 lbs. per charge.

Plan and Elevation

Exterior View

"BUFLOVAK" VERTICAL TUBE EVAPORATOR

High Concentrators.

Especially adapted to the high concentration of caustic soda, potash, ammonium nitrate and electrolytic caustic solutions above 36 Be. This evaporator produces a very rapid circulation of the liquor, and is designed for concentrating liquors to higher densities than are practicable in evaporators of standard construction.

The tubes are made of alkali resisting or acid resisting iron, copper or special bronze, depending on the nature of the liquor to be concentrated.

Furnished in single or multiple effects, with or without salt separation.

ELEVATION OF "BUFLOVAK" HIGH CONCENTRATOR

"Buflokast" Chemical Apparatus.

Only a few of the many types of "Buflokast" chemical apparatus are shown here. A partial list is given on the third page preceding. This line includes apparatus for producing heavy chemicals, acids, caustic soda and other alkalis, organic chemicals, high explosives, coal tar intermediates, etc. Apparatus furnished for all standard chemical operations, such as nitration, denitration, reduction, sulphonation, chlorination, distillation, crystallization, caustic fusion, etc.

Complete Chemical Plants.

Besides the individual pieces of chemical apparatus listed and illustrated, complete plants for the manufacture of many chemical products are also furnished. This service includes the designing, construction and initial operation (under guarantee where desired).

"Buflokast" Autoclaves.

These should not be confused with ordinary cheap autoclaves. They are designed with a view to providing a rigid construction with a large factor of safety, so as to insure a high degree of safety in operation.

"BUFLOKAST" AUTOCLAVE
With jacket and stirring device

"Buflokast" Nitrator, Standard Type.

Constructed with cooling jacket, and larger sizes provided with special closed-end cooling tubes. Jacket furnished tight or loose, as required in each case. Single or double agitating shafts.

Temperature of each cooling tube individually controlled, thereby regulating the temperature in all parts of the nitrator. Substantially constructed throughout.

"BUFLOKAST" NITRATOR, STANDARD TYPE

"Buflokast" Nitrator, Hough Type.

Designed in response to the demand for a nitrator combining in a self-contained, compact unit all the elements required to insure high efficiency, safe operation and large output, in manufacturing such products as trinitrotoluol (TNT), dinitrobenzol, mononitrobenzol, etc. It can be used with equal efficiency for nitrating, reducing, sulphonating, chlorinating, and other purposes in the chemical industry.

This apparatus has a capacity for output far in excess of any other type ever placed on the market, and reduces to a minimum the amount of operating labor required.

With modifications to suit the special requirements of each case, it can also be used to advantage for other purposes, especially for mixing, blending, and washing oils.

Built in small and large sizes.

"BUFLOKAST" NITRATOR, HOUGH TYPE

"Buflokast" Reducers and Sulphonators.

Furnished in a wide range of sizes, and constructed to meet the requirements of each case. Noted for their efficiency and durability. Reducers are furnished with or without jackets.

"BUFLOKAST" REDUCER

"BUFLOKAST" SULPHONATOR

"Buflokast" Caustic Pots and Fusion Kettles.

Constructed of a special composition of iron that is noted for its success in withstanding the combined action of the caustic and high temperature to which these pots are usually subjected.

"BUFLOKAST" CAUSTIC POT

"BUFLOKAST" FUSION KETTLE

"Buflokast" Nitric Retorts.

Furnished independently or in conjunction with our complete nitric plants; being used by most of the high explosive companies and other manufacturers of nitric acid. Furnished in vertical or horizontal types.

"BUFLOKAST" NITRIC ACID RETORTS

"Buflokast" Crystallizers.

Furnished in the atmospheric and vacuum types. Used for concentrating and crystallizing many products, including ammonium nitrate, TNT, and other chemicals. The atmospheric type is designed for materials that permit the use of high temperatures, and the vacuum type for more delicate materials where low temperatures are necessary.

VACUUM CRYSTALLIZER
When furnished in the atmospheric type, the dome is omitted

Special Chemical Castings.

"Buflokast" service also includes the manufacture of special castings for chemical, heat resisting and other requirements. The materials for these castings are carefully analyzed and metal compositions produced with laboratory exactness. The result is a finished casting of known quality, with physical and chemical properties suited to the conditions it is to meet.

SPECIAL JACKETED KETTLE

L. R. CHRISTIE COMPANY

Dryers, Calciners, Coolers

501 Peoples Bank Building
PITTSBURGH, PA.

NEW YORK OFFICE, 339 Hudson Terminal Building

Products.

ROTARY DRYERS, CALCINERS, ROASTERS, COOLERS.
Continuous Retorts.

Services.

The engineers of the L. R. CHRISTIE COMPANY have, through their extensive experience in designing and operating drying and similar machinery, developed several improved types based on established principles and data and are qualified to furnish apparatus best suited to any particular requirements.

Types of Dryers.

Practically every standard type of rotary dryer is manufactured by the L. R. CHRISTIE COMPANY.

Some of the distinctive types may be briefly described as follows:

SEMIDIRECT HEAT—A flue conveying hot gases surrounded by material to be dried, all enclosed by a steel cylinder and rotating as a unit. Gases after passing

SEMIDIRECT HEAT DRYER

through flue, where most of their heat is given up, mix with material in space between flue and cylinder. A novel method of introducing gases to inner flue and applying same externally and internally at the wet end makes this machine exceptionally reliable and efficient. Unobstructed inlet for material and outlet for waste gases; small amount of brickwork. Economical and continuous in operation.

INDIRECT HEAT—An annular drying compartment made up of two cylinders rotating as a unit. The inner cylinder acts as a heat flue for the waste gases, permitting further extraction of heat. Hot gases applied externally and internally, but do not have contact with the material being dried. Supply of air to drying compart-

INDIRECT OR WASTE HEAT DRYER

ment under control and amount reduced to a minimum where necessary. Heat is applied to best advantage, permitting low exhaust temperatures and resultant economies.

DIRECT HEAT—A rotating cylinder with furnace at feed or discharge end, depending on character of material being dried. Hot gases applied directly to material. High temperature of material may be obtained in this type. Simple in construction, but not as economical of fuel as the semidirect type.

STEAM HEATED—Internal coil, jacketed or independent air heater as best suited to requirements. Used where low temperatures are necessary to prevent injury to material. Sometimes combined with cooler to great advantage.

DRYER USING INDIRECT STEAM HEAT

Calciners and Roasters.

A rotary cylinder lined with refractory brick, capable of heating materials to high temperatures, so as to drive off combined moisture, burn out foreign matter, or cause chemical reactions.

Coolers.

Rotary cylinders for cascading material to be cooled through a current of air. Used for cooling materials after being dried, calcined or otherwise heat treated.

Frequently the heat given off is used to supplement the heat used in primary apparatus.

Further Information.

More complete description of the type best suited to any requirement will be furnished upon receipt of full information as to:—

Character of material to be dried.

Capacity in dry tons of 2000 lbs. per hour.

Initial percentage of moisture.

Final percentage of moisture.

Is moisture free or combined?

If combined, at what temperature is it driven off.

Temperature which material will stand without injury.

Fineness (mesh) of materials.
Are materials injured by direct contact with furnace gases?

Is waste heat available?

Temperature. Quantity.

Fuel to be used: coal, oil, gas or waste heat.

Any additional information.

DAHLSTROM METALLIC DOOR COMPANY

CABLE ADDRESS:
"DAHLSTROM JAMEST"

71 Blackstone Avenue
JAMESTOWN, N. Y.

NEW YORK OFFICE, 130 East 15th Street

CHICAGO OFFICE, 19 South La Salle Street

BRANCH OFFICES IN ALL PRINCIPAL CITIES

Products.

FUME HOODS, RADIATOR COVERS, CEILING LIGHTS, INTERIOR FINISH for Railway Coaches and kindred products.

Fume Hoods.

A very necessary and particular part of hospitals and laboratories. Installed in such institutions as the State Laboratory, Albany, N. Y. and the Rockefeller Institute, New York City.

Railway Coaches.

The interiors of the first steel sleepers, diners, private cars and day-coaches were developed and built at the Dahlstrom plant. Our equipment for doing this class of work is unsurpassed.

TRADE MARK.

Radiator Covers.

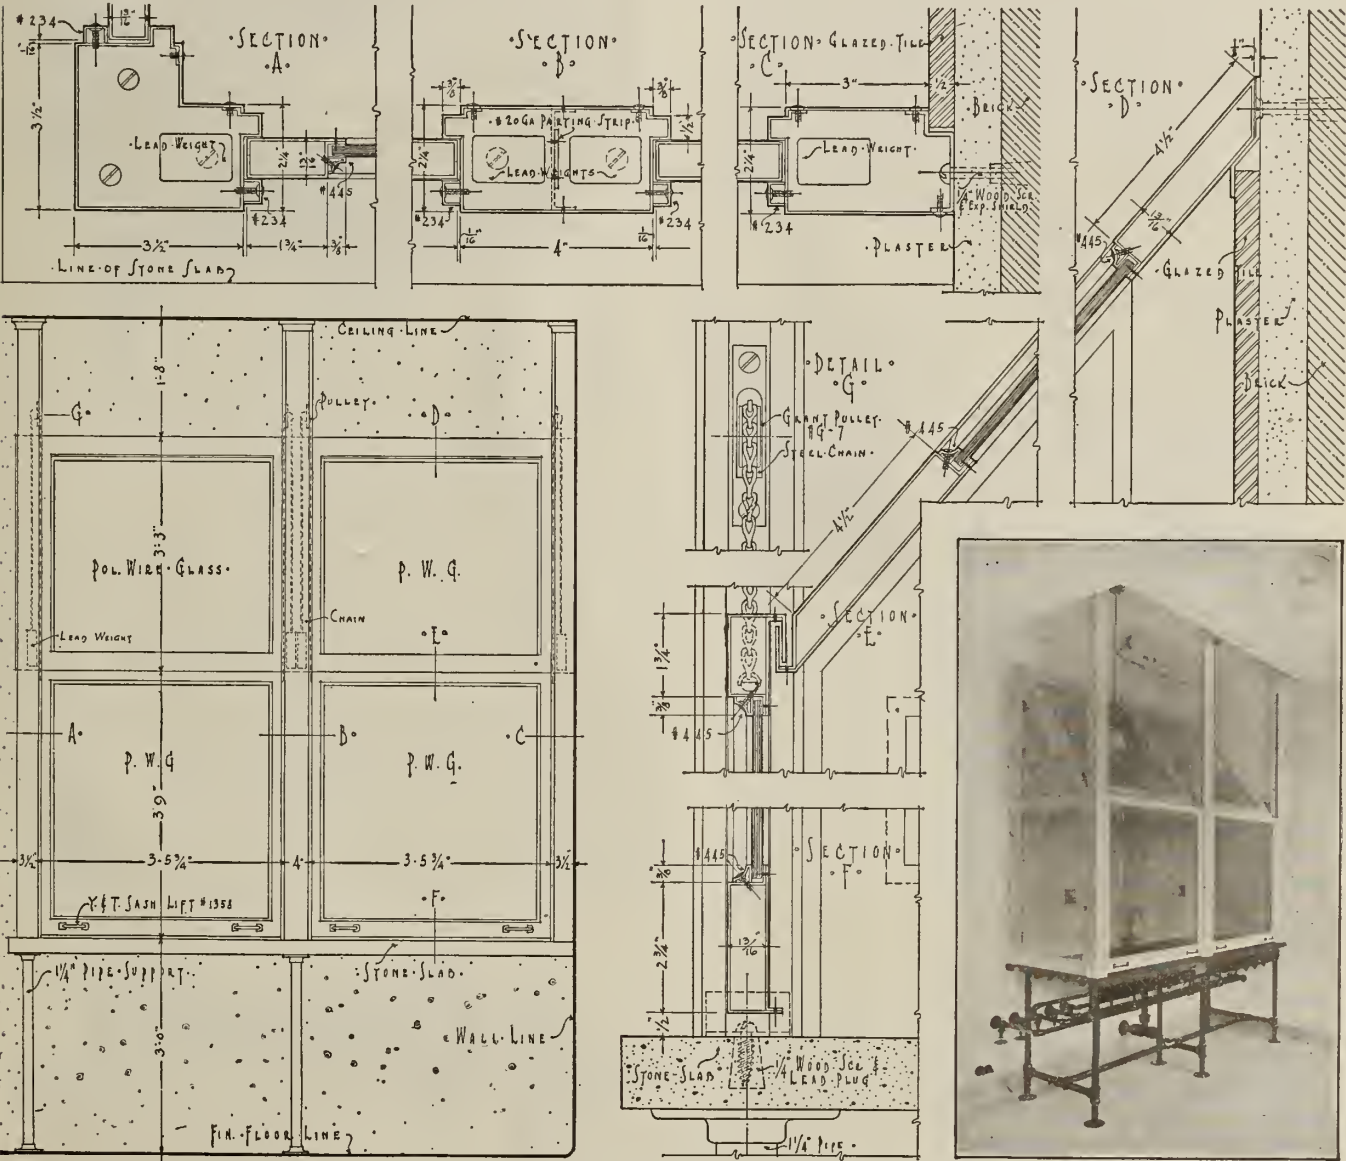

A simple but greatly desired feature of buildings, adding much to the sanitation and beauty of an office, apartment or hotel room.

Special Ornate Ceiling Lights.

The most striking of such installations is the Chester Water Side Station, Chester, Pa. These lights span practically the entire roof over 80 ft. above the floor.

Services.

The illustration below touches merely upon one article, but it may perhaps serve to illustrate the trend of the services that this Company can render the engineer.

SECTION DRAWINGS OF FUME HOOD

CHICAGO, ILL., C. B. ACHESON, People's Gas Building
LONDON, ENG., JAS. LIVINGSTON, LTD.

Products.

VACUUM CHAMBER DRYERS; VACUUM DRUM DRYERS; VACUUM ROTARY DRYERS; IMPREGNATING APPARATUS; NITRATING, REDUCTION, SULPHONATING and FUSION KETTLES; AUTOCLAVES; EVAPORATORS; VACUUM PUMPS; ROTARY VACUUM PUMPS.

Also, Solvent Recovery Apparatus, Acid Eggs, Acid Retorts, Beta Naphthol Stills, Caustic Pots, Columns, Crystallizing Pans, Digestors, Distilling Apparatus, Extractors, Logwood Extract Plants, Wood Distillating Plants, Sand Dryers, Fertilizer Apparatus, Steam Jacketed Pipes and Valves, Percolators, Vulcanizers, Washers, Defecators, Crystallizers, Filter Presses and other Apparatus for the Sugar Industry, Special Apparatus.

Vacuum Chamber Dryers.

This chamber dryer is designed for handling all materials that can be handled on trays or pans.

DEVINE VACUUM CHAMBER DRYER WITH SURFACE CONDENSER AND VACUUM PUMP

For colors, dyes, extracts, salts, rubber, smokeless powder and high explosives and other chemicals and food products. Materials which are difficult to dry in the atmosphere without decomposition can be handled rapidly and efficiently in this type of dryer without any danger of impairing their qualities. Vacuum drying chamber is designed to remove water rapidly and at a low temperature, assuring uniform drying and low operating cost.

Ask for Bulletin 101 on this subject.

Vacuum Drum Dryers.

This drum dryer is designed for handling all solutions containing solids, drying same to a powder.

For dyewood and tanning extracts, milk and food products, pastes, etc. This type of machine affords a rapid and uniform drying, because the drum takes up but a very thin film of wet material. Water is then evaporated from material, leaving dried substance on

DEVINE VACUUM DRUM DRYER

drum to be taken off by our improved method. Drying process is continuous and independent of climatic conditions, free from dust, and is uniform.

Fully described in Bulletin 102.

Vacuum Rotary Dryers.

For materials that can be mixed or tumbled in the drying.

For starch, granular substances and chemical products. Moist material is charged into dryer and by means of a high efficiency dry vacuum pump and condenser, furnished as part of the unit, a high vacuum is produced, the vapor being pulled over into the producer and condensed. Concentric with steam jacketed outside cylinder, is a revolving drum, heated by live exhaust steam, to which the stirring blades are attached. Material to be dried is between outside drum and inside cylinder, kept in constant motion by stirring blades.

Ask for Bulletin 103.

DEVINE ROTARY VACUUM DRYING APPARATUS

Impregnating Apparatus.

For armature, field, magnet and transformer coils, power and telephone cables, piano sharps, pencil slats and other wood products, leather fabrics, cotton or cord tire fabrics with rubber compound, etc. This is a combination vacuum drying and impregnating apparatus, the coils or material to be handled first being dried under vacuum, thereby removing both air and moisture from interior as rapidly as from surface. Compound is then drawn into impregnating tank and penetrates to innermost recesses of material; and to render this penetration more thorough, air at artificial pressure is admitted into impregnation tank above surface of compound.

Ask for Bulletin 104.

Nitrating, Reduction, Sulphonating and Fusion Kettles.

All sizes and capacities for every requirement. Built with or without stirring device, and supplied with or without reflux condensers. Also arranged for heating with fuel oil, gas, steam or water jacketed.

DEVINE CHEMICAL KETTLE

Nitrating kettles built with large cooling surface, powerful stirring device. Reduction kettles, combination rake stirring device, internal renewable cast iron slabs.

Ask for Bulletin 105A.

Autoclaves.

Sizes range from 1/4-gal. to 300-gal. capacities; for working pressures up to 1000 lbs. per sq. in., with or without stirring device. High pressure autoclaves are made of cast steel, and low pressure autoclaves of cast iron, copper or bronze. Provision made for heating. Every autoclave is fitted with cover with all necessary openings, pressure gage, safety valve, thermometer tube, etc.

Carbonators.

The rotary carbonator is constructed of sheet steel with all joints welded, and it is designed to work satisfactorily both under high pressure and high vacuum. Hollow trunnions permit steam, air, or gas being introduced or removed from the interior.

This apparatus is very versatile and can be adapted to five distinct operations: mixing, concentrating, drying, grinding and carbonating.

DEVINE ROTARY CARBONATORS

Evaporators.

Single and multiple effect units of all sizes and capacities of cast iron, sheet steel, copper, etc. These vacuum evaporators and pans are designed to insure maximum efficiency at a minimum cost of operation. In their design and construction the rule of thumb has been discarded, and for each requirement the size and type of apparatus is carefully selected, based upon the best results obtained in actual practice, combined with such improvements as experience demonstrates.

DEVINE QUADRUPLE EFFECT VACUUM EVAPORATOR

In the construction of Devine evaporators great stress is laid on securing the most rapid and intense circulation of the liquors, as only by such a circulation can all particles of the liquid come in contact with the heating surface, thus securing the quickest concentration without overheating the material. Special care is likewise given to metal of which the heating tubes are to be constructed, as well as to the lining, to resist acids and to prevent incrustation.

Ask for Bulletin 106.

Vacuum Pumps.

The vacuum pumps which are furnished with the vacuum apparatus, are constructed in two principal types, the dry vacuum type and the wet vacuum type. The dry vacuum type is built with either rotary valve or slide valve, and also in single- or two-phase. The rotary valve type is recommended where large capacity of air is required. The wet vacuum pump is furnished with jet condenser. This company also builds a rotary vacuum pump.

Ask for Bulletin 107.

DEVINE VACUUM PUMP

DURIRON CASTINGS COMPANY

Manufacturers of Acid Resistant Apparatus

DAYTON, OHIO

BRANCH OFFICES

NEW YORK, N. Y., 90 West Street

CHICAGO, ILL., 110 South Dearborn Street

SAN FRANCISCO, CAL., Monadnock Building

Products.

ACID RESISTANT COCKS and VALVES, PIPE and FITTINGS, RECIPROCATING and CENTRIFUGAL PUMPS, EXHAUST FANS, STEAM SIPHONS, LABORATORY UTENSILS, etc.

Apparatus for corrosive processes, including complete Nitric Acid Units, Jacketed Kettles, Pots, Stills, Condensers, Towers, Concentrators, Tanks, Jets, Manifolds, Stirrers, Acid Lifts, and special castings as ordered.

Field of Service.

Duriron withstands the action of nearly all corrosive liquors and gases. Since corrosion is met with in every industry, Duriron apparatus is not restricted to the chemical industries, but is universal in service. A consideration of its physical as well as its chemical properties will show its advantages—and new uses are being developed constantly.

Properties.

Duriron is a hard cast metal—an alloy with practically all the acid and alkali resisting properties of glass. It is strong and is highly resistant to erosion as well as corrosion.

Duriron is extremely hard and close grained, and shows a white fracture. At temperatures slightly below melting point (about 2300° Fahr.) it will not soften, lose shape or oxidize.

The physical properties of Duriron are:

Specific gravity.....	7.00
Weight per cu. in.....	0.253 lbs.
Melting point.....	2300° Fahr.
Coefficient of expansion...	.00001565 per degree Fahr.
Electrical conductivity, 1/40 that of standard annealed copper	
Thermal conductivity, 10 times stoneware or quartz	
Contraction allowance in casting, $\frac{1}{16}$ in. per ft.	

Except in a few instances Duriron successfully resists all acid and alkaline solutions.

DURIRON'S RESISTIVITY TO CORROSION

1 year in 25% sulphuric acid.....	.179 of 1% loss
1 year in 25% nitric acid.....	.155 of 1% loss
1 year in 25% acetic acid.....	.015 of 1% loss
1 year in copper sulphate.....	.010 of 1% loss

Exposures of various duration of Duriron to the following solutions showed *no loss*:

Ammonia	Boric acid
Ammonium hydroxide	Picric acid
Arsenate of lead	Calcium chloride
Arsenious acid	Sodium chloride
Sulphate of alumina	Calcium carbide

Apparatus.

Owing to the difficulties both in casting technique and in finishing, Duriron is ordinarily sold as completed units of either standard or special design.

COCKS AND VALVES—Straight-way plug cocks are made in 8 sizes ranging from $\frac{3}{8}$ to 4 in.; three-way plug cocks, in 5 sizes, ranging from 1 to 4 in.

GLOBE VALVES—In 1-, 2- and 3-in. sizes; also check valves and safety valves of the same sizes.

DURIRON PIPE AND FITTINGS—Standard pipe is made in 1- to 12-in. inside diameters, joints of which are flanged, bell and spigot or compression coupling types.

A comprehensive line of standard fittings are made to provide for all usages.

PUMPS—Both centrifugal and reciprocating, in various sizes and capacities.

EXHAUST FANS—In 4-, 8- and 12-in. suction and discharge.

STEAM SIPHONS—In 4 sizes, ranging from 1- to 2½-in. suction and delivery.

LABORATORY UTENSILS—Jacketed experimental kettle of 1-gal. capacity with agitator; crucibles, cascade basins, casseroles and evaporating dishes of various sizes; sinks, traps and drains—all designed with due regard for practical convenience and enduring service.

Acid lifts to take liquids from carboys, desirable for either laboratory or general use.

SPECIAL APPARATUS—From Duriron a large variety of apparatus, used in the chemical and general industrial fields is made, including complete units for nitric acid manufacture, Hough condensers, and a general class of apparatus listed in the second paragraph under products.

Co-operative Services.

Duriron Chemical and Mechanical Engineers will assist or take complete charge of the designing of apparatus for any specific purpose, and will without obligation make recommendations relative to any problems of corrosion or erosion.

Send for Duriron sample. Give it the "acid test" in *your* acid.

MARKING STAMPED ON DURIRON SAMPLES

GRAND RAPIDS VENEER WORKS

Grand Rapids Vapor Kilns

800-1000 Front Avenue, N. W.
GRAND RAPIDS, MICH.

WESTERN BUILDERS OF GRAND RAPIDS VAPOR KILNS
SEATTLE, WASH., WESTERN VAPOR KILN CO.

BRANCH OFFICES

SEATTLE, WASH., WESTERN VAPOR KILN Co., 580 First Avenue, So.

MANCHESTER, ENGLAND, OLIVER MACHINERY Co.
ST. JOHNS, N. B., A. R. WILLIAMS MACHINERY Co.
SYDNEY, AUSTRALIA, BOORMAN & BOORMAN

Products.

Designers and manufacturers of GRAND RAPIDS VAPOR KILNS, KILN TESTING INSTRUMENTS, GRAND RAPIDS LUMBER TESTERS, LINNODEIKS (wet and dry bulb thermometers), RECORDING THERMOMETERS, PANELS and VENEERS.

Also, "Tiemann" Humidity Regulated Kilns, Forest Products Laboratory Kilns, Ebonoid Waterproofing Paint, "Kilntite" Kiln Lining, "Plastico" (plastic cement), and "Hussey" Door Carrier.

Services.

Complete engineering and contract service, consultation, designing, installation, equipment, operation and remodeling.

In Pacific coast territory, the affiliated company, the Western Vapor Kiln Co., takes complete contracts for kiln buildings, equipment, yards, etc. In other territory co-operation with local contractors is given.

Grand Rapids Vapor Process.

A cooking process which dissolves and evaporates sap coagulations (which are not elements of strength but of decay), leaving intact the fibrous structure of the wood with its essential oils and gums, thus maintaining its strength, expanding instead of contracting the lumber and making it practically independent of changes of temperature or climate.

Lumber Dry Kilns.

Made in box, single charge and progressive types. Preliminary conference on kiln layouts solicited. Partial service through architects and engineers will be rendered, or complete service, making all building plans and specifications, supplying and installing all equipment, demonstrating and training operator, all under definite guarantee as to cost and output.

Kilns designed, remodeled and equipped to meet the exacting government requirements of *airplanes, gunstocks, shipbuilding, vehicles*, etc.

Testing Instruments, Kiln Records.

Grand Rapids lumber tester for determining moisture content of lumber. Linnodeiks for determining relative humidity in kiln atmosphere by means of maximum reading wet and dry bulb thermometers. Recording thermometers, decimal rules, metric scales, etc.

Consultation solicited on kiln operations by means of submitting the operation records. A full line of kiln record blanks, recording thermometer dials and graphic charts constantly in stock. Samples on request.

Veneers and Panels.

Manufacturers (on approved list of United States Government) of waterproof plywood for army and navy airplane construction; also of a full line of foreign and domestic veneers, together with a complete line of

thin lumber, panels and heavy built up stock for furniture, desk, phonograph and piano manufacturers.

Leaflets.

Uniform loose leaf style, 4 by 10 ins. with cover, cheerfully sent on request without charge.

ESTABLISHED 1893

RUGGLES-COLES ENGINEERING COMPANY

Designers and Builders of Dryers for all Materials

50 Church Street
NEW YORK, N. Y.

BRANCH OFFICE, CHICAGO, ILL., 332 South Michigan Avenue
WORKS: YORK, PA.

Products and Services.

RUGGLES-COLES DRYERS—Apparatus for driving off moisture from materials by the application of heat or by absorption of the moisture by heated air.

The Engineering Department of this company will gladly consult with any person in regard to any drying problem.

Scope of Use.

In Ruggles-Coles dryers the following materials have been successfully and economically dried:

Asbestos rock	Limestone
Bagasse	Litharge
Barium sulphate	Manganese ore
Bauxite	Marl
Bichromate of potash	Metal chips
Binder rock	Nitrate of ammonia
Carbonate of lime	Nitrate of potash
Carbonate of potash	Nitrate of soda
Carbonate of soda	Peanut hulls
Carborundum	Peat
Chalk	Phosphate, pebble
Charcoal	Phosphate rock
Chrome ore	Pineapple waste
Clays	Pitch
Clinker	Potash salts
Coal	Pumicestone
Coke	Pyrites
Concentrates	Quartz
Copper ore	Radium ore
Copra	Rock
Cork chips	Salt
Corn germs	Sand
Cotton seed	Sewage sludge
Feldspar	Shale
Fish scrap	Silica
Flue dust	Slurry
Fuller's earth	Soapstone
Glass sand	Sugar refuse
Grains	Talc rock
Graphite	Tankage
Gravel	Tobacco stems
Gypsum	Vanadium ore
Iron ore	Whiting
Kaolin	Wood chips
Leather scraps	Wood pulp
Lignite	Zinc ore

Class "A" Dryer.

This is a patented double shell, direct heat type of dryer, the gases of combustion passing directly from the furnace through the inner shell and back between the two shells in intimate contact with the material being dried.

This type of dryer is exceptionally economical in fuel consumption, using 30% to 40% less fuel for the

SECTIONAL VIEW OF RUGGLES-COLES CLASS "A" DRYER
Showing principle of operation

same capacity than any other type of dryer. It is made in 8 standard sizes.

Class "B" Dryer.

This is an indirect heat type of dryer, similar to the Class "A" machine, except that the gases, after leaving inner flue, pass through ducts attached to the inside of the outer shell, the gases not coming in contact with the material being dried. This type of machine is used for those materials which can not come in contact with furnace gases.

SECTIONAL VIEW
CLASS "B"
DRYER

Other Types of Dryers.

This company also build Class "C" type and Class "W" type, being steam dryers; and Classes "D," "E" and "EC" types, being paddle dryers. They also build roasters and coolers.

Particulars of these other different types will be sent on application.

SECTIONAL VIEW
CLASS "F"
DRYER

When Writing About Drying Problems.

To aid in the selection of proper type and size of machine, prospective purchasers are requested to send the following facts:

(1) Initial amount of moisture in material; (2) amount of moisture to remain in dried material; (3) capacity of dried material required per hour; (4) whether free or combined moisture is to be driven off; (5) to what temperature material can be heated without injuring same; (6) if furnace gases would be injurious to the material; and (7) size of material, and any other special physical or chemical characteristics.

Also, if possible, send (in a sealed container) sample of material to be dried, and it will be analyzed for moisture without charge.

STEACY-SCHMIDT MFG. CO.

Designers and Manufacturers of Sugar Machinery

Queen Street, Hay Street, Arch Street, Mill Road and Pennsylvania Railroad
YORK, PA.

CABLE ADDRESS: "BROOMELL"—Codes used: A. B. C. 5th Edition and Western Union

Products.

MACHINERY for CANE and BEET SUGAR PLANTS
and REFINERIES.
For Lime Kilns and Hydrating Plants, see page 612.

Experience.

The STEACY-SCHMIDT MFG. CO. has been building sugar machinery for over 25 years. Engineers who are specialists in this line have perfected the designs. The experience thus gained enables this company to furnish any machinery for sugar plants, beet sugar plants or sugar refineries.

Steacy-Schmidt products can be found in any of the up-to-date refineries in the United States and Cuba, or in the cane plants of the latter country and the beet plants of the former.

Service.

Co-operation with the engineer is the desire and aim of the STEACY-SCHMIDT MFG. CO. whose extended experience and technical knowledge are at all times available for consultation.

Much of the machinery has been sold in accordance with the requirements, specifications and blue prints of engineers, as well as direct to the owner.

Sugar Machinery.

Mechanical equipment to fulfil the many and varied wants of the sugar machinery trade is built at the Steacy-Schmidt shops: char dryers, char coolers, char

kilns, blow-ups, defecators, juice heaters, double, triple and quadruple effect evaporators, vacuum pans, lime tanks, retorts, coolers, jacketed, open and closed type crystallizers, etc.

Quotations.

This company solicits the opportunity to quote on the requirements of either engineer or owner for any or all of the special machinery needed in the manufacture and refining of sugar.

Products and Services.

We design, equip and start into operation complete FOUNDRY PLANTS for manufacturing any class of castings: Grey Iron, Brass, Car Wheel, Pipe, Steel (Converter) and Malleable Iron.

FOUNDRY EQUIPMENT: Cupolas; Cupola Charging Machines; Tumbling Barrels; Dust Arresters; Water Cinder Mills; all types Ladles; Core Ovens; Core Oven Cars; Core Oven Car Pullers; Converters; Brass and Malleable Iron Furnaces; Annealing Ovens; Cars and Trucks; Charging Cars; Turntables; Trolleys; Overhead Tramrail Systems; Air Hoists; Air and Hydraulic Elevators; Gate Hoists; Casting Breakers; Drop Test Machines; Cupola, Brass Furnace and Converter Linings.

RAILWAY EQUIPMENT—Screw Jack Locomotive Hoists; Screw Jack Coach Hoists; Transfer Tables; Turntable Tractors; Car Wheel Foundry Equipment.

Special Machinery: Gate Hoists, Spout Hoists for Ore Docks, Phosphate Dryers, etc.

For Cranes of various types, see page 882.

Whiting Cupola.

Strong and durable. Patented tuyere system gives most efficient distribution of blast. Produces hot, fluid iron. Over 3500 sold. Special design for continuous melting.

STANDARD CUPOLA

Tumblers.

CLASS A—Round, steel plate barrel arranged for exhaust. Low standards permit loading from either side. All parts extra heavy and durable; removable trunnions. Designed for heavy duty.

CLASS "A" TUMBLER

Belt or direct motor drive.

CLASS B—Square barrel, extra heavy steel plate reinforced by angles. For stove plate and frail work. Arranged for exhaust.

CLASS C—Round barrel with removable cast iron staves. Not suitable for exhaust.

SPECIAL—Wet or dry, for brass and light work.

Special arrangement of drawers at additional price.

Ladles.

CRANE LADLES — Shell plates, tank steel; bottom, best flange steel. Unless specified, open gearing supplied. Capacities up to 30 tons. Cast steel trunnions.

CRANE TRUCK LADLES—Geared, in capacities from 1 to 6 tons; plain, from 1000 to 3000 lbs.

STANDARD TRUCK LADLES —Plain and geared in capacities 1000 to 3000 lbs.; heavy type, geared, from 4000 to 8000 lbs. capacity.

SHANK LADLES—Capacities 100 to 3000 lbs.
HAND LADLES—Capacities 30 to 60 lbs.
Also bottom tap, teapot spout, car wheel and reservoir ladles.

CRANE LADLE

Whiting Converter.

Recommended for light castings from intricate patterns, requiring hot fluid metal, also for ordinary grades of steel castings of medium weight. Castings of 2 tons or more can be poured by accumulating several heats. Adapted for special mixtures. Heats may be taken daily or intermittently as desired.

Two sizes: 1 and 2 tons capacity.

CONVERTER 1

Turntables.

Rigid, self-contained construction. No tipping, no getting out of line, no journal friction. Entire load carried on chilled rollers, held rigidly apart by spacing frame. Flat top standard. Furnished also with track rail cast on top or with grooves for wheel flanges, to suit any gauge.

STANDARD TURNTABLE

Air Hoists.

For hoists 3 1/4 to 6 in. diameter, cylinders are seamless, drawn brass tubing, polished inside. Standard parts carried in stock. Hoists 7 to 24 in. are cast iron, carefully moulded and accurately bored and reamed. Heads in 2 pieces. Valve is disk type of improved design. Stem does not pass through air chamber, eliminating leakage. Automatic cut-off.

HORIZONTAL HOISTS—For locations where headroom is insufficient for vertical hoists or where more easily supported.

AIR HOIST

Cars and Trucks.

For severe service in foundry, shop or yard. Heavy steel frames; full line of core oven cars and trucks, with and without shelves; chilled wheels, roller bearings.

DATA. STANDARD TRUCKS

No.	Capacity, tons	Gauge, in.	Platform		Diam. of wheels, in.
			Wide	Long	
2	2	18 to 24	3'-0"	4'-0"	16
3	3	18 to 24	3'-0"	4'-0"	16
5	5	18 to 24	3'-0"	4'-0"	18
12	2	24 to 30	3'-6"	5'-0"	16
13	3	24 to 30	3'-6"	5'-0"	16
15	5	24 to 30	3'-6"	5'-0"	18
140	10	30 to 36	4'-6"	6'-0"	20
141	10	56 1/2	6'-0"	8'-0"	20

Special sizes made to order.

STANDARD SHOP TRUCK 1

Elevators.

For 1-story lifts only. Designed specially for foundry service in lifting charges to charging floor. Compressed air and hydro-pneumatic.

Overhead Tramrail Systems.

Consist of standard I-beams suspended from roof beams or trusses by hangers. Curves, switches or turntables introduced as required. Extensions readily made. Save time, floor space and labor in handling light loads.

Furnaces.

BRASS—For use with natural or forced draft. Base fitted with removable ash pit door, which is closed tight for forced draft. Light steel plate cover supplied if desired. Standard furnaces designed for 3-in. lining.

Complete outfits for brass foundries a specialty.
MALLEABLE FURNACES; ANNEALING OVENS—Complete outfits for making malleable castings. Practical outfits.

Railway Equipment.

LOCOMOTIVE HOIST—For unwheeling and wheeling any size locomotive. Special six-jack design for handling mallet compounds. Can be installed in any shop or yard at fraction of cost of high capacity traveling crane. Absolutely safe; wheels remain at floor level in all operations. Big time and labor saver.

COACH HOIST—For removing trucks from passenger coaches and interurban street cars with speed and safety. Car or coach kept level while raising or lowering.

TRANSFER TABLES—For locomotives or coaches. Designed for shallow pit. Practically any capacity, length or speed.

TURNTABLE TRACTOR—New design of simple, rugged construction for turntables of any capacity and pit rail radius.

FOUR-JACK LOCOMOTIVE HOIST

International Service.

This company will furnish, without cost, specifications, layouts of conduit, wiring diagrams and estimates covering installations of electric clock systems, upon receipt of necessary information, plans, etc.

Special designs or styles to suit architects' specifications can be secured in any model of International time systems and time recording devices.

The company will contract for installing its products where necessary; but the apparatus is so simple and substantial, that the average electrical contractor can install to the company's specifications and render perfect satisfaction.

Experience, Reputation and Quality of Products.

THE INTERNATIONAL TIME RECORDING COMPANY OF NEW YORK is the largest manufacturer in the world of time systems, time and cost recording equipment and allied products.

Its thoroughly equipped plant is the largest devoted to the manufacture of the above products and is the impressive result of 32 years' consistent advancement, reflecting in every department the efficient operating policies represented by International products.

The large force of skilled and experienced engineers and mechanics build into International products a degree of mechanical reliability and an appreciation of high manufacturing ideals, which is the finest and surest guarantee of satisfaction to the user.

International products are designed with utmost care by specialists; they embody the best materials and are scrupulously and repeatedly inspected and tested. They measure up in the minutest detail to the standards of accuracy, simplicity and durability upon which the dominance of International products has been built.

They are backed up by a field service of competent men to look after them.

Synchronized Time Systems.

For 25 years there has been nothing basically new in electric time system construction, nor have any great improvements been made in connection therewith.

In the past, minute impulse systems were erroneously termed "synchronized time systems."

A distinctive disadvantage of the impulse system was that, if the electric current was shut off, all secondary units in the system stopped (as they were not complete units in themselves, depending upon electrical impulses from the master clock), and when the current was again applied, secondary clocks and other devices were not in synchronism.

Synchronism was thus not fully maintained in the past by impulse systems, and THE INTERNATIONAL TIME RECORDING COMPANY OF NEW YORK, recognizing the disadvantages of such systems, developed and placed upon the market a new method which gives synchronism its full meaning and value for the first time.

The elements that have proved troublesome in impulse electric time systems have thus been eliminated.

DISTINCTIVE FEATURES OF THE NEW INTERNATIONAL SYNCHRONIZED TIME SYSTEM—In the new International system, should the electric current be cut off for any reason, especially over week-ends and holidays, all units in the system (being independent and self-winding) will continue operation. When the current is again applied, the secondary clocks and all other devices become synchronous with the master clock, thus accurate time is assured throughout the entire system and all battery troubles are eliminated.

This system will operate with equal accuracy and satisfaction on 110 and 220 volts A.C., 25 to 60 cycles or 110 to 220 volts D.C. The electric current consumed is so remarkably small that the expense is negligible.

The new International time equipment is operated by a 2-wire system from master clock to all units, and all units are electrically wound each day by the current wires from the nearest electric incandescent light or wall plug. Each separate unit is wound daily by its own electric motor, thus all key or manual winding is eliminated.

All units in the system will run 7 days without electric current.

Interruption of current can not harm or upset accurate operation of the system.

Any unit may be removed from the system and run independently with satisfactory results, as each unit is equipped with a reliable *marine clock movement* which will run in any position. There are no pendulums except in the master clock.

Each unit is self-corrective when added to the system and becomes synchronous with the master clock at the next synchronizing period, which is every hour.

No auxiliary apparatus, such as batteries, rectifier, pilot clocks, stepping keys, etc., is required.

The International system is a decided improvement over the impulse system employing minute jumpers as secondaries. International secondaries are complete clocks, not dependent upon a master clock for operation; but each secondary is synchronized every hour with the master clock, so that there is absolute unison with the International system. The lasting qualities of all contacts is thus 60 times greater than on the impulse system, because in the International synchronized system there is one contact an hour instead of one each minute, or 24 a day instead of 1440.

International synchronized time systems provide efficient time service at the lowest possible cost of upkeep and they do not require periodical inspection and attention as is essential in a battery system.

COMPONENT PARTS OF THE SYSTEM—The units comprising a typical International synchronized time system are a master clock, secondary clocks, program devices, time recorders, cost recorders, time stamps, relays, bells, gongs and whistles.

Master Clock—International master clocks are self-winding and control any number

of secondary clocks, program devices, time recorders, cost recorders and time stamps, bringing the entire system into synchronism.

Escapement is Graham dead beat, all parts are highly polished, pinions are of cut steel carefully hardened and burnished, pendulums have wooden rods with metal bob or mercurial compensation as desired, and circuit closers are platinum tipped.

Dials, hands and cases are standard in numerous styles, but can be varied to suit special requirements.

Secondary Clocks—These clocks are controlled by means of the master clock every hour and all clocks throughout the building are in exact synchronism with the master clock.

These units are complete clocks within themselves and will continue to keep time should the master clock be stopped for cleaning or any other purpose. They do not require regulation, winding, setting, etc.; are not affected by temperature changes or vibrations; are dust-proof, and their construction eliminates expensive cost of upkeep.

Secondary movement is of the highest refined special marine type.

These clocks can be located in places best suited for observation with reference to accessibility.

Any number of secondary clocks can be operated

Octagonal Case

Round Case

Square Case

INTERNATIONAL SECONDARY CLOCKS

INTERNATIONAL MASTER CLOCK

DIAGRAM SHOWING HOW SECONDARY CLOCKS ARE MOUNTED IN WALL

from one master clock regardless of the distance between master clock and outlying stations.

Dials, hands and cases are standard in a number of styles, but can be varied to suit requirements.

Relays—International relays are used to open and close local circuits and insure uniform current throughout the system.

Relay cabinets are furnished as illustrated.

INTERNATIONAL RELAY CABINET

METHOD OF WIRING—Method of wiring is in accordance with Class C, National Code, which is generally known and understood by the average electrical contractor.

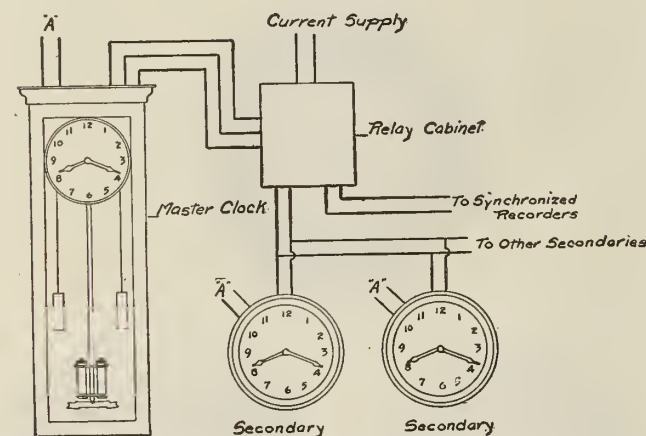

DIAGRAM SHOWING VARIOUS DEVICES OF THE NEW INTERNATIONAL SYNCHRONIZED TIME SYSTEM

Taps "A" connect to nearest electric light wires (for winding motor)

objection, thus silent and efficient time service is assured.

POWER REQUIRED—The International impulse system is provided with a storage battery of the proper size for the successful operation of the system. The International impulse system can be equipped with an automatic charging device, which minimizes the misuse of the battery system by inexperienced or careless operators.

Program Devices.

International program devices are used to automatically control a series of signals such as bells, gongs or whistles, or the operation of other devices according to a predetermined schedule.

They are actuated by the master clock and will ring a regular program in any 12-hour period at minute or longer intervals, and will automatically change to another program during a selected 12-hour period. They will also eliminate the programs for any given hour or day of the week.

Changes in programs or schedules can be quickly and easily effected without interfering with the mechanism of the program devices and without the use of special tools.

Duration of signals can be changed over a very wide range to meet all requirements.

Made in 2-, 4-, 6- and 8-circuit sizes, each circuit controlling a group of bells, gongs or whistles that are operated or sounded in unison.

INTERNATIONAL PROGRAM DEVICE

Impulse Time Systems.

In these systems, the controlling and operating energy is drawn from storage batteries or from commercial current.

The system is operated by a master clock, which is self-winding and controls any number of secondary clocks, program devices, time recorders, cost recorders, time stamps, bells, gongs and whistles.

The master clock actuates the secondary clocks and other devices by minute and half-minute electrical impulses.

POLARIZED SECONDARY CLOCKS—These clocks are not complete clocks within themselves, but their operation depends on minute or half-minute electrical impulses transmitted by the master clock.

They have a decided advantage over ordinary secondary clocks in that their peculiar construction renders their operation noiseless. In ordinary secondary clocks, the minute hand, upon receiving an impulse from the master clocks, gives a decided "click." The polarized secondary clock is so designed that it overcomes this

Time Recorders.

International time recorders give elastic systems of time recording and are popular because of their flexibility and accuracy.

They are manufactured in many different styles and sizes, in either spring driven or electric models.

All have the same basic mechanism, but additional features make them applicable to any possible requirement.

Such features as automatic in-and-out, automatic day-to-day and automatic 2-color ribbon shift are embodied in International time recorders.

Standard cases or cabinets are made from first quality kiln dried quartered oak. Special woods and finishes furnished when specified.

These recorders may be provided for use with the International synchronized time system or with the impulse system.

CARD TIME RECORDERS—These recorders are made in many styles, and are adaptable to any business and will meet all requirements.

They provide individual time card records for daily, weekly, bi-weekly or semi-monthly, and monthly pay periods.

Electric Drive

Spring Drive

INTERNATIONAL CARD TIME RECORDERS

AUTOGRAPH TIME RECORDERS—These recorders are specially adapted for places where arrival and departure of employees are irregular.

When registering time of arrival or departure, each employee is required to affix his signature in the place provided; thus it positively identifies the person who makes the record.

DIAL TIME RECORDERS—Registers time on daily or weekly sheet form and renders a printed pay roll complete. Made in electric or spring driven models, in 50-, 100- and 150-capacity sizes, and in automatic and non-automatic types.

INTERNATIONAL AUTO-GRAPH TIME RECORDER WITH CASE OPEN

INTERNATIONAL DIAL TIME RECORDER

Cost Recorders.

Specially adapted for recording the time spent on jobs; the time machines are in operation; the time spent on assembly, and numerous factors of a similar nature essential to reliable cost accounting.

The International cost recorder is the highest type of cost recording device made and is equipped with an automatic feature which eliminates from cost records all non-working hours, thus they reduce to the minimum the labor necessary in computing time records into a dollar-and-cents record of the job.

They furnish a printed record in one or two colors of time on a card of any size, form, width or thickness. They are equipped to print records in periods, hours and minutes, or in tenths and hundredths of hours, recording the stopping time above the starting time; thus a simple method of subtraction is provided.

These recorders are so flexible that they are adapted to any cost accounting system.

Made in electric and spring driven models.

Electric Drive with Spacing Device

Spring Drive

INTERNATIONAL COST RECORDERS

Time Stamps.

International time stamps are in extensive use for registering time and date of receipt of letters, telegrams, cards, correspondence, messages, and all other papers passing through offices, hotels, garages, shops, freight offices and many other places where they have been found indispensable for this purpose.

The printed impression of the International time stamp shows the hour, fractions of the hour, also the month, the day and the year. Time may be shown in hours, minutes, and tenths or hundredths of the hour.

Electric Drive

Model A Spring Drive

INTERNATIONAL TIME STAMPS

International electrically operated time stamps eliminate the objections of derangement of mechanism and incorrect time, as they have no delicate parts to be injured by severe service.

Made in electric or spring driven models, in various types to meet all demands, and can be used in conjunction with the International synchronized time system or with the impulse or battery system.

International Time Recording Lock.

FUNCTIONS—This lock is installed in connection with the International autograph time recorders and offers one of the greatest protections that can be secured.

It can be installed on any door for the purpose of recording the time when place of business is opened and closed; who opened it and who closed it; from which side of the door the key was used; whether anybody was in the establishment outside of business hours, and if so, how long; the time each employee arrives in the morning, goes to lunch, returns from lunch and the time each leaves at the close of business; amount of time each employee spends in the establishment each day.

This lock will not interfere with the ordinary operation of the door, nor will it detract from its beauty or appearance.

ILLUSTRATIONS SHOWING INTERNATIONAL TIME RECORDING LOCK INSTALLED ON DOOR

Its action is positive and as many as 8 locks and 8 different keys are available in each unit.

Made to fit wood or metal doors of any thickness, either right hand or left hand.

The record of 8 locks and 64 watchmen's boxes can be recorded on each time recorder.

Standard finish is dark golden oak. Special finishes made to order.

OPERATION—The simple turning of the key in this lock makes a record in the recorder. Every key prints its identity and positively identifies the user with the record made.

KEYS—Duplicate keys will be furnished to users only on their order, providing additional security.

Prominent Installations.

Below is given a partial list of prominent installations of International time systems and time recording equipment:

Adams Express Co., New York, N. Y.
 American Brass Co., Waterbury, Conn.
 American Car & Foundry Co., Detroit, Mich., and Depew, N. Y.
 American Radiator Co., Chicago, Ill.
 American Sugar Refining Co., New York, N. Y.
 American Telephone & Telegraph Co., New York, N. Y.
 Ansco Company, Binghamton, N. Y.
 Armour & Co., Chicago, Ill.
 Atchison, Topeka & Santa Fe R. R., Chicago, Ill.
 Babcock-Wilcox Co., Barberton, Ohio
 Bethlehem Steel Co., Bethlehem, Pa.
 Burroughs Adding Machine Co., Detroit, Mich.

The "STANDARD" ELECTRIC TIME SYSTEMS, which include Electric Self-winding Master Clocks or Regulators, Electric Secondary Clocks, Program Clocks, with Bells, Horns, Whistles, etc.

Also, Tower Clocks, Street Clocks, Time Stamps, Employees' Time Registers, or Synchronizers for keeping other makes of clocks in perfect unison with the "Standard" time systems.

"Standard" Factory Time System.

"Standard" electric clocks furnish a reliable, uniform time and signal service throughout any plant and can be arranged to operate any number of secondary clocks, employees' time registers and time stamps, whistles, bells, etc., depending on the size and arrangement of plant. They require no winding, oiling nor individual setting; everything is automatic and electrically operated and the system secures the promotion of more careful use of paid-for time and greater efficiency.

"Standard" equipment has been perfected as the result of years of practical experience. It is an effective, simple and reliable system, free from experimental features or devices likely to give trouble.

"Standard" Master Clock.

The master clock, or regulator, is the source of time for the whole plant, or system. "Standard" master clocks are self-wound every minute and are fitted with dead beat escapement and platinum contacts throughout. The master clock should preferably be of seconds beat type with mercurial compensating pendulum for greatest accuracy.

It is so arranged that it will electrically operate and control any number of secondary clocks, bell signals, synchronizers or other time keeping apparatus.

Secondary Clocks.

"Standard" centralized control permits secondary clocks to be located at the most advantageous point of observation, regardless of accessibility. They can be used for service that wind-up clocks will not adequately meet; are not affected by temperature or vibration, and never require oiling.

Automatic Control.

"Standard" electric time systems are now furnished with full automatic control of battery charging, reducing care and attention to a minimum.

Finishes.

"Standard" cases for master clocks and secondaries are of oak, in three shades: light, medium and dark. Other finishes are supplied when desired to match the interior trim of the building.

Secondary clocks in metal cases, or with marble faces and with special hands, furnished in accordance with the engineer's designs.

References.

This company will be glad to supply a list of manu-

facturing concerns where "Standard" electric time systems have been installed.

CHICAGO WATCHMAN'S CLOCK WORKS

1526 South Wabash Avenue
CHICAGO, ILL.

EASTERN BRANCH: 9 Church Street, NEW YORK, N. Y.

Products.

The CHICAGO PORTABLE WATCHMAN'S CLOCK.

Chicago Watchman's Clock.

The Chicago watchman's clock is a clock of the portable type and of the highest possible quality, possessing radical advantages.

The container case is a die-cast product, aluminum, combining lightness with strength and rigidity. As shown in the illustration a partition separates that portion of the case containing the movement from the section which contains the registering mechanism and the dial rotating device.

The movement used in this clock is the highest quality production of the famous Waltham Watch Co., and is manufactured by them exclusively for the CHICAGO WATCHMAN'S CLOCK WORKS.

This clock is sold with any number of stations from six up to the limit permitted by the Insurance Underwriters.

Individual Advantages.

(1) 8-day, 15-jewel, special Waltham movement, stem wind and set.

(2) Special die-cast, aluminum container case.

(3) Frictionless key action.

THE ARMOR CLAD MFG. CO.

Steel Bins, Shelving and Lockers

CANTON, OHIO.

Products.

ARMOR CLAD STEEL BINS and SHELVING; ARMOR CLAD STEEL LOCKERS.

Armor Clad Steel Bins and Shelving.

GENERAL—The main uprights are well formed and stiffened from one piece of sheet steel. Shelves are flanged on all four sides, for strength and stiffness; and are adjustable, up and down, on 2-in. centers, by simply removing bolts. Label holders are put on all fronts of shelves and bins. The entire structure is held securely together by 1/4-in. through bolts and nuts, which can be drawn up tightly with a wrench, thus affording strength and rigidity not always found in the slip-joint method of fastening.

CLOSED TYPE SHELVING—Made in double and single face. In double face, one back is used between front and rear. Compartment dividers, on 3-in. centers or bin fronts, 3 in. high, can be installed at any time without taking down the shelving.

SKELETON TYPE SHELVING—This type, sometimes called "racks," can be conveniently and economically

used for storing articles of such shape and size that they will not roll off the shelves. Made in both single and double face. The general construction is the same as the closed type of shelving. No bin fronts or dividers for pigeonholes are ordinarily used in this type of shelving, but each shelf has a label holder, holding a card 7/8 by 6 in.

OPEN TYPE SHELVING AND BINS—This is the same as the closed type, except that the back is left off. Made both in single and double face. Bin fronts and vertical dividers are furnished, if desired. This type of shelving is, however, usually used with plain shelves.

CLOSED TYPE LEDGE BINS AND SHELVING—The large bins are at bottom, to facilitate handling, and the shallow shelving is at the top. Made in either single or double face. Bin fronts are furnished, or may be ordered later. Removable compartment dividers, in multiples of 3 in., furnished, when desired.

Armor Clad Steel Lockers.

Sheet steel "uprights" are strong and stiff. Top and bottom brace, No. 16-gage, across front of lockers, is flanged on two sides. Doors are of one-piece high finish steel, re-folded, ribbed and welded. Door jambs are 1-in. angles. The 3-point locking device is exceptionally simple and strong. Lock catches are welded on. Locks, flat-key type.

STEEL LOCKERS and WARDROBES; STEEL SHELVING, RACKS and BINS for factories, warehouses, foundries and stores.

Stationery and Storage Lockers.

Specifications for Durand Steel Lockers.

STANDARD SIZES—

Width, 12", 15", 18", 24" and 36".

Depth, 12", 15", 18" and 24".

Height, double tier, 36" or 42"; single tier, 60" or 72".

All except the 42" lockers stand on 6" legs; this must be added to get the over all height. The 42" lockers stand on 3" legs.

MATERIAL AND CONSTRUCTION—Locker doors to be made of No. 16 U.S.S. gage steel, and ventilated by means of louver vents or round hole perforations. Doors to be flanged on all four edges for reinforcement, and all doors 18" or wider to have additional reinforcement consisting of a $\frac{3}{4}$ " x $\frac{3}{4}$ " x $\frac{1}{8}$ " angle, electrically welded to inside of door in the shape of a K-brace.

Doors to be hung in a strong and rigid frame composed of 1" x 1" x $\frac{1}{8}$ " angles, welded together at the corners. Angles are to be machine polished before enameling.

Doors to be hung by means of strong and secure hinges (two to a 36" door, three to a 42" door, three to a 60" door and four to a 72"

door). Hinges to be firmly riveted both to door and to door frame to prevent any hinge from working loose.

Body of locker to be made of not lighter than No. 22 U.S.S. gage sheet steel. Backs to be flanged and firmly bolted to partitions and ends by means of special bolts, spaced not over 8" apart on centers. All bolts exposed on ends to be flat head end slotless.

Bottoms to be made flush with front cross piece, so that dust and dirt settling on bottom can be easily brushed out.

Tops to be flat. (They can be made slanting, thus making locker 6" higher at back than at front, and the average extra cost for slanting top is 8% of the total cost of locker.)

Lockers to be built on the unit principle. Each door having its own complete frame surrounding that door. All similar parts cut to gage and interchangeable. All shearing, punching and perforating shall be done so as to leave no burrs or fins anywhere exposed.

LOCKING—Doors to be locked by means of Durand multiple locking device, locking door at two points on 36" or 42" lockers and at three points on 60" or 72" lockers. This device to be operated by lift handle; handle to be malleable. The following types of locks can be furnished to control this multiple locking device:

Flat key locks.

Combination locks.

Padlocks.

Or if no padlocks are desired, just padlock attachment without locks.

EQUIPMENT—All 60" and 72" lockers to be fitted with shelf spaced 10" from the top. All lockers fitted with electrogalvanized rustproof hooks. Lockers measuring 12" wide and 12" deep to be fitted with 4 hooks; lockers measuring 15" wide and 15" deep to be fitted with 5 hooks; lockers measuring 18" wide and 18" deep or deeper to be

SINGLE TIER LOCKERS
Type F. L. S.

DOUBLE TIER LOCKERS
Type F. L. D.

fitted with 7 hooks. Lockers measuring 24" deep to be also fitted with cross rod for coat hangers.

NUMBERING—Each locker to be numbered by means of a brass plate with sunken and black enamel figures.

FINISH—All parts to be thoroughly cleaned and then given 2 coats of best quality baked enamel, either black or olive green; each coat applied by dipping, and baked on separately.

SHIPMENT—Lockers are usually shipped knocked down, and in this way take the lowest freight rate; all parts are well crated.

On large equipments the company can also arrange to send mechanics to the building and install the lockers ready for use.

Durand Steel Rack Construction.

Durand steel racks are simple in construction and interchangeable throughout and are made in two types: Durand Standard and Durand Skeleton.

DURAND STANDARD—A closed type of shelving consisting of uprights and shelves, to which can be added interchangeable compartment dividers, bin fronts, counters, backs and label holders.

DURAND SKELETON—An open boltless structure for storage of patterns and packaged stock.

DURAND SHELVES—Both Standard and Skeleton types have sustained a load of 1000 lbs. per sq. ft. without exceeding their bending strength, and will carry an unevenly distributed load of 200 to 400 lbs. per sq. ft., depending on their area, without taking a permanent deflection.

ASSEMBLY OF DURAND STEEL RACKS

ISOMETRIC VIEW OF STANDARD RACK, SHOWING DETAILS OF CONSTRUCTION
A. Lengthwise bearer

Specifications for Durand Steel Racks.

STANDARD UPRIGHTS—To be composed of two 1/4" square tubes of No. 16 U.S.S. gage steel with a flat sheet welded between. (These sheets vary from No. 22 to No. 16 U.S.S. gage, according to the depth and height of the uprights.)

SKELETON UPRIGHTS—To consist of two 1/4" square tubes.

All uprights punched on 3" centers for shelf adjustment.

STANDARD SHELVES—Shelves in standard racks to be made of No. 16 U.S.S. gage steel flanged downward 1" and back 5/8" at front and back, and downward 1" at sides. Front and back of shelves to be carried on, and reinforced by, 1/4" x 1" high carbon bars (lengthwise bearers) and at sides fastened to the uprights by 1/4" bolts.

SKELETON SHELVES—Shelves in skeleton racks to be flanged at front and back the same as standard shelves, and at sides downward. These shelves to be carried front and rear on 1/4" x 1" high carbon bars (lengthwise bearers) and at sides on 1" x 5/8" x 1/8" angles (crosswise bearers), no bolts being used.

LENGTHWISE BEARERS—To be 1/4" x 1" rolled steel bars grooved at ends, grooves being tapered so that they are a wedging fit in the shelf adjustment slots.

CROSSWISE BEARERS—To be 1" x 5/8" x 1/8" angles having tapered notches that wedge on lengthwise bearers and lugs that engage in slots in upright tubes. Long legs of angles have tangs pressed out to bear side flanges of shelves.

BACKS—To be a flat sheet varying in gage according to size.

BIN FRONTS—To be formed of No. 16 U.S.S. gage so that a label card the full length of front can be inserted if desired, and fastened to uprights by clips that enter shelf adjustment slots and bolt to bin fronts.

LABEL HOLDERS—To be 1 1/8" wide and full length of shelf; drawn from No. 22 U.S.S. gage steel.

FINISH—Black japan and olive green enamel baked on are this company's two standard finishes. Black will stand a higher temperature in baking and therefore is recommended where shelves are to receive rough usage.

FEDERAL STEEL LOCKERS and SHELVEING.
Metal Racks, Bins, Boxes, Filing Cabinets, Metal Furniture, Hospital Equipment.

Federal Unit Steel Lockers.

Simple in design, with all parts thoroughly standardized, interchangeable and uniform. The welded angle steel frame and special overlap door absolutely guarantees against door troubles. The Federal locker has fewer parts, erects more easily and is clean cut, handsome and strong.

SPECIFICATIONS

Doors—Full pickled, cold rolled furniture steel, No. 16 U. S. gauge (.0625 in. thick) if 15 ins. wide by 72 ins. high or larger; smaller sizes No. 18 U. S. gauge (.05 in. thick). Doors shall have reinforcing panels of hard steel angle bars ($\frac{3}{4}$ by $\frac{3}{4}$ by $\frac{3}{32}$ in.) riveted or welded to reverse side. Doors shall overlap locker frame and allow $\frac{1}{2}$ -in. clearance between door panel and locker frame to prevent binding.

Frames—Front frames shall be of hard angle steel (1 by 1 by $\frac{1}{8}$ in.) assembled by oxy-acetylene weld. They shall be unit in principle to give absolute squareness and rigidity and allow for rearrangement of lockers.

Body—Locker body shall be pickled and cold rolled steel No. 22 U. S. gauge (.0312 in. thick). Single row lockers shall have angle steel framed backs ($\frac{3}{4}$ by $\frac{3}{4}$ by $\frac{3}{32}$ in.) for each second unit. All parts shall be properly flanged or braced to give uniform strength.

PARTS OF FEDERAL UNIT STEEL LOCKERS

Tops—Tops shall be inserted below top cross angles at front and back and shall overlap adjoining top 1 in. Slant tops shall have 6-in. pitch with $\frac{1}{4}$ -in. eave at front.

Bottoms—Bottoms shall be flush and supported by 1 by 1 by $\frac{1}{8}$ -in. angle reinforcement.

Shelves—Shelves shall be 9 ins. below top. They shall be flanged on all sides with double $\frac{1}{2}$ -in. smooth edged flange at front.

Locking Device—Locking device shall be 3-point, operating with quarter turn of handle to engage locker frame immediately opposite lock and on top and bottom cross bars. Locking bars shall be $\frac{1}{2}$ in. by No. 10 gauge stock. Door handles shall be provided with loop for padlock. (Quote extra for Eagle, Miller or Yale R381 $\frac{1}{2}$ -master-keyed locks with 2 keys each, or Miller 3332 B combination lock.

Hinges—Hinges shall be 2 $\frac{1}{2}$ -in. fixed pin heavy steel butts with concealed flanges. 72-in. doors shall have 3 hinges, smaller doors 2 hinges.

Hooks—Hooks shall have sherardized, rustless finish. Locker backs shall have 2-point hook for coat and hat. Sizes 15 ins. or less shall have a single prong hook attached with 2 bolts. Larger sizes shall have special 2-prong hooks with $\frac{3}{8}$ -in. steel rod for coat hanger on 60-in. or 72-in. sizes. A 2-prong ceiling hook shall be supplied if coat rod is omitted.

Legs—All front legs shall have a simple screw adjustment (to allow for any unevenness in floor). Back legs in single row locker sections shall be of $\frac{3}{4}$ -in. angle steel and shall be integral part of locker frame.

Ventilation—Doors shall have embossed, hooded or louver ventilators. They shall be 7 ins. long and 1 in. apart on centers with $\frac{1}{4}$ -in. opening at lower edge. There shall be nine embossings near top and also near bottom.

Numbers—Lockers shall be numbered with black figures $\frac{3}{4}$ in. high sunk in polished brass plates near top of door.

Finish—Two-coat olive green or pigment black enamel baked at a temperature of 300° Fahr.

STANDARD SIZES—Any combination of dimensions as listed:
12 ins. wide, 12 ins. deep, 36 ins. high, on 6-in. legs
15 ins. wide, 15 ins. deep, 42 ins. high, on 6-in. legs
18 ins. wide, 18 ins. deep, 48 ins. high, on 6-in. legs
60 ins. high, on 6-in. legs
72 ins. high, on 6-in. legs

NOTE—36-in. and 42-in. sizes made 2 lockers high.

SECTION OF FEDERAL VENTILATED LOCKERS

FEDERAL EXPANDED METAL LOCKERS

Federal Steel Shelving and Racks.

WEIGHT SAVING—Non-essentials have been eliminated by our engineers who have centralized strength so that floor load may be used to support more materials stored with less weight of shelving used. The Federal patented shelf formation with locked, full section flanges gives upward of 25% greater shelf strength.

STANDARDIZATION—Second only to the value of sturdy strength is standardization, simplicity, adaptability, extensibility. From the simple rack type (open verticals and shelves) to the completed equipment (closed sides, closed backs, bin fronts, shelf dividers, box dividers, box stops, hinged doors, sliding doors, ledge fronts) there is not a single item that must be discarded or substituted. The fewness of parts and their simple smoothness and uniformity make Federal shelving the ultimate in standardization, extensibility and adaptability.

ADJUSTABILITY AND TIME SAVING—The Federal patented shelf lock gives shelf adjustment in about half time. A hammer blow will either lock or disengage the shelf. This ease of adjustment and simplicity of parts makes for an economy of shelf space because compartments of proper size may be more readily provided.

Economy of shelf space used, means economy of time to stockkeepers.

SPECIFICATIONS

General—All shelving and rack parts shall be uniform and interchangeable. They shall adjust independently, and be so constructed that there shall be no exposed edges, and so that an equipment may be added to, separated, and parts inserted or removed without disturbing any but the one opening involved.

There shall be but one type

CONSTRUCTIONAL VIEWS
FEDERAL STEEL SHELVING

of upright, shelf, etc. Double faced sections shall be such that they may be separated and used in single row arrangement.

Uprights—The vertical load shall be carried by 1 1/2 by 1 1/2 by 1/8-in. hard steel T-bars, which shall provide for 3-in. [optional 1 1/2-in.] vertical shelf adjustment (closed uprights shall include No. 20 U. S. gauge [.0375 in. thick] cold rolled sheet steel).

Shelves—Shelves shall be of No. 18 U. S. gauge (.05 in. thick) cold rolled flat steel properly reinforced to support 150 lbs. per sq. ft. of shelf [optional—specify maximum safe load required.]

All shelf flanges shall be 1 in. deep with 1-in. return at front and rear. Flanges shall be full section, continuous and locked together under compression with the vertical T-bars. To prevent tearing or shearing, square washers 7/8 by 1/10 in. thick shall reinforce the shelf flange corners.

Backs—Closed backs shall be of No. 20 U. S. gauge (.0375 in. thick) cold rolled steel and shall attach with clincher bolts or in such manner that they may be added or removed without moving rack sections.

Double row shelving shall have full length backs.

Bin Fronts—Bin fronts shall be of No. 18 U. S. gauge (.05 in. thick) cold rolled steel. They shall overlap and engage the shelf or the bin front immediately below. The end wings shall attach to the T-bar adjustment holes.

Shelf Dividers—The shelf or compartment dividers shall be of No. 20 U. S. gauge (.0375 in. thick) cold rolled steel. They shall have 1/4-in. vertical beads and shall attach through the shelf with no raw flanges exposed.

Ledge Shelves—Ledge shelves and ledge uprights shall be of same materials as main sections. They shall attach with a close smooth fit to front of main equipment.

Label Holders—Label holders shall be of No. 24 U. S. gauge (.025 in. thick) steel. They shall be 7/8 in. high [optional 1 1/8 in. for bin fronts], shall extend entire length of shelf opening, and attach with bolts or clincher bolts.

Doors—All doors, whether hinged or sliding, shall be of No. 18 U. S. gauge (.05 in. thick) cold rolled, flat steel. They shall overlap and be so constructed that they can not bind.

Door hinges shall attach to main vertical adjustment holes so that doors may be added to any part of equipment entirely without special fitting, filing or drilling.

Sliding doors shall travel in double steel channels, shall have ball bearing rollers, and operate freely and easily.

Enamel Finish—The entire shelving shall have an olive green [optional—pigment black] baked enamel finish which shall be applied after machining is completed and to surfaces thoroughly clean and free from rust. The enamel shall bake at not less than 300° Fahr.

Special Service.

Our service department will be glad to co-operate in planning equipment and in suggesting features suited to individual requirements.

STEEL LOCKERS; STEEL SHELVING.

Standard Lockers.

BRIEF SPECIFICATION—Metal—All sheet metal used is best grade cold rolled U. S. standard gage, free from scale and buckle. Partitions (intermediate sides and ends), tops, shelves and bottoms No. 21 gage. Backs No. 20 gage. Door frames and doors No. 14 gage.

Door Frames and Backs—Made from one sheet each, flanged 1-in. on both edges, formed at bottom to provide 6-in. legs.

Sides—Securely bolted to door frame and back.

Top Member—Projects over and locks on to front frame, giving a finish. Flat top is standard.

Bottoms—Formed without ledges so they can be brushed out easily.

Locking Device—Operated by rustproof T-handle, engages door frame at 3 points. So arranged that manipulation of latch is impossible when thrown.

Doors—Type "B-C," 6-louvered openings top and bottom; one piece with steel channel reinforcing; hung to door frame with 3 solid 2-in. fast pin butts.

Type "A-C," same as "B-C," except panels are perforated with $\frac{5}{8}$ -in. square holes on 1-in. centers.

Unlocked Position Locked Position $\frac{1}{2}$ SIZE OF LOCK, SHOWING BACK OF DOOR SHOWING LOCK COVER DETAILS

Equipment—All standard lockers have a solid brass, pin tumbler, paracentric master-keyed lock, with 2 keys to each lock; 5000 changes.

Each locker has suitable number of 2-prong rustproof hooks of ramshorn design, a towel or coat hanger rod and a solid brass number plate with $\frac{1}{2}$ -in. numerals etched in black.

Single tier lockers have hat shelf 3 ins. below top with rounded front edge.
No shelf in double tier.

Optional Equipment—21° angle sloping tops. Combination

REPRESENTATIVE UNITS, "H & H" STEEL LOCKERS
Furnished in sections of any number of units. Details on following page

Standard Universal Unit Shelving.

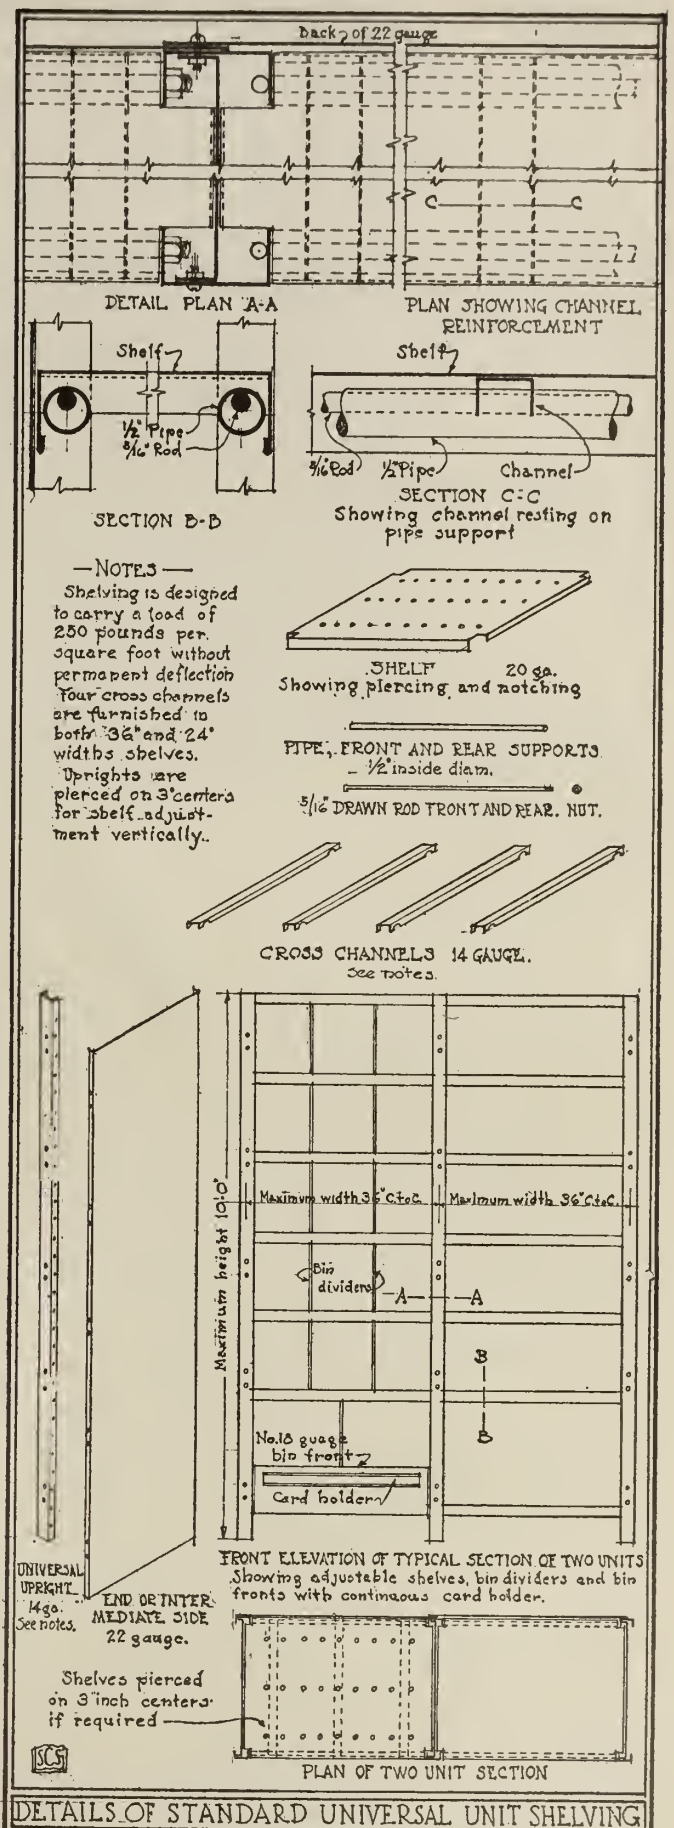

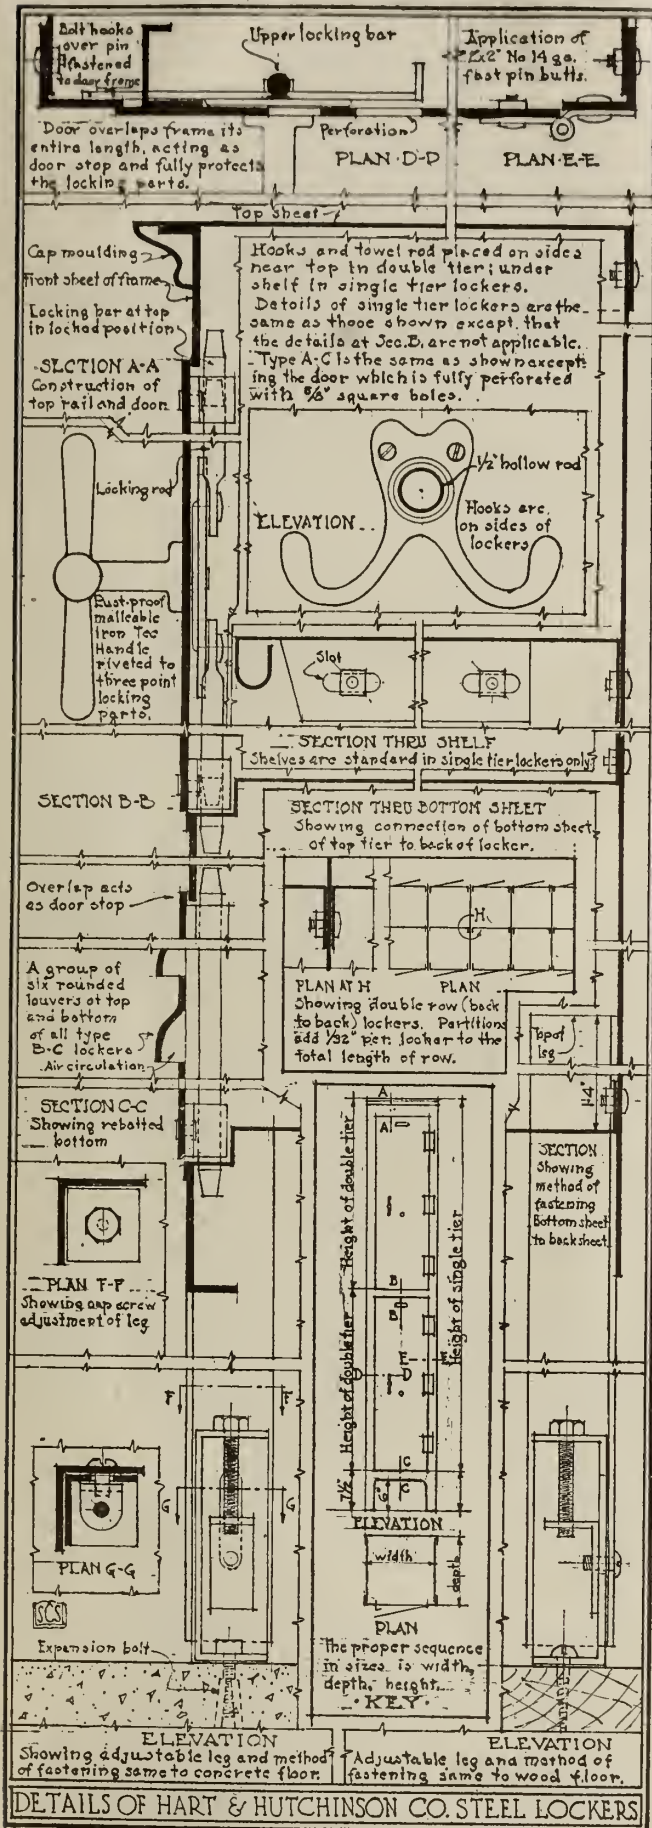

A standard unit type of steel shelving built on the "mill construction" principle. Substantial channel uprights are bolted together by rods incased in pipe separators and on these rest channel cross supports (or girders) that carry the loads imposed on the shelves. The load is not carried by the shelf but by the structural members under it.

Each section is a separate unit with ends and back; and dividers, bin fronts, card holders, etc., are furnished to suit the desired conditions.

Made in heavy and light weight.

Products.

LYON ADJUSTABLE and EXTENSIBLE STEEL SHELVING and STORAGE RACKS; STEEL LOCKERS.

Also, Steel Cabinets, including Blue Print and Stationery Cabinets; Steel Boxes, Barrels, Tool Boxes and Bench Drawers; Steel Benches and Tables; Steel Factory Desks, and Steel Enclosure Panels.

Lyon Steel Shelving and Racks.

STANDARDIZATION—Both "Open" (Skeleton) and "Closed" shelving are assembled from the same standard parts, which are interchangeable, reversible and adjustable. No special construction is required and racks may be easily rearranged to meet changing conditions.

FEATURES OF LYON STANDARD SHELVING—Simplicity—Weights less for guaranteed load than other types, fewer parts, easy to assemble.

Rigidity—Each stack rigid in itself. No fastening to floor or ceiling or bracing required.

Strength—Carries greater guaranteed load per weight of shelving than any other rack made.

Space Saving—Construction requires minimum floor area.

Fireproof—Approved by insurance authorities.

LYON STANDARD SHELVING FOR HEAVY LOADS—Each shelf is put under compression against the face strip by two $\frac{7}{8}$ -in. diameter rods, on which it rests. The one-piece steel face strip is rolled and grips the partition sheet, to which it is spot welded, on both sides.

The face strip design avoids the usual pocket behind the upright. With an ample factor of safety, Lyon shelves will support from 200 to 350 lbs. per sq. ft.

LYON COMMERCIAL SHELVING—Shelving consists of three members: uprights, shelves and shelf supporting clips. The shelves may be adjusted on $1\frac{1}{2}$ -in. centers. A screwdriver is the only tool required for erection. The commercial type shelving is particularly designed for loads which do not require the great strength of the standard shelving.

SUGGESTED USES OF LYON SHELVING

Standard Open (Skeleton)	Standard Closed	Commercial Open (Skeleton)	Commercial Closed
For heavy material which piles or stacks	For heavy material requiring bins or pockets	For material which piles or stacks	For material requiring bins or pockets
Metal pattern storage	Public service corporation shops	Wood pattern storage	Repair shop
Wholesale hardware houses	Warehouses	Wholesale drug houses	Garages
Machinists supply houses	Tool rooms	Mercantile establishments	Retail hardware stores
Printing establishments for paper stock	Supply houses	Wholesale groceries	Supplies
Binderies	Machinesthops	Stationery houses	Repairs
Factories	Factories	For display purposes in retail supply houses	Light hardware
Warehouses	Stock rooms

Lyon Steel Locker.**STANDARD SIZES—**

SINGLE TIER		
Depth	Width	Height
12 ins.	12 ins.	60 ins.
15 ins.	15 ins.	72 ins.
18 ins.	18 ins.	
24 ins.	24 ins.	

DOUBLE TIER		
Depth	Width	Height
12 ins.	12 ins.	36 ins.
15 ins.	15 ins.	42 ins.
18 ins.	18 ins.	

Height does not include 6-in. legs.
Any combination of the above sizes makes up a Standard Locker.

SPECIFICATIONS AND EQUIPMENT—**DOOR AND DOOR FRAME**

Construction—Full pickled cold rolled furniture steel. Sheet, lapped back on both sides, to form tubular reinforcement as shown, and provides double thickness of metal where hinges, locking device and handle are attached.

Upright member $1 \times 1 \times \frac{1}{8}$ -in. hard steel angles. Horizontal member $1\frac{1}{2} \times \frac{3}{4} \times \frac{1}{8}$ -in. steel channels. All joints are lap-welded.

Hinges—Double butt hinge riveted to door frame and bolted to door. Number of hinges to be determined by height of door as follows:

- 72 ins. high, 4 hinges
- 60 ins. high, 3 hinges
- 42 ins. high, 2 hinges
- 36 ins. high, 2 hinges

Locking Device—Gravity actuated, controlled by special pivot handle and locked with either flat key, master-keyed Yale & Towne lock, or ordinary padlock. Number of locking points to be determined by height of door as follows:

- 72 ins. high, 3 locking points
- 60 ins. high, 3 locking points
- 42 ins. high, 2 locking points
- 36 ins. high, 2 locking points

Ventilation—By means of either "louver" or "standard" ($\frac{1}{2}$ in. round hole) perforations in doors. "Half" perforation as shown, or "full" perforated doors (perforations full length).

BODY

Back and Sides—Full pickled cold rolled steel, flanged on four sides to give additional strength. Reversible and interchangeable with other of same size.

Top—Full pickled cold rolled steel made either flat or sloping. Flat tops and bottoms of same size are interchangeable.

Bottom—Full pickled cold rolled steel offset to fit inside and flush with top of cross channel of door frame. Bottoms and flat tops are interchangeable with others of same size.

Legs— $1 \times 1 \times \frac{1}{8}$ -in. hard steel angles 6 ins. long; adjustable; have feet punched for securing to floor.

HAT SHELF

In single tier lockers only, placed $9\frac{1}{2}$ ins. from top in 72-in. lockers and 8 ins. in 60-in. lockers.

HOOKS

All lockers have 1 double prong ceiling hook. Lockers 12 ins. wide have 1 single prong hook on back and 1 on each side. Lockers over 12 ins. wide have 2 single prong hooks on back and 1 on each side.

FINISH

Two coats of olive green or black enamel baked on at a temperature to secure maximum toughness and durability.

NUMBERING

Each locker is numbered by means of an etched aluminum plate with black enameled sunken figures.

METHOD OF SHIPMENT—According to existing conditions and quantity shipped, either erected or

**LYON STANDARD LOCKERS AND EXCLUSIVE FEATURES**

- (1) Door opening always true and square; reinforced one-piece door frame with welded corners.
- (2) Easily operated locking device; malleable handle; a single forward pull operates locking device and opens door.
- (3) All corner joints have double overlapping flanges.
- (4) Back legs strengthen and stiffen entire locker base.
- (5) Overlapping flanges at door corners.
- (6) Door will always shut and latch properly.
- (7) Gravity actuated locking device; engages automatically by merely pushing door shut; simple, strong, and secure.
- (8) Impossible to pry door open; three locking fingers and three door jams interlock.
- (9) Locker door, because of rigid reinforcing, can not get out of alignment.
- (10) Hinge can not be forced; securely riveted in position. Door can not swing back against adjoining locker door.

knocked down with complete erection instructions. Prices will also be quoted for lockers installed complete.

INFORMATION FOR PRICES—Prices are based on quantity, size and arrangement. Complete information of the installation desired should be furnished when possible for lowest prices. Our engineering department will make suggestions as to the arrangement of the lockers, the size required, interior fittings, etc., without charge.

Please advise on the following:

- (1) Quantity.
- (2) Size.
- (3) Arrangement: Single row (wall lockers); double row (back to back).
- (4) Sectionizing. Number of lockers or openings to each section in the above arrangement.
- (5) Furnish sketch of floor plan if possible.

Special Equipment.

All types of special steel equipment can be made, such as special cabinets, boxes, etc. Special sizes of shelving and lockers can also be made when absolutely necessary, but only at a higher cost.

Standard sizes are made in quantities and carried in stock, which enables the company to give better service with a lower cost. The wide ranges of sizes will be found to answer practically every requirement.

parts and construction and illustrations of this company's complete line comprising lockers, wardrobes, cupboards and shelving.

Terrell's Steel Lockers.

Built on the unit principle. Supporting frames made of special drawn steel angles 1 by 1 in. of not less than No. 14-gage U.S.S. steel. Corners mitered and acetylene welded. Bodies of high grade steel and smooth surface of not less than No. 24-gage U.S.S. or No. 22-gage B.&S.S. Ends reinforced with 2 strips of No. 20-gage steel welded inside of panel. Tops and bottoms reinforced with flanges on all sides. Backs have a flange on all sides. Doors made of No. 18-gage U.S.S. or No. 16-gage B.&S.S. high grade steel with smooth surface. Reinforced with special channels drawn from smooth strip steel. Panels welded to frames.

STANDARD EQUIPMENT—Three 2-prong hooks. Brass number plates numbered serially. Hat shelf in 60- and 72-in. lockers. Rod for hangers in 24-in. width and depth. Additional hooks furnished if desired.

STANDARD SIZES—Width, 12, 15, 18 and 24 in. Depth, 12, 15, 18 and 24 in. Height, single tier, 60 and 72 in.; double tier, 36 and 42 in. For over all height, add 6 in. for legs.

VENTILATION—Doors furnished with louver ventilation, with perforations or with ventilation omitted.

LOCKS—Master-keyed flat key locks, master-keyed padlocks and combination keyless locks.

FINISH—Baked enamel in olive green, black, grained oak and grained mahogany.

EUREKA MACHINE CO.

Manufacturers of Superheaters and Cooperage Coating Sprays

2615 Vega Avenue
CLEVELAND, OHIO

MATTHEW WYLIE & CO., GLASGOW, SCOTLAND, SOLE AGENTS FOR GREAT BRITAIN

Products.

SUPERHEATERS; COOPERAGE COATING SPRAYS; BARREL STERILIZING and COATING MACHINES.

Also, Pitch, Tar and Steam Jacket Kettles; Branding Machines; Number Brands.

Eureka Portable Superheater.

Designed for superheating ordinary saturated steam to extremely high temperature and for compounding, cooking and rendering materials of heavy consistency such as tar, pitch, fats, heavy greases and oils, where fire is ordinarily used.

DIMENSION DIAGRAM EUREKA PORTABLE SUPERHEATER
Weight 2000 lbs. Two smaller sizes

The Eureka superheater is indorsed by the National Board of Fire Underwriters, as a safety appliance where high temperature is applied to combustibles.

This machine can be placed convenient to the using point and give a steady flow of high temperature steam with low steam pressure, thus saving the strain on steam boilers.

STYLE "F" SUPERHEATER WITH SMOKE ESCAPE (STERILIZER)

With this appliance the superheater can be used for removing old coatings of pitch, paraffin, stearin or any greasy substance from barrels. It does it twice as fast as live steam and with far better results

Cooperage Coating Spray.

For coating the interior of barrels, tubs and buckets with glue, paraffin, silicate of soda, pitch or any protective lining.

One of these sprays will do the work of three men and do it far better with a saving of time and material. As none of the coating reaches the outside of the barrel it is not smeared with coating. Inside, it is a perfectly lined package. The spray will throw any liquid coating 40 ft. and will cover the interior of a 100-gal. cask as

readily as that of a small bucket. It does not matter how much coating is forced into a package, only a thin coating will adhere and the surplus immediately flows back into the kettle again.

The operation is very simple. A package is laid over the spray nozzle, the clutch is thrown in and after pump has made from 5 to 6 strokes the clutch is thrown out and the package is coated.

PRESSURE LEVER DEVICE—After the barrel is rolled over the nozzle, the pressure lever is pushed down, which forces the sliding bung into the bunghole of barrel. The clutch is thrown in and the barrel is coated and tested at the same time. A great advantage in this device is that the operator has the barrel in a convenient position and it is then an easy matter to plug leaks. Enough pressure is generated to force the coating into and through any worm or seed holes.

When the barrel is coated and inspected the pressure lever is pulled up which releases the bung allowing the surplus coating and pressure to escape. All coating flows back into the kettle.

COOPERAGE COATING SPRAY
Weight, 675 lbs.; floor space, 3 by 5 ft.; capacity, as fast as operator can handle cooperage. Three sizes, hand or power
